Note: All dimensions are approximate and for illustration purposes only. For exact dimensions consult certified dimensional prints
Valve 8"-12" are shown with double D stems which are standard. However spline shafts are also available for these sizes as an option.
All weights include either wrench or gear operator
Face-to-face dimensions comply to ANSI B16.10 and flange connections comply to ANSI B16.5

FLOWSERVE

How to Specify T4E Valves

Size[1]
0.5 in.
0.75 in.
1.5 in.
2 in.
3 in.
4 in.
6 in.
8 in.
10 in.
12 in.

Product Family
T4E = Standard

Pressure Class[1]
1 = ASME Cl. 150
2 = DIN PN 16
3 = ASME Cl. 300

End Configuration
1 = Raised Face Flanges

Plug Style		
C = 2-Way		
D = Slot	Cv = .8	1"
E = Vport	Cv = 3	1"
F = Vport	Cv = 8.3	1"
G = Vport	Cv = 13	1"
H = Vport	Cv = 29.6	1.5"
J = Vport	Cv = 53.6	2"
K = Vport	Cv = 88.7	3"
L = Vport	Cv = 187.1	4"

Options
C = Chlorine Service
D = Chlorine Clean Only
G = Bottom Vented Plug[8]
H = Upstream Vented Plug (side)
J = Side/Bottom Vented Plug (upstream)
L = Anti-Vibration Clip for Top Cap Bolts
M = Side Vent Downstream (requires release from customer in writing)
O = Oxygen Cleaning
R = Built Dry (no lubrication)[9]
S = Silicone Free Lubrication
W = No Options
@ = DuPont Flouropolymer Material
Q = Quality Plan

Manufacturers code
N = Internal use

Adjuster fastener[7]
1 = B840
2 = B9
3 = B7YC
4 = B7T
5 = C20
6 = HC
7 = B7
8 = MKH
9 = B7M
0 = B7MZ
E = 88YC

Top Cap Fastener[7]
1 = B840
2 = B9
3 = B7YC
4 = B7T
5 = C20
6 = HC
7 = B7
8 = MKH
9 = B7M
0 = B7MZ
E = 88YC

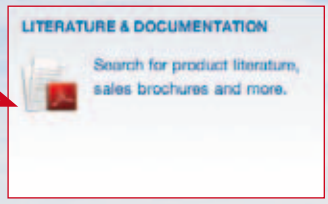
Operator
0 = Std. Wrench[5]
1 = Gear Cl[6]
2 = Locking Gear Cl
4 = Caustic Gear PF
9 = Bare Stem
B = Babbit/Chain

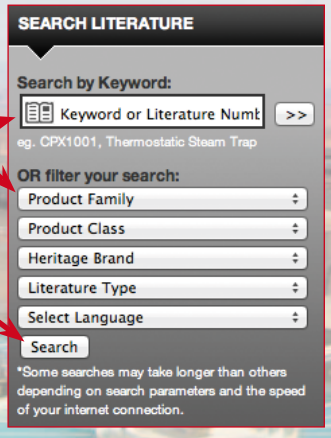
Standard Valve Codes		
Size	Class 150	Class 300
0.5	.5-T4E-11C11D033NW	.5-T4E-31C210033NW
0.75	.75-T4E-11C11D033NW	.75-T4E-31C210033NW
1	1-T4E-11C11D033NW	1-T4E-31C210033NW
1.5	1.5-T4E-11C11D033NW	1.5-T4E-31C210033NW
2	2-T4E-11C11D033NW	2-T4E-31C210033NW
3	3-T4E-11C11D033NW	3-T4E-31C210033NW
4	4-T4E-11C11D033NW	4-T4E-31C210033NW
6	6-T4E-11C11D033NW	6-T4E-31C210033NW
8	8-T4E-11C11D1EENW	8-T4E-31C2101EENW
10	10-T4E-11C11D1EENW	10-T4E-31C2101EENW
12	12-T4E-11C11D1EENW	

Body liner[2]	Plug Alloy[3]	Top Cap Alloy[4]
1 = DIPA	1 = DIPA	D = DCI
2 = DSPA	2 = D4PA	O = CD4M
3 = D4PA	3 = CDPA	

Codes	
DIPA	Ductile iron, PFA lined
DSPA	Carbon steel, PFA lined
D4PA	316 SS, PFA lined
CDPA	CD4MCuN, PFA lined

[1] Class 150 valves = ½" thru 12" ductile iron / 8" thru 12" stainless steel
Class 300 valves = ½" thru 10" carbon steel
[2] DIPA body = class 150 valves only
D4PA body = 8", 10" 12" class 150 valves only
DSPA body = class 300 valves only
[3] DIPA plug = ½" thru 12"
CDPA plug = 8", 10" and 12" only
[4] DCI top cap = DIPA valve bodies
CD4M top cap = D4PA and DSPA valve bodies
[5] Locking wrench standard thru 4"
[6] Gear standard 6" and above (also available on smaller sizes)
[7] B7YC = standard for ½" thru 6"
88YC = standard for 8", 10", 12" (Gr. 8.8 yellow chromated)
[8] 8" and larger plugs have bottom vent as standard
[9] No lubrication for valves up to 4"
Built with Krytox for valves 6" and above





To Access Literature On-line

More information about FLOWSERVE products can be obtained on-line. It's easy to find… it's free… and you do not need a password.

Do This:

1. Go to www.flowserve.com
2. Click in the box that says "Literature"
3. Enter "Keyword" or literature number and "Filter" as required
4. Click on "Search"

The most recent version of each product bulletin will be available on this site.

Once you have the PDF, you can:

- read it
- print it
- download it
- even e-mail it

Other Useful Information

In addition to lined plug valves, lined butterfly valves (Document number DVENTB0020) and lined ball valves, check valves and sight glasses (Document number ATENTB0010) are also available.

Finally, a wide variety of metallic and lined rotary valves and actuation equipment is summarized in the Document number DVENBR0001.

To obtain any of these brochures, follow the simple steps on the left of this page and enter the Document number in Step 3.

Ordering Preprinted Literature

Customers, please contact your Flowserve sales representative to get hard copy of a brochure. Flowserve representatives and distributors can go to www.flowserve.com and click on the "View Literature" link then click on "Log-in to order hard copy literature" and follow the prompts.

Flowserve Corporation has established industry leadership in the design and manufacture of its products. When properly selected, this Flowserve product is designed to perform its intended function safely during its useful life. However, the purchaser or user of Flowserve products should be aware that Flowserve products might be used in numerous applications under a wide variety of industrial service conditions. Although Flowserve can (and often does) provide general guidelines, it cannot provide specific data and warnings for all possible applications. The purchaser/user must therefore assume the ultimate responsibility for the proper sizing and selection, installation, operation, and maintenance of Flowserve products. The purchaser/user should read and understand the Installation Operation Maintenance (IOM) instructions included with the product, and train its employees and contractors in the safe use of Flowserve products in connection with the specific application.

While the information and specifications contained in this literature are believed to be accurate, they are supplied for informative purposes only and should not be considered certified or as a guarantee of satisfactory results by reliance thereon. Nothing contained herein is to be construed as a warranty or guarantee, express or implied, regarding any matter with respect to this product. Because Flowserve is continually improving and upgrading its product design, the specifications, dimensions and information contained herein are subject to change without notice. Should any question arise concerning these provisions, the purchaser/user should contact Flowserve Corporation at any one of its worldwide operations or offices.

Torques

INTRODUCTION TO TORQUES

There are a number of torques which butterfly valves may experience such as:

- **T_{su} - Seating and Unseating Torque**
- **T_d - Dynamic Torque Resulting from fluid flow**
- **T_{bf} – Bearing Friction Torque**
- **T_{ss} – Stem Seal Friction Torque**
- **T_e – Eccentricity Torque resulting from disc offset from centerline of stem (either single, double or triple offset)**
- **T_h – Hydrostatic Torque**

Factors which influence the butterfly valve torque values shown above are:

- Type of Seat and Seat Material
- Interference of Seat I.D. and Disc O.D.
- Shaft Diameter
- Valve Diameter
- Bearing Coefficient of Friction
- Angle of Opening
- Shut-off Pressure
- Fluid Velocity
- Disc Shape and Configuration
- Piping System and Location/Orientation of Valve in Pipe Line
- System Head Characteristics
- Physical Size of Disc/Shaft Obstructing Flow
- Disc Edge Finish

With respect to Butterfly Valves, the two major conditions for determining total valve operating torque (T_T) exists as follows:

CASE I (Angle = 0° , Disc in Closed Position)

$$T_T = T_h + T_{bf} + T_{ss} + T_{su}$$

Analyzed

Total Torque for Case I using a symmetrical disc butterfly valve is the sum of hydrostatic torque, bearing friction torque, stem seal, friction torque, and seating/unseating torque.

A. Hydrostatic Torque (T_h)

We will ignore discussion of the hydrostatic torque values as they are generally insignificant compared to the seating/unseating, bearing friction and stem seal torque values (the safety factor applied to seating/unseating, stem seal friction and bearing friction torque values more than compensates for the hydrostatic torque which is usually less than 2% of these total torques).

B. Bearing Friction Torque (T_{bf})

Bearing friction torque occurs because pressure forces against the disc are transmitted to the stem. As the stem is forced against the bearing supports, bearing friction torque is created between the stem material and the support material as the stem is turned. Bearing friction torques are normally included in the seating/unseating torque values.

Bearing friction torques can be determined by using the following equation:

$$T_{bf} = .785\ C_f\ D_v^2\ (d/2)\ \Delta P$$

Where:

- T_{bf} = Bearing Friction Torque
- C_f = Coefficient of Friction (approximately .25 for non-corroded stem to cast iron body) (dimensionless).
- D_v = Valve Diameter (Inches)
- d = Diameter of Shaft (Inches)
- ΔP = Pressure Differential (psi)

C. Stem Seal Friction Torque (T_{ss})

For all practical purposes stem seal friction torque values are insignificant when compared to seating/unseating and bearing friction torques. Stem seal friction torques are normally included in the seating/unseating torque values.

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.
The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

D. Seating/Unseating Torques (T_{su})

The seating/unseating torque value (T_{su}) is a function of the pressure differential, the seat material's coefficient of friction, the finished surface of the disc edge, the amount of interference between the seat I.D. and disc O.D. when flanged in piping, the seat thickness, and the type of service (media) for which the valve is being used. In determining the T_{su} values for Bray resilient seated butterfly valves, Bray has developed Seating/Unseating Torque Charts incorporating all bearing friction and stem seal friction torques for three classes of services for both the valves with standard discs (rated to full pressure) and for valves with reduced diameter discs (rated for 50 psi [3.5 bar]). The three service classes are:

Class A – Non-Corrosive, Lubricating Service

Class B – General Service

Class C – Severe Service

Please review the guidelines for each class in the technical manual when determining which Seating/Unseating Torque Class should be used. Most butterfly valves are used in Class II, General Service applications.

E. Total Torque (T_T)

The total torque values for Bray symmetrical disc valves for Case I applications are shown in the Seating/Unseating Torque Charts within this manual.

CASE II (Disc in Partial To Full Opening Position)

$$T_T = T_{bf} + T_{ss} + T_d$$

The total Torque for Case II using a symmetrical disc butterfly valve is the summation of bearing friction torque, stem seal friction torque and dynamic torque.

A. Bearing Friction Torque (T_{bf})

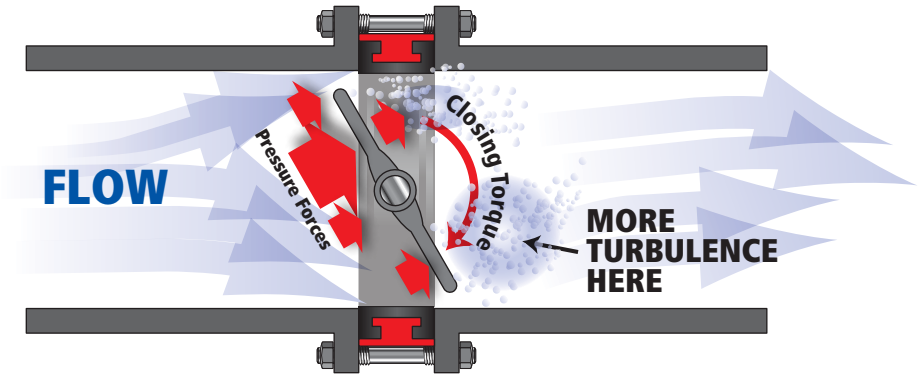
See Case I discussion. This torque value is normally included in the Dynamic Torque Value.

B. Stem Seal Friction Torque (T_{ss})

See Case I discussion. This torque value is normally included in the Dynamic torque value.

C. Dynamic Torque (T_d)

In a symmetrical disc design, dynamic torque occurs between the closed position, 0° and the full open position, 90°. With the disc in the partially open position, velocity of the fluid passing the leading disc edge is less than the velocity passing the trailing edge. This variance in velocity past the leading disc edge and trailing disc edge results in an unbalanced distribution of pressure forces on the upstream side of the face of the disc. The total pressure forces acting perpendicular to the disc face on the leading edge half of the disc are greater than the total pressure acting perpendicular on the trailing half of the disc. This uneven distribution of pressure on the disc face (exists on both sides of the disc) results in a torsional force which tries to turn the disc to the closed position **(Figure 1)**. This torsional closing force can become greater than the seating/unseating torque value depending on the valve angle of opening and differential pressure.



To determine dynamic torque, the following equation is applied:

$$T_d = C_{dt}\, d^3\, \Delta P$$

Where:

- T_d = Dynamic Torque (lbs- in).
- C_{dt} = Coefficient of Dynamic Torque (based on disc shape and angle of opening) (dimensionless)
- d = Diameter of Disc (Inches)
- ΔP = Pressure Differential Across Valve (psi)

Figure 1 - Pressure Distribution

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.
The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

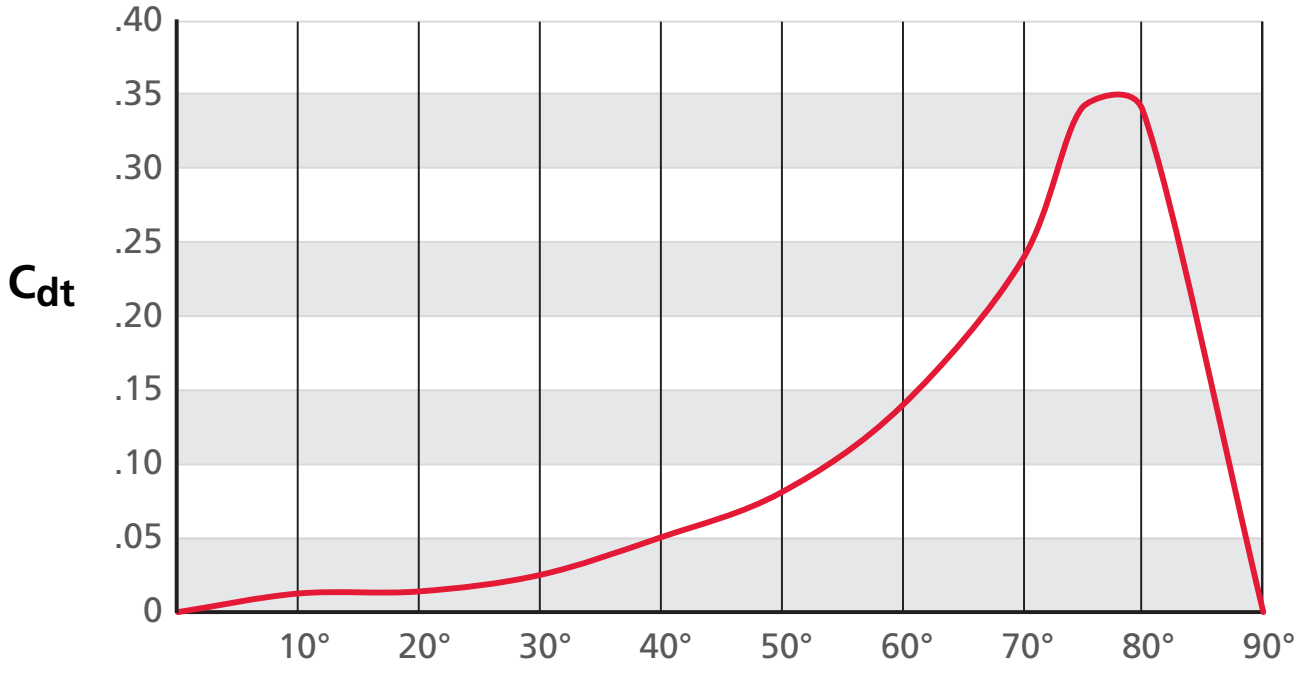
As shown in **Figure 2**, coefficient of dynamic torque for Bray's symmetrical disc valves is at 0° angle of opening and increases until the angle of opening reaches 75°-80°, where it then decreases to a zero value at full open (90°) (no internal friction factors considered, just dynamic torque only).

One final comment about dynamic torque is that one may minimize the dynamic torque by the orientation of the valve (stem horizontal or vertical) in the pipeline as well as by the location (distance) in the pipeline from elbows, other valves, etc. (See Bray Resilient Seated BFV Operations and Maintenance Manual).

D. Total Torque (T_T)

The total torque required for operating a Bray symmetrical disc butterfly valve at an angle opening between 0° and 90° is shown in the Dynamic Torque section of this manual. Note that the dynamic torque includes all internal friction torque values.

CONCLUSION



In most applications for butterfly valves, especially 20˝ (DN 500) or smaller, the maximum torque required to operate the valve will be seating/unseating torque. However, dynamic torque should be considered particularly in:

- Control applications using larger valves (24˝ [DN600] and above) where the disc is maintained in the open position
- Applications using larger valves (24˝ [DN 600] and above) where the velocity is high (16 ft./sec [4.9m/sec]).

Figure 2 - Angle of Opening

The C_{dt} value for Bray symmetrical disc valves are approximately:

Angle of Opening	0°	10°	20°	30°	40°	50°	60°	70°	75°	80°	90°
C_{dt}	0	0.0126	0.0140	0.0251	0.0505	0.0809	0.1394	0.2384	0.3419	0.3400	0

REDUCED DISC DIAMETER BRAY SERIES 30/31/3A VALVES

Bray offers a reduced disc diameter for 4"-20" for Series 30, 31 and 3A valves. The purpose of reducing the disc diameter is to decrease the seating/unseating torques and extend the seat life on low pressure applications.

By reducing the disc diameter, the interference between the disc O.D. and seat I.D. is decreased and the valve pressure rating, which is a function of this interference, is reduced to 50 PSI. Less interference between the disc and seat results in reduced seating/unseating torques. Lower seating/unseating torque may allow for the use of a smaller actuator on the valve. In other applications where abrasive dry bulk materials such as cement, sugar, plastic, pellets, flour, etc., are generally pneumatically conveyed at 50 PSI or less, the reduced disc diameter not only reduces the seating/unseating torque but, very importantly, usually significantly increases the service life of the seat.

Bray does the following to differentiate reduced diameter discs from full diameter discs:

Metal Discs: An " R " is stamped above the part number

Nylon 11 Coated Discs: Discs are differentiated by the color of the Nylon 11:

Grey – Full Disc Diameter

White – Reduced Disc Diameter

SEATING & UNSEATING TORQUES

Bray has developed Seating/Unseating Torque Charts for three Classes of Service for its valves with standard discs (rated for full pressure) and for valves with reduced diameter discs (rated for 50 PSI / 3.5 bar.).

The guidelines for selecting a Class to be used for determining a valve's seating/unseating torque are given below. Each valve application should comply with all five Class characteristics in order to be qualified for that Class.

Characteristics of Application	**Class A** Non-Corrosive, Lubricating Service	**Class B** General Service	**Class C** Severe Service
Media Type	Lubricating hydrocarbons; Aqueous processes and Water (See Note 1)	Water; aqueous processes; all other aqueous liquids including salt water; Lubricating gases	Dry, non-lubricating such as air, dry gas, cement, pneumatic conveying mediums
Corrosion by Media	Insignificant if any	No major corrosion or deposits from media	Can incur significant corrosion such as Ductile Iron disc in water
Chemical Reactions of Media with Seat	Insignificant if any	Only minor or insignificant in nature	Reactions causing swelling and hardness occur
Media Temperature	45º to 160ºF (7º to 71ºC)	Within seat temperature limits, not near limits	Near or at seat temperature limits
Frequency of Valve Cycling	Once weekly or more frequently	Minimum once every 3-6 weeks, or more frequently	Infrequently, sometimes not cycled for long periods

NOTE:

1. For aqueous processes and water, Class A torques may be used only if a Nylon 11 coated disc is selected and all other Class A characteristics apply. Otherwise, Class B torques should be used.
2. All the material trims may be classified into Class A, B, or C except Series 20/21 valves with a PTFE Lined Elastomer seat, PTFE molded disc/stem, or rubber molded disc/stem. These trims must always use Class C Seating/Unseating Torque Values unless they are used only in a throttling application. Valves with bonded seats must always be classified as Class C.
3. If a valve is used strictly in a throttling application, that is, it is never put in the closed position but throttled between 20° and 80°, then Class A torques may be used provided you have checked to see that dynamic torques do not exceed the Class A torque values.
4. With the exception of dry, non-lubricating medias, one is usually safe electing to use Class B torques for sizing actuators for all other valve service applications. Seating/Unseating Torque values shown include friction bearing torques for stated differential pressure.
5. Dynamic Torque values are not considered. See the Dynamic Torque chart in this manual for determination of Dynamic Torque.
6. Do not apply a safety factor to torque values when determining actuator output torque requirement.
7. **For 3-way assemblies where one valve is opening and another is closing, multiply torque by a 1.5 factor.**

DYNAMIC TORQUE FACTORS (IMPERIAL)

To Use the Torque Chart, note the following:

1. Dynamic Torque values include all bearing friction and stem-seal friction torques.
2. Dynamic Torque values are per 1 PSI ΔP. To determine dynamic torque (lb-in) at a desired angle of opening, multiply the pressure drop ΔP at this angle by the appropriate dynamic torque factor in the charts below.
3. Bray recommends sizing control valves between 20° and 70°, with 60° the preferred angle.
4. Dynamic Torque will tend to close all Bray valves whose disc are symmetrical to the stem.

Series 20/21 and 30/31/3A (Dynamic Torque Factor - lb-in./psi)

Valve Size in.	Angle of Opening									
	10°	20°	30°	40°	50°	60°	70°	75°	80°	90°

VALVE SIZING COEFFICIENTS

1. **Valve Sizing Coefficients (Cv)**..... Pages 15-16

    1. **Cv** stands for **Valve Sizing Coefficient**, sometimes called the **Flow Rate Coefficient**.
    2. **Cv** varies with the valve size, angle of opening and the manufacturer's valve style.
    3. **Cv** is defined as the volume of water in USGPM that will flow through a given restriction or valve opening with a pressure drop of one (1) psi at room temperature.

2. **Valve Sizing Coefficients (Kv)**..... Pages 17-18

    1. **Kv** stands for **Valve Sizing Coefficient**, sometimes called the **Flow Rate Coefficient**.
    2. **Kv** varies with the valve size, angle of opening and the manufacturer's valve style.
    3. **Kv** is defined as the volume of water in Cubic Meters/Hour (m^3/hr) that will flow through a given restriction or valve opening with a pressure drop of one (1) bar at room temperature.

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.

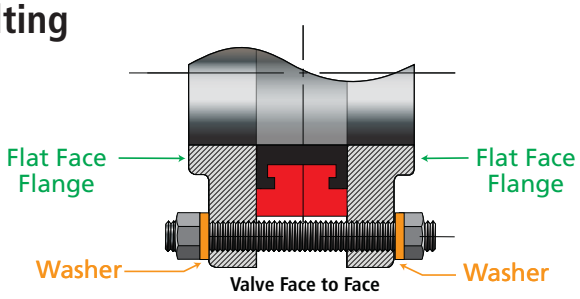
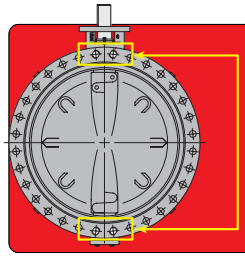
EXAMPLES OF TYPICAL FLANGE TO VALVE BOLTING*



** Lug Style Bolting

Flange Width Including Raise Face If Applicable + Washer Width + Minimum Bolt Engagement Equal to Bolt Diameter = Bolt Length



Wafer Style Bolting

Flange Width x2 Including Raise Face If Applicable + Valve Face to Face + Washer Width x2 + Width of Nut x2 + 4 Threads (2 Per Side) = Overall Length

**** Note: Please refer to Appropriate Bray Dimensional Drawings for specific valve drilling information on Wafer and Lug Valves 20" and larger.**

Please refer to ASME B-16.5 or B-16.47 for Flange and Bolt Dimension Information

* Double flange style bolting not shown.
** Lug threads may be tapped from both sides and therefore tap may not be continuous.

FLANGE BOLT TENSIONING
Bray Butterfly Valves with Metal Mating Flanges

A question frequently asked at Bray is "What torque do I apply to the flange bolts to insure the valve is properly installed?". Initially this seems to be a simple request until all of the factors are analyzed. The installation of a valve requires several components: the valve, mating flanges, nuts, bolts and studs. Each is supplied by different manufacturers and each has different characteristics. The proper torque for one combination may be too much or too little for a second combination. The following is a list of information which needs to be known in order to start calculating the torque requirements.

Valve
- Type
- Size
- Materials of construction (Body)
- Surface finishes / Surface conditions

Flange
- Type
- Size
- Finish / both sides
- Condition of flange / surface contamination

Bolt (or Stud)
- Type
- Materials of Construction
- Surface Conditions

Nut
- Type
- Materials of Construction
- Surface Conditions

Lubrication
- Type
- Coverage

General Factors
- Temperature and relative humidity at the time of installation
- Speed at which bolts are turned

Note: The elastomer valve seat manufactured by Bray also acts as the flange gasket. No additional gaskets are required or recommended. Other valve styles which do not have integral gaskets will need to have this component supplied. The characteristics of this component will also need to be considered.

Complete knowledge of all relevant conditions is almost impossible to obtain. As a result, the computation of the exact torque requirement is not practical. No reputable manufacturer can provide accurate information when so many outside factors are present.

The International Fasteners Institute covers some of the details required to "compute" a torque value. Even with this information the use of a torque wrench is only considered to be 25% accurate. Based on the difficulty and inaccuracy of using this method, Bray recommends the use of the "Turn of the nut" method.

"Turn of the Nut" Tightening
(For ANSI Standard Iron and Steel Flanges)
**For Non-Metallic or non-standard flanges, follow the manufacturers installation procedures.

1. The valve and flange faces must be aligned parallel to each other.

   Note: For rubber seated butterfly valves manufactured by Bray, it is required that the valve be fully opened prior to the tightening of the flange bolts.

2. After aligning the holes in a joint, sufficient bolts shall be placed and brought to a 'snug-tight' condition to ensure that the parts of the joint are *brought into full contact* with each other. 'Snug-Tight' is the tightness attained by the full effort of a man using a spud wrench.

3. Following the initial snugging operation, bolts shall be placed in any remaining holes and brought to snug-tightness. Re-snugging may be necessary in large joints.

4. Tighten opposite bolts in sequence to insure even pressure around the entire flange.

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.
The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

5. When all bolts are snug-tight, each bolt in the joint then shall be tightened additionally by the applicable amount of nut rotation given in Note 1. During tightening there shall be no rotation of the valve or flange.

Note 1

For bolt lengths **not exceeding** 8 diameters or 8 inches (203.2 mm) = **1/4 turn**
For bolt lengths **exceeding** 8 diameters or 8 inches (203.2 mm) = **1/2 turn**

Disclaimer:
Bray Controls is issuing these recommendations only as a guide to installation. This recommendation is based on the full compliance of all materials supplied to their appropriate specifications. Since many of the components are not manufactured by Bray we can take no responsibility for any damage caused during installation.

Series 20/21 and 30/31 - Flange Bolt Torque Chart

Valve Size		Normal Torque Range	Normal Torque Range
In	mm	Ft-lbs	Nm
2	50	30	40
2.5	65	30	40
3	80	35	50
4	100	35 - 40	50 - 55
5	125	35 - 45	50 - 60
6	150	35 - 50	50 - 65
8	200	45 - 55	60 - 75
10	250	55 - 75	75 - 100
12	300	65 - 110	90 - 150
14	350	75 - 120	100 - 165
16	400	75 - 120	100 - 165
18	450	85 - 130	115 - 175
20	500	85 - 130	115 - 175

Please note that the Nm and Ft-lbs values are based on bolt size in respective metric and ANSI flanges, i.e. these values are not a direct conversion between Nm and Ft-lbs.

The values represent average torques needed to ensure full compression of the resilient valves' seats into the valves' bodies when installed in pipeline flanges. The face of both flanges must come into full contact with the valves' metal bodies.

No additional torque is required for proper functioning of the Bray resilient seated valves.

The torque values are based on using new, coarse-threaded, lubricated fasteners. Up to 25% may be added to the Normal Torque Range values when using non-lubricated fasteners.

Torque Values specified by flange manufacturers ***must not be exceeded.***

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.
The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

Series 22/23 Installation - Flange Bolt Torque Chart, 150 lb Flanges

Valve Size		Normal Torque Range		Max Torque Range	
In	mm	Ft-lbs	Nm	Ft-lbs	Nm
2	50	30	40	35	50
2.5	65	30	40	35	50
3	80	35	50	40	55
4	100	35 - 40	50 - 55	40	55
5	125	35 - 45	50 - 60	50	65
6	150	35 - 50	50 - 65	65	90
8	200	45 - 55	60 - 75	80	110
10	250	55 - 75	75 - 100	100	135
12	300	65 - 110	90 - 150	120	165
14	350	75 - 120	100 - 165	140	190
16	400	75 - 120	100 - 165	140	190
18	450	85 - 130	115 - 175	170	230
20	500	85 - 130	115 - 175	180	245
24	600	100 - 150	135 - 205	220	300

The torque values are based on using new, coarse-threaded, lubricated fasteners. Up to 15% may be added to the Normal Torque Range values when using non-lubricated fasteners. However, the maximum torque should not be exceeded.

Flange gaskets are normally not used for installation of S22/23 valves. Flange leakage may be caused by combination of out-of-parallel and/or misaligned flanges, and surface damage on the flange face and/or the face of the valve seat. In such cases, suitable flange gaskets may be used to control flange leakage.

Torque values specified by manufacturers of certain flanges, for example plastic flanges, could be lower than the values specified above. In such cases, the flange manufacturers' torque values must not be exceeded. Use flange gaskets if necessary to secure flange seal.

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.

Bray CONTROLS

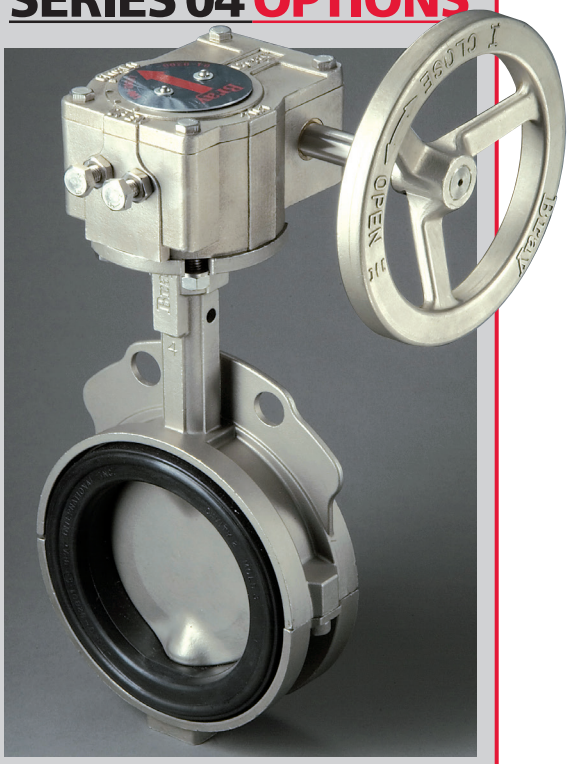
MANUAL OPERATORS

Bray Controls offers three operators for manual control of valve position. All manual operators mount directly to Bray valves, and all are epoxy coated for excellent corrosion, abrasion and impact resistance.

MANUAL OPERATORS	
SERIES 01 - Handle	1"-12" (25mm -300mm)
SERIES 04 - Gear Operator	2"-48" (50mm -1200mm)
SERIES 05 - Declutchable Gear Operator	2"-36" (50mm -900mm)

SERIES 01 - HANDLE & NOTCH PLATE

Bray offers two handles for on-off and throttling service – one for resilient seated valves from 1"-12" (25mm-300mm), and a high torque handle for high pressure valves from 2½"- 8" (65mm-200mm). These quarter turn handles have a locking spring and a directional pointer for valve disc position indication. Bolted notch plates are offered. For resilient seated valves a 10 position plate is standard. For high pressure valves a 9 position plate is standard. Both contain on-off stops to prevent over rotation of the valve. Optionally available are an infinite position plate, a 180° notch plate, a memory stop, a padlock kit, and a 2" square nut version.



SERIES 04 - GEAR OPERATOR

For heavy duty on-off and throttling service of 2"-48" (50mm-1200mm) valves, the Series 04 is self lubricated for smooth, trouble-free operation. The rugged, cast iron body with O-ring body seals is weatherproof to IP65. A self-locking worm and worm gear drive holds the valve in the desired position. Features include a readily accessible handwheel, a valve position indicator and mechanical travel stops which permit field adjustment of valve movement to specific degrees of rotation. Optionally available are chainwheel accessories, padlock kits and 2" square nut versions. A Gear Operator with a stainless steel housing is also available for valve sizes 1"-16".

SERIES 05 - DECLUTCHABLE GEAR OPERATOR

Available for 2"-36" (50mm-900mm) valves. This operator is excellent for the safe handling of spring return actuators. During pneumatic operation, the worm of the gear unit is disengaged. Should the valve require opening or closing in the event of power loss, manual rotation of the declutch lever will provide a camming action and engage the worm to the segmented worm gear, allowing rotation of the valve using the handwheel. The Series 05 can be installed in the field with existing Bray pneumatic actuators.

SERIES 04 OPTIONS

316 Stainless Steel
for sanitary & corrosive applications

Bray Controls proudly offers the Series 04 Stainless Steel Gear Operator for manual operation of quarter turn valves. With stainless steel housings, input shafts and handwheels, the Series 04 is designed for service in highly corrosive environments, sanitary, breweries and pharmaceutical applications. The units are suitable for on-off and throttling service.

Series 04 Stainless Steel Gear Operator units have different gear ratios – providing a torque output range of 2,000 to 24,000 lb-in. The temperature range is -4°F (-20°C) to 250°F (120°C).

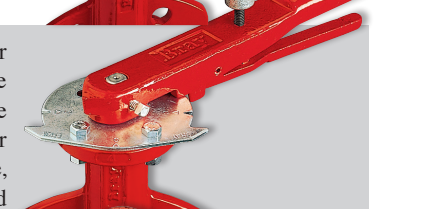
These weatherproof gear operators meet NEMA 4, 4x and IP 65 specifications.

CHAINWHEEL for remote access to valve positioning when the handwheel is not accessible, such as valves positioned high out of reach.

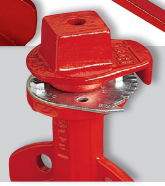
A PADLOCK KIT & 2" SQUARE NUT version for buried service are also available with the Series 04 (not shown).

SERIES 01

STANDARD 10 POSITION NOTCH PLATE has been designed to lock the handle securely in place, preventing position change of disc due to line pressure, vibration or shock. Standard 9 Position Plate for high pressure valves is not shown.



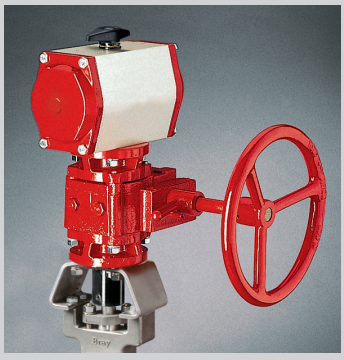
PADLOCK KIT allows the customer to lock the valve in the full open or closed position, tamper proofing the valve. By drilling a new hole in the top plate, the handle can be locked in mid travel.



HANDLE AND 180° NOTCH PLATE allows the operator to switch the handle to either side without removing the notch plate from the valve.

INFINITE POSITION NOTCH PLATE for throttling applications, allows for very precise adjustments of valve disc positioning anywhere from 0° to 90°. Positioning is simply a matter of loosening the set knob, moving the handle, then retightening the knob. For resilient seated valves only.

MEMORY STOP allows the operator to set the maximum amount the valve can open. When set, this limit will remain fixed until the stop is reset.



2" SQUARE NUT is used where the valve is buried under the surface. To rotate valve disc position, the nut is reached with a T-handle wrench.

SERIES 05

DECLUTCHABLE GEAR OPERATOR

The Series 05 offers the same superior features as the Series 04 gear operator with the added ability to manually override pneumatic actuators or rotate the valve when air pressure is not available.

1009 Stainless Steel Case Gauge

FEATURES

- Meets ASME B40.100 specifications
- Corrosion resistant SS case
- Dry gauges are field fillable
- Power***Flex***™ movement provides superior resistance to shock, vibration and pulsation
- True Zero™ reduces reading errors by using "zero box" instead of conventional dial pins
- ***PLUS!***™ performance available for liquid filled performance with a dry gauge
- MSL helium leak tested to 1X10^{-6} scc/s
- Ventable fill plug
- Accessory kits for easy panel mounting

TYPICAL USES

- Pumps and compressors
- Boilers
- Equipment skids
- Specialized OEM equipment
- Hydraulics and pneumatics
- Severe ambient conditions

SPECIFICATIONS

Accuracy:	ASME B40.100, Grade 1A, ±1% of span (Dry) ±1.5% of span (Liquid filled)
Dial Sizes:	2½″ (63mm), 3½″ (100mm)
Ranges:	Minimum 0-15 psi, maximum 0-15,000 psi, vacuum and compound
Wetted Materials	
Tube:	316L SS tube
Process Connection:	316L SS socket (SW) Aluminum bronze socket (AW)
Non Wetted Materials	
Window:	Polycarbonate (Std.), Safety glass (XSG), Polysulfone (XPS) 3½″ Dial only
Dial:	Black figures on white background, aluminum
Pointer:	Black, aluminum, adjustable (Std.), micrometer (XMP)
Movement:	Power***Flex*** movement Bottom plate – 304 SS Upper plate – 304 SS Pin – 304 SS Hairspring assembly – 304 SS Pinion – 304 SS Segment – Glass filled polyester
Case:	304 SS (Std.), 316L SS (XYW)
Ring:	304 SS (Std.), 316L SS (XYW)
Process Connection Location:	Lower, Back, Top, 3 o'clock, 9 o'clock
Process Connection Sizes:	⅛ NPT, ¼ NPT (see ordering code for more options)

KEY BENEFITS

- **IP65 Rating**
- **NEMA 4X**
- **CRN Approved**
- **PED**
- ***PLUS!***™ **Performance (XLL)**

Dampening:	Glycerin case fill (Std. liquid fill), Silicone case fill (XGV), Halocarbon case fill (XGX), ***PLUS!*** Performance (XLL)
Weather Protection:	IP65 (Plug closed), IP54 (Plug vented) NEMA 4X (Plug closed)
Approvals:	CRN, RoHS, PED

310, 315 All-Welded “Mini” Diaphragm Seal

FEATURES

- No gaskets or bolts
- Available with ⅛ NPT flushing connection
- Designed for use with transducers and 3½″ or smaller gauges

TYPICAL USES

- Oil and gas
- Chemical processes
- Process equipment

310
Threaded Seal

SPECIFICATIONS	
Connection Style:	310: All-welded 315: All-welded with flushing connection
Process Connection Size:	310: ⅛ to 1 NPT Male, ¼ or ½ NPT Female 315: ¼ or ½ NPT Female
Instrument Connection Size:	⅛ or ¼ NPT Female
Pressure Rating (MAWP):	2,500 psi
Added Tolerance:	±0.5% typical
Wetted Components:	Diaphragm & bottom housing
Non-Wetted Components:	Top housing: 316L SS

WETTED COMPONENTS	
Diaphragm Material	Bottom Housing Material
See ordering code on page 2	See ordering code on page 2

NON-WETTED COMPONENTS
Top Housing
316L SS

KEY BENEFITS

- **Protects instrumentation in tight spaces**
- **Eliminates potential leak path with all-welded construction**
- **Low fill volume reduces temperature effects on instrument accuracy**

All specifications are subject to change without notice.
All sales subject to standard terms and conditions.

1 Product Description

1.1 Product design

Usage

ENM-10 is a level regulator for level control applications. The level regulator starts and stops a pump or activates an alarm device when the liquid level reaches the regulator.

Materials

Denomination	Standard version	Ex version
Regulator casing	Polypropylene	Polypropylene with black conductive casing
Bend relief	EPDM rubber	NBR-PVC rubber
Cable sheath	PVC	NBR-PVC rubber

The plastic components are welded and screwed together.

1.2 Technical data

Application limits

Feature	Value
Liquid temperature	Minimum 0°C (32°F) Maximum 60°C (140°F)
Liquid density	Minimum 0.65 g/cm^3 Maximum 1.5 g/cm^3

Electrical specifications

Feature	Value
Degree of protection	IP68, 20 m (65 ft), 2 bars
Interrupting capacity of micro switch	AC, resistive load, 250 V 10 A AC, inductive load, 250 V 3 A cos ϕ = 0.5 DC, 30 V 5 A
Interrupting capacity of gold-plated micro switch	AC, resistive load, 250 V 10 A AC, inductive load, 250 V 3 A cos ϕ = 0.5 DC, 24 V 10 mA

Voltage limits are subject to local regulations.

Density ranges

Density g/cm^3	Regulator length mm (in.)	Diameter mm (in.)
0.65 – 0.80	194 (7 10/16)	100 (4)
0.80 – 0.95	177 (7)	100 (4)
0.95 – 1.10	162 (6 3/8)	100 (4)
1.05 – 1.20	142 (5 9/16)	100 (4)
1.20 – 1.30	133 (5 1/4)	100 (4)
1.30 – 1.40	130 (5 2/16)	100 (4)

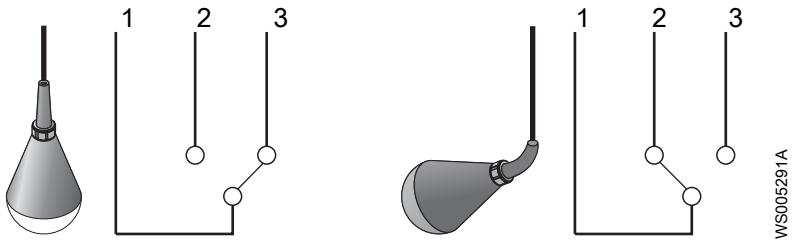
Density g/cm^3	Regulator length mm (in.)	Diameter mm (in.)
1.40 – 1.50	126 (5)	100 (4)

Weight

A regulator with standard density and 20 m cable weighs approximately 2 kg (4.5 lb).

1.3 Cables

Lengths



For liquids with specific density between 0.95 and 1.10 g/cm^3, the following cables are available:

Version	Lengths m (ft)
Standard	• 6 m (20 ft) • 13 m (42 ft) • 20 m (65 ft) • 30 m (100 ft) • 50 m (167 ft)
Ex	• 6 m (20 ft) • 13 m (42 ft) • 20 m (65 ft)

Diameter

The cable diameter for all product variants is 6.7 mm (0.26 in), +/- 0.2 mm (0.00787 in).

Color codes

Cable	1	2	3
Color	Grey	Black	Brown

1.4 Approvals and standards

Standard approvals

LVD approval according to EN61058
CSA approval: Certificate Number 1330172
Cl. I Zone 0, Gr. IIC
CL.I Div.1 Gr A, B, C and D
Cl.II Gr. E, F, and G

Ex approvals

IECEx ia IIC T4 Ga: -20°C≤Ta≤60°C
IECEx NEMKO 09.008
ATEX II 1G Ex ia IIC T4
NEMKO 10 ATEX 1082

Applied standards for ATEX and IEC

- EN 60079-0:2012/IEC 60079-0:2011
- EN 60079-11:2012/IEC 60079-11:2011
- IEC 60079-26:2014

Intrinsically safe circuits are required for the automatic control system. Use a Zener barrier, for example, part number 84 01 07.

The electrical connections must comply with the Ex regulations of the national submitter.

2 References

2.1 Chemical resistance tables

The tables show the degree of resistance the level regulator has to different chemicals at two different temperatures. The density of the liquid determines the buoyancy of the regulator.

1	Blue polyvinyl chloride (PVC)	Grey/Brown/Black
2	Red PVC	Grey/Brown/Black
3	Black nitrile rubber (NBR)/PVC	Grey/Brown/Black

1 See *Type of cables* on page 9.
2 Designed for low current, slow movements and oil. Includes micro switch with gold plated contacts.
3 Zener barrier 84 01 07 required.

Xylem |'zīləm|

1) The tissue in plants that brings water upward from the roots;
2) a leading global water technology company.

We're a global team unified in a common purpose: creating advanced technology solutions to the world's water challenges. Developing new technologies that will improve the way water is used, conserved, and re-used in the future is central to our work. Our products and services move, treat, analyze, monitor and return water to the environment, in public utility, industrial, residential and commercial building services settings. Xylem also provides a leading portfolio of smart metering, network technologies and advanced analytics solutions for water, electric and gas utilities. In more than 150 countries, we have strong, long-standing relationships with customers who know us for our powerful combination of leading product brands and applications expertise with a strong focus on developing comprehensive, sustainable solutions.

For more information on how Xylem can help you, go to www.xylem.com

Three Phase Induction Motor - Squirrel Cage

Customer	:

Product line	: W22 IEEE 841 NEMA Premium Efficiency Three-Phase	Product code :	13516376
		Catalog # :	00718ST3HIE213T-W22

Frame	: 213/5T	Locked rotor time	: 36s (cold) 20s (hot)
Output	: 7.5 HP (5.5 kW)	Temperature rise	: 80 K
Poles	: 4	Duty cycle	: Cont.(S1)
Frequency	: 60 Hz	Ambient temperature	: -20°C to +40°C
Rated voltage	: 575 V	Altitude	: 1000 m.a.s.l.
Rated current	: 7.34 A	Protection degree	: IP55
L. R. Amperes	: 52.1 A	Cooling method	: IC411 - TEFC
LRC	: 7.1x(Code H)	Mounting	: F-1
No load current	: 3.52 A	Rotation[1]	: Both (CW and CCW)
Rated speed	: 1765 rpm	Noise level[2]	: 58.0 dB(A)
Slip	: 1.94 %	Starting method	: Direct On Line
Rated torque	: 22.3 ft.lb	Approx. weight[3]	: 176 lb
Locked rotor torque	: 220 %		
Breakdown torque	: 310 %		
Insulation class	: F		
Service factor	: 1.25		
Moment of inertia (J)	: 1.34 sq.ft.lb		
Design	: B		

Output	25%	50%	75%	100%
Efficiency (%)	88.6	89.5	91.0	91.7
Power Factor	0.40	0.66	0.76	0.82

Foundation loads

Max. traction	: 302 lb
Max. compression	: 478 lb

		Drive end	Non drive end
Bearing type	:	6308 C3	6207 C3
Sealing	:	Inpro/Seal	Inpro/Seal
Lubrication interval	:	20000 h	20000 h
Lubricant amount	:	11 g	7 g
Lubricant type	:	Mobil Polyrex EM	

Notes

This revision replaces and cancel the previous one, which must be eliminated.
(1) Looking the motor from the shaft end.
(2) Measured at 1m and with tolerance of +3dB(A).
(3) Approximate weight subject to changes after manufacturing process.
(4) At 100% of full load.

These are average values based on tests with sinusoidal power supply, subject to the tolerances stipulated in NEMA MG-1.

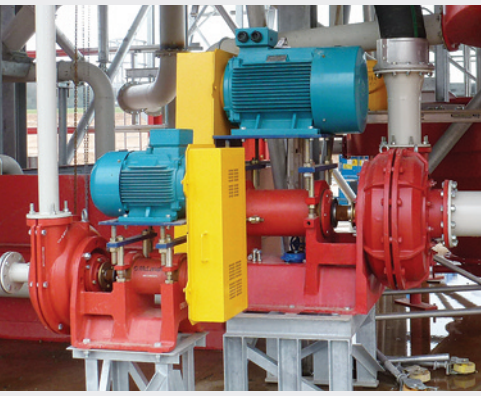
SLURRY PUMPS

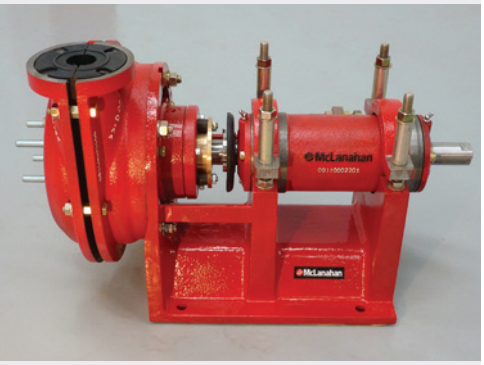
RELIABLE AND LONG LASTING

McLanahan's centrifugal Slurry Pumps are rubber-lined and abrasion resistant for long lasting service, low lifetime costs and straight forward servicing.

Eight models with discharge port sizes from 35mm to 250mm that can accommodate various options in lining material and gland type choices.



McLanahan®



mclanahan.com

APPLICATIONS

- Sand & Gravel / Minerals Processing
- Soil Washing / Remediation
- Waste Water Recovery / Disposal
- Concrete Wash-out

WETTED PARTS

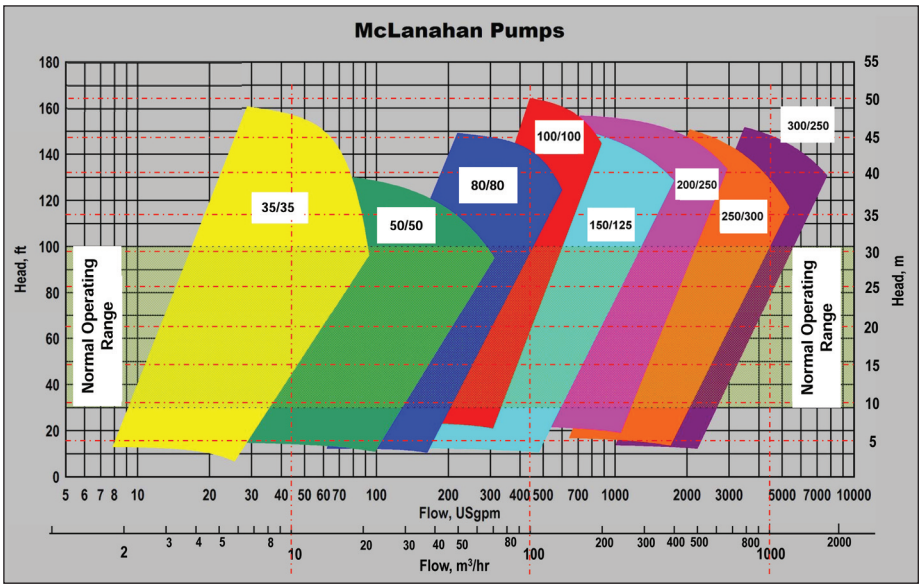
Standard pumps are equipped with natural rubber liners and impeller. However, bespoke options are available to suit a specific process and include premium natural rubber, Nitrile and food grade rubber. Shaft sleeves are from 304 St, but may be manufactured from other materials or coated to special order.

GLAND OPTIONS

D (Dry) Gland

An abrasion resistant Natural Rubber "Face Seal" riding a "Hard Face" and lubricated naturally by the process fluid. Controlled seepage of process fluid. Optional clean water injection facility.

H (Hydro) Gland



Clean water is injected into the inter-space between a pair of gland seals in tandem. Slight dilution – but total containment – of the process fluid. Controlled water seepage to atmosphere.

P (Packed) Gland

Gland packing mechanically adjusted to "ride" the shaft sleeve. Highest pressure capability. Some process dilution and water (or lubricating grease) seepage to atmosphere.

MOTOR AND DRIVE

McLanahan supplies pumps bare-shaft or complete with motor, overhead mounting platform, vee-belt drive and guard. Motors can also be oriented in Z-vee fashion, or side mounted on slide rails.

PUMP SELECTION

Initial pump selection can be determined by using the chart above as a guide. A qualified McLanahan engineer can determine the best pump performance for a specific application.

SPARES

High quality spare parts are available including moulded rubber Impellers, casing liners and suction bush components. All parts are available in various materials and hardness to suit differing applications. Mechanical spares such as fully assembled bearing housing cartridges and gland parts are available as kits for ease of procurement.

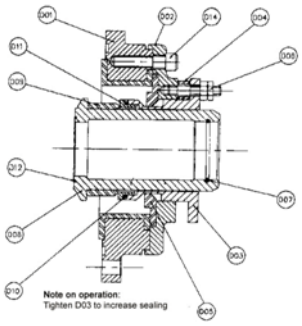
TECHNICAL INFORMATION - M3H-CR 2/2 PUMP

CLOSED VANE IMPELLER; 'D' TYPE GLAND; c/w 7.5HP IEEE841 Motor;

General Operating Conditions

Installation:	Inside building
Ambient Temperature:	20° C / 70° F
Humidity:	Up to 75%
Application type:	Continuous – 24/7
Electrical Supply:	3ph/60Hz/575V

Surface Treatment



Coating System:	McLanahan standard system - Powder Coating

Fabrication

Pedestal	Cast Iron
Casings	Cast Iron
Bearing Housing	Cast Iron
Motor Table	Fabricated Steel
Drive	V-Belt
Guards	Steel Fabrications
Lining	Natural Rubber
Impeller	Natural Rubber (Closed Vane)
Suction Flange	2" ANSI Class 150 B16.5
Discharge Flange	2" ANSI Class 150 B16.5
Flange type	Integral; self gasketed; with studs, nuts, washers
Orientation	Vertical discharge

Gland

Type	'D' Type, Self Lubricating
Shaft Sleeve	Stainless Steel
Rotating Seal	Natural rubber
Static Seal	Ceramic
Housing	Nitrile Rubber lined Cast Iron
Lubrication Water	N/A
Drip Pan	Included

Bearings – Grease Lubricated

Drive End	Double row, self-aligning spherical roller bearing
Non-Drive End	Roller bearing
Seals	Grease

Belted Drives Selection Tool

Duty 21 CVI Revised SF

Selection Number

1830047766 (Created on 10/31/2019)

Drive Requirements	Input	Actual
Motor Speed	1,750 rpm	1,750 rpm
Motor Power	7.50 hp	7.50 hp
Service Factor	1.2	2.25
Output Speed	1,869 - 1,985 rpm	1,944 rpm
Center Distance	11.75 - 13.75 in	12.54 in

Technical Data

Speed Ratio	0.90	Facewidth	1.50 in
Belt Speed	2,268 ft/min	Driver Pitch Diameter	4.95 in
Belt Pull	190 lbs	Driven Pitch Diameter	4.45 in
Static Shaft Load	185 lbs	Install/Take-up Center Distance Range	12.04 - 13.54 in

Tensioning

Sonic Tension Meter Data

Tension Frequency	69 - 84 Hz
Belt Mass Constant	72.0 g/m
Span Length	318.5 mm
# of Belts	3

Force Deflection Method

Span Length	12.54 in
Belt Deflection Distance	0.20 in
Belt Deflection Force	3.0 - 3.1 lbs

NOTE: Values shown are for new belts.

Selection

Product	Part Number	Description	Weight (lbs)	Qty.	List Price (USD)
Driver Sheave	112206	3-3V5.0-1610 SHEAVE	4.3	1	
Driver Bushing	119225	1610 X 1 3/8-IK BUSHING	0.6	1

CLARIFIER #2 ACP2-60

PAINT SPECIFICATION

OIM manual section: 4.2.4.12

This page is intentionally left blank

TANK CONSTRUCTION SPECIFICATIONS
& PAINT SPECIFICATIONS
RAL 7040 TANK WINDOW GREY (EXTERIOR)
& LIGHT GREY (INTERIOR)

CC-07-ACP

1.0 GENERAL

This specification describes construction elements of the steel welded tank and paint specifications of ACP MK3 product.

2.0 MATERIALS

- Carbon steel must conform to CSA 44W, unless otherwise specified (see type on plan);
- Nominal thickness, refer to plan.

3.0 CONSTRUCTION

According to the specifications of the referred plan(s):

- Steel plates and sections must conform to Canadian norm G40.21M-300W, except for HSS that must conform to Canadian norm G40.21M-350W;

- Welds will be realized according to the details shown on the referenced plan. All welds must conform to the Canadian norm CSA W59 standard. Remove surface defects and grind all sharp edges. Make sure to completely remove the flux and welding splashes. The fusion welding certifications to produce by the company will be: W47.1, W59;

- Welding process:

    - Flux-Cored Arc Welding (FCAW);
    - MIG welding;
    - Electrodes (SMAW).

- Welds will be brushed and be devoid of spots;

- All modifications to the dimensions or to the quality of materials, and dispositions other than those indicated on the plans, are subject to prior demand to **Veolia Water Technologies Canada Inc's.,** person in charge, and his subsequent written.

4.0 STEEL PREPARATION FOR PAINTING

- Tank's interior and exterior surfaces must be perfectly cleaned from grease and all other foreign substance;

- All sharp edges must be grinded;

- All flanged surfaces and threaded connections must be cleaned and protected adequately to avoid paint contact;

- The rough edges, weld splatter, excess metal flux and sharp edges must be removed by grinding.

5.0 CONTROL

5.1 Welds

Once completed, all tank interior welds must be dye penetrant inspected to verify the quality of the welds. All welds must be water tight, free from porosity, cracks and drains and in accordance with norm CSA W59.
A dye penetrant test control should be done on all interior welds. Exterior welds must be visually inspected only.
All lifting and handling lugs must be subject to magnetic particle testing and report. Quality control from **Veolia Water Technologies Canada Inc.** will verify results of welds control.

5.2 Dimensional

The dimensional control will be done by the manufacturer. At the same time, **Veolia Water Technologies Canada Inc.'s** inspector will provide control. Minutes will be written detailing the dimensional and tolerance divergences. These values are noted on the piece's plan, assigned to control.

5.3 Documents and Certificates of Material (to Supply)

The manufacturer will supply to **Veolia Water Technologies Canada Inc.'s** inspector at the beginning of work, the following documents:

- Planning of work, with detailed manufacturing stages;
- Supply Bill of Materials;
- Material certificates with copy of the supplier's delivery slip;
- Welding procedures.

6.0 TREATMENT

6.1 Internal Treatment

- Sandblast as per SSPC-SP-10;
- Brush application on welds and difficult to reach places (inside of holes and openings) of one layer of DURA_PLATE UHS by SHERWIN WILLIAMS, color « light green » and;
- Application of one coat of DURA-PLATE-UHS NSF61 compliant by SHERWIN WILLIAMS, 20 to 28 mils dft (restricted level 5 as per SSPC-PA 2), color « light gray »;
- Important note: **Never dilute** the DURA-PLATE-UHS paint.

- Only if needed, application of one coat of DURA-PLATE UHS PRIMER by SHERWIN WILLIAMS, 4 to 8 mils dft per coat, color “Gold”, if required depending on atmospheric conditions and delays between sandblast and paint.

6.2 External Treatment

- Sandblast as per SSPC-SP-6;
- Spacing between intermittent welds should be filled with an hybrid sealant LOXON H-1 by SHERWIN WILLIAMS before the application of the external coating;
- Brush application on welds and difficult to reach places (inside of holes and openings) of one layer of ENVIROLASTIC 940 LV by SHERWIN WILLIAMS, color « White »;
- Application of one layer of ENVIROLASTIC 940 LV by SHERWIN WILLIAMS, 7.0 to 9.0 mils dft, (restricted level 5 as per SSPC-PA 2), color RAL 7040 Window Grey.

6.3 Piping Treatment

Identical to the external coating of the works as stated for the tank previously. There is no internal coating to provide for the nozzles of 3″ diameter or less (should be made from Stainless Steel). Ensure pipe ends and flanges are covered with paint with the exception of the raised face.

6.4 Extra Paint to be Supplied

For every equipment, a touch-up paint kit of 1 gallon for both internal and exterior paint must be provided at shipping. Please attach the product label.

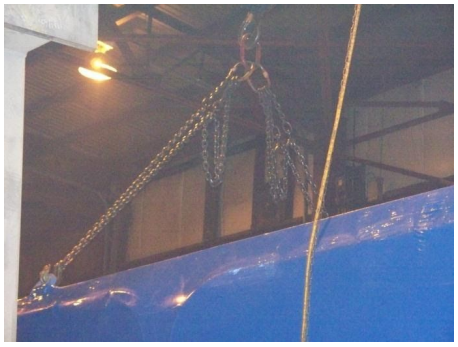
6.5 Application Procedure

The supplier’s procedure for application must be followed.

6.6 Protection of Metallic Parts during Treatment

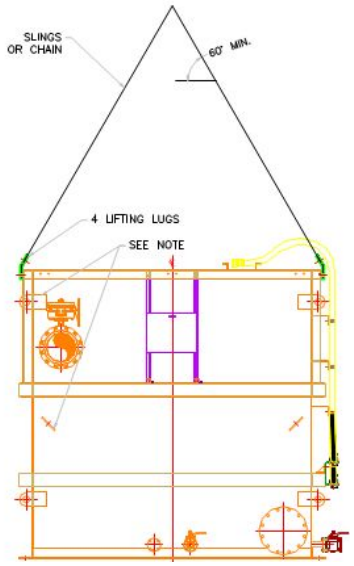
Threads, tapping, flange joint plans, etc. will be protected before sanding and treatment.

6.7 Paint Inspection



All interior surfaces must be inspected by performing a Holiday test in accordance with the standard NACE SP 0188, to verify the presence of discontinuity in the paint.

7.0 PACKAGING



- Plastic plug of the male and female threaded end caps;
- Wood plugs on flange sides.

8.0 HANDLING OF THE TANKS

- Always install the holding rings and any internal supporting beams before handling tanks.
- The tanks must be raised by chains attached to the holding rings. A minimum angle of 60º must be maintained. (see pictures)
- The lifting should ideally be carried out in two parallel points. (see pictures)

***ATTENTION*: Never use the side rings to lift and /or manipulate the tank. These rings should only be used to attach the tank during transport.**

WAM®

All the products described in this catalogue are manufactured according to **WAMGROUP S.p.A. Quality System procedures**. The Company's Quality System, certified in July 1994 according to International Standards **UNI EN ISO 9002** and extended to the latest release of **UNI EN ISO 9001**, ensures that the entire production process, starting from the processing of the order to the technical service after delivery, is carried out in a controlled manner that guarantees the quality standard of the product.

This publication cancels and replaces any previous edition and revision.
We reserve the right to implement modifications without notice.
This catalogue cannot be reproduced, even partially, without prior written consent by the Manufacturer.

SUMMARY

1.0 DESCRIPTION AND TECHNICAL CHARACTERISTICS 1
2.0 APPLICATION 15
3.0 ACCESSORIES 16
4.0 OPERATION AND MAINTENANCE 27
5.0 INQUIRY AND ORDER FORM 28
6.0 ORDER CODES 29

The MBF Micro-Batch Feeder for continuous volumetric feeding of powdery or granular materials consists of a steel-reinforced SINT engineering polymer body (optionally body entirely manufactured from stainless steel), a horizontally mounted rotating agitator tool, a feeder screw beneath the agitator tool, a feeder pipe enclosing the protruding feeder screw, one drive unit each for agitator and feeder screw.

Tests on product flow and material stress were carried out to establish optimum body geometry. Agitator and feeder tool geometry and materials were tested, too, before choosing an optimal steel and SINT engineering polymer composite.

On request, MBF series Micro-Batch Feeders are supplied in food-grade versions with both FDA and EN- approval.

MBF series Micro-Batch Feeders for powder and granular material feeding are particularly suitable for poorly flowing materials which tend to clog, along with adhesive materials.

Depending on the user's individual requirements and on material characteristics, MBF Micro-Batch Feeders can be supplied with alternative feeder screws and blending tools, with the addition of various accessories.

For more than four decades, MBF Micro-Batch Feeders have been successfully operating among others in the following industries: foods, building materials, plastics, chemicals, packaging, as well as in environmental technology.

CODES

MBF	Micro batch feeder	Machine
MDXCR	Round cover	Accesories
MDXGS	Cutter grille for square hopper	
MDXSV/C	Vertical spout	
MDXTR	Round hopper	
MDXTS	Square hopper	
UTD	Metering screw	Components
UTO	Blending tool	
MBT	Seal	
MBTP	Extendend pipe	
MBPR	Linerfeeder pipe	
MBPI	STD inspection hatch	
MBPIP	Inspection hatch with extended tube	

SELECTION CRITERIA

CF = [dm^3/ J] = theoretical capacity per hour at 1 RPM

CE = [dm^3/ h] = real capacity of MBF

CR = [dm^3/ h] requested capacity

CT = [dm^3/ h] theoretical capacity

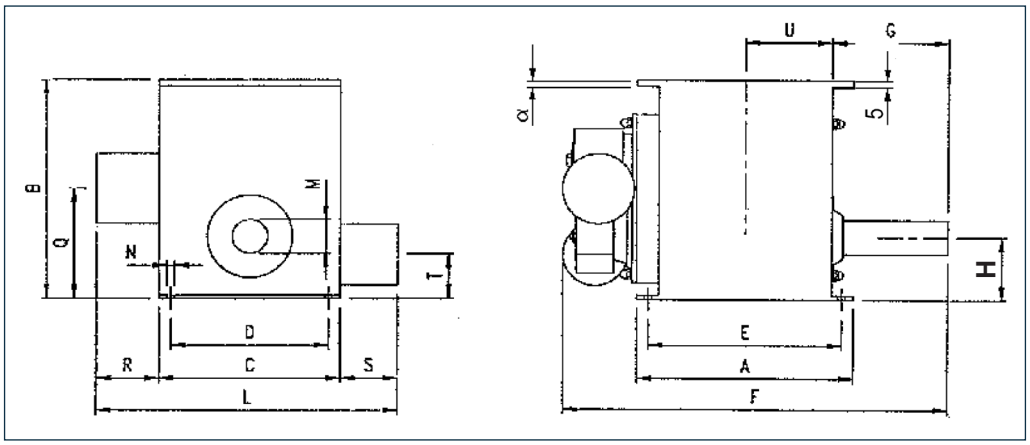
N = [RPM] = metering screw speed.

mvs = material efficiency

Given:

- the characteristics of the material to be handled, the application and the feeding system into the microbatch feeder;
- CR (=capacity requested by customer), in order to choose correct MBF type proceed as follows:
- Check from material table mvs and all other important characteristics (e.g. metering screw type, accessories, others)
- Calculate real capacity CE of standard MBF (with fixed or variable speed as required by customer)

CE = **CT** x mvs
where for CT refer to page T.10.



If difference between CE and CT is too big (that is, if customer does not accept standard MBF) it is necessary to find correct MBF speed in order to obtain the requested capacity, using the following formula:

$$N = \frac{CR}{CF \times mvs}$$

Subsequently, select ratio nearest to specific requirements (see page T.11). In carrying out these calculations it has to be born in mind that mvs given in materials table is empirical. The real value depends on a number of factors which may be difficult to control, such as the condition of the material, atmospheric conditions, height of material column inside the hopper, speed of rotation etc.

For material efficiency mvs see pag. T10.

MAIN COMPONENTS

1	Metering screw	**8**	Blending tool reducer
2	Blending tool	**9**	Drive support
3	Elastomer trough	**10**	Feeder pipe
4	End plate	**11**	Seals
5	Agitator motor	**12**	Reducer
6	Metering screw motor	**13**	Cover
7	Metering screw reducer		

N.B.: Item 4 in the stainless steel version, front panel can be opened for inspection.

The batch feeder must not be starded before the screw conveyor itself, as well as the plant it is going to be installed in, have been declared in conformity with the European Directive 14/06/1982 (89/392/EEC).

It is the plant designer's / plant fitter's responsability to design and install all necessary protection in order to avoid that breaking and / or yielding of the equipment or of parts of it might damage people and / or parts of the plant (e.g. adequate protection against falling down of the motor etc.).

For dangerous materials, i.e. those that must not get in contact with the human body or be inhaled, for flammable, explosive and bacteriologically dangerous materials the plant manufacturer or fitter must provide for the required safety devices and measures.

THEORETICAL STANDARD FEED RATES

N.B.: The theoretical feed rate has to be multiplied by the efficient factor which depends on the type of feeder screw and on the material fed.

GENERAL EFFICIENCY COEFFICIENT MVS DEPENEDING ON FEEDER SCREW USED

TAB. 3

UTD. 12 UTD. 32	UTD. 22 UTD. B2	UTD. 42 UTD. D2	UTD. 5 UTD. G UTD. E
			
Efficiency: 1.1	**Wirkungsgrad: 0.6**	**Coefficient: 0.75**	**Efficienza: 0.7**

The theoretical feeds rate (pag.T.11)has to be multiplied by the efficient factor which depends on the type of feeder screw fed.

NOTE: The efficiency factor can vary due to grain size, bulk density, degree of humidity and all the other material properties that have an influence on handling the material.

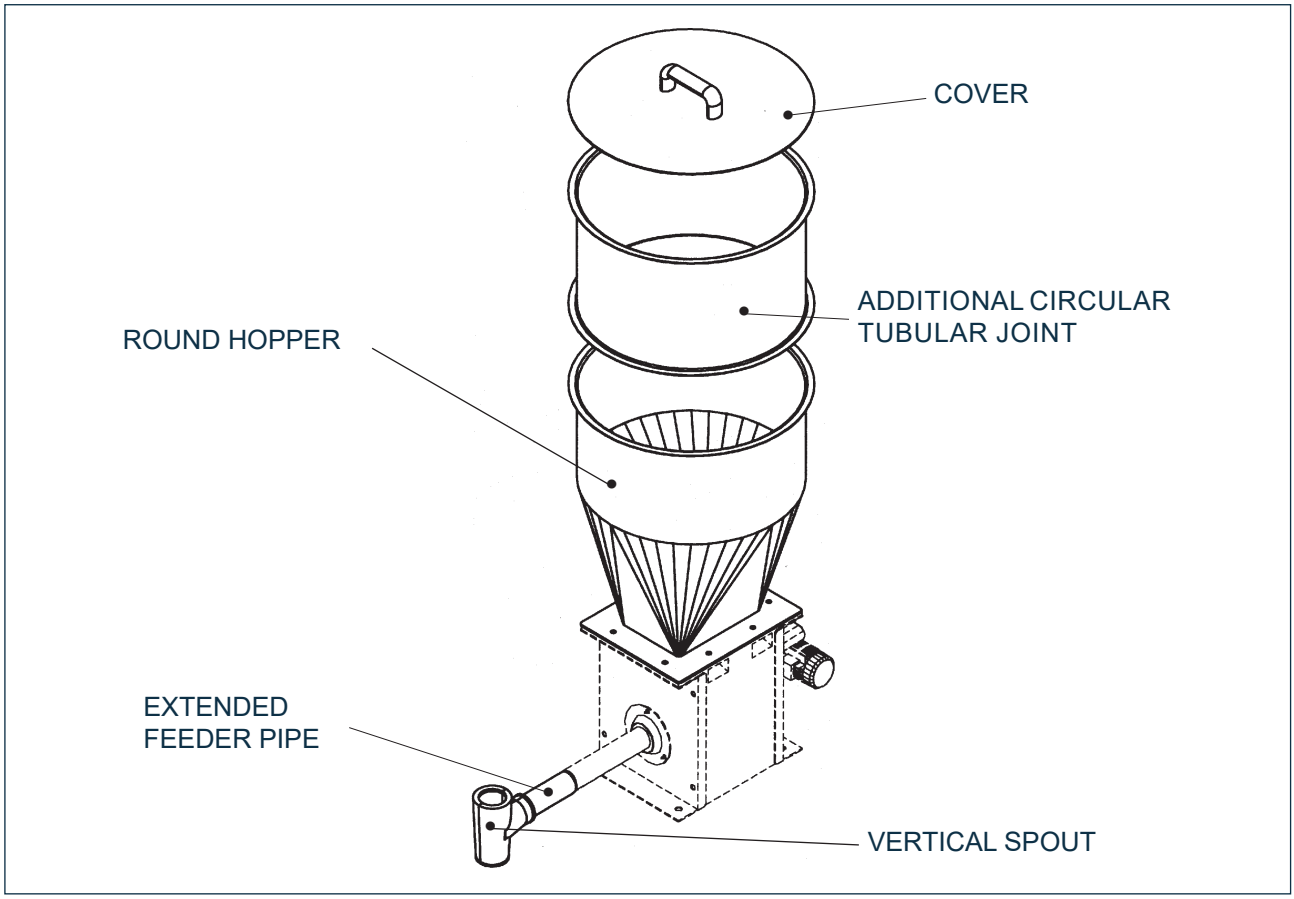
MBF micro-batch feeders are used in gravimetric and volumetric dosing plants for powders and granular materials of various kinds. The body is made of WAM®'s engineering polymers SINT®, SINT®AL for food application or AISI 304L/316L, while all other feeder parts including nuts and bolts are made of staimless steel 304.



On request micro-batch feeders are supplied in a food-grade version.

Unless otherwise specified, all the dimensions are given in millimetres.

Type 21 True Union Ball Valves

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

The Chemline **Type 21** True Union Ball valve incorporates state of the art features for long term performance. This is a full port, full blocking True Union valve pressure rated at 16 bar (230 psi)[3]. Double stem o-rings and Safety Shear stem design provide for a high degree of safety on hazardous fluid applications. All sizes have an ISO standard actuator mounting platform integral to the valve body. This provides for sturdy and secure mounting of pneumatic or electric actuators.

PVC | CPVC | PP | PVDF

CRN Registered Consult Chemline

NSF[4] Certified to NSF/ANSI 61

SERIES: Type 21

SIZES: 3/8" – 4"

ENDS: Socket, Threaded, Combo[6], Flanged, Butt[1] or ChemFlare™

SEATS: PTFE

SEALS[2]: EPDM, FKM (Viton®)

features

Pressure rated to 230 psi[3]
- Provides a high factor of safety

Integral Actuator Mounting Platform
- Actuation is easy. Electric or pneumatic actuators may be mounted in the field.

Full Port
- High capacity and low pressure drops

Fully Blocking
- Downstream union nut may be safely disassembled for piping maintenance while valve is closed off under full system pressure

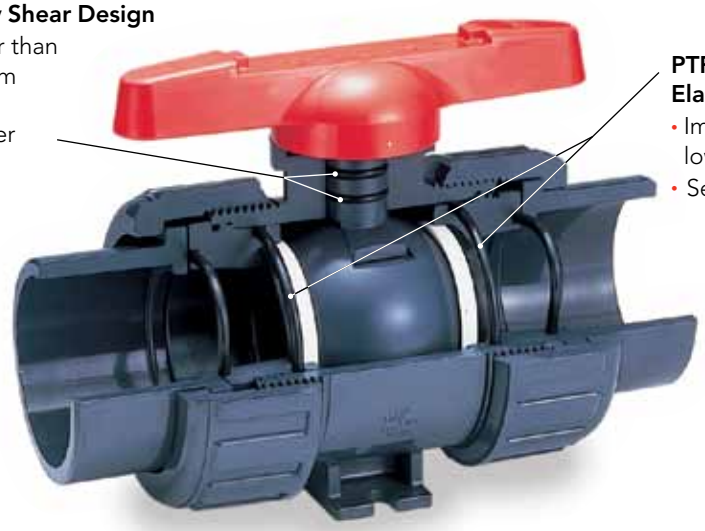
Built-In Spanner Wrench
- Top of the handle is designed to be used as a tool for accessing internal parts

Safety Shear Stem Design
- Stem has double o-rings
- Designed to hold full pressure even if stem breaks due to excessive torque

High Chemical Resistant Material
- PVC and CPVC compounds have an "A" chemical resistance rating as per ASTM D-1784. They have outperformed other PVC and CPVC compounds on aggressive chemicals.

CRN Registration numbers by province
- Ontario: OC11045.5
- Newfoundland: OC11045.50
- Saskatchewan/Manitoba/Quebec: OC11045.56
- New Brunswick: OC11045.57
- Nova Scotia: OC11045.58
- P.E.I.: OC11045.59
- British Columbia: not required
- Alberta: not required[5]

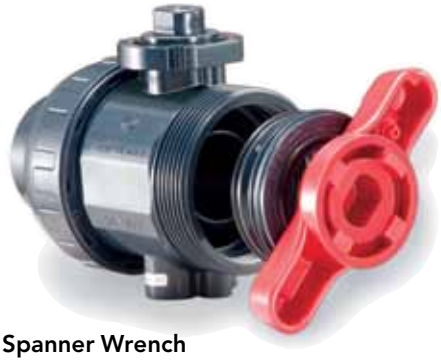
[1] Butt ends for fusion to Chemline metric PP, PVDF or ECTFE (Halar®) piping.
[2] Other materials are available.
[3] PVC, CPVC and PVDF 1/2" to 2" are rated at 230 psi; 2-1/2" to 4" and all size PP valves are rated at 150 psi at 20°C.
[4] PVC valves with EPDM or FKM (Viton®) seals are certified under NSF/ANSI Standard 61 for contact with drinking water.
[5] Not required for non-expandable fluids.
[6] PVC and CPVC valves 1/2" to 2" are available as Combo (threaded and socket ends).



11/20 ©Chemline Plastics Limited 2020
Chemline is a registered trade mark of Chemline Plastics Limited

Type 21 True Union Ball Valves

Features



Double Stem O-Rings – Safety Shear Design

- Upper o-ring groove is deeper than lower. In case of excessive stem torque, stem will shear at the upper groove, leaving the inner o-ring intact to seal against full line pressure.

PTFE Seats have Elastomer Cushions

- Improved sealing while lowering stem torques
- Self adjusts for seat wear

Built in Spanner Wrench

- For removing or tightening the seat carrier
- All parts are replaceable

Integral Actuator Mounting Platform

- Actuation is easy. Electric or pneumatic actuators may be mounted in the field. Simply pull off the handle to reveal a standard ISO 5211 mounting platform which accepts bolt-on hardware.

Fully Blocking

- Downstream pipe may be removed while upstream side is still pressurized. This may be done with valve installed in either direction.

Base Mounting Pad

- Optional threaded inserts allow valves to be securely anchored
- Supplied standard with actuated valves

Options + Accessories

ChemFlare™ Ends

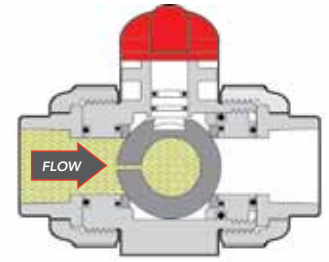
- For connection to PFA tube. Leak-free connections for difficult services such as sodium hypochlorite

One-piece moulded PVC and CPVC 6" socket ends

- Allows installation of 4" valve in 6" line
- Factory moulded, elimates cementing separate reducer and coupling
- Fixed to valve mechanically just like the one-piece moulded factory flanges

Optional Lock-out Handle & Hasp

- To prevent unauthorized operation of the valve during maintenance shut-downs
- Padlocks go through holes in hasp



Gear Operators

- Deluxe FRP construction
- IP67 enclosure resists short term immersion

Chain Wheel Operators

- For overhead operation, with 7' of chain drop
- Cast iron or stainless steel

Vented Ball

- Recommended for all sodium hypochlorite services
- Valve shown in closed position

Valve Tags

- Stainless steel or plastic

Different Colour Handles

- Choose a handle colour other than standard red for colour coding different services

Municipal Operating Nut

- 2" square nut for operating valves below grade using a standard municipal "key"
- Stainless Steel for corrosion resistance

Manual Limit Switch

- Electrical feedback of manual valve position
- NEMA 4X enclosure, position indicator beacon, 2x SPDT or proximity switches, stainless steel hardware

Shaft Extensions

- Different materials and lengths are available
- Several designs:
  - with no housing for indoors
  - with waterproofed PVC housing for indoors or outdoors
  - with stainless steel housing for buried or actuated services

Type 21 True Union Ball Valves

Electric + Pneumatic Actuation

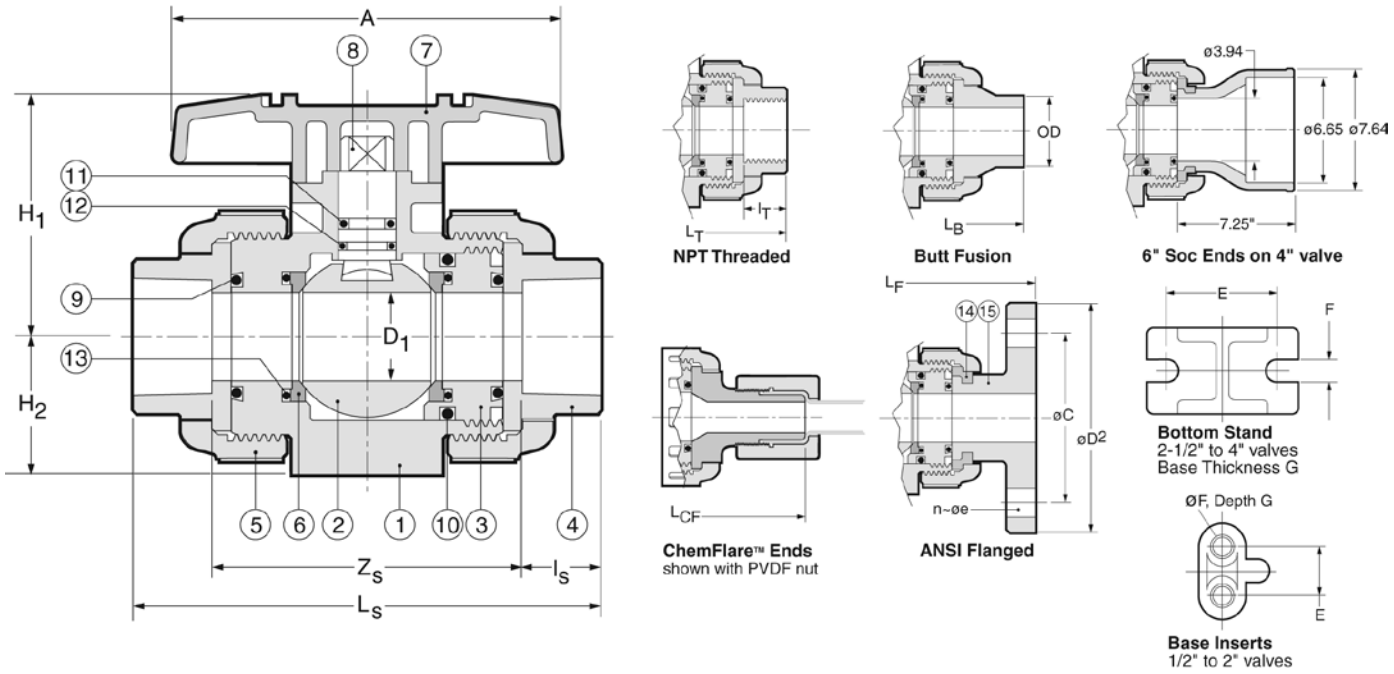
- A complete range of actuators and control accessories are available, mounted to valves using PPG plastic brackets and stainless steel couplings. Refer to separate data sheets.
- All actuators are CSA approved, have NEMA 4X enclosures, stainless steel hardware and permanently lubricated gear train

ERS Series Electric
- Type 21 ball valves up to 2"
- 180 in-lbs torque
- On-Off (3/2-wire), adjustable travel
- Visual feedback

E Series Electric
- Type 21 ball valves up to 4"
- Up to 885 in-lbs torque
- On-Off (3/2-wire), adjustable travel. Optional: failsafe, 3 position modulating
- Visual feedback and feedback switches. Optional: extra switches, feedback potentiometer and feedback transmitter

V Series Electric
(with optional Local Control Station)
- Type 21 ball valves up to 6"
- up to 8,850 in-lbs torque
- On-Off (2/3-wire), adjustable travel. Optional: failsafe, modulating, BUS
- Visual feedback, 2 feedback switches. Optional: 2 extra feedback switches, feedback potentiometer and feedback transmitter

PA Series Pneumatic
- Type 21 ball valves up to 6"
- up to 10,660 in-lbs torque
- industrial process submerged
- bleach/water washdown
- Rilsan-coated aluminum



PP Series Pneumatic
- Type 21 ball valves up to 6"
- up to 1,335 in-lbs torque
- industrial process with minimal use of metal
- Glass-filled Polyamide

OTHER OPTIONS & ACCESSORIES

- **Alternate O-Ring Seals**
- **Stem Extensions** made to any length
- **Limit Switches** – for open and/or closed position indication
- **Municipal Operating Nut**
- **Lubrication-free Valves** – factory clean room assembled
- **Vented Ball** – for sodium hypochlorite applications

Type 21 True Union Ball Valves

PARTS

▲ Recommended Spare Parts

No.	Part	Pcs.	Materials
1	Body	1	PVC, CPVC, PP, PVDF
2	Ball	1	PVC, CPVC, PP, PVDF
3	Carrier[1]	1/2	PVC, CPVC, PP, PVDF
4	End Connector	2	PVC, CPVC, PP, PVDF
5	Union Nut	2	PVC, CPVC, PP, PVDF
6▲	Ball Seat	2	PTFE
7	Handle	1	ABS

[1] 1 carrier for sizes 1/2" to 2", 2 carriers for sizes 2-1/2" to 4"
[2] EPDM seals standard with PVC, CPVC, PP; FKM (Viton®) with PVDF valves
[3] 2 pcs 1/2" to 2", 6 pcs 2-1/2" to 4"

SAMPLE SPECIFICATION

1. All True Union Ball Valves in PVC, CPVC, PP or PVDF shall be Chemline Type 21 or equal sizes 1/2" to 2" in PVC, CPVC, and PVDF rated at 230 psi and in PP 150 psi maximum working pressure. Sizes 2-1/2", 3" and 4" rated at 150 psi maximum working pressure with EPDM or FKM (Viton®) seals. Ball seats shall be PTFE with elastomer cushions for closure with minimum stem torques.
2. All valves will have Safety Shear stem design, blowout-proof with double o-rings for safety. The top o-ring groove shall be deeper so that if the stem breaks off under excessive torque the lower o-ring will remain intact and the valve will hold pressure.
3. All valves shall be full port and two-way blocking design.
4. All valves will be CRN (Canadian Registration Number) registered with TSSA.
5. PVC valves with EPDM or FKM (Viton®) seals shall be certified under NSF/ANSI Standard 61 for contact with drinking water.
6. All valves shall have chemical resistant labels permanently marked with manufacturing number to provide production level traceability.
7. PVC compound shall have an ASTM cell classification 12454-A with a minimum suffix "A" designation for chemical resistance as per ASTM D-1784 (CSA report LO 4000-172).
8. CPVC compound shall have an ASTM cell classification 23567-A with a minimum suffix "A" designation for chemical resistance as per ASTM D-1784.
9. PP material will conform to ASTM D-4101 PP 021 B 67272 material requirements.
10. PVDF material shall be unpigmented conforming to ASTM D-3222 material requirements and to be USDA Title 21 Chapter 1 Part 177. 2510 requirements for contact with food.
11. Socket ends in PVC and CPVC shall be Schedule 80 and conform to ASTM D-2467.
12. Threaded ends shall be Schedule 80 and conform to ASTM D-2464.
13. Butt fusion ends in PP or PVDF will be compatible with Chemline PP or PVDF metric piping systems.
14. Flanged ends shall be ANSI Class 150 one-piece factory moulded (not fabricated) to ensure maximum strength and close tolerance end to end dimensions.

Tube Nut	**–1** – includes nut	**Blank** – without nut						
Ends	**S** – Socket	**T** – Threaded	**C** – Combo[2]	**F** – Flanged	**B** – Butt[3]			

Example: Chemline Type 21 True Union Ball Valve, PVC, 1/2", with FPM (Viton®) seals, PVC ChemFlare™ end connectors, 1/2" tube size, including nuts.

[1] 1/4" is normally the 3/8" valve reduced. 6" is 4" valve with 6" end connections

[2] PVC and CPVC valves 1/2" to 2" are available as Combo (socket and threaded ends)

[3] Tube size must be equal or smaller than the valve size

[4] PP, PVDF and ECTFE (Halar®) metric butt fusion ends (1/2" to 4") connect to Chemline PP, PVDF and ECTFE (Halar®) piping systems

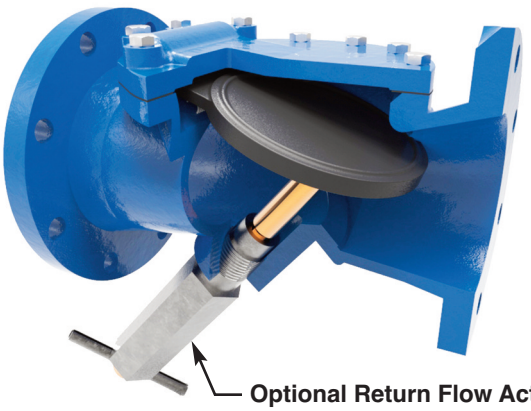
CLA-VAL®

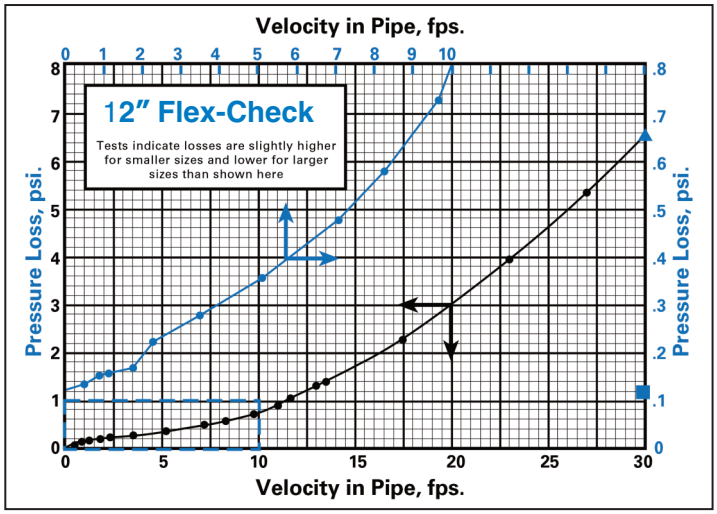
Series 584



Flex-Check Valve

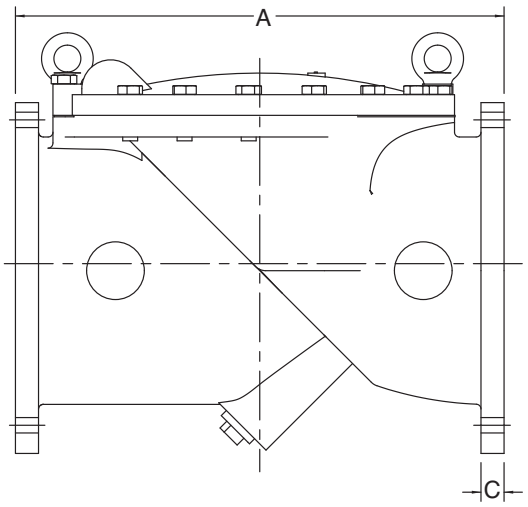
- **Full Pipe Size Flow Area**
- **Drip Tight Seating**
- **Non-Slam Closure**
- **NSF/ANSI 61 Fusion Bonded Epoxy Coating**
- **Available with Integral Surge Protector, Position Indicator and Backflushing features**
- **Sizes 2 through 24 inches available**
- **Meets the Federal Mandate Limiting Lead in Drinking Water**

The Cla-Val Seriesl 584 Flex-Check Valve has a full-flow area body with integral seat at 45° angle to reduce head loss. This minimizes disc travel to 35° degrees for improved non-slam check action and for reliable vertical up flow operation even on slurry applications. Body and Cover are NSF/ANSI 61 fusion bonded epoxy coated for long service life on potable and non-potable systems. Unique one-piece steel and nylon reinforced BUNA-N rubber flapper flexes to eliminate traditional metal hinge problems. During system flowing conditions the flapper flexes up to the open position allowing unrestricted flow through the valve. When system reverse flow conditions occur the flapper flexes down to the closed position for drop-tight seal preventing reverse flow. The flapper reliability is test-proven to over one million cycles. The optional Return Flow Actuator offers manual opening for pump priming, back flushing, draining lines, or system testing needs and is easy to field install.

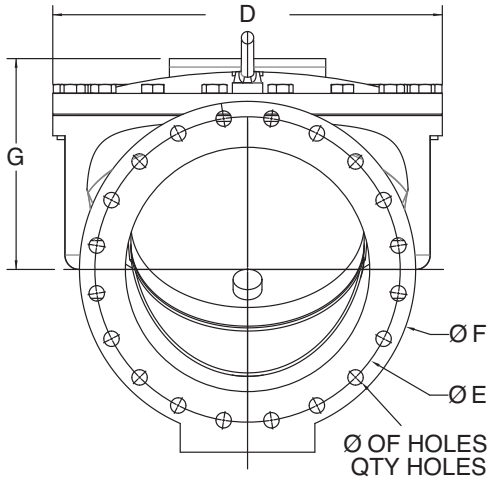


Model 584BF Backflushing Flex-Check Valve - Sizes 3" - 24"

Optional Return Flow Actuator 3-inches and larger



Typical Applications



- Water Systems
- Industrial Waste
- Erosive Services
- Acid Lines
- Light Slurries
- Leaching Lines
- Brine & Salt Water Systems
- Raw Sewage
- Chemical Lines
- Ash Service
- Tailings Systems
- Corrosive Services
- Scrubbers

Valve Materials of Construction

Valve Body & Cover: Ductile Iron - ASTM 536 65-45-12
Flapper Options: BUNA-N, Neoprene, Hypalon & Viton™
Lining Options: Natural Rubber, Neoprene & Hypalon *

* Operating Temperatures for Liner & Flapper Materials	
Material	°F
BUNA-N	- 70 to 250
Rubber	- 40 to 180
Neoprene	- 20 to 250
Hypalon	- 40 to 195
Viton™	- 40 to 450
Other Liner & Flapper materials available	

Standard Rubber Hardness Durometer of Flapper to be Determined by Operating Pressure		
Valve Size	Operating Pressure, PSI	
	10 to 80	81 to 175
2-inches to 8-inches	45 Durometer	70 Durometer
10-inches to 24-inches	70 Durometer

Features

- Wide range of pressure ratings, sizes, and resilient materials provide long service life and low internal leakage
- High flow valves for liquid, corrosive, and air/inert gas service
- Industrial applications include:
  - Car wash
  - Laundry equipment
  - Air compressors
  - Industrial water control
  - Pumps

Construction

Valve Parts in Contact with Fluids		
Body	Brass	304 Stainless Steel*
Seals and Discs	NBR or PTFE	
Disc-Holder	PA	
Core Tube	305 Stainless Steel	
Core and Plugnut	430F Stainless Steel	
Springs	302 Stainless Steel	
Shading Coil	Copper	Silver

*Catalog Numbers 8210G127, 8210G129, 8210G132, 8210G133 have 316L Stainless Steel bodies.

Standard Voltages: 24, 120, 240, 480 volts AC, 60 Hz (or 110, 220 volts AC, 50 Hz). 6, 12, 24, 120, 240 volts DC. Must be specified when ordering.
Other voltages available when required.

Solenoid Enclosures

Standard: RedHat II - Watertight, Types 1, 2, 3, 3S, 4, and 4X; RedHat - Type I.

Optional: RedHat II - Explosionproof and Watertight, Types 3, 3S, 4, 4X, 6, 6P, 7, and 9; Red-Hat - Explosionproof and Watertight, Types 3, 4, 4X, 7, and 9.

(To order, add prefix "EF" to catalog number, except Catalog Numbers 8210B057, 8210B058, and 8210B059, which are not available with Explosionproof enclosures.)
See Optional Features Section for other available options.

Nominal Ambient Temp. Ranges

RedHat II/RedHat AC: 32°F to 125°F (0°C to 52°C)
RedHat II DC: 32°F to 104°F (0°C to 40°C)
RedHat DC: 32°F to 77°F (0°C to 25°C)
(104°F/40°C occasionally)
8210G227 AC: 32°F to 130°F (0°C to 54°C)
DC: 32°F to 90°F (0°C to 32°C)
Refer to Engineering Section for details.

Approvals

UL listed as indicated. CSA certified.
RedHat II meets applicable CE directives.
Refer to Engineering Section for details.

ATEX/IECEx certified with prefix "EV" as listed. *Refer to Optional Features Electrical Section for details.*

① 5 psi on Air; 1 psi on Water.
② Valve provided with PTFE main disc.
③ Valve includes Ultem (G.E. trademark) piston.
④ Letter "D" denotes diaphragm construction; "P" denotes piston construction.
⑤ ❍ Safety Shutoff Valve; ● General Purpose Valve.
Refer to Engineering Section (Approvals) for details.
⑥ Valves not available with Explosionproof enclosures.
⑦ On 50 hertz service, the watt rating for the 6.1/F solenoid is 8.1 watts.
⑧ AC construction also has PA seating.
⑨ No disc-holder.
⑩ Stainless steel disc-holder.
† UL listed for fire protection systems per UL429A.
‡ DC constructions must have solenoid mounted vertical and upright.
✓ ATEX/IECEx certified with prefix "EV".
▼ ATEX/IECEx certified for DC only with prefix "EV".
◆ Not available in 6 Volt DC. EF and HB prefix only.

① 0.3 bar on Air; 0.0 bar on Water.
② Valve provided with PTFE main disc.
③ Valve includes ULtem (G.E. trademark) piston.
④ Letter "D" denotes diaphragm construction; "P" denotes piston construction.
⑤ ❍ Safety Shutoff Valve; ● General Purpose Valve.
Refer to Engineering Section (Approvals) for details.
⑥ Valves not available with Explosionproof enclosures.
⑦ On 50 hertz service, the watt rating for the 6.1/F solenoid is 8.1 watts.
⑧ AC construction also has PA seating.
⑨ No disc-holder.
⑩ Stainless steel disc-holder.
† UL listed for fire protection systems per UL429A.
‡ DC constructions must have solenoid mounted vertical and upright.
✓ ATEX/IECEx certified with prefix "EV".
▼ ATEX/IECEx certified for DC only with prefix "EV".
◆ Not available in 6 Volt DC. EF and HB prefix only.

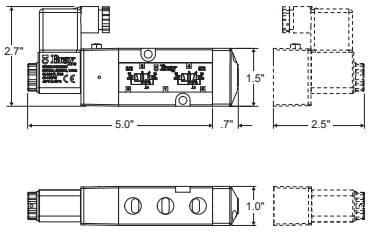
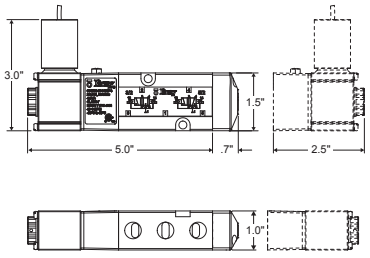
Series 63 Solenoid Valve

FEATURES



- Compact and modular design
- Pilot operated spool control valve
- Convertible from 3-way (3/2) to 4-way (5/2)
- Mechanical manual override

TECHNICAL DATA

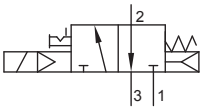


Materials of Construction		
Body	Anodized Aluminum	
Spring	Phosphate treated black steel	
Shading Coil	Copper	
Seals	NBR + PUR	
Core / Tube	Stainless / Brass	
End Covers & Plate	6/6 glass filled polyamide (PA/FV)	
Spool	Aluminum	
Internal Parts	Zamak, Steel, Acetal	
General Specifications		
Mounting	NAMUR VDI/VDE 3845, hardware included	
Pneumatic Ports	1/4" NPT G1/4 available for DIN Models	
Media	Filtered Air or Inert Gas	
Connections	NPT flying leads or DIN Form B Type I connections offered, both available with single and dual coils	
Electrical Connections	NEMA Housings: 1/2" NPT connection and flying leads	
	DIN Housing: Cable Gland PG9 and M15 threaded connector	
Coil Temperature Rating	Insulation Class "F", Max. 311°F [155°C]	
General Purpose (watertight)	NEMA 4, 4X (Flying Leads)	
	IP65 (DIN coil)	
Model Specifications	**High-flow**	**UL-Recognized**
Hazardous Locations (Optional)	—	NEMA 7, 9 Class I, Division 1 (Groups A-D) Class II, Division 1 (Groups E-G)
Temperature Range	-13°F to +140°F [-25°C to +60°C]	AC: -13°F to +140°F [-25°C to +60°C]
		DC: -13°F to +77°F [-25°C to +25°C]
Coil Voltage	Flying Leads & DIN 24, 110, 220 VAC, 50-60 HZ; 12, 24 VDC	Flying Leads: 24, 120, 220 VAC, 50-60 HZ; 12, 24 VDC
		DIN: 24, 120, 240 VAC, 50-60 HZ; 24 VDC
Nominal Power	4.5VA (24VAC); 6VA (110VAC); 7.5VA (220VAC); 4.5W (12 VDC); 3W (24VDC)	Flying Leads: 7VA (AC); 6.9W (DC)
		DIN: 3.5VA (AC); 3.0W (DC)
Flow Coefficient (1/4" pipe)	Cv=1.4	Cv=0.7
Operating Pressure	Min. 22 psi [1.5 bar] Max. 130 psi [9 bar]	Min. 30 psi [2 bar] Max. 130 psi [9 bar]
Operating Speed	5 cycles per minute	10 cycles per minute
Certifications	cCSAus (Flying Leads), CE (DIN coil)	UL, CSA, CE (DIN coil)

DIMENSIONS

DIN Solenoid

NEMA Solenoid



Note: Some dimensions may vary depending on model.

DIN 43650B

Flying Leads

ACCESSORIES

Connector	Description
600250-71106533	Form B Type I Plug Connector (DIN 43650) with Cable Gland PG9
600500-71106533	Form B Type I Plug Connector (DIN 43650) with 1/2" NPT Female Connection
090004-76146533	Form B Type I Plug Connector (DIN 43650), LED and Surge Protected 110-220 VAC, to Flying Leads, 4 meters
090004-76147533	Form B Type I Plug Connector (DIN 43650), LED and Surge Protected 24-30 VDC, to Flying Leads, 4 meters
600250-23663536	Y-Connector Cordset - Form B Type I Plug Connector (DIN 43650) to M12 female straight connector (4-pin sensor side) AND M12 male straight connector (5-pin system side)
600250-23667536	Y-Connector Cordset - Form B Type I Plug Connector (DIN 43650) to 7/8" female straight connector (5- pin sensor side) AND 7/8" male straight connector (6-pin system side)
090001-76159882	S-Connector Cordset - Form B Type I Plug Connector (DIN 43650) to M12 male right angle (2-pins + PE), 0.6 meters

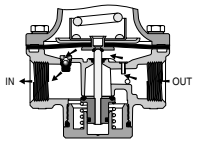
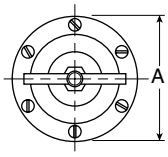
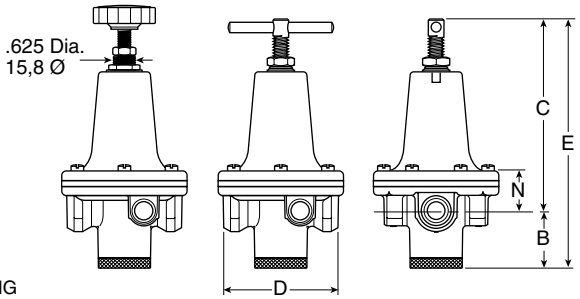
R119 Standard Regulators





Features



- High Flow Performance Featuring Rugged Design for the Most Demanding Applications
- Ideal for Those Installations Calling for Constant Pressure with Wide Variation in Flow
- Diaphragm Operated Design with Balanced Poppet Design for Quick and Accurate Regulation
- Secondary Aspiration Plus Balanced Poppet Provides Quick Response and Accurate Pressure Regulation
- Heavy Duty Tee Handle Adjustment
- Reverse Flow Version Available
- Panel Mount Version Available
- High Flow: 1/4" - 100 SCFM
  3/8" - 110 SCFM
  1/2" - 150 SCFM§

§ SCFM = Standard cubic feet per minute at 100 PSIG inlet, 75 PSIG no flow secondary setting, and 20 PSIG pressure drop.

X80 Reverse Flow Option

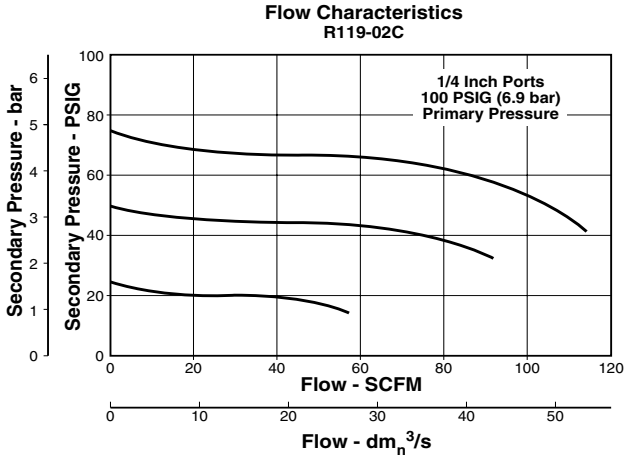
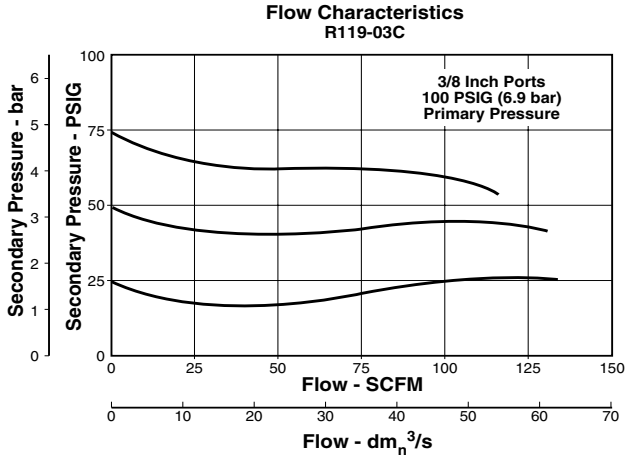
* Reverse flow for use downstream of control valves.

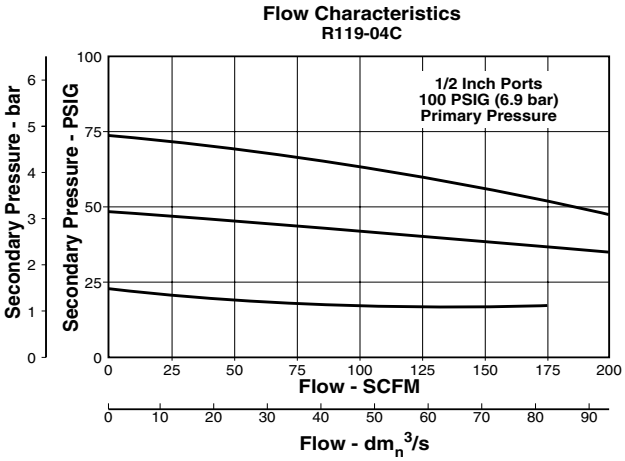
Engineering Change Designator



Will be entered at factory.



CAUTION:



REGULATOR PRESSURE ADJUSTMENT – The working range of knob adjustment is designed to permit outlet pressures within their full range. Pressure adjustment beyond this range is also possible because the knob is not a limiting device. This is a common characteristic of most industrial regulators, and limiting devices may be obtained only by special design.

NOTE: BOLD OPTIONS ARE STANDARD.

Globe Valves

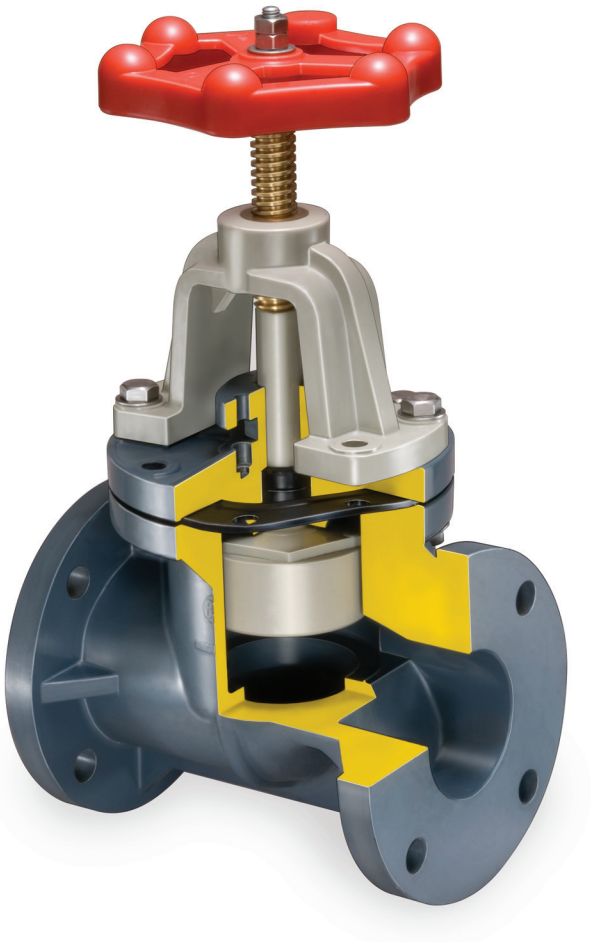
CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

The Chemline Globe Valve is an economical throttling valve. Its heavy duty design provides for long service life. The in-line globe design causes relatively high pressure drops, however this is a desirable valve due to its economy and reliability.

PVC PP

CRN Registered Consult Chemline

SERIES: GV



SIZES: 1/2" – 4"

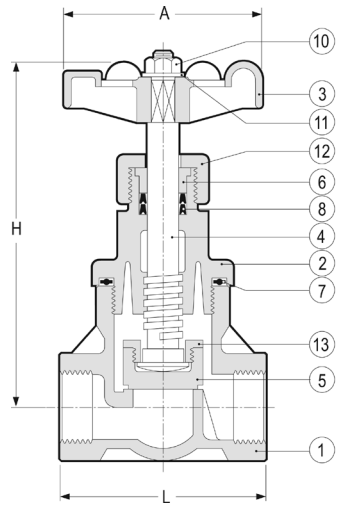
ENDS: Socket, Threaded[1], Flanged

SEALS: EPDM[2]

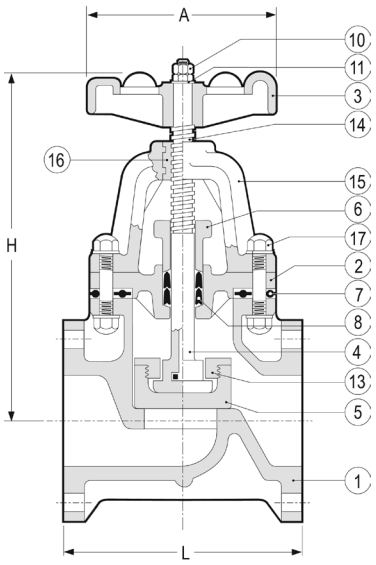
features

- **Slow Closing**
  – Prevents water hammer in PVC piping
- **Heavy Duty Construction**
  – Long service life
- **An economical throttling valve**

2-1/2" – 4" Outside Spindle and Yolk Type



Union Bonnet Design 1/2" – 2"



[1] Socket ends are available custom basis.
[2] Other seal materials are available special order.

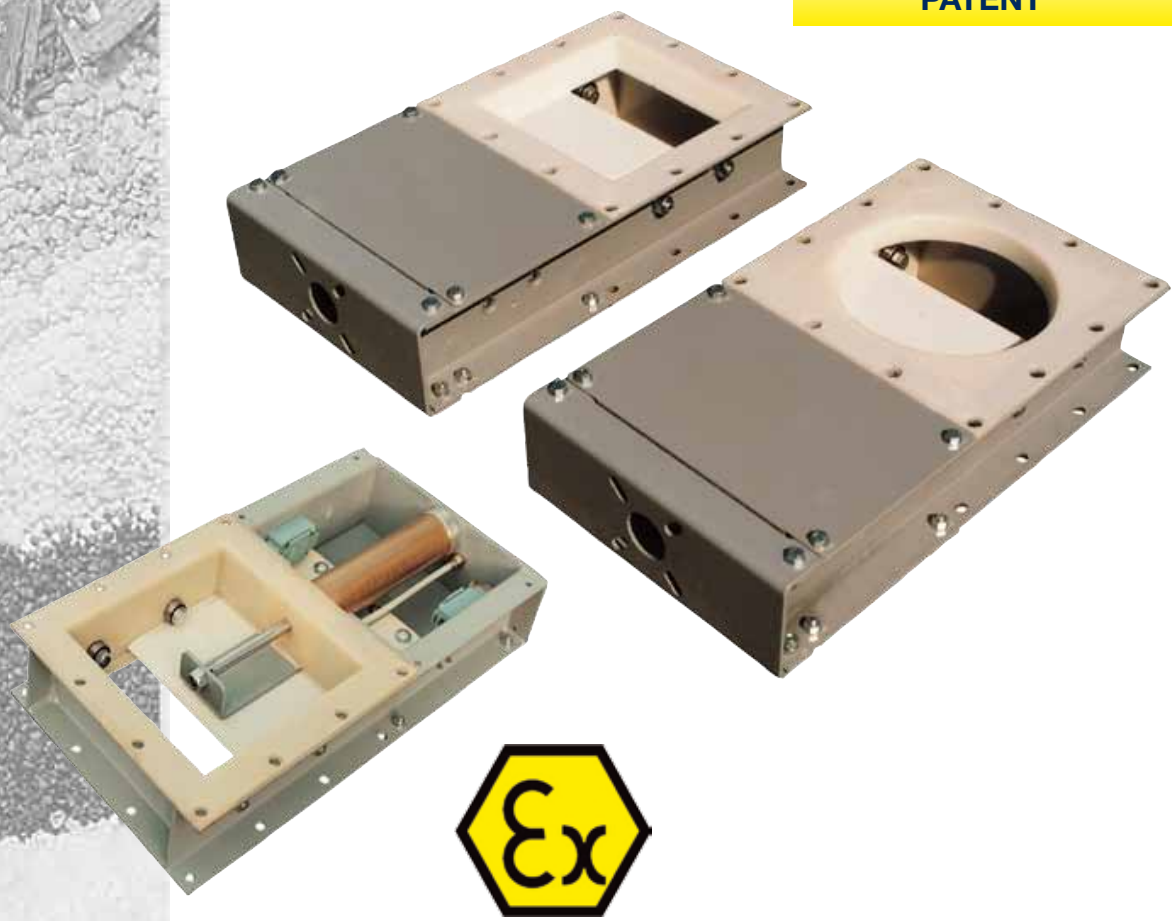
VL



Slide Gate Valves

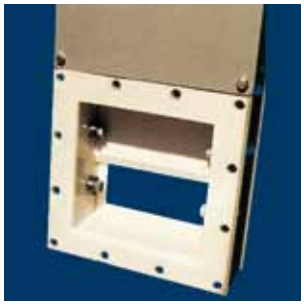
Flachschieber

Vannes Guillotine

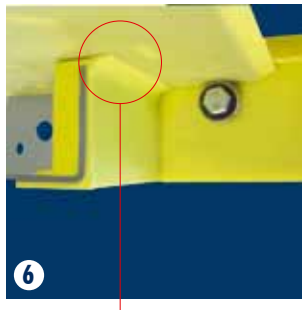
Valvole a Ghigliottina

INTERNATIONAL PATENT

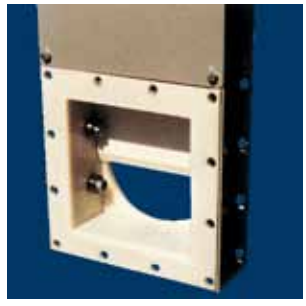
WAMGROUP



WAM®



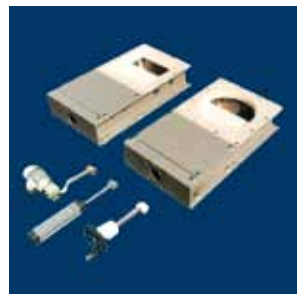
VL Slide Valves are used where the flow of a bulk solid caused by gravity or transport has to be intercepted. Valves may be fitted to hopper or silo outlets, to the inlets and outlets of mechanical conveyors and to the inlet of telescopic loading spouts.
VL-type Slide Valves consist of a two piece carbon or stainless steel frame, which is partly coated with WAM's unique SINT™ engineering polymer composite, and a sliding blade manufactured either in the same material or in stainless steel. The use of SINT™ engineering polymer considerably increases resistance to abrasion compared to traditional valves.
The special geometry of the Valve and the different options of blade design enable its application in virtually every sector including the food industry.



VL-Flachschieber finden überall dort Verwendung, wo ein durch Schwerkraft oder Förderung verursachter Schüttgutfluß unterbrochen werden soll. VL-Flachschieber können unter Silo- oder Trichterausläufen, über den Einläufen bzw. unter den Ausläufen von mechanischen Stetigförderern oder über dem Einlauf von Teleskop-Verladegarnituren eingebaut werden. VL-Flachschieber bestehen aus einem zweiteiligen, teilweise mit SINT™-Polymer ausgekleideten Stahl- oder Edelstahlrahmen und einem mit dem gleichen Polymer beschichteten oder aber ganz aus Edelstahl bestehenden Schieberblech. Die Verwendung von SINT™-Polymer erhöht die Abrasionsresistenz gegenüber traditionellen Flachschiebern beträchtlich.
Die spezielle Geomterie dieser Baureihe und diverse Schieberblechoptionen ermöglichen den Einsatz in allen industriellen Anwendungen inklusive der Nahrungsmittelindustrie.

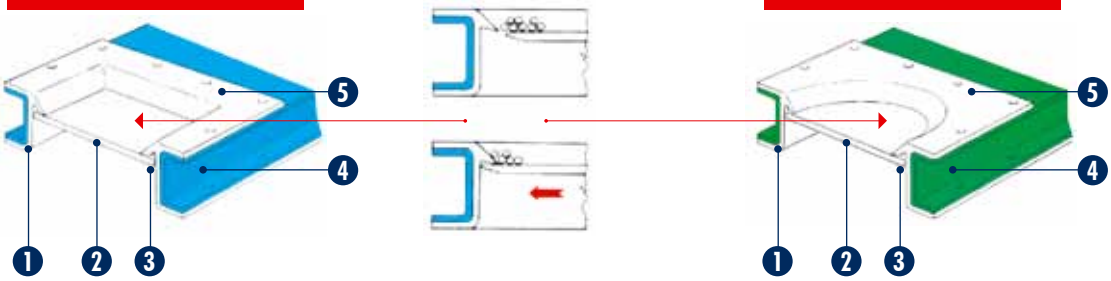
Les Vannes Guillotine VL sont utilisées pour sectionner l'écoulement d'un flux de matériau vrac. Les Vannes Guillotine VL peuvent être installées sous silos ou trémies, au-dessus des bouches d'entrée et au-dessous des bouches de sortie des transporteurs mécaniques ou en tête des goulottes télescopiques.
Les Vannes Guillotine VL sont composées d'un châssis en deux parties qui est partiellement revêtu en polymère technique SINT™ et d'une lame revêtue du même matériau ou entièrement en acier inox. L'utilisation de SINT™ augmente considérablement la résistance à l'abrasion par rapport aux vannes de type traditionnel.
La géométrie spéciale de cette gamme et lesdiverses options de lames rendent possible leur utilisation dans toutes les industries y compris celles de l'alimentaire.

Le Valvole a Ghigliottina VL sono utilizzate laddove un flusso di materiale alla rinfusa causato o dalla gravità o da un trasporto deve essere intercettato. Le Valvole a Ghigliottina VL possono essere installate sotto le bocche di scarico di sili o tramogge, sulle bocche di carico e scarico dei trasportatori meccanici o sulle bocche di carico degli scaricatori telescopici.
Le Valvole a Ghigliottina VL sono costituite da un telaio in due pezzi che è parzialmente rivestito del tecnopolimero SINT™ e da una lama rivestita dello stesso materiale o interamente in acciaio inossidabile. L'utilizzo del SINT™ aumenta considerevolmente la resistenza all'abrasione rispetto alle valvole ti tipo tradizionale.
La speciale geometria di questa gamma e le diverse opzioni di lame rendono possibile la loro applicazione in tutte le industrie compresa quella alimentare.



VLQ - VLR - VLS

VLC



3 interchangeable actuators for valve types VLQ-VLC-VLR

3 Antriebsvarianten bei gleichem Schieberrahmen, Typ VLQ-VLC-VLR

3 actionneurs interchangeables pour les vannes VLQ-VLC-VLR

3 attuatori intercambiabili per tipi di valvole VLQ-VLC-VLR

1. Valve body coated with SINT™MC or SINT™AL in order to avoid contact between product and body.
2. Heavy-duty blade (SINT™MC / SINT™AL, carbon steel, 304 st.st.)
3. Minimum friction contact
4. No additional lateral seals required
5. Dry food quality (coating in SINT™AL)
6. Dustproof (scraper included)

1. *Schieberrahmen komplett mit SINT™MC bzw. SINT™AL ummantelt, damit Medium niemals direkt mit dem Rahmen in Kontakt treten kann.*
2. *Robustes Schieberblech (SINT™MC / SINT™AL, Stahl, Edelstahl 1.4301)*
3. *Reibungsarmer Werkstoffkontakt*
4. *Keine zusätzlichen seitlichen Abdichtungen erforderlich*
5. *Auf Wunsch auch in nahrungsmitteltauglicher Ausführung (mit SINT™AL ummantelt)*
6. *Staubdicht (inkl. Abstreifer)*

1. *Vanne complètement revêtue en SINT™MC ou SINT™AL pour éviter le contact entre le produit et le corps.*
2. *Lame de forte épaisseur (SINT®MC / SINT™AL, acier au carbone, acier inox 304)*
3. *Résistance par friction minimum*
4. *Aucun système d'étanchéité supplémentaire latéral*
5. *Apte pour produits alimentaires secs (revêtements en SINT™AL)*
6. *Etanche à la poussière (muni de racleur)*

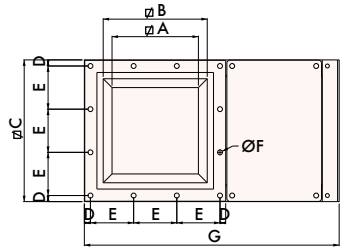
1. *Valvola completamente rivestita in SINT™MC o SINT™AL al fine di evitare il contatto tra il prodotto e il corpo.*
2. *Lama a grosso spessore con smusso per invito (SINT™MC / SINT™AL, acciaio al carbonio, AISI 304).*
3. *Contatto con minimo attrito*
4. *Tenuta laterale non necessaria*
5. *Idonea a prodotti alimentari secchi (rivestimento in SINT™AL)*
6. *Tenuta polvere (provvista di raschiatore)*

User Benefits
- Easy to handle
- Ex-stock delivery
- Highly abrasion-resistant
- Easy to fit
- Time-saving maintenance

Options
- Valve manufactured in carbon steel lined and coated with SINT™MC.
- Valve in 304 stainless steel lined and coated with SINT™AL (FDA-approved)

Vorteile für den Anwender
- *Einfaches Handling*
- *Ab Lager lieferbar*
- *Besonders verschleißresistent*
- *Einfacher Einbau*
- *Extrem wartungsfreundlich*

Optionen
- *Schieber aus Stahl, ausgekleidet mit SINT™MC.*
- *Schieber aus Edelstahl 1.4301, ausgekleidet mit SINT™AL (mit FDA-Zulassung)*



Avantages pour l'utilisateur
- *Légèreté et facilité de manutention*
- *Matériel disponible en stock*
- *Résistance élevée à l'usure*
- *Facilité d'installation*
- *Rapidité d'entretien*

Options
- *Vanne en acier au carbone revêtue en SINT™MC*
- *Vanne en inox 304 revêtue en SINT™AL (approuvée FDA)*

Vantaggi per l'utilizzatore
- *Leggerezza e facilità di movimentazione*
- *Materiale disponibile a magazzino*
- *Elevata resistenza all'usura*
- *Facilità di installazione*
- *Rapidità di manutenzione*

Opzioni
- *Valvola in acciaio al carbonio rivestita in SINT™MC.*
- *Valvola in AISI 304 rivestita in SINT™AL (approvata FDA)*

1009 Stainless Steel Case Gauge

FEATURES

- Meets ASME B40.100 specifications
- Corrosion resistant SS case
- Dry gauges are field fillable
- Power***Flex***™ movement provides superior resistance to shock, vibration and pulsation
- True Zero™ reduces reading errors by using "zero box" instead of conventional dial pins
- ***PLUS!***™ performance available for liquid filled performance with a dry gauge
- MSL helium leak tested to 1X10^{-6} scc/s
- Ventable fill plug
- Accessory kits for easy panel mounting

TYPICAL USES

- Pumps and compressors
- Boilers
- Equipment skids
- Specialized OEM equipment
- Hydraulics and pneumatics
- Severe ambient conditions

SPECIFICATIONS

Accuracy:	ASME B40.100, Grade 1A, ±1% of span (Dry) ±1.5% of span (Liquid filled)
Dial Sizes:	2½″ (63mm), 3½″ (100mm)
Ranges:	Minimum 0-15 psi, maximum 0-15,000 psi, vacuum and compound
Wetted Materials	
Tube:	316L SS tube
Process Connection:	316L SS socket (SW) Aluminum bronze socket (AW)
Non Wetted Materials	
Window:	Polycarbonate (Std.), Safety glass (XSG), Polysulfone (XPS) 3½″ Dial only
Dial:	Black figures on white background, aluminum
Pointer:	Black, aluminum, adjustable (Std.), micrometer (XMP)
Movement:	Power***Flex*** movement Bottom plate – 304 SS Upper plate – 304 SS Pin – 304 SS Hairspring assembly – 304 SS Pinion – 304 SS Segment – Glass filled polyester
Case:	304 SS (Std.), 316L SS (XYW)
Ring:	304 SS (Std.), 316L SS (XYW)
Process Connection Location:	Lower, Back, Top, 3 o'clock, 9 o'clock
Process Connection Sizes:	⅛ NPT, ¼ NPT (see ordering code for more options)

KEY BENEFITS

- **IP65 Rating**
- **NEMA 4X**
- **CRN Approved**
- **PED**
- ***PLUS!***™ **Performance (XLL)**

Dampening:	Glycerin case fill (Std. liquid fill), Silicone case fill (XGV), Halocarbon case fill (XGX), ***PLUS!*** Performance (XLL)
Weather Protection:	IP65 (Plug closed), IP54 (Plug vented) NEMA 4X (Plug closed)
Approvals:	CRN, RoHS, PED

MIN/MAX TEMPERATURE LIMITS

1009 Stainless Steel Case Gauge

FEATURES

- Meets ASME B40.100 specifications
- Corrosion resistant SS case
- Dry gauges are field fillable
- Power***Flex***™ movement provides superior resistance to shock, vibration and pulsation
- True Zero™ reduces reading errors by using "zero box" instead of conventional dial pins
- ***PLUS!***™ performance available for liquid filled performance with a dry gauge
- MSL helium leak tested to 1X10^{-6} scc/s
- Ventable fill plug
- Accessory kits for easy panel mounting

TYPICAL USES

- Pumps and compressors
- Boilers
- Equipment skids
- Specialized OEM equipment
- Hydraulics and pneumatics
- Severe ambient conditions

SPECIFICATIONS

Accuracy:	ASME B40.100, Grade 1A, ±1% of span (Dry) ±1.5% of span (Liquid filled)
Dial Sizes:	2½″ (63mm), 3½″ (100mm)
Ranges:	Minimum 0-15 psi, maximum 0-15,000 psi, vacuum and compound
Wetted Materials	
Tube:	316L SS tube
Process Connection:	316L SS socket (SW) Aluminum bronze socket (AW)
Non Wetted Materials	
Window:	Polycarbonate (Std.), Safety glass (XSG), Polysulfone (XPS) 3½″ Dial only
Dial:	Black figures on white background, aluminum
Pointer:	Black, aluminum, adjustable (Std.), micrometer (XMP)
Movement:	Power***Flex*** movement Bottom plate – 304 SS Upper plate – 304 SS Pin – 304 SS Hairspring assembly – 304 SS Pinion – 304 SS Segment – Glass filled polyester
Case:	304 SS (Std.), 316L SS (XYW)
Ring:	304 SS (Std.), 316L SS (XYW)
Process Connection Location:	Lower, Back, Top, 3 o'clock, 9 o'clock
Process Connection Sizes:	⅛ NPT, ¼ NPT (see ordering code for more options)

KEY BENEFITS

- **IP65 Rating**
- **NEMA 4X**
- **CRN Approved**
- **PED**
- ***PLUS!***™ **Performance (XLL)**

Dampening:	Glycerin case fill (Std. liquid fill), Silicone case fill (XGV), Halocarbon case fill (XGX), ***PLUS!*** Performance (XLL)
Weather Protection:	IP65 (Plug closed), IP54 (Plug vented) NEMA 4X (Plug closed)
Approvals:	CRN, RoHS, PED

310, 315 All-Welded “Mini” Diaphragm Seal

FEATURES

- No gaskets or bolts
- Available with ⅛ NPT flushing connection
- Designed for use with transducers and 3½″ or smaller gauges

TYPICAL USES

- Oil and gas
- Chemical processes
- Process equipment

310
Threaded Seal

SPECIFICATIONS	
Connection Style:	310: All-welded 315: All-welded with flushing connection
Process Connection Size:	310: ⅛ to 1 NPT Male, ¼ or ½ NPT Female 315: ¼ or ½ NPT Female
Instrument Connection Size:	⅛ or ¼ NPT Female
Pressure Rating (MAWP):	2,500 psi
Added Tolerance:	±0.5% typical
Wetted Components:	Diaphragm & bottom housing
Non-Wetted Components:	Top housing: 316L SS

WETTED COMPONENTS

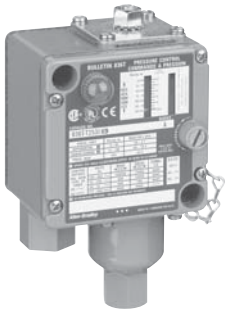
Product Overview

Bulletin 836T Style T Bellows Type Enclosure Type 1, 4 & 13, IEC IP66

Description

Bulletin 836T Pressure Controls are control circuit devices designed to meet the traditional requirements of the transportation, machine tool, and other heavy-duty industries. Allen-Bradley Bulletin 836T Pressure Controls can be used in pneumatic and hydraulic applications. The copper alloy bellows actuators can be used with air, water, oil, vapor, and other non-corrosive gases and liquids. Type 316 stainless steel bellows are available for more corrosive gases, vapors, and fluids.

A rugged stainless steel cylinder and stainless steel piston assembly is used for the higher-pressure coolant and hydraulic oil applications. May also be used with water and water-based fluids. The controls feature snap-action precision switches equipped with silver contacts. A relatively friction-free mechanism provides consistent operation regardless of mounting position. Devices are designed to allow easy adjustment of pressure settings.



Allen-Bradley Bulletin 836T Pressure Controls are used in many types of applications with adjustable ranges from 30 in. Hg vacuum…5000 psi. They can be used to control pneumatic systems and maintain a pressure tank within a preset and constant pressure range. They can be used to detect over-pressures of gases and liquids to prevent damage to valuable equipment. Pressure controls can also detect low pressure to protect equipment from loss of coolants and lubrication.

Bulletin 836T Pressure Controls are offered in a variety of styles to fit a wide range of applications. The devices are available with either a Type 1, 4 & 13, or 7 & 9 and 4 & 13 combined enclosure. They are available with two-circuit or four-circuit contact blocks. Accessories and modifications are available to tailor the devices to meet most application requirements.

Applications

- Machine tools
- Machine hydraulic pressures
- Material clamping fixtures
- Lubricant and coolant pressures
- Compactor ram pressures
- Air compressors

Style T — Pressure Control

Style T

- Independently adjustable operating range and differential
- Single bellows or piston operation

Copper Alloy Bellows

- 1/4 in. N.P.T. female pipe connection
- Adjustable operating range — 30 in. Hg vacuum…650 psi
- Maximum line pressure — up to 1300 psi
- Occasional surge pressure — up to 1600 psi

Type 316 Stainless Steel Bellows

- 1/4 in. N.P.T. female pipe connection
- Adjustable operating range — 30 in. Hg vacuum…375 psi
- Maximum line pressure — up to 600 psi
- Occasional surge pressure — up to 600 psi

Piston

- 3/8 in. N.P.T. female pipe connection
- SAE 7/16-20 UNF-2B thread O-ring boss seal
- SAE 9/16-18 UNF-2B thread O-ring boss seal
- Adjustable operating range — 40…5000 psi
- Occasional surge pressure — up to 15,000 psi

Style D — Pressure Difference Control

Style D

- Independently adjustable system difference range and differential
- Two-bellows operation, one bellows connected to each system

Copper Alloy Bellows

- 1/4 in. N.P.T. female pipe connection
- Adjustable system difference range — 1…70 psi
- Maximum line pressure — up to 600 psi
- Occasional surge pressure — up to 650 psi

Type 316 Stainless Steel Bellows

- 1/4 in. N.P.T. female pipe connection
- Adjustable system difference range — 1…70 psi
- Maximum line pressure — up to 500 psi
- Occasional surge pressure — up to 500 psi

Technical Terms

Adjustable operating range — Total span within which the contacts can be adjusted to trip and reset.

Trip setting — Higher pressure setting at which value the contacts transfer from their normal state to a change state.

Reset setting — Lower pressure setting at which value the contacts return to their normal state.

Adjustable differential — Difference between the trip and reset values

Minimum differential — When the differential is set to the lowest possible difference between trip and reset.

Maximum differential — When the differential is set to the highest possible difference between trip and reset.

Max. occasional surge pressure — Maximum surge pressure that can be applied to the actuator. Surges or ransients can occur during start-up and shut-down of a machine or system. Expressed in milliseconds, complex electronic instrumentation is required to measure the varying amplitude, frequency, and duration of this wave form. Extreme surges that occur approximately 8 times in a 24-hour period are negligible.

Maximum line pressure — Maximum sustained pressure that can be applied to the actuator without permanent damage. The control should not be cycled at this pressure. **Note:** Does not apply to piston type controls.

psi — Pounds per square inch gauge (positive pressure). Devices listed are in gauge pressure units which use atmospheric pressure as a reference. Atmospheric pressure at sea level is approximately 14.7 psi or 30 in. Hg.

Vacuum — Inches of mercury (in. Hg) vacuum (negative pressure).

Operating range adjustment screw — This screw is used to adjust the trip setting by varying the force of the main spring.

Differential adjustment screw — This screw is used to adjust reset setting by varying the force of the differential blade spring.

Pressure media — There are many types of pressure media that can be controlled. Examples include air, water, hydraulic fluids, and other types of gases and liquids. The type of media and the maximum system pressure will determine the type of actuator used for the pressure control application. See page 13-33.

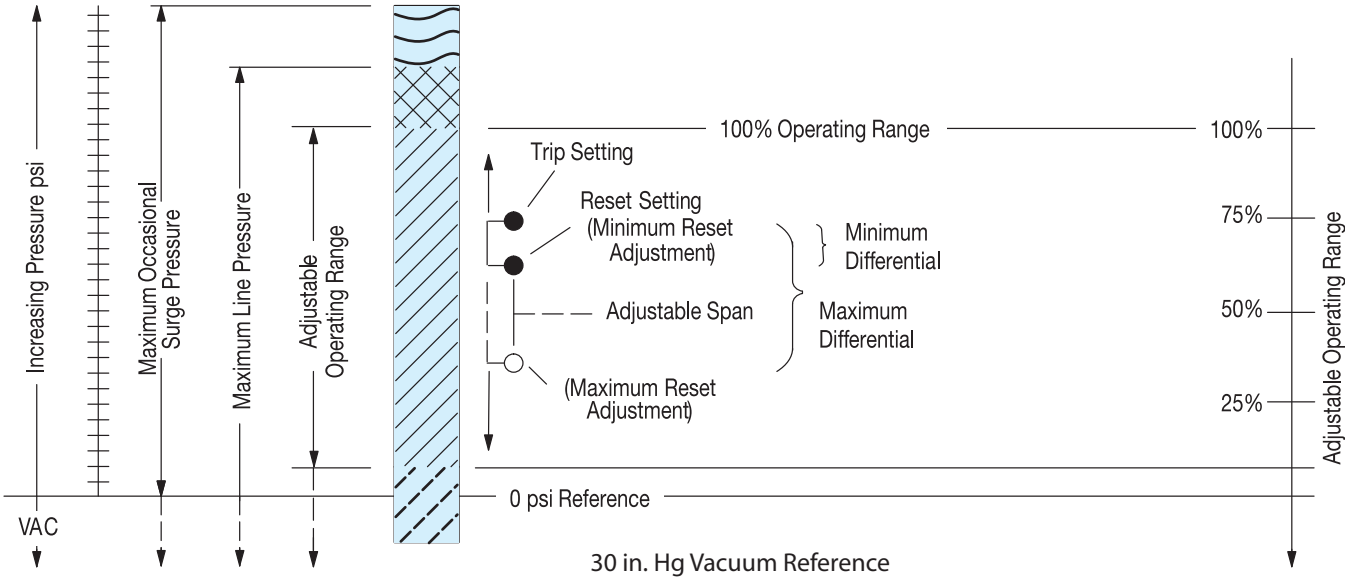
Pressure connection — Common standard types of pressure connections used in control systems are 1/4 in. and 3/8 in. N.P.T. female pipe threads. SAE 7/16 and SAE 9/16 O-ring boss seals are also available (piston versions only).

Contact configuration — Bulletin 836T controls are available with either a 2-circuit or 4-circuit contact block. See page 13-31.

Style D

Style D — pressure difference controls adjustable system difference range — The adjustable operating range for a pressure difference control.

System difference pressure bushing — This bushing is used to adjust the trip setting by varying the force on the main spring.



Trip setting — Desired difference in pressure between the two bellows at which value the contacts transfer from their normal state to a changed state. This occurs in one of the following conditions:

- The pressure in the bottom bellows is higher than the pressure in the top bellows by a value equal to the trip setting.
- The pressure in the bottom bellows remains constant and the pressure in the top bellows decreases by a value equal to the trip setting.

Reset setting — Predetermined normal difference in pressure between the two bellows, at which value the contacts return to their normal state. This occurs in one of the following conditions:

- The pressure in the bottom bellows is lower than the top bellows.
- The pressure in the bottom bellows remains constant and the pressure in the top bellows increases.

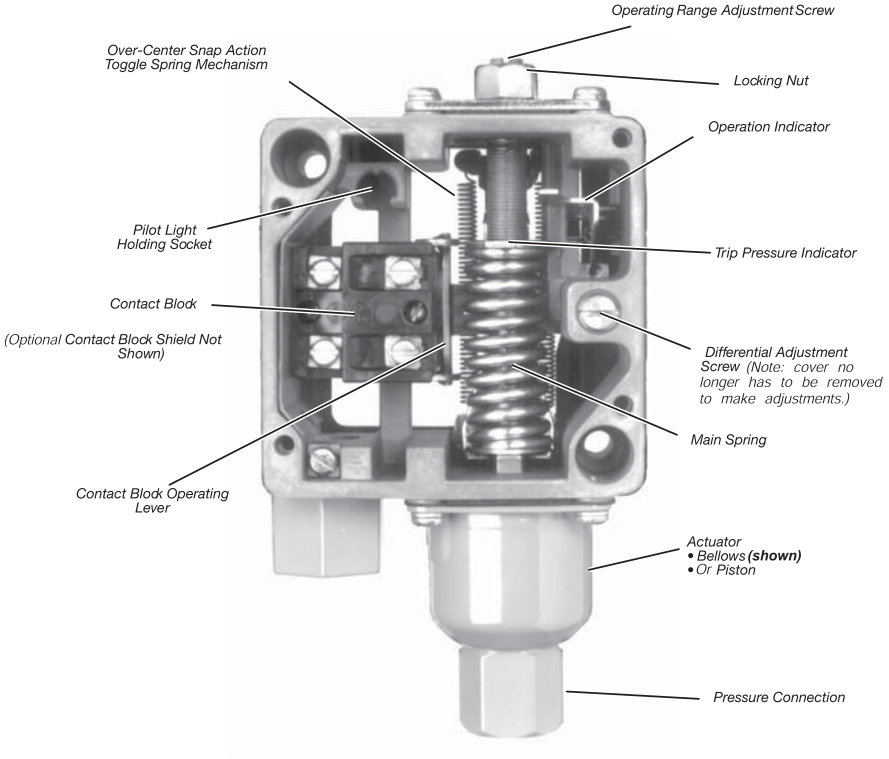
Allen-Bradley



Theory of Operation

Bulletin 836T Pressure Controls are designed to open or close electrical circuits in response to changes in pneumatic (air or gas) or hydraulic (oil or non-corrosive liquids) pressure. Piston controls are not intended for use with air or water. Figure 2 shows the basic operating mechanism.

Pressure is applied to the actuator which can be either a bellows or piston type. As pressure rises, the actuator exerts force on the main spring. When the threshold force of the main spring is overcome, levers transfer the motion to the contact block, displacing the contacts — this is referred to as the trip setting. The unique lever design amplifies the actuator motion, providing shorter stroke, which results in maximizing bellows life.

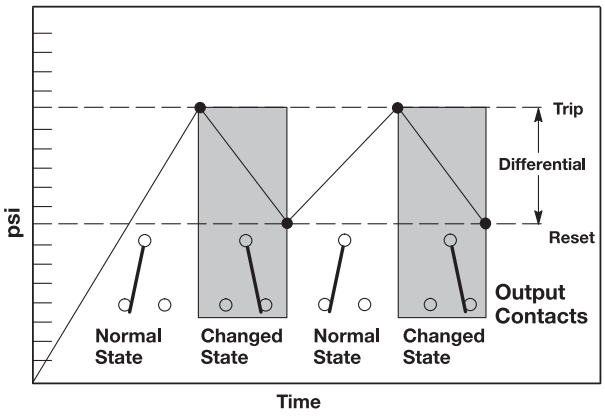
The lever assembly also includes a virtually friction-free over-center toggle arrangement, providing positive snap action to the contact block for long contact life. As pressure falls, force on the differential spring increases and contacts return to their normal state — this is referred to as reset setting. Varying the force of the main spring (by turning the operating range adjustment screw) determines when the contacts will trip. Varying the force of the differential spring (by turning the differential adjustment screw) determines when the contacts will reset. Setting trip and reset values determines the operating parameters of the application.

Figure 2
Basic mechanical structure

Applications for Control

Pressure controls can be used to either control or monitor a machine or process. Figure 3 shows a typical control application. Here, pressure is controlled within predetermined high and low values. Figure 4 shows a typical monitoring application. Here, pressure is monitored between a high and low value, signaling when a preset limit has been exceeded.

Figure 3
Typical control application



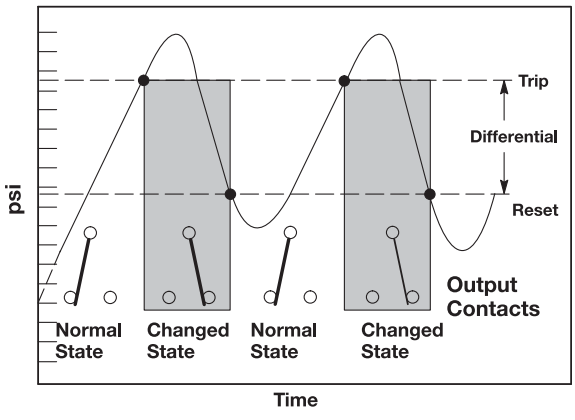


Figure 4
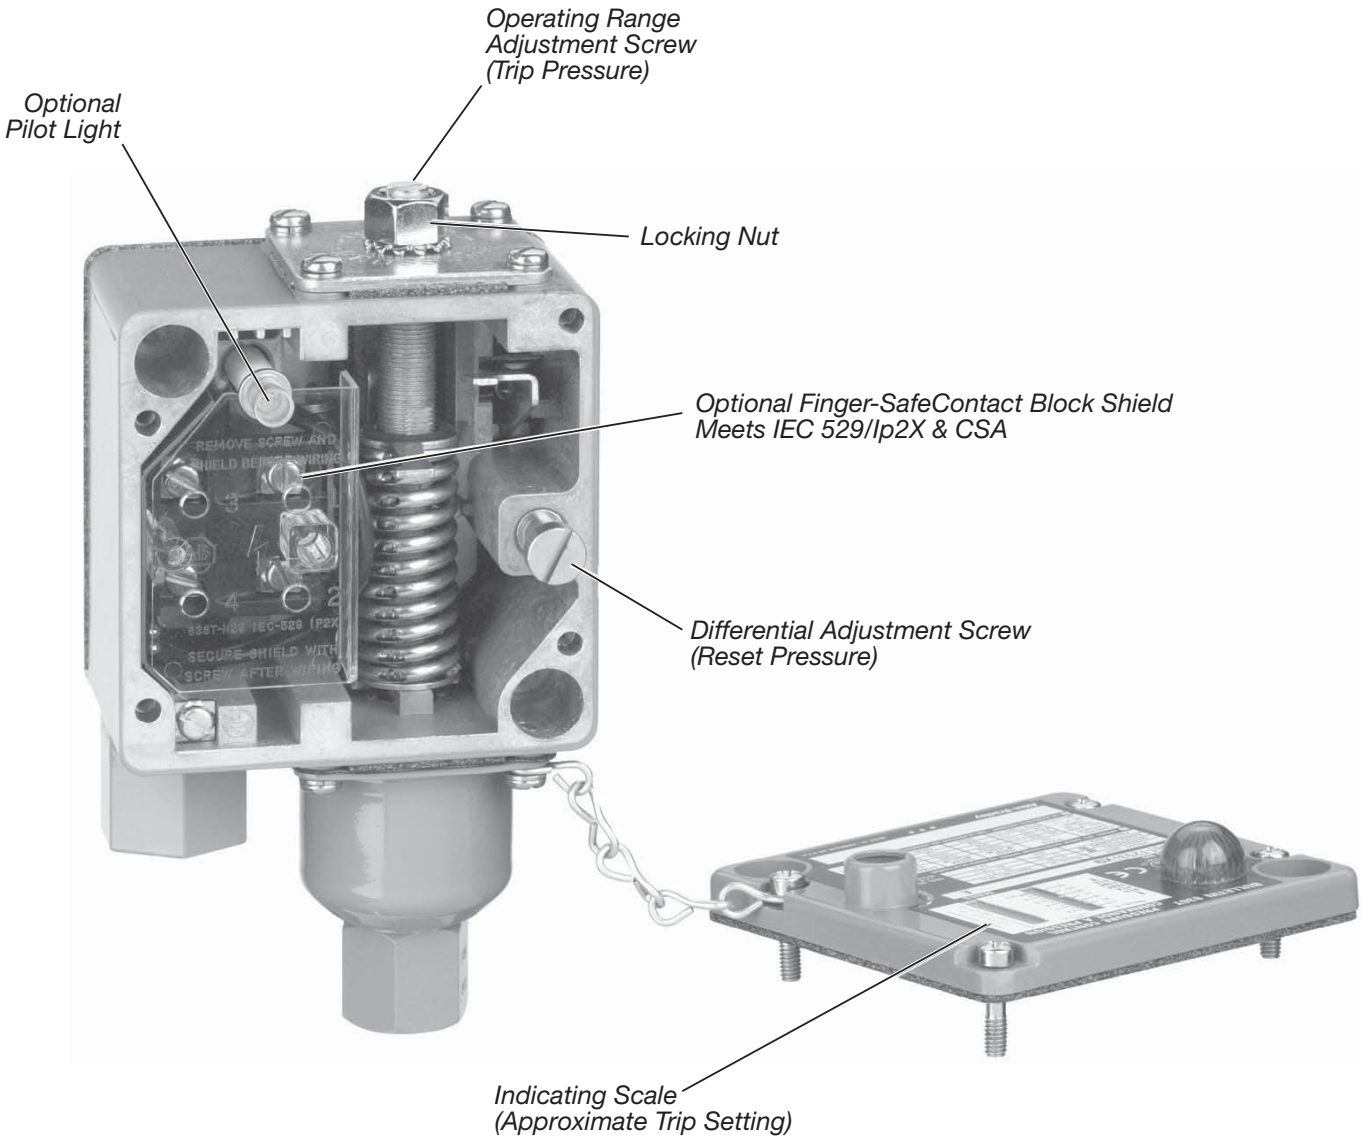
Typical monitoring application



Control Setting — Style T Pressure Controls

Allen-Bradley controls are designed for ease of setting to help minimize installation time. Standard pressure controls shipped from the factory are set at the maximum operating range and minimum differential. By using a pressure gauge and following these simple directions, the control can be set to the specific requirements for each application. See Figure 5.

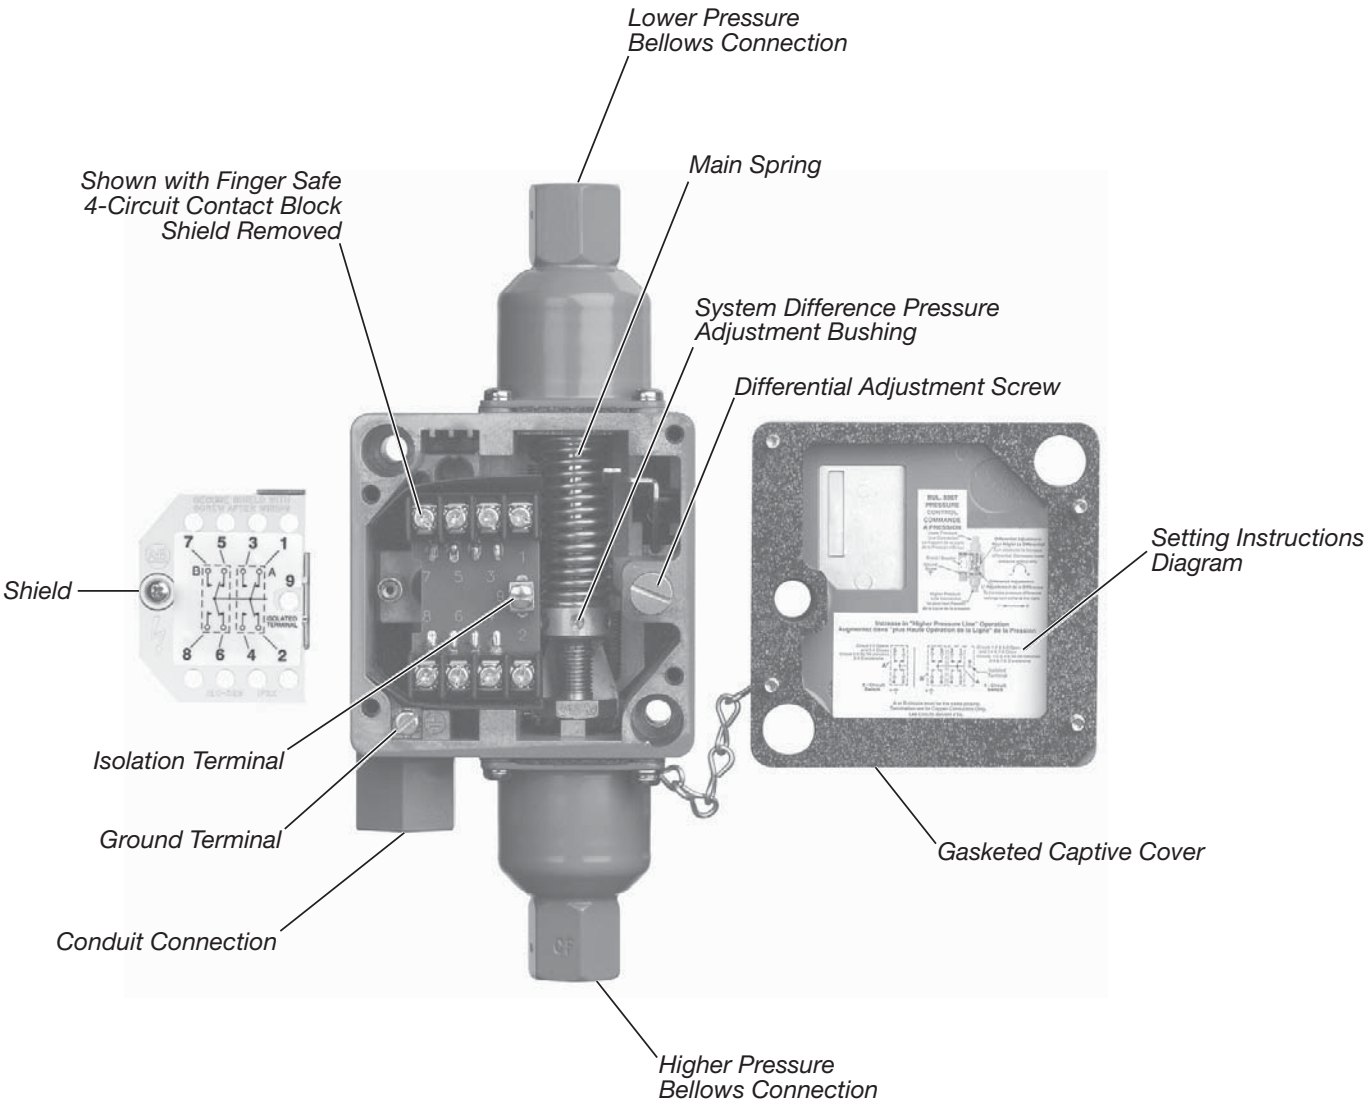
Step 1 — Adjust trip setting
The trip setting is controlled by the operating range adjustment screw and is adjusted externally. After loosening the lock nut, the trip setting is set by turning the operating range adjustment screw counterclockwise to lower the trip setting or clockwise to raise the trip setting. The approximate trip setting is shown on the indicating scale. When the proper setting is reached, simply tighten the lock nut.
Note: Turning the operating range adjustment screw will cause both the trip and reset settings to change in virtually equal increments.

Step 2 — Adjust reset setting
The reset setting is controlled by an external differential adjustment screw. The reset setting is set by turning the differential adjustment screw clockwise to increase the differential or counterclockwise to decrease the differential.
Note: Adjusting the differential has little or no affect on the trip setting.

Figure 5
Trip and reset adjustment for pressure controls

Control Setting — Style D Pressure Difference Controls

Standard pressure difference controls shipped from the factory are set at the maximum adjustable difference range and minimum differential. Remove the front cover and use a pressure gauge to make the following adjustments. See Figure 6.



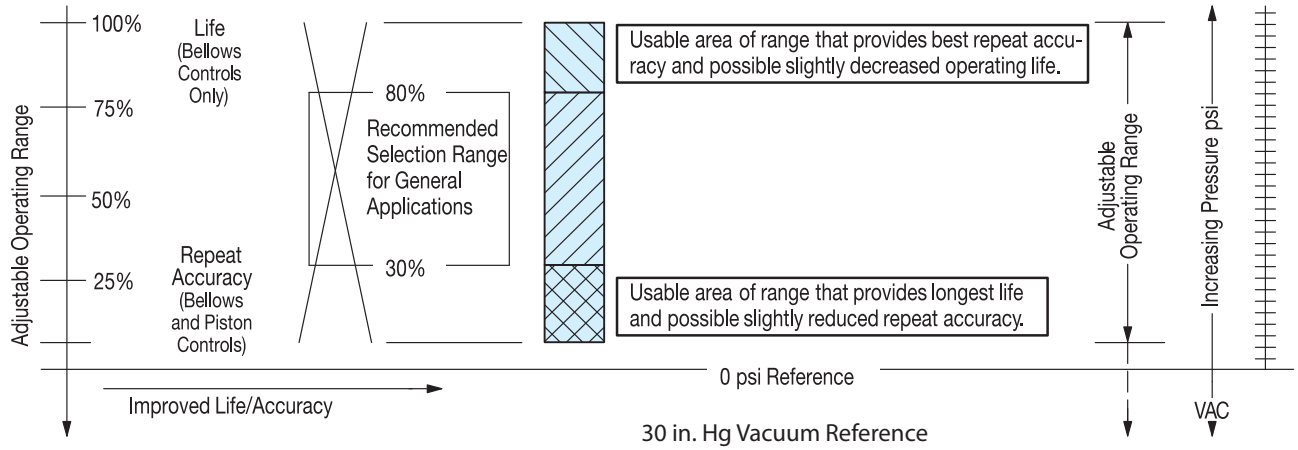
Step 1 — Adjust trip setting (difference pressure)

The trip setting is controlled by the system difference pressure bushing and is adjusted internally. With no pressure (open to atmosphere) applied to top bellows, apply a constant pressure to bottom bellows equal to the desired difference in pressure at which the contacts are to trip. Insert a 1/8 in. diameter rod into a hole in the bushing and turn bushing to the left. Continue to turn bushing until the mechanism trips; circuit 1-2 will open. At this value, the trip setting is set at the pressure which is being applied to the bottom bellows.
Note: Turning the system difference pressure bushing will cause both the trip and reset settings to change in virtually equal increments.

Step 2 — Adjust reset setting (differential pressure)

The reset setting is controlled by differential adjustment screw (this adjustment can be made with the cover on). The reset setting is adjusted by turning the differential adjustment screw clockwise to increase the differential or counterclockwise to decrease the differential.
Note: Adjusting the differential has little or no affect upon the trip setting (difference pressure).

Figure 6
Trip and reset adjustment for pressure difference controls — 4-circuit contact block



Repeat Accuracy and Mechanical Life

The design and construction of Bulletin 836T Pressure Controls provide a typical repeat accuracy equal to or better than the values shown in the repeat accuracy table below. Repeat accuracy is based on percent of maximum range, evaluated from test data and calculated using the formula per ICS 2-225 standards. Repeat accuracy and mechanical life of bellows type controls is graphically illustrated in Figure 7. The life curve does not apply to piston type controls.

For general applications, controls selected where the contacts operate between 30% and 80% of the operating range and where the maximum line and surge pressures do not exceed the specified values will provide excellent life and repeat accuracy. For more specific applications, it is important to note that the controls are designed to operate below or above these values. However, there may be a small trade-off between the factors of repeat accuracy and mechanical life.

Figure 7
Repeat accuracy versus mechanical life graph

Repeat Accuracy

Type	Typical Characteristics (% of Maximum Range) ✶
Bellows	± 1%
Piston with seal	± 5% ❄
Piston without seal	± 3%

✶ Evaluation made from test data and calculated using formula per ICS 2-225 standards.

❄ Seal adds additional friction and value shown takes into consideration initial breakaway frictional force incurred during start-up or infrequent cycle operation. On continual cycle operation the repeat accuracy approaches ±3%.

Conversion Factors (Rounded)

psi x 703.1 = mmH_2O
psi x 27.68 = in. H_2O
psi x 51.71 = mm/Hg
psi x 2.036 = in. Hg
psi x 0.0703 = kg/cm^2
psi x 0.0689 = bar
psi x 68.95 = mbar
psi x 6895 = Pa
psi x 6.895 = kPa

Note: psi - pounds per square inch (gauge).
H_2O at 39.2 °F
Hg at 32 °F

Mounting without Removing Cover

Bulletin 836T controls can be mounted without removing the front cover. This helps prevent foreign materials from entering the opened enclosure during the interval between mounting and wiring of the control.

Factory Set Pressure Controls

Rockwell Automation will factory set pressure controls to customer specified values. Unspecified pressure controls shipped from the factory are set at the maximum operating range and minimum differential. See Factory-Set Pressure Controls, page 13-44.

Temperature Range

The temperature range at +32 °F (0 °C) or below is based on the absence of freezing moisture, water, or other fluids that may solidify and impede the operation of the control. Temperature ratings:

Operating: –22… +150 °F (–30…+66 °C)
Storage: –22…+200 °F (–30…+93 °C)

Contacts

Bulletin 836T controls feature 2- and 4-circuit contact blocks for added control circuit flexibility. Two-circuit contact blocks have one normally open contact and one normally closed contact and may be arranged for single-pole double-throw operation or separate circuit operation having the same polarity. Four-circuit contact blocks may be arranged for double-pole double-throw operation or separate circuit operation having the same polarity.

2-Circuit Contact Ratings — NEMA A600 (ICS 2-125)

AC						DC	
Maximum AC Voltage	A		Continuous Carrying Current	VA		Maximum Voltage	[A]
	Make	Break		Make	Break		
120	60	6.00	10	7200	720	115…125	0.4

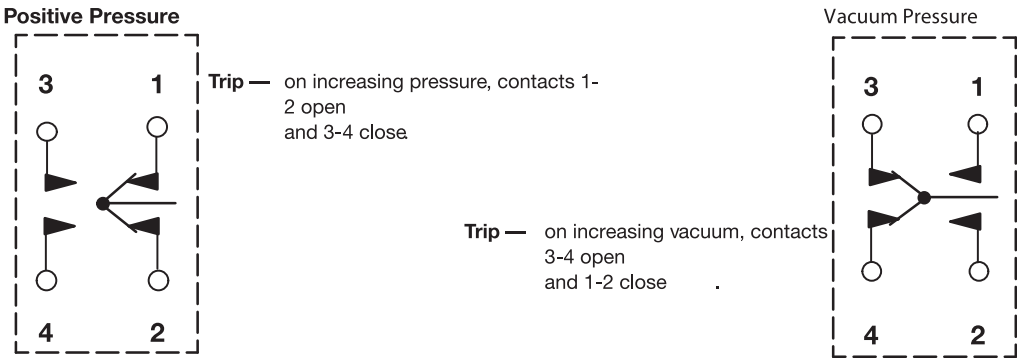
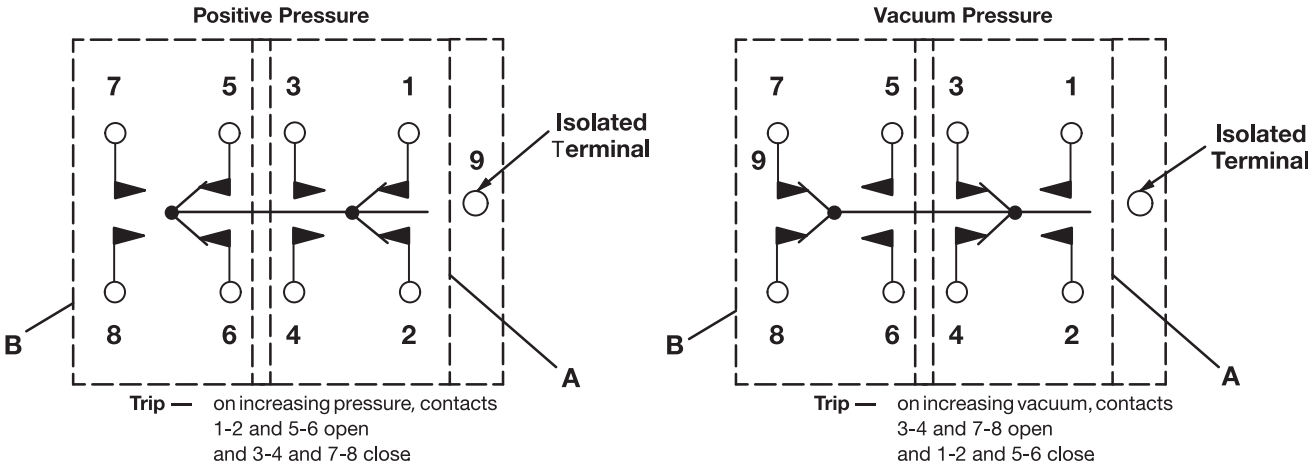
AC600	AC-11	10	120…600 AC	7200 VA	720 VA
		10	72…120 AC	60 A	720 VA
DC600	DC-11	10	24…72 AC	60 A	10 A
		—	115…600 DC	50 VA	50 VA

4-Circuit Contact Ratings — NEMA B150 (ICS 2-125)



AC						DC	
Maximum AC Voltage	A		Continuous Carrying Current	VA		Maximum Voltage	[A]
	Make	Break		Make	Break		
120	30	3.00	5	3600	360	115…120	0.33
240	27.5	2.80	5	6600	660	230…240	0.17

IEC 337-1					
Maximum Operational Voltage U_e	Utilization Category	Maximum Continuous Current I_{th}	Volts U_e	Rated Operational Current Make	Rated Operational Current Break
AC150	AC-11	5	72…120 AC	30 A	360 VA
		5	24…72 AC	30 A	3 A
DC150	DC-11	—	115…240 DC	40 VA	40 VA



Note: NEMA does not rate contacts to switch low voltage and current. Bulletin 836T Styles T and D Pressure Controls are supplied with silver contacts. The devices are designed to deliver high force snap action to the contacts. This provides exceptional contact fidelity at 24V DC I/O card current level entry when the integrity of the enclosure is maintained.

Contact Wiring Configurations

2-Circuit Contact Blocks

4-Circuit Contact Blocks

Note: Circuits A and B are electrically isolated from one another.
A or B circuits must be the same polarity.

Nameplate with Removable Paint Mask

The masks are convenient for the many users who repaint controls to match the machine or color code equipment. Saves costly time-consuming hand masking necessary so as not to conceal product functional specifications and approval listings. This feature is standard on most controls at no additional cost. The paint mask feature cannot be supplied on controls with pilot lights. They are also not available on those devices where it is necessary to remove the mask and add suffix modifications to the catalog number or specific customer identification in the space provided.

Figure 8
Removable paint mask

Cover with Transparent Mask and Instruction Label in Place

Cover with Mask Partially Removed

Pressure Control Selection

The selection table below is an overview of the five types of Bulletin 836T Pressure Controls Rockwell Automation offers. Each type of control is suitable for use on many types of applications. Pressure ranges, pressure connections, enclosure types, and the compatibility of the actulator with different types of pressure media are given to assist in the selection of which type of control to use.

836T				
Actuator Type	Copper Alloy Bellows	Type 316 Stainless Steel Bellows	Piston Type Without Seal	Piston Type With Seal
Adjustable operating ranges	30 in. Hg vacuum…650 psi	30 in. Hg vacuum…375 psi	40…5000 psi	80…5000 psi
Adjustable differentials	2…125 psi	2…90 psi	20…650 psi	40…650 psi
Maximum line pressures	up to 1300 psi	up to 600 psi	—	—
Occasional surge pressures	up to 1600 psi	up to 600 psi	up to 15,000 psi	up to 15,000 psi
Pressure Media				
Air	•	•		
Water	•	•	•	•
Hydraulic fluids	•	•	•	•
Corrosive liquids ∗		•		
Non-corrosive liquids	•	•	•	•
Corrosive gases ∗		•		
Non-corrosive gases	•	•		
Enclosures				
Type 1, 4 & 13	•	•	•	•
Type 7 & 9 and 4 & 13, IP66	•	•	•	•
Pipe Connections				
Standard pressure connection	1/4 in. N.P.T. female pipe thread	1/4 in. N.P.T. female pipe thread	3/8 in. N.P.T. female pipe thread SAE 7/16-20 UNF-2B thread O-ring boss seal SAE 9/16-18 UNF-2B thread O-ring boss seal	3/8 in. N.P.T. female pipe thread SAE 7/16-20 UNF-2B thread O-ring boss seal SAE 9/16-18 UNF-2B thread O-ring boss seal

∗ Corrosive liquids and gases must be compatible with Type 316 Stainless Steel Bellows.

Note: Pressure difference controls are supplied with either copper alloy or stainless steel bellows. See Product Selection on page 13-39 and page 13-40 for details.

Ordering Bulletin 836T Pressure Controls

When ordering Bulletin 836T Pressure Controls, consider the following:

- Device style
- Adjustable operating range
- Adjustable differential
- Maximum line pressure
- Occasional surge pressure
- Pressure media
- Enclosure type
- Pressure connection

How to Order

Step 1: Basic Device
Select a catalog number for the basic device.....**See pages 13-35…13-40.**

Step 2: Modifications
If required, add the appropriate modification suffix code(s) to the catalog number of the basic device.....**See page 13-41.**

Step 3: Accessories
If required, order accessories.....**See page 13-42.**

Step 4: Factory Options
Factory-set pressure controls.....**See page 13-44 .**

Catalog Number Explanation

Note: Catalog number must not include blank spaces.

836T –	T	25	1	J	X40	X15
	a	*b*	*c*	*d*	*e*	*f*

a

Style of Device

∗ Copper alloy bellows may be used on water or air, and other liquids or gases not corrosive to this alloy.

❄ Transients (pulses) can occur in a system prior to reaching a steady-state condition. Surge pressures within published values generated during startup or shutdown of a machine or system, not exceeding eight times in a 24-hour period, are negligible.

‡ The combined Type 7 & 9 and 4 & 13 hazardous gas and dust service enclosure is supplied with special gasket and O-ring seal to diminish/exclude moisture, fluids, and dust from entering the enclosure. Enclosure is rated for the following environments:
CLASS I Groups C,D
CLASS II Groups E,F,G
CLASS III

Ordering Modifications

Modifications are ordered by adding the appropriate modification suffix code to the catalog number of the basic device. Add suffix codes to the catalog number in descending order.

Item	Description	Suffix Code
Oxygen/nitrous oxide service	Bellows and fittings specially prepared for oxygen and nitrous oxide service. Devices tested with pure oxygen, bellows plugged for protection from contamination and a tag warning against contamination is applied.	X2
External adjustment sealed	The 836T external adjustment is sealed, requiring cover removal to adjust differential (includes contact block shield)	X3
Tamper resistant setting	Range and differential adjustments are factory sealed. Price includes factory setting charge.∗	X4
SAE 7/16-20 UNF thread O-ring boss seal (piston type pressure control)	Female SAE straight thread O-ring seal designed to prevent leaks and minimize loss of hydraulic fluids.	X6
SAE 9/16-18 UNF thread O-ring boss seal (piston type pressure control)		X7
Neon pilot light 120V AC	A high-intensity neon pilot light for 120V AC, 60 Hz applications is available and can be wired for ON or OFF operation. The current rating is 1.0 mA.❄	X9
Red LED pilot light 24V DC	A high-intensity LED 24V DC pilot light is available to meet the requirements of the automotive, machine tool builders, and other industries. The current rating is 22 mA and can be wired for ON or OFF operation.❄	X15
Green LED pilot light 24V DC		X18
Special diaphragm assembly (piston type pressure control)	Diaphragm is made of Viton® and Nomex® fabric. Required when phosphate ester base and other adverse hydraulic fluids are present. Use on Catalog Numbers **836T-T300J** through **836T-T303J** series controls.	X25
Special diaphragm and O-ring assembly (piston type pressure control)	Diaphragm is made of Viton® and Nomex® fabric, O-ring is made of Viton® . Required when phosphate esterbase and other adverse hydraulic fluids are present. Use on Catalog Numbers **836T-T350J, -T351J, -T352J, -T353J** and **-T400J** series controls.	X26
Viton® enclosure gaskets	Special enclosure gaskets made of Viton® are available for applications where the standard gasket materials are not fluid compatible. Viton® is generally specified by the user for use with existing and newly developed coolants and hydraulic fluids to maintain enclosure integrity. These include cover, backplate, cover, and bellows or piston gaskets. **Note**: Viton® enclosure gaskets are often used with special diaphragm assemblies **(X25 or X26)**. See description above.	X29
5-Pin mini-type receptacle without pilot light❄	Select the desired pin wiring configuration from the diagrams on pages 13-45…13-47. Rated at 8 A, 600V.	See pages 13-45…13-47.
5-Pin mini-type receptacle with prewired pilot light❄	Select the desired pin wiring, pilot light wiring, and voltage from the diagrams on pages 13-45…13-47. Includes receptacle and pilot light. Rated at 8 A, 600V.	See pages 13-45…13-47.
5-Pin micro-connect receptacle without pilot light❄	Select the desired pin wiring configuration from the diagrams on pages 13-45…13-47. Add number "1" to the suffix number immediately following the letter "X." **Example: "X19" becomes "X119."** Rated at 3 A, 300V. Pin/Wiring Code: 1 – Red with white tracer, 2 – Red, 3 – Green (Gnd), 4 – Red with yellow tracer, 5 – Red with Black Tracer	See pages 13-45…13-47.
5-Pin micro-connect receptacle with prewired pilot light❄	Select the desired pin wiring configuration and pilot light (X9 or X15, see above for specifications) from the diagrams on pages 13-45…13-47. Add number "1" to the Suffix Number immediately following the letter "X." **Example: "X12X9" becomes "X121X9."** Rated at 3 A, 300V. Pin/Wiring Code: 1 – Red with white tracer, 2 – Red, 3 – Green (Gnd), 4 – Red with yellow tracer, 5 – Red with black tracer	See pages 13-45…13-47.
Additional optional receptacles and wiring❄	For assistance, please consult your local Rockwell Automation sales office or Allen-Bradley distributor.	

∗ See paragraph entitled “Factory-Set Pressure Controls” on page 13-44.
❄ Not available on the Type 7 & 9 and 4 & 13 combined enclosed devices.

Ordering Accessories

Accessories are ordered as separate catalog numbers. Select the required accessories from the accessories table below.

Item	Description	Type	Cat. No.
External fixed pulsation snubbers	Controls are supplied as standard with an internal pulsation snubber. However, a control properly selected and used within the adjustable range values, yet having a short bellows life, is a good indication of the presence of extreme surge pressures. External fixed pulsation snubbers are available to provide **additional** dampening when extreme pulsations or surges are present. Recommended if more than eight line surges occur in a 24-hour time period.	Snubber for bellows control 1/4-18 N.P.T. thread	**836-N7**
		Snubber for piston control 3/8-18 N.P.T. thread	**836T-N8**
Selectable element pulsation snubbers	Controls are supplied as standard with an internal pulsation snubber. However, a control properly selected and used within the adjustable range values, yet having a short bellows life, is a good indication of the presence of extreme surge pressures. Selectable element pulsation snubbers are supplied with five different elements to provide a selectable balance between maximizing pressure control life and minimizing control response time. Pulsation snubbers are supplied with the mid-range element already mounted and four other color-coded porosity elements included in the package. See "Selectable Pulsation Snubber Porosity Elements" table on this page for porosity specifications.	Snubber for bellows control 1/4-18 N.P.T. thread	**836-N40**
		Snubber for piston control 3/8-18 N.P.T. thread	**836T-N41**
	Female SAE straight thread O-ring seal designed to prevent leaks and minimize loss of hydraulic fluids. Use on applications with a pressure range of 550…5000 psi.	SAE 7/16-20 UNF-2B thread O-ring boss seal for piston controls	836T-N49
		SAE 9/16-18 UNF-2B thread O-ring boss seal for piston controls	**836T-N50**
Selectable pulsation snubber porosity elements	Package consists of five porosity elements and complete instructions. Elements are color-coded for easy identification. Elements are available in five different porosities for a wide range of applications. See selectable pulsation snubber porosity elements table.		See Table on this page
Locking cap	Deters unauthorized tampering of range setting. Once installed, the locking cap can be removed with a screwdriver to re-adjust the control.	—	**836T-N13**
Isolation trap with two 1/4 in. male pipe fittings	An isolation trap is available for high-temperature media applications from 150…600 °F or corrosive applications compatible with Type 316 stainless steel tubing and fittings. The isolation coil is inserted between the bellows of the pressure control and the elevated temperature line of the system. The isolation trap will fill with condensed water or can be filled with water or suitable fluid when installed. A silicone buffer fluid is available in a convenient dispenser. Copper alloy lower and higher pressure range bellows can be applied to many applications using the isolation trap. The silicone buffer fluid is used to isolate many corrosive substances from coming in contact with the bellows. The isolation trap is rated at 3000 psi working pressure. Not available for piston-type controls. See photo on this page.		836-N25
Isolation trap with one 1/4 in. male and one 1/4 in. female pipe fittings			836-N26
2 oz. of buffer fluid to fill bellows and tubing			836-N27
Metric electrical entry conduit adapters	BS 20 mm thread adapter		**836T-N36**
	Pg 13.5 thread adapter		836T-N37

Selectable Pulsation Snubber Porosity Elements

Recommended Type of Service	Color Code	Porosity	Cat. No.
Viscous fluids (over 500 SSU)*	None	Coarser	836-N43
Medium type oils (225…500 SSU)*	Black		**836-N44**
Water and light oils (30… 225 SSU)*	Brown		**836-N45**
Low viscosity fluids (under 30 SSU)*	Green		**836-N46**
Air and other gases	Red	Finer	**836-N47**
One of each of the above	—	Assorted	836-N48

* Saybolt Seconds Universal (SSU) — units of viscosity measurement.

Note: Color code is located on end of element.

Conversion Kits

Ordering Conversion Kits

Conversion Kits are ordered by adding the appropriate suffix code to the catalog number of the basic device. Select the required conversion kits from the table below.

Conversion Kits

Item	Description	Suffix Code
Neon pilot light conversion kit	Converts standard control to control with 120V AC neon pilot light. Not available on Type 7 & 9 devices. Kit includes pilot light and cover assembly.	N9
Red LED pilot light conversion kit	Converts standard control to control with 24V DC LED pilot light; has a 22 mA current rating. Not available on Type 7 & 9 devices. Kit includes pilot light and cover assembly.	N15
Green LED pilot light conversion kit	Converts standard control to control with 24V DC LED pilot light; has a 22 mA current rating. Not available on Type 7 & 9 devices. Kit includes pilot light and cover assembly.	N18

Example:
To convert a **Cat. No. 836T-T301J** to a **Cat. No. 836T-T301JX15**, order **Cat. No. 836T-T301JN15**.

Renewal Parts

Ordering Renewal Parts

Renewal Parts are ordered as separate catalog numbers. Select the required renewal parts from the table below.

Renewal Parts

Item	Description	Cat. No.
2-Circuit contact block renewal kit	Allows renewal of worn contacts for Bulletin 836T controls.	**836T-N1**
4-Circuit contact block renewal kit	Allows renewal of worn contacts for Bulletin 836T controls.	836T-N2
Renewal seals for piston-type controls	For use on Cat. No. 836T-T350J.	836T-N20
	For use on Cat. No. 836T-T351J.	836T-N21
	For use on Cat. No. 836T-T352J and 836T-T400J.	836T-N22
	For use on Cat. No. 836T-T353J.	836T-N23

Factory-Set Pressure Controls

Ordering factory-set pressure controls

- When a specific factory setting is requested, the specific terminal connections must be specified — e.g., N.O. or N.C. It must also be specified whether the contact operation is occurring on either increasing or decreasing pressure. For example:

Normally Closed (N.C.) contacts to open at∗ psi increasing pressure and close at∗ psi decreasing pressure.

—OR—

Normally Open (N.O.) contacts to close at∗ psi increasing pressure and open at∗ psi decreasing pressure.

- If minimum differential is not critical and the inherent minimum differential satisfies the application, specify the factory setting as follows:

Normally Closed (N.C.) contacts to open at∗ psi increasing pressure minimum differential.

—OR—

Normally Open (N.O.) contacts to close at∗ psi increasing pressure minimum differential.

Quality analog test gauges§ are used when applying requested factory settings to these rugged industrial grade pressure controls. (Gauges are calibrated and accuracy is traceable to the The National Institute of Standards and Technology.)

The actual requested setting is applied to the control by reading the set point directly from the test gauge being used. However, traceable gauge tolerance variance between source and user, and possible severe shock during shipping and installation, may contribute to the factory settings deviating slightly from the specified values. Slight recalibration can easily be accomplished upon final installation to meet specific requirements for the more demanding applications.

When installed, the controls will perform with a repeat accuracy as established in the paragraph entitled “Repeat Accuracy" (see page 13-54). Special service is available to factory-set controls on digital laboratory instruments, up to 600 psi, when required for more critical applications. An additional charge may be added for this service contingent upon setting tolerance and quantity. Please contact your local Rockwell Automation sales office or Allen-Bradley distributor.

∗ Specify psi (pounds per square inch) or, in. Hg vac (inches of mercury vacuum).

❄ Per ANSI B40.1 Grade 2A (0.5% accuracy full scale), Grade 3A (0.25% accuracy full scale).

If not specified, setting tolerances will be as shown in the table below.

Pressure Range	Tolerance
30 in. Hg Vac....0	+/- 1 in. Hg vac.
> 0...100 psi	+/- 1 psi
> 100...300 psi	+/- 2 psi
> 300...500 psi	+/- 5 psi
> 500...1000 psi	+/- 10 psi
> 1000...5000 psi	+/- 50 psi

Standards Compliance

- UL508
- CSA 22,2 No. 14
- UL698, 1604 (Haz. Loc.)
- NEMA ICS-2

Variable Area Flow Meters

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

Chemline F Series Variable Area Flow Meters are ideal for plastic piping. They provide a combination of accurate visual flow rate measurement and clear flow indication from a distance. Optional limit switches allow the units to signal a low or high flow alarm. An optional flow transmitter provides a 4 to 20 mA signal output. These flow meters must be installed vertically with flow upward.

PVC | PA | PSU | PVDF — Tube

PVC | CPVC | PP | PVDF — Ends

CRN Registered Consult Chemline

SERIES: FC – Compact – 5" Single Scale
FS – Full Size – 7" Dual Scale[1]

MATERIALS: Tube: Clear PVC, Polyamide (PA), Polysulfone (PSU) or PVDF[2]
Float: PVDF
Ends: PVC, CPVC, PP, PVDF, Socket, Threaded, Flanged, Butt or ChemFlare™[3]

O-RINGS: EPDM, FPM (Viton®)

CAPACITIES: Up to 220 USGPM (50,000 litres per hour)

features

Clear Visual Indication

- Large orange float is visible from a distance
- Range indicators slide along dovetail track

Easy Installation and Maintenance

- Just unscrew union nuts and tube slides out of line

Choice of Four Tube Materials for Many Applications:

- ***Clear PVC*** – For Water or Chemicals up to 60°C (140°F) – High Chemical resistance at low cost
- ***Polyamide (PA)*** – For Water or Air up to 75°C (167°F) – High impact strength and optical clarity
- ***Polysulfone (PSU)*** – For Chemicals and Gases up to 100°C (212°F) – High impact strength and good chemical resistance
- ***PVDF[2]*** – For Chemicals and Ultrapure fluids up to 110°C (230°F) – High impact strength and excellent chemical resistance.

Ideal for All Types of Plastic Piping

- All types of end connections in PVC, CPVC, PP & PVDF

- **Low Pressure Drop**

Good Measuring Accuracy – Class IV

- ± 3% of indicated value, plus ± 1% of full scale. – Read scale at top (largest diameter) of float

Non Fouling

- Float is self supporting in the flow. No guide rod (which can cause the float to jam) is necessary.

[1] USGPM and litres per hour (water) scale is supplied as standard on full size meters.
[2] Because PVDF is translucent, a magnetic float and limit switches are usually used.
[3] For ChemFlare™ end connectors, consult Chemline.

03/13 ©Chemline Plastics Limited 2013
Chemline is a registered trade mark of Chemline Plastics Limited

Variable Area Flow Meters

NOTES:

PVDF flow meters are available in all sizes. Change third letter in item number to **K**.

[1] △P = Pressure loss through flow meter with water at 20°C (68°F).

[2] Dimension **L** is for PVC Socket ends.

Variable Area Flow Meters

PARTS

▲ Recommended Spare Parts

No.	Part	Pcs.	Materials
1	Tube	1	Polyamide (PA), Polysulfone (PSU), Clear PVC, PVDF
2	Float	1	PVDF (standard or magnetic)
3	Lower Float Stop	1	PVDF
4	Upper Float Stop	1	PVDF
5	Union Nut	2	PVC, PPG, PVDF
6	End Connector	2	PVC, CPVC, PP or PVDF
7▲	O-Rings	2	EPDM, FPM(Viton®)
8▲	Range Indicator	2	ABS

ACCESSORIES

- **Limit Switches** – One switch for both maximum or minimum. A magnetic float is required.
- **Switch Ratings** – P (max) = 10 VA, E (max) = 470VAC, I (max) = 0.5A
- **Throttling Valve** for flow control
- **4–20 mA Output Signal Unit** must be factory calibrated for specific service

OPTIONS

- **Custom Direct Reading Scale** for services other than water
- **Alternate O-Rings** – ie. FPM (Viton®)
- **End Size Reduction** – Accuracy is not significantly affected by end reduction
- **Other Ends** – Threaded, socket or flanged end connections in PVC, CPVC, PP or PVDF. Butt ends in PP or PVDF.

MAXIMUM WORKING PRESSURES AND TEMPERATURE RANGES

Construction (‡ = Optional Materials)				Maximum	
Tube	O-Rings	Union Nuts	Ends	Pressure[2]	Temperature Range
PVC	EPDM	PVC	PVC	150 psi	0 to 60°C (32 to 140°F)
Polyamide (PA)	EPDM	PVC	PVC	150 psi	0 to 60°C (32 to 140°F)
Polyamide (PA)	EPDM	PPG‡	PP or CPVC‡	150 psi	0 to 75°C (32 to 167°F)
Polysulfone (PSU)	EPDM	PVC	PVC	150 psi	0 to 60°C (32 to 140°F)
Polysulfone (PSU)	EPDM	PPG‡	PP or CPVC‡	150 psi	0 to 90°C (32 to 194°F)
PVDF	FPM(Viton®)	PVDF	PVDF	150 psi	–40 to 110°C (–40 to 230°F)

[2] 150 psi is not recommended at maximum temperatures. Consult Chemline.

flow meter sizing – liquid flow

Standard Scale values are for clean water flow at 20°C (68°F). For liquids with densities and viscosities similar to water (ie. specific gravity of 1.0 and viscosities between 0.5 cP and 1.3 cP) the standard water scale will be accurate enough.

The table below shows correction factors to be applied for liquids with specific gravities other then 1.0. Multiply the correction factor by the water scale value to obtain actual flow rate. Example: For a liquid of specific gravity of 1.66, the correction factor is 0.740. For water flow range of 100 to 1000 litres/hr, corrected range becomes 74 to 740 litres/hr. Viscosity should be between 0.5 cP and 1.3 cP for standard scales to be accurate.

For "sizing" liquid flows ie. determining actual flow range of a tube, please advise the **chemical name, concentration, temperature, specific gravity** and **viscosity.** Custom direct reading scales in any units are available special order.

SCALE CORRECTION FACTORS – FOR LIQUIDS WITH SPECIFIC GRAVITIES OTHER THAN 1.00

SCALE CORRECTION FACTORS – FOR AIR AT NON-STANDARD TEMPERATURES AND PRESSURES

Air density is dependent on the actual pressure and temperature.
Calculate the Scale Correction Factor using either Method 1 or 2. Multiply the standard air flow ranges above by the Factor to obtain actual flow rates.

Method 1

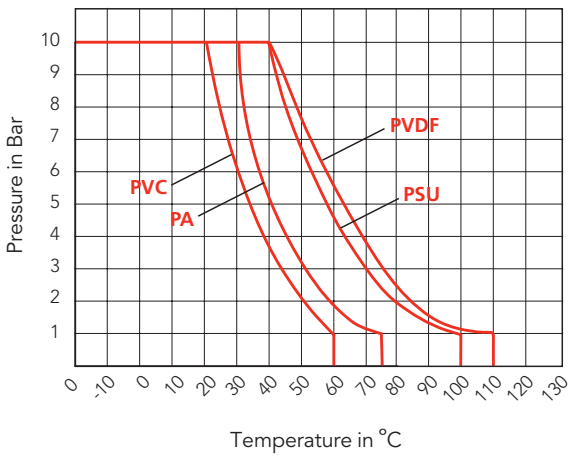
Calculate the Factor with the following formula.

$$\text{Factor} = \frac{1}{3.7005}\sqrt{\frac{\text{psia}}{(1+0.00367t)}}$$

psia = pressure of the air absolute
= psig + 14.7 (atmospheric pressure = 14.7 psia)
t = temperature of the air °C

Method 2

Calculate the density of the air at conditions and find factor from the chart below.



$$\text{Air Density (g/ml)} = \frac{\text{psia}}{11{,}360\,(1+0.00367t)}$$

psia = pressure of the air absolute
= psig + 14.7 (atmospheric pressure = 14.7 psia)
t = temperature of the air °C

Air Density vs. Flow Factor

Temperature vs. Pressure

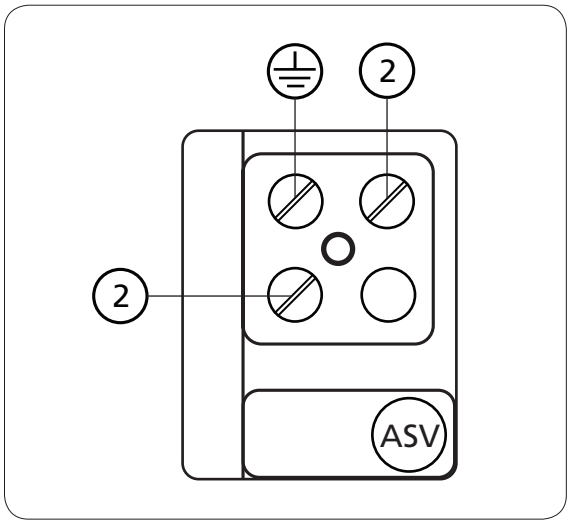
LSFLO Reed Limit Switch

for FC & FS flow meters

The **LSFLO** limit switches serve as switches for minimum or maximum flow values. The normally open latching reed switch closes when the float in the measuring tube reaches and exceedes the switching position. The switch condition is maintained as long as the float is above the limit switch and will open when the float in the tube drops below the switch.

Normally closed switches are available on request.



technical

- **Operating voltage:** maximum 230 VAC
- **Operating current:** maximum 0.5 A
- **Constant current when switched:** maximum 1 A
- **Rupturing capacity:** maximum 10 W/10 VA
- **Closed resistance:** < 150 mΩ
- **Open resistance:** > 10^{10} Ω
- **Operating temperature:** 0°C(32°F) to 55°C(131°F)
- **Protection:** IP 65 (DIN EN 60528)
- **Hysteresis (switch on and off point):** 3 mm
- **Protection:** IP 65 (DIN EN 60528)
- **Dimensions:** 34 x 17 x 41 mm
- **Weight (with plug):** 40 g
- **Connections:** the polarity of the connections has no influence on the function

INSTALLATION

Screw clamps are used to fit the LSFLO on the dovetail guide of the flow meter.

CONNECTIONS

START-UP

Prior to the first start up it is important that the float passes the LSFLO switch three times to ensure the electronics inside recognize the magnetic field from the floats properly.

ZE3000 Flow Transmitters

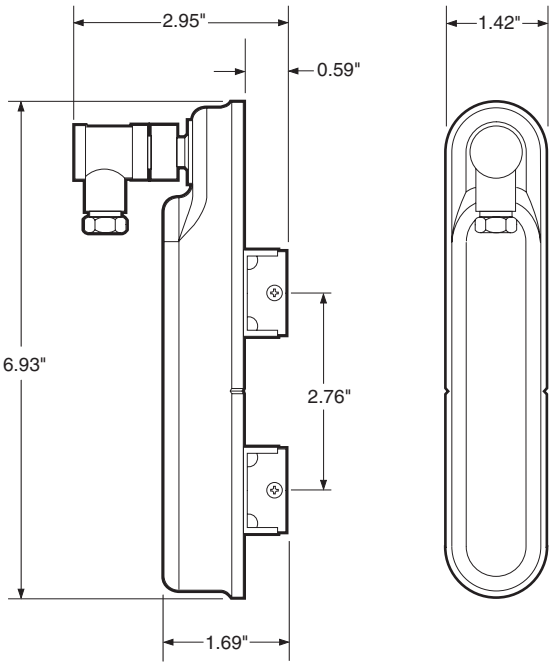
for FS flow meters

The **ZE300**0 flow transmitter provides a 4–20 mA output signal, generated by detection of the position of the magnetic float.

IMPORTANT: This micro-processor controlled unit is factory calibrated and unique to each flowmeter model. Flowmeter model must be advised when ordering.

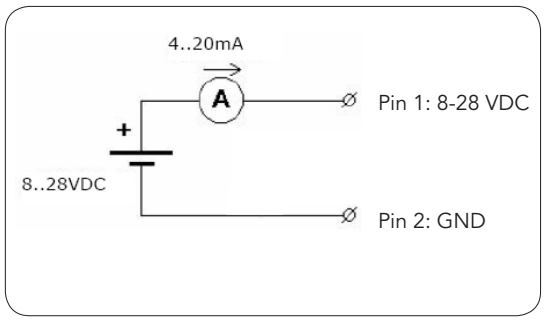
technical

- **2-Wire technology**
- **4–20 mA analog output** (4-20.1 for 8 VDC supply; 4-22.0 for 28 VDC supply
- **8–28 VDC input**
- **Factory calibrated (flow meter to be specified when ordering)**
- **11 point calibration**
- **Non-volatile value storage**
- **0 Button to compensate for the surrounding magnetic influences**
- **Factory setting of the lower limit value (low-cut-off) 0-99% according to customer's specificaitons**
- **Factory time lag (low-pass filter) 0.1-2.5 sec. according to customer's specifications**
- **Measuring accuracy:** < 0.5%
- **Temperature range:** –30°C(–20°F) to 65°C(150°F)



INSTALLATION

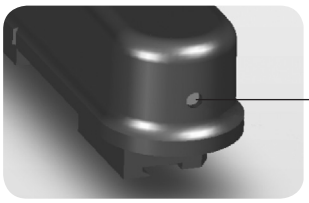
Screw clamps are used to fit the ZE3000 on the dovetail guide of the flow meter.



During installation, ensure that the notch of the ZE3000 coincides with the 50% mark on the flow meter scale.

Following this, proceed with the wiring according to the diagram.

DIMENSIONS



WIRING

START-UP

After installation and wiring, press the 0 button for at least 2 sec. to compensate for possible electro-magnetic interference. During this time make sure the float is at the bottom of the flowmeter (ie. no flow condition).

Note:
Do not press button during normal operation.

CHEMLINE PLASTICS

ZE3075 Flow Transmitters

for FC flow meters

The **ZE3075** flow transmitter provides a 2- wire 4–20 mA output signal omit generated by precise detection of the position of the magnetic float.

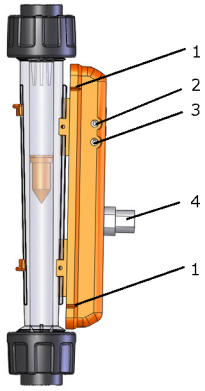
The magnetic float travels along the reed chain of switches activating them.

This micro-processor controlled unit is field calibrated.

technical

- **2-Wire technology**
- **4–20 mA analog output** (4-20.1 for 8 VDC supply; 4-22.0 for 28 VDC supply
- **18–30 VDC input**
- **Field calibration**
- **Non-volatile value storage**
- **Measuring length:** 114 mm (4.5")
- **Measuring resolution:** 3.5 mm (0.138")
- **Measuring accuracy:** 3%
- **Temperature range:** –20°C(–4°F) to 70°C(158°F)

INSTALLATION



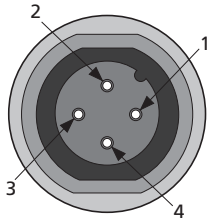
Screw clamps are used to fit the ZE3075 on the dovetail guide of the flow meter.

During installation, ensure that the top and bottom notches of the ZE3075 coincide with the 10% and 100% marks on the flow meter scale.

Following this, proceed with the wiring according to the diagram.

COMPONENTS

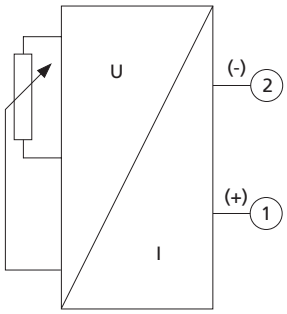
1. Alignment notches for the proper location of the transmitter
2. Potentiometer for the upper limit value of the output signal
3. Potentiometer for the lower limit value of the output signal
4. Plug connector



WIRING

The unit is connected with a commercially available unshielded cable.

Where electro-magnetic interference is to be expected, we recommend the use of a shielded cable.



Cable cross section: max. 0.75 mm² cable outer diameter: 6 to 8 mm.

Flange Connector

1. Signal (+)
2. Signal (+)
3. n.c.
4. n.c.

Circuit Diagram

CALIBRATION

Compensation between the non-linear scaling of the flowmeter and the linear output signal of the flow data sensor must be performed by adjusting, preferably between 20% and 80% of the flow rate.

20% corresponds to 7.2mA and 80% to 16.8mA.

- Connect the ampermeter and the respective voltage supply to the flow data sensor
- Allow 20% of the flow to pass through the FC flow meter
- Set the min. trimmer potentiometer (3) such that the corresponding current (7.2mA) is shown in the ampermeter
- Allow 80% of the flow to pass through the FC flow meter
- Set the max. trimmer potentiometer (3) such that the corresponding current (16.8mA) is shown in the ampermeter
- Check the values at 20% and 80% several times and repeat the adjustment, if required

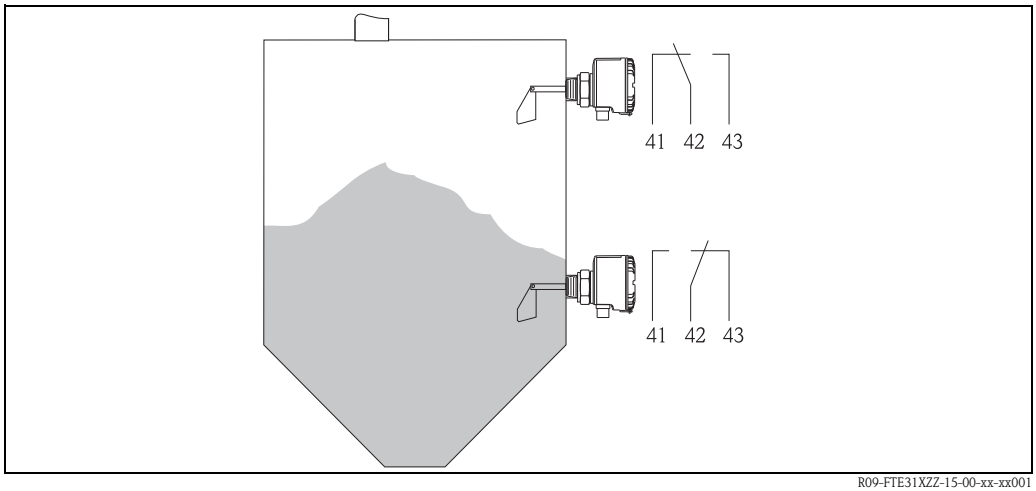
Technical Information

Soliswitch FTE31

Level Limit Switch
Economical paddle limit switch
For application in dust hazardous explosive areas

Application areas
The universal paddle level limit switch FTE 31 is used as a full, empty and demand alarm on silos containing solids. Its construction and materials make the unit suitable for use in the food industry.
The unit is suitable as a level limit switch in dust explosion hazardous areas.
Typical applications are level detection in:
- Cereals
- Sugar
- Cacao
- Animal feeds
- Washing powders
- Chalk
- Dry plaster
- Cement
- Granulates
- Wood chips

Features and benefits
- Simple operation
- Proven principle
- Slip clutch
- Ingress protection to IP 65 / NEMA 4x / Type 4x



TI068R/09/en

Endress+Hauser
People for Process Automation

Function and system construction

Measurement principle

The shaft and paddle are driven using a reduction gear and synchronous motor. If the paddle is stopped by material covering it, the hinged motor in the housing moves from the rest to the switch position. This movement operates two switch contacts, the first is for external level indication and the second switches the power off to the motor.
The paddle starts to rotate once the medium level falls below the paddle, the hinged motor returns to its rest position and the two contacts switch to normal operation. Intermittent loads that operate against or even in the same direction of rotation are evened out by using a slip clutch.

Level measurement changeover contact

System

Complete level measurement limit switch, paddle, shaft with synchronous motor and slip clutch, single pole double throw switch.

Input values

Measurement value

Level of solids

Range

Variable types dependent on:
- Installation point
- Length of shaft or rope

Output values

Output signal

Binary, once the set level is reached the micro switch contact changes.

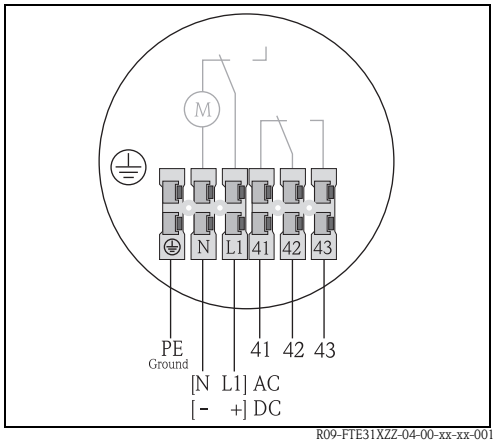
Output circuit

Connectable load:
≤ 250 VAC, 10 A nominal current, 3 A on motor

Switch output

Potential free changeover contact (SPDT)

Switch delay



Approx. 2 seconds

Mechanical life time

min. 500 000 switch cycles

Power supply

Electrical connection

Terminal layout FTE31

AC	DC	
PE		Earth (ground) connection
N	-	Power connection
L	+	Power connection
41		Normally closed contact
42		Common contact
43		Normally open contact

Cable entry

Power supply and signal cable (in-/output):
- Thread for cable gland [½" NPT]

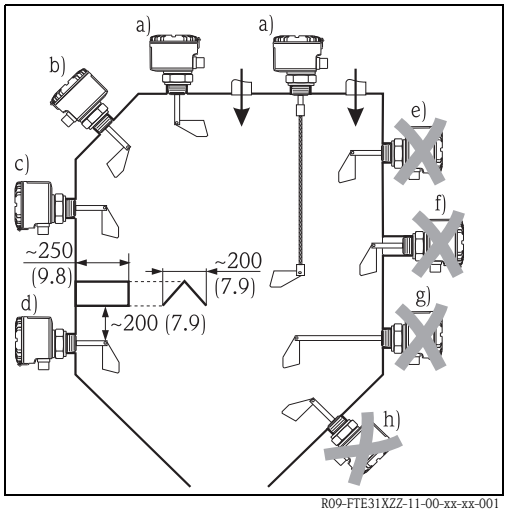
Power supply

Standard:
- 230 V AC, 50/60 Hz (±10%)

Option:
- 115 V AC, 50/60 Hz (±10%)
- 20...28 V DC

Power consumption

AC: P < 4,5 VA; DC: P < 3,5 W



Current requirement

DC: $I_{max} \leq 66$ mA

Installation conditions

Installation hints

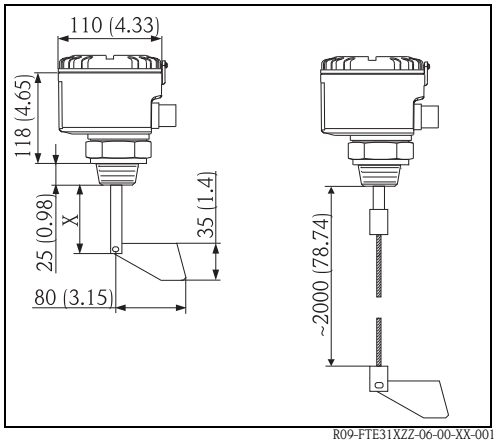
Installation position:
- horizontal up to shaft length > 300 mm (11.8") or vertical (see diagram)
- side load on the shaft max. 60 N
- Load on the rope max. 1500 N

Installation of the FTE31 paddle level limit switch, dimensions in mm (inch).

Correct installation	Incorrect installation
a) Vertical from top of silo	e) In dierction of solids flow
b) Angled from the top	f) Installation coupling too long
c) From the side	g) Horizontal with shaft length > 300 mm
d) With protective cover against falling solids	h) Angled from below

The FTE31 paddle limit switch can be installed in solids silos as shown under points a, b, c and d.

Environment conditions



Ambient temperature	- 20 °C ... + 60 °C (-4 °F ... + 140 °F)
Storage temperature	- 20 °C ... + 60 °C (-4 °F ... + 140 °F)
Ingress protection	■ IP 65 / NEMA 4x / Type 4x with closed cover ■ IP 20 / NEMA 1 with open cover
Vibration protection	IEC 654-3, dimension V.S.1 (v<3 mm/s, 1<f<150 Hz)
EMC	To EN 61 326, Class B
Protection class	I
Over voltage protection category	II
Altitude	Up to 2000 m (6560 ft) above sea level.

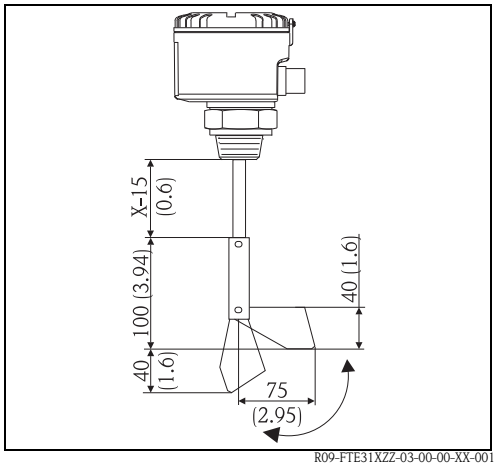
Process conditions

Material temperature range	- 20 °C ... + 80 °C (-4 °F ... 176 °F)
Operating pressure range	0.5 bar ... 1.8 bar (7.25 PSI ... 26.1 PSI)
Material conditions	Solids - grain size ≤ 50 mm (1.97")
Product density (solids weight)	100 g/l

Mechanical construction

Model/dimensions

Construction of the compact unit - dimensions in mm (inch).



Shaft variations:

Standard shaft X = 75 mm (2.95")
Special length X:
100 mm (3.94"), 200 mm (7.87"), 300 mm (11.8"), 400 mm (15.75"), 500 mm (19.7"), 600 mm (23.6")

Rope version:

Rope length approx. 2000 mm (78.7"), can be shortened.

Caution!
If the shaft length is > 300 mm (11.8") the FTE31 can only be installed vertically downwards.

Hinged paddle - dimensions in mm (inch)

Option hinged paddle:

The paddle is hinged so that it can be easily mounted through a threaded mounting boss. Because it is spring loaded the paddle retuns to its normal operation once inside the vessel. Removal of the unit is always possible.

The hinged paddle can be mounted to both the solid shaft as well as the rope extension versions.

Weight	approx. 1 kg (2.2 lb)
Materials	Housing, cover and process connection: – VALOX 553 plastic with 30% fibre glass. Shaft: – Corrosion resistant steel 1.4435 Paddle: – Corrosion reseitant steel 1.4435 Option: – Process connection - corrosion resistant steel 1.4435 – Rope extension- corrosion resistant1.4571 with corrosion resistant steel 1.4305 weight – Hinged paddle - corrosion resistant steel 1.4435 O-ring seal: – NBR Shaft sealing ring: – NBR Perbunan Cable entries NPT ½": – Nickel plated brass
Shaft bearing	High performance friction bearing - maintenance free
Shaft revolution	approx. 1 revolution per minute
Process connection	Threaded boss - thread NPT 1¼" or NPT 1½"
Electrical connection	Plug-in terminals 2.5 mm^2 (14 AWG) solid core, 1.5 mm^2 (16 AWG) stranded with ferrule

Certification

CE approval	The measurement system fulfils the requirements demanded by the EU regulations. Endress+Hauser acknowledges successful unit testing by adding the CE mark.

Technical Information

Liquiphant M
FTL50, FTL51, FTL50H, FTL51H

Vibronic

Point level switch for all kinds of liquids

Application

- Process temperatures from −50 °C to 150 °C (-58 to 302 °F)
- Pressures up to 100 bar (1450 psi)
- Viscosities up to 10,000 mm^2/s (cSt)
- For liquids with densities ≥ 0.5 g/cm^3(SGU)

FTL50: Compact design
FTL51: Extension pipe up to 3 m (9.8 ft) and up to 6 m (20 ft) on request
FTL50H, FTL51H: Certified for the food and pharmaceutical industries

Ideal substitute for float switches, as reliable function not affected by flow, turbulence, bubbles, foam, vibration, solids content or buildup.

Your benefits

- Recommended for safety systems requiring functional safety to SIL2/SIL3 as per IEC 61508/IEC 61511-1
- Design in accordance with ASME B31.3
- Recommended for use in sterile applications in the life science industry (design in accordance with ASME BPE)
- No adjustment: quick, low-cost startup
- No mechanically moving parts: no maintenance, no wear, long operating life
- Functional safety: Monitoring of tuning fork for damage
- Compact stainless steel housing (optional): the IP69K protection rating guarantees that the unit remains impermeable, even in the event of intensive cleaning or flooding for several hours.

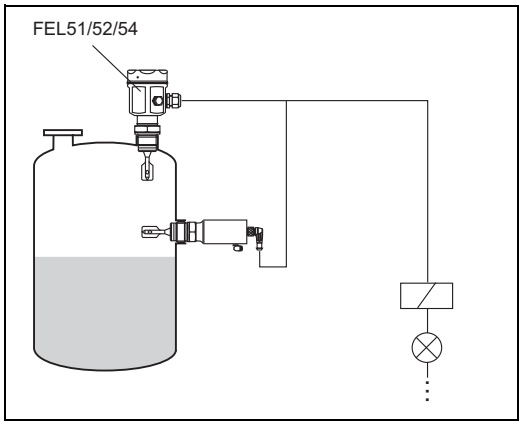
Application

Point level detection

Maximum or minimum detection in tanks or pipes containing all kinds of liquids, including use in hazardous areas, food and pharmaceuticals.

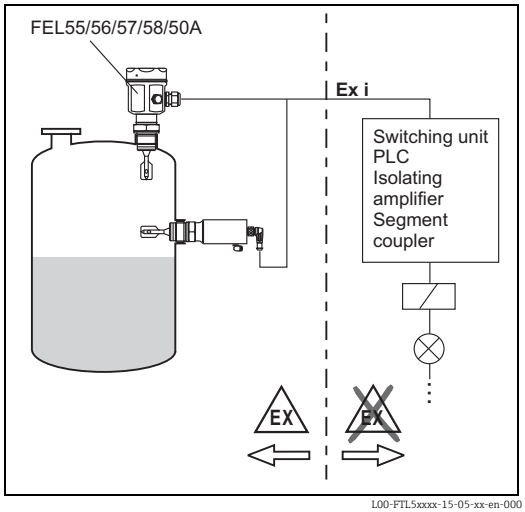
L00-FTL5xxxx-11-05-xx-xx-000



Function and system design

Measuring principle

The sensor's fork vibrates at its intrinsic frequency. This frequency is reduced when covered with liquid. This change in frequency causes the point level switch to switch.



Modularity

Point level switch
Liquiphant M FTL with electronic versions
FEL51, FEL52, FEL54

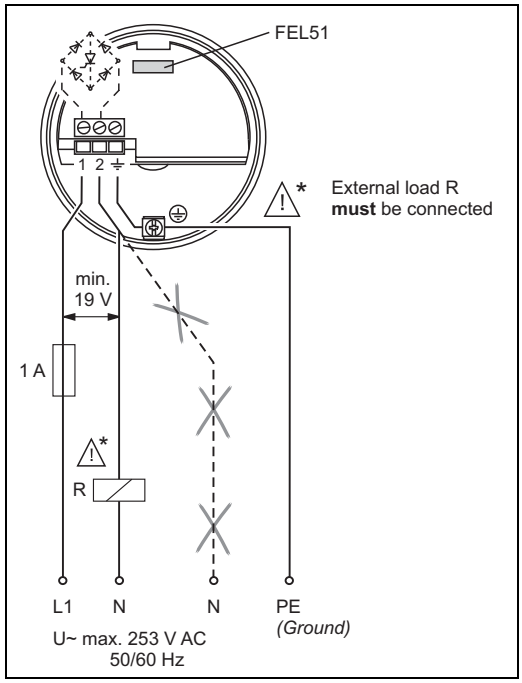
Input

Measured variable	Level (limit value)
Measuring range (detection range)	FTL50: dependent on mounting point FTL51: dependent on mounting point and the extension pipe ordered. Standard extension pipe up to 3 m (9.8 ft) and up to 6 m (20 ft) on request.
Density	Setting on the electronic insert > 0.5 g/cm³ (SGU) or > 0.7 g/cm³ (SGU) (others on request)

Electronic insert FEL51 (AC 2-wire)

Power supply

Supply voltage: AC 19 to 253 V
Power consumption: < 0.83 W
Residual current consumption: < 3.8 mA
Short-circuit protection
Overvoltage protection FEL51: overvoltage category III



Electrical connection

Two-wire AC connection

Switches the load directly into the power supply circuit via an electronic switch.

Always connect in series with a load!

Check the following:
- The residual current in blocked state (up to 3.8 mA)
- That for low voltage
  - the voltage drop across the load is such that the minimum terminal voltage at the electronic insert (19 V) when blocked is not undershot.
  - the voltage drop across the electronics when switched through is observed (up to 12 V)
- That a relay cannot de-energize with holding power below 3.8 mA.
  If this is the case, a resistor should be connected parallel to the relay. An RC module is available under the part number: 71107226
- When selecting the relay, pay attention to the holding power / rated power (see "Connectable load")

L00-FTL5xxxx-04-05-xx-en-007

Output signal

I_L = load current (switched through)

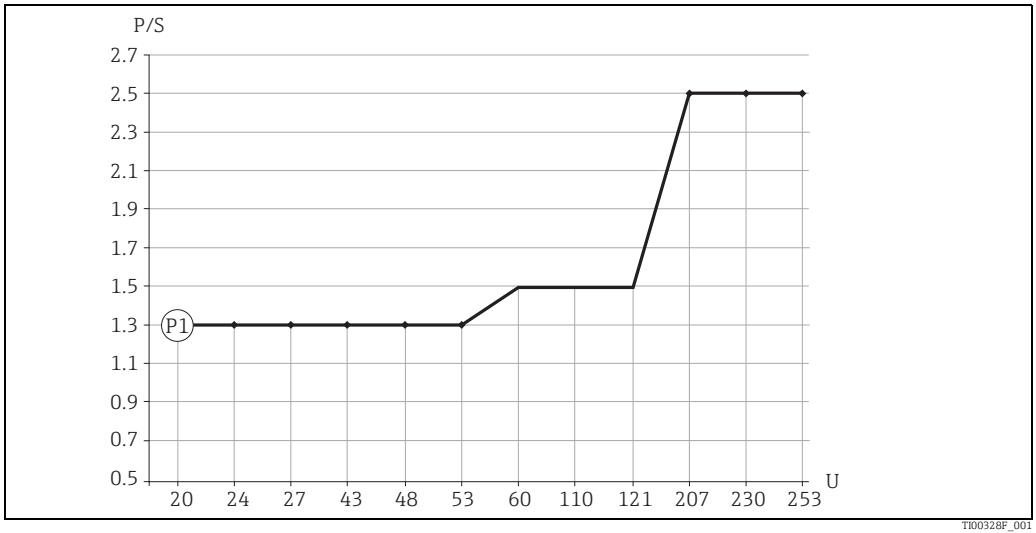
L00-FTL5xxxx-04-05-xx-xx-001

Signal on alarm



Output signal on power failure or in the event of damaged sensor: < 3.8 mA

Connectable load

- Voltage drop via FEL51 ≤ 12 V
- Residual current if electrical switch is blocked: ≤ 3.8 mA
- Load switched directly into the power supply circuit via the thyristor.
  Transient (40 ms) ≤ 1.5 A, ≤ 375 VA at 253 V or ≤ 36 VA at 24 V (not short-circuit-proof)

The load is switched via an electronic switch directly in the power circuit.
Always connect in series with a load!
Not suitable for connection to low-voltage PLC inputs!

Selection guide for relays

Minimum nominal power of load
P/S nominal power in [W] / [VA]
U operating voltage in [V]

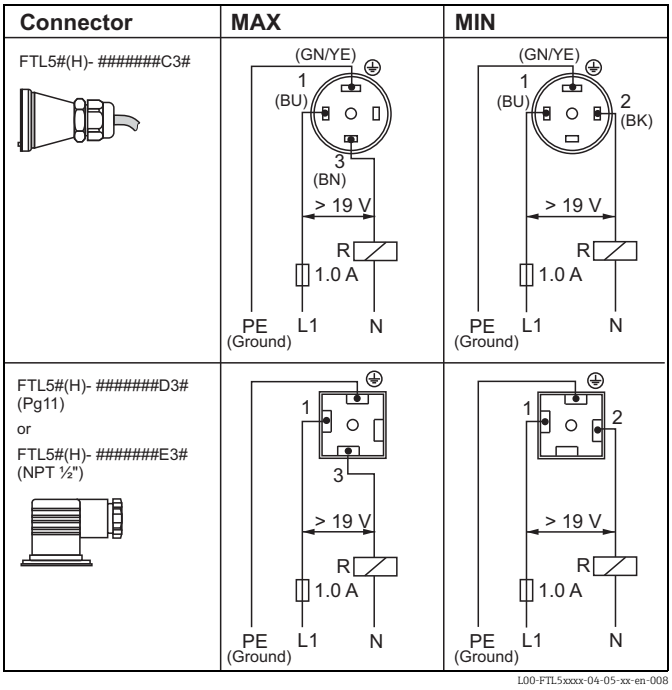
Position	Operating voltage	Nominal power	
		min.	max.
P1	24 V	> 1.3 VA	< 6 VA
AC operation	110 V	> 1.5 VA	< 27.5 VA
	230 V	> 2.5 VA	< 57.5 VA

Relays with less nominal power can be operated via an RC module connected in parallel (optional).

Electronics FEL51 (AC, in compact housing)

Power supply

Supply voltage: AC 19 to 253 V
Power consumption: < 0.83 W
Residual current consumption: < 3.8 mA
Short-circuit protection
Overvoltage protection FEL51: overvoltage category III



Electrical connection

Two-wire AC connection

Switches the load directly into the power supply circuit via an electronic switch.

Always connect in series with a load!

Check the following:
- The residual current in blocked state (up to 3.8 mA)
- That for low voltage
  - the voltage drop across the load is such that the minimum terminal voltage at the electronic insert (19 V) when blocked is not undershot.
  - the voltage drop across the electronics when switched through is observed (up to 12 V)

- That a relay cannot de-energize with holding power below 3.8 mA.
  If this is the case, a resistor should be connected parallel to the relay (e.g. RC module: part number 71107226).

Output signal

I_L = load current (switched through)

< 3.8 mA = residual current (blocked)

☼ = lit

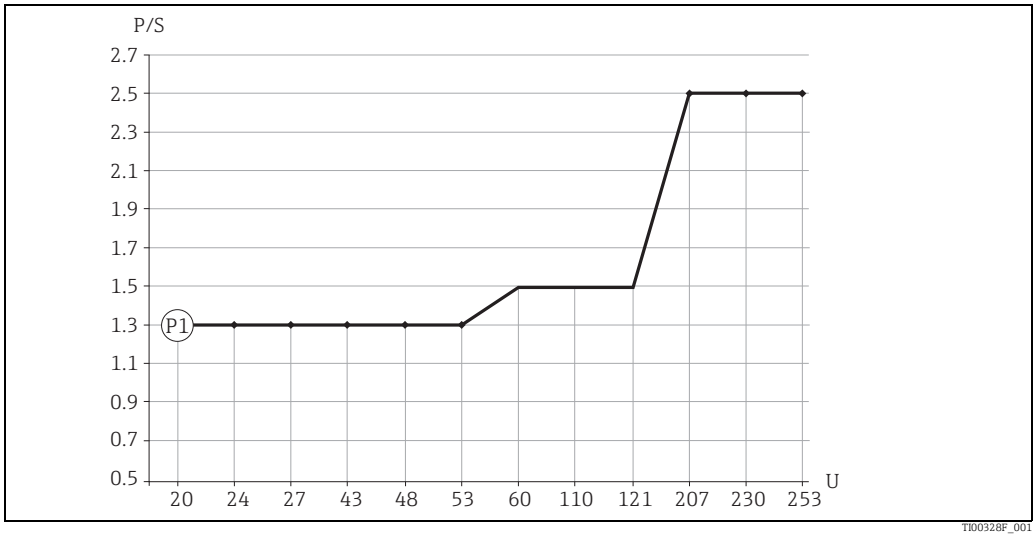
L00-FTL5xxxx-04-05-xx-xx-001a

Signal on alarm



Output signal on power failure or in the event of damaged sensor: < 3.8 mA

Connectable load

- Voltage drop via FEL51 ≤ 12 V
- Residual current if electrical switch is blocked: ≤ 3.8 mA
- Load switched directly into the power supply circuit via the thyristor.
  Transient (40 ms) ≤ 1.5 A, ≤ 375 VA at 253 V or ≤ 36 VA at 24 V (not short-circuit-proof)

The load is switched via an electronic switch directly in the power circuit.
Always connect in series with a load!
Not suitable for connection to low-voltage PLC inputs!

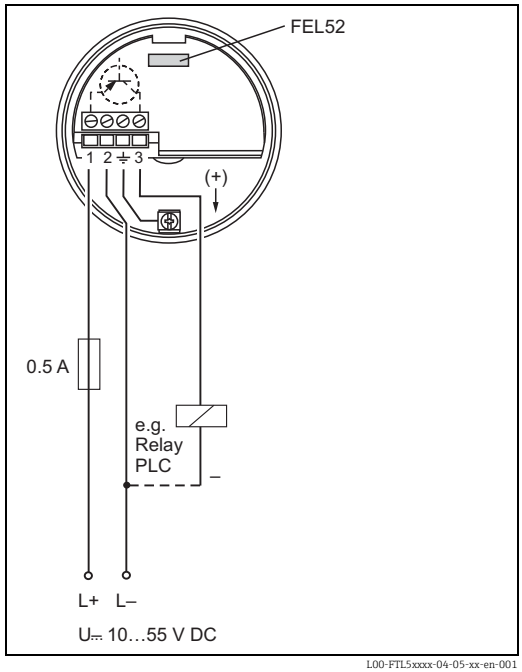
Selection guide for relays

Minimum nominal power of load
P/S nominal power in [W] / [VA]
U operating voltage in [V]

Position	Operating voltage	Nominal power	
		min.	max.
P1 AC operation	24 V	> 1.3 VA	< 6 VA
	110 V	> 1.5 VA	< 27.5 VA
	230 V	> 2.5 VA	< 57.5 VA

Relays with less nominal power can be operated via an RC module connected in parallel (optional).

Electronic insert FEL52 (DC PNP)



Power supply

Supply voltage: DC 10 to 55 V
Ripple: ≤ 1.7 V, 0 to 400 Hz
Current consumption: ≤ 15 mA
Power consumption: ≤ 0.83 W
Reverse polarity protection
Overvoltage protection FEL52: overvoltage category III

Electrical connection

Three-wire DC connection

Switches the load via the transistor (PNP) and separate connection.
Preferably used with programmable logic controllers (PLC),
DI modules as per EN 61131-2.
Positive signal at switching output of the electronics (PNP); Output blocked on reaching point level.

L00-FTL5xxxx-04-05-xx-en-001

- Residual voltage < 3 V (with transistor switched through);

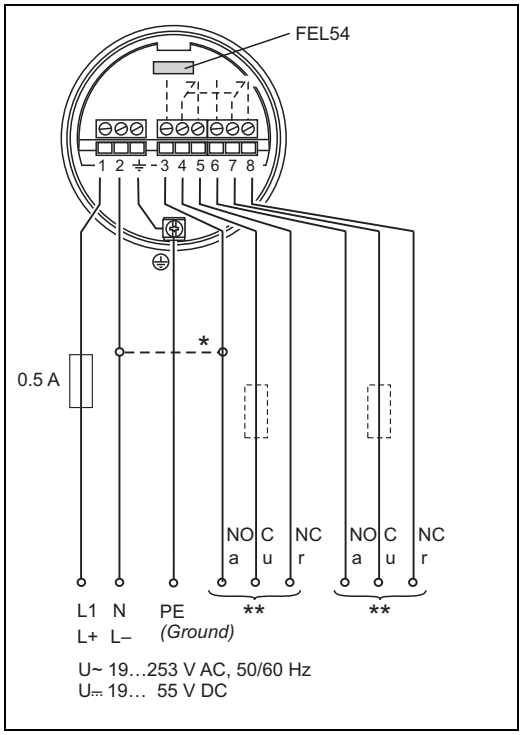
Electronic insert FEL54 (AC/DC with relay output)

Power supply

Supply voltage: AC 19 to 253 V, 50/60 Hz or DC 19 to 55 V
Power consumption: ≤ 1.3 W
Reverse polarity protection
Overvoltage protection FEL54: overvoltage category III

Electrical connection



Universal current connection with relay output

Power supply:
Please note the different voltage ranges for AC and DC.

Output:
When connecting an instrument with high inductance, provide a spark arrester to protect the relay contact.
A fine-wire fuse (depending on the load connected) protects the relay contact on short-circuiting.
Both relay contacts switch simultaneously.

* When jumpered, the relay output works with NPN logic.

L00-FTL5xxxx-04-05-xx-xx-005

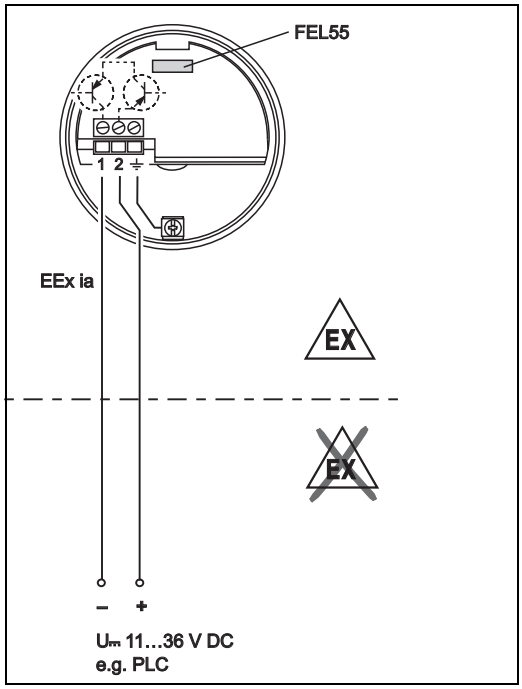
Signal on alarm

Output signal on power failure or in the event of damaged sensor: relay de-energized

Connectable load

- Loads switched via 2 floating change-over contacts (DPDT).
- I~ ≤ 6 A (Ex de 4 A), U~ ≤ AC 253 V; P~ ≤ 1500 VA, cos φ = 1, P~ ≤ 750 VA, cos φ > 0.7
- I⎓ ≤ 6 A (Ex de 4 A) to DC 30 V , I⎓ ≤ 0.2 A to 125 V
- When connecting a low-voltage circuit with double insulation according to IEC 1010, the following applies: the sum of the voltages of the relay output and power supply is ≤ 300 V
- The electronic insert FEL52 DC-PNP is preferred for low DC load currents (e.g. when connecting to a PLC)
- Relay contact material: silver/nickel AgNi 90/10

Electronic insert FEL55 (8/16 mA)



Power supply

Supply voltage: DC 11 to 36 V
Power consumption: < 600 mW
Reverse polarity protection
Overvoltage protection FEL55: overvoltage category III

Electrical connection

Two-wire connection for separate switching unit

For separate switching unit.
Signal transmission 16/8 mA on two-wire cabling.
For connection to programmable logic controllers (PLCs) for example,
AI module 4 to 20 mA to EN 61131-2.
Output signal jump from high to low current on point level.

L00-FTL5xxxx-04-05-xx-en-000

Output signal

~ 16 mA = 16 mA ± 5 %

~ 8 mA = 8 mA ± 6 %

☼ = lit

L00-FTL5xxxx-04-05-xx-xx-006

Signal on alarm

Output signal on power failure or in the event of damaged sensor: < 3.6 mA

Connectable load

- R = (U - 11 V) : 16.8 mA
- U = connection voltage: DC 11 to 36 V

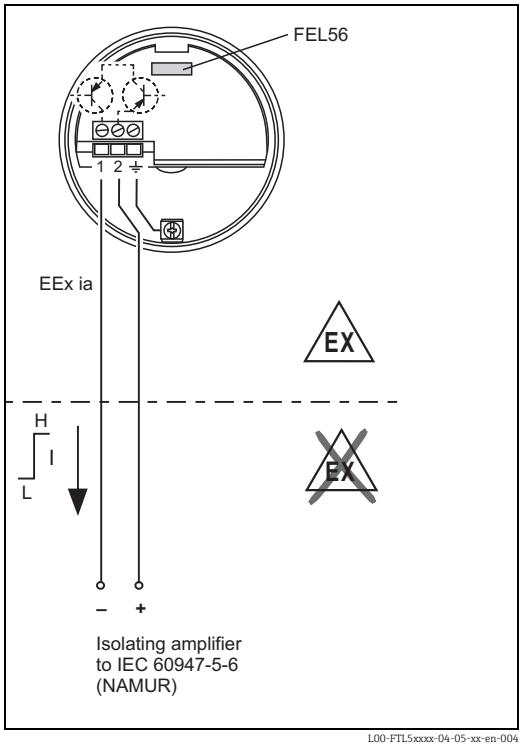
Example: PLC with 250 Ω with 2-wire version

250 Ω = (U – 11V) / 16.8 mA
4.2 [Ω /A] = U – 11 V
U = 15.2 V

Electronic insert FEL56 (NAMUR L-H edge)

Power supply

Power consumption: < 6 mW at I < 1 mA; < 38 mW at I = 2.8 mA
Connection data interface: IEC 60947-5-6



Electrical connection

Two-wire connection for separate switching unit

For connecting to isolating amplifiers acc. to NAMUR (IEC 60947-5-6), e.g. FTL325N, FTL375N from Endress+Hauser.
Output signal jump from low to high current on point level.

(L–H edge)

Connecting to multiplexer:
Set clock time to min. 2 s.

L00-FTL5xxxx-04-05-xx-en-004

Output signal

= lit
= flashes
= unlit

L00-FTL5xxxx-07-05-xx-xx-002

Safety mode	Level	Output signal	LEDs green	LEDs red

L00-FTL5xxxx-04-05-xx-xx-003

Signal on alarm

Output signal in the event of damaged sensor: > 2.2 mA

Connectable load

- See Technical Data of the isolating amplifier connected according to IEC 60947–5–6 (NAMUR)

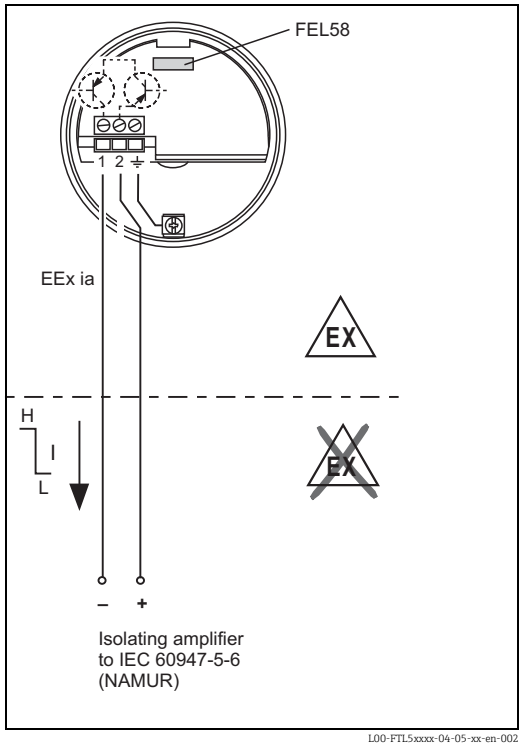
Electronic insert FEL58 (NAMUR H-L edge)

Power supply

Power consumption: < 6 mW at I < 1 mA; < 38 mW at I = 3.5 mA
Connection data interface: IEC 60947-5-6

Electrical connection

Two-wire connection for separate switching unit



For connecting to isolating amplifiers as per NAMUR (IEC 60947-5-6), e.g. FTL325N, FTL375N from Endress+Hauser.
Output signal jump from high to low current on point level.

(H–L edge)

Additional function:
Test key on the electronic insert.
Pressing the key breaks the connection to the isolating amplifier.

✎ Note!
In Ex–d applications, the additional function can only be used if the housing is not exposed to an explosive atmosphere.

Connecting to multiplexer:
Set clock time to min. 2 s.

L00-FTL5xxxx-04-05-xx-en-002

Output signal

☼ = lit
◪ = flashes
● = unlit

L00-FTL5xxxx-07-05-xx-xx-002

L00-FTL5xxxx-04-05-xx-xx-007a

Signal on alarm

Output signal in the event of damaged sensor: < 1.0 mA

Connectable load

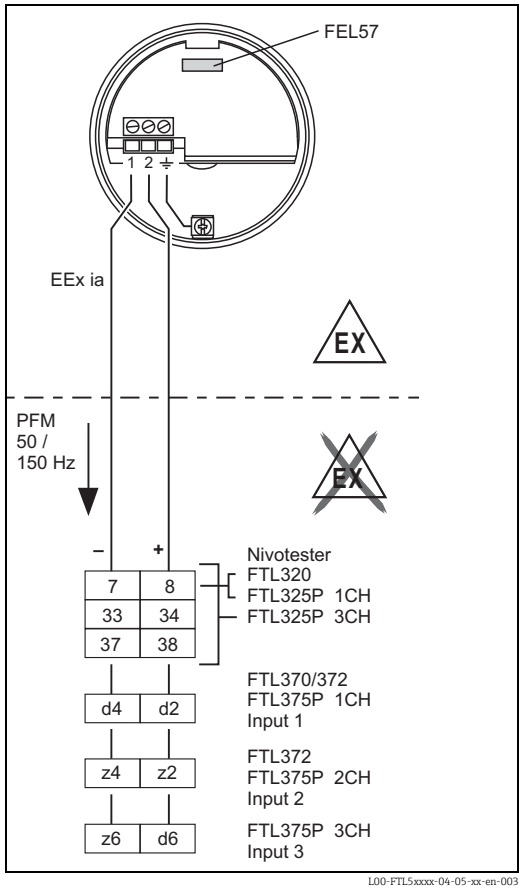
- See Technical Data of the isolating amplifier connected according to IEC 60947–5–6 (NAMUR)
- Connection also to isolating amplifiers which have special safety circuits (I > 3.0 mA)

Electronic insert FEL57 (PFM)

Power supply

Supply voltage: DC 9.5 to 12.5 V
Current consumption: 10 to 13 mA
Power consumption: < 150 mW
Reverse polarity protection

Electrical connection



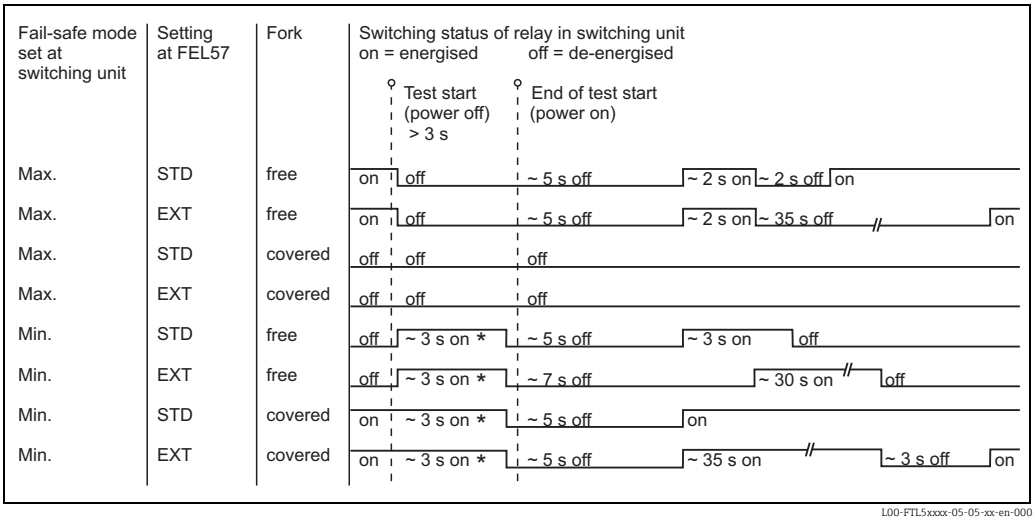
Two-wire connection for separate switching unit

For connecting to Endress+Hauser switching units Nivotester FTL320, FTL325P, FTL370, FTL372, FTL375P (also with proof test).

Output signal jump of the PFM signal from high to low frequency when sensor is covered. Switching between minimum/maximum safety in the Nivotester.

Additional function “proof test”:
After interruption of the power supply, a test cycle is activated which checks the sensor and electronics without any change in level.
Approved for overfill protection acc. to WHG (German Water Resources Act).
The following can be switched at the electronic insert:

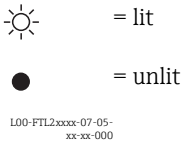
- **Standard (STD):**
  Corrosion of the fork unlikely;
  simulation approx. 8 s
  tuning fork exposed – covered – exposed.
  For proof testing, the Nivotester tests the sensor's level notification function.
- **Extended (EXT)**:
  Corrosion of the fork possible;
  Simulation approx. 41 s: tuning fork exposed – covered – corroded – exposed.
  For proof testing, the Nivotester tests the sensor's level notification function and fault notification (alarm) function.



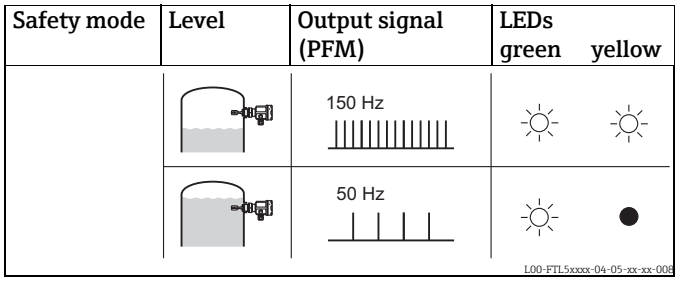
The check is activated and monitored at the switching unit.

The twin-core connecting cable (instrument cable) with a cable resistance of ≤ 25 Ω per core is connected to the screw terminals (conductor cross-sections 0.5 to 2.5 mm / 0.02 to 0.1 in) in the connection compartment. Protective circuits against reverse polarity, HF influences and overvoltage peaks are installed.
Maximum cable length up to 1000 m (3281 ft).

A shielded connecting cable is recommended in the event of strong electromagnetic interference. Here the shielding must be connected to the sensor and the power supply.



Switching behavior of the connected device:



* De-energized on power supply failure

Please note this switching response and function of the plant especially when replacing a Liquiphant incorporating electronic insert EL17Z or FEL37 with a Liquiphant M incorporating electronic insert FEL57.

Output signal

Signal on alarm

Output signal on power failure or in the event of damaged sensor: 0 Hz

Connectable load

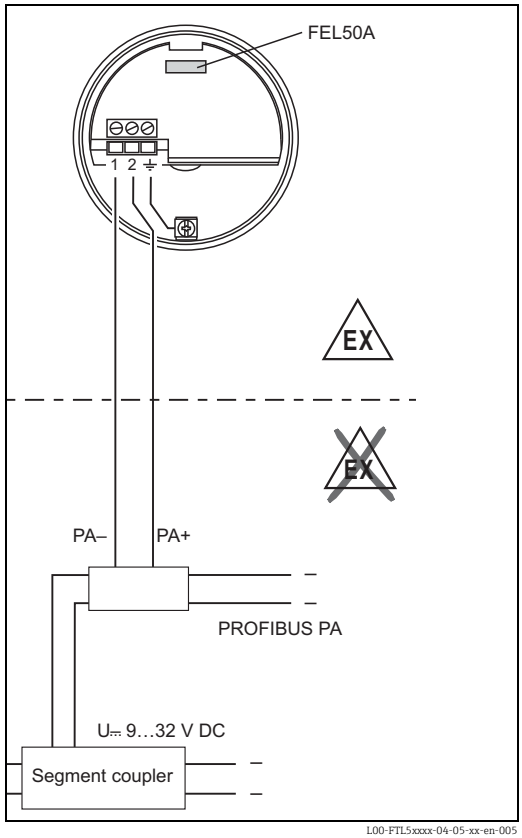
- Floating relay contacts in the connected switching unit Nivotester FTL320, FTL325P, FTL370, FTL372, FTL375P
- For contact load, see the Technical Data of the switching unit.

Electronic insert FEL50A (PROFIBUS PA)

Power supply

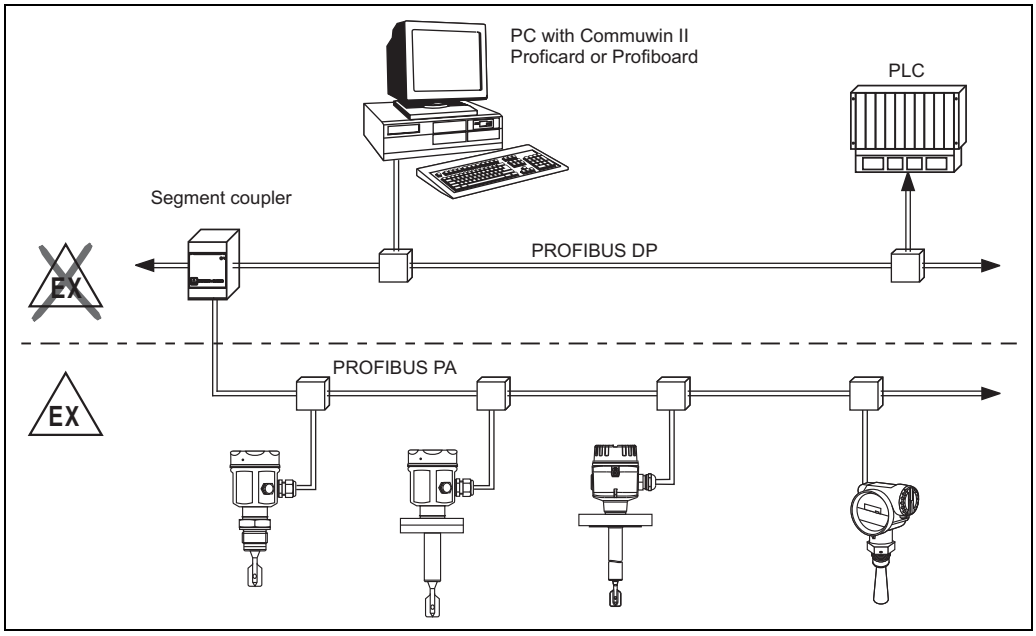
Bus voltage: DC 9 to 32 V
Bus current:
- 12.5 mA +/– 1.0 mA (software version: 01.03.00, hardware version: 02.00)
- 10.5 mA +/– 1.0 mA (software version: 01.03.00, hardware version: 01.00)

Electrical connection



Two-wire connection for power supply and data transfer

For connecting to PROFIBUS PA



Additional functions:

– Digital communication enables the representation, reading and editing of the following parameters: Fork frequency, switch-on frequency, switch-off frequency, switch-on time and switch-off time, status, measured value, density switch.

– Matrix locking possible
– Switch to WHG mode possible (WHG approval)
– For a detailed description, see BA198F

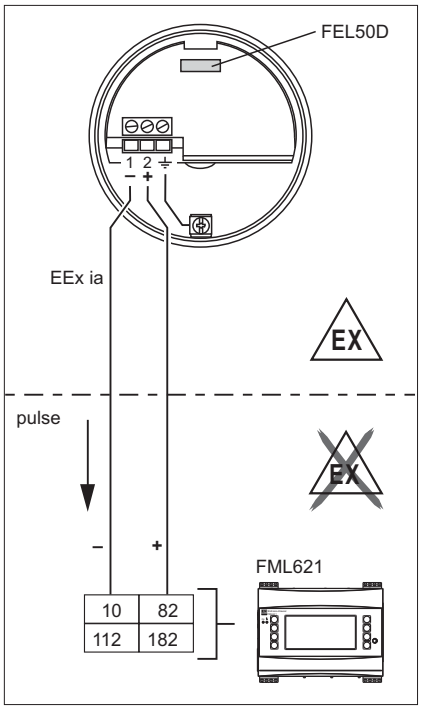
Signal on alarm

- Failure information can be opened using the following interfaces:
  Yellow LED flashing, status code, diagnostic code; see BA00198F

Electronic insert FEL50D (density)

Power supply



Frequency range: 300 to 1500 Hz
Signal level: 4 mA
Pulse height: 16 mA
Pulse width: 20 µS

Electrical connection

Two-wire connection at Density Computer FML621
For connecting to the density and concentration computer
FML621.

The output signal is based on pulse technology. With the aid of this signal, the fork frequency is constantly
forwarded to the switching unit.

Caution!
Operation with other switching units, such as FTL325P, is not permitted.
This electronic insert cannot be installed in devices that were originally used as a point level switch.

TI420Fen004

Signal on alarm

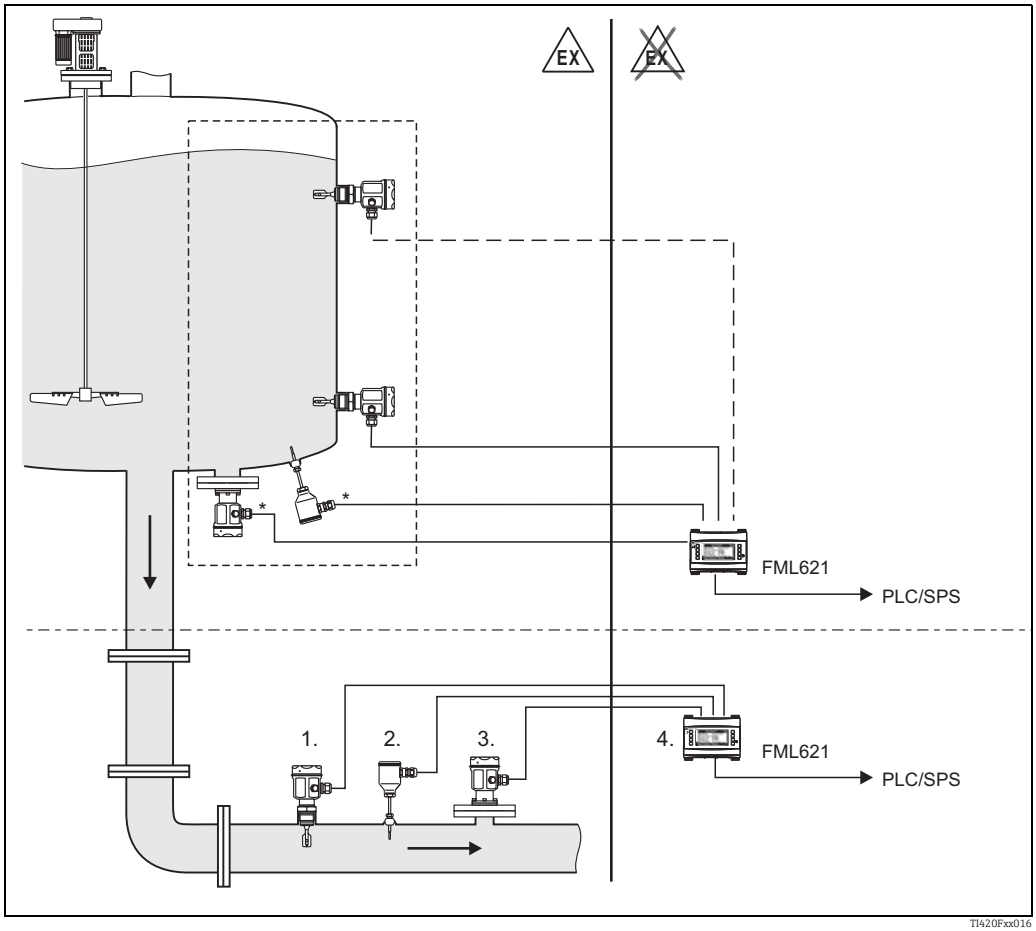
Output signal on power failure or in the event of damaged sensor: 0 Hz

Adjustment

In the Liquiphant M modular system, the option of an adjustment is also provided in addition to the electronics (see feature 60: "Accessories").

There are three types of adjustment:

Standard adjustment (see ordering information for additional option, basic version A)
- Here, two fork parameters are determined to describe the sensor characteristics, indicated in the adjustment report and provided with the product.
  These parameters must be transmitted to the Density Computer FML621.



Special adjustment (see ordering information for additional option, special adjustment, density H_2O (K) or special adjustment, density H_2O with 3.1 certificate (L))
- Here, three fork parameters are determined to describe the sensor characteristics, indicated in the adjustment report and provided with the product.
  These parameters must be transmitted to the Density Computer FML621.
  Greater accuracy is achieved with this type of adjustment (see also "Performance characteristics").

Field Adjustment
- During field adjustment, a density value actually determined by the customer is entered and the system is automatically adjusted to this value (wet adjustment).

Note!
More information on Liquiphant M Density is available in Technical Information TI00420F. This can be downloaded from www.endress.com => Download.

Operating principle

Measuring the density of a liquid medium in pipes and tanks. Also suitable for use in hazardous areas, and preferably for applications in the chemical and food industry.

** Pressure and temperature information required depending on the application.*
1. Liquiphant M sensor with electronic insert FEL50D (pulse output);
2. Temperature sensor (e.g. 4 to 20 mA output);
3. Pressure transmitter (4 to 20 mA output);
4. Liquiphant density and concentration computer FML621 with display and operating unit

Light signals

LED	Symbol	Information
Yellow		Measurement valid
		Unstable process situation
		Maintenance required
Green		Power on
		Power off
Red		No fault
		Maintenance required
		Device failure

Connection and function

Connecting cables

- Electronic inserts: cross-section ≤ 2.5 mm² (14 AWG); strand in ferrule as per DIN 46228
- Protective ground in housing: cross-section ≤ 2.5 mm² (14 AWG)
- External equipotential bonding connection on housing: cross-section ≤ 4 mm² (12 AWG)

Safety mode

Minimum/maximum residual current safety selectable on electronic insert.
(with FEL57 on Nivotester only)

MAX = maximum safety:
The output switches to the power fail response when the fork is covered
For use with overfill protection for example

MIN = minimum safety:
The output switches to the power fail response when the fork is exposed
For use with dry running protection for example

Switching time

When fork is covered: approx. 0.5 s
When fork is exposed: approx. 1.0 s
Additionally configurable for PROFIBUS PA:
0.5-60 s

Other switching times available on request.

Switch-on behavior

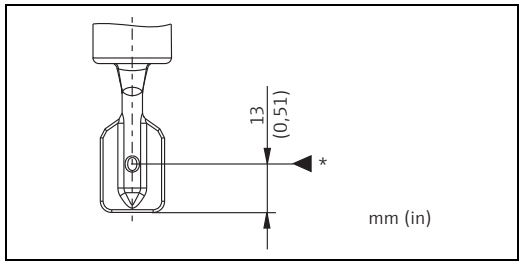
When switching on the power supply, the output assumes the alarm signal.
After ≤ 3 s it assumes the correct switching mode (exception: FEL57)

Performance characteristics

Reference operating conditions

Ambient temperature: 23 °C (73 °F)

Medium temperature: 23 °C (73 °F)



Medium density (water): 1 g/cm³ (SGU)

Medium viscosity: 1 mm²/s (cSt)

Medium pressure p_e: 0 bar (0 psi)

Sensor mounting: vertical from above

Density switch: to > 0.7 g/cm³ (SGU)

L00-FTL5xxxx-06-05-xx-xx-031

** Switch point under reference operating conditions*

Maximum measured error

Under reference operating conditions: max. +/−1 mm (0.04 in)

Repeatability

0.1 mm (0.004 in)

Hysteresis

approx. 2 mm (0.08 in)

Influence of medium temperature

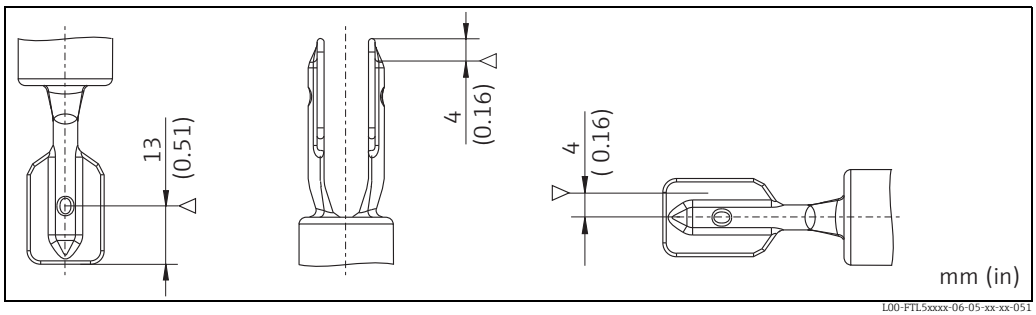
max. +1.8 to −2.8 mm (−50 to +150 °C / -58 to 302 °F)

Influence of medium density

max. +4.8 to −3.5 mm ((0.5 to 1.5 g/cm³ (SGU))
max. +0.19 to -0.14 in

Influence of medium pressure

max. 0 to −2.5 mm (−1 to 64 bar (-14.5 to 928 psi))
max. 0 to -0.1 in



Operating conditions

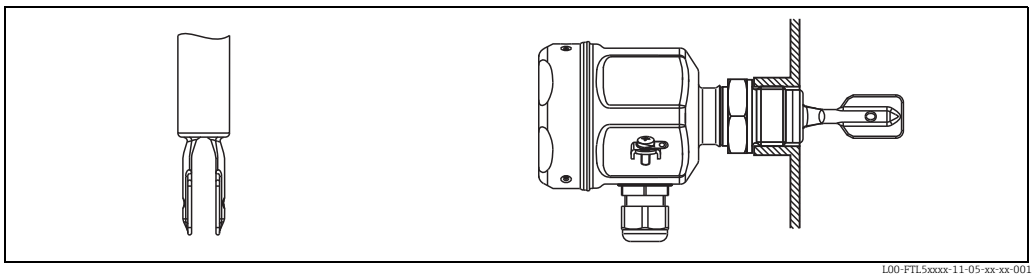
Installation

Installation instructions

Switch points on the sensor depend on the mounting position, with reference to water,

Density 1 g/cm³ (SGU), 23 °C (73 °F), p_e 0 bar (0 psi).

Mounting from above *Mounting from below* *Mounting from the side*

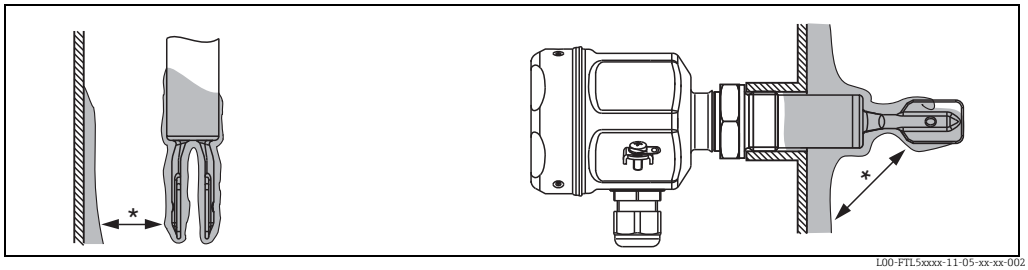


Note!
The switch points of the Liquiphant **M** are at other positions to those of the previous version Liquiphant **II**.

Examples of mounting

Examples of mounting with regard to the viscosity ν of the liquid and the tendency to form buildup

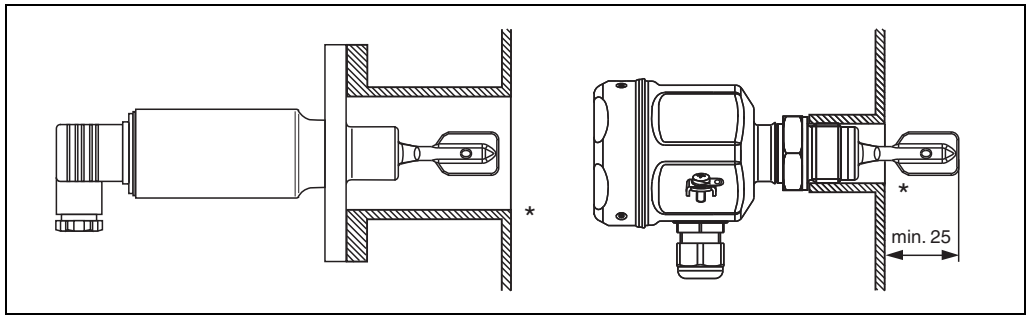
Optimum mounting, without problem even with high viscosity:



Position the fork so that the narrow edge of the tines is vertical to ensure that the liquid can run off easily.

Vertical from above *Flush-mounted from the side*

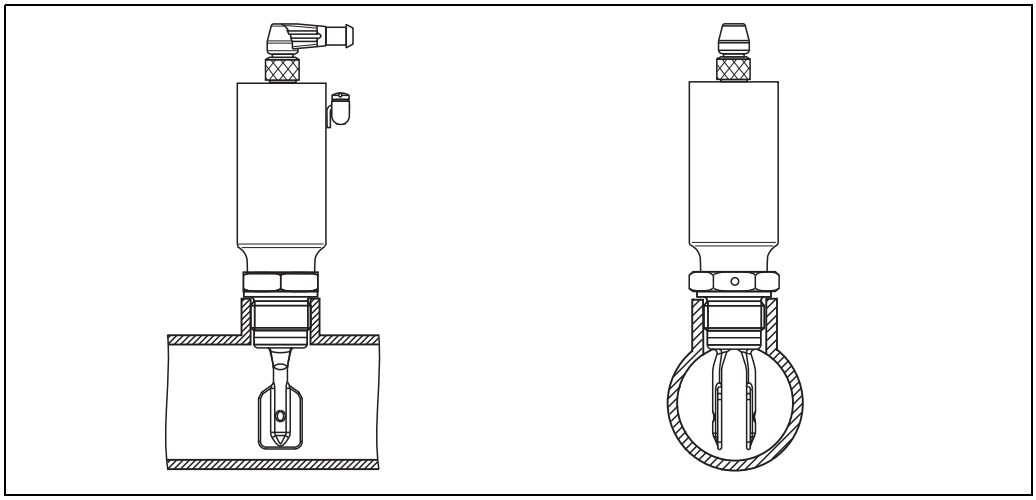
With buildup on the tank walls:



* Ensure that there is sufficient distance between the buildup expected on the tank wall and the fork.

Vertical from above *Protruding into the tank from the side*

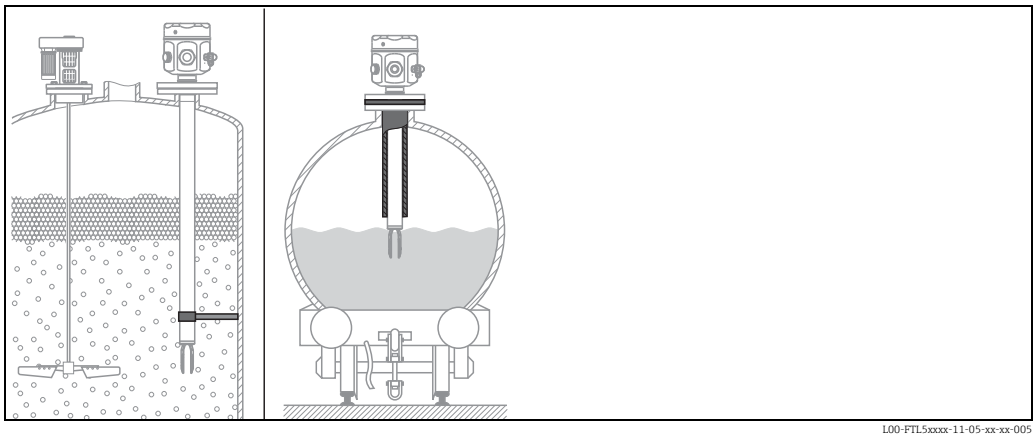
Mounting positions in the case of low viscosity up to 2000 mm²/s (cSt):



* Deburr the nozzle surfaces

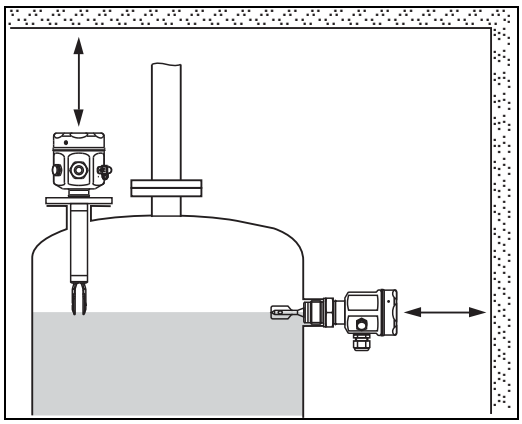
L00-FTL5xxxx-11-05-xx-en-003

Mounting in piping from 2"



Flow velocities up to 5 m/s for viscosity of 1 mm²/s (cSt) and density 1 g/cm³ (SGU).
(Check the function for other medium conditions.)

L00-FTL5xxxx-11-05-xx-xx-004



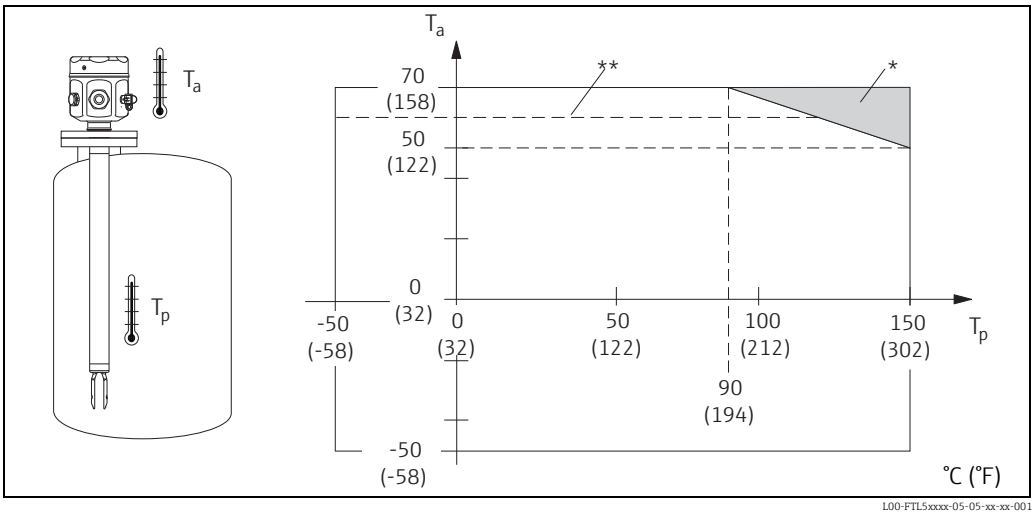
Dynamic load

Support the Liquiphant M FTL51(H) in the event of a severe dynamic load.

L00-FTL5xxxx-11-05-xx-xx-005

Ensure adequate space outside the tank for mounting, connection and configuration.

L00-FTL5xxxx-11-05-xx-xx-006



Orientation

- FTL50(H) and FTL51(H) with short pipe up to approx. 500 mm (19.7 in): any position
- FTL51(H) with long pipe: vertical

Environment

Ambient temperature range

Permitted ambient temperature T_a at the housing depending on the medium temperature T_p in the tank:

L00-FTL5xxxx-05-05-xx-xx-001

* Additional temperature range for devices with a temperature spacer or pressure-tight feedthrough.
** Maximum ambient temperature with FEL50D/FEL50A in hazardous areas.

Storage temperature

−50 to +80 °C (-58 to 176 °F)

Installation height as per IEC61010-1 Ed.3

Up to 2000 m (6600 ft) above sea level.

Can be extended up to 3000 m (9800 ft) above sea level if overvoltage protection is used, for example HAW562 or HAW569.

Climate class

Climate protection to IEC 68, Part 2-38, Fig. 2a

Degree of protection

Types of housing	IP65	IP66*	IP67*	IP68*	IP69k	NEMA type**
Compact housing with valve connector Pg11/NPT ½	X	–	–	–	–	–
Compact housing with 5 m (16 ft) cable tail	–	X	–	X	–	–
Compact housing with M12x1 connector (52010285) 316L (metal)	–	X	–	X	–	–
Compact housing with elbowed connector (52024216) / L= 5 m (16 ft), without integrated LEDs	–	X	–	X	X	–
Compact housing with elbowed connector (52018763) / L= 5 m (16 ft), with integrated LEDs	–	X	–	X	X	–
Polyester housing F16	–	X	X	–	–	4X
Stainless steel housing F15	–	X	X	–	–	4X
Aluminum housing F17	–	X	X	–	–	4X
Aluminum housing F13****	–	X	–	X***	–	4X/6P
Stainless steel housing F27	–	X	–	X	–	4X/6P
Aluminum housing T13 with separate connection compartment (Ex d)	–	X	–	X***	–	4X/6P

* As per EN60529
** As per NEMA 250
*** only with M20 cable entry or G1/2 thread
**** F13 housing only in conjunction with XP or Ex d approval

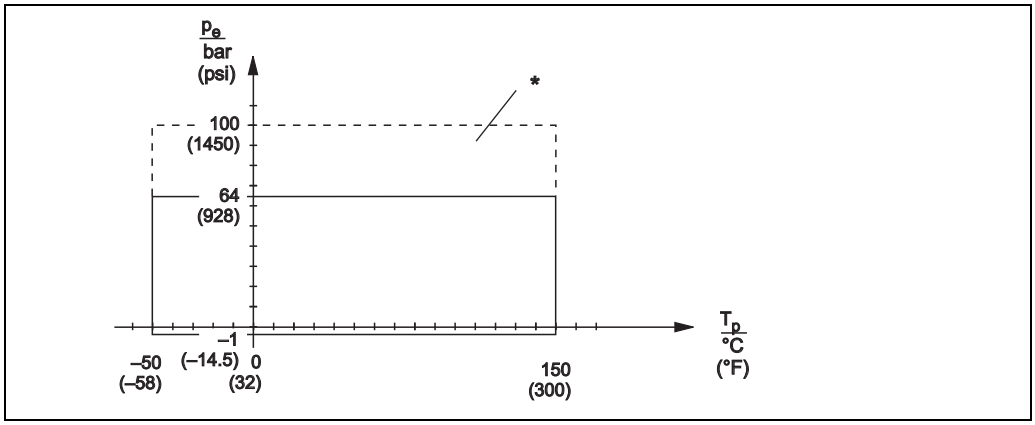
Vibration resistance

As per IEC 68, parts 2-6 (10 to 55 Hz, 0.15 mm (0.01 in), 100 cycles)
In the event of increased vibrations, the following additional option is recommended: feature "060" version "P" 100 bar (1450 psi) process pressure.

Electromagnetic compatibility

Interference emission to EN 61326, Electrical Equipment Class B
Interference immunity to EN 61326; Annex A (Industrial) and NAMUR Recommendation NE 21 (EMC)

Medium conditions



Medium temperature

−50 to +150 °C (-58 to 302 °F); for exceptions, see "Process connections"

Thermal shock

≤ 120 °C/s (248 °F/s)

Medium pressure p_e

L00-FTL5xxxx-05-05-xx-xx-003

* Permitted pressure rating when the "100 bar (1450 psi)" option is selected (see "Product structure FTL51", feature 060, from → 43).
See "Process connections" → 33 for exceptions.
Canadian CRN approval: Additional details on maximum pressure values are available in the download area of the product page at "www.endress.com".

Please refer to the standards listed for the permitted pressure values of the flanges at higher temperatures:

- pR EN 1092-1: 2005
  With regard to their stability-temperature property, the materials 1.4435 and 1.4404 are identical and are grouped together in EN 1092-1 Tab. 18 under 13E0. The chemical composition of the two materials can be identical.
- ASME B 16.5 - 2013 Tab. 2-2.2 F316
- ASME B 16.5 - 2013 Tab. 2-3.8 N10276
- JIS B 2220

The lowest value from the derating curves of the device and selected flange applies in each case.

Test pressure

p_e = 64 bar (928 psi):
- ≤ 100 bar (1450 psi) or 1.5 times the medium pressure p_e
- Sensor burst pressure at 200 bar (2900 psi)

p_e = 100 bar (1450 psi):
- ≤ 150 bar (2175 psi) or 1.5 times the medium pressure p_e)
- Sensor burst pressure at 400 bar (5800 psi)

Note!
The device function is restricted during pressure testing.

State of aggregation

Liquid

Density

0.7 g/cm³ (SGU) = delivery status

0.5 g/cm³* (SGU) can be adjusted via switches

* Density settings for the compact housing on request

Viscosity

≤ 10,000 mm²/s (cSt)

Solids content

≤ ø5 mm (0.2 in)

Lateral loading capacity

≤ 75 Nm

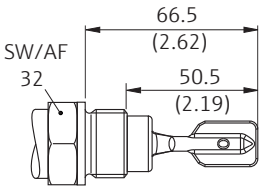
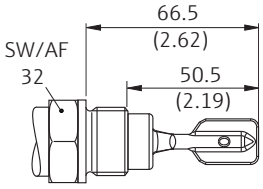
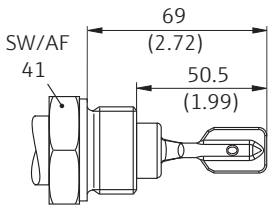
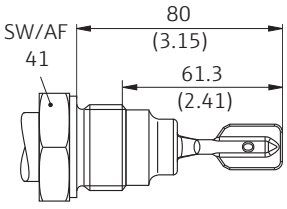
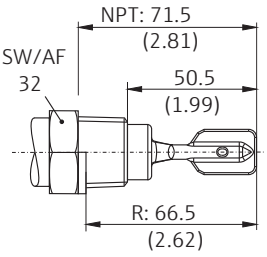
Bushings: temperature spacer, pressure-tight feedthrough



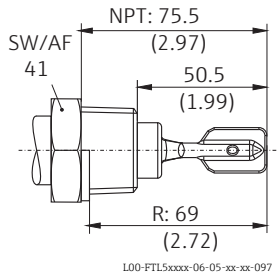


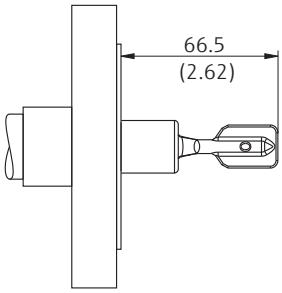


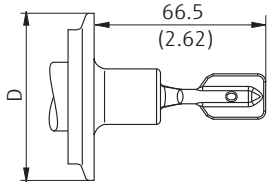


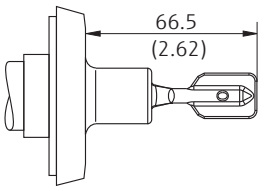


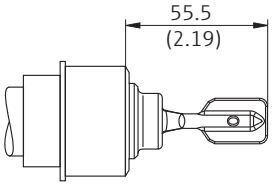
Temperature spacer
Provides sealed insulation for the vessel and normal ambient temperatures for the housing.

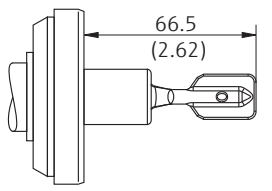




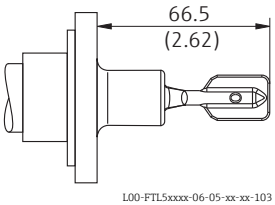


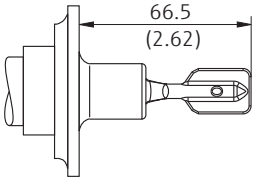


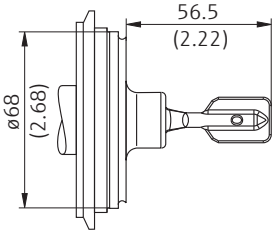


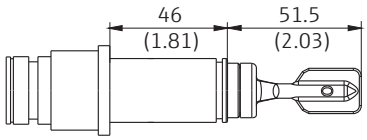


Pressure-tight feedthrough
Protects the housing from pressures up to 100 bar (1450 psi) if the sensor is damaged. Provides sealed insulation for the vessel and normal ambient temperatures for the housing.

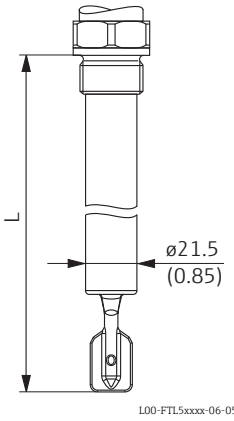


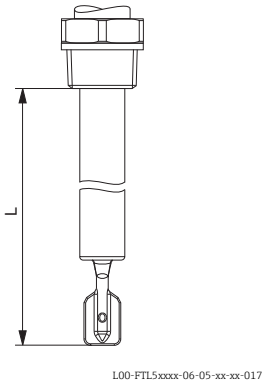


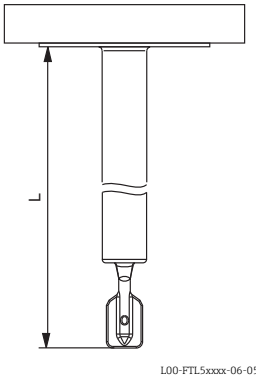




L00-FTL5xxxx-06-05-xx-xx-091







Process connections for FTL50(H) and FTL51(H)

Process connection		Dimensions	Accessories	Pressure Temperature
G ¾ DIN ISO 228/1 with defined thread start; Flat seal to DIN 7603: supplied	GQ2 GQ6	L00-FTL5xxxx-06-05-xx-xx-092		≤ 100 bar / only FTL51 (≤ 1450 psi) ≤ 150 °C (302 °F)

Sensor length L for FTL51 and FTL51H, depending on process connection

Thread: G ¾ G 1	Thread: NPT ¾ NPT1 R ¾ R 1	Flanges and flange-like process connections
		
From seal surface of thread adapter	From lower edge of thread	

Customized length L:
- 148 mm to 3000 mm (6 to 115in); special version (TSP) on request up to 6000 mm (235 in)
- Length tolerances L: < 1 m (–5 mm), 1 to 3 m (–10 mm) / < 3.3 ft (-0.2 in), 3.3 to 9.8 ft (-0.39 in)

Note!
The switch points of the Liquiphant M are at other positions to those of the previous version Liquiphant **II**.
Special length "L II":
With vertical mounting from above the same switch point as for the Liquiphant II
FTL360, FTL365, FDL30, FDL35

"L II" depends on process connection:

L = 115 mm (4.53 in) for flanges and flange-like process connections
L = 99 mm (3.9 in) for threads NPT and R (BSPT)
L = 118 mm (4.65 in) for threads G1 (BSP 1)
L = 115 mm (4.53 in) for threads G ¾ (BSP ¾)
L = 104 mm (4.09 in) for flush-mounted 1" (Endress+Hauser)

Weights

See "Ordering information" → 📄 43ff

Materials and surfaces

Material specifications as per AISI and DIN-EN.

Parts in contact with process

- Process connection and extension pipe:
  - FTL5x → 316L (1.4404 or 1.4435) optional 2.4602 (AlloyC22)
  - FTL5xH → 316L (1.4435)
- Tuning fork: 316L (1.4435) optional 2.4602 (AlloyC22)
- Flanges: 316L (1.4404)
- Flange plating: AlloyC22
- Flat seal for process connection G ¾ or G 1: elastomer fiber, asbestos-free

Surface roughness

Choice of mechanically polished surface roughness (version → probe length → type):

- Ra < 1.5 µm (59.1 µin), with EHEDG approval
- Ra < 0.3 µm (11.8 µin), 3-A and EHEDG approval and CoC-ASME-BPE

Note!
The surface is electropolished if the additional option "B"
(CoC - ASME BPE) is selected in addition to surface roughness quality Ra < 0.3 µm (11.8 µin). The

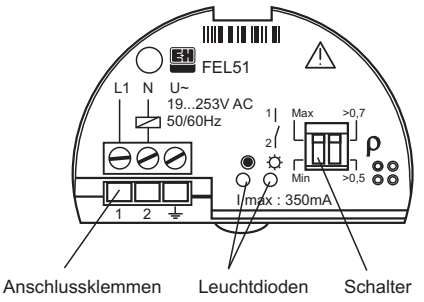
surface roughness is then: Ra < 0.38 µm (15.0 µin).
With this combination, the wetted parts are made of 316L (1.4435) in accordance with BN2 (delta-ferrite content < 1 %).

Parts with no process contact

- Tuning fork/housing seal: EPDM
- Temperature spacer: 316 L (1.4435)
- Pressure-tight feedthrough: 316L (1.4435)
- Ground terminal on housing (external): 316L (1.4404)
- Cable glands
  - Housing F13, F15, F16, F17: polyamide (PA)
    With B or C approval (→ 📄 43 ordering information): nickel-plated brass
  - Housing F27: polyamide PA, with approval "B" or "C" 316L (1.4435)
  - Housing T13: nickel-plated brass
- Polyester housing F16: PBT-FR with PBT-FR cover or with PA12 transparent cover
  - Cover seal: EPDM
  - Nameplate glued: polyester film (PET)
  - Pressure compensation filter: PBT-GF20
- Stainless steel housing F15: 316L (1.4404)
  - Cover seal: silicone
  - Safety claw: 304 (1.4301)
  - Pressure compensation filter: PBT-GF20, PA
- Aluminum housing F17/F13: EN-AC-AlSi10Mg, plastic-coated
  - Nameplate: aluminum, anodized
  - Cover seal: EPDM
  - Safety claw: nickel-plated brass
  - Pressure compensation filter: silicone
- Stainless steel housing F27: 316L
  - Nameplate: 316L (1.4404)
  - Cover seal: FVMQ (optional: EPDM seal available as spare part)
  - Safety claw: 316L (1.4435)
- Aluminum housing T13: EN-AC-AlSi10Mg, plastic-coated,
  - Nameplate: aluminum, anodized
  - Cover seal: EPDM
  - Safety claw: nickel-plated brass
- Compact housing (valve connector or M12 connector): 316L (1.4435)

Process connections

- Parallel thread G ¾, G 1 to DIN ISO 228/I with flat seal to DIN 7603
- Tapered thread R ¾, R 1 to EN10226
- Tapered thread ¾ -14 NPT, 1 - 11½ NPT as per ASME B 1.20.1
- Flush-mounted installation with weld-in adapter to factory standard Endress+Hauser (G ¾, G 1)
- Flush-mounted installation with weld-in adapter to factory standard Endress+Hauser (1"), sensor can be positioned
- Tri-Clamp 1½", 2" to ISO 2852
- Threaded pipe joint DN 32, 40, 50 to DIN 11851
- Aseptic connection DN 50 to DIN 11864-1
  Form A for pipe DIN 11850
- SMS connection 2" (DN 51)
- DRD flange
- Varivent® DN 50 (50/40) to factory standard Tuchenhagen
- Flanges: as per EN/DIN 1092-1 from DN 25, as per ASME B 16.5 from 1", as per JIS B2220 (RF)
- Ingold DN25 fitting length 46 mm (1.81 in) with thread adapter nut G1 ¼



Further details at Ordering information → 📄 43.

Human interface

Electronic inserts

With FEL51, FEL52, FEL54, FEL55:

- 2 switches for safety mode and density change
- green LED to indicate operational status
- red LED to indicate the switching status, flashes in the event of corrosion damage on sensor or if the electronics are defective

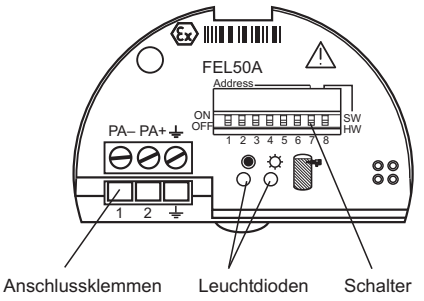
L00-FTL5xxxx-03-05-xx-en-001

With FEL56:

- 2 switches for safety mode and density change
- green LED flashes to indicate operational status
- red LED to indicate the switching status, flashes in the event of corrosion damage on sensor or if the electronics are defective

With FEL57:

- 2 switches for density change and Testing
- green LED to indicate operational status
- yellow LED to indicate the covered status, flashes in the event of corrosion damage on sensor or if the electronics are defective

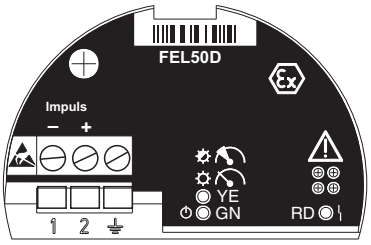


L00-FTL5xxxx-03-05-xx-xx-013

With FEL58:

- 2 switches for safety mode and density change
- green LED
  - flashes quickly to indicate operational status,
  - flashes slowly in the event of corrosion damage to the sensor of if the electronics are defective
- yellow LED to indicate the switching status, Test key – breaks the cable connection

With FEL50A:



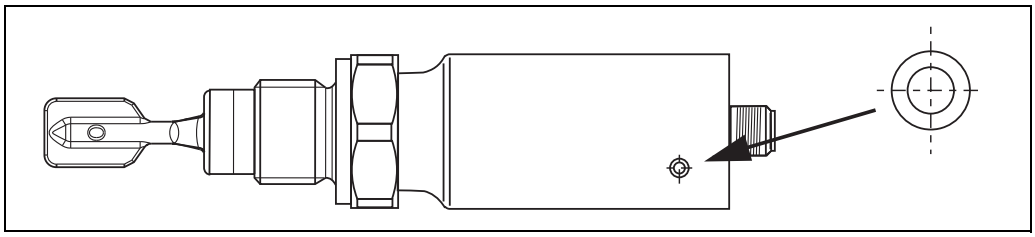
- 8 switches for configuring the device address
- green LED to indicate operational status, pulsing to indicate communication;
- yellow LED to indicate the switching status, flashes in the event of corrosion damage on sensor or if the electronics are defective

L00-FTL5xxxx-03-05-xx-en-002

With FEL50D:

- yellow LED: to indicate the validation of the measurement
- green LED: to indicate the operational status
- red LED: to indicate faults

TI328Fxx004

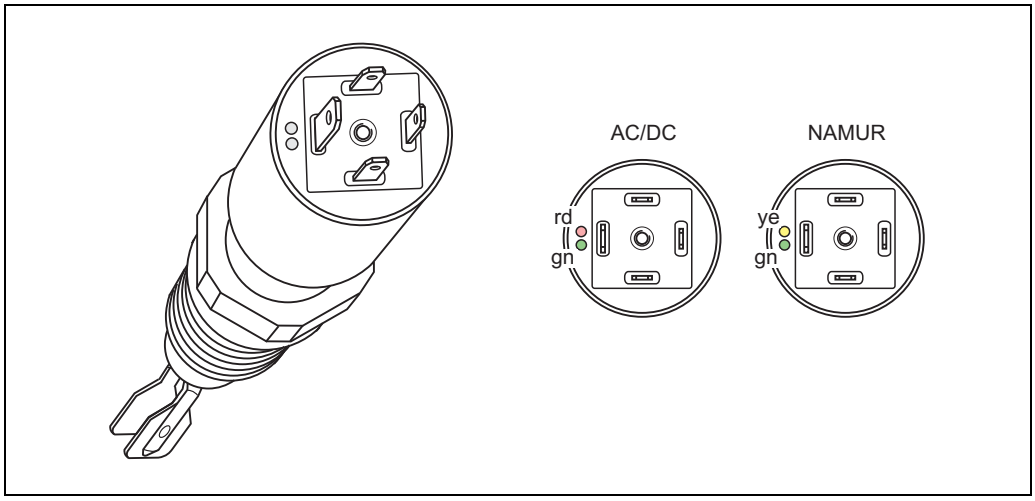


Compact housing

Function test with test magnet

Versions AC, DC-PNP and NAMUR:

During the test, the current state of the electronic switch is reversed.



Hold the test magnet against the marking on the nameplate: The switching status is changed.

L00-FTL5xxxx-19-05-xx-xx-001

Light signals

Versions AC and DC-PNP with valve connector or cable tail

L00-FTL5xxxx-07-05-xx-xx-005

Green light (gn) lights up (AC/DC):

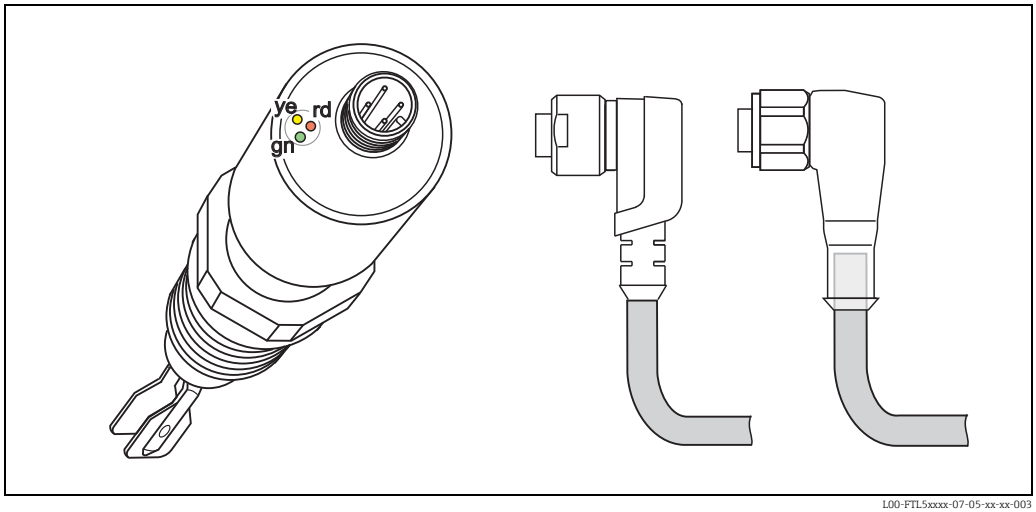
Liquiphant M is connected to the power supply and is operational.

Green light (gn) flashing (NAMUR):

Liquiphant M is connected to the power supply and is operational.

Red light (rd) lights up (AC/DC):

MAX application mode (overfill protection): sensor is immersed in liquid.
MIN application mode (dry running protection): sensor is not immersed in liquid.



Yellow light (ye) lights up (NAMUR):

MAX application mode (overfill protection): sensor is not immersed in liquid.
MIN application mode (dry running protection): sensor is immersed in liquid.

Red light (rd) flashing (AC/DC):

Liquiphant M has detected a fault.

Version NAMUR and DC-PNP with M12x1 round connector 316L

L00-FTL5xxxx-07-05-xx-xx-003

Green light (gn) lights up (DC-PNP):

Liquiphant M is connected to the power supply and is operational.

Green light (gn) flashing with 1 Hz (NAMUR):

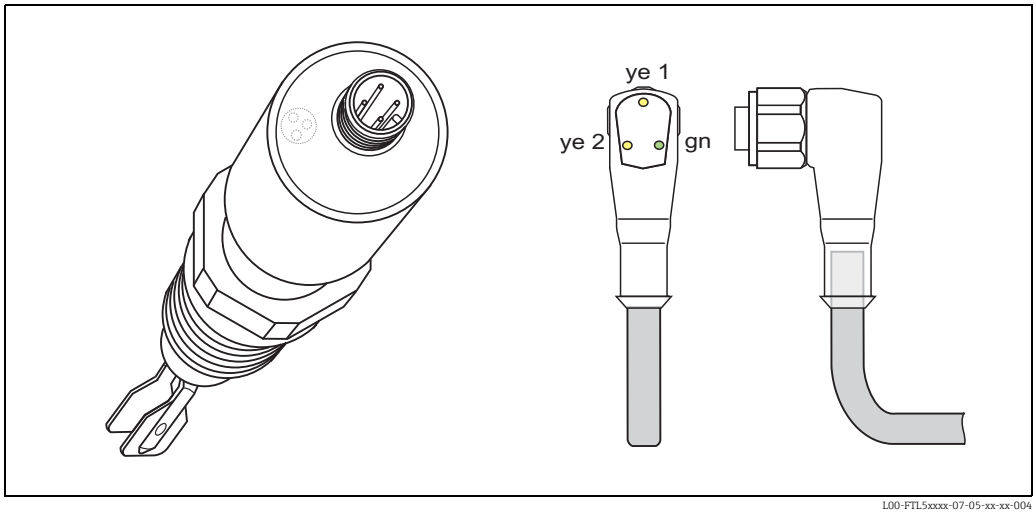
Liquiphant M is connected to the power supply and is operational.

Yellow light (ye) lights up (DC-PNP):

Sensor is immersed in liquid.

Yellow light (ye) lights up (NAMUR):

MAX application mode (overfill protection): sensor is not immersed in liquid.
MIN application mode (dry running protection): sensor is immersed in liquid.



Red light (rd) flashing (DC-PNP):

Liquiphant M has detected a fault.

Green light (gn) flashing with 0.3 Hz (NAMUR):

Liquiphant M has detected a fault.

Version DC-PNP with M12x1 round connector 316L

L00-FTL5xxxx-07-05-xx-xx-004

Green light (gn) lights up:

Liquiphant M is connected to the power supply and is operational.

Yellow light (ye 1) lights up:

MAX application mode (overfill protection): sensor is not immersed in liquid.
MIN application mode (dry running protection): sensor is not immersed in liquid.

Yellow light (ye 2) lights up:

MAX application mode (overfill protection): sensor is immersed in liquid.
MIN application mode (dry running protection): sensor is immersed in liquid.

Green light (gn) lights up, both yellow lights (ye 1+2) do not light up:

Liquiphant M has detected a fault.

Operating concept

Onsite configuration

Certificates and approvals

CE mark

The measuring system meets the legal requirements of the applicable EC Directives. These are listed in the corresponding EC Declaration of Conformity along with the standards applied.
Endress+Hauser confirms successful testing of the device by affixing to it the CE mark.

C-tick mark

The measuring system complies with the EMC requirements of the "Australian Communications and Media Authority (ACMA)".

General approvals

The following approvals are available for Liquiphant M FTL50H, FTL51H:

- EHEDG: certification (from TNO, The Netherlands), Report No. V99.394:
- 3A: 3A certificate (USA), Authorization no. 459: 74-06 Sensors and Sensor Fittings and Connections
- Certificate of Compliance as per ASME BPE-2012. (Order code: additional option = B)

Ingold fitting 25x46mm, 316L	TT2	–	–	X	–

Warning!
To avoid risk of contamination, install according to the "Hygienic Equipment Design Criteria (HDC)" as stated in the Subgroup Design Principles of the EHEDG, Doc. 8, July 1993.
The flow of liquid during cleaning is important and should be in compliance with the HDC.

Note!
- For CIP (Clean in Place) and SIP (Sterilize in Place) processes the pressure and temperature specifications of the process connections must be observed.
- Suitable fittings and seals must be used to ensure hygiene-compliant design according to 3A, EHEDG, ASME BPE etc.
- Surfaces with ASME-BPE option: Ra < 0.38 µm (< 15 µin) electropolished and passivated or Ra < 1.5 µm (59 µin) mechanically polished.

CRN approval

Versions with a CRN approval (Canadian Registration Number) are marked with a "*" in ordering information feature 20 "process connection" (s. Seite 43 ff.). CRN-approved devices are assigned the registration number 0F10525.5C on the nameplate.

Process seal according to ANSI/ISA 12.27.01

Practice in North America for the installation of process seals
Endress+Hauser devices are designed as either single seal or dual seal devices with an alarm in accordance with ANSI/ISA 12.27.01. This means that the user does need to install for an external secondary process seal in the thermowell which is required in ANSI/NFPA 70 (NEC) and CSA 22.1 (CEC). These devices comply with installation practice in North America and enable very safe, low-cost installation in pressurized applications with hazardous media.
Further information is provided in the Safety Instructions (XA) for the specific device → 58 ff.

Product	Type	Max. process pressure	Marking	Listing
Liquiphant M	FTL50-S/T##... FTL50-P/Q/R##...	64 bar (928 psi)	Single Seal	CSA/FM
	FTL51-S/T##... FTL51-P/Q/R##...	64/100 bar (928/1450 psi)	Single Seal	CSA/FM
	FTL50H-S/T##... FTL50H-P/Q/R##...	64 bar (928 psi)	Single Seal	CSA/FM
	FTL51H-S/T##... FTL51H-P/Q/R##...	64 bar (928 psi)	Single Seal	CSA/FM

Other certificates

- Material certificate as per EN 10204/3.1 for all wetted parts NACE MR0175/MR0103, AD2000
- Leak detection system in conjunction with WHG approval
  Approval number: Z–65.40–446 (see also "Ordering information" s. Seite 43 ff.)
- TSE Certificate of Suitability
  The following applies to wetted device components:
  – They do not contain any materials derived from animals.
  – No additives or operating materials derived from animals are used in production or processing.

Note!
Wetted device components are listed in the "Mechanical construction" (→ 30 ff.) and "Ordering information" (→ 43 ff.) sections.

Manufacturer declarations

The following documents are optionally available to order with the device:

- FDA conformity
- TSE-free: Materials not derived from animals
- Regulation (EC) no. 2023/2006 (GMP)
- Regulation (EC) No. 1935/2004 materials in contact with food

The applicable European guidelines and standards can be found in the relevant EU Declarations of Conformity.

Regulation (EC) no. 10/2011: The regulation on plastic materials does not apply to the Liquiphant FTL5x, as the wetted materials are made exclusively of stainless steel.
The silicone seals supplied comply with BFR recommendation XV (commodities based on silicones from the Federal Institute for Risk Assessment - BFR), and the EPDM seals provided comply with BFR recommendation XXI (commodities based on natural and synthetic rubber).

Use in hazardous zones

Pay particular attention to the information provided in the documentation: Safety Instructions, Control Drawings etc. → 58

ASME B 31.3

Design and materials in accordance with ASME B31.3 The welding seals are through-penetration welded and comply with ASME Boiler and Pressure Vessel Code Section IX and EN ISO 15614-1.

Pressure equipment directive

The pressure equipment directive 97/23/EC does not apply to the Liquiphant FTL5x, as it does not have a pressurized housing in accordance with Article 1, Paragraph 2.1.4 of the directive.

Ordering information

Note!
Versions that are mutually exclusive are not indicated in this list.

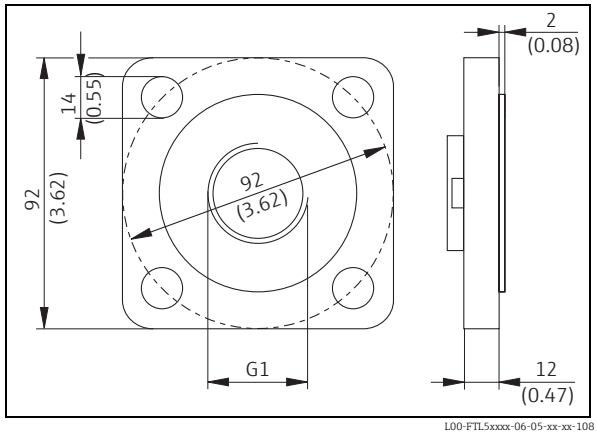
Weather protection cover

For F16 housing

Material	Order No.	Weight
PBT, gray	71127760	240 g (8.46 oz)

For F13, F17 and F27 housing

Material	Order No.	Weight
PA6, gray	71040497	300 g (10.58 oz)



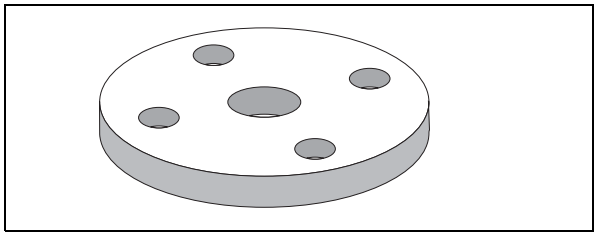
Lap joint flange

Order number: 918158-0000
With G 1 thread for mounting
a Liquiphant FTL50, FTL51
with process connection GR2

Pressure up to 40 bar (580 psi)

Material: corrosion-resistant steel
1.4301 (AISI 304)

Weight: 0.54 kg (1.19 lbs)

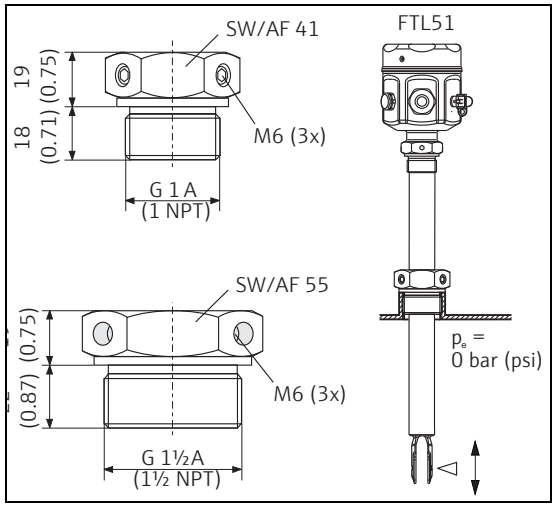


Lap joint flanges

With G 1 thread for mounting
a Liquiphant FTL50, FTL51
with process connection GR2

Material: corrosion-resistant steel
1.4571 (AISI 316Ti)

- Order number: 918143-0000
  Flange DN50 PN40, EN 1092-1
  Weight: 3.11 kg (6.86 lbs)
- Order number: 918144-0000
  Flange ASME 2", 150 psi, RF
  Weight: 2.38 kg (5.25 lbs)



L00-FTL5xxxx-03-05-xx-xx-015

Sliding sleeves for unpressurized operation

Switch point infinitely variable for
Liquiphant M FTL51

Material: corrosion-resistant steel
1.4435 (AISI 316 L)

Weight for G 1, NPT 1: 0.21 kg (0.46 lbs)
Weight for G 1½, NPT 1½: 0.54 kg (1.19 lbs)

L00-FTL5xxxx-06-05-xx-xx-109

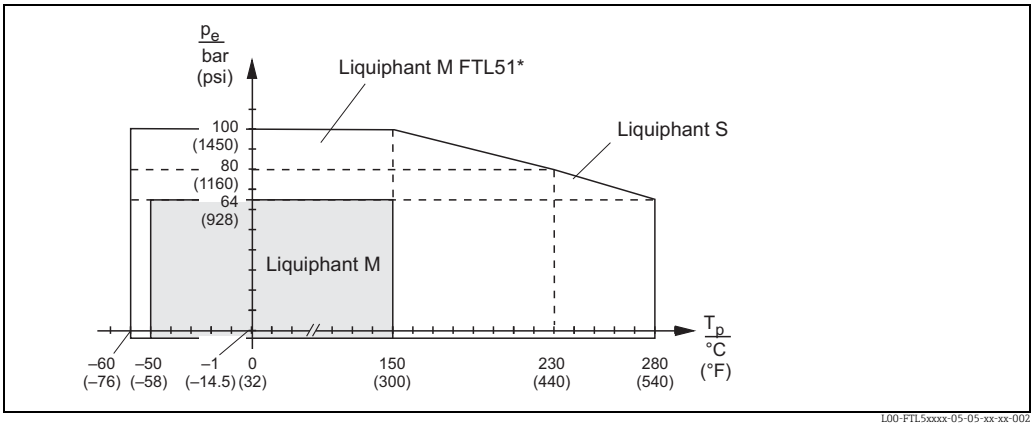
High pressure sliding sleeves

For continuous adjustment of the switch point of a Liquiphant M FTL51.
Also for use in hazardous areas. For further information → 📄 58ff. (ATEX, NEPSI).

Material: corrosion-resistant steel 1.4435 (AISI 316L) or AlloyC22



Weight for G 1, NPT 1: 1.13 kg (2.49 lbs)
Weight for G 1½, NPT 1½: 1.32 kg (2.91 lbs)

Seal package made of graphite

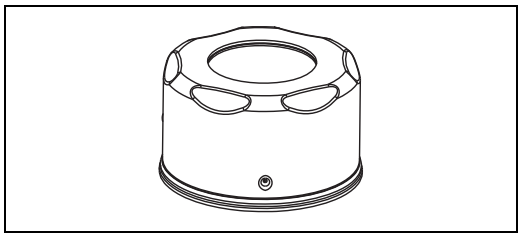
Cover with sight glass

Order number: 943461-0001
for polyester housing F16

Material: PA 12

Weight: 0.04 kg (0.09 lbs)

L00-FTL5xxxx-03-05-xx-xx-016



Cover with sight glass

For stainless steel housing F15

Material: AISI 316L

Weight: 0.16 kg (0.35 lbs)

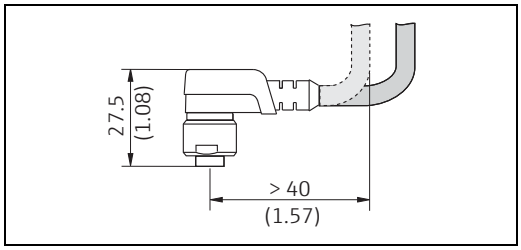
- Order number: 52027002
  With glass sight glass
- Order number: 52028207
  With PC sight glass
  (Not for CSA, General Purpose)

L00-FTL5xxxx-03-05-xx-xx-017

Circular connector

Order number: 52010285

4x0.34 M12 socket



Cable: PVC (gray) 5 m (16 ft)

Body: PUR (blue)

Thread adapter nut: Cu Sn/Ni

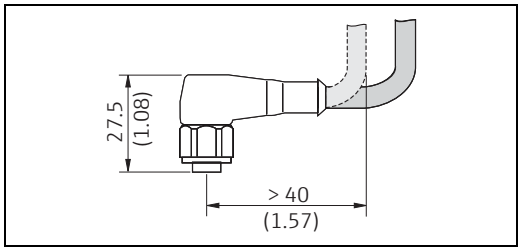
Degree of protection: IP67

Temperature range: –25 to +70 °C (-13 to +158 °F)

L00-FTL5xxxx-06-05-xx-xx-111

Order number: 52024216

4x0.34 M12 socket



Cable: PVC (orange) 5 m (16 ft)

Body: PVC (orange)

Thread adapter nut: 316L

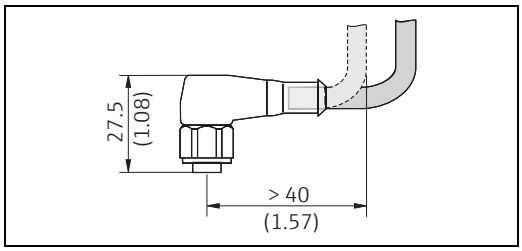
Degree of protection: IP69K (fully locked)

Temperature range: –25 to +70 °C (-13 to +158 °F)

L00-FTL5xxxx-06-05-xx-xx-112

Order number: 52018763

4x0.34 M12 socket with integrated LEDs



Cable: PVC (orange) 5 m (16 ft)

Body: PVC (transparent)

Thread adapter nut: 316L

Degree of protection: IP69K (fully locked)

Temperature range: –25 to +70 °C (-13 to +158 °F)

PFS Injection Quills

PFS Injection Quills have been developed to allow chemical injection into the center stream of the flow. This ensures the dispersion of chemical in a more uniform manner, providing for a more homogenous mix in the pipeline.

Standard features include:

- 6 materials of construction
- 2 standard sizes available 6"or 8"
- threaded or socket connections
- built in spring loaded check valve
- pressure range to 3000 PSIG
- temperatures to 260°C (500°F)
- custom materials and sizes available on request
- standard 1/8" orifice discharge and optional 1/4" for higher flow

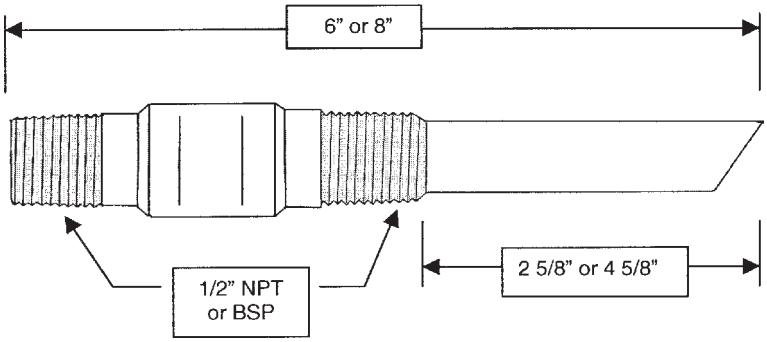
Notes and Options:

* maximum pressure @ 70°F(21°C) working temperature

Hastelloy C springs available. Suffix model number with -H for this option (e.g. IQ-56-PVC-H)



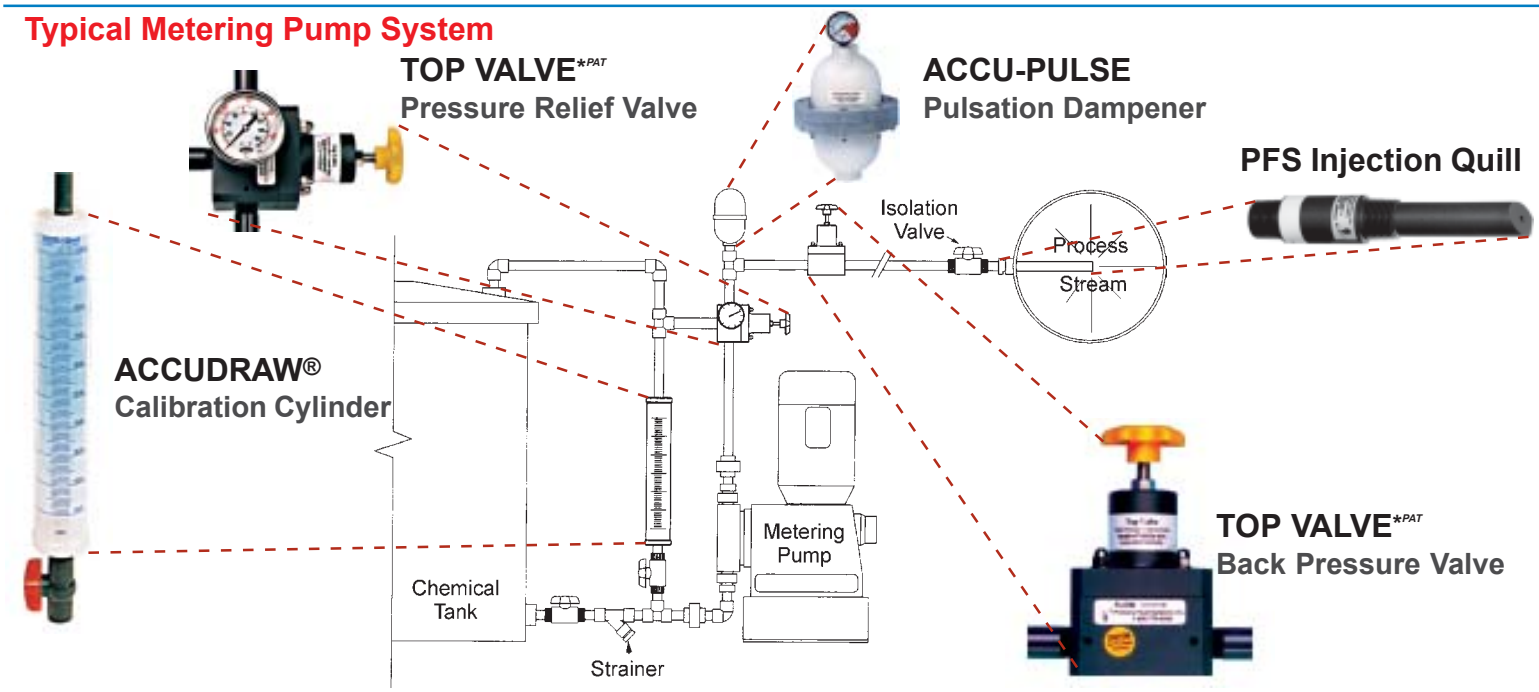
Hastelloy C ball check available. Suffix model -I (e.g. IQ-56-PVC-I)

PVDF ball check available. Suffix model -K (e.g. IQ-56-PVC-K)

TFE ball check available Suffix model -T (e.g. IQ-56-PVC-T)

CRN certification, other materials of construction and bubble tight/resilient seat check valves available on request. Please contact factory.

Dimensional Information



Capacities at Given Pressure (US and Metric)

Pressure		Flow Rate			
		1/8" Bore		1/4" Bore	
psi	*kPa*	*USGPM*	*LPM*	*USGPM*	*LPM*
20	138	0.05	0.19	2.62	9.92
30	207	1.25	4.73	3.98	15.07
40	276	1.55	5.87	4.77	18.06
50	345	1.90	7.19	5.59	21.14
60	414	2.20	8.33	6.39	24.19
70	483	2.48	9.39	7.30	27.63
80	552	2.72	10.30	8.10	30.66
90	621	2.97	11.24	8.82	33.39
100	689	3.21	12.15	9.48	35.87

Note: Quills have standard 1/8" discharge orifice for high velocity discharge. Optional 1/4" discharge orifice available for higher capacity flow.

FIBC Dischargers

Big-Bag - Entleerstationen
Déchargeuses de Big-Bag
Svuota Big-Bag

SBB

WAMGROUP

EXTRAC®

When discharging an FIBC the following problems can be encountered:

- Dust is produced when the bag is opened;
- Difficulties occur when trying to remove substances from the bag which have been compressed during transportation or storage;
- Substances remain trapped in the corners of the bag, making it necessary for the subsequent discharging to be carried out by hand.

Beim Entleeren von Big-Bags treten oft Probleme auf wie:

- *Staubentwicklung beim Öffnen des Big-Bags;*
- *Big-Bag lässt sich nicht vollständig entleeren, weil sich der Inhalt durch Transport oder längere Lagerung stark verdichtet hat;*
- *In den Ecken des Big-Bags befinden sich Produktreste, die von Hand entfernt werden müssen.*

Au moment de la vidange des Big-Bags, il se posent généralement les problèmes suivants:

- *Dégagement des poussières à l'ouverture du sac;*
- *Extraction difficile des produits dûe au tassement généré par le transport ou le stockage;*
- *Opération manuelle supplémentaire pour vider complètement les sacs du produit restant dans les angles.*

Alcuni dei problemi che si manifestano durante le fasi di svuotamento dei Big-Bag sono:

- *Emissione di polvere durante l'apertura della bocca;*
- *Estrazione difficile del prodotto dovuto alla sua compattazione in seguito allo stoccaggio e a trasporto del Big-Bag;*
- *Svuotamento parziale dei sacconi che contengono prodotti compattati.*

In order to avoid such problems we suggest you use our modular FIBC Discharging System.

Our systems can be extended and a range of accessories is available to satisfy every individual requirement with unrivalled efficiency, simplicity and cost.

Standard material: carbon steel.

On request: 304 or 316 stainless steel.

Bei Big-Bag-Entleerstationen vom Typ SBB werden diese Probleme dank eines Konzepts, welches stark auf individuelle Kundenbedürfnisse ausgerichtet ist, bereits im Vorfeld vermieden.

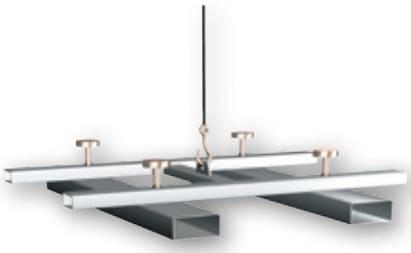
Die Modulbauweise und eine breite Auswahl an Zubehör bieten effiziente und wirtschaftliche, vor allem aber anwenderfreundliche Lösungen.

Standardausführung aus Stahl.

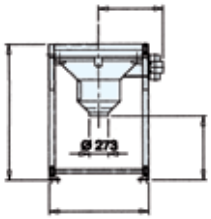
Auf Wunsch Ausführungen aus Edelstahl 1.4301 oder 1.4401.

Pour éliminer ces inconvénients, nous vous proposons un système de déchargement modulaire et expansible, accompagné de toute une gamme d'accessoires qui permettent de satisfaire aux demandes spécifiques.

Ce système est efficace, simple et économique.

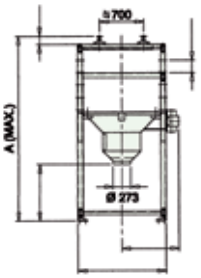


Fabrication de série: en acier au carbone.



Sur demande: en inox AISI 304-316.

Al fine di evitare gli inconvenienti sopra esposti proponiamo un sistema di svuotamento modulare ed espandibile completo di una gamma di accessori che consente di soddisfare richieste specifiche con ineguagliabile efficienza, semplicità ed economicità.



Esecuzione standard: acciaio al carbonio

A richiesta: AISI 304-316

ENVIREQUIP (Division 6445772 Canada Inc)

JOB	VWTC - Meliadine	Date	January 27, 2021
JOB Quotation Number	05075		
Application	Sludge with microsand		
Quantity of Units	1		
Manufacturer	Envirequip		
Model (MIX-TECH)	EVGX - 4 - 3.0		
Power Used Continuous Duty	1.31 hp	0.98	kw
Loading on Motor < 100 %	43.82 %		
Tank Diameter	90.00 inch	2,286.0	mm
Liquid Depth	144.00 inch	3,657.6	mm
Tank Liquid Volume	3,966 usg	15.0	cu m
Information Liquid	Water		
Temperature	32 F	0.0	C
Viscosity	1.778 cp		
Liquid Specific Gravity	1.007		
Number of Impeller(s)	2		
Impeller Type	Envirefoil (F4) Bladed Design		
Material of Construction	Stainless Steel 2205		
Angle of Attack	22 degrees		
Power Number / Pumping Number	Np = 0.733 & Nq = 0.72		
Diameter	51 inch	1,295.4	mm
Bottom Clearance	25.5 inch	647.7	mm
Peripheral Tip Speed	7.57 ft / sec	2.31	m / sec
D / T Ratio	0.567		
Rotation / Direction of Thrust	CW/DN		
Spacing for 2 nd Impeller Up	66 inch	1676.4	mm
Spacing for 3 rd Impeller Up	0 inch	0	mm
Shaft Cantilevered	Stainless Steel 2205		
Number of Sections	2		
Shaft Diameter	2.25 inch	57.15	mm
Length of Shaft	142.49 inch	3,619.3	mm
Output Shaft Coupling	With coupling		
Harmonic Frequency / Critical Speed	98.3 rpm		
Percent on 1 st Critical Speed	34.58 %		
Bending Moment Stress - Tensile	8,732 psi	613.9	kg sq cm
Shear Stress - Torsion	4,434 psi	311.7	kg sq cm
Twist Based on BHP	0.718 Degree		

ENVIREQUIP (Division 6445772 Canada Inc)

JOB	VWTC - Meliadine	Date	January 27, 2021
JOB Quotation Number	05075		
Application	Sludge with microsand		
Gear Reducer	Nord with parallel gears		
Model	SK 4282 AHZ/VL		
Output Impeller Speed	34.00 rpm		
Service Factor	2.800		
Bearing B10 Life	100,000 hours		
Oil	Food Grade		
Type / Gearing / Efficiency	Parallel Gears: AGMA 11 (LS) & 13 (HS) AGMA	/ 98.5 % / stage	
Reduction Ratio on Gear Reducer	52.21 to 1		
Motor (Manufacturer) Type	WEG IEEE841		
Type / Invertor Duty	Squirrel Cage / NEMA MG1. Part 31 Invertor Service		
Motor Efficiency	89.5 %		
Motor Frame and Size	182 TC		
Motor Speed	34.0 rpm	TEFC / IP 55 / Class F insulation	
Absorbed Power Full Load	3 hp	2.24 kw	
Motor Amps	3.13 amps		
Power Supply	575-3-60		
Pumping Capacity on Volume	28,115 usgpm	1.774 cu m / sec	
Bulk Fluid Velocity per Zone	42.54 ft / min	21.61 cm / sec	
Mixing Intensity (Scale 1 to 10)	7.09		
Velocity Gradient (G factor)	198.61 sec-1		
Turnovers in Tank	7.089 minutes		
BHP per 1000 usg	0.3315 bhp / 1000 usg		
Torque per usg	0.6145 in lb / usg		
Reynolds Number	535,861		
Mounting (Steel Base Dimensions)	16.5 sq in	419 sq mm	
Weight of Complete System	380 lbs	172 kg	
Thrust Add if pumping up	57 lbs	26 kg	
Bending Moment	23,778 in lb	27,390 kg cm	
Torque Reaction	13,903 in lb	16,014 kg cm	
Beam Size (Estimated)	8 C at 11.5 # / ft inch		
Beam Span (Estimated)	8 feet	2.438 meters	

DATA SHEET

Three Phase Induction Motor - Squirrel Cage

Customer	:

Product line	: W22 IEEE 841 NEMA Premium Efficiency Three-Phase	Product code :	13533095
		Catalog # :	IE003504W22CIS

Frame	: 182/4TC	Locked rotor time	: 41s (cold) 23s (hot)
Output	: 3 HP (2.2 kW)	Temperature rise	: 80 K
Poles	: 4	Duty cycle	: Cont.(S1)
Frequency	: 60 Hz	Ambient temperature	: -20°C to +40°C
Rated voltage	: 575 V	Altitude	: 1000 m.a.s.l.
Rated current	: 3.13 A	Protection degree	: IP55
L. R. Amperes	: 25.3 A	Cooling method	: IC411 - TEFC
LRC	: 8.1x(Code K)	Mounting	: F-1
No load current	: 1.60 A	Rotation[1]	: Both (CW and CCW)
Rated speed	: 1760 rpm	Noise level[2]	: 56.0 dB(A)
Slip	: 2.22 %	Starting method	: Direct On Line
Rated torque	: 8.95 ft.lb	Approx. weight[3]	: 103 lb
Locked rotor torque	: 229 %		
Breakdown torque	: 340 %		
Insulation class	: F		
Service factor	: 1.25		
Moment of inertia (J)	: 0.3401 sq.ft.lb		
Design	: B		

Output	25%	50%	75%	100%
Efficiency (%)	86.4	87.5	88.5	89.5
Power Factor	0.36	0.61	0.73	0.79

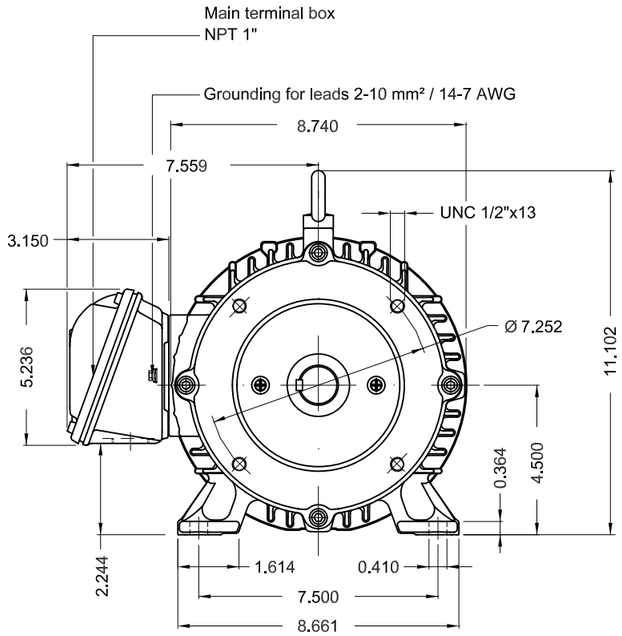
Foundation loads

Max. traction	: 143 lb
Max. compression	: 246 lb

		Drive end	Non drive end
Bearing type	:	6207 C3	6206 C3
Sealing	:	Inpro/Seal	Inpro/Seal
Lubrication interval	:	20000 h	20000 h
Lubricant amount	:	7 g	5 g
Lubricant type	:	Mobil Polyrex EM	

Notes

This revision replaces and cancel the previous one, which must be eliminated.
(1) Looking the motor from the shaft end.
(2) Measured at 1m and with tolerance of +3dB(A).
(3) Approximate weight subject to changes after manufacturing process.
(4) At 100% of full load.



These are average values based on tests with sinusoidal power supply, subject to the tolerances stipulated in NEMA MG-1.

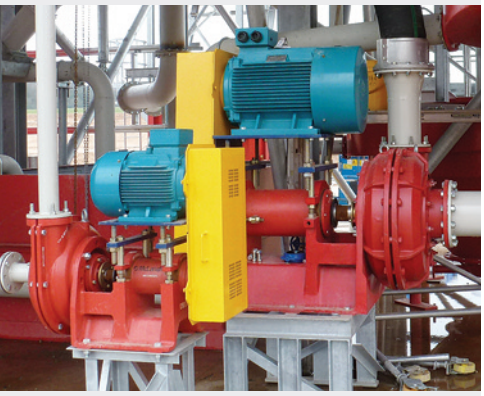
SLURRY PUMPS

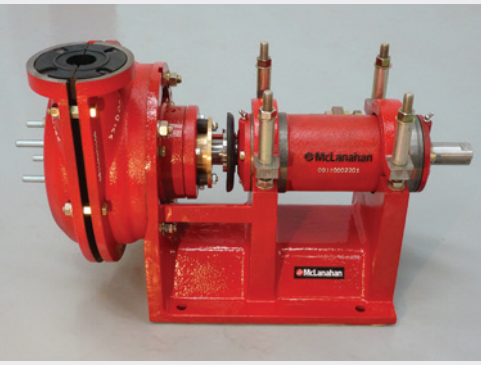
RELIABLE AND LONG LASTING

McLanahan's centrifugal Slurry Pumps are rubber-lined and abrasion resistant for long lasting service, low lifetime costs and straight forward servicing.

Eight models with discharge port sizes from 35mm to 250mm that can accommodate various options in lining material and gland type choices.



McLanahan®



mclanahan.com

APPLICATIONS

- Sand & Gravel / Minerals Processing
- Soil Washing / Remediation
- Waste Water Recovery / Disposal
- Concrete Wash-out

WETTED PARTS

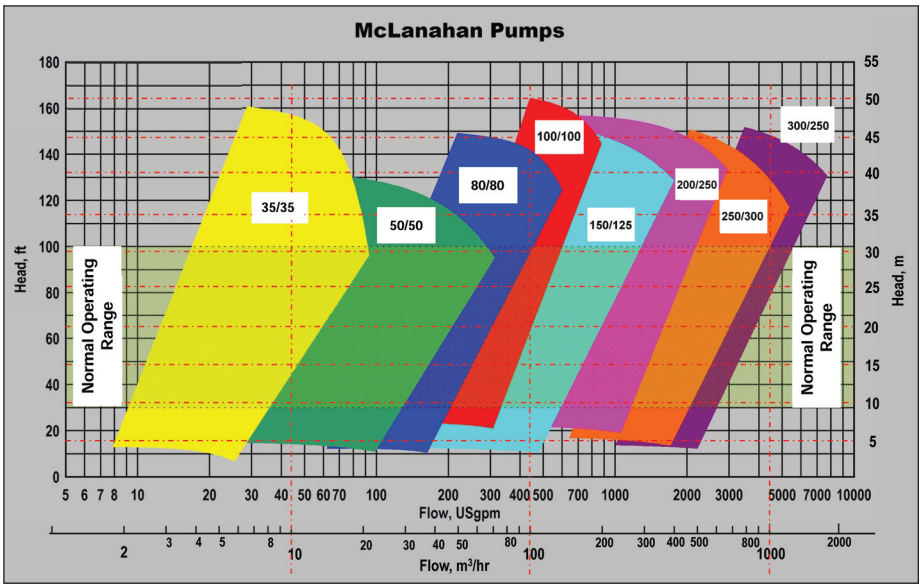
Standard pumps are equipped with natural rubber liners and impeller. However, bespoke options are available to suit a specific process and include premium natural rubber, Nitrile and food grade rubber. Shaft sleeves are from 304 St, but may be manufactured from other materials or coated to special order.

GLAND OPTIONS

D (Dry) Gland

An abrasion resistant Natural Rubber "Face Seal" riding a "Hard Face" and lubricated naturally by the process fluid. Controlled seepage of process fluid. Optional clean water injection facility.

H (Hydro) Gland



Clean water is injected into the inter-space between a pair of gland seals in tandem. Slight dilution – but total containment – of the process fluid. Controlled water seepage to atmosphere.

P (Packed) Gland

Gland packing mechanically adjusted to "ride" the shaft sleeve. Highest pressure capability. Some process dilution and water (or lubricating grease) seepage to atmosphere.

MOTOR AND DRIVE

McLanahan supplies pumps bare-shaft or complete with motor, overhead mounting platform, vee-belt drive and guard. Motors can also be oriented in Z-vee fashion, or side mounted on slide rails.

PUMP SELECTION

Initial pump selection can be determined by using the chart above as a guide. A qualified McLanahan engineer can determine the best pump performance for a specific application.

SPARES

High quality spare parts are available including moulded rubber Impellers, casing liners and suction bush components. All parts are available in various materials and hardness to suit differing applications. Mechanical spares such as fully assembled bearing housing cartridges and gland parts are available as kits for ease of procurement.

FLOWSERVE

Durco T4E Lined Plug Valves

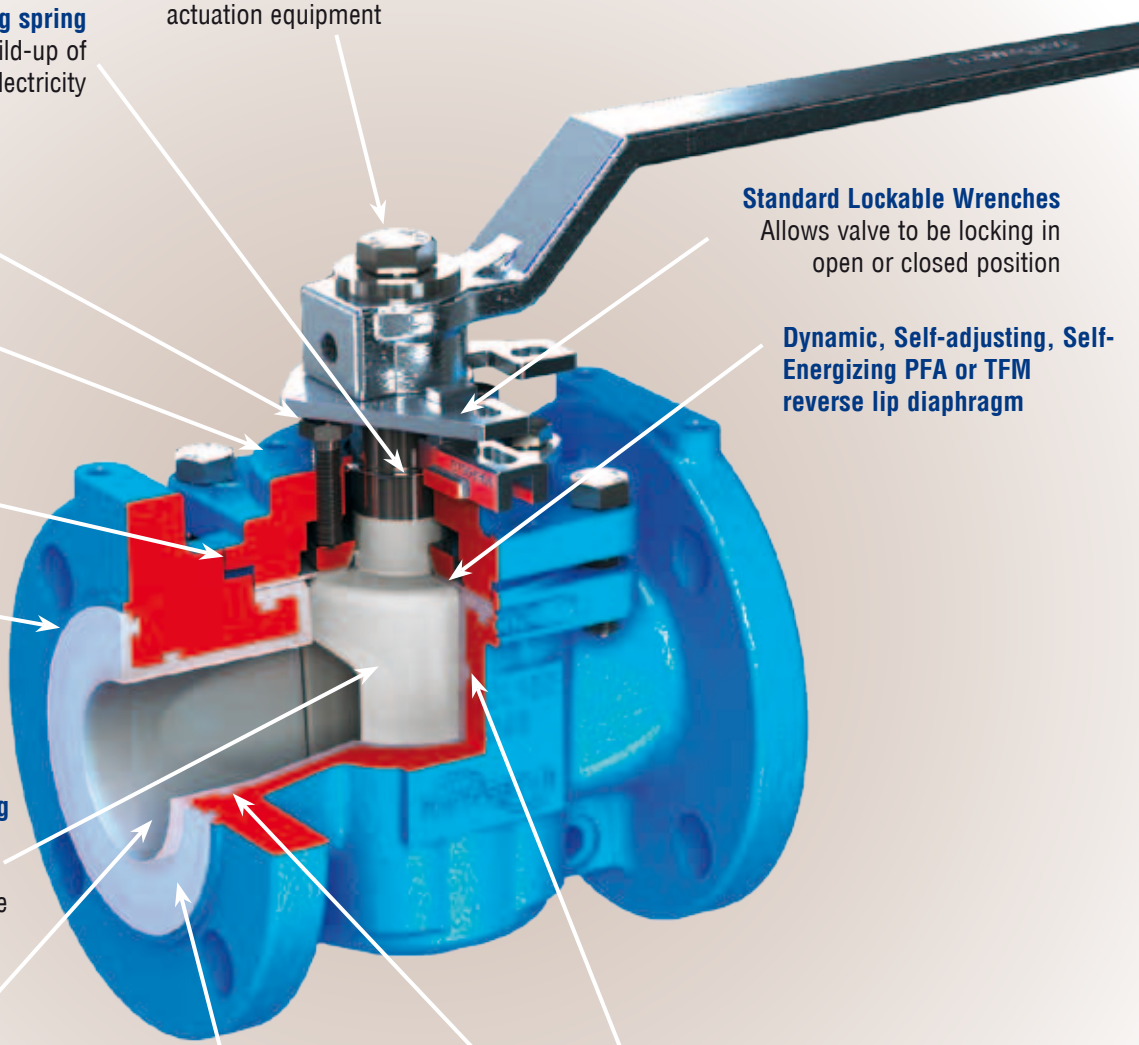
Fluoropolymer Lined Valves

Experience In Motion

History

Flowserve Durco T4E valves have been designed and developed with the latest technology and are the most preferred fluoropolymer lined valves in the global chemical industries.
Durco T4E valves provide maximum corrosion resistance and the elimination of product contamination at a reasonable cost.

Available in a Broad Size Range and



- ***T4E1*** *ASME Class 150 is available in sizes ½" through 12"*
- ***T4E2*** *DIN PN 16 is available in sizes DN 15 through DN 300*
- ***T4E3*** *ASME Class 300 is available in sizes ½" through 10"*

Extended Pressure Classes

- ***T4E1 and T4E2*** *rated 180 psi @400 °F (12.4 bar @ 204 °C), 250 psi @ 100 °F (17.2 bar @ 100 °C)*
- ***T4E3*** *rated 320 psi @ 400 °F (22 bar @ 204 °C), 740 psi @ 100 °F (51 bar @ 100 °C)*

Available with pneumatic or electric actuators for On-Off or modulating control applications.
All T4E valve series are rated to 4 Kpa (30 inches Hg) vacuum at ambient temperature.

Features

Double-D plug stem
accepts most standard actuation equipment

Grounding spring
To avoid build-up of static electricity

Inline adjustment
Stops thru-line leakage

ISO 5211 Mounting Pad
Universal flange for easy actuation mounting

Anti-Rotation Lugs
Help to eliminate stress on fasteners during actuation

Raised Lip
Prevents cold flow outward

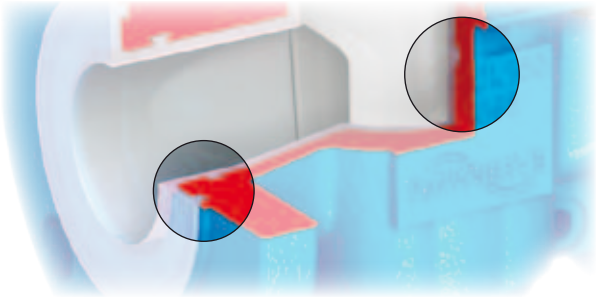
Standard Lockable Wrenches
Allows valve to be locking in open or closed position

Dynamic, Self-adjusting, Self-Energizing PFA or TFM reverse lip diaphragm

Solid Encapsulated PFA Molded Plug
All plug inserts have anchor holes to ensure a strong adhesion of the plug PFA liner material even under extreme cycling conditions

Large Ports
Offer good Cv values. Reduced frictional losses & pressure drop

High Quality PFA Liner
Protects the body and forms the flange gasket. The PFA liner is resistant against a wide variation of chemical products



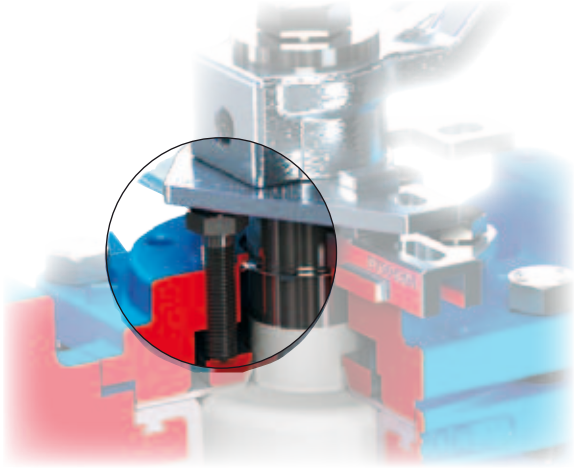
T-Slots in Critical Areas to Lock Liner Against Body Wall
Advantage will be a tight and perfect fit of the liner and an additional support during vacuum service

Additional Benefits

Benefits that give you the extra security which you will appreciate when using the T4E valves

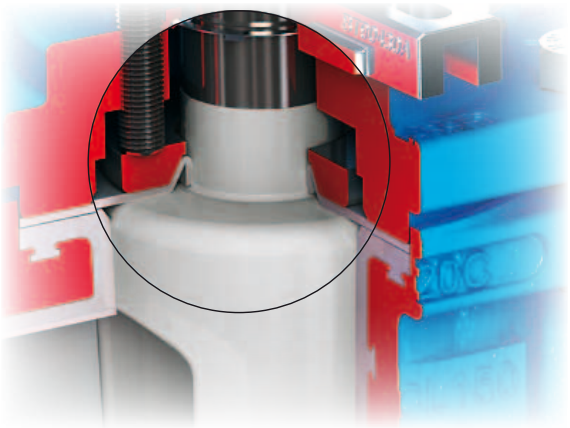
Body Liner

- A perfectly fixed PFA body liner is well anchored to the body by means of machined T-slots. The plug substrate has anchor holes to ensure that the PFA liner material is securely attached to the plug.
- Due to the selected mode to lock the liner to the valve body and plug, the T4E valve series is very suitable for extreme service conditions including vacuum applications at elevated temperatures.
- The PFA body liner covers all wetted surfaces in the body.
- Due to it's large sealing surface a tight shut-off is assured.
- In addition to the large seating area the valve is fully bi-directional and the seal is totally independent of line pressure.



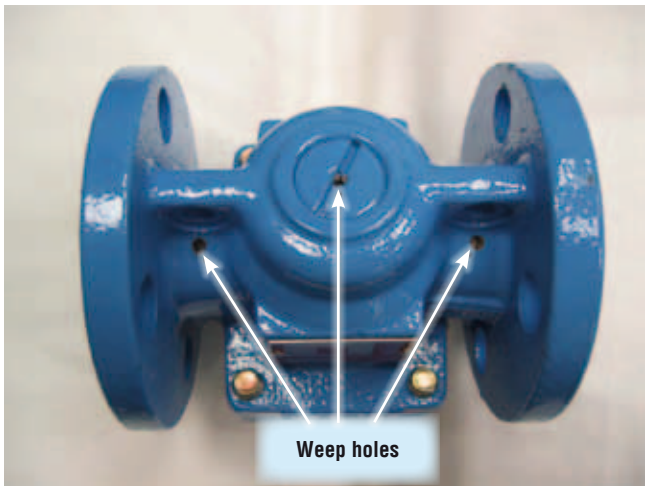
In-Line Adjustment

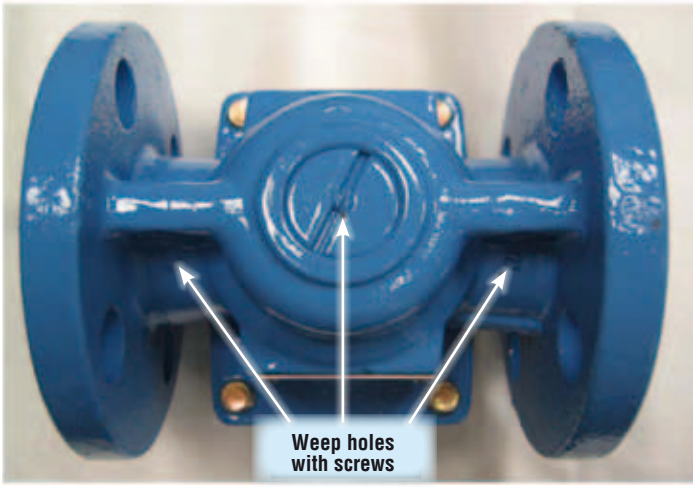
- No disassembly required to restore seating; plug can be reseated with a quick and easy in-line adjustment.
- An open end wrench and a few seconds are the extent of your maintenance requirements.



There are:

- No seats to replace
- No lengthy production disruption
- No piping disconnection
- No complicated, time-consuming maintenance procedures
- No hazards to personnel

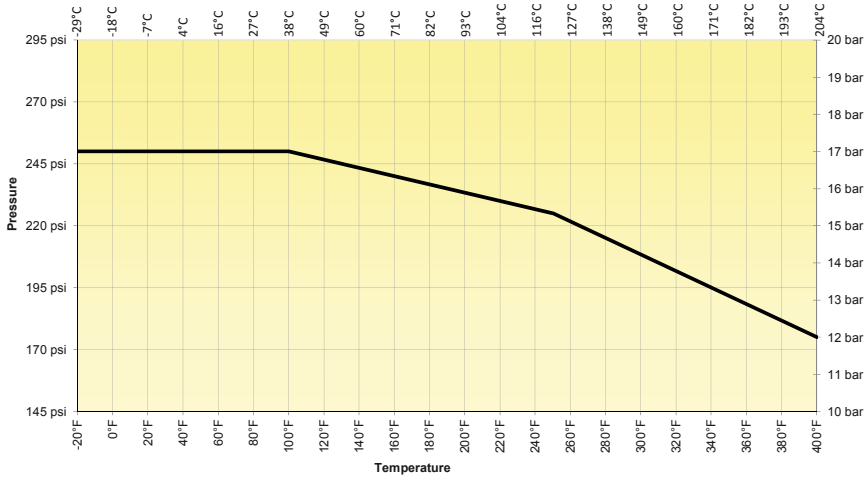


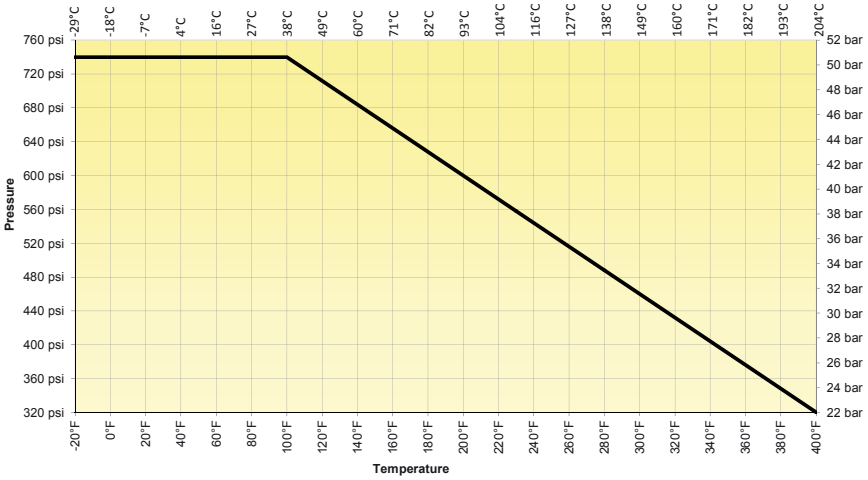


Secure Sealing

- A dynamic self-adjusting, self energized reverse lip PFA diaphragm seal prevents stem leakage.
- If line pressure forces liquid to the stem seal area, the self-energizing reverse lip PFA diaphragm will be forced against the stem to prevent external leakage.
- A sealing surface as much as 10x greater than other lined valves assures drop tight shut-off.
- In addition to the large sealing area, sealing is both upstream and downstream and is totally independent of line pressure.

Weepholes





Weepholes for early leakage detection

Durco T4E valves are supplied with three weepholes that are plugged with screws. The customer has the option to remove the screws. In so doing he is able to detect any leakage of process fluid through the liner and to take appropriate action.

Pressure-Temperature-Diagram - T4E1 and T4E2

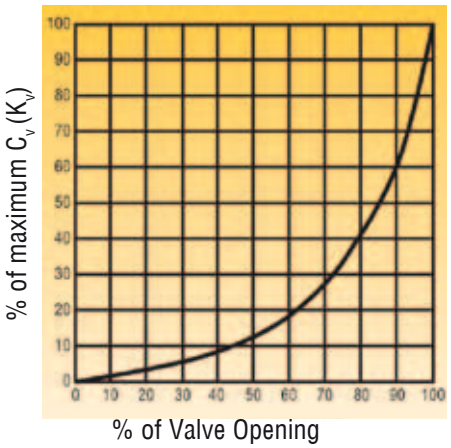
Pressure-Temperature-Diagram - T4E3

Durco T4E Automated Valves

Choose from a complete line of Flowserve Automax Automation Equipment for precise proportioning and On-Off control.....or we'll build a control package to your specification.

Flowserve Automax, a specialist in complete automation systems, produces a broad line of rack and pinion, heavy-duty, electric and linear actuators. In addition, a comprehensive line of engineered special control circuits, solenoid valves, limit switches, positioners and actuator mounting kits is offered.

Actuator Mounting

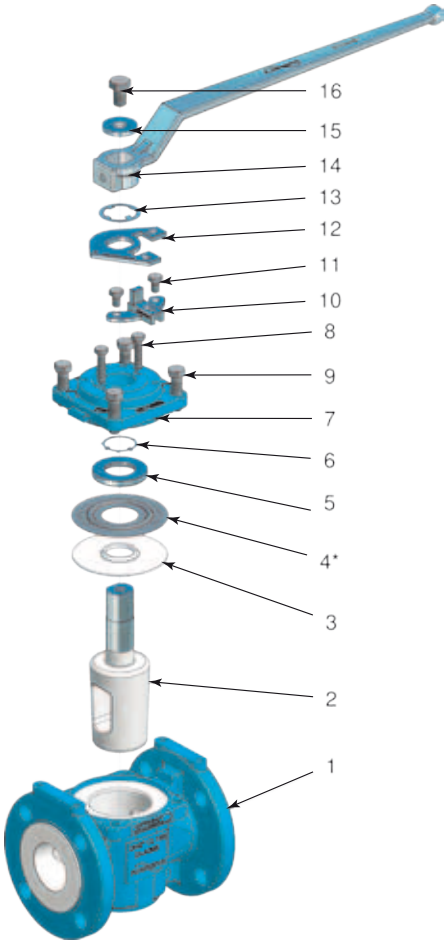


The body style of the T4E offers a choice of two locations for actuator mounting : an ISO 5200 pattern on the topcap or the flat-top pads of the flanges.

Software Capability

Flowserve offers a state-of-the-art range of software to help in sizing valves and actuation and creating drawings.

Modulating Control



V-port T4E valves are available in 1" (DN 25) through 4" (DN 100) sizes with Cv (Kv) values of 1 through 187 (Kv of 1 through 161). Standard port T4E valves are available in ½" (DN 15) through 12" (DN 300) sizes with Cv (Kv) values from 15 through 3200 (Kv from 13 through 2750).

Control Plugs

Size	Cv	Kv	Plug Type
1"	1	1	slotted plug

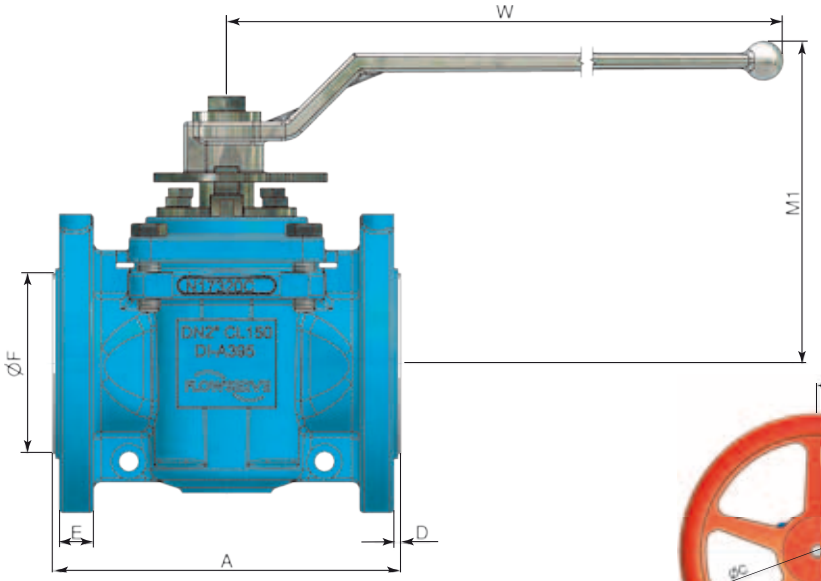
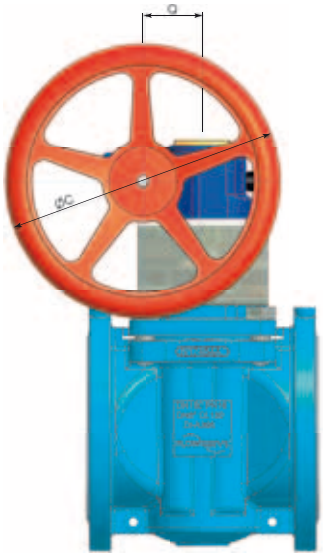
3	Diaphragm	T4E1: TFM (PFA*) | T4E3: PFA
4*	Metal diaphragm	Stainless steel - 302
5	Thrust gland	Machining steel - 1.0718
6	Grounding spring	Stainless steel - 302
7	Top cap T4E1	Ductile cast iron - EN-JS1049/ASTM A395
	Top cap T4E3	Carbon steel ASTM A995 Gr CD4MCuN
8	Adjuster bolt	ASTM A193 grade B7YC
9	Top cap bolt	ASTM A193 grade B7YC
10	Stop	Stainless steel ASTM A351/A744 grade CF-8M (316 SS)
11	Stop fastener	Stainless steel 1.4301
12	Stop collar	Carbon steel, protective plated
13	Stop collar retainer	Stainless steel - 302
14	Wrench	Ductile cast iron - EN-JS1082/ASTM A536
15	Washer	Stainless steel - 1.4301
16	Hexagon bolt	Stainless steel - 1.4301

*Optional

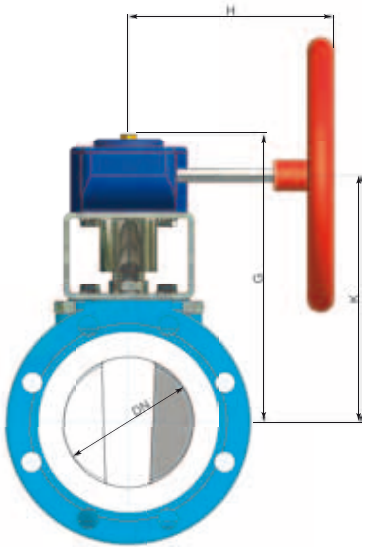
T4E1 and T4E2 (8" - 12") T4E3 (8" - 10")



No.	Designation	Material
1	Body T4E1	Ductile cast iron - EN-JS1049/ASTM A395*, PFA lined
	Body T4E3	Carbon steel ASTM A216 grade WCB, PFA lined
2	Plug	Ductile cast iron - EN-JS1049/ASTM A395, PFA lined
3	Top cap T4E1	Ductile cast iron - EN-JS1049/ASTM A395
	Top cap T4E3	Carbon steel ASTM A995 grade CD4MCuN
4	Diaphragm	T4E1: DN8" - TFM (PFA*), DN10"-DN12" - PFA | T4E3: PFA
4a**	Metal diaphragm	Stainless steel - 302
5	Thrust gland	Dupex stainless steel ASTM A995 Gr CD4MCuN
6	Adjuster	Dupex stainless steel ASTM A995 Gr CD4MCuN
7	Grounding spring	Stainless steel - 302
8	Adjuster bolt	88YC
9	Hexagon bolt	88YC



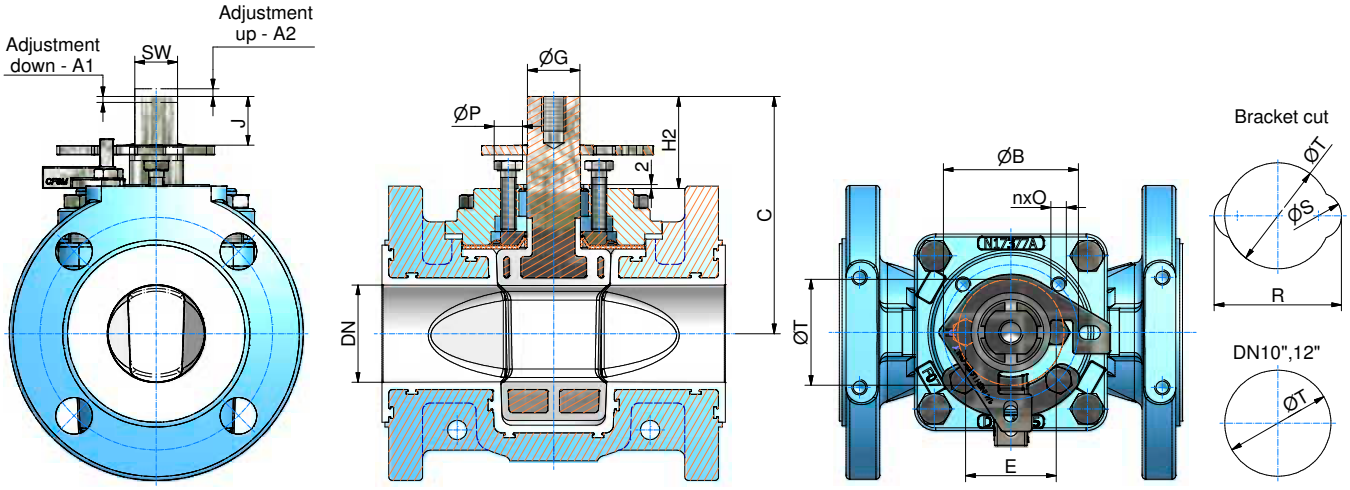
* Other materials upon request
** Optional



Dimensions

Valve Dimensions

Dimensions are in Inches and millimetres. Weights are in lb. and kg.



T4E1, T4E2 and T4E3 ½˝ to 12˝

Note: All dimensions are approximate and for illustration purposes only. For exact dimensions consult certified dimensional prints
Valve 8"-12" are shown with double D stems which are standard. However spline shafts are also available for these sizes as an option.
All weights include either wrench or gear operator
Face-to-face dimensions comply to ANSI B16.10 and flange connections comply to ANSI B16.5

FLOWSERVE

How to Specify T4E Valves

Size[1]
0.5 in.
0.75 in.
1.5 in.
2 in.
3 in.
4 in.
6 in.
8 in.
10 in.
12 in.

Product Family
T4E = Standard

Pressure Class[1]
1 = ASME Cl. 150
2 = DIN PN 16
3 = ASME Cl. 300

End Configuration
1 = Raised Face Flanges

Plug Style		
C = 2-Way		
D = Slot	Cv = .8	1"
E = Vport	Cv = 3	1"
F = Vport	Cv = 8.3	1"
G = Vport	Cv = 13	1"
H = Vport	Cv = 29.6	1.5"
J = Vport	Cv = 53.6	2"
K = Vport	Cv = 88.7	3"
L = Vport	Cv = 187.1	4"

Options
C = Chlorine Service
D = Chlorine Clean Only
G = Bottom Vented Plug[8]
H = Upstream Vented Plug (side)
J = Side/Bottom Vented Plug (upstream)
L = Anti-Vibration Clip for Top Cap Bolts
M = Side Vent Downstream (requires release from customer in writing)
O = Oxygen Cleaning
R = Built Dry (no lubrication)[9]
S = Silicone Free Lubrication
W = No Options
@ = DuPont Flouropolymer Material
Q = Quality Plan

Manufacturers code
N = Internal use

Adjuster fastener[7]
1 = B840
2 = B9
3 = B7YC
4 = B7T
5 = C20
6 = HC
7 = B7
8 = MKH
9 = B7M
0 = B7MZ
E = 88YC

Top Cap Fastener[7]
1 = B840
2 = B9
3 = B7YC
4 = B7T
5 = C20
6 = HC
7 = B7
8 = MKH
9 = B7M
0 = B7MZ
E = 88YC

Operator
0 = Std. Wrench[5]
1 = Gear Cl[6]
2 = Locking Gear Cl
4 = Caustic Gear PF
9 = Bare Stem
B = Babbit/Chain

Standard Valve Codes		
Size	Class 150	Class 300

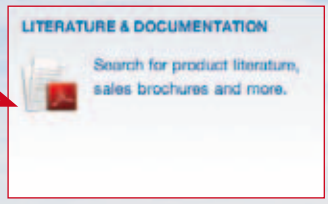
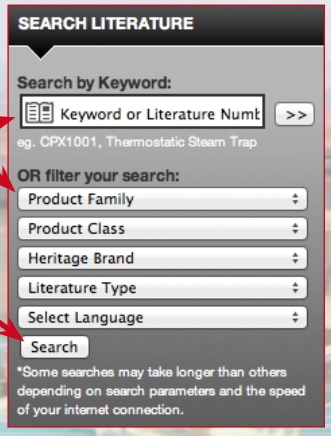
Body liner[2]	Plug Alloy[3]	Top Cap Alloy[4]
1 = DIPA	1 = DIPA	D = DCI
2 = DSPA	2 = D4PA	O = CD4M
3 = D4PA	3 = CDPA	

Codes	
DIPA	Ductile iron, PFA lined
DSPA	Carbon steel, PFA lined
D4PA	316 SS, PFA lined
CDPA	CD4MCuN, PFA lined

[1] Class 150 valves = ½" thru 12" ductile iron / 8" thru 12" stainless steel
Class 300 valves = ½" thru 10" carbon steel
[2] DIPA body = class 150 valves only
D4PA body = 8", 10" 12" class 150 valves only
DSPA body = class 300 valves only
[3] DIPA plug = ½" thru 12"
CDPA plug = 8", 10" and 12" only
[4] DCI top cap = DIPA valve bodies
CD4M top cap = D4PA and DSPA valve bodies
[5] Locking wrench standard thru 4"
[6] Gear standard 6" and above (also available on smaller sizes)
[7] B7YC = standard for ½" thru 6"
88YC = standard for 8", 10", 12" (Gr. 8.8 yellow chromated)
[8] 8" and larger plugs have bottom vent as standard
[9] No lubrication for valves up to 4"
Built with Krytox for valves 6" and above





To Access Literature On-line

More information about FLOWSERVE products can be obtained on-line. It's easy to find… it's free… and you do not need a password.

Do This:

1. Go to www.flowserve.com
2. Click in the box that says "Literature"
3. Enter "Keyword" or literature number and "Filter" as required
4. Click on "Search"

The most recent version of each product bulletin will be available on this site.

Once you have the PDF, you can:

- read it
- print it
- download it
- even e-mail it

Other Useful Information

In addition to lined plug valves, lined butterfly valves (Document number DVENTB0020) and lined ball valves, check valves and sight glasses (Document number ATENTB0010) are also available.

Finally, a wide variety of metallic and lined rotary valves and actuation equipment is summarized in the Document number DVENBR0001.

To obtain any of these brochures, follow the simple steps on the left of this page and enter the Document number in Step 3.

Ordering Preprinted Literature

Customers, please contact your Flowserve sales representative to get hard copy of a brochure. Flowserve representatives and distributors can go to www.flowserve.com and click on the "View Literature" link then click on "Log-in to order hard copy literature" and follow the prompts.

Flowserve Corporation has established industry leadership in the design and manufacture of its products. When properly selected, this Flowserve product is designed to perform its intended function safely during its useful life. However, the purchaser or user of Flowserve products should be aware that Flowserve products might be used in numerous applications under a wide variety of industrial service conditions. Although Flowserve can (and often does) provide general guidelines, it cannot provide specific data and warnings for all possible applications. The purchaser/user must therefore assume the ultimate responsibility for the proper sizing and selection, installation, operation, and maintenance of Flowserve products. The purchaser/user should read and understand the Installation Operation Maintenance (IOM) instructions included with the product, and train its employees and contractors in the safe use of Flowserve products in connection with the specific application.

While the information and specifications contained in this literature are believed to be accurate, they are supplied for informative purposes only and should not be considered certified or as a guarantee of satisfactory results by reliance thereon. Nothing contained herein is to be construed as a warranty or guarantee, express or implied, regarding any matter with respect to this product. Because Flowserve is continually improving and upgrading its product design, the specifications, dimensions and information contained herein are subject to change without notice. Should any question arise concerning these provisions, the purchaser/user should contact Flowserve Corporation at any one of its worldwide operations or offices.

1009 Stainless Steel Case Gauge

FEATURES

- Meets ASME B40.100 specifications
- Corrosion resistant SS case
- Dry gauges are field fillable
- Power***Flex***™ movement provides superior resistance to shock, vibration and pulsation
- True Zero™ reduces reading errors by using "zero box" instead of conventional dial pins
- ***PLUS!***™ performance available for liquid filled performance with a dry gauge
- MSL helium leak tested to 1X10^{-6} scc/s
- Ventable fill plug
- Accessory kits for easy panel mounting

TYPICAL USES

- Pumps and compressors
- Boilers
- Equipment skids
- Specialized OEM equipment
- Hydraulics and pneumatics
- Severe ambient conditions

SPECIFICATIONS

Accuracy:	ASME B40.100, Grade 1A, ±1% of span (Dry) ±1.5% of span (Liquid filled)
Dial Sizes:	2½″ (63mm), 3½″ (100mm)
Ranges:	Minimum 0-15 psi, maximum 0-15,000 psi, vacuum and compound
Wetted Materials	
Tube:	316L SS tube
Process Connection:	316L SS socket (SW) Aluminum bronze socket (AW)
Non Wetted Materials	
Window:	Polycarbonate (Std.), Safety glass (XSG), Polysulfone (XPS) 3½″ Dial only
Dial:	Black figures on white background, aluminum
Pointer:	Black, aluminum, adjustable (Std.), micrometer (XMP)
Movement:	Power***Flex*** movement Bottom plate – 304 SS Upper plate – 304 SS Pin – 304 SS Hairspring assembly – 304 SS Pinion – 304 SS Segment – Glass filled polyester
Case:	304 SS (Std.), 316L SS (XYW)
Ring:	304 SS (Std.), 316L SS (XYW)
Process Connection Location:	Lower, Back, Top, 3 o'clock, 9 o'clock
Process Connection Sizes:	⅛ NPT, ¼ NPT (see ordering code for more options)

KEY BENEFITS

- **IP65 Rating**
- **NEMA 4X**
- **CRN Approved**
- **PED**
- ***PLUS!***™ **Performance (XLL)**

Dampening:	Glycerin case fill (Std. liquid fill), Silicone case fill (XGV), Halocarbon case fill (XGX), ***PLUS!*** Performance (XLL)
Weather Protection:	IP65 (Plug closed), IP54 (Plug vented) NEMA 4X (Plug closed)
Approvals:	CRN, RoHS, PED

310, 315 All-Welded “Mini” Diaphragm Seal

FEATURES

- No gaskets or bolts
- Available with ⅛ NPT flushing connection
- Designed for use with transducers and 3½″ or smaller gauges

TYPICAL USES

- Oil and gas
- Chemical processes
- Process equipment

310
Threaded Seal

SPECIFICATIONS	
Connection Style:	310: All-welded 315: All-welded with flushing connection
Process Connection Size:	310: ⅛ to 1 NPT Male, ¼ or ½ NPT Female 315: ¼ or ½ NPT Female
Instrument Connection Size:	⅛ or ¼ NPT Female
Pressure Rating (MAWP):	2,500 psi
Added Tolerance:	±0.5% typical
Wetted Components:	Diaphragm & bottom housing
Non-Wetted Components:	Top housing: 316L SS

WETTED COMPONENTS	
Diaphragm Material	Bottom Housing Material
See ordering code on page 2	See ordering code on page 2

NON-WETTED COMPONENTS
Top Housing
316L SS

KEY BENEFITS

- **Protects instrumentation in tight spaces**
- **Eliminates potential leak path with all-welded construction**
- **Low fill volume reduces temperature effects on instrument accuracy**

All specifications are subject to change without notice.
All sales subject to standard terms and conditions.

Three Phase Induction Motor - Squirrel Cage

Customer	:

Product line	: W22 IEEE 841 NEMA Premium Efficiency Three-Phase	Product code :	11433808
		Catalog # :	00518ST3HIE184T-W22

Frame	: 182/4T	Locked rotor time	: 27s (cold) 15s (hot)
Output	: 5 HP (3.7 kW)	Temperature rise	: 80 K
Poles	: 4	Duty cycle	: Cont.(S1)
Frequency	: 60 Hz	Ambient temperature	: -20°C to +40°C
Rated voltage	: 575 V	Altitude	: 1000 m.a.s.l.
Rated current	: 5.16 A	Protection degree	: IP55
L. R. Amperes	: 38.7 A	Cooling method	: IC411 - TEFC
LRC	: 7.5x(Code J)	Mounting	: F-1
No load current	: 2.56 A	Rotation[1]	: Both (CW and CCW)
Rated speed	: 1755 rpm	Noise level[2]	: 56.0 dB(A)
Slip	: 2.50 %	Starting method	: Direct On Line
Rated torque	: 2.07 kgfm	Approx. weight[3]	: 49.9 kg
Locked rotor torque	: 229 %		
Breakdown torque	: 320 %		
Insulation class	: F		
Service factor	: 1.25		
Moment of inertia (J)	: 0.0169 kgm²		
Design	: B		

Output	25%	50%	75%	100%
Efficiency (%)	88.2	88.5	89.5	89.5
Power Factor	0.37	0.62	0.74	0.80

Foundation loads	
Max. traction	: 113 kgf
Max. compression	: 163 kgf

		Drive end	Non drive end
Bearing type	:	6207 C3	6206 C3
Sealing	:	Inpro/Seal	Inpro/Seal
Lubrication interval	:	20000 h	20000 h
Lubricant amount	:	7 g	5 g
Lubricant type	:	Mobil Polyrex EM	

Notes

This revision replaces and cancel the previous one, which must be eliminated.
(1) Looking the motor from the shaft end.
(2) Measured at 1m and with tolerance of +3dB(A).
(3) Approximate weight subject to changes after manufacturing process.
(4) At 100% of full load.

These are average values based on tests with sinusoidal power supply, subject to the tolerances stipulated in NEMA MG-1.

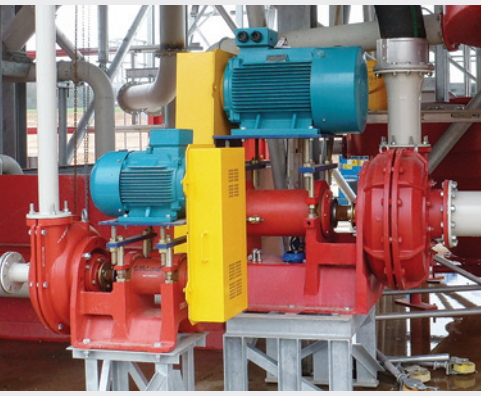
SLURRY PUMPS

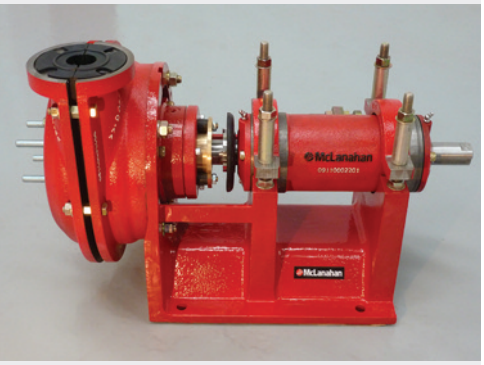
RELIABLE AND LONG LASTING

McLanahan's centrifugal Slurry Pumps are rubber-lined and abrasion resistant for long lasting service, low lifetime costs and straight forward servicing.

Eight models with discharge port sizes from 35mm to 250mm that can accommodate various options in lining material and gland type choices.



McLanahan®



mclanahan.com

APPLICATIONS

- Sand & Gravel / Minerals Processing
- Soil Washing / Remediation
- Waste Water Recovery / Disposal
- Concrete Wash-out

WETTED PARTS

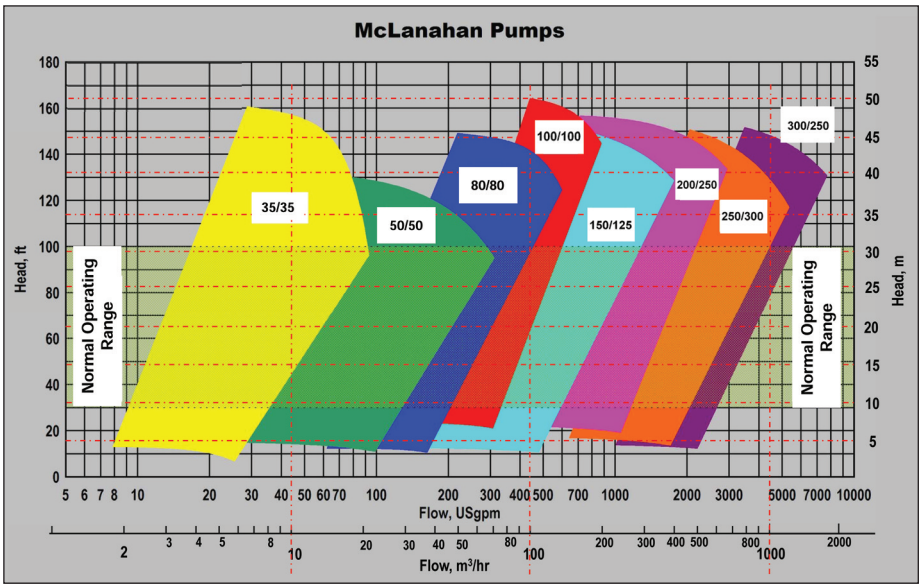
Standard pumps are equipped with natural rubber liners and impeller. However, bespoke options are available to suit a specific process and include premium natural rubber, Nitrile and food grade rubber. Shaft sleeves are from 304 St, but may be manufactured from other materials or coated to special order.

GLAND OPTIONS

D (Dry) Gland

An abrasion resistant Natural Rubber "Face Seal" riding a "Hard Face" and lubricated naturally by the process fluid. Controlled seepage of process fluid. Optional clean water injection facility.

H (Hydro) Gland



Clean water is injected into the inter-space between a pair of gland seals in tandem. Slight dilution – but total containment – of the process fluid. Controlled water seepage to atmosphere.

P (Packed) Gland

Gland packing mechanically adjusted to "ride" the shaft sleeve. Highest pressure capability. Some process dilution and water (or lubricating grease) seepage to atmosphere.

MOTOR AND DRIVE

McLanahan supplies pumps bare-shaft or complete with motor, overhead mounting platform, vee-belt drive and guard. Motors can also be oriented in Z-vee fashion, or side mounted on slide rails.

PUMP SELECTION

Initial pump selection can be determined by using the chart above as a guide. A qualified McLanahan engineer can determine the best pump performance for a specific application.

SPARES

High quality spare parts are available including moulded rubber Impellers, casing liners and suction bush components. All parts are available in various materials and hardness to suit differing applications. Mechanical spares such as fully assembled bearing housing cartridges and gland parts are available as kits for ease of procurement.

FLOWSERVE

Durco T4E Lined Plug Valves

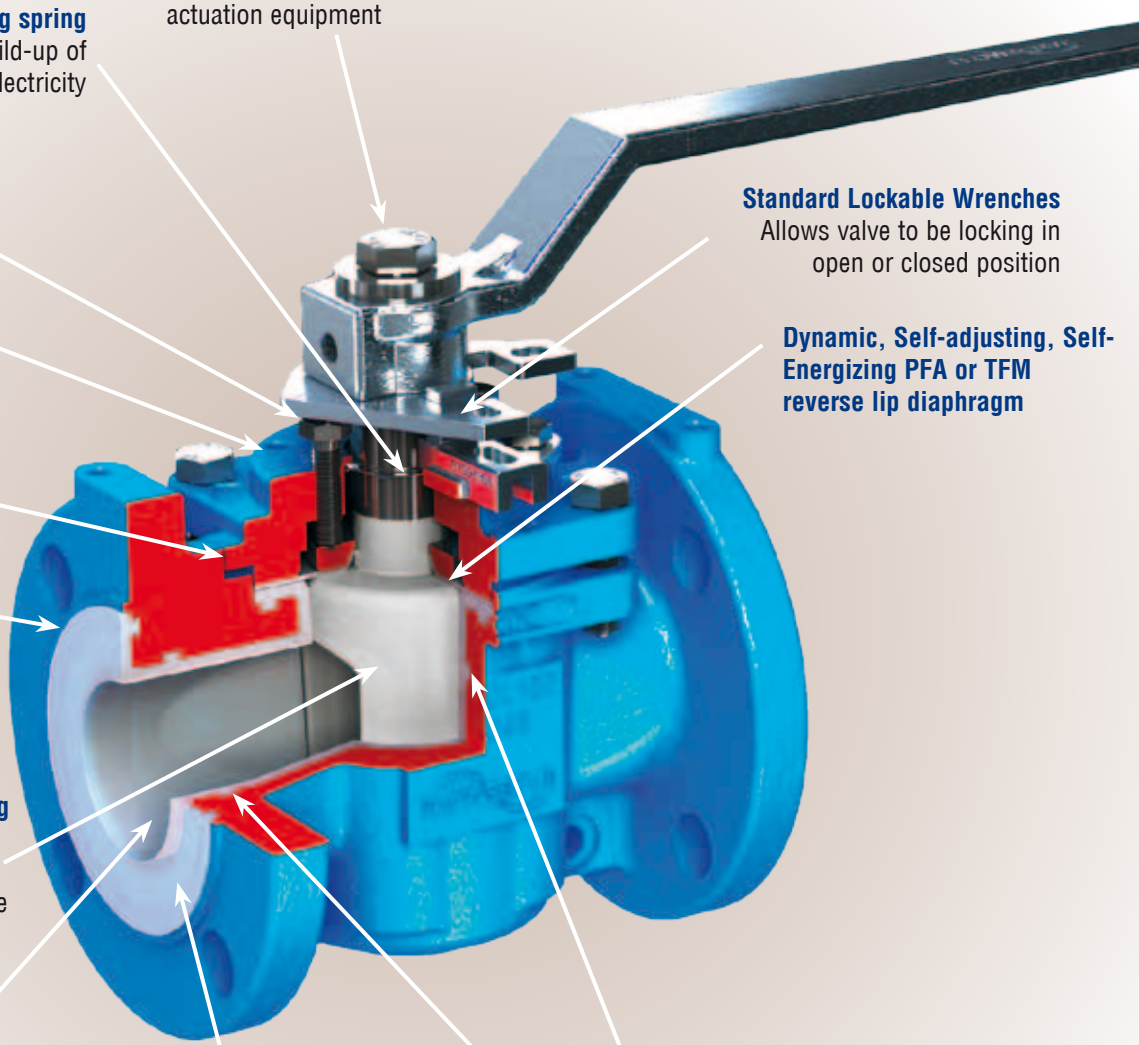
Fluoropolymer Lined Valves

Experience In Motion

History

Flowserve Durco T4E valves have been designed and developed with the latest technology and are the most preferred fluoropolymer lined valves in the global chemical industries.
Durco T4E valves provide maximum corrosion resistance and the elimination of product contamination at a reasonable cost.

Available in a Broad Size Range and



- ***T4E1*** *ASME Class 150 is available in sizes ½" through 12"*
- ***T4E2*** *DIN PN 16 is available in sizes DN 15 through DN 300*
- ***T4E3*** *ASME Class 300 is available in sizes ½" through 10"*

Extended Pressure Classes

- ***T4E1 and T4E2*** *rated 180 psi @400 °F (12.4 bar @ 204 °C), 250 psi @ 100 °F (17.2 bar @ 100 °C)*
- ***T4E3*** *rated 320 psi @ 400 °F (22 bar @ 204 °C), 740 psi @ 100 °F (51 bar @ 100 °C)*

Available with pneumatic or electric actuators for On-Off or modulating control applications.
All T4E valve series are rated to 4 Kpa (30 inches Hg) vacuum at ambient temperature.

Features

Double-D plug stem
accepts most standard actuation equipment

Grounding spring
To avoid build-up of static electricity

Inline adjustment
Stops thru-line leakage

ISO 5211 Mounting Pad
Universal flange for easy actuation mounting

Anti-Rotation Lugs
Help to eliminate stress on fasteners during actuation

Raised Lip
Prevents cold flow outward

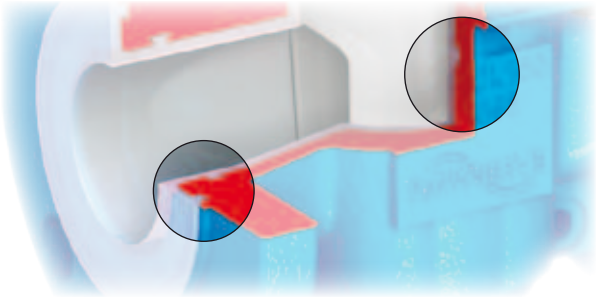
Standard Lockable Wrenches
Allows valve to be locking in open or closed position

Dynamic, Self-adjusting, Self-Energizing PFA or TFM reverse lip diaphragm

Solid Encapsulated PFA Molded Plug
All plug inserts have anchor holes to ensure a strong adhesion of the plug PFA liner material even under extreme cycling conditions

Large Ports
Offer good Cv values. Reduced frictional losses & pressure drop

High Quality PFA Liner
Protects the body and forms the flange gasket. The PFA liner is resistant against a wide variation of chemical products



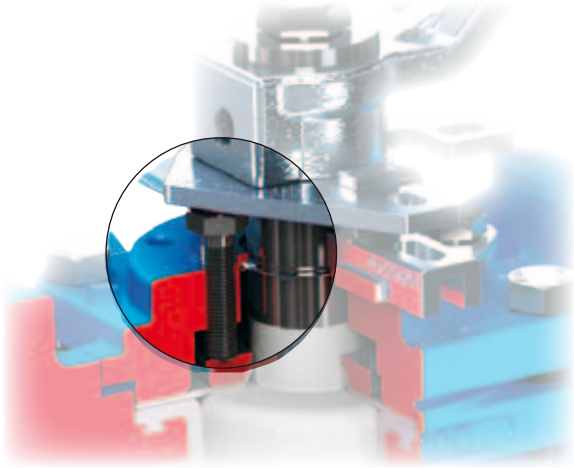
T-Slots in Critical Areas to Lock Liner Against Body Wall
Advantage will be a tight and perfect fit of the liner and an additional support during vacuum service

Additional Benefits

Benefits that give you the extra security which you will appreciate when using the T4E valves

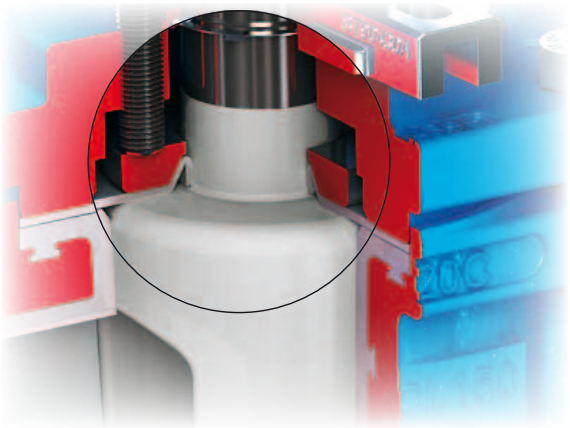
Body Liner

- A perfectly fixed PFA body liner is well anchored to the body by means of machined T-slots. The plug substrate has anchor holes to ensure that the PFA liner material is securely attached to the plug.
- Due to the selected mode to lock the liner to the valve body and plug, the T4E valve series is very suitable for extreme service conditions including vacuum applications at elevated temperatures.
- The PFA body liner covers all wetted surfaces in the body.
- Due to it's large sealing surface a tight shut-off is assured.
- In addition to the large seating area the valve is fully bi-directional and the seal is totally independent of line pressure.



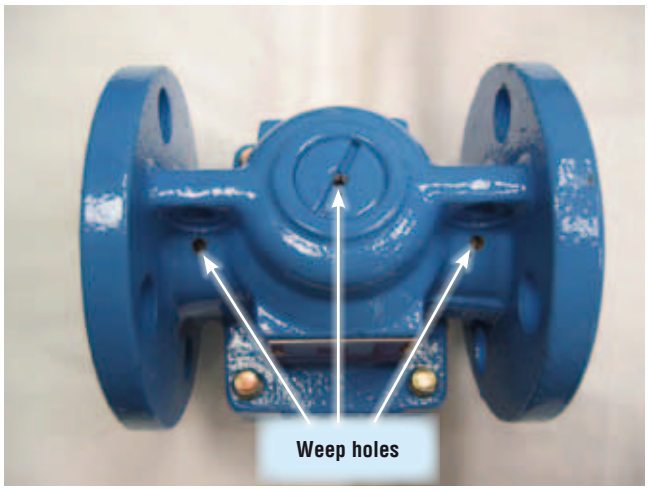
In-Line Adjustment

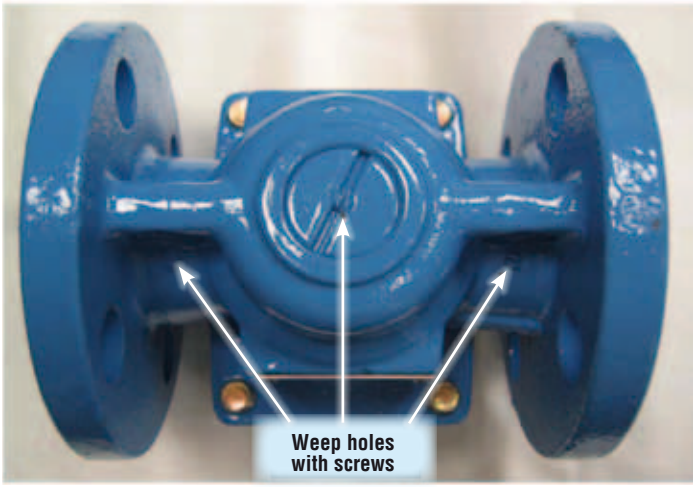
- No disassembly required to restore seating; plug can be reseated with a quick and easy in-line adjustment.
- An open end wrench and a few seconds are the extent of your maintenance requirements.



There are:

- No seats to replace
- No lengthy production disruption
- No piping disconnection
- No complicated, time-consuming maintenance procedures
- No hazards to personnel

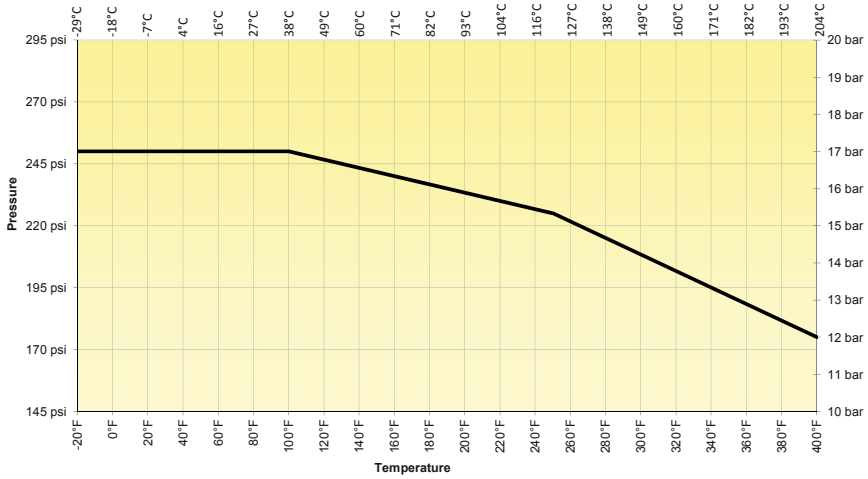


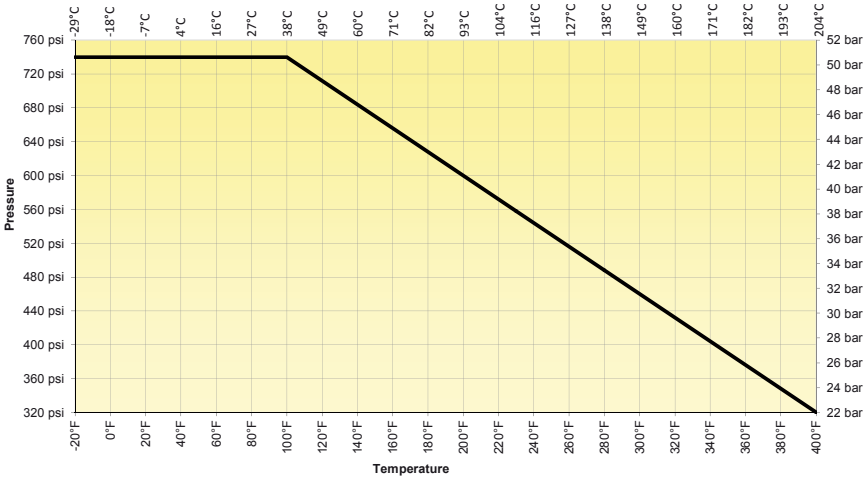


Secure Sealing

- A dynamic self-adjusting, self energized reverse lip PFA diaphragm seal prevents stem leakage.
- If line pressure forces liquid to the stem seal area, the self-energizing reverse lip PFA diaphragm will be forced against the stem to prevent external leakage.
- A sealing surface as much as 10x greater than other lined valves assures drop tight shut-off.
- In addition to the large sealing area, sealing is both upstream and downstream and is totally independent of line pressure.

Weepholes





Weepholes for early leakage detection

Durco T4E valves are supplied with three weepholes that are plugged with screws. The customer has the option to remove the screws. In so doing he is able to detect any leakage of process fluid through the liner and to take appropriate action.

Pressure-Temperature-Diagram - T4E1 and T4E2

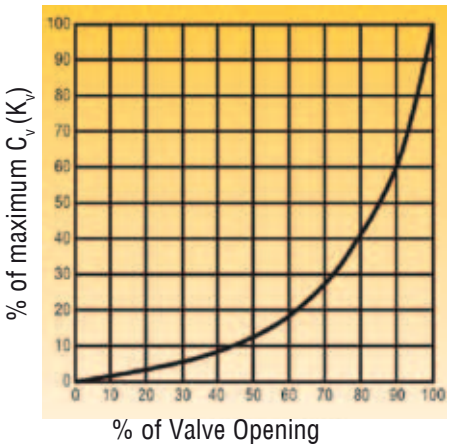
Pressure-Temperature-Diagram - T4E3

Durco T4E Automated Valves

Choose from a complete line of Flowserve Automax Automation Equipment for precise proportioning and On-Off control.....or we'll build a control package to your specification.

Flowserve Automax, a specialist in complete automation systems, produces a broad line of rack and pinion, heavy-duty, electric and linear actuators. In addition, a comprehensive line of engineered special control circuits, solenoid valves, limit switches, positioners and actuator mounting kits is offered.

Actuator Mounting

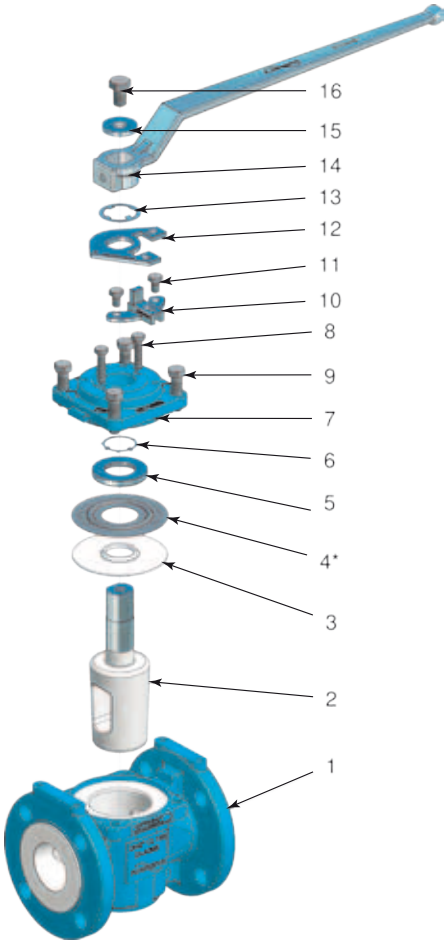


The body style of the T4E offers a choice of two locations for actuator mounting : an ISO 5200 pattern on the topcap or the flat-top pads of the flanges.

Software Capability

Flowserve offers a state-of-the-art range of software to help in sizing valves and actuation and creating drawings.

Modulating Control



V-port T4E valves are available in 1" (DN 25) through 4" (DN 100) sizes with Cv (Kv) values of 1 through 187 (Kv of 1 through 161). Standard port T4E valves are available in ½" (DN 15) through 12" (DN 300) sizes with Cv (Kv) values from 15 through 3200 (Kv from 13 through 2750).

Control Plugs

Size	Cv	Kv	Plug Type
1"	1	1	slotted plug
1"	3	3	slotted plug
1"	8	7	V-port
1"	13	11	V-port
1"	25	21	V-port

FLOWSERVE

How to Specify T4E Valves

Size[1]
0.5 in.
0.75 in.
1.5 in.
2 in.
3 in.
4 in.
6 in.
8 in.
10 in.
12 in.

Product Family
T4E = Standard

Pressure Class[1]
1 = ASME Cl. 150
2 = DIN PN 16
3 = ASME Cl. 300

End Configuration
1 = Raised Face Flanges

Plug Style		
C = 2-Way		
D = Slot	Cv = .8	1"
E = Vport	Cv = 3	1"
F = Vport	Cv = 8.3	1"
G = Vport	Cv = 13	1"
H = Vport	Cv = 29.6	1.5"
J = Vport	Cv = 53.6	2"
K = Vport	Cv = 88.7	3"
L = Vport	Cv = 187.1	4"

Options
C = Chlorine Service
D = Chlorine Clean Only
G = Bottom Vented Plug[8]
H = Upstream Vented Plug (side)
J = Side/Bottom Vented Plug (upstream)
L = Anti-Vibration Clip for Top Cap Bolts
M = Side Vent Downstream (requires release from customer in writing)
O = Oxygen Cleaning
R = Built Dry (no lubrication)[9]
S = Silicone Free Lubrication
W = No Options
@ = DuPont Flouropolymer Material
Q = Quality Plan

Manufacturers code
N = Internal use

Adjuster fastener[7]
1 = B840
2 = B9
3 = B7YC
4 = B7T
5 = C20
6 = HC
7 = B7
8 = MKH
9 = B7M
0 = B7MZ
E = 88YC

Top Cap Fastener[7]
1 = B840
2 = B9
3 = B7YC
4 = B7T
5 = C20
6 = HC
7 = B7
8 = MKH
9 = B7M
0 = B7MZ
E = 88YC

Operator
0 = Std. Wrench[5]
1 = Gear Cl[6]
2 = Locking Gear Cl
4 = Caustic Gear PF
9 = Bare Stem
B = Babbit/Chain

Standard Valve Codes		
Size	Class 150	Class 300

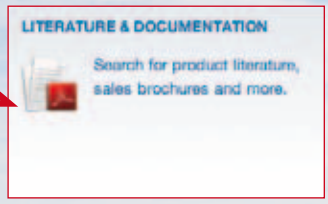
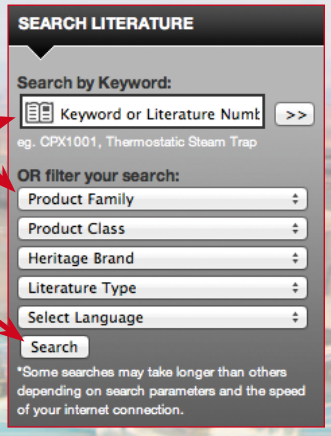
Body liner[2]	Plug Alloy[3]	Top Cap Alloy[4]
1 = DIPA	1 = DIPA	D = DCI
2 = DSPA	2 = D4PA	O = CD4M
3 = D4PA	3 = CDPA	

Codes	
DIPA	Ductile iron, PFA lined
DSPA	Carbon steel, PFA lined
D4PA	316 SS, PFA lined
CDPA	CD4MCuN, PFA lined

[1] Class 150 valves = ½" thru 12" ductile iron / 8" thru 12" stainless steel
Class 300 valves = ½" thru 10" carbon steel
[2] DIPA body = class 150 valves only
D4PA body = 8", 10" 12" class 150 valves only
DSPA body = class 300 valves only
[3] DIPA plug = ½" thru 12"
CDPA plug = 8", 10" and 12" only
[4] DCI top cap = DIPA valve bodies
CD4M top cap = D4PA and DSPA valve bodies
[5] Locking wrench standard thru 4"
[6] Gear standard 6" and above (also available on smaller sizes)
[7] B7YC = standard for ½" thru 6"
88YC = standard for 8", 10", 12" (Gr. 8.8 yellow chromated)
[8] 8" and larger plugs have bottom vent as standard
[9] No lubrication for valves up to 4"
Built with Krytox for valves 6" and above





To Access Literature On-line

More information about FLOWSERVE products can be obtained on-line. It's easy to find… it's free… and you do not need a password.

Do This:

1. Go to www.flowserve.com
2. Click in the box that says "Literature"
3. Enter "Keyword" or literature number and "Filter" as required
4. Click on "Search"

The most recent version of each product bulletin will be available on this site.

Once you have the PDF, you can:

- read it
- print it
- download it
- even e-mail it

Other Useful Information

In addition to lined plug valves, lined butterfly valves (Document number DVENTB0020) and lined ball valves, check valves and sight glasses (Document number ATENTB0010) are also available.

Finally, a wide variety of metallic and lined rotary valves and actuation equipment is summarized in the Document number DVENBR0001.

To obtain any of these brochures, follow the simple steps on the left of this page and enter the Document number in Step 3.

Ordering Preprinted Literature

Customers, please contact your Flowserve sales representative to get hard copy of a brochure. Flowserve representatives and distributors can go to www.flowserve.com and click on the "View Literature" link then click on "Log-in to order hard copy literature" and follow the prompts.

Flowserve Corporation has established industry leadership in the design and manufacture of its products. When properly selected, this Flowserve product is designed to perform its intended function safely during its useful life. However, the purchaser or user of Flowserve products should be aware that Flowserve products might be used in numerous applications under a wide variety of industrial service conditions. Although Flowserve can (and often does) provide general guidelines, it cannot provide specific data and warnings for all possible applications. The purchaser/user must therefore assume the ultimate responsibility for the proper sizing and selection, installation, operation, and maintenance of Flowserve products. The purchaser/user should read and understand the Installation Operation Maintenance (IOM) instructions included with the product, and train its employees and contractors in the safe use of Flowserve products in connection with the specific application.

While the information and specifications contained in this literature are believed to be accurate, they are supplied for informative purposes only and should not be considered certified or as a guarantee of satisfactory results by reliance thereon. Nothing contained herein is to be construed as a warranty or guarantee, express or implied, regarding any matter with respect to this product. Because Flowserve is continually improving and upgrading its product design, the specifications, dimensions and information contained herein are subject to change without notice. Should any question arise concerning these provisions, the purchaser/user should contact Flowserve Corporation at any one of its worldwide operations or offices.

1009 Stainless Steel Case Gauge

FEATURES

- Meets ASME B40.100 specifications
- Corrosion resistant SS case
- Dry gauges are field fillable
- Power***Flex***™ movement provides superior resistance to shock, vibration and pulsation
- True Zero™ reduces reading errors by using "zero box" instead of conventional dial pins
- ***PLUS!***™ performance available for liquid filled performance with a dry gauge
- MSL helium leak tested to 1X10^{-6} scc/s
- Ventable fill plug
- Accessory kits for easy panel mounting

TYPICAL USES

- Pumps and compressors
- Boilers
- Equipment skids
- Specialized OEM equipment
- Hydraulics and pneumatics
- Severe ambient conditions

SPECIFICATIONS

Accuracy:	ASME B40.100, Grade 1A, ±1% of span (Dry) ±1.5% of span (Liquid filled)
Dial Sizes:	2½″ (63mm), 3½″ (100mm)
Ranges:	Minimum 0-15 psi, maximum 0-15,000 psi, vacuum and compound
Wetted Materials	
Tube:	316L SS tube
Process Connection:	316L SS socket (SW) Aluminum bronze socket (AW)
Non Wetted Materials	
Window:	Polycarbonate (Std.), Safety glass (XSG), Polysulfone (XPS) 3½″ Dial only
Dial:	Black figures on white background, aluminum
Pointer:	Black, aluminum, adjustable (Std.), micrometer (XMP)
Movement:	Power***Flex*** movement Bottom plate – 304 SS Upper plate – 304 SS Pin – 304 SS Hairspring assembly – 304 SS Pinion – 304 SS Segment – Glass filled polyester
Case:	304 SS (Std.), 316L SS (XYW)
Ring:	304 SS (Std.), 316L SS (XYW)
Process Connection Location:	Lower, Back, Top, 3 o'clock, 9 o'clock
Process Connection Sizes:	⅛ NPT, ¼ NPT (see ordering code for more options)

KEY BENEFITS

- **IP65 Rating**
- **NEMA 4X**
- **CRN Approved**
- **PED**
- ***PLUS!***™ **Performance (XLL)**

Dampening:	Glycerin case fill (Std. liquid fill), Silicone case fill (XGV), Halocarbon case fill (XGX), ***PLUS!*** Performance (XLL)
Weather Protection:	IP65 (Plug closed), IP54 (Plug vented) NEMA 4X (Plug closed)
Approvals:	CRN, RoHS, PED

MIN/MAX TEMPERATURE LIMITS

- Designed for use with transducers and 3½″ or smaller gauges

TYPICAL USES

- Oil and gas
- Chemical processes
- Process equipment

310
Threaded Seal

SPECIFICATIONS	
Connection Style:	310: All-welded 315: All-welded with flushing connection
Process Connection Size:	310: ⅛ to 1 NPT Male, ¼ or ½ NPT Female 315: ¼ or ½ NPT Female
Instrument Connection Size:	⅛ or ¼ NPT Female
Pressure Rating (MAWP):	2,500 psi
Added Tolerance:	±0.5% typical
Wetted Components:	Diaphragm & bottom housing
Non-Wetted Components:	Top housing: 316L SS

WETTED COMPONENTS	
Diaphragm Material	Bottom Housing Material
See ordering code on page 2	See ordering code on page 2

NON-WETTED COMPONENTS
Top Housing
316L SS

KEY BENEFITS

- **Protects instrumentation in tight spaces**
- **Eliminates potential leak path with all-welded construction**
- **Low fill volume reduces temperature effects on instrument accuracy**

All specifications are subject to change without notice.
All sales subject to standard terms and conditions.

HYDROTECH

TECHNICAL SPECIFICATION

HPF

2218 – 2228-1F

REV. 20180827

Hydrotech™ Discfilter

The Hydrotech Performance Discfilter “HPF” is a mechanical and self-cleaning filter unit that offers the most compact filter area per footprint on the market. Introducing our trademarked PAGUS technology we are able to offer a faster particle extraction during the cleaning process that improves the filtration rate over the Discfilter. This design is superior to any filtration in fine solids removal and product recovery within woven media filtration. The compact design of this Discfilter makes this system a perfect choice for effluent polishing of wastewater, recirculation systems, filtration of intake water and other applications where a space saving filter with small openings and large filter area is required. Recommended filter openings range between 10—100 µm.

The Discfilter unit is equipped and delivered complete as a turn key system, which includes fully assembled backwash system, complete with pump, piping and patented spray nozzles. The Hydrotech patented moving spray bar design ensures an efficient cleaning of the filter media, increased life time of the filter media and 20% savings of rinse water consumption. Since march 2011, Hydrotech has been ISO9001 certified which is an additional step in reassuring a high quality product and the best possible support to our clients.

The Discfilter is delivered according to EC Machinery Directive and welding is performed in accordance with European standards with ASME welding as an option.

Filter model	HPF2218-1F	HPF2220-1F	HPF2222-1F
Number of discs installed	18	20	22
Filter area (m^2)	110,9	123,2	135,5
Number of filter panels	432	480	528
Number of backwash spray nozzles	252	280	308
Number of chemical spray nozzles	36	40	44
Hydraulic capacity (l/s)	360	400	440
Backwash pump Grundfos, 50Hz (60Hz)	MTR32-11/6 (32-11/3)	MTR45-10/4 (32-11/4)	MTR45-10/4 (32-11/4)

Appox. power consumotion, kW (backwash 30%)	3,38	3,38	4,12

General data	
Disc diameter (m)	2,2
SEW drive motor model	S77DRN90S4
Drive motor, installed power (kW) 50/60Hz	1,1
Transmission	Helical-worm gear
Chain drive	H78 2205/plastic
Backwash pressure (bar)	6,5
Backwash pump protection class	IP55
Backwash spray nozzles, material	Ceramic/plastic
Chemical spray nozzles, material	Plastic
Discs rotation speed (rpm)	Variable, 3,3 at 50/60 Hz
Water level detection	Conductivity sensor
Dry running protection for backwash pump	Telemecanique pressure switch
Pressure gauge	Nuova Fima analog pressure gauge
Ambient temperature °C (Others on reguest)	0 - 40
Stainless steel quality according to quote or order confirmation

Product No.: Uppdateras med 575 V, 60 Hz motor ABB
Vertical, non-self-priming, multistage, in-line, centrifugal pump for installation in pipe systems and mounting on a foundation.

The pump has the following characteristics:

- Impellers, intermediate chambers and outer

Impeller: sleeve are made of Titanium.
Pump housing: - Pump head cover and base are made of Titanium.
- The shaft seal has assembly length according to EN 12756.
- Power transmission is via cast iron split coupling.
Flange standard: - Pipework connection is via PJE flanges/couplings.

Phase: The motor is a 3-phase AC motor.

Liquid:

Pumped liquid:	Water
Liquid temperature range:	-20 .. 120 °C
Selected liquid temperature:	20 °C
Density:	998.2 kg/m³

Technical:

Pump speed on which pump data are based:	3500 rpm
Rated flow:	300 l/min
Rated head:	85.6 m
Primary shaft seal:	AUUE
Approvals on nameplate:	CE,TR
Curve tolerance:	ISO9906:2012 3B

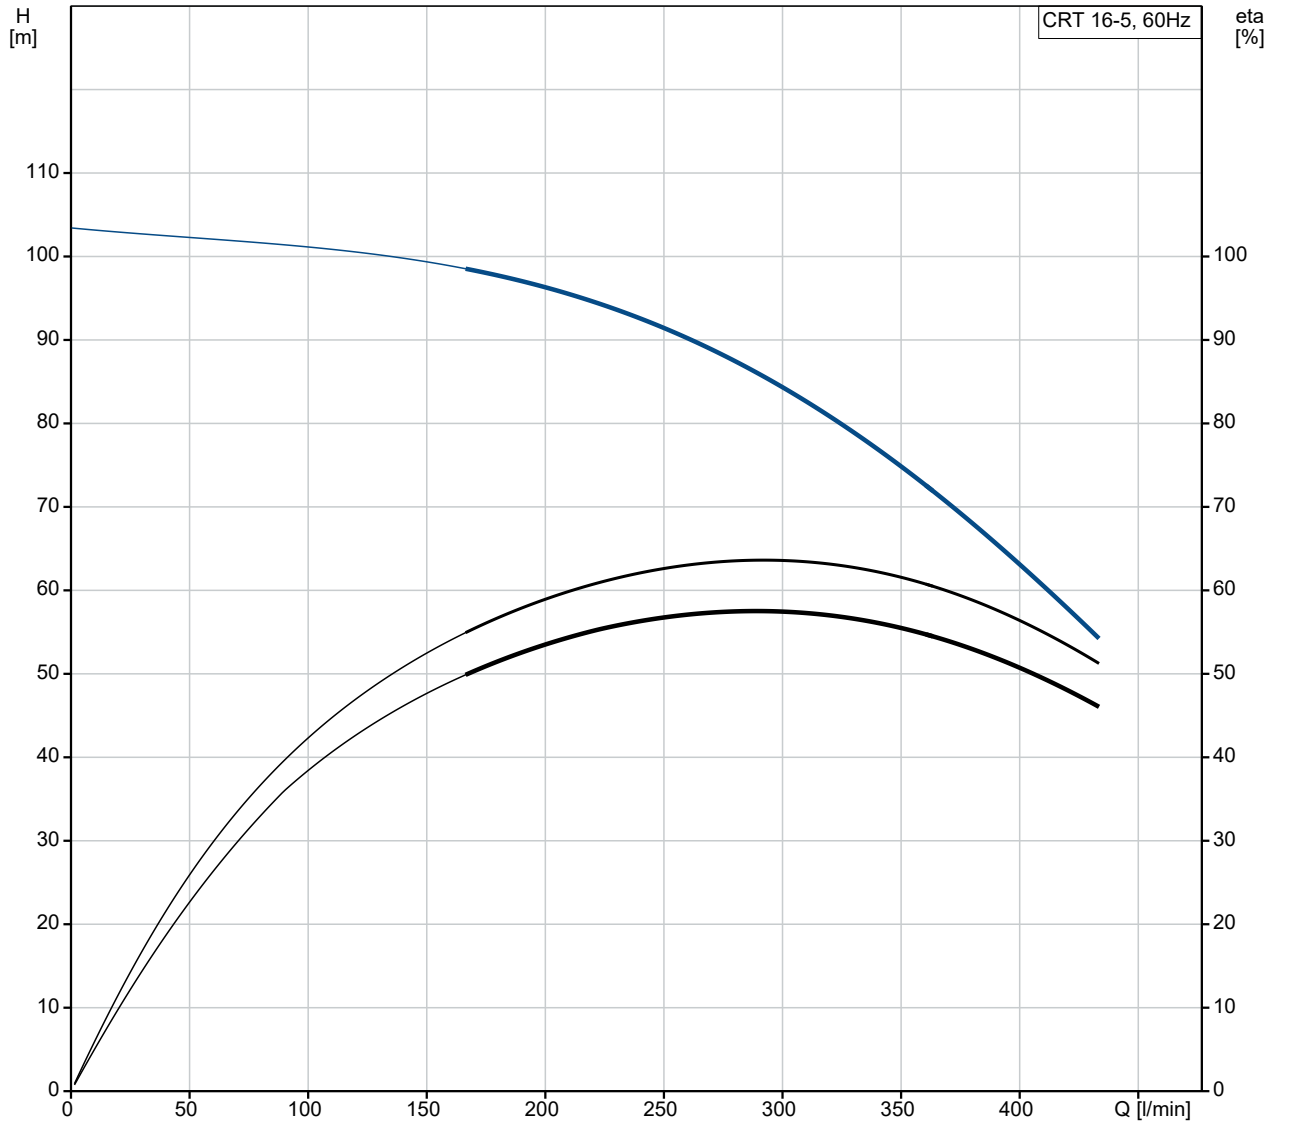
Materials:

Pump housing:	Titanium ASTM B 265
Impeller:	Titanium ASTM B 265
Bush material:	NONE

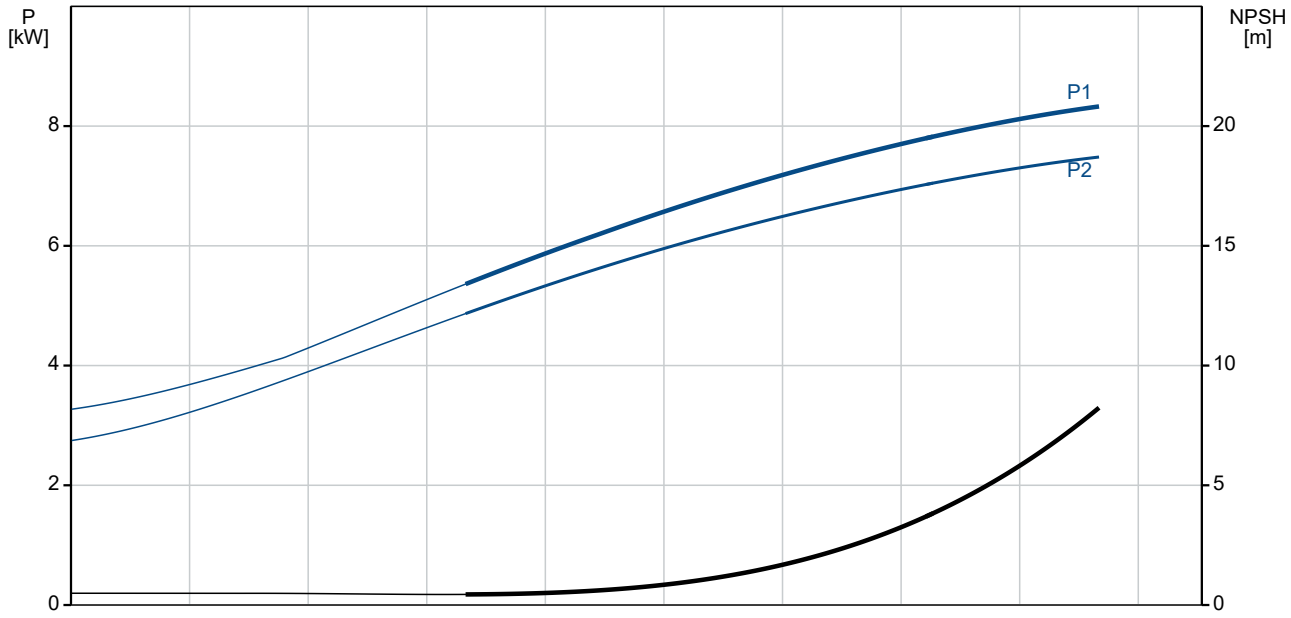
Installation:

Maximum ambient temperature:	60 °C
Max pressure at stated temp:	25 bar / 120 °C 25 bar / -20 °C
Flange standard:	PJE
Pipe connection:	60,3 mm
Flange size for motor:	FF265

Electrical data:



D r



Motor type:	132SB
IE Efficiency class:	IE2 - IE3
Rated power - P2:	7.5 kW
Power (P2) required by pump:	7.5 kW
	7.5 kW
Mains frequency:	60 Hz
Rated voltage:	3 x 220-277D/380-480Y V
Rated current:	24,6-20,8/14,2-12,0 A
Starting current:	680-1050 %
Cos phi - power factor:	0.90-0.82
Rated speed:	3490-3530 rpm
Efficiency:	IE2 89,5% - IE3 90,2%
Motor efficiency at full load:	89.5-90.2 %
Motor efficiency at 3/4 load:	90.8 %
Motor efficiency at 1/2 load:	90.8 %
Number of poles:	2
Enclosure class (IEC 34-5):	55 Dust/Jetting
Insulation class (IEC 85):	F
Motor No:	85U07522

Others:

Minimum efficiency index, MEI â‰¥:	0.69
Net weight:	88 kg
Gross weight:	98 kg

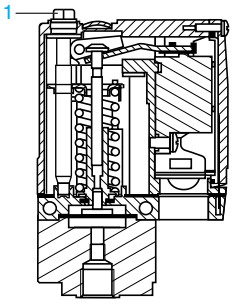
Electromechanical pressure and vacuum switches

Nautilus®

For control circuits, type XML

Presentation

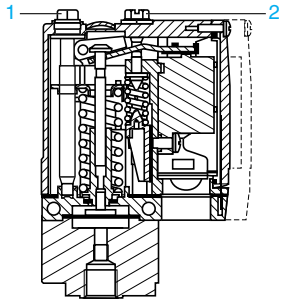


Pressure and vacuum switches type **XML** are switches for control circuits.
They are used to control the pressure of hydraulic oils, fresh water, sea water, air, steam, corrosive fluids or viscous products, up to 500 bar.

XML A pressure and vacuum switches have a fixed differential and are for detection of a single threshold. They incorporate a 1 C/O single-pole contact.
XML B pressure and vacuum switches have an adjustable differential and are for regulation between 2 thresholds. They incorporate a 1 C/O single-pole contact.
XML C pressure and vacuum switches have an adjustable differential and are for regulation between 2 thresholds. They incorporate 2 C/O single-pole contacts.
XML D pressure and vacuum switches are dual stage switches, each stage with a fixed differential, and are for detection at each threshold. They incorporate 2 C/O single-pole contacts (one per stage).

Setting

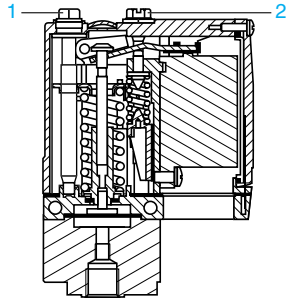
When setting pressure and vacuum switches XML, adjust the switching point on rising pressure (PH) first and then the switching point on falling pressure (PB).



Pressure and vacuum switches with fixed differential, type XML A

Switching point on rising pressure
The switching point on rising pressure (PH) is set by adjusting the red screw 1.

Switching point on falling pressure
The switching point on falling pressure (PB) is not adjustable.
The difference between the tripping and resetting points of the contact is the natural differential of the switch (contact differential, friction, etc.).



Pressure and vacuum switches with adjustable differential, types XML B and XML C

Switching point on rising pressure
The switching point on rising pressure (PH) is set by adjusting the red screw 1.

Switching point on falling pressure
The switching point on falling pressure (PB) is set by adjusting the green screw 2.

Dual stage pressure and vacuum switches with fixed differential for each threshold, type XML D

Switching point on rising pressure of stage 1 and stage 2
The first stage switching point on rising pressure (PH1) is set by adjusting the red screw 1.
The second stage switching point on rising pressure (PH2) is set by adjusting the blue screw 2.

Switching point on falling pressure
The switching points on falling pressure (PB1 and PB2) are not adjustable.
The difference between the tripping and resetting points of each contact is the natural differential of the switch (contact differential, friction, etc.).

Electromechanical pressure and vacuum switches

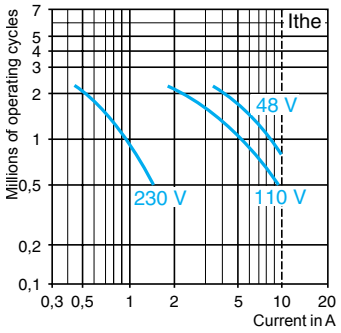
Environmental characteristics

Conformity to standards		CE, IEC/EN 60947-5-1, UL 508, CSA C22-2 n° 14
Product certifications		UL, CSA, CCC, BV, LROS, RINA, GL, DNV, VIT-SEPRO
Protective treatment		Standard version “TC”. Special version “TH”
Ambient air temperature	**°C**	For operation: - 25…+ 70. For storage: - 40 …+ 70
Fluids or products controlled		Hydraulic oils, air, fresh water, sea water (0…+ 160 °C), depending on model Steam, corrosive fluids, viscous products (0…+ 160 °C), depending on model
Materials		Case: zinc alloy Component materials in contact with fluid: see pages 6/128 and 6/129
Operating position		All positions
Vibration resistance		4 gn (30...500 Hz) conforming to IEC 68-2-6 except **XML ●L35●●●●●**, **XML ●001●●●●●** and **XML BM03●●●●●**: 2 gn
Shock resistance		50 gn conforming to IEC 68-2-27 except **XML ●L35●●●●●**, **XML ●001●●●●●** and **XML BM03●●●●●**: 30 gn
Electric shock protection		Class I conforming to IEC 1140, IEC 536 and NF C 20-030
Degree of protection		Screw terminal models: IP 66 conforming to IEC/EN 60529 Connector models: IP 65 conforming to IEC/EN 60529
Operating rate	**Op. cycles/ min**	Piston version switches: ≤ 60 (for temperature > 0 °C) Diaphragm version switches: ≤ 120 (for temperature > 0 °C)
Repeat accuracy		< 2%
Fluid connection		G 1/4 (BSP female) conforming to NF E 03-005, ISO 228 or 1/4” NPTF (consult your Regional Sales Office)
Electrical connection		Screw terminal models: ISO M20 x 1.5 tapped entry For an entry tapped for n° 13 (DIN Pg 13.5) cable gland, replace the last number of the reference by 1 (example: **XML A010A2S12** becomes **XML A010A2S11**) For an entry tapped 1/2” NPT, please consult your Regional Sales Office Connector models (either type DIN 43650 A or M12): please consult your Regional Sales Office

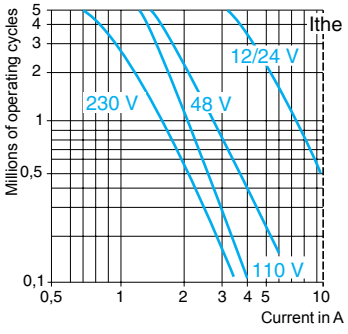


Contact block characteristics

Rated operational characteristics		~ AC-15; B300 (Ue = 240 V, Ie = 1.5 A - Ue = 120 V, Ie = 3 A) ⎓ DC-13; R300 (Ue = 250 V, Ie = 0.1 A) conforming to IEC 947-5-1 Appendix A, EN 60 947-5-1
Rated insulation voltage		Ui = 500 V conforming to IEC/EN 60947-1 Ui = 300 V conforming to UL 508, CSA C22-2 n° 14
Rated impulse withstand voltage		U imp = 6 kV conforming to IEC/EN 60947-1
Type of contacts		Silver tipped contacts **XML A** and **XML B**: 1 C/O single-pole contact (4 terminal), snap action **XML C**: 2 C/O single-pole contacts (8 terminal), simultaneous, snap action **XML D**: 2 C/O single-pole contacts (8 terminal), staggered, snap action
Resistance across terminals	**mΩ**	< 25 conforming to NF C 93-050 method A or IEC 255-7 category 3
Terminal referencing		Conforming to CENELEC EN 50013
Short-circuit protection		10 A cartridge fuse type gG (gl)
Connection		Screw clamp terminals. Clamping capacity, min: 1 x 0.2 mm², max: 2 x 2.5 mm²

Electrical durability
Conforming to IEC/EN 60947-5-1 Appendix C
Utilisation categories AC-15 and DC-13

Operating rate: 3600 operating cycles/hour
Load factor: 0.5



XML A and **XML B**

FMX21-CD121CGD15A-CSA-approved

Technical Information
Waterpilot FMX21

Hydrostatic level measurement

Compact transmitter for level measurement

Application

The Waterpilot FMX21 is a pressure sensor for hydrostatic level measurement.

Endress+Hauser offers three different versions of the device:
- FMX21 with a stainless steel housing, external diameter of 22 mm (0.87 in): This version is excellently suited to drinking water applications and for use in bore holes and wells with small diameters
- FMX21 with a stainless steel housing, external diameter of 42 mm (1.65 in): Heavy-duty version and easy to clean thanks to flush-mounted process isolating diaphragm, ideally suited to wastewater and wastewater treatment plants
- FMX21 with plastic insulation, external diameter of 29 mm (1.14 in): Robust version for use in salt water and excellently suited to applications on ships (e.g. ballast water tanks)

Your benefits

- High resistance to overload
- High-precision, robust ceramic measuring cell with long-term stability
- Climate proofed sensor thanks to completely potted electronics and 2-filter pressure compensation system
- Simultaneous measurement of level and temperature with optionally integrated Pt100 temperature sensor
- Accuracy
  - Standard reference accuracy ±0.2 %
  - PLATINUM version ±0.1 %
- Automatic density compensation to increase accuracy
- Usage in drinking water: KTW, NSF, ACS
- Approvals: ATEX, FM, CSA
- Marine approvals: GL, ABS, BV, DNV
- Extensive range of accessories provides complete measuring point solutions

The Brief Operating Instructions contain all the essential information from incoming acceptance to initial commissioning.

Operating Instructions (BA): your comprehensive reference

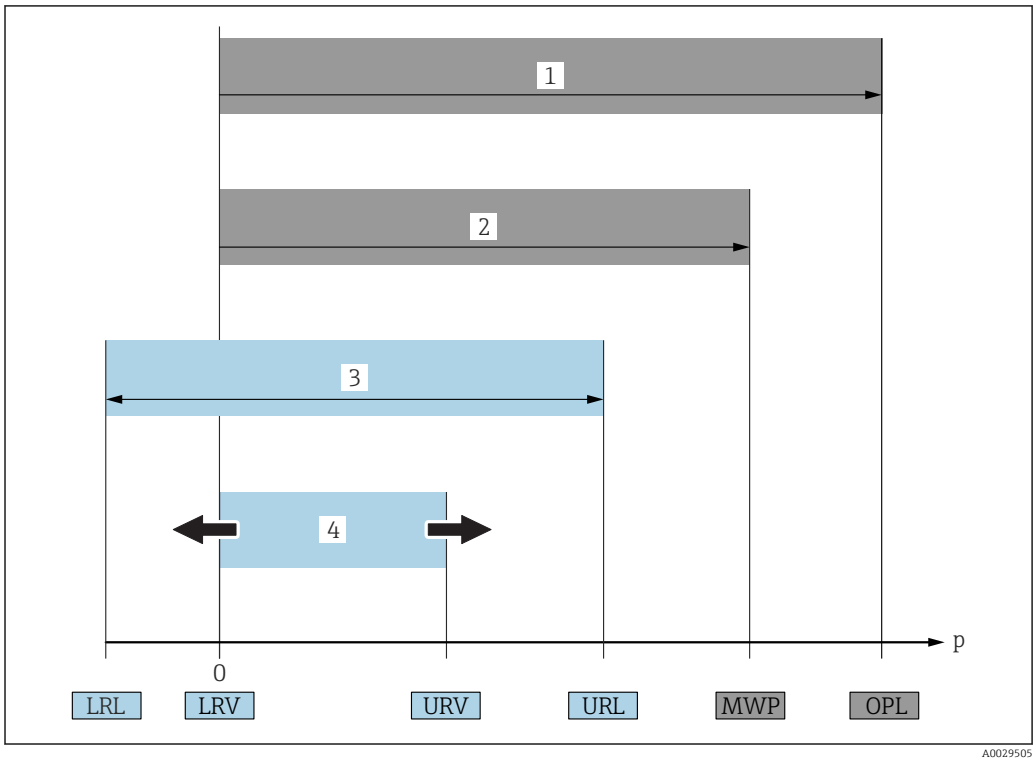
FMX21 4 to 20 mA Analog - BA01605P:

FMX21 4 to 20 mA HART - BA00380P:

RIA15 - BA01170K:

These Operating Instructions contain all the information that is required in various phases of the life cycle of the device: from product identification, incoming acceptance and storage, to mounting, connection, operation and commissioning through to troubleshooting, maintenance and disposal.

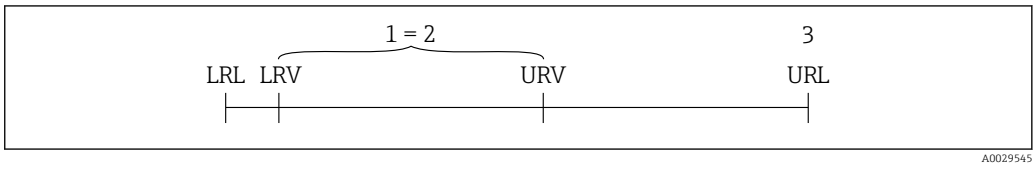
Safety Instructions (XA)



Depending on the approval, the following Safety Instructions (XA) are supplied with the device. They are an integral part of the Operating Instructions.

Directive	Type of protection	Category	Documentation	Option [1]
ATEX	Ex ia IIC	II 2 G	XA00454P	BD
ATEX	Ex nA IIC	II 3 G	XA00485P	BE
IECEx	Ex ia IIC	n/a	XA00455P	IC
CSA C/US	Ex ia IIC	n/a	ZD00232P (960008976)	CE
FM	AEx ia IIC	n/a	ZD00231P (960008975)	FE
NEPSI	Ex ia IIC	n/a	XA00456P	NA
INMETRO	Ex ia IIC	n/a	XA01066P	MA

1) Product Configurator order code for "Approval"



The nameplate indicates the Safety Instructions (XA) that are relevant to the device.

Terms and abbreviations

Item	Term/abbreviation	Explanation
1	OPL	The OPL (over pressure limit = sensor overload limit) for the measuring device depends on the lowest-rated element, with regard to pressure, of the selected components, i.e. the process connection has to be taken into consideration in addition to the measuring cell. Also observe pressure-temperature dependency. The OPL may only be applied for a limited period of time.
2	MWP	The MWP (maximum working pressure) for the sensors depends on the lowest-rated element, with regard to pressure, of the selected components, i.e. the process connection has to be taken into consideration in addition to the measuring cell. Also observe pressure-temperature dependency. The MWP may be applied at the device for an unlimited period. The MWP can also be found on the nameplate.
3	Maximum sensor measuring range	Span between LRL and URL This sensor measuring range is equivalent to the maximum calibratable/adjustable span.
4	Calibrated/adjusted span	Span between LRV and URV Factory setting: 0 to URL Other calibrated spans can be ordered as customized spans.
p	-	Pressure
-	LRL	Lower range limit
-	URL	Upper range limit
-	LRV	Lower range value
-	URV	Upper range value
-	TD (turn down)	Turn down Example - see the following section.
-	PE	Polyethylene
-	FEP	Fluorinated ethylene propylene
-	PUR	Polyurethane

Turn down calculation

1 Calibrated/adjusted span
2 Zero point-based span (4 to 20 mA Analog: customer-specific span can only be set at the factory when ordered)
3 URL sensor

Example

- Sensor:10 bar (150 psi)
- Upper range value (URL) = 10 bar (150 psi)
- Calibrated/adjusted span: 0 to 5 bar (0 to 75 psi)
- Lower range value (LRV) = 0 bar (0 psi)
- Upper range value (URV) = 5 bar (75 psi)

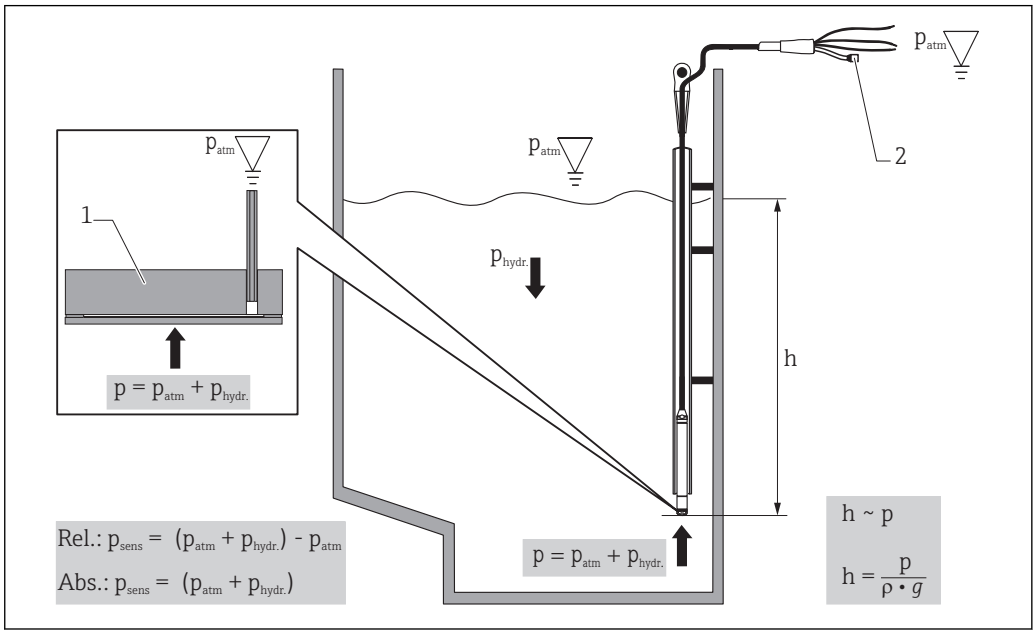
Turn down (TD):

$$TD = \frac{URL}{|URV - LRV|}$$

$$TD = \frac{10\ \text{bar (150 psi)}}{|5\ \text{bar (75 psi)} - 0\ \text{bar (0 psi)}|} = 2$$

In this example, the TD is 2:1.
This span is based on the zero point.

Function and system design



Device version

Outer diameter	22 mm (0.87 in)	42 mm (1.65 in)	Max. 29 mm (1.14 in)
	 A0018640	 A0018641	 A0018642
Field of application	Hydrostatic level measurement in deep wells e.g. drinking water	Hydrostatic level measurement in wastewater	Hydrostatic level measurement in saltwater
	NOTICE **The Waterpilot is not suitable for use in biogas plants since the gases can diffuse through the elastomers (seals, cable).** ▶ For applications involving biogas, Endress+Hauser offers the Deltapilot level measuring device.		
Process connection	▪ Suspension clamp ▪ Cable mounting screw with G 1½" A or NPT 1½" thread		
Extension cable	PE, PUR, FEP → 🖹 45		
Seals	▪ FKM Viton ▪ EPDM [1]	FKM Viton	▪ FKM Viton ▪ EPDM [1]
Measuring ranges	▪ Relative pressure: 0 to 0.1 bar (0 to 1.5 psi) to 0 to 20 bar (0 to 300 psi) ▪ Absolute pressure: 0 to 2 bar (0 to 30 psi) to 0 to 20 bar (0 to 300 psi)		▪ Relative pressure: 0 to 0.1 bar (0 to 1.5 psi) to 0 to 4 bar (0 to 60 psi) ▪ Absolute pressure: 0 to 2 bar (0 to 30 psi) to 0 to 4 bar (0 to 60 psi)
	▪ Customer-specific measuring ranges; factory-calibrated. ▪ The following output units can be configured: %, mbar, bar, kPa, MPa, mmH_2O, mH_2O, inH_2O, ftH_2O, psi and numerous level units.		
Overload	to 40 bar (600 psi)		to 25 bar (375 psi)
Process temperature range	−10 to +70 °C (+14 to +158 °F)		0 to +50 °C (+32 to +122 °F)
Reference accuracy	▪ ±0.2 % of the set span ▪ Optional: ±0.1 % of set span (PLATINUM version)		
Supply voltage	10.5 to 35 V DC, Ex: 10.5 to 30 V DC		
Output	▪ 4 to 20 mA Analog ▪ 4 to 20 mA HART (can be inverted) with superimposed digital communication protocol HART 6.0, 2-wire		
Options	Drinking water approval	–	
	▪ Wide range of approvals, including ATEX, FM, CSA ▪ Numerous accessories ▪ Integrated Pt100 temperature sensor and TMT181 temperature head transmitter (4 to 20 mA) ▪ Integrated Pt100 temperature sensor and TMT182 temperature head transmitter (4 to 20 mA HART) ▪ Marine approval		
Specialties	▪ High-precision, robust ceramic measuring cell with long-term stability ▪ Automatic density compensation ▪ Customer-specific cable marking		

1) Recommended for drinking water applications, not suitable for use in hazardous areas.

Measuring principle

The ceramic measuring cell is a dry measuring cell i.e. the pressure acts directly on the robust, ceramic process isolating diaphragm of the Waterpilot FMX21. Changes in air pressure are guided via a pressure compensation tube through the extension cable to the rear of the ceramic process isolating diaphragm and are compensated for. A pressure-dependent change in capacitance, caused by the movement of the process isolating diaphragm, is measured at the electrodes of the ceramic carrier. The electronics unit then converts this to a signal that is proportional to the pressure and linear to the level.

1 Ceramic measuring cell
2 Pressure compensation tube
h Height level
p Total pressure = atmospheric pressure + hydrostatic pressure
ρ Density of the medium
g Acceleration due to gravity
$P_{hydr.}$ Hydrostatic pressure
P_{atm} Atmospheric pressure
P_{sens} Pressure displayed on the sensor

Temperature measurement with optional Pt100 resistance thermometer [1)]

For simultaneous measurement of level and temperature, Endress+Hauser offers the Waterpilot FMX21 with an optional 4-wire Pt100 resistance thermometer → 🖹 52. The Pt100 is categorized as Accuracy Class B as per DIN EN 60751.

Temperature measurement with optional Pt100 and TMT181 temperature head transmitter for FMX21 4 to 20 mA Analog [1)]

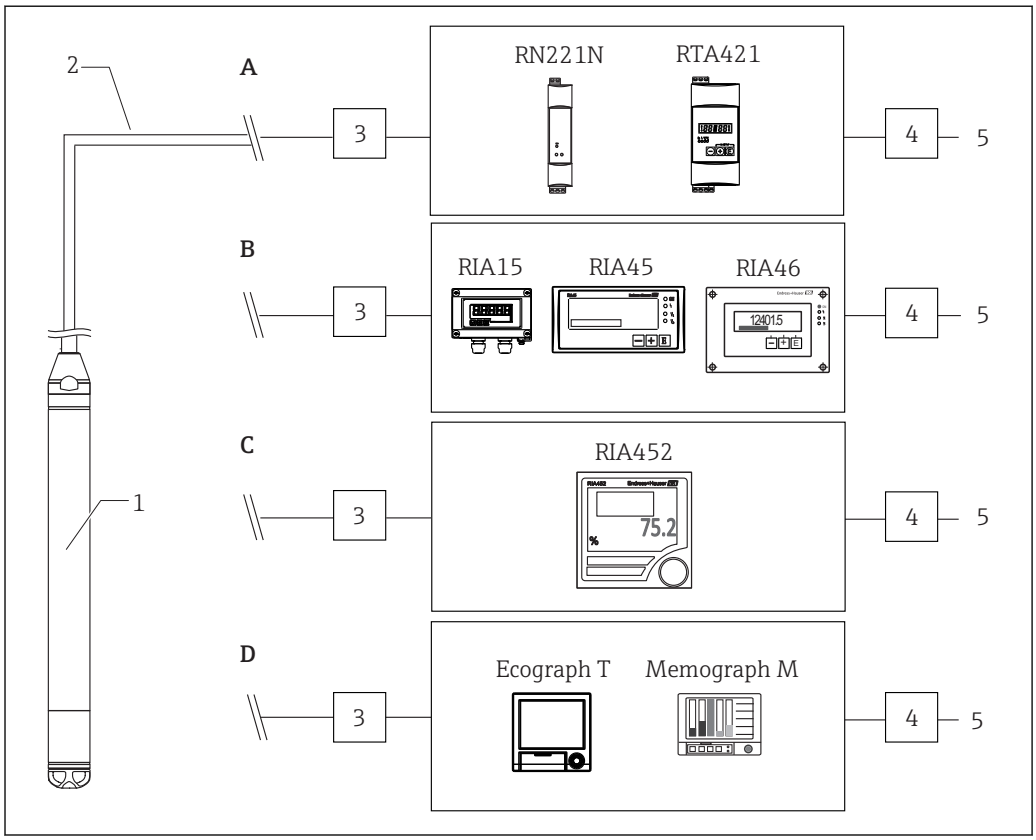
To convert the temperature signal to an analog, scalable 4 to 20 mA output signal, Endress+Hauser also offers the TMT181 temperature head transmitter.

Ordering information: → 🖹 50; "Accessories" → 🖹 52. Technical Information TI00070R.

Temperature measurement with optional Pt100 and TMT182 temperature head transmitter for FMX21 4 to 20 mA HART [1)]

Endress+Hauser also offers the TMT182 temperature head transmitter with HART protocol for converting the temperature signal to an analog, scalable 4 to 20 mA output signal superimposed with HART 6.0. See also: "Density compensation with Pt100 temperature sensor" → 🖹 12

Ordering information: → 🖹 50; "Accessories" → 🖹 52. Technical Information TI00078R.



1) Not for use in hazardous areas.

Measuring system

Application examples

As standard, the complete measuring system consists of a Waterpilot FMX21 and a transmitter power supply unit with a supply voltage of 10.5 to 30 V DC (hazardous areas) or 10.5 to 35 V DC (non-hazardous areas).

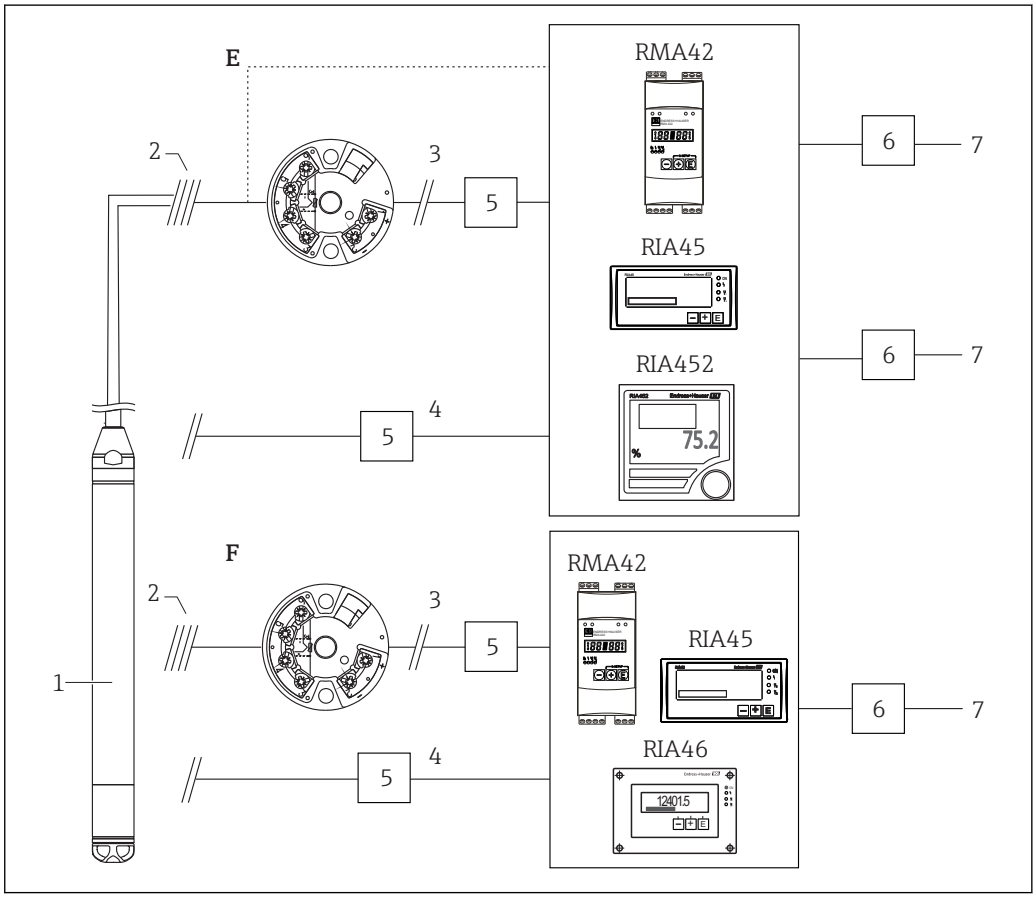
Possible measuring point solutions with a transmitter and evaluation units from Endress+Hauser:

A0018644

1 Waterpilot FMX21
2 4 to 20 mA or 4 to 20 mA HART
3+4 Overvoltage protection, e.g. HAW from Endress+Hauser (not for use in hazardous areas) HAW562; for DIN rail: HAW562/intrinsically safe HAW562Z. Selection in accordance with supply voltage.
5 Power supply

A: Easy and cost-effective measuring point solution: power supplied to the Waterpilot in hazardous and non-hazardous areas via the RN221N active barrier. Power supply and additional control of two appliances, such as pumps, via the RTA421 limit value switch with local display.

B: The RIA45 evaluation unit (for panel mounting) or the RIA46 evaluation unit (for field installation) offers power supply, local display and two switch outputs. If the RIA15 is used, the basic settings for the FMX21 HART can be made via the display module.



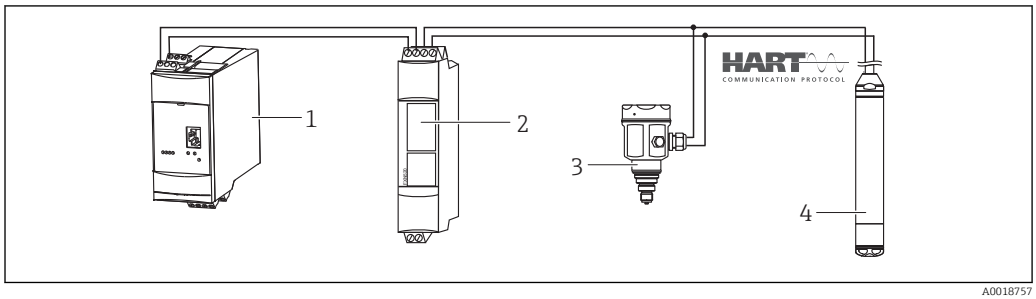
C: If several pumps are used, the pump service life can be prolonged by alternate switching. With alternating pump control, the pump which was out of service for the longest period of time is switched on. The RIA452 evaluation unit (for panel mounting) offers this option in addition to numerous other functions.

D: State-of-the-art recording technology with graphic display recorders from Endress+Hauser, such as Ecograph T, Memograph M for documentation, monitoring, visualization and archiving purposes.

Application examples with the Pt100

As standard, the complete measuring system consists of a Waterpilot FMX21 and a transmitter power supply unit with a supply voltage of 10.5 to 30 V DC (hazardous areas) or 10.5 to 35 V DC (non-hazardous areas).

Possible measuring point solutions with a transmitter and evaluation units from Endress+Hauser:



1 *Waterpilot FMX21*
2 *Connection for integrated Pt100 in the FMX21*
3 *Temperature for 4 to 20 mA or 4 to 20 mA HART*
4 *Level for 4 to 20 mA or 4 to 20 mA HART*
5 *Overvoltage protection, e.g. HAW from Endress+Hauser (not for use in hazardous areas) on the sensor side for field installation: HAW569; for DIN rail: HAW562/intrinsically safe HAW562Z. Selection in accordance with supply voltage.*
6 *Overvoltage protection, e.g. HAW from Endress+Hauser (not for use in hazardous areas) on the supply side for DIN rail: HAW561 (115/230 V) and HAW561K (24/48 V AC/DC). Selection in accordance with supply voltage.*
7 *Power supply*

E: If you wish to measure, display and evaluate the temperature as well as the level, e.g. to monitor the temperature in fresh water for the purpose of detecting temperature limits for germ formation, the options available to you include the following: The optionally available TMT182 temperature head transmitter can convert the Pt100 signal to a 4 to 20 mA signal or a 4 to 20 mA HART signal and transfer it to any commonly used evaluation unit. The RMA42, RIA45 and RIA452 evaluation units also offer a direct input for the Pt100 signal.

F: If you wish to record and evaluate the level and temperature measured value with one device, use the RMA42, RIA45 and RIA46 evaluation units with two inputs. It is even possible to mathematically link the input signals with this unit. These evaluation units are HART-compatible.

Level measurement with absolute pressure probe and external pressure signal for FMX21 4 to 20 mA HART

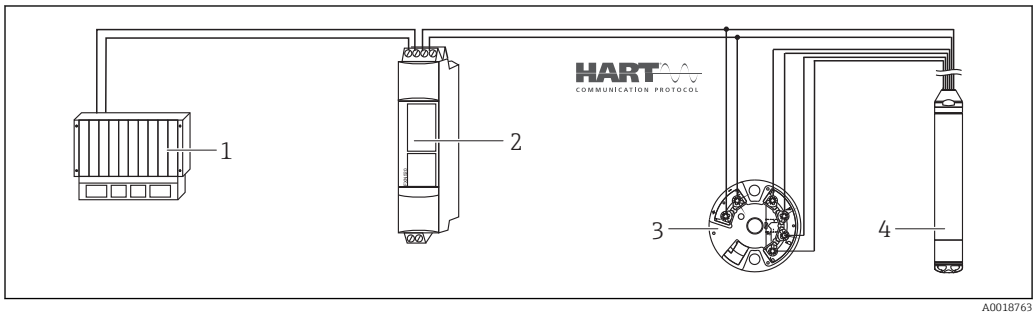
1 Fieldgate FXA520
2 Multidrop Connector FXN520
3 Cerabar
4 Waterpilot FMX21 4 to 20 mA HART

It is advisable to use an absolute pressure probe for applications in which condensation can occur. For level measurement using an absolute pressure probe, the measured value is affected by fluctuations in the ambient pressure. To correct the resulting measured error, you can connect an external absolute pressure sensor (e.g. Cerabar) to the HART signal line, switch the Waterpilot to burst mode and operate the Cerabar in the "Electr. Delta P" mode. The external absolute pressure sensor then calculates the difference between the two pressure signals and can thus determine the level precisely. Only one level measured value can be corrected in this way.

If using intrinsically safe devices, the regulations for interconnecting intrinsically safe circuits as stipulated in IEC60079-14 (proof of intrinsic safety) must be observed.

Density compensation with the Pt100 temperature sensor for FMX21 4 to 20 mA HART

The Waterpilot FMX21 4 to 20 mA HART can correct measured errors that result from fluctuations in the density of the water caused by temperature. Users can choose from the following options:



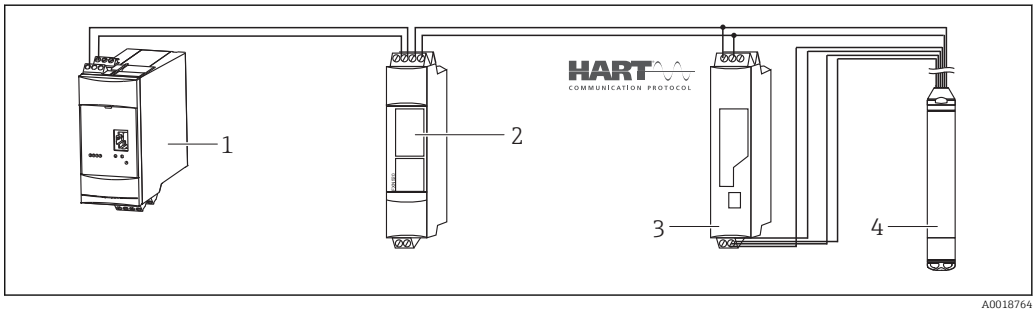
Use the internally measured sensor temperature of the FMX21

The internally measured sensor temperature is calculated in the Waterpilot FMX21 4 to 20 mA HART for density compensation. The level signal is thus corrected according to the density characteristic line of water.

Use the optional internal temperature sensor for density compensation in a suitable HART master (e.g. PLC)

The Waterpilot FMX21 4 to 20 mA HART is optionally available with a Pt100 temperature sensor. To convert the Pt100 signal to a 4 to 20 mA HART signal, Endress+Hauser also offers the TMT182 temperature head transmitter.

The temperature and pressure signals are queried by a HART master (e.g. PLC), where a corrected level value can be generated using a stored linearization table or density function (of a chosen medium).



1 HART master, e.g. PLC (programmable logic controller)
2 FXN520 Multidrop Connector
3 TMT182 temperature head transmitter
4 Waterpilot FMX21 4 to 20 mA HART

Use an external temperature signal, which is transmitted to the FMX21 4 to 20 mA HART via the HART burst mode

The Waterpilot FMX21 4 to 20 mA HART is optionally available with a Pt100 temperature sensor. With this option, the signal of the Pt100 is evaluated with a HART-compliant temperature transmitter (min. HART 5.0) that supports the BURST mode. The temperature signal can thus be transmitted to the FMX21 4 to 20 mA HART. The FMX21 4 to 20 mA HART uses this signal for density correction of the level signal.

The TMT182 temperature head transmitter is not suitable for this configuration.

1 Fieldgate FXA520
2 Multidrop Connector FXN520
3 HART-compatible temperature transmitter (e.g. TMT82)
4 Waterpilot FMX21 4 to 20 mA HART

Without additional compensation due to the anomaly of water, errors of up to 4% may occur at a temperature of 70 °C (158 °F), for example. With density compensation, this error can be decreased to 0.5 % in the entire temperature range from 0 to +70 °C (+32 to +158 °F).

More information can be found in the Technical Information:

- TI01010T: TMT82 temperature transmitter (4 to 20 mA HART)

2) Product Configurator order code for "Sensor range"
3) These measuring ranges are not available for the special version with plastic insulation, external diameter of 29 mm (1.14 in).

Input signal

FMX21 + Pt100 (optional)

- Change in capacitance
- Pt100: Change in resistance

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

Pt100 resistance signal, 4 wire

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

Pt100 resistance signal, 4 wire

Output

Output signal

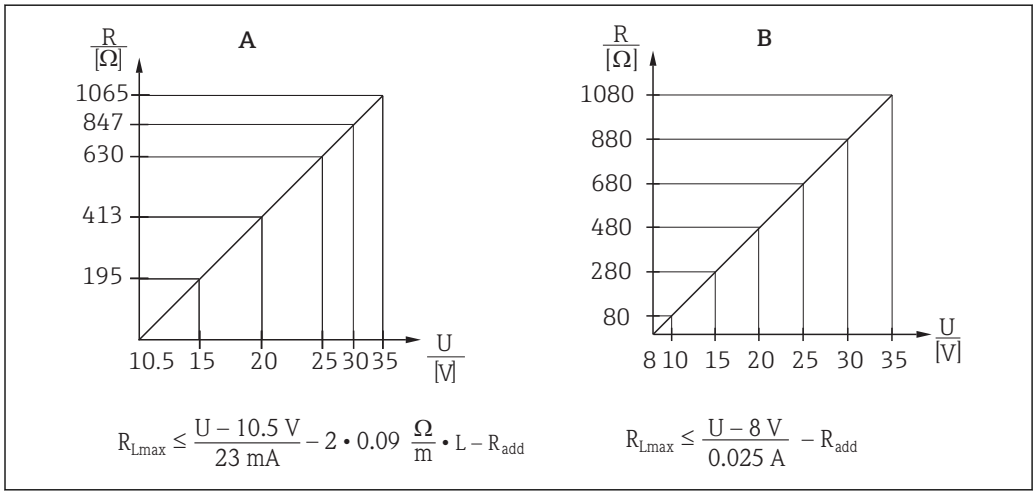
FMX21 + Pt100 (optional)

- 4 to 20 mA Analog, 2-wire for hydrostatic pressure measured value.
  Ordering information: Product Configurator order code for "Output", option "1"
- 4 to 20 mA HART with superimposed digital communication protocol HART 6.0, 2-wire for hydrostatic pressure measured value.
  Ordering information: Product Configurator order code for "Output", option "2"
  Options:
  - Max. alarm (factory setting 22mA): can be set from 21 to 23 mA
  - Hold measured value: last measured value is held
  - Min. alarm: 3.6 mA
- Pt100: temperature-dependent resistance value

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

4 to 20 mA Analog for temperature measured value, 2-wire

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART



4 to 20 mA HART with superimposed digital communication protocol HART 5.0 for temperature measured value, 2-wire

Signal range

3.8 mA to 20.5 mA

Maximum load for FMX21 4 to 20 mA Analog

The maximum load resistance depends on the supply voltage (U) and must be determined individually for each current loop, see formula and diagrams for FMX21 and temperature head transmitter. The total resistance resulting from the resistances of the connected devices, the connecting cable and, where applicable, the resistance of the extension cable may not exceed the load resistance value.

⚠ WARNING

Electrical safety is compromised by an incorrect connection!

- When using the measuring device in a hazardous area, the relevant national standards and guidelines as well as the Safety Instructions (XAs) or installation or control drawings (ZDs) must be adhered to. All data relating to explosion protection can be found in separate documentation which is available on request. This documentation is supplied with the devices as standard → 🖹 5

Supply voltage

FMX21 + Pt100 (optional)

- 10.5 to 35 V (not hazardous areas)
- 10.5 to 30 V (hazardous areas)

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

8 to 35 V DC

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

11.5 to 35 V DC

Power consumption

FMX21 + Pt100 (optional)

- ≤ 0.805 W at 35 V DC (non-hazardous area)
- ≤ 0.690 W at 30 V DC (hazardous area)

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

≤ 0.875 W at 35 V DC

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

≤ 0.805 W at 35 V DC

Current consumption

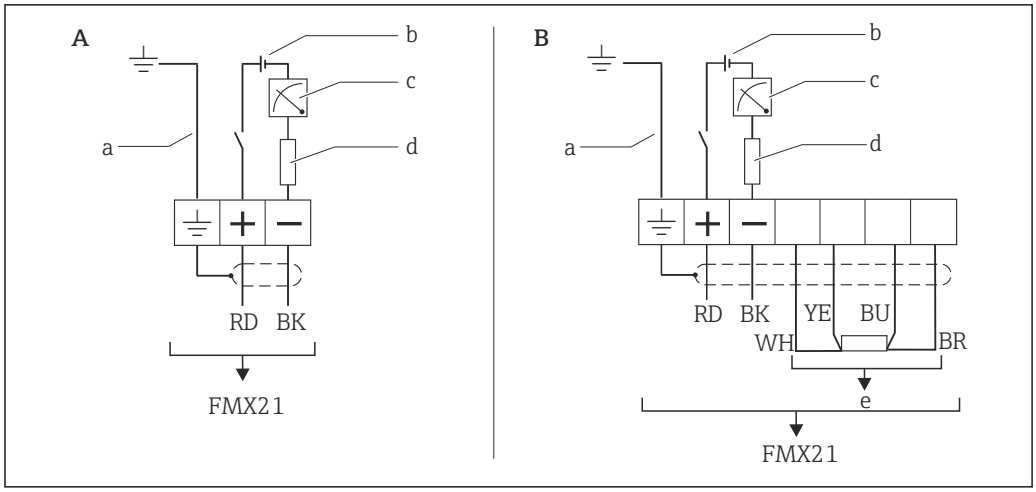
FMX21 + Pt100 (optional)

Max. current consumption: ≤ 23 mA
Min. current consumption: ≥ 3.6 mA

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

- Max. current consumption: ≤ 25 mA
- Min. current consumption: ≥ 3.5 mA

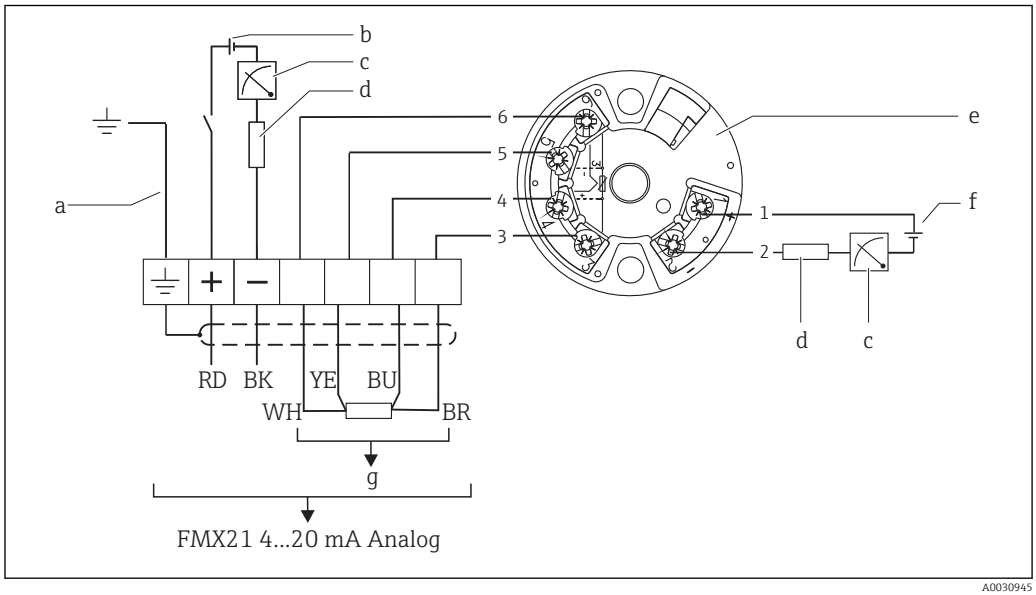
TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART



- Max. current consumption: ≤ 23 mA
- Min. current consumption: ≥ 3.5 mA

Connecting the device

- Waterpilot
  Reverse polarity protection is integrated in the Waterpilot FMX21 and the temperature head transmitter. Changing the polarities will not result in damage to the devices.
- The cable must end in a dry room or a suitable terminal box. The terminal box (IP66/IP67) with GORE-TEX® filter from Endress+Hauser is suitable for outdoor installation. The terminal box may be ordered as an accessory using the order code for the FMX21, Product Configurator order code for "Accessories enclosed", option "PS".



The electrical connection is established with the corresponding wires of the probe cable and with the optional use of the terminal box → 🖹 37 and a power supply (e.g. RN221N active barrier → 🖹 10).

Waterpilot with Pt100

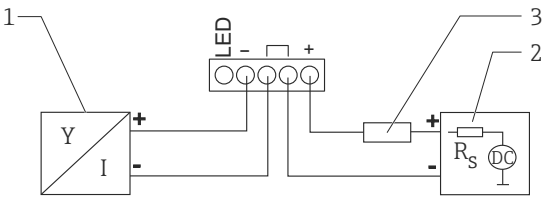
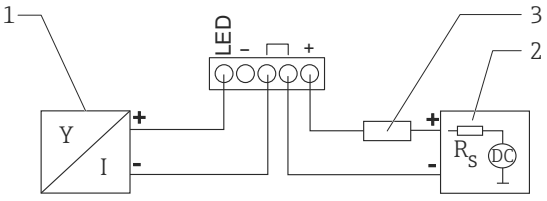
Waterpilot FMX21 with RIA15





The RIA15 remote display can be ordered together with the device.

Product structure, feature 620 "Accessory enclosed":
- Option R4 "Remote display RIA15 non-hazardous area, field housing"
- Option R5 "Remote display RIA15 Ex= explosion protection approval, field housing"

Compensation of the atmospheric pressure must be ensured for the installation. A black, vented cable gland is supplied for this purpose.

The RIA15 process display unit is loop-powered and does not require any external power supply.

The voltage drop to be taken into account is:
- ≤1 V in the standard version with 4 to 20 mA communication
- ≤1.9 V with HART communication
- and an additional 2.9 V if display light is used

Waterpilot FMX21 connection and RIA15 **with** backlight	 4 *Waterpilot FMX21 block diagram, RIA15 with light, HART communication resistor module* *1 HART communication resistor module* *2 Waterpilot FMX21* *3 Power supply*

Wire colors

RD = red, BK = black, WH = white, YE = yellow, BU = blue, BR = brown

Connection data

Connection classification as per IEC 61010-1:
- Overvoltage category 1
- Pollution level 1

Connection data in the hazardous area

See relevant XA.

Terminals in the terminal box

- Three terminals as standard in the terminal box (terminal box can optionally be ordered as an enclosed accessory → 52)
- 4-terminal strip can be ordered as an accessory, order number: 52008938 cable cross-section 0.08 to 2.5 mm² (28 to 14 AWG)

The 4-terminal strip is not designed for use in hazardous areas incl. CSA GP.

Probe cable

- Overall external diameter: 8 mm (0.31 in) ±0.25 mm (0.01 in)
- Pressure compensation tube with Teflon filter: External diameter of 2.5 mm (0.1 in), internal diameter of 1.5 mm (0.06 in)

Cross-section

- FMX21: 3 x 0.2 mm^2 (3 x 26 AWG) + pressure compensation tube with Teflon filter
- FMX21 with Pt100 (optional): 7 x 0.2 mm^2 (7 x 26 AWG) + pressure compensation tube with Teflon filter

Cable resistance

per wire: ≤ 0.09 Ω/m

Cable specifications

Endress+Hauser recommends using shielded, twisted-pair two-wire cables.

The probe cables are shielded for device versions with outer diameters of 22 mm (0.87 in) and 42 mm (1.65 in).

FMX21 + Pt100 (optional)

- Commercially available instrument cable
- Terminals, terminal box: 0.08 to 2.5 mm^2 (28 to 14 AWG)

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

- Commercially available instrument cable
- Terminals, terminal box: 0.08 to 2.5 mm^2 (28 to 14 AWG)
- Transmitter connection: max. 1.75 mm^2 (15 AWG)

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

- Commercially available instrument cable
- Terminals, terminal box: 0.08 to 2.5 mm^2 (28 to 14 AWG)
- Transmitter connection: max. 1.75 mm^2 (15 AWG)

Residual ripple for FMX21 4 to 20 mA Analog

FMX21 + Pt100 (optional)

No impact on the 4 to 20 mA signal up to ±5 % residual ripple within the permitted voltage range.

TMT181 temperature head transmitter (optional)

U_{ss} ≥ 5 V at U ≥ 13 V, $f_{max.}$ = 1 kHz

Residual ripple for FMX21 4 to 20 mA HART

FMX21 + Pt100 (optional)

No impact on the 4 to 20 mA signal up to ±5 % residual ripple within the permitted voltage range (according to HART Hardware Specification HCF_SPEC-54 (DIN IEC 60381-1)).

TMT182 temperature head transmitter (optional)

U_{ss} ≥ 3 V at U ≥ 13 V, $f_{max.}$ = 1 kHz

Performance characteristics

Reference operating conditions

FMX21 + Pt100 (optional)

- As per IEC 60770
- Ambient temperature T_U = constant, in the range of +21 to +33 °C (+70 to +91 °F)
- Humidity φ = constant, in the range of 20 to 80 % rH
- Ambient pressure p_U = constant, in the range of 860 to 1060 mbar (12.47 to 15.37 psi)
- Position of measuring cell constant, vertical in the range of ±1°
- Input of LOW SENSOR TRIM and HIGH SENSOR TRIM for lower range value and upper range value (only for HART)
- Supply voltage constant: 21 V DC to 27 V DC
- Load with HART: 250 Ω
- Pt100: DIN EN 60770, T_U = +25 °C (+77 °F)

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

Calibration temperature +23 °C (+73 °F) ±5 K

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

Calibration temperature +25 °C (+77 °F) ±5 K

Reference accuracy

FMX21 + Pt100 (optional)

The reference accuracy comprises the non-linearity after limit point configuration, hysteresis and non-reproducibility in accordance IEC 60770.

Standard version [2]:
Setting ±0.2 %
– to TD 5:1: < 0.2 % of set span
– from TD 5:1 to TD 20:1 ±(0.02 x TD+0.1)

Platinum version [3]:
- Setting ±0.1 % (optional)
  – to TD 5:1: < 0.1 % of set span
  – from TD 5:1 to TD 20:1 ±(0.02 x TD)
- Class B as per DIN EN 60751
  Pt100: max. ±1 K

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

- ±0.2 K
- With Pt100: max. ±0.9 K

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

- ±0.2 K
- With Pt100: max. ±0.9 K

Resolution

Current output: 1 µA

Reading cycle

HART commands: on average 2 to 3 per second

2) Ordering information: Product Configurator order code for "Reference accuracy", option "G"
3) Ordering information: Product Configurator order code for "Reference accuracy", option "D"

Long-term stability

FMX21 + Pt100 (optional)

- ≤ 0.1 % of URL/year
- ≤ 0.25 % of URL/5 years

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

≤ 0.1 K per year

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

≤ 0.1 K per year

Influence of medium temperature

- Thermal change in the zero output and the output span:
  0 to +30 °C (+32 to +86 °F): < (0.15 + 0.15 x TD)% of set span
  −10 to +70 °C (+14 to +158 °F): < (0.4 + 0.4 x TD)% of set span
- Temperature coefficient (T_K) of the zero output and the output span
  −10 to +70 °C (+14 to +158 °F): 0.1 % / 10 K of URL

Warm-up period

FMX21 + Pt100 (optional)

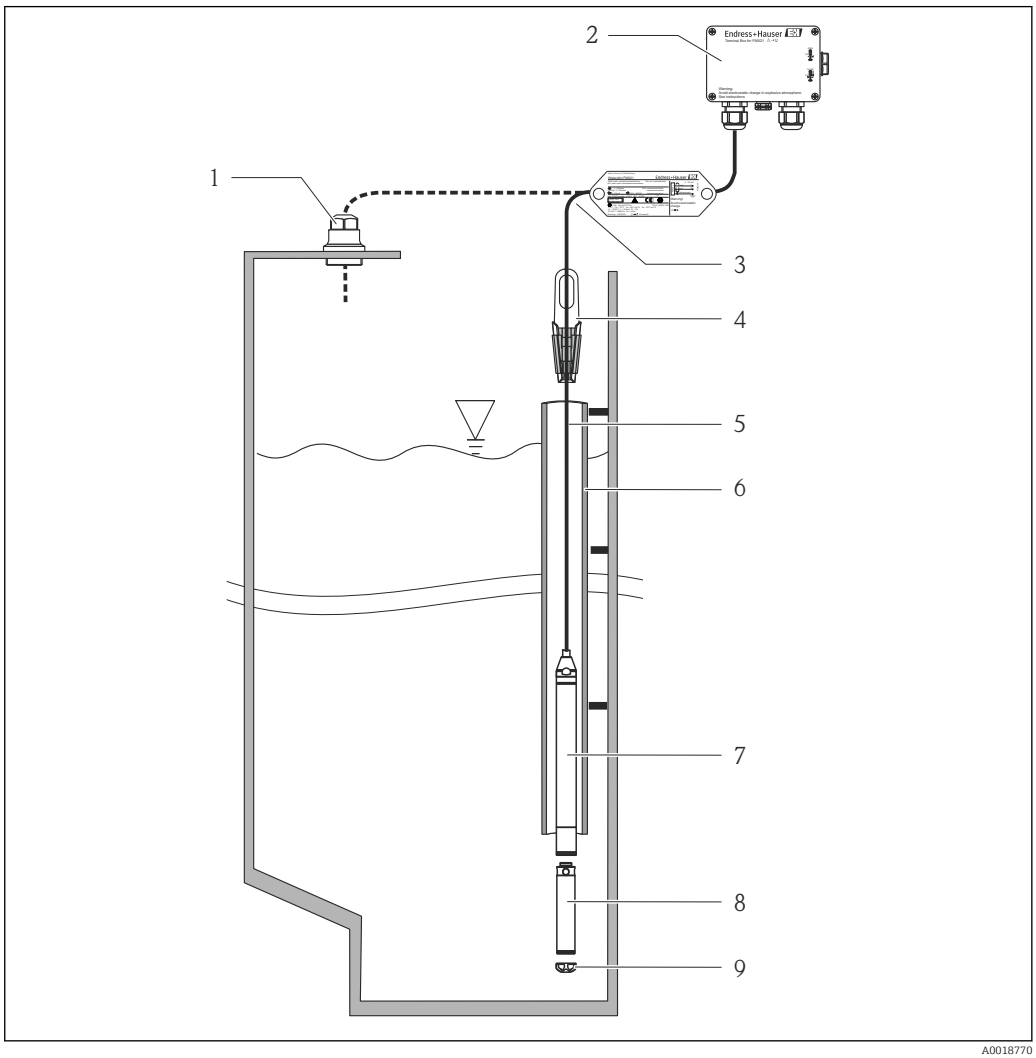
- FMX21: < 6 s
- Pt100: 300 s

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

4 s

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

4 s



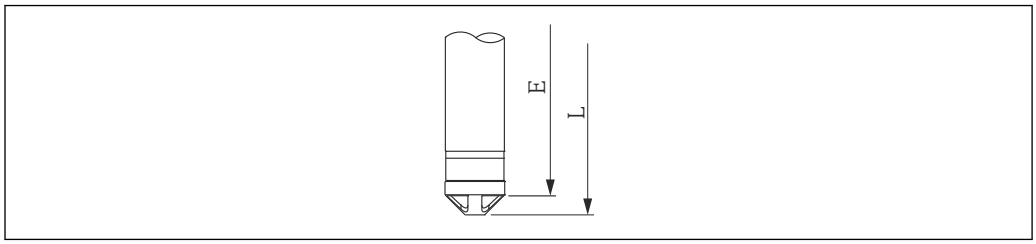
Response time

FMX21 + Pt100 (optional)

- FMX21: 400 ms (T90 time), 500 ms (T99 time)
- Pt100: 160 s (T90 time), 300 s (T99 time)

Installation

Installation instructions

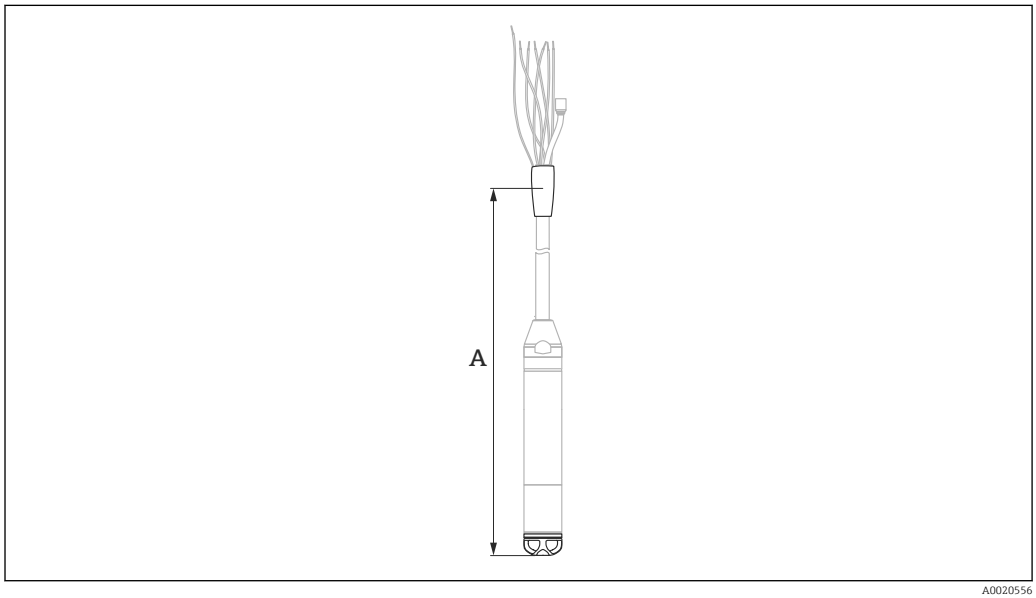


1 *Cable mounting screw can be ordered via the order code or as an accessory → 52*
2 *Terminal box can be ordered via the order code or as an accessory → 52*
3 *Bending radius of extension cable > 120 mm (4.72 in)*
4 *Mounting clamp can be ordered via the order code or as an accessory → 52*
5 *Extension cable, cable length → 28*
6 *Guide tube*
7 *Waterpilot FMX21*
8 *Additional weight can be ordered as an accessory for the FMX21 with external diameter of 22 mm (0.87 in) and 29 mm (1.14 in)→ 52*
9 *Protection cap*

Additional installation instructions

- Sideways movement of the level probe can result in measuring errors. For this reason, install the probe at a point free from flow and turbulence, or use a guide tube. The internal diameter of the guide tube should be at least 1 mm (0.04 in) greater than the external diameter of the selected FMX21.
- To avoid mechanical damage to the measuring cell, the device is equipped with a protection cap.
- The cable must end in a dry room or a suitable terminal box. The terminal box from Endress +Hauser provides humidity and climatic protection and is suitable for installation outdoors → 52.
- Cable length tolerance: < 5 m (16 ft): ±17.5 mm (0.69 in); > 5 m (16 ft): ±0.2 %
- If the cable is shortened, the filter at the pressure compensation tube must be reattached. Endress +Hauser offers a cable shortening kit for this purpose → 52 (documentation SD00552P/00/A6).

- Endress+Hauser recommends using twisted, shielded cable.
- In shipbuilding applications, measures are required to restrict the spread of fire along cable looms.
- The length of the extension cable depends on the intended level zero point. The height of the protection cap must be taken into consideration when designing the layout of the measuring point. The level zero point (E) corresponds to the position of the process isolating diaphragm. Level zero point = E; tip of probe = L (see the following diagram).
  For dimensions, see "Mechanical construction" section.



A0026013

Cable length

- Pay attention to the "Load"
- Cable lengths available for order
  - Customer-specific in meters or feet
  - Limited cable length when performing installation with freely suspended device with cable mounting screw or mounting clamp, as well as for Ex approval: max. 300 m (984 ft).

When using the measuring device in hazardous areas, installation must comply with the corresponding national standards and regulations and the Safety Instructions or Installation or Control Drawings.

A0020556

A Length of extension cable

Cable	Option [1]
10 m cable, can be shortened, PE	10
20 m cable, can be shortened, PE	11
..... m cable, can be shortened, PE	15
30 ft cable, can be shortened, PE	20
60 ft cable, can be shortened, PE	21

60 ft cable, can be shortened, PUR	61
..... ft cable, can be shortened, PUR	65

1) Ordering information: Product Configurator order code for "Probe connection"

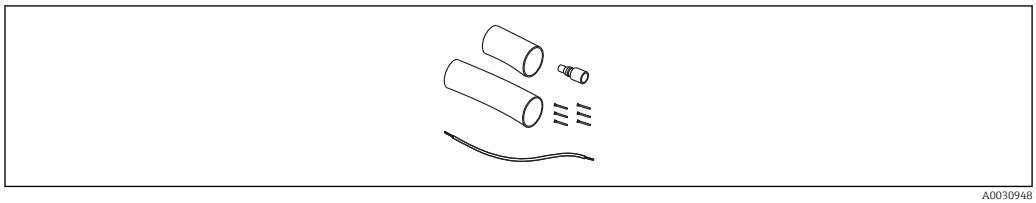
Technical data for cable

- Minimum bending radius: 120 mm (4.72 in)
- Tensile strength: max. 950 N (213.56 lbf)
- Cable extraction force (= tensile force required to extract the cable from the probe):
  - PE, FEP: typically ≥ 400 N (89.92 lbf), PUR: typically ≥ 150 N (33.72 lbf)
  - when used in hazardous area: ≥ 100 N (73.75 lbf)
- UV-resistant (UV = ultraviolet)
- PE: For use in drinking water

Cable marking

A0030955

- To make installation easier, Endress+Hauser marks the extension cable if a customer-specific length has been ordered.
  Ordering information: Product Configurator order code for "Service", option "IR" or "IS".
- Cable marking tolerance (distance to lower end of level probe):
  Cable length < 5 m (16 ft): ±17.5 mm (0.69 in)
  Cable length > 5 m (16 ft): ±0.2 %
- Material: PET, stick-on label: acrylic
- Immunity to temperature change: −30 to +100 °C (−22 to +212 °F)



NOTICE

The marking is used exclusively for installation purposes.

- ▶ The mark must be thoroughly removed without trace in the case of devices with drinking water approval. The extension cable must not be damaged in the process.

Not for use of the FMX21 in hazardous areas.

Cable shortening kit

A0030948

The cable shortening kit is used to shorten a cable easily and professionally.

The cable shortening kit is not designed for the FMX21 with FM/CSA approval.

- Ordering information: Product Configurator order code for "Accessories enclosed", option "PW"
- Associated documentation SD00552P/00/A6.

Environment

Ambient temperature range

FMX21 + Pt100 (optional)

- With external diameter of 22 mm (0.87 in) and 42 mm (1.65 in):
  −10 to +70 °C (+14 to +158 °F) (= medium temperature)
- With external diameter of29 mm (1.14 in):
  0 to +50 °C (+32 to +122 °F) (= medium temperature)

Cable

(when mounted in a fixed position)
- With PE: −30 to +70 °C (−22 to +158 °F)
- With FEP: −40 to +70 °C (−40 to +158 °F)
- With PUR: −40 to +70 °C (−40 to +158 °F)

Terminal box

−40 to +80 °C (−40 to +176 °F)

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

−40 to +85 °C (−40 to +185 °F)

Temperature head transmitter 2-wire, configured for a measuring range of
−20 to +80 °C (−4 to +176 °F). This configuration offers a temperature range of 100 K which can be easily mapped. Please note that the Pt100 resistance temperature detector is suitable for a temperature range of −10 to +70 °C (14 to +158 °F)

The TMT181 temperature head transmitter is not designed for use in hazardous areas incl. CSA GP.

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

−40 to +85 °C (−40 to +185 °F)

Temperature head transmitter 2-wire, configured for a measuring range of
−20 to +80 °C (−4 to +176 °F). This configuration offers a temperature range of 100 K which can be easily mapped. Please note that the Pt100 resistance temperature detector is suitable for a temperature range of −10 to +70 °C (14 to +158 °F)

The TMT182 temperature head transmitter is not designed for use in hazardous areas incl. CSA GP.

Storage temperature range

FMX21 + Pt100 (optional)

−40 to +80 °C (−40 to +176 °F)

Cable

(when mounted in a fixed position)
- With PE: −30 to +70 °C (−22 to +158 °F)
- With FEP: −30 to +80 °C (−22 to +176 °F)
- With PUR: −40 to +80 °C (−40 to +176 °F)

Terminal box

−40 to +80 °C (−40 to +176 °F)

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

−40 to +100 °C (−40 to +212 °F)

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

−40 to +100 °C (−40 to +212 °F)

Degree of protection

FMX21 + Pt100 (optional)

IP68, permanently hermetically sealed at 20 bar (290 psi) (~200 m H_2O)

Terminal box (optional)

IP66, IP67

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

IP00, condensation permitted

When installed in the optional terminal boxes: IP66/IP67

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

IP00, condensation permitted

Electromagnetic compatibility (EMC)

FMX21 + Pt100 (optional)

- EMC in accordance with all relevant requirements of EN 61326 series. For details, refer to the Declaration of Conformity.
- Maximum deviation: < 0.5 % of span.

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

Interference emission to EN 61326 Class B equipment, interference immunity to EN 61326 Appendix A (Industrial). For details, refer to the Declaration of Conformity.

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

EMC in accordance with all relevant requirements of EN 61326 series. For details, refer to the Declaration of Conformity.

Overvoltage protection

FMX21 + Pt100 (optional)

- Integrated overvoltage protection as per EN 61000-4-5 (500 V symmetrical/1000 V asymmetrical)
- Overvoltage protection ≥ 1.0 kV, external if necessary

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

Provide overvoltage protection, externally if necessary → 🖹 10.

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

Provide overvoltage protection, externally if necessary → 🖹 10.

Process

Medium temperature range

FMX21 + Pt100 (optional)

- With external diameter of 22 mm (0.87 in) and 42 mm (1.65 in):
  −10 to +70 °C (+14 to +158 °F)
- With external diameter of 29 mm (1.14 in):
  0 to +50 °C (+32 to +122 °F)

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

−40 to +85 °C (−40 to +185 °F)

(= ambient temperature), install temperature head transmitter outside the medium.

Temperature head transmitter 2-wire, configured for a measuring range of −20 to +80 °C (−4 to +176 °F). This configuration offers a temperature range of 100 K which can be easily mapped. Please note that the Pt100 resistance temperature detector is suitable for a temperature range of −10 to +70 °C (14 to +158 °F)

The TMT181 temperature head transmitter is not designed for use in hazardous areas incl. CSA GP.

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

−40 to +85 °C (−40 to +185 °F)

(= ambient temperature), install temperature head transmitter outside the medium.

Temperature head transmitter 2-wire, configured for a measuring range of −20 to +80 °C (−4 to +176 °F). This configuration offers a temperature range of 100 K which can be easily mapped. Please note that the Pt100 resistance temperature detector is suitable for a temperature range of −10 to +70 °C (14 to +158 °F)

The TMT182 temperature head transmitter is not designed for use in hazardous areas incl. CSA GP.

Medium temperature limit

FMX21 + Pt100 (optional)

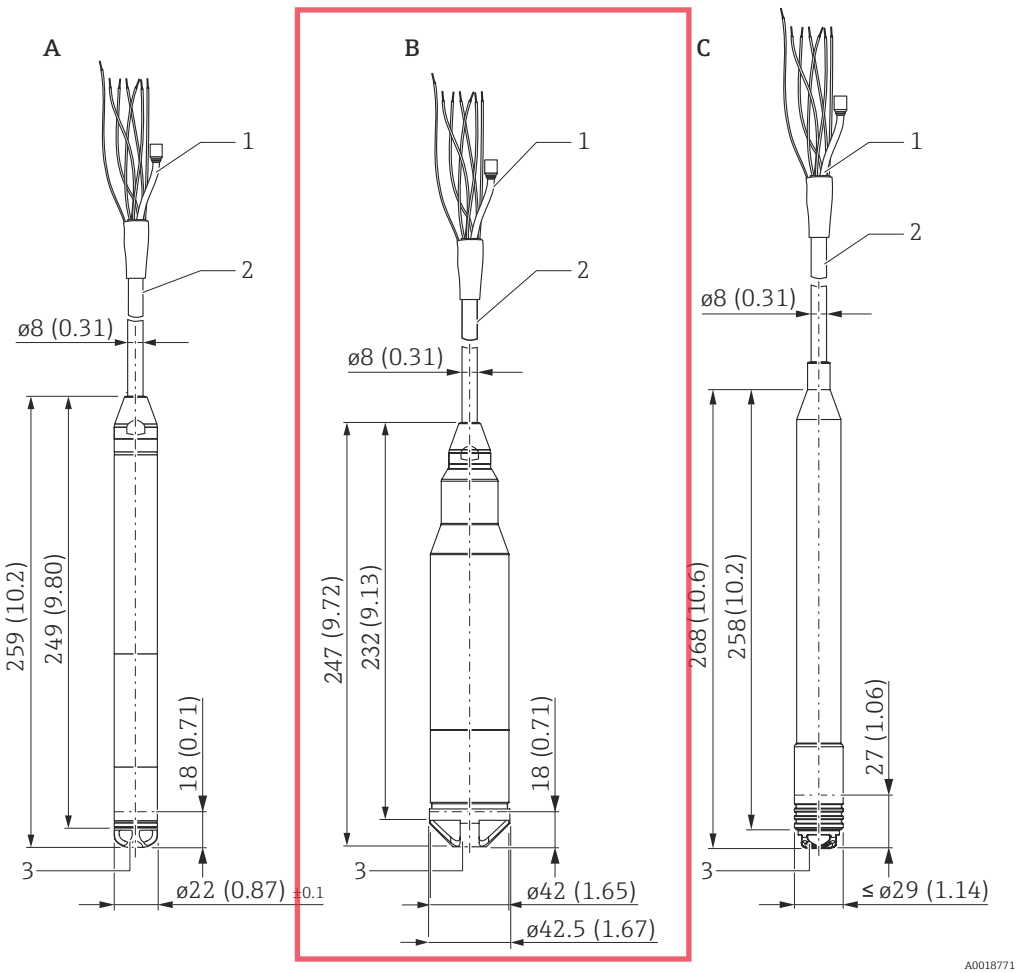
With external diameter of 22 mm (0.87 in) and 42 mm (1.65 in):
−20 to +70 °C (−4 to +158 °F)

In hazardous areas incl. CSA GP, the medium temperature limit is −10 to +70 °C (+14 to +158 °F).

With external diameter of29 mm (1.14 in): 0 to +50 °C (+32 to +122 °F)

The FMX21 may be operated in this temperature range. The specification values, such as accuracy, may be exceeded.

Pressure specifications



⚠ WARNING

The maximum pressure for the measuring device depends on the lowest-rated element with regard to pressure.

- For pressure specifications, see the "Measuring range" section and the "Mechanical construction" section.
- The measuring device must be operated only within the specified limits!
- The Pressure Equipment Directive (2014/68/EU) uses the abbreviation "PS". The abbreviation "PS" corresponds to the MWP (maximum working pressure) of the measuring device.
- MWP (maximum working pressure): The MWP (maximum working pressure) is specified on the nameplate. This value refers to a reference temperature of +20 °C (+68 °F) and may be applied to the device for an unlimited time. Observe temperature dependency of the MWP.
- OPL (Over Pressure Limit = sensor overload limit): The test pressure corresponds to the over pressure limit of the sensor and may only be applied for a limited time period to ensure measurement within specification and in order to avoid permanent damage. In the case of sensor range and process connections where the over pressure limit (OPL) of the process connection is smaller than the nominal value of the sensor, the device is set at the factory, at the very maximum, to the OPL value of the process connection. If you want to use the entire sensor range, select a process connection with a higher OPL value.
- avoid steam hammering! Steam hammering can cause zero point drifts. Recommendation: Residue (such as condensation or drops of water) can remain on the process isolating diaphragm after CIP cleaning and lead to local steam hammering if steam cleaning is performed again. In practice, drying the process isolating diaphragm (e.g. by blowing) has proved to prevent steam hammering.

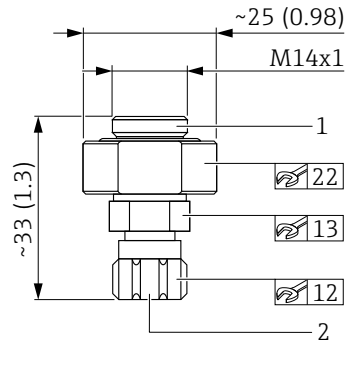
Additional weight

For FMX21 with external diameter of 22 mm (0.87 in) or 29 mm (1.14 in)

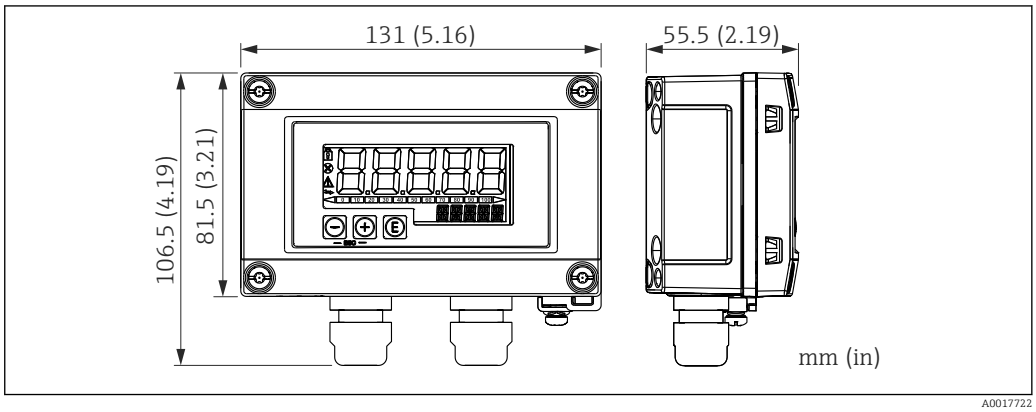
- Endress+Hauser offers additional weights to prevent sideways movement that results in measuring errors, or to make it easier to lower the device in a guide tube. You can screw several weights together. The weights are screwed directly onto the FMX21. For the FMX21 with external diameter of 29 mm (1.14 in), a maximum of 5 weights may be screwed on. In conjunction with the Ex nA approval, a maximum of one additional weight is permitted for the FMX21 with external diameter of 29 mm (1.14 in).
- Order number: 52006153 Ordering information: Product Configurator order code for "Accessories enclosed", option "PU"



Engineering unit mm (in)

Testing adapter

For FMX21 with external diameter of 22 mm (0.87 in) or 29 mm (1.14 in)



- Endress+Hauser offers a testing adapter to ease function-testing of the level probes.
- Observe the maximum pressure for compressed air hose and maximum overload for level probe → 14
- Maximum pressure for the quick coupling piece provided: 10 bar (145 psi)
- Adapter material: 304 (1.4301)
- Material of quick coupling piece: anodized aluminum
- Order number 52011868
  Ordering information: Product Configurator order code for "Accessories enclosed", option "PV"

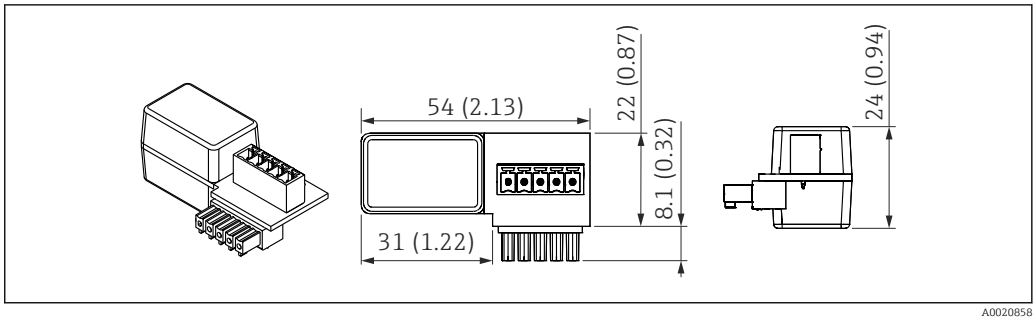
Engineering unit mm (in)

RIA15 in the field housing



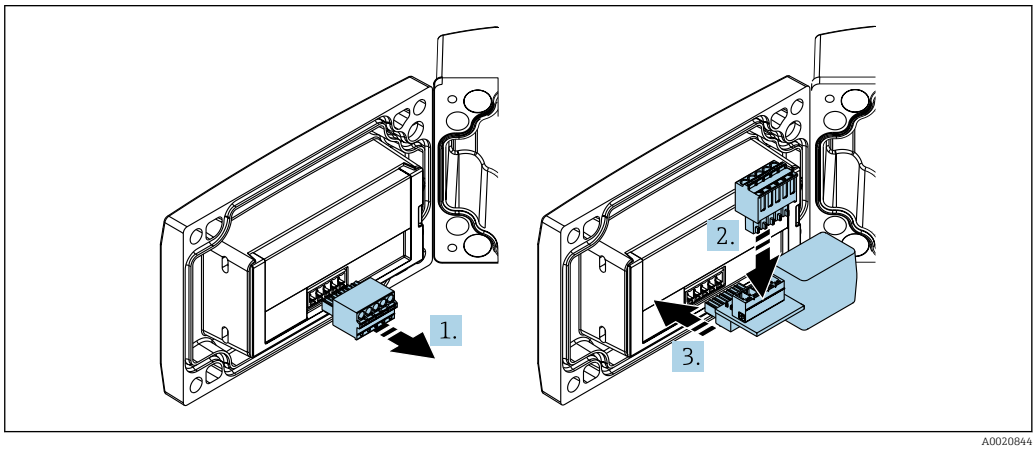
5 *Dimensions of RIA15 in field housing, engineering unit: mm (in)*

The RIA15 remote display can be ordered together with the device. Product structure, feature 620 "Accessories enclosed":

- Option R4 "Remote display RIA15 non-hazardous area, field housing"
- Option R5 "Remote display RIA15 Ex= explosion protection approval, field housing"

Alternatively available as an accessory, for details see Technical Information TI01043K and Operating Instructions BA01170K

HART communication resistor

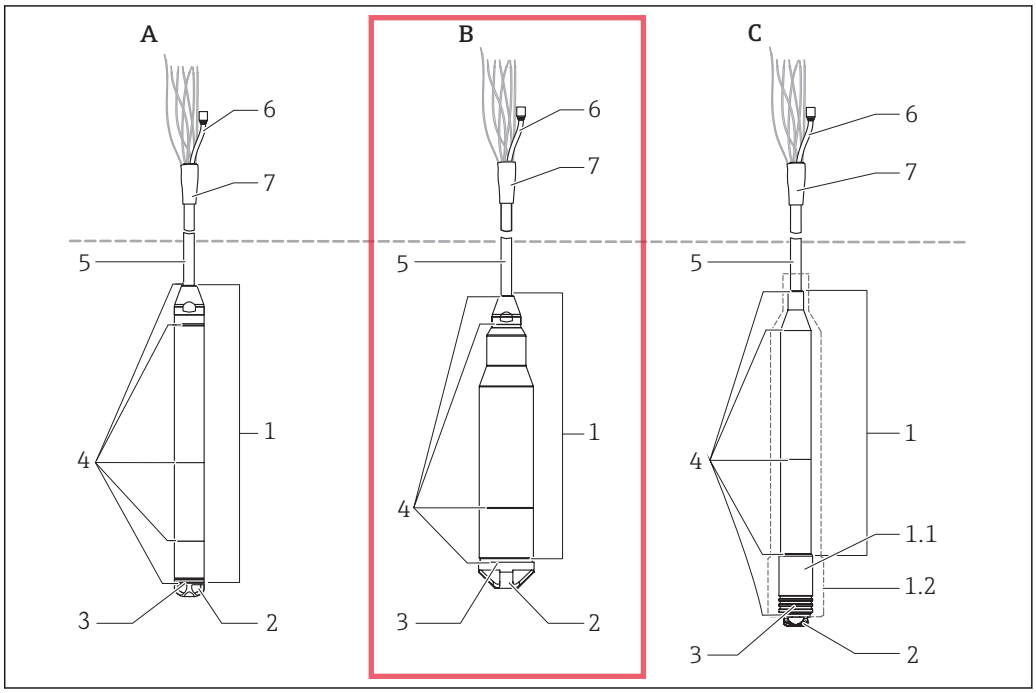


6 *Dimensions of HART communication resistor, engineering unit: mm (in)*

A communication resistor is required for HART communication. If this is not already present (e.g. in the power supply RMA, RN221N, RNS221, ...), it can be ordered with the device via the product structure, feature 620 "Accessories enclosed": option R6 "HART communication resistor hazardous / non-hazardous area".

Alternatively available as an accessory, for details see Technical Information TI01043K and Operating Instructions BA01170K

The HART communication resistor is specially designed for use with the RIA15 and can be attached easily.



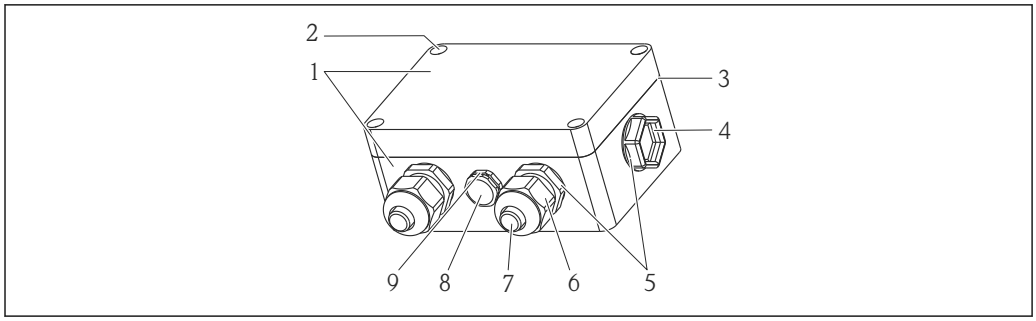
1. Disconnect plug-in terminal block.
2. Insert the terminal block into the slot provided on the HART communication resistor module.
3. Insert the HART communication resistor in the slot in the housing.

Weight

Component part		Weight
Level probe, external diameter of 22 mm (0.87 in)		344 g (12.133 oz)
Level probe, external diameter of 42 mm (1.65 in)		1376 g (48.532 oz)
Level probe, external diameter of 29 mm (1.14 in)		394 g (13.896 oz)
Extension cable	PE	52 g/m (0.035 lbs/1 ft)
	PUR	60 g/m (0.040 lbs/1 ft)
	FEP	108 g/m (0.072 lbs/1 ft)
Suspension clamp		170 g (5.996 oz)
Cable mounting screw G 1½" A		770 g (27.158 oz)
Cable mounting screw NPT 1½"		724 g (25.535 oz)
Terminal box		235 g (8.288 oz)
TMT181 temperature head transmitter		40 g (1.411 oz)
TMT182 temperature head transmitter		40 g (1.411 oz)
Additional weight		300 g (10.581 oz)
Testing adapter		39 g (1.376 oz)

Materials

Materials in contact with process

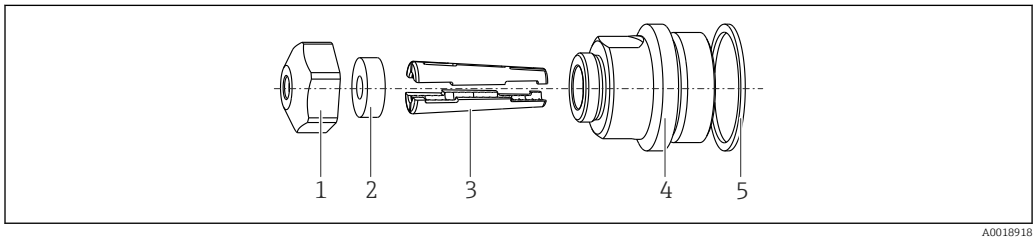


Item number	Component part	Material
1	▪ A: Level probe, external diameter of 22 mm (0.87 in) ▪ B: Level probe, external diameter of 42 mm (1.65 in) ▪ C: Level probe, max. external diameter of 29 mm (1.14 in)	316L (1.4404/1.4435) [1]
1.1	Sensor sleeve	PPS (Polyphenylene sulfide)
1.2	Heat-shrink tube	Polyolefin and hot melt adhesive
	The heat-shrink tube around the level probe acts as insulation. It prevents electrical contact between the level probe and the tank. Electrochemical corrosion is thus avoided.	
2	Protection cap for A and C: with outer diameter 22 mm (0.87 in) and 29 mm (1.14 in) (order number: 52008999)	POM
	Protection cap for B: device with outer diameter 42 mm (1.65 in) (order number: 917755-0000)	PFA
3	Process ceramic	Al_2O_3 (Aluminum oxide ceramic)
4	Seal	EPDM [2]
		FKM Viton [3]
5	Extension cable insulation Additional information	Choose from: ▪ PE-LD (Low-density polyethylene) ▪ FEP (Fluorinated ethylene propylene) ▪ PUR (Polyurethane)

1) Material 316L (1.4404/1.4435) is not in contact with the process in the case of level probe C
2) Product Configurator order code for "Seal", option "H"
3) Product Configurator order code for "Seal", option "A"

Materials not in contact with process

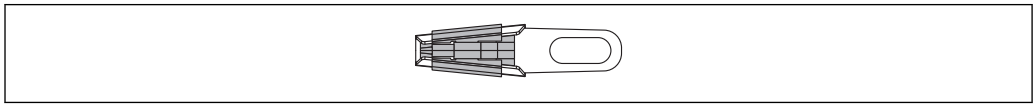
Item number	Component part	Material
6	Pressure compensation tube	PA
7	Heat-shrink tube	Polyolefin



Terminal box (not in contact with process)

A0018917

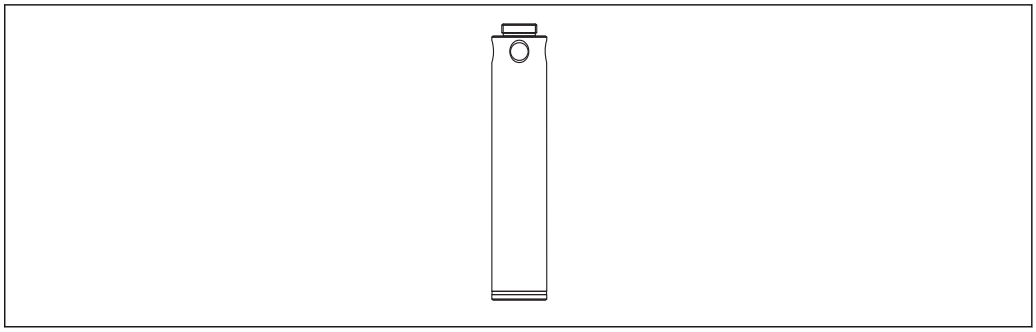
Item number	Component part	Material
1	Housing	PC
2	Mounting screws (4 x)	A2
3	Seal	CR (Chloroprene rubber)
4	Dummy plug M20x1.5	PBT-GF30
5	Cable gland M20x1.5	PE-HD
6		PA6
7		PA6-GF30
8	Pressure compensation filter	PA6-GF10, ePTFE
9	Pressure compensation filter, O-ring	Silicone (VMQ)



Cable mounting screw (not in contact with process)

A0018918

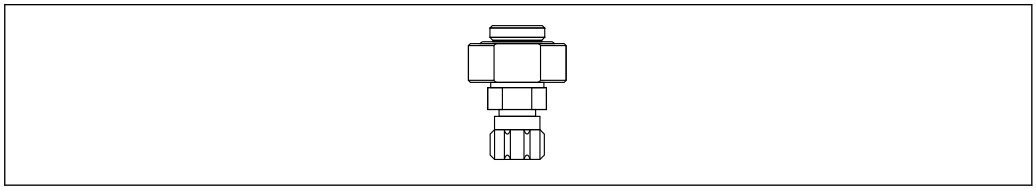
Item number	Component part	Material
1	Cover for cable mounting screw	304 (1.4301)
2	Sealing ring	NBR
3	Clamping sleeves	PA66-GF35
4	Adapter for cable mounting screw G 1½" A, NPT 1½"	304 (1.4301)
5	Seal ® Only for G 1½" A	EPDM



Suspension clamp

A0030950

Material: 316L (1.4404) and fiber-glass reinforced PA (polyamide)

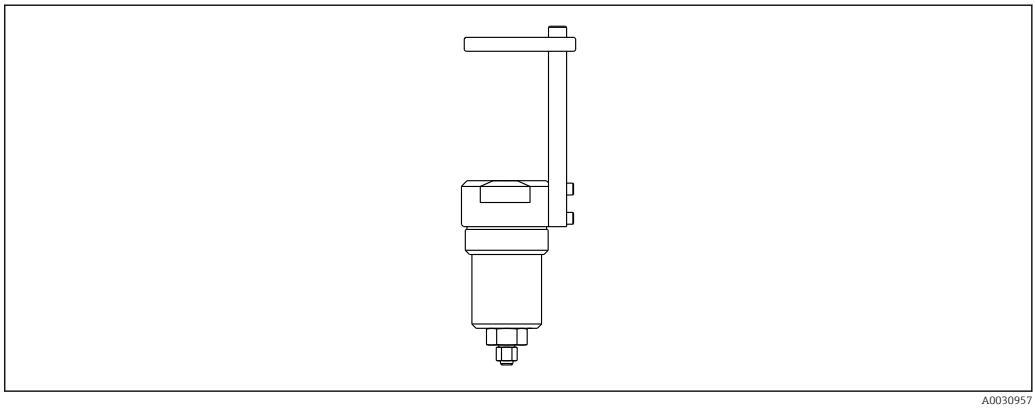


Additional weight

A0030954

Material: 316L (1.4435)

Testing adapter for FMX21 with outer diameter 22 mm (0.87 in) or 29 mm (1.14 in)



A0030956

Adapter material: 304 (1.4301)

Material of quick coupling piece: anodized aluminum

Testing adapter for FMX21 with outer diameter 42 mm (1.65 in)

A0030957

Adapter material: 304 (1.4301)

Material of quick coupling piece: anodized aluminum

Extension cable

PE	PUR	FEP
▪ Abrasion-resistant extension cable with strain-relief members made of high-strength PE fibers ▪ Shielded (aluminum) ▪ Insulated with polyethylene (PE), black ▪ Copper wires, twisted ▪ Pressure compensation tube with Teflon filter	▪ Abrasion-resistant extension cable with strain-relief members made of high-strength PE fibers ▪ Shielded (aluminum) ▪ Insulated with polyurethane (PUR), black ▪ Copper wires, twisted ▪ Pressure compensation tube with Teflon filter	▪ Abrasion-resistant extension cable ▪ Shielded with galvanized steel wire netting ▪ Insulated with fluorinated ethylene propylene (FEP), black ▪ Copper wires, twisted ▪ Pressure compensation tube with Teflon filter

Operability

FMX21 4 to 20 mA Analog

No display or other operation facility is required to operate the device. However, the measured values can be read out with optional evaluation units.

FMX21 4 to 20 mA HART

FieldCare

FieldCare is an Endress+Hauser asset management tool based on FDT technology. With FieldCare, you can configure all Endress+Hauser devices as well as devices from other manufacturers that support the FDT standard.

FieldCare supports the following functions:
- Configuration of transmitters in online and offline mode
- Loading and saving device data (upload/download)
- Documentation of the measuring point

Connection options:
- Via Commubox FXA195 and the USB interface of a computer
- Via Fieldgate FXA520

For additional information and free download of FieldCare, see → www.de.endress.com → Download → Text Search: FieldCare

DeviceCare

Function scope

Tool for connecting and configuring Endress+Hauser field devices.

The fastest way to configure Endress+Hauser field devices is with the dedicated "DeviceCare" tool. Together with the device type managers (DTMs) it presents a convenient, comprehensive solution.

For details, see Innovation brochure IN01047S

Field Xpert SFX

Field Xpert SFX is an industrial PDA with integrated 3.5" touchscreen from Endress+Hauser based on Windows Mobile. It offers wireless communication via the optional VIATOR® Bluetooth ® modem as a point-to-point connection to a HART device, or via WiFi and Endress+Hauser's Fieldgate FXA520 to one or more HART devices. Field Xpert also works as a stand-alone device for asset management applications. For details, refer to BA00060S/04/EN.

RIA15

The RIA15 can be used as a local display unit and for the basic commissioning of the Waterpilot FMX21 hydrostatic level sensor via HART.

Certificates and approvals

CE mark

The device meets the legal requirements of the relevant EC directives. Endress+Hauser confirms that the device has been successfully tested by applying the CE mark.

RCM-Tick marking

The supplied product or measuring system meets the ACMA (Australian Communications and Media Authority) requirements for network integrity, interoperability, performance characteristics as well as health and safety regulations. Here, especially the regulatory arrangements for electromagnetic compatibility are met. The products are labelled with the RCM- Tick marking on the name plate.

A0029561

Ex approvals

- ATEX
- CSA C/US
- FM
- IEC
- NEPSI
- INMETRO

- The approvals apply exclusively to the Waterpilot FMX21 without Pt100 and without TMT181/TMT182.
- Waterpilot FMX21 is only available for use in hazardous areas with the FKM Viton seal.
- All explosion protection data are given in separate documentation which is available upon request. The Ex documentation is supplied as standard with all Ex-systems → 📄 5.

EAC conformity

The measuring system meets the legal requirements of the applicable EAC guidelines. These are listed in the corresponding EAC Declaration of Conformity together with the standards applied.

Endress+Hauser confirms successful testing of the device by affixing to it the EAC mark.

Drinking water approval

For FMX21 with an external diameter of 22 mm (0.87 in) with EPDM seal

Designation	Option [1]
KTW	LQ
NSF61	LR
ACS	LS

1) Product Configurator order code for "Additional ordering information (optional)"

Marine approval

For FMX21 with outer diameter 22 mm (0.87 in).

Designation	Option [1]
GL	LE
ABS	LF
BV	LH
DNV	LI

1) Product Configurator order code for "Additional ordering information (optional)"

Other standards and guidelines

The applicable European guidelines and standards can be found in the relevant EU Declarations of Conformity. The following were also applied:

DIN EN 60770 (IEC 60770):

Transmitters for use in industrial process control systems Part 1: Methods for performance evaluation

Methods for evaluating the performance of transmitters for control and regulation in industrial process control systems.

DIN 16086:

Electrical pressure measuring instruments, pressure sensors, pressure transmitters, pressure measuring instruments, concepts, specifications on data sheets

Procedure for writing specifications in data sheets for electrical pressure measuring instruments, pressure sensors and pressure transmitters.

EN 61326:

Electrical equipment for measurement, control and laboratory use – EMC requirements

EN 61010-1 (IEC 61010-1):

Protection Measures for Electrical Equipment for Measurement, Control, Regulation and Laboratory Procedures

EN 60529:

Degrees of protection provided by enclosures (IP code)

Calibration

Designation	Option [1]
Factory calibration certificate, 5-point	F1

1) Product Configurator order code for "Calibration"

Pressure Equipment Directive 2014/68/EU (PED)

Pressure equipment with allowable pressure ≤ 200 bar (2 900 psi)

Pressure equipment (with a maximum allowable pressure PS ≤ 200 bar (2 900 psi)) can be classified as pressure accessories in accordance with Pressure Equipment Directive 2014/68/EU. If the maximum allowable pressure is ≤ 200 bar (2 900 psi) and the pressurized volume of the pressure equipment is ≤ 0.1 l, the pressure equipment is subject to the Pressure Equipment Directive (cf. Pressure Equipment Directive 2014/68/EU, Article 4, point 3). The Pressure Equipment Directive only requires that the pressure equipment shall be designed and manufactured in accordance with the "sound engineering practice of a Member State".

Reasons:

- Pressure Equipment Directive (PED) 2014/68/EU Article 4, point 3
- Pressure equipment directive 2014/68/EU, Commission's Working Group "Pressure", Guideline A-05 + A-06

Note:

A partial examination shall be performed for pressure instruments that are part of safety equipment for the protection of a pipe or vessel from exceeding allowable limits (safety accessory in accordance with Pressure Equipment Directive 2014/68/EU, Article 2, point 4).

Calibration unit

Designation	Option [1]
Sensor range; %	A
Sensor range; mbar/bar	B
Sensor range; kPa/MPa	C
Sensor range; mm/m H2O	D
Sensor range; in H2O/ft H2O	E

Designation	Option [1]
Sensor range; psi	F
Customized pressure; see additional specification	J
Customized level; see additional specification	K

1) Product Configurator order code for "Calibration; unit"

Service

Designation	Option [1]
Configured min alarm current	IA
Adjusted HART Burst Mode PV	IB
Adjusted density compensation	IC
... m cable marking>installation	IR
... ft cable marking>installation	IS
Special version	I9

1) Product Configurator order code for "Service"'

Downloading the Declaration of Conformity

http://www.endress.com/en/download

1. Select "Approvals & Certificates"
2. Select "Manufact. Declaration"
3. Enter the required product code
4. Click "Search"

The available downloads are displayed.

Ordering information

Detailed ordering information is available from the following sources:
- In the Product Configurator on the Endress+Hauser website: www.endress.com -> Click "Corporate" -> Select your country -> Click "Products" -> Select the product using the filters and search field -> Open product page -> The "Configure" button to the right of the product image opens the Product Configurator.
- From your Endress+Hauser Sales Center: www.addresses.endress.com

Product Configurator - the tool for individual product configuration
- Up-to-the-minute configuration data
- Depending on the device: Direct input of measuring point-specific information such as measuring range or operating language
- Automatic verification of exclusion criteria
- Automatic creation of the order code and its breakdown in PDF or Excel output format
- Ability to order directly from the Endress+Hauser Online Shop

Scope of delivery

- Measuring device
- Optional accessories
- Brief Operating Instructions
- Certificates

Configuration data sheet

Level

The following configuration data sheet must be completed and included with the order if option "K: customized level" has been selected for order code "090: Calibration; unit" in the product structure.

PRODUCT DATA SHEET

ACTUATOR LA36

Features:

- *12, 24 or 36 V DC Permanent magnetic motor (IC only 12/24 V DC, IECEx/ATEX only 24 V DC)*
- *Thrust from 500 N - 10,000 N depending on gear ratio and spindle pitch*
- *Max. speed up to 160 mm/sec. depending on load and spindle pitch*
- *Non rotating piston rod eye*
- *Protection class: IP66 (dynamic) and IP69K (static)*

Options in general:

- *Built in endstop switches*
- *Hall effect sensor*
- *iFLEX options including:*
  - *IC - Integrated Controller (H-bridge),*
  - *Integrated Parallel Controller*
  - *Modbus and LINbus communication*
  - *Analogue or digital feedback for precise positioning*
  - *Endstop signals*
  - *PC configuration tool*
- *Mechanical potentiometer (not with IC)*
- *Exchangeable cables in different lengths*
- *IECEx/ATEX certified for Zone 21*

Usage:

- *Duty cycle at max. load from 5 -20% depending on load and stroke length. Ambient operating temperature -30°C to +65°C, full performance from +5°C to +40°C*

The actuator LA36 is one of the most solid and powerful LINAK actuators, designed to operate under extreme conditions. The LA36 is a maintenance-free product with a long lifetime and a high IP degree. This high-quality actuator offers a very strong alternative to hydraulic solutions.

iFLEX Integrated Flexibility

iFLEX is a descriptive term under which every **TECHLINE®** actuator with built-in intelligence is unified.

For more information on iFLEX, please see: www.linak.com/techline

Specifications

Motor:	Permanent magnet motor 12, 24, or 36V *
Cable:	Motor: 2 x 14 AWG PVC cable Control: 6 x 20 AWG PVC cable **
Gear ratio:	6 different gear ratios available in steel (500 N, 1,700/2,600 N, 4,500 N, and 6,800/10,000 N)
Slip clutch:	Mechanical overload protection through an integrated slip clutch
Brake:	Integrated brake ensures a high self-locking ability. The brake is deactivated when the actuator is powered in order to obtain a high efficiency
Hand crank:	As a standard feature the actuator can be operated manually
Housing:	The housing is made of casted aluminium, coated for outdoor use and in harsh conditions
Spindle part:	Outer tube: Extruded aluminium anodised Inner tube: Stainless steel AISi304/SS2333 Acme spindle: Trapezoidal spindle with high efficiency
Temperature range:	- 30° C to +65° C - 22° F to +149° F Full performance +5° C to +40° C
End play:	2 mm maximum
Weather protection:	Rated IP66 for outdoor use. Furthermore, the actuator can be washed down with a high-pressure cleaner (IP69K).
Noise level:	73dB (A) measuring method DS/EN ISO 8746 actuator not loaded.

* Modbus actuators only 24V - please see the
Modbus installation guide http://www.linak.com/techline/?id3=2363.

** Special control cabels for the Modbus actuator - please see the
Modbus installation guide http://www.linak.com/techline/?id3=2363.

Be aware of the following two symbols throughout this product data sheet:

Recommendations
Failing to follow these instructions can result in the actuator suffering damage or being ruined.

Additional information
Usage tips or additional information that is important in connection with the use of the actuator.

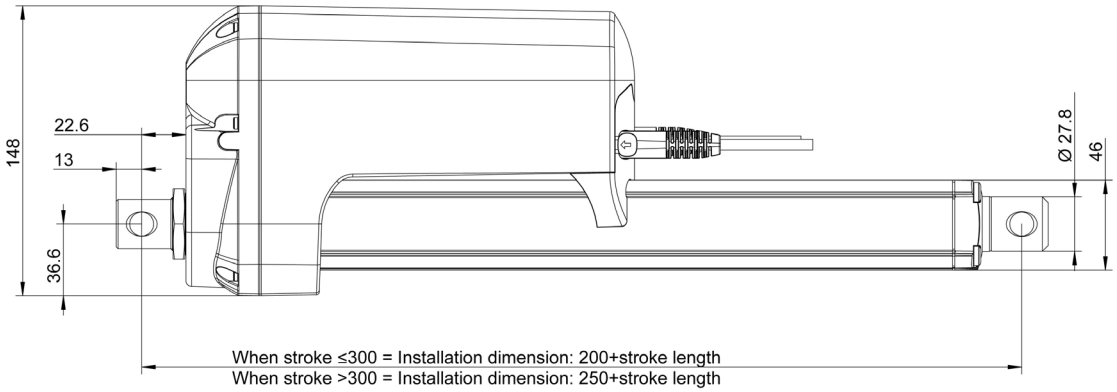
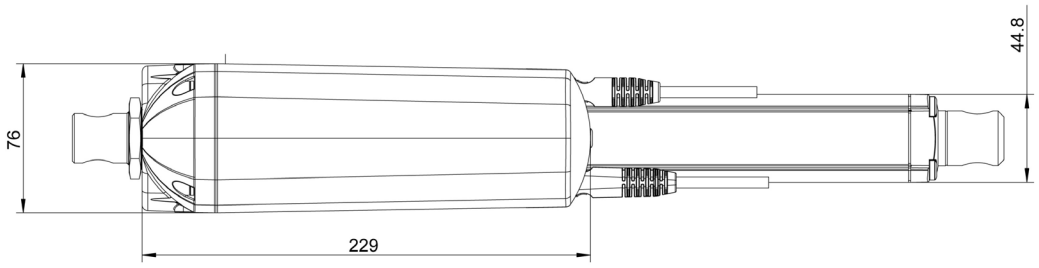
* There are limitations on the stroke length if you need full load, please see " LA36 Load v. Stroke Length"

** Note: Fully loaded actuators need a softstart in order to prevent the clutch from slipping when starting (see curves).

LA36 Load versus Stroke Length



N.B.
LA36 500 - 1.700 N is with 20 mm spindle pitch
LA36 500 - 6.800 N is with 12 mm spindle pitch
LA36 500 - 10.000 N is with 8 mm spindle pitch



- For applications that only operate in pull the limitations are 999 mm stroke and 10,000 N load
- **The Piston Rod Eye is only allowed to turn 0-90 degrees**
- Safety factor 2

Stroke tolerance:

End stop options E.g. 36XXXX+**?**XXXXXXX	**Descriptions**	**Typical stroke tolerance**	**Example for 200mm stroke**
? = 0	Without endstop switches Mechanical endstop	+/- 2mm	198 to 202mm
? = 1 to 4	With built-in limit switches	+0/-4mm	196mm
? = 7, 8, 9, A, B	Integrated controller Modbus Linbus	+0/-5mm	195mm

Manual hand crank:

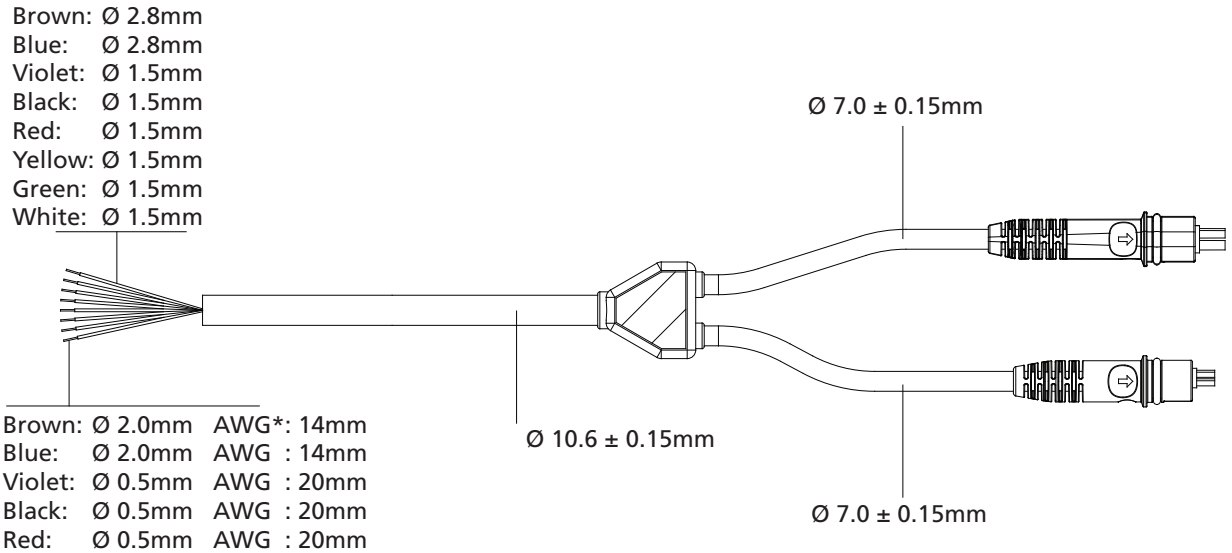
The manual hand crank can be used in the case of power failure.

The cover over the Allen Key socket must be unscrewed before the Allen Key can be inserted and the Hand Crank operated.

Hand Crank Torque: 6-8 Nm

Piston Rod movement per turn

	8 mm	12 mm	20 mm
Gear A	-	11 mm	18 mm
Gear B	-	6 mm	10 mm
Gear C	3 mm	4 mm	7 mm
Gear F	-	-	27 mm

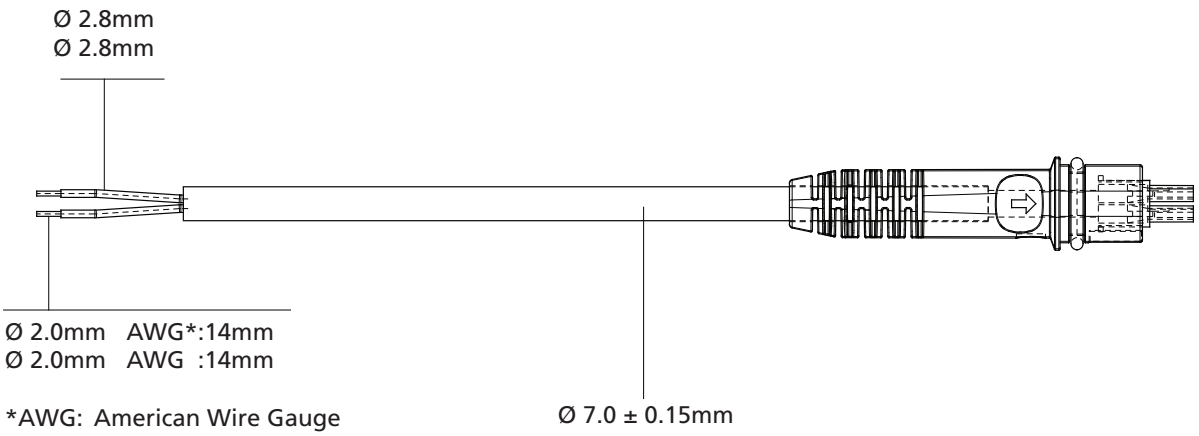


6 mm Allen key

Note:

- The power supply has to be disconnected during manual operation.
- If the actuator is operated as a Hand crank, it must be operated by hand or carefully by machine, otherwise there is a potential risk of overloading and hereby damaging the actuator. LA36 with CS or Modbus options only operate by hand.
- With stainless steel screws: 5 mm Allen Key

Cable dimensions



Y-cable dimensions:

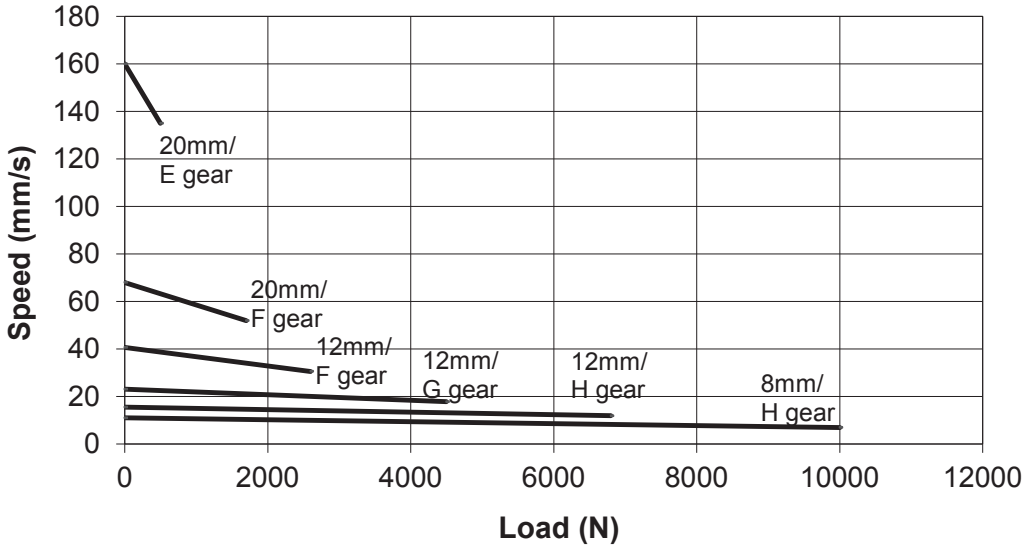
Green: Ø 1.5mm
White: Ø 1.5mm

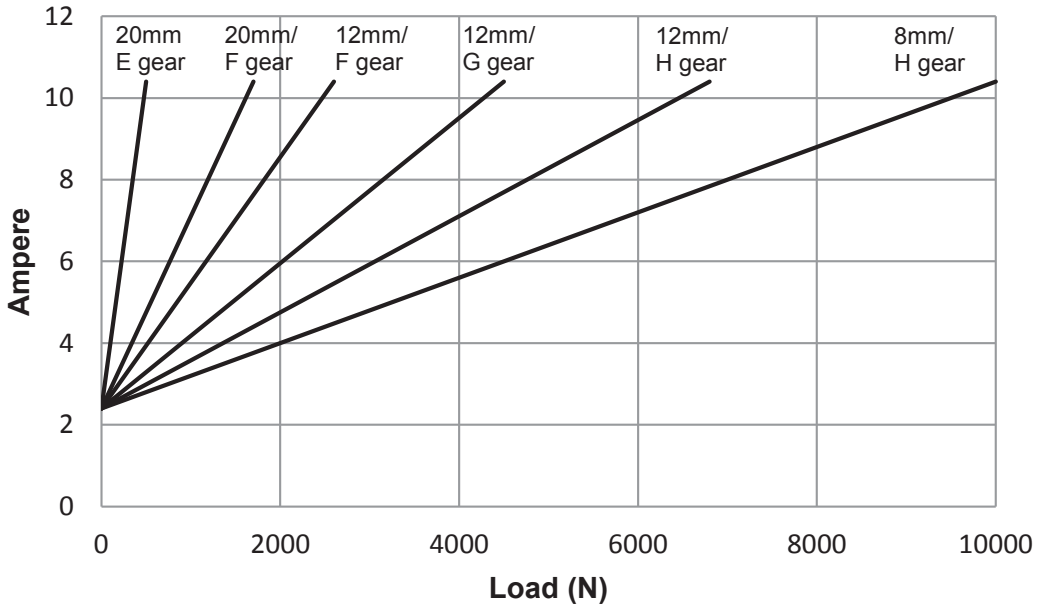


Speed and current curves - 12V motor

The values below are typical values and made with a stable power supply and an ambient temperature of 20˚C.

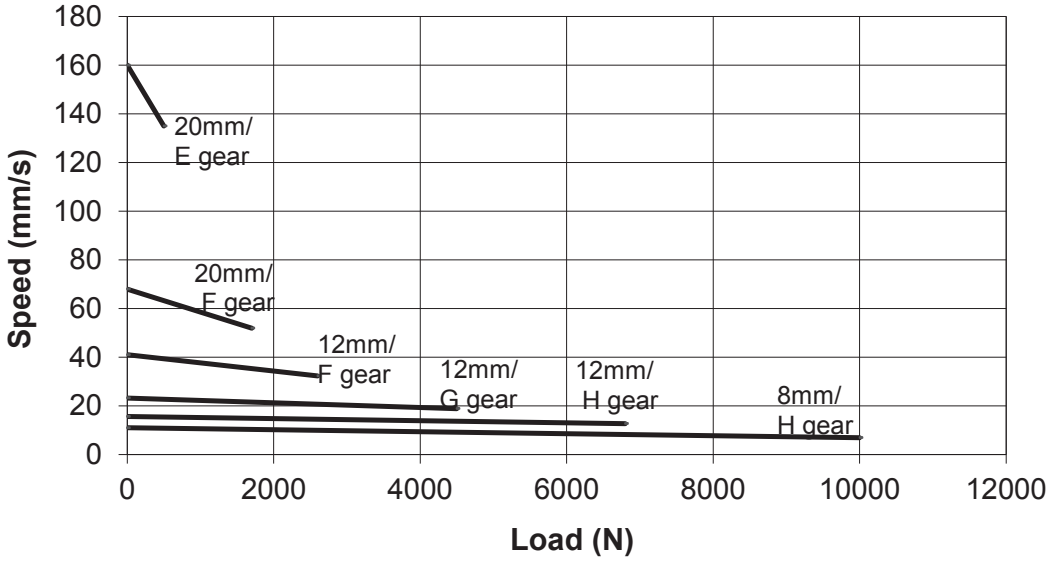
LA36 12V motor current vs. load

LA36 12V motor speed vs. load



All measurements above describe the spindle pitch (e.g. 20mm) and the gear type (e.g. E gear) of the actuator.

Speed and current are based on a nominal power supply of 12, 24, 36VDC.

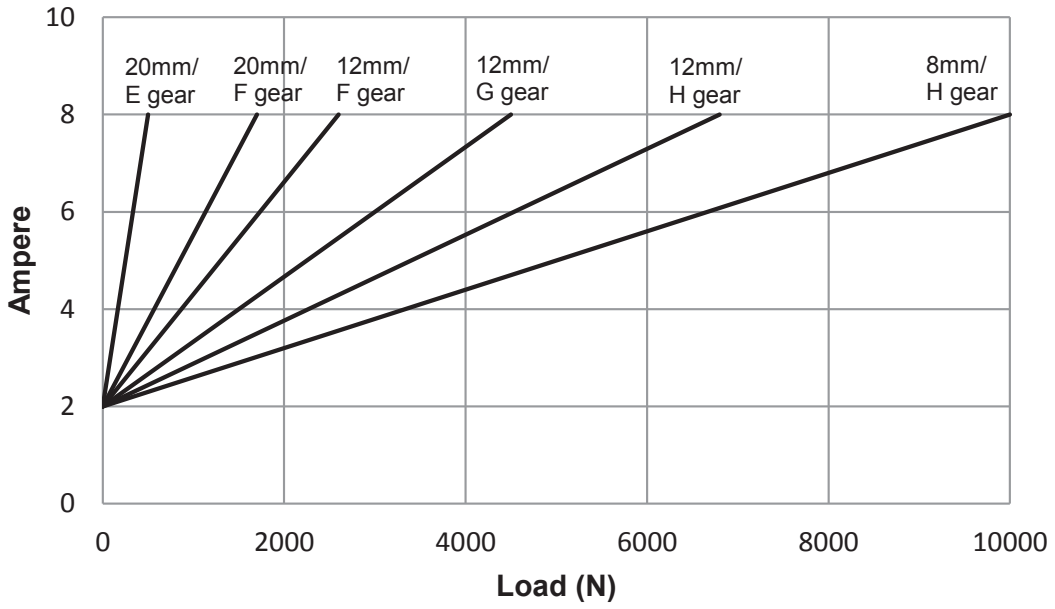


Speed and current curves - 24V motor

The values below are typical values and made with a stable power supply and an ambient temperature of 20˚C.

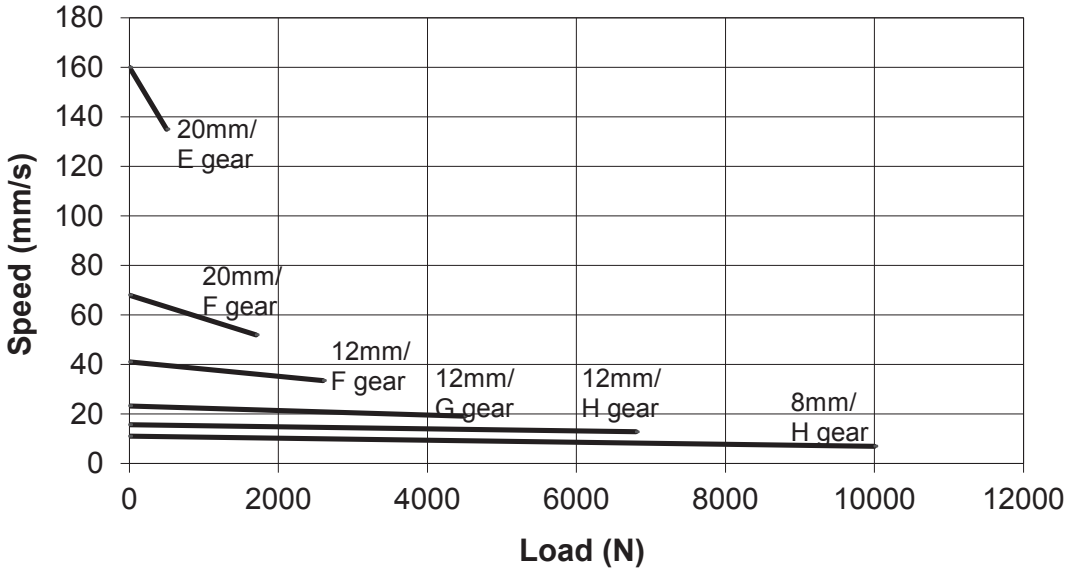
LA36 24V motor current vs. load

LA36 24V motor speed vs. load



All measurements above describe the spindle pitch (e.g. 20mm) and the gear type (e.g. E gear) of the actuator.

Speed and current are based on a nominal power supply of 12, 24, 36VDC.



Speed and current curves - 36V motor

The values below are typical values and made with a stable power supply and an ambient temperature of 20˚C.

LA36 36V motor current vs. load

LA36 36V motor speed vs. load

All measurements above describe the spindle pitch (e.g. 20mm) and the gear type (e.g. E gear) of the actuator.

Speed and current are based on a nominal power supply of 12, 24, 36VDC.

Chapter 2

I/O specifications: Actuator without feedback

Input/Output	Specification	Comments
Description	Permanent magnetic DC motor.	
Brown	12, 24 or 36VDC (+/-) 12V ± 20% 24V ± 10% 36V ± 10%	To extend actuator: Connect Brown to positive To retract actuator: Connect Brown to negative

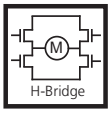
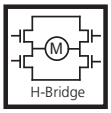
I/O specifications: Actuator with endstop signals and absolute positioning - Mechanical potentiometer feedback:



Input/Output	Specification	Comments
Description	The actuator can be equipped with a mechanical potentiometer, 10 kohm.	 Bourns 0-10 kohm, 5%, 10-Turn Type: 3540 Wirewound
Brown	12, 24 or 36VDC (+/-) 12V ± 20% 24V ± 10% 36V ± 10% Under normal conditions: 12V, max. 26A depending on load 24V, max. 13A depending on load 36V, max. 10A depending on load	To extend actuator: Connect Brown to positive To retract actuator: Connect Brown to negative
Blue		To extend actuator: Connect Blue to negative To retract actuator: Connect Blue to positive
Red	Signal power supply (+) 12-24VDC	For endstop signals
Black	Signal power supply GND (-)	
Green	Endstop signal out	Output voltage min. V_{IN} - 1V Source current max. 100mA NOT potential free
Yellow	Endstop signal in	
Violet	Mechanical potentiometer output Output range with 8mm spindle pitch: 0 kohm = 0mm stroke 10 kohm = 333mm stroke Output range with 12mm spindle pitch: 0 kohm = 0mm stroke 10 kohm = 500mm stroke Output range with 20mm spindle pitch: 0 kohm = 0mm stroke 10 kohm = 833mm stroke	+10V or other value Output protection: 1 kohm protection resistor Linearity: ± 0.25%
White	VCC+ to POT 10VDC or other values	

Please note that Potentiometer is not possible on variants with fast gear (Spindle pitch 20mm, H Gear).



I/O specifications: Actuator with endstop signals and absolute positioning - PWM

Input/Output	Specification	Comments
Description	The actuator can be equipped with electronic circuit that gives an analogue feedback signal when the actuator moves.	
Brown	12, 24 or 36VDC (+/-) 12V ± 20% 24V ± 10% 36V ± 10%	To extend actuator: Connect Brown to positive To retract actuator: Connect Brown to negative
Blue	Under normal conditions: 12V, max. 26A depending on load 24V, max. 13A depending on load 36V, max. 10A depending on load	To extend actuator: Connect Blue to negative To retract actuator: Connect Blue to positive
Red	Signal power supply (+) 12-24VDC	Current consumption: Max. 60mA, also when the actuator is not running
Black	Signal power supply GND (-)	
Green	Endstop signal out	Output voltage min. V_{IN} - 1V Source current max. 100mA NOT potential free
Yellow	Endstop signal in	
Violet	Digital output feedback (PNP) 10-90% 20-80%	Output voltage min. V_{IN} - 1V Tolerances +/- 2% Max. current output: 12mA Frequency: 75Hz It is recommendable to have the actuator to activate its limit switches on a regular basis, to ensure more precise positioning
White	Not to be connected	

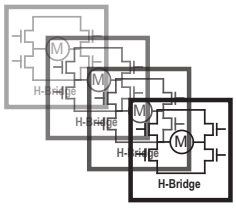
I/O specifications: Actuator with IC Basic

Input/Output	Specification	Comments
Description	Easy to use interface with integrated power electronics (H-bridge). The actuator can also be equipped with electronic circuit that gives an absolute or relative feedback signal. The version with "IC option" cannot be operated with PWM (power supply).	
Brown	12-24VDC + (VCC) Connect Brown to positive 12V ± 20% 24V ± 10% 12V, current limit 25A 24V, current limit 13A	Note: Do not change the power supply polarity on the brown and blue wires! Power supply GND (-) is electrically connected to the housing
Blue	12-24VDC - (GND) Connect Blue to negative 12V ± 20% 24V ± 10% 12V, current limit 25A 24V, current limit 13A	
Red	Extends the actuator	On/off voltages: > 67% of V_{IN} = ON < 33% of V_{IN} = OFF Input current: 10mA
Black	Retracts the actuator	
Green	Not to be connected	
Yellow	Not to be connected	
Violet	Analogue feedback 0-10V	Standby power consumption: 12V, 60mA 24V, 45 mA Ripple max. 200mV Transaction delay 20ms Linear feedback 0.5% Max. current output: 1mA It is recommendable to have the actuator to activate its limit switches on a regular basis, to ensure more precise positioning
	Single Hall output (PNP)	Output voltage min. V_{IN} - 1V Max. current output: 12mA For more information see fig. 2, page 20
White	Signal GND	

I/O specifications: Actuator with IC Advanced - with BusLink

Input/Output	Specification	Comments
Description	Easy to use interface with integrated power electronics (H-bridge). The actuator can also be equipped with electronic circuit that gives an absolute or relative feedback signal. IC Advanced provides a wide range of possibilities for customisation. The version with "IC option" cannot be operated with PWM (power supply).	
Brown	12-24VDC + (VCC) Connect Brown to positive 12V ± 20% 24V ± 10% 12V, current limit 25A 24V, current limit 13A	Note: Do not change the power supply polarity on the brown and blue wires! Power supply GND (-) is electrically connected to the housing Current limit levels can be adjusted through BusLink
Blue	12-24VDC - (GND) Connect Blue to negative 12V ± 20% 24V ± 10% 12V, current limit 25A 24V, current limit 13A	
Red	Extends the actuator	On/off voltages: > 67% of V_{IN} = ON < 33% of V_{IN} = OFF Input current: 10mA
Black	Retracts the actuator	
Green	Endstop signal out	Output voltage min. V_{IN} - 1V Source current max. 100mA Endstop signals are NOT potential free. Endstop signals can be configured with BusLink software according to any position needed. Only use one virtual endstop - keep one end open for initialisation. (See I/O specifications for endstop on page 18).
Yellow	Endstop signal in	

I/O specifications: Actuator with IC Advanced - with BusLink



Input/Output	Specification	Comments
Violet	Analogue feedback (Hall Pot): Configure any high/low combination between 0-10V	Ripple max. 200mV Transaction delay 20ms Linear feedback 0.5% Max. current output. 1mA
	Single Hall output (PNP)	Output voltage min. V_{IN} - 1V Max. current output: 12mA Please be aware that when choosing single hall, feedback position readout and virtual endstops are not available in BusLink. For more information, see fig. 2, page 20
	Digital output feedback PWM: Configure any high/low combination between 0-100%	Output voltage min. V_{IN} - 1V Frequency: 75Hz ± 10Hz as standard, but this can be customised. Duty cycle: Any low/high combination between 0 and 100 percent. Open drain source current max. 12mA
	Analogue feedback (4-20mA): Configure any high/low combination between 4-20mA	Transaction delay 20ms Linear feedback 0.5% Output: Source Serial resistance: 12V max. 300 ohm 24V max. 900 ohm
	All absolute value feedbacks (Hall Pot, PWM and 4-20mA)	Standby power consumption: 12V, 60mA 24V, 45mA It is recommendable to have the actuator to activate its limit switches on a regular basis, to ensure more precise positioning
White	Signal GND	

BusLink is available for IC Advanced and can be used for:
Diagnostics, manual run and configuration

Please note that the BusLink cables must be purchased separately from the actuator!

Item numbers for BusLink cables: USB2LIN: USB2LIN05, USB2LIN06 and onwards
Adaptor cable: 0964826-A

I/O specifications: Actuator with Parallel

Input/Output	Specification	Comments
Description	Self-configurable option that allows for parallel drive of up to 8 actuators. A master actuator with an integrated H-bridge controller controls up to 7 slaves. The version with "IC option" cannot be operated with PWM (power supply).	
Brown	12-24VDC + (VCC) Connect Brown to positive 12V ± 20% 24V ± 10% 12V, current limit 25A 24V, current limit 13A	Note: Do not change the power supply polarity on the brown and blue wires! The parallel actuators can run on one OR separate power supplies
Blue	12-24VDC - (GND) Connect Blue to negative 12V ± 20% 24V ± 10% 12V, current limit 25A 24V, current limit 13A	Power supply GND (-) is electrically connected to the housing Current limit levels can be adjusted through BusLink (only one actuator at a time for parallel)
Red	Extends the actuator	On/off voltages: > 67% of V_{IN} = ON < 33% of V_{IN} = OFF Input current: 10mA It does not matter where the in/out signals are applied. You can either choose to connect the signal cable to one actuator OR you can choose to connect the signal cable to each actuator on the line. Either way this will ensure parallel drive
Black	Retracts the actuator	
Green	Endstop signal out	Output voltage min. V_{IN} - 1V Source current max. 100mA NOT potential free
Yellow	Endstop signal in	
Violet	Parallel communication: Violet cords must be connected together	Standby power consumption: 12V, 60mA 24V, 45mA No feedback available during parallel drive
White	Signal GND: White cords must be connected together	

BusLink is available for Parallel and can be used for:

- Diagnostics
- Service counter is available with Parallel
- Parallel actuator configurations can be changed through BusLink, but all actuators need the same configurations!

Please note that the BusLink cables must be purchased separately from the actuator!

Item numbers for BusLink cables: USB2LIN: USB2LIN05, USB2LIN06 and onwards
Adaptor cable: 0964826-A

Change of temperature	EN60068-2-14 (Na)	Rapid change of temperature: High temperature: +100°C in 60 minutes. Low temperature: -30°C in 60 minutes. Transition time:<10 seconds Duration: 100 cycles Actuator is not activated/connected. Tested at room temperature.	TRD0501
	EN60068-2-14 (Nb)	Controlled change of temperature: Temperature change 5°C pr. minute High temperature: +70°C in 60 minutes. Low temperature: -30°C in 30 minutes. 130 minutes pr. Cycle. Duration: 1.000 cycles (90days) Actuator is not activated/connected. Tested at 250, 500 and 1,000 cycles at low and high temperatures.	TRD0508
Damp heat	EN60068-2-30 (Db)	Damp heat, Cyclic: Relative humidity: 93-98% High temperature: +55°C in 12 hours Low temperature: +25°C in 12 hours Duration: 21cycles * 24hours Actuator is not activated/connected Tested within 1 hour after condensation, That means after upper temperature has been reached.	TRD0505
	EN60068-2-3 (Ca)	Damp heat, Steady state: Relative humidity: 93-95% Temperature: +40 ±2°C Duration: 56 days Actuator is not activated/connected. Tested within one hour after exposure.	TRD0518
Salt mist.	EN60068-2-52 (Kb)	Salt spray test: Salt solution: 5% sodium chloride (NaCl) 4 spraying periods, each of 2 hours. Humidity storage 7 days after each. Actuator not activated/connected. Exposure time: 500 hours	TRD0506

Degrees of protection	EN60529 – IP66	<u>IP6X - Dust:</u> Dust-tight, No ingress of dust. Actuator is not activated.	TRD0514
		<u>IPX6 – Water:</u> Ingress of water in quantities causing harmful effects is not allowed. Duration: 100 litres pr. minute in 3 minutes Actuator is not activated.	TRD0513
		<u>IPX6 –Connected actuator:</u> Actuator is driving out and in for 3 min. 100(l/min) jet of water is placed at the wiper ring for 3 (min).	TRD0513
	DIN40050 – IP69K	<u>IPX6 –Connected actuator and push 6800 (N)</u> Actuator is driving out and in for 3 min. and Push 6800(N) at the end-pos. 100 (l/min.) jet of water is placed at the wiper ring for 3 min.	TRD0513
		<u>High pressure cleaner:</u> Water temperature: +80°C Water pressure: 80 bar Spray angle: 45° Spray distance: 100mm Duration: From any direction 10 seconds of spraying followed by 10 seconds rest. Actuator is not activated. Ingress of water in quantities causing harmful effects is not allowed.	TRD0512
	DUNK test	The actuator has been warmed up to 115°C for 20 hours. After this it is cooled down in 20°C saltwater. Cooling time: 5 minutes Opened for checking salt deposit and water.	TRD0515
Chemicals	BS7691 / 96hours	Diesel 100% Hydraulic oil 100% Ethylene Glucol 50% Urea Nitrogen saturated solution Liquid lime 10% (Super- Cal) NPK Fertilizer (NPK 16-4-12) saturated Tested for corrosion.	TRD0525

Environmental tests - Mechanical:

Test	Specification	Comment	TRD number
Free fall		Free fall from all sides: Height of fall: 0.4 meter onto steel. Actuator not activated/connected.	TRD0511
Vibration	EN60068-2-36 (Fdb)	Random vibration: Short time test:6.29g RMS Actuator is not connected Long time test: 7.21g RMS Actuator is not connected Duration: 2 hours in each direction	TRD0502
	EN 60068-2-6 (Fc)	Sinus vibration: Frequency 5-25Hz: Amplitude = 3.3mm pp Frequency 25-200Hz: Acceleration 4g Number of directions: 3 (X-Z-Y) Duration: 2 hours in each direction. Actuator is not activated	TRD0517
Bump	EN60068-2-29 (Eb)	Bump test: Level: 40g Duration: 6 milliseconds Number of bumps: 500 shocks in each of 6 directions. Actuator is not connected.	TRD0503
Shock	EN60068-2-27 (Ea)	Shock test: Level: 100g Duration: 6 milliseconds Number of bumps: 3 shocks in each of 6 directions. Actuator is not connected.	TRD0504

Environmental tests - Electrical:

Test	Specification	Comment	TRD number
Power supply	ASAE EP455 (1990)	Operating voltages +10V - +16V Over voltage +26(V) / 5min. Reverse polarity –26(V) / 5min. Short circuit to ground 16 (V) / 5 min. Short circuit to supply 16(V) / 5 min.	TRD0522
HF-immunity	EN61000-6-2	Level: 30 V/m. at 26 MHz – 1000 mHz 80% 1 KHz	TRD0516
Emission	EN61000-6-4	Level is inside limits for 12 V motor	TRD0516
Automotive transients	ISO 7637	Load dump test only accepted on motor power connection.	TRD0521

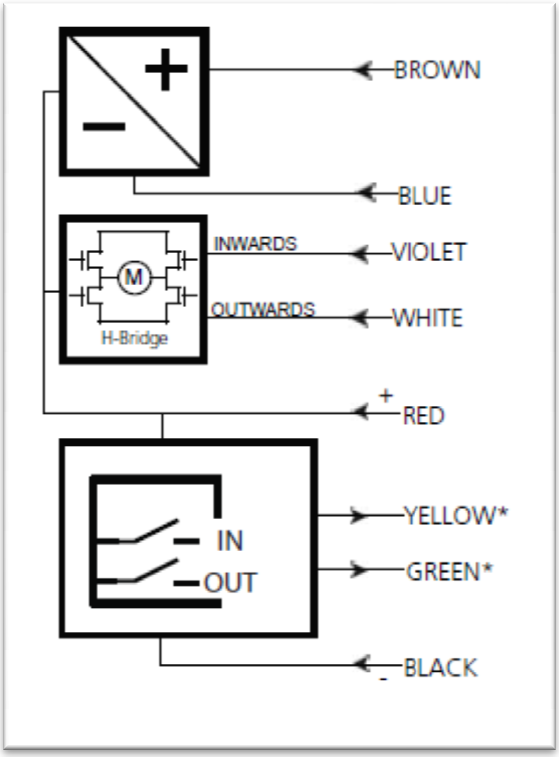
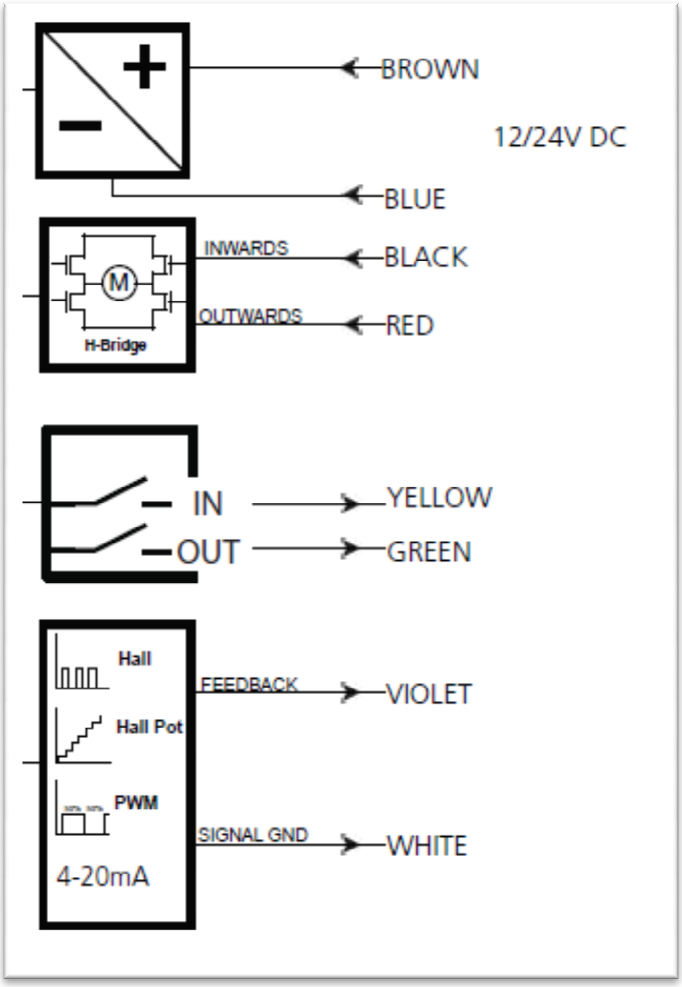
All sales are subject to the Standard Terms of Sale and Delivery for LINAK. For a copy hereof, please contact LINAK.



New type of LA36 liner actuator

Due to changes on the electrical connections on the LA36 liner actuator done by the supplier the following has to be considered when replacing an actuator of this type delivered before the year 2016.



On the previous model of actuator the end stop signals have a separate power supply, which the new model hasn't. This is important if you have different supplies for power and control voltage to the actuators. On the new model of actuators there is only one power supply.

Also please notice that the wiring colors have changed.

Actuators delivered before 2016

Actuators delivered 2016 and after

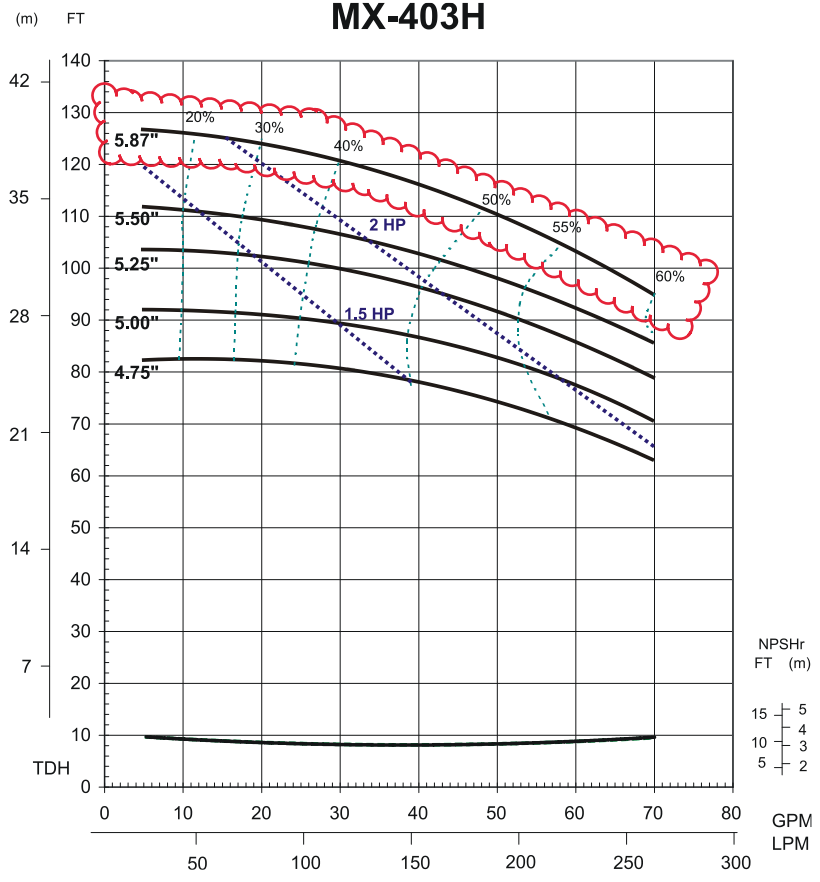
MX-403H 3 HP

Model	MX-403H	
Mark	CV(CE)	RV (RE)
1 Front Casing	GFRPP	
2 Impeller	GFRPP	
3 Rear Casing	GFRPP	
4 Magnet capsule	PP	
5 O-ring	FKM[1]	
6 Spindle	Alumina Ceramic	
7 Bearing	Carbon	PTFE
8 Rear thrust	CFRPEEK	
9 Mouth ring	PTFE	
10 Thrust/Liner ring	Alumina Ceramic	
11 Lock pin	GFRPPS	



1 EPDM and AFLAS® o-ring also available

- **Engineered to meet the most severe operating conditions.**
- **When fitted with a carbon bearing, the MX will allow for brief periods of dry running.**
- **The MX Series is the first resin magnet pump that uses a Split Volute Pump Casing that forms a vortex chamber.**
- **Patented Self-radiating structure – Heat dispersion holes force the liquid to circulate around the spindle and bearing .**

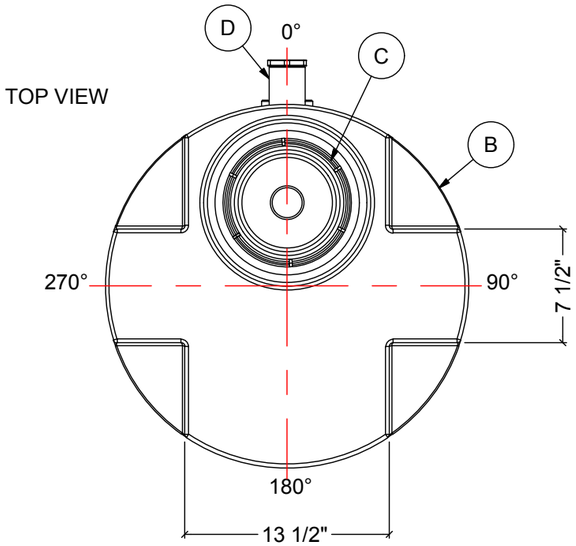
W01 Rolled Steel NEMA Premium Eff. Motors
TEFC

Standard Features

- Motors are compliant with DOE and NRCAN
- Three-phase, 2, 4 and 6 pole, 60Hz
- Voltage: 230/460V, 575V
- Totally Enclosed Fan Cooled - TEFC (IP55) waterproof as per NEMA MG1 1.26.6 “Waterproof Machine”
- Die cast aluminum squirrel cage rotor
- V’Ring sealing
- Ball bearings
- 1045 heat treated and stress relieved carbon steel shaft
- Class “F” insulation for all frames. Temperature rise limited to Class “B” (80K)
- 575V rated motors have Spike Resistant WISE wire.
  - Protects against IGBT voltage spikes up to 2400V.
  - Exceeds NEMA MG1 Part 31.4.4.2
- Dip and Bake Insulation system
- NEMA design “B”
- 1.15 Service Factor
- Continuous duty (S1)
- 104ºF (40ºC) ambient temperature
- Altitude: 3300 ft (1000m)
- Double Gasketed terminal box
- Paint: Synthetic enamel alkyd resin base
- Paint Plan:
  - 207N - Frame 143/5T
  - 207A - Frame 182/4T & 213/5T
  - 203A - Frame 254/6T
- Color: Munsell N1 - Flat Black
- All frames have dual mounting



Class I, Div 2, Groups A,B,C & D
Class I, Zone 2, IIC

Inverter Ratings				
Frames	Poles	Constant Torque	Variable Torque	VFD
143/5T - 254/6T	2 Pole	10:1	1000:1	Any
	4 Pole	4:1		
See page 7.6 for details				

Optional Features

- 50Hz
- Special voltages
- Special shafts
- Oil Seal, Lip Seal
- Thermostats, Thermistors, RTD’s (PT100)
- Drip cover (canopy) for shaft down applications
- NEMA C flange for all ratings
- Special paint
- Shaft grounding (Aegis or WEG). Not for Hazloc.
- Forced ventilation
- No feet

Type 21 True Union Ball Valves

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

The Chemline **Type 21** True Union Ball valve incorporates state of the art features for long term performance. This is a full port, full blocking True Union valve pressure rated at 16 bar (230 psi)[3]. Double stem o-rings and Safety Shear stem design provide for a high degree of safety on hazardous fluid applications. All sizes have an ISO standard actuator mounting platform integral to the valve body. This provides for sturdy and secure mounting of pneumatic or electric actuators.

PVC | CPVC | PP | PVDF

CRN Registered Consult Chemline

NSF[4] Certified to NSF/ANSI 61

SERIES:	Type 21
SIZES:	3/8" – 4"
ENDS:	Socket, Threaded, Combo[6], Flanged, Butt[1] or ChemFlare™
SEATS:	PTFE
SEALS[2]:	EPDM, FKM (Viton®)

features

Pressure rated to 230 psi[3]
- Provides a high factor of safety

Integral Actuator Mounting Platform
- Actuation is easy. Electric or pneumatic actuators may be mounted in the field.

Full Port
- High capacity and low pressure drops

Fully Blocking
- Downstream union nut may be safely disassembled for piping maintenance while valve is closed off under full system pressure

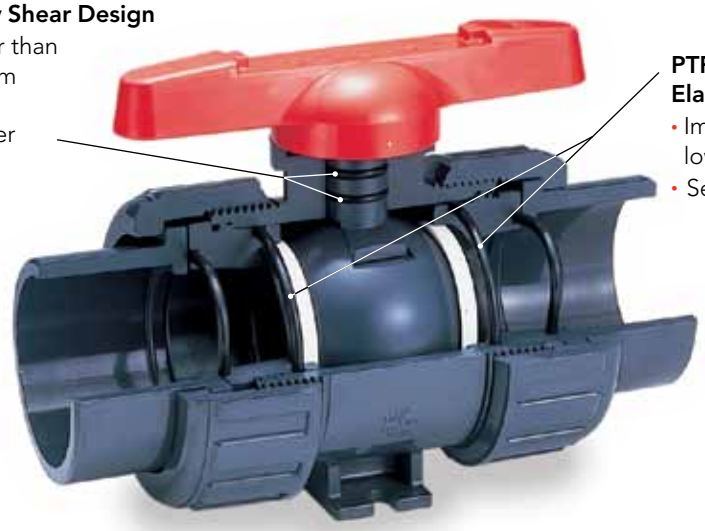
Built-In Spanner Wrench
- Top of the handle is designed to be used as a tool for accessing internal parts

Safety Shear Stem Design
- Stem has double o-rings
- Designed to hold full pressure even if stem breaks due to excessive torque

High Chemical Resistant Material
- PVC and CPVC compounds have an "A" chemical resistance rating as per ASTM D-1784. They have outperformed other PVC and CPVC compounds on aggressive chemicals.

CRN Registration numbers by province
- Ontario: OC11045.5
- Newfoundland: OC11045.50
- Saskatchewan/Manitoba/Quebec: OC11045.56
- New Brunswick: OC11045.57
- Nova Scotia: OC11045.58
- P.E.I.: OC11045.59
- British Columbia: not required
- Alberta: not required[5]

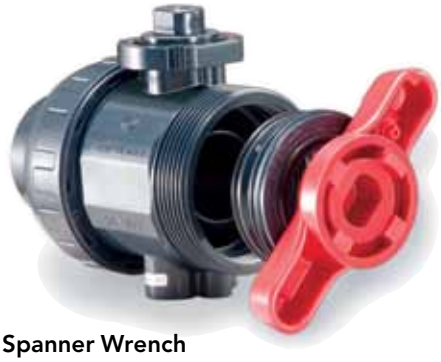
[1] Butt ends for fusion to Chemline metric PP, PVDF or ECTFE (Halar®) piping.
[2] Other materials are available.
[3] PVC, CPVC and PVDF 1/2" to 2" are rated at 230 psi; 2-1/2" to 4" and all size PP valves are rated at 150 psi at 20°C.
[4] PVC valves with EPDM or FKM (Viton®) seals are certified under NSF/ANSI Standard 61 for contact with drinking water.
[5] Not required for non-expandable fluids.
[6] PVC and CPVC valves 1/2" to 2" are available as Combo (threaded and socket ends).



12/18 ©Chemline Plastics Limited 2018
Chemline is a registered trade mark of Chemline Plastics Limited

Type 21 True Union Ball Valves

Features



Double Stem O-Rings – Safety Shear Design

- Upper o-ring groove is deeper than lower. In case of excessive stem torque, stem will shear at the upper groove, leaving the inner o-ring intact to seal against full line pressure.

PTFE Seats have Elastomer Cushions

- Improved sealing while lowering stem torques
- Self adjusts for seat wear

Built in Spanner Wrench

- For removing or tightening the seat carrier
- All parts are replaceable

Integral Actuator Mounting Platform

- Actuation is easy. Electric or pneumatic actuators may be mounted in the field. Simply pull off the handle to reveal a standard ISO 5211 mounting platform which accepts bolt-on hardware.

Fully Blocking

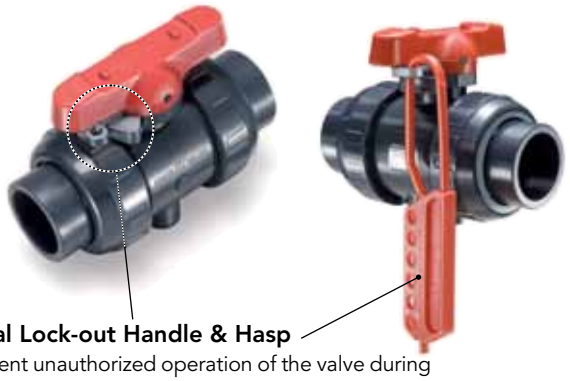
- Downstream pipe may be removed while upstream side is still pressurized. This may be done with valve installed in either direction.

Base Mounting Pad

- Optional threaded inserts allow valves to be securely anchored
- Supplied standard with actuated valves

Type 21 True Union Ball Valves

Options + Accessories



ChemFlare™ Ends

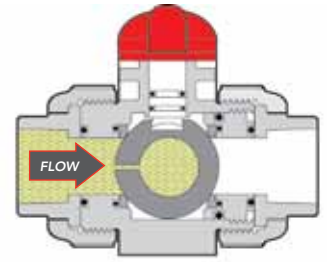
- For connection to PFA tube. Leak-free connections for difficult services such as sodium hypochlorite

One-piece moulded PVC and CPVC 6" socket ends

- Allows installation of 4" valve in 6" line
- Factory moulded, not fabricated with couplings and reducers cemented together
- Fixed to valve mechanically just like the one-piece moulded factory flanges

Optional Lock-out Handle & Hasp

- To prevent unauthorized operation of the valve during maintenance shut-downs
- Padlocks go through holes in hasp



Gear Operators

- Deluxe FRP construction
- IP67 enclosure resists short term immersion

Chain Wheel Operators

- For overhead operation, with 7' of chain drop
- Cast iron or stainless steel

Vented Ball

- Recommended for all sodium hypochlorite services
- Valve shown in closed position

Valve Tags

- Stainless steel or plastic

Different Colour Handles

- Choose a handle colour other than standard red for colour coding different services

Municipal Operating Nut

- 2" square nut for operating valves below grade using a standard municipal "key"
- Stainless Steel for corrosion resistance

Manual Limit Switch

- Electrical feedback of manual valve position
- NEMA 4X enclosure, position indicator beacon, 2x SPDT or proximity switches, stainless steel hardware

Shaft Extensions

- Different materials and lengths are available
- Several designs:
  - with no housing for indoors
  - with waterproofed PVC housing for indoors or outdoors
  - with stainless steel housing for buried or actuated services

Type 21 True Union Ball Valves

Electric + Pneumatic Actuation

Pneumatic and Electric Actuators

- A complete range of actuators and control accessories are available, mounted to valves using PPG plastic brackets and stainless steel couplings. Refer to separate data sheets.
- All actuators are CSA approved, have NEMA 4X enclosures, stainless steel hardware and permanently lubricated gear train

ERS Series Electric

- Type 21 ball valves up to 2”
- 180 in-lbs torque
- On-Off (3 wire, 2-wire)
- Visual feedback

E Series Electric

- Type 21 ball valves up to 4”
- Up to 885 in-lbs torque
- On-Off (3 wire, 2 wire); optional failsafe, modulating
- Visual feedback and feedback switches; optional extra switches, feedback potentiometer and feedback transmitter

Q Series Electric

- Type 21 ball valves up to 3”
- 300 in-lbs torque
- On-Off (3 wire) adjustable travel, optional On-Off (2 wire), failsafe 3-position, modulating
- Visual feedback, optional 2 feedback switches, feedback potentiometer and feedback transmitter

A Series Electric

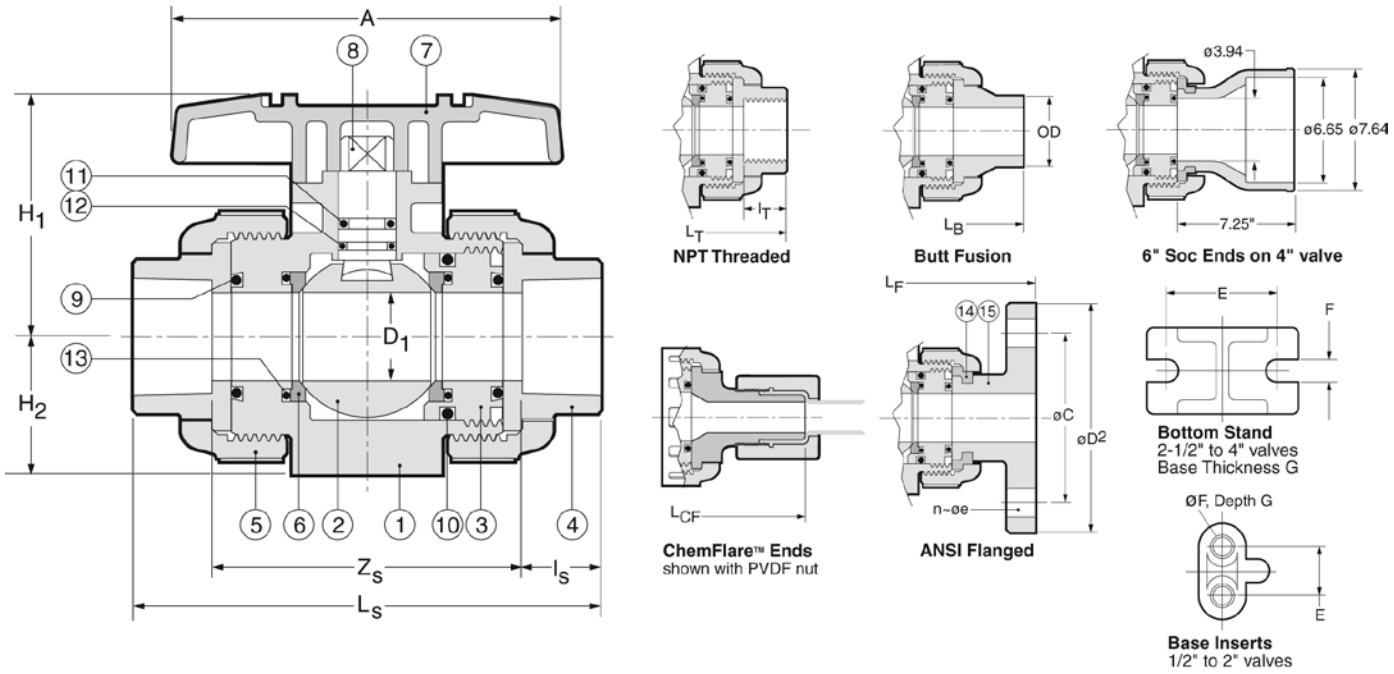
- Type 21 ball valves up to 6”
- up to 2,000 in-lbs torque
- On-Off (3 wire) adjustable travel, optional On-Off (2 wire), failsafe multi-turn, 3 position modulating, BUS
- Visual feedback, optional 2 feedback switches, feedback potentiometer and feedback transmitter

V Series Electric

with Local Control Station

- Type 21 ball valves up to 6”
- up to 8,850 in-lbs torque
- On-Off (2/3 wire) adjustable travel, optional failsafe, modulating, BUS
- Visual feedback, 2 feedback switches, optional 2 extra feedback switches, feedback potentiometer and feedback transmitter

PA Series Pneumatic



- Type 21 ball valves up to 6”
- up to 10,660 in-lbs torque
- industrial process submerged
- bleach/water washdown
- Rilsan-coated aluminum

PP Series Pneumatic

- Type 21 ball valves up to 6”
- up to 1,335 in-lbs torque
- industrial process with minimal use of metal
- Glass-filled Polyamide

Type 21 True Union Ball Valves

SAMPLE SPECIFICATION

1. All True Union Ball Valves in PVC, CPVC, PP or PVDF shall be Chemline Type 21 or equal sizes 1/2" to 2" in PVC, CPVC, and PVDF rated at 230 psi and in PP 150 psi maximum working pressure. Sizes 2-1/2", 3" and 4" rated at 150 psi maximum working pressure with EPDM or FKM (Viton®) seals. Ball seats shall be PTFE with elastomer cushions for closure with minimum stem torques.
2. All valves will have Safety Shear stem design, blowout-proof with double o-rings for safety. The top o-ring groove shall be deeper so that if the stem breaks off under excessive torque the lower o-ring will remain intact and the valve will hold pressure.
3. All valves shall be full port and two-way blocking design.
4. All valves will be CRN (Canadian Registration Number) registered with TSSA.
5. PVC valves with EPDM or FKM (Viton®) seals shall be certified under NSF/ANSI Standard 61 for contact with drinking water.
6. All valves shall have chemical resistant labels permanently marked with manufacturing number to provide production level traceability.
7. PVC compound shall have an ASTM cell classification 12454-A with a minimum suffix "A" designation for chemical resistance as per ASTM D-1784 (CSA report LO 4000-172).
8. CPVC compound shall have an ASTM cell classification 23567-A with a minimum suffix "A" designation for chemical resistance as per ASTM D-1784.
9. PP material will conform to ASTM D-4101 PP 021 B 67272 material requirements.
10. PVDF material shall be unpigmented conforming to ASTM D-3222 material requirements and to be USDA Title 21 Chapter 1 Part 177. 2510 requirements for contact with food.
11. Socket ends in PVC and CPVC shall be Schedule 80 and conform to ASTM D-2467.
12. Threaded ends shall be Schedule 80 and conform to ASTM D-2464.
13. Butt fusion ends in PP or PVDF will be compatible with Chemline PP or PVDF metric piping systems.
14. Flanged ends shall be ANSI Class 150 one-piece factory moulded (not fabricated) to ensure maximum strength and close tolerance end to end dimensions.

Example: Chemline Type 21 True Union Ball Valve, PVC, 2", with EPDM seals, socket ends.

[1] 1/4" is normally the 3/8" valve reduced. 6" is 4" valve with 6" end connections.

[2] PVC and CPVC valves 1/2" to 2" are available as Combo (socket and threaded ends).

[3] PP, PVDF and ECTFE (Halar®) metric butt fusion ends (1/2" to 4") connect to Chemline PP, PVDF and ECTFE (Halar®) piping systems.

OTHER OPTIONS & ACCESSORIES

- **Alternate O-Ring Seals**
- **Stem Extensions** made to any length
- **Limit Switches** – For open and/or closed position indication
- **Municipal Operating Nut**
- **Lubrication-free Valves** – Factory clean room assembled
- **Vented Ball** – For sodium hypochlorite applications

Gauge Isolators

Chemline SG Series Gauge Isolators allow inexpensive pressure gauges, or any other pressure instrument to be used in corrosive services. The upper chamber (gauge side) is filled with a stable fluid such as glycol or glycerine‡. A diaphragm separates it from the lower chamber which receives the media under pressure.

The 1/2" gauge connection allows use of the popular 4" and 4-1/2" diameter gauges. Pressure switches or transmitters may also be installed. Customers can easily fill isolators and install their own gauges.

CHEMLINE Plastics Limited

Your Pipeline To Quality

PVC, PP, PVDF

SERIES: SG

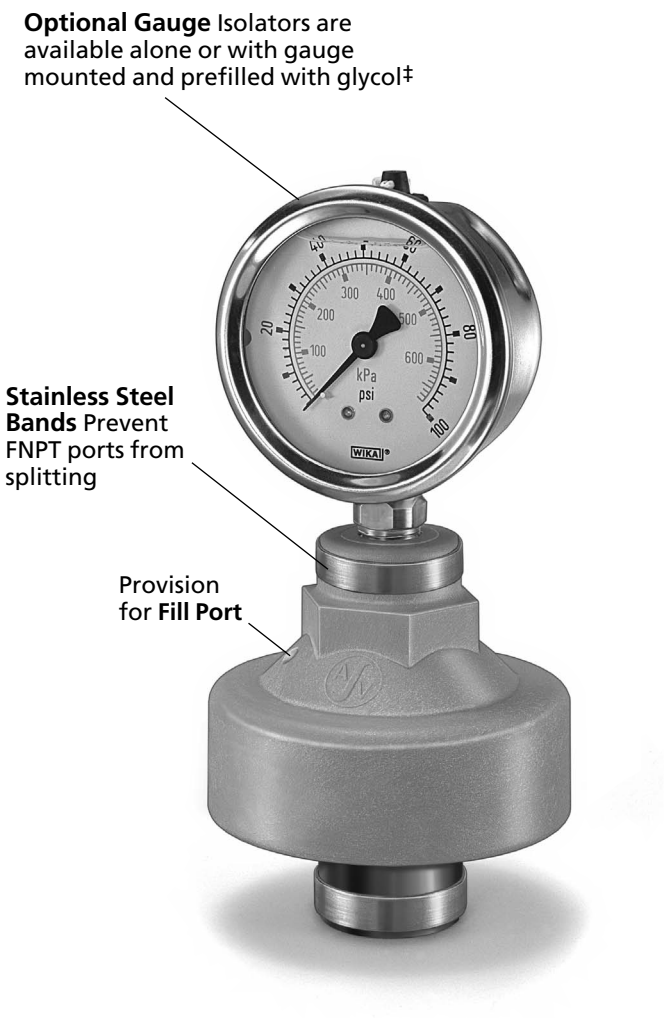
INLET CONNECTION: 1/4" or 1/2" Threaded†

INSTRUMENT CONNECTION: 1/4" or 1/2" Threaded

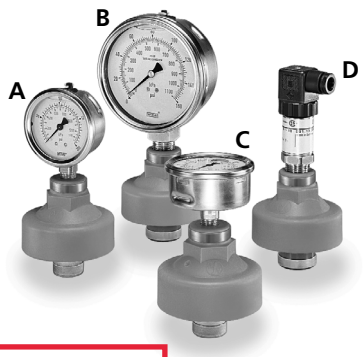
DIAPHRAGM: Teflon®

Isolate Pressure Instruments from Corrosive Media

Teflon® Diaphragm



Features

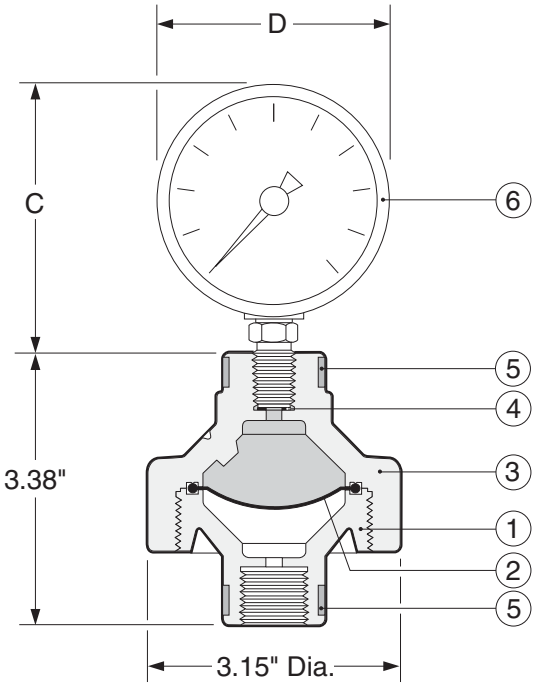


Easy to Mount Gauges
- It is easy to fill an isolator and field mount a gauge. No special equipment is required.
- Will accept popular 4" and 4-1/2" diameter gauges

Provision for Fill Port
- Housing may be drilled and tapped by Chemline or customer for a threaded fill port. This is used for filling isolator using a vacuum filling station

High Chemical Resistance
- Choice of body materials for a wide range of applications
- Teflon® PTFE bonded EPDM dished diaphragm for high chemical resistance and sensitivity

Heavy Duty Design for Safety
- PPG* top chamber
- Heavy wall connection ports



A With 2" gauge
B With 4-1/2" gauge
C With 2" back mount gauge
D With pressure transmitter

† Other available inlet connections are 1/2" socket or 1/2" to 1" flanged.
‡ Other fluids are available for special applications such as chlorine service.
* Glass reinforced polypropylene.

Y Sediment Strainers

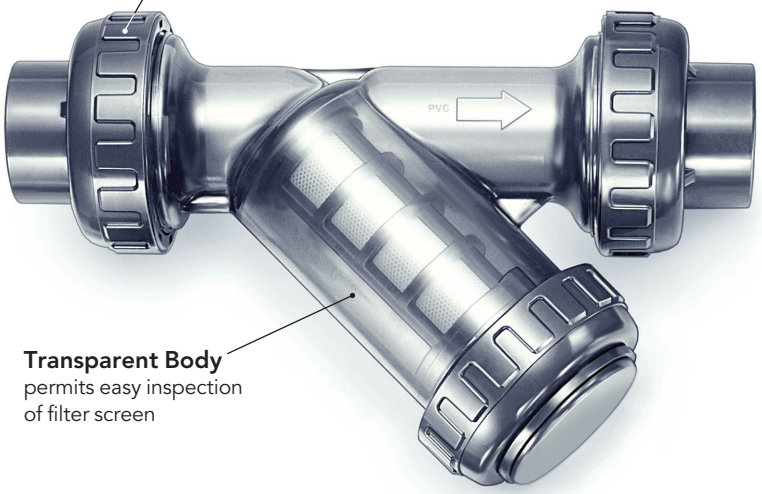
CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

The Chemline YSA Series Y Sediment Strainer is a safety filtration device designed to entrap occasional solid impurities in the line. This is to protect equipment with small orifices such as solenoid valves, and prevent damage to pumps or control valves, etc. The easily replaceable filter screen comes in a choice of meshes. The new YSA Series True Union models have greatly increased filtration areas. Pressure drops are lower and less frequent cleaning is required.

PVC [1]

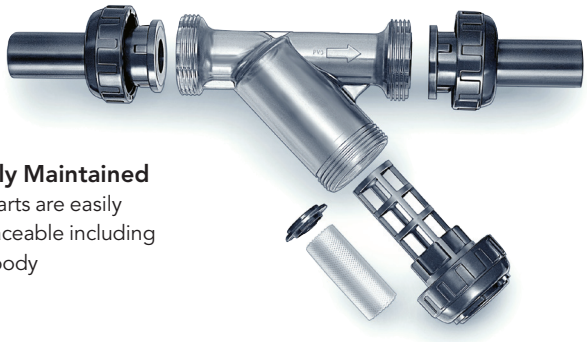
CRN Registered Consult Chemline

NSF [4] Certified to NSF/ANSI 61



SERIES: YSA

SIZES: 1/2" – 4"



ENDS: True Union, Threaded, Socket, Flanged or ChemFlare™ [2]

SEALS: EPDM, FKM (Viton®) [3]

True Union Design
Body slips out of line.
No need for flanges.

Transparent Body
permits easy inspection
of filter screen

- **Easily Maintained**
  All parts are easily replaceable including the body

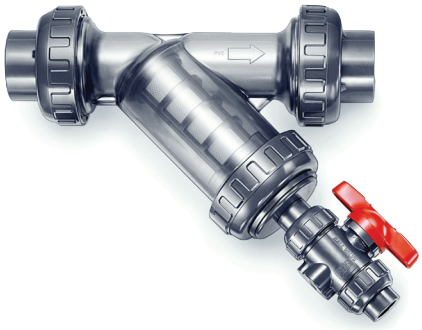
features

- **High Capacity**
- **Transparent Body**

Large Filtration Capacity Low Pressure Drops

- Diameter of screens are full pipe bore. The effective filtering area is in some sizes twice the filtering area of other makes. This results in larger filtration capacities and lower pressure drops.

Replaceable Filter Screens



- Available with choice of PVC 24, 35 or 55 mesh filter screens
- 316 SS screens are also available

Dual Socket and Threaded Ends

- Sizes 1/2" to 2" in PVC are supplied with socket ends plus two free threaded ends in each box

CRN Registration numbers by province

SB12 Series Back Pressure/Relief Valves

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

PVC PP PVDF

CRN Registered as Category C Fittings Consult Chemline

NSF[3] Certified to NSF/ANSI 61

SERIES: SB12

SIZES: 3/8" – 4"

ENDS: True Union Socket, Threaded or ChemFlare™[1] Spigot[2] Bodies with Plain, Socket, Threaded or Flanged ends

DIAPHRAGM: PTFE Bonded EPDM

SEALS: EPDM, FKM (Viton®)

The Chemline SB Series Back Pressure/ Relief Valve has two functions. As a ***back pressure valve***, installed in-line downstream of a pump, the back pressure below the metering pump is maintained. When installed in the branch of a tee it is a ***pressure relief valve***. The valve stays closed until inlet pressure reaches the set pressure which is adjusted by turning the spring tensioning bolt. Inlet pressure acts upward against the piston allowing excess pressure to flow upwards through the orifice.

The SB12 Series has a built-in check valve function, desirable for dosing applications. It is not so sensitive as to open with every pulsation from a metering pump.

features

True Union Ends

- Easy installation and maintenance
- Eliminate chemical leakage problems common with old fashioned threaded connections

Long Cycling Life

- Dynamic seal is PTFE bonded EPDM for high chemical resistance
- This moulded diaphragm is designed for superior sealing and flex life

Superior Performance in Dosing Systems

- Valves are hydraulically designed for very low hysteresis ("backlash") and to eliminate chatter
- Built-in check (non-return) function
- Valve opening depends on inlet pressure only and is uneffected by changes in downstream (back) pressure

CRN Registration numbers by province

- Ontario: OC10134.5
- Newfoundland: OC10134.50
- Alberta: OC10134.52

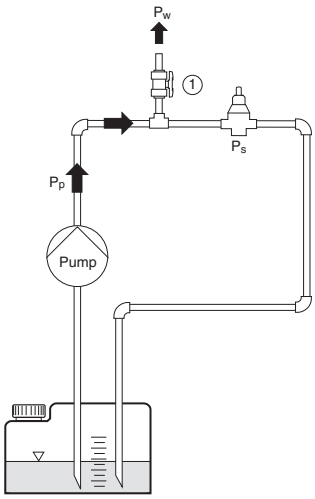
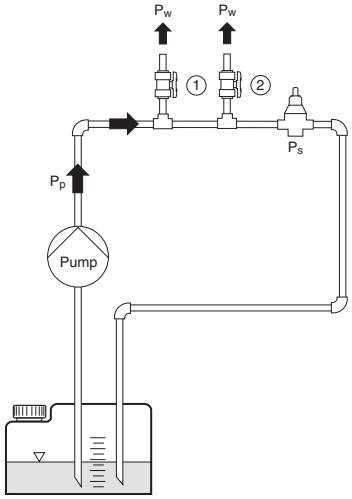
pressure loss nomogram for SB12 valves 3/8” to 2”



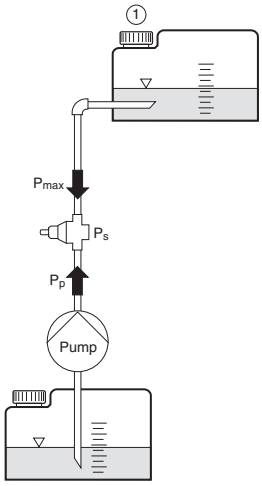
typical dosing system schematic



application of pressure relief valves

Constant System Pressure

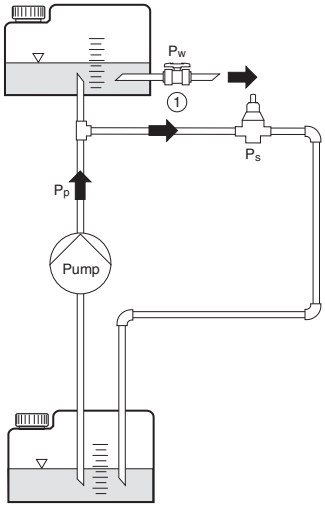
$P_p \geq P_w$
$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed



Consumer 1 and/or 2 Open, Valve Closes

$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

Non-Return Valve



Container 1 is located above the pump

$P_s \geq P_{max}$
$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

Overflow Valve

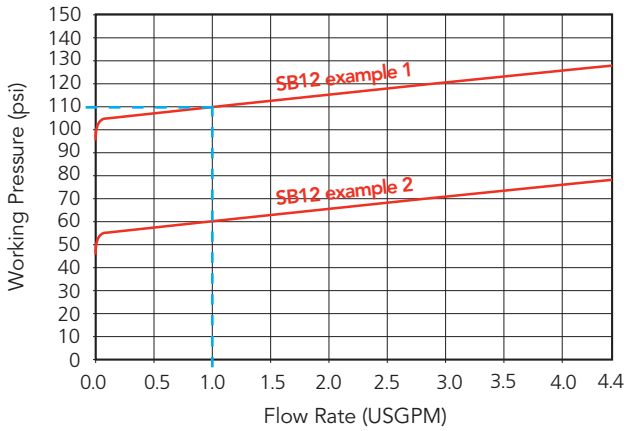
Pressure of container or application system should not exceed the maximum pressure value

$P_s \leq P_w$
$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

P_w = Working Pressure
P_p = Pump Pressure
P_s = Set Pressure

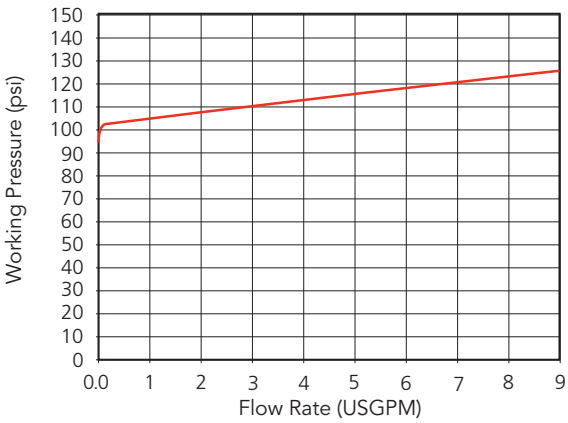
SB12 Series Back Pressure/Relief Valves 1/2" to 2"

working pressure vs. flow rate



The curves show the relationship between the working pressure and the approximate flow rate through the valve for water at 20°C (68°F) . These values will vary depending on:

- The configuration of the piping and the pressure losses associated with it
- The fluid if not water at 20°C (68°F)
- Whether the pressure is rising or falling, hysteresis is approximately 4 psi for 1/2" to 2" valves. For valves 2-1/2" to 4", hysteresis is approximately 14.5 psi.



operation examples

1. The valve is set closed at 100 psi. At a pressure increase of 10 psi, a flow of approximately 1.0 USGPM will be reached.
   - set pressure = 100 psi
   - working pressure = 110 psi
   - opening pressure = approximately 104 psi
2. The valve is set closed at 50 psi. At a pressure increase of 10 psi, a flow of approximately 1.0 USGPM will be reached.
   - set pressure = 50 psi
   - working pressure = 60 psi
   - opening pressure = approximately 54 psi

> UV500 Online Water Analyser

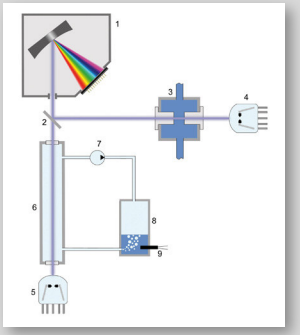
***The UV500** is a on-line water analyser based on a high resolution UV-visible spectrograph.*

It allows to monitor simultaneously many different parameters for waste water treatment plants or river monitoring stations with an excellent stability and low operating cost.

The same spectrograph can measure organic matter, nitrate, colour, turbidity, phosphate, ammonia and hydrogen sulphide. A complementary UV-visible fluorescence module allows the measurement of aromatics hydrocarbons (PAH). Nephelometric turbidity by visible or infra-red laser diode is also available.

The full UV-visible spectrum can also be used to monitor specific chemical process making the UV500 a ideal instrument for chemical plants. Different materials are available for the flow cell and hydraulic parts depending on the matrix chemical compatibility.

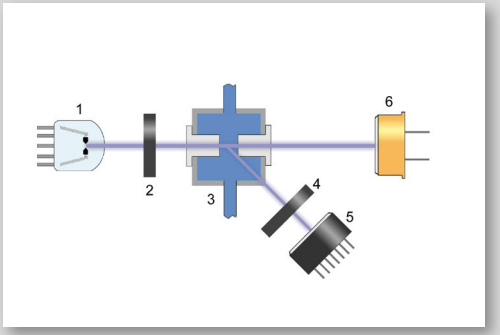
External probes can be added for physicochemical parameters like pH, ORP, dissolved oxygen, conductivity and turbidity.



Thanks to its automatic cleaning system and its extremely long life time lamp, the maintenance is roughly limited to the periodic refill of the inexpensive cleaning solution and eventually reagents depending on the parameters.

TETHYS INSTRUMENTS

UV-visible Spectroscopy *on liquid and gas phase : a unique method*



- A 2048 pixels high resolution spectrograph scanning wavelengths from 180 nm to 750 nm is the master part of the UV500. Direct absorbance measurement for UV254, COD, BOD, TOC, NO3, Colour PO4 and Cr VI brings fast and stable measurements with a simple hydraulic circuit. Factory predefined or local multi-point calibration allows to get readings of COD, BOD and TOC under the UV alternative method for compatible applications. UV spectroscopy brings faster results than conventional methods like COD, BOD, TOC with much less maintenance once the correlation is dertermined.
- An additional circuit allows the measurement of ammonia and hydrogen sulphide on the gas phase after a stripping step. This unique method allows measurements on extremely turbid or coloured samples like activated sludge as the gas phase is not affected. A fast Fourier transform (FFT) brings an exceptional selectivity and no interference has never been reported after years of operation on many different applications.
- The patented flow cell allows very high level of suspended solid without clogging. The turbidity is automatically compensated by a dual-wavelength method.
- The UV source is a xenon flash lamp specified for 10^9 flashes that corresponds to more than 10 years of life time with one measurement every minute.
- Physico-chemical measurements like pH, ORP, dissolved oxygen, conductivity can be added to the internal measurements by using external probes. The dissolved oxygen probe is based on fluorescence method for a lower maintenance and higher stability.

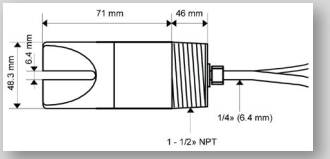
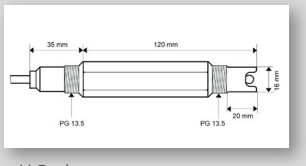
UV fluorescence principle

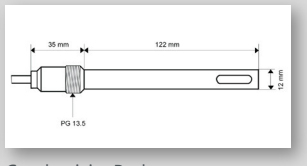
Robust *Industrial Probes*



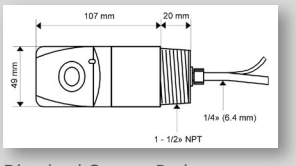
All the probes are specially designed for harsh environments with high level of suspended solid.



Turbidity Probe Low Range



Turbidity Probe Medium Range



Turbidity Probe High Range

pH Probe

Conductivity Probe

Dissolved Oxygen Probe

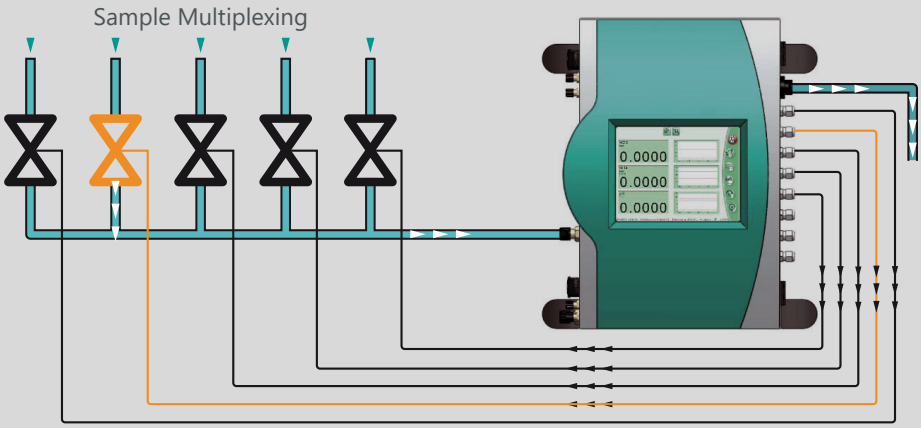
Communication

The RS232 port supports the MODBUS protocol to transmit each measuring channel value to a SCADA system

Additional parameters are available like status code, error code, calibration values and pumps run time.

Basic 4-20 mA output modules can be plugged on the main board for each measuring channel, in the limit of 12 modules. A USB port enables to download on any USB key the last 5000 recorded measurements as well as a diagnostic file containing the configuration and useful information for remote troubleshooting.

The recorded measurements file can be imported to Excel for graphs or other treatments.
The software of the analyser can be upgraded by connecting a USB key.

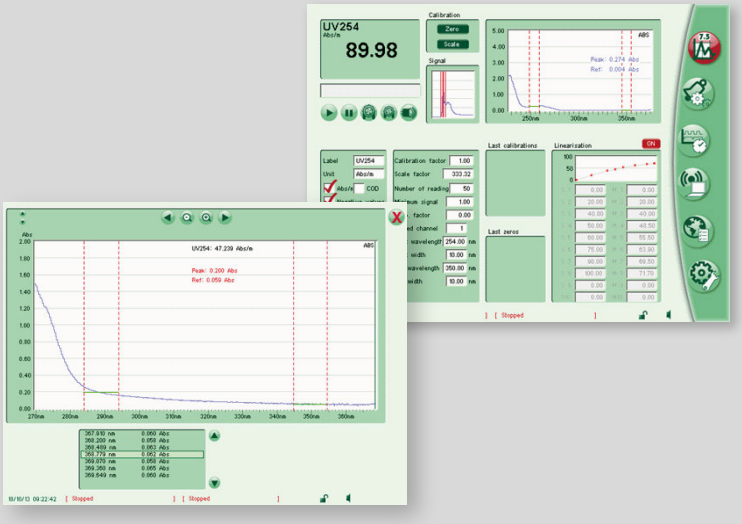


Multiplexing *system*

When different streams need to be analysed, for example inlet and outlet of a plant, an optional multiplexing system delivers relay contacts to control external electric-valves or external pumps.

Up to 6 different streams can be selected

The measuring channels can be either duplicated (each one having its own 4-20mA output or MODBUS register), or measured sequentially to fit with the maximum of 16 measuring channels (a MODBUS register tells which stream is currently being measured).

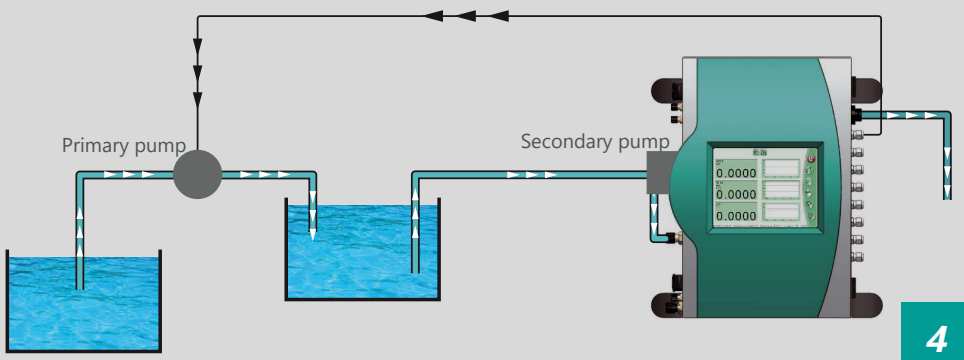


User-Friendly ***Interface***

The colour touch screen and intuitive interface available in 9 different languages (Chinese, English, French, German, Hungarian, Italian, Portuguese, Spanish, Turkish) makes very easy to test or configure the analyser.

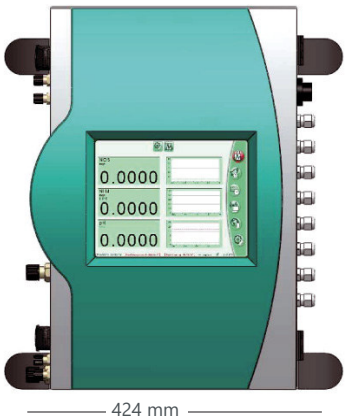
Many test functions allows to test and troubleshoot each element of the analysers (light signal, pumps, solenoid valves, etc...) to setup quickly a maintenance diagnostic.

An acid resistant protection film on the screen assumes an efficient long term protection.

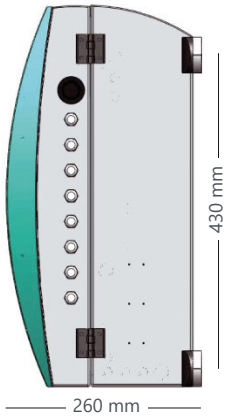


Sampling System

The UV500 can adapt to many different kind of sampling depending of the application : surface water, drinking water, process water or wastewater.



If the water is already pressurized, the sample can be admitted directly inside the analyser with a maximal pressure of 4 bars. Otherwise an optional built-in peristaltic pump, synchronised with the measurement to extend the tubing life time, allows to take the sample directly from a tank located up to 6 meters below the analyser.



For demanding applications with long distances, another peristaltic pump in a separate enclosure is proposed as an option.

For some applications on river water or wastewater where two sampling pumps are necessary, the UV500 delivers a relay contact to synchronise the primary pump. The delay and running time of each pump can be adjusted easily in the parameters menu of the analyser.

> UV500 General Specifications

Sample flow	Recommended: 0 - 5 l/min 0 - 0.5 l/min for NH4 or H2S
Sample pressure	0 - 4 Bar (0 - 1 Bar with sampling peristaltic pump) 0 - 0.5 Bar for NH4 or H2S
Sample temperature	0 - 80 °C 0 - 30 °C for NH4 or H2S
Wet parts materials	Quartz, Polypropylene, Polyethylene, FPM (viton), PMMA (+ Pharmed and glass for NH4 or H2S)
Measuring time	5 sec (except PO4, NH4, H2S : 3 min)
Measurement interval	1 min to 720 min Physicochemical parameters may be continuous
Memory	5000 lines of measurements (up to 16 channels) with date and time
Consumption	Cleaning solution (5% sulfuric acid): 220 ml/day Reagent for PO4: 2 ml per measurement NaOH 10% for NH4: 2 ml per measurement HCl 10% for H2S: 2 ml per measurement
Maintenance interval	Recommended: 6 months to 1 year (except for refilling)
Power supply	90 - 264 VAC 50/60 Hz 80 VA
Screen	Colour TFT LCD 640x480 pixels with LED backlight
Communication	RS232 with MODBUS protocol RS485 for external probes (DO, TSS) USB WI-FI (IEEE802.11B) optional Ethernet (IEEE802.3) optional
Certifications	CE, EN 61010-1, EN 61326
Enclosure	Stainless steel with epoxy coating, IP65, wall mounting brackets
Dimensions	525x345x260 mm
Weight	20 to 30 kg depending on the configuration

The manufacturer reserves the right to modify and/or change any specifications, dimensions, design or drawing at any time without prior notice

> UV500 Parts references

Basic unit

UV500 — ***Basic unit (no measurement included)***

Color graphic display 640x320 pixels with touch screen
Built-in data logger, memory 5000 measurements for each parameter
12 sockets for input and output modules (not included, refer to options)
7 available glands for inputs / outputs
RS232 included (Sub-D 9 ways female connector) with 2 meters cable for PC
RS485 included for communication with MODBUS protocol
USB port included for USB key connection
Automatic cleaning system with 2-litres tank
Power supply 90-260 VAC 47-63 Hz with power cord 2 meters
Enclosure IP65/Nema4x stainless steel 316 525x345x260 mm (HxWxD) / 20 to 30 kg
Mounting lugs for wall

Sampling pump

P — ***Sampling peristaltic pump for unpressurized water***

Built-in on the left side of the enclosure
Flow of about 600 ml/min
Discontinuous operating to increase tube lifetime

P-EXT — ***External Peristaltic sampling pump for unpressurized water***

Flow of about 940 ml/min
Heavy duty brushless motor
Discontinuous operating to increase tube lifetime

Spectrograph (required for UV254, COD, BOD, TOC, NO3, Colour, PO4, Cr VI, NH4 and H2S measurements)

SPECTRO500 — ***UV-Visible spectrograph***

Range: 180 – 750 nm
Resolution 0.29 nm
2048 pixels

Absorbance flow cell and xenon lamp (required for UV254, COD, BOD, TOC, NO3, Colour, PO4, Cr VI measurements)

ABS500 — ***Flow cell and xenon lamp for absorbance measurements***

Optical path: 1 or 3 or 10 mm
Lamp lifetime: 1 E 9 flashes
Wet materials: PMMA, Viton, Quartz

Configuration and calibration for measurements by absorbance (require SPECTRO500 and ABS500 modules)

COD-H-500 — ***Organic matter high range***

high range: 0 – 2,000 Abs/m
(equivalent to approx. 20,000 mg/l COD on municipal waste water)

COD-M-500 — ***Organic matter Medium range***

medium range: 0 – 600 Abs/m

COD-L-500 — ***Organic matter low range***

low range: 0 – 200 Abs/m
(equivalent to 100 mg/l COD on river water)

NO3-500 — ***Nitrate***

Range: 0 – 100 mg/l NO3 (0 – 25 mg/l N of NO3)
Measurement possible until 250 mg/l NO3 (60 mg/l N-NO3)

CO-H-500 — ***Colour high range***

Range: 0 – 1000 Pt-Co unit

CO-L-500 — ***Colour low range***

Range: 0 – 100 Pt-Co unit

Measurement by UV fluorescence (required for PAH and OIW measurements)

PAH-500 — ***Poly-aromatic hydrocarbons***

Range: 0 – 10 ppm phenol
Range: 0 – 100 ppm OIW
(equivalent to approx. 0 – 100 ppm oil with 10% aromatic ratio)

Measurement module by colorimetric method (require SPECTRO500 and ABS500 module)

PO4-H-500 — ***Phosphate high range***

High range: 0 – 20 mg/l P (60 mg/l PO4)
Sampling peristaltic pump included

PO4-L-500 — ***Phosphate low range***

Low range: 0 – 2 mg/l P (6 mg/l PO4)
Sampling peristaltic pump included

CR6-500 — ***Hexavalent chromium (VI)***

Range: 0 – 2 mg/l Cr VI
Measurement possible until 5 mg/l Cr VI

Measurement by nephelometry

IRTURB-H-500 — ***Internal turbidity sensor high range***

High range: 0 – 1,000 NTU
Nephelometric method by laser diode at 650 nm (850 nm on request)

IRTURB-M-500 — ***Internal turbidity sensor medium range***

Low range: 0 – 100 NTU
Nephelometric method by laser diode at 650 nm (850 nm on request)

IRTURB-L-500 — ***Internal turbidity sensor low range***

Low range: 0 – 10 NTU
Nephelometric method by laser diode at 650 nm (850 nm on request)

> UV500 Parts references

Measurements by optical method

DO-F — ***Dissolved oxygen probe by fluorescence***
Range: 0 - 25 mg/l O2
7 meters of cable

EXT-TURB-H — ***Turbidity probes high range***
High range: 0 – 30,000 mg/l TSS
7 meters cable

EXT-TURB-L — ***Turbidity probes low range***
Low range: 0 – 1500 mg/l TSS
7 meters cable

Measurement by UV absorption in gas phase

⚠ ***The spectrograph option SPECTRO must be included***

STRIP500 — ***Stripping system***
Include xenon lamp, flow cell, glassware, air pump, air filter and solenoid valve

NH4-500 — ***Ammonia***
Range: 0 – 100 ppm NH4+

H2S-500 — ***Hydrogen sulfide***
Range: 0 – 20 ppm H2S

Measurements by electrode *(external)*

PH500 — ***pH/ORP module***
pH Range: 0 – 14
ATC input for platinum RTD 100 Ohm or 1000 Ohm
ORP Range: -2000 mV to +2000 mV

ELPH — ***pH on-line electrode***
Range: 0 – 14
5 meters of cable (10 meters in option)
Built-in ATC RTD 100 Ohm

ELORP — ***ORP on-line electrode***
Range: -2000 mV to +2000 mV
5 meters of cable (10 meters in option)
Built-in ATC RTD 100 Ohm

COND500 — ***Conductivity module***
Range: 0 – 100 µS to 0 – 100 mS
ATC input for platinum RTD 100 Ohm

ELCOND — ***Conductivity on-line electrode***
Range: 0 – 10 mS
Cell constant k=1.0 cm-1 (medium range)
5 meters of cable (10 meters in option)
Built-in ATC RTD 100 Ohm

ICOND — ***Inductive conductivity online probe***
Range: 0 – 100 mS
3 meters of cable
Built-in temperature compensation at 2.2%/°C
Requires a IN4-20-500 module instead of COND500 module

EXT-TURBNEPH-H — ***Nephelometric turbidity probes high range***
Range: 0 – 400 NTU
10 meters cable

EXT-TURBNEPH-M — ***Nephelometric turbidity probes medium range***
Range: 0 – 40 NTU
10 meters cable

EXT-TURBNEPH-L — ***Nephelometric turbidity probes low range***
Range: 0 – 4 NTU
10 meters cable

Input modules

IN4-20-500 — ***4-20 mA input module***
Isolated 4-20 mA input
Impedance: 100 Ohm

LOGIC500 — ***Double logical inputs module***
Input no 1 : external pulse command for measurement
Input no 2 : measurements inhibition
Isolated 0 – 48 V DC inputs
Impedance: >10 Kohm

Output modules

OUT4-20-500 — ***4-20 mA output module***
Isolated 4-20 mA output
Active output, Max load 500 Ohm

RELAY500 — ***Relay module***
Contact rating: 2A/220V

Communications

WIFI500 — ***Wifi Interface***
Connection to wireless WIFI network
Secured data transfer (WEP keys)

ETHER500 — ***Ethernet interface***
Ethernet 10 base-T (IEEE 802.3)

MTI133 — ***Phone modem***
Industrial modem 33,6 Kb/s V34+
DIN rail Mounting
Power supply 24V from the analyser

GSM — ***GSM modem***
Dual band (EGSM 900/1800 MHz)
Integral SIM card reader
R & TTE approved

Recommanded consumables for 2 years :

P-ACI-HD1 : *Head of cleaning pump (x1)*
P-RGT-HD1 : *Head of reagent pump (x1) (only for NH4 or H2S)*
T-PHAR-1 : *Tubing 6.4x9.6 mm (if optional sampling pump) (x2 to x8 depending on sampling pump use)*

Cleaning solution and reagents (if any) are not provided

The manufacturer reserves the right to modify and/or change any specifications, dimensions, design or drawing at any time without prior notice

Monitor AMI Codes-II

Data sheet no. DenA254411000

Complete monitoring system for the automatic, continuous measurement of chlorine and other disinfectants (e.g. monochloramine) in potable water, swimming pools, cooling water, hot water loops and effluent.

Monitor AMI Codes-II

- For the continuous online determination of disinfectants based on the DPD colorimetric method (EN ISO 7393-2; APHA 4500 Cl-G).
- Measurement values : free chlorine / chlorine dioxide / iodine or bromine using DPD+Buffer or monochloramine / ozone using DPD+Buffer&KI, flow and if installed pH and temperature.
- Also applicable for water containing additives like cyanuric acid.
- Complete system including measurement and control electronics, photometer, flow indicator, reaction chamber, reagent dosing system and reagent containers.
- Integrated pH measurement with temperature compensation (available as option).
- All usual dosing devices for disinfectants and pH control can be connected either through relays or analog output signals. Two independent controllers can operate simultaneously.
- Dosing of disinfectant can be interrupted automatically with an external signal, e.g. during sample flow interruption or filter backwashing.
- Two (optionally three) selectable measurement values are available as analog output signals.
- Alarm display and activation of alarm relay when user defined, critical limits for a measurement value are reached.
- Continuous, automatic monitoring of main instrument functions (dirty photometer, sample flow, reagents).
- Large back-lit LCD display showing all measured values and status information simultaneously.
- Factory tested, ready for installation and operation.

Options:
- Communication interface
- pH option containing pH sensor, temperature sensor, cables and electronics board.

Accessory:
- Chemical cleaning module. For details please see separate data sheet no. DenA82312000.

Order Nr.	Monitor AMI Codes-II	A–25.441.100.0
Option:	[ ] 3rd current signal output (0/4 – 20mA)	A-81.420.050
	[ ] Profibus DP & Modbus RTU interface (RS-485)	A-81.420.020
	[ ] USB interface	A-81.420.042
	[ ] HART interface	A-81.420.060
Option:	[ ] pH and temperature measurement	A-87.127.020

Monitor AMI Codes-II

Data sheet no. DenA254411000

Disinfectant measurement

Measuring range:	Accuracy:
Ozone	
0.05 – 1.00 ppm	± 0.01 ppm
HOCl, free chlorine, monochloramine	
0.00 – 1.00 ppm	± 0.01 ppm
1.00 – 3.00 ppm	± 0.06 ppm
3.00 – 5.00 ppm	± 0.2 ppm
Chlorine dioxide, iodine, bromine	
0.00 – 2.00 ppm	± 0.02 ppm
2.00 – 6.00 ppm	± 0.12 ppm

Response time:
90% of change of excessive Cl in 60 seconds after sample entered flow cell.

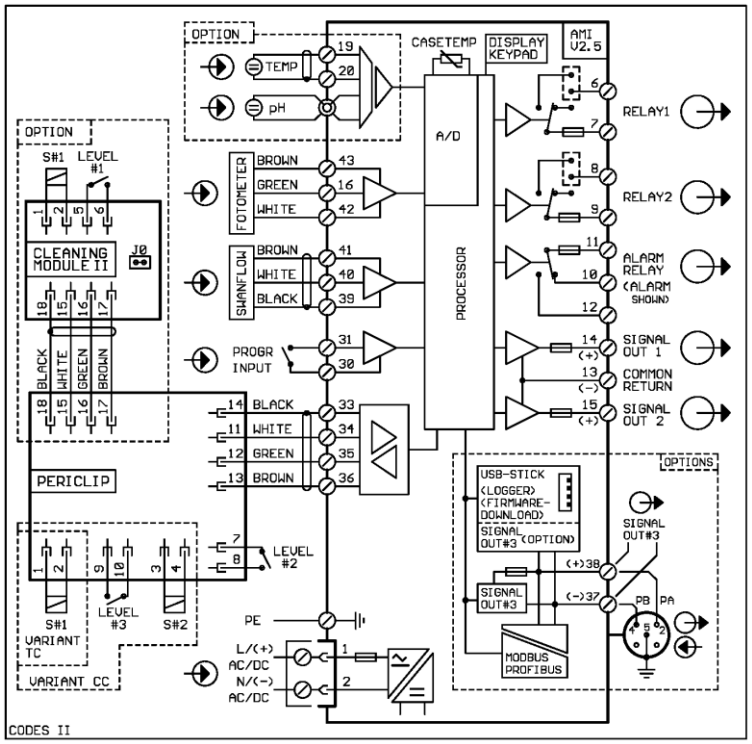
Cycle time free chlorine: 1 – 12 min.

pH (option):
Measuring range: pH 2 - 12
Resolution: 0.01 pH

Temperature measurement (Option)
with Nt5k sensor
Measuring range : -30 to +100 °C
Resolution : 0.1 °C

Transmitter Specifications and Functionality

Electronics case: Cast aluminum
Protection degree: IP 66 / NEMA 4X
Display: backlit LCD, 75 x 45 mm
Electrical connectors: screw clamps
Ambient temperature: -10 to +50 °C
Limit range of operation: -25 to +65 °C
Storage and transport: -30 to +85 °C
Humidity: 10 to 90 % relative, non condensing



Power supply
Voltage: 100 - 240 VAC (± 10 %), 50/60 Hz (± 5 %) or 24 VDC (± 10 %)
Power consumption: max. 30 VA

Operation
Easy operation based on separate menus for “Messages”, “Diagnostics”, “Maintenance”, “Operation” and “Installation”.
User menus in English, German, French and Spanish
Separate, menu specific password protection.
Display of process value, alarm status and time during operation.
Storage of event log, and alarm log and calibration history.
Storage of the last 1’500 data records in logger with selectable time interval.

Safety features
No data loss after power failure, all data is saved in non-volatile memory. Over-voltage protection of in- and outputs.
Galvanic separation of measuring inputs and signal outputs.

Transmitter temperature monitoring
With programmable high/low alarm limits.

Electrical Connection Scheme

Real-time clock with calendar
For action time stamp and preprogrammed actions.

1 Alarm relay
One potential free contact for summary alarm indication for programmable alarm values and instrument faults.
Maximum load: 1A / 250 VAC

1 Input
One input for potential-free contact. Programmable hold or remote off function.

2 Relay outputs
Two potential-free contacts programmable as limit switches for measuring values, controllers or timer with automatic hold function.
Rated load: 1A / 250 VAC

2 Signal outputs (3rd optional)
Two programmable signal outputs for measured values (freely scaleable, linear or bilinear) or as continuous control outputs (control parameters programmable) as current source. 3rd signal output selectable as current source or current sink.
Current loop: 0/4 - 20 mA
Maximum burden: 510 Ω

Control functions
Relays or current outputs programmable for 1 or 2 pulse dosing pumps, solenoid valves or for one motor valve.
Programmable P, PI, PID or PD control parameters.

1 Communication interface (option)
- RS485 interface (galvanically separated) with Fieldbus protocol Modbus RTU or Profibus DP
- 3rd Signal output
- USB interface
- HART interface

Monitor Data

Sample conditions
Water consumption: min. 10 l/h
Water inlet pressure 0.15 to 2 bar
Sample temperature: 5 to 50 °C

Flow cell and connections
Made of acrylic glass with water inlet filter and needle valve.
Openings for pH and temperature sensors.
Inlet tubing: 6 x 8 mm
Outlet pressure: atmospheric drain
Outlet tubing: 15 x 20 mm (1/2")

Panel
Panel dimensions: 400 x 850 x 200 mm
Panel material: PVC
Weight: 12.0 kg

Monitor AMI Codes-II TC

Data sheet no. DenA254416000

Complete monitoring system for the automatic, continuous measurement of total chlorine in potable water, sanitary water, cooling water and effluent.

Monitor AMI Codes-II TC

- For the continuous online determination of disinfectants based on the DPD colorimetric method (EN ISO 7393-2; APHA 4500-Cl G).
- Measurement values : total chlorine 1, total chlorine 2, calculated dichloramine, flow and if installed pH and temperature.
- Complete system including measurement and control electronics, photometer, flow indicator, reaction chamber, reagent dosing system and reagent containers.
- Integrated pH measurement with temperature compensation (available as option).
- All usual dosing devices for disinfectants and pH control can be connected either through relays or analog output signals. Two independent controllers can operate simultaneously.
- Dosing of disinfectant can be interrupted automatically with an external signal, e.g. during sample flow interruption or filter backwashing.
- Two (optionally three) selectable measurement values are available as analog output signals.
- Alarm display and activation of alarm relay when user defined, critical limits for a measurement value are reached.
- Continuous, automatic monitoring of main instrument functions (dirty photometer, sample flow, reagents).
- Large back-lit LCD display showing all measured values and status information simultaneously.
- Factory tested, ready for installation and operation.

Options:

- Communication interface
- pH option containing pH sensor, temperature sensor, cables and electronics board.

Accessory:

- Chemical cleaning module. For details please see separate data sheet no. DenA82312000.

Monitor AMI Codes-II TC

Data sheet no. DenA254416000

Disinfectant measurement

Total chlorine (tc1 & tc2) measurement

Measuring range (Standard)	Accuracy
0.00 - 1.00 ppm	± 0.01 ppm
1.00 - 3.00 ppm	± 0.06 ppm
3.00 - 5.00 ppm	± 0.2 ppm

Measuring range (Extended)	Accuracy
0.0 – 10 ppm	± 10%

Measurement time tc1:	3-5 sec.
Measurement time tc2:	2 min.
Cycle time:	3 - 60 min.

tc1: measurement 3-5 seconds after injection of DPD & KI
tc2: measurement 2 minutes after injection of DPD & KI

Dichloramine: calculated by the difference of tc1 and tc2.

pH measurement (option)

Measuring range:	pH 2 - 12
Resolution:	0.01 pH

Temperature measurement (Option)
with Nt5k sensor

Measuring range :	-30 to +100 °C
Resolution :	0.1 °C

Transmitter Specifications and Functionality

SOLITAX®sc TURBIDITY & SUSPENDED SOLIDS SENSORS

Applications

- Drinking Water
- Wastewater
- Beverage
- Industrial Water
- Power

PROGNOSYS™ READY

Accurate, color-independent suspended solids and turbidity measurements.

Greater Accuracy, Less Maintenance

Hach SOLITAX sc sensors provide accurate, color-independent measurement of turbidity and suspended solids in drinking water, wastewater and industrial process applications. A self-cleaning device prevents biological growth and interference of gas bubbles. This system's reliable performance and full data communication capability help improve process control and reduce treatment costs associated with polymer use, digester volume, and sludge handling.

Excellent Correlation to Laboratory Analysis

SOLITAX sc sensors show an exceptional correlation to laboratory analysis. On-line measurement not only saves time on manual analysis, but also provides critical real-time measurements that can be used to operate the plant more efficiently.

Fully Serviceable Sensors

Conventional turbidity and suspended solids sensors are potted and are discarded when they no longer function. SOLITAX sc sensors are fully serviceable, which often doubles the useful life of the sensor.

Easy One-point Calibration

Factory calibrated in conformity with DIN EN ISO 7027 for long-term calibration stability. Calibration is easy with a simple correction factor procedure.

Multi-channel, Multi-parameter System

Any two SOLITAX sc sensors can be installed on one Hach sc200 Controller. The same controller can also accommodate any combination of parameters. All of Hach's model sc sensors are "plug and play" with no complicated wiring or set-up procedure necessary.

HACH®
Be Right™

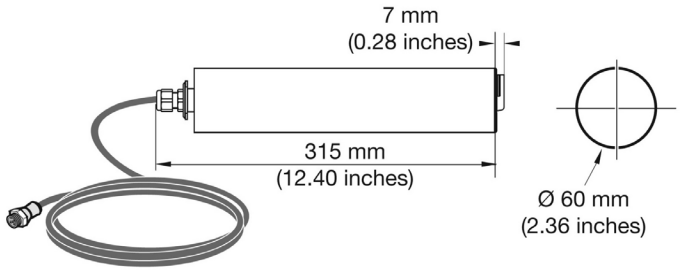
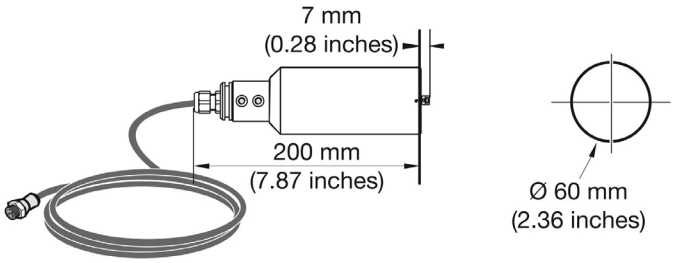
					Subject to change without notice

Principle of Operation

SOLITAX sc ts-line sensor with dual-beam optics and added backscatter detector



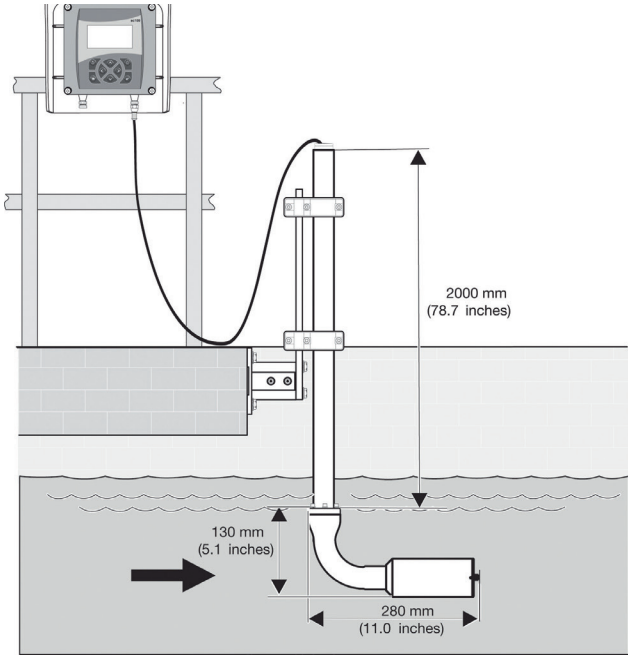
- Dual infrared light beams. LED light source transmits light at 45° to sensor face.
- Nephelometric photoreceptors detect light at 90° to the transmitted light beam.
- Backscatter photoreceptor (included on all models except the SOLITAX sc t-line) detects light at 140° to the transmitted light beam to measure suspended solids in heavily loaded sample streams.
- Self-cleaning wiper, optional.
- T-line probes measure turbidity only. TS, HS, inline, and highline sensors measure either turbidity or suspended solids.



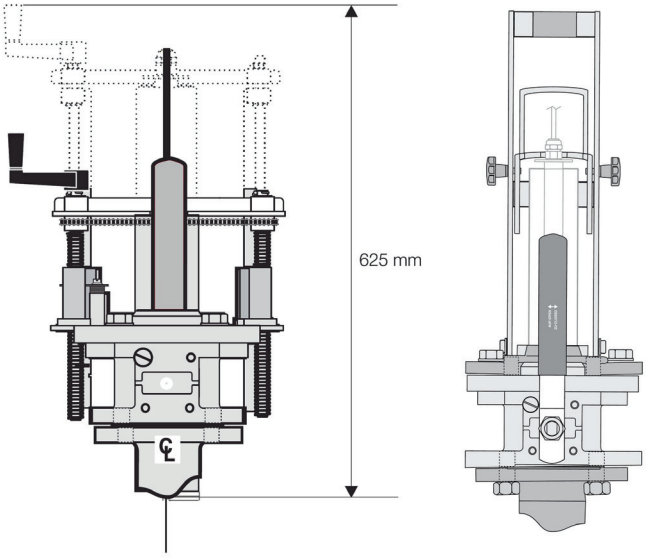
Dimensions

Hach SOLITAX sc sensors can be fixed to the rim of the tank for immersion applications or inserted directly through the sidewall of a pipeline for insertion applications. A variety of installation kits are available.

SOLITAX sc Insertion Probe



SOLITAX sc Immersion Probe



Installation / Mounting

Installation for mounting SOLITAX sc for immersion in open tanks. (Stainless steel pole mount kit, Prod. No. LZY714.99.53120)

Fixture with ball valve for mounting SOLITAX sc models inline and highline sensors in pipes., minimum pipe size 100 mm (4-in.) (Prod. No. LZX337, max pressure 6 bar; Prod. No. 936, max. pressure 1 bar.

Ordering Information

Common Configurations: SOLITAX sc Turbidity and Suspended Solids Analyzers with sc200 controller and sensors shown

Immersion in Open Tanks Applications

2983400	Turbidity Analyzer, t-line sc, stainless steel with wiper (0.001 to 4000 NTU)
2983500	Turbidity and Suspended Solids Analyzer, ts-line sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)
2983600	Turbidity and High Range Suspended Solids Analyzer, hs-line sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)

Insertion in Pipes Applications (includes insertion mounting kit)

2983700	Turbidity and Suspended Solids Analyzer, inline sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)
2983900	Turbidity and High Range Suspended Solids Analyzer, highline sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)

NOTE:
1. *Power Cords must be ordered separately.*
2. *Fixed point installation kit or handrail mount kit must be ordered separately for all immersion analyzers.*

Individual SOLITAX sc Sensors

Immersion Sensors

LXV423.99.10000	Turbidity, t-line sc, PVC with wiper (0.001 to 4000 NTU)
LXV423.99.12000	Turbidity, t-line sc, PVC without wiper (0.001 to 4000 NTU)
LXV423.99.10100	Turbidity and Suspended Solids, ts-line sc, PVC with wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)
LXV423.99.12100	Turbidity and Suspended Solids, ts-line sc, PVC without wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)
LXV423.99.00100	Turbidity and Suspended Solids, ts-line sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)
LXV423.99.02100	Turbidity and Suspended Solids, ts-line sc, stainless steel without wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)
LXV423.99.10200	Turbidity and Suspended Solids, hs-line sc, PVC with wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)
LXV423.99.12200	Turbidity and Suspended Solids, hs-line sc, PVC without wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)
LXV423.99.00200	Turbidity and Suspended Solids, hs-line sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)
LXV423.99.02200	Turbidity and Suspended Solids, hs-line sc, stainless steel without wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)

Insertion Sensors

LXV424.99.00100	Turbidity and Suspended Solids, inline sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)
LXV424.99.02100	Turbidity and Suspended Solids, inline sc, stainless steel without wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)
LXV424.99.00200	Turbidity and Suspended Solids, highline sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)
LXV424.99.02200	Turbidity and Suspended Solids, highline sc, stainless steel without wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)

Installation Accessories

LZY714.99.53120	Stainless Steel pole mount kit for SOLITAX t-line, ts-line, and hs-line immersion sensors, including 10 cm base and 2 m pole with sensor adapter
5738400	Insertion Mounting Kit for inline and highline insertion sensors (ball valve safety armature and extraction system). Kit includes a 4 inch pre-coped Carbon Steel Flange. Non-coped flanges are available
AHA033NPT	Sensor Adapter, straight 1-1/2 FNPT
AHA034NPT	Sensor Adapter, elbow 1-1/2 FNPT 90°
MH236B00Z	Handrail Mounting Kit (for sensor to be used with either adapter above) includes 1.5-inch diameter by 7.5-ft long CPVC pipe and swivel/pivot/ pipe clamp assembly
LZX337	Stainless steel ball valve safety armature/ extraction fitting for in-line and hi-line probes w/o welding flange, maximum operating pressure 6 bar/87 psi
LZX936	Stainless steel ball valve armature, maximum operation pressure 1 bar/14.5 psi
LZX660	Non-coped stainless steel welding flange for insertion kit
LZX661	Non-coped carbon steel welding flange for insertion kit

sc200™ UNIVERSAL CONTROLLER

Applications
- Drinking Water
- Wastewater
- Industrial Water
- Power

One Controller for the Broadest Range of Sensors.

Choose from 30 digital and analog sensor families for up to 17 different parameters.

Maximum Versatility

The sc200 controller allows the use of digital and analog sensors, either alone or in combination, to provide compatibility with Hach's broad range of sensors, eliminating the need for dedicated, parameter-specific controllers.

Ease of Use and Confidence in Results

Large, high-resolution, transreflective display provides optimal viewing resolution in any lighting condition. Guided calibration procedures in 19 languages minimize complexity and reduce operator error. Password-protected SD card reader offers a simple solution for data download and transfer. Visual warning system provides critical alerts.

Wide Variety of Communication Options

Utilize two to five analog outputs to transmit primary and secondary values for each sensor, or integrate Hach sensors and analyzers into MODBUS RS232/RS485, Profibus® DP, and HART networks.

Password protected SD card reader offers a simple solution for data download and transfer, and sc200 and digital sensor configuration file duplication and backup.

Specifications*

Dimensions (H x W x D)	5.7 in x 5.7 in x 7.1 in (144 mm x 144 mm x 181 mm)
Display	Graphic dot matrix LCD with LED backlighting, transreflective
Display Size	1.9 x 2.7 in. (48 mm x 68 mm)
Display Resolution	240 x 160 pixels
Weight	3.75 lbs. (1.70 kg)
Power Requirements (Voltage)	100 - 240 V AC, 24 V DC
Power Requirements (Hz)	50/60 Hz
Operating Temperature Range	-20 to 60 °C , 0 to 95% RH non-condensing
Analog Outputs	Two (Five with optional expansion module) to isolated current outputs, max 550 Ω , Accuracy: ± 0.1% of FS (20mA) at 25 °C, ± 0.5% of FS over -20 °C to 60 °C range Operational Mode: measurement or calculated value
Analog Output Functional Mode	Linear, Logarithmic, Bi-linear, PID
Security Levels	2 password-protected levels
Mounting Configurations	Wall, pole, and panel mounting
Enclosure Rating	NEMA 4X/IP66
Conduit Openings	1/2 in NPT Conduit
Relay: Operational Mode	Primary or secondary measurement, calculated value (dual channel only) or timer
Relay Functions	Scheduler (Timer), Alarm, Feeder Control, Event Control, Pulse Width Modulation, Frequency Control, and Warning
Relays	Four electromechanical SPDT (Form C) contacts, 1200 W, 5 A
Communication	MODBUS RS232/RS485, PROFIBUS DPV1, or HART 7.2 optional
Memory Backup	Flash memory
Electrical Certifications	EMC CE compliant for conducted and radiated emissions: - CISPR 11 (Class A limits) - EMC Immunity EN 61326-1 (Industrial limits) Safety cETLus safety mark for: - General Locations per ANSI/UL 61010-1 & CAN/CSA C22.2. No. 61010-1 - Hazardous Location Class I, Division 2, Groups A,B,C & D (Zone 2, Group IIC) per FM 3600 / FM 3611 & CSA C22.2 No. 213 M1987 with approved options and appropriately rated Class I, Division 2 or Zone 2 sensors cULus safety mark - General Locations per UL 61010-1 & CAN/CSA C22.2. No. 61010-1

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

The Chemline **Type 21** True Union Ball valve incorporates state of the art features for long term performance. This is a full port, full blocking True Union valve pressure rated at 16 bar (230 psi)[3]. Double stem o-rings and Safety Shear stem design provide for a high degree of safety on hazardous fluid applications. All sizes have an ISO standard actuator mounting platform integral to the valve body. This provides for sturdy and secure mounting of pneumatic or electric actuators.

PVC | CPVC | PP | PVDF

CRN Registered Consult Chemline

NSF[4] Certified to NSF/ANSI 61

SERIES: Type 21

SIZES: 3/8" – 4"

ENDS: Socket, Threaded, Combo[6], Flanged, Butt[1] or ChemFlare™

SEATS: PTFE

SEALS[2]: EPDM, FKM (Viton®)

features

Pressure rated to 230 psi[3]
- Provides a high factor of safety

Integral Actuator Mounting Platform
- Actuation is easy. Electric or pneumatic actuators may be mounted in the field.

Full Port
- High capacity and low pressure drops

Fully Blocking
- Downstream union nut may be safely disassembled for piping maintenance while valve is closed off under full system pressure

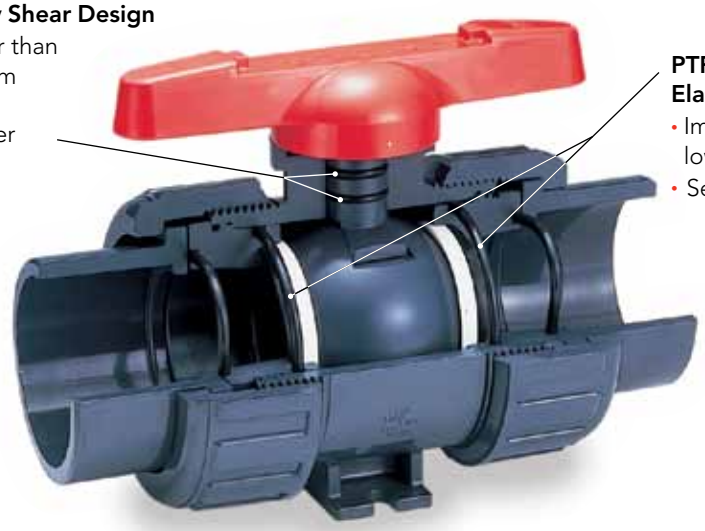
Built-In Spanner Wrench
- Top of the handle is designed to be used as a tool for accessing internal parts

Safety Shear Stem Design
- Stem has double o-rings
- Designed to hold full pressure even if stem breaks due to excessive torque

High Chemical Resistant Material
- PVC and CPVC compounds have an "A" chemical resistance rating as per ASTM D-1784. They have outperformed other PVC and CPVC compounds on aggressive chemicals.

CRN Registration numbers by province
- Ontario: OC11045.5
- Newfoundland: OC11045.50
- Saskatchewan/Manitoba/Quebec: OC11045.56
- New Brunswick: OC11045.57
- Nova Scotia: OC11045.58
- P.E.I.: OC11045.59
- British Columbia: not required
- Alberta: not required[5]

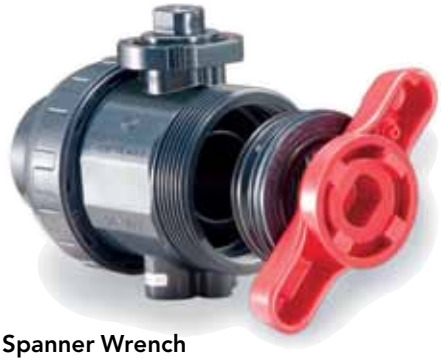
[1] Butt ends for fusion to Chemline metric PP, PVDF or ECTFE (Halar®) piping.
[2] Other materials are available.
[3] PVC, CPVC and PVDF 1/2" to 2" are rated at 230 psi; 2-1/2" to 4" and all size PP valves are rated at 150 psi at 20°C.
[4] PVC valves with EPDM or FKM (Viton®) seals are certified under NSF/ANSI Standard 61 for contact with drinking water.
[5] Not required for non-expandable fluids.
[6] PVC and CPVC valves 1/2" to 2" are available as Combo (threaded and socket ends).



11/20 ©Chemline Plastics Limited 2020
Chemline is a registered trade mark of Chemline Plastics Limited

Type 21 True Union Ball Valves

Features



Double Stem O-Rings – Safety Shear Design

- Upper o-ring groove is deeper than lower. In case of excessive stem torque, stem will shear at the upper groove, leaving the inner o-ring intact to seal against full line pressure.

PTFE Seats have Elastomer Cushions

- Improved sealing while lowering stem torques
- Self adjusts for seat wear

Built in Spanner Wrench

- For removing or tightening the seat carrier
- All parts are replaceable

Integral Actuator Mounting Platform

- Actuation is easy. Electric or pneumatic actuators may be mounted in the field. Simply pull off the handle to reveal a standard ISO 5211 mounting platform which accepts bolt-on hardware.

Fully Blocking

- Downstream pipe may be removed while upstream side is still pressurized. This may be done with valve installed in either direction.

Base Mounting Pad

- Optional threaded inserts allow valves to be securely anchored
- Supplied standard with actuated valves

Options + Accessories

ChemFlare™ Ends

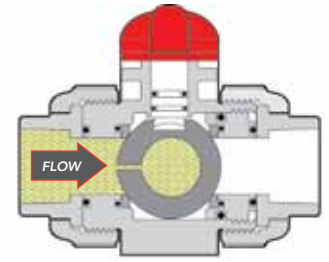
- For connection to PFA tube. Leak-free connections for difficult services such as sodium hypochlorite

One-piece moulded PVC and CPVC 6" socket ends

- Allows installation of 4" valve in 6" line
- Factory moulded, elimates cementing separate reducer and coupling
- Fixed to valve mechanically just like the one-piece moulded factory flanges

Optional Lock-out Handle & Hasp

- To prevent unauthorized operation of the valve during maintenance shut-downs
- Padlocks go through holes in hasp



Gear Operators

- Deluxe FRP construction
- IP67 enclosure resists short term immersion

Chain Wheel Operators

- For overhead operation, with 7' of chain drop
- Cast iron or stainless steel

Vented Ball

- Recommended for all sodium hypochlorite services
- Valve shown in closed position

Valve Tags

- Stainless steel or plastic

Different Colour Handles

- Choose a handle colour other than standard red for colour coding different services

Municipal Operating Nut

- 2" square nut for operating valves below grade using a standard municipal "key"
- Stainless Steel for corrosion resistance

Manual Limit Switch

- Electrical feedback of manual valve position
- NEMA 4X enclosure, position indicator beacon, 2x SPDT or proximity switches, stainless steel hardware

Shaft Extensions

- Different materials and lengths are available
- Several designs:
  - with no housing for indoors
  - with waterproofed PVC housing for indoors or outdoors
  - with stainless steel housing for buried or actuated services

Type 21 True Union Ball Valves

Electric + Pneumatic Actuation

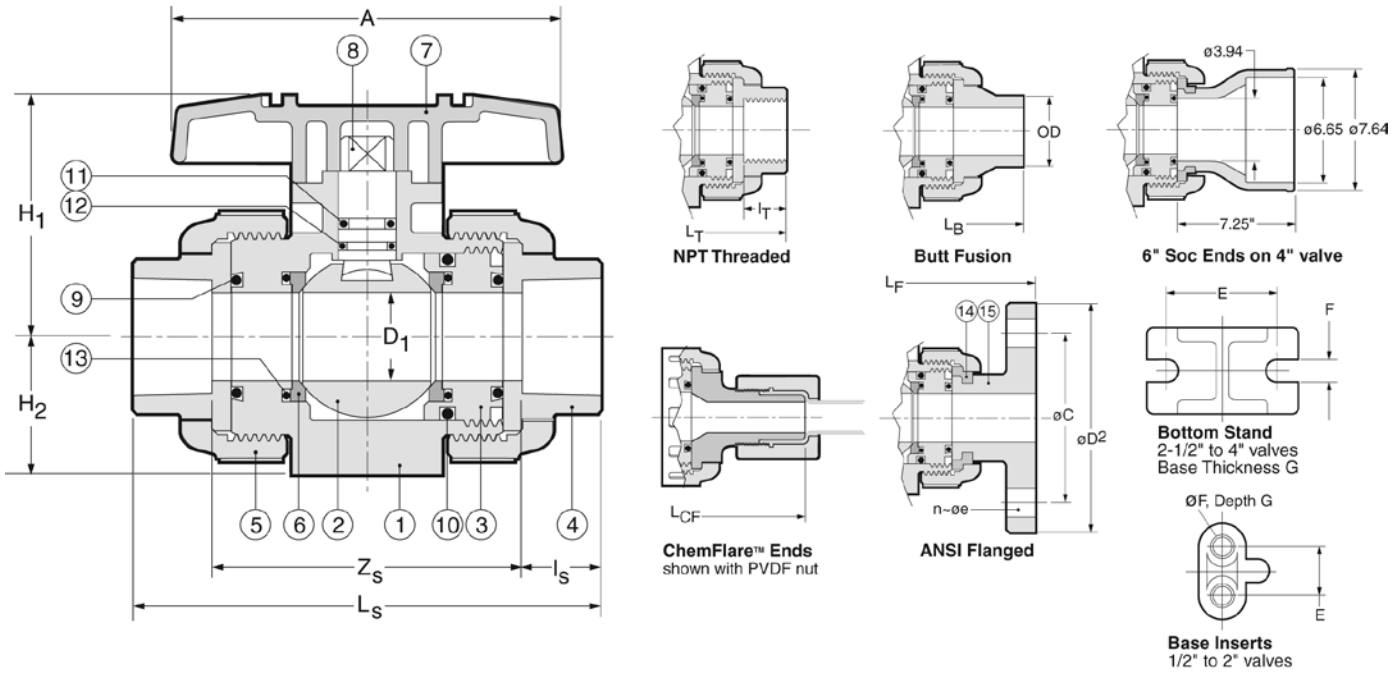
- A complete range of actuators and control accessories are available, mounted to valves using PPG plastic brackets and stainless steel couplings. Refer to separate data sheets.
- All actuators are CSA approved, have NEMA 4X enclosures, stainless steel hardware and permanently lubricated gear train

ERS Series Electric
- Type 21 ball valves up to 2"
- 180 in-lbs torque
- On-Off (3/2-wire), adjustable travel
- Visual feedback

E Series Electric
- Type 21 ball valves up to 4"
- Up to 885 in-lbs torque
- On-Off (3/2-wire), adjustable travel. Optional: failsafe, 3 position modulating
- Visual feedback and feedback switches. Optional: extra switches, feedback potentiometer and feedback transmitter

V Series Electric
(with optional Local Control Station)
- Type 21 ball valves up to 6"
- up to 8,850 in-lbs torque
- On-Off (2/3-wire), adjustable travel. Optional: failsafe, modulating, BUS
- Visual feedback, 2 feedback switches. Optional: 2 extra feedback switches, feedback potentiometer and feedback transmitter

PA Series Pneumatic
- Type 21 ball valves up to 6"
- up to 10,660 in-lbs torque
- industrial process submerged
- bleach/water washdown
- Rilsan-coated aluminum



PP Series Pneumatic
- Type 21 ball valves up to 6"
- up to 1,335 in-lbs torque
- industrial process with minimal use of metal
- Glass-filled Polyamide

OTHER OPTIONS & ACCESSORIES

- **Alternate O-Ring Seals**
- **Stem Extensions** made to any length
- **Limit Switches** – for open and/or closed position indication
- **Municipal Operating Nut**
- **Lubrication-free Valves** – factory clean room assembled
- **Vented Ball** – for sodium hypochlorite applications

SAMPLE SPECIFICATION

1. All True Union Ball Valves in PVC, CPVC, PP or PVDF shall be Chemline Type 21 or equal sizes 1/2" to 2" in PVC, CPVC, and PVDF rated at 230 psi and in PP 150 psi maximum working pressure. Sizes 2-1/2", 3" and 4" rated at 150 psi maximum working pressure with EPDM or FKM (Viton®) seals. Ball seats shall be PTFE with elastomer cushions for closure with minimum stem torques.
2. All valves will have Safety Shear stem design, blowout-proof with double o-rings for safety. The top o-ring groove shall be deeper so that if the stem breaks off under excessive torque the lower o-ring will remain intact and the valve will hold pressure.
3. All valves shall be full port and two-way blocking design.
4. All valves will be CRN (Canadian Registration Number) registered with TSSA.
5. PVC valves with EPDM or FKM (Viton®) seals shall be certified under NSF/ANSI Standard 61 for contact with drinking water.
6. All valves shall have chemical resistant labels permanently marked with manufacturing number to provide production level traceability.
7. PVC compound shall have an ASTM cell classification 12454-A with a minimum suffix "A" designation for chemical resistance as per ASTM D-1784 (CSA report LO 4000-172).
8. CPVC compound shall have an ASTM cell classification 23567-A with a minimum suffix "A" designation for chemical resistance as per ASTM D-1784.
9. PP material will conform to ASTM D-4101 PP 021 B 67272 material requirements.
10. PVDF material shall be unpigmented conforming to ASTM D-3222 material requirements and to be USDA Title 21 Chapter 1 Part 177. 2510 requirements for contact with food.
11. Socket ends in PVC and CPVC shall be Schedule 80 and conform to ASTM D-2467.
12. Threaded ends shall be Schedule 80 and conform to ASTM D-2464.
13. Butt fusion ends in PP or PVDF will be compatible with Chemline PP or PVDF metric piping systems.
14. Flanged ends shall be ANSI Class 150 one-piece factory moulded (not fabricated) to ensure maximum strength and close tolerance end to end dimensions.

SB12 Series Back Pressure/Relief Valves

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

PVC PP PVDF

CRN Registered as Category C Fittings Consult Chemline

NSF[3] Certified to NSF/ANSI 61

SERIES: SB12

SIZES: 3/8" – 4"

ENDS: True Union Socket, Threaded or ChemFlare™[1] Spigot[2] Bodies with Plain, Socket, Threaded or Flanged ends

DIAPHRAGM: PTFE Bonded EPDM

SEALS: EPDM, FKM (Viton®)

ChemFlare™ Ends
For connection to PFA tube. Leak-free connections for difficult services such as sodium hypochlorite.

Optional Pressure Gauge
For inlet and/or outlet

The Chemline **SB Series** Back Pressure/ Relief Valve has two functions. As a ***back pressure valve***, installed in-line downstream of a pump, the back pressure below the metering pump is maintained. When installed in the branch of a tee it is a ***pressure relief valve***. The valve stays closed until inlet pressure reaches the set pressure which is adjusted by turning the spring tensioning bolt. Inlet pressure acts upward against the piston allowing excess pressure to flow upwards through the orifice.

The SB12 Series has a built-in check valve function, desirable for dosing applications. It is not so sensitive as to open with every pulsation from a metering pump. It is designed for ***clean fluids only***.

features

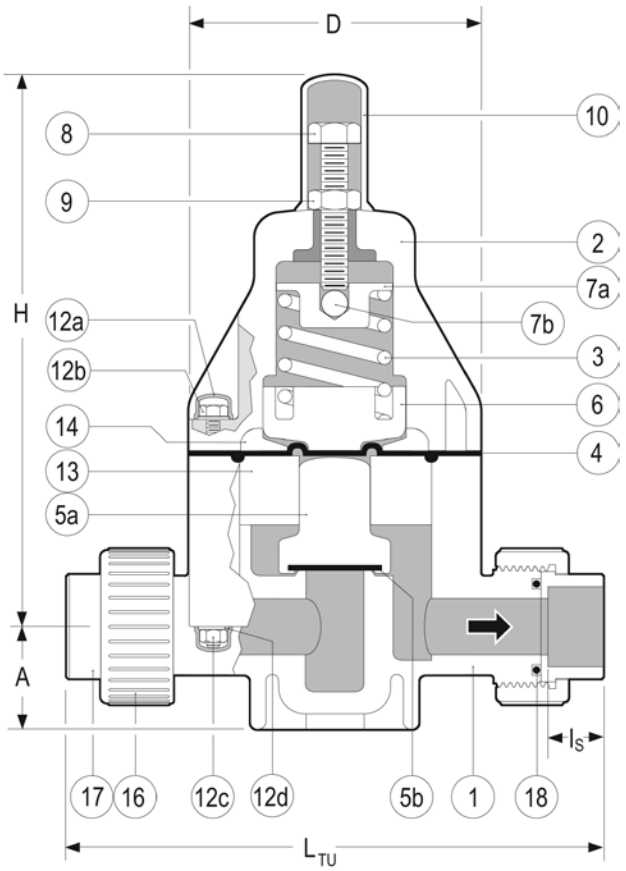
True Union Ends
- Easy installation and maintenance
- Eliminate chemical leakage problems common with old fashioned threaded connections

Long Cycling Life
- Dynamic seal is PTFE bonded EPDM for high chemical resistance
- This moulded diaphragm is designed for superior sealing and flex life

Superior Performance in Dosing Systems
- Valves are hydraulically designed for very low hysteresis ("backlash") and to eliminate chatter
- Built-in check (non-return) function
- Valve opening depends on inlet pressure only and is uneffected by changes in downstream (back) pressure

CRN Registration numbers by province
- Ontario: OC10134.5
- Newfoundland: OC10134.50
- Alberta: OC10134.52
- Saskatchewan/Manitoba/Quebec: OC10134.56
- New Brunswick: OC10134.57
- Nova Scotia: OC10134.58
- P.E.I.: OC10134.59
- British Columbia: not required

technical



Set Pressure Ranges
- 1/2" to 2" – 5 to 150 psi
- 2-1/2" and 3" – 7.5 to 150 psi
- 2-1/2" to 4" – 5 to 60 psi (optional)
- 4" – 7.5 to 90 psi

Maximum Viscosity
- 120cP is maximum recommended service viscosity

SB12 Series Back Pressure/Relief Valves 1/2" to 2"

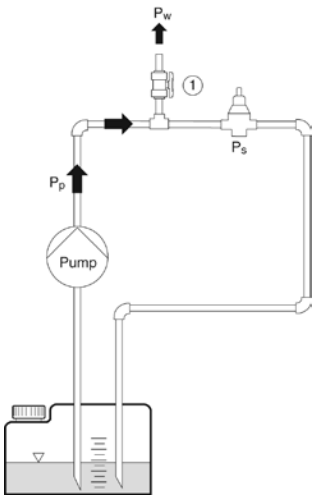
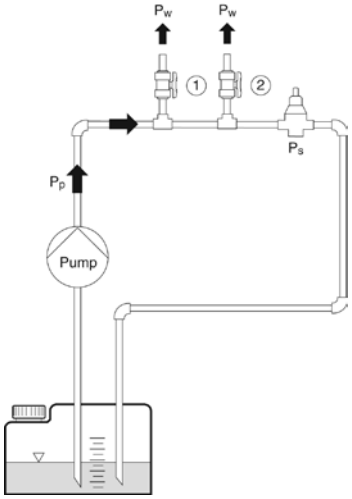
pressure loss nomogram for SB12 valves 3/8" to 2"



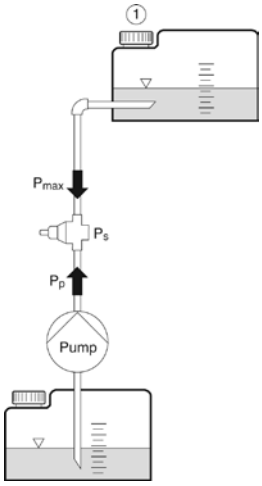
typical dosing system schematic

application of pressure relief valves



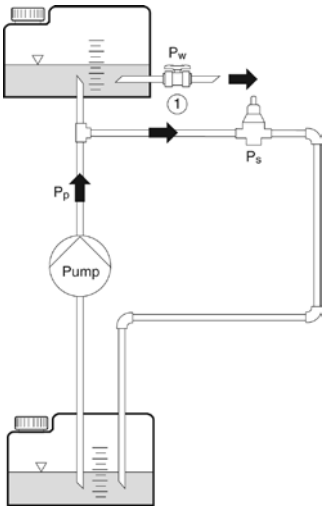
Constant System Pressure

$P_p \geq P_w$
$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed



P_w = Working Pressure
P_p = Pump Pressure
P_s = Set Pressure

Consumer 1 and/or 2 Open, Valve Closes



$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

Non-Return Valve
Container 1 is located above the pump

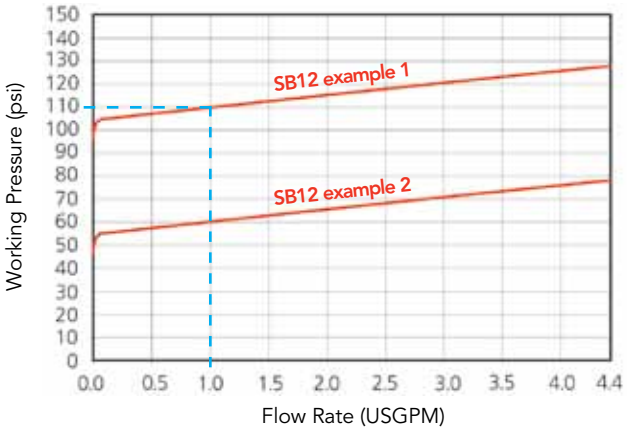
$P_s \geq P_{max}$
$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

Overflow Valve
Pressure of container or application system should not exceed the maximum pressure value

$P_s \leq P_w$
$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

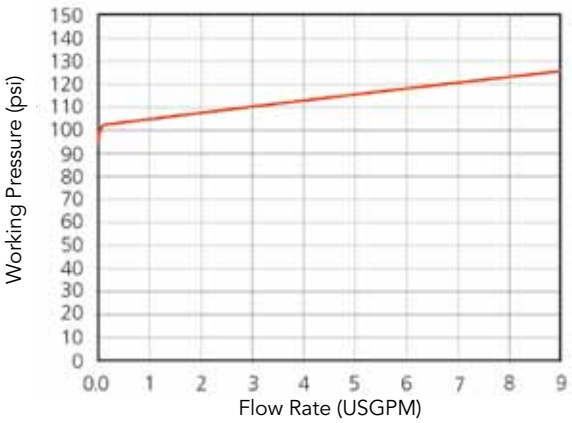
SB12 Series Back Pressure/Relief Valves 1/2" to 2"

working pressure vs. flow rate



The curves show the relationship between the working pressure and the approximate flow rate through the valve for water at 20°C (68°F) . These values will vary depending on:

- The configuration of the piping and the pressure losses associated with it
- The fluid if not water at 20°C (68°F)
- Whether the pressure is rising or falling, hysteresis is approximately 4 psi for 1/2" to 2" valves. For valves 2-1/2" to 4", hysteresis is approximately 14.5 psi.



operation examples

1. The valve is set closed at 100 psi. At a pressure increase of 10 psi, a flow of approximately 1.0 USGPM will be reached.
   - set pressure = 100 psi
   - working pressure = 110 psi
   - opening pressure = approximately 104 psi
2. The valve is set closed at 50 psi. At a pressure increase of 10 psi, a flow of approximately 1.0 USGPM will be reached.
   - set pressure = 50 psi
   - working pressure = 60 psi
   - opening pressure = approximately 54 psi

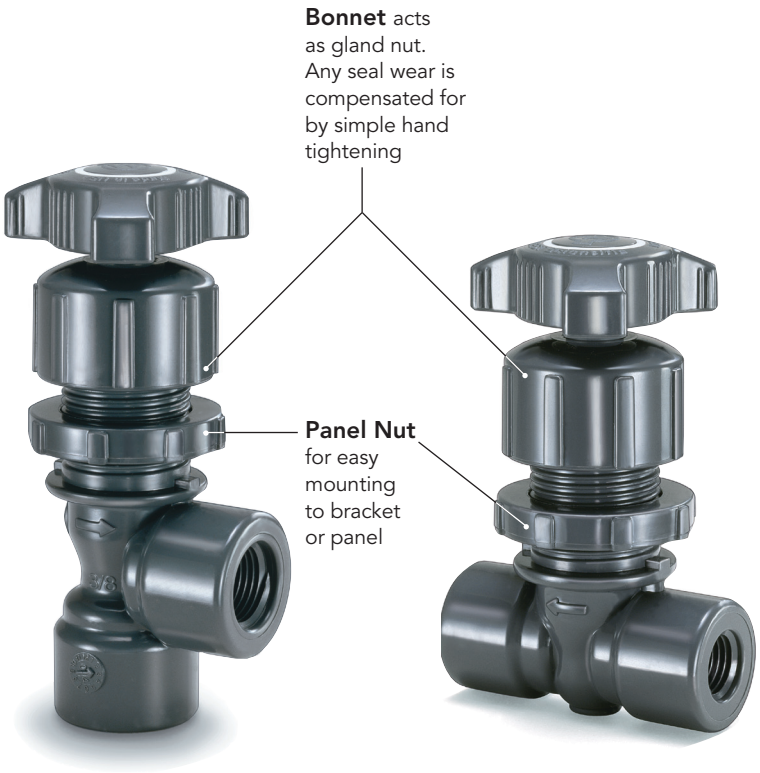
Needle Valves

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

Chemline N Series Needle Valves are designed for fine throttling of corrosive and ultrapure fluids at low flow rates. Because the seal material is PTFE, these valves are suitable for aggressive chemicals where similar valves with elastomer seals will not stand up.



PVC | CPVC | PPG[1]

SERIES: NG – Globe Body
NA – Angle Body

SIZES: 1/4", 3/8" & 1/2"

ENDS: Female NPT

STEM SEALS: PTFE

Angle Body **Globe Body**

features

Precise Control with Fine Adjustment

- Precision machined seat and matching ground needle tip along with a 24 pitch fine thread stem (five turns from closed to full-open) provides for excellent flow control. Better control of reagents can mean significant cost savings.

High Chemical Resistance

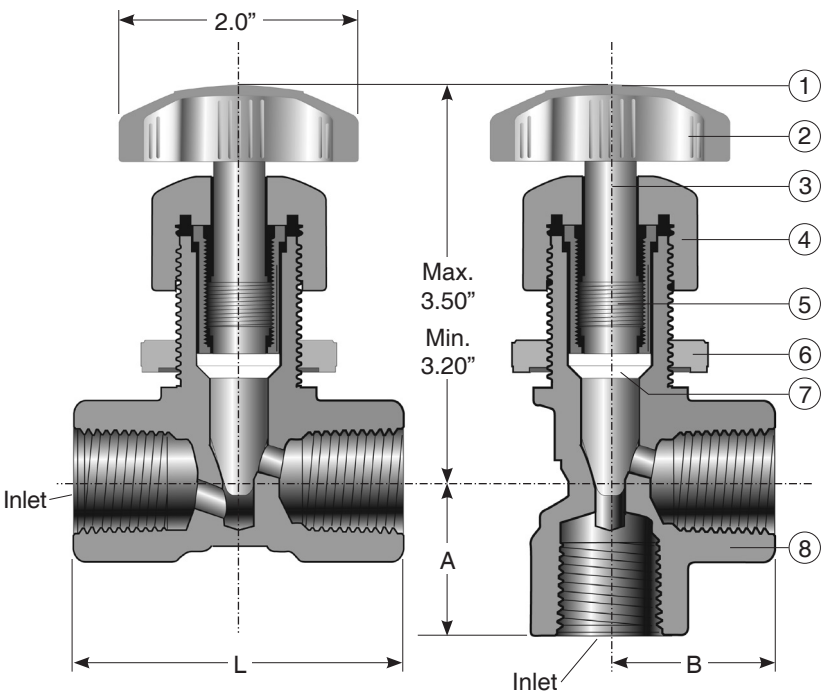
- All parts are plastic or PTFE. No elastomers or metal parts are used.

Lubrication Free

- No silicone or other lubricants are used

Easy Maintenance

- Seal wear is compensated for by hand tightening the cap (gland). Valve can be serviced in-line. Simply unscrew bonnet to remove complete topworks for inspection or disassembly.



Heavy Duty Construction

- Thick stems

[1] PPG=Glass Reinforced Polypropylene.

Globe Valves

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

The Chemline Globe Valve is an economical throttling valve. Its heavy duty design provides for long service life. The in-line globe design causes relatively high pressure drops, however this is a desirable valve due to its economy and reliability.

Variable Area Flow Meters

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

Chemline F Series Variable Area Flow Meters are ideal for plastic piping. They provide a combination of accurate visual flow rate measurement and clear flow indication from a distance. Optional limit switches allow the units to signal a low or high flow alarm. An optional flow transmitter provides a 4 to 20 mA signal output. These flow meters must be installed vertically with flow upward.

PVC | PA | PSU | PVDF — Tube

PVC | CPVC | PP | PVDF — Ends

CRN Registered Consult Chemline

SERIES: FC – Compact – 5" Single Scale
FS – Full Size – 7" Dual Scale[1]

MATERIALS: Tube: Clear PVC, Polyamide (PA), Polysulfone (PSU) or PVDF[2]
Float: PVDF
Ends: PVC, CPVC, PP, PVDF, Socket, Threaded, Flanged, Butt or ChemFlare™[3]

O-RINGS: EPDM, FPM (Viton®)

CAPACITIES: Up to 220 USGPM (50,000 litres per hour)

features

Clear Visual Indication

- Large orange float is visible from a distance
- Range indicators slide along dovetail track

Easy Installation and Maintenance

- Just unscrew union nuts and tube slides out of line

Choice of Four Tube Materials for Many Applications:

- ***Clear PVC*** – For Water or Chemicals up to 60°C (140°F) – High Chemical resistance at low cost
- ***Polyamide (PA)*** – For Water or Air up to 75°C (167°F) – High impact strength and optical clarity
- ***Polysulfone (PSU)*** – For Chemicals and Gases up to 100°C (212°F) – High impact strength and good chemical resistance
- ***PVDF[2]*** – For Chemicals and Ultrapure fluids up to 110°C (230°F) – High impact strength and excellent chemical resistance.

Ideal for All Types of Plastic Piping

- All types of end connections in PVC, CPVC, PP & PVDF

- **Low Pressure Drop**

Good Measuring Accuracy – Class IV

- ± 3% of indicated value, plus ± 1% of full scale. – Read scale at top (largest diameter) of float

Non Fouling

- Float is self supporting in the flow. No guide rod (which can cause the float to jam) is necessary.

[1] USGPM and litres per hour (water) scale is supplied as standard on full size meters.
[2] Because PVDF is translucent, a magnetic float and limit switches are usually used.
[3] For ChemFlare™ end connectors, consult Chemline.

03/13 ©Chemline Plastics Limited 2013
Chemline is a registered trade mark of Chemline Plastics Limited

Variable Area Flow Meters

NOTES:

PVDF flow meters are available in all sizes. Change third letter in item number to **K**.

[1] △P = Pressure loss through flow meter with water at 20°C (68°F).

[2] Dimension **L** is for PVC Socket ends.

Variable Area Flow Meters

PARTS

▲ Recommended Spare Parts

No.	Part	Pcs.	Materials
1	Tube	1	Polyamide (PA), Polysulfone (PSU), Clear PVC, PVDF
2	Float	1	PVDF (standard or magnetic)
3	Lower Float Stop	1	PVDF
4	Upper Float Stop	1	PVDF
5	Union Nut	2	PVC, PPG, PVDF
6	End Connector	2	PVC, CPVC, PP or PVDF
7▲	O-Rings	2	EPDM, FPM(Viton®)
8▲	Range Indicator	2	ABS

ACCESSORIES

- **Limit Switches** – One switch for both maximum or minimum. A magnetic float is required.
- **Switch Ratings** – P (max) = 10 VA, E (max) = 470VAC, I (max) = 0.5A
- **Throttling Valve** for flow control
- **4–20 mA Output Signal Unit** must be factory calibrated for specific service

OPTIONS

- **Custom Direct Reading Scale** for services other than water
- **Alternate O-Rings** – ie. FPM (Viton®)
- **End Size Reduction** – Accuracy is not significantly affected by end reduction
- **Other Ends** – Threaded, socket or flanged end connections in PVC, CPVC, PP or PVDF. Butt ends in PP or PVDF.

MAXIMUM WORKING PRESSURES AND TEMPERATURE RANGES

Construction (‡ = Optional Materials)				Maximum	
Tube	O-Rings	Union Nuts	Ends	Pressure[2]	Temperature Range
PVC	EPDM	PVC	PVC	150 psi	0 to 60°C (32 to 140°F)
Polyamide (PA)	EPDM	PVC	PVC	150 psi	0 to 60°C (32 to 140°F)
Polyamide (PA)	EPDM	PPG‡	PP or CPVC‡	150 psi	0 to 75°C (32 to 167°F)
Polysulfone (PSU)	EPDM	PVC	PVC	150 psi	0 to 60°C (32 to 140°F)
Polysulfone (PSU)	EPDM	PPG‡	PP or CPVC‡	150 psi	0 to 90°C (32 to 194°F)
PVDF	FPM(Viton®)	PVDF	PVDF	150 psi	–40 to 110°C (–40 to 230°F)

[2] 150 psi is not recommended at maximum temperatures. Consult Chemline.

flow meter sizing – liquid flow

Standard Scale values are for clean water flow at 20°C (68°F). For liquids with densities and viscosities similar to water (ie. specific gravity of 1.0 and viscosities between 0.5 cP and 1.3 cP) the standard water scale will be accurate enough.

The table below shows correction factors to be applied for liquids with specific gravities other then 1.0. Multiply the correction factor by the water scale value to obtain actual flow rate. Example: For a liquid of specific gravity of 1.66, the correction factor is 0.740. For water flow range of 100 to 1000 litres/hr, corrected range becomes 74 to 740 litres/hr. Viscosity should be between 0.5 cP and 1.3 cP for standard scales to be accurate.

For "sizing" liquid flows ie. determining actual flow range of a tube, please advise the **chemical name, concentration, temperature, specific gravity** and **viscosity.** Custom direct reading scales in any units are available special order.

SCALE CORRECTION FACTORS – FOR LIQUIDS WITH SPECIFIC GRAVITIES OTHER THAN 1.00

SCALE CORRECTION FACTORS – FOR AIR AT NON-STANDARD TEMPERATURES AND PRESSURES

Air density is dependent on the actual pressure and temperature.
Calculate the Scale Correction Factor using either Method 1 or 2. Multiply the standard air flow ranges above by the Factor to obtain actual flow rates.

Method 1

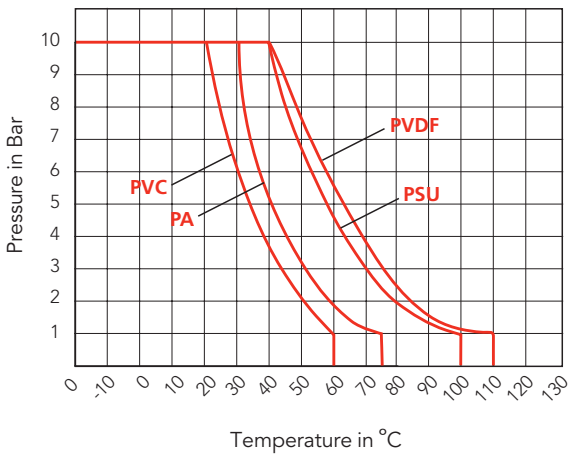
Calculate the Factor with the following formula.

$$\text{Factor} = \frac{1}{3.7005}\sqrt{\frac{\text{psia}}{(1+0.00367t)}}$$

psia = pressure of the air absolute
= psig + 14.7 (atmospheric pressure = 14.7 psia)
t = temperature of the air °C

Method 2

Calculate the density of the air at conditions and find factor from the chart below.



$$\text{Air Density (g/ml)} = \frac{\text{psia}}{11{,}360\,(1+0.00367t)}$$

psia = pressure of the air absolute
= psig + 14.7 (atmospheric pressure = 14.7 psia)
t = temperature of the air °C

Air Density vs. Flow Factor

Temperature vs. Pressure

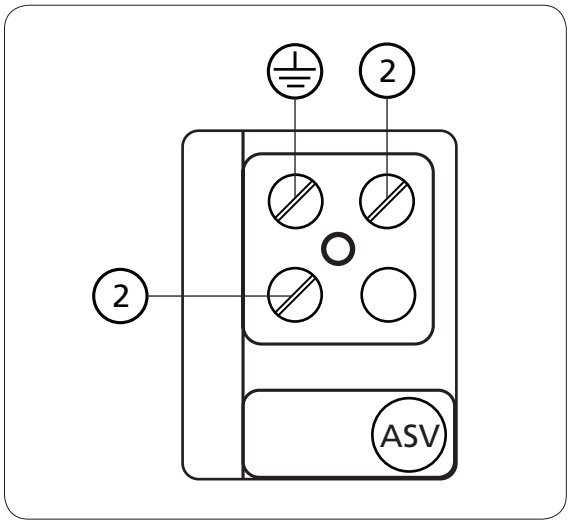
LSFLO Reed Limit Switch

for FC & FS flow meters

The **LSFLO** limit switches serve as switches for minimum or maximum flow values. The normally open latching reed switch closes when the float in the measuring tube reaches and exceedes the switching position. The switch condition is maintained as long as the float is above the limit switch and will open when the float in the tube drops below the switch.

Normally closed switches are available on request.



technical

- **Operating voltage:** maximum 230 VAC
- **Operating current:** maximum 0.5 A
- **Constant current when switched:** maximum 1 A
- **Rupturing capacity:** maximum 10 W/10 VA
- **Closed resistance:** < 150 mΩ
- **Open resistance:** > 10^{10} Ω
- **Operating temperature:** 0°C(32°F) to 55°C(131°F)
- **Protection:** IP 65 (DIN EN 60528)
- **Hysteresis (switch on and off point):** 3 mm
- **Protection:** IP 65 (DIN EN 60528)
- **Dimensions:** 34 x 17 x 41 mm
- **Weight (with plug):** 40 g
- **Connections:** the polarity of the connections has no influence on the function

INSTALLATION

Screw clamps are used to fit the LSFLO on the dovetail guide of the flow meter.

CONNECTIONS

START-UP

Prior to the first start up it is important that the float passes the LSFLO switch three times to ensure the electronics inside recognize the magnetic field from the floats properly.

ZE3000 Flow Transmitters

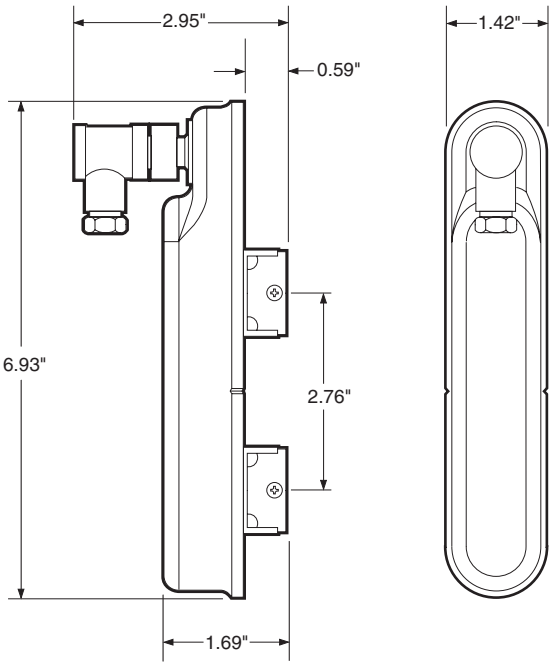
for FS flow meters

The **ZE300**0 flow transmitter provides a 4–20 mA output signal, generated by detection of the position of the magnetic float.

IMPORTANT: This micro-processor controlled unit is factory calibrated and unique to each flowmeter model. Flowmeter model must be advised when ordering.

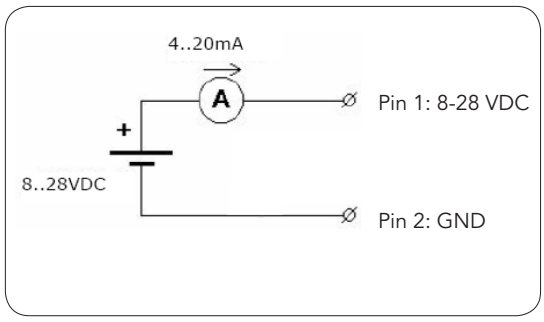
technical

- **2-Wire technology**
- **4–20 mA analog output** (4-20.1 for 8 VDC supply; 4-22.0 for 28 VDC supply
- **8–28 VDC input**
- **Factory calibrated (flow meter to be specified when ordering)**
- **11 point calibration**
- **Non-volatile value storage**
- **0 Button to compensate for the surrounding magnetic influences**
- **Factory setting of the lower limit value (low-cut-off) 0-99% according to customer's specificaitons**
- **Factory time lag (low-pass filter) 0.1-2.5 sec. according to customer's specifications**
- **Measuring accuracy:** < 0.5%
- **Temperature range:** –30°C(–20°F) to 65°C(150°F)



INSTALLATION

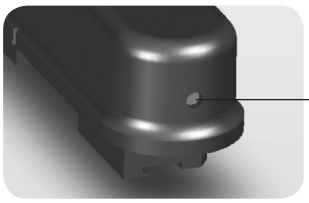
Screw clamps are used to fit the ZE3000 on the dovetail guide of the flow meter.



During installation, ensure that the notch of the ZE3000 coincides with the 50% mark on the flow meter scale.

Following this, proceed with the wiring according to the diagram.

DIMENSIONS



WIRING

START-UP

After installation and wiring, press the 0 button for at least 2 sec. to compensate for possible electro-magnetic interference. During this time make sure the float is at the bottom of the flowmeter (ie. no flow condition).

Note:
Do not press button during normal operation.

ZE3075 Flow Transmitters

for FC flow meters

The **ZE3075** flow transmitter provides a 2- wire 4–20 mA output signal omit generated by precise detection of the position of the magnetic float.

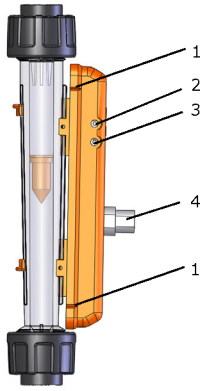
The magnetic float travels along the reed chain of switches activating them.

This micro-processor controlled unit is field calibrated.

technical

- **2-Wire technology**
- **4–20 mA analog output** (4-20.1 for 8 VDC supply; 4-22.0 for 28 VDC supply
- **18–30 VDC input**
- **Field calibration**
- **Non-volatile value storage**
- **Measuring length:** 114 mm (4.5")
- **Measuring resolution:** 3.5 mm (0.138")
- **Measuring accuracy:** 3%
- **Temperature range:** –20°C(–4°F) to 70°C(158°F)

INSTALLATION



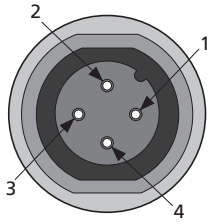
Screw clamps are used to fit the ZE3075 on the dovetail guide of the flow meter.

During installation, ensure that the top and bottom notches of the ZE3075 coincide with the 10% and 100% marks on the flow meter scale.

Following this, proceed with the wiring according to the diagram.

COMPONENTS

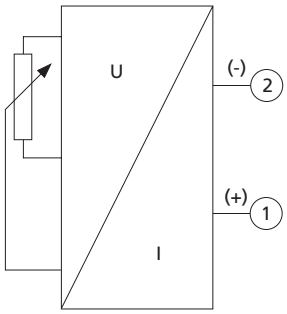
1. Alignment notches for the proper location of the transmitter
2. Potentiometer for the upper limit value of the output signal
3. Potentiometer for the lower limit value of the output signal
4. Plug connector



WIRING

The unit is connected with a commercially available unshielded cable.

Where electro-magnetic interference is to be expected, we recommend the use of a shielded cable.



Cable cross section: max. 0.75 mm² cable outer diameter: 6 to 8 mm.

Flange Connector

1. Signal (+)
2. Signal (+)
3. n.c.
4. n.c.

Circuit Diagram

CALIBRATION

Compensation between the non-linear scaling of the flowmeter and the linear output signal of the flow data sensor must be performed by adjusting, preferably between 20% and 80% of the flow rate.

20% corresponds to 7.2mA and 80% to 16.8mA.

- Connect the ampermeter and the respective voltage supply to the flow data sensor
- Allow 20% of the flow to pass through the FC flow meter
- Set the min. trimmer potentiometer (3) such that the corresponding current (7.2mA) is shown in the ampermeter
- Allow 80% of the flow to pass through the FC flow meter
- Set the max. trimmer potentiometer (3) such that the corresponding current (16.8mA) is shown in the ampermeter
- Check the values at 20% and 80% several times and repeat the adjustment, if required

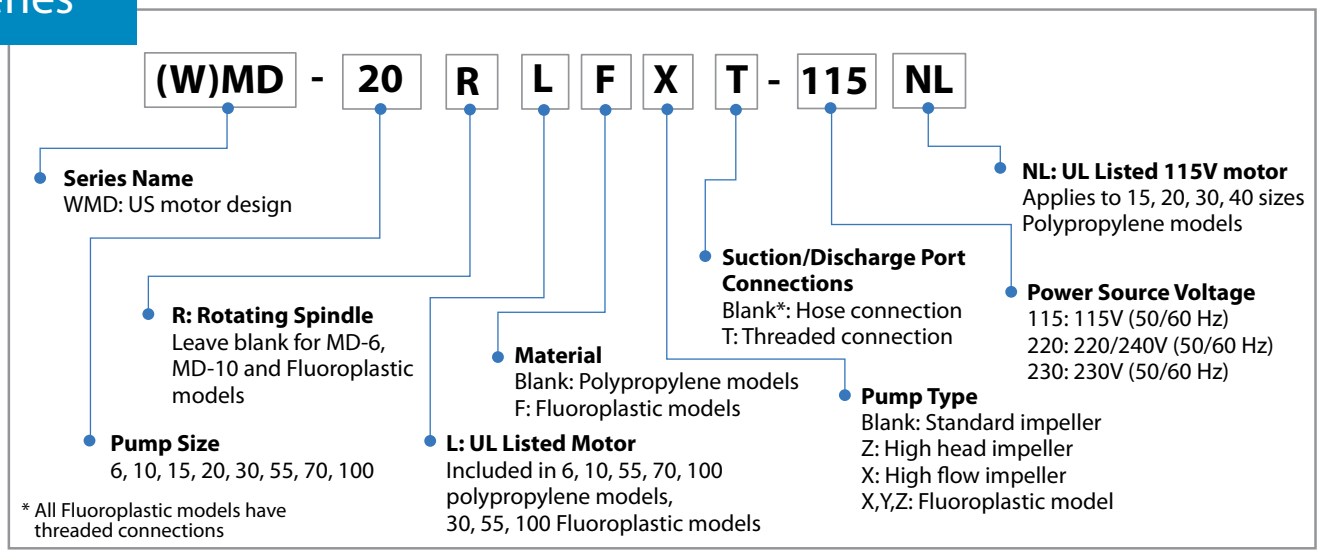
IWAKI

MD
series

Magnetic Drive Pump



Iwaki America, the world leader in small magnetically coupled centrifugal pump technology, offers the premier line of non-metallic centrifugal pumps.

- **Excellent chemical compatibility** - Manufactured from the most corrosion-resistant materials including Polypropylene, ETFE, SiC, or Alumina Ceramic to handle your most aggressive chemicals and high purity applications.
- **Motor options** - Choice of premium, high efficiency motors in AC and DC voltages.
- **Multiple impeller options** - Choose from enclosed, open or semi-open impellers to ensure a perfect hydraulic fit for your application.
- **Dual bearing system** - Leads to longer pump life.
- **Rotating spindle** - Reduces friction and heat generation.
- **Dynamically balanced drive magnet** - Reduces unbalanced loads on the motor shaft leading to longer motor life.
- **Unique internal cooling loop** - Allows for lower pump operating temperature.
- **Impeller balance holes** - Minimize axial thrust for better hydraulics.

Y Sediment Strainers

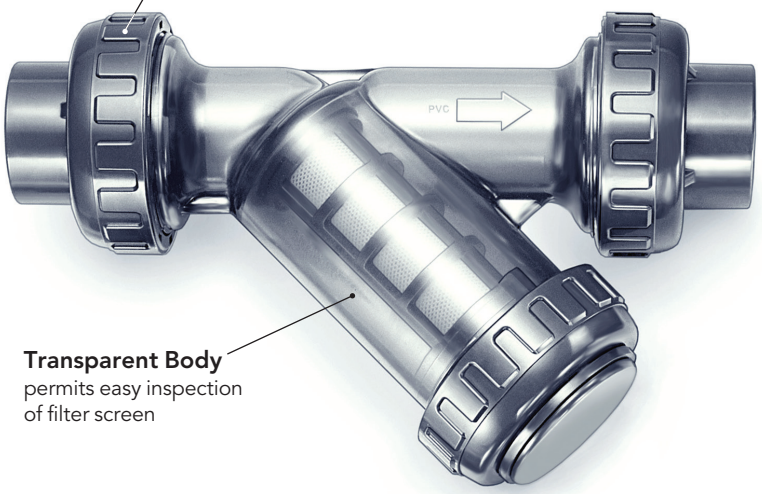
CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

The Chemline YSA Series Y Sediment Strainer is a safety filtration device designed to entrap occasional solid impurities in the line. This is to protect equipment with small orifices such as solenoid valves, and prevent damage to pumps or control valves, etc. The easily replaceable filter screen comes in a choice of meshes. The new YSA Series True Union models have greatly increased filtration areas. Pressure drops are lower and less frequent cleaning is required.

PVC [1]

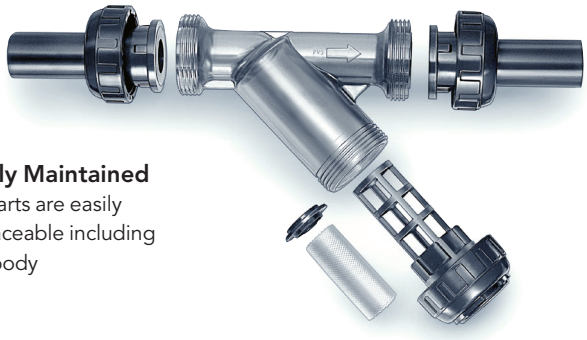
CRN Registered Consult Chemline

NSF [4] Certified to NSF/ANSI 61



SERIES: YSA

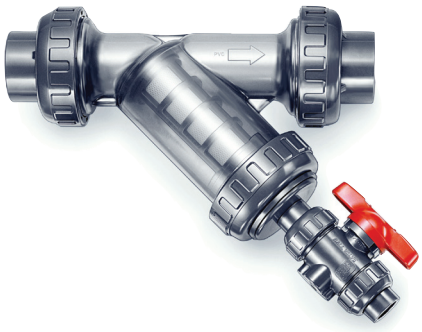
SIZES: 1/2" – 4"



ENDS: True Union, Threaded, Socket, Flanged or ChemFlare™ [2]

SEALS: EPDM, FKM (Viton®) [3]

True Union Design
Body slips out of line.
No need for flanges.

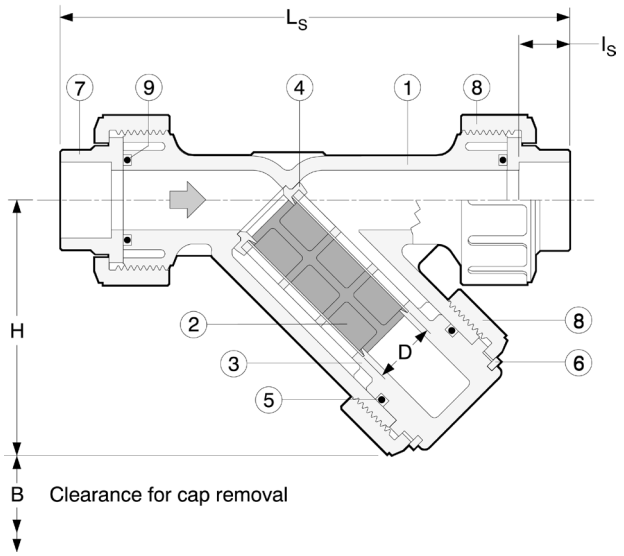


Transparent Body
permits easy inspection of filter screen

- **Easily Maintained**
  All parts are easily replaceable including the body

features

- **High Capacity**
- **Transparent Body**
- **Large Filtration Capacity Low Pressure Drops**
  – Diameter of screens are full pipe bore. The effective filtering area is in some sizes twice the filtering area of other makes. This results in larger filtration capacities and lower pressure drops.
- **Replaceable Filter Screens**
  – Available with choice of PVC 24, 35 or 55 mesh filter screens
  – 316 SS screens are also available
- **Dual Socket and Threaded Ends**
  – Sizes 1/2" to 2" in PVC are supplied with socket ends plus two free threaded ends in each box



- **Optional Flush Valve**

[1] Polypropylene and PVDF Strainers are available special order.
[2] For ChemFlare™ end connectors, consult Chemline.
[3] Other seal materials are available special order.
[4] PVC valves with EPDM or FKM (Viton®) seals are certified under NSF/ANSI Standard 61 for contact with drinking water.

Type 21 True Union Ball Valves

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

The Chemline **Type 21** True Union Ball valve incorporates state of the art features for long term performance. This is a full port, full blocking True Union valve pressure rated at 16 bar (230 psi)[3]. Double stem o-rings and Safety Shear stem design provide for a high degree of safety on hazardous fluid applications. All sizes have an ISO standard actuator mounting platform integral to the valve body. This provides for sturdy and secure mounting of pneumatic or electric actuators.

PVC | CPVC | PP | PVDF

CRN Registered Consult Chemline

NSF[4] Certified to NSF/ANSI 61

SERIES: Type 21

SIZES: 3/8" – 4"

ENDS: Socket, Threaded, Combo[6], Flanged, Butt[1] or ChemFlare™

SEATS: PTFE

SEALS[2]: EPDM, FKM (Viton®)

features

Pressure rated to 230 psi[3]
- Provides a high factor of safety

Integral Actuator Mounting Platform
- Actuation is easy. Electric or pneumatic actuators may be mounted in the field.

Full Port
- High capacity and low pressure drops

Fully Blocking
- Downstream union nut may be safely disassembled for piping maintenance while valve is closed off under full system pressure

Built-In Spanner Wrench
- Top of the handle is designed to be used as a tool for accessing internal parts

Safety Shear Stem Design
- Stem has double o-rings
- Designed to hold full pressure even if stem breaks due to excessive torque

High Chemical Resistant Material
- PVC and CPVC compounds have an "A" chemical resistance rating as per ASTM D-1784. They have outperformed other PVC and CPVC compounds on aggressive chemicals.

CRN Registration numbers by province
- Ontario: OC11045.5
- Newfoundland: OC11045.50
- Saskatchewan/Manitoba/Quebec: OC11045.56
- New Brunswick: OC11045.57
- Nova Scotia: OC11045.58
- P.E.I.: OC11045.59
- British Columbia: not required
- Alberta: not required[5]

[1] Butt ends for fusion to Chemline metric PP, PVDF or ECTFE (Halar®) piping.
[2] Other materials are available.
[3] PVC, CPVC and PVDF 1/2" to 2" are rated at 230 psi; 2-1/2" to 4" and all size PP valves are rated at 150 psi at 20°C.
[4] PVC valves with EPDM or FKM (Viton®) seals are certified under NSF/ANSI Standard 61 for contact with drinking water.
[5] Not required for non-expandable fluids.
[6] PVC and CPVC valves 1/2" to 2" are available as Combo (threaded and socket ends).

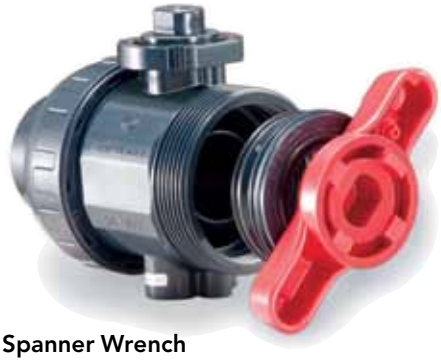
Chemline is a registered trade mark of Chemline Plastics Limited

Type 21 True Union Ball Valves

Features



Double Stem O-Rings – Safety Shear Design

- Upper o-ring groove is deeper than lower. In case of excessive stem torque, stem will shear at the upper groove, leaving the inner o-ring intact to seal against full line pressure.

PTFE Seats have Elastomer Cushions

- Improved sealing while lowering stem torques
- Self adjusts for seat wear

Built in Spanner Wrench

- For removing or tightening the seat carrier
- All parts are replaceable

Integral Actuator Mounting Platform

- Actuation is easy. Electric or pneumatic actuators may be mounted in the field. Simply pull off the handle to reveal a standard ISO 5211 mounting platform which accepts bolt-on hardware.

Fully Blocking

- Downstream pipe may be removed while upstream side is still pressurized. This may be done with valve installed in either direction.

Base Mounting Pad

- Optional threaded inserts allow valves to be securely anchored
- Supplied standard with actuated valves

Options + Accessories

ChemFlare™ Ends

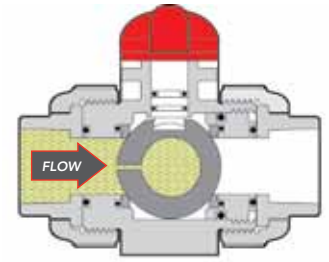
- For connection to PFA tube. Leak-free connections for difficult services such as sodium hypochlorite

One-piece moulded PVC and CPVC 6" socket ends

- Allows installation of 4" valve in 6" line
- Factory moulded, elimates cementing separate reducer and coupling
- Fixed to valve mechanically just like the one-piece moulded factory flanges

Optional Lock-out Handle & Hasp

- To prevent unauthorized operation of the valve during maintenance shut-downs
- Padlocks go through holes in hasp



Gear Operators

- Deluxe FRP construction
- IP67 enclosure resists short term immersion

Chain Wheel Operators

- For overhead operation, with 7' of chain drop
- Cast iron or stainless steel

Vented Ball

- Recommended for all sodium hypochlorite services
- Valve shown in closed position

Valve Tags

- Stainless steel or plastic

Different Colour Handles

- Choose a handle colour other than standard red for colour coding different services

Municipal Operating Nut

- 2" square nut for operating valves below grade using a standard municipal "key"
- Stainless Steel for corrosion resistance

Manual Limit Switch

- Electrical feedback of manual valve position
- NEMA 4X enclosure, position indicator beacon, 2x SPDT or proximity switches, stainless steel hardware

Shaft Extensions

- Different materials and lengths are available
- Several designs:
  - with no housing for indoors
  - with waterproofed PVC housing for indoors or outdoors
  - with stainless steel housing for buried or actuated services

Type 21 True Union Ball Valves

Electric + Pneumatic Actuation

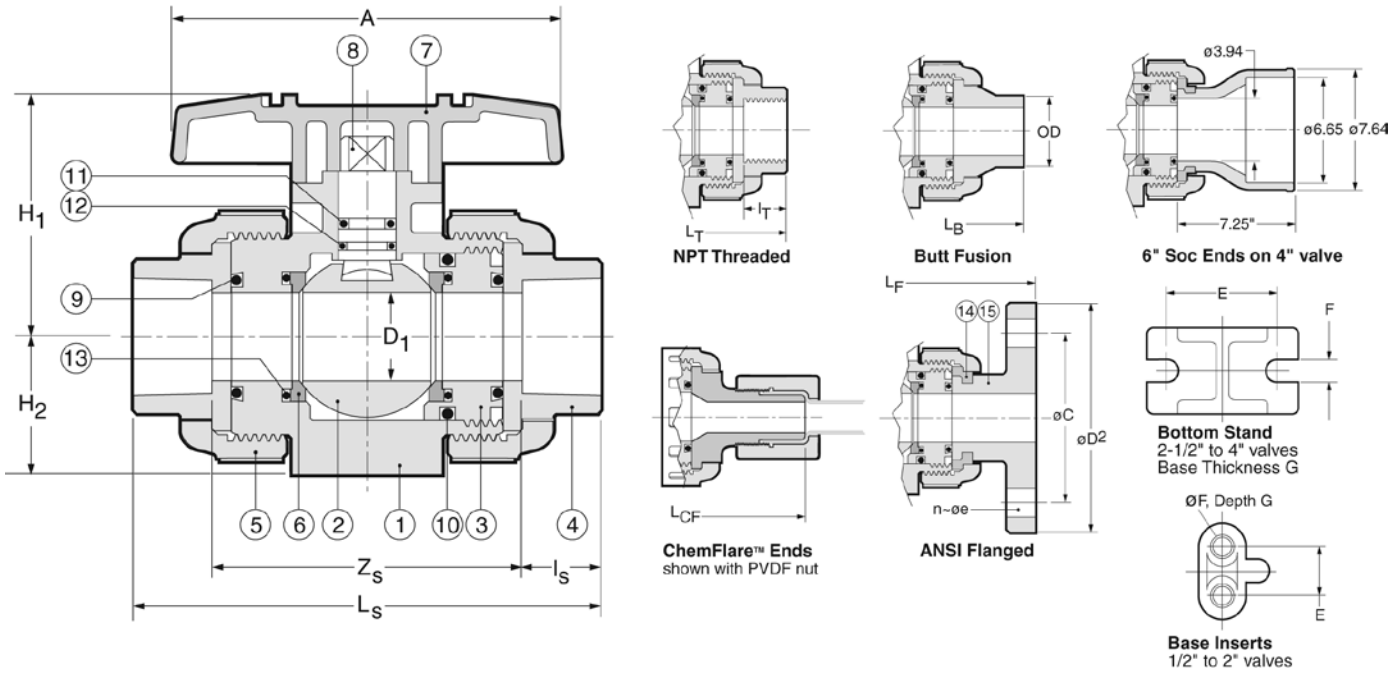
- A complete range of actuators and control accessories are available, mounted to valves using PPG plastic brackets and stainless steel couplings. Refer to separate data sheets.
- All actuators are CSA approved, have NEMA 4X enclosures, stainless steel hardware and permanently lubricated gear train

ERS Series Electric
- Type 21 ball valves up to 2"
- 180 in-lbs torque
- On-Off (3/2-wire), adjustable travel
- Visual feedback

E Series Electric
- Type 21 ball valves up to 4"
- Up to 885 in-lbs torque
- On-Off (3/2-wire), adjustable travel. Optional: failsafe, 3 position modulating
- Visual feedback and feedback switches. Optional: extra switches, feedback potentiometer and feedback transmitter

V Series Electric
(with optional Local Control Station)
- Type 21 ball valves up to 6"
- up to 8,850 in-lbs torque
- On-Off (2/3-wire), adjustable travel. Optional: failsafe, modulating, BUS
- Visual feedback, 2 feedback switches. Optional: 2 extra feedback switches, feedback potentiometer and feedback transmitter

PA Series Pneumatic
- Type 21 ball valves up to 6"
- up to 10,660 in-lbs torque
- industrial process submerged
- bleach/water washdown
- Rilsan-coated aluminum



PP Series Pneumatic
- Type 21 ball valves up to 6"
- up to 1,335 in-lbs torque
- industrial process with minimal use of metal
- Glass-filled Polyamide

OTHER OPTIONS & ACCESSORIES

- **Alternate O-Ring Seals**
- **Stem Extensions** made to any length
- **Limit Switches** – for open and/or closed position indication
- **Municipal Operating Nut**
- **Lubrication-free Valves** – factory clean room assembled
- **Vented Ball** – for sodium hypochlorite applications

SAMPLE SPECIFICATION

1. All True Union Ball Valves in PVC, CPVC, PP or PVDF shall be Chemline Type 21 or equal sizes 1/2" to 2" in PVC, CPVC, and PVDF rated at 230 psi and in PP 150 psi maximum working pressure. Sizes 2-1/2", 3" and 4" rated at 150 psi maximum working pressure with EPDM or FKM (Viton®) seals. Ball seats shall be PTFE with elastomer cushions for closure with minimum stem torques.
2. All valves will have Safety Shear stem design, blowout-proof with double o-rings for safety. The top o-ring groove shall be deeper so that if the stem breaks off under excessive torque the lower o-ring will remain intact and the valve will hold pressure.
3. All valves shall be full port and two-way blocking design.
4. All valves will be CRN (Canadian Registration Number) registered with TSSA.
5. PVC valves with EPDM or FKM (Viton®) seals shall be certified under NSF/ANSI Standard 61 for contact with drinking water.
6. All valves shall have chemical resistant labels permanently marked with manufacturing number to provide production level traceability.
7. PVC compound shall have an ASTM cell classification 12454-A with a minimum suffix "A" designation for chemical resistance as per ASTM D-1784 (CSA report LO 4000-172).
8. CPVC compound shall have an ASTM cell classification 23567-A with a minimum suffix "A" designation for chemical resistance as per ASTM D-1784.
9. PP material will conform to ASTM D-4101 PP 021 B 67272 material requirements.
10. PVDF material shall be unpigmented conforming to ASTM D-3222 material requirements and to be USDA Title 21 Chapter 1 Part 177. 2510 requirements for contact with food.
11. Socket ends in PVC and CPVC shall be Schedule 80 and conform to ASTM D-2467.
12. Threaded ends shall be Schedule 80 and conform to ASTM D-2464.
13. Butt fusion ends in PP or PVDF will be compatible with Chemline PP or PVDF metric piping systems.
14. Flanged ends shall be ANSI Class 150 one-piece factory moulded (not fabricated) to ensure maximum strength and close tolerance end to end dimensions.

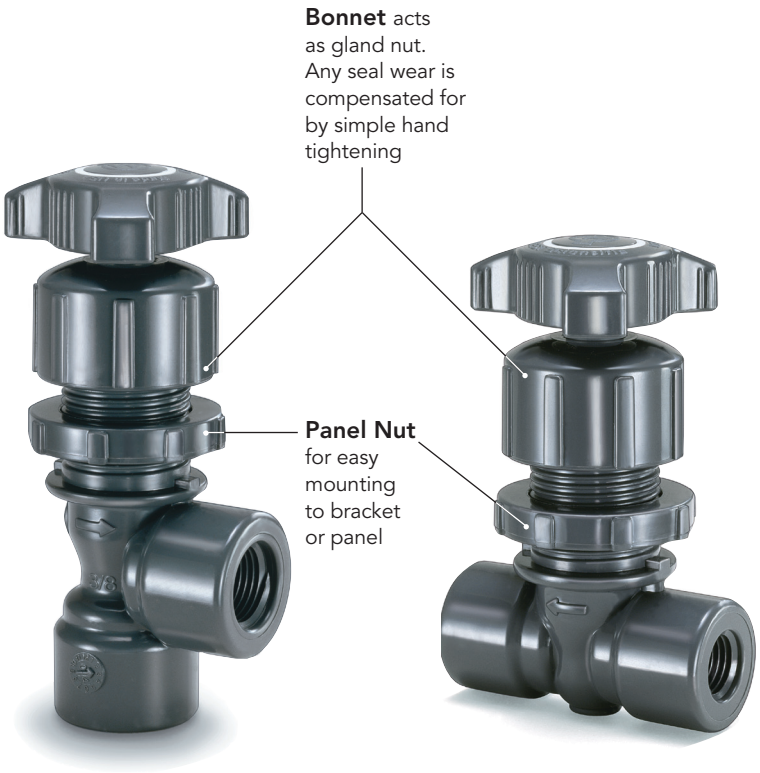
Needle Valves

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

Chemline N Series Needle Valves are designed for fine throttling of corrosive and ultrapure fluids at low flow rates. Because the seal material is PTFE, these valves are suitable for aggressive chemicals where similar valves with elastomer seals will not stand up.



PVC | CPVC | PPG[1]

SERIES: NG – Globe Body
NA – Angle Body

SIZES: 1/4", 3/8" & 1/2"

ENDS: Female NPT

STEM SEALS: PTFE

Angle Body **Globe Body**

features

Precise Control with Fine Adjustment

- Precision machined seat and matching ground needle tip along with a 24 pitch fine thread stem (five turns from closed to full-open) provides for excellent flow control. Better control of reagents can mean significant cost savings.

High Chemical Resistance

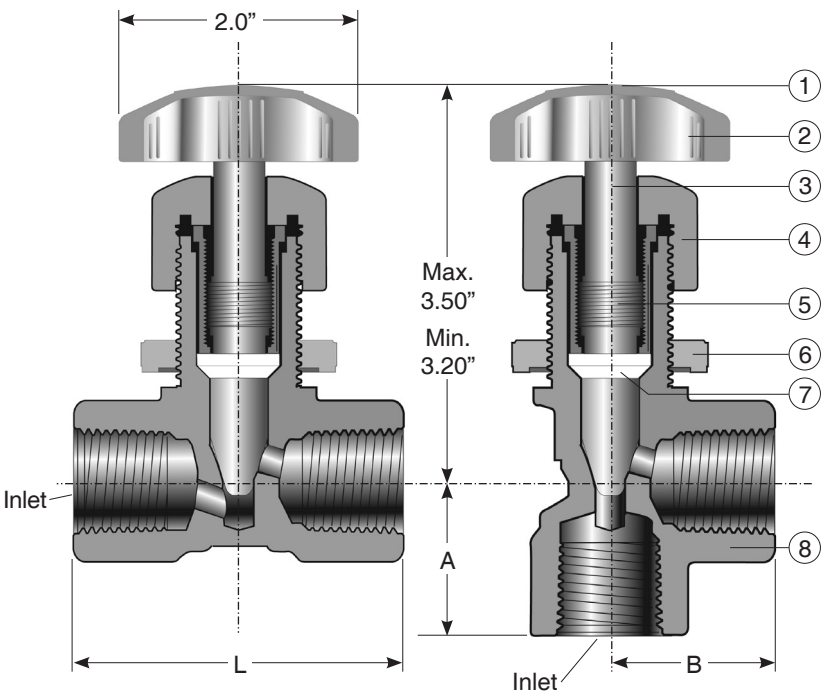
- All parts are plastic or PTFE. No elastomers or metal parts are used.

Lubrication Free

- No silicone or other lubricants are used

Easy Maintenance

- Seal wear is compensated for by hand tightening the cap (gland). Valve can be serviced in-line. Simply unscrew bonnet to remove complete topworks for inspection or disassembly.



Heavy Duty Construction

- Thick stems

[1] PPG=Glass Reinforced Polypropylene.

1/2”	150	150	100	60	150	100	60

Temperature Ranges: PVC 0 to 60°C (32 to 140°F), **CPVC** 0 to 95°C (32 to 203°F), **PPG** –20 to 75°C (–4 to 167°F)

Sample Specification

All (PVC/CPVC/PPG) Needle Valves 1/4” to 1/2” shall be Chemline N Series (Globe/Angle) body with PTFE seal and no elastomers. Valves will have 24 pitch stem threads for fine control and have panel mounting capability.

ORDERING EXAMPLE

Chemline Needle Valves			N	G	A	005
Body Pattern	**G** – Globe	**A** – Angle				
Valve Material	**A** – PVC	**B** – PPG	**C** – CPVC			
Size	**002** – 1/4”	**003** – 3/8”	**005** – 1/2”			

Example: Needle Valve, Globe Pattern, PVC, 1/2”, threaded ends.

VACUUM RATING

- 29.9 inches mercury

OPTIONS

- Black, white, blue or red rings are available for colour coding

Type 21 True Union Ball Valves

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

The Chemline **Type 21** True Union Ball valve incorporates state of the art features for long term performance. This is a full port, full blocking True Union valve pressure rated at 16 bar (230 psi)[3]. Double stem o-rings and Safety Shear stem design provide for a high degree of safety on hazardous fluid applications. All sizes have an ISO standard actuator mounting platform integral to the valve body. This provides for sturdy and secure mounting of pneumatic or electric actuators.

PVC | CPVC | PP | PVDF

CRN Registered Consult Chemline

NSF[4] Certified to NSF/ANSI 61

SERIES: Type 21

SIZES: 3/8" – 4"

ENDS: Socket, Threaded, Combo[6], Flanged, Butt[1] or ChemFlare™

SEATS: PTFE

SEALS[2]: EPDM, FKM (Viton®)

features

Pressure rated to 230 psi[3]
- Provides a high factor of safety

Integral Actuator Mounting Platform
- Actuation is easy. Electric or pneumatic actuators may be mounted in the field.

Full Port
- High capacity and low pressure drops

Fully Blocking
- Downstream union nut may be safely disassembled for piping maintenance while valve is closed off under full system pressure

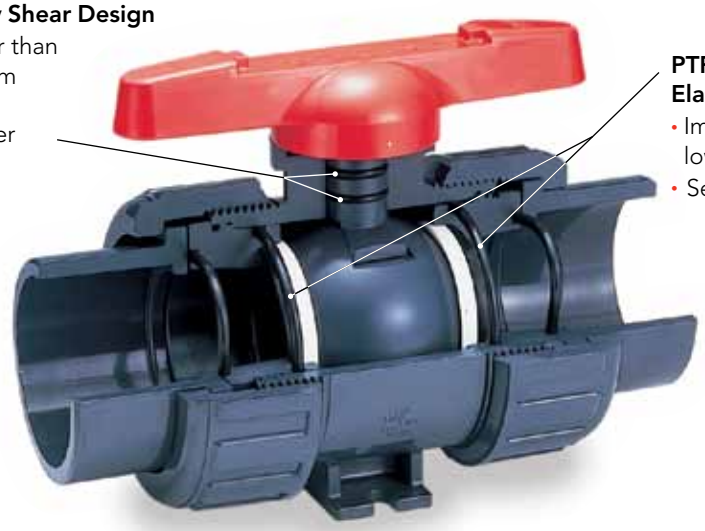
Built-In Spanner Wrench
- Top of the handle is designed to be used as a tool for accessing internal parts

Safety Shear Stem Design
- Stem has double o-rings
- Designed to hold full pressure even if stem breaks due to excessive torque

High Chemical Resistant Material
- PVC and CPVC compounds have an "A" chemical resistance rating as per ASTM D-1784. They have outperformed other PVC and CPVC compounds on aggressive chemicals.

CRN Registration numbers by province
- Ontario: OC11045.5
- Newfoundland: OC11045.50
- Saskatchewan/Manitoba/Quebec: OC11045.56
- New Brunswick: OC11045.57
- Nova Scotia: OC11045.58
- P.E.I.: OC11045.59
- British Columbia: not required
- Alberta: not required[5]

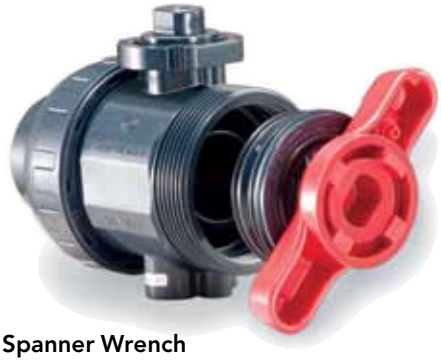
[1] Butt ends for fusion to Chemline metric PP, PVDF or ECTFE (Halar®) piping.
[2] Other materials are available.
[3] PVC, CPVC and PVDF 1/2" to 2" are rated at 230 psi; 2-1/2" to 4" and all size PP valves are rated at 150 psi at 20°C.
[4] PVC valves with EPDM or FKM (Viton®) seals are certified under NSF/ANSI Standard 61 for contact with drinking water.
[5] Not required for non-expandable fluids.
[6] PVC and CPVC valves 1/2" to 2" are available as Combo (threaded and socket ends).



11/20 ©Chemline Plastics Limited 2020
Chemline is a registered trade mark of Chemline Plastics Limited

Type 21 True Union Ball Valves

Features



Double Stem O-Rings – Safety Shear Design

- Upper o-ring groove is deeper than lower. In case of excessive stem torque, stem will shear at the upper groove, leaving the inner o-ring intact to seal against full line pressure.

PTFE Seats have Elastomer Cushions

- Improved sealing while lowering stem torques
- Self adjusts for seat wear

Built in Spanner Wrench

- For removing or tightening the seat carrier
- All parts are replaceable

Integral Actuator Mounting Platform

- Actuation is easy. Electric or pneumatic actuators may be mounted in the field. Simply pull off the handle to reveal a standard ISO 5211 mounting platform which accepts bolt-on hardware.

Fully Blocking

- Downstream pipe may be removed while upstream side is still pressurized. This may be done with valve installed in either direction.

Base Mounting Pad

- Optional threaded inserts allow valves to be securely anchored
- Supplied standard with actuated valves

Options + Accessories

ChemFlare™ Ends

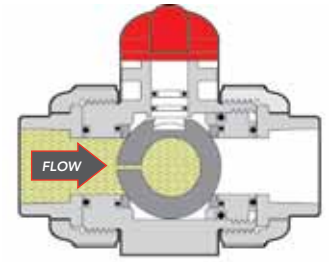
- For connection to PFA tube. Leak-free connections for difficult services such as sodium hypochlorite

One-piece moulded PVC and CPVC 6" socket ends

- Allows installation of 4" valve in 6" line
- Factory moulded, elimates cementing separate reducer and coupling
- Fixed to valve mechanically just like the one-piece moulded factory flanges

Optional Lock-out Handle & Hasp

- To prevent unauthorized operation of the valve during maintenance shut-downs
- Padlocks go through holes in hasp



Gear Operators

- Deluxe FRP construction
- IP67 enclosure resists short term immersion

Chain Wheel Operators

- For overhead operation, with 7' of chain drop
- Cast iron or stainless steel

Vented Ball

- Recommended for all sodium hypochlorite services
- Valve shown in closed position

Valve Tags

- Stainless steel or plastic

Different Colour Handles

- Choose a handle colour other than standard red for colour coding different services

Municipal Operating Nut

- 2" square nut for operating valves below grade using a standard municipal "key"
- Stainless Steel for corrosion resistance

Manual Limit Switch

- Electrical feedback of manual valve position
- NEMA 4X enclosure, position indicator beacon, 2x SPDT or proximity switches, stainless steel hardware

Shaft Extensions

- Different materials and lengths are available
- Several designs:
  - with no housing for indoors
  - with waterproofed PVC housing for indoors or outdoors
  - with stainless steel housing for buried or actuated services

Type 21 True Union Ball Valves

Electric + Pneumatic Actuation

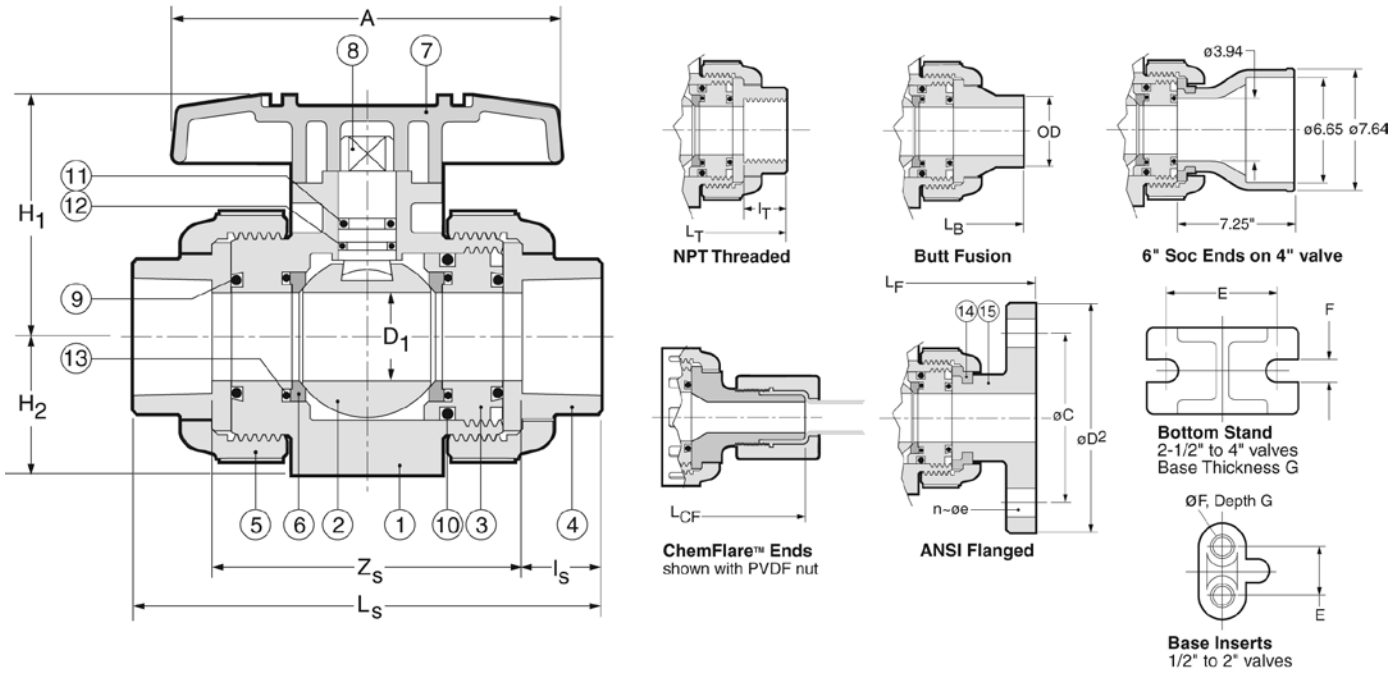
- A complete range of actuators and control accessories are available, mounted to valves using PPG plastic brackets and stainless steel couplings. Refer to separate data sheets.
- All actuators are CSA approved, have NEMA 4X enclosures, stainless steel hardware and permanently lubricated gear train

ERS Series Electric
- Type 21 ball valves up to 2"
- 180 in-lbs torque
- On-Off (3/2-wire), adjustable travel
- Visual feedback

E Series Electric
- Type 21 ball valves up to 4"
- Up to 885 in-lbs torque
- On-Off (3/2-wire), adjustable travel. Optional: failsafe, 3 position modulating
- Visual feedback and feedback switches. Optional: extra switches, feedback potentiometer and feedback transmitter

V Series Electric
(with optional Local Control Station)
- Type 21 ball valves up to 6"
- up to 8,850 in-lbs torque
- On-Off (2/3-wire), adjustable travel. Optional: failsafe, modulating, BUS
- Visual feedback, 2 feedback switches. Optional: 2 extra feedback switches, feedback potentiometer and feedback transmitter

PA Series Pneumatic
- Type 21 ball valves up to 6"
- up to 10,660 in-lbs torque
- industrial process submerged
- bleach/water washdown
- Rilsan-coated aluminum



PP Series Pneumatic
- Type 21 ball valves up to 6"
- up to 1,335 in-lbs torque
- industrial process with minimal use of metal
- Glass-filled Polyamide

OTHER OPTIONS & ACCESSORIES

- **Alternate O-Ring Seals**
- **Stem Extensions** made to any length
- **Limit Switches** – for open and/or closed position indication
- **Municipal Operating Nut**
- **Lubrication-free Valves** – factory clean room assembled
- **Vented Ball** – for sodium hypochlorite applications

SAMPLE SPECIFICATION

1. All True Union Ball Valves in PVC, CPVC, PP or PVDF shall be Chemline Type 21 or equal sizes 1/2" to 2" in PVC, CPVC, and PVDF rated at 230 psi and in PP 150 psi maximum working pressure. Sizes 2-1/2", 3" and 4" rated at 150 psi maximum working pressure with EPDM or FKM (Viton®) seals. Ball seats shall be PTFE with elastomer cushions for closure with minimum stem torques.
2. All valves will have Safety Shear stem design, blowout-proof with double o-rings for safety. The top o-ring groove shall be deeper so that if the stem breaks off under excessive torque the lower o-ring will remain intact and the valve will hold pressure.
3. All valves shall be full port and two-way blocking design.
4. All valves will be CRN (Canadian Registration Number) registered with TSSA.
5. PVC valves with EPDM or FKM (Viton®) seals shall be certified under NSF/ANSI Standard 61 for contact with drinking water.
6. All valves shall have chemical resistant labels permanently marked with manufacturing number to provide production level traceability.
7. PVC compound shall have an ASTM cell classification 12454-A with a minimum suffix "A" designation for chemical resistance as per ASTM D-1784 (CSA report LO 4000-172).
8. CPVC compound shall have an ASTM cell classification 23567-A with a minimum suffix "A" designation for chemical resistance as per ASTM D-1784.
9. PP material will conform to ASTM D-4101 PP 021 B 67272 material requirements.
10. PVDF material shall be unpigmented conforming to ASTM D-3222 material requirements and to be USDA Title 21 Chapter 1 Part 177. 2510 requirements for contact with food.
11. Socket ends in PVC and CPVC shall be Schedule 80 and conform to ASTM D-2467.
12. Threaded ends shall be Schedule 80 and conform to ASTM D-2464.
13. Butt fusion ends in PP or PVDF will be compatible with Chemline PP or PVDF metric piping systems.
14. Flanged ends shall be ANSI Class 150 one-piece factory moulded (not fabricated) to ensure maximum strength and close tolerance end to end dimensions.

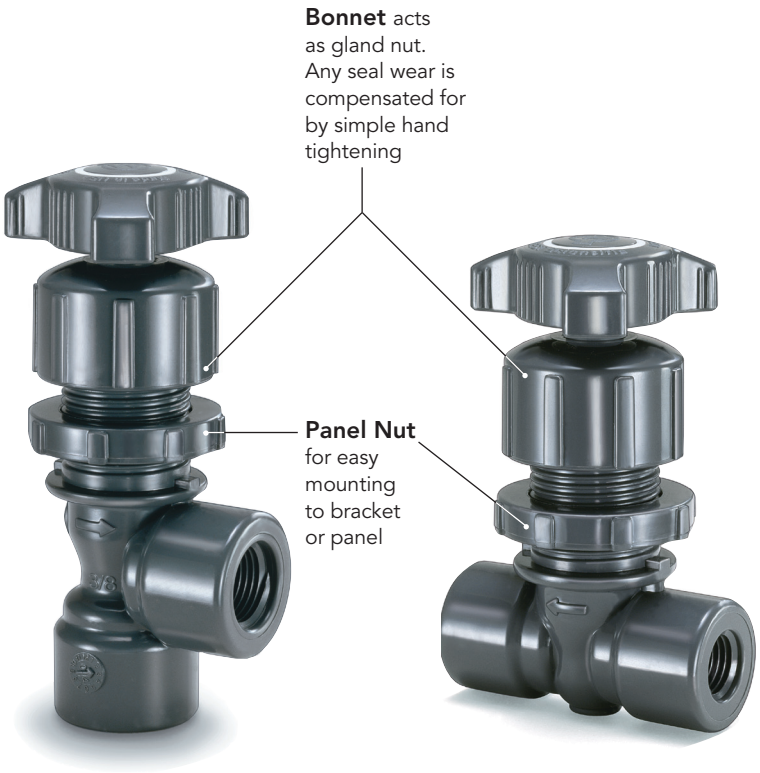
Needle Valves

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

Chemline N Series Needle Valves are designed for fine throttling of corrosive and ultrapure fluids at low flow rates. Because the seal material is PTFE, these valves are suitable for aggressive chemicals where similar valves with elastomer seals will not stand up.



PVC | CPVC | PPG[1]

SERIES: NG – Globe Body
NA – Angle Body

SIZES: 1/4", 3/8" & 1/2"

ENDS: Female NPT

STEM SEALS: PTFE

Angle Body **Globe Body**

features

Precise Control with Fine Adjustment

- Precision machined seat and matching ground needle tip along with a 24 pitch fine thread stem (five turns from closed to full-open) provides for excellent flow control. Better control of reagents can mean significant cost savings.

High Chemical Resistance

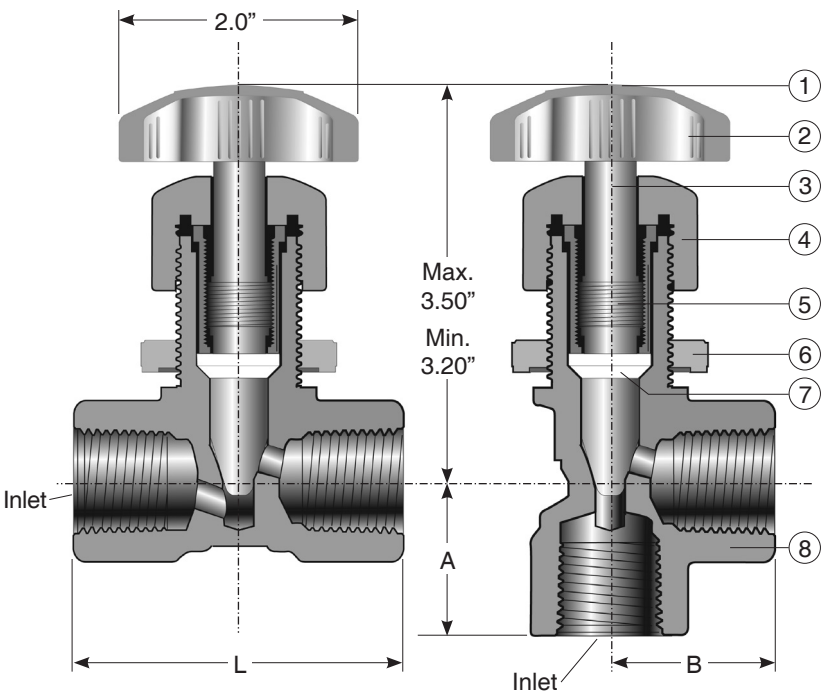
- All parts are plastic or PTFE. No elastomers or metal parts are used.

Lubrication Free

- No silicone or other lubricants are used

Easy Maintenance

- Seal wear is compensated for by hand tightening the cap (gland). Valve can be serviced in-line. Simply unscrew bonnet to remove complete topworks for inspection or disassembly.



Heavy Duty Construction

- Thick stems

[1] PPG=Glass Reinforced Polypropylene.

SR50 Series Pressure Regulating (Reducing) Valves

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

The Chemline **SR 50 Series** Pressure Regulating (Reducing) valves maintains a set downstream pressure independent of higher variable upstream pressures. As downstream pressure increases reaching the set pressure, the valve closes. It opens as soon as the downstream pressure decreases below set pressure.

The SR 50 is sensitive and provides precise control. One application is to protect filters from damaging pressure surges.

PVC PP PVDF

CRN Registered as Category C Fittings Consult Chemline

NSF[3] Certified to NSF/ANSI 61

SERIES: SR50

SIZES: 3/8" – 3"

ENDS: True Union Socket, Threaded or ChemFlare™[1] Spigot[2] Bodies with Plain, Socket, Threaded or Flanged ends

DIAPHRAGM: PTFE Bonded EPDM

SEALS: EPDM, FKM (Viton®)

ChemFlare™ Ends
For connection to PFA tube. Leak-free connections for difficult services such as sodium hypochlorite.

Optional Pressure Gauge
For inlet and/or outlet

features

True Union Ends
- Easy installation and maintenance
- Eliminate chemical leakage problems common with old fashioned threaded connections

Long Cycling Life
- Dynamic seal is PTFE bonded EPDM for high chemical resistance
- This moulded diaphragm is designed for superior sealing and flex life

Designed for Superior Performance
- Designed for minimum hysteresis
- Seat is hydraulically designed to eliminate chatter

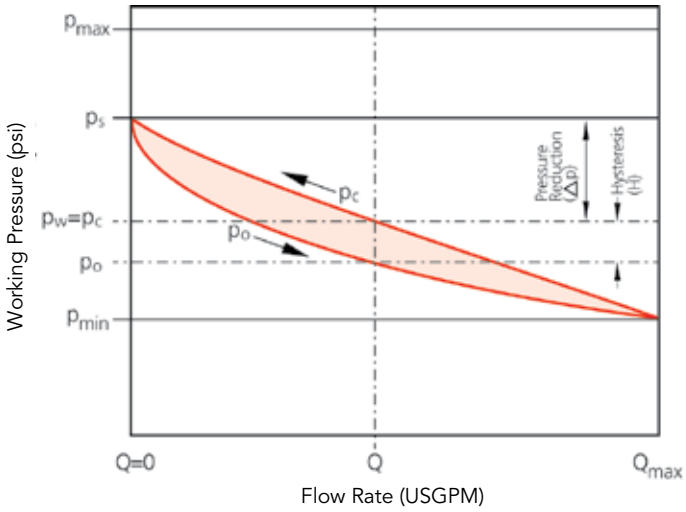
Pressure Regulating (Reducing) Valves

how they work

The SR50 controls downstream pressure, which must always be below the inlet pressure. It is normally open until the downstream pressure (which acts on the control diaphragm) reaches the set pressure, adjustable with the spring tensioning bolt. At this point the valve closes. It opens again as soon as downstream pressure decreases slightly below the set pressure.



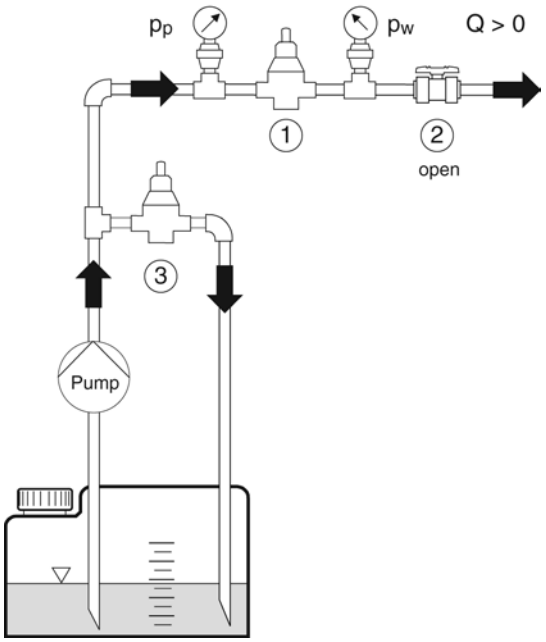
The large diaphragm provides for sensitive and precise control. The valve seat opens and closes until a balance is achieved between the spring force (set pressure) and the downstream pressure.

working pressure vs. flow rate

The curves show the relationship between the ***working pressure*** and the flow rate through the valve for water at 20°C (68°F). These values will vary depending on:

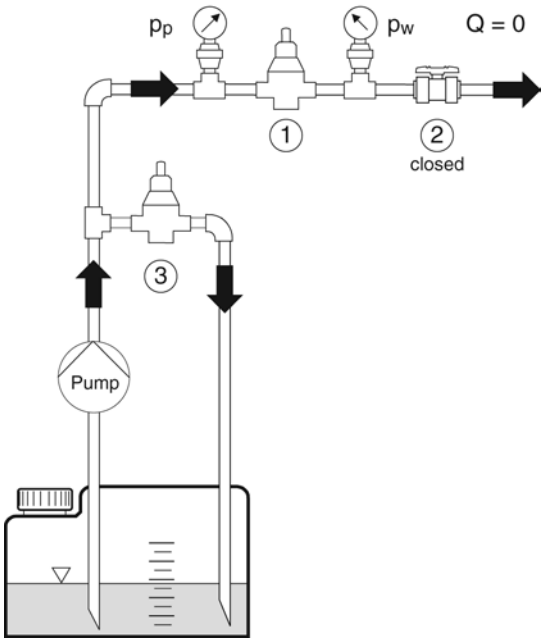
- the configuration of the piping and the pressure losses associated with it
- the fluid if not water at 20°C (68°F)
- whether the pressure is rising or falling, ***hysteresis*** is approximately 1.5 to 6 psi.

configuration example



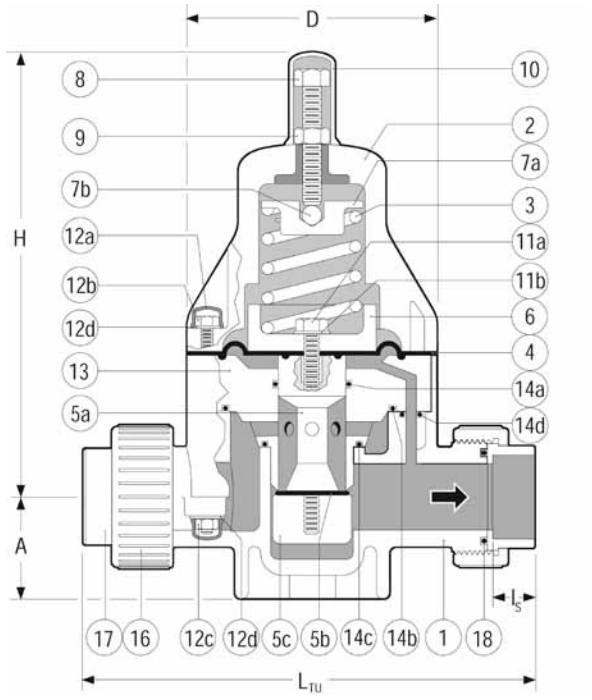
p_s = set pressure
p_w = working pressure
p_o = opening pressure
p_c = closing pressure
p_p = pump pressure
H = $p_o - p_c$ = hysteresis
Δp = $p_w - p_s$ = flow dependent pressure reduction
Q = flow

application of pressure regulating valves



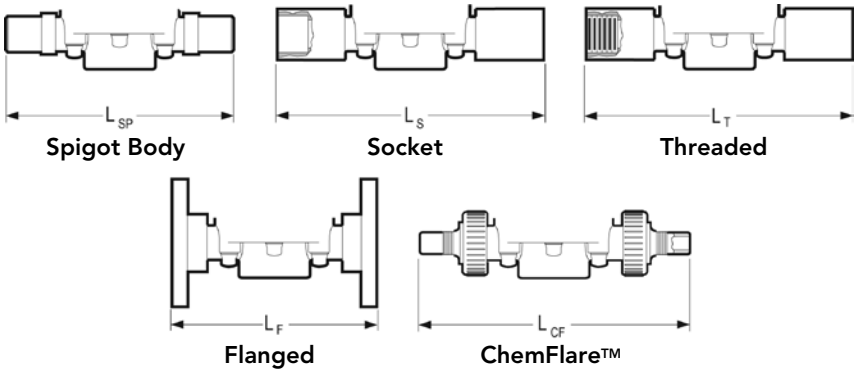
Secondary Pressure – System Dynamically Flowing

If the ball valve is closed, the working pressure P_W rises by the amount of the closing pressure P_C



Secondary Pressure – System Closed

If the ball valve is opened, the working pressure P_W drops by the amount of the opening pressure P_O



① = pressure reducing valve
② = ball valve
③ = pressure relief valve

Type 21 True Union Ball Valves

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

The Chemline **Type 21** True Union Ball valve incorporates state of the art features for long term performance. This is a full port, full blocking True Union valve pressure rated at 16 bar (230 psi)[3]. Double stem o-rings and Safety Shear stem design provide for a high degree of safety on hazardous fluid applications. All sizes have an ISO standard actuator mounting platform integral to the valve body. This provides for sturdy and secure mounting of pneumatic or electric actuators.

PVC | CPVC | PP | PVDF

CRN Registered Consult Chemline

NSF[4] Certified to NSF/ANSI 61

SERIES: Type 21

SIZES: 3/8" – 4"

ENDS: Socket, Threaded, Combo[6], Flanged, Butt[1] or ChemFlare™

SEATS: PTFE

SEALS[2]: EPDM, FKM (Viton®)

features

Pressure rated to 230 psi[3]
- Provides a high factor of safety

Integral Actuator Mounting Platform
- Actuation is easy. Electric or pneumatic actuators may be mounted in the field.

Full Port
- High capacity and low pressure drops

Fully Blocking
- Downstream union nut may be safely disassembled for piping maintenance while valve is closed off under full system pressure

Built-In Spanner Wrench
- Top of the handle is designed to be used as a tool for accessing internal parts

Safety Shear Stem Design
- Stem has double o-rings
- Designed to hold full pressure even if stem breaks due to excessive torque

High Chemical Resistant Material
- PVC and CPVC compounds have an "A" chemical resistance rating as per ASTM D-1784. They have outperformed other PVC and CPVC compounds on aggressive chemicals.

CRN Registration numbers by province

- Newfoundland: OC11045.50
- Saskatchewan/Manitoba/Quebec: OC11045.56
- New Brunswick: OC11045.57
- Nova Scotia: OC11045.58
- P.E.I.: OC11045.59
- British Columbia: not required
- Alberta: not required[5]

[1] Butt ends for fusion to Chemline metric PP, PVDF or ECTFE (Halar®) piping.
[2] Other materials are available.
[3] PVC, CPVC and PVDF 1/2" to 2" are rated at 230 psi; 2-1/2" to 4" and all size PP valves are rated at 150 psi at 20°C.
[4] PVC valves with EPDM or FKM (Viton®) seals are certified under NSF/ANSI Standard 61 for contact with drinking water.
[5] Not required for non-expandable fluids.
[6] PVC and CPVC valves 1/2" to 2" are available as Combo (threaded and socket ends).

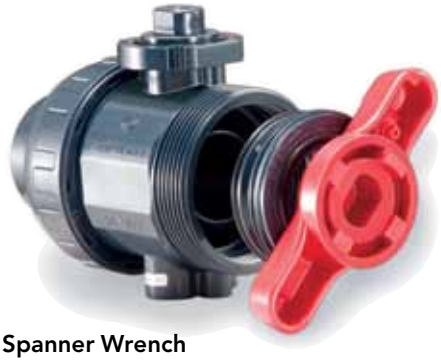
Type 21 True Union Ball Valves

Features



Double Stem O-Rings – Safety Shear Design

- Upper o-ring groove is deeper than lower. In case of excessive stem torque, stem will shear at the upper groove, leaving the inner o-ring intact to seal against full line pressure.

PTFE Seats have Elastomer Cushions

- Improved sealing while lowering stem torques
- Self adjusts for seat wear

Built in Spanner Wrench

- For removing or tightening the seat carrier
- All parts are replaceable

Integral Actuator Mounting Platform

- Actuation is easy. Electric or pneumatic actuators may be mounted in the field. Simply pull off the handle to reveal a standard ISO 5211 mounting platform which accepts bolt-on hardware.

Fully Blocking

- Downstream pipe may be removed while upstream side is still pressurized. This may be done with valve installed in either direction.

Base Mounting Pad

- Optional threaded inserts allow valves to be securely anchored
- Supplied standard with actuated valves

Options + Accessories

ChemFlare™ Ends

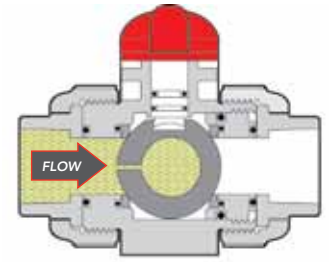
- For connection to PFA tube. Leak-free connections for difficult services such as sodium hypochlorite

One-piece moulded PVC and CPVC 6" socket ends

- Allows installation of 4" valve in 6" line
- Factory moulded, elimates cementing separate reducer and coupling
- Fixed to valve mechanically just like the one-piece moulded factory flanges

Optional Lock-out Handle & Hasp

- To prevent unauthorized operation of the valve during maintenance shut-downs
- Padlocks go through holes in hasp



Gear Operators

- Deluxe FRP construction
- IP67 enclosure resists short term immersion

Chain Wheel Operators

- For overhead operation, with 7' of chain drop
- Cast iron or stainless steel

Vented Ball

- Recommended for all sodium hypochlorite services
- Valve shown in closed position

Valve Tags

- Stainless steel or plastic

Different Colour Handles

- Choose a handle colour other than standard red for colour coding different services

Municipal Operating Nut

- 2" square nut for operating valves below grade using a standard municipal "key"
- Stainless Steel for corrosion resistance

Manual Limit Switch

- Electrical feedback of manual valve position
- NEMA 4X enclosure, position indicator beacon, 2x SPDT or proximity switches, stainless steel hardware

Shaft Extensions

- Different materials and lengths are available
- Several designs:
  - with no housing for indoors
  - with waterproofed PVC housing for indoors or outdoors
  - with stainless steel housing for buried or actuated services

Type 21 True Union Ball Valves

Electric + Pneumatic Actuation

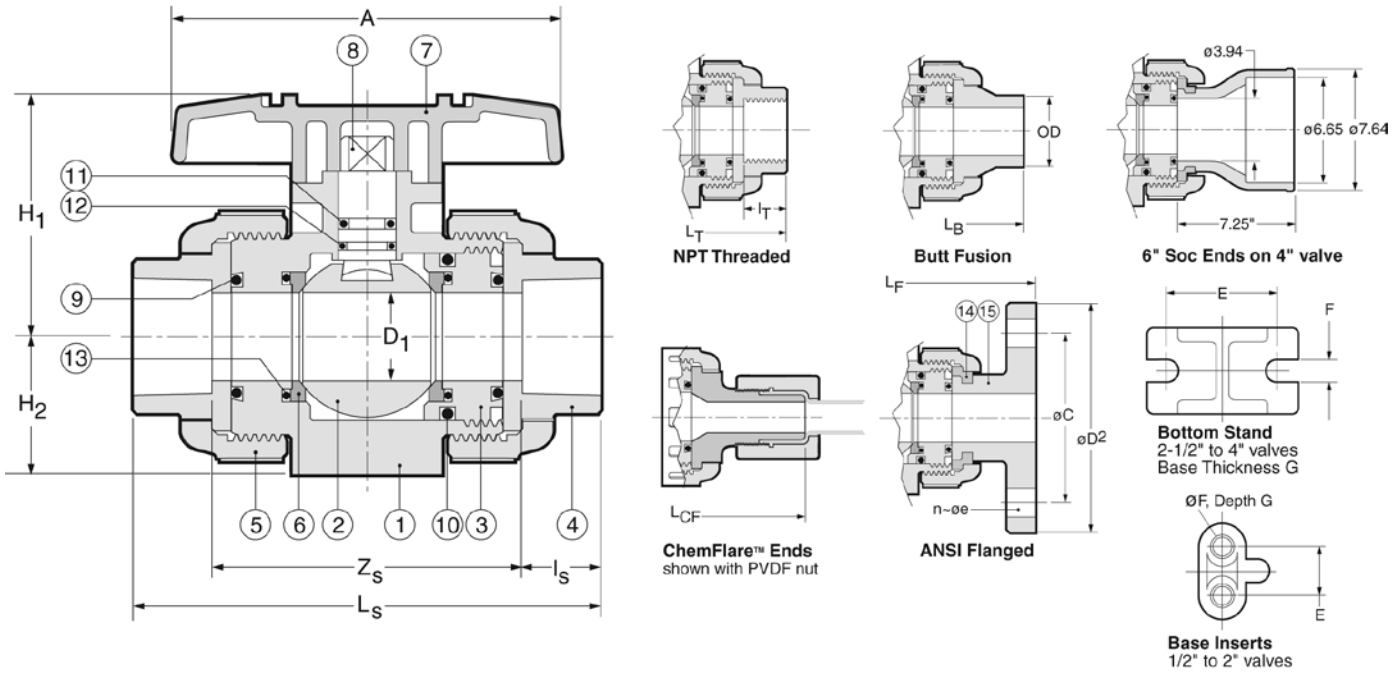
- A complete range of actuators and control accessories are available, mounted to valves using PPG plastic brackets and stainless steel couplings. Refer to separate data sheets.
- All actuators are CSA approved, have NEMA 4X enclosures, stainless steel hardware and permanently lubricated gear train

ERS Series Electric
- Type 21 ball valves up to 2"
- 180 in-lbs torque
- On-Off (3/2-wire), adjustable travel
- Visual feedback

E Series Electric
- Type 21 ball valves up to 4"
- Up to 885 in-lbs torque
- On-Off (3/2-wire), adjustable travel. Optional: failsafe, 3 position modulating
- Visual feedback and feedback switches. Optional: extra switches, feedback potentiometer and feedback transmitter

V Series Electric
(with optional Local Control Station)
- Type 21 ball valves up to 6"
- up to 8,850 in-lbs torque
- On-Off (2/3-wire), adjustable travel. Optional: failsafe, modulating, BUS
- Visual feedback, 2 feedback switches. Optional: 2 extra feedback switches, feedback potentiometer and feedback transmitter

PA Series Pneumatic
- Type 21 ball valves up to 6"
- up to 10,660 in-lbs torque
- industrial process submerged
- bleach/water washdown
- Rilsan-coated aluminum



PP Series Pneumatic
- Type 21 ball valves up to 6"
- up to 1,335 in-lbs torque
- industrial process with minimal use of metal
- Glass-filled Polyamide

OTHER OPTIONS & ACCESSORIES

- **Alternate O-Ring Seals**
- **Stem Extensions** made to any length
- **Limit Switches** – for open and/or closed position indication
- **Municipal Operating Nut**
- **Lubrication-free Valves** – factory clean room assembled
- **Vented Ball** – for sodium hypochlorite applications

Type 21 True Union Ball Valves

PARTS

▲ Recommended Spare Parts

No.	Part	Pcs.	Materials
1	Body	1	PVC, CPVC, PP, PVDF
2	Ball	1	PVC, CPVC, PP, PVDF
3	Carrier[1]	1/2	PVC, CPVC, PP, PVDF
4	End Connector	2	PVC, CPVC, PP, PVDF
5	Union Nut	2	PVC, CPVC, PP, PVDF
6▲	Ball Seat	2	PTFE
7	Handle	1	ABS

[1] 1 carrier for sizes 1/2" to 2", 2 carriers for sizes 2-1/2" to 4"
[2] EPDM seals standard with PVC, CPVC, PP; FKM (Viton®) with PVDF valves
[3] 2 pcs 1/2" to 2", 6 pcs 2-1/2" to 4"

SAMPLE SPECIFICATION

1. All True Union Ball Valves in PVC, CPVC, PP or PVDF shall be Chemline Type 21 or equal sizes 1/2" to 2" in PVC, CPVC, and PVDF rated at 230 psi and in PP 150 psi maximum working pressure. Sizes 2-1/2", 3" and 4" rated at 150 psi maximum working pressure with EPDM or FKM (Viton®) seals. Ball seats shall be PTFE with elastomer cushions for closure with minimum stem torques.
2. All valves will have Safety Shear stem design, blowout-proof with double o-rings for safety. The top o-ring groove shall be deeper so that if the stem breaks off under excessive torque the lower o-ring will remain intact and the valve will hold pressure.
3. All valves shall be full port and two-way blocking design.
4. All valves will be CRN (Canadian Registration Number) registered with TSSA.
5. PVC valves with EPDM or FKM (Viton®) seals shall be certified under NSF/ANSI Standard 61 for contact with drinking water.
6. All valves shall have chemical resistant labels permanently marked with manufacturing number to provide production level traceability.
7. PVC compound shall have an ASTM cell classification 12454-A with a minimum suffix "A" designation for chemical resistance as per ASTM D-1784 (CSA report LO 4000-172).
8. CPVC compound shall have an ASTM cell classification 23567-A with a minimum suffix "A" designation for chemical resistance as per ASTM D-1784.
9. PP material will conform to ASTM D-4101 PP 021 B 67272 material requirements.
10. PVDF material shall be unpigmented conforming to ASTM D-3222 material requirements and to be USDA Title 21 Chapter 1 Part 177. 2510 requirements for contact with food.
11. Socket ends in PVC and CPVC shall be Schedule 80 and conform to ASTM D-2467.
12. Threaded ends shall be Schedule 80 and conform to ASTM D-2464.
13. Butt fusion ends in PP or PVDF will be compatible with Chemline PP or PVDF metric piping systems.
14. Flanged ends shall be ANSI Class 150 one-piece factory moulded (not fabricated) to ensure maximum strength and close tolerance end to end dimensions.

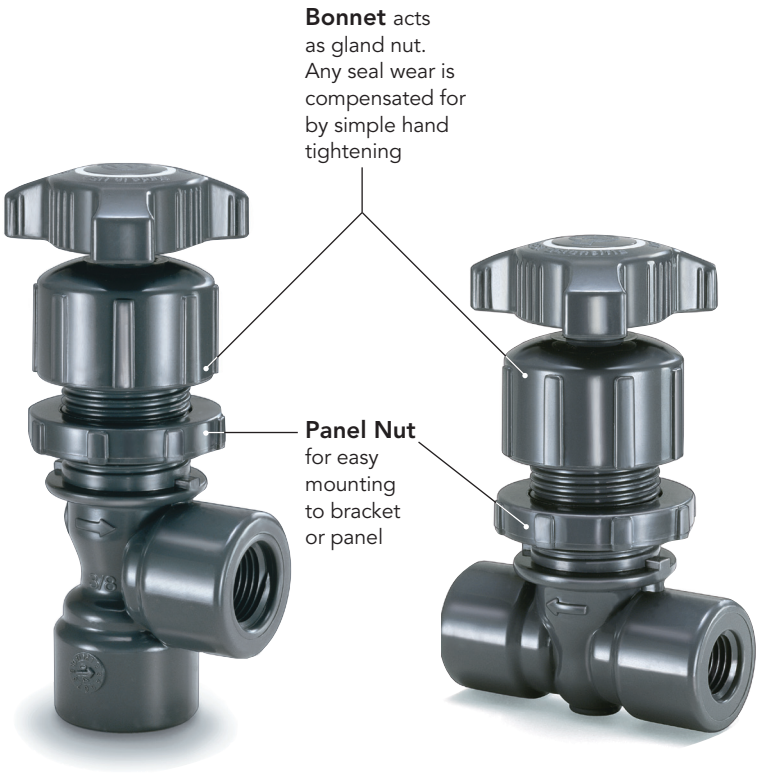
Needle Valves

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

Chemline N Series Needle Valves are designed for fine throttling of corrosive and ultrapure fluids at low flow rates. Because the seal material is PTFE, these valves are suitable for aggressive chemicals where similar valves with elastomer seals will not stand up.



PVC | CPVC | PPG[1]

SERIES: NG – Globe Body
NA – Angle Body

SIZES: 1/4", 3/8" & 1/2"

ENDS: Female NPT

STEM SEALS: PTFE

Angle Body **Globe Body**

features

Precise Control with Fine Adjustment

- Precision machined seat and matching ground needle tip along with a 24 pitch fine thread stem (five turns from closed to full-open) provides for excellent flow control. Better control of reagents can mean significant cost savings.

High Chemical Resistance

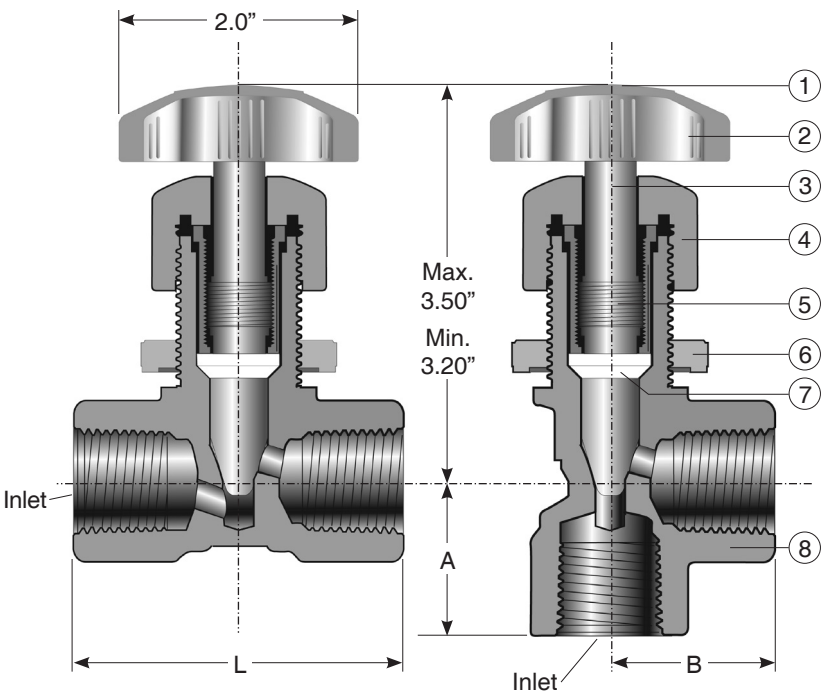
- All parts are plastic or PTFE. No elastomers or metal parts are used.

Lubrication Free

- No silicone or other lubricants are used

Easy Maintenance

- Seal wear is compensated for by hand tightening the cap (gland). Valve can be serviced in-line. Simply unscrew bonnet to remove complete topworks for inspection or disassembly.



Heavy Duty Construction

- Thick stems

[1] PPG=Glass Reinforced Polypropylene.

SR50 Series Pressure Regulating (Reducing) Valves

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

The Chemline **SR 50 Series** Pressure Regulating (Reducing) valves maintains a set downstream pressure independent of higher variable upstream pressures. As downstream pressure increases reaching the set pressure, the valve closes. It opens as soon as the downstream pressure decreases below set pressure.

The SR 50 is sensitive and provides precise control. One application is to protect filters from damaging pressure surges.

PVC PP PVDF

CRN Registered as Category C Fittings Consult Chemline

NSF[3] Certified to NSF/ANSI 61

SERIES: SR50

SIZES: 3/8" – 3"

ENDS: True Union Socket, Threaded or ChemFlare™[1] Spigot[2] Bodies with Plain, Socket, Threaded or Flanged ends

DIAPHRAGM: PTFE Bonded EPDM

SEALS: EPDM, FKM (Viton®)

ChemFlare™ Ends
For connection to PFA tube. Leak-free connections for difficult services such as sodium hypochlorite.

Optional Pressure Gauge
For inlet and/or outlet

features

True Union Ends
- Easy installation and maintenance
- Eliminate chemical leakage problems common with old fashioned threaded connections

Long Cycling Life
- Dynamic seal is PTFE bonded EPDM for high chemical resistance
- This moulded diaphragm is designed for superior sealing and flex life

Designed for Superior Performance
- Designed for minimum hysteresis
- Seat is hydraulically designed to eliminate chatter

CRN Registration numbers by province
- Ontario: OC10134.5

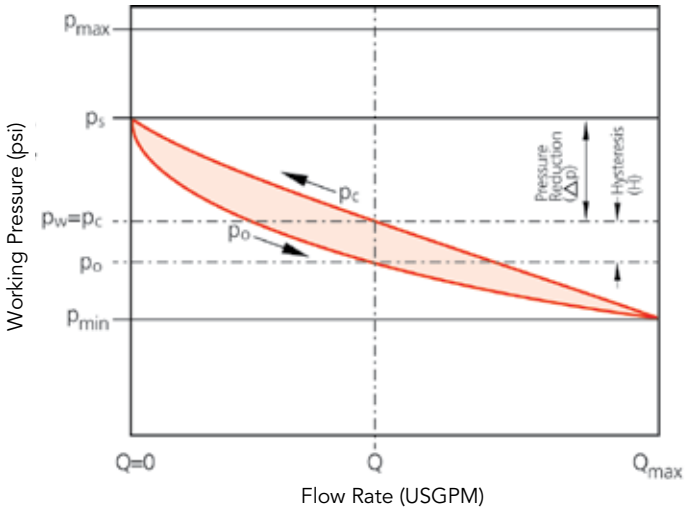
Pressure Regulating (Reducing) Valves

how they work

The SR50 controls downstream pressure, which must always be below the inlet pressure. It is normally open until the downstream pressure (which acts on the control diaphragm) reaches the set pressure, adjustable with the spring tensioning bolt. At this point the valve closes. It opens again as soon as downstream pressure decreases slightly below the set pressure.



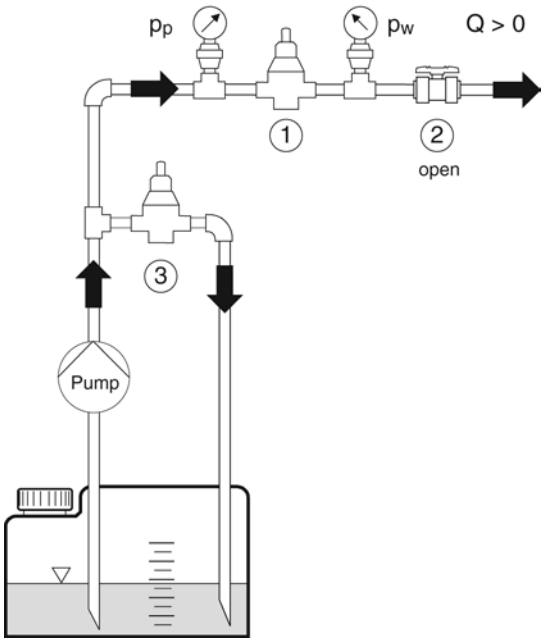
The large diaphragm provides for sensitive and precise control. The valve seat opens and closes until a balance is achieved between the spring force (set pressure) and the downstream pressure.

working pressure vs. flow rate

The curves show the relationship between the ***working pressure*** and the flow rate through the valve for water at 20°C (68°F). These values will vary depending on:

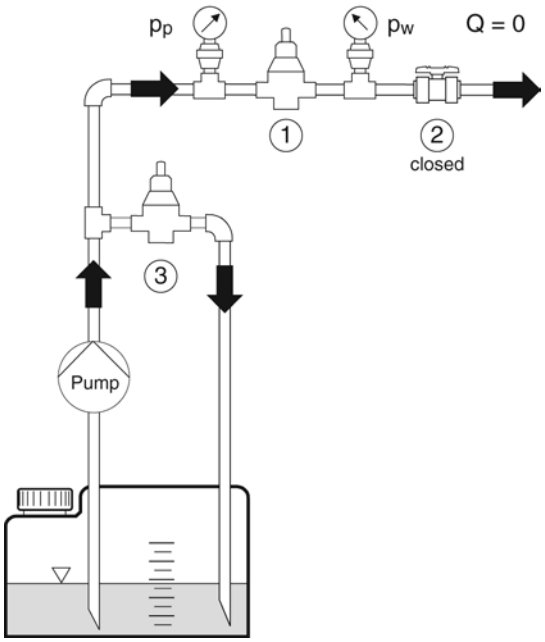
- the configuration of the piping and the pressure losses associated with it
- the fluid if not water at 20°C (68°F)
- whether the pressure is rising or falling, ***hysteresis*** is approximately 1.5 to 6 psi.

configuration example



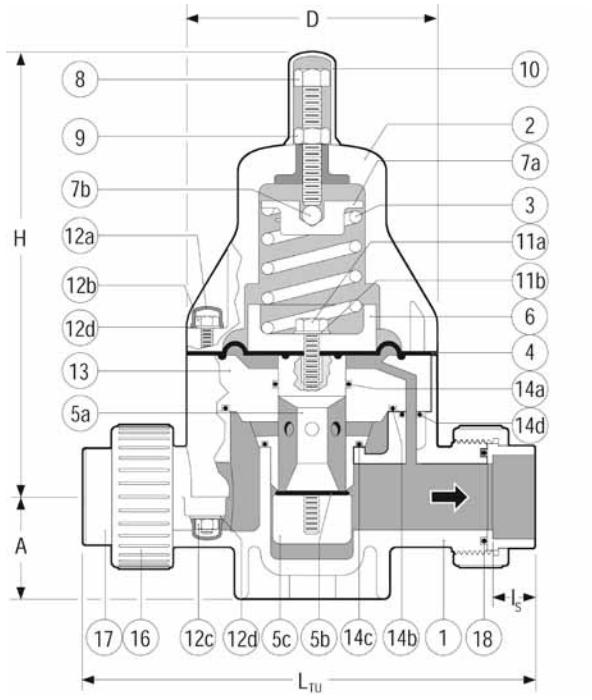
p_s = set pressure
p_w = working pressure
p_o = opening pressure
p_c = closing pressure
p_p = pump pressure
H = $p_o - p_c$ = hysteresis
Δp = $p_w - p_s$ = flow dependent pressure reduction
Q = flow

application of pressure regulating valves



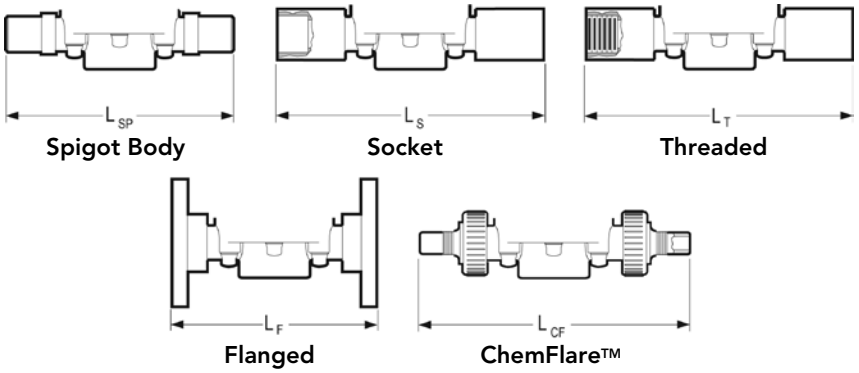
Secondary Pressure – System Dynamically Flowing

If the ball valve is closed, the working pressure P_W rises by the amount of the closing pressure P_C



Secondary Pressure – System Closed

If the ball valve is opened, the working pressure P_W drops by the amount of the opening pressure P_O



① = pressure reducing valve
② = ball valve
③ = pressure relief valve

Pier, Piling, and Ballast Tank

Cast Aluminum Anodes

Corrosion Control In Saltwater Environments

Aluminum anodes are used more often than any other type of galvanic material in saltwater environments due to their relatively low consumption rate of approximately 7 lbs. per amp.-year. To meet the demand for this effective anode material, Corrpro manufactures an extensive array of aluminum anodes in two different alloys. The anodes are cast in a variety of weights and configurations to address numerous installation possibilities. Steel cores cast into each anode allow for electrical connection. The cores are available in bolt-on, eyebolt, pie, rod, or weld-on configurations, and can also be provided with lead wire upon request.

Because alloy composition is so important to the performance of galvanic anodes, Corrpro performs a number of quality control tests to ensure its aluminum anodes conform to the proper alloying specifications. The firm conducts atomic absorption, inductive coupled plasma, or Baird spectrovac optical emission tests to confirm chemical composition. The results of these tests are obtained using traceable standards developed by the National Institute of Standards and Technology.

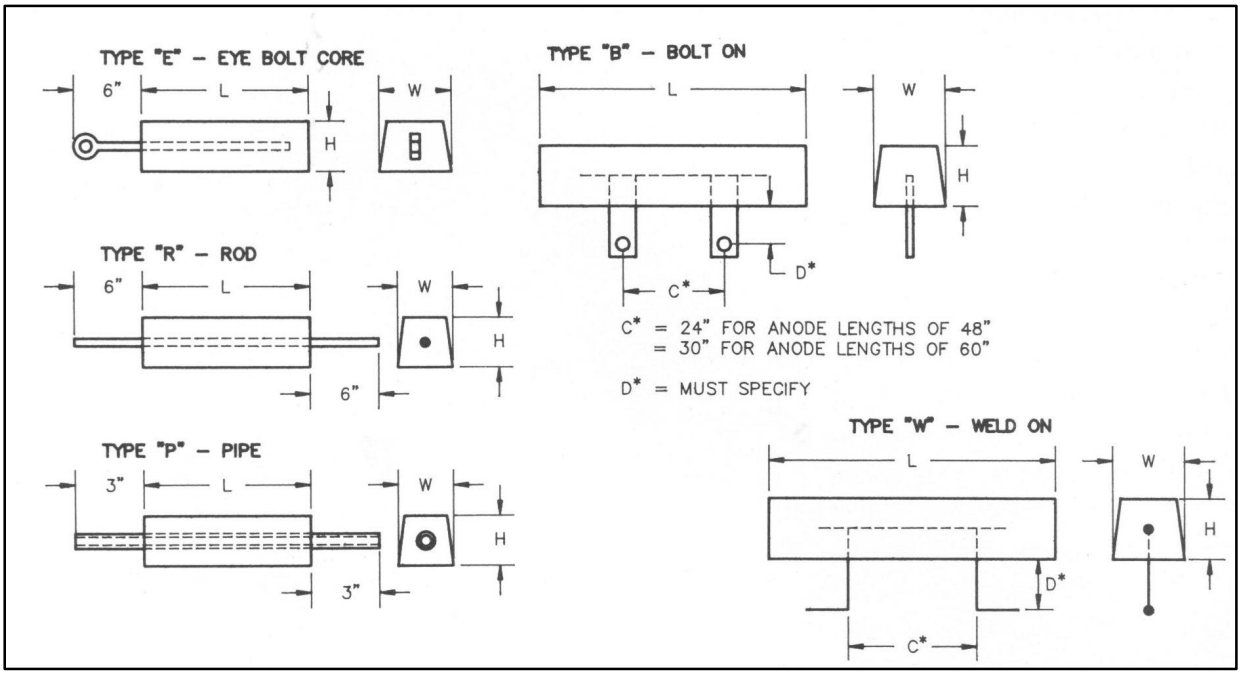
Typical Applications

Aluminum anodes produced by Corrpro are designed for superior performance in saltwater environments. The first alloy, which has an open circuit potential of 1.05 volts (with respect to an Ag/AgCl reference cell), contains a nominal amount of mercury, and is recommended for use only in free-flowing saltwater environments. The second anode has an open circuit potential of 1.10 volts, and produces a higher ampacity and better performance than the previous alloy in lower chloride water and saline mud electrolytes.

CHEMICAL COMPOSITION

Element	Content %	
	Alloy 1	Alloy 2
Zn	0.35-0.50	2.8-3.5
Si	0.14-0.21 max	0.08-0.20 max
Hg	0.035-0.048	–
In	–	0.01-0.02
Aluminum	Remainder	Remainder

Ordering Procedure



Corrpro aluminum anodes are manufactured in a variety of dimensions and weights, and are offered with several different core types. To order the required anode for your structure, indicate that you need an aluminum pier, piling, or ballast tank anode, and specify the quantity desired, alloy grade, anode type, and core configuration. All anodes are shipped without lead wire unless otherwise specified. An example is provided to help illustrate this process.

1 INTRODUCTION

1.1 Project Definition

Veolia Water Technologies Canada (VWTC) was contracted by Agnico Eagles Mines (A.E.M.) to supply the equipment for a mining effluent treatment.

VWTC is responsible for the supply of mechanical equipment.

This control narrative shall be read in conjunction with the related documents as listed in Section 1.3.

1.2 Process Summary

The treatment system proposed will consist of the following steps:

- Breakpoint chlorination for ammonia removal
- Dechlorination using activated carbon
- Breakpoint chlorination Actiflo
- Secondary Actiflo
- Discfilter filtration
- Backwash tank
- Sludge tank

1.2.1 Breakpoint Chlorination for Ammonia Removal

Part of the raw water, which is composed of a mix of underground saline water and surface water, is sent to a closed-top reaction tank where a hypochlorite source and an alkali (NaOH) are added. The hypochlorite is a compound added to oxidize the ammonia (NH_{4+}) into mainly nitrogen gas (N_2) through breakpoint chlorination and ammonia and nitrite (NO_{2-}) into nitrates (NO_{3-}) through simple oxidation. The hypochlorite dosage is adjusted according to the dissolved organic carbon (DOC), nitrites and ammonia concentrations in the raw water as all of these compounds will consume the added chlorine.

The hypochlorite injected in the water produces hypochlorous acid (HOCl). The hypochlorous acid is a weak acid, and part of the hypochlorous acid is decomposed in water into hypochlorite ions (OCl_-) depending of the pH. The pH can be adjusted to optimize the hypochlorite ion concentration in the reactor, therefore optimizing the chlorine dosage. The control of the pH also prevents the release of chlorine gas, which can be observed in acidic pH and which is a safety and corrosion issue.

The hypochlorous acid and hypochlorite ions in solution will first be consumed by reducing agents and organic matter contained in the water. When more chlorine is added in solution and there is a presence of ammonia, the ammonia will react to form chloramines, specifically monochloramines (NH_2Cl). When the

quantity of chlorine is sufficient, the monochloramine will be destroyed, and depending of the concentration, will be transformed in dichloramines ($NHCl_2$) or trichloramines (NCl_3) and then, finally, in nitrogen (N_2). If the quantity of chlorine injected is sufficient, a breakpoint is reached where all chloramines and ammonia are converted into nitrogen. The raw water is sent to a reaction tank where calcium hypochlorite and an alkali are added. The calcium hypochlorite is a compound added to oxidize the ammonia (NH_4^+) into nitrogen (N_2). The calcium hypochlorite feed is added as a function of nitrites (NO_2^-) and ammonia concentration in the raw water.

The Figure 1.1 below presents a typical curve showing chlorination breakpoint

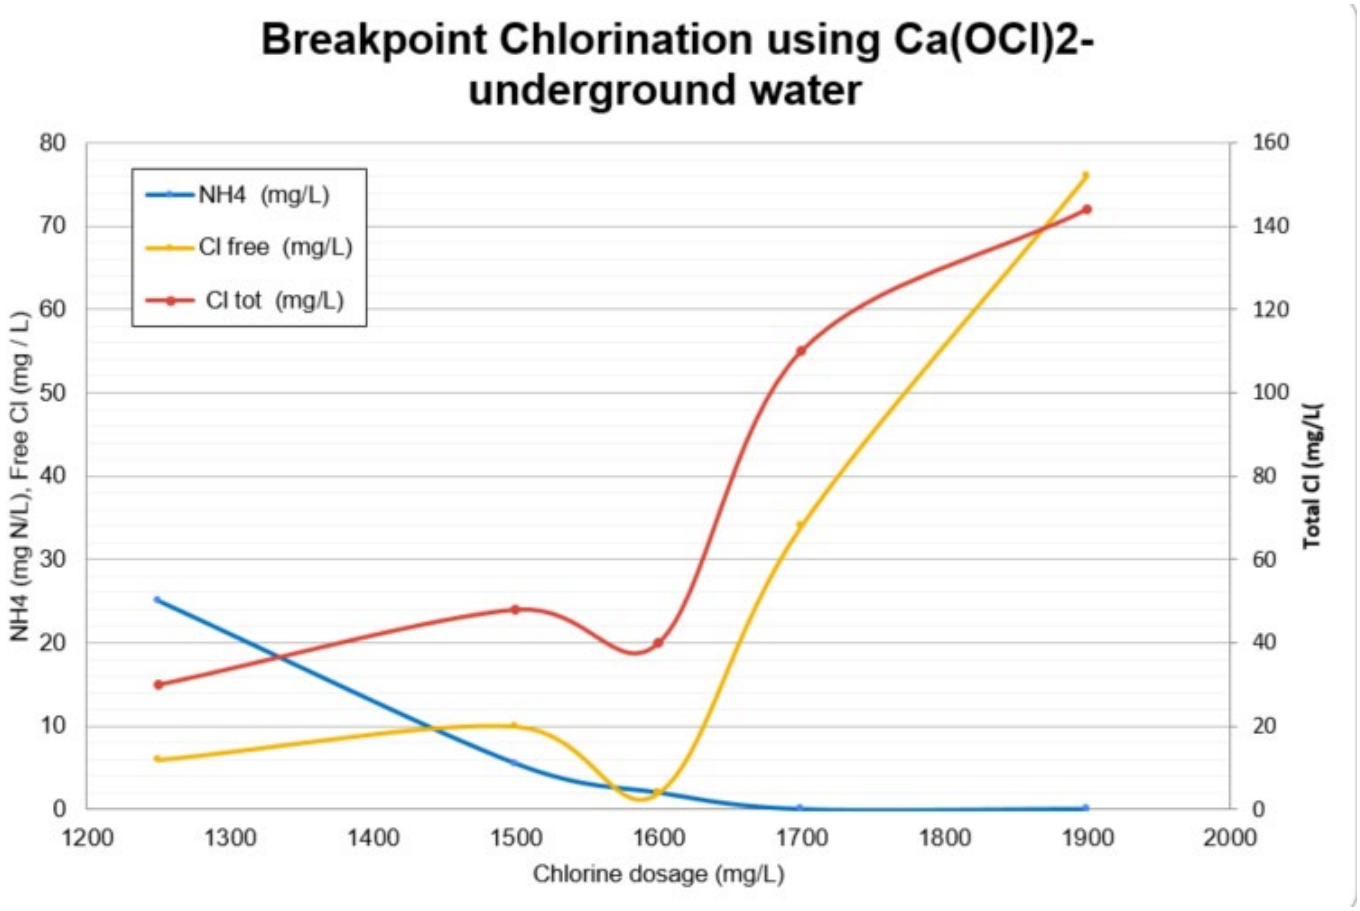

Figure 1: Breakpoint chlorination determination

It is important to notice that once the breakpoint is passed, ammonia concentration is still low but free and combined chlorine are climbing up again. Accurate management of ammonia but also chlorine residual out of the chlorination tank is required to not exhaust the downstream Powder Activated Carbon (PAC) - see Section 1.2.3.

1.2.2 Dechlorination Using Activated Carbon

The chlorinated water, containing chlorine residual, flows to the dechlorination reactor for chlorine destruction. The dechlorination process aims to ensure the destruction of the residual chlorine, which is

acutely lethal to aquatic life. Traditional breakpoint chlorination, which is already in place on site, uses powder activated carbon (PAC) for the chlorine destruction. Since the use of calcium hypochlorite causes inactivation issues on the PAC, powdered activated carbon (PAC) is used for chlorine destruction instead.

The PAC is dosed in the dechlorination reactor in two steps (in the first two compartments), to allow a sufficient contact time for complete chlorine destruction and provide fresh activated carbon along the dechlorination process. Continuous automatic dosing systems are used to add fresh PAC to the dechlorination step. Some recirculated PAC, from the ACTIFLO ballasted flocculation system, is also added to the dechlorination reactor. This allows a slight reduction of the PAC requirement and higher efficiency for the chlorine destruction.

Since the proposed water treatment chain will be operating in cold water conditions, coagulant addition is also done in the dechlorination reactor, which provides high reaction time for the activation of the coagulant and coagulation of the colloids particles. The coagulant acts as a destabilization agent to agglomerate TSS particles contained in the raw water for further removal.

1.2.3 Breakpoint Chlorination Actiflo

The Breakpoint chlorination Actiflo receives two streams.

In the first stream, the water is charged with PAC, destabilized TSS and with a slight chlorine residual flows to the ACTIFLO clarifier. The proposed ACTIFLO is designed to remove suspended solids presents in the water and the PAC dosed for chlorine destruction.

In the second stream, the water, bypassed from the two RX, goes directly to the breakpoint chlorination ACTIFLO. For this reason, a security coagulant dosage point is added to address possible by-passed water and increase the coagulant efficiency.

Sand-ballasted settling is a high-rate coagulation/flocculation/ sedimentation process that utilizes microsand as a seed for floc formation. The microsand provides a surface area that enhances flocculation and acts as a ballast or weight. The resulting floc settles very fast, allowing for compact clarifier designs compared to conventional clarifiers, with high overflow rates and short detention times. The use of microsand also permits the unit to perform well under dramatically changing flow rates without impacting final effluent quality

The ACTIFLO has three active chambers. The slurry flows through the first chamber, to break bubbles formed during the chlorine destruction, which could affect the settling efficiency. Within the Breakpoint chlorination ACTIFLO, sodium thiosulfate, a quenching agent, is also dosed to the first chamber of the ACTIFLO to destroy any residual chlorine coming from the dechlorination reactor. The slurry, bubble-free and chlorine residual free, flows to the second chamber, the maturation tank, where anionic polymeric flocculant and microsand are added to initiate floc formation. These serve as a “seed” for floc formation and development in the next process step.

The sand-sludge-PAC mixture settles to the bottom of the clarifier. Scrapers force the sludge collected at the bottom of the clarifier into a centre cone from which it is continuously withdrawn and pumped to a

cyclone where sludge and microsand are separated by centrifugal force. After separation, the higher density microsand is discharged from the bottom of the cyclone and reinjected into the process for re-use.

The sludge from the breakpoint chlorination ACTIFLO, coming from the hydrocyclone overflow, flows by gravity to a dedicated Splitter Box where part of the sludge flows back in the reaction tank. The sludge splitter box from the breakpoint Chlorination ACTIFLO is used for homogenization of the sludge quality over time, providing some thickening up to 20 g/L of the sludge. In addition, it promotes the reuse of the PAC in the ACTIFLO, the sludge is partly recirculated to the dechlorination reactor, thus reducing the PAC requirement for dechlorination. The excess sludge is sent to a common sludge holding tank thus mixing spend PAC from the breakpoint chlorination ACTIFLO and the partially thickened sludge from the bypass ACTIFLO.

1.2.4 Secondary Actiflo

The secondary Actiflo receives the third stream composed of the underground water and surface water. It is designed to remove suspended solids present in the raw water. A coagulant is dosed within the first chamber to provide coagulation of the colloids particles. The coagulant then acts as a destabilization agent to agglomerate TSS particles contained in the raw water for further removal.

The ACTIFLO has three active chambers. A coagulant is dosed within the first chamber to provide coagulation of the colloids particles. The coagulant then acts as a destabilization agent to agglomerate TSS particles contained in the raw water for further removal. The water then flows into the second chamber, the injection tank, where an anionic polymeric flocculant and microsand is added to initiate floc formation. These serve as a “seed” for floc formation and development in the next process step. From the injection tank, the water underflows to a third tank section called the maturation tank.

In this tank, a TURBOMIX® mixer provides ideal conditions for bridging between the microsand and the destabilized suspended solids. The fully formed ballasted floc enters into the third and final tank, the settling tank, equipped with a lamella, which provides the rapid and effective removal of the microsand/sludge floc. The clarified water exits the system via a weir and flows to a clarified water holding tank.

The sand-sludge-PAC mixture settles to the bottom of the clarifier. Scrapers force the sludge collected at the bottom of the clarifier into a centre cone from which it is continuously withdrawn and pumped to a cyclone where sludge and microsand are separated by centrifugal force. After separation, the higher density microsand is discharged from the bottom of the cyclone and reinjected into the process for re-use. The sludge from the secondary ACTIFLO, coming from the hydrocyclone overflow, flows by gravity to a dedicated Splitter Box where part of the sludge flows back in the first chamber of the secondary ACTIFLO. The sludge splitter boxes from the secondary ACTIFLO is used for homogenization of the sludge quality over time, providing some thickening up to 20 g/L of the sludge.

1.2.5 Discfilter Filtration

Water from both ACTIFLO process flows by gravity to the DISCFILTER filtration process. The DISCFILTER is used as a polishing step to reduce the suspended solids at the clarified water aiming further reduction of metal at the final effluent. The DISCFILTER utilizes a filter cloth mounted on filter panels. These panels stem from a central drum where inlet water is admitted into the unit for treatment. Water is filtered in inside-out mode, flowing from the centre tube to the open base of the filter discs, through the polyester cloth before reaching the DISCFILTER water collection tank. The DISCFILTER water collection tank is part of the DISCFILTER and contains the filters and the filtered water. Particulate matter presents in the DISCFILTER inlet water is retained by the filter media on the inside of the filter panels, eventually leading to solids built-up on the filter media. Consequently, the head loss across the DISCFILTER increases, resulting in increased water level at the inlet of the unit. The unit includes an integral high level switch that initiates a backwash cycle, which rotates the filter discs in order to expose clean filter media to the water flow path, while subjecting the dirty filter media to the cleaning action of the backwash spray tips. Filtered water stored in the DISCFILTER water collection tank is pumped to feed the series of spray tips strategically installed on the moving arms of the backwash system. This serves to clean the entire surface of the filter media while limiting the use of filtered water in the process. An outlet weir integral to the DISCFILTER water collection tank is used to maintain the water. The backwash water will be directed to a dirty water holding tank to be pumped back to the ACTIFLO process. Filtered water flows over the weir of the tank and out of the unit. A chemical trolley is available with the DISCFILTER unit in the case of chemical scaling due to high calcium concentration in the water (possibility to use an acidic wash to wash down any calcite that might precipitate on the discs cloth). The water then flows to a treated water tank and is pumped to discharge. Online TSS and Total Chlorine will be monitored at the outlet for discharge compliance.

1.2.6 Backwash tank

The Backwash tank collects the dirty backwash water that flows out of the DISCFILTER unit. The backwash waste is pumped from the holding tank to the secondary ACTIFLO (for TSS removal only). The flow of the backwash watse must be considered in the hydraulic of the ACTIFLO in order not to exceed the maximum flow to the bypass ACTIFLO.

1.2.7 Sludge tank

The sludge holding tank is required for sludge management. Sludge is pumped from the two sludge splitter boxes to the sludge holding tank, which will be mixed to prevent any settling and accumulation within the sludge tank.

1.3 List of related documents

This document is to be read in conjunction with the following documents:

- P&IDs (5000220043_PI0001)
- Equipment List
- Table of setpoint and alarms
- All GA drawings

1.4 List of abbreviations

The following abbreviations are used in the text of this document.

HMI: Human/Machine Interface
PLC: Programmable Logic Controller
SCADA: Supervisory Control and Data Acquisition
VFD: Variable Frequency Drive
VWTC: Veolia Water Technologies Canada

1.5 List of Units

The following lists the parameters referred to in this document and the units they are measured in unless otherwise specified.

Concentration (in general): mg/L
Flowrate (main process): m^3/h
Flowrate (chemical dosing): LPH
Level in tank: %
pH: -
Pressure: PSIg
Temperature: ° C
Turbidity: NTU
TSS: mg/L

2 Overall Plant Control

In this section, only the automatic control sequences are described.

2.1 Overview

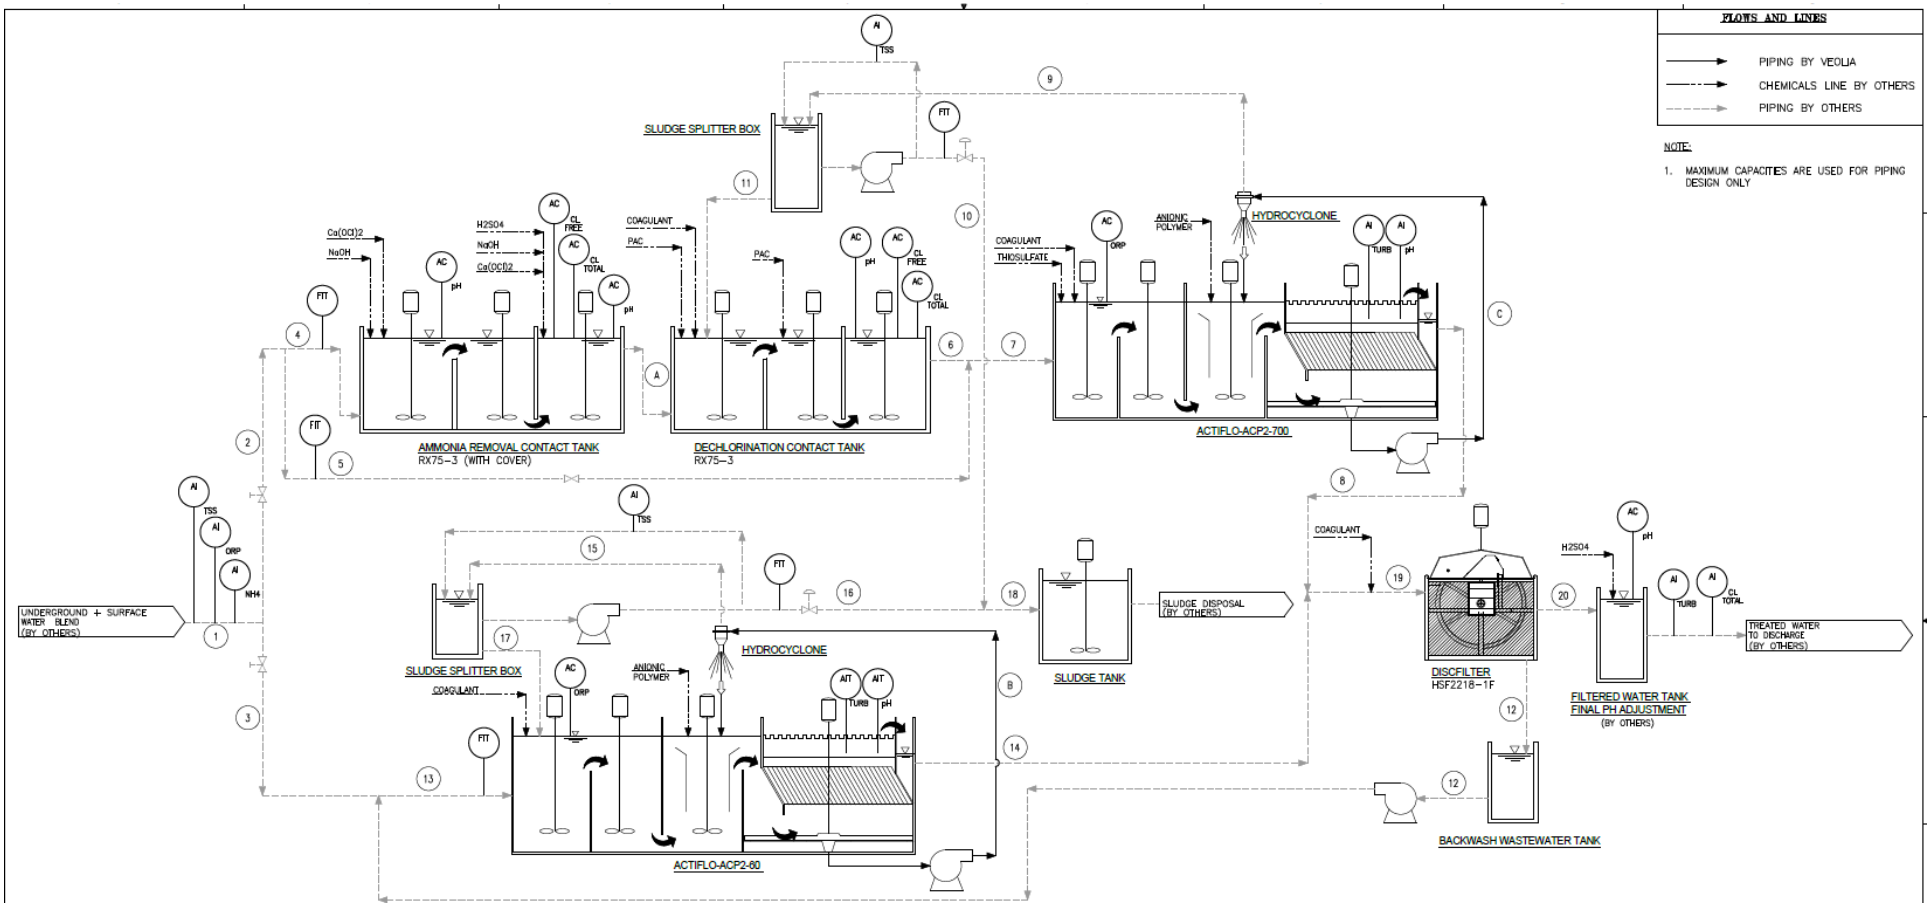
The process includes the following unit operations:

- One (1) Chlorination Tank, mixing and instrumentation
- One (1) Dechlorination Tank, mixing and instrumentation
- One (1) Breakpoint Chlorination Actiflo and instrumentation
- One (1) Secondary Actiflo and instrumentation
- One (1) Discfilter
- One (1) Powder activated Carbon preparation and dosing system
- Two (2) Total Chlorine analyzer and associated flowmeter
- Two (2) Free Chlorine analyzer and associated flowmeter
- Two (2) Splitter Boxes

The WTP will receive an influent flow rate up to 20 000 m3/d.

2.2 Plant overall control

The inlet water flowrate is controlled from a setpoint adjustable by the operator, using two (2) modes: Program or Local.



The program modes calculate the breakpoint chlorination flowrate using the ammonia concentration value at the inlet, the ammonia concentration setpoint at the outlet and the inlet water flowrate. The remaining flowrate is then distributed between the breakpoint chlorination bypass and the secondary Actiflo.

The effluent flows to the whole treatment chain by gravity. Both streams coming from Each Actiflo are combined together and feeds the Discfilter.

Sludge produced by each actiflo is either recirculated or extracted to the sludge discharge line depending on a timer with feedback on TSS concentration in the sludge.

Backwash water from Discfilter is collected into a backwash tank and evacuated gradually using backwash pumps back to the secondary Actiflo.

Chemicals are dosed proportionally to flow with correction factors to take into account pH or ammonia values for final effluent quality adjustment and oxidation efficiency.

3 Inlet Flowrate Distribution

3.1 Description

The inlet flowrate distribution can be done following two (2) modes:

In Local mode, operator will manually enter the desired water flowrates on the PID loop pop-up page.

In Program mode, the flowrate setpoints are calculated as described below.

The ammonia concentration at the outlet and total inlet Flowrate are two fixed value entered by the operator on the HMI. Using these values and the ammonia concentration measured at the inlet, the minimum ammonia load to be removed is calculated and the breakpoint chlorination flowrate is deducted. The remaining flowrate is then calculated and compared to the minimum allowable flow rates of each Actiflo (using a settling rate of 20 m/h).

3.2 Controls

3.2.1 Flow rates calculation

The raw inlet flowrate Qin is entered by the operator on the HMI. It is then distributed among the three streams as per the following equation:

Qin = QBPC + QBPBPC + QSec

Where :

Qin : inlet flowrate in m3/d

QBPC : Flow going to chlorination tank (breakpoint chlorination) in m3/d

QBPBPC : : Flow by-passing the breakpoint chlorination but being treated by the breakpoint chlorination Actiflo in m3/d

QSec : Flow by-passing the breakpoint chlorination to the secondary ACTIFLO unit in m3/d

QBPTOT = QBPBPC + QSec

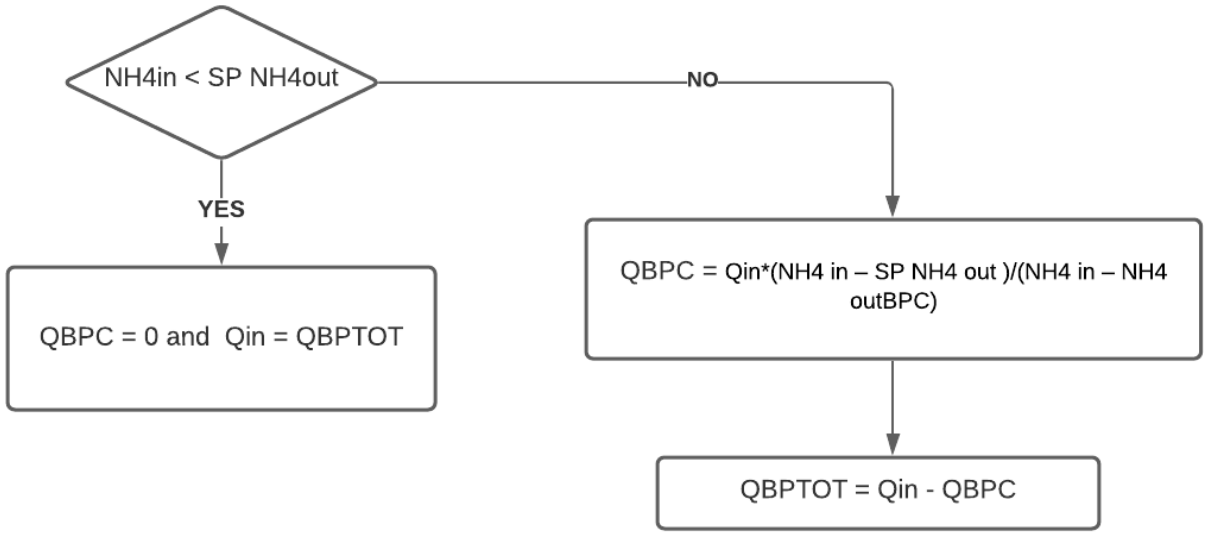
Where ;

QBPTOT : Total flow by-passing the breakpoint chlorination step (going to one or the other ACTIFLO unit) in m3/d

The ammonia concentration measured at the inlet determines the usage of the breakpoint chlorination treatment chain. The following equation presents the calculation of the Breakpoint chlorination flow rate :

QBPC= Qin*(NH4 in – SP NH4 out)/(NH4 in – NH4 outBPC)

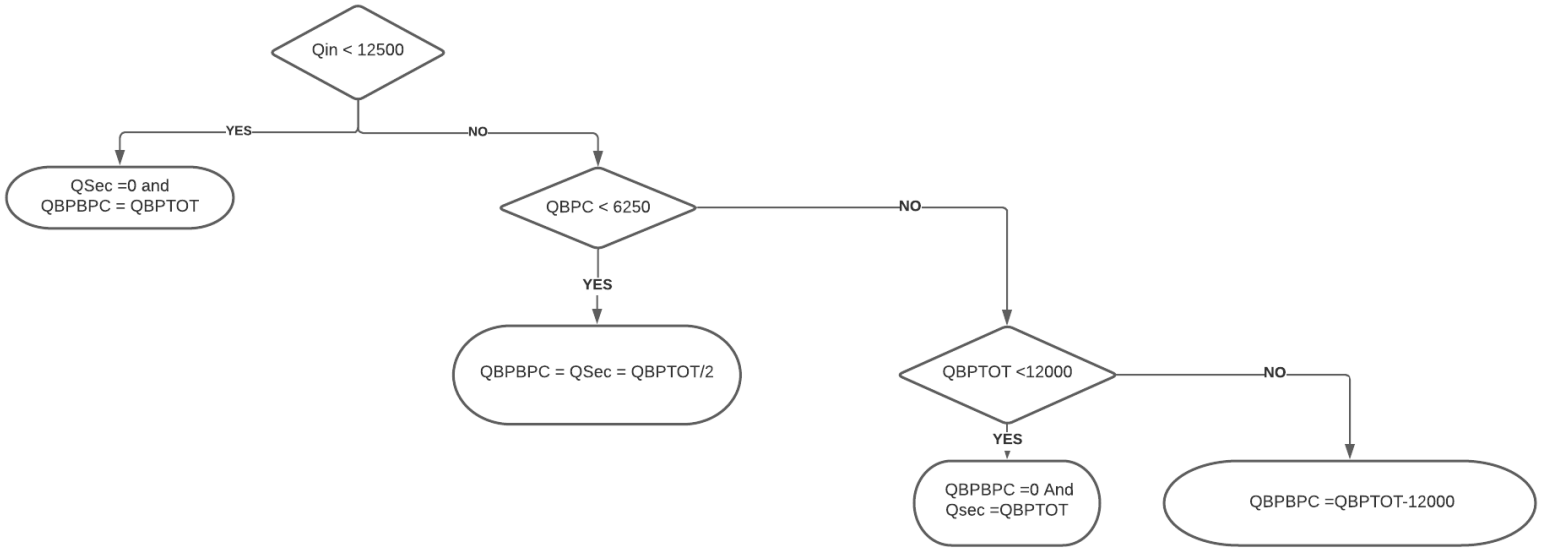
Where :



NH4 in: Ammonia in raw water. The value of NH4 as measured by the ammonia analyzer. The operator selects one of the three modes : Local (concentration entered by the operator in mg/L), Remote 1 (direct usage of the ammonia analyzer 65AIT6801101 signal), Remote 2 (Calculated mobile average concentration measured by ammonia analyzer 65AIT6801101 refreshed every 4 hours – adjustable delay).

SP NH4 out : Targeted concentration at final discharge. Can be modified, but restricted access (in case of law modification in the future). Will be initially set at 40 mg N/L.

NH4 outBPC : Ammonia concentration out of the BPC process. Can be modified, but with restricted access (after better understanding of optimal operation on site). Will be initially set at 5 mg N/L.



The decision diagram below presents the calculation steps of the breakpoint chlorination flowrate (QBPC) and the total flow bypassing the BPC treatment chain (QBPTOT)

Figure 3.1 : Breakpoint chlorination flowrate Flowchart

The next figure presents the calculation steps of the Bypass flowrate (QBPBPC and Qsec)

Figure 3.2 : Bypass flowrate Flowchart

An overview page presents the flowrates for each stream, the ammonia load removed, the ammonia concentration at the inlet, the targeted ammonia concentration at the outlet and the ammonia concentration out of the BPC process.

3.2.2 Flow control mode

The calculated flowrate is used as a setpoint. PID loop controls the modulating valve opening accordingly, using the flowrate from each flowmeter as a process value and the valve opening as a manipulated variable.

In either mode (Program or local), priority of the flow control loop shall be assigned in the following order:

1. Breakpoint chlorination flow control
2. Secondary flowrate (if active)

The breakpoint chlorination (B.C.) bypass flow control is not activated in that case and is used as an exhaust of the system in order to avoid a fight between the different flow control loop.

3.3 Fault response

Ammonia Analyzer out of range

Tag: 65AIT6801101

The ammonia analyzer is used for inlet distribution flow rate calculation. If the instrument fails, a FATAL alarm is displayed on the screen and the last value recorded is used for calculation. The operator can override the value on the screen.

Flowmeter out of range

Tag: 65FIT6801102, 65FIT XX, 65FIT6801301

The flowmeters are used for the flow control of the modulating valves. If one of the three flowmeter falls out of range, a FATAL alarm is displayed on the screen and the openings of the valves are held in last position. . The flow calculation is disabled until the fault is acknowledged on the HMI. The flow control is used in local mode.

Flow control valve Fault

Tag: 65FCVXX, 65FCV6801302, 65FCV6801102
If one of the three fow control valve falls out of range, a FATAL alarm is displayed on the screen. . The flow calculation is disabled until the fault is acknowledged on the HMI.

4 Chlorination tank

4.1 Description

In the chlorination tank, the chlorine level and pH control is achieved by the following control devices and instruments:

Table 4-1: Chlorination tank devices

SKID	P&ID TAG	DESCRIPTION	COMMENTS

	65AIT6801116	FREE CHLORINE ANALYZER	

4.2 Controls

4.2.1 Chlorination tank Start/Stop/Auto function

By activating the Auto function, the Chlorination tank is set in Auto start mode and is ready to start. If all the system availability conditions are satisfied, it starts only after receiving the automatic start command.

A start and a stop button will be displayed on the HMI.

- By activating the Start function, the chlorination tank starts the fan and then the three mixers after a delay adjustable on the HMI whatever the automatic start command status.
- By activating the Stop function on the HMI, the chlorination tank stops the three mixers and then the fan after a delay adjustable on the HMI.

If required equipment is in manual and not running when the chlorination tank Auto function is triggered, automatic starting command cannot be activated.

4.2.2 Alkali pH control loop

The alkali is dosed in the first compartment proportionally to the calculated flowrate, but the dosage is modulated to maintain a pH at an adjustable setpoint entered by the operator on the interface.

A PID loop controls dosing setpoint accordingly, using the pH meter 65AIT6801107 as a process value and the dosing rate as a manipulated process value to maintain a constant pH.

If the pH value as read by the pH meter 65AIT6801107 is below the pH setpoint, the dosing rate is incremented.

If the pH value as read by the pH meter 65AIT6801107 is above the pH setpoint, the dosing rate is decreased.

The changes are capped by an adjustable range to prevent overdose or underdose of alkali.

If the pH meter is out of range, the PID loop is deactivated and only dosing setpoint is taken into account.

A button on the interface also allows the operator to select the pH control or disable it (in case of pH sensor malfunction).

4.2.3 Acid pH control loop

The sulfuric acid is dosed in the last compartment of the chlorination tak. The dosage is modulated to maintain a pH at an adjustable setpoint entered by the operator on the interface.

A PID loop controls dosing setpoint accordingly. The control loop uses the pH meter 65AIT680111 as a feedforward process value, the pH meter 65AIT680136 (located in the dechlorination tank) as feedback value and the dosing rate as a manipulated process value to maintain a constant pH.

If the pH value as read by the pH meter 65AIT680111 is below the pH setpoint, the dosing rate is incremented.

If the pH value as read by the pH meter 65AIT680111 is above the pH setpoint, the dosing rate is decreased.

The changes are capped by an adjustable range to prevent overdose or underdose of sulfuric acid.

If the pH meter is out of range, the PID loop is deactivated and only dosing setpoint is taken into account.

A button on the interface also allows the operator to select the pH control or disable it (in case of pH sensor malfunction).

4.2.4 Ammonia and chlorine residual control

The calcium hypochlorite is dosed proportionally to the calculated flowrate as described. But the dosage is modulated to maintain a fixed outlet ammonia concentration. The outlet ammonia concentration is an adjustable setpoint entered by the operator on the interface.

The operator has two options for the hypochlorite dosing:

Option 1: Stoichiometric dosage with free chlorine residual correction

The required dosage concentration RC_{HYPO} when expressed in mg/L is calculated as follows:

RC_{HYPO}= 7.6 x ([NH4 inf]-[NH4 eff]) + Correction factor 1

Where NH4inf is the ammonia concentration in mg/L as given by ammonia analyzer 65AIT6801101 at the raw water inlet and NH4 eff the required ammonia concentration at the outlet.

The correction factor 1 can be modulated by the operator to control the free chlorine residual as measured by 65AIT6801116 and is clamped by an adjustable range to avoid underdosing or overdosing of calcium hypochlorite.

A free chlorine setpoint is adjustable by the operator on the HMI. A volumic PI loop controls dosing manipulated process value accordingly, using the free chlorine analyzer 65AIT6801116 (when reading chlorination tank effluent) as a process value and the free chlorine setpoint as target value to optimize calcium hypochlorite dosages. The volumic integral pH control loop applies a correction to the calculated required dosage. It considers the volume between the dosing point and the measurement (hydraulic retention time) and the pH setpoint Vs the actual pH value (Error). A Gain applies a factor on the error. The loop is tuned by adjusting the gain and the volume.

If the residual free chlorine value as read by the free chlorine analyzer 65AIT6801116 is above the free chlorine setpoint, the calcium hypochlorite dosing setpoint is decreased.

If the residual free chlorine value as read by the free chlorine analyzer 65AIT6801116 is below the free chlorine setpoint, the calcium hypochlorite dosing setpoint is increased.

Option 2: Dosage entry

If chorine analysers falls out of range, the operator can enter the required calcium hypochlorite dosage RC_{HYPO} in mg/L or µL/L on the interface.

4.3 System Availability Conditions

The automatic start sequence will be activated when the automatic start command is true and the following conditions are met:

- At least two mixers are in PROGRAM mode
- No major fault

4.4 Fault response

The following are the possible major faults associated with the contact reactor.

1. Chlorination tank high high level switch
2. Multiple chlorination tank mixers fault
3. Fan fault

A major fault on the chlorination tank stops the associated alkali pumps, sulfuric acid pump and calcium hypochlorite pumps.

Chlorination tank high high level switch

Tag: 65LSHH6801106

A float in the chlorination tank is used as a high high Level switch. It is a major fault. Stop the Plant according to the automatic stop sequence when the switch is activated.

Fail safe mode:

The floats are to be wired so that the when no current is detected, the float fault alarm is activated.

Chlorination tank mixer fault

Tag: 65AGI68012/65AGI68013/65AGI68014

If one Chlorination tank mixer faults (1 of 3), the treatment train is not stopped. An alarm is activated, signalling to the operator there is a fault, but treatment continues. If more than one contact reactor mixer faults it is considered a major fault and the Plant is stopped according to the automatic stop sequence.

Fan fault

Tag : 65FAN68005

The Fan fault is a major fault and the plant is stopped according to the automatic stop sequence.

4.5 Interlocks

The faults that stop and prevent the Chlorination tank to start are as follows:

- The feeding pumps (by others) are in fault.
- The inlet breakpoint chlorination flowmeter 65FI6801102 is in out of range fault
- Dechlorination tank in major fault
- Breakpoint chlorination Actiflo is in major fault

5 Dechlorination tank

5.1 Description

In the dechlorination tank, PAC is added in the first section and in the third one. Each addition is done by a disctinct PAC preparation system. The chlorine level is monitored at the outlet in order to manually adjust the PAC dosage. Chlorine removal is achieved by the following control devices and instruments

Table 4-1: Dechlorination tank devices

SKID	P&ID TAG	DESCRIPTION	COMMENTS

	65AIT6801141	FREE CHLORINE ANALYZER	

5.2 Controls

5.2.1 Dechlorination tank Start/Stop/Auto function

By activating the Auto function, the Dechlorination tank is set in Auto start mode and is ready to start. If all the system availability conditions are satisfied, it starts only after receiving the automatic start command.

A start and a stop button will be displayed on the HMI.

- by activating the Start function, the dechlorination tank starts the three mixers whatever the automatic start command status.
- by activating the Stop function on the HMI, the dechlorination tank stops the three mixers.

If required equipment is in manual and not running when the dechlorination tank Auto function is triggered, automatic starting command cannot be activated.

5.2.2 Chlorine residual control

Free chlorine concentration and total chlorine concentrations are continuously monitored. The PAC dosages are manually adjusted on the HMI accordingly by the operator. See functional description in appendix E.

5.2.3 Coagulant dosage

Coagulant is dosed proportionally to the Breakpoint chlorination water flow rate indicated by 65FI6801102.

The coagulant dosage in mg/L is entered by the operator on the HMI.

5.3 System Availability Conditions

The automatic start sequence will be activated when the automatic start command is true and the following conditions are met:

- At least two mixers are in PROGRAM mode
- No major fault

5.4 Fault response

The following are the possible major faults associated with the contact reactor.

- Dechlorination tank high high level switch
- Multiple dechlorination tank mixers fault

A major fault on the dechlorination tank stops the associated pac dosages and coagulant pump,

Dechlorination tank high high level switch

Tag: 65LSHH6801131

A float in the dechlorination tank is used as a high high Level switch. It is a major fault. Stop the Plant according to the automatic stop sequence when the switch is activated.

Fail safe mode:

The floats are to be wired so that the when no current is detected, the float fault alarm is activated.

Dechlorination tank mixer fault

Tag: 65AGI68015/65AGI68016/65AGI68017

If one Dechlorination tank mixer faults (1 of 3), the treatment train is not stopped. An alarm is activated, signalling to the operator there is a fault, but treatment continues. If more than one contact reactor mixer faults it is considered a major fault and the Plant is stopped according to the automatic stop sequence.

5.5 Interlocks

The faults that stop and prevent the Chlorination tank to start are as follows:

- The feeding pumps (by others) are in fault.
- The inlet breakpoint chlorination flowmeter 65FI6801102 is in out of range fault
- Chlorination tank in major fault
- Breakpoint chlorination Actiflo is in major fault

6 Breakpoint Chlorination Actiflo

6.1 Description

The dechlorination effluent enters the Breakpoint chlorination Actiflo (Acticarb).

A quenching agent (sodium thiosulfate) is dosed in the coagulation chamber in order to remove any remaining chlorine. The sodium thiosulfate dosage is controlled with a Volumic PID loop using the ORP analyzer as a process value

The clarified water is collected by throughs and gets mixed with the secondary Actiflo clarified effluent prior to Discfilter filtration. Part of the sludge produced by the Acticarb is directed to the dechlorination tank. The remaining sludge is pumped to the sludge tank.

The detailed Acticarb process functional description is presented in Appendix B.

The Acticarb unit and its Activated Carbon Extraction/Recirculation consists on the following control devices and instruments:

6.2 Controls

6.2.1 Acticarb Start/Stop/Auto function

By activating the Auto function, the Acticarb is set in Auto start mode and is ready to start. If all start sequence conditions are satisfied, it starts only after receiving the automatic start command.

By deactivating the Auto mode, the Acticarb stops following the automatic stopping sequence and a start and a stop button will be displayed on the HMI.

- by activating the Start function, the Acticarb starts following the automatic starting sequence whatever the automatic start command status.
- by activating the Stop function on the HMI, the Acticarb stops following the automatic stopping sequence.

If required equipment is in manual and not running when the Acticarb Auto function is triggered, starting sequence cannot be activated.

6.2.2 Sodium thiosulfate dosage

The sodium thiosulfate is dosed in the coagulation chamber proportionally to the calculated flowrate and the free chlorine value measured at the outlet of the dechlorination tank. The dosage is corrected to maintain an ORP at an adjustable setpoint entered by the operator on the interface.

The required dosage concentration RC_{ST} when expressed in mg/L is calculated as follows:

RC_{ST}= A x ([FCl meas]-[FCl SP]) + Correction factor 1

Where:

A : is a stoichiometric factor determined with lab tests

[FCl meas] : is the free chlorine concentration as measured with 65AIT6801141

[FCl SP] : is the free chlorine setpoint

A volumic PI loop controls dosing setpoint according to the value read by 65AIT6801141 (FFW), using the ORP meter 65AIT6801201 as a (FB) process value and the dosing rate as a manipulated process value to maintain a constant ORP.

If the ORP value as read by the ORP meter 65AIT6801201 is below the ORP setpoint, the dosing rate is incremented.

If the ORP value as read by the ORP meter 65AIT680120 is above the ORP setpoint, the dosing rate is decreased.

The changes are capped by an adjustable range to prevent overdose or underdose of sodium thiosulfate.

If the ORP meter is out of range, the feedback is disabled and the sodium thiosulfate is controlled with an open PID loop.

A button on the interface also allows the operator to select the ORP control or disable it (in case of ORP sensor malfunction).

6.3 Fault response

If a fault occurs on one activated carbon extraction pump, the Acticarb is stopped according to emergency shutdown sequence.(Emergency)
If the sludge valve 65FCV6801433 falls in fault, an alarm is generated. (Warning)

If the sludge flowmeter 65FIT6801432are in out of range fault, an alarm is generated. (Warning)

If the sludge flowmeter 65FIT6801432 is in deviation alarm and the valve 65FCV6801433 is closed, an alarm is generated, a major fault is generated and the Actiflo is stopped according to automatic shutdown sequence to prevent pump or line blockage. (Fatal)

If the sludge flowmeter 65FIT6801432 is in low low alarm and the valve 65FCV6801433 is open, but the 65FIT6801432 value is above the low low alarm, an alarm is generated. If the fault is not reset after an adjustable delay, the Actiflo is stopped according to automatic shutdown sequence to prevent line blockage. (Emergency).

Specific Acticarb faults are detailed in Acticarb FD in Appendix C

6.4 Interlocks.

The faults that stop and prevent the Acticarb to start are as follows:

- Sludge extraction pump is in fault
- The feeding pumps (by others) are in fault.
- The inlet flowmeter 65FI6801102 is in out of range fault
- Chlorination tank in major fault
- Dechlorination tank in major fault

7 Secondary Actiflo

The secondary Actiflo receives the third stream composed of the underground water and surface water. It is designed to remove suspended solids present in the raw water. The secondary flowrate is defined as explained in section 1.

A coagulant is dosed within the first chamber to provide coagulation of the colloids particles. The coagulant then acts as a destabilization agent to agglomerate TSS particles contained in the raw water for further removal.

The sludge from the secondary ACTIFLO, coming from the hydrocyclone overflow, flows by gravity to a dedicated Splitter Box where part of the sludge flows back in the first chamber of the secondary. The remaining sludge is pumped to the sludge tank. The flow rate to the sludge storage tank is controlled through a control valve and a turbidity control loop.

A recirculation loop on the sludge splitter box prevents sludge from settling. The sludge recirculation loop is equipped with a turbidity mete.

The clarified water is collected by throughs and gets mixed with the breakpoint chlorination Actiflo clarified effluent prior to Discfilter filtration. Part of the sludge produced by the Acticarb is directed to the dechlorination tank.

The detailed Actiflo process functional description is presented in Appendix C

The Actiflo unit and its Actiflo Extraction/Recirculation splitter box consists on the following control devices and instruments:

Table 7-1: Actiflo control devices

65PSR68007C	Sludge extraction pump
65FCV6801437	Sludge extraction control valve

7.1 Controls

7.1.1 Actiflo® Start/Stop/Auto function

By activating the Auto function, the Actiflo® is set in Auto start mode and is ready to start. If all start sequence conditions are satisfied, it starts only after receiving the automatic start command.

By deactivating the Auto mode, the Actiflo® stops following the automatic stopping sequence and a start and a stop button will be displayed on the HMI.

- by activating the Start function, the Actiflo® starts following the automatic starting sequence whatever the automatic start command status.
- by activating the Stop function on the HMI, the Actiflo® stops following the automatic stopping sequence.

If required equipment is in manual and not running when the Actiflo® Auto function is triggered, starting sequence cannot be activated.

7.1.2 Sludge recirculation/extraction control

The TSS control loop will act on the opening of the splitter box outlet flow control valve to adjust the sludge flow rate being recirculated back to the coagulation chamber.

A TSS set point will be entered by the operator. If the TSS measured by 65AIT6801427 is below the set point, the control loop will close 65FCV6801437. This will increase the sludge recirculation to the coagulation chamber and increase the turbidity.

On the contrary, if the measured TSS is above the set point, the control loop will open 65FCV6801437. This will decrease the sludge recirculation to the coagulation chamber and increase the sludge flow rate going to the sludge storage tank.

If the TSS analyzer is in fault, an alarm is generated and the sludge valve 65FCV6801437 opens to prevent sludge build-up in the Actiflo process.

If the fault is not reset after an adjustable delay, the Actiflo is stopped according to automatic shutdown sequence.

7.2 Fault response

If a fault occurs on one sludge extraction pump, the Actiflo is stopped according to emergency shutdown sequence.(Emergency)
If the sludge valve 65FCV6801437 falls in fault, an alarm is generated. (Warning)

If the sludge flowmeter 65FIT6801437are in out of range fault, an alarm is generated. (Warning)

If the sludge flowmeter 65FIT6801437 is in deviation alarm and the valve 65FCV6801437 is closed, an alarm is generated, a major fault is generated and the Actiflo is stopped according to automatic shutdown sequence to prevent pump or line blockage. (Fatal)

If the sludge flowmeter 65FIT6801437 is in low low alarm and the valve 65FCV6801437 is open, but the 65FIT6801437 value is above the low low alarm, an alarm is generated. If the fault is not reset after an adjustable delay, the Actiflo is stopped according to automatic shutdown sequence to prevent line blockage. (Emergency).

Specific Actiflo faults are detailed in Actiflo FD in Appendix C

7.3 Interlocks.

The faults that stop and prevent the Actiflo to start are as follows:

- Sludge extraction pumps is in fault
- The feeding pumps (by others) are in fault.
- The secondary flowmeter 65FI6801301 is in out of range fault

Specific Actiflo interlocks are detailed in Actiflo FD in Appendix C.

8 Discfilter

8.1 Description

Water from both ACTIFLO process flows by gravity to the DISCFILTER filtration process. The DISCFILTER is used as a polishing step to reduce the suspended solids at the clarified water aiming further reduction of metal at the final effluent.

The DISCFILTER utilizes a filter cloth mounted on filter panels. These panels stem from a central drum where inlet water is admitted into the unit for treatment. Water is filtered in inside-out mode, flowing from the centre tube to the open base of the filter discs, through the polyester cloth before reaching the DISCFILTER water collection tank. The DISCFILTER water collection tank is part of the DISCFILTER and contains the filters and the filtered water. Particulate matter presents in the DISCFILTER inlet water is retained by the filter media on the inside of the filter panels, eventually leading to solids built-up on the filter media. Consequently, the head loss across the DISCFILTER increases, resulting in increased water level at the inlet of the unit.

The unit includes an integral two level transmitters located upstream and downstream. The differential level initiates a backwash cycle, which rotates the filter discs in order to expose clean filter media to the water flow path, while subjecting the dirty filter media to the cleaning action of the backwash spray tips.

Filtered water stored in the DISCFILTER water collection tank is pumped to feed the series of spray tips strategically installed on the moving arms of the backwash system. This serves to clean the entire surface of the filter media while limiting the use of filtered water in the process. An outlet weir integral to the DISCFILTER water collection tank is used to maintain the water level. The backwash water will be directed to backwash tank to be pumped back to the secondary ACTIFLO. Filtered water flows over the weir of the tank and out of the unit.

A chemical trolley is available with the DISCFILTER unit in the case of chemical scaling due to high calcium concentration in the water (possibility to use an acidic wash to wash down any calcite that might precipitate on the discs cloth). The water then flows to a treated water tank and is pumped to discharge. Online TSS and Total Chlorine will be monitored at the outlet for discharge compliance.

10 Sampling and analyses unit

10.1 Process overview

The free / total chlorine analysers skid is connected to the third compartment of each of the chlorination and dechlorination tank, a sample flow will be directed into the skid through gravity. A gravity settling system will allow the separation of the PAC particles and any other solids present in the sampled water. Then the effluent of the settling system is pumped into the dilution system of the skid. The pumped effluent is diluted with service water. In addition, both pumped effluent and service water flowrates are measured by a rotameter and a magnetic flowmeter respectively and controlled by controlling valves, therefore to meet the dilution ratio required to fit the analysers measuring ranges.

Table 9.1: Free / Total Chlorine Analysers Skid devices

	65AIT6801141 / 65AIT6801116	FREE CHLORINE ANALYSER	

10.2 Controls

10.2.1 Calculation of the chlorine concentration

The equations below calculates the initial chlorine concentration using the different flowrates measured :

$[CLfree_0] = [CLfree_m] . (Q_{dil} + Qp_1) / (Qp1)$

Where

$[CLfree_0]$: is the initial free chlorine concentration measured in the chlorination/dechlorination tank

$[CLfree_m]$: is the free chlorine concentration measure by the free chlorine analyzer

Qdil : is dilution flow rate measured by the flowmeter 65FITXXX

QP1 : is the pumped flow rate entered by the operator and measured with the rotameter.

The same equation applies for the total chlorine.

10.2.2 Pump control

Prior to operating the pump, its priming should be done by keeping both sample control valves #1 and #2 at the discharge section closed and opening the isolation valve at the suction section. When the suction line is filled, the pump can be started. All the listed valves are controlled manually.

10.2.2.1 Dilution flow control

For an efficient free chlorine and total chlorine concentration monitoring, the dilution process should be done adequately. Without the appropriate service water and sample flows, this can't be achieved. This control is done by monitoring the service water flowmeters #1 / #2 and the sample rotameters #1 / #2 of each dilution line per the listed set points.

10.2.2.2 Chlorine residual control

The free / total chlorine residual is measured by the analysers and it is controlled by a range of set points to avoid overdosing or underdosing of calcium hypochlorite and PAC dosages.

10.3 System Availability Conditions

For the system to run the following conditions should be met:

- Successful manual pump priming
- There is no major fault on the system

10.4 Fault Response

The following are the possible major faults associated with the sampling and analyses units:

1. Pump fault
2. Low low service water flow
3. Chlorine analysers out of range fault

Pump Fault

Tag: 65PSRXXX

Failure in priming the pump prior to its operation will result in a pump fault, the pump should be stopped and the skid should be isolated.

Low Low Service Water Flow

Tag: 65FITXXX

If service flowmeters indicate a low flow fault, a fatal alarm is signaled. The operator should give this major fault immediate attention in order to regulate the control valve 15-BA99-XXX upstream of the flowmeters 65FITXXX in order to avoid erroneous measures by the analysers.

Chlorine Analysers Out of Range Fault

Tag: 65AIT6801142 / 65AIT6801117 / 65AIT6801141 / 65AIT6801116

If analysers fall in out of range fault, a fatal alarm is generated. It will impact the calcium hypochlorite and PAC dosages. If fault persists, the operator can enter the required calcium hypochlorite and PAC dosages on the interface.

11 Treated water

11.1 Description

Water is pumped from treated water tank prior to discharge.
The treated water monitoring is composed of the following control devices and instruments.

Table 11.1: treated water system control devices

SKID	P&ID TAG	DESCRIPTION	COMMENTS
	pH	pH analyzer	
	AITXXX	Total Chlorine analyzer	
	AITXXX	TSS Analyzer	

11.2 Controls

In order to discharge effluent within effluent criteria, chlorine analyzer , TSS and pH analyzer are installed on the effluent line, prior to discharge.

The allowed discharge effluent setpoints (TSS_{max}, pH_{min}, pH_{max}, $Chlorine_{max}$) is entered by the operator at the interface.

When the transfer pump from treated water tank starts, the discharge valve (treated water valve by others) opens.

During the initial start-up of the plant, alarms are disabled for an adjustable period to enable enough time for complete on-line water analysis. After this adjustable delay, if all the effluent values are lower than the setpoints (including an adjustable hysteresis to prevent frequent opening and closing of the valve) for an adjustable delay, the treated water valve stays open.

When at least one of the values is above the corresponding setpoint (or below for pH_{min}) for an adjustable delay, , the off spec valve (by others) will open to allow water to be directed back to treatment chain inlet through to the off-spec line and discharge valve (by others) will close once the opening status of the off-spec valve is confirmed.

The raw water pumps will be stopped to prevent more water to enter the off-spec water loop. The chemical dosages will be adapted depending on the source of the non-compliance.

When all of the values are below the corresponding setpoint (or above pH_{min}) for an adjustable delay, the discharge valve will open to allow water to be directed to the treated water line and off-spec valve will close once the opening status of the discharge valve is confirmed.

The raw water pumps will then restart in automatic mode to provide water to the treatment plant.

11.3 Fault response

The following faults will stop the raw water pumps :

1. opening/closing fault from discharge valve (treated water valve)

If one of the analyzer (pH, TSS, chlorine) is in fault, an alarm is generated and the off-spec valve opens and discharge valve closes to prevent off-spec water to be discharged to the treated water line.

11.4 Interlock

No interlock.

12 Backwash tank

12.1 Description

The backwash tank collects water from the discfilter. Two transfer pumps (duty / assist) are used to recirculate the backwash effluent to the head of the secondary Actiflo.

The backwash tank is made up of the following control devices and instruments:

Table 6.1: Backwash tank control devices

SKID	P&ID TAG	DESCRIPTION	COMMENTS
	LITXX/LITXX	Level transmitters	
	65PSR68009A	Backwash tank pump #1	
	65PSR68009B	Backwash tank pump #2	

12.2 Controls

12.2.1 Level control

The backwash tank is equipped with two redundant level transmitters, LITXX and LITXX and two transfer pumps.

Level transmitters can be set with priority. The two level transmitters operate in a duty/standby configuration

The level transmitter priority (lead /lag) is changed manually by the operator. The priority is changed automatically when one transmitter is in out of range fault.

The transfer pumps are equipped with VFD. A loop controls the Pump VFD accordingly, using the lead level transmitter as a process value and the speed of the pumps as setpoints.

If the level in this tank increases, the flow rate pumped from the tank should also increase. If the level in the tank is lower, the pump will slowly decrease speed until stop level is reached.

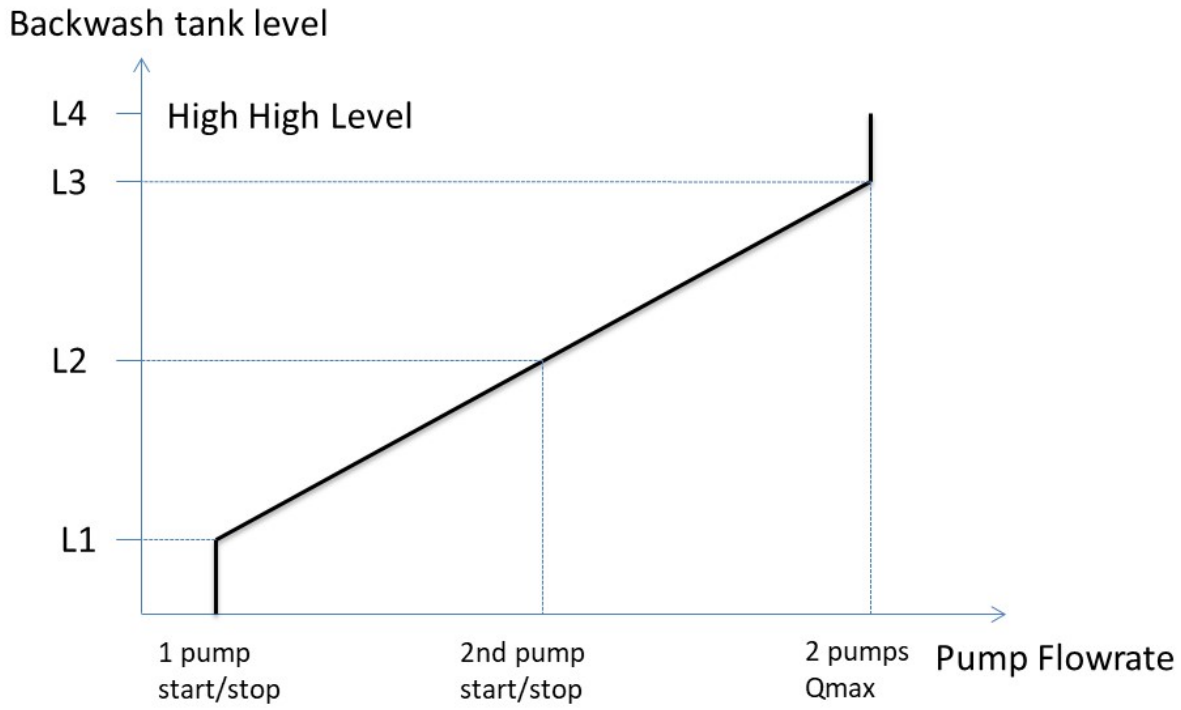

Figure 6-1 backwash tank level control

The following three (3) set points must be entered by the operator to properly control the flow and number of operating pumps.

Duty pump start level (LT_SP1);
Assist pump start level (LT_SP2);
Maximum speed pumps (LT_SP3);

When two pumps are operated at the same time, the pumps VFD setpoints are equal.

12.2.2 Backwash tank transfer pumps' Logic

In normal operation, only one transfer pump needs to run. The operator selects the assist pump on the interface.

Each time the running pump is stopped, the other pump starts at the next start sequence. If the pump is in manual or in fault, the second pump starts.

A button on the HMI permits to alternate manually the priority.

12.3 Fault Response

When the duty pump is in fault or not running and the secondary actiflo unit is in operation, the assist pump starts. If the second pump is in fault or in manual (not running) an alarm is generated and a message is displayed to warn the operator.

If low low level alarm on duty LITXX is activated, transfer pump is stopped until operator is able to reset the alarm.

If the two transmitters readings have discrepancy higher than an adjustable deviation value, an alarm is generated.

If the duty level transmitter is out of range, the priority is automatically transferred to the stand-by level transmitter. If both level transmitters are out of range, an alarm is generated and message is displayed to warn the operator about risk of overflow during discfilter backwash. The backwash pumps and discfilter are stopped.

12.4 Interlock

The interlocks that prevent the backwash tank pumps to start are:

- Low low level in backwash tank from duty level transmitter
- Both level transmitters out of range
- Secondary ACtiflo not running

13 Sludge tank

13.1 Description

The excess sludge from the two splitter boxes is pumped to a sludge holding tank. The sludge will be mixed to prevent any settling and accumulation within the sludge tank.

The sludge tank is made up of the following control devices and instruments:

Table 6.1: Sludge tank control devices

SKID	P&ID TAG	DESCRIPTION	COMMENTS
	LITXX/65LIT6801441	Level transmitters	
	65PSR68009A	Sludge tank pump #1	
	65PSR68009B	Backwash tank pump #2	
	65AGI68024	Mixer	

13.2 Controls

13.2.1 Level control

The Sludge tank is equipped with two redundant level transmitters, LITXX and 65LIT6801441 and one transfer pump (by others).

Level transmitters can be set with priority. The two level transmitters operate in a duty/standby configuration

The level transmitter priority (lead /lag) is changed manually by the operator. The priority is changed automatically when one transmitter is in out of range fault.

The transfer pumps shall be equipped with VFD. A loop controls the Pump VFD accordingly, using the lead level transmitter as a process value and the speed of the pumps as setpoints.

If the level in this tank increases, the flow rate pumped from the tank should also increase. If the level in the tank is lower, the pump will slowly decrease speed until stop level is reached.

13.2.2 Sludge tank mixing

The mixer starts when the sludge level is above the low Level.

13.3 Fault Response

If low low level alarm on duty LITXX is activated, transfer pump and mixer are stopped until operator is able to reset the alarm.

If the two transmitters readings have discrepancy higher than an adjustable deviation value, an alarm is generated.

If the duty level transmitter is out of range, the priority is automatically transferred to the stand-by level transmitter. If both level transmitters are out of range, an alarm is generated and message is displayed to warn the operator about risk of overflow. The Sludge extraction pumps and the sludge pump are stopped.

If the mixer is in fault or in manual (not running) a fatal alarm is generated and a message is displayed to warn the operator

13.4 Interlock

The interlocks that prevent the Sludge tank pumps to start and stop the mixer are:

- Low low level in Sludge tank from duty level transmitter
- Both level transmitters out of range

14 Summary of Interlocks that trigger WTP trip

- BREAKPOINT CHLORINATION FLOWMETER OUT OF RANGE

15 Trends

15.1 Graphic pages

The Contractor must provide the graphic pages necessary for the proper operation of the system. The following list is not exhaustive and should correspond to the requirements of the plans and specifications:

1. One page on the entire operation of the treatment station and one page for each P & ID page;
2. Real time data;
3. Alarms graphic page;
4. Graphical page of trend curves (flow, on-line analyzers);
5. Graphical equipment calibration page.

15.2 Display and indications

• State:

1. State of the breakpoint chlorination treatment plant;
2. Operating condition of each pump or motorized equipment;
3. Indication of flow rates;
4. Indication of all analytical values (pH, NH4, Chlorine, TSS, turbidity)
5. Operating status of chemical dosing systems
6. Operating pressure of operating systems;
7. Measurement of tanks levels;
8. Operation of VFDs;
9. Equipment running time.

15.3 Faults and alarms

Failure of motorized equipment and instruments;

Alarms according to the table of setpoints, parameters and alarms.

15.4 Compiled data

1. Measurement and compilation of all flows;
2. Cumulative run times of each pump and equipment;
3. Number of departures per day for the last five days for each pump;
4. Daily, weekly, monthly and annual average of influent flow, sludge discharge flow, off-spec flow and treated water flow.

15.5 Trends

1. Trends can be analog points or the internal result.
2. Trend curves will be recorded on a 30-day possibility.

15.6 Alarm management

1. Alarm management is required to inform the operator of the status of the water treatment system. All alarms will be compiled into a register for later reference.
2. The alarms will be transmitted to the operator via a communication system integrated into the supervision software.
3. The combined alarm will operate a strobe light/horn outside the building (TBC).

APPENDIX A

Set point table

1 INTRODUCTION

1.1 Reference Documents

Document Number	Name	Revision
5000220043_PI_0001_GEN_VWT	PI001 _Process and Instrumentation diagram	1

1.2 Process Overview

The ACTICARB® clarifier are based on the ballasted flocculation process. The key feature of this process is that very fine sand (85 µm or 130 µm size), termed “microsand” is added to the pre coagulated effluent loaded with PAC. A polymer is also added that binds the microsand to the floc, creating a ballasted floc with greatly increased effective density. The ballasted flocculation process is capable of being shut down when treatment capacity is not needed and then rapidly restarted when needed.

The flocs settle in the clarifier portion of the system where they are collected by a rake mechanism. A percentage of the unit’s design raw water flow is continuously withdrawn from the clarifier and pumped to a hydrocyclone system which separates the microsand from the sludge. The recovered microsand (typically 20% of the recycled flow) is reused in the process. A small quantity of the microsand is not recovered by the hydrocyclones and is discharged with the sludge. The lost microsand needs to be replaced periodically by adding more of it to the process (typically 1 to 3 mg/L). After sand separation, the sludge is rejected to another set of reactors, from which a portion will be recirculated to upstream points in the treatment train, and the remainder extracted.

A tank downstream of the ACTICARB® unit accepts the sludge removed in the ACTICARB® clarification process. This tank splits the rejected mix of activated carbon and flocs into two streams. A fraction is pumped and rejected into the sludge tank unit in order to be extracted from the process. The remaining fraction is recirculated by gravity into the contact reactor in order to increase the activated carbon contact time in the process. The flowrate of the pumped fraction is controlled by a flowrate control loop. The flowrate is measured by a flowmeter and controlled by a modulating valve (pinch valve).

1.3 List of Abbreviations

The following abbreviations are used in the text of this document.

- HMI: Human/Machine Interface
- H-O-A: Hand-Off-Auto
- PLC: Programmable Logic Controller
- LCP: Local Control Panel
- VFD: Variable Frequency Drive
- VWT: Veolia Water Technologies Canada

1.4 List of Units

The following lists the parameters referred to in this document and the units they are measured in unless otherwise specified.

- Concentration (in general): mg/L
- Dosing rate: mL/L
- Flow rate (main process): m^3/h
- Flow rate (chemical dosing): LPH
- Level in the tanks: %
- pH: -
- Pressure: PSIg
- Temperature: °C
- Turbidity: mg/L or NTU

2 ACTICARB® CONTROL DESCRIPTION

2.1 Equipment and Instrument

This section connects the tags from the P&ID and the terminology used throughout Equipment and Instrument Schedules

P&ID TAG	DESCRIPTION
65FIT6801102	Inlet Breakpoint Chlorination Flowmeter
65FCV6801102	Inlet Breakpoint Chlorination valve
65AGI68018	Coagulation mixer
65AGI68019	Injection mixer
65AGI68020	Maturation mixer
65TRM68002	Scraper
SSL20-03	High Torque detector
65PSR68005A	Recirculation pump #1
65PSR68005B	Recirculation pump #2

65LSLL6801406	Splitter box Low low level switch
65PSR68007A	Activated carbon extraction pump
65FCV68011433	Activated carbon extraction control valve

2.2 Operating Modes Overview

There are two primary modes for each ACTICARB®: Manual and Semi-Automatic. The Manual mode is designed for operation of individual equipment. The Semi-Auto mode is designed for operation of the ACTICARB® system as a whole.

HMI manual mode

Manual operation from the HMI provides the same equipment protection and alarming as Semi-Auto.

Semi-Auto

Semi-Auto mode allows the operator to initiate the ACTICARB® system start-up and shutdown sequences from HMI or remotely.

NOTE: Train equipment cannot be controlled manually while in Semi-Auto operation.

The coagulation mixer or injection mixer, maturation mixer, scraper, and at least one recirculation pump H-O-As must be in Auto to enable Semi-Automatic control of all respective equipment at the HMI All start-up sequences are described below. Each ACTICARB® train and its associated equipment are controlled as an independent system by the PLC.

The table below presents the control modes summary.

Table 1: Summary of Control Modes

	HMI Manual	Semi-Auto
Control Functions	N/A	Allowed (PLC)
Initiation of Semi-Automatic functions	N/A	Operator or Remote Start-up Initiation Required
HMI Operation of Individual Equipment	Allowed (virtual HOA on HMI)	Not Allowed

2.3 Permissive

Permissive to allow initiation of the Semi-Automatic start sequence are:

- H-O-A selector switches for mixers, scraper and at least one recirculation pump, are in Auto at the HMI.
- Mixers whichever is in Auto at HMI, scraper, and the above mentioned recirculation pump do not have existing equipment alarms.
- Aforementioned equipment alarms must be manually reset.

2.4 Semi-Auto Train Response to Equipment Conditions

2.4.1 Equipment Removed From Auto PLC Response

If the mixers and the scraper are removed from Auto while the PLC is running in Semi-Automatic control of the ACTICARB® system, the PLC will initiate a Shutdown Sequence as described in section 2.6.2.

Since the scraper will not be operational, the Shutdown Sequence will consist of the recirculation pump running for the durations indicated in section 2.6.2.

If the lead recirculation pump is removed from Auto, the PLC will sequentially initiate operation of the next available pump. If all recirculation pumps are removed from Auto or no additional pumps are available, the PLC will initiate an emergency shutdown of all equipment.

NOTE: No alarm will be generated if an ACTICARB® system shutdown is initiated due to a piece of equipment being removed from Auto by the operator.

2.4.2 Equipment Failure PLC Response

If the coagulation mixer fails during Semi-Automatic control of the ACTICARB® system, the system will continue to run.

Should the injection mixer or the maturation mixer fail at any time during Semi-Automatic control of the ACTICARB® system, the PLC will issue an equipment alarm and will initiate a Shutdown Sequence as described in section 2.6.2.

Should the scraper fail at any time during operation or start-up, the PLC will issue an equipment alarm and will initiate a Shutdown Sequence as described in section 2.6.2 .Since the scraper will not be operational, the Shutdown Sequence will consist of the recirculation pumps running for the durations indicated in section 2.6.2.

Should lead recirculation pump fail, the PLC will issue an equipment alarm and sequentially initiate operation of the next available pump. If all recirculation pumps fail or no additional pumps are available, the PLC will initiate an emergency shutdown of all equipment.

NOTE: An AVAILABLE recirculation pump is defined as one that is placed in Auto and does not have any existing un-reset alarm conditions.

2.5 Recirculation Pumps Logic

2.5.1 Duty/Standby Orientation

When two recirculation lines are provided they can be set with priority. The two recirculation pumps operate in a Duty / standby orientation. If all recirculation pumps are in “auto” but not running, the pump set as priority (duty) will start when the start condition will be met.

The recirculation pumps priority (duty/standby) is changed manually by the operator anytime or is changed automatically when the plant stops.

2.6 SEQUENCES OF FUNCTIONS

2.6.1 Start-up Sequence

If all permissive conditions are present and no respective equipment alarms exist, the HMI will display **"Train Ready"**. The Start-up Sequence can now be initiated via the HMI or remotely. Refer to table 2 for more information.

NOTE: To prevent damage to the equipment, the Train must have water in the tanks above the mixer impeller elevations prior to Start-up (to be checked by the operator).

To start the train when "Train Ready" is displayed on the HMI, the operator presses the "Train Start" pushbutton. A starting system displays "Train Starting" at the HMI. The start-up sequence automatically cycles through the steps listed below.

1. System Start-up Initiated:
    a. **Start duty recirculation pump**
    b. **Open injection water solenoid valve**
    c. **Start activated carbon extraction pump**

If a failure occurs, the duty pump will be locked out in the PLC and the next available pump will be assigned as the lead pump. The PLC will then attempt to continue operation. This cycle will occur until a recirculation pump starts or all recirculation pumps have been locked out. If all sand pumps are locked out, the PLC will immediately abort the start-up.

2. Delay 30 seconds (adjustable):
    a. **Start the Scraper**

If a Scraper failure occurs initiate a Shutdown Sequence.

3. Delay 10 seconds (adjustable):
    a. **Start the mixers**. These mixers start are respectively staggered by 5 seconds.

If a maturation Mixer failure occurs initiate a Shutdown Sequence.

4. Delay 10 seconds (adjustable):
    a. **Start the chemical feed pumps**
    b. **Start activated carbon flow control loop**
    c. HMI will display **"Train Started"**

If any Duty Chemical Feed Pump is not available while in operation, the Stand-by pump shall be initiated. The duty pump will not be locked out so when the pump is placed back into Semi-Auto, it will resume operation. Duty chemical feed pump alternation is manual and available only at the HMI.

The Operator can terminate the start-up at any point in the sequence by pressing the "Train Stop" pushbutton. If any pertinent equipment fails during the start-up sequence, the PLC will initiate a train shutdown. The operator can correct the failure, and then resume the start-up sequence from the current shutdown sequence step by pressing the "Train Start" pushbutton.

2.6.2 Shutdown Sequence

When in Semi-Automatic mode, the operator may implement the Shutdown Sequence at any time from the HMI or remotely. During shutdown, the HMI will display “Train Stopping”. Refer to table 3 for more information

The shutdown sequence automatically cycles through the steps listed below.

1. System Shutdown Initiated:
    a. **Close the inlet breakpoint chlorination valve**
    b. **Shutdown the Chemical Feed Pumps**
    c. **Shutdown the mixers**
    d. **Stop Water Polymer Carrier Solenoid valve.**
2. Delay (Operator Adjustable) (10-30 minutes):
    a. **Shutdown the scraper**
3. Delay 5 minutes:
    a. **Shutdown the duty recirculation pump**
    b. **Close injection water solenoid valves**

NOTE: This delay allows purging of sand and sludge contained in the settling tank and piping and re-deposits it back into the Maturation tank.

The operator can initiate the Train start-up sequence from the current shutdown sequence step by pressing the “Train Start” pushbutton without stopping the equipment already started.

Start-up Sequence

Table 1: ACTICARB® automatic start sequence

Step #	STEP NAME	ACTION	STEP CHANGE CONDITION	Recirculation pumps	Coagulation mixer	Injection mixer	Maturation Mixer	Dosage & raw water flow	Scraper	Injection Water Valve	Activated carbon extraction pump	Activated carbon extraction valve	Status light	Status output

2.7 Alarm/Failure Conditions and PLC Responses

2.7.1 Alarm Priorities

Alarms are grouped in to 3 priority levels for various attention requirements:

Emergency alarms:

1. Needs immediate operator attention.
2. The ACTICARB® unit will initiate the emergency shutdown sequence.

Fatal alarms:

1. Needs immediate operator attention.
2. The ACTICARB® unit will initiate the stop sequence.

Warning alarms:

1. Does not need immediate operator attention.

If the ACTICARB® unit was stopped by an Emergency alarm or fatal alarm, it will not restart automatically. The operator must remove alarm condition and reset the alarm. Then press the start button on the operator interface will restart the unit if all automatic start sequence conditions are satisfied. In case of remote control, the system will wait for rising edge of the remote start signal.

2.7.2 Alarm and Set Point Table

Refer to Appendix A.

2.8 Safety

2.8.1 Emergency Stop

Emergency stop actions

When an emergency stop button is activated, an alarm is triggered. The fault associated with this alarm will latch.

During emergency stop, many stopping actions are initiated on equipment. These actions are presented in sections describing the relevant equipment.

Recovery after emergency stop

When all emergency stop buttons are back into normal position, the fault associated with an alarm is maintained until the operator presses the reset button.

2.8.2 Control Power Failure PLC Response

Should control power fail at any time during Semi-Automatic control of the ACTICARB® system, the PLC will issue an alarm and will initiate a Shutdown Sequence as described in this document. Systems with an Uninterruptable Power Supply (UPS) will see the alarm as the condition occurs. Systems without an UPS will see the alarm upon restoration of power. There is a ten (10) second delay upon restoring power, and then the train will enter the Shutdown Sequence as described in this document. If the restored power does not include the actual motor controls, a run status will not be received by the PLC and equipment (pumps and scraper) will shut down immediately without a re-inventory of the sand to the maturation tank. If the unit is configured to resume via the HMI, it will automatically resume to the last known state. Otherwise the unit will remain in Stop.

2.9 System Available Conditions

2.9.1 Conditions for automatic Start sequence

The automatic start sequence will be activated when the automatic start command is true and the following conditions are met:

1. If delay for power return is elapsed;
2. If remote run request bit is activated;
3. ACTICARB® in Auto start mode.

2.9.2 Conditions for automatic stop sequence

The automatic stop sequence will be activated when any of the following conditions are met:

1. The ACTICARB® Auto start mode is deactivated on the interface or one of the following occurs:
   a. If a major fault is active;
   b. If remote contact is not activated;
2. The ACTICARB® automatic start command is false.

2.10 ACTICARB® Fault Responses

Table 4: ACTICARB® major faults

MAJOR FAULT	ALARM TYPE
Coagulation mixer	FATAL
Injection mixer	FATAL
Maturation mixer	EMERGENCY
Scraper High High torque	EMERGENCY
Recirculation pumps	EMERGENCY
High High clarified water turbidity	FATAL
High high water level	EMERGENCY
Activated carbon extraction system	FATAL
Coagulant dosing system	FATAL
Polymer dosing system	FATAL
Power failure	EMERGENCY

If the ACTICARB was stopped by a major fault, it will not restart automatically. The operator must fix the problem on the operator interface. The ACTICARB will restart if all automatic start sequence conditions are satisfied.

2.11 Controls

2.11.1 General

1. ACTICARB® Start/Stop push button function:
   - By pushing the Start/Stop push button, the ACTICARB® will be set in Auto start mode and will be ready to start. If all automatic start sequence conditions are satisfied, it will start only after receiving the automatic start command.
   - If the ACTICARB® is in Auto start mode and it is running or on starting sequence, pushing the Start/Stop push button will activate the stopping sequence and deactivate the Auto start mode. Pushing the Start/Stop push button again will restart the ACTICARB® if the automatic start command is still true.

2. If an essential equipment is in manual and not running when the ACTICARB® Start/Stop push button is pressed to activate the Auto mode, Auto start mode cannot be activated.
   The essential ACTICARB equipment's to be in Auto are:
   - Coagulation mixer
   - Injection mixer
   - Maturation mixer
   - Scraper
   - Recirculation pumps

3. If a major fault occurs while the ACTICARB® is in start sequence or is running, the ACTICARB® is forced into a stop sequence and the ACTICARB® major fault is set.

4. The operator may set/reset the ACTICARB® in Auto start mode by pressing the Start/Stop push button from the HMI.
   The conditions to activate the Auto mode are the followings:
   - No major faults;
   - All equipment in Auto on HMI or running;
   - No Polymer system fault
   - No sludge recirculation pump fault

Pressing on the ACTICARB® Start/Stop push button on the operator interface for 3 seconds when the ACTICARB® is stopped and will enable forced start mode if all the conditions to activate the Auto mode are true the forced start mode will become active. The unit will then start all the drives and request to open the raw water valve, bypassing the auto start sequence commands.

2.11.2 Recirculation pumps logic

Pump Fault
The pump is in fault when:

- The command is present and the status is not for a short delay

When the duty pump is in fault, and the ACTICARB® unit is in operation the standby pump will start, the ACTICARB® will not stop, a WARNING alarm is activated and a message is displayed. If the second pump was in fault or in manual (not running), a FATAL alarm is activated, a message will be displayed and the ACTICARB® unit will stop.

Pump Priority
Each time the running pump is stopped, the other pump will start at the next ACTICARB® start sequence. If the other pump is in manual or in fault, the first pump will restart.

2.11.3 Maturation Mixer Speed

The maturation mixer motor is powered by a variable speed drive (VFD). The speed of the mixer will be set on the PLC during the process start-up of the system to get an optimal mixing. Thereafter, the speed usually does not need any further adjustment.

2.11.4 ACTICARB® High Level Switch

A float over the settling tank is used as a High Level switch. When the switch is activated, stop the corresponding ACTICARB® unit according to the automatic stop sequence.

2.11.5 Activated Carbon Extraction Control

Several parameters affect the performance of PAC in the treatment (mixing, injection point, concentration, residence time, temperature etc.).
The required concentration and the time of contact are a function of the characteristics and the concentration of the chlorine to be eliminated. An insufficient time of contact requires more PAC for a same removal rate.

The dechlorination tank will provide a minimum Hydraulic Residence Time of 20 minutes at the max flowrate for the fresh PAC Slurry. During this time the fresh powder will remove chlorine. Its removal rate will decrease in the process due to the addition of coagulant and polymers into the ACTICARB®. However some active remaining sites will be used by recirculating the sludge extracted from the ACTICARB® Clarifier. The effective Residence Time of the powder in the process is called the Solids Residence Time (SRT).

The concentration and the Solids Residence Time will be adjusted by the operators with the molecules removal rates measured by a laboratory.

2.11.6 Activated Carbon Concentration

The sample of Activated Carbon will be taken by the operator at the bottom of the splitter box. The measure of the concentration with a thermal weighing scale will be the exact value of the extracted activated carbon (C_{acext}) in g/m3.

With the following equation, the operator will know the activated carbon concentration in the ACTICARB® and the dechlorination tank (C_{acdt}).

$$\mathbf{C_{acdt} = (C_{acext}.\ Q_{recir}.f_{hydr}) / (Q_{indt})}$$

Where:

C_{acdt}= activated carbon concentration in the process (g/m^3)

C_{acext}= extracted activated carbon concentration (g/m^3)

Q_{recir} = Total flowrate of the ACTICARB recirculation pump (m^3/h)

f_{hydr} = Hydrocyclones hydraulic split ratio. Entered with a value < 1. Ex: 0,8 for 80%

Q_{indt} = Inlet Breakpoint chlorination flowrate incoming into the dechlorination tank.

Q_{indt} = Inlet Breakpoint chlorination flowrate (65FIT6801102) + Chemicals Flowrate (calcium hypochlorite) - Extracted Activated Carbon (65FIT6801432) + hydrocyclone overflow flowrate (m^3/h) The operator will enter the overflow flowrate of each hydrocyclone on the interface.

2.11.7 Solids Residence Time

The Solids Residence Time is calculated by the equation:

Solids Residence Time = Activated Carbon Mass in the dechlorination tank (g) / Extracted Activated Carbon Massic Flowrate (g/h)

Or:

$$\mathbf{SRT = m_{acdt} / Q_{macext}}$$

With:

$$\mathbf{m_{acdt} = V_{dt} \,.\, C_{acdt}}$$

$$\mathbf{Q_{macext} = Q_{vacext} \,.\, C_{acext}}$$

And where:

SRT = Solids Residence Time (h)

$\mathbf{m_{acdt}}$= Activated Carbon Mass in the dechlorination tank (g)

$\mathbf{V_{dtx}}$ = dechlorination tank Volume (m^3)

$\mathbf{C_{acdt}}$= activated carbon concentration in the process (g/m^3). See above.

$\mathbf{C_{acext}}$= extracted activated carbon concentration (g/m^3). See above.

$\mathbf{Q_{macext}}$ = Activated Carbon Massic Flowrate (g/h)

$\mathbf{Q_{vacext}}$ = Activated Carbon Volumic Flowrate (m^3/h). Process value of 65FIT6801432.

2.11.8 Activated Carbon Extraction Valve

The extraction valve has two available operation modes:

- **Normal mode:** the valve is controlled with a PID loop and its opening is used as a manipulated variable to reach the flow set point.
- **Pulse mode:** as very low flow rates can be difficult to achieve with the valve, a pulse mode shall be programmed. Parameters such as opening duration and opening frequency shall be entered by the operator on the HMI. The extracted volume is totalized over time by the flowmeter.

2.12 Activated Carbon Extraction/ Recirculation System Fault Response

The following are the major faults associated with the activated carbon recirculation and extraction system.

1. **Activated Carbon splitter box tank high high level**

   The ACTICARB® unit falls on major fault and is stopped according to the automatic stop sequence.

2. **Activated Carbon splitter box tank low low level**

   The ACTICARB® unit falls on major fault and is stopped according to the automatic stop sequence.

3. **Sludge tank high high level**

   The ACTICARB® unit falls on major fault and is stopped according to the automatic stop sequence.

4. **Activated Carbon Extraction pump fault**

   The ACTICARB® unit falls on major fault and is stopped according to the automatic stop sequence.

5. **Extraction modulating valve open failure**

   The ACTICARB® unit falls on major fault and is stopped according to the automatic stop sequence.

2.13 Calculated Parameters

The following sections explain the main calculations made in the control of the ACTICARB® system.

The PLC calculates the chemical feed rates and controls the chemical metering pumps using the following procedure. The chemical feed rate is based on:

1. The influent raw water flow rate
2. The chemical dose
3. The physical properties of the chemicals
4. The capacity and settings of the metering pump
5. The raw water turbidity

The influent raw water flow rate is obtained through the raw water flow meter, which sends a signal to the PLC.

The influent raw water turbidity rate is obtained through the raw water turbidity meter.

The chemical dose, physical properties and metering pump capacity are input by the user/operator at the HMI.

The basic equation for the chemical feed rate is:

$$\text{Chemical feed rate} = \frac{\text{influent flow rate} \times \text{chemical dose}}{\text{stock chemical concentration}}$$

This equation is the general form for all chemical feed rates that use flow pacing control, including coagulant and polymer.

2.13.1 Flow Pace Control

The way the PLC uses these calculations to determine the chemical metering pump output is:

1. The chemical feed rate equations are programmed into the PLC.
2. The user/operator inputs the chemical dose, physical properties, and maximum chemical metering pump capacity at the HMI on the ACTICARB® control panel. The PLC calculates the specific chemical feed rate based on the user/operator inputs and the influent (raw water) flow to the train.
3. The calculated feed rate is then converted by the PLC into a percent speed, based on the maximum capacity of the metering pumps. This signal is then sent to the metering pump.

2.14 Interlocks

2.14.1 ACTICARB® High Level Switch

A float over the settling tank is used as a High Level switch. When the switch is activated, stop the corresponding ACTICARB® unit according to the automatic stop sequence

2.14.2 High Scraper Torque

The torque detector/alarm is independent from the PLC. So it is enabled (will stop the scraper) through a hardwired interlock to the scraper starter in the corresponding ACTICARB® control panel.

A high torque alarm is activated when the torque is higher than the adjustable set point for more than the adjustable delay.

When the alarm is activated, the scraper is stopped and then the ACTICARB® is stopped according to the automatic stop sequence.

2.14.3 Activated Carbon Extraction Pump

The activated carbon extraction pump cannot be started if the low level switch has been activated. If the pump is in operation and the low level switch is activated the pump is stopped by interlock.

2.14.4 Maturation Mixer

The maturation mixer cannot run if the scraper is not running.

1 INTRODUCTION

1.1 REFERENCE DOCUMENTS

Document Number	Name	Revision
5000220043_PI_0001_GEN_VWT	PI001 _Process and Instrumentation diagram	1

1.2 PROCESS OVERVIEW

ACTIFLO® units are based on the ballasted flocculation process. The key feature of this process is that very fine sand (85 µm or 130 µm size), termed “microsand” is added to the raw water following coagulant addition. A polymer is also added that binds the microsand to the floc, creating a ballasted floc with greatly increased effective density. The ballasted flocculation process is capable of being shut down when treatment capacity is not needed and then rapidly restarted when needed.

Ballasted flocculation works with most types of waters but is most advantageous with raw waters that either experience high turbidity raw water conditions (up to 2 500 NTU) and/or rapidly changing raw water turbidity conditions. It is also suitable for low turbidity, highly colored raw waters.

It consists of a coagulation basin, an injection basin, a maturation basin, and a lamella tube clarifier. Coagulant is added at the inlet and subsequent formation of microfloc takes place in the coagulant basin prior to addition of microsand and polymer in the injection basin. The water then flows into the maturation tank where bridging between the microsand and the destabilized suspended solids occurs.

The ballasted flocs settle in the clarifier portion of the system where they are collected by a rake mechanism. Typically 3% to 6% of the unit’s design raw water flow is continuously withdrawn from the clarifier and pumped to a hydrocyclone system which separates the microsand from the sludge. The recovered microsand (typically 20% of the recycled flow) is reused in the process. A small quantity of the microsand is not recovered by the hydrocyclones and is discharged with the sludge. Thus the lost microsand needs to be made up by periodically adding it to the process (typically 1 to 3 mg/L). After sand separation, sludge are partially wasted and recycled with the sludge withdrawn from the clarifier. Approximately 1% to 2,4% of flow becomes waste or residuals stream.

A tank downstream of the ACTIFLO® unit accepts the sludge removed in the ACTIFLO® clarification process. This tank splits the rejected mix of activated carbon and flocs into two streams. A fraction is pumped and rejected into the sludge tank unit in order to be extracted from the process. The remaining fraction is recirculated by gravity into the contact reactor in order to increase the activated carbon contact time in the process. The flowrate of the pumped fraction is controlled by a flowrate control loop. The flowrate is measured by a flowmeter and controlled by a modulating valve (pinch valve).

1.3 List of Abbreviations

The following abbreviations are used in the text of this document.

- HMI: Human/Machine Interface
- H-O-A: Hand-Off-Auto
- PLC: Programmable Logic Controller
- LCP: Local Control Panel
- VFD: Variable Frequency Drive
- VWT: Veolia Water Technologies Canada

1.4 List of Units

The following lists the parameters referred to in this document and the units they are measured in unless otherwise specified.

- Concentration (in general): mg/L
- Dosing rate: mL/L
- Flow rate (main process): m^3/h
- Flow rate (chemical dosing): LPH
- Level in the tanks: %
- pH: -
- Pressure: PSIg
- Temperature: °C
- Turbidity: mg/L or NTU

2 ACTIFLO® CONTROL DESCRIPTION

2.1 EQUIPMENT AND INSTRUMENT

This section connects the tags from the P&ID and the terminology used throughout Equipment and Instrument Schedules.

Project Tag No	Description
65AGI68021	Coagulation mixer
65AGI68022	Injection mixer
65AGI68023	Maturation mixer
65TRM68003	Scraper
65LSHH6801324	High High level switch
65AIT6801322	Turbidity meter
65AIT6801321	pH meter
SSL20-03	High Torque detector
65PSR68006A	Recirculation pump #1
65PSR68006B	Recirculation pump #2
65FIT6801437	Sludge extraction flowmeter
65LSHH6801411	Splitter box High high level switch
65LSLL6801411	Splitter box Low low level switch
65AIT6801427	TSS meter sludge
65PSR68007C	Sludge extraction pump
65FCV6801438	Sludge extraction control valve

2.2 OPERATING MODES OVERVIEW

There are two primary modes for each ACTIFLO®: Manual and Semi-Automatic. The Manual mode is designed for operation of individual equipment. The Semi-Auto mode is designed for operation of the ACTIFLO® system as a whole.

HMI manual mode

Manual operation from the HMI provides the same equipment protection and alarming as Semi-Auto.

Semi-Auto

Semi-Auto mode allows the operator to initiate the ACTIFLO® system start-up and shutdown sequences from HMI or remotely.

NOTE: Train equipment cannot be controlled manually while in Semi-Auto operation.

The coagulation mixer or injection mixer, maturation mixer, scraper, and at least one sand pump H-O-As must be in Auto to enable Semi-Automatic control of all respective equipment at the HMI. All startup sequences are described below. Each ACTIFLO® train and its associated equipment are controlled as an independent system by the PLC.

The table below presents the control modes summary.

Table 1: Summary of Control Modes

	HMI Manual	Semi-Auto
Control Functions	N/A	Allowed (PLC)
Initiation of Semi-Automatic functions	N/A	Operator or Remote Start-up Initiation Required
HMI Operation of Individual Equipment	Allowed (virtual HOA on HMI)	Not Allowed

2.3 PERMISSIVE

Permissive to allow initiation of the Semi-Automatic start sequence are:

- H-O-A selector switches for mixers, scraper and at least one recirculation pump, are in Auto at the HMI.
- Mixers whichever is in Auto at HMI, scraper, and the above mentioned recirculation pump do not have existing equipment alarms.
- Aforementioned equipment alarms must be manually reset.

2.4 SEMI-AUTO TRAIN RESPONSE TO EQUIPMENT CONDITIONS

2.4.1 Equipment Removed From Auto PLC Response

If the mixers and the scraper are removed from Auto while the PLC is running in Semi-Automatic control of the ACTIFLO® system, the PLC will initiate a Shutdown Sequence as described in section 2.6.2.

Since the scraper will not be operational, the Shutdown Sequence will consist of the recirculation pump running for the durations indicated in section 2.6.2.

If the lead recirculation pump is removed from Auto, the PLC will sequentially initiate operation of the next available pump. If all sand pumps are removed from Auto or no additional pumps are available, the PLC will initiate an emergency shutdown of all equipment.

NOTE: No alarm will be generated if an ACTIFLO® system shutdown is initiated due to a piece of equipment being removed from Auto by the operator.

2.4.2 Equipment Failure PLC Response

If the coagulation mixer fails during Semi-Automatic control of the ACTIFLO® system, the system will continue to run.

Should the injection mixer or the maturation mixer fail at any time during Semi-Automatic control of the ACTIFLO® system, the PLC will issue an equipment alarm and will initiate a Shutdown Sequence as described in section 2.6.2.

Should the scraper fail at any time during operation or start-up, the PLC will issue an equipment alarm and will initiate a Shutdown Sequence as described in section 2.6.2. Since the scraper will not be operational, the Shutdown Sequence will consist of the sand recirculation pumps running for the durations indicated in section 2.6.2.

Should lead recirculation pump fail, the PLC will issue an equipment alarm and sequentially initiate operation of the next available pump. If all sand pumps fail or no additional pumps are available, the PLC will initiate an emergency shutdown of all equipment.

NOTE: An AVAILABLE sand pump is defined as one that is placed in Auto at the LCP and does not have any existing un-reset alarm conditions.

2.5 RECIRCULATION PUMPS LOGIC

2.5.1 Duty/Stand by Orientation

When two recirculation lines are provided they can be set with priority. The two recirculation pumps operate in a Duty / Stand by orientation. If all recirculation pumps are in “auto” but not running, the pump set as priority (duty) will start when the start condition will be met.

The recirculation pumps priority (duty or stand by) is changed manually by the operator anytime or is changed automatically when the plant stops.

2.6 SEQUENCES OF FUNCTIONS

2.6.1 Start-up Sequence

If all permissive conditions are present and no respective equipment alarms exist, the HMI will display **"Train Ready"**. The Start-up Sequence can now be initiated via the HMI or remotely. Refer to table 2 for more information.

NOTE: To prevent damage to the equipment, the Train must have water in the tanks above the mixer impeller elevations prior to Start-up (to be checked by the operator).

To start the train when "Train Ready" is displayed on the HMI, the operator presses the "Train Start" pushbutton. A starting system displays "Train Starting" at the HMI. The start-up sequence automatically cycles through the steps listed below.

1. System Start-up Initiated:
    a. **Start duty recirculation pump**
    b. **Start sludge extraction pump**

If a failure occurs, the duty pump will be locked out in the PLC and the next available pump will be assigned as the lead pump. The PLC will then attempt to continue operation. This cycle will occur until a recirculation pump starts or all recirculation pumps have been locked out. If all sand pumps are locked out, the PLC will immediately abort the start-up.

2. Delay 30 seconds (adjustable):
    a. **Start the Scraper**

If a Scraper failure occurs initiate a Shutdown Sequence.

3. Delay 10 seconds (adjustable):
    a. **Start the mixers**. These mixers start are respectively staggered by 5 seconds.

If a maturation Mixer failure occurs initiate a Shutdown Sequence.

4. Delay 10 seconds (adjustable):
    a. **Start the Chemical Feed Pumps**
    b. **Open Raw water Valve. Open Water Polymer Carrier Solenoid valve**
    c. **Start sludge flow control loop**
    d. HMI will display **"Train Started"**

If any Duty Chemical Feed Pump is not available while in operation, the Stand-by pump shall be initiated. The duty pump will not be locked out so when the pump is placed back into Semi-Auto, it will resume operation. Duty chemical feed pump alternation is manual and available only at the HMI.

The Operator can terminate the start-up at any point in the sequence by pressing the "Train Stop" pushbutton. If any pertinent equipment fails during the start-up sequence, the PLC will

initiate a train shutdown. The operator can correct the failure, and then resume the start-up sequence from the current shutdown sequence step by pressing the “Train Start” pushbutton.

2.6.2 Shutdown Sequence

When in Semi-Automatic mode, the operator may implement the Shutdown Sequence at any time from the HMI or remotely. During shutdown, the HMI will display “Train Stopping”. Refer to table 3 for more information.

The shutdown sequence automatically cycles through the steps listed below.

1. System Shutdown Initiated:
    a. **Close the secondary valve**
    b. **Shutdown the Chemical Feed Pumps**
    c. **Shutdown the mixers**
    d. **Stop Water Polymer Carrier Solenoid valve.**
2. Delay an (Operator Adjustable) (10-30 minutes):
    a. **Shutdown the Scraper**
3. Delay 5 minutes:
    a. **Shutdown the duty recirculation pump**

NOTE: This delay allows purging of sand and sludge contained in the settling tank and piping and re-deposits it back into the Maturation tank.

The operator can initiate the Train start-up sequence from the current shutdown sequence step by pressing the “Train Start” pushbutton without stopping the equipment already started.

2.7 ALARM/FAILURE CONDITIONS AND PLC RESPONSES

2.7.1 Alarm Priorities

Alarms are grouped in to 3 priority levels for various attention requirements:

Emergency alarms:

1. Needs immediate operator attention.
2. The ACTIFLO® unit will initiate the emergency shutdown sequence.

Fatal alarms:

1. Needs immediate operator attention.
2. The ACTIFLO® unit will initiate the stop sequence.

Warning alarms:

1. Does not need immediate operator attention.

If the ACTIFLO® unit was stopped by an Emergency alarm or fatal alarm, it will not restart automatically. The operator must remove alarm condition and reset the alarm. Then press the start button on the operator interface will restart the unit if all automatic start sequence conditions are satisfied. In case of remote control, the system will wait for rising edge of the remote start signal.

2.7.2 Alarm and Set Point Table

Refer to Appendix A.

2.8 SAFETY

2.8.1 Emergency Stop

Emergency stop actions

When an emergency stop button is activated, an alarm is triggered. The fault associated with this alarm will latch.

During emergency stop, many stopping actions are initiated on equipment. These actions are presented in sections describing the relevant equipment.

Recovery after emergency stop

When all emergency stop buttons are back into normal position, the fault associated with an alarm is maintained until the operator presses the reset button.

2.8.2 Control Power Failure PLC Response

Should control power fail at any time during Semi-Automatic control of the ACTIFLO® system, the PLC will issue an alarm and will initiate a Shutdown Sequence as described in this document. Systems with an Uninterruptable Power Supply (UPS) will see the alarm as the condition occurs. Systems without an UPS will see the alarm upon restoration of power. There is a ten (10) second delay upon restoring power, and then the train will enter the Shutdown Sequence as described in this document. If the restored power does not include the actual motor controls, a run status will not be received by the PLC and equipment (pumps and scraper) will shut down immediately without a re-inventory of the sand to the maturation tank. If the unit is configured to resume via the HMI, it will automatically resume to the last known state. Otherwise the unit will remain in Stop.

2.9 System Availability Conditions

2.9.1 Conditions for automatic Start sequence

The automatic start sequence will be activated when the automatic start command is true and the following conditions are met:

1. If delay for power return is elapsed;
2. If remote run request bit is activated;
3. ACTIFLO® in Auto start mode.

2.9.2 Conditions for automatic stop sequence

The automatic stop sequence will be activated when any of the following conditions are met:

1. The ACTIFLO® Auto start mode is deactivated on the interface or one of the following occurs:
   a. If a major fault is active;
   b. If remote contact is not activated;
2. The ACTIFLO® automatic start command is false.

2.10 ACTIFLO® Fault Responses

Table 4: ACTIFLO® major faults

MAJOR FAULT	ALARM TYPE
Coagulation mixer	FATAL
Injection mixer	FATAL
Maturation mixer	EMERGENCY
Scraper High High torque	EMERGENCY
Recirculation pumps	EMERGENCY
High High clarified water turbidity	FATAL
High high water level	EMERGENCY
Sludge extraction system	FATAL
Coagulant dosing system	FATAL
Polymer dosing system	FATAL
Power failure	EMERGENCY

If the ACTIFLO® was stopped by a major fault, it will not restart automatically. The operator must fix the problem on the operator interface. The ACTIFLO® will restart if all automatic start sequence conditions are satisfied.

2.11 CONTROLS

2.11.1 General

1. ACTIFLO® Start/Stop push button function:
   - By pushing the Start/Stop push button, the ACTIFLO® will be set in Auto start mode and will be ready to start. If all automatic start sequence conditions are satisfied, it will start only after receiving the automatic start command.
   - If the ACTIFLO® is in Auto start mode and it is running or on starting sequence, pushing the Start/Stop push button will activate the stopping sequence and deactivate the Auto start mode. Pushing the Start/Stop push button again will restart the ACTIFLO® if the automatic start command is still true.

2. If an essential equipment is in manual and not running when the ACTIFLO® Start/Stop push button is pressed to activate the Auto mode, Auto start mode cannot be activated.
   The essential ACTIFLO® equipment's to be in Auto are:
   - Coagulation mixer
   - Injection mixer
   - Maturation mixer
   - Scraper
   - Recirculation pumps

3. If a major fault occurs while the ACTIFLO® is in start sequence or is running, the ACTIFLO® is forced into a stop sequence and the ACTIFLO® major fault is set.

4. The operator may set/reset the ACTIFLO® in Auto start mode by pressing the Start/Stop push button from the HMI.
   The conditions to activate the Auto mode are the followings:
   - No major faults;
   - All equipment in Auto on HMI or running;
   - No Polymer system fault
   - No sludge recirculation pump fault

Pressing on the ACTIFLO® Start/Stop push button on the operator interface for 3 seconds when the ACTIFLO® is stopped and will enable forced start mode if all the conditions to activate the Auto mode are true the forced start mode will become active. The unit will then start all the drives and request to open the raw water valve, bypassing the auto start sequence commands.

2.11.2 Recirculation pumps logic

2.11.2.1 Pump Fault

The pump is in fault when:

- The command is present and the status is not for a short delay

When the duty pump is in fault, and the ACTIFLO® unit is in operation the standby pump will start, the ACTIFLO® will not stop, a WARNING alarm is activated and a message is displayed. If the second pump was in fault or in manual (not running), a FATAL alarm is activated, a message will be displayed and the ACTIFLO® unit will stop.

2.11.2.2 Pump Priority

Each time the running pump is stopped, the other pump will start at the next ACTIFLO® start sequence. If the other pump is in manual or in fault, the first pump will restart.

2.11.3 Maturation Mixer Speed

The maturation mixer motor is powered by a variable speed drive (VFD). The speed of the mixer will be set on the PLC during the process start-up of the system to get an optimal mixing. Thereafter, the speed usually does not need any further adjustment.

2.11.4 ACTIFLO® High Level Switch

A float over the settling tank is used as a High Level switch. When the switch is activated, stop the corresponding ACTIFLO® unit according to the automatic stop sequence.

2.11.5 Sludge Extraction Control

The TSS control loop will act on the opening of the splitter box outlet flow control valve to adjust the sludge flow rate being recirculated back to the coagulation chamber.

A TSS set point will be entered by the operator. If the TSS measured by 65AIT6801427 is below the set point, the control loop will close 65FCV6801437. This will increase the sludge recirculation to the coagulation chamber and increase the turbidity.

On the contrary, if the measured TSS is above the set point, the control loop will open 65FCV6801437. This will decrease the sludge recirculation to the coagulation chamber and increase the sludge flow rate going to the sludge storage tank.

If the TSS analyzer is in fault, an alarm is generated and the sludge valve 65FCV6801437 opens to prevent sludge build-up in the ACTIFLO® process.

If the fault is not reset after an adjustable delay, the ACTIFLO® is stopped according to automatic shutdown sequence.

2.11.6 Sludge Extraction Valve

The extraction valve has two available operation modes:

- **Normal mode:** the valve is controlled with a PID loop and its opening is used as a manipulated variable to reach the flow set point.
- **Pulse mode:** as very low flow rates can be difficult to achieve with the valve, a pulse mode shall be programmed. Parameters such as opening duration and opening frequency shall be entered by the operator on the HMI. The extracted volume is totalized over time by the flowmeter.

2.12 SLUDGE EXTRACTION/RECIRCULATION SYSTEM FAULT RESPONSE

The following are the major faults associated with the Sludge recirculation and extraction system.

1. **Sludge splitter box tank high high level**

   The ACTIFLO® unit falls on major fault and is stopped according to the automatic stop sequence.

2. **Sludge splitter box tank low low level**

   The ACTIFLO® unit falls on major fault and is stopped according to the automatic stop sequence.

3. **Sludge tank high high level**

   The ACTIFLO® unit falls on major fault and is stopped according to the automatic stop sequence.

4. **Sludge Extraction pump fault**

   The ACTIFLO® unit falls on major fault and is stopped according to the automatic stop sequence.

5. **Extraction modulating valve open failure**

   The corresponding ACTIFLO® unit falls on major fault and is stopped according to the automatic stop sequence.

2.13 CALCULATED PARAMETERS

The following sections explain the main calculations made in the control of the ACTIFLO® system.

The PLC calculates the chemical feed rates and controls the chemical metering pumps using the following procedure. The chemical feed rate is based on:

1. The influent raw water flow rate
2. The chemical dose
3. The physical properties of the chemicals
4. The capacity and settings of the metering pump
5. The raw water turbidity

The influent raw water flow rate is obtained through the raw water flow meter, which sends a signal to the PLC.

The influent raw water turbidity rate is obtained through the raw water turbidity meter.

The chemical dose, physical properties and metering pump capacity are input by the user/operator at the HMI.

The basic equation for the chemical feed rate is:

$$\text{Chemical feed rate} = \frac{\text{influent flow rate} \times \text{chemical dose}}{\text{stock chemical concentration}}$$

This equation is the general form for all chemical feed rates that use flow pacing control, including coagulant and polymer.

2.13.1 Flow Pace Control

The way the PLC uses these calculations to determine the chemical metering pump output is:

1. The chemical feed rate equations are programmed into the PLC.
2. The user/operator inputs the chemical dose, physical properties, and maximum chemical metering pump capacity at the HMI on the ACTIFLO® control panel. The PLC calculates the specific chemical feed rate based on the user/operator inputs and the influent (raw water) flow to the train.

3. The calculated feed rate is then converted by the PLC into a percent speed, based on the maximum capacity of the metering pumps. This signal is then sent to the metering pump.

2.14 INTERLOCKS

2.14.1 Actiflo® High Level Switch

A float over the settling tank is used as a High Level switch. When the switch is activated, stop the corresponding Actiflo® unit according to the automatic stop sequence.

2.14.2 High Scraper Torque

The torque detector/alarm is independent from the PLC. So it is enabled (will stop the scraper) through a hardwired interlock to the scraper starter in the corresponding Actiflo® control panel.

A high torque alarm is activated when the torque is higher than the adjustable set point for more than the adjustable delay.

When the alarm is activated, the scraper is stopped and then the Actiflo® is stopped according to the automatic stop sequence.

2.14.3 Sludge Extraction Pump

The sludge extraction pump cannot be started if the low level switch has been activated. If the pump is in operation and the low level switch is activated the pump is stopped by interlock.

2.14.4 Maturation Mixer

The maturation mixer cannot run if the scraper is not running.

1.2 PROCESS OVERVIEW

The Discfilter is a mechanical and self-cleaning filter unit that offers a large filter area on a small footprint. This design is superior to any filtration in fine solids removal and product recovery within micro screens.

The water flows by gravity into the center of the drum and into the filter segments. The disc filter unit remains stationary under normal filtration. Solids are separated from the water by the micro screen cloth mounted on two sides of the disc segments. The buildup of captured solids increases the head loss across the Discfilter and as a result the inlet water level rises. At a predetermined level a backwash cycle is initiated which results in Discfilter rotation presenting clean filter elements in to the flow path and at the same time cleaning the filter elements with high-pressure water jets. The backwash water is collected in a trough within the center of the Discfilter and flows away by gravity. When the inlet water level falls under the set point, the backwash sequence continues for approximately 20 seconds (controlled by a timer and adjusted during commissioning to reflect local conditions).

Once the timed over-run is elapsed, the disc filter drive and backwash pump stop. The disc filter unit returns to a stationary state until the next backwash cycle is initiated. Filtration is continuous even during the backwash cycle and the effluent water quality is also the same throughout the backwash cycle. The operational head loss across the unit varies from zero to approximately 250mm.

1.3 LIST OF ABBREVIATIONS

The following abbreviations are used in the text of this document.

- HMI: Human/Machine Interface
- H-O-A: Hand-Off-Auto
- PLC: Programmable Logic Controller
- LCP: Local Control Panel
- VFD: Variable Frequency Drive
- VWT: Veolia Water Technologies Canada

1.4 LIST OF UNITS

The following lists the parameters referred to in this document and the units they are measured in unless otherwise specified.

- Concentration (in general): mg/L
- Dosing rate: mL/L
- Flow rate (main process): m^3/h
- Flow rate (chemical dosing): LPH
- Level in the tanks: %
- pH: -
- Pressure: PSIg
- Temperature: °C
- Turbidity: mg/L or NTU

2 HYDROTECH® CONTROL DESCRIPTION

2.1 EQUIPMENT AND INSTRUMENT

This section connects the tags from the P&ID and the terminology used throughout Equipment and Instrument Schedules.

Project Tag No	Standard Tag-No.	Description
65PSL8165	PS4-031	Pressure switch backwash pump
65LIT6801502A	LT3-031	Level transmitter inlet channel
65LIT6801502B	LT3-032	Level transmitter effluent channel
65FIL68001	M4-001	Drum motor Disc
65PSR68008A / 65PSR68008B	P4-001	Backwash pump #1/#2

2.1.1 Backwash Pump

Number of Pieces: 2 per unit
Operation: On/Off
Indication: Run status in local and SCADA
Control: The pump runs intermittently or continuous and is initiated during the backwash operation.

2.1.2 Drum Drive

Number of Pieces: 1 per unit
Operation: On/Off
Indication: Run status in local and SCADA
Control: The drum motor/drive runs intermittently or continuous and is initiated during the backwash operation.

2.1.3 VFD (by others)

Number of Pieces: 1 per unit
Operation: Open/Close
Indication: Run status in local and SCADA
Control: The VFD controls the drum motor/drive. It ramps up the drive motor to operating speed and runs a long as required by the backwash operation.

2.1.4 Level Sensor/Level transmitter (Inlet box)

Number of Pieces: 1 located in discfilter inlet box
Indication: Local and SCADA
Control: Main unit used in process control to calculate the backwash elevation setting and high water alarm setting. This calculated parameter is used for control actions and alarms.

2.1.5 Low Level Sensor Probe/Low Level transmitter (Effluent side)

Number of Pieces: 1 per Unit
Indication: Local and SCADA
Control: Used in process control to calculate the backwash elevation and to prevent the backwash pump from dry operation during the backwash initiation. This parameter is used for control actions and alarms.

2.1.6 Cover Actuator

Number of Pieces: 2 per Unit
Operation: Open/Close
Indication: Local and SCADA
Control: Used to open and close cover panels of the discfilter to access nozzles and media panels.

2.1.7 Spray Bar Actuator

Number of Pieces: 1 per Unit
Operation: Open/Close
Indication: Local and SCADA
Control: Used to raise spray bar of backwash nozzles.

2.2 OPERATING MODES OVERVIEW

There are two primary modes for each Hydrotech®: Manual and Automatic. The Manual mode is designed for operation of individual equipment. The Auto mode is designed for operation of the Hydrotech® system as a whole.

Manual mode

In manual Mode, the operator can operate individual equipment.

Equipment can be started manually at the LCP using the Hand position of the H-O-A.
In the manual operating mode, the drum rotation and backwash are started manually.
The backwash nozzles spray backwash water on the outside of the filter panels.
When the backwash pump and drum drive are placed in HAND, the Discfilter operates in a continuous backwash.
The solid particles that accumulate are washed from the filter panels to the sludge channel, at the same time as the drum rotates.
The removed particles and backwash water flow with gravity out of the filter.
The H-O-A switch is placed in the OFF position to prevent the respective piece of equipment from operating.

Automatic mode

Auto mode allows the operator to initiate the Hydrotech® system sequence from HMI or remotely.

NOTE: Train equipment cannot be controlled manually while in Semi-Auto operation.

The drum motor, and backwash pump H-O-As must be in Auto to enable Automatic control of all respective equipment at the HMI and at the LCP. The automatic sequence is described below. Each Hydrotech® train and its associated equipment are controlled as an independent system by the PLC.

The table below presents the control modes summary.

Table 1: Summary of Control Modes

	Manual		Auto
	Local (HOA Selector)	**HMI Manual**	
Control Functions	N/A	N/A	Allowed (PLC), Backwash sequence
Initiation of Automatic functions	N/A	N/A	Operator or Remote Start-up Initiation Required
HMI Operation of Individual Equipment	N/A	Allowed (virtual HOA on HMI)	Not Allowed
Local Operation of Individual Equipment	Allowed By HOA on LCP	N/A	Not Allowed

2.3 PERMISSIVE

Permissive to allow initiation of the Automatic start sequence are:

- H-O-A selector switches for drum motor and backwash pump, are in Auto at the HMI and at the LCP.
- Motor (whichever is in Auto at HMI and LCP) and the backwash pump do not have existing equipment alarms.
- Aforementioned equipment alarms must be manually reset.
- No interlocking conditions are present to prevent the backwash pump from starting.
- Remote request run bit is activated.
- E-stop not activated.

2.4 AUTO TRAIN RESPONSE TO EQUIPMENT CONDITIONS

In the automatic operating mode, the solid particles that accumulate on the inside of the filter media gradually reduce the water flow through the filter panel.
The water level on the inside of the drum begins to rise ultimately triggering the backwash sequence.

2.4.1 Equipment Removed From Auto PLC Response

If the drum motor and the pump are removed from Auto at the LCP while the PLC is running in Automatic control of the Hydrotech® system, the system will be paused.

Since the Discfilter will not be operational, the water level will rise and trigger the high level alarm. An alarm will be sent to operator and influent water will overflow into the backwash waste tank.

NOTE: No alarm will be generated if an Hydrotech® system shutdown is initiated due to a piece of equipment being removed from Auto by the operator.

2.4.2 Equipment Failure PLC Response

Should the drum motor fail at any time during Automatic control of the Hydrotech® system, the PLC will issue an equipment alarm and the system will be paused.

Should the backwash pump fail at any time during backwash sequence, the PLC will issue an equipment alarm and the system will be paused.

2.5 SEQUENCES OF FUNCTIONS

2.5.1 Discfilter functions

Discfilter operation consists of four (4) functions:

- Filtration
- Level Initiated Backwash
- Time Initiated Backwash
- Manual (“Hand”) Backwash

FILTRATION
The Discfilter system is filtering any time water is passing through the media. Even in static (non-backwash) conditions, the filter units are filtering the water, provided they are not hydraulically isolated from the influent flow (i.e an inlet valve or gate is closed).

LEVEL INITIATED BACKWASH

Water level difference is calculated using inlet box and effluent side level transmitters. This differential elevation is then used to trigger a backwash cycle when it reaches a predefined setpoint. When that happens, the PLC controller starts the backwash cycle of the filter. The backwash pump and drum motor are started. Once the backwash begins and the inlet box water level drops and the differential elevation decreases below the setpoint, the backwash process will stop after a predefined timer. With the standard settings, ¾ of a rotation (based on time) is done to ensure all clogged media panels have been taken through backwash nozzles spray. This will reset the timed backwash timer.

TIMED BACKWASH

If the Discfilter system is static without any backwash due to low flow or no flow, the backwash cycle will be initiated with a predefined timer. This operation will prevent solids from drying onto the media. The timed backwash is also useful for outdoor installations in cold weather conditions to prevent icing in the backwash piping by initiating a frequent backwash during low flow periods.

MANUAL ("HAND") BACKWASH

A manual backwash can be triggered with a button at any given time. This will reset the timed backwash timer.

2.5.2 Operating Sequence

If all permissive conditions are present and no respective equipment alarms exist, the HMI will display **"Filtration"**.

2.5.3 Chemical Cleaning

If the backwash frequency is increasing or if the inlet box level does not decrease during backwash cycle, there is a possibility of long term clogging, which may be caused by, among others, iron and calcium precipitates or organic fouling.
It might then be necessary to chemically clean the filter media. The small frequency of chemical cleanings is estimated to 1 to 3 times per year according to needs.

The chemical cleanings are planned to be conducted as the Discfilter is in operation and filtering. It will start a sequence during which the chemical solution is dosed onto the part of the filter above the water level, while the submerged part continues to filter. A time is allowed for chemical reaction and then the chemically cleaned filters are rinsed as the discs rotate and cleaned filters become submerged. Please refer to operation manual for chemical selection.

The automatic chemical cleaning procedure is fully automated once the HCT has been filled with the cleaning chemical to be used, connected to the filter and control cabinet and the operation of the filter is changed to cleaning mode. For the automatic chemical cleaning to start, the operator has to press the buttons manually. Consequently, the chemical cleaning requires someone to be on site to make sure that it is safe to start the chemical cleaning. The cleaning procedure takes approximately 20 minutes. The procedure is as follows.

- Fill the container with the chemical to be used.
- Connect the HCT to the filter and the PLC
- Change to the cleaning mode in the HMI.
- When the panels are clean, disconnect the HCT from the filter unit and the PLC.
- Change to the standard operation mode in the HMI.

Chemical Cleaning Sequence

The chemical cleaning is controlled by the Discfilter control panel and will be started manually from the HMI.

- The chemical pump starts.
- After a set time, the drum start delay, when the pressure in the chemical spray bar has built up and the spray pattern is right, the filter drum starts to rotate at the set drum dispersing speed.
- The drum rotates for a set time, the drum dispersing time, during which 2-3 segments are sprayed with the cleaning chemicals.
- When the drum dispersing time has elapsed, a stop signal is sent to the drum motor, which ramps down the rotation of the drum. Due to the time it will take to slow down and stop the filter drum, a chemical pump stop delay is used, in order to make sure the chemicals are evenly applied to all of the filter segments.
- After the chemical pump and the drum has stopped, the segments sprayed with cleaning chemicals will soak during a soaking time of, usually, 300-600 s.
- After the soaking time, the whole cleaning sequence (steps 1-5 above) is repeated on the other segments, until all of the filter segments have been cleaned. The number of repetitions will depend on the filter model. As an example, a disc filter from the HSF2600-series has 14 segments and requires a minimum of 5 index steps to clean the whole filter discs. It is recommended, however, to clean the filter in 6-8 index steps to ensure that the filter segments are completely covered by cleaning chemicals. For other filter models and placements of the chemical spray bar, other settings might be needed.
- When all of the filter segments have been sprayed and left soaking with cleaning chemicals, the chemical cleaning sequence is finished by backwashing of the filter for a rinsing time of approximately 5 minutes, to remove the cleaning chemicals from the filter media.

It is strongly recommended during commissioning of the filters that all of the above settings are evaluated, and if necessary adjusted, by using tap water. This should be done by having manometers installed on the chemical spray bar and the filter lid kept open, to be able to inspect the performance.
The key is to verify the spray pattern from the chemical nozzles (spray pressure >3 bar) before the filter starts to rotate, that the filter stops before the treated segments enter the water, that the treated segments are left soaking long enough and that the cleaning of the filter segments overlap to avoid untreated sections.

2.6 ALARM/FAILURE CONDITIONS AND PLC RESPONSES

2.6.1 Major faults

The following are the major faults associated with the Discfilter:

- Discfilter High High level (bypass alarm)
  The Hydrotech® discfilter is in major fault.
- Backwash pump in fault
  The Hydrotech® discfilter is in major fault
- Discfilter motor in fault
  The Hydrotech® discfilter is in major fault

2.6.2 Alarm Table

Refer to Project Alarm and setpoint Table for specific values. Table 2 below presents the typical alarm list.

Table 2: List of alarms

Description	Alarm Type	Alarm Delay	System Action	Equipment Action / Alarm Action
Control Panel Power Failure	Discrete	NA	Alarm,	Shutdown
Backwash Pump Overload Condition	Discrete	NA	Alarm,	Shutdown
Backwash pump Fail to Start (No Run Status)	Discrete	NA	Alarm,	Shutdown
Drum Drive Fail Condition	Discrete	NA	Alarm,	Shutdown
Drum Drive Fail To Start	Discrete	NA	Alarm,	Shutdown
Backwash Pump Low Level (Dry Run Protection)	Discrete	NA	Alarm,	Interlock of Backwash pumps / Operator Reset
Inlet Box High Level (Bypass Level)	Discrete	NA	Alarm,	NA

2.7 SAFETY

2.7.1 Emergency Stop

Emergency stop actions

When an emergency stop button is activated, an alarm is triggered. The fault associated with this alarm will latch.
During emergency stop, many stopping actions are initiated on equipment. These actions are presented in sections describing the relevant equipment.

Recovery after emergency stop

When all emergency stop buttons are back into normal position, the fault associated with an alarm is maintained until the operator presses the reset button.

2.7.2 Control Power Failure PLC Response

Should control power fail at any time during Automatic control of the Hydrotech® system, the PLC will issue an alarm. Systems with an Uninterruptable Power Supply (UPS) will see the alarm as the condition occurs. Systems without an UPS will see the alarm upon restoration of power. There is a ten (10) second delay upon restoring power, and then the train will resume to the last known state

2.8 CALCULATED PARAMETERS

The following sections explain the main calculations made in the control of the Discfilter® system.

Backwash frequency

This parameter is calculated using this equation

$$BF = t_B * 100 / (t_S + t_B)$$

With:

BF: Backwash frequency [%]

t_B: Time of the last backwash sequence [s]

t_S: Time in Filtration mode before last backwash [s]

This parameter should be available on history trend to assess chemical cleaning requirement.

2.8.1 Setpoints Table

The Table 3 presents the list of the main process setpoints.

Table 3: List of operator setpoint

Name	Controller Actions	Increment Setting	Typical Settings
Drum Start Delay (t_1)	The drum delay setpoint delays drum rotation until the backwash pump is operating at full pressure.	1 to 10 seconds	1-2 seconds
Backwash Stop Delay (t_2)	The backwash Stop Delay time is initiated after the water falls away from the backwash level threshold to ensure the drum rotates at least ¾ of a rotation for complete media panel cleaning.	10 to 400 seconds	Approximately 20 seconds
Timed Backwash Interval (t_3)	Initiates a backwash after preset period of static time with no backwash events. This mode prevents solids from drying onto the media from a prolonged period of static operation.	5 to 240 minutes	30 minutes
Drum Speed	Drum rotation speed during backwash sequence	0 to 60 Hz	Adjust to have 2.85 RPM
Chemical Cleaning Sequence			
Number of cleaning cycles	Number of chemical cleaning cycles to be performed when starting the chemical cleaning sequence	1 to 5	1

Drum Start Delay Chemical Cleaning	The drum delay setpoint delays drum rotation until the chemical cleaning system is operating at full pressure.	1 to 60 seconds	1-5 seconds
Chemical Spraying Timer	Duration of the spraying phase for each chemical cleaning segment	1 to 30 seconds	13 seconds
Chemical Soaking Timer	Duration of the soaking phase for each chemical cleaning segment	1 to 600 seconds	120 seconds
Chemical Cleaning Drum Speed	Drum rotation speed during the chemical cleaning sequence	0 to 60 Hz	10-20 Hz
Rotations Per Chemical Cleaning Cycle	Number of spraying/soaking steps to repeat during one cycle of chemical cleaning	1 to 10	Adjust to ensure all panels are sprayed during one cycle
Rinsing Backwash Timer	Duration of the backwash sequence performed after chemical cleaning to rinse the panels	1 to 600 seconds	300 seconds

2.9 INTERLOCKS

2.9.1 Effluent Side Level transmitter

Tag: 65LIT6801502B

- Dry running protection

A low level switch or low low level alarm (transmitter option) prevents the backwash pump from running dry. Dry running is reset with a reset button.

2.9.2 Backwash pump low Pressure Switch

Tag: 65PSL8165

- Low pressure protection

A pressure sensor is preset at 2-4 bar and pressure must be obtained within a time limit preset otherwise the backwash sequence shuts down and gives an alarm “Pump low pressure”. Low pressure is reset with a reset button. The backwash sequence is stopped and system returns to static mode.

2.9.3 Cover proximity switch

- Spray bar opening protection

A proximity switch prevent the spray bar to be raised if the cover is not open.

- Rotating equipment protection

A proximity switch prevent the rotation of the filter drum when the cover is open. An override of this interlock must be programmed for commissioning and troubleshooting of the backwash and chemical cleaning sequences.

1 INTRODUCTION

1.1 Reference Documents

Document Number	Name	Revision
5000220043_PI_0001_GEN_VWT	PI001 _Process and Instrumentation diagram	1

1.2 Process Overview

Powder activated carbon (PAC) will be received in 550 kg bags. Since this chemical is classified as a solid product that can easily ignite (CSA Class 2, Div. 1, Gr. F), make-up system is a classified area. Also, PAC is a hydroscopic solid, so it as to be stored in a dry and warm environment to avoid plugging in the dosing system. The dry powder will be dosed using a solid-liquid system consisting of a volumetric feeder dosing powder into a high energy eductor.

The principle is to use fresh water under pressure through a converging nozzle in the eductor and produces a high velocity jet. This creates a vacuum in the body of the eductor which causes the material to be drawn into the solids inlet and entrained by the liquid. Both the motive liquid and the entrained material are intimately mixed in the throat of the educator and discharged against some backpressure as a slurry.

This PAC slurry can be easily carried to the Dechlorination tank Reactor in order to renew the extracted activated carbon powder. The suction in the eductor must be well established before dosing activated carbon. A rinse sequence will be initiated after each screw stop.

1.3 List of Abbreviations

The following abbreviations are used in the text of this document.

- HMI: Human/Machine Interface
- H-O-A: Hand-Off-Auto
- PLC: Programmable Logic Controller
- LCP: Local Control Panel
- VFD: Variable Frequency Drive
- VWT: Veolia Water Technologies Canada

1.4 List of Units

The following lists the parameters referred to in this document and the units they are measured in unless otherwise specified.

- Concentration (in general): mg/L
- Dosing rate: mL/L
- Flow rate (main process): m^3/h
- Flow rate (chemical dosing): LPH
- Level in the tanks: %
- pH: -
- Pressure: PSIg
- Temperature: °C
- Turbidity: mg/L or NTU

2 ACTICARB® CONTROL DESCRIPTION

2.1 Equipment and Instrument

This section connects the tags from the P&ID and the terminology used throughout Equipment and Instrument Schedules

P&ID TAG	DESCRIPTION
65LSH6801612 65LSH6801632	Wetting cone high Level switch
65LSL6801611 65LSL6801631	Hopper Low level Switch
65PSL6801601 65PSL6801621	Service Water Pressure Switch
65FY6801613 65FY6801633	Air Solenoid valve
65FY6801602 65FY6801622	Service Water Inlet Solenoid Valve

2.2 Controls

2.2.1 Continuous dosing

Dosing is continuous with the dosing screw and the required dosing flowrate is adjusted using the VFD of the dosing screw motor. The calculation of the dosage percentage is done by integrating calibration values retrieved from the dosing screw.

$$(QP_{PAC}) = (CF_{PAC}) * (Q_{RW}) \ / \ (SG_{PAC}) * 1000$$

Where:
QP_{PAC} = Required PAC Dosing Flowrate (L/h)
CF_{PAC} = Required Chemicals Concentration in the process (mg/L)
Q_{RW} = Raw Water Flowrate (m3/h). Process Value given by the inlet raw water flowmeter.
SG_{PAC} = Chemical Specific Gravity (kg/L) see 5000220043_PSDS_0001_SKG_VWT

2.2.2 Discharge Pipe rinsing

The piping of the activated carbon injection line must be flushed with service water to prevent build-up every times that the dosing screw shuts downs. Service water should be flushed through the lines for 1.5 times the transit time the flushing water takes to pass through the pipes.

Table 1: Activated Carbon automatic sequence

Step #	Step name	Actions Transition conditions	Dosing screw	Service water valve	Powder Supply Valve	Blending tool
0	Stand-by	Equipment shut off	S	C	C	S
1	Open injection line	Open injection valve Open Powder Supply valve	S	C	O	S
		Valve delay has elapsed				
2	Vacuum	Open Service water Inlet	S	O	O	S
		20 s delay				
3	Dosing	Start hopper agitator cycle Start dosing screw Active coagulant metering pump	R	O	O	R
		Normal Stop condition				
4	Rinsing	Stop the feeder Stop blending tool Close Powder Supply Valve	S	O	C	S
		Rinsing delay elapsed (45 sec)				
5	End	Close the Service water inlet valve	S	C	C	S
		Go to Step 0 at end of normal sequence and reset timers Go to Step 7 at end of sequence if a fault occurs				
6	Sequence stopped on a fault	Stop the feeder Stop blending tool Close the powder supply valve Close the Service water inlet valve Wait for fault reset	S	C	C	S
		Go to Step 1				

Legend

Motor	***Valve***	***Cycle***
S: Stop	*C: Closed*	*D : Deactivate*
R: Running	*O: Open*	*A : Activate*

Note: if there is a power outage before the completed preparation confirmation is active, repeat at Step 1 when the power returns.

2.3 System Availability Conditions

2.3.1 Conditions for automatic sequence

The automatic start sequence will be activated when the automatic start command is true and the following conditions are met:

1. If delay for power return is elapsed;
2. If remote run request bit is activated (exchange table);
3. Activated Carbon dosing system components are in Auto start mode.
4. Service Water System components are in Auto start mode (exchange table);
5. Low Pressure Switch is not activated
6. Low level switch is not activated

2.4 Fault response

The major faults associated with the make-up sequence are:

1. Dosing screw motor fault
2. Blending tool motor fault

2.5 Interlocks

2.5.1 Service Water Inlet Pressure Switch

If the low pressure switch on the service water inlet is activated when the system is running, it will stop the sequence on a fault as per table 1. The Interlock is active in automatic mode and interface manual mode.

When the service water inlet valve is closed, the signal of the pressure switch is disabled.

2.5.2 Wetting Cone High Level Switch

If the high level switch on the wetting cone is activated when the system is running, it will stop the sequence on a fault as per table 1. The Interlock is active in automatic mode and interface manual mode.

Product data sheet
Characteristics

HMIST6200
4"W touch panel display, 1COM, 1Ethernet, USB host&device, 24VDC

Main

Range of product	Harmony ST6
Product or component type	Touch panel screen
Software designation	EcoStruxure Operator Terminal Expert
Processor name	ARM Cortex-A8

Complementary

Display size	4 inch
Display type	Colour TFT LCD
Display colour	16 million colours
Display resolution	480 x 272 pixels
Touch panel	Single touch analogue resistive
Backlight lifespan	50000 hours white
Brightness	16 levels
Character font	ASCII ASCII (European characters) Chinese (simplified Chinese) Japanese (ANK, Kanji) Katakana Korean Taiwanese (traditional Chinese)
[Us] rated supply voltage	24 V DC +/- 20 %
Inrush current	30 A
Local signalling	Status LED green, steady offline Status LED green, steady operating Status LED green, flashing operating Status LED green, faded stand-by Status LED orange, flashing software starting up Status LED red, steady power supply (ON) Status LED red, flashing operating Status LED red, off power supply (OFF)

Modules Mounted on Racks

Dimensions

(1) With removable terminal block (cage, screw or spring).
(2) With FCN connector.
(3) On AM1 ED rail: 35 mm wide, 15 mm deep. Only possible with BMXXBP0400/0400H/0600/0600H/0800/0800H rack.

Rack references	a in mm	a in in.
BMXXBP0400 and BMXXBP0400H	242.4	09.54
BMXXBP0600 and BMXXBP0600H	307.6	12.11
BMXXBP0800 and BMXXBP0800H	372.8	14.68
BMXXBP1200 and BMXXBP1200H	503.2	19.81

Module Connection

(1) pre-actuator
(2) fuse: fast blow fuse of 2 A for each 16-channel group
power supply 24 VDC
PPS pre-actuator power supply

Product data sheet
Characteristics

ABE7P16T210
sub-base for plug-in relay ABE7 - 16 channels - relay 10 mm

Main

Range of product	Modicon ABE7
Product or component type	Sub-base for plug-in relay
Sub-base type	Output sub-base
[Us] rated supply voltage	19...30 V IEC 61131-2
Number of channels	16
Connections - terminals	Screw type terminals, 1 x 0.09...1 x 1.5 mm² AWG 28...AWG 16) flexible with cable end Screw type terminals, 1 x 0.14...1 x 2.5 mm² AWG 26...AWG 12) solid Screw type terminals, 1 x 0.14...1 x 2.5 mm² AWG 26...AWG 14) flexible without cable end Screw type terminals, 2 x 0.09...2 x 0.75 mm² AWG 28...AWG 20) flexible with cable end Screw type terminals, 2 x 0.2...2 x 2.5 mm² AWG 24...AWG 14) solid

Complementary

Supply voltage type	DC
Product compatibility	ABS7SC2. ABR7S2. ABS7SA2. ABE7ACC20
Status LED	Channel status 1 LED per channel green) Power ON 1 LED green)
Polarity distribution	Volt-free
Short-circuit protection	1 A internal fuse, 5 x 20 mm, fast blow PLC end)
Fixing mode	By clips 35 mm symmetrical DIN rail) By screws solid plate with fixing kit)
Maximum supply current	1 A
Voltage drop on power supply fuse	0.3 V
Maximum current per output common	16 A
[Ui] rated insulation voltage	300 V coil circuit/contact circuits IEC 60947-1 2000 V terminals/mounting rails
[Uimp] rated impulse withstand voltage	2.5 kV

Disclaimer: This documentation is not intended as a substitute for and is not to be used for determining suitability or reliability of these products for specific user applications

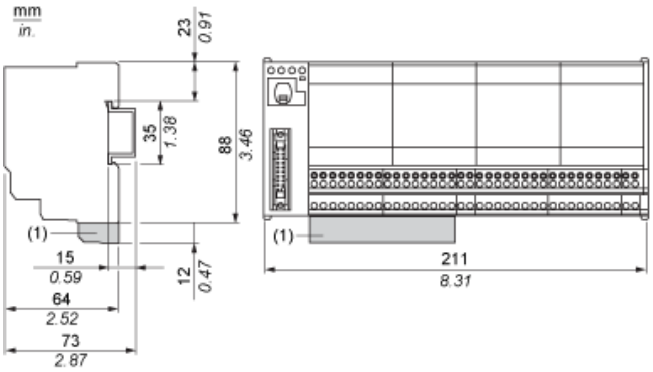
Installation category	II IEC 60664-1
Tightening torque	5.31 lbf.in (0.6 N.m) flat Ø 3.5 mm
Net weight	1.36 lb(US) (0.615 kg)

Environment

Product certifications	BV GL LROS (Lloyds register of shipping) CSA UL DNV EAC
IP degree of protection	IP2x conforming to IEC 60529
Resistance to incandescent wire	1382 °F (750 °C) IEC 60695-2-11
Shock resistance	15 gn 11 ms IEC 60068-2-27
Vibration resistance	2 gn 10…150 Hz)IEC 60068-2-6
Resistance to electrostatic discharge	4 kV contact) level 3 IEC 61000-4-2 8 kV air) level 3 IEC 61000-4-2
Resistance to radiated fields	9.14 V/yd (10 V/m) 26000000…1000000000 Hz)IEC 61000-4-3 level 3
Resistance to fast transients	2 kV level 3 IEC 61000-4-4
Ambient air temperature for operation	23…140 °F (-5…60 °C) IEC 61131-2
Ambient air temperature for storage	-40…176 °F (-40…80 °C) IEC 61131-2
Pollution degree	2 IEC 60664-1

Packing Units

Unit Type of Package 1	PCE
Number of Units in Package 1	1
Package 1 Weight	20.88 oz (592 g)
Package 1 Height	3.15 in (8 cm)
Package 1 width	3.74 in (9.5 cm)
Package 1 Length	8.66 in (22 cm)
Unit Type of Package 2	S03
Number of Units in Package 2	12
Package 2 Weight	16.50 lb(US) (7.486 kg)
Package 2 Height	11.81 in (30 cm)
Package 2 width	11.81 in (30 cm)
Package 2 Length	15.75 in (40 cm)

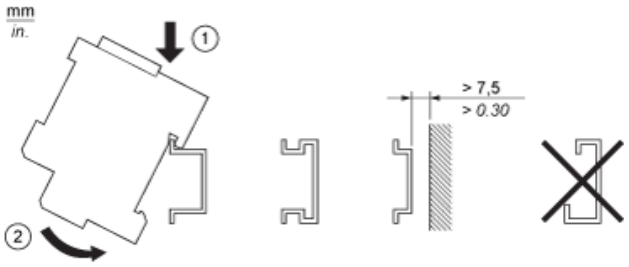


Offer Sustainability

Sustainable offer status	Green Premium product
REACh Regulation	REACh Declaration
REACh free of SVHC	Yes
EU RoHS Directive	Pro-active compliance (Product out of EU RoHS legal scope) EU RoHS Declaration
Mercury free	Yes
RoHS exemption information	Yes
China RoHS Regulation	China RoHS declaration
Environmental Disclosure	Product Environmental Profile
Circularity Profile	End of Life Information
WEEE	The product must be disposed on European Union markets following specific waste collection and never end up in rubbish bins

Contractual warranty

Warranty	18 months



Dimensions

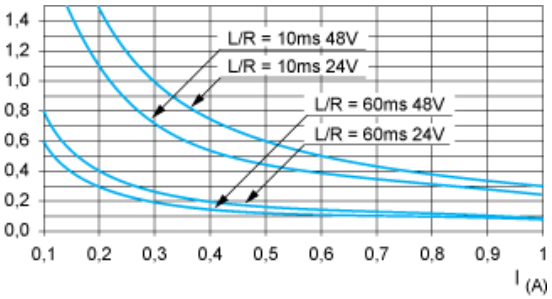
Contractual warranty

Warranty	18 months

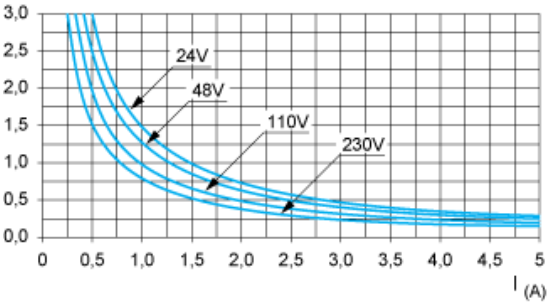
Electrical Durability (in Millions of Operating Cycles) Conforming to IEC 60947-5-1



DC Loads

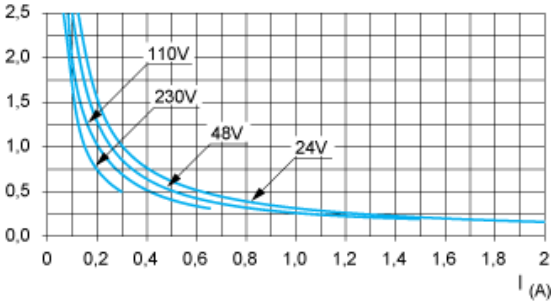
DC12 curves

DC12 control of resistive loads and of solid state loads isolated by optocoupler, I/R ≤ 1 ms.



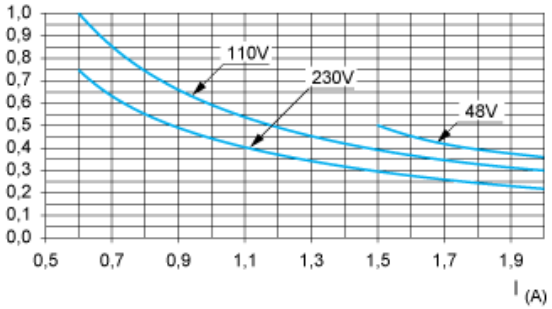
DC13 curves

DC13 switching electromagnets, L/R ≤ 2 x (Ue x Ie) in ms, Ue: rated operational voltage, Ie: rated operational current (with a protective diode on the load, D



AC Loads

AC12 curves



AC12 control of resistive loads and of solid state loads isolated by optocoupler, cos ϕ ≥ 0.9.

AC14 curves

AC14 control of small electromagnetic loads ≤ 72 VA, make: cos ϕ = 0.3, break: cos ϕ = 0.3.

AC15 curves

AC15 control of electromagnetic loads > 72 VA, make: cos ϕ = 0.7, break: cos ϕ = 0.4.

Micro drives

ACS255 600 V AC, 1 to 20 hp

Compact and available with flexible mounting options without the need for accessory mounting kits. These drives are ideal for panel builders and OEM's needing a micro drive with low cost, flexible mounting options, and rapid parameter setup.

ABB micro drive ACS255 with 600 V AC supply offers easy to use and compact solutions for general purpose low power applications, such as; screws, mixers, pumps, fans and conveyors. The key features include a built-in safe torque-off (STO), Modbus RTU and CANopen communication interfaces.

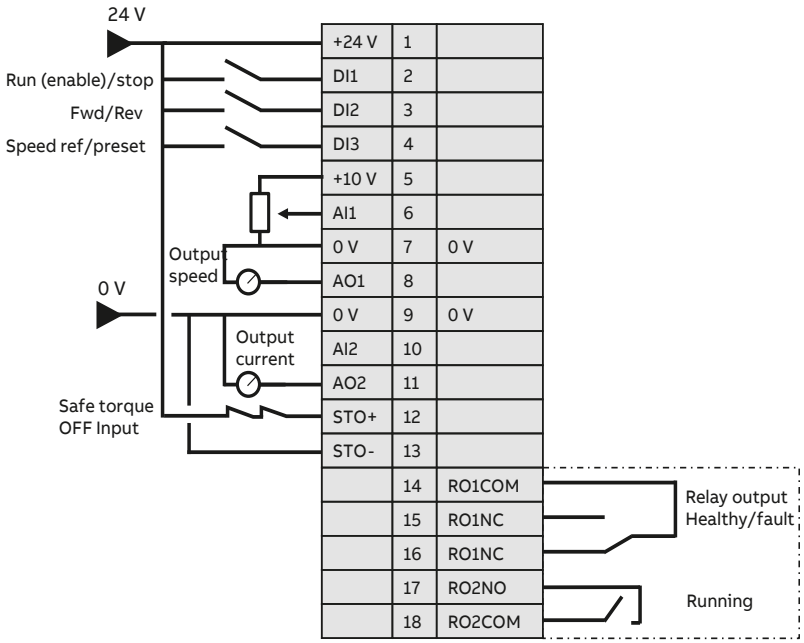
Part of ABB micro drives portfolio

The ACS255 drive is part of ABB's complete micro drive range, which offers a solution for every need:

- Drives for simple to more complex machines
- Full voltage range from 110 to 600 V
- Enclosures IP20 and IP66
- Power range up to 20 hp

Supporting options

- Remote keypad (RCRP-02) provides easy cabinet installations
- Parameter upload/download tool (RCCS-01) for straightforward commissioning
- Relay output card (RCRO-01)
- UL Type 4X/IP66 frames for harsh environments up to 15 hp
- Disconnect switch for UL Type 4X/IP66 frames



Product highlights

- Easy to use, compact design
- High performance vector control
- Input voltage 500 to 600 V +/- 10%
- Built-in safe torque-off (STO) complies with EN62061 SIL level 2
- Built-in braking chopper in all types
- Built-in communication with Modbus RTU and CANopen® interfaces
- Rated for 150% overload for 60 sec as standard
- DIN rail mounting
- Pluggable control terminals
- Remote keypad available as an option
- PID control with sleep mode
- IP20 panel mount and IP66/NEMA 4X enclosures
- Feed-thru wiring on IP 20 drives
- Front mounted operator control option for IP66/NEMA 4X drives

P_N for kW = Typical motor power at 400V in normal use
P_N for Hp = Typical motor power at 480V in normal use
I_{2N} for A = Continuous rms currrent. 50% overload is allowed for one minute in ten minutes
U within the type code = no EMC filter
+B063 = IP66/UL TYPE 4X enclosure without input disconnect.
+B063+F278 = IP66/UL TYPE 4X enclosure with input disconnect and operator controls.

Standard I/O configurations

Mains connection	
Supply voltage	3-ph, 500 to 600 V ±10%: 1 to 20 hp
Frequency	48 to 62 Hz
Phase imbalance	3% maximum allowed
Motor connection	
Motor types	Asynchronous induction motors Permanent magnet synchronous motors
Frequency	0 to 500 Hz, 0.1 Hz resolution
Overload capacity	150% of rated amps for 1 minute
Switching frequency	4-32kHz Effective
Control types	Scalar U/f Sensorless vector speed control PM motor vector speed control BLDC motor speed control (contact factory)
Environmental limits	
Temperature	Storage: –40 to 60°C Operating: –10 to 50°C
Relative humidity	95% (without condensation)
Vibration	Conforms to IEC 60068-2-6 Sinusoidal Vibration 10 - 57Hz @ 0.075mm Pk 57 - 150Hz @ 1g Pk
Product compliance	
UL, cUL, C-Tick, CE listing/conformance; RoHS Compliant	
Programmable control connections	
Power supply	24 Volt DC, 100mA, Short Circuit Protected 10 Volt DC, 5mA for Potentiometer
Programmable Inputs	5 Total 3 Digital 2 Analog / Digital selectable
Digital inputs	8 – 30 Volt DC, internal or external supply Response time < 4ms
Analog inputs	0 - 10 VDC, 0 or 4 - 20mA, bi-polar Resolution: 12 bits Response time: < 4ms Accuracy: < 1% full scale Parameter adjustable scaling and offset
Programmable outputs	4 Total 2 Analog / Digital 2 Relay
Relay output	Maximum Voltage: 250 VAC, 30 VDC Switching Current Capacity: 6A AC, 5A DC
Analog outputs	0 to 10 Volt 0 to 20mA 4 to 20mA
PI control	Internal PID Controller Multi Setpoint Select Standby / Sleep Mode Boost Function
Serial communication	Modbus RTU 9.6 - 115.2 kbps selectable 8N1, 8N2, 8E1, 8O1 CANopen 125 - 1000kbps

SPECIAL NOTE:

- **Reactor Tank RX75-3**

The handling, storage and maintenance of the Reactor Tanks RX is similar to the ones of the Actiflo units. Refer to the appropriate sections as in the following manual for mixers start-up, handling, and maintenance as for the tank handling, installation and maintenance:

- Section 4: Unit Handling
- Section 5.1/ 5.2 / 5.7/ 5.8: Mechanical Installation
- Section 7.1/ 7.2: Piping Connection
- Section 8: Torque Values
- Section 9.1/ 9.3: Electrical Installation
- Section 12.1.1: Preliminary Verification for Start-up
- Section 15.1.2: Mixers Maintenance
- Section 15.6: Paint Inspection
- Section 15.7: Paint Repair Procedure
- Section 15.8.1: Lubrication Schedule for Mixers Only

- **ActiCarb ACP700R:**

The MA hydrocyclone placed on the the clarifier #1 acticarb ACP700R is different from the krebs placed on the clarifier #2 ACP2-60. It requires a service water connection, refer to P&ID for the valves and instruments to be placed on this line. For more information, regarding the handling, operation and maintenance of the MA Hydrocyclone Refer to the annexed manual at the end of this manual.

Service Water requirements:

Quality	20 um filtered water
Pressure	sludge/sand inlet pressure + 0.5 to 3 bar
Flow	8% to 10% of the hydrocyclone inlet flow
Type of connection	Hose Barb

1 INTRODUCTION

This document describes the functions of the various components of the Actiflo® Package Plant clarifier MKIII, describes the procedures for the installation, start-up and standard operation of the system. It also plans preventive maintenance measures and describe procedures for the regular maintenance of the equipment.

The components of the Actiflo® Package Plant clarifier MKIII, the latest generation, are supplied by Veolia Water Technologies Canada (VWTC). This equipment of superior quality and proven design will insure years of operation without problems. However, in order to maintain peak efficiency and performance of the system, it is imperative to take into consideration the preventive measures and procedures described in this manual. These measures include the operation and maintenance of its components.

To obtain any additional information regarding characteristics, operation or maintenance of this equipment, or if a problem persists, please do not hesitate to contact us.

The Actiflo® Package Plant clarifier is manufactured in Canada by:

Veolia Water Technologies Canada
4105, Sartelon
Saint-Laurent, Qc.
Canada H4S 2B3
Phone: 514-334-7230
Fax: 514-334-5070

For technical support or service needs, for spare parts or to get assistance during your warranty period, you may contact us at the following number during regular business hours or write us at:

Veolia Water Technologies Canada – After Sales Support
1-844-SER-VWT9 | 1-844-737-8989 | vwtservicecanada@veolia.com

Our business hours are from
Monday to Friday
8:30am to 5:00pm EST

1.1 OBJECTIVES OF THIS MANUAL

- To describe the installation of the unit and its ancillary components.
- To describe and explain the functions of the various components of the Actiflo® clarifier and reaction tanks, if installed.
- To describe the procedure for the start-up and standard operation of the system.
- To plan preventive maintenance measures and describe procedures for the regular maintenance of the equipment.

IMPORTANT NOTE:

The Actiflo® Package Plant (MKIII) is delivered with 2 major variations. The ACP R (classic variation) and the ACP2 (turbo variation).

For the sake of simplicity, whenever appropriate descriptions in the following manual will follow ACP R (classic variation) terminology.

If you are operating the ACP2 (turbo variation), and when no explicit alternative explanation is given, in place term replacement has to be done throughout this manual for the following terms:

- **Replace injection tank by flocculation tank.**
- **Replace injection mixer by flocculation (Turbomix®) mixer.**
- **Replace maturation tank by flocculation tank.**
- **Replace maturation mixer by flocculation (Turbomix®) mixer.**

1.2 SAFETY

Operation of the Actiflo® Package Plant clarifier should be done by qualified personnel only.

It is imperative to ensure the security of all operators during the operation and maintenance of all mechanical equipment. In order to avoid accidents, it is important to determine the correct way to proceed and conveniently select appropriate clothing for the job. All workers having access to the equipment must scrupulously respect all the standard rules of safety as well as the precautions described in this manual.

Workers, which are directly responsible for the operation and maintenance of the equipment, must be aware of standard rules of safety.

The following safety rules should be followed:

- Safety devices such as handrail and belt guards should be installed and inspected regularly.
- Access to the building should be limited to authorize personnel only.
- Non-authorized personnel must never approach rotating shafts, connections, etc., in order to avoid injuries.
- The owner should implement a safety program and provide training for operation staff.
- Material Safety Data Sheets (MSDS) should be available for each chemical product.

- Appropriate protective gear including safety glasses, hard hat, boots, gloves, and ear protection should be worn at all times.

Protection systems or any other type of safety device supplied by the manufacturer must be carefully installed. If these are not supplied by the manufacturer, the user must supply and install the safety devices necessary for the protection of employees responsible for the operation of the equipment.

WARNING: The lamella pack is pre-installed in the settling tank section of the Actiflo® clarifier. The HIPS (High impact polystyrene) version of the lamella pack is made of a very flammable material. Do not expose it to open flames or sparks. Do not allow any welding works nearby unless special precautions have been taken.

WARNING: The operation staff should be aware that coagulant is highly corrosive and polymer solution can be very slippery. Handle dosing equipment and chemical products with extreme care. Always wear appropriate protective gear. Spills should be cleaned immediately according to the MSDS instructions.

WARNING: The microsand may contains fine particles of silica. Therefore, it must be handle safely and with caution by qualified staff. Consult the MSDS for further instructions.

1.3 STANDARDS

Unless specified otherwise, the equipment described in this manual is consistent with the most recent construction standards that are applicable, including:

American Society of Mechanical Engineers	ASME
Canadian Standards Association	CSA
Canadian Electrical Manufacturers Association	CEMA
National Electrical Manufacturers Association	NEMA
American Society for Testing and Materials	ASTM
American National Standard Institute	ANSI

Table 1: List of applicable standards

1.4 MODIFICATIONS DONE BY THE CLIENT

Please note that it is mandatory to contact Veolia Water Technologies Canada Inc. before undertaking any modification work to the equipment supplied in this project. In fact, any alteration made to any equipment (mechanical, control, computers, etc.) without prior notification and consent by VWTC voids the warranty of the mentioned equipment. Furthermore, the client is responsible for any additional cost necessary to restore the equipment to its original state.

1.5 FIELD INSTALLATION – PAINT PROTECTION

IMPORTANT NOTE TO CONTRACTORS

You are about to install Actiflo® Package Plant unit and its related equipment. Veolia Water Technologies Canada Inc. wants to warn the reader about potential problems related to installation of large steel units protected against corrosion by paint.

VWTC maintains a comprehensive quality program to prevent equipment from being affected by corrosion. Our fabrication methods are specially adapted to manufacturing of painted equipment. Every step of our fabrication and assembly process is checked to reduce corrosion issues. Each unit is also delivered under strict measures, meant to reduce potential corrosion problems and long product life.

However, we have identified that handling unit at job site is a key element of corrosion protection process. This operation completely escapes our control and is your responsibility. Consequently, we invite you to perform a thorough review of your installation procedures before handling VWTC products. Protecting units during and after installation is paramount to maintain corrosion risks to a bare minimum.

Likewise, after installation of units, you must insure complete equipment protection from working environment before unit is put into service. This will prevent damages caused by work not related to VWTC products taking place on site. Contractor is responsible for installation of any additional protection necessary at job site.

In order to maintain quality products free of defects, VWTC requests from contractor, that he takes all necessary measures to reduce risks of paint or equipment damage leading to steel corrosion. Among most important protection measures of paint protection, here are the principal ones:

- Making all men, working close to units, conscious of paint fragility and potential corrosion problems. Please encourage them to act with extreme care while working around installation.
- Protecting units from weld projection or falling debris, by covering unit with adequate plastic or cardboard hoods and padding.
- Protecting unit's tank bottom when installing mixers or other equipment inside unit.
- Keeping area and unit clean at all times.

All measures taken by contractor to insure paint protection will assure transfer to client of a quality product and will benefit to all.

1.6 WARRANTY

All equipment manufactured by **Veolia Water Technologies Canada Inc. (VWTC)** is guaranteed to be free from defects in material and workmanship for a period of twelve (12) months from the date at which unit is placed in service, eighteen (18) months from the date of shipment, whichever occurs first. All equipment found with defects during this period will be replaced at no extra charge when shipped

prepaid FOB to the manufacturer's shop. All parts sold by VWTC are warranted the same way for a period of three (3) months from date of shipment.

If the customer promptly notifies VWTC in writing of a claimed defect in the equipment and said equipment is found not to be in conformity with this warranty, VWTC will, at its option and expenses, repair or replace such defective part, prepaid FOB to the manufacturer's shop.

Must be given notice of such defect, and, where requested, such material must be returned to the manufacturer's shop, transportation charges prepaid, with written approval for the shipment by VWTC.

This warranty shall be void if start-up of equipment is not authorized by VWTC, or if repairs and/or alterations are made without a written authorization by VWTC. If the equipment or parts supplied by VWTC are altered in any way without VWTC consent, the present warranty will not be valid and have no effect.

The customer will use only VWTC parts for all labour covered by this warranty.

The foregoing warranty excludes responsibility or liability for:

(a) Failures not reported promptly within the warranty period, above specified.
(b) Damage due to accident, abuse, shipment, improper installation or operation, or abnormal operation condition.
(c) Damage caused by client's replacement, repair or inspection of parts.
(d) Lesion or personal accidents, material damage or any direct or indirect expenses or loss of profit related to this warranty.
(e) Damage, loss, expenses, lesion or personal accidents directly or indirectly related to the installation, the operation or the failure of the equipment supplied by VWTC.

The foregoing warranty is exclusive and replaces all other warranties, expressed or implied, including but not limited to any warranty of bargaining or modification for a particular purpose.

This warranty does not cover the following:

(a) Costs of repair, modification or other work done or requested by the customer or the management and all indirect costs.
(b) All expenses related to regular maintenance of parts as prescribed in the operation and maintenance manuals supplied by VWTC.
(c) Costs of dismantling, installation, transportation and insurance.
(d) Travelling and living expenses for the personnel carrying out the repair under such warranty.
(e) This warranty is not a performance or production warranty.

VWTC has the right to examine or to ask for details about defects before empowering the present warranty.

2 RECEIVING

Preliminary field-testing, inspection, and checkout of the unit, following installation, shall be performed by a qualified representative of both the supplier and the general contractor. Tests shall be conducted to demonstrate to the client that all system components furnished by the equipment supplier are fully operational, that all connecting piping is leak proof and properly anchored, and that the entire system furnished by the supplier is ready for continuous safe operation. The purpose of the checkout shall be to ensure that each individual system component has been correctly installed, shall operate fully in the manner intended, and is ready to perform its function as part of an integrated system when placed in continuous operation.

MISSING EQUIPMENT/SHIPPING DAMAGE NOTIFICATION

The condition of all delivered equipment must be verified by the responsible party upon arrival at site. Verification that all equipment has been delivered as per contract must also be done upon arrival at site. Notification of missing or damaged items must be sent to Veolia Water Technologies Canada (VWTC) within 10 days of receipt of equipment. If there is no documented notification of missing or damaged parts within 10 days, VWTC is not responsible for replacement of any items found to be missing or damaged at the time of installation and start-up of the supplied equipment. It is the responsibility of the party receiving the equipment to ensure all packaging is opened at the time of receipt to uncover and document any and all damages to the Freight Company and VWTC.

Photographs and written documentation should be provided on all damaged equipment.

2.1 STORAGE

The following instructions outline the duties and responsibilities of the responsible party for equipment storage. The responsible party shall assume responsibility for the equipment upon arrival at the project site. These instructions shall define the minimum expectations for storage of all equipment.

While this storage specification taken into account common environmental issues that may affect the system during storage, common sense should be the overriding factor in determining the best method to ensure the integrity and proper storage of the VWTC equipment.

Should it be necessary to delay installation and subsequent operation of a unit for more than one month from date of shipment, special precautions must be taken. If possible, all equipment should be stored indoors in a dry and sheltered environment having a relatively constant temperature (especially for gear reducers, motors, bearings, etc.).

Air may contain excessive moisture, pollutants, microorganisms, and other particulates that accelerate the deterioration of some materials. Humidity and pollutants can produce an aggressive atmosphere.

The storage environment into which a system is placed can have a dramatic effect on the long-term usefulness of some spare parts. Key environmental factors are:

1) Temperature
2) Relative Humidity
3) Pollutants

The environmental indoor conditions should not exceed the following ranges:

Min/Max Temperature Range between:	8°- 28°C (46°- 82°F)
Relative Humidity Range between:	40% +/- 5% (RH)

A. OUTDOOR STORAGE:

Pre mounted Actiflo® Package Plant clarifier can be stored outside with the following storage specifications:

1) Drain water completely with special attention for sections without drain on lower point.
2) Remove all motored, electronic equipment and instruments and store them indoor (heated and ventilated area).
3) Tanks must be stored with adequate support underneath to prevent distortion and to raise equipment above any undesirable ground or floor conditions. It will also prevent flooding damages.
4) Completely cover the equipment with a tarp or similar protections shield to prevent direct exposure to the elements (dust, rain, snow, etc.). The tarp should fit tightly around the equipment to prevent accumulation beneath tarp.
5) Make sure that the plastic tarp is in perfect condition. Repair plastic tarp if needed.
6) Remove all snow, dust or water accumulation from the top of the units.

B. INDOOR STORAGE:

All other equipment have to be stored indoors in a climate controlled environment under a clean dust free non-aggressive and dry environment, including but not limited to electrical enclosures, spare parts, etc.

1) The equipment should be stored in a manner to be kept free from allowing insects, rodents, etc. from entering the equipment.
2) Cover the equipment with a tarp or similar protective shield to prevent direct exposure to dust or any other contamination. However, never enclose the unit or components totally in plastic covers; always leave adequate ventilation of air to prevent condensation.
3) Storage volume depends on the size of the project.
4) Equipment must be checked on a weekly basis for tarp/wrap integrity and accumulation.
5) To avoid damage, do NOT stack crates.
6) To avoid damage, do NOT stack enclosures.
7) Do not store spares in barns, equipment sheds or any other building without the capacity for heating and cooling as needed.

C. SPECIAL MAINTENANCE REQUIREMENTS DURING STORAGE:

Mixers, Scraper and Recirculation Pumps

After three (3) months of storage, long term storage methods must be applied to the unit including complete fill with lubricant. Protect machined surfaces and rotate shafts periodically (every month). Five (5) complete rotations of the output shafts are recommended each time.

Periodic checks should be made to ensure that no rusting or other damage has occurred. Should such be noted, corrective action should be quickly initiated. Prior to putting unit into service, drain lubricant and refill to proper level as determined by the mounting position. Refer to manufacturer documentation.

All motors must be removed and store indoor (in a heated and ventilated area). All motors must be run every 3 month as a preventive measure against the formation of corrosion.

Instrumentation

All instruments must be store inside. Refer to manufacturer documentation.

Electrical Equipment and Spare Parts

It is required that all electrical equipment is stored indoors in a climate controlled environment under a clean dust free non-aggressive and dry environment, including but not limited to electrical enclosures, spare parts, etc.

1) The electrical equipment should be stored in a manner to be kept free from allowing insects/rodents from entering the equipment.
2) Completely cover the equipment with a tarp or similar protective shield to prevent direct exposure to dust or any other contamination.
3) Storage volume depends on the size of the project.
4) Equipment should be checked on a weekly basis for tarp/wrap integrity and accumulation.
5) To avoid damage, do not stack crates.
6) To avoid damage, do not stack enclosures.
7) Do not store spares in barn, equipment sheds or any other building without the capacity for heating and cooling as needed.

Other Equipment

It is recommended that tanks and pumps be stored indoors and on a raised surface to avoid flooding however if this cannot be done, they must be places on secure, high ground and meet all other specifications provided in this document. The responsible party must be sure to elevate the equipment off of the ground.

If the equipment are stored outdoor they must be kept on a high ground not susceptible to flooding and elevate the equipment at least 10 inches (250 mm) of the ground. If there is reason known to the responsible party that more than 10 inches of elevation is required, appropriate measures should be taken. Completely cover the equipment with a tarp or similar protections shield to prevent direct

exposure to the elements (dust, rain, snow, etc.). The tarp should fit tightly around the equipment to prevent accumulation beneath tarp. Equipment to be checked on a weekly basis for tarp integrity and accumulation.

To avoid possible module damage, do not stack module crates.

Equipment Cleaning

VWTC is not responsible for cleaning of any equipment prior to installation and start-up due to the storage of the equipment. This is the complete responsibility of others.

The cleaning of the equipment, if necessary, must be completed prior to the VWTC start-up technician arriving at site.

Handling

Equipment will arrive at the project site in several different shipments, from various freight companies and in several different packaging containers. Typically a flatbed truck is used which requires a fork lift or a crane to remove the various items.

Control panels are shipped in a separate crate or wrapped for protection and should be removed from the flat bed with a fork lift along with all other items. Weight dependent upon system configuration.

3 GENERAL INSTALLATION

The Actiflo® package plant may be pre-mounted. However, for freight purpose and practical reasons, the installation of some items must be completed on site by the contractor. Please find below the list of tasks that need to be performed by the contractor at job site:

- Installation should be performed by qualified contractors.
- The contractor must ensure that the necessary lifting equipment is available on site to carry out the installation.
- All nuts & bolts need to be verified, accounted for and tightened.

WARNING: The HIPS variation of the settling tubes is very flammable, do not use any open flames near it and do not allow any welding works in the nearby area unless safety precautions have been taken. Once the settling tubes are submerged in water (normal use), this warning is no longer applicable.

- Refer to all field installation drawings for the installation of each Actiflo® unit.
- If any paint touch-ups are required, refer to documentation for recommended paint preparation and application instructions.
- After installation completion, clean the tank sections of all debris and objects that could damage the rotating mechanisms, damage pumps or clog the recirculation line.
- Microsand is supplied in 50 lbs. bags in quantities required for the first fill. Sand will be added to the maturation tank during process start up. Sand should be poured slowly once tank is filled with water. Initial sand loading should be performed with supervision of start-up personnel.

4 UNIT HANDLING

- Install each unit at the designated location at site. Lifting lugs are on top of each unit to facilitate handling and shall be removed after proper installation of Actiflo® unit in order to install the handrails.
- For equipment handling please refer to the following sketch and pictures for proper handling of the tank.
- The general contractor is responsible for the equipment unloading and handling.

WARNING: Do not use the welded lugs on Actiflo® package unit sides to lift the tank. These are for transportation purpose only.

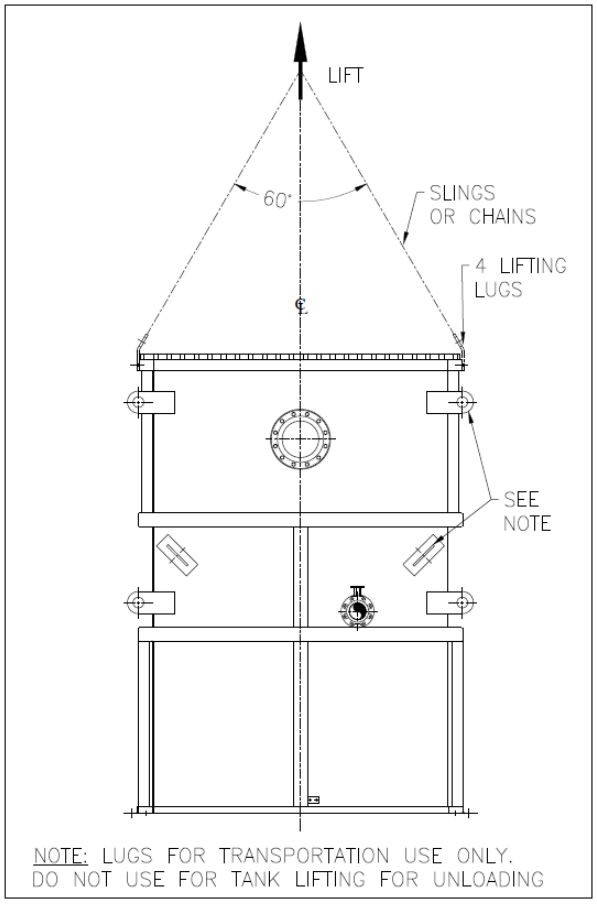

Figure 1: Actiflo® lifting lugs location

ATTENTION: DO NOT LIFT THIS WAY

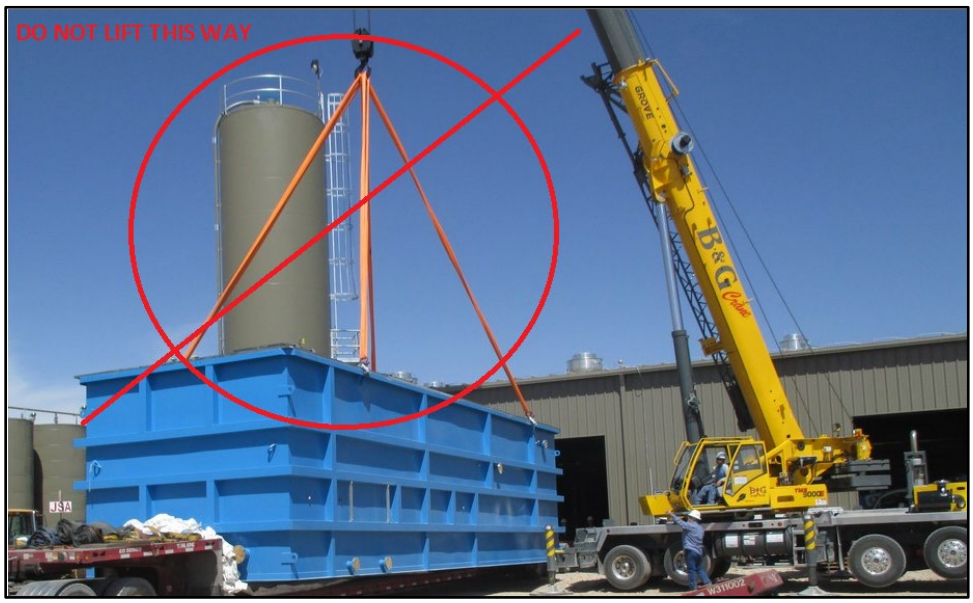

Figure 2: Actiflo® lifting (1)

PROPER LIFTING: ALWAYS HAVE AT LEAST TWO LIFTING POINTS

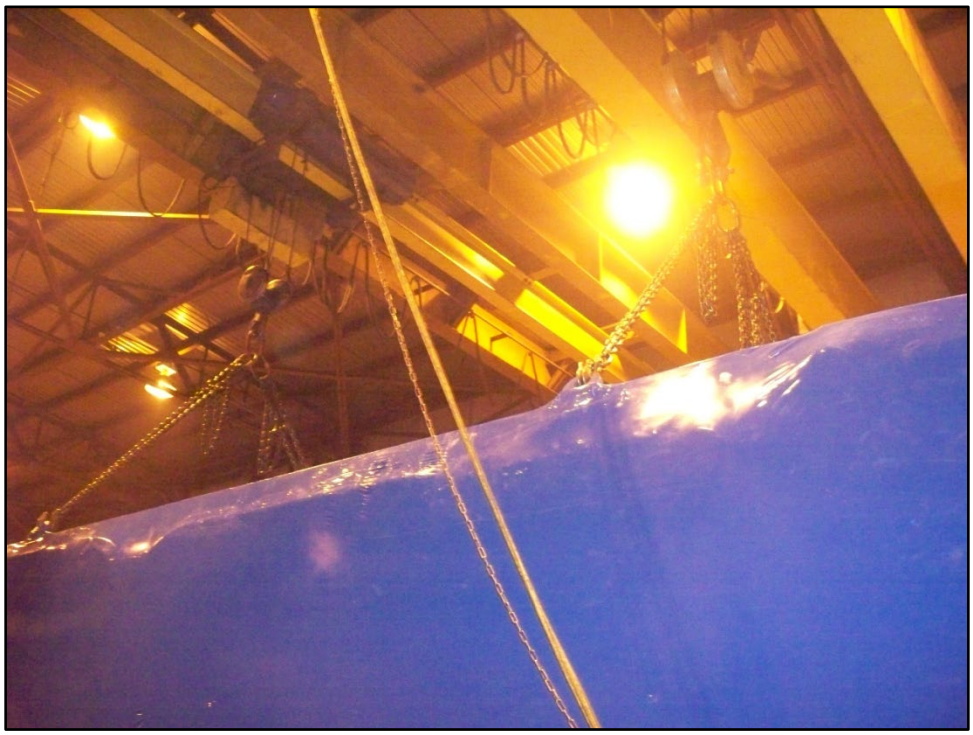

Figure 3: Actiflo® lifting (2)

Figure 4: Actiflo® lifting (3)

Figure 5: Actiflo® lifting (4)

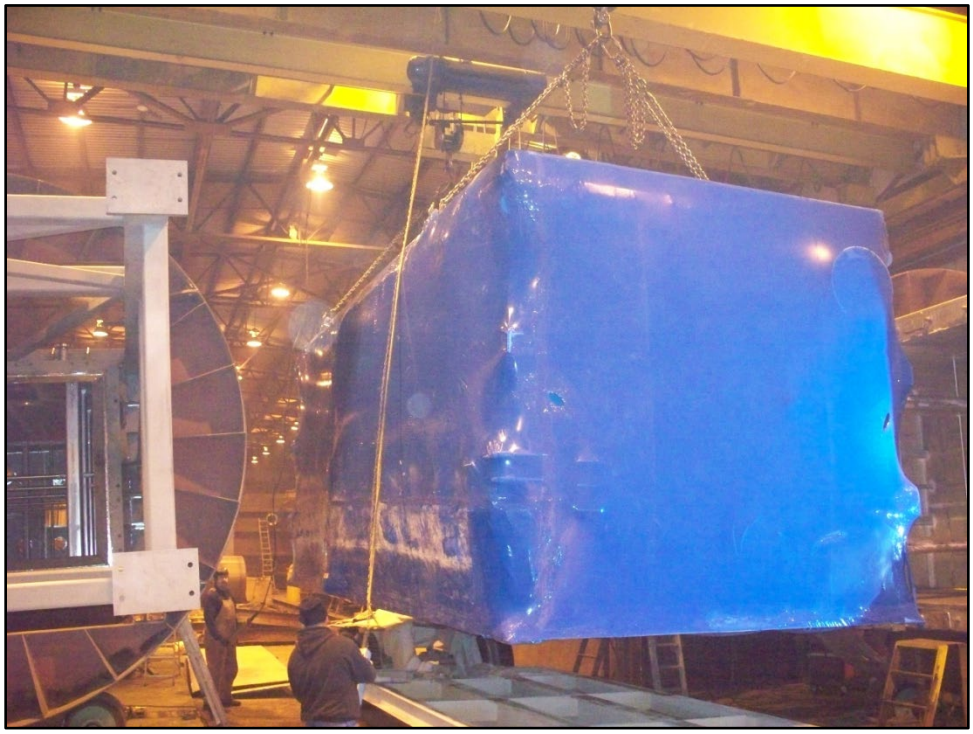

Figure 6: Actiflo® lifting (5)

4.1 LEVELING

- Unit base frame must be flat and leveled within proper tolerance (max. 1/8” every 15 ft).

4.2 ANCHORING TO CONCRETE FLOOR

- Refer to field installation drawing for tank anchors location.
- Drill appropriate holes in concrete support piers, in line with the anchoring holes of the Actiflo® base and fasten the tank structure with anchors (may be provided by others).
- Add leveling/finishing grout under the base frame where required.

4.3 UNWRAPPING

- Unwrap the equipment and remove any temporary supports and plywood protections from the unit. Be cautious when removing instrumentation protection.

5 MECHANICAL INSTALLATION

5.1 GRATING

- Install grating on each unit. The grating may already be mounted as part of shop assembly.

5.2 HANDRAIL

- Install hand railing on each unit at the site. Please refer to the field installation drawings.

5.3 SETTLING SECTION

- Lamella packs are already installed in settling section.
- If using HIPS variation of lamella packs and if required, be very cautious when manipulating the lamella packs in cold temperatures. They become very brittle and may break easily.

WARNING: HIPS variation of lamella pack is highly flammable. Submerge with water as soon as possible.

5.4 TROUGHS

- The troughs already installed in the settling section should be leveled using the adjustment nuts. All troughs must be at the same elevation. Tolerance should be 1/8”, so that water is distributed evenly within settling section.

5.5 SCRAPER DRIVE INSTALLATION

- Remove the transportation plate from the rake assembly.
- Lower the rake shaft using the inside round bar fixture.
- Connect the rake drive to the shaft.
- Add the lubricant in the primary gear box. Use FDA approved **Total Nevastane 460 EP** lubricating oil or equivalent. Please be careful about the oil quantity that is pour in the scraper drive assembly as too much oil may overflow into the tank. The primary gear box oil capacity is 8 liters and the oil level should correspond to about half the height of the gear (i.e. 25 to 30 mm from the bottom). The oil level plug, on the side of the gear box, can be unscrewed to drain excess oil and retain optimal oil level. Refer to the next figure.

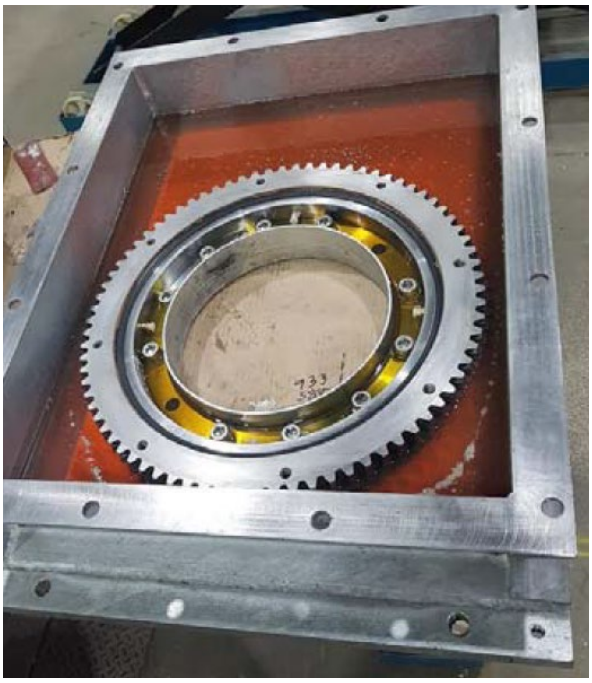

Figure 7: Primary gear box recommended oil level (opened up gear box and filled with 8 L of oil)

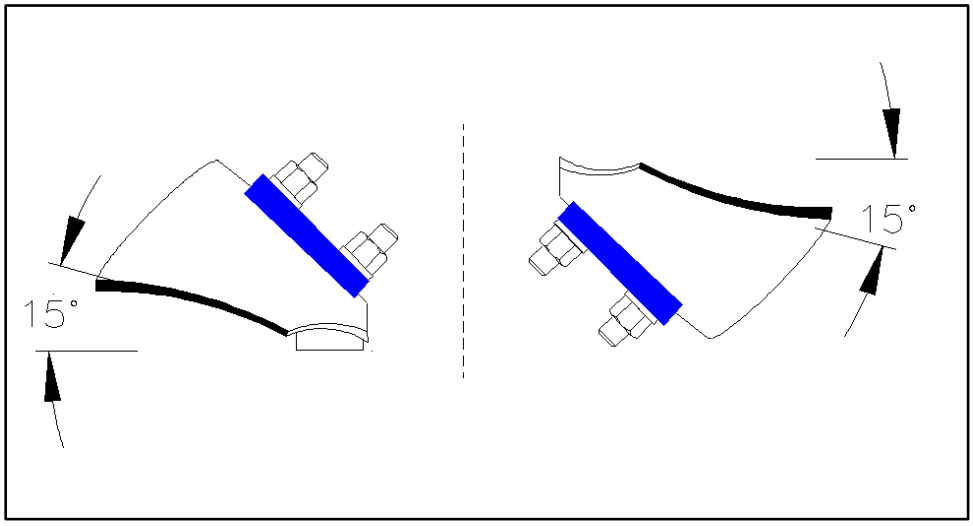
- Rectify alignment if necessary.
- All electrical connections must be completed.
- Rotation of the rake must be clockwise (CW).
- Ensure that there is no contact between the rake arm and the bottom of the hopper.
- Clean the tank sections of all debris and objects that could damage the rotating mechanisms.
- Inspect the recirculation inlet pipe. It should be free of any debris.

NOTE: Pay particular attention to remove temporary material (wood, cardboard) at the bottom of the scraper that was used to prevent movement during transport.

5.6 HYDROCYCLONE SUPPORT(S)

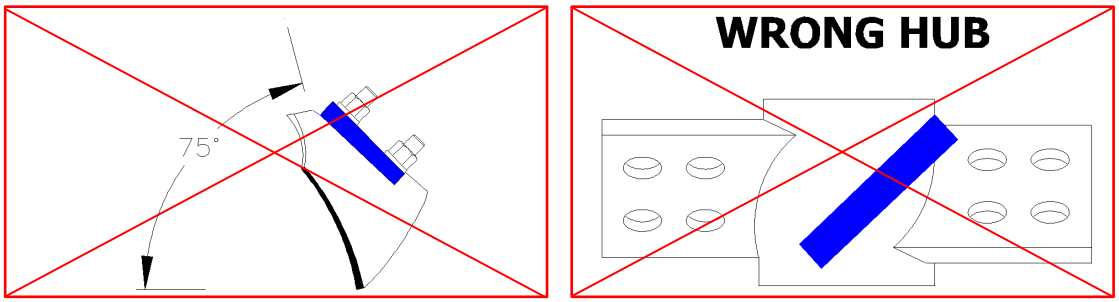
- Refer to the field installation drawings for proper hydrocyclone installation.
- Install the hydrocyclone assembly support on the maturation tank with supplied screws, nuts and washers at the site.
- Install the piping connections. It is important to drop one (1) meter (approximately 3 feet) at the sludge outlet of each hydrocyclone, to avoid backflow through hydrocyclone. Discharge of sludge pipe must not be submerged.

NOTE: Disruption in hydrocyclone pressure distribution will potentially affect separations performances, hence adequate return of microsand to the process.



5.7 COAGULATION / INJECTION / MATURATION TANK MIXER

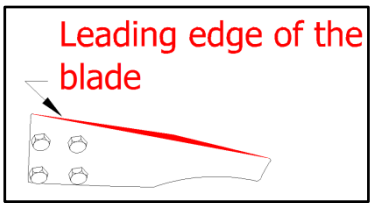
- Refer to field installation drawings for proper mixers installation.
- The mixers are delivered separately. The shafts are already assembled to the gear box. The contractor must assemble the impellers on the shafts at job site.
- Install the motor on the appropriate tank mixer following instructions given in the supplier's equipment manual.
- Verify the mixer blade installation and orientation.
- Verify that set screws are well tightened to secure the hub onto the shaft.
- Follow manufacturer recommendations for oil check and fill up procedure (manufacturer manual).
- Larger mixers may require installation of an oil expansion chamber (to be installed on site).
- All electrical connections must be completed.
- Refer to the following sketches for proper hubs installation in section 5.8.



5.8 MIXER IMPELLER BLADE INSTALLATION

WARNING:

- Ensure the use of a right hub (\ ) in the tanks. Always refer to field installation drawings.
- The leading edge of the blade shall be at 15° from horizontal and not at 75°.
- The screws and nuts must be installed on the wing with nuts on the opposite side from the blade or with screw head contacting blade or on blade side.



INSTALLATION: TWO POSSIBLE CHOICES

WRONG HUB INSTALLATION

Figure 8: Mixer hub installation

LEGEND	
CW-UP	Clockwise – Up
CW-DOWN	Clockwise – Down
CCW-UP	Counterclockwise – Up
CCW-DOWN	Counterclockwise – Down

POSSIBLE MIXER IMPELLER BLADE MOUNTING POSITION:

Note: Refer to the field installation drawings for your particular application.

The following figures shows the different impeller blade mounting positions.

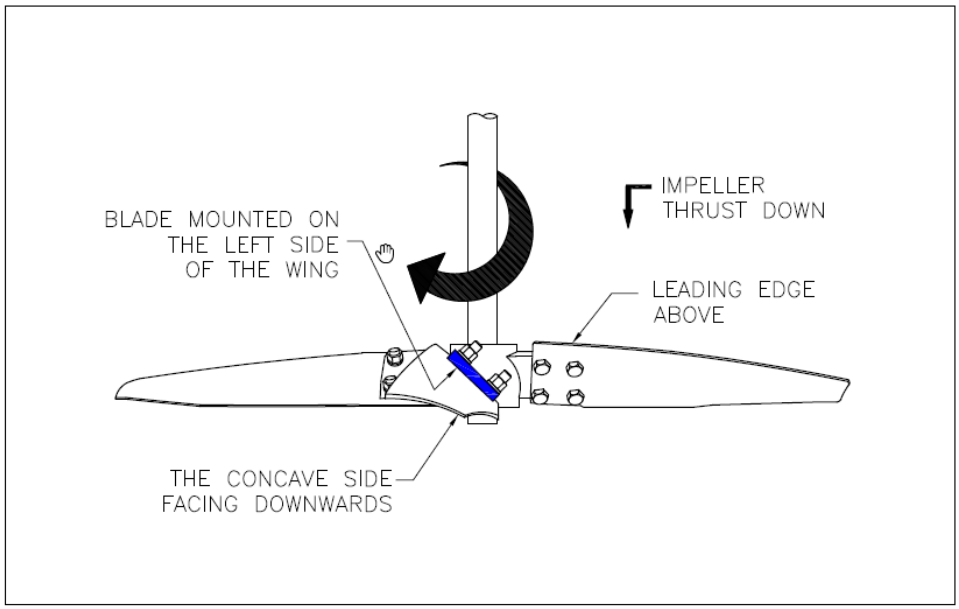


Figure 9: Mixer blades installation for CW rotation and DOWNWARD thrust

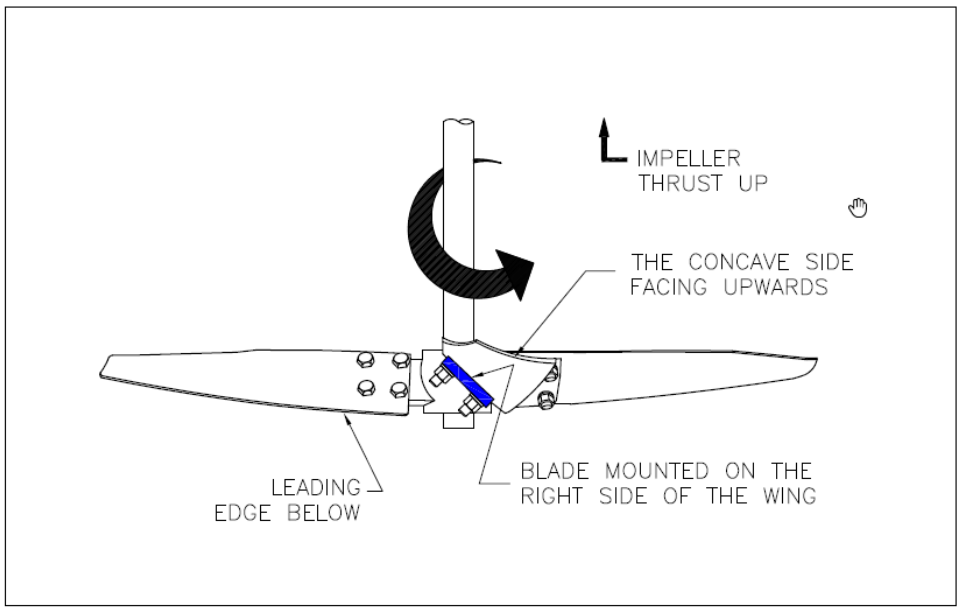

Figure 10: Mixer blades installation for CCW rotation and UPWARD thrust

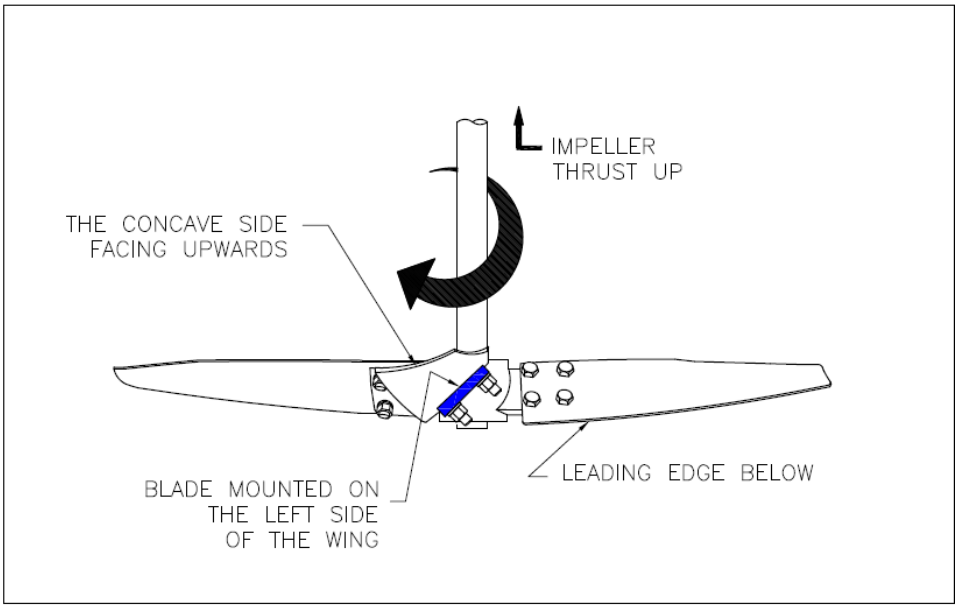

Figure 11: Mixer blades installation for CW rotation and UPWARD thrust

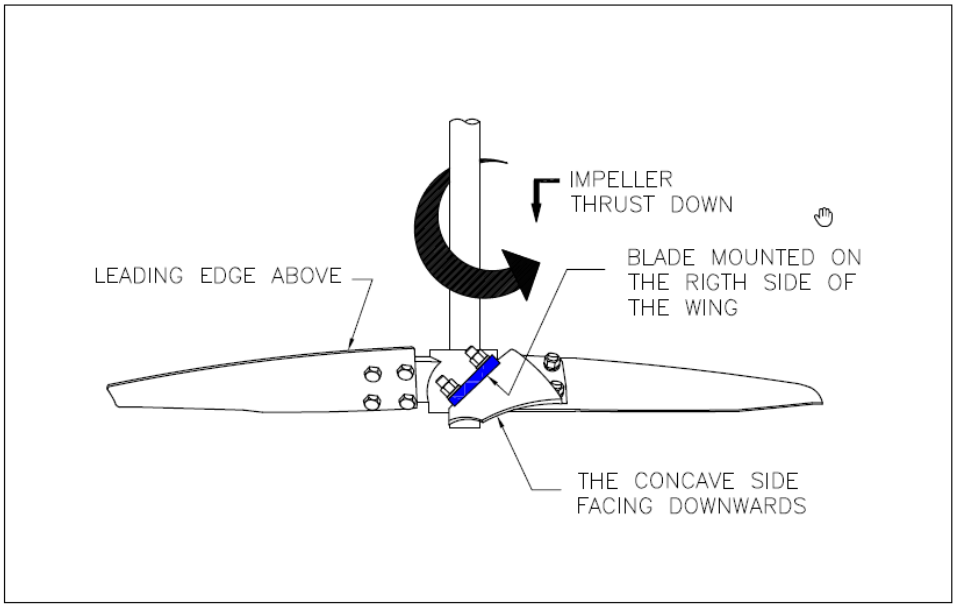

Figure 12: Mixer blades installation for CCW rotation and DOWNWARD thrust

5.9 STAIRS (Optional)

- Refer to field installation drawings for proper stairs installation.
- The stairs are delivered separately. The contractor must assemble and install the stairs at job site. Grout may be used underneath stairs legs to make sure that top of grating on tank matches stairs elevation.

5.10 LADDERS AND SAFETY GATES (Optional)

- Refer to the field installation drawings for details on ladder and safety gate installation.
- Ladder and safety gate are delivered separately. Install the ladder in place and fasten to unit at job site. Install the safety gate in the access opening of the ladder with the supplied screws and nuts.

6 PERIPHERAL EQUIPMENT INSTALLATION

6.1 MICROSAND RECIRCULATION PUMP SYSTEM

- Refer to field installation drawings for proper microsand recirculation pump system location and installation.
- Pump base frame must be leveled within proper tolerance.
- Drill appropriate holes in concrete floor and fasten the pump and flexible pipe supports with anchors.
- Connect the drip pan to a drain to avoid any leakage on the floor.

6.2 COAGULATION pH METER

- Refer to field installation drawings and manufacturer installation recommendations, for proper coagulation pH meter installation.
- Install the coagulation pH meter with probe mounted to scraper support beam on the settling tank side using supplied screws, nuts and washers. Refer as well to manufacturer's manual for installing and electrically connecting the instrument.

6.3 CLARIFIED WATER TURBIDIMETER

FOR ENDRESS+HAUSER TURBIMAX CUS51D or HACH SOLITAX PROBE

- Refer to field installation drawings and manufacturer installation recommendations, for proper location, installation and connection of the instrument. Install the turbidimeter probe mounted to scraper support beam on the settling tank side using supplied screws, nuts and washers.

6.4 INLET TURBIDIMETER (Optional)

FOR ENDRESS+HAUSER TURBIMAX CUS51D or HACH SOLITAX PROBE

- Install in line pipe. Refer to field installation drawings and manufacturer installation recommendations, for proper location and installation.
- The connection and installation are by others.

6.5 INLET FLOWMETER (Optional)

- Follow manufacturer installation recommendations (refer to manufacturer manual), to ensure adequate operation.

6.6 INLET CONTROL VALVE (Optional)

- Refer to field installation drawings and manufacturer installation recommendations, for proper location and installation.

6.7 RECIRCULATION PRESSURE TRANSMITTER (Optional)

- Install pressure transmitter on the piping at the inlet of each hydrocyclone. Refer to field installation drawings for proper location and installation.

6.8 PRESSURE GAUGE (Optional)

- Install on the piping at the outlet of each recirculation pump. Refer to field installation drawings for proper location and installation.

7 PIPING CONNECTION

NOTE: Remove the flange protecting grease prior to the installation of the valves and pipes.

7.1 WATER COLLECTOR

- Install a pipe from the Actiflo® unit effluent flange to the clarified water collector.
- A vent must be installed on the discharge if any equipment or instrument installed downstream could malfunction with air presence (UV, flowmeter, …)

7.2 TANK DRAIN

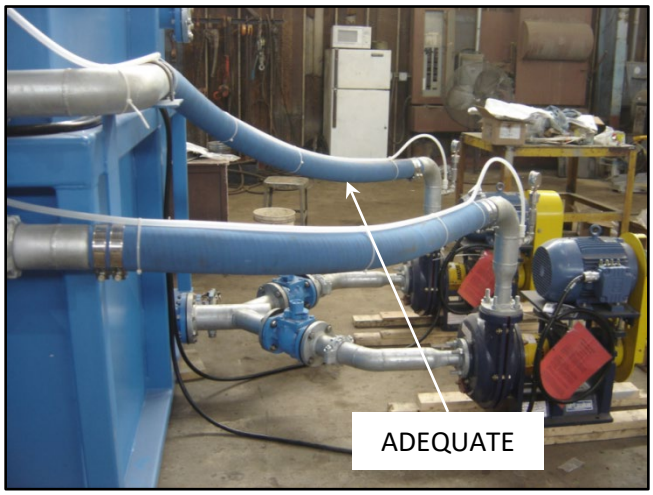
- Install a pipe from the tank drain valves to the drain.

7.3 SETTLED WATER TANK PARTIAL DRAIN

- Install a pipe from the pre-installed partial drain valve, located on Actiflo® effluent side, to the drain.

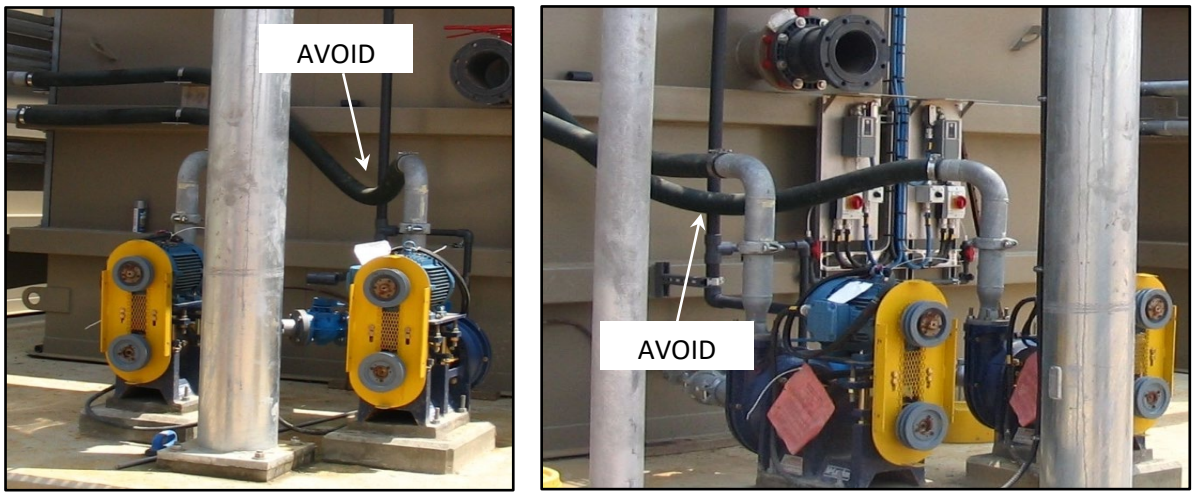
7.4 HYDROCYCLONES SLUDGE OUTLET

- Install a pipe from the hydrocyclones sludge outlet grooved coupling to the drain.



IMPORTANT: Provide sufficient pipe slope and size to prevent any backflow to the hydrocyclones. It is important to drop one (1) meter (approximately 3 feet) at the sludge outlet of each hydrocyclone to avoid backflow through hydrocyclone. After the drop, if the sludge collector is a gravity pipe, it must be calculated as free flow with maximum 70-80% of filling and with a maximum velocity of 0.8 m/s. If several hydrocyclones are in operation at the same time, a vent must be added on the collector.

7.5 POLYMER FEEDING



- Connect the supplied polymer injection tubing from the Actiflo® maturation and injection reservoirs to the appropriate hydrocyclone assembly support polymer distributor outlet.
- Connect polymer feeding pipe from the polymer metering pump skid outlet to the hydrocyclone assembly support polymer distributor inlet for the Actiflo® unit.

7.6 RECIRCULATION FLEXIBLE PIPE

- Refer to field installation drawings for proper recirculation pipe installation.
- Inspect the recirculation inlet pipe. It should be free of any debris.
- Connect the flexible pipe section using the connections provided.
- Pipe straps are supplied on the unit to secure the pipe along the tank wall. Install the recirculation flexible pipe in order to avoid any pipe drop that could cause sand accumulation and vibrations.
- Refer to the following pictures for proper installation.

MICROSAND RECIRCULATION PUMP ADEQUATE HOSE INSTALLATION

MICROSAND RECIRCULATION PUMP INCORRECT HOSE INSTALLATION

Figure 13: Microsand recirculation pump hose installation

7.7 CLARIFIED WATER TURBIDIMETER

FOR ENDRESS+HAUSER TURBIMAX CUS51D PROBE

- Install solenoid valve (ship loose item) and connect the probe cleaning head with compressed air tubing (¼" diameter, by others).

FOR HACH SOLITAX PROBE

- No action needed.

7.8 INLET TURBIDIMETER (Optional)

FOR ENDRESS+HAUSER TURBIMAX CUS51D and HACH SOLITAX PROBRE

- Refer to manufacturer's manual for installing inline retractable assembly kit to be mounted on inlet piping.

7.9 LAMELLA CLEANING SYSTEM (Optional)

- Refer to field installation drawings for proper system location and installation.
- Close all valves situated on the cleaning system conduct.
- Inspect the pipe inlet; it should be free of any debris.
- Connect the compressed air supply to pipe.
- Before feeding the system with air, reopen valves and refer to AERSHAFT® operation and maintenance manual.

8 TORQUE VALUES

EQUIPMENT TYPE AND SIZE	LUBRICATED	
	in-lbs	ft-lbs
Plug valves (drain connection and recirculation pump isolation) with ASTM A193 B8 304 bolts		
1/2" - 13 UNC	420	35
5/8" - 11 UNC	420	35
3/4" - 10 UNC	540	45
Butterfly valves (drain connections) with ASTM A193 B8 304 bolts		
5/8" - 11 UNC	420	35
3/4" - 10 UNC	540	45
Recirculation pumps (piping connections) with zinc plated ASTM A193 B7 studs [1]		
1/2" - 13 UNC	576	48
5/8" - 11 UNC	1140	95
Lifting system hardware with SAE Gr. 8 zinc plated bolts [2]		
5/8" - 11 UNC	1908	159
1" - 8 UNC	8172	681
Steel flange bolting with red rubber gasket and ASTM A193 B8 AISI 304 bolts [3]		
Flange 1½" (1/2" - 13 UNC bolt)	300	25
Flange 2" (5/8" - 11 UNC bolt)	588	49
Flange 2½" (5/8" - 11 UNC bolt)	600	50
Flange 3" (5/8" - 11 UNC bolt)	600	50
Flange 4" (5/8" - 11 UNC bolt)	588	49
Flange 6" (3/4" - 10 UNC bolt)	828	69
Flange 8" (3/4" - 10 UNC bolt)	996	83
Flange 10" (7/8" - 9 UNC bolt)	1152	96
Flange 12" (7/8" - 9 UNC bolt)	1596	133
Flange 14" (1" - 8 UNC bolt)	2412	201
Flange 16" (1" - 8 UNC bolt)	2172	181
Flange 18" (1⅛" - UN8 bolt)	2373	198
Flange 20" (1⅛" - UN8 bolt)	2244	187
Flange 24" (1¼" - UN8 bolt)	3120	260
Other steel hardware bolting with ASTM F593 AISI 316 bolts [4]		
1/4" - 20 UNC	62	-
3/8" - 16 UNC	228	19
1/2" - 13 UNC	552	46
5/8" - 11 UNC	1104	92
3/4" - 10 UNC	1356	113
7/8" - 9 UNC	2184	182

Table 2: Torque values for bolting by equipment type and size

Notes:

1) Values used with this note is calculated from 60% of the full bolt torque (with anti-seize K = 0.17, formula T = KDF) to account for pump rubber seals.
2) Lubricated based on K = 0.15 for torque values calculated with formula T = KDF.
3) Durometer 60 red rubber gasket B16.5 #150 flat face flanges and A193 B8 Class 1 bolts preferred torque values.
4) Lubricated based on K = 0.16 for torque values calculated with formula T = KDF.
5) The use of this information is at sole risk of the user.

9 ELECTRICAL INSTALLATION

NOTE: Electrical work should be performed by a qualified contractor. Refer to control panel and electrical diagram for proper wiring installation.

9.1 GROUNDING

- Connect tanks earthing lugs in order to ground the tank.

9.2 CONTROL PANEL

- Supply wiring between unit (junction box optional) and the control panel.
- Supply power (575V or 460V / 3 ph / 60 Hz) and (120V / 1 ph / 60 hz) to the control panel. Refer to technical datasheet.
- Before permanently wiring the control panel, verify the rotation of each motor (clockwise or counter clockwise).

9.3 TANK MIXER

- Connect each mixer motor to control panel or junction box.

WARNING: Never run a mixer without the tank being completely filled with water.

9.4 SCRAPER

- Connect scraper motor to control panel or junction box.

9.5 RECIRCULATION PUMP

- Connect each recirculation pump motor to control panel or junction box.

9.6 CLARIFIED WATER TURBIDIMETER

- Recommended supplier wiring instructions are given in the manufacturer' manual.

WARNING: Never cut the original cable between turbidimeter unit and its power supply unit. This cable must remain at full length.

9.7 CLARIFIED WATER pH METER

- Connect coagulation pH meter to transmitter or junction box.

9.8 WATER LEVEL SWITCH

- Complete connection if any.
- Recommended supplier wiring instructions are given in the supplier manual.

9.9 INLET FLOWMETER (Optional)

- Supply wiring between unit and control panel.
- Complete connection if any.
- Recommended supplier wiring instructions are given in the supplier manual.

9.10 INLET TURBIDIMETER (Optional)

- Supply wiring between unit and control panel.
- Complete connection if any.
- Recommended supplier wiring instructions are given in the supplier manual.

9.11 RECIRCULATION PRESSURE TRANSMITTER (Optional)

- Supply wiring between unit and transmitter or junction box.
- Complete connection if any.
- Recommended supplier wiring instructions are given in the supplier manual.

10 ACTIFLO® BALLASTED CLARIFICATION PROCESS

10.1 GENERAL INFORMATION

The Actiflo® process is a high-speed clarification process that combines the benefits of ballasted flocculation and lamellar clarification. It is a high-performance compact process that results from many years of research and development in the fields of potable water, wastewater and storm water. It represents the most efficient clarification method currently available on the market to effectively eliminate turbidity, colour, algae, suspended solids (SS), metals, total organic carbon (TOC), tastes and odours.

Suspended particles, previously destabilized with the injection of a coagulant in the raw water, are fixed to the microsand with the help of a polyelectrolyte added to the water. The flocculate (or floc) thus formed is subsequently separated from the water by countercurrent lamellar settling with an ascending hydraulic flux.

10.2 CHARACTERISTICS AND PERFORMANCES

The high efficiency of the Actiflo® process is the result of the combination of two tried and tested technologies:

- Injection of microsand, which supports the ballasted flocs and works as weight in order to create very dense flocs, thus ensuring a very high rate of settling.
- Lamellar settling, which increases the settling surface in a reduced tank volume by using a set of inclined parallel tubes.

Combining ballasted flocculation and lamellar settling, the Actiflo® process enables the water to reach very high ascending hydraulic speeds. Furthermore, these technologies render the system very stable against variations in raw water flow, temperature, pH and/or turbidity without, however, compromising effluent quality. The stability of the Actiflo® process simplifies its operation.

When the water flow is at its peak, all treatment stages (coagulation/flocculation/maturation) take approximately 10 minutes to complete. This short hydraulic retention time makes the process extremely reactive to chemical dosage adjustments. An optimal use of reagents also results in minimal operating costs, i.e., up to 40% less compared to conventional processes.

Ballasted flocculation produces clarified water of very high quality, including in difficult operating conditions, such as very cold, very cloudy and/or very coloured water.

The Actiflo® clarifier reacts very quickly to starting requirements and changing operating conditions. Turbidity at the clarifier's outlet may be reduced to the point of surpassing required standards in less than 20 minutes (as the case may be) following system start-up.

The excellent settleability of the outgoing sludge makes it easy to thicken and dewater the sludge produced.

10.3 REVIEW OF THE WATER CHEMISTRY AND THE ACTIFLO® PROCESS

Extremely small colloidal particles (measuring 0.001–1 µm) are mainly what give water its turbidity and colour. These particles are stable and repel each other. To eliminate them, coagulation and flocculation processes are used.

The primary objective of coagulation is to destabilize the colloidal particles, i.e., to facilitate their coalescence. In practice, this process is characterized by the injection of a coagulant that coalesces the small particles into larger particles.

Flocculation is the physicochemical process during which suspended solids in a liquid coalesce and form larger particles, usually very porous, known as flocs. The flocs usually settle much more quickly than the primary particles of which they are formed. Flocculation may occur naturally or be accelerated by the use of a flocculant. The resulting flocculate is combined with microsand to increase its density and accelerate its settling, as is the case here using a combination of polymer and sand.

Coagulation

Coagulation is the destabilization of colloidal particles (measuring 0.001–1 µm) to facilitate their coalescence.

Coagulation is affected by:

- The pH, which must be within the optimal range.
- The concentrations of dissolved salts, which impact the pH range, the coagulant dosage and the duration of the mixture.
- The temperature of the water, which impacts the kinetics of the chemical reactions and increases the water's viscosity.
- The mixture (a quick mixture increases the dispersion of the coagulant but can also break up the flocs).
- The turbidity (an increase in turbidity will lead to an increase in the required coagulant dosage).
- The colour (resulting from the presence of organic matter, the required coagulant dosage depends on the colour of the raw water).
- Overdosing, this impacts the stability of the solution (destabilization of the double layer) and the pH range.

Flocculation

Flocculation consists of combining the coagulated flocs and microsand to create larger and heavier flocs in the injection and maturation tanks under the effect of the flocculant (polymer) which binds the particles together.

Microsand

Microsand is used as a ballast to accelerate the settling of the flocs in the settling tank. It also buffers the impact of wastewater flow, quality or temperature variations.

10.4 OPERATION PRINCIPLES

Raw water goes through four (4) successive steps that are part of the Actiflo® treatment process:

10.4.1 EXTENDED COAGULATION (ACP2 VARIATION ONLY)

A coagulant is added to the raw water upstream of the unit. The water then enters a first tank, i.e., the extended coagulation tank. A mechanical mixer is optionally fitted on this tank and allows to intensively mix the coagulant. The coagulant is homogeneously dispersed in the water and destabilizes the suspended particles. The rapid mixing triggers the dispersion of the coagulant in the raw water to form small flocs (also known as “pin flocs”).

10.4.2 COAGULATION

For ACP R variation: A coagulant is added to the raw water upstream of the unit. The water then enters a first tank, i.e., the coagulation tank.

For ACP2 variation: The water enters the second tank, i.e. the coagulation tank from the extended coagulation tank.

Within the coagulation tank, a mechanical mixer is used to ensure intensive mixing. Consequently, the coagulant is homogeneously dispersed in the water and destabilizes the suspended particles. The rapid mixing triggers the dispersion of the coagulant in the raw water to form small flocs (also known as “pin flocs”).

10.4.3 INJECTION (ACP R VARIATION ONLY)

The coagulated water then enters the injection tank. Microsand and the polymer are added simultaneously to foster contact between the coagulated solids, the polymer and the microsand. The rapid mixing accelerates the dispersion of the polymer and the microsand as well as the formation of ballasted flocs.

10.4.4 MATURATION (ACP R VARIATION ONLY)

Next, the water enters the maturation tank, which is the largest of the three (3) tanks. An additional quantity of polymer is injected in this tank and the slower mixing combined with a longer retention time foster the maturation of the flocculate. The resulting flocs are larger in size.

10.4.5 FLOCCULATION (ACP2 VARIATION ONLY)

The ACP2 variation of the Actiflo® has a flocculation tank which is the largest of the three (3) tanks that plays both the role of injection of microsand, polymer and maturation of the flocculate. This can be achieved through the use of Turbomix® technology that enhances flocculation.

10.4.6 COUNTER-CURRENT LAMELLAR SETTLING

Ballasted flocs precipitate to the bottom of a hopper and the clarified water is collected at the surface using troughs. The sludge is drawn out of the hopper by a pump and is directed toward a series of hydrocyclones. The hydrocyclones located above the injection tank separate the microsand from the sludge. The microsand is recirculated into the system via the underflow of the hydrocyclones while the sludge is evacuated through the overflow.

11 DESCRIPTION OF COMPONENTS

11.1 ACTIFLO® CLARIFIER (ACP R VARIATION ONLY)

11.1.1 GENERAL DESCRIPTION

An Actiflo® clarifier (ACP R variation) is composed of coagulation, injection and maturation tanks, a lamellar settling tank with a hopper, a series of lamellar tubes and troughs for the collection of clarified water, a microsand recirculation circuit, piping and a control panel.

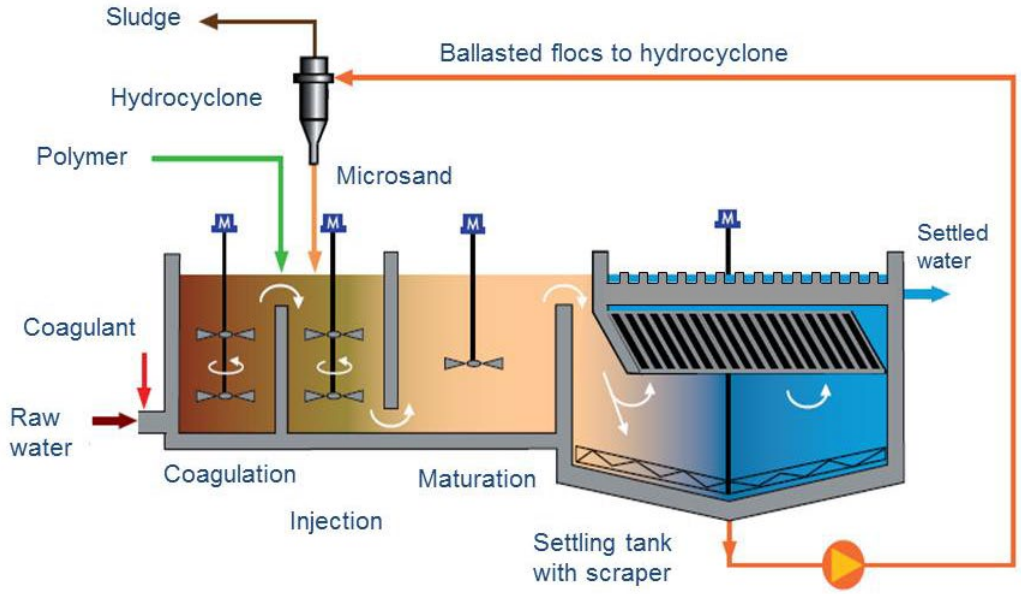


Figure 14: Actiflo® clarifier schematic – ACP R variation – General description

11.1.2 COAGULATION TANK

Raw water enters the Actiflo® at the bottom of the coagulation tank. Coagulant is added upstream of this tank to improve contact time.

The coagulation tank is equipped with a mechanical mixer composed of a shaft and a four-bladed propeller made of stainless steel. The mixer is vertically mounted and the induced water flow direction is downward.

The mixer is driven by a motor and a helical gear speed reducer. It is a totally enclosed fan cooled motor (TEFC) and operates at a constant speed. In case of thermo-mechanical overload, the motor stops automatically and an alarm warns the operator.

A manual drainage valve, located in the coagulation tank, allows draining this tank through the existing draining network.

11.1.3 INJECTION TANK

Coagulated water enters the top portion of the injection tank by going over a flooded overflow, which communicates directly with the coagulation tank. An accurate amount of microsand and polymer is added at the tank water surface. The polymer may also be directly added in the bottom injection or maturation tanks.

The injection tank is equipped with a mechanical mixer composed of a shaft and a four-bladed propeller made of stainless steel. The mixer is vertically mounted and the induced water flow direction is upward.

The mixer is driven by a motor and a helical gear speed reducer. It is a totally enclosed fan cooled motor (TEFC) and operates at a constant speed. In case of thermo-mechanical overload, the motor stops automatically and an alarm warns the operator.

A manual drainage valve, located in the injection tank, allows draining this tank and the maturation tank through the existing draining network.

11.1.4 MATURATION TANK

Water and flocculated solids originating from the injection tank enter at the bottom of the maturation tank through a common opening.

The maturation tank is equipped with a mechanical mixer composed of a shaft and a four-bladed propeller made of stainless steel. The mixer is vertically mounted and the induced water flow direction is downward. The maturation tank is equipped with baffles to insure better mixing.

The mixer is driven by a motor and a helical gear speed reducer. It is a totally enclosed fan cooled motor (TEFC) and may operate at a constant or variable speed. An adjustment to the rotating speed can be proven necessary when the incoming water flow rate is greatly reduced. In this case, it might be advantageous to compensate for losses in hydraulic energy by increasing the speed of rotation of the maturation mixer. In case of thermo-mechanical overload, the motor stops automatically and an alarm warns the operator. The unit automatic shutdown sequence is also initiated.

A manual drainage located, in the injection tank, allows draining the maturation tank through the existing draining network.

11.2 ACTIFLO® CLARIFIER (ACP2 VARIATION ONLY)

11.2.1 GENERAL DESCRIPTION

An Actiflo® clarifier (ACP2 variation) is composed of an extended coagulation (not shown but is located between raw water inlet and coagulation tank), coagulation and flocculation tanks, a lamellar settling tank with a hopper, a series of lamellar tubes and troughs for the collection of clarified water, a microsand recirculation circuit, piping and a control panel.

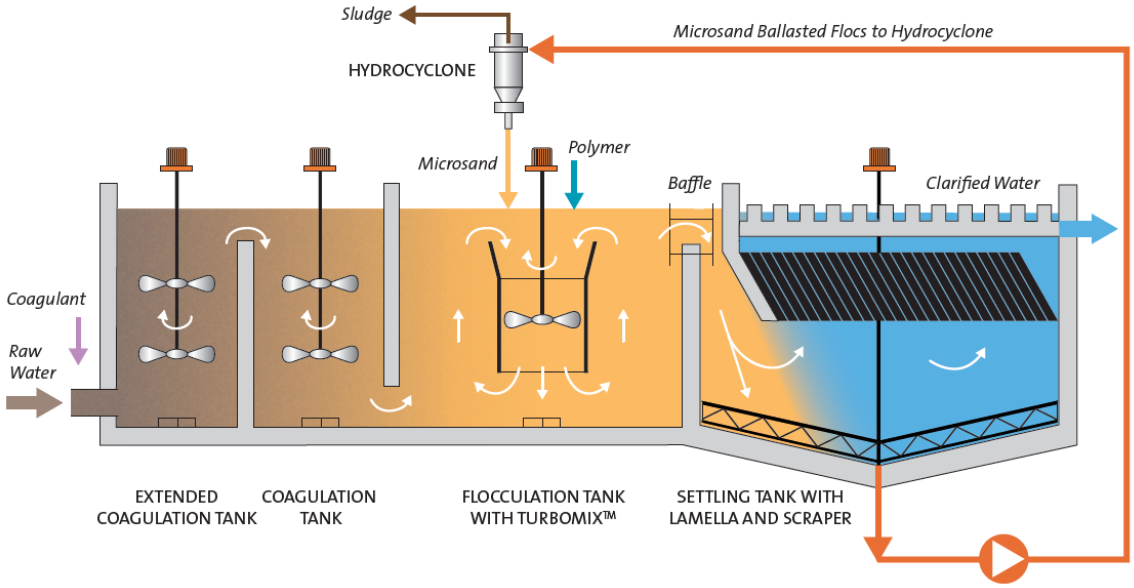

Figure 15: Actiflo® clarifier schematic – ACP2 variation – General description

11.2.2 EXTENDED COAGULATION TANK

Raw water enters the Actiflo® at the bottom of the extended coagulation tank. Coagulant is added upstream of this tank to improve contact time.

The extended coagulation tank is optionally equipped with a mechanical mixer composed of a shaft and a four-bladed propeller made of stainless steel. The mixer is vertically mounted and the induced water flow direction is downward.

The mixer is driven by a motor and a helical gear speed reducer. It is a totally enclosed fan cooled motor (TEFC) and operates at a constant speed. In case of thermo-mechanical overload, the motor stops automatically and an alarm warns the operator.

A manual drainage valve, located in the extended coagulation tank, allows draining this tank through the existing draining network.

11.2.3 COAGULATION TANK

Coagulated water enters the top portion of the coagulation tank by going over a flooded overflow, which communicates directly with the extended coagulation tank.

The coagulation tank is equipped with a mechanical mixer composed of a shaft and a four-bladed propeller made of stainless steel. The mixer is vertically mounted and the induced water flow direction is upward.

The mixer is driven by a motor and a helical gear speed reducer. It is a totally enclosed fan cooled motor (TEFC) and operates at a constant speed. In case of thermo-mechanical overload, the motor stops automatically and an alarm warns the operator.

A manual drainage valve, located in the coagulation tank, allows draining this tank and the flocculation tank through the existing draining network.

11.2.4 FLOCCULATION TANK

Coagulated water enters the bottom of the flocculation tank through a common opening.

The flocculation tank is equipped of a draft tube, a pyramid, anti-bypass baffles and a mechanical mixer composed of a shaft and a four-bladed propeller made of stainless steel that constitutes the Turbomix® technology. The mixer is vertically mounted and rotates within the draft tube and the induced water flow direction is downward towards the pyramid. The flocculation tank is equipped with baffles to insure better mixing. An accurate amount of microsand and polymer is added at the tank water surface above the draft tube. The polymer may also be directly added in the bottom of the flocculation tank.

The mixer is driven by a motor and a helical gear speed reducer. It is a totally enclosed fan cooled motor (TEFC) and may operate at a constant or variable speed. An adjustment to the rotating speed can be proven necessary when the incoming water flow rate is greatly reduced. In this case, it might be advantageous to compensate for losses in hydraulic energy by increasing the speed of rotation of the flocculation mixer. In case of thermo-mechanical overload, the motor stops automatically and an alarm warns the operator. The unit automatic shutdown sequence is also initiated.

A manual drainage located, in the coagulation tank, allows draining the flocculation tank through the existing draining network.

11.3 SETTLING TANK

The settling tank is composed of a set of lamella tubes, a sludge collection system and a clarified water collector.

The water coming from the maturation tank contains a suspension of microsand-ballasted flocs and enters the settling tank after going through a vertical baffle. The solids settle in the hopper while clarified water flows through the lamella pack to the clarified water troughs.

11.3.1 LAMELLA PACK

The settling tank contains a set of lamellar tube modules made from high impact polystyrene or polypropylene (depending on the standard option selected). The lamellar tubes are positioned at an angle of 60° from the horizontal plane. They are laid out in such a way as to form hexagonal (honeycomb) cells.

Clarified water flows upwards to the collection troughs and out of the clarifier.

WARNING: The lamella pack is installed in the settling tank section of the Actiflo® clarifier. The HIPS version of the lamella pack is made of a very flammable material. Do not expose it to open flames or sparks. Do not allow any welding works nearby unless special precautions have been taken.

11.3.2 SLUDGE COLLECTION HOPPER

The collection of sludge takes place within a hopper located at the base of settling tank where the settling solids are pumped to the hydrocyclones.

11.3.3 CIRCULAR SCRAPER

The settling tank has a circular scraper equipped with a drive shaft and metal and rubber flights. The vertically mounted scraper moves the settled microsand to the center of the hopper, where a basin captures the accumulated sludge. These components are powered by a combination of gear boxes and TEFC motor. In case of a mechanical overload, the scraper stops automatically and an alarm is displayed on the control panel. The automatic shutdown sequence is also triggered.

11.3.4 CLARIFIED WATER TROUGHS

Clarified water is collected above the lamella modules by stainless steel troughs. The dimension and position of the square-edged notches are designed in order to obtain an optimal hydraulic distribution of the flow rate inside the settling tank.

11.3.5 PARTIAL DRAINAGE

A manual valve, installed below the settling lamellas, allows for partial draining of the settling tank to facilitate the preventive maintenance of the lamellar tubes.

11.3.6 COMPLETE DRAINAGE

There is two (2) ways to achieve a complete drainage of the clarifier:

1) By opening the coagulation, injection and hopper drain manual valves.
2) By opening the coagulation and injection manual drainage valves and turning the recirculation pump on.

WARNING: It is important that the recirculation pump does not operate without water.

11.4 MICROSAND RECIRCULATION PIPING

11.4.1 COLLECTION OF SLUDGE AND MICROSAND

Sludge containing microsand is collected in the hopper and pumped to the hydrocyclones through galvanized steel pipes and flexible non-abrasive pipes that can withstand highly abrasive conditions.

In case of clogging, a clean-out assembly is provided to backwash and flush the suction line by connecting a pressurized service water hose.

11.4.2 MICROSAND RECIRCULATION PUMPS

The clarifier is provided with a centrifugal pump (second pump optional) equipped with a pulley and drive belt arrangement. A backup pump is also optionally supplied. The backup pump may be used to assist the first pump if higher influent solids are experienced. The impeller and the inside of the volute are coated with a material (usually natural rubber) resistant to microsand abrasion. The motor is totally enclosed fan cooled (TEFC). In case of a thermo-mechanical overload, the motor will automatically shut down and an alarm will warn the operator.

The recirculation pump operates at a constant pressure. An increase in pressure may be caused by an obstruction of the discharge pipe and a decrease in pressure may be caused by unpriming of the pump or an obstruction of the inlet pipe. An optional pressure gauge could be located at the pump discharge. An optional pressure transmitter is located at the hydrocyclone inlet. If the measured pressure becomes too low, the pump stops and an alarm will warn the operator.

11.4.3 HYDROCYCLONES

The sludge and microsand are pumped by the recirculation pump to a dedicated hydrocyclone where the microsand is separated from the sludge particles. This process allows the recycling of clean microsand back into the system. Sludge-microsand separation is accomplished by a vortex effect exerting a centrifugal force on the mixture of particles.

The microsand grains, more dense than sludge particles, descend along the internal surface of the hydrocyclone, while the sludge particles ascend. The microsand is returned to the injection tank while the sludge is evacuated out of the system through the hydrocyclone overflow piping.

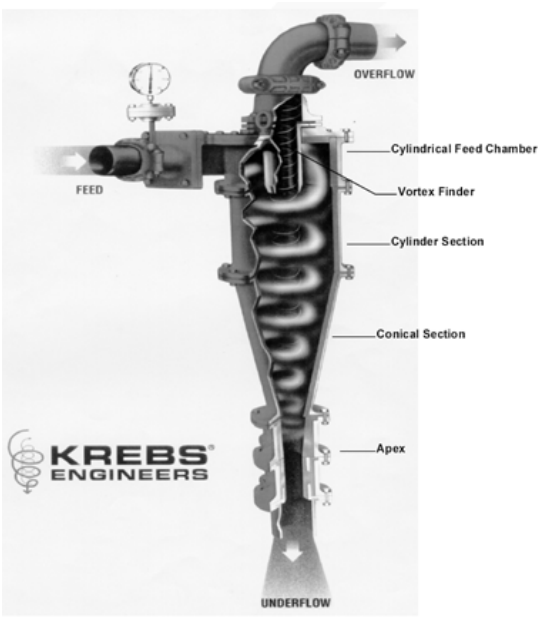

Figure 16: Hydrocyclone – General description

11.5 MICROSAND

The recycling of microsand into the injection tank along with the polyelectrolyte solution (polymer), serves as support for the flocs formation. The floc, ballasted with the microsand grain, becomes considerably heavier and therefore can settle more rapidly.

Two types of microsand with different grain sizes may be used:

- Effective size: 85 µm and 135 µm (refer to data sheet)
- Available in bags of 22.7 kg (50 lbs)

The first sand size (85 µm) is generally used in drinking water applications with water lightly to moderately loaded while the 2nd sand size (135 µm) is used in more heavily loaded water (waste water, industrial water, storm water) and higher rise rates.

A small portion of the microsand is lost in the process and microsand must therefore be periodically added to the system. Microsand refills that meet Actiflo® specifications are available from Veolia Water Technologies Canada Inc.

WARNING: The microsand may contains fine particles of silica. Therefore, it must be handle safely and with caution by qualified staff. Consult the MSDS for further instructions.

11.6 COAGULANT

The choice of a coagulant depends on the process. The following can be used as a coagulant: an aluminum salt such as alum, an iron salt such as ferric chloride, PASS (poly aluminum silicate sulfate) or PAC (poly aluminum chloride), if the feed pumps are sufficiently resistant to chemicals.

The coagulant is injected upstream of the raw water feed pipe and reacts with the water's alkaline components to form a precipitate that clings to the suspended colloidal particles and organic components in the raw water, thereby producing floc. In certain cases, an alkali such as caustic soda must be added to the water upstream of the settling tank before the coagulant is injected.

The coagulant is rapidly dispersed in the water when it is introduced in the coagulation tank.

WARNING: The operation staff should be aware that coagulant is highly corrosive. Spills should be cleaned immediately according to the MSDS instructions.

11.7 FLOCCULANT (POLYELECTROLYTE)

The polyelectrolyte is a white powder [1] generally sold in 50 lbs bags or supple big bags of 2000 lbs. The powder is naturally hygroscopic so it must be stored in a dry environment. The polymer powder must be vigorously mixed with service water using preparation and maturation equipment.

Polyelectrolyte is pumped into the injection and maturation tank along with the microsand. It forms a coating on the microsand particles in order to activate them and facilitate fixing of the floc onto the sand particle surface. Other injection points of flocculant can also be used, that is, at the inlet of the maturation tank and at various locations inside the maturation tank.

WARNING: The operation staff should be aware that flocculant solution could be very slippery. Spills should be cleaned immediately according to the MSDS instructions.

[1] Polymer could also be in emulsion form in certain waste water applications.

11.8 CONTROL PANEL

The Actiflo® clarifier operation is fully automated but manual control is possible from the control panel interface. The control panel normally includes but is not limited to components such as fuses, starters, Variable Frequency Drive (VFD), warning lights, PLC (Programmable Logic Controller) and operator interface.

The electrical circuit of the control panel performs the necessary functions for a fully automatic operation and equipment protection of the Actiflo® unit. The control panel gives the operator access to every mechanical component of the system. In addition, all the alarms are channelled through the control panel, which in turn warns the operator in the event of equipment malfunction. Refer to the process functional description of control system in the «Electricity and Control» section of the complete operation and maintenance manual for a detailed description of the control panel.

12 START-UP & OPERATION

12.1 START-UP

12.1.1 PRELIMINARY VERIFICATION

Before starting the Actiflo®, the following points must be checked:

- Remove any debris from the settling tank to prevent hydrocyclone clogging.
- Every section of the Actiflo® must be filled with water.
- Valves configuration on the microsand recirculation lines is adequate.
- Chemical metering systems must be ready to operate.
- Chemical storage tanks must be full.
- Chemical metering pumps must be calibrated and set for the desired dosage. These can however be adjusted once that the system is operational.
- All the field instruments must be calibrated (flowmeter, pressure transmitter, pH, turbidimeter).
- Verify the oil level in the mixers gear reducers and the grease in the recirculation pumps.
- Verify the rotation of each mixer.
- Verify the rotation of each recirculation pump; remove the belt to prevent impeller unscrewing if the rotation is the wrong way.
- Verify the proper installation of the mixer impellers, especially the height above tank floor (refer to technical sheet and field installation drawing).
- Adjust motor overload protection to the proper value as indicated on each motor nameplate.
- Record the pressure at the hydrocyclone inlet gauge. Refer to technical datasheet.

Once all these conditions have been checked, the system can be put into operation.

12.1.2 INITIAL MICROSAND LOADING

The standard microsand load in an Actiflo® clarifier is approximately 1000 lbs per MGD of design or 2.5 kg per m^3/h, flow rating of unit.

The addition of microsand is done by pouring it directly in the injection tank until the required concentration is reached. It is preferable to begin by adding a small quantity of microsand and measure the resulting microsand concentration in the recirculation line after a whole recirculation cycle has been completed (15 to 20 minutes). The quantity of microsand should be increased until the optimal concentration in the recirculation line is reached (typically 30 to 100 ml/litre).

WARNING: The microsand may contains fine particles of silica. Therefore, it must be handle safely and with caution by qualified staff. Consult the MSDS for further instructions.

12.1.3 AUTOMATIC START-UP

Refer to the process functional description of control system of the «Electricity and Control» section of the complete operation and maintenance manual to start the Actiflo® system in automatic mode.

12.2 NORMAL OPERATION

NOTE: In the case of a discrepancy between this section of the manual and the functional description of control system, the latest shall prevail.

12.2.1 ACTIFLO® CLARIFIERS

12.2.1.1 Mixers

Role in the process

By fostering contact between the chemicals and the raw water, the coagulation mixer improves the coagulation of the colloidal particles present in the raw water. The injection tank mixer triggers the forming of the flocs and transfers them to the maturation tank. The maturation tank mixer is required to keep the flocs in suspension and foster their growth.

Impact of a mixer problem on the process

If the coagulation tank mixer breaks down during the normal process operation, the effectiveness of the treatment will be affected because optimal coagulation will not be achieved. The flocs may decrease in size and the turbidity of the clarified water may increase as a result of suboptimal coagulation. However, when the Actiflo® unit is operated in automatic mode, a breakdown of the coagulation mixer will not force the shutdown of the process. Although not optimal, the operation remains possible.

If the injection tank mixer breaks down during the normal process operation, the microsand that is recirculated by the hydrocyclone will settle and accumulate at the bottom of the injection tank. The effectiveness of the treatment will be significantly affected as the microsand is no longer available to ballast the flocs. For that reason, when the Actiflo® unit is operated in automatic mode, a breakdown of the injection tank mixer immediately results in a shutdown of the process, pursuant to the automatic shutdown sequence.

If the maturation tank mixer breaks down during the normal process operation, the microsand will settle and accumulate at the bottom of the maturation tank. The effectiveness of the treatment will be significantly affected as the microsand is no longer available to ballast the flocs. For that reason, when the Actiflo® unit is operated in automatic mode, a breakdown of the maturation tank mixer immediately results in a shutdown of the process, pursuant to the automatic shutdown sequence.

Direction of rotation and position of the blades

It is very important to pay attention to the direction of rotation of the mixers in an Actiflo® unit, for example, when a motor is replaced and electrical connections are unplugged and replugged. When blades are replaced, it is also important to reinstall the blades in the correct position.

A mixer should always circulate the water in the opposite direction of the hydraulic path in the process, the goal being to increase turbulence and promote contact between the water and the chemicals added to it.

The following figure illustrates the direction of rotation of each of the mixers used in the Actiflo® process for a typical tank configuration. If a mixer does not rotate in the correct direction, the microsand may settle at the bottom of the injection or maturation tank and preferential currents may be generated. The performance of the process may be greatly affected.

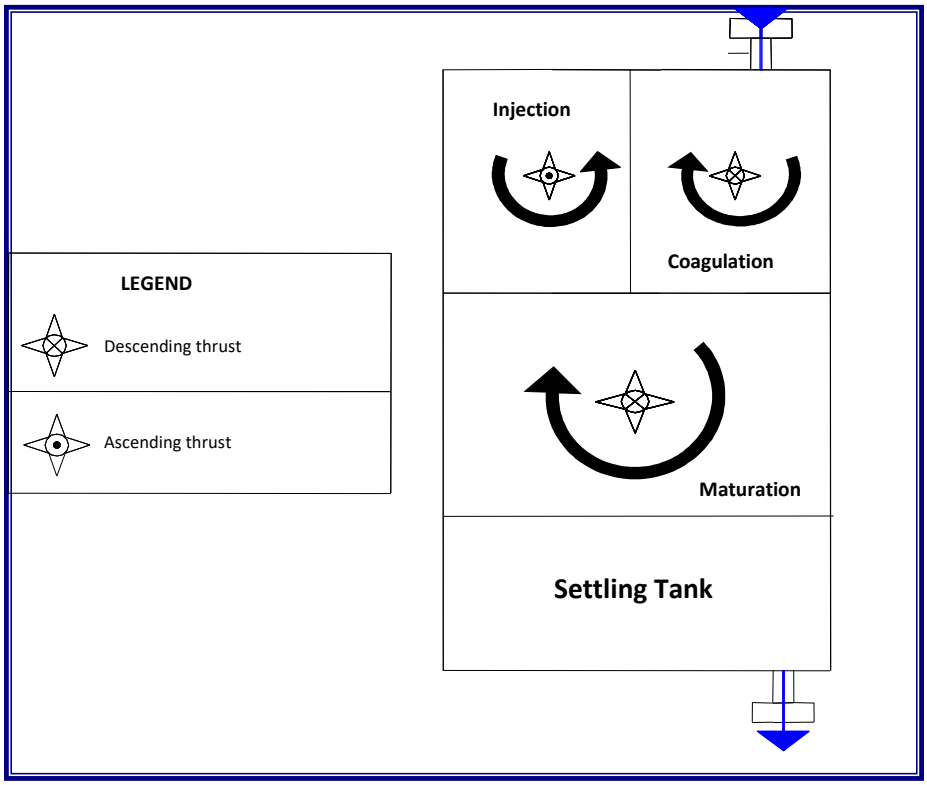

Figure 17: Direction of rotation and thrust of an Actiflo® unit's mixers

Rotation speed

The coagulation and injection tank mixers operate at a predetermined nominal rotation speed.

In the case of the maturation tank mixer, a speed variator is added inside the control panel to provide the operator with the possibility of modifying the rotation speed. The rotation speed can be modified

using the variator's potentiometer. Furthermore, the operator can access a series of operating parameters through the speed variator's pin pad. The full list of these operating parameters is provided in the supplier's manual. When selected by the operator, these parameters are displayed on the screen of the speed variator along with their respective values and can then be modified. It may be necessary in certain situations to adjust the speed, for example, to compensate for a lack of kinetic energy resulting from a low processing speed or to reduce the speed in cases where the flocs are abnormally fragile to shearing.

12.2.1.2 Circular scraper

Role in the process

The Actiflo® clarifier is equipped with a circular scraper that collects the sludge resulting from the physico-chemical treatment of the raw water and directs it to the suction piping of the microsand recirculation pump.

Impact of a scraper problem on the process

Normally, the scraper operates on an ongoing basis and an accidental shutdown (electrical overload, very high torque) may lead to a sharp drop in treatment efficiency seeing as the microsand is then no longer recirculated in the process. That is why the whole system stops after the scraper has stopped working when the Actiflo® is operated in automatic mode.

Rotation detection

When the scraper's high torque alarm sounds, verify:

1) If the concentration of microsand in the hydrocyclone's underflow is too high, calculate the concentration of sand in the Actiflo® to determine if there is too much sand in the unit. If that is the case, it is then possible to redirect the excess sand by blocking the hydrocyclone's underflow for several minutes. However, this is a last-resort method to prevent damaging the sludge treatment equipment located downstream. A concentration of sand that is too high in the Actiflo® may sometimes be detected by unusual hydrocyclone behaviour and pressure (underflow that "bulges", unusual "umbrella", pressure that is unstable or different from that of normal operation, etc.). Refer to section 13.4.7.
2) Verify for the presence of debris at the bottom of the tank. Stop the Actiflo® unit and drain the settling tank to verify for the presence of debris at the bottom of the tank.

12.2.1.2.1 Speed monitor configuration (IFM DD2503)

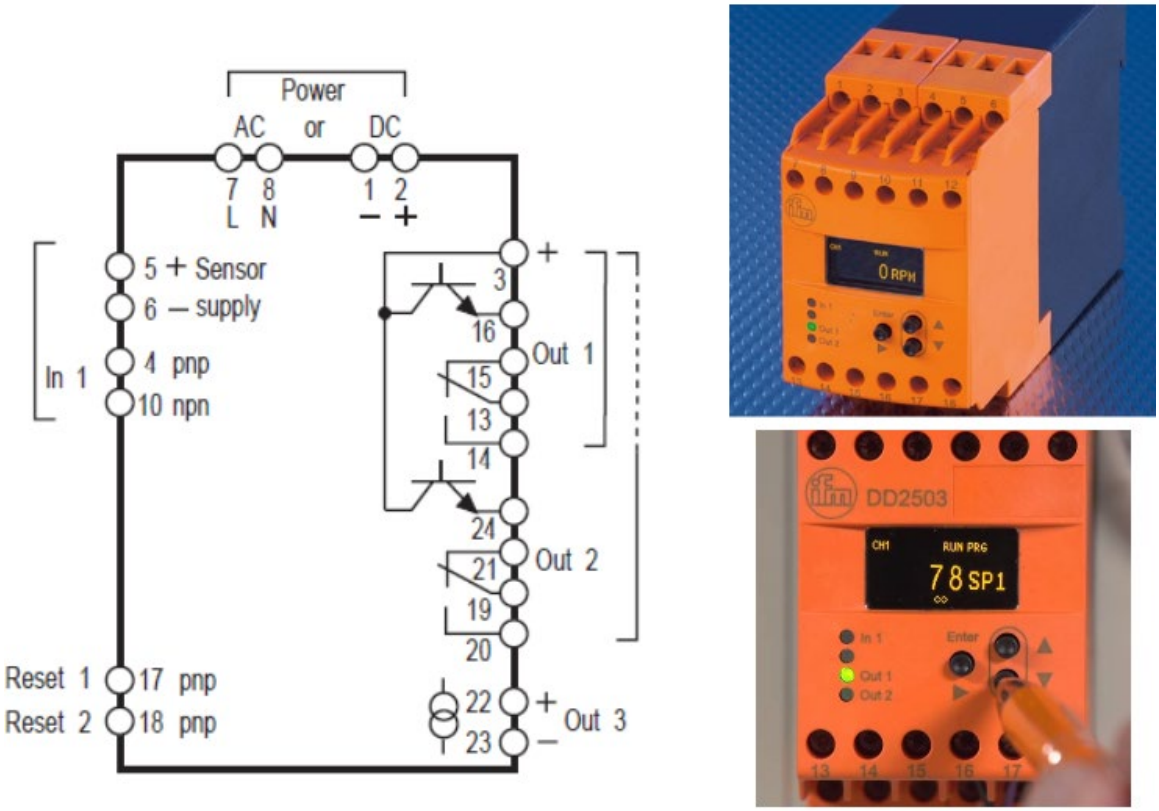

Figure 18: Speed monitor configuration parameters (IFM DD2503)

Typical Adjustment

- FO1: 2
- SO1: 0
- FWx: 0
- NC1: 1
- DIM: 0 = RPM
- SP1: Refer to Table 3 (next page)
- HY1: 5
- ST1: 15
- DT1: 0
- FT1: 5

ACTIFLO® MODEL	DD2503 SP1 (RPM)

ACP-300R/ACP2-30	79
ACP-400R/ACP2-40	77
ACP-450R/ACP2-45	71
ACP-550R/ACP2-55	1745
ACP-600R/ACP2-60	1745
ACP-700R/ACP2-70	1745
ACP-750R/ACP2-75	1745

Table 3: Speed monitor IFM DD2503 set point (SP1) per Actiflo® model

12.2.1.3 Lamellas

Role in the process

The settling of the ballasted flocs is the final step in the raw water clarification process. The flocs descend to the bottom of the settling tank while the clarified water is collected in the troughs. By increasing the contact surface, the lamellas increase the settling of small residual particles.

Impact of the fouling of the lamellas on the process

Over time, flocs accumulate on the surfaces of the lamellas (i.e., within the lamellar tubes) and the latter must be cleaned periodically. An excessive fouling of the lamellas may result in a carryover of flocs in the clarified water and an increase in turbidity, particularly when the flow increases within the Actiflo® unit (cleaning). Also, if the unit is not properly cleaned, the accumulation of sand in the modules may ultimately lead to the collapse or breakdown of the lamellar modules when they are exposed to the open air (emptying of the clarifier, for example).

The lamellas must be cleaned on a weekly basis at minimum. However, if the Actiflo® unit is used in wastewater or if fouling is visible after a few hours, it is then recommended to clean the lamellas after two days of ongoing operation.

The cleaning water pressure must not be too high (20–25 lb/in^2 or less, depending on the distance) to avoid damaging the lamellas. It is, however, recommended to use a large hose to ensure an optimal cleaning of the lamellas. This operation may take up to one hour per Actiflo® unit.

Refer to the lamellas cleaning procedure in section 15.1.1 for detailed information.

12.2.1.4 Microsand recirculation pumps

The Actiflo® clarifier requires the operation of at least one microsand recirculation pump.

Role in the process

The recirculation pump collects the mix of sludge produced by the process and microsand and directs it to the hydrocyclones. The hydrocyclones use centrifugal force to separate the microsand and the sludge.

Impact of a recirculation pump or hydrocyclone problem on the process

Normally, the recirculation pump operates continuously and an accidental stop (electrical overload, low or high pressure alarm) may result in a sharp decrease in treatment efficiency because the microsand is no longer recirculated in the process. That is why, when the Actiflo® unit is operated in automatic mode, a breakdown of the recirculation pump results in an immediate stop of the process according to the automatic sequence. Also, in the case of an accidental stop, microsand may accumulate and compact in the recirculation piping, thereby affecting the pump at the time of a subsequent start-up. That is why, in the event of an accidental stop of the recirculation pump, the problem must be diagnosed and quickly solved to avoid clogging the recirculation piping.

Recirculation pump alarms

A pump alarm sounds in each of the following three situations:

- Thermo-mechanical overload of the pump: This is normally a sign that the pump motor is overheating and can be caused by a mechanical breakdown or a pressure surge. The operator must correct this problem by verifying the pump and motor as well as the outlet piping and then reactivate the overload relay located inside the control panel. The overload relay must be adjusted to the maximum amperage value indicated on the pump motor's nameplate.
- Low pressure at the hydrocyclone inlet (optional): This can be caused by an incomplete priming of the pump, a closed isolation valve or the clogging of the pump suction line. The operator must make sure that there is no obstruction at the inlet of the pump and, if so, the sludge suction piping must be cleaned as follows:
    1. Close the suction valve.
    2. Connect a service water hose to the clean-out quick-connect outlet.
    3. Open the service water valve to enable the clean-out.
    4. Clean out the pipe for five minutes.
    5. Put the equipment back into normal operation.
    6. Restart the pump.

This alarm's set point is adjustable and is normally set at 35 kPa below operating pressure.

When one of these alarms is activated, the pump automatically stops. The operator must fix the problem and then reset the system by pressing the interface's alarm reset button. The pump will restart automatically.

In the presence of an alternate (optional) recirculation circuit, the alternate circuit pump will automatically start and become the priority once the alarm has sounded and the operating pump has stopped. This makes it possible to avoid having to completely shut down the Actiflo® clarifier.

In manual mode, when the microsand recirculation pump must be stopped, the following steps must be carried out first to avoid clogging problems:

- Stop the maturation tank's mixer to allow the microsand to settle in this tank rather than the hopper.
- Allow the pump to operate for approximately 15 minutes and then verify the absence of sand in the hydrocyclone's underflow. It is then possible to stop pumping sand without the risk of clogging the microsand recirculation circuit.

12.2.1.5 Hydrocyclones

Role in the process

The hydrocyclones operate at a stable pressure. Manometers are generally positioned at the inlets of the hydrocyclones and track the operating pressure. Through the hydrocyclone's overflow, the sludge is directed to the sewer and microsand losses are kept to a minimum.

The hydrocyclone's underflow and overflow must normally represent between 10–40% and 60–90% respectively of the total feed flow. Below is a typical hydrocyclone curve (in this case, Krebs' model U6-10) to illustrate the relationship between flow and pressure depending on the size of the Vortex Finder.

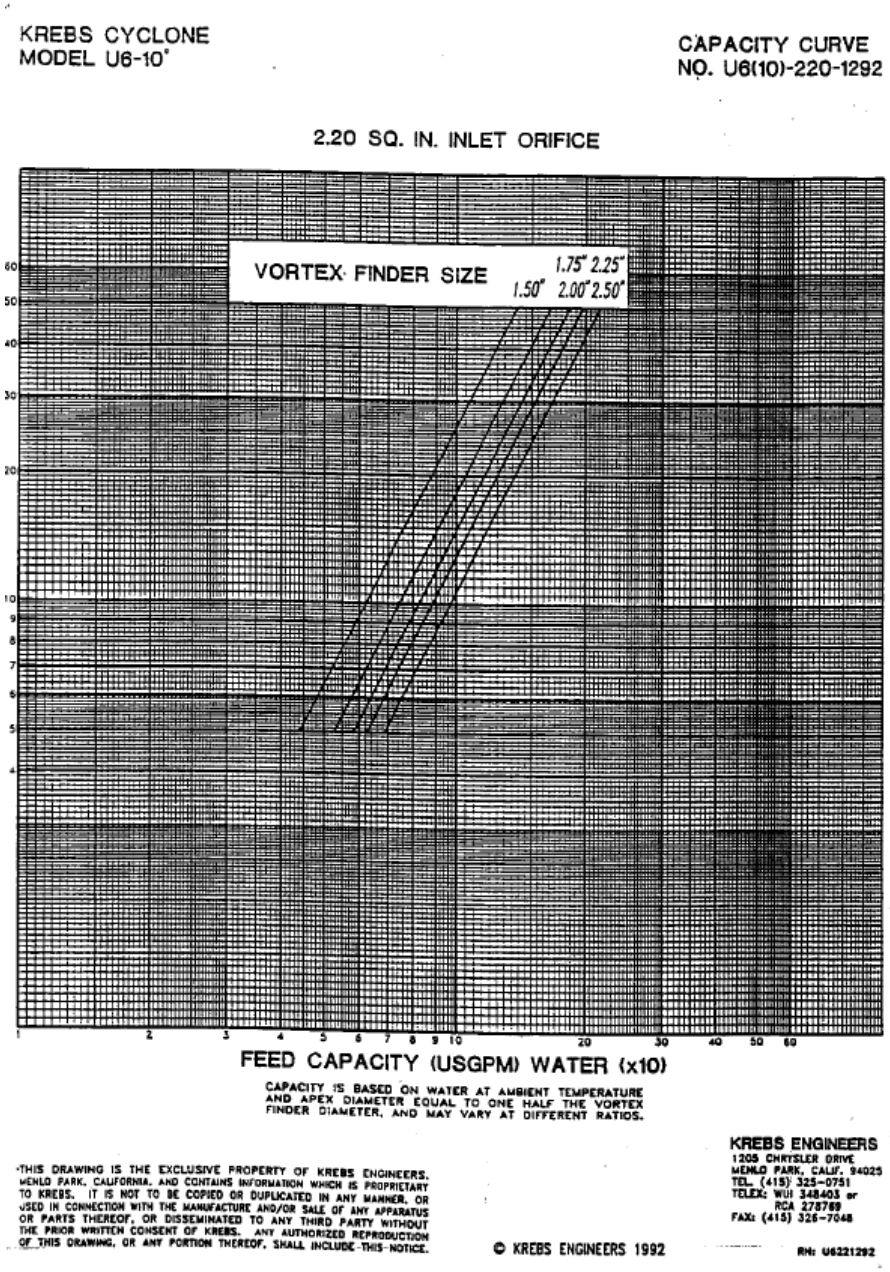

Figure 19: Typical hydrocyclone capacity curve

Impact of a clogged hydrocyclone

The operator must make sure at all times that neither of the hydrocyclone's two extremities are blocked.

In the case of the total or partial clogging of a hydrocyclone, microsand may be released with the sludge without separation and the concentration of microsand in the Actiflo® unit will decrease more rapidly than normal. Also, treatment efficiency will be affected. It is also possible that a separation problem results in sludge being reinjected in the process, thereby affecting the quality of the clarified water. Given its mechanical nature, hydrocyclone clogging will often be diagnosed only once the process lost.

WARNING: It is important to keep the Linaplus skirt in place at the underflow of the hydrocyclone at all times during operation of the Actiflo®. In absence of this Linaplus skirt, a premature wear of the tank wall may occur due to the sandblasting of the hydrocyclone.

12.2.1.6 Microsand monitoring

Microsand concentration is an important parameter to consider when it comes to process monitoring and optimization as well as troubleshooting treatment problems. The microsand treatment rate in the Actiflo® is usually between 3 and 10 kg/m³. Use the Excel file provided at the time of commissioning to automatically calculate the concentration of microsand in the Actiflo®.

Two methods can be used to measure the microsand concentration. Method 1 is used if the line separating the sand and the sludge in the sample is visible. It is the most used method, namely in potable and industrial water applications. Method 2 is used in more particular cases when the line separating the sand and the sludge is less visible (domestic wastewater, concentrated sludge, use of activated charcoal, for example).

Method 1: Sampling in the recirculation line (upstream of the hydrocyclone)

The concentration of the microsand in the feed line to the hydrocyclones is determined as follows:

- Open the isolation valve on the sampling line located on the hydrocyclone supply line. First, drain the line and then fill the 5 gallon US (19 L) conical bottom sampling tank attached to the hydrocyclone support structure. When the tank is full, close the valve. Refer to the following figure.

Figure 20: Microsand conical bottom sampling tank (actual cone may differ from picture)

- Wait for the microsand to settle in the semi-translucent or translucent tank (at least 2 minutes) and record the microsand volume (V_s) obtained as well as the total volume of the sample (V).
- Empty the contents of the tank by opening the drain valve of the can and rinse with clear water.
- Readings will vary depending on raw water quality and flow in Actiflo®. The microsand concentration (C_s) calculated should normally be between 3 to 10 g/L (refer to the following formula).
- Determine the flow rate of the recirculation pump using the curves provided in the Operation and Maintenance Manual (in volume 2, McLanahan tab or recirculation pump).
- Record the flow rate of Actiflo® at the time of sampling.

The concentration will be obtained as follows:

$$Cs\ (g/L) = \frac{\frac{Microsand\ volume\ V_m\ (L)}{Total\ volume\ V_t\ (L)} \times Q_{recirculation\ pump}\ (m^3/h) \times 1650\ \ g/L}{Actiflo\ flow\ (m^3/h)}$$

Where:

V_m = volume of microsand in litres
V_t = volume of the collected sample in litres
1650 g/L = density of the wet settled sand

NOTE: For the most accurate determination of microsand in any given system the sampling procedure above should be performed three (3) times throughout a 24 hour period. Three (3) separate values of C_s should be averaged to determine one final microsand concentration for the day. It is also important to record and trend the final daily value of C_s to give indication of microsand loss over an extended period of time.

Method 2: Sampling in the recirculation line (upstream of the hydrocyclone) and sample weighing

The concentration of the microsand in the hydrocyclone feed line is determined as follows:

- Open the isolation valve on the sampling line located on the hydrocyclone supply line. First, drain the line and fill the 3 L (V_{tot}) sampling tank up to the make-up line and then close the valve.
- Place the filled sampling tank on a scale pre-calibrated using the empty tank and record the total mass (M_{tot}).
- Empty the contents of the tank in the injection or maturation tank and rinse with clear water.
- Readings will vary depending on raw water quality and flow in the Actiflo®. The microsand concentration (C_s) should normally be calculated between 3 and 10 g/L (refer to the following formula).
- Determine the flow rate of the recirculation pump using the curves provided in the Operation and Maintenance Manual (in volume 2, McLanahan tab or recirculation pump).
- Record the flow rate of the Actiflo® at the time of sampling.

The concentration will be obtained as follows:

$$Cs\ (g/L) = \frac{(M_{tot}\ - (V_{tot} \times \rho_{water})) \times Q_{recirculation\ pump}\ (m^3/h) \times \rho_{sand} \times 1000}{(\rho_{sand} - \rho_{water}) \times V_{tot} \times Actiflo\ flow\ (m^3/h)}$$

Where:

M_{tot} = Mass of the sampled liquid in kg
V_{tot} = Volume of the collected sample in litres
ρ_{sand} =Sand density in kg/L = 1.65 kg/L
ρ_{water} = Water density in kg/L = 1 kg/L

12.2.1.6.1 Regular additions of microsand in normal operations

The microsand concentration in an Actiflo® unit decreases over time and new microsand must therefore be added to the unit on a regular basis. Microsand losses are normally of the order of between 0 and 3 g/m^3 of water treated by the process at the nominal flow rate (determination based on the application at the time of commissioning). These values are based on normal operating conditions and depend on the raw water flow rate, chemical dosages and type of microsand used.

To determine if microsand needs to be added to the unit, the microsand concentration in the Actiflo® unit should ideally be measured **at an equal raw water flow rate**. Even though the microsand

concentration in the recirculation line increases following an increase in the raw water flow rate, seeing as more microsand crosses the partition separating the maturation tank from the settling tank, the increase is not necessarily linear.

It is recommended to add microsand on a regular basis such as to maintain a stable concentration and keep the process operating efficiently. If, for example, a unit is sized to treat a maximum flow rate of 8000 m^3/d with a microsand loss of 3 g/m^3, the daily consumption of one Actiflo® unit can be estimated at 24 kg of microsand, i.e., 1 bag.

It is therefore strongly recommended to add **on a daily basis** small quantities of sand instead of making one large addition over a longer period. Combined with low retention times, the massive addition of sand does not foster sufficient contact with the polymer and the floc. Also, such a practice may lead to massive losses of microsand in the clarified water. To compensate losses, the sand must be added directly to the injection tank.

Seeing as microsand always contains a small quantity of fine particles, it is normal that the turbidity of the clarified water slightly increases temporarily following the addition of microsand.

WARNING: The microsand contains fine silica particles and must therefore be handled safely to protect the health of the personnel. Refer to the MSDS to this effect. The use of a P100 respirator filter is mandatory.

The concentration of microsand in the system is determined using the methods detailed in section 12.2.1.6.

In normal operating mode, if the raw water's turbidity increases and/or its colour darkens, it may be necessary to increase the concentration of microsand in the system. Refer to section 13.4 - Troubleshooting.

12.2.1.6.2 Verification of the hydrocyclones' underflow-overflow ratio

Ideally, this verification should be made every 6 to 12 months to confirm the integrity of the hydrocyclone and determine if the apex needs to be replaced. The measurement must be taken on each cyclone individually. If a flowmeter is present on the hydrocyclone's overflow line, the flow reading simply needs to be compared with the flow established at the time the unit was put into service. A variation in flow could be indicative of a damaged hydrocyclone part.

In the absence of a flowmeter, it is often possible to conduct an up-test in the sludge tank or to redirect the sludge line to a 200 L container if the outlet hose is of sufficiently small diameter and flexible.

A visual observation of the shape of the underflow jet may also provide information on how worn the apex is. Refer to section 13.4.7.

12.2.2 DOSAGE OF CHEMICALS

12.2.2.1 Coagulant

The coagulant is injected into the raw water feed line.

The coagulant is an essential product used in the Actiflo® process because it destabilizes the colloidal particles—first step leading to the formation of ballasted flocs. The coagulant dosage must be tracked on a regular basis to optimize process performance and diagnose process problems that may arise.

Manual method

To validate the flow generated by the coagulant dosing pump as well as the value transmitted by the coagulant line's flowmeter (if applicable), the coagulant dosage may be measured manually through the coagulant dosage system's calibration cylinder. It is recommended to manually measure the coagulant dosage once per shift.

Material required: chronometer

Procedure:

Fill up the coagulant calibration cylinder by using the valves of the coagulant dosage system. Close the valve that connects the coagulant pump's suction line to the coagulant tank and open the valve that connects the coagulant pump's suction line to the calibration cylinder. The pump is now fed only by the calibration cylinder. Measure the volume pumped during a specific period (ideally longer than 1 minute). Put the valves back in their original position to once again feed the dosing pump from the coagulant tank. (**ATTENTION:** Do not forget this step or the calibration cylinder will empty itself and the coagulant will no longer be injected in the process.) Record the pumped volume and the required pumping time.

The required dosage will vary according to the type of coagulant used as well as the quality and temperature of the raw water to be treated. The product's dosage must often be increased when the turbidity of the raw water increases. During certain dark overflow periods, the coagulant dosage must be increased considerably, as determined by the *laboratory test procedure* presented in section 14.

The coagulant dosage at the inlet of the system is calculated from the raw water and dosing pump flow rates:

To obtain the volumetric flow:

$$Dosage\ (\mu L/L) = \frac{Dosing\ pump\ volumetric\ flow\ (\mu L/h)}{Raw\ water\ flow\ (L/h)}$$

At a more detailed level, we obtain:

$$Dosage\ (\mu L/L) = \frac{\frac{Measured\ volume\ (ml)}{Measured\ time\ (sec)} \times \frac{60\ sec}{1\ min} \times \frac{60\ min}{1\ h} \times \frac{1000\ \mu L}{ml}}{Raw\ water\ flow\ (m^3/h) \times \frac{1000\ L}{1\ m^3}}$$

The volumetric dosage also enables the operator to plan future chemical requirements by estimating the volume consumed on a daily or monthly basis.

To obtain the mass flow:

$$Dosage\ (mg/L) = \frac{Dosing\ pump\ mass\ flow\ (mg/h)}{Raw\ water\ flow\ (L/h)}$$

At a more detailed level, we obtain:

$$Dosage\ (mg/L) = \frac{\frac{Measured\ volume\ (L)}{Measured\ time\ (sec)} \times \frac{60\ sec}{1\ min} \times \frac{60\ min}{1\ h} \times [Density]\ g/L \times \frac{1000\ mg}{g}}{Raw\ water\ flow\ (m^3/h) \times \frac{1000\ L}{1\ m^3}}$$

[Density] = Specific gravity of the solution in g/L
Information obtained from the supplier's analysis sheets when the product is delivered

12.2.2.2 Flocculant (polymer)

The polymer that is used must enable the attainment of the performance levels required from the coagulant aid in the Actiflo® process.

The polymer is used in the form of a viscous solution. To ensure polymer quality, it is recommended to use **non-chlorinated** filtered water to prepare it and transport it to the injection point.

The polymer is an essential ingredient for the Actiflo® process because it facilitates the agglomeration of the coagulated particles to form the ballasted flocs. The dosage of the polymer must be tracked regularly such as to optimize process performance levels and diagnose process problems that may arise.

Manual method

To validate the flow generated by the polymer dosing pump as well as the value transmitted by the polymer line's flowmeter, the polymer dosage may be measured manually through the polymer dosage system's calibration cylinder. It is recommended to manually measure the polymer dosage once per shift.

Material required: chronometer

Procedure:

Fill up the polymer calibration cylinder by using the valves of the polymer dosage system. Close the valve that connects the polymer pump's suction line to the polymer tank and open the valve that connects the polymer pump's suction line to the calibration cylinder. The pump is now fed only by the calibration cylinder. Measure the volume pumped during a specific period (ideally longer than 1 minute). Put the valves back in their original position to once again feed the dosing pump from the polymer tank. (**ATTENTION:** Do not forget this step or the calibration cylinder will empty itself and the polymer will no longer be injected in the process.) Note down the pumped volume and the required pumping time.

The polymer dosage in the clarifier will depend on the quality of the raw water and is calculated from the raw water and dosing pump flow rates:

$$Dosage\ (mg/L) = \frac{Dosing\ pump\ mass\ flow\ (mg/h)}{Raw\ water\ flow\ (L/h)}$$

At a more detailed level, we obtain:

$$Dosage\ (mg/L) = \frac{\frac{Measured\ volume\ (L)}{Measured\ time\ (sec)} \times \frac{60\ sec}{1\ min} \times \frac{60\ min}{1\ h} \times [C]\ g/L \times \frac{1000\ mg}{g}}{Raw\ water\ flow\ (m^3/h) \times \frac{1000\ L}{1\ m^3}}$$

[C] = Concentration of the solution → In the case of 0.2% polymer = 2 g/L

The ideal polymer dosage can be determined by the *Laboratory test procedure* presented in section 14.

A polymer dosage that is too low is characterized by the presence of free flocs that are not ballasted by the sand and that will not be efficiently eliminated by the clarifier. The clarified water will have a higher turbidity and/or a darker colour as well as a high aluminum or iron concentration.

Moreover, if the polymer dosage is too high, the resulting sludge may be very sticky and difficult to recycle. It will also tend to quickly clog the filters located downstream of the system (if applicable).

12.2.2.3 Alkali, pH Adjustment

The pH and alkalinity are the most important variables that need to be taken into consideration in the coagulation process. To optimize this treatment step, it is important that the water be within the pH and alkalinity ranges that are conductive to an effective coagulation. If the raw water has a low pH or a low alkalinity, it is important that these values be increased by adding an alkali to the water upstream of the coagulation step or as otherwise determined by the designers. However, if the water is highly alkaline, it may be important to bring down the pH by adding an acid, usually sulfuric acid, to it.

The alkali dosage in the system is calculated from the raw water and dosing pump flow rates:

$$Dosage\ (mg/L) = \frac{Dosing\ pump\ mass\ flow\ (mg/h)}{Raw\ water\ flow\ (L/h)}$$

At a more detailed level, we obtain:

$$Dosage\ (mg/L) = \frac{\frac{Measured\ volume\ (L)}{Measured\ time\ (sec)} \times \frac{60\ sec}{1\ min} \times \frac{60\ min}{1\ h} \times [C]\ g/L \times \frac{1000\ mg}{g}}{Raw\ water\ flow\ (m^3/h) \times \frac{1000\ L}{1\ m^3}}$$

[C] = Concentration of the solution

Upstream of the coagulation process, the alkali's contact time with the water must be long enough to allow for the complete dispersion of the alkali in the water, thereby increasing the accuracy of the adjustment of the water's pH.

13 SURVEY OF OPERATIONS

In order to insure a reliable survey of the Actiflo® system operation and to provide the operators with a useful data bank, we suggest to the operators to record the following parameters:

ON A HOURLY BASIS:

- Turbidity, raw water
- Color, raw water
- pH, raw water
- Turbidity, clarified water
- Color, clarified water
- PH, clarified water

EVERY EIGHT HOURS/SHIFT:

- Flow rate, raw water
- Flow rate, coagulant metering pump and calculated concentration
- Flow rate, polyelectrolyte metering pump and calculated concentration
- Flow rate, alkali metering pump and calculated concentration
- Pressure at the recirculation pump outlet
- Pressure at the hydrocyclones inlet
- Shape of the hydrocyclones underflow
- Microsand concentration in the recirculation line

ON A DAILY BASIS:

- Total quantity of clarified water
- Mixers speed
- Electric current drawn by the mixers
- Lamella clogging state
- Other parameters of interest: dissolved iron and manganese, total organic carbon, etc.
- Alkalinity, raw water and clarified water
- Average raw water flow

13.1 AUTOMATION

Refer to the functional description of control system in the «Electricity and Control» section of the complete operation and maintenance manual.

13.2 MANUAL SHUT DOWN OF THE MICROSAND RECIRCULATION PUMP

In manual mode, when the microsand recirculation pump needs to be stopped, the following procedure must be followed in order to prevent possible clogging problems:

- Stop the mixer in the maturation tank. This allows the microsand to settle in the maturation tank instead of in the hopper.
- After approximately 30 minutes, verify that the underflow of the hydrocyclone does not contain any microsand.
- The microsand recirculation pump can then be stopped without any risk of clogging the recirculation line.

13.3 PROCESS OPTIMIZATION

The main optimization parameters are the following:

- Polymer
- Coagulant
- Microsand
- pH

13.3.1 POLYMER DOSAGE AND INJECTION POINTS

Polymer Dosage

The optimal dosage of polymer is generally determined when the Actiflo® process is commissioned. This optimal dosage can be adjusted and varies according to raw water quality. Different polymer dosages may be tested in an optic of improving the effectiveness of the process (quality of the clarified water, microsand losses), but it is recommended to avoid excessive polymer doses.

As illustrated in the following figure, an excessive dose of polymer will not make a notable contribution to improving turbidity.

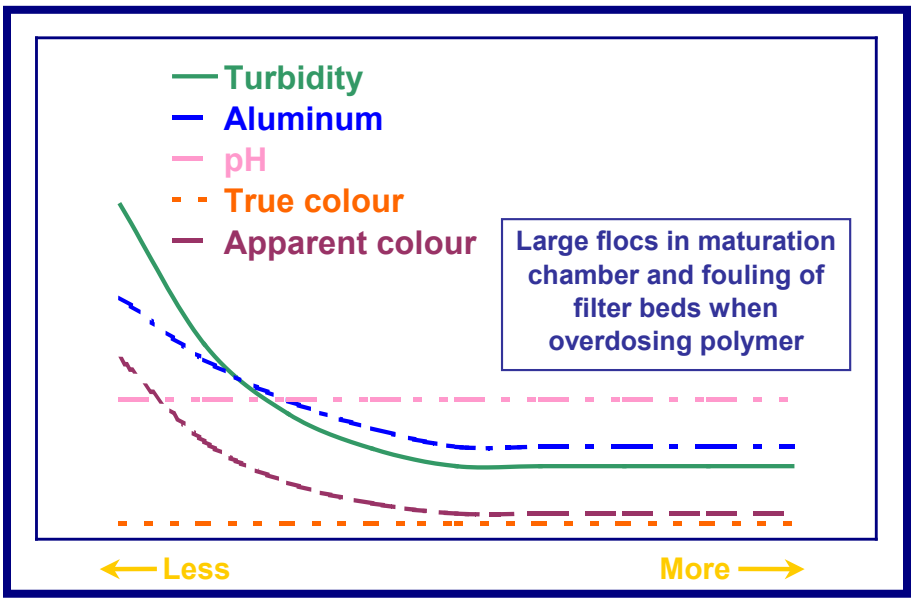

Figure 21: Impact of polymer dosage on clarified water quality

Transport Water

Service water is used to transport the polymer in the line and foster a better dispersion of the product in the process. The flow rate of the water used to convey the polymer should be anywhere from 3 to 5 times the dosing pump's flow rate. If the flow rate of the service water is too high (more than 10 times the dosing pump's flow rate), the polymer could lose some of its effectiveness and a higher dosage could be required.

Injection Points

There are three polymer injection points available on an Actiflo® unit:

- One in the injection tank, at the level of the hydrocyclones.
- One in the flow opening that connects the injection and maturation tanks (ACP R only).
- One at the middle of the maturation tank, generally under the mixer blade.

As a general rule and according to the type of polymer used, the following injection points are privileged:

Cationic polymer: Injection tank (hydrocyclones) and opening between the injection and maturation tanks because a longer reaction time is associated with this type of polymer and the polymer must therefore be dosed more upstream in the process.

Anionic polymer: Injection tank (hydrocyclones) and the middle of the maturation tank because a shorter reaction time is associated with this type of polymer and the polymer tends to lose in effectiveness if it is dosed more upstream.

The injection points used as well as the distribution of the total dosage of polymer between the injection points are generally determined when the process is commissioned, but they should be verified on a regular basis. The piping system used to control the polymer injection points is located at the level of the hydrocyclone support.

13.3.2 COAGULANT DOSAGE AND INJECTION POINTS

The optimal coagulant dosage is generally determined when the process is commissioned. Afterward, the dosage is adjusted according to changes in raw water quality, mainly with respect to turbidity and colour.

Different coagulant dosages may be tested in an attempt to improve the effectiveness of the Actiflo® process (turbidity and colour of the clarified water, microsand consumption), but the coagulant must be neither underdosed nor overdosed. Refer to the figure below.

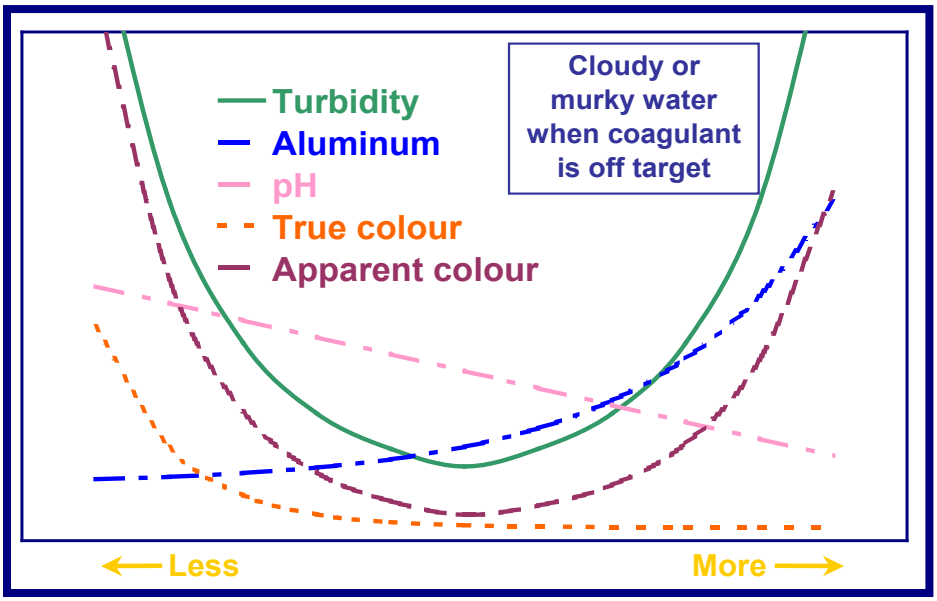

Figure 22: Impact of coagulant dosage on clarified water quality

As illustrated in the above figure, a coagulant dosage that is too low will increase the water's turbidity because the colloids will not have coagulated. On the other hand, a dosage that is too high will have for effect to destabilize the solution and increase the water's turbidity.

Injection points

Two coagulant injection points can be available on the Actiflo® process:

- One in raw water line, before entering Actiflo® process.
- One in the coagulation tank (optional).

If a longer coagulation time is required (water temperature below 5°C or during turbidity or color events) the coagulant has to be injected in the contact tank/near the raw water pumping station in order to enhance coagulation and improve the treatment efficiency.

If no extra contact time is necessary, coagulant may be injected in the coagulation tank.

This injection point may also be used in case of maintenance for the injection point in the contact tank (injection quills cleaning) without stopping the Actiflo® unit.

13.3.3 MICROSAND DOSAGE AND INJECTION POINTS

The optimal concentration of microsand is determined when the process is commissioned. The dosage may vary according to raw water quality, especially when turbidity increases.

Microsand concentration should be anywhere between 3–10 g/L to foster the effectiveness of the flocculation and settling. The concentration may be increased if the turbidity increases or colour darkens, thereby creating more flocs that requires more microsand to ballast them. However, it is recommended not to exceed a concentration of 15–20 g/L to avoid damaging equipment such as the scraper.

The figure below illustrates the impact of microsand concentration on different clarified water parameters.

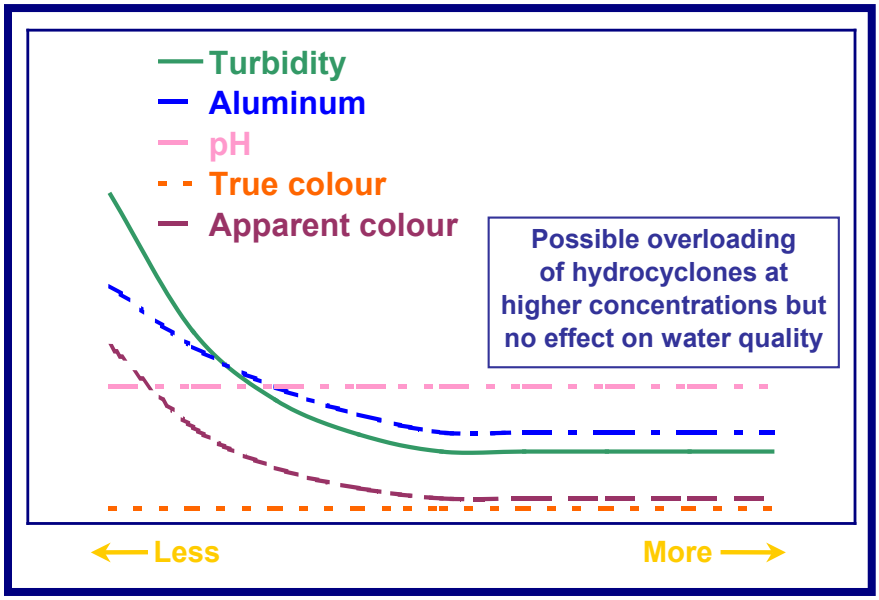

Figure 23: Impact of microsand concentration on clarified water quality

The above figure illustrates that a lack of microsand will result in water of poor quality because the flocs will not be ballasted and will remain suspended in the clarified water. On the other hand, an excessive concentration of microsand will in no way lead to considerably improved performance levels.

13.3.4 pH INFLUENCE

The pH is a very important factor when it comes to optimizing the process because the effectiveness of both the coagulant and the polymer could be diminished if the pH is not adequately controlled. The following figure illustrates the impact of the pH on different clarified water parameters.

It is recommended not to adjust the pH on the basis of the coagulant dosage because this could result in underdosing or overdosing. It is preferable to modify the pH adjustment dosage (lime, caustic soda or acid) to attain the optimal pH.

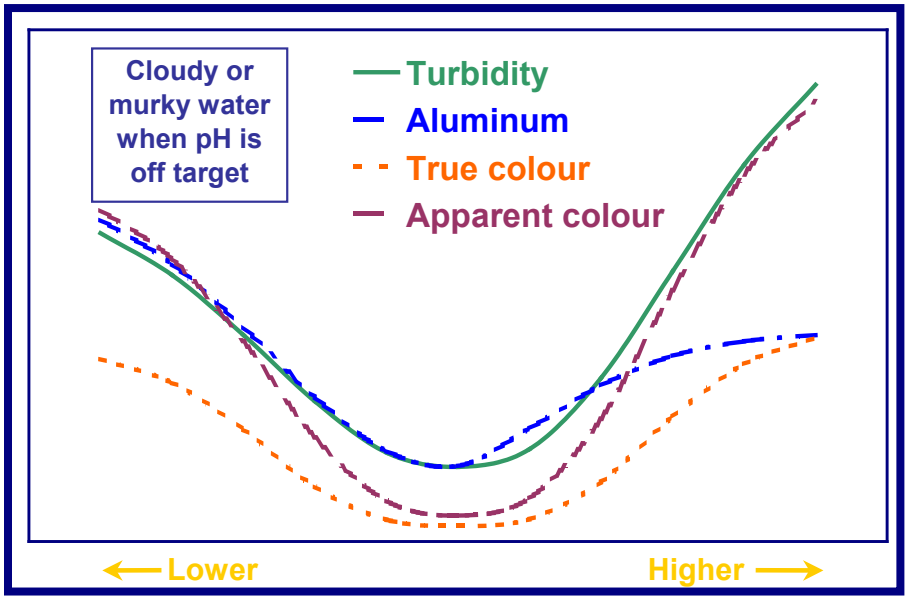

Figure 24: Impact of pH on clarified water quality

13.3.5 OTHER PARAMETERS

The water temperature has a major impact on the treatment process. As this parameter is predetermined by the raw water quality, the operator should adjust the other process parameters in order to decrease the potential damages, on the clarified water quality, that can be generated by the temperature variation. These kind of adjustments are required if the operator wish to keep a stable system.

The main problems, in term of treatment efficiency, are observed at low water temperature and could be resumed by the following:

1) The water viscosity that increases at low temperatures (below 5°C) so the flocs will have some difficulties to settle in the settling tank.
2) The water chemistry that changes at low temperatures and can affect the following parameters:
    - Coagulant that reacts more slowly.
    - Optimum pH range shrinks.

13.4 TROUBLESHOOTING

In the event of a sudden change in the quality of the raw water (turbidity, colour, etc.) or of accidental or unexpected spillage (spring peak, storm, etc.), the applied dosages may no longer be appropriate to maintain water quality and may need to be adjusted if the quality of the clarified water has deteriorated.

The troubleshooting guides are designed to help operators diagnose changes in the quality of the clarified water and take appropriate action to maintain the treatment chain's performance.

13.4.1 REVIEW OF THE TROUBLESHOOTING GUIDES

The troubleshooting guides are provided to the operators and maintenance personnel to facilitate diagnoses and support operations. The following guides are provided in this manual:

- Troubleshooting with respect to an **increase in the turbidity of the clarified water**
- Troubleshooting with respect to a **darkening of the colour of the clarified water**
- Troubleshooting with respect to **chemical dosages**
- Troubleshooting with respect to **microsand concentration**
- Troubleshooting with respect to **water pH**

13.4.2 INCREASE IN CLARIFIED WATER TURBIDITY

Turbidity of clarified water is one of the most monitored parameter is an excellent indicator of Actiflo® process performance, as well as accuracy of chemicals dosing (coagulant, polymer and microsand). If the turbidity of the clarified water should increase suddenly, this will result in excessive microsand losses. If filters are present downstream of the Actiflo®, filtration cycles will reduce in time and consequently increase backwash frequencies.

In potable water applications, the turbidity of the clarified water should normally be lower than 1.0 NTU at nominal flow. If it increases suddenly above this value, we recommend to verify the following parameters:

- The flow rate of raw water: if it is greatly increased or diminished, dosage flow rate of coagulant and polyelectrolyte should be adjusted in consequence.
- The flow rate of coagulant and polyelectrolyte: the metering pumps must inject an accurate dosage of these chemicals, such that the desired concentrations in the system can be obtained.
- The quality of raw water: if the turbidity, colour and/or the alkalinity of the raw water are increased or decreased, it is normally necessary to adjust the concentration of coagulant in the system. This dosage can be predetermined with the help of a jar test described in section 14. However, a change in the quality of the raw water does not usually require an adjustment in polyelectrolyte concentration.
- The concentration of microsand in the recirculation line: this must approach a value between 30–100 ml/L (5–10 g/L). Deterioration in the raw water quality can necessitate an increase in the quantity of microsand in the system.
- Sludge-sand recirculation rates: these flow rate generated by the recirculation pump must be kept constant.
- Maturation mixer rotation speed: mixer speed can be read directly on the display of the corresponding variable frequency drive.

Troubleshooting Guide
Clarified water turbidity

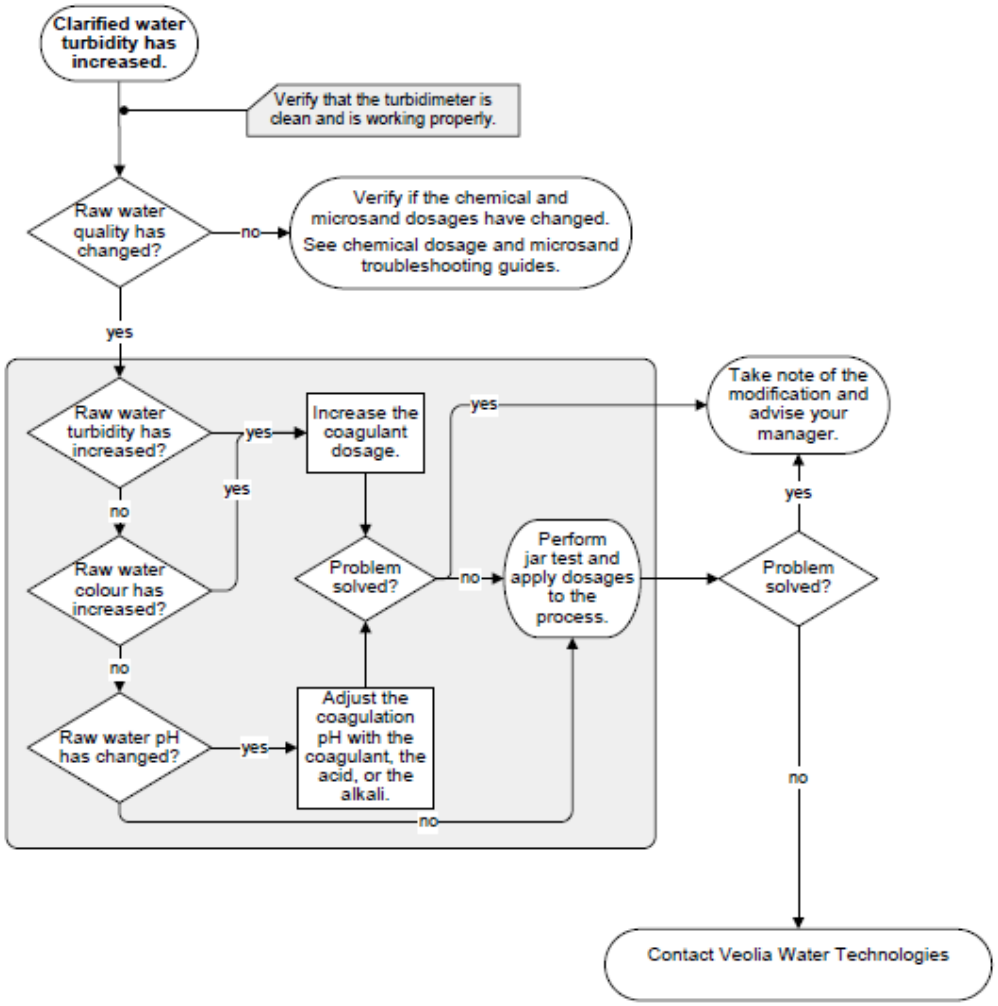

Figure 25: Clarified water turbidity – Troubleshooting guide

13.4.3 INCREASE IN CLARIFIED WATER COLOUR

The (apparent or true) colour of the clarified water is a parameter that needs to be monitored. It is indicative not only of the performance of the Actiflo® process, but also of the adequacy of the coagulant dosage or pH applied during the settling process.

If the colour of the clarified water is darker than normal:

- Verify if the colour of the raw water has increased.
- Verify the coagulant dosage (too high or too low).
- Conduct laboratory tests (jar tests) by carrying out a coagulant dosage curve.
- Consult the troubleshooting guide with respect to clarified water colour.

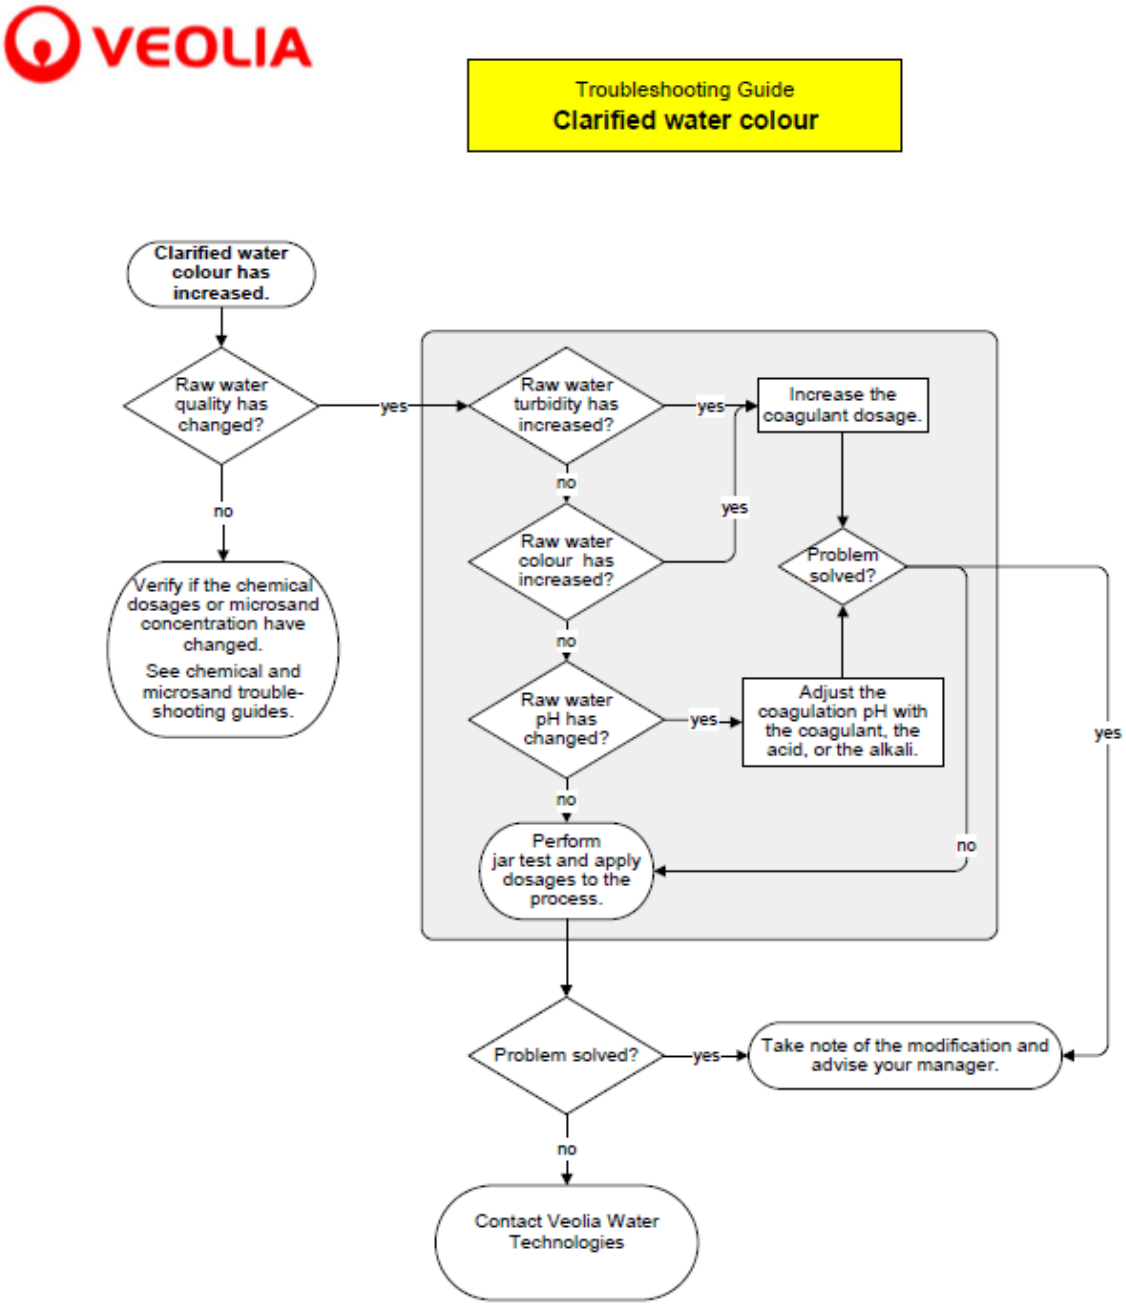

Figure 26: Clarified water colour – Troubleshooting guide

13.4.4 CHEMICAL DOSING TROUBLESHOOTING

Chemicals dosages have to be carefully monitored since the chemicals directly influence the process treatment by decreasing coagulation and flocculation. The clarified water quality may decrease (turbidity and color increase, more sand losses).

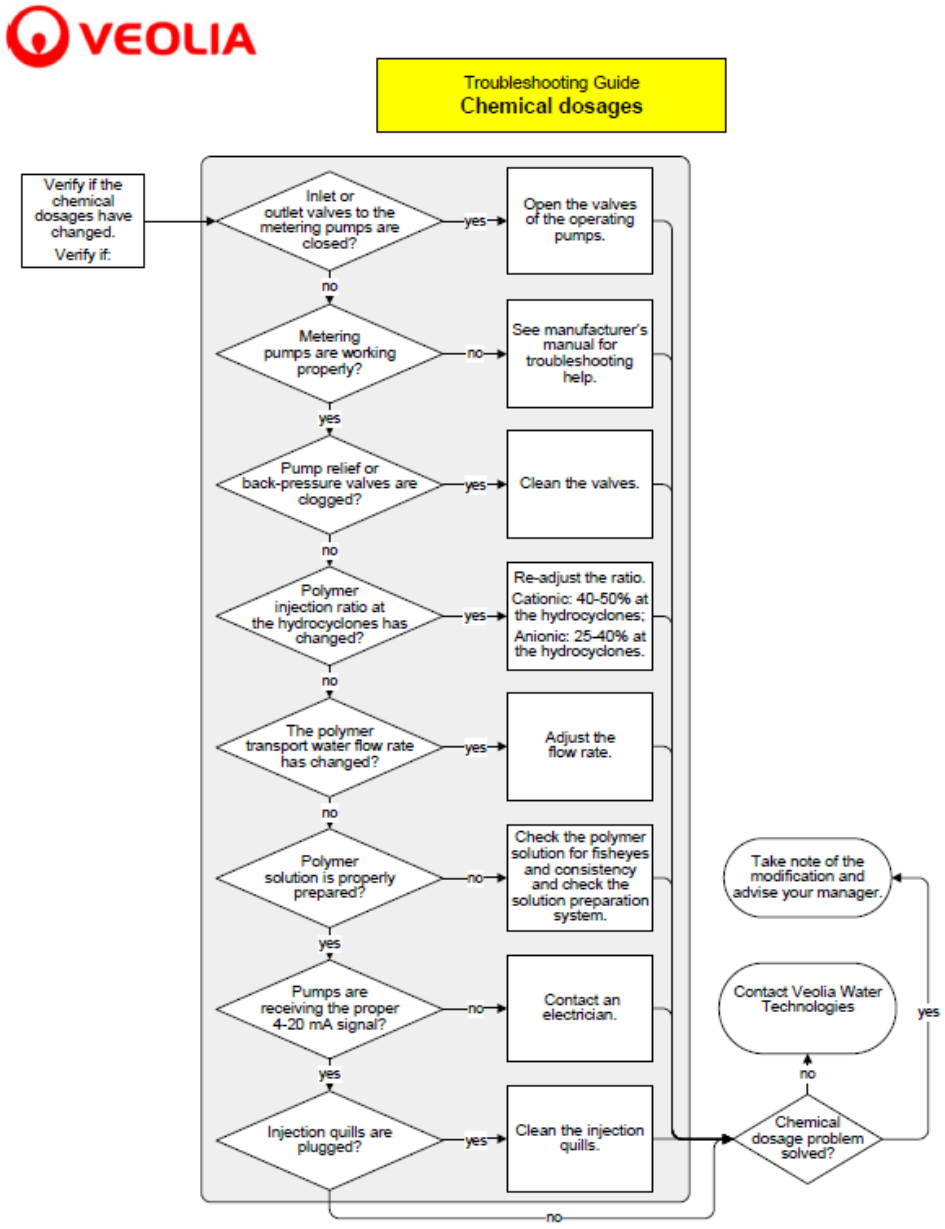

Figure 27: Chemicals dosing – Troubleshooting guide

13.4.5 MICROSAND TROUBLESHOOTING

The microsand is a key factor in the Actiflo® process because the concentration of sand has a direct influence on the quality of the clarified water by affecting flocculation and floc settling. The quality of the clarified water is therefore directly affected (increased turbidity and darkness, significant losses of sand).

The sand concentration is low:

If the sand concentration remains low despite repeated additions of microsand:

- Verify that the recirculation pump is functioning adequately.
- Verify for the presence of debris in the hydrocyclones' apex (even a partially clogged cyclone will lead to sand being evacuated along with the sludge).
- Verify the speed of the maturation tank mixer (a rotation speed that is too low will not keep the microsand in suspension and the sand will accumulate at the bottom of the maturation tank).
- Verify that the scraper is functioning adequately.
- Validate the direction of rotation of the injection and maturation tank mixers.
- Consult the troubleshooting guide with respect to microsand concentration.

There are significant losses of sand:

If a significant loss of sand is observed, the operator must verify the following with respect to the hydrocyclone:

- Compare the hydrocyclone's underflow rate with the base values.
- Compare the hydrocyclone's overflow rate (verify the presence of sand) with the base values.

The overflow and underflow rates differ from the base values:

If the overflow and underflow rates differ from the base values, inspect the hydrocyclone for signs of debris clogging it.

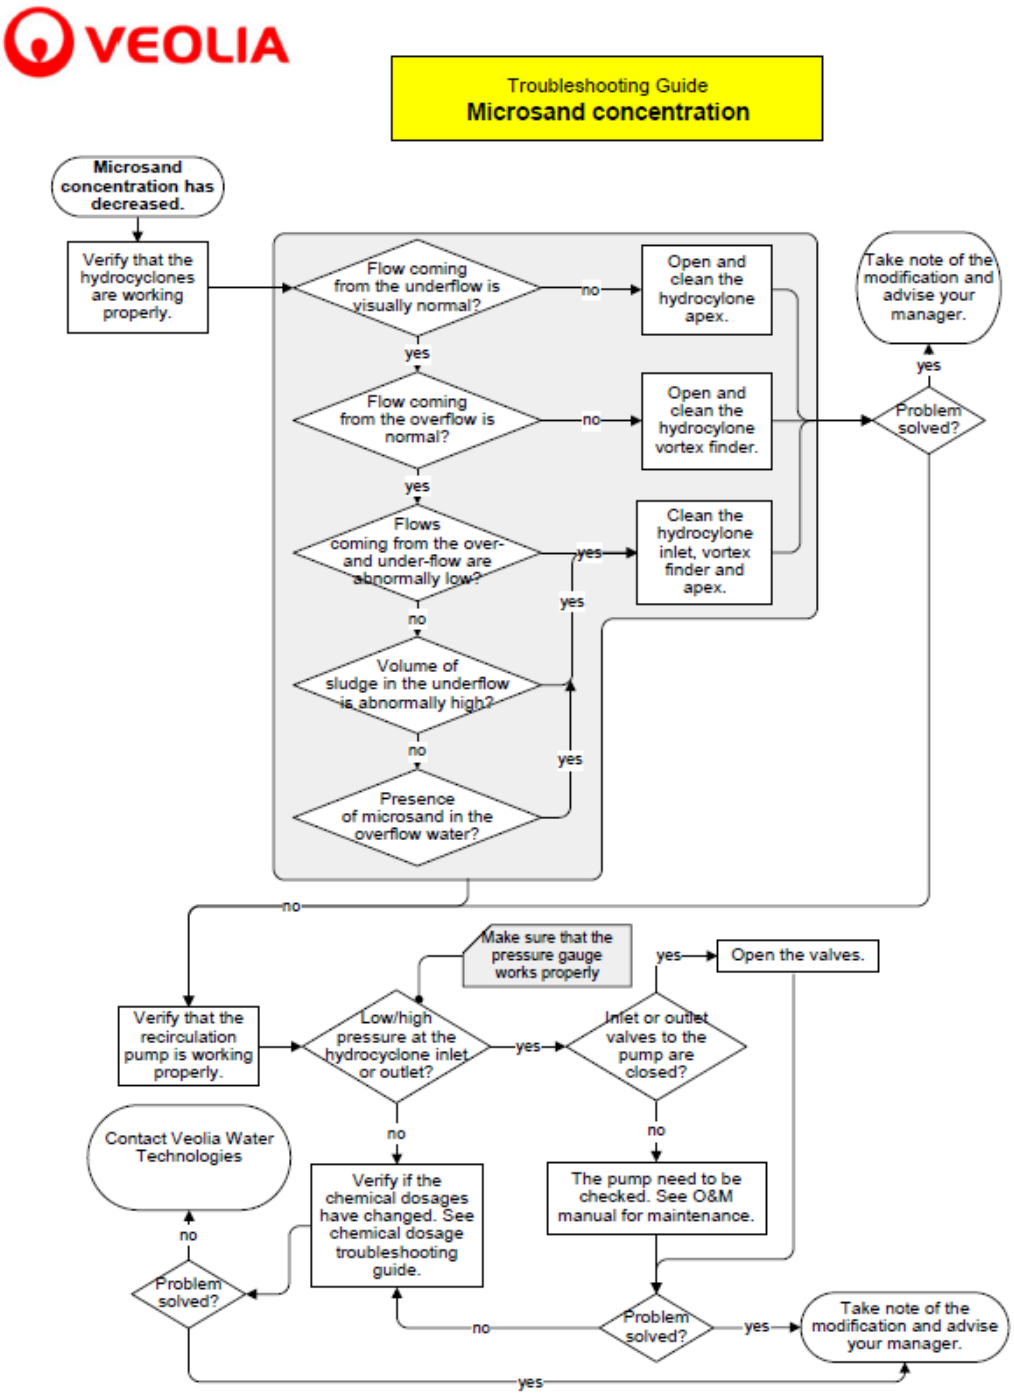

Figure 28: Microsand concentration – Troubleshooting guide

13.4.6 pH TROUBLESHOOTING

The pH is an important factor when it comes to process troubleshooting because the effectiveness of the coagulation and flocculation processes may be reduced if the pH is not adequately monitored and adjusted. That, in turn, could affect the quality of the clarified water (darker colour, increased turbidity, loss of sand).

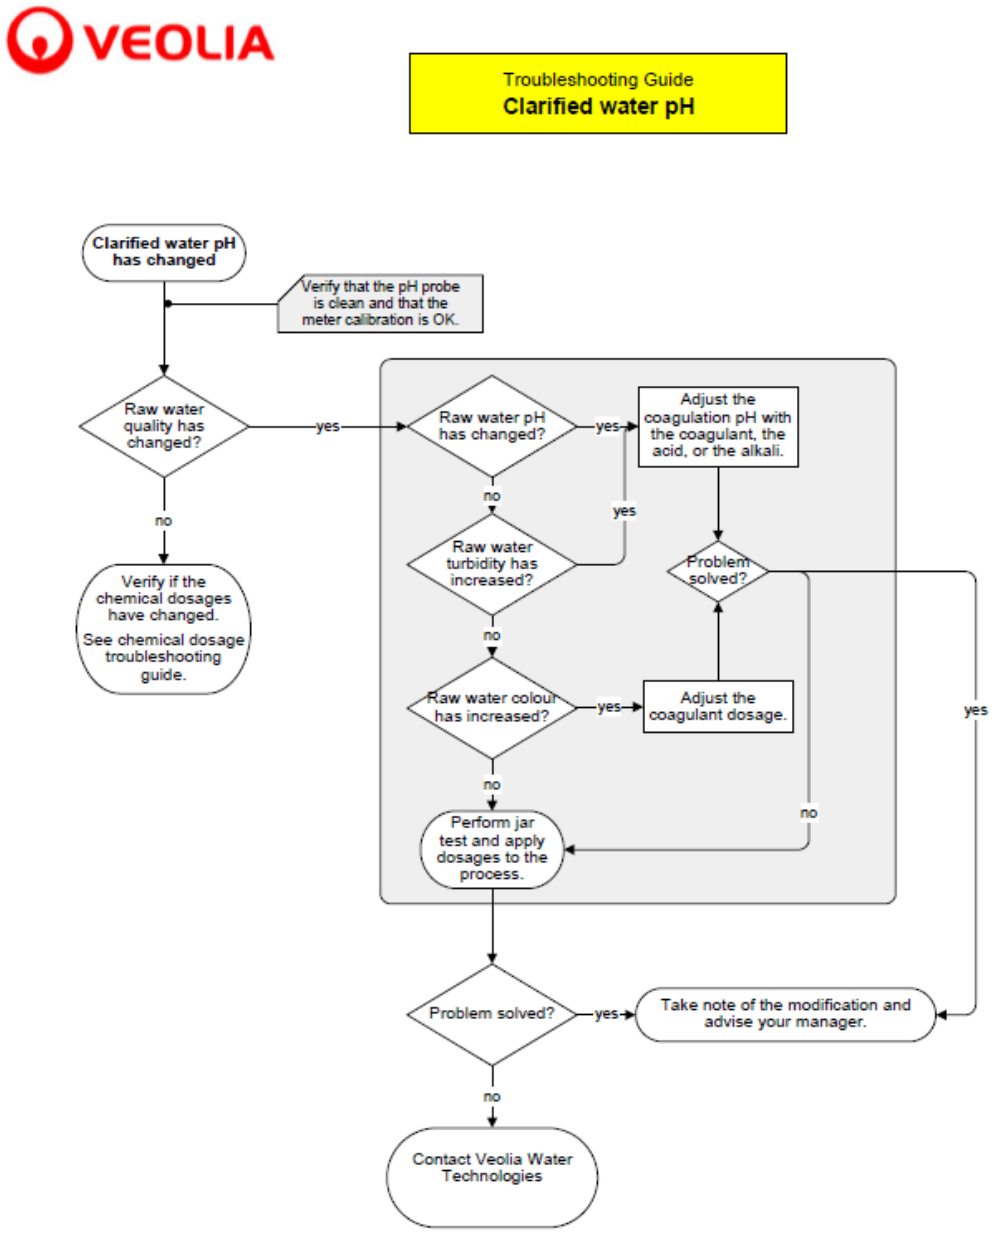

Figure 29: pH change – Troubleshooting guide

13.4.7 TROUBLESHOOTING THROUGH VISUAL INSPECTIONS OF THE ACTIFLO® UNITS

During routine verifications and if the clarified water presents a high turbidity and/or dark colour, operators may diagnose inappropriate dosages by conducting a simple visual inspection of the flocs and the water in the maturation and settling tanks.

Different scenarios:

The flocs in the maturation tank are smaller than usual and the water is coloured and cloudy between the flocs:

- Not enough coagulant (the polymer does not normally remove the colour from the water).

The flocs in the maturation tank are smaller than usual but the water is clear between the flocs:

- Not enough polymer (the coagulant is correctly dosed seeing as the water between the flocs is of good quality, but the lack of polymer results in flocs of smaller size).

Colour that varies from the usual beige and few flocs:

- Not enough sand: the microsand gives the maturation tank a beige appearance. Also, if the concentration of microsand is too low, there will also be fewer flocs. The turbidity of the clarified water is also deteriorated (presence of pin flocs).

Small brown or grey flocs drawn into the settling tank and milky or dark coloured water:

- Too much coagulant: the presence of too much coagulant colours the water, which becomes milky white (alum or PAC) or brown (ferric chloride). The result is a clarified water of darker colour and increased turbidity.

Unusually shaped hydrocyclone underflow jets

- The shape of the underflow jet provides information on the functioning of the hydrocyclone and the state of the apex. The following table illustrates how to interpret the shape of the jet.

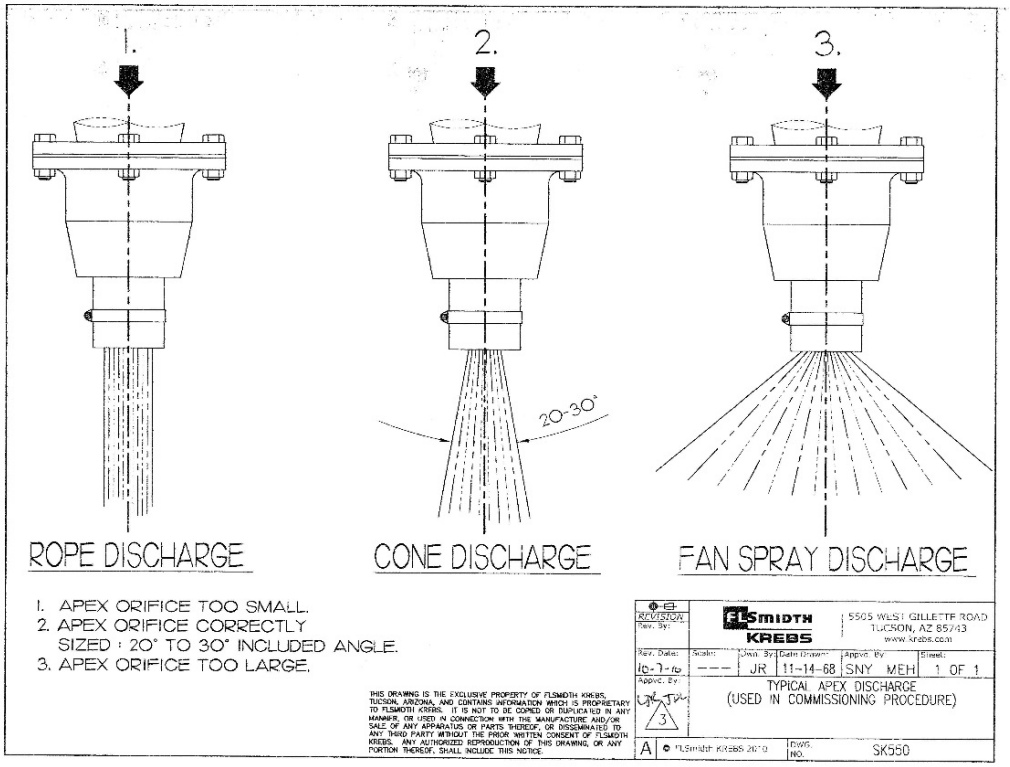

Figure 30: Hydrocyclone typical apex discharge jet shape

1. ROPE DISCHARGE: The opening of the apex is too small.
2. CONE DISCHARGE: The opening of the apex is properly dimensioned: 20–30° (included angle).
3. FAN SPRAY DISCHARGE: The opening of the apex is too large.

A rope discharge may also be symptomatic of a clogged hydrocyclone or of a concentration of sand in the system that is too high.

A fan spray discharge may be symptomatic of a worn apex that needs to be replaced or caused by a concentration of sand beyond recommended values.

13.4.8 POWER FAILURE

Refer to the functional description of control system in the «Electricity and Control» section of the complete Operation and Maintenance Manual.

13.5 ACTIFLO® SHUT DOWN OPERATIONS

The Actiflo® is designed to be operated in fully automatic mode, using PLC program and SCADA interface. The operational set points such as start-up/shut down flowrate or other conditions are entered by operation team but the system manages start and shut-down sequences in automatic. The system for lamellas cleaning (optional) is also in automatic sequence, and the operator's task will be to trigger an automatic cleaning when required. However, in the unlikely event of PLC/SCADA shut-down or failure, manual procedures are presented in the following sections to manually start and shut-down the Actiflo® unit, as well as manual cleaning of lamellas in section 15.1.1.

The purpose of the following sections is to provide information on the proper procedures required when the Actiflo® process is operated intermittently. The Actiflo® process has the unique ability to operate under repeated start and stop operations without effecting process performance or the equipment supplied with it. This type of operation is typical for the Actiflo® process and provides the ability to successfully treat events within 10–15 minutes of system start-up. The Actiflo® system intermittent use procedures is described in the following pages as pertaining to a single Actiflo® train.

13.5.1 ACTIFLO®: SHORT-TERM STORAGE PROCEDURE (LESS THAN A WEEK)

Short-term is defined as a shutdown where microsand and water are retained in the Actiflo® system for purposes of keeping the system active and ready for an event. Nearly all Actiflo® installations use the wet storage stand-by mode during offline conditions.

Operating conditions: When the unit is stopped for a period less than seven (7) days.

Operators' activities: Clean instrumentation, clean the lamellas, run equipment.

STEPS	DURATION
1. Stop the Actiflo® using the normal stopping procedure.	15 minutes
2. Clean the lamellas using the automatic air cleaning procedure or manual procedure.	60 minutes
3. Clean the instruments (turbidimeter, pH-meter, etc.).	10 minutes
4. Once a day, run the motors (mixers, recirculation pumps and scraper) for 30 minutes to prevent sand compaction, avoid anaerobic development in stagnant water (waste water application) and facilitate the restart of the unit.	30 minutes

Table 4: Short-Term storage procedure

Estimated duration day 1: 2 hours
Estimated duration daily: 0.5 hours

13.5.2 ACTIFLO®: MID-TERM STORAGE PROCEDURE (MORE THAN A WEEK)

This method is recommended by VWT Canada as wet system storage without removing the water from the system.

Operating conditions: When the unit is stopped for a period including one to four (1 to 4) weeks.

Operators' activities: Operate valves, clean the lamellas, add chlorine in the tanks, measure chlorine residual.

STEPS	DURATION
Day 1	
1. Stop the Actiflo® using the normal stopping procedure.	10 minutes
2. Clean the lamellas using the automatic air cleaning procedure (optional) or manual procedure.	60 minutes
3. Clean the turbidimeter and store the pH probe in the storage solution.	15 minutes
4. Add sodium hypochlorite in each tank (30–50 mg/L) to get a minimum chlorine residual of 15 mg/L after 12 hours of soaking*. Run the mixers, scraper and recirculation pumps to mix the chlorine for 5 minutes. Let react for a minimum of 12 hours. Measure the chlorine residual after 12 hours.	12 hours minimum
5. Once a day, run the motors (mixers, recirculation pumps and scraper for 30 minutes to avoid anaerobic development in stagnant water.	30 minutes
6. Equipment specific procedures: refer to the following table.	

*Recommendation from AWWA for filter disinfection

Table 5: Mid-Term storage procedure

Estimated duration day 1: >13 hours
Estimated duration weekly: 0.25 hour

13.5.3 ACTIFLO® WASTEWATER AND CSO APPLICATION ONLY: MID-TERM STORAGE PROCEDURE (UP TO ONE MONTH)

This method is recommended by VWT Canada as wet system storage without removing the water from the system but replace the wastewater by clean/potable water.

Operating conditions: When the unit is stopped for a period up to one (1) month.

Operators' activities: Operate valves, clean the lamellas, drain tanks, fill tanks with clean water.

STEPS	DURATION
Day 1	
1. Stop the Actiflo® using the normal stopping procedure.	10 minutes
2. Clean the lamellas using the automatic air cleaning procedure (optional) or manual procedure.	60 minutes
3. Clean the turbidimeter and store the pH probe in the storage solution.	15 minutes
4. Drain completely the maturation/injection tank using drain valve.	2–3 hours
5. Drain completely the coagulation tank using drain valve and close the valve.	1 hour
6. Drain the settling tank using the two recirculation pumps until level in the settling tank reaches the bottom **(IMPORTANT: do not let the pumps running dry).**	1 hour
7. Fill with potable/service water up to the top of the lamellas.	Up to 10 hours*
8. Once a day, run the motors (mixers, recirculation pumps and scraper for 30 minutes to avoid anaerobic development in stagnant water.	30 minutes
9. Equipment specific procedures: refer to the following table.	

*Depending the flow and pressure available

Table 6: Mid-Term storage procedure – Wastewater and CSO application

Estimated duration day 1: >13 hours
Estimated duration weekly: 0.25 hour

Valves	• Butterfly: Leave 100% close. • Eccentric plug: Leave 100% close. • PVC ball: Leave 100% close.
Instrumentation	• Flowmeter: Power on. • Turbidimeter: Clean, power on and submerged. • pH meter: Power on and store the probe in storage solution or submerged.
Mixers	• No particular measures. • Power off.
Scraper	• Power off. • When ready to run again, check the oil operating level.
Recirculation pump	• No particular measures. • Check operating leak on the gland, adjust if required.
Control Panel	• Keep the power on (to keep the program in the PLC).

Table 7: Actiflo® Mid-Term storage specific procedure

13.5.4 ACTIFLO®: LONG-TERM STORAGE PROCEDURE (MORE THAN ONE MONTH)

This method is recommended by VWT Canada as dry system storage without removing the sand from the system.

Operating conditions: When the unit is stopped for a period more than one month.

Operators' activities: Operate valves, clean the lamellas, adding chlorine in the tanks, measure chlorine residual, drain the tanks.

STEPS	DURATION
Day 1	
1. Stop the Actiflo using the normal stopping procedure.	10 minutes
2. Clean the lamellas using the automatic air cleaning procedure.	60 minutes
3. Clean the turbidimeter and store the pH probe in the storage solution.	15 minutes
4. Add sodium hypochlorite in each tank to get chlorine residual of 15-30 mg/L[2]. Run the mixers, scraper and recirculation pumps to mix the chlorine for 5 minutes. Let react for a minimum of 12 hours.	12 hours minimum
Day 2	
5. Drain completely the maturation/injection tank using drain valve.	2–3 hours
6. Drain completely the coagulation tank using drain valve.	1 hour
7. Drain the settling tank using the two recirculation pumps until level in the settling tank reaches the bottom **(IMPORTANT: do not let the pumps running dry).**	1 hour
8. Equipment specific procedures: refer to the following table.	

Table 8: Long-Term storage application

Estimated duration day 1: >13 hours
Estimated duration day 2: 4-5 hours
Estimated duration weekly: 0.25 hour

[2] Recommendation from AWWA for filter disinfection

Valves	• Butterfly: Leave 100% open. Close-open every 2 weeks. • Eccentric plug: Leave 75% open. Close-open every 2 weeks. • PVC ball: Leave 100% open. Close-open every 2 weeks.
Piping (inlet/outlet)	• Drain (watch for low points) and leave the drain valves open.
Instrumentation	• Flowmeter: Power off • Turbidimeter: Clean. Power off. • pH meter : Power off and store the probe in storage solution.
Mixers	• No particular measures. • Power off.
Scraper	• Fill the gear box with new oil to avoid humidity. • Power off. • When ready to run again, drain the oil until the normal operating level.
Recirculation pump	• Drain the discharge line, the suction line and the casing. • Loosen the gland adjusting screws. • Power off. • Rotate the pump manually with the belts in the proper direction of rotation every month.
Control Panel	• Keep the power on (to keep the program in the PLC). • Power off the equipment and remove the fuses and breakers.

Table 9: Actiflo® Long-Term storage specific procedures

13.5.5 ACTIFLO®: RESTART AFTER LONG-TERM STORAGE PROCEDURE

Operating conditions: After a long term storage period.

Operators' activities: Operate valves, readjust the recirculation pumps gland, run equipment.

STEPS	DURATION
1. Close all the isolation valves on the unit.	15 minutes
2. Fill up the Actiflo® tanks: Open the water inlet valve and fill up the unit until the water level reaches the level of the spillway between the maturation and settling tanks. Close the Actiflo®'s water inlet valve.	30 minutes
3. Open the recirculation pump isolation valves and readjust the gland screws.	30 minutes
4. Power on all the equipment.	15 minutes
5. Put back the pH probe in the process.	10 minutes
6. Make sure the equipment is in AUTO mode for AUTO start and open the isolation valves on chemical lines.	20 minutes
7. Start the unit in AUTO or MANUAL mode. Be sure all tank are full of water **(at least impeller have to be submerged).**	15 minutes
8. Perform the final adjustment on the recirculation dry gland.	30 minutes

Table 10: Long-Term storage restart procedure

Estimated duration day: 3 hours

14 JAR TEST PROCEDURE

14.1 INTRODUCTION

This jar test procedure was developed for the purpose of simulating the Actiflo® process. It may be used to determine the coagulant and polymer dosages required to procedure clarified water of low turbidity. In addition, the modified jar test procedure makes it possible to evaluate or predict the operational performances of an existing Actiflo® unit and accurately diagnose operating problems.

This simulation method generates results that are very similar to those generated for a large-scale unit. Such a level of reproducibility is obtained by simulating the same contact times in each tank and adding the chemicals and microsand in the same sequence as in the case of the life-size unit.

At the designated flow, the surface loading rate in a typical Actiflo® unit is 40 m/h. This loading rate corresponds to hydraulic retention times of 2, 2, 6 and 3 minutes in the coagulation, injection, maturation and settling tanks respectively.

14.2 MATERIAL REQUIRED

- Jar test apparatus (Phipps-Bird or equivalent)
- Raw water
- Circulating open bath for temperature control (optional)
- Square or round glass beakers
- Washed microsand
- Polymer
- Coagulant
- Acid or alkali, to adjust the pH (optional)
- Measurement apparatus (turbidimeter, spectrophotometer, etc.)
- Stopwatch
- Micro pipettes 20 µl - 1000 µl
- Disposable syringes 1 ml - 5 ml - 100 ml

14.3 CHEMICALS PREPARATION

Prepare the microsand dedicated to Jar Test

This microsand has to be already washed with distilled or tap water to remove sand dust causing turbidity. To prepare the microsand, follow the procedure below:

- Rinse the new or used microsand thoroughly 10 times or until the supernatant is clear, in order to eliminate turbidity caused by micro-grains or any suspended particles that could be introduced into the water tested in the jar test. Dry in a 104°C oven overnight. Place in an identified microsand plastic or glass jar.

Prepare a polymer solution in the laboratory or use the polymer solution prepared for the full-scale unit in the WTP.

From dry polymer powder:

- Prepare a 0.1% solution. Weight 0.1 g of dry polymer and slowly add in a 250 mL beaker filled with 100 mL distilled water. The beaker has to be mixed to avoid eye fish in the solution. Mix the solution for approximately 1 hour until complete dissolution of the polymer. 0.1 mL of this solution corresponds to 1 mg/L. For better accuracy, it is recommended to dilute this solution prior injecting in the jar test beakers: measure 10 mL of prepared polymer solution and complete at 100 mL with distilled water. 1 mL of this diluted solution corresponds to 0.1 mg/L of polymer dosage.

CAUTION: ***The 0.1% solution is efficient for 1 day. The diluted polymer solution (0.01%) is efficient for approximately 1 hour. Prepare new diluted solution after 1 hour use.***

From polymer preparation tank:

- **Polymer at 0.1 g/L (0.01%)**

Sample polymer from polymer metering pump or polymer preparation tank at the WTP.

Dilution to obtain a 0.1 g/L solution:

Concentration in the tank	Dilution	Volume to add in the 100 ml cylinder
1.5	15	6.7
2	20	5
2.5	25	4
3	30	3.3

Table 11: Polymer dilution to obtain 0.1 g/L solution

Fill the cylinder to 100 mL mark with distilled water and stir.

CAUTION: The polymer solution as prepared is efficient for approximately 1 hour. Prepare new dilution after 1 hour use.

CAUTION: The polymer solution is viscous and very slippery if spilled.

- **Coagulant**

Use coagulant from manufacturer bottle or sample coagulant metering pump skid in the WTP.

CAUTION: Dilution is not necessary if a micropipette is available (0-200 µL).

CAUTION: Change your tip or pipette between each jar tests series (risk of coagulant precipitation in the tip).

CAUTION: Never dilute PAC or PASS coagulants (risk of precipitation).

If no micropipette is available, prepare the following dilutions:

- In the case of an organic coagulant, a dilution factor of 10 is recommended. Dilute 10 mL of net coagulant in distilled water in a 100 mL graduated cylinder.
- In the case of an inorganic coagulant, a dilution factor of 10 or 50 can be used.

The coagulant dosage can be expressed in different ways:

- Volumetric dosage (µL/L).
- mg/L of commercial product as sold = volume (µL/L) x specific density.
- mg/L of active ingredient = volume (µL/L) x specific density x concentration (%).
- Mg Fe or Al/L (recommended but not very common)
  Mg Fe or Al/L = volume (µL/L) x specific density x % Fe or Al
- mg/L of solid product (not recommended but very common in water treatment plants)
  mg/L of solid product = volume (µL/L) x specific density x dry solid content (%)

To validate the calculation, refer to the chemical's technical specifications sheet.

14.4 CHEMICAL DOSAGES

- **Polymer at 0.1 g/L (0.01%)**

Polymer volume to inject for 1 L water during the Jar Test is as follow:

Plant polymer diluted at 0.1 g/L (0.01%)			
Dosage required mg/L	Total Volume ml	Volume to add	
		1st injection	2nd injection
0.1	1	0.5	0.5
0.2	2	1	1
0.3	3	1.5	1.5
0.5	5	2.5	2.5
0.8	8	4	4
1	10	5	5
1.2	12	6	6

Table 12: Polymer volume to inject for 1 L water during jar test

- **Coagulant Volume**

The coagulant dosage is expressed in volumetric dosage (µL/L).

Coagulant volume to inject for 1 L water during the Jar Test is as follow:

Dosage required µL/L	Volume of beaker	Volume to inject (µL)
10	1	10
30	1	30
50	1	50
80	1	80
100	1	100
130	1	130
150	1	150

Table 13: Coagulant volume to inject for 1 L water during jar test

14.5 LABORATORY METHODS AND PROCEDURE

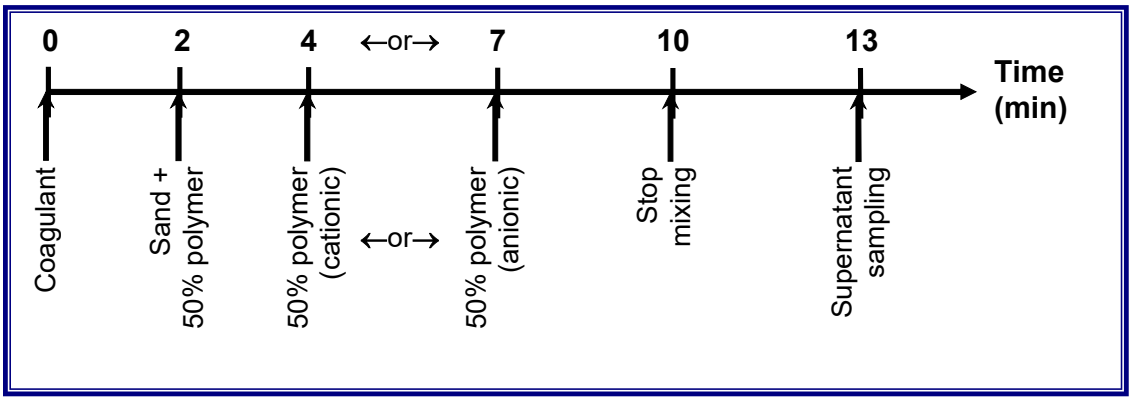
Proceed as follows to produce optimal results:

Step 1: Conduct a series of jar tests using fixed coagulant and polymer dosages and different pH values (pH curve).

Step 2: Conduct a series of jar tests using a fixed pH, different coagulant dosages and a fixed polymer dosage (coagulant curve). You may revise the pH curve in accordance with the most effective coagulant dosage found (optional).

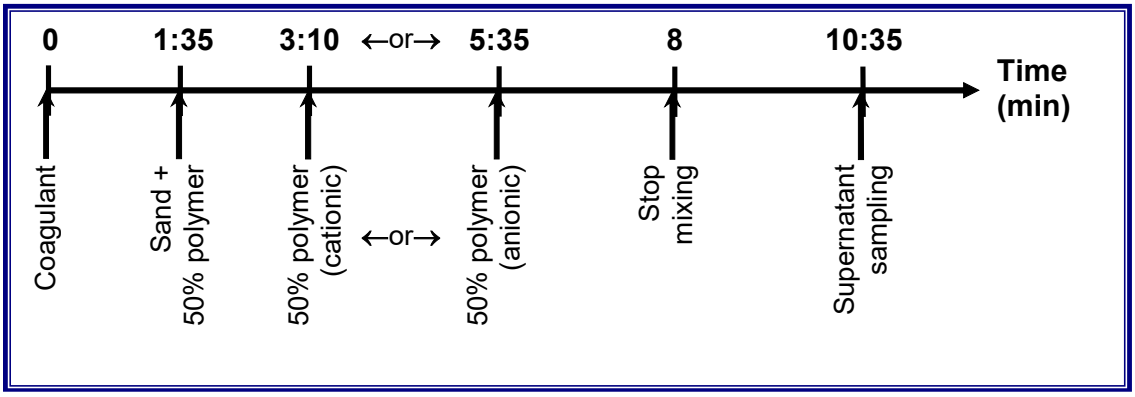
Step 3: Conduct a series of jar tests using different polymer dosages and the optimal pH and coagulant values determined during the previous steps (polymer curve).

Procedure:



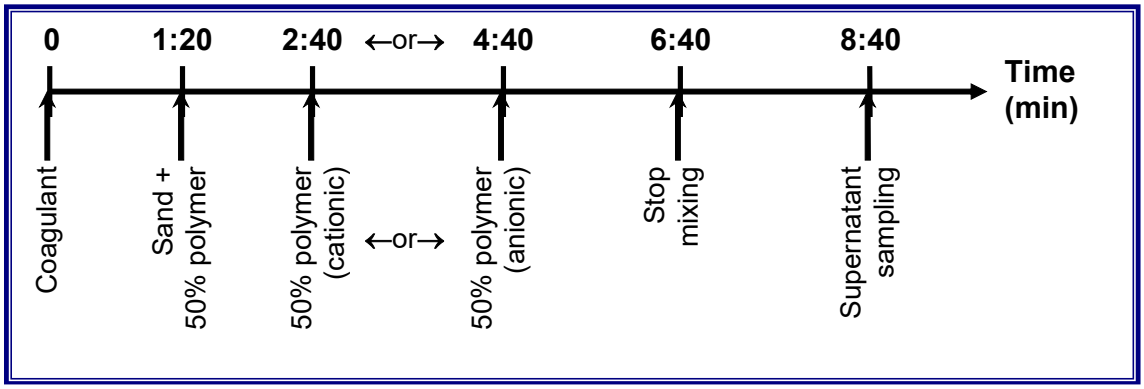
The times provided in the following method are specific to a speed of 40 m/h.

- Adjust the circulating bath to the desired temperature (optional).
- Measure the raw water's parameters (pH, alkalinity, actual and apparent colour, turbidity, UV absorbance, temperature). Measure the parameters according to the protocol and test objectives.
- Fill the 1 L beakers with raw water.
- Place the beakers on a test bench.
- Make sure that the raw water is at the desired temperature (optional).
- Place the blades at 0.5–1.0 cm from the bottom of the beakers.
- Begin mixing and adjust the speed at 150 RPM.



- Add the acid or alkali to adjust the pH (optional).
- Add the coagulant (refer to the timeline below).
- Start the chronometer.
- Two minutes after having added the coagulant, add the microsand (8–10 g/L of water) and 50% of the polymer dose.
- Two minutes (if cationic polymer is used) or five minutes (if anionic polymer is used) after having added the microsand and first dose of polymer, add the remaining dose of polymer.
- After an additional maturation contact time of six minutes (if cationic polymer is used) or three minutes (if anionic polymer is used), stop mixing and let the water rest for the following three minutes.
- Use a 50–100 mL syringe, a pipette or a vacuum hose to collect the supernatant (DO NOT collect it at the surface because of the microsand and micro-flocs that may be floating on the surface). Collect a sample of the clarified water.
- Measure the main parameters for the clarified water test objectives.
- Record all of the results and parameters on the Actiflo® jar test data sheet
- Collect the sand and have it disposed of in accordance with site regulations.

14.6 TIMELINE FOR SELECTED RISE RATE



40 m/h

50 m/h

60 m/h

14.7 CHEMICAL DOSING GUIDE

To simulate the Actiflo® process in a laboratory setting, it is strongly recommended to plan the tests carefully to avoid losing time and having to repeat steps uselessly. In general, it is recommended to vary only one parameter from one test to another in order to accurately determine the impact of each parameter on the process. The following figure illustrates an example of a laboratory test.

Step 1: Measure the parameters of the raw water (pH, turbidity, colour, etc.).

Step 2: Select the most effective polymer (anionic, non-ionic or cationic).

Step 3: Change the coagulant dosage.

Step 4: Change the pH by adding the acid (sulfuric acid) or the base (lime, caustic soda, etc.).

Step 5: Change the polymer dosage.

Project:

Project no.

Test	Water type	Simulated. superficial speed	pH adjustment			Coagulant		Polymer		Microsand	Parameters				
			Type	Dosage	Contact time	Type	Dosage	Type	Dosage		Turbidity	Colour		pH	Alkalinity (CaC_3)
												App.	Actual		
		m/h		(mg/L)	minutes		mg/L		mg/L	g/L	NTU	CU	RCU	-	mg/L
Raw water characteristics (non-ozonized)											1.12	60	39	5.3	< 20

3B	Ozonized	40	Lime	2,5	5	Alum	40	640	0.2	0.1	0.85	10	< 2	6.0	-

Table 14: Example of a series of laboratory tests with results

Microsand concentration

For the purpose of a laboratory test, 5 g of microsand are usually added to 1 L of raw water, but this quantity can be increased to 10 g/L to verify its impact on the treatment.

Polymer dosage

Pursuant to standard procedure, in Actiflo® process simulation tests conducted in a laboratory setting, 50% of the dosage is applied during the first injection of polymer and the remaining 50%, during the second injection. This procedure can be modified to optimize the process and visually assess a change in the formation and size of the flocs before the mixing is stopped.

Note: It is important to keep in mind that anionic and cationic polymers are not effective in the same pH ranges. Thus, a cationic polymer will be much more effective within a pH range of 3 to 7, whereas an anionic polymer will perform more effectively within a pH range of 6.2 to 12.

Impact of the simulated surface speed

It is possible to simulate the impact of an increase of the raw water flow rate and, thereby, of the surface speed on the performance of the Actiflo® process by modifying each treatment stage's contact time. The timelines presenting the time required to simulate various surface speeds are presented in the laboratory test procedure.

15 MAINTENANCE

15.1 ACTIFLO® CLARIFIER

15.1.1 LAMELLA PACK

WARNING

- Comply with all safety rules and policies if you need to access the settling tank.
- If you must go under the lamellas, make sure of the support beams integrity and the cleanliness of the lamellas.
- Before lowering the water under the lamellas, make sure you have removed some of the accumulated sludge in the lamellas (visible from the top of the clarifier) to reduce the supported weight.
- In the case of excessive plugging, the sludge weight can damage the lamellas and in extreme cases, collapse and cause serious injury to anyone under the modules.
- For the HIPS version and if lamellas are exposed to very cold temperatures, do not proceed with dewatering the lamellas because the cold makes them too fragile. It is then cleaned by keeping a layer of water above and uses the water jet to create pulsations in the lamella cells to loosen sludge.

15.1.1.1 Lamellas fouling

To maintain the Actiflo® performance, the lamellas should be cleaned regularly. The nature of the raw water, the quality of the clarified water produced and the flow rates handled are factors influencing the fouling. The lamellas fouling can be of two types:

- Visible (observable fouling from above lamellas)
- Invisible (fouling in the lower area of the lamellas)

The visible fouling may be an indicator of an invisible fouling in the lower area. In the case of significant invisible fouling, the lamellas can be damaged.

15.1.1.2 Cleaning frequency

There is a need for a regular cleaning of the lamella modules, by water jet or air jet, to maintain the Actiflo® clarifier performance. The recommended cleaning frequency is **once every week**. This may be more or less spaced according to the fouling rate observed. The cleaning frequency interval is the operator responsibility, although a minimum frequency is recommended.

15.1.1.3 Required equipment

Depending on whether the cleaning is carried out by air or water, it is suggested to use a PVC pipe fitted at its upstream end of a hose connector and elbow, nozzle or sprayer at its downstream end to direct water or air along the inclined axis of the lamellas. The length of PVC pipe should be sufficient for it to be handled from the top of the Actiflo® unit while allowing access to the bottom of the modules.

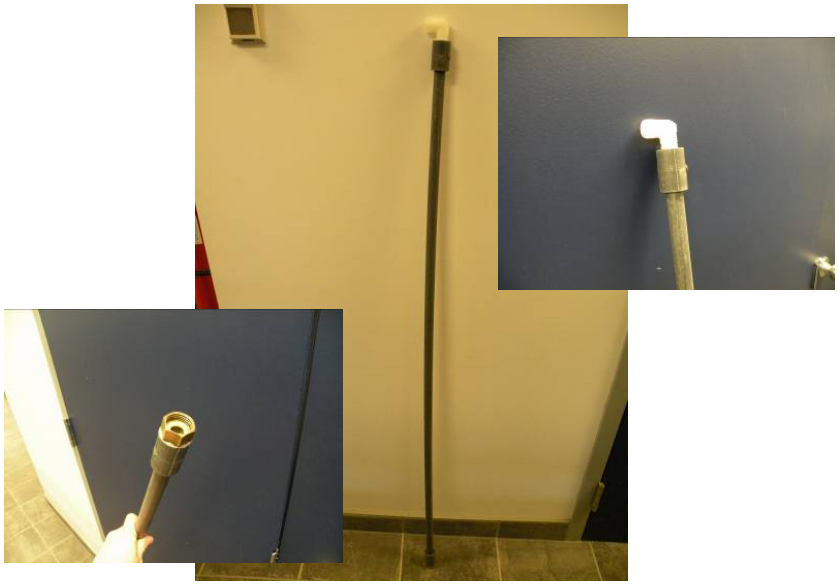

Figure 31: Suggested material for lamella cleaning

15.1.1.4 Lamella cleaning procedure

Lamellas cleaning can be achieved in 3 ways:

- Manual cleaning with water.
- Manual cleaning with air.
- Automatic cleaning with integrated system under the lamella modules (optional).

15.1.1.5 Manual cleaning with water

The cleaning procedure with water is:

1. Stop the Actiflo® unit according to the normal procedure.
2. Start the microsand recirculation system, in manual mode, including the scraper, if necessary, to assist in the disposal of cleaning sludge.
3. Slowly drain the basin using the partial drain located under the lamellas so as to have a lowering rate of 2 to 5 cm/min and start cleaning during emptying.
4. Open water jet on a wall of the decanter to prevent damage to the lamellas.

5. Clean the lamellas with a low pressure water jet (approximately 20 to 25 psi) using a cleaning tool (refer to previous figure). Repeat to clean every lamella. The water jet should be directed parallel to the lamella axis to clean the entire length.
6. With the aid of a high intensity light beam, validate the quality of the cleaning. When the lamellas are properly cleaned, it is possible to see through them.
7. Once completed, close the water jet on a wall of the decanter to prevent damage to the lamellas.
8. Finally, return the Actiflo® unit to service, to the sewer or to production depending on the quality of clarified water to be produced.

15.1.1.6 Manual cleaning with air

The cleaning procedure with air is:

1. Stop the Actiflo® unit according to the normal procedure.
2. Start the microsand recirculation system, in manual mode, including the scraper, if necessary, to assist in the disposal of cleaning sludge.
3. Insert the cleaning tool through the lamellas so that it goes below the lamella module and then inject air. Repeat to clean every lamella section.
4. Slowly drain the basin using the partial drain located under the lamellas so as to have a lowering rate of 2 to 5 cm/min.
5. Clean the lamellas with a low pressure air jet (approximately 20 to 25 psi) using a cleaning tool (refer to previous figure). Repeat to clean every lamella. The air jet should be directed parallel to the lamella axis to clean the entire length.
6. With the aid of a high intensity light beam, validate the quality of the cleaning. When the lamellas are properly cleaned, it is possible to see through them.
7. Finally, return the Actiflo® unit to service, to the sewer or to production depending on the quality of clarified water to be produced.

15.1.1.7 Automatic cleaning with integrated system under the lamella modules (optional)

The automatic cleaning system will clean the lamella modules according to a programmed sequence. The variation of the water level and air injection will be used for cleaning.

- The partial drain valve: used to drain the settling tank of the Actiflo® unit down to a few inches under the lamella.
- Backwash air valve: inject air under the lamellas with proper flow rate and pressure. Refer to technical datasheet.

Manual backwash sequence:

- Stop the Actiflo® unit according to the normal procedure.
- Open the partial drain valve to lower the level under the through.
- Open the backwash air valve and continue lowering the water level.
- Close the backwash air valve.
- Continue draining for a short time (with partial drain).
- Close the partial drain valve.
- Restart the Actiflo® unit.

NOTE: Open confirmation from partial drain valve is needed to allow the opening of the air valve. Close confirmation from partial drain valve is needed to allow Actiflo® to restart.

15.1.1.8 Severe obstruction

If the lamellas are severely obstructed or if the cleaning system is temporally down. It is recommended, every week, to stop the unit and partially drain the clarifier such that the lamellas are exposed (with the partial drain valve on the hopper). The lamellas can then be cleaned using a garden hose at 20 to 25 psi (maximum pressure). Remove any substance that is stuck to the settling module and which could interfere with the process efficiency.

15.1.2 MIXERS

For each mixer:

- Make sure that the gear box remains clean.
- Check on a regular basis the oil level in the gear box.
- Change the oil in the gear box.
- Refer to the mixer manufacturer manual for complete inspection and maintenance requirements.

15.1.3 MICROSAND RECIRCULATION PUMPS

- Every day, proceed to a visual inspection of the packing adjustment.
- Every 1000 hours of service (every 6 weeks at 24 hr/day), lubricate the bearings and check belt tension.
- Twice a year, proceed to an inspection of the pump: dry seal, impeller, rubber coating, bearings, etc.
- Refer to the pump manufacturer manual for complete inspection and maintenance requirements.

15.1.4 HYDROCYCLONES

- After the first year, inspect the inside surface. Replace worn sections if needed. The first inspection will determine the frequency of replacement.
- Refer to the hydrocyclone manufacturer manual for complete inspection and maintenance requirements.

15.1.5 SCRAPER

- Every 8700 hours of operation, change the oil in the gear motor.
- Refer to the gear motor manufacturer manual for complete inspection and maintenance requirements.

15.2 CONTROL PANEL

For each panel, including junction boxes:

- Replace fuses when needed.
- In case of an electrical problem other than a fuse, contact a certified electrician and verify the circuits.
- Refer to the electrical drawings.

15.3 INSTRUMENTATION

For each instrument equipped with a controller/transmitter:

- Calibrate instrument on a regular basis.
- Refer to the manufacturer manual for calibration instructions and maintenance requirements.

15.4 VALVES

15.4.1 MANUAL VALVES

- No preventive maintenance required.
- Refer to the manufacturer manual, if needed.

15.4.2 AUTOMATIC VALVES

- Refer to the manufacturer manual for complete inspection and maintenance requirements.

15.5 PERIPHERAL EQUIPMENT

- Any other peripheral equipment needing maintenance should be inspected on a regular basis.
- Refer to the manufacturer manual for complete inspection and maintenance requirements.

15.6 PAINT INSPECTION

To maintain the life expectancy or life-cycle of **Sherwin Williams Macropoxy 646 PW** or **Duraplate UHS** coating system applied as an internal lining system for potable or fresh water tank, a well-planned inspection schedule is required. When the coating system is applied adequately to properly prepare steel substrate, it can last up to 15 years or more.

The recommended inspection schedule is:

- Inspect after 12 months following the initial application of the coating system. If the substrate is exposed, if the surface is damage or require repairs, perform spot repairs according to the coating system manufacturer instructions specified in the following section.
- Repeat inspection every 3 years and repair.

15.7 PAINT REPAIR PROCEDURE

This procedure applies to **Sherwin Williams Macropoxy 646 PW** or **Duraplate UHS** coating system applied as an internal lining system for potable or fresh water tank.

If the painted surface is damage or require repairs perform the following:

1. Clean the surface with solvent according to surface preparation standard SSPC SP1 to remove any contamination.
2. Perform abrasive blasting of the surface according to surface preparation standard SSPC SP10 or perform power tool cleaning to bare metal as per SSPC SP11.
3. Surface preparation must create or expose existing profile to meet the minimum requirement set in the Sherwin Williams product data sheet.
4. Lessen the unevenness between the existing coating and steel by sanding the edges of the existing coating to a smoother transition.
5. Sand 5 to 10 cm on the existing coating surrounding the repair area in order to obtain a matte and rough surface.
6. Clean again the surface according to SSPC SP1 to remove any contamination or dust.
7. Apply Macropoxy 646 PW or Duraplate UHS, depending on the paint type used in the project, to restore specified dry film thickness (DFT) measurement.

15.8 LUBRICATION

- Refer to the following table for the lubrication schedule.
- Refer to the manufacturer equipment manual for complete lubrication, inspection and maintenance requirements.

15.8.1 LUBRICATION SCHEDULE

Equipment to be serviced	Component serviced	Type of lubrication	Lubricant manufacturer	Lubricant brand name	Quantity of lubricant	Lubrication schedule	Comments
Scraper (SEW Eurodrive)	Reducer box *Applicable for ACP-400R ACP2-40 and up*	Food grade oil	Total	Nevastane EP 460 or equivalent	8 Liters	Change oil every 8700 hours of continuous operation	Fill by the glass window up to the oil level plug or to about half of the height of the slewing ring gear
	Gearmotor	Food grade oil	Klüberoil	4UH1-460 N	1.9 Liters for primary gear reducer and 14.0 Liters for secondary reducer	Check oil and oil level every 6 months Change oil every 3 years	When changing oil, also replace oil seal (do not install it in the same track)
	Gearmotor bearings	Food grade grease	Aral	Aralube BAB EP2	Low RPM bearings: Fill the cavities between the rolling elements one-third full with grease High RPM bearings: Fill the cavities between the rolling elements two-third full with grease	Replace anti-friction bearing grease every 3 years	Regreasing recommended at the same time as changing the oil or replacing bearings
	Motor bearings	Food grade grease	Aral	Aralube BAB EP2	N/A	Every 10000 hours of operation, check ball bearings and change if necessary	The anti-friction motor bearings are sealed and does not require lubrication

Table 15: Lubrication schedule

Equipment to be serviced	Component serviced	Type of lubrication	Lubricant manufacturer	Lubricant brand name	Quantity of lubricant	Lubrication schedule	Comments
Mixers (Envirequip)	Motor bearings	N/A	N/A	N/A	N/A	N/A	The bearings are sealed for life. No additional lubrication required.
	Reducer box	Food grade oil	Chevron	FM ISO FM 220	Refer to manufacturer's manual (quantity varies with reducer box model)	Check oil and oil level every 6 months Change oil every 2 years or 10000 hours	N/A
	Reducer box bearings	Food grade grease	Mobil	Grease FM 222 (NLGI 2)	The bearing cavity should be packed to approximately 1/3 full with grease	Regrease bearings every 6 months	N/A
Recirculation pump (McLanahan)	Pump	Grease	Shell	Alvania Grease 3 (NLGI 2)	Inject grease by six strokes of a regular size grease gun (2" diameter body)	Regrease bearings every 1000 hours of operation	N/A
	Motor bearings	Grease	Esso	Polyrex® EM (NLGI 2)	N/A	N/A	Does not require lubrication as bearing life is 20000 hours

Table 15: Lubrication schedule (cont'd)

APPENDIX: "TYPE D" DRY GLAND REPAIR PROCEDURE

MICROSAND RECIRCULATION PUMP

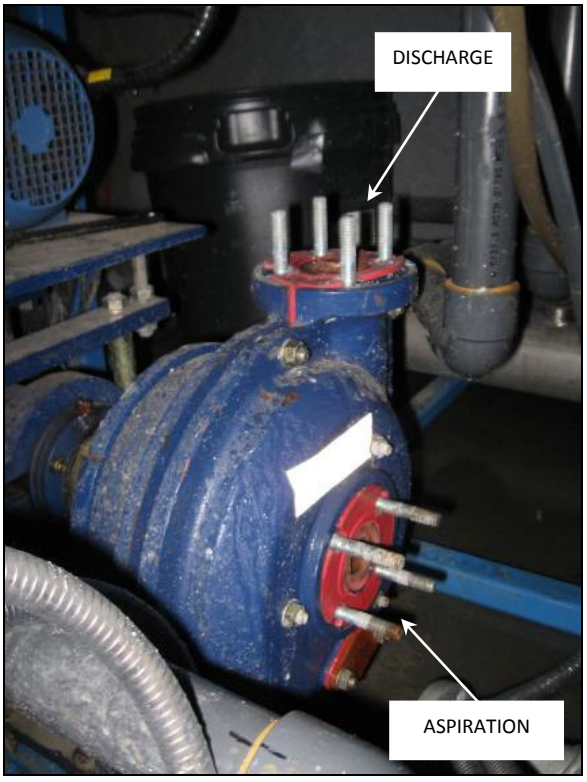
MICROSAND RECIRCULATION PUMP
DRY GLAND REPAIR PROCEDURE

1 INTRODUCTION

The face seal of the microsand recirculation pump (Linatex pump) is a wearing part that must be changed after a period of 5 years or 40 000 hours of operation following the application.

The face seal is a rubber piece in rotation which ensures sealing of the shaft. If the fit is too tight, the face seal will be damaged due to friction and the pump will leak. A proper adjusted face seal will not leak. However, a too tight face seal will not leak either, but lead to the results shown below.

It is therefore important to adjust the seal face so as to maximize its lifetime. The photo below shows a seal face damaged/used and another brand new.



2 PUMP DISMANTLING

Disassembly of the pump can be according to the following steps:

1. It is important to lockout/tagout the power supply to the pump before handling the pump;
2. Disassembly of the suction and discharge pipes;

The first step will be to debunk the suction and discharge in order to open the volute.

3. Volute opening;

   The opening of the volute provides access to the impeller that will also have to be removed.

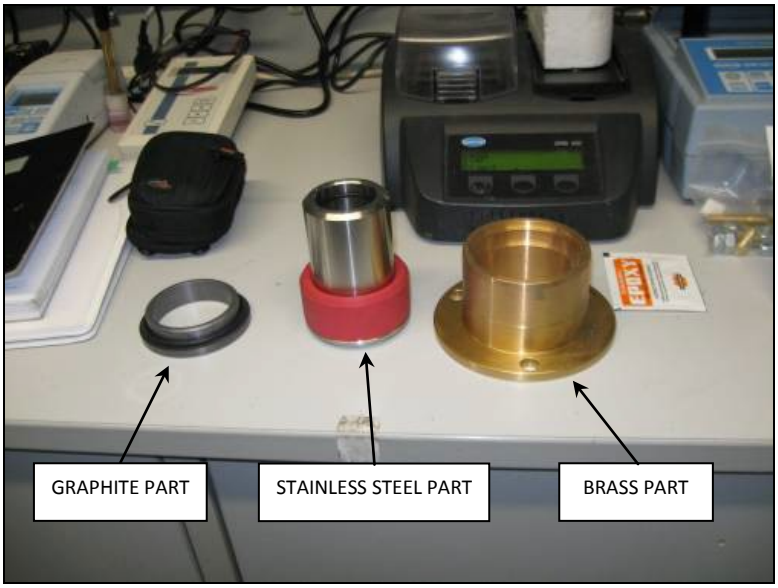
4. Impeller removal;

   The impeller of the pump is removed by unscrewing in the counter clockwise rotation. This is usually done by hand and requires blocking the pump shaft to prevent it from turning. Depending on the size of the pump, using a lever may be appropriate.

5. Removal of the rear portion of the volute;

   The second half of the volute must be removed to access the gland. This requires unscrewing the 4 bolts clamping the volute and the clamping bolts of the gland (step 3) as shown below.

   It is important to remove the remaining half of the scroll carefully not to break the piece of graphite part of the gland. You must separate the volute structure by moving horizontally without up or down movement until the shaft is completely cleared.



6. Gland removal.

   The gland is now accessible and can be removed from the shaft.

3 NEW DRY GLAND SEAL ASSEMBLY

The following parts are required to assemble the new dry gland seal.

To assemble the dry gland seal, follow the assembly sequence (also refer to the McLanahan manual):

1. Bonding of the graphite part to brass part:

   Epoxy preparation.

   Coat the piece of graphite with epoxy glue, put the EPDM seal.

   Insert the piece of graphite in the piece brass and apply pressure to lower the graphite piece until it stops. A period of 4 hours the glue begins. Check glue drying on the unused epoxy sheet before moving workpiece. It is necessary to leave a weight on the graphite part during drying to ensure that the graphite piece seat uniformly on the brass part (5 kg approx.).

2. Final assembly.

   The final assembly is shown below.

4 PUMP ASSEMBLY

1. Assembly of the brass part on the volute:

   Assemble the brass gland adjustment piece on the volute with 3 adjustment bolts. It is important that the bolts are screwed only 3 to 4 threads.

2. Assembly of the rear part of the volute:

   Assemble the rear portion of the volute on its structure with 4 bolts. Assemble the volute to the structure horizontally without moving up and down once engaged on the volute shaft.

3. Install the face seal:

   Slide the stainless steel sleeve with the seal surface on the shaft to the shoulder on the shaft.

4. Install the impeller:

   The pump impeller is screwed clockwise on the pump shaft. This is done manually and requires blocking the pump shaft to prevent it from turning.

5. Installation of the outer portion of the volute:

   Install the outer portion of the volute and tight bolts evenly.

6. Installation of suction and discharge pipe:

   Bolt the suction and discharge pipes.

5 DRY GLAND SEAL ADJUSTMENT

With the adjustment part of the gland down, turn the shaft by hand to familiarize with the resistance of the bearings without friction of the dry gland.

Adjust the brass part to be parallel to the frame of the pump. Then tighten the 3 adjustment brass nuts to keep the parallelism of the piece with the frame until an additional resistance is felt during the rotation of the shaft and then loosen ¼ turn on the 3 nuts.

Open the valve upstream of the pump. If there is substantial water leak, close the valve and tighten the nut 1/8 turn and recheck the resistance of the shaft. Once the valve opened and no major water leak, start the pump for a short period of time (2 minutes) to check if there are leaks during operation. If so, stop the pump, lock out again and tighten 1, 2 or 3 nuts to try to improve the fit. It is important, after each adjustment, to rotate the shaft by hand to ensure that the seal is not too tight.

A well-adjusted seal will not leak (or 1 to 2 drops/min) and will have a very low additional resistance during rotation of the shaft.

1. INTRODUCTION

1.1. INTENT OF THIS MANUAL

This document describes the functions and components of the Hydrocyclones MA, and the procedures for the installation, start-up and standard operation of the system. It also plans preventive maintenance measures and describes procedures for the regular maintenance of the equipment as well as troubleshooting.

The Hydrocyclones MA are manufactured and supplied by Veolia Water Technologies. This equipment of proven design will ensure decades of trouble-free operation. However, in order to reach and maintain peak efficiency and performance of the system, it is imperative to take into consideration all guidelines described in this manual.

To obtain any additional information regarding characteristics, operation or maintenance of this equipment, or if a problem persists, please do not hesitate to contact us:

Veolia Water Technologies

1.2. DISCLAIMER STATEMENT

The information in these manuals may not cover all operating details or variations or provide for all conditions in connection with installation, operation, and maintenance. Should questions arise which are not answered specifically in this manual, contact the Veolia Water Technologies' Service Department.

Veolia Water Technologies reserves the right to make engineering refinements that may not be reflected in these manuals. The material in these manuals is for informational purposes and is subject to change without notice.

1.3. PROPRIETARY RIGHTS STATEMENT

This manual discloses information in which Veolia Water Technologies has proprietary rights. Neither receipt nor possession of this manual confers or transfers any right to the client, and by its retention hereof, the client acknowledges that it will not reproduce or cause to be reproduced, in whole or in part, any such information except by written permission from Veolia Water Technologies. The client shall have the right to use and disclose to its employees the

information contained herein for the purpose of operating and maintaining the Veolia Water Technologies equipment, and for no other purpose.

In the event the content of this manual is altered or section/items are omitted during a reproduction, in whole or in part, and instructions or definitions within the reproduction result in personal injury to those who follow the altered instructions, the burden of responsibility for personal injury falls solely on the party who affects the reproduction.

2. HEALTH & SAFETY

2.1. SAFETY INSTRUCTIONS

The safety instructions listed in this document must be read carefully and strictly adhered to in order to reduce possible health hazards and to avoid dangerous situations.

In this chapter you will find general safety instructions that draw attention to hazards in the handling of the system as well as unavoidable residual risks.

Action-related safety instructions are shown ahead of the corresponding instructions.

The “Safety” chapter is fundamentally important and must be read carefully and adhered to. It is the only way to ensure that all operations and work on the system can be carried out safely and correctly.

Not adhering to the safety instructions can result in danger to persons and material damages to the system.

Please keep this Operator Manual & these safety instructions close to the unit so that they are available for reference by the operators at all times.

To the Operator:
It is your responsibility to read & become familiar with the instructions in this manual.
If in doubt, seek guidance before carrying out an operation / procedure with this equipment.

The following indications:

Danger

Warning

Attention

are shown at various points in this manual for your protection - please take note of them.

2.2. OPERATOR CARE

The equipment has been designed and manufactured to applicable harmonized standards and technical specifications and with the greatest possible safety in all operating modes.

The safety of the plant / unit operation can only be achieved if all of the following points are adhered too.

The operator must pay particular attention to the following:

- The equipment is used as only as specified
- The equipment is operated only when in good functional condition. All safety devices should be checked regularly to ensure proper functioning.
- Personnel Protection Equipment (PPE) is available in good condition and used when required.
- The operating instructions are complete, readable and available on site for use on the plant / unit.
- Only trained, qualified and authorised personnel are permitted to operate, maintain and repair the plant / unit.
- Those personnel are instructed with regard to safe working practices and environmental protection, and know the contents of the operating instructions and any safety notes.
- All safety and warning labels on the plant / unit are visible, readable and are not removed.
- Modifications are only to be carried out by authorised specialised personnel.

2.3. PERSONAL PROTECTIVE EQUIPMENT

To minimise safety hazards, personal protective equipment has to be worn correctly during operation of the plant.

Please respect any additional signs regarding personal protective equipment which are installed in the plant area.

Protective clothing

Protective clothing is tightly fitted and resistant to tearing, with tight sleeves and no external parts.

Pair of goggles with side protection

Used to protect the eyes from splashes and from contact with hazardous substances and microsand.

Safety gloves

Used to protect the hands from hot or cold surfaces, abrasive materials such as microsand and from contact with hazardous substances.

Safety boots

Used to protect the feet from falling parts and slipping on slick surfaces.

Safety Helmet

Used to protect the head from falling of parts and heavy loads.

2.4. SAFETY NOTES - FOLLOWING INSTALLATION

2.4.1. Water

Attention

Where water ingress is possible / expected, ensure that measures are taken to allow water to exit the electrical enclosure and / or provide a water leakage sensor and alarm system.

Ensure that there is sufficient drain capacity.

2.4.2. Chemicals

Attention

Refer to Chemical Safety Data Sheets before handling any chemicals.
Where chemicals are added to the system there is a risk of splashing.
Wear suitable personal protective equipment (PPE) - safety glasses, rubber gloves etc, when handling chemicals. Detailed information for the HYDREX products described in this leaflet can be found in our relevant health and safety information (Safety Data Sheet) available on following link: http://frclg11msdgenp1.vws.vh20.net/MSDSViewer/Default.aspx .
This tool is only accessible to VWT employees. Please contact your Hydrex water treatment additives expert for further information.

2.4.3. Fire

Danger

Fire Risk!
The unit should not be installed near flammable liquids or gases.
Hydrocyclones are made in Polyurethane that is flammable. It must not be put in contact with direct flame.

2.4.4. Natural disasters

Attention

Possible impacts of natural disasters (earthquake, cyclones, floods or others) have not been considered in the system standard conception. Risks criticality must be evaluated on a case by case basis by the company in charge of installation, in order to put in place suitable protective measures for the designated installation site (extra-reinforcements, clearance area,...)

2.5. SAFETY NOTES - DAILY OPERATION

2.5.1. Electrical

Danger

Make sure your hands and the place where you are standing is dry before touching any live electrical components.
When working on electrical equipment make sure that the mains power has been isolated / switched off.
Keep flammable liquids and gases away from electrical components.

Attention

Avoid touching electrical components / terminals with wet hands.
Switch off / electrically isolate the equipment during electric (thunder) storms.

2.5.2. Water

Attention

Ensure that all electrical enclosures around the hydrocyclones are sealed & / or locked during operation of the equipment.
A large content of microsand is present at the inlet of the hydrocyclone and at the underflow. Always wear eyes protection.

2.5.3. Performance

Attention

Do not supply out-of-specification feed water to the equipment under any circumstances.
A regular weekly, monthly and annual schedule of maintenance should be instigated to ensure continued good & cost-effective performance.

3. HYDROCYCLONE DESCRIPTION

MA hydrocyclones have been developed and patented by Veolia Water Technologies under the management of Veolia Performance and Technical Department. They are distributed by SOLYS.

MA hydrocyclones are devices used to separate microsand from sludge using centrifugal separation. They are used for all Actiflo® applications but are not designed for other applications. In these devices, the microsand particles, due to their specific mass and density, are pushed to the bottom while sludge is extracted from the top.

Their main differentiation to most other hydrocyclones available on the market is the injection of service water at the bottom part of the hydrocyclone to increase the cyclone efficiency on several specific Actiflo applications. The MA hydrocyclone range has been designed to offer a cutting point that is suitable for the Actiflo different types of microsand that are suitable.

3.1. THE DIFFERENT MODELS OF HYDROCYCLONES

Different sizes of MA hydrocyclone are available. The recommended working ranges are:

- MA1 for an inlet flow of 0.4 to 1 m^3/h (inlet pressure of 0.5 to 2 bar)
- MA5 for an inlet flow of 4 to 6 m^3/h (inlet pressure of 0.6 to 1.5 bar)
- MA10 for an inlet flow of 8 to 14 m^3/h (inlet pressure of 0.6 to 1.8 bar)
- MA20 for an inlet flow of 16 to 30 m^3/h (inlet pressure of 0.6 to 2 bar)
- MA40 for an inlet flow of 35 to 54 m^3/h (inlet pressure of 1.2 to 2 bar)
- MA80 for an inlet flow of 60 to 80 m^3/h (inlet pressure of 1 to 2 bar)

In some specific cases, it is possible to work at flow rates slightly below or above the recommended range but performances may be affected. It is in most cases not recommended.

Head loss vs flow indicative curves are available in chapter 6.1.

3.2. MATERIAL OF CONSTRUCTION

MA hydrocyclone body is made of Polyurethane that has a good resistance to abrasion (reference TM 390). This material is suitable for drinking water applications (DWI agreement in the UK, ACS certification in France, FDA approval). Seals are made of EPDM and nuts and bolts of SS.

Note: If the hydrocyclone is exposed to UV, it can turn yellow, but this has no impact on the properties of the material.

The suitable temperature range for the hydrocyclones is from -20°C to +60°C. If this range is not respected, there will be modifications of the mechanical properties of the material.

There are some chemical incompatibilities with MA hydrocyclones. The following chemical resistance is given for a water temperature of 20°C. The higher the temperature is, the lower is the chemical resistance.

Products to be avoided whatever the concentration:

- Chlorinated solvents (methylene chloride, chloroform, trichloroethane,..)
- Aromatic chlorinated solvents (chlorobenzene,…)
- Other solvents (THF, DMF, NMP, DMSO and pyridine)
- Ketones (MEK or MIBK)

Products to be avoided above a certain concentration:

- Weak acids (acetic, citric, boric, stearic): 3% maximum
- Strong acids (hydrochloric, sulphuric): 3% maximum
- Mineral acids (sodium bisulphate and phosphoric acid): 3% maximum
- Oxidant solutions:
  - Bleach (continuous): 0.5% maximum
  - Bleach (shock): 3% maximum
  - Sodium nitrate: 3% maximum
- Alkaline solutions:
  - Caustic soda: 3% maximum
  - Lime slurry: saturated
- Alcohol:
  - Ethanol and iso-propanol: 5% maximum
  - Methanol

There are no chemical incompatibilities with:

- Ferric chloride and aluminium chloride
- Oil and grease

3.3. CONNECTIONS, WEIGHT AND LAYOUT OF THE HYDROCYCLONES

The MA hydrocyclone has various connections:

- A feed inlet with Victaulic connection
- A service water inlet with barbed hose fitting
- An overflow with Victaulic connection
- An underflow nozzle

Note: MA1 hydrocyclone has four barbed hose fittings (feed, overflow and underflow and service water inlet).

Table 1: Connections and weights of the MA hydrocyclones

	MA1	MA5	MA10	MA20	MA40	MA80
Feed inlet	15.8mm	1''	2"	2" ½	4''	4''
Overflow outlet	15.8mm	1''½	2"	2" ½	4''	6''
Service water inlet	15.8mm	½''	¾''	¾''	¾''	1''
Weight	650g	6.2kg	10.5kg	18.2kg	76.2kg	116kg

The MA10, 20, 40 and 80 have all a very similar design that is described in the Figure 1, Figure 2 and Figure 3. A per the latest design, some Victaulic connections of the MA40 and MA80 are reinforced with SS inserts.
The MA1 and MA5 have several specificities as shown in Figure 4. One of the key difference of these models is that they don't have a replaceable Apex Tip so must be full replaced when worn internally.

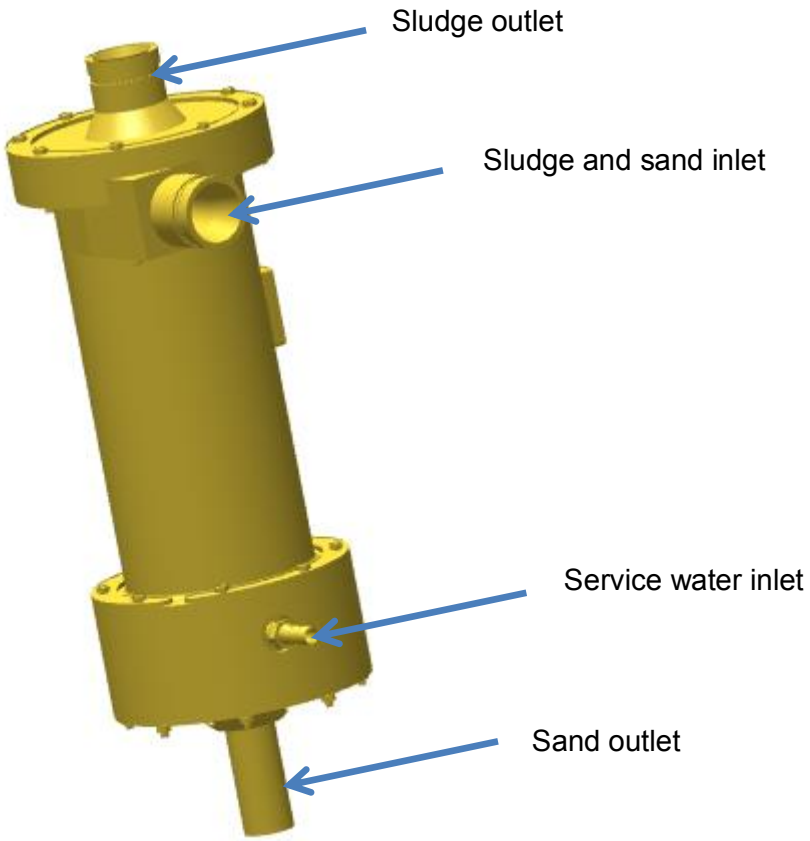

Figure 1:Hydrocyclone MA20 external view

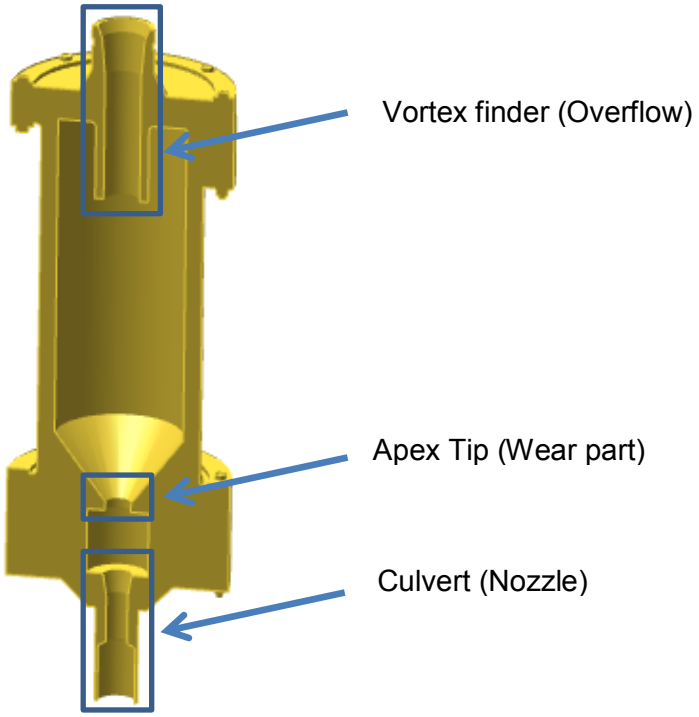

Figure 2: Hydrocyclone MA20 internal view 1

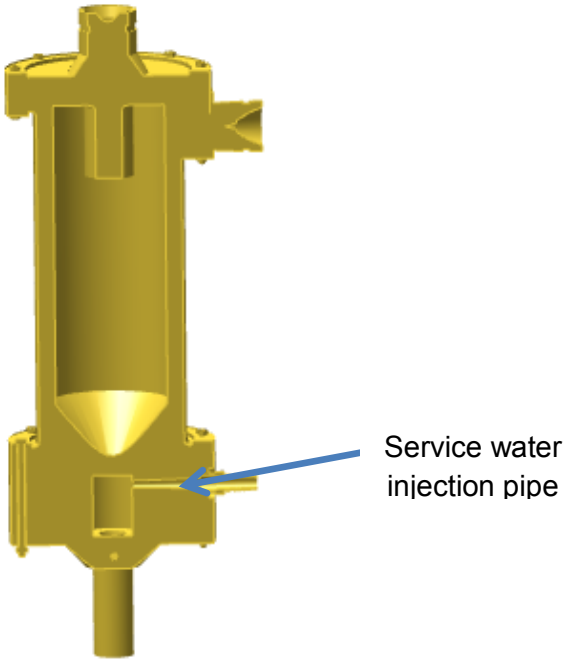

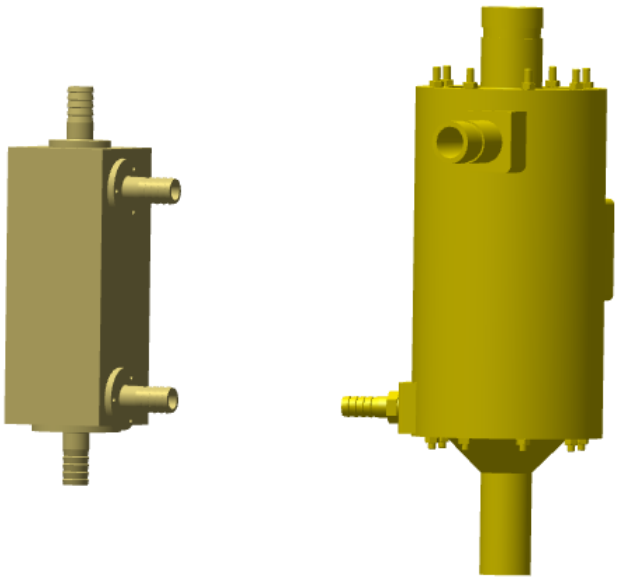

Figure 3: Hydrocyclone MA20 internal view 2

MA1 MA5

Figure 4: External views of Hydrocyclones MA1 and MA5

For the models MA20, MA40 and MA80, several alternatives Apex Tip and Vortex finder internal diameters are available in case the standard one doesn't provide expected performances and resistance to abrasion.

4. SHIPPING AND HANDLING REQUIREMENTS

4.1. TRANSPORT

Transport must be done by qualified staff, following local applicable legislations.
The freight company and its driver are responsible for ensuring that all components transported are secured according to all applicable transport regulations at pick-up, during transport and upon arrival.
Lifting must be done as described in the following chapter.
Suitable access control and limitation as well as signalisation must be ensured at the delivery place before the arrival of the trucks, according to local regulations.

4.1.1. Packing description

Unless specifically requested, MA hydrocyclones are delivered in carton boxes or filmed on pallets (depending on size and quantity ordered). Weight of the hydrocyclone without the packing are listed below. Dimensions of the hydrocyclone are available on the Outline and Connection Drawings.

Table 2: External dimensions and weight of the hydrocyclones

Model	MA1	MA5	MA10	MA20	MA40	MA80
Total height	224 mm	445 mm	606 mm	796 mm	1116 mm	1293 mm
Body external width/diameter	60 mm	150 mm	210 mm	260 mm	400 mm	470 mm
Empty Weight	650 g	6.2 kg	10.5 kg	18.2 kg	76.2 kg	116 kg
Max Operating weight	750 g	7.5 kg	15 kg	31 kg	102 kg	170 kg

4.1.2. Lifting

During any lifting operation, ensure you wear appropriate Personal Protective Equipment such as safety gloves, safety Shoes and suitable Helmet.
For MA1 to MA20, each hydrocyclone can be carried by hand.
For MA40 and MA80, lifting must be done using suitable equipment (two straps for example), by trained and authorized staff, following local regulations. Before lifting, delimit the no access safety perimeter to be maintained throughout the lifting operation. It shall also be ensured that no item is loose or damaged before.

If it is not possible to directly unload the hydrocyclone to its final location, suitable equipment shall be used for transportation between the unloading area and the final installation position. Ensure that the means used to lift and transport the hydrocyclone will not jeopardize its mechanical integrity. Use CE approved (or equivalent) lifting and transportation devices.

4.2. STORAGE

The following instructions outline the duties and responsibilities of the responsible party for equipment storage. The responsible party shall assume responsibility for the equipment upon arrival at the project site. These instructions shall define the minimum expectations for storage of all equipment.

While this storage specification takes into account common environmental issues that may affect the system during storage, common sense should be the overriding factor in determining the best method to ensure the integrity and proper storage of the VWT equipment.

If the equipment has to be stored on site, take into account following recommendations:

- Temperature between 5 and 50°C
- Relative humidity between 5 and 95% without condensation.
- Sheltered from sunlight and UV
- **Keep away from ignition sources at all time**
- Maximum storage of 10 years

5. MECHANICAL INSTALLATION & PIPING CONNECTION

5.1. MECHANICAL INSTALLATION

WARNING : ***Some of the re-assembly steps may require working at heights There are also heavy loads that require suitable lifting devices. All work must be done with the suitable personal protective equipment at every step. This could include, amongst others wearing/using: a helmet, safety shoes, gloves, safety glasses, a harness, ladder, stop-fall device and mobile platform with handrails.***
The unit should not be installed near flammable liquids or gases. Hydrocyclones are made in Polyurethane that is flammable. It must not be put in contact with direct flame. The hydrocyclone should be protected against any projections that could occur during welding activities.

Before starting installation, check that the material is not damaged and the delivery is correct:

- There are no cracks
- There are no air bubbles in the polyurethane
- The model and number of parts is correct
- Material certificates are available

MA hydrocyclones are delivered already mounted. The only part of the cyclone that could be required to assemble on site is the service water connection. Teflon tap or a sealing gel should be applied to the threads before screwing the connection to the hydrocyclone. It is important to respect the maximum tightening torque as per values in the Table 3. If you don't need service water for your application, you can remove the service water nipple and use instead a simple plug in SS with Teflon tap or a sealing gel (refer to general assembly drawings for thread dimensions).

Table 3: Maximal tightening torques for the different hydrocyclones parts

	MA5	MA10	MA20	MA40	MA80
Nuts & bolts between overflow and cyclone body	4Nm Max	6Nm Max	8Nm Max	16Nm Max	24Nm Max
Nuts & bolts between the underflow and the cyclone body	4Nm Max	2Nm Max	8Nm Max	16Nm Max	24Nm Max
Service water connection	1Nm Max	1Nm Max	1Nm Max	1Nm Max	1Nm Max
Nozzle	1Nm Max	1Nm Max	1Nm Max	1Nm Max	1Nm Max

Before installing the hydrocyclone to its final location, tightening must be checked and adjusted as per the table above. When tightening the connection between the overflow and the body as well as the overflow and the body, do not screw nut & bolts one after the other clockwise, but

screw opposite nuts & bolts one after the other (in a star shape as per Figure 5 below) and tight progressively the nuts, repeating the tightening sequence several times. This will avoid deformation problems and issues of leaking at the gaskets or O–rings.

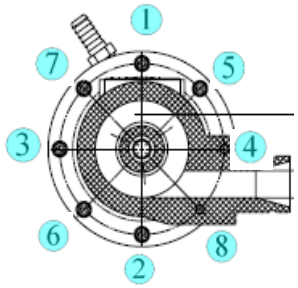

Figure 5: Nuts & bolts screwing sequence

There are many possible mechanical installations in terms of supporting skid. Below are some pictures of existing design within Veolia. An important point is that a belt or strap must maintain the body of the cyclone to minimize vibrations and expansion in operation (except for MA1) that hasn't a cylindrical body. It is mandatory for mechanical installation of MA40 and MA80 to consider a suitable strap in order to avoid excessive vibrations.

Figure 6: Examples of hydrocyclone installation

When installing the hydrocyclone:

- Make sure that the hydrocyclone is perfectly vertical
- Avoid knocking the hydrocyclone
- Install the hydrocyclone with its support
- Once the support assembly is set up, connect the different pipes

The Victaulic connections can compensate a slight misalignment. Avoid excessive misalignment which will generate stress and could break the cyclone.
During operation, hydrocyclones can inflate and vibrate. It is mandatory to consider a belt and a saddle around the body that would constraint the body over 360°.
For largest models (especially MA80 but also MA40 or MA20 when operating at high flows), it is recommended to have 2 belts and saddles.
Please refer to pictures available in Figure 6 as possible installation. Below in Figure 7, an example of skid in Stainless steel with Saddle in Item 6 and belt in Item 3. Other materials such as rigid plastics can be also considered for these 2 parts.

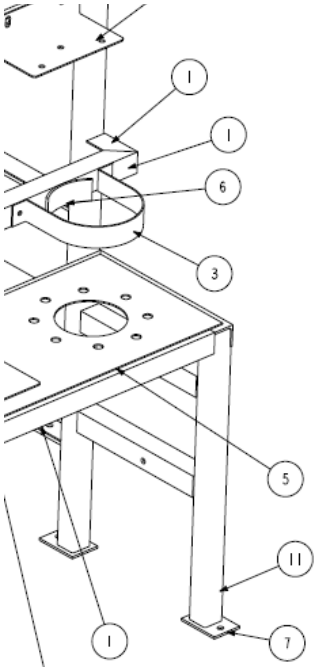

Figure 7: Example of hydrocyclone support skid

Refer to Table 2 for the weight of each hydrocyclone empty and full of water.

The unit should not be installed near flammable liquids or gases.
Hydrocyclones are made in Polyurethane that is flammable. It must not be put in contact with direct flame.

5.2. HYDRAULIC CONNECTIONS

5.2.1. Inlet for sand + sludge

The recirculation pipework of sludge + sand must be connected to the hydrocyclone inlet. This pipe must be self-supported and should not apply significant stress on the Hydrocyclone. A suitable victaulic coupling (not in hydrocyclone scope of supply) must be used to avoid any leaks. Ensure that you have proper tightening of the victaulic coupling with suitable torque as per supplier's datasheet. At least one device to control pressure at the inlet of sand+sludge is mandatory. As pressure cannot always be fully reliable to estimate flowrate, and is not always possible to install in the right position just before the hydrocyclone inlet, it can also be useful to have a suitable flow meter installed in the recirculation line, between the recirculation pump and the hydrocyclone.
If the inlet pipework does not match the hydrocyclone victaulic size, a slightly tapering convergent cone must be use or standard reducer if installed more than 10 times the pipe diameter before the hydrocyclone inlet.

Pipework should be straight without elbows more than 10 times the pipe diameter before the hydrocyclone inlet.

In case of single pump feeding several hydrocyclones, a proper repartition must absolutely be ensured through a proper pipework design.

5.2.2. Sludge outlet (overflow)

The pipework for sludge outlet must be connected to the hydrocyclone top outlet. This pipe must be self-supported and should not apply significant stress on the Hydrocyclone. A suitable victaulic coupling (not in hydrocyclone scope of supply) must be used to avoid any leaks. Ensure that you have proper tightening of the victaulic coupling with suitable torque as per supplier's datasheet.
It can be useful to have a suitable flow meter installed to monitor sludge flow rate.
The diameter of the sludge outlet pipework must be the same than the sludge outlet victaulic connection.
Hydrocyclone operation introduces air into the sludge extraction line. Therefore, it is necessary to install a vent in the sludge outlet pipework, for each Hydrocyclone. Vent must be at the highest point of the sludge outlet pipework, have a diameter equal to the sludge outlet pipework and a height of at least 10 times the pipe diameters, preferably 15 times.
To ensure proper functioning of the hydrocyclone, the overflow must be at atmospheric pressure. Sludge outlet pipework must go to a collector with an air break. Counter-pressure (static and dynamic) induced to the cyclone by the outlet pipework should be less than 0,15 bar.

5.2.3. Sand outlet (underflow)

For all Actiflo Turbo applications, return of sand must be going inside the draft tube of the flocculation mixer. In case it is impossible, it is possible but much less effective to design return of sand to go to the inlet of the flocculation tank.
The underflow outlet generates a lot of splashes so a suitable device shall be considered to protect against these. Materials of construction of this device must be suitable to resist against abrasion (rubber lining, suitable polyurethane or plastic). See Figure 6 for examples.

5.2.4. Service water inlet

Service water requirements are the following:

- Quality: 20 µm filtered water
- Pressure: Sand and sludge recirculation flow inlet pressure + 0.5bar
- Flow: 10% of the inlet flow

The service water pipe shall be connected to the hydrocyclone with a flexible pipe (Tricoclair for example) to avoid damage due to vibrations.

It is highly recommended to have a flow indicator in the service water feed line in order to check the inlet flow and a solenoid valve interlocked to the recirculation pump. If pressure is not controlled by another device, suitable pressure adjustment device and pressure indicator are mandatory to ensure proper pressure.

5.3. PRE-COMMISSIONING CHECKS

The minimum numbers of points, to verify before commissioning, are listed below. Use your good judgement to determine if there are any other points to verify. Any additional verification required according to project, site or local regulations must be also made. Read chapter 6 of this manual before proceeding with pre-commissioning.

1. Check that the micro-sand that will be used in commissioning and after in operation is in line with the specifications as per Table 4.
2. Check also that all components, especially the ones related to safety, are properly bolted/installed and that there is no unusual movement. If there is any risk of injury, the problem must be solved before proceeding with further tests.
3. Check that the Actiflo tanks are clean and completely empty of foreign objects
4. Run the recirculation pump with clear water and check no leaks are present and that the underflow water going out has the shape of a cone/umbrella. See Figure 8. If you don't obtain such shape, there might a problem with the recirculation pump duty point or maybe a foreign objects are inside the Hydrocyclone and must be removed.

5. Check the hydrocyclone inlet pressure and the back-pressure on the overflow
6. If applicable adjust service water flow and pressure.

Table 4: Micro-sand specifications

	Drinking water / Process water (Type I)	Waste water (Type II)
Type (Rolled or Crushed)	Crushed	Crushed
Silica concentration (SiO2)	>95%	>95%
Effective size (d10)	85-100 µm	130-150 µm
Uniformity coefficient (d60/d10)	<1.7	<1.7
Minimum size (2/3*d10)	60 µm	80 µm
Maximum size	200 µm	300 µm
Real density	2650 kg/m3	2650 kg/m3
Loss on combustion	Less than 0.1%	Less than 0.1%

Figure 8: underflow cone shape in normal operation conditions

5.4. COMMISSIONING CHECKS

During commissioning, micro-sand is present inside the Actiflo and so will be also present inside the hydrocyclone when the recirculation pumps are running. During all commissioning steps, suitable eyes protection must be worn next to the hydrocyclone to protect against sands projections. Also, suitable gloves must be worn anytime hands are exposed to the underflow fluid as microsand can be very abrasive.

The minimum numbers of points, to verify during commissioning, are listed below. Use your good judgement to determine if there are any other points to verify. Any additional verification

required according to project, site or local regulations must be also made. Read chapter 6 of this manual before proceeding with commissioning.

1. Check that the underflow water going out has the shape of a cone/umbrella. See Figure 8. If you don't obtain such shape, there is a problem with the recirculation pump duty point or foreign objects are inside the Hydrocyclone and must be removed.
2. Check sand concentration at the inlet of the hydrocyclone (it should be less than 150g/l)
3. Check that sand concentration and flow at the underflow are in line with the process calculations
4. Check repartition between overflow and underflow (should be around 80/20)
5. Check the absence of significant amount from micro-sand at the overflow. In theory, less than 0,1% of the micro-sand entering the hydrocyclone is going to the overflow.

To better adapt their performance, hydrocyclones MA20, 40 and 80 are equipped with interchangeable parts of different diameters for the overflow and underflow. Next table shows the available sizes. The ones already installed inside the hydrocyclone in standard are indicated with in bold and underlined. In most cases, the standard ones are suitable but depending on site parameters (Actiflo application, type of sludge, concentration of sludge, specification of microsand, etc), it might be required to change them for one of the available alternatives.

Note: The use of interchangeable parts with different inner diameters does not affect the connection diameters of the hydrocyclone.

Table 5: MA20, 40 and 80 interchangeable parts (Vortex finder and Apex Tip)

	MA20	MA40	MA80
Vortex finder internal diameter D1 (mm)	37	51	65
	42	**56**	**70**
	47	61	
Apex Tip iternal diameter D2 (mm)	25	35	45
	30	**40**	**50**
	35	45	55

Please refer to the spare parts list in the chapter 7.4 for more information.

Some parts of the largest hydrocyclones are heavy. Suitable Personnel Protection Equipment such as safety shoes and a suitable helmet must be worn during the interchangeable parts replacements. For the largest hydrocyclones, suitable lifting devices are required.

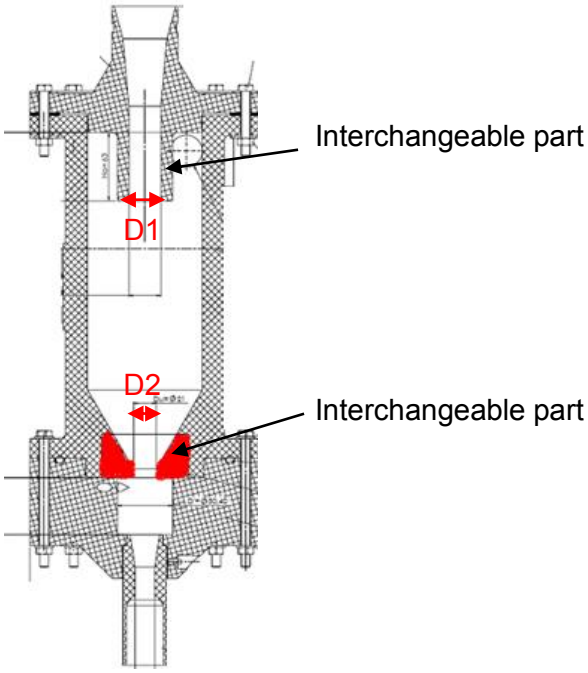

Figure 9: Interchangeable parts

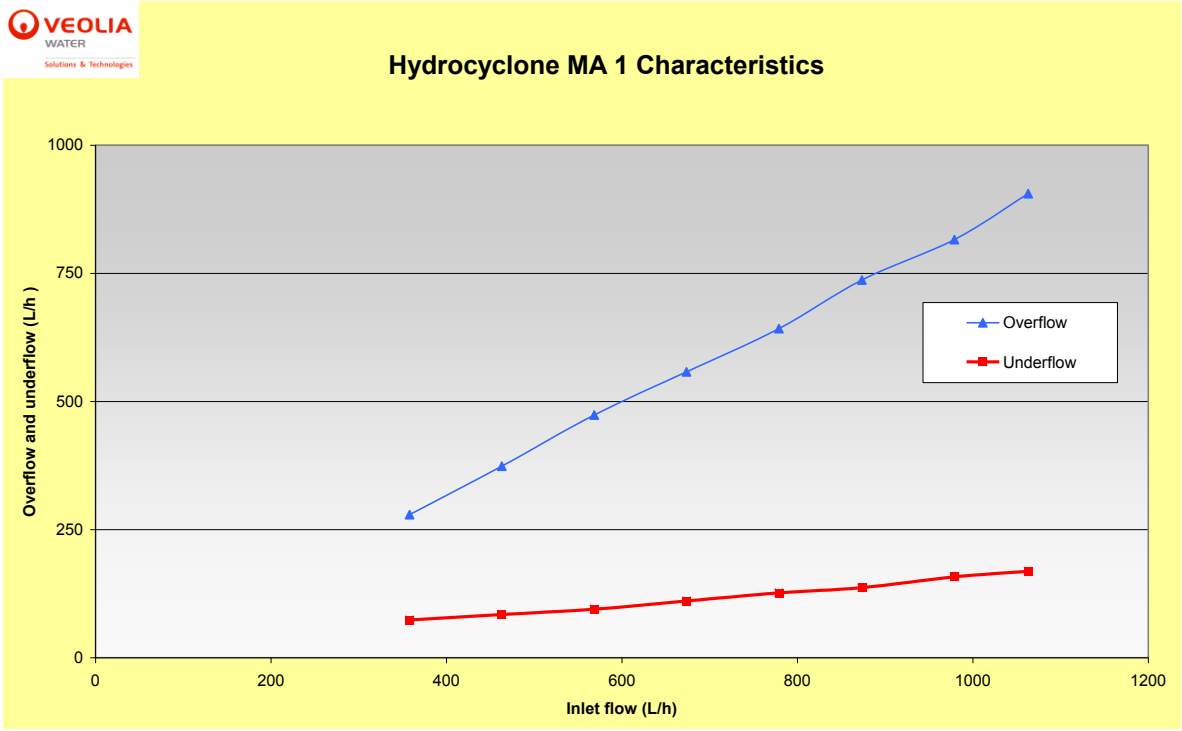
The diameter of the overflow opening (VORTEX finder) affects the cut-off efficiency and the hydrocyclone head loss whereas the underflow (APEX Tip) diameter has influence on the cut-off efficiency and flow.

The lower the APEX Tip internal diameter is, the lower the water underflow is: the SS flow remains constant, but the underflow SS concentration rises.

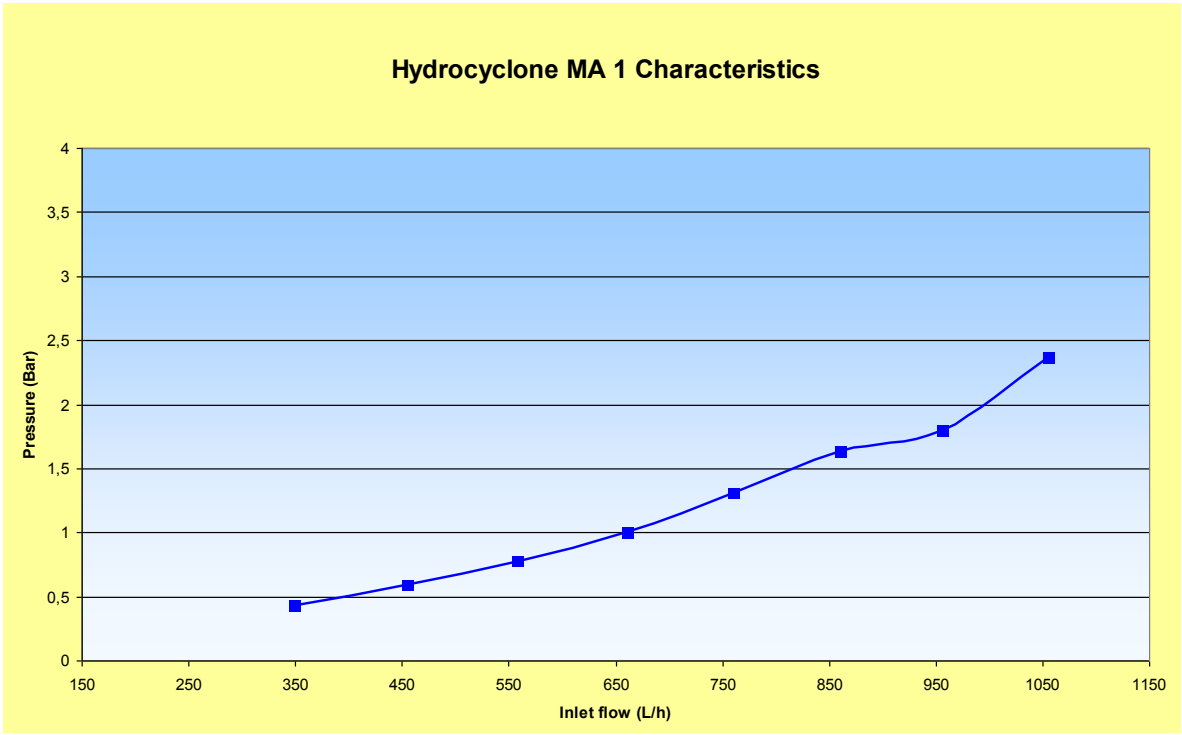
The lower the overflow internal diameter is, the higher the pressure loss is and the lower the sand loss is.

6. OPERATION AND MONITORING

To minimise the risk of injury, adequate lighting is required for proper operation and monitoring. Only authorized personnel, using suitable Personnel Protection Equipment, shall be able to access the Actiflo Area while the unit is operating.
To reduce the risk of biological hazards, use personal protection equipment and ensure that all personnel working around the Actiflo have received the proper vaccines.
If you need to spend prolonged period of time near the Actiflo, consider also ear protections against motor noise.

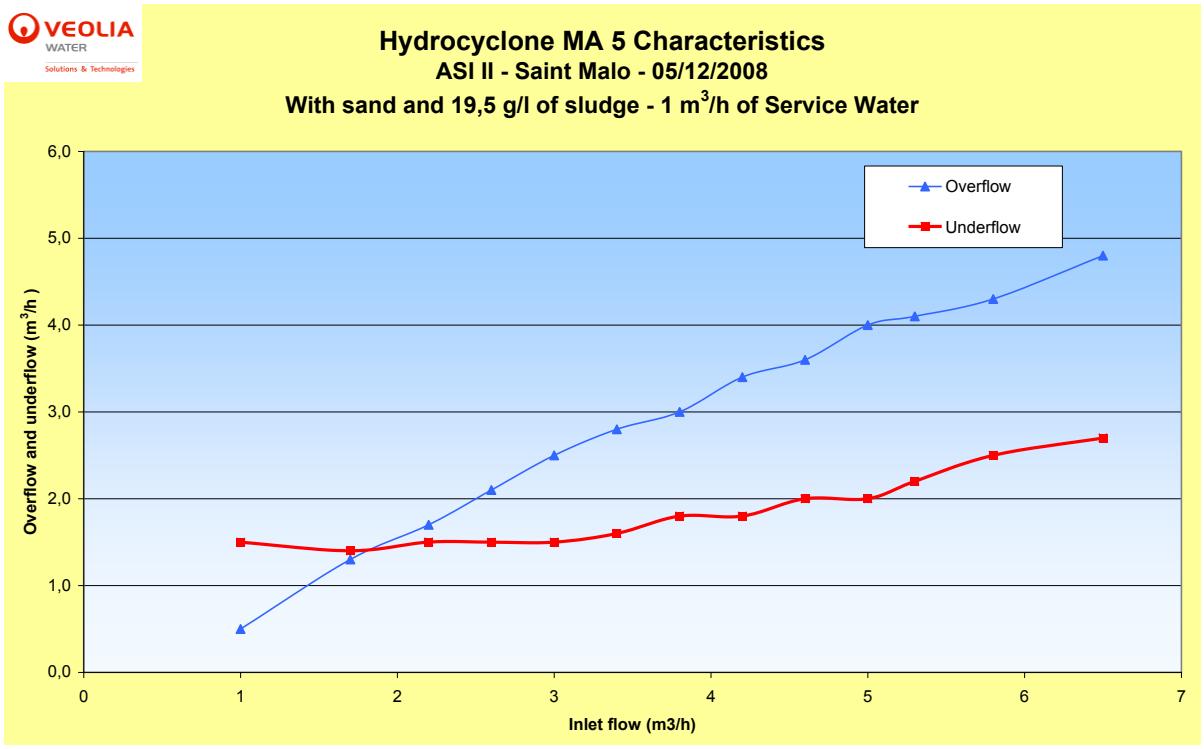


6.1. FLOWS AND PRESSURE

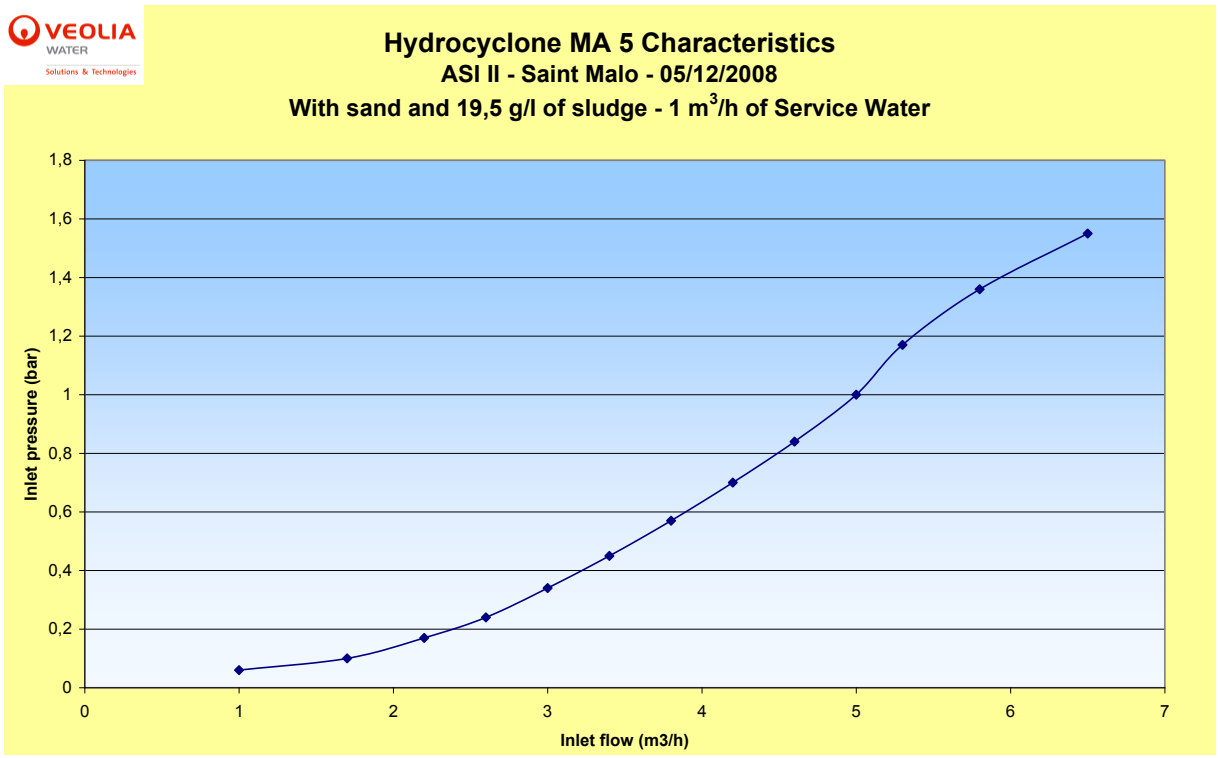


The following graphs shows:
- Relation between inlet flow, overflow and underflow
- Relation between hydrocyclone's inlet flow and pressure losses inside the hydrocyclone for each model.

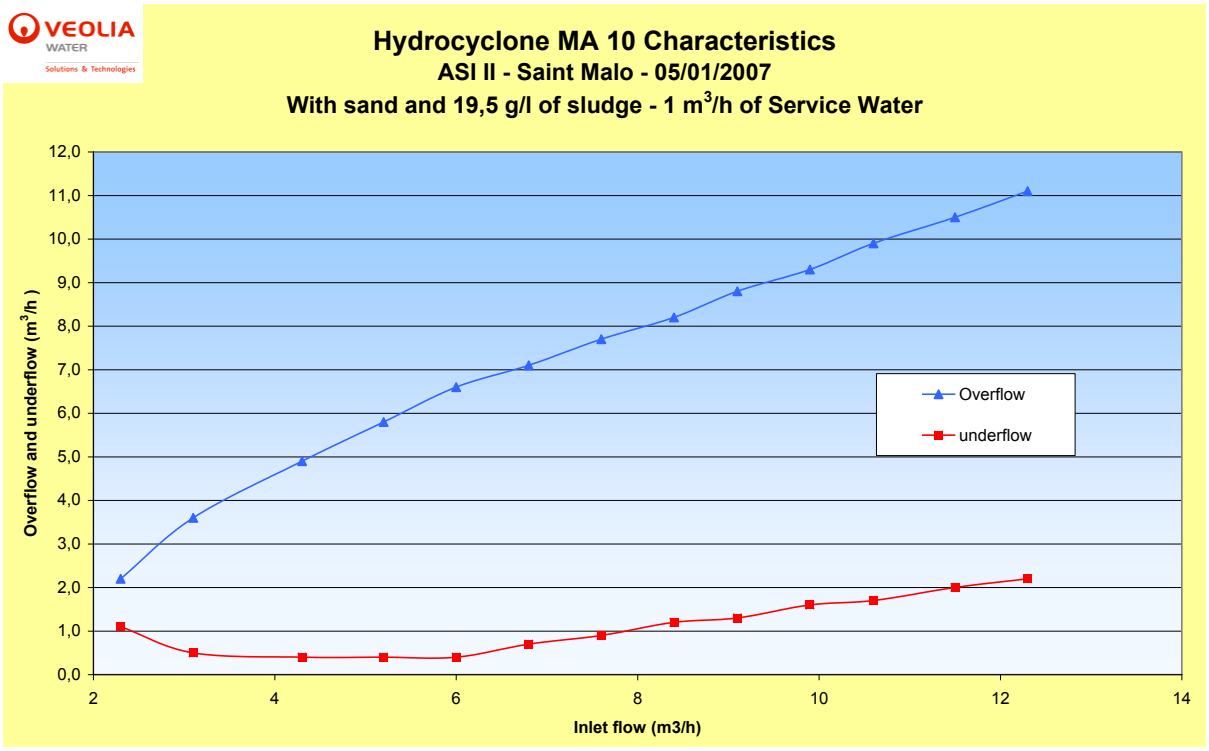
In case of pressure measurement at the inlet of the hydrocyclone, counter pressure applied on the overflow (less than 0.15 bar) must be removed from the value read on the pressure measurement device, in order to interpret properly these graphs.
In addition, if pressure is measured at the outlet of the recirculation pump, pressure losses in the recirculation pipework and hydrostatic pressure shall also be removed from the value read on the pressure measurement device, in order to interpret properly these graphs.

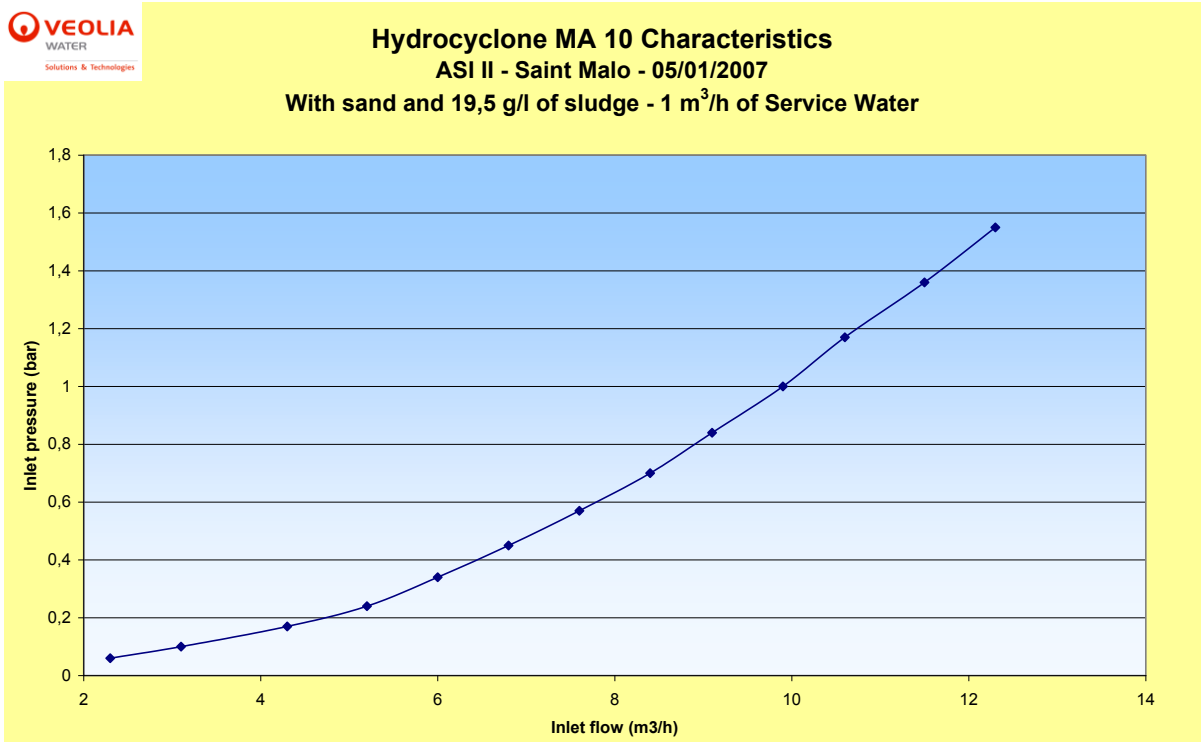


All the values of these graphs must be considered as approximate (+/-15%) as they depend on many site parameters such as type of sludge, concentration of sludge, concentration of sand, specification of microsand, temperature, type of supports, shape of pipework before the hydrocyclone, etc

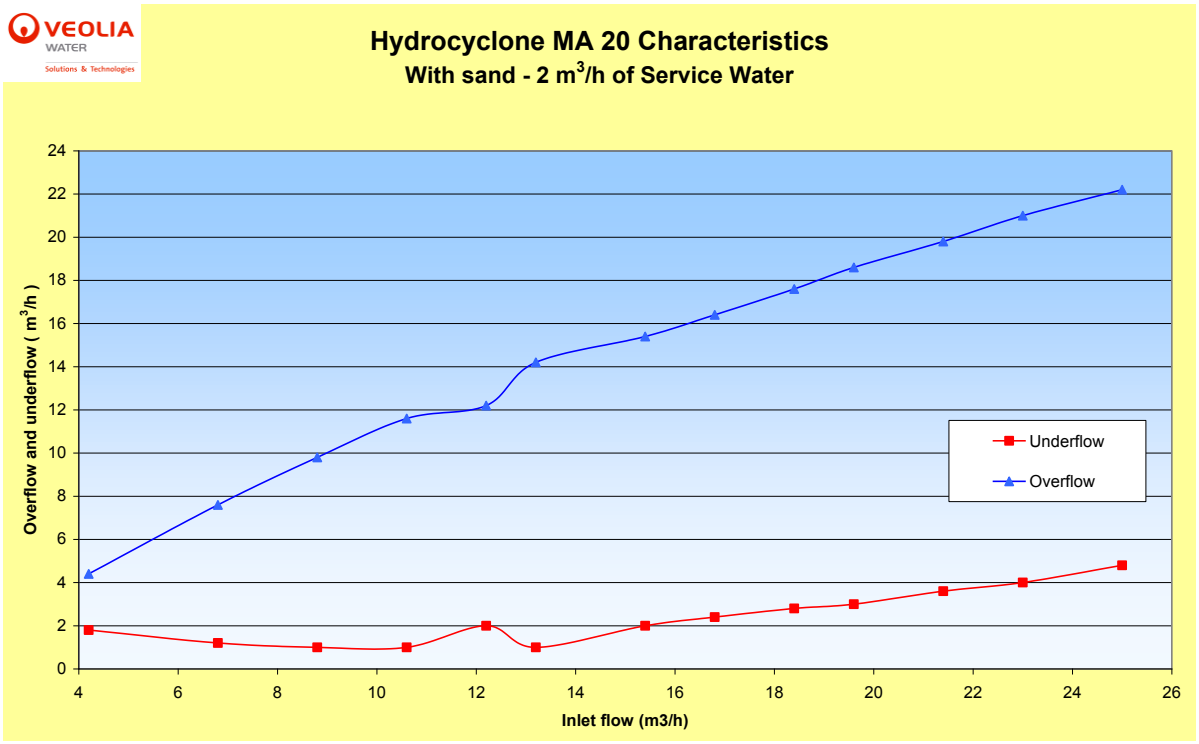


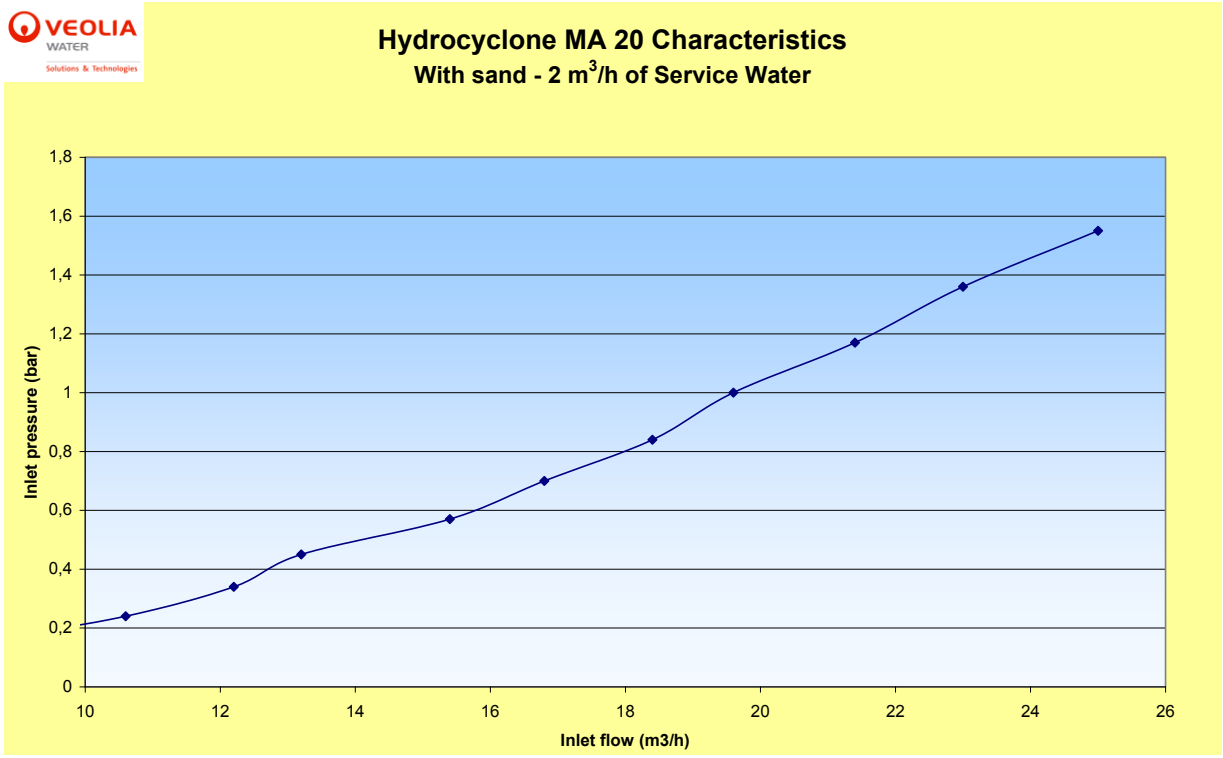
6.1.1. MA1: range from 400 to 1000 L/h



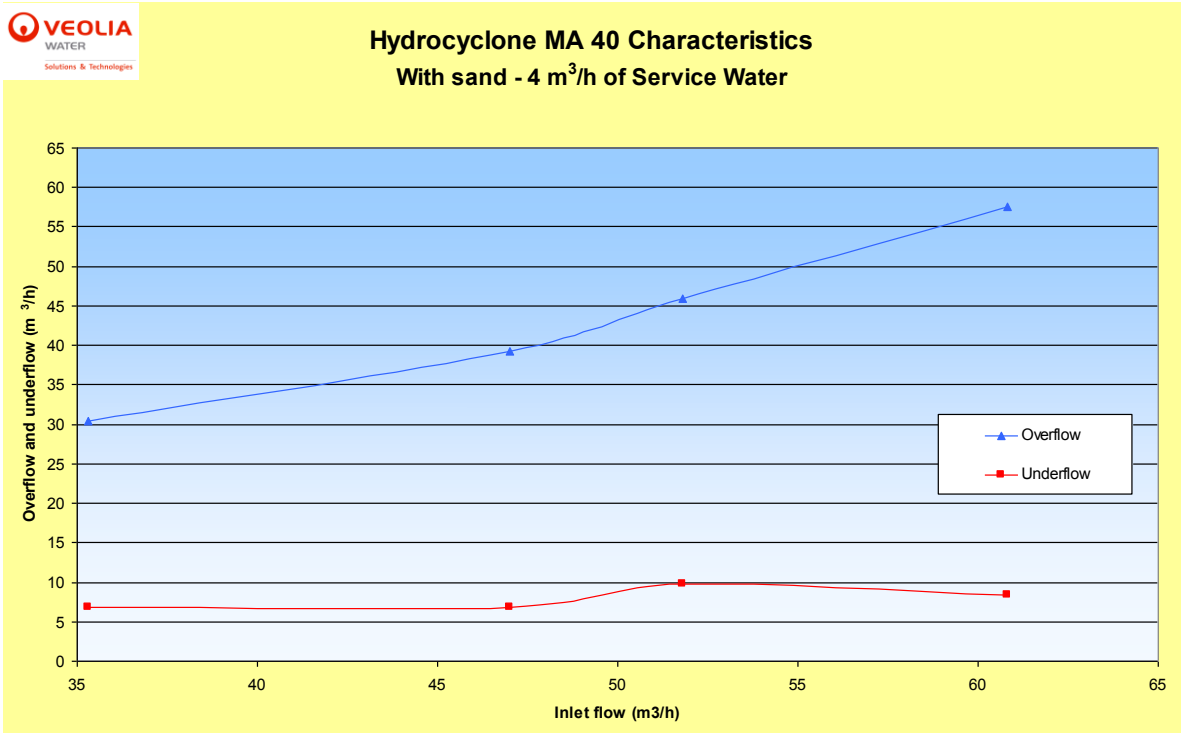


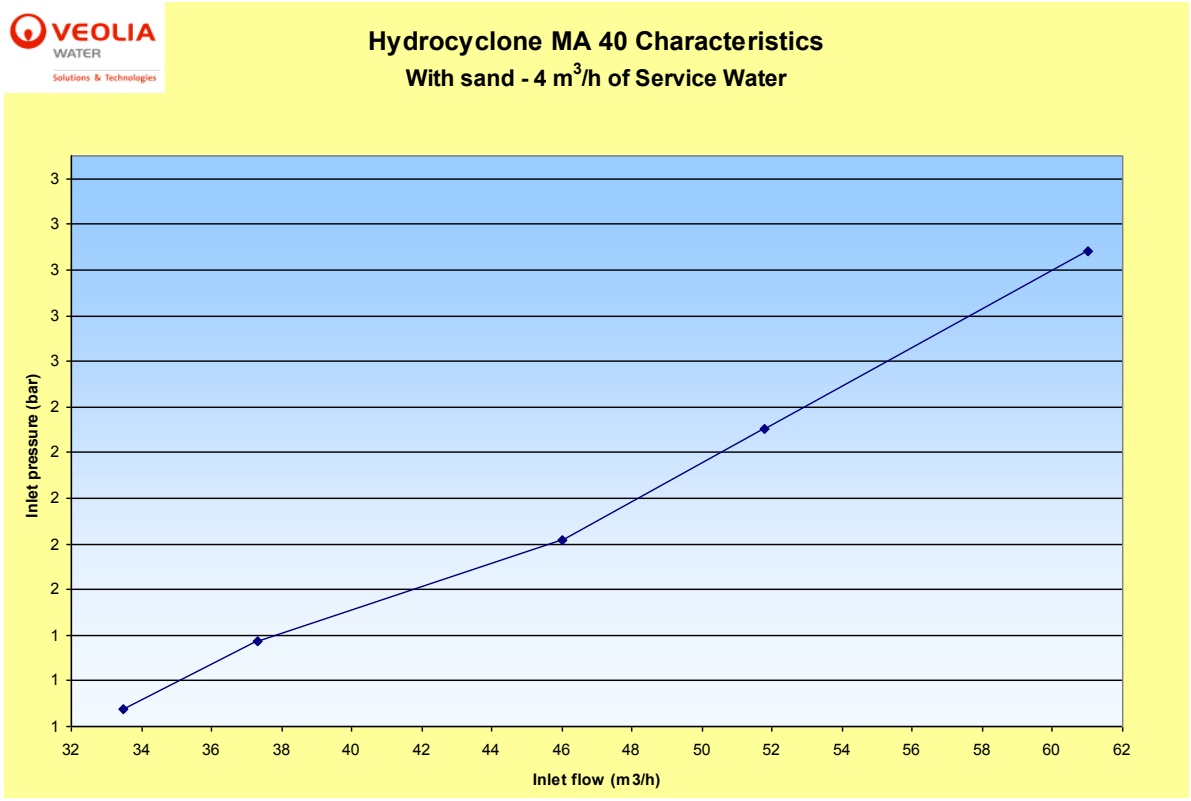
6.1.2. MA5: range from 4 to 6 m3/h



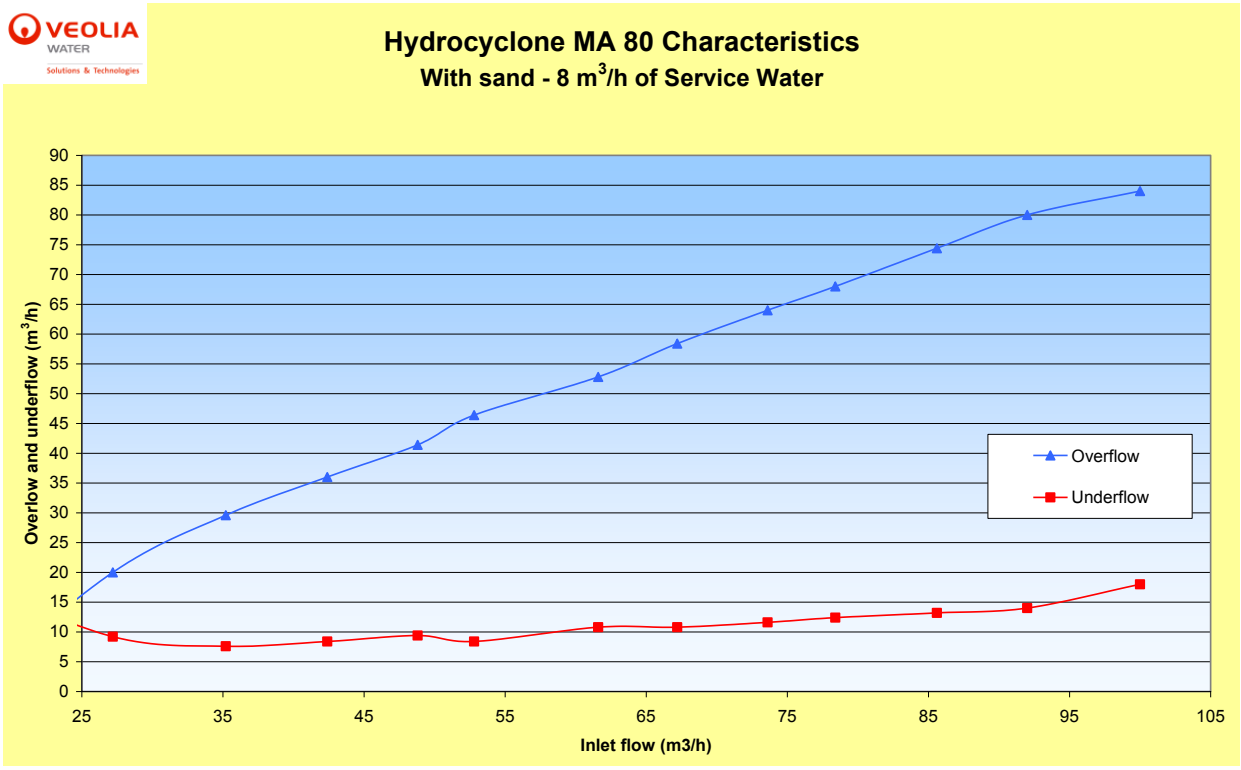


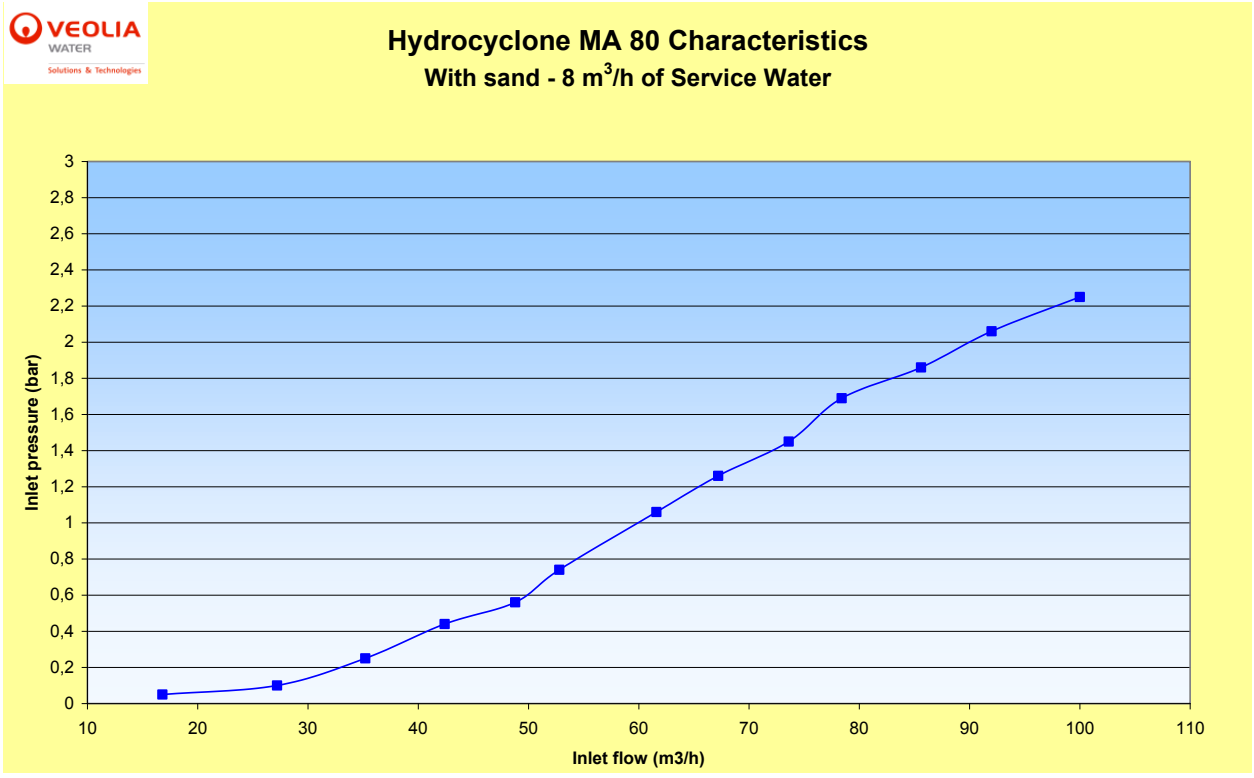
6.1.3. MA10: range from 8 to 14 m3/h





6.1.4. MA20: range from 16 to 30 m3/h





6.1.5. MA40: range from 35 to 54 m3/h

6.1.6. MA80: range from 60 to 80 m3/h

6.2. NORMAL OPERATIONS AND PARAMETERS TO MONITOR

In order to ensure optimum performance of the hydrocyclone, it is necessary to follow-up on several parameters on a regular basis and to record them.
Several parameters can be monitored by using the instruments, with values recorded managed by the automation software. Some other values (like sand concentration) are more usually measured manually, using suitable Personnel Protection Equipment.

It is recommended that the operators record the following parameters, if suitable devices are available:

- Every eight hours
  - pressure at the hydrocyclones inlet
  - flow rate in recirculation lines
  - microsand concentration in the recirculation lines

- On a daily basis
  - microsand concentration in the sludge outlet
  - microsand concentration in the flocculation tank
  - Overflow sludge flow rate

- On a weekly basis
  - flow rate at the hydrocyclone underflow
  - sand concentration, hydrocyclone underflow

During the operation required to check these values, always wear suitable eyes protection as well as gloves suitable to protect against microsand abrasion.

WARNING :	***Check on a daily basis that anchoring of the hydrocyclone supporting skid is stable and tightened. Also, check that there are no abnormal vibrations that could loosen supports or devices related to safety***

7. MAINTENANCE AND TROUBLESHOOTING

For all daily inspections, maintenance and troubleshooting activities, always wear the required personnel protection equipment (Safety shoes and helmet against heavy loads, gloves and safety glasses projections of sand or chemicals, dust, etc). If you need to spend a prolonged period of time near the Actiflo, wear hearing protection to reduce motor noise. In addition, always ensure you are following the site procedures in terms of safety, especially electrical, mechanical and hydraulic isolation/lock out-tag out.
If you need to use lifting devices, ensure they are suitable (max loads, etc) and that they are operated only by qualified staff.

7.1. DAILY INSPECTION

Inspections should be carried out on a daily basis. The purpose is to confirm that the unit is safe to operate and is fully functional.
In this section, there is a list of some major tasks to be carried out. Additional tasks may be required depending upon site requirements. In addition to the tasks in the following table, process parameters must also be monitored as listed in section 6.2.

Table 6: Daily inspection tasks

Task	Location	Action	Specification
1	Unit and piping	Confirm no leakage	No water leakage
2	Unit and piping	Confirm no abnormal vibration	Vibrations hardly visible
3	Support and anchorings	Confirm no abnormal movements	No risk of falling, No abnormal movement of mechanical parts
4	Underflow	Check the shape of the sandy water out of the underflow	Cone similar to Figure 8

In case of leakage or abnormal vibrations, stop water/chemicals and check the integrity of the pipework, seals and check that all bolts are properly tightened.
If defect on seals are detected, replace damaged components. If all parts are in good state and retightening is not solving the leakage issue, replace the complete hydrocyclone.

7.2. COMPONENTS MAINTENANCE

Maintenance work should be carried out on a regular basis or in response to faults found during daily inspection and during exceptional maintenance during shutdown of the plant. This section indicates the minimum number of maintenance tasks that are required.

Depending on site conditions (sand concentration, type of sand, temperature and humidity, flow rate, etc.), the advised frequency might need to be increased. To optimize maintenance costs, many of these tasks can be done at the same time during yearly maintenance visits.

Table 7: Components maintenance guidelines

No.	Location	Action	Frequency advised and references
1	APEX Tip	Check wear/attrition and replace when required	Check internal diameter increase every 6 months during the first 2 years. Replacement recommended every 6 to 18 months (depending wear speed, to replace when internal diameter is 10% larger than originally)
2	Vortex Finder	Check wear/attrition and replace when required	Check internal diameter increase every year during the first 2 years. Replacement recommended every 18 to 36 months (depending wear speed, to replace when internal diameter is 5% larger than originally or when external diameter is 5% smaller than originally)
3	Bolts and Nuts	Check tightening torque	Tighten every year, targeting 5% below the values in Table 3

7.3. TROUBLESHOOTING

The symptoms, related causes and actions might not be applicable to issues faced during commissioning. There causes and recommended actions are defined considering an hydrocyclone operating originally properly and then starting to malfunction.

Table 8: troubleshooting guidelines

No.	Symptom	Probable causes	Recommended Actions
1	Excessive Sand Loss in Overflow	Blockage at the underflow outlet Too high inlet pressure/flow High Wear of Vortex finder Too high flow of service water	Check overflow sludge pipework internal aspect and clean if it is clogged or contains debris Check recirculation pump speed and compare with recommended frequency on site Replace the Vortex finder Adjust flow to be around or below 10% of recirculation flow
2	Excessive vibration	Untightened bolts and nuts Too high inlet pressure/flow High Wear of Vortex finder	Tighten targeting 5% below the values in Table 3 Check recirculation pump speed and compare with recommended frequency on site Replace the Vortex finder
3	High return of sludge in underflow	Blockage in the overflow pipework Too low inlet pressure/flow High wear of APEX tip	Check overflow sludge pipework internal aspect and clean if it is clogged or contains debris Check recirculation pump speed and compare with recommended frequency on site Replace Wear part/Vortex finder
4	Excessive pressure loss inside the cyclone	Blockage at the underflow outlet Blockage in the overflow pipework	Check overflow sludge pipework internal aspect and clean if it is clogged or contains debris Open the hydrocyclone, remove foreign objects and clean internal parts
5	Leakage from the hydrocyclone	Untightened bolts and nuts Damaged gasket or O-ring	Tighten targeting 5% below the values in Table 3 Replace Gasket and/or O-ring

7.4. SPARE-PARTS

Spare-parts for MA1 and MA5 are not available. They must be fully replaced every 3 to 6 years.
If required spares are not in this list, replacement complete hydrocyclone must be ordered.

Table 9: Spare-parts list

8. MAINTENANCE SCHEDULE 42

Symbols used on Hydrotech filters 43

Manuals & technical information 44

1. INTRODUCTION

This manual contains instructions for the operation and maintenance of Hydrotech Discfilters in the HPF2200 series with PFLC automation.

Pay attention to all warning symbols that appear in this manual. If this information is ignored it may result in serious personal injury and/or damage to equipment.

The manual must always be available to the personnel working with the equipment.

It is important that:

► The manual and other relevant documents are kept throughout the life of the equipment.

The manual and other relevant documents are a part of the equipment.

The following documents (manuals) are a part of the equipment:

- Operation & Maintenance Manual
- Automatic System Manual

► All applicable personnel must read the manuals carefully.

2. SAFETY INSTRUCTIONS

Hydrotech Discfilters in the HPF2200 series are designed for safe operation provided they are installed correctly and used in accordance with the enclosed instructions. The equipment must be installed correctly and adapted in accordance with local regulations. This equipment is designed for use by one or more operators. You must read the relevant sections of this manual before using the equipment or carrying out maintenance work.

► Pay attention to all warning symbols that appear in this manual. If this information is ignored it may result in serious personal injury and/or damage to equipment.

► Assume all electrical equipment to be live.

► Assume all hoses and pipes to be pressurised.

► Before carrying out maintenance work, the main power switch (see Figure 2.3) must be turned to the OFF (0) position and locked with a padlock.

► Maintenance and service may only be performed by authorised personnel.

► Adequate lighting should be used while operating the filter and when working in close proximity to the filter.

2.1 Warning symbols

Figur 2.1

Warning symbols are used in this manual to draw attention to potentially dangerous situations:

Figur 1

Information that warns you of a potential risk of personal injury and/or damage to equipment.

Warning stickers (see Figure 2.1) are attached to the filter to warn personnel and act as a reminder to keep hands and fingers away from the filter's moving parts.

2.2 CE marking

CE

Figur 2.2

This equipment is CE marked (see Figure 2.2), which guarantees that the equipment is designed, manufactured and described in accordance with the requirements set out in the EU Machinery Directive.

2.3 Conversion

The CE marking does not include any components that are not approved by Hydrotech AB and which are used in conversion/reconstruction of the equipment.

The warning symbols and CE marking must be attached where they are fully visible. If any part of the equipment with a warning symbol is replaced, a new symbol must be attached in the same position. Damaged symbols and CE markings must be replaced immediately.

2.4 Personnel requirements

Only personnel trained for the equipment and conversant with local regulations may perform service and maintenance, in order to avoid personal injury and damage to the equipment. Service and maintenance personnel may only handle those parts of the equipment they have been trained for.

The operator may need to work inside the safety barrier and in the safety zone during maintenance and set-up before operation.

2.5 Emergency stop

The filter is equipped with an emergency stop and a main power switch (see Figure 2.3).

In the event of a power outage, turn the main power switch to the OFF (0) position to prevent the filter drum from unintentionally starting when the power returns.

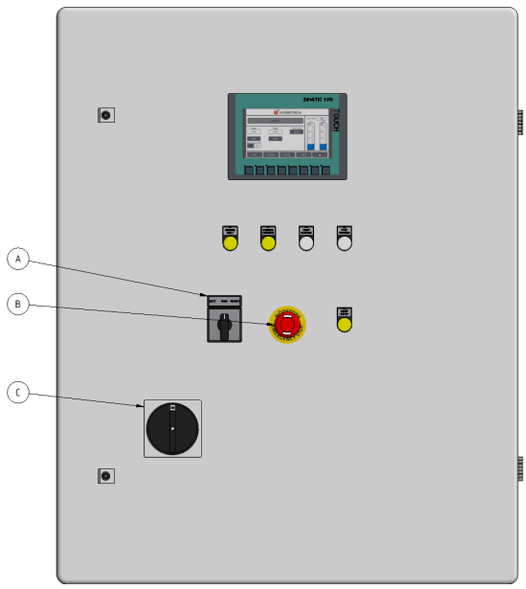

Figure 2.3 Hydrotech control cabinet PFLC.
A. Mode selector
B. Emergency stop
C. Main power switch

2.6 Electrical safety

Electrical installation must be carried out by a qualified electrician and in accordance with local regulations.

The filter tank or the frame must be connected to ground. Also see section 4.4.

The main power switch/emergency stop must be fitted in accordance with applicable regulations.

2.7 Safety instructions

The filter is activated by turning the main power switch to the ON (1) position and then selecting AUTO, REMOTE or HAND with the mode selector on the front of the control cabinet.

NB See instructions in section 5.1.

Turn the main power switch to the OFF (0) position and lock it with a padlock before performing any work on the filter.

Access to the filter by unauthorised persons is strictly prohibited. Outdoor installations must be fenced in.

The drum can start rotating without warning if automatic control is activated. Moving parts must not be touched.

Safety guards are fitted around the power transmission. Make sure these are secured and correctly fitted.

Spray from the backwash water may contain harmful substances.

Measured noise levels from the filter are less than 74 dB (A). Personnel should use appropriate protection, when necessary, in accordance with local regulations.

3. HYDROTECH DISCFILTER HPF2200 SERIES

3.1 Reception

Once the equipment has been delivered and received it must be checked for transport damage. Document any transport damage before further handling of the equipment. The consignment note, manual and spare part kit are attached to the equipment. Check all parts against the consignment note. Some parts may be delivered unassembled. Handle fragile parts with care. Refer to section 4.1 before lifting the equipment.

3.2 Storage

Some precautions must be taken to prevent damage to equipment if a long storage time is necessary (several weeks or more):

► The equipment should preferably be stored indoors, in a frost-free area.

► The filter must be protected against direct sunlight if stored outdoors. Heat and UV radiation can damage the filter panels and the control panel touch screen.

► If the filters are delivered inside plastic covered wooden crates, a special type of corrosion can occur if stored outdoors, especially in coastal areas. The moisture inside the plastic acts as an anode and the exposed dry components as a cathode. In these areas, filters must therefore be unpacked immediately upon delivery.

3.3 Overview

3.3.1 HPF2200 type 1, filter with tank

NB Also see section 3.3.2 (HPF2200 type 2, filter without tank) where several filter parts are shown.

3.4 Identifying the filter

Filter type, serial number and year of manufacture are stated on the marking plate. The filter type and serial number are also stated on the front of this manual.

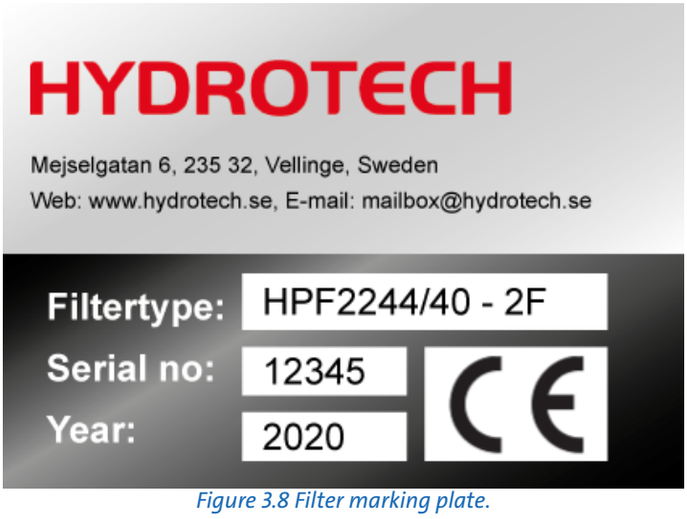

Figure 3.8 Filter marking plate.

3.4.1 Definition of filter type

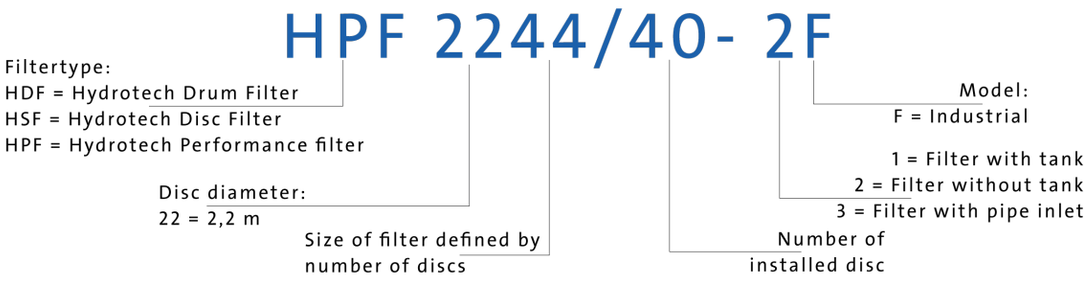

Figure 3.9 Definition of filter type.

4. GENERAL INSTALLATION INSTRUCTIONS

4.1 Lifting the equipment

► A forklift truck with long forks must be used when lifting filters in wooden crates.

► Filters with a tank can be lifted using a crane or overhead crane by using the filter's lifting lugs, or with a forklift truck.

WARNING! The work area must be fenced off before unloading, in accordance with local regulations, to prevent unauthorised access.

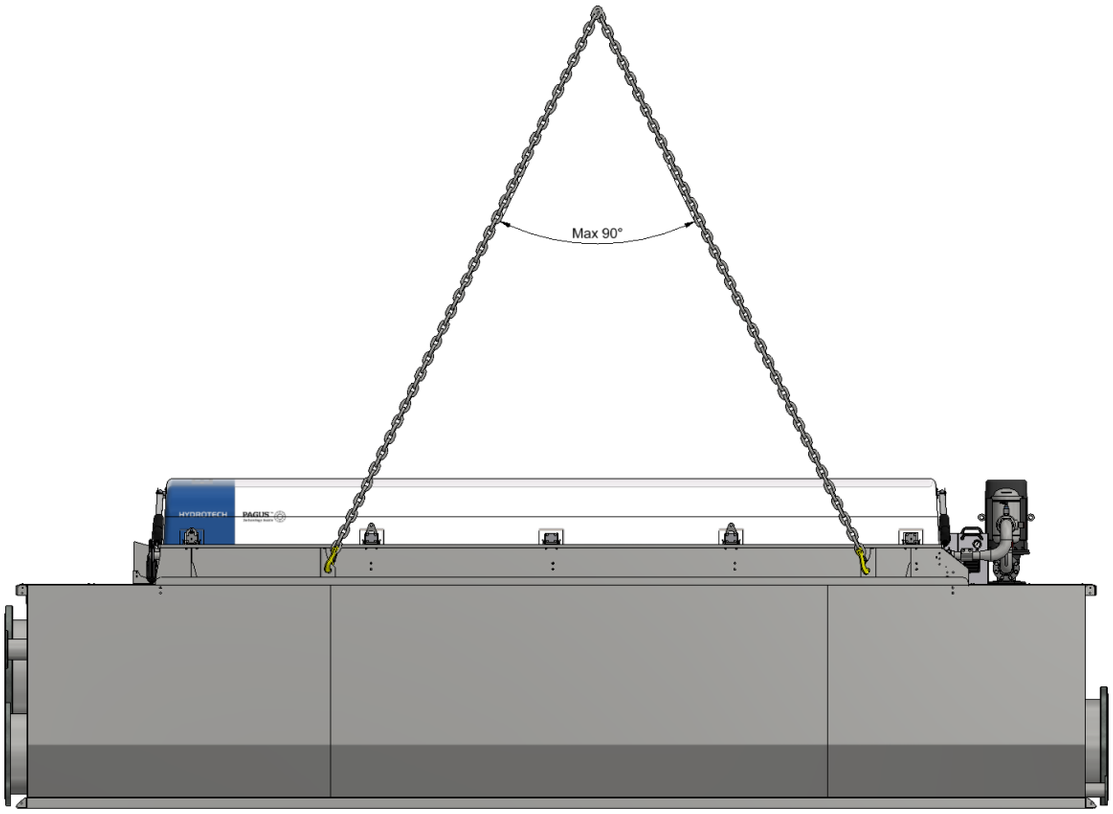

Figure 4.1 Lifting Hydrotech Discfilter in HPF2200 series type 1 (with tank).

► Filters without a tank can be lifted using a crane or overhead crane by using the filter's lifting lugs or by the use of a forklift.

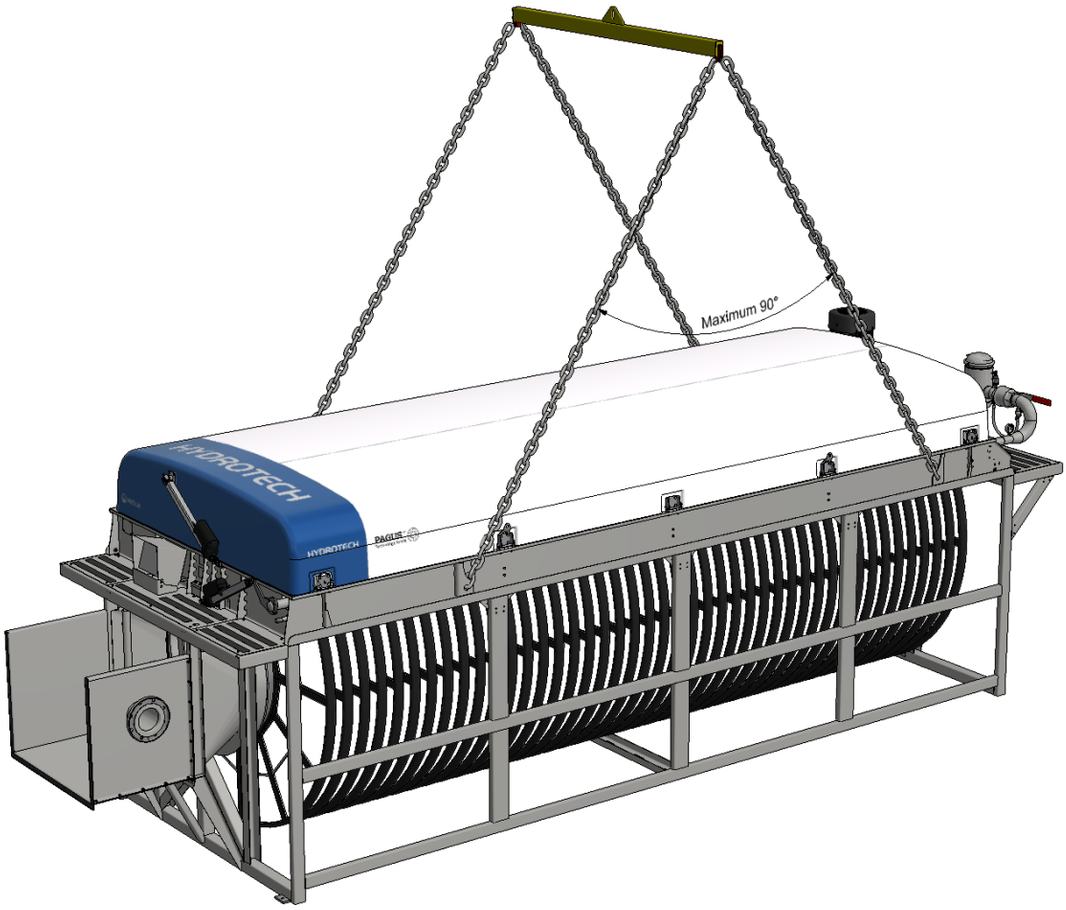

Figure 4.2 Shows how lifting devices are attached (filter without tank).

4.2 Installation site

4.2.1 Outdoor installation

In the event of outdoor installation it is important to protect the filter panels against direct sunlight, as heat and UV radiation otherwise can cause damage to the filter panels. The same applies to the control panel touch screen.

The equipment must be protected against temperatures below freezing point. At water temperatures above +5°C and air temperatures above -10°C the filter cover provides sufficient protection. At lower water and air temperatures, filter installation should be indoors.

4.2.2 Foundations

► The filter must be installed on a flat surface that offers sufficient load bearing capacity.

► The filter is to be bolted to the foundation.

► The filter must be level in both directions (see Figure 4.4).

► 600 mm wide aisles should be laid out around the filter to permit easy access to the filter during service work.

► The gap between the filter and the concrete structure must be sealed for safety reasons and to keep out foreign objects that can cause blockages in the backwash system.

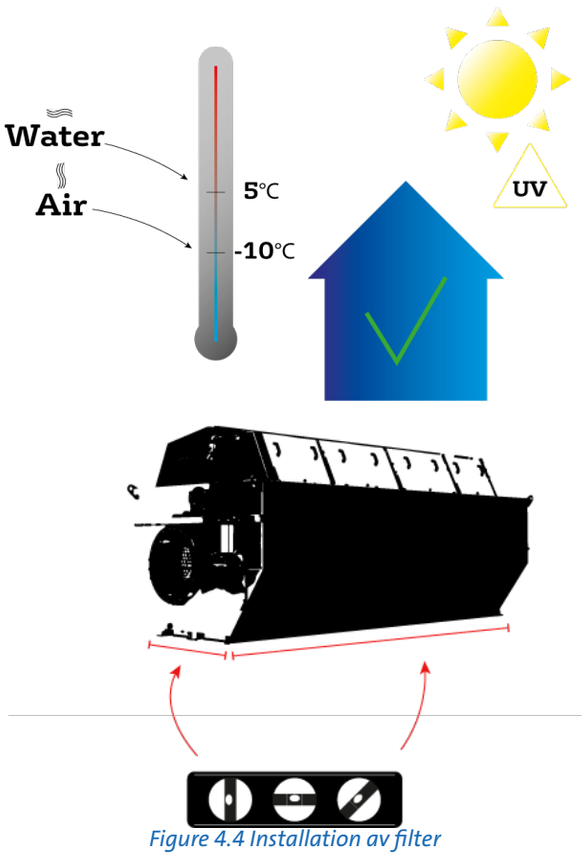

Figure 4.4 Installation av filter

4.3 Electrical connection

Qualified electricians must perform all electrical work.

Electrical connection must be done in accordance with local regulations. Check that the settings on the motor protection correspond with the motor data.

Section 4.5 must be read before starting the filter's drum rotation.

4.4 Equipotential bonding

The Hydrotech Discfilter and associated equipment should be protected with a suitable system for equipotential bonding. This is very important to prevent galvanic corrosion. Ideally use a cable with a cross section of 10–16 mm2. The cable should be connected to the same electrical potential as the drive system.

4.5 Checking drum rotation

Start drum rotation and check that the drum rotates in the same direction as the rotation arrow on the drive unit cover.

4.6 Pipe connections

Piping for reject should have a minimum inclination of 1%.

5. START UP AND OPERATION

5.1 Check procedures during start-up

1. Check that the drive unit cover is installed correctly.

2. Set the mode selector to the HAND position (see F in Figure 5.2).

3. Set the main power switch to the ON (1) position (see I in Figure 5.2).

4. Start the drum rotation on the operator panel main menu (see Figure 5.1 and Figure 5.2).

5. Open the water supply a little so that the water can slowly run into the filter drum. Make sure that the difference in water level between the inside and outside of the filter drum does not exceed 450 mm (see section 5.2.1). If the filter cloth becomes clogged, it may be necessary to fill the filter tank/chamber with water from an external source or to remove a filter panel and fill the filter tank/chamber with unfiltered water.

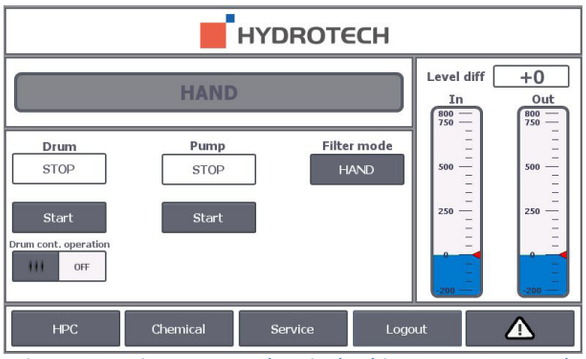

Figure 5.1 Main menu on electrical cabinet operator panel. (Indication of current backwash pressure is an option.)

WARNING! A greater difference in water level between the inside and outside of the filter drum than 450 mm will damage the filter.

6. When the water level inside the filter tank/chamber exceeds the suction pipe of the pump (or, the suction pipe if a CR- pump has been installed), the pump must be started by pressing “Start” on the operator panel main menu (see Figure 5.1). NB Also read section 2.7.

WARNING! The backwash pump must not be started until the water level has reached the suction pipe of the pump (or, the suction pipe connected to the pump if using a CR- pump), otherwise the pump will run dry and fail.

7. If the water level inside the filter tank/chamber reaches the overflow wall, turn the mode selector from HAND position to either REMOTE or AUTO (see section 5.2).

8. Open the water supply fully.

If the filter is operated using automatic level control, it may be necessary to calibrate the level sensor in order for the filter to be run optimally (see “Automatic System Manual HPF2200”).

5.2 Automatic settings

The control system for the HPF2200 series must be equipped with a frequency converter on the drive unit. This is factory calibrated if delivered from Hydrotech. To perform a soft start of the drive motor, the frequency converter settings must be min. 5 sec “ramp up” and min. 3 sec ”ramp down”. The filter works with 50 Hz or 60 Hz as standard, depending on region of delivery.

If the filter is equipped with a Hydrotech standard control, the filter has three operating modes:

1. Automatic level control (AUTO mode).

2. Remote control (REMOTE mode).

3. Service mode (HAND mode).

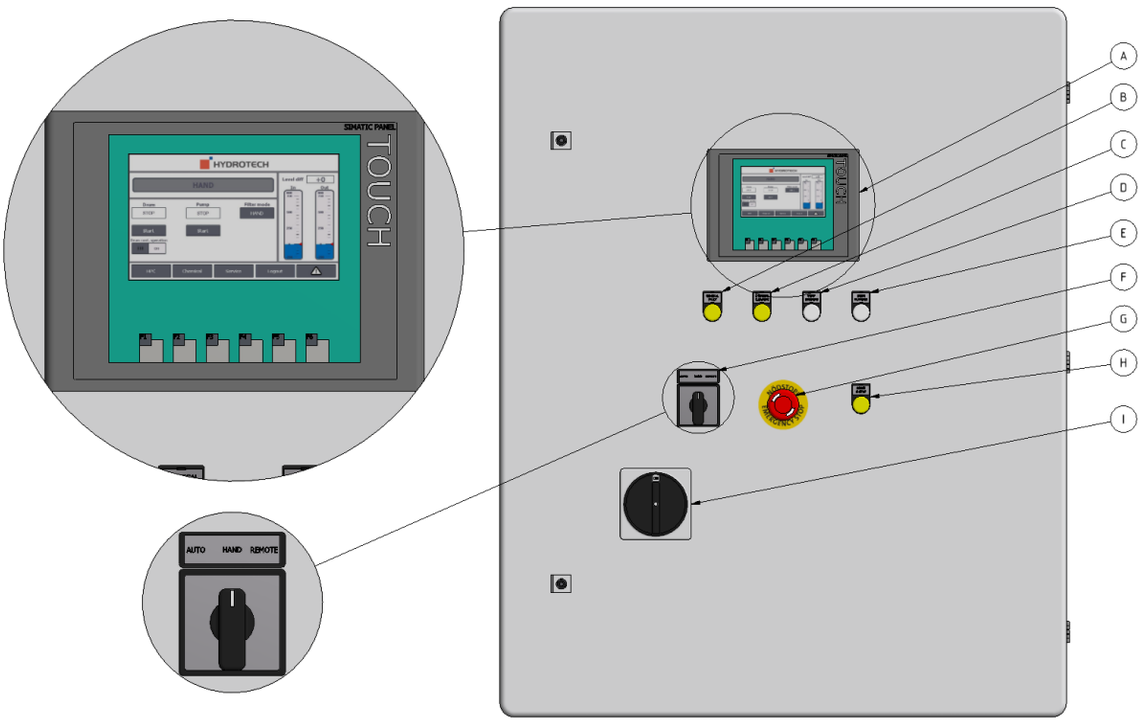

Figure 5.2 Front of the control cabinet.
A. Operator panel
B. Warning lamp: Fault indicator
C. Warning lamp: Chemical cleaning
D. Indicator lamp: Drum operation
E. Indicator lamp: Pump operation
F. Mode selector (Auto/Hand/Remote)
G. Emergency stop
H. Reset button for emergency stop
I. Main power switch

Turn the mode selector to select the appropriate operating mode (see Figure 5.2, detail F).

5.2.1 Level differences

The maximum permitted difference between the water levels inside and outside the drum is 250 mm during normal operation (see Figure 5.4). The recommended level difference is 100–200 mm.

If an even flow after the filter is required, the filter must be run with a small level difference.

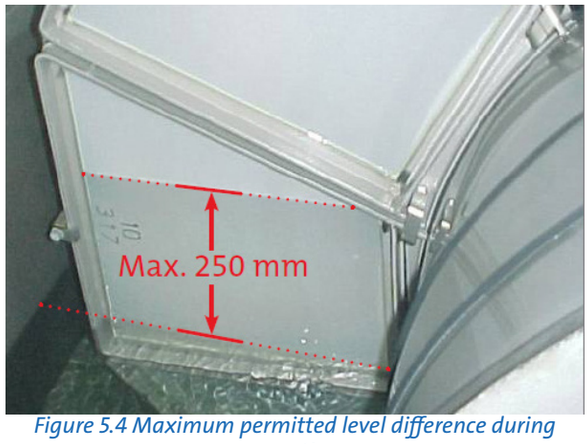

Figure 5.4 Maximum permitted level difference during operation.

The filter must be installed so that the level difference in the event of operating disturbances under no circumstances exceeds 450 mm.

The filter must be run so that the level difference during normal operation does not exceed 250 mm.

Prolonged operation with a greater level difference will significantly shorten the life of the filter panels and other vital parts.

5.2.2 Operating mode AUTO – Automatic level control

With automatic level control, drum rotation and the backwash pump are activated once the level difference between filtered and unfiltered water exceeds an adjustable value. The filter is force-started if the filter has stood still for an extended period of time. If an external backwash water supply is used, the level sensor can control a solenoid valve instead of a pump.

The water level inside the drum will vary when AUTO mode has been selected. The water level is at its lowest immediately after a backwash cycle and then rises until drum rotation and backwashing start.

5.2.3 Operating mode REMOTE – Remote control

In REMOTE operating mode, the filter can be controlled remotely. In remote control mode, the filter can either be controlled as if in AUTO operating mode or using an external controller, see the “Automatic System Manual”.

5.2.4 Service mode HAND

HAND is only a service mode.

In order to operate the filter in HAND mode, the following steps must be implemented:

1. Turn the mode selector shown in Figure 5.2 to the HAND position.

2. Once the mode selector has been turned to HAND, “HAND” will be shown in the operator panel main menu, see Figure 5.5. Press the drum “Start” button, see Figure 5.5.

3. Press the pump “Start” button, see Figure 5.5.

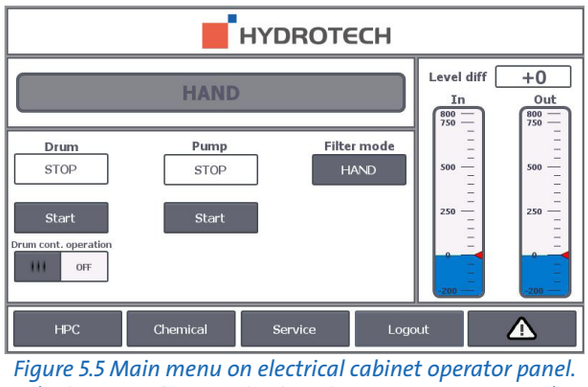

Figure 5.5 Main menu on electrical cabinet operator panel. (Indication of current backwash pressure is an option.)

The operator panel main menu also shows the water levels of unfiltered (In) and filtered water (Out), as well as the level difference between them (Level Diff).

5.3 Backwash system

NB Prior to servicing, read section 2.7.

The system pressure for backwashing must be set to 6–9 (preferably above 6,5) bar. Newly connected pipe systems for external backwash water should be rinsed through before they are connected to the filter. Check that the nozzles are not blocked, see section 7.1.

6. FUNCTION

6.1 Intended use

The filter is designed and manufactured to remove solid particles in unpressurised water flow systems. The filter is not a pressure vessel.

6.2 Non-intended use

Unless approved in writing by Hydrotech, the filter must not be used to filter liquids other than water. The filter must not be installed in an environment with an explosive atmosphere or another risk of explosion, such as high concentrations of dust.

6.3 Filtration and backwash process

A brief description of the process is given below.

1. The water to be filtered flows with gravity from the inside of the filter drum out to the filter segments.

2. Solid particles are separated from the water using a filter medium attached to both sides of the filter segments, whilst clean water passes through the filter medium to the outside of the filter segment.

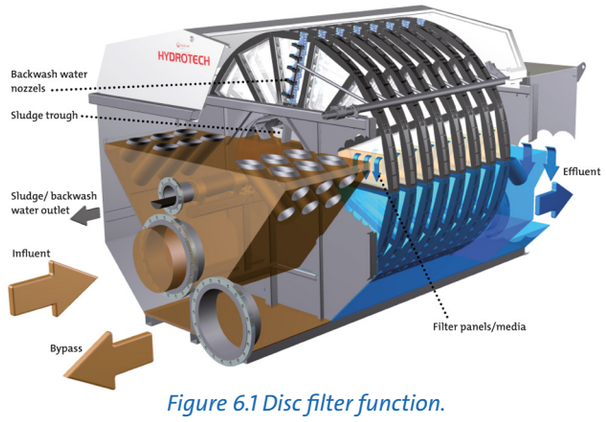

Figure 6.1 Disc filter function.

3. Operating mode AUTO – The solid particles trapped on the inside of the filter medium gradually reduce the water flow through the filter panel. The water level on the inside of the drum begins to rise. When the level difference between filtered and unfiltered water exceeds the set value, drum rotation and backwashing start. Operating mode REMOTE – The filter is controlled as in AUTO operating mode or using external control (e.g. time-controlled drum rotation and backwashing). Operating mode HAND – Drum rotation and backwashing are started manually.

4. The backwash nozzles spray wash water on the outside of the filter panels. The solid particles that accumulate are washed from the filter panels to the sludge channel, at the same time as the drum rotates.

5. The removed particles and backwash water flow with gravity out of the filter.

7. MAINTENANCE/SERVICE

7.1 Backwash system

The most common cause of operating disruptions in the backwash system is clogged nozzles. Clogging is caused by particles in the wash water and/or by e.g. biofouling in the pipe system.

7.1.1 Servicing conventional nozzles

1. Set the mode selector to the HAND position.

2. Open the cover on the side where the backwash pipe is located.

3. Extend the backwash ramp (see Figure 7.2).

3. Open the bypass valve (see Figure 7.1).

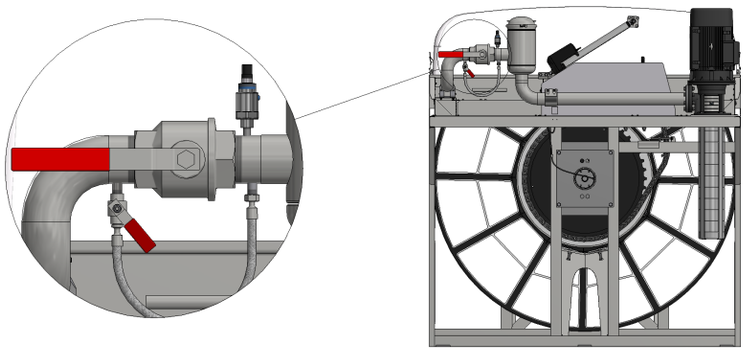

Figure 7.1 Main valve and bypass valve for checking the nozzles.

4. Close the main valve. The water flow can later be adjusted with the bypass valve so that it flows a little, yet with a constant flow through the nozzles. This makes it easy to determine which nozzles that needs to be cleaned.

5. Start drum rotation and the backwash pump.

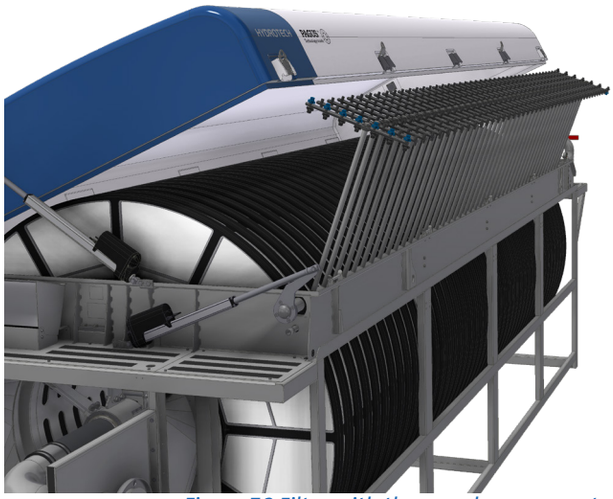

Figure 7.2 Filter with the spraybar ramp extended

8. Check whether any of the nozzles are clogged by checking whether water runs through them. Clogged nozzles are cleaned as follows:

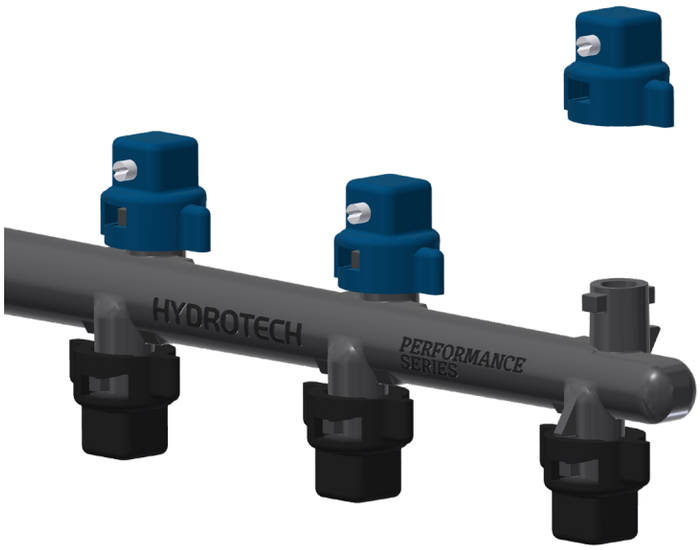

Figure 7.3 Nozzle components.

9. Remove the nozzle nut by turning it a ¼ turn anticlockwise. Exercise care not to lose the rubber seal.

10. Clean the tip of the nozzle with compressed air or a plastic brush. Never use a wire brush, metal pins or similar as these can damage the nozzle.

11. Assemble the parts in the reverse order. Make sure the nozzle nut reaches the stop position when turned a ¼ turn, clockwise.

12. Place the backwash ramp in its original position.

13. Open the main valve to the backwash water.

14. Close the cover.

15. Before restarting operations. Check the placement of the spraying arms and verify that no arms has been bent out of position during the check of the nozzles.

16. Start operations again as set out in section 5.1.

WARNING! It is important that the nozzle nuts (see Figure 7.3) are refitted correctly after the nozzles have been cleaned.

7.2 Cleaning the Hydrotech strainer

NB Prior to servicing, read section 2.7.

If the pressure gauge indicates a pressure that is more than 0.5 bar below normal pressure, it's time to clean the Hydrotech strainer.

1. Turn the main power switch to the OFF (0) position and lock with a padlock.

2. Loosen the wing nut and remove the clamping ring (B in figure 7.5).

3. Lift off the wash water filter cover (A in figure 7.5).

4. Remove and clean the filter insert.

5. Secure the filter insert in the cover.

6. Refit the cover/filter insert and the clamping ring.

7. Start operation in accordance with section 5.1.

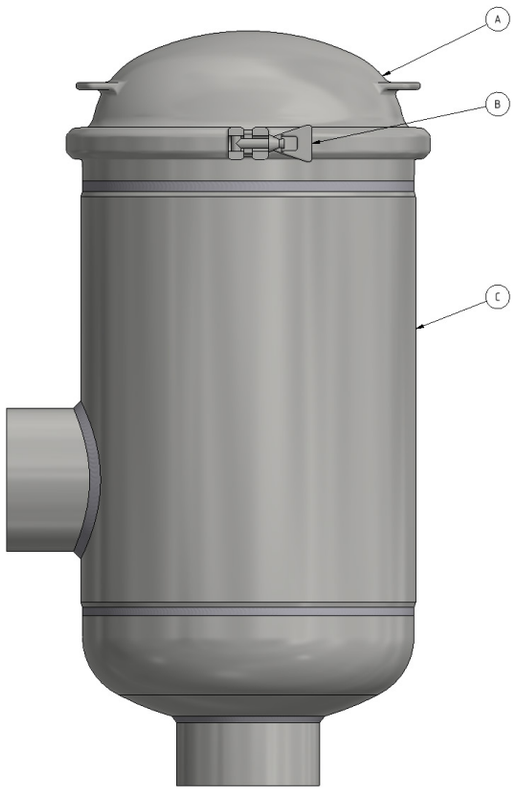

Figure 7.5 Hydrotech wash water filter.
A. Cover
B. Wing nut
C.Strainer

7.3 Bearings

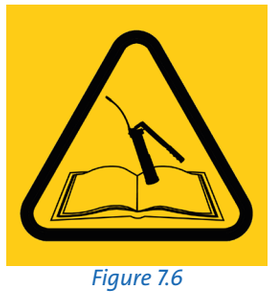

Figure 7.6

NB Prior to servicing, read section 2.7.

Stickers indicating the lubrication points are attached to the filter, see Figure 7.6.

7.3.1 Lubrication of swivel

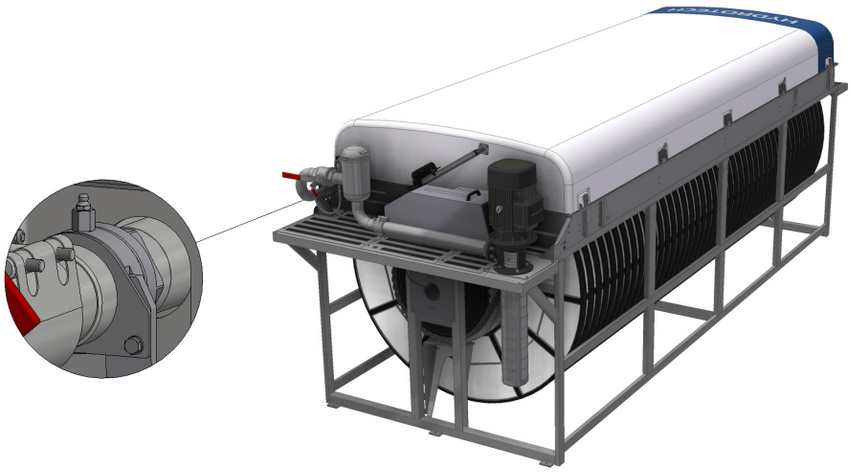

Figure 7.7 Location of the swivel.

The swivel makes up the bearing between the backwash pipe and the connecting pipe for the backwash water (see Figure 7.7 & 7.8).

Figure 7.7 Swivel

The swivel's lubrication points are shown in Figure 3.3 and Figure 3.6.

7.3.2 Lubricating drum bearings

The bearings' lubrication nipples are fitted on the outside of the filter. The drum must rotate when the bearings are lubricated.

Lubricate the drum bearings according to the recommendations in chapter 8. The lubrication points are shown in Figure 3.2, 3.3, 3.6 and 3.7.

7.3.3 Checking drum bearing wear

1. Turn the main power switch to the OFF (0) position and lock with a padlock.

2. Drain the chamber/filter tank.

3. Check the drum bearings with respect to wear. If the distance between the bearing housing (A) and the shaft (B) is less than 22 mm (see Figure 7.8), the drum bearing must be replaced.

4. Contact your supplier if the drum bearings need to be replaced.

5. Start operations again as set out in section 5.1.

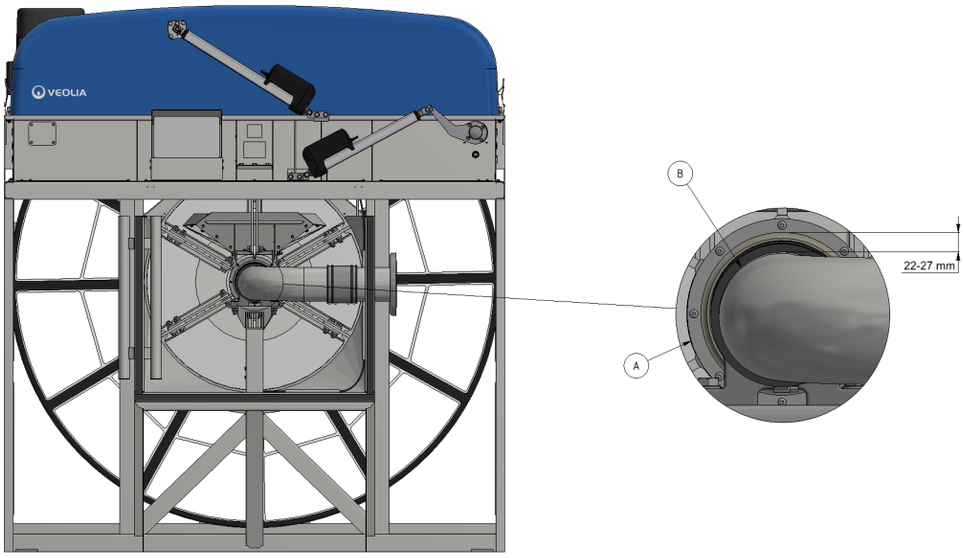

Figure 7.8 Drum bearing housing on inlet side.

7.4 Filter panels

NB Prior to servicing, read section 2.7.

7.4.1 Additional cleaning

Additional cleaning of the filter panels may be necessary. The need for additional cleaning becomes clear if the frequency of automatic backwash starts increases. Additional cleaning can be chemical cleaning or cleaning with a high pressure washer.

When using a high pressure washer a wash pressure of max. 80 bar may be used. Maximum allowed water temperature is 60 °C. Never hold the cleaning nozzle directly against the filter media.

A chemical cleaning programme can be started in accordance with section 7.4.2.

7.4.2 Chemical cleaning of filter panels

Long-term clogging of the filter media can be caused by, among other things, iron, calcium or organic fouling. This clogging can normally be removed through chemical cleaning. Three proven products that do not affect the life of the filter media are dilute hydrochloric acid (HCl), dilute sodium hypochlorite (NaClO) and dilute sodium hydroxide (NaOH).

The use of other types of cleaning agents can cause damage to equipment.

The cleaning products must not be mixed. If, for example, HCl and NaClO are mixed this produces toxic chlorine gas. HCl and NaOH are highly corrosive. For safety advice, see applicable local regulations.

For more detailed instructions, please contact your supplier.

Hydrotech Discfilters in the HPF2200 series as standard are prepared with a chemical ramp to make removal of long-term clogging of the filter media possible.

The Hydrotech chemical trolley HCT (option) is connected to the chemical ramp connection (see Figure 3.2 and Figure 3.6). The control system is prepared and programmed for connection of a dosage system. After completing electrical and mechanical connection, chemical cleaning is started as follows:

1. Turn the mode selector to “HAND”.

2. Select “Login” (if the user is not already logged in) and log in using your user name and password.

3. Select “Chemical” on the operator panel, see Figure 7.11.

4. Set the number of full cleaning cycles to be completed, see Figure 7.12.

5. Select “Start” to start the chemical cleaning programme, see Figure 7.12. (Settings are found under “Settings”, see Automatic System Manual.)

6. Once chemical cleaning has been completed, re-start operation as described in section 5.1.

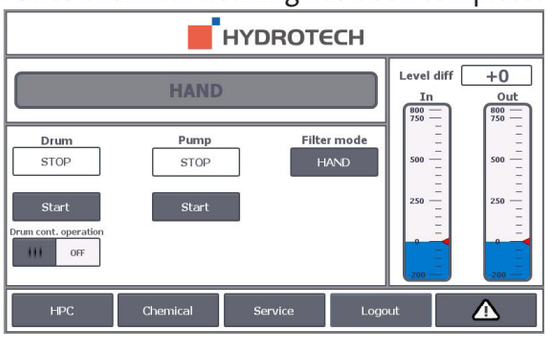

Figure 7.11 Main menu in HAND operating mode.

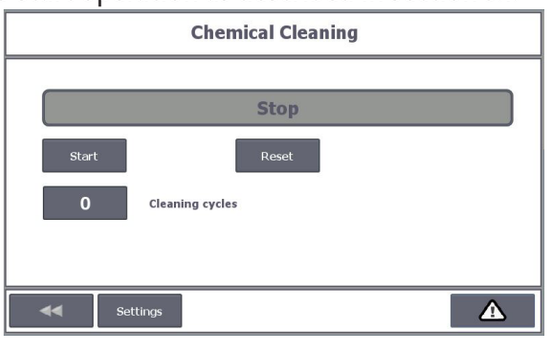

Figure 7.12 “Chemical cleaning” window.

If necessary clean the chemical ramp nozzles as described below:

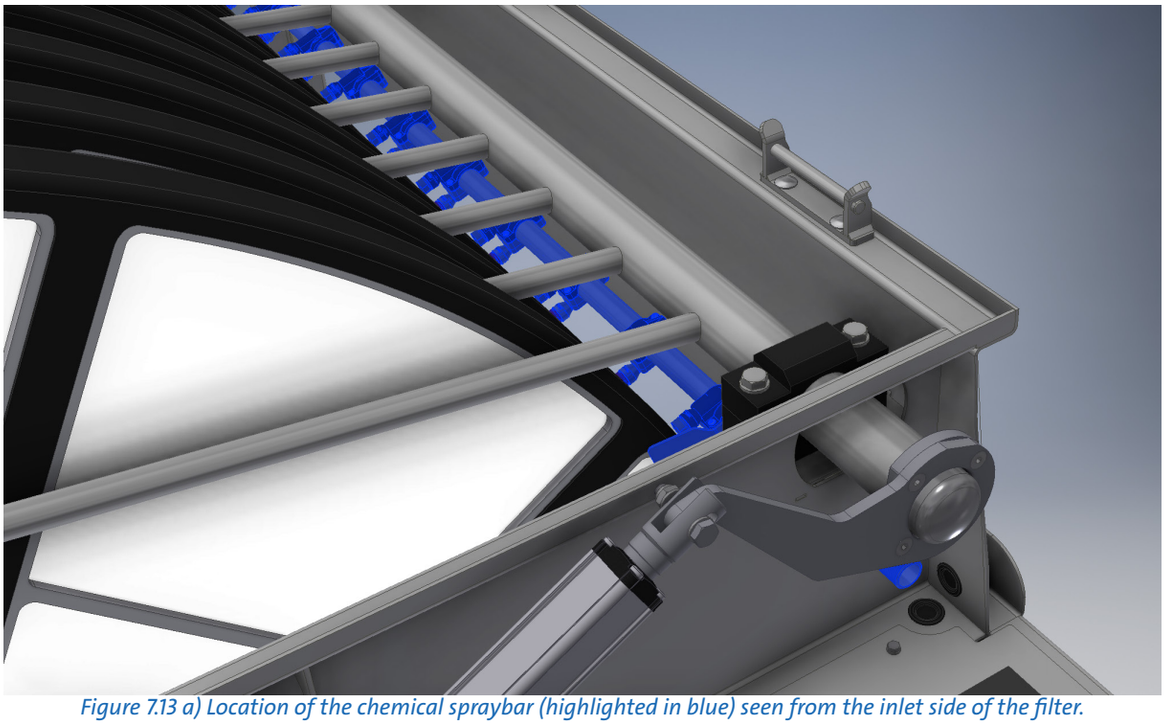

Figure 7.13 a) Location of the chemical spraybar (highlighted in blue) seen from the inlet side of the filter.

1. Turn the main power switch to the OFF (0) position and lock with a padlock.

2. Remove the nozzle by turning it ¼ turn anticlockwise (see Figure 7.13 b).

3. Clean the nozzle with compressed air or a plastic brush.

Never use a wire brush, metal pins or similar as these can damage the nozzle.

4. Refit the nozzle on the chemical ramp.

5. Start operations again as set out in section 5.1.

Figure 7.13 b) Nozzles on chemical ramp.

7.4.4 Changing filter panels

When replacing the filter panels it is important to maintain the balance of the drum. Remove/ refit every other filter panel. This prevents unintentional rotation of the drum and reduces the load on the drive chain and gearbox.

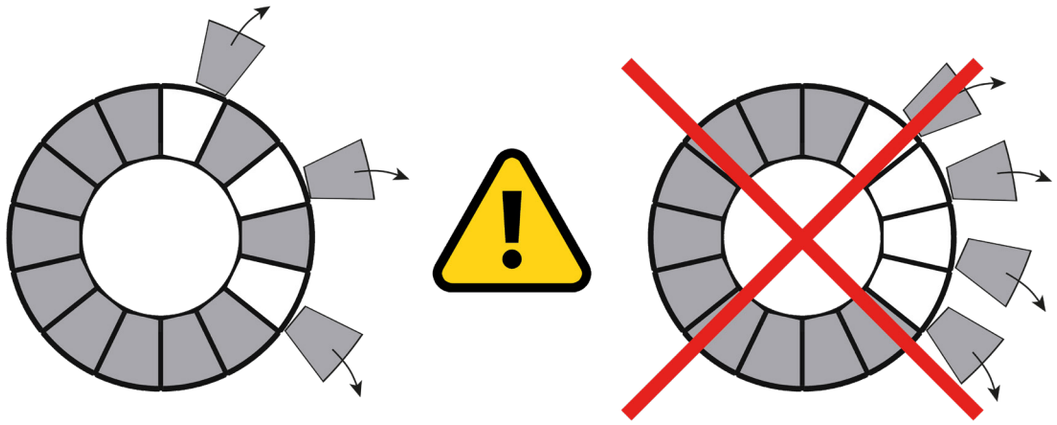

Figure 7.14 Correct way of changing filter panels.

NEVER remove or refit all filter panels on just ONE side of the disc (see Figure 7.14).

1. Turn the mode selector to “HAND”.

2. Select “Service” on the operator panel, see Figure 7.15.

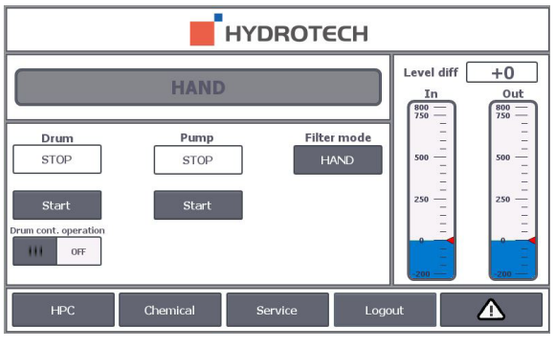

Figure 7.15 Main menu in HAND operating mode.

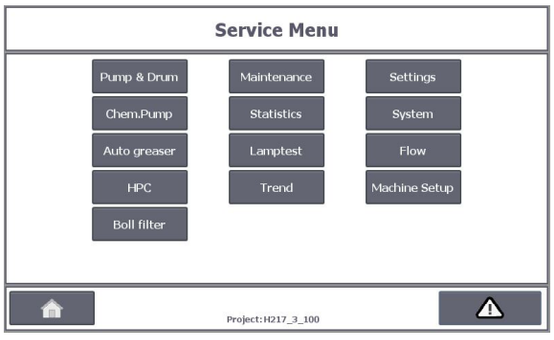

Figure 7.16 Service menu.

3. Select “Pump & Drum”, see Figure 7.16. Use the “Jog Fwd” and “Jog Bwd” buttons to set the drum to the desired mode, see Figure 7.17.

4. Turn the safety switch to the OFF (0) position and lock in the OFF (0) position with a padlock.

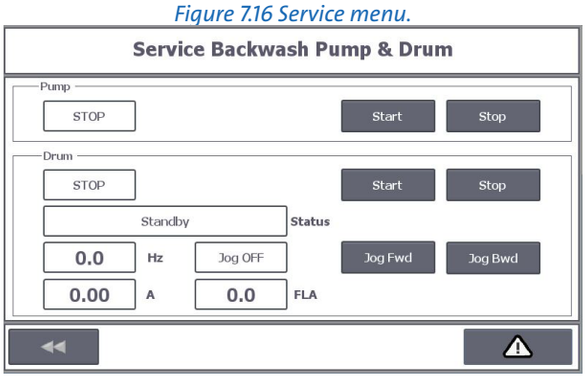

Figure 7.17 “Service Backwash Pump & Drum”.

5. Undo the filter segment cover screw and remove the cover, see Figure 7.18).

Figure 7.18 The filter segment cover is removed.

6. Pull out the filter panel (see Figure 7.19).

Figure 7.19 The filter panel is pulled out.

7. Insert a new filter panel and press in until it touches the bottom.

NB Filter panels with steel frames must be positioned with the filter cloth facing inwards (see Figure 7.20).

Incorrect installation of the filter panels can cause damage to the filter segments.

8. Replace the filter segment cover and tighten the screws.

Maximum tightening torque: 3 Nm.

9. Fit the remaining filter panels and covers in the same manner.

10. Start operations again as set out in section 5.1.

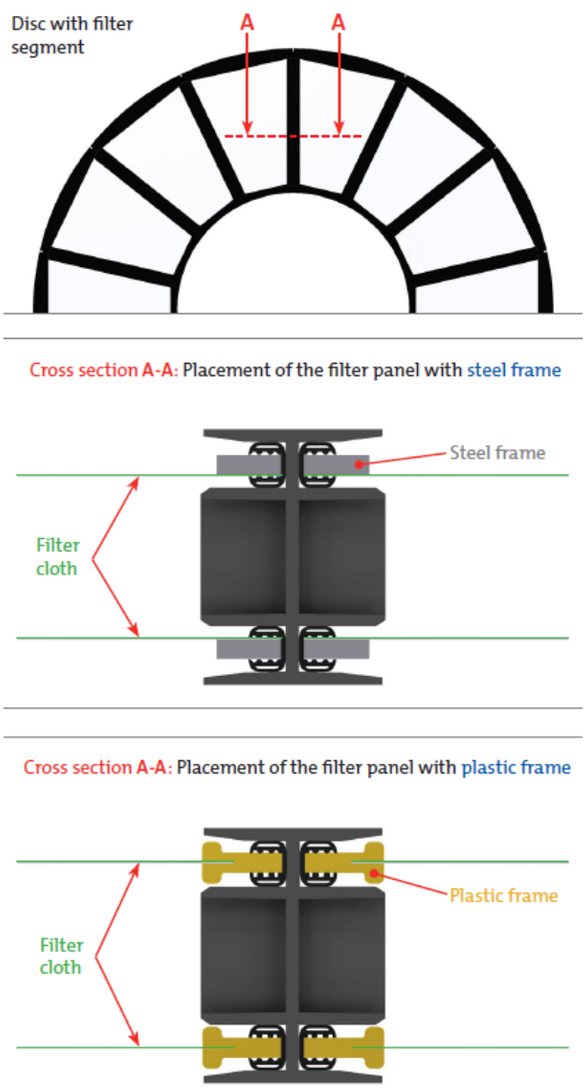

Figure 7.20 Location of filter panel with steel or plastic frame.

7.5 Drive chain

NB Prior to servicing, read section 2.7.

The filter is equipped with a chain drive. For technical data, see Appendices A and D.

7.5.1 Checking and tensioning the drive chain

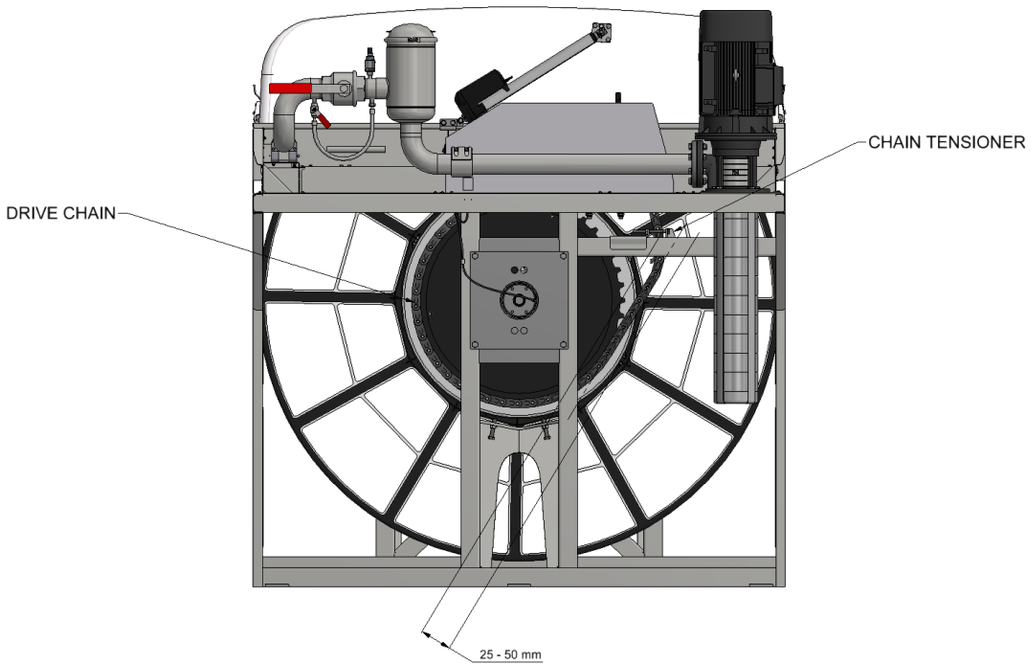

Figure 7.21 Displaying the correct slack of the drive chain and position of the tensioner.

1. Turn the main power switch to the OFF (0) position and lock with a padlock.

2. Remove the motor cover to access the chain.

3. Stretch the chain by turning the drum by hand in the non operational direction.

4. Check the tension of the chain's return section; it must be possible to move it between 25 and 50 mm, see Figure 7.21.

5. Adjust the chain setting, if necessary, with use of the chain tensioner, see figure 7.22.

6. Start operations again as described in section 5.1.

7.5.2 Using the chain tensioner to achieve correct tension

1. Turn the main power switch to the OFF (0) position and lock with a padlock.

2. Remove the motor cover to access the chain.

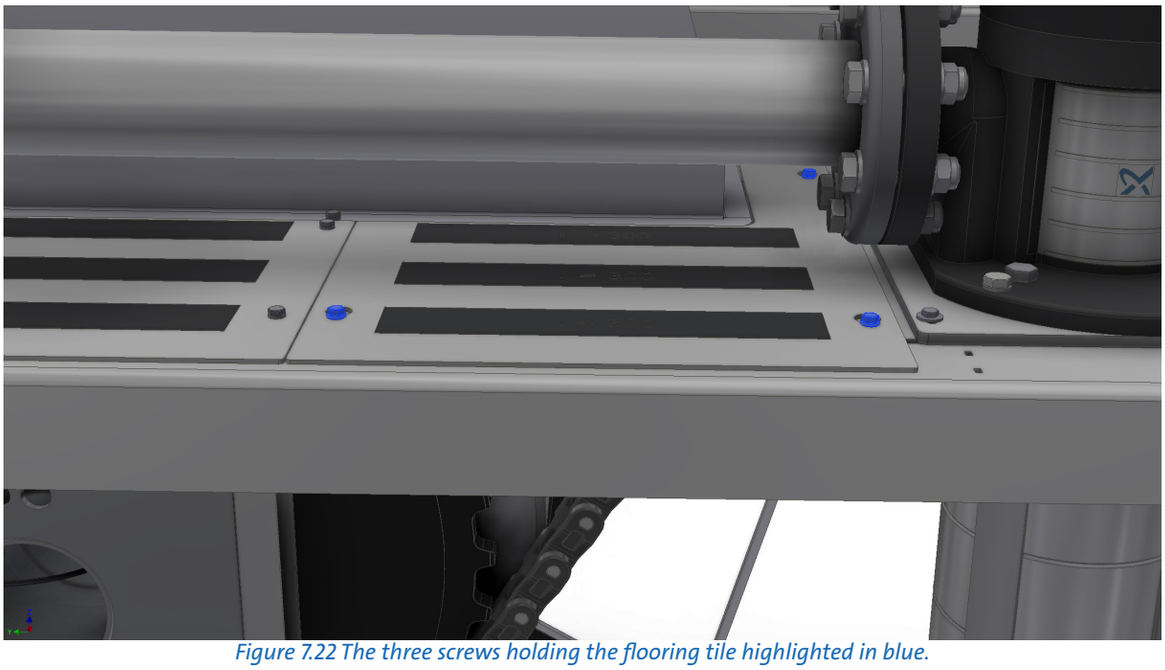

Figure 7.22 The three screws holding the flooring tile highlighted in blue.

3. Remove the flooring tile with the three screws marked blue in figure 7.22. This is done by releasing the tension of the screw and the sliding the tile towards the end of the filter. Then lift the tile to get access down below.

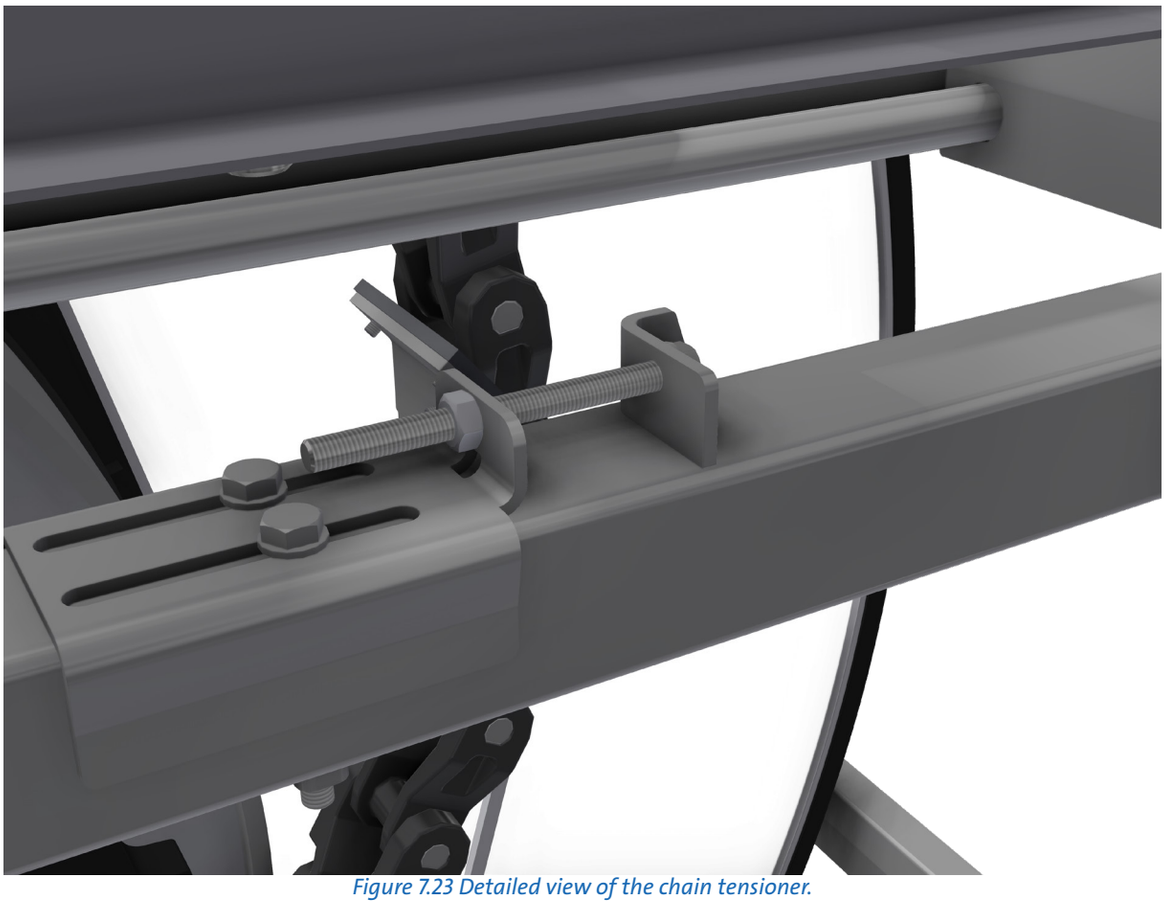

Figure 7.23 Detailed view of the chain tensioner.

4. Loosen the two screws to the left in figure 7.22. The screws are loosend enough when the chain tensioner is able to move freely. Be careful when loosening the screws so that the bracket underneath the beam dont fall off. Loosen the nut on the adjustment screw.

5. Adjust the long screw until the chain gets the correct amount of tension.

6. Secure the chain tensioner by tightening the nut onn the adjustmen screw, then tighten the screws to the beam again.

7. Start operations again as described in section 5.1.

7.5.3 Replacing the drive chain

1. Turn the main power switch to the OFF position and lock with a padlock.

2. Get maximum amount of slack on the drive chain by using the chain tensioner. For further information of how to use the chain tensioner, read section 7.5.2.

3. Split and remove the drive chain.

4. Fit the new drive chain.

5. Adjust drive chain tension in accordance with section 7.5.2.

6. Start operations again as set out in section 5.1.

7.6 Drive unit

NB Prior to servicing, read section 2.7.

For information about the drive unit, see Appendix D.

7.7 Inlet gasket

NB Prior to servicing, read section 2.7.

7.7.1 Checking the inlet gasket

1. Turn the main power switch to the OFF (0) position and lock with a padlock.

2. Lower the water level in the filter until the whole inlet gasket is accessible.

3. Make sure the inlet gasket rests against the inside of the drum.

4. Inspect the inlet gasket for damage and wear (see Figure 7.24).

5. If necessary, replace the inlet gasket in accordance with section 7.7.2.

Figure 7.24 Inlet gasket.

6. Start operations again as set out in section 5.1.

7.7.2 Replacing the inlet gasket

1. Turn the main power switch to the OFF (0) position and lock with a padlock.

2. Lower the water level in the filter until the whole inlet gasket is accessible.

3. Note how the inlet gasket is fitted before it is dismantled.

4. Loosen the screws and nuts holding the inlet gasket in position.

5. Remove the inlet gasket.

6. Fit a new inlet gasket.

7. Start operations again as set out in section 5.1.

7.8 Lifting the drum

The filter is equipped with two drumlifting devices, each located at the gables of the filter, that is to be used when lifting the drum.

7.8.1 Use of the front drum lifter

The front drum lifter is placed along the centreline of the filter, on a bracket behind the horizontal beam above the inlet channel. The screw marked in blue in figure 7.8.1 displays where the front drum lifter is located.

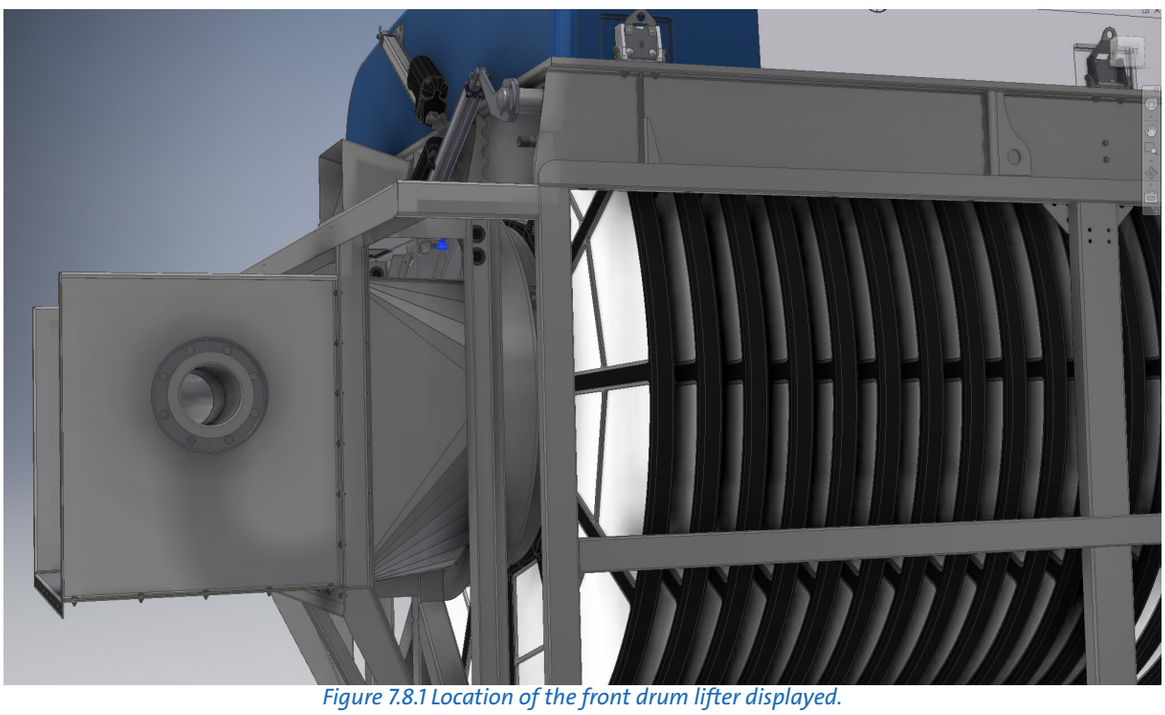

Figure 7.8.1 Location of the front drum lifter displayed.

The drum lifter is operated by tightening the screw (the screw marked blue, in figure 7.8.2). This will push on the center of the inside ring of the drum, lifting it vertically.

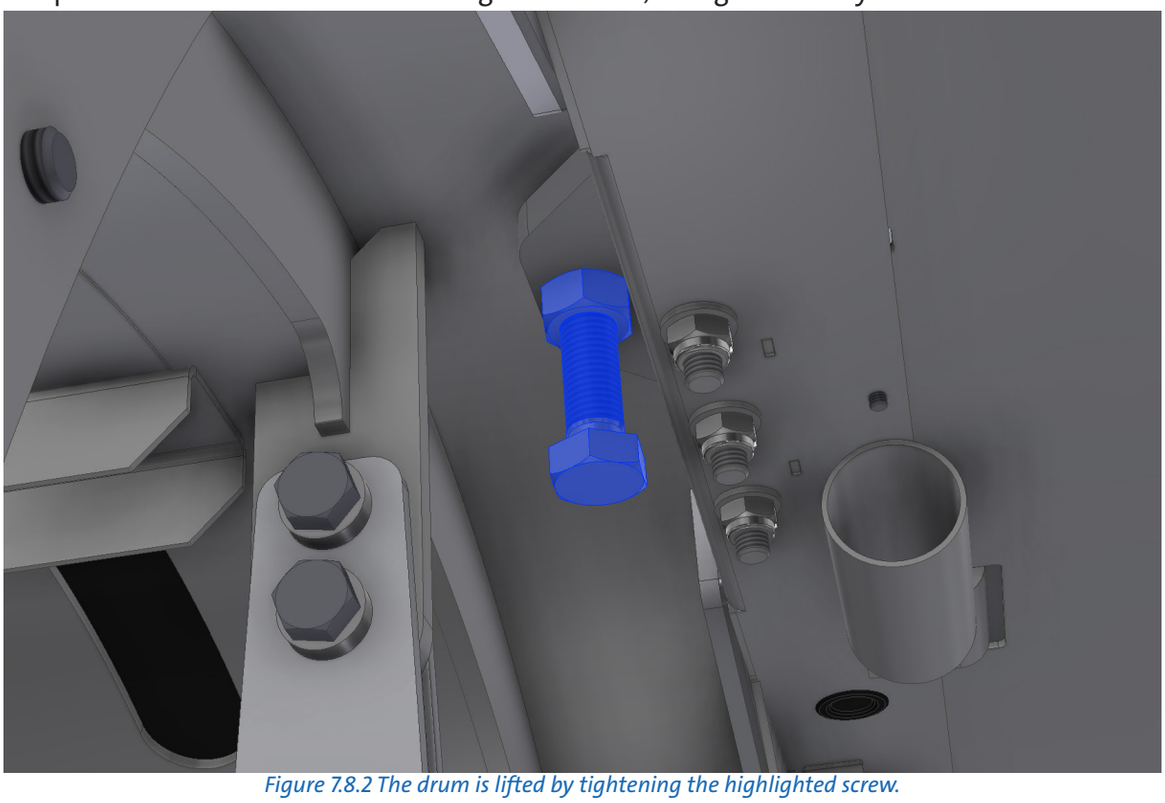

Figure 7.8.2 The drum is lifted by tightening the highlighted screw.

7.8.1 Use of the rear drum lifter

The location of the rear drumlifter is displayed in figure 7.8.3 below.

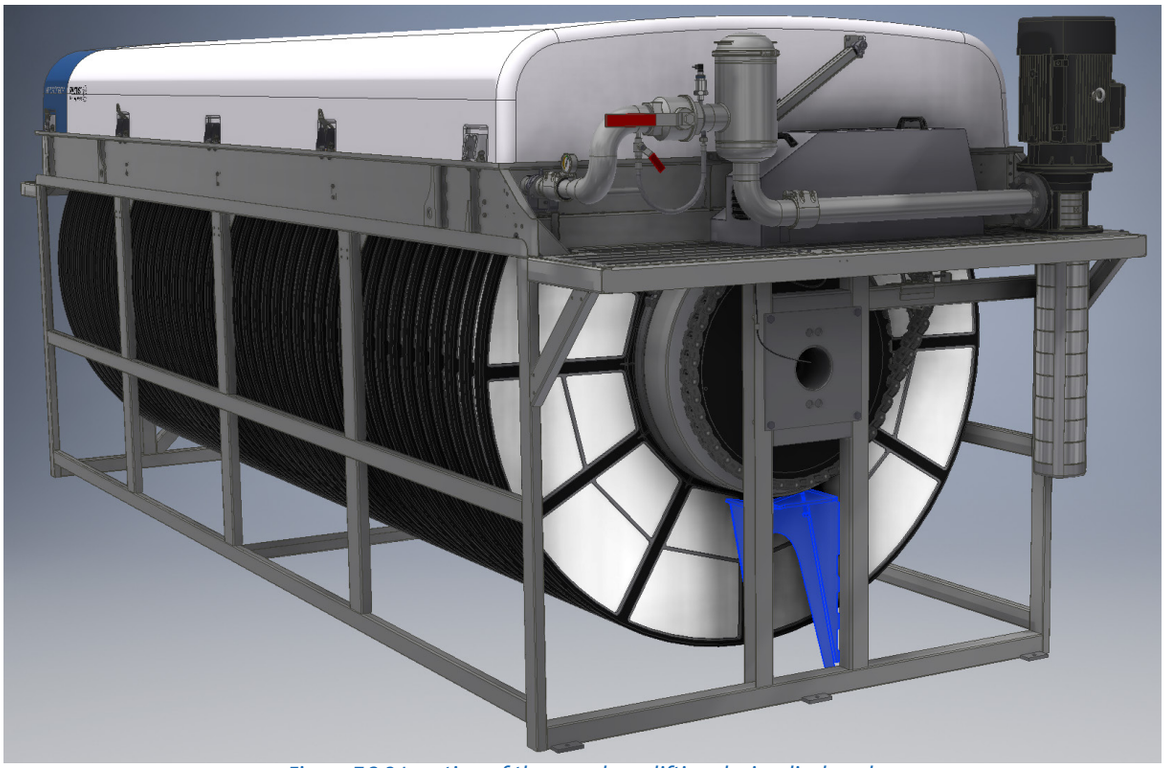

Figure 7.8.3 Location of the rear drum lifting device displayed.

The rear drum lifter is opeated in the same way as the front drum lifter, but instead of one screw placed in the center of the drum, there is now two screws lifting the drum.

Tighten one screw at the time, and lift the drum slowly by taking turns on the two screws so that the drum is being held close to the centreline of the filter during the entire process.

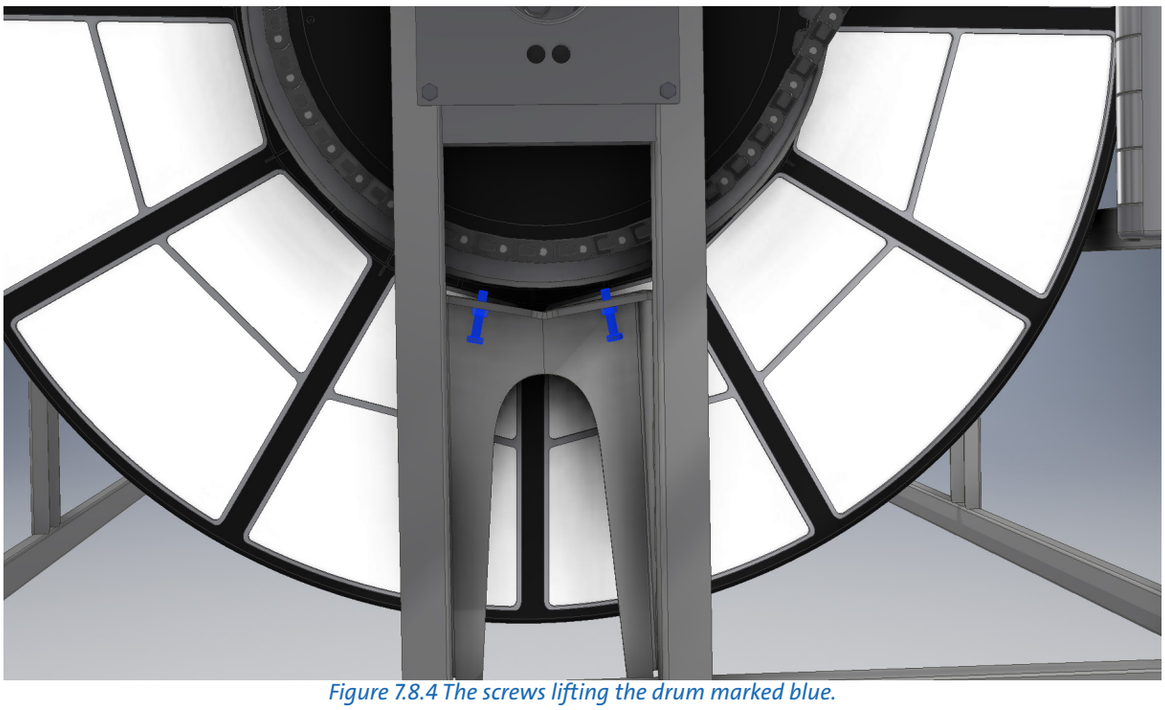

Figure 7.8.4 The screws lifting the drum marked blue.

7.8.2 Lifting the drum on filters with tank

The procedure for lifting the drum on a filter with tank is the same as for the frame version of the filter.

On the inlet side of the filter the drum lifter can be accessed by lifting the center flooring tile marked blue in figure 7.8.5.

On the effluent side of the filter the plate marked blue in figure 7.8.6 must be removed to access the drum lifter.

Figure 7.8.5 Accessing the front drum lifter.

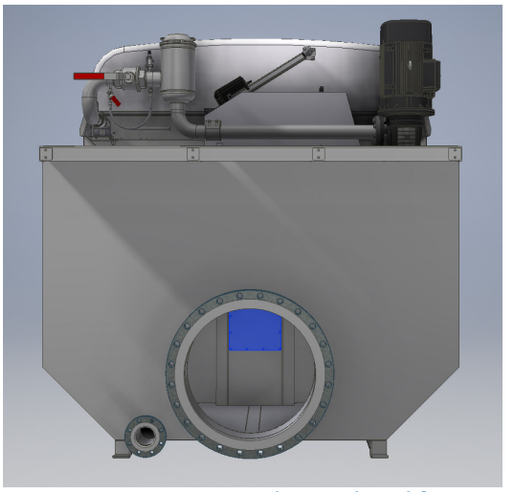

Figure 7.8.6 Accessing the rear drum lifter.

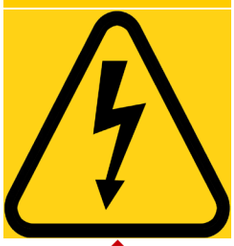
8. MAINTENANCE SCHEDULE

Check/Action	Maintenance interval
Check whether the wash water filter is clogged. See section 7.2.	The interval is based on experience from the application in question. (When the backwash water pressure drops 0.5 bar below the normal value.)
Check the filter panels for clogging and damage. See section 7.4.	Once a week or another interval based on experience from the application in question.
Inspect the inside of the filter: Make sure no large objects that can get caught in the drum, filter segments or sludge trough have entered the filter. Also check that the reject does not accumulate (sediment) in the sludge trough. NB Prior to servicing, read section 2.7. Remove large objects and rinse the sludge trough. *WARNING! Turn the main power switch to the OFF position and lock in the OFF position with a padlock.*	Once a week or another interval based on experience from the application in question.
Rinse the metal surfaces of the filter structure with clean water. Clean (uncontaminated) metal surfaces minimise corrosion, particularly in salt water applications.	Twice a month or another interval based on experience from the application in question.
Check the nozzles with respect to clogging. See section 7.1.	Twice a month or another interval based on experience from the application in question.
Lubricate the swivel to the backwash pipe using grease of the type NLGI:2 (e.g. Molykote Multilub, Rembrandt EP or equivalent grease). See section 7.3.1.	Twice a month with continuous drum rotation. Once a month with intermittent drum operation.
Lubricate the drum bearings (on the inlet and drive side) using grease of the type NLGI:2 (e.g. Molykote Multilub, Rembrandt EP or equivalent grease). See section 7.3.2.	Twice a month with continuous drum rotation. Once a month with intermittent drum operation.
Check drive chain tension and condition. See section 7.5.1	Four times a year with continuous drum rotation. Twice a year with intermittent drum rotation.
Check the drive unit's oil level. See section 7.6.	Twice a year.
Check the wear on the drum bearing. See section 7.3.3.	Once a year.
Check the inlet gasket. See section 7.7.	Once a year.
Change the gearbox oil. Oil type: ISO viscosity VG 680 (e.g. Omala oil 680 (Shell) or equivalent gearbox oil). Also see Appendix D.	See Appendix D.

Symbols used on Hydrotech filters

Symbol is displaying equipotential earth bonding points on the filter.

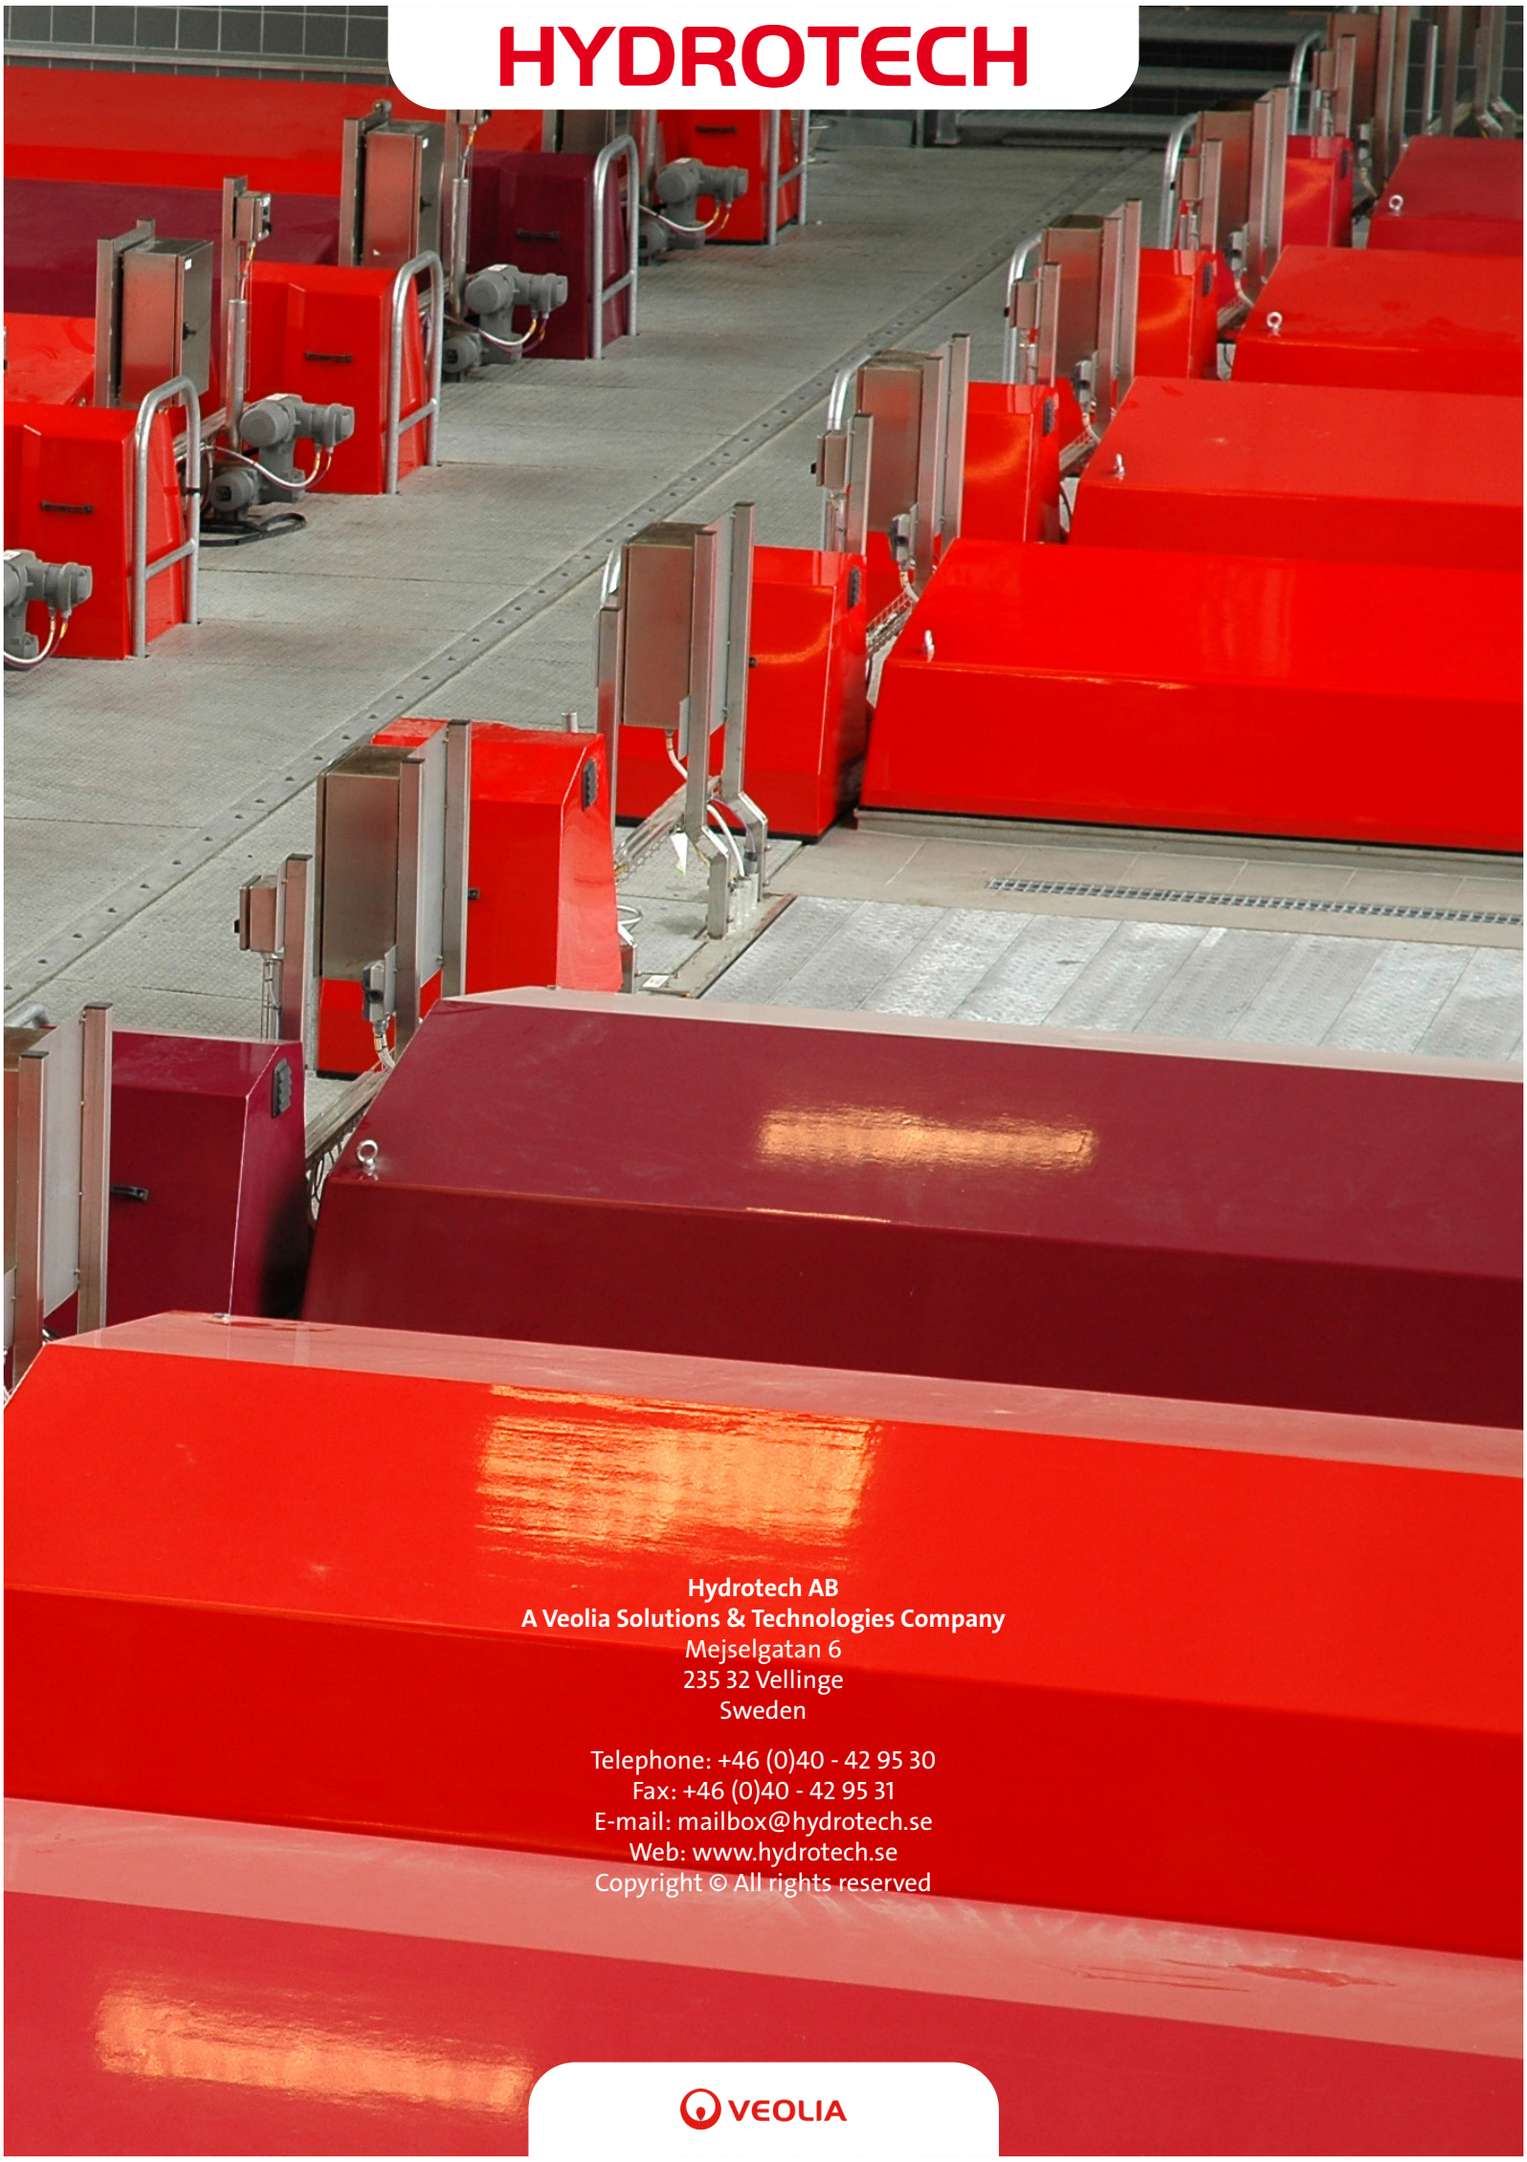


Symbol shown at lubrication points on the filter. Read the manual for further information about lubrication.

Symbol displaying moving parts. Negligence to comply with safety regulations may lead to injury.

This symbol is placed where certain attention is needed when handling the filter. Read the manual for further information.

Warning for high voltage. Always assume all electrical equipment to be live and



Used as a warning where corrosive fluids is used. Always use appropriate safety equipment when handling corrosive products.

Manuals & technical information

For further information regarding Hydrotech filters or any other product used together with Hydrotech filters, please visit www.hydrotech.se. Click on ”Manuals & technical information”.

Locate the desired product manual and select manual by clicking on one of the language options. The manual will open in a new browser tab where the option to save the manual also can be found.

HYDROTECH

CHEMICAL CLEANING OF HYDROTECH FILTERS

Version 1.2

Vellinge
June 2, 2020

by VEOLIA Water Technologies

Introduction

The purpose of this instruction is to provide a detailed overview of when and how to perform chemical cleaning of Hydrotech filters. The document can be used as an encyclopedia, where the user, by the help of the table of content, will find which sections to read when looking for answers to chemical cleaning related questions.

The document includes a short background describing how the filters work and how to determine when chemical cleaning is needed. The instruction also covers general health and safety aspects, the recommended chemicals to use and the estimated chemical consumptions for the drum and disc filters. The instruction also comprises different ways of performing chemical cleaning, manually or automatically, how to evaluate the performance of the chemical cleaning and a list of relevant documents for further reading.

6. Appendices 15

1. Background

The drum filter and the disc filter are based on the same principle. Water flows by gravity into a central drum, supporting vertically mounted discs (disc filter, Figure 1) or covered by filter panels (drum filter, Figure 2). During filtration, solids larger than the pore openings of the filter cloth are caught on the filter panels. As the solids layer on the panels increases, the water flux through the filtration media decreases, which (at a constant inlet flow) causes the water level inside the central drum to rise. When the water level reaches a level sensor, mounted at a certain critical head loss level, the backwash is initiated. The backwash pump is activated and the drum starts to rotate, to transport the solids retained from the water up to the backwash nozzles. The nozzles spray the filter cloth from the outside with clean water, at up to 8 bar, and the solids fall into a solids collection trough, from which they can be discharged.

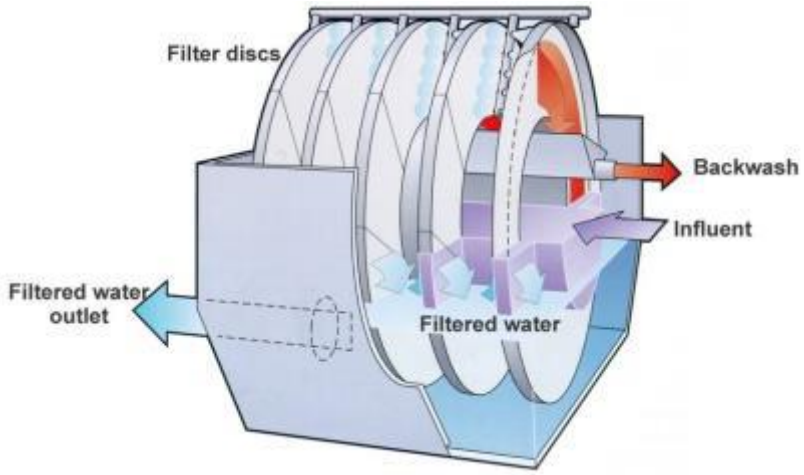

Figure 1. The disc filter filtration principle.

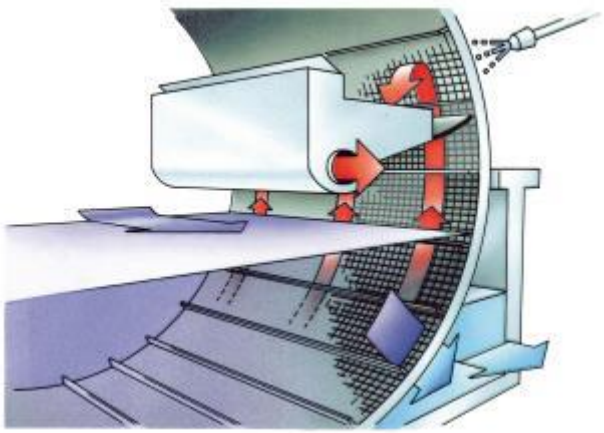

Figure 2. The drum filter filtration principle.

Once the water level inside the drum decreases, the backwash pump and the rotation of the drum stops. The filtration continues, without interruption, throughout the whole backwash cycle. In the best-case scenario, the filter installations will operate for several months without any noticeable reduction of the hydraulic capacity thanks to the regular backwash. There is however, a risk of the hydraulic capacity decreasing due to either clogging or fouling or by a combination of both.

Clogging occurs when particles are blocking the pore openings of the filter media, whilst fouling can be either reversible i.e. physically removed by the standard backwash or by high-pressure cleaning, or irreversible, which will require chemical cleaning. The fouling of the filter cloth is usually caused by both inorganic and organic foulants, where inorganic fouling is most often associated with chemical precipitating agents used in the treatment process, e.g. coagulants for phosphorus removal. Meanwhile, accumulation of biological material on the filter panels is typically seen in connection with applications with very active biomass (e.g. biofilm processes) and/or during long periods of very low

loading e.g. at night. For long periods of low loading, it is recommended to introduce a forced backwash once an hour and to implement a longer overrun on the backwash timer.

Fouling can in many cases be prevented by performing regular high-pressure cleaning (at max 80 bar), e.g. once a week or every second week, either by using the optional built-in high-pressure cleaning equipment or by cleaning the filters manually. If manual high-pressure cleaning is done, the high-pressure nozzles should not be closer than 10 cm to the filter media, in order to avoid tearing it. When the standard backwash and the high-pressure cleaning cannot remove the foulants, chemical cleaning of the filter media is required to recover the filtration capacity, see Figure 3.

Figure 3. A disc filter panel from an installation with iron based coagulant dosing, before (left) and after (right) chemical cleaning and recovery of the filtration capacity.

2. Frequency

How often chemical cleaning is needed depends on the pore sizes of the filter cloth, the dose of chemicals upstream the filter and the water characteristics of each installation. In some cases, it is rarely needed, while in others it might be needed every week. It is recommended to check if chemical cleaning is needed every 3-4 weeks by using the test-tube set-up described below, and adjust the chemical cleaning interval accordingly.

In general, for smaller pore openings such as 10 µm, chemical cleaning is needed more often than for larger openings such as 40 µm. When chemical precipitation is used in the water treatment process, e.g. for phosphorus removal, the chemical cleaning frequency might increase. For more information regarding the chemical cleaning frequency, see examples from full-scale installations in Appendix I.

Determining if chemical cleaning is needed can be done by comparing the operation hours, the sludge flow, the power consumption or the frequency of the backwash cycles for similar conditions over time. If the backwash frequency[1], hours of operation or power consumption for a similar load and the same backwash pressure increases over time, it means that the backwash is not succeeding in keeping the panels clean anymore, and that the capacity of the filter is decreasing. A decrease in the sludge flow over time can also serve as an indication that the filter media is suffering from clogging and/or fouling.

Another way of determining if chemical cleaning is necessary is to use a test-tube with an insert (see Figure 4) to relate the hydraulic capacity of the filter media to that of a new filter cloth, see the user manual in Appendix IV.

Figure 4. Test tube and insert for measuring long-term fouling of the filter media.

[1] Calculated as the backwash time divided by the time of the whole backwash cycle, i.e. the backwash time plus the static time when the filter is not backwashing.

3. Material

3.1. Health and safety

Read the labels, and safety data sheets (SDS) of the cleaning chemicals prior to use. Always wear gloves and all required personal protective equipment (PPE) as indicated on the SDS.

Local regulations for work with hazardous chemicals must be observed. For information regarding handling, storage, transport and disposal of the cleaning chemicals, see the SDS of each chemical used.

A workplace risk assessment should be done before starting the chemical cleaning. For an example of a risk assessment, see Appendix II.

3.2. Chemicals

The chemicals required for chemical cleaning will depend on the type and the extent of fouling. Before chemical cleaning is performed, the most effective chemical or combination of chemicals must be determined. In addition, the required concentration and necessary contact time of the chemicals should be evaluated. In some cases, it may be necessary to repeat the cleaning procedure a number of times or to use two different chemicals in succession. Higher concentrations than necessary should be avoided and the contact times stipulated below should not be exceeded.

To determine what chemicals should be used for chemical cleaning, a test-tube with an insert can be used to compare the hydraulic capacity before and after cleaning a clogged panel with the chemical that is being evaluated. For instructions that are more detailed see *User manual - Determination of clogging degree of filter media.*

The recommended products for chemical cleaning that do not affect the filter media lifetime are:

- Dilute hydrochloric acid (HCl, 3-5%)
- Dilute sodium hypochlorite (NaClO, 0,5-1,5%)

Generally, if the chemical cleanings are performed regularly according to site-specific maintenance schedules, a 3-5% HCl solution (v/v) and 0,5-1,5% NaClO (v/v) is sufficient. However, if the filter panels have been completely blinded, concentrations of up to 15% HCl and 4% NaClO respectively can be used.

If needed, the product Hydrex 4921 (10% w/w), dilute phosphoric acid (H_3PO_4, <10%) or dilute nitric acid (HNO_3, <10%) can be used as a replacement of HCl. Hydrogen peroxide (H_2O_2, <15% v/v), dilute sodium hydroxide (NaOH, 5%) or sodium percarbonate ($2Na_2CO_3 \cdot 3H_2O_2$, 5%) can be proposed as a substitute for NaClO. There are also commercial (acid) products, which include surfactants and inhibitors, available that can be used for chemical cleaning, for example Benco Extra/Duge supplied by FR Kemi ApS, Denmark. Dilute solutions of phosphoric acid or nitric acid can also be an alternative.

Do not use basic solutions at high pH, such as potassium hydroxide (KOH) and sodium hydroxide (NaOH), at high concentrations as this might damage the structural integrity of the filter cloth. Other solutions to avoid are listed in Table 1 below. Please contact Hydrotech for assistance in evaluating if any of the chemicals listed could be used for cleaning without damaging the filter media.

IMPORTANT NOTE!
Do not mix hydrochloric acid and sodium hypochlorite, as poisonous chlorine gas will form.

Table 1. The chemical compatibility of the polyester cloth with different chemicals. The resistance of the filter media is limited for the chemicals on the left, and the filter media is strongly attacked by the chemicals on the right.[2]

Limited resistance		**Strongly attacking**
Hydrofluoric acid	Sulphuric acid	Sulphuric acid
Nitric acid	Potassium hydroxide	Potassium hydroxide
Aqua regia	Sodium hydroxide	Sodium hydroxide
Salicylic acid	Sodium chlorite	Sodium chlorite
Sodium carbonate	Propylene glycol	Propylene glycol
Peracetic acid	Phenol	Phenol
Bromine	Cresol	
Potassium chlorite	Nitrobenzene	
Chlorine		

3.3. Chemical consumption

Tables with the chemical consumption for the drum, disc and performance filters can be found in Appendix III. The chemical consumption per cleaning cycle presented for the different filter models in the tables should be seen as a general estimation, which is likely to differ depending on the site-specific conditions, the cleaning frequency, the settings and the cleaning chemicals used. Hydrotech strongly recommends that the chemical cleaning settings, frequency, etc. are adapted to the conditions of each site.

[2] All information is derived from published data of the fiber manufacturers. Generally, it reflects the resistance at 20 °C (68 °F) of concentrated or saturated solutions. Rating, sample preparation, exposure time, load and other relevant factors vary between materials. Consequently, this information should be used as a guide only. Prior to any application, users are strongly advised to determine the accuracy, safety and suitability of this information by laboratory and field tests. Please contact Hydrotech for more information.

4. Execution

The cleaning procedure includes the following steps:

1. A backwash (and high-pressure cleaning, if available) is done to physically remove contaminants
2. The backwash water is allowed to drain from the filter panels
3. The chemical working solution is sprayed onto the panels
4. A certain contact time is allowed for the chemical reaction to take place
5. A backwash is done to wash the chemicals off the filter panels

While it is possible to clean the filter media manually with chemicals, Hydrotech strongly recommends using the Hydrotech Cleaning Trolley (HCT). The HCT is fully automated after it has been filled with the chemical and connected to the filter and the control cabinet. The control system ensures optimized cleaning and automatically rinses the filter after the chemical cleaning is finished.

If the panels are extremely fouled, due to e.g. issues with the chemical precipitation (over-/underdosing of coagulant and/or polymer), an option is to remove all of the panels, wash them with high-pressure equipment and let them soak in the chemicals.

4.1. High-pressure cleaning system (option)

If the filters have been equipped with the optional high-pressure cleaning system[3] (HPC, see Figure 5 and Figure 6), it can be operated using the buttons on the control cabinet (see Figure 7 for an example). For detailed instructions, see the filter manuals.

Figure 5. The optional high-pressure cleaning system for disc filters.

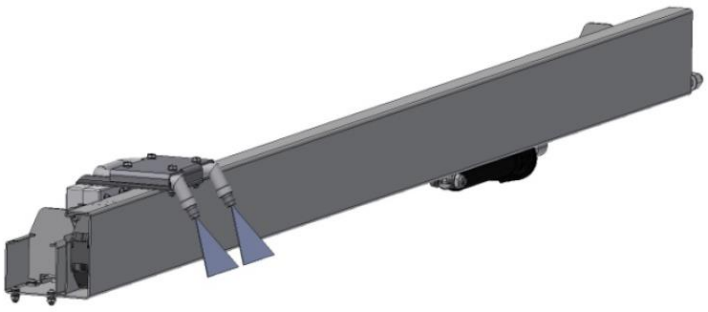

Figure 6. The optional high-pressure cleaning system for drum filters.

[3] Not available as an option for the HPF series.

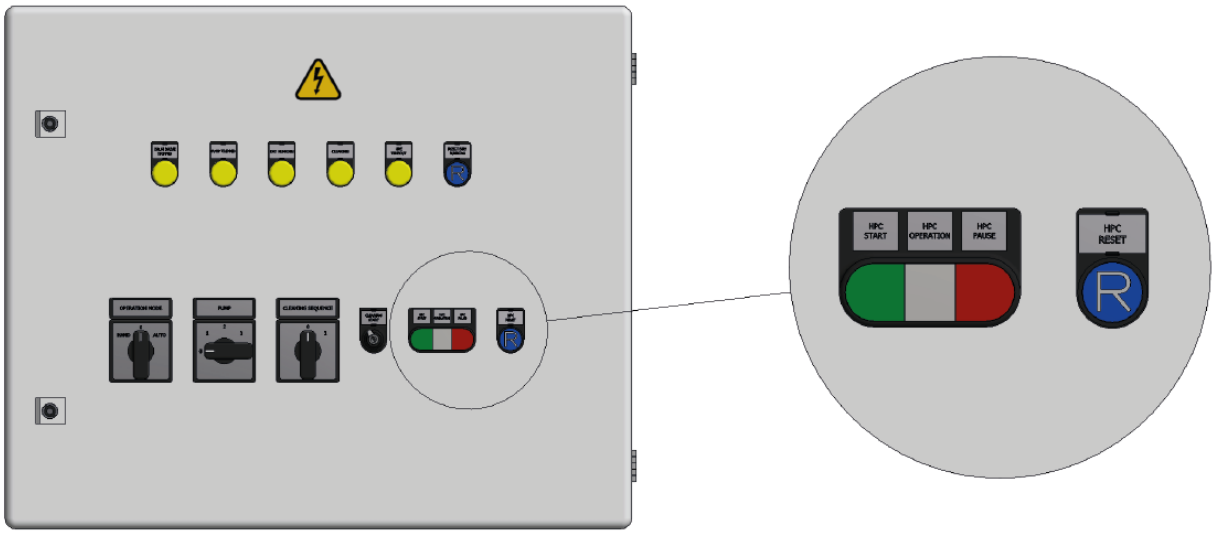

Figure 7. Control cabinet on filter with the high-pressure cleaning system integrated.

The high-pressure cleaning should be set to operate at a pressure of 80 bar. The time it takes to complete a cleaning cycle depends on the filter model. During the cleaning cycle, the filter will rotate continuously, while the high-pressure equipment cleans one filter segment at a time.

Manual high-pressure cleaning can also be performed, but it requires a pressure washer lance with an angled nozzle to fit in the space between the filter panels of the disc filters. The pressure washer lance must not be used closer than 10 cm from the filter panels.

If the fat, oil and grease concentration in the water is high and causes the filter media to clog, hot water (<60°C) can be used for the high-pressure cleaning.

4.2. Manual chemical cleaning

Note that the procedure for chemical cleaning outlined below is an example only. The actual procedure, i.e. the chemicals, concentrations and number of repetitions needed, must be determined for each installation depending on the type and extent of clogging before starting. The chemicals are preferably applied to the filter panels using a portable pressure spray bottle or similar (see Figure 8).

A. Backwash the filter continuously for 5 minutes at maximum pressure (7.5 bar or higher[4]). Alternatively, high-pressure wash the filter panels at a maximum of 80 bar, as described above.
B. Allow the filter panels to drain 1 minute.
C. Spray hydrochloric acid[5] on the filter panels that are visible and leave it for a contact time of 5-10 minutes.
D. Backwash the filter at maximum pressure (7.5 bar or higher[3]) for 5 minutes, to wash the hydrochloric acid off the filter panels.
E. Rotate the filter to expose untreated panels and allow the panels to drain for 1 minute.

Repeat steps C to E until all of the filter panels have been cleaned.

[4] The maximum backwash pressure depends on the filter model. It can be found in the technical specifications for each filter model.
[5] Alternatively, an equivalent cleaning product.

Figure 8. Portable pressure spray bottle used for application of cleaning chemicals on the filter media.

Safety note: Before starting with the following steps, make sure that the hydrochloric acid is not mixed with the sodium hypochlorite, to prevent toxic chlorine gas from forming.

A. Spray sodium hypochlorite[6] on the visible filter panels and leave it for a contact time of 5-10 minutes.
B. Backwash the filter at the maximum pressure (7.5 bar or higher[4]) for 5 minutes, to wash the sodium hypochlorite off the filter panels.
C. Rotate the filter to expose untreated panels and allow the panels to drain for 1 minute.

Repeat steps F to H until all of the filter panels have been cleaned.

4.3. Chemical spray bar

The filters can be equipped with chemical ramps[7] (see Figure 9 and Figure 10) with spray nozzles, to enable automatic chemical cleaning of the filter panels by connecting the optional Hydrotech Cleaning Trolley. Hydrotech recommends having one spray bar per cleaning chemical.

The chemical spray bar can also be used for manual cleaning. The chemicals are then injected using e.g. technical water as motive water and a dosing pump or ejector. The type and size of ejector needed depends on the filter model and the flows required to obtain the correct concentrations of the cleaning chemicals.

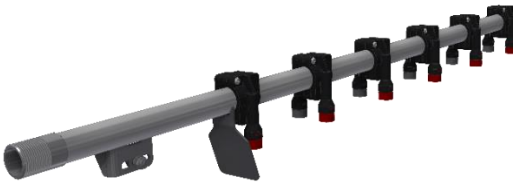

Figure 9. Chemical spray bar with nozzles for disc filters.

Figure 10. Chemical spray bar with nozzles for drum filters.

Before starting the chemical cleaning the spray bar, nozzles, spray pattern, and spray angle should be checked with pressurized tap water to ensure there are no leaks or clogged nozzles, which can significantly reduce the cleaning efficiency. If clogged nozzles, due to biological growth in the filter, is a recurring issue, exchanging the nozzles for blinded nozzles can be considered when the chemical spray bar is not in use.

[6] Alternatively, use an equivalent cleaning product.
[7] The HSF1700 series and the drum filters are not, as a standard, equipped with chemical ramps.

The spray pattern can be modified, if necessary, by replacing the standard spray nozzles with a larger model. Using larger nozzles, however, will have an effect on the chemical consumption.

4.4. Hydrotech Cleaning Trolley (option)

The Hydrotech Cleaning Trolley (HCT, Figure 11) can either be used with the automatic settings in the control cabinet or manually, as described in section 4.6. Before starting the chemical cleaning, the HCT manual should have been read and understood, see Appendix V.
The HCT has three connections:

- A 10 m power cable (3 x 400V), to be connected to the filter unit
- A 10 m signal cable, to be connected to the control cabinet
- A hose for the chemicals, to be connected to the spray bar of the filter unit

Figure 11. The Hydrotech Cleaning Trolley (HCT).

The HCT can be stored separately from the filter units, indoors, to protect it from frost and direct sunlight. When a chemical cleaning is needed, the HCT can be moved into position close to the filter unit and connected, as described above.

4.5. Automatic chemical cleaning with HCT, and PFC control cabinet

The automatic chemical cleaning procedure is fully automated once the HCT has been filled with the cleaning chemical to be used, connected to the filter and control cabinet and the operation of the filter is changed to cleaning mode. For the automatic chemical cleaning to start, the operator has to press the buttons manually. Consequently, the chemical cleaning requires someone to be on site to make sure that it is safe to start the chemical cleaning. The procedure is as follows.

A. Fill the container with the chemical to be used.
B. Connect the HCT to the filter and the control cabinet
C. Change to the cleaning mode in the control cabinet.

The system will start the cleaning, by spraying the chemical onto the filter panels following a sequence, which will allow the filter panels to be soaked in chemicals. When all the panels have been sprayed and left soaking, the backwash cycle will start to rinse the panels. The cleaning procedure is fully automated, and takes approximately 20 minutes.

If several chemicals are needed for the chemical cleaning, replace the chemical container and restart the procedure. If both hydrochloric acid (HCl) and sodium hypochlorite (NaClO) have to be used, great care should be taken to avoid mixing the two, as it can produce toxic chlorine gas. The

safer, faster and easier option is to use two separate cleaning trolleys, instead of using the same trolley.

If the same cleaning trolley has to be used, the chemical cleaning procedure with hydrochloric acid (HCl) is performed (see the HCT operation manual). The residual HCl is then pumped out of the tank and the whole system is thoroughly washed with an excess of water. After this is done, the sodium hypochlorite solution is pumped into the tank and the chemical cleaning procedure is repeated.

D. When the panels are clean, disconnect the HCT from the filter unit and the control cabinet.
E. Change to the standard operation mode in the control cabinet.

4.5.1. Chemical cleaning settings

Several different parameters can be adjusted to optimize the chemical cleaning, depending on the conditions of the specific site. When the HCT is used the factory settings are recommended, but for permanent chemical cleaning installations, the chemical cleaning system is more likely to require adjustments. Factors that can influence the choice of settings are, for example, the time required to build pressure in the chemical pipe and time delays in the control system, as well as the type and development of the fouling.
The parameters that need to be checked, and if necessary adjusted, are:

- Number of cleaning cycles
- Drum start delay
- Drum dispensing time
- Drum dispensing speed
- Chemical pump stop delay
- Soaking time
- Index steps
- Rinsing time

For more information, see the operation manuals and functional descriptions for the filters.

4.5.2. Chemical cleaning sequence

1. The chemical pump starts.
2. After a set time, the *drum start delay*, when the pressure in the chemical spray bar has built up and the spray pattern is right, the filter drum starts to rotate at the set *drum dispersing speed* (normally 10-20 Hz).
3. The drum rotates for a set time, the *drum dispersing time*, during which 2-3 segments are sprayed with the cleaning chemicals.
4. When the drum dispersing time has elapsed, a stop signal is sent to the drum motor, which ramps down the rotation of the drum. Due to the time it will take to slow down and stop the filter drum, a *chemical pump stop delay* is used, in order to make sure the chemicals are evenly applied to all of the filter segments.
5. After the chemical pump and the drum has stopped, the segments sprayed with cleaning chemicals will soak during a *soaking time* of, usually, 300-600 s.
6. After the soaking time, the whole cleaning sequence (steps 1-5 above) is repeated on the other segments, until all of the filter segments have been cleaned. The number of repetitions will depend on the filter model. As an example, a disc filter from the HSF2600-series has 14 segments and requires a minimum of 5 *index steps* to clean the whole filter discs. It is recommended, however, to clean the filter in 6-8 index steps to ensure that the filter segments are completely covered by cleaning chemicals. For other filter models and placements of the chemical spray bar, other settings might be needed.
7. When all of the filter segments have been sprayed and left soaking with cleaning chemicals, the chemical cleaning sequence is finished by backwashing of the filter for a *rinsing time* of approximately 5 minutes, to remove the cleaning chemicals from the filter media.

It is strongly recommended during commissioning of the filters that all of the above settings are evaluated, and if necessary adjusted, by using tap water. This should be done by having

manometers installed on the chemical spray bar and the filter lid kept open, to be able to inspect the performance.

The key is to verify the spray pattern from the chemical nozzles (spray pressure >3 bar) before the filter starts to rotate, that the filter stops before the treated segments enter the water, that the treated segments are left soaking long enough and that the cleaning of the filter segments overlap to avoid untreated sections.

4.6. Manual chemical cleaning with HCT, without PCF control cabinet

A. Backwash the filter continuously for 5 minutes at maximum pressure (7.5 bar or higher[8]) and allow the filter panels to drain for 1 minute.
B. Rotate the drum at 10-20Hz by changing the settings in the control panel.
C. Spray hydrochloric acid at 3 bar for 12 seconds (with the drum rotating at 10-20 Hz) using the chemical spray bar.
D. Stop the drum rotation and let the chemical soak for 3 minutes.
E. Repeat steps B-D 5 times until the whole surface has been covered with acid.
F. Backwash for 5 minutes and allow the filter panels to drain for 1 minute.
G. Repeat the above steps with sodium hypochlorite, if necessary.

NB Make sure to never mix hydrochloric acid and sodium hypochlorite to prevent poisonous chlorine gas from forming.

[8] The maximum backwash pressure depends on the filter model. It can be found in the technical specifications for each filter model.

5. Performance evaluation

To evaluate the efficiency of the chemical cleaning, remove a filter panel and use a test-tube with insert, as described in user manual in Appendix IV. The time it takes for 1 L of tap water to pass the filter is compared to the corresponding time of a new filter panel. If there is a substantial difference in time, repeating part of or the whole chemical cleaning sequence should be considered.

6. Appendices

Appendix I – Examples of Chemical Cleaning in Full-scale Installations

Appendix II – Example of a Risk Assessment

Appendix III – Chemical Consumption

Appendix IV – User manual - Determination of fouling degree of filter

Appendix V – Operation Manual Hydrotech Chemical Cleaning Trolley - HCT

Appendix I - Examples of Chemical Cleaning in Full-scale Installations

Example	**1**	**2**	**3**
Application	Tertiary treatment	Phosphorus removal	Phosphorus removal
Location	Sweden	Sweden	France
Pore size	15 µm	10 µm	40 µm
Filter area installed	3584 m²	821 m²	62 m²
Process upstream	Secondary clarifiers (activated sludge) and post-DN MBBR	Secondary clarifiers (activated sludge) and primary effluent by-pass	MBBR (C+N)
Chemical dosing upstream	Simultaneous precipitation (iron)	Coagulation (aluminium) and flocculation (anionic polymer)	Coagulation (aluminium) and flocculation (cationic polymer)
Chemical cleaning frequency	- HCl[1] (10%): Once a month - NaClO[2] (6%): Once every third month[3]	- HCl: Once every sixth week - NaClO: Once every sixth week	- HCl (10%): Three times per year - NaClO (<10%): Three times per year
Chemical consumption	- HCl (34% solution): 6 m³/year - NaClO: 7 m³/year	- HCl: 5200 L/year - NaClO: 312 L/year	- HCl: 210 L/year - NaClO: 250 L/year
Hours required	- HCl: 192 hours/year - NaClO: 128 hours/year	- HCl + NaClO: 208 hours/year	N/A

[1] Hydrochloric acid
[2] Sodium hypochlorite
[3] Continuous dosing of NaClO in the backwash water system to reduce the maintenance need of the nozzles (self-cleaning nozzles not installed).

Appendix II - Example of a Risk Assessment

Division: Process						**Date:** 2020-XX-XX	
Installation: Pilot						**Conducted by:** NN	
Overall activity	**Identified risk**	**Preventive measures**	**C***	**P****	**Risk**	**Recommendations**	**Comments**
H_2S formation due to anaerobic environment in confined spaces	Suffocation	Ensure proper ventilation on site.	5	1	3	Be particularly observant during start-up after power failure (more than 4 days) when H_2S can be present where it normally does not appear.	Under normal operation no H_2S is expected due to water flowing.
Cl_2-formation during cleaning of filter panels with HCl and NaClO.	Toxic	Make sure that the chemicals are not in contact with each other. Rinse the filter panels properly after use of each chemical	5	1	3	Perform chemical cleaning in a well-ventilated area	
Splashes of corrosive liquids, especially when chemicals are replaced or when cleaning the filter panels	Chemical burn	Always use eye protection in the container and protective clothing when handling chemicals. Emergency eye-wash is available in the control room.	2	2	2		The main risk is when chemical containers are replaced or when filter panels are cleaned with acid and bleach.
Physical injuries by moving parts	Physical injuries	Use the safety switch to stop machinery before reparation or sampling.	3	2	3	Make sure that no one can operate the equipment while performing work around these parts	Moving parts: pumps, engines, mixers, rotating drum, screw conveyors, valves
Injuries due to the physical environment	- Physical injuries - Burns due to hot surfaces - Electrocution	- Keep the pilot cleaned - Use the right tool for the task.	5	3	4	- Make sure there are no pipe leakages, make people aware about them	Beware slippery floors due to polymer leakage. Beware of cables, pipes and tubes

* Consequence
** Probability

	- Heavy lifts - Spills - Fires	- Be careful when moving around among the piping. - Never open an electrical cabinet without switching the power off - Use mechanical help for heavy lifts - In case of fire use the fire extinguisher, if possible, otherwise leave the container immediately				and clean them immediately. - Make sure there are no obstructions in the pipes causing overpressures - Any electrical work should be performed by an electrician - Make sure the sink is connected to a proper drain - Do not cover the radiators	when moving around in the containers
Analyses	Chemical risks	Read the MSDS before use	3	2	3	Make a risk assessment for any chemical analyses you perform.	The phosphax unit requires use of reagents that could pose health hazards
Noise	Hearing damage	Use hearing protection when required	3	1	2	Use hearing protection during longer work close to the backwash-pump.	
Biological risks	Upset stomach, polio (very rare), diphtheria	Take required vaccinations, use protective gloves and wash hands after contamination. Use mouth protection to avoid inhalation of aerosols.	4	2	3	Follow up for biological risks not present in Swedish treatment plants. Use protective clothes. Don't handle waste water with open wounds. No eating or drinking in the containers	All Hydrotech employees have vaccinations required by Swedish legislation

The risk assessment considers the consequence and the probability of an accident and combines them to a final risk for the activity. The consequence of an accident is considered on a scale from 1 (some discomfort) to 5 (lethal accident). The probability of an accident is assessed in a similar way from 1 (unlikely, happens once in 100 years) to 5 (very common, occurs once a week). The risk is judged based on the matrix below, risks rated as 1 or 2 could be considered safe while a risk of 3 might require preventive actions. If the order of a risk is 4 or 5 preventive actions are required before the work can continue.

Probability	Consequence				
	Some discomfort	Injury without sick leave	Shorter sick leave	Longer sick leave	Lethal accident
Very common (1/week)	R3	R4	R5	R5	R5
Common (1/month)	R2	R3	R4	R5	R5
Quite common (1/year)	R2	R3	R3	R4	R5
Rare (1/10 years)	R1	R2	R3	R3	R4
Unlikely (1/100 years)	R1	R1	R2	R2	R3

Risk order		Need of preventive measures
R1	**Low** Insignificant risk	No preventive measures
R2	Low risk	Take preventive measures if necessary
R3	**Medium** Some risk	Take all reasonable preventive action
R4	Serious risk	Require preventive measures
R5	**High** Very serious risk	Work stopped until preventive measures are taken

Appendix III - Chemical consumption

The chemical consumption per cleaning cycle presented for the different filter models in the table below should be seen as a general estimation, which is likely to differ depending on the site-specific conditions, the cleaning frequency, the settings and the cleaning chemicals used. Hydrotech strongly recommends that the chemical cleaning settings, frequency, etc. are adapted to the conditions of each site.

The chemical flow is calculated based on the flow rate capacity of the spray nozzles multiplied by the number of nozzles installed in the filter. The chemical flow is then multiplied by the dispersion time, which will depend on the rotation speed of the filter drum. The maximum standard rotation speed during chemical cleaning is 20 Hz. Depending on the water characteristics, the process line upstream the filters, etc. a slower rotation speed might be required to let more of the chemicals penetrate the filter cloth and dissolve the fouling on the inside of the filter panels. If precipitation chemicals are dosed upstream of the filters, a rotation speed of 10-15 Hz has shown good results. Consequently, the calculations below are based on the factory settings for chemical cleaning but with a rotation speed of 10 Hz. For installations where chemical cleaning is done regularly and/or when the fouling is easier to remove, 20 Hz can be used and the consumption of chemicals per cleaning cycle will be lower than in the table below.

The values in the table are based on a pressure of > 3 bar for the chemical pump, which is necessary to ensure the correct spray pattern. Previously the spray nozzle types **QMVV-KY-9501** and **QMVV-KY-11001** (the white nozzle in Figure 1) have been used, but nowadays **QMVV-110015** (the red nozzle in Figure 1) is the new standard. The nozzles are placed in such a way to cover the whole filter area in the different models. Since the spray nozzles are a standard component and the same type is used in all filter models, more chemicals per m² of filter area will be needed for the smaller filter models and the drum filters than for the large disc filters.

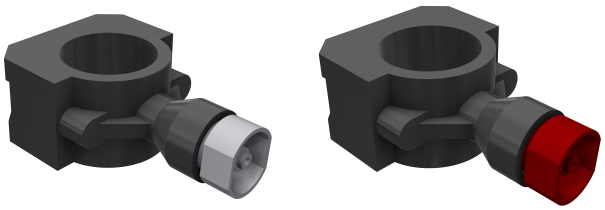

*Figure 1. Chemical cleaning nozzles **QMVV-KY 110-01 (left) and** **QMVV 110-015** (right).*

The Hydrotech Performance Filters (HPF) are equipped with two chemical cleaning nozzles per side of the filter disc, the **QMVV-110015** with a 110° spray angle and a QMVV-2502 nozzle[1] with a 25° spray angle to cover the increased filter area in a more efficient way.

Introduction

The following instructions summarise the recommended method for tests with the Hydrotech bench-scale Test-Tube unit and insert to evaluate the degree of fouling and identify the type of fouling of the filter media. The fouling can be either “hard” in character such as inorganic Ca , Fe, Al precipitates or “soft” of organic origin such as extracellular polymeric substances (EPS) or flocculant polymer residuals or a mixture of both. In this context, the long-term fouling is defined as the fouling caused by precipitates or biofoulants that are not removed by ordinary backwash (BW) at maximum 8 bar or high-pressure cleaning at maximum 80 bar.

This simple laboratory-scale apparatus promotes rapid and efficient tests to detect a decrease in filtration capacity. The equipment required is (Figure 1):

- A beaker with 1 L of tap water
- A 10 µm filter cartridge for pre-filtering of tap water (required only for the fouling evaluation of filter media with pore openings smaller than 18 µm)
- The bench-scale Test-Tube unit supplied by Hydrotech, consisting of:
    - A Test-Tube, fabricated from a PVC plastic pipe approximately 300 mm long and 75 mm wide (i.d. 67.8 mm);
    - An insert with a neoprene rubber gasket and a 20 mm hole
    - A clamp with a rubber joint to secure the insert at the bottom of the Test-tube and a hex key to tighten it

Figure 1. Hydrotech bench-scale Test-Tube and insert.

Procedure

1. Prepare an area of the filter media:
    a. If the test is performed on site, backwash the filter continuously for 5 minutes at the standard backwash pressure (6.5 - 8 bar). For Drum Filters, the capacity test can be performed with the filter panel in place (Figure 2a), while for Disc Filters, the filter panel must be removed and placed on top of a bucket or similarly (Figure 2b).
    b. If the test is performed off-line and the panel has left to dry, soak the panel in tap water for 1 hour.
2. Rinse the media with a water hose (2 - 4 bar) to remove any loose debris. Initially only rince from the BW side only to avoid altering the condition of the panel. Generally “soft” fouling such as EPS or polymer residual can be rinsed off with a regular water hose if rinsed from the filtration side of the panel, thus to have a correct measurement and evaluation of the type of fouling present this type of fouling should remain on the panel for the initial measurements.
3. Fill a beaker with 1 L of tap water.
4. Attach the insert at the bottom of the Test-Tube with the supplied clamp and tighten it.
5. Press the Test-Tube firmly against the media by hand.
6. Pour the water as quickly as possible into the Test-Tube.
7. Record the time it takes for the water to reach the upper part of the clamp (Figure 2c).
8. Repeat the measurements (3-5 times) on different parts of the filter panel, as shown in Figure 3, and calculate the average time.
9. Now the panel can be BW with a max pressure of 80 bar from the BW side at a distance of approx 6-8 cm to evaluate the degree of “soft” fouling by repeating the steps 3-8.

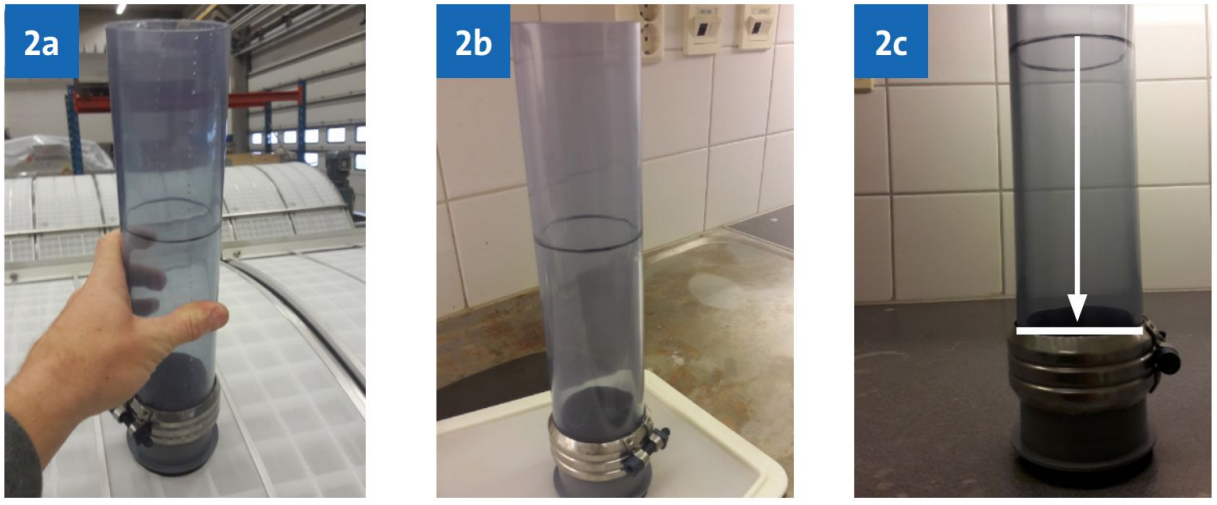

Figure 2. a) The test set-up on a mounted Drum Filter panel and b) with a Disc Filter panel that has been removed from the filter. c) The assembled equipment with the line representing the end of the time measurement highlighted in white.

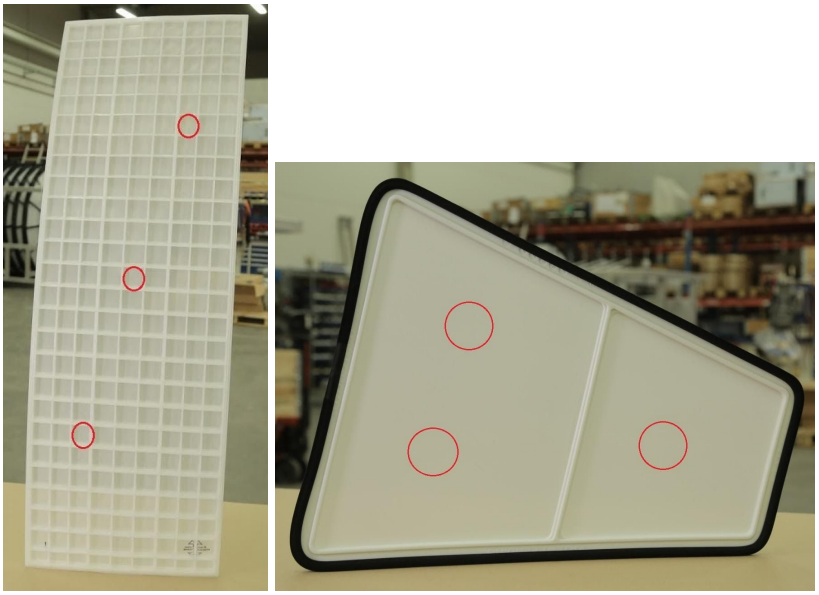

Figure 3. Examples of three different positions for the tests, for a Drum Filter (left) and a Disc Filter (right) panel respectively.

Fouling evaluation

The following procedure is used to estimate the “soft” and “hard” fouling degree, by comparing the filtration time needed for a fouled panel to that of a new/cleaned panel:

1. Perform the tests (at least 3 times, in different positions, as shown in Figure 3) on a new panel (previously soaked in water and washing-up liquid for 1 hour to remove the hydrophobicity of the fabric) to determine the reference filtration time (T_0). Expected ranges are given in Table 2. Results may vary due to the water temperature (20°C for the ranges reported in Table 2) and slight differences between the filter media batches. It is always recommended to determine a site-specific T_0.
2. Perform filtration tests, 3-5 times in different areas on the clogged panel, as described in the previous section to determine the initial filtration time (T_1) when fouled.
3. Optional: perform high pressure cleaning or chemical cleaning applying the BW or chemicals from the BW side following the Hydrotech guidelines (see Appendix I) and consequently drop-tests (3 replicates) on the cleaned panel to determine the final filtration time (T_2). For severely fouled panels hte chemical cleaning needs to be repeated in order for the media to recover.

Table 2. Estimated filtration times for the different filter cloth pore openings (water temperature 20°C).

Cloth label[1]	Opening (µm)	Reference filtration time T_0 (s)
B	10	45 - 60
C	15	30 - 40
D	18	20 - 25
F	25	18 - 25
H	40	15 - 20
J	60	10 - 12
M	90	10 -12
N	100	8 - 10
n.a.	200	4 - 5
n.a.	300	4 - 5

Thereafter, the fouling degree (FD) can be calculated as follows:

$$FD\ [\%] = \frac{T_1 - T_0}{T_0}$$

In some cases it might not be possible to recover the full capacity of the new cloth. As a consequence, it may be preferable to refer to the filtration time after chemical cleaning (T_2) instead of the reference filtration time (T_0). Vise versa, filter fabric can increase in flux due to the removal of the hydrophobicity from the manufacturing and that there can be a minor stretch to the fabric after extended use, thus the reference has to be determined individually for each installation.

The capacity recovery (R) can be estimated through the following ratio:

$$R\ [\%] = \frac{T_1 - T_2}{T_1 - T_0}$$

The recovery rate can also be evaluated for the individual cleaning steps, 80 bar high pressure and chemical cleaning. If most of the capacity can be recovered with 80 Bar high pressure then fouling can be regarded as “soft” and thus a solution is to install an automated high pressure system provided by HT. If most of the fouling is related to “hard” fouling then a chem for chemical cleaning needs to be determined. To bear in mind, chemical cleaning will remove both the “soft” and “hard” fouling ,thus 80 BW must be evaluated before a chemical cleaning is conducted.

1. INTRODUCTION

This manual contains instructions for the operation of the Hydrotech Chemical cleaning Trolley - HCT.

Pay attention to all warning symbols that appear in this manual. If this information is ignored it may result in serious personal injury and/or damage to equipment.

The manual must always be available to the personnel working with the equipment.

It is important that:

- The manual and other relevant documents are kept throughout the whole life of the equipment.
- The manual and other relevant documents are a part of the equipment.
- All personnel affected must read the manuals carefully.

2. SAFETY INSTRUCTIONS

The Hydrotech Chemical cleaning Trolley - HCT is designed for safe operation provided it is installed correctly and used in accordance with the enclosed instructions. The equipment must be installed correctly and adapted in accordance with local regulations. This equipment is designed for use by one or more operators. You must read the relevant sections of this manual before using the equipment.

The equipment is intended to be used in conjunction with Hydrotech filter units/control systems.

- Pay attention to all warning symbols that appear in this manual. If this information is ignored it may result in serious personal injury and/or damage to equipment.
- Assume all electrical equipment to be live.
- Assume all hoses and pipes to be pressurised.
- The equipment may be used only by authorised personnel with the appropriate protective equipment. This also applies to service/maintenance work on the equipment.
- A risk zone of 3m in all directions around the chemical cleaning trolley must be marked out and fenced off from unauthorised personnel when the system is in operation. Only authorised personnel may be inside this area, wearing the appropriate protective equipment for the purpose. The power cable, signal cable and the hose between the chemical cleaning trolley and the filter must be clearly marked to minimise the risk of tripping over them.
- The protective cap on the hose must always be in place when moving the chemical cleaning trolley.
- Before maintenance work is carried out, the signal cable from the filter control system and the power cable must be disconnected. The tank and the pipe system must be drained and flushed with clean water to ensure that no chemicals remain in the system.
- When handling the chemical cleaning trolley, whole body protection and respiratory equipment is required and work involves: filling of containers, connection, start-up, flushing and post-flushing the system.
- Only pre-diluted chemicals may be used.
- Local safety regulations must be followed.

2.1 Warning symbols

Warning symbols are used in this manual to draw attention to potentially dangerous situations:

Information that warns you of a potential risk of personal injury and/or damage to equipment.

Figure 2.1

Warning stickers (see Figure 2.1) are affixed to the chemical cleaning trolley container to warn personnel and remind them that corrosive/harmful chemicals may be used in the system.

2.2 CE marking

This equipment is CE marked (see Figure 2.2), which ensures that the equipment is designed, manufactured and described in accordance with the requirements set out in the EU Machinery directive.

CE

Figure 2.2

NOT APPLICABLE

2.3 Conversion

The CE marking does not include any components that are not approved by Hydrotech AB and which are used in conversion/reconstruction of the equipment.

The warning symbols and CE marking must be attached where they are fully visible. If any part of the equipment with a warning symbol is replaced, a new symbol must be attached in the same position. Damaged symbols and CE markings must be replaced immediately.

2.4 Demands on personnel

Only personnel trained for the equipment and conversant with local regulations may perform service and maintenance, in order to avoid personal injury and damage to the equipment. Service and maintenance personnel may only handle those parts of the equipment they have been trained for.

2.5 Emergency stop

The emergency stop/main switch is in the Hydrotech control cabinet (see example of a Hydrotech control cabinet in Figure 2.3).

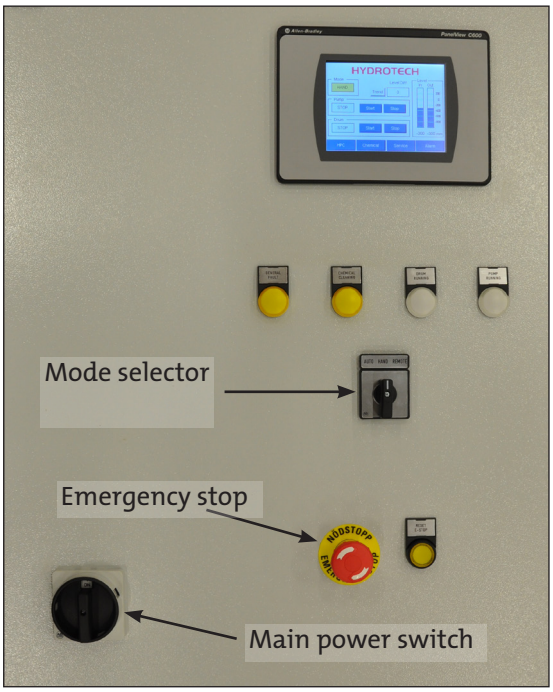

Figure 2.3 *Example of a Hydrotech control cabinet.*

2.6 Risk zone

A risk zone of 3 m in all directions around the chemical trolley must be marked out and fenced off from unauthorised personnel when the system is in operation. Only authorised personnel may be inside this area, wearing the appropriate protective equipment for the purpose. The power cable and the hose between the chemical cleaning trolley and the filter must be clearly marked to minimise the risk of tripping over them.

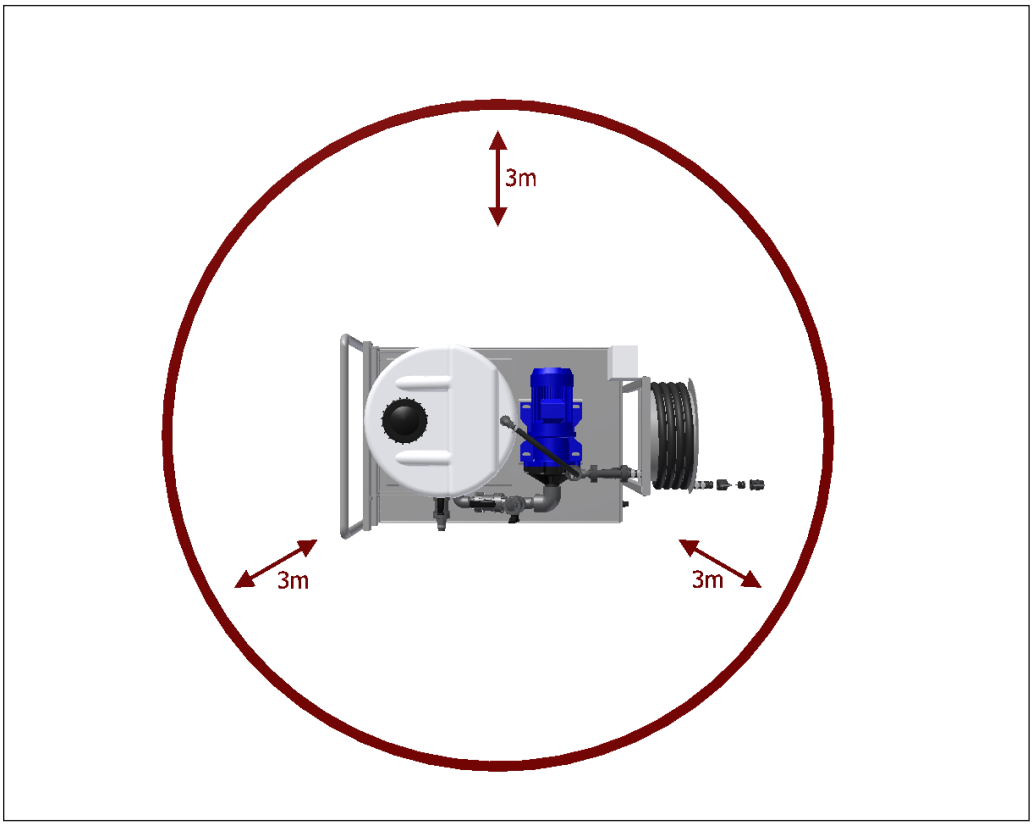

Figure 2.4 *Risk zone*

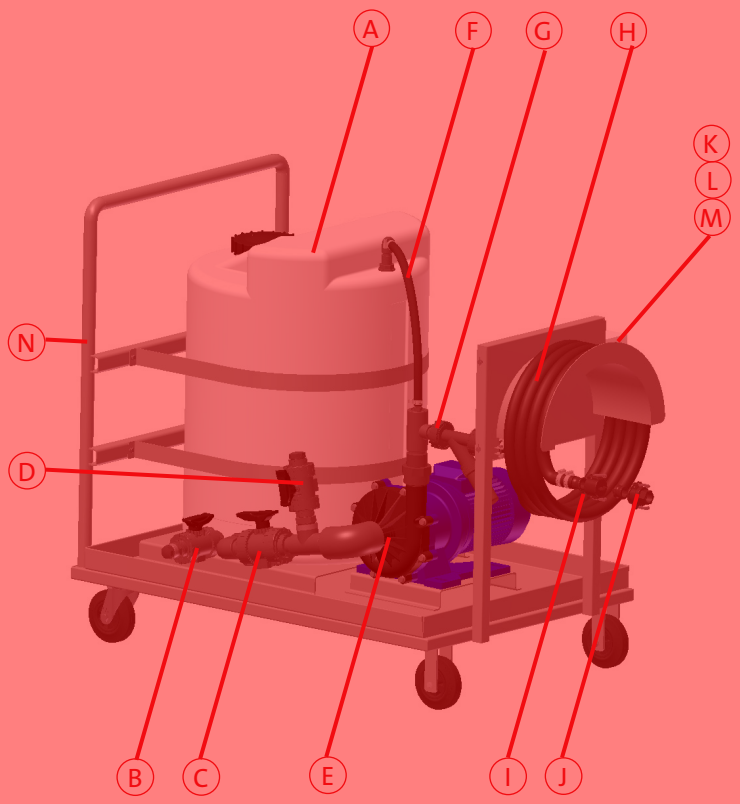
3. HYDROTECH CHEMICAL CLEANING TROLLEY - HCT

3.1 Reception



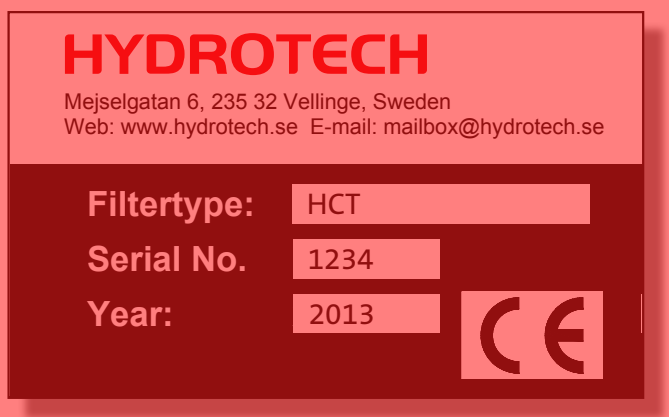
Once the equipment has been delivered and received it must be checked for transport damage. Document any transport damage before further handling of the equipment. The consignment note and manual are attached to the equipment. Check all parts against the consignment note. Some parts may be delivered unassembled. Handle fragile parts with care.

3.2 Storage

Some precautions must be taken to prevent damage to equipment if a long storage time is necessary (several weeks or more).

- ► The equipment should preferably be stored indoors, in a frost-free area.
- ► The equipment must be protected against direct sunlight if stored outdoors. Heat and UV radiation can damage the equipment.

3.3 Overview of components included



A. Container for chemicals
B. Drain valve
C. Shut-off valve
D. Flush valve (for connecting external flushing water)
E. Pump
F. Evacuation hose for venting
G. Pressure relief valve
H. Hose
I. Camlock coupling (male) with protective cap
J. Camlock coupling (female) with stopper
K. Connection box
L. Signal cable
M. Power cable
N. Trolley

Figure 3.1 *Components included*

3.4 Identification of equipment

Filter type, serial number and year of manufacture are stated on the marking plate. The filter type and serial number are also stated on the front of this manual.

NOT APPLICABLE
REFER TO GA DRAWING

Figure 3.2 *The rating plate for the equipment.*

4. START UP AND OPERATION

The equipment may be used only by authorised personnel with the appropriate protective equipment.

4.1 Chemical cleaning products

Long-term clogging of the filter media can be caused by iron, calcium or organic fouling, among other things. This clogging can normally be removed through chemical cleaning. Three proven products that do not affect the life of the filter media are dilute hydrochloric acid (HCl), dilute sodium hypochlorite (NaClO) and dilute sodium hydroxide (NaOH).

The use of other types of cleaning agents can cause damage to equipment.

4.2 Filling of containers

The chemical cleaning trolley HCT is equipped with a 150 l container (see Figure 3.1). Care must be exercised when filling the chemicals in the container since some of the chemicals that must be handled are corrosive. When filling the chemicals, use the barrel pump or fill via the bottom valve in the chemical storage tank (see Figure 4.1). Check and ensure that the drain valve, shut-off valve and flush valve are closed before starting to fill the chemicals.

Only pre-diluted chemicals may be used in the chemical cleaning trolley container.

Figure 4.1 *Storage tank for chemicals with barrel pump and bottom valve.*

The cleaning products must not be mixed. If, for example, HCl and NaClO are mixed this produces toxic chlorine gas. HCl and NaOH are highly corrosive. For safety advice, see applicable local regulations.

4.3 Start up and operation

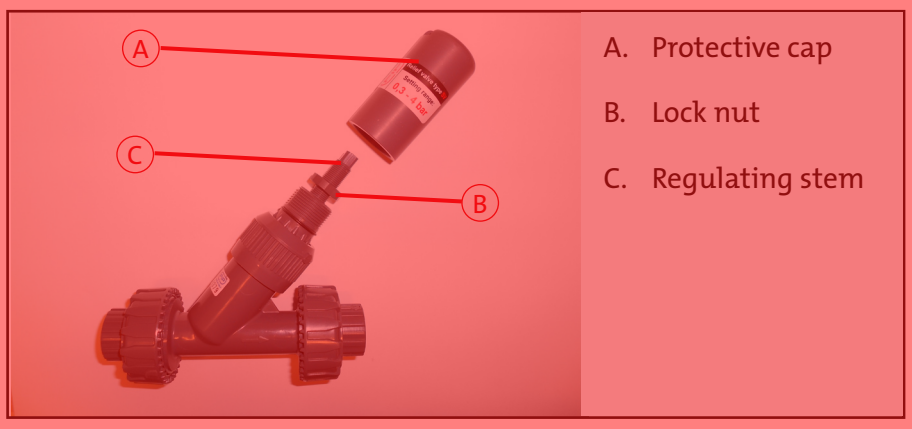
1. Place the chemical cleaning trolley on a flat/stable surface by the filter to be cleaned and lock the brakes on the two rear wheels of the trolley.
2. Mark out the risk zone in accordance with section 2.6
3. Check that the shut-off valve, drain valve and flushing valve are all in the closed position.
4. Make a visual check of the hoses and pipe system for any damage/leaks.
5. Connect the hose to the chemical connection on the filter and check that there are no kinks/blocks in the hose.
6. Check that the chemical container is filled with sufficient volumes of cleaning chemicals for the intended number of cleaning cycles. (Contact Hydrotech if you do not have the relevant information for the filter model in question.)

The liquid level in the chemical containers must always be above the pump inlet to avoid the pump running dry. If the pump runs dry, this may lead to serious damage to the pump.

7. Connect the signal cable to the filter control cabinet.
8. Plug in the power cable.
9. Mark the cables and hoses as in section 2.6
10. Open the shut-off valve and make a visual check of the system for any damage/leaks. In the event of any damage/leaks they must be rectified and the cleaning cycle interrupted.
11. Select the number of cleaning cycles to be carried out and start the cleaning cycle on the filter control cabinet (see instructions in the relevant filter manual/control manual).
12. Check the rotation direction of the pump. The pump rotation must be clockwise when seen from the pump motor fan. The correct rotation direction is indicated by an arrow on the pump type plate. If the rotation direction is incorrect, it must be rectified and the cleaning cycle interrupted.
13. After the cleaning cycle is completed, close the shut-off valve.
14. Plug in the pressurised external flush water to the flush water valve.
15. Open the flush valve and check the system for leaks. In the event of any leaks, they must be rectified and the cleaning cycle interrupted.
16. Flush the system until all cleaning chemicals have been removed from the pump, down-stream pipe system, hoses and the filter chemical unit.
17. Close the flush valve and disconnect the external flushing water.
18. Disconnect the hose from the filter chemical connection and replace the protective cover on the hose.
19. Disconnect the power cable and signal cable.

The protective cap on the hose must always be in place when moving the chemical cleaning trolley.

4.4 Adjusting the pressure relief valve



The Hydrotech chemical cleaning trolley is equipped with a pressure relief valve. This is installed in the pipe system on the pressurised side of the pump. The pressure relief valve is adjustable between 0.3-4 bar back pressure and is used to avoid the cleaning chemicals from flowing through the system by gravity, if the filter chemical unit is at a lower level than the liquid level in the trolley's chemical container. If the pre-set back-pressure needs to be adjusted this can be done by removing the protective cap (A) on the pressure relief valve and then loosening the locknut (B) to enable the back-pressure to be set using the regulating stem (C). When the regulating stem has been adjusted to the desired position, the regulating stem (C) is locked with the locknut (B) and the protective cap (A) is refitted.

Before any maintenance work is carried out, the signal cable from the filter control system and the power cable must be disconnected. The tank and the pipe system must be drained and flushed with clean water toensure that no chemicals are left in the system.

NOT APPLICABLE

5. FUNCTION

5.1 Intended use

The equipment is designed and manufactured for the chemical cleaning of filter media in Hydrotech filters. The equipment may only be used with Hydrotech filters and control systems.

5.2 Non-intended use

Unless approved in writing by Hydrotech, no other cleaning chemicals may be used than those described in this manual.

5.3 Functional description

A concise description of the function is given below.

1. Cleaning chemicals are gravity fed from the container to the pump, which then pressurises the system.
2. The cleaning chemicals are pumped into the filter chemical unit through the chemical cleaning trolley's pipe system and hose.
3. The cleaning chemicals are applied to the filter media via the nozzles on the chemical unit.
4. The filter media is flushed clean using the filter flush water pump.
5. After the cleaning cycle is completed, the pump and downstream pipe system (on the chemical cleaning trolley), including the hose and chemical unit, must be flushed clean with external flushing water via the flushing valve.

1 INTRODUCTION

This document provides handling, storage, installation, operation and maintenance instructions for the Hydra-Carb make-up system. The components of the Hydra-Carb are supplied by Veolia Water Technologies Canada (**VWTC**).

To obtain any additional information regarding characteristics or instructions on this equipment, please do not hesitate to contact us.

The system was designed in Canada by:

Veolia Water Technologies Canada
4105, Sartelon
Saint-Laurent, Qc.
Canada H4S 2B3
Phone: 514-334-7230
Fax: 514-334-5070

For technical support or service needs, for spare parts or to get assistance during your warranty period, you may contact us at the following number during regular business hours or write us at:

Veolia Water Technologies Canada After Sales Support
1-844-SER-VWT9 | 1-844-737-8989 | vwtservicecanada@veolia.com

Our business hours are from
Monday to Friday
8:30am to 5pm EST

2 SAFETY

2.1 INTRODUCTION

It is important that the operator has understood the instructions of use, security and maintenance before using the Hydra-Carb system. The manufacturer cannot be held responsible for use or improper maintenance resulting from a breach or non-compliance with instructions. The Operation and Maintenance manual contents must be kept permanently close to the system in a safe place.

It is important for Operations and Maintenance individuals to understand the nature of the products they are working with.

The safety rules and guidelines issued to the operators are the primary precautions that are necessary for the prevention of accidents. The operators should be very familiar with these rules. The safety pictograms used in the plant are to be respected at all times.

Operators should always wear the safety equipment that is provided or required by their management. Such items as hard hats, safety shoes, safety glasses, gloves, breathing protection, protective clothing, protection harness and hearing protection are very basic and go a long way in preventing accidents.

Operators should be aware of the location of eye wash stations, safety showers, self-contained breathing apparatus, first aid stations, and other safety equipment furnished for the plant.

Good housekeeping will also eliminate safety hazards such as tripping or slipping. When spills happen, the floor should be cleaned as soon as possible.

2.1.1 Utility Hazards

Utility hazards exist on a system including high-voltage electricity, pressurized water, and high pressure air. Care should be taken when utilizing this system.

2.1.1.1 Electrical

Electrical connections must be made by certified electricians in compliance with all applicable codes and regulations. Electrical equipment should never be worked on unless it is turned off and locked and tagged out. The lockout system key should belong to the person doing the repair or the on-site electrician. This will remove the potential danger for electrical shock or accidental start-up.

Even though most electrical motors and switch boxes are designed to be water tight, the presence of water around electrical equipment always presents a hazard and therefore should be used with care.

2.1.1.2 Pressurized Water

Only the proper pressure fittings should be used in the piping system. Leaks should be repaired as soon as possible. Isolation valves on piping that are being repaired should be shut tight and locked out. Lock out the water inlet and remove pressure before starting any maintenance.

2.1.2 Equipment Hazards

2.1.2.1 Rotating Parts

<u>General instructions</u>

Since the system includes equipment with rotating parts (Volumetric dosing screw and homogenizer agitator), operators should avoid wearing loose clothing and jewellery. Loose clothing can present one of the biggest safety hazards that exist when working near equipment in process.

<u>Volumetric dosing screw</u>

- Never introduce hands into a running dosing screw.
- Never open the inspection hatch when the dosing screw is running.
- It is however necessary fitting upstream the machine a fix safety grid or a hopper high enough to prevent damages to limbs according to the Machine Directive inforce. The same approach is necessary for the outlet: it is required using a vertical outlet or similar systems meant to prevent foreign bodies from entering the machine and cause damage to it, to persons or to their limbs. Always ensure the Machine Directive in force is being followed.
- Lock out the system before starting any maintenance.

<u>Homogenizer agitator</u>

- Never introduce hands into a running homogenizer agitator.
- Never open the inspection hatch when the blending tool is running.
- Lock-out the motor starter before starting any maintenance.

2.1.2.2 Operation and Maintenance

The system in its normal use can present a hazard if not operated or repaired in a safe manner.

All equipment should only be operated and repaired according to the recommended procedures of the manufacturer, and by qualified individuals.

Only recommended spare parts should be used.

Maintenance on pumps, piping, etc. should be performed only after valves are locked and tagged or slip blanks are installed to completely isolate the equipment being worked on. Instrumentation and controls should always be kept in good working order to help assure the safe operation of equipment. Never remove instruments or controls out of service until having communicated with the operator and have established a plan to define the operation maintenance steps. If air operated valves are used for isolation, the air line should be removed to prevent inadvertent operation of the valves. When possible the valve can also be locked in position.

When maintenance is finished on equipment, the protective caps provided must be reinstalled. If a protection must be left off, unwary personnel should be notified by using safety pictograms or installing temporary protection. Equipment should never be inspected or maintenance attempted while the equipment is operating. All pumps and various automatic valves may cause harm to an operator if care is not taken.

2.1.3 Product Hazards

Activated Carbon Material Safety Data Sheets (MSDS) should be available close to the system.

All plant personnel should be required to wear proper protective clothing when handling or working near these products. A minimum wardrobe should include, but not be limited to, a plastic hard hat, coat, boots and gloves of a resistant material as well as a pair of safety glasses.

Hazardous Environments

Hazardous environments are areas where flammable liquids, gases or vapors or combustible dust exist in sufficient quantities to produce an explosion or fire. In hazardous environments, specially designed equipment and special installation techniques must be used to protect against the explosive and flammable potential of these substances. (OSHA Publication 3073).

Presence of activated carbon powder implies a classified area around the Hydra-Carb system. The area classification is **Class 2 Division 1 Group F**. Every equipment used within that perimeter must be approved for for safe operation in Class 2 Division 1 Group F locations.

3 SHIPPING

Most of the equipment and material for this project will be drop shipped from **VWTC** facilities and delivered directly to the site.

- All items delivered will be clearly identified with **VWTC**'s name, **VWTC**'s project name, **VWTC**'s project number.
- All shipments will have a clear Packing List identifying all parts in the shipment.
- All equipment will be tagged with the corresponding tag numbers shown on the design drawings (if applicable).

If there are more stringent requirements in the contract documents, they will take precedence over the above. If any of these requirements are not being followed, please notify the **VWTC** Project Manager immediately.

4 RECEIVING

The condition of all delivered equipment must be verified by the responsible party upon arrival at site. Verification that all equipment has been delivered as per contract must also be done upon arrival at site. Notification of missing or damaged items must be sent to Veolia Water Technologies Canada within five (5) working days of receipt of equipment. If there is no documented notification of missing or damaged parts within five (5) working days, Veolia Water Technologies Canada is not responsible for replacement of any items found to be missing or damaged at the time of installation and start-up of the supplied equipment. It is the responsibility of the party receiving the equipment to ensure all packaging is opened at the time of receipt to uncover and document any and all damages to the Freight Company and Veolia Water Technologies Canada.

Photographs and written documentation should be provided for all damaged equipment.

5 HANDLING

5.1 GENERAL

Equipment will arrive at the project site in several different shipments, from various freight companies and in several different packaging containers. Typically a flatbed truck is used which requires a fork lift or a crane to remove the items.

The Contractor is responsible for unloading and handling the equipment.

5.2 STAINLESS STEEL MATERIAL HANDLING

In order to minimize potential corrosion damage or unsightly surface marking, measures shall be taken to prevent contamination by iron, aluminium, copper, chlorides, and sulphides from lifting equipment. Stainless steel slippers or wooden packers should be used on forklift trucks to prevent contamination. Any resultant incidental contamination shall be removed at the earliest opportunity.

6 STORAGE

6.1 GENERAL

The following instructions outline the duties and responsibilities of the responsible party for equipment storage. The responsible party shall assume responsibility for the equipment upon arrival at the project site. These instructions shall define the minimum expectations for storage of all equipment. While this storage specification takes into account common environmental issues that may affect the system during storage, common sense should be the overriding factor in determining the best method to ensure the integrity and proper storage of the **VWTC** equipment.

For contractual purposes, **VWTC** demands the Client to send pictures of major equipment once it is placed in storage, any time it gets moved during storage and again prior to removing from storage. For outside storage, pictures must be sent every month. Alternatively, a written document (check list, etc.) confirming that proper storage conditions are maintained will suffice. Failing to do so would cancel the proposed warranty.

Should it be necessary to delay installation and subsequent operation of a unit for more than one month from date of receipt at Site, special precautions must be taken.

Although some equipment can be stored outdoors, indoor storage is preferred for most equipment.

The storage environment into which a system is placed can have a severe effect on the long-term usefulness of some parts. Key environmental factors are:

- Temperature
- Relative humidity
- Pollutants

Air may contain excessive moisture, pollutants, microorganisms, and other particulates that accelerate the deterioration of some materials. Humidity and pollutants can produce an aggressive atmosphere.

Indoor storage refers to storage in a climate controlled environment in a clean, non-aggressive, dry (non-condensing) and sheltered environment having a relatively constant temperature (especially for gear reducers, motors, bearings, etc.). Storage volume depends on the size of the project.

The environmental indoor conditions should not exceed the following ranges:

Min/Max Temperature Range between:	5°- 40°C
Relative Humidity (RH) Range between:	35% - 70%

1. Equipment should be stored in such a manner that it is free from allowing insects/rodents etc. from entering the equipment.
2. Cover the equipment with a tarp or similar protective shield to prevent direct exposure to dust or any other contamination. However, never enclose the unit or components totally in plastic covers; always leave adequate ventilation of air to prevent condensation.

Equipment must be checked on a weekly basis for tarp/wrap integrity and accumulation of dust or contaminants.

To avoid damage, do NOT stack crates.

To avoid damage, do NOT stack enclosures.

Do not store equipment or spares parts in barns, equipment sheds, or any other building without the capacity for heating and cooling as needed.

6.2 STAINLESS STEEL MATERIAL STORAGE

Stainless steel materials and products shall be stored separately from carbon steels and nonferrous materials. Materials should be stored under conditions that minimise the accumulation of dust and deposits. Any resultant incidental contamination shall be removed at the earliest opportunity.

6.3 SPECIAL MAINTENANCE REQUIREMENTS DURING STORAGE

After three (3) months of storage, long term storage methods must be applied to the unit including complete fill with lubricant. Protect machined surfaces and rotate shafts periodically (every month). Five (5) complete rotations of the output shafts are recommended each time.

Periodic checks should be made to ensure that no rusting or other damage has occurred. Should such be noted, corrective action should be taken immediately. Prior to putting the unit into service, drain lubricant and refill to the proper level as determined by the mounting position. Refer to manufacturer documentation.

All motors must be run every 3 month as a preventive measure against the formation of corrosion.

6.4 EQUIPMENT CLEANING

VWTC is not responsible for cleaning of any equipment prior to installation and start-up due to the storage of the equipment. This is the complete responsibility of others.

7 HYDRA-CARB DESCRIPTION

7.1 ACTIVATED CARBON DOSING – GENERAL

The activated carbon goes through the following steps prior to being dosed to each injection points (usually in Actiflo® injection tanks):

- Storage in bulk bag above feeder/hopper and eductor assembly.
- Metering on a dosing screw.
- Dilution to the proper concentration for effective transportation in conveying pipes via hydro-eductor.

Activated carbon is a critical component of the Acticarb® system and activated carbon addition is required to maintain the concentration in the basins between the recommended values.

In normal operation, the activated carbon is dosed on an automatic basis, in respect of treated volume by each Actiflo® unit.

7.2 DESIGN SUMMARY

7.2.1 Datasheet

Refer to the Detailed Technical Documentation section of the Operation and Maintenance Manual for the activated carbon dosing system datasheet.

7.2.2 P&ID

Refer to the Process and/or Detailed Technical Documentation section of the Operation and Maintenance Manual for the activated carbon dosing system drawings.

7.2.3 General Arrangement Drawings

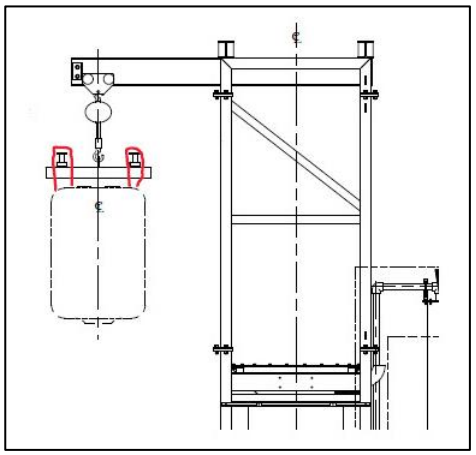
Refer to the Process and/or Detailed Technical Documentation section of the Operation and Maintenance Manual for the activated carbon dosing system drawings.

7.3 COMPONENTS DESCRIPTION

The components of the Hydra-Carb system provide two main functions:

- Dry activated carbon storage and dosing
- Activated carbon dilution and transfer to the injection tank

7.3.1 Activated Carbon Storage and Dosing



7.3.1.1 Hopper with Big Bag Unloader

The Hydra-Carb system comes standard with a 2000 lbs big bag frame/support. It may be configured with a hoist and trolley or with a special frame for forklift loading. Each big bag unloader includes four (4) strap hooks that raise the big bag to the activated carbon dosing system. A manual gate (plate) allows the discharge of the activated carbon to a storage hopper.

Hoist and Big Bag Manipulating Instructions (if applicable):

Refer to the figure on the right

- The lifting yoke is attached to the hook of the hoist.
- The lifting yoke is brought above the big bag. The center of the lifting yoke needs to be positioned right above the center of the big bag to prevent any swinging of the load when the big bag is being lifted.
- The 4 lifting loops of the big bag are placed around the 4 strap hooks of the lifting yoke.
- The operator raises the lifting yoke slowly, stops when the lifting loops are stretched and checks that the 4 straps are correctly positioned.
- The lifting of the big bag can be performed safely.

7.3.1.2 Volumetric Feeder

A volumetric feeder doses a dry material at a constant rate. It includes a homogenizer agitator installed in a hopper for a better material flow. The feed screw is made of stainless steel 304. The feeder includes, at the outlet, a T nozzle which directs the flow of the material, allows for isolation of the dosing screw, and has an inspection window where the product dosing can be observed. The feeder contains a level switch, preventing the volumetric feeder from running when empty. A transition hopper is optional. It can be integrated with the volumetric feeder. It is made of stainless steel 304 and has a capacity of 100 L.

The feeder is also composed of a plunger which closes the T nozzle (at the exit of the metering) of the hopper. The operation of this device is controlled by a 4 way service solenoid valve that allows a flow of water to the cylinder.

7.3.2 Activated Carbon Dilution and Transfer to the Actiflo® Injection Tank

7.3.2.1 Isolation Valve

An isolation ball valve is placed at the entry of the system to close the water inlet to the Hydra-Carb.

7.3.2.2 Solenoid Valves

Two solenoid valves are placed in the system.

The first valve (*activated carbon service water valve*) monitors the pressure of the inlet to the service water line. It has three (3) main functions:

- Supply motive water to the eductor.
- Supply water tangentially to the conical hopper to impart a rotating flushing action around the cone (“toilet bowl” principle).
- Supply a perpendicular water jet to stop the rolling action of the first line after it has done one full round (optimal concept).

When the switch detects a fault, a switch commands the solenoid valve to close.

The second valve (*activated carbon output valve*) is a 4 way service water valve which function is to open or close the hydraulic (water operated) piston at the discharge of the screw.

The piston is open in operation to allow activated carbon to discharge/drop into the conical hopper.

The piston is closed (using water pressure) when system is not in function to seal the screw discharge portion and prevent moisture from entering the zone. Note: Water pressure required to seal is less than minimal pressure required for the system.

When piston is in open position or when piston is in closed position, water exhausts via the solenoid body through the conical hopper.

7.3.2.3 Service Water Low Pressure Switch

If pressure is lower than required, there will not be enough vacuum created at the eductor and will cause the conical hopper to overflow. The pressure switch activation will trigger an error message and close the service water inlet valve if the inlet pressure is below its set point.

7.3.2.4 Pressure Gauge

The gauge is used to read the service water inlet pressure.

7.3.2.5 Conical Hopper and Eductor

The hopper is a device that mixes the metered activated carbon with water and prevents material accumulation in the cone at the feeder output. It includes a tangential inlet to the cone and a perpendicular water jet that are controlled by two (2) manual metering ball valves. It is very important to have the right amount of flow from this inlet into the cone to avoid having too little flow and a resulting accumulation of product. However too much flow is also an issue, as it can cause water to splash up out of the cone and into the T Nozzle.

An eductor, installed at the bottom of the conical hopper, draws the activated carbon into the water flow through the system.

7.3.2.6 Check Valve (and On-Off valve positioned upstream)

The check valve is required to prevent water in the downstream line to flow back through the conical hopper and flood it, when the dosing operation stops. The device is carefully selected to be resistant to abrasion. The check valve is installed as an extra security measure for the actuated on-off valve positioned upstream in case of power outage or malfunction. For some configuration (i.e. pipe runs downward towards the injection point), the check valve is not needed.

7.3.2.7 Level Switch

A level switch is installed in the hopper to signal the operator and stop the system when the level of activated carbon becomes too low.

7.3.2.8 Control Panel

A control panel allows the fully automated system operation. It also allows the transmission of alarm signals to an external system.

8 INSTALLATION

8.1 SERVICE WATER

The Hydra-Carb system needs a clean water supply. The installer must connect the water supply as indicated on the general arrangement drawing.

8.1.1 Flowrate and Inlet Pressure

The required flow and pressure indicated on the technical data sheet are important to ensure proper system operation. These conditions must be met as a requirement for starting a dosing sequence. When setting these inlet water standards, the dynamic head losses have to be taken into account. Non-compliance can lead to overflows at the conical hopper or plugging of the conical hopper due to improper blending. Inlet pressure is not to exceed 120 psig working pressure and must exceed 80 psig.

8.2 RECOMMENDED ARRANGEMENT

The installation should be performed by qualified personnel.

Select a location providing:

- An easy access to the system and an easy activated carbon bulk bag handling.
- At least a clearance of one meter in front of the electrical panel.
- At least 72 inches of clearance behind the feeder for the maintenance.

It is recommended:

- To do not install equipment in areas of extreme heat, cold, dust or humidity. Avoid areas where objects or fluids can drop from overhead. Units are to be installed as close to the point of application as possible.

After selecting the optimal location, the installer will:

- Unpack the components.
- Install the dosing frame/structure on a sturdy level surface. Fasten to prevent movement.

8.3 PIPES CONNECTIONS

The installer has to connect the following pipes:

- Service water inlet.
- Interconnecting pipes between the dosing system and the injection tank. (The dosing system should be located as close as possible from the injection tank to reduce at the maximum the interconnecting pipe as shown on the General Arrangement drawing. Any extension of the pipe could bring an additional backpressure on the eductor and change its performance).

8.4 ELECTRICAL REQUIREMENT

Electrical connections and maintenance must only be performed by qualified personnel. Electrical elements have to be connected according to local regulations. The Hydra-Carb system is usually provided with its own control panel.

If not, the electrician has to connect:

- Screw feeder motor and homogenizer agitator motor to the control panel
- Cables of instruments to the control panel

In any cases, electrician has to connect main power supply to the control panel.

It is recommended to ground the dosing system frame.

9 INSTALLATION AND PRE START-UP INSPECTION

9.1 PRE-OPERATIONAL CHECKOUT

Included in appendices of this manual are standard **VWTC** checklist forms to be completed by the installer and returned to **VWTC** project manager prior **VWTC** onsite installation inspection. **VWTC** will schedule our field service visits prior to return of completed checklists but it is our policy to not dispatch field personnel to the jobsite until the completed and signed checklist is received by our project manager or field service manager.

9.2 START-UP CHECKOUT

9.2.1 Mechanical, Electrical and Control Start-Up

The mechanical and electrical start-up of the activated carbon dosing system includes the connection, verification and inspection of the following elements:

- Mounting
- Motors
- I/O Check
- Tubing and process connections
- Power connections and supply
- Valves
- Instrument calibration

9.2.1.1 Initial Checking and Adjustment

Prior to calibration the following elements will be verified:

Automatic Activated Carbon Dosing System Installation Checklist

		Date	
		Expected	Realized
☐	Verify unit is properly installed (fastened and leveled) and all process connections are complete.		
☐	Verify feeder & blending tool gearboxes have been lubricated as required in the supplier's O&M manual.		
☐	Verify feeder & blending tool gear reducers have been filled with oil as required in the supplier's O&M manual.		
☐	Verify the unit is accessible from all sides. Unit should not be installed up against walls or in enclosed spaces.		
☐	Verify service water flowrate and service pressure are as required (18.0 m^3/h @ 80 psig min).		
☐	Verify service water temperature.		
☐	Verify service water quality.		
☐	Verify instruments location. Avoid potential flooding.		
☐	Verify tightening of pipes flange.		
☐	Verify frame grounding.		
☐	Verify that the Electrical Panel has been wired with 575 VAC.		
☐	Verify that the communication cable is installed and VWT will be able to communicate between Main Control Panel and Activated Carbon Dosing System Panel.		

Automatic Activated Carbon Dosing System Functional Checklist

		Date	
		Expected	Realized
Hoist and Trolley	Check that the hoist and the trolley operate correctly.		
Feeder	Check whether foreign substances or water have entered the feeder. In such a case, clean thoroughly.		
	Avoid any friction between the metering screw and the body. This requires opening the hopper and removing the T nozzle. Inspecting the screw/auger to be sure that it is flush with the walls of the hopper is very important because removing the material can be difficult and risky.		
	Check that the metering screw rotates counter clockwise when looking from the rear of the drive unit.		
Wetting cone	Check that the wetting cone is completely clean and free from dirt or foreign objects.		
	Check that the water flows tangentially into the wetting cone.		
	Ensure that the water speed is sufficient to create a vortex.		
	Ensure that water speed is not too great to create splashing up into the T nozzle.		
	Check that the metered powder falls vertically in the middle of the wetting cone.		
Eductor	Check that the eductor is completely clean and free from dirt or foreign objects.		
	Check that the service water pressure is 80 psig ± 5 psig in operation.		
Piping	Check that the pipework are completely clean and free from dirt or foreign objects.		
Manual valves	Check that all manual valves are working properly.		
	The globe valve controls the whirl and blending of the powder. Ensure that the flow is appropriate; it should be showing at least 900 LPH on the rotameter.		
Automatic valves	Check that all automatic/electric valves are connected to the control panel.		
	Check that all automatic/electric valves are working at proper times and the limit switches are set.		
Instruments	Check that all instruments are properly calibrated.		
	Check that all instruments are properly installed.		
Pressure switch	Check that the pressure switch works properly by closing the water inlet valve.		
	Check the pressure gauges are working correctly.		
Blending tool agitator	Adjust the motor overload protection to the value shown on each motor nameplate.		
	During start-up, listen for unusual noises and check for excessive vibration.		
	Check the temperature of the motor and the gear reducer. The temperature should not exceed 180°F (82°C).		

9.2.2 Hydraulic Test

Due to the nature of the materials used in the Hydra-Carb systems, it is important that the hydraulic integrity of the system is verified even before the Control Start-Up is performed. The hydraulic inspection and testing is comprised of the following elements:

- Connect all fittings and walk the piping to be sure that the hydraulic pathway meets operational specifications.
- Verify that the service water system is ready to provide water and that the client is ready to accept water into their downstream system.
    - NOTE: this step is of extreme importance as during the construction phase, often communication with other workers is complicated and difficult. Be sure that you yourself check the discharge point and that no one is working in the area and that all risks are mitigated.
- Briefly allow water through the system by manually operating the valves. Check for leaks. Provided no leaking or loose connections are found, continue to the next step.
- Walk the Hydra-Carb to verify that all tubing fittings are tight, that the T nozzle plunger is pulled back, and that the whirl in the wetting code is adequate.
    - NOTE: this step is of importance. If the whirl of the conical hopper is not adequate, then the conical hopper may clog with activated carbon and the clean-up will take time.
- Stop the system and do a final walk-through of all hydraulic and mechanical integrity.

9.2.3 Control Start-Up

The control start-up for the activated carbon dosing system include; connection, verification and inspection of the following elements:

- The alarms, start-up and shut down of the motors.
- The transmission of the electric signals of the different components as well as their configuration parameters if needed.
- The pumps alarm transmission to the plant system.
- I/O verification of instrumentation.
- Sequencing.
- The proper functioning of the electrical and process alarms.
- The variable frequency drives connection.
- The control panel.
- Other elements of control, if required.

Start-up and shut down sequencing will be checked:

- Normal start and stop sequencing.
- Alarms stop sequencing.
- Clearing alarms and restarting the process.

9.2.4 Process Start-Up

Once the mechanical, electrical, hydraulic and control start-up of the preparation system have been completed, the equipment commissioning can begin. The following steps will be performed.

9.2.4.1 Screw Calibration Procedure

Tests will be performed using water for the initial testing and the specific product for the final test.

- Calibration of the dosing screw at minimum, full range and intermediate speeds to set the functional output curve.
- Dosage settings.

9.2.4.1.1 Dosage Calculation

Dosing is continuous with the dosing screw and the required dosing flowrate is adjusted using the VFD of the dosing screw motor. The calculation of the dosage percentage is done by integrating calibration values retrieved from the dosing screw.

$$\mathbf{(QP_{PAC}) = (CF_{PAC}) * (Q_{RW}) \ / (SG_{PAC}) * 1000}$$

Where:
QP_{PAC} = Required PAC Dosing Flowrate (L/h)
CF_{PAC} = Required Chemicals Concentration in the process (mg/L)
Q_{RW} = Raw Water Flowrate (m3/h). Process Value given by the inlet raw water flowmeter.
SG_{PAC} = Chemical Specific Gravity (kg/L)

Formula below gives reference speed for activated carbon volumetric dosing screw, in percentage. Screw calibration must be done in order to get a linear speed curve, depending on screw capacity.

$$V_d = 20 + \left[\left(\frac{60}{C_{80} - C_{20}}\right) \times (C_m - C_{20})\right]$$

V_d: Activated carbon volumetric dosing screw per Actiflo® (%)
C_m: Dosing flow (mass) ($C_m = \mathbf{QP_{PAC}} \times \mathbf{SG_{PAC}}$) (kg/h)
C_{20}: Dosing flow (mass) measured at 20% of screw speed (kg/h)
C_{80}: Dosing flow (mass) measured at 80% of screw speed (kg/h)

Variables C_{20} & C_{80} are entered on the operator interface and are common for both Actiflo® units.

9.2.4.1.2 Feeder Capacity

The feeder capacity must be checked by weighing the discharged amount of activated carbon/time.

The operator must repeat four (4) times the following procedure:

- Hold a sample shovel just under the outlet of the dry feeder.
- Then turn the switch for FEEDER to position H for a specific time.
- Weigh the contents in the sample shovel.

EXAMPLE:

Obtained value 2000 g/20 sec = 6 kg/min = feeder capacity

This dosing time is set on the interface. Record the test procedures and test results/settings within the manual.

9.2.5 Process Start-Up Records

The personal in charge of the commissioning will furnish inspection sheets for equipment including:

- Project name
- Tag number and description
- Manufacturer
- Model and serial number
- Date, time and person who will perform calibration
- Calibration data to include:
  - Input, output and error at minimum, intermittent and maximum output range
- Space for comments
- Certification by installer and acknowledgment by contractor and date
- Adjustment of the service water flow rate and pressures (if required)

10 TROUBLESHOOTING GUIDE

COMPONENT	ISSUES	POSSIBLE CAUSES	ACTION
SERVICE WATER INLET	Service water low pressure.	Service water feed system low pressure.	Inspect service water system and booster pumps (if applicable).
		Obstruction.	Clean pipes.
CONICAL HOPPER	Clogging of the conical hopper.	The feeder shutter at the outlet of the feeder is not shut.	Check the function of the solenoid valve to the feeder shutter, or clean the shutter from possible activated carbon clogging.
		The water whirl in the conical hopper is too small.	Check water pressure.
FEEDER	Feeder does not run.	No power to the feeder.	Check the button or the on / off switch of the machine is turned on.
			Check that the isolating switch is in the on position.
			Check that the inverter is not set to 0 Hz.
			Check if there are short circuits, blown fuses or tripped breakers.
			Check that the power supply corresponds to control and motor requirements.
			Check if there are error messages in the drive controller screen.
	Feeder screw or agitator is damaged.	Foreign body inside feeder.	Remove foreign body and replace damaged components
	Feeder screw or agitator stops.	Hygroscopic material inside feeder has absorbed humidity.	Unload feeder completely when shutting down for long periods.
	Feeder – Rotating components unscrewed, no material handled.	Motor incorrectly wired.	Rewire (metering screw must turn counter clockwise when viewed from behind drive unit).
	Feeder – Sticking of hygroscopic products; Agglomeration of viscous materials; Contamination of the product.	Long shutdown period.	Unload feeder completely when shutting down for longer periods.
	Feeder makes scraping or grinding noise.	Foreign body inside feeder. Poor alignment of gearbox, hopper wall welding.	Visually inspect the hopper and the level of the auger by removing the T nozzle.

11 MAINTENANCE

Any manipulation of metering equipment and activated carbon should be done by qualified and trained personnel. Refer to product MSDS for safe material handling.

ITEM	DESCRIPTION	WEEKLY	MONTHLY	BI-MONTHLY	YEARLY	COMMENTS
PIPING	Check for leaks.	X				
	Rinse pipes with lukewarm water.				Every 6 months	
LEVEL TRANSMITTER	Calibrate on a regular basis and / or when readings become inaccurate (specific to each type of use).				Every 6 months	
FEEDER	If the feeder uses MBTX, MBTN or MBTT type shaft seals, check these on a monthly basis to make sure they are in good working condition.		X			Grease monthly
CONICAL HOPPER	Inspect the cone for the presence of activated carbon agglomeration. In case of loss of suction, remove and clean eductor with hot water. Inspect weekly to ensure that there is no accumulation of activated carbon or fouling and, if necessary, clean by draining the cone and the eductor with water.	X				
VALVES	Inspected and clean if required. Refer to supplier's maintenance manual.				Every 6 month	
DOSING SKID FRAME OR BIG BAG UNLOADER	Check the appearance of the structure, paying particular attention to the state of welds.		X			
	Check that all bolts are correctly tightened, in particular the vibrator fixing bolts.		X			

12 SPARE PARTS

It is highly recommended to keep in stock spare parts in sufficient quantity for all critical components to the proper functioning of the system.

Only the use of original Veolia spare parts will ensure proper and reliable operation of the system.

When ordering a spare part, please give the following information:

- Veolia's project number
- Veolia's project name
- Part number

Installation & Maintenance Record 17

Safety Checklist

- **Confirm chemical compatibility** of product being stored with that of the polyethylene tank and fittings.

- **Vent tanks** as required to prevent pressure or vacuum from developing as the tank is filling or emptying. Unrestricted (no screen) vent size must exceed size of tank's largest inlet or outlet nozzles by one inch. With exceptionally high rates of intake or discharge, larger vents could be required. If tank has two inlets or outlets, add the size of the two nozzles together to determine the minimum vent size. Screened vent size must exceed size of tank's largest inlet or outlet nozzles by two inches.

- **Prevent excessive heat near or inside the tank.** Polyethylene tanks are designed for a maximum continuous temperature of 120°F for Linear Polyethylene and 150° for Cross-Linked Polyethylene.

- **Have and use Material Safety Data Sheets** (MSDS) for the product being stored.

- **Regard tanks as confined spaces.** Follow proper entry procedures.

- **Make sure ladders are properly secured,** top and bottom. Allow only one person on a ladder at a time.

- **Avoid standing and working on tank domes.** The surface is flexible and slippery. There is no weight or load rating for the dome.

- **Do not move tanks while holding liquid and never allow personnel under a tank when it is being lifted!**

- **ACO Container Systems Ltd. offers a seismic hold down assembly** for all Zone 4 applications.

Receiving Your Tank

Upon receipt of your tank, INSPECT IMMEDIATELY for obvious defects. Please look for any loose packages containing parts and accessories. Open the packages, inspect and account for all parts against the packing slip. Any damage or discrepancies should be noted on both the driver's delivery copy and your packing list. We urge you to IMMEDIATELY NOTIFY your sales representative of any problems within one business day.

Damaged merchandise or other problems

Failure to report damaged / lost merchandise within the time limitations may mean you relinquish your rights to claim. Always inspect your merchandise on the day you receive it, because damage or loss can occur in transit. Obvious damage should be noted on the freight bill or shipping invoice and the driver should initial the notation. Hidden damage must be reported to the carrier with THREE (3) WORKING DAYS. Any damaged / lost items can be reported to your ACO Container Systems Ltd. Sales or Customer service representative, and we will work to repair or replace the damaged or missing product as quickly as possible.

Return Merchandise

ACO Container Systems Ltd. cannot accept used containers at its facilities for safety and liability reasons.

However, to return unused merchandise and ensure you're receiving proper credit, please do the following:

- Contact your ACO Container Systems Ltd. Customer service representative and obtain an ACO Return Merchandise Authorization (RMA) number. Have your packing slip available for any needed information.
- Use the RMA number on all return shipping paperwork and all correspondence.
- Return the merchandise *prepaid*. Freight collect shipments will be refused.

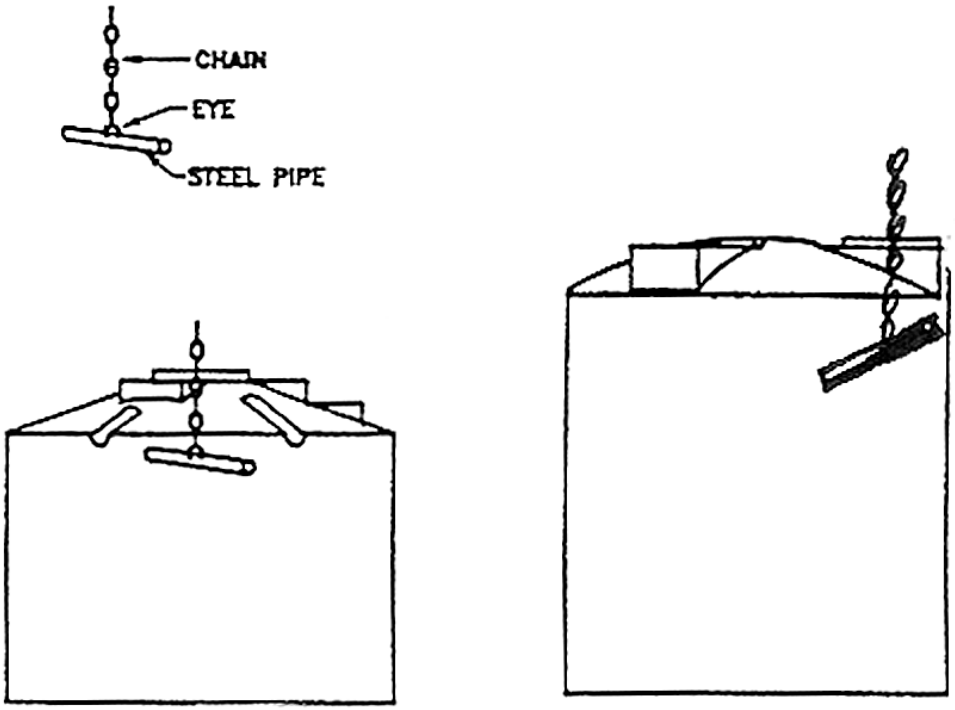
Upon receipt, ACO will inspect the merchandise and issue appropriate credit. A restocking fee may be assessed, particularly on products "made and fitted to order."

Uninstalled Parts

Parts must sometimes be shipped uninstalled to prevent damage in transit. These parts can usually be found bagged or boxed in separate packages. Please check before reporting missing parts.

Unloading Instructions

By Crane using Lifting Lugs:



Use Lifting Lugs (if provided) to lift Tank after standing upright.

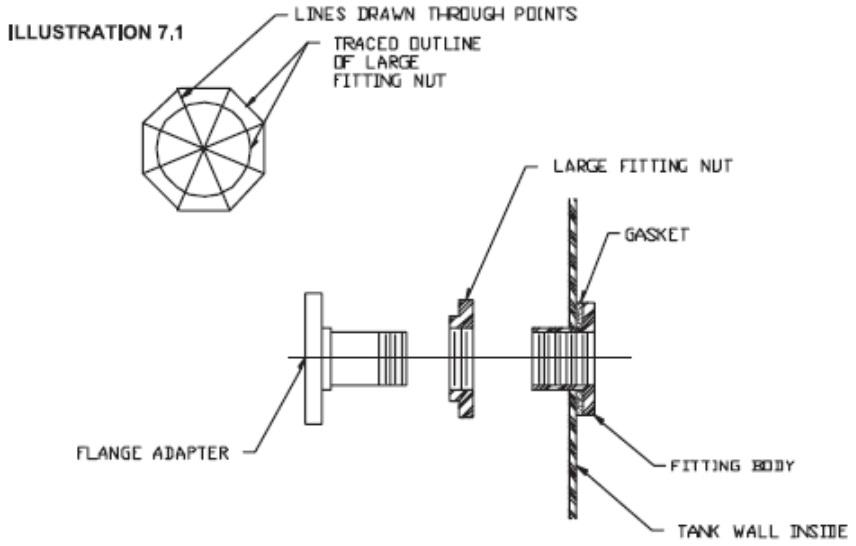
By Forklift:

Make sure the forklift tines are **smooth and free from burrs.**
Use **extended tines** if handling a large tank.
Tie the tank to the forklift mast if there is a possibility of rolling or sliding.

By Crane using Manway:

Use the usual method of rigging and lifting a tank with slings or **use a pipe and chain** in the manway of the tank as shown below: The pipe should be 42″ to 46″ long(no shorter than 42″), and a minimum of 3″ in diameter.

Installation Instructions

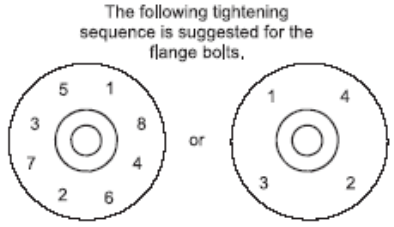


- Retrieve and check the uninstalled parts usually shipped inside the tank.
- Locate the tank on a hard, flat surface. Make certain ongoing servicing will be easy and inexpensive. Protect personnel from chemical danger in the event of a leak and protect the tank from traffic damage and excessive heat. Tanks are designed for above ground use only.
- Utilize adequate secondary containment according to specific chemical danger and governmental and industry requirements.
- Support hoses, piping, and valves using structural support independent of tank sidewall and dome, within 4" of flange.
- Use Teflon tape, paste, or both at all threaded connections. Do not over tighten; threaded connections should be no more than one to two turns past hand tight.
- Flexible connections are recommended to preserve the life of your tank. They allow for tank expansion / contraction and to reduce pump / piping vibration stress on the tank.
- Flange gaskets must be used when mating flanges. It is imperative to use a flange gasket that is a minimum of 3/16" thick and made from an appropriate, compressible gasket material (i.e. EPDM, Viton, Buna or Teflon). Failure to use a proper flange gasket when joining flanges together will void your warranty.
- When mating installed flanges on tank to other flanges, the two flange faces must meet face to face with no gaps or spaces between the two. **A SPACE OR GAP BETWEEN THE FLANGE FACES CAN NOT BE ACCOMODATED BY OVER TIGHTENEING THE BOLTS**! A maximum torque of 15-20 ft. lbs. is to be used when tightening all bolts. Failure to properly join flanges together will void your warranty.
- Fully support the *entire* bottom of the tank on a clean, smooth concrete foundation or in ACO approved metalwork. Make certain no trash of any kind is trapped between the tank and its foundation. **FAILURE TO PROVIDE PROPER FOUNDATION AND SUPPORT CONSTITUTES A MISUSE OF THE TANK AND WILL VOID YOUR WARRANTY.**
- Fill the usable capacity of the tank with water and hydro test for 24 hours after installation, and *before* product is introduced, to ensure tank and fitting integrity.
- Make sure there is an ACO Container Systems Ltd. warning label on the tank.
- All ACO Container Systems Ltd. rotationally molded tanks are manufactured from UV8 stabilized raw material, pigmentation can also be added for further protection against ultra violet rays. For outdoor applications, we recommend using PVC mechanical connections.

EXTREME CAUTION:
Consult Customer Service on any applications where continuous use is above 100°F.

Field Installation of Fittings

Bulkhead Fittings Installation Instructions



1. Remove the large fitting nut from the fitting body. Note that the gasket is located immediately below this nut. The gasket and remainder of the fitting should be set aside for later use.
2. Using the nut as a template, locate the desired position of the fitting. Trace the nut inside and out. Draw a line through the centre of the traced outline from each of the points of the nut (see illustration 7.1). This will locate the centre of the fitting. **Fittings must be installed at an elevation that will prevent interference with tank's inside bottom knuckle radius.**
3. Before drilling, the hole saw should match the Outside Diameter (O.D.) portion of the fitting that must go through the hole in the tank. Drill the tank with a hole saw. Remove any flashing with a de-burring tool and brush away any shavings around the hole.
4. Working from the inside of the tank, slide the fitting body through the hole in the tank. The gasket should be between the back of the shoulder of the fitting and the inside wall of the tank.
5. Install the largest fitting nut on the outside of the tank. Tighten the nut securely; hand tight plus one half turn to three quarter turn. Care should be taken to prevent the fitting body from turning during this process to prevent the gasket from creeping from between the fitting and the tank wall.
6. Inspect the gasket to make sure it has not crept from the shoulder of the fitting. If so, loosen the nut on the outside of the tank and the gasket will return to its original position. Retighten nut carefully.
7. Piping such as a flange adapter should now be threaded into the fitting. Teflon sealant tape or other thread sealant should be applied to all pipe threads. Do not over tighten.
8. **HYDRO TEST THE TANK WITH STANDING WATER FOR AT LEAST 24 HOURS BEFORE PUTTING INTO SERVICE.**
9. **NOTE:** Some bulkhead fittings have left hand threads for the large fitting Nut.

Bolted-Flange Fittings Installation Instructions

1. Disassemble the fittings as shipped. If the holes are not drilled, place the flange against the tank in the desired location and use as a template for drilling the holes. Use either a hole saw the same size as the fittings size or up to a ½" size larger.
2. With the gaskets installed, place the stud bolts through the holes with the plastic head on the inside of the tank, threads on the outside.
3. Place the full face flange gasket over the bolts on the outside surface of the tank.
4. Place the flange over the gasket and stud threads with the hub of the flange facing out.
5. Put a washer and nut on each stud bolt. Be sure to lubricate the threads of the bolts with anti-seize lubricant.
6. Tighten the nuts by pulling down the nuts diametrically opposite each other using a torque wrench. Tighten bolts according to sequence shown in illustration 7.2. Complete tightening should be accomplished in stages. Tighten until the gasket is fully compressed (Approximately 15/20 ft.lbs. for all size flanges)
7. Inspect fitting. Gasket must be compressed and the outer flange drawn down evenly.
8. Piping such as a flange adapter should now be threaded into the fitting. Teflon sealant tape or other thread sealant should be applied to all pipe threads. **Do not over tighten**.
9. Flanges for pipe sizes 4" and larger should be curved to match the outside diameter of the tank.
10. **HYDRO TEST THE TANK WITH STANDING WATER FOR AT LEAST 24 HOURS BEFORE PUTTING INTO SERVICE.**

ILLUSTRATION 7.2

CAUTION: OVERTORQUING WILL DAMAGE THE FLANGE AND GASKETS.

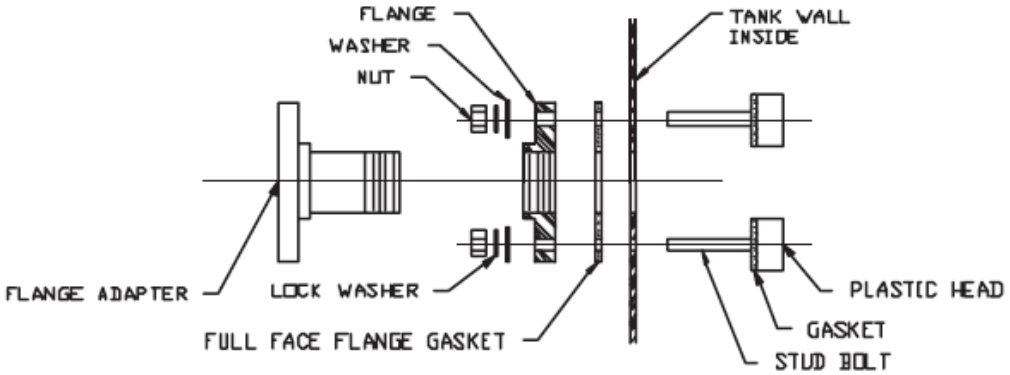


ILLUSTRATION
(F:\DWG\FITTING\ASM2FLG)

Stainless Steel Fittings

1. Disassemble the stainless steel fitting by removing the nuts from the stud bolts. Remove the 1/8" thick stainless steel outer plate. Set the remainder of the fitting aside along with the nuts and washers.
2. Using the outer plate as a template, mark the hole patters on the outside of the tank.
3. Find the center of the large "tank fitting" hole be drawing an "X" through the center of the bolt holes (see illustration).
4. With the drill motor and hole saw, drill out the pipe fitting hole. Please not that the hole to be drilled in the tank may be much smaller than the hole in the outer plate that was used as a template. The hole saw should match the Outside Diameter (O.D.) of the portion of the fitting that must go through the hole in the tank.
5. Next drill out the stud bolt holes using the 9/16" drill bit for fittings with ½" diameter studs or a 3/8" drill bit for fittings with 5/16" diameter studs.
6. Trim any flashing from the holes with a de-burring tool and brush away any shavings around the hole.
7. You are now ready to install the tank fitting. With the gasket on the studs against the back plate of the fitting, install the fitting from the inside of the tank. Slide the outer plate onto the stud bolts that are protruding from the tank wall.
8. Replace the washers and nuts on the stud bolts. Tighten the nuts by pulling down the nuts diametrically opposite each other using a torque wrench. Tighten bolts according to sequence shown in illustration 7.2 on pg. 7. Complete tightening should be accomplished in stages. Tighten until the gasket is fully compressed (Approximately 15/20 ft.lbs. on a torque wrench). **½" nuts should be torqued to 30 ft. lbs., 5/16" nuts to 12 ft. lbs. Be sure to lubricate the threads of the bolts with copper anti-seize lubricant prior to tightening.**
9. Inspect the fitting. The gasket should be compressed and the other stainless steel plate should conform to the wall of the tank.
10. **HYDRO TEST THE TANK WITH STANDING WATER FOR AT LEAST 24 HOURS BEFORE PUTTING INTO SERVICE.**

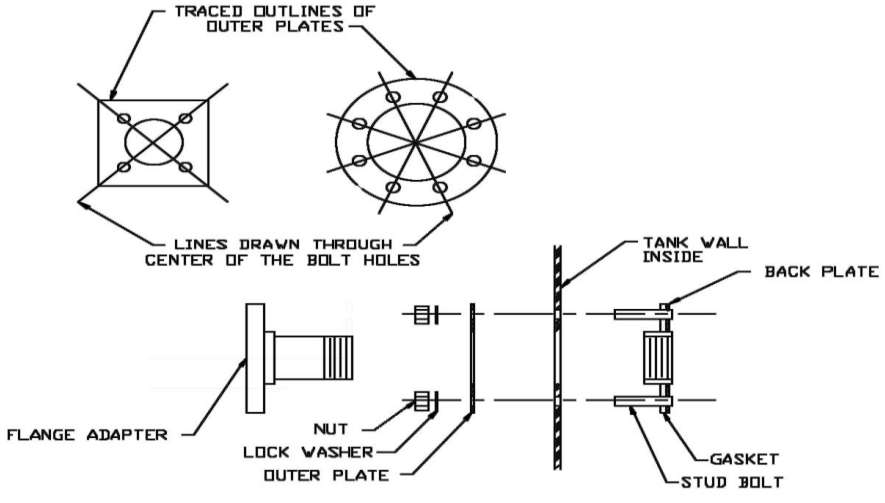


ILLUSTRATION
(F:\DWG\FITTING\ASMSSFTG)

“Universal Dome” Bulkhead Fittings

1. Remove the large fitting nut from the fitting body. Note that the gasket is located immediately below this nut. The gasket and remainder of the fitting should be set aside for later use.
2. Using the nut as a template, locate the desired position of the fitting. Trace the nut inside and out. Draw a line through the center of the traced outline from each of the points of the nut (see illustration) This will locate the center of the fitting.
3. Before drilling, the hole saw should match the Outside Diameter (O.D.) portion of the fitting that must go through the hole in the tank. Drill the tank with a hole saw. Remove any flashing with a de-burring tool and brush away any shavings around the hole.
4. Working from the inside of the tank, slide the fitting body through the hole in the tank. The gasket should be between the back of the shoulder of the fitting and the inside wall of the tank.
5. Install the large fitting nut on the outside of the tank. Tighten the nut securely; hand tight plus one half turn to three quarter turn.
6. Inspect the gasket to make sure it has not crept from the shoulder of the fitting. If so, loosen the nut carefully.
7. Piping such as flange adapter should be threaded into the “ball” of the fitting now. Teflon sealant tape or other thread sealant should be applied to all pipe threads. Piping may not be adjusted to any angle desired within the limits of the fitting.
8. Note, universal ball fittings are adjusted at the factory to provide vertical entry into the tank dome, but are sometimes knocked out of adjustment during transit. If necessary, gently loosen the ball retainer ring located on top of the fitting ball using a spanner wrench, adjust to desired angle, and tighten ring taking care not to over-tighten and crack.
9. For a flanged connection Flange Adaptors may be used.

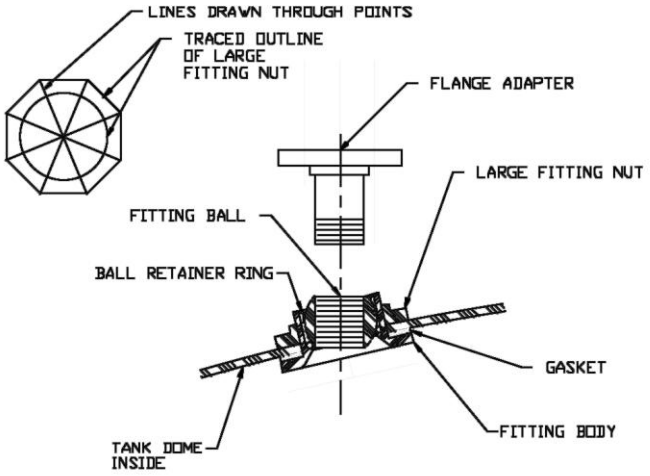


ILLUSTRATION
(F:\DWG\FITTING\ASMUDBS)

"Universal Dome" Flange Fittings

1. Disassemble the fitting as shipped.
2. If the holes are not drilled, place the full face flange gasket against the tank in the desired location and use as a template.
3. Drill the center hole using the proper size hole saw. Hole must be at least ½" larger than the hole in back of the flange in order for ball to turn.
4. Drill the bolt holes using a 9/16" bit.
5. Remove any flashing with a de-burring tool.
6. From the outside of the tank, reach through the center hole and place the threaded end of the stud bolts with their gaskets on them through the bolts on the inside.
7. Please the full face flange gasket over the stud bolts on the outside surface of the tank.
8. Place the flange style universal dome fitting over the stud bolts and the full face flange gasket.
9. Put the washers and nuts on the stud bolts. (Note: Be sure to lubricate the threads of the bolt.)
10. Tighten the nuts by pulling down the nuts diametrically opposite each other using a torque wrench. Tighten bolts according to sequence shown in illustration 7.2 on page 7. Complete tightening should be accomplished in stages. Tighten until the gasket is fully compressed (Approximately 15/20 ft. lbs. on a torque wrench).
11. Inspect the fitting and the gaskets. The gaskets should be compressed and the fitting should be drawn down evenly.
12. Piping such as a flange adapter should be threaded into the ball of the fitting now. Teflon sealant tape or other thread sealant should be applied to pipe threads. Piping may be adjusted to any angle desired within the limits of the fitting.
13. Note, universal dome fittings are adjusted at the factory to provide vertical entry into the tank dome, but are sometimes knocked out of adjustment during transit. If necessary, gently loosen the ball retainer ring located on top of the ball using a spanner type wrench, adjust to desired angle and tighten the retainer ring, taking care not to over tighten and crack.

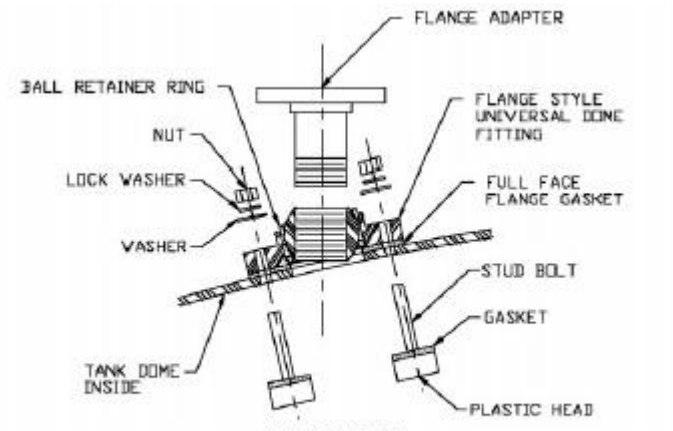
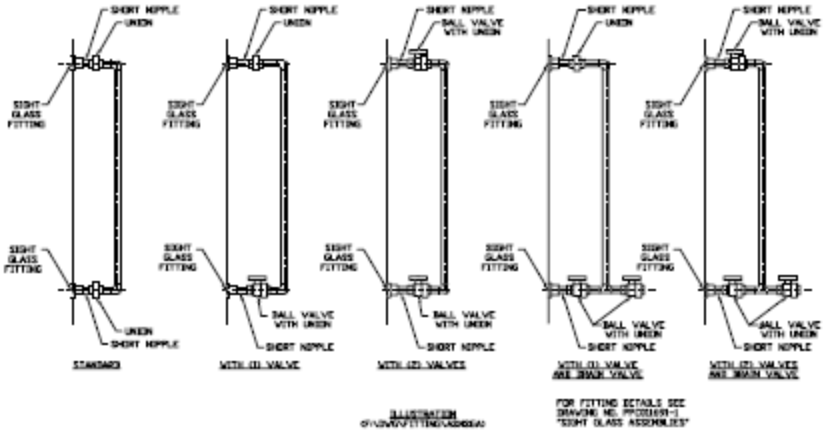


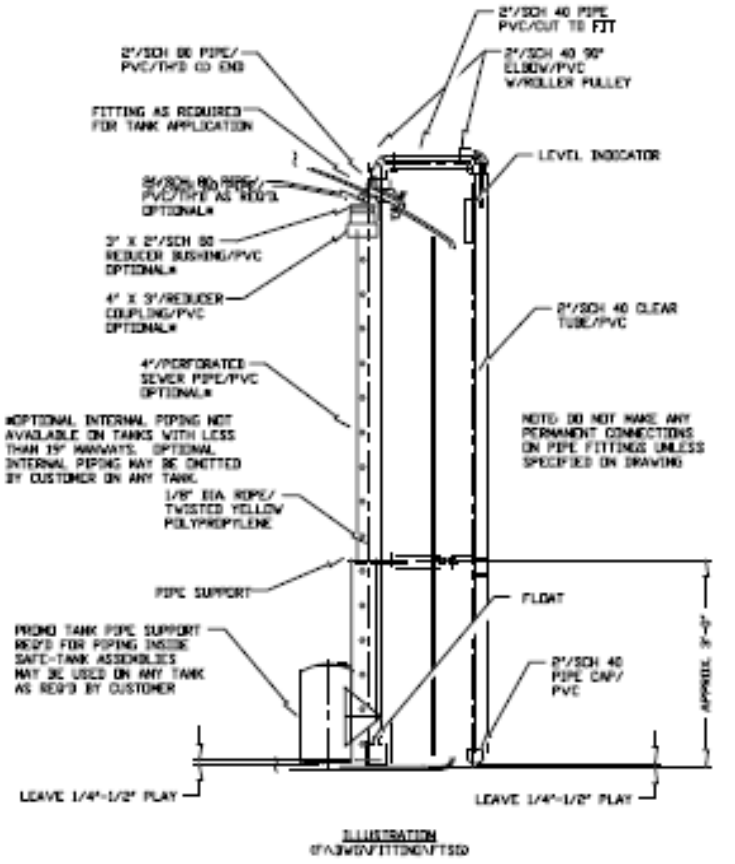
ILLUSTRATION
(F:\DWG\FITTING\ASMUDFS)



Vents

2” vents and larger may not be installed for shipping in order to protect against breakage. Installation will require threading the gooseneck vent into the proper fitting.

Field Installation of Liquid Level Gauges

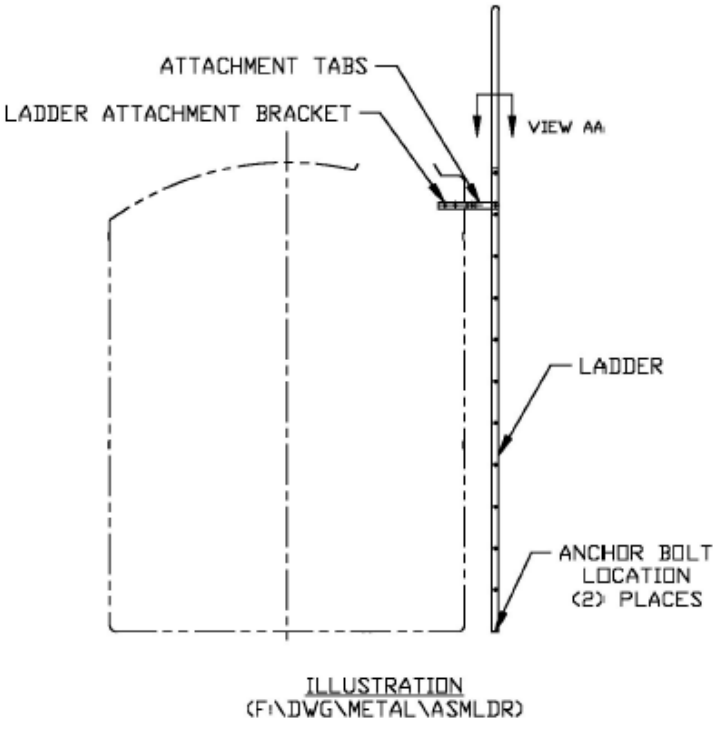


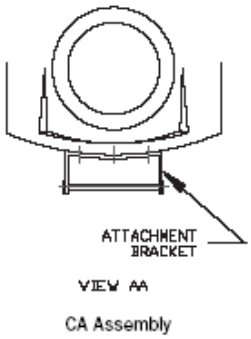
Sight Glass Style

Sight glass assemblies are made up complete at the factory when ordered with your tank. They are usually shipped “loose” since they can easily be damaged in transit. To install a sight glass assembly, “break” the two unions apart on either end of the sight glass. Screw the short nipple and one half of the union into the sight glass fittings which have been mounted onto the tank wall at the factory. For your convenience and ease of assembly, drawings of standard sight glass assemblies are shown below. (Also, see instructions of “Uninstalled Parts” on page 3.) If sight gauge is added later to tank, tank fittings must be drilled according to previous installation instructions. Clear sight glass will be provided loose from sight gauge assembly, to be cut down and custom fitted to tank. **IF FIELD INSTALLED, HYDRO TEST WITH STANDING WATER FOR 24 HOURS BEFORE PUTTING INTO SERVICE.**

Reverse Float Style

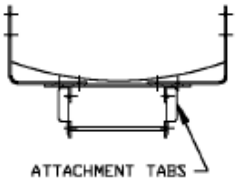
Liquid level gauges of a float type are shipped complete but with this exterior portion uninstalled. This exterior portion of the assembly will be shipped inside the tank and upon retrieving, the installation can begin. The installation is a simple matter of connecting the threaded end of the gauge into the pose. The pipe portion of the gauge will be attached to the combination support pipe bracket on the side wall of the tank. This is usually done with a hose clamp that fits around the exterior pipe and attaches to the pipe support bracket. Review the drawing to understand how these parts fit and this will be a simple installation. Do not glue 2″ elbows.





ILLUSTRATION

\



Ladder Installation

1. Inspect the vessel, check the ladder attachment bracket if installed prior to shipping. Check all fasteners, making sure they are secured.
2. Locate the (2) 9/16″ diameter mounting holes near the top portion of the ladder. From the bolts provided, insert (2) ¼″ x 1½″ long bolts such that the threaded ends protrude outward from the ladder.
3. Locate the (2) 2″ x 2″ x ½″ x 9″ angle iron attachment tabs that have (2) 9/16″ diameter holes punched approximately 6¼″ apart. Place tabs, one on each side, on the outside of ladder facing toward the direction in which the ladder is to be attached. Orient the tabs so that the slotted out section is against the ladder and the horizontal leg is on the top facing to the outside and attach with (2) ½″ x 1½″ bolts.
4. Stand the ladder base with approved type anchor bolts. Removal of ladder may be required for anchor installation
5. Replace ladder in its desired position. Using a stepladder or approved personnel lifting device, bolt the attachment tabs to the ladder attachment bracket using (2) ½″ x 1½″ long bolts.
6. Secure all connections.
7. If a return or cage is required, they will be welded to the ladder and no other assembly will be required. These are not field additions.

CA Assembly

LA Assembly

Horizontal Tank Stands

NOTE: HORIZONTAL TANK STANDS ARE DESIGNED TO BE ERECTED ON LEVEL CONCRETE (OR OTHER APPROVED SURFACES) SUPPORT PADS. WE STRONGLY RECOMMEND THAT TANK STANDS BE BOLTED TO THE SUPPORT PADS. (Please see the section marked "Installation Checklist" of Page 5.)

Stands for horizontal tanks are normally designed as one piece steel units. The stands are shrink wrapped for protection during shipping.

1. **CHECK TO ENSURE THAT ALL COMPONENTS HAVE BEEN RECEIVED.**
2. **INSTALL THE STAND.** Carefully set the stand up in the location required ensuring that the foundation upon which the stand rests is level.
3. **PLACE THE TANK ON THE STAND**. With a forklift, crane, or other lifting device, raise the tank onto the stand being careful not to damage the tank or the paint. Center the tank on the stand.
4. **HYDRO TEST.** ACO Container Systems Ltd. recommends that all tanks be hydro tested for at least 24 hours at end users location before being placed into service.

PRODUCT LIMITATIONS

TEMPERATURE LIMITATIONS – Tanks are designed for a maximum continuous temperature use of 120° F. Continuous temperature above 120° F reduces the design hoop stress, which will require a thicker wall for a given application. Consult Customer Service for any continuous use above 120° F.

CHEMICAL COMPATIBILITY – In all cases the chemical resistance of the assembly (tank, fittings, accessories and gaskets) must be confirmed by chemical resistance data. This should have been done before the tank was ordered, however the service of the tank can change and it is important to be sure the tank and assembly are compatible with the chemical. It should be noted that the effect of the storage of sulfuric acid, hydrochloric acid, and aqua ammonia darkens the tank over time and this is not an indication of weakness or failure of the tank. This change of color is simply a reaction of the reagent with the additives in the plastic (e.g., UV stabilizers, anti-oxidants, etc). Chemical compatibility is the sole responsibility of the end user.

FITTINGS AND VENTS – Tank fittings are installed and sealed at the factory per your specifications. Temperature variations, road vibrations and other factors may influence these fittings, requiring minor adjustments before use. All bolted fittings should have the outer nuts checked before the tank is hydro tested or put into service. Non-bolted fittings have at least one outer nut which should be checked as well. **REMEMBER – PLASTIC FITTINGS ARE EASILY OVER-TIGHTENED.** Review that portion of the manual related to the particular fitting involved for complete instructions for installation.

The most frequent cause of leaks and tank failure is improperly supported plumbing, over-tightening of bolts, and misalignment of fittings. All piping and valves must be independently supported separately from the tank. Any external valves / piping that are connected to tank fittings must be supported. Tank fittings are not designed to bear weight. Be sure that all vents, pressure relief devices, vacuum relief devices, fill assemblies, and other connecting accessories are clear of any obstruction before attempting to use.

Maintenance Guidelines

Tanks should be inspected on a routine basis every three months, and the findings of the inspections recorded. As a very minimum, follow these guidelines:

- Clean the exterior and interior of the tank. You cannot properly inspect a dirty tank. Tank can be cleaned with varsol and a rag and / or a paint scraper.
- Inspect the exterior and the interior of the tank for cracking, glazing, and brittle appearance.
    - Pay particular attention to areas around fittings and where different planes of the tank radius into one another.
    - A bright light source should be used to inspect the interior from the manway opening to avoid a confined space entry.
- Inspect fittings, bolts and exterior gaskets for leaks and signs of general corrosion and deterioration.

Confirm that secondary containment is appropriate for chemical stored, adequate in size, and in good repair.

Shipping Polyethylene Tanks

- Tanks with a diameter smaller than 90" can be shipped in a closed van.
- Anything with a diameter exceeding 90" should be shipped on a flat bed or special truck as required if oversized.
- For applications where the tank height surpasses that of the trailer, tanks may be placed on their side for shipping.
- When shipping tanks on their side, one should allow for one side of tank to be free of fittings. This provides a flat surface on which to lay the tank. Laying the tank down on top of fittings will most likely result in damage.

Installation & Maintenance Record

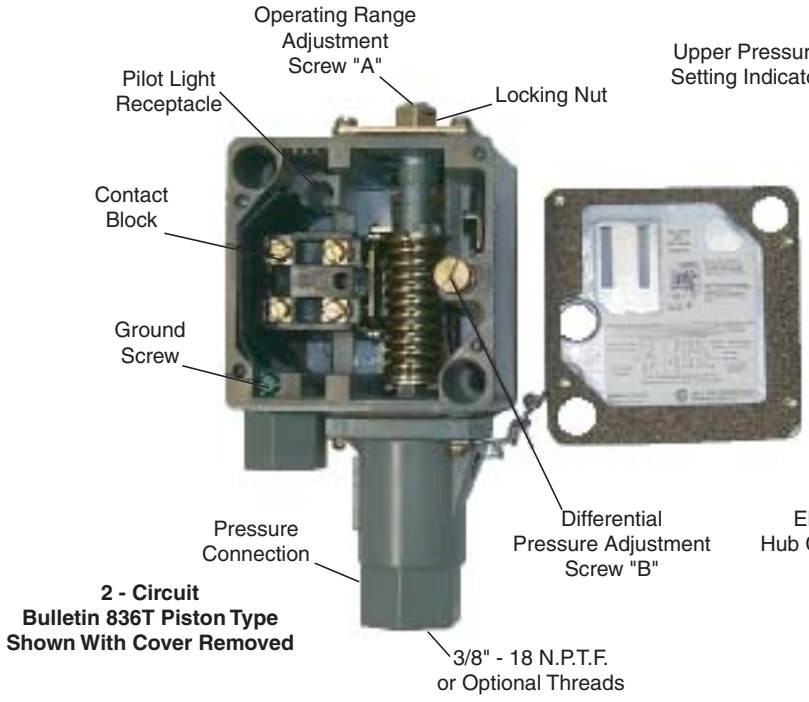
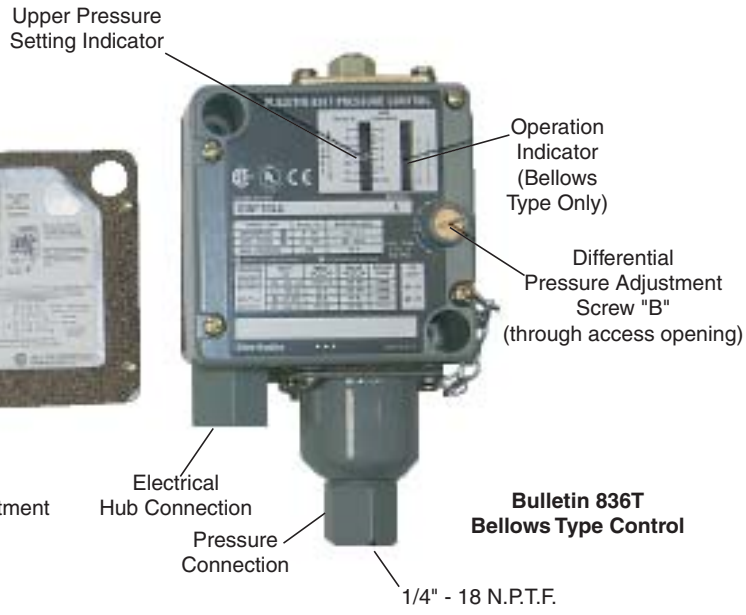
LEFT BLANK



ALLEN BRADLEY

MODEL 836T, PRESSURE SWITCH



LEFT BLANK

Bulletin 836T Pressure Controls

ATTENTION: To prevent electrical shock, disconnect from power source before installing or servicing.

2 - Circuit Bulletin 836T Piston Type Shown With Cover Removed

Bulletin 836T Bellows Type Control

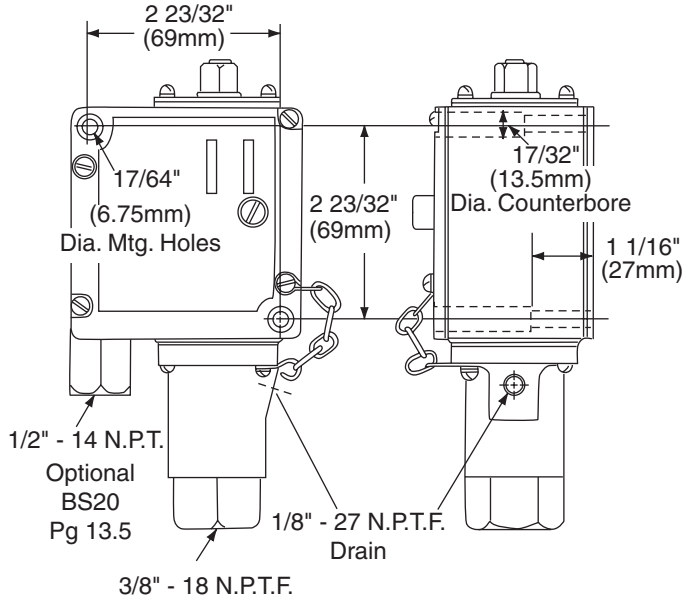
DESCRIPTION - Bulletin 836T, Type 1, 4, & 13 oiltight pressure controls are designed for use on machine tool applications where a stream of oil or water may flow over the enclosure. Other applications would include areas where it is desirable to resist the entrance of lint, dust, and dirt into the enclosure.

The operating range pressure and differential are adjustable externally.

Bellows type devices are available from vacuum to pressures up to 650 psi.

ATTENTION: Copper alloy bellows may be used on water or air and other liquids or gases not corrosive to this alloy. Type 316 stainless steel bellows are available and are used for the more corrosive liquids and gases.

Piston type devices are available for pressures up to 5000 psi.



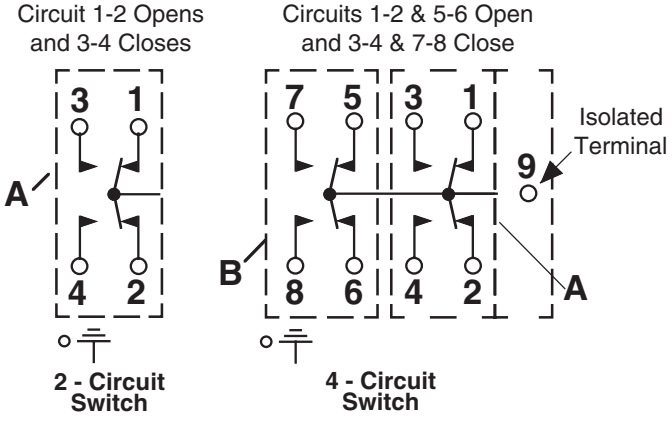
ATTENTION: Stainless steel piston type controls are designed for use on oil, water and waterbased fluids but must not be used on air or gases.

The 2 - Circuit contact block has one set of normally open and one set of normally closed contacts. These contacts may be arranged for single pole double-throw operation or separate circuit operation having the same polarity.

A 4 - Circuit contact block assembly with two normally open and two normally closed contacts is also available. An isolated terminal is furnished to provide a termination point when an optional power source is used. These contacts may be arranged for double pole double-throw operation or two isolated single pole double-throw, electrically isolated circuits. Circuits must be of the same polarity.

MOUNTING - The pressure control should be mounted securely to a firm base using two mounting screws. The recommended fastener for mounting is a 1/4"-20 or M6X1 metric screw. The applied torque should not exceed 70 lb-in (8 Nm).The mounting holes (see sketch) are easily accessible without removing the front cover assembly.

ATTENTION: The control should not be supported by only the electricaland pressure connections. A support wrench should be used when tightening the electrical hub and pressure connections.



Piston Type Shown

OPERATION - A toggle mechanism operates the snap action switch at a predetermined pressure setting. For the 2 - Circuit snap switch the pressure causes the normally closed circuit 1-2 to open and normally open circuit 3-4 to close. This is known as the trip pressure. When the pressure returns to a lower predetermined setting, the circuit 1-2 will close and circuit 3-4 will open. This is known as the reset pressure. The difference between "trip" and "reset" pressure is the differential.
Similarly, for the 4 - Circuit snap switch, both normally closed circuits, 1-2 & 5-6 would open and both normally open circuits, 3-4 & 7-8 would close on increasing pressure. On decreasing pressure, the contacts would return to their original state at a predetermined setting.

Catalog number 836T-T251J can also be operated in a vacuum. At a higher vacuum setting (lower pressure toward 30" Hg) the 2 - Circuit switch contacts 1-2 will be closed and 3-4 open. At a lower vacuum (higher pressure toward 0 psi) circuit 1-2 will open and circuit 3-4 will close.

EXAMPLE: Control set to close contacts at 15" Hg vacuum, open at 5" Hg vacuum. For the 2 - Circuit switch, circuit 1-2 would be used. For the 4 - Circuit switch, circuits 1-2 or 5-6 would be used.

CONTACT BLOCK WIRING SYMBOL
(Increasing Pressure Operation)

A or B circuits must be the same polarity.

ADJUSTMENT - Generally, unless otherwise specified, controls shipped from the factory are set at the maximum operating range pressure and minimum differential.

The following procedure should be used to set the control to a particular requirement.

OPERATING RANGE ADJUSTMENT: Turn lock nut on adjustment screw "A" counterclockwise to loosen. Turn range adjustment screw "A" clockwise to raise upper and lower pressure settings. To decrease the upper and lower settings, turn screw "A" counterclockwise. The approximate upper pressure setting is shown by an indicator in the left window between the calibration scales on the nameplate. When the proper setting is reached, tighten the lock nut on screw "A" clockwise.

DIFFERENTIAL ADJUSTMENT: When the differential screw "B" is up against the underside of the differential access opening in the cover the control will function at minimum differential. To increase the differential, turn adjustment screw "B" clockwise. This will decrease the lower setting only. The higher setting will not change. Similarly, to decrease the differential turn the differential adjustment screw "B" counterclockwise. This will raise the lower setting only.
Condensed instructions can be found on the inside of the front cover.

NOTE: The use of a pressure gauge is desirable when setting the control.

ATTENTION: The adjustment screw "A" should not be forced beyond the range of the control indicated on the calibrated scale. The adjustment screw "B" should not be adjusted beyond the maximum specified differential of the control.

Operating variables in a system may cause changing pressure requirements. It is recommended that a periodic inspection of the gauge pressure be made and the pressure control adjusted to compensate when necessary for these changes.

PISTON TYPE APPLICATIONS -

ATTENTION: All pistons are provided with a 1/8 inch threaded drainopening which should be connected to an oil return line leading to anoil reservoir which is vented to atmosphere. This reservoir may be at ahigher level of elevation than the control. The controls with seal ringsusually do not require return lines. However, the 1/8 inch threaded drainopening should never be plugged on either type of piston control. Thisalso includes the shipping plug which must be removed upon installa-tion. Filters should be used to reduce contamination of hydraulic fluid.

PILOT LIGHT OPTION - A high intensity neon glow pilot light is available for 120 volt, 60 hertz applications and can be installed at the factory or in the field. To order pilot light kit specify catalog number of existing control and add N9 to this number. Optional pilot lights are available on special orders.

The pilot light is wired to the contact block as follows:

A. **2 - Circuit**
Always connect lamp wires to same set of terminals used for the load. To light on increasing pressure connect across 1-2. To light on decreasing pressure connect across 3-4.

B. **4 - Circuit**
Consists of 2 electrically isolated single pole-double throw circuits. Connect lamp wires to same set of terminals used for load. To light on increasing pressure connect across 1-2 or 5-6. To light on decreasing pressure connect across 3-4 or 7-8.
(or)
An isolated terminal, 9, is provided as a termination point when an optional power source is used. This provides a convenient means for various circuit connections when separation of the load and pilot light is required. Circuits must be the same polarity for pilot light connections and switching of auxiliary equipment.

PAINTING - Standard controls are supplied with a removable paint mask on the nameplate. Remove the mask on final installation.

CONTACT BLOCK REPLACEMENT - To order Bulletin 836T Contact Block 2 - Circuit (SPDT-DB) Replacement Kit specify Catalog Number 836T-N1. For the 4 - Circuit (DPDT-DB) Contact Block Replacement Kit specify Catalog Number 836T-N2.

REPAIRS - Due to the integral construction of the Bulletin 836T Pressure Control, it is recommended it be returned to the factory for repairs (excluding contact block replacement). The control will be adjusted for optimum performance and tested to specifications.

ASCO

MODEL 8210G100, SOLENOID VALVE

LEFT BLANK

Installation & Maintenance Instructions

2 - WAY INTERNAL PILOT - OPERATED SOLENOID VALVES
NORMALLY CLOSED OPERATION
2" OR 2 1/2" NPT

BULLETIN
8210
8211

IMPORTANT: See separate solenoid installation and maintenance instructions for information on: Wiring, Solenoid Temperature, Cause of Improper Operation, Coil or Solenoid Replacement.

DESCRIPTION

Series 8210 valves are 2-way normally closed, internal pilot operated solenoid valves designed for general service. These valves are made of rugged forged brass or die cast stainless steel and have an integral adjustable bleed device for controlling the opening and closing speed of the piston. Series 8210 valves are supplied with general purpose, or explosionproof/ watertight solenoids.

Series 8211 valves are the same as Series 8210 except that they are provided with a metal explosionproof/watertight solenoid enclosure.

OPERATION

Normally Closed: Valve is closed when solenoid is de-energized; open when energized.

IMPORTANT: Minimum operating pressure differential required is 5 psi.

Adjustable Bleed Device

Series 8210 valves have an integral adjustable bleed device for controlling the opening and closing speed of the piston. When valve leaves the factory, the bleed adjusting screw (metering pin) has been preset to provide quick shockless closing for most applications. If faster or slower closing is required, adjust the screw (metering pin) as follow:

1. Turn metering pin in (clockwise) as far as possible without over tightening. Back out tightening. Back out metering pin (counterclockwise) two complete turns. From this point, adjustments may be made to suit system.
2. Turn metering pin clockwise for slower closing.
3. Turn metering pin counterclockwise for faster closing.

Manual Operation (Optional Feature)

Valve with suffix ***MO*** in the catalog number are provided with a manual operator which allows manual operation when desired or during an electrical power outage.

To engage manual operator, rotate stem fully clockwise (approximately 180°). Valve will now be in the same position as when the solenoid is energized.

To disengage manual operatork, rotate stem fully counterclockwise (approximately 180°) before operating electrically.

⚠ CAUTION: For valve to operate electrically, manual operator stem/lever must be fully rotated counterclockwise.

⚠ ATTENTION : Afin que la vanne fonctionne électriquement, la commande manuelle doit être complètement tournée dans le sens inverse des aiguilles d'une montre.

INSTALLATION

Check nameplate for correct catalog number, pressure, voltage, frequency, and service. Never apply incompatible fluids or exceed pressure rating of the valve. Installation and valve maintenance to be performed by qualified personnel.

Future Service Considerations

Provision should be made for performing seat leakage, external leakage, and operational tests on the valve with a nonhazardous, noncombustible fluid after disassembly and reassembly.

Temperature Limitations

For maximum valve ambient and fluid temperatures, refer to chart below. Check catalog number prefix on nameplate to determine the maximum temperatures.

Construction	Catalog Number Prefix	Coil Class	Maximum Ambient Temp.°F	Maximum Fluid Temp.°F
AC	None or FT	F	122	180
	HT	H	140	180
DC	None,FT or HT	F or H	77	150

Positioning

This valve is designed to perform properly when mounted in any position. However, for optimum life and performance, the solenoid should be mounted vertically and upright to reduce the possibility of foreign matters accumulating in the solenoid base sub-assembly area.

Piping

Connect piping or tubing to valve according to markings on valve body. Apply pipe compound sparingly to male pipe threads only. If applied to valve threads, the compound may enter the valve and cause operational difficulty. Avoid pipe strain by properly supporting and aligning piping. When tightening the pipe, do not use valve or solenoid as a lever. Locate wrenches applied to valve body or piping as close as possible to connection point.

IMPORTANT: To protect the solenoid valve, install a strainer or filter, suitable for the service involved, in the inlet side as close to the valve as possible. Clean periodically depending on service conditions. See ASCO Series 8600 and 8601 for strainers.

Wiring

Wiring must comply with Local and National Electrical Codes. Housing is provided with 7/8 diameter hole to accommodate 1/2 inch conduit. The general purpose solenoid enclosure may be rotated to facilitate wiring by removing the retaining clip.

MAINTENANCE

⚠ WARNING: To prevent the possibility of death, serious injury or property damage, turn off electrical power, depressurize valve, and vent fluid to a safe area before servicing the valve.

⚠ AVERTISSEMENT: Pour éviter tous danger de mort, de blessure grave ou de dommage matériel, avant d'intervenir sur la vanne, couper le courant, purger la vanne dans une zone sécurisée.

NOTE: It is not necessary to remove the valve from the pipeline for repairs.

Cleaning

All solenoid valves should be cleaned periodically. The time between cleanings will vary depending on the medium and service conditions. In general, if the voltage to the coil is correct, sluggish valve operation, excessive noise, or leakage will indicate that cleaning is required. In the extreme case, faulty valve operation will occur and the valve may fail to open or close. Clean valve strainer or filter when cleaning the valve.

Preventive Maintenance

- Keep medium flowing through the valve as free from dirt and foreign material as possible.
- Periodic exercise of the valve should be considered if ambient or fluid conditions are such that corrosion, elastomer degradation, fluid contamination build up, or other conditions that could impede solenoid valve shifting are possible. The actual frequency of exercise necessary will depend on specific operating conditions. A successful operating history is the best indication of a proper interval between exercise cycles.
- Depending on the medium and service conditions, periodic inspection of internal valve parts for damage or excessive wear is recommended. Thoroughly clean all parts. If parts are worn or damaged, install a complete rebuild kit.

Causes of Improper Operation

- **Incorrect Pressure:** Check valve pressure. Pressure to valve must be within range specified on nameplate.
- **Excessive Leakage:** Disassemble valve and clean all parts. If parts are worn or damaged, install a complete ASCO Rebuild Kit.

Valve Disassembly (Refer to Figure 3 on page 4)

1. Disassemble valve in an orderly fashion. Use exploded view for identification and placement of parts.
2. Remove solenoid, see separate instructions.
3. If the valve being serviced has a manual operator, ***suffix MO*** in the catalog number, refer to section on ***Manual Operator Disasembly***.
4. Unscrew solenoid base sub-assembly and remove solenoid base gasket, core assembly with core spring.
5. For normal maintenance, it is not necessary to remove the valve seat. However, if valve seat removal is required, use a 7/16" socket wrench.
6. Dislodge retainer from metering pin passageway and remove metering pin with gasket. Then remove metering pin gasket from metering pin.
7. Remove bonnet screws, valve bonnet, piston spring, piston assembly, support, lip seal, body gasket, and body passage gasket.
8. Remove aspirator tube and disc with disc gasket from piston.
9. All parts are now accessible to clean or replace. If parts are worn or

 All Rights Reserved.
©ASCO, L.P. 160 Park Avenue, Florham Park, New Jersey 07932 www.asco.com

damaged, install a complete ASCO Rebuild kit.

Valve Reassembly

1. Reassemble valve using exploded views for identification and placement of parts.
2. Lubricate the solenoid base gasket, body gasket, body passage gasket, metering pin gasket, and the surface of the piston which contacts the lip seal with MOLYKOTE® 200 Fluid lubricant.
3. Lubricate disc and disc gasket with MOLYKOTE® 111 Compound lubricant or an equivalent high-grade silicone grease.
4. Position body gasket, body passage gasket, and support in valve body.
5. Install aspirator tube and disc with disc gasket in piston.
6. Position lip seal, flanged end out, onto piston assembly. Install piston assembly with lip seal into support in valve body cavity.
7. Replace piston spring, valve bonnet, and bonnet screws. Torque bonnet screws in a crisscross manner to 144 ± 15 in-lbs [16,3 ± 1,7 Nm].
8. Replace valve seat with a small amount of thread compound on the seat threads. Torque valve seat to 65 ± 15 in-lbs [7,3 ± 1,7 Nm].
9. Install metering pin with metering pin gasket into valve body. Replace retainer and refer to ***Adjustable Bleed Device*** section for metering pin adjustment.
10. If the valve being service has a manual operator, refer to ***Manual Operator Reassembly*** section.
11. Replace solenoid base gasket, core assembly, core spring, and solenoid base sub-assembly. Torque solenoid base sub-assembly to 175 ± 25 in-lbs [19,8 ± 2,8].
12. Install solenoid, see separate instructions and make electrical hookup.

⚠ **WARNING: To prevent the possibility of death, serious injury or property damage, check valve for proper operation before returning to service. Also perform internal seat and external leakage tests with a nonhazardous, noncombustible fluid.**

⚠ **AVERTISSEMENT: Afin d'éviter le risque de mort, de blessure ou de dommage matériel, vérifier le bon fonctionnement de l'électrovanne avant de la remettre en service. Contrôler aussi les fuites externe et interne avec un fluide non dangereux.**

13. Restore line pressure and electrical power supply to valve.
14. After maintenance is completed, operate the valve a few times to be sure of proper operation. A metallic *click* signifies the solenoid is operating.

Manual Operator Disassembly

1. Refer to ***Valve Disassembly*** section and follow step 1 and 2.
2. For AC construction refer to Figure 1 on page 3; DC construction Figre 2 on page 3.
3. Unscrew solenoid base sub-assembly from manual operator body.
4. Unscrew manual operator body and remove this assembly intact. Remove body gasket from main valve body.
5. Before removing the stem retainer from the manual operator body, note the location of captive spacing washer on the stem/lever sub-assembly. The captive spacing washer will be on the ***inside*** of the fork on the stem retainer for AC construction and on the ***outside*** for DC construction. Location of this captive spacing washer is important for reassembly.
6. Remove stem/lever sub-assembly with stem gasket from manual operator body. remove solenoid base gasket, core assembly with core spring.
7. Refer to ***Valve Disassembly*** sections, step 5 for further disassembly.

Manual Operator Reassembly

Refer to steps 1 through 9 of ***Valve Reassembly*** then proceed as follows:

1. Position stem gasket on stem/lever sub-assembly.
2. Preassemble manual operator parts as follows: Position core assembly with core spring into manual operator body from the bottom. Install stem/lever sub-assembly into manual operator body. Install stem retainer and be sure the captive spacing washer on the stem/level sub-assembly is located on the ***inside*** of the fork on the stem retainer for AC construction and on the ***outside*** of the fork on the stem retainer for DC construciton.
3. Replace body gasket in valve body.
4. Screw manual operator body intact into valve body. Torque manual operator body to 175 ± 25 in-lbs [19,8 ± 2,8 Nm].

ORDERING INFORMATION
FOR ASCO REBUILD KITS

Parts marked with an asterisk (*) in the exploded view are supplied in Rebuild Kits.

* When Ordering Rebuild Kits for ASCO valves, order the Rebuild Kit number stamped on the valve nameplate.

+ If the number of the kit is not visible, order by indicating the number of kits required, and the Catalog Number and Serial Number of the valve(s) for which they are intended.

Installation&Maintenance Instructions

ASCO Red-Hat II™

OPEN-FRAME, GENERAL PURPOSE, WATERTIGHT/EXPLOSIONPROOF SOLENOIDS
OPTIONAL FEATURE FOR OPEN FRAME (GENERAL PURPOSE) CONSTRUCTION ONLY

SERIES
8016G/H

— SERVICE NOTICE —

ASCO™ solenoid valves with design change letter "G" or "H" in the catalog number (ex. 8210G1) have an epoxy encapsulated ASCO Red Hat II® solenoid. This solenoid replaces some of the solenoids with metal enclosures and open-frame constructions. Follow these installation and maintenance instructions if your valve or operator uses this solenoid.

DESCRIPTION

Catalog numbers 8016G/H1 and 8016G/H2 are epoxy encapsulated pull-type solenoids. The green solenoid with lead wires and 1/2 conduit connection is designed to meet Enclosure Type 1-General Purpose, Type 2-Dripproof, Types 3 and 3S-Raintight, and Types 4 and 4X-Watertight. The black solenoid on catalog numbers prefixed "EF" is designed to meet Enclosure Types 3 and 3S-Raintight, Types 4 and 4X-Watertight, Types 6 and 6P-Submersible, Type 7, Explosionproof Class I, Division1 Groups A, B, C, & D and Type 9, -Dust-Ignitionproof Class II, Division1 Groups E, F & G. The Class II, Groups F & G Dust Locations designation is not applicable for solenoids or solenoid valves used for steam service or when a class "H" solenoid is used. See *Temperature Limitations* section for solenoid identification and nameplate/retainer for service. When installed just as a solenoid and not attached to an ASCO valve, the core has a 0.250-28 UNF-2B tapped hole, 0.38 minimum full thread.

Series 8016G/H are also available in:

- **Open-Frame Construction:** The green solenoid may be supplied with 1/4″ spade, screw or DIN terminals. (Refer to Figure 4)
  - □ **DIN Plug Connector Kit No. K236034:** Use this kit only for solenoids with DIN terminals. The DIN plug connector kit provides a two pole with grounding contact DIN Type 43650 construction (See Figure 6).
- **Panel Mounted Construction:** These solenoids are specifically designed to be panel mounted by the customer through a panel having a .062 to .093 maximum wall thickness. (Refer to Figure 3 and section on *Installation of Panel Mounted Solenoid*).
- **Junction Box:** This junction box construction meets Enclosure Types 2, 3, 3S, 4, and 4X. Only solenoids with 1/4″ spade or screw terminals may have a junction box. The junction box provides a 1/2″ conduit connection, grounding and spade or screw terminal connections within the junction box (See Figure 5).
- **Multipin Connectors:** All Multipin connectors (VT, ZT) do not have any enclosure ratings.

NOTE: For China RoHS Hazardous Substances table, please go to the link below or scan QR code:

www.asco.com/ChinaRoHSDisclosure

OPERATION

When the solenoid is energized, the core is drawn into the solenoid base sub-assembly.

IMPORTANT: When the solenoid is de-energized, the initial return force for the core, whether developed by spring, pressure, or weight, must exert a minimum force to overcome residual magnetism created by the solenoid. Minimum return force for AC construction is 0.69 lbs (3.1 N) and 0.31 lbs (1.38 N) for DC.

INSTALLATION

Check nameplate for correct catalog number, service, and wattage. Check front of solenoid for voltage and frequency.

⚠ WARNING: Electrical hazard from the accessibility of live parts. To prevent the possibility of death, serious injury or property damage, install the open - frame solenoid in an enclosure.

⚠ AVERTISSEMENT: Risque d'accès aux parties électriques actives. Afin d'éviter tout risque de mort, blessure ou dommage, installer la bobine dans un boitier.

FOR BLACK ENCLOSURE TYPES 7 AND 9 ONLY

⚠ CAUTION: To prevent fire or explosion, do not install solenoid and/or valve where ignition temperature of hazardous atmosphere is less than 165 °C. On valves used for steam service or when a class "H" solenoid is used, do not install in hazardous atmosphere where ignition temperature is less than 180 °C. See nameplate/retainer for service.

⚠ ATTENTION: Afin d'éviter le risque de feu ou d'explosion, ne pas installer la bobine ou l'électrovanne ou la température d'inflammation en atmosphère explosible est inferieure à 165 °C. Pour les vannes vapeur ou lorsqu'une bobine de classe H est utilisée, ne pas installer en atmosphère explosible lorsque la température d'inflammation est inférieure à 180 °C. Consulter les conditions d'utilisations sures indiquées sur le produit ou dans la notice.

NOTE: These solenoids have an internal non-resetable thermal fuse to limit solenoid temperature in the event that extraordinary conditions occur which could cause excessive temperatures. These conditions include high input voltage, a jammed core, excessive ambient temperature or a shorted solenoid, etc. This unique feature is a standard feature only in solenoids with black explosionproof/dust-ignitionproof enclosures (Types 7 & 9).

⚠ CAUTION: To protect the solenoid valve or operator, install a strainer or filter, suitable for the service involved in the inlet side as close to the valve or operator as possible. Clean periodically depending on service conditions. See ASCO Series 8600 and 8601 for strainers.

⚠ ATTENTION : Afin de protéger l'électrovanne ou l'actionneur, installer une crépine ou un filtre adapté le plus proche possible en amont de l'électrovanne ou de l'actionneur. Nettoyer périodiquement le filtre en fonction des conditions d'utilisation. Se référer aux séries 8600 et 8601 pour les crépines.

Temperature Limitations

For maximum solenoid ambient temperatures, refer to chart. The temperature limitations listed, only indicate maximum application temperatures for field wiring rated at 90 °C. Check catalog number prefix and watt rating on nameplate to determine maximum ambient temperature. See valve installation and maintenance instructions for valve temperature limitations.

NOTE: For steam service, refer to *Wiring* section, *Junction Box* for temperature rating of supply wires.

Temperature Limitations For Series 8016G Solenoids			
Watt Rating	Catalog Number Coil Prefix	Class of Insulation	Maximum § Ambient Temp.
6.1, 8.1, 9.1 & 11.1	None, FB, KF, KP, SC, SD, SF, SP, VT & ZT	F	125 °F (52 °C)
6.1, 8.1, 9.1, 11.1 & 20.6	HB, HT, KB, KH, SS, ST, HC & SU	H	140 °F (60 °C)
10.6**	None, KF, SF, SC, HT, KH, ST, SU, VT & ZT	F & H	104 °F (40 °C)
7.1 @ 60Hz (8.1 @ 50Hz)		F & H	175 °F (79 °C)*
10.6**		F & H	140 °F (60 °C)

§ Minimum ambient temperature -40 °F (-40 °C).
* When used with watertight aluminum junction boxes (screw or spade) max. ambient and fluid temperature will be reduced to 157 °F (69.4 °C)
** 10.6 Watt solenoids rated for 104 °F are 8030, 8260, 8316, 8321, 8320, 8360 & 8344 valves while those rated for 140 °F are 8040 valves

Temperature Limitations for Series 8016H solenoids						
		Watt Ratings			Maximum Ambient Temperature	
Prefix ①	Coil Class	AC		DC		
		60 Hz	50 Hz		°C	°F
EF	FT	6.1	8.1	-	52	125
EF	FB	9.1	11.1	-		
	FT	6.1	8.1	-	55	131
	FB	9.1	11.1	-		
	HT	-	-	10.6	40 ②	104②
	HB	-	-	18.6		
EF	HT	-	-	10.6		
EF	HB	-	-	18.6		
	HT	6.1	8.1	-	60 ③	140 ③
	HB	9.1	11.1	-		
EF	HT	6.1	8.1	-		
EF	HB	9.1	11.1	-		
EF	HC	-	-	20.6		

①= EF data applies to Explosionproof coils only.
②= Some DC solenoid valves can be operated at maximum ambient temperature of 55 °C / 131 °F with reduced pressure ratings. See valve I&M for maximum operating pressure differential ratings.
③= Steam Service Valves have a maximum ambient temperature of 55 ° C/ 131 °F.

Positioning

This solenoid is designed to perform properly when mounted in any position. However, for optimum life and performance, the solenoid should be mounted vertically and upright to reduce the possibility of foreign matter accumulating in the solenoid base sub-assembly area.

Wiring

Wiring must comply with local codes and the National Electrical Code. All solenoids supplied with lead wires are provided with a grounding wire which is green or green with yellow stripes and a 1/2″ conduit connection. To facilitate wiring, the solenoid may be rotated 360°. For explosionproof solenoid version, the conduit lead wires are factory sealed for use in hazardous locations.

Additional Wiring Instructions For Optional Features:

- **Open-Frame solenoid with 1/4″ spade terminals.**

For solenoids supplied with screw terminal connections use #12-18 AWG stranded copper wire rated at 90°C or greater. Torque terminal block screws to 10±2 in-lbs [1,1±0,2 Nm]. A tapped hole is provided in the solenoid for grounding, use a #10-32 machine screw. Torque grounding screw to 15-20 in-lbs [1,7-2,3 Nm]. On solenoids with screw terminals, the socket head screw holding the terminal block to the solenoid is the grounding screw. Torque the screw to 15-20 in-lbs [1,7-2,3 Nm] with a 5/32″ hex key wrench.

- **Junction Box**

The junction box is used with spade or screw terminal solenoids only and is provided with a grounding screw and a 1/2″ conduit connection. Connect #12-18 AWG standard copper wire only to the screw terminals. Within the junction box use field wire that is rated 90°C or greater for connections. For steam service use 105°C rated wire up to 50 psi or use 125°C rated wire above 50 psi. After electrical hookup, replace cover gasket, cover, and screws. Tighten screws evenly in a crisscross manner.

Multipin Connector		
Connector type	Mating Connector	Application
VT	4-Pin, M12, Female, Single Keyway	DC
	4-Pin, M12, Female, Dual Reverse Keyway	AC
ZT	3-Pin, Mini, Female, Singe Keyway	AC/DC

- **DIN Plug Connector Kit No. K236034**

1. The open-frame solenoid is provided with DIN terminals to accommodate the plug connector kit.
2. Remove center screw from plug connector. Using a small screwdriver, pry terminal block from connector cover.
3. Use #12-18 AWG stranded copper wire rated at 90°C or greater for connections. Strip wire leads back approximately 1/4″ for installation in socket terminals. The use of wire-end sleeves is also recommended for these socket terminals. Maximum length of wire-end sleeves to be approximately 1/4″. Tinning of the ends of the lead wires is not recommended.
4. Thread wire through gland nut, gland gasket, washer and connector cover.

NOTE: Connector housing may be rotated in 90° increments from position shown for alternate positioning of cable entry.

5. Check DIN connector terminal block for electrical markings. Then make electrical hookup to terminal block according to markings on it. Snap terminal block into connector cover and install center screw.
6. Position connector gasket on solenoid and install plug connector. Torque center screw to 5±1 in-lbs [0,6±1,1 Nm].

NOTE: Alternating current (AC) and direct current (DC) solenoids are built differently and cannot be converted from one to the other by changing the coil.

Installation of Solenoid

Solenoids may be assembled as a complete unit. Tightening is accomplished by means of a hex flange at the base of the solenoid.

Installation of Panel Mounted Solenoid (See Figure 3)

Disassemble solenoid following instruction under *Solenoid Replacement* then proceed.

3/4" Valve Bonnet Construction

1. Install retainer (convex side to solenoid) in 1.312 diameter mounting hole in customer panel.
2. Position spring washer over plugnut/core tube sub-assembly.
3. Install plugnut/core tube sub-assembly through retainer in customer panel then replace solenoid, nameplate and red cap.

15/16" Valve Bonnet Construction

1. Install solenoid base sub-assembly through 0.69 diameter mounting hole in customer panel.
2. Position spring washer on opposite side of panel over solenoid base sub-assembly then replace.

Solenoid Temperature

Standard solenoids are designed for continuous duty service. When the solenoid is energized for a long period, the solenoid becomes hot and can be touched by hand only for an instant. This is a safe operating temperature.

MAINTENANCE

⚠ WARNING: To prevent the possibility of death, serious injury or property damage, turnoff electrical power, depressurize solenoid operator and/or valve, and vent fluid to a safe area before servicing.

⚠ AVERTISSEMENT : Afin d'éviter tout risque de mort, blessure ou dommage, couper l'alimentation électrique, dépressuriser la vanne ou l'électrovanne et vidanger le fluide en zone non dangereuse avant toute maintenance.

Cleaning

All solenoid operators and valves should be cleaned periodically. The time between cleaning will vary depending on medium and service conditions. In general, if the voltage to the solenoid is correct, sluggish valve operation, excessive noise or leakage will indicate that cleaning is required. Clean strainer or filter when cleaning the valve.

Preventive Maintenance

- Keep the medium flowing through the solenoid operator or valve as free from dirt and foreign material as possible.
- Periodic exercise of the valve should be considered if ambient or fluid conditions are such that corrosion, elastomer degradation, fluid contamination build up, or other conditions that could impede solenoid valve shifting are possible. The actual frequency of exercise necessary will depend on specific operating conditions. A successful operating history is the best indication of a proper interval between exercise cycles.
- Depending on the medium and service conditions, periodic inspection of internal valve parts for damage or excessive wear is recommended. Thoroughly clean all parts. Replace any worn or damaged parts.

Causes of Improper Operation

- **Faulty Control Circuit:** Check the electrical system by energizing the solenoid. A metallic *click* signifies that the solenoid is operating. Absence of the *click* indicates loss of power supply. Check for loose or blown fuses, open-circuited or grounded solenoid, broken leadwires or splice connections.
- **Burned-Out Solenoid:** Check for open-circuited solenoid. Replace if necessary. Check supply voltage; it must be the same as specified on nameplate/retainer and marked on the solenoid. Check ambient temperature and check that the core is not jammed.
- **Low Voltage:** Check voltage across the solenoid leads. Voltage must be at least 85% of rated voltage.

Solenoid Replacement

1. On solenoids with lead wires disconnect conduit, coil leads, and grounding wire.

NOTE: Any optional parts attached to the old solenoid must be reinstalled on the new solenoid.

2. Disassemble solenoids with optional features as follows:
   - **Spade or Screw Terminals**

   Remove terminal connections, grounding screw, grounding wire, and terminal block (screw terminal type only).

NOTE: For screw terminals, the socket head screw holding the terminal block serves as a grounding screw.

©ASCO, L.P. 160 Park Avenue, Florham Park, New Jersey 07932
www.asco.com

- **Junction Box**
  Remove conduit and socket head screw (use 5/32″ hex key wrench) from center of junction box. Disconnect junction box from solenoid.
- **DIN Plug Connector**
  Remove center screw from DIN plug connector. Disconnect DIN plug connector from adapter. Remove socket head screw (use 5/32″ hex key wrench), DIN terminal adapter, and gasket from solenoid.

3. Snap off red cap from top of solenoid base sub-assembly.
4. Push down on solenoid. Then using a suitable screwdriver, insert blade in slot provided between solenoid and nameplate/retainer. Pry up slightly and push to remove. Then remove solenoid from solenoid base sub-assembly.
5. Reassemble using exploded views for parts identification and placement.

Disassembly and Reassembly of Solenoids

1. Remove solenoid, see *Solenoid Replacement*.
2. Remove spring washer from solenoid base sub-assembly.
3. Unscrew solenoid base sub-assembly.

NOTE: Some solenoid constructions have a plugnut/core tube sub-assembly, bonnet gasket and bonnet in place of the solenoid base sub-assembly. To remove bonnet use special wrench adapter supplied in ASCO Rebuild Kit. For wrench adapter only, order ASCO Wrench Kit No. K218948.

4. The core is now accessible for cleaning or replacement.
5. If the solenoid is part of a valve, refer to basic valve installation and maintenance instructions for further disassembly.
6. Reassemble using exploded views for identification and placement of parts.

ORDERING INFORMATION FOR ASCO SOLENOIDS

When Ordering Solenoids for ASCO Solenoid Operators or Valves, order the number stamped on the solenoid. Also specify voltage and frequency.

Torque Chart

Part Name	Torque Value in Inch-Pounds	Torque Value in Newton-Meters
solenoid base sub-assembly	175 ± 25	19,8± 2,8
valve bonnet (3/4" bonnet construction)	90 ± 10	10,2 ± 1,1
bonnet screw (3/8" or 1/2" NPT pipe size)	25	2,8
bonnet screw (3/4" NPT pipe size)	40	4,5

GENERAL INSTALLATION AND MAINTENANCE INSTRUCTIONS

Note: These general Installation and Maintenance Instructions must be read in conjunction with the Instruction Sheet for the specific product.

INSTALLATION

ASCO Numatics components are intended to be used only within the technical characteristics as specified on the nameplate. Changes to the equipment are only allowed after consulting the manufacturer or its representative. Before installation, depressurize the piping system and clean internally.
The equipment may be mounted in any position if not otherwise indicated on the product by means of an arrow.
The flow direction and pipe connection of valves are indicated on the body.
The pipe connections have to be in accordance with the size indicated on the nameplate and fitted accordingly.

Caution:
- Reducing the connections may cause improper operation or malfunctioning.
- For the protection of the equipment install a strainer or filter suitable for the service involved in the inlet side as close to the product as possible.
- If tape, paste, spray or a similar lubricant is used when tightening, avoid particles entering the system.
- Use proper tools and locate wrenches as close as possible to the connection point.
- To avoid damage to the equipment. DO NOT OVERTIGHTEN pipe connections
- Do not use valve or solenoid as lever.
- The pipe connections should not apply any force, torque or strain to the product.

ELECTRICAL CONNECTION

In case of electrical connections, they are only to be made by trained personnel and have to be in accordance with the local regulations and standards.

Caution:
- Turn off electrical power supply and de-energize the electrical circuit and voltage carrying parts before starting work.
- All electrical screw terminals must be properly tightened according to the standards before putting into service.
- Dependent upon the voltage electrical components must be provided with an earth connection and satisfy local regulations and standards.

The equipment can have one of the following electrical terminals:
- Spade plug connections according to ISO-4400 or 3 x DIN-46244 (when correctly installed, this connection provides IP-65 protection).
- Embedded screw terminals in metal enclosure with “Pg” cable gland
- Spade terminals (AMP type).
- Flying leads or cables.

PUTTING INTO SERVICE

Before pressurizing the system, first carry-out an electrical test. In case of solenoid valves, energize the coil a few times and notice a metal click signifying the solenoid operation.

SERVICE

Most of the solenoid valves are equipped with coils for continuous duty service. To prevent the possibility of personal or property damage, do not touch the solenoid which can become hot under normal operating conditions.

SOUND EMISSION

The emission of sound depends on the application, medium and nature of the equipment used. The exact determination of the sound level can only be carried out by the user having the valve installed in his system

MAINTENANCE

Maintenance of ASCO Numatics products is dependent on service conditions. Periodic cleaning is recommended, the timing of which will depend on the media and service conditions. During servicing, components should be examined for excessive wear. A complete set of internal parts is available as spare parts or rebuild kit. If a problem occurs during installation/maintenance or in case of doubt please contact ASCO Numatics or authorized representatives.

*A separate Declaration of Incorporation relating to EU-Directive 2006/42/EC Annex IIB is available on request for applicable products. Please provide product identification number and serial numbers of products concerned.
The product, , when marked CE, complies with the essential requirements of the EMC 2004/108/EC (until April 20th 2016) and EMC 2014/30/EU (from April 20th 2016) and LVD 2006/95/EC (until April 20th 2016) and LVD 2014/35/EU (from April 20th 2016). A separate Declaration of Conformity is available on request. Please provide product identification number and serial numbers of the products concerned.

FR CE*

INSTRUCTIONS GÉNÉRALES D’INSTALLATION ET D’ENTRETIEN

Note: Ces instructions générales d’installation et d’entretien complètent la notice spécifique du produit.

MONTAGE

Les composants ASCO Numatics sont conçus pour les domaines de fonctionnement indiqués sur la plaque signalétique ou la documentation. Aucune modification ne peut être réalisée sur le matériel sans l’accord préalable du fabricant ou de son représentant. Avant de procéder au montage, dépressuriser les canalisations er effectuer un nettoyage inteme.
A moins qu’une fléche ou la notice n’indique un sens de montage spécifique de la tête magnétique, le produit peut être monté dans n’importe quelle position
Le sens de circulation du fluide est indiqué par repères sur le corps er dans la documentation.
La dimension des tuyauteries doit correspondre au raccordement indiqué sur le corps, l’étiquette ou la notice.

Attention:
- Une restriction des tuyauteries peut entraîner des dysfonctionnements.
- Afin de protéger le matériel, installer une crépine ou un filtre adéquat en amont, aussi près que possible du produit.
- En cas d’ utilisation de ruban; pàte, aérosol ou autre lubrifiant lors du serrage, veiller à ce qu” aucun corps étranger ne pénètre dans le circuit.
- Utiliser un outillage approprié et placer les clés aussi près que possible du point de raccordement.
- Afin d’éviter toute détérioration, NE PAS TROP SERRER les raccords des tuyauteries.
- Ne pas se servir de la vanne ou de tête magnétique comme d’un levier.
- The pipe connections should not apply any force, torque or strain to the product.

RACCORDEMENT ÉLECTRIQUE

Le raccordement électrique doit être réalisé par un personnel qualifié et selon les normes et règlements locaux.

Attention:
- Avant toute intervention, couper l’alimentation électrique pour mettre hors tension les composants.
- Toutes les bornes à vis doivent être serrées correctement avant la mise en service.
- Selon la tension, les composants électrique doivent être mis à la terre conformément aux normes et règlements locaux.

Selon les cas, le raccordement électrique s’effectué par:
- Connecteur débrochable ISO-4400 ou 3 x DIN-46244 avec degré de protection IP-65 lorsque le raccordement est correctement effectué.
- Bornes à vis solidaires du bobinage, sous boîter métallique avec presse-étoupe “Pg--”.
- Cosses (type AMP).
- Fils ou câbles solidaires de la bobine.

MISE EN SERVICE

Avant de mettre le circuit sous pression, effectuer un essai électrique. Dans le cas d’une électrovanne, mettre la bobine sous tension plusieurs fois er écouter le “clic” métallique qui signale le fonctionnement de la tête magnétique.

FONCTIONNEMENT

La plupart des électrovannes comportant des bobinages prévus pour mise sous tension permanente. Pour éviter toute brûlure, ne pas toucher la tête magnétique qui, en fonctionnement normal et en permanence sous tension, peut atteindre une température élevée.

BRUIT DE FONCTIONNEMENT

Le bruit de fonctionnement varie selon l’utilisation, le fluide et le type de matériel employé. L’utilisateur ne pourra déterminer avec précision le niveau sonore émis qu’après avoir monté le composant sur l’installation.

ENTRETIEN

L’entretien nécessaire aux produits ASCO Numatics varie avec leurs conditions d’utilisation. Il est souhaitable de procéder à un nettoyage périodique dont l’intervalle varie suivant la nature du fluide, les conditions de fonctionnement et le milieu ambiant. Lors de l’intervention. Les composants doivent être examinés our détecter toute usure excessive. Un ensemble de pièces internes est proposé en pièces de rechange pour procéder à la réfection. En cas de problème lors du montage/entretien ou en cas de doute, veuillez contacter ASCO Numatics ou ses représentants officiels.

*Une déclaration d’incorporation relative à la directive UE 2006/42/CE Annexe II B est disponible sur demande pour les produits applicables. Veuillez fournir le numéro d'identification du produit et les numéros de série des produits concernés.
Lorsqu’il est marqué du label CE, le produit est conforme aux exigences essentielles des directives CEM 2004/108/CE (jusqu’au 20 avril 2016) et CEM 2014/30/UE (à partir du 20 avril 2016) et des directives Basse tension 2006/95/CE (jusqu’au 20 avril 2016) et 2014/35/UE (à partir du 20 avril 2016). Une déclaration de conformité peut être fournie sur simple demande. Veuillez fournir le numéro d'identification du produit et les numéros de série des produits concernés.

DE CE*

ALLGEMEINE BETRIEBSANLEITUNG

Achtung: Diese Allgemeine Betriebsanleitung gilt in Zusammenhang mit der jeweiligen Betriebsanleitung für die speziellen Produkte.

EINBAU

Die ASCO Numatics-Komponenten dürfen nur innerhalb der auf den Typenschildern angenebenen Daten eingesetzt warden, Veränderungen an den Produkten sind nur nach Rücksprache mit ASCO Numatics zulässig.
Vor dem Einbau der Ventile muß das Rohrleitungssystem drucklos geschaltet und innen gereinigt werden.
Die Einbaulage der Produkte ist genereil beliebig. Ausnahme: Die mit einem Pfeil gekennzeichneten Produkte mûssen entsprechend der Pfeilrichtung montiert werden.
Die Durchflußrichtung und der Eingang von Ventilen sind gekennzeichnet.
Die Rohranschlüsse sollten entsprechend den Größenangaben auf den Typenschildern mit handelsüblichen Verschraubungen durchgeführt werden.

Dabei ist folgendes zu beachten:
- Eine Reduzierung der Anschlüsse kann zu Leistungs-und Funktionsminderungen führen.
- Zum Schutz der Ventile sollten Schmutzfänger oder Filter so dicht wie möglich in den Ventileingang integriert werden.
- Bei Abdichtung am Gewinde ist darauf zu achten, daß kein Dichtungsmaterial in die Rohrleitung oder das Ventil gelangt.
- Zur Montage darf nur geeignetes Werkzeug verwendetwerden.
- Konische Verschraubungen sind sorgfältig anzuziehen. Es ist darauf zu achten, daß beim Anziehen das Gehäuse nicht beschádigt wird.
- Spule und Führungsrohr von Ventilen dürfen nicht als Gegenhalter benutzt werde.
- Die Rohrleitungsanschlüsse sollen fluchten und dürfen keine Spannungen auf das Ventil übertragen.

ELECTRISCHER ANSCHLUß

Der elektrische Anschluß ist von Fachpersonal entsprechend den geltenden VDE-und CEE Richtlinien auszuführen.

Es ist besonders auf foigendes zu achten:
- Vor Beginn der Arbeiten ist sicherzustellen, daß alle elektrischen Leitungen und Netzteile spannungslos geschaltet sind.
- Alle Anschlußklemmen sind nach Beendigung der Arbeiten vorschriftsmäßig entsprechend den geltenden Regeln anzuziehen.
- Je nach Spannungsbereich muß das Ventil nach den geltenden Regeln einen Schutzleiteranschluß erhalten.

Der Magnetantrieb kann je nach Bauart folgende Anschlüsse haben:
- Anschluß für Gerätesteckdose nach DIN 43650 Form A/ISO 4400 oder 3 x DIN 46244 (durch ordnungsgemäße Montage der Gerätesteckdose wird Schutzklasse IP 65 erreicht).
- Anschlüsse innerhalb eines Blechgehäuses mittels Schraubklemmen. Kabeleinführung ins Gehäuse mit PG-Verschraubung.
- Offene Spulen mit Flachsteckern (AMP-Fahnen) oder mit eingegossenen Kabelenden.

INBETRIEBNAHME

Vor Druckbeaufschlagung des Produktes sollte eine elektrische Funktionsprüfung erfolgen:
Bei Ventilen Spannung an der Magnetspule mehrmals ein-und ausschalten. Es muß ein Klicken zu hören sein.

BETRIEB

Die meisten Ventile sind mit Spulen für Dauerbetrieb ausgerüstet. Zur Vermeidung von Personen-und Sachschäden sollte jede Berührung mit dem Ventil vermieden werden, da die Magnetspule bei längerem Betrieb sehr heiß werden kann.

GERÄUSCHEMISSION

Diese hängt sehr stark vom Anwendungsfall, den Betriebsdaten und dem Medium, mit denen das Produkt beaufschlagt wird, ab. Eine Aussage über die Geräuschemission des Produktes muß deshalb von demjenigen getroffen werden, der das Produkt innerhalb einer Maschine in Betrieb nimmit.

WARTUNG

Die Wartung hängt von den Einsatzbedigungen ab. In entsprechenden Zeitabständen muß das Produkt geöffnet und gereinigt werden. Für die Überholung der ASCO Numatics-Produkte können Ersatzteilsätze geliefert werden. Treten Schwierigkeiten bei Einbau, Betrieb oder Wartung auf, sowie bei Unklarheiten, ist mit ASCO Numatics Rücksprache zu halten. ASCO Numatics Produkte sind entsprechend der EG-Richtlinie 89/392/EWG gefertigt.

*Eine separate Herstellererklärung im Sinne der Richtlinie 2006/42/EWG Anhang II B ist auf Anfrage für die entsprechenden Produkte erhältlich. Geben Sie bitte die Kennnummer sowie die Seriennummer der betreffenden Produkte an.
Das Produkt, wenn mit CE gekennzeichnet, erfüllt die Anforderungen von EMV 2004/108/EWG (bis 20. April 2016) und EMV 2014/30/EU (vom 20. April 2016) und LVD 2006/95/EWG (bis 20. April 2016) und LVD 2014/35/EU (vom 20. April 2016). Eine separate Konformitätserklärung ist auf Anfrage erhältlich. Geben Sie bitte die Kennnummer sowie die Seriennummer der betreffenden Produkte an.

1.0 SELECTION & APPLICATION

Users should become familiar with ASME B40.100 (Gauges – Pressure Indicating Dial Type – Elastic Element) before specifying pressure measuring gauges. That document – containing valuable information regarding gauge construction, accuracy, safety, selection and testing – may be ordered from:

ASME International
Three Park Avenue
New York, N.Y. 10016-5990
800-843-2763 (US/Canada)
001-800-843-2763 (Mexico)
973-882-1170 outside North America
email: infocentral@asme.org
www.asme.org

WARNING: To prevent misapplication, pressure gauges should be selected considering media and ambient operating conditions. Improper application can be detrimental to the gauge, causing failure and possible personal injury, property damage or death. The information contained in this manual is offered as a guide in making the proper selection of a pressure gauge. Additional information is available from Ashcroft Inc.

The following is a highlight of some of the more important considerations:

1.1 Range – The range of the instrument should be approximately twice the maximum operating pressure. Too low a range may result in (a) low fatigue life of the elastic element due to high operating stress and (b) susceptibility to overpressure set due to pressure transients that exceed the normal operating pressure. Too high a range may yield insufficient resolution for the application.

1.2 Temperature – Refer to Section 2 of this manual for important information concerning temperature related limitations of pressure gauges, both dry and liquid filled.

1.3 Media – The material of the process sensing element must be compatible with the process media. Use of a diaphragm seal with the gauge is recommended for process media that (a) is corrosive to the process sensing element; (b) contain heavy particulates (slurries) or (c) are very viscous including those that harden at room temperature.

1.4 Oxidizing media – Gauges for direct use on oxidizing media should be specially cleaned. Gauges for oxygen service should be ordered to variation X6B and will carry the ASME required dial marking "USE NO OIL" in red letters. Gauges for direct use on other oxidizing media may be ordered to variation X6W. They will be cleaned but carry no dial marking. *PLUS!*™ Performance gauges or Halocarbon filled gauge or diaphragm fill is required for use with oxidizing media; order variation XCF.

1.5 Pulsation/Vibration – Pressure pulsation can be dampened by several mechanisms; the patented *PLUS! Performance* gauge will handle the vast majority of applications. One exception to this is high frequency pulsation which is difficult to detect. The only indication may be an upscale zero shift due to movement wear. These applications should be addressed with a liquid filled gauge, or in extreme cases, a remotely mounted liquid filled gauge connected with a length of capillary line. The small diameter of the capillary provides excellent dampening, but can be plugged. The Ashcroft 1106 pulsation dampener and 1112 snubber are auxiliary devices which dampen pulsation with less tendency to plug.
