January 2022

Operation & Maintenance Manual
Saline Effluent Treatment Plant (SETP-WTC)
Water Treatment Complex

In Accordance with Water License 2AM-MEL1631

Prepared by:
Agnico Eagle Mines Limited – Meliadine Division

EXECUTIVE SUMMARY

The Nunavut Water Board (NWB) has issued Type A Water License 2AM-MEL1631 to Agnico Eagle Mines Limited (Agnico Eagle) for the Meliadine gold mine, authorizing the use of water and the disposal of waste required by mining, milling, and associated uses.

Agnico Eagle has prepared the following document which summarizes the operational and maintenance procedures to be followed at the Saline Effluent Treatment Plant (SETP-WTC) located in the Water Treatment Complex building (WTC).

This document is the stand-alone Operation & Maintenance Manual – Saline Effluent Treatment Plant, as specified under Water License 2AM-MEL1631 Part F, Item 9 and includes the following requirements:

- The manual was prepared in accordance with the “Guidelines for the Preparation of an Operation and Maintenance Manual for Sewage and Solid Waste Disposal Facilities in the Northwest Territories, 1996”, and adapted for the use of a mechanical contact water treatment facility;
- The manual includes contingency measures in the event of a plant malfunction; and
- The manual includes sludge management procedures.

IMPLEMENTATION SCHEDULE

As required by Water License 2AM-MEL1631, Part D, Item 10, the proposed implementation schedule for this Plan is outlined below.

This Plan will be implemented upon the Board approval and is subject to any modifications proposed by the NWB, as a result of the review and approval process.

DISTRIBUTION LIST

Agnico Eagle Internal:

- Water Management General Supervisors (Env. and E&I)
- Water Management Supervisors
- Water Management Process Engineer
- Environment Superintendent
- E&I Superintendent
- Environment General Supervisor
- RMMS&Compliance Coordinator
- Saline Effluent Treatment Plant Operators

1 INTRODUCTION

1.1 PURPOSE

The Saline Effluent Treatment Plant (SETP-WTC) Operation and Maintenance Manual (OMM) for the Meliadine Gold Mine (the Project) has been prepared in accordance with the Nunavut Water Board (NWB) Type A Water License 2AM-MEL1631 (Type A Licence), Part F, item 9, and is based on the "*Guidelines for the Preparation of an Operation and Maintenance Manual for Sewage and Solid Waste Disposal Facilities in the Northwest Territories, 1996, prepared by the Department of Municipal and Community Affairs, NWT*". The manual has been adapted for an industrial water treatment facility.

This manual is a component of the Meliadine Environmental Management System. The objectives of this plan are summarized as follows:

1. To define the location, design and operating procedures to be used in the treatment of water generated at the Project; and
2. To provide the monitoring requirements for the SETP-WTC.

1.2 BRIEF DESCRIPTION OF THE PROJECT

Agnico Eagle Mines Limited (Agnico Eagle) is operating the Meliadine gold mine located approximately 25 km north of Rankin Inlet, and 80 km southwest of Chesterfield Inlet in the Kivalliq Region of Nunavut. The site is located on the peninsula between the East, South, and West basins of Meliadine Lake (63°01'23.8"N, 92°13'6.42"W). The area is accessible from the all-weather access road linking the Meliadine mine site with Rankin Inlet.

The current mine plan focuses on the development of the Tiriganiaq gold deposit which will be mined using both conventional open-pit and underground mining operations. Current mining facilities to support the mine include a plant site and accommodations, tailings storage facility, waste rock storage facilities, ore storage pads, process plant, power plant, maintenance facilities, water management treatment plants and supporting infrastructures.

Such infrastructures include water retention dikes, berms, culverts, channels, collection ponds, pumping stations, freshwater intake and water treatment plants. These infrastructures are required to manage water during pre-production, operation, and interim mine closure. In 2019, a Saline Effluent Treatment Plant (SETP), providing water treatment prior to discharge to Melvin Bay, was constructed with a design flowrate of 800 m^3/day. The facility was upgraded in 2020 to treat up to 1600 m^3/day (see design report 6526-680-132-REP-001).

To support the water management plan for the Life of Mine (LOM), a new saline effluent treatment plant located in the water treatment complex (WTC), is required. In this document, the new plant will be referred to as the SETP-WTC. TIt will be located in the WTC building already approved by the NWB (see design report 6526-694-132-REP-001 and As-built report 6526-694-132-REP-002). The SETP-WTC will be located in the same building as the Effluent Water Treatment Plant (EWTP-WTC). The EWTP-WTC has been already approved within the Design Report 6526-693-132-REP-001 and the As-built Report 6526-693-132-REP-003. No change to the functionality of the EWTP-WTC is expected from the addition of the SETP-WTC. Figures 1 and 2 illustrate the location and general arrangement of the WTC.

1.3 CONTACT INFORMATION

The individuals responsible for the operation of the SETP-WTC are the following:

E&I Water Management General Supervisor	819-759-3555 ext 4603063
E&I Superintendent	819-759-3555 ext 4603161

2 DESCRIPTION

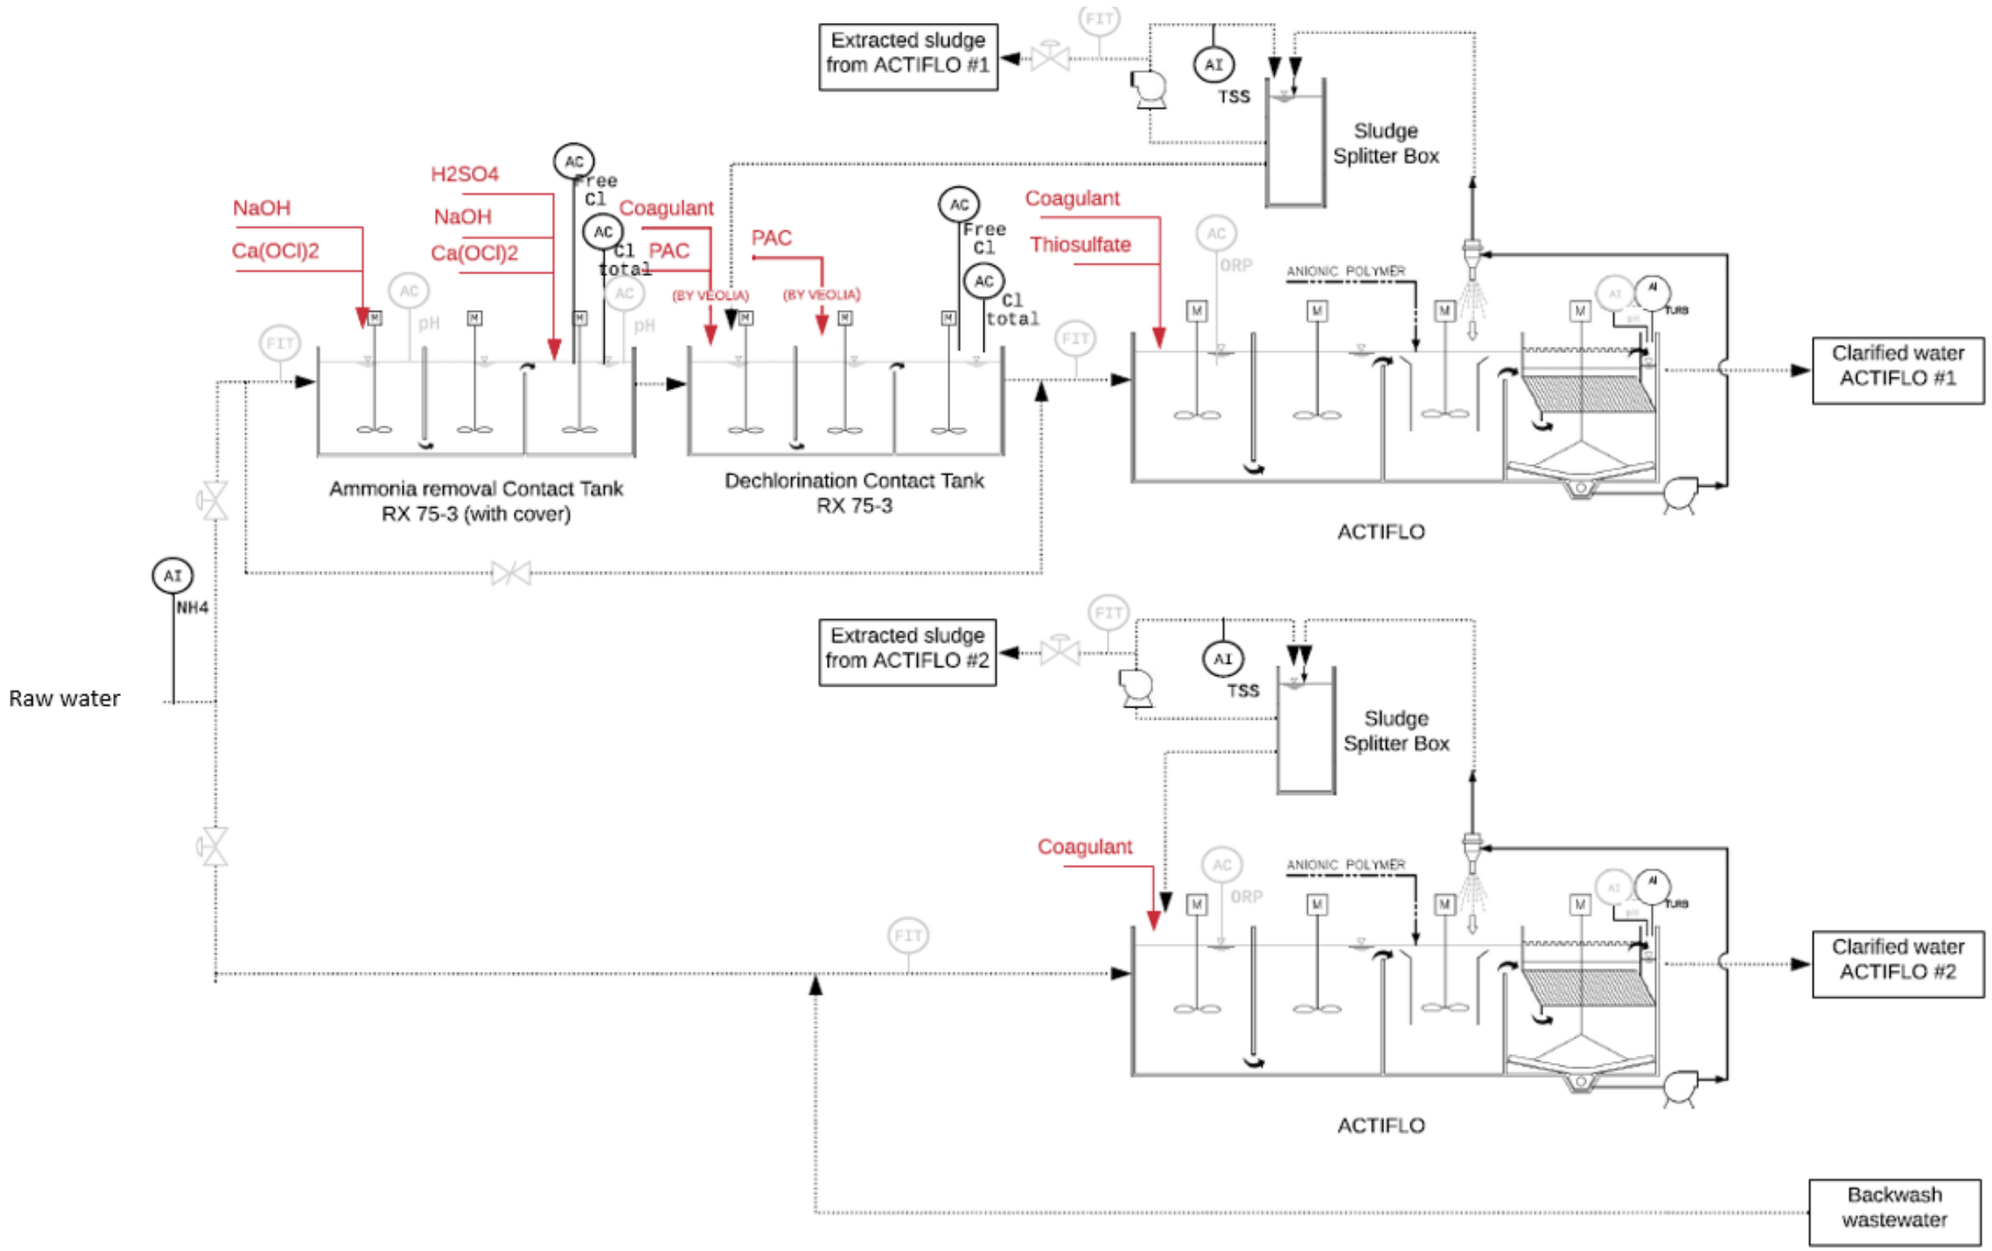
2.1 SALINE EFFLUENT TREATMENT PLANT (SETP-WTC)

2.1.1 Process summary

The Raw water feeding the SETP-WTC will be pumped to two parallel treatment lines.

One line is used for ammonia and TSS removal through a break point chlorination process and TSS clarification. This line is composed of the following steps:

- Oxidation of ammonia in nitrogen gas in a mixed reactor using calcium hypochlorite solution. In this step, pH is controlled by caustic and sulphuric acid addition.
- Dechlorination using powder activated carbon to remove the excess of chlorine, followed by an addition of sodium thiosulfate for chlorine removal polishing.
- TSS removal using a sand ballasted clarifier (Actiflo®). Addition of coagulant, flocculent and microsand is required to achieve high removal rates of TSS



The second line is composed of the following step:

- TSS removal using a sand ballasted clarifier (Actiflo®). Addition of coagulant, flocculent and microsand is required to achieve high removal rates of TSS

Both lines are then conveyed in a polishing filtration step using a disk filtration system prior to being pumped in the water line pumping station, where pH can be adjusted with sulphuric acid if needed.

The treatment concept is presented in Figure 3. The layout of the SETP-WTC (including the EWTP-WTC) is presented in Appendix A. The piping and instrumentation diagrams (P&ID) can be found in Appendix B.

Design basis of the SETP-WTC are presented in the Design Report 6526-680-132-REP-006.

2.1.2 Break point chlorination

Raw water is pumped to a closed-top reaction tank where a hypochlorite source and an alkali (NaOH) are added. The hypochlorite is a compound added to oxidize the ammonia (NH_4^+) into mainly nitrogen gas (N_2) through breakpoint chlorination and nitrite (NO_2^-) into nitrates (NO_3^-) through simple oxidation. The hypochlorite dosage is adjusted according to the dissolved organic carbon (DOC), nitrites and ammonia concentrations in the raw water, since all of these compounds will consume the added chlorine.

The hypochlorite injected in the water produces hypochlorous acid (HOCl). The hypochlorous acid is a weak acid, and part of the hypochlorous acid is decomposed in water into hypochlorite ions (OCl^-) depending on the pH. The pH can be adjusted to optimize the hypochlorite ion concentration in the reactor, therefore optimizing the chlorine dosage. The control of the pH also prevents the release of chlorine gas which can be observed in acidic pH and which is a safety and corrosion issue.

The hypochlorous acid and hypochlorite ions in solution will first be consumed by reducing agents and organic matter contained in the water. When more chlorine is added in solution and there is a presence of ammonia, the ammonia will react to form chloramines, specifically monochloramines (NH_2Cl). When the quantity of chlorine is sufficient, the monochloramine will be destroyed, and depending on the concentration, will be transformed in dichloramines ($NHCl_2$) or trichloramines (NCl_3) and then, finally, in nitrogen (N_2). If the quantity of chlorine injected is sufficient, a breakpoint is reached where all chloramines and ammonia are converted into nitrogen.

The overall reaction leading to the release of nitrogen and nitrate as a final product is presented below:

- $NH_4^+ + 1.5\ HOCl \rightarrow 0.5\ N_2 + 1.5\ H_2O + 2.5\ H^+ + 1.5\ Cl^-$
- $NH_4^+ + 4\ HOCl \rightarrow NO_3^- + H_2O + 6\ H^+ + 4\ Cl^-$

Figure 4 also presents a graphical view of the break point determination.

The retention time within the chlorination tank is typically around 20 minutes.

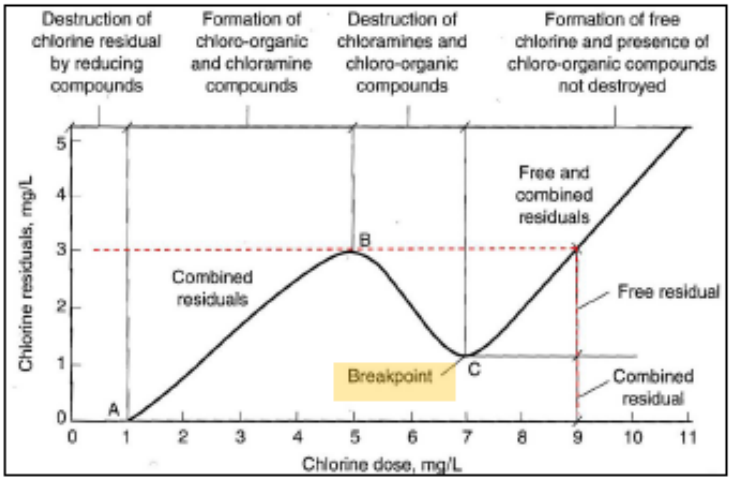

Figure 4 – Break point determination

2.1.3 Dechlorination

The chlorinated water, containing chlorine residual, flows to the dechlorination reactor for chlorine destruction. The dechlorination process aims to ensure the destruction of the residual chlorine. Powdered Activated Carbon (PAC) is used for chlorine removal.

The PAC is dosed in the dechlorination reactor in two steps (in the first two compartments), to allow a sufficient contact time for complete chlorine destruction and provide fresh activated carbon along the dechlorination process. Continuous automatic dosing systems are used to add fresh PAC to the dechlorination step. Some recirculated PAC, from the Actiflo® ballasted flocculation system, is also added to the dechlorination reactor. This allows a slight reduction of the PAC requirement and higher efficiency for the chlorine destruction.

Coagulant addition is also done in the dechlorination reactor, which provides high reaction time for the activation of the coagulant and coagulation of the colloids particles. The coagulant acts as a destabilization agent to agglomerate TSS particles contained in the raw water for further removal.

As a polishing step for chlorine removal, sodium thiosulfate is added in the first chamber of the Actiflo® system to remove trace of chlorine.

2.1.4 Clarification step

Actiflo® are sand-ballasted settling units with a high-rate coagulation/flocculation/sedimentation process that utilizes microsand as a seed for floc formation. The microsand provides a surface area that enhances flocculation and acts as a ballast or weight. The resulting floc settles very fast, allowing for compact clarifier designs with high overflow rates and short retention times. The use of microsand also permits the unit to perform well under changing flow rates without impacting final effluent quality.

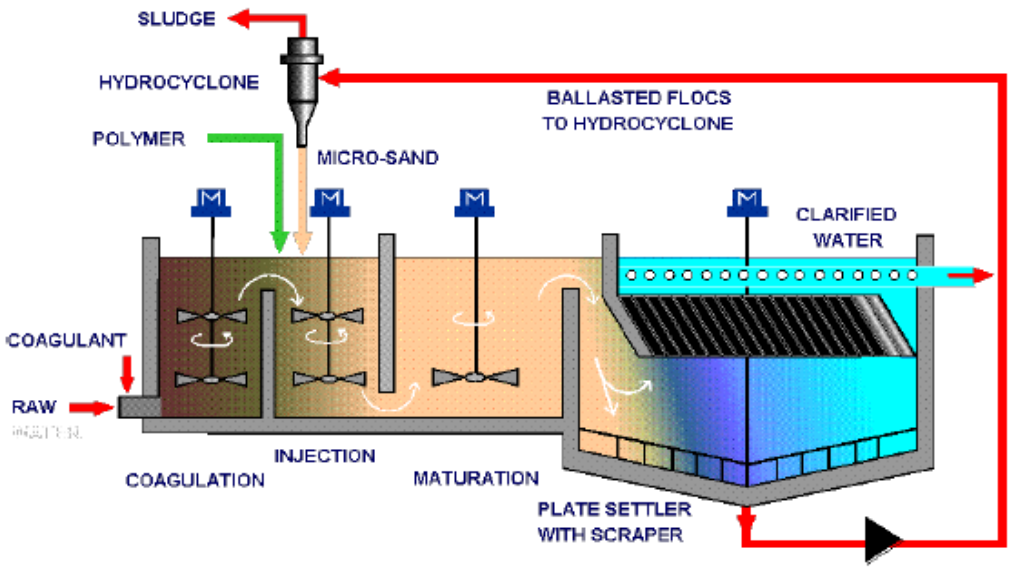

Figure 5 : Actiflo® Process

The slurry flows to the first basin, the coagulation chamber, where the reaction is optimized. The aluminum-based coagulant forms a floc of aluminum hydroxide ($Al(OH)_3$) which acts as a bridge to tie colloidal particles together. The coagulated water then overflows to a second tank section called the injection tank. There, the microsand and flocculent aid polymer are added. The microsand provides a large contact area for floc attachment and acts as ballast, thereby accelerating the settling of the flocs. The flocculent aid polymer binds the destabilized suspended solids to the microsand particles by forming polymer bridges. From the injection tank, the water underflows to a third tank section called the maturation tank. In this section, the microsand and sludge flocs agglomerate and grow into high-density flocs known as microsand ballasted flocs. From the maturation zone, the water overflows to the settling section of the tank. In the settling zone, the microsand ballasted flocs settle quickly to the bottom of the unit. In the settling zone, the settling efficiency is further increased by the use of the lamella tubes. The clarified water exits the system via a series of collection troughs or wires. The clarified water is monitored for turbidity.

The sand-sludge mixture settles to the bottom of the clarifier. Scrapers force the sludge collected at the bottom of the clarifier into a central cone from which is continuously withdrawn and pumped to a hydro cyclone where the sludge and microsand are separated by centrifugal force. After separation, the higher density microsand is discharged from the bottom of the hydro cyclone and reinjected into the process for reuse. The lighter density sludge is discharged from the top of the hydro cyclone and directed to the sludge splitter box (one per Actiflo®) which recirculated sludge in the process. The extraction of sludge is performed to keep a sludge solid percentage close to 2% (w/w). Sludge is conveyed into the sludge tank prior pumping to the saline contact water storage area or in an appropriate location.

There will be two Actiflo® in the SETP-WTC. Each Actiflo® as specific features, which are listed below:

- Actilfo on the Breakpoint chlorination line:
    - No coagulant is dosed in the first chamber of the Actilfo® to allow to break bubbles resulting from the dechlorination process
    - Sodium thiosulfate is dosed to remove trace of chlorine in the first chamber
    - Sludge return is done in the dechlorination reactor

- Actiflo on the TSS removal line:
    - Sludge from the splitter box overflow is recirculated at the entry of the Actiflo® system

2.1.5 Polishing Filtration

Water from both Actiflo® process flows by gravity to the discfilter filtration process. The discfilter is used as a polishing step to reduce the suspended solids at the clarified water. The discfilter utilizes a filter cloth mounted on filter panels. These panels stem from a central drum where inlet water is admitted into the unit for treatment. Water is filtered in inside-out mode, flowing from the centre tube to the open base of the filter discs, through the polyester cloth before reaching the discfilter water collection tank.

The discfilter water collection tank is part of the discfilter and contains the filters and the filtered water. Particulate matter presents in the discfilter inlet water is retained by the filter media on the inside of the filter panels, eventually leading to solids built-up on the filter media. Consequently, the head loss across the discfilter increases, resulting in increased water level at the inlet of the unit. The unit includes an integral high-level switch that initiates a backwash cycle, which rotates the filter discs in order to expose clean filter media to the water flow path, while subjecting the dirty filter media to the cleaning action of the backwash spray tips. Filtered water stored in the discfilter water collection tank is pumped to feed

the series of spray tips strategically installed on the moving arms of the backwash system. This serves to clean the entire surface of the filter media while limiting the use of filtered water in the process.

An outlet weir integral to the discfilter water collection tank is used to maintain the water. The backwash water will be directed to a dirty water holding tank to be pumped back to the Actiflo® process. Filtered water flows over the weir of the tank and out of the unit.

A chemical trolley is available to clean the unit in the case of chemical scaling due to high calcium concentration in the water (possibility to use an acidic wash to wash down any calcite that might precipitate on the discs cloth).

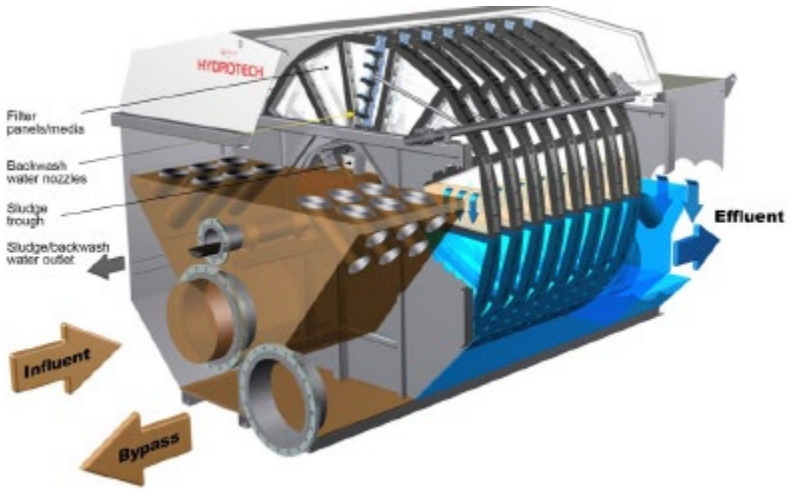

Figure 6 : Discfilter

2.1.6 pH Adjustment Tank

Treated waters (from discfilter) flow into a transfer tank where pH is adjusted if needed. Sulphuric acid will be used for pH adjustment in this tank. Water is then pumped to the water line pumping station. Details on the water line pumping station is presented in Appendix C.

2.1.7 Service Water System

The service water system will be sourced from the EWTP-WTC treated water tank. The description of the EWTP-WTC is presented in the approved reports: Design Report 6526-693-132-REP-001 and As-built Report 6526-693-132-REP-003. Below is a summary of EWTP-WTC description.

EWTP-WTC Summary

The purpose of the EWTP-WTC (ACP-700R) is to remove TSS from the influent water pumped from Collection Pont 1 (CP1). The equipment has an operational range of 6,250 to 28,000 m^3/d. The first treatment component consists of one Actiflo® clarifier with two (2) recirculation lines and two (2) hydrocyclones. The Actiflo® can be operated with one (1) or two (2) lines, depending on the influent flow rate and TSS content. The hydrocyclone overflow is sent to the Multiflo for sludge thickening. The

Multiflo overflows by gravity into a tank which is then pumped into the raw water Actiflo® inlet pipe for recirculation. The principal purpose of the Multiflo is to decrease the amount of water in the sludge. The Actiflo® overflow is designed to meet the Type A License (and MDMER) final effluent discharge criteria for TSS concentrations. The final effluent is monitored for pH, turbidity and flow rate, which are monitored continuously.

2.2 REAGENTS

The following reagents will be used at the SETP-WTC:

Coagulant injection: Aluminum Chloride

The coagulant used on site for the EWTP-WTC is dry poly-aluminum chloride. The same coagulant will be used for the SETP-WTC, reusing the same make-down system currently in operation. The dosage will be performed using mechanical diaphragm metering pumps.

Polymer makedown and Injection: Anionic Polymer

The use of a flocculation agent is essential for a TSS removal process in cold temperature. The selected polymer for this application is Hydrex 6105. Hydrex 6105 is a solid, anionic polymer used to enhance flocculation and will be received in 25 kg bags. The make-down system used in the current EWTP-WTC will be used in the new SETP-WTC as well. This automatic preparation make down system will be used to prepare a 0.05-0.3% solution. Warm water can be used if required for the polymer preparation. The solution will be dosed using mechanical metering pumps specifically designed for high viscosity products.

NaOH injection

Dry sodium hydroxide is a commodity and will be received in superbags of 1 m^3 at 100 % active content concentration. A solution targeted at 25% (w/w) will be prepared to reduce the risk associated with the exothermic reaction associated with NaOH dissolution and dosing of the dry powder to the water will be done in a way that limits heat production from the chemical make-down. An ambient temperature over 12 °C in the WTC will be required since 25% NaOH freezing point is at 12 °C. It is a hazardous product (class 8-corrosive) and will be handled accordingly. Note that the solution concentration may be adjusted depending on the process optimisation.

Hypochlorite Injection

Calcium hypochlorite solution will be used to oxidize ammonia (target concentration at 10% w/w). It will be received in 45 kg pails at a concentration of approximately 60-70% of active product. Solid will be transferred in a hopper by vacuum suction lances. Then, solid will be added with a screw conveyor in a dissolution reactor to prepare a 10% solution. This solution will be dosed from the distribution reaction to the chlorination reactor. Note that the solution concentration may be adjusted depending on the process optimisation.

Sulphuric Acid

Sulphuric acid is used for pH control in the chlorination reactor and before final discharge. The addition of hypochlorite has an impact on the pH of the solution. If any excess from the breakpoint chlorination was to react slightly slower than expected, the pH of the water will increase as the hypochlorite release

OH^- ions once the breakpoint is reached. An increase of the pH, for a water containing high calcium concentration, would result in calcite precipitation, affects the activated carbon efficiency and causes accumulation of solids within the water treatment chain. Sulphuric acid is a commodity and will be received in bulk containers of 1 m^3 at 93 % concentration. This product will be used as is. Sulphuric acid has a freezing point of -30 °C. It is a hazardous product (class 8-corrosive) and will be handled accordingly.

Powdered Activated Carbon

The Powdered Activated Carbon (PAC) is used for the removal of residual chlorine. It will be received in superbags. PAC is dosed into the process using the HydraCarb system, which is based on a gravimetric feeder, a wetting cone and an educator to transport the PAC slurry to the dosing points. Manual injection valves allow a split between each compartment of the dechlorination reactor and dosing of the PAC is controlled by the flow of water passing in the chlorination reactor.

Sodium Thiosulphate

Sodium Thiosulphate is used to quench the residual chlorine prior discharge to prevent residual toxicity. It will be received in superbag of 1 m^3 at 100% active contact as dry product. Dosage will be performed used dosing pumps in the dichlorination reactor. Dosage will be optimised to minimize residual chlorine the effluent.

Microsand

The presence of microsand in the Actiflo® allows for:

- An increase in the probability of encounters between particles;
- An increase in the exchange surface and consequently in the adsorption capacity compared to conventional flocculation; and
- The formation of solid and dense ballasted flocs which will resist an energetic stirring followed by rapid settling.

These properties lead to very short residence times for flocculation as well as settling, thus optimizing the process. The microsand is recycled in the process. During the operation, it is estimated that 2 to 5 g of microsand per cubic metre of raw water will be lost in the sludge. Therefore, approximately 3 g of microsand per cubic metre of raw water needs to be added. The microsand will be supplied in 22.68 kg bags and will be added manually to the Actiflo® as required, approximately once or twice a week (the dosage of sand is through batch addition).

The SDS sheets for all these chemicals are provided in Appendices C.

2.3 SOLID WASTE MANAGEMENT

Wastes

Chemical bags and containers will be managed accordingly to the site Hazardous Materials Management Plan.

Sludge from SETP-WTC and EWTP-WTC

Sludge produced in the SETP-WTC and EWTP-WTC system will be stored in the sludge tank prior to being disposed in saline contact water ponds according to the site Water Management Plan.

2.4 CONTROLS

The general control strategy is detailed in the P&ID in Appendix B and in the Functional Description in Appendix D. The SETP-WTC pump and dosing skid will be controlled by a series of sensors measuring levels, flows, pressures and water quality. Treated water will be monitored continuously for pH, turbidity and total chlorine. These analyzers will dictate if the treated water is sent to the water line or recirculated in the saline contact water storage area. Ammonia and TSS will be analyzed periodically in the treated effluent with a manual method to assess the treatment performance.

3 OPERATION AND MAINTENANCE

3.1 PUMPING

The system includes many pumps for the operation of the SETP-WTC. Some of these pumps are equipped with Variable Frequency Drives (VFD) that can be adjusted by the Operator or by an automatic system. In all cases, the pumps can only be started by the Operator.

All pumps are regularly inspected by the Operator who will ensure the pumps continue to operate efficiently and will address any deficiencies. If the pumps require maintenance, the Operator will report the situation and take appropriate action. Some of the pumps are installed with a standby unit that allows the Operator to switch from one pump to the other if necessary. In some situations, it may be necessary to temporarily shut down the SETP-WTC for servicing of the equipment.

A preventative maintenance program, as recommended by the pump suppliers, will be followed by the Maintenance Crew to ensure the pumps are always kept in good working order.

For the operation of the SETP-WTC, the following pumps and water lines installed outside the WTC building includes:

- Lines from the surface contact water and saline contact water storage areas to the pre-mixing pond;
- Raw water line from the pre-mixing pond to the SETP-WTC;
- Water line from the SETP-WTC to Melvin Bay;
- Recirculation line from SETP-WTC to the saline contact water storage area.

More information on the pump's maintenance operation and can be found in Appendix E and G.

3.2 MIXERS

Mixers are essential to batch chemicals and allow chemicals to react with contaminants during the treatment process. A series of mixers are included in the process (reactor tanks and Actiflo®). All mixers are regularly inspected by the Operator who will ensure they continue to operate efficiently and will address any deficiencies. If the mixer requires maintenance, the Operator will report the situation and take appropriate action. A preventative maintenance program, as recommended by the mixer suppliers, will be followed by the Maintenance Crew to ensure the mixers are always kept in good working order.

More information on the mixer maintenance operation and can be found in Appendix F.

3.3 REAGENT PREPARATION

The reagent preparation systems are fully automated system. The only requirement is to change the reagent bags when are empty or transfer calcium hypochlorite pails into the storage hoper. Daily verification of the dry reagent level will be performed by the Operator to ensure stable operation of the process.

Note that the activated carbon powder preparation area is in an explosion-proof area. Special handling procedure will be put in place.

During the daily inspection, the Operator will monitor the different reagent systems and prepare additional reagent, as required, according to the reagent preparation procedures in place. The water

levels in the chemical mixing and chemical distribution tanks are instrumented and monitored, which will ensure sufficient water is supplied to the reagent preparation systems. In the event of a lack of water supply, an alarm will occur to notify the Operator.

Preventive maintenance of the mechanical equipment will be performed according to the suppliers operating manual specifications.

More information on the chemical preparation system operation and maintenance can be found in Appendix F.

3.4 CLARIFIERS

The main elements per Actiflo clarifier are:

- Mixers (3)
- Rake/Scraper
- Lamella
- Hydrocyclones (2)
- Recirculation pumps (2)
- Sludge splitter box
- Sludge extraction pump

The Operator will ensure that these elements are operated appropriately during his daily inspection. If one element requires maintenance, the Operator will report the situation and take appropriate action. Lamella cleaning will need to be performed periodically to ensure optimal TSS removal.

Preventive maintenance of the mechanical equipment will be performed according to the suppliers operating manual specifications.

Sand concentration needs to be kept constant within the Actiflo, thus periodic sand concentration determination will be performed and in case of low concentration, bags of sand will be added manually in the process.

Hydrocyclone inspection needs to be performed periodically to ensure that the sand is recirculated within the process continually.

More information on the clarifier’s operation and maintenance can be found in Appendix F.

3.5 FILTRATION

Disk filtration is an automatic process. Continuous back wash is performed to keep a good filterability. If the filterability decrease, filter clothes changing or chemical cleaning maybe be required to be done by the OOperator.

Preventive maintenance of the mechanical equipment will be performed according to the supplier operating manual specifications.

More information on the disk filter operation and maintenance can be found in Appendix F.

3.6 TROUBLESHOOTING AND MAINTENANCE PROCEDURES

The sections below outline the general operational and maintenance procedures at the plant. Further details are available in the manufacturer's operating manuals in Appendix F.

The break point chlorination and dechlorination are the main process within the SETP-WTC. The dosage of chemical need to be adjusted to remove ammonia and residual chlorine. In case of loss of treatment, jar test needs to be performed to reassess dosage requirements. Inline analyzers need to be maintained calibrated also during the operation of the process.

The operation of the Actiflo® process is relatively simple and a visual inspection will determine whether the process is performing as expected.

The dosage of chemical need to be adjusted to remove TSS. In case of loss of treatment, jar test needs to be performed to reassess dosage requirements.

A critical component of the process for monitoring is the maturation tank. The agitator of this tank is equipped with a VFD and the speed is adjusted to obtain a gentle mixing in this tank. When the process is operated correctly, big flocs of about 5 mm are visible in the tank and moving slowly. The agitation must be adjusted in a way that the flocs are maintained in suspension and not broken down. The water between the flocs should look clear. If flocs are visible but the water is cloudy, it is an indication that the coagulant dosage is insufficient. If the water is clear but the flocs are small, it is an indication that the flocculant addition is insufficient.

The system must also contain enough microsand to obtain flocs that are heavy enough to sink in the clarifier section. If large flocs are visible but are present at the top of the clarifier, this is an indication of insufficient microsand. Usually, the microsand load is maintained by adding one bag at a time. The frequency of the addition of microsand is determined by trial and error. There is no environmental issue with an excessive addition since it would be compensated by an increased loss within the sludge.

The hydrocyclone is also an important part of the system since it allows the microsand to be recycled in the system. The underflow of the cyclone should never be blocked, and the flow should have an umbrella shape.

The filtration system is also simple to operate, and the back wash is continuously performed. In case of poor filterability, section of the filter clothes maybe be changed, and chemical cleaning may be required.

3.7 EFFLUENT QUALITY CONTROL

The Operator will conduct regular inspections of the entire operating system to ensure it operates as intended. Any upset condition will be reported, and corrective actions will be applied accordingly. The OOperator will also record process key values that will allow the process to be optimized and any discrepancies between the process and expected performances to be detected.

The quality of the final effluent is monitored on a continuous basis by pH, conductivity, total chlorine and turbidity (Nephelometric Turbidity Unit (NTU)) probes. The turbidity measurement is an indirect indication of the TSS in the water and will be used to infer the effluent TSS. The output of these instruments will send an alarm indicating that the levels are higher than the set point, but lower than the maximum discharge criteria. This allows the Operator to act on the process before the limit is

exceeded. In the event that the discharge limit is about to be reached, a second alarm will send a signal to actuated valves allowing an automatic diversion of the effluent to saline contact water storage area before discharge limits are breached.

The final effluent will be sampled for water quality following the frequency and parameters stipulated in the Metal & Diamond Mining Effluent Regulations (MDMER) and sent to a certified laboratory for analysis. The results generated by the laboratory will be compared with those obtained with the plant instrumentation to detect any deviations. All the probes and instrumentation within the plant will be calibrated and serviced as per the preventative maintenance program.

As stipulated in the MDMER, the final effluent discharged shall not exceed a pH range between 6.0 and 9.5 or a maximum average concentration for TSS of 15 mg/L, and a maximum of 30 mg/L for a grab sample. The sample should not be acutely toxic.

Internal analysis will be performed at different locations of the process to measure TSS, ammonia, free and total chlorine with inline analyzers and handheld analyzers to assess process efficiency. Appendix G presents handheld protocol for chlorine and ammonia.

3.8 MONITORING

To ensure efficiency of SETP-WTC, samples of water will be collected, and inspections must be completed periodically.

The break point chlorination monitoring needs to be done regularly to avoid any overdosing of chlorine. This monitoring consists of verification of pH, ammonia, total and free chorine concentrations.

In the dechlorination step, pH, ammonia, total and free chorine concentrations also needs to be done regularly.

In the clarifications and filtration steps, TSS (and turbidity) will be performed periodically.

Table 3 presents the daily operation task that SETP-WTC Operator should perform.

Every day, items 1 to 4 should be performed by the Operator to ensure an optimal operation. Item 5 of Table 1 will be periodically performed according to the supplier recommendations. This preventive maintenance will allow maintaining good operation.

Table 1 : Routine Operation and Maintenance checkups[1]

Item	Item	Action	Comments
[1] Process parameter	Flow rate	Daily	-
	Flow rate totalizer	Daily	Volume discharge
	Feed water turbidity and TSS	Daily	For chemical dosing adjustment
	Feed water pH & conductivity	Daily	For chemical dosing adjustment
	Feed water ammonia	Daily	For chemical dosing adjustment
	Treated water turbidity and TSS	Daily	Quality control
	Treated water pH, conductivity	Daily	Quality control
	Treated water ammonia & Chlorine	Daily	
	Duration of the operation	Daily	-
	Actiflo sludge solid percentage	Weekly	Process performance
	Water Quality	Daily	Process performance – at different locations of the process to assess efficiency
	Volume of sludge produced	Daily	Process performance
	Ponds Levels	Daily	Raw water quantity
	Sand concentration	Daily	Process performance
[2] Chemical	Security and PPE	Daily	Verify/use PPI and security procedure to manipulate chemical
	Coagulant set point	Daily	Chemical consumption
	Polymer anionic set point	Daily	Chemical consumption
	Hypochlorite set point	Daily	Chemical consumption
	Maturation mixer speed	Daily	
	Caustic set point	Daily	Chemical consumption
	Thiosulfate set point	Daily	Chemical consumption
	Activated carbon Set point	Daily	Chemical consumption
	Acid set point	Daily	Chemical consumption
	Level of chemical	Daily	Chemical consumption & preparation
	Dosing pumps	Daily	Calibration if needed
	Chemical inventory	Weekly	Storage & reorder if needed
	Waste disposal	Daily	
	Lab inventory	Weekly	Storage & reorder if needed
[3] Environment	Weather	Daily	-
	Temperature of water	Daily	-
[4] Mechanical	Complete Visual Inspection before Start-Up	Before start up	Complete a good inspection before operating. Ensure that no alarms are active on the HMI. Ensure equipment are in good order, with no leaks and all safety devices are in place.
	Complete Inspection after Start-Up or during every shift	Daily	Complete a good inspection while in operation. Ensure that no strange noises are audible. Make sure auxiliary equipment (valves & level probe) and PLC operate correctly. Look, Listen, Smell, and Feel.

[1] Non-exhaustive list – will be updated during commissioning and operation

[4] Mechanical	Water Flow comparison	Daily	Compare flowmeter VS water level
	Pressure	Daily	Feed and discharge line. Process water
	Visual Leak On Piping	Daily	Ensure not water leaks are visible on the piping
	Feed, recirculation and discharge lines	Routinely	Ensure no leaks
	Sump Level	Daily	Ensure sump is empty
	Pumps inspection	Daily	Visual
	Manual Valve	Daily	Ensure manual valves are the appropriate positions
	Building	Daily	Ensure the wall exhaust fans are operational. Excess of humidity must be evacuated outside.
	PLC functionality - alarm	Daily	No abnormal operation. Solve each alarm
	Filter	Daily	No clogging – change filter, chemical cleaning
[5] Maintenance	Lamella cleaning	As needed	Clean lamella when SETP-WTC is offline
	Hydrocyclone wear parts replacement	As needed	According to supplier
	Dosing pump	As needed	Inspect wear parts
	Process pumps, Dosing pumps, rakes, mixers, pumps, compressor, dosing screws, safety shower, fire extinguisher, water heater maintenance	Periodically,	According to supplier recommendations. In case of major maintenance or malfunction, use standby equipment if possible. Critical spare parts will be kept in inventory for critical processes
	Instrumentation calibration	Weekly or when required	Turbidity meter, pH meter, etc. According to supplier recommendations
	Instrument cleaning	Periodically	Turbidity meter, pH meter etc., According to supplier recommendations
	Motor oil change, greasing and changing bearings	Periodically	According to supplier recommendations
	Winterization	Fall	Flush – drain – clean equipment, dosing skid cleaning, instrumentation (leaning, disconnecting and draining if needed), air network to be purged, shut down power.

3.9 RECORD KEEPING

Records of the operational, maintenance and sampling procedures (daily log sheet) will be accessible to assist in the evaluation of the SETP-WTC performance. Details of any maintenance undertaken will also be recorded.

The volume, pH, turbidity total chlorine and temperature of effluent discharged to environment will be recorded on a continuous basis. The data will be saved on a network database.

3.10 SAFETY PROCEDURES FOR OPERATORS

Operators working in the WTC facility must be trained prior to work so that they are aware of the health and safety risks as well as the operational procedures associated with the EWTP-WTC and SETP-WTC. The following are important safety considerations:

- Working with non-treated water requires adequate personal protective equipment (PPE) for Operators. This includes wearing steel toed boots, hard hat, safety glasses and gloves.
- Working with chemical requires adequate personal protective equipment (PPE) for Operators. This includes wearing chemical resistant gloves, tychem, half and full-face respirator as needed. Relying on buddy system when needed will also be required.
- Operators are required to conduct good housekeeping of the working area to minimize the risk of incidents.
- Lock-out/tag-out procedures must be applied when servicing equipment.
- The SDS for reagents used in the WTC will be readily available for the Operator at all times.
- Eyewash stations and safety showers are located within proximity of reagent systems in the WTC.

3.11 CONTROLLING ACCESS TO THE WTC

Access to the WTC will be restricted to authorized personnel only. Signs will be posted at the WTC entrance.

4 EMERGENCY RESPONSE

4.1 FIRE

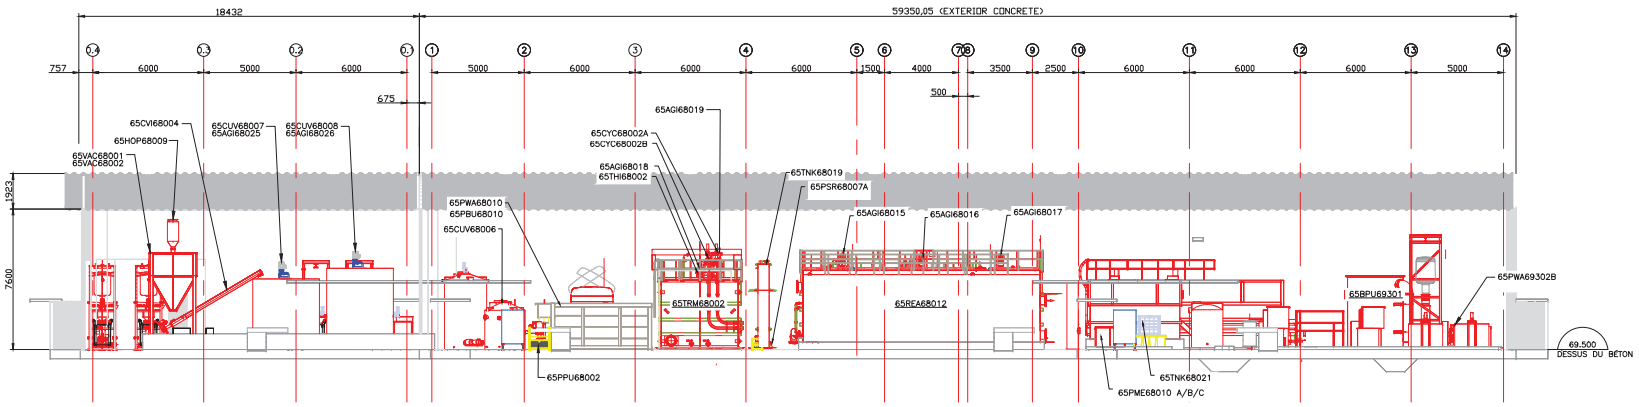
In case of fire at the WTC, the on-site Emergency Response Team (ERT) will be notified as per Agnico Eagle's protocol. Instructions from the on-site ERT will be followed by all personnel at the WTC. Further details of fire response are provided in the "*Risk Management & Emergency Response Plan*". The WTC will include the necessary fire safety protection measures in accordance with the Nunavut and North West Territories Mine Act.

4.2 SPILL

Spill kits and the necessary secondary containment will be provided within the building of the WTC. In the event of a spill at the WTC, the Environment Department will be notified immediately and provide support, as required. If a large spill occurs, the on-site ERT will be notified as per Agnico Eagle's protocol. Instructions from the ERT will be followed by all personnel at the WTC. A spill kit will be available at the WTC. Further details regarding the site spill response procedure are provided in the "*Spill Contingency Plan"*.

4.3 PLANT MALFUNCTION

If there is a major problem or failure in the SETP-WTC, it will be likely be from a problem with the reagent addition systems caused by the malfunction of the pump, a major change of water chemistry, or due to a cyclone blockage on the sludge reclaim system.



In the case of an operational upset, the most likely consequence will be an increase of TSS or ammonia or chlorine in the effluent. This would be managed by the process control systems in place, which will automatically divert the flow to the saline contact water area (recirculation mode). In such an event, the problem will be investigated while the system is operated in closed circuit. Once the problem is resolved and the water quality returns to concentrations within discharge criteria, the valves will be re-opened to allow discharge to environment.

In the case of a cyclone underflow blockage, the microsand will be completely lost to the rejected sludge. New sand will then need to be added once the issue resolved.

Appendix C

SAFETY DATA SHEET

1. Identification

Product identifier **HYDREX 3267**

Other means of identification None.

Recommended use Potable Water Treatment

Recommended restrictions PROFESSIONAL USE ONLY

Manufacturer/Importer/Supplier/Distributor information

Supplier Veolia Water Technologies Canada Inc.

Address 2000 Argentia Road, Plaza IV, Suite 430
Mississauga, ON L5N 1W1
Canada

Contact Person Hydrex Product Specialist

Telephone (905) 286-4846

Fax (905) 286-0488

e-mail vwtcanada-hydrex@veolia.com

24-Hour Emergency telephone +1-760-476-3962 (Code:333239)

Supplier Not available.

2. Hazard(s) identification

Physical hazards Not classified.

Health hazards Not classified.

Environmental hazards Hazardous to the aquatic environment, acute hazard Category 3

Label elements

Hazard symbol None.

Signal word None.

Hazard statement Harmful to aquatic life.

Precautionary statement

Prevention Avoid release to the environment.

Response Wash hands after handling.

Storage Store in cool place. Protect from sunlight. Store away from incompatible materials.

Disposal Dispose of contents/container to an appropriate treatment and disposal facility in accordance with applicable laws and regulations, and product characteristics at time of disposal.

Other hazards None known.

Supplemental information None.

3. Composition/information on ingredients

Mixtures

Chemical name	Common name and synonyms	CAS number	%
ALUMINUM, WATER SOLUBLE SALTS, N.O.S.		39290-78-3	95
Other components below reportable levels			5

All concentrations are in percent by weight unless ingredient is a gas. Gas concentrations are in percent by volume.

4. First-aid measures

Inhalation Move to fresh air. Call a physician if symptoms develop or persist.

Skin contact Wash off with soap and water. Get medical attention if irritation develops and persists.

Eye contact Do not rub eyes. Rinse with water. Get medical attention if irritation develops and persists.

Ingestion	Rinse mouth. Get medical attention if symptoms occur.
Most important symptoms/effects, acute and delayed	Dusts may irritate the respiratory tract, skin and eyes.
Indication of immediate medical attention and special treatment needed	Treat symptomatically.
General information	Ensure that medical personnel are aware of the material(s) involved, and take precautions to protect themselves.

5. Fire-fighting measures

Suitable extinguishing media	Water fog. Foam. Dry chemical powder. Carbon dioxide (CO2).
Unsuitable extinguishing media	Not available.
Specific hazards arising from the chemical	During fire, gases hazardous to health may be formed.
Special protective equipment and precautions for firefighters	Self-contained breathing apparatus and full protective clothing must be worn in case of fire.
Fire fighting equipment/instructions	Use water spray to cool unopened containers.
Specific methods	Use standard firefighting procedures and consider the hazards of other involved materials.
General fire hazards	No unusual fire or explosion hazards noted.

6. Accidental release measures

Personal precautions, protective equipment and emergency procedures	Keep unnecessary personnel away. Keep people away from and upwind of spill/leak. Wear appropriate protective equipment and clothing during clean-up. Ensure adequate ventilation. Local authorities should be advised if significant spillages cannot be contained. For personal protection, see section 8 of the SDS.
Methods and materials for containment and cleaning up	Avoid the generation of dusts during clean-up. Collect dust using a vacuum cleaner equipped with HEPA filter. Prevent product from entering drains. Large Spills: Stop the flow of material, if this is without risk. Shovel the material into waste container. Following product recovery, flush area with water. Small Spills: Sweep up or vacuum up spillage and collect in suitable container for disposal. For waste disposal, see section 13 of the SDS.
Environmental precautions	Avoid release to the environment. Inform appropriate managerial or supervisory personnel of all environmental releases. Prevent further leakage or spillage if safe to do so. Avoid discharge into drains, water courses or onto the ground.

7. Handling and storage

Precautions for safe handling	Minimize dust generation and accumulation. Provide appropriate exhaust ventilation at places where dust is formed. Wear appropriate personal protective equipment. Avoid release to the environment. Observe good industrial hygiene practices.
Conditions for safe storage, including any incompatibilities	Store in original tightly closed container. Store in a well-ventilated place. Store away from incompatible materials (see Section 10 of the SDS).

8. Exposure controls/personal protection

Occupational exposure limits

US. ACGIH Threshold Limit Values

Material	Type	Value	Form
HYDREX 3267	TWA	1 mg/m3	Respirable fraction.

Canada. Alberta OELs (Occupational Health & Safety Code, Schedule 1, Table 2)

Material	Type	Value
HYDREX 3267	TWA	2 mg/m3

Canada. British Columbia OELs. (Occupational Exposure Limits for Chemical Substances, Occupational Health and Safety Regulation 296/97, as amended)

Material	Type	Value	Form
HYDREX 3267	TWA	1 mg/m3	Respirable.

Canada. Ontario OELs. (Control of Exposure to Biological or Chemical Agents)

Material	Type	Value	Form
HYDREX 3267	TWA	1 mg/m3	Respirable fraction.

Canada. Quebec OELs. (Ministry of Labor - Regulation Respecting the Quality of the Work Environment)

Material	Type	Value
HYDREX 3267	TWA	2 mg/m3

Biological limit values No biological exposure limits noted for the ingredient(s).

Appropriate engineering controls If material is ground, cut, or used in any operation which may generate dusts, use appropriate local exhaust ventilation to keep exposures below the recommended exposure limits.

Individual protection measures, such as personal protective equipment

Eye/face protection Wear safety glasses with side shields (or goggles) and a face shield. Chemical goggles and face shield are recommended. Before any handling, wear protective glasses side-shields complying with the NF EN 166.

Skin protection

Hand protection Chemical resistant gloves.

Other Wear suitable protective clothing. Chemical resistant gloves.

Respiratory protection Wear respirator with dust filter.

Thermal hazards Wear appropriate thermal protective clothing, when necessary.

General hygiene considerations Always observe good personal hygiene measures, such as washing after handling the material and before eating, drinking, and/or smoking. Routinely wash work clothing and protective equipment to remove contaminants.

9. Physical and chemical properties

Appearance Powder.

Physical state Solid.

Form Powder.

Color Pale yellow

Odor Slight

Odor threshold Not available.

pH 3 - 5 (0.3% solution)

Melting point/freezing point 10.4 °F (-12 °C) (33% solution)

Initial boiling point and boiling range Not available.

Flash point Not available.

Evaporation rate Not available.

Flammability (solid, gas) Not available.

Upper/lower flammability or explosive limits

Flammability limit - lower (%) Not available.

Flammability limit - upper (%) Not available.

Explosive limit - lower (%) Not available.

Explosive limit - upper (%) Not available.

Vapor pressure Not available.

Vapor density Not available.

Relative density Not available.

Solubility(ies)

Solubility (water)	Easily soluble in cold water.
Partition coefficient (n-octanol/water)	Not available.
Auto-ignition temperature	Not available.
Decomposition temperature	Not available.
Viscosity	Not available.

Other information

Density	800.00 - 900.00 kg/m3
Explosive properties	Not explosive.
Oxidizing properties	Not oxidizing.
Specific gravity	0.8 - 0.9

10. Stability and reactivity

Reactivity	The product is stable and non-reactive under normal conditions of use, storage and transport.
Chemical stability	Material is stable under normal conditions.
Possibility of hazardous reactions	No dangerous reaction known under conditions of normal use.
Conditions to avoid	Contact with incompatible materials. None under normal conditions.
Incompatible materials	Ammonia. Chlorine. Do not mix with other chemicals. Alkalies.
Hazardous decomposition products	Aluminum and Sulfur oxides.

11. Toxicological information

Information on likely routes of exposure

Inhalation	Dust may irritate respiratory system.
Skin contact	Dust or powder may irritate the skin.
Eye contact	Dust may irritate the eyes.
Ingestion	Expected to be a low ingestion hazard.
Symptoms related to the physical, chemical and toxicological characteristics	Dusts may irritate the respiratory tract, skin and eyes.

Information on toxicological effects

Acute toxicity	Not available.
Skin corrosion/irritation	Prolonged skin contact may cause temporary irritation.
Serious eye damage/eye irritation	Direct contact with eyes may cause temporary irritation.

Respiratory or skin sensitization

Respiratory sensitization	Not a respiratory sensitizer.
Skin sensitization	This product is not expected to cause skin sensitization.
Germ cell mutagenicity	No data available to indicate product or any components present at greater than 0.1% are mutagenic or genotoxic.
Carcinogenicity	Not available.
Reproductive toxicity	This product is not expected to cause reproductive or developmental effects.
Specific target organ toxicity - single exposure	Not classified.
Specific target organ toxicity - repeated exposure	Not classified.
Aspiration hazard	Not an aspiration hazard.

12. Ecological information

Ecotoxicity	Harmful to aquatic life.

Product		Species	Test Results
HYDREX 3267			
Aquatic			
Crustacea	EC50	Daphnia	91.5789 mg/l, 48 hours estimated
Acute			
Algae	EC50	Algae	14 mg/l, 72 hours OCDE TG 201

* Estimates for product may be based on additional component data not shown.

Persistence and degradability

Bioaccumulative potential No data available.

Mobility in soil No data available.

Other adverse effects No other adverse environmental effects (e.g. ozone depletion, photochemical ozone creation potential, endocrine disruption, global warming potential) are expected from this component.

13. Disposal considerations

Disposal instructions Collect and reclaim or dispose in sealed containers at licensed waste disposal site. Do not allow this material to drain into sewers/water supplies. Do not contaminate ponds, waterways or ditches with chemical or used container. Dispose of contents/container in accordance with local/regional/national/international regulations.

Local disposal regulations Dispose in accordance with all applicable regulations.

Hazardous waste code The waste code should be assigned in discussion between the user, the producer and the waste disposal company.

Waste from residues / unused products Dispose of in accordance with local regulations. Empty containers or liners may retain some product residues. This material and its container must be disposed of in a safe manner (see: Disposal instructions).

Contaminated packaging Since emptied containers may retain product residue, follow label warnings even after container is emptied. Empty containers should be taken to an approved waste handling site for recycling or disposal.

14. Transport information

TDG

Not regulated as dangerous goods.

IATA

Not regulated as dangerous goods.

IMDG

Not regulated as dangerous goods.

Transport in bulk according to Annex II of MARPOL 73/78 and the IBC Code Not applicable.

15. Regulatory information

Canadian regulations This product has been classified in accordance with the hazard criteria of the HPR and the SDS contains all the information required by the HPR.

Controlled Drugs and Substances Act

Not regulated.

Export Control List (CEPA 1999, Schedule 3)

Not listed.

Greenhouse Gases

Not listed.

Precursor Control Regulations

Not regulated.

International regulations Additional information is given in the Safety Data Sheet.

Stockholm Convention

Not applicable.

Rotterdam Convention

Not applicable.

Kyoto protocol

Not applicable.

Montreal Protocol

Not applicable.

Basel Convention

Not applicable.

International Inventories

Country(s) or region	Inventory name	On inventory (yes/no)*
Australia	Australian Inventory of Chemical Substances (AICS)	No
Canada	Domestic Substances List (DSL)	Yes

Fournisseur Non disponible.

2. Identification des dangers

Dangers physiques Non classé.

Dangers pour la santé Non classé.

Dangers environnementaux Dangereux pour le milieu aquatique, danger aigu Catégorie 3

Éléments d'étiquetage

Symbole de danger Aucune.

Mention d'avertissement Aucune.

Mention de danger Nocif pour les organismes aquatiques.

Conseil de prudence

Prévention Éviter le rejet dans l'environnement.

Intervention Se laver les mains après utilisation.

Stockage Stocker dans un endroit frais. Protéger du rayonnement solaire. Conserver à l'écart de matières incompatibles.

Élimination Éliminer le contenu/contenant dans une installation appropriée de traitement et d'élimination conformément aux lois et règlements applicables, ainsi qu'en fonction des caractéristiques du produit au moment de l'élimination.

Autres dangers Aucun(e) connu(e).

Renseignements supplémentaires Aucune.

3. Composition/information sur les ingrédients

Mélanges

Dénomination chimique	Nom commun et synonymes	Numéro d'enregistrement CAS	%
ALUMINIUM , WATER SOLUBLE SALTS, n.s.a.		39290-78-3	95
Autres composant sous les niveaux à déclarer			5

Toutes les concentrations sont en pourcentage en poids, sauf si l'ingrédient est un gaz. Les concentrations des gaz sont er pourcentage en volume.

4. Premiers soins

Inhalation	Transporter à l'extérieur. Appeler un médecin si des symptômes se développent ou persistent
Contact avec la peau	Laver avec de l'eau et du savon. Consulter un médecin si une irritation se développe et persiste.
Contact avec les yeux	Ne pas se frotter les yeux. Rincer avec de l'eau. Consulter un médecin si une irritation se développe et persiste.
Ingestion	Rincer la bouche. Consulter un médecin si des symptômes apparaissent.
Symptômes et effets les plus importants, qu'ils soient aigus ou retardés	La poussière peut irriter les voies respiratoires, la peau et les yeux.
Mention de la nécessité d'une prise en charge médicale immédiate ou d'un traitement spécial, si nécessaire	Traiter de manière symptomatique.
Informations générales	S'assurer que le personnel médical est averti du (des) produits(s) en cause et qu'il prend des mesures pour se protéger.

5. Mesures à prendre en cas d'incendie

Agents extincteurs appropriés	Brouillard d'eau. Mousse. Poudre chimique. Dioxyde de carbone (CO2).
Agents extincteurs inappropriés	Non disponible.
Dangers spécifiques du produit dangereux	Des gaz dangereux pour la santé peuvent se former pendant un incendie.
Équipements de protection spéciaux et précautions spéciales pour les pompiers	Porter un appareil respiratoire autonome et un vêtement de protection complet en cas d'incendie.
Équipement/directives de lutte contre les incendies	Utiliser une pulvérisation d'eau pour refroidir les récipients fermés.
Méthodes particulières d'intervention	Utiliser des procédures standard en cas d'incendie et tenir compte des dangers des autres substances en cause.
Risques d'incendie généraux	Aucun risque inhabituel d'incendie ou d'explosion observé.

6. Mesures à prendre en cas de déversement accidentel

Précautions individuelles, équipements de protection et mesures d'urgence	Tenir à l'écart le personnel non requis. Ternir les gens à l'écart de l'endroit du déversement/de la fuite et en amont du vent. Porter un équipement et des vêtements de protection appropriés durant le nettoyage. S'assurer une ventilation adéquate. Prévenir les autorités locales si des fuites significatives ne peuvent pas être contenues. Pour la protection individuelle, voir la section 8 de la FDS.
Méthodes et matériaux pour le confinement et le nettoyage	Éviter la formation de poussières pendant le nettoyage. Récupérer la poussière en utilisant un aspirateur muni d'un filtre HEPA. Empêcher le produit de pénétrer dans les égouts. Déversements importants : Arrêter l'écoulement de la substance, si cela peut se faire sans risque. Pelleter le matériau dans un conteneur à déchets. Après avoir récupéré le produit, rincer la zone à l'eau. Déversements peu importants : Balayer ou aspirer le déversement et mettre dans un récipient approprié pour élimination. Pour l'élimination des déchets, voir la section 13 de la FDS.
Précautions relatives à l'environnement	Éviter le rejet dans l'environnement. Informer le personnel de direction et de supervision de tous les rejets dans l'environnement. Empêcher d'autres fuites ou déversements lorsqu'il est possible de le faire en toute sécurité. Éviter le rejet dans les égouts, les cours d'eau ou sur le sol.

7. Manutention et stockage

Précautions relatives à la sûreté en matière de manutention	Minimiser la formation et l'accumulation de poussière. Assurer une ventilation aspirante adéquate aux endroits où la poussière se forme. Porter un équipement de protection individuelle approprié. Éviter le rejet dans l'environnement. Observer de bonnes pratiques d'hygiène industrielle.
Conditions de sûreté en matière de stockage, y compris les incompatibilités	Stocker dans des récipients d'origine fermés de manière étanche. Stocker dans un endroit bien ventilé. Stocker à l'écart des matériaux incompatibles (Consulter la section 10 de la FDS).

8. Contrôle de l'exposition/protection individuelle

Limites d'exposition professionnelle

ÉTATS-UNIS. Valeurs limites d'exposition de l'ACGIH

Substance	Type	Valeur	Forme
HYDREX 3267	TWA	1 mg/m3	Fraction respirable.

Canada. LEMT pour l'Alberta (Code de l'hygiène et de la sécurité au travail, Annexe 1, Tableau 2)

Substance	Type	Valeur
HYDREX 3267	TWA	2 mg/m3

Canada. LEMT pour la Colombie-Britannique. (Valeurs limites d'exposition en milieu de travail pour les substances chimiques, Réglementation sur la santé et sécurité au travail 296/97, ainsi modifiée

Substance	Type	Valeur	Forme
HYDREX 3267	TWA	1 mg/m3	Respirable.

Canada. LEMT pour l'Ontario. (Contrôle de l'exposition à des agents biologiques et chimiques)

Substance	Type	Valeur	Forme
HYDREX 3267	TWA	1 mg/m3	Fraction respirable.

Canada. LEMT du Québec, (Ministère du Travail. Règlement sur la qualité du milieu de travail)

Substance	Type	Valeur
HYDREX 3267	TWA	2 mg/m3

Valeurs biologiques limites Aucune limite d'exposition biologique observée pour les ingrédients.

Contrôles d'ingénierie appropriés Si le matériau est moulu, coupé ou utilisé dans toute opération susceptible de créer des poussières, utiliser une ventilation locale par aspiration appropriée pour maintenir les expositions sous les limites d'exposition recommandées.

Mesures de protection individuelle, telles que les équipements de protection individuelle

Protection du visage/des yeux Porter des lunettes de sécurité à écrans latéraux (ou des lunettes à coques) et un écran facial. Il est recommandé de porter des lunettes de protection chimique et un écran facial. Avant toute manipulation, il est nécessaire de porter des lunettes à protection latérale conformes à la norme NF EN 166.

Protection de la peau

Protection des mains Gants résistants aux produits chimiques.

Autre Porter un vêtement de protection approprié. Gants résistants aux produits chimiques.

Protection respiratoire Porter un appareil respiratoire muni de filtres antipoussière.

Dangers thermiques Porter des vêtements de protection thermique appropriés, au besoin.

Considérations d'hygiène générale Toujours adopter de bonnes pratiques d'hygiène personnelle, comme se laver après avoir manipulé la substance et avant de manger, de boire ou de fumer. Laver régulièrement les vêtements de travail et l'équipement de protection pour éliminer les contaminants

9. Propriétés physiques et chimiques

Apparence Poudre.

État physique Solide.

Forme Poudre.

Couleur Jaune pâle

Odeur Léger

Seuil olfactif Non disponible.

pH 3 - 5 (0.3% solution)

Point de fusion et point de congélation -12 °C (10.4 °F) (33% solution)

Point initial d'ébullition et domaine d'ébullition Non disponible.

Point d'éclair Non disponible.

Taux d'évaporation Non disponible.

Inflammabilité (solides et gaz)	Non disponible.
Limites supérieures et inférieures d'inflammabilité ou d'explosibilité	
Limites d'inflammabilité - inférieure (%)	Non disponible.
Limites d'inflammabilité - supérieure (%)	Non disponible.
Limite d'explosibilité - inférieure (%)	Non disponible.
Limite d'explosibilité - supérieure (%)	Non disponible.
Tension de vapeur	Non disponible.
Densité de vapeur	Non disponible.
Densité relative	Non disponible.
Solubilité	
Solubilité (eau)	Facilement soluble dans l'eau froide.
Coefficient de partage n-octanol/eau	Non disponible.
Température d'auto-inflammation	Non disponible.
Température de décomposition	Non disponible.
Viscosité	Non disponible.
Autres informations	
Densité	800.00 - 900.00 kg/m3
Propriétés explosives	Non explosif.
Propriétés comburantes	Non oxydant.
Densité	0.8 - 0.9

10. Stabilité et réactivité

Réactivité	Le produit est stable et non réactif dans des conditions normales d'utilisation, d'entreposage et de transport.
Stabilité chimique	La substance est stable dans des conditions normales.
Risque de réactions dangereuses	Aucune réaction dangereuse connue dans des conditions normales d'utilisation.
Conditions à éviter	Contact avec des matériaux incompatibles. Aucun(e) dans des conditions normales.
Matériaux incompatibles	Ammoniac. Chlore Ne pas mélanger avec d'autres produits chimiques. Alcalis.
Produits de décomposition dangereux	Aluminium et Oxydes de soufre.

11. Données toxicologiques

Renseignements sur les voies d'exposition probables

Inhalation	La poussière peut irriter l'appareil respiratoire.
Contact avec la peau	La poussière ou la poudre peut irriter la peau.
Contact avec les yeux	La poussière peut irriter les yeux.
Ingestion	Faible danger présumé en cas d'ingestion.
Les symptômes correspondant aux caractéristiques physiques, chimiques et toxicologiques	La poussière peut irriter les voies respiratoires, la peau et les yeux.

Renseignements sur les effets toxicologiques

Toxicité aiguë	Non disponible.
Corrosion cutanée/irritation cutanée	Un contact prolongé avec la peau peut causer une irritation temporaire.

Lésions oculaires graves/irritation oculaire Le contact direct avec les yeux peut causer une irritation temporaire.

Sensibilisation respiratoire ou cutanée

Sensibilisation respiratoire Pas un sensibilisant respiratoire.

Sensibilisation cutanée On ne s'attend pas à ce que ce produit provoque une sensibilisation cutanée.

Mutagénicité sur les cellules germinales Il n'existe pas de données qui indiquent que ce produit, ou tout composant présent à des taux de plus de 0,1 %, soit mutagène ou génétoxique.

Cancérogénicité Non disponible.

Toxicité pour la reproduction On ne s'attend pas à ce que ce produit présente des effets sur la reproduction ou le développement.

Toxicité pour certains organes cibles - exposition unique Non classé.

Toxicité pour certains organes cibles - expositions répétées Non classé.

Danger par aspiration Pas un danger par aspiration.

12. Données écologiques

Écotoxicité Nocif pour les organismes aquatiques.

Produit		Espèces	Résultats d'épreuves
HYDREX 3267			
Aquatique			
Crustacés	CE50	Daphnia	91.5789 mg/l, 48 heures estimation
Aiguë			
Algues	CE50	Algues	14 mg/l, 72 heures OCDE TG 201

* Les estimations pour le produit peuvent être basées sur d'autres données de composants non montrées.

Persistance et dégradation

Potentiel de bioaccumulation Aucune donnée disponible.

Mobilité dans le sol Aucune donnée disponible.

Autres effets nocifs On ne s'attend pas à ce que ce composant ait des effets néfastes sur l'environnement (par ex., appauvrissement de la couche d'ozone, potentiel de formation photochimique d'ozone, perturbation endocrinienne, potentiel de réchauffement de la planète).

13. Données sur l'élimination

Instructions pour l'élimination Recueillir et réutiliser ou éliminer dans des récipients scellés dans un site d'élimination des déchets autorisé. Ne pas laisser la substance
s'infiltrer dans les égoûts/les conduits d'alimentation en eau. Ne pas contaminer les étangs, les voies navigables ou les fossés avec le produit ou le récipient utilisés. Éliminer le contenu/récipient conformément à la réglementation locale/régionale/nationale/internationale.

Règlements locaux d'élimination Détruire conformément à
toutes les réglementations applicables.

Code des déchets dangereux Les codes de déchets doivent être attribués dans le cadre d'une consultation entre l'utilisateur, le fabricant et l'entreprise de décharge.

Déchets des résidus / produits non utilisés Éliminer conformément à la réglementation locale. Les récipients ou pochettes vides peuvent conserver certains résidus de produit. Éliminer ce produit et son récipient d'une manière sûre (voir : instructions d'élimination).

Emballages contaminés Comme les récipients vides peuvent contenir un résidu du produit, suivre les avertissements de l'étiquette, même une fois le récipient vide. Les contenants vides doivent être acheminés vers une installation certifiée de traitement des déchets en vue de leur élimination ou recyclage.

14. Informations relatives au transport

TMD

N'entre pas dans la réglementation des marchandises dangereuses.

IATA

N'entre pas dans la réglementation des marchandises dangereuses.

IMDG

N'entre pas dans la réglementation des marchandises dangereuses.

Transport en vrac selon l'Annexe II de MARPOL 73/78 et le recueil IBC Sans objet.

Coagulant
Water Clarification - Polyaluminum Chloride

Description and Use

Hydrex 3267 is a highly effective polyaluminum chloride based coagulant, supplied in solid form. This product provides a most concentrated form of active aluminum and is a cost-efficient approach where bulk delivery of liquid product is not an option.

Advantages

Hydrex 3267 provides the performance well associated with polyaluminum chloride coagulant chemistry in a most concentrated form. Reduced transportation costs, the elimination of bulk storage footprint or the elimination of tote IBC management issues are benefits associated with this form of polyaluminum chloride.

Application Information

Hydrex 3267 is rehydrated to a 33 percent (by weight) solution, prior to dosing to the system. Contact your Hydrex representative to provide verification of the active aluminum concentration of this solution.

Rehydration of Hydrex 3267 to a 33% solution should be performed with th highest quality water available. Dissolution is best acheived through use of warm water to a temperature limit of 70 degrees celsius. While complete dissolution is attainable at lower temperature, additional mixing time may be required. Take care to add the dry Hydrex 3267 in a controlled flow of the powder. Avoid "dumping" large mass of Hydrex 3267 that is disportionately greater to the mass of dilution water.

Hydrex 3267 is to be stored in a cool, dry location. Keep shipping containers unopened until required for use. For best results, Hydrex 3267 should be stored in conditons in which relative humidity does not exceed 30%. Storage temperature should not exceed 30 degrees celsius. Environmental control systems are recommended for optimal product performance.

Coagulant
Water Clarification - Polyaluminum Chloride

Specifications

Physical Form :	Solid (powder)
Bulk Density :	800 to 900 kg/m3
Specific Gravity (g/cm3) @ 25°C :	1.1 to 1.3 (as 33% solution)
Product pH :	3.0 to 5.0 (as 33% solution)
Color :	Pale Yellow
Freezing Point (°C/°F) :	Not Applicable
Solubility :	Complete (30 minutes in most cases)

Materials Compatibility

Solution tanks, piping and all wetted components should be constructed from a selection including teflon or cross-linked polyethylene. Hydrex 3267 is mildly corrosive. Avoid use of mild steel, copper, aluminum and stainless steel in contact with the solution.

Storage of the the dry Hydrex 3267 in stainless steel is acceptable.

Packaging

Hydrex 3267 is available in 25 kags or 800 kilogram supersacs.

Safety Information

Refer to the product Material Safety Data Sheet before use.

No binding document, just for information purposes - 11/13

Polychlorure d’aluminium en poudre

Applications

L’HYDREX 3267 est un polychlorure d’aluminium parmi les plus performant.

Ce coagulant de haute pureté, partiellement neutralisé et polymérisé, permet d’obtenir d’excellentes performances dans le traitement des eaux potables, usées et industrielles.

Avantages

L’HYDREX 3267 amène une réduction du volume de boues, une diminution des produits correcteurs de pH, une meilleure qualité d’eau finie et des performances accrues en eaux froides.

L’HYDREX 3267 réagit particulièrement bien dans les procédés ou applications de filtration directe, de maturation des filtres, de décantation lestée, ou sur des eaux à très faibles ou très fortes turbidités.

L’utilisation du L’HYDREX 3267 en poudre permet de réduire les coûts de transport et de faciliter l’entreposage dans des conditions froides.

Mise en œuvre

DOSAGE

L’HYDREX 3267 peut être remis en solution. Afin d’obtenir une concentration de 5,3% Al (solution originale), ajouter en rapport massique 1 partie de HYDREX 3267 à 2 parties d’eau. Ajouter graduellement la poudre à l’eau tout en mélangeant.

Manufacturer/Importer/Supplier/Distributor information

Supplier	Veolia Water Technologies Canada Inc.
Address	2000 Argentia Road, Plaza IV, Suite 430 Mississauga, ON L5N 1W1 Canada
Contact Person	Hydrex Product Specialist
Telephone	(905) 286-4846
Fax	(905) 286-0488
e-mail	vwtcanada-hydrex@veolia.com
24-Hour Emergency telephone	+1-760-476-3962 (Code:333239)
Supplier	Not available.

2. Hazard(s) identification

Physical hazards	Not classified.
Health hazards	Not classified.
Environmental hazards	Not classified.

Label elements

Hazard symbol	None.
Signal word	None.
Hazard statement	The mixture does not meet the criteria for classification.
Precautionary statement	
Prevention	Observe good industrial hygiene practices.
Response	Wash hands after handling.
Storage	Store in cool place. Protect from sunlight. Store away from incompatible materials.
Disposal	Dispose of contents/container to an appropriate treatment and disposal facility in accordance with applicable laws and regulations, and product characteristics at time of disposal.
Other hazards	None known.
Supplemental information	None.

3. Composition/information on ingredients

Mixtures

Chemical name	Common name and synonyms	CAS number	%
ADIPIC ACID		124-04-9	1 - < 3
Other components below reportable levels			90 - 100

All concentrations are in percent by weight unless ingredient is a gas. Gas concentrations are in percent by volume.

4. First-aid measures

Inhalation	Move to fresh air. Call a physician if symptoms develop or persist.
Skin contact	Wash off with soap and water. Get medical attention if irritation develops and persists.
Eye contact	Do not rub eyes. Rinse with water. Get medical attention if irritation develops and persists.
Ingestion	Rinse mouth. Get medical attention if symptoms occur.

Most important symptoms/effects, acute and delayed	Dusts may irritate the respiratory tract, skin and eyes.
Indication of immediate medical attention and special treatment needed	Treat symptomatically.
General information	Ensure that medical personnel are aware of the material(s) involved, and take precautions to protect themselves.

5. Fire-fighting measures

Suitable extinguishing media	Water fog. Foam. Dry chemical powder. Carbon dioxide (CO2).
Unsuitable extinguishing media	Not available.
Specific hazards arising from the chemical	Material can be slippery when wet. During fire, gases hazardous to health may be formed.
Special protective equipment and precautions for firefighters	Self-contained breathing apparatus and full protective clothing must be worn in case of fire.
Fire fighting equipment/instructions	Use water spray to cool unopened containers.
Specific methods	Use standard firefighting procedures and consider the hazards of other involved materials.
General fire hazards	No unusual fire or explosion hazards noted.

6. Accidental release measures

Personal precautions, protective equipment and emergency procedures	Keep unnecessary personnel away. Wear appropriate protective equipment and clothing during clean-up. For personal protection, see section 8 of the SDS. Slippery when wet.
Methods and materials for containment and cleaning up	Avoid the generation of dusts during clean-up. Collect dust using a vacuum cleaner equipped with HEPA filter. Stop the flow of material, if this is without risk. Large Spills: Wet down with water and dike for later disposal. Shovel the material into waste container. Following product recovery, flush area with water. Small Spills: Sweep up or vacuum up spillage and collect in suitable container for disposal. For waste disposal, see section 13 of the SDS.
Environmental precautions	Avoid discharge into drains, water courses or onto the ground.

7. Handling and storage

Precautions for safe handling	Minimize dust generation and accumulation. Provide appropriate exhaust ventilation at places where dust is formed. Material can be slippery when wet. Practice good housekeeping.
Conditions for safe storage, including any incompatibilities	Store in original tightly closed container. Store in a well-ventilated place. Store away from incompatible materials (see Section 10 of the SDS).

8. Exposure controls/personal protection

Occupational exposure limits	No exposure limits noted for ingredient(s).
Biological limit values	No biological exposure limits noted for the ingredient(s).
Appropriate engineering controls	If material is ground, cut, or used in any operation which may generate dusts, use appropriate local exhaust ventilation to keep exposures below the recommended exposure limits.

Individual protection measures, such as personal protective equipment

Eye/face protection	Wear safety glasses with side shields (or goggles) and a face shield. Chemical goggles and face shield are recommended. Before any handling, wear protective glasses side-shields complying with the NF EN 166.
Skin protection	
Hand protection	Chemical resistant gloves.
Other	Wear suitable protective clothing. Chemical resistant gloves.
Respiratory protection	Wear respirator with dust filter.
Thermal hazards	Wear appropriate thermal protective clothing, when necessary.

General hygiene considerations	Always observe good personal hygiene measures, such as washing after handling the material and before eating, drinking, and/or smoking. Routinely wash work clothing and protective equipment to remove contaminants.

9. Physical and chemical properties

Appearance	Granular or Powder.
Physical state	Solid.
Form	Powder.
Color	Off-white.
Odor	Not available.
Odor threshold	Not available.
pH	Not available.
Melting point/freezing point	Not available.
Initial boiling point and boiling range	Not available.
Flash point	Not available.
Evaporation rate	Not available.
Flammability (solid, gas)	Not available.
Upper/lower flammability or explosive limits	
Flammability limit - lower (%)	Not available.
Flammability limit - upper (%)	Not available.
Explosive limit - lower (%)	Not available.
Explosive limit - upper (%)	Not available.
Vapor pressure	Not available.
Vapor density	Not available.
Relative density	Not available.
Solubility(ies)	
Solubility (water)	Not available.
Partition coefficient (n-octanol/water)	Not available.
Auto-ignition temperature	Not available.
Decomposition temperature	Not available.
Viscosity	Not available.
Other information	
Density	0.70 - 0.80 g/cm3
Explosive properties	Not explosive.
Oxidizing properties	Not oxidizing.
pH of 1% Solution	3 - 5

10. Stability and reactivity

Reactivity	The product is stable and non-reactive under normal conditions of use, storage and transport.
Chemical stability	Material is stable under normal conditions. Material is stable under normal conditions.
Possibility of hazardous reactions	Hazardous polymerization does not occur.
Conditions to avoid	Contact with incompatible materials. None under normal conditions.
Incompatible materials	Oxygen.
Hazardous decomposition products	No dangerous reaction known under conditions of normal use. At thermal decomposition temperatures, carbon monoxide and carbon dioxide. Ammonia. Nitrogen oxides (NOx). Hydrogen chloride.

11. Toxicological information

Information on likely routes of exposure

Inhalation Dust may irritate respiratory system.

Skin contact Dust or powder may irritate the skin.

Eye contact Dust may irritate the eyes.

Ingestion Expected to be a low ingestion hazard.

Symptoms related to the physical, chemical and toxicological characteristics Dusts may irritate the respiratory tract, skin and eyes.

Information on toxicological effects

Acute toxicity Not known.

Product	Species	Test Results
Hydrex 3613		
Acute		
Oral		
LD50	Rat	> 5000 mg/kg

* Estimates for product may be based on additional component data not shown.

Skin corrosion/irritation Prolonged skin contact may cause temporary irritation.

Serious eye damage/eye irritation Direct contact with eyes may cause temporary irritation.

Respiratory or skin sensitization

Respiratory sensitization Not a respiratory sensitizer.

Skin sensitization This product is not expected to cause skin sensitization.

Germ cell mutagenicity No data available to indicate product or any components present at greater than 0.1% are mutagenic or genotoxic.

Carcinogenicity Not available.

Reproductive toxicity This product is not expected to cause reproductive or developmental effects.

Specific target organ toxicity - single exposure Not classified.

Specific target organ toxicity - repeated exposure Not classified.

Aspiration hazard Not an aspiration hazard.

Further information This product has no known adverse effect on human health.

12. Ecological information

Ecotoxicity The product is not classified as environmentally hazardous. However, this does not exclude the possibility that large or frequent spills can have a harmful or damaging effect on the environment.

Product		Species	Test Results
Hydrex 3613			
Aquatic			
Crustacea	EC50	Daphnia	> 10 mg/l, 48 hr
Fish	LC50	Fish	3880 mg/l, 96 hours estimated

* Estimates for product may be based on additional component data not shown.

Persistence and degradability

Bioaccumulative potential

Mobility in soil No data available.

Other adverse effects No other adverse environmental effects (e.g. ozone depletion, photochemical ozone creation potential, endocrine disruption, global warming potential) are expected from this component.

13. Disposal considerations

Disposal instructions	Collect and reclaim or dispose in sealed containers at licensed waste disposal site.
Local disposal regulations	Dispose in accordance with all applicable regulations.
Hazardous waste code	The waste code should be assigned in discussion between the user, the producer and the waste disposal company.
Waste from residues / unused products	Dispose of in accordance with local regulations. Empty containers or liners may retain some product residues. This material and its container must be disposed of in a safe manner (see: Disposal instructions).
Contaminated packaging	Since emptied containers may retain product residue, follow label warnings even after container is emptied. Empty containers should be taken to an approved waste handling site for recycling or disposal.

14. Transport information

TDG

Not regulated as dangerous goods.

IATA

Not regulated as dangerous goods.

IMDG

Not regulated as dangerous goods.

Transport in bulk according to Annex II of MARPOL 73/78 and the IBC Code	Not applicable.

15. Regulatory information

Canadian regulations This product has been classified in accordance with the hazard criteria of the HPR and the SDS contains all the information required by the HPR.

Controlled Drugs and Substances Act

Not regulated.

Export Control List (CEPA 1999, Schedule 3)

Not listed.

Greenhouse Gases

Not listed.

Precursor Control Regulations

Not regulated.

International regulations Additional information is given in the Safety Data Sheet.

Stockholm Convention

Not applicable.

Rotterdam Convention

Not applicable.

Kyoto protocol

Not applicable.

Montreal Protocol

Not applicable.

Basel Convention

Not applicable.

International Inventories

Country(s) or region	Inventory name	On inventory (yes/no)*
Australia	Australian Inventory of Chemical Substances (AICS)	Yes
Canada	Domestic Substances List (DSL)	Yes
Canada	Non-Domestic Substances List (NDSL)	No
China	Inventory of Existing Chemical Substances in China (IECSC)	Yes
Europe	European Inventory of Existing Commercial Chemical Substances (EINECS)	No
Europe	European List of Notified Chemical Substances (ELINCS)	No

Country(s) or region	Inventory name	On inventory (yes/no)*
Japan	Inventory of Existing and New Chemical Substances (ENCS)	Yes
Korea	Existing Chemicals List (ECL)	Yes
New Zealand	New Zealand Inventory	Yes
Philippines	Philippine Inventory of Chemicals and Chemical Substances (PICCS)	Yes
United States & Puerto Rico	Toxic Substances Control Act (TSCA) Inventory	Yes

*A "Yes" indicates that all components of this product comply with the inventory requirements administered by the governing country(s)
A "No" indicates that one or more components of the product are not listed or exempt from listing on the inventory administered by the governing country(s).

Fournisseur Non disponible.

2. Identification des dangers

Dangers physiques Non classé.

Dangers pour la santé Non classé.

Dangers environnementaux Non classé.

Éléments d'étiquetage

Symbole de danger Aucune.

Mention d'avertissement Aucune.

Mention de danger Le mélange ne satisfait pas les critères de classification.

Conseil de prudence

Prévention Observer de bonnes pratiques d'hygiène industrielle.

Intervention Se laver les mains après utilisation.

Stockage Stocker dans un endroit frais. Protéger du rayonnement solaire. Conserver à l'écart de matières incompatibles.

Élimination Éliminer le contenu/contenant dans une installation appropriée de traitement et d'élimination conformément aux lois et règlements applicables, ainsi qu'en fonction des caractéristiques du produit au moment de l'élimination.

Autres dangers Aucun(e) connu(e).

Renseignements supplémentaires Aucune.

3. Composition/information sur les ingrédients

Mélanges

Dénomination chimique	Nom commun et synonymes	Numéro d'enregistrement CAS	%
ACIDE ADIPIQUE		124-04-9	1 - < 3
Autres composant sous les niveaux à déclarer			90 - 100

Toutes les concentrations sont en pourcentage en poids, sauf si l'ingrédient est un gaz. Les concentrations des gaz sont er pourcentage en volume.

4. Premiers soins

Inhalation	Transporter à l'extérieur. Appeler un médecin si des symptômes se développent ou persistent
Contact avec la peau	Laver avec de l'eau et du savon. Consulter un médecin si une irritation se développe et persiste.
Contact avec les yeux	Ne pas se frotter les yeux. Rincer avec de l'eau. Consulter un médecin si une irritation se développe et persiste.
Ingestion	Rincer la bouche. Consulter un médecin si des symptômes apparaissent.
Symptômes et effets les plus importants, qu'ils soient aigus ou retardés	La poussière peut irriter les voies respiratoires, la peau et les yeux.
Mention de la nécessité d'une prise en charge médicale immédiate ou d'un traitement spécial, si nécessaire	Traiter de manière symptomatique.
Informations générales	S'assurer que le personnel médical est averti du (des) produits(s) en cause et qu'il prend des mesures pour se protéger.

5. Mesures à prendre en cas d'incendie

Agents extincteurs appropriés	Brouillard d'eau. Mousse. Poudre chimique. Dioxyde de carbone (CO2).
Agents extincteurs inappropriés	Non disponible.
Dangers spécifiques du produit dangereux	Le matériau peut être glissant lorsque mouillé. Des gaz dangereux pour la santé peuvent se former pendant un incendie.
Équipements de protection spéciaux et précautions spéciales pour les pompiers	Porter un appareil respiratoire autonome et un vêtement de protection complet en cas d'incendie.
Équipement/directives de lutte contre les incendies	Utiliser une pulvérisation d'eau pour refroidir les récipients fermés.
Méthodes particulières d'intervention	Utiliser des procédures standard en cas d'incendie et tenir compte des dangers des autres substances en cause.
Risques d'incendie généraux	Aucun risque inhabituel d'incendie ou d'explosion observé.

6. Mesures à prendre en cas de déversement accidentel

Précautions individuelles, équipements de protection et mesures d'urgence	Tenir à l'écart le personnel non requis. Porter un équipement et des vêtements de protectior appropriés durant le nettoyage. Pour la protection individuelle, voir la section 8 de la FDS. Glissant lorsque mouillé.
Méthodes et matériaux pour le confinement et le nettoyage	Éviter la formation de poussières pendant le nettoyage. Récupérer la poussière en utilisant un aspirateur muni d'un filtre HEPA. Arrêter l'écoulement de la substance, si cela peut se faire sans risque. Déversements importants : Mouiller avec de l'eau et endiguer pour une élimination ultérieure. Pelleter le matériau dans un conteneur à déchets. Après avoir récupéré le produit, rincer la zone à l'eau. Déversements peu importants : Balayer ou aspirer le déversement et mettre dans un récipient approprié pour élimination. Pour l'élimination des déchets, voir la section 13 de la FDS.
Précautions relatives à l'environnement	Éviter le rejet dans les égouts, les cours d'eau ou sur le sol.

7. Manutention et stockage

Précautions relatives à la sûreté en matière de manutention	Minimiser la formation et l'accumulation de poussière. Assurer une ventilation aspirante adéquate aux endroits où la poussière se forme. Le matériau peut être glissant lorsque mouillé. Assurer un bon entretien ménager.
Conditions de sûreté en matière de stockage, y compris les incompatibilités	Stocker dans des récipients d'origine fermés de manière étanche. Stocker dans un endroit bien ventilé. Stocker à l'écart des matériaux incompatibles (Consulter la section 10 de la FDS).

8. Contrôle de l'exposition/protection individuelle

Limites d'exposition professionnelle	Il n'y a pas de limites d'exposition pour ce ou ces ingrédients.
Valeurs biologiques limites	Aucune limite d'exposition biologique observée pour les ingrédients.
Contrôles d'ingénierie appropriés	Si le matériau est moulu, coupé ou utilisé dans toute opération susceptible de créer des poussières, utiliser une ventilation locale par aspiration appropriée pour maintenir les expositions sous les limites d'exposition recommandées.

Mesures de protection individuelle, telles que les équipements de protection individuelle

Protection du visage/des yeux	Porter des lunettes de sécurité à écrans latéraux (ou des lunettes à coques) et un écran facial. Il est recommandé de porter des lunettes de protection chimique et un écran facial. Avant toute manipulation, il est nécessaire de porter des lunettes à protection latérale conformes à la norme NF EN 166.
Protection de la peau	
Protection des mains	Gants résistants aux produits chimiques.
Autre	Porter un vêtement de protection approprié. Gants résistants aux produits chimiques.
Protection respiratoire	Porter un appareil respiratoire muni de filtres antipoussière.
Dangers thermiques	Porter des vêtements de protection thermique appropriés, au besoin.
Considérations d'hygiène générale	Toujours adopter de bonnes pratiques d'hygiène personnelle, comme se laver après avoir manipulé la substance et avant de manger, de boire ou de fumer. Laver régulièrement les vêtements de travail et l'équipement de protection pour éliminer les contaminants

9. Propriétés physiques et chimiques

Apparence	Granuleux. ou Poudre.
État physique	Solide.
Forme	Poudre.
Couleur	Blanc cassé.
Odeur	Non disponible.
Seuil olfactif	Non disponible.
pH	Non disponible.
Point de fusion et point de congélation	Non disponible.
Point initial d'ébullition et domaine d'ébullition	Non disponible.
Point d'éclair	Non disponible.
Taux d'évaporation	Non disponible.
Inflammabilité (solides et gaz)	Non disponible.

Limites supérieures et inférieures d'inflammabilité ou d'explosibilité

Limites d'inflammabilité - inférieure (%)	Non disponible.
Limites d'inflammabilité - supérieure (%)	Non disponible.
Limite d'explosibilité - inférieure (%)	Non disponible.
Limite d'explosibilité - supérieure (%)	Non disponible.
Tension de vapeur	Non disponible.
Densité de vapeur	Non disponible.
Densité relative	Non disponible.

Solubilité

Solubilité (eau)	Non disponible.

Coefficient de partage n-octanol/eau	Non disponible.
Température d'auto-inflammation	Non disponible.
Température de décomposition	Non disponible.
Viscosité	Non disponible.
Autres informations	
Densité	0.70 - 0.80 g/cm3
Propriétés explosives	Non explosif.
Propriétés comburantes	Non oxydant.
pH (solution à 1%)	3 - 5

10. Stabilité et réactivité

Réactivité	Le produit est stable et non réactif dans des conditions normales d'utilisation, d'entreposage et de transport.
Stabilité chimique	La substance est stable dans des conditions normales. La substance est stable dans des conditions normales.
Risque de réactions dangereuses	Une polymérisation dangereuse ne se produit pas.
Conditions à éviter	Contact avec des matériaux incompatibles. Aucun(e) dans des conditions normales.
Matériaux incompatibles	Oxygène.
Produits de décomposition dangereux	Aucune réaction dangereuse connue dans des conditions normales d'utilisation. Aux températures de décomposition thermique, du monoxyde et du dioxyde de carbone. Ammoniac. Oxydes d'azote (NOx). Chlorure d'hydrogène.

11. Données toxicologiques

Renseignements sur les voies d'exposition probables

Inhalation	La poussière peut irriter l'appareil respiratoire.
Contact avec la peau	La poussière ou la poudre peut irriter la peau.
Contact avec les yeux	La poussière peut irriter les yeux.
Ingestion	Faible danger présumé en cas d'ingestion.
Les symptômes correspondant aux caractéristiques physiques, chimiques et toxicologiques	La poussière peut irriter les voies respiratoires, la peau et les yeux.

Renseignements sur les effets toxicologiques

Toxicité aiguë	Inconnu(e).

Produit	**Espèces**	**Résultats d'épreuves**
Hydrex 3613		
Aiguë		
Orale		
DL50	Rat	> 5000 mg/kg

* Les estimations pour le produit peuvent être basées sur d'autres données de composants non montrées.

Corrosion cutanée/irritation cutanée	Un contact prolongé avec la peau peut causer une irritation temporaire.
Lésions oculaires graves/irritation oculaire	Le contact direct avec les yeux peut causer une irritation temporaire.

Sensibilisation respiratoire ou cutanée

Sensibilisation respiratoire	Pas un sensibilisant respiratoire.
Sensibilisation cutanée	On ne s'attend pas à ce que ce produit provoque une sensibilisation cutanée.
Mutagénicité sur les cellules germinales	Il n'existe pas de données qui indiquent que ce produit, ou tout composant présent à des taux de plus de 0,1 %, soit mutagène ou génétoxique.

Cancérogénicité	Non disponible.
Toxicité pour la reproduction	On ne s'attend pas à ce que ce produit présente des effets sur la reproduction ou le développement.
Toxicité pour certains organes cibles - exposition unique	Non classé.
Toxicité pour certains organes cibles - expositions répétées	Non classé.
Danger par aspiration	Pas un danger par aspiration.
Autres informations	Ce produit n'est associé à aucun effet néfaste connu pour la santé humaine.

12. Données écologiques

Écotoxicité Le produit n'est pas classé comme dangereux pour l'environnement. Toutefois, ceci n'exclut pas la possibilité que des déversements importants ou fréquents puissent avoir un effet nocif ou nuisible sur l'environnement.

Produit		Espèces	Résultats d'épreuves
Hydrex 3613			
Aquatique			
Crustacés	CE50	Daphnia	> 10 mg/l, 48 hr
Poisson	CL50	Poisson	3880 mg/l, 96 heures estimation

* Les estimations pour le produit peuvent être basées sur d'autres données de composants non montrées.

Persistance et dégradation

Potentiel de bioaccumulation

Mobilité dans le sol	Aucune donnée disponible.
Autres effets nocifs	On ne s'attend pas à ce que ce composant ait des effets néfastes sur l'environnement (par ex., appauvrissement de la couche d'ozone, potentiel de formation photochimique d'ozone, perturbation endocrinienne, potentiel de réchauffement de la planète).

13. Données sur l'élimination

Instructions pour l'élimination	Recueillir et réutiliser ou éliminer dans des récipients scellés dans un site d'élimination des déchets autorisé.
Règlements locaux d'élimination	Détruire conformément à toutes les réglementations applicables.
Code des déchets dangereux	Les codes de déchets doivent être attribués dans le cadre d'une consultation entre l'utilisateur, le fabricant et l'entreprise de décharge.
Déchets des résidus / produits non utilisés	Éliminer conformément à la réglementation locale. Les récipients ou pochettes vides peuvent conserver certains résidus de produit. Éliminer ce produit et son récipient d'une manière sûre (voir : instructions d'élimination).
Emballages contaminés	Comme les récipients vides peuvent contenir un résidu du produit, suivre les avertissements de l'étiquette, même une fois le récipient vide. Les contenants vides doivent être acheminés vers une installation certifiée de traitement des déchets en vue de leur élimination ou recyclage.

14. Informations relatives au transport

TMD

N'entre pas dans la réglementation des marchandises dangereuses.

IATA

N'entre pas dans la réglementation des marchandises dangereuses.

IMDG

N'entre pas dans la réglementation des marchandises dangereuses.

Transport en vrac selon l'Annexe II de MARPOL 73/78 et le recueil IBC	Sans objet.

15. Informations sur la réglementation

Réglementation canadienne Ce produit a été classé conformément aux critères de danger énoncés dans le Règlement sur les produits dangereux et la FDS contient tous les renseignements exigés par le Règlement sur les produits dangereux.

Loi réglementant certaines drogues et autres substances

Non réglementé.

Liste des marchandises d'exportation contrôlée (LCPE 1999, Annexe 3)

Non inscrit.

Solids conditioning for dewatering operations and water clarification aid in various industries

Description and Use

HYDREX 3613 is a highly effective cationic flocculant of high molecular weight.

HYDREX 3613 conditions solids for dewatering operations and aids water clarification processes in various industries.

HYDREX 3613 shows exceptional performance in liquid-solid separations in a wide range of shear conditions.

HYDREX 3613 may be beneficial in any liquid-solid separation process. It is especially recommended for:

- Belt filter, centrifuge and screw press dewatering
- Dissolved air floatation
- Filtration
- Thickening
- Water clarification

Advantages

- Dry product minimizes storage requirements
- Economical to use – effective at low dosage levels
- Effective high solids removal
- Effective over a wide pH range; does not alter the system pH
- Improves production and cake solids

Application Information

Stock solutions can be prepared up to 0.5 % concentration via an automated make down unit or on a batch basis. Solutions should be aged 30-60 minutes for maximum effectiveness. High quality make up water should be used. Secondary dilution water should be added to the stock solution prior to the addition point at a ratio of at least 10:1.

Centrifugal pumps should be avoided for polymer transfer.

No binding document, just for information purposes - 02/09

VEOLIA WATER
Solutions & Technologies

Solids conditioning for dewatering operations and water clarification aid in various industries

Specifications

Appearance:	Off White, granular powder
Degree of Charge :	Low
Relative Molecular Weight:	High
Bulk Density, kg/m^3:	750 +/- 50
pH of 0.5 % solution, at 25°C:	3.0 - 5.0
Standard Viscosity, cps :	3.0 - 3.8
Viscosity at 25°C, Cps:	
0.10 %:	80
0.25 %:	200
0.50 %:	400
1.00 %:	800

Product Sales Specification:	
Insolubles, % w/w :	0.5 max
Residual Acrylamide, %:	0.020 max

The shelf life of HYDREX 3613 is 24 months when stored in unopened packages in a dry atmosphere at temperatures no higher than 40°C.

Materials Compatibility

Solutions are no more corrosive than water and recommended materials of construction include stainless steel, fiber glass, plastic, and glass or epoxy-lined vessels. Do not use iron, copper or aluminium.

Packaging

Supplied in bags. Other packaging : please consult us.

Safety Information

Spilled polymer is very slippery and should be collected prior to flushing with water. Whoever is responsible for the use and the manipulation of HYDREX 3613 should be familiar with the safety detailed in our MSDS.

Regulatory Approvals : see MSDS

No binding document, just for information purposes - 02/09

Conditionnement de solides pour la déshydratation et les opérations de clarification de l'eau

Applications

HYDREX 3613 est un floculant cationique très efficace, de haut poids moléculaire.

HYDREX 3613 montre des performances exceptionnelles en séparation solide/liquide sur un large éventail de conditions.

HYDREX 3613 est bénéfique à tout processus de séparation solide liquide-. Il est particulièrement recommandé pour:

• Les deshydratation surfiltres à bande, centrifugeuses et filtres presses
• Les opérations de flottation à air dissous
• La filtration
• L'épaississement
• La clarification de l'eau.

Avantages

• Produit sec : minimise les besoins en stockage
• Économique à l'utilisation : efficace à faible doses
• Efficace, même sur effluents fortement chargés en solides
• Efficace sur une large gamme de pH : ne modifie pas le pH
• Améliore la production et la qualité des gâteaux de filtration.

Mise en oeuvre

HYDREX 3613 ne peut être utilisé tel quel. Il faut au préalable préparer une solution stock.
Utiliser pour ce faire une installation de dispersion et de maturation de la poudre prévue à cet effet.

Concentration maxi de la solution stock (g/l) : 5
Utiliser pour ce faire une eau de bonne qualité
Temps de maturation nécessaire : de 30-60 minutes

Une dilution secondaire est préférable avant le point d'injection à un ratio d'au moins 10:1.
Les Pompes centrifuges sont à proscrire pour le transfert des polymères

Document non contractuel, à caractère informatif - 11/09

VEOLIA WATER
Solutions & Technologies

HYDREX 3613
Fiche Produit

Conditionnement de solides pour la déshydratation et les opérations de clarification de l'eau

Spécifications

Aspect :	Blanc cassé, sous forme de poudre granuleuse
Degré de Charge:	Basse
Masse moléculaire relative:	Haute
Densité:	750+ / - 50
pH de solution à 0,5%, à 25°C:	3.0 - 5.0
Viscosité standard, Cps:	3.0-3.8
Viscosité à 25°C, Cps:	
@0,10%:	80
@0,25%:	200
@0,50%:	400
@1.00 %:	800

Spécifications de ventes du produit :

Insolubles,% w / w:	0.5 max
Acrylamide résiduel,%:	0,020 max.

HYDREX 3613 se conserve jusqu'à 24 mois dans son emballage d'origine non entamé, au sec et à une température ne dépassant pas 40°C.

Compatibilité Matériels

Les solutions ne sont plus corrosives que l'eau. Les matériaux recommandés sont : l'acier inoxydable, la fibre de verre, le plastique et de verre ou matériaux enduits époxy ou fibre de verre.
Ne pas utiliser de fer, cuivre ou aluminium.

Conditionnement

Livraison par sacs. Pour toute autre demande d'emballage : veuillez nous consulter.

Sécurité

Le déversement de polymère rend les surfaces très glissantes.
La manipulation de tous produits chimiques demande de la précaution. Quiconque est responsable de l'utilisation et de la manipulation de l'hydrex 3613 devrait se familiariser avec les consignes de sécurité détaillées dans notre MSDS.

Agréments: voir la msds

SAFETY DATA SHEET

1. Identification

Product identifier **VEOLIA ACTISAND**

Other means of identification None.

Recommended use Wastewater Treatment

Recommended restrictions Workers (and your customers or users in the case of resale) should be informed of the potential presence of respirable dust and respirable crystalline silica as well as their potential hazards. Appropriate training in the proper use and handling of this material should be provided as required under applicable regulations. PROFESSIONAL USE ONLY

Manufacturer/Importer/Supplier/Distributor information

Manufacturer

Supplier Veolia Water Technologies Canada Inc.

Address 2000 Argentia Road, Plaza IV, Suite 430
Mississauga, ON L5N 1W1
Canada

Contact Person Hydrex Product Specialist

Telephone (905) 286-4846

Fax (905) 286-0488

e-mail vwtcanada-hydrex@veolia.com

24-Hour Emergency telephone +1-760-476-3962 (Code:333239)

Supplier Not available.

2. Hazard(s) identification

Physical hazards Not classified.

Health hazards Carcinogenicity Category 1A

Environmental hazards Not classified.

Label elements

Signal word Danger

Hazard statement May cause cancer.

Precautionary statement

Prevention Obtain special instructions before use. Do not handle until all safety precautions have been read and understood. Wear protective gloves/protective clothing/eye protection/face protection.

Response IF exposed or concerned: Get medical advice/attention.

Storage Not available.

Disposal Dispose of contents/container in accordance with local/regional/national/international regulations.

Other hazards None known.

Supplemental information None.

3. Composition/information on ingredients

Mixtures

Chemical name	Common name and synonyms	CAS number	%
Crystalline sillica		14808-60-7	100

All concentrations are in percent by weight unless ingredient is a gas. Gas concentrations are in percent by volume.

4. First-aid measures

Inhalation	Move to fresh air. Call a physician if symptoms develop or persist.
Skin contact	Wash off with soap and water. Get medical attention if irritation develops and persists.
Eye contact	Rinse with water. Get medical attention if irritation develops and persists.
Ingestion	Rinse mouth. Get medical attention if symptoms occur.
Most important symptoms/effects, acute and delayed	Coughing.
Indication of immediate medical attention and special treatment needed	Provide general supportive measures and treat symptomatically. Keep victim under observation. Symptoms may be delayed.
General information	IF exposed or concerned: Get medical advice/attention. Ensure that medical personnel are aware of the material(s) involved, and take precautions to protect themselves.

5. Fire-fighting measures

Suitable extinguishing media	Water fog. Foam. Dry chemical powder. Carbon dioxide (CO2).
Unsuitable extinguishing media	Not available.
Specific hazards arising from the chemical	During fire, gases hazardous to health may be formed.
Special protective equipment and precautions for firefighters	Self-contained breathing apparatus and full protective clothing must be worn in case of fire.
Fire fighting equipment/instructions	Use water spray to cool unopened containers.
Specific methods	Use standard firefighting procedures and consider the hazards of other involved materials.
General fire hazards	No unusual fire or explosion hazards noted.

6. Accidental release measures

Personal precautions, protective equipment and emergency procedures	Keep unnecessary personnel away. Keep people away from and upwind of spill/leak. Wear appropriate protective equipment and clothing during clean-up. Ensure adequate ventilation. Local authorities should be advised if significant spillages cannot be contained. For personal protection, see section 8 of the SDS.
Methods and materials for containment and cleaning up	The product is immiscible with water and will spread on the water surface. Stop the flow of material, if this is without risk. Following product recovery, flush area with water. For waste disposal, see section 13 of the SDS.
Environmental precautions	Avoid discharge into drains, water courses or onto the ground.

7. Handling and storage

Precautions for safe handling	Obtain special instructions before use. Do not handle until all safety precautions have been read and understood. Keep formation of airborne dusts to a minimum. Provide appropriate exhaust ventilation at places where dust is formed. Do not breathe dust. Avoid prolonged exposure. Should be handled in closed systems, if possible. Wear appropriate personal protective equipment. Observe good industrial hygiene practices.
Conditions for safe storage, including any incompatibilities	Protect from sunlight. Store in original tightly closed container. Store away from incompatible materials (see Section 10 of the SDS). Store in cool, dry place.

8. Exposure controls/personal protection

Occupational exposure limits

US. ACGIH Threshold Limit Values

Material	Type	Value	Form
VEOLIA ACTISAND	TWA	0.025 mg/m3	Respirable fraction.

Components	Type	Value	Form
Crystalline sillica (CAS 14808-60-7)	TWA	0.025 mg/m3	Respirable fraction.

Canada. Alberta OELs (Occupational Health & Safety Code, Schedule 1, Table 2)

Material	Type	Value	Form
VEOLIA ACTISAND	TWA	0.025 mg/m3	Respirable particles.

Components	Type	Value	Form
Crystalline sillica (CAS 14808-60-7)	TWA	0.025 mg/m3	Respirable particles.

Canada. British Columbia OELs. (Occupational Exposure Limits for Chemical Substances, Occupational Health and Safety Regulation 296/97, as amended)

Material	Type	Value	Form
VEOLIA ACTISAND	TWA	0.025 mg/m3	Respirable fraction.

Components	Type	Value	Form
Crystalline sillica (CAS 14808-60-7)	TWA	0.025 mg/m3	Respirable fraction.

Canada. Manitoba OELs (Reg. 217/2006, The Workplace Safety And Health Act)

Components	Type	Value	Form
Crystalline sillica (CAS 14808-60-7)	TWA	0.025 mg/m3	Respirable fraction.

Canada. Ontario OELs. (Control of Exposure to Biological or Chemical Agents)

Material	Type	Value	Form
VEOLIA ACTISAND	TWA	0.1 mg/m3	Respirable.

Components	Type	Value	Form
Crystalline sillica (CAS 14808-60-7)	TWA	0.1 mg/m3	Respirable.

Canada. Quebec OELs. (Ministry of Labor - Regulation Respecting the Quality of the Work Environment)

Material	Type	Value	Form
VEOLIA ACTISAND	TWA	0.1 mg/m3	Respirable dust.

Components	Type	Value	Form
Crystalline sillica (CAS 14808-60-7)	TWA	0.1 mg/m3	Respirable dust.

Biological limit values No biological exposure limits noted for the ingredient(s).

Exposure guidelines Occupational exposure to nuisance dust (total and respirable) and respirable crystalline silica should be monitored and controlled.

Appropriate engineering controls Good general ventilation (typically 10 air changes per hour) should be used. Ventilation rates should be matched to conditions. If applicable, use process enclosures, local exhaust ventilation, or other engineering controls to maintain airborne levels below recommended exposure limits. If exposure limits have not been established, maintain airborne levels to an acceptable level.

Individual protection measures, such as personal protective equipment

Eye/face protection Wear safety glasses with side shields (or goggles).

Skin protection

Hand protection Chemical resistant gloves. Suitable gloves can be recommended by the glove supplier.

Other Use of an impervious apron is recommended. Chemical resistant gloves.

Respiratory protection Use a particulate filter respirator for particulate concentrations exceeding the Occupational Exposure Limit.

Thermal hazards Not available.

General hygiene considerations Observe any medical surveillance requirements. Always observe good personal hygiene measures, such as washing after handling the material and before eating, drinking, and/or smoking. Routinely wash work clothing and protective equipment to remove contaminants.

9. Physical and chemical properties

Appearance

Physical state Solid.

Form Solid.

Color Not available.

Odor	Not available.
Odor threshold	Not available.
pH	Not available.
Melting point/freezing point	Not available.
Initial boiling point and boiling range	Not available.
Flash point	Not available.
Evaporation rate	Not available.
Flammability (solid, gas)	Not available.
Upper/lower flammability or explosive limits	
Flammability limit - lower (%)	Not available.
Flammability limit - upper (%)	Not available.
Explosive limit - lower (%)	Not available.
Explosive limit - upper (%)	Not available.
Vapor pressure	< 0.0000001 kPa at 25 °C
Vapor density	Not available.
Relative density	Not available.
Solubility(ies)	
Solubility (water)	Insoluble
Partition coefficient (n-octanol/water)	Not available.
Auto-ignition temperature	Not available.
Decomposition temperature	Not available.
Viscosity	Not available.
Other information	
Explosive properties	Not explosive.
Heat of combustion (NFPA 30B)	0 kJ/g
Molecular formula	O2Si
Oxidizing properties	Not oxidizing.

10. Stability and reactivity

Reactivity	The product is stable and non-reactive under normal conditions of use, storage and transport.
Chemical stability	Material is stable under normal conditions.
Possibility of hazardous reactions	No dangerous reaction known under conditions of normal use.
Conditions to avoid	Contact with incompatible materials.
Incompatible materials	Powerful oxidizers. Chlorine.
Hazardous decomposition products	No hazardous decomposition products are known.

11. Toxicological information

Information on likely routes of exposure

Inhalation	Prolonged inhalation may be harmful.
Skin contact	No adverse effects due to skin contact are expected.
Eye contact	Direct contact with eyes may cause temporary irritation.
Ingestion	Expected to be a low ingestion hazard.

Symptoms related to the physical, chemical and toxicological characteristics Coughing.

Information on toxicological effects

Acute toxicity Not available.

Skin corrosion/irritation Prolonged skin contact may cause temporary irritation.

Serious eye damage/eye irritation Direct contact with eyes may cause temporary irritation.

Respiratory or skin sensitization

Respiratory sensitization Not a respiratory sensitizer.

Skin sensitization This product is not expected to cause skin sensitization.

Germ cell mutagenicity No data available to indicate product or any components present at greater than 0.1% are mutagenic or genotoxic.

Carcinogenicity In 1997, IARC (the International Agency for Research on Cancer) concluded that crystalline silica inhaled from occupational sources can cause lung cancer in humans. However in making the overall evaluation, IARC noted that "carcinogenicity was not detected in all industrial circumstances studied. Carcinogenicity may be dependent on inherent characteristics of the crystalline silica or on external factors affecting its biological activity or distribution of its polymorphs." (IARC Monographs on the evaluation of the carcinogenic risks of chemicals to humans, Silica, silicates dust and organic fibres, 1997, Vol. 68, IARC, Lyon, France.) In June 2003, SCOEL (the EU Scientific Committee on Occupational Exposure Limits) concluded that the main effect in humans of the inhalation of respirable crystalline silica dust is silicosis. "There is sufficient information to conclude that the relative risk of lung cancer is increased in persons with silicosis (and, apparently, not in employees without silicosis exposed to silica dust in quarries and in the ceramic industry). Therefore, preventing the onset of silicosis will also reduce the cancer risk..." (SCOEL SUM Doc 94-final, June 2003) According to the current state of the art, worker protection against silicosis can be consistently assured by respecting the existing regulatory occupational exposure limits. May cause cancer. Occupational exposure to respirable dust and respirable crystalline silica should be monitored and controlled.

ACGIH Carcinogens

Crystalline sillica (CAS 14808-60-7)	A2 Suspected human carcinogen.

Canada - Alberta OELs: Carcinogen category

Crystalline sillica (CAS 14808-60-7)	Suspected human carcinogen.

Canada - Manitoba OELs: carcinogenicity

SILICA, CRYSTALLINE-.ALPHA.-QUARTZ, RESPIRABLE FRACTION (CAS 14808-60-7)	Suspected human carcinogen.

Canada - Quebec OELs: Carcinogen category

Crystalline sillica (CAS 14808-60-7)	Suspected carcinogenic effect in humans.

IARC Monographs. Overall Evaluation of Carcinogenicity

Crystalline sillica (CAS 14808-60-7)	1 Carcinogenic to humans.

Reproductive toxicity This product is not expected to cause reproductive or developmental effects.

Specific target organ toxicity - single exposure Not classified.

Specific target organ toxicity - repeated exposure Not classified.

Aspiration hazard Not an aspiration hazard.

Chronic effects Prolonged inhalation may be harmful. Prolonged exposure may cause chronic effects.

12. Ecological information

Ecotoxicity The product is not classified as environmentally hazardous. However, this does not exclude the possibility that large or frequent spills can have a harmful or damaging effect on the environment.

Persistence and degradability No data is available on the degradability of this product.

Bioaccumulative potential No data available.

Mobility in soil No data available.

Other adverse effects No other adverse environmental effects (e.g. ozone depletion, photochemical ozone creation potential, endocrine disruption, global warming potential) are expected from this component.

13. Disposal considerations

Disposal instructions	Collect and reclaim or dispose in sealed containers at licensed waste disposal site. Dispose of contents/container in accordance with local/regional/national/international regulations.
Local disposal regulations	Dispose in accordance with all applicable regulations.
Hazardous waste code	The waste code should be assigned in discussion between the user, the producer and the waste disposal company.
Waste from residues / unused products	Dispose of in accordance with local regulations. Empty containers or liners may retain some product residues. This material and its container must be disposed of in a safe manner (see: Disposal instructions).
Contaminated packaging	Since emptied containers may retain product residue, follow label warnings even after container is emptied. Empty containers should be taken to an approved waste handling site for recycling or disposal.

14. Transport information

TDG

Not regulated as dangerous goods.

IATA

Not regulated as dangerous goods.

IMDG

Not regulated as dangerous goods.

Transport in bulk according to Annex II of MARPOL 73/78 and the IBC Code Not applicable.

15. Regulatory information

Canadian regulations

Controlled Drugs and Substances Act

Not regulated.

Export Control List (CEPA 1999, Schedule 3)

Not listed.

Greenhouse Gases

Not listed.

Precursor Control Regulations

Not regulated.

International regulations

Stockholm Convention

Not applicable.

Rotterdam Convention

Not applicable.

Kyoto protocol

Not applicable.

Montreal Protocol

Not applicable.

Basel Convention

Not applicable.

International Inventories

Country(s) or region	Inventory name	On inventory (yes/no)*
Australia	Australian Inventory of Chemical Substances (AICS)	Yes
Canada	Domestic Substances List (DSL)	Yes
Canada	Non-Domestic Substances List (NDSL)	No
China	Inventory of Existing Chemical Substances in China (IECSC)	Yes
Europe	European Inventory of Existing Commercial Chemical Substances (EINECS)	Yes
Europe	European List of Notified Chemical Substances (ELINCS)	No

Country(s) or region	Inventory name	On inventory (yes/no)*
Japan	Inventory of Existing and New Chemical Substances (ENCS)	Yes
Korea	Existing Chemicals List (ECL)	Yes
New Zealand	New Zealand Inventory	Yes
Philippines	Philippine Inventory of Chemicals and Chemical Substances (PICCS)	Yes
United States & Puerto Rico	Toxic Substances Control Act (TSCA) Inventory	Yes

*A "Yes" indicates that all components of this product comply with the inventory requirements administered by the governing country(s)
A "No" indicates that one or more components of the product are not listed or exempt from listing on the inventory administered by the governing country(s).

16. Other Information

Issue date 08-16-2016

Version # 01

Disclaimer Veolia Water Technologies is not able to anticipate all conditions under which this information and its product, or the products of other manufacturers in combination with its product, may be used. It is the user's responsibility to ensure safe conditions for handling, storage and disposal of the product, and to assume liability for loss, injury, damage or expense due to improper use and or non respect of Veolia Water Technologies' requirement.

Revision information Product and Company Identification: Product Review

FICHE SIGNALÉTIQUE

1. Identification

Identificateur de produit	**VEOLIA ACTISAND**
Autres moyens d'identification	Aucune.
Usage recommandé	Traitement des eaux usées
Restrictions d'utilisation	Les travailleurs (et vos clients et utilisateurs dans le cas d'une revente) doivent être informés de la présence possible de poussière respirable et de silice cristalline respirable ainsi que de leurs dangers possibles. Une formation appropriée dans la bonne utilisation et la bonne manipulation de cette matière doit être fournie selon la réglementation applicable. USAGE PROFESSIONNEL

Renseignements sur le fabricant/importateur/fournisseur/distributeur

Fabricant	
Fournisseur	Veolia Water Technologies Canada Inc.
Adresse	2000 Argentia Road, Plaza IV, Suite 430 Mississauga, ON L5N 1W1 Canada
Personne à contacter	Hydrex Product Specialist
Téléphone	(905) 286-4846
Télécopieur	(905) 286-0488
courriel	vwtcanada-hydrex@veolia.com
24 Hr Numéro de téléphone d'appel d'urgence	+1-760-476-3962 (Code:333239)
Fournisseur	Non disponible.

2. Identification des dangers

Dangers physiques	Non classé.	
Dangers pour la santé	Cancérogénicité	Catégorie 1A
Dangers environnementaux	Non classé.	

Éléments d'étiquetage

Mention d'avertissement	Danger
Mention de danger	Peut provoquer le cancer.
Conseil de prudence	
Prévention	Se procurer les instructions avant utilisation. Ne pas manipuler avant d'avoir lu et compris toutes les mesures de sécurité. Porter des gants/vêtements de protection/ équipement de protection des yeux/du visage.
Intervention	Si exposé(e) ou préoccupé(e) : Obtenir une consultation médicale ou des soins médicaux.
Stockage	Non disponible.
Élimination	Éliminer le contenu/les conteneurs selon la loi internationale/nationale/régionale/locale.
Autres dangers	Aucuns connus.
Renseignements supplémentaires	Aucune.

3. Composition/information sur les ingrédients

Mélanges

Dénomination chimique	Nom commun et synonymes	Numéro d'enregistrement CAS	%
Crystalline sillica		14808-60-7	100

Toutes les concentrations sont en pourcentage en poids, sauf si l'ingrédient est un gaz. Les concentrations des gaz sont en pourcentage en volume.

4. Premiers soins

Inhalation Sortir au grand air. Appeler un médecin si les symptômes se développent ou s'ils persistent.

Contact avec la peau Laver avec de l'eau et du savon. Consulter un médecin si une irritation se développe et persiste.

Contact avec les yeux Rincer avec de l'eau. Consulter un médecin si une irritation se développe et persiste.

Ingestion Rincer la bouche. Faire appel à une assistance médicale si des symptômes apparaissent.

Symptômes et effets les plus importants, qu'ils soient aigus ou retardés Toux.

Mention de la nécessité d'une prise en charge médicale immédiate ou d'un traitement spécial, si nécessaire Donner des soins généraux et traiter en fonction des symptômes. Garder la victime en observation. Les symptômes peuvent se manifester à retardement.

Informations générales Si exposé(e) ou préoccupé(e) : Obtenir une consultation médicale ou des soins médicaux. S'assurer que le personnel médical est averti des substances impliquées et prend les précautions pour se protéger.

5. Mesures à prendre en cas d'incendie

Agents extincteurs appropriés Brouillard d'eau. Mousse. Poudre chimique sèche. Dioxyde de carbone (CO2).

Agents extincteurs inappropriés Non disponible.

Dangers spécifiques du produit dangereux Des gaz dangereux pour la santé peuvent se former pendant l'incendie.

Équipements de protection spéciaux et précautions spéciales pour les pompiers Porter un appareil respiratoire autonome et un vêtement de protection complet en cas d'incendie.

Équipement/directives de lutte contre les incendies Les récipients fermés peuvent être refroidis par eau pulvérisée.

Méthodes particulières d'intervention Employer des méthodes normales de lutte contre l'incendie et tenir compte des dangers associés aux autres substances présentes.

Risques d'incendie généraux Aucun risque exceptionnel d'incendie et d'explosion.

6. Mesures à prendre en cas de déversement accidentel

Précautions individuelles, équipements de protection et mesures d'urgence Tenir à l'écart le personnel dont la présence sur les lieux n'est pas indispensable. Garder les personnes à l'écart de l'endroit du déversement/de la fuite et en amont du vent. Porter un équipement et des vêtements de protection appropriés durant le nettoyage. S'assurer une ventilation adéquate. Prévenir les autorités locales si des fuites significatives ne peuvent pas être contenues. Pour s'informer sur la protection individuelle, voir la rubrique 8.

Méthodes et matériaux pour le confinement et le nettoyage Le produit n'est pas miscible avec l'eau et se dispersera sur la surface de l'eau. Arrêter l'écoulement de la substance, si cela peut se faire sans risque. Après avoir récupéré le produit, rincer la zone à l'eau. Pour se renseigner sur l'élimination, voir la rubrique 13.

Précautions relatives à l'environnement Éviter le rejet dans les égouts, les cours d'eau ou sur le sol.

7. Manutention et stockage

Précautions relatives à la sûreté en matière de manutention Se procurer les instructions avant utilisation. Ne pas manipuler avant d'avoir lu et compris toutes les mesures de sécurité. Minimiser la formation de poussières en suspension dans l'air. Fournir une ventilation aspirante adéquate aux endroits où la poussière se forme. Ne pas respirer les poussières. Éviter l'exposition prolongée. Si possible, manipuler dans un système clos. Porter un équipement de protection individuelle approprié. Observer de bonnes pratiques d'hygiène industrielle.

Conditions de sûreté en matière de stockage, y compris les incompatibilités

Protéger du rayonnement solaire. Conserver dans l'emballage d'origine à fermeture étanche. Conserver à l'écart de matières incompatibles (voir rubrique 10). Entreposer dans un endroit frais et sec.

8. Contrôle de l'exposition/protection individuelle

Limites d'exposition professionnelle

ÉTATS-UNIS. Valeurs limites d'exposition de l'ACGIH

Substance	Type	Valeur	Forme
VEOLIA ACTISAND	TWA	0.025 mg/m3	Fraction respirable.
Composants	**Type**	**Valeur**	**Forme**
Crystalline sillica (CAS 14808-60-7)	TWA	0.025 mg/m3	Fraction respirable.

Canada. LEMT pour l'Alberta (Code de l'hygiène et de la sécurité au travail, Annexe 1, Tableau 2)

Substance	Type	Valeur	Forme
VEOLIA ACTISAND	TWA	0.025 mg/m3	Particules inhalables.
Composants	**Type**	**Valeur**	**Forme**
Crystalline sillica (CAS 14808-60-7)	TWA	0.025 mg/m3	Particules inhalables.

Canada. LEMT pour la Colombie-Britannique. (Valeurs limites d'exposition en milieu de travail pour les substances chimiques, Réglementation sur la santé et sécurité au travail 296/97, ainsi modifiée

Substance	Type	Valeur	Forme
VEOLIA ACTISAND	TWA	0.025 mg/m3	Fraction respirable.
Composants	**Type**	**Valeur**	**Forme**
Crystalline sillica (CAS 14808-60-7)	TWA	0.025 mg/m3	Fraction respirable.

Canada. LEMT de Manitoba (Règlement 217/2006, Loi sur la sécurité et l'hygiène du travail)

Composants	Type	Valeur	Forme
Crystalline sillica (CAS 14808-60-7)	TWA	0.025 mg/m3	Fraction respirable.

Canada. LEMT pour l'Ontario. (Contrôle de l'exposition à des agents biologiques et chimiques)

Substance	Type	Valeur	Forme
VEOLIA ACTISAND	TWA	0.1 mg/m3	Respirable.
Composants	**Type**	**Valeur**	**Forme**
Crystalline sillica (CAS 14808-60-7)	TWA	0.1 mg/m3	Respirable.

Canada. LEMT du Québec, (Ministère du Travail. Règlement sur la qualité du milieu de travail)

Substance	Type	Valeur	Forme
VEOLIA ACTISAND	TWA	0.1 mg/m3	Poussière respirable.
Composants	**Type**	**Valeur**	**Forme**
Crystalline sillica (CAS 14808-60-7)	TWA	0.1 mg/m3	Poussière respirable.

Valeurs biologiques limites

Aucune limite d'exposition biologique observée pour les ingrédients.

Directives au sujet de l'exposition

Une exposition professionnelle à de la poussière nuisible (totale et respirable) et à de la silice cristalline respirable doit être suivie et contrôlée.

Contrôles d'ingénierie appropriés

Il faut utiliser une bonne ventilation générale (habituellement dix changements d'air l'heure). Les débits de ventilation doivent être adaptés aux conditions. S'il y a lieu, utiliser des enceintes d'isolement, une ventilation locale ou d'autres mesures d'ingénierie pour maintenir les concentrations atmosphériques sous les limites d'exposition recommandées. Si des limites d'exposition n'ont pas été établies, maintenir les concentrations atmosphériques à un niveau acceptable.

Mesures de protection individuelle, telles que les équipements de protection individuelle

Protection du visage/des yeux

Porter des lunettes de sécurité à écrans latéraux (ou des lunettes à coques).

Protection de la peau

Protection des mains Gants résistants aux produits chimiques. Les gants appropriés peuvent être indiqués par le fournisseur de gants.

Autre L'emploi d'un tablier imperméable est recommandé. Gants résistants aux produits chimiques.

Protection respiratoire Utiliser un respirateur avec filtre particulaire lorsque les concentrations particulaires sont supérieures à la limite d'exposition professionnelle.

Dangers thermiques Non disponible.

Considérations d'hygiène générale Suivre toutes les exigences de surveillance médicale. Toujours adopter de bonnes pratiques d'hygiène personnelle, telles que se laver après avoir manipulé la substance et avant de manger, de boire ou de fumer. Nettoyer régulièrement la tenue de travail et l'équipement de protection pour éliminer les contaminants.

9. Propriétés physiques et chimiques

Apparence

État physique Solide.

Forme Solide.

Couleur Non disponible.

Odeur Non disponible.

Seuil olfactif Non disponible.

pH Non disponible.

Point de fusion et point de congélation Non disponible.

Point initial d'ébullition et domaine d'ébullition Non disponible.

Point d'éclair Non disponible.

Taux d'évaporation Non disponible.

Inflammabilité (solides et gaz) Non disponible.

Limites supérieures et inférieures d'inflammabilité ou d'explosibilité

Limites d'inflammabilité - inférieure (%) Non disponible.

Limites d'inflammabilité - supérieure (%) Non disponible.

Limite d'explosibilité - inférieure (%) Non disponible.

Limite d'explosibilité - supérieure (%) Non disponible.

Tension de vapeur < 0.0000001 kPa à 25 °C

Densité de vapeur Non disponible.

Densité relative Non disponible.

Solubilité

Solubilité (eau) Insoluble

Coefficient de partage n-octanol/eau Non disponible.

Température d'auto-inflammation Non disponible.

Température de décomposition Non disponible.

Viscosité Non disponible.

Autres informations

Propriétés explosives Non explosif.

Chaleur de combustion (NFPA 30B)	0 kJ/g
Formule moléculaire	O2Si
Propriétés comburantes	Non oxydant.

10. Stabilité et réactivité

Réactivité	Le produit est stable et non réactif dans des conditions normales d'utilisation, d'entreposage et de transport.
Stabilité chimique	La substance est stable dans des conditions normales.
Risque de réactions dangereuses	Pas de réactions dangereuses connues dans les conditions normales d'utilisation.
Conditions à éviter	Contact avec des matériaux incompatibles.
Matériaux incompatibles	Oxydants puissants. Chlore
Produits de décomposition dangereux	Aucun produit dangereux de décomposition n'est connu.

11. Données toxicologiques

Renseignements sur les voies d'exposition probables

Inhalation	Toute inhalation prolongée peut être nocive.
Contact avec la peau	Aucun effet indésirable par contact avec la peau n'est attendu.
Contact avec les yeux	Le contact direct avec les yeux peut causer une irritation temporaire.
Ingestion	Faible danger présumé en cas d'ingestion.
Les symptômes correspondant aux caractéristiques physiques, chimiques et toxicologiques	Toux.

Renseignements sur les effets toxicologiques

Toxicité aiguë	Non disponible.
Corrosion cutanée/irritation cutanée	Un contact prolongé avec la peau peut entraîner une irritation temporaire.
Lésions oculaires graves/irritation oculaire	Le contact direct avec les yeux peut causer une irritation temporaire.

Sensibilisation respiratoire ou cutanée

Sensibilisation respiratoire	N'est pas un sensibilisant respiratoire.
Sensibilisation cutanée	Ce produit ne devrait pas causer une sensibilisation de la peau.
Mutagénicité sur les cellules germinales	Il n'existe pas de données indiquant que ce produit, ou tout composant présent à des taux de plus de 0,1 %, soit mutagène ou génétoxique.
Cancérogénicité	En 1997, le CIRC (Centre international de recherche sur le cancer) a conclu que la silice cristalline inhalée de sources professionnelles pouvait provoquer un cancer du poumon chez l'homme. Toutefois, lors de son évaluation globale, le CIRC a observé que « le pouvoir cancérogène n'était pas détecté dans toutes les conditions industrielles examinées. Le pouvoir cancérogène peut dépendre de caractéristiques intrinsèques de la silice cristalline ou de facteurs externes qui touchent son activité biologique ou la distribution de ses polymorphes. » (Monographies du CIRC sur l'évaluation des risques cancérogènes de substances chimiques pour l'être humain, Silice, poussière de silicates et fibres organiques, 1997, vol. 68, CIRC, Lyon, France.) En juin 2003, le CSLEP (Comité scientifique en matière de limites d'exposition professionnelle à des agents chimiques) a conclu que le principal effet chez l'être humain de l'inhalation de la poussière de silice cristalline respirable est la silicose. « Les données disponibles sont suffisantes pour conclure que le risque de cancer du poumon est accru chez les personnes atteintes de silicose (et non, semble-t-il, chez les employés exempts de silicose exposés à la poussière de silice dans les carrières et dans le secteur industriel des céramiques). Dès lors, la prévention de l'apparition de la silicose réduira également le risque de cancer... » (SCOEL SUM Doc 94-final, juin 2003) Selon l'état de la technique actuel, la protection des travailleurs contre la silicose peut être assurée de manière systématique en respectant les limites d'exposition professionnelle réglementaires existantes. Peut provoquer le cancer. Une exposition professionnelle à de la poussière respirable et à de la silice cristalline respirable doit être suivie et contrôlée.

Carcinogènes selon l'ACGIH

Crystalline sillica (CAS 14808-60-7)	A2 Probablement cancérogène pour l'homme.

Canada - LEMT pour l'Alberta : Catégorie de carcinogène

Crystalline sillica (CAS 14808-60-7)	Probablement cancérogène pour l'homme.

Canada - LEMT pour le Manitoba : cancérogénicité

SILICE, CRISTALLINE-.ALPHA.-QUARTZ, FRACTION RESPIRABLE (CAS 14808-60-7)	Probablement cancérogène pour l'homme.

Canada - LEMT pour le Québec : Catégorie de carcinogène

Crystalline sillica (CAS 14808-60-7)	Effet cancérogène suspecté chez les humains.

Monographies du CIRC. Évaluation globale de la cancérogénicité

Crystalline sillica (CAS 14808-60-7)	1 Cancérogène pour l'homme.

Toxicité pour la reproduction	On ne s'attend pas à ce que ce produit présente des effets sur la reproduction ou le développement.
Toxicité pour certains organes cibles - exposition unique	Non classé.
Toxicité pour certains organes cibles - expositions répétées	Non classé.
Danger par aspiration	N'est pas un danger d'aspiration.
Effets chroniques	Toute inhalation prolongée peut être nocive. Une exposition prolongée peut causer des effets chroniques.

12. Données écologiques

Écotoxicité	Le produit n'est pas classé comme dangereux pour l'environnement. Toutefois, ceci n'exclut pas la possibilité que des déversements importants ou fréquents puissent avoir un effet nocif ou nuisible sur l'environnement.
Persistance et dégradation	Aucune donnée n'est disponible sur la biodégradabilité du produit.
Potentiel de bioaccumulation	Aucune donnée disponible.
Mobilité dans le sol	Aucune donnée disponible.
Autres effets nocifs	On ne prévoit aucun autre effet environnemental négatif (par ex., appauvrissement de la couche d'ozone, potentiel de formation photochimique d'ozone, perturbation endocrinienne, potentiel de réchauffement de la planète) causé par ce composant.

13. Données sur l'élimination

Instructions pour l'élimination	Recueillir et réutiliser ou éliminer dans des récipients scellés dans un site d'élimination des déchets autorisé. Éliminer le contenu/les conteneurs selon la loi internationale/nationale/régionale/locale.
Règlements locaux d'élimination	Détruire conformément à toutes les réglementations applicables.
Code des déchets dangereux	Les codes de déchets doivent être attribués dans le cadre d'une consultation entre l'utilisateur, le fabricant et l'entreprise de décharge.
Déchets des résidus / produits non utilisés	Éliminer le produit conformément avec la réglementation locale en vigueur. Des résidus de produit peuvent demeurer dans les contenants vides et sur les toiles d'emballage. Ce produit et son contenant doivent être éliminés de façon sécuritaire (voir les instructions d'élimination).
Emballages contaminés	Comme les récipients vides peuvent contenir des résidus de produit, respecter les avertissements sur l'étiquette même après avoir vidé le récipient. Les contenants vides doivent être acheminés vers une installation certifiée de traitement des déchets en vue de leur élimination ou recyclage.

14. Informations relatives au transport

TMD

N'entre pas dans la réglementation des marchandises dangereuses.

IATA

N'entre pas dans la réglementation des marchandises dangereuses.

IMDG

N'entre pas dans la réglementation des marchandises dangereuses.

Transport en vrac selon l'Annexe II de MARPOL 73/78 et le recueil IBC Sans objet.

*La réponse « Oui » indique que tous les composants du produit sont conformes aux exigences d'entreposage du pays ayant compétence Un « Non » indique qu'un ou plusieurs composant(s) du produit n'est/ne sont pas inscrit(s) ou exempt(s) d'une inscription sur l'inventaire administré par le(s) pays ayant compétence.

16. Renseignements divers

Date de publication 16-Août-2016

Version n° 01

Avis de non-responsabilité Veolia Water Solutions & Technologies ne peut prévoir toutes les conditions d'utilisation des présents renseignements et de son produit, ou des produits d'autres fabricants en association avec son produit. L'utilisateur est responsable d'assurer des conditions sécuritaires de manutention, d'entreposage et d'élimination du produit, et il assume toute responsabilité quant à des pertes, des blessures, des dommages ou des dépenses liés à une utilisation incorrecte ou au non-respect des exigences de Veolia Solutions & Technologies.

Informations relatives à la révision	Identification du produit et de l'entreprise : Identification du produit et de l'entreprise

Hydrex

MATERIAL SAFETY DATA SHEET

1. Product and Company Identification

Product identifier	**Hydrex 6105**
Version #	01
Issue date	08-15-2014
CAS #	Mixture
Product use	Wastewater Flocculant
Manufacturer	
Supplier	VWS Canada
Address	2000 Argentia Road, Plaza IV, Suite 430 Mississauga, ON L5N 1W1 Canada
Contact Person	Hydrex Product Specialist
Telephone	(905) 286-4846
Fax	(905) 286-0488
e-mail	vwscanada.hydrex@veoliawater.com
24-Hour Emergency telephone	+1-760-476-3962 (Code:333239)

2. Hazards Identification

Potential health effects

Eyes	Health injuries are not known or expected under normal use.
Skin	Health injuries are not known or expected under normal use.
Inhalation	Health injuries are not known or expected under normal use.
Ingestion	Health injuries are not known or expected under normal use.

3. Composition / Information on Ingredients

The components are not hazardous or are below required disclosure limits.

4. First Aid Measures

First aid procedures

Eye contact	Rinse with water. Get medical attention if irritation develops and persists.
Skin contact	Rinse skin with water/shower. Get medical attention if irritation develops and persists.
Inhalation	If breathing is difficult, remove to fresh air and keep at rest in a position comfortable for breathing. Call a physician if symptoms develop or persist.
Ingestion	Rinse mouth. If ingestion of a large amount does occur, call a poison control center immediately.
General advice	If you feel unwell, seek medical advice (show the label where possible). Show this safety data sheet to the doctor in attendance.

5. Fire Fighting Measures

Flammable properties	Dust accumulation from this product may present an explosion hazard in the presence of an ignition source.
Extinguishing media	
Suitable extinguishing media	Water spray, fog, CO2, dry chemical, or alcohol resistant foam.
Protection of firefighters	
Protective equipment for firefighters	In the event of fire, wear self-contained breathing apparatus.
Fire fighting equipment/instructions	Use water spray to cool unopened containers. Dust may form an explosive mixture in the atmosphere.
Specific methods	Use water spray to cool unopened containers.

Explosion data

Sensitivity to static discharge	Not available.
Sensitivity to mechanical impact	Not available.

6. Accidental Release Measures

Personal precautions	Slippery when wet.
Environmental precautions	Prevent further leakage or spillage if safe to do so. Do not contaminate water.
Methods for cleaning up	Should not be released into the environment. Following product recovery, flush area with water. For waste disposal, see section 13 of the MSDS.

7. Handling and Storage

Handling	Avoid release to the environment. Material can be slippery when wet.
Storage	Store in a dry area. Store in closed original container at temperatures between 5°C and 30°C.

8. Exposure Controls / Personal Protection

Biological limit values	No biological exposure limits noted for the ingredient(s).

Personal protective equipment

Eye / face protection	Chemical goggles are recommended.
Skin protection	Normal work clothing (long sleeved shirts and long pants) is recommended.
Respiratory protection	No specific recommendation made, but protection against nuisance dust must be used when the general level exceeds 10 mg/m3.

9. Physical & Chemical Properties

Appearance	Not available.
Physical state	Solid.
Form	Not available.
Color	White
Odor	Not available.
pH	Not available.
Vapor pressure	0 hPa estimated
Vapor density	Not available.
Boiling point	Not available.
Melting point/Freezing point	Not available.
Solubility (water)	Not available.
Specific gravity	0.65 - 0.9
Flash point	Not available.
Auto-ignition temperature	Not available.
Ph Of 1% Solution	5 - 7

10. Chemical Stability & Reactivity Information

Chemical stability	Material is stable under normal conditions.
Conditions to avoid	None under normal conditions.
Incompatible materials	Not available.
Hazardous decomposition products	Upon decomposition, this product may yield oxides of nitrogen and ammonia, carbon dioxide, carbon monoxide and other low molecular weight hydrocarbons.

11. Toxicological Information

Toxicological data

Product	Species	Test Results
Hydrex 6105 (CAS Mixture)		
Acute		
Dermal		
LD50	Rabbit	> 10000 mg/kg
Oral		
LD50	Rat	> 5000 mg/kg

* Estimates for product may be based on additional component data not shown.

Chronic effects Not expected to be hazardous by WHMIS criteria.

12. Ecological Information

Ecotoxicological data

Product		Species	Test Results
Hydrex 6105 (CAS Mixture)			
Algae	IC50	Algae	2276 mg/l, 72 hr
Crustacea	EC50	Daphnia	> 100 mg/l, 48 hr
Other	LC50	Rainbow Trout	> 120 mg/l, 96 hr
Aquatic			
Fish	LC50	Zebra danio (Danio rerio)	> 100 mg/l, 96 hr

* Estimates for product may be based on additional component data not shown.

Ecotoxicity Contains a substance which causes risk of hazardous effects to the environment.

Environmental effects An environmental hazard cannot be excluded in the event of unprofessional handling or disposal.

Persistence and degradability Not available.

13. Disposal Considerations

Disposal instructions Collect and reclaim or dispose in sealed containers at licensed waste disposal site. Do not allow this material to drain into sewers/water supplies. This product, in its present state, when discarded or disposed of, is not a hazardous waste according to Federal regulations (40 CFR 261.4 (b)(4)). Under RCRA, it is the responsibility of the user of the product to determine, at the time of disposal, whether the product meets RCRA criteria for hazardous waste. Dispose in accordance with all applicable regulations.

Contaminated packaging Empty containers should be taken to an approved waste handling site for recycling or disposal.

14. Transport Information

TDG

Not regulated as dangerous goods.

IATA

Not regulated as dangerous goods.

IMDG

Not regulated as dangerous goods.

15. Regulatory Information

Canadian regulations This product has been classified in accordance with the hazard criteria of the CPR and the MSDS contains all the information required by the CPR.

WHMIS status Non-controlled

Inventory status

Country(s) or region	Inventory name	On inventory (yes/no)*
Australia	Australian Inventory of Chemical Substances (AICS)	Yes
Canada	Domestic Substances List (DSL)	Yes

Country(s) or region	Inventory name	On inventory (yes/no)*
Canada	Non-Domestic Substances List (NDSL)	No
China	Inventory of Existing Chemical Substances in China (IECSC)	Yes
Europe	European Inventory of Existing Commercial Chemical Substances (EINECS)	No
Europe	European List of Notified Chemical Substances (ELINCS)	No
Japan	Inventory of Existing and New Chemical Substances (ENCS)	Yes
Korea	Existing Chemicals List (ECL)	Yes
New Zealand	New Zealand Inventory	Yes
Philippines	Philippine Inventory of Chemicals and Chemical Substances (PICCS)	Yes
United States & Puerto Rico	Toxic Substances Control Act (TSCA) Inventory	Yes

*A "Yes" indicates that all components of this product comply with the inventory requirements administered by the governing country(s)
A "No" indicates that one or more components of the product are not listed or exempt from listing on the inventory administered by the governing country(s).

16. Other Information

Further information
HMIS® is a registered trade and service mark of the NPCA.

HMIS® ratings
Health: 0
Flammability: 1
Physical hazard: 0

NFPA ratings
Health: 0
Flammability: 1
Instability: 0

Disclaimer
Veolia Water Solutions & Technologies is not able to anticipate all conditions under which this information and its product, or the products of other manufacturers in combination with its product, may be used. It is the user's responsibility to ensure safe conditions for handling, storage and disposal of the product, and to assume liability for loss, injury, damage or expense due to improper use and or non respect of Veolia Water Solutions & Technologies' requirement.

This data sheet contains changes from the previous version in section(s):
Product and Company Identification: Product and Company Identification

SAFETY DATA SHEET

SULFURIC ACID 66 BE

Section 1. Identification

Product identifier : SULFURIC ACID 66 BE

Product code : Q02248

Relevant identified uses of the substance or mixture

Identified uses
Industrial applications

Supplier's details : QUADRA CHEMICALS LTD.
3901 F.X Tessier
Vaudreuil-Dorion, QC
CANADA J7V 5V5
1-800-665-6553

Emergency telephone number (with hours of operation) : **TRANSPORTATION EMERGENCY - 24HRS/DAY - 7 DAYS/WEEK IN CANADA - CALL 1-800-567-7455**

Section 2. Hazard identification

Classification of the substance or mixture : CORROSIVE TO METALS - Category 1
SKIN CORROSION - Category 1
SERIOUS EYE DAMAGE - Category 1
CARCINOGENICITY - Category 1
Health Hazards Not Otherwise Classified - Category 1

GHS label elements

Hazard pictograms :

Signal word : Danger

Hazard statements : May be corrosive to metals.
Causes digestive tract burns.
Causes respiratory tract burns.
Causes severe skin burns and eye damage.
May cause cancer.

Precautionary statements

Prevention : Obtain special instructions before use. Do not handle until all safety precautions have been read and understood. Wear protective gloves. Wear eye or face protection. Wear protective clothing. Keep only in original packaging. Wash hands thoroughly after handling.

Section 2. Hazard identification

Response : Absorb spillage to prevent material damage. IF exposed or concerned: Get medical attention. IF INHALED: Remove person to fresh air and keep comfortable for breathing. Immediately call a POISON CENTER or physician. IF SWALLOWED: Immediately call a POISON CENTER or physician. Rinse mouth. Do NOT induce vomiting. IF ON SKIN (or hair): Take off immediately all contaminated clothing. Rinse skin with water. Wash contaminated clothing before reuse. Immediately call a POISON CENTER or physician. IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Immediately call a POISON CENTER or physician.

Storage : Store locked up. Store in a corrosion resistant container with a resistant inner liner.

Disposal : Dispose of contents and container in accordance with all local, regional, national and international regulations.

Supplemental label elements : Keep container tightly closed. Do not breathe vapor or spray. Do not taste or swallow. Use only with adequate ventilation. Wash thoroughly after handling.

Section 3. Composition/information on ingredients

Substance/mixture : Substance

Ingredient name	% (w/w)	CAS number
sulphuric acid	93	7664-93-9

There are no additional ingredients present which, within the current knowledge of the supplier and in the concentrations applicable, are classified as hazardous to health or the environment and hence require reporting in this section.

Occupational exposure limits, if available, are listed in Section 8.

Section 4. First-aid measures

Description of necessary first aid measures

Eye contact : Get medical attention immediately. Call a poison center or physician. Immediately flush eyes with plenty of water, occasionally lifting the upper and lower eyelids. Check for and remove any contact lenses. Continue to rinse for at least 10 minutes. Chemical burns must be treated promptly by a physician.

Inhalation : Get medical attention immediately. Call a poison center or physician. Remove victim to fresh air and keep at rest in a position comfortable for breathing. If it is suspected that fumes are still present, the rescuer should wear an appropriate mask or self-contained breathing apparatus. If not breathing, if breathing is irregular or if respiratory arrest occurs, provide artificial respiration or oxygen by trained personnel. It may be dangerous to the person providing aid to give mouth-to-mouth resuscitation. If unconscious, place in recovery position and get medical attention immediately. Maintain an open airway. Loosen tight clothing such as a collar, tie, belt or waistband.

Skin contact : Get medical attention immediately. Call a poison center or physician. Wash contaminated skin with soap and water. Remove contaminated clothing and shoes. Wash contaminated clothing thoroughly with water before removing it, or wear gloves. Continue to rinse for at least 10 minutes. Chemical burns must be treated promptly by a physician. Wash clothing before reuse. Clean shoes thoroughly before reuse.

Section 4. First-aid measures

Ingestion : Get medical attention immediately. Call a poison center or physician. Wash out mouth with water. Remove dentures if any. Remove victim to fresh air and keep at rest in a position comfortable for breathing. If material has been swallowed and the exposed person is conscious, give small quantities of water to drink. Stop if the exposed person feels sick as vomiting may be dangerous. Do not induce vomiting unless directed to do so by medical personnel. If vomiting occurs, the head should be kept low so that vomit does not enter the lungs. Chemical burns must be treated promptly by a physician. Never give anything by mouth to an unconscious person. If unconscious, place in recovery position and get medical attention immediately. Maintain an open airway. Loosen tight clothing such as a collar, tie, belt or waistband.

Most important symptoms/effects, acute and delayed

Potential acute health effects

Eye contact : Causes serious eye damage.

Inhalation : Corrosive to the respiratory system.

Skin contact : Causes severe burns.

Ingestion : May cause burns to mouth, throat and stomach. Corrosive to the digestive tract. Causes burns.

Over-exposure signs/symptoms

Eye contact : Adverse symptoms may include the following:
pain
watering
redness

Inhalation : Adverse symptoms may include the following:
respiratory tract irritation
coughing

Skin contact : Adverse symptoms may include the following:
pain or irritation
redness
blistering may occur

Ingestion : Adverse symptoms may include the following:
stomach pains

Indication of immediate medical attention and special treatment needed, if necessary

Notes to physician : Treat symptomatically. Contact poison treatment specialist immediately if large quantities have been ingested or inhaled.

Specific treatments : No specific treatment.

Protection of first-aiders : No action shall be taken involving any personal risk or without suitable training. If it is suspected that fumes are still present, the rescuer should wear an appropriate mask or self-contained breathing apparatus. It may be dangerous to the person providing aid to give mouth-to-mouth resuscitation. Wash contaminated clothing thoroughly with water before removing it, or wear gloves.

See toxicological information (Section 11)

Section 5. Fire-fighting measures

Extinguishing media

Suitable extinguishing media : Use an extinguishing agent suitable for the surrounding fire.

Unsuitable extinguishing media : None known.

Specific hazards arising from the chemical : In a fire or if heated, a pressure increase will occur and the container may burst.

Hazardous thermal decomposition products : Decomposition products may include the following materials:
sulfur oxides

Special protective actions for fire-fighters : Promptly isolate the scene by removing all persons from the vicinity of the incident if there is a fire. No action shall be taken involving any personal risk or without suitable training.

Special protective equipment for fire-fighters : Fire-fighters should wear appropriate protective equipment and self-contained breathing apparatus (SCBA) with a full face-piece operated in positive pressure mode.

Section 6. Accidental release measures

Personal precautions, protective equipment and emergency procedures

For non-emergency personnel : No action shall be taken involving any personal risk or without suitable training. Evacuate surrounding areas. Keep unnecessary and unprotected personnel from entering. Do not touch or walk through spilled material. Do not breathe vapor or mist. Provide adequate ventilation. Wear appropriate respirator when ventilation is inadequate. Put on appropriate personal protective equipment.

For emergency responders : If specialized clothing is required to deal with the spillage, take note of any information in Section 8 on suitable and unsuitable materials. See also the information in "For non-emergency personnel".

Environmental precautions : Avoid dispersal of spilled material and runoff and contact with soil, waterways, drains and sewers. Inform the relevant authorities if the product has caused environmental pollution (sewers, waterways, soil or air).

Methods and materials for containment and cleaning up

Small spill : Stop leak if without risk. Move containers from spill area. Dilute with water and mop up if water-soluble. Alternatively, or if water-insoluble, absorb with an inert dry material and place in an appropriate waste disposal container. Absorb spillage to prevent material damage. Dispose of via a licensed waste disposal contractor.

Large spill : Stop leak if without risk. Move containers from spill area. Absorb spillage to prevent material damage. Approach release from upwind. Prevent entry into sewers, water courses, basements or confined areas. Wash spillages into an effluent treatment plant or proceed as follows. Contain and collect spillage with non-combustible, absorbent material e.g. sand, earth, vermiculite or diatomaceous earth and place in container for disposal according to local regulations (see Section 13). The spilled material may be neutralized with sodium carbonate, sodium bicarbonate or sodium hydroxide. Dispose of via a licensed waste disposal contractor. Contaminated absorbent material may pose the same hazard as the spilled product. Note: see Section 1 for emergency contact information and Section 13 for waste disposal.

Section 7. Handling and storage

Precautions for safe handling

Protective measures : Put on appropriate personal protective equipment (see Section 8). Avoid exposure - obtain special instructions before use. Do not handle until all safety precautions have been read and understood. Do not get in eyes or on skin or clothing. Do not breathe vapor or mist. Do not ingest. Use only with adequate ventilation. Wear appropriate respirator when ventilation is inadequate. Keep in the original container or an approved alternative made from a compatible material, kept tightly closed when not in use. Keep away from alkalis. Empty containers retain product residue and can be hazardous. Do not reuse container. Absorb spillage to prevent material damage.

Advice on general occupational hygiene : Eating, drinking and smoking should be prohibited in areas where this material is handled, stored and processed. Workers should wash hands and face before eating, drinking and smoking. Remove contaminated clothing and protective equipment before entering eating areas. See also Section 8 for additional information on hygiene measures.

Conditions for safe storage, including any incompatibilities : Store in accordance with local regulations. Store in original container protected from direct sunlight in a dry, cool and well-ventilated area, away from incompatible materials (see Section 10) and food and drink. Store in a corrosion resistant container with a resistant inner liner. Store locked up. Separate from alkalis. Keep container tightly closed and sealed until ready for use. Containers that have been opened must be carefully resealed and kept upright to prevent leakage. Do not store in unlabeled containers. Use appropriate containment to avoid environmental contamination.

Section 8. Exposure controls/personal protection

Control parameters

Occupational exposure limits

Ingredient name	Exposure limits
sulphuric acid	**ACGIH TLV (United States, 3/2016).** TWA: 0.2 mg/m³ 8 hours. Form: Thoracic fraction

Appropriate engineering controls : Use only with adequate ventilation. If user operations generate dust, fumes, gas, vapor or mist, use process enclosures, local exhaust ventilation or other engineering controls to keep worker exposure to airborne contaminants below any recommended or statutory limits.

Environmental exposure controls : Emissions from ventilation or work process equipment should be checked to ensure they comply with the requirements of environmental protection legislation. In some cases, fume scrubbers, filters or engineering modifications to the process equipment will be necessary to reduce emissions to acceptable levels.

Individual protection measures

Hygiene measures : Wash hands, forearms and face thoroughly after handling chemical products, before eating, smoking and using the lavatory and at the end of the working period. Appropriate techniques should be used to remove potentially contaminated clothing. Wash contaminated clothing before reusing. Ensure that eyewash stations and safety showers are close to the workstation location.

Section 8. Exposure controls/personal protection

Eye/face protection : Safety eyewear complying with an approved standard should be used when a risk assessment indicates this is necessary to avoid exposure to liquid splashes, mists, gases or dusts. If contact is possible, the following protection should be worn, unless the assessment indicates a higher degree of protection: chemical splash goggles and/or face shield. If inhalation hazards exist, a full-face respirator may be required instead.

Hand protection : Chemical-resistant, impervious gloves complying with an approved standard should be worn at all times when handling chemical products if a risk assessment indicates this is necessary. Considering the parameters specified by the glove manufacturer, check during use that the gloves are still retaining their protective properties. It should be noted that the time to breakthrough for any glove material may be different for different glove manufacturers. In the case of mixtures, consisting of several substances, the protection time of the gloves cannot be accurately estimated.

Body protection : Personal protective equipment for the body should be selected based on the task being performed and the risks involved and should be approved by a specialist before handling this product.

Other skin protection : Appropriate footwear and any additional skin protection measures should be selected based on the task being performed and the risks involved and should be approved by a specialist before handling this product.

Respiratory protection : Based on the hazard and potential for exposure, select a respirator that meets the appropriate standard or certification. Respirators must be used according to a respiratory protection program to ensure proper fitting, training, and other important aspects of use.

Section 9. Physical and chemical properties

Physical state : Liquid. [Oily liquid. Clear.]

Color : Colorless to amber.

Odor : Odorless.

Odor threshold : Not available.

pH : <0.1

Melting point : 10.5°C (50.9°F)

Boiling point : 280°C (536°F)

Flash point : Not available.

Evaporation rate : Not available.

Flammability (solid, gas) : Not available.

Lower and upper explosive (flammable) limits : Not available.

Vapor pressure : <0.04 kPa (<0.3 mm Hg) [room temperature]

Vapor density : 3.4 [Air = 1]

Relative density : 1.84

Density : Not available.

Solubility : Easily soluble in the following materials: cold water.

Dispersibility properties : Not available.

Partition coefficient: n-octanol/water : Not available.

Auto-ignition temperature : Not available.

Decomposition temperature : Not available.

Viscosity : Not available.

Section 9. Physical and chemical properties

Volatility : Not available.

Section 10. Stability and reactivity

Reactivity : No specific test data related to reactivity available for this product or its ingredients.

Chemical stability : The product is stable.

Possibility of hazardous reactions : Under normal conditions of storage and use, hazardous reactions will not occur.

Conditions to avoid : No specific data.

Incompatible materials : oxidizing materials
reducing materials
combustible materials
organic materials
metals
acids
alkalis
moisture

Hazardous decomposition products : Under normal conditions of storage and use, hazardous decomposition products should not be produced.

Section 11. Toxicological information

Information on toxicological effects

Acute toxicity

Product/ingredient name	Result	Species	Dose	Exposure
sulphuric acid	LD50 Oral	Rat	2140 mg/kg	-

Irritation/Corrosion

Product/ingredient name	Result	Species	Score	Exposure	Observation
sulphuric acid	Eyes - Severe irritant	Rabbit	-	250 Micrograms	-
	Eyes - Severe irritant	Rabbit	-	0.5 minutes 5 milligrams	-

Sensitization

Not available.

Mutagenicity

Not available.

Carcinogenicity

Not available.

Carcinogenicity Classification

Product/ingredient name	IARC	NTP	ACGIH
sulphuric acid	1	Known to be a human carcinogen.	A2

Section 11. Toxicological information

Reproductive toxicity

Not available.

Teratogenicity

Not available.

Specific target organ toxicity (single exposure)

Not available.

Specific target organ toxicity (repeated exposure)

Not available.

Aspiration hazard

Not available.

Information on the likely routes of exposure : Routes of entry anticipated: Oral, Inhalation.

Potential acute health effects

Eye contact : Causes serious eye damage.

Inhalation : Corrosive to the respiratory system.

Skin contact : Causes severe burns.

Ingestion : May cause burns to mouth, throat and stomach. Corrosive to the digestive tract. Causes burns.

Symptoms related to the physical, chemical and toxicological characteristics

Eye contact : Adverse symptoms may include the following:
pain
watering
redness

Inhalation : Adverse symptoms may include the following:
respiratory tract irritation
coughing

Skin contact : Adverse symptoms may include the following:
pain or irritation
redness
blistering may occur

Ingestion : Adverse symptoms may include the following:
stomach pains

Delayed and immediate effects and also chronic effects from short and long term exposure

Short term exposure

Potential immediate effects : Not available.

Potential delayed effects : Not available.

Long term exposure

Potential immediate effects : Not available.

Potential delayed effects : Not available.

Potential chronic health effects

General : No known significant effects or critical hazards.

Carcinogenicity : May cause cancer. Risk of cancer depends on duration and level of exposure.

Section 11. Toxicological information

Numerical measures of toxicity

Acute toxicity estimates

Route	ATE value
Oral	2301.1 mg/kg

Section 12. Ecological information

Toxicity

Product/ingredient name	Result	Species	Exposure
sulphuric acid	Acute LC50 42500 µg/l Marine water Acute LC50 36 ul/L Marine water	Crustaceans - Pandalus montagui - Adult Fish - Agonus cataphractus	48 hours 96 hours

Persistence and degradability

Product/ingredient name	Aquatic half-life	Photolysis	Biodegradability
SULFURIC ACID 66 BE	-	-	Readily

Bioaccumulative potential

Not available.

Mobility in soil

Soil/water partition coefficient (K_{OC}) : Not available.

Other adverse effects : No known significant effects or critical hazards.

Section 13. Disposal considerations

Disposal methods : The generation of waste should be avoided or minimized wherever possible. Disposal of this product, solutions and any by-products should at all times comply with the requirements of environmental protection and waste disposal legislation and any regional local authority requirements. Dispose of surplus and non-recyclable products via a licensed waste disposal contractor. Waste should not be disposed of untreated to the sewer unless fully compliant with the requirements of all authorities with jurisdiction. Waste packaging should be recycled. Incineration or landfill should only be considered when recycling is not feasible. This material and its container must be disposed of in a safe way. Care should be taken when handling emptied containers that have not been cleaned or rinsed out. Empty containers or liners may retain some product residues. Avoid dispersal of spilled material and runoff and contact with soil, waterways, drains and sewers.

Section 14. Transport information

	TDG Classification
UN number	1830
UN proper shipping name	SULFURIC ACID
Transport hazard class(es)	8 
Packing group	II
Additional information	ERP / PIU # 2-0032

Section 15. Regulatory information

Canada inventory : All components are listed or exempted.

Section 16. Other information

History

Date of issue/Date of revision : 10 July 2017

Prepared by : Regulatory Affairs

Key to abbreviations : ATE = Acute Toxicity Estimate
BCF = Bioconcentration Factor
GHS = Globally Harmonized System of Classification and Labelling of Chemicals
LogPow = logarithm of the octanol/water partition coefficient
UN = United Nations
HPR = Hazardous Products Regulations

Procedure used to derive the classification

Classification	Justification
CORROSIVE TO METALS - Category 1	Expert judgment
SKIN CORROSION - Category 1	On basis of test data
SERIOUS EYE DAMAGE - Category 1	On basis of test data
CARCINOGENICITY - Category 1	Calculation method
Health Hazards Not Otherwise Classified - Category 1	Calculation method

Notice to reader

To the best of our knowledge, the information contained herein is accurate. However, neither the above-named supplier, nor any of its subsidiaries, assumes any liability whatsoever for the accuracy or completeness of the information contained herein.
Final determination of suitability of any material is the sole responsibility of the user. All materials may present unknown hazards and should be used with caution. Although certain hazards are described herein, we cannot guarantee that these are the only hazards that exist.

SAFETY DATA SHEET

1. Identification

Product identifier	**HYDREX 3966**
Other means of identification	None.
Recommended use	Potable Water Treatment PROFESSIONAL USE ONLY
Recommended restrictions	No other uses are advised.

Manufacturer/Importer/Supplier/Distributor information

Supplier	Veolia Water Technologies Canada Inc.
Address	2000 Argentia Road, Plaza IV, Suite 430 Mississauga, ON L5N 1W1 Canada
Contact Person	Hydrex Product Specialist
Telephone	(905) 286-4846
Fax	(905) 286-0488
e-mail	vwtcanada-hydrex@veolia.com
24-Hour Emergency telephone	24 Hour Number: +1-760-476-3962 (Code:333239)
Supplier	Not available.

2. Hazard identification

Physical hazards	Self-heating substances and mixtures	Category 2
Health hazards	Not classified.	
Environmental hazards	Not classified.	

Label elements

Signal word	Warning
Hazard statement	Self-heating in large quantities; may catch fire.
Precautionary statement	
Prevention	Keep cool. Wear protective gloves/protective clothing/eye protection/face protection.
Response	Wash hands after handling.
Storage	Maintain air gap between stacks or pallets. Store separately.
Disposal	Dispose of waste and residues in accordance with local authority requirements.
Other hazards	Warning: Wet activated carbon depletes oxygen from the air and therefore dangerously low levels of oxygen may be encountered. Whenever workers enter a vessel containing activated carbon, the oxygen content should be determined and work procedures for potentially low oxygen areas should be followed.
Supplemental information	None.

3. Composition/information on ingredients

Mixtures

Chemical name	Common name and synonyms	CAS number	%
Activated Carbon		7440-44-0	100

All concentrations are in percent by weight unless ingredient is a gas. Gas concentrations are in percent by volume.

4. First-aid measures

Inhalation	Move to fresh air. Call a physician if symptoms develop or persist.
Skin contact	Wash off with soap and water. Get medical attention if irritation develops and persists. Remove and isolate contaminated clothing and shoes.
Eye contact	Rinse with water. Get medical attention if irritation develops and persists.
Ingestion	Rinse mouth. Drink 1 or 2 glasses of water. Get medical attention if symptoms occur.
Most important symptoms/effects, acute and delayed	Coughing.
Indication of immediate medical attention and special treatment needed	Treat symptomatically. Medications efficiency can be reduced by the adsorbing power of the activated carbon.
General information	Ensure that medical personnel are aware of the material(s) involved, and take precautions to protect themselves.

5. Fire-fighting measures

Suitable extinguishing media	Water fog. Foam. Dry chemical powder. Carbon dioxide (CO2).
Unsuitable extinguishing media	Not available.
Specific hazards arising from the chemical	During fire, gases hazardous to health may be formed.
Special protective equipment and precautions for firefighters	Self-contained breathing apparatus and full protective clothing must be worn in case of fire.
Fire fighting equipment/instructions	Use water spray to cool unopened containers.
Specific methods	Use standard firefighting procedures and consider the hazards of other involved materials.
General fire hazards	Self-heating in large quantities; may catch fire.

6. Accidental release measures

Personal precautions, protective equipment and emergency procedures	Keep unnecessary personnel away. Keep people away from and upwind of spill/leak. Wear appropriate protective equipment and clothing during clean-up. Ensure adequate ventilation. Local authorities should be advised if significant spillages cannot be contained. For personal protection, see section 8 of the SDS.
Methods and materials for containment and cleaning up	Stop the flow of material, if this is without risk. Large Spills: Following product recovery, flush area with water. For waste disposal, see section 13 of the SDS.
Environmental precautions	Avoid discharge into drains, water courses or onto the ground.

7. Handling and storage

Precautions for safe handling	Keep cool. Provide adequate ventilation. Wear appropriate personal protective equipment. Observe good industrial hygiene practices.
Conditions for safe storage, including any incompatibilities	Store in a cool, dry place out of direct sunlight. Store in tightly closed container. Store away from other materials. Maintain air gap between stacks/pallets. Store in cool, dry place. Keep away from moisture.

8. Exposure controls/personal protection

Occupational exposure limits	No exposure limits noted for ingredient(s).
Biological limit values	No biological exposure limits noted for the ingredient(s).
Appropriate engineering controls	Not available.

Individual protection measures, such as personal protective equipment

Eye/face protection	Wear dust goggles.
Skin protection	
Hand protection	Chemical resistant gloves.
Other	Wear suitable protective clothing. Chemical resistant gloves.

Respiratory protection	In case of insufficient ventilation, wear suitable respiratory equipment. Wear a disposable respiratory equipment against droplets and which complies with NF EN 149, category P1. Use a particulate filter respirator for particulate concentrations exceeding the Occupational Exposure Limit.
Thermal hazards	Not applicable.
General hygiene considerations	Always observe good personal hygiene measures, such as washing after handling the material and before eating, drinking, and/or smoking. Routinely wash work clothing and protective equipment to remove contaminants.

9. Physical and chemical properties

Appearance	
Physical state	Solid.
Form	Solid. Powder.
Color	Black.
Odor	Odorless.
Odor threshold	Not available.
pH	Not available.
Melting point/freezing point	Not available.
Initial boiling point and boiling range	Not available.
Flash point	Not available.
Evaporation rate	Not available.
Flammability (solid, gas)	Not available.
Upper/lower flammability or explosive limits	
Flammability limit - lower (%)	Not available.
Flammability limit - upper (%)	Not available.
Explosive limit - lower (%)	60 g/m3
Explosive limit - upper (%)	Not available.
Vapor pressure	Not available.
Vapor density	Not available.
Relative density	Not available.
Solubility(ies)	
Solubility (water)	0 % OECD Guideline 105 (Water Solubility)
Partition coefficient (n-octanol/water)	Not applicable
Auto-ignition temperature	Not available.
Decomposition temperature	Not available.
Viscosity	Not available.
Other information	Physical and chemical properties of the saturated activated carbon may be different from the virgin material.
Bulk density	300 - 600 kg/m³
Dust explosion properties	
Pmax	6 bar
dP/dT	160 bar/s
St class	1 Weak explosion.
Minimum ignition energy (MIE) - dust cloud	> 1200 mJ

Minimum ignition temperature (MIT) - dust cloud	1256 °F (680 °C) EN50281/VDI2263 - dust cloud in contact with a hot surface (Godbert-Greenwald)
Explosive properties	Explosion risk in case of fire.
Explosivity	Explosible
Oxidizing properties	Not oxidizing.
pH of 1% Solution	7 - 11

10. Stability and reactivity

Reactivity	The product is stable and non-reactive under normal conditions of use, storage and transport.
Chemical stability	Material is stable under normal conditions.
Possibility of hazardous reactions	No dangerous reaction known under conditions of normal use.
Conditions to avoid	Keep away from heat, hot surfaces, sparks, open flames and other ignition sources. Contact with incompatible materials.
Incompatible materials	Oxygen. Chlorine. Solvents. Strong acids. Strong oxidizing agents. Combustible material. Humid air.
Hazardous decomposition products	At thermal decomposition temperatures, carbon monoxide and carbon dioxide.

11. Toxicological information

Information on likely routes of exposure

Inhalation	No adverse effects due to inhalation are expected.
Skin contact	No adverse effects due to skin contact are expected.
Eye contact	Direct contact with eyes may cause temporary irritation.
Ingestion	Expected to be a low ingestion hazard.
Symptoms related to the physical, chemical and toxicological characteristics	Coughing.

Information on toxicological effects

Acute toxicity Not known.

Product	Species	Test Results
HYDREX 3966		
Acute		
Inhalation		
Dust		
LC50	Rat	> 64 mg/l OECD 403 Acute Inhalation Toxicity
Oral		
Solid		
LD50	Rat	> 2000 mg/kg bw/day OECD 423
Presumed Non-Toxic		
Dermal		
Solid		
LD50	Rat	

Skin corrosion/irritation	Prolonged skin contact may cause temporary irritation.
Serious eye damage/eye irritation	Direct contact with eyes may cause temporary irritation.

Respiratory or skin sensitization

Respiratory sensitization	Not a respiratory sensitizer.
Skin sensitization	This product is not expected to cause skin sensitization.
Germ cell mutagenicity	No data available to indicate product or any components present at greater than 0.1% are mutagenic or genotoxic.
Carcinogenicity	Not classifiable as to carcinogenicity to humans.

Reproductive toxicity	This product is not expected to cause reproductive or developmental effects.
Specific target organ toxicity - single exposure	Not classified.
Specific target organ toxicity - repeated exposure	Not classified.
Aspiration hazard	Not an aspiration hazard.

12. Ecological information

Ecotoxicity The product is not classified as environmentally hazardous. However, this does not exclude the possibility that large or frequent spills can have a harmful or damaging effect on the environment.

Product		Species	Test Results
HYDREX 3966			
Aquatic			
Acute			
Algae	Presumed Non-Toxic	Algae	
Crustacea	Presumed Non-Toxic	Crustacea	
		Daphnia	
Fish	Presumed Non-Toxic	Fish	

Persistence and degradability	The product is not biodegradable.
Bioaccumulative potential	It is expected to be nonbiodegradable and unlikely to bioconcentrate.
Mobility in soil	No data available.
Other adverse effects	No other adverse environmental effects (e.g. ozone depletion, photochemical ozone creation potential, endocrine disruption, global warming potential) are expected from this component.

13. Disposal considerations

Disposal instructions	Consult authorities before disposal. Dispose of contents/container in accordance with local/regional/national/international regulations. Warning: Wet activated carbon depletes oxygen from the air and therefore dangerously low levels of oxygen may be encountered.
Local disposal regulations	Dispose in accordance with all applicable regulations.
Hazardous waste code	The waste code should be assigned in discussion between the user, the producer and the waste disposal company.
Waste from residues / unused products	Dispose of in accordance with local regulations. Empty containers or liners may retain some product residues. This material and its container must be disposed of in a safe manner (see: Disposal instructions).
Contaminated packaging	Since emptied containers may retain product residue, follow label warnings even after container is emptied. Empty containers should be taken to an approved waste handling site for recycling or disposal.

14. Transport information

TDG

UN number	UN1362
UN proper shipping name	CARBON, ACTIVATED
Transport hazard class(es)	
Class	4.2
Subsidiary risk	-
Packing group	III
Environmental hazards	Not available.
Special precautions for user	Read safety instructions, SDS and emergency procedures before handling.

IATA

UN number	UN1362
UN proper shipping name	Carbon, activated
Transport hazard class(es)	
Class	4.2

Subsidiary risk	-
Packing group	III
Environmental hazards	No.
ERG Code	4L
Special precautions for user	Read safety instructions, SDS and emergency procedures before handling.
Other information	
Passenger and cargo aircraft	Allowed with restrictions.
Cargo aircraft only	Allowed with restrictions.

IMDG

UN number	UN1362
UN proper shipping name	CARBON, ACTIVATED
Transport hazard class(es)	
Class	4.2
Subsidiary risk	-
Packing group	III
Environmental hazards	
Marine pollutant	No.
EmS	F-A, S-J
Special precautions for user	Read safety instructions, SDS and emergency procedures before handling.

Transport in bulk according to Annex II of MARPOL 73/78 and the IBC Code Not applicable.

IATA; IMDG; TDG

General information Under the UN classification for activated carbon, all activated carbons have been identified as a class 4.2 product. However, This product has been tested according to the United Nations Transport of Dangerous Goods test protocol for a "self-heating substance" (United Nations Transportation of Dangerous Goods, Manual of Tests and Criteria, Part III, Section 33.3.1.6 – Test N.4 – Test Method for Self Heating Substances) and it has been specifically determined that this product does not meet the definition of a self heating substance (class 4.2) or any other hazard class, and therefore should not be listed as a hazardous material. This information is applicable only for the Activated Carbon Product identified in this document.

15. Regulatory information

Canadian regulations This product has been classified in accordance with the hazard criteria of the HPR and the SDS contains all the information required by the HPR.

Controlled Drugs and Substances Act

Not regulated.

Export Control List (CEPA 1999, Schedule 3)

Not listed.

Greenhouse Gases

Not listed.

Precursor Control Regulations

Not regulated.

International regulations

Stockholm Convention

Not applicable.

Rotterdam Convention

Not applicable.

Kyoto protocol

Not applicable.

Montreal Protocol

Not applicable.

Basel Convention

Not applicable.

International Inventories

Country(s) or region	Inventory name	On inventory (yes/no)*
Australia	Australian Inventory of Chemical Substances (AICS)	Yes
Canada	Domestic Substances List (DSL)	Yes
Canada	Non-Domestic Substances List (NDSL)	No
China	Inventory of Existing Chemical Substances in China (IECSC)	Yes
Europe	European Inventory of Existing Commercial Chemical Substances (EINECS)	Yes
Europe	European List of Notified Chemical Substances (ELINCS)	No
Japan	Inventory of Existing and New Chemical Substances (ENCS)	No
Korea	Existing Chemicals List (ECL)	Yes
New Zealand	New Zealand Inventory	Yes
Philippines	Philippine Inventory of Chemicals and Chemical Substances (PICCS)	Yes
Taiwan	Taiwan Chemical Substance Inventory (TCSI)	No
United States & Puerto Rico	Toxic Substances Control Act (TSCA) Inventory	Yes

*A "Yes" indicates that all components of this product comply with the inventory requirements administered by the governing country(s)
A "No" indicates that one or more components of the product are not listed or exempt from listing on the inventory administered by the governing country(s).

Jacobi | THE CARBON COMPANY

TECHNICAL DATASHEET

AquaSorb™ CP1

Activated carbon for potable and industrial water treatment

AquaSorb™ CP1 is a high activity powdered activated carbon, specifically manufactured for the treatment of water for human consumption, in both municipal and industrial applications. This grade of activated carbon is highly microporous and is particularly suited to the removal of low molecular weight organics present in low concentrations. Manufactured from a sustainable raw material, AquaSorb™ CP1 contributes to a reduction in atmospheric carbon dioxide (CO_2). The material is compliant with international standards for activated carbon products used in this application.

SPECIFICATION*

Iodine adsorption	min. 1000 mg/g
Total ash content	max. 5%
Moisture content	max. 5%

TYPICAL PROPERTIES*

Surface area (BET N_2)	1050 m^2/g
Water solubles	max. 3%
Apparent density, aspirated	330 kg/m^3
Apparent density, tapped	505 kg/m^3

* SPECIFICATIONS AND TYPICAL PROPERTIES ARE PRODUCED USING JACOBI CARBONS' TEST METHODS. THEY ARE LISTED FOR INFORMATIONAL PURPOSES ONLY AND NOT TO BE USED AS PURCHASE SPECIFICATIONS. SALES SPECIFICATIONS CAN BE OBTAINED FROM YOUR JACOBI CARBONS TECHNICAL SALES REPRESENTATIVE AND SHOULD BE REVIEWED BEFORE PLACING AN ORDER.

Features and Benefits

- Rapid adsorption kinetics
- High activity adsorbent
- Microporous product
- High trace contaminant removal efficiency
- Carefully controlled particle size
- Compliant with international standards (AWWA/EN12903/ ANSI NSF61)

Available Particle Sizes

- PAC–C d_{50} >35µm
- PAC–S d_{50} 15-35µm
- PAC–F d_{50} 8-15µm
- PAC-MG d_{50} 6-10µm

Supply options

- Standard PAC
- Pre-wetted carbon 'cake'
- Liquid suspension (HYDROSOL® S23)
- Other supply forms considered on request

Standard Packaging

- 25 kg sack (55 lb)
- 500 kg bulk bag (1100 lb)
- Bulk tanker
- Other packing considered on request

Polypropylene liner-free FIBCs (super sacks), two bags per pallet

Technical Datasheet: AquaSorb™ CP1

SUSTAINABILITY

A variety of raw materials can be used for the manufacture of activated carbons. Only coconut shell is truly sustainable, using a renewable source of material that complements other uses for parts of the nut; from the flesh used for foodstuffs, to the coir used to produce matting.

The use of coconut shell in the production of activated carbon represents a net reduction of atmospheric Carbon Dioxide (CO_2), and almost a four-fold lower emission of greenhouse gases than the use of coal as a raw material source.

PRODUCTION CAPABILITY

Jacobi Carbons operates multiple facilities for the manufacture of activated carbons. These production plants are strategically located close to market and raw material sources. With an annual output in excess of 70 000 metric tonnes, Jacobi Carbons is able to supply product to all locations around the globe.

Our production units are certified according to internationally recognised standards. Quality control is consistent throughout the group of companies and goods are always shipped in compliance with customer specifications.

BURNING AND EXPLOSION CHARACTERISTICS

Auto-ignition temperature	260 °C	
Smolder temperature	No smoldering up to 400 °C	
Dust explosion class	St1 (weak explosion potential)	
TGA/TDA under air	288°C (medium reactivity)	
Minimum ignition energy	>1200mJ	
Minimum ignition temperature	>680°C	
Lower explosion limit	>60g/m³	
Explosion severity (20l sphere)	P max.	6 bar
	MRE (ΔP)	160 bar/s
	Kmax or Kst	43 bar/m/s

DATA PROVIDED IS INDICATIVE ONLY AND BASED ON THE ANALYSIS OF MATERIAL UNDER SPECIFIC CONDITIONS. THESE MAY NOT BE REPRESENTATIVE OF PREVAILING CIRCUMSTANCES DURING THE HANDLING AND USE OF THIS ACTIVATED CARBON GRADE.

CARBON APPLICATION KNOWLEDGE

The supply of activated carbon products is supported by an industry-leading technical support service. Our in-house expertise extends over many years of practical experience in the design and utilisation of activated carbon in a variety of applications. Jacobi Carbons can assist in the design, specification and method of use of our products to achieve the optimum treatment outcome required. Our laboratory facilities support our product portfolio with a extensive library of technical data.

NOTICE Due to the progressive nature of the Jacobi Carbons Group and the continually improving design and performance of our products, we reserve the right to change product specifications without prior notification. The information contained in this datasheet is intended to assist a customer in the evaluation and selection of products supplied by Jacobi Carbons. The customer is responsible for determining whether products and the information contained in this document are appropriate for customer's use. Jacobi Carbons assumes no obligation or liability for the usage of the information in this datasheet, no guarantees or warranties, expressed or implied, are provided. Jacobi Carbons disclaims responsibility and the user must accept full responsibility for performance of systems based on this data.

SAFETY DATA SHEET

1. Identification

Product identifier	**HYDREX 9508**
Other means of identification	None.
Recommended use	Industrial Process Aid
Recommended restrictions	INDUSTRIAL USE ONLY.
Manufacturer/Importer/Supplier/Distributor information	
Supplier	Veolia Water Technologies Canada Inc.
Address	2000 Argentia Road, Plaza IV, Suite 430 Mississauga, ON L5N 1W1 Canada
Contact Person	Hydrex Product Specialist
Telephone	(905) 286-4846
Fax	(905) 286-0488
e-mail	vwtcanada-hydrex@veolia.com
24-Hour Emergency telephone	24 Hour Number: +1-760-476-3962 (Code:333239)
Supplier	Not available.

2. Hazard identification

Physical hazards	Corrosive to metals	Category 1
Health hazards	Acute toxicity, dermal	Category 4
	Skin corrosion/irritation	Category 1A
	Serious eye damage/eye irritation	Category 1
Environmental hazards	Hazardous to the aquatic environment, acute hazard	Category 3

Label elements

Signal word	Danger
Hazard statement	May be corrosive to metals. Harmful in contact with skin. Causes severe skin burns and eye damage. Causes serious eye damage. Harmful to aquatic life.
Precautionary statement	
Prevention	Keep only in original packaging. Wash hands thoroughly after handling. Avoid release to the environment. Wear protective gloves/protective clothing/eye protection/face protection. Observe good industrial hygiene practices.
Response	IF SWALLOWED: Rinse mouth. Do NOT induce vomiting. IF ON SKIN (or hair): Take off immediately all contaminated clothing. Rinse skin with water. IF INHALED: Remove person to fresh air and keep comfortable for breathing. IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Immediately call a POISON CENTER/doctor/paramedic. Call a POISON CENTER/doctor/paramedic if you feel unwell. Specific treatment (see First aid measures on this label). Take off contaminated clothing and wash it before reuse. Absorb spillage to prevent material-damage. Wash hands after handling.
Storage	Store in cool place. Store in corrosive resistant container with a resistant inner liner. Protect from sunlight. Store away from incompatible materials.
Disposal	Dispose of waste and residues in accordance with local authority requirements. Dispose of contents/container to an appropriate treatment and disposal facility in accordance with applicable laws and regulations, and product characteristics at time of disposal.
Other hazards	None known.

Supplemental information None.

3. Composition/information on ingredients

Mixtures

Chemical name	Common name and synonyms	CAS number	%
Sodium hydroxide		1310-73-2	95 - 100
Non-hazardous ingredients			<5

*Designates that a specific chemical identity and/or percentage of composition has been withheld as a trade secret. All concentrations are in percent by weight unless ingredient is a gas. Gas concentrations are in percent by volume.

4. First-aid measures

Inhalation If breathing is difficult, remove to fresh air and keep at rest in a position comfortable for breathing. Call a physician if symptoms develop or persist.

Skin contact Take off immediately all contaminated clothing. Rinse skin with water/shower. Call a physician or poison control center immediately. Chemical burns must be treated by a physician. Wash contaminated clothing before reuse.

Eye contact Immediately flush eyes with plenty of water for at least 15 minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Call a physician or poison control center immediately.

Ingestion Call a physician or poison control center immediately. Rinse mouth. Do not induce vomiting. If vomiting occurs, keep head low so that stomach content doesn't get into the lungs.

Most important symptoms/effects, acute and delayed Burning pain and severe corrosive skin damage. Causes serious eye damage. Symptoms may include stinging, tearing, redness, swelling, and blurred vision. Permanent eye damage including blindness could result.

Indication of immediate medical attention and special treatment needed Provide general supportive measures and treat symptomatically. Chemical burns: Flush with water immediately. While flushing, remove clothes which do not adhere to affected area. Call an ambulance. Continue flushing during transport to hospital. Keep victim warm. Keep victim under observation. Symptoms may be delayed.

General information If you feel unwell, seek medical advice (show the label where possible). Ensure that medical personnel are aware of the material(s) involved, and take precautions to protect themselves. Show this safety data sheet to the doctor in attendance.

5. Fire-fighting measures

Suitable extinguishing media Water fog. Foam. Dry chemical powder. Carbon dioxide (CO2).

Unsuitable extinguishing media Do not use water jet as an extinguisher, as this will spread the fire.

Specific hazards arising from the chemical During fire, gases hazardous to health may be formed.

Special protective equipment and precautions for firefighters Self-contained breathing apparatus and full protective clothing must be worn in case of fire.

Fire fighting equipment/instructions Move containers from fire area if you can do so without risk.

Specific methods Use standard firefighting procedures and consider the hazards of other involved materials.

General fire hazards No unusual fire or explosion hazards noted.

6. Accidental release measures

Personal precautions, protective equipment and emergency procedures Keep unnecessary personnel away. Wear appropriate protective equipment and clothing during clean-up. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Ensure adequate ventilation. Local authorities should be advised if significant spillages cannot be contained.

Methods and materials for containment and cleaning up

Prevent entry into waterways, sewer, basements or confined areas.

Large Spills: Stop the flow of material, if this is without risk. Dike the spilled material, where this is possible. Absorb spillage to prevent material damage. Use a non-combustible material like vermiculite, sand or earth to soak up the product and place into a container for later disposal. Shovel up and place in a container for salvage or disposal. Following product recovery, flush area with water.

Small Spills: Sweep or scoop up and remove. Clean surface thoroughly to remove residual contamination.

Never return spills to original containers for re-use.

Environmental precautions

Avoid release to the environment. Inform appropriate managerial or supervisory personnel of all environmental releases. Prevent further leakage or spillage if safe to do so. Avoid discharge into drains, water courses or onto the ground.

7. Handling and storage

Precautions for safe handling

Do not get in eyes, on skin, or on clothing. Avoid prolonged exposure. When using, do not eat, drink or smoke. Provide adequate ventilation. Wear appropriate personal protective equipment. Wash hands thoroughly after handling. Avoid release to the environment. Handle and open container with care. Wash contaminated clothing before reuse. Observe good industrial hygiene practices. Use care in handling/storage.

Conditions for safe storage, including any incompatibilities

Store in a cool, dry place out of direct sunlight. Store in corrosive resistant container with a resistant inner liner. Keep only in the original container. Use care in handling/storage. Store in cool, dry place.

8. Exposure controls/personal protection

Occupational exposure limits

US. ACGIH Threshold Limit Values

Material	Type	Value
HYDREX 9508	Ceiling	2 mg/m3
Components	**Type**	**Value**
Sodium Hydroxide (CAS 1310-73-2)	Ceiling	2 mg/m3

Canada. Saskatchewan OELs (Occupational Health and Safety Regulations, 1996, Table 21)

Material	Type	Value
HYDREX 9508	Ceiling	2 mg/m3
Components	**Type**	**Value**
Sodium Hydroxide (CAS 1310-73-2)	Ceiling	2 mg/m3

Biological limit values No biological exposure limits noted for the ingredient(s).

Exposure guidelines No exposure standards allocated.

Appropriate engineering controls General ventilation normally adequate. Eye wash facilities and emergency shower must be available when handling this product.

Individual protection measures, such as personal protective equipment

Eye/face protection Wear safety glasses with side shields (or goggles) and a face shield. Chemical goggles and face shield are recommended.

Skin protection

Hand protection Chemical resistant gloves. Suitable gloves can be recommended by the glove supplier.

Other Wear appropriate chemical resistant clothing. Use of an impervious apron is recommended. Chemical resistant gloves.

Respiratory protection In case of insufficient ventilation, wear suitable respiratory equipment.

Thermal hazards Not applicable.

General hygiene considerations Always observe good personal hygiene measures, such as washing after handling the material and before eating, drinking, and/or smoking. Routinely wash work clothing and protective equipment to remove contaminants.

9. Physical and chemical properties

Appearance

Physical state Solid.

Form Powder. Dry flowable granules. Flakes.

Color White

Odor Odorless.

Odor threshold Not available.

pH 12 [0.05% wt/wt solution]

Melting point/freezing point 613.4 °F (323 °C)

Initial boiling point and boiling range 2530.4 °F (1388 °C)

Flash point Not available.

Evaporation rate Not available.

Flammability (solid, gas) Not available.

Upper/lower flammability or explosive limits

Flammability limit - lower (%)	Not available.
Flammability limit - upper (%)	Not available.
Explosive limit - lower (%)	Not available.
Explosive limit - upper (%)	Not available.
Vapor pressure	< 0.0000001 kPa at 25 °C
Vapor density	Not available.
Relative density	Not available.
Solubility(ies)	
Solubility (water)	1110 g/l
Partition coefficient (n-octanol/water)	Not available.
Auto-ignition temperature	Not available.
Decomposition temperature	Not available.
Viscosity	Not available.
Other information	
Density	2.13 g/cm3 estimated at 25 °C
Explosive properties	Not explosive.
Oxidizing properties	Not oxidizing.
Specific gravity	2.13 at 25 °C
Surface tension	101.05 mN/m (64.4 °F (18 °C))

10. Stability and reactivity

Reactivity	Reacts violently with strong acids. This product may react with oxidizing agents. May be corrosive to metals.
Chemical stability	Material is stable under normal conditions.
Possibility of hazardous reactions	No dangerous reaction known under conditions of normal use. Hazardous polymerization does not occur.
Conditions to avoid	Contact with incompatible materials. Do not mix with other chemicals.
Incompatible materials	Strong acids. Acids. Strong oxidizing agents. Oxidizing agents. Metals.
Hazardous decomposition products	No dangerous reaction known under conditions of normal use. Thermal decomposition can emit : Sodium oxides.

11. Toxicological information

Information on likely routes of exposure

Inhalation	May cause irritation to the respiratory system. Prolonged inhalation may be harmful.
Skin contact	Causes severe skin burns. Harmful in contact with skin.
Eye contact	Causes serious eye damage.
Ingestion	Causes digestive tract burns. May cause discomfort if swallowed. However, ingestion is not likely to be a primary route of occupational exposure.
Symptoms related to the physical, chemical and toxicological characteristics	Burning pain and severe corrosive skin damage. Causes serious eye damage. Symptoms may include stinging, tearing, redness, swelling, and blurred vision. Permanent eye damage including blindness could result. Exposure may cause temporary irritation, redness, or discomfort.

Information on toxicological effects

Acute toxicity	Harmful in contact with skin.

Components	Species	Test Results
Sodium hydroxide (CAS 1310-73-2)		
Acute		
Oral		
Liquid		
LD50	Rat	> 300 mg/kg

* Estimates for product may be based on additional component data not shown.

Skin corrosion/irritation Causes severe skin burns and eye damage.

Serious eye damage/eye irritation Causes serious eye damage.

Respiratory or skin sensitization

Canada - Alberta OELs: Irritant

Sodium hydroxide (CAS 1310-73-2) Irritant

Respiratory sensitization Not a respiratory sensitizer.

Skin sensitization This product is not expected to cause skin sensitization.

Germ cell mutagenicity No data available to indicate product or any components present at greater than 0.1% are mutagenic or genotoxic.

Carcinogenicity This product is not considered to be a carcinogen by IARC, ACGIH, NTP, or OSHA. Not classifiable as to carcinogenicity to humans.

Reproductive toxicity This product is not expected to cause reproductive or developmental effects.

Specific target organ toxicity - single exposure Based on available data, the classification criteria are not met.

Specific target organ toxicity - repeated exposure Not classified.

Aspiration hazard Not an aspiration hazard.

Chronic effects Not expected to be hazardous by WHMIS criteria. Prolonged inhalation may be harmful.

12. Ecological information

Ecotoxicity Harmful to aquatic life.

Components		Species	Test Results
Sodium hydroxide (CAS 1310-73-2)			
Aquatic			
Acute			
Crustacea	EC50	Water flea (Ceriodaphnia dubia)	34.59 - 47.13 mg/l, 48 hours
Fish	LC50	Western mosquitofish (Gambusia affinis)	125 mg/l, 96 hours

* Estimates for product may be based on additional component data not shown.

Persistence and degradability Not applicable.

Bioaccumulative potential No data available.

Mobility in soil No data available.

Other adverse effects No other adverse environmental effects (e.g. ozone depletion, photochemical ozone creation potential, endocrine disruption, global warming potential) are expected from this component.

13. Disposal considerations

Disposal instructions Contract with a disposal operator licensed by the Law on Disposal and Cleaning. Do not allow this material to drain into sewers/water supplies. Do not contaminate ponds, waterways or ditches with chemical or used container. Dispose of contents/container in accordance with local/regional/national/international regulations. When your own wastewater treatment plant is not available, collect entire waste and then charge to a licensed industrial waste management professional with manifests for industrial waste.

Local disposal regulations Dispose in accordance with all applicable regulations.

Hazardous waste code D002: Waste Corrosive material [pH <=2 or =>12.5, or corrosive to steel]
The waste code should be assigned in discussion between the user, the producer and the waste disposal company.

Waste from residues / unused products	Dispose of in accordance with local regulations. Empty containers or liners may retain some product residues. This material and its container must be disposed of in a safe manner (see: Disposal instructions). Not applicable.
Contaminated packaging	Empty containers should be taken to an approved waste handling site for recycling or disposal. Since emptied containers may retain product residue, follow label warnings even after container is emptied.

14. Transport information

TDG

UN number	UN1823
UN proper shipping name	SODIUM HYDROXIDE, SOLID
Transport hazard class(es)	
Class	8
Subsidiary risk	-
Packing group	II
Environmental hazards	Not available.
Special precautions for user	Not available.

IATA

UN number	UN1823
UN proper shipping name	Sodium hydroxide, solid
Transport hazard class(es)	
Class	8
Subsidiary risk	-
Packing group	II
Environmental hazards	No.
ERG Code	8L
Special precautions for user	Not available.
Other information	
Passenger and cargo aircraft	Allowed with restrictions.
Cargo aircraft only	Allowed with restrictions.

IMDG

UN number	UN1823
UN proper shipping name	SODIUM HYDROXIDE, SOLID
Transport hazard class(es)	
Class	8
Subsidiary risk	-
Packing group	II
Environmental hazards	
Marine pollutant	No.
EmS	F-A, S-B
Special precautions for user	Not available.

Transport in bulk according to Annex II of MARPOL 73/78 and the IBC Code Not established.

IATA; IMDG; TDG

15. Regulatory information

Canadian regulations This product has been classified in accordance with the hazard criteria of the CPR and the SDS contains all the information required by the CPR.

Controlled Drugs and Substances Act

Not regulated.

Export Control List (CEPA 1999, Schedule 3)

Not listed.

Greenhouse Gases

Not listed.

Precursor Control Regulations

Not regulated.

International regulations The product is classified and labelled in accordance with EC directives or respective national laws This Safety Data Sheet complies with the requirements of Regulation (EC) No 1907/2006. The product does not need to be labelled in accordance with EC directives or respective national laws.

Stockholm Convention

Not applicable.

Rotterdam Convention

Not applicable.

Kyoto protocol

Not applicable.

Montreal Protocol

Not applicable.

Basel Convention

Not applicable.

International Inventories

Country(s) or region	Inventory name	On inventory (yes/no)*
Australia	Australian Inventory of Chemical Substances (AICS)	Yes
Canada	Domestic Substances List (DSL)	Yes
Canada	Non-Domestic Substances List (NDSL)	No
China	Inventory of Existing Chemical Substances in China (IECSC)	Yes

Disclaimer

Veolia Water Technologies is not able to anticipate all conditions under which this information and its product, or the products of other manufacturers in combination with its product, may be used. It is the user's responsibility to ensure safe conditions for handling, storage and disposal of the product, and to assume liability for loss, injury, damage or expense due to improper use and or non respect of Veolia Water Technologies' requirement.

SAFETY DATA SHEET

1. Identification

Product identifier	**HYDREX 9566**
Other means of identification	None.
Recommended use	Industrial Process Aid PROFESSIONAL USE ONLY
Recommended restrictions	No other uses are advised.
Manufacturer/Importer/Supplier/Distributor information	
Supplier	Veolia Water Technologies Canada Inc.
Address	2000 Argentia Road, Plaza IV, Suite 430 Mississauga, ON L5N 1W1 Canada
Contact Person	Hydrex Product Specialist
Telephone	(905) 286-4846
Fax	(905) 286-0488
e-mail	vwtcanada-hydrex@veolia.com
24-Hour Emergency telephone	24 Hour Number: +1-760-476-3962 (Code:333239)
Supplier	Not available.

2. Hazard identification

Physical hazards	Not classified.
Health hazards	Not classified.
Environmental hazards	Not classified.
Label elements	
Hazard symbol	None.
Signal word	None.
Hazard statement	The mixture does not meet the criteria for classification.
Precautionary statement	
Prevention	Observe good industrial hygiene practices.
Response	Wash hands after handling.
Storage	Store away from incompatible materials.
Disposal	Dispose of waste and residues in accordance with local authority requirements.
Other hazards	None known.
Supplemental information	None.

3. Composition/information on ingredients

Mixtures

Chemical name	Common name and synonyms	CAS number	%
SODIUM THIOSULFATE		10102-17-7	99
Other components below reportable levels			1

All concentrations are in percent by weight unless ingredient is a gas. Gas concentrations are in percent by volume.

4. First-aid measures

Inhalation	Move to fresh air. Call a physician if symptoms develop or persist.
Skin contact	Wash off with soap and water. Get medical attention if irritation develops and persists.
Eye contact	Rinse with water. Get medical attention if irritation develops and persists.
Ingestion	Rinse mouth. Get medical attention if symptoms occur.

Most important symptoms/effects, acute and delayed	Direct contact with eyes may cause temporary irritation.
Indication of immediate medical attention and special treatment needed	Treat symptomatically.
General information	Ensure that medical personnel are aware of the material(s) involved, and take precautions to protect themselves.

5. Fire-fighting measures

Suitable extinguishing media	Water fog. Foam. Dry chemical powder. Carbon dioxide (CO2).
Unsuitable extinguishing media	Not available.
Specific hazards arising from the chemical	During fire, gases hazardous to health may be formed.
Special protective equipment and precautions for firefighters	Self-contained breathing apparatus and full protective clothing must be worn in case of fire.
Fire fighting equipment/instructions	Use water spray to cool unopened containers.
Specific methods	Use standard firefighting procedures and consider the hazards of other involved materials.
General fire hazards	No unusual fire or explosion hazards noted.

6. Accidental release measures

Personal precautions, protective equipment and emergency procedures	Keep unnecessary personnel away. For personal protection, see section 8 of the SDS.
Methods and materials for containment and cleaning up	Stop the flow of material, if this is without risk. Following product recovery, flush area with water. For waste disposal, see section 13 of the SDS.
Environmental precautions	Avoid discharge into drains, water courses or onto the ground.

7. Handling and storage

Precautions for safe handling	Observe good industrial hygiene practices.
Conditions for safe storage, including any incompatibilities	Protect from sunlight. Store in tightly closed container. Store away from incompatible materials (see Section 10 of the SDS). Store in cool, dry place.

8. Exposure controls/personal protection

Occupational exposure limits	No exposure limits noted for ingredient(s).
Biological limit values	No biological exposure limits noted for the ingredient(s).
Appropriate engineering controls	General ventilation normally adequate.

Individual protection measures, such as personal protective equipment

Eye/face protection	Do not get this material in contact with eyes. Wear safety glasses with side shields (or goggles).
Skin protection	
Hand protection	Wear appropriate chemical resistant gloves.
Other	Wear appropriate chemical resistant clothing.
Respiratory protection	In case of insufficient ventilation, wear suitable respiratory equipment.
Thermal hazards	Not applicable.
General hygiene considerations	Always observe good personal hygiene measures, such as washing after handling the material and before eating, drinking, and/or smoking. Routinely wash work clothing and protective equipment to remove contaminants.

9. Physical and chemical properties

Appearance

Physical state	Solid.
Form	Crystalline.

Color	Colorless to White
Odor	Odorless.
Odor threshold	Not available.
pH	Not available.
Melting point/freezing point	118.4 °F (48 °C)
Initial boiling point and boiling range	Not available.
Flash point	Not available.
Evaporation rate	Not available.
Flammability (solid, gas)	Not available.
Upper/lower flammability or explosive limits	
Flammability limit - lower (%)	Not available.
Flammability limit - upper (%)	Not available.
Explosive limit - lower (%)	Not available.
Explosive limit - upper (%)	Not available.
Vapor pressure	Not available.
Vapor density	Not available.
Relative density	Not available.
Solubility(ies)	
Solubility (water)	Not available.
Partition coefficient (n-octanol/water)	Not available.
Auto-ignition temperature	Not available.
Decomposition temperature	Not available.
Viscosity	Not available.
Other information	
Density	1.01 g/ml
Explosive properties	Not explosive.
Oxidizing properties	Not oxidizing.
Specific gravity	1.69
pH of 10% Solution	6 - 9

10. Stability and reactivity

Reactivity	The product is stable and non-reactive under normal conditions of use, storage and transport.
Chemical stability	Material is stable under normal conditions.
Possibility of hazardous reactions	No dangerous reaction known under conditions of normal use.
Conditions to avoid	Keep away from heat, hot surfaces, sparks, open flames and other ignition sources. Contact with incompatible materials.
Incompatible materials	Strong oxidizing agents.
Hazardous decomposition products	No dangerous reaction known under conditions of normal use. Thermal decomposition can emit : Sulfur oxides, Sodium oxides.

11. Toxicological information

Information on likely routes of exposure

Inhalation	No adverse effects due to inhalation are expected.
Skin contact	No adverse effects due to skin contact are expected.
Eye contact	Direct contact with eyes may cause temporary irritation.
Ingestion	Expected to be a low ingestion hazard.

Symptoms related to the physical, chemical and toxicological characteristics Direct contact with eyes may cause temporary irritation.

Information on toxicological effects

Product	Species	Test Results
HYDREX 9566		
Acute		
Oral		
Solid		
LD50	Rat	> 2500 mg/kg
Presumed Non-Toxic		
Dermal		
Solid		

Skin corrosion/irritation Prolonged skin contact may cause temporary irritation.

Serious eye damage/eye irritation Direct contact with eyes may cause temporary irritation.

Respiratory or skin sensitization

Respiratory sensitization Not a respiratory sensitizer.

Skin sensitization This product is not expected to cause skin sensitization.

Germ cell mutagenicity No data available to indicate product or any components present at greater than 0.1% are mutagenic or genotoxic.

Carcinogenicity Not listed by ACGIH, IARC, NIOSH, NTP OR OSHA.

Reproductive toxicity This product is not expected to cause reproductive or developmental effects.

Specific target organ toxicity - single exposure Not classified.

Specific target organ toxicity - repeated exposure Not classified.

Aspiration hazard Not an aspiration hazard.

12. Ecological information

Ecotoxicity The product is not classified as environmentally hazardous. However, this does not exclude the possibility that large or frequent spills can have a harmful or damaging effect on the environment.

Product		Species	Test Results
HYDREX 9566			
Aquatic			
Acute			
Crustacea	EC50	Daphnia	> 100 mg/l, 48 hours
Fish	LC50	Fish	>= 100 mg/l, 96 hours

Components		Species	Test Results
SODIUM THIOSULFATE (CAS 10102-17-7)			
Aquatic			
Fish	LC50	Western mosquitofish (Gambusia affinis)	24000 mg/l, 96 hours

Persistence and degradability No data is available on the degradability of any ingredients in the mixture.

Bioaccumulative potential No data available.

Mobility in soil No data available.

Other adverse effects No other adverse environmental effects (e.g. ozone depletion, photochemical ozone creation potential, endocrine disruption, global warming potential) are expected from this component.

13. Disposal considerations

Disposal instructions Collect and reclaim or dispose in sealed containers at licensed waste disposal site.

Local disposal regulations Dispose in accordance with all applicable regulations.

Hazardous waste code The waste code should be assigned in discussion between the user, the producer and the waste disposal company.

Waste from residues / unused products	Dispose of in accordance with local regulations. Empty containers or liners may retain some product residues. This material and its container must be disposed of in a safe manner (see: Disposal instructions).
Contaminated packaging	Since emptied containers may retain product residue, follow label warnings even after container is emptied. Empty containers should be taken to an approved waste handling site for recycling or disposal.

14. Transport information

TDG

Not regulated as dangerous goods.

IATA

Not regulated as dangerous goods.

IMDG

Not regulated as dangerous goods.

Transport in bulk according to Annex II of MARPOL 73/78 and the IBC Code	Not applicable.

15. Regulatory information

Canadian regulations

This product has been classified in accordance with the hazard criteria of the HPR and the SDS contains all the information required by the HPR.

Controlled Drugs and Substances Act

Not regulated.

Export Control List (CEPA 1999, Schedule 3)

Not listed.

Greenhouse Gases

Not listed.

Precursor Control Regulations

Not regulated.

International regulations

Stockholm Convention

Not applicable.

Rotterdam Convention

Not applicable.

Kyoto protocol

Not applicable.

Montreal Protocol

Not applicable.

Basel Convention

Not applicable.

International Inventories

Country(s) or region	Inventory name	On inventory (yes/no)*
Australia	Australian Inventory of Chemical Substances (AICS)	Yes
Canada	Domestic Substances List (DSL)	Yes
Canada	Non-Domestic Substances List (NDSL)	No
China	Inventory of Existing Chemical Substances in China (IECSC)	Yes
Europe	European Inventory of Existing Commercial Chemical Substances (EINECS)	Yes
Europe	European List of Notified Chemical Substances (ELINCS)	No

SAFETY DATA SHEET

1. Identification

Product identifier	**HYDREX 9578**
Other means of identification	None.
Recommended use	Disinfectants for drinking water. PROFESSIONAL USE ONLY
Recommended restrictions	No other uses are advised.

Manufacturer/Importer/Supplier/Distributor information

Supplier	Veolia Water Technologies Canada Inc.
Address	2000 Argentia Road, Plaza IV, Suite 430 Mississauga, ON L5N 1W1 Canada
Contact Person	Hydrex Product Specialist
Telephone	(905) 286-4846
Fax	(905) 286-0488
e-mail	vwtcanada-hydrex@veolia.com
24-Hour Emergency telephone	24 Hour Number: +1-760-476-3962 (Code:333239)
Supplier	Not available.

2. Hazard identification

Physical hazards	Oxidizing solids	Category 2
Health hazards	Acute toxicity, oral	Category 4
	Skin corrosion/irritation	Category 1B
	Serious eye damage/eye irritation	Category 1
Environmental hazards	Hazardous to the aquatic environment, acute hazard	Category 1

Label elements

Signal word	Danger
Hazard statement	May intensify fire; oxidizer. Harmful if swallowed. Causes severe skin burns and eye damage. Very toxic to aquatic life.

Precautionary statement

Prevention	Keep away from heat, hot surfaces, sparks, open flames and other ignition sources. No smoking. Keep away from clothing and other combustible materials. Wash thoroughly after handling. Do not eat, drink or smoke when using this product. Avoid release to the environment. Wear protective gloves/protective clothing/eye protection/face protection.
Response	IF SWALLOWED: Rinse mouth. Do NOT induce vomiting. IF ON SKIN (or hair): Take off immediately all contaminated clothing. Rinse skin with water. IF INHALED: Remove person to fresh air and keep comfortable for breathing. IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Immediately call a POISON CENTER/doctor. Wash contaminated clothing before reuse. In case of fire: Use appropriate media to extinguish. Collect spillage.
Storage	Store locked up.
Disposal	Dispose of contents/container in accordance with local/regional/national/international regulations.
Other hazards	None known.
Supplemental information	None.

3. Composition/information on ingredients

Mixtures

Chemical name	Common name and synonyms	CAS number	%
Calcium hypochlorite	CALCIUM HYPOCHLORITE MIXTURE, DRY HYPOCHLOROUS ACID, CALCIUM SALT (AS TOTAL AVAILABLE CHLORINE) HTH Lime chloride	7778-54-3	60 - 80
Hydrated Lime	Hydrated lime LIME WATER MILK OF LIME SLAKED LIME	1305-62-0	5 -15
Non-hazardous ingredients			5 - 10

All concentrations are in percent by weight unless ingredient is a gas. Gas concentrations are in percent by volume.

4. First-aid measures

Inhalation Move to fresh air. Call a physician if symptoms develop or persist.

Skin contact If on clothing: Rinse immediately contaminated clothing and skin with plenty of water before removing clothes. Rinse skin with water/shower. Call a physician or poison control center immediately. Chemical burns must be treated by a physician. Wash contaminated clothing before reuse.

Eye contact Immediately flush eyes with plenty of water for at least 15 minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Call a physician or poison control center immediately.

Ingestion Call a physician or poison control center immediately. Rinse mouth. Do not induce vomiting. If vomiting occurs, keep head low so that stomach content doesn't get into the lungs.

Most important symptoms/effects, acute and delayed Burning pain and severe corrosive skin damage. Causes serious eye damage. Symptoms may include stinging, tearing, redness, swelling, and blurred vision. Permanent eye damage including blindness could result.

Indication of immediate medical attention and special treatment needed Provide general supportive measures and treat symptomatically. Chemical burns: Flush with water immediately. While flushing, remove clothes which do not adhere to affected area. Call an ambulance. Continue flushing during transport to hospital. Keep victim warm. Keep victim under observation. Symptoms may be delayed.

General information Take off all contaminated clothing immediately. Contact with combustible material may cause fire. Ensure that medical personnel are aware of the material(s) involved, and take precautions to protect themselves. Show this safety data sheet to the doctor in attendance. Wash contaminated clothing before reuse.

5. Fire-fighting measures

Suitable extinguishing media Water fog. Foam. Dry chemical powder. Carbon dioxide (CO2).

Unsuitable extinguishing media An explosion can occur if either a carbon tetrachloride or a dry ammonium compound fire extinguisher is used to extinguish a fire involving calcium hypochlorite.

Specific hazards arising from the chemical Greatly increases the burning rate of combustible materials. Containers may explode when heated. During fire, gases hazardous to health may be formed.

Special protective equipment and precautions for firefighters Self-contained breathing apparatus and full protective clothing must be worn in case of fire.

Fire fighting equipment/instructions In case of fire and/or explosion do not breathe fumes. Move containers from fire area if you can do so without risk. Use water spray to cool unopened containers.

Specific methods Cool containers exposed to flames with water until well after the fire is out.

General fire hazards May intensify fire; oxidizer. Contact with combustible material may cause fire.

6. Accidental release measures

Personal precautions, protective equipment and emergency procedures Keep unnecessary personnel away. Keep people away from and upwind of spill/leak. Keep away from clothing and other combustible materials. Wear appropriate protective equipment and clothing during clean-up. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Ensure adequate ventilation. Local authorities should be advised if significant spillages cannot be contained. For personal protection, see section 8 of the SDS.

Methods and materials for containment and cleaning up

Eliminate all ignition sources (no smoking, flares, sparks, or flames in immediate area). Keep combustibles (wood, paper, oil, etc.) away from spilled material. Ventilate the contaminated area. Minimize dust generation and accumulation. Wear appropriate protective equipment and clothing during clean-up. Prevent product from entering drains.

Large Spills: Seek advice of a specialist. Following product recovery, flush area with water.

Small Spills: Transfer to a container that contains water. Carefully destroy the hypochlorite by adding hydrogen peroxide. Hydrogen peroxide reacts with calcium hypochlorite to form calcium chloride and oxygen gas. Do not close container. Other chemicals that can be used are sodium sulfite and sodium bisulfite. Once calcium hypochlorite is reduced, the remaining solution should be neutralized cautiously with dilute hydrochloric acid or sulfuric acid to near neutral pH level. Clean surface thoroughly to remove residual contamination.

Never return spills to original containers for re-use. For waste disposal, see section 13 of the SDS.

Environmental precautions

Avoid release to the environment. Inform appropriate managerial or supervisory personnel of all environmental releases. Prevent further leakage or spillage if safe to do so. Avoid discharge into drains, water courses or onto the ground.

7. Handling and storage

Precautions for safe handling

Minimize dust generation and accumulation. Routine housekeeping should be instituted to ensure that dusts do not accumulate on surfaces. Keep away from heat. Take any precaution to avoid mixing with combustibles. Keep away from clothing and other combustible materials. Do not get in eyes, on skin, or on clothing. Do not taste or swallow. When using, do not eat, drink or smoke. Provide adequate ventilation. Wear appropriate personal protective equipment. Wash hands thoroughly after handling. Avoid release to the environment. Observe good industrial hygiene practices.

Conditions for safe storage, including any incompatibilities

Store locked up. Keep away from heat. Store in a cool, dry place out of direct sunlight. Store in tightly closed container. Store in a well-ventilated place. Do not store near combustible materials. Store away from incompatible materials (see Section 10 of the SDS). Store in cool, dry place. To maintain good product quality and a shelf life of 12 months, store between 5°C (41°F) and 30°C (86°F). Keep from contact with oxidizing materials, highly oxygenated or halogenated solvents, organic compounds containing reducible functional groups, or aqueous ammonia. Charcoal (activated or not). Urea. Organic sulfur compounds.

8. Exposure controls/personal protection

Occupational exposure limits

US. ACGIH Threshold Limit Values

Components	Type	Value
HYDRATED LIME (CAS 1305-62-0)	TWA	5 mg/m3

Canada. Alberta OELs (Occupational Health & Safety Code, Schedule 1, Table 2)

Components	Type	Value
HYDRATED LIME (CAS 1305-62-0)	TWA	5 mg/m3

Canada. British Columbia OELs. (Occupational Exposure Limits for Chemical Substances, Occupational Health and Safety Regulation 296/97, as amended)

Components	Type	Value
HYDRATED LIME (CAS 1305-62-0)	TWA	5 mg/m3

Canada. Manitoba OELs (Reg. 217/2006, The Workplace Safety And Health Act)

Components	Type	Value
HYDRATED LIME (CAS 1305-62-0)	TWA	5 mg/m3

Canada. Ontario OELs. (Control of Exposure to Biological or Chemical Agents)

Components	Type	Value
HYDRATED LIME (CAS 1305-62-0)	TWA	5 mg/m3

Canada. Quebec OELs. (Ministry of Labor - Regulation respecting occupational health and safety)

Components	Type	Value
HYDRATED LIME (CAS 1305-62-0)	TWA	5 mg/m3

Biological limit values No biological exposure limits noted for the ingredient(s).

Appropriate engineering controls Good general ventilation should be used. Ventilation rates should be matched to conditions. If applicable, use process enclosures, local exhaust ventilation, or other engineering controls to maintain airborne levels below recommended exposure limits. If exposure limits have not been established, maintain airborne levels to an acceptable level. Eye wash facilities and emergency shower must be available when handling this product.

Individual protection measures, such as personal protective equipment

Eye/face protection Avoid contact with eyes. Wear chemical goggles. Provide an emergency eye wash fountain and quick drench shower in the immediate work area.

Skin protection

Hand protection Wear protective gloves. PVC or rubber gloves are recommended.

Other Wear appropriate chemical resistant clothing. Use of an impervious apron is recommended.

Respiratory protection In case of insufficient ventilation, wear suitable respiratory equipment. NIOSH RECOMMENDATIONS FOR CHLORINE CONCENTRATIONS IN AIR: Up to 5 ppm: (APF = 10) Chemical cartridge respirator; SAR. Up to 10 ppm: (APF = 25) SAR operated in a continuous-flow mode; Powered, air-purifying respirator with cartridge(s).

Thermal hazards Not applicable.

General hygiene considerations Keep from contact with clothing and other combustible materials. Remove and wash contaminated clothing promptly. Keep away from food and drink. Always observe good personal hygiene measures, such as washing after handling the material and before eating, drinking, and/or smoking. Routinely wash work clothing and protective equipment to remove contaminants.

9. Physical and chemical properties

Appearance

Physical state Solid.

Form Powder. or Granular.

Color White. or Light grey.

Odor Slight Chlorine.

Odor threshold Not available.

pH Not available.

Melting point/freezing point Not available.

Initial boiling point and boiling range Not available.

Flash point Not available.

Evaporation rate Not available.

Flammability (solid, gas) Not available.

Upper/lower flammability or explosive limits

Flammability limit - lower (%) Not available.

Flammability limit - upper (%) Not available.

Explosive limit - lower (%) Not available.

Explosive limit - upper (%) Not available.

Vapor pressure Not available.

Vapor density 6.9

Relative density Not available.

Solubility(ies)

Solubility (water) > 200 g/l

Partition coefficient (n-octanol/water)	-2.46
Auto-ignition temperature	Not available.
Decomposition temperature	212 °F (100 °C)
Viscosity	Not available.
Other information	
Dust explosion properties	
Kst	0 (non-combustible dust)
St class	Not Applicable
Explosive properties	Not explosive.
Oxidizing properties	May intensify fire; oxidizer.
Specific gravity	2.35
pH of 1% Solution	12 - 12.5

10. Stability and reactivity

Reactivity	Greatly increases the burning rate of combustible materials.
Chemical stability	Material is stable under normal conditions.
Possibility of hazardous reactions	Hazardous polymerization does not occur.
Conditions to avoid	Keep away from heat, hot surfaces, sparks, open flames and other ignition sources. Avoid temperatures exceeding the decomposition temperature. Contact with incompatible materials.
Incompatible materials	Water, moisture. Acids. Oxidizing agents. Combustible material. Reducing agents. Maleic anhydride. Nitroethane. Nitromethane. Nitroparaffins. Nitropropane. Phosphorus. Cyanides. Ethanol. Metals. Sulfur compounds.
Hazardous decomposition products	Hydrogen chloride. Oxygen. Chlorine compounds.

11. Toxicological information

Information on likely routes of exposure

Inhalation	May cause irritation to the respiratory system.
Skin contact	Causes severe skin burns.
Eye contact	Causes serious eye damage.
Ingestion	Causes digestive tract burns. Harmful if swallowed.
Symptoms related to the physical, chemical and toxicological characteristics	Burning pain and severe corrosive skin damage. Causes serious eye damage. Symptoms may include stinging, tearing, redness, swelling, and blurred vision. Permanent eye damage including blindness could result.

Information on toxicological effects

Acute toxicity Harmful if swallowed.

Components	Species	Test Results
Calcium hypochlorite (CAS 7778-54-3)		
Acute		
Dermal		
Solid		
LD50	Rat	2200 mg/kg
Inhalation		
Dust		
LC50	Rat	480 mg/m3
Oral

LD50	Rat	7300 mg/kg

Skin corrosion/irritation Causes severe skin burns and eye damage.

Serious eye damage/eye irritation Causes serious eye damage.

Respiratory or skin sensitization

Canada - Alberta OELs: Irritant

Hydrated Lime (CAS 1305-62-0) Irritant

Respiratory sensitization Not a respiratory sensitizer.

Skin sensitization This product is not expected to cause skin sensitization.

Germ cell mutagenicity No data available to indicate product or any components present at greater than 0.1% are mutagenic or genotoxic.

Carcinogenicity

IARC Monographs. Overall Evaluation of Carcinogenicity

Calcium hypochlorite (CAS 7778-54-3) 3 Not classifiable as to carcinogenicity to humans.

Reproductive toxicity This product is not expected to cause reproductive or developmental effects.

Specific target organ toxicity - single exposure May cause respiratory irritation.

Specific target organ toxicity - repeated exposure Not classified.

Aspiration hazard Not an aspiration hazard.

12. Ecological information

Ecotoxicity Very toxic to aquatic life.

Product		Species	Test Results
HYDREX 9578			
Aquatic			
Crustacea	EC50	Daphnia	1.16 mg/l, 48 hours estimated
Fish	LC50	Fish	0.26 mg/l, 96 hours estimated
Components		**Species**	**Test Results**

	LD50	Bird	111 mg/kg
Aquatic			
Acute			
Crustacea	LC50	Crustacea	50 - 500 mg/l, 96 hours
Fish	LC50	Threespine stickleback (Gasterosteus aculeatus)	262 - 785 mg/l, 96 hours
		Western mosquitofish (Gambusia affinis)	220 mg/l, 48 hours
		Zambezi barbel (Clarias gariepinus)	33.88 mg/l, 96 hours

Persistence and degradability No data is available on the degradability of any ingredients in the mixture.

Bioaccumulative potential No data available.

Partition coefficient n-octanol / water (log Kow)

HYDREX 9578 -2.46

Mobility in soil No data available.

Other adverse effects No other adverse environmental effects (e.g. ozone depletion, photochemical ozone creation potential, endocrine disruption, global warming potential) are expected from this component.

13. Disposal considerations

Disposal instructions	Collect and reclaim or dispose in sealed containers at licensed waste disposal site. Do not allow this material to drain into sewers/water supplies. Do not contaminate ponds, waterways or ditches with chemical or used container. Dispose of contents/container in accordance with local/regional/national/international regulations.
Local disposal regulations	Dispose in accordance with all applicable regulations.
Hazardous waste code	The waste code should be assigned in discussion between the user, the producer and the waste disposal company.
Waste from residues / unused products	Dispose of in accordance with local regulations. Empty containers or liners may retain some product residues. This material and its container must be disposed of in a safe manner (see: Disposal instructions).
Contaminated packaging	Since emptied containers may retain product residue, follow label warnings even after container is emptied. Empty containers should be taken to an approved waste handling site for recycling or disposal.

14. Transport information

TDG

UN number	UN2880

1 INTRODUCTION

1.1 Project Definition

Veolia Water Technologies Canada (VWTC) was contracted by Agnico Eagles Mines (A.E.M.) to supply the equipment for a mining effluent treatment.

VWTC is responsible for the supply of mechanical equipment.

This control narrative shall be read in conjunction with the related documents as listed in Section 1.3.

1.2 Process Summary

The treatment system proposed will consist of the following steps:

- Breakpoint chlorination for ammonia removal
- Dechlorination using activated carbon
- Breakpoint chlorination Actiflo
- Secondary Actiflo
- Discfilter filtration
- Backwash tank
- Sludge tank

1.2.1 Breakpoint Chlorination for Ammonia Removal

Part of the raw water, which is composed of a mix of underground saline water and surface water, is sent to a closed-top reaction tank where a hypochlorite source and an alkali (NaOH) are added. The hypochlorite is a compound added to oxidize the ammonia (NH_{4+}) into mainly nitrogen gas (N_2) through breakpoint chlorination and ammonia and nitrite (NO_{2-}) into nitrates (NO_{3-}) through simple oxidation. The hypochlorite dosage is adjusted according to the dissolved organic carbon (DOC), nitrites and ammonia concentrations in the raw water as all of these compounds will consume the added chlorine.

The hypochlorite injected in the water produces hypochlorous acid (HOCl). The hypochlorous acid is a weak acid, and part of the hypochlorous acid is decomposed in water into hypochlorite ions (OCl_-) depending of the pH. The pH can be adjusted to optimize the hypochlorite ion concentration in the reactor, therefore optimizing the chlorine dosage. The control of the pH also prevents the release of chlorine gas, which can be observed in acidic pH and which is a safety and corrosion issue.

The hypochlorous acid and hypochlorite ions in solution will first be consumed by reducing agents and organic matter contained in the water. When more chlorine is added in solution and there is a presence of ammonia, the ammonia will react to form chloramines, specifically monochloramines (NH_2Cl). When the

quantity of chlorine is sufficient, the monochloramine will be destroyed, and depending of the concentration, will be transformed in dichloramines ($NHCl_2$) or trichloramines (NCl_3) and then, finally, in nitrogen (N_2). If the quantity of chlorine injected is sufficient, a breakpoint is reached where all chloramines and ammonia are converted into nitrogen. The raw water is sent to a reaction tank where calcium hypochlorite and an alkali are added. The calcium hypochlorite is a compound added to oxidize the ammonia (NH_4^+) into nitrogen (N_2). The calcium hypochlorite feed is added as a function of nitrites (NO_2^-) and ammonia concentration in the raw water.

The Figure 1.1 below presents a typical curve showing chlorination breakpoint

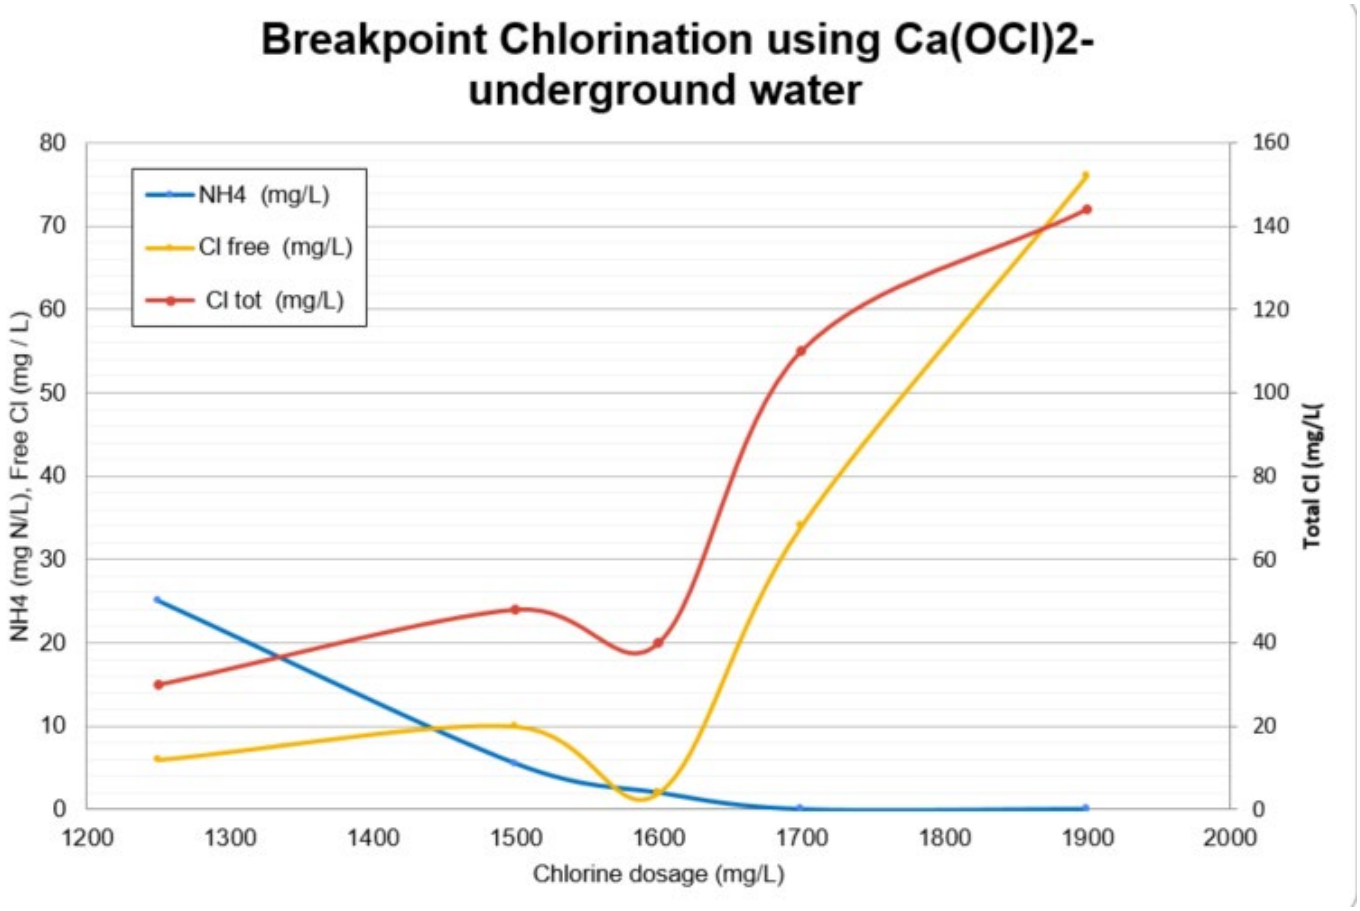

Figure 1: Breakpoint chlorination determination

It is important to notice that once the breakpoint is passed, ammonia concentration is still low but free and combined chlorine are climbing up again. Accurate management of ammonia but also chlorine residual out of the chlorination tank is required to not exhaust the downstream Powder Activated Carbon (PAC) - see Section 1.2.3.

1.2.2 Dechlorination Using Activated Carbon

The chlorinated water, containing chlorine residual, flows to the dechlorination reactor for chlorine destruction. The dechlorination process aims to ensure the destruction of the residual chlorine, which is

acutely lethal to aquatic life. Traditional breakpoint chlorination, which is already in place on site, uses powder activated carbon (PAC) for the chlorine destruction. Since the use of calcium hypochlorite causes inactivation issues on the PAC, powdered activated carbon (PAC) is used for chlorine destruction instead.

The PAC is dosed in the dechlorination reactor in two steps (in the first two compartments), to allow a sufficient contact time for complete chlorine destruction and provide fresh activated carbon along the dechlorination process. Continuous automatic dosing systems are used to add fresh PAC to the dechlorination step. Some recirculated PAC, from the ACTIFLO ballasted flocculation system, is also added to the dechlorination reactor. This allows a slight reduction of the PAC requirement and higher efficiency for the chlorine destruction.

Since the proposed water treatment chain will be operating in cold water conditions, coagulant addition is also done in the dechlorination reactor, which provides high reaction time for the activation of the coagulant and coagulation of the colloids particles. The coagulant acts as a destabilization agent to agglomerate TSS particles contained in the raw water for further removal.

1.2.3 Breakpoint Chlorination Actiflo

The Breakpoint chlorination Actiflo receives two streams.

In the first stream, the water is charged with PAC, destabilized TSS and with a slight chlorine residual flows to the ACTIFLO clarifier. The proposed ACTIFLO is designed to remove suspended solids presents in the water and the PAC dosed for chlorine destruction.

In the second stream, the water, bypassed from the two RX, goes directly to the breakpoint chlorination ACTIFLO. For this reason, a security coagulant dosage point is added to address possible by-passed water and increase the coagulant efficiency.

Sand-ballasted settling is a high-rate coagulation/flocculation/ sedimentation process that utilizes microsand as a seed for floc formation. The microsand provides a surface area that enhances flocculation and acts as a ballast or weight. The resulting floc settles very fast, allowing for compact clarifier designs compared to conventional clarifiers, with high overflow rates and short detention times. The use of microsand also permits the unit to perform well under dramatically changing flow rates without impacting final effluent quality

The ACTIFLO has three active chambers. The slurry flows through the first chamber, to break bubbles formed during the chlorine destruction, which could affect the settling efficiency. Within the Breakpoint chlorination ACTIFLO, sodium thiosulfate, a quenching agent, is also dosed to the first chamber of the ACTIFLO to destroy any residual chlorine coming from the dechlorination reactor. The slurry, bubble-free and chlorine residual free, flows to the second chamber, the maturation tank, where anionic polymeric flocculant and microsand are added to initiate floc formation. These serve as a “seed” for floc formation and development in the next process step.

The sand-sludge-PAC mixture settles to the bottom of the clarifier. Scrapers force the sludge collected at the bottom of the clarifier into a centre cone from which it is continuously withdrawn and pumped to a

cyclone where sludge and microsand are separated by centrifugal force. After separation, the higher density microsand is discharged from the bottom of the cyclone and reinjected into the process for re-use.

The sludge from the breakpoint chlorination ACTIFLO, coming from the hydrocyclone overflow, flows by gravity to a dedicated Splitter Box where part of the sludge flows back in the reaction tank. The sludge splitter box from the breakpoint Chlorination ACTIFLO is used for homogenization of the sludge quality over time, providing some thickening up to 20 g/L of the sludge. In addition, it promotes the reuse of the PAC in the ACTIFLO, the sludge is partly recirculated to the dechlorination reactor, thus reducing the PAC requirement for dechlorination. The excess sludge is sent to a common sludge holding tank thus mixing spend PAC from the breakpoint chlorination ACTIFLO and the partially thickened sludge from the bypass ACTIFLO.

1.2.4 Secondary Actiflo

The secondary Actiflo receives the third stream composed of the underground water and surface water. It is designed to remove suspended solids present in the raw water. A coagulant is dosed within the first chamber to provide coagulation of the colloids particles. The coagulant then acts as a destabilization agent to agglomerate TSS particles contained in the raw water for further removal.

The ACTIFLO has three active chambers. A coagulant is dosed within the first chamber to provide coagulation of the colloids particles. The coagulant then acts as a destabilization agent to agglomerate TSS particles contained in the raw water for further removal. The water then flows into the second chamber, the injection tank, where an anionic polymeric flocculant and microsand is added to initiate floc formation. These serve as a “seed” for floc formation and development in the next process step. From the injection tank, the water underflows to a third tank section called the maturation tank.

In this tank, a TURBOMIX® mixer provides ideal conditions for bridging between the microsand and the destabilized suspended solids. The fully formed ballasted floc enters into the third and final tank, the settling tank, equipped with a lamella, which provides the rapid and effective removal of the microsand/sludge floc. The clarified water exits the system via a weir and flows to a clarified water holding tank.

The sand-sludge-PAC mixture settles to the bottom of the clarifier. Scrapers force the sludge collected at the bottom of the clarifier into a centre cone from which it is continuously withdrawn and pumped to a cyclone where sludge and microsand are separated by centrifugal force. After separation, the higher density microsand is discharged from the bottom of the cyclone and reinjected into the process for re-use. The sludge from the secondary ACTIFLO, coming from the hydrocyclone overflow, flows by gravity to a dedicated Splitter Box where part of the sludge flows back in the first chamber of the secondary ACTIFLO. The sludge splitter boxes from the secondary ACTIFLO is used for homogenization of the sludge quality over time, providing some thickening up to 20 g/L of the sludge.

1.2.5 Discfilter Filtration

Water from both ACTIFLO process flows by gravity to the DISCFILTER filtration process. The DISCFILTER is used as a polishing step to reduce the suspended solids at the clarified water aiming further reduction of metal at the final effluent. The DISCFILTER utilizes a filter cloth mounted on filter panels. These panels stem from a central drum where inlet water is admitted into the unit for treatment. Water is filtered in inside-out mode, flowing from the centre tube to the open base of the filter discs, through the polyester cloth before reaching the DISCFILTER water collection tank. The DISCFILTER water collection tank is part of the DISCFILTER and contains the filters and the filtered water. Particulate matter presents in the DISCFILTER inlet water is retained by the filter media on the inside of the filter panels, eventually leading to solids built-up on the filter media. Consequently, the head loss across the DISCFILTER increases, resulting in increased water level at the inlet of the unit. The unit includes an integral high level switch that initiates a backwash cycle, which rotates the filter discs in order to expose clean filter media to the water flow path, while subjecting the dirty filter media to the cleaning action of the backwash spray tips. Filtered water stored in the DISCFILTER water collection tank is pumped to feed the series of spray tips strategically installed on the moving arms of the backwash system. This serves to clean the entire surface of the filter media while limiting the use of filtered water in the process. An outlet weir integral to the DISCFILTER water collection tank is used to maintain the water. The backwash water will be directed to a dirty water holding tank to be pumped back to the ACTIFLO process. Filtered water flows over the weir of the tank and out of the unit. A chemical trolley is available with the DISCFILTER unit in the case of chemical scaling due to high calcium concentration in the water (possibility to use an acidic wash to wash down any calcite that might precipitate on the discs cloth). The water then flows to a treated water tank and is pumped to discharge. Online TSS and Total Chlorine will be monitored at the outlet for discharge compliance.

1.2.6 Backwash tank

The Backwash tank collects the dirty backwash water that flows out of the DISCFILTER unit. The backwash waste is pumped from the holding tank to the secondary ACTIFLO (for TSS removal only). The flow of the backwash watse must be considered in the hydraulic of the ACTIFLO in order not to exceed the maximum flow to the bypass ACTIFLO.

1.2.7 Sludge tank

The sludge holding tank is required for sludge management. Sludge is pumped from the two sludge splitter boxes to the sludge holding tank, which will be mixed to prevent any settling and accumulation within the sludge tank.

1.3 List of related documents

This document is to be read in conjunction with the following documents:

- P&IDs (5000220043_PI0001)
- Equipment List
- Table of setpoint and alarms
- All GA drawings

1.4 List of abbreviations

The following abbreviations are used in the text of this document.

HMI: Human/Machine Interface
PLC: Programmable Logic Controller
SCADA: Supervisory Control and Data Acquisition
VFD: Variable Frequency Drive
VWTC: Veolia Water Technologies Canada

1.5 List of Units

The following lists the parameters referred to in this document and the units they are measured in unless otherwise specified.

Concentration (in general): mg/L
Flowrate (main process): m^3/h
Flowrate (chemical dosing): LPH
Level in tank: %
pH: -
Pressure: PSIg
Temperature: ° C
Turbidity: NTU
TSS: mg/L

2 Overall Plant Control

In this section, only the automatic control sequences are described.

2.1 Overview

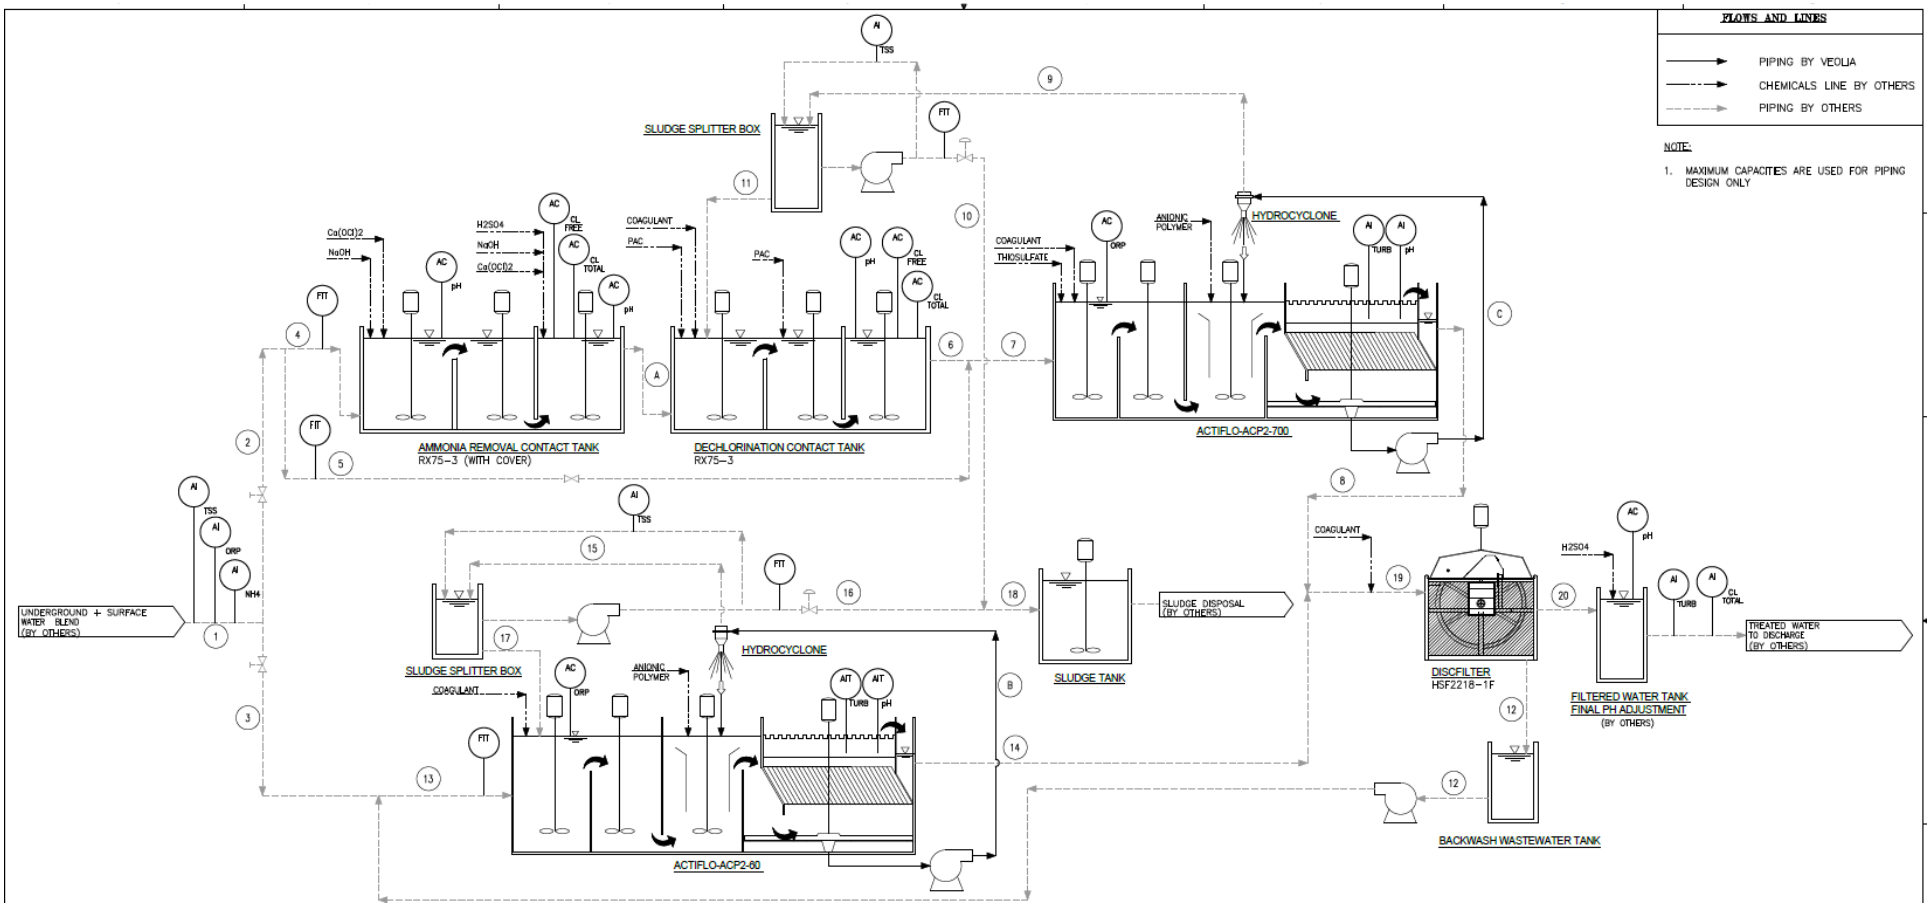
The process includes the following unit operations:

- One (1) Chlorination Tank, mixing and instrumentation
- One (1) Dechlorination Tank, mixing and instrumentation
- One (1) Breakpoint Chlorination Actiflo and instrumentation
- One (1) Secondary Actiflo and instrumentation
- One (1) Discfilter
- One (1) Powder activated Carbon preparation and dosing system
- Two (2) Total Chlorine analyzer and associated flowmeter
- Two (2) Free Chlorine analyzer and associated flowmeter
- Two (2) Splitter Boxes

The WTP will receive an influent flow rate up to 20 000 m3/d.

2.2 Plant overall control

The inlet water flowrate is controlled from a setpoint adjustable by the operator, using two (2) modes: Program or Local.



The program modes calculate the breakpoint chlorination flowrate using the ammonia concentration value at the inlet, the ammonia concentration setpoint at the outlet and the inlet water flowrate. The remaining flowrate is then distributed between the breakpoint chlorination bypass and the secondary Actiflo.

The effluent flows to the whole treatment chain by gravity. Both streams coming from Each Actiflo are combined together and feeds the Discfilter.

Sludge produced by each actiflo is either recirculated or extracted to the sludge discharge line depending on a timer with feedback on TSS concentration in the sludge.

Backwash water from Discfilter is collected into a backwash tank and evacuated gradually using backwash pumps back to the secondary Actiflo.

Chemicals are dosed proportionally to flow with correction factors to take into account pH or ammonia values for final effluent quality adjustment and oxidation efficiency.

3 Inlet Flowrate Distribution

3.1 Description

The inlet flowrate distribution can be done following two (2) modes:

In Local mode, operator will manually enter the desired water flowrates on the PID loop pop-up page.

In Program mode, the flowrate setpoints are calculated as described below.

The ammonia concentration at the outlet and total inlet Flowrate are two fixed value entered by the operator on the HMI. Using these values and the ammonia concentration measured at the inlet, the minimum ammonia load to be removed is calculated and the breakpoint chlorination flowrate is deducted. The remaining flowrate is then calculated and compared to the minimum allowable flow rates of each Actiflo (using a settling rate of 20 m/h).

Table 3-1: Inlet control devices

	65FCV6801302	Secondary modulating valve	

3.2 Controls

3.2.1 Flow rates calculation

The raw inlet flowrate Qin is entered by the operator on the HMI. It is then distributed among the three streams as per the following equation:

Qin = QBPC + QBPBPC + QSec

Where :

Qin : inlet flowrate in m3/d

QBPC : Flow going to chlorination tank (breakpoint chlorination) in m3/d

QBPBPC : : Flow by-passing the breakpoint chlorination but being treated by the breakpoint chlorination Actiflo in m3/d

QSec : Flow by-passing the breakpoint chlorination to the secondary ACTIFLO unit in m3/d

QBPTOT = QBPBPC + QSec

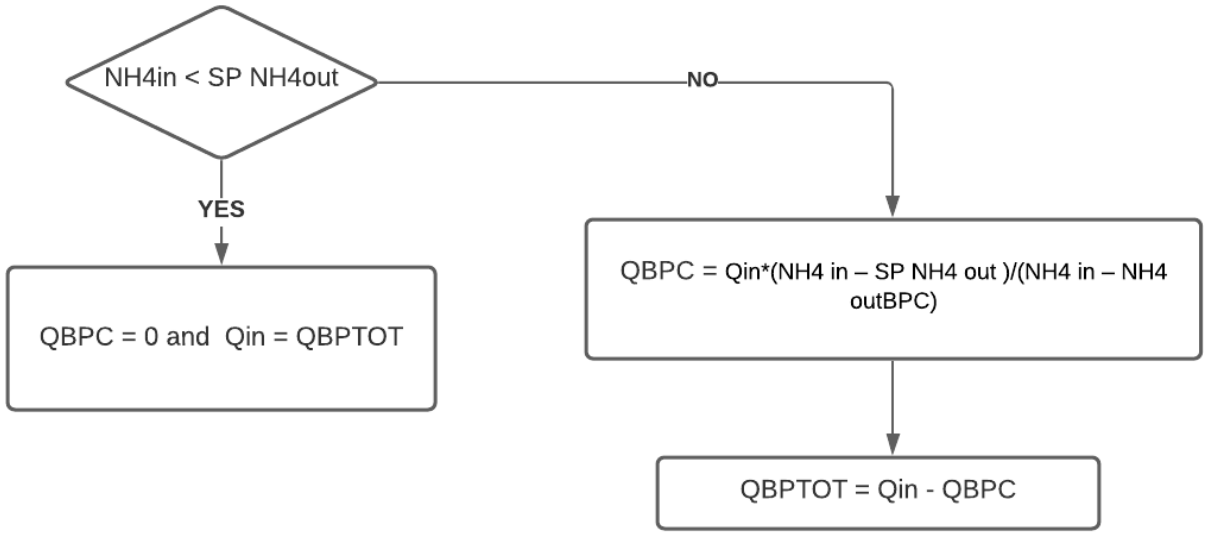
Where ;

QBPTOT : Total flow by-passing the breakpoint chlorination step (going to one or the other ACTIFLO unit) in m3/d

The ammonia concentration measured at the inlet determines the usage of the breakpoint chlorination treatment chain. The following equation presents the calculation of the Breakpoint chlorination flow rate :

QBPC= Qin*(NH4 in – SP NH4 out)/(NH4 in – NH4 outBPC)

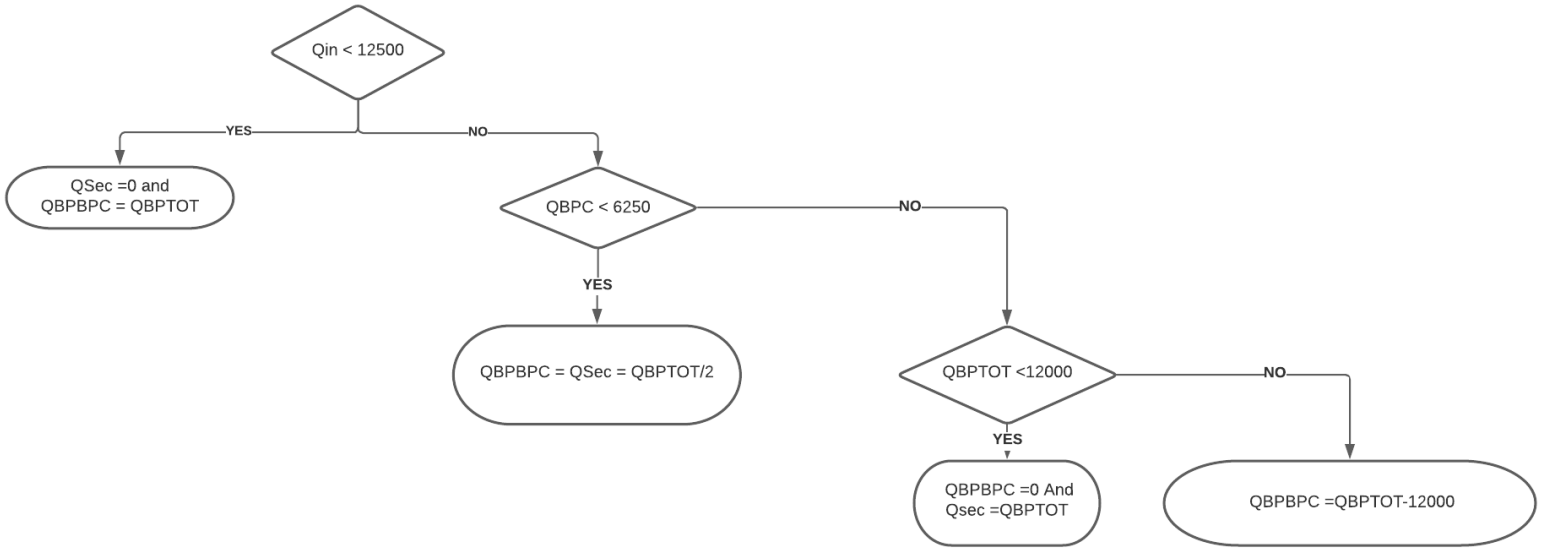
Where :



NH4 in: Ammonia in raw water. The value of NH4 as measured by the ammonia analyzer. The operator selects one of the three modes : Local (concentration entered by the operator in mg/L), Remote 1 (direct usage of the ammonia analyzer 65AIT6801101 signal), Remote 2 (Calculated mobile average concentration measured by ammonia analyzer 65AIT6801101 refreshed every 4 hours – adjustable delay).

SP NH4 out : Targeted concentration at final discharge. Can be modified, but restricted access (in case of law modification in the future). Will be initially set at 40 mg N/L.

NH4 outBPC : Ammonia concentration out of the BPC process. Can be modified, but with restricted access (after better understanding of optimal operation on site). Will be initially set at 5 mg N/L.



The decision diagram below presents the calculation steps of the breakpoint chlorination flowrate (QBPC) and the total flow bypassing the BPC treatment chain (QBPTOT)

Figure 3.1 : Breakpoint chlorination flowrate Flowchart

The next figure presents the calculation steps of the Bypass flowrate (QBPBPC and Qsec)

Figure 3.2 : Bypass flowrate Flowchart

An overview page presents the flowrates for each stream, the ammonia load removed, the ammonia concentration at the inlet, the targeted ammonia concentration at the outlet and the ammonia concentration out of the BPC process.

3.2.2 Flow control mode

The calculated flowrate is used as a setpoint. PID loop controls the modulating valve opening accordingly, using the flowrate from each flowmeter as a process value and the valve opening as a manipulated variable.

In either mode (Program or local), priority of the flow control loop shall be assigned in the following order:

1. Breakpoint chlorination flow control
2. Secondary flowrate (if active)

The breakpoint chlorination (B.C.) bypass flow control is not activated in that case and is used as an exhaust of the system in order to avoid a fight between the different flow control loop.

3.3 Fault response

Ammonia Analyzer out of range

Tag: 65AIT6801101

The ammonia analyzer is used for inlet distribution flow rate calculation. If the instrument fails, a FATAL alarm is displayed on the screen and the last value recorded is used for calculation. The operator can override the value on the screen.

Flowmeter out of range

Tag: 65FIT6801102, 65FIT XX, 65FIT6801301

The flowmeters are used for the flow control of the modulating valves. If one of the three flowmeter falls out of range, a FATAL alarm is displayed on the screen and the openings of the valves are held in last position. . The flow calculation is disabled until the fault is acknowledged on the HMI. The flow control is used in local mode.

Flow control valve Fault

Tag: 65FCVXX, 65FCV6801302, 65FCV6801102
If one of the three fow control valve falls out of range, a FATAL alarm is displayed on the screen. . The flow calculation is disabled until the fault is acknowledged on the HMI.

4 Chlorination tank

4.1 Description

In the chlorination tank, the chlorine level and pH control is achieved by the following control devices and instruments:

Table 4-1: Chlorination tank devices

SKID	P&ID TAG	DESCRIPTION	COMMENTS
	65LSHH6801106	HIGH HIGH LEVEL SWITCH

	65AIT6801117	TOTAL CHLORINE ANALYZER	
	65AIT6801116	FREE CHLORINE ANALYZER	

4.2 Controls

4.2.1 Chlorination tank Start/Stop/Auto function

By activating the Auto function, the Chlorination tank is set in Auto start mode and is ready to start. If all the system availability conditions are satisfied, it starts only after receiving the automatic start command.

A start and a stop button will be displayed on the HMI.

- By activating the Start function, the chlorination tank starts the fan and then the three mixers after a delay adjustable on the HMI whatever the automatic start command status.
- By activating the Stop function on the HMI, the chlorination tank stops the three mixers and then the fan after a delay adjustable on the HMI.

If required equipment is in manual and not running when the chlorination tank Auto function is triggered, automatic starting command cannot be activated.

4.2.2 Alkali pH control loop

The alkali is dosed in the first compartment proportionally to the calculated flowrate, but the dosage is modulated to maintain a pH at an adjustable setpoint entered by the operator on the interface.

A PID loop controls dosing setpoint accordingly, using the pH meter 65AIT6801107 as a process value and the dosing rate as a manipulated process value to maintain a constant pH.

If the pH value as read by the pH meter 65AIT6801107 is below the pH setpoint, the dosing rate is incremented.

If the pH value as read by the pH meter 65AIT6801107 is above the pH setpoint, the dosing rate is decreased.

The changes are capped by an adjustable range to prevent overdose or underdose of alkali.

If the pH meter is out of range, the PID loop is deactivated and only dosing setpoint is taken into account.

A button on the interface also allows the operator to select the pH control or disable it (in case of pH sensor malfunction).

4.2.3 Acid pH control loop

The sulfuric acid is dosed in the last compartment of the chlorination tak. The dosage is modulated to maintain a pH at an adjustable setpoint entered by the operator on the interface.

A PID loop controls dosing setpoint accordingly. The control loop uses the pH meter 65AIT680111 as a feedforward process value, the pH meter 65AIT680136 (located in the dechlorination tank) as feedback value and the dosing rate as a manipulated process value to maintain a constant pH.

If the pH value as read by the pH meter 65AIT680111 is below the pH setpoint, the dosing rate is incremented.

If the pH value as read by the pH meter 65AIT680111 is above the pH setpoint, the dosing rate is decreased.

The changes are capped by an adjustable range to prevent overdose or underdose of sulfuric acid.

If the pH meter is out of range, the PID loop is deactivated and only dosing setpoint is taken into account.

A button on the interface also allows the operator to select the pH control or disable it (in case of pH sensor malfunction).

4.2.4 Ammonia and chlorine residual control

The calcium hypochlorite is dosed proportionally to the calculated flowrate as described. But the dosage is modulated to maintain a fixed outlet ammonia concentration. The outlet ammonia concentration is an adjustable setpoint entered by the operator on the interface.

The operator has two options for the hypochlorite dosing:

Option 1: Stoichiometric dosage with free chlorine residual correction

The required dosage concentration RC_{HYPO} when expressed in mg/L is calculated as follows:

RC_{HYPO}= 7.6 x ([NH4 inf]-[NH4 eff]) + Correction factor 1

Where NH4inf is the ammonia concentration in mg/L as given by ammonia analyzer 65AIT6801101 at the raw water inlet and NH4 eff the required ammonia concentration at the outlet.

The correction factor 1 can be modulated by the operator to control the free chlorine residual as measured by 65AIT6801116 and is clamped by an adjustable range to avoid underdosing or overdosing of calcium hypochlorite.

A free chlorine setpoint is adjustable by the operator on the HMI. A volumic PI loop controls dosing manipulated process value accordingly, using the free chlorine analyzer 65AIT6801116 (when reading chlorination tank effluent) as a process value and the free chlorine setpoint as target value to optimize calcium hypochlorite dosages. The volumic integral pH control loop applies a correction to the calculated required dosage. It considers the volume between the dosing point and the measurement (hydraulic retention time) and the pH setpoint Vs the actual pH value (Error). A Gain applies a factor on the error. The loop is tuned by adjusting the gain and the volume.

If the residual free chlorine value as read by the free chlorine analyzer 65AIT6801116 is above the free chlorine setpoint, the calcium hypochlorite dosing setpoint is decreased.

If the residual free chlorine value as read by the free chlorine analyzer 65AIT6801116 is below the free chlorine setpoint, the calcium hypochlorite dosing setpoint is increased.

Option 2: Dosage entry

If chorine analysers falls out of range, the operator can enter the required calcium hypochlorite dosage RC_{HYPO} in mg/L or µL/L on the interface.

4.3 System Availability Conditions

The automatic start sequence will be activated when the automatic start command is true and the following conditions are met:

- At least two mixers are in PROGRAM mode
- No major fault

4.4 Fault response

The following are the possible major faults associated with the contact reactor.

1. Chlorination tank high high level switch
2. Multiple chlorination tank mixers fault
3. Fan fault

A major fault on the chlorination tank stops the associated alkali pumps, sulfuric acid pump and calcium hypochlorite pumps.

Chlorination tank high high level switch

Tag: 65LSHH6801106

A float in the chlorination tank is used as a high high Level switch. It is a major fault. Stop the Plant according to the automatic stop sequence when the switch is activated.

Fail safe mode:

The floats are to be wired so that the when no current is detected, the float fault alarm is activated.

Chlorination tank mixer fault

Tag: 65AGI68012/65AGI68013/65AGI68014

If one Chlorination tank mixer faults (1 of 3), the treatment train is not stopped. An alarm is activated, signalling to the operator there is a fault, but treatment continues. If more than one contact reactor mixer faults it is considered a major fault and the Plant is stopped according to the automatic stop sequence.

Fan fault

Tag : 65FAN68005

The Fan fault is a major fault and the plant is stopped according to the automatic stop sequence.

4.5 Interlocks

The faults that stop and prevent the Chlorination tank to start are as follows:

- The feeding pumps (by others) are in fault.
- The inlet breakpoint chlorination flowmeter 65FI6801102 is in out of range fault
- Dechlorination tank in major fault
- Breakpoint chlorination Actiflo is in major fault

5 Dechlorination tank

5.1 Description

In the dechlorination tank, PAC is added in the first section and in the third one. Each addition is done by a disctinct PAC preparation system. The chlorine level is monitored at the outlet in order to manually adjust the PAC dosage. Chlorine removal is achieved by the following control devices and instruments

Table 4-1: Dechlorination tank devices

5.2 Controls

5.2.1 Dechlorination tank Start/Stop/Auto function

By activating the Auto function, the Dechlorination tank is set in Auto start mode and is ready to start. If all the system availability conditions are satisfied, it starts only after receiving the automatic start command.

A start and a stop button will be displayed on the HMI.

- by activating the Start function, the dechlorination tank starts the three mixers whatever the automatic start command status.
- by activating the Stop function on the HMI, the dechlorination tank stops the three mixers.

If required equipment is in manual and not running when the dechlorination tank Auto function is triggered, automatic starting command cannot be activated.

5.2.2 Chlorine residual control

Free chlorine concentration and total chlorine concentrations are continuously monitored. The PAC dosages are manually adjusted on the HMI accordingly by the operator. See functional description in appendix E.

5.2.3 Coagulant dosage

Coagulant is dosed proportionally to the Breakpoint chlorination water flow rate indicated by 65FI6801102.

The coagulant dosage in mg/L is entered by the operator on the HMI.

5.3 System Availability Conditions

The automatic start sequence will be activated when the automatic start command is true and the following conditions are met:

- At least two mixers are in PROGRAM mode
- No major fault

5.4 Fault response

The following are the possible major faults associated with the contact reactor.

- Dechlorination tank high high level switch
- Multiple dechlorination tank mixers fault

A major fault on the dechlorination tank stops the associated pac dosages and coagulant pump,

Dechlorination tank high high level switch

Tag: 65LSHH6801131

A float in the dechlorination tank is used as a high high Level switch. It is a major fault. Stop the Plant according to the automatic stop sequence when the switch is activated.

Fail safe mode:

The floats are to be wired so that the when no current is detected, the float fault alarm is activated.

Dechlorination tank mixer fault

Tag: 65AGI68015/65AGI68016/65AGI68017

If one Dechlorination tank mixer faults (1 of 3), the treatment train is not stopped. An alarm is activated, signalling to the operator there is a fault, but treatment continues. If more than one contact reactor mixer faults it is considered a major fault and the Plant is stopped according to the automatic stop sequence.

5.5 Interlocks

The faults that stop and prevent the Chlorination tank to start are as follows:

- The feeding pumps (by others) are in fault.
- The inlet breakpoint chlorination flowmeter 65FI6801102 is in out of range fault
- Chlorination tank in major fault
- Breakpoint chlorination Actiflo is in major fault

6 Breakpoint Chlorination Actiflo

6.1 Description

The dechlorination effluent enters the Breakpoint chlorination Actiflo (Acticarb).

A quenching agent (sodium thiosulfate) is dosed in the coagulation chamber in order to remove any remaining chlorine. The sodium thiosulfate dosage is controlled with a Volumic PID loop using the ORP analyzer as a process value

The clarified water is collected by throughs and gets mixed with the secondary Actiflo clarified effluent prior to Discfilter filtration. Part of the sludge produced by the Acticarb is directed to the dechlorination tank. The remaining sludge is pumped to the sludge tank.

The detailed Acticarb process functional description is presented in Appendix B.

The Acticarb unit and its Activated Carbon Extraction/Recirculation consists on the following control devices and instruments:

65PSR68005A	Recirculation pump #1

6.2 Controls

6.2.1 Acticarb Start/Stop/Auto function

By activating the Auto function, the Acticarb is set in Auto start mode and is ready to start. If all start sequence conditions are satisfied, it starts only after receiving the automatic start command.

By deactivating the Auto mode, the Acticarb stops following the automatic stopping sequence and a start and a stop button will be displayed on the HMI.

- by activating the Start function, the Acticarb starts following the automatic starting sequence whatever the automatic start command status.
- by activating the Stop function on the HMI, the Acticarb stops following the automatic stopping sequence.

If required equipment is in manual and not running when the Acticarb Auto function is triggered, starting sequence cannot be activated.

6.2.2 Sodium thiosulfate dosage

The sodium thiosulfate is dosed in the coagulation chamber proportionally to the calculated flowrate and the free chlorine value measured at the outlet of the dechlorination tank. The dosage is corrected to maintain an ORP at an adjustable setpoint entered by the operator on the interface.

The required dosage concentration RC_{ST} when expressed in mg/L is calculated as follows:

RC_{ST}= A x ([FCl meas]-[FCl SP]) + Correction factor 1

Where:

A : is a stoichiometric factor determined with lab tests

[FCl meas] : is the free chlorine concentration as measured with 65AIT6801141

[FCl SP] : is the free chlorine setpoint

A volumic PI loop controls dosing setpoint according to the value read by 65AIT6801141 (FFW), using the ORP meter 65AIT6801201 as a (FB) process value and the dosing rate as a manipulated process value to maintain a constant ORP.

If the ORP value as read by the ORP meter 65AIT6801201 is below the ORP setpoint, the dosing rate is incremented.

If the ORP value as read by the ORP meter 65AIT680120 is above the ORP setpoint, the dosing rate is decreased.

The changes are capped by an adjustable range to prevent overdose or underdose of sodium thiosulfate.

If the ORP meter is out of range, the feedback is disabled and the sodium thiosulfate is controlled with an open PID loop.

A button on the interface also allows the operator to select the ORP control or disable it (in case of ORP sensor malfunction).

6.3 Fault response

If a fault occurs on one activated carbon extraction pump, the Acticarb is stopped according to emergency shutdown sequence.(Emergency)
If the sludge valve 65FCV6801433 falls in fault, an alarm is generated. (Warning)

If the sludge flowmeter 65FIT6801432are in out of range fault, an alarm is generated. (Warning)

If the sludge flowmeter 65FIT6801432 is in deviation alarm and the valve 65FCV6801433 is closed, an alarm is generated, a major fault is generated and the Actiflo is stopped according to automatic shutdown sequence to prevent pump or line blockage. (Fatal)

If the sludge flowmeter 65FIT6801432 is in low low alarm and the valve 65FCV6801433 is open, but the 65FIT6801432 value is above the low low alarm, an alarm is generated. If the fault is not reset after an adjustable delay, the Actiflo is stopped according to automatic shutdown sequence to prevent line blockage. (Emergency).

Specific Acticarb faults are detailed in Acticarb FD in Appendix C

6.4 Interlocks.

The faults that stop and prevent the Acticarb to start are as follows:

- Sludge extraction pump is in fault
- The feeding pumps (by others) are in fault.
- The inlet flowmeter 65FI6801102 is in out of range fault
- Chlorination tank in major fault
- Dechlorination tank in major fault

7 Secondary Actiflo

The secondary Actiflo receives the third stream composed of the underground water and surface water. It is designed to remove suspended solids present in the raw water. The secondary flowrate is defined as explained in section 1.

A coagulant is dosed within the first chamber to provide coagulation of the colloids particles. The coagulant then acts as a destabilization agent to agglomerate TSS particles contained in the raw water for further removal.

The sludge from the secondary ACTIFLO, coming from the hydrocyclone overflow, flows by gravity to a dedicated Splitter Box where part of the sludge flows back in the first chamber of the secondary. The remaining sludge is pumped to the sludge tank. The flow rate to the sludge storage tank is controlled through a control valve and a turbidity control loop.

A recirculation loop on the sludge splitter box prevents sludge from settling. The sludge recirculation loop is equipped with a turbidity mete.

The clarified water is collected by throughs and gets mixed with the breakpoint chlorination Actiflo clarified effluent prior to Discfilter filtration. Part of the sludge produced by the Acticarb is directed to the dechlorination tank.

The detailed Actiflo process functional description is presented in Appendix C

The Actiflo unit and its Actiflo Extraction/Recirculation splitter box consists on the following control devices and instruments:

Table 7-1: Actiflo control devices

7.1 Controls

7.1.1 Actiflo® Start/Stop/Auto function

By activating the Auto function, the Actiflo® is set in Auto start mode and is ready to start. If all start sequence conditions are satisfied, it starts only after receiving the automatic start command.

By deactivating the Auto mode, the Actiflo® stops following the automatic stopping sequence and a start and a stop button will be displayed on the HMI.

- by activating the Start function, the Actiflo® starts following the automatic starting sequence whatever the automatic start command status.
- by activating the Stop function on the HMI, the Actiflo® stops following the automatic stopping sequence.

If required equipment is in manual and not running when the Actiflo® Auto function is triggered, starting sequence cannot be activated.

7.1.2 Sludge recirculation/extraction control

The TSS control loop will act on the opening of the splitter box outlet flow control valve to adjust the sludge flow rate being recirculated back to the coagulation chamber.

A TSS set point will be entered by the operator. If the TSS measured by 65AIT6801427 is below the set point, the control loop will close 65FCV6801437. This will increase the sludge recirculation to the coagulation chamber and increase the turbidity.

On the contrary, if the measured TSS is above the set point, the control loop will open 65FCV6801437. This will decrease the sludge recirculation to the coagulation chamber and increase the sludge flow rate going to the sludge storage tank.

If the TSS analyzer is in fault, an alarm is generated and the sludge valve 65FCV6801437 opens to prevent sludge build-up in the Actiflo process.

If the fault is not reset after an adjustable delay, the Actiflo is stopped according to automatic shutdown sequence.

7.2 Fault response

If a fault occurs on one sludge extraction pump, the Actiflo is stopped according to emergency shutdown sequence.(Emergency)
If the sludge valve 65FCV6801437 falls in fault, an alarm is generated. (Warning)

If the sludge flowmeter 65FIT6801437are in out of range fault, an alarm is generated. (Warning)

If the sludge flowmeter 65FIT6801437 is in deviation alarm and the valve 65FCV6801437 is closed, an alarm is generated, a major fault is generated and the Actiflo is stopped according to automatic shutdown sequence to prevent pump or line blockage. (Fatal)

If the sludge flowmeter 65FIT6801437 is in low low alarm and the valve 65FCV6801437 is open, but the 65FIT6801437 value is above the low low alarm, an alarm is generated. If the fault is not reset after an adjustable delay, the Actiflo is stopped according to automatic shutdown sequence to prevent line blockage. (Emergency).

Specific Actiflo faults are detailed in Actiflo FD in Appendix C

7.3 Interlocks.

The faults that stop and prevent the Actiflo to start are as follows:

- Sludge extraction pumps is in fault
- The feeding pumps (by others) are in fault.
- The secondary flowmeter 65FI6801301 is in out of range fault

Specific Actiflo interlocks are detailed in Actiflo FD in Appendix C.

8 Discfilter

8.1 Description

Water from both ACTIFLO process flows by gravity to the DISCFILTER filtration process. The DISCFILTER is used as a polishing step to reduce the suspended solids at the clarified water aiming further reduction of metal at the final effluent.

The DISCFILTER utilizes a filter cloth mounted on filter panels. These panels stem from a central drum where inlet water is admitted into the unit for treatment. Water is filtered in inside-out mode, flowing from the centre tube to the open base of the filter discs, through the polyester cloth before reaching the DISCFILTER water collection tank. The DISCFILTER water collection tank is part of the DISCFILTER and contains the filters and the filtered water. Particulate matter presents in the DISCFILTER inlet water is retained by the filter media on the inside of the filter panels, eventually leading to solids built-up on the filter media. Consequently, the head loss across the DISCFILTER increases, resulting in increased water level at the inlet of the unit.

The unit includes an integral two level transmitters located upstream and downstream. The differential level initiates a backwash cycle, which rotates the filter discs in order to expose clean filter media to the water flow path, while subjecting the dirty filter media to the cleaning action of the backwash spray tips.

Filtered water stored in the DISCFILTER water collection tank is pumped to feed the series of spray tips strategically installed on the moving arms of the backwash system. This serves to clean the entire surface of the filter media while limiting the use of filtered water in the process. An outlet weir integral to the DISCFILTER water collection tank is used to maintain the water level. The backwash water will be directed to backwash tank to be pumped back to the secondary ACTIFLO. Filtered water flows over the weir of the tank and out of the unit.

A chemical trolley is available with the DISCFILTER unit in the case of chemical scaling due to high calcium concentration in the water (possibility to use an acidic wash to wash down any calcite that might precipitate on the discs cloth). The water then flows to a treated water tank and is pumped to discharge. Online TSS and Total Chlorine will be monitored at the outlet for discharge compliance.

10 Sampling and analyses unit

10.1 Process overview

The free / total chlorine analysers skid is connected to the third compartment of each of the chlorination and dechlorination tank, a sample flow will be directed into the skid through gravity. A gravity settling system will allow the separation of the PAC particles and any other solids present in the sampled water. Then the effluent of the settling system is pumped into the dilution system of the skid. The pumped effluent is diluted with service water. In addition, both pumped effluent and service water flowrates are measured by a rotameter and a magnetic flowmeter respectively and controlled by controlling valves, therefore to meet the dilution ratio required to fit the analysers measuring ranges.

Table 9.1: Free / Total Chlorine Analysers Skid devices

SKID	P&ID TAG	DESCRIPTION	COMMENTS
	65PSRXXX	SAMPLE PUMP	
	15-BA99-XXX	SAMPLE CONTROL VALVE #1	
	65FIXXX	SAMPLE ROTAMETER #1	Not controlled
	15-BA99-XXX	SAMPLE CONTROL VALVE #2	
	65FIXXX	SAMPLE ROTAMETER #2	Not controlled
	15-BA99-XXX	SERVICE WATER – CONTROL VALVE #1	
	65FITXXX	SERVICE WATER – FLOWMETER #1	
	15-BA99-XXX	SERVICE WATER – CONTROL VALVE #2	
	65FITXXX	SERVICE WATER – FLOWMETER #2	
	65AIT6801142 / 65AIT6801117	TOTAL CHLORINE ANALYSER	
	65AIT6801141 / 65AIT6801116	FREE CHLORINE ANALYSER	

10.2 Controls

10.2.1 Calculation of the chlorine concentration

The equations below calculates the initial chlorine concentration using the different flowrates measured :

$[CLfree_0] = [CLfree_m] . (Q_{dil} + Qp_1) / (Qp1)$

Where

$[CLfree_0]$: is the initial free chlorine concentration measured in the chlorination/dechlorination tank

$[CLfree_m]$: is the free chlorine concentration measure by the free chlorine analyzer

Qdil : is dilution flow rate measured by the flowmeter 65FITXXX

QP1 : is the pumped flow rate entered by the operator and measured with the rotameter.

The same equation applies for the total chlorine.

10.2.2 Pump control

Prior to operating the pump, its priming should be done by keeping both sample control valves #1 and #2 at the discharge section closed and opening the isolation valve at the suction section. When the suction line is filled, the pump can be started. All the listed valves are controlled manually.

10.2.2.1 Dilution flow control

For an efficient free chlorine and total chlorine concentration monitoring, the dilution process should be done adequately. Without the appropriate service water and sample flows, this can't be achieved. This control is done by monitoring the service water flowmeters #1 / #2 and the sample rotameters #1 / #2 of each dilution line per the listed set points.

10.2.2.2 Chlorine residual control

The free / total chlorine residual is measured by the analysers and it is controlled by a range of set points to avoid overdosing or underdosing of calcium hypochlorite and PAC dosages.

10.3 System Availability Conditions

For the system to run the following conditions should be met:

- Successful manual pump priming
- There is no major fault on the system

10.4 Fault Response

The following are the possible major faults associated with the sampling and analyses units:

1. Pump fault
2. Low low service water flow
3. Chlorine analysers out of range fault

Pump Fault

Tag: 65PSRXXX

Failure in priming the pump prior to its operation will result in a pump fault, the pump should be stopped and the skid should be isolated.

Low Low Service Water Flow

Tag: 65FITXXX

If service flowmeters indicate a low flow fault, a fatal alarm is signaled. The operator should give this major fault immediate attention in order to regulate the control valve 15-BA99-XXX upstream of the flowmeters 65FITXXX in order to avoid erroneous measures by the analysers.

Chlorine Analysers Out of Range Fault

Tag: 65AIT6801142 / 65AIT6801117 / 65AIT6801141 / 65AIT6801116

If analysers fall in out of range fault, a fatal alarm is generated. It will impact the calcium hypochlorite and PAC dosages. If fault persists, the operator can enter the required calcium hypochlorite and PAC dosages on the interface.

11 Treated water

11.1 Description

Water is pumped from treated water tank prior to discharge.
The treated water monitoring is composed of the following control devices and instruments.

Table 11.1: treated water system control devices

SKID	P&ID TAG	DESCRIPTION	COMMENTS
	pH	pH analyzer	
	AITXXX	Total Chlorine analyzer	
	AITXXX	TSS Analyzer	

11.2 Controls

In order to discharge effluent within effluent criteria, chlorine analyzer , TSS and pH analyzer are installed on the effluent line, prior to discharge.

The allowed discharge effluent setpoints (TSS_{max}, pH_{min}, pH_{max}, $Chlorine_{max}$) is entered by the operator at the interface.

When the transfer pump from treated water tank starts, the discharge valve (treated water valve by others) opens.

During the initial start-up of the plant, alarms are disabled for an adjustable period to enable enough time for complete on-line water analysis. After this adjustable delay, if all the effluent values are lower than the setpoints (including an adjustable hysteresis to prevent frequent opening and closing of the valve) for an adjustable delay, the treated water valve stays open.

When at least one of the values is above the corresponding setpoint (or below for pH_{min}) for an adjustable delay, , the off spec valve (by others) will open to allow water to be directed back to treatment chain inlet through to the off-spec line and discharge valve (by others) will close once the opening status of the off-spec valve is confirmed.

The raw water pumps will be stopped to prevent more water to enter the off-spec water loop. The chemical dosages will be adapted depending on the source of the non-compliance.

When all of the values are below the corresponding setpoint (or above pH_{min}) for an adjustable delay, the discharge valve will open to allow water to be directed to the treated water line and off-spec valve will close once the opening status of the discharge valve is confirmed.

The raw water pumps will then restart in automatic mode to provide water to the treatment plant.

11.3 Fault response

The following faults will stop the raw water pumps :

1. opening/closing fault from discharge valve (treated water valve)

If one of the analyzer (pH, TSS, chlorine) is in fault, an alarm is generated and the off-spec valve opens and discharge valve closes to prevent off-spec water to be discharged to the treated water line.

11.4 Interlock

No interlock.

12 Backwash tank

12.1 Description

The backwash tank collects water from the discfilter. Two transfer pumps (duty / assist) are used to recirculate the backwash effluent to the head of the secondary Actiflo.

The backwash tank is made up of the following control devices and instruments:

Table 6.1: Backwash tank control devices

SKID	P&ID TAG	DESCRIPTION	COMMENTS
	LITXX/LITXX	Level transmitters	
	65PSR68009A	Backwash tank pump #1	
	65PSR68009B	Backwash tank pump #2	

12.2 Controls

12.2.1 Level control

The backwash tank is equipped with two redundant level transmitters, LITXX and LITXX and two transfer pumps.

Level transmitters can be set with priority. The two level transmitters operate in a duty/standby configuration

The level transmitter priority (lead /lag) is changed manually by the operator. The priority is changed automatically when one transmitter is in out of range fault.

The transfer pumps are equipped with VFD. A loop controls the Pump VFD accordingly, using the lead level transmitter as a process value and the speed of the pumps as setpoints.

If the level in this tank increases, the flow rate pumped from the tank should also increase. If the level in the tank is lower, the pump will slowly decrease speed until stop level is reached.

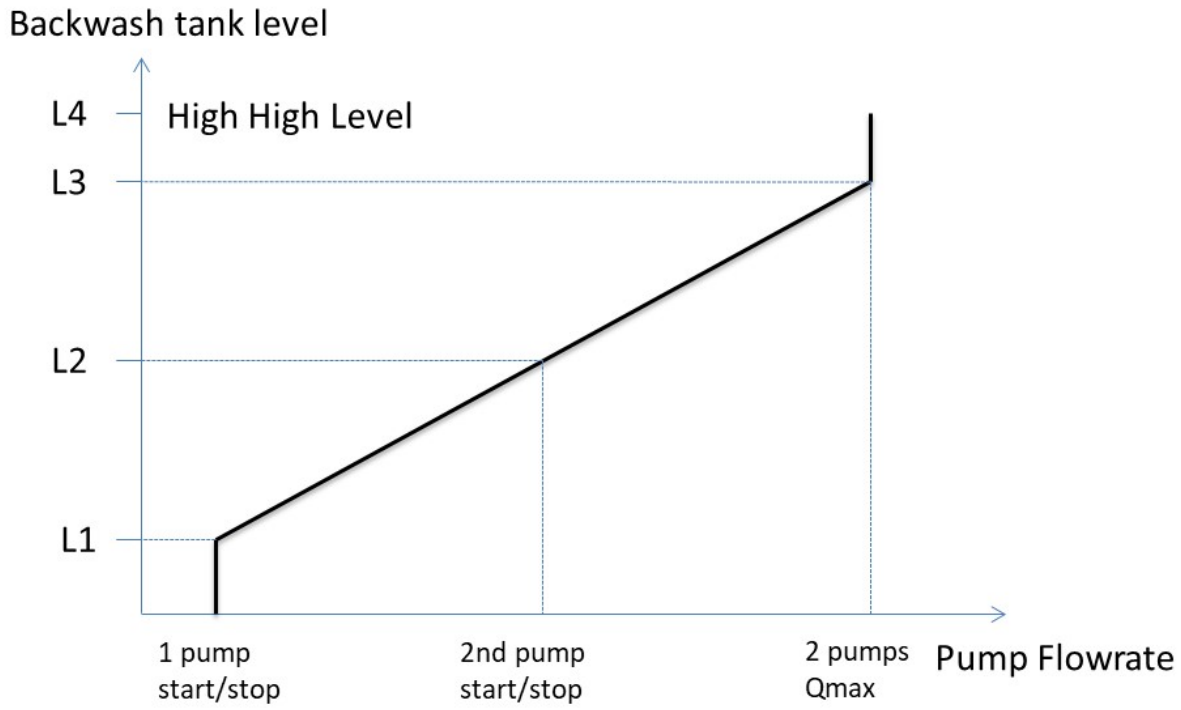

Figure 6-1 backwash tank level control

The following three (3) set points must be entered by the operator to properly control the flow and number of operating pumps.

Duty pump start level (LT_SP1);
Assist pump start level (LT_SP2);
Maximum speed pumps (LT_SP3);

When two pumps are operated at the same time, the pumps VFD setpoints are equal.

12.2.2 Backwash tank transfer pumps' Logic

In normal operation, only one transfer pump needs to run. The operator selects the assist pump on the interface.

Each time the running pump is stopped, the other pump starts at the next start sequence. If the pump is in manual or in fault, the second pump starts.

A button on the HMI permits to alternate manually the priority.

12.3 Fault Response

When the duty pump is in fault or not running and the secondary actiflo unit is in operation, the assist pump starts. If the second pump is in fault or in manual (not running) an alarm is generated and a message is displayed to warn the operator.

If low low level alarm on duty LITXX is activated, transfer pump is stopped until operator is able to reset the alarm.

If the two transmitters readings have discrepancy higher than an adjustable deviation value, an alarm is generated.

If the duty level transmitter is out of range, the priority is automatically transferred to the stand-by level transmitter. If both level transmitters are out of range, an alarm is generated and message is displayed to warn the operator about risk of overflow during discfilter backwash. The backwash pumps and discfilter are stopped.

12.4 Interlock

The interlocks that prevent the backwash tank pumps to start are:

- Low low level in backwash tank from duty level transmitter
- Both level transmitters out of range
- Secondary ACtiflo not running

13 Sludge tank

13.1 Description

The excess sludge from the two splitter boxes is pumped to a sludge holding tank. The sludge will be mixed to prevent any settling and accumulation within the sludge tank.

The sludge tank is made up of the following control devices and instruments:

Table 6.1: Sludge tank control devices

SKID	P&ID TAG	DESCRIPTION	COMMENTS
	LITXX/65LIT6801441	Level transmitters	
	65PSR68009A	Sludge tank pump #1	
	65PSR68009B	Backwash tank pump #2	
	65AGI68024	Mixer	

13.2 Controls

13.2.1 Level control

The Sludge tank is equipped with two redundant level transmitters, LITXX and 65LIT6801441 and one transfer pump (by others).

Level transmitters can be set with priority. The two level transmitters operate in a duty/standby configuration

The level transmitter priority (lead /lag) is changed manually by the operator. The priority is changed automatically when one transmitter is in out of range fault.

The transfer pumps shall be equipped with VFD. A loop controls the Pump VFD accordingly, using the lead level transmitter as a process value and the speed of the pumps as setpoints.

If the level in this tank increases, the flow rate pumped from the tank should also increase. If the level in the tank is lower, the pump will slowly decrease speed until stop level is reached.

13.2.2 Sludge tank mixing

The mixer starts when the sludge level is above the low Level.

13.3 Fault Response

If low low level alarm on duty LITXX is activated, transfer pump and mixer are stopped until operator is able to reset the alarm.

If the two transmitters readings have discrepancy higher than an adjustable deviation value, an alarm is generated.

If the duty level transmitter is out of range, the priority is automatically transferred to the stand-by level transmitter. If both level transmitters are out of range, an alarm is generated and message is displayed to warn the operator about risk of overflow. The Sludge extraction pumps and the sludge pump are stopped.

If the mixer is in fault or in manual (not running) a fatal alarm is generated and a message is displayed to warn the operator

13.4 Interlock

The interlocks that prevent the Sludge tank pumps to start and stop the mixer are:

- Low low level in Sludge tank from duty level transmitter
- Both level transmitters out of range

14 Summary of Interlocks that trigger WTP trip

15 Trends

15.1 Graphic pages

The Contractor must provide the graphic pages necessary for the proper operation of the system. The following list is not exhaustive and should correspond to the requirements of the plans and specifications:

1. One page on the entire operation of the treatment station and one page for each P & ID page;
2. Real time data;
3. Alarms graphic page;
4. Graphical page of trend curves (flow, on-line analyzers);
5. Graphical equipment calibration page.

15.2 Display and indications

• State:

1. State of the breakpoint chlorination treatment plant;
2. Operating condition of each pump or motorized equipment;
3. Indication of flow rates;
4. Indication of all analytical values (pH, NH4, Chlorine, TSS, turbidity)
5. Operating status of chemical dosing systems
6. Operating pressure of operating systems;
7. Measurement of tanks levels;
8. Operation of VFDs;
9. Equipment running time.

15.3 Faults and alarms

Failure of motorized equipment and instruments;

Alarms according to the table of setpoints, parameters and alarms.

15.4 Compiled data

1. Measurement and compilation of all flows;
2. Cumulative run times of each pump and equipment;
3. Number of departures per day for the last five days for each pump;
4. Daily, weekly, monthly and annual average of influent flow, sludge discharge flow, off-spec flow and treated water flow.

15.5 Trends

1. Trends can be analog points or the internal result.
2. Trend curves will be recorded on a 30-day possibility.

15.6 Alarm management

1. Alarm management is required to inform the operator of the status of the water treatment system. All alarms will be compiled into a register for later reference.
2. The alarms will be transmitted to the operator via a communication system integrated into the supervision software.
3. The combined alarm will operate a strobe light/horn outside the building (TBC).

1 INTRODUCTION

1.1 Reference Documents

Document Number	Name	Revision
5000220043_PI_0001_GEN_VWT	PI001 _Process and Instrumentation diagram	1

1.2 Process Overview

The ACTICARB® clarifier are based on the ballasted flocculation process. The key feature of this process is that very fine sand (85 µm or 130 µm size), termed “microsand” is added to the pre coagulated effluent loaded with PAC. A polymer is also added that binds the microsand to the floc, creating a ballasted floc with greatly increased effective density. The ballasted flocculation process is capable of being shut down when treatment capacity is not needed and then rapidly restarted when needed.

The flocs settle in the clarifier portion of the system where they are collected by a rake mechanism. A percentage of the unit’s design raw water flow is continuously withdrawn from the clarifier and pumped to a hydrocyclone system which separates the microsand from the sludge. The recovered microsand (typically 20% of the recycled flow) is reused in the process. A small quantity of the microsand is not recovered by the hydrocyclones and is discharged with the sludge. The lost microsand needs to be replaced periodically by adding more of it to the process (typically 1 to 3 mg/L). After sand separation, the sludge is rejected to another set of reactors, from which a portion will be recirculated to upstream points in the treatment train, and the remainder extracted.

A tank downstream of the ACTICARB® unit accepts the sludge removed in the ACTICARB® clarification process. This tank splits the rejected mix of activated carbon and flocs into two streams. A fraction is pumped and rejected into the sludge tank unit in order to be extracted from the process. The remaining fraction is recirculated by gravity into the contact reactor in order to increase the activated carbon contact time in the process. The flowrate of the pumped fraction is controlled by a flowrate control loop. The flowrate is measured by a flowmeter and controlled by a modulating valve (pinch valve).

1.3 List of Abbreviations

The following abbreviations are used in the text of this document.

- HMI: Human/Machine Interface
- H-O-A: Hand-Off-Auto
- PLC: Programmable Logic Controller
- LCP: Local Control Panel
- VFD: Variable Frequency Drive
- VWT: Veolia Water Technologies Canada

1.4 List of Units

The following lists the parameters referred to in this document and the units they are measured in unless otherwise specified.

- Concentration (in general): mg/L
- Dosing rate: mL/L
- Flow rate (main process): m^3/h
- Flow rate (chemical dosing): LPH
- Level in the tanks: %
- pH: -
- Pressure: PSIg
- Temperature: °C
- Turbidity: mg/L or NTU

2 ACTICARB® CONTROL DESCRIPTION

2.1 Equipment and Instrument

This section connects the tags from the P&ID and the terminology used throughout Equipment and Instrument Schedules

P&ID TAG	DESCRIPTION
65FIT6801102	Inlet Breakpoint Chlorination Flowmeter
65FCV6801102	Inlet Breakpoint Chlorination valve
65AGI68018	Coagulation mixer
65AGI68019	Injection mixer
65AGI68020	Maturation mixer
65TRM68002	Scraper
SSL20-03	High Torque detector
65PSR68005A	Recirculation pump #1
65PSR68005B	Recirculation pump #2
65AIT6801221	pH meter
65AIT6801222	Turbidity meter
65LSHH6801224	High high level switch
65AIT6801201	ORP meter
N/A	Pressure transmitter first recirculation line
N/A	Pressure transmitter second recirculation line
65FY6801242	Injection water solenoid valve hydrocyclone #1
65FY6801237	Injection water solenoid valve hydrocyclone #2
65FIT6801432	Activated carbon extraction flowmeter
65LSHH6801406	Splitter box High high level switch
65LSLL6801406	Splitter box Low low level switch
65PSR68007A	Activated carbon extraction pump
65FCV68011433	Activated carbon extraction control valve

2.2 Operating Modes Overview

There are two primary modes for each ACTICARB®: Manual and Semi-Automatic. The Manual mode is designed for operation of individual equipment. The Semi-Auto mode is designed for operation of the ACTICARB® system as a whole.

HMI manual mode

Manual operation from the HMI provides the same equipment protection and alarming as Semi-Auto.

Semi-Auto

Semi-Auto mode allows the operator to initiate the ACTICARB® system start-up and shutdown sequences from HMI or remotely.

NOTE: Train equipment cannot be controlled manually while in Semi-Auto operation.

The coagulation mixer or injection mixer, maturation mixer, scraper, and at least one recirculation pump H-O-As must be in Auto to enable Semi-Automatic control of all respective equipment at the HMI All start-up sequences are described below. Each ACTICARB® train and its associated equipment are controlled as an independent system by the PLC.

The table below presents the control modes summary.

Table 1: Summary of Control Modes

	HMI Manual	Semi-Auto
Control Functions	N/A	Allowed (PLC)
Initiation of Semi-Automatic functions	N/A	Operator or Remote Start-up Initiation Required
HMI Operation of Individual Equipment	Allowed (virtual HOA on HMI)	Not Allowed

2.3 Permissive

Permissive to allow initiation of the Semi-Automatic start sequence are:

- H-O-A selector switches for mixers, scraper and at least one recirculation pump, are in Auto at the HMI.
- Mixers whichever is in Auto at HMI, scraper, and the above mentioned recirculation pump do not have existing equipment alarms.
- Aforementioned equipment alarms must be manually reset.

2.4 Semi-Auto Train Response to Equipment Conditions

2.4.1 Equipment Removed From Auto PLC Response

If the mixers and the scraper are removed from Auto while the PLC is running in Semi-Automatic control of the ACTICARB® system, the PLC will initiate a Shutdown Sequence as described in section 2.6.2.

Since the scraper will not be operational, the Shutdown Sequence will consist of the recirculation pump running for the durations indicated in section 2.6.2.

If the lead recirculation pump is removed from Auto, the PLC will sequentially initiate operation of the next available pump. If all recirculation pumps are removed from Auto or no additional pumps are available, the PLC will initiate an emergency shutdown of all equipment.

NOTE: No alarm will be generated if an ACTICARB® system shutdown is initiated due to a piece of equipment being removed from Auto by the operator.

2.4.2 Equipment Failure PLC Response

If the coagulation mixer fails during Semi-Automatic control of the ACTICARB® system, the system will continue to run.

Should the injection mixer or the maturation mixer fail at any time during Semi-Automatic control of the ACTICARB® system, the PLC will issue an equipment alarm and will initiate a Shutdown Sequence as described in section 2.6.2.

Should the scraper fail at any time during operation or start-up, the PLC will issue an equipment alarm and will initiate a Shutdown Sequence as described in section 2.6.2 .Since the scraper will not be operational, the Shutdown Sequence will consist of the recirculation pumps running for the durations indicated in section 2.6.2.

Should lead recirculation pump fail, the PLC will issue an equipment alarm and sequentially initiate operation of the next available pump. If all recirculation pumps fail or no additional pumps are available, the PLC will initiate an emergency shutdown of all equipment.

NOTE: An AVAILABLE recirculation pump is defined as one that is placed in Auto and does not have any existing un-reset alarm conditions.

2.5 Recirculation Pumps Logic

2.5.1 Duty/Standby Orientation

When two recirculation lines are provided they can be set with priority. The two recirculation pumps operate in a Duty / standby orientation. If all recirculation pumps are in “auto” but not running, the pump set as priority (duty) will start when the start condition will be met.

The recirculation pumps priority (duty/standby) is changed manually by the operator anytime or is changed automatically when the plant stops.

2.6 SEQUENCES OF FUNCTIONS

2.6.1 Start-up Sequence

If all permissive conditions are present and no respective equipment alarms exist, the HMI will display **"Train Ready"**. The Start-up Sequence can now be initiated via the HMI or remotely. Refer to table 2 for more information.

NOTE: To prevent damage to the equipment, the Train must have water in the tanks above the mixer impeller elevations prior to Start-up (to be checked by the operator).

To start the train when "Train Ready" is displayed on the HMI, the operator presses the "Train Start" pushbutton. A starting system displays "Train Starting" at the HMI. The start-up sequence automatically cycles through the steps listed below.

1. System Start-up Initiated:
    a. **Start duty recirculation pump**
    b. **Open injection water solenoid valve**
    c. **Start activated carbon extraction pump**

If a failure occurs, the duty pump will be locked out in the PLC and the next available pump will be assigned as the lead pump. The PLC will then attempt to continue operation. This cycle will occur until a recirculation pump starts or all recirculation pumps have been locked out. If all sand pumps are locked out, the PLC will immediately abort the start-up.

2. Delay 30 seconds (adjustable):
    a. **Start the Scraper**

If a Scraper failure occurs initiate a Shutdown Sequence.

3. Delay 10 seconds (adjustable):
    a. **Start the mixers**. These mixers start are respectively staggered by 5 seconds.

If a maturation Mixer failure occurs initiate a Shutdown Sequence.

4. Delay 10 seconds (adjustable):
    a. **Start the chemical feed pumps**
    b. **Start activated carbon flow control loop**
    c. HMI will display **"Train Started"**

If any Duty Chemical Feed Pump is not available while in operation, the Stand-by pump shall be initiated. The duty pump will not be locked out so when the pump is placed back into Semi-Auto, it will resume operation. Duty chemical feed pump alternation is manual and available only at the HMI.

The Operator can terminate the start-up at any point in the sequence by pressing the "Train Stop" pushbutton. If any pertinent equipment fails during the start-up sequence, the PLC will initiate a train shutdown. The operator can correct the failure, and then resume the start-up sequence from the current shutdown sequence step by pressing the "Train Start" pushbutton.

2.6.2 Shutdown Sequence

When in Semi-Automatic mode, the operator may implement the Shutdown Sequence at any time from the HMI or remotely. During shutdown, the HMI will display “Train Stopping”. Refer to table 3 for more information

The shutdown sequence automatically cycles through the steps listed below.

1. System Shutdown Initiated:
    a. **Close the inlet breakpoint chlorination valve**
    b. **Shutdown the Chemical Feed Pumps**
    c. **Shutdown the mixers**
    d. **Stop Water Polymer Carrier Solenoid valve.**
2. Delay (Operator Adjustable) (10-30 minutes):
    a. **Shutdown the scraper**
3. Delay 5 minutes:
    a. **Shutdown the duty recirculation pump**
    b. **Close injection water solenoid valves**

NOTE: This delay allows purging of sand and sludge contained in the settling tank and piping and re-deposits it back into the Maturation tank.

The operator can initiate the Train start-up sequence from the current shutdown sequence step by pressing the “Train Start” pushbutton without stopping the equipment already started.

Start-up Sequence

Table 1: ACTICARB® automatic start sequence

Step #	STEP NAME	ACTION	STEP CHANGE CONDITION	Recirculation pumps	Coagulation mixer	Injection mixer	Maturation Mixer	Dosage & raw water flow	Scraper	Injection Water Valve	Activated carbon extraction pump	Activated carbon extraction valve	Status light	Status output

2.7 Alarm/Failure Conditions and PLC Responses

2.7.1 Alarm Priorities

Alarms are grouped in to 3 priority levels for various attention requirements:

Emergency alarms:

1. Needs immediate operator attention.
2. The ACTICARB® unit will initiate the emergency shutdown sequence.

Fatal alarms:

1. Needs immediate operator attention.
2. The ACTICARB® unit will initiate the stop sequence.

Warning alarms:

1. Does not need immediate operator attention.

If the ACTICARB® unit was stopped by an Emergency alarm or fatal alarm, it will not restart automatically. The operator must remove alarm condition and reset the alarm. Then press the start button on the operator interface will restart the unit if all automatic start sequence conditions are satisfied. In case of remote control, the system will wait for rising edge of the remote start signal.

2.7.2 Alarm and Set Point Table

Refer to Appendix A.

2.8 Safety

2.8.1 Emergency Stop

Emergency stop actions

When an emergency stop button is activated, an alarm is triggered. The fault associated with this alarm will latch.

During emergency stop, many stopping actions are initiated on equipment. These actions are presented in sections describing the relevant equipment.

Recovery after emergency stop

When all emergency stop buttons are back into normal position, the fault associated with an alarm is maintained until the operator presses the reset button.

2.8.2 Control Power Failure PLC Response

Should control power fail at any time during Semi-Automatic control of the ACTICARB® system, the PLC will issue an alarm and will initiate a Shutdown Sequence as described in this document. Systems with an Uninterruptable Power Supply (UPS) will see the alarm as the condition occurs. Systems without an UPS will see the alarm upon restoration of power. There is a ten (10) second delay upon restoring power, and then the train will enter the Shutdown Sequence as described in this document. If the restored power does not include the actual motor controls, a run status will not be received by the PLC and equipment (pumps and scraper) will shut down immediately without a re-inventory of the sand to the maturation tank. If the unit is configured to resume via the HMI, it will automatically resume to the last known state. Otherwise the unit will remain in Stop.

2.9 System Available Conditions

2.9.1 Conditions for automatic Start sequence

The automatic start sequence will be activated when the automatic start command is true and the following conditions are met:

1. If delay for power return is elapsed;
2. If remote run request bit is activated;
3. ACTICARB® in Auto start mode.

2.9.2 Conditions for automatic stop sequence

The automatic stop sequence will be activated when any of the following conditions are met:

1. The ACTICARB® Auto start mode is deactivated on the interface or one of the following occurs:
   a. If a major fault is active;
   b. If remote contact is not activated;
2. The ACTICARB® automatic start command is false.

2.10 ACTICARB® Fault Responses

Table 4: ACTICARB® major faults

MAJOR FAULT	ALARM TYPE
Coagulation mixer	FATAL
Injection mixer	FATAL
Maturation mixer	EMERGENCY
Scraper High High torque	EMERGENCY
Recirculation pumps	EMERGENCY
High High clarified water turbidity	FATAL
High high water level	EMERGENCY
Activated carbon extraction system	FATAL
Coagulant dosing system	FATAL
Polymer dosing system	FATAL
Power failure	EMERGENCY

If the ACTICARB was stopped by a major fault, it will not restart automatically. The operator must fix the problem on the operator interface. The ACTICARB will restart if all automatic start sequence conditions are satisfied.

2.11 Controls

2.11.1 General

1. ACTICARB® Start/Stop push button function:
   - By pushing the Start/Stop push button, the ACTICARB® will be set in Auto start mode and will be ready to start. If all automatic start sequence conditions are satisfied, it will start only after receiving the automatic start command.
   - If the ACTICARB® is in Auto start mode and it is running or on starting sequence, pushing the Start/Stop push button will activate the stopping sequence and deactivate the Auto start mode. Pushing the Start/Stop push button again will restart the ACTICARB® if the automatic start command is still true.

2. If an essential equipment is in manual and not running when the ACTICARB® Start/Stop push button is pressed to activate the Auto mode, Auto start mode cannot be activated.
   The essential ACTICARB equipment's to be in Auto are:
   - Coagulation mixer
   - Injection mixer
   - Maturation mixer
   - Scraper
   - Recirculation pumps

3. If a major fault occurs while the ACTICARB® is in start sequence or is running, the ACTICARB® is forced into a stop sequence and the ACTICARB® major fault is set.

4. The operator may set/reset the ACTICARB® in Auto start mode by pressing the Start/Stop push button from the HMI.
   The conditions to activate the Auto mode are the followings:
   - No major faults;
   - All equipment in Auto on HMI or running;
   - No Polymer system fault
   - No sludge recirculation pump fault

Pressing on the ACTICARB® Start/Stop push button on the operator interface for 3 seconds when the ACTICARB® is stopped and will enable forced start mode if all the conditions to activate the Auto mode are true the forced start mode will become active. The unit will then start all the drives and request to open the raw water valve, bypassing the auto start sequence commands.

2.11.2 Recirculation pumps logic

Pump Fault
The pump is in fault when:

- The command is present and the status is not for a short delay

When the duty pump is in fault, and the ACTICARB® unit is in operation the standby pump will start, the ACTICARB® will not stop, a WARNING alarm is activated and a message is displayed. If the second pump was in fault or in manual (not running), a FATAL alarm is activated, a message will be displayed and the ACTICARB® unit will stop.

Pump Priority
Each time the running pump is stopped, the other pump will start at the next ACTICARB® start sequence. If the other pump is in manual or in fault, the first pump will restart.

2.11.3 Maturation Mixer Speed

The maturation mixer motor is powered by a variable speed drive (VFD). The speed of the mixer will be set on the PLC during the process start-up of the system to get an optimal mixing. Thereafter, the speed usually does not need any further adjustment.

2.11.4 ACTICARB® High Level Switch

A float over the settling tank is used as a High Level switch. When the switch is activated, stop the corresponding ACTICARB® unit according to the automatic stop sequence.

2.11.5 Activated Carbon Extraction Control

Several parameters affect the performance of PAC in the treatment (mixing, injection point, concentration, residence time, temperature etc.).
The required concentration and the time of contact are a function of the characteristics and the concentration of the chlorine to be eliminated. An insufficient time of contact requires more PAC for a same removal rate.

The dechlorination tank will provide a minimum Hydraulic Residence Time of 20 minutes at the max flowrate for the fresh PAC Slurry. During this time the fresh powder will remove chlorine. Its removal rate will decrease in the process due to the addition of coagulant and polymers into the ACTICARB®. However some active remaining sites will be used by recirculating the sludge extracted from the ACTICARB® Clarifier. The effective Residence Time of the powder in the process is called the Solids Residence Time (SRT).

The concentration and the Solids Residence Time will be adjusted by the operators with the molecules removal rates measured by a laboratory.

2.11.6 Activated Carbon Concentration

The sample of Activated Carbon will be taken by the operator at the bottom of the splitter box. The measure of the concentration with a thermal weighing scale will be the exact value of the extracted activated carbon (C_{acext}) in g/m3.

With the following equation, the operator will know the activated carbon concentration in the ACTICARB® and the dechlorination tank (C_{acdt}).

$$\mathbf{C_{acdt} = (C_{acext}.\ Q_{recir}.f_{hydr}) / (Q_{indt})}$$

Where:

C_{acdt}= activated carbon concentration in the process (g/m^3)

C_{acext}= extracted activated carbon concentration (g/m^3)

Q_{recir} = Total flowrate of the ACTICARB recirculation pump (m^3/h)

f_{hydr} = Hydrocyclones hydraulic split ratio. Entered with a value < 1. Ex: 0,8 for 80%

Q_{indt} = Inlet Breakpoint chlorination flowrate incoming into the dechlorination tank.

Q_{indt} = Inlet Breakpoint chlorination flowrate (65FIT6801102) + Chemicals Flowrate (calcium hypochlorite) - Extracted Activated Carbon (65FIT6801432) + hydrocyclone overflow flowrate (m^3/h) The operator will enter the overflow flowrate of each hydrocyclone on the interface.

2.11.7 Solids Residence Time

The Solids Residence Time is calculated by the equation:

Solids Residence Time = Activated Carbon Mass in the dechlorination tank (g) / Extracted Activated Carbon Massic Flowrate (g/h)

Or:

$$\mathbf{SRT = m_{acdt} / Q_{macext}}$$

With:

$$\mathbf{m_{acdt} = V_{dt} \,.\, C_{acdt}}$$

$$\mathbf{Q_{macext} = Q_{vacext} \,.\, C_{acext}}$$

And where:

SRT = Solids Residence Time (h)

$\mathbf{m_{acdt}}$= Activated Carbon Mass in the dechlorination tank (g)

$\mathbf{V_{dtx}}$ = dechlorination tank Volume (m^3)

$\mathbf{C_{acdt}}$= activated carbon concentration in the process (g/m^3). See above.

$\mathbf{C_{acext}}$= extracted activated carbon concentration (g/m^3). See above.

$\mathbf{Q_{macext}}$ = Activated Carbon Massic Flowrate (g/h)

$\mathbf{Q_{vacext}}$ = Activated Carbon Volumic Flowrate (m^3/h). Process value of 65FIT6801432.

2.11.8 Activated Carbon Extraction Valve

The extraction valve has two available operation modes:

- **Normal mode:** the valve is controlled with a PID loop and its opening is used as a manipulated variable to reach the flow set point.
- **Pulse mode:** as very low flow rates can be difficult to achieve with the valve, a pulse mode shall be programmed. Parameters such as opening duration and opening frequency shall be entered by the operator on the HMI. The extracted volume is totalized over time by the flowmeter.

2.12 Activated Carbon Extraction/ Recirculation System Fault Response

The following are the major faults associated with the activated carbon recirculation and extraction system.

1. **Activated Carbon splitter box tank high high level**

   The ACTICARB® unit falls on major fault and is stopped according to the automatic stop sequence.

2. **Activated Carbon splitter box tank low low level**

   The ACTICARB® unit falls on major fault and is stopped according to the automatic stop sequence.

3. **Sludge tank high high level**

   The ACTICARB® unit falls on major fault and is stopped according to the automatic stop sequence.

4. **Activated Carbon Extraction pump fault**

   The ACTICARB® unit falls on major fault and is stopped according to the automatic stop sequence.

5. **Extraction modulating valve open failure**

   The ACTICARB® unit falls on major fault and is stopped according to the automatic stop sequence.

2.13 Calculated Parameters

The following sections explain the main calculations made in the control of the ACTICARB® system.

The PLC calculates the chemical feed rates and controls the chemical metering pumps using the following procedure. The chemical feed rate is based on:

1. The influent raw water flow rate
2. The chemical dose
3. The physical properties of the chemicals
4. The capacity and settings of the metering pump
5. The raw water turbidity

The influent raw water flow rate is obtained through the raw water flow meter, which sends a signal to the PLC.

The influent raw water turbidity rate is obtained through the raw water turbidity meter.

The chemical dose, physical properties and metering pump capacity are input by the user/operator at the HMI.

The basic equation for the chemical feed rate is:

$$\text{Chemical feed rate} = \frac{\text{influent flow rate} \times \text{chemical dose}}{\text{stock chemical concentration}}$$

This equation is the general form for all chemical feed rates that use flow pacing control, including coagulant and polymer.

2.13.1 Flow Pace Control

The way the PLC uses these calculations to determine the chemical metering pump output is:

1. The chemical feed rate equations are programmed into the PLC.
2. The user/operator inputs the chemical dose, physical properties, and maximum chemical metering pump capacity at the HMI on the ACTICARB® control panel. The PLC calculates the specific chemical feed rate based on the user/operator inputs and the influent (raw water) flow to the train.
3. The calculated feed rate is then converted by the PLC into a percent speed, based on the maximum capacity of the metering pumps. This signal is then sent to the metering pump.

2.14 Interlocks

2.14.1 ACTICARB® High Level Switch

A float over the settling tank is used as a High Level switch. When the switch is activated, stop the corresponding ACTICARB® unit according to the automatic stop sequence

2.14.2 High Scraper Torque

The torque detector/alarm is independent from the PLC. So it is enabled (will stop the scraper) through a hardwired interlock to the scraper starter in the corresponding ACTICARB® control panel.

A high torque alarm is activated when the torque is higher than the adjustable set point for more than the adjustable delay.

When the alarm is activated, the scraper is stopped and then the ACTICARB® is stopped according to the automatic stop sequence.

2.14.3 Activated Carbon Extraction Pump

The activated carbon extraction pump cannot be started if the low level switch has been activated. If the pump is in operation and the low level switch is activated the pump is stopped by interlock.

2.14.4 Maturation Mixer

The maturation mixer cannot run if the scraper is not running.

1 INTRODUCTION

1.1 REFERENCE DOCUMENTS

Document Number	Name	Revision
5000220043_PI_0001_GEN_VWT	PI001 _Process and Instrumentation diagram	1

1.2 PROCESS OVERVIEW

ACTIFLO® units are based on the ballasted flocculation process. The key feature of this process is that very fine sand (85 µm or 130 µm size), termed “microsand” is added to the raw water following coagulant addition. A polymer is also added that binds the microsand to the floc, creating a ballasted floc with greatly increased effective density. The ballasted flocculation process is capable of being shut down when treatment capacity is not needed and then rapidly restarted when needed.

Ballasted flocculation works with most types of waters but is most advantageous with raw waters that either experience high turbidity raw water conditions (up to 2 500 NTU) and/or rapidly changing raw water turbidity conditions. It is also suitable for low turbidity, highly colored raw waters.

It consists of a coagulation basin, an injection basin, a maturation basin, and a lamella tube clarifier. Coagulant is added at the inlet and subsequent formation of microfloc takes place in the coagulant basin prior to addition of microsand and polymer in the injection basin. The water then flows into the maturation tank where bridging between the microsand and the destabilized suspended solids occurs.

The ballasted flocs settle in the clarifier portion of the system where they are collected by a rake mechanism. Typically 3% to 6% of the unit’s design raw water flow is continuously withdrawn from the clarifier and pumped to a hydrocyclone system which separates the microsand from the sludge. The recovered microsand (typically 20% of the recycled flow) is reused in the process. A small quantity of the microsand is not recovered by the hydrocyclones and is discharged with the sludge. Thus the lost microsand needs to be made up by periodically adding it to the process (typically 1 to 3 mg/L). After sand separation, sludge are partially wasted and recycled with the sludge withdrawn from the clarifier. Approximately 1% to 2,4% of flow becomes waste or residuals stream.

A tank downstream of the ACTIFLO® unit accepts the sludge removed in the ACTIFLO® clarification process. This tank splits the rejected mix of activated carbon and flocs into two streams. A fraction is pumped and rejected into the sludge tank unit in order to be extracted from the process. The remaining fraction is recirculated by gravity into the contact reactor in order to increase the activated carbon contact time in the process. The flowrate of the pumped fraction is controlled by a flowrate control loop. The flowrate is measured by a flowmeter and controlled by a modulating valve (pinch valve).

1.3 List of Abbreviations

The following abbreviations are used in the text of this document.

- HMI: Human/Machine Interface
- H-O-A: Hand-Off-Auto
- PLC: Programmable Logic Controller
- LCP: Local Control Panel
- VFD: Variable Frequency Drive
- VWT: Veolia Water Technologies Canada

1.4 List of Units

The following lists the parameters referred to in this document and the units they are measured in unless otherwise specified.

- Concentration (in general): mg/L
- Dosing rate: mL/L
- Flow rate (main process): m^3/h
- Flow rate (chemical dosing): LPH
- Level in the tanks: %
- pH: -
- Pressure: PSIg
- Temperature: °C
- Turbidity: mg/L or NTU

2 ACTIFLO® CONTROL DESCRIPTION

2.1 EQUIPMENT AND INSTRUMENT

This section connects the tags from the P&ID and the terminology used throughout Equipment and Instrument Schedules.

Project Tag No	Description
65AGI68021	Coagulation mixer
65AGI68022	Injection mixer
65AGI68023	Maturation mixer
65TRM68003	Scraper
65LSHH6801324	High High level switch
65AIT6801322	Turbidity meter
65AIT6801321	pH meter
SSL20-03	High Torque detector
65PSR68006A	Recirculation pump #1
65PSR68006B	Recirculation pump #2
65FIT6801437	Sludge extraction flowmeter
65LSHH6801411	Splitter box High high level switch
65LSLL6801411	Splitter box Low low level switch
65AIT6801427	TSS meter sludge
65PSR68007C	Sludge extraction pump
65FCV6801438	Sludge extraction control valve

2.2 OPERATING MODES OVERVIEW

There are two primary modes for each ACTIFLO®: Manual and Semi-Automatic. The Manual mode is designed for operation of individual equipment. The Semi-Auto mode is designed for operation of the ACTIFLO® system as a whole.

HMI manual mode

Manual operation from the HMI provides the same equipment protection and alarming as Semi-Auto.

Semi-Auto

Semi-Auto mode allows the operator to initiate the ACTIFLO® system start-up and shutdown sequences from HMI or remotely.

NOTE: Train equipment cannot be controlled manually while in Semi-Auto operation.

The coagulation mixer or injection mixer, maturation mixer, scraper, and at least one sand pump H-O-As must be in Auto to enable Semi-Automatic control of all respective equipment at the HMI. All startup sequences are described below. Each ACTIFLO® train and its associated equipment are controlled as an independent system by the PLC.

The table below presents the control modes summary.

Table 1: Summary of Control Modes

	HMI Manual	Semi-Auto
Control Functions	N/A	Allowed (PLC)
Initiation of Semi-Automatic functions	N/A	Operator or Remote Start-up Initiation Required
HMI Operation of Individual Equipment	Allowed (virtual HOA on HMI)	Not Allowed

2.3 PERMISSIVE

Permissive to allow initiation of the Semi-Automatic start sequence are:

- H-O-A selector switches for mixers, scraper and at least one recirculation pump, are in Auto at the HMI.
- Mixers whichever is in Auto at HMI, scraper, and the above mentioned recirculation pump do not have existing equipment alarms.
- Aforementioned equipment alarms must be manually reset.

2.4 SEMI-AUTO TRAIN RESPONSE TO EQUIPMENT CONDITIONS

2.4.1 Equipment Removed From Auto PLC Response

If the mixers and the scraper are removed from Auto while the PLC is running in Semi-Automatic control of the ACTIFLO® system, the PLC will initiate a Shutdown Sequence as described in section 2.6.2.

Since the scraper will not be operational, the Shutdown Sequence will consist of the recirculation pump running for the durations indicated in section 2.6.2.

If the lead recirculation pump is removed from Auto, the PLC will sequentially initiate operation of the next available pump. If all sand pumps are removed from Auto or no additional pumps are available, the PLC will initiate an emergency shutdown of all equipment.

NOTE: No alarm will be generated if an ACTIFLO® system shutdown is initiated due to a piece of equipment being removed from Auto by the operator.

2.4.2 Equipment Failure PLC Response

If the coagulation mixer fails during Semi-Automatic control of the ACTIFLO® system, the system will continue to run.

Should the injection mixer or the maturation mixer fail at any time during Semi-Automatic control of the ACTIFLO® system, the PLC will issue an equipment alarm and will initiate a Shutdown Sequence as described in section 2.6.2.

Should the scraper fail at any time during operation or start-up, the PLC will issue an equipment alarm and will initiate a Shutdown Sequence as described in section 2.6.2. Since the scraper will not be operational, the Shutdown Sequence will consist of the sand recirculation pumps running for the durations indicated in section 2.6.2.

Should lead recirculation pump fail, the PLC will issue an equipment alarm and sequentially initiate operation of the next available pump. If all sand pumps fail or no additional pumps are available, the PLC will initiate an emergency shutdown of all equipment.

NOTE: An AVAILABLE sand pump is defined as one that is placed in Auto at the LCP and does not have any existing un-reset alarm conditions.

2.5 RECIRCULATION PUMPS LOGIC

2.5.1 Duty/Stand by Orientation

When two recirculation lines are provided they can be set with priority. The two recirculation pumps operate in a Duty / Stand by orientation. If all recirculation pumps are in “auto” but not running, the pump set as priority (duty) will start when the start condition will be met.

The recirculation pumps priority (duty or stand by) is changed manually by the operator anytime or is changed automatically when the plant stops.

2.6 SEQUENCES OF FUNCTIONS

2.6.1 Start-up Sequence

If all permissive conditions are present and no respective equipment alarms exist, the HMI will display **"Train Ready"**. The Start-up Sequence can now be initiated via the HMI or remotely. Refer to table 2 for more information.

NOTE: To prevent damage to the equipment, the Train must have water in the tanks above the mixer impeller elevations prior to Start-up (to be checked by the operator).

To start the train when "Train Ready" is displayed on the HMI, the operator presses the "Train Start" pushbutton. A starting system displays "Train Starting" at the HMI. The start-up sequence automatically cycles through the steps listed below.

1. System Start-up Initiated:
    a. **Start duty recirculation pump**
    b. **Start sludge extraction pump**

If a failure occurs, the duty pump will be locked out in the PLC and the next available pump will be assigned as the lead pump. The PLC will then attempt to continue operation. This cycle will occur until a recirculation pump starts or all recirculation pumps have been locked out. If all sand pumps are locked out, the PLC will immediately abort the start-up.

2. Delay 30 seconds (adjustable):
    a. **Start the Scraper**

If a Scraper failure occurs initiate a Shutdown Sequence.

3. Delay 10 seconds (adjustable):
    a. **Start the mixers**. These mixers start are respectively staggered by 5 seconds.

If a maturation Mixer failure occurs initiate a Shutdown Sequence.

4. Delay 10 seconds (adjustable):
    a. **Start the Chemical Feed Pumps**
    b. **Open Raw water Valve. Open Water Polymer Carrier Solenoid valve**
    c. **Start sludge flow control loop**
    d. HMI will display **"Train Started"**

If any Duty Chemical Feed Pump is not available while in operation, the Stand-by pump shall be initiated. The duty pump will not be locked out so when the pump is placed back into Semi-Auto, it will resume operation. Duty chemical feed pump alternation is manual and available only at the HMI.

The Operator can terminate the start-up at any point in the sequence by pressing the "Train Stop" pushbutton. If any pertinent equipment fails during the start-up sequence, the PLC will

initiate a train shutdown. The operator can correct the failure, and then resume the start-up sequence from the current shutdown sequence step by pressing the “Train Start” pushbutton.

2.6.2 Shutdown Sequence

When in Semi-Automatic mode, the operator may implement the Shutdown Sequence at any time from the HMI or remotely. During shutdown, the HMI will display “Train Stopping”. Refer to table 3 for more information.

The shutdown sequence automatically cycles through the steps listed below.

1. System Shutdown Initiated:
    a. **Close the secondary valve**
    b. **Shutdown the Chemical Feed Pumps**
    c. **Shutdown the mixers**
    d. **Stop Water Polymer Carrier Solenoid valve.**
2. Delay an (Operator Adjustable) (10-30 minutes):
    a. **Shutdown the Scraper**
3. Delay 5 minutes:
    a. **Shutdown the duty recirculation pump**

NOTE: This delay allows purging of sand and sludge contained in the settling tank and piping and re-deposits it back into the Maturation tank.

The operator can initiate the Train start-up sequence from the current shutdown sequence step by pressing the “Train Start” pushbutton without stopping the equipment already started.

Start-up Sequence

Table 1: ACTIFLO® automatic start sequence

Step #	STEP NAME	ACTION	STEP CHANGE CONDITION	Recirculation pumps	Coagulation mixer	Injection mixer	Maturation Mixer	Dosage & raw water flow	Scraper	Injection Water Valve	Sludge extraction pump	Sludge extraction valve	Status light	Status output

2.7 ALARM/FAILURE CONDITIONS AND PLC RESPONSES

2.7.1 Alarm Priorities

Alarms are grouped in to 3 priority levels for various attention requirements:

Emergency alarms:

1. Needs immediate operator attention.
2. The ACTIFLO® unit will initiate the emergency shutdown sequence.

Fatal alarms:

1. Needs immediate operator attention.
2. The ACTIFLO® unit will initiate the stop sequence.

Warning alarms:

1. Does not need immediate operator attention.

If the ACTIFLO® unit was stopped by an Emergency alarm or fatal alarm, it will not restart automatically. The operator must remove alarm condition and reset the alarm. Then press the start button on the operator interface will restart the unit if all automatic start sequence conditions are satisfied. In case of remote control, the system will wait for rising edge of the remote start signal.

2.7.2 Alarm and Set Point Table

Refer to Appendix A.

2.8 SAFETY

2.8.1 Emergency Stop

Emergency stop actions

When an emergency stop button is activated, an alarm is triggered. The fault associated with this alarm will latch.

During emergency stop, many stopping actions are initiated on equipment. These actions are presented in sections describing the relevant equipment.

Recovery after emergency stop

When all emergency stop buttons are back into normal position, the fault associated with an alarm is maintained until the operator presses the reset button.

2.8.2 Control Power Failure PLC Response

Should control power fail at any time during Semi-Automatic control of the ACTIFLO® system, the PLC will issue an alarm and will initiate a Shutdown Sequence as described in this document. Systems with an Uninterruptable Power Supply (UPS) will see the alarm as the condition occurs. Systems without an UPS will see the alarm upon restoration of power. There is a ten (10) second delay upon restoring power, and then the train will enter the Shutdown Sequence as described in this document. If the restored power does not include the actual motor controls, a run status will not be received by the PLC and equipment (pumps and scraper) will shut down immediately without a re-inventory of the sand to the maturation tank. If the unit is configured to resume via the HMI, it will automatically resume to the last known state. Otherwise the unit will remain in Stop.

2.9 System Availability Conditions

2.9.1 Conditions for automatic Start sequence

The automatic start sequence will be activated when the automatic start command is true and the following conditions are met:

1. If delay for power return is elapsed;
2. If remote run request bit is activated;
3. ACTIFLO® in Auto start mode.

2.9.2 Conditions for automatic stop sequence

The automatic stop sequence will be activated when any of the following conditions are met:

1. The ACTIFLO® Auto start mode is deactivated on the interface or one of the following occurs:
   a. If a major fault is active;
   b. If remote contact is not activated;
2. The ACTIFLO® automatic start command is false.

2.10 ACTIFLO® Fault Responses

Table 4: ACTIFLO® major faults

MAJOR FAULT	ALARM TYPE
Coagulation mixer	FATAL
Injection mixer	FATAL
Maturation mixer	EMERGENCY
Scraper High High torque	EMERGENCY
Recirculation pumps	EMERGENCY
High High clarified water turbidity	FATAL
High high water level	EMERGENCY
Sludge extraction system	FATAL
Coagulant dosing system	FATAL
Polymer dosing system	FATAL
Power failure	EMERGENCY

If the ACTIFLO® was stopped by a major fault, it will not restart automatically. The operator must fix the problem on the operator interface. The ACTIFLO® will restart if all automatic start sequence conditions are satisfied.

2.11 CONTROLS

2.11.1 General

1. ACTIFLO® Start/Stop push button function:
   - By pushing the Start/Stop push button, the ACTIFLO® will be set in Auto start mode and will be ready to start. If all automatic start sequence conditions are satisfied, it will start only after receiving the automatic start command.
   - If the ACTIFLO® is in Auto start mode and it is running or on starting sequence, pushing the Start/Stop push button will activate the stopping sequence and deactivate the Auto start mode. Pushing the Start/Stop push button again will restart the ACTIFLO® if the automatic start command is still true.

2. If an essential equipment is in manual and not running when the ACTIFLO® Start/Stop push button is pressed to activate the Auto mode, Auto start mode cannot be activated.
   The essential ACTIFLO® equipment's to be in Auto are:
   - Coagulation mixer
   - Injection mixer
   - Maturation mixer
   - Scraper
   - Recirculation pumps

3. If a major fault occurs while the ACTIFLO® is in start sequence or is running, the ACTIFLO® is forced into a stop sequence and the ACTIFLO® major fault is set.

4. The operator may set/reset the ACTIFLO® in Auto start mode by pressing the Start/Stop push button from the HMI.
   The conditions to activate the Auto mode are the followings:
   - No major faults;
   - All equipment in Auto on HMI or running;
   - No Polymer system fault
   - No sludge recirculation pump fault

Pressing on the ACTIFLO® Start/Stop push button on the operator interface for 3 seconds when the ACTIFLO® is stopped and will enable forced start mode if all the conditions to activate the Auto mode are true the forced start mode will become active. The unit will then start all the drives and request to open the raw water valve, bypassing the auto start sequence commands.

2.11.2 Recirculation pumps logic

2.11.2.1 Pump Fault

The pump is in fault when:

- The command is present and the status is not for a short delay

When the duty pump is in fault, and the ACTIFLO® unit is in operation the standby pump will start, the ACTIFLO® will not stop, a WARNING alarm is activated and a message is displayed. If the second pump was in fault or in manual (not running), a FATAL alarm is activated, a message will be displayed and the ACTIFLO® unit will stop.

2.11.2.2 Pump Priority

Each time the running pump is stopped, the other pump will start at the next ACTIFLO® start sequence. If the other pump is in manual or in fault, the first pump will restart.

2.11.3 Maturation Mixer Speed

The maturation mixer motor is powered by a variable speed drive (VFD). The speed of the mixer will be set on the PLC during the process start-up of the system to get an optimal mixing. Thereafter, the speed usually does not need any further adjustment.

2.11.4 ACTIFLO® High Level Switch

A float over the settling tank is used as a High Level switch. When the switch is activated, stop the corresponding ACTIFLO® unit according to the automatic stop sequence.

2.11.5 Sludge Extraction Control

The TSS control loop will act on the opening of the splitter box outlet flow control valve to adjust the sludge flow rate being recirculated back to the coagulation chamber.

A TSS set point will be entered by the operator. If the TSS measured by 65AIT6801427 is below the set point, the control loop will close 65FCV6801437. This will increase the sludge recirculation to the coagulation chamber and increase the turbidity.

On the contrary, if the measured TSS is above the set point, the control loop will open 65FCV6801437. This will decrease the sludge recirculation to the coagulation chamber and increase the sludge flow rate going to the sludge storage tank.

If the TSS analyzer is in fault, an alarm is generated and the sludge valve 65FCV6801437 opens to prevent sludge build-up in the ACTIFLO® process.

If the fault is not reset after an adjustable delay, the ACTIFLO® is stopped according to automatic shutdown sequence.

2.11.6 Sludge Extraction Valve

The extraction valve has two available operation modes:

- **Normal mode:** the valve is controlled with a PID loop and its opening is used as a manipulated variable to reach the flow set point.
- **Pulse mode:** as very low flow rates can be difficult to achieve with the valve, a pulse mode shall be programmed. Parameters such as opening duration and opening frequency shall be entered by the operator on the HMI. The extracted volume is totalized over time by the flowmeter.

2.12 SLUDGE EXTRACTION/RECIRCULATION SYSTEM FAULT RESPONSE

The following are the major faults associated with the Sludge recirculation and extraction system.

1. **Sludge splitter box tank high high level**

   The ACTIFLO® unit falls on major fault and is stopped according to the automatic stop sequence.

2. **Sludge splitter box tank low low level**

   The ACTIFLO® unit falls on major fault and is stopped according to the automatic stop sequence.

3. **Sludge tank high high level**

   The ACTIFLO® unit falls on major fault and is stopped according to the automatic stop sequence.

4. **Sludge Extraction pump fault**

   The ACTIFLO® unit falls on major fault and is stopped according to the automatic stop sequence.

5. **Extraction modulating valve open failure**

   The corresponding ACTIFLO® unit falls on major fault and is stopped according to the automatic stop sequence.

2.13 CALCULATED PARAMETERS

The following sections explain the main calculations made in the control of the ACTIFLO® system.

The PLC calculates the chemical feed rates and controls the chemical metering pumps using the following procedure. The chemical feed rate is based on:

1. The influent raw water flow rate
2. The chemical dose
3. The physical properties of the chemicals
4. The capacity and settings of the metering pump
5. The raw water turbidity

The influent raw water flow rate is obtained through the raw water flow meter, which sends a signal to the PLC.

The influent raw water turbidity rate is obtained through the raw water turbidity meter.

The chemical dose, physical properties and metering pump capacity are input by the user/operator at the HMI.

The basic equation for the chemical feed rate is:

$$\text{Chemical feed rate} = \frac{\text{influent flow rate} \times \text{chemical dose}}{\text{stock chemical concentration}}$$

This equation is the general form for all chemical feed rates that use flow pacing control, including coagulant and polymer.

2.13.1 Flow Pace Control

The way the PLC uses these calculations to determine the chemical metering pump output is:

1. The chemical feed rate equations are programmed into the PLC.
2. The user/operator inputs the chemical dose, physical properties, and maximum chemical metering pump capacity at the HMI on the ACTIFLO® control panel. The PLC calculates the specific chemical feed rate based on the user/operator inputs and the influent (raw water) flow to the train.

3. The calculated feed rate is then converted by the PLC into a percent speed, based on the maximum capacity of the metering pumps. This signal is then sent to the metering pump.

2.14 INTERLOCKS

2.14.1 Actiflo® High Level Switch

A float over the settling tank is used as a High Level switch. When the switch is activated, stop the corresponding Actiflo® unit according to the automatic stop sequence.

2.14.2 High Scraper Torque

The torque detector/alarm is independent from the PLC. So it is enabled (will stop the scraper) through a hardwired interlock to the scraper starter in the corresponding Actiflo® control panel.

A high torque alarm is activated when the torque is higher than the adjustable set point for more than the adjustable delay.

When the alarm is activated, the scraper is stopped and then the Actiflo® is stopped according to the automatic stop sequence.

2.14.3 Sludge Extraction Pump

The sludge extraction pump cannot be started if the low level switch has been activated. If the pump is in operation and the low level switch is activated the pump is stopped by interlock.

2.14.4 Maturation Mixer

The maturation mixer cannot run if the scraper is not running.

1.2 PROCESS OVERVIEW

The Discfilter is a mechanical and self-cleaning filter unit that offers a large filter area on a small footprint. This design is superior to any filtration in fine solids removal and product recovery within micro screens.

The water flows by gravity into the center of the drum and into the filter segments. The disc filter unit remains stationary under normal filtration. Solids are separated from the water by the micro screen cloth mounted on two sides of the disc segments. The buildup of captured solids increases the head loss across the Discfilter and as a result the inlet water level rises. At a predetermined level a backwash cycle is initiated which results in Discfilter rotation presenting clean filter elements in to the flow path and at the same time cleaning the filter elements with high-pressure water jets. The backwash water is collected in a trough within the center of the Discfilter and flows away by gravity. When the inlet water level falls under the set point, the backwash sequence continues for approximately 20 seconds (controlled by a timer and adjusted during commissioning to reflect local conditions).

Once the timed over-run is elapsed, the disc filter drive and backwash pump stop. The disc filter unit returns to a stationary state until the next backwash cycle is initiated. Filtration is continuous even during the backwash cycle and the effluent water quality is also the same throughout the backwash cycle. The operational head loss across the unit varies from zero to approximately 250mm.

1.3 LIST OF ABBREVIATIONS

The following abbreviations are used in the text of this document.

- HMI: Human/Machine Interface
- H-O-A: Hand-Off-Auto
- PLC: Programmable Logic Controller
- LCP: Local Control Panel
- VFD: Variable Frequency Drive
- VWT: Veolia Water Technologies Canada

1.4 LIST OF UNITS

The following lists the parameters referred to in this document and the units they are measured in unless otherwise specified.

- Concentration (in general): mg/L
- Dosing rate: mL/L
- Flow rate (main process): m^3/h
- Flow rate (chemical dosing): LPH
- Level in the tanks: %
- pH: -
- Pressure: PSIg
- Temperature: °C
- Turbidity: mg/L or NTU

2 HYDROTECH® CONTROL DESCRIPTION

2.1 EQUIPMENT AND INSTRUMENT

This section connects the tags from the P&ID and the terminology used throughout Equipment and Instrument Schedules.

Project Tag No	Standard Tag-No.	Description
65PSL8165	PS4-031	Pressure switch backwash pump
65LIT6801502A	LT3-031	Level transmitter inlet channel
65LIT6801502B	LT3-032	Level transmitter effluent channel
65FIL68001	M4-001	Drum motor Disc
65PSR68008A / 65PSR68008B	P4-001	Backwash pump #1/#2

2.1.1 Backwash Pump

Number of Pieces: 2 per unit
Operation: On/Off
Indication: Run status in local and SCADA
Control: The pump runs intermittently or continuous and is initiated during the backwash operation.

2.1.2 Drum Drive

Number of Pieces: 1 per unit
Operation: On/Off
Indication: Run status in local and SCADA
Control: The drum motor/drive runs intermittently or continuous and is initiated during the backwash operation.

2.1.3 VFD (by others)

Number of Pieces: 1 per unit
Operation: Open/Close
Indication: Run status in local and SCADA
Control: The VFD controls the drum motor/drive. It ramps up the drive motor to operating speed and runs a long as required by the backwash operation.

2.1.4 Level Sensor/Level transmitter (Inlet box)

Number of Pieces: 1 located in discfilter inlet box
Indication: Local and SCADA
Control: Main unit used in process control to calculate the backwash elevation setting and high water alarm setting. This calculated parameter is used for control actions and alarms.

2.1.5 Low Level Sensor Probe/Low Level transmitter (Effluent side)

Number of Pieces: 1 per Unit
Indication: Local and SCADA
Control: Used in process control to calculate the backwash elevation and to prevent the backwash pump from dry operation during the backwash initiation. This parameter is used for control actions and alarms.

2.1.6 Cover Actuator

Number of Pieces: 2 per Unit
Operation: Open/Close
Indication: Local and SCADA
Control: Used to open and close cover panels of the discfilter to access nozzles and media panels.

2.1.7 Spray Bar Actuator

Number of Pieces: 1 per Unit
Operation: Open/Close
Indication: Local and SCADA
Control: Used to raise spray bar of backwash nozzles.

2.2 OPERATING MODES OVERVIEW

There are two primary modes for each Hydrotech®: Manual and Automatic. The Manual mode is designed for operation of individual equipment. The Auto mode is designed for operation of the Hydrotech® system as a whole.

Manual mode

In manual Mode, the operator can operate individual equipment.

Equipment can be started manually at the LCP using the Hand position of the H-O-A.
In the manual operating mode, the drum rotation and backwash are started manually.
The backwash nozzles spray backwash water on the outside of the filter panels.
When the backwash pump and drum drive are placed in HAND, the Discfilter operates in a continuous backwash.
The solid particles that accumulate are washed from the filter panels to the sludge channel, at the same time as the drum rotates.
The removed particles and backwash water flow with gravity out of the filter.
The H-O-A switch is placed in the OFF position to prevent the respective piece of equipment from operating.

Automatic mode

Auto mode allows the operator to initiate the Hydrotech® system sequence from HMI or remotely.

NOTE: Train equipment cannot be controlled manually while in Semi-Auto operation.

The drum motor, and backwash pump H-O-As must be in Auto to enable Automatic control of all respective equipment at the HMI and at the LCP. The automatic sequence is described below. Each Hydrotech® train and its associated equipment are controlled as an independent system by the PLC.

The table below presents the control modes summary.

Table 1: Summary of Control Modes

	Manual		Auto
	Local (HOA Selector)	**HMI Manual**	
Control Functions	N/A	N/A	Allowed (PLC), Backwash sequence
Initiation of Automatic functions	N/A	N/A	Operator or Remote Start-up Initiation Required
HMI Operation of Individual Equipment	N/A	Allowed (virtual HOA on HMI)	Not Allowed
Local Operation of Individual Equipment	Allowed By HOA on LCP	N/A	Not Allowed

2.3 PERMISSIVE

Permissive to allow initiation of the Automatic start sequence are:

- H-O-A selector switches for drum motor and backwash pump, are in Auto at the HMI and at the LCP.
- Motor (whichever is in Auto at HMI and LCP) and the backwash pump do not have existing equipment alarms.
- Aforementioned equipment alarms must be manually reset.
- No interlocking conditions are present to prevent the backwash pump from starting.
- Remote request run bit is activated.
- E-stop not activated.

2.4 AUTO TRAIN RESPONSE TO EQUIPMENT CONDITIONS

In the automatic operating mode, the solid particles that accumulate on the inside of the filter media gradually reduce the water flow through the filter panel.
The water level on the inside of the drum begins to rise ultimately triggering the backwash sequence.

2.4.1 Equipment Removed From Auto PLC Response

If the drum motor and the pump are removed from Auto at the LCP while the PLC is running in Automatic control of the Hydrotech® system, the system will be paused.

Since the Discfilter will not be operational, the water level will rise and trigger the high level alarm. An alarm will be sent to operator and influent water will overflow into the backwash waste tank.

NOTE: No alarm will be generated if an Hydrotech® system shutdown is initiated due to a piece of equipment being removed from Auto by the operator.

2.4.2 Equipment Failure PLC Response

Should the drum motor fail at any time during Automatic control of the Hydrotech® system, the PLC will issue an equipment alarm and the system will be paused.

Should the backwash pump fail at any time during backwash sequence, the PLC will issue an equipment alarm and the system will be paused.

2.5 SEQUENCES OF FUNCTIONS

2.5.1 Discfilter functions

Discfilter operation consists of four (4) functions:

- Filtration
- Level Initiated Backwash
- Time Initiated Backwash
- Manual (“Hand”) Backwash

FILTRATION
The Discfilter system is filtering any time water is passing through the media. Even in static (non-backwash) conditions, the filter units are filtering the water, provided they are not hydraulically isolated from the influent flow (i.e an inlet valve or gate is closed).

LEVEL INITIATED BACKWASH

Water level difference is calculated using inlet box and effluent side level transmitters. This differential elevation is then used to trigger a backwash cycle when it reaches a predefined setpoint. When that happens, the PLC controller starts the backwash cycle of the filter. The backwash pump and drum motor are started. Once the backwash begins and the inlet box water level drops and the differential elevation decreases below the setpoint, the backwash process will stop after a predefined timer. With the standard settings, ¾ of a rotation (based on time) is done to ensure all clogged media panels have been taken through backwash nozzles spray. This will reset the timed backwash timer.

TIMED BACKWASH

If the Discfilter system is static without any backwash due to low flow or no flow, the backwash cycle will be initiated with a predefined timer. This operation will prevent solids from drying onto the media. The timed backwash is also useful for outdoor installations in cold weather conditions to prevent icing in the backwash piping by initiating a frequent backwash during low flow periods.

MANUAL ("HAND") BACKWASH

A manual backwash can be triggered with a button at any given time. This will reset the timed backwash timer.

2.5.2 Operating Sequence

If all permissive conditions are present and no respective equipment alarms exist, the HMI will display **"Filtration"**.

2.5.3 Chemical Cleaning

If the backwash frequency is increasing or if the inlet box level does not decrease during backwash cycle, there is a possibility of long term clogging, which may be caused by, among others, iron and calcium precipitates or organic fouling.
It might then be necessary to chemically clean the filter media. The small frequency of chemical cleanings is estimated to 1 to 3 times per year according to needs.

The chemical cleanings are planned to be conducted as the Discfilter is in operation and filtering. It will start a sequence during which the chemical solution is dosed onto the part of the filter above the water level, while the submerged part continues to filter. A time is allowed for chemical reaction and then the chemically cleaned filters are rinsed as the discs rotate and cleaned filters become submerged. Please refer to operation manual for chemical selection.

The automatic chemical cleaning procedure is fully automated once the HCT has been filled with the cleaning chemical to be used, connected to the filter and control cabinet and the operation of the filter is changed to cleaning mode. For the automatic chemical cleaning to start, the operator has to press the buttons manually. Consequently, the chemical cleaning requires someone to be on site to make sure that it is safe to start the chemical cleaning. The cleaning procedure takes approximately 20 minutes. The procedure is as follows.

- Fill the container with the chemical to be used.
- Connect the HCT to the filter and the PLC
- Change to the cleaning mode in the HMI.
- When the panels are clean, disconnect the HCT from the filter unit and the PLC.
- Change to the standard operation mode in the HMI.

Chemical Cleaning Sequence

The chemical cleaning is controlled by the Discfilter control panel and will be started manually from the HMI.

- The chemical pump starts.
- After a set time, the drum start delay, when the pressure in the chemical spray bar has built up and the spray pattern is right, the filter drum starts to rotate at the set drum dispersing speed.
- The drum rotates for a set time, the drum dispersing time, during which 2-3 segments are sprayed with the cleaning chemicals.
- When the drum dispersing time has elapsed, a stop signal is sent to the drum motor, which ramps down the rotation of the drum. Due to the time it will take to slow down and stop the filter drum, a chemical pump stop delay is used, in order to make sure the chemicals are evenly applied to all of the filter segments.
- After the chemical pump and the drum has stopped, the segments sprayed with cleaning chemicals will soak during a soaking time of, usually, 300-600 s.
- After the soaking time, the whole cleaning sequence (steps 1-5 above) is repeated on the other segments, until all of the filter segments have been cleaned. The number of repetitions will depend on the filter model. As an example, a disc filter from the HSF2600-series has 14 segments and requires a minimum of 5 index steps to clean the whole filter discs. It is recommended, however, to clean the filter in 6-8 index steps to ensure that the filter segments are completely covered by cleaning chemicals. For other filter models and placements of the chemical spray bar, other settings might be needed.
- When all of the filter segments have been sprayed and left soaking with cleaning chemicals, the chemical cleaning sequence is finished by backwashing of the filter for a rinsing time of approximately 5 minutes, to remove the cleaning chemicals from the filter media.

It is strongly recommended during commissioning of the filters that all of the above settings are evaluated, and if necessary adjusted, by using tap water. This should be done by having manometers installed on the chemical spray bar and the filter lid kept open, to be able to inspect the performance.
The key is to verify the spray pattern from the chemical nozzles (spray pressure >3 bar) before the filter starts to rotate, that the filter stops before the treated segments enter the water, that the treated segments are left soaking long enough and that the cleaning of the filter segments overlap to avoid untreated sections.

2.6 ALARM/FAILURE CONDITIONS AND PLC RESPONSES

2.6.1 Major faults

The following are the major faults associated with the Discfilter:

- Discfilter High High level (bypass alarm)
  The Hydrotech® discfilter is in major fault.
- Backwash pump in fault
  The Hydrotech® discfilter is in major fault
- Discfilter motor in fault
  The Hydrotech® discfilter is in major fault

2.6.2 Alarm Table

Refer to Project Alarm and setpoint Table for specific values. Table 2 below presents the typical alarm list.

Table 2: List of alarms

Description	Alarm Type	Alarm Delay	System Action	Equipment Action / Alarm Action
Control Panel Power Failure	Discrete	NA	Alarm,	Shutdown
Backwash Pump Overload Condition	Discrete	NA	Alarm,	Shutdown
Backwash pump Fail to Start (No Run Status)	Discrete	NA	Alarm,	Shutdown
Drum Drive Fail Condition	Discrete	NA	Alarm,	Shutdown
Drum Drive Fail To Start	Discrete	NA	Alarm,	Shutdown
Backwash Pump Low Level (Dry Run Protection)	Discrete	NA	Alarm,	Interlock of Backwash pumps / Operator Reset
Inlet Box High Level (Bypass Level)	Discrete	NA	Alarm,	NA

2.7 SAFETY

2.7.1 Emergency Stop

Emergency stop actions

When an emergency stop button is activated, an alarm is triggered. The fault associated with this alarm will latch.
During emergency stop, many stopping actions are initiated on equipment. These actions are presented in sections describing the relevant equipment.

Recovery after emergency stop

When all emergency stop buttons are back into normal position, the fault associated with an alarm is maintained until the operator presses the reset button.

2.7.2 Control Power Failure PLC Response

Should control power fail at any time during Automatic control of the Hydrotech® system, the PLC will issue an alarm. Systems with an Uninterruptable Power Supply (UPS) will see the alarm as the condition occurs. Systems without an UPS will see the alarm upon restoration of power. There is a ten (10) second delay upon restoring power, and then the train will resume to the last known state

2.8 CALCULATED PARAMETERS

The following sections explain the main calculations made in the control of the Discfilter® system.

Backwash frequency

This parameter is calculated using this equation

$$BF = t_B * 100 / (t_S + t_B)$$

With:

BF: Backwash frequency [%]

t_B: Time of the last backwash sequence [s]

t_S: Time in Filtration mode before last backwash [s]

This parameter should be available on history trend to assess chemical cleaning requirement.

2.8.1 Setpoints Table

The Table 3 presents the list of the main process setpoints.

Table 3: List of operator setpoint

Name	Controller Actions	Increment Setting	Typical Settings
Drum Start Delay (t_1)	The drum delay setpoint delays drum rotation until the backwash pump is operating at full pressure.	1 to 10 seconds	1-2 seconds
Backwash Stop Delay (t_2)	The backwash Stop Delay time is initiated after the water falls away from the backwash level threshold to ensure the drum rotates at least ¾ of a rotation for complete media panel cleaning.	10 to 400 seconds	Approximately 20 seconds
Timed Backwash Interval (t_3)	Initiates a backwash after preset period of static time with no backwash events. This mode prevents solids from drying onto the media from a prolonged period of static operation.	5 to 240 minutes	30 minutes
Drum Speed	Drum rotation speed during backwash sequence	0 to 60 Hz	Adjust to have 2.85 RPM
Chemical Cleaning Sequence			
Number of cleaning cycles	Number of chemical cleaning cycles to be performed when starting the chemical cleaning sequence	1 to 5	1

Drum Start Delay Chemical Cleaning	The drum delay setpoint delays drum rotation until the chemical cleaning system is operating at full pressure.	1 to 60 seconds	1-5 seconds
Chemical Spraying Timer	Duration of the spraying phase for each chemical cleaning segment	1 to 30 seconds	13 seconds
Chemical Soaking Timer	Duration of the soaking phase for each chemical cleaning segment	1 to 600 seconds	120 seconds
Chemical Cleaning Drum Speed	Drum rotation speed during the chemical cleaning sequence	0 to 60 Hz	10-20 Hz
Rotations Per Chemical Cleaning Cycle	Number of spraying/soaking steps to repeat during one cycle of chemical cleaning	1 to 10	Adjust to ensure all panels are sprayed during one cycle
Rinsing Backwash Timer	Duration of the backwash sequence performed after chemical cleaning to rinse the panels	1 to 600 seconds	300 seconds

2.9 INTERLOCKS

2.9.1 Effluent Side Level transmitter

Tag: 65LIT6801502B

- Dry running protection

A low level switch or low low level alarm (transmitter option) prevents the backwash pump from running dry. Dry running is reset with a reset button.

2.9.2 Backwash pump low Pressure Switch

Tag: 65PSL8165

- Low pressure protection

A pressure sensor is preset at 2-4 bar and pressure must be obtained within a time limit preset otherwise the backwash sequence shuts down and gives an alarm “Pump low pressure”. Low pressure is reset with a reset button. The backwash sequence is stopped and system returns to static mode.

2.9.3 Cover proximity switch

- Spray bar opening protection

A proximity switch prevent the spray bar to be raised if the cover is not open.

- Rotating equipment protection

A proximity switch prevent the rotation of the filter drum when the cover is open. An override of this interlock must be programmed for commissioning and troubleshooting of the backwash and chemical cleaning sequences.

1 INTRODUCTION

1.1 Reference Documents

Document Number	Name	Revision
5000220043_PI_0001_GEN_VWT	PI001 _Process and Instrumentation diagram	1

1.2 Process Overview

Powder activated carbon (PAC) will be received in 550 kg bags. Since this chemical is classified as a solid product that can easily ignite (CSA Class 2, Div. 1, Gr. F), make-up system is a classified area. Also, PAC is a hydroscopic solid, so it as to be stored in a dry and warm environment to avoid plugging in the dosing system. The dry powder will be dosed using a solid-liquid system consisting of a volumetric feeder dosing powder into a high energy eductor.

The principle is to use fresh water under pressure through a converging nozzle in the eductor and produces a high velocity jet. This creates a vacuum in the body of the eductor which causes the material to be drawn into the solids inlet and entrained by the liquid. Both the motive liquid and the entrained material are intimately mixed in the throat of the educator and discharged against some backpressure as a slurry.

This PAC slurry can be easily carried to the Dechlorination tank Reactor in order to renew the extracted activated carbon powder. The suction in the eductor must be well established before dosing activated carbon. A rinse sequence will be initiated after each screw stop.

1.3 List of Abbreviations

The following abbreviations are used in the text of this document.

- HMI: Human/Machine Interface
- H-O-A: Hand-Off-Auto
- PLC: Programmable Logic Controller
- LCP: Local Control Panel
- VFD: Variable Frequency Drive
- VWT: Veolia Water Technologies Canada

1.4 List of Units

The following lists the parameters referred to in this document and the units they are measured in unless otherwise specified.

- Concentration (in general): mg/L
- Dosing rate: mL/L
- Flow rate (main process): m^3/h
- Flow rate (chemical dosing): LPH
- Level in the tanks: %
- pH: -
- Pressure: PSIg
- Temperature: °C
- Turbidity: mg/L or NTU

2 ACTICARB® CONTROL DESCRIPTION

2.1 Equipment and Instrument

This section connects the tags from the P&ID and the terminology used throughout Equipment and Instrument Schedules

P&ID TAG	DESCRIPTION
65LSH6801612 65LSH6801632	Wetting cone high Level switch
65LSL6801611 65LSL6801631	Hopper Low level Switch
65PSL6801601 65PSL6801621	Service Water Pressure Switch
65FY6801613 65FY6801633	Air Solenoid valve
65FY6801602 65FY6801622	Service Water Inlet Solenoid Valve

2.2 Controls

2.2.1 Continuous dosing

Dosing is continuous with the dosing screw and the required dosing flowrate is adjusted using the VFD of the dosing screw motor. The calculation of the dosage percentage is done by integrating calibration values retrieved from the dosing screw.

$$(QP_{PAC}) = (CF_{PAC}) * (Q_{RW}) \ / \ (SG_{PAC}) * 1000$$

Where:
QP_{PAC} = Required PAC Dosing Flowrate (L/h)
CF_{PAC} = Required Chemicals Concentration in the process (mg/L)
Q_{RW} = Raw Water Flowrate (m3/h). Process Value given by the inlet raw water flowmeter.
SG_{PAC} = Chemical Specific Gravity (kg/L) see 5000220043_PSDS_0001_SKG_VWT

2.2.2 Discharge Pipe rinsing

The piping of the activated carbon injection line must be flushed with service water to prevent build-up every times that the dosing screw shuts downs. Service water should be flushed through the lines for 1.5 times the transit time the flushing water takes to pass through the pipes.

Table 1: Activated Carbon automatic sequence

Step #	Step name	Actions Transition conditions	Dosing screw	Service water valve	Powder Supply Valve	Blending tool
0	Stand-by	Equipment shut off	S	C	C	S
1	Open injection line	Open injection valve Open Powder Supply valve	S	C	O	S
		Valve delay has elapsed				
2	Vacuum	Open Service water Inlet	S	O	O	S
		20 s delay				
3	Dosing	Start hopper agitator cycle Start dosing screw Active coagulant metering pump	R	O	O	R
		Normal Stop condition				
4	Rinsing	Stop the feeder Stop blending tool Close Powder Supply Valve	S	O	C	S
		Rinsing delay elapsed (45 sec)				
5	End	Close the Service water inlet valve	S	C	C	S
		Go to Step 0 at end of normal sequence and reset timers Go to Step 7 at end of sequence if a fault occurs				
6	Sequence stopped on a fault	Stop the feeder Stop blending tool Close the powder supply valve Close the Service water inlet valve Wait for fault reset	S	C	C	S
		Go to Step 1				

Legend

Motor	***Valve***	***Cycle***
S: Stop	*C: Closed*	*D : Deactivate*
R: Running	*O: Open*	*A : Activate*

Note: if there is a power outage before the completed preparation confirmation is active, repeat at Step 1 when the power returns.

2.3 System Availability Conditions

2.3.1 Conditions for automatic sequence

The automatic start sequence will be activated when the automatic start command is true and the following conditions are met:

1. If delay for power return is elapsed;
2. If remote run request bit is activated (exchange table);
3. Activated Carbon dosing system components are in Auto start mode.
4. Service Water System components are in Auto start mode (exchange table);
5. Low Pressure Switch is not activated
6. Low level switch is not activated

2.4 Fault response

The major faults associated with the make-up sequence are:

1. Dosing screw motor fault
2. Blending tool motor fault

2.5 Interlocks

2.5.1 Service Water Inlet Pressure Switch

If the low pressure switch on the service water inlet is activated when the system is running, it will stop the sequence on a fault as per table 1. The Interlock is active in automatic mode and interface manual mode.

When the service water inlet valve is closed, the signal of the pressure switch is disabled.

2.5.2 Wetting Cone High Level Switch

If the high level switch on the wetting cone is activated when the system is running, it will stop the sequence on a fault as per table 1. The Interlock is active in automatic mode and interface manual mode.

Series: 70, 71, 125, 126
.7 & 1.25HP, 3450RPM, 60Hz

DESCRIPTION:
The pumps are compact, lightweight units and highly portable. Designed specifically for use by contractors and utility service personnel. These pumps can operate in up to 104°F (40°C) temperature water. Before pumping fluids other than water consult the factory, giving fluid, fluid temperature, specific gravity, viscosity, capacity in USGPM and total head and/or pressure requirements, including friction loss through discharge line, fittings, valves, etc.

WARNING:
CANCER AND REPRODUCTIVE HARM - WWW.P65WARNINGS.CA.GOV

Testing is performed with water specific gravity of 1.0 @ 68˚F (20˚C), other fluids may vary performance

Pump rated for operation at ± 10% voltage at motor.

IMPORTANT !

1.) PUMP MAY BE OPERATED "DRY" FOR EXTENDED PERIODS WITHOUT DAMAGE TO MOTOR AND/OR SEALS.
2.) INSTALLATIONS SUCH AS DECORATIVE FOUNTAINS OR WATER FEATURES PROVIDED FOR VISUAL ENJOYMENT MUST BE INSTALLED IN ACCORDANCE WITH THE NATIONAL ELECTRIC CODE ANSI/NFPA 70 AND/OR THE AUTHORITY HAVING JURISDICTION. THIS PUMP IS NOT INTENDED FOR USE IN SWIMMING POOLS, RECREATIONAL WATER PARKS, OR INSTALLATIONS IN WHICH HUMAN CONTACT WITH PUMPED MEDIA IS A COMMON OCCURRENCE.

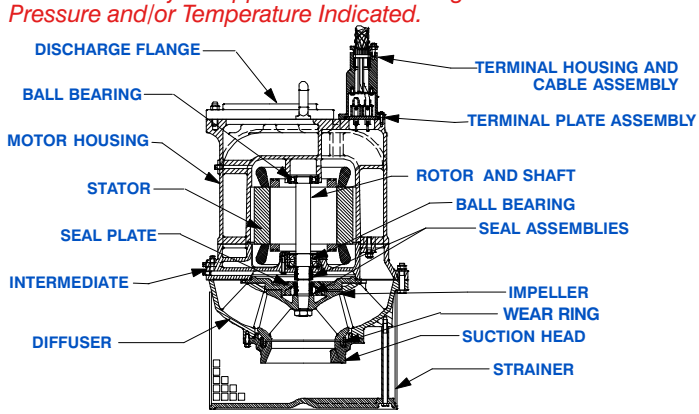
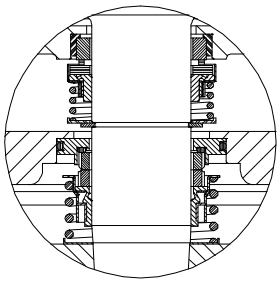
SETP Feed pump



Electric Motor Driven
Submersible Pump
Model GRP-38521
Size 12”

Certified in Canada

CERTIFIED PERFORMANCE
CONTRACTORS PUMP BUREAU cpb
The manufacturer of this pump certifies that it was manufactured in accordance with the standards of the Contractors Pump Bureau.

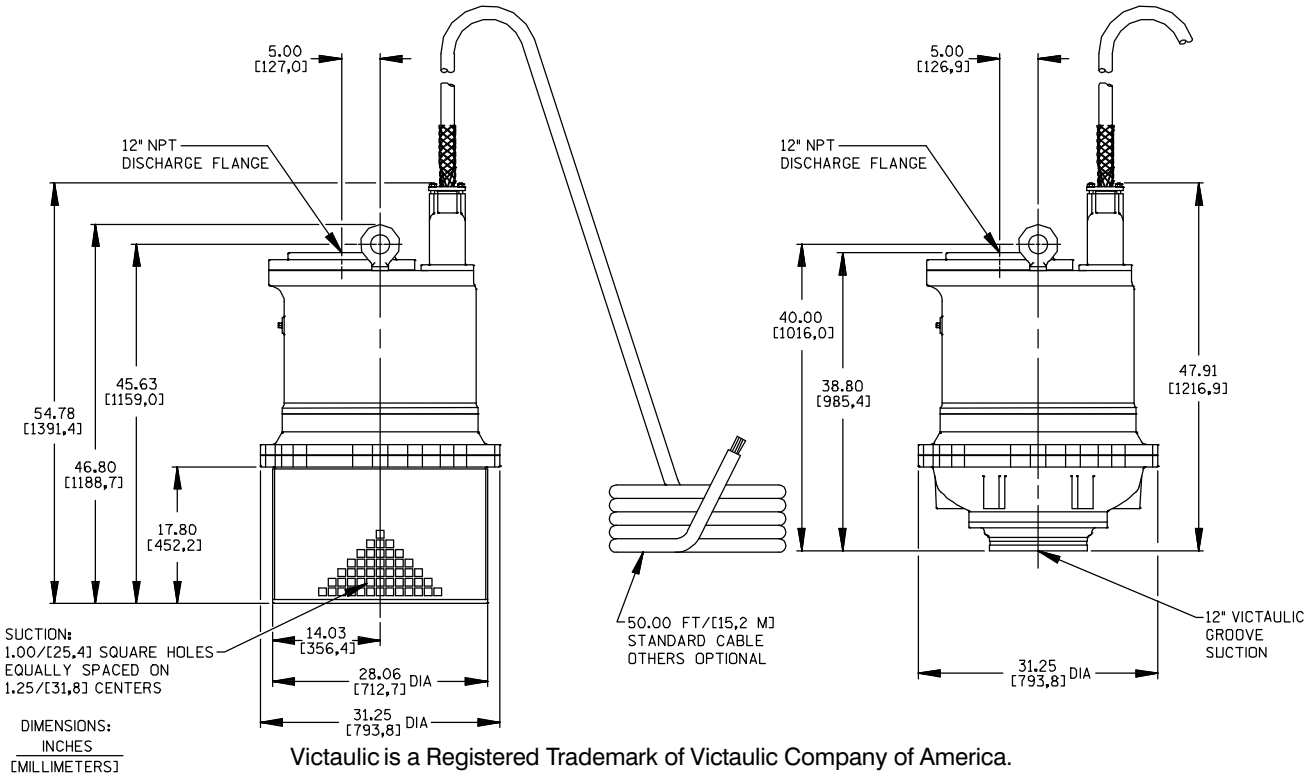


PUMP SPECIFICATIONS
Diffuser: Ductile Iron 80-60-03.
Maximum Operating Pressure 90 psi (621 kPa).*
Impeller: Ductile Iron 60-40-18.
Suction Head: Gray Iron 30.
Wear Ring: Copper Alloy C93200.
Motor Housing: Aluminum Alloy 356-T6.
Intermediate Bracket: Aluminum Alloy 356-T6.
Seal Plate: Gray Iron 30.
Motor Shaft: Stainless Steel 17-4 PH.
Bearings: Upper, Open Single Row Ball.
Lower, Sealed Double Row Ball.
Discharge Flange: Gray Iron 30.
Gaskets: Cork w/Nitrile Binder (NC710) and Vegetable Fiber.
O-Ring: Buna-N
Wetted Hardware: Standard Plated Steel and Stainless Steel.
Strainer: Urethane Coated Steel; 60% Open Area,
1.00” (25,4 mm) Square Openings.
Hoisting Eye Bolts: Urethane Coated Steel.
Standard Equipment:
NEMA Type 3R Rainproof Control Box. Provides On-Off, Circuit Breaker and Motor Overload Protection. (See Section 130, Page 100.)
Staging Adapter.
Optional Equipment
Liquid Level Control: (See Sec. 130, Page 150.)
a. Turtle Type Pressure Activated Level Switch.
b. Float Activated Level Switch.

MOTOR/CABLE SPECIFICATIONS
Motor: Oil Filled Enclosure; 140 H.P.; 1750 R.P.M.; Three Phase: 460/575 Volt, 60 Hz, 171/137 Full Load Amps, 117 kW (Max.)
Power Cable: 6 Wire; Type GGC;
(460V) 2/0 AWG 3 Power Conductors, 2 Ground Conductors and 1 Ground Check.
(575V) 1 AWG; 3 Power Conductors, 2 Ground Conductors and 1 Ground Check.
Nominal Length 50 Feet (15 m) Standard.
(*Specify Alternate Length at Time of Order.*)
Recommended Generator Size: 200 kW Across the Line Start, 150 kW for Reduced Voltage Starting.
. Consult Factory for Applications Exceeding Maximum Pressure and/or Temperature Indicated.*

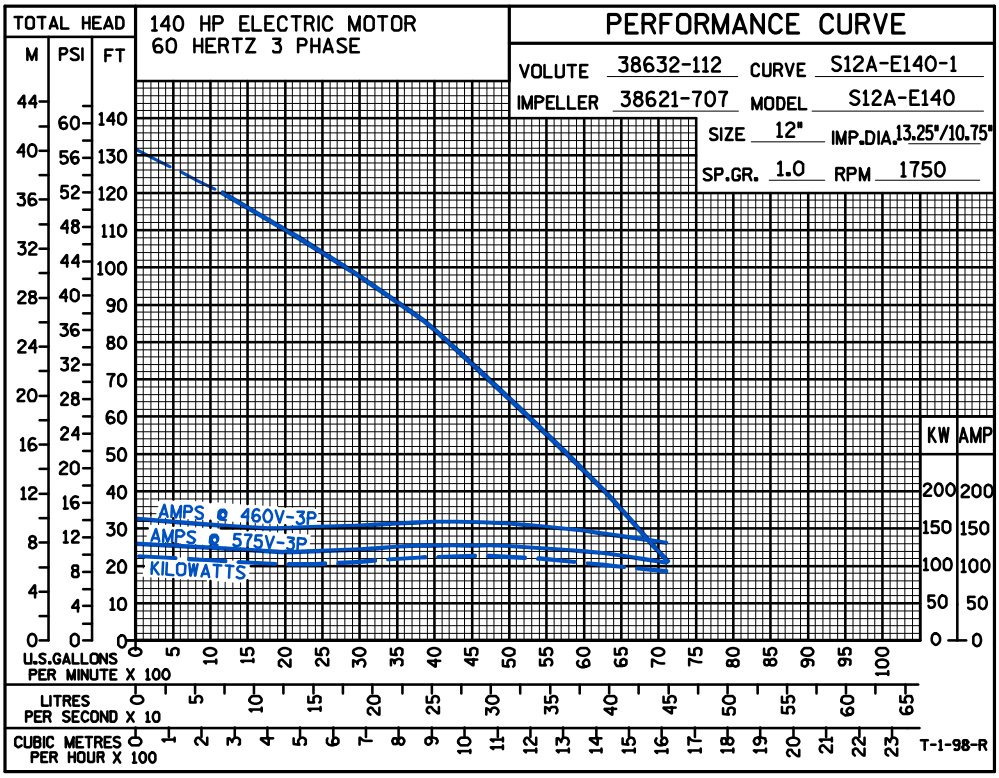
WARNING!
Do not use in explosive atmosphere or for pumping volatile flammable liquids.

SEAL DETAILS
Tandem, Oil Lubricated.



Upper Seal: Type 21, Mechanical. Carbon Rotating Face. Ni-Resist Stationary Face. Buna-N Elastomers. Stainless Steel 18-8 Cage and Spring.

Lower Seal: Type 2, Mechanical. Tungsten Titanium Carbide Rotating and Stationary Faces. Stainless Steel 316 Stationary Seat. Fluorocarbon Elastomers (DuPont Viton® or Equivalent). Stainless Steel 18-8 Cage and Spring.



Maximum Temperature of Liquid Pumped,122°F (50°C).*

INSTALLATION AND OPERATION

SUBMERSIBLE PUMP MODEL GRP-38521 (OPP21-023)

HydroTech Mining

UPDATE : FEB 2022

INTRODUCTION

Thank You for purchasing a Gorman-Rupp S Series Pump. **Read this manual** carefully to learn how to safely install and operate your pump. Failure to do so could result in personal injury or damage to the pump.

A set of three manuals accompanies your pump. Each set consists of three parts; the Installation/ Operation Manual contains essential information on installing and operating the pump, and on making electrical connections. However, since pump installations are seldom identical, some of the information only summarizes general recommendations and practices required to inspect, position, and arrange the pump and piping.

The Parts List Manual provides performance curve(s), a pump model cross-section drawing, and parts list for your pump.

The Maintenance and Repair Manual provides troubleshooting and maintenance instructions required to properly diagnose operational problems, and to service the pump hydraulic components. Pump motor maintenance may be performed **only** by a Gorman-Rupp authorized repair facility, or the factory. Otherwise, the pump warranty will be negated, and damage to the pump, and injury or death to personnel can result. Contact the factory for the authorized repair facility closest to you.

The integral electric motor must be operated through the control box furnished with the pump as standard equipment. If the motor is dual-voltage, the pump is shipped from the factory wired **only** for the voltage shown on the nameplate. If desired to have the voltage changed, return the pump to the factory or to a Gorman-Rupp authorized submersible repair facility.

The pump motor **must** be operated through an appropriate control box matching the voltage, phase and other characteristics of the motor. The control box must be approved by Gorman-Rupp for the application and environment intended, and must also provide for proper operation of the motor protection devices, such as the integral moisture and thermal switches. Control boxes and other control devices not integral to the pump are **no**t covered in this manual.

Pump construction may be aluminum with ductile iron or steel wearing parts, or stainless steel fitted, or completely stainless steel. The pump may be operated fully or partially submerged. Neither the pump nor the control box are explosion-proof, and should not be operated in a hazardous atmosphere.

Because pump installations are seldom identical, this manual cannot possibly provide detailed instructions and precautions for every aspect of each specific application. Therefore, it is the responsibility of the owner/installer of the pump to ensure that applications not addressed in this manual are performed **only** after establishing that neither operator safety nor pump integrity are compromised by the installation. Pumps and related equipment **must** be installed and operated according to all national, local and industry standards.

If there are any questions regarding the pump which are not covered in this manual or in other literature accompanying the unit, please contact your Gorman-Rupp distributor or the Gorman-Rupp Company**.**

RECORDING MODEL AND SERIAL NUMBERS

Please record the pump model, serial number, voltage, and motor frame size in the spaces provided below. Your Gorman-Rupp distributor needs this information when you require parts or service.

Pump Model: _____

Serial Number: _____

Voltage: _____

Phase: _____

WARRANTY INFORMATION

The warranty provided with your pump is part of Gorman-Rupp's support program for customers who operate and maintain their equipment as described in this and the other accompanying literature. Please note that should the equipment be abused or modified to change its performance beyond the original factory specifications, the warranty will become void and any claim will be denied.

The following are used to alert personnel to procedures which require special attention, to those which could damage equipment, and to those which could be dangerous to personnel:

DANGER!

Immediate hazards which WILL result in severe personal injury or death. These instructions describe the procedure required and the injury which will result from failure to follow the procedure.

WARNING!

Hazards or unsafe practices which COULD result in severe personal injury or death. These instructions describe the procedure required and the injury which could result from failure to follow the procedure.

CAUTION

Hazards or unsafe practices which COULD result in minor personal injury or product or property damage. These instructions describe the requirements and the possible damage which could result from failure to follow the procedure.

NOTE

Instructions to aid in installation, operation, and maintenance or which clarify a procedure.

SAFETY — SECTION A

This information applies to the S Series submersible motor driven pumps and control boxes.

Because pump installations are seldom identical, this manual cannot possibly provide detailed instructions and precautions for each specific application. Therefore, it is the owner/installer's responsibility to ensure that applications not addressed in this manual are performed only after establishing that neither operator safety nor pump integrity are compromised by the installation.

WARNING!

Before attempting to open or service the pump:

1. **Familiarize yourself with this manual.**
2. **Lock out incoming power to the control box to ensure that the pump will remain inoperative.**
3. **Allow the pump to completely cool if overheated.**
5. **Close the discharge valve (if used).**

WARNING!

This pump is not designed to pump volatile, explosive, or flammable materials. Do not attempt to pump any liquids for which you pump is not approved, or which may damage the pump or endanger personnel as a result of pump failure. Consult the factory for specific application data.

WARNING!

Before connecting any cable to the control box, be sure to ground the control box. Refer to the Control Box Manual for the suggested grounding methods.

WARNING!

The pump motor is designed to be operated through the control box furnished with the pump. The control box provides overload protection and power control. Do not connect the pump motor directly to the incoming power lines.

WARNING!

The electrical power used to operate this pump is high enough to cause injury or death. Obtain the services of a qualified electrician to make all electrical connections. Make certain that the pump and enclosure are properly grounded; never use gas pipe as an electrical ground. Be sure that the incoming power matches the voltage and phase of the pump and control before connecting the power source. Do not run the pump if the voltage is not within the limits. If the overload unit is tripped during pump operation, correct the problem before restarting the pump.

WARNING!

The electrical power used to operate this pump is high enough to cause injury or death. Make certain that the control handle on the control box is in the OFF

position and locked out, or that the power supply to the control box has been otherwise cut off and locked out, before attempting to open or service the pump assembly. Tag electrical circuits to prevent accidental start-up.

WARNING!

Never attempt to alter the length or repair any power cable with a splice. The pump motor and cable must be completely waterproof. Injury or death may result from alterations.

WARNING!

All electrical connections must be in accordance with The National Electric Code and all local codes. If there is a conflict between the instructions provided and N.E.C. Specifications, N.E.C. Specifications shall take precedence. All electrical equipment supplied with this pump was in conformance with N.E.C. requirements in effect on the date of manufacture. Failure to follow applicable specifications, or substitution of electrical parts not supplied or approved by the manufacturer, can result in severe injury or death and void warranty.

WARNING!

Death or serious personal injury and damage to the pump or components can occur if proper lifting procedures are not observed. Make certain that hoists, chains, slings or cables are in good working condition and of sufficient capacity and that they are positioned so that loads will be balanced and the pump or components will not be damaged when lifting. Do not attempt to lift this pump by the motor or control cables, or the piping. Attach proper lifting equipment to the lifting bail fitted on the pump. Lift the pump or component only as high as necessary and keep personnel away from suspended objects.

WARNING!

After the pump has been installed, make certain that the pump and all piping or hose connections are secure before operation.

WARNING!

Obtain the services of a qualified electrician to troubleshoot, test and/or service the electrical components of this pump.

WARNING!

Approach the pump cautiously after it has been running. Although the motor is cooled by the liquid being pumped, normal operating temperatures can be high enough to cause burns. The temperature will be especially high if operated against a closed discharge valve. Never operate against a closed discharge valve for long periods of time.

WARNING!

Do not remove plates, covers, gauges, pipe plugs, or fittings from an overheated pump. Vapor pressure within the pump can cause parts being disengaged to be ejected with great force. Al-

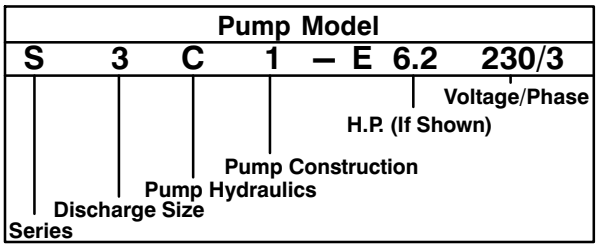
low the pump to completely cool before servicing.

Do not attempt to lift the pump by the motor power cable or the piping. Attach proper lifting equipment to the lifting device fitted to the pump. If chains or cable are wrapped around the pump to lift it, make certain that they are positioned so as not to damage the pump, and so that the load will be balanced.

Pumps and related equipment must be installed and operated according to all national, local and industry standards.

INSTALLATION — SECTION B

GENERAL INFORMATION



Review all SAFETY information in Section A.

Since pump installations are seldom identical, this section is intended only to summarize general recommendations and practices required to inspect, position, and arrange the pump and piping. If there are any questions concerning your specific installation, contact your Gorman-Rupp distributor or the Gorman-Rupp Company.

Liquid level devices are available from Gorman-Rupp as optional equipment. For information on installing and operating these items, refer to the literature accompanying them.

Pump Model Designation

Following is a description of the model numbering system for S Series pumps. These submersible pumps are available in a range of sizes. Refer to the following chart to identify the size for your specific pump model.

PREINSTALLATION INSPECTION

The pump assembly was inspected and tested before shipment from the factory. Before installation, check for damage which may have occurred during shipment. Check as follows:

a. Inspect the pump assembly for cracks, dents, damaged threads, and other obvious damage.

b. Check for loose attaching hardware. Since gaskets tend to shrink after drying, check for loose hardware at the mating surfaces.

c. Inspect the power cable for cuts or any other obvious damage.

d. Check that amperes, phase, voltage and hertz indicated on the name plate match the ratings on the control box and incoming power.

e. Carefully read all tags, decals, and markings on the pump, and perform all duties indicated.

f. Check for oil leaks. If there is any indication of an oil leak, see **LUBRICATION** at the end of this manual.

PUMP SEAL

S Series pumps utilize one of the following sealing methods.

1. There are two shaft seals in the pump. The lower seal prevents liquid from entering the intermediate cavity at the impeller end. The upper seal prevents oil leakage from the motor housing cavity and acts as back-up protection in the event of lower seal failure.

2. The pump is equipped with one double-faced seal assembly. It is designed to prevent the liquid being pumped from entering the intermediate cavity at the impeller end, and to prevent moisture from entering the motor housing cavity at the motor end.

Regardless of which sealing method is used, the seal is lubricated by premium quality submersible pump oil.

LUBRICATION

S series pumps are lubricated in one of the following methods.

1. Some pumps utilize two lubrication cavities. The motor housing cavity provides lubrication to the motor assembly and bearings, while the intermediate cavity provides lubrication to the pump seal.

2. Some pumps utilize one lubrication cavity, located just behind the seal plate. It is filled with premium quality submersible pump oil which lubricates the pump seal. The motor operates in and is cooled by air, therefore it requires no lubrication.

All S Series pumps are fully lubricated when shipped from the factory. However, lubrication levels **must be checked** before installing the pump

(see **LUBRICATION** in the **MAINTENANCE AND REPAIR MANUAL**). An additional quart (0,9 liter) of oil is provided to "top off" the oil level in the pump motor cavity, if so required. If the oil level is abnormally low, determine the cause before putting the pump into service.

Due to differences in pump design, the quantity of oil and manner in which oil is to be added to the seal cavity varies between pump models. Refer to Table B-2 for oil capacities and positions for filling the seal cavity in each pump. Motor cavities requiring lubrication should always be positioned vertically for filling. Refer to **LUBRICATION**, Section C for lubrication specifications and intervals.

PUMP INSTALLATION

*** Position Pumps at Approximately 30° off Vertical**

Pump Dimensions

For the approximate physical dimensions of your pump, refer to the pump specification data sheet or contact your Gorman-Rupp distributor or the Gorman-Rupp Company.

PUMP INSTALLATION

WARNING!

When installing or servicing the pump or controls, follow all requirements for the installation of wiring or electrical equipment as outlined in the National Electric Code. Follow all safety requirements. Failure to observe these requirements could result in injury or death to personnel.

CAUTION

Do not allow the free end of the power cable to enter the liquid being pumped. The free end of the cable **must** be kept dry to prevent liquid from wicking through the cable and into the motor.

NOTE

Refer to the performance curve in the Parts List Manual when determining the most efficient piping installation. ***The recommended maximum submergence depth is 65 feet.***

Lifting

Pump unit weights will vary depending on the mounting and drive provided. Check the shipping tag on the unit packaging for the actual weight, and use lifting equipment with appropriate capacity. Drain the pump and remove all customer-installed equipment such as suction and discharge hoses or piping before attempting to lift existing, installed units.

Refer to Table B–2 for the approximate maximum weight for each pump.

WARNING!

Death or serious personal injury and damage to the pump or components can occur if proper lifting procedures are not observed. Make certain that hoists, chains, slings or cables are in good working condition and of sufficient capacity and that they are positioned so that loads will be balanced and the pump or components will not be damaged when lifting. Do not attempt to lift this pump by the motor or control cables, or the piping. Attach proper lifting equipment to the lifting bail fitted on the pump. Lift the pump or component only as high as necessary and keep personnel away from suspended objects.

CAUTION

Use **Only Genuine Gorman–Rupp** replacement parts. Failure to do so may create a hazard and damage the pump or diminish optimal pump performance. Any such hazard, damage or diminished performance is not covered by the warranty.

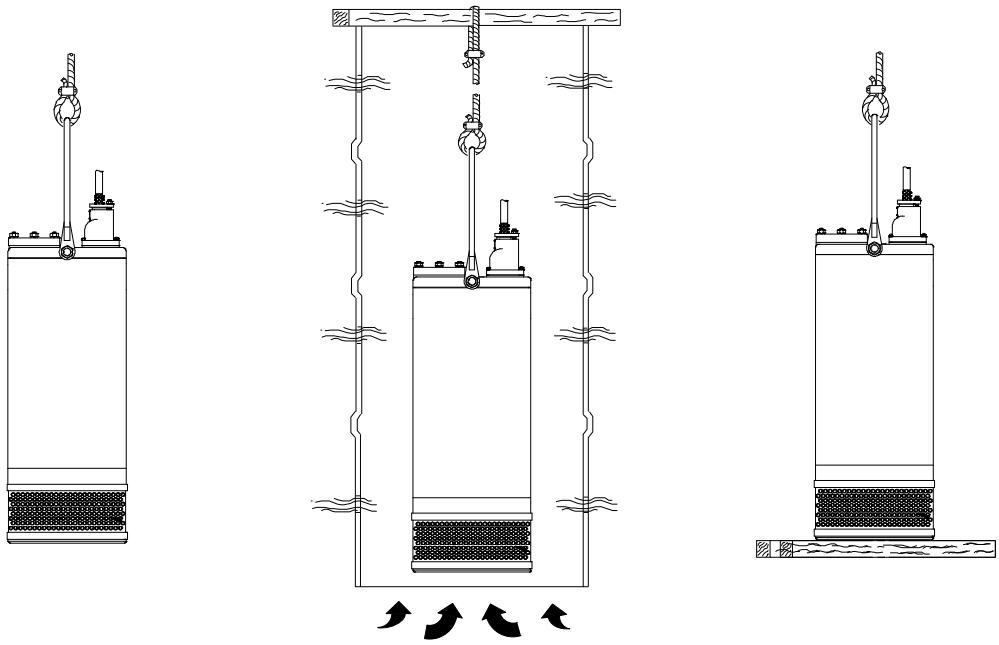
NOTE

When appropriate recycling facilities are available, the user should recycle components and fluids when doing any routine maintenance / repairs and also at the end of the pump's useful life. All other components and fluids shall be disposed of according to all applicable codes and regulations.

Positioning the Pump

NOTE

Before installing and operating the pump, check the direction of impeller rotation to ensure that the pump is properly wired at the control box. See ***IMPELLER ROTATION****, Section C.*



The pump is designed to operate fully or partially submerged. The rotating parts are oil lubricated, and the motor is cooled by a constant flow of liquid or air discharged through internal passages.

As a safeguard against rupture or explosion due to heat, models equipped with oil-lubricated motors are fitted with a pressure relief valve which will open if vapor pressure within the pump motor reaches a critical point.

The pump will operate if positioned on its side, but this is not recommended because the motor torque could cause the pump to roll during operation.

The pump should be independently secured and supported by the lifting device fitted on the pump. If the application involves a lot of debris, protect the pump from excessive wear and clogging by suspending it in a perforated barrel or culvert pipe. If the bottom is heavily sludge-covered, rest the pump on support blocks or suspend it from a raft or similar device near the surface of the liquid. See Figure B—1 for typical pump installations.

All liquid entering the pump must pass through a strainer screen. Any spherical solids which pass through the screen will pass through the pump.

BY BAIL **IN PERFORATED CULVERT PIPE** **ON SUPPORTS**

Figure B—1 Typical Pump Installations

Piping

No suction piping is required in a standard installation.

S Series pumps are provided with a suction strainer to prevent large solids from clogging the impeller. On some models the strainer can be removed and the pump suction “staged” to the discharge of another pump, allowing one pump to feed the other on high discharge head applications.

To determine the size of the discharge connection, see **Table B—1, Pump Specifications**. Either hose or rigid pipe may be used. To facilitate mobility and maintenance, it is recommended that the discharge line be fitted with a quick disconnect fitting near the pump. The discharge line must be independently supported to avoid strain and vibration on the pump.

Either hose or rigid pipe may be used to make discharge connections. For maximum pumping capacity, keep the line as short and straight as possible. Elbows and fittings used in discharge lines increase friction loss, minimize their use.

It is recommended that a check valve or throttling valve be installed in the discharge line to control siphoning or back flow when the pump is shut off.

ELECTRICAL CONNECTIONS

WARNING!

Install and operate this pump in accordance with the National Electrical Code and all local codes. Have a qualified electrician perform all checks and connections in this section.

Never attempt to alter the length of the pump motor cable or to repair it with a splice. The power cable and pump motor must be kept completely waterproof. Serious damage to the pump and injury or death to personnel can result from any alteration to the cable.

Control Box Installation

WARNING!

The pump is designed to be operated through the control box furnished with the pump. The control box provides overload protection and power control. Do not connect the pump motor directly to the incoming power lines.

The control box is a rainproof enclosure with a padlockable front cover. **The enclosure is not designed to be watertight, and should not be submerged.** Refer to the control box manual for enclosure dimensions and parts.

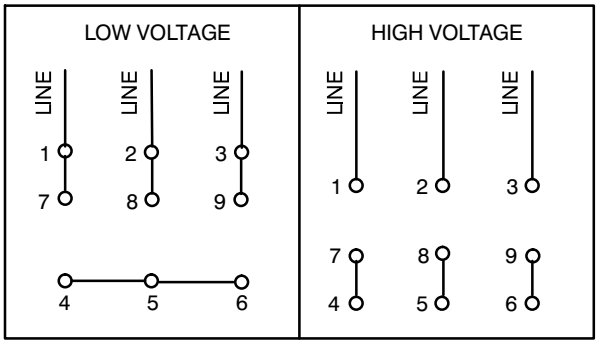
Secure the control vertically on a level surface, above flood level. The box should be easily accessible to the operator, and located close enough to the pump to avoid excessive voltage drop due to cable length (see **Pump Power Cable Connection**). After the box is installed, make certain the front cover latches properly.

CAUTION

Failure to mount the control box vertically on a level surface may affect operation of the pump controls.

Dual Voltage Usage

Some pumps are powered by a dual-voltage motor for utilization with high or low voltage. The motor was originally wired and shipped from the factory for use with the voltage indicated as “Factory Wired” on the pump’s name plate. The name plate also indicates the dual voltage pertaining to this motor. If the alternate voltage must be utilized, control box modifications and/or certain wiring changes are required.



The control box assembly provided with this pump has been designed to accommodate **only** the voltage indicated on the front of the box. This voltage coincides with the “Factory Wired” voltage of the motor. If the alternate voltage is utilized, the control box must be replaced with another box designed for the appropriate voltage. Alternate voltage control boxes are shown in the Parts List Manual under Pump Options.

WARNING!

Dual voltage pumps are wired at the factory <u>only</u> for the voltage shown on the name plate. Make certain that the control box voltage matches the pump voltage before using. If the pump voltage is changed, the pump name plate must be changed and a new control box must be installed. Do not run the pump if the voltages do not match; otherwise, the pump warranty will be negated, and damage to the pump, and injury or death to personnel can result.

The motor wiring **must also** be changed before utilizing alternate voltage. For detailed instructions on disassembly and reassembly of the terminal housing, see **Terminal Housing and Power Cable Disassembly** and **Terminal Housing and Power**

Cable Reassembly in the Maintenance And Repair manual. Change the motor leads as indicated on the wiring diagram plate affixed to the side of the terminal housing (see Figure B–2). **Be sure** to tag the revised voltage on the pump.

Field Wiring Connections (Incoming Power)

WARNING!

The electrical power used to operate this pump is high enough to cause injury or death. Obtain the services of a qualified electrician to make all electrical connections. Make certain that the pump and enclosure are properly grounded; never use gas pipe as an electrical ground. Be sure that the incoming power matches the voltage and phase of the pump and control before connecting the power source. Do not run the pump if the voltage is not within the limits.

WARNING!

Do not connect the pump motor directly to the incoming power lines. The pump motor is designed to operate through a Gorman-Rupp approved control box which provides overload protection and power control; otherwise, the pump warranty will be voided. Make certain that the pump and control box are properly grounded. Install and operate the control box in accordance with the National Electric Code and all local codes. Failure to follow these could result in injury or death to personnel.

Field wiring is **not** provided with the pump, and must be supplied by the user. The field wiring must be of the proper size and type to ensure an adequate voltage supply to the pump. Voltage available **at the motor** must be within the range indicated in Table B-3.

To calculate the voltage available at the motor, proceed as follows:

a. Measure the voltage across the incoming lines (1 & 2 for single phase, 1 & 2, 2 & 3, and 1 & 3 for three phase) **while the pump is operating at full capacity**. Refer to the literature supplied with the control box for power supply connections.

b. Next, subtract the motor cable voltage drop (see Table 4, **Pump Power Cable Specifications**).

c. Do not continue to operate the pump if this voltage is not within the recommended limits. Obtain the services of a qualified electrician to determine the correct field wiring size and other details to ensure an adequate voltage supply to the pump.

Table B-3. Pump Voltage Requirements

NOMINAL VOLTAGE	PHASE	MINIMUM VOLTAGE	MAXIMUM VOLTAGE
115	1	110	120
230	1	220	240
230	3	210	250
460	3	420	500
575	3	520	630
380	3	345	415

Make certain all connections are tight and that cable entry points are rainproof. Support the cable weight, if required, to prevent excessive strain on cable clamps and cable.

Grounding Methods

Electrically ground the installation before connecting the field wiring to the control box. Install a

grounding terminal to the enclosure and connect it to a properly embedded electrode.

The material used for the electrode **must** be an excellent conductor of electricity, such as copper. If iron or steel is used, it must be galvanized or otherwise metal plated to resist corrosion. **Do not** coat the electrode with any material of poor conductivity, such as paint or plastic.

The electrode must conform to the recommendations of N.E.C. ARTICLE 250. Follow all installation requirements of the N.E.C., and all applicable codes. See Figure B—3 for some suggested grounding methods.

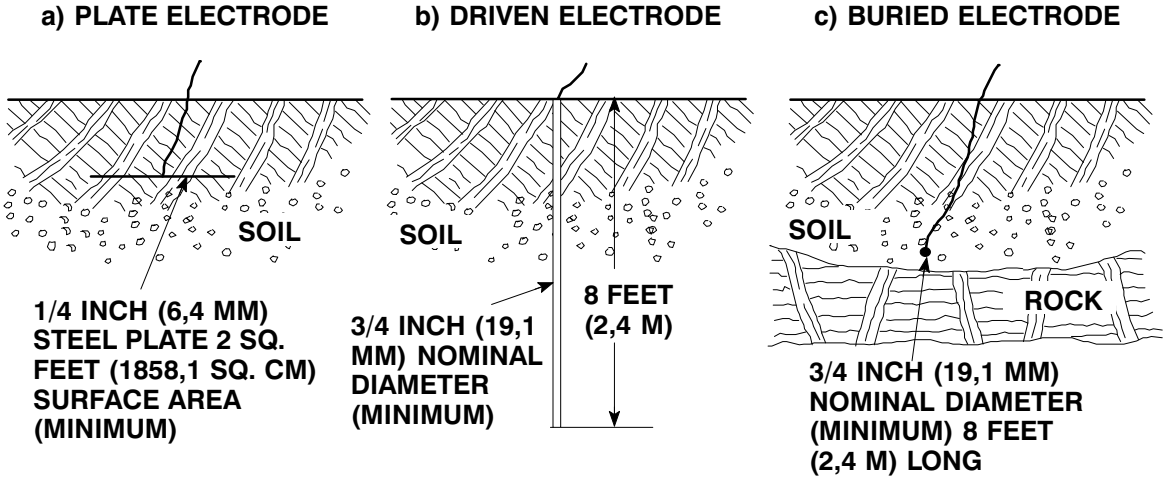


Figure B—3. Suggested Grounding Methods

a. **Plate Electrode:** An iron or steel plate, 1/4 inch (6,4 mm) thick, completely impeded in the ground. The plate must present a surface area of at least 2 square feet (1858,1 sq. cm.).

b. **Driven Electrode:** A rod or pipe, 3/4 inch (19,1 mm) in diameter minimum, 8 feet (2,4 m) long, completely driven into the ground.

c. **Buried electrode:** If rock or stone prevents embedding the full 8 foot (2,4 m) length of the ground rod, bury it horizontally in a trench.

   Space the ground rod or plates at least 6 feet (1,8) from any other electrode or ground rod, such as those used for signal circuits, radio grounds, lightning rods, etc.

   The earth surrounding the ground rod or plate **must** contain enough moisture to make a good electrical connection. In dry or sandy areas, pour water around the rod, or consult qualified personnel to devise a method of improving the connections.

WARNING!

The electrical power used to operate this pump is high enough to cause injury or death. Make certain that the control box is properly grounded after installation.

Refer to the literature accompanying the control box for field wiring connections.

Pump Power Cable Connections

WARNING!

The electrical power used to operate this pump is high enough to cause injury or death. Obtain the services of a qualified electrician to make all electrical connections. Make certain that incoming power to the control box is in the OFF position and locked out, or that the power supply to the control box has

been otherwise cut off and locked out, before connecting power or accessory cables.

The pump is provided with a 50 ft. (15,2 m) power cable (see Table B–4 for standard power cable specifications). If a longer cable is required, an optional cable assembly **must** be ordered from the factory. Splicing of the power cable is **not** recommended by the Gorman-Rupp Company due to safety and warranty considerations.

Never attempt to alter the length or repair any power cable with a splice. The pump motor and cable must be completely waterproof. Injury or death may result from alternations.

NOTE: * Amp Rating at 30°C (86°F) ◗ **Canada Use Type SOW Cable**
**** Amp Rating at 40°C (104°F)**

When necessary to change or connect the pump power cable to the control box, make certain the incoming power is **OFF** and **LOCKED OUT**, Make certain the control box is **PROPERLY GROUNDED** and that the electrical data on the control matches the motor name plate data.

Connect the pump power cable to the control box as shown in the wiring diagrams in the control box manual. Use conduit or cable clamps to secure the power cable to the control box. Make certain that all connections are tight and that cable entry points are rainproof.

NOTE

The power cable furnished with the pump includes three electrical conductors (white, red, and black), two grounding conductors (green) and one ground check conductor (yellow). The yellow ground check lead is used in conjunction with customer-supplied ground monitoring equipment. If this equipment is not used, the yellow lead should be used as a ground conductor.

Control Box Specifications

WARNING!

Any control box used to operate the pump must be approved by the Gorman-Rupp Company for the application.

Motor Cable Grounding Test

WARNING!

Do not connect the pump control cable to the control box or incoming voltage before verifying the pump ground; otherwise, personnel will be exposed to serious injury or death.

Using a volt-ohm meter, connect one lead to the motor cable green/yellow ground lead. Connect the other lead to an **uninsulated** point on the pump body. The test circuit should close.

If the test circuit does not close, there is a defect in the cable or motor which must be corrected.

Control Box Connections

This pump is shipped completely wired for the voltage shown on the name plate, and is ready for operation through an approved control box.

Ground and wire the control box in accordance with the instructions accompanying it.

NOTE

For reference, internal motor wiring connections are shown in the Maintenance and Repair manual.

Liquid Level Devices

The standard pump is **not** furnished with a means to automatically regulate liquid level. However, the pump may be controlled to perform filling or dewatering functions by using **either** of the following optional sensing devices (see Figure B–4):

- **Diaphragm Type:** two fixed-position sensors (upper and lower) each contain a diaphragm which flexes with changes in liquid level, thus activating an enclosed miniature switch.
- **Bulb (Float) Type:** a bulb raises or lowers (floats) with the liquid level, thus activating an enclosed miniature switch.

Models under 6 horsepower require an additional control box to incorporate liquid level controls. For models over 6 horsepower, the circuitry may be prewired as a factory option, or easily added to the standard control box in the field by qualified personnel. The unit is complete except for the remote float switches. For installation and operation, see the detailed instructions included with the optional package.

CAUTION

Liquid level devices **must** be positioned far enough apart to allow 10 minutes between starts. If the pump motor cycles more than 6 starts per hour, it will over-heat, resulting in damage to the motor windings or control box components.

Other types of liquid level devices may also be used. Consult the factory for the liquid level device best suited for your application.

CAUTION

If the pump requires liquid level devices, install the liquid level devices and connect them to the control box in accordance with the instructions accompanying the devices.

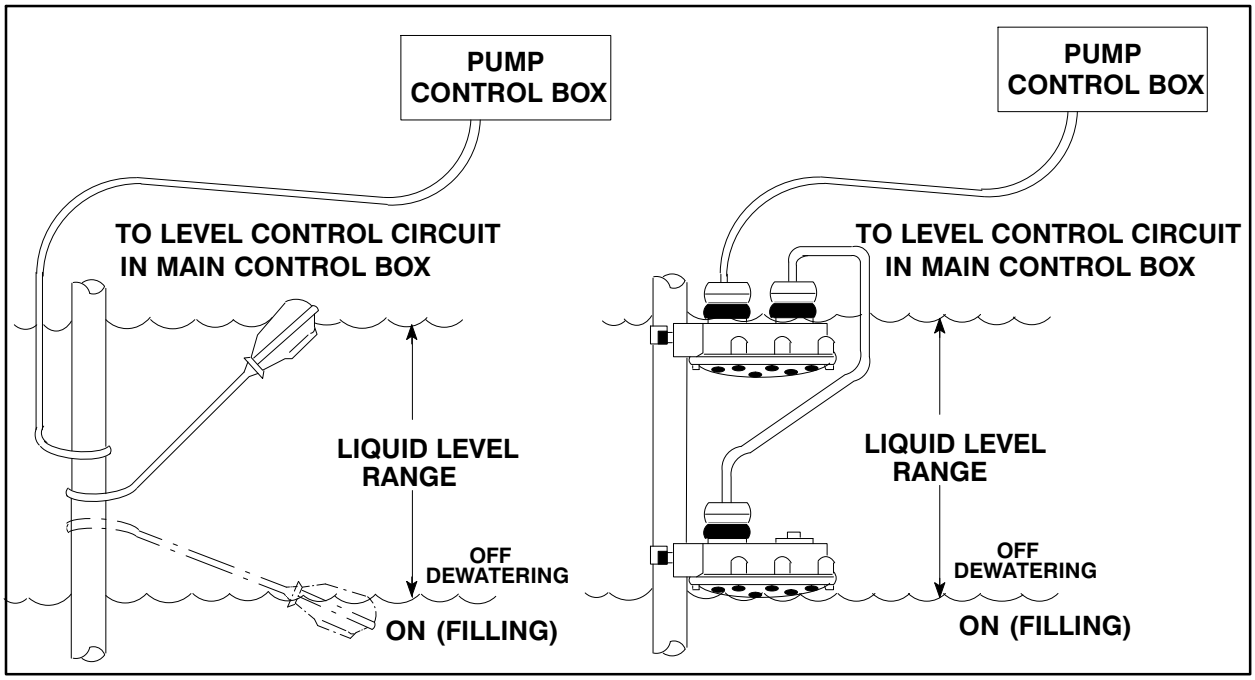

Figure B—4. Liquid Level Devices

CAUTION

The internal wiring of the sensing devices are different for filling and dewatering functions. Be sure to follow the instructions included with the option before making wiring connections.

WIRING DIAGRAMS

Refer to the appropriate wiring diagram in the literature accompanying the control box when making electrical connections.

OPERATION — SECTION C

GENERAL INFORMATION

Review all SAFETY information in Section A.

WARNING!

This pump is designed to handle most non-volatile, non-flammable liquids. Do not attempt to pump any liquids for which your pump is not approved, or which may damage the pump or endanger personnel as a result of pump failure. Consult the factory for specific application data.

Follow the instructions on all tags, labels and decals attached to the pump.

Pump Performance

CAUTION

Since operation of the pump motor is dependent upon the quality and performance of the electrical controls, the pump warranty is valid only when controls have been specified or provided by The Gorman-Rupp Company.

Refer to the pump Specification Data Sheet or the accompanying Parts List Manual for the specific performance for your pump.

Control Box

A control box is provided to facilitate operation of the pump. It contains controls for starting and stopping the pump, and provides overload protection for the pump motor. The pump control (for models 10 horsepower and up) may be equipped with an optional automatic liquid level sensing device, in which case those circuits are also contained within the control box. Pump models under 6 horsepower require an additional control box to incorporate liquid level controls.

WARNING!

The pump motor and control box are not designed to be explosion-proof. Do not operate in an explosive atmosphere. Any control box used to operate the pump must be approved by the Gorman-Rupp Company for the application. Improper location of a non-explosion proof control box could result in destruction of equipment, injury or death to personnel.

See the operating instructions furnished with the control box, and with other optional accessories and controls, before attempting to start the pump.

PUMP OPERATION

Liquid Temperature and Overheating.

WARNING!

Overheated pumps can cause severe burns and injury. If the pump becomes overheated:

1. **Stop the pump immediately.**
2. **Lock out the power to the control panel to ensure that the pump will remain inoperative.**
3. **Allow the pump to completely cool if overheated.**
4. **Close the discharge valve (if used).**
5. **Refer to instructions in this manual before restarting the pump.**

Overheating can occur if the pump is misapplied; if it is started more than 6 times within one hour; if the temperature of the liquid being pumped ex-

ceeds the temperature for which the pump was designed, if the control box fails to provide overload or thermal protection, or if the pump is operated against a closed discharge valve for an extended period of time.

CAUTION

Do not start the pump more than 6 times per hour. If the motor does not cool between starts it will overheat, resulting in damage to the motor windings.

As a safeguard against rupture or explosion due to heat, models equipped with oil-lubricated motors are fitted with a pressure relief valve which will open if vapor pressure within the pump motor reaches a critical point. Always terminate power to the pump and control before investigating pump or control box problems.

WARNING!

Approach the pump cautiously after it has been running. Although the motor is cooled by the liquid being pumped, normal operating temperatures can be high enough to cause burns. The temperature will be especially high if operated against a closed discharge valve. Never operate against a closed discharge valve for long periods of time.

If overheating does occur, stop the pump immediately and allow it to cool before servicing it. **Approach any overheated pump cautiously.**

WARNING!

Overheated pumps can cause severe burns and injuries. If overheating of the pump occurs:

1. **Stop the pump immediately.**
2. **Ventilate the area.**
3. **Allow the pump to completely cool.**
4. **Check the temperature before servicing.**
5. **Vent the pump slowly and cautiously**
6. **Refer to instructions in this manual before restarting the pump.**

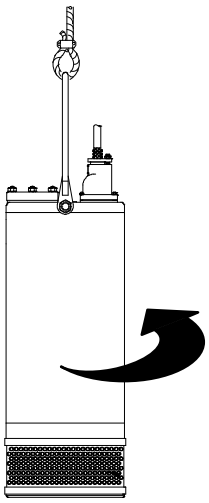
Is so equipped, it is recommended that the pressure relief valve assembly be replaced at each overhaul, or any time the pump motor overheats and activates the valve. **Never** replace this valve with a substitute which has not been specified or provided by the Gorman-Rupp Company.

Impeller Rotation

Check impeller rotation as follows before operation to ensure that the impeller is rotating in the correct direction.

CAUTION

While checking impeller rotation, secure the pump to prevent the power cable from coiling.



Suspend the pump from the lifting device fitted on the pump. Apply power briefly and note the direction of pump kickback. As viewed from the top, the pump should kick in a **counterclockwise** direction; this will indicate that impeller rotation is correct.

If the pump kicks in a **clockwise** direction, impeller rotation is incorrect. If the pump is powered by a three-phase motor, have a qualified electrician interchange the control box connections of any two pump motor power leads. Re-check pump kickback; it should now be in a counterclockwise direction.

If rotation is incorrect on a single-phase motor, contact the factory before installing the pump.

WARNING!

The electrical power used to operate this pump is high enough to cause injury or death. Make certain that incoming power is off and locked out before interchanging motor leads.

DIRECTION OF KICKBACK AT STARTUP

Figure C—1. Checking Pump Rotation

STARTING, STOPPING, AND OPERATIONAL CHECKS

Starting

CAUTION

Do not attempt to operate the pump until impeller rotation has been checked; improper rotation will affect pump performance and may damage the pump.

Follow the instructions accompanying the control box, start the pump, and run any recommended checks.

CAUTION

Never start the pump more than 6 times per hour. If the pump motor does not cool between starts, it will over-heat, resulting in damage to the motor windings.

Stopping

Follow the instructions accompanying the control box for stopping the pump.

WARNING!

On pumps equipped with a motor thermal protector, the integral thermal overload device will shut off the motor if the temperature rises above design limits. When the pump cools and the temperature falls below these limits, the motor will restart automatically. To avoid the hazards of an unexpected motor startup, do not attempt to handle or service the pump unless all power to the motor has been shut off and locked out at the control box; otherwise, serious personal injury could result.

During motor shutoff by the thermal overload device, control box circuits remain live. Do not attempt to service any control box components unless incoming power has been shut off.

To stop the pump, turn the control handle OFF, thereby opening the circuit breakers. This **does not** terminate incoming power through the field wiring connected to the control box.

After stopping the pump, be sure to perform all required maintenance and preservation procedures.

Operational Checks

To detect minor problems, check the pump for proper operation when it is first started, and at periodic intervals during operation.

CAUTION

To avoid serious damage to the pump, check for unusual noises or excessive vibration while the pump is running. If noise or vibration is excessive, stop operation and refer to the troubleshooting chart in the maintenance and repair manual.

The suction inlet or impeller may become clogged with debris. In some cases, stopping the pump momentarily may backflush this blockage. If backflushing does not clear the debris, remove the pump from the sump or wet well and clear manually.

WARNING!

Never introduce air or steam pressure into the pump casing to remove a blockage. This could result in personal injury or damage to the equipment. If backflushing is absolutely necessary, limit liquid pressure input to 50% of the maximum permissible operating pressure shown in the pump performance curve (refer to the accompanying Parts List Manual).

Check the pump for overheating. Overheating can occur if the pump is misapplied, required to start repeatedly, if the control box fails to provide overload or thermal protection, or if the pump is operated against a closed discharge valve for an extended period of time.

CAUTION

Do not start the pump more than 6 times per hour. If the motor does not cool between starts it will overheat, resulting in damage to the motor windings.

Check the oil level(s) as indicated in the following **LUBRICATION** section.

COLD WEATHER PRESERVATION

WARNING!

Do not attempt to thaw the pump by using a torch or other source of flame. This could damage gaskets, O-rings or heat the oil in the seal housing above critical temperatures, causing the pump to rupture or explode.

The pump will not freeze as long as the casing is submerged in liquid. If the casing is not submerged, or if the liquid begins to freeze, remove the pump from the sump or wet well and dry it thoroughly. Run the pump for two or three minutes to dry the inner walls.

If the pump does freeze while it is out of the liquid, submerge it until thawed; if the liquid is near freezing, the pump must be submerged for an extended period of time. Check thawing by starting the pump and checking that the shaft rotates freely. If the pump remains frozen, allow additional thawing time before attempting to restart.

If submerging does not thaw the pump, move it into a warm area until completely thawed.

LUBRICATION

WARNING!

Do not remove plates, covers, gauges, pipe plugs or fittings from an overheated pump. Vapor pressure within the pump can cause parts being disengaged to be ejected with great force. Allow the pump to completely cool before servicing.

On a new pump, check the oil level in both seal and motor cavities (if oil lubricated) before initial startup, and drain and replace the oil after the first 200 hours of operation. Following this, check the oil level in the seal cavity after the first two weeks of op-

eration, and every month thereafter. Check the motor lubrication level any time the pressure relief valve is activated, and replace the oil annually.

Before installing or removing the lubrication plug(s), always clean the area around the plug(s) to prevent contamination.

Draining Oil

Refer to the Parts List Manual for drain plug location.

For the smaller pump, lay the pump horizontal on a flat work surface with the seal cavity drain plug facing up. Remove the drain plug slowly to release any pressure. Install a short pipe nipple in the hole. Place a clean container under the plug and roll the pump on its side to drain the seal housing.

For the larger pump, remove the drain plug slowly to release any pressure. Install a short pipe nipple in the hole. Place a clean container under the plug and using a hoist, tilt the pump at an angle of approximately 60 degrees.

If the motor is oil-cooled, repeat the procedure for the motor housing oil.

Condition Of Oil

Check the condition of the oil drained from the pump. Clear oil indicates that the pump seal(s) are functioning properly. If the oil is milky or contains a small amount of water, it must be changed.

If the oil contains a large amount of water, it must be changed, and the seal(s) must be checked before the pump is put back in operation (refer to the Maintenance and Repair Manual).

Adding Oil

Due to differences in pump design, the quantity of oil and manner in which oil is to be added to the seal cavity varies between pump models. Refer to Table B–2 in **INSTALLATION** for oil capacities and positions for filling the seal cavity in each pump. Motor cavities requiring lubrication should always be positioned vertically for filling.

The grade of lubricant used is critical to the operation of this pump. Use premium quality submersible pump oil as specified in the following table. Oil must be stored in a clean, tightly closed container in a reasonably dry environment.

When lubricating the seal cavity, remove the lubrication plug as indicated in **Draining Oil**, and position the pump as indicated in Table B–2. Add premium quality submersible pump oil through this plug hole. If the pump is to be positioned vertically or at an angle, fill the cavity to the bottom of the plug hole. If the pump is to be positioned horizontally, completely fill the cavity.

Install and tighten the lubrication plug.

When lubricating the motor cavity, add oil through the hole for the pressure relief valve. If the pump is equipped with a motor lubricant level plug, remove this plug and fill the cavity until oil escapes through the hole. If the pump is not equipped with a motor lubricant level plug, fill the cavity to the top of the hole.

Reinstall the pressure relief valve.

Table C—1. Pump Oil Specifications

Specifications:	
Type	Premium high viscosity index, anti-wear hydraulic oil
Viscosity @ 100°F (38°C)	110 to 155
Viscosity @ 210°F (99°C)	40 to 50
Dielectric	26,000 (volts-min)

PARTS MANUAL

SUBMERSIBLE PUMP MODEL GRP-38521
(OPP21-023)

HydroTech Mining

UPDATE : FEB 2022

PERFORMANCE CURVE – SECTION A

RECORDING MODEL AND SERIAL NUMBERS

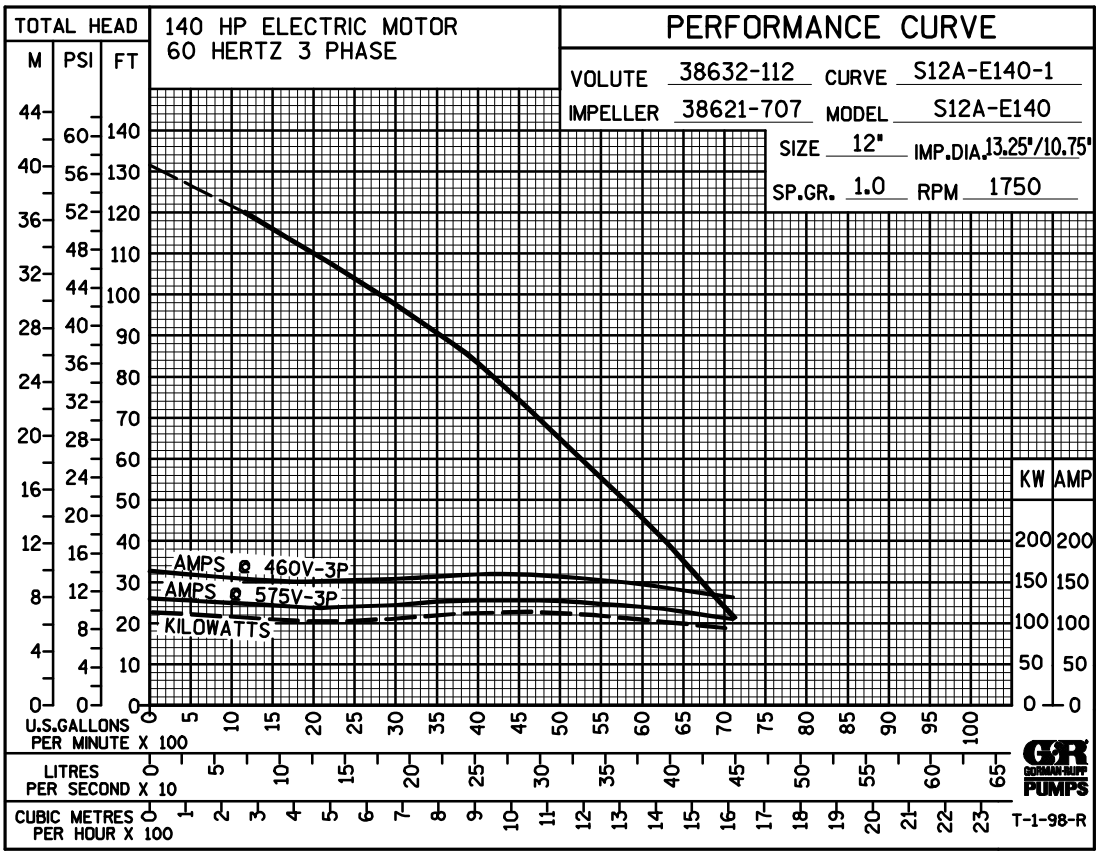
Please record the pump model and serial number in the spaces provided below and in the separate Installation/Operation Manual accompanying your pump. Your Gorman-Rupp distributor needs this information when you require parts or service.

Pump Model: _____

Serial Number: _____

WARRANTY INFORMATION

The pump warranty is provided as part of Gorman-Rupp's support program for customers who operate and maintain their equipment as described in this manual and other accompanying literature. Please note that should the equipment be abused or modified to change its performance beyond the original factory specifications, the warranty will become void and any claim will be denied.



PERFORMANCE CURVES

The performance curves on the following page are based on 70° F (21° C) clear water at sea level. Since pump installations are seldom identical, your performance may be different due to such factors as viscosity, specific gravity, elevation, temperature, and impeller trim.

If your pump serial number is followed by an "N", your pump is **NOT** a standard production model. Contact the Gorman-Rupp Company to verify performance or part numbers.

Pump speed and operating condition points must be within the continuous performance range shown on the curve(s).

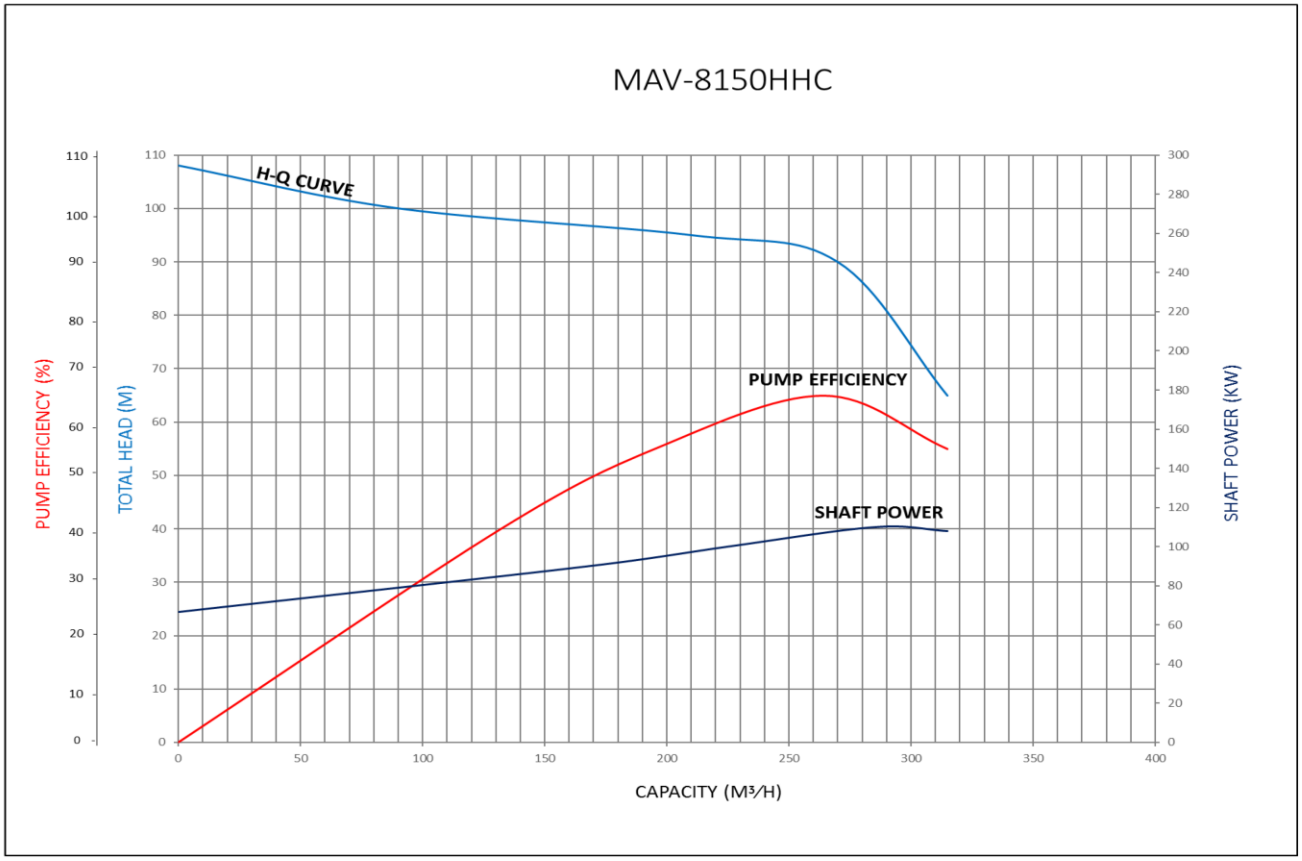
MAV-8150HHC Specification Sheet



Discharge Diameter - inch (mm)	8 (200)
Flow at rated point - USGPM (m3/h)	1188 (270)
Head at rated point - ft (m)	295 (90)
Impeller Type	Closed-Impeller
Max Solide Sizes - inch (mm)	NA
Weight - lb (kg)	2376 (1080)
Diameter - inch (mm)	22.3 (568)
Height - inch (mm)	61.02 (1550)
Motor size - HP (kw)	150 (110)
Seal Type	Double Mechanical Seal
Mechanical Seal Cooler	Non-additive Turbine Oil (JIS No.1)
Oil Capacity - Gallons (L)	1.980 (7.5)
Number of bearings	3
Run Dry Motor	Yes
Speed - RPM	3600
Voltage - V (at 60Hz)	575
Rated Current - A (at 60Hz)	144,0
Motor Service Factor	1,0
Motor Protection	NA
Starting Method	Softstart
Insulation Class	F
Service Factor	1,0
Cable length - ft (m)	50 (16)
Shaft	SUS420J2 Stainless Steel
Pump Casing	Ductile Cast Iron
Impeller	High Chrome Alloy
Suction Cover	Cast Iron
Upper Bearing	NU310C3
Lower Bearing	7313BTDBC3+SP
Standard Connection Type	8'' Victaulic

WEIGHT: — SCALE: 1:1

HD Polyurethane Discharge Hose
Tuyau de refoulement en polyuréthane HD

Tube: polyurethane - available in black, yellow, red, blue.
Reinforcement: high tensile textile.
Cover: black, yellow, blue or red polyurethane - ribbed or smooth cover.
Application: lay flat irrigation, pumping of sludge and liquid fertilizers, supply or drag hose.
Constant operation: -50 °C +80 °C (-58 °F +176 °F)

Tuyau : polyuréthane - disponible en noir, jaune, rouge, bleu.
Renfort: Nappes textiles haute résistance.
Revêtement: polyuréthane noir, jaune, rouge ou blue - couverture nervuré ou lisse
Application : pose d'irrigation à plat, pompage de boues et d' engrais liquide, tuyau d'alimentation ou de traînée.
Plage de température de fonctionnement :
-50 °C à +80 °C (-58 °F à +176 °F)

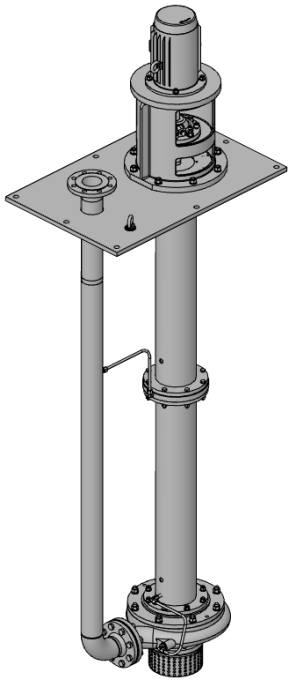
INSTRUCTIONS MANUAL

VERTICAL SUMP PUMP : PUM-38114
(OPP21-020)



HydroTech Mining

UPDATE : FEB 2022

PUM-38114

Vertical pumps for tanks

This manual contains important instructions and warnings. You must read them before mounting, making the electrical connections and starting up. You must also comply with the instructions for the components related to this pump.

You should also remember that it is essential to keep this Manual close to the motor pump equipment.

1 General

Note This KSB ITUR pump has been developed in line with state-of-the-art technology, manufactured with great care and put through continuous Quality Control. The present Instructions Manual will provide you with knowledge of the pump and the ways it can be applied.

It contains important instructions to operate the pump appropriately and profitably. It is important to comply with the manual in order to guarantee reliability and a long useful life for the pump, whilst avoiding any possible risks.

This manual does not include any local regulations or any instructions with regards to assembly personnel, which the user shall be responsible for.

 This group cannot be used in conditions in excess of those established in the technical documentation with regards to the liquid to be pumped, flow, speed (rpm), density, pressure and temperature, and with regards to the motor power or anything else set out in the instructions manual and contractual documentation. Check with the manufacturer as appropriate.

The factory plate shows the model/size, the main service data and the manufacture number of the pump. Please include these data in any queries, subsequent orders or requests for spare parts.

If you require any additional information or have problems with regards to failures, please contact the nearest KSB ITUR service.

2 Safety

This instructions manual contains fundamental instructions which must be complied with in assembly, service and maintenance. It must be read by assembly personnel, competent technical personnel and users before installing and starting up, and it must be available at all times at the place of location of the machine.
Proceed not only in line with this main safety chapter, but also observing the instructions described in other similarly important safety points.

2.1 Marking of warnings in this manual

The instructions which may involve hazard if not observed are highlighted with the following general symbols:

 Safety instructions which may involve a hazard to people and facilities if not complied with in accordance with ISO 7000-0434.

 Safety instructions to prevent electrical hazards in accordance with IEC 417-5036.

Note Safety instructions which may affect the equipment and its operation if not complied with.

 Safety instructions to prevent the risk of explosion. Only applicable to groups with ATEX plate, specially designed to satisfy Directive 94/9/EC on the prevention of the risk of explosion.

The details shown directly on the machine, such as:

- Rotation direction arrow
- Fluid connection identifications

These must be observed, and conserved in a manner which ensures they are legible.

2.2 Personnel qualifications and instruction

All Service, Maintenance, Inspection and Assembly personnel must be duly qualified. The terms regarding responsibility, competence and supervision of personnel must be regulated by the user in an exact manner.

Any personnel lacking appropriate know-how must be duly instructed. This preparation can be obtained upon request by the machine user to the manufacturer or supplier of the machine.

Finally, the user must ensure that all personnel have fully understood the content of the instructions manual.

2.3 Risks of failing to comply with the safety instructions

Failure to comply with the safety instructions may lead to risks both for people, the environment and the machine, and may lead to the loss of any entitlement to claims.

In particular, failure to comply may cause the following hazards:

- Failure of important machine/facility functions.
- Failure of the prescribed maintenance and conservation methods.
- Personal hazard resulting from electrical, mechanical or chemical effects.
- Danger to the environment due to escaping noxious products.

2.4 Conscientious safety at work

The safety instructions contained in this Manual must be observed, as must international prescriptions on Health and Safety at Work and any possible Safety Regulations at the workplace of the user.

2.5 Safety instructions for users and service personnel

 The operator is responsible for keeping the temperature of the fluid within the pump classification temperature limits.

- The installer must ensure that the parts of the machine which may create danger due to heat or cold are protected against accidental contact.
- The contact protections of moving parts (e.g. couplings) must not be removed whilst the machine is in service.
- Any possible leaks (e.g. through the shaft sealing) of hazardous products must be channelled in such a manner as they do not present any risk to people or the environment, in line with corresponding legislation.
- Electrical hazard must be avoided (see details in the specific legislation of the country and/or the electricity supply company).

2.6 Safety instructions for maintenance, inspection and assembly work

The user must ensure that all maintenance, inspection and assembly tasks are carried out by authorised, qualified, specialised personnel who have been sufficiently informed through careful study of the instructions manual.

The pump frame must have returned to environmental temperature. It must then be depressurised and emptied of liquid.

It is a fundamental principle that any work on the machine must be carried only during standstill. It is essential to respect the pump shutdown procedure described in the instructions manual.

All pumps or motor pumps which pump hazardous materials must be decontaminated.

All safety and protection devices must be installed and put into operation as soon as work concludes.

Before starting up again, all that described in the First Start-Up section must be followed.

2.7 Modifications and arbitrary manufacture of spare parts

The machine must not be modified or changed without prior agreement with the manufacturer. Only original spare parts and accessories approved by the manufacturer can guarantee safety. The use of other components may terminate any liability for consequences deriving from their use.

2.8 Unauthorised operation modes

The safe service of the supplied pump can only be guaranteed through correct use, in line with section 4 of the Instructions Manual. The operation limits established in the Datasheet must not be exceeded under any circumstance.

2.9 Warnings for equipment with a marking

KSB ITUR pumps marked with the ATEX plate are valid for group II category 2 and 3, zones 1, 21, 2 and 22 temperature class as shown on the plate and Conformity Certificate.

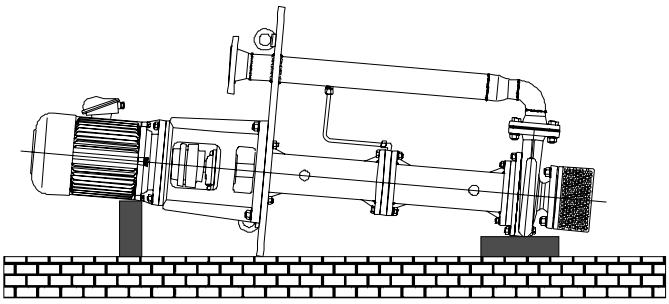
Reliability may be lost through incorrect use, poor connections or any modifications, however small.

It is necessary to take into account the rules on the connection and use of electrical devices in hazardous areas, in particular national regulations on installation. Only qualified personnel who are familiar with these rules should handle this type of machine.

Any repair made by the end user, unless explicitly approved by KSB ITUR, shall release the manufacturer from any liability relating to Directive 94/9/EC. Individual pieces supplied as spare parts must be originals, supplied and checked by KSB ITUR.

3 Transport and storage

3.1 Transport and handling



The transport and handling of the equipment must be carried out using suitable means in line with the weight to be supported. The weight is generally shown on the delivery note or on the data plate. If it is not, and the equipment cannot be handled safely, please contact KSB ITUR.

Remember that the equipment should never be lifted using the ring bolts of each of the elements, e.g. the motor and pump ring bolts, which are exclusively for independent transport.

Note It is also important not to use the pump and pipe flanges or joining elements, e.g. couplings.

Note If the equipment is to be lifted using straps, these must always be run underneath the motor and pump support.

Note Do not position the pump on the filter/suction hood. When positioning the pump outside of the well on the ground, place a wooden plug at the height of the pump casing, in order to prevent the filter being the support point for the pump.

When the pumps are dismounted from their transport pallet, suitable means must be used to ensure the stability of the equipment, until it is finally secured at its definitive location.

3.2 Provisional storage/conservation

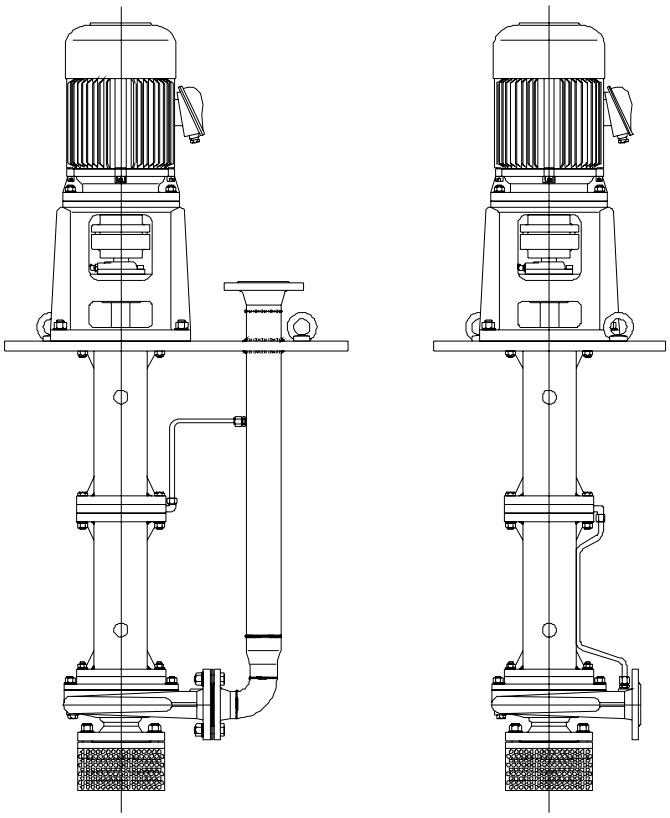
During provisional storage, it is only necessary to protect with preservation products those low alloy parts in contact with the liquid (e.g. grey cast, nodular cast, etc). Preservation products available on the sector market can be used, in line with the manufacturer's instructions on application and disposal.

The pump, or motor pump, shall be deposited in a dry site where the relative humidity is as constant as possible.

When stored outside, it is necessary to keep the pump/motor pump in an impermeable box, ensuring it does not come into contact with external humidity.

Note Protect the stored product from humidity, dirt, parasites and unauthorised access! All openings must remain closed, and must not be opened until required during assembly!

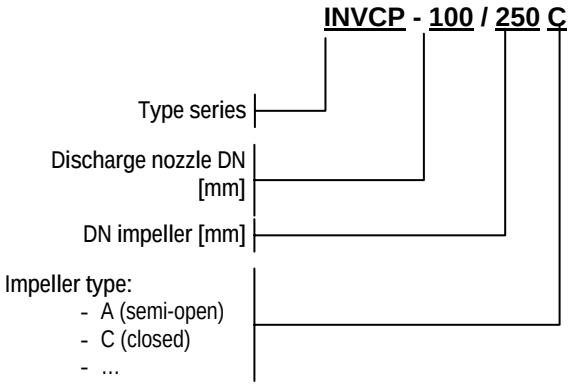
The shiny (mechanised) parts and surfaces of the pump must be protected from corrosion using silicone-free oil or grease.



The electric motor must be disconnected, the connection cables removed and the terminal box closed with its cover on.

The switchboards must be in vertical position and disconnected.

4 Group description



4.1 General description

Vertical centrifugal pump designed for wells, ditches and tanks. For neutral or aggressive liquids, both clean and with light solid particles.

INVCP INVCN

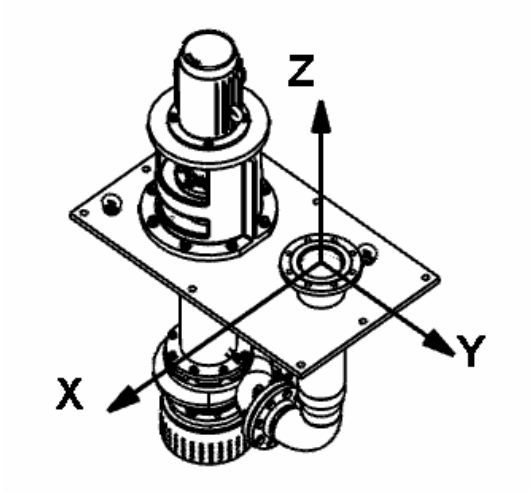
4.2 Denomination

4.3 Form of construction

Spiral pump casing with axial suction and radial impulsion. Single-stage impeller closed or semi-open. Filter in suction.

The INVCP series has a discharge pipe to the outside of the base plate.

The INVCN series does not have a discharge pipe.



Bearings: Both series are fitted with two classes of bearing: grease-lubricated ballbearings and friction bearings lubricated by the pumped liquid (when possible) or through the exterior injection of liquid or grease.

Shaft sealing: The standard sealing system is by way of a lip seal. This can be done optionally using a packing or mechanical seal.

4.4 Noise. Permitted levels

The acoustic pressure level of these pumps is less than 90 dB (A) at 1 m in any operation point within the operation range without cavitation. The acoustic power is less than 100 dB (A).

4.5 Forces and moments permitted

Maximum permitted strain in the upper discharge flange, INVCP series exclusively						
	Force [N]			Moment [N·m]		
DN	Fz	Fx	Fy	Mz	Mx	My
32 - 1 1/4"	630	510	540	450	510	660
40 - 1 1/2"	750	600	660	540	630	780
50 - 2"	990	810	900	600	690	840
65 - 2 1/2"	1260	1020	1110	660	720	900
80 - 3"	1500	1230	1350	690	780	960
100 - 4"	2010	1620	1800	750	870	1050
125 - 5"	2370	1920	2130	900	1140	1260
150 - 6"	3000	2430	2700	1050	1230	1500
200 - 8"	4020	3240	3600	1380	1590	1950
250 - 10"	5010	4050	4470	1890	2190	2670
300 - 12"	6000	4830	5370	2580	2970	3630
350 - 14"	6990	5640	6270	3300	3810	4650
400 - 16"	7980	6450	7170	4140	4770	5820

The INVCN series does not admit any strain on the discharge flange.

5 Installation

The electropump is dispatched totally mounted and prepared for installation and operation (except for the few cases of the motor being dispatched disassembled, as is the case of large, heavy motors).

Note The design of the pipe systems, anchorings and other installation areas corresponds to other parties. KSB ITUR only offers details and comments as a help, but does not assume any responsibility with regards to the design, assembly and operation of any installation. We recommend that customers check with a specialist in the design of castings, pipes, wells, etc in order to interpret and supplement the information given by KSB ITUR and to ensure correct operation.

5.1 Check before assembly

Before positioning, check that the assembly base is in line with the dimensional plan of the equipment.

The upper surface of the base must be horizontal and flat.

If the anchor pins are to be placed in existing holes, place the anchor pins in their orifices suspended from the pump.

Do not connect the suction and impulsion nozzles until the equipment is completely installed on its base.

5.2 Group positioning

5.2.1 Vertical groups

Levelling

Use a spirit level to level the equipment. Use wedges to alter the height at different points. The maximum deviation permitted is 0.2 mm/m.

The correct separation between the two coupling halves must be maintained.

Pump - motor alignment

In order to prevent misalignment between the shafts, it is necessary to correctly install, check and maintain the coupling. See the instructions manual of the coupling.

The coupling may produce a source of ignition or high temperature in the event of incorrect operation. The coupling must be classified as non-electric equipment with at least the same type of area and temperature as the pump. It is necessary to follow the instructions in the coupling manual which is included with the pump.

The equipment is aligned at factory, and this alignment will never be lost. In case of dismantling of the motor and when mounting again the motor following instructions must be followed:

- Check that the flange support surface of the motor support and of the motor itself are perfectly clean and smooth.
- Check the correct separation between the two halves of the coupling.
- Check that the alignment between both shafts is correct by turning the equipment by hand.

5.3 Pipe joint

In no case can the pump be used as a fixed point for the pipes.

The pipe system must at no time exercise force in excess of the values shown in the chart in point 4.5 (due to connection, thermal variation, etc) in the pump.

The short pipes must be of at least the diameter of the pump connections. The diameter of long pipes is, in some cases, determined by economic criteria.

Transition pieces at larger diameters must have an extension angle of around 8°, in order to prevent pressure drops.

The thermal expansions of the pipes must be compensated with suitable measures, in order not to exceed the maximum strains permitted on the pump.

The diameters of the pipes, valves and accessories must be calculated in line with the load losses envisaged in the installation, so that the fluid impulsion speeds in the pipes will be from 2 to 3 m/s

Exceeding the admitted strains of the pipes may lead to leaks in the pump and to the fluid escaping. Hazard of death with hot liquids!

The suction and impulsion flange covers of the pump must be removed before connecting the pipes.

Before starting up a new installation, it is necessary to thoroughly clean the tanks, pipes and accessories by brushing and blowing. Welding material, scales and other impurities are often cast off some time after.

Note In order to prevent the rotation of the pumps in inverse direction (danger of the impeller breaking out), a retention valve must be placed in the impulsion pipe.

Wet well. Suction conditions

It is not enough to simply submerge the pump in the well to make it primed. We need to pay attention to the suction of the pump, since in this case good suction will depend more on the environment surrounding the pump (physical conditions of the well or sump) than on the pump itself.

An insufficient liquid submergence level may lead to dry operation of the parts of the pump, which in turn leads to the heating of the parts in sliding contact. This circumstance should be avoided, with plant operators manually checking or equipment stop devices ensuring that the liquid level in the suction well is never lower than the indicated submergence level.

High suction pressure may overload the bearings and lead to their overheating. This circumstance must be avoided, to which end the suction pressure must not exceed that shown in the data sheet, either through manual control by the operators or through devices which stop the equipment in the event of excessive pressure.

The pump must not work without liquid under any circumstance. If this condition may come about, the installation must be fitted with safety devices which prevent the operation of the pump without liquid inside, or have automatic devices to discharge the minimum flow of the pump. See the section Minimum flow necessary for the pump

As a general rule we can make some observations:

- The minimum liquid level in the well must be at the distance indicated in the table in annex 9.2, except for particular pump plans or datasheets showing other greater or lower values for minimum submergence.
- The input of liquid to the well must be carried out gently, without any fluctuation or turbulence which may harm the pump suction, always aiming to achieve the most stable flow possible.
- If several pumps are working in parallel in a single well, they should be at a suitable distance from each other, or precautions should be taken to ensure there is no disturbance which may affect the suction conditions of the pump.

The maximum liquid level must always be below the base plate in order for it not to overflow.

Dry well. Suction conditions

In this type of installation we need to:

- In the pump suction, avoid sharp elbows and accessories which lead to brusque narrowing and widening.
- Position a gate valve in the suction to isolate the pump during maintenance.
- With a pipe, take the excess fluid of the column from the orifice in the upper column through to an upper level at the maximum water level of the suction tank or suitable drainage system.

The minimum liquid level in the well in start-up must be a least 0.5 m above the pump suction flange, and must be maintained at sufficient height as to avoid air coming in through suction due to the vortex effect.

5.3.1 Auxiliary connections

The equipment is normally delivered mounted and ready for immediate operation, with only the hydraulic and exterior electrical connections being necessary.

In the case of dirty or abrasive pumping liquids in which it is necessary to connect the auxiliary refrigeration connections or lubrication of the equipment, follow the instructions detailed in 7.2.2 or in annexes to this manual.

Note Auxiliary pipes are designed exclusively to support internal strains due to the pressure of the circulating fluid, to which end it is forbidden to subject them to additional exterior strains (e.g leaning on them, etc).

If the pumping liquid is fuel and the leak can lead to ignition, this contingency should be avoided through constant control of the seal tightness of the auxiliary pipe joints by the plant operator.

5.4 Electrical connection

The electrical connection must be carried out by a specialist electrician! Applicable regulations must be complied with.

Check the mains voltage available with the factory plate data and choose the appropriate connection.

The technical connection conditions and the conditions of the local energy supply company must be observed when carrying out the connections.

We strongly recommend the use of a safety circuit breaker for the motor and a thermistor associated to a trigger device.

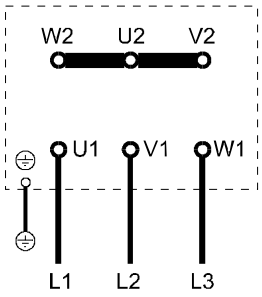
These instructions apply to asynchronous three-phase standard electric motors with a squirrel cage both in horizontal and vertical execution, in IP-23, IP-54 and IP-55 protection grades, with frame sizes of between 56L and 355S, both inclusive, with voltages of 200 to 500 V between phases.

Before starting up the pump, it must be earthed or the frame must be connected to an effective earthed point of the installation

5.4.1 Motor connection

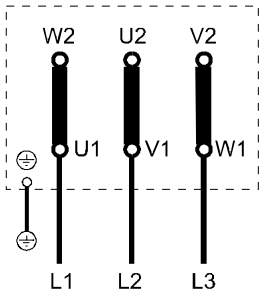
Whilst connecting the cables, ensure it is not possible for voltage to appear.

Check that the earth connection is in line with local regulations.



The coupling may produce a source of ignition or high temperature in the event of incorrect operation. For this reason, the motor must be classified with at least the same type of zone and temperature as the pump. It is necessary to follow the instructions in the coupling manual which is included with the pump.

Connection in single speed motors

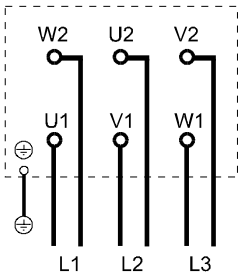


Direct start-up:

In direct start-up the motor can be used in two different connections:

The voltage and the connection, e.g. 400 VY, 240 VD is stamped on the motor plate. This means that the motor can connect at 400 volts in star connection (Y) or at 240 volts in delta connection (D).

Star connection



Delta connection

Star-delta start-up:

In star-delta start-up, the line voltage must coincide with the voltage shown on the motor for delta start up (D). The six terminals indicated in the following diagram will be connected:

Connection to the star-delta contactor

5.4.2 Time relay adjustment

In the star-delta start-up of three-phase motors, it is necessary to ensure that the switching from star to delta takes place quickly. Prolonged switchover periods may damage the pump.

Time relay adjustment in the star-triangle connection:

Motor power	Time adjustment -Y
≤ 30 kW	< 3 sec.
> 30 kW	< 5 sec.

5.4.3 Rotation direction. Check

Note Check the motor rotation direction by starting up and immediately stopping. The rotation direction must correspond with that shown by the pump arrow located on the pump casing or support. If the rotation direction is not correct, any two phases L1, L2 or L3 of the power cable must be inverted in the motor terminal box.

The incorrect rotation of the pump may lead to the incorrect operation of the seal and the heating of its faces. For this reason, correct rotation direction must be ensured using the arrow shown on the pump, with the pump completely filled with liquid and properly vented.

6 Start-up

It is necessary to prevent the formation of explosive atmosphere within the well or tank where the pump is to be installed.

Start-up shall be carried out when all the necessary mechanical, hydraulic, electrical and pneumatic connections are complete.

Motor checks.

When making the electrical connection, ensure the type of current and nominal voltage shown on the motor's data plate concur with the type of current and the mains voltage in the place of installation.

Follow the instructions described in the motor manual.

6.1 First start-up

The pump cannot operate with a closed impulsion valve, as this may lead to overheating of the pumped liquid. If it is necessary to work with the discharge valve closed, a minimum flow relief device is required at the output. This device does not form part of the pump and will be separate from the pump's discharge flange.

Other recommended devices include the constant output orifice plates, constant bypass valves and automatic recirculation valves. If you require further details, please check with KSB ITUR.

The pump cannot work in closed suction valve conditions. If this condition may come about, the plant operator must use a device which detects this condition and forces the pump to stop when it occurs.

6.1.1 Lubricant

BEARINGS:

Lubricated with grease. PUMP WITH GREASE NIPPLES: The pump leaves the factory with the bearings greased for approximately 1000 hours of operation. See lubricant in section 7.2.2.

FRICTION BEARINGS:

Lubricated with pumping fluid: If the pumped fluid is clean (without particles in suspension) and non-aggressive, the friction bearings are lubricated with the pumped fluid. Lubricant is not required.

Note Lubricated with external fluid. PUMPS WITH EXTERIOR AUXILIARY CONNECTION IN THE BASE PLATE: If the pumped fluid is dirty, aggressive, abrasive, etc, the PUMP HAS A CONNECTION for the lubrication and cooling of the bearings through an exterior means. Clean water or another fluid compatible with the pumped fluid must be injected. See section 7.2.2.

Note Lubricated WITH AUTOMATIC LUBRICATION PUMP IN THE BASE PLATE: If the pumped fluid is dirty, aggressive, abrasive, etc, the PUMP HAS AN AUTOMATIC LUBRICATION PUMP ON THE BASE PLATE for the lubrication and cooling of the bearings. The automatic pump container must be filled with grease before starting up. See lubricant in section 7.2.2.

The bearings must be lubricated with oil/grease in a good state, to which end it is essential to follow the lubrication instructions indicated in 7.2.2.

If the bearings support suffers impediments which prevent correct air-cooling, the resulting excess temperature may be excessive for the classification temperature class. For this reason, the support must be kept free of obstacles, thus facilitating natural air cooling.

6.1.2 Filling (priming) of the pump

- Check that the level of liquid in the well is sufficient.
- Turn the pump shaft by hand in order to break any adherence.

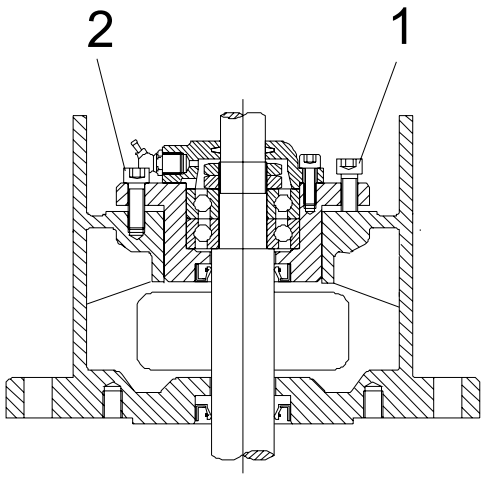
Shaft sealing

Packing: The packing gland nuts must be gently tightened (by hand). The packing gland must form a right angle to the shaft.

6.1.3 Final control

Make the final check of the group alignment in accordance with 5.2.1. The coupling/shaft must allow easy manual rotation.

Note Check all the auxiliary connections are correct and functioning.



According to the **rules on the prevention of accidents at work**, equipment cannot be started up without protection for the coupling. If the buyer has expressly requested that this protector be excluded from supply, it must be provided by the user.

Before and during the operation of the pump, the coupling guard must be in place and firmly secured. Regularly check this state in order to prevent problems resulting from incorrect positioning or deficient attachment. The coupling guard must be free of any foreign elements.

6.1.4 Impeller adjustment

Turn the pump shaft by hand to check that the rotor is not blocked. Should interior contact in the pump be detected, carry out an axial regulation. To do this:

- Release the attachment screws (2)
- Tighten the adjusting screws (1) to slightly raise the whole moving section.
- Turn the shaft again by hand and check that the rotor rotates freely without any internal contact. If there is still contact, tighten a little more using the adjusting screws.
- Tighten the attachment screws (2) to fix the position reached.

Note If a mechanical seal is used, remove it first before regulating. Please contact us before carrying out this operation.

6.1.5 Start-up

Before starting up the group, check all the sections with regards to chapter 6.

The start-up must be carried out with the suction valve (where fitted) completely open and the impulsion valve partially closed. Once the pump has reached its service speed and the suction air has been eliminated, regulate the operation point using the impulsion valve.

If the electric motor guard is triggered when starting up, close the impulsion valve more until the equipment starts up normally.

The pump must NEVER work with zero flow or flow which is less than the operating minimum, as internal recirculation will cause the fluid to heat up quickly, leading to hazards (including explosion) as a result of the high pressures reached within the frame. Check the minimum flow in the operation curves.

Minimum flow necessary for the pump

The pumps cannot work below the minimum flow specified in the datasheets.

If this condition may come about, the installation must be fitted with safety devices which prevent the operation of the pump without liquid inside, or have automatic devices to discharge the minimum flow of the pump.

For liquids other than water, the minimum flow is determined by the following formula:

$$Qmin = \frac{3.600.000 \times Pa}{Pe \times Ce}$$

In which:

Qmin: Minimum flow in m^3/h.

Pa: Power absorbed by the pump in kW at closed valve.

*Ce: Specific heat of the fluid in J/kg*ºC.*

Pe: Specific weight of the fluid in kg/m^3

Maximum flow permitted by the pump

Unless indicated in another datasheet, the maximum flow permitted is 1.1x optimum flow of the pump with the supplied impeller diameter.

6.1.6 Shutdown

Close the impulsion pipe valve.

If there is anti-return in impulsion with counter pressure, leave the impulsion valve open.

- Shutdown the motor. Check that shutdown is normal.
- In prolonged periods of non-operation, close the suction pipe valve (where fitted) and the auxiliary connection valves.
- The pump must be protected from freezing whenever this risk exists, and must be emptied in prolonged periods of non-operation.

If, whilst the pump is in standstill, it must remain on standby for service, start up at regular intervals for around 5 minutes (see also 7.2)

- Fire pumps: 1x/month, at minimum.
- Drink-safe water pumps: 1x/48 hours, at minimum.
- Reserve pumps: 1x/week, at minimum (it is best to change the operating pump every day).

The seal tightness and function of the auxiliary connections must be examined during these start-ups.

6.2 Service limits

6.2.1 Switching frequency

In order to prevent abnormally high temperatures and overloading of the motor, pump, coupling, seals, etc, the switching frequency must not exceed the following number of start-ups per hour:

MOTOR POWER	MAX. START-UPS/HOUR
Up to 3 kW	20
From 4 to 11 kW	15
From 11 to 45 kW	10
From 45 kW	5

6.2.2 Temperature of the liquid to be pumped

The permitted operation temperature is indicated in the order and in the ATEX conformity declaration. If the pump is to work at a higher temperature or you do not have the data sheet, please ask KSB ITUR.

6.2.3 Density of the liquid to be pump

The power absorbed by the pump increases in direct proportion to the density of the impelled liquid. In order to prevent overloading in the motor, pump and coupling, this density must not exceed that shown in the order and in the ATEX declaration of conformity.

6.2.4 Viscosity of the liquid to be pumped

The power absorbed by the pump increases with the viscosity of the impelled liquid. In order to prevent overloading in the motor, pump and coupling, this viscosity must not exceed that shown in the order and in the ATEX declaration of conformity.

6.2.5 Maximum pump speed

In order to protect the pump from excess speed, the maximum rotation speed shall be that shown on the plate engraved in the pump, and in the ATEX declaration of conformity. First check with KSB ITUR if you wish for the pump to work at a higher speed.

6.3 Starting up after storage

If the storage and/or standstill of the pump has been for a prolonged period of time (over 6 months), it is necessary to:

- Check the state of the joints.
- Check the levelling.
- Check all the auxiliary connections.
- Renew the lubrication of the bearings (where fitted).
- Change the packing (when fitted).
- After a short storage period, simply turn the pump shaft manually to unlock the rotor equipment.
- Follow the specific post-storage instructions in the motor manuals and other items.
- Observe all the steps shown in the "Start-up" section.

Note If the equipment is going to be in shutdown state for a certain period of time and there is the possibility of freezing temperatures, it is necessary to completely drain the pump in order to prevent any deterioration from the freezing of the contained fluid.

7 Maintenance/Conservation

7.1 General instructions

Before dismounting, ensure that:

The motor cannot be operated accidentally, by disconnecting from the electricity supply (e.g. removing cut-outs, unplugging, disconnecting the automatic circuit breaker, etc) or the start-up batteries (disconnect operating energy).

The pump is free of pumped fluid, cleaning it internally with appropriate liquid whenever it is a hazardous fluid (hot, contaminant, inflammable,…)

7.2 Maintenance/inspection

7.2.1 Checking instructions

<u>During the first minutes of operation:</u>

In cases of mechanical seal

- There may be a brief large leak during start up. Should this leak persist, shutdown the group and determine the cause. The causes may be, amongst others, dirt in the pumped area or dry operation due to incomplete discharge of the pump air.

In cases of packing:

- There is no leak; immediately loosen the packing gland until a small dripping is achieved.
- Excessive fluid leak; leave to settle for 10 minutes; tighten the packing gland by turning 1/6th and leaving for 5 minutes. Repeat the process until between 20 and 60 drops per minute are achieved.

<u>After a few hours operation:</u>

Note Check the bearing temperature at the point in the bearing location area. Normal temperature can reach up to 40°C above environmental temperature, but must never exceed 90°C.

Observe the possible anomalies shown in point 8 of this manual.

The reserve pumps should be started up and shutdown once a week, in order to ensure they are always in service conditions.

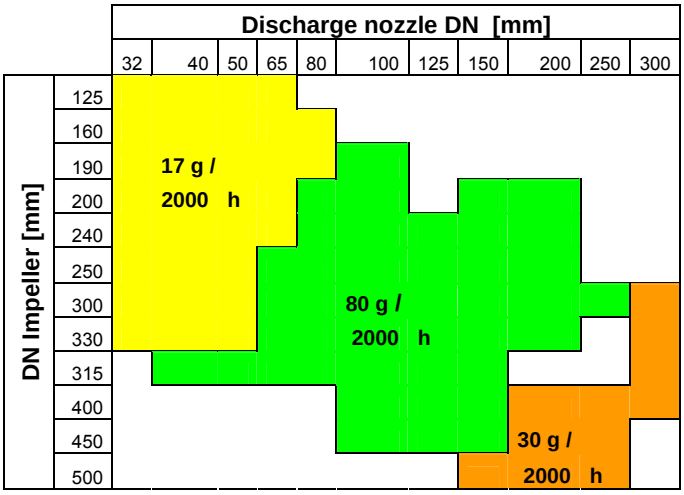
The failure of one or both sides of the seal may lead to excess heating. This can be corrected by following the instructions of the seal manufacturer, both with regards to its assembly and the maintenance of the auxiliary seal devices, where appropriate. Alternatively, the pump may be fitted with a surveillance device if the purchaser has so specified.

7.2.2 Lubrication

Before lubricating the pump, ensure that

The pump is stopped and cannot be started up accidentally.

The bearing support temperature is less than 40ºC, in order to prevent burns to the hands. To do this, measure the temperature with a thermocouple.



The absence of grease in the bearing support may lead to a lack of lubrication of the lip seals, which will come into dry contact with the shaft. This contact may lead to a high shaft temperature which might cause ignition. To prevent this, regularly check the grease level in the bearings support.

BEARINGS:

<u>Lubricated with grease. PUMP WITH GREASE NIPPLES:</u>

The pump leaves the factory with the bearings greased for approximately 1000 hours of operation.

For lubrication, a chart is attached with the amount of grease to be applied in each greaser, along with the regularity.

Grease change

In order to completely change the grease, first dismantle the bearings and carefully clean their positions in the support in order to remove old grease.

Type of grease:

We recommend using lytic-based lubrication grease with antioxidant additives, of consistency 3 in line with DIN-51502 K3K.

FRICTION BEARINGS:

The friction bearings are found in the cover of pumps (always) and also in case of double/triple intermediate pipe pumps, in the intermediate couplings. These bearings must always be lubricated and cooled. There are three types of lubrication:

1. Lubricated with pumping fluid: If the pumped fluid is clean (without particles in suspension) and non-aggressive, the friction bearings are lubricated with the pumped fluid. Lubricant is not required.

Note 2. Lubricated with external fluid. PUMPS WITH EXTERIOR AUXILIARY CONNECTION IN THE BASE PLATE: For this purpose there is an adapter in the base plate which the customer will inject with clean water or another fluid compatible with the pumped fluid at a pressure of approximately 3 kg/cm^2 (manometer). The flow necessary per bearing can be seen in the chart in annex 9.2.

Note 3. Lubricated WITH AUTOMATIC LUBRICATION PUMP IN THE BASE PLATE: The auxiliary pump has a container with grease to lubricate the bearings. We recommend using lytic-based lubrication grease with antioxidant additives, of consistency 2, in line with DIN-51502 class K2K. The auxiliary pump does not require maintenance, although the container must contain grease at all times.

Note The automatic pump container must be filled with grease before starting up.

Excessive wear of the bearings may cause friction of the metal parts, thus locally increasing the temperature. The pump shall have forced refrigeration from the pumping fluid if it is clean or with exterior lubrication of clean liquid if the pumping fluid is dirty. In the latter case, the plant operator must maintain a permanent input of clean liquid to ensure the correct maintenance of the bearing refrigeration fluid and conducts.

7.3 Emptying/Drainage

The emptying and drainage of pumps used to expel liquids which are a health hazard must be carried out in such a way as there is no risk to people or to the environment, in line with legislation. If necessary, use protective clothing and mask.

7.4 Dismantling

7.4.1 Fundamental instructions/observations

Note Before dismantling, ensure the pump cannot be started up.

The suction and impulsion valves must be closed.

The pump frame must have returned to environmental temperature.

The pump frame must be emptied.

Comply with all safety measures in accordance with 7.1. When working on the motor, also take into account the rules and instructions of the manufacturer.

7.4.2 Coupling

Motor pump coupling

- Release the motor attachment screws and remove the motor along with the male coupling.
- The rubber plugs can then be extracted from the female coupling.
- If you need to release the coupling, use an extractor. Never bang in order to extract, as this may cause serious damage to the bearings.

Intermediate coupling

- Release the cover halves on both ends of the coupling.
- Uncouple the two shafts by gently and uniformly banging the coupling with a plastic hammer.

7.4.3 Mechanical seal (where fitted)

In order to access the seal, first dismount almost all the pump as described in point 7.4.5 (until the seal dismantling section is reached). Once this process is complete:

- Release the seal cover joining screws and slide the cover carefully along the shaft towards the pump.
- Release the keep pins from the casing or rechangeable bushing and slide this, along with the moving part of the seal, along the shaft towards the pump.
- Slide and carefully extract the seal cover along with the fixed part of the seal along the shaft towards the pump. We can then release the fixed part of the seal by pushing it from outside (upper part of the cover), taking care for it not to touch the contact face.

7.4.4 Packing (where fitted)

In order to access the seal, first dismount almost all the pump as described in point 7.4.5 (until the packing dismantling section is reached). Once this process is complete:

- Release the packing gland.
- Slide and extract the cover with the packing along the shaft towards the pump side.
- Extract the packing from the cover. If the lantern ring is also extracted, note down the order in which is disposed.

7.4.5 Pump

For the extraction of ballbearings, shaft, bearings, etc., it is necessary to dismantle the entire pump.

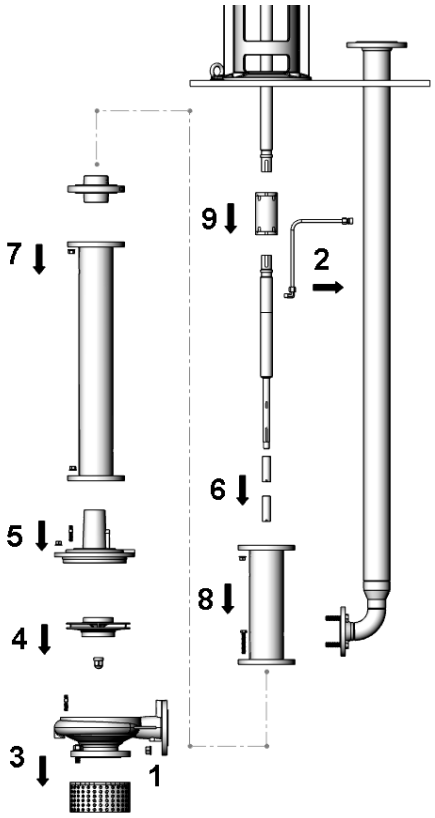
To do this, see the sectional plan and diagram with a breakdown of the attached pieces.

Before dismantling the pump, remove it from its location:

- Release the pins which fix the attachment plate to the support plate of the well.

First check that the lifting clamp bolts are securely in place, as they will be used to lift the equipment. In this position, leave to drain for a few moments to discharge the fluid contained in the pump.

- Lay down or support the equipment on the edge of the attachment plate, supporting the motor to ensure it does not rest on it as a cantilever.



DISMANTLING:

As a general guide to dismount the equipment, follow these steps:

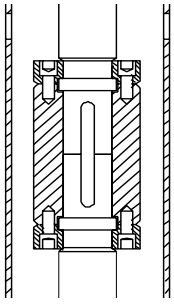
- Loosen the screws which join the pump to the impulsion pipe, therefore releasing it. (1)
- Release the auxiliary connections. (2)
- Release the nuts which join the cover to the pump casing and separate it. Use extractor screws to separate the casing. It is not necessary to release the suction filter, although we can clean it if the orifices are blocked. (3)
- Release the impeller attachment nuts and extract it. At this moment the wear rings are accessible (where appropriate). (4)
- Release the nuts which attach the cover to the intermediate pipe and extract the cover. (5)
- Remove the impeller key and remove the re-changeable bushing. Check the state of the friction bearing located in the bearing carrier cover. (6)
- If an intermediate bearing is fitted (7):
  - o Release the nuts which join the intermediate bearing support to the lower intermediate pipe and extract it.
  - o Release the nuts which join the intermediate bearing support to the upper intermediate pipe.
  - o Remove the whole intermediate bearing support by taking it to the side of the impeller, sliding it along the shaft without coming into contact with the edges.
  - o Observe the state of the friction bearing.
- Release the nuts which join the intermediate pipe to the support, and remove the intermediate pipe. (8)
- When an intermediate coupling is fitted, follow that indicated in point 7.4.2.. (9)
- Release the bolts which join the motor to the support, and dismount the motor and the coupling as shown in point 7.4.2.
- If fitted, release the seal or the packing as described in point 7.4.3 or 7.4.4, if not, release the lip seal.
- The support cover is released.
- Using a plastic hammer, gently bang the shaft on the side opposite the motor, causing the shaft and the bearings to come up where the motor was.
- Loosening the nut(s) of the bearings will release them and the pump as a whole.

Pump bearing failure.

Failure of the bearings may cause ignition through increased heat on the surface of the bearings. This can be avoided by using officially approved quality bearings, which are supplied as original spare parts.

7.5 Assembly

7.5.1 Coupling



Motor pump coupling

Note

- Proceed in inverse order to assembly. It is not necessary to check the alignment, due to the design of the pump in which the concentricity of the shafts is guaranteed by way of guides between the motor and the pump support.

Intermediate coupling

- The two shafts are positioned: motor side and pump side in line, then position the key.
- Introduce the coupling in both ends of the shaft and attach axially with two screwed cover halves on each side.

7.5.2 Mechanical seal (where fitted)

Mount in reverse order to dismounting.

Note For the correct operation of the seal it is necessary to at least:

- Take great care when cleaning the different parts of the mechanical seal, especially the contact faces. Not use lubricant; use only clean water with a cloth for cleaning optical devices.
- Not damage the O-rings during assembly.

7.5.3 Packing (where fitted)

- Introduce the packing gland and the cover along the shaft.
- Mount and secure the cover on the lantern support.
- Cut the new packing, forming as many rings as required. The cuts, seen from above, may be straight or inclined at 45º.
- We recommend leaving a small clearance of 0.5 mm in the packing cut.
- Position the rings one by one, pushing on them but without excessive force. The rings shall be introduced with the cut ends alternated 90°.
- Take care to introduce the lantern ring in the same order as before.
- Once the packing has been introduced, check that the shaft rotates freely without any stiff points.
- Secure the packing gland. The packing gland must not penetrate its entire free length. If necessary, introduce more rings.
- Gently tighten the gland nuts.
- In order to determine the appropriate torque of the gasket, proceed as indicated in point 7.2.

7.5.4 Pump

Proceed in reverse order to that described above, taking special care:

- When mounting the shaft in the support, take care to ensure it does not tilt and maintains the axial direction with the support.
- To introduce the different elements, use a plastic hammer, banging gently in order to prevent damage to the ballbearings, seals and bearings.
- Proceed to lubricate the bearings.
- Do not forget to position new joints. There should be no clearances and the joints should be perfect.

The pump materials have been selected in accordance with the process fluid indicated in the datasheets. If this fluid is modified, check with KSB ITUR that the new fluid is suitable for the pump.

- Note that the mounted intermediate bearing support is not symmetrical, since it presents a larger interior diameter on one side than on the other. Tighten the keep pin which secures the intermediate bearing. The smaller interior diameter part of the intermediate bearing support must remain towards the bottom, on the side of the pump.
- Use your hand to check that the shaft rotates freely every time a piece is mounted.
- If the friction bearing has been removed from its position in the cover, clean the inside of the cover and the exterior bearing surface before returning it, and use a plastic hammer to hit an intermediate piece into place. Do not forget to position the keep pin which fixes the bearing to the pump cover.
- It is very important to check that the bearings are perfectly aligned with the shaft, without any gaps which may lead to the deviation of the shaft.
- The impulsion pipes of the INVCP series pumps must take a position perpendicular to the support plate without presenting tensions or deviations from the shaft.

Note

- Check the correct positioning of pieces, especially seals, bushing and impellers.

7.5.5 Tightening torque of the screws/nuts

	Steel	Stainless steel
ISO Metric thread	Tightening Torque in [N·m] (for non-lubricated thread)	
M4	3.1	2.15
M5	6.1	4.25
M6	10.4	7.3
M8	25.2	17.7
M10	49.5	34.8

19	Tighten gland	Manually	When the leaks are excessive	
20	Change the packing	See point 7.4.4 and 7.5.3 of the manual	Every 4000 hours	
21	Carry out the axial regulation	See point 6 of the manual	When detecting contact and when dismounting	

(1) If the environment is dusty, humid or aggressive, the grease change should be carried out more often
(2) Where fitted

8 Trouble-shooting

The pump does not move the fluid
| Insufficient pressure or flow
| | Excessive absorbed power
| | | Excessive vibrations and noise
| | | | Excessive support temperature
| | | | | Loss of fluid through the mechanical seal
| | | | | | Wear rings deteriorate quickly

							Cause	Solution
X	X						Suction or impulsion valves closed or poorly regulated	Open the suction valve or search for work point with the impulsion valve
X							Incorrect rotation direction	Change the motor connections
X	X						Pipes, filter or impeller obstructed	Dismount and unblock
X	X		X				Pump not correctly submerged	Check minimum submergence (See point 5.3)
X	X						Maximum height generated by the pump lower than that required by the installation or counter pressure too high.	Increase the rotation speed. If this is not possible, a larger impeller or larger pump needs to be assembled. Please ask
	X						Rotation speed incorrect	Measure the speed, check the motor drive power supply voltage
	X		X				Wear rings or bearings deteriorated or incorrectly assembled	Dismount and change, or reinstall them
	X						Leaks between the casing and pipes	Dismount and check the joints
	X						Unsuitable installation/disturbances from other pumps	Check with the installer
		X					Liquid viscosity or density greater than normal.	Reduce the design point or change the motor
		X	X	X		X	Poor motor assembly	Check and clean the pump-motor joint.
		X					Obstruction inside the pump.	Dismount the pump and clean the impeller, inlets, pipe or filter
		X					The real height to be generated by the pump is lower than that of the design point, meaning the flow and power are greater	Partially close the impulsion valve
		X	X	X			Ballbearings deteriorated, poorly assembled or poorly lubricated	Check them, check the assembly or lubricate them, adjust them properly in their positions.
		X					Excessive contact in rotating parts	Dismount the pump and check elements are correctly assembled and/or worn
		X	X	X		X	Misaligned or deformed shaft	Dismount it and replace it
			X				Loose impeller support nuts	Dismount the pump and tighten them
		X	X	X		X	Pipe tensions on the pump	Check the installation
			X				Lack of rigidity in the foundations or anchor bolts loose	Make new foundations or tighten the bolts
			X				Pump cavitation	Improve the suction. Please ask.
			X	X		X	Impeller imbalanced or deteriorated	Balance the impeller or change it
			X			X	Bearings excessively worn or deteriorated	Change bearings
					X		Very deteriorated mechanical seal, seal spring broken or without elasticity, poorly assembled seal, or joints broken, deformed or without elasticity, or contact faces of the seal very deteriorated.	Dismount and replace the seal, or dismount, review damage and change as appropriate.
				X			High suction pressure	Please ask
					X		Re-changeable bushing scratched or deteriorated	Dismount and change the bushing

INSTALLATION, OPERATION AND MAINTENANCE MANUAL OF ELECTRIC MOTORS

This manual provides information about WEG induction motors fitted with squirrel cage, permanent magnet or hybrid rotors, low, medium and high voltage, in frame sizes IEC 56 to 630 and NEMA 42 to 9606/10.
The motor lines indicated below have additional information that can be checked in their respective manuals:

- Smoke Extraction Motors;
- Electromagnetic Brake Motors;
- Hazardous Area Motors.

These motors meet the following standards, if applicable:

- NBR 17094-1: Máquinas Elétricas Girantes - Motores de Indução - Parte 1: trifásicos.
- NBR 17094-2: Máquinas Elétricas Girantes - Motores de Indução - Parte 2: monofásicos.
- IEC 60034-1: Rotating Electrical Machines - Part 1: Rating and Performance.
- NEMA MG 1: Motors and Generators.
- CSA C 22.2 N°100: Motors and Generators.
- UL 1004-1: Rotating Electrical Machines - General Requirements.

If you have any questions regarding this manual please contact your local WEG branch, contact details can be found at www.weg.net.

1. TERMINOLOGY

Balancing: the procedure by which the mass distribution of a rotor is checked and, if necessary, adjusted to ensure that the residual unbalance or the vibration of the journals and/or forces on the bearings at a frequency corresponding to service speed are within specified limits in International Standards.
[ISO 1925:2001, definition 4.1]

Balance quality grade: indicates the peak velocity amplitude of vibration, given in mm/s, of a rotor running free-in-space and it is the product of a specific unbalance and the angular velocity of the rotor at maximum operating speed.

Grounded Part: metallic part connected to the grounding system.

Live Part: conductor or conductive part intended to be energized in normal operation, including a neutral conductor.

Authorized personnel: employee who has formal approval of the company.

Qualified personnel: employee who meets the following conditions simultaneously:
- Receives training under the guidance and responsibility of a qualified and authorized professional;
- Works under the responsibility of a qualified and approved professional.

Note*: The qualification is only valid for the company that trained the employee in the conditions set out by the authorized and qualified professional responsible for training.*

2. INITIAL RECOMMENDATIONS

Electric motors have energized circuits, exposed rotating parts and hot surfaces that may cause serious injury to people during normal operation. Therefore, it is recommended that transportation, storage, installation, operation and maintenance services are always performed by qualified personnel.
Also the applicable procedures and relevant standards of the country where the machine will be installed must be considered.
Noncompliance with the recommended procedures in this manual and other references on the WEG website may cause severe personal injuries and/or substantial property damage and may void the product warranty.

For practical reasons, it is not possible to include in this Manual detailed information that covers all construction variables nor covering all possible assembly, operation or maintenance alternatives.
This Manual contains only the required information that allows qualified and trained personnel to carry out their services. The product images are shown for illustrative purpose only.

For *Smoke Extraction Motors*, please refer to the additional instruction manual 50026367 available on the website www.weg.net.

For brake motors, please refer to the information contained in WEG 50021973 brake motor manual available on the website www.weg.net.

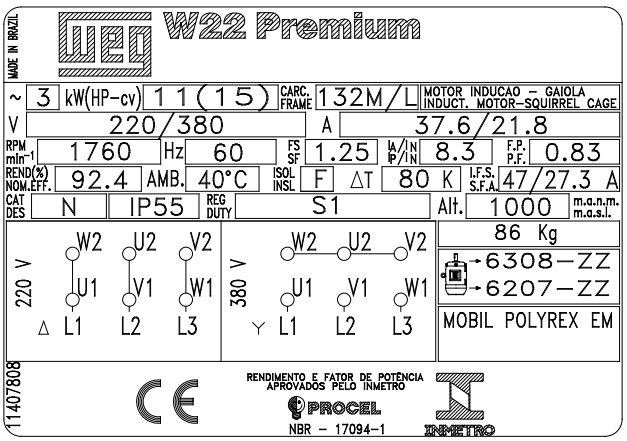
For information about permissible radial and axial shaft loads, please check the product technical catalogue.

The user is responsible for the correct definition of the installation environment and application characteristics.

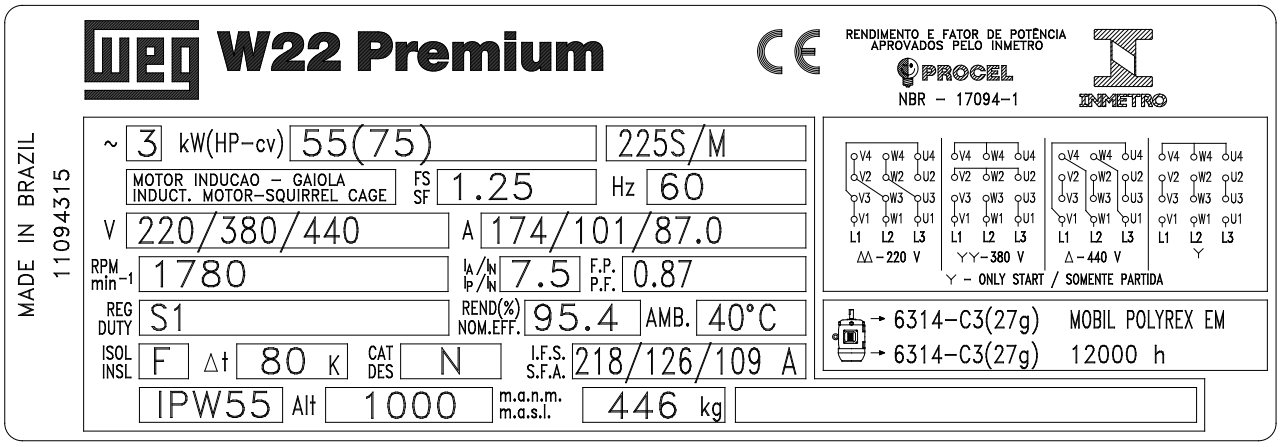
During the warranty period, all repair, overhaul and reclamation services must be carried out by WEG authorized Service Centers to maintain validity of the warranty.

2.1. WARNING SYMBOL

Warning about safety and warranty.



2.2. RECEIVING INSPECTION

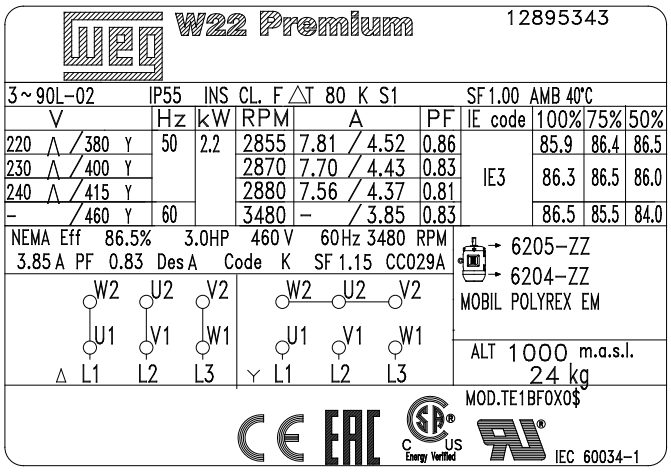


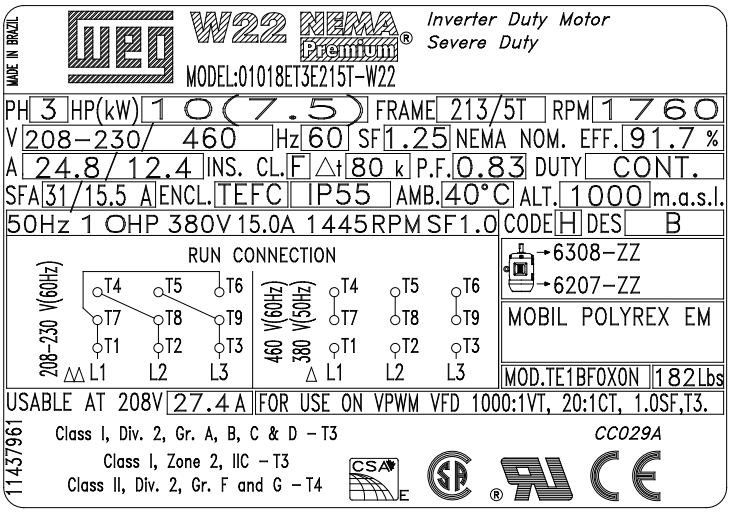
All motors are tested during the manufacturing process.
The motor must be checked when received for any damage that may have occurred during the transportation. All damages must be reported in writing to the transportation company, to the insurance company and to WEG. Failure to comply with such procedures will void the product warranty.
You must inspect the product:
- Check if nameplate data complies with the purchase order;
- Remove the shaft locking device (if any) and rotate the shaft by hand to ensure that it rotates freely;
- Check that the motor has not been exposed to excessive dust and moisture during the transportation.

Do not remove the protective grease from the shaft, or the plugs from the cable entries. These protections must remain in place until the installation has been completed.

2.3. NAMEPLATES

The nameplate contains information that describes the construction characteristics and the performance of the motor. Figure 2.1 and Figure 2.2 show nameplate layout examples.





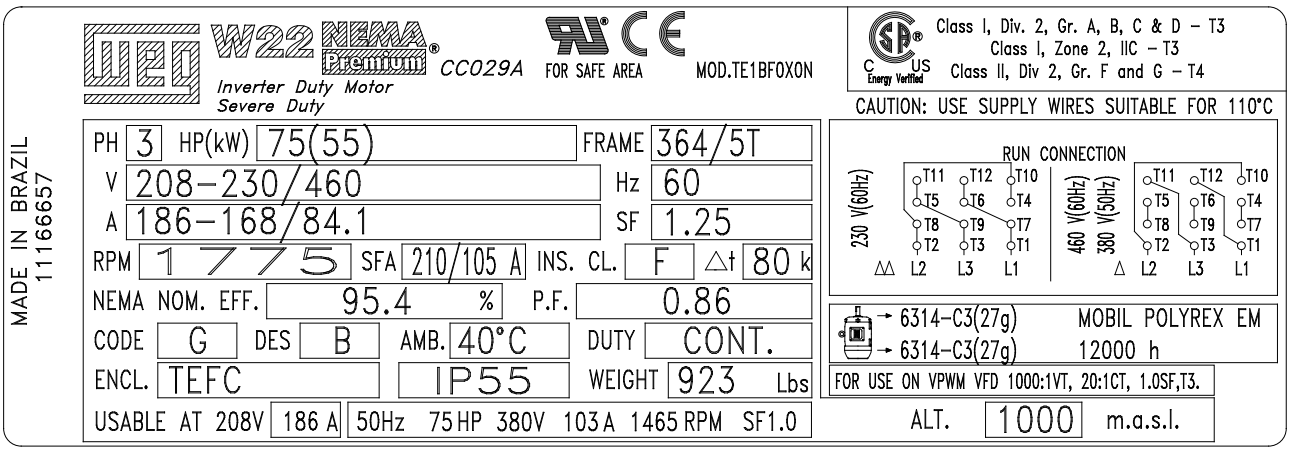


Figure 2.1 *- IEC motor nameplate*

Figure 2.1 - *IEC motor nameplate*

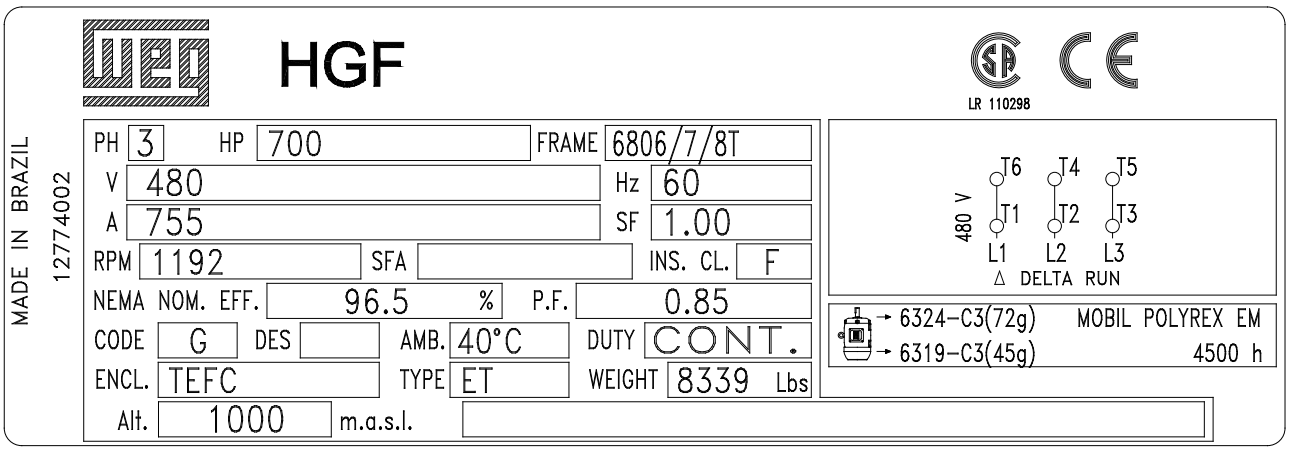

Figure 2.2 - *NEMA motor nameplate*

3. SAFETY INSTRUCTIONS

The motor must be disconnected from the power supply and be completely stopped before conducting any installation or maintenance procedures. Additional measures should be taken to avoid accidental motor starting.

Professionals working with electrical installations, either in the assembly, operation or maintenance, should use proper tools and be instructed on the application of standards and safety requirements, including the use of Personal Protective Equipment (PPE) that must be carefully observed in order to reduce risk of personal injury during these services.

Electric motors have energized circuits, exposed rotating parts and hot surfaces that may cause serious injury to people during normal operation. It is recommended that transportation, storage, installation, operation and maintenance services are always performed by qualified personnel.

Always follow the safety, installation, maintenance and inspection instructions in accordance with the applicable standards in each country.

4. HANDLING AND TRANSPORT

Individually packaged motors should never be lifted by the shaft or by the packaging. They must be lifted only by means of the eyebolts, when supplied. Use always suitable lifting devices to lift the motor. Eyebolts on the frame are designed for lifting the machine weight only as indicated on the motor nameplate. Motors supplied on pallets must be lifted by the pallet base with lifting devices fully supporting the motor weight.

The package should never be dropped. Handle it carefully to avoid bearing damage.

Eyebolts provided on the frame are designed for lifting the machine only. Do not use these eyebolts for lifting the motor with coupled equipment such as bases, pulleys, pumps, reducers, etc..

Never use damaged, bent or cracked eyebolts. Always check the eyebolt condition before lifting the motor.

Eyebolts mounted on components, such as on end shields, forced ventilation kits, etc. must be used for lifting these components only. Do not use them for lifting the complete machine set.

Handle the motor carefully without sudden impacts to avoid bearing damage and prevent excessive mechanical stresses on the eyebolts resulting in its rupture.

To move or transport motors with cylindrical roller bearings or angular contact ball bearings, use always the shaft locking device provided with the motor.
All HGF, W50 and W60 motors, regardless of bearing type, must be transported with shaft locking device fitted.
Vertical mounted motors with oil-lubricated bearings must be transported in the vertical position. If necessary to move or transport the motor in the horizontal position, install the shaft locking device on both sides (drive end and non-drive end) of the motor.

4.1. LIFTING

Before lifting the motor ensure that all eyebolts are tightened properly and the eyebolt shoulders are in contact with the base to be lifted, as shown in Figure 4.1. Figure 4.2 shows an incorrect tightening of the eyebolt.
Ensure that lifting machine has the required lifting capacity for the weight indicated on the motor nameplate.

Figure 4.1 *- Correct tightening of the eyebolt*

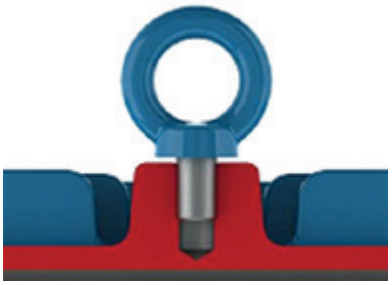

Figure 4.2 *- Incorrect tightening of the eyebolt*

The center-of-gravity may change depending on motor design and accessories. During the lifting procedures the maximum allowed angle of inclination should never be exceeded as specified below.

4.1.1. Horizontal motors with one eyebolt

For horizontal motors fitted with only one eyebolt, the maximum allowed angle-of-inclination during the lifting process should not exceed 30º in relation to the vertical axis, as shown in Figure 4.3.

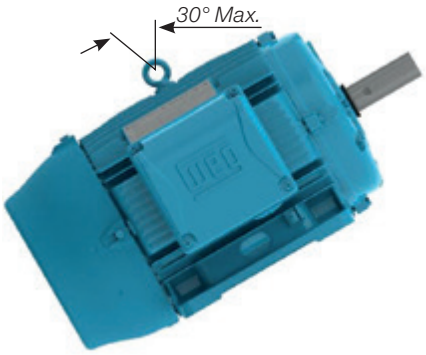

Figure 4.3 *- Maximum allowed angle-of-inclination for motor with one eyebolt*

4.1.2. Horizontal motor with two eyebolts

When motors are fitted with two or more eyebolts, all supplied eyebolts must be used simultaneously for the lifting procedure.

There are two possible eyebolt arrangements (vertical and inclined), as shown below:

- For motors with vertical lifting eyebolts, as shown in Figure 4.4, the maximum allowed lifting angle should not exceed 45° in relation to the vertical axis. We recommend to use a spreader beam for maintaining the lifting elements (chain or rope) in vertical position and thus preventing damage to the motor surface;

Figure 4.4 *- Maximum resulting angle for motors with two or more lifting eyebolts*

- For HGF, W40 and W50 motors, as shown in Figure 4.5, the maximum resulting angle should not exceed 30° in relation to the vertical axis;

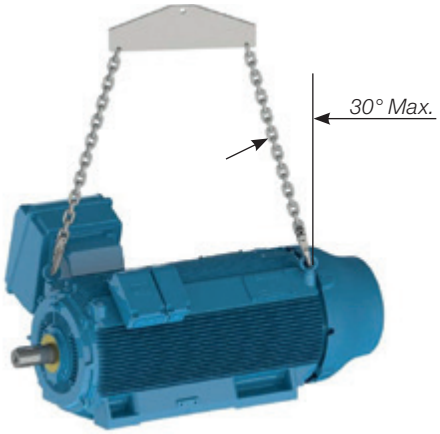

Figure 4.5 *- Maximum resulting angle for horizontal HGF, W40 and W50 motors*

For W60 motors, as shown in Figure 4.6, the use of a spreader beam is required for maintaining the lifting elements (chain or rope) in vertical position and thus preventing damage to the motor surface.

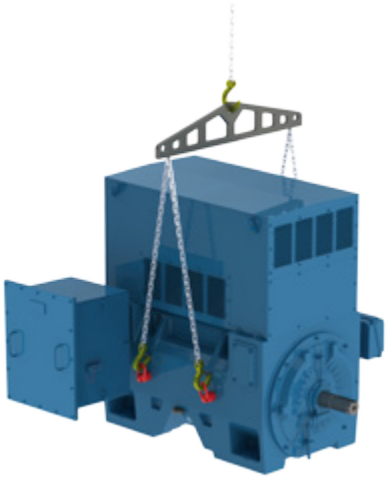

Figure 4.6 *- Lifting for W60 motors with paralel chains*

- For motors fitted with inclined eyebolts, as shown in Figure 4.7, the use of a spreader beam is required for maintaining the lifting elements (chain or rope) in vertical position and thus preventing damage to the motor surface.

Figure 4.7 *- Use of a spreader beam for lifting*

4.1.3. Vertical motors

For vertical mounted motors, as shown in Figure 4.8, the use of a spreader beam is required for maintaining the lifting element (chain or rope) in vertical position and thus preventing damage to the motor surface.

Figure 4.8 *- Lifting of vertical mounted motors*

Always use the eyebolts mounted on the top side of the motor, diametrically opposite, considering the mounting position. See Figure 4.9.

Figure 4.9 *- Lifting of HGF and W50 motors.*

4.1.3.1. Procedures to place W22 motors in the vertical position

For safety reasons during the transport, vertical mounted Motors are usually packed and supplied in horizontal position.
To place W22 motors fitted with eyebolts (see Figure 4.7), to the vertical position, proceed as follows:

1. Ensure that the eyebolts are tightened properly, as shown in Figure 4.1;
2. Remove the motor from the packaging, using the top mounted eyebolts, as shown in Figure 4.10;

Figure 4.10 *- Removing the motor from the packaging*

3. Install a second pair of eyebolts, as shown in Figure 4.11;

Figure 4.11 *- Installation of the second pair of eyebolts*

4. Reduce the load on the first pair of eyebolts to start the motor rotation, as shown in Figure 4.12. This procedure must be carried out slowly and carefully.

Figure 4.12 *- End result: motor placed in vertical position*

These procedures will help you to move motors designed for vertical mounting. These procedures are also used to place the motor from the horizontal position into the vertical position and vertical to horizontal.

4.1.3.2. Procedures to place HGF and W50 motors in the vertical position

HGF motors are fitted with eight lifting points: four at drive end and four at non-drive end. W50 motors are fitted with nine lifting points: four at drive end, one in the central part and four at non-drive end. The motors are usually transported in horizontal position, however for the installation they must be placed in the vertical position.
To place an these motors in the vertical position, proceed as follows:

1. Lift the motor by using the four lateral eyebolts and two hoists, see Figure 4.13;

Figure 4.13 *- Lifting of HGF and W50 motors with two hoists*

2. Lower the hoist fixed to motor drive end while lifting the hoist fixed to motor non-drive end until the motor reaches its equilibrium, see Figure 4.14;

Figure 4.14 *- Placing HGF and W50 motors in vertical position*

3. Remove the hoist hooks from the drive end eyebolts and rotate the motor 180° to fix the removed hooks into the two eyebolts at the motor non-drive end, see Figure 4.15;

Figure 4.15 *- Lifting HGF and W50 motors by the eyebolts at the non-drive end*

4. Fix the removed hoist hooks in the other two eyebolts at the non-drive end and lift the motor until the vertical position is reached, see Figure 4.16.

Figure 4.16 *- HGF and W50 motors in the vertical position*

These procedures will help you to move motors designed for vertical mounting. These procedures are also used to place the motor from the horizontal position into the vertical position and vertical to horizontal.

4.2 Procedures to place W22 vertical mount motors in horizontal position

To place W22 vertical mount motor in horizontal position, proceed as follows:

1. Ensure that all eyebolts are tightened properly, as shown in Figure 4.1;

2. Install the first pair of eyebolts and lift the motor as shown in Figure 4.17;

Figure 4.17 - *Install the first pair of eyebolts*

3. Install the second pair of eyebolts, as shown in Figure 4.18;

Figure 4.18 - *Install the second pair of eyebolts*

4. Reduce the load on the first pair of eyebolts for rotating the motor, as shown in Figure 4.19. This procedure must be carried out slowly and carefully;

Figure 4.19 - *Motor is being rotated to horizontal position*

5. Remove the first pair of eyebolts, as shown in Figure 4.20.

Figure 4.20 - *Final result: motor placed in horizontal position*

5. STORAGE

If the motor is not installed immediately, it must be stored in a dry and clean environment, with relative humidity not exceeding 60%, with an ambient temperature between 5 °C and 40 °C, without sudden temperature changes, free of dust, vibrations, gases or corrosive agents. The motor must be stored in horizontal position, unless specifically designed for vertical operation, without placing objects on it. Do not remove the protection grease from shaft end to prevent rust.

If the motor are fitted with space heaters, they must always be turned on during the storage period or when the installed motor is out of operation. Space heaters will prevent water condensation inside the motor and keep the winding insulation resistance within acceptable levels. Store the motor in such position that the condensed water can be easily drained. If fitted, remove pulleys or couplings from the shaft end (more information are given on item 6).

The space heaters should never be energized when the motor is in operation.

5.1. EXPOSED MACHINED SURFACES

All exposed machined surfaces (like shaft end and flange) are factory-protected with temporary rust inhibitor. A protective film must be reapplied periodically (at least every six months), or when it has been removed and/or damaged.

5.2. STORAGE

The stacking height of the motor packaging during the storage period should not exceed 5 m, always considering the criteria indicated in Table 5.1:

Table 5.1 *- Max. recommended stacking height*

Packaging type	Frame sizes	Maximum stacking quantity
Cardboard box	IEC 63 to 132 NEMA 143 to 215	Indicated on the top side of the cardboard box
Wood crate	IEC 63 to 315 NEMA 48 to 504/5	06
	IEC 355 NEMA 586/7 and 588/9	03
	W40 / W50 / W60 / HGF IEC 315 to 630 W40 / W50 / HGF NEMA 5000 to 9600	Indicated on the packaging

Notes*:*
1) Never stack larger packaging onto smaller packaging;
2) Align the packaging correctly (see Figure 5.1 and Figure 5.2);

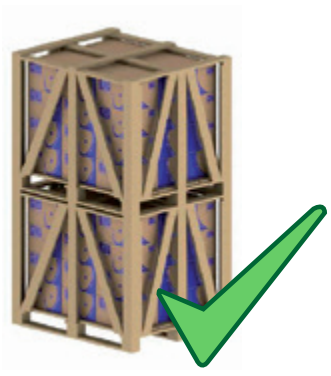

Figure 5.1 *- Correct stacking*

Figure 5.2 *- Incorrect stacking*

3) The feet of the crates above should always be supported by suitable wood battens (Figure 5.3) and never stand on the steel tape or without support (Figure 5.4);

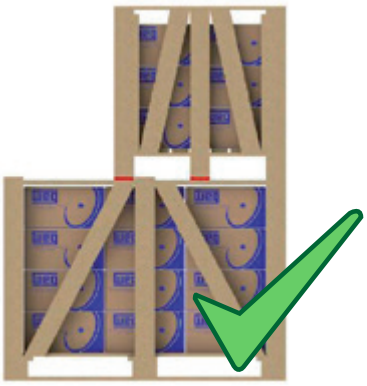

Figure 5.3 - Correct stacking

Figure 5.4 - Incorrect stacking

4) When stacking smaller crates onto longer crates, always ensure that suitable wooden supports are provided to withstand the weight (see Figure 5.5). This condition usually occurs with motor packaging above IEC 225S/M (NEMA 364/5T) frame sizes.

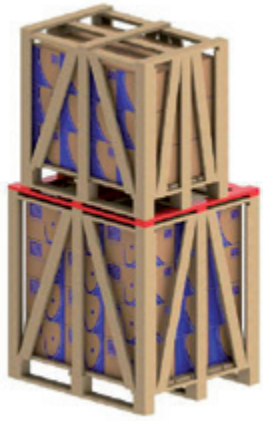

***Figure 5.5** - Use of additional battens for stacking*

5.3 BEARINGS

5.3.1 Grease lubricated bearings

We recommend rotating the motor shaft at least once a month (by hand, at least five revolutions, stopping the shaft at a different position from the original one). If the motor is fitted with shaft locking device, remove it before rotating the shaft and install it again before performing any handling procedure. Vertical motors may be stored in the vertical or in horizontal position. If motors with open bearings are stored longer than six months, the bearings must be relubricated according to item 8.2 before commissioning of the motor.
If the motor is stored for longer than 2 years, the bearings must be replaced or removed, washed, inspected and relubricated according to item 8.2.

5.3.2 Oil lubricated bearings

The motor must be stored in its original operating position and with oil in the bearings. Correct oil level must be ensured. It should be in the center of the sight glass.
During the storage period, remove the shaft locking device and rotate the shaft by hand every month, at least five revolutions, thus achieving an even oil distribution inside the bearing and maintaining the bearing in good operating conditions. Reinstall the shaft locking device every time the motor has to be moved.
If the motor is stored for a period equal or longer than the oil change interval, the oil must be replaced according to Item 8.2, before starting the operation. If the motor is stored for a period of over two years, the bearings must be replaced or removed, washed according to manufacturer instructions, checked and relubricated according to Item 8.2. The oil of vertical mounted motors is removed to prevent oils leaks during the transport. After receiving the motor the bearings must be lubricated.

5.3.3 Oil Mist lubricated bearings

The motor must be stored in horizontal position. Lubricate the bearings with ISO VG 68 mineral oil in the amount indicated in the Table 5.2 (this is also valid for bearings with equivalent dimensions). After filling with oil, rotate the shaft by hand, at least five revolutions)
During the storage period, remove the shaft locking device (if any) and rotate the shaft by hand every week, at least five revolutions, stopping it at a different position from the original one. Reinstall the shaft locking device every time the motor has to be moved. If the motor is stored for a period of over two years, the bearings must be replaced or removed, washed according to manufacturer instructions, checked and relubricated according to item 8.2.

***Table 5.2** - Amount of oil per bearing*

Bearing size	Amount of oil (ml)	Bearing size	Amount of oil (ml)
6201	15	6309	65
6202	15	6311	90
6203	15	6312	105
6204	25	6314	150
6205	25	6315	200
6206	35	6316	250
6207	35	6317	300
6208	40	6319	350
6209	40	6320	400
6211	45	6322	550
6212	50	6324	600
6307	45	6326	650
6308	55	6328	700

The oil must always be removed when the motor has to be handled. If the oil mist system is not operating after installation, fill the bearings with oil to prevent bearing rusting. During the storage period, rotate the shaft by hand, at least five revolutions, stopping it at a different position from the original one. Before starting the motor, all bearing protection oil must be drained from the bearing and the oil mist system must be switched ON.

5.3.4 Sleeve bearing

The motor must be stored in its original operating position and with oil in the bearings. Correct oil level must be ensured. It should be in the middle of the sight glass. During the storage period, remove the shaft locking device and rotate the shaft by hand every month, at least five revolutions, and at 30 rpm, thus achieving an even oil distribution inside the bearing and maintaining the bearing in good operating conditions. Reinstall the shaft locking device every time the motor has to be moved.
If the motor is stored for a period equal or longer than the oil change interval, the oil must be replaced, according to Item 8.2, before starting the operation.

If the motor is stored for a period longer than the oil change interval, or if it is not possible to rotate the motor shaft by hand, the oil must be drained and a corrosion protection and dehumidifiers must be applied.

5.4. INSULATION RESISTANCE

We recommend measuring the winding insulation resistance at regular intervals to follow-up and evaluate its electrical operating conditions. If any reduction in the insulation resistance values are recorded, the storage conditions should be evaluated and corrected, where necessary.

5.4.1. Insulation resistance measurement

We recommend measuring the winding insulation resistance at regular intervals to follow-up and evaluate its electrical operating conditions. If any reduction in the insulation resistance values are recorded, the storage conditions should be evaluated and corrected, where necessary.

The insulation resistance must be measured in a safe environment.

The insulation resistance must be measured with a megohmmeter. The machine must be in cold state and disconnected from the power supply.

To prevent the risk of an electrical shock, ground the terminals before and after each measurement. Ground the capacitor (if any) to ensure that it is fully discharged before the measurement is taken.

It is recommended to insulate and test each phase separately. This procedure allows the comparison of the insulation resistance between each phase. During the test of one phase, the other phases must be grounded. The test of all phases simultaneously evaluates the insulation resistance to ground only but does not evaluate the insulation resistance between the phases.
The power supply cables, switches, capacitors and other external devices connected to the motor may considerably influence the insulation resistance measurement. Thus all external devices must be disconnected and grounded during the insulation resistance measurement.
Measure the insulation resistance one minute after the voltage has been applied to the winding. The applied voltage should be as shown in Table 5.3.

Table 5.3 *- Voltage for the insulation resistance*

Winding rated voltage (V)	Testing voltage for measuring the insulation resistance (V)
< 1000	500
1000 - 2500	500 - 1000
2501 - 5000	1000 - 2500
5001 - 12000	2500 - 5000
> 12000	5000 - 10000

The reading of the insulation resistance must be corrected to 40 °C as shown in the Table 5.4.

Table 5.4 *- Correction factor for the insulation resistance corrected to 40 °C*

Measuring temperature of the insulation resistance (°C)	Correction factor of the insulation resistance corrected to 40 °C	Measuring temperature of the insulation resistance (°C)	Correction factor of the insulation resistance corrected to 40 °C
10	0.125	30	0.500
11	0.134	31	0.536
12	0.144	32	0.574
13	0.154	33	0.616
14	0.165	34	0.660
15	0.177	35	0.707
16	0.189	36	0.758
17	0.203	37	0.812
18	0.218	38	0.871
19	0.233	39	0.933
20	0.250	40	1.000
21	0.268	41	1.072
22	0.287	42	1.149
23	0.308	43	1.231
24	0.330	44	1.320
25	0.354	45	1.414
26	0.379	46	1.516
27	0.406	47	1.625
28	0.435	48	1.741
29	0.467	49	1.866
30	0.500	50	2.000

The motor insulation condition must be evaluated by comparing the measured value with the values indicated in Table 5.5 (corrected to 40 °C):

Table 5.5 *- Evaluation of the insulation system*

Limit value for rated voltage up to 1.1 kV (MΩ)	Limit value for rated voltage above 1.1 kV (MΩ)	Situation
Up to 5	Up to 100	Dangerous. The motor can not be operated in this condition
5 to 100	100 to 500	Regular
100 to 500	Higher than 500	Good
Higher than 500	Higher than 1000	Excellent

The values indicated in the table should be considered only as reference values. It is advisable to log all measured values to provide a quick and easy overview on the machine insulation resistance.
If the insulation resistance is low, moisture may be present in the stator windings. In this case the motor should be removed and transported to a WEG authorized Service Center for proper evaluation and repair (This service is not covered by the warranty). To improve the insulation resistance through the drying process, see section 8.4.

6. INSTALLATION

The insulation resistance must be measured in a safe environment.

Check some aspects before proceeding with the installation:

1. Insulation resistance: must be within the acceptable limits. See item 5.4.
2. Bearings:
   If the motor is installed without running immediately, proceed as described in item 5.3.
3. Operating conditions of the start capacitors: If single-phase motors are stored for a period of over two years, it is recommended to change the start capacitors before motor starting since they lose their operating characteristics.
4. Terminal box:
   a. the inside of the terminal box must be clean and dry;
   b. the contacts must be correctly connected and corrosion free. See 6.9 and 6.10;
   c. the cable entries must be correctly sealed and the terminal box cover properly mounted in order to ensure the degree of protection indicated on the motor nameplate.
5. Cooling: the cooling fins, air inlet and outlet openings must be clean and unobstructed. The distance between the air inlet openings and the wall should not be shorter than ¼ (one quarter) of the diameter of the air inlet. Ensure sufficient space to perform the cleaning services. See item 7.
6. Coupling: remove the shaft locking device (where fitted) and the corrosion protection grease from the shaft end and flange just before installing the motor. See item 6.4.
7. Drain hole: the motor must always be positioned so the drain hole is at the lowest position (If there is any indication arrow on the drain, the drain must be so installed that the arrow points downwards).
   Motors supplied with rubber drain plugs leave the factory in the closed position and must be opened periodically to allow the exit of condensed water. For environments with high water condensation levels and motor with degree of protection IP55, the drain plugs can be mounted in open position (see Figure 6.1).
   For motors with degree of protection IP56, IP65 or IP66, the drain plugs must remain at closed position (see Figure 6.1), being opened only during the motor maintenance procedures.
   The drain system of motors with Oil Mist lubrication system must be connected to a specific collection system (see Figure 6.12).

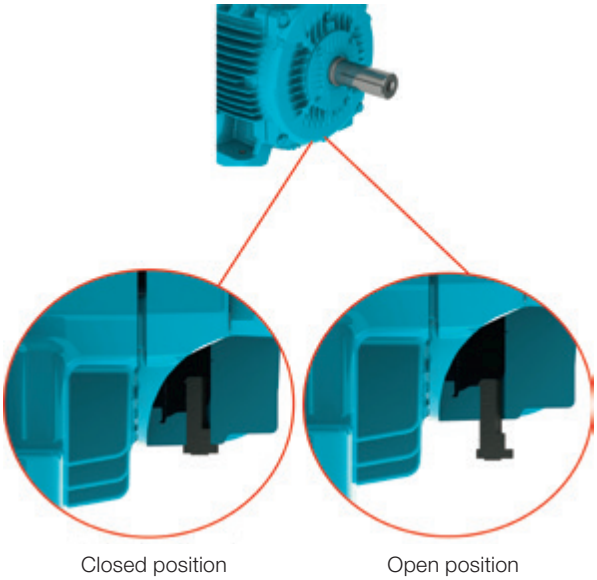

Figure 6.1 *- Detail of the rubber drain plug mounted in closed and open position*

8.Additional recommendations:
a. Check the direction of motor rotation, starting the motor at no-load before coupling it to the load;
b. Vertical mounted motors with shaft end down must be fitted with drip cover to protect them from liquids or solids that may drop onto the motors;
c. Vertical mounted motors with shaft end up should be fitted with water slinger ring to prevent water ingress inside the motor.
d. The fixing elements mounted in the threaded through holes in the motor enclosure (for example, the flange) must be properly sealed.

Remove or fix the shaft key before starting the motor.

Changes on the motor construction (features), such as installation of extended grease fittings or modification of the lubrication system, installation of accessories at alternative locations, etc., can be carried out only after prior written consent from WEG.

6.1. FOUNDATIONS

The foundation is the structure, structural element, natural or prepared base, designed to withstand the stresses produced by the installed equipment, ensuring safe and stable performance during operation. The foundation design should consider the adjacent structures to avoid the influences of other installed equipment and no vibration is transferred through the structure

The foundation must be flat and its selection and design must consider the following characteristics:

a) The features of the machine to be installed on the foundation, the driven loads, application, maximum allowed deformations and vibration levels (for instance, motors with reduced vibration levels, foot flatness, flange concentricity, axial and radial loads, etc. lower than the values specified for standard motors).

b) Adjacent buildings, conservation status, maximum applied load estimation, type of foundation and fixation and vibrations transmitted by theses constructions.

If the motor is supplied with leveling/alignment bolts, this must be considered in the base design.

Please consider for the foundation dimensioning all stresses that are generated during the operation of the driven load.
The user is responsible for the foundation designing and construction.

The foundation stresses can be calculated by using the following equations (see Figure 6.2):

$$F_1 = 0,5 * g * m - (4 * T_b / A)$$
$$F_2 = 0,5 * g * m + (4 * T_b / A)$$

Where:

F_1 and F_2 = lateral stresses (N);
g = gravitational acceleration (9,8 m/s^2);
m = motor weight (kg);
T_b = breakdown torque (Nm);
A = distance between centerlines of mounting holes in feet or base of the machine (end view) (m).

The motors may be mounted on:

- Concrete bases: are most used for large-size motors (see Figure 6.2);
- Metallic bases: are generally used for small-size motors (see Figure 6.3).

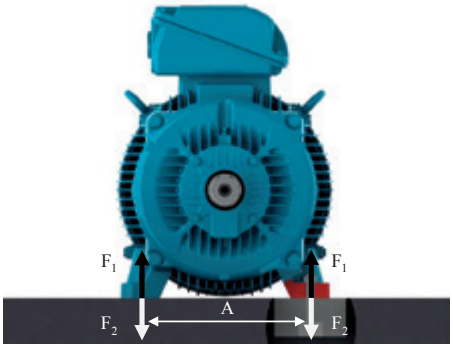

Figure 6.2 *- Motor installed on concrete base*

Figure 6.3 *- Motor installed on metallic base*

The metallic and concrete bases may be fitted with sliding system. These types of foundations are generally used where the power transmission is achieved by belts and pulleys. This power transmission system is easier to assemble/disassemble and allows the belt tension adjustment. Other important aspect of this foundation type is the location of the base locking screws that must be diagonally opposite. The rail nearest the drive pulley is placed in such a way that the positioning bolt is between the motor and the driven machine. The other rail must be placed with the bolt on the opposite side (diagonally opposite), as shown in Figure 6.4 .

To facilitate assembly, the bases may have the following features:

- Shoulders and/or recesses;
- Anchor bolts with loose plates;
- Bolts cast in the concrete;
- Leveling screws;
- Positioning screws;
- Steel & cast iron blocks, plates with flat surfaces.

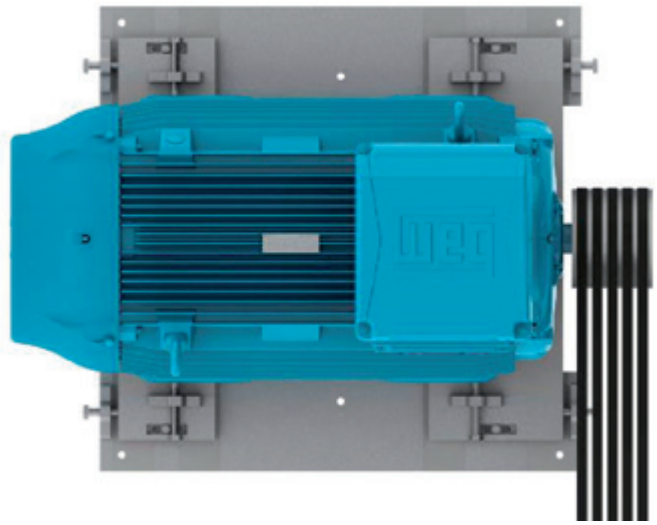

Figure 6.4 *- Motor installed on sliding base*

After completing the installation, it is recommended that all exposed machined surfaces are coated with suitable rust inhibitor.

6.2. MOTOR MOUNTING

Footless motors supplied with transportation devices, according to Figure 6.5, must have their devices removed before starting the motor installation.

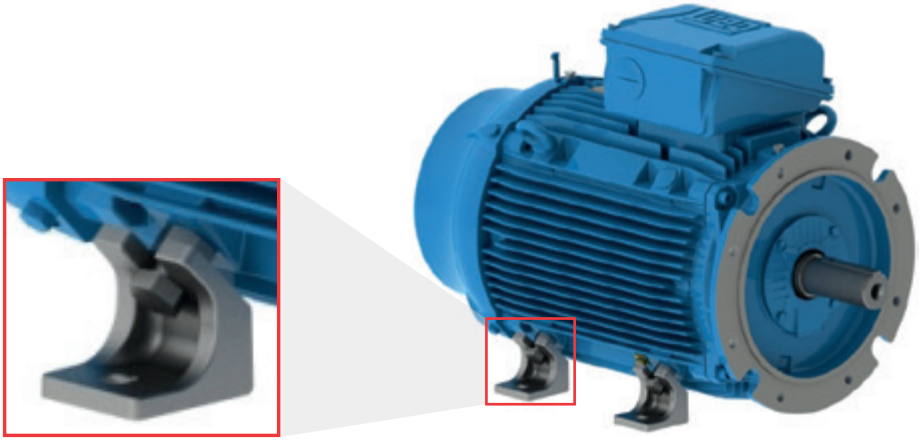

Figure 6.5 *- Detail of the transportation devices for footless motors*

6.2.1. Foot mounted motors

The drawings of the mounting hole dimensions for NEMA or IEC motors can be checked in the respective technical catalogue.
The motor must be correctly aligned and leveled with the driven machine. Incorrect alignment and leveling may result in bearing damage, generate excessive vibration and even shaft distortion/breakage.
For more details, see section 6.3 and 6.6. The thread engagement length of the mounting bolt should be at least 1.5 times the bolt diameter. This thread engagement length should be evaluated in more severe applications and increased accordingly.
Figure 6.6 shows the mounting system of a foot mounted motor indicating the minimum required thread engagement length.

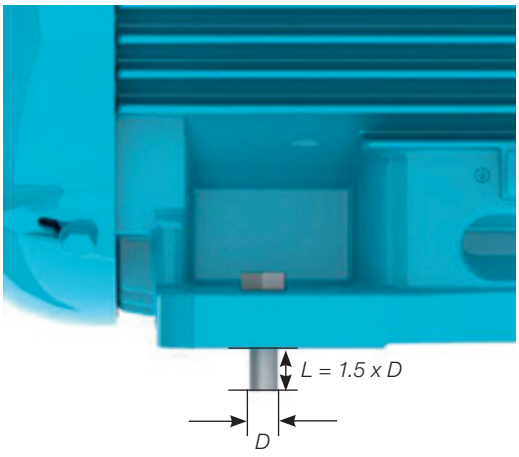

Figure 6.6 *- Mounting system of a foot mounted motor*

6.2.2. Flange mounted motors

The drawings of the flange mounting dimensions, IEC and NEMA flanges, can be checked in the technical catalogue.
The coupling of the driven equipment to the motor flange must be properly dimensioned to ensure the required concentricity of the assembly.
Depending on the flange type, the mounting can be performed from the motor to the driven equipment flange (flange FF (IEC) or D (NEMA)) or from the driven equipment flange to the motor (flange C (DIN or NEMA)).
For the mounting process from the driven equipment flange to the motor, you must consider the bolt length, flange thickness and the thread depth of the motor flange.

If the motor flange has tapped through-holes, the length of the mounting bolts must not exceed the tapped through-hole length of the motor flange, thus preventing damage to the winding head.

For flange mounting the thread engagement length of the mounting bolt should be at least 1.5 times the bolt diameter. In severe applications, longer thread engagement length may be required.
In severe applications or if large motors are flange mounted, a foot or pad mounting may be required in addition to the flange mounting (Figure 6.7). The motor must never be supported on its cooling fins.

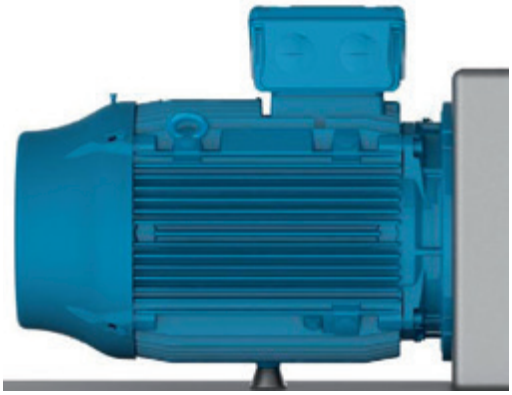

Figure 6.7 *- Mounting method of flange mounted motors with frame base support*

Note*:*
When liquid (for example oil) is likely to come into contact with the shaft seal, please contact your local WEG representative.

6.2.3. Pad mounted motors

Typically, this method of mounting is used in axial fans. The motor is fixed by tapped holes in the frame. The dimensions of these tapped holes can be checked in the respective product catalogue. The selection of the motor mounting rods/bolts must consider the dimensions of the fan case, the installation base and the thread depth in the motor frame.
The mounting rods and the fan case wall must be sufficiently stiff to prevent the transmission of excessive vibration to the machine set (motor & fan). Figure 6.8 shows the pad mounting system.

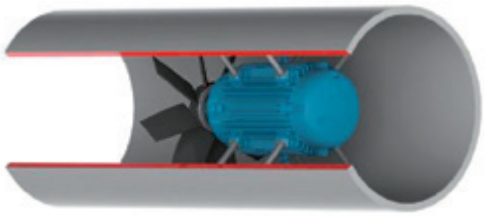

Figure 6.8 *- Mounting of the motor inside the cooling duct*

6.3. BALANCING

Unbalanced machines generate vibration which can result in damage to the motor. WEG motors are dynamically balanced with “half key” and without load (uncoupled). Special balancing quality level must be stated in the Purchase Order.

The transmission elements, such as pulleys, couplings, etc., must balanced with “half key” before they are mounted on the motor shaft.

The balance quality grade meets the applicable standards for each product line.

The maximum balancing deviation must be recorded in the installation report.

6.4. COUPLINGS

Couplings are used to transmit the torque from the motor shaft to the shaft of the driven machine. The following aspects must be considered when couplings are installed:

- Use proper tools for coupling assembly & disassembly to avoid damages to the motor and bearings;
- Whenever possible, use flexible couplings, since they can absorb eventual residual misalignments during the machine operation;
- The maximum loads and speed limits informed in the coupling and motor manufacturer catalogues cannot be exceeded;
- Level and align the motor as specified in sections 6.5 and 6.6, respectively.

Remove or fix the shaft key firmly when the motor is operated without coupling in order to prevent accidents.

6.4.1. Direct coupling

Direct coupling is characterized when the Motor shaft is directly coupled to the shaft of the driven machine without transmission elements. Whenever possible, use direct coupling due to lower cost, less space required for installation and more safety against accidents.

Do not use roller bearings for direct coupling, unless sufficient radial load is expected.

6.4.2. Gearbox coupling

Gearbox coupling is typically used where speed reduction is required.
Make sure that shafts are perfectly aligned and strictly parallel (in case of straight spur gears) and in the right meshing angle (in case of bevel and helical gears).

6.4.3. Pulley and belt coupling

Pulleys and belts are used when speed increase or reduction between motor shaft and driven load is required.

Excessive belt tension will damage the bearings and cause unexpected accidents such as breakage of the motor shaft.

6.4.4. Coupling of sleeve bearing motors

Motors designed with sleeve bearings must be operated with direct coupling to the driven machine or a gearbox. Pulley and belts can not be applied for sleeve bearing motors.

Motors designed with sleeve bearings have 3 (three) marks on the shaft end. The center mark is the indication of the magnetic center and the 2 (two) outside marks indicate the allowed limits of the rotor axial movement, as shown in Figure 6.9.
The motor must be so coupled that during operation the arrow on the frame is placed over the central mark indicating the rotor magnetic center. During start-up, or even during operation, the rotor may freely move between the two outside marks when the driven machine exerts an axial load on the motor shaft. However, under no circumstance, the motor can operate continuously with axial forces on the bearing.

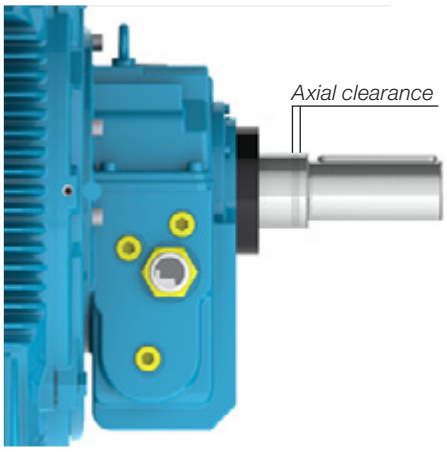

Figure 6.9 *- Axial clearance of motor designed with sleeve bearing*

For coupling evaluation consider the maximum axial bearing clearance as shown in Table 6.1.
The axial clearance of the driven machine and coupling influence the maximum bearing clearance.

Table 6.1 *- Clearance used for sleeve bearings*

Bearing size	Total axial clearance (mm)
9*	3 + 3 = 6
11*	4 + 4 = 8
14*	5 + 5 =10
18	7,5 + 7,5 = 15

** For Motors in accordance with API 541, the total axial clearance is 12.7 mm*

The sleeve bearings used by WEG were not designed to support axial load continuously.
Under no circumstance must the motor be operated continuously at its axial clearance limits.

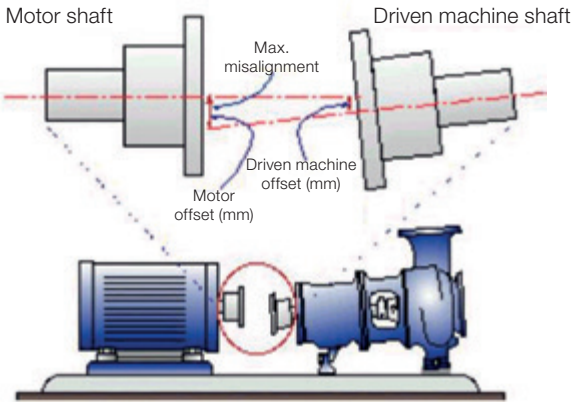
6.5. LEVELING

The motor must be leveled to correct any deviations in flatness arising from the manufacturing process and the material structure rearrangement. The leveling can be carried out by a leveling screw fixed on the motor foot or on the flange or by means of thin compensation shims. After the leveling process, the leveling height between the motor mounting base and the motor cannot exceed 0.1 mm.
If a metallic base is used to level the height of the motor shaft end and the shaft end of the driven machine, level only the metallic base relating to the concrete base.

Record the maximum leveling deviations in the installation report.

6.6. ALIGNMENT

The correct alignment between the motor and the driven machine is one of the most important variables that extends the useful service life of the motor. Incorrect coupling alignment generates high loads and vibrations reducing the useful life of the bearings and even resulting in shaft breakages. Figure 6.10 illustrates the misalignment between the motor and the driven machine.



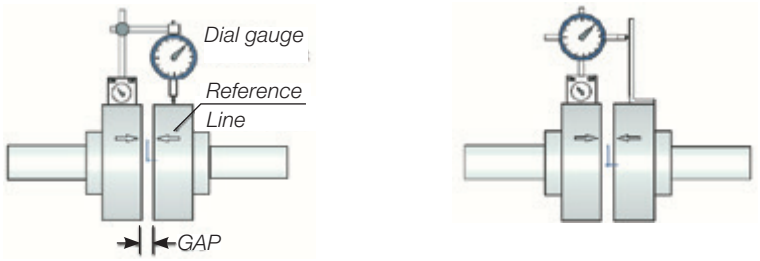


Figure 6.10 *- Typical misalignment condition*

Alignment procedures must be carried out using suitable tools and devices, such as dial gauge, laser alignment instruments, etc.. The motor shaft must be aligned axially and radially with the driven machine shaft.

The maximum allowed eccentricity for a complete shaft turn should not exceed 0.03 mm, when alignment is made with dial gauges, as shown in Figure 6.11. Ensure a gap between couplings to compensate the thermal expansion between the shafts as specified by the coupling manufacturer.

Parallel alignment *Angular alignment*

Figure 6.11 *- Alignment with dial gauge*

If alignment is made by a laser instrument, please consider the instructions and recommendations provided by the laser instrument manufacturer.
The alignment should be checked at ambient temperature with machine at operating temperature.

The coupling alignment must be checked periodically.

Pulley and belt couplings must be so aligned that the driver pulley center lies in the same plane of the driven pulley center and the motor shaft and the shaft of the driven machine are perfectly parallel.
After completing the alignment procedures, ensure that mounting devices do not change the motor and machine alignment and leveling resulting into machine damage during operation.

It is recommended to record the maximum alignment deviation in the Installation Report.

6.7. CONNECTION OF OIL LUBRICATED OR OIL MIST LUBRICATED MOTORS

When oil lubricated or oil mist lubricated motors are installed, connect the existing lubricant tubes (oil inlet and oil outlet tubes and motor drain tube), as shown in Figure 6.12. The lubrication system must ensure continuous oil flow through the bearings as specified by the manufacturer of the installed lubrication system.

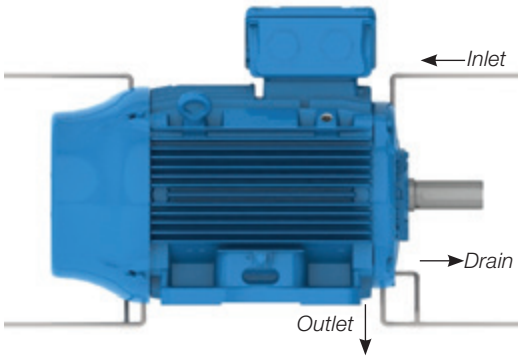

Figure 6.12 *- Oil supply and drain system of oil lubricated or oil mist lubricated motors*

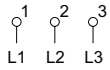
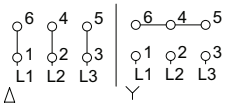
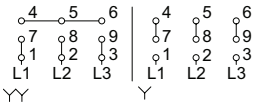
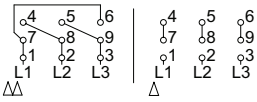
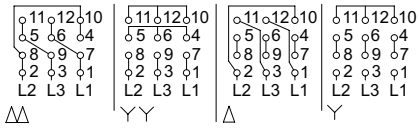
6.8. CONNECTION OF THE COOLING WATER SYSTEM

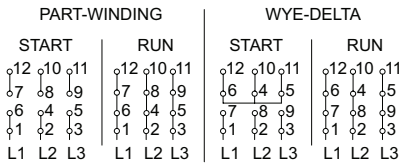


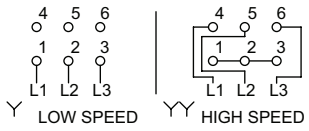


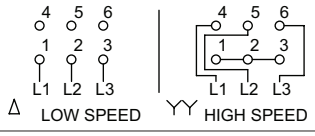


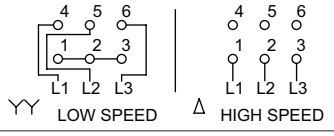


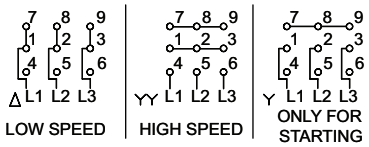


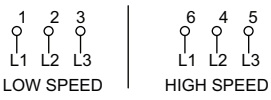










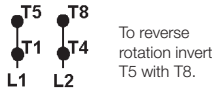


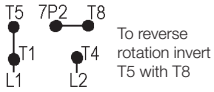
When water cooled motors are installed, connect the water inlet and outlet tubes to ensure proper motor cooling. According to item 7.2, ensure correct cooling water flow rate and water temperature in the motor cooling system.

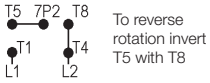
6.9. ELECTRICAL CONNECTION

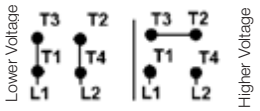
Consider the rated motor current, service factor, starting current, environmental and installation conditions, maximum voltage drop, etc. to select appropriate power supply cables and switching and protection devices. All motors must be installed with overload protection systems. Three-phase motors should be fitted with phase fault protection systems.

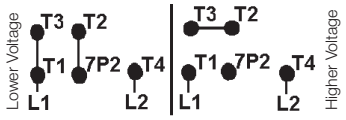
Before connecting the motor, check if the power supply voltage and the frequency comply with the motor nameplate data. All wiring must be made according to the connection diagram on the motor nameplate. Please consider the connection diagrams in the Tables 6.2 and 6.3 as reference value.
To prevent accidents, check if motor has been solidly grounded in accordance with the applicable standards.

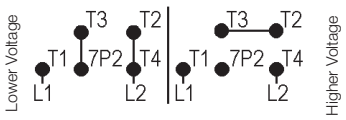


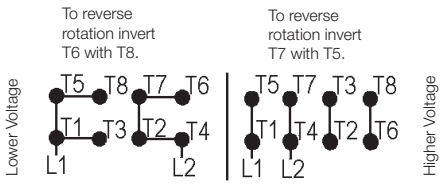


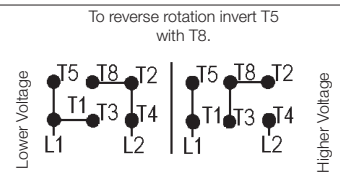


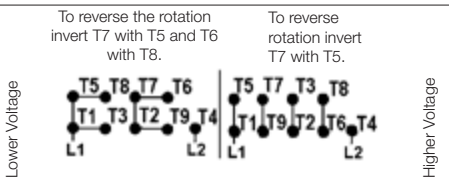


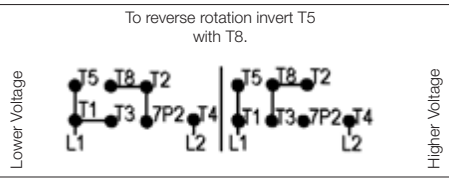


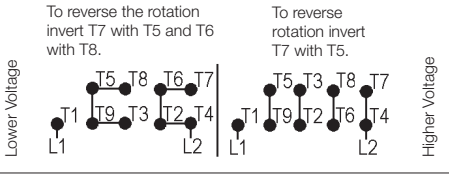












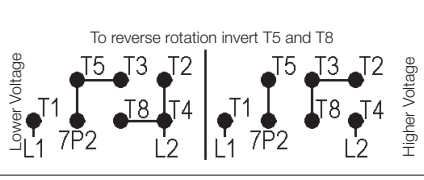


Table 6.2 *- Typical connection diagram for three-phase motors.*

Configuration	Quantity of leads	Type of connection	Connection diagram
Single speed	3	-	
	6	Δ - Y	
	9	YY - Y	
		ΔΔ - Δ	
	12	ΔΔ - YY - Δ - Y	
		Δ - PWS Part-winding start	
Double speed Dahlander	6	YY - Y Variable Torque	
		Δ - YY Constant Torque	
		YY - Δ Constant Output	
	9	Δ - Y - YY	
Double speed Double winding	6	-	

Equivalent table for lead identification													
Lead identification on the wiring diagram		**1**	**2**	**3**	**4**	**5**	**6**	**7**	**8**	**9**	**10**	**11**	**12**
Single speed	NEMA MG 1 Part 2	T1	T2	T3	T4	T5	T6	T7	T8	T9	T10	T11	T12
	IEC 60034-8	U1	V1	W1	U2	V2	W2	U3	V3	W3	U4	V4	W4
Double speed (Dahlander / Double winding)	NEMA MG 1 Part 2[1)]	1U	1V	1W	2U	2V	2W	3U	3V	3W	4U	4V	4W
	IEC 60034-8	1U	1V	1W	2U	2V	2W	3U	3V	3W	4U	4V	4W

1) NEMA MG 1 Part 2 defines T1 to T12 for two or more winding, however WEG adopts 1U to 4W.

Table 6.3 - *Typical connection diagram for single-phase motors.*

Voltage	Direction of Rotation	Thermal Protection	Type	Connection diagram
Single	CW or CCW	With or Without	Run / Permanent Capacitors Two values	
	Both	Without

		Phenolic Thermal Protector	Split Phase (without capacitor)	
			Run / Permanent Capacitors Two values	
		Thermostat	Split Phase (without capacitor)	
			Run / Permanent Capacitors Two values	

WARNING - Local Standards have priority on the definition of the connection standards.

The connections presented below are a reference for the connection of the customer's power cables on low voltage motors with terminal block. The terminal blocks presented below are the standard for each product line, however variations may occur.
It is recommended the use of terminals made of electrolytic copper or brass, similar to the terminals used on the motors cables.

W21 and W22

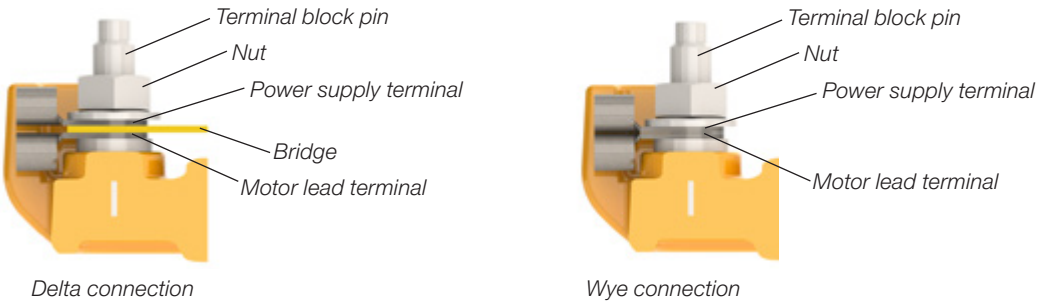

Figure 6.13 *- Connetion for W21 and W22 motors with terminal block*

HGF, W40, W50 and W60

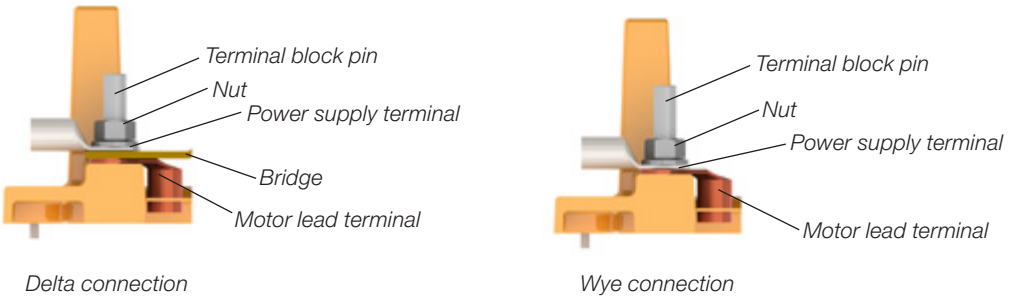

Figure 6.14 *- Connetion for HGF, W40, W50 and W60 motors with terminal block*

If motors are supplied without terminal blocks, insulate the cable terminals with suitable insulation material that meets the power supply voltage and the insulation class indicated on the motor nameplate.

Ensure correct tightening torque for the power cable and grounding connections as specified in Table 8.11

The clearance distance (see Figure 6.15) between non-insulated live parts with each other and between grounded parts must be as indicated in Table 6.4.

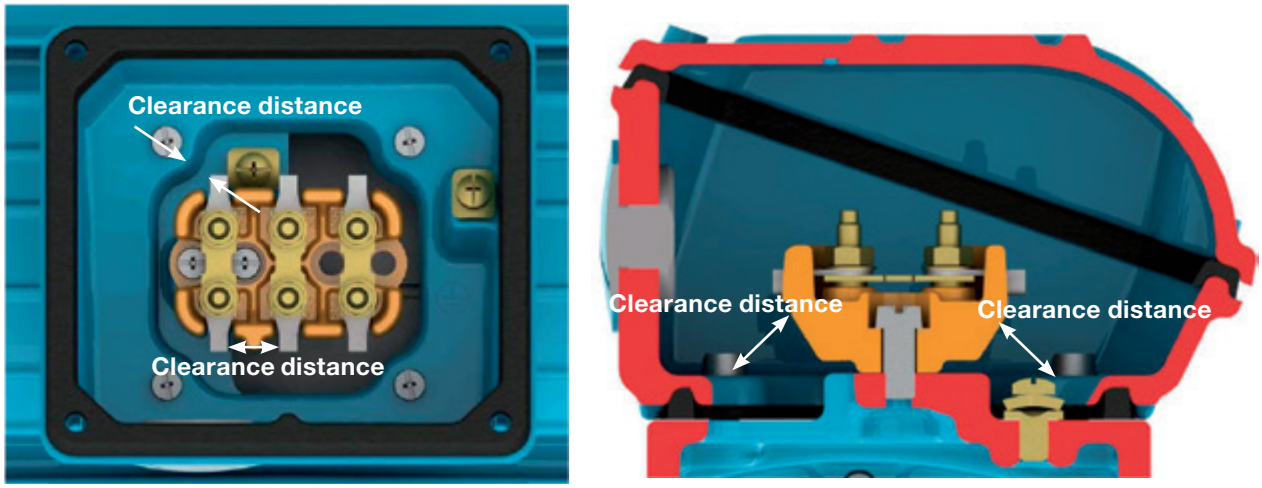

Figure 6.15 *- Clearance distance representation*

Table 6.4 *- Minimum clearance distance (mm) x supply voltage*

Voltage	Minimum clearance distance (mm)
U ≤ 440 V	4
440 < U ≤ 690 V	5.5
690 < U ≤ 1000 V	8
1000 < U ≤ 6900 V	45
6900 < U ≤ 11000 V	70
11000 < U ≤ 16500 V	105

Even when the motor is off, dangerous voltages may be present inside the terminal box used for the space heater supply or winding energization when the winding is used as heating element.
Motor capacitors will hold a charge even after the power has been cut off. Do not touch the capacitors and/or motor terminals, before discharging the capacitors completely.

After the motor connection has been completed, ensure that no tool or foreign body has been left inside the terminal box.

Take the required measures in order to ensure the degree of protection indicated on the motor nameplate:
- unused cable inlet holes in the terminal boxes must be properly closed with blanking plugs;
- components supplied loose (for example, terminal boxes mounted separately) must be properly closed and sealed.
The cable inlets used for power supply and control must be fitted with components (for example, cable-glands and conduits) that meet the applicable standards and regulations in each country.

If the motor is fitted with accessories, such as brakes and forced cooling systems, these devices must be connected to the power supply according to the information provided on their nameplates and with special care as indicated above.

All protection devices, including overcurrent protection, must be set according to the rated machine conditions. These protection devices must protect the machine against short circuit, phase fault or locked rotor condition. The motor protection devices must be set according to the applicable standards.

Check the direction of rotation of the motor shaft. If there is no limitation for the use of unidirectional fans, the shaft rotation direction can be changed by reversing any two of the phase connections. For single-phase motor, check the connection diagram indicated on the motor nameplate.

6.10. CONNECTION OF THE THERMAL PROTECTION DEVICES

If the motor is supplied with temperature monitoring devices, such as, thermostat, thermistors, automatic thermal protectors, Pt-100 (RTD), etc., they must be connected to the corresponding control devices as specified on the accessory nameplates. The non-compliance with this procedure may void the product warranty and cause serious material damages.

Do not apply test voltage above 2.5 V on thermistors and current above 1 mA on RTDs (Pt-100) according to IEC 60751 standard.

Figure 6.16 and Figure 6.17 show the connection diagram of the bimetal thermal protector (thermostats) and thermistors, respectively.

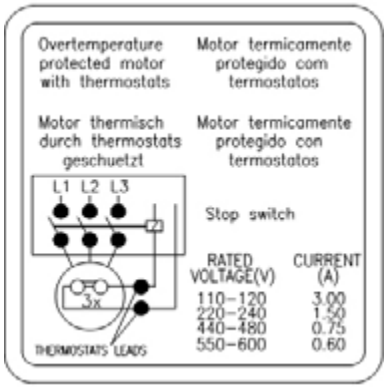

Figure 6.16 *- Connection of the bimetal thermal protectors (thermostats)*

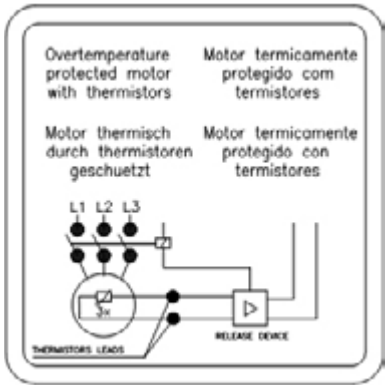

Figure 6.17 *- Thermistor connection*

The alarm temperature limits and thermal protection shutdowns can be defined according to the application; however these temperature limits can not exceed the values in Table 6.5.

Table 6.5 *- Maximum activation temperature of the thermal protections*

Component	Insulation class	Maximum temperature of the protection setting (°C)	
		Alarm	Tripping
Winding	B	-	130
	F	130	155
	H	155	180
Bearing	All	110	120

Notes:
1) The number and type of the installed protection devices are stated on the accessory nameplate of the motor.
2) If the motor is supplied with calibrated resistance, (for example, Pt-100), the motor protection system must be set according to the operating temperatures indicated in Table 6.5.

6.11. RESISTANCE TEMPERATURE DETECTORS (PT-100)

The thermocouples Pt-100 are made of materials, whose resistance depends on the temperature variation, intrinsic property of some materials (usually platinum, nickel or copper), calibrated resistance. Its operation is based on the principle that the electric resistance of a metallic conductor varies linearly with the temperature, thus allowing a continuous monitoring of the motor warm-up through the controller display ensuring a high level of precision and answer stability. These devices are widely used for measuring temperatures in various industry sectors.
In general these devices are used in installations where precise temperature control is required, for example, in installation for irregular or intermittent duty.
The same detector may be used for alarm and tripping purposes.

Table 6.6 and Figure 6.18 show the equivalence between the Pt-100 resistance and the temperature.

Table 6.6 *- Equivalence between the Pt-100 resistance and the temperature*

°C	Ω	°C	Ω	°C	Ω	°C	Ω	°C	Ω

6.12. CONNECTION OF THE SPACE HEATERS

Before switching ON the space heaters, check if the space heaters connection have been made according to the connection diagram shown on the space heater nameplate. For motors supplied with dual voltage space heaters (110-127/220-240 V), see Figure 6.19.

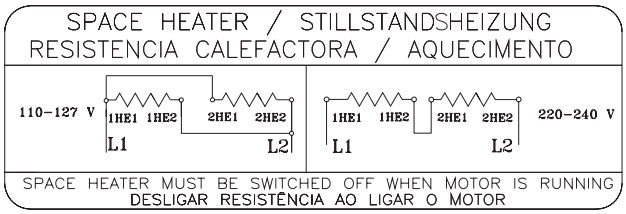

Figure 6.19 *- Dual voltage space heater connection*

The space heaters should never be energized when the motor is in operation.

ENGLISH

6.13. STARTING METHODS

Whenever possible, the motor starting must be Direct On Line (DOL) at rated voltage. This is the most simple and feasible starting method. However, it must only be applied when the starting current does not affect the power supply. Please consider the local electric utility regulations when installing a motor.
High inrush current may result in:
a) high voltage drop in the power supply line creating unacceptable line disturbance on the distribution system;
b) requiring oversized protection system (cables and contactor) increasing the installation costs.

If DOL starting is not allowed due to the reasons mentioned above, an indirect starting method compatible with the load and motor voltage to reduce the starting current may be used.
If reduced voltage starters are used for starting, the motor starting torque will also be reduced.

Table 6.7 shows the possible indirect starting methods that can be used depending on the number of the motor leads.

Table 6.7 *- Starting method x number of motor leads*

Number of leads	Possible starting methods
3 leads	Autotransformer Soft-starter
6 leads	Star-Delta Autotransformer Soft-starter
9 leads	Series/Parallel Part winding Autotransformer Soft-starter
12 leads	Star-Delta Series/Parallel Part winding Autotransformer Soft-starter

Table 6.8 shows examples of possible indirect starting methods to be used according to the voltage indicated on the motor nameplate and the power supply voltage.

Table 6.8 *- Starting methods x voltage*

Nameplate voltage	Operating voltage	Star-delta	Autotransformer starting	Starting by series/ parallel switch	Part-winding starting	Starting by Soft-starter
220/380 V	220 V 380 V	YES NO	YES YES	NO NO	NO NO	YES YES
220/440 V	220 V 440 V	NO NO	YES YES	YES NO	YES NO	YES YES
230/460 V	230 V 460 V	NO NO	YES YES	YES NO	YES NO	YES YES
380/660 V	380 V	YES	YES	NO	NO	YES
220/380/440 V	220 V 380 V 440 V	YES NO YES	YES YES YES	YES YES NO	YES YES NO	YES YES YES

The WQuattro line motors must be started direct on-line (DOL) or driven by a frequency inverter in scalar mode.

6.14. MOTORS DRIVEN BY FREQUENCY INVERTER

The operation with frequency inverter must be stated in the Purchase Order since this drive type may require some changes of the motor design.

Wmagnet Motors must only be driven by WEG frequency inverter.

The frequency inverter used to drive motors up to 690 V must be fitted with Pulse With Modulation (PWM) with vector control.

When a motor is driven by a frequency inverter at lower frequencies than the rated frequency, you must reduce the motor torque to prevent motor overheating. The torque reduction (derating torque) can be found in the item 6.4 of the "Technical Guidelines for Induction Motors driven by PWM Frequency inverters" available on the site www.weg.net.

If the motor is operated above the rated frequency, please note:
- That the motor must be operated at constant output;
- That the motor can supply max. 95% of its rated output;
- Do not exceed the maximum speed and please consider:
  - max. operating frequency stated on the additional nameplate;
  - mechanical speed limitation of the motor.

Information on the selection of the power cables between the frequency inverter and the motor can be found in the item 6.4 of the "Technical Guidelines for Induction Motors driven by PWM Frequency inverters" available at www.weg.net.

6.14.1. Use of dV/dt filter

6.14.1.1. Motor with enameled round wire

Motors designed for rated voltages up to 690 V, when driven by frequency inverter, do not require the use of dV/dT filters, provided they comply with the criteria in Table 6.9.

Table 6.9 *- Criteria for the selection of motors with round enameled wire when driven by frequency inverter*

Motor rated votage [1]	Peak voltage at the motor terminals (max)	dV/dt inverter output (max)	Inverter Rise Time [2] (min.)	MTBP [2] Time between pulses (min)
Vnom < 460 V	≤ 1600 V	≤ 5200 V/µs	≥ 0,1 µs	≥ 6 µs
460 ≤ Vnom < 575 V	≤ 2000 V	≤ 6500 V/µs		
575 ≤ Vnom ≤ 1000 V	≤ 2400 V	≤ 7800 V/µs		

Notes:
1. For the application of dual voltage motors, example 380/660 V, consider the lower voltage (380 V).
2. Information supplied by the inverter manufacturer.

6.14.1.2. Motor with prewound coils

Motors with prewound coils (medium and high voltage motors regardless of frame sizes, and low voltage motors from IEC 500 / NEMA 800 frame on), designed for the use with frequency inverters, do not require the use of filters, provided they comply with the criteria in Table 6.10.

Table 6.10 *- Criteria to be considered when using motor with prewound coils to be drive by frequency inverters*

Motor rated voltage	Type of modulation	Turn to turn insulation (phase-phase)		Phase-ground insulation	
		Peak voltage at the motor terminals	dV/dt at the motor terminals	Peak voltage at the motor terminals	dV/dt at the motor terminals
690 < Vnom ≤ 4160 V	Sinusoidal	≤ 5900 V	≤ 500 V/µs	≤ 3400 V	≤ 500 V/µs
	PWM	≤ 9300 V	≤ 2700 V/µs	≤ 5400 V	≤ 2700 V/µs
4160 < Vnom ≤ 6600 V	Sinusoidal	≤ 9300 V	≤ 500 V/µs	≤ 5400 V	≤ 500 V/µs
	PWM	≤ 14000 V	≤ 1500 V/µs	≤ 8000 V	≤ 1500 V/µs

6.14.2. Bearing insulation

Only the motors in IEC frame size 315 (NEMA 50) and larger are supplied, as standard, with insulated bearing. If motor must be driven by frequency inverter, insulate the bearing according to Table 6.11.

Table 6.11 *- Recommendation on the bearing insulation for inverter driven motors*

Frame size	Recommendation
IEC 315 and 355 NEMA 445/7 to L5810/11	■ Insulated bearing/end shield ■ Grounding between shaft and frame by grounding brush
IEC 400 and larger NEMA 680 and larger	■ Insulated NDE bearing ■ Grounding between shaft and frame by grounding brush

When motors are supplied with shaft grounding system, monitor the grounding brush constantly during its operation and, when it reaches the end of its useful life, it must be replaced by another brush with the same specification.

6.14.3. Switching frequency

The minimum inverter switching frequency must not be lower than 2 kHz and should not exceed 5 kHz.

The non-compliance with the criteria and recommendations indicated in this manual may void the product warranty.

6.14.4. Mechanical speed limitation

Table 6.12 shows the maximum speeds allowed for motors driven by frequency inverter.

Table 6.12 *- Maximum motor speed (in rpm)*

Frame size		DE-bearing	Maximum speed for standard motors
IEC	NEMA		
63-90	143/5	6201 6202 6203 6204 6205	10400
100	-	6206	8800
112	182/4	6207	7600
		6307	6800
132	213/5	6308	6000
160	254/6	6309	5300
180	284/6	6311	4400
200	324/6	6312	4200
225-630	364/5-9610	6314	3600
		6315	3600
		6316	3200
		6218	3600
		6319	3000
		6220	3600
		6320	2200
		6322	1900
		6324	1800
		6328	1800
		6330	1800
		6224	1800
		6228	1800

Note:
To select the maximum allowed motor speed, consider the motor torque derating curve.

For more information on the application of frequency inverters, contact WEG or check the “Technical Guidelines for Induction Motors driven by PWM Frequency inverters” available at www.weg.net.

7. COMMISSIONING

7.1. INITIAL START-UP

After finishing the installation procedures and before starting the motor for the first time or after a long period without operation, the following items must be checked:

- If the nameplate data (voltage, current, connection diagram, degree of protection, cooling system, service factor, etc.) meet the application requirements;
- If the machine set (motor + driven machine) has been mounted and aligned correctly;
- If the motor driving system ensures that the motor speed does not exceed the max. allowed speed indicated in Table 6.12;
- Measure the winding insulation resistance, making sure it complies with the specified values in item 5.4;
- Check the motor rotation direction;
- Inspect the motor terminal box for damage and ensure that it is clean and dry and all contacts are rust-free, the seals are in perfect operating conditions and all unused threaded holes are properly closed thus ensuring the degree of protection indicated on the motor nameplate;
- Check if the motor wiring connections, including grounding and auxiliary equipment connection, have been carried out properly and are in accordance with the recommendations in item 6.9;
- Check the operating conditions of the installed auxiliary devices (brake, encoder, thermal protection device, forced cooling system, etc.);
- Check bearing operating conditions. If the motors are stored and/or installed for more than two years without running, it is recommended to change the bearings, or to remove, wash, inspect and relubricate them before the motor is started. If the motor is stored and/or installed according to the recommendations described in item 5.3, lubricate the bearings as described in item 8.2. For the bearing condition evaluation, it is recommended to use of the vibration analysis techniques: Envelope Analysis or Demodulation Analysis.
- For roller bearing motors with oil lubrication, ensure:
  - The oil level should be in the center of the sight glass (see Figure 8.1 and 8.2);
  - That if the motor is stored for a period equal or longer than the oil change interval, the oil must be changed before starting the motor.
- When motors are fitted with sleeve bearings, ensure:
  - Correct oil level for the sleeve bearing. The oil level should be in the center of the sight glass (see Figure 8.3);
  - That the motor is not started or operated with axial or radial loads;
  - That if the motor is stored for a period equal or longer than the oil change interval, the oil must be changed before starting the motor.
- Inspect the capacitor operating condition, if any. If motors are installed for more than two years, but were never commissioned, it is recommended to change the start capacitors since they lose their operating characteristics;
- Ensure that the air inlet and outlet opening are not blocked. The minimum clearance to the nearest wall (L) should be at least ¼ of the fan cover diameter (D), see Figure 7.1. The intake air temperature must be at ambient temperature.

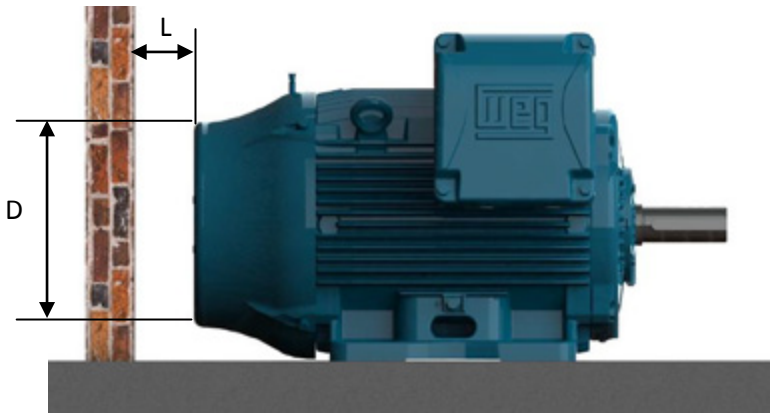

***Figure 7.1**- Minimum clearance to the wall*

Please consider the minimum distances shown in the Table 7.1 as reference value;

Table 7.1 *- Minimum distance between the fan cover and wall*

Frame size		Distance between the fan cover and the wall (L)	
IEC	**NEMA**	**mm**	**inches**
63	-	25	0.96

500	8006/10	171	6.73
560	8806/10	185	7.28
630	9606/10	200	7.87

- Ensure correct water flow rate and water temperature when water cooled motors are used. See item 7.2;
- Ensure that all rotating parts, such as pulleys, couplings, external fans, shaft, etc. are protected against accidental contact.

Other tests and inspections not included in the manual may be required, depending on the specific installation, application and/or motor characteristics.

After all previous inspections have been carried out, proceed as follows to start the motor:

- Start the motor on no-load (if possible) and check the motor direction of rotation. Check for the presence of any abnormal noise, vibration or other abnormal operating conditions;
- Ensure the motor starts smoothly. If any abnormal operating condition is noticed, switch off the motor, check the assembly system and connections before the motor is started again;
- If excessive vibrations are noticed, check if the motor mounting bolts are well tightened or if the vibrations are not generated and transmitted from adjacent installed equipment. Check the motor vibration periodically and ensure that the vibration limits are as specified in item 7.2.1;
- Start the motor at rated load during a short time and compare the operating current with the rated current indicated on the nameplate;
- Continue to measure the following motor variables until thermal equilibrium is reached: current, voltage, bearing and motor frame temperature, vibration and noise levels;
- Record the measured current and voltage values on the Installation Report for future comparisons.

As induction motors have high inrush currents during start-up, the acceleration of high inertia load requires an extended starting time to reach full speed resulting in fast motor temperature rise. Successive starts within short intervals will result in winding temperature increases and can lead to physical insulation damage reducing the useful life of the insulation system. If the duty cycle S1 / CONT. is specified on the motor nameplate, this means that the motor has been designed for:

- Two successive starts: first start from cold condition, i. e., the motor windings are at room temperature and the second start immediately after the motor stops;
- One start from hot condition, i. e., the motor windings are at rated temperature.

The Troubleshooting Chart in section 10 provides a basic list of unusual cases that may occur during motor operation with the respective corrective actions.

7.2. OPERATING CONDITIONS

Unless otherwise stated in the Purchase Order, electric motors are designed and built to be operated at altitudes up to 1000 meters above sea level and in a temperature range from -20 °C to +40 °C. Any deviation from the normal condition of motor operation must be stated on the motor nameplate. Some components must be changed if the ambient temperature is different from the specified one. Please contact WEG to check the required special features.

For operating temperatures and altitudes differing from those above, the factors indicated in Table 7.2 must be applied to the nominal motor power rating in order to determine the derated available output (Pmax = Pnom x correction factor).

Table 7.2 - *Correction factors for altitude and ambient temperature*

T (°C)	Altitude (m)								
	1000	1500	2000	2500	3000	3500	4000	4500	5000
10							0.97	0.92	0.88
15						0.98	0.94	0.90	0.86
20					1.00	0.95	0.91	0.87	0.83
25				1.00	0.95	0.93	0.89	0.85	0.81
30			1.00	0.96	0.92	0.90	0.86	0.82	0.78
35		1.00	0.95	0.93	0.90	0.88	0.84	0.80	0.75
40	1.00	0.97	0.94	0.90	0.86	0.82	0.80	0.76	0.71

50	0.92	0.90	0.87	0.85	0.82	0.80	0.77	0.72	0.67
55	0.88	0.85	0.83	0.81	0.78	0.76	0.73	0.70	0.65
60	0.83	0.82	0.80	0.77	0.75	0.73	0.70	0.67	0.62
65	0.79	0.76	0.74	0.72	0.70	0.68	0.66	0.62	0.58
70	0.74	0.71	0.69	0.67	0.66	0.64	0.62	0.58	0.53
75	0.70	0.68	0.66	0.64	0.62	0.60	0.58	0.53	0.49
80	0.65	0.64	0.62	0.60	0.58	0.56	0.55	0.48	0.44

Motors installed inside enclosures (cubicles) must be ensured an air renewal rate in the order of one cubic meter per second for each 100 kW installed power or fraction of installed power. Totally Enclosed Air Over motors - TEAO (fan and exhaust / smoke extraction) are supplied without cooling fan and the manufacturer of the driven machine is responsible for sufficient motor cooling. If no minimum required air speed between motor fins is indicated on the motor nameplate, ensure the air speed indicated in the table 7.3 is provided. The values shown in Table 7.3 are valid for 60 Hz motors. To obtain the minimum air speed for 50 Hz motors, multiply the values in the table by 0.83.

Table 7.3 *- Minimum required air speed between motor fins (metres/second)*

Frame		Poles			
IEC	NEMA	2	4	6	8
63 to 90	143/5	13	7	5	4
100 to 132	182/4 to 213/5	18	12	8	6
160 to 200	254/6 to 324/6	20	15	10	7
225 to 280	364/5 to 444/5	22	20	15	12
315 to 450	445/7 to 7008/9	25	25	20	15

The voltage and frequency variations may affect the performance characteristics and the electromagnetic compatibility of the motor. The power supply variations should not exceed the values specified in the applicable standards. Examples:

- ABNT NBR 17094 - Parts 1 and 2. The motor has been designed to supply the rated torque for a combined variation in voltage and frequency:
  - Zone A: ±5% of the rated voltage and ±2% of the rated frequency;
  - Zone B: ±10% of the rated voltage and +3% -5% of the rated frequency.

When operated continuously in Zone A or B, the motor may show performance variations and the operating temperature may increase considerably. These performance variations will be higher in Zone B. Thus it is not recommended to operate the motor in Zone B during extended periods.

- IEC 60034-1. The motor has been designed to supply the rated torque for combined variation in voltage and frequency:
  - Zone A: ±5% of the rated voltage and ±2% of the rated frequency;
  - Zone B: ±10% of the rated voltage and +3% -5% of the rated frequency.

When operated continuously in Zone A or B, the motor may show performance variations and the operating temperature may increase considerably. These performance variations will be higher in Zone B. Thus it is not recommended to operate the motor in Zone B during extended periods. For multivoltage motors (example 380-415/660 V), a ±5% voltage variation from the rated voltage is allowed.

- NEMA MG 1 Part 12. The motor has been designed to be operated in one of the following variations:
  - ±10% of the rated voltage, with rated frequency;
  - ±5% of the rated frequency, with rated voltage;
  - A combined variation in voltage and frequency of ±10%, provided the frequency variation does not exceed ±5%.

If the motor is cooled by ambient air, clean the air inlet and outlet openings and cooling fins at regular intervals to ensure a free airflow over the frame surface. The hot air should never be returned to the motor. The cooling air must be at room temperature limited to the temperature range indicated on the motor nameplate (if no room temperature is specified, please consider a temperature range between -20 °C and +40 °C).

Table 7.4* shows the minimum required water flow for water cooled motors considering the different frame sizes and the maximum allowed temperature rise of the cooling water after circulating through the motor. The inlet water temperature should not exceed 40 °C.

Table 7.4 *- Minimum required water flow and the maximum allowed temperature rise of the cooling water after circulating through the motor*

Frame size		Flow rate (litres/minute)	Maximum allowed water temperature rise (°C)
IEC	NEMA		
180	284/6	12	5
200	324/6	12	5
225	364/5	12	5
250	404/5	12	5
280	444/5 445/7 447/9	15	6
315	504/5	16	6
355	586/7 588/9	25	6

For W60 motors, please see the nameplate at heat-exchanger.
Motors fitted with oil mist lubrication systems can be operated continuously for a maximum of one hour after the failure of the oil pumping system.

Considering the sun's heat increases the operating temperature, externally mounted motors should always be protected from direct sunlight exposure.

Each and every deviation from the normal operating condition (tripping of the thermal protection, noise and vibration level increase, temperature and current rise) should be investigated and corrected by WEG Authorized Service Centers.

Motors fitted with cylindrical roller bearings require a minimum radial load to ensure a normal operation. For information regarding the radial preload, please contact WEG.

7.2.1.Limits of vibration

The vibration severity is the maximum vibration value measured at all positions and in all directions as recommended in the standard IEC 60034-14. Table 7.5 specifies the limits of the maximum vibrations magnitudes according to standard IEC 60034-14 for shaft heights IEC 56 to 400, for vibrations grades A and B. The vibration severity limits in Table 7.5 are given as RMS values (Root Mean Square values or effective values) of the vibration speed in mm/s measured in free suspension condition.

Table 7.5 *- Recommended limits for the vibration severity according to standard IEC 60034-14*

Shaft height [mm]	56 ≤ H ≤ 132	132 ≤ H ≤ 280	H > 280
Vibration grade	Vibration severity on elastic base [mm/s RMS]		
A	1.6	2.2	2.8
B	0.7	1.1	1.8

Notes:
1 - The values in Table 7.5 are valid for measurements carried out with decoupled machines (without load) operated at rated voltage and frequency.
2 - The values in Table 7.5 are valid regardless of the direction of rotation of the machine.
3 - The values in Table 7.5 are not applicable to single-phase motors, three-phase motors powered by a single-phase system or to machines mounted in situ or coupled with inertia flywheels or to loads.

According to NEMA MG 1, the allowed vibration limit for standard motors is 0.15 in/s (peak vibration in in/s).

Note:
For the load operation condition, the use of the standard ISO 10816-3 is recommended for evaluating the motor vibration limits. In the load condition the motor vibration will be influenced by several factors, such as, type of the coupled load, condition of the motor fixation, alignment condition under load, structure or base vibration due to other equipments, etc..

8. MAINTENANCE

The purpose of the maintenance is to extend the useful life of the equipment. The non-compliance with one of these previous items can cause unexpected machine failures.

If motors with cylindrical roller or angular contact bearings are to be transported during the maintenance procedures, the shaft locking device must always be fitted. All HGF, W50 and W60 motors, regardless of the bearing type, must always be transported with the shaft locking device fitted.

All repairs, disassembly and assembly related services must be carried out only by qualified and well-trained personnel by using proper tools and techniques. Make sure that the machine has stopped and it is disconnected from the power supply, including the accessory devices (space heater, brake, etc.), before any servicing is undertaken.
The company does not assume any responsibility or liability for repair services or maintenance operations executed by non-authorized Service Centers or by non qualified service personnel. The company shall have no obligation or liability whatsoever to the buyer for any indirect, special, consequential or incidental loss or damage caused or arising from the company's proven negligence

8.1. GENERAL INSPECTION

The inspection intervals depend on the motor type, application and installation conditions. Proceed as follows during inspection:

- Visually inspect the motor and coupling. Check if abnormal noises, vibrations, excessive heating, wear signs, misalignment or damaged parts are noticed. Replace the damaged parts as required;
- Measure the insulation resistance according to the item 5.4;
- Clean the motor enclosure. Remove oil spills and dust accumulation from the motor frame surface to ensure a better heat transfer to the surrounding ambient;
- Check cooling fan condition and clean the air inlet & outlet openings to ensure a free air flow over the motor;
- Investigate the actual condition of the seals and replace them, if required;
- Drain the condensed water from inside the motor. After draining, reinstall the drain plugs to ensure the degree of protection as indicated on the motor nameplate. The motor must always be positioned so the drain hole is at the lowest position (see item 6);
- Check the connections of the power supply cables, ensuring the correct clearance distance between live and grounded parts, as specified in Table 6.3;
- Check if the tightening torque of the bolted connections and mounting bolts meets the tightening torque specified in Table 8.11;
- Check the status of the cable passages, the cable gland seals and the seals inside the terminal box and replace them, if required;
- Check the bearing operating conditions. Check for the presence of any abnormal noise, vibration or other abnormal operating conditions, like motor temperature rise. Check the oil level, the lube oil condition and compare the workings hours with the informed life time;
- Record and file all changes performed on the motor.

Do not reuse damaged or worn parts. Damaged or worn parts must be replaced by parts supplied by the manufacturer and must be installed as if they were the original parts.

8.2. LUBRICATION

Proper lubrication plays a vital role in the motor performance. Only use the grease or oil types, amounts and lubrication intervals recommended for the bearings. This information is available on the motor nameplate and the lubrication procedures must be carried out according to the type of lubricant (oil or grease).
When the motor is fitted with thermal protection devices for bearing temperature control, consider the operating temperature limits shown in Table 6.4.
The maximum operating temperature of motors used in special applications may differ from those shown in Table 6.4. The grease and oil disposal should be made in compliance with applicable laws in each country.

Please contact WEG when motors are to be installed in special environments or used for special applications.

8.2.1. Grease lubricated rolling bearings

Excess grease causes bearing overheating, resulting in bearing failure.

The lubrication intervals specified in Table 8.1, Table 8.2, Table 8.3, Table 8.4, Table 8.5, Table 8.6, Table 8.7, Table 8.8 and Table 8.9 consider an absolute temperature on the bearing of 70 °C (up to frame size IEC 200 / NEMA 324/6) and 85 °C (for frame size IEC 225 / NEMA 364/5 and above), the motor running at rated speed, a motor mounted in horizontal position and greased with Mobil Polyrex EM grease. Any variation of the parameters listed above must be evaluated.

Table 8.1 *- Lubrication intervals for ball bearings*

	400G/F	6810/11	4				1500				1500
			6/8				4500				4500

For each increment of 15 °C above the bearing temperature, the relubrication intervals given in the Table must be halved. The relubrication interval of motors designed by the manufacturer for mounting in horizontal position, but installed in vertical position (with WEG authorization), must be halved.
For special applications, such as: high and low temperatures, aggressive environments, driven by frequency inverter (VFD - frequency inverter), etc., please contact WEG about the required amount of grease and the relubrication intervals.

8.2.1.1. Motor without grease fitting

Motors without grease fittings must be lubricated in accordance with the existing Maintenance Plan. Motor disassembly must be carried out as specified in Item 8.3. If motors are fitted with shielded bearings (for example, ZZ, DDU, 2RS, VV), these bearings must be replaced at the end of the grease service life.

8.2.1.2. Motor with grease fitting

To lubricate the bearings with the motor stopped, proceed as follows:
- Before lubricating, clean the grease nipple and immediate vicinity thoroughly;
- Lift grease inlet protection;
- Remove the grease outlet plug;
- Pump in approximately half of the total grease indicated on the motor nameplate and run the motor for about 1 (one) minute at rated speed;
- Switch-off the motor and pump in the remaining grease;
- Lower again the grease inlet protection and reinstall the grease outlet protection.

To grease the motor while running, proceed as follows:
- Before lubricating, clean the grease nipple and immediate vicinity thoroughly;
- Pump the total grease indicated on the motor nameplate;
- Lower again the grease inlet protection.

For lubrication, use only manual grease gun.

If Motors are provided with a spring device for grease removal, the grease excess must be removed by pulling the rod and cleaning the spring until the spring does not remove more grease.

8.2.1.3. Compatibility of the Mobil Polyrex EM grease with other greases

The Mobil Polyrex EM grease has a polyurea thickener and a mineral oil and it is not compatible with other greases.
If you need another type of grease, contact WEG.
It is not recommended to mix different types of greases. In such a case, clean the bearings and lubrication channels before applying new grease.
The used grease must have in its formulation corrosion and oxidation inhibitors.

8.2.2. Oil lubricated bearings

To change the oil of oil lubricated motor proceed as follows:
- Switch-off the motor;
- Remove threaded oil drain plug;
- Open the valve and drain the oil;
- Close the drain valve again;
- Reinstall the threaded oil drain plug;
- Fill-up with the type and amount of oil as specified on the nameplate;
- Check oil level. The oil level is OK when the lubricant can be viewed approximately in the center of the sight glass;
- Reinstall oil inlet plug;
- Check for oil leaks and ensure that all not used threaded plugs are closed with plugs.

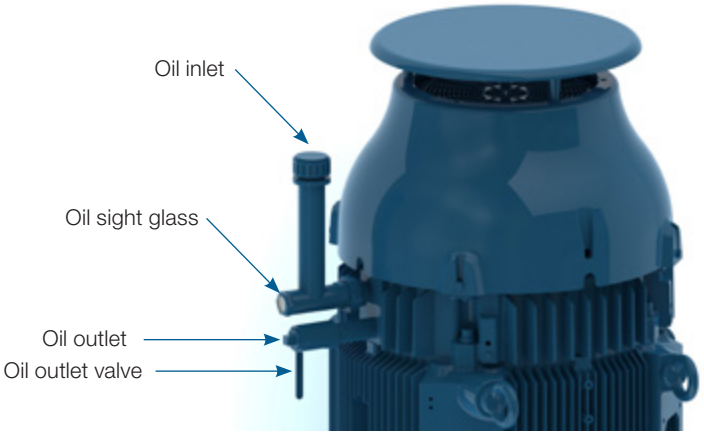

Figure 8.1 *- Oil lubricated bearing - vertical mounting*

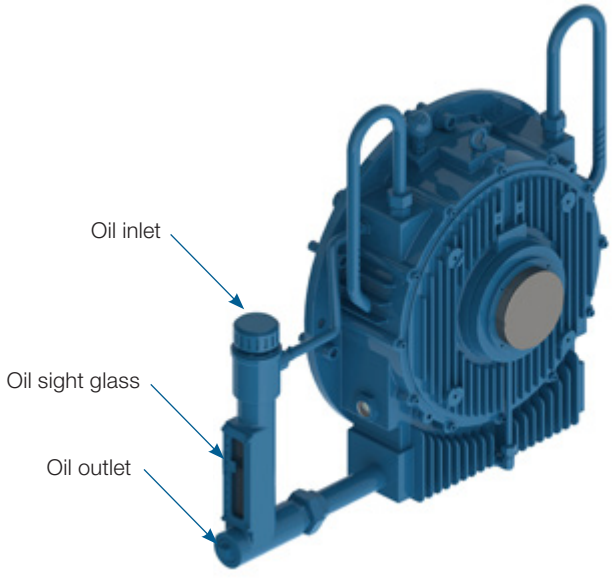

Figure 8.2 *- Oil lubricated bearing - horizontal mounting*

The bearing lubricating oil must be replaced as specified on the nameplate or whenever changes in the oil properties are noticed. The oil viscosity and pH must be checked periodically. The oil level must be checked every day and must be kept in the center of the sight glass.
Please contact WEG, when oils with different viscosities should be used.

***Note**:*
The HGF vertical mounted motors with high axial thrust are supplied with grease lubricated DE-bearings and with oil lubricated NDE-bearings. The DE-bearings must be lubricated according to recommendations in item 8.2.1. Table 8.10 specifies the oil type and the amount of oil required for this motor lubrication.

***Table 8.10** - Oil properties for HGF vertical mounted motors with high axial thrust*

Mounting - high axial thrust	Frame		Poles	Bearing designation	Oil (liters)	Interval (h)	Lubricant	Lubricant specification
	IEC	NEMA						
	315L/A/B and 315C/D/E	5006/7/8T and 5009/10/11T	4 - 8	29320	20	8000	FUCHS Renolin DTA 40 / Mobil SHC 629	ISO VG150 mineral oil with antifoam and antioxidant additives
	355L/A/B and 355C/D/E	5807/8/9T and 5810/11/12T			26			
	400L/A/B and 400C/D/E	6806/7/8T and 6809/10/11T			37			
	450	7006/10			45			

8.2.3. Oil mist lubricated bearings

Check the service conditions of the seals and if replacement is required use only original components. Clean the seal components before assembly (bearing caps, end shields, etc.).
Apply joint sealant between the bearing caps and end shields. The joint sealant must be compatible with the used lubricating oil. Connect the oil lubricant tubes (oil inlet and oil outlet tubes and motor drain tube), as shown in Figure 6.12.

8.2.4. Sleeve bearings

The lubricating oil of sleeve bearings must be changed at the intervals specified in Table 8.11. To replace the oil, proceed as follows:

- NDE-bearing: remove the protection plate from the fan cover;
- Drain the oil through the drain hole located at the bottom of the bearing (see Figure 8.3);
- Close the oil drain hole;
- Remove the oil inlet plug;
- Fill the sleeve bearing with the specified oil and with the amount of oil specified in;
- Check the oil level and ensure it is kept close to the center of the sight glass;
- Install the oil inlet plug;
- Check for oil leaks.

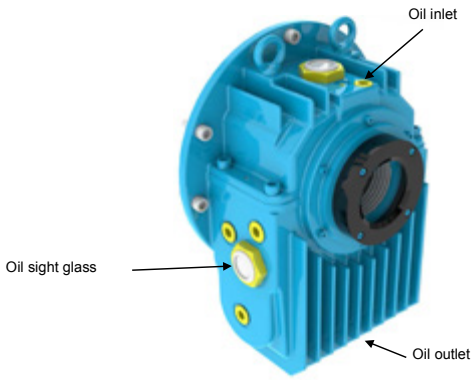

***Figure 8.3** - Sleeve bearing*

Table 8.11 - Oil properties for sleeve bearings

Frame		Poles	Bearing designation	Oil (liters)	Interval (h)	Lubricant	Lubricant specification
IEC	NEMA						
315	5000	2	9-80	3.6	8000	FUCHS Renolin DTA 10	ISO VG32 mineral oil with antifoam and antioxidant additives
355	5800						
400	6800

355	5800		9-100				
400	6800		11-110	4.7			
450	7000		11-125				
500	8000						

The lubricating oil must be replaced as specified on the nameplate or whenever changes on the oil properties are noticed. The oil viscosity and pH must be checked periodically. The oil level must be checked every day and kept in the center of the sight glass.
Please contact WEG, when oils with different viscosities are to be used.

8.3. MOTOR ASSEMBLY AND DISASSEMBLY

All repair services on motors should be always performed by qualified personnel and in accordance with the applicable laws and regulations in each country. Always use proper tools and devices for motor disassembly and assembly.

Disassembly and assembly services can be carried out only after the motor has been disconnected from the power supply and is completely stopped.

Dangerous voltages may be present at the motor terminals inside the terminal box since capacitors can retain electrical charge for long periods of time even when they are not connected directly to a power source or when space heaters are connected to the motor or when the motor windings are used as space heaters. Dangerous voltages may be present at the motor terminals when they are driven by frequency inverter even when they are completely stopped.

Record the installation conditions such as terminal connection diagram, alignment / leveling conditions before starting the disassembly procedures. These records should be considered for later assembly.

Disassemble the motor carefully without causing scratches on machined surfaces or damaging the threads.

Assemble the motor on a flat surface ensuring a good support base. Footless motors must be fixed/locked on the base to prevent accidents.

Handle the motor carefully to not damage the insulated components such as windings, insulated rolling bearings, power cables etc..

Seal elements, such as joint seals and bearing seals should always be replaced when wear or damage is noticed.
Motors with degree of protection higher than IP55 are supplied with joint and screw seal Loctite 5923 (Henkel) Clean the components and apply a new coat of Loctite 5923 on the surfaces before assembly.

For the W40, W50 and HGF motor lines provided with axial fans, the motor and the axial fan have different markings for indicating the direction of rotation for prevent incorrect assembly.
The axial fan must be assembled so that the indicative arrow for direction of rotation is always visible, viewing the non-drive end side. The marking indicated on the axial fan blade, CW for clockwise direction of rotation or CCW for counterclockwise direction of rotation, indicates the direction of rotation of the motor viewing the drive end side.

8.3.1. Terminal box

Proceed as follows to remove the terminal box cover and to disconnect/connect the power supply cables and the cables of the accessory devices:

- Ensure that during the screw removal the terminal box cover does not damage the components installed inside the terminal box;
- If the terminal box cover is fitted with lifting eyebolt, lift the terminal box cover always by its lift eyebolt;
- If motors are supplied with terminal blocks, ensure the correct tightening torque on the motor terminals as specified in Table 8.12;
- Ensure that the cables do not contact sharp edges;
- Ensure that the original IP degree of protection is not changed and is maintained as indicate on the motor nameplate. The power supply cables and the control cables must always be fitted with components (cable glands, conduits) that meet the applicable standards and regulations of each country;
- Ensure that the pressure relief device is in perfect operating condition, if provided. The seals in the terminal box must be in perfect condition for reuse and must be reinstalled correctly to ensure the specified degree of protection;
- Ensure the correct tightening torque for the securing bolts of the terminal box cover as specified in Table 8.12.

Combined slotted screw (rigid joint)	1,5 to 3	3 to 5	5 to 10	10 to 18	-	-	-	-	-
Hex bolt/hex socket bolt (flexible joint)	-	3 to 5	4 to 8	8 to 15	18 to 30	25 to 40	30 to 45	35 to 50	-
Combined slotted screw (flexible joint)	-	3 to 5	4 to 8	8 to 15	-	-	-	-	-
Terminal blocks	1 to 1,5	2 to 4 1)	4 to 6,5	6,5 to 9	10 to 18	15,5 to 30	-	30 to 50	50 to 75
Grounding terminals	1,5 to 3	3 to 5	5 to 10	10 to 18	28 to 40	45 to 70	-	115 to 170	-

Note: 1) For 12-pin terminal block, apply the minimum torque of 1.5 Nm and maximum torque of 2.5 Nm.

8.4. DRYING THE STATOR WINDING INSULATION

Dismantle the motor completely. Remove the end shields, the rotor with the shaft, the fan cover, the fan and the terminal box before the wound stator with the frame is transferred to the oven for the drying process. Place the wound stator in the oven heated to max. 120 °C for two hours. For larger motors a longer drying time may be required. After the drying process has been concluded, allow the stator to cool to room temperature. Measure the insulation resistance again as described in item 5.4. Repeat the stator drying process if the required insulation resistance does not meet the values specified in Table 5.3. If the insulation resistance does not improve despite several drying processes, evaluate the causes of the insulation resistance drop carefully and an eventual replacement of the motor winding may be required. If in doubt contact WEG.

To prevent electrical shock, discharge the motor terminals immediately before, and after each measurement. If the motor is equipped with capacitors, these must be discharged before beginning any repair.

8.5. SPARE PARTS

When ordering spare parts, always provide complete motor designation, indicating the motor type, the code number and the serial number, which are stated on the motor nameplate.

Spare parts must always be purchased from WEG authorized Service Centers. The use of non-original spare parts can cause motor failure, performance drop and void the product warranty.

The spare parts must be stored in a clean, dry and properly ventilated room, with relative air humidity not exceeding 60%, with ambient temperature between 5 °C and 40 °C, free of dust, vibrations, gases, corrosive smokes and at constant temperature. The spare parts must be stored in their normal mounting position without placing other components onto them.

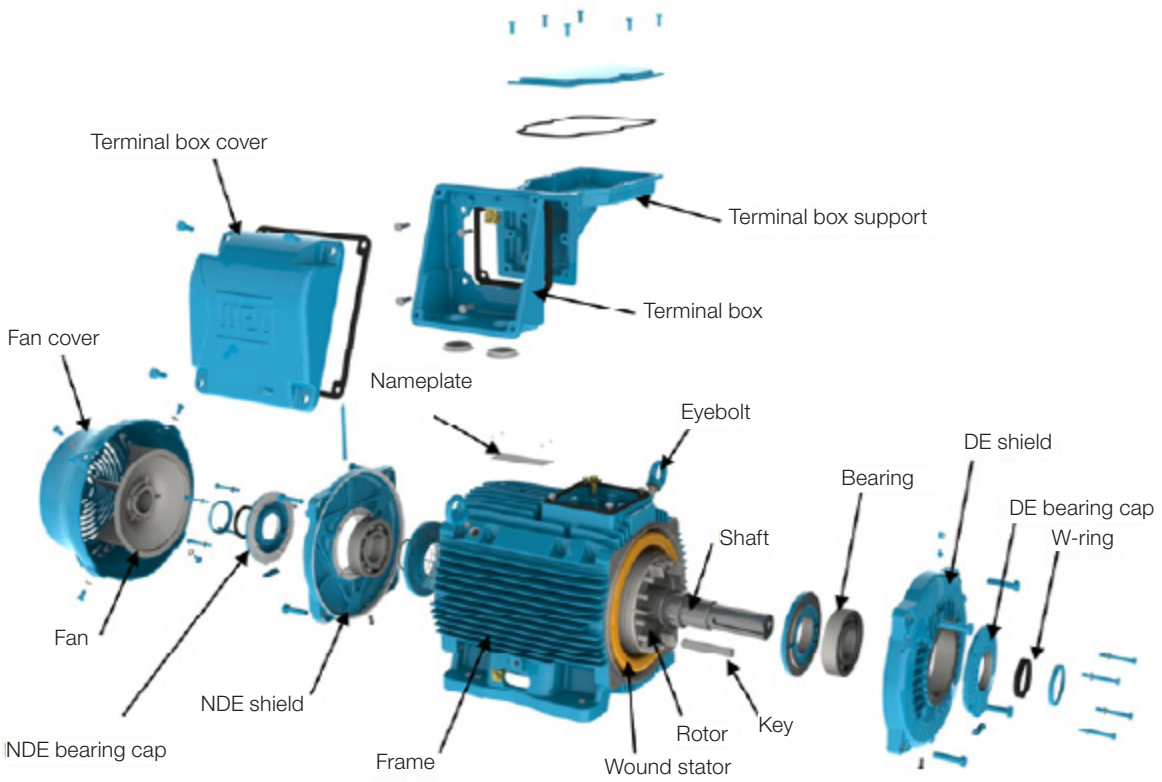

Figure 8.4 *- Exploded view of the components of a W22 motor*

9. ENVIRONMENTAL INFORMATION

9.1. PACKAGING

WEG electric motors are supplied in cardboard, plastic or wooden packaging. These materials can be recycled and must be disposed according to the applicable laws and regulations in each country. All wood used in the packaging of WEG motors come from the company reforestation program and is not submitted to any chemical conservation treatment.

9.2. PRODUCT

Electric motors consist mainly of ferrous metals (steel plates and cast iron), non ferrous metals (copper and aluminum) and plastic materials.

In general, electric motors have relatively long service live. However when they must be discarded, WEG recommends to dismantle the motor, sort the different materials and send them for recycling.

No-recyclable materials should be disposed of at industrial landfills according to the applicable environmental laws and regulations in each country, or co-processed in cement kilns or incinerated.

The recycling service providers, the disposal in industrial landfills, the waste co-processing or the incineration process must be properly authorized by the state environment agency to carry out these activities.

10. TROUBLESHOOTING CHART X SOLUTIONS

This troubleshooting chart provides a basic list of problems that may occur during motor operation, possible causes and recommended corrective actions. In case of doubts, please contact WEG Service Center.

Problem	Possible cause	Corrective action
Motor does not start, neither coupled nor decoupled	Power cables are interrupted	Check the control panel and the motor power supply cables
	Blown fuses	Replace blown fuses
	Wrong motor connection	Correct the motor connection according to connection diagram
	Locked rotor	Check motor shaft to ensure that it rotates freely
The motor starts at no-load, but fails when load is applied. It starts very slowly and does not reach the rated speed	Load toque is too high during start-up	Do not start the motor on load
	Too high voltage drop in the power cables	Check the installation dimensioning (transformer, cable cross section, relays, circuit breakers, etc.)
Abnormal/excessive noise	Defective transmission component or defective driven machine	Check the transmission force, the coupling and the alignment
	Misaligned / unleveled base	Align / level the motor with the driven machine
	Unbalanced components or unbalanced driven machine	Balance the machine set again
	Different balancing methods used for motor and coupling balancing (halve key, full key)	Balance the motor again
	Wrong motor direction of rotation	Reverse the direction of rotation
	Loose bolts	Retighten the bolts
	Foundation resonance	Check the foundation design
	Damaged bearings	Replace the bearings
Motor overheating	Insufficient cooling	Clean air inlet and outlet and cooling fins
		Check the minimum required distance between the fan cover and nearest walls. See item 7
		Check air temperature at inlet
	Overload	Measure motor current, evaluate motor application and if required, reduce the load
	Number of starts per hour is too high or the load inertia moment is too high	Reduce the number of starts per hour
	Power supply voltage too high	Check the motor power supply voltage. Power supply voltage must not exceed the tolerance specified in item 7.2
	Power supply voltage too low	Check the motor power supply voltage and the voltage drop. Power supply voltage must not exceed the tolerance specified in item 7.2
	Interrupted power supply	Check the connection of the power cables
	Voltage unbalance at the motor terminals	Check for blown fuses, wrong commands, voltage unbalance in the power line, phase fault or interrupted power cables
	Direction of rotation is not compatible with the unidirectional fan	Check if the direction of rotation matches the rotation arrow indicated on end shield
Bearing overheating	Excessive grease/oil	Clean the bearing and lubricate it according to the provided recommendations
	Grease/oil aging	
	The used grease/oil does not matches the specified one	
	Lack of grease/oil	Lubricate the bearing according to the provided recommendations
	Excessive axial or radial forces due to the belt tension	Reduce the belt tension
		Reduce the load applied to the motor

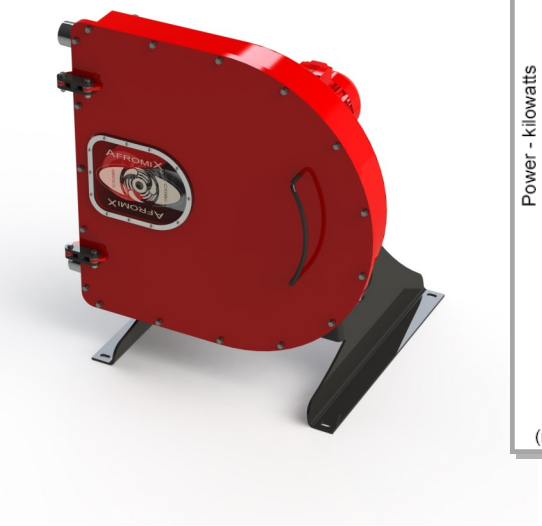
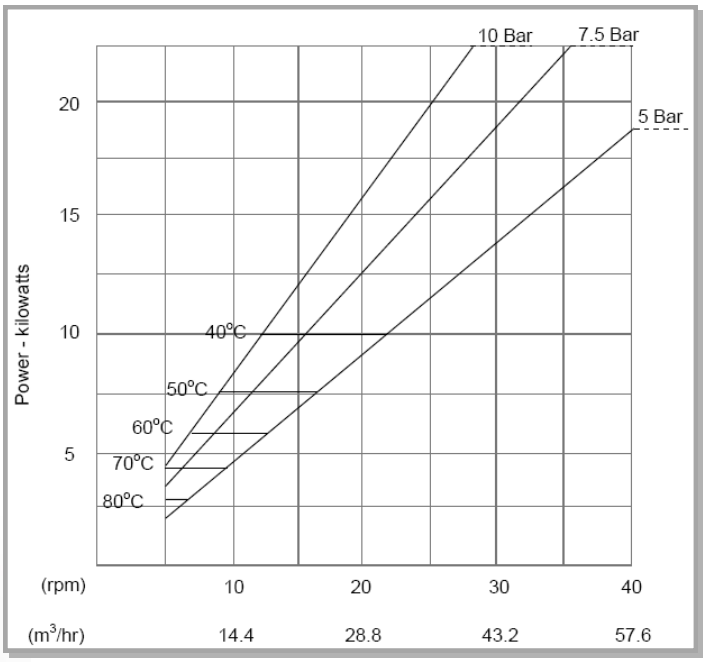
Sludge pumps



PUM-36488



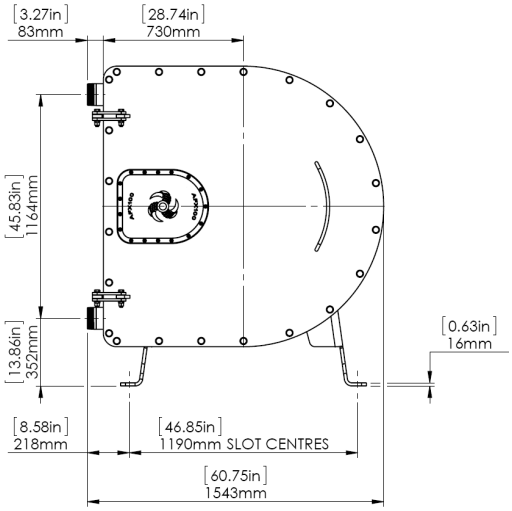
HydroTech Mining
Organized dewatering solutions

Product Data Sheet

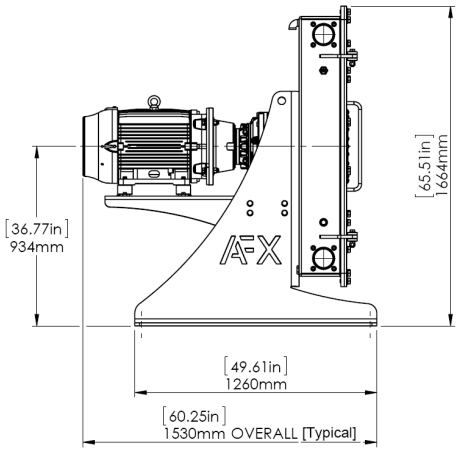
Features

- Pumps abrasive slurries, corrosive material, solids and gaseous liquids with ease
- Ideal for high viscosity or shear sensitive products
- Pumps can run-dry indefinitely without damage
- No check valves or seal water flush systems
- Fully reversible – pumps in either direction
- Minimal maintenance – the hose is the only wearing part
- Pump casings available in a choice of materials including stainless steel
- Suction lift capability up to 9.5 metres and self-priming
- Highly accurate

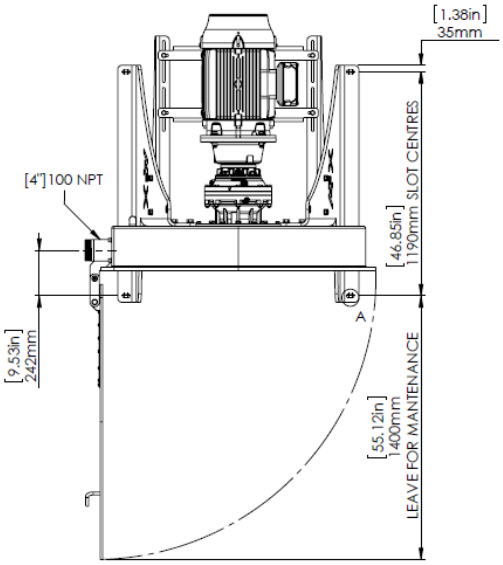
Technical Specifications



Maximum intermittent flow rate of:	57,600 litres per hour / 254 gallons per minute
Maximum continuous flow rate of:	43,200 litres per hour / 190 gallons per minute
Flow per revolution of:	24 litres / 6.87 gallons
Pressure capability of:	10 Bar / 150 psi
Maximum temperature:	80 Degrees Celsius / 176 Degrees Fahrenheit
Inner hose diameter of:	100 mm / 4 inches



Technical Specifications



Operating Speeds:	0 to 40rpm
Product Temperature Range:	-10 °C to +80 °C / 14 °F to 176 °F
Suction Lift:	9.5 metres / 30 feet lift
Hose Materials:	Natural Rubber, Nitrile (Buna), EPDM and CSM
Connections available:	BSP, NPT, DIN, ASA, Groove End: 316 St. Stl., PVC
Hose Lubricant Required:	40 litres / 10.6 gallons
Sound level at 1m:	< 70 dB(A) (pumping water at maximum continuous flow)
Optional Hose Failure Sensor:	Capacitive DC sensor

Materials of Construction

Pump housing:	Carbon steel or stainless steel
Rotor:	Aluminium or carbon steel
Compression rollers:	Aluminium or steel
Front cover:	Carbon steel
Support Frame:	Carbon steel
Seals:	Neoprene or Nitrile

Approximate Weight 1,300kgs / 2,866lbs

Actual weight depends upon drive fitted. Contact factory for details.

Agnico Eagle No. VDL 7.03 Insp Test Plan R:

DOCUMENT FOR INFORMATION

See Table 10: *Recommended Oils* for recommended lubricants. **DO NOT USE DETERGENT OILS**. The oil must be free of water, sediment, resin, soaps, acid and fillers of any kind. It should contain rust oxidation inhibitors and anti-foam additives. The proper oil viscosity is determined by the bearing housing operating temperature as given in Table 12: *Oil Viscosity Grades*.

Note that on APE4 power ends there is no constant level oiler and no vent/breather (replaced by a plug). This is the ASME B73.1 compliant configuration and is preferred. As stated above, proper oil level is the center of the "bull's eye" sight glass [8221]. Refer to Figure 22

NOTICE Only add oil when the pump has not operated for a least five minutes. Due to windage of the bearing housing oil, the observed oil level will appear to drop when the pump is running. This is normal operation. Do not add additional oil while the pump is running.

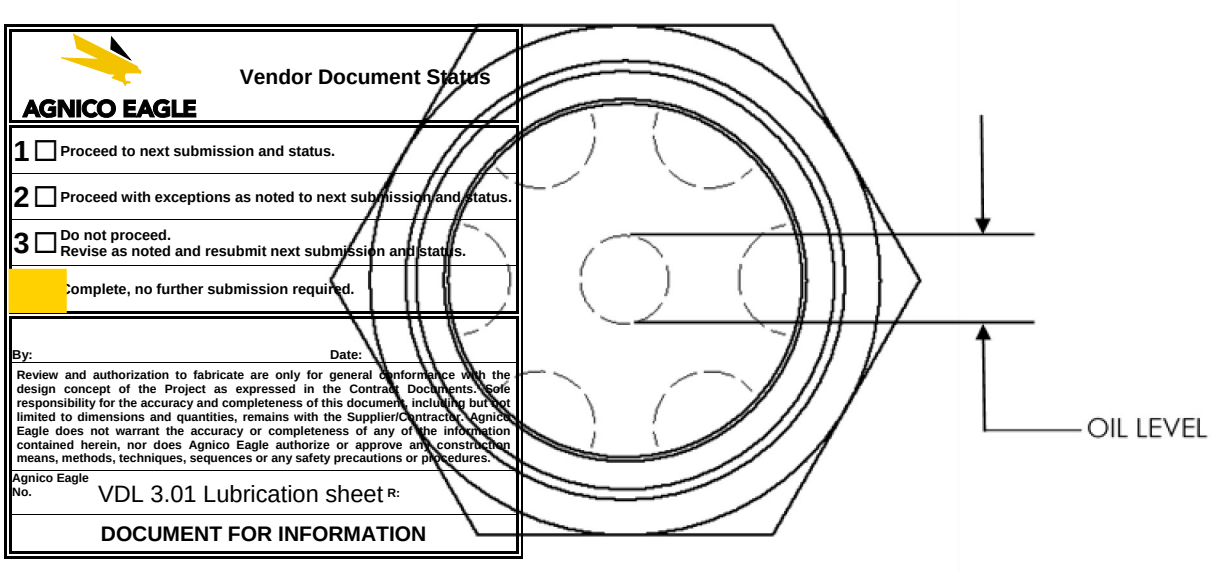

Figure 22: Sight Glass [8221]

In many pumping applications lubricating oil becomes contaminated before it loses its lubricating qualities or breaks down. For this reason, it is recommended that the first oil change take place after approximately 160 hours of operation, at which time, the used oil should be examined carefully for contaminants. During the initial operating period, monitor and record the oil temperature. See Table 12: *Oil Viscosity Grades* for maximum acceptable temperatures. Verify that the initial oil fill viscosity is appropriate for the previously recorded oil temperature. The normal oil change interval is based on temperature and is shown in Table 13: *Lubricant Intervals*.

	Royal Purple **	SYNFILM 32	**SYNFILM 46**	SYNFILM 68

(*) Note that it normally takes 4 hours for bearing temperature to stabilize and the final temperature will depend on the ambient, r/min, pumpage temperature and pump size. Also some oils have a greater viscosity index than the minimum acceptable of 95 (eg Mobil DTE 10 Excel™ Series) which may extend the minimum temperature capability of the oil. Always check the grade capability where the ambient is less than -5 ˚C (23 ˚F). An oil heater is recommended for temperatures below -12 ˚C (14 ˚F).

(†) Use LSC for oil mist. Oil parameters provide flash point >166 ˚C (331 ˚F), density >0.87 @ 15 ˚C (59 ˚F), pour point of -10 ˚C (14 ˚F) or lower.

(**) Normal compounded oils CANNOT be used with oil mist as anti-foam additives need to be avoided. Most oils recommended for wet splash lubrication contain foam inhibitors, as well as, antioxidants and anticorrosion additives, so they are unsuitable for oil mist. Some synthetic lubricants may attack the Nitrile seals when used in the bearing housing. The LSC LSO oils are recommended for oil mist applications. The APE4 and OPE4 power end are equipped with fluoroelastomers O-rings, for compatibility with synthetic lubricants.

Where the ambient temperature is very low, special lubricants are required. When oil lubrication is utilized and the ambient is less than -5 ˚C (23 ˚F), ensure the oil pour point is at least 15 ˚K (27 ˚F) below the lowest anticipated ambient temperature, and ensure the upper operating range of the oil is not exceeded. IS0 VG 46 oil is generally selected for an initial lubrication schedule, when ambient temperatures are expected to between 7 ˚C (45 ˚F) and 32 ˚C (90 ˚F).

Other drivers and gearboxes, if appropriate, should be lubricated in accordance with their manuals.

Table 11: Recommended Greases

General Purpose Grease	Mobil Polyrex™ EM (or compatible) Polyurea with mineral oil. Factory fill. 0.885g/ml
Food Grade	Klübersynth UH1 64-62. (NLGI 2) NSF H1 registered, complies with FDA 21 CFR § 178.3570, 0.920g/ml
Low Temp	Aeroshell 22 -60 to 38 °C (-76 to 100 °F), 0.868g/ml Aeroshell 7 -35 to 60 °C (-31 to 140 °F), 0.966g/ml

Note: Grease lubricated pumps and electric motors are supplied pre-greased.

Table 12: Oil Viscosity Grades

Maximum Oil Temperature	ISO Viscosity Grade	Minimum Viscosity Index
Up to 58 °C (136 °F)	32	95
Up to 70 °C (158 °F)	46	95
Up to 80 °C (176 °F)	68	95
Up to 90 °C (194 °F)	100	95

NOTICE **The maximum temperature that the bearings can be exposed to is 105 ˚C (220 ˚F).**

Table 13: Lubricant Intervals*

Lubricants	Under 60 °C (140 °F)***	60-70 °C (140-158 °F)***	71-80 °C (158-176 °F)***	80-90 °C (176-194 °F)***
Grease	12 months	6 months	3 months	1.5 months
Mineral oil	12 months	6 months	3 months	1.5 months
Synthetic oil**	24 months	18 months	18 months	18 months

(*) Assuming good maintenance and operation practices, and no contamination.
(**) May be increased to 36 months after initial oil change with APE4 power end.
(***) Bearing temperatures up to 16 ˚C (30 ˚F) higher than housing.

5.3.2.2 Re-greaseable: RPE4

Single shielded re-greaseable bearings

When the grease lubrication option is specified the bearing housing [3200] is equipped with, a single shielded inboard (radial) bearing [3011], outboard (thrust) bearing retainer [2530] with integral grease shield, oil return blocking pin [6810], grease fittings [3853.1 & .2] and an inboard (radial) bearing grease relief fitting [9220].

NOTICE **The orientation of the bearing shield, as shown in Figure 23**

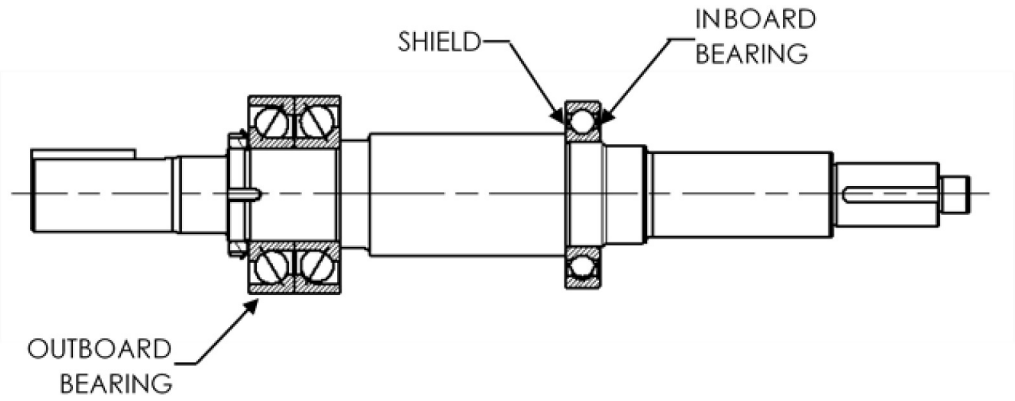

Figure 23: Bearing Shield Orientation

Pump bearings are packed with Mobil Polyrex™ EM grease prior to assembly. See Table 13: *Lubricant Intervals* for the recommend re-lubrication interval. For re-lubrication, a grease with the same type base (polyurea) and oil (mineral) should be used. To re-grease the radial bearing, add grease to the inboard grease fitting until grease exits the relief fitting on the opposite side of the bearing housing. To re-grease the thrust bearing, add the measured amount of grease specified in Table 14: *Grease Lubrication Amount*. Refer to Figure 24 for the grease fitting locations. After eight (8) re-lubrication intervals or three (3) years, it is recommended that the power end be disassembled and thoroughly cleaned, removing any used grease. See Section 8 for complete maintenance instructions.

NOTICE **Do not intermix greases shown in Table 11**: *Recommended Greases*. **They are not compatible.**

Table 14: Grease Lubrication Amount**

Power End	Initial lube*	Re-lubrication
Frame 41K inboard	77g	24g
Frame 41K outboard	125g	66g
Frame 42K inboard	115g	31g
Frame 42K outboard	173g	82g

(*) If new bearings are not lubricated, they should be hand packed, approximately 70% of the open bearing volume, with the initial lube quantity prior to installation.
(**) Listed quantities are for Polyrex™EM with a density of 0.885g/ml. Grease quantity must be adjusted for the density of the grease applied. Multiply the ratio of {0.885/grease density} by the quantities listed to arrive at the required amount in grams.

DOCUMENT FOR INFORMATION

Full Page GA Drawing

NAMEPLATE:
DISCHARGE TO SEA PUMP
see 60-000-265-GGD-001 For nameplate information requested.

General Notes:

1. Consult User Instruction Manual before pump installation.
2. Installation dimensions are +/- .13" (3 mm) unless otherwise noted.
3. Foundation bolts and piping should not be set rigidly before receipt of equipment.
4. Allow a minimum of .75" (19 mm) under the baseplate for adjustment and grouting.
5. All holes in flanges straddle centerlines.
6. Recheck alignment after the unit reaches operating conditions.
7. Piping, foundations, and systems are the responsibility of others. Flowserve Pump Division (FPD) data and comments are offered as an aid, but FPD cannot assume responsibility for the system design or operation. It is recommended that a specialist skilled in this area be consulted to ensure a successful installation.
8. Use only certified prints for construction.

NOTES: 136

1 General Information

1.1 Scope of manual

These instructions must be kept close to the product's operating location or directly with the product.

These instructions must be read prior to installing, operating, using, or maintaining the equipment in any region worldwide. The equipment must not be put into service until all of the safe operating conditions noted in the instructions have been met. Failure to comply with the information provided in the User Instructions is considered to be misuse. Personal injury, product damage, delay in operation, or product failure caused by misuse are not covered by the Flowserve warranty.

Flowserve products are designed, developed and manufactured with state-of-the-art technologies in modern facilities. The unit is produced with great care and commitment to continuous quality control, utilizing sophisticated quality techniques, and safety requirements.

Flowserve is committed to continuous quality improvement and being at your service for any further information about the product in its installation and operation or about its support products, repair and diagnostic services.

The following user information covers the Flowserve, Durco, Mark 3 Group 4:
English ASME Units - Class 150,
Suction NPS 8" – 16"
Discharge NPS 4" – 16"
Comes with or without Flowserve IPS-Beacon™ equipment

These instructions are intended to familiarize the reader with the product and its permitted use. Operating the product in compliance with these instruction is important to help ensure reliability in service and avoid risks. These instructions may not take into account all local regulations; ensure such regulations are observed by all, including those installing the product. Always coordinate repair activities with operations personnel, and follow all plant safety requirements and applicable safety and health legislation.

Supplementary user instructions determined from the contract requirements for inclusion into User Instructions for buy-out equipment such as driver, instrumentation, controller, sub-driver, seals, seal system, mounting component etc. If required, copies of other information sent separately to the Purchaser should be obtained from the Purchaser and retained with these User Instructions.

The typical general arrangement drawing and any specific drawings required by the contract will be sent to the Purchaser separately unless the contract specifically calls for these to be included into the User Instructions. If required, copies of other drawings sent separately to the Purchaser should be obtained from the Purchaser and retained with these User Instructions.

If any changes, agreed with Flowserve Solution group, are made to the product after it is supplied, a record of the details should be maintained with these User instructions.

1.2 Disclaimer

Information in this User Instruction is believed to be complete and reliable. In spite of all Flowserve's efforts to provide comprehensive information and instructions, sound engineering and safety practices should always be used. Please consult with a qualified engineer.

Flowserve manufactures products to applicable International Quality Management System Standards as certified and audited by external Quality Assurance organizations. Genuine parts and accessories have been designed, tested, and incorporated into the products to help ensure continued product quality and performance in use. As Flowserve cannot test parts and accessories sourced from other vendors the incorrect incorporation of such parts and accessories may adversely affect the performance and safety features of the product. The failure to properly select, install, or use authorized Flowserve parts and accessories is considered to be misuse. Damage or failure caused by misuse is not covered by Flowserve's warranty. In addition, any modification of Flowserve products or removal of original components may impair the safety of these products in use.

1.3 Certification instruction

Certificates defined in the Contract requirements are provided with these instructions where applicable. Examples are certificates for CE marking and ATEX marking etc. If required, copies of other certificates sent separately to the Purchaser should be obtained from the Purchaser for retention with this User Instruction.

1.4 Units

This product was designed with United States customary system (USC) units. However, the primary system of units in this document is the International System of Units (SI). USC units are display in (parenthesize).

2 Safety Information

2.1 Intended use

This product has been selected to meet the specifications of your purchase order. The acknowledgement of these conditions has been sent separately to the Purchaser. A copy should be kept with these instructions.

⚠ The product/system must not be operated beyond the parameters specified for the application. If there is any doubt as to the suitability of the product/system for the application intended, contact Flowserve for advice, quoting the serial number.

- Installing, operating, or maintaining the product/system in any way that is not covered in this User Instruction could cause death, serious personal injury, or damage to the equipment. This includes any modification to the product/system or use of the parts not provided by Flowserve.
- Only operate the product/system when it has successful passed all inspection acceptance criteria
- Do not operate the product/system in a partially assembled condition.
- If the conditions of service on the customer's purchase order change (i.e. pumping fluid, temperature, or duty conditions) it is requested that the user seeks written agreement from Flowserve before start up.
- Observe equipment labels, such as arrows designating the direction of rotation, warning signs, etc., and keep them in a legible condition. Replace any damaged and/or illegible labels immediately.

If the conditions of service on your purchase order are going to be changed (for example liquid pumped, temperature or duty) it is requested that user seeks the written agreement of Flowserve before start up.

2.2 Safety symbols and description

This User Instruction contains specific safety markings where non-observance of an instruction would cause a hazard. The specific safety markings can be found in Table 1: *Definition of safety symbols and markings*, and Table 2: *Additional symbols*.

Table 1: Definition of Safety Symbols & Markings

Symbol	Description
DANGER	**DANGER** This symbol indicates a hazardous situation which, if not avoided, will result in death or serious injury
WARNING	**WARNING** This symbol indicates a hazardous situation which, if not avoided, could result in death or serious injury
CAUTION	**CAUTION** This symbol indicates a hazardous situation which, if not avoided, could result in minor or moderate injury
SAFETY INSTRUCTIONS	**SAFETY INSTRUCTIONS** This symbol indicates specific safety-related instruction or procedures
NOTICE	**NOTICE** This symbol is used to address practices not related to physical injury
	This is the safety alert symbol. It is used to alert you to potential physical injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.

Table 2: Additional Symbols

Symbol	Description
	**ELECTRICAL HAZARD** This symbol indicates electrical safety instructions where non-compliance would affect personal safety and could result in loss of life
	**TOXIC HAZARD** This symbol indicates "hazardous substances and toxic fluid" safety instructions where non-compliance would affect personal safety and would damage the equipment or property
	**ATEX EXPLOSION PROTECTION** This symbol indicates explosive atmosphere marking according to ATEX. It is used in safety instructions where non-compliance in the hazardous area would cause the risk of an explosion
	**DO NOT USE DRY CLOTH** This symbol is used in safety instructions to remind not to rub non-metallic surfaces with a dry cloth; ensure the cloth is damp. It is used in safety instructions where non-compliance in the hazardous area would cause risk of an explosion.

2.3 General hazard sources

This is a summary of conditions and actions to help prevent injury to personnel and damage to the environment. For products used in potentially explosive atmospheres section 2.4 also applies.

2.3.1 Mechanical hazards

Lifting limits and guidelines

The load values mentioned in this section are Flowserve recommendations only. All lifting must be done in compliance with site safety protocol, local regulations, and related industry standards.

 Many precision parts have sharp corners which require appropriate personal protective equipment during handling. Prior to any attempt to lift an item, personnel must first determine the approximate weight and stability of the load.

- Large, unstable, or awkward loads should always be handled with the assistance of additional personnel or appropriate mechanical means.
- Loads in excess of 23 kg (50 lb.) should only be lifted by appropriate mechanical means and in accordance with current local legislation or with the assistance of additional personnel.
- Lifting items less than 23 kg (50 lb.) may be prohibited without assistance if the lift is repetitive and/or awkward (i.e., away from the body, above the shoulders or below the knees) thus placing excessive stress on the personnel.
- Repetitive lifting of any kind should be evaluated as part of a documented end-user safety program.

See section 4.4, Transportation for proper lifting instructions.

2.3.2 Electrical hazards

 NEVER DO MAINTENANCE WORK WHEN THE UNIT IS CONNECTED TO POWER (Lock out)

2.3.3 Hazardous Liquids

 When the pump is handling hazardous liquids, care must be taken to avoid exposure to the liquid by appropriate siting of the pump by limiting personnel access and by operator training. If the liquid is flammable and/or explosive, strict safety procedures must be applied.

⚠CAUTION GLAND PACKING MUST NOT BE USED WHEN PUMPING HAZARDOUS LIQUIDS

⚠CAUTION PREVENT EXCESSIVE EXTERNAL PIPE LOAD

Do not use pump as a support for piping. Do not mount piping expansion joints, unless allowed by Flowserve in writing, so that their force, due to internal pressure, acts on the pump flange. When applied on a pressure line, tie rods limiting the elongation of the joint and take the axial thrust created by the internal pressure must be used.

 **⚠CAUTION NEVER RUN THE PUMP DRY OR WITHOUT PROPER PRIME** (Casing flooded)

 **⚠CAUTION NEVER OPERATE THE PUMP WITH THE DISCHARGE VALVE CLOSED**. Unless otherwise instructed at a specific point in the User Instructions. See section 6, *Commissioning*, & Section 7, *Operation*

 **⚠CAUTION NEVER OPERATE THE PUMP WITH SUCTION VALVE CLOSED**. It should be fully opened when the pump is running

 **⚠CAUTION NEVER OPERATE THE PUMP AT ZERO FLOW OR FOR EXTENDED PERIODS BELOW THE MINIMUM CONTINUOUS FLOW**

 **⚠CAUTION DO NOT RUN THE PUMP AT ABNORMALLY HIGH OR LOW FLOW RATES**

Operating at a flow rate higher than normal or at a flow rate with no back pressure on the pump may overload the motor and cause cavitation. Low flow rates may cause a reduction in pump/bearing life, overheating of the pump, instability and cavitation/vibration

 **⚠CAUTION ENSURE CORRECT LUBRICATION**

See section 5.3.2, *Pump lubricants*

⚠CAUTION NEVER EXCEED THE MAXIMUM DESIGN PRESSURE (MDP) AT THE TEMPERATURE SHOWN ON THE PUMP NAMEPLATE

See section 7, for pressure versus temperature ratings based on the material of construction

⚠CAUTION THE PUMP SHAFT MUST TURN CLOCKWISE WHEN VIEWED FROM THE MOTOR END

It is absolutely essential that the rotation of the motor be checked before installation of the coupling spacer and starting the pump. Incorrect rotation of the pump for even a short period can unscrew the impeller nut, which can cause significant damage.

2.3.4 Additional hazards

⚠ GUARDS MUST NOT BE REMOVED WHILE THE PUMP IS OPERATIONAL

⚠ NEVER OPERATE THE PUMP WITHOUT THE COUPLING GUARD AND ALL OTHER SAFETY DEVICES CORRECTLY INSTALLED

⚠ DRAIN THE PUMP AND ISOLATE PIPEWORK BEFORE DISMANTLING THE PUMP

The appropriate safety precautions should be taken where the pumped liquids are hazardous.

⚠ NEVER APPLY HEAT TO REMOVE IMPELLER

Trapped lubricants or vapor could cause an explosion.

⚠ FLUOROELASTOMERS (When fitted)

When a pump has experienced temperatures over 250 ˚C (482 ˚F), partial decomposition of fluoroelastomers (example: Viton®, ASTM D1418 1629 - FKM) will occur. In this condition these are extremely dangerous and skin contact must be avoided.

⚠ THERMAL SHOCK

Rapid changes in the temperature of the liquid within the pump can cause thermal shock, which can result in damage or breakage of components and should be avoided.

HOT & COLD PARTS

If hot or freezing components or auxiliary heating equipment can present a danger to operators and persons entering the immediate area, action must be taken to avoid accidental contact (such as shielding). If complete protection is not possible, the machine access must be limited to maintenance staff only with clear visual warnings and indicators to those entering the immediate area. Note: bearing housings must not be insulated and drive motors and bearings may be hot.

If the temperature is greater than 80 ˚C (175 ˚F) or below -5 ˚C (23 ˚F) in a restricted zone, or exceeds local regulations, action as above shall be taken.

2.4 Potential explosive areas

Measures are required to:

- Avoid excess temperature
- Prevent build-up of explosive mixtures
- Prevent the generation of sparks
- Prevent leakages
- Maintain the pump to avoid hazard

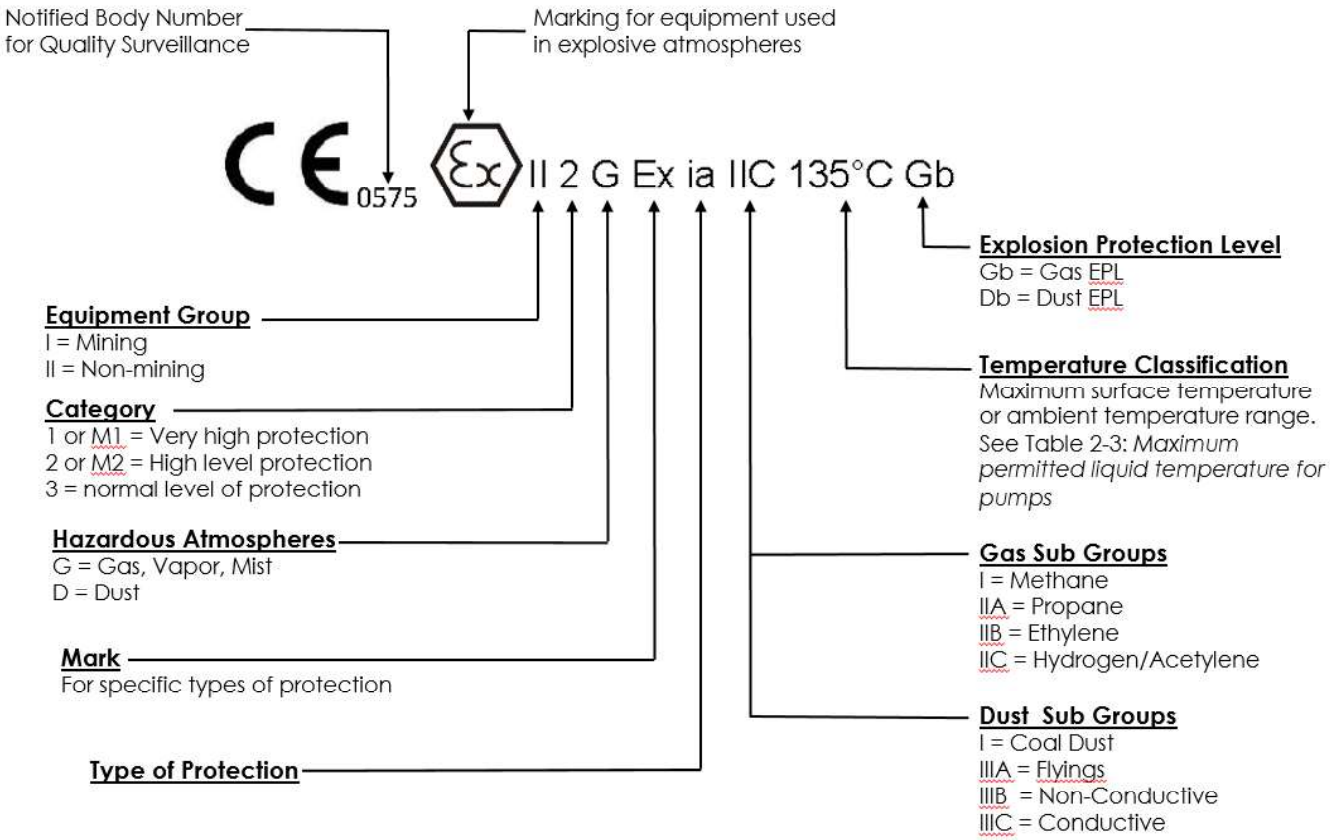
All instructions for equipment installed in potentially explosive atmospheres must be followed to help ensure explosion protection. For ATEX, both electrical and non-electrical equipment must meet the requirements of the European Explosion Protection Directive 2014/34/EU. Always observe the regional legal Ex requirements, e.g. Ex electrical items outside the EU may be required certified to other than ATEX e.g. IECEx, UL.

2.4.1 Scope of compliance

Use equipment only in the zone for which it is appropriate. Always check that all equipment is suitably rated and/or certified for the classification of the specific atmosphere in which they are to be installed.

Where Flowserve has supplied only the bare shaft pump, the Ex rating applies only to the pump. The party responsible for assembling the ATEX pump set shall select the coupling, driver and any additional equipment, with the necessary CE Certificate/Declaration of Conformity establishing it is suitable for the area in which it is to be installed.

The output from a variable frequency drive (VFD) can cause additional heating affects in the motor. On pump installations controlled by a VFD, the ATEX Certification for the motor must state that it covers the situation where electrical supply is form the VFD. This particular requirement still applies even if the VFD is in a safe area.



2.4.2 Marking

It is a legal requirement that machinery and equipment put into service within certain regions of the world shall conform with the applicable CE Marking Directives covering Machinery and, where applicable, Low Voltage Equipment, Electromagnetic Compatibility (EMC), Pressure Equipment Directive (PED) and Equipment for Potentially Explosive Atmospheres (ATEX).

Where applicable, the Directive and any additional Approvals, cover important safety aspects relating to machinery and equipment and the satisfactory provision of technical documents and safety instructions. Where applicable this document incorporates information relevant to these Directives and Approvals.

To confirm the Approvals applying and if the product is CE marked, checked the serial number plate markings and the Certification. (See section 1.3, *Certification instruction*)

An example of ATEX equipment marking is shown below. The actual classification of pump will be engraved on the nameplate.

2.4.3 Avoiding excessive surface temperatures

ENSURE THE EQUIPMENT TEMPERATURE CLASS IS SUITABLE FOR THE HAZARD ZONE

Pump liquid temperature

Pumps have a temperature class as stated in the ATEX Ex rating on the nameplate. These are based on a maximum ambient temperature of 40 ˚C (104 ˚F); refer to Flowserve for higher ambient temperatures.

The surface temperature on the pump is influenced by the temperature of the liquid handled. The maximum permissible liquid temperature depends on the temperature class and must not exceed the values in the table applicable below.

Table 3: Maximum Permitted Temperature

Temperature class to En 13463-1	Maximum surface temperature permitted	Temperature limit of liquid handled
T6	85 ˚C (185 ˚F)	Consult Flowserve *
T5	100 ˚C (212 ˚F)	Consult Flowserve *
T4	135 ˚C (275 ˚F)	115 ˚C (239 ˚F) *
T3	200 ˚C (392 ˚F)	180 ˚C (356 ˚F) *

*The table only takes the ATEX temperature class into consideration. Pump design or material, as well as component design or material, may further limit the maximum working temperature of the liquid.

The temperature-rise at the seals/bearings and due to the minimum permitted flow rate is taken into account in the temperatures stated.

The operator is responsible to ensure the specified maximum liquid temperature is not exceeded.

Temperature classification "Tx" is used when the liquid temperature varies and when the pump is required to be used in differently classified potentially explosive atmospheres. In this case, the user is responsible for ensuring that the pump surface temperature does not exceed that permitted in its actual installed location.

Do not attempt to check the direction of rotation with coupling element/pins fitted due to risk of severe contact between rotating and stationary components.

Avoid mechanical, hydraulic or electrical overload by using motor overload trips, temperature monitor or a power monitor and perform routine vibration monitoring.

In dirty or dusty environments, make regular checks and remove dirt from areas around close clearances, bearing housings and motors.

Where there is any risk of the pump being run against a closed valve generating high liquid and casing external surface temperature, fit an external surface temperature protection device.

Where the system operation does not ensure control of priming, as defined in these User Instructions, and the maximum permitted surface temperature of the T Class could be exceeded, install an external surface temperature protection device.

2.4.4 Preventing the buildup of explosive mixtures

 ENSURE THE PUMP IS PROPERLY FILLED AND VENTED AND DOES NOT RUN DRY

Ensure that the pump and relevant suction and discharge piping system is totally filled with liquid at all times during the pumps operation so that an explosive atmosphere is prevented.

In addition, it is essential to make sure that seal chamber, auxiliary shaft seal systems and any heating and cooling systems are properly filled.

If the operation of the system cannot avoid this condition, fit an appropriate dry run protection device (for example liquid detection or a power monitor).

To avoid potential hazards from fugitive emissions of vapor or gas to atmosphere, the surrounding area must be well ventilated.

2.4.5 Preventing sparks

 To prevent a potential hazard from mechanical contact, the coupling guard must be non-sparking for Category 2.

To avoid the potential hazard from random induced current generating a spark, the baseplate must be properly grounded.

 Avoid electrostatic charge. Do not rub non-metallic surfaces with a dry cloth; ensure the cloth is damp.

For ATEX the coupling must be selected to comply with 2014/34/EU. Correct coupling alignment must be maintained.

Additional requirements for metallic pumps on non-metallic baseplates

When metallic components are fitted on a non-metallic baseplate they must be individually earthed.

2.4.6 Preventing leakage

The pump must only be used to handle liquids for which it has been approved to have the correct corrosion resistance.

Avoid entrapment of liquid in the pump and associated piping due to closing of suction and discharge valves, which could cause dangerous excessive pressures to occur if there is heat input to the liquid. This can occur if the pump is stationary or running.

Bursting of liquid containing parts due to freezing must be avoided by draining or protecting the pump and auxiliary systems.

Where there is the potential hazard of a loss of a seal barrier fluid or external flush, the fluid must be monitored.

If leakage of liquid to atmosphere can result in a hazard, install a liquid detection device.

2.4.7 Maintenance to avoid the hazard

CORRECT MAINTENANCE IS REQUIRED TO AVOID POTENTIAL HAZARDS WHICH GIVE A RISK OF EXPLOSION

The responsibility for compliance with maintenance instructions is with the plant operator.

To avoid potential explosion hazards during maintenance, the tools, cleaning and painting materials used must not give rise to sparking or adversely affect the ambient conditions. Where there is a risk from such tools or materials, maintenance must be conducted in a safe area.

It is recommended that a maintenance plan and schedule is adopted. (See section 8, *Maintenance*)

2.5 Responsibility of the operating company

To ensure personnel safety the operating company must do the following:

- Complete a risk assessment of the site where the product/system will be in operation, by observing the working conditions
- Create site specific work instructions for the operation of the product
- Ensure that the personnel have read and understand all applicable instructions
- Provide regular training to the necessary personnel in regular intervals
- Provide the required personal protective equipment

2.6 Qualified personnel and targeted group

All personnel involved in the operation, installation, inspection and maintenance of the unit must be qualified to carry out the work involved. If the personnel in question does not already possess the necessary knowledge and skill, appropriate training and instruction must be provided. If required, the operator may commission the manufacturer / supplier to provide applicable training.

Always co-ordinate repair activities with operation and health and safety personnel, and follow all plant safety requirements and applicable safety and health laws and regulations.

2.7 Industrial health and safety measures

Follow industry safety standards including the use of appropriate equipment in required areas.

2.8 Protective equipment

Necessary protective equipment including personal protective equipment shall adhere to facility standards.

3 Product Description

3.1 General product description

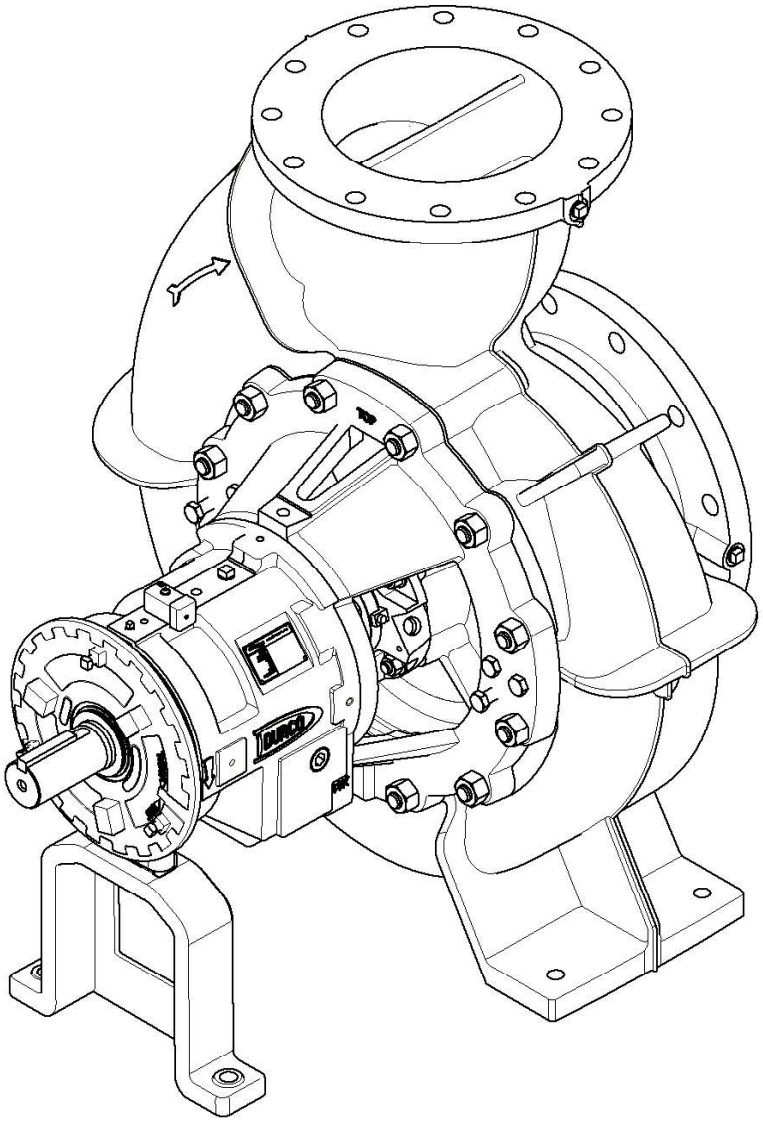


Figure 1: Isometric view of the Mark 3 Group 4

The Flowserve Durco Mark 3 Group 4 product line, is a single stage centrifugal, flexibly coupled, horizontal, foot mounted, end suction, center-line discharge, back pullout pump designed to ASME B73.1 Specification for Horizontal End Suction Centrifugal Pump for Chemical Processing functional requirements.

3.2 Design

3.2.1 Pump Casing

The casing design permits removal of the back pullout assembly from the casing without disturbing the suction and discharge connections. Tapped holes for jackscrews are provided in the adapter to facilitate removal of the back pullout assembly. The design also avoids disturbing the motor, with use of a spacer coupling with sufficient DBSE (Distance Between Shaft Ends).

3.2.2 Impeller

Depending on the configuration, the impeller is either a reverse vane or semi-open design. The attachment is keyed and is protected so not to be wetted by the pumped fluid.

3.2.3 Shaft/sleeve

Solid and sleeved shafts are available, supported on bearings, and keyed drive end. Solid and sleeved shafts are designed to limit dynamic shaft deflection at the impeller centerline to not exceed 0.13 mm (0.005in.) within the allowable operating region as specified in ASME B73.1.

3.2.4 Pump bearings & lubrication

Anti-friction bearings are fitted as standard and may be either oil bath, oil mist or grease lubricated. Bearings are sized in accordance with ANSI/ABMA-9, ANSI/ABMA-11, and ISO 281. The minimum L10 bearing life is 17,500 hr in the allowable operating region.

3.2.5 Bearing Housing

The bearing housing is designed to incorporate four types of lubrication options. The options are ASME B73 Power End (APE4), Oiler Power End (OPE4), Re-greaseable Power End (RPE4) and Oil Mist Power End (MPE4). For details on each configuration and lubricants needed see section 5.3.2, *Pump lubricants*.

3.2.6 Seal Chamber (cover)

The seal chamber has a spigot (rabbet) fit between the pump casing and bearing housing adapter for optimum concentricity. The seal chamber can be a cylindrical or a self-venting tapered design with radial flow modifiers, which eliminates fitting the pump with auxiliary seal piping in many services. A packing box may be fitted as an option.

3.2.7 Shaft Seal

The mechanical seal(s), attached to the pump shaft, prevents the pumped liquid from entering the environment. When fitted with optional shaft packing, pump liquid will exist the pump during normal operation.

3.2.8 Driver

The driver is normally an electric motor. Different drive configurations may be fitted such as internal combustion engines, steam turbines, hydraulic turbines, driven via couplings, belts, gearboxes, drive shafts etc.

3.2.9 Accessories

Accessories may be fitted when specified by the customer. The operation and maintenance of these may not be covered in this document.

3.3 Scope of delivery

The exact scope of the delivery is stated in the order documentation.

3.4 Function description

The Flowserve Mark 3 Group 4 is single-stage centrifugal pump. Mark 3 Group 4 pumps are categorized as a kinetic-energy pump which uses centrifugal force to push the liquid outward from the eye of the impeller where it enters the casing. Differential head can be increased by increasing impeller rotation speed or increasing impeller diameter. The impeller and fluid being pumped are isolated from outside contaminants by packing or mechanical seals. Radial and thrust bearings restrict the movement of the shaft and reduce the fiction of rotation. The Mark 3 Group 4 design is widely accepted and has proven to be highly reliable in many applications.

For performance parameters see section 2.1, Intended use. Where performance data has been supplied separately to the purchaser these should be obtained and retained with these User Instructions.

3.5 Connections

3.5.1 Electrical connections

 Electrical connections must be made by a qualified Electrician in accordance with relevant local, national and international regulations.

 It is important to be aware of the EUROPEAN DIRECTIVE on potentially explosive areas where compliance with IEC 60079-14 is an additional requirement for making electrical connections.

 It is important to be aware of the EUROPEAN DIRECTIVE on electromagnetic compatibility when wiring up and installing equipment on site. Attention must be paid to ensure that the techniques used during wiring/installation do not increase electromagnetic emissions or decrease the electromagnetic immunity of the equipment, wiring or any connected devices. If in any doubt, contact Flowserve for advice.

The motor must be wired up in accordance with the motor manufacturer's instructions (normally supplied within the terminal box) including any temperature, earth leakage, current and other protective devices as appropriate. The identification nameplate should be checked to ensure the power supply is appropriate.

A device to provide emergency stopping must be fitted. If not supplied pre-wired to the pump unit, the controller/starter electrical details will also be supplied within the controller/starter. For electrical details on pump sets with controllers see the separate wiring diagram.

CAUTION **See section 8, Maintenance, for direction of rotation before connecting the motor to the electrical supply**.

3.5.2 Suction & discharge piping connections

CAUTION **Protective covers are fitted to both the suction and discharge flanges of the casing and must be removed prior to connecting the pump to any pipes**.

All piping must be independently supported, accurately aligned and preferably connected to the pump by a short length of flexible piping. The pump should not have to support the dead weight of the pipe, its contents or compensate for misalignment. It should be possible to install suction and discharge bolts through mating flanges without pulling or prying either of the flanges. All piping must be tight. Pumps may air-bind if air is allowed to leak into the piping. If the pump flange(s) have tapped holes, select flange fasteners with thread engagement at least equal to the fasteners diameter but that do not bottom out in the tapped holes before the joint is tight.

3.5.2.1 Suction Piping

To avoid NPSH and suction problems, suction piping must be at least as large as the pump suction connection. Never use pipe or fittings on the suction that are smaller in diameter than the pump suction size. Figure 2 illustrates the ideal piping configuration with a minimum of 10 pipe diameters between the source and the pump suction. Refer to ANSI/HI 9.6.6-2016 Rotodynamic Pump for Pump Piping for minimum required straight pipe length. When multiple fittings are adjacent, the fitting with the longest minimum length requirement will govern the minimum length of the pipe attached to the pump suction.

Where no potential for air or vapor accumulation exists, a concentric reducer is recommended. When the potential for air of vapor accumulation exists, an eccentric convergent reducer is recommended. Where piping approaches from below, the flat side shall be located on top, as shown in Figure 3, with a maximum of one pipe size reduction. Mount eccentric reducers with the flat side down, when the inlet approaches from above. Horizontally mounted concentric reducers should not be used if there is any possibility of entrained air in the process fluid. Vertically mounted concentric reducers are acceptable.

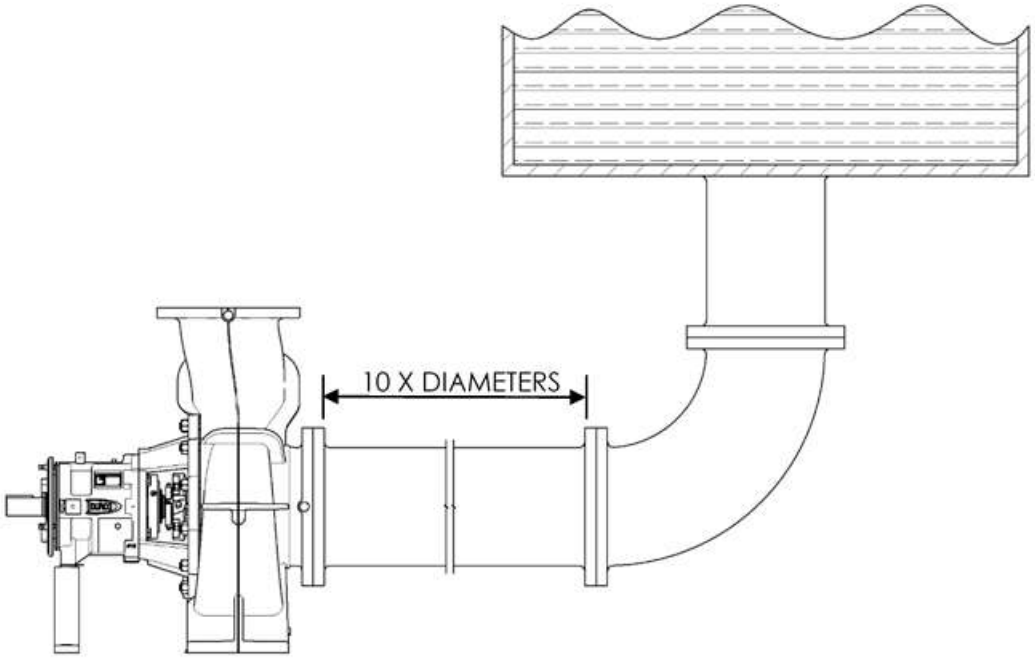

Figure 2: Minimum Piping Configuration

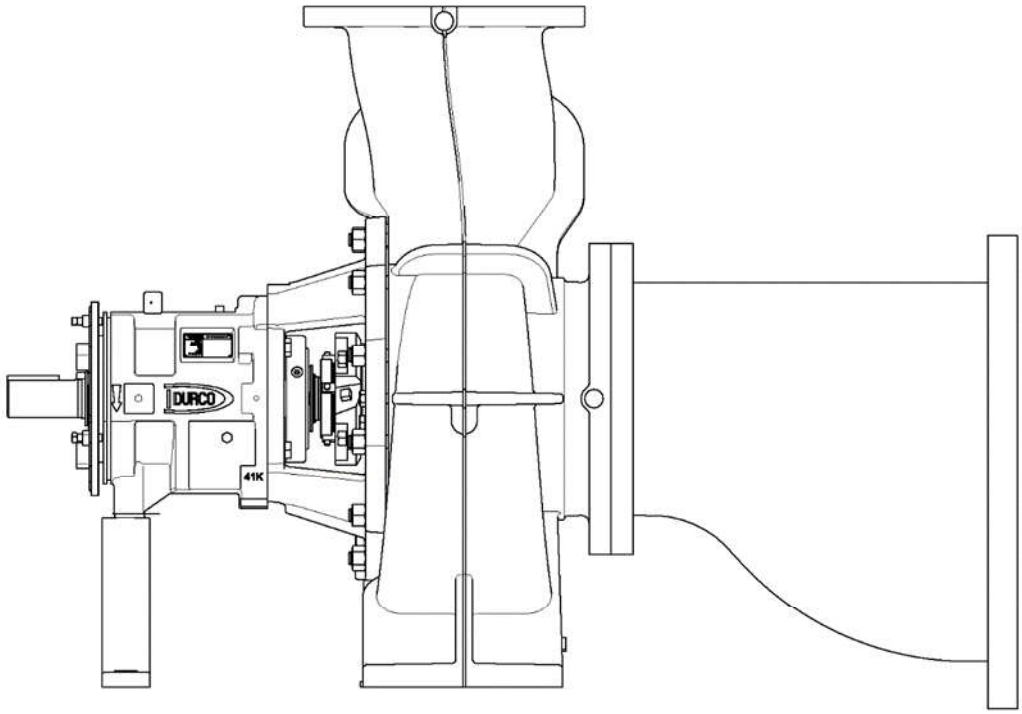

Figure 3: Suction Piping with Eccentric Reducer

Start-up strainers must be removed shortly before final start-up. When the pump is installed below the source of supply, a valve should be installed in the suction line to isolate the pump and permit pump inspection and maintenance. However, never place a valve directly on the suction nozzle of the pump.

A cruciform flow conditioner, as shown in Figure 4, is recommended. Cruciform suction piping is designed as a flow conditioner which reduces swirl, pulsation, noise, and reduces flow profile distortion. The cruciform should extend (2) pipe diameters in to the suction pipe. Minimum length of suction pipe before the cruciform is as specified in ANSI/HI 9.6.6 for length of pipe prior to the pump inlet. See Annex C for addition source recommendation on suction piping.

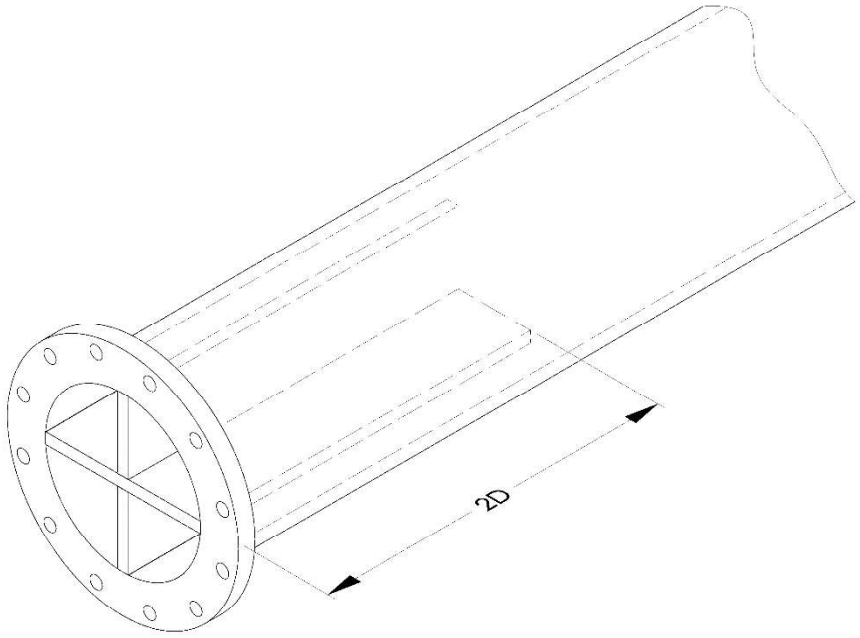

Figure 4: Suction Cruciform

Refer to Section 7.2.6 for performance and operating limits.

3.5.2.2 Discharge piping

Install a valve in the discharge line. This valve is required for regulating flow and/or to isolate the pump for inspection and maintenance. The maximum recommended velocity in the discharge piping is 4.5 m/s (15 ft/s). The straight length of pipe at the discharge nozzle is not subject to this velocity limitation.

An elbow should not be connected directly to the pump discharge. Flow distribution in the discharge nozzle will be affected, reducing pump performance, and having possible other negative effects. This can result in increased noise, vibration, increased nozzle loads.

⚠CAUTION When Fluid velocity in the pipe is high, for example, 3 m/s (10 ft/sec) or higher, a rapidly closing discharge valve can cause a damaging pressure surge, or water hammer. A dampening arrangement should be provided in the piping. Refer to ANSI/HI 9.6.6-Appendix B-Water-2016 Hammer for further information.

3.5.2.3 Gage connections

The pump should be optionally configured with discharge and suction gage connection, TAP II and TAP III, if pump hydraulic performance is to be monitored. Fittings located between the pump and any gage connection should be avoided, as changes in fluid velocity and flow distribution will cause significant errors in observed pressure. Observations taken in the field do not constitute certified results.

3.5.2.4 Allowable nozzle load

In this section, F represents force, M represents moment. Combinations of subscripts are used to define direction, type, and location of the load. Definitions of the subscripts:

1. X, Y, Z: Directions of the load
2. S: Suction flange
3. D: Discharge flange
4. A: Applied load
5. R: Resultant load
6. adj: Adjusted load
7. xS: Horizontal distance from the face of the suction flange to the pump discharge centerline
8. zD: Vertical distance from the face of the discharge flange to the pump suction centerline
9. C: Pump Center

The Flowserve Durco Mark 3 Group 4 pumps are designed with reference to the allowable nozzle loads specified by API 610. The calculation approach is developed based on API 610 with reference to ANSI/HI 9.6.2. The following steps describe how to calculate the allowable loads for each pump and how to determine if the applied loads are acceptable.

1. Determine the appropriate casing "Material Group No." in Section 7.2.7 Table 17: *Alloy Cross-Reference*.
2. Find the "Casing material correction factor" in Table 4: *Casing Material Correction Factor* based upon the "Material Group No." and operating temperature. Linear interpolation may be used to determine the correction factor for a specific temperature.
3. Find the "Baseplate correction factor" in Table 5: *Baseplate Correction Factor*. Note that the correction factor depends upon how the baseplate is to be installed.
4. Locate the pump size being evaluated in Table 7: *Nozzle Loading*, and record the allowable load component values.
5. Multiply each load rating found in Table 7: *Nozzle Loading* by the casing material correction factors to get the "adjusted loads" F_{XS_adj}, F_{YS_adj}, F_{ZS_adj}, M_{XS_adj}, M_{YS_adj}, M_{ZS_adj}, F_{XD_adj}, F_{YD_adj}, F_{ZD_adj}, M_{XD_adj}, M_{YD_adj}, M_{ZD_adj}.
6. Record the applied loads at the casing flanges according to the coordinate system found in Figure 5. The 12 forces and moments possible are F_{XSA}, F_{YSA}, F_{ZSA}, M_{XSA}, M_{YSA}, M_{ZSA}, F_{XDA}, F_{YDA}, F_{ZDA}, M_{XDA}, M_{YDA}, M_{ZDA}.
7. The equation sets 1 through 3 found in Table 6: *Acceptance criteria equations* must be satisfied.
8. **Equation Set 1.** Each applied load is divided by the corresponding adjusted values from Table 7: *Nozzle Loading*. The absolute value of each ratio must be less than two.
9. **Equation Set 2.** Calculate the resultant applied forces and resultant adjusted Table 7: *Nozzle Loading* forces (F_{RSA}, F_{RDA}, F_{RS_adj}, F_{RD_adj}), resultant applied moments and resultant adjusted Table 7 moments (M_{RSA}, M_{RDA}, M_{RS_adj}, M_{RD_adj}). Calculate the ratios and summations listed in the equations. The final values must be less than two.

10. **Equation Set 3.** From Table 8: *Pump Nozzles to Centerline*, find the distance from the center of the pump to the suction and discharge nozzles, xS and zD. Translate the applied component forces and moments applied to each pump nozzle flange to the center of the pump. Calculate component loads at the center of the pump, F_{XCA}, F_{YCA}, F_{ZCA}, M_{XCA}, M_{YCA}, M_{ZCA}. Calculate the resultant loads at the center of the pump F_{RCA}, M_{RCA}. These values shall be limited by the formula shown.

Table 4: Casing Material Correction Factor

	Material Group No.												
	1.0	1.1	2.1	2.2	2.3	2.4	2.8	3.1	3.2	3.4	3.5	3.7	3.8

3.5.3 Auxiliary connections

Mechanical seal

When the pump is intended to be equipped with a mechanical seal, it is Flowserve's standard practice to install the mechanical seal in the pump prior to shipment. Specific order requirements may specify that the seal be shipped separately, or none be supplied. It is the pump installer's responsibility to determine if a seal was installed. If a seal was supplied but not installed, the seal and installation instructions will be shipped with the pump.

⚠CAUTION Failure to ensure that a seal is installed may result in serious leakage of the pumped fluid.

Seal and seal support system must be installed and operational as specified by the seal manufacturer.

The packing box/seal chamber/gland may have ports that have been temporarily plugged at the factory to keep out foreign matter. It is the installer's responsibility to determine if these plugs should be removed and external piping connected. Refer to the seal drawings and or the local Flowserve representative for the proper connections.

Packing

When the pump is intended to be equipped with shaft packing, it is not Flowserve standard practice not to install packing in the packing box prior to shipment. The packing is shipped with the pump. It is the pump installer's responsibility to install the packing in the packing box.

⚠CAUTION Failure to ensure that the packing is installed may result in serious leakage of the pumped fluid.

3.5.3.1 Seal/packing support system

⚠CAUTION If the pump has a seal support system, it is mandatory that this system be fully installed and operational before the pump is started.

Packing Lubrication

When the pumpage is a clean liquid and there is a positive pressure on the suction, the packing box can be packed solid and adjusted so that a slight spray leakage cools and lubricates the packing. TAP V should be plugged. The gland should be adjusted to give a flow rate of 10 to 12 drops per minute for clean fluid. Allow packing to leak freely at first and gradually tighten gland, over a 24-hour period, to the desired leakage rate. Do not overtighten the packing.

When pumpage contains abrasives, or is corrosive a cool clean liquid compatible with the pumpage, should be introduced into TAP V, as shown in Figure 6, at pressure 69 to 103 kPa (10 to 15 psi) above the packing box pressure (The packing box pressure can be obtained from Flowserve, the pump size, rotating speed, suction pressure, fluid specific gravity and impeller diameter are needed to provide the correct information.) The gland should be adjusted to give a flow rate of 40 to 60 drops per minute. For abrasive applications, the regulated flow rate should be 0.06 to 0.13 l/s (1 to 2 US gpm). FIS107 Compression Packing Installation Instructions, is available from Flowserve.

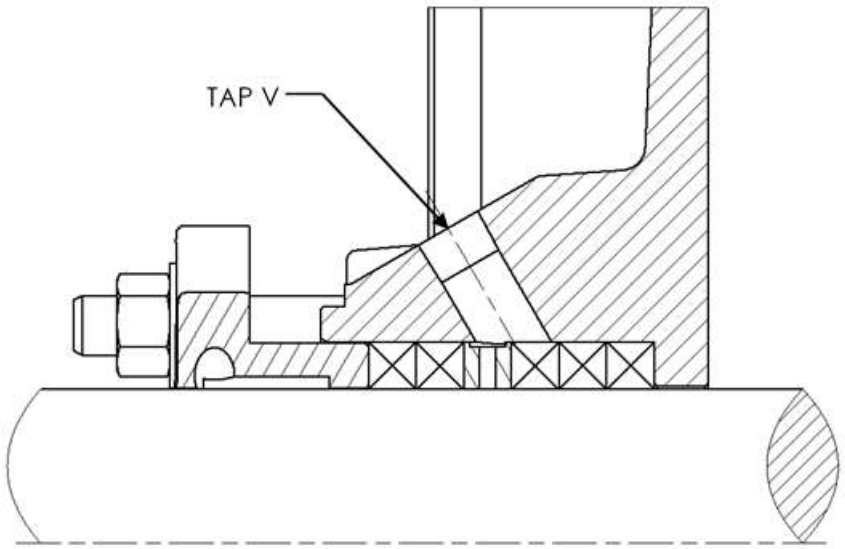

Figure 6: Grease Lube, TAP V with Packing

Grease lubrication, when compatible with the liquid being pumped, may be used. Again, introduced into TAP V.

In non-abrasive applications the liquid being pumped may be sufficient to lubricate the packing without need for external lines. Bearing housing cooling system

Make connections as shown below. Liquid at less than 32 ˚C (90 ˚F) should be supplied at a regulated flow rate of at least 0.06 l/s (1.0 US gpm).

3.5.3.2 Bearing Housing cooling system

The piping connections for jacketed covers and casings are shown below. The flow rate of the cooling water – less than 32 ˚C (90 ˚F) – should be at least 0.13 l/s (2 gpm). Do not allow the oil temperature to drop below the dew point, or condensation and contamination of the oil with water will occur.

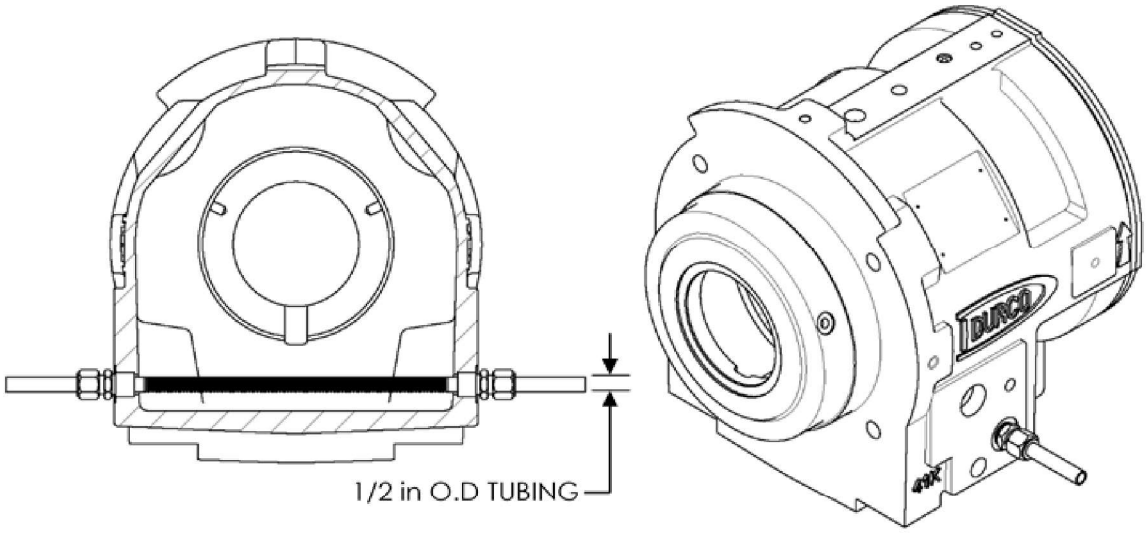

Figure 7: Bearing Housing Cooling System

3.5.3.3 Heating/cooling fluid for jacketed cover/casing

The piping connections for jacketed covers and casings are shown below. The flow rate of the cooling water – less than 32 ˚C (90 ˚F) – should be at least 0.13 l/s (2 US gpm). Jacket Maximum Design Pressure (MDP) is 689 kPa gage @ 171 ˚C (100 psig at 340˚F).

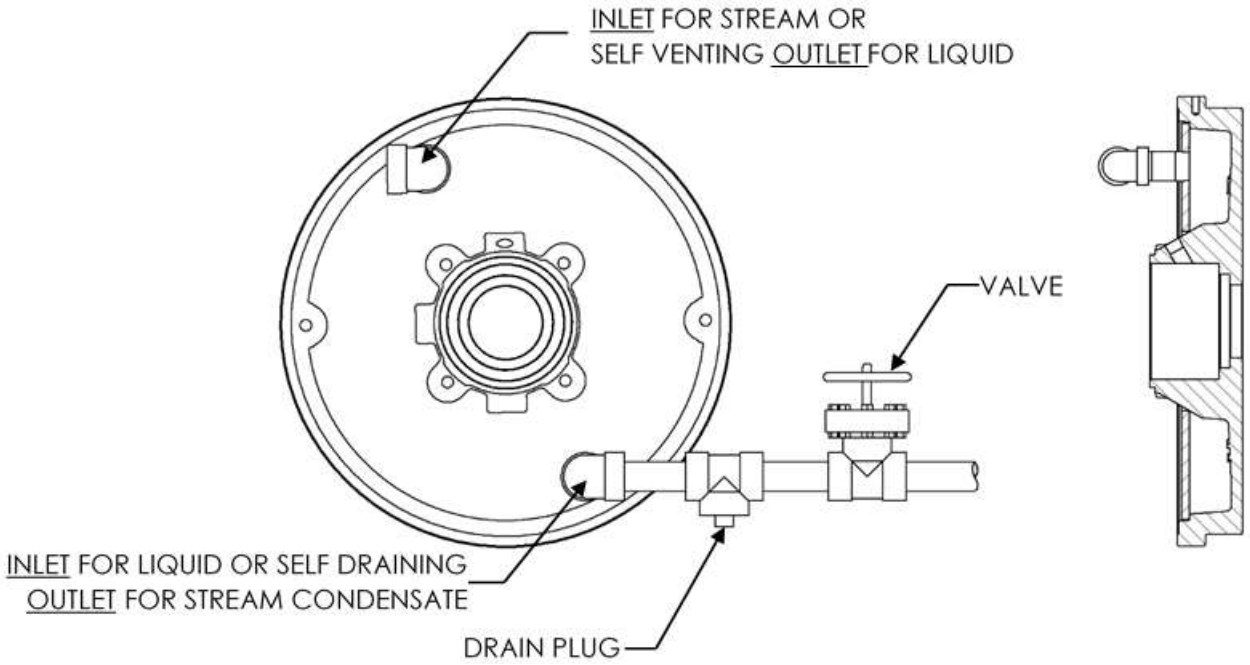

Figure 8: Heating/Cooling Fluid (cover)

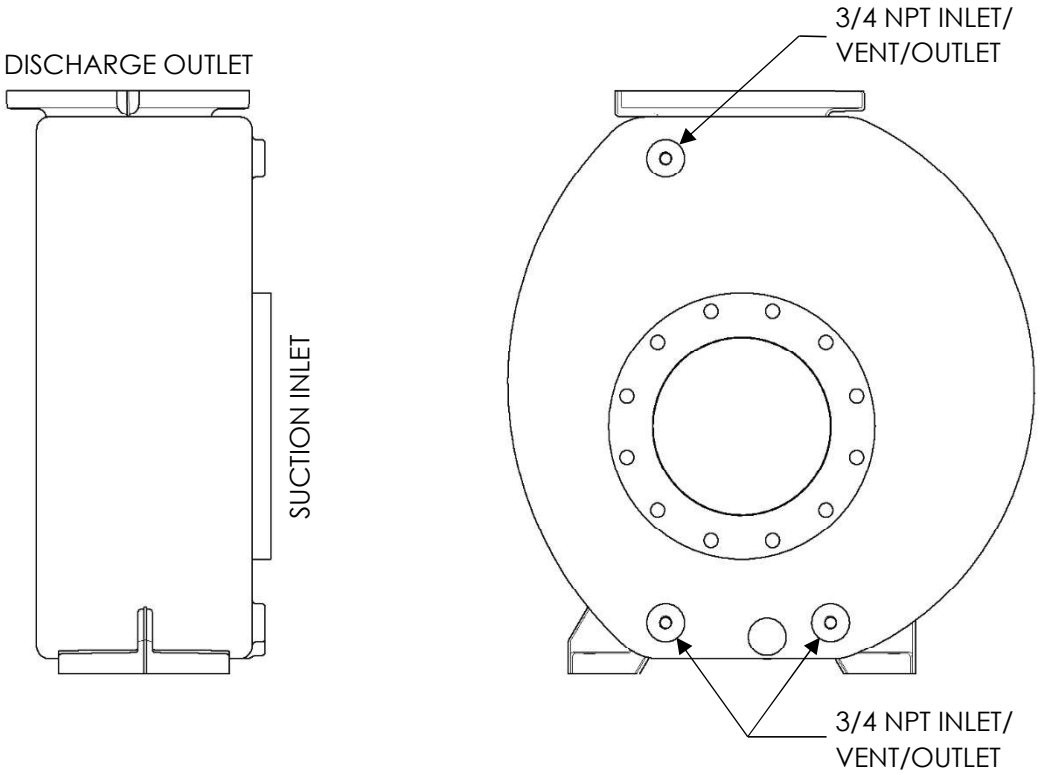

Figure 9: Heating/Cooling Fluid (casing)

NOTICE When circulating steam, use top hole for inlet. Both bottom holes must be plumbed together for outlet, to ensure draining both sides of jacket.

NOTICE When circulating liquid use both bottom holes as inlets. Use top hole as outlet.

3.5.3.4 Oil mist lubrication system - MPE4

The piping connection for an oil mist lubrication system are shown in Figures 10 & 11.

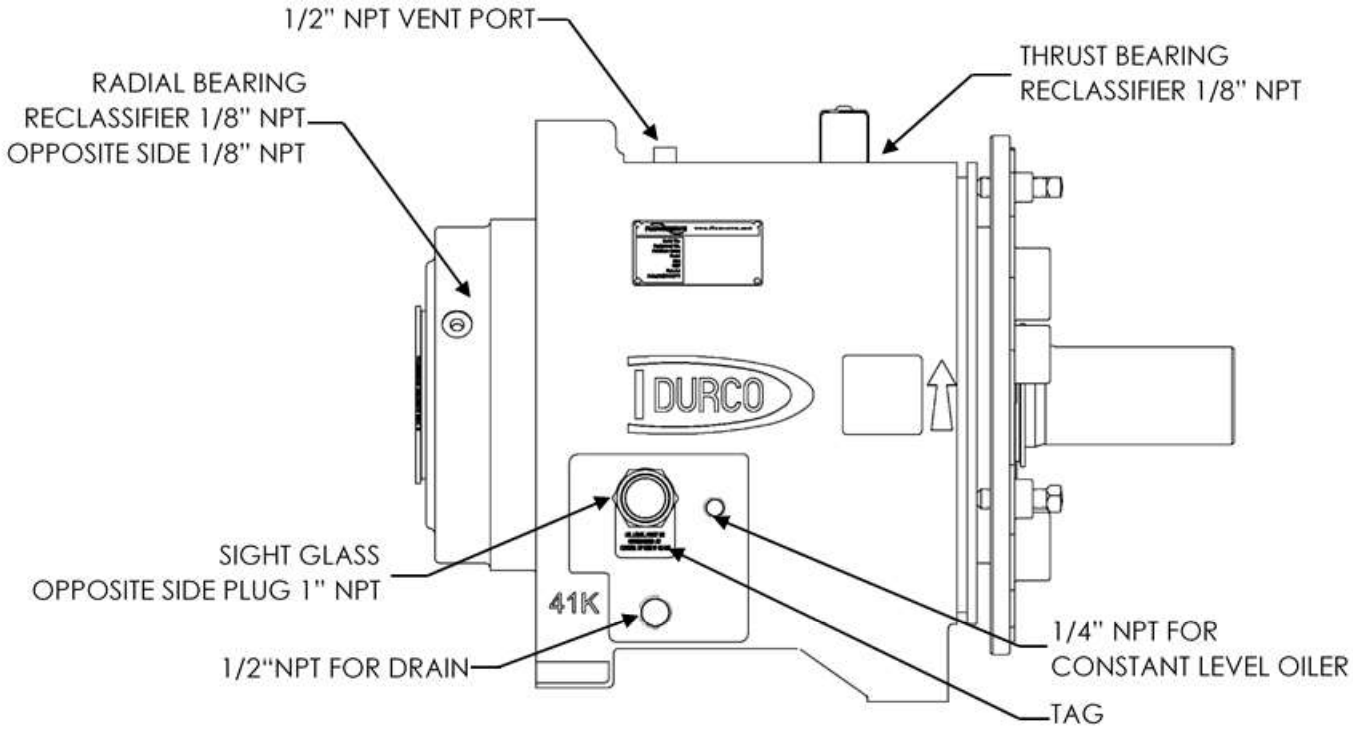

Figure 10: Oil Mist Lubrication System (wet sump)

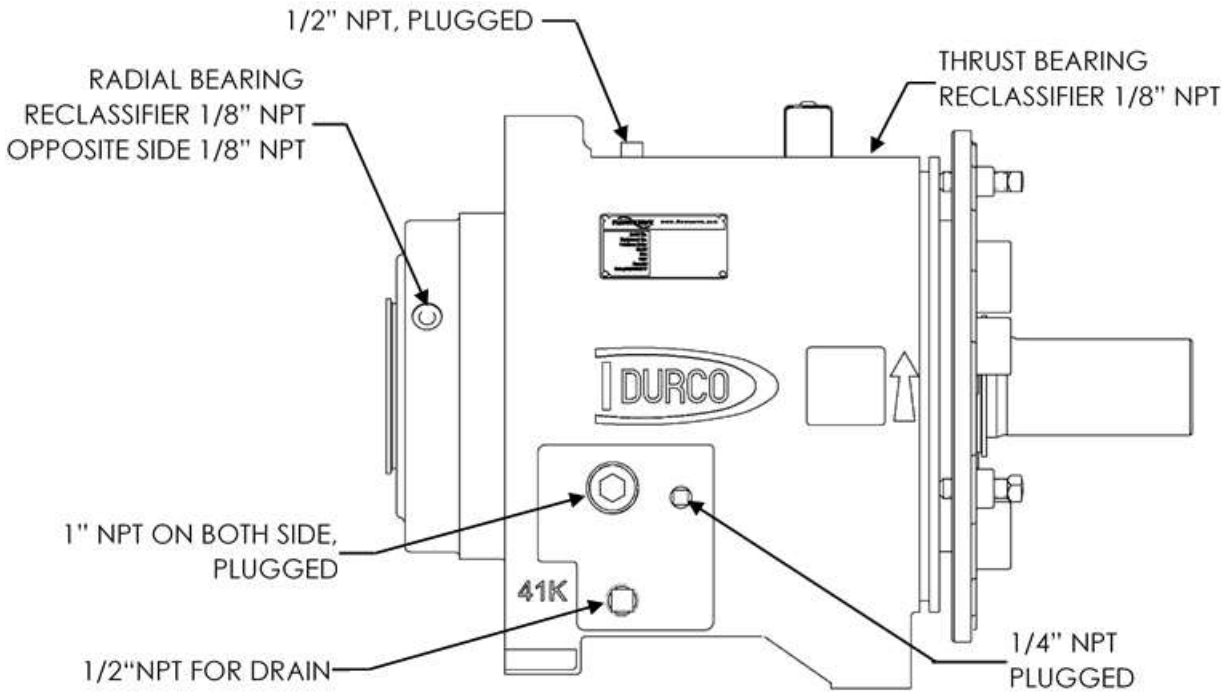

Figure 11: Oil Mist Lubrication System (dry sump)

3.6 Controls

3.6.1 Protection system

The following protection systems are recommended particularly if the pump is installed in a potentially explosive area or is handling a hazardous liquid. If in doubt consult Flowserve.

If there is any possibility of the system allowing the pump to run against a closed valve or below minimum continuous safe flow a protection should be installed to ensure the temperature of the liquid does not rise to an unsafe level.

If there are any circumstances in which the system can allow the pump to run dry, or start up empty, a power monitor should be fitted to stop the pump or prevent it from being started. This is particularly relevant if the pump is handling a flammable liquid.

If leakage of product from the pump or its associated sealing system can cause a hazard it is recommended that an appropriate leakage detection system is installed.

To prevent excessive surface temperatures at bearings it is recommended that temperature or vibration monitoring is carried out.

3.7 Accessories

If you have purchased a bare shaft pump, the following items are required for operations.

1. Mechanical Seal or Packing
2. Auxiliary piping plan for seal
3. Seal Guard
4. Coupling
5. Coupling Guard
6. Baseplate
7. Driver (typical a NEMA motor)

3.8 Tools, equipment, and fixtures

See Section 8.3, Special tools, for necessary tools/special tools needed for disassembly, maintenance and reassembly.

4 Packaging, Transportation and Storage

4.1 Consignment receipt

Immediately after receipt of the product/system it must be checked against the delivery/shipping documents for its completeness and that there has been no damage in transportation. Any shortage and/or damage must be reported immediately to Flowserve Solution Group and must be received in writing within (10) ten days of receipt of the equipment. Later claims cannot be accepted.

The following symbols are used to label the packaging:

This side up

Fragile

Keep dry

Protect from direct sunlight

Centre of gravity

Do not use hooks

Attachment point

4.2 Unpacking

The pump and its associated equipment were carefully inspected at the factory prior to shipment, to ensure quality compliance. It is suggested that the equipment be inspected on arrival and that any irregularities or damage be reported to the carrier immediately.

The condition of the skid and covering is indicative of the way the shipment was handled. Broken skids, torn covering, bent hold down bolts, broken straps, etc. indicate rough handling. The protective covers on the pump nozzles should be in place and undamaged.

In general, care is to be taken when removing crating, coverings, and strapping in order not to damage any auxiliary equipment and/or the paint finish.

Check any crate, boxes or wrappings for any accessories or spare parts that may be packed separately with the equipment or attached to side wall of the box or equipment.

Each product has a unique serial number. Check that this number corresponds with that advised and always quote this number in correspondence as well as when ordering spare parts or further accessories.

Boxes, crates, pallets or cartons may be unloaded using fork lift vehicles or slings dependent on their size and construction.

4.3 Packaging

The equipment has been packaged in a suitable container or transporting device that protects the material from exterior forces or impact, vibration, and environmental conditions normally encountered during transportation. Flowserve completes the following in preparation for shipment:

1. All items are inspected for cleanliness immediately before packaging. Dirt, oil residue, metal chips or other forms of contamination are removed by approved cleaning methods.
2. Components which are not immediately packaged, are protected from contamination and oxidation. Package with a barrier such that water vapor, salt air, dust, dirt and other forms of contamination do not penetrate the package.
3. Items that can be damaged by condensation trapped within the package are packaged with approved desiccant inside the water vapor proof barrier or by an equivalent method.
4. Items and their containers are properly identified by markings.

It is Flowserve's responsibility to ensure that materials and products are handled, prior to shipment, in a manner that will prevent deterioration or damage to the product or personnel.

Material that has been subjected to conditions that may result in hidden damage are disassembled as required and inspected. A record of the inspection is retained in the appropriate job file or quality records.

Additional care should be taken, by all involved parties, to ensure that the quality of items being loaded/unloaded will not be damaged.

Before shipping, a packing slip is prepared and fasten it to the unit. The packing slip contain the following information:

1. Customer's Purchase Order Number.
2. Flowserve Job Number.
3. Customer's Name and Address.
4. "Ship to" Address.
5. Quantity.
6. Description.
7. Date Shipped.
8. Carrier Used.

For shipments with more than one-unit container or package for any given order, each parcel is marked as 1 of 3, 2 of 3, etc., and contain a copy of the packing list.

4.4 Transportation

A crane must be used for all pump sets more than 23 kg (50 lb). Fully trained personnel must carry out lifting, in accordance with local regulations.

Sling, ropes and other lifting gear should be positioned where they cannot slip and where a balanced lift is obtained. The angle between sling or ropes used for lifting must not exceed 60˚.

CAUTION

Pumps and motors often have integral lifting lugs or eye bolts. These are intended for use in only lifting the individual piece of equipment.

CAUTION **Do not use eye bolts or cast-in lifting lugs to lift pump, motor and baseplate assemblies.**

NOTICE **To avoid distortion, the pump unit should be lifted as shown**.

CAUTION **Care must be taken to lift components or assemblies above the center of gravity to prevent the unit from flipping**.

4.4.1 Lifting pump components

For component or assembled components that weigh more than 23 kg (50 lb), Flowserve uses the technique below to properly transport components during assembly or disassembly procedures. If the site does not utilize rigging equipment mentioned, use the facilities' procedures while adhering to each component's lifting procedures.

4.4.1.1 Casing [1100]

Use a choker hitch sling pulled tight around the discharge nozzle. See Figure 17: Lifting Bare Pump, for the casing rigging technique.

4.4.1.2 Cover [1220]

With the back pullout assembly secured to the work surface, See Figure 51: Removing Impeller, Insert a long shank eyebolt in the drilled and taped hole at the top of the cover. Sling or hook through the eye of the eyebolt. Install the (2) Token bolt cap screws [6570.6] before removing tension from load.

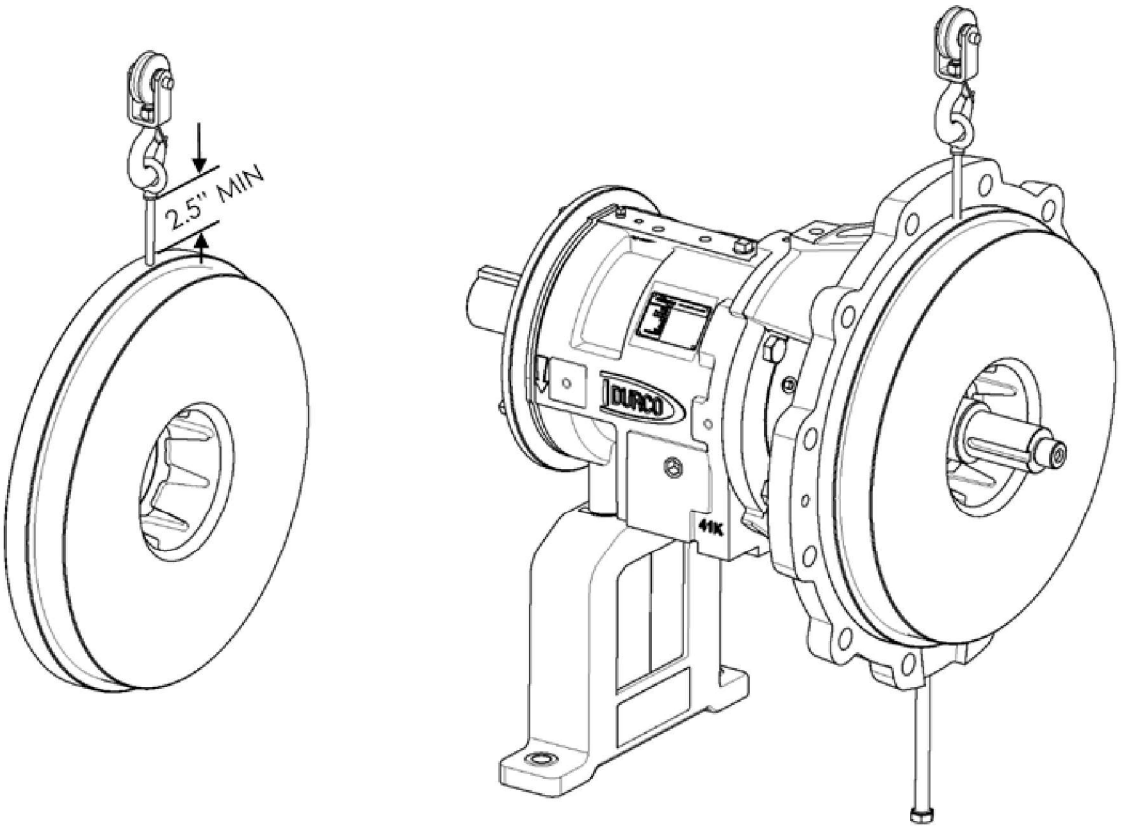

Figure 12: Lifting Cover

4.4.1.3 Impeller [2200]

Use a clamp suitable for lifting the impeller, as shown in Figure 13. A suitable clamp example is a Campbell® GX clamp no. 642300. *Read all safety instruction for the lifting device used.*

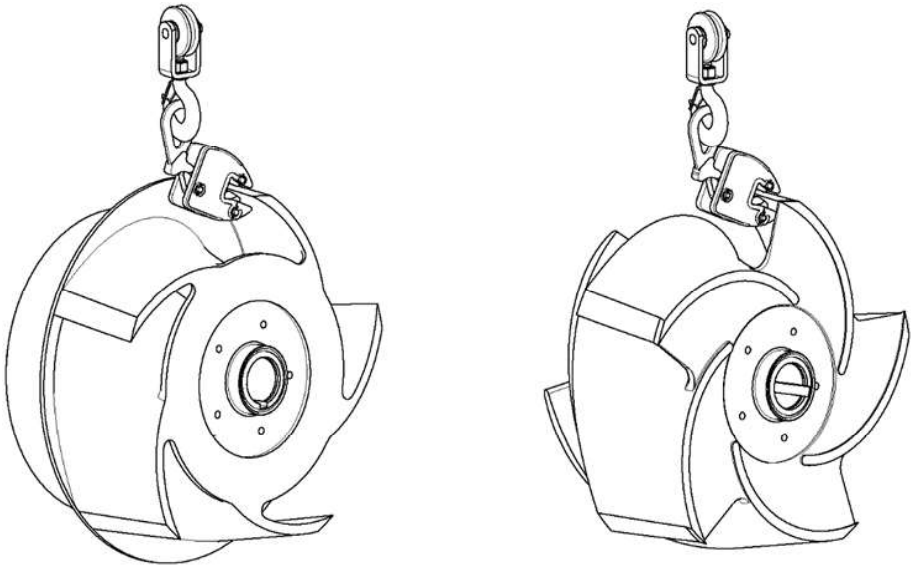

Figure 13: Lifting Impeller

4.4.1.4 Adapter [1340]

Insert hitch choker sling in openings of adapter, ensure a tight fit, as shown in Figure 14.

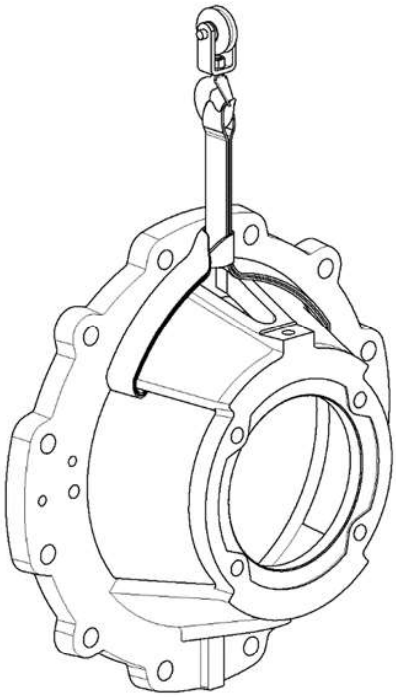

Figure 14: Lifting Adapter

4.4.1.5 Bearing housing [3200]

Insert either a sling or hook through a Shoulder Type Machinery Eye Bolt, installed on the top of the housing

with the Eye Bolt shoulder squarely against the bearing housing, as shown in Figure 15.

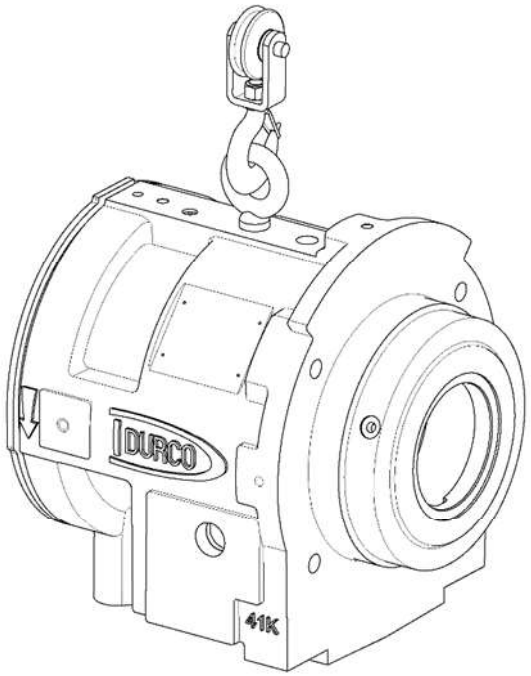

Figure 15: Lifting Bearing Housing

4.4.1.6 Back Pullout Assembly (Power end)

Insert hitch choker sling in openings of adapter, ensure tight fit, or hook through a Shoulder Type Machinery Eye Bolt, installed on the top of the adapter, with the Eye Bolt shoulder squarely against the adapter, as shown in Figure 16.

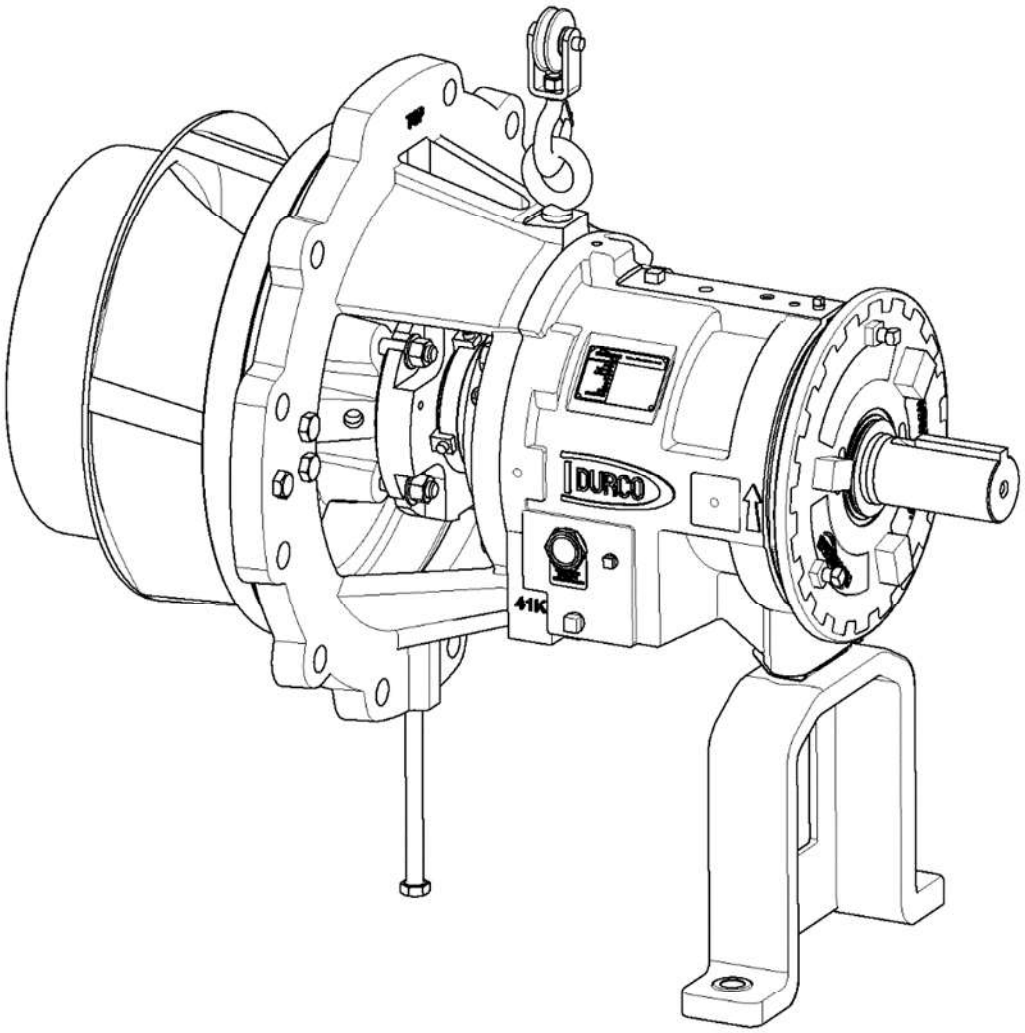

Figure 16: Lifting Back Pullout Assembly

4.4.1.7 Bare pump

Sling around the pump discharge nozzle. This is sufficient to lift the pump level in most instances. If the pump does not lift level, choke around the outboard end of the bearing housing with second sling. Choker hitches must be pulled tight at each attachment. The choker hitch on the discharge nozzle is towards the coupling end of the pump shaft, as shown in Figure 17. If two slings are used, sling lengths should be adjusted to balance the load before attaching the lifting hook.

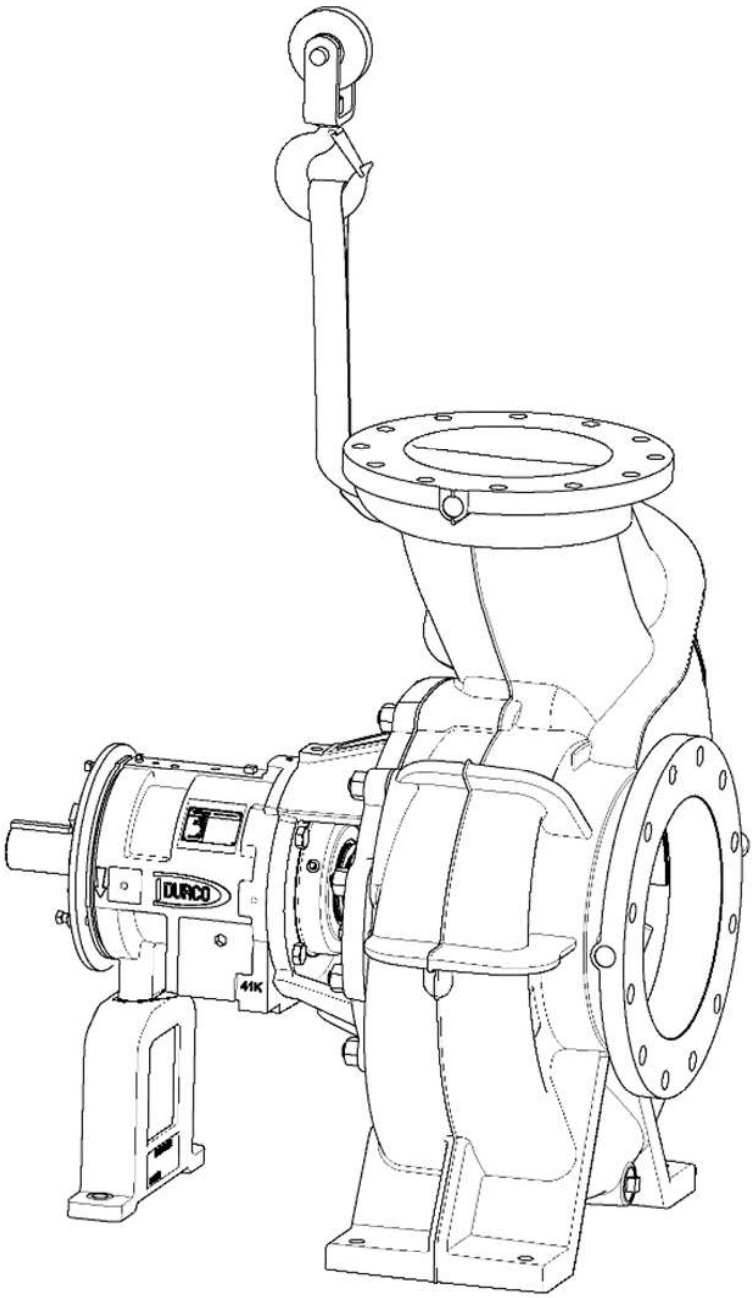

Figure 17: Lifting Bare Pump

4.4.1.8 Assembled pump with baseplate and motor

Use spreader beams with dropper chains attached to a lifting beam, as shown in Figure 18. This method eliminates compressive loads on the baseplate. Do not use slings through the lifting holes. Using lifting holes located in the baseplate corners (Type D and Type E bases), hook with SOS chain slings, connect the master links to the spreader beam hooks. Attach the spreader beam master links to the lifting beam hooks. Adjust the lifting beam bail to balance the load.

⚠CAUTION Do not lift or transport baseplates with motors larger than a NEMA 449 Frame, or above 1590 kg (3500 lb). Permanent damage to the baseplate may result.

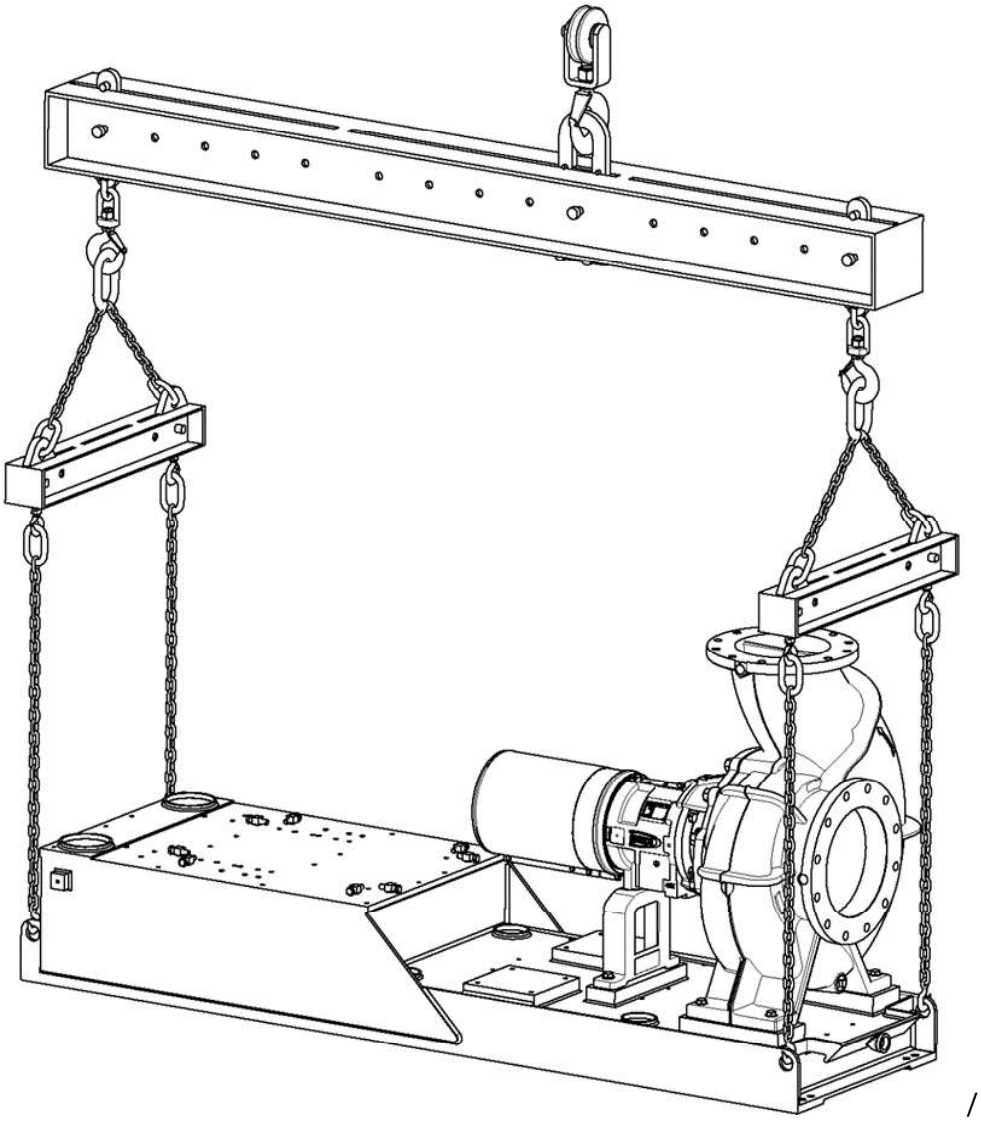

Figure 18: Lifting Assembled Pump with Baseplate

4.5 Storage and packing

NOTICE **Store the pump in a clean, dry location away from vibration. Leave flange covers in place to keep dirt and other foreign material out of the pump casing. Turn the pump shaft at regular intervals to prevent brinelling of the bearings and the seal faces, if fitted, from sticking.**

The pump may be stored as above for up to six months. Consult Flowserve for preservative actions when a longer storage period is needed.

4.5.1 Short term procedures

Normal packaging is designed to protect the pump and parts during shipment and for dry, indoor storage for up to six months or less. The following is an overview of our normal packaging:

1. All loose unmounted items are packaged in a water proof plastic bag and placed under the coupling guard
2. Inner surfaces of the bearing housing, shaft (area through bearing housing) and bearings are coated with Cortec VpCI®-329 rust inhibitor, or equal

   NOTICE **Bearing housing are not filled with oil prior to shipment**
3. Re-greaseable bearings are packed with grease (EXXON POLYREX EM for horizontal pumps)
4. The internal surface of ferrous casings, covers, flange faces, and the impeller surface are sprayed with Cortec VpCI®-389, or equal
5. Exposed shafts are taped with Polywrap
6. Flange covers are secured to both the suction and discharge flanges
7. In some cases, with assemblies ordered with external piping, components may be disassembled for shipment
8. The pump must be stored in a covered, dry location

4.5.2 Long term storage and packing

Long term storage is defined as more than six months, but less than twelve months. The procedure Flowserve follows for long-term storage of pumps is given below. These procedures are in addition to the short-term procedure.

1. Each assembly is hermetically (heat) sealed from the atmosphere by means of tack wrap sheeting and rubber bushings (mounting holes)
2. Desiccant bags are placed inside the track wrapped packaging
3. A solid wood box is used to cover the assembly

This packaging will provide protection for up to twelve months from humidity, salt laden air, dust etc.

After unpacking, protection will be the responsibility of the user. Addition of oil to the bearing housing will remove the inhibitor. If units are to be idle for extended periods after addition of lubricants, inhibitor oils, and greases should be used. Every three months, the pump shaft should be rotated approximately ten (10) revolutions.

5 Installation

5.1 Inspection and preparation

5.1.1 Location

The pump should be located to allow room for access, ventilation, maintenance, and inspection with ample headroom for lifting and should be as close as practicable to the supply of liquid to be pumped. Refer to the general arrangement drawing for the pump set.

5.1.2 Part assemblies

The supply of motors and baseplates are optional. Equipment must be remove from the baseplate, when installed correctly. *It is the responsibility of the installer to align the pump and motor set, as detailed in Section 5.3 Installation.*

5.1.3 Protection of openings and threads

When the pump is shipped, all taped connection, threads and all openings are covered or plugged. This protection/covering should not be removed until installation. If for any reason, the pump is removed from service, this protection should be reinstalled. When equipment is removed from the baseplate, in a non-weather protected location, reinstall hardware with Henkel Loctite® 242 locker and sealant applied to thread. This prevents moisture and debris from entering unprotected threaded hole.

5.1.4 Rigid baseplate – overview

The baseplate provides a rigid foundation for the pump and driver. Its primary function is to maintain alignment between the pump and driver shafts. Two styles of grouted baseplates are available for the Mark 3 Group 4, Type D and Type E, as shown in Figure 19.

Figure 19: Type D & Type E Baseplates

Baseplates intended for grouted installation are designed to use the grout as a stiffening member. It must provide certain functions that ensure a reliable installation. Three of these requirements are:

1. The baseplate must provide sufficient rigidity to assure the assembly can be transported and installed, given reasonable care in handling, without damage. It must also be rigid enough when properly installed to resist operating loads.

NOTICE After factory pre-alignment verification is completed, motors larger than a NEMA 449T frame are unmounted, packaged and shipped separately from the pump and baseplate.

2. The baseplate must provide a reasonably flat mounting surface for the pump and driver. Uneven surfaces will result in a soft-foot condition that may make alignment difficult or impossible. Experience indicates that a baseplate with a top surface flatness of 1.25 mm/m (0.015 in/ft) across the diagonal corners of the baseplate provides such a mounting surface. Therefore, this is the tolerance to which we supply our standard Type D baseplate. Some users may desire an even flatter surface, which complies with API 686-2009 Section 3 paragraph 3.9.4.4 for level requirements. Flowserve will supply flatter baseplates upon request at extra cost. For example, mounting surface flatness of 0.17 mm/m (0.002 in/ft) is offered, as standard, on the Flowserve Type E "Ten Point" baseplate, as shown in Figure 19.
3. The baseplate must be designed to allow the user to final field align the pump and driver to within their own particular standards and to compensate for any pump or driver movement that occurred during handling. Normal industry practice is to achieve final alignment by moving the motor to match the pump. Flowserve practice is to pre-align confirm in our shop that the pump assembly can be accurately aligned. Before shipment, the factory verifies that there is enough horizontal movement capability at the motor to obtain a "perfect" final alignment when the installer puts the baseplate assembly into its original, top levelled, unstressed condition. When a baseplate, pump and motor assembly is supplied as a unit, a label showing the completed pre-alignment verification results is attached to the coupling guard.

5.2 Baseplate mounting

The following steps are grouting instructions to install Type D and Type E baseplates.

5.2.1 Mounting grouted baseplates

1. The pump foundation should be located as close to source of the fluid to be pumped as practical.
2. There should be adequate space for workers to install, operate, and maintain the pump. The foundation should be sufficient to absorb any vibration and should provide a rigid support for the pump, motor and baseplate.
3. Recommended mass of a concrete foundation should be at minimum three times that of the pump, motor and base. Refer to Figure 20

NOTICE Foundation bolts are imbedded in the concrete inside a sleeve to allow some movement of the anchor.

NOTICE If the baseplate is sandblasted in preparation for grouting, all equipment must be removed and protected from blasting media.

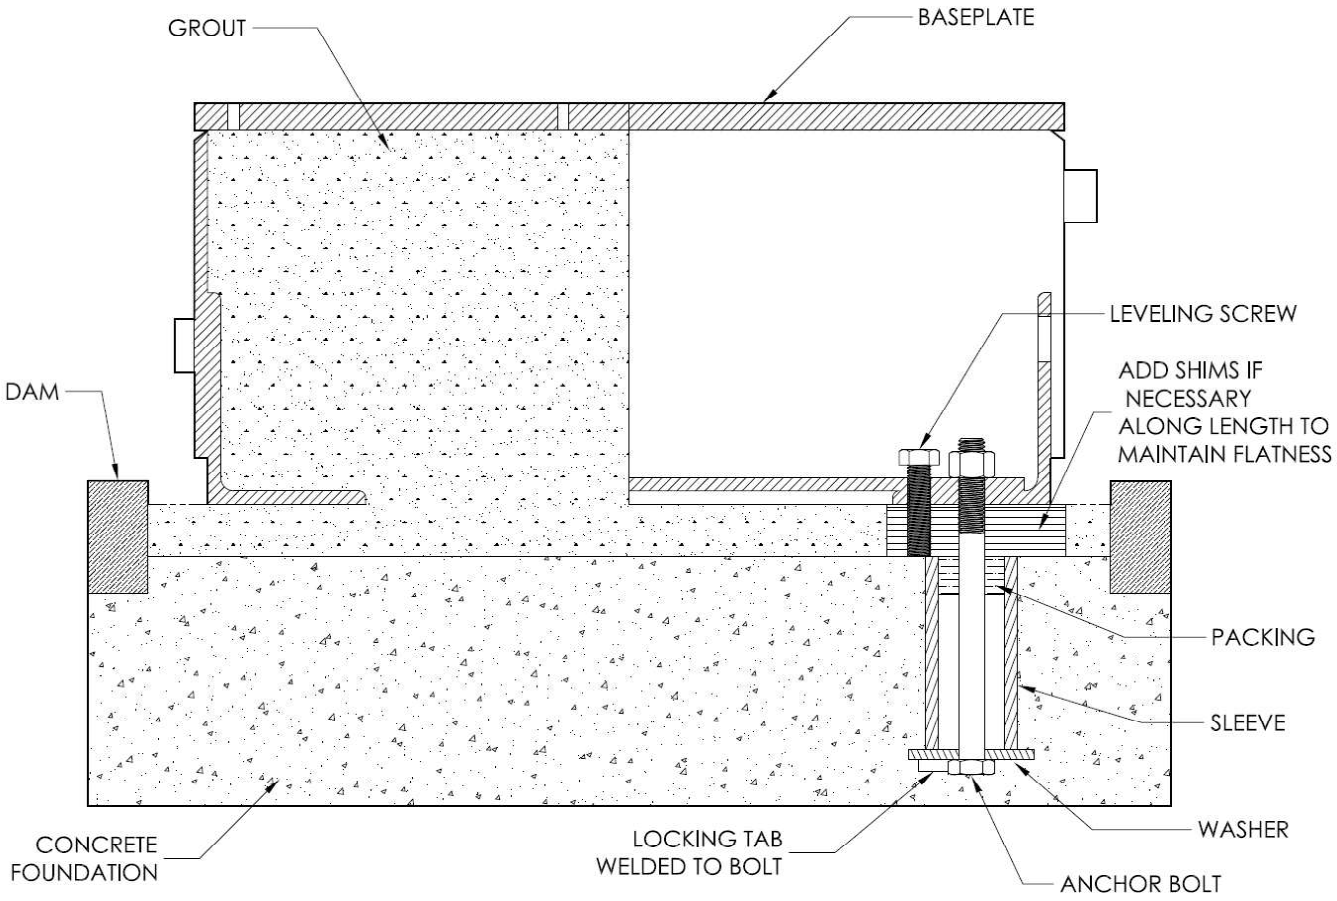

Figure 20: Grouted Mount Baseplate

4. Level Type D baseplate mounting surfaces longitudinally and transversely within 1.25 mm/m (0.015 in/ft). Level Type E baseplate mounting surfaces longitudinally and transversely within 0.42 mm/m (0.005 in/ft); level within 0.30 mm/m (0.0035 in/ft) is achievable in most cases, but not required. The machined coplanar and parallel mounting surfaces are to be referenced when levelling the baseplate. This may require that the pump and motor be removed from the baseplate to reference the machined faces. DO NOT stress the baseplate.
5. Do not bolt the suction or discharge flanges of the pump to the piping, until the baseplate foundation is completely installed. Use levelling jackscrews to level the baseplate. Check for levelness in both the longitudinal and lateral directions, to values in paragraph 4. If necessary, shims should be placed along the middle edge of the base. Do not rely on the bottom of the baseplate to be flat. The bottom baseplate surface is not machined, and it is unlikely that the field mounting surface is flat.
6. After levelling the baseplate, tighten the anchor bolts. If shims were used, make sure that the levelling screws are in contact with the foundation before tightening. Failure to do this may result in a twist of the baseplate, which could make it impossible to obtain final alignment.

7. Check the level of the baseplate to make sure that tightening the anchor bolts did not disturb the level of the baseplate. If the anchor bolts did change the level, adjust the levelling screws, and shims if used, as needed to level the baseplate.
8. Continue adjusting the levelling screws and tightening the anchor bolts until the baseplate is level.
9. Check initial alignment. If the pump and/or motor were removed from the baseplate proceed with step 10 first, then the pump and/or motor should be reinstalled onto the baseplate using Flowserve's factory preliminary alignment procedure as described in Section 5.2.2, and then continue with the following. As described above, pumps are given a preliminary alignment at the factory. This preliminary alignment is done in a way that ensures that, if the installer duplicates the factory conditions, there will be sufficient clearance between the motor hold down bolts and motor foot holes to move the motor into final alignment. If the pump and motor were properly reinstalled to the baseplate or if they were not removed from the baseplate and there has been no transit damage, and if the above steps were done properly, the pump and driver should be within 0.38 mm (0.015 in) FIM (Full Indicator Movement) parallel, and 0.0025 mm/mm (0.0025 in/in) FIM angular. If this is not the case, first check to see if the driver mounting fasteners are centered in the driver feet holes. If not, re-center the fasteners and perform a preliminary alignment to the above tolerances by shimming under the motor for vertical alignment, and by moving the pump for horizontal alignment.
10. Grout the baseplate. A non-shrinking grout should be used. Make sure the grout fills all areas under the baseplate. After the grout has cured, check for voids and repair them. Jackscrews, shims and wedges should be removed from under the baseplate at this time. If they were to be left in place, they could rust, swell, and cause distortion in the baseplate. Fill the voids left from removal of the jackscrews and shims with flexible seam sealant.
11. After grouting baseplate some distortion may occur during grouting cure. The post-grout cure level criterion, for Type E baseplates, is a maximum of 0.67 mm/m (0.008 in/ft) (both longitudinally and transversely). For Type D baseplates the criterion, is a maximum of 1.50 mm/m (0.018 in/ft) Mounting plates that settle unevenly and/or beyond the specified level tolerance shall be corrected. Correction of level may include removal and regrouting or field machining of the equipment mounting surfaces.
12. Run piping to the suction and discharge of the pump. There should be no piping loads transmitted to the pump after connection is made. Place dial indicators vertically and horizontally at the end of the pump shaft. Zero the indicators and observe any movement as the suction flange fasteners are tightened in increments of 10%, 30%, 60% and 100% of the required final torque. (See ASME PCC-1-2013 for additional details) Repeat the process on the discharge flange. Movement more than 0.05 mm (0.002 in), indicates excess pipe strain is present. Loosen flange fasteners, remove the flange gasket, and correct the source of pipe strain. Replace the flange gasket(s), and then repeat this step until pipe strain is eliminated.

5.2.2 Initial alignment procedure

The purpose of factory alignment is to ensure that the user will have full utilization of the clearance in the motor holes for final job-site alignment. To achieve this, the factory alignment procedure specifies that the pump be aligned in the horizontal plane to the motor, with the motor foot bolts centered in the motor holes. This procedure ensures that there is sufficient clearance in the motor holes for the customer to field align the motor to the pump, to zero tolerance. This philosophy requires that the customer can place the base in the same condition as the factory. Thus, the factory alignment will be done with the base sitting in an unrestrained

condition on a flat and level surface. This standard also emphasizes the need to ensure that shaft spacing is adequate to accept the specified coupling spacer.

The factory alignment procedure is summarized below:

1. The baseplate is placed on a flat and level workbench in a free and unstressed position.
2. The baseplate is levelled as necessary. Levelling is accomplished by placing shims under the rails of the base at the appropriate anchor bolt hole locations. Levelness is checked in both the longitudinal and lateral directions.
3. The motor and appropriate motor mounting hardware is placed in the baseplate and the motor is checked for any planar soft-foot condition. If any is present it is eliminated by shimming.
4. The motor feet holes are centered on the motor mounting fasteners. This is done by using a centering nut, as shown in Figure 21.

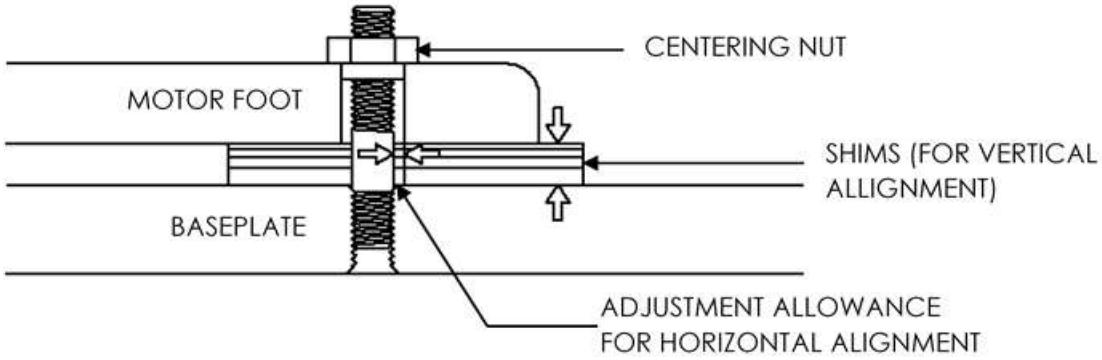

Figure 21: Center Mounting Feet Holes

5. The motor is fastened in place by tightening the nuts on two diagonal motor mounting studs.
6. The pump is put onto the baseplate and levelled. The foot piece under the bearing housing is adjustable. It is used to level the pump, if necessary.

NOTICE If an adjustment is necessary, add or remove shims [3126.1] between the foot piece and the bearing housing.

The standard shim [3126.1] thickness is 0.76 mm (0.030 in); 0.13 mm (0.005 in) and 0.25 mm (0.010 in) are available.

7. The spacer coupling gap is verified.
8. The parallel and angular vertical alignment is made by shimming under the motor.
9. The motor feet holes are again centered on the motor mounting studs using the centering nut. At this point the centering nut is removed and replaced with a standard nut. This gives maximum potential mobility for the motor to be horizontally moved during the final, field alignment. All four motor feet are tightened down.
10. The pump and motor shafts are then aligned horizontally, both parallel and angular, by moving the pump to the fixed motor. The pump feet are tightened down.

11. Both horizontal and vertical alignment is again final checked as is the coupling spacer gap.
12. The nominal DBSE is 6 mm (0.25 in) longer than the coupling spacer length, facilitating installation and removal of the coupling spacer. Example: A pump/motor combination requiring a 178 mm (7.00 in) spacer coupling has a nominal DBSE of 184 mm (7.25 in)
13. **NOTICE** See section 5.3.7 for Final Shaft Alignment

5.3 Installation

5.3.1 Pump and shaft alignment check

After connecting the piping (Section 5.3.7), rotate the pump drive shaft clockwise (viewed from motor end) by hand several complete revolutions to be sure there is no binding and that all parts are free. Recheck shaft alignment (Section 5.2.2). If piping caused unit to be out of alignment, correct piping to relieve strain on the pump.

5.3.2 Pump lubricants

5.3.2.1 Oil Bath: APE4 / OPE4

Oil bath is available on all product models. The standard bearing housing configuration is oil bath lubricated and is not lubricated by Flowserve. Before operating the pump, fill the bearing housing to the center of the oil sight glass with the proper type oil, when equipped sight glass or Watchdog oiler. (See Table 9: *Oil Sump Capacity* for approximate amount of oil required – do not overfill.)

The oil level in the bearing housing must be maintained at ±3 mm (±1/8 in) from the center of the sight glass. The sight glass has a 6 mm (1/4 in) hole in the center of its reflector. The bearing housing oil level must be within the circumference of the center hole to ensure adequate lubrication of the bearings.

NOTICE The correct oil level can only be obtained when the pump is level in the longitudinal and transverse plans. Failure to level the pump may result in bearing damage and/or oil leakage. See Section 5 for levelling instructions.

To add oil to the housing, clean the area adjacent to and then remove the vent/breather [6521] at the top of the bearing housing, pour in oil until it is visually half way up in the sight glass [8221] or Watchdog oiler [3856] integral sight glass. Oil added to the bearing housing through vent location the falls directly on to the shaft. It takes several minutes for the oil level to rise to it finial level after adding oil. To avoid overfilling the bearing housing, wait several minutes after the oil level has reached the bottom of the center hole in the sight glass reflector [8221]. Then, add additional oil slowly to raise the oil level to the center of the reflector. When not equipped with a sight glass, the correct oil level is obtained with the constant level oiler in its lowest position, which results in the oil level being at the top of the oil inlet pipe nipple, or half way up in the sight glass window. Oil must be visible in the bottle at all times.

See Table 10: *Recommended Oils* for recommended lubricants. **DO NOT USE DETERGENT OILS**. The oil must be free of water, sediment, resin, soaps, acid and fillers of any kind. It should contain rust oxidation inhibitors and anti-foam additives. The proper oil viscosity is determined by the bearing housing operating temperature as given in Table 12: *Oil Viscosity Grades*.

Note that on APE4 power ends there is no constant level oiler and no vent/breather (replaced by a plug). This is the ASME B73.1 compliant configuration and is preferred. As stated above, proper oil level is the center of the "bull's eye" sight glass [8221]. Refer to Figure 22

NOTICE Only add oil when the pump has not operated for a least five minutes. Due to windage of the bearing housing oil, the observed oil level will appear to drop when the pump is running. This is normal operation. Do not add additional oil while the pump is running.

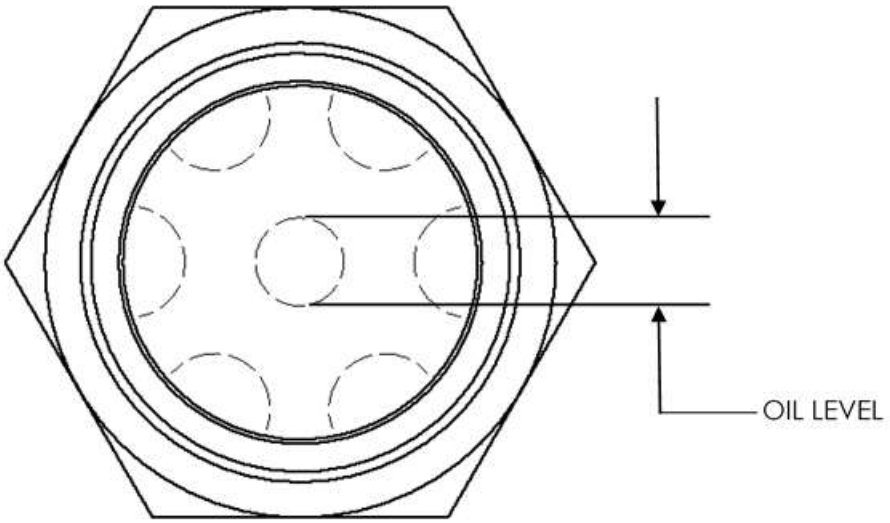

Figure 22: Sight Glass [8221]

In many pumping applications lubricating oil becomes contaminated before it loses its lubricating qualities or breaks down. For this reason, it is recommended that the first oil change take place after approximately 160 hours of operation, at which time, the used oil should be examined carefully for contaminants. During the initial operating period, monitor and record the oil temperature. See Table 12: *Oil Viscosity Grades* for maximum acceptable temperatures. Verify that the initial oil fill viscosity is appropriate for the previously recorded oil temperature. The normal oil change interval is based on temperature and is shown in Table 13: *Lubricant Intervals*.

	Royal Purple **	SYNFILM 32	**SYNFILM 46**	SYNFILM 68

(*) Note that it normally takes 4 hours for bearing temperature to stabilize and the final temperature will depend on the ambient, r/min, pumpage temperature and pump size. Also some oils have a greater viscosity index than the minimum acceptable of 95 (eg Mobil DTE 10 Excel™ Series) which may extend the minimum temperature capability of the oil. Always check the grade capability where the ambient is less than -5 ˚C (23 ˚F). An oil heater is recommended for temperatures below -12 ˚C (14 ˚F).

(†) Use LSC for oil mist. Oil parameters provide flash point >166 ˚C (331 ˚F), density >0.87 @ 15 ˚C (59 ˚F), pour point of -10 ˚C (14 ˚F) or lower.

(**) Normal compounded oils CANNOT be used with oil mist as anti-foam additives need to be avoided. Most oils recommended for wet splash lubrication contain foam inhibitors, as well as, antioxidants and anticorrosion additives, so they are unsuitable for oil mist. Some synthetic lubricants may attack the Nitrile seals when used in the bearing housing. The LSC LSO oils are recommended for oil mist applications. The APE4 and OPE4 power end are equipped with fluoroelastomers O-rings, for compatibility with synthetic lubricants.

Where the ambient temperature is very low, special lubricants are required. When oil lubrication is utilized and the ambient is less than -5 ˚C (23 ˚F), ensure the oil pour point is at least 15 ˚K (27 ˚F) below the lowest anticipated ambient temperature, and ensure the upper operating range of the oil is not exceeded. IS0 VG 46 oil is generally selected for an initial lubrication schedule, when ambient temperatures are expected to between 7 ˚C (45 ˚F) and 32 ˚C (90 ˚F).

Other drivers and gearboxes, if appropriate, should be lubricated in accordance with their manuals.

Table 11: Recommended Greases

General Purpose Grease	Mobil Polyrex™ EM (or compatible) Polyurea with mineral oil. Factory fill. 0.885g/ml
Food Grade	Klübersynth UH1 64-62. (NLGI 2) NSF H1 registered, complies with FDA 21 CFR § 178.3570, 0.920g/ml
Low Temp	Aeroshell 22 -60 to 38 °C (-76 to 100 °F), 0.868g/ml Aeroshell 7 -35 to 60 °C (-31 to 140 °F), 0.966g/ml

Note: Grease lubricated pumps and electric motors are supplied pre-greased.

Table 12: Oil Viscosity Grades

Maximum Oil Temperature	ISO Viscosity Grade	Minimum Viscosity Index
Up to 58 °C (136 °F)	32	95
Up to 70 °C (158 °F)	46	95
Up to 80 °C (176 °F)	68	95
Up to 90 °C (194 °F)	100	95

NOTICE **The maximum temperature that the bearings can be exposed to is 105 ˚C (220 ˚F).**

Table 13: Lubricant Intervals*

Lubricants	Under 60 °C (140 °F)***	60-70 °C (140-158 °F)***	71-80 °C (158-176 °F)***	80-90 °C (176-194 °F)***
Grease	12 months	6 months	3 months	1.5 months
Mineral oil	12 months	6 months	3 months	1.5 months
Synthetic oil**	24 months	18 months	18 months	18 months

(*) Assuming good maintenance and operation practices, and no contamination.
(**) May be increased to 36 months after initial oil change with APE4 power end.
(***) Bearing temperatures up to 16 ˚C (30 ˚F) higher than housing.

5.3.2.2 Re-greaseable: RPE4

Single shielded re-greaseable bearings

When the grease lubrication option is specified the bearing housing [3200] is equipped with, a single shielded inboard (radial) bearing [3011], outboard (thrust) bearing retainer [2530] with integral grease shield, oil return blocking pin [6810], grease fittings [3853.1 & .2] and an inboard (radial) bearing grease relief fitting [9220].

NOTICE **The orientation of the bearing shield, as shown in Figure 23**

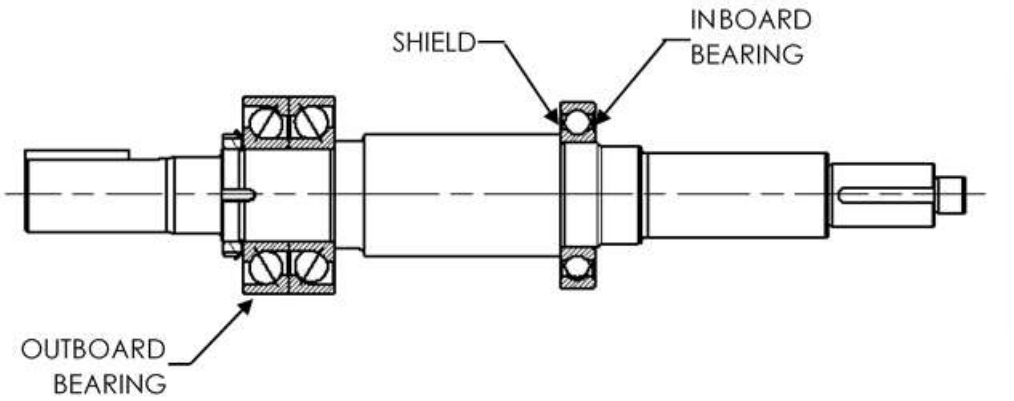

Figure 23: Bearing Shield Orientation

Pump bearings are packed with Mobil Polyrex™ EM grease prior to assembly. See Table 13: *Lubricant Intervals* for the recommend re-lubrication interval. For re-lubrication, a grease with the same type base (polyurea) and oil (mineral) should be used. To re-grease the radial bearing, add grease to the inboard grease fitting until grease exits the relief fitting on the opposite side of the bearing housing. To re-grease the thrust bearing, add the measured amount of grease specified in Table 14: *Grease Lubrication Amount*. Refer to Figure 24 for the grease fitting locations. After eight (8) re-lubrication intervals or three (3) years, it is recommended that the power end be disassembled and thoroughly cleaned, removing any used grease. See Section 8 for complete maintenance instructions.

NOTICE **Do not intermix greases shown in Table 11**: *Recommended Greases*. **They are not compatible.**

Table 14: Grease Lubrication Amount**

Power End	Initial lube*	Re-lubrication
Frame 41K inboard	77g	24g
Frame 41K outboard	125g	66g
Frame 42K inboard	115g	31g
Frame 42K outboard	173g	82g

(*) If new bearings are not lubricated, they should be hand packed, approximately 70% of the open bearing volume, with the initial lube quantity prior to installation.
(**) Listed quantities are for Polyrex™EM with a density of 0.885g/ml. Grease quantity must be adjusted for the density of the grease applied. Multiply the ratio of {0.885/grease density} by the quantities listed to arrive at the required amount in grams.

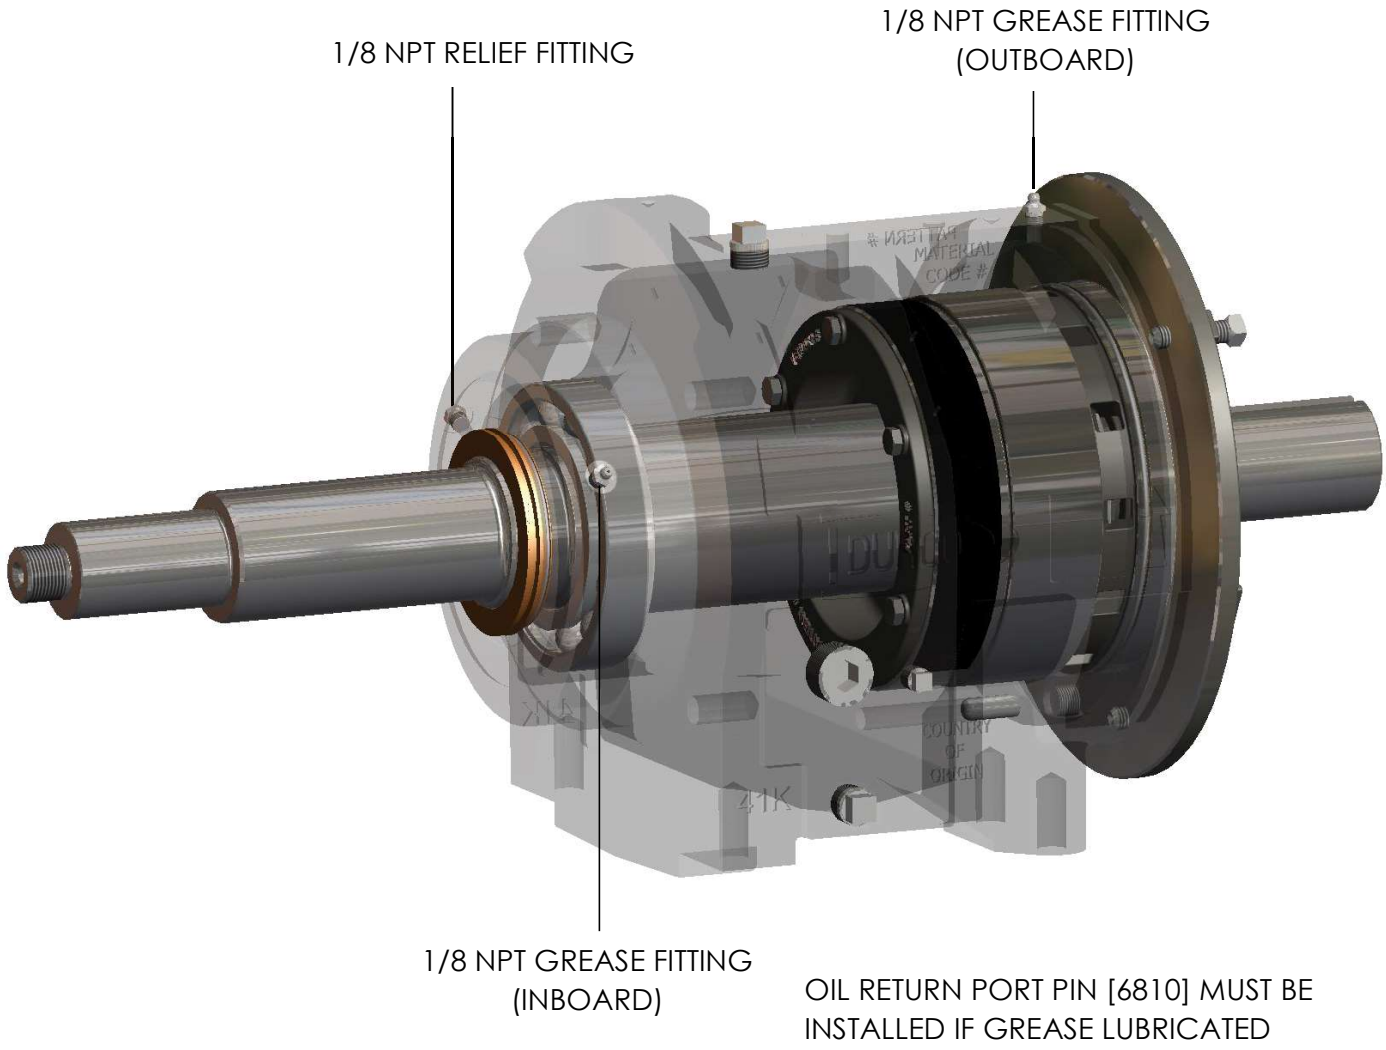

Figure 24: Re-greaseable Option

NOTICE **Do not fill the housing with oil when greased bearings are used. The power end must be configured for oil; APE4 or OPE4 power end configuration required for oil.**

NOTICE **Do not convert the power end to grease lubrication without installing the grease return pin [6810] in the bearing housing [3200]. The inboard bearing [3011] must contain a shield. The bearing retainer [2530] functions as a shield for the outboard bearings [3013]. See Figure 34: RPE4 Power End Assembly**

5.3.2.3 Grease for life

Grease for life option is not available with the Mark 3 Group 4 models.

5.3.2.4 Oil Mist: MPE4

To further limit dirt ingress and dew point issues within the bearing housing a ½ NPT. connection is available for a low-pressure instrument air or nitrogen supply where applicable.

The oil-mist fitting connections are located so that oil mist flows through the rolling element bearings to the sump. The thrust bearing inlet connection is a plugged 1/8 NPT port located on top of the rear most section of the bearing housing. The two radial bearing inlet connections are plugged 1/8 NPT ports located inside the adapter 25 degrees above horizontal. Either of the radial bearing connections can be used for the reclassifier connection. The unused connection must remain plugged. A plugged ½ NPT bottom drain is provided on the bearing housing. See section 3.5.3.4 for connection locations, *Oil mist lubrication system*. Do not allow oil level to remain above the center of the bearing housing sight glass window with purge mist (wet sump) systems. The thrust bearing oil return port must be closed with the Bearing Housing Pin [6810].

5.3.3 Impeller clearance

The impeller [2200] clearance was set at the factory. No further impeller adjustment should be necessary, see Table 15: *Impeller Clearance Setting*, unless the pump serviced. For reverse-vane impellers, the clearance is set to the cover [1220], while the semi-open impeller clearance is set to the casing [1100]. See section 8.8.3, for *Setting impeller clearance and impeller replacement*.

Table 15: Impeller Clearance Setting

Temperature ˚C (˚F)	Clearance mm (in.)
-73 to 204 (-100 to 400)	0.81 (0.032)

Notes:

1. Rotation of bearing carrier from center of one lug to center of next results in axial shaft movement of 0.10 mm (0.004 in)
2. Set Reverse vane impeller clearance to cover, and semi-open impeller clearance to casing

5.3.4 Direction of rotation

All Mark 3 Group 4 pumps turn clockwise as viewed from the motor end. Direction arrows are cast in each side of the bearing housing [3200], as well as, the front and rear of the casing [1100], as shown in Figure 25. Bump the motor starter button without the pump connected to the motor. Verify that the motor rotates clockwise.

⚠CAUTION **It is essential that the rotation of the motor be checked before connecting the shaft coupling. Incorrect rotation of the pump, for even a short time, can dislodge and damage the impeller, casing, shaft and shaft seal**.

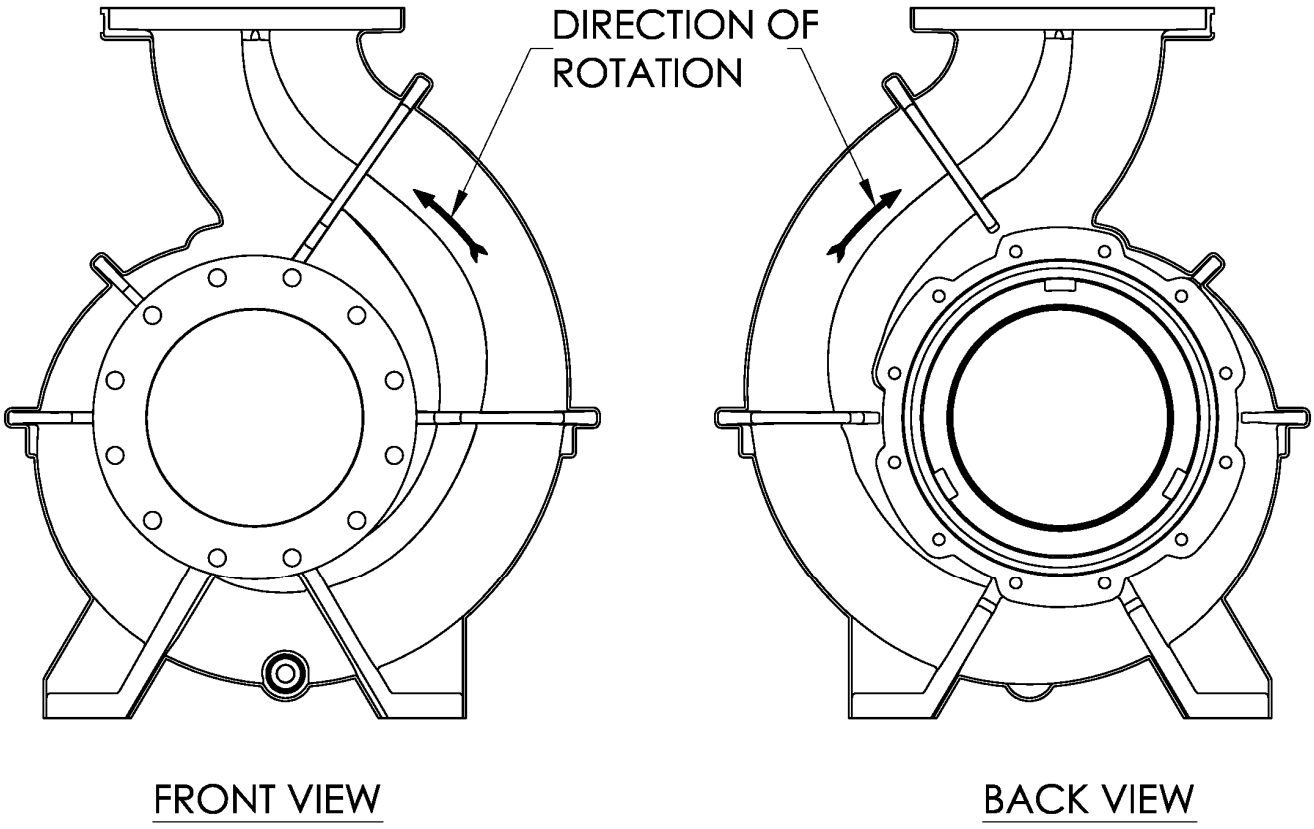

Figure 25: Direction of Rotation

5.3.5 Coupling installation

CAUTION **The coupling (Figure 26) should be installed as advised by the coupling manufacturer.** Pumps are shipped without the spacer installed. If the spacer has been installed to facilitate alignment, then it must be removed prior to checking rotation. Remove all protective material from the coupling and shaft before installing the coupling.

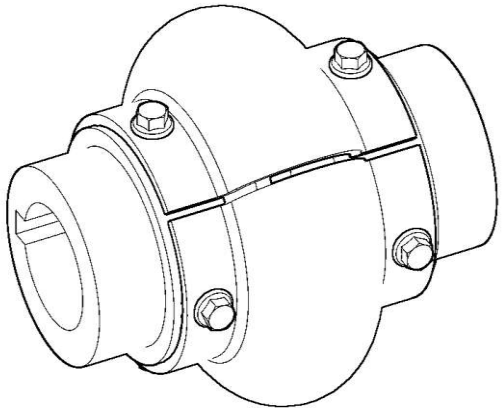

Figure 26: Coupling (typical)

5.3.6 Guarding

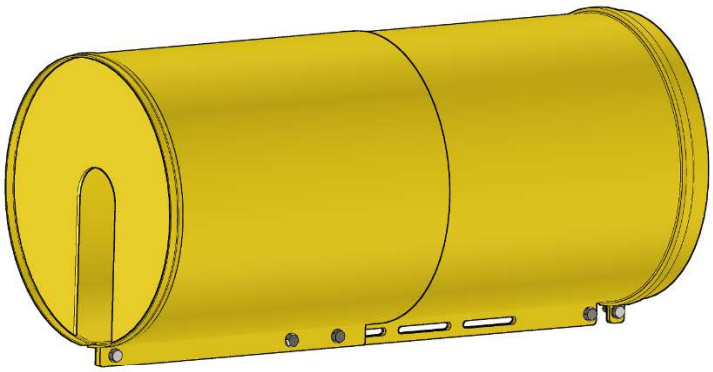

Figure 27: Assembled Guard

CAUTION **Power must never be applied to the driver when the coupling guard is not installed.**

NOTICE In member countries of the EU and EFTA, it is a legal requirement that fasteners for guards must remain captive in the guard to comply with the Machinery Directive 2006/42/EC. When releasing such guards, the fasteners must be unscrewed in an appropriate way to ensure that the fasteners remain captive.

Flowserve coupling guards are safety devices intended to protect workers from inherent dangers of the rotating pump shaft, motor shaft and coupling. It is intended to prevent entry of hands, fingers or other body parts into a point of hazard by reaching through, over, under or around the guard. No standard coupling guard provides complete protection from a disintegrating coupling. Flowserve cannot guarantee their guards will completely contain an exploding coupling.

Guarding is supplied and fitted to the pump set. If this has been removed or disturbed, ensure pump driver has been disconnected from its power supply.

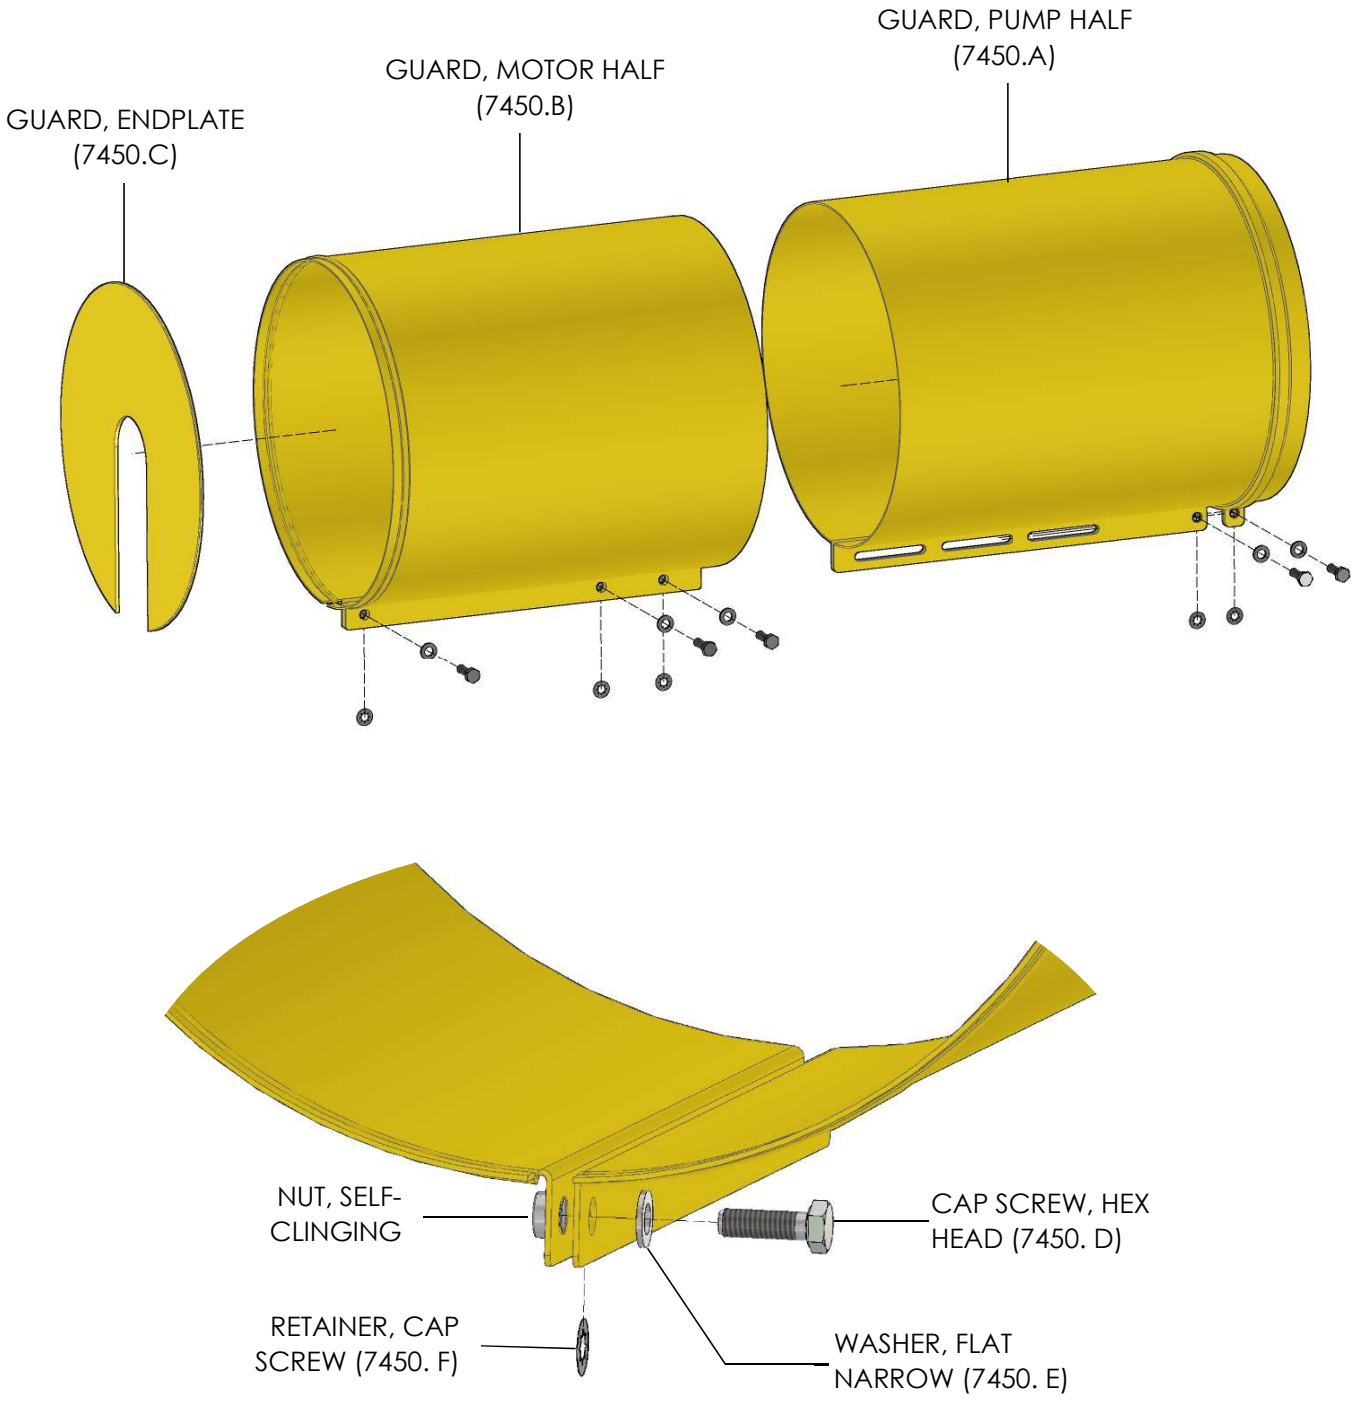

Figure 28: Guard Assembly

5.3.6.1 Removing coupling guard

Refer to Figure 28: Guard Assembly

1. De-energize the driver. Isolate from the power supply following your site's lockout-tagout (tag and lock) procedures.
2. Loosen all cap screws [7450. D] in the slotted holes in the center of the coupling guard. Cap screws should remain attached to the guard.
3. Slide the Motor Half [7450. B] towards the Pump Half [7450.A]
4. Remove the Endplate [7450. C], by slightly spreading the bottom of the Motor Half apart.
5. Remove the Motor Half, by slightly spreading the bottom apart and lifting upwards.
6. Remove the Pump Half from the bearing carrier [3240], by slightly spread the bottom apart and lifting upwards.

5.3.6.2 Installing coupling guard

Refer to Figure 28: Guard Assembly

1. De-energize the driver. Isolate from the power supply following your site's lockout-tagout (tag and lock) procedures.
2. Place Pump Half [7450.A] around bearing carrier [3240], by slightly spread bottom apart and placing over bearing carrier.
3. Loosely tighten the (2) cap screw [7450.D] in the Pump Half.
4. Place Motor Half [7450.B] around the Pump Half, by slightly spreading the bottom apart.
5. Place Endplate [7450.C] in the internal circumferential groove in the Motor Half.
6. Loosely tighten the (3) cap screw on the Motor Half.
7. Slide the assembled Motor Half towards the driver until it or the Endplate contacts the driver. If the driver is equipped with a bearing isolator, leave a distance of 6mm (0.25in) to the isolator rotor.
8. Once both halves of the guard are positioned correctly, tighten the (5) Cap Screws into the self-clinging nuts [7450.G]. Torque (5) Cap Screws to 12Nm (9 ft-lb).

5.3.7 Final shaft alignment check

1. Check and level the baseplate if needed. See 5.2.1 Mounting grouted baseplates
2. Mount and level pump, if not completed previously. Level the pump by putting a level on the discharge flange.
3. If not level, adjust the foot piece by adding or deleting shims [3126] between the foot piece [3143] and the bearing housing [3200].
4. Check initial alignment. If pump and driver have been remounted or the specifications given below are not met, perform an initial alignment as described in Section 5.2.2. This ensures there will be sufficient clearance between the motor hold down bolts and motor foot holes to move the motor into final alignment. The pump and driver should be within 0.38 mm (0.015 in) FIM (full indicator movement) parallel, and 0.0025 mm/mm (0.0025 in/in) FIM angular.

5. Run piping to the suction and discharge of the pump. There should be no piping loads transmitted to the pump after connection is made. Recheck the initial alignment to verify that there are no significant changes. If either the vertical or horizontal alignment changes more than 0.05 mm (0.002 in) after final torque of flange bolts, correct pipe strain before continuing to final alignment.
6. Perform final alignment. Check for soft-foot under the driver. Place a dial indicator base on the baseplate with the indicator in contact with the top on the motor foot. Then loosen the holding down bolt while noting any deflection reading on the Dial Test Indicator – a maximum of 0.05 mm (0.002 in) is considered acceptable, but any more will have to be corrected by adding shims, for example, if the dial indicator shows the foot lifting 0.15 mm (0.006 in) then this is the thickness of shim to be placed under that foot. Tighten down and repeat the same procedure on all other feet until all are within tolerance.
7. When satisfactory alignment is obtained the number of shims in the pack should be minimized. It is recommended that no more than five shims be used under any foot. Final horizontal alignment is made by moving the driver. Maximum pump reliability is obtained by having near perfect alignment. Flowserve recommends no more than 0.05 mm (0.002 in) TIR parallel, and 0.0005 mm/mm (0.0005 in/in) angular misalignment. It is recommended that the motor shaft is set 0.05 mm (0.002 in) below the pump shaft during cold alignment, to allow for vertical thermal growth of the motor. (See section 8.6.11, Installed pump)
8. Operate the pump for at least two hours or until it and the driver reaches final operating temperature. Shut the pump down and recheck alignment while the pump is hot. Piping thermal expansion and motor vertical growth may change the alignment. Realign pump as necessary.

5.3.8 Priming and auxiliary supplies

The Mark 3 Group 4 standard pump will not move liquid unless the pump is primed. A pump is said to be "primed" when the casing and the suction piping are completely filled with liquid. To prime open discharge valves a slight amount. This will allow any entrapped air to escape and will normally allow the pump to prime, if the suction source is above the pump. When the suction source is below the pump, close the discharge valve and open the suction valve. The pump requires manual venting to prime the pump with vacuum. Once the pump fills with liquid, isolate the vacuum source and start the pump.

When a condition exists where the suction pressure may drop below the pump's suction capability (NPSHr), it is advisable to add a low-pressure control device to shut the pump down when the pressure drops below a predetermined minimum.

6 Commissioning

CAUTION **These operations must be carried out by fully qualified personnel**.

Pre-commissioning procedure

Prior to starting the pump, it is essential that the following checks be made. These checks are all described in detail in Section 8, *Maintenance*.

1. Pump and motor properly secured to the baseplate
2. All fasteners tightened to the correct torque
3. Coupling guard in place and not rubbing
4. Rotation check, see Section 5.3.4, *Direction of rotation*. **This is essential**
5. Impeller clearance setting
6. Shaft seal properly installed
7. Seal support system operational
8. Bearing are lubricated
9. Bearing housing cooling system operational, if fitted
10. Support leg cooling for center line mounting option operational
11. Heating/cooling for jacketed casing/cover operational
12. Pump instrumentation is operational
13. Pump is primed, See Section 5.3.8, *Priming and auxiliary supplies*
14. Rotation of shaft by hand

As a final step in preparation for operation, it is important to rotate the shaft by hand to be certain that all rotating parts move freely, and that there are no foreign objects in the pump casing.

WARNING Driver power must be isolated. Lockout-tagout required prior to checking for free rotation.

7 Operation

7.1 Start-up

1. Fully open the suction valve. The suction valve must remain open while the pump is operating. Any throttling or adjusting of flow must be done through the discharge valve. Partially closing the suction valve can create cavitation and related pump performance problems.

   NOTICE **Never operate pump with the suction valve partially or fully closed. Damage to the pump is likely.**

   ⚠WARNING **Never operate pump with both the suction and discharge valves closed. This could cause an explosion**.
2. If liquid supply in not above pump, prime pump. See Section 5.3.8, *Priming and auxiliary supplies*
3. All cooling, heating, and flush lines must be started and regulated.
4. Start the driver (typically, the electric motor).

   NOTICE **Always operate the pump above 400 rpm. Otherwise damage to the labyrinth seals will occur.**
5. Slowly open the discharge valve until the desired flow is reached. Maintain capacity above the Minimum Continuous Stable Flow (MCSF) listed in Section 7.2.1

   ⚠WARNING **The discharge valve must be opened within a short interval after starting the driver. Failure to do so could cause a dangerous build-up of heat, and possibly and explosion. See section 7.2.2 *Minimum thermal flow***

7.2 Normal operation

7.2.1 Minimum Continuous Sable Flow (MSCF)

Minimum continuous stable flow (MCSF) is the lowest flow at which the pump can operate and still meet the bearing life, shaft deflection and bearing housing vibration limits documented in ASME B73.1. Pumps may be operated at lower flows, but it must be recognized that the pump may exceed one or more of these limits. For example, vibration may exceed the limit set by the ASME standard. The size of the pump, the energy absorbed, and the liquid pumped are some of the considerations in determining MCSF.

The minimum continuous stable flow (MCSF) is based on a percentage of the best efficiency point (BEP). Table 16: *Minimum Continuous Stable Flow* identifies the MCSF for each Mark 3 Group 4 pump models. **Do not operate the pump below the MCSF shown on the Hydraulic Datasheet.**

When operating on a VFD at speeds not listed, the MCSF is obtained by linearly interpolating between the speeds shown in Table: 16 *Minimum Continuous Stable Flow*.

Table 16: Minimum Continuous Stable Flow

Pump Size	60 Hz		50 Hz	
	RPM	Min. Flow (% of BEP)	RPM	Min. Flow (% of BEP)
41K8X4-19 OP	1780	48%	1480	21%

	885	25%	740	25%
42K12X10-22 OP	1180	65%	980	63%
	885	65%	740	70%
42K12X10-22 RV	1180	65%	980	14%
	885	19%	740	20%

7.2.2 Minimum thermal flow

All Mark 3 pumps also have a *minimum thermal flow*. This is defined as the minimum flow that will not cause an excessive temperature rise. Minimum thermal flow is application dependent.

⚠WARNING Do not operate the pump below minimum thermal flow, as this could cause an excessive temperature rise. Contact a Flowserve sales engineer for determination of minimum thermal flow, if you are not qualified to determine this value.

Avoid running a centrifugal pump at drastically reduced capacities or with discharge valve closed for extended periods of time. This can cause rapid temperature rise and the liquid in the pump may reach its boiling point. If this occurs, the mechanical seal will be exposed to vapor. The lack of fluid lubrication to the seal, may damage the seal faces. Continued running under these conditions when the suction valve is also closed can create an explosive condition due to the confined vapor at high pressure and temperature.

Thermostats may be used to safeguard against overheating by shutting down the pump at a predetermined temperature.

Safeguards should also be taken against possible operation with a closed discharge valve, such as installing a bypass back to the suction source. The size of the bypass line and the required bypass flow rate is a function of the input horsepower and the allowable temperature rise.

7.2.3 Reduced head

As the discharge value is opened, discharge pressure will drop and capacity will increase. Power drawn by the pump will increase with the increase capacity. Increased motor temperature, is an indication of overload. A motor temperature above 60 ˚C (140 ˚F) is an indication of overload (consult motor manufacture for specific maximum temperature recommendations). If overloading occurs, throttle the discharge.

Reduced discharge is also an indication higher than normal flow. Cavitation and recirculation may occur, damaging the pump. If abnormal noise is heard, throttle the pumps.

7.2.4 Surging condition

A rapidly closing discharge or check valve can cause a damaging pressure surge (water hammer). A dampening arrangement should be provided in the piping.

⚠CAUTION Pressure rise due to water hammer can exceed the MDP (Maximum Design Pressure) for the pump. The mechanical seal, gaskets or casing can fail, causing a loss of the pumped liquid.

7.2.5 Operation in sub-freezing conditions

When using the pump in sub-freezing conditions where the pump is periodically idle, the pump should be properly drained or protected with thermal devices which will keep the liquid in the pump from freezing.

7.2.6 Performance and operation limits

This product has been selected to meet the specification of your purchase order. See section 2.1, Intended use. The data in the following sub-sections contains additional information to help with your installation. It is typical, and factors such as liquid being pumped, temperature, material of construction, and seal type may influence this data. If required, a definitive statement for your application can be obtained from Flowserve.

7.2.7 Alloy cross reference chart

Table 17: Alloy Cross-Reference

Flowserve Material code	Designation	Durco Legacy Codes	ACI Designation	Equivalent Wrought Designation	ASTM Specifications	Material Group No.

7.2.8 Pressure-temperature ratings

The pressure-temperature (P-T) ratings for Mark 3 Group 4 pumps are shown in Table 18. Determine the appropriate casing "Material Group No." in Table 17: *Alloy Cross-Reference*. Interpolation may be used to find the pressure rating for a specific temperature.

Example:

The pressure temperature rating for a Mark 3 Group 4 pump with Class 150 flanges and CF8M construction at an operating temperature of 150 ˚C (140 ˚F) is found as Follows:

1. The correct pressure - temperature chart is Table 18: *P-T Rating for 150# Flanges*
2. From Table 17: *Alloy Cross-Reference*, the correct material group for CF8M (D4) is 2.2
3. From Table 18: *P-T Rating for 150# Flanges*, the pressure-temperature rating is 14.8 bar (215 psig)
    a. Linearly interpolate between listed temperatures to determine P-T ratings at other temperatures.

 The maximum discharge pressure must be less than or equal to the P-T rating. Discharge pressure may be approximated by adding the suction pressure and the differential head developed by the pump.

Table 18: P-T Rating for 150# Flanges

Temp °C	**Material Group No.**										
	1.0	1.1	2.1	2.2	2.8	3.2	3.4	3.5	3.7	3.8	3.17

400	200	200	190	195	200	185	180	200	200	200	160

7.2.9 Maximum suction pressure

The maximum suction pressure for Mark 3 Group 4 pumps with reverse-vane (RV) impeller is located in Table 19: *Maximum Suction Pressure (RV)*. Suction pressure is limited to the lower of the maximum suction pressure listed or the P-T rating determined is Section 7.2.8 *Pressure temperature ratings*. For semi-open (OP) impellers, suction pressure is only limited by the P-T rating.

Table 19: Maximum Suction Pressure (RV)

Pump Size	Max. Suction Pressure barg (psig)
41K12X10-16	5.7 (80)
41K14X14-16	16.9 (245)
41K8X4-19	6.4 (90)
41K8X6-19	7.5 (110)
41K10X6-19	8.2 (120)
41K12X10-19	15.4 (220)
41K14X12-19	16.0 (230)
42K10X8-19	9.4 (135)
42K16X16-19	16.4 (235)
42K12X8-22	12.8 (185)
42K12X10-22	13.3 (190)
42K14X12-22	13.8 (200)
42K16X14-22	6.2 (90)

Notes:
For suction pressure above 4 barg (60 psig) other factors may reduce the maximum allowable suction pressure, Refer to application specific Hydraulic Datasheet for details

7.3 Cleaning, disinfecting, and sterilizing

One of the major causes of pump failure is the presence of contaminants in the bearing housing. This contamination can be in the form of moisture, dust, dirt and other solid particles such as metal chips. Contamination can also be harmful to the mechanical seal (especially the seal faces) as well as other parts of the pump. For example, dirt in the impeller hub bore could cause the impeller to not be seated properly against the shaft. For these reasons, it is very important that proper cleanliness be maintained. Some guidelines are listed below.

- After draining the oil from the bearing housing, periodically send it out for analysis. If it is contaminated, determine the cause and correct.
- The work area should be clean and free from dust, dirt, oil, grease etc.
- Hands and gloves should be clean.
- Only clean towels, rags and tools should be used.

7.4 Shut-down

When the pump is being shut down, the procedure should be the reverse of the start-up procedure.

1. Slowly close the discharge valve
2. Shut down the driver
3. Close the suction valve

 Closing the suction valve while the pump is running is a safety hazard and could seriously damage the pump and other equipment.

8 Maintenance, disassembly, inspection of parts, & assembly

8.1 Maintenance procedure

It is the plant operator's responsibility to ensure that all maintenance, inspection and assembly work is carried out by authorized and qualified personnel who have adequately familiarized themselves with the subject matter by studying this manual in detail. (See Section 2)

⚠ Any work on the machine must be performed when it is at a standstill and de-energized state. It is imperative that the procedure for shutting down the machine is followed, as described in Section 7.4, *Shut-down*.

Guard fasteners must remain captive during dismantling of guards, as described in Section 5.3.6, *Guarding*.

On completion of work all guards and safety devices must be re-installed and made operative again. Before restarting the machine, the relevant instruction listed in Section 6, Commissioning, must be observed.

Oil and grease leaks may make the ground slippery. Machine maintenance must always begin and finish by cleaning the ground and the exterior of the machine.

If platforms, stairs and guard rails are required for maintenance, they must be placed for easy access to areas where maintenance and inspection are to be carried out. The positioning of these accessories must not limit access or hinder lifting of the part to be serviced.

When air or compressed inert gas is used in the maintenance process, the operator and anyone in the vicinity must be careful and have the appropriate PPE, Personal Protective Equipment.

Do not spray air or compressed inert gas on skin

Do not direct an air or gas jet towards other people

Never use air or compressed inert gas to clean clothes

Never use air or compressed inert gas to spin bearings

 Follow your company's lock-out tag-out procedures. If none exist perform the following steps:

Before working on the pump, take measures to prevent the pump from being accidently started. Place a warning sign on the starter device:

"Machine under repair: do not start."

With electric drive equipment, lock the main switch open and withdraw any fuses. Put a warning sign on the fuse box or main switch:

"Machine under repair: do not connect."

 Never clean equipment with flammable solvent or carbon tetrachloride. Protect yourself against toxic fumes when using cleaning agents, using appropriate PPE.

Refer to Table 22: *Parts List* shown in Section 8.5 for items number reference used throughout this section.

8.1.1 Preventive maintenance

The following sections of this manual give instructions on how to perform a complete maintenance overhaul. However, it is also important to periodically repeat the pre-commission procedures listed in Section 6. These checks will help extend pump like as well as the length of time between major overhauls.

8.1.2 Need for maintenance records

A procedure for keeping accurate maintenance records is critical part of any program to improve pump reliability. There are many variables that can contribute to pump failures. Often long term and repetitive problems can only be solved by analysing these variables through pump maintenance records.

8.2 Schedule

Table 20: Maintenance Schedule

Frequency	Task
Daily	Check suction and discharge gauges Check for abnormal conditions (high/low temperature, flows, vibration, pressure etc.) Check motor current/driver power. Check for leakage from seals and joints. Check all lubricants levels (i.e. bearings housing oilers, seal plan 52/53, seal supply systems) (if applicable). Check for free flow of cooling medium (if applicable). Check stand-by pump is at applicable temperature and available to start as required.
Weekly	Check unit vibration Check operators log for loss of unit performance
Monthly	Check all lubricants for contaminations by sample analysis. Check all paint or protective coatings. Check all power/instrument cable glands for tightness
Every Six Months	Change all lubricants. See Table 13: *Lubrication Intervals* for specific recommendations.
Yearly	Check foundation fixing, bolting, grouting for looseness, cracking or general distress. Check unit alignment against previous inspections. Check calibration of instruments.
Every Three Years	Check internal conditions of pump and all auxiliary piping for corrosion/erosion. Check internal pump components for wear.

NOTICE This schedule is a recommendation only and is intended to be amended by site experience of the prevailing conditions. It outlines recommendations for the pump only and must be supplemented by schedules for other equipment on the package.

8.3 Special tools

A typical range of tolls that will be required to maintain these pumps is listed below. SAE standard tools are required (standard inch).

- Hand wrenches
- Socket wrenches
- Allen wrenches
- Soft mallet
- Screwdrivers

Special equipment

- Bearing pullers
- Bearing induction heaters
- Dial indicators
- Spanner wrench
- Torque wrenches
- Flowserve Mark 3 Group 4 tool kit (see below)

To simplify maintenance, it is recommended that Flowserve Mark 3 Group 4 tool kit, as shown in Figure 29, is used. This tool kit includes a handy impeller wrench, which simplifies installation and removal of the impeller. It also contains "nose cones" which protect shaft threads and O-rings during maintenance. This tool kit can be ordered from your local Flowserve sales engineer or from a Flowserve distributor or representative.

Figure 29: Mark 3 Group 4 tool kit

8.4 Required replacement parts for maintenance

- Mechanical process fluid seals
- Bearing housing seals
- Bearings
- Shaft or shaft sleeve
- Impeller
- Gaskets / O-rings

8.5 Disassembly

Table 21: Torque Requirements

Item	Location & Description		Frame 41K		Frame 42K	
			Nominal size	Fasteners Nm (ft-lb)	Nominal size	Fasteners Nm (ft-lb)

6572.2		Studs				
6814	Bearing Carrier	Set Screw	.500-13 UNC	37 (27)	.500-13 UNC	37 (27)
6541.1	Shaft	Locknut	AN 16	267 - 273 (197 - 275)	AN 18	336 - 508 (248 - 375)
-	Foot to Baseplate	Cap Screw	.750-10 UNC	150 (110)	.750-10 UNC	150 (110)
-	Casing to Baseplate	Cap Screw	.750-10 UNC	150 (110)	.875-9 UNC	250 (190)

Note:

1. Use Nickel Anti-Seize lubricant on the impeller nut thread.
2. Unless noted values shown are for non-lubricated / non-coated threads.
3. Gasket joints torque values are for unfilled PTFE gaskets. Other gaskets materials may require additional torque to seal. Exceeding metal joint torque values is not recommended.
4. Use only AS
5. A193 studs and A194 nuts. This is a requirement for pressure retaining fastener per ASTM Boiler Pressure Vessel Code BPVC. Studs ends must be stamped with the ASTM A193 Grade designation. Examples: B7, B8, B8M, B7TF. Grade B8C1 is only suitable for packing gland studs.

* Use the values shown if the torque value is not supplied by the seal manufacture.

** These values apply to factory supplied Flowserve ISC2 Series seals only. For all other seals follow the manufacture's recommendations.

*** These values apply to B8, B8M, and B7TF studs. If needed to seal the joint, B7FT stud torque can be increased up to 20%, and B8 stud torque can be increased up to 10%.

Note: The following subscripts also apply for Figures: 30 and 31 Only APE4 power end is shown in sectionals

a = APE4 power end b = OPE4 power end c = RPE4 power end d = MPE4 power end NS = Not Shown in Sectionals

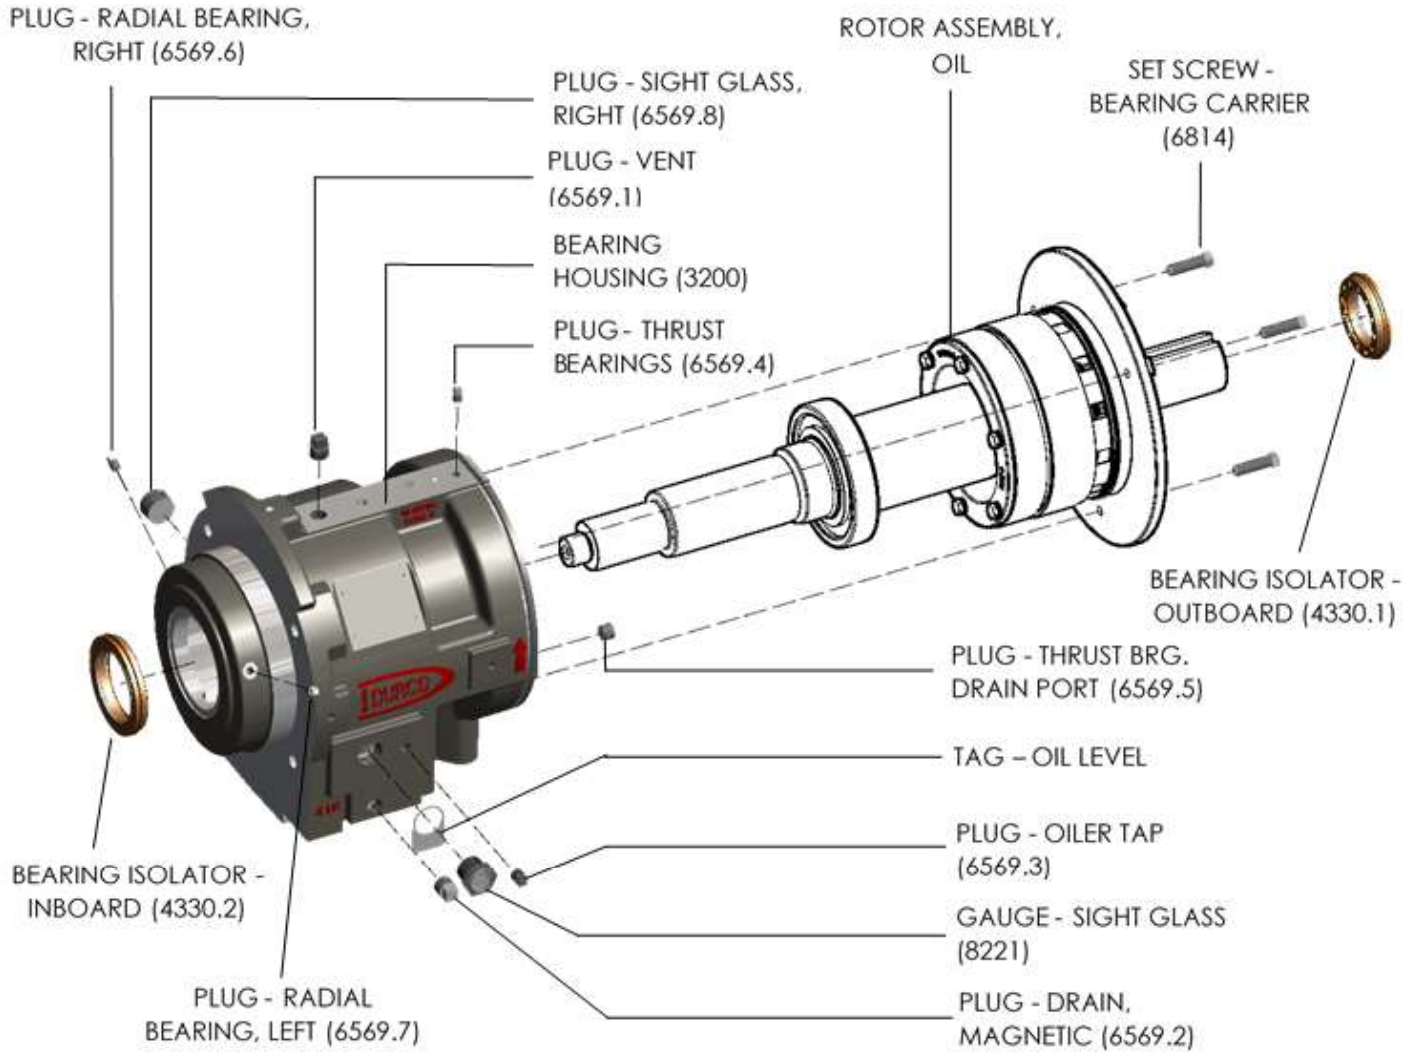

Figure 32: APE4 Power End

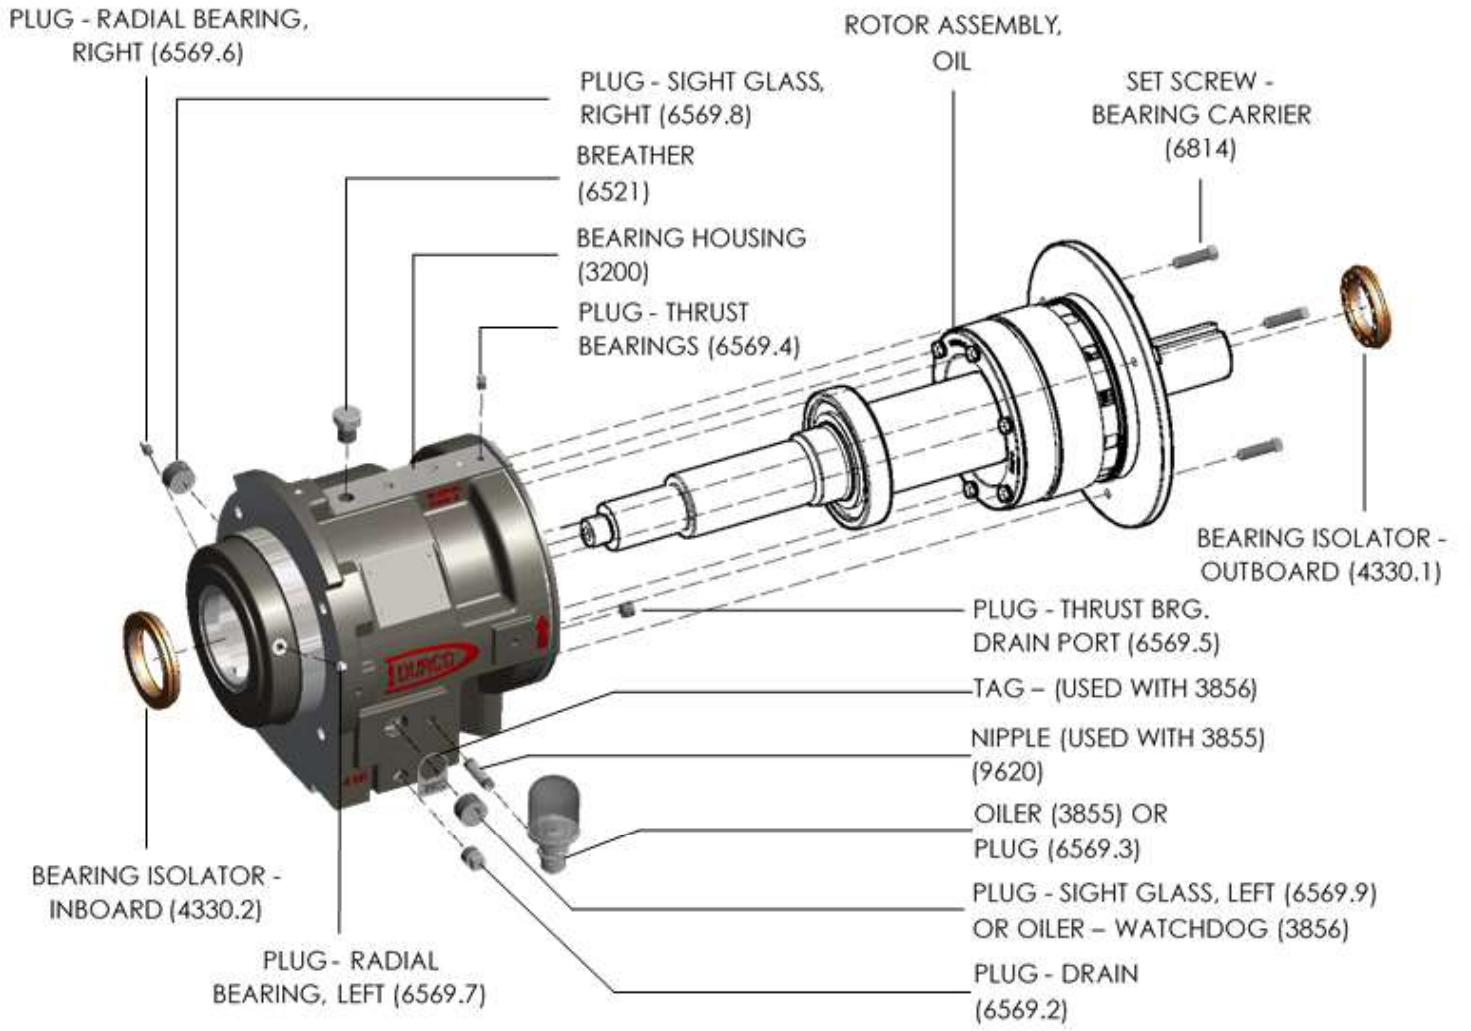

Figure 33: OPE4 Power End Assembly

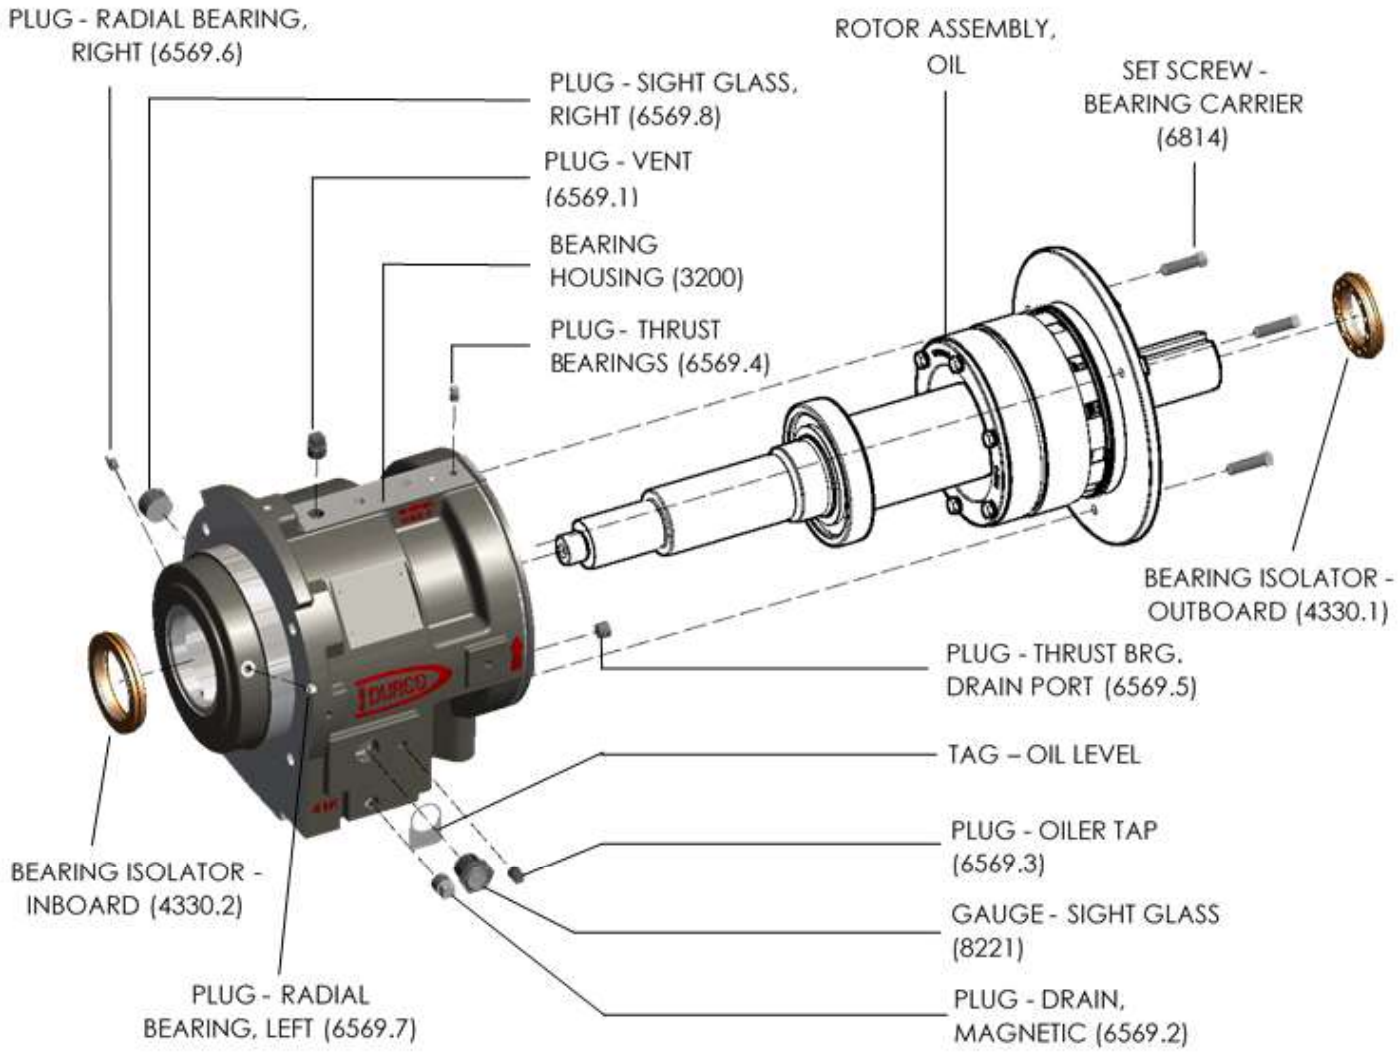

Figure 34: RPE4 Power End Assembly

⚠CAUTION **The power end / rear cover assembly is heavy, as are the individual components**. Follow the lifting procedure found in Section 4, *Transportation*, when moving, disassembling or assembling the pump. Always follow facility safety guidelines when lifting.

8.5.1 Power end removal

1. Before performing any maintenance, lock-out and tag-out driver.

   CAUTION **Lock out power to driver to prevent personal injury.**
2. Close the discharge and suction valves, and drain all the liquid from the pump.
3. Close all valves on auxiliary equipment and piping, then disconnect all auxiliary piping.
4. Decontaminate the pump as necessary.

   WARNING **If the pumps contain dangerous chemicals, it is important to follow plant safety guidelines to avoid personal injury or death.**
5. Remove the coupling guard. (see Section 5.3.6)
6. Remove the spacer from the coupling.
7. Remove casing fasteners [6580.1].
8. Remove the fasteners holding the bearing housing foot to the baseplate.
9. Move the (back pullout assembly) power end, rear cover, impeller and seal chamber assembly away from the casing. Discard the casing/cover gasket [4590.1]
10. Install the adapter support screw [6570.7].
11. Transport the assembly to maintenance shop.

8.5.2 Pump disassembly

1. Remove the coupling hub from the pump shaft [2100].
2. If oil or oil mist lubricated, remove drain plug [6569.2] from the bearing housing [3200] to drain oil. Recycle or disposed of using local environmental regulation methods.
3. Bolt or clamp the bearing housing foot [3134] securely to a heavy work table. Using the coupling key [6700.2], mount the impeller wrench from the Flowserve Mark 3 tool kit (Figure 29) to the end of the shaft, as shown in Figure 51: Removing Impeller. With the impeller wrench handle pointing to the left when viewed from the impeller end, with an impact wrench, loosen the impeller nut [2913], turning counter-clockwise.
4. Carefully remove impeller. Mark 3 Group 4 impellers weight up to 77 kg (170 lb). Secure the impeller, as shown in Figure 13: Lifting Impeller. Remove the impeller key [6700.1]
5. Discard the impeller and impeller nut O-rings [4610.1] and [4610.2].
6. **CAUTION** **Do not apply heat to the impeller. If liquid is entrapped in the hub, an explosion could occur.**
7. If equipped with a cartridge type mechanical seal [4200], reinstall the seal setting clips or tabs, per the seal manufacturer's instructions. This will ensure that the proper seal compression is maintained.
8. Remove the seal or packing gland nuts [6580.2] and washers [2905], if so equipped.
9. If a component type outside mechanical seal is used, loosen the set screws on the rotating unit and remove it from the shaft. Remove the gland and the stationary seat. Remove the stationary seat from the gland. Discard all O-rings and gaskets.
10. If a cartridge type inside mechanical seal [4200] is used, loosen the set screws on the rotating unit and remove it from the shaft, see Figure 49: FML Cover with Cartridge Seal. Then pull the

gland [4120] and stationary seat off the shaft. Remove the stationary seat from the gland. Discard all O-rings and gaskets.

11. If a component type inside mechanical seal is used, remove the gland and the stationary seat. Remove the stationary seat from the gland. Loosen the set screws in the rotating unit and remove it from the shaft. Discard all O-rings and gaskets.
12. If packing [4130] is used, remove it and the seal cage [lantern ring, 4134], using a packing puller.
13. To remove the cover, first secure with a long shank lifting eye, as shown in Figure 12: Lifting Cover. Remove the two token bolt screws [6570.6], that attach the Cover [1220] to the adapter. Carefully remove lift and remove the cover.
14. If packing is used, remove the packing gland [4120]
15. If the pump has a hook type sleeve [2400] it can now be removed. Discard the sleeve O-ring [4610.4]

    NOTICE Do not pry against the shaft.
16. Loosen the (3) three set screws [6814] on the bearing carrier [3240]. The bearing carrier must be completely unscrewed from the bearing housing. The face of the bearing carrier has three square lugs that protrude from the surface. Turn the bearing carrier [3240] counter-clockwise, using an open-end wrench on one of the rectangular lugs.
17. The carrier O-ring [4610.3], radial bearing [3011] fit in the bearing housing [3200], and the inboard bearing isolator [4330.2] O-rings on the shaft [2100] will cause some resistance in removing the bearing carrier assembly from the housing. Temporarily, screw the impeller nut [2912] on to the shaft hand tight. A slight impact, with a soft mallet, on the impeller nut, will free the bearing carrier assembly with the shaft and bearings, see Figure 44: Rotor Assembly - Oil. Further disassembly is not required unless the bearings are to be replaced, or cleaned (grease lubrication).

    ⚠CAUTION **The rotor assembly weight up to 80 kg (176 lb). Use appropriate lifting equipment.**
18. Remove the (6) bearing retainer – cap screws [6570.1] and bearing retainer [2530]. Remove the carrier [3240] from the thrust bearing [3013].
19. One tab on the lock-washer will be engaged in the locknut. Bend the tab on the lock-washer [6541.1] away from the locknut [3712]. The bearing locknut and lock-washer may now be removed from the shaft [2100]. Discard the lock-washer.
20. An arbor or hydraulic press may be used to remove the bearings [3011] and [3013] from the shaft. It is extremely important to apply even pressure to the inner bearing race only. Never apply pressure to the outer race as this exerts excess load on the balls and causes damage.

    ⚠CAUTION **Applying pressure to the outer race could will damage the bearing. And, the outer bearing race to separate from the balls and inner race.**
21. On the adapter [1340] side of the bearing housing [3200], remove the plugs [6569.6 & 7] or grease fitting [3853.2] and [9220] from the bearing housing.
22. The bearing housing [3200] must be separated from the adapter [1340]. This is accomplished by removing the (4) cap screws [6570.5], which thread into the bearing housing.
23. If the bearing isolators [4330] are removed from either the bearing carrier or bearing housing they must not be reused, discard appropriately. The isolator rotor O-rings should be replaced, if reusing the isolators.
24. If magnetic seals are used, maintain the seals as specified by manufacturer.

25. Remove Oiler and/or sight glass
    a) OPE4 design
        - Remove the Trico Watchdog oiler/sight glass [3856] or Opti-Matic oiler [3855] and oil level tag, if equipped, from the bearing housing. See Figures 35 and 36.
    b) APE4 design
        - Remove the sight glass [8221] and oil level tag from the bearing housing. See Figures 35 and 36.

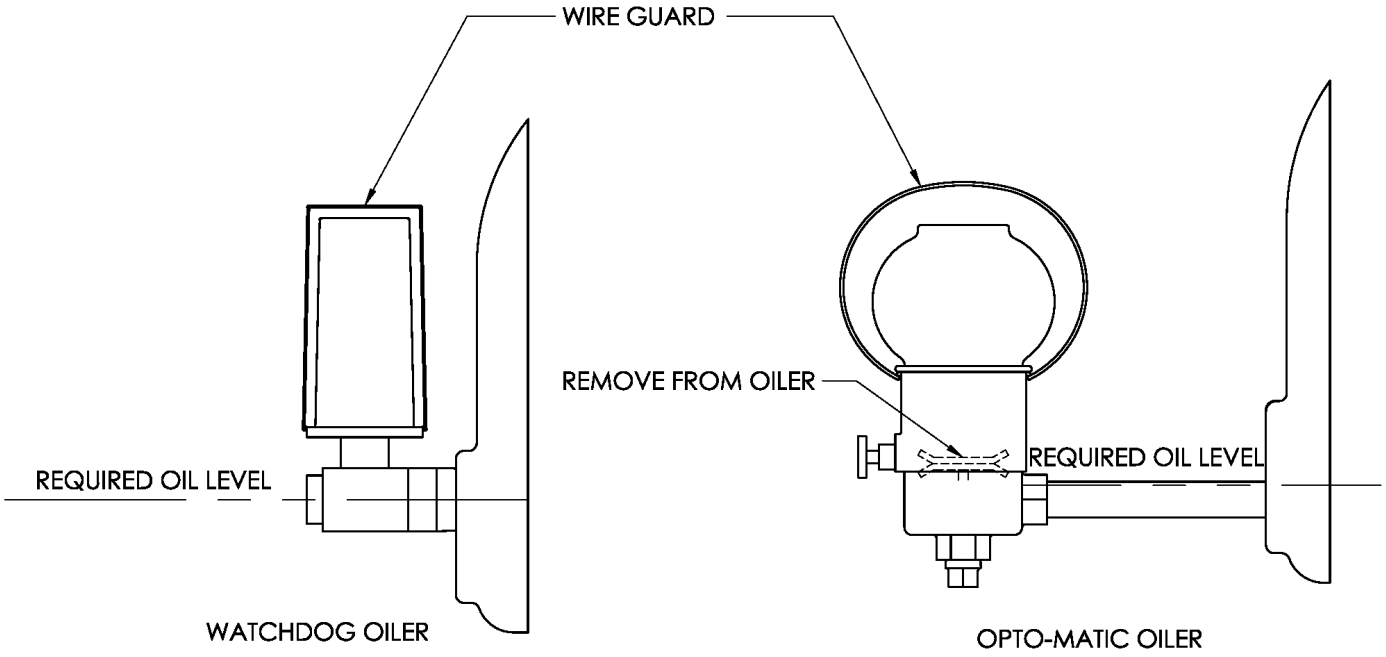

Figure 35: Oilers options

Figure 36: Oil Level Tag

8.6 Inspection of parts

8.6.1 Cleaning/inspection

All parts should now be thoroughly cleaned and inspected. New bearings, O-rings, gaskets, and lip seals should be used. Any parts that show wear or corrosion should be replaced with new genuine Flowserve parts.

⚠CAUTION **It is important that only non-flammable, non-contaminated cleaning fluids are used. These fluids must comply with plant safety and environmental guidelines**.

8.6.2 Critical measurements and tolerances

To maximize reliability of pumps, it is important that certain parameters and dimensions are measured and maintained within specified tolerances. It is important that all parts be checked. Any parts that do not conform to the specifications should be replaced with new Flowserve parts. All geometrical and dimensional values contained in this document are at a standard reference temperature of 20 ˚C (68 ˚F). See ISO 1:2016

8.6.3 Parameters that should be checked by users

Flowserve recommends that the user check the measurements and tolerance in Table 23: *Measurements & Tolerances* whenever pump maintenance is performed. Each of these measurements is described in more detail on the following pages.

8.6.4 Additional parameters checked by Flowserve

The parameters listed below are somewhat more difficult to measure and/or may require specialized equipment. For this reason, they are not typically checked by our customers, although they are monitored by Flowserve during the manufacturing and/or design process.

8.6.5 Shaft and sleeve (if fitted)

Replace if grooved, pitted or worn. Prior to mounting bearings or installing the shaft into the bearings housing, check the following parameters.

8.6.5.1 Diameter/tolerance, under bearings

To ensure proper fit between the shaft and bearings, verify that both the inboard (IB) and outboard (OB) shaft diameter is consistently within the minimum/maximum values shown in table 24: *Bearing Fits*. A micrometer should be used to check these outside diameters (O.D.) dimensions on the shaft.

8.6.6 Bearings

It is recommended that bearings not be re-used after removal from the shaft. Prior to mounting bearings, check the following parameters.

8.6.6.1 Diameter/tolerance, inside diameters

In order to ensure proper fit between bearings and the shaft, verify that the inside diameter (I.D.) of both the IB and OB bearings are consistently within the minimum/maximum values shown in Table 24: *Bearing Fits*. A bore gauge should be used to check I.D. of the bearings.

8.6.6.2 Diameter/tolerance, outside diameters

To ensure proper fit between bearings and the bearing housing, verify that the outside diameter (O.D.) on both the IB and OB bearings are consistently within the minimum/maximum values shown in Table 24: *Bearing Fits*. A micrometer should be used to check the O.D. on the bearings.

8.6.7 Impeller balancing

Shaft whip is deflection where the centerline of the impeller is moving around the true axis of the pump. It is not caused by hydraulic force but rather by a mass imbalance within the rotating element. Shaft whip shortens the life of mechanical seals, because the rotating face must move with each shaft revolution in order to maintain contact. To minimize shaft whip it is imperative that the impeller is balanced. All impellers manufactured by Flowserve are balanced after they are trimmed. If for any reason, a customer trims an impeller, it must be re-balanced. See note 1 under Table 23: *Measurements and tolerances* regarding acceptance criteria.

8.6.8 Bearing housing/carrier

Prior to installing the shaft into the bearing housing, check the following parameters.

8.6.8.1 Diameter/tolerance, at bearing surface

To ensure proper fit between the bearing housing/carrier and the bearings, verify that the inside diameter (I.D.) of both the IB and OB bearings surfaces are consistently within the minimum/maximum values shown in Table 23: *Measurements & Tolerances*. An inside micrometer or bore gauge should be used to check I.D. dimensions in the bearings housing.

Table 23: Measurements & Tolerances

Topic	ASME B73.1 Standard mm (in.)	Suggested by major seal vendor mm (in.)	Suggested and/or provided by Flowserve mm (in.)
Shaft Journals			
Diameter tolerance, under bearings	N/S	-	0.013 (0.0005)

Bearing Housing Journals			
Inside diameter, tolerance at bearings	N/S	-	0.02 (0.001)
Power end assembly			
Shaft runout (See note 4)	0.05 (0.002)	0.03 (0.001)	0.03 (0.001)
Shaft sleeve runout	0.05 (0.002)	0.05 (0.002)	0.05 (0.002)
Radial Deflection – static	N/S	0.08 (0.003)	0.05 (0.002)
Shaft End Play	N/S	0.05 (0.002)	0.00 (0.000)
Seal Chamber			
Face squareness to shaft	0.08 (0.003)	0.03 (0.001)	0.08 (0.003)
Register concentricity	0.13 (0.005)	0.13 (0.005)	0.13 (0.005)
Complete pump			
Shaft movement caused by pipe strain	N/S	0.05 (.002)	0.05 (0.002)
Alignment	N/S	-	See note 2
Vibration at bearing housing	See note 3	-	See note 3

Notes:

N/S = not specified.

1. The maximum values of acceptable unbalance are:
   a) 1500 r/min: 40 g•mm/kg (1800 r/min: 0.021 oz-in/lb) of mass.
   b) 2900 rpm: 20 g•mm/kg (3600) rpm: 0.011 oz-in/lb) of mass.
   c) Flowserve performs a two-plane dynamic balance, as required by the ASME B73.1 standard. All balancing is performed to the ISO 21940-11 Grade 6.3 tolerance criteria.
2. The ASME B73.1 standard does not specify a recommended level of alignment. Flowserve recommends that the pump and motor shafts be aligned to within 0.05 mm (0.002 in.) parallel FIM (full indicator movement) and 0.0005 mm/mm (0.0005 in./in.) angular FIM. Closer alignment will extend MTBPM. For a detailed discussion of this subject see the alignment section of this manual.
3. The ASME B73.1, Paragraph 7.1.4
4. The ASME B73.1, Paragraph 5.5.3

Note: All geometrical and dimensional values contained in this document are at a standard reference temperature of 20 ˚C (68 ˚F). See ISO 1:2016

T = Interference fit
L = Loose fit

8.6.9 Power end inspection

Perform the follow checked to the assembled bearing housing, carrier, bearings, shaft, seals and adapter.

8.6.9.1 Shaft/shaft sleeve runout

Shaft runout is the amount the shaft is "out of true" when rotated in the pump. It is measured by attaching a dial indicator to a stationary part of the pump so that its contact point indicates the radial movement of the shaft surface as the shaft is rotated slowly. If a shaft sleeve is used, then shaft sleeve runout must be checked. It is analogous to shaft runout. Measurement of shaft runout/shaft sleeve runout will disclose any out of roundness of the shaft, any eccentricity between the shaft and the sleeve, any permanent bend in the shaft, and/or any eccentricity in the way the shaft or bearings are mounted in the bearing housing.

Excessive shaft runout can shorten the life of the bearings and the mechanical seal. The following diagrams show how to measure shaft/shaft sleeve runout. Note that both ends need to be checked. The runout should be 0.05 mm (0.002 in.) FIM or less at the gland end of the seal chamber.

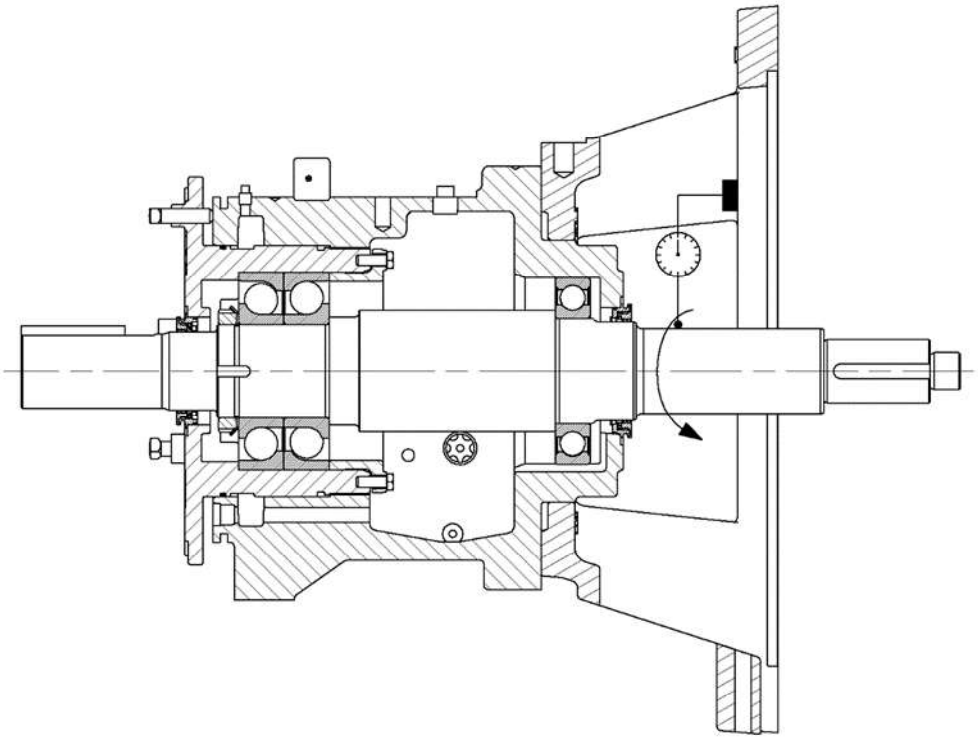

Figure 37: Runout

8.6.9.2 Radial deflection – static

Radial movement of the shaft can be caused by a loose fit between the shaft and the bearing and/or the bearing and the housing. Tighten bearing the (3) three bearing carrier set screws [6814] to the torque value shown in Table 21: *Torque Requirements*. Movement is measured by attempting to displace the shaft vertically by applying an upward force of approximately 9.1 kg (20 lb) to the impeller end of the shaft. While applying this force, indicator movement is observed, as shown in Figure 38. Check movement at a point as near as possible to the location of the seal faces. A movement of more than 0.05 mm (0.002 in.) is not acceptable.

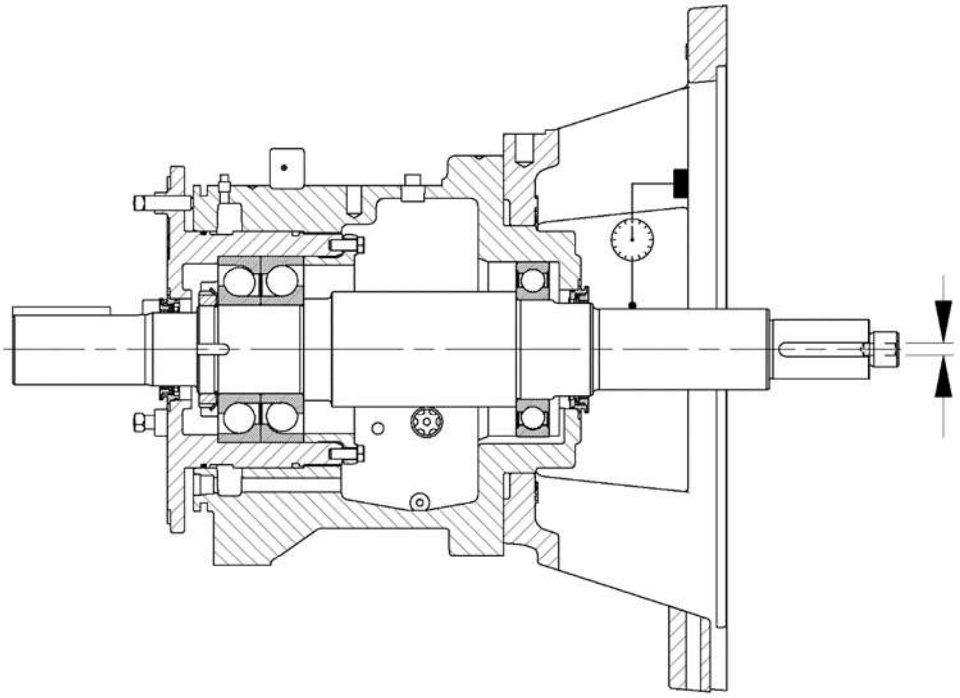

Figure 38: Radial Deflection

8.6.9.3 Shaft endplay

The maximum amount of axial shaft movement, or endplay, on a Mark 3 Group 4 pump should be 0.013 mm (0.0005 in.) With the bearing carrier set screws [6814] tighten to the torque value shown in Table 21: *Torque Requirements*, and standard BEGAY designation thrust bearings installed, endplay is measured, as shown in Figure 39. Observe indicator movement while lightly impacting the shaft from each end in turn with a soft mallet. Shaft endplay can cause several problems. It can cause fretting or wear at the point of contact between the shaft and the secondary sealing element. It can also cause seal overloading or under loading and possibly chipping of the seal faces. It can also cause the faces to separate if significant axial vibration occurs.

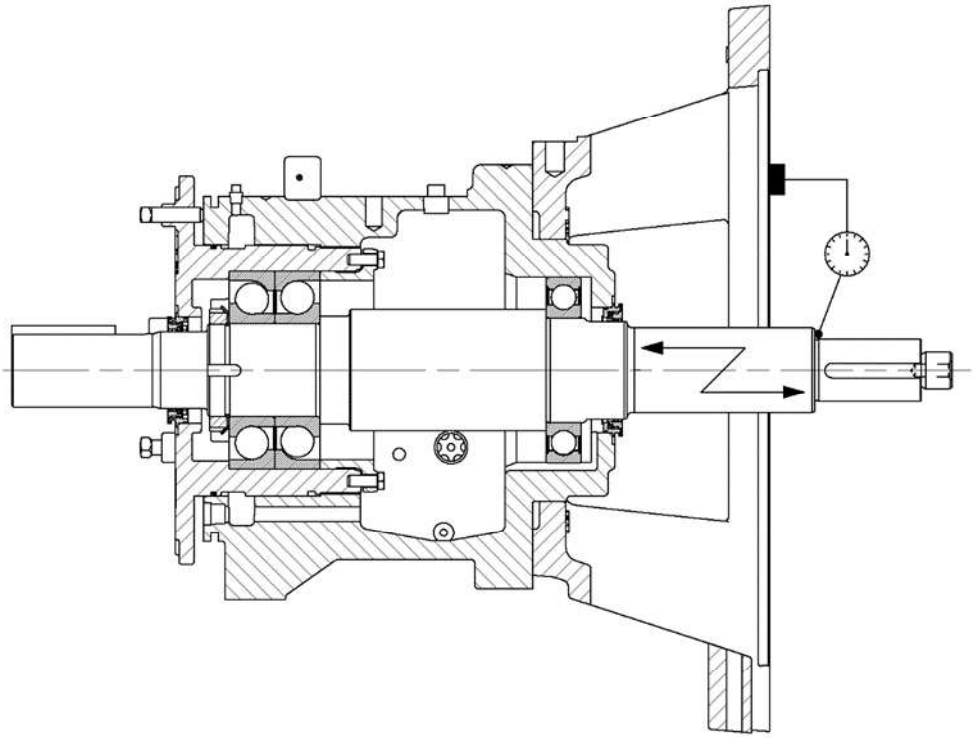

Figure 39: Endplay

8.6.10 Seal chamber inspection

Perform the following checks with the assembled power end and rear cover.

8.6.10.1 Seal chamber face perpendicularity to shaft

Also referred to as "Seal Chamber Face Runout." This runout occurs when the seal chamber face is not perpendicular to the shaft axis. This will locate the gland askew in relation to the shaft axis, which causes the stationary seat to be cocked, resulting is excess seal rotor movement, wear and a possible leak. This runout should be less than 0.08 mm (0.003 in.) FIM and should be measured, as shown in Figure 40.

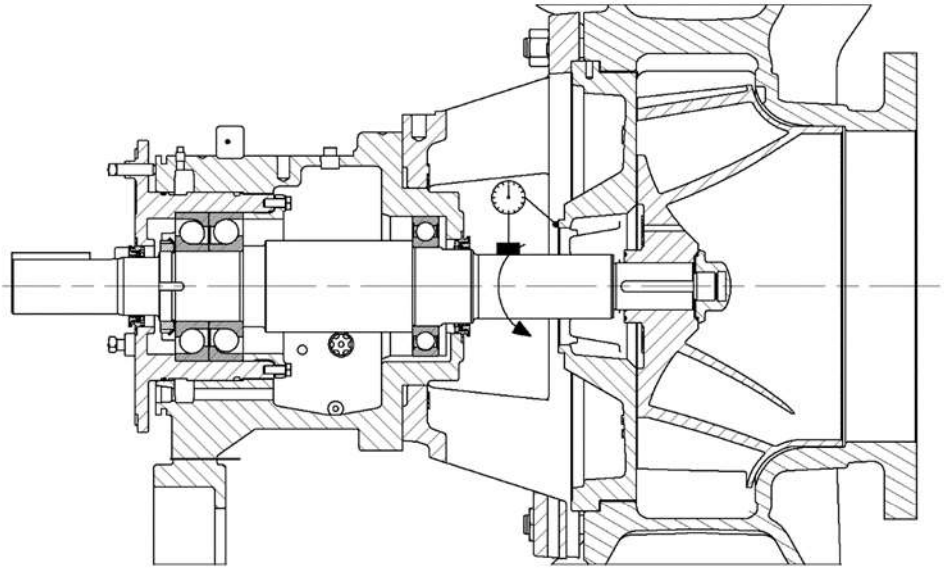

Figure 40: Face Perpendicularity

8.6.10.2 Seal Chamber register concentricity

An eccentric seal chamber bore or gland register can interfere with the piloting and centering of the seal components and alter the hydraulic loading of the seal faces, resulting in reduction of seal life and performance. The seal chamber register concentricity with the shaft or sleeve should be less than 0.13 mm (0.005 in.) TIR. The diagram below shows how to measure this concentricity.

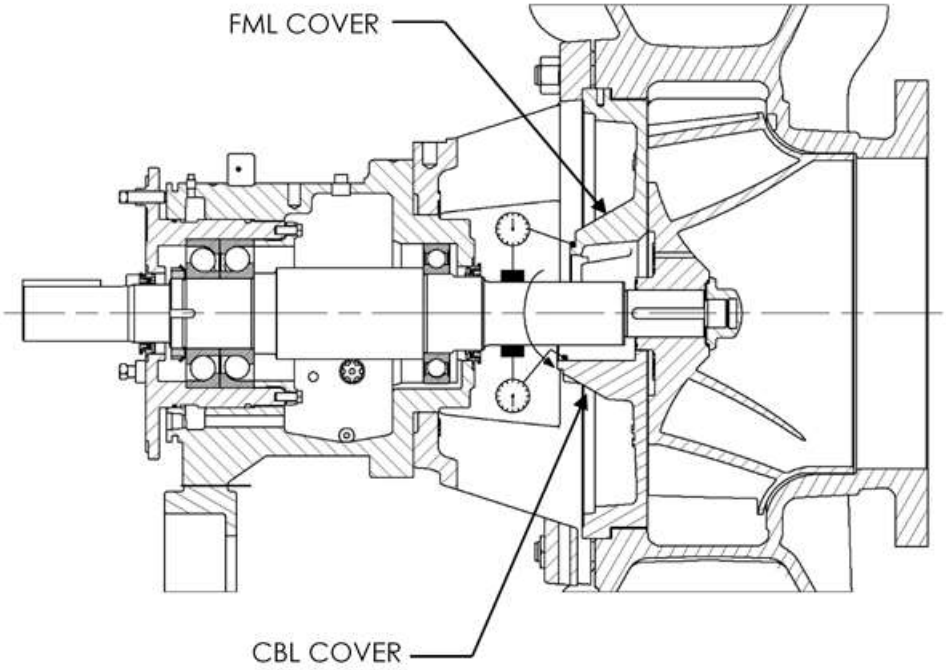

Figure 41: Concentricity

8.6.11 Installed pump: complete pump installed

The following must be checked during the installation and initial run-in of the pump.

8.6.11.1 Shaft movement caused by pipe strain

Pipe strain is excessive force put on the pump casing by the piping. Pipe strain should be measured, as shown in Figure 42. Install dial indicators or laser equipment as shown before attaching the piping to the pump. The flanges should now be bolted to the piping separately, starting with the suction. Continuously observed the indicators for movement. Tighten the flange bolts in steps. First to 10% of total torque, 30%, 60% and then 100% of total final torque. The maximum shaft movement in either direction, after finial tightening, is 0.05 mm (0.002 in.). If the movement exceeds 0.05 mm (0.002 in.), loosen the flange bolts, make corrections to the piping or supports. Replace the flange gaskets and repeat the procedure. If multiple pumps are attached to common suction or discharge piping, piping strain is to be checked simultaneously on all pumps.

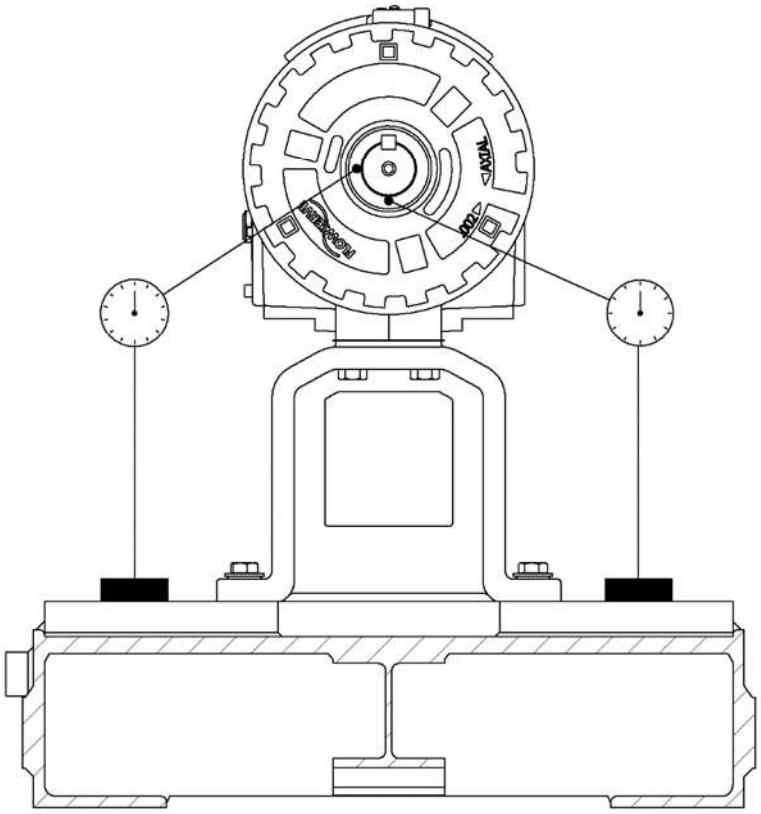

Figure 42: Pipe Strain Movement

8.6.11.2 Final alignment

Misalignment of the pump and motor shafts can cause the following problems:

- Failure of the mechanical seal
- Failure of the motor and/or pump bearings
- Failure of the coupling
- Excessive vibration/noise

The schematics below show the technique for a typical reverse rim alignment using dial indicators. It is important that this alignment be done after the flanges are connected, and at typical operating temperatures.

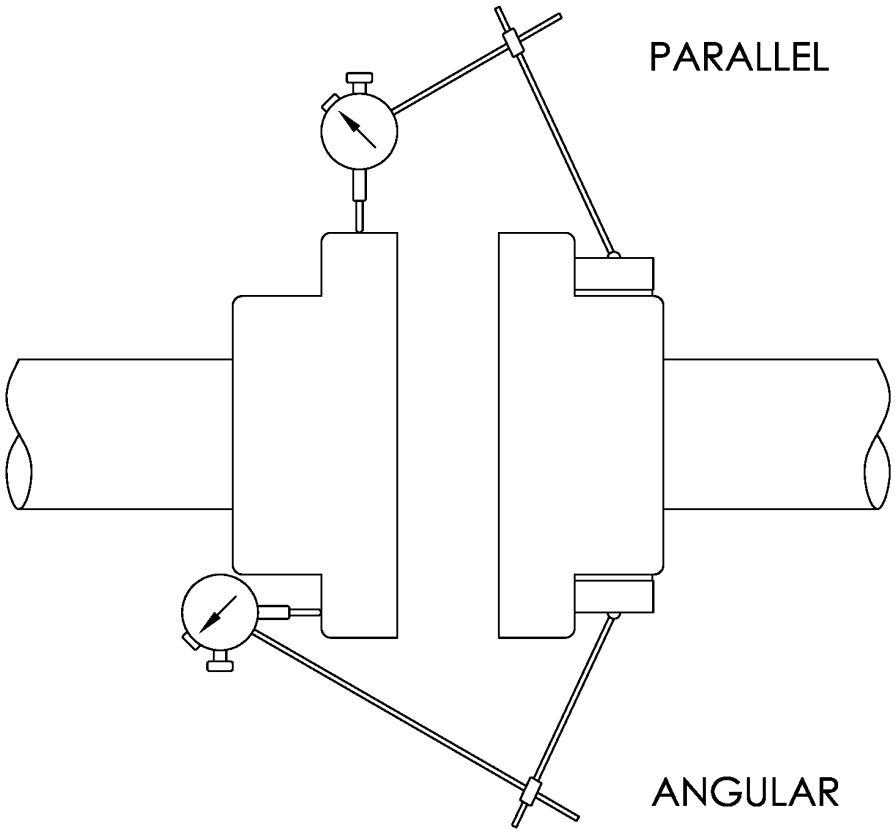

Figure 43: Alignment

Many companies today are using laser alignment which is more sophisticated and accurate technique. With this method a laser and sensor measure misalignment. This is fed to a computer with a graphic display that shows the required adjustment for each of the motor feet.

Detailed finial alignment instructions are outside the scope of this document. Only experienced trained personnel should perform the finial alignment. Flowserve can provide this service at additional cost.

See Section 5.3.7 for recommended final shaft alignment limits.

8.6.11.3 Vibration analysis

Vibration analysis is a type of condition monitoring where a pump's vibration "signature" is monitored on a regular, periodic basis. The primary goal of vibration analysis is extension of Mean Team Between Pump Maintenance (MTBPM). By using this tool Flowserve can often determine not only the existence of a problem before it becomes serious, but also the root cause and possible solution.

Modern vibration analysis equipment can not only detect if a vibration problem exists, but can also suggest the possible source of the problem. On a centrifugal pump, these causes can include the following:

- Unbalance
- Misalignment
- Soft-foot
- Defective bearings
- Resonance
- Hydraulic forces
- Pipe Strain
- Cavitation
- Recirculation

Once identified, the problem can be corrected, leading to increased MTBPM for the pump.

Flowserve does not make vibration analysis equipment; however, Flowserve strongly urges customers to work with an equipment supplier or consultant to establish an on-going vibration analysis program. See note 4 under Table 23: *Measurements and tolerances*, regarding acceptance criteria.

8.7 Power end assembly

PTFE tape provides a very reliable seal over a wide range of fluids, but it has a serious shortcoming if not installed properly. If, during application to the threads, the tape is wrapped over the end of the male thread, the tape is wrapped over the end of the male thread, strings of the tape will be formed when threaded into the female fitting. These strings can then tear away and lodge in the piping system.

If this occurs in the seal flush system, small orifice can become blocked effectively shutting off flow. For this reason, Flowserve does not recommend the use of PTFE tape as a thread sealant.

Flowserve has investigated and tested alternate sealants and has identified LOCTITE® 567™ provides an effective seal on tapered threads. The lubricating properties of this compound prevent galling on all metal pipe threads and fittings. LOCTITE® 567™ offers high temperature performance and oil tolerance.

⚠CAUTION **It is important that all pipe threads be sealed properly.**

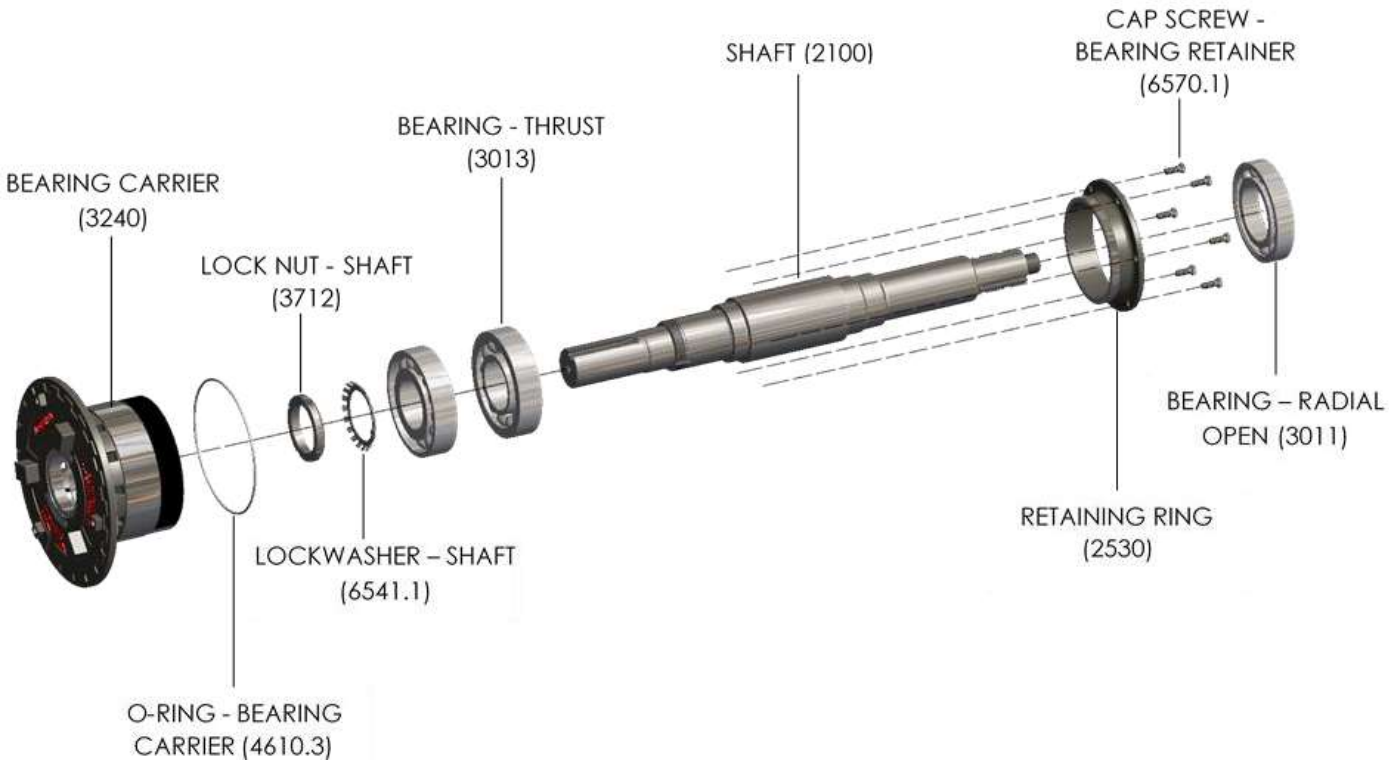

Figure 44: Rotor Assembly, Oil

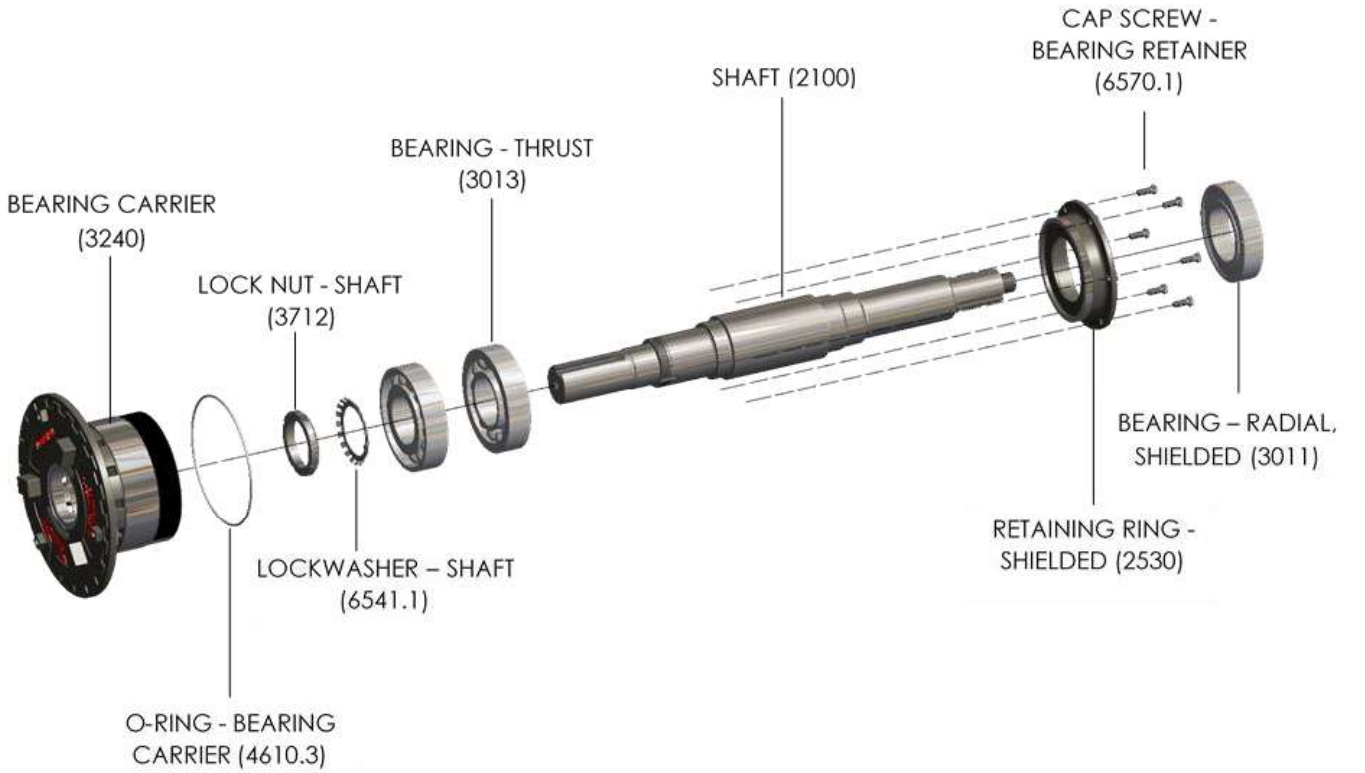

Figure 45: Rotor Assembly, Grease

8.7.1 Bearing installation

Mounting of bearings on shafts must be done in a clean environment. Bearings and power end life can be drastically reduced if even very small foreign particles work their way into the bearings. Wear clean gloves.

Bearings should be removed from their protective packing only immediately before assembly to limit exposure to possible contamination. After removing the packing, they should only come in contact with clean hands, fixtures, tools and work surfaces.

Table 25: *Flowserve Mark 3 Group 4 Bearings* gives the SKF part numbers for bearings in Flowserve Mark 3 Group 4 pumps. Note that the term Inboard Bearing (IB) refers to the bearings nearest to the casing. Outboard Bearing (OB) refers to the bearings nearest to the motor. See Figure 23: *Bearing Shield Orientation*

NOTICE **Both bearings have a slight interference fit which requires that they be pressed on the shaft with an arbor or hydraulic press. Tables: 24 identifies the bearings fits. Even force should be applied to only the inner race. Never press on the outer race, as the force will damage the balls and races.**

An alternate method of installing bearings is to heat the bearings to 93 ˚C (200 ˚F) by means of an oven or induction heater. The shaft temperature must be below 38 ˚C (100 ˚F) before attempting to install bearings. With this approach the bearing must be quickly positioned on the shaft.

Never heat the bearings above 110 ˚C (230 ˚F). Doing so may cause the bearings fit to permanently change, leading to early failure.

1. Install the radial IB bearing [3011] on the shaft [2100]
   If the power end is equipped with single shielded re-greaseable bearings, position shield, as shown in Figure 23: *Bearing Shield Orientation*.
2. Before installing the thrust bearings [3013] on the shaft [2100]. Place the bearing retainer [2530.1] onto the outboard end of the shaft and slide down to the inboard bearing.
3. Install the duplex angular contact bearings. The bearing must be mounted back-to-back with the wider thrust sides of the outer races in contact with each other shown in Figure 46. Only bearings designed for universal mounting should be used. The SKF designation is "BEGAY".

NOTICE The inboard bearings must be positioned against the shoulder and the bearing retainer placed on the shaft oriented, as shown in Figure 23: *Bearing Shield Orientation*.

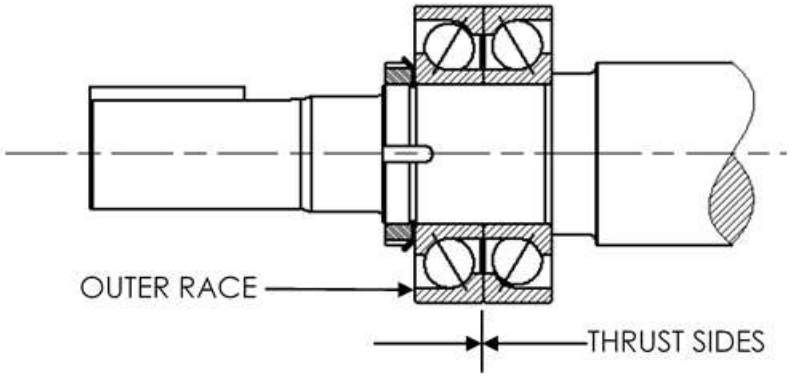

Figure 46: Duplex angular contact bearing

NOTICE It must be understood that fixtures and equipment used to press the bearing must be designed so no load is ever transmitted through the bearing balls. This would damage the bearing.

4. If the thrust bearing [3013] is installed by the heating method, the install the locknut [3712] immediately after the bearing is placed on the shaft and tightened to ensure the bearing remains in contact with the shaft shoulder. As the bearing cools tighten the locknut repeatedly. Once cool remove the locknut.
5. Install lock washer [6451.1] and locknut [3712]. Torque the locknut to the minimum value shown in Table 21: *Torque Requirements*. Then continue turning the locknut clockwise until a single notch aligns with a tang on the lock washer. Bend one of the lock washer tangs into the corresponding groove on the locknut.
6. Let the shaft assembly cool to room temperature before proceeding to the bearing carrier [3240] installation. Protect from airborne debris.

Table 25: Flowserve Mark 3 Group 4 Bearings

Frame	Type of bearing	Duplex angular contact ball bearing (outboard) [6]	Deep groove ball bearing (inboard) [6]
41 K	Oil bath/mist – open	7316 BEGAY	6218/C3 [1]
	Re-greaseable single shielded	Note 4	6218-Z/C3 [2]
42 K	Oil bath/mist – open	7318 BEGAY	6220/C3 [1]
	Re-greaseable single shielded [2]	Note 4	6220-Z/C3 [2]

Notes:

1. These bearings are open on both sides. They are lubricated by oil bath or oil mist.
2. These bearings are pre-greased by Flowserve. Replacement bearings will generally not be pre-greased, so grease must be applied by the user. They have a single shield, which is located away from the grease reservoir. The grease reservoir is initially filled with grease by Flowserve. Lubrication fittings are provided, to allow the customer to periodically replenish the grease, as recommended by the bearings and/or grease manufacturer.
3. The codes shown are SKF codes. Standard inboard bearings have the C3, greater than "normal" clearance. These clearances are recommended by SKF to maximize bearing life, in most applications. Flowserve Engineering may specify other clearances in some applications. Away verify the replacement bearing designation is identical to the original.

4. Re-greaseable – single shielded bearings are not available in the duplex configuration; however, open oil bath-type bearings are used for the re-greaseable configuration. The bearing retainer features an integral shield to retain grease. These bearings must be pre-greased during assembly. Lubrication fittings are provided, to allow the user to periodically replenish the grease, as recommended by the bearing and/or grease manufacturer.
5. Deep groove bearings configurations are supplied only with steel cages. Angular contact ball bearings are supplied with machined brass cages.
6. Only SKF – Explore performance class bearings are approved for uses in the Mark 3 Group 4 pump. SKF bearing are often counterfeited. Purchasing bearings from Flowserve to assure authenticity. If bearings are purchased from a non-Flowserve supplier and are suspected to be counterfeit, SKF advises that sharp pictures of all visual markings on the bearing and/or its package is taken and sent to genuine@skf.com T.

8.7.2 Bearing carrier installation

1. Install new O-ring [4610.3] onto the bearing carrier.
2. Slide the bearing carrier [3240] over the outboard (OB) bearing [3013].
3. Slide the bearing retainer [2530] against the OB bearing. Install the (6) six socket head cap screws [6570.1]. See Table 21: *Torque Requirements*, for correct torque values.

8.7.3 Rotor installation

1. Place the bearing housing, with the inboard bearing bore facing down, on a work surface or assembly fixture capable of supporting a minimum of 227 kg (500 lb). A 230 to 254 mm (9.00 to 10.00 in) diameter opening in the work surface is require for the end of the bearing housing to pass through. The opening allows the shaft [2100] pass through the bearing housing. 18 in of clearance is required below the work surface, allowing the shaft [2100] pass through the bearing housing.
2. *If previously removed, reinstall the thrust bearing oil return port plug [6569.5] in the bearing housing [3200]. Apply LOCTITE® 567™ to the plug prior to installation. Failure to install this plug will result is a total loss of lubricating oil. See Figure 34: RPE4 Power End Assembly for the correct location.*
3. Install a swivel lifting eye on the outboard end of the shaft. The internal shaft threads are ½-13 UNC – 2B, 1.00 in thread depth. Hook the lifting eye and carefully lift the rotor assembly in to a vertical position with a crane.
4. Lubricate the bearing carrier [3240] O-ring and threads, and bearing housing [3200] internal bores with oil. The shaft, bearings, and bearing carrier, *rotor assembly*, can now be installed into the bearing housing. See Figures 44 & 45
5. Slowly lower the rotor assembly in to the bearing housing [3200] until the bearing carrier [3240] threads contact the bearing housing threads. See Figure 34: *RPE4 Power End Assembly* for the correct orientation.
6. To avoid damaging the threads the they must be properly indexed. With the rotor assembly still attached to the crane, and a portion of the rotor assemblies weight still supported, rotate the bearing carrier [3240] counter-clockwise, until the rotor assembly drops approximate 1.6 mm (0.06 in) further in to the bearing housing [3200]. The bearing housing and carrier threads are now indexed.
7. Thread the bearing carrier [3240] into the bearing housing [3200] by turning it clockwise. Thread the bearing carrier onto the housing until the carrier flange is approximately 3 mm (0.13 in.) from the bearing housing. Install the (3) three set screws [6570.3] loosely, not to contact the bearing housing.

8. Reinstall any tags, plugs, site gages and oiler, as shown.
    a) APE4, ASME Power End (See Figure 33)
        - If the adapter is to be install immediately after completion of the power end, do not install Radial bearing plugs [6569.4] & [6569.5], at this time.
    b) OPE4, Oiler Power End (See Figure 34)
        - If the adapter is to be install immediately after completion of the power end, do not install Radial bearing plugs [6569.4] & [6569.5], at this time.
    c) RPE4, Regreaseable Power End (See Figure 35)
        - If the adapter is to be install immediately after completion of the power end, do not install the Radial bearing grease fitting [3853.2], and Radial bearing relief fitting [9200]
    d) MPE4, (Not Shown) all opening are plugged
        - If the adapter is to be install immediately after completion of the power end, do not install Radial bearing plugs [6569.4] & [6569.5], at this time.

8.7.4 Adapter Installation

1. Assemble the adapter [1340] to the bearing housing [3200]. Thread the cap screws [6570.5] through the adapter and into the tapped holes in the bearing housing.
2. Install the radial bearing plugs [6569.4] & [6569.5], or radial bearing grease fitting [3853.2], and radial bearing relief fitting [9200], as required.
3. If the pump is equipped with a hook type sleeve [2400], install the sleeve O-ring [4610.4] in the sleeve's internal groove. Lubricate the O-ring with oil or Parker-O-Lube. Slip the sleeve into place over the impeller end of the shaft [2100].

8.7.5 Bearing housing seals

8.7.5.1 Flowserve® Bearing Gard™ Bearing Isolators

The standard bearing housing seal is the Flowserve Bearing Gard™. It is a permanent, non-wearing bearing protection device. Its main purpose is to retain lubrication in the bearing housing and prevent the ingress of contamination as this can lead to premature failure of the lubrication and bearings. The Bearing Gard™ also services to regulate the passage of atmosphere in and out of the bearing housing.

NOTICE Bearing Gard's labyrinth is designed to contain oil and repel water. It is not designed for use in either horizontal or vertical application that are flooded with oil or other liquid.

NOTICE To ensure safe and reliable operation of the Bearing Gard™ follow all installation, operation, and maintenance instructions. Failure to comply with these instructions may result in frictional heating of the Bearing Gard™ components and will result in loss in performance.

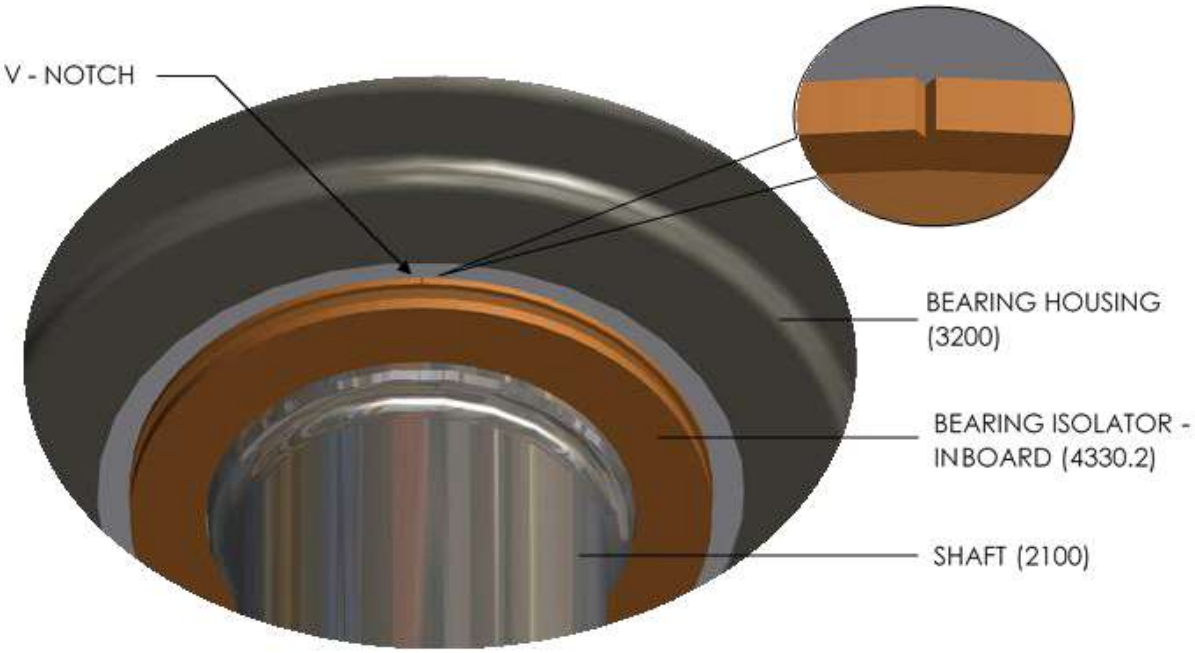

Figure 47: Inboard (IB) Bearing Gard™ Orientation (V-Notch)

8.7.5.2 Preparation for Installation

Do not disassemble the Bearing Gard™. It is designed to be installed as an assembly. Leave the Bearing Gard™ in its original packaging until installation.

1. Inspect for and remove sharp edges from the housing bore, and shaft steps where Bearing Gard™ O-Rings must pass.
2. Thoroughly clean both the shaft and housing bore.
3. Ensure Bearing Gard™ shaft O-ring position is located on an area of the shaft free from scratches, nicks, or dings.
4. Shaft and housing surface must be 0.8 micrometer (32 µin) or better.

8.7.5.3 Inboard Installation [4330.2]

See section 8.7.5.1 for proper V-Notch position before installing. Do not disassemble the Bearing Gard™. It is designed to be installed as an assembly. Leave the Bearing Gard™ in its original packaging until installation.

1. Lightly lubricate O-rings, shaft, and housing bore with the lubricant provided.
2. Align the Bearing Gard™ in housing so the oil and contaminant outlets are located on the bottom at 6 o'clock. The V-Notch must be vertically up when the pump assembly is complete.
3. Use an arbor press to push the Bearing Gard™ over the shaft into the housing bore. The tool should contact as much of rotor surface as possible. Do not hammer or hit the Bearing Gard™ directly. A sleeve for pressing in the isolator can be made of a Delrin®, HDPE tube or similar engineered plastic.
4. Visually confirm the Bearing Gard™ is fully seated against the bearing housing shoulder.

5. Spin shaft by hand. Listen and feel for any shaft binding for rubbing. If binding or rubbing occurs, repeat step 4 to reseat the isolator.
6. If shaft binding or rubbing remains, remove the Bearing Gard™ and verify equipment is within tolerance shown below in Table 26: *Bearing Gard™ Tolerance & Limits*.
7. Correct any defect and repeat steps 1 thru 4.

8.7.5.4 Outboard Installation [4330.1]

The outboard Bearing Gard™ will function is any radial position.

1. Rotate the power end assembly, so that the outboard end (coupling end) is facing up.
2. Lightly lubricate O-rings, shaft, and housing bore with the lubricant provided.
3. Use an arbor press to push the Bearing Gard™ over the shaft into the housing bore. The tool should contact as much of rotor surface as possible. Do not hammer or hit the Bearing Gard™ directly. A sleeve for pressing in the isolator can be made of a Delrin®, HDPE tube or similar engineered plastic.
4. Visually confirm the Bearing Gard™ is fully seated against the bearing housing shoulder.
5. Spin shaft by hand. Listen and feel for any shaft binding for rubbing. If binding or rubbing occurs, repeat step 4 to reseat the isolator.

Table 26: Bearing Gard™ Tolerance & Limits

Parts	Tolerance	
Shaft	± 0.051 mm	± 0.002 in.
Housing	± 0.025 mm	± 0.001 in.
Maximum axial movement (TIR)	0.63 mm	0.025 in.
Maximum radial runout (TIR)	0.13 mm	0.005 in.
Maximum Temperature *	190 ˚C	375 ˚F
Maximum Speed	30 m/s	6000 ft/min

* For ATEX parts, see attached document that is provided with pump

8.7.5.5 Lip Seals

NOTICE Lip seals are not available. Shaft design and finishes DO NOT accommodate their operation. ASME B73.1 specifies labyrinth-type bearing isolators as standard. Flowserve no longer recommends lip seals on ASME B73.1 Chemical Process Pumps.

8.7.5.6 INPRO/SEAL® VBXX®-D Bearing Isolators

The installation instructions for the INPRO/SEAL® VBXX®-D bearing isolators are identical to the Flowserve Bearing Gard™, with the following modifications

1. The stator has an interference fit in the housing and the elastomer O-ring located on the outside diameter (O.D.) of the seal has been sized to overfill the groove in which it is located. When installing the seal into its corresponding housing, in addition to compressing the O-ring a certain amount of material may shear off. This sheared material should be removed.
2. If the INPRO/SEAL® is removed and reinstalled for any reason, replace the stator O-ring, as some of the material may have sheared off during the initial installation.
3. Install the inboard seal in the bore of the bearing housing with the single expulsion port positioned at the bottom 6 o'clock position. A V-Notch is not present on the stator to verify orientation after assembly.

8.7.5.7 Other Bearing Isolators and Magnetic seals

Follow the installation instruction provided by the manufacturer.

8.7.6 Operation

1. The maintain pump speed above 400 rpm, when Bearing Gard™ isolators are installed.
2. Contact your Flowserve seal representative for technical support of the Bearing Gard™.

8.8 Wet end assembly

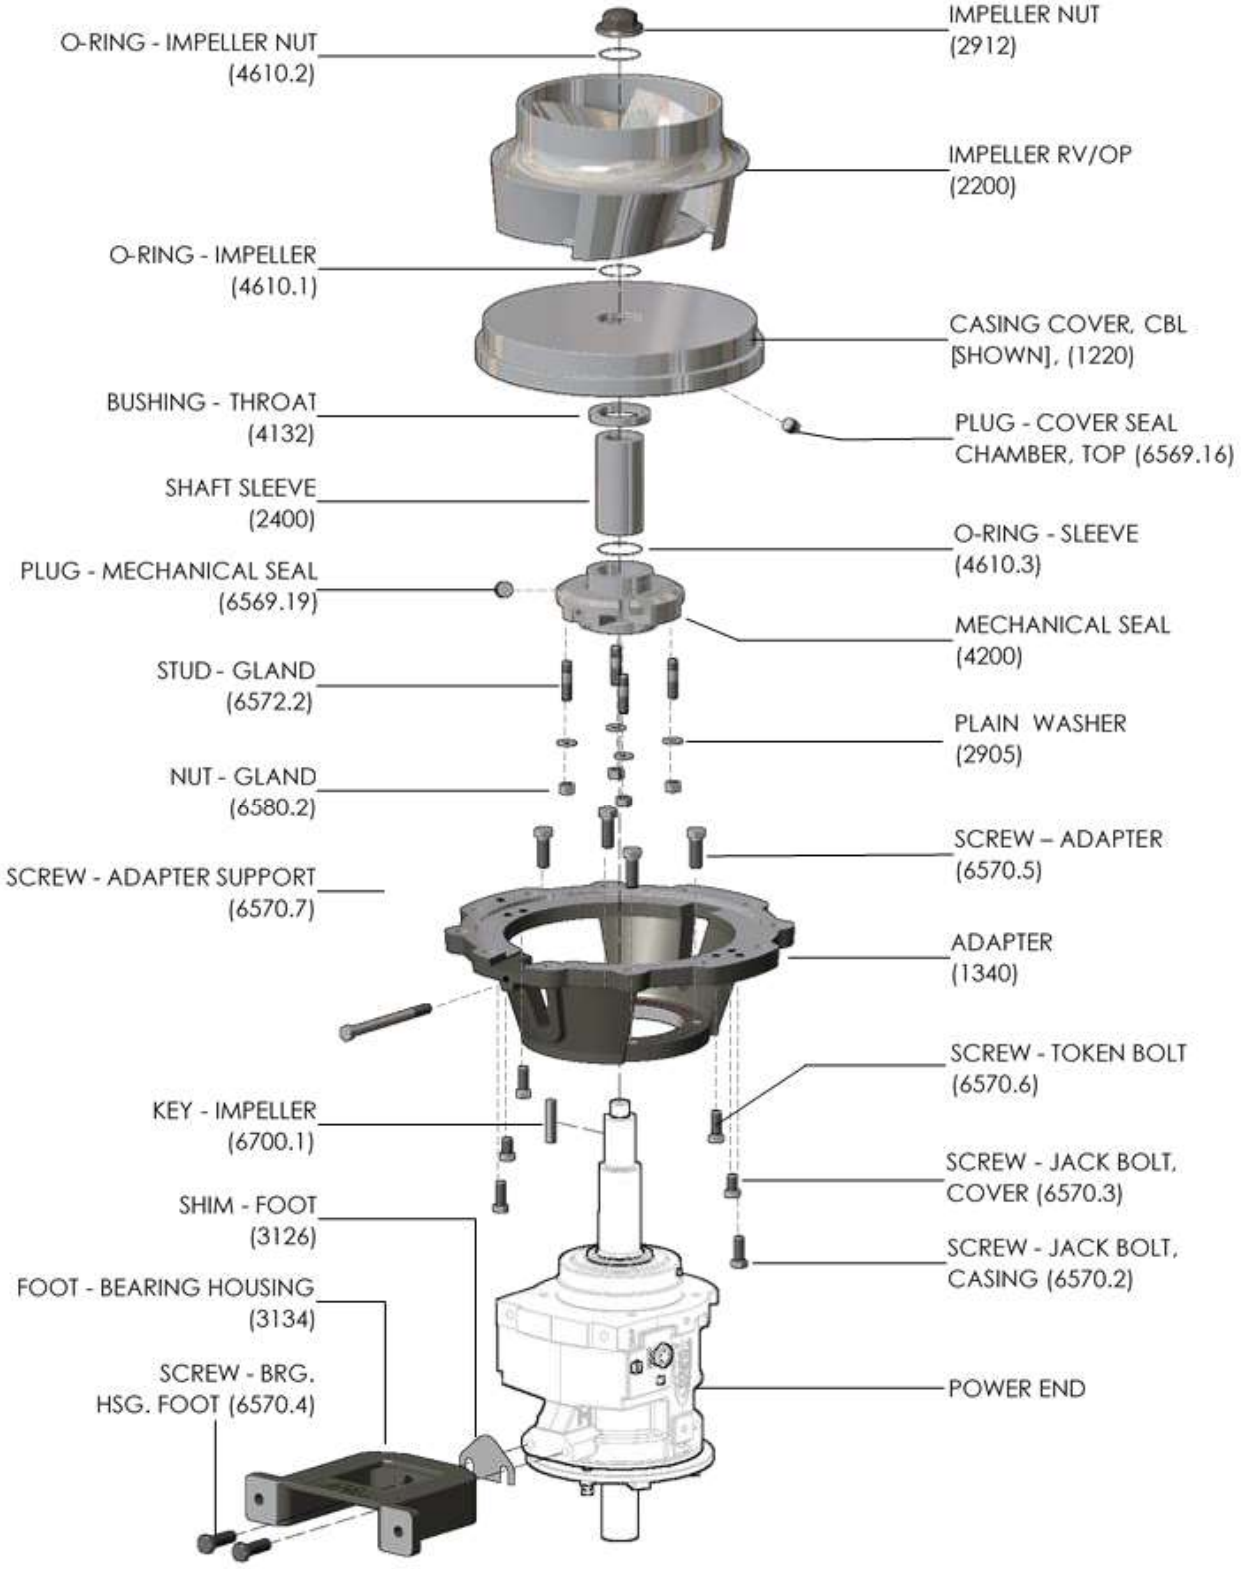

Figure 48: Back Pullout Assembly

8.8.1 Cartridge mechanical seals

Review the seal assembly instructions and drawings provided by the seal manufacturer.

1. A nose cone is not required. The outside diameter shaft [2100] or sleeve [2400] end is machined with a 20-degree lead chamfer to facilitate installation of the mechanical seal [4200]. Lubricate the shaft or sleeve and the mechanical seal O-ring (not shown) with the supplied lubricant or Parker-O-Lube.
2. Place the mechanical seal on the shaft end with the seal collar facing the bearing housing [3200]. Slide the mechanical seal onto the shaft until it lightly touches the bearing isolator [4330.2]. *Orient the seal ports as shown on the seal assembly drawing.*
3. Install the casing cover [1220] to the adapter [1340] with the word, "TOP" oriented, as shown is Figure 49 and 50, secure with (2) cap screws [6570.6]; token bolts. Now slide the mechanical seal to the casing cover [1220], using gland studs [6572.2], washers [2905] and gland nuts [6580.2], fasten the seal to the cover. Torque the gland studs to the value shown in the instructions supplied with the seal.
4. Install the impeller [2200] and then set the impeller clearance, as instructed in Section 8.8.3, *Setting impeller clearance and replacement*.
5. Hand tighten the seal collar set screw to lock the rotating unit to the shaft. Then torque to the value shown in the instructions supplied with the seal. If no value is provided torque set screws with 3/8-16 threads to 47 Nm (35 lb-ft) and 5/16-18 threads to 27 Nm (20 lb-ft).
6. Finally remove centering clips or tabs from the seal.

NOTICE Retain centering clips and tabs for future maintenance.

8.8.2 Packing and split gland installation

1. Install the casing cover [1220] to the bearing housing adapter by using the cap screws [6570.6], token bolts.
2. Install and set the impeller clearance as outlined in Section 8.8.3
3. Install packing rings [4130] and lantern ring packing [4134] into the packing box in an alternating sequence. The typical order is, as shown in Figure 30. Always stagger the end gaps 90 degrees to ensure a better seal. To speed installation of each ring, have an assistant turn the pump shaft in one direction. This movement of the shaft will tend to draw the rings into the packing box. Corrugated cardboard rolled around the shaft or split tubing can be used to tamp the packing rings in to the packing box. Install rings in to the box in this order. P = Packing Ring, L = Lantern Ring
    a. Clean service operating on a suction lift: 2P-L-3P
    b. Clean service operating with a flooded suction: 2P-L-3P
    c. Clean service with >2 barg (30psig) suction pressure: 3P-L-2P or 6P
    d. Dirty service operating on a suction lift to <4barg (60psig): 3P-L-2P
    e. Dirty service with >4 barg (60psig) suction pressure: *Packing Not Recommended*
4. The split gland [4120] is an assembly of two matched gland halves. Install the gland halves around the shaft. Bolt the halves together using (2) cap screws [6570.10] to form a gland assembly.
5. Attached the gland assembly [4120] using studs [6572.2], washers [2905] and gland nuts [6580.2].
6. Lightly snug up the gland nuts. Final adjustments must be made after the pump has begun operation. See Section 3.5.3.1 Seal/packing support system, for final adjustment procedures.

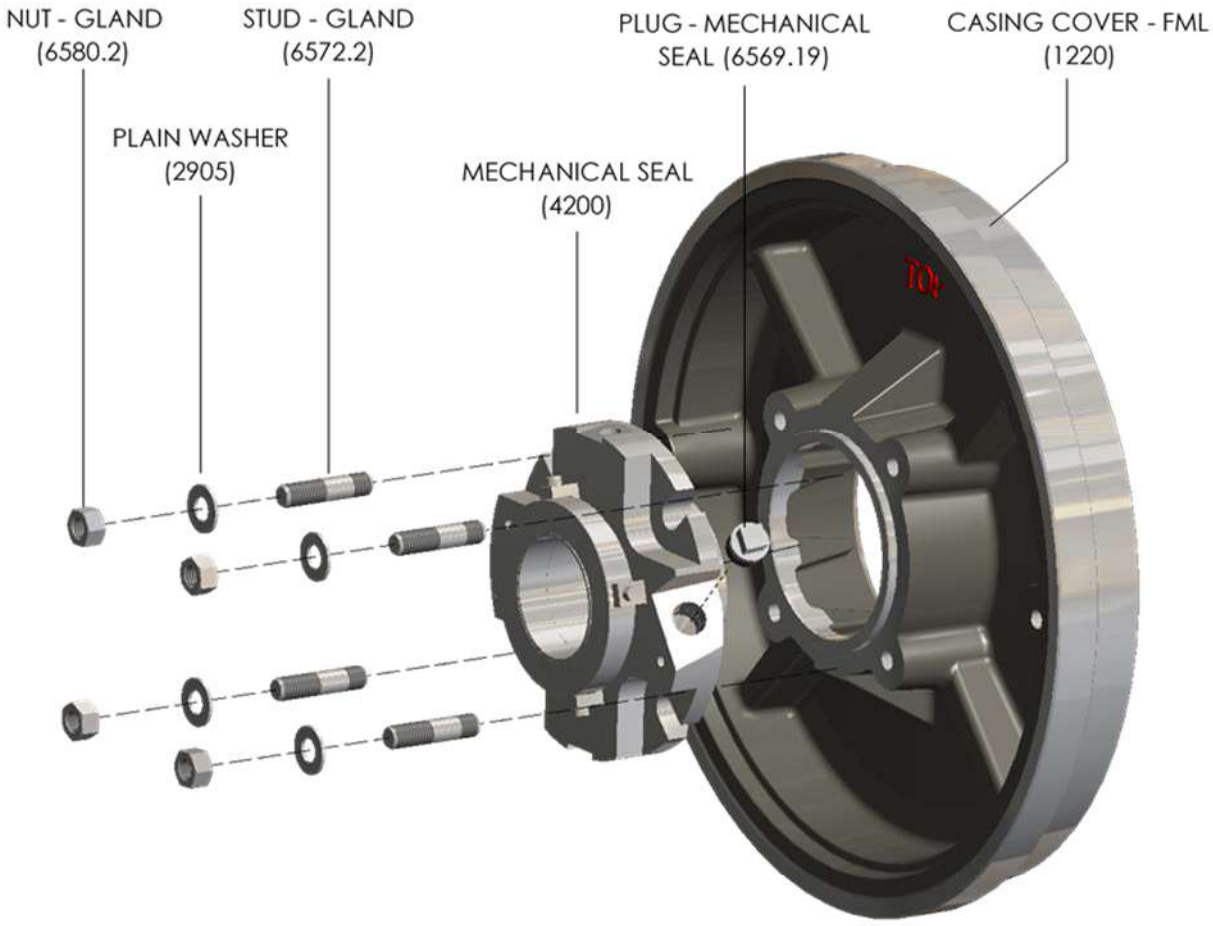

Figure 49: FML Cover with Cartridge Seal

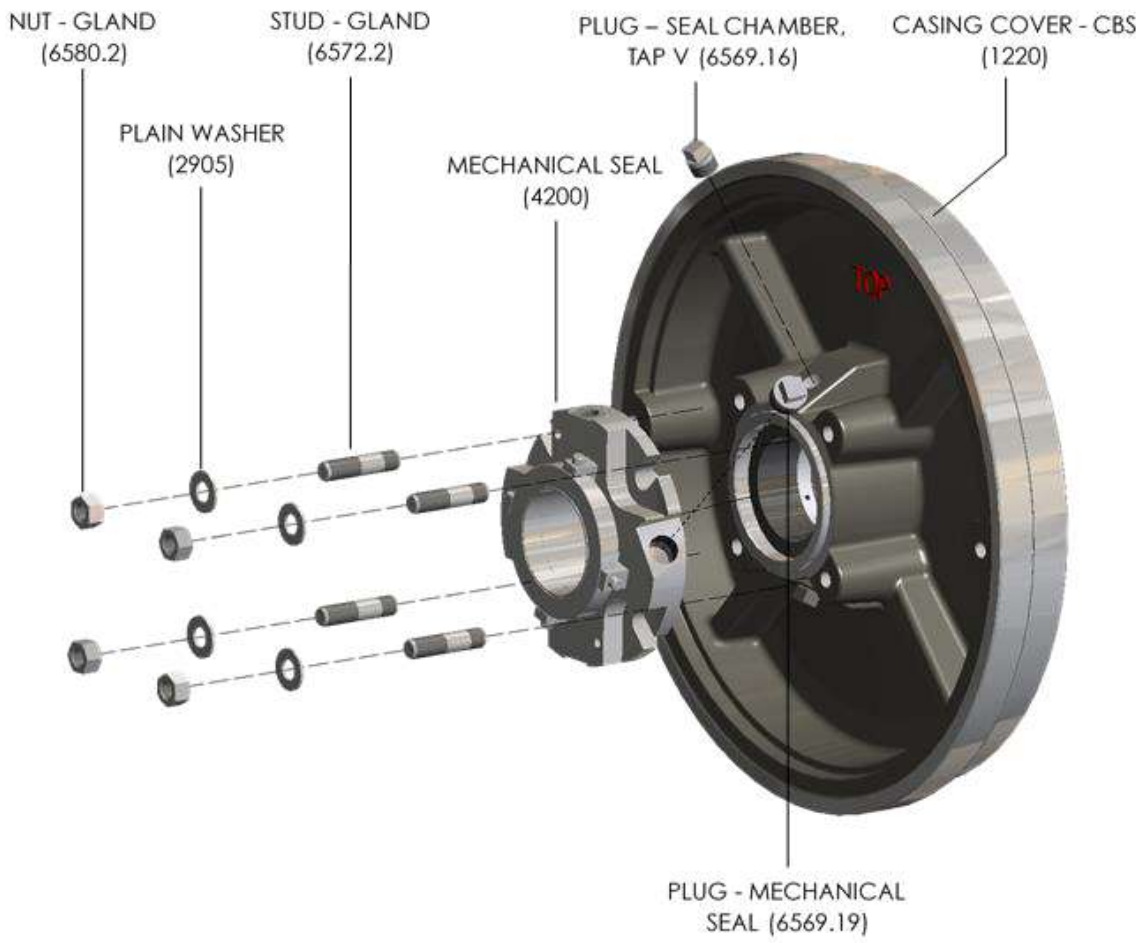

Figure 50: CBS Cover with Cartridge Seal

8.8.3 Setting impeller clearance and impeller replacement

A new impeller O-ring [4610.1] and impeller nut O-ring [4610.2] must be installed whenever the impeller has been removed from the shaft. Impeller clearance settings may be found in Section 5.3.3. Impeller balancing instruction may be found in Section 8.6.7.

Do not adjust the impeller clearance with the seal set. Doing so may result in seal leakage and/or damage. Hazardous material may be released.

CAUTION **The impeller could have sharp edges, which could cause injury. It is very important to wear heavy gloves**.

CAUTION **It is recommended that a crane and rigging or two people install a Group 4 impeller. Depending on pump size and trim, impeller weight is 32-77 kg (70-170 lbs).**

8.8.3.1 Removal of Impeller

Follow the steps below to properly remove impeller, refer to Figure 51. For lifting techniques see section 4.4.1, *Lifting pump components*.

1. Ensure that pump casing [1100] is removed.
2. Place power end with assembly fastened on a level work surface, by the foot [3134].
3. Place the impeller wrench supplied in the Mark 3 Group 4 tool kit on the shaft [2100] with the shaft key [6700.2].
4. Turn the impeller wrench clockwise until impeller wrench handle touches the work surface.
5. Remove the impeller nut [2912] by rotating counter clockwise using an impact wrench.
6. Discard impeller nut O-ring [4610.2]
7. Secure impeller with suitable clamp. Remove impeller and impeller key [6700.1] from the shaft. Refer to Section 4.4.1.3 Impeller [2200] for lifting instructions.
8. Discard impeller O-ring [4610.1].
9.

Figure 51: Removing Impeller

8.8.3.2 Installing new impeller

NOTICE Ensure Back Pullout Assembly, Figure 48, is properly installed up to the Cover [1220]

1. Start the impeller [2200] installation by placing impeller wrench onto the shaft with shaft key.
2. Turn impeller wrench clockwise until impeller wrench touches the work station.
3. Add new impeller O-ring [4610.1].
4. Place impeller key in slot between shaft and impeller.
5. Slide impeller onto the shaft. Ensure the impeller keyway is aligned with impeller key.
6. Install a new impeller nut O-ring [4610.2] on the impeller nut [2912].
7. Lubricate the impeller nut threads. Hand tighten impeller nut.
8. Verify the impeller and impeller nut are fully seated and the O-Rings are not pinched.
9. Tighten the impeller nut to the torque value listed in *Table 21: Torque Requirements*. See Note 1

Figure 52: Installing Impeller

8.8.3.3 Installation and clearance setting for Reverse Vane (RV) Impellers

Flowserve reverse vane (RV) impellers are set off the cover. This allows the impeller to be set without the casing. Set the impeller clearance by loosening the set screws [6814] and rotating the bearing carrier [3240] to obtain the proper clearance. Turn the bearing carrier counter-clockwise until the impeller [2200] comes into light rubbing contact with the cover [1220]. Rotating the shaft at the same time will accurately determine this zero setting. Now, rotate the bearing carrier clockwise to get the proper clearance. Refer to Table 15: *Impeller Clearance Setting* for the impeller clearance based on the fluid operating temperature.

Rotating the bearing carrier one width of the indicator patterns cast into the bearing carrier moves the impeller axially 0.10 mm (0.004 in.). See Figure 53

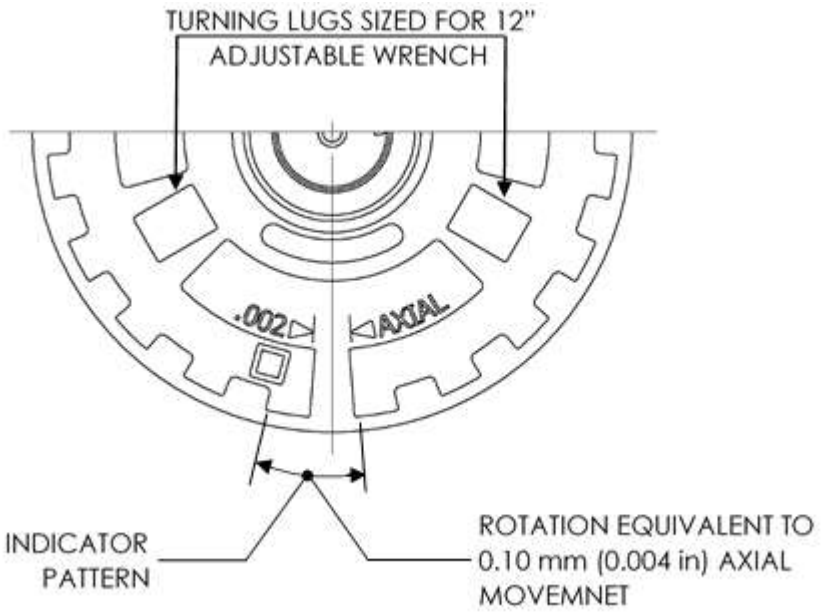

Figure 53: Bearing Carrier Indicator

Determine how far to rotate the bearing carrier by dividing the desired impeller clearance by 0.10 mm (0.004 in.) (one indicator pattern). Tightening the set screws [6814] will move the impeller 0.05 mm (0.002 in.) closer to the cover, due to the internal looseness in the bearing carrier threads. This must be considered when setting impeller clearance. Rotate the bearing carrier clockwise the required amount to obtain desired RV impeller clearance to the cover.

NOTICE After adjustment, uniformly tighten the (3) three set screws [6814] in incremental steps up to the final torque, value locking the bearing carrier in place. See Table 21: *Torque Requirements*

Figure 54: Bearing Carrier Markings

Example: When setting a pump with a RV impeller with an operating temperature of 100 ˚C (212 ˚F), the impeller setting the off the cover [1220] wear surface is 0.81 mm (0.032 in.), as shown in Table 15: *Impeller Clearance Setting*. To compensate for additional movement caused by tightening the set screws [6814], add 0.05 mm (0.002 in.) to the specified impeller clearance. Thus, an initial adjustment of 0.86 mm (0.034 in.) is needed.

First, turn the bearing carrier [3240] counter-clockwise until the impeller [2200] comes into light rubbing contact with the cover. Using a felt tip pen mark the initial reference point on the bearing housing [3200] and the bearing carrier, as shown in Figure 54. Then make mark a second mark on the bearing carrier the predetermined number of indicator patterns counter-clockwise from the initial reference point. Rotate the bearing carrier clockwise until the second mark aligns with the initial reference point on the bearing housing.

To complete the setting, lock the bearing carrier. Uniformly tighten the (3) three set screws [6814] in incremental steps up to the final torque. See Table 21: *Torque Requirements*

To determine the number of indicator patterns that you will need to rotate the carrier, divide 0.10 mm (0.004 in.) into the desired setting;

From above 0.86 mm / 0.10 mm or (0.034 in. / 0.004 in.) = 9.5 patterns, round up to the nearest half pattern if required. Rotate the bearing carrier clockwise 9.5 indicator patterns which results in a clearance of 0.81 mm (0.032 in.).

8.8.3.4 Installation and clearance setting for Semi-Open Vane (OP) Impellers

Like all semi-open style impellers, the Flowserve semi-open impeller clearance must be set off the casing. The casing must be installed to accurately set the impeller clearance. (Realizing that this can be difficult, Flowserve strongly promotes the use of reverse vane impellers, which do not require the presence of the casing to properly set.)

With the back pullout assembly installed in the casing [1100], See Section 8.8.4. Set the impeller clearance by loosening the set screws [6814] and rotating the bearing carrier [3240] to obtain the proper clearance. Turn the bearing carrier clockwise until the impeller [2200] comes into light rubbing contact with the casing [1100]. Rotating the shaft at the same time will assist in determine this zero setting. Now, rotate the bearing carrier clockwise to get the proper clearance. Refer to Table 15: *Impeller Clearance Setting* for the impeller clearance based on the fluid operating temperature.

Rotating the bearing carrier one width of the indicator patterns cast into the bearing carrier moves the impeller axially 0.10 mm (0.004 in.). See Figure 53

Determine how far to rotate the bearing carrier by dividing the desired impeller clearance by 0.10 mm (0.004 in.) (one indicator pattern). Tightening the set screws [6814] will move the impeller 0.05 mm (0.002 in.) closer to the cover [1240], due to the internal looseness in the bearing carrier threads. This must be considered when setting impeller clearance. Rotate the bearing carrier counter-clockwise the required amount to obtain the desired OP impeller clearance to the casing.

NOTICE After adjustment, uniformly tighten the (3) three set screws [6814] in incremental steps up to the final torque, value locking the bearing carrier in place. See Table 21: *Torque Requirements*

See section 5.3.3 for impeller clearance settings.

Example: When setting a pump with a OP impeller with an operating temperature of 150 ˚C (302 ˚F), the impeller setting the off the casing [1100] wear surface is 0.81 mm (0.032 in.), as shown in Table 15: *Impeller Clearance Setting*. To compensate for additional movement caused by tightening the set screws [6814], subtract 0.05 mm (0.002 in.) to the specified impeller clearance. Thus, an initial adjustment of 0.76 mm (0.030 in.) is needed.

First, turn the bearing carrier [3240] clockwise until the impeller [2200] comes into light rubbing contact with the casing. Using a felt tip pen mark the initial reference point on the bearing housing [3200] and the bearing carrier, as shown in Figure 54. Then make mark a second mark on the bearing carrier the predetermined number of indicator patterns clockwise from the initial reference point. Rotate the bearing carrier counter-clockwise until the second mark aligns with the initial reference point on the bearing housing.

To complete the setting, lock the bearing carrier. Uniformly tighten the (3) three set screws [6814] in incremental steps up to the final torque. See Table 21: *Torque Requirements*

To determine the number of indicator patterns that you will need to rotate the carrier, divide 0.10 mm (0.004 in.) into the desired setting;

From above 0.76 mm / 0.10 mm or (0.030 in. / 0.004 in.) = 8.5 patterns, round up to the nearest half pattern if required. Rotate the bearing carrier clockwise 8.5 indicator patterns which results in a clearance of 0.81 mm (0.032 in.).

8.8.3.5 Back pullout assembly clearance setting for Semi-Open Vane (OP) Impellers

The above procedure, 8.8.3.4 Installation and clearance setting for Semi-Open Vane (OP) Impellers, is straightforward when doing the final setting of the impeller. However, it can be quite laborious when servicing a back pullout assembly as a spare and performing the preliminary setting to establish the location of the mechanical seal. For this reason, the following practice is recommended. Before the pump is taken out of service, install the mechanical seal locking clips or tabs. Loosen the seal collar set screws. Adjust the impeller, by turning the bearing carrier clockwise, until it touches the casing. Then rotate the bearing carrier counter-clockwise until the desired impeller clearance is obtained. Identify this location on the bearing carrier and then continue rotating the bearing carrier counter-clockwise until the impeller contacts the cover. Record the distance from the desired impeller clearance setting to when the impeller contacts the cover. The pump (back pullout assembly) is now removed from the casing and taken to the shop for maintenance. When it is time to set the seal, the impeller is simply set off the cover by the same distance recorded earlier.

NOTICE The above technique is only applicable if all the original pump components are reinstalled. If the casing, cover, impeller or shaft is replaced, or casing gasket type changed this method must not be used.

8.8.4 Back pullout assembly installation in casing

1. Remove the adapter support screw [6570.7], not shown.
2. Install a new casing/cover gasket [4590.1] between the cover [1220] and casing [1100].
3. Lift the back pullout assembly in to the casing, See Section 4.4.1.6.
   The pump casing and bearing housing feet must be on the baseplate or a machined worktable to align the feet on the same plane, prior to final tightening of the casing fasteners.
4. Lightly snug all casing nuts [6580.1]. Check that feet are in plane. If a 0.05 mm (0.002 in.) thick shim cannot be slid under the bearing housing or casing feet, continue to Step 5.
5. If the shim can be slid under a foot, loosen the casing nuts and rotate the bearing housing to bring the bearing housing foot in to plate. Repeat Step 4.
6. Tighten the casing nuts in a Cross-Pattern in three increments of final the torque value shown in Table 21: *Torque Requirements*. 30%, 60% and 100% of final torque.
7. Place the coupling key [6700.2] in the shaft [2100] keyway. Apply tape around the shaft and key. This will retain the key until the coupling is install.
8. The pump assembly is now complete. The (optional) IPS Beacon™ 2 [9050] can now be installed. A plastic thread protector or screw may be in the Beacon mounting threads. Remove if either is present. Attach the Beacon with button socket head cap screw [6570.8] and lock washer [6541.2]. Torque to value show in Table 21: *Torque Requirements*. See Figure 56

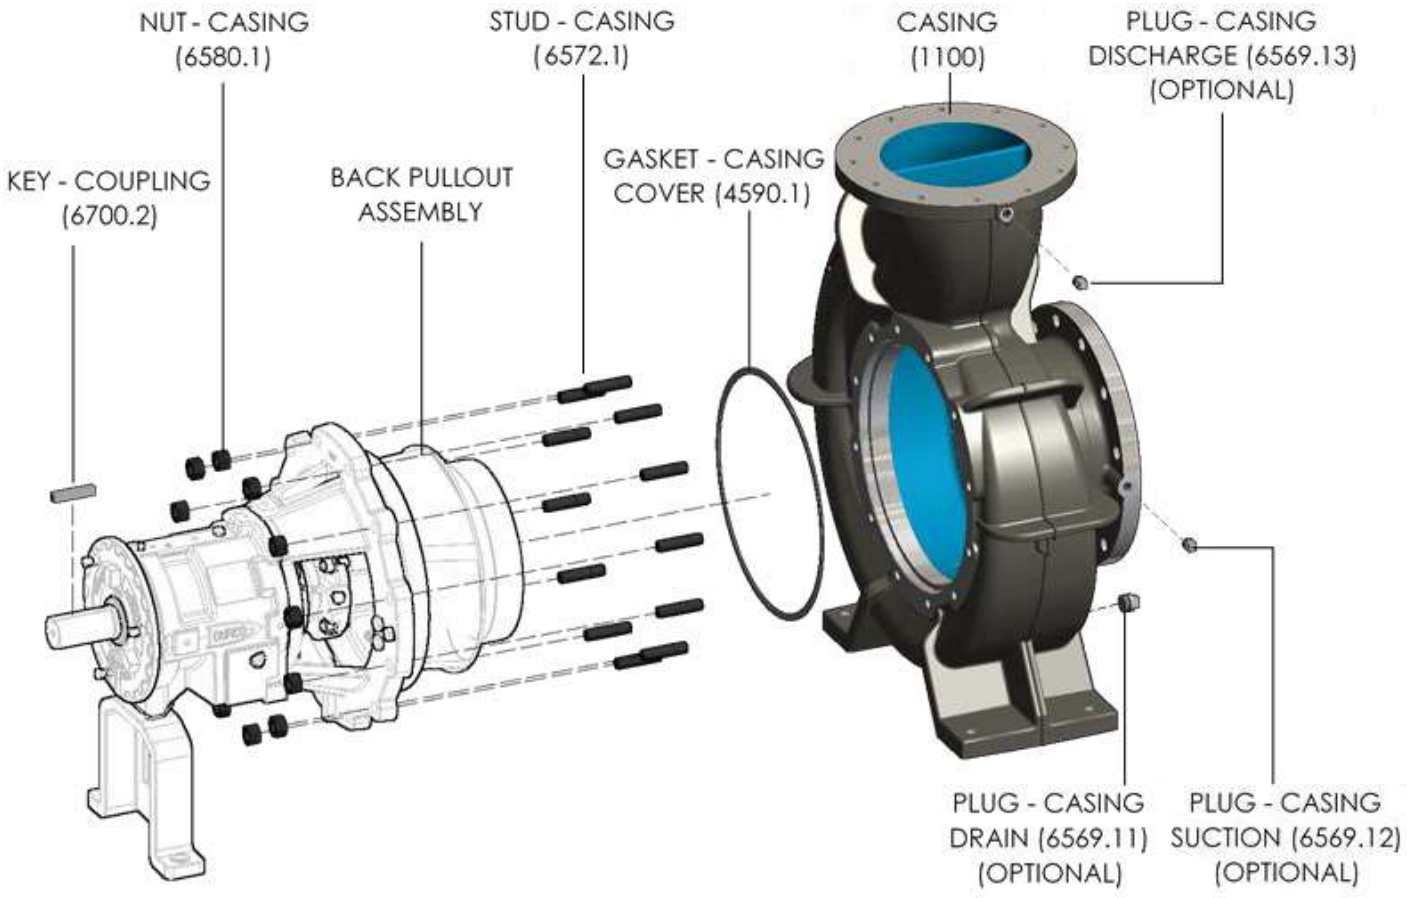

Figure 55: Final Pump Assembly

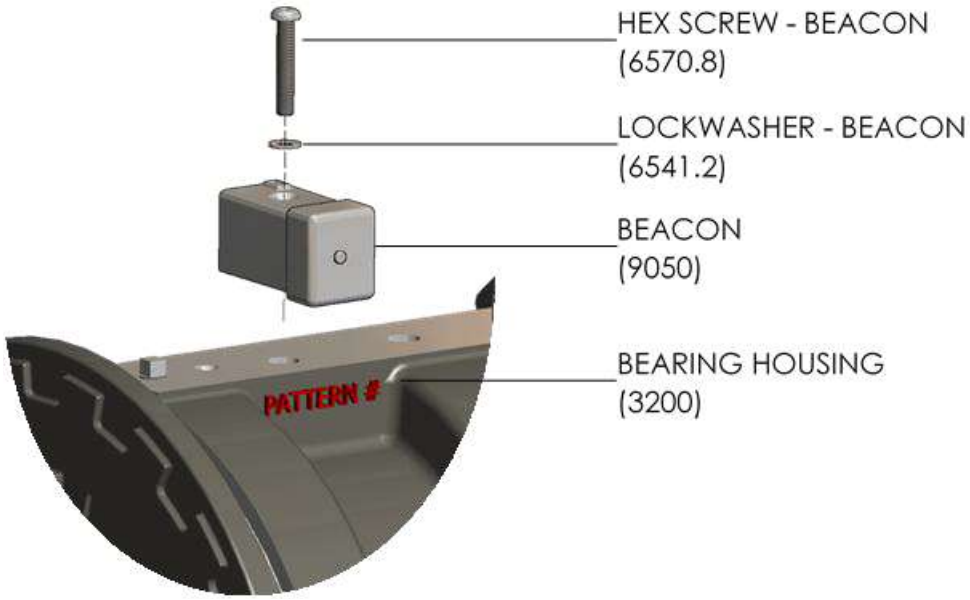

Figure 56: Beacon Assembly (Optional)

8.9 Post maintenance inspection

It is recommended that a maintenance plan and schedule be implemented, in accordance with these User Instructions, to include the following:

1. Any auxiliary systems installed must be monitored, if necessary, to ensure they function correctly.
2. Gland packing must be adjusted correctly to give visible leakage and concentric alignment of the gland follower to prevent excessive temperature of the packing or follower.
3. Check for any leaks from gaskets and seals. The correct functioning of the shaft seal must be checked regularly.
4. Check bearing lubricant level, and the remaining hours before a lubricant change is required.
5. Check that the duty conditions are in the safe operating range for the pump.
6. Check vibration, noise level and surface temperature at the bearings to confirm satisfactory operation.
7. Check dirt and dust is removed from areas around close clearances, bearings housings and motors.
8. Check coupling alignment and re-align if necessary.

See Section 6 *Commissioning*, for pre-commissioning procedures.

8.10 Spare parts stocking recommendation

The decision on what spare parts to stock varies greatly depending on many factors such as the criticality of the application, the time required to buy and receive new spares, the erosive/corrosive nature of the application, and the cost of the spare part. Section 8.5 identifies all of the components that make up each pump addressed in this manual.

Recommended spares are defined on the following basis:

- Class 1 – Start-up and commissioning spares
- Class 2 – Two-year spares requirements covering maintenance for this period
- Class 3 – Capital spares requirements

Flowserve keeps records of all pumps that have been supplied. Spare parts can be ordered from your local Flowserve sales engineer or from a Flowserve distributor or representative.

When ordering spare parts, the following information should be provided to Flowserve:

1. Pump serial number
2. Pump size and type
3. Part name – taken from the parts list/sectional drawing
4. Part item number – taken from the parts list/sectional drawing
5. Material of construction (alloy)
6. Number of parts required
7. Part number – taken from the parts list/sectional drawing*

*If an as built sectional drawing is available, provide sectional drawing number. Or if taken from an existing part.

The product size and serial number are provided on the nameplate.

SAFETY INSTRUCTIONS

To ensure continued satisfactory operation, replacement parts to the original design specification should be obtained from Flowserve. Any change to the original design specification (modification or use of non-standard part) will invalidate the product safety certification.

8.10.1 Spare parts per pump

The following spare parts are recommended for an individual pump installation. Were a population of identical pumps or a family of pumps utilizing the same power end exist, Section 8.10.2 applies.

Table 27: Recommended Spares & Consumable Items (Individual Pump)

Commissioning Spares (Class 1)	Two Years Operational Spares (Class 2)	Five Years Operational Spares (Class 3)	Part Description	
			Sleeved Shaft & Solid Shaft	
			Labyrinth Oil Seal	
			Description	Item
1	1	2	O-Ring – Impeller	4610.1
1	1	2	O-Ring – Impeller Nut	4610.2
N/A	2	4	O-Ring – Bearing Carrier	4610.3
N/A	2	4	O-Ring – sleeve	4610.4
N/A	N/A	1	Impeller	2200
N/A	N/A	1*	Casing Cover	1220
1	1	2	Gasket – Casing/Cover	4590.1
N/A	1	2	Radial Bearing	3011
N/A	1	2	Thrust Bearing	3013
N/A	1	2	Locknut -Shaft	3712
N/A	1	2	Lock Washer -Shaft	6541.1
N/A	1	2	Bearing Isolator – Outboard	4330.1
N/A	1	2	Bearing Isolator – Inboard	4330.2
N/A	1	2	Key - Impeller	6700.1
N/A	1	2	Key - Coupling	6700.2
N/A	N/A	1	Sleeve (if fitted)	2400
N/A	N/A	1	Shaft	2100

* abrasive service with an RV impeller

8.10.2 Spare parts per pump

The following spare parts are recommended with an installation population of identical pumps or a family of pumps utilizing the same power end exist.

Table 28: Recommended Spares & Consumable Items (Multiple identical pumps)

Item	Designation	Number of Pumps (including stand-by)						
		2	**3**	**4**	**5**	**6/7**	**8/9**	**10(+)**
2200	Impeller	1			2		3	30%
2400	Sleeve (if fitted)	2			3		4	50%
2912	Impeller nut	1		2			3	30%
2100	Shaft	1		2			3	30%
3712	Locknut - Shaft	1		2		3	4	50%
6541.1	Lock Washer - Shaft	1		2		3	4	50%
3011	Radial Bearing	1		2		3	4	50%
3013	Thrust Bearing**	1		2		3	4	50%
4590.1	Gasket – Casing/Cover	4	6	8		9	12	150%
4610.1	O-Ring – Impeller	4	6	8		9	12	150%
4610.2	O-Ring – Impeller Nut	4	6	8		9	12	100%
4610.4	O-Ring - Sleeve (if fitted)	2		3			4	50%
4610.3	O-Ring – Bearing Carrier	4	6	8		9	12	150%
4330.1 / 4330.2	Bearing Isolators	1	2			3		30%
4130	Gland Packing*	2		3			4	40%
4134	Lantern Ring	1	2			3		30%
4200	Mechanical Seal	1	2			3		30%
-	Power end	-	-	-	-	-	1	2
6700.1	Key – Impeller	1		2			3	30%
6700.2	Key - Coupling	1		2			3	30%

*Full set of packing is (3) rings

**The duplex Thrust Bearing requires (2) two bearings for a complete assembly

9 Troubleshooting Guide

The following is a guide to troubleshooting problems with Flowserve Mark 3 pumps. Common problems are analysed and solutions offered. Obviously, it is impossible to cover every possible scenario. If a problem exists that is not covered by one of the examples, then refer to one of the books listed in Annex C "Additional Sources of Information" or contact a Flowserve sales engineer or distributor/representative for assistance.

Table 29: Trouble Shooting Recommendations

Pump not reaching design flow rate								
⇓	Pump not reaching design head (TDH)							
	⇓	No discharge or flow with pump running						
		⇓	Pump operates for short period, then loses prime					
			⇓	Excessive noise from wet end				
				⇓	Excessive noise from power end			
					⇓			
						⇓	**Possible Causes**	**Possible Remedies**
●	●		●	●			Insufficient NPSH. (Noise may not be present).	Recalculate NPSH available. It must be greater than the NPSH required by pump at desired flow. If not, redesign suction piping, holding number of elbows and number of plans to a minimum to avoid adverse flow rotation as it approaches the impeller.
●	●	●					System friction head greater than anticipated.	Reduce system head by increasing pipe size and/or reducing number of fittings. Increase impeller diameter. (note: Increasing impeller diameter may require use of a larger motor.)
●	●		●				Entrained air. Air leak from atmosphere on suction side	1. Check suction line gaskets and threads for tightness. 2. If vortex formation is observed in suction tank, install vortex breaker. 3. Check for minimum submergence
●	●						Entrained gas from process	Process generated gases may require larger pumps.
●	●						Speed to slow	Check motor speed against design speed.
●	●	●					Direction of rotation wrong	After confirming wrong rotation, reverse any two of the three leads on the three phase motor. The pump should be disassembled and inspected before it is restarted.
●	●						Impeller too small	Replace with proper diameter impeller. (NOTE: Increasing impeller diameter may require use of a larger motor.)
●	●						Impeller clearance too large	Reset impeller clearance.
●	●	●					Plugged impeller, suction line or casing which may be due to a product or larger solids.	1. Reduce length of fiber when possible. 2. Reduce solids in the process fluid when possible. 3. Consider larger pump.
●	●						Wet end parts (casing cover, impeller) worn, corroded or missing.	Replace part or parts.

Pump not reaching design flow rate								
⇓	Pump not reaching design head (TDH)							
	⇓	No discharge or flow with pump running						
		⇓	Pump operates for short period, then loses prime					
			⇓	Excessive noise from wet end				
				⇓	Excessive noise from power end			
					⇓			
						⇓	**Possible Causes**	**Possible Remedies**
	●	●					Not properly primed.	Repeat priming operation, recheck instructions. If pump has run dry, disassemble and inspect the pump before operation.
●	●			●			Impeller rubbing.	1. Check and reset impeller clearance. 2. Check outboard bearing assembly for axial end play. 3. Pump running outside of the Allowable Operating Range AOR. Check flow.
	●	●					Damaged pump shaft, impeller.	Replace damage parts.
				●			Abnormal fluid rotation due to complex suction piping.	1. Redesign suction piping, holding the number of elbows and planes to a minimum to avoid adverse fluid rotation as it approaches the impeller. 2. Add cruciform to the suction piping.
					●		Bearing contamination appearing on raceways as scoring, pitting, scratching or rusting caused by adverse environment and entrance of abrasive contaminants from atmosphere.	3. Work with clean tools in clean surroundings. 4. Remove all outside dirt from housing before exposing bearings. 5. Handle with clean dry hands. 6. Treat a used bearing as carefully as a new one. 7. Use clean solvent and flushing oil. 8. Protect disassembled bearing from dirt and moisture. 9. Keep bearings wrapped in paper or clean cloth while not in use. 10. Clean inside of housing before replacing bearings. 11. Check oil seals and replace as required. 12. Check all plugs and tapped openings to make sure that they are tight.
					●		Brinelling of bearing identified by indentation on the ball races, usually caused by incorrectly applied forces in assembling the bearing or by shock loading such as hitting the bearing or drive shaft with a hammer.	When mounting the bearing on the drive shaft use a proper size ring and apply the pressure against the inner ring only. Be sure when mounting a bearing to apply the mounting pressure slowly and evenly.
					●		False brinelling of bearing identified again by either axial or circumferential indentations usually caused by vibration of the balls between the races in a stationary bearing.	1. Correct the source of vibration. 2. Where bearings are oil lubricated and employed in units that may be out of service for extended periods, the drive shaft should be turned over periodically to relubricate all bearings surfaces at intervals of one to three months.
					●		Thrust overload on bearings identified by flaking ball path on one side of the outer race or in the case of maximum capacity bearings, may appear as a spalling of the races in the vicinity of the loading slot. (Please note: Maximum capacity bearings are not recommended in Mark 3 pumps.) These thrust failures are caused by improper mounting of the bearing or excessive thrust loads.	1. Check the SG of the fluid pump 2. Check the suction pressure 3. Pump running outside of the Allowable Operating Range AOR. Check flow. 4. Follow the correct mounting procedures for the bearing.

Pump not reaching design flow rate								
⇓	Pump not reaching design head (TDH)							
	⇓	No discharge or flow with pump running						
		⇓	Pump operates for short period, then loses prime					
			⇓	Excessive noise from wet end				
				⇓	Excessive noise from power end			
					⇓			
						⇓	**Possible Causes**	**Possible Remedies**
					●		Misalignment identified by fracture of ball retainer or a wide ball path on the inner race and a narrower cocked ball path on the outer race. Misalignment is caused by poor mounting practices or defective drive shaft. For example, bearing not square with the centerline or possibly a bent shaft due to improper handling.	Handle parts carefully and follow recommended mounting procedures. Check all parts for proper fit and alignment.
					●		Bearing damaged by electric arcing identified as electro-etching of both inner and outer ring as a pitting or cratering. Electrical arcing is caused by a static electrical charge emanating from belt drives, electrical leakage or short circuiting.	1. Where current shunting through the bearing cannot be corrected, a shunt in the form of a slip ring assembly should be incorporated. 2. Check all wiring, insulation and rotor windings to be sure that they are sound and all connections are properly made. 3. Where pumps are belt driven, consider the elimination of static charges by proper grounding or consider belt material that is less generative.
					●		Bearing damage due to improper lubrication, identified by one or more of the following: 1. Abnormal bearing temperature rise. 2. A stiff cracked grease appearance. 3. A brown or bluish discoloration of the bearing races.	1. Be sure the lubrication is clean. 2. Be sure proper amount of lubricant is used. The constant level oiler supplied with Durco pumps will maintain the proper oil level if lubricated bearings, be sure that there is space adjacent to the bearing into which it can rid itself of excessive lubricant, otherwise the bearing may overheat and fail prematurely 3. Be sure the proper grade of lubricant is used.

10 Decommissioning and Recommissioning

10.1 Decommissioning

Ensure all liquids are removed from the pump as followed:

1. Drain pump
2. Drain seal systems
3. Drain oil and or remove grease

After liquid has been drained follow long term storage procedures

10.2 Recommissioning

For products stored for 6 months follow short term Storage procedures, section 4.5.1, for more than 6 months follow Long term procedures, section 4.5.2.

See Section 6 for commissioning & Section 7 for Operations

11 Returns and Disposal

11.1 Returns

The product/system shall be emptied, cleaned, and preserved before returning the equipment to the manufacturer. The manufacturer will only open the returned equipment if the contamination declaration is present.

(Note: the terms and conditions associated with returning a product/system shall be addressed within the purchasing agreement or contract, and not part of the User Instruction.)

NOTICE

Contact Flowserve for return authorization. Any goods received without prior written authorization and proper documentation upon receipt will be return to the sender.

11.2 Disposal and recycling

At the end of the equipment service life of the product or its parts, the relevant materials and parts should be recycled or disposed of using local environmental regulation methods. If the product contains substances which are harmful to the environment, then the removal or disposal of the equipment must be in accordance with local/regional regulations. This includes any liquid and/or gas in the "seal system" or other utilities.

Refer to Safety Data Sheets and make sure that hazardous substances or toxic fluids are disposed of safely and that the correct personal protective equipment is used. All activities involving hazardous substances or toxic fluids must be in compliance with published safety standards.

12 Technical Data

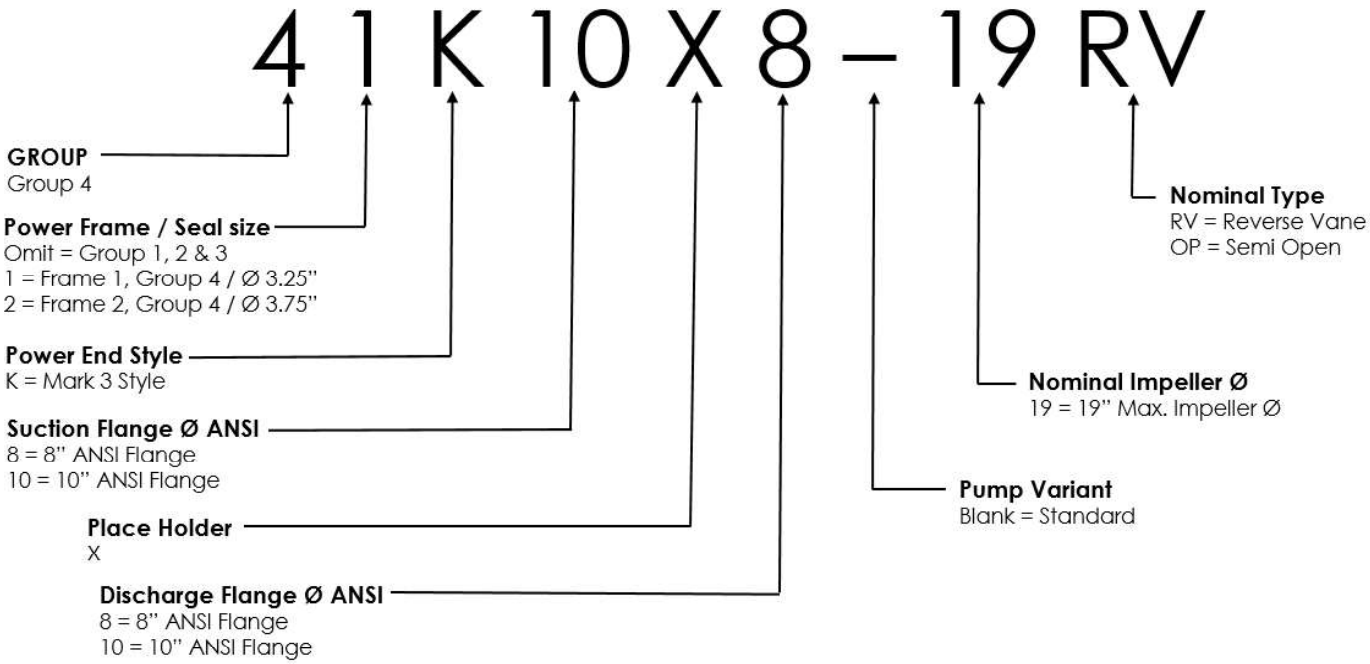
12.1 Equipment dimensions and weights

Table 30: *Pump Weight* shows the approximant weights for Mark 3 Group 4 pump sizes. For the exact dimensions and weights of the product ordered, refer to the General Arrangement drawing included upon receiving the product.

Table 30: Pump Weight

Frame	Pump size	Impeller Dia. "Approx." Pump Weight kg (lb)
41K	12X10-16	605 (1325)
	14X14-16	715 (1570)
	8X4-19	450 (990)
	8X6-19	465 (1015)
	10X6-19	525 (1150)
	12X10-19	645 (1415)
	14X12-19	740 (1625)
42K	10X8-19	600 (1320)
	16X16-19	950 (2080)
	12X8-22	720 (1580)
	12X10-22	785 (1720)
	14X12-22	895 (1960)
	16X14-22	1040 (2280)

12.2 Nameplate



An example of the name plate is shown in Figure 57. For more details on nameplate, see the Declaration of Conformity or separate documentation included with these User Instructions.

Figure 57: Nameplate

12.2.1 Nomenclature

The pump size will be engraved on the nameplate typically as shown below. See section 12.2, Nameplate.

12.3 Operating limits

Refer to Section 7.2 for operating limits.

12.4 Torque requirements

Refer to Section 8.5, Table 21: *Torque Requirements*, for torque values.

12.5 Noise level

Attention must be given to the exposure of personnel to the noise. Local legislation will define when guidance to personnel on noise limitation is required, and when noise exposure reduction is mandatory. This is typically 80 to 85 dBA.

The usual approach is to control the exposure time to the noise or to enclose the machine to reduce emitted sound. The customer may have already specified a limiting noise level when the equipment was ordered, however if no noise requirements were defined, then attention is drawn to the following table to give an indication of equipment noise level so that the end-user can take the appropriate action in the plant, or site of operation.

Pump noise level is dependent on a number of operational factors, flow rate, pipework design and acoustic characteristics of the building, and so the values given are subject to a 3 dBA tolerance and cannot be guaranteed.

Similarly, the motor noise assumed in the "pump and motor" is that typically expected from standard and high efficiency motors when on load directly driving the pump. Note that a motor driven by an inverter may show an increased noise at some speeds.

If a pump unit only has been purchased for fitting with your own driver, then the "pump only" noise levels in the table should be combined with the level for the driver obtained from the supplier. Consult Flowserve or a noise specialist if assistance is required in combining the values.

It is recommended that where exposure approaches the prescribed limit, then site noise measurements should be made.

The values are sound pressure level L_{pA} at 1 m (3.3 ft) from the machine, for "free field conditions over a reflecting plane".

For estimating sound power level L_{WA} (re 1 pW) then add 14 dBA to the sound pressure value.

Table 31: Noise Levels

Motor size and speed kW (hp)	Typical sound pressure level L_{pA} at 1 m reference 20 µPa, dBa											
	60 Hz						50 Hz					
	1 780 r/min		1 180 r/min		885 r/min		1 480 r/min		980 r/min		740 r/min

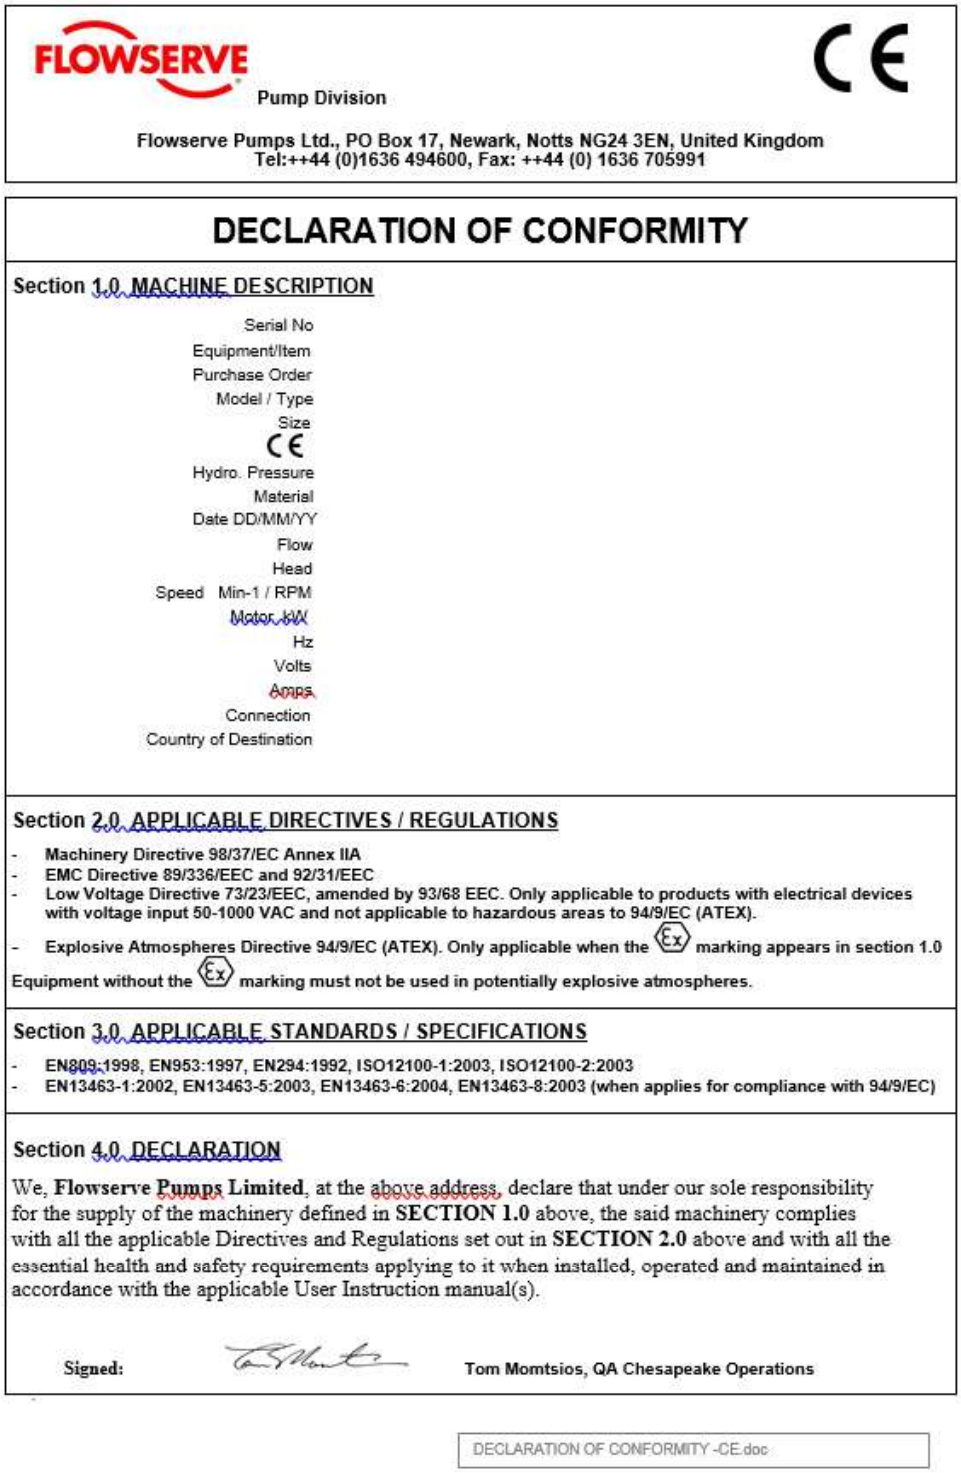
373 (500)	91	93	88	90	-	-	-	-	85	88	-	-
447 (600)	93	95	90	92	-	-	-	-	-	-	-	-
522 (700)	-	-	93	94	-	-	-	-	-	-	-	-

Notes:

1. Noise values provided are for reference and are not guaranteed
2. The suction and discharge piping has a significant impact on noise level
3. Noise levels provided are for clean water. Other fluids may impact noise levels
4. Motor driven by an inverter may show an increased noise at some speeds, up 15 dBa

12.6 Energy rating



The Mark 3 Group 4 is excluded from Title 10 Chapter II Subchapter D Part 431 Subpart Y-Pumps of the US Code of Federal Regulations (CFR)

The Department of Energy DOE Regulations Subpart Y applies to "Clean Water" pumps only. Excluded are:

1. Chemical process pump that meets the requirements of ANSI/ASME Standard B73.1–2012, "Specification for Horizontal End Suction Centrifugal Pumps for Chemical Process", and ANSI/ASME B73.2–2002, "Specifications for Vertical In-Line Centrifugal Pumps for Chemical Process"
2. International Organization for Standardization (ISO) 2858:1975, "End-suction centrifugal pumps (rating 16 bar) -- Designation, nominal duty point and dimensions" and ISO 5199:2002, "Technical specifications for centrifugal pumps -- Class II"

Annex A: Declaration of Conformity

If the product/system is being sold into a country which requires a Declaration of Conformity (DoC), an example of each DoC for the subject product/system must be included in this Annex.

Section 4.0 DECLARATION

We, **Flowserve Pumps Limited**, at the above address, declare that under our sole responsibility for the supply of the machinery defined in **SECTION 1.0** above, the said machinery complies with all the applicable Directives and Regulations set out in **SECTION 2.0** above and with all the essential health and safety requirements applying to it when installed, operated and maintained in accordance with the applicable User Instruction manual(s).

Signed: Tom Momtsios, QA Chesapeake Operations

DECLARATION OF CONFORMITY -CE.doc

Annex B: Technical Terms, Acronyms, and Abbreviations

1. Net positive suction head – available ($NPSH_A$)
    a. The measure of the energy in a liquid above the vapor pressure. It is used to determine the likelihood that a fluid will vaporize in the pump. It is critical because a centrifugal pump is designed to pump a liquid, not a vapor.
    b. Vaporization in a pump will result in damage to the pump, causing deterioration in Total Differential Head (TDH), vibration and possibly a complete stopping of pumping. Vaporization is synonymous with cavitation.
2. Net positive suction head – required ($NPSH_R$)
    a. The fluid energy decreases between the inlet of the pump, and the point of lowest pressure in the pump. This decrease occurs because of friction losses and fluid accelerations. The total energy (NPSH) in the fluid is typically the lowest as fluid enters the impeller vanes. $NPSH_R$ is the minimum required fluid energy need to maintain pumping.
    b. The value for $NPSH_R$ for the specific pump purchased is given in the pump data sheet, and on the pump performance curve. The value varies with flow.
    c. For a pump to operate properly the $NPSH_A$ must be greater than the $NPSH_R$. Good practice dictates that this margin is at minimum 1.5 m (5 ft) or 20%, whichever is greater.

    NOTICE Ensuring that $NPSH_A$ is larger than $NPSH_R$ by the suggested margin will greatly enhance pump performance, efficiency and reliability. It will also reduce the likelihood of cavitation, which can severely damage the pump.
3. Specific gravity (SG)
    a. Pump capacity and total head in meter (feet) of liquid do not change with SG, however pressure displayed on a pressure gauge is directly proportional to SG. Power absorbed is also directly proportional to SG. It is therefore important to check that any change in SG will not overload the pump driver or over pressurize the pump.
4. Viscosity
    a. For a given flow rate the total head reduces with increased viscosity. Also for a given flow rate the power absorbed increases with the increased viscosity, and reduces with reduced viscosity. Contact Flowserve if changes in viscosity are planned.
5. Pump speed
    a. Changing the pump speed affects flow, total head, power absorbed, $NPSH_R$, noise and vibration levels. Flow varies in direct proportion to pump speed. Head varies as the speed ratio squared. Power varies as speed ratio cubed. If increasing speed, it is important to ensure that maximum pump working pressure is not exceeded, the driver is not overloaded, $NPSH_A > NPSH_R$ and that noise and vibration are within local requirements and regulations.
6. Pumped flow
    a. Flow must not fall outside the minimum and maximum continuous safe flows shown on the pump performance curve and or data sheet. Operate the pump between Minimum Continuous Stable Flow MCSF and End of Curve EOC.

Annex C: Additional Sources of Information

Flowserve Corporation has established industry leadership in the design and manufacture of its products. When properly selected, this Flowserve product is designed to perform its intended function safely during its useful life. However, the purchaser or user of Flowserve products should be aware that Flowserve product might be used in numerous application under a wide variety of industrial service conditions. Although Flowserve can (and often does) provide general guidelines, it cannot provide specific data and warnings for all possible applications. The purchaser/user should read and understand the User Instructions: Installation Operation Maintenance included with the product, and train its employees and contractors in the safe use of Flowserve products in connection with its application

While the information and specifications contained in this literature are believed to be accurate, they are supplied for informative purpose only and should not be considered certified or as a guaranteed of satisfactory results by reliance thereon. Nothing contained herein is to be construed as a warranty or guarantee, express or implied, regarding any matter with respect to the product. Because Flowserve is continually improving and upgrading its product design, the specifications, dimensions and information contained herein are subject to change without notice. Should any question arise concerning these provisions, the purchaser/user should contact Flowserve Corporation at any one of its worldwide operations or offices.

INSTALLATION, OPERATION AND MAINTENANCE MANUAL OF ELECTRIC MOTORS

This manual provides information about WEG induction motors fitted with squirrel cage, permanent magnet or hybrid rotors, low, medium and high voltage, in frame sizes IEC 56 to 630 and NEMA 42 to 9606/10.
The motor lines indicated below have additional information that can be checked in their respective manuals:

- Smoke Extraction Motors;
- Electromagnetic Brake Motors;
- Hazardous Area Motors.

These motors meet the following standards, if applicable:

- NBR 17094-1: máquinas Elétricas Girantes - Motores de Indução - Parte 1: trifásicos
- NBR 17094-2: Máquinas Elétricas Girantes - Motores de Indução - Parte 2: monofásicos
- IEC 60034-1: Rotating Electrical Machines - Part 1: Rating and Performance
- NEMA MG 1: Motors and Generators
- CSA C 22.2 N°100: Motors and Generators
- UL 1004-1: Rotating Electrical Machines - General Requirements

If you have any questions regarding this manual please contact your local WEG branch, contact details can be found at www.weg.net.

1. TERMINOLOGY

Balancing: the procedure by which the mass distribution of a rotor is checked and, if necessary, adjusted to ensure that the residual unbalance or the vibration of the journals and/or forces on the bearings at a frequency corresponding to service speed are within specified limits in International Standards.
[ISO 1925:2001, definition 4.1]

Balance quality grade: indicates the peak velocity amplitude of vibration, given in mm/s, of a rotor running free-in-space and it is the product of a specific unbalance and the angular velocity of the rotor at maximum operating speed.

Grounded Part: metallic part connected to the grounding system.

Live Part: conductor or conductive part intended to be energized in normal operation, including a neutral conductor.

Authorized personnel: employee who has formal approval of the company.

Qualified personnel: employee who meets the following conditions simultaneously:
- Receives training under the guidance and responsibility of a qualified and authorized professional;
- Works under the responsibility of a qualified and approved professional.

Note*: The qualification is only valid for the company that trained the employee in the conditions set out by the authorized and qualified professional responsible for training.*

2. INITIAL RECOMMENDATIONS

Electric motors have energized circuits, exposed rotating parts and hot surfaces that may cause serious injury to people during normal operation. Therefore, it is recommended that transportation, storage, installation, operation and maintenance services are always performed by qualified personnel.
Also the applicable procedures and relevant standards of the country where the machine will be installed must be considered.
Noncompliance with the recommended procedures in this manual and other references on the WEG website may cause severe personal injuries and/or substantial property damage and may void the product warranty.

For practical reasons, it is not possible to include in this Manual detailed information that covers all construction variables nor covering all possible assembly, operation or maintenance alternatives.
This Manual contains only the required information that allows qualified and trained personnel to carry out their services. The product images are shown for illustrative purpose only.

For *Smoke Extraction Motors*, please refer to the additional instruction manual 50026367 available on the website www.weg.net.

For brake motors, please refer to the information contained in WEG 50006742 / 50021973 brake motor manual available on the website www.weg.net.

For information about permissible radial and axial shaft loads, please check the product technical catalogue.

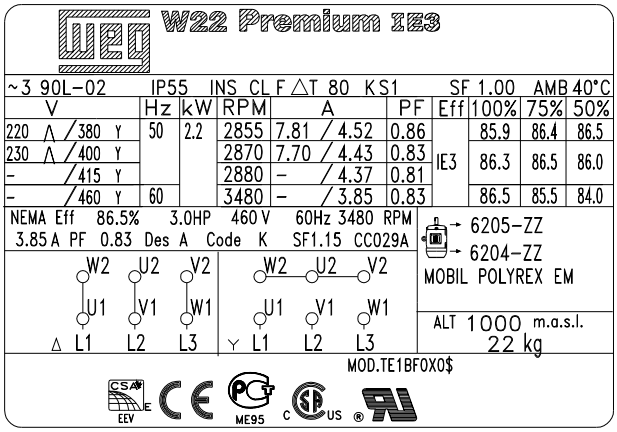
The user is responsible for the correct definition of the installation environment and application characteristics.

During the warranty period, all repair, overhaul and reclamation services must be carried out by WEG authorized Service Centers to maintain validity of the warranty.

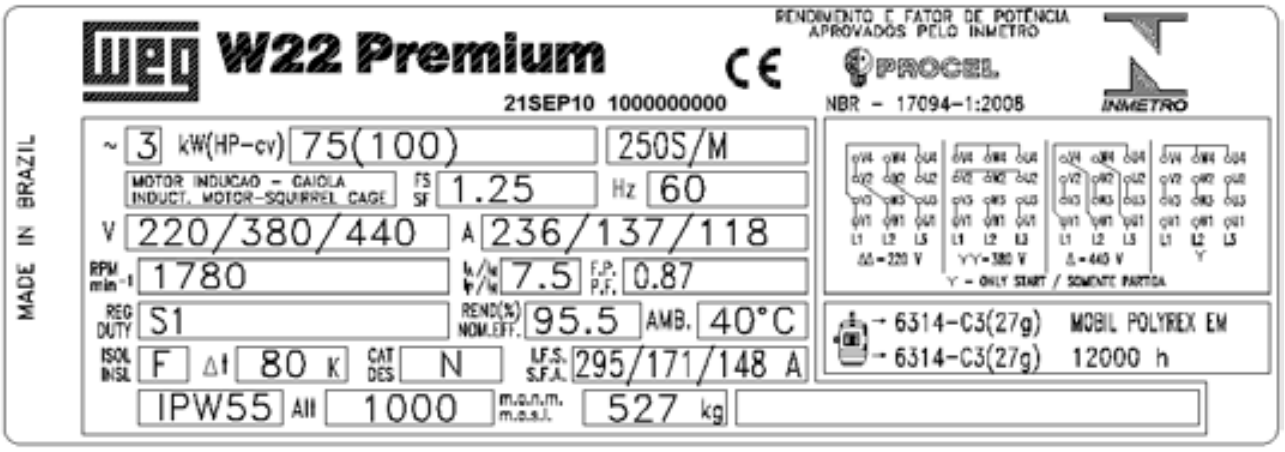
2.1. WARNING SYMBOL

Warning about safety and warranty.

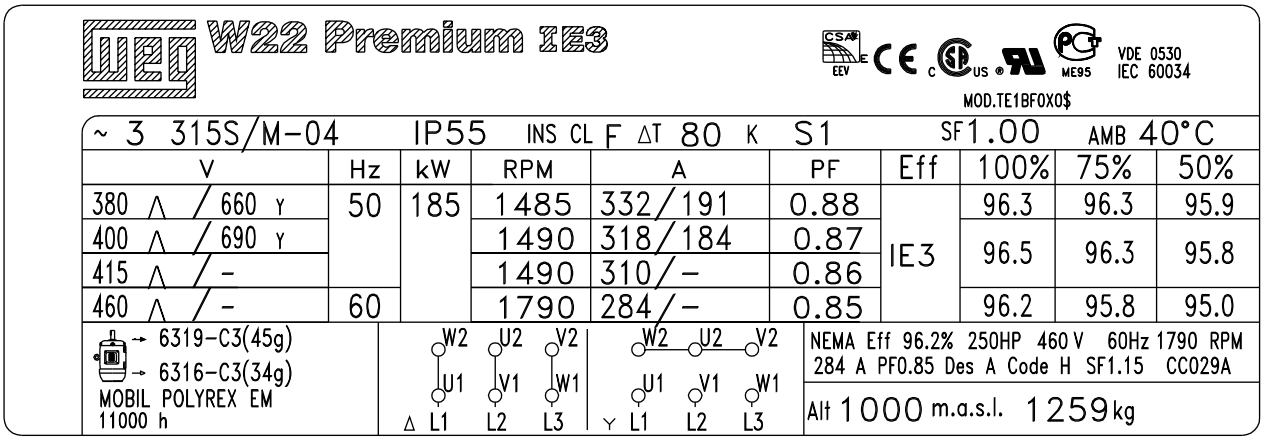
2.2. RECEIVING INSPECTION



All motors are tested during the manufacturing process.
The motor must be checked when received for any damage that may have occurred during the transportation. All damages must be reported in writing to the transportation company, to the insurance company and to WEG. Failure to comply with such procedures will void the product warranty.
You must inspect the product:
- Check if nameplate data complies with the purchase order;
- Remove the shaft locking device (if any) and rotate the shaft by hand to ensure that it rotates freely.
- Check that the motor has not been exposed to excessive dust and moisture during the transportation.

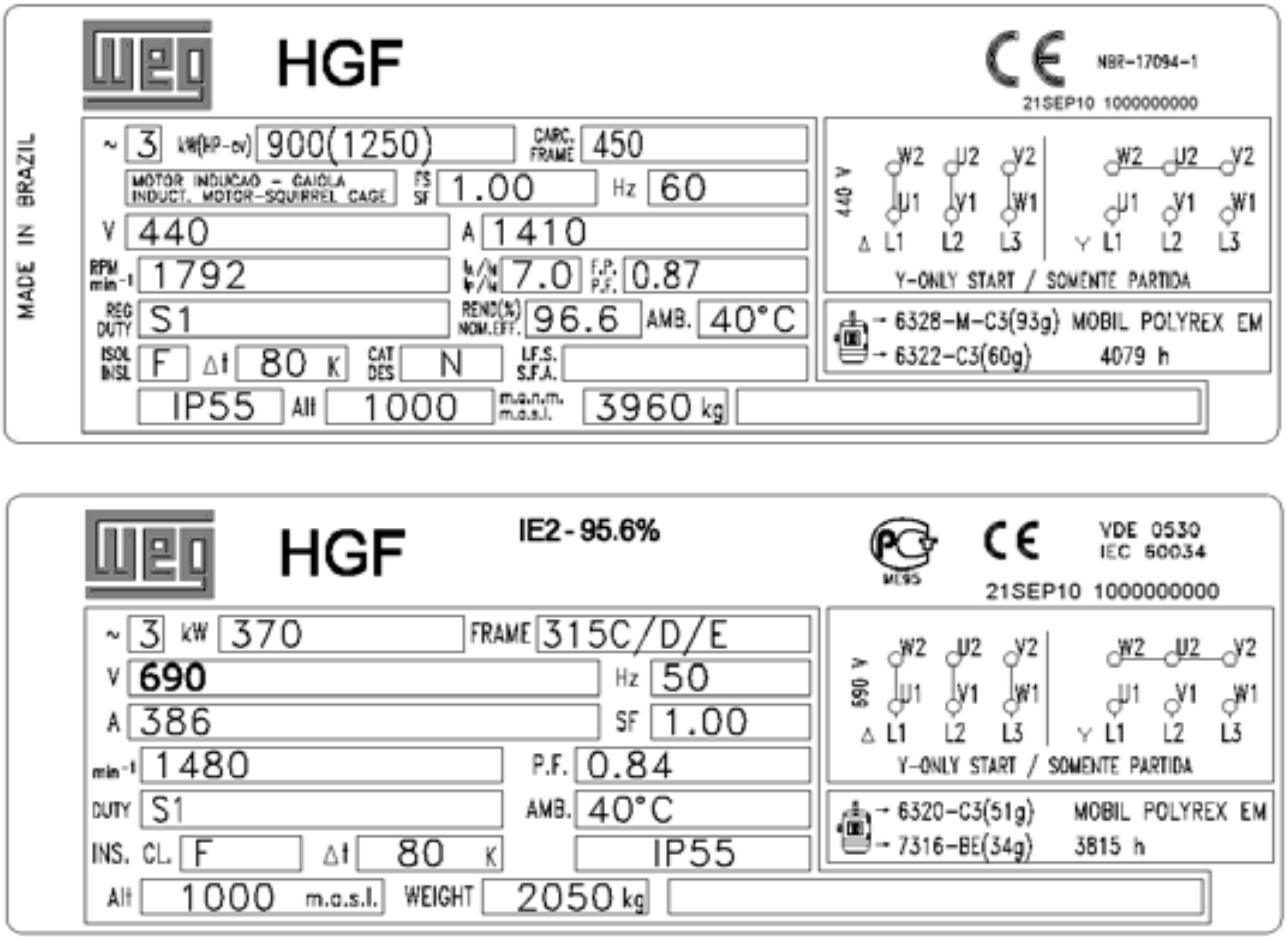


Do not remove the protective grease from the shaft, or the plugs from the cable entries. These protections must remain in place until the installation has been completed.



2.3. NAMEPLATES

The nameplate contains information that describes the construction characteristics and the performance of the motor. Figure 2.1 and Figure 2.2 show nameplate layout examples.



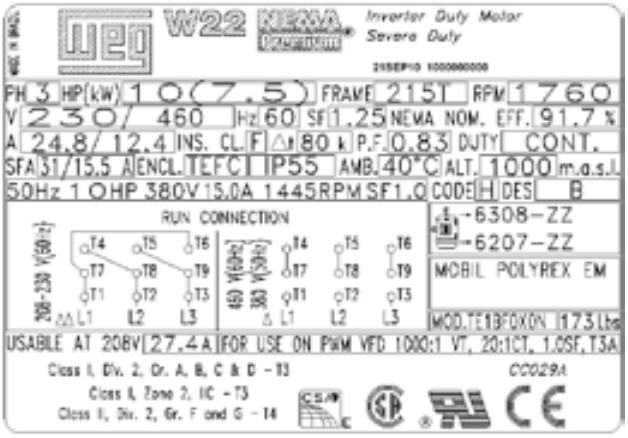


Figure 2.1 *- IEC motor nameplate.*

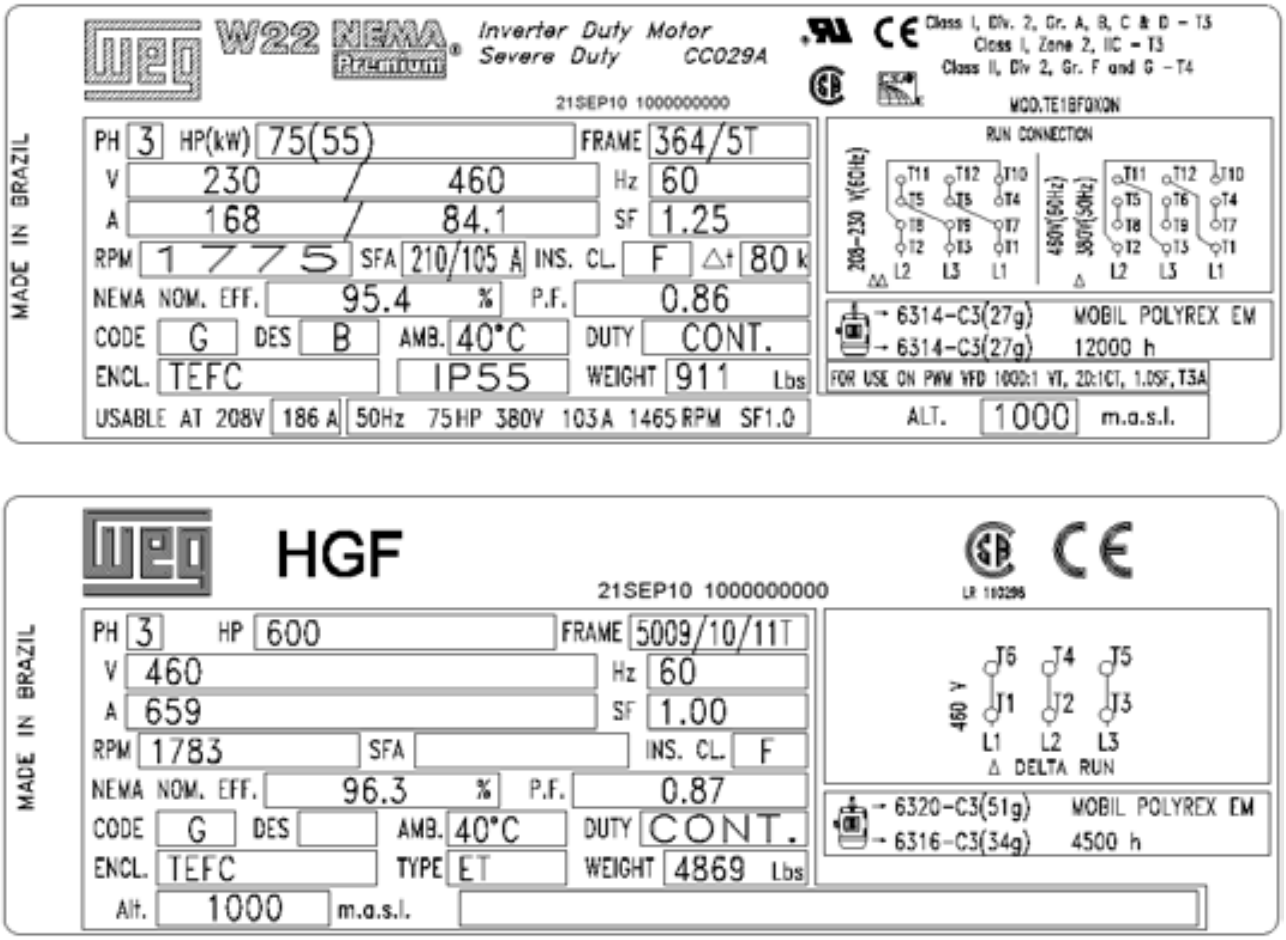

Figure 2.2 *- NEMA motor nameplate*

3. SAFETY INSTRUCTIONS

The motor must be disconnected from the power supply and be completely stopped before conducting any installation or maintenance procedures. Additional measures should be taken to avoid accidental motor starting.

Professionals working with electrical installations, either in the assembly, operation or maintenance, should use proper tools and be instructed on the application of standards and safety requirements, including the use of Personal Protective Equipment (PPE) that must be carefully observed in order to reduce risk of personal injury during these services.

Electric motors have energized circuits, exposed rotating parts and hot surfaces that may cause serious injury to people during normal operation. It is recommended that transportation, storage, installation, operation and maintenance services are always performed by qualified personnel.

Always follow the safety, installation, maintenance and inspection instructions in accordance with the applicable standards in each country.

4. HANDLING AND TRANSPORT

Individually packaged motors should never be lifted by the shaft or by the packaging. They must be lifted only by means of the eyebolts, when supplied. Use always suitable lifting devices to lift the motor. Eyebolts on the frame are designed for lifting the machine weight only as indicated on the motor nameplate. Motors supplied on pallets must be lifted by the pallet base with lifting devices fully supporting the motor weight.

The package should never be dropped. Handle it carefully to avoid bearing damage.

Eyebolts provided on the frame are designed for lifting the machine only. Do not use these eyebolts for lifting the motor with coupled equipment such as bases, pulleys, pumps, reducers, etc.

Never use damaged, bent or cracked eyebolts. Always check the eyebolt condition before lifting the motor.

Eyebolts mounted on components, such as on end shields, forced ventilation kits, etc. must be used for lifting these components only. Do not use them for lifting the complete machine set.

Handle the motor carefully without sudden impacts to avoid bearing damage and prevent excessive mechanical stresses on the eyebolts resulting in its rupture.

To move or transport motors with cylindrical roller bearings or angular contact ball bearings, use always the shaft locking device provided with the motor.
All HGF motors, regardless of bearing type, must be transported with shaft locking device fitted.

4.1. LIFTING

Before lifting the motor ensure that all eyebolts are tightened properly and the eyebolt shoulders are in contact with the base to be lifted, as shown in Figure 4.1. Figure 4.2 shows an incorrect tightening of the eyebolt.
Ensure that lifting machine has the required lifting capacity for the weight indicated on the motor nameplate.

Figure 4.1 *- Correct tightening of the eyebolt*

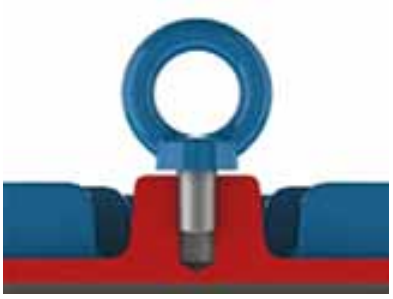

Figure 4.2 *- Incorrect tightening of the eyebolt.*

The center-of-gravity may change depending on motor design and accessories. During the lifting procedures the maximum allowed angle of inclination should never be exceeded as specified below.

4.1.1. Horizontal motors with one eyebolt

For horizontal motors fitted with only one eyebolt, the maximum allowed angle-of-inclination during the lifting process should not exceed 30° in relation to the vertical axis, as shown in Figure 4.3.

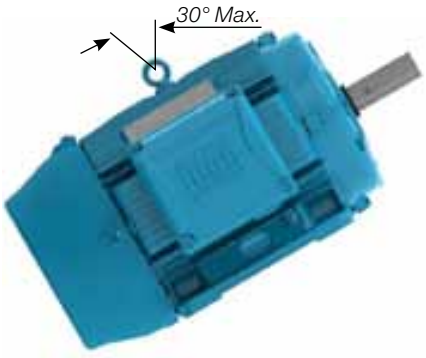

Figure 4.3 *- Maximum allowed angle-of-inclination for motor with one eyebolt.*

4.1.2. Horizontal motor with two eyebolts

When motors are fitted with two or more eyebolts, all supplied eyebolts must be used simultaneously for the lifting procedure.

There are two possible eyebolt arrangements (vertical and inclined), as shown below:

- For motors with vertical lifting eyebolts, as shown in Figure 4.4, the maximum allowed lifting angle should not exceed 45° in relation to the vertical axis. We recommend to use a spreader bar for maintaining the lifting elements (chain or rope) in vertical position and thus preventing damage to the motor surface.

Figure 4.4 *- Maximum resulting angle for motors with two or more lifting eyebolts.*

- For HGF motors, as shown in Figure 4.5, the maximum resulting angle should not exceed 30° in relation to the vertical axis.

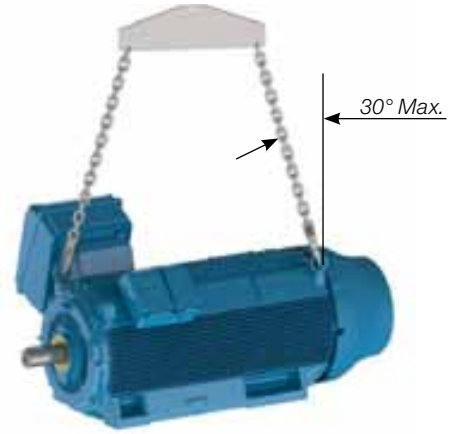

Figure 4.5 *- Maximum resulting angle for horizontal HGF motors*

- For motors fitted with inclined eyebolts, as shown in Figure 4.6, the use of a spreader bar is required for maintaining the lifting elements (chain or rope) in vertical position and thus preventing damage to the motor surface.

Figure 4.6 *- Use of a spreader bar for lifting.*

4.1.3. Vertical motors

For vertical mounted motors, as shown in Figure 4.7, the use of a spreader bar is required for maintaining the lifting element (chain or rope) in vertical position and thus preventing damage to the motor surface.

Figure 4.7 *- Lifting of vertical mounted motors.*

Always use the eyebolts mounted on the top side of the motor, diametrically opposite, considering the mounting position. See Figure 4.8.

Figure 4.8 *- Lifting of HGF motors.*

4.1.3.1. Procedures to place W22 motors in the vertical position

For safety reasons during the transport, vertical mounted Motors are usually packed and supplied in horizontal position.
To place W22 motors fitted with eyebolts (see Figure 4.6), to the vertical position, proceed as follows:

1. Ensure that the eyebolts are tightened properly, as shown in Figure 4.1;
2. Remove the motor from the packaging, using the top mounted eyebolts, as shown in Figure 4.9;

Figure 4.9 *- Removing the motor from the packaging.*

3. Install a second pair of eyebolts, as shown in Figure 4.10;

Figure 4.10 *- Installation of the second pair of eyebolts.*

4. Reduce the load on the first pair of eyebolts to start the motor rotation, as shown in Figure 4.11. This procedure must be carried out slowly and carefully.

Figure 4.11 *- End result: motor placed in vertical position.*

These procedures will help you to move motors designed for vertical mounting. These procedures are also used to place the motor from the horizontal position into the vertical position and vertical to horizontal.

4.1.3.2. Procedures to place HGF motors in the vertical position

HGF motors are fitted with eight lifting points: four at drive end and four at non-drive end. The HGF motors are usually transported in horizontal position, however for the installation they must be placed in the vertical position.
To place an HGF motor in the vertical position, proceed as follows:

1. Lift the motor by using the four lateral eyebolts and two hoists, see Figure 4.12;

Figure 4.12 *- Lifting HGF motor with two hoists.*

2. Lower the hoist fixed to motor drive end while lifting the hoist fixed to motor non-drive end until the motor reaches its equilibrium, see Figure 4.13.

Figure 4.13 *- Placing HGF motor in vertical position*

3. Remove the hoist hooks from the drive end eyebolts and rotate the motor 180° to fix the removed hooks into the two eyebolts at the motor non-drive end, see Figure 4.14.

Figure 4.14 *- Lifting HGF motors by the eyebolts at the non-drive end.*

4. Fix the removed hoist hooks in the other two eyebolts at the non-drive end and lift the motor until the vertical position is reached, see Figure 4.15.

Figure 4.15 *- HGF motor in the vertical position*

These procedures will help you to move motors designed for vertical mounting. These procedures are also used to place the motor from the horizontal position into the vertical position and vertical to horizontal.

4.2 Procedures to place W22 vertical mount motors in horizontal position

To place W22 vertical mount motor in horizontal position, proceed as follows:

1. Ensure that all eyebolts are tightened properly, as shown in Figure 4.1;

2. Install the first pair of eyebolts and lift the motor as shown in Figure 4.16;

Figure 4.16 - *Install the first pair of eyebolts*

3. Install the second pair of eyebolts, as shown in Figure 4.17;

Figure 4.17 - *Install the second pair of eyebolts*

4. Reduce the load on the first pair of eyebolts for rotating the motor, as shown in Figure 4.18. This procedure must be carried out slowly and carefully.

Figure 4.18 - *Motor is being rotated to horizontal position*

5. Remove the first pair of eyebolts, as shown in Figure 4.19.

Figure 4.19 - *Final result: motor placed in horizontal position*

5. STORAGE

If the motor is not installed immediately, it must be stored in a dry and clean environment, with relative humidity not exceeding 60%, with an ambient temperature between 5 ºC and 40 ºC, without sudden temperature changes, free of dust, vibrations, gases or corrosive agents. The motor must be stored in horizontal position, unless specifically designed for vertical operation, without placing objects on it. Do not remove the protection grease from shaft end to prevent rust.

If the motor are fitted with space heaters, they must always be turned on during the storage period or when the installed motor is out of operation. Space heaters will prevent water condensation inside the motor and keep the winding insulation resistance within acceptable levels. Store the motor in such position that the condensed water can be easily drained. If fitted, remove pulleys or couplings from the shaft end (more information are given on item 6).

The space heaters should never be energized when the motor is in operation.

5.1. EXPOSED MACHINED SURFACES

All exposed machined surfaces (like shaft end and flange) are factory-protected with temporary rust inhibitor. A protective film must be reapplied periodically (at least every six months), or when it has been removed and/or damaged.

5.2. STORAGE

The stacking height of the motor packaging during the storage period should not exceed 5 m, always considering the criteria indicated in Table 5.1:

Table 5.1 *- Max. recommended stacking height*

Packaging Type	Frame sizes	Maximum stacking quantity
Cardboard box	IEC 63 to 132 NEMA 143 to 215	Indicated on the top side of the cardboard box
Wood crate	IEC 63 to 315 NEMA 48 to 504/5	06
	IEC 355 NEMA 586/7 and 588/9	03
	HGF IEC 315 to 630 HGF NEMA 5000 to 9600	Indicated on the packaging

Notes*:*
1) Never stack larger packaging onto smaller packaging.
2) Align the packaging correctly (see Figure 5.1 and Figure 5.2).

Figure 5.1 *- Correct stacking*

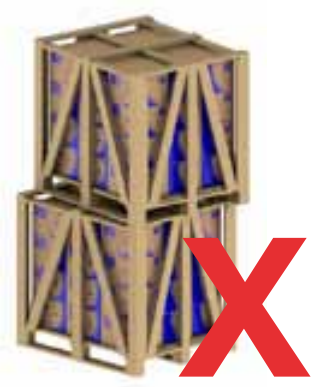

Figure 5.2 *- Incorrect stacking*

ENGLISH

3) The feet of the crates above should always be supported by suitable wood battens (Figure 5.3) and never stand on the steel tape or without support (Figure 5.4).

Figure 5.3 - Correct stacking

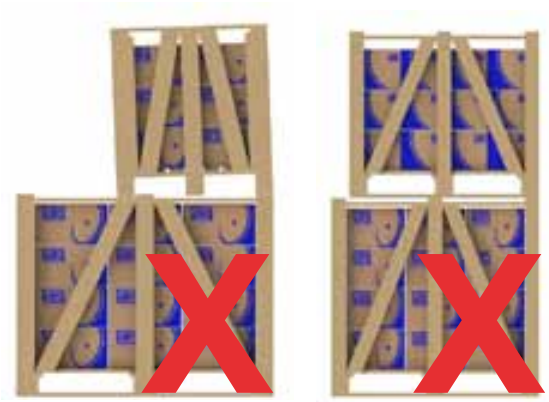

Figure 5.4 - Incorrect stacking

4) When stacking smaller crates onto longer crates, always ensure that suitable wooden supports are provided to withstand the weight (see Figure 5.5). This condition usually occurs with motor packaging above IEC 225S/M (NEMA 364/5T) frame sizes.

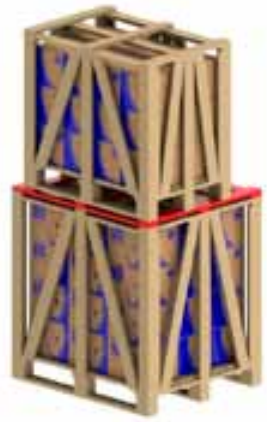

***Figure 5.5** - Use of additional battens for stacking*

5.3 BEARINGS

5.3.1 Grease lubricated bearings

We recommend rotating the motor shaft at least once a month (by hand, at least five revolutions, stopping the shaft at a different position from the original one). If the motor is fitted with shaft locking device, remove it before rotating the shaft and install it again before performing any handling procedure. Vertical motors may be stored in the vertical or in horizontal position. If motors with open bearings are stored longer than six months, the bearings must be relubricated according to item 8.2 before commissioning of the motor.
If the motor is stored for longer than 2 years, the bearings must be replaced or removed, washed, inspected and relubricated according to item 8.2.

5.3.2 Oil lubricated bearings

The motor must be stored in its original operating position and with oil in the bearings. Correct oil level must be ensured. It should be in the center of the sight glass.
During the storage period, remove the shaft locking device and rotate the shaft by hand every month, at least five revolutions, thus achieving an even oil distribution inside the bearing and maintaining the bearing in good operating conditions. Reinstall the shaft locking device every time the motor has to be moved.
If the motor is stored for a period of over six months, the bearings must be relubricated according to Item 8.2 before starting the operation. If the motor is stored for a period of over two years, the bearings must be replaced or removed, washed according to manufacturer instructions, checked and relubricated according to Item 8.2. The oil of vertical mounted motors that are transported in horizontal position is removed to prevent oils leaks during the transport. These motors must be stored in vertical position after receiving and the bearing must be lubricated.

5.3.3 Oil Mist lubricated bearings

The motor must be stored in horizontal position. Lubricate the bearings with ISO VG 68 mineral oil in the amount indicated in the Table 5.2 (this is also valid for bearings with equivalent dimensions). After filling with oil, rotate the shaft by hand, at least five revolutions)
During the storage period, remove the shaft locking device (if any) and rotate the shaft by hand every week, at least five revolutions, stopping it at a different position from the original one. Reinstall the shaft locking device every time the motor has to be moved. If the motor is stored for a period of over two years, the bearings must be replaced or removed, washed according to manufacturer instructions, checked and relubricated according to item 8.2.

Table 5.2 - *Amount of oil per bearing*

Bearing Size	Amount of Oil (ml)	Bearing Size	Amount of Oil (ml)
6201	15	6309	65
6202	15	6311	90
6203	15	6312	105
6204	25	6314	150
6205	25	6315	200
6206	35	6316	250
6207	35	6317	300
6208	40	6319	350
6209	40	6320	400
6211	45	6322	550
6212	50	6324	600
6307	45	6326	650
6308	55	6328	700

The oil must always be removed when the motor has to be handled. If the oil mist system is not operating after installation, fill the bearings with oil to prevent bearing rusting. During the storage period, rotate the shaft by hand, at least five revolutions, stopping it at a different position from the original one. Before starting the motor, all bearing protection oil must be drained from the bearing and the oil mist system must be switched ON.

5.3.4 Sleeve bearing

The motor must be stored in its original operating position and with oil in the bearings. Correct oil level must be ensured. It should be in the middle of the sight glass. During the storage period, remove the shaft locking device and rotate the shaft by hand every month, at least five revolutions, and at 30 rpm, thus achieving an even oil distribution inside the bearing and maintaining the bearing in good operating conditions. Reinstall the shaft locking device every time the motor has to be moved.
If the motor is stored for a period of over six months, the bearings must be relubricated according to the Item 8.2 before starting the operation.

If the motor is stored for a period longer than the oil change interval, or if it is not possible to rotate the motor shaft by hand, the oil must be drained and a corrosion protection and dehumidifiers must be applied.

5.4. INSULATION RESISTANCE

We recommend measuring the winding insulation resistance at regular intervals to follow-up and evaluate its electrical operating conditions. If any reduction in the insulation resistance values are recorded, the storage conditions should be evaluated and corrected, where necessary.

5.4.1. Insulation resistance measurement

We recommend measuring the winding insulation resistance at regular intervals to follow-up and evaluate its electrical operating conditions. If any reduction in the insulation resistance values are recorded, the storage conditions should be evaluated and corrected, where necessary.

The insulation resistance must be measured in a safe environment.

The insulation resistance must be measured with a megohmmeter. The machine must be in cold state and disconnected from the power supply.

To prevent the risk of an electrical shock, ground the terminals before and after each measurement. Ground the capacitor (if any) to ensure that it is fully discharged before the measurement is taken.

It is recommended to insulate and test each phase separately. This procedure allows the comparison of the insulation resistance between each phase. During the test of one phase, the other phases must be grounded. The test of all phases simultaneously evaluates the insulation resistance to ground only but does not evaluate the insulation resistance between the phases.
The power supply cables, switches, capacitors and other external devices connected to the motor may considerably influence the insulation resistance measurement. Thus all external devices must be disconnected and grounded during the insulation resistance measurement.
Measure the insulation resistance one minute after the voltage has been applied to the winding. The applied voltage should be as shown in Table 5.3.

Table 5.3 *- Voltage for the insulation resistance*

Winding rated voltage (V)	Testing voltage for measuring the insulation resistance (V)
< 1000V	500
1000 - 2500	500 - 1000
2501 - 5000	1000 - 2500
5001 - 12000	2500 - 5000
> 12000	5000 - 10000

The reading of the insulation resistance must be corrected to 40 °C as shown in the Table 5.4.

Table 5.4 *- Correction Factor for the Insulation Resistance corrected to 40 °C*

Measuring temperature of the insulation resistance (°C)	Correction factor of the insulation resistance corrected to 40 °C	Measuring temperature of the insulation resistance (°C)	Correction factor of the insulation resistance corrected to 40 °C
10	0.125	30	0.500
11	0.134	31	0.536
12	0.144	32	0.574
13	0.154	33	0.616
14	0.165	34	0.660
15	0.177	35	0.707
16	0.189	36	0.758
17	0.203	37	0.812
18	0.218	38	0.871
19	0.233	39	0.933
20	0.250	40	1.000
21	0.268	41	1.072
22	0.287	42	1.149
23	0.308	43	1.231
24	0.330	44	1.320
25	0.354	45	1.414
26	0.379	46	1.516
27	0.406	47	1.625
28	0.435	48	1.741
29	0.467	49	1.866
30	0.500	50	2.000

The motor insulation condition must be evaluated by comparing the measured value with the values indicated in Table 5.5 (corrected to 40 °C):

Table 5.5 *- Evaluation of the insulation system*

Limit value for rated voltage up to 1.1 kV (MΩ)	Limit value for rated voltage above 1.1 kV (MΩ)	Situation
Up to 5	Up to 100	Dangerous. The motor can not be operated in this condition
5 to 100	100 to 500	Regular
100 to 500	Higher than 500	Good
Higher than 500	Higher than 1000	Excellent

The values indicated in the table should be considered only as reference values. It is advisable to log all measured values to provide a quick and easy overview on the machine insulation resistance.
If the insulation resistance is low, moisture may be present in the stator windings. In this case the motor should be removed and transported to a WEG authorized Service Center for proper evaluation and repair (This service is not covered by the warranty). To improve the insulation resistance through the drying process, see section 8.4.

6. INSTALLATION

The insulation resistance must be measured in a safe environment.

Check some aspects before proceeding with the installation:

1. Insulation resistance: must be within the acceptable limits. See item 5.4.
2. Bearings:
   a. Rolling bearings: oxidized bearings must be replaced. If no oxidation is detected, lubricate the bearings as described in Item 8.2. If the motor is stored for a period of over two years, the bearings must be replaced before starting the motor.
   b. Sleeve bearing: if sleeve bearing motors are stored longer than the recommended oil change interval, the oil must be changed before machine starting. Don't forget to remove the dehumidifiers when you drain the oil from the motor and to fill it again with new oil before starting the machine. For more details, see item 8.2.
3. Operating conditions of the start capacitors: If single-phase motors are stored for a period of over two years, it is recommended to change the start capacitors before motor starting since they lose their operating characteristics.
4. Terminal box:
   a. the inside of the terminal box must be clean and dry.
   b. the contacts must be correctly connected and corrosion free. See 6.9 and 6.10.
   c. the cable entries must be correctly sealed and the terminal box cover properly mounted in order to ensure the degree of protection indicated on the motor nameplate.
5. Cooling: the cooling fins, air inlet and outlet openings must be clean and unobstructed. The distance between the air inlet openings and the wall should not be shorter than ¼ (one quarter) of the diameter of the air inlet. Ensure sufficient space to perform the cleaning services. See item 7.
6. Coupling: remove the shaft locking device (where fitted) and the corrosion protection grease from the shaft end and flange just before installing the motor. See item 6.4.
7. Drain hole: the motor must always be positioned so the drain hole is at the lowest position (If there is any indication arrow on the drain, the drain must be so installed that the arrow points downwards).
   Motors supplied with rubber drain plugs leave the factory in the closed position and must be opened periodically to allow the exit of condensed water. For environments with high water condensation levels and motor with degree of protection IP55, the drain plugs can be mounted in open position (see Figure 6.1).
   For motors with degree of protection IP56, IP65 or IP66, the drain plugs must remain at closed position (see Figure 6.1), being opened only during the motor maintenance procedures.
   The drain system of motors with Oil Mist lubrication system must be connected to a specific collection system (see Figure 6.12).

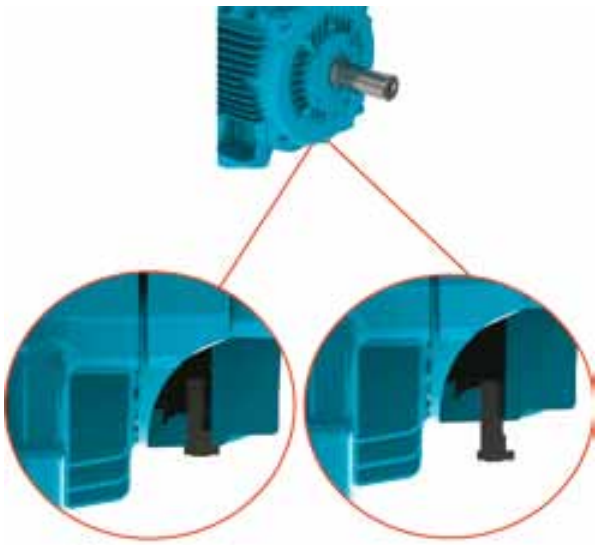

Figure 6.1 *- Detail of the rubber drain plug mounted in closed and open position.*

8.Additional recommendations:
a. Check the direction of motor rotation, starting the motor at no-load before coupling it to the load.
b. Vertical mounted motors with shaft end down must be fitted with drip cover to protect them from liquids or solids that may drop onto the motors.
c. Vertical mounted motors with shaft end up must be fitted with water slinger ring to prevent water penetration inside the motor.

Remove or fix the shaft key before starting the motor.

6.1. FOUNDATIONS

The foundation is the structure, structural element, natural or prepared base, designed to withstand the stresses produced by the installed equipment, ensuring safe and stable performance during operation. The foundation design should consider the adjacent structures to avoid the influences of other installed equipment and no vibration is transferred through the structure

The foundation must be flat and its selection and design must consider the following characteristics:

a) The features of the machine to be installed on the foundation, the driven loads, application, maximum allowed deformations and vibration levels (for instance, motors with reduced vibration levels, foot flatness, flange concentricity, axial and radial loads, etc. lower than the values specified for standard motors).

b) Adjacent buildings, conservation status, maximum applied load estimation, type of foundation and fixation and vibrations transmitted by theses constructions.

If the motor is supplied with leveling/alignment bolts, this must be considered in the base design.

Please consider for the foundation dimensioning all stresses that are generated during the operation of the driven load.
The user is responsible for the foundation designing and construction.

The foundation stresses can be calculated by using the following equations (see Figure 6.2):

$$F_1 = 0,5 * g * m - (4 * T_b / A)$$
$$F_2 = 0,5 * g * m + (4 * T_b / A)$$

Where:

F_1 and F_2 = lateral stresses (N);
g = gravitational acceleration (9,8 m/s^2);
m = motor weight (kg);
T_b = breakdown torque (Nm);
A = distance between centerlines of mounting holes in feet or base of the machine (end view) (m).

The motors may be mounted on:
- Concrete bases: are most used for large-size motors (see Figure 6.2);
- Metallic bases: are generally used for small-size motors (see Figure 6.3).

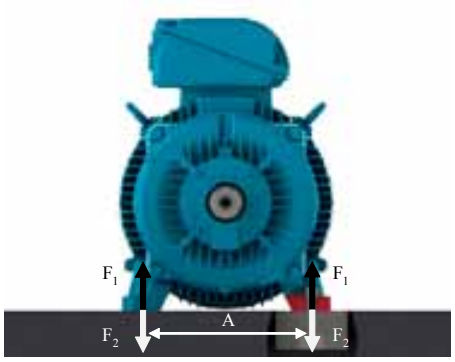

Figure 6.2 *- Motor installed on concrete base*

Figure 6.3 *- Motor installed on metallic base*

The metallic and concrete bases may be fitted with sliding system. These types of foundations are generally used where the power transmission is achieved by belts and pulleys. This power transmission system is easier to assemble/disassemble and allows the belt tension adjustment. Other important aspect of this foundation type is the location of the base locking screws that must be diagonally opposite. The rail nearest the drive pulley is placed in such a way that the positioning bolt is between the motor and the driven machine. The other rail must be placed with the bolt on the opposite side (diagonally opposite), as shown in Figure 6.4 .

To facilitate assembly, the bases may have the following features:
- shoulders and/or recesses;
- anchor bolts with loose plates;
- bolts cast in the concrete;
- leveling screws;
- positioning screws;
- steel & cast iron blocks, plates with flat surfaces.

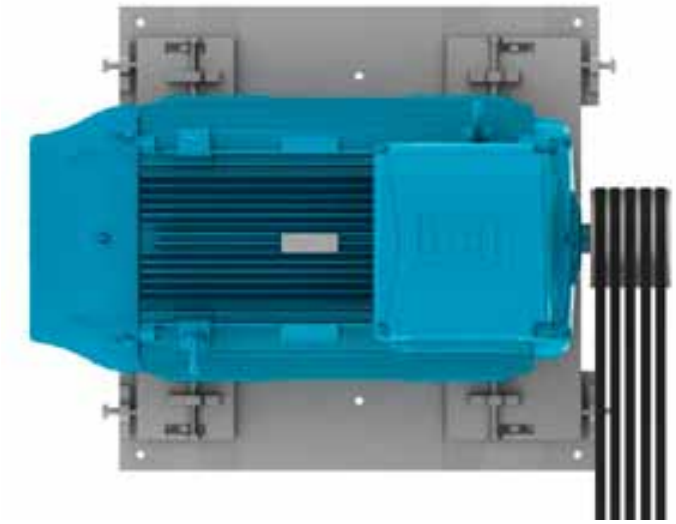

Figure 6.4 *- Motor installed on sliding base*

After completing the installation, it is recommended that all exposed machined surfaces are coated with suitable rust inhibitor.

6.2. MOTOR MOUNTING

Footless motors supplied with transportation devices, according to Figure 6.5, must have their devices removed before starting the motor installation.

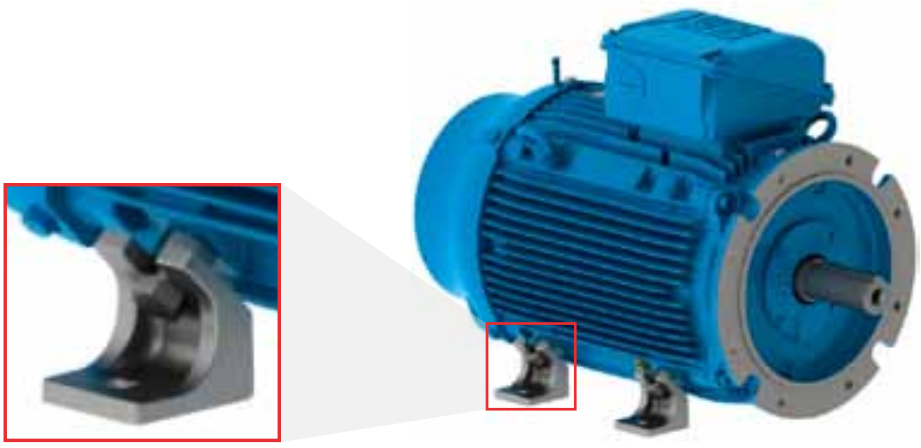

Figure 6.5 *- Detail of the transportation devices for footless motors.*

6.2.1. Foot mounted motors

The drawings of the mounting hole dimensions for NEMA or IEC motors can be checked in the respective technical catalogue.
The motor must be correctly aligned and leveled with the driven machine. Incorrect alignment and leveling may result in bearing damage, generate excessive vibration and even shaft distortion/breakage.
For more details, see section 6.3 and 6.6. The thread engagement length of the mounting bolt should be at least 1.5 times the bolt diameter. This thread engagement length should be evaluated in more severe applications and increased accordingly.
Figure 6.6 shows the mounting system of a foot mounted motor indicating the minimum required thread engagement length.

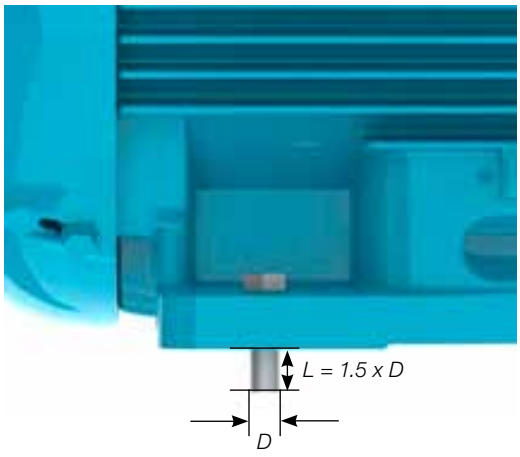

Figure 6.6 *- Mounting system of a foot mounted motor*

6.2.2. Flange mounted motors

The drawings of the flange mounting dimensions, IEC and NEMA flanges, can be checked in the technical catalogue.
The coupling of the driven equipment to the motor flange must be properly dimensioned to ensure the required concentricity of the assembly.
Depending on the flange type, the mounting can be performed from the motor to the driven equipment flange (flange FF (IEC) or D (NEMA)) or from the driven equipment flange to the motor (flange C (DIN or NEMA)).
For the mounting process from the driven equipment flange to the motor, you must consider the bolt length, flange thickness and the thread depth of the motor flange.

If the motor flange has tapped through-holes, the length of the mounting bolts must not exceed the tapped through-hole length of the motor flange, thus preventing damage to the winding head.

For flange mounting the thread engagement length of the mounting bolt should be at least 1.5 times the bolt diameter. In severe applications, longer thread engagement length may be required.
In severe applications or if large motors are flange mounted, a foot or pad mounting may be required in addition to the flange mounting (Figure 6.7). The motor must never be supported on its cooling fins.

Figure 6.7 *- Mounting method of flange mounted motors with frame base support*

Note*:*
When liquid (for example oil) is likely to come into contact with the shaft seal, please contact your local WEG representative.

6.2.3. Pad mounted motors

Typically, this method of mounting is used in axial fans. The motor is fixed by tapped holes in the frame. The dimensions of these tapped holes can be checked in the respective product catalogue. The selection of the motor mounting rods/bolts must consider the dimensions of the fan case, the installation base and the thread depth in the motor frame.
The mounting rods and the fan case wall must be sufficiently stiff to prevent the transmission of excessive vibration to the machine set (motor & fan). Figure 6.8 shows the pad mounting system.

Figure 6.8 *- Mounting of the motor inside the cooling duct*

6.3. BALANCING

Unbalanced machines generate vibration which can result in damage to the motor. WEG motors are dynamically balanced with “half key” and without load (uncoupled). Special balancing quality level must be stated in the Purchase Order.

The transmission elements, such as pulleys, couplings, etc., must balanced with “half key” before they are mounted on the motor shaft.

The balance quality grade meets the applicable standards for each product line.

The maximum balancing deviation must be recorded in the installation report

6.4. COUPLINGS

Couplings are used to transmit the torque from the motor shaft to the shaft of the driven machine. The following aspects must be considered when couplings are installed:
- Use proper tools for coupling assembly & disassembly to avoid damages to the motor and bearings.
- Whenever possible, use flexible couplings, since they can absorb eventual residual misalignments during the machine operation.
- The maximum loads and speed limits informed in the coupling and motor manufacturer catalogues cannot be exceeded.
- Level and align the motor as specified in sections 6.5 and 6.6, respectively.

Remove or fix the shaft key firmly when the motor is operated without coupling in order to prevent accidents.

6.4.1. Direct coupling

Direct coupling is characterized when the Motor shaft is directly coupled to the shaft of the driven machine without transmission elements. Whenever possible, use direct coupling due to lower cost, less space required for installation and more safety against accidents.

Do not use roller bearings for direct coupling, unless sufficient radial load is expected.

6.4.2. Gearbox coupling

Gearbox coupling is typically used where speed reduction is required.
Make sure that shafts are perfectly aligned and strictly parallel (in case of straight spur gears) and in the right meshing angle (in case of bevel and helical gears).

6.4.3. Pulley and belt coupling

Pulleys and belts are used when speed increase or reduction between motor shaft and driven load is required.

Excessive belt tension will damage the bearings and cause unexpected accidents such as breakage of the motor shaft.

6.4.4. Coupling of sleeve bearing motors

Motors designed with sleeve bearings must be operated with direct coupling to the driven machine or a gearbox. Pulley and belts can not be applied for sleeve bearing motors.

Motors designed with sleeve bearings have 3 (three) marks on the shaft end. The center mark is the indication of the magnetic center and the 2 (two) outside marks indicate the allowed limits of the rotor axial movement, as shown in Figure 6.9.
The motor must be so coupled that during operation the arrow on the frame is placed over the central mark indicating the rotor magnetic center. During start-up, or even during operation, the rotor may freely move between the two outside marks when the driven machine exerts an axial load on the motor shaft. However, under no circumstance, the motor can operate continuously with axial forces on the bearing.

Figure 6.9 *- Axial clearance of motor designed with sleeve bearing*

For coupling evaluation consider the maximum axial bearing clearance as shown in Table 6.1.
The axial clearance of the driven machine and coupling influence the maximum bearing clearance.

Table 6.1 *- Clearance used for sleeve bearings*

Bearing size	Total axial clearance (mm)
9*	3 + 3 = 6
11*	4 + 4 = 8
14*	5 + 5 =10
18	7,5 + 7,5 = 15

** For Motors in accordance with API 541, the total axial clearance is 12.7 mm*

The sleeve bearings used by WEG were not designed to support axial load continuously.
Under no circumstance must the motor be operated continuously at its axial clearance limits.

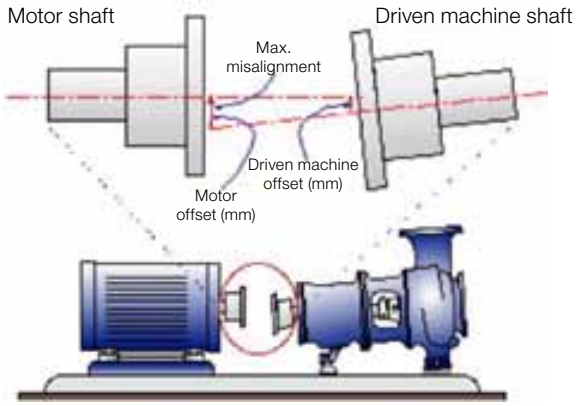
6.5. LEVELING

The motor must be leveled to correct any deviations in flatness arising from the manufacturing process and the material structure rearrangement. The leveling can be carried out by a leveling screw fixed on the motor foot or on the flange or by means of thin compensation shims. After the leveling process, the leveling height between the motor mounting base and the motor cannot exceed 0.1 mm.
If a metallic base is used to level the height of the motor shaft end and the shaft end of the driven machine, level only the metallic base relating to the concrete base.

Record the maximum leveling deviations in the installation report.

6.6. ALIGNMENT

The correct alignment between the motor and the driven machine is one of the most important variables that extends the useful service life of the motor. Incorrect coupling alignment generates high loads and vibrations reducing the useful life of the bearings and even resulting in shaft breakages. Figure 6.10 illustrates the misalignment between the motor and the driven machine.



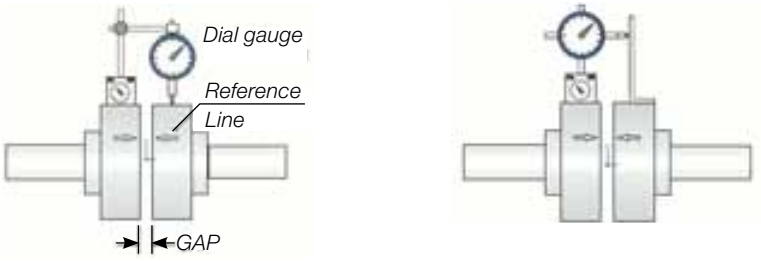


Figure 6.10 *- Typical misalignment condition*

Alignment procedures must be carried out using suitable tools and devices, such as dial gauge, laser alignment instruments, etc. The motor shaft must be aligned axially and radially with the driven machine shaft.

The maximum allowed eccentricity for a complete shaft turn should not exceed 0.03 mm, when alignment is made with dial gauges, as shown in Figure 6.11. Ensure a gap between couplings to compensate the thermal expansion between the shafts as specified by the coupling manufacturer.

Parallel alignment *Angular alignment*

Figure 6.11 *- Alignment with dial gauge.*

If alignment is made by a laser instrument, please consider the instructions and recommendations provided by the laser instrument manufacturer.
The alignment should be checked at ambient temperature with machine at operating temperature.

The coupling alignment must be checked periodically

Pulley and belt couplings must be so aligned that the driver pulley center lies in the same plane of the driven pulley center and the motor shaft and the shaft of the driven machine are perfectly parallel.
After completing the alignment procedures, ensure that mounting devices do not change the motor and machine alignment and leveling resulting into machine damage during operation.

It is recommended to record the maximum alignment deviation in the Installation Report.

6.7. CONNECTION OF OIL LUBRICATED OR OIL MIST LUBRICATED MOTORS

When oil lubricated or oil mist lubricated motors are installed, connect the existing lubricant tubes (oil inlet and oil outlet tubes and motor drain tube), as shown in Figure 6.12. The lubrication system must ensure continuous oil flow through the bearings as specified by the manufacturer of the installed lubrication system.

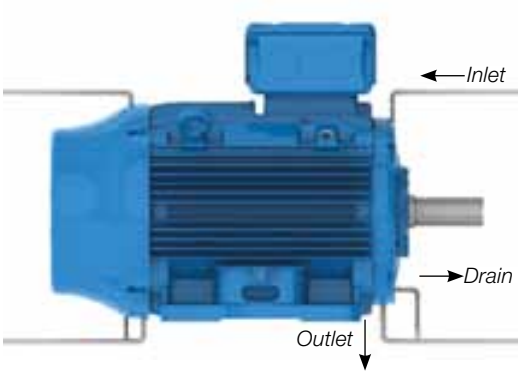

Figure 6.12 *- Oil supply and drain system of oil lubricated or oil mist lubricated motors*

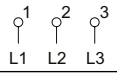
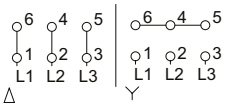
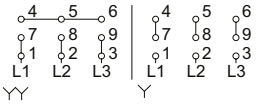
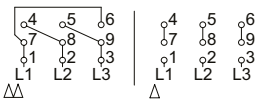
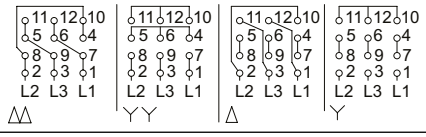
6.8. CONNECTION OF THE COOLING WATER SYSTEM

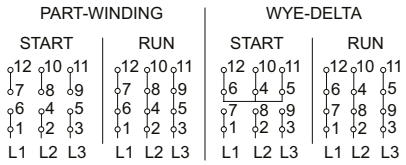


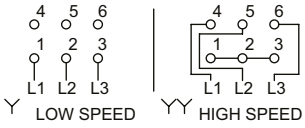


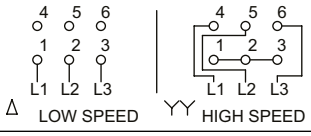


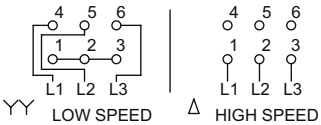


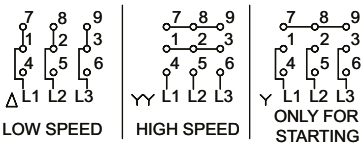












When water cooled motors are installed, connect the water inlet and outlet tubes to ensure proper motor cooling. According to item 7.2, ensure correct cooling water flow rate and water temperature in the motor cooling system.

6.9. ELECTRICAL CONNECTION

Consider the rated motor current, service factor, starting current, environmental and installation conditions, maximum voltage drop, etc. to select appropriate power supply cables and switching and protection devices. All motors must be installed with overload protection systems. Three-phase motors should be fitted with phase fault protection systems.

Before connecting the motor, check if the power supply voltage and the frequency comply with the motor nameplate data. All wiring must be made according to the connection diagram on the motor nameplate. Please consider the connection diagrams in the Table 6.2 as reference value.
To prevent accidents, check if motor has been solidly grounded in accordance with the applicable standards.

Table 6.2 - Typical connection diagram for three-phase motors.

Configuration	Quantity of Leads	Type of connection	Connection diagram
Single Speed	3	-	
	6	Δ - Y	
	9	YY - Y	
		ΔΔ - Δ	
	12	ΔΔ - YY - Δ - Y	
		Δ - PWS Part-winding start	
Double Speed Dahlander	6	YY - Y Variable Torque	
		Δ - YY Constant Torque	
		YY - Δ Constant Output	
	9	Δ - Y - YY	
Double Speed Double Winding	6	-	

Equivalent table for lead identification													
Lead identification on the wiring diagram		1	2	3	4	5	6	7	8	9	10	11	12
Single Speed	NEMA MG 1 Part 2	T1	T2	T3	T4	T5	T6	T7	T8	T9	T10	T11	T12
	IEC 60034-8	U1	V1	W1	U2	V2	W2	U3	V3	W3	U4	V4	W4
	JIS (JEC 2137) - up to 6 terminals	U	V	W	X	Y	Z						
	JIS (JEC 2137) - above 6 terminals	U1	V1	W1	U2	V2	W2	U5	V5	W5	U6	V6	W6
Double Speed (Dahlander / Double Winding)	NEMA MG 1 Part 2[1)]	1U	1V	1W	2U	2V	2W	3U	3V	3W	4U	4V	4W
	IEC 60034-8	1U	1V	1W	2U	2V	2W	3U	3V	3W	4U	4V	4W
	JIS (JEC 2137)	1U	1V	1W	2U	2V	2W	3U	3V	3W	4U	4V	4W

1) NEMA MG 1 Part 2 defines T1 to T12 for two or more winding, however WEG adopts 1U to 4W.

If motors are supplied without terminal blocks, insulate the cable terminals with suitable insulation material that meets the power supply voltage and the insulation class indicated on the motor nameplate.

Ensure correct tightening torque for the power cable and grounding connections as specified in Table 8.7

The clearance distance (see Figure 6.13) between non-insulated live parts with each other and between grounded parts must be as indicated in Table 6.3.

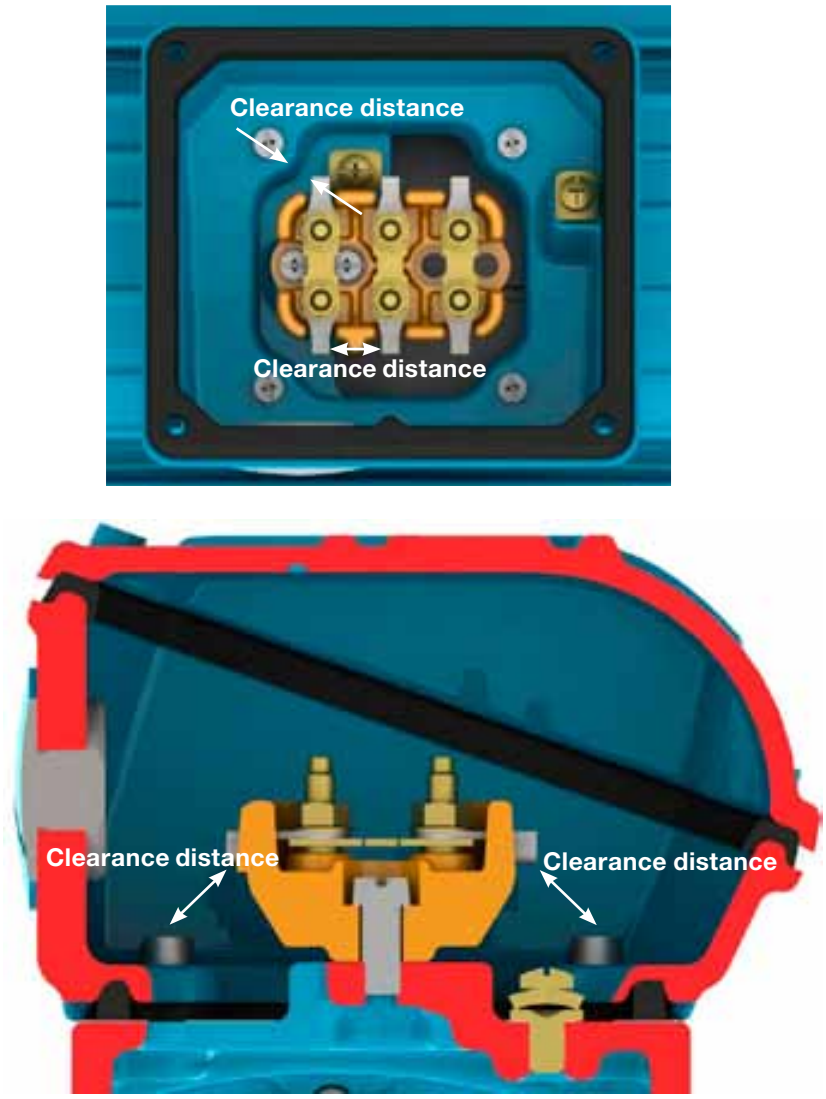


Figure 6.13 *- Clearance distance representation*

Table 6.3 *- Minimum clearance distance (mm) x supply voltage.*

Voltage	Minimum clearance distance (mm)
U ≤ 440 V	4
440 < U ≤ 690 V	5.5
690 < U ≤ 1000 V	8
1000 < U ≤ 6900 V	45
6900 < U ≤ 11000 V	70
11000 < U ≤ 16500 V	105

Even when the motor is off, dangerous voltages may be present inside the terminal box used for the space heater supply or winding energization when the winding is used as heating element.
Motor capacitors will hold a charge even after the power has been cut off. Do not touch the capacitors and/or motor terminals, before discharging the capacitors completely.

After the motor connection has been completed, ensure that no tool or foreign body has been left inside the terminal box.

Unused cable inlet holes in the terminal box must be properly closed to ensure the degree of protection indicated on the motor nameplate.
The cable inlets used for power supply and control must be fitted with components (for example, cable-glands and conduits) that meet the applicable standards and regulations in each country.

If the motor is fitted with accessories, such as brakes and forced cooling systems, these devices must be connected to the power supply according to the information provided on their nameplates and with special care as indicated above.

All protection devices, including overcurrent protection, must be set according to the rated machine conditions. These protection devices must protect the machine against short circuit, phase fault or locked rotor condition. The motor protection devices must be set according to the applicable standards.

Check the direction of rotation of the motor shaft. If there is no limitation for the use of unidirectional fans, the shaft rotation direction can be changed by reversing any two of the phase connections. For single-phase motor, check the connection diagram indicated on the motor nameplate.

6.10. CONNECTION OF THE THERMAL PROTECTION DEVICES

If the motor is supplied with temperature monitoring devices, such as, thermostat, thermistors, automatic thermal protectors, Pt-100 (RTD), etc., they must be connected to the corresponding control devices as specified on the accessory nameplates. The non-compliance with this procedure may void the product warranty and cause serious material damages.

Do not apply test voltage above 2.5 V on thermistors and current above 1 mA on RTDs (Pt-100) according to IEC 60751 standard.

Figure 6.14 and Figure 6.15 show the connection diagram of the bimetal thermal protector (thermostats) and thermistors, respectively.

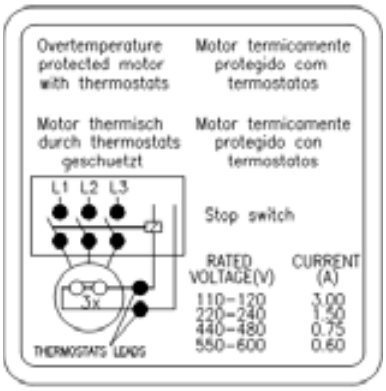

Figure 6.14 *- Connection of the bimetal thermal protectors (thermostats)*

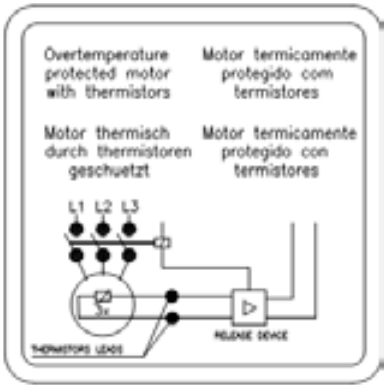

Figure 6.15 *- Thermistor connection*

The alarm temperature limits and thermal protection shutdowns can be defined according to the application; however these temperature limits can not exceed the values in Table 6.4.

Table 6.4 *- Maximum activation temperature of the thermal protections*

Component	Insulation class	Maximum temperature of the protection setting (°C)	
		Alarm	Tripping
Winding	B	-	130
	F	130	155
	H	155	180
Bearing	All	110	120

Notes*:*
1) The number and type of the installed protection devices are stated on the accessory nameplate of the motor.
2) If the motor is supplied with calibrated resistance, (for example, Pt-100), the motor protection system must be set according to the operating temperatures indicated in Table 6.4.

6.11. RESISTANCE TEMPERATURE DETECTORS (PT-100)

The thermocouples Pt-100 are made of materials, whose resistance depends on the temperature variation, intrinsic property of some materials (usually platinum, nickel or copper), calibrated resistance. Its operation is based on the principle that the electric resistance of a metallic conductor varies linearly with the temperature, thus allowing a continuous monitoring of the motor warm-up through the controller display ensuring a high level of precision and answer stability. These devices are widely used for measuring temperatures in various industry sectors.
In general these devices are used in installations where precise temperature control is required, for example, in installation for irregular or intermittent duty.
The same detector may be used for alarm and tripping purposes.

Table 6.5 and Figure 6.16 show the equivalence between the Pt-100 resistance and the temperature.

Table 6.5 - Equivalence between the Pt-100 resistance and the temperature.

6.12. CONNECTION OF THE SPACE HEATERS

Before switching ON the space heaters, check if the space heaters connection have been made according to the connection diagram shown on the space heater nameplate. For motors supplied with dual voltage space heaters (110-127/220-240 V), see Figure 6.17.

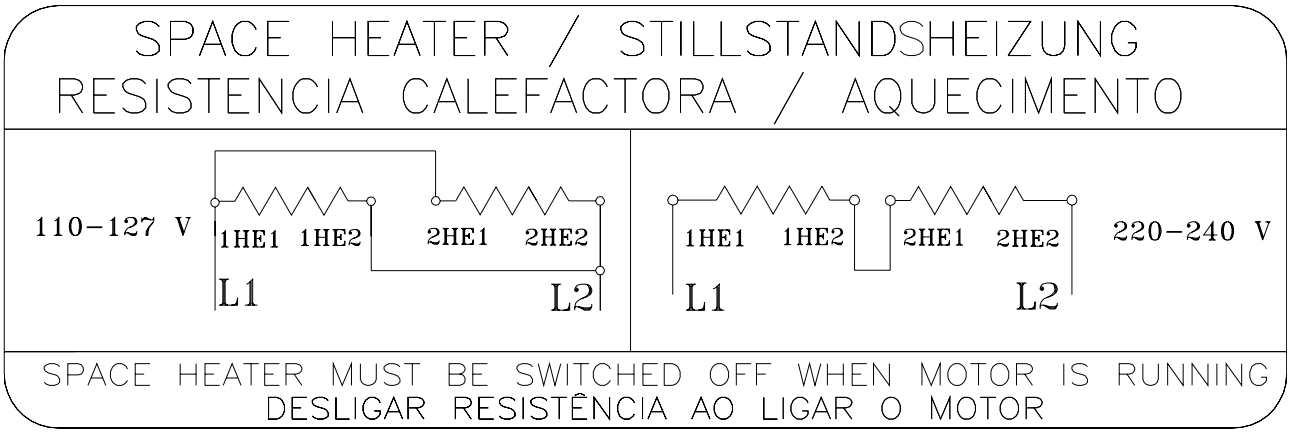

Figure 6.17 *- Dual voltage space heater connection.*

The space heaters should never be energized when the motor is in operation.

ENGLISH

6.13. STARTING METHODS

Whenever possible, the motor starting must be Direct On Line (DOL) at rated voltage. This is the most simple and feasible starting method. However, it must only be applied when the starting current does not affect the power supply. Please consider the local electric utility regulations when installing a motor.
High inrush current may result in:
a) high voltage drop in the power supply line creating unacceptable line disturbance on the distribution system;
b) requiring oversized protection system (cables and contactor) increasing the installation costs.

If DOL starting is not allowed due to the reasons mentioned above, an indirect starting method compatible with the load and motor voltage to reduce the starting current may be used.
If reduced voltage starters are used for starting, the motor starting torque will also be reduced.

Table 6.6 shows the possible indirect starting methods that can be used depending on the number of the motor leads.

Table 6.6 *- Starting method x number of motor leads.*

Number of leads	Possible starting methods
3 leads	Autotransformer Soft-starter
6 leads	Star-Delta Autotransformer Soft-Starter
9 leads	Series/Parallel Part Winding Autotransformer Soft-Starter
12 leads	Star-Delta Series/Parallel Part Winding Autotransformer Soft-Starter

Table 6.7 shows examples of possible indirect starting methods to be used according to the voltage indicated on the motor nameplate and the power supply voltage.

Table 6.7 *- Starting methods x voltage*

Nameplate voltage	Operating voltage	Star-delta	Autotransformer Starting	Starting by series/ parallel switch	Part-winding Starting	Starting by soft-starter
220/380 V	220 V 380 V	YES NO	YES YES	NO NO	NO NO	YES YES
220/440 V	220 V 440 V	NO NO	YES YES	YES NO	YES NO	YES YES
230/460 V	230 V 460 V	NO NO	YES YES	YES NO	YES NO	YES YES
380/660 V	380 V	YES	YES	NO	NO	YES
220/380/440 V	220 V 380 V 440 V	YES NO YES	YES YES YES	YES YES NO	YES YES NO	YES YES YES

The WQuattro line motors must be started direct on-line (DOL) or driven by a frequency inverter in scalar mode.

6.14. MOTORS DRIVEN BY FREQUENCY INVERTER

The operation with frequency inverter must be stated in the Purchase Order since this drive type may require some changes of the motor design.

Wmagnet Motors must only be driven by WEG frequency inverter.

The frequency inverter used to drive motors up to 690 V must be fitted with Pulse With Modulation (PWM) with vector control.

When a motor is driven by a frequency inverter at lower frequencies than the rated frequency, you must reduce the motor torque to prevent motor overheating. The torque reduction (derating torque) can be found in the item 6.4 of the "Technical Guidelines for Induction Motors driven by PWM Frequency inverters" available on the site www.weg.net.

If the motor is operated above the rated frequency, please note:
- That the motor must be operated at constant output;
- That the motor can supply max. 95% of its rated output;
- Do not exceed the maximum speed and please consider:
  - max. operating frequency stated on the additional nameplate;
  - mechanical speed limitation of the motor.

Information on the selection of the power cables between the frequency inverter and the motor can be found in the item 6.4 of the "Technical Guidelines for Induction Motors driven by PWM Frequency inverters" available at www.weg.net.

6.14.1. Use of dV/dt filter

6.14.1.1. Motor with enameled round wire

Motors designed for rated voltages up to 690 V, when driven by frequency inverter, do not require the use of dV/dT filters, provided that following criteria are considered.

Criteria for the selection of motors with round enameled wire when driven by frequency inverter [1]				
Motor rated votage [2]	**Peak voltage at the motor terminals (max)**	**dV/dt inverter output (max)**	**Inverter Rise Time [3] (min.)**	**MTBP [3] Time between pulses (min)**
Vnom ≤ 460 V	≤ 1600 V	≤ 5200 V/µs	≥ 0,1 µs	≥ 6 µs
460 < Vnom ≤ 575 V	≤ 1800 V	≤ 6500 V/µs		
575 < Vnom ≤ 690 V [4]	≤ 1600 V	≤ 5200 V/µs		
575 < Vnom ≤ 690 V [5]	≤ 2200 V	≤ 7800 V/µs		

Notes:
1. For the application of motors with round enameled wires designed for 690 < Vnom ≤ 1100 V, please contact WEG.
2. For the application of dual voltage motors, example 380/660 V, consider the lower voltage (380 V).
3. Information supplied by the inverter manufacturer.
4. When not stated in the Purchase Order that the motor will be driven by frequency inverter.
5. When stated in the Purchase Order that the motor will be driven by frequency inverter.

6.14.1.2. Motor with prewound coils

Motors with prewound coils (medium and high voltage motors regardless of frame sizes, and low voltage motors from IEC 500 / NEMA 800 frame on), designed for the use with frequency inverters, do not require the use of filters, provided they comply with the criteria in Table 6.8.

Table 6.8 *- Criteria to be considered when using motor with prewound coils to be drive by frequency inverters*

Motor rated voltage	**Type of modulation**	**Turn to turn insulation (phase-phase)**		**Phase-ground insulation**	
		Peak voltage at the motor terminals	**dV/dt at the motor terminals**	**Peak voltage at the motor terminals**	**dV/dt at the motor terminals**
690 < Vnom ≤ 4160 V	Sinusoidal	≤ 5900 V	≤ 500 V/µs	≤ 3400 V	≤ 500 V/µs
	PWM	≤ 9300 V	≤ 2700 V/µs	≤ 5400 V	≤ 2700 V/µs
4160 < Vnom ≤ 6600 V	Sinusoidal	≤ 9300 V	≤ 500 V/µs	≤ 5400 V	≤ 500 V/µs
	PWM	≤ 14000 V	≤ 1500 V/µs	≤ 8000 V	≤ 1500 V/µs

6.14.2. Bearing insulation

Only the motors in IEC frame size 400 (NEMA 680) and larger are supplied, as standard, with insulated bearing. If motor must be driven by frequency inverter, insulate the bearing according to Table 6.9.

Table 6.9 *- Recommendation on the bearing insulation for inverter driven motors*

Frame size	Recommendation
IEC 315 and 355 NEMA 445/7, 447/9, L447/9, 504/5, 5006/7/8, 5009/10/11, 586/7, 5807/8/9, 5810/11/12 and 588/9	■ Insulated bearing/end shield ■ Grounding between shaft and frame by grounding brush
IEC 400 and larger NEMA 680 and larger	■ Insulated NDE bearing ■ Grounding between shaft and frame by grounding brush

When motors are supplied with shaft grounding system, monitor the grounding brush constantly during its operation and, when it reaches the end of its useful life, it must be replaced by another brush with the same specification.

6.14.3. Switching frequency

The minimum inverter switching frequency must not be lower than 2.5 kHz and should not exceed 5 kHz.

The non-compliance with the criteria and recommendations indicated in this manual may void the product warranty.

6.14.4. Mechanical speed limitation

Table 6.10 shows the maximum speeds allowed for motors driven by frequency inverter.

Table 6.10 *- Maximum motor speed (in rpm).*

Frame size		DE-bearing	Maximum speed for standard motors
IEC	NEMA		
63-90	143/5	6201 6202 6203 6204 6205	10400
100	-	6206	8800
112	182/4	6207	7600
		6307	6800
132	213/5	6308	6000
160	254/6	6309	5300
180	284/6	6311	4400
200	324/6	6312	4200
225-630	364/5-9610	6314	3600
		6315	3600
		6316	3200
		6319	3000
		6220	3600
		6320	2200
		6322	1900
		6324	1800
		6328	1800
		6330	1800

Note:
to select the maximum allowed motor speed, consider the motor torque derating curve.

For more information on the application of frequency inverters, contact WEG or check the “Technical Guidelines for Induction Motors driven by PWM Frequency inverters” available at www.weg.net.

7. COMMISSIONING

7.1. INITIAL START-UP

After finishing the installation procedures and before starting the motor for the first time or after a long period without operation, the following items must be checked:

- If the nameplate data (voltage, current, connection diagram, degree of protection, cooling system, service factor, etc.) meet the application requirements.
- If the machine set (motor + driven machine) has been mounted and aligned correctly.
- If the motor driving system ensures that the motor speed does not exceed the max. allowed speed indicated in Table 6.10.
- Measure the winding insulation resistance, making sure it complies with the specified values in item 5.4.
- Check the motor rotation direction.
- Inspect the motor terminal box for damage and ensure that it is clean and dry and all contacts are rust-free, the seals are in perfect operating conditions and all unused threaded holes are properly closed thus ensuring the degree of protection indicated on the motor nameplate.
- Check if the motor wiring connections, including grounding and auxiliary equipment connection, have been carried out properly and are in accordance with the recommendations in item 6.9.
- Check the operating conditions of the installed auxiliary devices (brake, encoder, thermal protection device, forced cooling system, etc.).
- Check bearing operating conditions. If signs of oxidation are detected, replace the bearings. If no sign of oxidation is detected, relubricate the bearings as described in item 8.2. If the motors are stored for more than two years, the bearings must be replaced before starting the motor.

- When motors are fitted with sleeve bearings, ensure:
  - correct oil level for the sleeve bearing. The oil level should be in the center of the sight glass (see Figure 6.8);
  - that the motor is not started or operated with axial or radial loads;
  - that if the motor is stored for a period equal or longer than the oil change interval, the oil must be changed before starting the motor.
- Inspect the capacitor operating condition, if any. If motors are installed for more than two years, but were never commissioned, it is recommended to change the start capacitors since they lose their operating characteristics.
- Ensure that the air inlet and outlet opening are not blocked. The minimum clearance to the nearest wall (L) should be at least ¼ of the fan cover diameter (D), see Figure 7.1. The intake air temperature must be at ambient temperature.

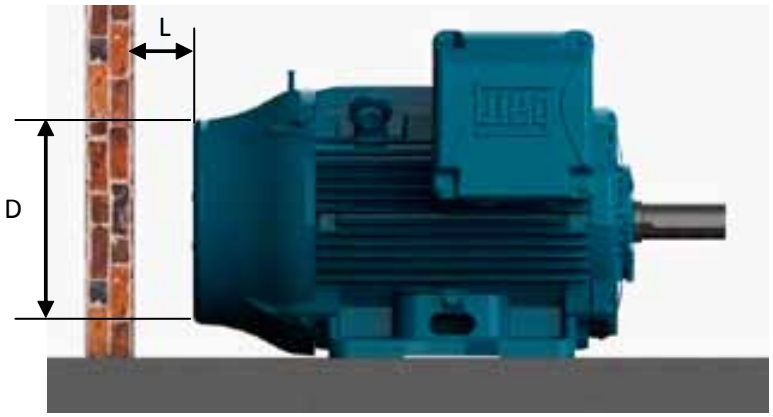

***Figure 7.1**- Minimum clearance to the wall*

Please consider the minimum distances shown in the Table 7.1 as reference value

Table 7.1 - Minimum distance between the fan cover and wall

Frame size		Distance between the fan cover and the wall (L)	
IEC	NEMA	mm	inches
63	-	25	0.96
71	-	26	1.02
80	-	30	1.18
90	143/5	33	1.30
100	-	36	1.43
112	182/4	41	1.61
132	213/5	50	1.98
160	254/6	65	2.56
180	284/6	68	2.66
200	324/6	78	3.08
225 250	364/5 404/5	85	3.35
280	444/5 445/7 447/9	108	4.23
315	L447/9 504/5 5006/7/8 5009/10/11	122	4.80
355	586/7 588/9 5807/8/9 5810/11/12	136	5.35
400	6806/7/8 6809/10/11	147	5.79
450	7006/10	159	6.26
500	8006/10	171	6.73
560	8806/10	185	7.28
630	9606/10	200	7.87

- ensure correct water flow rate and water temperature when water cooled motors are used. See item 7.2.
- ensure that all rotating parts, such as pulleys, couplings, external fans, shaft, etc. are protected against accidental contact.

Other tests and inspections not included in the manual may be required, depending on the specific installation, application and/or motor characteristics.

After all previous inspections have been carried out, proceed as follows to start the motor:

- Start the motor on no-load (if possible) and check the motor direction of rotation. Check for the presence of any abnormal noise, vibration or other abnormal operating conditions.
- Ensure the motor starts smoothly. If any abnormal operating condition is noticed, switch off the motor, check the assembly system and connections before the motor is started again.
- If excessive vibrations are noticed, check if the motor mounting bolts are well tightened or if the vibrations are not generated and transmitted from adjacent installed equipment. Check the motor vibration periodically and ensure that the vibration limits are as specified in item 7.2.1.
- Start the motor at rated load during a short time and compare the operating current with the rated current indicated on the nameplate.
- Continue to measure the following motor variables until thermal equilibrium is reached: current, voltage, bearing and motor frame temperature, vibration and noise levels.
- Record the measured current and voltage values on the Installation Report for future comparisons.

As induction motors have high inrush currents during start-up, the acceleration of high inertia load requires an extended starting time to reach full speed resulting in fast motor temperature rise. Successive starts within short intervals will result in winding temperature increases and can lead to physical insulation damage reducing the useful life of the insulation system. If the duty cycle S1 / CONT. is specified on the motor nameplate, this means that the motor has been designed for:

- two successive starts: first start from cold condition, i. e., the motor windings are at room temperature and the second start immediately after the motor stops.
- one start from hot condition, i. e., the motor windings are at rated temperature.

The Troubleshooting Chart in section 10 provides a basic list of unusual cases that may occur during motor operation with the respective corrective actions

7.2. OPERATING CONDITIONS

Unless otherwise stated in the Purchase Order, electric motors are designed and built to be operated at altitudes up to 1000 meters above sea level and in a temperature range from -20 °C to +40 °C. Any deviation from the normal condition of motor operation must be stated on the motor nameplate. Some components must be changed if the ambient temperature is different from the specified one. Please contact WEG to check the required special features.

For operating temperatures and altitudes differing from those above, the factors indicated in Table 7.2 must be applied to the nominal motor power rating in order to determine the derated available output (Pmax = Pnom x correction factor).

Table 7.2 - *Correction factors for altitude and ambient temperature.*

T (°C)	Altitude (m)								
	1000	1500	2000	2500	3000	3500	4000	4500	5000
10							0.97	0.92	0.88
15						0.98	0.94	0.90	0.86
20					1.00	0.95	0.91	0.87	0.83
25				1.00	0.95	0.93	0.89	0.85	0.81
30			1.00	0.96	0.92	0.90	0.86	0.82	0.78
35		1.00	0.95	0.93	0.90	0.88	0.84	0.80	0.75
40	1.00	0.97	0.94	0.90	0.86	0.82	0.80	0.76	0.71
45	0.95	0.92	0.90	0.88	0.85	0.81	0.78	0.74	0.69
50	0.92	0.90	0.87	0.85	0.82	0.80	0.77	0.72	0.67
55	0.88	0.85	0.83	0.81	0.78	0.76	0.73	0.70	0.65
60	0.83	0.82	0.80	0.77	0.75	0.73	0.70	0.67	0.62
65	0.79	0.76	0.74	0.72	0.70	0.68	0.66	0.62	0.58
70	0.74	0.71	0.69	0.67	0.66	0.64	0.62	0.58	0.53
75	0.70	0.68	0.66	0.64	0.62	0.60	0.58	0.53	0.49
80	0.65	0.64	0.62	0.60	0.58	0.56	0.55	0.48	0.44

Motors installed inside enclosures (cubicles) must be ensured an air renewal rate in the order of one cubic meter per second for each 100 kW installed power or fraction of installed power. Totally Enclosed Air Over motors - TEAO (fan and exhaust / smoke extraction) are supplied without cooling fan and the manufacturer of the driven machine is responsible for sufficient motor cooling. If no minimum required air speed between motor fins is indicated on the motor nameplate, ensure the air speed indicated in the table 7.3 is provided. The values shown in Table 7.3 are valid for 60 Hz motors. To obtain the minimum air speed for 50 Hz motors, multiply the values in the table by 0.83.

Table 7.3 *- Minimum required air speed between motor fins (metres/second).*

Frame		Poles			
IEC	**NEMA**	**2**	**4**	**6**	**8**
63 to 90	143/5	14	7	5	4
100 to 132	182/4 to 213/5	18	10	8	6
160 to 200	254/6 to 324/6	20	20	12	7
225 to 280	364/5 to 444/5	22	22	18	12
315 to 355	445/7 to 588/9	25	25	20	15

The voltage and frequency variations may affect the performance characteristics and the electromagnetic compatibility of the motor. The power supply variations should not exceed the values specified in the applicable standards. Examples:

- ABNT NBR 17094 - Parts 1 and 2. The motor has been designed to supply the rated torque for a combined variation in voltage and frequency:
  - Zone A: ±5% of the rated voltage and ±2% of the rated frequency.
  - Zone B: ±10% of the rated voltage and +3% -5% of the rated frequency.

When operated continuously in Zone A or B, the motor may show performance variations and the operating temperature may increase considerably. These performance variations will be higher in Zone B. Thus it is not recommended to operate the motor in Zone B during extended periods.

- IEC 60034-1. The motor has been designed to supply the rated torque for combined variation in voltage and frequency:
  - Zone A: ±5% of the rated voltage and ±2% of the rated frequency.
  - Zone B: ±10% of the rated voltage and +3% -5% of the rated frequency.

When operated continuously in Zone A or B, the motor may show performance variations and the operating temperature may increase considerably. These performance variations will be higher in Zone B. Thus it is not recommended to operate the motor in Zone B during extended periods. For multivoltage motors (example 380-415/660 V), a ±5% voltage variation from the rated voltage is allowed.

- NEMA MG 1 Part 12. The motor has been designed to be operated in one of the following variations:
  - ±10% of the rated voltage, with rated frequency;
  - ±5% of the rated frequency, with rated voltage;
  - A combined variation in voltage and frequency of ±10%, provided the frequency variation does not exceed ±5%.

If the motor is cooled by ambient air, clean the air inlet and outlet openings and cooling fins at regular intervals to ensure a free airflow over the frame surface. The hot air should never be returned to the motor. The cooling air must be at room temperature limited to the temperature range indicated on the motor nameplate (if no room temperature is specified, please consider a temperature range between -20 °C and +40 °C).

Table 7.4 shows the minimum required water flow for water cooled motors considering the different frame sizes and the maximum allowed temperature rise of the cooling water after circulating through the motor. The inlet water temperature should not exceed 40 °C.

Table 7.4 *- Minimum required water flow and the maximum allowed temperature rise of the cooling water after circulating through the motor*

Frame size		Flow rate (litres/minute)	Maximum allowed water temperature rise (°C)
IEC	NEMA		
180	284/6	12	5
200	324/6	12	5
225	364/5	12	5
250	404/5	12	5
280	444/5 445/7 447/9	15	6
315	504/5	16	6
355	586/7 588/9	25	6

Motors fitted with oil mist lubrication systems can be operated continuously for a maximum of one hour after the failure of the oil pumping system.

Considering the sun's heat increases the operating temperature, externally mounted motors should always be protected from direct sunlight exposure.

Each and every deviation from the normal operating condition (tripping of the thermal protection, noise and vibration level increase, temperature and current rise) should be investigated and corrected by WEG Authorized Service Centers.

Motors fitted with cylindrical roller bearings require a minimum radial load to ensure a normal operation. For information regarding the radial preload, please contact WEG.

7.2.1.Limits of vibration

The vibration severity is the maximum vibration value measured at all positions and in all directions as recommended in the standard IEC 60034-14. Table 7.5 specifies the limits of the maximum vibrations magnitudes according to standard IEC 60034-14 for shaft heights IEC 56 to 400, for vibrations grades A and B. The vibration severity limits in Table 7.5 are given as RMS values (Root Mean Square values or effective values) of the vibration speed in mm/s measured in free suspension condition.

Table 7.5 *- Recommended limits for the vibration severity according to standard IEC 60034-14*

Shaft height [mm]	56 ≤ H ≤ 132	132 ≤ H ≤ 280	H > 280
Vibration Grade	Vibration severity on elastic base [mm/s RMS]		
A	1.6	2.2	2.8
B	0.7	1.1	1.8

Notes:

1 - The values in Table 7.5 are valid for measurements carried out with decoupled machines (without load) operated at rated voltage and frequency.

2 - The values in Table 7.5 are valid regardless of the direction of rotation of the machine.

3 - The values in Table 7.5 are not applicable to single-phase motors, three-phase motors powered by a single-phase system or to machines mounted in situ or coupled with inertia flywheels or to loads.

According to NEMA MG 1, the allowed vibration limit for standard motors is 0.15 in/s (peak vibration in in/s).

Note:

For the load operation condition, the use of the standard ISO 10816-3 is recommended for evaluating the motor vibration limits. In the load condition the motor vibration will be influenced by several factors, such as, type of the coupled load, condition of the motor fixation, alignment condition under load, structure or base vibration due to other equipments, etc.

8. MAINTENANCE

The purpose of the maintenance is to extend the useful life of the equipment. The non-compliance with one of these previous items can cause unexpected machine failures.

If motors with cylindrical roller or angular contact bearings are to be transported during the maintenance procedures, the shaft locking device must always be fitted. All HGF motors, regardless of the bearing type, must always be transported with the shaft locking device fitted.

All repairs, disassembly and assembly related services must be carried out only by qualified and well-trained personnel by using proper tools and techniques. Make sure that the machine has stopped and it is disconnected from the power supply, including the accessory devices (space heater, brake, etc.), before any servicing is undertaken.
The company does not assume any responsibility or liability for repair services or maintenance operations executed by non-authorized Service Centers or by non qualified service personnel. The company shall have no obligation or liability whatsoever to the buyer for any indirect, special, consequential or incidental loss or damage caused or arising from the company's proven negligence

8.1. GENERAL INSPECTION

The inspection intervals depend on the motor type, application and installation conditions. Proceed as follows during inspection:

- Visually inspect the motor and coupling. Check if abnormal noises, vibrations, excessive heating, wear signs, misalignment or damaged parts are noticed. Replace the damaged parts as required.
- Measure the insulation resistance according to the item 5.4.
- Clean the motor enclosure. Remove oil spills and dust accumulation from the motor frame surface to ensure a better heat transfer to the surrounding ambient.
- Check cooling fan condition and clean the air inlet & outlet openings to ensure a free air flow over the motor.
- Investigate the actual condition of the seals and replace them, if required.
- Drain the condensed water from inside the motor. After draining, reinstall the drain plugs to ensure the degree of protection as indicated on the motor nameplate. The motor must always be positioned so the drain hole is at the lowest position (see item 6).
- Check the connections of the power supply cables, ensuring the correct clearance distance between live and grounded parts, as specified in Table 6.3.
- Check if the tightening torque of the bolted connections and mounting bolts meets the tightening torque specified in Table 8.7.
- Check the status of the cable passages, the cable gland seals and the seals inside the terminal box and replace them, if required.
- Check the bearing operating conditions. Check for the presence of any abnormal noise, vibration or other abnormal operating conditions, like motor temperature rise. Check the oil level, the lube oil condition and compare the workings hours with the informed life time.
- Record and file all changes performed on the motor.

Do not reuse damaged or worn parts. Damaged or worn parts must be replaced by parts supplied by the manufacturer and must be installed as if they were the original parts.

8.2. LUBRICATION

Proper lubrication plays a vital role in the motor performance. Only use the grease or oil types, amounts and lubrication intervals recommended for the bearings. This information is available on the motor nameplate and the lubrication procedures must be carried out according to the type of lubricant (oil or grease).
When the motor is fitted with thermal protection devices for bearing temperature control, consider the operating temperature limits shown in Table 6.4.
The maximum operating temperature of motors used in special applications may differ from those shown in Table 6.4. The grease and oil disposal should be made in compliance with applicable laws in each country

Please contact WEG when motors are to be installed in special environments or used for special applications.

8.2.1. Grease lubricated rolling bearings

Excess grease causes bearing overheating, resulting in bearing failure.

The lubrication intervals specified in Table 8.1, Table 8.2, Table 8.3 and Table 8.4 consider an absolute temperature on the bearing of 70 °C (up to frame size IEC 200 / NEMA 324/6) and 85 °C (for frame size IEC 225 / NEMA 364/5 and above), the motor running at rated speed, a motor mounted in horizontal position and greased with Mobil Polyrex EM grease. Any variation of the parameters listed above must be evaluated.

Table 8.1 *- Lubrication intervals for ball bearings*

Frame		Poles	Bearing designation	Amount of grease (g)	LUBRICATION INTERVALS (hours)

		6		120	4300	3100
		8		140	4500	4500

For each increment of 15 ºC above the bearing temperature, the relubrication intervals given in the Table must be halved. The relubrication interval of motors designed by the manufacturer for mounting in horizontal position, but installed in vertical position (with WEG authorization), must be halved.
For special applications, such as: high and low temperatures, aggressive environments, driven by frequency inverter (VFD - frequency inverter), etc., please contact WEG about the required amount of grease and the relubrication intervals.

8.2.1.1. Motor without grease fitting

Motors without grease fittings must be lubricated in accordance with the existing Maintenance Plan. Motor disassembly must be carried out as specified in Item 8.3. If motors are fitted with shielded bearings (for example, ZZ, DDU, 2RS, VV), these bearings must be replaced at the end of the grease service life.

8.2.1.2. Motor with grease fitting

To lubricate the bearings with the motor stopped, proceed as follows:
Motors with grease fittings must be stopped to be lubricated. Proceed as follows:
- Before lubricating, clean the grease nipple and immediate vicinity thoroughly;
- Lift grease inlet protection;
- Remove the grease outlet plug;
- Pump in approximately half of the total grease indicated on the motor nameplate and run the motor for about 1 (one) minute at rated speed;
- Switch-off the motor and pump in the remaining grease;
- Lower again the grease inlet protection and reinstall the grease outlet protection.

To grease the motor while running, proceed as follows:
- Before lubricating, clean the grease nipple and immediate vicinity thoroughly;
- Pump the total grease indicated on the motor nameplate;
- Lower again the grease inlet protection.

For lubrication, use only manual grease gun.

If Motors are provided with a spring device for grease removal, the grease excess must be removed by pulling the rod and cleaning the spring until the spring does not remove more grease.

8.2.1.3. Compatibility of the Mobil Polyrex EM grease with other greases

The Mobil Polyrex EM grease has a polyurea thickener and a mineral oil thus being compatible with greases that contain:
- Lithium based thickener, lithium-based complex thickener, polyurea thickener and refined mineral oil;
- The used grease must have in its formulation corrosion and oxidation inhibitors.

In general terms, greases with the same type of soap are compatible to each other. However, depending on the proportion of the mixture there may be incompatibility. In such a case, it is not recommended to mix different types of greases without contacting the supplier or WEG beforehand.

8.2.2. Oil lubricated bearings

To change the oil of oil lubricated motor proceed as follows:
- switch-off the motor;
- remove threaded oil drain plug;
- open the valve and drain the oil;
- close the drain vale again;
- reinstall the threaded oil drain plug;
- fill-up with the type and amount of oil as specified on the nameplate;
- check oil level. The oil level is OK when the lubricant can be viewed approximately in the center of the sight glass;
- reinstall oil inlet plug;
- check for oil leaks and ensure that all not used threaded plugs are closed with plugs.

The bearing lubricating oil must be replaced as specified on the nameplate or whenever changes in the oil properties are noticed. The oil viscosity and pH must be checked periodically. The oil level must be checked every day and must be kept in the center of the sight glass.
Please contact WEG, when oils with different viscosities should be used.

***Note**:*
The HGF vertical mounted motors with high axial thrust are supplied with grease lubricated DE-bearings and with oil lubricated NDE-bearings. The DE-bearings must be lubricated according to recommendations in item 8.2.1. Table 8.5 specifies the oil type and the amount of oil required for this motor lubrication.

***Table 8.5** - Oil properties for HGF vertical mounted motors with high axial thrust*

Mounting - High axial thrust	Frame		Poles	Bearing designation	Oil (liters)	Interval (h)	Lubricant	Lubricant specification
	IEC	NEMA						
	315L/A/B e 315C/D/E	5006/7/8T e 5009/10/11T	4 - 8	29320	20	8000	Renolin DTA 40 / SHC 629	ISO VG150 mineral oil with antifoam and antioxidant additives
	355L/A/B e 355C/D/E	5807/8/9T e 5810/11/12T	4 - 8	29320	26			
	400L/A/B e 400C/D/E	6806/7/8T e 6809/10/11T	4 - 8	29320	37			
	450	7006/10	4 - 8	29320	45			

8.2.3. Oil mist lubricated bearings

Check the service conditions of the seals and if replacement is required use only original components. Clean the seal components before assembly (bearing caps, end shields, etc.).
Apply joint sealant between the bearing caps and end shields. The joint sealant must be compatible with the used lubricating oil. Connect the oil lubricant tubes (oil inlet and oil outlet tubes and motor drain tube), as shown in Figure 6.12.

8.2.4. Sleeve bearings

The lubricating oil of sleeve bearings must be changed at the intervals specified in Table 8.6. To replace the oil, proceed as follows:
- NDE-bearing: remove the protection plate from the fan cover;
- Drain the oil through the drain hole located at the bottom of the bearing (see Figure 8.1);
- Close the oil drain hole;
- Remove the oil inlet plug;
- Fill the sleeve bearing with the specified oil and with the amount of oil specified in;
- Check the oil level and ensure it is kept close to the center of the sight glass;
- Install the oil inlet plug;
- Check for oil leaks.

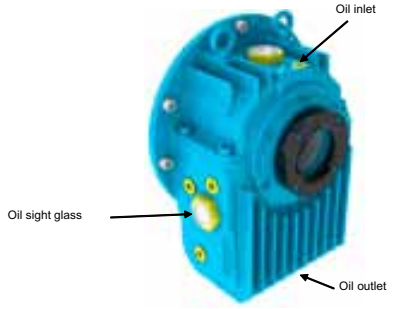

***Figure 8.1** - Sleeve bearing*

Table 8.6 - *Oil properties for sleeve bearings.*

Frame		Poles	Bearing designation	Oil (liters)	Interval (h)	Lubricant	Lubricant Specification
IEC	NEMA						
315L/A/B and 315C/D/E	5006/7/8T and 5009/10/11T	2	9-80	2.8	8000	Renolin DTA 10	ISO VG32 mineral oil with antifoam and antioxidant additives

400L/A/B and 400C/D/E	6806/7/8 and 6809/10/11T		11-110	4.7			
450	7006/10		11-125				
500	8006/10						

The lubricating oil must be replaced as specified on the nameplate or whenever changes on the oil properties are noticed. The oil viscosity and pH must be checked periodically. The oil level must be checked every day and kept in the center of the sight glass.
Please contact WEG, when oils with different viscosities are to be used.

8.3. MOTOR ASSEMBLY AND DISASSEMBLY

All repair services on motors should be always performed by qualified personnel and in accordance with the applicable laws and regulations in each country. Always use proper tools and devices for motor disassembly and assembly.

Disassembly and assembly services can be carried out only after the motor has been disconnected from the power supply and is completely stopped.

Dangerous voltages may be present at the motor terminals inside the terminal box since capacitors can retain electrical charge for long periods of time even when they are not connected directly to a power source or when space heaters are connected to the motor or when the motor windings are used as space heaters. Dangerous voltages may be present at the motor terminals when they are driven by frequency inverter even when they are completely stopped.

Record the installation conditions such as terminal connection diagram, alignment / leveling conditions before starting the disassembly procedures. These records should be considered for later assembly.

Disassemble the motor carefully without causing scratches on machined surfaces or damaging the threads.

Assemble the motor on a flat surface ensuring a good support base. Footless motors must be fixed/locked on the base to prevent accidents.

Handle the motor carefully to not damage the insulated components such as windings, insulated rolling bearings, power cables etc.

Seal elements, such as joint seals and bearing seals should always be replaced when wear or damage is noticed.

Motors with degree of protection higher than IP55 are supplied with joint and screw seal Loctite 5923 (Henkel) Clean the components and apply a new coat of Loctite 5923 on the surfaces before assembly.

8.3.1. Terminal box

Proceed as follows to remove the terminal box cover and to disconnect/connect the power supply cables and the cables of the accessory devices:

- Ensure that during the screw removal the terminal box cover does not damage the components installed inside the terminal box.
- If the terminal box cover is fitted with lifting eyebolt, lift the terminal box cover always by its lift eyebolt.
- If motors are supplied with terminal blocks, ensure the correct tightening torque on the motor terminals as specified in Table 8.7.
- Ensure that the cables do not contact sharp edges.
- Ensure that the original IP degree of protection is not changed and is maintained as indicate on the motor nameplate. The power supply cables and the control cables must always be fitted with components (cable glands, conduits) that meet the applicable standards and regulations of each country.
- Ensure that the pressure relief device is in perfect operating condition, if provided. The seals in the terminal box must be in perfect condition for reuse and must be reinstalled correctly to ensure the specified degree of protection.
- Ensure the correct tightening torque for the securing bolts of the terminal box cover as specified in Table 8.7.

Table 8.7 *- Tightening torque for the securing bolts [Nm]*

Screw type and seal	M4	M5	M6	M8	M10	M12	M16	M20
Hex bolt/hex socket bolt (without seal)	-	4 to 7	7 to 12	16 to 30	30 to 50	55 to 85	120 to 180	230 to 360
Combined slotted screw (without seal)	-	3 to 5	5 to 10	10 to 18	-	-	-	-
Hex bolt/hex socket bolt (with seal with metallic stop/cord)	-	-	-	13 to 20	25 to 37	40 to 55	50 to 65	-
Combined slotted screw (with flat seal 'and/or mettallic stop/cord)	-	3 to 5	4 to 8	8 to 15	-	-	-	-
Hex bolt/hex socket bolt (with flat seal)	-	-	-	8 to 15	18 to 30	25 to 40	35 to 50	-
Terminal blocks	1 to 1,5	1,5 to 4	3 to 6,5	6 to 9	10 to 18	15,5 to 30	30 to 50	-
Grounding terminals	-	3 to 5	5 to 10	10 to 18	30 to 50	55 to 85	120 to 180	-

8.4. DRYING THE STATOR WINDING INSULATION

Dismantle the motor completely. Remove the end shields, the rotor with the shaft, the fan cover, the fan and the terminal box before the wound stator with the frame is transferred to the oven for the drying process. Place the wound stator in the oven heated to max. 120 °C for two hours. For larger motors a longer drying time may be required. After the drying process has been concluded, allow the stator to cool to room temperature. Measure the insulation resistance again as described in item 5.4. Repeat the stator drying process if the required insulation resistance does not meet the values specified in Table 5.3. If the insulation resistance does not improve despite several drying processes, evaluate the causes of the insulation resistance drop carefully and an eventual replacement of the motor winding may be required. If in doubt contact WEG.

To prevent electrical shock, discharge the motor terminals immediately before, and after each measurement. If the motor is equipped with capacitors, these must be discharged before beginning any repair.

8.5. SPARE PARTS

When ordering spare parts, always provide complete motor designation, indicating the motor type, the code number and the serial number, which are stated on the motor nameplate.

Spare parts must always be purchased from WEG authorized Service Centers. The use of non-original spare parts can cause motor failure, performance drop and void the product warranty.

The spare parts must be stored in a clean, dry and properly ventilated room, with relative air humidity not exceeding 60%, with ambient temperature between 5 °C and 40 °C, free of dust, vibrations, gases, corrosive smokes and at constant temperature. The spare parts must be stored in their normal mounting position without placing other components onto them.

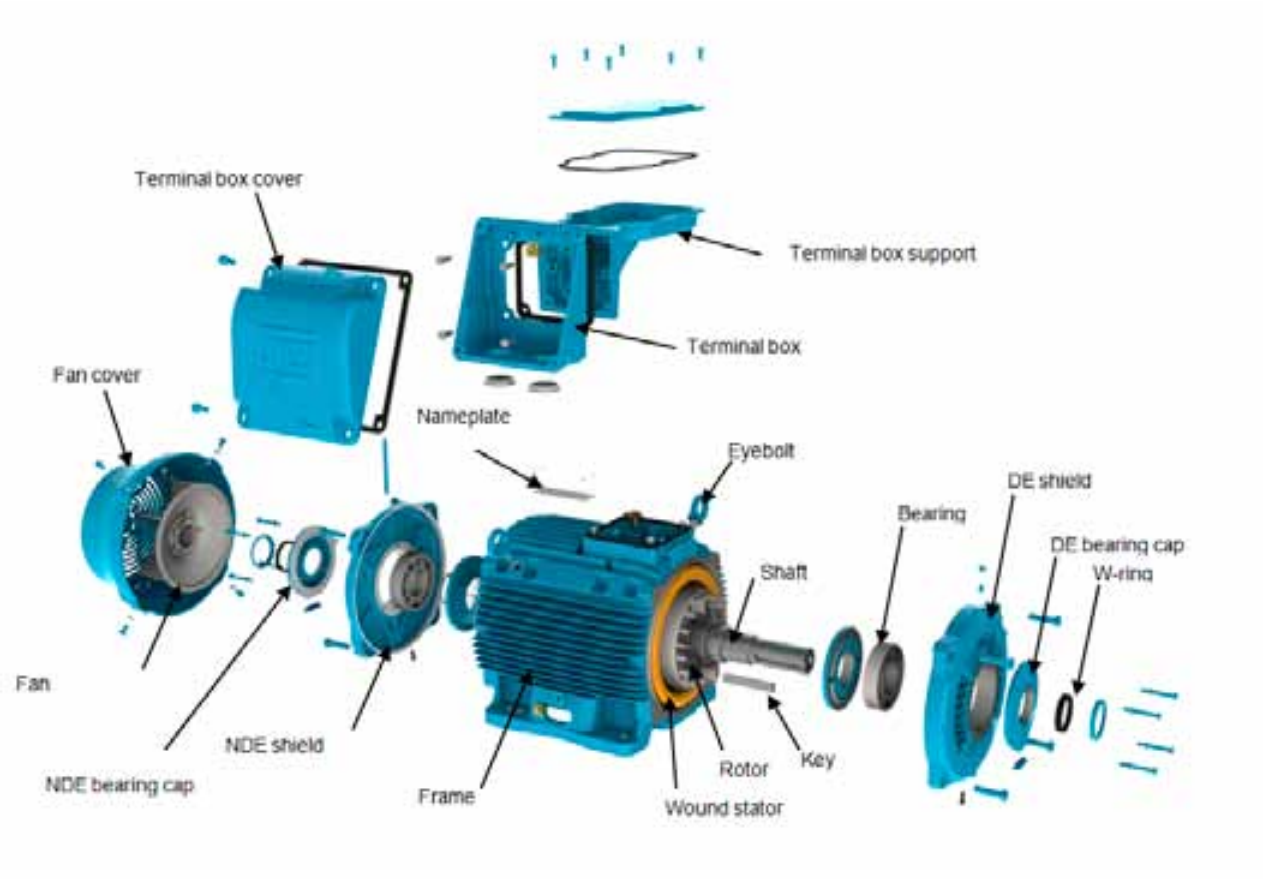

Figure 8.2 *- Exploded view of the components of a W22 motor*

9. ENVIRONMENTAL INFORMATION

9.1. PACKAGING

WEG electric motors are supplied in cardboard, plastic or wooden packaging. These materials can be recycled and must be disposed according to the applicable laws and regulations in each country. All wood used in the packaging of WEG motors come from the company reforestation program and is not submitted to any chemical conservation treatment.

9.2. PRODUCT

Electric motors consist mainly of ferrous metals (steel plates and cast iron), non ferrous metals (copper and aluminum) and plastic materials.

In general, electric motors have relatively long service live. However when they must be discarded, WEG recommends to dismantle the motor, sort the different materials and send them for recycling.

No-recyclable materials should be disposed of at industrial landfills according to the applicable environmental laws and regulations in each country, or co-processed in cement kilns or incinerated.

The recycling service providers, the disposal in industrial landfills, the waste co-processing or the incineration process must be properly authorized by the state environment agency to carry out these activities.

10. TROUBLESHOOTING CHART X SOLUTIONS

This troubleshooting chart provides a basic list of problems that may occur during motor operation, possible causes and recommended corrective actions. In case of doubts, please contact WEG Service Center.

Problem	Possible cause	Corrective action
Motor does not start, neither coupled nor decoupled	Power cables are interrupted.	Check the control panel and the motor power supply cables.
	Blown fuses.	Replace blown fuses.
	Wrong motor connection.	Correct the motor connection according to connection diagram.
	Locked rotor.	Check motor shaft to ensure that it rotates freely.
The motor starts at no-load, but fails when load is applied. It starts very slowly and does not reach the rated speed.	Load toque is too high during start-up.	Do not start the motor on load.
	Too high voltage drop in the power cables	Check the installation dimensioning (transformer, cable cross section, relays, circuit breakers, etc.)
Abnormal / excessive noise	Defective transmission component or defective driven machine.	Check the transmission force, the coupling and the alignment.
	Misaligned / unleveled base.	Align / level the motor with the driven machine
	Unbalanced components or unbalanced driven machine	Balance the machine set again
	Different balancing methods used for motor and coupling balancing (halve key, full key)	Balance the motor again
	Wrong motor direction of rotation	Reverse the direction of rotation
	Loose bolts	Retighten the bolts
	Foundation resonance	Check the foundation design
	Damaged bearings	Replace the bearings
Motor overheating	Insufficient cooling	Clean air inlet and outlet and cooling fins
		Check the minimum required distance between the fan cover and nearest walls. See item 7
		Check air temperature at inlet
	Overload	Measure motor current, evaluate motor application and if required, reduce the load
	Number of starts per hour is too high or the load inertia moment is too high	Reduce the number of starts per hour
	Power supply voltage too high	Check the motor power supply voltage. Power supply voltage must not exceed the tolerance specified in item 7.2
	Power supply voltage too low	Check the motor power supply voltage and the voltage drop. Power supply voltage must not exceed the tolerance specified in item 7.2
	Interrupted power supply	Check the connection of the power cables
	Voltage unbalance at the motor terminals	Check for blown fuses, wrong commands, voltage unbalance in the power line, phase fault or interrupted power cables
	Direction of rotation is not compatible with the unidirectional fan	Check if the direction of rotation matches the rotation arrow indicated on end shield
Bearing overheating	Excessive grease / oil	Clean the bearing and lubricate it according to the provided recommendations
	Grease / oil aging	
	The used grease / oil does not matches the specified one	
	Lack of grease / oil	Lubricate the bearing according to the provided recommendations
	Excessive axial or radial forces due to the belt tension	Reduce the belt tension
		Reduce the load applied to the motor

11. WARRANTY TERM

WEG Equipamentos Elétricos S/A, Motor Unit, offers warranty against defects in workmanship and materials for their products for a period of 18 months from the invoice issue date by factory or distributor / dealer, limited to 24 months from date of manufacture. Motors of the HGF Line are covered for a period of 12 months from the invoice issue date by the factory or distributor / dealer, limited to 18 months from the date of manufacture.

The paragraph above contains the legal warranty periods. If a warranty period is defined in a different way in the commercial, technical proposal of a particular sale, that will override the time limits set out above.
The periods above are independent of installation date and provided that the following requirements are met: proper transportation, handling and storage; correct installation in specified environmental conditions free of aggressive agents; operation within the capacity limits and observation of the Installation, Operation and Maintenance Manual; execution of regular preventive maintenance; execution of repairs and/or changes only by personnel with WEG's written authorization; in the occurrence of an anomaly, the product must be available to the supplier for the minimum period necessary to identify the cause of the anomaly and to repair it properly; the buyer must immediately notify WEG of any defects occurred and they must be later confirmed as manufacturing defects by WEG. The warranty does not include assembly and disassembly services at the buyer's premises, costs of product transportation, as well as travel, lodging and meals expenses for the technical assistance staff when requested by the customer. The warranty service will be provided exclusively at a WEG authorized Technical Assistance or at the plant.
Components, parts and materials whose useful life is usually less than 12 (twelve) months are not covered by the warranty.
Under no circumstance will warranty services extend the warranty period of the equipment. However, new warranty equivalent to the original one will be due only to the components repaired or replaced by WEG.
The present warranty is limited to the product supplied. WEG will not be liable for damages to people, third parties, other equipment and facilities, loss of profits or other incidental or consequential damages.

12. EC DECLARATION OF CONFORMITY

WEG Equipamentos Elétricos S/A
Av. Prefeito Waldemar Grubba, 3000
89256-900 - Jaraguá do Sul - SC - Brazil,

and its authorised representative established in the European Community,
WEGeuro - Industria Electrica SA
Rua Eng Frederico Ulrich, Apartado 6074
4476-908 - Maia - Porto - Portugal

hereby declare that the products:

WEG induction motors and components for using in these motors:

Three-phase
IEC frames 63 to 630
NEMA frames 42, 48, 56 and 143 to 9610
……

Single-phase
IEC frames 63 to 132
NEMA frames 42, 48, 56 and 143 to 215
……

when installed, maintained and used in applications for which they were designed, and in compliance with the relevant installation standards and manufacturer's instructions, comply with the requirements of the following European Directives and standards where applicable:

Directives:
Low Voltage Directive 2006/95/EC
Regulation (EC) No 640/2009
Directive 2009/125/EC
EMC Directive 2004/108/EC (induction motors are considered inherently benign in terms of electromagnetic compatibility)

Standards:
EN 60034-1/2-1/5/6/7/8/9/11/12/14/30 and 60204-1

From 29/12/2009 on low voltage electric motors are no longer considered under the scope of the current Machinery Directive 2006/42/EC.

CE marking in: 1996

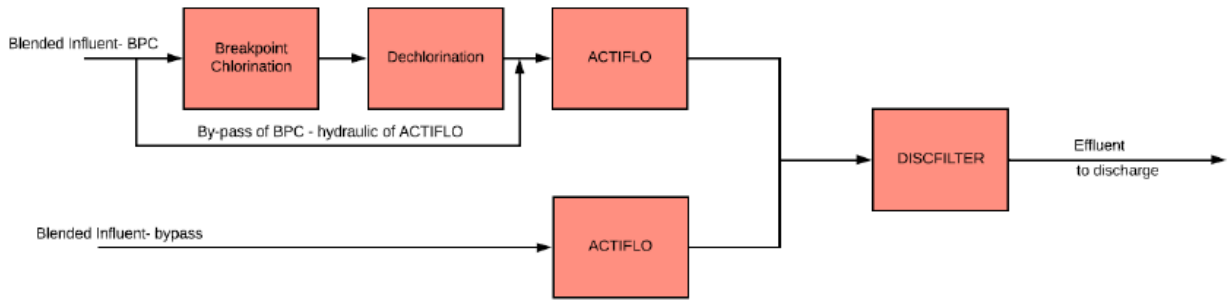
1 – INTRODUCTION

1.1 – GENERAL DESCRIPTION



LEFT BLANK

GENERAL DESCRIPTION

Veolia Water Technologies Canada Inc. (VEOLIA) has been contracted by Agnico Eagle Mines Ltd (AEM) for the supply of a new effluent treatment plant. The water to be treated is a mixture of surface water and underground water which is highly saline and contains high levels of ammonia originating from the mining activity.

This project is an expansion to the current Breakpoint Chlorination Process plant that was executed also by VEOLIA in 2019. This allows the enlargement of the treatment flow to 6000 m³/d of underground water and from 6000 m³/d to 12000 m³/d of surface water.

The treatment consists of a newly developed chain of Actiflo and reactors with powder activated carbon. The treatment will be composed of these following major equipments:

The mixed raw water, underground water and surface water, goes through the first reactor tank RX75-3, the Chlorination Reactor for the breakpoint chlorination for ammonia removal, which is a closed-top tank where an hypochlorite source which VEOLIA considered to be Calcium Hypochlorite and an alkali, Sodium hydroxide (NaOH) are added. The injected hypochlorite will produce hypochlorous acid (HOCl) which is a weak acid, and depending on the pH, part of it will decompose into hypochlorite ions (OCl-). The control of the pH is done by the injection of sulfuric acid in order to optimize the hypochlorite ion concentration thus the chlorine dosage. The control of the pH avoids generation of chlorine gases which are observed in acid pH resulting in safety and corrosion issues. The hypochlorous acid and hypochlorite ions are consumed first by the reducing agents and organic matter in the water, adding more chlorine and with the presence of ammonia, the ammonia reaction will result in forming chloramines, specifically monochloramines (NH2Cl). The adequate addition of chlorine and depending on its concentration, will lead to the destruction of the monochloramine which will be transformed to dichloramines (NHCl2) or trichloramines (NCl3) and then finally into nitrogen (N2). The breaking point will be reached if the sufficient quantity of chlorine is injected and will result in having all the chloramines and ammonia converted to nitrogen.

The effluent of the Chlorination Reactor rich in chlorine residual will go through the second reactor tank RX75-3, the Dechlorination Reactor for chlorine destruction. The dechlorination process consists of eliminating the chlorine residual which is dangerous for aquatic life. With the two steps injection of Powdered Activated Carbon (PAC) in the first two compartments of the open-top tank a sufficient contact time is allowed for complete chlorine destruction with the presence of fresh activated carbon along the process. The PAC is dosed into the process using the HydraCarb system which consists of gravimetric feeder, a wetting cone and an eductor to transport the PAC slurry to the dosing points, in addition to the superbags support system. Manual injection valve will allow the proper split of the PAC in each of the Dechlorination Reactor compartments. Some the PAC will be recirculated from the Actiflo unit ACP-700R, Clarifier #1 which will slightly reduce the PAC requirement and elevate the efficiency of chlorine destruction. Finally, due to the low water temperature, coagulant will also be injected into the Dechlorination Reactor for a higher contact time for the activation of the coagulant which is a destabilization agent in order to agglomerate TSS particles contained in the raw water for further removal.

Two Actiflo ballasted flocculation systems are placed in this process chain. The first is of the model ACP-700R, Clarifier #1, functioning as an ActiCarb for the TSS removal and the dosed PAC following the breakpoint chlorination and dechlorination process. The second is of the model ACP2-60, Clarifier #2, functioning as a by-pass to the whole breakpoint chlorination process for TSS removal only. In the proposed chain, there are three different sources of feed to the Actiflo units. The Clarifier #1 can have a first source from the breakpoint and dechlorination process coming for the upstream installed reactor tanks or from the by-pass of these tanks for which coagulant injection is added in the first compartment of the Clarifier #1 to increase coagulant efficiency. As for the Clarifier #2, the raw water composed of underground water and surface water is directly sent to it. The sand-ballasted settling is a high-rate coagulation / flocculation / sedimentation process that utilizes microsand as a seed for floc formation. The microsand will act as an additional weight on the formed flocs from the injection of polymer leading to an increase in sedimentation efficiency. The Actiflo units consist of three active chambers, the slurry flows the first chamber for bubbles bursting generated from the chlorine destruction (if applicable) to avoid having an impact of the settling process. In this compartment coagulant is injected for both clarifiers for TSS particles agglomeration, exceptionally in the Clarifier #1, sodium thiosulfate is dosed in order to destroy any residual chlorine from the Dechlorination Reactor. The chlorine and bubble free slurry flows through the second chamber, the injection compartment in which anionic polymeric flocculant and microsand are added for floc formation, then goes through the maturation compartment in order to create the ideal bridging between the microsand and the destabilized suspended solids. The fully formed ballasted flocs will enter the third and final tank, the settling tank, equipped with lamella which provide the rapid and effective removal of the microsand / sludge floc. Clarified water exits the system via a weir and flows to a clarified water holding tank. The settled sand-sludge-PAC will be forced to the center cone of the clarifier by a scraper, which will be continuously withdrawn by the recirculation pumps in the hydrocyclones in order to separate the sludge and microsand by centrifugal force.

After separation, the high density microsand will be reinjected in the clarifier, as for the sludge will be directed gravitairly to dedicated Splitter Box per Actiflo unit where part of this sludge coming from the Clarifier #1 flows back to the dechlorination reactor due to the presence of PAC in it and the one coming from the Clarifier #2 will be recirculated in its first compartment. These Sludge Splitter Boxes will allow the homogenization of the sludge quality and provide some thickening of it for later disposal by pumping it in a separate sludge holding tank which will be mixed to prevent any settling or accumulation of the sludge in it.

The clarified water of both Clarifiers #1 and #2 will then flow gravitairly to the Discfilter filtration process. This step is used as an additional suspended solids removal step aiming for supplemental metal reduction at the final effluent. The discfilter consists of a filter cloth mounted on filter panels. These panels stem from a central drum where inlet water is admitted into the unit. Water will be filtered in inside-out mode from the central tube to the open base of the filter discs though the polyester cloth before reaching its water collection tank. Solids will create build-ups on the filter media which will result in head loss generation resulting in increase of the water level at the inlet which will be detected by high level switches that initiate the backwash cycle. Part of the filtered water will be used for the backwash of the filter cloths, the collected dirty backwash water is then stored in a separate holding tank then pumped back in the Clarifier #2 for recirculation. A chemical trolley is supplied in the case of chemical scaling due to calcium concentration in the water and more aggressive backwashing of the filters is required.

Finally, in addition to the listed technologies above, to assure adequate control and analysis of this process a variation of instrumentation have been provided, the likes of the Tethys as an ammonia analyser at the inlet of the treatment along with various stand-alone instrumentation skids for the TSS and pH measurements and a dilution and analysing skid for the free and total chlorine measurements for each of the Chlorination Reactor and Dechlorination Reactor.

APPENDIX		**11**

1.0 GENERAL

It should be recognized that potential hazards exist in any processing system. By including this section in the operating manual, Veolia Water Technologies Canada Inc. is in no way attempting to override the plant safety rules laid out to the employees by their employer. However, because of our concern for good, efficient operation of the equipment furnished, we recognize our obligation to point out certain hazards. We also recognize that this section cannot cover every possible hazard; rather, it merely points out some of the most common and important ones.

In each plant, the hazards vary slightly because of the particular chemical or material that is being processed. However, there are some safety recommendations that apply to all operations. These hazards can be broken down into three general areas, namely utility hazards (compressed air, electrical, etc.), equipment hazards, and chemical hazards. These three areas will be covered separately in the following sections.

One of the most important ways to avoid hazards is to have a good understanding of the process. Familiarity with the system and good common sense will enable operators to run the system smoothly and safely.

WHMIS Safety Data Sheets (SDS) should be available for each chemical product used.

2.0 OPERATION AND MAINTENANCE MANUAL

It is important that the operator understand the use, security and maintenance instructions before using the Veolia Water Technologies Canada Inc. system. The manufacturer cannot be held responsible for improper use or maintenance resulting from a breach or non-compliance with instructions. The Operation and Maintenance Manual contents must be kept permanently close to Veolia Water Technologies Canada Inc. system in a safe place.

3.0 PLANT SAFETY PROCEDURES

As stated earlier, the safety rules and guidelines issued to the employees are the primary precautions that are necessary for the prevention of accidents. The employee should be very familiar with these rules. The safety pictograms used in the plant are to be respected at all times.

Operators should always wear the safety equipment that is provided or required by their management. Such items as hard hats, safety shoes, safety glasses, gloves, breathing protection, protective clothing, protection harness and hearing protection are very basic and go a long way in preventing accidents.

Operators should be aware of the location of fire extinguishers, eyewash stations, safety showers, self-contained breathing apparatus, first aid stations, and other safety equipment furnished for the plant.

Good housekeeping will also eliminate safety hazards such as tripping or slipping.

When spills happen, the floor should be washed as soon as possible. When construction or maintenance is finished, removing debris also eliminates a hazard. Proper housekeeping is a good indication of safety attitude in general.

Management provided training can always help in making employees more safety conscious. In these seminars, potential hazards can be pointed out. Veolia Water Technologies Canada Inc. will be glad to assist these efforts by furnishing details on its equipment relating to safety as well as on its operation.

Investigation of an accident to determine its cause will help to prevent the same accident from occurring again and will aid in finding a way of correcting or eliminating the hazard.

Remember, safety rules provided by your employer are designed to protect you and should be strictly adhered to. However, as an operator, safety is your responsibility and you should voice any concerns you have and follow through until corrective action is taken.

4.0 UTILITY HAZARDS

Utility hazards that may exist in the plant may include high-pressure/ high-temperature steam, high-voltage electricity, high-pressure water, and high pressure air. Care should be taken when utilizing any of the utilities.

4.1 STEAM

Whenever steam is used the potential for burns exist. The recommended first aid for burns is to first apply ice or cold water directly to the burn and then cover the area with cool, moist application gauze or bandage material to minimize blistering. If burns are critical (second and third degree), transport the injured person to a medical facility promptly.

Hot surfaces in areas frequented by personnel should be covered with insulation for protection. When hot surfaces must be left exposed, such as steam valves or sight glasses, operators should be warned of the potential hazard displaying pictograms, training, and supervision.

Steam valve packing, steam traps, and pipe fittings that are leaking should be brought to the attention of supervision and repaired as soon as possible. Instrumentation connections and pipeline for steam should be piped with good connections. Valves should be tagged and locked out on equipment that is being worked on where steam is used to prevent someone from opening the valve. At times, steam is used for cleaning lines. Operators should make sure that if hoses are used, they are designed for steam service. Make sure the connections are tight and do not leak.

Drain and sample connections should be suitably identified and piped with proper fittings. Rupture discs, pressure relief valves, and steam trap discharges should be suitably identified and piped in such a way that they do not release steam in an area of access. These must also be periodically checked to make sure that they are in good working order. Precautions should be taken to prevent accidental release of pressurization, which could injure personnel. Water or

steam hammering in steam lines should be investigated for the source and stopped as soon as possible to prevent rupture.

4.2 ELECTRICAL

As with steam, electrical equipment should never be worked on unless it is turned off and locked and tagged out. The lockout system key should belong to the person doing the repair or the on-site electrician. This will remove the potential danger for electrical shock or accidental start-up.

Electrical hazards fall into three categories: shock, burn, and fire. The severity of electrical shock depends on several items, such as the nature of the electrical impulse and the path that the shock takes through the body. Burns can be caused by contact with an electrical current. Fire can be caused by a chemical or gas burning or exploding when coming in contact with an electrical spark.

General first aid for electrical burns is as follows:

- Remove the victim from contact with the electrical current without coming into contact with the current yourself.
- Check for cardiac arrest or respiratory failure.
- Check for points of entry and exit of the current.
- Cover the burned surface with a clean dressing.
- Splint all fractures.
- Treat for physical shock.
- Transport to a medical facility promptly.

Except for very low voltage exposure (below 24 V) and very low body current (below 0.2 mA), it is difficult to state safe limits for electrical exposure. Even these low energy exposures can be traumatic for people with heart diseases.

Even though most electrical motors and switch boxes are designed to be watertight, it must be recognized that the presence of water around electrical equipment always presents a hazard and therefore should be used with care.

4.3 HIGH PRESSURE WATER

High pressure water is used in some pumps, cooling devices and heat exchangers. As with steam, high pressure water can be a hazard if a small leak is not repaired.

Only the proper pressure fittings should be used in the piping system. As stated earlier, leaks should be repaired as soon as possible. Isolation valves on piping that are being repaired should be shut tight and locked out. As with electrical repairs, the lockout system key should be in the possession of the individual working on the piping.

4.4 PLANT AIR

Care should be taken when using plant air to clean equipment, unblock lines, or blow dust off personnel. High pressure air can be very dangerous to personnel, especially in the area of the face. Pressure should be reduced before using the air to blow dust off clothing. Make sure all fittings have good connections and cannot be blown loose.

5.0 EQUIPMENT HAZARDS

5.1 ROTATING PARTS, HAZARDOUS AREAS AND CONFINED SPACES

Rotating parts

Since the system includes equipment with rotating parts (e.g. pumps, mixers, etc.). Operators should avoid wearing loose clothing and jewellery. Loose clothing can present one of the biggest safety hazards that exist when working near equipment in the process.

Dangerous Surfaces

Sharp or protruding surfaces are normally eliminated in areas frequented by personnel. When present in an operating area, the surface should be covered for protection and clearly marked to minimize the danger of contact.

High Noise

Equipment that is likely to generate high noise levels should be insulated and/or isolated for personal access. If personnel must enter a high noise area, they will wear hearing protection.

Confined Spaces

Before entering or breaking the plane of any vessel, be sure to check if it is a potential Confined Space and if a permit is required for entrance. Vessels that require a Confined Space Entry Permit may include but are not limited to flash tanks, heaters, condensers, and storage tanks.

5.2 OPERATION AND MAINTENANCE

The equipment in its normal use can present a hazard if not operated or repaired in a safe manner. Example of equipment: pumps, valves, instruments, hoses, etc.

All equipment should only be operated and repaired according to the recommended procedures of the manufacturer, and by qualified individuals.

Only recommended spare parts should be used. For instance, when replacing a gasket, verify the proper gasket is selected (pressure steam, corrosive, etc.).

In the repair or replacement of Veolia Water Technologies Canada Inc. furnished equipment, the Veolia Water Technologies Canada Inc. specifications should be consulted to ensure the correct

pressure rating is used.

Maintenance on pumps, piping, etc. should be performed only after valves are locked and tagged or slip blanks are installed to completely isolate the equipment being worked on. Instrumentation and controls should always be kept in good working order to help assure the safe operation of equipment. Never remove instruments or controls out of service until having communicated with the operator and have established a plan to define the operation maintenance steps. If air operated valves are used for isolation, the air line should be removed to prevent inadvertent operation of the valves. When possible the valve can also be locked in position.

When maintenance is finished on equipment, the protective caps provided must be reinstalled. If a protection must be left off, unwary personnel should be notified by using safety pictograms or installing temporary protection. Equipment should never be inspected or maintained while the equipment is operating. All pumps and various automatic valves may cause harm to an operator if care is not taken.

Before starting the equipment, the operator must verify if the maintenance staff has completed the work, if the pumps are not locked or frozen and whether bare electrical wires are present. He must also check the pipes to ensure there are no leaks, and all debris should be cleaned.

6.0 CHEMICAL HAZARDS

WHMIS Safety Data Sheets (SDS) should be available for each chemical product used.

Since chemicals or chemical dosage are used during normal operations of the treatment facility, the risks of fire, explosion and exposure to toxic chemicals or chemical burns are present. Chemicals that may be used regularly or, for instance, during cleaning include, without limitation, acids, caustics, polymers, ozone, coagulant and microsand. Operators should be made aware of the following:

- All chemicals which are used and any potentially dangerous reaction that could occur.
- Toxicity of all chemicals that are used or could be formed via reactions.
- Acidic or basic properties of all materials used.
- Potential fire or explosion hazards posed by the chemicals.
- Antidotes for exposure to toxic materials.
- Protective clothing that is recommended.
- Any other information that helps make the operators aware of a hazard.

6.1 CHEMICAL BURNS

Some treatment plant chemicals can be very acidic or basic and can cause serious burns if coming in contact with the skin or eyes. Operators should be careful when opening valves and working on lines and pumps. Safety glasses with side shields are always recommended when working around chemicals. Operators should familiarize themselves with the location and operation of safety showers and

eyewash stations. These stations should be inspected and tagged acceptably with a date and signature on a regular basis.

Whenever a leak or spill is sighted, corrective action should be taken immediately and the spill should be cleaned up. It should never be assumed that someone else is aware of the problem or will take care of the spill.

Accordingly, chemical lines should be clearly identified by colour coding or other suitable means. Routing of these lines should be in open areas and should avoid major work/ access areas wherever possible. This is critical if the vessels and piping are overhead.

Plant areas where these materials are handled should be restricted. A safety briefing for all visitors and/or new personnel is recommended before access is granted.

All plant personnel should be required to wear proper protective clothing when handling or working near these chemicals. A minimum wardrobe should include, but not be limited to, a plastic hard hat, coat, boots and gloves of a resistant material as well as a pair of safety glasses. Safety glasses, even with shields, are not adequate for use in areas where very acidic or basic materials are handled.

Accidental contact with these chemicals should be avoided. Remember, most liquid chemicals resemble water. Good housekeeping practices should be a requirement in areas where these materials are handled.

6.2 FIRE AND EXPLOSION

A combustible material will spontaneously start to burn when its temperature is raised to its ignition point in the presence of air. The ignition point of all chemicals used in the process should be known and posted for operators. In some cases, the mixture of vapour and air can burn violently in the form of an explosion.

Accordingly, chemicals should not be added to other materials if the effects of the addition are unknown. This includes disposal, which should only be into suitable containers. Sinks and/or sewers are not suitable for disposal.

WARNING:	In systems with Actiflo® clarifier, the lamella pack is pre-installed in the settling tank section of the Actiflo®. It is made of a very flammable material. Do not expose it to open flames or sparks. Do not allow any welding works nearby unless special precautions have been taken.

6.3 TOXIC EXPOSURE

Since we are dealing with the effects on individuals who may react to various toxic materials to different degrees, it is difficult to establish an absolute evaluation of toxicity.

However, most toxic materials do not have particularly adverse effects when present in small amounts. Consequently, the concept of the “threshold limit value” (TLV) has been developed and is defined as a concentration of toxic material below which it is believed nearly all individuals may be repeatedly exposed over a long duration without adverse effects. The TLV for all chemicals used should be on record and easily accessible.

7.0 SAMPLING AND LINE UNBLOCKING PROCEDURES

7.1 SAMPLING PROCEDURES

In the course of a start-up and operations of Veolia Water Technologies Canada Inc. supplied equipment, sampling of the process fluid is generally conducted in order to:

- Verify the system instrumentation.
- Adjust the system to maintain desired stability of operation.
- Troubleshoot upset conditions.
- Verify that the system performance meets contractual guarantees.

Regardless of the process fluid being sampled, care should always be taken to ensure samples are collected without placing personnel at risk of injury. Personnel who are collecting samples should always practice good safety habits in their collection routine. Personal protective equipment (PPE) should be selected and worn with respect to the type of sample being collected and its collection method.

PPE required for sampling is dependent on the material, the temperature and pressure, the sampling point, the surrounding conditions, etc. An example of the varying level of PPE required for each given sample is given below. However, the person responsible for sampling should determine for him or herself if his or her level of PPE is adequate for the task. **Remember, YOU are responsible for your safety.**

<u>PPE required for general field work</u>

- Steel-toed work boots, safety glasses, hard hat, leather gloves, hearing protection, respirator, long-sleeved shirt.

<u>Additional PPE required for handling hot, non-hazardous material</u>

- Insulated rubber gloves and face shield with goggles.

<u>Additional PPE required for handling hazardous material</u>

- Consult SDS
- Full-body suit, respirator, rubber gloves, face shield with goggles, protective sampling container.

The collector should study the pertinent sampling station specific to his/her process until comfortable he/she can collect a sample from the station in a safe manner that is also representative of the process conditions. The collector should then develop his/her own sampling procedure.

7.2 UNBLOCKING PROCEDURES

The systems processing highly viscous or sludgy solutions are prone to produce blocked drains, valves, and/or sampling stations. The operator should expect blocked connections in these systems. As such, the operator will eventually be required to unblock a connection to access a sample or drain a vessel or line. In doing so, the operator should:

- Review the need for proper personal protective equipment (PPE).
- Develop a plan for unblocking the connection
- Obtain the proper equipment to unblock the connection
- Safely implement the unblocking plan

Selecting the proper PPE for use in unblocking a connection is very similar to the PPE required for sampling noted in the previous section. However, unblocking a connection can result in an instantaneous release of fluid or material at velocities or forces much greater than seen during normal sampling methods. The operator should consider “what if” scenarios such as excessive splashing or large volume release after unblocking the connection and determine his/her PPE with these “worst case” conditions in mind.

Before attempting to unblock a connection, the operator should study the situation and develop a safe procedure to unblock the connection. He/she should observe the area around the connection problem in case a quick “get-a-way” should be required. He/she should inform any personnel in the area that may be affected by unblocking the connection. The operator should know the operating data of the material behind the plug, such as: its temperature, pH, pressure, etc. and modify his/her plan accordingly to develop the safest method of releasing the connection. It might be better for him/her to perform an exercise to test the method of unblocking to validate the proposed method.

Any equipment used in the unblocking process should be reviewed for adequacy of use. Is the hose rated for the material, temperature, and pressure expected in its use? Are the hose and fittings in good condition? If not, replace the unfit equipment with new or adequate equipment. Make sure all connections are tight and proper for the job. In addition, the hose assembly utilized in the unblocking process should be equipped with a bleed-off valve to depressurize the system prior to the dismantling of the connection. If a bleed-off valve does not exist, special care should be taken when dismantling a hose connection because it may still be subject to internal pressure after the release.

Once the plan and the equipment are in place, the operator must focus on the task to ensure the line is unblocked in the safest manner possible. He/she should especially be concerned not only with his/her own safety, but also of others in the area. Cordoning off the area surrounding the blocked connection is advisable. Remember, whatever means is used, with water, steam, or air, or mechanical means, BE READY FOR ANY CONSEQUENCES when unblocking the pipe.

Finally, when working with a partner, take special precautions to communicate your plan to avoid harming anyone due to miscommunication.

TABLE 5 FLUID

CODE	FLUID
QCA	ACTIVATED CARBON (POWDER)
JSA	ACTIVATED SILICA
KWC	ALUMINIUM CHLORIDE BASIC(COAGULANT)
KSA	ALUMINIUM SULFATE
IDT	ANTI SCALANT
DCE	ASH AND RESIDUS
ARL	BACKWASH AIR
ERL	BACKWASH WATER
OEC	CHLORINATED WATER < 5 ppm cl2
RSI	CITRIC ACID 10 – 50 %
ECO	COAGULATED WATER
EGL	COLD WATER
ACO	COMPRESSED AIR
EDD	DEGREASED WATER
EPO	DRINKING WATER
BSE	DRYED SLUDGE
KCF	FERRIC CHLORIDE 39 – 41 %
KSQ	FERRIC SULFATE
BFL	FLOATED SLUDGE
EFL	FLOCCULATED WATER
FEC	HOT WATER
AIN	INSTRUMENT AIR
APM	MEMBRANE PROCESS AIR
SMS	MICROSAND SLURRY
OAZ	OZONE
JPE	POLYMER
EPT	PRETREATED WATER
BPR	PRIMARY SLUDGE
BPE	PRIMARY THICKENED SLUDGE
APS	PROCESS AIR
EBR	RAW WATER
SAB	SAND SiO2
SWA	SAND WATER
EID	SERVICE WATER
BMC	SLUDGE
QBS	SODIUM BISULPHITE 37%
PCS	SODIUM CARBONATE
SCS	SODIUM CHLORIDE
OCS	SODIUM CHLORITE
XFR	SODIUM FLUORIDE
PBS	SODIUM HYDROGENCARBONATE
RDA	SODIUM HYDROXYDE >50% (CAUSTIC SODA)
IPP	SODIUM POLYPHOSPHATE
RSD	SULPHURIC ACID 70 – 96%
RSC	SULPHURIC ACID 93 – 98%
AVT	TREATED AIR
ETE	TREATED WATER
COI	TURBO GENERATOR LUBRICATING OIL
EUS	WASTE WATER

ACTUATORS

- BACK PRESSURE REGULATOR
- BACK PRESSURE REGULATOR WITH EXTERNAL TAP
- DIAPHRAGM–SPRING
- DIAPHRAGM–SPRING WITH POSITIONER
- DIFFERENTIAL PRESSURE REDUCING REGULATOR
- ELECTRO HYDRAULIC
- ELECTRO PNEUMATIC
- HAND WHEEL WITH ACTUATOR
- MANUAL ACTUATOR
- MOTOR
- MOTORISED WITH POSITIONER
- PNEUMATIC CYLINDER WITH POSITIONER
- PNEUMATIC CYLINDER
- POSITIONER * – TYPE
- SOLENOID
- SOLENOID MANUAL RESET

INSULATION PIPE

- INSULATION
- ELECTRIC HEAT TRACE
- STEAM HEAT TRACE

CONNECTION

- HOSE CONNECTION
- FLANGED CONNECTION
- END CAP DISCONNECT
- PIPE TO TUBING ADAPTER
- QUICK DISCONNECT
- PLUG

FLOW METER SYMBOLS

- FLOW ORIFICE
- CORIOLIS MASS FLOWMETER
- FLUME
- MAGNETIC FLOW METER
- SONIC FLOW METER
- TURBINE FLOW METER
- VENTURI
- WEIR
- VORTEX SENSOR
- ROTAMETER
- STOP LOG
- SIGHT FLOW STRAINER
- SIGHT FLOW INDICATOR

AIR SUPPLY ACCESSORIES

- AIR TRAP
- AIR FILTER
- AIR LUBRICATOR
- AIR REGULATOR
- COMB. AIR FILTER/ COMC. REGULATOR W/GAUGE

MISCELLANEOUS SYMBOLS

- AIR FILTER
- CALIBRATION COLUMN
- DRESSER COUPLING
- EJECTOR/EDUCTOR
- EXPANSION JOINT
- FLEXIBLE HOSE
- INJECTION QUILL
- PULSATION DAMPENER
- SILENCER
- STATIC MIXER
- STEAM TRAP
- STRAINER
- DRAIN
- FUNNEL
- PIGTAIL SIPHON
- VACUUM BREAKER
- VENT

AGITATORS SYMBOLS

- AERATOR W/SPARGE RING
- AGITATOR (PROPELLER)
- AGITATOR (TURBINE)
- BLADE AGITATOR
- IN LINE MIXER
- PADDLE AGITATOR

BLOWERS SYMBOLS

- CENTRIFUGAL BLOWER
- ROTARY BLOWER
- POSITIVE DISPLACEMENT BLOWER

FILTERS SYMBOLS

- AUTOMATIC SELF–CLEANING STRAINER
- BAG FILTER
- BASKET FILTER
- MULTIMEDIA FILTERS
- OIL FILTER

HEATERS SYMBOLS

- HEAT EXCHANGER
- ELECTRICAL HEATER
- INLINE HEATER

MOTORS SYMBOLS

- MOTOR VARIABLE SPEED
- MOTOR FIXED SPEED

PUMPS SYMBOLS

- AIR OPERATED DOUBLE DIAPHRAGM
- DRUM PUMP
- SUBMERSIBLE CENTRIFUGAL PUMP
- CENTRIFUGAL PUMP (STANDARD)
- CENTRIFUGAL SUMP PUMP
- DOUBLE SUCTION CENTRIFUGAL PUMP
- GEAR PUMP
- HORIZONTAL CENTRIFUGAL PUMP
- LIQUID RING VACUUM PUMP
- METERING PUMP
- PERISTALTIC
- POSITIVEDIS DISPLACEMENT PUMP
- PROGRESSIVE CAVITY PUMP
- SCREW PUMP
- SUBMERSIBLE PUMP
- SUBMERSIBLE WELL PUMP
- SUMP PUMP

- VERTICAL CAN PUMP
- VERTICAL INLINE PUMP

TANKS SYMBOLS

- HORIZONTAL STORAGE TANK
- PRESSURE VESSEL
- VERTICAL TANK
- VERTICAL STORAGE TANK
- OPEN TOP TANK
- CLOSED TOP TANK
- SPLITTER BOX
- BARREL
- TOTE
- UV UNIT

MISCELLANEOUS SYMBOLS

- AIR COMPRESSOR
- HYDROCYCLONE
- SCREW CONVEYOR
- BELT CONVEYOR

SAFETY AND TRANSPORT SYMBOLS

- EMERGENCY SHOWER/EYE WASH
- EMERGENCY SHOWER
- HOIST WITH CARRIAGE
- LIFT TRUCK
- TANK TRUCK

OTHERS SYMBOLS

- GFI POWER OUTLET 120VAC. C/W BOX, COVER & CONNECTOR
- CONTROL PANEL

ABREVIATION

AVG	AVERAGE
CFM	CUBIC FEET PER MINUTE
Cl2	CHLORINE
COND.	CONDUCTIVITY
CW	CITY WATER (POTABLE)
DEV	DEVIATION
GAL	GALLONS
GPD	GALLONS PER DAY
GPH	GALLONS PER HOUR
GPM	GALLONS PER MINUTE
HH	HIGH HIGH
H	HIGH
HOA	HAND/OFF/AUTO
HP	HORSEPOWER
IA	INSTRUMENT AIR
IDEM	EQUAL
L	LOW
LL	LOW LOW
MH	MANHOLE
MW	MANWAY
N.C.	NORMALLY CLOSED
N.O.	NORMALLY OPEN
TURB	TURBIDITY
OF	OVERFLOW
pH	PH
PART	PARTICLES
PA	PLANT AIR
PSIG	POUNDS PER SQUARE INCH – GAUGE
PW	PLANT WATER
RUN	RUNNING
RPM	REVOLUTIONS PER MINUTE
SCFM	STANDARD CUBIC FEET PER MINUTE
SCH	SCHEDULE
SG	SPECIFIC GRAVITY
SP	SETPOINT
SSH	STRAIGHT SIDE HEIGHT
SW	SEAL WATER
SWD	SIDE WATER DEPTH
TDH	TOTAL DYNAMIC HEAD (FT OF FLUID)
VAC	VACUUM
VSD	VARIABLE SPEED DRIVE
WC	WATER COLUMN
WD	WATER DEPTH
WL	WATER LEVEL
WV	WORKING VOLUME (DOES NOT INCLUDE FREEBOARD OR HEEL)

GENERAL INSTRUMENT OR FUNCTION SYMBOLS

	PRIMARY LOCATION ***NORMALLY ACCESSIBLE TO OPERATOR	PRIMARY LOCATION ***NORMALLY INACCESSIBLE TO OPERATOR	FIELD MOUNTED	AUXILIARY LOCATION ***NORMALLY ACCESSIBLE TO OPERATOR
DISCRETE INSTRUMENTS	1 * IP1**	2	3	4
SHARED DISPLAY, SHARED CONTROL	5	6	7	8
COMPUTER FUNCTION	9	10	11	12
PROGRAMMABLE LOGIC CONTROL	13	14	15	16

* SYMBOL SIZE MAY VARY ACCORDING TO THE USER'S NEEDS AND THE TYPE OF DOCUMENT. A SUGGESTED SQUARE AND CIRCLE SIZE FOR LARGE DIAGRAMS IS SHOWN ABOVE. CONSISTENCY IS RECOMMENDED.

** ABBREVIATIONS OF THE USER'S CHOICE SUCH AS IP1 (INSTRUMENT PANEL #1), IC2 (INSTRUMENT CONSOLE #2), CC3 (COMPUTER CONSOLE #3), ETC., MAY BE USED WHEN IT IS NECESSARY TO SPECIFY INSTRUMENT OR FUNCTIONLOCATION.

*** NORMALLY INACCESSIBLE OR BEHIND–THE–PANEL DEVICES OR FUNCTIONS MAY BE DEPICTED BY USING THE SAME SYMBOL BUT WITH DASHED HORIZONTAL BARS, I.E.

ISA INSTRUMENT IDENTIFICATION TABLE

NOTES:

1. SLUDGE DISCHARGE PIPING MUST BE DESIGNED TO PREVENT BACKPRESSURE INTO THE CYCLONES. IT IS IMPORTANT TO DROP ONE (1) FOOT AT THE SLUDGE OUTLET OF EACH HYDROCYCLONE.
   AFTER THE DROP, IF THE SLUDGE COLLECTOR IS A GRAVITY PIPE, IT MUST BE CALCULATED AS FREE FLOW WITH MAX 70–80% OF FILLING AND WITH A MAX VELOCITY OF 0.8 m/s.
   IF SEVERAL HYDROCYCLONES ARE IN OPERATION AT THE SAME TIME A VENT MUST BE ADDED ON EACH DROP.
2. ACTIFLO UNITS ARE PRE–ASSEMBLED. HOWEVER, FOR FREIGHT PURPOSES OR GENERAL PRACTICAL REASONS, THE INSTALLATION OF SOME ITEMS NEEDS TO BE COMPLETED ON SITE BY A CONTRACTOR.
3. A VENT MUST BE INSTALLED ON THE PIPE DISCHARGE IF ANY EQUIPMENT OR INSTRUMENT INSTALLED DOWNSTREAM COULD MALFUNCTION WITH AIR PRESENCE.
4. FOR TIE–POINT DESCRIPTION SEE GA DRAWING.
5. WATER ADMISSION IS REQUIRED ON THE HYDROCYCLONES TO ENHANCE THE SEPARATION OF FINE PARTICLES.

ø100 — SLUDGE OVERFLOW TO CLARIFIER #2 SHEET 8

ø150 — SLUDGE OVERFLOW TO DECHLORINATION REACTOR SHEET 6

NOTE:

1. LOW POINT DRAIN AND HIGH POINT VENT WILL BE DEFINED AT DETAILED ENGINEERING PHASE.
2. STABILIZE THE SPLITTER BOXES TO AVOID LATERAL MOVEMENT.
3. USE OF FLEXIBLE JOINTS OR FLEXIBLE PIPING AT INLET AND OUTLET CONNECTION OF THE SPLITTER BOXES IS RECOMMENDED TO PREVENT EXCESSIVE SHEAR STRESS ON FLANGES WELDS.
4. HIGH SOLID CONCENTRATION AND HIGH VELOCITY IN THE PIPING COULD LEAD TO ABRASION OF MATERIAL. VWT RECOMMENDS USING ADEQUATE FLEXIBLE PIPING MATERIAL FOR EXEMPLE ALFAGOMMA TYPE 202AA.

GENERAL :
–REFER TO THE INSTALLATION,OPERATION AND MAINTENANCE MANUAL (IOM) BEFOREHAND TO COORDINATE THE PLANT DESIGN, INSTALLATION AND START UP OF THE ACTIFLO PACK UNIT.
M.O.C. :
–TANK : PAINTED CARBON STEEL
–PIPING : STAINLESS STEEL 2205 AND ABRASION RESISTANT HOSE EXCEPT FOR RECIRCULATION PIPE UNDER –SETTLING TANK (STAINLESS STEEL 2205).

COLORS :
–TANK: WINDOW GRAY RAL 7040
–HANDRAILS, LADDER OR STAIRCASE – SAFETY YELLOW
TANK WEIGHTS:
–DRY SHIPPING WEIGHT: 16 000 KG (35 000 LBS)
–INSTALLED WET (FULL OF WATER) WEIGHT: 173 000 KG (273 600 LBS)
DESIGN COORDINATION :
–DO NOT SUPPORT ANY OTHER EQUIPMENT (PLATFORM, STAIRS, GRATING, PIPING, ETC..) ON UNIT STRUCTURE.
–THE TANK MUST BE GROUNDED.
–HATCHED AREA SHOWN ON THE FOOTPRINT NEEDS TO BE SUPPORTED.
–ROTATION DETECTION MONITOR (IFM DD2503) MUST BE INSTALLED IN THE STARTERS PANEL OR MCC (REFER TO IOM FOR MORE DETAILS).
–IMPORTANT TO DROP 3 FEET AT THE SLUDGE OUTLET OF EACH HYDROCYCLONE TO AVOID BACKFLOW THROUGH HYDROCYCLONE (SEE P&ID FOR MORE DETAILS).
INSTALLATION :
–CHECK CONCRETE PAD FLATNESS BEFORE INSTALLING THE ACTIFLO UNIT.
–REFER TO FIELD INSTALLATION DRAWINGS AND IOM MANUAL FOR INSTALLATION DETAILS.
–DO NOT PULL THE UNIT ON GROUND.
–DO NOT USE LATERAL LUGS (SEE DRAWING) TO LIFT OR PULL THE UNITS.
–REMOVE LIFTING LUGS AFTER INSTALLATION.
COMMISSIONING :
–REFER TO IOM FOR COMMISSIONING INSTRUCTIONS.

GENERAL :
–REFER TO THE INSTALLATION,OPERATION AND MAINTENANCE MANUAL (IOM) BEFOREHAND TO COORDINATE THE PLANT DESIGN, INSTALLATION AND START UP OF THE ACTIFLO PACK UNIT.
M.O.C. :
–TANK : PAINTED CARBON STEEL
–PIPING : STAINLESS STEEL 2205 AND ABRASION RESISTANT HOSE EXCEPT FOR RECIRCULATION PIPE UNDER –SETTLING TANK (STAINLESS STEEL 2205).

COLORS :
–TANK: WINDOW GRAY RAL 7040
–HANDRAILS, LADDER OR STAIRCASE – SAFETY YELLOW
TANK WEIGHTS:
–DRY SHIPPING WEIGHT: 21 000 KG (46 000 LBS)
–INSTALLED WET (FULL OF WATER) WEIGHT: 173 000 KG (381 000 LBS)
DESIGN COORDINATION :
–DO NOT SUPPORT ANY OTHER EQUIPMENT (PLATFORM, STAIRS, GRATING, PIPING, ETC..) ON UNIT STRUCTURE.
–THE TANK MUST BE GROUNDED.
–HATCHED AREA SHOWN ON THE FOOTPRINT NEEDS TO BE SUPPORTED.
–ROTATION DETECTION MONITOR (IFM DD2503) MUST BE INSTALLED IN THE STARTERS PANEL OR MCC (REFER TO IOM FOR MORE DETAILS).
–IMPORTANT TO DROP 3 FEET AT THE SLUDGE OUTLET OF EACH HYDROCYCLONE TO AVOID BACKFLOW THROUGH HYDROCYCLONE (SEE P&ID FOR MORE DETAILS).
INSTALLATION :
–CHECK CONCRETE PAD FLATNESS BEFORE INSTALLING THE ACTIFLO UNIT.
–REFER TO FIELD INSTALLATION DRAWINGS AND IOM MANUAL FOR INSTALLATION DETAILS.
–DO NOT PULL THE UNIT ON GROUND.
–DO NOT USE LATERAL LUGS (SEE DRAWING) TO LIFT OR PULL THE UNITS.
–REMOVE LIFTING LUGS AFTER INSTALLATION.
COMMISSIONING :
–REFER TO IOM FOR COMMISSIONING INSTRUCTIONS.

NOTES:

1. TANK IS MANUFACTURED FROM HDPE. (1.9 SG)
2. TANK IS MANUFACTURED TO ASTM-D-1998 STANDARD.
3. ALL TANK DIMENSIONS ARE SUBJECT TO A +/-3% TOLERENCE.
4. FLEXIBLE COUPLINGS ARE REQUIRED FOR ALL EXTERNAL PIPING.
5. ALL FITTING GASKETS ARE EPDM.
6. ACO RECOMMENDS ALL FLANGE GASKETS TO BE MIN. 1/4" THICK.
7. ON LARGER SIZED TANKS SOME MECHANICAL FITTINGS MAY NEED TO BE REMOVED IN ORDER TO AVOID WIDE OR OVERSIZED LOADS.
8. HDPE ALIGNMENT WEDGES ARE REQUIRED ON SOME TOP FITTINGS TO KEEP THEM PERPENDICULAR TO THE GROUND.
9. TANK MUST BE PROPERLY VENTED TO PREVENT PRESSURE OR VACUUM FROM DEVELOPING AS THE TANK IS FILLING OR EMPTYING.

NOTES:
GENERAL:

REFER TO P&ID DRAWING FOR MORE INFORMATION: 500022043_PI_0001_GEN_VWT SHEET16-17
DRY WEIGHT: 718 KG (1583LBS).

MATERIAL:

PIPING: PVC SHC80. FLEXIBLE CLEAR REINFORCED PVC.
SUPPORT; GALVANIZED UNISTRUT AND POLYPROPYLENE PLATE.

DESIGN COORDINATION:

DO NOT SUPPORT OTHER EQUIPMENT (PLATFORM, STAIRS, GRIDS, PIPING, ECT...) ON THE STRUCTURE.

INSTALLATION:

SKID IS PRE MOUNTED AS MUCH AS POSSIBLE BUT FOR FREIGHT PURPOSE SOME COMPONENTS HAVE TO BE INSTALLED ON SITE BY CLIENT OR HIS INSTALLER.

REFER TO THE FIELD INSTALLATION DRAWINGS ON SITE AND THE IOM MANUAL FOR INSTALLATION DETAILS.

VENT SHOULD BE INSTALLED AT APPROXIMATELY THE SAME HEIGHT OF THE WATER LEVEL IN THE TANK WHICH WATER IS BEING SAMPLED.

START-UP:

BEFORE RUNNING THE PUMP, MANUAL PRIMING SHOULD BE DONE. THIS IS ACHIEVED BY CLOSING THE DISCHARGE VALVES AND OPENING THE SUCTION VALVE. ONCE THE SUCTION LINE IS COMPLETELY FILLED. THE PUMP CAN BE OPERATED.

CONTROL VALVES UPSTREAM OF THE FLOWMETERS AND ROTOMETERS ALOW THE MODULATION OF THE FLOWS IN ORDER TO REACH THE REQUIRED PARAMETERS:

.	FREE CHLORINE ANALYZER	TOTAL CHLORINE ANALYZER
MEASURING RANGE (ppm)	0.00–5.00	0.00–10.00
SERVICE WATER FLOW (L/h)	12	30
SAMPLE FLOW (L/h)	3	3
DILUTION RATIO	1:4	1:10

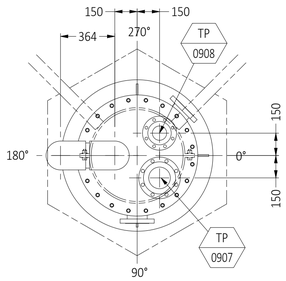
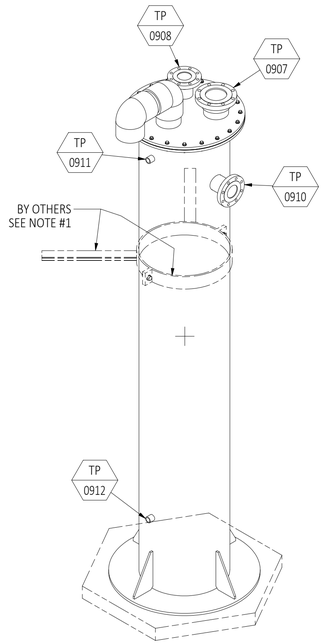
TP–0911	HIGH LEVEL SWITCH	ø25mm [ø1"] – COUPLING FNPT
TP–0912	LOW LEVEL SWITCH	ø25mm [ø1"] – COUPLING FNPT



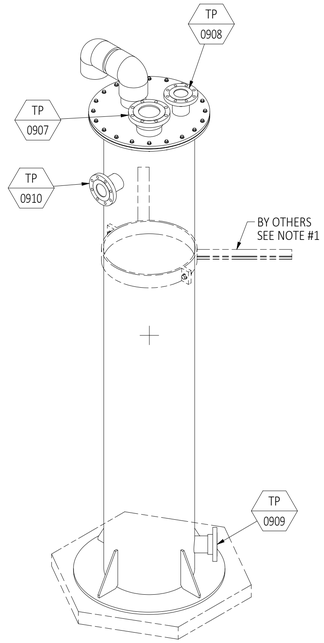
NOTES:
1- STABILIZATION OF THE SPLITTER BOX TO PREVENT LATERAL MOVEMENT.

2- ANCHORING TO THE FLOOR IS NOT CONSIDERED BECAUSE OF THE RISK OF SETTLEMENT, BRACKETS SHALL BE ADDED UPON CLIENT DISCRETION.



3- REFER TO THE INSTALLATION, OPERATION AND MAINTENANCE MANUAL (IOM) BEFOREHAND TO COORDINATE THE PLANT DESIGN, INSTALLATION AND START UP OF THE SPLITTER BOX UNIT.

M.O.C.
TANK WEIGHTS: - WEIGHT: 223 KG (491 Lbs).
- DRY SHIPPING WEIGHT: 223 KG (491 LBS).
- INSTALLED WET (FULL OF WATER) WEIGHT: 1201 KG (2647 LBS).



DESIGN COORDINATION:
- DO NOT SUPPORT ANY OTHER EQUIPMENT (PLATFORM, STAIRS, GRATING, PIPING ETC.) ON TANK.

PLAN VIEW

NOTES:

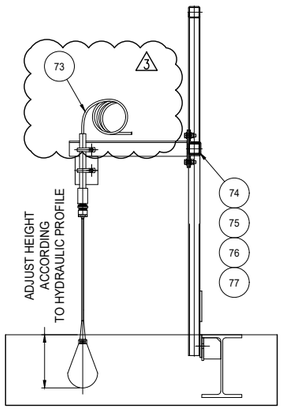
1. SEE BILL OF MATERIAL : 5000220043–FI001 AND MANUFACTUR'S INSTRUCTIONS INCLUDED IN O&M MANUAL.

2. ALL ITEMS MENTIONED WILL BE SUPPLIED BY VEOLIA, AS PER B.O.M. AND WILL NEED TO BE INSTALLED ON SITE.

3. DO NOT REMOVE THE GREASE AND PROTECTION COATING WHEN INSTALLING THE SCRAPER GEAR BOX (ITEM #2).

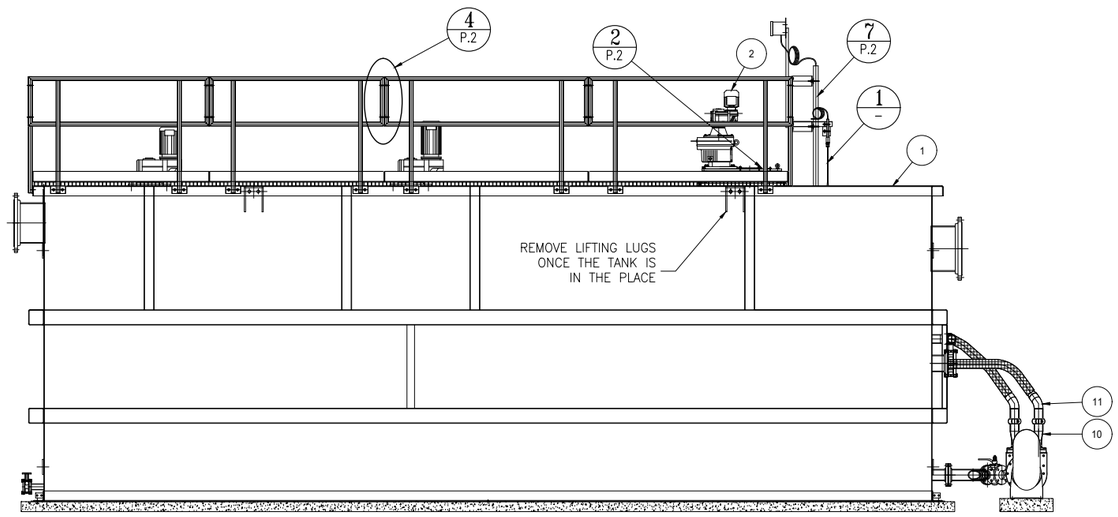
4. THE UPPER SCRAPER SUPPORT PLATE MUST BE REMOVED IN ORDER TO INSTALL THE SCRAPER GEAR MOTOR
(ITEM #2). PLEASE USE THE SAME BOLTS AND NUTS.

5. FILL SCRAPER GEAR BOX WITH OIL (ITEM #84) PRIOR TO STARTUP.



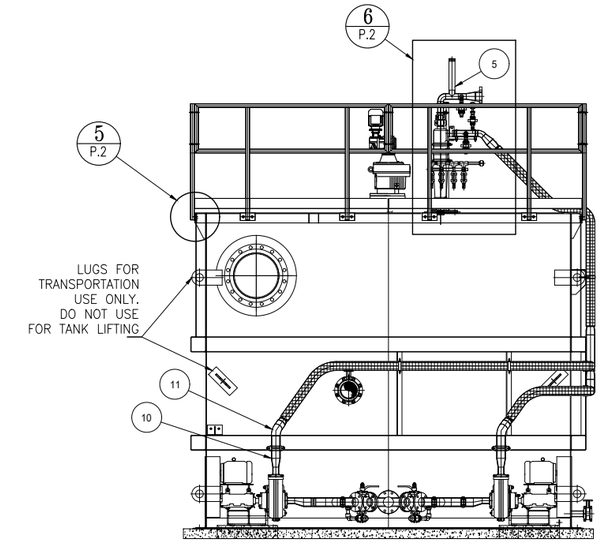
6. PLEASE VERIFY ALL BOLTS AND NUTS ALREADY INSTALLED AND REFER TO THE TORQUE REQUIREMENTS
DATA TABLE (SEE INSTALLATION MANUAL).

7. IMPORTANT TO DROP 3 FEET AT THE SLUDGE OUTLET OF EACH HYDROCYCLONE TO AVOID BACKFLOW THROUGH HYDROCYCLONE. DISCHARGE OF SLUDGE PIPE MUST NOT BE SUBMERGED.



8. INSTALL THE BLUE FLEXIBLE TUBE (ITEM #42) IN ORDER TO AVOID ANY LOOSE SECTIONS.

9. TANKS SHALL NOT BE USED AS A SUPPORT FOR ANY OTHER EQUIPMENT. EQUIPMENTS THAT NEEDS TO BE CONNECTED
TO TANK SHALL BE SELF SUPPORTED.



10. INSERT DRIP PAN (ITEM #4) UNDER EACH PUMP DRY GLAND TO PREVENT LEAKAGE.

TYPICAL DETAIL FOR ANODE INSTALLATION

VUE EN PLAN

NOTES:

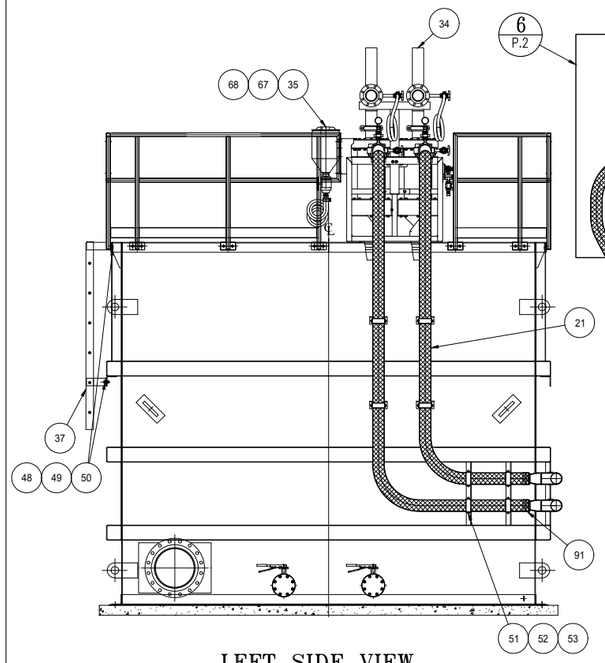
1. SEE BILL OF MATERIAL : 5000220043–FI002 AND MANUFACTUR'S INSTRUCTIONS INCLUDED IN O&M MANUAL.

2. ALL ITEMS MENTIONED WILL BE SUPPLIED BY VEOLIA, AS PER B.O.M. AND WILL NEED TO BE INSTALLED ON SITE.

3. DO NOT REMOVE THE GREASE AND PROTECTION COATING WHEN INSTALLING THE SCRAPER GEAR BOX (ITEM #2).

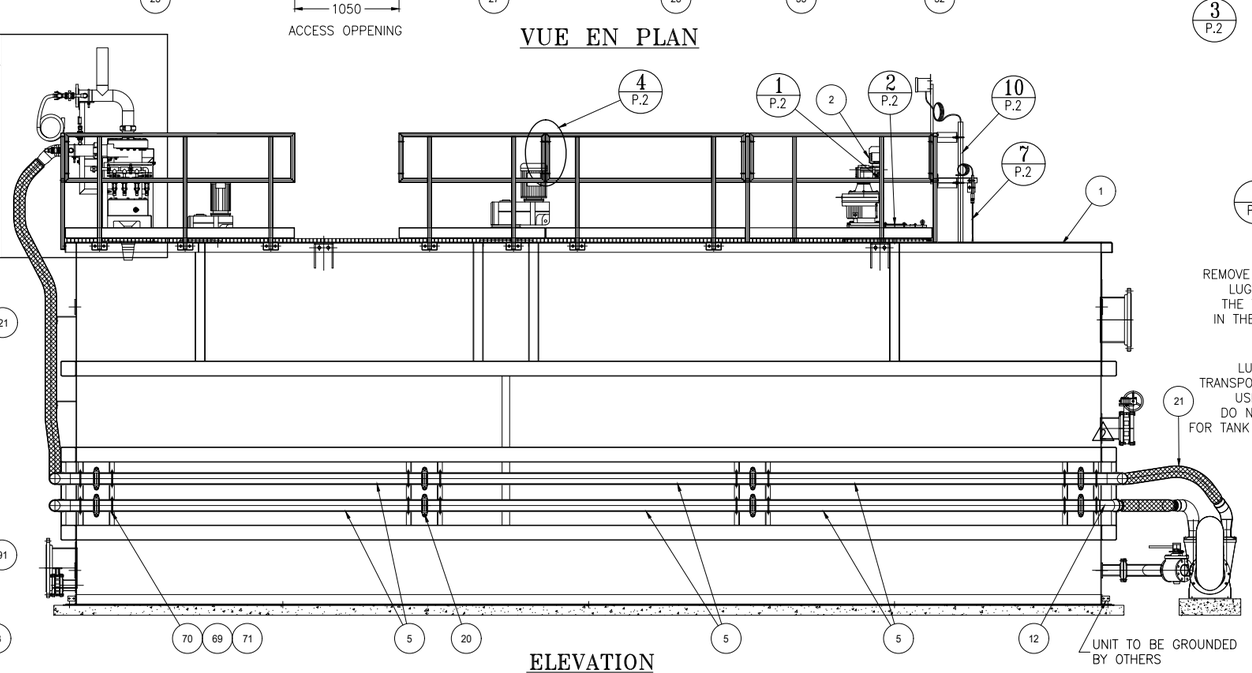
4. THE UPPER SCRAPER SUPPORT PLATE MUST BE REMOVED IN ORDER TO INSTALL THE SCRAPER GEAR MOTOR (ITEM #2). PLEASE USE THE SAME BOLTS AND NUTS.

5. FILL SCRAPER GEAR BOX WITH OIL (ITEM #87) PRIOR TO STARTUP.



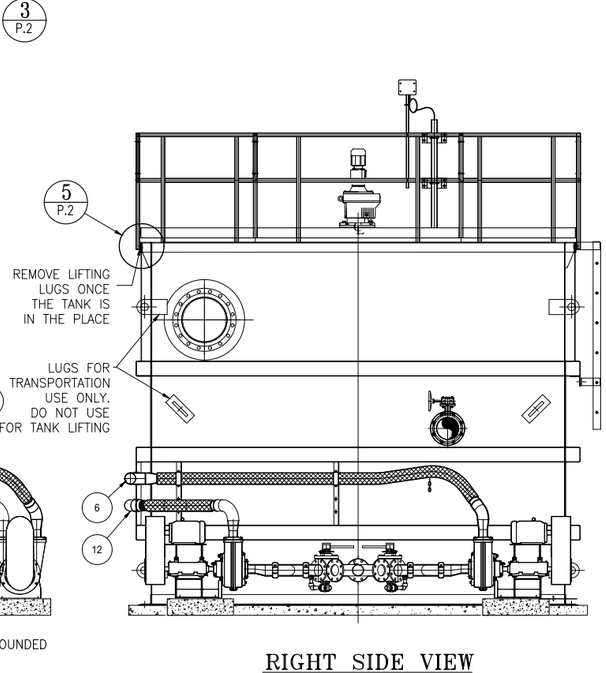
6. PLEASE VERIFY ALL BOLTS AND NUTS ALREADY INSTALLED AND REFER TO THE TORQUE REQUIREMENTS DATA TABLE (SEE INSTALLATION MANUAL).

7. IMPORTANT TO DROP 3 FEET AT THE SLUDGE OUTLET OF EACH HYDROCYCLONE TO AVOID BACKFLOW THROUGH HYDROCYCLONE. DISCHARGE OF SLUDGE PIPE MUST NOT BE SUBMERGED.



8. INSTALL THE BLUE FLEXIBLE TUBE (ITEM #21) IN ORDER TO AVOID ANY LOOSE SECTIONS.

9. TANKS SHALL NOT BE USED AS A SUPPORT FOR ANY OTHER EQUIPMENT. EQUIPMENTS THAT NEEDS TO BE CONNECTED TO TANK SHALL BE SELF SUPPORTED.



10. INSERT DRIP PAN (ITEM #3) UNDER EACH PUMP DRY GLAND TO PREVENT LEAKAGE.

Torques

INTRODUCTION TO TORQUES

There are a number of torques which butterfly valves may experience such as:

- **T_{su} - Seating and Unseating Torque**
- **T_d - Dynamic Torque Resulting from fluid flow**
- **T_{bf} – Bearing Friction Torque**
- **T_{ss} – Stem Seal Friction Torque**
- **T_e – Eccentricity Torque resulting from disc offset from centerline of stem (either single, double or triple offset)**
- **T_h – Hydrostatic Torque**

Factors which influence the butterfly valve torque values shown above are:

- Type of Seat and Seat Material
- Interference of Seat I.D. and Disc O.D.
- Shaft Diameter
- Valve Diameter
- Bearing Coefficient of Friction
- Angle of Opening
- Shut-off Pressure
- Fluid Velocity
- Disc Shape and Configuration
- Piping System and Location/Orientation of Valve in Pipe Line
- System Head Characteristics
- Physical Size of Disc/Shaft Obstructing Flow
- Disc Edge Finish

With respect to Butterfly Valves, the two major conditions for determining total valve operating torque (T_T) exists as follows:

CASE I (Angle = 0° , Disc in Closed Position)

$$T_T = T_h + T_{bf} + T_{ss} + T_{su}$$

Analyzed

Total Torque for Case I using a symmetrical disc butterfly valve is the sum of hydrostatic torque, bearing friction torque, stem seal, friction torque, and seating/unseating torque.

A. Hydrostatic Torque (T_h)

We will ignore discussion of the hydrostatic torque values as they are generally insignificant compared to the seating/unseating, bearing friction and stem seal torque values (the safety factor applied to seating/unseating, stem seal friction and bearing friction torque values more than compensates for the hydrostatic torque which is usually less than 2% of these total torques).

B. Bearing Friction Torque (T_{bf})

Bearing friction torque occurs because pressure forces against the disc are transmitted to the stem. As the stem is forced against the bearing supports, bearing friction torque is created between the stem material and the support material as the stem is turned. Bearing friction torques are normally included in the seating/unseating torque values.

Bearing friction torques can be determined by using the following equation:

$$T_{bf} = .785\ C_f\ D_v^2\ (d/2)\ \Delta P$$

Where:

- T_{bf} = Bearing Friction Torque
- C_f = Coefficient of Friction (approximately .25 for non-corroded stem to cast iron body) (dimensionless).
- D_v = Valve Diameter (Inches)
- d = Diameter of Shaft (Inches)
- ΔP = Pressure Differential (psi)

C. Stem Seal Friction Torque (T_{ss})

For all practical purposes stem seal friction torque values are insignificant when compared to seating/unseating and bearing friction torques. Stem seal friction torques are normally included in the seating/unseating torque values.

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.
The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

D. Seating/Unseating Torques (T_{su})

The seating/unseating torque value (T_{su}) is a function of the pressure differential, the seat material's coefficient of friction, the finished surface of the disc edge, the amount of interference between the seat I.D. and disc O.D. when flanged in piping, the seat thickness, and the type of service (media) for which the valve is being used. In determining the T_{su} values for Bray resilient seated butterfly valves, Bray has developed Seating/Unseating Torque Charts incorporating all bearing friction and stem seal friction torques for three classes of services for both the valves with standard discs (rated to full pressure) and for valves with reduced diameter discs (rated for 50 psi [3.5 bar]). The three service classes are:

Class A – Non-Corrosive, Lubricating Service

Class B – General Service

Class C – Severe Service

Please review the guidelines for each class in the technical manual when determining which Seating/Unseating Torque Class should be used. Most butterfly valves are used in Class II, General Service applications.

E. Total Torque (T_T)

The total torque values for Bray symmetrical disc valves for Case I applications are shown in the Seating/Unseating Torque Charts within this manual.

CASE II (Disc in Partial To Full Opening Position)

$$T_T = T_{bf} + T_{ss} + T_d$$

The total Torque for Case II using a symmetrical disc butterfly valve is the summation of bearing friction torque, stem seal friction torque and dynamic torque.

A. Bearing Friction Torque (T_{bf})

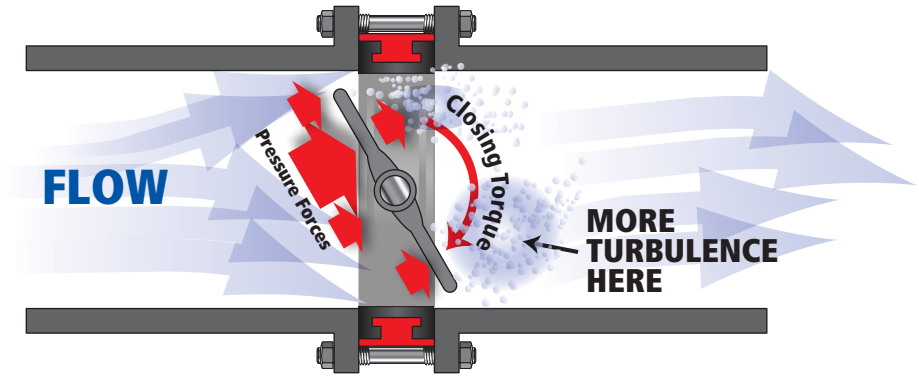
See Case I discussion. This torque value is normally included in the Dynamic Torque Value.

B. Stem Seal Friction Torque (T_{ss})

See Case I discussion. This torque value is normally included in the Dynamic torque value.

C. Dynamic Torque (T_d)

In a symmetrical disc design, dynamic torque occurs between the closed position, 0° and the full open position, 90°. With the disc in the partially open position, velocity of the fluid passing the leading disc edge is less than the velocity passing the trailing edge. This variance in velocity past the leading disc edge and trailing disc edge results in an unbalanced distribution of pressure forces on the upstream side of the face of the disc. The total pressure forces acting perpendicular to the disc face on the leading edge half of the disc are greater than the total pressure acting perpendicular on the trailing half of the disc. This uneven distribution of pressure on the disc face (exists on both sides of the disc) results in a torsional force which tries to turn the disc to the closed position **(Figure 1)**. This torsional closing force can become greater than the seating/unseating torque value depending on the valve angle of opening and differential pressure.



To determine dynamic torque, the following equation is applied:

$$T_d = C_{dt}\, d^3\, \Delta P$$

Where:

- T_d = Dynamic Torque (lbs- in).
- C_{dt} = Coefficient of Dynamic Torque (based on disc shape and angle of opening) (dimensionless)
- d = Diameter of Disc (Inches)
- ΔP = Pressure Differential Across Valve (psi)

Figure 1 - Pressure Distribution

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.
The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

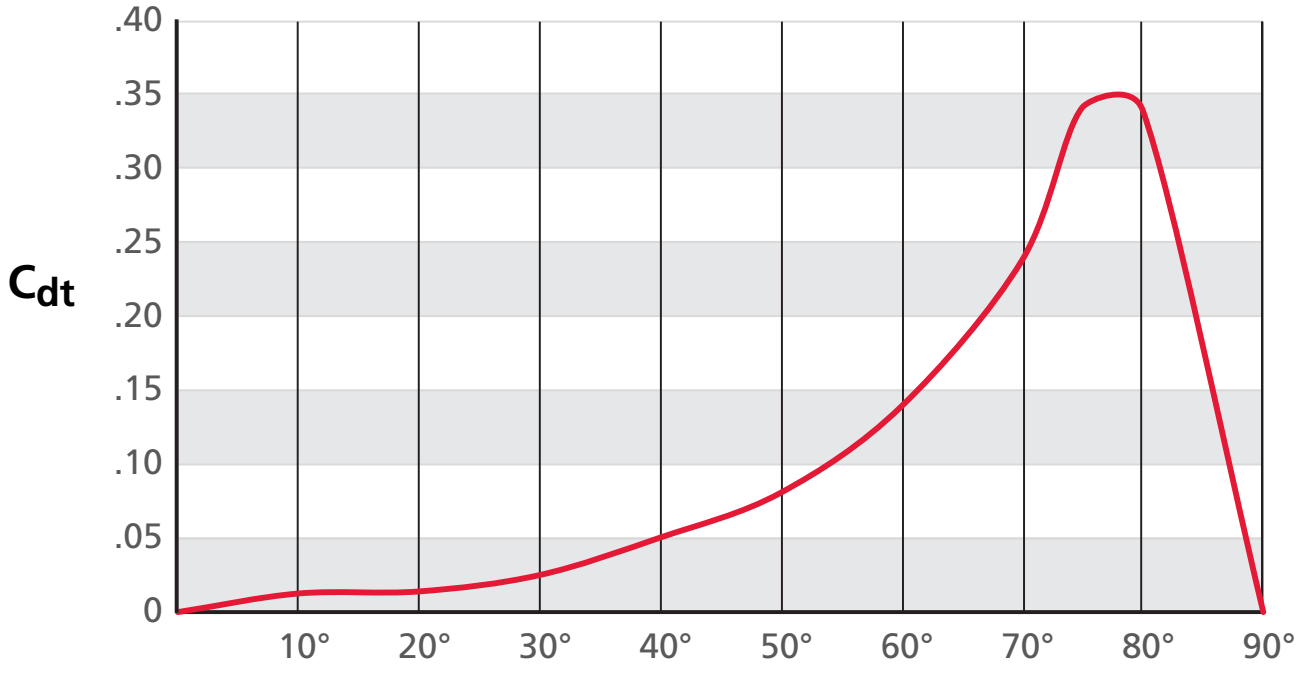
As shown in **Figure 2**, coefficient of dynamic torque for Bray's symmetrical disc valves is at 0° angle of opening and increases until the angle of opening reaches 75°-80°, where it then decreases to a zero value at full open (90°) (no internal friction factors considered, just dynamic torque only).

One final comment about dynamic torque is that one may minimize the dynamic torque by the orientation of the valve (stem horizontal or vertical) in the pipeline as well as by the location (distance) in the pipeline from elbows, other valves, etc. (See Bray Resilient Seated BFV Operations and Maintenance Manual).

D. Total Torque (T_T)

The total torque required for operating a Bray symmetrical disc butterfly valve at an angle opening between 0° and 90° is shown in the Dynamic Torque section of this manual. Note that the dynamic torque includes all internal friction torque values.

CONCLUSION



In most applications for butterfly valves, especially 20˝ (DN 500) or smaller, the maximum torque required to operate the valve will be seating/unseating torque. However, dynamic torque should be considered particularly in:

- Control applications using larger valves (24˝ [DN600] and above) where the disc is maintained in the open position
- Applications using larger valves (24˝ [DN 600] and above) where the velocity is high (16 ft./sec [4.9m/sec]).

Figure 2 - Angle of Opening

The C_{dt} value for Bray symmetrical disc valves are approximately:

Angle of Opening	0°	10°	20°	30°	40°	50°	60°	70°	75°	80°	90°
C_{dt}	0	0.0126	0.0140	0.0251	0.0505	0.0809	0.1394	0.2384	0.3419	0.3400	0

REDUCED DISC DIAMETER BRAY SERIES 30/31/3A VALVES

Bray offers a reduced disc diameter for 4"-20" for Series 30, 31 and 3A valves. The purpose of reducing the disc diameter is to decrease the seating/unseating torques and extend the seat life on low pressure applications.

By reducing the disc diameter, the interference between the disc O.D. and seat I.D. is decreased and the valve pressure rating, which is a function of this interference, is reduced to 50 PSI. Less interference between the disc and seat results in reduced seating/unseating torques. Lower seating/unseating torque may allow for the use of a smaller actuator on the valve. In other applications where abrasive dry bulk materials such as cement, sugar, plastic, pellets, flour, etc., are generally pneumatically conveyed at 50 PSI or less, the reduced disc diameter not only reduces the seating/unseating torque but, very importantly, usually significantly increases the service life of the seat.

Bray does the following to differentiate reduced diameter discs from full diameter discs:

Metal Discs: An " R " is stamped above the part number

Nylon 11 Coated Discs: Discs are differentiated by the color of the Nylon 11:

Grey – Full Disc Diameter

White – Reduced Disc Diameter

SEATING & UNSEATING TORQUES

Bray has developed Seating/Unseating Torque Charts for three Classes of Service for its valves with standard discs (rated for full pressure) and for valves with reduced diameter discs (rated for 50 PSI / 3.5 bar.).

The guidelines for selecting a Class to be used for determining a valve's seating/unseating torque are given below. Each valve application should comply with all five Class characteristics in order to be qualified for that Class.

Characteristics of Application	**Class A** Non-Corrosive, Lubricating Service	**Class B** General Service	**Class C** Severe Service
Media Type	Lubricating hydrocarbons; Aqueous processes and Water (See Note 1)	Water; aqueous processes; all other aqueous liquids including salt water; Lubricating gases	Dry, non-lubricating such as air, dry gas, cement, pneumatic conveying mediums
Corrosion by Media	Insignificant if any	No major corrosion or deposits from media	Can incur significant corrosion such as Ductile Iron disc in water
Chemical Reactions of Media with Seat	Insignificant if any	Only minor or insignificant in nature	Reactions causing swelling and hardness occur
Media Temperature	45º to 160ºF (7º to 71ºC)	Within seat temperature limits, not near limits	Near or at seat temperature limits
Frequency of Valve Cycling	Once weekly or more frequently	Minimum once every 3-6 weeks, or more frequently	Infrequently, sometimes not cycled for long periods

NOTE:

1. For aqueous processes and water, Class A torques may be used only if a Nylon 11 coated disc is selected and all other Class A characteristics apply. Otherwise, Class B torques should be used.
2. All the material trims may be classified into Class A, B, or C except Series 20/21 valves with a PTFE Lined Elastomer seat, PTFE molded disc/stem, or rubber molded disc/stem. These trims must always use Class C Seating/Unseating Torque Values unless they are used only in a throttling application. Valves with bonded seats must always be classified as Class C.
3. If a valve is used strictly in a throttling application, that is, it is never put in the closed position but throttled between 20° and 80°, then Class A torques may be used provided you have checked to see that dynamic torques do not exceed the Class A torque values.
4. With the exception of dry, non-lubricating medias, one is usually safe electing to use Class B torques for sizing actuators for all other valve service applications. Seating/Unseating Torque values shown include friction bearing torques for stated differential pressure.
5. Dynamic Torque values are not considered. See the Dynamic Torque chart in this manual for determination of Dynamic Torque.
6. Do not apply a safety factor to torque values when determining actuator output torque requirement.
7. **For 3-way assemblies where one valve is opening and another is closing, multiply torque by a 1.5 factor.**

DYNAMIC TORQUE FACTORS (IMPERIAL)

To Use the Torque Chart, note the following:

1. Dynamic Torque values include all bearing friction and stem-seal friction torques.
2. Dynamic Torque values are per 1 PSI ΔP. To determine dynamic torque (lb-in) at a desired angle of opening, multiply the pressure drop ΔP at this angle by the appropriate dynamic torque factor in the charts below.
3. Bray recommends sizing control valves between 20° and 70°, with 60° the preferred angle.
4. Dynamic Torque will tend to close all Bray valves whose disc are symmetrical to the stem.

Series 20/21 and 30/31/3A (Dynamic Torque Factor - lb-in./psi)

Valve Size in.	Angle of Opening									
	10°	20°	30°	40°	50°	60°	70°	75°	80°	90°

VALVE SIZING COEFFICIENTS

1. **Valve Sizing Coefficients (Cv)**..... Pages 15-16

    1. **Cv** stands for **Valve Sizing Coefficient**, sometimes called the **Flow Rate Coefficient**.
    2. **Cv** varies with the valve size, angle of opening and the manufacturer's valve style.
    3. **Cv** is defined as the volume of water in USGPM that will flow through a given restriction or valve opening with a pressure drop of one (1) psi at room temperature.

2. **Valve Sizing Coefficients (Kv)**..... Pages 17-18

    1. **Kv** stands for **Valve Sizing Coefficient**, sometimes called the **Flow Rate Coefficient**.
    2. **Kv** varies with the valve size, angle of opening and the manufacturer's valve style.
    3. **Kv** is defined as the volume of water in Cubic Meters/Hour (m^3/hr) that will flow through a given restriction or valve opening with a pressure drop of one (1) bar at room temperature.

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.

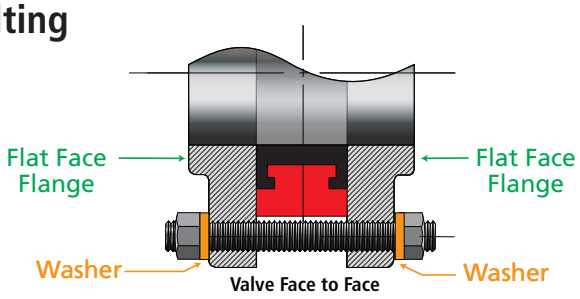
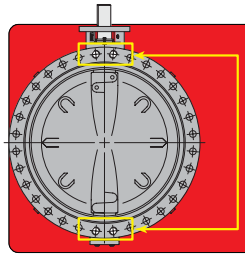
EXAMPLES OF TYPICAL FLANGE TO VALVE BOLTING*



** Lug Style Bolting

Flange Width Including Raise Face If Applicable + Washer Width + Minimum Bolt Engagement Equal to Bolt Diameter = Bolt Length



Wafer Style Bolting

Flange Width x2 Including Raise Face If Applicable + Valve Face to Face + Washer Width x2 + Width of Nut x2 + 4 Threads (2 Per Side) = Overall Length

**** Note: Please refer to Appropriate Bray Dimensional Drawings for specific valve drilling information on Wafer and Lug Valves 20" and larger.**

Please refer to ASME B-16.5 or B-16.47 for Flange and Bolt Dimension Information

* Double flange style bolting not shown.
** Lug threads may be tapped from both sides and therefore tap may not be continuous.

FLANGE BOLT TENSIONING
Bray Butterfly Valves with Metal Mating Flanges

A question frequently asked at Bray is "What torque do I apply to the flange bolts to insure the valve is properly installed?". Initially this seems to be a simple request until all of the factors are analyzed. The installation of a valve requires several components: the valve, mating flanges, nuts, bolts and studs. Each is supplied by different manufacturers and each has different characteristics. The proper torque for one combination may be too much or too little for a second combination. The following is a list of information which needs to be known in order to start calculating the torque requirements.

Valve
- Type
- Size
- Materials of construction (Body)
- Surface finishes / Surface conditions

Flange
- Type
- Size
- Finish / both sides
- Condition of flange / surface contamination

Bolt (or Stud)
- Type
- Materials of Construction
- Surface Conditions

Nut
- Type
- Materials of Construction
- Surface Conditions

Lubrication
- Type
- Coverage

General Factors
- Temperature and relative humidity at the time of installation
- Speed at which bolts are turned

Note: The elastomer valve seat manufactured by Bray also acts as the flange gasket. No additional gaskets are required or recommended. Other valve styles which do not have integral gaskets will need to have this component supplied. The characteristics of this component will also need to be considered.

Complete knowledge of all relevant conditions is almost impossible to obtain. As a result, the computation of the exact torque requirement is not practical. No reputable manufacturer can provide accurate information when so many outside factors are present.

The International Fasteners Institute covers some of the details required to "compute" a torque value. Even with this information the use of a torque wrench is only considered to be 25% accurate. Based on the difficulty and inaccuracy of using this method, Bray recommends the use of the "Turn of the nut" method.

"Turn of the Nut" Tightening
(For ANSI Standard Iron and Steel Flanges)
**For Non-Metallic or non-standard flanges, follow the manufacturers installation procedures.

1. The valve and flange faces must be aligned parallel to each other.

   Note: For rubber seated butterfly valves manufactured by Bray, it is required that the valve be fully opened prior to the tightening of the flange bolts.

2. After aligning the holes in a joint, sufficient bolts shall be placed and brought to a 'snug-tight' condition to ensure that the parts of the joint are *brought into full contact* with each other. 'Snug-Tight' is the tightness attained by the full effort of a man using a spud wrench.

3. Following the initial snugging operation, bolts shall be placed in any remaining holes and brought to snug-tightness. Re-snugging may be necessary in large joints.

4. Tighten opposite bolts in sequence to insure even pressure around the entire flange.

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.
The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

5. When all bolts are snug-tight, each bolt in the joint then shall be tightened additionally by the applicable amount of nut rotation given in Note 1. During tightening there shall be no rotation of the valve or flange.

Note 1

For bolt lengths **not exceeding** 8 diameters or 8 inches (203.2 mm) = **1/4 turn**
For bolt lengths **exceeding** 8 diameters or 8 inches (203.2 mm) = **1/2 turn**

Disclaimer:
Bray Controls is issuing these recommendations only as a guide to installation. This recommendation is based on the full compliance of all materials supplied to their appropriate specifications. Since many of the components are not manufactured by Bray we can take no responsibility for any damage caused during installation.

Series 20/21 and 30/31 - Flange Bolt Torque Chart

Valve Size		Normal Torque Range	Normal Torque Range
In	mm	Ft-lbs	Nm
2	50	30	40
2.5	65	30	40
3	80	35	50
4	100	35 - 40	50 - 55
5	125	35 - 45	50 - 60
6	150	35 - 50	50 - 65
8	200	45 - 55	60 - 75
10	250	55 - 75	75 - 100
12	300	65 - 110	90 - 150
14	350	75 - 120	100 - 165
16	400	75 - 120	100 - 165
18	450	85 - 130	115 - 175
20	500	85 - 130	115 - 175

Please note that the Nm and Ft-lbs values are based on bolt size in respective metric and ANSI flanges, i.e. these values are not a direct conversion between Nm and Ft-lbs.

The values represent average torques needed to ensure full compression of the resilient valves' seats into the valves' bodies when installed in pipeline flanges. The face of both flanges must come into full contact with the valves' metal bodies.

No additional torque is required for proper functioning of the Bray resilient seated valves.

The torque values are based on using new, coarse-threaded, lubricated fasteners. Up to 25% may be added to the Normal Torque Range values when using non-lubricated fasteners.

Torque Values specified by flange manufacturers ***must not be exceeded.***

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.
The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

Series 22/23 Installation - Flange Bolt Torque Chart, 150 lb Flanges

Valve Size		Normal Torque Range		Max Torque Range	
In	mm	Ft-lbs	Nm	Ft-lbs	Nm
2	50	30	40	35	50
2.5	65	30	40	35	50
3	80	35	50	40	55
4	100	35 - 40	50 - 55	40	55
5	125	35 - 45	50 - 60	50	65
6	150	35 - 50	50 - 65	65	90
8	200	45 - 55	60 - 75	80	110
10	250	55 - 75	75 - 100	100	135
12	300	65 - 110	90 - 150	120	165
14	350	75 - 120	100 - 165	140	190
16	400	75 - 120	100 - 165	140	190
18	450	85 - 130	115 - 175	170	230
20	500	85 - 130	115 - 175	180	245
24	600	100 - 150	135 - 205	220	300

The torque values are based on using new, coarse-threaded, lubricated fasteners. Up to 15% may be added to the Normal Torque Range values when using non-lubricated fasteners. However, the maximum torque should not be exceeded.

Flange gaskets are normally not used for installation of S22/23 valves. Flange leakage may be caused by combination of out-of-parallel and/or misaligned flanges, and surface damage on the flange face and/or the face of the valve seat. In such cases, suitable flange gaskets may be used to control flange leakage.

Torque values specified by manufacturers of certain flanges, for example plastic flanges, could be lower than the values specified above. In such cases, the flange manufacturers' torque values must not be exceeded. Use flange gaskets if necessary to secure flange seal.

Bray CONTROLS

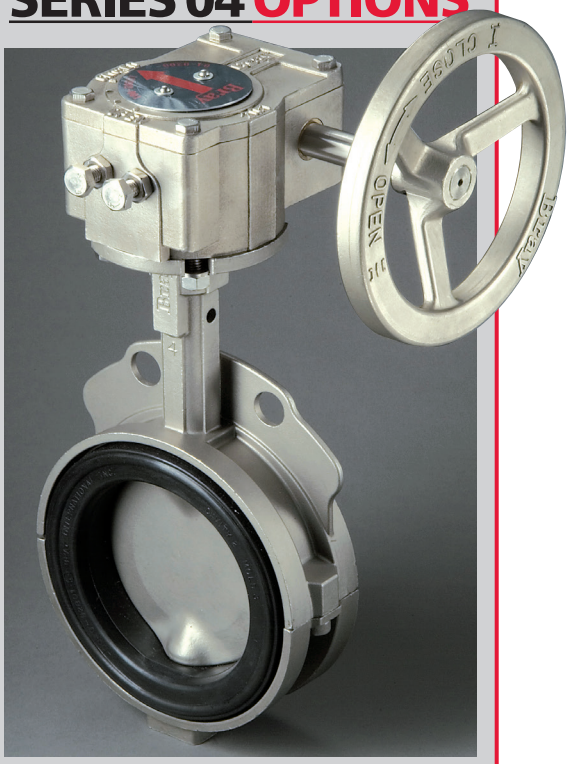
MANUAL OPERATORS

Bray Controls offers three operators for manual control of valve position. All manual operators mount directly to Bray valves, and all are epoxy coated for excellent corrosion, abrasion and impact resistance.

MANUAL OPERATORS	
SERIES 01 - Handle	1"-12" (25mm -300mm)
SERIES 04 - Gear Operator	2"-48" (50mm -1200mm)
SERIES 05 - Declutchable Gear Operator	2"-36" (50mm -900mm)

SERIES 01 - HANDLE & NOTCH PLATE

Bray offers two handles for on-off and throttling service – one for resilient seated valves from 1"-12" (25mm-300mm), and a high torque handle for high pressure valves from 2½"- 8" (65mm-200mm). These quarter turn handles have a locking spring and a directional pointer for valve disc position indication. Bolted notch plates are offered. For resilient seated valves a 10 position plate is standard. For high pressure valves a 9 position plate is standard. Both contain on-off stops to prevent over rotation of the valve. Optionally available are an infinite position plate, a 180° notch plate, a memory stop, a padlock kit, and a 2" square nut version.



SERIES 04 - GEAR OPERATOR

For heavy duty on-off and throttling service of 2"-48" (50mm-1200mm) valves, the Series 04 is self lubricated for smooth, trouble-free operation. The rugged, cast iron body with O-ring body seals is weatherproof to IP65. A self-locking worm and worm gear drive holds the valve in the desired position. Features include a readily accessible handwheel, a valve position indicator and mechanical travel stops which permit field adjustment of valve movement to specific degrees of rotation. Optionally available are chainwheel accessories, padlock kits and 2" square nut versions. A Gear Operator with a stainless steel housing is also available for valve sizes 1"-16".

SERIES 05 - DECLUTCHABLE GEAR OPERATOR

Available for 2"-36" (50mm-900mm) valves. This operator is excellent for the safe handling of spring return actuators. During pneumatic operation, the worm of the gear unit is disengaged. Should the valve require opening or closing in the event of power loss, manual rotation of the declutch lever will provide a camming action and engage the worm to the segmented worm gear, allowing rotation of the valve using the handwheel. The Series 05 can be installed in the field with existing Bray pneumatic actuators.

SERIES 04 OPTIONS

316 Stainless Steel
for sanitary & corrosive applications

Bray Controls proudly offers the Series 04 Stainless Steel Gear Operator for manual operation of quarter turn valves. With stainless steel housings, input shafts and handwheels, the Series 04 is designed for service in highly corrosive environments, sanitary, breweries and pharmaceutical applications. The units are suitable for on-off and throttling service.

Series 04 Stainless Steel Gear Operator units have different gear ratios – providing a torque output range of 2,000 to 24,000 lb-in. The temperature range is -4°F (-20°C) to 250°F (120°C).

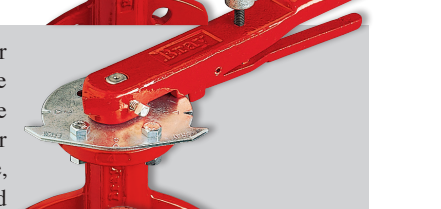
These weatherproof gear operators meet NEMA 4, 4x and IP 65 specifications.

CHAINWHEEL for remote access to valve positioning when the handwheel is not accessible, such as valves positioned high out of reach.

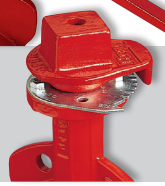
A PADLOCK KIT & 2" SQUARE NUT version for buried service are also available with the Series 04 (not shown).

SERIES 01

STANDARD 10 POSITION NOTCH PLATE has been designed to lock the handle securely in place, preventing position change of disc due to line pressure, vibration or shock. Standard 9 Position Plate for high pressure valves is not shown.



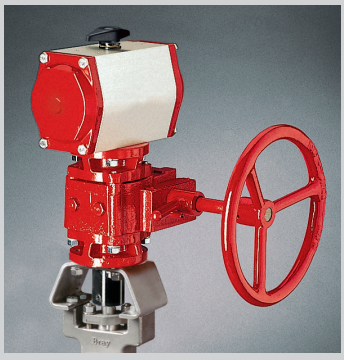
PADLOCK KIT allows the customer to lock the valve in the full open or closed position, tamper proofing the valve. By drilling a new hole in the top plate, the handle can be locked in mid travel.



HANDLE AND 180° NOTCH PLATE allows the operator to switch the handle to either side without removing the notch plate from the valve.

INFINITE POSITION NOTCH PLATE for throttling applications, allows for very precise adjustments of valve disc positioning anywhere from 0° to 90°. Positioning is simply a matter of loosening the set knob, moving the handle, then retightening the knob. For resilient seated valves only.

MEMORY STOP allows the operator to set the maximum amount the valve can open. When set, this limit will remain fixed until the stop is reset.



2" SQUARE NUT is used where the valve is buried under the surface. To rotate valve disc position, the nut is reached with a T-handle wrench.

SERIES 05

DECLUTCHABLE GEAR OPERATOR

The Series 05 offers the same superior features as the Series 04 gear operator with the added ability to manually override pneumatic actuators or rotate the valve when air pressure is not available.

PAINT SPECS

OIM manual section: 4.2.1.6

This page is intentionally left blank

TANK CONSTRUCTION SPECIFICATIONS
& PAINT SPECIFICATIONS
RAL 7040 TANK WINDOW GREY (EXTERIOR)
& LIGHT GREY (INTERIOR)

CC-07-ACP

1.0 GENERAL

This specification describes construction elements of the steel welded tank and paint specifications of ACP MK3 product.

2.0 MATERIALS

- Carbon steel must conform to CSA 44W, unless otherwise specified (see type on plan);
- Nominal thickness, refer to plan.

3.0 CONSTRUCTION

According to the specifications of the referred plan(s):

- Steel plates and sections must conform to Canadian norm G40.21M-300W, except for HSS that must conform to Canadian norm G40.21M-350W;

- Welds will be realized according to the details shown on the referenced plan. All welds must conform to the Canadian norm CSA W59 standard. Remove surface defects and grind all sharp edges. Make sure to completely remove the flux and welding splashes. The fusion welding certifications to produce by the company will be: W47.1, W59;

- Welding process:

    - Flux-Cored Arc Welding (FCAW);
    - MIG welding;
    - Electrodes (SMAW).

- Welds will be brushed and be devoid of spots;

- All modifications to the dimensions or to the quality of materials, and dispositions other than those indicated on the plans, are subject to prior demand to **Veolia Water Technologies Canada Inc's.,** person in charge, and his subsequent written.

4.0 STEEL PREPARATION FOR PAINTING

- Tank's interior and exterior surfaces must be perfectly cleaned from grease and all other foreign substance;

- All sharp edges must be grinded;

- All flanged surfaces and threaded connections must be cleaned and protected adequately to avoid paint contact;

- The rough edges, weld splatter, excess metal flux and sharp edges must be removed by grinding.

5.0 CONTROL

5.1 Welds

Once completed, all tank interior welds must be dye penetrant inspected to verify the quality of the welds. All welds must be water tight, free from porosity, cracks and drains and in accordance with norm CSA W59.
A dye penetrant test control should be done on all interior welds. Exterior welds must be visually inspected only.
All lifting and handling lugs must be subject to magnetic particle testing and report. Quality control from **Veolia Water Technologies Canada Inc.** will verify results of welds control.

5.2 Dimensional

The dimensional control will be done by the manufacturer. At the same time, **Veolia Water Technologies Canada Inc.'s** inspector will provide control. Minutes will be written detailing the dimensional and tolerance divergences. These values are noted on the piece's plan, assigned to control.

5.3 Documents and Certificates of Material (to Supply)

The manufacturer will supply to **Veolia Water Technologies Canada Inc.'s** inspector at the beginning of work, the following documents:

- Planning of work, with detailed manufacturing stages;
- Supply Bill of Materials;
- Material certificates with copy of the supplier's delivery slip;
- Welding procedures.

6.0 TREATMENT

6.1 Internal Treatment

- Sandblast as per SSPC-SP-10;
- Brush application on welds and difficult to reach places (inside of holes and openings) of one layer of DURA_PLATE UHS by SHERWIN WILLIAMS, color « light green » and;
- Application of one coat of DURA-PLATE-UHS NSF61 compliant by SHERWIN WILLIAMS, 20 to 28 mils dft (restricted level 5 as per SSPC-PA 2), color « light gray »;
- Important note: **Never dilute** the DURA-PLATE-UHS paint.

- Only if needed, application of one coat of DURA-PLATE UHS PRIMER by SHERWIN WILLIAMS, 4 to 8 mils dft per coat, color “Gold”, if required depending on atmospheric conditions and delays between sandblast and paint.

6.2 External Treatment

- Sandblast as per SSPC-SP-6;
- Spacing between intermittent welds should be filled with an hybrid sealant LOXON H-1 by SHERWIN WILLIAMS before the application of the external coating;
- Brush application on welds and difficult to reach places (inside of holes and openings) of one layer of ENVIROLASTIC 940 LV by SHERWIN WILLIAMS, color « White »;
- Application of one layer of ENVIROLASTIC 940 LV by SHERWIN WILLIAMS, 7.0 to 9.0 mils dft, (restricted level 5 as per SSPC-PA 2), color RAL 7040 Window Grey.

6.3 Piping Treatment

Identical to the external coating of the works as stated for the tank previously. There is no internal coating to provide for the nozzles of 3″ diameter or less (should be made from Stainless Steel). Ensure pipe ends and flanges are covered with paint with the exception of the raised face.

6.4 Extra Paint to be Supplied

For every equipment, a touch-up paint kit of 1 gallon for both internal and exterior paint must be provided at shipping. Please attach the product label.

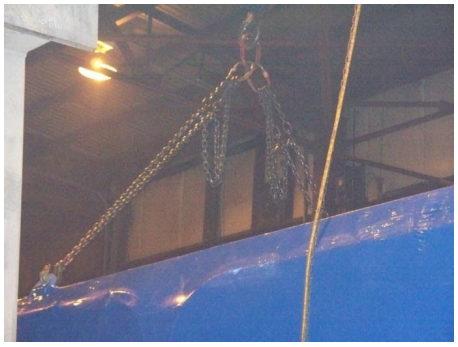
6.5 Application Procedure

The supplier’s procedure for application must be followed.

6.6 Protection of Metallic Parts during Treatment

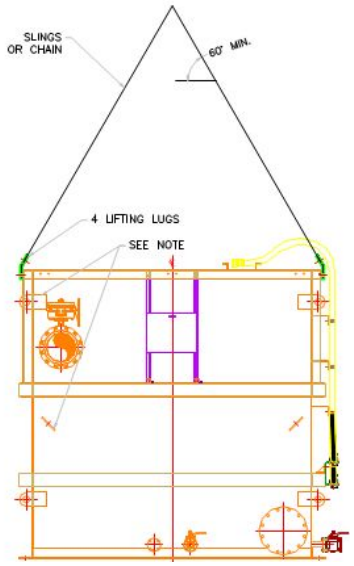
Threads, tapping, flange joint plans, etc. will be protected before sanding and treatment.

6.7 Paint Inspection



All interior surfaces must be inspected by performing a Holiday test in accordance with the standard NACE SP 0188, to verify the presence of discontinuity in the paint.

7.0 PACKAGING



- Plastic plug of the male and female threaded end caps;
- Wood plugs on flange sides.

8.0 HANDLING OF THE TANKS

- Always install the holding rings and any internal supporting beams before handling tanks.
- The tanks must be raised by chains attached to the holding rings. A minimum angle of 60º must be maintained. (see pictures)
- The lifting should ideally be carried out in two parallel points. (see pictures)

***ATTENTION*: Never use the side rings to lift and /or manipulate the tank. These rings should only be used to attach the tank during transport.**

Tightening Torque for Lifting Hooks

Model	Bolt Diam.	TPI	Fastener Coating (Bolt, washer & nut)	SAE & Grade (Bolt, washer & nut)	Torque Value (Lbs-ft)

Torques

INTRODUCTION TO TORQUES

There are a number of torques which butterfly valves may experience such as:

- **T_{su} - Seating and Unseating Torque**
- **T_d - Dynamic Torque Resulting from fluid flow**
- **T_{bf} – Bearing Friction Torque**
- **T_{ss} – Stem Seal Friction Torque**
- **T_e – Eccentricity Torque resulting from disc offset from centerline of stem (either single, double or triple offset)**
- **T_h – Hydrostatic Torque**

Factors which influence the butterfly valve torque values shown above are:

- Type of Seat and Seat Material
- Interference of Seat I.D. and Disc O.D.
- Shaft Diameter
- Valve Diameter
- Bearing Coefficient of Friction
- Angle of Opening
- Shut-off Pressure
- Fluid Velocity
- Disc Shape and Configuration
- Piping System and Location/Orientation of Valve in Pipe Line
- System Head Characteristics
- Physical Size of Disc/Shaft Obstructing Flow
- Disc Edge Finish

With respect to Butterfly Valves, the two major conditions for determining total valve operating torque (T_T) exists as follows:

CASE I (Angle = 0° , Disc in Closed Position)

$$T_T = T_h + T_{bf} + T_{ss} + T_{su}$$

Analyzed

Total Torque for Case I using a symmetrical disc butterfly valve is the sum of hydrostatic torque, bearing friction torque, stem seal, friction torque, and seating/unseating torque.

A. Hydrostatic Torque (T_h)

We will ignore discussion of the hydrostatic torque values as they are generally insignificant compared to the seating/unseating, bearing friction and stem seal torque values (the safety factor applied to seating/unseating, stem seal friction and bearing friction torque values more than compensates for the hydrostatic torque which is usually less than 2% of these total torques).

B. Bearing Friction Torque (T_{bf})

Bearing friction torque occurs because pressure forces against the disc are transmitted to the stem. As the stem is forced against the bearing supports, bearing friction torque is created between the stem material and the support material as the stem is turned. Bearing friction torques are normally included in the seating/unseating torque values.

Bearing friction torques can be determined by using the following equation:

$$T_{bf} = .785\ C_f\ D_v^2\ (d/2)\ \Delta P$$

Where:

- T_{bf} = Bearing Friction Torque
- C_f = Coefficient of Friction (approximately .25 for non-corroded stem to cast iron body) (dimensionless).
- D_v = Valve Diameter (Inches)
- d = Diameter of Shaft (Inches)
- ΔP = Pressure Differential (psi)

C. Stem Seal Friction Torque (T_{ss})

For all practical purposes stem seal friction torque values are insignificant when compared to seating/unseating and bearing friction torques. Stem seal friction torques are normally included in the seating/unseating torque values.

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.
The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

D. Seating/Unseating Torques (T_{su})

The seating/unseating torque value (T_{su}) is a function of the pressure differential, the seat material's coefficient of friction, the finished surface of the disc edge, the amount of interference between the seat I.D. and disc O.D. when flanged in piping, the seat thickness, and the type of service (media) for which the valve is being used. In determining the T_{su} values for Bray resilient seated butterfly valves, Bray has developed Seating/Unseating Torque Charts incorporating all bearing friction and stem seal friction torques for three classes of services for both the valves with standard discs (rated to full pressure) and for valves with reduced diameter discs (rated for 50 psi [3.5 bar]). The three service classes are:

Class A – Non-Corrosive, Lubricating Service

Class B – General Service

Class C – Severe Service

Please review the guidelines for each class in the technical manual when determining which Seating/Unseating Torque Class should be used. Most butterfly valves are used in Class II, General Service applications.

E. Total Torque (T_T)

The total torque values for Bray symmetrical disc valves for Case I applications are shown in the Seating/Unseating Torque Charts within this manual.

CASE II (Disc in Partial To Full Opening Position)

$$T_T = T_{bf} + T_{ss} + T_d$$

The total Torque for Case II using a symmetrical disc butterfly valve is the summation of bearing friction torque, stem seal friction torque and dynamic torque.

A. Bearing Friction Torque (T_{bf})

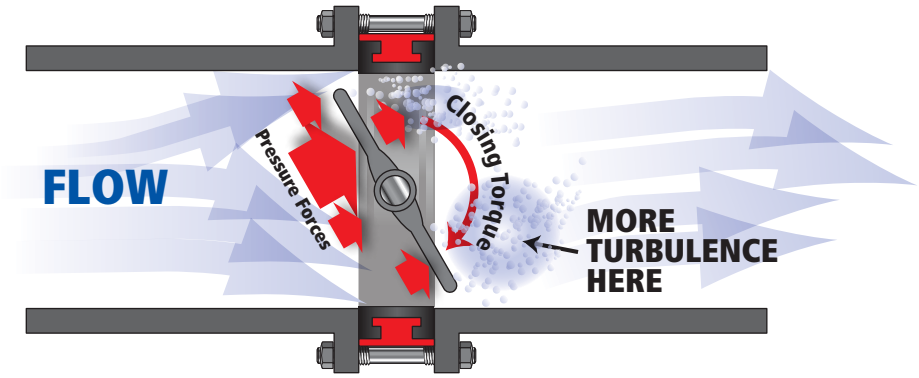
See Case I discussion. This torque value is normally included in the Dynamic Torque Value.

B. Stem Seal Friction Torque (T_{ss})

See Case I discussion. This torque value is normally included in the Dynamic torque value.

C. Dynamic Torque (T_d)

In a symmetrical disc design, dynamic torque occurs between the closed position, 0° and the full open position, 90°. With the disc in the partially open position, velocity of the fluid passing the leading disc edge is less than the velocity passing the trailing edge. This variance in velocity past the leading disc edge and trailing disc edge results in an unbalanced distribution of pressure forces on the upstream side of the face of the disc. The total pressure forces acting perpendicular to the disc face on the leading edge half of the disc are greater than the total pressure acting perpendicular on the trailing half of the disc. This uneven distribution of pressure on the disc face (exists on both sides of the disc) results in a torsional force which tries to turn the disc to the closed position **(Figure 1)**. This torsional closing force can become greater than the seating/unseating torque value depending on the valve angle of opening and differential pressure.



To determine dynamic torque, the following equation is applied:

$$T_d = C_{dt}\, d^3\, \Delta P$$

Where:

- T_d = Dynamic Torque (lbs- in).
- C_{dt} = Coefficient of Dynamic Torque (based on disc shape and angle of opening) (dimensionless)
- d = Diameter of Disc (Inches)
- ΔP = Pressure Differential Across Valve (psi)

Figure 1 - Pressure Distribution

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.
The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

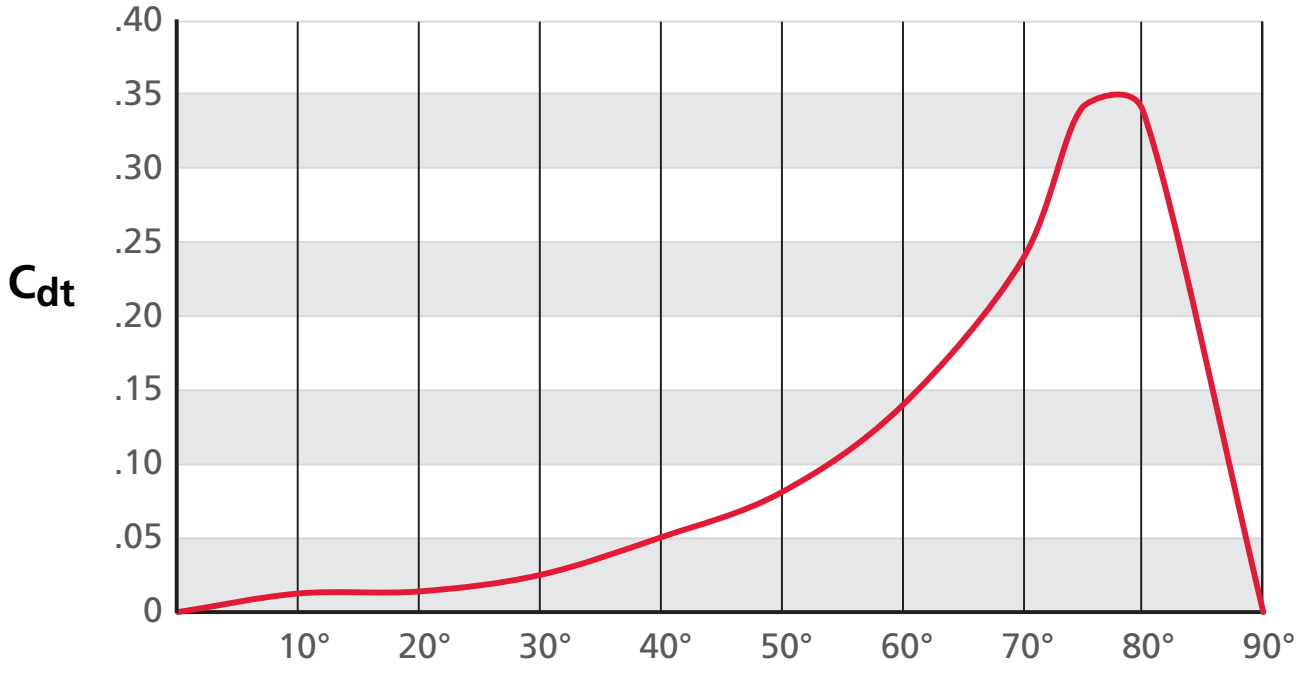
As shown in **Figure 2**, coefficient of dynamic torque for Bray's symmetrical disc valves is at 0° angle of opening and increases until the angle of opening reaches 75°-80°, where it then decreases to a zero value at full open (90°) (no internal friction factors considered, just dynamic torque only).

One final comment about dynamic torque is that one may minimize the dynamic torque by the orientation of the valve (stem horizontal or vertical) in the pipeline as well as by the location (distance) in the pipeline from elbows, other valves, etc. (See Bray Resilient Seated BFV Operations and Maintenance Manual).

D. Total Torque (T_T)

The total torque required for operating a Bray symmetrical disc butterfly valve at an angle opening between 0° and 90° is shown in the Dynamic Torque section of this manual. Note that the dynamic torque includes all internal friction torque values.

CONCLUSION



In most applications for butterfly valves, especially 20˝ (DN 500) or smaller, the maximum torque required to operate the valve will be seating/unseating torque. However, dynamic torque should be considered particularly in:

- Control applications using larger valves (24˝ [DN600] and above) where the disc is maintained in the open position
- Applications using larger valves (24˝ [DN 600] and above) where the velocity is high (16 ft./sec [4.9m/sec]).

Figure 2 - Angle of Opening

The C_{dt} value for Bray symmetrical disc valves are approximately:

Angle of Opening	0°	10°	20°	30°	40°	50°	60°	70°	75°	80°	90°
C_{dt}	0	0.0126	0.0140	0.0251	0.0505	0.0809	0.1394	0.2384	0.3419	0.3400	0

REDUCED DISC DIAMETER BRAY SERIES 30/31/3A VALVES

Bray offers a reduced disc diameter for 4"-20" for Series 30, 31 and 3A valves. The purpose of reducing the disc diameter is to decrease the seating/unseating torques and extend the seat life on low pressure applications.

By reducing the disc diameter, the interference between the disc O.D. and seat I.D. is decreased and the valve pressure rating, which is a function of this interference, is reduced to 50 PSI. Less interference between the disc and seat results in reduced seating/unseating torques. Lower seating/unseating torque may allow for the use of a smaller actuator on the valve. In other applications where abrasive dry bulk materials such as cement, sugar, plastic, pellets, flour, etc., are generally pneumatically conveyed at 50 PSI or less, the reduced disc diameter not only reduces the seating/unseating torque but, very importantly, usually significantly increases the service life of the seat.

Bray does the following to differentiate reduced diameter discs from full diameter discs:

Metal Discs: An " R " is stamped above the part number

Nylon 11 Coated Discs: Discs are differentiated by the color of the Nylon 11:

Grey – Full Disc Diameter

White – Reduced Disc Diameter

The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

SEATING & UNSEATING TORQUES

Bray has developed Seating/Unseating Torque Charts for three Classes of Service for its valves with standard discs (rated for full pressure) and for valves with reduced diameter discs (rated for 50 PSI / 3.5 bar.).

The guidelines for selecting a Class to be used for determining a valve's seating/unseating torque are given below. Each valve application should comply with all five Class characteristics in order to be qualified for that Class.

Characteristics of Application	**Class A** Non-Corrosive, Lubricating Service	**Class B** General Service	**Class C** Severe Service
Media Type	Lubricating hydrocarbons; Aqueous processes and Water (See Note 1)	Water; aqueous processes; all other aqueous liquids including salt water; Lubricating gases	Dry, non-lubricating such as air, dry gas, cement, pneumatic conveying mediums
Corrosion by Media	Insignificant if any	No major corrosion or deposits from media	Can incur significant corrosion such as Ductile Iron disc in water
Chemical Reactions of Media with Seat	Insignificant if any	Only minor or insignificant in nature	Reactions causing swelling and hardness occur
Media Temperature	45º to 160ºF (7º to 71ºC)	Within seat temperature limits, not near limits	Near or at seat temperature limits
Frequency of Valve Cycling	Once weekly or more frequently	Minimum once every 3-6 weeks, or more frequently	Infrequently, sometimes not cycled for long periods

NOTE:

1. For aqueous processes and water, Class A torques may be used only if a Nylon 11 coated disc is selected and all other Class A characteristics apply. Otherwise, Class B torques should be used.
2. All the material trims may be classified into Class A, B, or C except Series 20/21 valves with a PTFE Lined Elastomer seat, PTFE molded disc/stem, or rubber molded disc/stem. These trims must always use Class C Seating/Unseating Torque Values unless they are used only in a throttling application. Valves with bonded seats must always be classified as Class C.
3. If a valve is used strictly in a throttling application, that is, it is never put in the closed position but throttled between 20° and 80°, then Class A torques may be used provided you have checked to see that dynamic torques do not exceed the Class A torque values.
4. With the exception of dry, non-lubricating medias, one is usually safe electing to use Class B torques for sizing actuators for all other valve service applications. Seating/Unseating Torque values shown include friction bearing torques for stated differential pressure.
5. Dynamic Torque values are not considered. See the Dynamic Torque chart in this manual for determination of Dynamic Torque.
6. Do not apply a safety factor to torque values when determining actuator output torque requirement.
7. **For 3-way assemblies where one valve is opening and another is closing, multiply torque by a 1.5 factor.**

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.
The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

DYNAMIC TORQUE FACTORS (IMPERIAL)

To Use the Torque Chart, note the following:

1. Dynamic Torque values include all bearing friction and stem-seal friction torques.
2. Dynamic Torque values are per 1 PSI ΔP. To determine dynamic torque (lb-in) at a desired angle of opening, multiply the pressure drop ΔP at this angle by the appropriate dynamic torque factor in the charts below.
3. Bray recommends sizing control valves between 20° and 70°, with 60° the preferred angle.
4. Dynamic Torque will tend to close all Bray valves whose disc are symmetrical to the stem.

Series 20/21 and 30/31/3A (Dynamic Torque Factor - lb-in./psi)

Valve Size in.	Angle of Opening									
	10°	20°	30°	40°	50°	60°	70°	75°	80°	90°

VALVE SIZING COEFFICIENTS

1. **Valve Sizing Coefficients (Cv)**..... Pages 15-16

    1. **Cv** stands for **Valve Sizing Coefficient**, sometimes called the **Flow Rate Coefficient**.
    2. **Cv** varies with the valve size, angle of opening and the manufacturer's valve style.
    3. **Cv** is defined as the volume of water in USGPM that will flow through a given restriction or valve opening with a pressure drop of one (1) psi at room temperature.

2. **Valve Sizing Coefficients (Kv)**..... Pages 17-18

    1. **Kv** stands for **Valve Sizing Coefficient**, sometimes called the **Flow Rate Coefficient**.
    2. **Kv** varies with the valve size, angle of opening and the manufacturer's valve style.
    3. **Kv** is defined as the volume of water in Cubic Meters/Hour (m^3/hr) that will flow through a given restriction or valve opening with a pressure drop of one (1) bar at room temperature.

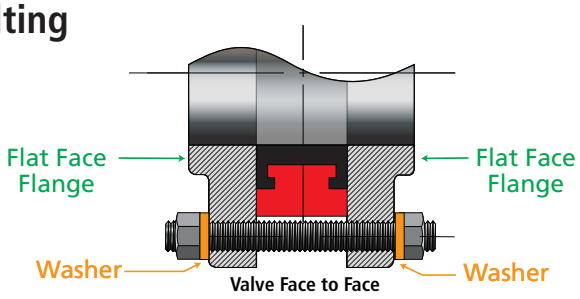
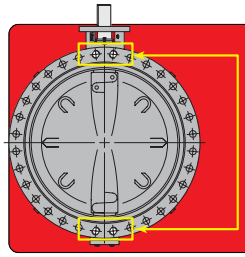
EXAMPLES OF TYPICAL FLANGE TO VALVE BOLTING*



** Lug Style Bolting

Flange Width Including Raise Face If Applicable + Washer Width + Minimum Bolt Engagement Equal to Bolt Diameter = Bolt Length



Wafer Style Bolting

Flange Width x2 Including Raise Face If Applicable + Valve Face to Face + Washer Width x2 + Width of Nut x2 + 4 Threads (2 Per Side) = Overall Length

**** Note: Please refer to Appropriate Bray Dimensional Drawings for specific valve drilling information on Wafer and Lug Valves 20" and larger.**

Please refer to ASME B-16.5 or B-16.47 for Flange and Bolt Dimension Information

* Double flange style bolting not shown.
** Lug threads may be tapped from both sides and therefore tap may not be continuous.

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.
The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

FLANGE BOLT TENSIONING
Bray Butterfly Valves with Metal Mating Flanges

A question frequently asked at Bray is "What torque do I apply to the flange bolts to insure the valve is properly installed?". Initially this seems to be a simple request until all of the factors are analyzed. The installation of a valve requires several components: the valve, mating flanges, nuts, bolts and studs. Each is supplied by different manufacturers and each has different characteristics. The proper torque for one combination may be too much or too little for a second combination. The following is a list of information which needs to be known in order to start calculating the torque requirements.

Valve
- Type
- Size
- Materials of construction (Body)
- Surface finishes / Surface conditions

Flange
- Type
- Size
- Finish / both sides
- Condition of flange / surface contamination

Bolt (or Stud)
- Type
- Materials of Construction
- Surface Conditions

Nut
- Type
- Materials of Construction
- Surface Conditions

Lubrication
- Type
- Coverage

General Factors
- Temperature and relative humidity at the time of installation
- Speed at which bolts are turned

Note: The elastomer valve seat manufactured by Bray also acts as the flange gasket. No additional gaskets are required or recommended. Other valve styles which do not have integral gaskets will need to have this component supplied. The characteristics of this component will also need to be considered.

Complete knowledge of all relevant conditions is almost impossible to obtain. As a result, the computation of the exact torque requirement is not practical. No reputable manufacturer can provide accurate information when so many outside factors are present.

The International Fasteners Institute covers some of the details required to "compute" a torque value. Even with this information the use of a torque wrench is only considered to be 25% accurate. Based on the difficulty and inaccuracy of using this method, Bray recommends the use of the "Turn of the nut" method.

"Turn of the Nut" Tightening
(For ANSI Standard Iron and Steel Flanges)
**For Non-Metallic or non-standard flanges, follow the manufacturers installation procedures.

1. The valve and flange faces must be aligned parallel to each other.

   Note: For rubber seated butterfly valves manufactured by Bray, it is required that the valve be fully opened prior to the tightening of the flange bolts.

2. After aligning the holes in a joint, sufficient bolts shall be placed and brought to a 'snug-tight' condition to ensure that the parts of the joint are *brought into full contact* with each other. 'Snug-Tight' is the tightness attained by the full effort of a man using a spud wrench.

3. Following the initial snugging operation, bolts shall be placed in any remaining holes and brought to snug-tightness. Re-snugging may be necessary in large joints.

4. Tighten opposite bolts in sequence to insure even pressure around the entire flange.

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.
The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

5. When all bolts are snug-tight, each bolt in the joint then shall be tightened additionally by the applicable amount of nut rotation given in Note 1. During tightening there shall be no rotation of the valve or flange.

Note 1

For bolt lengths **not exceeding** 8 diameters or 8 inches (203.2 mm) = **1/4 turn**
For bolt lengths **exceeding** 8 diameters or 8 inches (203.2 mm) = **1/2 turn**

Disclaimer:
Bray Controls is issuing these recommendations only as a guide to installation. This recommendation is based on the full compliance of all materials supplied to their appropriate specifications. Since many of the components are not manufactured by Bray we can take no responsibility for any damage caused during installation.

Series 20/21 and 30/31 - Flange Bolt Torque Chart

Valve Size		Normal Torque Range	Normal Torque Range
In	mm	Ft-lbs	Nm
2	50	30	40
2.5	65	30	40
3	80	35	50
4	100	35 - 40	50 - 55
5	125	35 - 45	50 - 60
6	150	35 - 50	50 - 65
8	200	45 - 55	60 - 75
10	250	55 - 75	75 - 100
12	300	65 - 110	90 - 150
14	350	75 - 120	100 - 165
16	400	75 - 120	100 - 165
18	450	85 - 130	115 - 175
20	500	85 - 130	115 - 175

Please note that the Nm and Ft-lbs values are based on bolt size in respective metric and ANSI flanges, i.e. these values are not a direct conversion between Nm and Ft-lbs.

The values represent average torques needed to ensure full compression of the resilient valves' seats into the valves' bodies when installed in pipeline flanges. The face of both flanges must come into full contact with the valves' metal bodies.

No additional torque is required for proper functioning of the Bray resilient seated valves.

The torque values are based on using new, coarse-threaded, lubricated fasteners. Up to 25% may be added to the Normal Torque Range values when using non-lubricated fasteners.

Torque Values specified by flange manufacturers ***must not be exceeded.***

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.
The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

Series 22/23 Installation - Flange Bolt Torque Chart, 150 lb Flanges

Valve Size		Normal Torque Range		Max Torque Range	
In	mm	Ft-lbs	Nm	Ft-lbs	Nm
2	50	30	40	35	50
2.5	65	30	40	35	50
3	80	35	50	40	55
4	100	35 - 40	50 - 55	40	55
5	125	35 - 45	50 - 60	50	65
6	150	35 - 50	50 - 65	65	90
8	200	45 - 55	60 - 75	80	110
10	250	55 - 75	75 - 100	100	135
12	300	65 - 110	90 - 150	120	165
14	350	75 - 120	100 - 165	140	190
16	400	75 - 120	100 - 165	140	190
18	450	85 - 130	115 - 175	170	230
20	500	85 - 130	115 - 175	180	245
24	600	100 - 150	135 - 205	220	300

The torque values are based on using new, coarse-threaded, lubricated fasteners. Up to 15% may be added to the Normal Torque Range values when using non-lubricated fasteners. However, the maximum torque should not be exceeded.

Flange gaskets are normally not used for installation of S22/23 valves. Flange leakage may be caused by combination of out-of-parallel and/or misaligned flanges, and surface damage on the flange face and/or the face of the valve seat. In such cases, suitable flange gaskets may be used to control flange leakage.

Torque values specified by manufacturers of certain flanges, for example plastic flanges, could be lower than the values specified above. In such cases, the flange manufacturers' torque values must not be exceeded. Use flange gaskets if necessary to secure flange seal.

Bray CONTROLS

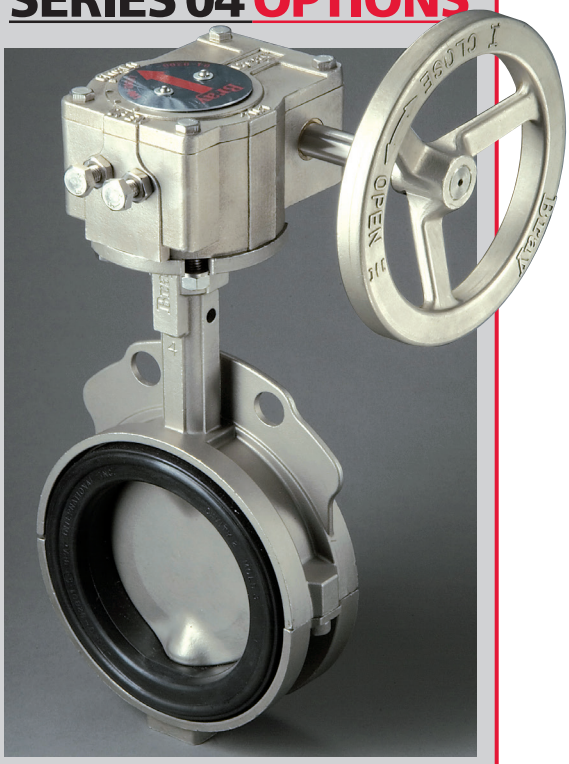
MANUAL OPERATORS

Bray Controls offers three operators for manual control of valve position. All manual operators mount directly to Bray valves, and all are epoxy coated for excellent corrosion, abrasion and impact resistance.

MANUAL OPERATORS	
SERIES 01 - Handle	1"-12" (25mm -300mm)
SERIES 04 - Gear Operator	2"-48" (50mm -1200mm)
SERIES 05 - Declutchable Gear Operator	2"-36" (50mm -900mm)

SERIES 01 - HANDLE & NOTCH PLATE

Bray offers two handles for on-off and throttling service – one for resilient seated valves from 1"-12" (25mm-300mm), and a high torque handle for high pressure valves from 2½"- 8" (65mm-200mm). These quarter turn handles have a locking spring and a directional pointer for valve disc position indication. Bolted notch plates are offered. For resilient seated valves a 10 position plate is standard. For high pressure valves a 9 position plate is standard. Both contain on-off stops to prevent over rotation of the valve. Optionally available are an infinite position plate, a 180° notch plate, a memory stop, a padlock kit, and a 2" square nut version.



SERIES 04 - GEAR OPERATOR

For heavy duty on-off and throttling service of 2"-48" (50mm-1200mm) valves, the Series 04 is self lubricated for smooth, trouble-free operation. The rugged, cast iron body with O-ring body seals is weatherproof to IP65. A self-locking worm and worm gear drive holds the valve in the desired position. Features include a readily accessible handwheel, a valve position indicator and mechanical travel stops which permit field adjustment of valve movement to specific degrees of rotation. Optionally available are chainwheel accessories, padlock kits and 2" square nut versions. A Gear Operator with a stainless steel housing is also available for valve sizes 1"-16".

SERIES 05 - DECLUTCHABLE GEAR OPERATOR

Available for 2"-36" (50mm-900mm) valves. This operator is excellent for the safe handling of spring return actuators. During pneumatic operation, the worm of the gear unit is disengaged. Should the valve require opening or closing in the event of power loss, manual rotation of the declutch lever will provide a camming action and engage the worm to the segmented worm gear, allowing rotation of the valve using the handwheel. The Series 05 can be installed in the field with existing Bray pneumatic actuators.

SERIES 04 OPTIONS

316 Stainless Steel
for sanitary & corrosive applications

Bray Controls proudly offers the Series 04 Stainless Steel Gear Operator for manual operation of quarter turn valves. With stainless steel housings, input shafts and handwheels, the Series 04 is designed for service in highly corrosive environments, sanitary, breweries and pharmaceutical applications. The units are suitable for on-off and throttling service.

Series 04 Stainless Steel Gear Operator units have different gear ratios – providing a torque output range of 2,000 to 24,000 lb-in. The temperature range is -4°F (-20°C) to 250°F (120°C).

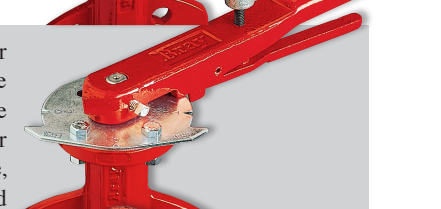
These weatherproof gear operators meet NEMA 4, 4x and IP 65 specifications.

CHAINWHEEL for remote access to valve positioning when the handwheel is not accessible, such as valves positioned high out of reach.

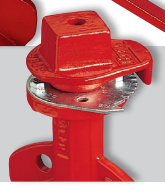
A PADLOCK KIT & 2" SQUARE NUT version for buried service are also available with the Series 04 (not shown).

SERIES 01

STANDARD 10 POSITION NOTCH PLATE has been designed to lock the handle securely in place, preventing position change of disc due to line pressure, vibration or shock. Standard 9 Position Plate for high pressure valves is not shown.



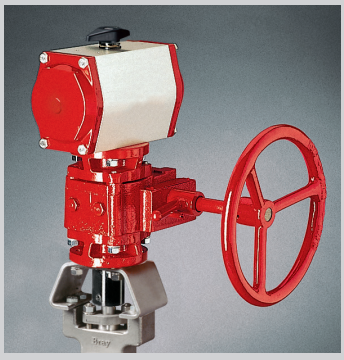
PADLOCK KIT allows the customer to lock the valve in the full open or closed position, tamper proofing the valve. By drilling a new hole in the top plate, the handle can be locked in mid travel.



HANDLE AND 180° NOTCH PLATE allows the operator to switch the handle to either side without removing the notch plate from the valve.

INFINITE POSITION NOTCH PLATE for throttling applications, allows for very precise adjustments of valve disc positioning anywhere from 0° to 90°. Positioning is simply a matter of loosening the set knob, moving the handle, then retightening the knob. For resilient seated valves only.

MEMORY STOP allows the operator to set the maximum amount the valve can open. When set, this limit will remain fixed until the stop is reset.



2" SQUARE NUT is used where the valve is buried under the surface. To rotate valve disc position, the nut is reached with a T-handle wrench.

SERIES 05

DECLUTCHABLE GEAR OPERATOR

The Series 05 offers the same superior features as the Series 04 gear operator with the added ability to manually override pneumatic actuators or rotate the valve when air pressure is not available.

1 Product Description

1.1 Product design

Usage

ENM-10 is a level regulator for level control applications. The level regulator starts and stops a pump or activates an alarm device when the liquid level reaches the regulator.

Materials

Denomination	Standard version	Ex version
Regulator casing	Polypropylene	Polypropylene with black conductive casing
Bend relief	EPDM rubber	NBR-PVC rubber
Cable sheath	PVC	NBR-PVC rubber

The plastic components are welded and screwed together.

1.2 Technical data

Application limits

Feature	Value
Liquid temperature	Minimum 0°C (32°F) Maximum 60°C (140°F)
Liquid density	Minimum 0.65 g/cm^3 Maximum 1.5 g/cm^3

Electrical specifications

Feature	Value
Degree of protection	IP68, 20 m (65 ft), 2 bars
Interrupting capacity of micro switch	AC, resistive load, 250 V 10 A AC, inductive load, 250 V 3 A cos ϕ = 0.5 DC, 30 V 5 A
Interrupting capacity of gold-plated micro switch	AC, resistive load, 250 V 10 A AC, inductive load, 250 V 3 A cos ϕ = 0.5 DC, 24 V 10 mA

Voltage limits are subject to local regulations.

Density ranges

Density g/cm^3	Regulator length mm (in.)	Diameter mm (in.)
0.65 – 0.80	194 (7 10/16)	100 (4)
0.80 – 0.95	177 (7)	100 (4)
0.95 – 1.10	162 (6 3/8)	100 (4)
1.05 – 1.20	142 (5 9/16)	100 (4)
1.20 – 1.30	133 (5 1/4)	100 (4)
1.30 – 1.40	130 (5 2/16)	100 (4)

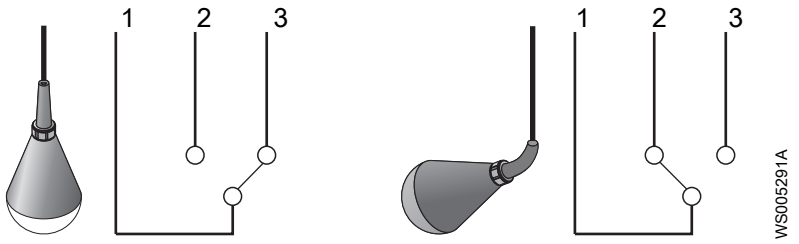
Density g/cm^3	Regulator length mm (in.)	Diameter mm (in.)
1.40 – 1.50	126 (5)	100 (4)

Weight

A regulator with standard density and 20 m cable weighs approximately 2 kg (4.5 lb).

1.3 Cables

Lengths



For liquids with specific density between 0.95 and 1.10 g/cm^3, the following cables are available:

Version	Lengths m (ft)
Standard	• 6 m (20 ft) • 13 m (42 ft) • 20 m (65 ft) • 30 m (100 ft) • 50 m (167 ft)
Ex	• 6 m (20 ft) • 13 m (42 ft) • 20 m (65 ft)

Diameter

The cable diameter for all product variants is 6.7 mm (0.26 in), +/- 0.2 mm (0.00787 in).

Color codes

Cable	1	2	3
Color	Grey	Black	Brown

1.4 Approvals and standards

Standard approvals

LVD approval according to EN61058
CSA approval: Certificate Number 1330172
Cl. I Zone 0, Gr. IIC
CL.I Div.1 Gr A, B, C and D
Cl.II Gr. E, F, and G

Ex approvals

IECEx ia IIC T4 Ga: -20°C≤Ta≤60°C
IECEx NEMKO 09.008
ATEX II 1G Ex ia IIC T4
NEMKO 10 ATEX 1082

Applied standards for ATEX and IEC

- EN 60079-0:2012/IEC 60079-0:2011
- EN 60079-11:2012/IEC 60079-11:2011
- IEC 60079-26:2014

Intrinsically safe circuits are required for the automatic control system. Use a Zener barrier, for example, part number 84 01 07.

The electrical connections must comply with the Ex regulations of the national submitter.

2 References

2.1 Chemical resistance tables

The tables show the degree of resistance the level regulator has to different chemicals at two different temperatures. The density of the liquid determines the buoyancy of the regulator.

Acids

Type of cables

Type of cable	Jacket	Color coding of wires
1	Blue polyvinyl chloride (PVC)	Grey/Brown/Black
2	Red PVC	Grey/Brown/Black
3	Black nitrile rubber (NBR)/PVC	Grey/Brown/Black

1 See *Type of cables* on page 9.
2 Designed for low current, slow movements and oil. Includes micro switch with gold plated contacts.
3 Zener barrier 84 01 07 required.

Xylem |'zīləm|

1) The tissue in plants that brings water upward from the roots;
2) a leading global water technology company.

We're a global team unified in a common purpose: creating advanced technology solutions to the world's water challenges. Developing new technologies that will improve the way water is used, conserved, and re-used in the future is central to our work. Our products and services move, treat, analyze, monitor and return water to the environment, in public utility, industrial, residential and commercial building services settings. Xylem also provides a leading portfolio of smart metering, network technologies and advanced analytics solutions for water, electric and gas utilities. In more than 150 countries, we have strong, long-standing relationships with customers who know us for our powerful combination of leading product brands and applications expertise with a strong focus on developing comprehensive, sustainable solutions.

PAINT SPECS

OIM manual section: 4.2.2.6

This page is intentionally left blank

TANK CONSTRUCTION SPECIFICATIONS
& PAINT SPECIFICATIONS
RAL 7040 TANK WINDOW GREY (EXTERIOR)
& LIGHT GREY (INTERIOR)

CC-07-ACP

1.0 GENERAL

This specification describes construction elements of the steel welded tank and paint specifications of ACP MK3 product.

2.0 MATERIALS

- Carbon steel must conform to CSA 44W, unless otherwise specified (see type on plan);
- Nominal thickness, refer to plan.

3.0 CONSTRUCTION

According to the specifications of the referred plan(s):

- Steel plates and sections must conform to Canadian norm G40.21M-300W, except for HSS that must conform to Canadian norm G40.21M-350W;

- Welds will be realized according to the details shown on the referenced plan. All welds must conform to the Canadian norm CSA W59 standard. Remove surface defects and grind all sharp edges. Make sure to completely remove the flux and welding splashes. The fusion welding certifications to produce by the company will be: W47.1, W59;

- Welding process:

    - Flux-Cored Arc Welding (FCAW);
    - MIG welding;
    - Electrodes (SMAW).

- Welds will be brushed and be devoid of spots;

- All modifications to the dimensions or to the quality of materials, and dispositions other than those indicated on the plans, are subject to prior demand to **Veolia Water Technologies Canada Inc's.,** person in charge, and his subsequent written.

4.0 STEEL PREPARATION FOR PAINTING

- Tank's interior and exterior surfaces must be perfectly cleaned from grease and all other foreign substance;

- All sharp edges must be grinded;

- All flanged surfaces and threaded connections must be cleaned and protected adequately to avoid paint contact;

- The rough edges, weld splatter, excess metal flux and sharp edges must be removed by grinding.

5.0 CONTROL

5.1 Welds

Once completed, all tank interior welds must be dye penetrant inspected to verify the quality of the welds. All welds must be water tight, free from porosity, cracks and drains and in accordance with norm CSA W59.
A dye penetrant test control should be done on all interior welds. Exterior welds must be visually inspected only.
All lifting and handling lugs must be subject to magnetic particle testing and report. Quality control from **Veolia Water Technologies Canada Inc.** will verify results of welds control.

5.2 Dimensional

The dimensional control will be done by the manufacturer. At the same time, **Veolia Water Technologies Canada Inc.'s** inspector will provide control. Minutes will be written detailing the dimensional and tolerance divergences. These values are noted on the piece's plan, assigned to control.

5.3 Documents and Certificates of Material (to Supply)

The manufacturer will supply to **Veolia Water Technologies Canada Inc.'s** inspector at the beginning of work, the following documents:

- Planning of work, with detailed manufacturing stages;
- Supply Bill of Materials;
- Material certificates with copy of the supplier's delivery slip;
- Welding procedures.

6.0 TREATMENT

6.1 Internal Treatment

- Sandblast as per SSPC-SP-10;
- Brush application on welds and difficult to reach places (inside of holes and openings) of one layer of DURA_PLATE UHS by SHERWIN WILLIAMS, color « light green » and;
- Application of one coat of DURA-PLATE-UHS NSF61 compliant by SHERWIN WILLIAMS, 20 to 28 mils dft (restricted level 5 as per SSPC-PA 2), color « light gray »;
- Important note: **Never dilute** the DURA-PLATE-UHS paint.

- Only if needed, application of one coat of DURA-PLATE UHS PRIMER by SHERWIN WILLIAMS, 4 to 8 mils dft per coat, color “Gold”, if required depending on atmospheric conditions and delays between sandblast and paint.

6.2 External Treatment

- Sandblast as per SSPC-SP-6;
- Spacing between intermittent welds should be filled with an hybrid sealant LOXON H-1 by SHERWIN WILLIAMS before the application of the external coating;
- Brush application on welds and difficult to reach places (inside of holes and openings) of one layer of ENVIROLASTIC 940 LV by SHERWIN WILLIAMS, color « White »;
- Application of one layer of ENVIROLASTIC 940 LV by SHERWIN WILLIAMS, 7.0 to 9.0 mils dft, (restricted level 5 as per SSPC-PA 2), color RAL 7040 Window Grey.

6.3 Piping Treatment

Identical to the external coating of the works as stated for the tank previously. There is no internal coating to provide for the nozzles of 3″ diameter or less (should be made from Stainless Steel). Ensure pipe ends and flanges are covered with paint with the exception of the raised face.

6.4 Extra Paint to be Supplied

For every equipment, a touch-up paint kit of 1 gallon for both internal and exterior paint must be provided at shipping. Please attach the product label.

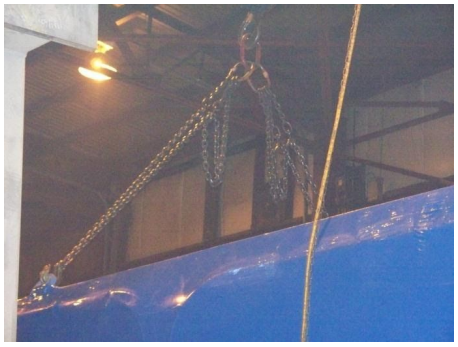
6.5 Application Procedure

The supplier’s procedure for application must be followed.

6.6 Protection of Metallic Parts during Treatment

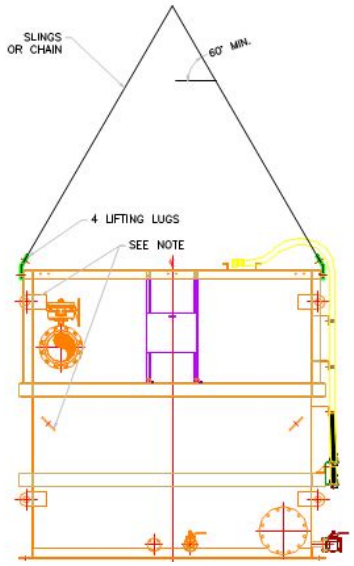
Threads, tapping, flange joint plans, etc. will be protected before sanding and treatment.

6.7 Paint Inspection



All interior surfaces must be inspected by performing a Holiday test in accordance with the standard NACE SP 0188, to verify the presence of discontinuity in the paint.

7.0 PACKAGING



- Plastic plug of the male and female threaded end caps;
- Wood plugs on flange sides.

8.0 HANDLING OF THE TANKS

- Always install the holding rings and any internal supporting beams before handling tanks.
- The tanks must be raised by chains attached to the holding rings. A minimum angle of 60º must be maintained. (see pictures)
- The lifting should ideally be carried out in two parallel points. (see pictures)

***ATTENTION*: Never use the side rings to lift and /or manipulate the tank. These rings should only be used to attach the tank during transport.**

Tightening Torque for Lifting Hooks

Model	Bolt Diam.	TPI	Fastener Coating (Bolt, washer & nut)	SAE & Grade (Bolt, washer & nut)	Torque Value (Lbs-ft)
Actiflo					
ACP-150R/ACP2-15	5/8 UNC	11	Zinc Plated	SAE J429 – Grade 8	190

SETTLING LAMELLA

OIM manual section: 4.2.3.7

This page is intentionally left blank

POLIMERI EUROPA

Edistir® R 850E

Polystyrene

TECHNICAL DATA SHEET

Product description

Super high impact polystyrene with good heat resistance.

Designed for sheet extrusion and thermoforming of deep drawn containers even diluted with high percentage of GP. Suitable for general injection molding of tough medium-walled articles.

Designation: Thermoplastics ISO 2897-PS-I,G,093-03-10-18

Applications

Typical uses are thermoformed food packaging as disposable tumblers, flatwares, yoghurt cups, lids. Injection molding of technical items, shoe heels, reels.

Typical processing data

Extrusion:
- melt temperature 210 - 240°C

Injection molding:
- predrying normally not required
- melt temperature 210 - 260°C
- mold temperature 20 - 60°C

General information

R 850E is certified UL94 HB "all colors" at 1.5 mm (UL file E83071).

This grade in natural version complies by composition with the requirements set by the main Regulations for plastic materials intended for food contact (included the EEC Directive 90/128 and following amendments).

HYDROCYCLONE MA

Separation technology designed for Microsand enhanced clarifier

The range of Standard Hydrocyclones MA has been specifically developed by Veolia for the separation of microsand and sludge on all the Actiflo Applications.

6 models

Inlet flow rate from 0.4 m^3/h to 100 m^3/h

Features & Benefits

- Body made of polyurethane resistant to abrasion
- Material suitable for drinking water applications (WRAS and ACS approved, FDA approval in progress)
- Design specifically for separation of specific microsand used by Veolia
- Possibility to use service water to wash the microsand, reducing largely sludge and bacteria (including E. coli) return into Actiflo Process
- Only design suitable for Actiflo Carb, Soft and HCS applications

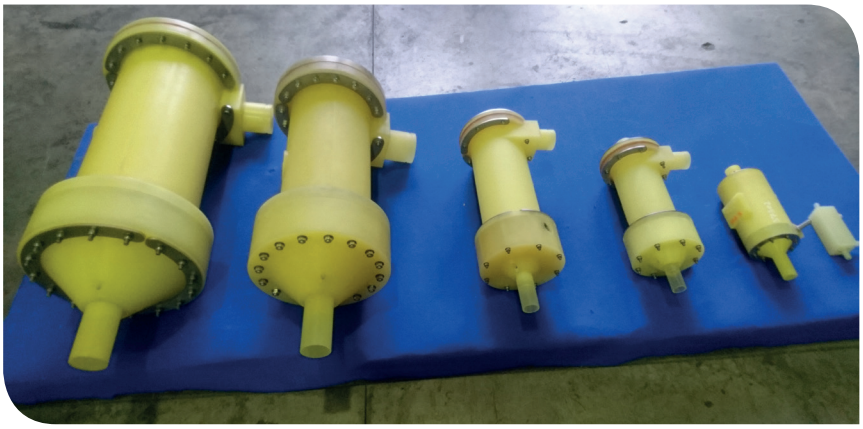
Options

- Different diameters of Vortex finder in order to reduce pressure loss (available for the 3 bigger models only)
- Different diameters of APEX wear part in order to adjust water underflow (available for the 3 bigger models only)

Applications

- Actiflo Classic
- Actiflo Turbo
- Actiflo HCS
- Actiflo Carb and Twin Carb
- Actiflo Soft

Markets



- Drinking Water
- Process Water
- Municipal Waste Water
- Industrial Waste Water
- Storm Water

Related Services

Local after-sales service and support teams offer preventative and corrective maintenance programs to ensure the long-term, efficient operation of installed plant.

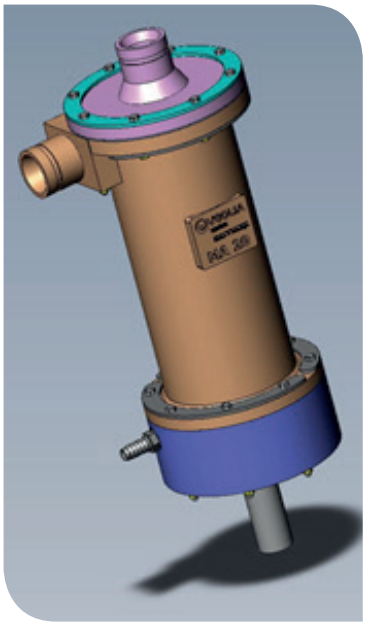
Hydrex™ Chemicals

Hydrex™ 9000 water treatment chemicals from Veolia Water Technologies should be used for optimized operation.

HYDROCYCLONE MA

Equipment Performance & Dimensions

Model	MA1	MA5	MA10	MA20	MA40	MA80
Min inlet flowrate	0.4 m^3/h	4 m^3/h	8 m^3/h	16 m^3/h	35 m^3/h	60 m^3/h
Max inlet flowrate	1 m^3/h	6 m^3/h	14 m^3/h	30 m^3/h	60 m^3/h	100 m^3/h
Pressure required at minimum inlet flowrate*	0.5 bar	0.6 bar	0.6 bar	0.6 bar	1.25 bar	1 bar
Pressure required at maximum inlet flowrate*	2.5 bar	1.5 bar	1.8 bar	2 bar	3 bar	2.3 bar



* Counter-pressure on overflow to be considered in addition.

Connections and dimensions

Model	MA1	MA5	MA10	MA20	MA40	MA80

Type 21 True Union Ball Valves

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

The Chemline **Type 21** True Union Ball valve incorporates state of the art features for long term performance. This is a full port, full blocking True Union valve pressure rated at 16 bar (230 psi)[3]. Double stem o-rings and Safety Shear stem design provide for a high degree of safety on hazardous fluid applications. All sizes have an ISO standard actuator mounting platform integral to the valve body. This provides for sturdy and secure mounting of pneumatic or electric actuators.

PVC | CPVC | PP | PVDF

CRN Registered Consult Chemline

NSF[4] Certified to NSF/ANSI 61

SERIES: Type 21

SIZES: 3/8" – 4"

ENDS: Socket, Threaded, Combo[6], Flanged, Butt[1] or ChemFlare™

SEATS: PTFE

SEALS[2]: EPDM, FKM (Viton®)

features

Pressure rated to 230 psi[3]
- Provides a high factor of safety

Integral Actuator Mounting Platform
- Actuation is easy. Electric or pneumatic actuators may be mounted in the field.

Full Port
- High capacity and low pressure drops

Fully Blocking
- Downstream union nut may be safely disassembled for piping maintenance while valve is closed off under full system pressure

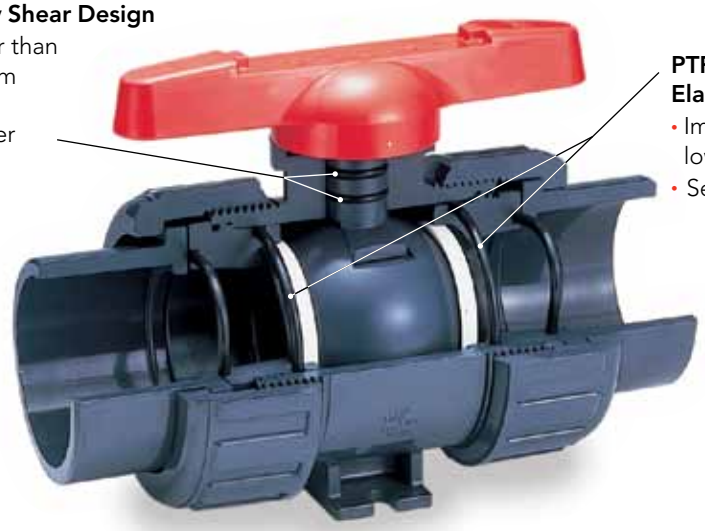
Built-In Spanner Wrench
- Top of the handle is designed to be used as a tool for accessing internal parts

Safety Shear Stem Design
- Stem has double o-rings
- Designed to hold full pressure even if stem breaks due to excessive torque

High Chemical Resistant Material
- PVC and CPVC compounds have an "A" chemical resistance rating as per ASTM D-1784. They have outperformed other PVC and CPVC compounds on aggressive chemicals.

CRN Registration numbers by province
- Ontario: OC11045.5
- Newfoundland: OC11045.50
- Saskatchewan/Manitoba/Quebec: OC11045.56
- New Brunswick: OC11045.57
- Nova Scotia: OC11045.58
- P.E.I.: OC11045.59
- British Columbia: not required
- Alberta: not required[5]

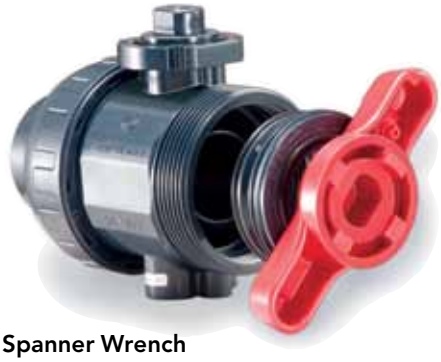
[1] Butt ends for fusion to Chemline metric PP, PVDF or ECTFE (Halar®) piping.
[2] Other materials are available.
[3] PVC, CPVC and PVDF 1/2" to 2" are rated at 230 psi; 2-1/2" to 4" and all size PP valves are rated at 150 psi at 20°C.
[4] PVC valves with EPDM or FKM (Viton®) seals are certified under NSF/ANSI Standard 61 for contact with drinking water.
[5] Not required for non-expandable fluids.
[6] PVC and CPVC valves 1/2" to 2" are available as Combo (threaded and socket ends).



11/20 ©Chemline Plastics Limited 2020
Chemline is a registered trade mark of Chemline Plastics Limited

Type 21 True Union Ball Valves

Features



Double Stem O-Rings – Safety Shear Design

- Upper o-ring groove is deeper than lower. In case of excessive stem torque, stem will shear at the upper groove, leaving the inner o-ring intact to seal against full line pressure.

PTFE Seats have Elastomer Cushions

- Improved sealing while lowering stem torques
- Self adjusts for seat wear

Built in Spanner Wrench

- For removing or tightening the seat carrier
- All parts are replaceable

Integral Actuator Mounting Platform

- Actuation is easy. Electric or pneumatic actuators may be mounted in the field. Simply pull off the handle to reveal a standard ISO 5211 mounting platform which accepts bolt-on hardware.

Fully Blocking

- Downstream pipe may be removed while upstream side is still pressurized. This may be done with valve installed in either direction.

Base Mounting Pad

- Optional threaded inserts allow valves to be securely anchored
- Supplied standard with actuated valves

Options + Accessories

ChemFlare™ Ends

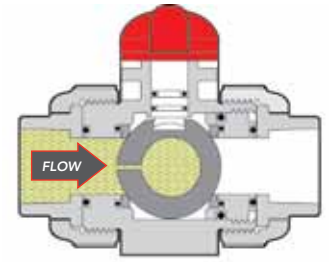
- For connection to PFA tube. Leak-free connections for difficult services such as sodium hypochlorite

One-piece moulded PVC and CPVC 6" socket ends

- Allows installation of 4" valve in 6" line
- Factory moulded, elimates cementing separate reducer and coupling
- Fixed to valve mechanically just like the one-piece moulded factory flanges

Optional Lock-out Handle & Hasp

- To prevent unauthorized operation of the valve during maintenance shut-downs
- Padlocks go through holes in hasp



Gear Operators

- Deluxe FRP construction
- IP67 enclosure resists short term immersion

Chain Wheel Operators

- For overhead operation, with 7' of chain drop
- Cast iron or stainless steel

Vented Ball

- Recommended for all sodium hypochlorite services
- Valve shown in closed position

Valve Tags

- Stainless steel or plastic

Different Colour Handles

- Choose a handle colour other than standard red for colour coding different services

Municipal Operating Nut

- 2" square nut for operating valves below grade using a standard municipal "key"
- Stainless Steel for corrosion resistance

Manual Limit Switch

- Electrical feedback of manual valve position
- NEMA 4X enclosure, position indicator beacon, 2x SPDT or proximity switches, stainless steel hardware

Shaft Extensions

- Different materials and lengths are available
- Several designs:
  - with no housing for indoors
  - with waterproofed PVC housing for indoors or outdoors
  - with stainless steel housing for buried or actuated services

Type 21 True Union Ball Valves

Electric + Pneumatic Actuation

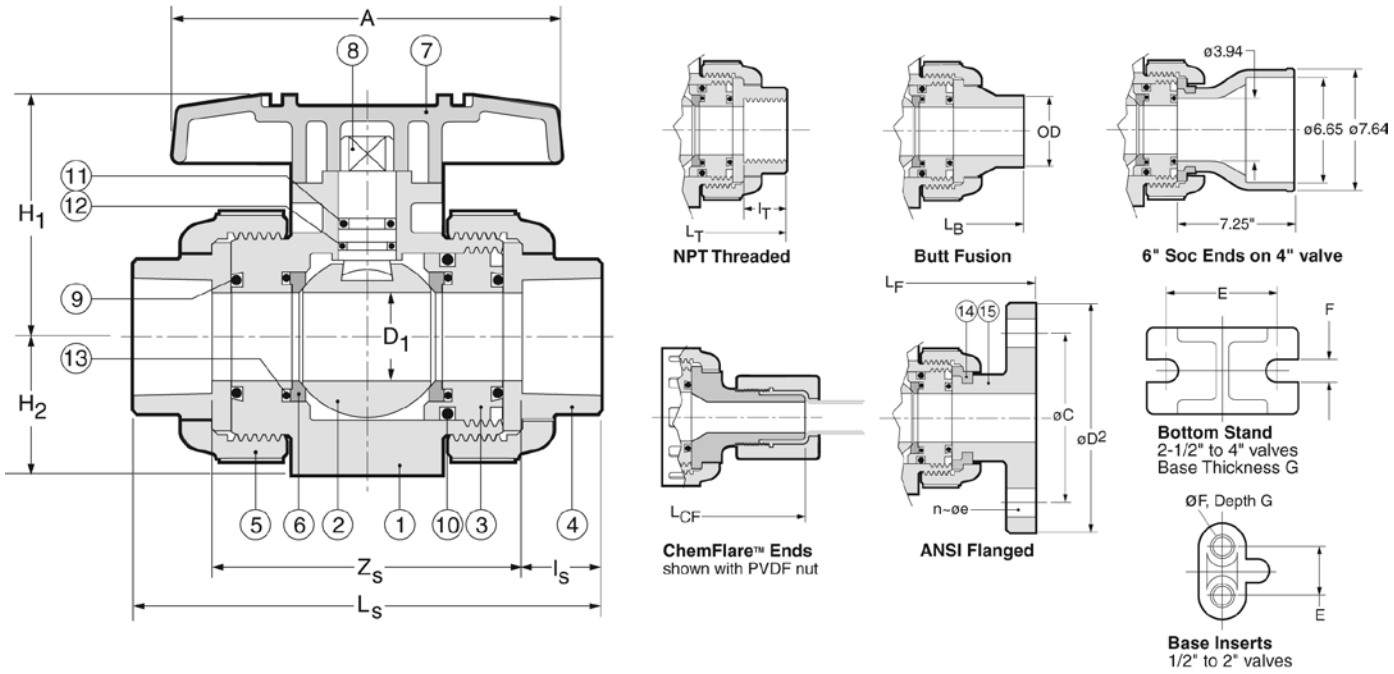
- A complete range of actuators and control accessories are available, mounted to valves using PPG plastic brackets and stainless steel couplings. Refer to separate data sheets.
- All actuators are CSA approved, have NEMA 4X enclosures, stainless steel hardware and permanently lubricated gear train

ERS Series Electric
- Type 21 ball valves up to 2"
- 180 in-lbs torque
- On-Off (3/2-wire), adjustable travel
- Visual feedback

E Series Electric
- Type 21 ball valves up to 4"
- Up to 885 in-lbs torque
- On-Off (3/2-wire), adjustable travel. Optional: failsafe, 3 position modulating
- Visual feedback and feedback switches. Optional: extra switches, feedback potentiometer and feedback transmitter

V Series Electric
(with optional Local Control Station)
- Type 21 ball valves up to 6"
- up to 8,850 in-lbs torque
- On-Off (2/3-wire), adjustable travel. Optional: failsafe, modulating, BUS
- Visual feedback, 2 feedback switches. Optional: 2 extra feedback switches, feedback potentiometer and feedback transmitter

PA Series Pneumatic
- Type 21 ball valves up to 6"
- up to 10,660 in-lbs torque
- industrial process submerged
- bleach/water washdown
- Rilsan-coated aluminum



PP Series Pneumatic
- Type 21 ball valves up to 6"
- up to 1,335 in-lbs torque
- industrial process with minimal use of metal
- Glass-filled Polyamide

OTHER OPTIONS & ACCESSORIES

- **Alternate O-Ring Seals**
- **Stem Extensions** made to any length
- **Limit Switches** – for open and/or closed position indication
- **Municipal Operating Nut**
- **Lubrication-free Valves** – factory clean room assembled
- **Vented Ball** – for sodium hypochlorite applications

Type 21 True Union Ball Valves

PARTS

▲ Recommended Spare Parts

No.	Part	Pcs.	Materials
1	Body	1	PVC, CPVC, PP, PVDF
2	Ball	1	PVC, CPVC, PP, PVDF
3	Carrier[1]	1/2	PVC, CPVC, PP, PVDF
4	End Connector	2	PVC, CPVC, PP, PVDF
5	Union Nut	2	PVC, CPVC, PP, PVDF
6▲	Ball Seat	2	PTFE
7	Handle	1	ABS

[1] 1 carrier for sizes 1/2" to 2", 2 carriers for sizes 2-1/2" to 4"
[2] EPDM seals standard with PVC, CPVC, PP; FKM (Viton®) with PVDF valves
[3] 2 pcs 1/2" to 2", 6 pcs 2-1/2" to 4"

SAMPLE SPECIFICATION

1. All True Union Ball Valves in PVC, CPVC, PP or PVDF shall be Chemline Type 21 or equal sizes 1/2" to 2" in PVC, CPVC, and PVDF rated at 230 psi and in PP 150 psi maximum working pressure. Sizes 2-1/2", 3" and 4" rated at 150 psi maximum working pressure with EPDM or FKM (Viton®) seals. Ball seats shall be PTFE with elastomer cushions for closure with minimum stem torques.
2. All valves will have Safety Shear stem design, blowout-proof with double o-rings for safety. The top o-ring groove shall be deeper so that if the stem breaks off under excessive torque the lower o-ring will remain intact and the valve will hold pressure.
3. All valves shall be full port and two-way blocking design.
4. All valves will be CRN (Canadian Registration Number) registered with TSSA.
5. PVC valves with EPDM or FKM (Viton®) seals shall be certified under NSF/ANSI Standard 61 for contact with drinking water.
6. All valves shall have chemical resistant labels permanently marked with manufacturing number to provide production level traceability.
7. PVC compound shall have an ASTM cell classification 12454-A with a minimum suffix "A" designation for chemical resistance as per ASTM D-1784 (CSA report LO 4000-172).
8. CPVC compound shall have an ASTM cell classification 23567-A with a minimum suffix "A" designation for chemical resistance as per ASTM D-1784.
9. PP material will conform to ASTM D-4101 PP 021 B 67272 material requirements.
10. PVDF material shall be unpigmented conforming to ASTM D-3222 material requirements and to be USDA Title 21 Chapter 1 Part 177. 2510 requirements for contact with food.
11. Socket ends in PVC and CPVC shall be Schedule 80 and conform to ASTM D-2467.
12. Threaded ends shall be Schedule 80 and conform to ASTM D-2464.
13. Butt fusion ends in PP or PVDF will be compatible with Chemline PP or PVDF metric piping systems.
14. Flanged ends shall be ANSI Class 150 one-piece factory moulded (not fabricated) to ensure maximum strength and close tolerance end to end dimensions.

FLOWSERVE

Durco T4E Lined Plug Valves

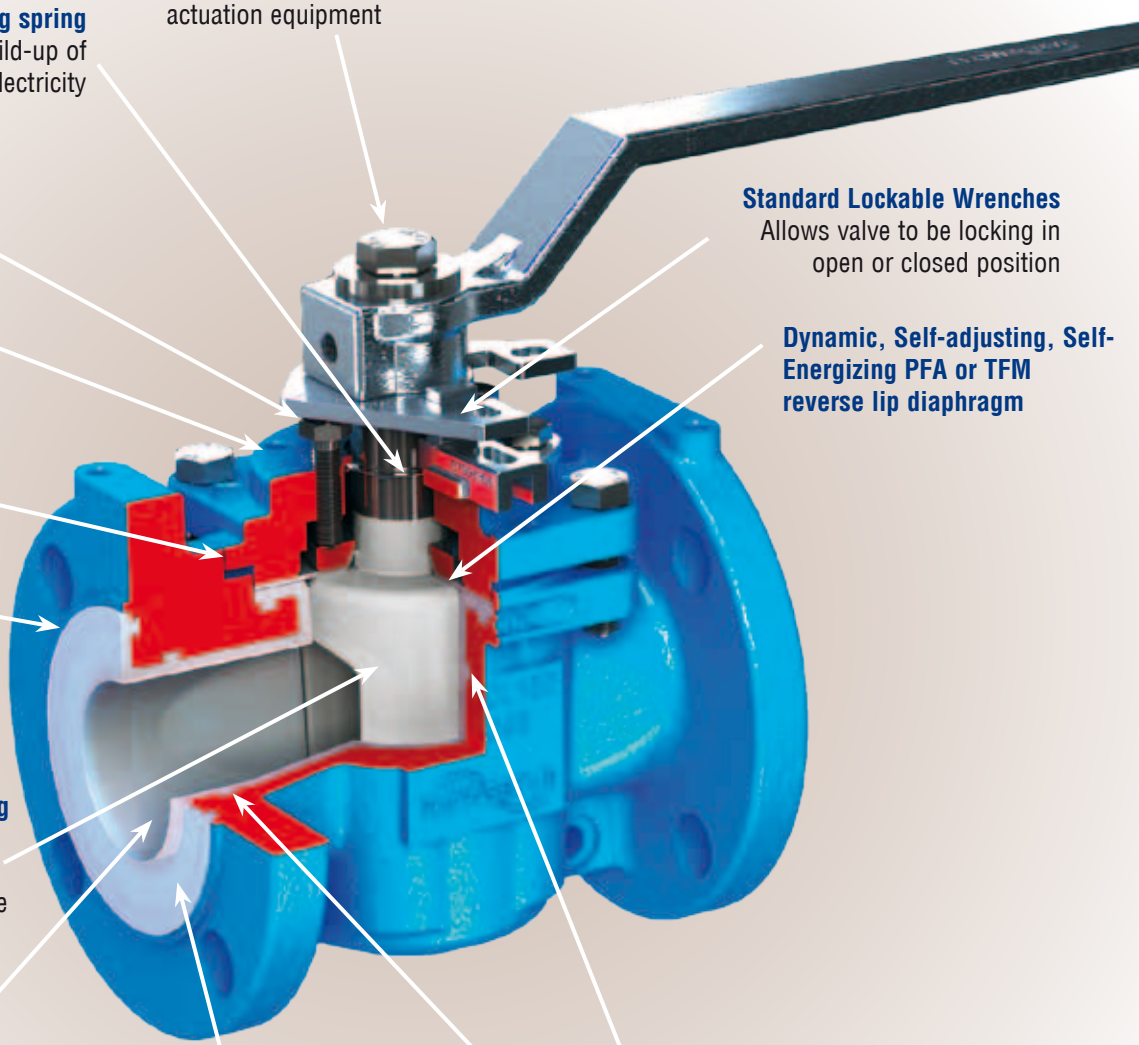
Fluoropolymer Lined Valves

Experience In Motion

History

Flowserve Durco T4E valves have been designed and developed with the latest technology and are the most preferred fluoropolymer lined valves in the global chemical industries.
Durco T4E valves provide maximum corrosion resistance and the elimination of product contamination at a reasonable cost.

Available in a Broad Size Range and



- ***T4E1*** *ASME Class 150 is available in sizes ½" through 12"*
- ***T4E2*** *DIN PN 16 is available in sizes DN 15 through DN 300*
- ***T4E3*** *ASME Class 300 is available in sizes ½" through 10"*

Extended Pressure Classes

- ***T4E1 and T4E2*** *rated 180 psi @400 °F (12.4 bar @ 204 °C), 250 psi @ 100 °F (17.2 bar @ 100 °C)*
- ***T4E3*** *rated 320 psi @ 400 °F (22 bar @ 204 °C), 740 psi @ 100 °F (51 bar @ 100 °C)*

Available with pneumatic or electric actuators for On-Off or modulating control applications.
All T4E valve series are rated to 4 Kpa (30 inches Hg) vacuum at ambient temperature.

Features

Double-D plug stem
accepts most standard actuation equipment

Grounding spring
To avoid build-up of static electricity

Inline adjustment
Stops thru-line leakage

ISO 5211 Mounting Pad
Universal flange for easy actuation mounting

Anti-Rotation Lugs
Help to eliminate stress on fasteners during actuation

Raised Lip
Prevents cold flow outward

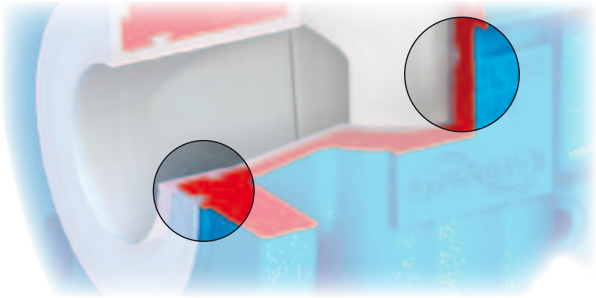
Standard Lockable Wrenches
Allows valve to be locking in open or closed position

Dynamic, Self-adjusting, Self-Energizing PFA or TFM reverse lip diaphragm

Solid Encapsulated PFA Molded Plug
All plug inserts have anchor holes to ensure a strong adhesion of the plug PFA liner material even under extreme cycling conditions

Large Ports
Offer good Cv values. Reduced frictional losses & pressure drop

High Quality PFA Liner
Protects the body and forms the flange gasket. The PFA liner is resistant against a wide variation of chemical products



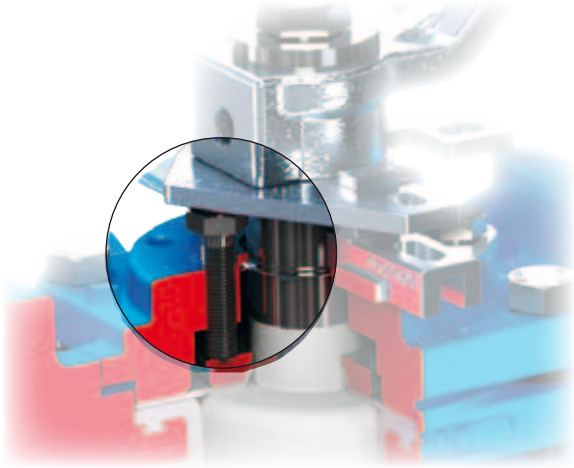
T-Slots in Critical Areas to Lock Liner Against Body Wall
Advantage will be a tight and perfect fit of the liner and an additional support during vacuum service

Additional Benefits

Benefits that give you the extra security which you will appreciate when using the T4E valves

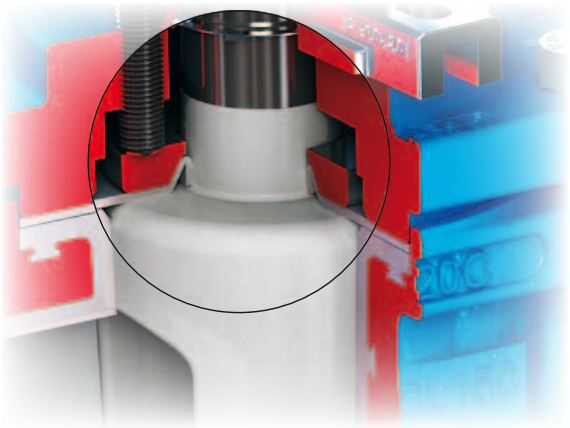
Body Liner

- A perfectly fixed PFA body liner is well anchored to the body by means of machined T-slots. The plug substrate has anchor holes to ensure that the PFA liner material is securely attached to the plug.
- Due to the selected mode to lock the liner to the valve body and plug, the T4E valve series is very suitable for extreme service conditions including vacuum applications at elevated temperatures.
- The PFA body liner covers all wetted surfaces in the body.
- Due to it's large sealing surface a tight shut-off is assured.
- In addition to the large seating area the valve is fully bi-directional and the seal is totally independent of line pressure.



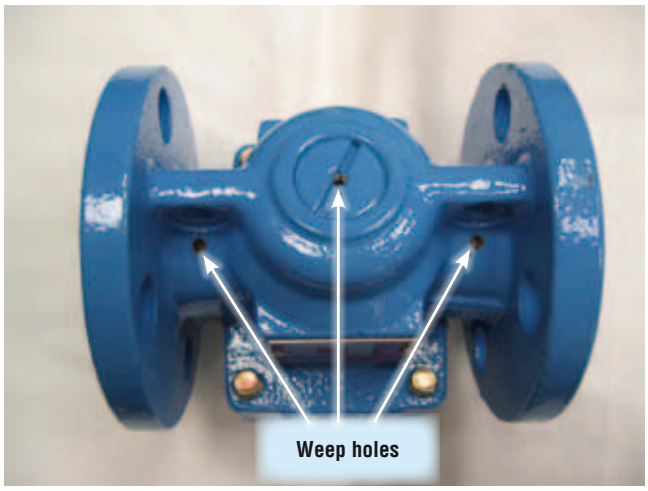
In-Line Adjustment

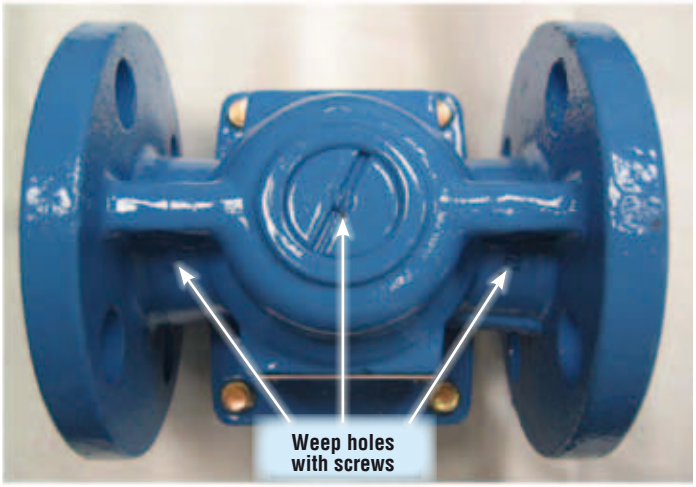
- No disassembly required to restore seating; plug can be reseated with a quick and easy in-line adjustment.
- An open end wrench and a few seconds are the extent of your maintenance requirements.



There are:

- No seats to replace
- No lengthy production disruption
- No piping disconnection
- No complicated, time-consuming maintenance procedures
- No hazards to personnel

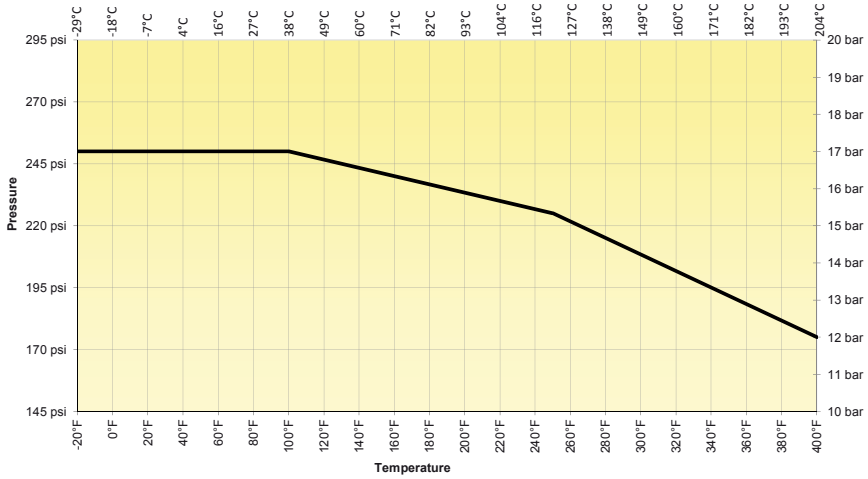


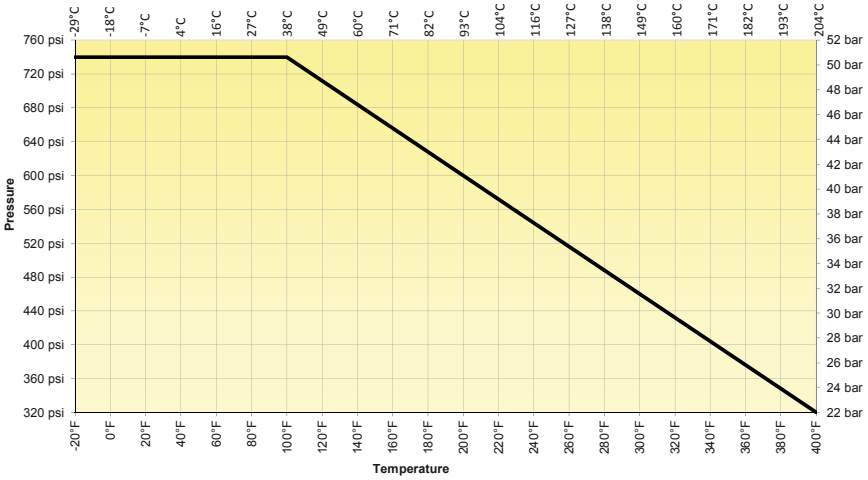


Secure Sealing

- A dynamic self-adjusting, self energized reverse lip PFA diaphragm seal prevents stem leakage.
- If line pressure forces liquid to the stem seal area, the self-energizing reverse lip PFA diaphragm will be forced against the stem to prevent external leakage.
- A sealing surface as much as 10x greater than other lined valves assures drop tight shut-off.
- In addition to the large sealing area, sealing is both upstream and downstream and is totally independent of line pressure.

Weepholes





Weepholes for early leakage detection

Durco T4E valves are supplied with three weepholes that are plugged with screws. The customer has the option to remove the screws. In so doing he is able to detect any leakage of process fluid through the liner and to take appropriate action.

Pressure-Temperature-Diagram - T4E1 and T4E2

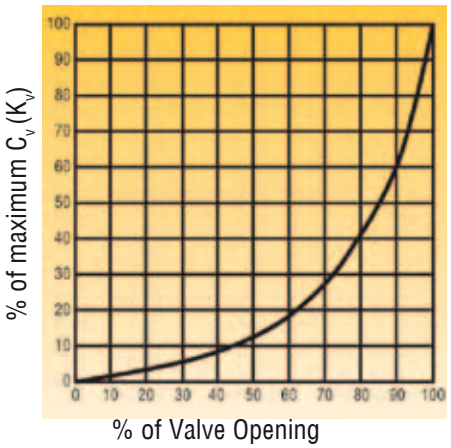
Durco T4E Automated Valves

Choose from a complete line of Flowserve Automax Automation Equipment for precise proportioning and On-Off control.....or we'll build a control package to your specification.

Flowserve Automax, a specialist in complete automation systems, produces a broad line of rack and pinion, heavy-duty, electric and linear actuators. In addition, a comprehensive line of engineered special control circuits, solenoid valves, limit switches, positioners and actuator mounting kits is offered.

Actuator Mounting

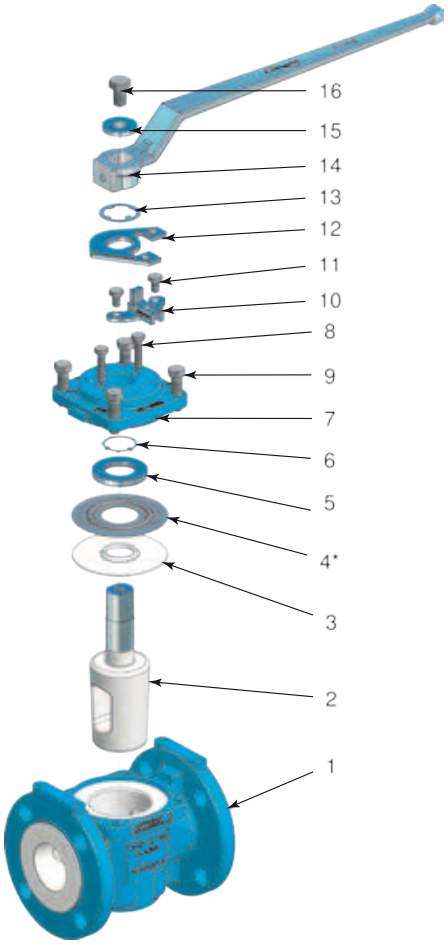


The body style of the T4E offers a choice of two locations for actuator mounting : an ISO 5200 pattern on the topcap or the flat-top pads of the flanges.

Software Capability

Flowserve offers a state-of-the-art range of software to help in sizing valves and actuation and creating drawings.

Modulating Control



V-port T4E valves are available in 1" (DN 25) through 4" (DN 100) sizes with Cv (Kv) values of 1 through 187 (Kv of 1 through 161). Standard port T4E valves are available in ½" (DN 15) through 12" (DN 300) sizes with Cv (Kv) values from 15 through 3200 (Kv from 13 through 2750).

Control Plugs

Size	Cv	Kv	Plug Type
1"	1	1	slotted plug

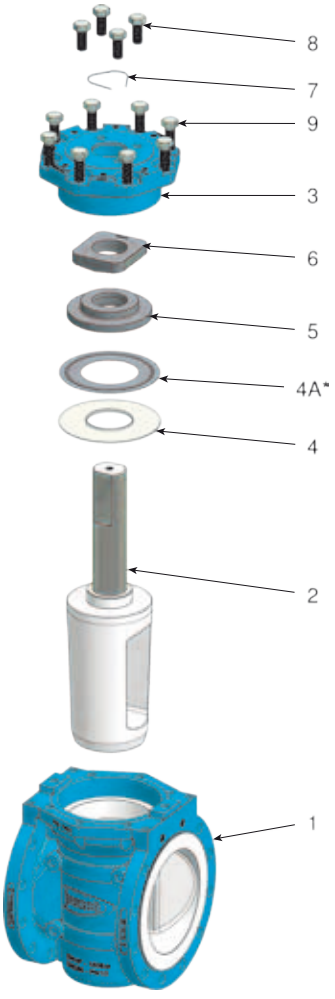
4"	187	161	V-port



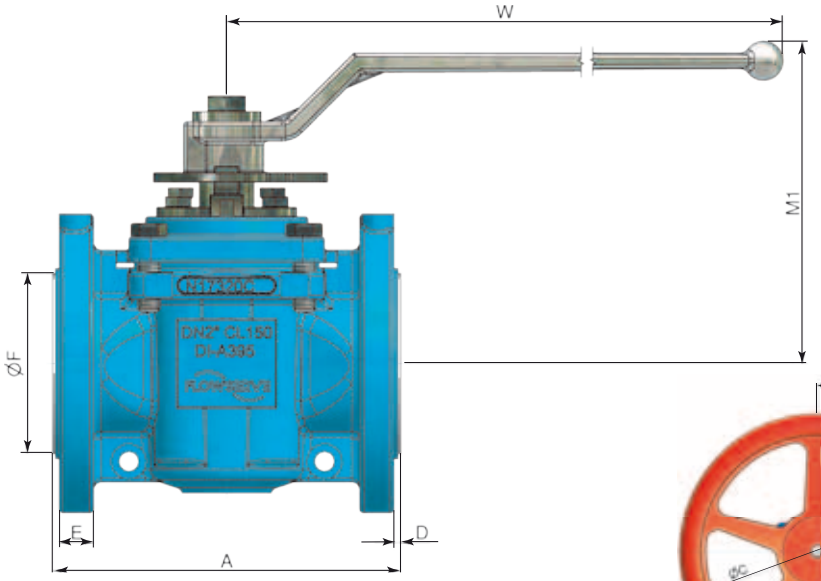
Material Specification

T4E1, T4E2 and T4E3 (½" - 6")

No.	Designation	Material
1	Body T4E1	Ductile cast iron - EN-JS1049/ASTM A395, PFA lined
	Body T4E3	Carbon steel ASTM A216 grade WCB, PFA lined
2	Plug	Ductile cast iron - EN-JS1049/ASTM A395, PFA lined
3	Diaphragm	T4E1: TFM (PFA*) | T4E3: PFA
4*	Metal diaphragm	Stainless steel - 302
5	Thrust gland	Machining steel - 1.0718
6	Grounding spring	Stainless steel - 302
7	Top cap T4E1	Ductile cast iron - EN-JS1049/ASTM A395
	Top cap T4E3	Carbon steel ASTM A995 Gr CD4MCuN
8	Adjuster bolt	ASTM A193 grade B7YC
9	Top cap bolt	ASTM A193 grade B7YC
10	Stop	Stainless steel ASTM A351/A744 grade CF-8M (316 SS)
11	Stop fastener	Stainless steel 1.4301
12	Stop collar	Carbon steel, protective plated
13	Stop collar retainer	Stainless steel - 302
14	Wrench	Ductile cast iron - EN-JS1082/ASTM A536
15	Washer	Stainless steel - 1.4301
16	Hexagon bolt	Stainless steel - 1.4301

*Optional

T4E1 and T4E2 (8" - 12") T4E3 (8" - 10")



No.	Designation	Material
1	Body T4E1	Ductile cast iron - EN-JS1049/ASTM A395*, PFA lined
	Body T4E3	Carbon steel ASTM A216 grade WCB, PFA lined
2	Plug	Ductile cast iron - EN-JS1049/ASTM A395, PFA lined
3	Top cap T4E1	Ductile cast iron - EN-JS1049/ASTM A395
	Top cap T4E3	Carbon steel ASTM A995 grade CD4MCuN
4	Diaphragm	T4E1: DN8" - TFM (PFA*), DN10"-DN12" - PFA | T4E3: PFA
4a**	Metal diaphragm	Stainless steel - 302
5	Thrust gland	Dupex stainless steel ASTM A995 Gr CD4MCuN
6	Adjuster	Dupex stainless steel ASTM A995 Gr CD4MCuN
7	Grounding spring	Stainless steel - 302
8	Adjuster bolt	88YC
9	Hexagon bolt	88YC

Note: All dimensions are approximate and for illustration purposes only. For exact dimensions consult certified dimensional prints
Valve 8"-12" are shown with double D stems which are standard. However spline shafts are also available for these sizes as an option.
All weights include either wrench or gear operator
Face-to-face dimensions comply to ANSI B16.10 and flange connections comply to ANSI B16.5

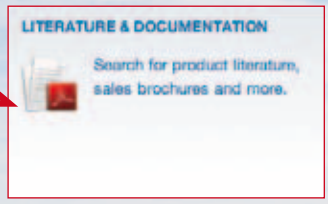
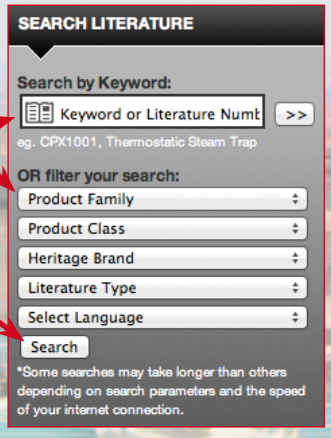
DSPA body = class 300 valves only
[3] DIPA plug = ½" thru 12"
CDPA plug = 8", 10" and 12" only
[4] DCI top cap = DIPA valve bodies
CD4M top cap = D4PA and DSPA valve bodies
[5] Locking wrench standard thru 4"
[6] Gear standard 6" and above (also available on smaller sizes)
[7] B7YC = standard for ½" thru 6"
88YC = standard for 8", 10", 12" (Gr. 8.8 yellow chromated)
[8] 8" and larger plugs have bottom vent as standard
[9] No lubrication for valves up to 4"
Built with Krytox for valves 6" and above





To Access Literature On-line

More information about FLOWSERVE products can be obtained on-line. It's easy to find… it's free… and you do not need a password.

Do This:

1. Go to www.flowserve.com
2. Click in the box that says "Literature"
3. Enter "Keyword" or literature number and "Filter" as required
4. Click on "Search"

The most recent version of each product bulletin will be available on this site.

Once you have the PDF, you can:

- read it
- print it
- download it
- even e-mail it

Other Useful Information

In addition to lined plug valves, lined butterfly valves (Document number DVENTB0020) and lined ball valves, check valves and sight glasses (Document number ATENTB0010) are also available.

Finally, a wide variety of metallic and lined rotary valves and actuation equipment is summarized in the Document number DVENBR0001.

To obtain any of these brochures, follow the simple steps on the left of this page and enter the Document number in Step 3.

Ordering Preprinted Literature

Customers, please contact your Flowserve sales representative to get hard copy of a brochure. Flowserve representatives and distributors can go to www.flowserve.com and click on the "View Literature" link then click on "Log-in to order hard copy literature" and follow the prompts.

Flowserve Corporation has established industry leadership in the design and manufacture of its products. When properly selected, this Flowserve product is designed to perform its intended function safely during its useful life. However, the purchaser or user of Flowserve products should be aware that Flowserve products might be used in numerous applications under a wide variety of industrial service conditions. Although Flowserve can (and often does) provide general guidelines, it cannot provide specific data and warnings for all possible applications. The purchaser/user must therefore assume the ultimate responsibility for the proper sizing and selection, installation, operation, and maintenance of Flowserve products. The purchaser/user should read and understand the Installation Operation Maintenance (IOM) instructions included with the product, and train its employees and contractors in the safe use of Flowserve products in connection with the specific application.

While the information and specifications contained in this literature are believed to be accurate, they are supplied for informative purposes only and should not be considered certified or as a guarantee of satisfactory results by reliance thereon. Nothing contained herein is to be construed as a warranty or guarantee, express or implied, regarding any matter with respect to this product. Because Flowserve is continually improving and upgrading its product design, the specifications, dimensions and information contained herein are subject to change without notice. Should any question arise concerning these provisions, the purchaser/user should contact Flowserve Corporation at any one of its worldwide operations or offices.

Torques

INTRODUCTION TO TORQUES

There are a number of torques which butterfly valves may experience such as:

- **T_{su} - Seating and Unseating Torque**
- **T_d - Dynamic Torque Resulting from fluid flow**
- **T_{bf} – Bearing Friction Torque**
- **T_{ss} – Stem Seal Friction Torque**
- **T_e – Eccentricity Torque resulting from disc offset from centerline of stem (either single, double or triple offset)**
- **T_h – Hydrostatic Torque**

Factors which influence the butterfly valve torque values shown above are:

- Type of Seat and Seat Material
- Interference of Seat I.D. and Disc O.D.
- Shaft Diameter
- Valve Diameter
- Bearing Coefficient of Friction
- Angle of Opening
- Shut-off Pressure
- Fluid Velocity
- Disc Shape and Configuration
- Piping System and Location/Orientation of Valve in Pipe Line
- System Head Characteristics
- Physical Size of Disc/Shaft Obstructing Flow
- Disc Edge Finish

With respect to Butterfly Valves, the two major conditions for determining total valve operating torque (T_T) exists as follows:

CASE I (Angle = 0° , Disc in Closed Position)

$$T_T = T_h + T_{bf} + T_{ss} + T_{su}$$

Analyzed

Total Torque for Case I using a symmetrical disc butterfly valve is the sum of hydrostatic torque, bearing friction torque, stem seal, friction torque, and seating/unseating torque.

A. Hydrostatic Torque (T_h)

We will ignore discussion of the hydrostatic torque values as they are generally insignificant compared to the seating/unseating, bearing friction and stem seal torque values (the safety factor applied to seating/unseating, stem seal friction and bearing friction torque values more than compensates for the hydrostatic torque which is usually less than 2% of these total torques).

B. Bearing Friction Torque (T_{bf})

Bearing friction torque occurs because pressure forces against the disc are transmitted to the stem. As the stem is forced against the bearing supports, bearing friction torque is created between the stem material and the support material as the stem is turned. Bearing friction torques are normally included in the seating/unseating torque values.

Bearing friction torques can be determined by using the following equation:

$$T_{bf} = .785\ C_f\ D_v^2\ (d/2)\ \Delta P$$

Where:

- T_{bf} = Bearing Friction Torque
- C_f = Coefficient of Friction (approximately .25 for non-corroded stem to cast iron body) (dimensionless).
- D_v = Valve Diameter (Inches)
- d = Diameter of Shaft (Inches)
- ΔP = Pressure Differential (psi)

C. Stem Seal Friction Torque (T_{ss})

For all practical purposes stem seal friction torque values are insignificant when compared to seating/unseating and bearing friction torques. Stem seal friction torques are normally included in the seating/unseating torque values.

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.
The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

D. Seating/Unseating Torques (T_{su})

The seating/unseating torque value (T_{su}) is a function of the pressure differential, the seat material's coefficient of friction, the finished surface of the disc edge, the amount of interference between the seat I.D. and disc O.D. when flanged in piping, the seat thickness, and the type of service (media) for which the valve is being used. In determining the T_{su} values for Bray resilient seated butterfly valves, Bray has developed Seating/Unseating Torque Charts incorporating all bearing friction and stem seal friction torques for three classes of services for both the valves with standard discs (rated to full pressure) and for valves with reduced diameter discs (rated for 50 psi [3.5 bar]). The three service classes are:

Class A – Non-Corrosive, Lubricating Service

Class B – General Service

Class C – Severe Service

Please review the guidelines for each class in the technical manual when determining which Seating/Unseating Torque Class should be used. Most butterfly valves are used in Class II, General Service applications.

E. Total Torque (T_T)

The total torque values for Bray symmetrical disc valves for Case I applications are shown in the Seating/Unseating Torque Charts within this manual.

CASE II (Disc in Partial To Full Opening Position)

$$T_T = T_{bf} + T_{ss} + T_d$$

The total Torque for Case II using a symmetrical disc butterfly valve is the summation of bearing friction torque, stem seal friction torque and dynamic torque.

A. Bearing Friction Torque (T_{bf})

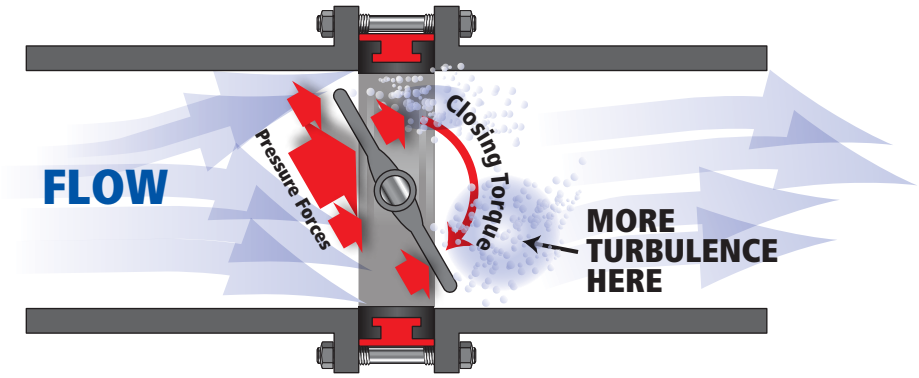
See Case I discussion. This torque value is normally included in the Dynamic Torque Value.

B. Stem Seal Friction Torque (T_{ss})

See Case I discussion. This torque value is normally included in the Dynamic torque value.

C. Dynamic Torque (T_d)

In a symmetrical disc design, dynamic torque occurs between the closed position, 0° and the full open position, 90°. With the disc in the partially open position, velocity of the fluid passing the leading disc edge is less than the velocity passing the trailing edge. This variance in velocity past the leading disc edge and trailing disc edge results in an unbalanced distribution of pressure forces on the upstream side of the face of the disc. The total pressure forces acting perpendicular to the disc face on the leading edge half of the disc are greater than the total pressure acting perpendicular on the trailing half of the disc. This uneven distribution of pressure on the disc face (exists on both sides of the disc) results in a torsional force which tries to turn the disc to the closed position **(Figure 1)**. This torsional closing force can become greater than the seating/unseating torque value depending on the valve angle of opening and differential pressure.



To determine dynamic torque, the following equation is applied:

$$T_d = C_{dt}\, d^3\, \Delta P$$

Where:

- T_d = Dynamic Torque (lbs- in).
- C_{dt} = Coefficient of Dynamic Torque (based on disc shape and angle of opening) (dimensionless)
- d = Diameter of Disc (Inches)
- ΔP = Pressure Differential Across Valve (psi)

Figure 1 - Pressure Distribution

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.
The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

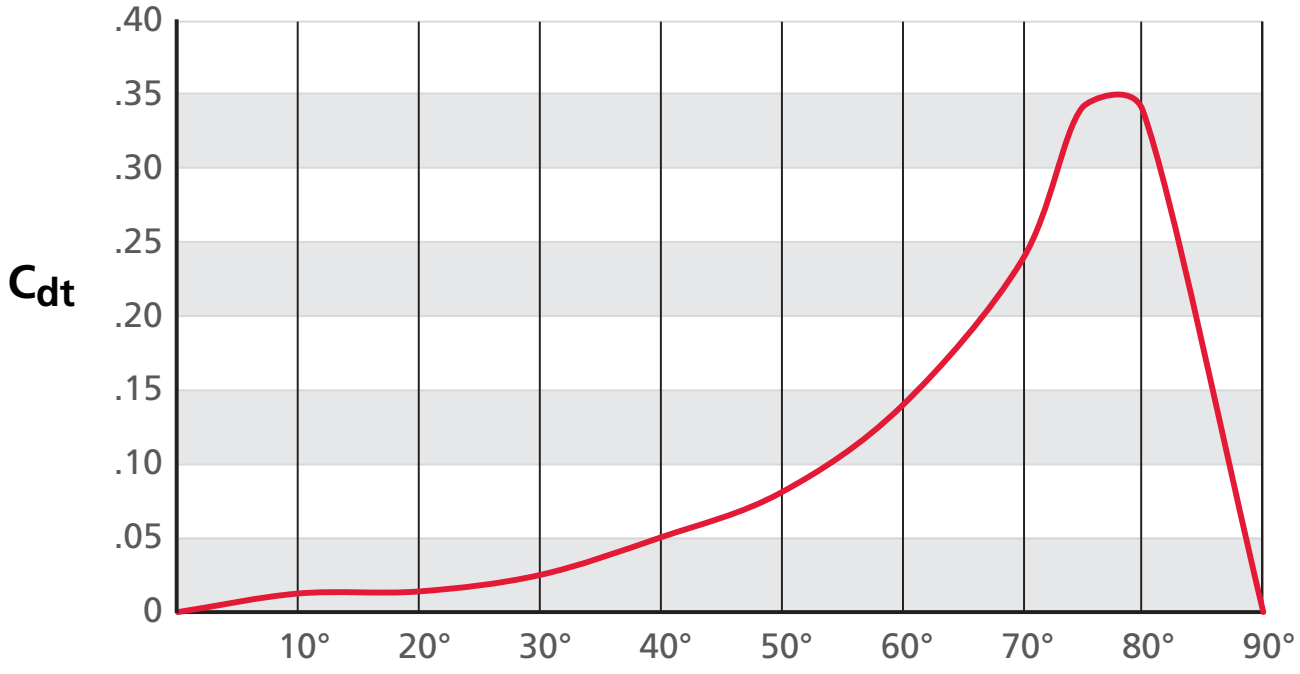
As shown in **Figure 2**, coefficient of dynamic torque for Bray's symmetrical disc valves is at 0° angle of opening and increases until the angle of opening reaches 75°-80°, where it then decreases to a zero value at full open (90°) (no internal friction factors considered, just dynamic torque only).

One final comment about dynamic torque is that one may minimize the dynamic torque by the orientation of the valve (stem horizontal or vertical) in the pipeline as well as by the location (distance) in the pipeline from elbows, other valves, etc. (See Bray Resilient Seated BFV Operations and Maintenance Manual).

D. Total Torque (T_T)

The total torque required for operating a Bray symmetrical disc butterfly valve at an angle opening between 0° and 90° is shown in the Dynamic Torque section of this manual. Note that the dynamic torque includes all internal friction torque values.

CONCLUSION



In most applications for butterfly valves, especially 20˝ (DN 500) or smaller, the maximum torque required to operate the valve will be seating/unseating torque. However, dynamic torque should be considered particularly in:

- Control applications using larger valves (24˝ [DN600] and above) where the disc is maintained in the open position
- Applications using larger valves (24˝ [DN 600] and above) where the velocity is high (16 ft./sec [4.9m/sec]).

Figure 2 - Angle of Opening

The C_{dt} value for Bray symmetrical disc valves are approximately:

Angle of Opening	0°	10°	20°	30°	40°	50°	60°	70°	75°	80°	90°
C_{dt}	0	0.0126	0.0140	0.0251	0.0505	0.0809	0.1394	0.2384	0.3419	0.3400	0

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.
The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

REDUCED DISC DIAMETER BRAY SERIES 30/31/3A VALVES

Bray offers a reduced disc diameter for 4"-20" for Series 30, 31 and 3A valves. The purpose of reducing the disc diameter is to decrease the seating/unseating torques and extend the seat life on low pressure applications.

By reducing the disc diameter, the interference between the disc O.D. and seat I.D. is decreased and the valve pressure rating, which is a function of this interference, is reduced to 50 PSI. Less interference between the disc and seat results in reduced seating/unseating torques. Lower seating/unseating torque may allow for the use of a smaller actuator on the valve. In other applications where abrasive dry bulk materials such as cement, sugar, plastic, pellets, flour, etc., are generally pneumatically conveyed at 50 PSI or less, the reduced disc diameter not only reduces the seating/unseating torque but, very importantly, usually significantly increases the service life of the seat.

Bray does the following to differentiate reduced diameter discs from full diameter discs:

Metal Discs: An " R " is stamped above the part number

Nylon 11 Coated Discs: Discs are differentiated by the color of the Nylon 11:

Grey – Full Disc Diameter

White – Reduced Disc Diameter

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.
The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

SEATING & UNSEATING TORQUES

Bray has developed Seating/Unseating Torque Charts for three Classes of Service for its valves with standard discs (rated for full pressure) and for valves with reduced diameter discs (rated for 50 PSI / 3.5 bar.).

The guidelines for selecting a Class to be used for determining a valve's seating/unseating torque are given below. Each valve application should comply with all five Class characteristics in order to be qualified for that Class.

Characteristics of Application	**Class A** Non-Corrosive, Lubricating Service	**Class B** General Service	**Class C** Severe Service
Media Type	Lubricating hydrocarbons; Aqueous processes and Water (See Note 1)	Water; aqueous processes; all other aqueous liquids including salt water; Lubricating gases	Dry, non-lubricating such as air, dry gas, cement, pneumatic conveying mediums
Corrosion by Media	Insignificant if any	No major corrosion or deposits from media	Can incur significant corrosion such as Ductile Iron disc in water
Chemical Reactions of Media with Seat	Insignificant if any	Only minor or insignificant in nature	Reactions causing swelling and hardness occur
Media Temperature	45º to 160ºF (7º to 71ºC)	Within seat temperature limits, not near limits	Near or at seat temperature limits
Frequency of Valve Cycling	Once weekly or more frequently	Minimum once every 3-6 weeks, or more frequently	Infrequently, sometimes not cycled for long periods

NOTE:

1. For aqueous processes and water, Class A torques may be used only if a Nylon 11 coated disc is selected and all other Class A characteristics apply. Otherwise, Class B torques should be used.
2. All the material trims may be classified into Class A, B, or C except Series 20/21 valves with a PTFE Lined Elastomer seat, PTFE molded disc/stem, or rubber molded disc/stem. These trims must always use Class C Seating/Unseating Torque Values unless they are used only in a throttling application. Valves with bonded seats must always be classified as Class C.
3. If a valve is used strictly in a throttling application, that is, it is never put in the closed position but throttled between 20° and 80°, then Class A torques may be used provided you have checked to see that dynamic torques do not exceed the Class A torque values.
4. With the exception of dry, non-lubricating medias, one is usually safe electing to use Class B torques for sizing actuators for all other valve service applications. Seating/Unseating Torque values shown include friction bearing torques for stated differential pressure.
5. Dynamic Torque values are not considered. See the Dynamic Torque chart in this manual for determination of Dynamic Torque.
6. Do not apply a safety factor to torque values when determining actuator output torque requirement.
7. **For 3-way assemblies where one valve is opening and another is closing, multiply torque by a 1.5 factor.**

DYNAMIC TORQUE FACTORS (IMPERIAL)

To Use the Torque Chart, note the following:

1. Dynamic Torque values include all bearing friction and stem-seal friction torques.
2. Dynamic Torque values are per 1 PSI ΔP. To determine dynamic torque (lb-in) at a desired angle of opening, multiply the pressure drop ΔP at this angle by the appropriate dynamic torque factor in the charts below.
3. Bray recommends sizing control valves between 20° and 70°, with 60° the preferred angle.
4. Dynamic Torque will tend to close all Bray valves whose disc are symmetrical to the stem.

Series 20/21 and 30/31/3A (Dynamic Torque Factor - lb-in./psi)

Valve Size in.	Angle of Opening									
	10°	20°	30°	40°	50°	60°	70°	75°	80°	90°

DYNAMIC TORQUE FACTORS (METRIC)

To Use the Torque Chart, note the following:

1. Dynamic Torque values include all bearing friction and stem-seal friction torques.
2. Dynamic Torque values are per 1 bar ΔP. To determine dynamic torque (Nm) at a desired angle of opening, multiply the pressure drop ΔP at this angle by the appropriate dynamic torque factor in the charts below.
3. Bray recommends sizing control valves between 20° and 70°, with 60° the preferred angle.
4. Dynamic Torque will tend to close all Bray valves whose disc are symmetrical to the stem.

Series 20/21 and 30/31/3A (Dynamic Torque Factor - Nm/bar)

Valve Size mm.	Angle of Opening									
	10°	20°	30°	40°	50°	60°	70°	75°	80°	90°

VALVE SIZING COEFFICIENTS

1. **Valve Sizing Coefficients (Cv)**..... Pages 15-16

    1. **Cv** stands for **Valve Sizing Coefficient**, sometimes called the **Flow Rate Coefficient**.
    2. **Cv** varies with the valve size, angle of opening and the manufacturer's valve style.
    3. **Cv** is defined as the volume of water in USGPM that will flow through a given restriction or valve opening with a pressure drop of one (1) psi at room temperature.

2. **Valve Sizing Coefficients (Kv)**..... Pages 17-18

    1. **Kv** stands for **Valve Sizing Coefficient**, sometimes called the **Flow Rate Coefficient**.
    2. **Kv** varies with the valve size, angle of opening and the manufacturer's valve style.
    3. **Kv** is defined as the volume of water in Cubic Meters/Hour (m^3/hr) that will flow through a given restriction or valve opening with a pressure drop of one (1) bar at room temperature.

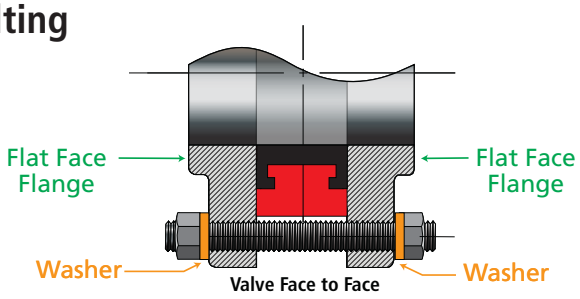
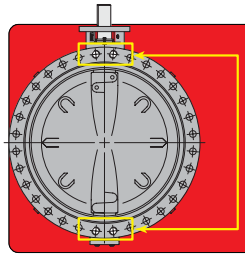
EXAMPLES OF TYPICAL FLANGE TO VALVE BOLTING*



** Lug Style Bolting

Flange Width Including Raise Face If Applicable + Washer Width + Minimum Bolt Engagement Equal to Bolt Diameter = Bolt Length



Wafer Style Bolting

Flange Width x2 Including Raise Face If Applicable + Valve Face to Face + Washer Width x2 + Width of Nut x2 + 4 Threads (2 Per Side) = Overall Length

**** Note: Please refer to Appropriate Bray Dimensional Drawings for specific valve drilling information on Wafer and Lug Valves 20" and larger.**

Please refer to ASME B-16.5 or B-16.47 for Flange and Bolt Dimension Information

* Double flange style bolting not shown.
** Lug threads may be tapped from both sides and therefore tap may not be continuous.

FLANGE BOLT TENSIONING
Bray Butterfly Valves with Metal Mating Flanges

A question frequently asked at Bray is "What torque do I apply to the flange bolts to insure the valve is properly installed?". Initially this seems to be a simple request until all of the factors are analyzed. The installation of a valve requires several components: the valve, mating flanges, nuts, bolts and studs. Each is supplied by different manufacturers and each has different characteristics. The proper torque for one combination may be too much or too little for a second combination. The following is a list of information which needs to be known in order to start calculating the torque requirements.

Valve
- Type
- Size
- Materials of construction (Body)
- Surface finishes / Surface conditions

Flange
- Type
- Size
- Finish / both sides
- Condition of flange / surface contamination

Bolt (or Stud)
- Type
- Materials of Construction
- Surface Conditions

Nut
- Type
- Materials of Construction
- Surface Conditions

Lubrication
- Type
- Coverage

General Factors
- Temperature and relative humidity at the time of installation
- Speed at which bolts are turned

Note: The elastomer valve seat manufactured by Bray also acts as the flange gasket. No additional gaskets are required or recommended. Other valve styles which do not have integral gaskets will need to have this component supplied. The characteristics of this component will also need to be considered.

Complete knowledge of all relevant conditions is almost impossible to obtain. As a result, the computation of the exact torque requirement is not practical. No reputable manufacturer can provide accurate information when so many outside factors are present.

The International Fasteners Institute covers some of the details required to "compute" a torque value. Even with this information the use of a torque wrench is only considered to be 25% accurate. Based on the difficulty and inaccuracy of using this method, Bray recommends the use of the "Turn of the nut" method.

"Turn of the Nut" Tightening
(For ANSI Standard Iron and Steel Flanges)
**For Non-Metallic or non-standard flanges, follow the manufacturers installation procedures.

1. The valve and flange faces must be aligned parallel to each other.

   Note: For rubber seated butterfly valves manufactured by Bray, it is required that the valve be fully opened prior to the tightening of the flange bolts.

2. After aligning the holes in a joint, sufficient bolts shall be placed and brought to a 'snug-tight' condition to ensure that the parts of the joint are *brought into full contact* with each other. 'Snug-Tight' is the tightness attained by the full effort of a man using a spud wrench.

3. Following the initial snugging operation, bolts shall be placed in any remaining holes and brought to snug-tightness. Re-snugging may be necessary in large joints.

4. Tighten opposite bolts in sequence to insure even pressure around the entire flange.

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.
The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

5. When all bolts are snug-tight, each bolt in the joint then shall be tightened additionally by the applicable amount of nut rotation given in Note 1. During tightening there shall be no rotation of the valve or flange.

Note 1

For bolt lengths **not exceeding** 8 diameters or 8 inches (203.2 mm) = **1/4 turn**
For bolt lengths **exceeding** 8 diameters or 8 inches (203.2 mm) = **1/2 turn**

Disclaimer:
Bray Controls is issuing these recommendations only as a guide to installation. This recommendation is based on the full compliance of all materials supplied to their appropriate specifications. Since many of the components are not manufactured by Bray we can take no responsibility for any damage caused during installation.

Series 20/21 and 30/31 - Flange Bolt Torque Chart

Valve Size		Normal Torque Range	Normal Torque Range
In	mm	Ft-lbs	Nm
2	50	30	40
2.5	65	30	40
3	80	35	50
4	100	35 - 40	50 - 55
5	125	35 - 45	50 - 60
6	150	35 - 50	50 - 65
8	200	45 - 55	60 - 75
10	250	55 - 75	75 - 100
12	300	65 - 110	90 - 150
14	350	75 - 120	100 - 165
16	400	75 - 120	100 - 165
18	450	85 - 130	115 - 175
20	500	85 - 130	115 - 175

Please note that the Nm and Ft-lbs values are based on bolt size in respective metric and ANSI flanges, i.e. these values are not a direct conversion between Nm and Ft-lbs.

The values represent average torques needed to ensure full compression of the resilient valves' seats into the valves' bodies when installed in pipeline flanges. The face of both flanges must come into full contact with the valves' metal bodies.

No additional torque is required for proper functioning of the Bray resilient seated valves.

The torque values are based on using new, coarse-threaded, lubricated fasteners. Up to 25% may be added to the Normal Torque Range values when using non-lubricated fasteners.

Torque Values specified by flange manufacturers ***must not be exceeded.***

Series 22/23 Installation - Flange Bolt Torque Chart, 150 lb Flanges

Valve Size		Normal Torque Range		Max Torque Range	
In	mm	Ft-lbs	Nm	Ft-lbs	Nm
2	50	30	40	35	50
2.5	65	30	40	35	50
3	80	35	50	40	55
4	100	35 - 40	50 - 55	40	55
5	125	35 - 45	50 - 60	50	65
6	150	35 - 50	50 - 65	65	90
8	200	45 - 55	60 - 75	80	110
10	250	55 - 75	75 - 100	100	135
12	300	65 - 110	90 - 150	120	165
14	350	75 - 120	100 - 165	140	190
16	400	75 - 120	100 - 165	140	190
18	450	85 - 130	115 - 175	170	230
20	500	85 - 130	115 - 175	180	245
24	600	100 - 150	135 - 205	220	300

The torque values are based on using new, coarse-threaded, lubricated fasteners. Up to 15% may be added to the Normal Torque Range values when using non-lubricated fasteners. However, the maximum torque should not be exceeded.

Flange gaskets are normally not used for installation of S22/23 valves. Flange leakage may be caused by combination of out-of-parallel and/or misaligned flanges, and surface damage on the flange face and/or the face of the valve seat. In such cases, suitable flange gaskets may be used to control flange leakage.

Torque values specified by manufacturers of certain flanges, for example plastic flanges, could be lower than the values specified above. In such cases, the flange manufacturers' torque values must not be exceeded. Use flange gaskets if necessary to secure flange seal.

Bray CONTROLS

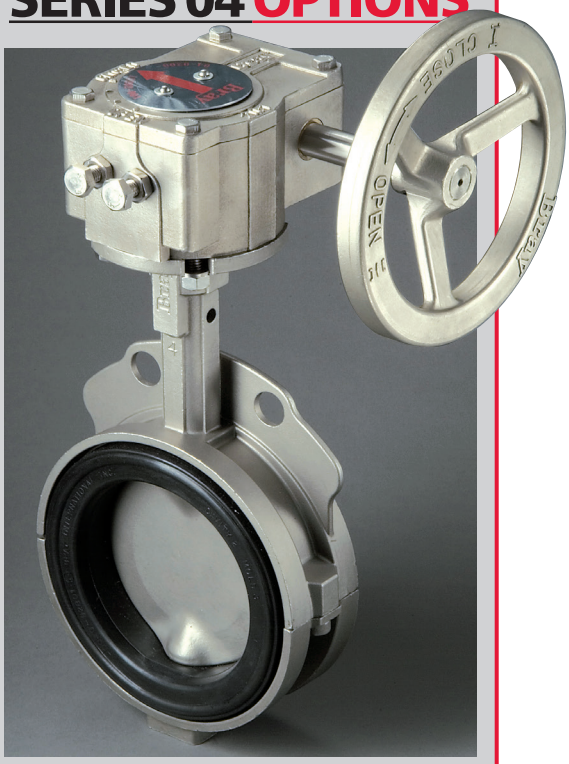
MANUAL OPERATORS

Bray Controls offers three operators for manual control of valve position. All manual operators mount directly to Bray valves, and all are epoxy coated for excellent corrosion, abrasion and impact resistance.

MANUAL OPERATORS	
SERIES 01 - Handle	1"-12" (25mm -300mm)
SERIES 04 - Gear Operator	2"-48" (50mm -1200mm)
SERIES 05 - Declutchable Gear Operator	2"-36" (50mm -900mm)

SERIES 01 - HANDLE & NOTCH PLATE

Bray offers two handles for on-off and throttling service – one for resilient seated valves from 1"-12" (25mm-300mm), and a high torque handle for high pressure valves from 2½"- 8" (65mm-200mm). These quarter turn handles have a locking spring and a directional pointer for valve disc position indication. Bolted notch plates are offered. For resilient seated valves a 10 position plate is standard. For high pressure valves a 9 position plate is standard. Both contain on-off stops to prevent over rotation of the valve. Optionally available are an infinite position plate, a 180° notch plate, a memory stop, a padlock kit, and a 2" square nut version.



SERIES 04 - GEAR OPERATOR

For heavy duty on-off and throttling service of 2"-48" (50mm-1200mm) valves, the Series 04 is self lubricated for smooth, trouble-free operation. The rugged, cast iron body with O-ring body seals is weatherproof to IP65. A self-locking worm and worm gear drive holds the valve in the desired position. Features include a readily accessible handwheel, a valve position indicator and mechanical travel stops which permit field adjustment of valve movement to specific degrees of rotation. Optionally available are chainwheel accessories, padlock kits and 2" square nut versions. A Gear Operator with a stainless steel housing is also available for valve sizes 1"-16".

SERIES 05 - DECLUTCHABLE GEAR OPERATOR

Available for 2"-36" (50mm-900mm) valves. This operator is excellent for the safe handling of spring return actuators. During pneumatic operation, the worm of the gear unit is disengaged. Should the valve require opening or closing in the event of power loss, manual rotation of the declutch lever will provide a camming action and engage the worm to the segmented worm gear, allowing rotation of the valve using the handwheel. The Series 05 can be installed in the field with existing Bray pneumatic actuators.

SERIES 04 OPTIONS

316 Stainless Steel
for sanitary & corrosive applications

Bray Controls proudly offers the Series 04 Stainless Steel Gear Operator for manual operation of quarter turn valves. With stainless steel housings, input shafts and handwheels, the Series 04 is designed for service in highly corrosive environments, sanitary, breweries and pharmaceutical applications. The units are suitable for on-off and throttling service.

Series 04 Stainless Steel Gear Operator units have different gear ratios – providing a torque output range of 2,000 to 24,000 lb-in. The temperature range is -4°F (-20°C) to 250°F (120°C).

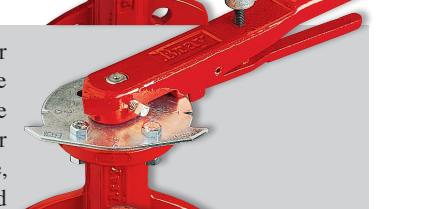
These weatherproof gear operators meet NEMA 4, 4x and IP 65 specifications.

CHAINWHEEL for remote access to valve positioning when the handwheel is not accessible, such as valves positioned high out of reach.

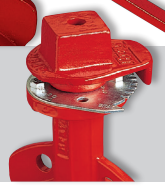
A PADLOCK KIT & 2" SQUARE NUT version for buried service are also available with the Series 04 (not shown).

SERIES 01

STANDARD 10 POSITION NOTCH PLATE has been designed to lock the handle securely in place, preventing position change of disc due to line pressure, vibration or shock. Standard 9 Position Plate for high pressure valves is not shown.



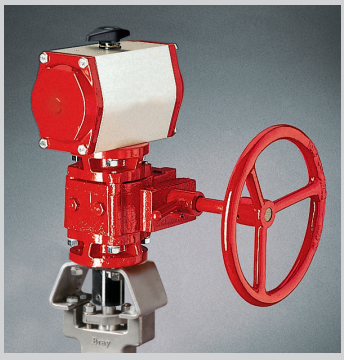
PADLOCK KIT allows the customer to lock the valve in the full open or closed position, tamper proofing the valve. By drilling a new hole in the top plate, the handle can be locked in mid travel.



HANDLE AND 180° NOTCH PLATE allows the operator to switch the handle to either side without removing the notch plate from the valve.

INFINITE POSITION NOTCH PLATE for throttling applications, allows for very precise adjustments of valve disc positioning anywhere from 0° to 90°. Positioning is simply a matter of loosening the set knob, moving the handle, then retightening the knob. For resilient seated valves only.

MEMORY STOP allows the operator to set the maximum amount the valve can open. When set, this limit will remain fixed until the stop is reset.



2" SQUARE NUT is used where the valve is buried under the surface. To rotate valve disc position, the nut is reached with a T-handle wrench.

SERIES 05

DECLUTCHABLE GEAR OPERATOR

The Series 05 offers the same superior features as the Series 04 gear operator with the added ability to manually override pneumatic actuators or rotate the valve when air pressure is not available.

1009 Stainless Steel Case Gauge

FEATURES

- Meets ASME B40.100 specifications
- Corrosion resistant SS case
- Dry gauges are field fillable
- Power***Flex***™ movement provides superior resistance to shock, vibration and pulsation
- True Zero™ reduces reading errors by using "zero box" instead of conventional dial pins
- ***PLUS!***™ performance available for liquid filled performance with a dry gauge
- MSL helium leak tested to 1X10^{-6} scc/s
- Ventable fill plug
- Accessory kits for easy panel mounting

TYPICAL USES

- Pumps and compressors
- Boilers
- Equipment skids
- Specialized OEM equipment
- Hydraulics and pneumatics
- Severe ambient conditions

SPECIFICATIONS

Accuracy:	ASME B40.100, Grade 1A, ±1% of span (Dry) ±1.5% of span (Liquid filled)
Dial Sizes:	2½″ (63mm), 3½″ (100mm)
Ranges:	Minimum 0-15 psi, maximum 0-15,000 psi, vacuum and compound
Wetted Materials	
Tube:	316L SS tube
Process Connection:	316L SS socket (SW) Aluminum bronze socket (AW)
Non Wetted Materials	
Window:	Polycarbonate (Std.), Safety glass (XSG), Polysulfone (XPS) 3½″ Dial only
Dial:	Black figures on white background, aluminum
Pointer:	Black, aluminum, adjustable (Std.), micrometer (XMP)
Movement:	Power***Flex*** movement Bottom plate – 304 SS Upper plate – 304 SS Pin – 304 SS Hairspring assembly – 304 SS Pinion – 304 SS Segment – Glass filled polyester
Case:	304 SS (Std.), 316L SS (XYW)
Ring:	304 SS (Std.), 316L SS (XYW)
Process Connection Location:	Lower, Back, Top, 3 o'clock, 9 o'clock
Process Connection Sizes:	⅛ NPT, ¼ NPT (see ordering code for more options)

KEY BENEFITS

- **IP65 Rating**
- **NEMA 4X**
- **CRN Approved**
- **PED**
- ***PLUS!***™ **Performance (XLL)**

Dampening:	Glycerin case fill (Std. liquid fill), Silicone case fill (XGV), Halocarbon case fill (XGX), ***PLUS!*** Performance (XLL)
Weather Protection:	IP65 (Plug closed), IP54 (Plug vented) NEMA 4X (Plug closed)
Approvals:	CRN, RoHS, PED

1 Product Description

1.1 Product design

Usage

ENM-10 is a level regulator for level control applications. The level regulator starts and stops a pump or activates an alarm device when the liquid level reaches the regulator.

Materials

Denomination	Standard version	Ex version
Regulator casing	Polypropylene	Polypropylene with black conductive casing
Bend relief	EPDM rubber	NBR-PVC rubber
Cable sheath	PVC	NBR-PVC rubber

The plastic components are welded and screwed together.

Application limits

Feature	Value
Liquid temperature	Minimum 0°C (32°F) Maximum 60°C (140°F)
Liquid density	Minimum 0.65 g/cm^3 Maximum 1.5 g/cm^3

Electrical specifications

Feature	Value
Degree of protection	IP68, 20 m (65 ft), 2 bars
Interrupting capacity of micro switch	AC, resistive load, 250 V 10 A AC, inductive load, 250 V 3 A cos ϕ = 0.5 DC, 30 V 5 A
Interrupting capacity of gold-plated micro switch	AC, resistive load, 250 V 10 A AC, inductive load, 250 V 3 A cos ϕ = 0.5 DC, 24 V 10 mA

Voltage limits are subject to local regulations.

Density ranges

Density g/cm^3	Regulator length mm (in.)	Diameter mm (in.)
0.65 – 0.80	194 (7 10/16)	100 (4)
0.80 – 0.95	177 (7)	100 (4)
0.95 – 1.10	162 (6 3/8)	100 (4)
1.05 – 1.20	142 (5 9/16)	100 (4)
1.20 – 1.30	133 (5 1/4)	100 (4)
1.30 – 1.40	130 (5 2/16)	100 (4)

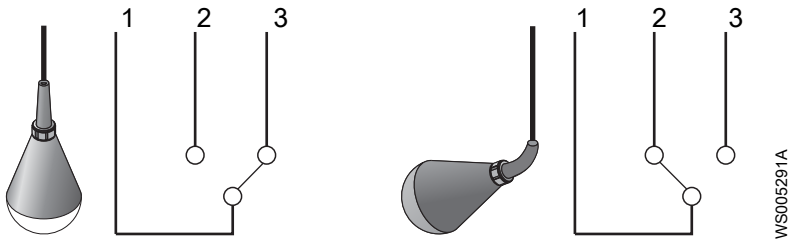
Density g/cm^3	Regulator length mm (in.)	Diameter mm (in.)
1.40 – 1.50	126 (5)	100 (4)

Weight

A regulator with standard density and 20 m cable weighs approximately 2 kg (4.5 lb).

1.3 Cables

Lengths



For liquids with specific density between 0.95 and 1.10 g/cm^3, the following cables are available:

Version	Lengths m (ft)
Standard	• 6 m (20 ft) • 13 m (42 ft) • 20 m (65 ft) • 30 m (100 ft) • 50 m (167 ft)
Ex	• 6 m (20 ft) • 13 m (42 ft) • 20 m (65 ft)

Diameter

The cable diameter for all product variants is 6.7 mm (0.26 in), +/- 0.2 mm (0.00787 in).

Color codes

Cable	1	2	3
Color	Grey	Black	Brown

1.4 Approvals and standards

Standard approvals

LVD approval according to EN61058
CSA approval: Certificate Number 1330172
Cl. I Zone 0, Gr. IIC
CL.I Div.1 Gr A, B, C and D
Cl.II Gr. E, F, and G

Ex approvals

IECEx ia IIC T4 Ga: -20°C≤Ta≤60°C
IECEx NEMKO 09.008
ATEX II 1G Ex ia IIC T4
NEMKO 10 ATEX 1082

Applied standards for ATEX and IEC

- EN 60079-0:2012/IEC 60079-0:2011
- EN 60079-11:2012/IEC 60079-11:2011
- IEC 60079-26:2014

Intrinsically safe circuits are required for the automatic control system. Use a Zener barrier, for example, part number 84 01 07.

The electrical connections must comply with the Ex regulations of the national submitter.

2 References

2.1 Chemical resistance tables

The tables show the degree of resistance the level regulator has to different chemicals at two different temperatures. The density of the liquid determines the buoyancy of the regulator.

Acids

Type of cables

Type of cable	Jacket	Color coding of wires
1	Blue polyvinyl chloride (PVC)	Grey/Brown/Black
2	Red PVC	Grey/Brown/Black
3	Black nitrile rubber (NBR)/PVC	Grey/Brown/Black

1 See *Type of cables* on page 9.
2 Designed for low current, slow movements and oil. Includes micro switch with gold plated contacts.
3 Zener barrier 84 01 07 required.

Xylem |'zīləm|

1) The tissue in plants that brings water upward from the roots;
2) a leading global water technology company.

We're a global team unified in a common purpose: creating advanced technology solutions to the world's water challenges. Developing new technologies that will improve the way water is used, conserved, and re-used in the future is central to our work. Our products and services move, treat, analyze, monitor and return water to the environment, in public utility, industrial, residential and commercial building services settings. Xylem also provides a leading portfolio of smart metering, network technologies and advanced analytics solutions for water, electric and gas utilities. In more than 150 countries, we have strong, long-standing relationships with customers who know us for our powerful combination of leading product brands and applications expertise with a strong focus on developing comprehensive, sustainable solutions.

For more information on how Xylem can help you, go to www.xylem.com

DATA SHEET

Three Phase Induction Motor - Squirrel Cage

Customer	:

Product line	: W22 IEEE 841 NEMA Premium Efficiency Three-Phase	Product code :	12385110
		Catalog # :	01518ST3HIE254T-W22

Frame	: 254/6T	Locked rotor time	: 30s (cold) 17s (hot)
Output	: 15 HP (11 kW)	Temperature rise	: 80 K
Poles	: 4	Duty cycle	: Cont.(S1)
Frequency	: 60 Hz	Ambient temperature	: -20°C to +40°C
Rated voltage	: 575 V	Altitude	: 1000 m.a.s.l.
Rated current	: 14.4 A	Protection degree	: IP55
L. R. Amperes	: 92.2 A	Cooling method	: IC411 - TEFC
LRC	: 6.4x(Code G)	Mounting	: F-1
No load current	: 5.44 A	Rotation[1]	: Both (CW and CCW)
Rated speed	: 1765 rpm	Noise level[2]	: 64.0 dB(A)
Slip	: 1.94 %	Starting method	: Direct On Line
Rated torque	: 6.17 kgfm	Approx. weight[3]	: 149 kg
Locked rotor torque	: 229 %		
Breakdown torque	: 270 %		
Insulation class	: F		
Service factor	: 1.25		
Moment of inertia (J)	: 0.1104 kgm²		
Design	: B		

Output	25%	50%	75%	100%
Efficiency (%)	90.2	91.0	91.7	92.4
Power Factor	0.44	0.68	0.78	0.83

Foundation loads	
Max. traction	: 187 kgf
Max. compression	: 336 kgf

		Drive end	Non drive end
Bearing type	:	6309 C3	6209 C3
Sealing	:	Inpro/Seal	Inpro/Seal
Lubrication interval	:	20000 h	20000 h
Lubricant amount	:	13 g	9 g
Lubricant type	:	Mobil Polyrex EM	

Notes

This revision replaces and cancel the previous one, which must be eliminated.
(1) Looking the motor from the shaft end.
(2) Measured at 1m and with tolerance of +3dB(A).
(3) Approximate weight subject to changes after manufacturing process.
(4) At 100% of full load.

These are average values based on tests with sinusoidal power supply, subject to the tolerances stipulated in NEMA MG-1.

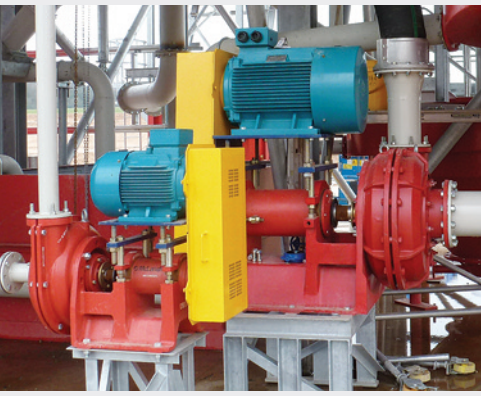
SLURRY PUMPS

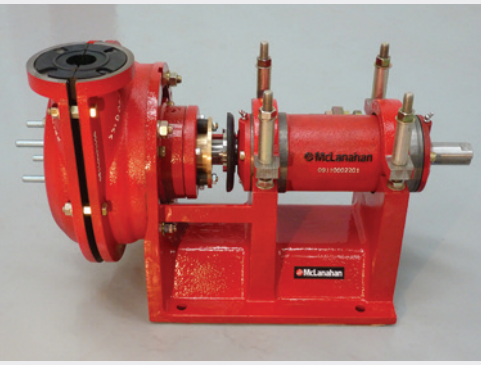
RELIABLE AND LONG LASTING

McLanahan's centrifugal Slurry Pumps are rubber-lined and abrasion resistant for long lasting service, low lifetime costs and straight forward servicing.

Eight models with discharge port sizes from 35mm to 250mm that can accommodate various options in lining material and gland type choices.



McLanahan®



mclanahan.com

APPLICATIONS

- Sand & Gravel / Minerals Processing
- Soil Washing / Remediation
- Waste Water Recovery / Disposal
- Concrete Wash-out

WETTED PARTS

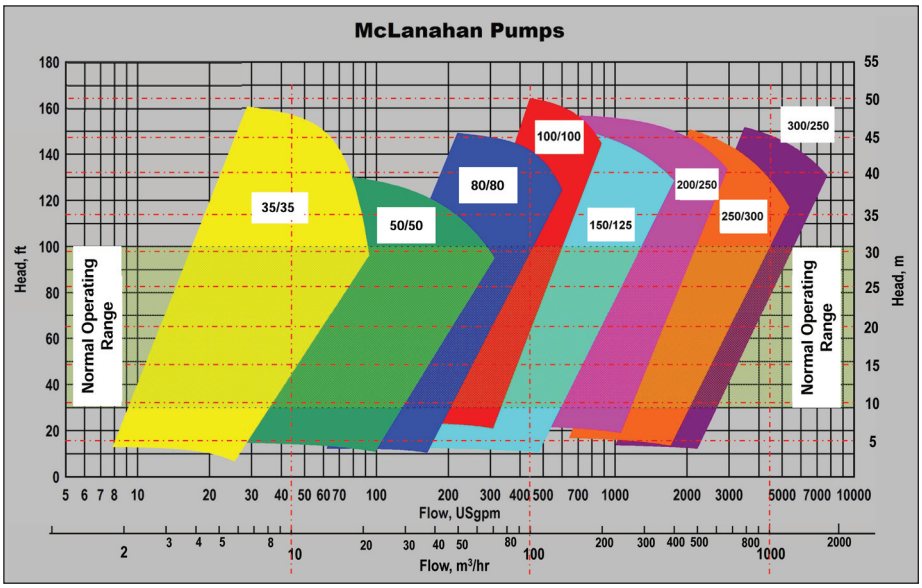
Standard pumps are equipped with natural rubber liners and impeller. However, bespoke options are available to suit a specific process and include premium natural rubber, Nitrile and food grade rubber. Shaft sleeves are from 304 St, but may be manufactured from other materials or coated to special order.

GLAND OPTIONS

D (Dry) Gland

An abrasion resistant Natural Rubber "Face Seal" riding a "Hard Face" and lubricated naturally by the process fluid. Controlled seepage of process fluid. Optional clean water injection facility.

H (Hydro) Gland



Clean water is injected into the inter-space between a pair of gland seals in tandem. Slight dilution – but total containment – of the process fluid. Controlled water seepage to atmosphere.

P (Packed) Gland

Gland packing mechanically adjusted to "ride" the shaft sleeve. Highest pressure capability. Some process dilution and water (or lubricating grease) seepage to atmosphere.

MOTOR AND DRIVE

McLanahan supplies pumps bare-shaft or complete with motor, overhead mounting platform, vee-belt drive and guard. Motors can also be oriented in Z-vee fashion, or side mounted on slide rails.

PUMP SELECTION

Initial pump selection can be determined by using the chart above as a guide. A qualified McLanahan engineer can determine the best pump performance for a specific application.

SPARES

High quality spare parts are available including moulded rubber Impellers, casing liners and suction bush components. All parts are available in various materials and hardness to suit differing applications. Mechanical spares such as fully assembled bearing housing cartridges and gland parts are available as kits for ease of procurement.

CLARIFIER #1 ACP-700R

PAINT SPECIFICATION

OIM manual section: 4.2.3.12

This page is intentionally left blank

TANK CONSTRUCTION SPECIFICATIONS
& PAINT SPECIFICATIONS
RAL 7040 TANK WINDOW GREY (EXTERIOR)
& LIGHT GREY (INTERIOR)

CC-07-ACP

1.0 GENERAL

This specification describes construction elements of the steel welded tank and paint specifications of ACP MK3 product.

2.0 MATERIALS

- Carbon steel must conform to CSA 44W, unless otherwise specified (see type on plan);
- Nominal thickness, refer to plan.

3.0 CONSTRUCTION

According to the specifications of the referred plan(s):

- Steel plates and sections must conform to Canadian norm G40.21M-300W, except for HSS that must conform to Canadian norm G40.21M-350W;

- Welds will be realized according to the details shown on the referenced plan. All welds must conform to the Canadian norm CSA W59 standard. Remove surface defects and grind all sharp edges. Make sure to completely remove the flux and welding splashes. The fusion welding certifications to produce by the company will be: W47.1, W59;

- Welding process:

    - Flux-Cored Arc Welding (FCAW);
    - MIG welding;
    - Electrodes (SMAW).

- Welds will be brushed and be devoid of spots;

- All modifications to the dimensions or to the quality of materials, and dispositions other than those indicated on the plans, are subject to prior demand to **Veolia Water Technologies Canada Inc's.,** person in charge, and his subsequent written.

4.0 STEEL PREPARATION FOR PAINTING

- Tank's interior and exterior surfaces must be perfectly cleaned from grease and all other foreign substance;

- All sharp edges must be grinded;

- All flanged surfaces and threaded connections must be cleaned and protected adequately to avoid paint contact;

- The rough edges, weld splatter, excess metal flux and sharp edges must be removed by grinding.

5.0 CONTROL

5.1 Welds

Once completed, all tank interior welds must be dye penetrant inspected to verify the quality of the welds. All welds must be water tight, free from porosity, cracks and drains and in accordance with norm CSA W59.
A dye penetrant test control should be done on all interior welds. Exterior welds must be visually inspected only.
All lifting and handling lugs must be subject to magnetic particle testing and report. Quality control from **Veolia Water Technologies Canada Inc.** will verify results of welds control.

5.2 Dimensional

The dimensional control will be done by the manufacturer. At the same time, **Veolia Water Technologies Canada Inc.'s** inspector will provide control. Minutes will be written detailing the dimensional and tolerance divergences. These values are noted on the piece's plan, assigned to control.

5.3 Documents and Certificates of Material (to Supply)

The manufacturer will supply to **Veolia Water Technologies Canada Inc.'s** inspector at the beginning of work, the following documents:

- Planning of work, with detailed manufacturing stages;
- Supply Bill of Materials;
- Material certificates with copy of the supplier's delivery slip;
- Welding procedures.

6.0 TREATMENT

6.1 Internal Treatment

- Sandblast as per SSPC-SP-10;
- Brush application on welds and difficult to reach places (inside of holes and openings) of one layer of DURA_PLATE UHS by SHERWIN WILLIAMS, color « light green » and;
- Application of one coat of DURA-PLATE-UHS NSF61 compliant by SHERWIN WILLIAMS, 20 to 28 mils dft (restricted level 5 as per SSPC-PA 2), color « light gray »;
- Important note: **Never dilute** the DURA-PLATE-UHS paint.

- Only if needed, application of one coat of DURA-PLATE UHS PRIMER by SHERWIN WILLIAMS, 4 to 8 mils dft per coat, color “Gold”, if required depending on atmospheric conditions and delays between sandblast and paint.

6.2 External Treatment

- Sandblast as per SSPC-SP-6;
- Spacing between intermittent welds should be filled with an hybrid sealant LOXON H-1 by SHERWIN WILLIAMS before the application of the external coating;
- Brush application on welds and difficult to reach places (inside of holes and openings) of one layer of ENVIROLASTIC 940 LV by SHERWIN WILLIAMS, color « White »;
- Application of one layer of ENVIROLASTIC 940 LV by SHERWIN WILLIAMS, 7.0 to 9.0 mils dft, (restricted level 5 as per SSPC-PA 2), color RAL 7040 Window Grey.

6.3 Piping Treatment

Identical to the external coating of the works as stated for the tank previously. There is no internal coating to provide for the nozzles of 3″ diameter or less (should be made from Stainless Steel). Ensure pipe ends and flanges are covered with paint with the exception of the raised face.

6.4 Extra Paint to be Supplied

For every equipment, a touch-up paint kit of 1 gallon for both internal and exterior paint must be provided at shipping. Please attach the product label.

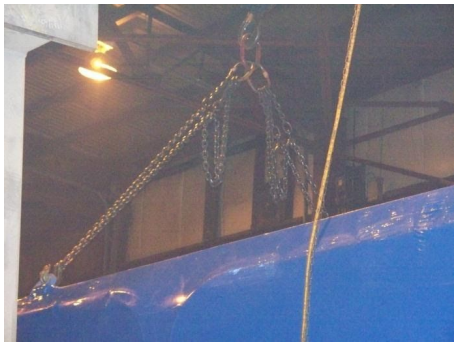
6.5 Application Procedure

The supplier’s procedure for application must be followed.

6.6 Protection of Metallic Parts during Treatment

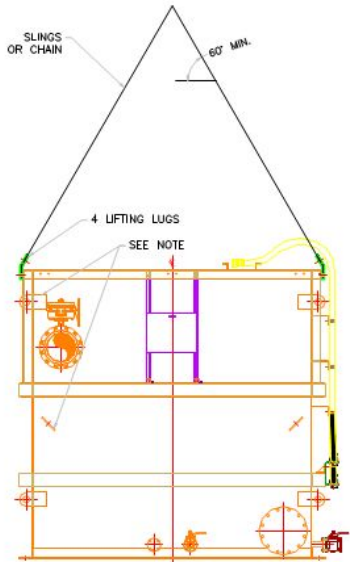
Threads, tapping, flange joint plans, etc. will be protected before sanding and treatment.

6.7 Paint Inspection



All interior surfaces must be inspected by performing a Holiday test in accordance with the standard NACE SP 0188, to verify the presence of discontinuity in the paint.

7.0 PACKAGING



- Plastic plug of the male and female threaded end caps;
- Wood plugs on flange sides.

8.0 HANDLING OF THE TANKS

- Always install the holding rings and any internal supporting beams before handling tanks.
- The tanks must be raised by chains attached to the holding rings. A minimum angle of 60º must be maintained. (see pictures)
- The lifting should ideally be carried out in two parallel points. (see pictures)

***ATTENTION*: Never use the side rings to lift and /or manipulate the tank. These rings should only be used to attach the tank during transport.**

Tightening Torque for Lifting Hooks

POLIMERI EUROPA

Edistir® R 850E

Polystyrene

TECHNICAL DATA SHEET

Product description

Super high impact polystyrene with good heat resistance.

Designed for sheet extrusion and thermoforming of deep drawn containers even diluted with high percentage of GP. Suitable for general injection molding of tough medium-walled articles.

Designation: Thermoplastics ISO 2897-PS-I,G,093-03-10-18

Applications

Typical uses are thermoformed food packaging as disposable tumblers, flatwares, yoghurt cups, lids. Injection molding of technical items, shoe heels, reels.

Typical processing data

Extrusion:
- melt temperature 210 - 240°C

Injection molding:
- predrying normally not required
- melt temperature 210 - 260°C
- mold temperature 20 - 60°C

General information

R 850E is certified UL94 HB "all colors" at 1.5 mm (UL file E83071).

This grade in natural version complies by composition with the requirements set by the main Regulations for plastic materials intended for food contact (included the EEC Directive 90/128 and following amendments).

POLIMERI EUROPA

Edistir® R 850E

Type 21 True Union Ball Valves

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

The Chemline **Type 21** True Union Ball valve incorporates state of the art features for long term performance. This is a full port, full blocking True Union valve pressure rated at 16 bar (230 psi)[3]. Double stem o-rings and Safety Shear stem design provide for a high degree of safety on hazardous fluid applications. All sizes have an ISO standard actuator mounting platform integral to the valve body. This provides for sturdy and secure mounting of pneumatic or electric actuators.

PVC | CPVC | PP | PVDF

CRN Registered Consult Chemline

NSF[4] Certified to NSF/ANSI 61

SERIES: Type 21

SIZES: 3/8" – 4"

ENDS: Socket, Threaded, Combo[6], Flanged, Butt[1] or ChemFlare™

SEATS: PTFE

SEALS[2]: EPDM, FKM (Viton®)

features

Pressure rated to 230 psi[3]
- Provides a high factor of safety

Integral Actuator Mounting Platform
- Actuation is easy. Electric or pneumatic actuators may be mounted in the field.

Full Port
- High capacity and low pressure drops

Fully Blocking
- Downstream union nut may be safely disassembled for piping maintenance while valve is closed off under full system pressure

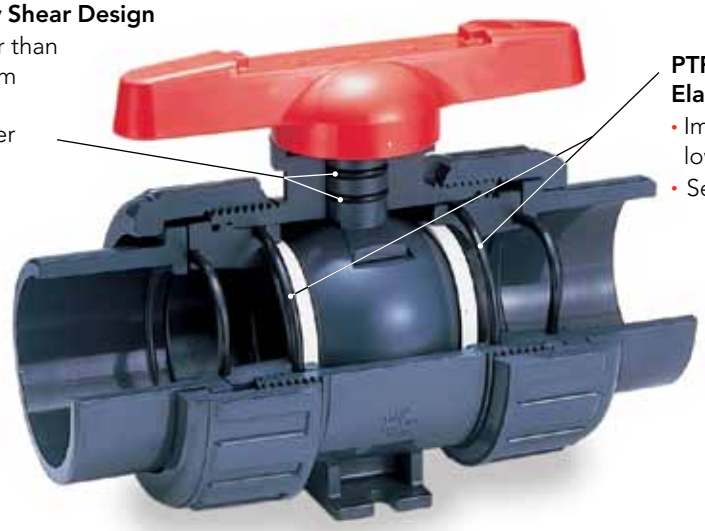
Built-In Spanner Wrench
- Top of the handle is designed to be used as a tool for accessing internal parts

Safety Shear Stem Design
- Stem has double o-rings
- Designed to hold full pressure even if stem breaks due to excessive torque

High Chemical Resistant Material
- PVC and CPVC compounds have an "A" chemical resistance rating as per ASTM D-1784. They have outperformed other PVC and CPVC compounds on aggressive chemicals.

CRN Registration numbers by province
- Ontario: OC11045.5
- Newfoundland: OC11045.50
- Saskatchewan/Manitoba/Quebec: OC11045.56
- New Brunswick: OC11045.57
- Nova Scotia: OC11045.58
- P.E.I.: OC11045.59
- British Columbia: not required
- Alberta: not required[5]

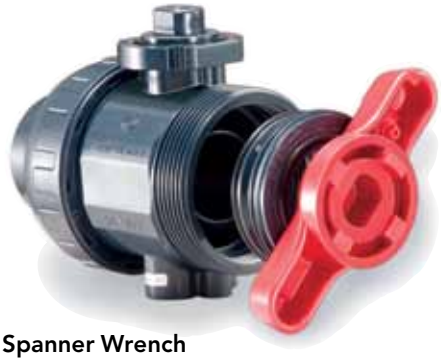
[1] Butt ends for fusion to Chemline metric PP, PVDF or ECTFE (Halar®) piping.
[2] Other materials are available.
[3] PVC, CPVC and PVDF 1/2" to 2" are rated at 230 psi; 2-1/2" to 4" and all size PP valves are rated at 150 psi at 20°C.
[4] PVC valves with EPDM or FKM (Viton®) seals are certified under NSF/ANSI Standard 61 for contact with drinking water.
[5] Not required for non-expandable fluids.
[6] PVC and CPVC valves 1/2" to 2" are available as Combo (threaded and socket ends).



11/20 ©Chemline Plastics Limited 2020
Chemline is a registered trade mark of Chemline Plastics Limited

Type 21 True Union Ball Valves

Features



Double Stem O-Rings – Safety Shear Design

- Upper o-ring groove is deeper than lower. In case of excessive stem torque, stem will shear at the upper groove, leaving the inner o-ring intact to seal against full line pressure.

PTFE Seats have Elastomer Cushions

- Improved sealing while lowering stem torques
- Self adjusts for seat wear

Built in Spanner Wrench

- For removing or tightening the seat carrier
- All parts are replaceable

Integral Actuator Mounting Platform

- Actuation is easy. Electric or pneumatic actuators may be mounted in the field. Simply pull off the handle to reveal a standard ISO 5211 mounting platform which accepts bolt-on hardware.

Fully Blocking

- Downstream pipe may be removed while upstream side is still pressurized. This may be done with valve installed in either direction.

Base Mounting Pad

- Optional threaded inserts allow valves to be securely anchored
- Supplied standard with actuated valves

Options + Accessories

ChemFlare™ Ends

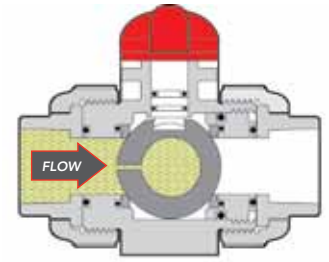
- For connection to PFA tube. Leak-free connections for difficult services such as sodium hypochlorite

One-piece moulded PVC and CPVC 6" socket ends

- Allows installation of 4" valve in 6" line
- Factory moulded, elimates cementing separate reducer and coupling
- Fixed to valve mechanically just like the one-piece moulded factory flanges

Optional Lock-out Handle & Hasp

- To prevent unauthorized operation of the valve during maintenance shut-downs
- Padlocks go through holes in hasp



Gear Operators

- Deluxe FRP construction
- IP67 enclosure resists short term immersion

Chain Wheel Operators

- For overhead operation, with 7' of chain drop
- Cast iron or stainless steel

Vented Ball

- Recommended for all sodium hypochlorite services
- Valve shown in closed position

Valve Tags

- Stainless steel or plastic

Different Colour Handles

- Choose a handle colour other than standard red for colour coding different services

Municipal Operating Nut

- 2" square nut for operating valves below grade using a standard municipal "key"
- Stainless Steel for corrosion resistance

Manual Limit Switch

- Electrical feedback of manual valve position
- NEMA 4X enclosure, position indicator beacon, 2x SPDT or proximity switches, stainless steel hardware

Shaft Extensions

- Different materials and lengths are available
- Several designs:
  - with no housing for indoors
  - with waterproofed PVC housing for indoors or outdoors
  - with stainless steel housing for buried or actuated services

Type 21 True Union Ball Valves

Electric + Pneumatic Actuation

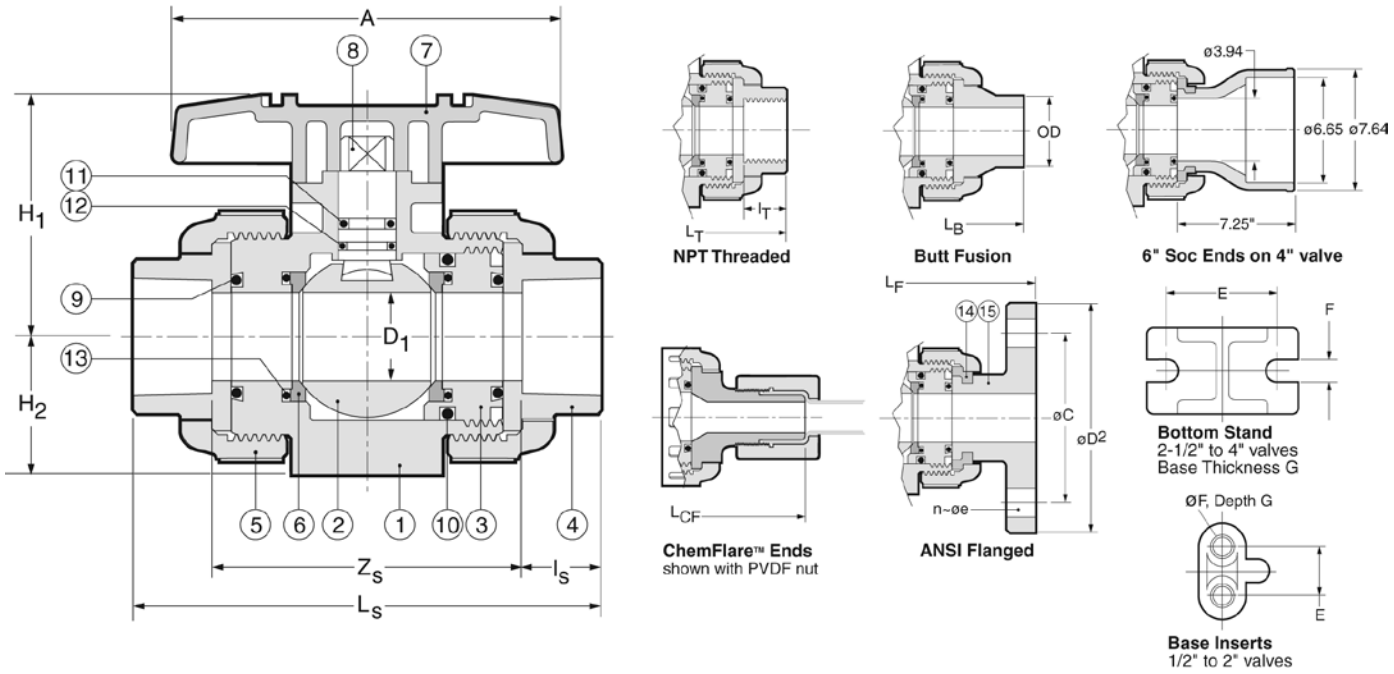
- A complete range of actuators and control accessories are available, mounted to valves using PPG plastic brackets and stainless steel couplings. Refer to separate data sheets.
- All actuators are CSA approved, have NEMA 4X enclosures, stainless steel hardware and permanently lubricated gear train

ERS Series Electric
- Type 21 ball valves up to 2"
- 180 in-lbs torque
- On-Off (3/2-wire), adjustable travel
- Visual feedback

E Series Electric
- Type 21 ball valves up to 4"
- Up to 885 in-lbs torque
- On-Off (3/2-wire), adjustable travel. Optional: failsafe, 3 position modulating
- Visual feedback and feedback switches. Optional: extra switches, feedback potentiometer and feedback transmitter

V Series Electric
(with optional Local Control Station)
- Type 21 ball valves up to 6"
- up to 8,850 in-lbs torque
- On-Off (2/3-wire), adjustable travel. Optional: failsafe, modulating, BUS
- Visual feedback, 2 feedback switches. Optional: 2 extra feedback switches, feedback potentiometer and feedback transmitter

PA Series Pneumatic
- Type 21 ball valves up to 6"
- up to 10,660 in-lbs torque
- industrial process submerged
- bleach/water washdown
- Rilsan-coated aluminum



PP Series Pneumatic
- Type 21 ball valves up to 6"
- up to 1,335 in-lbs torque
- industrial process with minimal use of metal
- Glass-filled Polyamide

OTHER OPTIONS & ACCESSORIES

- **Alternate O-Ring Seals**
- **Stem Extensions** made to any length
- **Limit Switches** – for open and/or closed position indication
- **Municipal Operating Nut**
- **Lubrication-free Valves** – factory clean room assembled
- **Vented Ball** – for sodium hypochlorite applications

Type 21 True Union Ball Valves

SAMPLE SPECIFICATION

1. All True Union Ball Valves in PVC, CPVC, PP or PVDF shall be Chemline Type 21 or equal sizes 1/2" to 2" in PVC, CPVC, and PVDF rated at 230 psi and in PP 150 psi maximum working pressure. Sizes 2-1/2", 3" and 4" rated at 150 psi maximum working pressure with EPDM or FKM (Viton®) seals. Ball seats shall be PTFE with elastomer cushions for closure with minimum stem torques.
2. All valves will have Safety Shear stem design, blowout-proof with double o-rings for safety. The top o-ring groove shall be deeper so that if the stem breaks off under excessive torque the lower o-ring will remain intact and the valve will hold pressure.
3. All valves shall be full port and two-way blocking design.
4. All valves will be CRN (Canadian Registration Number) registered with TSSA.
5. PVC valves with EPDM or FKM (Viton®) seals shall be certified under NSF/ANSI Standard 61 for contact with drinking water.
6. All valves shall have chemical resistant labels permanently marked with manufacturing number to provide production level traceability.
7. PVC compound shall have an ASTM cell classification 12454-A with a minimum suffix "A" designation for chemical resistance as per ASTM D-1784 (CSA report LO 4000-172).
8. CPVC compound shall have an ASTM cell classification 23567-A with a minimum suffix "A" designation for chemical resistance as per ASTM D-1784.
9. PP material will conform to ASTM D-4101 PP 021 B 67272 material requirements.
10. PVDF material shall be unpigmented conforming to ASTM D-3222 material requirements and to be USDA Title 21 Chapter 1 Part 177. 2510 requirements for contact with food.
11. Socket ends in PVC and CPVC shall be Schedule 80 and conform to ASTM D-2467.
12. Threaded ends shall be Schedule 80 and conform to ASTM D-2464.
13. Butt fusion ends in PP or PVDF will be compatible with Chemline PP or PVDF metric piping systems.
14. Flanged ends shall be ANSI Class 150 one-piece factory moulded (not fabricated) to ensure maximum strength and close tolerance end to end dimensions.

FLOWSERVE

Durco T4E Lined Plug Valves

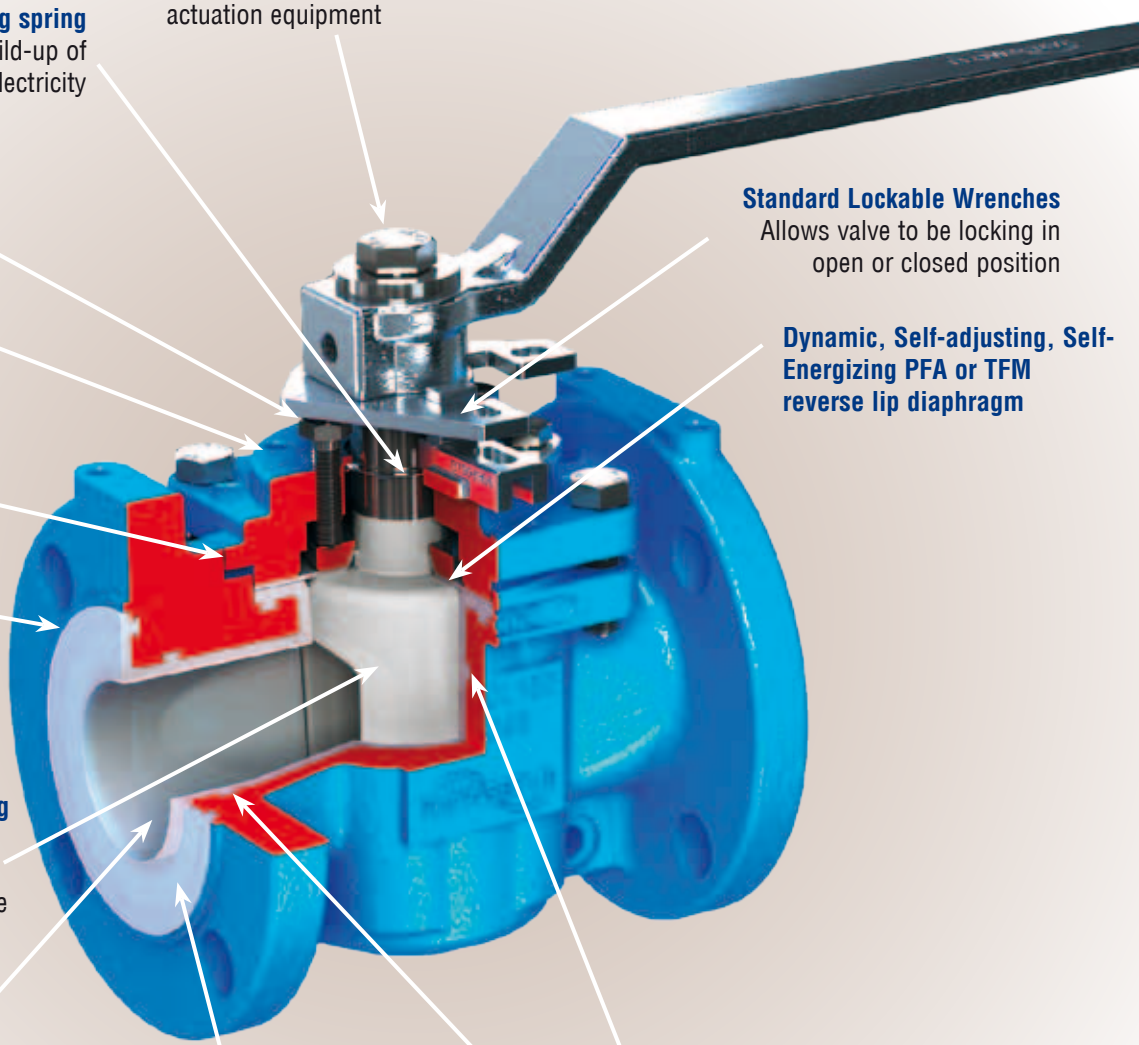
Fluoropolymer Lined Valves

Experience In Motion

History

Flowserve Durco T4E valves have been designed and developed with the latest technology and are the most preferred fluoropolymer lined valves in the global chemical industries.
Durco T4E valves provide maximum corrosion resistance and the elimination of product contamination at a reasonable cost.

Available in a Broad Size Range and



- ***T4E1*** *ASME Class 150 is available in sizes ½" through 12"*
- ***T4E2*** *DIN PN 16 is available in sizes DN 15 through DN 300*
- ***T4E3*** *ASME Class 300 is available in sizes ½" through 10"*

Extended Pressure Classes

- ***T4E1 and T4E2*** *rated 180 psi @400 °F (12.4 bar @ 204 °C), 250 psi @ 100 °F (17.2 bar @ 100 °C)*
- ***T4E3*** *rated 320 psi @ 400 °F (22 bar @ 204 °C), 740 psi @ 100 °F (51 bar @ 100 °C)*

Available with pneumatic or electric actuators for On-Off or modulating control applications.
All T4E valve series are rated to 4 Kpa (30 inches Hg) vacuum at ambient temperature.

Features

Double-D plug stem
accepts most standard actuation equipment

Grounding spring
To avoid build-up of static electricity

Inline adjustment
Stops thru-line leakage

ISO 5211 Mounting Pad
Universal flange for easy actuation mounting

Anti-Rotation Lugs
Help to eliminate stress on fasteners during actuation

Raised Lip
Prevents cold flow outward

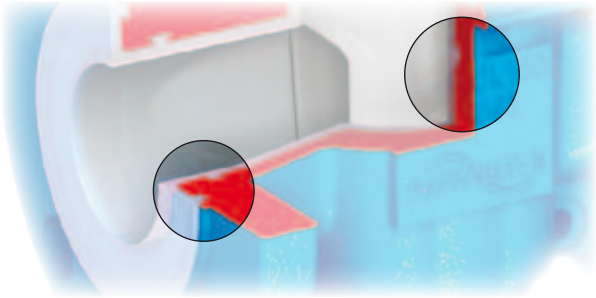
Standard Lockable Wrenches
Allows valve to be locking in open or closed position

Dynamic, Self-adjusting, Self-Energizing PFA or TFM reverse lip diaphragm

Solid Encapsulated PFA Molded Plug
All plug inserts have anchor holes to ensure a strong adhesion of the plug PFA liner material even under extreme cycling conditions

Large Ports
Offer good Cv values. Reduced frictional losses & pressure drop

High Quality PFA Liner
Protects the body and forms the flange gasket. The PFA liner is resistant against a wide variation of chemical products



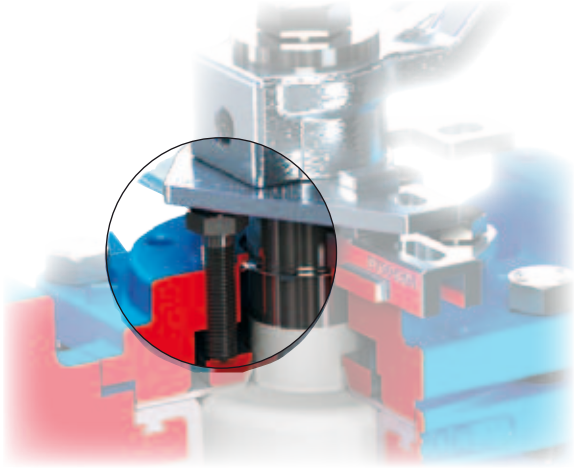
T-Slots in Critical Areas to Lock Liner Against Body Wall
Advantage will be a tight and perfect fit of the liner and an additional support during vacuum service

Additional Benefits

Benefits that give you the extra security which you will appreciate when using the T4E valves

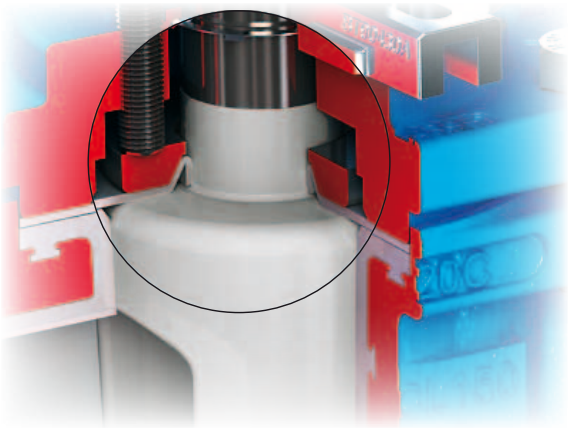
Body Liner

- A perfectly fixed PFA body liner is well anchored to the body by means of machined T-slots. The plug substrate has anchor holes to ensure that the PFA liner material is securely attached to the plug.
- Due to the selected mode to lock the liner to the valve body and plug, the T4E valve series is very suitable for extreme service conditions including vacuum applications at elevated temperatures.
- The PFA body liner covers all wetted surfaces in the body.
- Due to it's large sealing surface a tight shut-off is assured.
- In addition to the large seating area the valve is fully bi-directional and the seal is totally independent of line pressure.



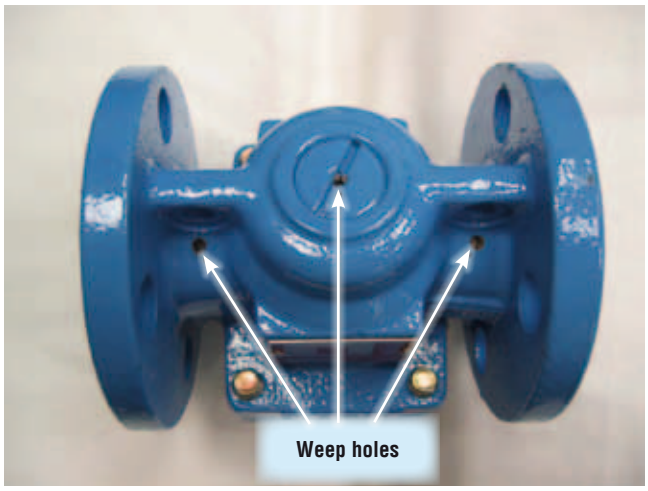
In-Line Adjustment

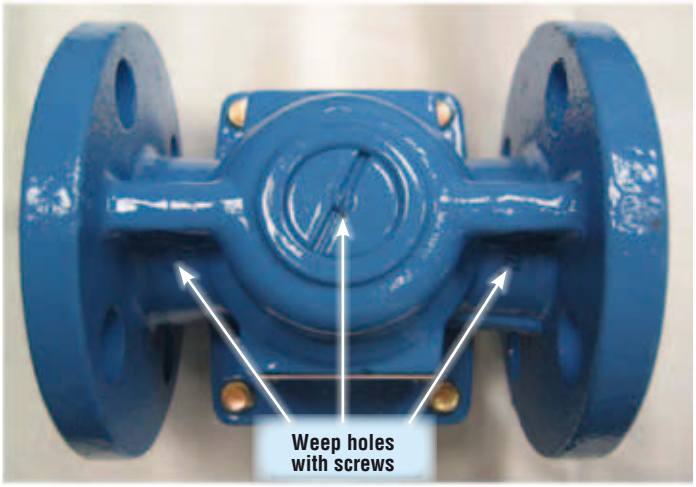
- No disassembly required to restore seating; plug can be reseated with a quick and easy in-line adjustment.
- An open end wrench and a few seconds are the extent of your maintenance requirements.



There are:

- No seats to replace
- No lengthy production disruption
- No piping disconnection
- No complicated, time-consuming maintenance procedures
- No hazards to personnel

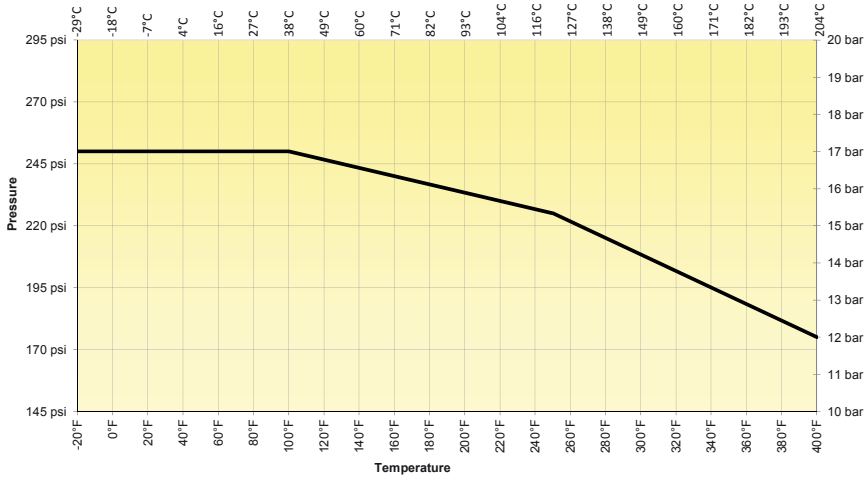


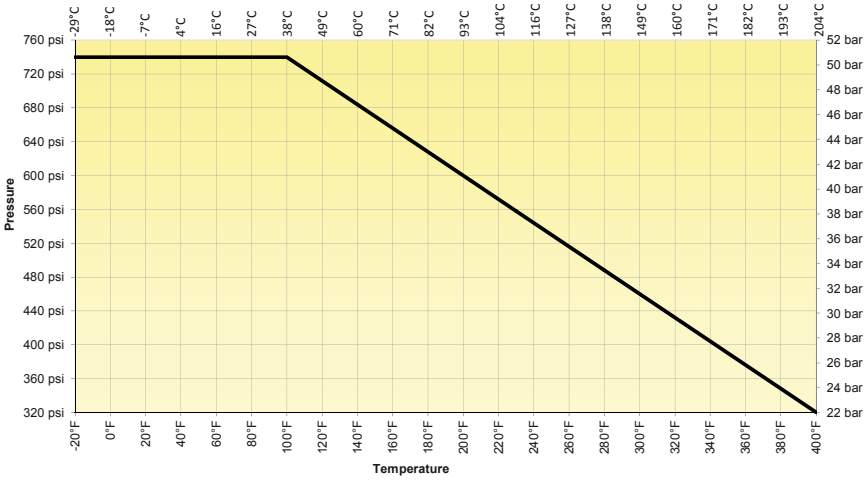


Secure Sealing

- A dynamic self-adjusting, self energized reverse lip PFA diaphragm seal prevents stem leakage.
- If line pressure forces liquid to the stem seal area, the self-energizing reverse lip PFA diaphragm will be forced against the stem to prevent external leakage.
- A sealing surface as much as 10x greater than other lined valves assures drop tight shut-off.
- In addition to the large sealing area, sealing is both upstream and downstream and is totally independent of line pressure.

Weepholes





Weepholes for early leakage detection

Durco T4E valves are supplied with three weepholes that are plugged with screws. The customer has the option to remove the screws. In so doing he is able to detect any leakage of process fluid through the liner and to take appropriate action.

Pressure-Temperature-Diagram - T4E1 and T4E2

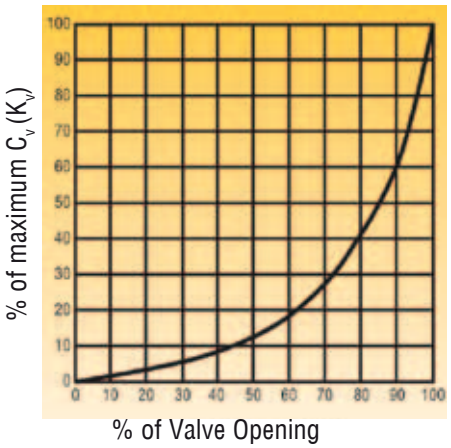
Pressure-Temperature-Diagram - T4E3

Durco T4E Automated Valves

Choose from a complete line of Flowserve Automax Automation Equipment for precise proportioning and On-Off control.....or we'll build a control package to your specification.

Flowserve Automax, a specialist in complete automation systems, produces a broad line of rack and pinion, heavy-duty, electric and linear actuators. In addition, a comprehensive line of engineered special control circuits, solenoid valves, limit switches, positioners and actuator mounting kits is offered.

Actuator Mounting

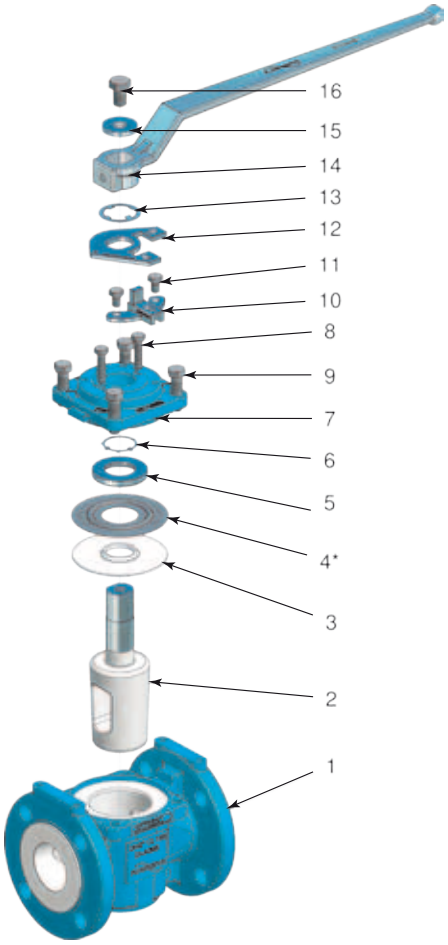


The body style of the T4E offers a choice of two locations for actuator mounting : an ISO 5200 pattern on the topcap or the flat-top pads of the flanges.

Software Capability

Flowserve offers a state-of-the-art range of software to help in sizing valves and actuation and creating drawings.

Modulating Control



V-port T4E valves are available in 1" (DN 25) through 4" (DN 100) sizes with Cv (Kv) values of 1 through 187 (Kv of 1 through 161). Standard port T4E valves are available in ½" (DN 15) through 12" (DN 300) sizes with Cv (Kv) values from 15 through 3200 (Kv from 13 through 2750).

Control Plugs

Size	Cv	Kv	Plug Type
1"	1	1	slotted plug

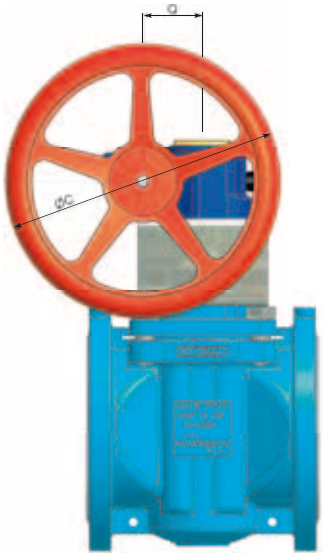
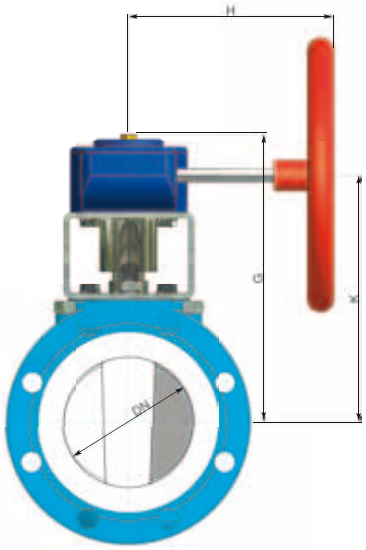
5	Thrust gland	Dupex stainless steel ASTM A995 Gr CD4MCuN
6	Adjuster	Dupex stainless steel ASTM A995 Gr CD4MCuN
7	Grounding spring	Stainless steel - 302
8	Adjuster bolt	88YC
9	Hexagon bolt	88YC



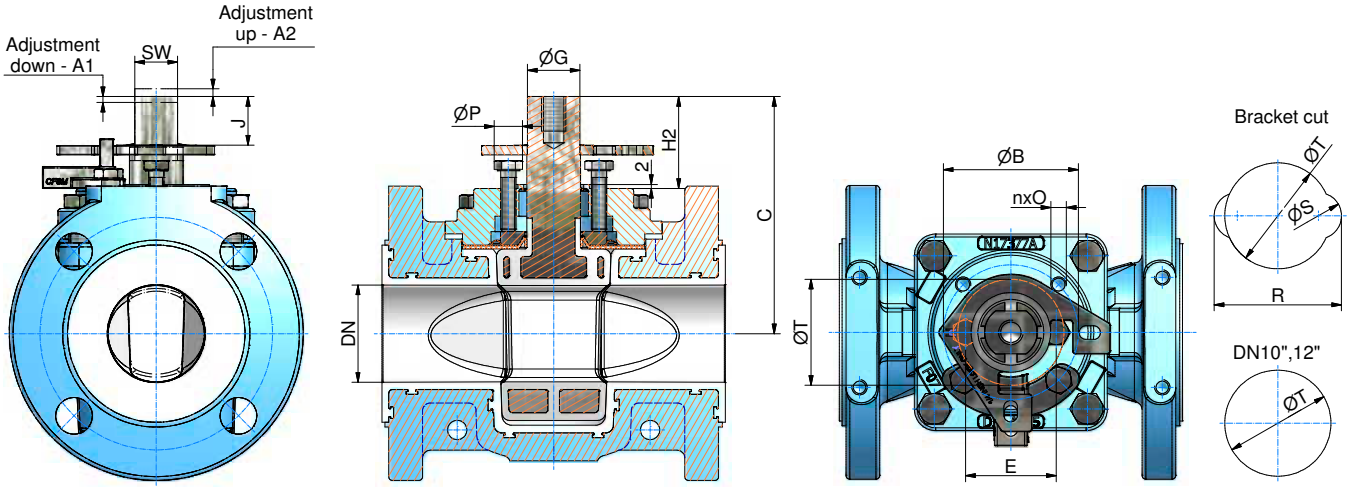
* Other materials upon request
** Optional



Dimensions

Valve Dimensions

Dimensions are in Inches and millimetres. Weights are in lb. and kg.



T4E1, T4E2 and T4E3 ½˝ to 12˝
