AGNICO EAGLE

MELIADINE GOLD MINE

Water Management Plan

JUNE 2025
VERSION 16
6513-MPS-11

EXECUTIVE SUMMARY

Agnico Eagle Mines Limited (Agnico Eagle) is operating the Meliadine Gold Mine (Meliadine Mine), located approximately 25 kilometres (km) north of Rankin Inlet, and 80 km southwest of Chesterfield Inlet in the Kivalliq Region of Nunavut.

The water management objectives are to minimize potential impacts to the quantity and quality of surface water at the Mine. Water management structures include collection ponds (CPs), saline ponds (SPs), mined-out pits, diversion channels, dikes, berms, and treatment facilities: a potable Water Treatment Plant (WTP), a Sewage Treatment Plant (STP), an Effluent Water Treatment Plant (EWTP), a Saline Effluent Treatment Plant (SETP), and a Saline Effluent Waterline.

During mine Construction and Operations, contact water originating from affected areas on surface will be intercepted, diverted and collected within designated collection ponds. The collected water at the Mine will eventually be pumped and stored in Collection Pond 1 (CP1) and in Wesmeg Open Pit 3 (WES03), once mining of this pit is complete. Water stored in CP1 will be treated by the EWTP for removal of Total Suspended Solids (TSS) prior to discharge to the receiving environment. WES03 serves as an intermediate storage reservoir for contact water prior to controlled discharge to Itivia Harbour. Discharge to Itivia Harbour is prioritized, with the remainder discharged to Meliadine Lake according to the approved Meliadine Mine Adaptive Management Plan. At the Discovery site, contact water will be managed in the Discovery collection ponds (CPD1 and CPD2) and subsequently conveyed to the mined-out Wesmeg Open Pit 2 (WES02) for discharge to Itivia Harbour. Contact water from the Underground Mine will be collected in underground storage stopes and sumps. Some water from Underground will be reused for underground operations. Excess saline contact water will be pumped to SPs on the surface. From there, it is transferred to Tiriganiaq Open Pit (TIR02) or WES02, and ultimately treated at the SETP-WTC prior to discharge to Itivia Harbour via the waterline.

The long-term, post-closure water quality in the collection ponds and in the flooded open pit lakes will meet Metal and Diamond Mining Effluent Regulations (MDMER), Canadian Council of Ministers of the Environment Water Quality Guidelines (CCME-WQG) for the protection of aquatic life and/or the Site-Specific Water Quality Objectives (SSWQOs) developed for the Mine.

During mine closure, the water management infrastructure on site will remain in place until mine closure activities are completed, and monitoring demonstrates that the water quality is acceptable for environmental discharge without treatment.

SECTION 1 • INTRODUCTION

Agnico Eagle Mines Ltd. (Agnico Eagle) operates the Meliadine Gold Mine (Meliadine Mine) located approximately 25 kilometres (km) north of Rankin Inlet (Figure 1), Nunavut, and 80 km southwest of Chesterfield Inlet in the Kivalliq Region of Nunavut. The Mine is subject to the terms and conditions of both the amended Project Certificate 006 issued by the Nunavut Impact Review Board (NIRB) in accordance with the Nunavut Land Claims Agreement Article 12.5.12 on March 2nd, 2022 (NIRB, 2022) and the Amended Water Licence No. 2AM-MEL1631 (the Licence), issued by the Nunavut Water Board (NWB) on October 25th, 2024 and approved by the Minister of Northern Affairs on November 22nd, 2024 (NWB, 2024). The previous Type A Water Licence (2AM-MEL1631) authorized the mining undertaking at Tiriganiaq open pits and underground. The recently amended Water Licence also includes mining of the Wesmeg/Wesmeg North, Pump, F Zone, and Discovery deposits that were included in the 2014 Final Environmental Impact Statement (Agnico Eagle 2014) and Project Certificate No.006. A Water Licence Modification Application was recently submitted with the following proposed modification activities:

- Development of a portal within Pump Open Pit 2 (PUMP02) to facilitate access to mineralized zones within permafrost;
- Temporary surface storage of waste rock generated from Pump Underground development; and
- Utilization of mined-out pits for the storage of saline or contact water.

This document presents the updated WMP incorporating the most recent regulatory approvals and proposed modification activities.

1.1 Water Management Objectives

The water management objectives are to minimize potential impacts to the quantity and quality of surface water at the Mine and surrounding waterbodies. The purpose of the WMP is to provide information to applicable mine departments (e.g., Environment, Engineering, Mine, Energy and Infrastructure, etc.) for sound water management practices, proposed and existing infrastructure, the water balance model, water quality predictions, and for the water quality monitoring plan for the Mine.

Water management structures (collection ponds, mined-out open pits, culverts, sumps, pipelines, water diversion channels and water retention dikes/berms) are utilized to contain and manage contact water from areas affected by mining activities. Measures have been implemented for the Mine Construction and Mine Operation phases.

1.2 Management and Execution of the Water Management Plan

Revisions of the WMP can be initiated by changes in the Mine Development Plan (Mine Plan), operational performance, personnel or organizational structure, regulatory or social considerations, and/or design philosophy. The WMP will be reviewed annually by Agnico Eagle and updated as

necessary as part of the Annual Report. The Meliadine Mine Adaptive Management Plan is also used in combination with the Water Management Plan to provide management and mitigation actions.

SECTION 2 • BACKGROUND

2.1 Site Conditions

The Mine is located in an area of poorly drained lowlands near the northwest coast of Hudson Bay. The dominant terrain in the area consists of glacial landforms such as drumlins (glacial till), eskers (gravel and sand), and many small lakes. The topography is gently rolling with a mean elevation of 65 metres above sea level (m asl) and a maximum relief of 20 meters.

The local overburden consists of a thin layer of topsoil overlying silty gravelly sandy glacial till. Cobbles and boulders are present throughout the region at various depths. Bedrock at the Mine site area consists of a stratigraphic sequence of clastic sediments, oxide iron formation, siltstones, graphitic argillite, and mafic volcanic flows (Snowden, 2008; Golder, 2009).

The climate is extreme in the area, with long cold winters and short cool summers, and mean air temperatures of 12°C in July and -31°C in January. The mean annual air temperature at the Mine site is approximately -10.4 °C (Golder, 2012a). Strong winds blow from the north and north-northwest direction more than 30 percent of the time.

The mean annual precipitation in the area is approximately 412 mm and is typically equally split between rainfall and snowfall.

2.1.1 Local Hydrology

The Mine is located within the Meliadine Lake watershed. Meliadine Lake has a water surface area of approximately 107 square kilometres (km^2), a maximum length of 31 km, features a highly convoluted shoreline of 465 km, and has over 200 islands. Unlike most lakes, it has two outflows that drain into Hudson Bay through two separate river systems. It has a drainage area of 560 km^2 upstream of its two outflows. Most drainage occurs via the Meliadine River, which originates at the southwest end of the lake. The Meliadine River flows for a total stream distance of 39 km. The Meliadine River flows through a series of waterbodies, until it reaches Little Meliadine Lake and then continues into Hudson Bay. A second, smaller outflow from the west basin of Meliadine Lake drains into Peter Lake, which discharges into Hudson Bay through the Diana River system (a stream distance of 70 km). At its mouth, the Diana River has a drainage area of 1,460 km^2.

Watersheds in the Mine area are comprised of an extensive network of waterbodies, and interconnecting streams. The hydrology of these watersheds is dominated by lake storage and evaporation.

2.1.2 Ice and Winter Flows

Late-winter ice thicknesses on freshwater lakes in the Mine area range between 1.0 to 2.3 m with an average thickness of 1.7 m. Ice covers usually appear by the end of October and are completely

formed in early November. The spring ice melt (freshet) typically begins in mid-June and is complete by early July (Golder, 2012b).

2.1.3 Spring Melt (freshet) and Freeze-up Conditions

With the exception of the main outlet of Meliadine Lake, which has been observed to flow continuously throughout the year, outlets of waterbodies near the Mine typically start flowing late May or early June, followed by freshet flows in mid-to-late-June. Flows steadily decrease in July and low flows are ongoing from August to the end of October, prior to winter freeze.

2.1.4 Permafrost

The Mine is located in an area of continuous permafrost. The depth of permafrost is estimated to be in the order of 320 to 490 m (WSP, 2024b). The depth of the active layer ranges from about 1 m in areas with shallow overburden, up to 3 m adjacent to the lakes. The typical permafrost ground temperatures at the depths of zero annual amplitude (typically at the depth of below 15 m) are in the range of -5.0 to
-7.5 °C in the areas away from lakes and streams. The geothermal gradient ranges from 0.012 to 0.02 °C/m (Golder, 2012b).

2.1.5 Local Hydrogeology

Continuous permafrost areas, in dominant presence in the Mine area, are subject to the following groundwater flow regimes characteristics:

- A shallow flow regime located in an active layer (seasonally thawed) near the ground surface and above permafrost, also called suprapermafrost groundwater; and,
- A deep groundwater flow regime beneath the base of the permafrost, also called subpermafrost groundwater.

From late spring to early autumn, when temperatures are above 0 ˚C, the shallow active layer thaws. Within the active layer, the water table is projected to be a subdued replica of topography. Groundwater within the active layer flows to local depressions and ponds that drain to larger waterbodies. The talik, or unfrozen ground, beneath large waterbodies will be open. Open talik define areas of connections between suprapermaforst groundwater and deep groundwater flow regime beneath the permafrost.

In a study investigating groundwater flow within the vicinity of the Meliadine site, Golder (2012a) identified that circular lakes with a minimum radius of 290 m or elongated lakes with minimum half width of 160 m, are subject to have underlying open taliks. Meliadine Lake and Lake B7 are likely to have open taliks connected to the deep groundwater flow regime.

2.2 Mine Development Plan

Agnico Eagle is currently mining the Tiriganiaq deposit with two open pits and one underground operation. The 2024 Water Licence Amendment extends the Life of Mine to 2031 with the open pit mining of F Zone, Wesmeg, Pump, and Discovery deposits. In parallel, underground development of the Pump deposit (PUMP02) is planned to enhance resource recovery and operational efficiency. The approved Mine Plan is expected to produce approximately 38.1 million tonnes (Mt) of ore, 180.7 Mt of waste rock, 34.5 Mt of overburden waste, and 30.6 Mt of tailings. Agnico Eagle will continue exploration activities with the objective to extend mine life beyond 2031.

Mining facilities on surface include a plant site and accommodation buildings, ore stockpiles, a tailings storage facility (TSF), waste rock storage facilities (WRSFs), a water management system that includes collection ponds, mined-out pits, water diversion channels, retention dikes/berms, and a series of water treatment plants. The general mine site layout plan is shown on Figure 2.

SECTION 3 • WATER MANAGEMENT CONTROLS AND STRUCTURES

There are three major sources of water at the Mine requiring management under the Mine water management system: freshwater pumped from Meliadine Lake, natural runoff from precipitation, and natural groundwater inflow to the Underground Mine. For the purpose of clarity and consistency, terminology and definitions are applied to these three main sources as follows below. These terms are applied throughout the remainder of the WMP.

- **Freshwater**: Water contained within natural water bodies (e.g., Meliadine Lake) which has not come into contact with the mine infrastructure.

- **Surface Contact Water**: Rain and snowmelt that has come into contact with the mine infrastructure and is collected within the collection ponds.

- **Saline Contact Water**: Saline groundwater which flows into the underground mine and comes into contact with the underground mine infrastructure.

A network of berms, dikes, collection ponds, mined-out pits, channels, culverts and sumps are in place and maintained to facilitate water management. Design Reports and As-Built Reports have been submitted and approved for the water management structures discussed in this section, as applicable. This section is included to summarize design and as-built information.

3.1 Water Management Systems

The water management systems, as shown in Figure 5, required to support the additional deposits in the Meliadine Mine Plan per the latest Water Licence Amendment, include the following components:

- Five water retention dikes including D-B5North, D-B5South, D-A8North, D-A8South, and D-A6;
- Ten water collection ponds (CP1, CP2.5, CP3, CP4, CP5, CP6, CP9, CPD1, CPD2 and SP6);
- Four mined-out pits for water storage (TIRI02, WES02, WES03 and PUMP02);
- Dewatered waterbodies to be managed (A8, A6, J6, B5, B6, and B59);
- Five water diversion channels including Channel 11, Channel 14, Channel 15, and Channel 17 to Channel 19;
- Two sumps including Sump F1, and Sump F2;
- Five thermal protection berms including Berm 4, Thermal Berm CP9, Berm-SP6 North and Berm-SP6-West, and Berm-F2;
- Culverts as required;
- An effluent water treatment plant (EWTP);
- A saline effluent treatment plant (SETP);
- A water treatment complex (WTC) building – housing the EWTP and SETP;
- A sewage treatment plant (STP);

- A potable water treatment plant (WTP);
- A network of surface pumps and pipelines;
- A freshwater intake;
- Three jetties and pumping infrastructure (located at CP1, CP5 and A8);
- An effluent diffuser located in Meliadine Lake; and
- An effluent diffuser located in Melvin Bay.

Surface contact water is intercepted, diverted and collected within various collection ponds/mined-out pit(s) prior to passive evaporation, treatment and/or discharge. Collection and routing of contact water is planned as follows:

- Surface contact water from CP2.5, CP3 and CP4 are pumped to culvert 3, just upstream of CP1, which convey the flow naturally to CP1.
- Water collected in CP5 is pumped to CP1.
- SP6 functions as an overflow storage pond for CP1, used as needed during high-flow conditions.
- The WES03 pit serves as an intermediate reservoir, storing water from CP2.5, CP3, CP4, CP5 and STP for eventual discharge to Itivia Harbour via the waterline or to CP1. WES03 discharge to Itivia Harbour will be prioritized over discharge to CP1 and Meliadine Lake.
- Surface contact water from the WRSF3 area is collected in CP2 and CP6, and then pumped to CP1.
- CP9 will be established using the PUMP01 pit to manage contact water from the Pump area. Water from CP9 will also be pumped to CP1.

Surface contact water collected in CP1 is treated for total suspended solids (TSS) at the EWTP-WTC and discharged through the diffuser located in Meliadine Lake (Section 3.10).

Saline contact water from the Underground Mine is collected in underground sumps, transported to a clarification system, and subsequently recirculated for use in various underground operations. Excess saline contact water is pumped to surface and management is planned as follows:

- Stored in Tiriganiaq Pit 2 (TIRI02) until it is unavailable.
- The PUMP02 pit will be used as a saline water sump once mining of the PUMP02 deposit is complete and will continue to capture saline runoff from the temporary Pump Underground WRSF.
- The WES02 pit will also be used as a saline water reservoir once mining of the WES02 deposit is complete.

Excess saline contact water stored on surface is treated at the Saline Effluent Treatment Plant (SETP). Further details are found in the Groundwater Management Plan.

During the mine closure, the water management infrastructure will remain in place until closure activities are completed and monitoring demonstrates that water quality is acceptable for discharge to the environment without treatment.

A list of the water management control structures already constructed at Meliadine Mine is presented in Table 1. Table 2 summarizes future water infrastructures proposed to support mining of all deposits included in the Mine Plan. Figure 5 shows the location of the respective structures over the development stages of the mine life. Final design details of these structures will also be provided to

the Regulators for approval at least 60 days prior to construction, as per the Water Licence.

Table 2: Water Management Control Structures to be Constructed

Water Management Infrastructure Type	Nomenclature	Location and Operational Function
Collection Ponds	CP2.5	Located south-west of the TSF, CP2.5 will be used to capture TSF runoff and interflow along the northwestern boundary
	CP9	Located within the footprint of the dewatered lake B36 and the Pump01 pit, CP9 will be used to contain contact water from the Pump area.
	CPD1	Located south of WRSF9, CPD1 will be used to contain contact water from the WRSF9 within Discovery area.
	CPD2	Located south-west of Disc01, CPD2 will be used to contain contact water from the Disc01 pit within Discovery area.
	SP6	Located within the footprint of the dewatered lake B7, SP6 will be used as an overflow storage pond for CP1, used as needed during high-flow conditions
Dikes	Dike D-B5North	Located north of WN01 open pit within dewatered Lake B5. D-B5North will be used to divert runoff from flowing into WN01 pit.
	Dike D-B5South	Located south of WN01 open pit within dewatered Lake B5. D-B5South will be used to collect runoff from B5 south catchment.
	Dike D-A8North	Located south of WES03 open pit. D-A8South will be used to divert runoff from flowing into WES03 open pit.
	Dike D-A8South	Located north of PUM02 and PUM04 open pits. D-A8South will be used to divert runoff from flowing into PUM02 and PUM04 open pits.
	Dike D-A6	Located southwest of FZO01 open pit. D-A6 will be used to divert contact water from Lake A6 from flowing into FZO01 open pit.
Berms	Thermal Berm SP6North	Located North of future collection pond SP6, Thermal Berm SP6 is designed to preserve the permafrost foundation within the SP6 Thermal Berm footprint and to limit in between Lake E3 and SP6.
	Thermal Berm SP6West	Located North of future collection pond SP6, Thermal Berm SP6 is designed to preserve the permafrost foundation within the SP6 Thermal Berm footprint and to limit in between Lake E3 and SP6.
	Thermal Berm F2	Located West of future WRSF7, Thermal Berm F2 is designed to preserve the permafrost foundation within the F2 Thermal Berm footprint.
Channels	Channels 14	Channel 14 to divert contact water from WRSF7 towards Sump F1.
	Channel 18	Channel 18 to divert contact water from industrial pad, and fuel pad at Discovery towards the downstream CPD2.
	Sump F1	Sump F1 to collect contact water from WRSF7 that has been diverted by Channel 14.

Water Management Infrastructure Type	Nomenclature	Location and Operational Function
Culverts	To be determined	Numerous culverts will be necessary for water conveyance through haul roads and access roads. Their exact location still needs to be confirmed based on the design of the road's overs the next years.

3.2 Water Management Structures Design Criteria

The water management systems meet the following criteria:

- Treated surface contact water quality will meet regulatory criteria of the Licence and MDMER (described in the Water Quality and Flow Monitoring Plan).
- Treated saline water quality will meet MDMER criteria (described in the Water Quality and Flow Monitoring Plan).
- Design capacity of the EWTP is sufficient to ensure that D-CP1 and CP1 are able to manage the surface contact water from the entire site for a 1:100 wet year spring freshet, or a 1:2 mean year spring freshet in combination with a 1:1000 return 24-hour extreme rainfall.
- D-CP5 and CP5 are able to manage the surface contact water from its catchment area for 3/7 of a 1:100 wet year spring freshet or a 1:1000 return 24-hour extreme rainfall. This design is based on an allowable 3-day delay in initiation of pumping during a 7-day, 1:100 year freshet. Design capacity of pumping from CP5 to CP1 is sufficient to ensure that remaining freshet inflows to CP5 are managed via pumping to CP1.
- Storage capacity of each of the other water management ponds (CP2, CP3, CP4, CP6) is able to manage the surface contact water from their respective catchment area for 3/7 of a 1:100 wet year spring freshet or a 1:1000 return 24-hour extreme rainfall.
- The daily pumping rate for each of the ponds (CP2, CP3, CP4, CP5, CP6) is designed to have sufficient pumping capacity to handle the runoff surface contact water, which would result from one day (24.4 mm) of a 1:100 return wet spring freshet plus a 1:2 return one-hour rainfall (9.8 mm).
- Storage capacity of water management infrastructure associated with the TSF extension, Pump, Wesmeg, F Zone, and Discovery mining areas are planned to allow for partial (3/7 days) or full (7/7 days) storage for the runoff volume from a 1:100 wet year, 7-day spring Freshet from each waterbody's catchment area. The requirement for partial storage follows a similar design philosophy of CP2, P3, CP4, and CP6 whereby, following 3 days of storage, water is actively pumped to a downstream collection pond for the remaining 4 days of a 7-day Freshet. The requirement for full storage follows a similar design philosophy of CP1 whereby the facility is able to store the entirety of the runoff from the lake's catchment area. Detailed information regarding the storage capacities of these facilities will be provided following the detailed design of each facility.
- Once WES03 is mined, excess volume (4/7 of a 100-years freshet) of partial storage ponds CP3, CP4, CP5 and CP2.5 will be pumped to WES03. WES03 is designed to have a full-storage capacity (7/7 days) for the runoff volume from a 1:100 wet year, 7-day spring Freshet from its catchment area and for each of the collection ponds reporting to this pit.

Channel 2 to Channel 4 are in place to pass an extreme intensity flow under a 5-minute 1:100 return rainfall of 9.2 mm. Channels 9 and 10 were designed to pass an extreme intensity flow under a 5-minute 1:100 return rainfall of 5.0 mm. Channel 1 and Channel 5 to Channel 8 are designed as internal

channels where any surface contact water overflowing the channels will remain within the catchment areas of various collection ponds. Hydraulic analyses indicated that very wide channels are required to pass an extreme intensity flow under a 5-minute 1:100 return rainfall of 9.2 mm. As a result, these channels were designed to have a reasonable bottom width to pass a flow with lesser intensity, but the surface contact water overflowing the channels can be safely managed by berms or temporarily stored in a lower basin nearby. For example, surface contact water overflowing Channel 5 can be contained by Berm 3. Water overflowing Channel 7 and Channel 8 can be stored in the lower basin in the drained Pond H13, and Berm 1 combined with a mass till backfill protects the Portal No.2 entrance from flooding. Furthermore, the MULTI-PLATE at Portal No. 2 is protected by compacted, engineered structural fill. Surface contact water overflowing Channel 1 will flow through the flat ground between the Stage 1 pad and Stage 2 pad of Ore Storage Pad 2 (OP2) into CP1. Table 3 presents the design parameters for CP1 and CP5. CP2, CP3, CP4 and CP6 were built through excavation of the original ground to increase water storage capacity and prevent water levels from reaching the thermal protection berms. The as-built parameters for CP2, CP3, CP4 and CP6 are provided in Table 4 and are discussed in further detail within Tetra Tech (2022), Agnico Eagle (2019c), Agnico Eagle (2019d), and Tetra Tech (2020a).

Table 3: As-Built Parameters for CP1 and CP5

Pond	CP1	CP5
Pond Volume at Maximum Operating Elevation under Normal Operating Conditions and Mean Precipitation Years (m^3)	742,075	46,674
Maximum Operating Water Elevation (m)	66.2	66.0
Maximum Water Elevation during IDF (m)	66.6	66.3
Estimated Pond Volume for Water Elevation at Maximum Operating Water Elevation during IDF (m^3)	855,245	70,000
Dike for Pond	D-CP1	D-CP5
As-Built Crest Elevation of Dike Collection Element (liner system) (m)	67.37	66.72

Table 4: As-Built Parameters for CP2, CP3, CP4, and CP6

Pond	CP2	CP3	CP4	CP6
Elevated Pond Bottom Elevation (m)	41.4	53.3	51.0	51.1
Estimated Maximum Water Elevation during IDF (m)	52.0	63.0	63.0	62.0
Pond Volume at Estimated Maximum Water Elevation during IDF (m^3)	48,160	44,848	48,995	67,799
Thermal Berm for Pond	Berm-CP2	Berm-CP3	Berm-CP4	Berm-CP6

3.3 Water Collection ponds

Six planned water collection ponds (CP1, CP2, CP3, CP4, CP5, and CP6) have been constructed to date as part of the water management infrastructure. CP2.5 and CP9 will be built in 2025 or over the winter of 2026 and will be in operation for the 2026 freshet. Although initially intended to serve as the primary saline water storage pond SP6 will now serve exclusively as a surge storage reservoir for surface contact water from CP1 during high-flow periods (see Section 3.6.2). The WES03 pit will act as an intermediate reservoir, receiving water from CP3, CP4, CP5 and CP2.5. Table 5 presents the locations and the required operational period of the collection ponds. The locations of the six water collection ponds are shown in Figure 2.

Table 5: Location of Collection Pond and Required Operation Periods

Collection Pond	Relative Location	Required Operation Period
CP1	Pond H17 and H6	Year 2017 to Mine closure
CP3	North of Lake B7 and southwest of TSF	2019 to 2026 (covered by TSF)
CP4	Southeast of Lake B7 and south of WRSF1	2019 to 2026 (covered by WRSF1)
CP5	North of Tiriganiaq Pit 2	2017 to Mine Closure
CP6	Pond H19 and north of WRSF3	Year 2020 to Mine closure
CP2	East of WRSF3	Year 2022 to Mine closure
CP9/Pump01	Within the Pump01 and Lake B36 footprint	Year 2026 to Mine closure
CP2.5	South-West of TSF	Year 2026 to Mine Closure

3.4 P-Area Ponds

The P-area formerly consisted of three storage ponds as part of the saline contact water management system from 2016 to 2018.

Backfilling of the P-Area cells (P1 and P2) began in Q3 of 2020 and finished in Q3 of 2021 using waste rock obtained form the underground mine and open pits to promote permafrost aggradation.

In 2024, cell P3 was decommissioned and backfilled to serve as a laydown and storage pad. Design of the P3 backfilling included a ditch surrounding the pad and a 1.3 m deep sump excavated into the overburden at the west extremity of the pad. The ditch can safely pass an extreme intensity flow under a 5-minute 1:100 return rainfall of 5.0 mm. Water levels within the sump are controlled by a level-indicator switch which provides a freeboard greater than 0.5 m below (66.8 m) the core elevation in the DP3-A berm (67.5 m) and the crest of the P3 laydown pad. Surface runoff to the sump is managed by pumping water over the DP3 containment structure into CP5. TDS monitoring in P3 over several years has demonstrated a sufficient degree of flushing has occurred such that the risk of salt contamination from the former presence of saline water in cell P3 is minimized and the

subsequent downstream impact on CP5 TDS is negligible.

Table 6 presents the design criteria of the P3 sump. Figure 3 presents the layout of P3 pad.

Table 6: P3 Sump Design Criteria

Design criteria	Sump P3
Sump drainage area	23,560 m^2
1:100 24h rainfall event	59.9 mm
Total inflow	1,270 m^3
Minimum freeboard during IDF	0.5 m
Maximum Design Water Elevation	66.8 m
Sump Bottom Elevation	64.6 m
Storage Capacity	894 m^3
Minimum Pumping Rate	20 m^3/h
Level-Indicator Switch Elevation	65.5 m

3.5 Contaminated Snow Cell

A contaminated snow cell is used to store snow containing hydrocarbons (i.e., snow on which spills occur). The contaminated snow cell was constructed in 2017 (Agnico Eagle, 2017a) and is currently in place as a contingency measure for contaminated snow storage over the winter (refer to the Freshet Management Plan). Upon snowmelt, water within the contaminated snow cell is transferred to the Landfarm for treatment at the oil-water separator (Section 3.9.5).

The snow cell is lined with a polyethylene liner to avoid seepage of melting snow into the surrounding environment. The cell is designed to contain a volume of 1500 m^3 of snow and to contain 930 m^3 of water at a water surface elevation of 69.5 m.

3.6 Saline Ponds

3.6.1 Existing Saline Ponds

Saline Pond 1 (SP1) was constructed in Q3 2016 to accommodate excess saline contact water from the Underground Mine. SP1 is located north of CP5 (Figure 2). Table 7 summarizes the Saline Pond capacity for storage and maximum designed operating water levels.

Saline Pond 2 (SP2) was constructed within the footprint of Tiriganiaq Pit 2 in Q2 2019 as a temporary saline contact water storage pond on site, accommodating excess saline contact water from the Underground Mine. In Q2 2020 SP2 was decommissioned to allow mining of Tiriganiaq Pit 2. Saline contact water stored in SP2 was emptied into Saline Pond 4 (SP4) which was commissioned in March of 2020.

Saline Pond 3 (SP3) was constructed within the footprint of P-Area Pond 3 (P3). Construction of SP3 was completed in Q2 2019. SP3 is part of the medium-term groundwater management strategy, that consists of treating groundwater from the Meliadine Underground with respect to quality standards and discharge the treated water effluent into Melvin Bay. SP3 is used to store the treated water exiting the former Saline Effluent Treatment Plant (SETP) (i.e., the SETP not within the WTC) before being discharged to sea.

Saline Pond 4 (SP4) was temporary in nature and allowed for the dewatering of SP2 to facilitate construction of Tiriganiaq Pit 2 while providing additional storage for saline contact water from the underground mine. SP4 was constructed in bedrock within the footprint of Tiriganiaq Pit 1 (Figure 4). SP4 was dewatered to Tiriganiaq Pit 2 in 2021 to facilitate mining beneath the facility and allow for mining to continue in Tiriganiaq Pit 1 in this area. In 2023, development of Tiriganiaq Pit 1 extended into SP4 and thus the pond no longer exists.

In Q3 2021, mining in Tiriganiaq Pit 2 was stopped and the pit was subsequently converted to a saline water storage facility. Tiriganiaq Pit 2 has a total saline water capacity of 1,616,554 m^3 and will be used to store the saline contact water pumped out of the underground mine. Further information on the saline contact water storage strategy is provided in the Groundwater Management Plan.

Groundwater from the underground mine is pumped to Tiriganiaq Pit 2 where it will remain in storage until it is treated for discharge to sea (see Section 3.11 or Groundwater Management Plan). Water stored in the saline ponds is isolated from the surface runoff collection system and will thus not be discharged to Meliadine Lake.

Table 7: Storage Capacities for Saline Pond 1 and Tiriganiaq Pit 2

Item	Saline Pond 1	Tiriganiaq Pit 2
Maximum Operational Water Elevation (m)	62.9	62.0
Maximum Water Capacity (m^3)	32,686*	1,616,554

* Tetra Tech (2017) maximum operating capacity, not including IDF storage

3.6.2 Saline Pond 6 (SP6) to be Constructed

Once Lake B7 is dewatered, it will become Saline Pond 6 (SP6). Although initially intended to serve as the primary saline water storage pond for underground mine water and saline contact water from saline ponds, this function has been reassigned to WES02 Pit. As a result, SP6 will now serve exclusively as a surge storage reservoir for surface contact water from CP1 during high-flow periods.

3.7 Water Storage in Mined-Out Pits

Mined-out pits at the Meliadine Mine play a critical role in the integrated water management strategy, serving as both temporary and long-term storage facilities for contact and saline water. These pits are repurposed to manage water volumes generated during operations, thereby reducing

the need for additional surface infrastructure.

- PUMP02 pits will be used as a saline water sump once mining of the deposit is complete and will capture saline runoff from the Pump Underground WRSF.
- WES02 will be used as the primary storage facility for excess saline contact water pumped from the underground mine, which will later be treated at the SETP before discharge to Itivia Harbour.
- WES03 functions as an intermediate reservoir for surface contact water collected from CP3, CP4, CP5, and CP2.5. Water stored in WES03 is designated to Itivia Harbour via the waterline.

3.8 Water Diversion Channels, Dikes and Berms

The following sections provides details on existing water management infrastructures currently required for mining the Tiriganiaq deposit. Water management infrastructures to be constructed to support the Mine Plan are summarized in Table 3. Details will be updated in the Water Management Plan as these structures progress into the detail design phase.

3.8.1 Water Diversion Channels

Nine water diversion channels (Channels 1 to 5, and 7 to 10) have been constructed and form part of the surface contact water management infrastructure. Construction of Channel 6 is tentative based on future water management strategies downstream of the P-area. Construction of Channels 9 and 10 was completed in Q2 2022. Channel 11 will be constructed in 2025 to collect and divert the runoff water from the proposed WRSF6 catchment area to CP9/Pump01 Pit. The as-built and design parameters for the water diversion channels are presented in Table 8.

Table 8: As-Built and Design Parameters for Channels

Channel	Approximate Total Length (m)	Bottom Width (m)	Side Slopes	Rip-rap Thickness (m)	Minimum Bottom Slope Gradient (%)	
1 (As-built)	528	3	3(H):1(V)**	0.3 to 0.5	0.2	
2 (As-built)	269.5	1.257	1.82(H):1(V)	0.277	0.30†

3.8.2 Water Retention Dikes and Berms

In general terms, “dikes” were constructed with impervious liner systems and “berms” are constructed with entirely till cores. With the extension of the mine within the Pump area, Berm 4 will be used to divert runoff water from WRSF6 to Channel 11 and CP9, and to prevent contact water from flowing into the receiving environment.

Water retention dikes D-CP1 and D-CP5 have been designed as a zoned earth fill dams with a geomembrane liner keyed into the permafrost foundation to limit the seepage through the dike and its foundation. The characteristics of the dikes and berms required for the WMP are summarized in Table 9.

Table 9: As-Built and Design Parameters for Water Retention Dike/Berm

Dike/Berm	Approximate Maximum Height (m)	Maximum Elevation (m)	Maximum Head of Water Retained (m)
D-CP1	6.6	68.5	3.6
Berm-CP2	5.07	58.6	0
Berm-CP3	4.9	69.9	0
Berm-CP4	5.0	69.1	0
D-CP5	3.3	67.3	1.4
Berm-CP6	6.0	68.0	0
DP1-A	3.7	70.5	68.5
DP1-B	3.4	70.7	68.7
DP2-A	4.0	69.5	67.5
DP3-A	3.4	69.0	67
Berm1	2.6	69.0	0
Berm2	1.5	varies	0
Berm3	2.76	67.37	0
Channel 2 Berm	1.7	71.0	1.5
Berm 4	1.5	74.0	0

3.8.2.1 Thermal Monitoring

Horizontal Ground Temperature Cables (GTCs) are installed along the key trenches of D-CP1 and D-CP5 at a depth of approximately 3 m below the original ground level. These installations are in place to verify that the foundations remain frozen and dike integrity is not compromised. D-CP1 and D-CP5 also contain vertical GTCs installed to an approximate depth of 15 m below the crest of each dike. Thermal berms of CP2, CP3, CP4 and CP6 contain vertical GTCs installed to approximately 8 m below original ground elevation to monitor the thermal performance of the foundation materials. Thermal records collected from these sensors provide temporal analysis of vertical temperature profiles to assess whether the structures are performing as designed.

D-CP1 and D-CP5 readings are obtained, recorded, and assessed weekly during open water season and monthly after freeze-up. Data loggers are set to record temperatures in the dikes every 12-hours. Reading frequency at the thermal berms is generally monthly during the first year following construction and quarterly thereafter. The measured readings are analyzed by an Agnico Eagle geotechnical engineer and are reported in the annual geotechnical inspection report.

In addition to thermal monitoring, visual geotechnical inspections of water management structures are currently performed, as described in Section 3.12 below.

3.9 Freshwater Intake

Freshwater usage at the Mine includes potable uses, fire suppression, make-up water for the mill, and other operational requirements, such as drilling water, dust suppression, paste backfill production, and use at the washbay. The main freshwater intake is located northeast of the industrial pad in Meliadine Lake, depicted in Figure 5. The intakes consist of vertical filtration wells fitted with vertical turbine pumps that supply water on demand. Both intake pipes are fitted with a screen of an appropriate mesh size to ensure that fish will not be entrained and shall withdraw water at a rate such that fish do not become impinged on the screen (NWB, 2021).

3.10 Water Treatment

Contact water will be treated (if necessary) to meet Licence requirements prior to being discharged to the environment. TSS mitigation techniques (i.e., attenuation ponds, silt screens, etc.), oil separation treatment, the STP, the SETP, the RO Plant, and the EWTP are used accordingly at various locations at the Mine prior to water being transferred to collection ponds and/or prior to effluent discharge to Meliadine Lake or Melvin Bay. Water quality criteria are discussed in Section 6 and in the Water Quality and Flow Monitoring Plan.

3.10.1 Freshwater Treatment Plant (WTP)

Freshwater from Meliadine Lake is treated in the WTP before being directed to the camp areas for potable (domestic) water uses. The design flow rate for freshwater for the main camp and accommodations is 216 m^3/day. In the WTP, freshwater is pumped through cartridge filters, then pumped through ultraviolet units, and finally treated with sodium hypochlorite (chlorine). The treated water is stored within a potable water tank. Potable water is monitored according to the Nunavut Health Regulations for total and residual chlorine and microbiological parameters. Operation and maintenance details for the WTP can be reviewed in the Operational & Maintenance Manual – Water Treatment Plant (Agnico Eagle, 2020a).

3.10.2 Sewage Treatment Plant (STP)

Wastewater from the accommodation complex and from satellite sewage tanks will be treated in the STP using a membrane bioreactor process before being directed to CP1 and, when available, to the WES03 Pit. Operation and maintenance details for the STP can be reviewed in the Operational & Maintenance Manual – Sewage Treatment Plant (Agnico Eagle, 2021a). Sludge is pressed using a volute dewatering unit and stored in the active deposition zone WRSF1 or WRSF3 to ensure coverage with waste rock.

3.10.3 Saline Water Treatment Plant (SWTP)

In 2018, Agnico Eagle constructed and commissioned a Saline Water Treatment Plant (SWTP) consisting of two evaporator-crystallizers (SaltMakers) to treat saline contact water. The SWTP removes total suspended solids (TSS), calcium chloride ($CaCl_2$), sodium chloride (NaCl), metals,

phosphorous (P), and nitrogen compounds from the influent saline contact water. Further specifications of the SWTP can be found within the SWTP Design Report (Agnico Eagle 2018) and the SWTP As-Built Report (Agnico Eagle 2019a).

In March 2020, operation of the plant was suspended due to poor performance coupled with high energy consumption and plant safety concerns. The SWTP is not currently a component of the groundwater management strategy. More information regarding the groundwater management strategy can be found in the Groundwater Management Plan.

3.10.4 Water Treatment Complex (WTC)

The WTC is a building designed to house both the EWTP and SETP. The design rationale for the WTC is to address concerns with the stability of the concrete slab at the previous EWTP building location. Additionally, the WTC provides a centralized building for contact water treatment, allowing for improved operational synergy.

Construction of the WTC commenced in Q3 2020. Further information regarding the WTC can be found the As-Built Report (Agnico Eagle 2021b).

3.10.4.1 Effluent Water Treatment Plant (EWTP)

The installation of the EWTP within the WTC (EWTP-WTC) was completed in Q2 2021 to allow for discharge to Meliadine Lake during the open water season.

The purpose of the EWTP-WTC (Actiflo® model ACP-700R) is to reduce Total Suspended Solids (TSS) to a target maximum concentration of 15 mg/L from the influent surface contact water pumped from CP1 prior to its discharge through the diffuser into Meliadine Lake.

The EWTP is designed to meet the minimum required rate of 12,000 m^3/d per the design requirements of dike D-CP1 (Tetra Tech, 2016b). While EWTP equipment has an operational range up to 28,000 m^3/d, the current system is configured to operate a maximum discharge rate of 18,000 m^3/d to prevent over-pressuring in the HDPE line that conveys water from the EWTP to the diffuser.

Further information regarding EWTP-WTC operation can be found in the EWTP-WTC Operation and Maintenance Manual (Agnico Eagle 2021c).

Trigger limits for stopping discharge are in place at the EWTP-WTC as a component of TSS, TDS, and pH exceedance mitigation during periods of discharge. These trigger limits are derived from a regression analysis of TSS concentration as a function of turbidity, and TDS as a function of specific conductivity. The regressions are developed using MEL-14 grab sample laboratory measured specific conductivity and turbidity readings paired with corresponding TDS and TSS results. Rating curves are then applied to continuous *in situ* specific conductivity and turbidity readings taken from internal probes within the EWTP-WTC prior to discharge to approximate TDS and TSS, respectively. Trigger limits for pH also prevent the discharge of non-compliant effluent using internal probes measuring *in*

situ pH. When a trigger limit is reached, the EWTP-WTC stops discharge immediately and begins recirculating treated water to CP1.

Agnico Eagle will continue to gather calibration/confirmatory paired samples in the future to actively increase the number of data points and strengthen the turbidity-TSS and conductivity-TDS correlations.

3.10.4.2 Saline Effluent Treatment Plant (SETP)

Prior to discharge of saline effluent to Itivia Harbour (see Section 3.11 and Groundwater Management Plan), saline contact water is store on site (Section 3.6). Saline contact water as well as surface contact water is pumped to the SETP for ammonia nitrogen and total suspended solids treatment. Treated saline contact water will meet MDMER end-of-pipe discharge criteria. Initial treatment includes a clarification unit for TSS removal. Agnico Eagle is currently designing a treatment system for ammonia nitrogen to meet the MDMER, including acute toxicity testing on *A. tonsa*. This system will replace breakpoint chlorination for treatment of ammonia nitrogen levels, which are inferred to be the result of the use of explosives in the underground mine.

Commissioning of the TSS treatment component of the SETP within the WTC (SETP-WTC) is expected to take place in Q3 2026. Further information on the SETP-WTC design for the TSS treatment component can be found in Agnico Eagle (2021d). Operation of the SETP-WTC and subsequent discharge will occur following construction and commissioning of the waterline (more information can be found in the Groundwater Management Plan). Once mining of the deposit in WES02 is complete, all saline contact water will be collected in WES02 and routed to the SETP-WTC where it will be used to treated prior to discharge to Itivia Harbour. Final discharge point (FDP) samples will be analyzed at an accredited laboratory as per MDMER requirements, as discussed within the Water Quality and Flow Monitoring Management Plan.

3.10.4.3 Sludge management

Sludge produced as part of the TSS removal processes at the WTC is discharged into saline water storage. Since its commissioning in 2021, the EWTP-WTC has discharged approximately 50 m^3/day of sludge in Tiriganiaq pit 2 (when in operation), consistent with the expected value presented in its design report (Tetra Tech, 2022a). According to the SETP-WTC design report, this plant is expected to produce an additional 450 m^3/day of sludge (when in operation). The sludge produced by the TSS removal area of the SETP-WTC will have similar characteristic to the sludge produced at the EWTP-WTC, considering the processes are the same.

The WTC sludge is sampled monthly for deleterious substances found in Table 1of Schedule 4 of the MDMER, to determine potential impact on the receiving saline ponds. Saline ponds are also sampled periodically for the same parameters.

Since 2021, available data suggests that none of the deleterious substances found in Table 1of Schedule 4 of the MDMER have increased in concentration in Tiriganiaq pit 2, except for Total Suspended Solids (TSS) and ammonia nitrogen. The loading of ammonia nitrogen in saline contact water is a known phenomenon at Meliadine, attributed to the dissolution of undetonated explosives from the underground mine. The increase of TSS in Tiriganiaq Pit 2 may in part be a consequence of discharging WTC sludge in saline water storage but is not deemed problematic. All saline water will be treated by the SETP-WTC for TSS removal prior to discharge to the Itivia Harbour.

3.10.5 Oil Separators

An oil-water separator is installed at the Landfarm. The oil-water separator located at the Landfarm is used to treat both direct precipitation to the Landfarm footprint and melt from snow containing hydrocarbons (i.e., snow on which spills occur) that is stored either in the Landfarm or the contaminated snow cell over winter (Section 3.4). Treated water is analyzed for benzene, toluene, ethylbenzene and xylene (BTEX), lead, and oil and grease prior to discharge to CP1 or used on the windrows to increase moisture content, as required. Hydrocarbons removed from water are stored and managed as hazmat.

A second oil water separator is applied to treat water from the maintenance shop wash bay, in which mining equipment from both surface and underground operations undergo cleaning (Section 4.1.6). Treated water is analyzed for BTEX, lead, and oil and grease prior to discharge to CP1 or saline ponds depending on *in situ* specific conductivity applied to approximate TDS concentrations. Hydrocarbons removed from water are stored and managed as hazmat.

3.10.6 Reverse Osmosis Plant (RO)

A reverse osmosis (RO) treatment plant is used to treat marginally saline runoff water captured by site water management infrastructure that would otherwise be directed to saline water storage. The application of the RO through these means is intended to reduce storage requirements of saline water on site until the Waterline is operational. Permeate water produced by the RO – treated water of low salinity that passes through the semi-permeable membranes – is directed to CP1. Brine water – high salinity water rejected by the semi-permeable membranes – is directed to saline storage.

Efficacy of treatment is generally dependent on the quality and homogeneity of water being treated. As TDS of influent water increases, pressure against the semi-permeable membranes increases, resulting in a lower recovery of treated permeate and a greater volume of rejected brine. However, the treatment flow rate can be lowered to reduce pressure and improve permeate recovery in feed water with a high concentration of TDS. Other water quality constituents such as the concentrations

of TSS, organic content, and certain minerals in the feed water may also negatively affect performance of the RO. As size exclusion is the mechanism driving treatment, the concentration of TDS in the permeate generally remains below 1000 mg/L (average for 2022 was 447 mg/L), but can be influenced by feed water quality and treatment rates. Consequently, the TDS concentration in the brine by-product is primarily the difference in mass of feed water solutes and mass of permeate water solutes per unit of brine volume. Additionally, more stable quality conditions or homogeneity of the water source used to feed the RO allows a better adjustment of the treatment settings and thus an optimization of the recovery rate.

The treatment rate of the RO is primarily limited by the actual capacity and size of the plant, in addition to the influence of previously mentioned water quality factors. A rate of approximately 2000 m^3/day has been achieved with a recovery of 80% (i.e. 1600 m^3/d and 400 m^3/d of permeate and brine produced, respectively) where influent TDS was approximately 3500 mg/L. Depending on the objective of treatment (e.g. volume targets versus quality targets) a lower recovery rate may be used to ensure brine quality discharged to saline storage meets a desired TDS criteria, resulting in the allowance of feed water with much higher TDS while still treating water at an appreciable flow rate. For example, feed water with a TDS concentration of approximately 12,000 mg/L has been treated at a rate of approximately 1500 m^3/d with a permeate recovery rate of 53%.

In addition to the treatment of marginally saline runoff, the plant may also be used to treat stratified layers of low salinity water in the saline ponds. The cause of low salinity water in the saline ponds is assumed to be driven by the downward exclusion of TDS during ice formation in addition to poorly mixed runoff inflows. This results in a relatively homogeneous stratified layer of water with a lower concentration of TDS overlaying more saline water in storage. Removing the marginally saline water from saline storage increases storage capacity for saline contact water from the underground mine.

3.11 Meliadine Lake Discharge Diffuser

The discharge diffuser is the final surface contact water effluent discharge location for the Mine. The overall purpose of the diffuser is to discharge water from CP1 (at sampling station MEL-14) to Meliadine Lake while providing minimal environmental impacts to the Lake. The effluent mixing will be dependent on ambient currents in Meliadine Lake, driven by wind during the open water period. The diffuser modelling was initially conducted by Golder Associates Ltd. (Golder, 2015) and updated design progress was reported by Tetra Tech EBA (Tetra Tech EBA, 2016). Further updates to the diffuser model were completed by Tetra Tech in support of the Water Licence Amendment (Tetra Tech, 2020).

3.12 Saline Water Discharge to Sea

Currently due to sufficient forecasted storage capacity until 2027, saline water on site is managed through storage and treatment of marginally saline water. The suspension of continuous hauling operation followed the approval of the waterline to discharge to sea (section 3.3.3) under the

Amendment 002 of the NIRB Project Certificate No. 006 issued on March 2nd. Once in operation, the waterline will be used in combination with the SETP-WTC to discharge treated saline water to Melvin Bay. Detailed information regarding treatment and discharge criteria are provided in the Groundwater Management Plan.

3.13 Water Management Structure Monitoring

Pursuant to Part E, Item 18 of the Licence, Agnico Eagle will carry out weekly inspections of all Water management structures during periods of flow and monthly thereafter. The records will be maintained for review upon request of an Inspector. More frequent inspections may be required at the request of an Inspector. Inspections will focus on structures and conditions detailed in Sections 3.13.1 to 3.12.5 to follow.

3.12.1 Culvert and Water Crossing Inspections

Culverts listed in Section 3.1, as well as culverts and water crossings along the All Weather Access Road (AWAR), Bypass Road, and at the Itivia site will be inspected for the following conditions. These inspections also satisfy the monitoring procedures outlined in the Sediment and Erosion Management Plan:

- Damage to the inlet or outlet of the culvert which may impede flow capacity;
- Bed erosion upstream and downstream of watercourse crossing structures;
- Scour under bridge abutments and abutment foundations;
- Erosion along cutslopes and fillslopes of embankments (rill and gully erosion);
- Blockages within the culvert including snow, ice, debris; and
- Snow cover or snow piles which would prevent routing of water towards the inlet of the culvert (only applicable prior to freshet).

In the case that any of the above conditions are observed, corrective actions will be taken to optimize culvert/water crossing function and integrity.

3.12.2 Collection Pond Inspections

Water collection ponds discussed in Section 3.3 and P3 pond discussed in Section 3.4 will be inspected for the following conditions:

- Laboratory water quality results as a trigger to implement mitigation actions;
- Unplanned inputs via surface runoff which are not part of the water management system; and

- Water level elevation above the operating manual maximum.

In the case that any of the above conditions are observed, corrective actions will be taken to prevent unaccounted for losses of available water capacity or potential compromise to dike integrity.

3.12.3 Dike and Thermal Berm Inspections

Dikes and thermal berms discussed in Section 3.6.2 are inspected to track natural (expected) movement of the structure. Pertaining to dikes, a "master" sketch of all the issues that were documented in the past is maintained as a means to spot any changes/new issues. Inspections focus on the upstream slope, the crest, the downstream slope, and downstream toe and observations include the following:

- New areas of movement/deterioration not previously documented;
- Changes to previously documented areas of movement/deterioration;
- Seepage through the downstream slope;
- Water presence in downstream channel/sump; and
- Areas of movement/deterioration of downstream channel/sump (where present).

Any issues or potential problems identified will be addressed accordingly by the Geotechnical Engineer in order to mitigate risks and maintain dike integrity.

3.12.4 Water Diversion Channel and Berm Inspections

In addition to the water management structures requiring inspections under the Water Licence, Agnico Eagle will carry out inspections of channels on site listed for the following conditions:

- Obstructions to flow (ice, debris);
- Inflows not part of the water management system;
- Structural failure of channel banks;
- Seepage through water diversion berms resulting in water movement to areas not planned within the water management system; and
- Erosion of diversion berms (i.e., undercutting, slope failure).

In the case that any of the above conditions are observed, corrective actions as directed by the Geotechnical Engineer will be taken if there is potential for compromise effectiveness of the

channel function or potential for unplanned impact to water quality or quantity in associated collection ponds.

SECTION 4 • WATER MANAGEMENT STRATEGY

A brief summary of the water management strategy during the operation of the Mine is presented as follows:

- Surface contact water from key mine infrastructure is diverted and/or collected in collection ponds (CP1, CP2, CP2.5, CP3, CP4, CP5, CP6, CP9, SP6 and the Saline Ponds).
- The collected surface contact water is pumped to CP1 and/or WES03 pit; water collected in CP1 may be reused for operational purposes and/or treated by the EWTP-WTC prior to discharge via the diffuser into Meliadine Lake whereas, WES03 pit functions as an intermediate reservoir, ultimately conveying water to Itivia Harbour via the waterline.
- SP6 has been designated as an overflow storage pond for CP1 during high-flow events.
- Surface contact water in Tiriganiaq Pit 1 and PUMP02 Pit will be collected in a sump and, depending on salinity, pumped to a collection pond or to a saline pond.
- Saline contact water from the Underground Mine (i.e., saline groundwater) will be contained in underground sumps and the water storage stope and reused for mining operations. Excess saline contact water volumes will be stored in Tiriganiaq Pit, PUMP02 Pit and WES02 pit until the waterline is commissioned and saline water can be treated for discharge to Itivia Harbour.
- CP9 constructed within the footprint of PUMP01 will be used to capture the runoff from the PUMP area including WRSF6, future Pits from the PUMP area (i.e. PUMP04 and PUMP02 prior being used for excess saline storage) will also be pumped to PUMP01 prior to transfer to CP1.

Details regarding the collection facilities for new project areas will be described in future updates of the Water Management Plans as the mine plan advances. Water management during closure is detailed in Section 7.

The Meliadine Mine Freshet Management Plan includes the Freshet Action Procedure and the Snow Management Procedure for the Mine. Table 10 and Table 11 summarizes the overall contact water management plan for the existing and future key infrastructure respectively, with initial water collection locations and final water destinations. The plans for water management at key areas are described in the subsequent sections.

Table 10: Existing Water Management Infrastructures

Contact Water Source	Initial Contact Water Collection Location	Final Contact Water Collection Location
Industrial Site Pad Area (camp/process plant area)	CP1	CP1
WRSF1 Area	CP1, CP4 and CP5	
WRSF3 Area	CP2 and CP6	
Dry Stack TSF Area	CP1 and CP3	
Ore Storage Pad 2 (OP2)	CP1	
Landfill	CP1	
Landfarm (biopile)	Sump within Landfarm	To CP1 after oil separation
Maintenance Wash Bay	Retention Tank	CP1 or surface saline storage (based on effluent salinity) after oil separation
Tiriganiaq Pit 1	Open pit sumps	Salinity based - CP4, CP5, SP1, or Tiriganiaq Pit 2.
Tiriganiaq underground	Sumps in underground mine	Sumps in underground mine, Tiriganiaq Pit 2, then discharged to sea

4.1 Key Water Management Activities

Current activities and planned construction schedule for water management infrastructures required for the WMP to support the Mine Plan are summarized in Table 12. Water management activities during closure are described in Section 7.

Table 12: Completed and Planned Key Water Management Activities

Mine Year	Major Water Management Activities and Sequence
Pre-Construction (2015)	• Started to re-use saline contact water • Dewatered top 0.5 to 1.0 m of fresh water in Pond H17 • Constructed Channel 2
Pre-Construction (2016)	• Dewatered H17 into Meliadine Lake • Started construction of D-CP1 to impound CP1 • Started construction of D-CP5 to impound CP5 • Dewatered Pond A54 in Q3 of Year -4 and pumped the water to CP1 • Constructed Saline Pond 1 (SP1) for additional saline contact water storage • Constructed and operated P-Area Containment Ponds • Started to store the excess saline contact water from the underground mine at surface • Implemented and tested evaporators at P-Area to reduce saline contact water volumes stored at surface • Constructed trenches down gradient from DP1-B and DP3-A to be able to pump collected water and pump back to P1 and P3, respectively • Constructed Channel 5 • Installed Culverts 3 and 4
Pre-Construction (2017)	• Completed construction of D-CP1, jetty and Pumping station CP1 • Completed construction of D-CP5, jetty and Pumping station CP5 • Started construction Channel 1 • Constructed Berm 3 • Constructed freshwater intake in Meliadine Lake and installed pumping station • Constructed Lv75 water stope for additional underground saline contact water storage • Installed Culvert 13 • Started to treat sewage from Sewage Treatment Plant (STP) and pump the treated sewage from STP to CP1 • Started to pump the surface contact water from CP5 to CP1 for treatment (solids removal) • Started to pump water collected in trenches, down gradient from D-CP1, D-CP5, DP1 and DP3 to the associated containment pond • Started to pump the water from the Type A Landfarm to CP1 after oil/water separator treatment • Started to pump water from washbay to underground for storage until a biological treatment unit for hydrocarbon reduction/removal arrives at the site
Pre- Construction (2018)	• Completed construction of Channel 1 • Started construction Channel 3, Berm-CP3 and Pond CP3 • Installed Culverts 1, 2, 15 and 16 • Constructed Berm 2 • Started to pump the surface contact water from CP1 to EWTP for treatment prior to discharge via the diffuser to Meliadine Lake • Pumped the solids sludge from EWTP to CP1. To limit recirculation of the sludge within CP1, the discharge of the sludge was located away from the EWTP intake • Started diversion of surface contact water from industrial pad to CP1 via Channel 1 • Constructed and commissioned (in Q4) SWTP to discharge to CP1.

Mine Year	Major Water Management Activities and Sequence
Pre- Construction (2019)	• Constructed Saline Pond 2 within footprint of Tiriganiaq Pit 2 and began storing excess saline contact water • Installed culverts 7, 8, 10, 11 and 20 • Constructed Channels 7 and 8 and Berm 1 • Completed construction of Channel 3, Berm-CP3 and Pond CP3 and started to collect surface contact water • Constructed Channel 4, Pond CP4 and Berm-CP4 and started to collect surface contact water • Started to pump the surface contact water in Ponds CP3 and CP4 to the partially drained Pond H13 where the water flows through Channel 1 into CP1 • Constructed, commissioned, and started discharge of saline water through the discharge to sea diffuser system • Partially dewatered Ponds H19 and H20 in Q3 of Year -1 by pumping water to the EWTP for discharge to Meliadine Lake • Started construction of Saline Pond 4 (SP4) within footprint of Tiriganiaq Pit 1
2020	• Completed construction of SP4 • Constructed Pond CP6 and Berm-CP6 • Transferred SP2 into SP4 • Decommissioning of evaporators • Started to pump surface contact water in CP6 to CP1 • Started to pump surface contact water collected in Tiriganiaq Pit 2 to CP5 • Started decommissioning of P1 and P2 (P-Area) by backfilling with waste rock • Decommissioning of SWTP
2021	• Start to pump surface contact water collected in Tiriganiaq Pit 1 to Tiriganiaq Pit 2 • Construct and commission EWTP within WTC (EWTP-WTC) • Complete conversion of Tiriganiaq Pit 2 to saline contact water storage facility • Dewater SP4 and SP1 into Tiriganiaq Pit 2 • Start pumping excess saline contact water from underground mine to Tiriganiaq Pit 2 • Finish decommissioning P1 and P2 (P-Area) by backfilling with waste rock • Pump EWTP and SETP sludge to saline contact water storage
2022	• Constructed Pond CP2 and Berm CP2 • Constructed Channels 9 and 10 • Store marginally saline water into SP1 • Pump water from Tiriganiaq Pit 1 to CPs, SP1, or Tiriganiaq Pit 2 • Operation of the RO plant for treatment of marginally saline water on site • Continued pumping saline contact water from underground mine to Tiriganiaq Pit 2 • SETP upgrade installation at the WTC • Constructed Pond CP2 and Berm CP2 • Constructed Channels 9 and 10 • Store marginally saline water into SP1 • Pump water from Tiriganiaq Pit 1 to CPs, SP1, or Tiriganiaq Pit 2 • Operation of the RO plant for treatment of marginally saline water on site • Continued pumping saline contact water from underground mine to Tiriganiaq Pit 2 • SETP upgrade installation at the WTC

Mine Year	Major Water Management Activities and Sequence
2023	• Water management plan similar to Year 3 • Channel 3 remediation work completed • Channel 2 outlet berm constructed • Waterline construction (AWAR KM 15 to 30)
2024	• Water management plan similar to Year 3 • Waterline construction (continued, AWAR KM6 to 15) • Dewatering of B36 • Fish out of B36, B37, B38, B60, B61, and B62
2025 (Planned Schedule)	• Continued waterline construction • Anticipated commissioning of the SETP-WTC • Construction of Channel 11, CP9 Thermal Berm, Berm 4 • Creation of CP9 within the footprint of PUMP01 pit • Dewatering of B38, A8, J6, J7, A35, A37 • Channel 1, 7 and 8 remediation work • Culverts installation/replacement
2026 (Planned schedule)	• Anticipated Waterline commissioning • SETP-WTC discharge through waterline • Construction of CP2.5 and channel on the west margin of TSF • Dewatering of A6 and other FZone lakes • Culverts – as required
2027 (Planned schedule)	• SETP-WTC discharge through waterline • Construction of Dikes D-A6 • Dewatering of B7 and B6 • Construction of Sump F1 • Construction of Channel 14 • Dewatering oand B5 • Culverts – as required
2028 (Planned schedule)	• SETP-WTC discharge through waterline • Culverts – as required
2029 (Planned schedule)	• SETP-WTC discharge through waterline • Construction of CPD1 and CPD2 • Construction of Channels 17, 18 and 19 • Culverts – as required
2030+ (Planned schedule)	• SETP-WTC discharge through waterline • Start to fill the mined-out Tiriganiaq Pits 1 and 2 with active freshwater pumping from Meliadine Lake • Stop pumping excess saline contact water from underground when underground mine is completed • Start natural flooding of Tiriganiaq Underground mine with groundwater seepage • Stop pumping water to process plant when the processing is completed

4.1.1 Pond Dewatering and Displacement

The initial dewatering at Lake H17 and Lake A54 was conducted in 2016 prior to constructing CP1 and CP5, respectively. The water from these ponds was pumped to Meliadine Lake through a temporarily installed diffuser.

Preparation for construction of CP4 facility required dewatering of the two shallow ponds B8 and B9 into CP1. Preparation for CP3 did not require dewatering as B28 contained insufficient volumes to dewater.

In Q3 2019, partial dewatering of Ponds H19 and H20 to the EWTP took place, following the advanced timeline for the construction of CP6 and WRSF3. Specifically, H19 was partially dewatered to facilitate construction of Berm CP6, while H20 was partially dewatered to allow the placement of waste rock and overburden within the drained lake basin. Detailed information regarding the CP6 design and subsurface thermal analysis can be found in the CP6 and Berm Design Report (Tetra Tech, 2020).

In Q3 2022, lakes and ponds A9, A38, A40, B33, and B33A were dewatered to allow for the continued mining within the final footprint of Tiriganiaq Pit 1, as authorized by DFO in a letter on April 20, 2022 (file 21-HCAA-02733). Water was pumped into the site water management collection ponds before being treated by the EWTP and discharged to Meliadine Lake. The final dewatering report was provided by Agnico Eagle to KivIA and DFO on October 21st, 2022.

In Q3 2024, dewatering of lake B36 and partial dewatering of lakes and ponds B37, B38, B60, B61 and B62 to the EWTP took place to allow mining within the Pump area. Dewatering and fish-out authorizations were granted by DFO (file 24-HCAA-00842). The final dewatering report was provided by Agnico Eagle to DFO on December 12th, 2024.

As presented in Table 12, other waterbodies are planned to be dewatered to allow the construction of water management infrastructure and other developments of the mine plan. A total of 25 waterbodies were identified for potential dewatering under the 2024 Water Licence Amendment application. However, most of the volume of water planned to be dewatered is related to 6 lakes: A52, A6, A8, B4, B5 and B7. Table 13 summarizes the waterbodies dimensions and estimated dewatering timelines and volumes.

Dewatering of waterbodies may expose shoals composed of unconsolidated sediments, which may lead to local sedimentation within the impounded water. The introduction of sediments (TSS) into the water column will depend on the type of material exposed, material properties, slope gradient, prevailing weather conditions, dewatering timing and rate at which the waterbody is drawn down.

The quality of water pumped from each waterbody will be monitored daily to verify that it is acceptable for release to the receiving environment according to the Part D, Item 12 of the amended Water Licence (see Water Quality and Flow Monitoring Plan, section 3.1.2). Non-compliant water will be pumped to CP1 for TSS removal at the EWTP-WTC before discharge to the receiving environment (see section 3.9.4.1 and 3.9.4.4 for more details on treatment and sludge disposal). The FEIS (Golder,

2014b) estimated that at base case for the site conditions, 60% of the total dewatered water would be suitable to direct discharge to the receiving environment. However, based on the uncertainties in TSS generation during dewatering, a more conservative estimate of 50% of the planned dewatering volume is assumed to require TSS treatment at the EWTP-WTC prior to discharge.

Table 3 describes the water management infrastructure that will be built within the footprint of the dewatered waterbodies and Table 13 presents the planned water management strategy for dewatered waterbodies; the annual report will capture updates on completed dewatering.

Among all planned dewatered waterbodies, only five (i.e., A8, A6, B5, J6, B34) will need to be included in the water management system and pumped to manage their water level. All other dewatered waterbodies that are not overlapped by infrastructure will naturally drain toward one of the aforementioned lakes. Dewatered waterbodies will be operated (pumped) to ensure sufficient storage for extreme events. Level in managed dewatered waterbodies will be lowered to ensure sufficient storage at freshet for extreme events without having to rely on pumping to CP1 to store the event water volume. Operating levels will be determined and dewatering of the waterbodies will be completed to allow partial (3:7) or full (7:7) storage of the drainage volume from a 1:100 wet year spring freshet.

Table 13: Planned Lakes and Ponds Dewatering Schedule Inventory

Pond/Lakes	Maximum Water Depth (m)	Average Water Depth (m)	Existing Pond Surface Area (m^2)	Total Lake Volume (m^3)	Planned Proportion of Lake Volume Dewatered (%)	Estimated Total Volume of Water Dewatered (m^3)	50% of Volume of Water Dewatered (m^3)
A19*	0.7	0.1	8,143	457	100%	457	228

Waterbodies with no bathymetric data available, volumes are estimated from an extrapolation of the surrounding lake topography (Messager et al., 2016)

4.1.2 Underground Water Management

The underground water management system is designed to prevent water from affecting the workings or production. The system contains a series of sumps (generally one at the access of each level) designed to capture groundwater inflows and runoff from mining operations (i.e., drilling), a clarification system, and a pumping system to redistribute the clarified saline contact water. Excess saline contact water is pumped to surface for management. Further details on the underground water management system are provided in the Groundwater Management Plan.

Beginning December 2018, the SWTP began treating groundwater to reduce stored saline contact water on site (See Section 3 for details). Furthermore, as part of the strategy to manage excess groundwater infiltration within the underground portion of the mine, Agnico Eagle received approval for marine discharge of saline water with the amended Project Certificate on February 26, 2019 (See Section 3.11 and Groundwater Management Plan for details). A new amendment (Amendment 002 of the NIRB Project Certificate No. 006) was received March 2nd, 2022, allowing the discharge of treated saline water through a waterline.

4.1.3 Water Management for Haul Road

A network of roads provide access to infrastructure at the Mine. The majority of the roadways servicing the mining area are located so that drainage is directed by berms, channels and culverts towards CP1, CP2, CP3, CP4, CP5, and CP6. Detailed information about water management on roads is described in the Meliadine Mine Roads Management Plan.

4.1.4 Water Management for Landfarm and Landfill

Any water that accumulates at the onsite Landfarm is pumped through an oil-water separator prior to discharge into CP1. Additional details for Landfarm water management are described in the Landfarm Management Plan.

Leachate from the Landfill is anticipated to be non-hazardous and non-toxic due to the controls put in place on the materials accepted for deposition in the Landfill. Annual Landfill operations involve clearing of snow prior to spring melt. In the event there is leachate from the Landfill due to periods of heavy rainfall or spring freshet, the runoff will be collected, controlled and treated, if necessary, and sent to CP1, as per the Landfill Management Plan.

Internal runoff and drainage from the Landfill will gradually seep through the northeast perimeter berm towards pond H13. As per the Technical Memorandum for the Operation Landfill (Stage 4) Berm Raise Summary (Agnico Eagle, 2024c), the Operation Landfill (Stage 4) utilizes a pumping system to facilitate the removal of water ponded against the perimeter berm if the rate of seepage is insufficient for water removal. Water pumped from the Landfill is directed to Pond H13, which is the current location seepage from the Landfill flows towards. H13 is immediately upstream of Culvert 2, which is upstream of Channel 1 and ultimately CP1. Water collected in CP1 is treated at the EWTP-WTC prior to being discharged to Meliadine Lake.

Monitoring of seepage from the Landfill (between the Landfill and Pond H13) or water pumped from the Landfill and directed to Pond H13 is conducted as per the Water Licence at compliance monitoring station MEL-24.

4.1.5 Water Management for Emulsion Plant Area

Freshwater is trucked to the emulsion plant and used for manufacturing emulsion as well as for washing vehicles. Water within the emulsion plant is re-used when feasible, and excess water is collected and disposed of on site (i.e., STP) or stored and shipped south as hazmat.

4.1.6 Water Management for the Wash Bay

Water used in the Wash Bay is re-used when feasible and excess water is treated with an oil-water separator to reduce or remove hydrocarbons. Treated water is moved to CP1 or the surface saline ponds, depending on *in situ* specific conductivity applied to approximate TDS concentration. Solid waste from the treatment process is removed and disposed of appropriately (Landfarm, hazmat, or underground).

4.2 Freshwater and Sewage Management

Additional freshwater usage and sewage management is described in the following sections.

4.2.1 Freshwater Management

Major freshwater usages on site include potable use, fire suppression, make-up water for the mill, and other operational needs, such as drilling and paste production for backfill. Freshwater is sourced from Meliadine Lake through a freshwater intake and pump system. For dust suppression, water is sourced from the freshwater intake system, ponded water located along the AWAR, or small ponds proximal to the road. Surface contact water from collection ponds may be used for dust suppression on areas that are within the site surface contact water system catchment.

Freshwater is pumped through an overland pipeline to potable water storage tanks and a fire water suppression tank. Under the Amended Licence, 1,100,296 m^3/year of freshwater is permitted during operation phase. Additionally, 8,676,481 m^3 of freshwater is permitted per year to fill the mined-out open pits during the mine closure. These quantities are inclusive of water needs for dust suppression.

The maximum design flow rate for the potable water for the main camp and accommodations (kitchen, laundry) is 216 m^3 per day. There is an onsite Potable Water Treatment System (Section 3.9.1). Treated potable water is piped to areas in the service complex and other facilities requiring potable water. Table 15 provides the updated freshwater consumption needs during the mine Operation phase in comparison to needs assessed for the 2014 FEIS and for the 2021 Water Licence.

Table 14: Freshwater Consumption for Meliadine Mine

Items	2014 FEIS		Amended Water Licence (2021)	Amended Water Licence (2024)
	provided in m^3/h	converted to m^3/yr	m^3/yr	m^3/yr
Camp Use	5.67	49,669	50,000	73,000
Truck Shop-Washbay	8.5	74,460	9,636	365
Paste Plant	5.5	48,180	105,120	157,000
Mill	107.2	939,072	424,860	652,000
Drilling Water	N/A	N/A	1,460	730
Dust Control	18	45,000	24,168	24,168
Emulsion Plant	1.6	14,016	1,520	1,950
Underground Washbay	50	438,000	2,200	2,200
Discovery Installation				5,500
Pit Production	1.5	12,000	N/A	
Sub-total	198	1,620,397	618,964	916,913
Contingency	**25%**		**20%**	**20%**
Total	**247.5**	**2,168,100**	**742,757**	**1,100,296**

4.2.2 Sewage Management

Sewage collected from the camp and MSB facilities is pumped to the STP. The objective of the STP is to treat sewage to an acceptable level for discharge to CP1 via a treated sewage water discharge pipeline. The STP is housed in a prefabricated (modular) structure, located at south-east of the service complex at the Industrial Pad, as shown in Figure 2. The system is designed to treat a maximum daily flow of 299 m^3 per day.

The STP for the camp facilities is designed to meet appropriate guidelines for wastewater discharge (Agnico Eagle, 2020c). Details regarding STP specifications and operation can be found in the Operation & Maintenance Manual Sewage Treatment Plant (Agnico Eagle, 2021a).

4.2.3 Process Water Management

Process water is required in the mill for ore processing and is primarily sourced from Meliadine Lake through the freshwater intake system. As per the Licence, reclaim of surface contact water for use at the Mill is maximized to the greatest practical extent.

4.3 Meliadine Lake Diffuser Effluent Flow Rates

The EWTP is designed to meet the minimum required rate of 12,000 m^3/d per the design requirements of dike D-CP1 (Tetra Tech, 2016b). While the EWTP equipment has an operational range up to 28,000 m^3/d, the current system is configured to operate a maximum discharge rate of 18,000 m^3/d to prevent over-pressuring in the HDPE line that conveys water from the EWTP to the diffuser.

The pump does not operate continuously at the maximum rate. The rate of discharge is determined during the open water season to meet the design criteria and performance objectives of D-CP1. The anticipated amount of effluent discharge each month per year can be found in the Water Balance and Water Quality Model (WBWQM) results in section 3.2 of the Annual Report. Details on the WBWQM setup and methods are discussed in section 5 of this document.

Discharge to Meliadine Lake is expected to be required on an annual basis. However, discharge of surface contact water through the waterline to Itivia Harbour will be conducted in accordance with the Adaptive Management Plan to minimize discharge to Meliadine Lake once the waterline is operational (Agnico Eagle, 2024a).

The anticipated amount of effluent requiring discharge over each year is based on the Water Balance and Water Quality Model (WBWQM). Updates to the WBWQM are conducted at a minimum of annually and results can be found in the most recent submission of the Annual Report.

SECTION 5 • WATER BALANCE

5.1 Site Water Balance Model

The site-wide water balance model is set-up to represent the interaction of the local climatic regime with the mine plan and water management plan, and based on these interactions, to predict the volumes of various water types (i.e., non-contact, surface contact and saline contact) requiring management, treatment and discharge to the receiving environment (Lorax 2025).

Table 15: Evolution of Site Water Balance Model

Year	Reference	Update Summary
2014	Tetra-Tech, 2014	Initial model for evaluating contact water infrastructure and pumping needs for Life of Mine and Closure. Included CP1, CP3, CP4, CP5, CP6, Tiriganiaq Open Pit and Tiriganiaq Underground
2020	Golder, 2020b	Update for 2020 Water Licence Amendment; inclusion of CP2
2021	Lorax, 2021	New Water Balance Water Quality Model (WBWQM) using the GoldSim modelling platform
2024	Lorax, 2024	Updated WBWQM for 2024 Water Licence Amendment
2025	Lorax, 2025	Updated WBWQM for 2025 Modification Application (inclusion of CP2.5, storage of water in mined-out Pits, and Pump Underground)

As per Part E, Item 13 of the Water Licence, the WBWQM is updated at minimum once every year to reflect operating conditions and results are provided in the Annual Report. See Appendix A for details of the Water Balance Water Quality Model that was updated for the current Modification application.

SECTION 6 • WATER QUALITY

Water quality monitoring is an important part of the Water Management Plan to verify the predicted water quality trends, conduct adaptive management should differing trends be observed, and to ensure all water quality limits at discharge points are met (i.e., effluent to Meliadine Lake and Itivia Harbour). Water quality results and water transfers (i.e., origin, destination, rate) at the Mine are monitored and documented pursuant the Licence.

Water quality monitoring was initiated at the pre-development stage, continued through construction into operations, and will continue into closure and post-closure. Monitoring occurs at four levels:

1. Regulated discharge monitoring that occurs at monitoring points specified in the Licence or MDMER regulations.
2. Verification monitoring that is undertaken for operational and water management purposes by Agnico Eagle.
3. General monitoring that is commonly included in the Licence, specifying what is to be monitored according to a schedule. General monitoring is subject to change as directed by an Inspector, or by the Licensee, subject to approval by the NWB.
4. Event Monitoring that addresses the site-specific monitoring that is required following any accidental release. The EM program is designed to verify whether contamination of the surface soil and/or any nearby receiving environment and active zone has occurred as a result of an accidental release of a hazardous material or contaminated water. A “release” may be caused by spills, including unidentified seepage or emergencies.

Water quality monitoring include quality assurance/quality control procedures that are implemented as per current Quality Assurance/Quality Control Plan. Appendix D of the Meliadine Mine Water Quality and Flow Monitoring Plan provides details of the Monitoring Program Stations on site and at Itivia. Figure 8and Figure 9 depict the Monitoring Program Stations on site and at Itivia.

6.1 Summary of Regulatory Guidelines

Water quality results are compared to MDMER criteria and effluent quality limits listed in the Licence. Water quality pertaining to MEL-14 will be compliant to Part F, Item 3 of the Licence prior to discharging to Meliadine Lake. All surface runoff and/or discharge from drainage management systems associated with the Mine, including laydown areas and All-Weather Access Road, where flow may directly or indirectly enter a Water body, shall not exceed the Effluent quality limits listed in Part D, Item 18 of the Licence. Furthermore, all waters from natural water body dewatering activities shall be directed to Meliadine Lake and shall not exceed the Effluent quality limits listed in Part D, Item 12.

Post-closure discharge water quality will be compared to Canadian Council of Ministers of the Environment Water Quality Guidelines (CCME-WQG) guidelines or the Meliadine SSWQO developed

for aluminum, fluoride, and iron (Golder 2013a, 2013b, 2014). The Meliadine SSWQO criteria was developed as a conservative protection to the aquatic receiving environment and was developed by Golder (2013a, 2014) to assess whether waste rock consisted of a deleterious substance according to Environment Canada (2013). The outcome of the assessment was that Meliadine waste rock is not a deleterious substance (Environment Canada 2014).

6.2 Water Quality Monitoring - Licence Amendment

As a component the Emergency Amendment (2020) and in support of the Water Licence Amendment Application (Amendment No. 1, 2021), additional regulated discharge monitoring was carried out in 2020, as described in the Meliadine Mine Water Quality Management and Optimization Plan (WQ-MOP). The purpose of the WQ-MOP sampling program was both to assess conditions experienced in Meliadine Lake during the 2020 discharge event and for the application as a science-based framework to support the determination of acceptable effluent quality conditions (EQCs) and Site-Specific Water Quality Objectives (SSWQOs). Further information regarding the WQ-MOP, including specifics of the 2020 sampling program, application of monitoring data, adaptive management measures and thresholds for the development of SSWQOs for chloride can be found in Meliadine Mine Water Quality Management and Optimization Plan Progress Update (Golder 2021).

6.3 Water Quality Modelling and Forecasts

Water quality for past and current (2024) operation of the mine is simulated using the Operational version of the WBWQM, whereas updated water quality predictions for future operations (2025+), closure and post-closure periods are conducted using the WBWQM updated for the Meliadine Modification (Lorax 2025). Concentrations of water quality parameters required by the Type A Water Licence 2AM-MEL1631 under Part F, Item 3 are modelled for all mine water management ponds and sumps.

As per the amended Water Licence, the water quality forecast will be updated annually. Future updates to the water quality forecast will be provided in the Annual Report.

6.4 Post-Closure

As per the 2014 Final Environmental Impact Statement (FEIS) water quality model provided in Agnico Eagle (2015b), long-term, post-closure water quality in the collection ponds and in the flooded open pit lakes are anticipated to meet MDMER limits and CCME-WQG for the protection of aquatic life or the SSWQO developed for the Mine for aluminum, fluoride, and iron. Water quality is predicted to improve in Closure when mining activities cease, and pit lakes are flooded with Meliadine Lake water. Detailed water quality predictions at Post-Closure are included in the Meliadine Mine Water Balance and Water Quality Model Technical Report (Lorax 2025).

SECTION 7 • WATER MANAGEMENT DURING CLOSURE

The detailed Mine closure and reclamation activities are provided in the Meliadine Mine Interim Closure and Reclamation Plan. Water management during closure and reclamation will involve controlled flooding of the open pits using a combination of excess surface water and freshwater from Meliadine Lake, as well as the natural flooding of the Underground Mine workings with groundwater inflows (groundwater seepage) and may include the transfer of any saline water remaining on surface. Flooding of open pits with excess surface water will be such that water quality is to meet the closure objectives as set out in the Meliadine Mine Interim Closure and Reclamation Plan. Water management infrastructure will remain operational until monitoring confirms that water quality is suitable for discharge to the environment without further treatment. Once water quality meets the discharge criteria, the water management systems will be decommissioned to allow the water to naturally flow to the environment.

The key water management activities during Mine closure are summarized in Table 20. Figure 10 illustrate the water management layout after Mine closure. Additional details for the activities are described in the following sections.

Table 16: Key Water Management Activities during Mine Closure

Phase	Figure	Key Water Management Activities and Sequence
Active Closure (2032 to 2038)	5	• Flooding of mined out pits • Continue to collect and manage the contact water in collection ponds • Continue to pump the contact water in CP1 to EWTP, if required, for treatment before being discharged to the outside environment • Remove non-essential site infrastructure • Pump the underflow sludge water from EWTP to CP1 • Continue natural flooding of Tiriganiaq and Pump Underground Mine and the transfer of remaining surface saline water (if needed) • Remove Meliadine Lake pumping system
Post-Closure (2039+)	10	• Treat the contact water until water quality meet direct discharge criteria and then decommission the water management system • Continue natural flooding of Tiriganiaq and Pump Underground • Breach water retention dikes and thermal berms once water quality monitoring results meet discharge criteria to allow water to naturally flow to outside environment • Remove culverts and breach remaining water retention berms (pending the demonstration of acceptable water quality)

7.1 Mine Flooding

Water management during closure and reclamation will involve controlled flooding of the open pits using a combination of excess surface water and freshwater from Meliadine Lake. Flooding of open pits with excess surface water will be such that water quality is to meet the closure objectives set

out in the Meliadine Mine Interim Closure and Reclamation Plan. Transfer of remaining surface saline water in the open pits to the Underground Mine workings

Refilling of the mine out pits is anticipated to take seven years, with pumping of Meliadine Lake water at a maximum of 8.5 Mm^3/year over six years, reducing to 2.6 Mm^3 in the last year of Active Closure (Lorax 2025). There will be no discharge into Meliadine Lake or to Itivia Harbour during this phase. The water quality model results indicated that water quality in the flooded pits will meet the discharge criteria and post closure treatment will not be required. The water quality within the pits will be monitored during flooding to verify the prediction of the water quality model. The information will be used to develop a strategy to minimize contamination of the regional surface water system.

More details are provided in the Meliadine Mine Water Balance and Water Quality Model Technical Report (Lorax 2025).

7.3 Collection Ponds, Dikes and Berms

The collection ponds, dikes and berms will remain in place to collect the surface runoff water and seepage from the Mine until the water quality meets discharge criteria. Once the water quality meets discharge criteria, dikes/berms will be breached to allow runoff to follow natural (topographically induced) flow paths. Dikes/berms breaching will involve the removal of a portion of the dikes to a minimum depth of 1 m below average water level or back to original ground levels. Consideration will be given to breach staging, with the above water portions of the dike/berm in the breach area removed during winter periods, when there will be little surface water flow, thereby minimizing the potential release of sediments to the neighbouring waterbodies. The remainder of the breach would be conducted during the open water season following freshet. Turbidity curtains would be deployed to minimize any potential sediment release to surface water.

7.4 Channels and Sumps

Once monitoring results have indicated that contact water conveyed in channels and sumps meets acceptable water quality, the infrastructure will be graded and/or surface treated according to site-specific conditions to minimize wind-blown dust and erosion from surface runoff, if required. This closure activity is intended to enhance site area development for re-colonization by native plants and wildlife habitat.

AGNICO EAGLE

Glossary and Abbreviations

Terminology used in this document is defined where it is first used. The following list will assist readers who may choose to review only portions of the document.

CP	Collection Pond
EOM	End of mining/end of Operations
EOP	End-of-pipe
EWTP	Effluent water treatment plant
FEIS	Final Environmental Impact Statement
MDMER	Metal and Diamond Mining Effluent Regulations
NWB	Nunavut Water Board
POPC	Parameter of potential concern
RCP4.5	Representative Concentration Pathway Scenario (4.5)
SETP	Saline effluent treatment plant
SP	Saline Contact Water Pond
STP	Sewage treatment plant
TDS	Total dissolved solids
TSF	Tailings storage facility
TSS	Total suspended solids
WBM	Site-wide water balance model
WBWQM	Site-side water balance and water quality model
WQM	Site-wide water quality model
WRSF	Waste rock storage facility

Plain Language Summary

AGNICO EAGLE

Plain Language Summary

The Meliadine Mine currently includes one underground mining area and open pits. While the full mine development plan was approved by the Nunavut Impact Review Board (NIRB) through Project Certificate No. 006, only select components initially advanced to the Type A Water Licence process. The previous Type A Water Licence (2AM-MEL1631) authorized mining at the Tiriganiaq open pits and underground operations.

The 2024 amended Water Licence expands this authorization to include the Wesmeg/Wesmeg North, Pump, F Zone, and Discovery deposits—areas already assessed in the 2014 Final Environmental Impact Statement and covered under Project Certificate No. 006.

In support of the current Water License modification application, the Water Balance and Water Quality Model (WBWQM) has been updated to reflect updates including changes to the PUMP area relative to the 2024 Nunavut Water Board (NWB) model (Lorax, 2024a), including earlier mining of the PUMP01 and PUMP02 pits in 2025, and inclusion of the PUMP underground mine, its contribution to the saline water balance and associated surface infrastructure, including an underground waste rock storage facility (WRSF) and ore pad. In addition, an update to the saline water management plan has been incorporated as well, with storage of saline water from the underground mines in TIRI02 and PUMP02 pits augmented by additional storage in the WES02 pit. Lake B7, once dewatered, will be utilized as a surge storage reservoir for surface contact water during high flow periods, and the CP2.5 sump will be constructed to capture TSF runoff and interflow along the northwestern boundary, routing to the saline storage system. Finally, once mining is completed in the WES03 pit it is utilized as an additional surface contact water storage reservoir, allowing further flexibility in site water management, with the objective of reducing total discharge volumes to Meliadine Lake.

The WBWQM fully incorporates the mine plan on a year-by-year basis, and includes annual changes to volume, area, and the characteristics of all mine infrastructure. In parallel, all water management infrastructure and activities are represented, with volumes and water quality predicted on a daily time-step. Two water ‘types’ are tracked in parallel within the model:

1. *Saline contact water* originating from underground dewatering and runoff from ore pads, saline waste rock storage facilities and a portion of the tailings storage facility; and

2. *Surface contact water* generated by the waste rock storage facilities, open pit walls, and other disturbed areas not related to underground mining operation.

The operation of ponds, pumps, water treatment systems and discharges to Meliadine Lake and Itivia Harbour are also represented within the model. Each mine component is assigned specific geochemical source terms and discharge concentrations to represent the predicted water quality for each component. These mine contact water flows are then transported within the model to collection sumps, and larger collection ponds where the various waters are mixed within the model prior to treatment and discharge. The model assumes that saline contact water is collected and treated to reduce ammonia-N and total suspended solids (TSS) concentrations and is subsequently discharged to Itivia Harbour. Surface contact water is treated for TSS, and discharged to Itivia Harbour, and then Meliadine Lake; discharge to Itivia Harbour is prioritized in the model, with the objective of minimizing discharge volumes to Meliadine Lake.

The model is run over a 100-year period to include the Operations, Active Closure, and post-Closure phases of the Meliadine Mine. The climate inputs used in the model reflect a variable climate condition, including the predicted climate change under the RCP4.5 scenario.

Under all conditions modeled, the mine water management infrastructure is shown to be capable of collecting, storing, and releasing the mine contact waters and saline waters in a controlled manner, according to the existing licenses and management plans. In addition, the WBWQM results indicate that the predicted Meliadine Mine volumes and water quality will remain within those presented in the 2014 Final Environmental Impact Statement (FEIS), and within the water license limits as prescribed in 2AM-MEL1631.

During the Operations phase, model predictions for the EWTP discharge to Meliadine Lake remain below the MDMER/Water License limits. Ammonia-N concentrations are predicted to be above discharge criteria to Itivia Harbour, and mitigation options (e.g., treatment) are currently being investigated. No other exceedances of are expected in effluent discharged to Meliadine Lake and Itivia Harbour during mine Operations.

1. Introduction

AGNICO EAGLE

1. Introduction

Agnico Eagle Mines Ltd. (Agnico Eagle) operates the Meliadine Gold Mine (Meliadine Mine), located 25 km North of Rankin Inlet in the Kivalliq region of Nunavut. The environmental assessment of the Meliadine Mine, resulting in the issuance of Project Certificate No.006 in 2015 by the Nunavut Impact Review Board (NIRB), included approval of a multi-phase approach to development, including mining of Tiriganiaq deposit using open pit and underground mining methods and mining of the Pump, F Zone, Discovery and Wesmeg deposits using open pit methods. Type A Water License 2AM-MEL1631 issued in 2016 was primarily for the Tiriganiaq deposit and associated infrastructure including, process plant, camp, tailings storage facility and waste rock storage facilities. The Water License was subsequently amended in 2024 to allow mining of all deposits (Tiriganiaq, Wesmeg/Wesmeg North, Pump, F Zone, and Discovery) to proceed until 2031, including the Tiriganiaq underground.

This model update includes the following changes to the mine plan submitted in the January 2024 Water License amendment application:

- The Waterline is online as of June 2026;
- The PUMP01 and PUMP02 pits are now mined earlier in mine life, beginning in 2025 (previously mined in 2029);
- Inclusion of the PUMP underground mine, beginning in 2026, along with an underground WRSF and ore pad located upgradient of the PUMP02 pit;
- The PUMP02 pit will be used as a saline water sump once mining is complete in mid-2025 and will be online to capture saline runoff from the underground WRSF in 2026;
- The WES02 pit will also be used as a saline water reservoir once mining is complete in 2026;
- The WES03 pit will serve as an intermediate surface contact water reservoir, with CP3, CP4, CP5, SP6, and STP discharge routed here, prior to discharge to Itivia Harbour via the Waterline;
- Once dewatered, Lake B7 will be utilized as a surge storage reservoir for surface contact water (SP6) during high flow periods, and will no longer be utilized as a saline storage reservoir; and,

- Sump CP2.5 will be constructed to capture TSF runoff and interflow along the northwestern boundary to prevent these flows from reporting to B7, and instead, will be routed to the saline storage system.

The mine plan represented in the updated WBWQM remains within the footprint and Meliadine Lake discharge volumes approved by NIRB in 2015, and by the Nunavut Water Board in 2024.

Lorax Environmental Services Ltd. (Lorax) was retained by Agnico Eagle to update the WBWQM to represent the minor mine plan changes listed above. The modelling effort described in this report builds upon and supersedes that presented in Lorax (2024). The reader is referred to that report for technical details on model setup, assumptions, calibration and validation. This memorandum presents only the information pertinent to the mine plan changes above, all other inputs and assumptions, as presented in Lorax (2024), remain applicable.

1.1 Report Structure

Following this introduction, the report is structured as follows:

- Section 2 describes the modifications to the mine plan included in the model update;
- Section 3 summarizes the water balance model results;
- Section 4 summarizes the water quality model results; and,
- Section 5 provides a summary of key findings.

2. Model Input Sources

2. Model Input Sources

Key model inputs and sources are described in this section, including the mine plan, water management schedule and assumptions for underground flows.

2.1 Meliadine Mine Plan

The Meliadine Mine timeline is as follows:

- Meliadine Mine Operations: 2019 to 2031 (End-of-Mine [EOM]);
- Active Closure: 2032 to 2038; and,
- Post-Closure: 2039 onwards (modelled to calendar year 2119).

The EOM mine layout (2031), including all delineated sub-catchments is presented in Figure 2-1. The full series of semi-annual layout maps are provided in Appendix A, and the annual water management wire diagrams are in Appendix B of this report.

Mine plan updates are focused on the Pump area, associated saline water management, and use of select mined out pits as surface contact and saline water storage reservoirs (Table 2-1) as follows:

- The Waterline is online as of June 2026;
- PUMP01 and PUMP02 pits are mined in 2025;
- PUMP UG online in 2026, along with the PUMP underground WRSF and ore pad (Table 2-2);
    - Runoff from these features, along with the saline water encountered in the PUMP UG will be routed to the PUMP02 pit, which is mined out by May 2026. Saline water collected in the PUMP02 pit is then pumped to either TIRI02 pit or WES02 pit, for eventual discharge to Itivia Harbour.
- Collection of contact water from WRSF6 is simplified, with the Phase 1 footprint (2025-2028) runoff directly to PUMP01/CP9 via Channel 11, and runoff from the Phase 2 (2029-2030) footprint routed to either PUMP01 or SUMPP5 via Channel 12;
- The WES02 pit will also be used as a saline water reservoir once mining is complete in 2026, and treated discharges will be sent to Itivia Harbour via the Waterline;
- The WES03 pit will serve as an intermediate surface contact water reservoir, with flows from CP3, CP4, CP5, and the STP routed here, prior to treatment and discharge to Itivia Harbour via the Waterline;

- Once dewatered, Lake B7 will be utilized as a surge storage reservoir (SP6) for surface contact water during high flow periods;
- Sump CP2.5 will be constructed to capture TSF runoff and interflow along the northwestern boundary to prevent these flows from reporting to B7, and instead, will be routed to the saline storage system; and,
- TSF runoff will be routed to the underground mine void for the duration of the Active Closure phase (2032-2038).

CW = Contact Water Storage

2.2 Underground Inflows

The predicted average daily inflows to the underground mine workings remain uncharged from the 2024 NWB submission (Lorax, 2024), except for the addition of inflows from the PUMP underground mine (Table 2-4; WSP 2024). Measured underground inflows are presented for the 2018-2024 period in Table 2-3. The base case predicted inflows for the Tirganiaq, Wesmeg and Wesmeg-North underground operations were subsequently adjusted to account for the calculated difference between the predicted and measured underground inflows over the 2020-2023 period. This is equivalent to an approximate ratio of *measured:predicted* ratio of 0.74. Further losses to ore moisture (assumed to equal 2%) of ore mass are also applied, resulting in the adjusted values in Table 2-4. The predicted PUMP UG inflow values were not adjusted prior to input to the model. Owing to the elevated TDS of the groundwater system dewatering of all underground mines will be managed to the saline water management system.

Table 2-3:
Monthly underground dewatering volumes (2018-2024). All values in m^3/day.

2031	828	81	16	125	1,050

2.3 Closure Assumptions

In principle, the management of surface contact water and saline water follows the same logic as previously presented in the January 2024 NWB submission (Lorax, 2024), with the following updates noted for this submission:

- Any surface contact water remaining in SP6 and CP1 is pumped to TIRI04 via the EWTP to speed up pit flooding in early Active Closure;
- The Waterline is assumed to remain operational for the first three years of Active Closure (2032 through 2034), to allow the WES04 and PUMP01 pits to be dewatered. In addition, all saline water remaining in WES02, and remaining contact water in WES03 is pumped out via the Waterline over the 2032 to 2034 period, prior to flooding with Meliadine Lake water.
- TSF contact water reporting to the CP2.5, CP3, CP4, and CP5 sumps, and any TSF runoff reporting to Channel 1 are pumped to the underground void over the 2032 to 2038 period for permanent storage.

3. Water Balance Results

AGNICO EAGLE

3. Water Balance Results

Water balance model results are presented in this section, with a focus on the annual operational discharges to Itivia Harbour and Meliadine Lake (Section 1). Operations phase water balance time-series are provided for the key saline (TIRI02, PUMP02 and WES02) and surface contact water collection (CP1, WES03 and SP6) ponds, as well as tabular summaries of annual water balances for the remaining sumps, ponds, and open pits (Section 3.1).

As compared to the January 2024 submission, the following changes in the mine water management plan, and therefore the overall operational water balance and discharge volumes are highlighted:

- Waterline commissioning in June 2026 moves the discharge to Itivia Harbour back by one year;
- Addition of PUMP UG inflows, PUMP02 catchment runoff and PUMP Saline WRSF runoff to the saline water balance;
- Removal of CP8 collection pond reduces total volume of surface contact water;
- Use of SP6 as a surface contact water reservoir removes a significant volume of surrounding catchment runoff (including from the TSF) from the saline water management system, and adds it to the surface contact water system;
- Delaying the majority of dewatering of TIRI02 until 2027 and 2028 allows much more surface contact water to be discharged via the Waterline in 2026; and,
- Operation of Waterline to discharge any remaining surface contact water and saline water for the first three years of Active Closure.

3.1 Operational Mine Water Discharge to Itivia Harbour and Meliadine Lake

All surface contact water collected in the WES03 and CP1 Ponds is routed to the EWTP for treatment, targeting removal of TSS, before discharge to the receiving environment. Throughout Operations, discharge priority for surface contact water is via the Waterline to Itivia Harbour, with the objective of minimizing operational discharges to Meliadine Lake as outlined in the Adaptive Management Plan for Water Management. Under the Base Case RCP4.5 climate scenario, discharges to Itivia Harbour are predicted to be 2.04 Mm^3 per year while the Waterline is in operation with 0.45 Mm^3 per year on average comprised of saline water and 1.56 Mm^3 per year comprised of surface contact water (Figure 3-1 and Table 3-1).

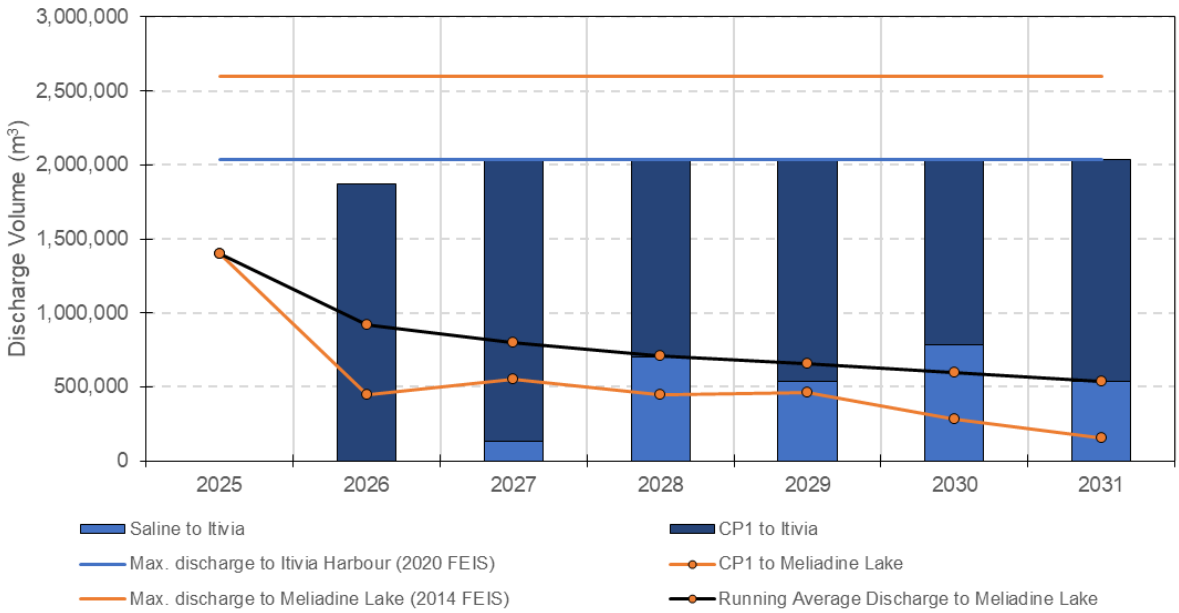

Figure 3-1: Annual discharges to Itivia Harbour and Meliadine Lake. The maximum predicted discharges to each receiver from the 2014 FEIS are presented for reference.

Table 3-1:
Annual discharge volumes and sources. Active closure phase discharges highlighted in grey.

Discharge	TIRI02 to WES02	WES02 to Itivia Harbour	Surface Contact to Itivia Harbour	Total Discharge to Itivia Harbour	Discharge to Meliadine Lake
Year	**m³**				
2025	0	0	0	0	1,359,000
2026	240,160	0	1,936,000	1,885,000	548,147
2027	1,093,684	193,404	1,898,000	2,039,404	464,203
2028	1,028,894	792,288	1,299,000	2,039,288	459,126
2029	0	579,815	1,511,000	2,039,815	484,839
2030	0	809,636	1,281,000	2,039,636	261,973
2031	0	564,103	1,527,000	2,040,103	151,152
2032	0	2,091,000	30,153	2,121,153	0
2033	0	517,876	1,573,000	2,039,876	0
2034	0	0	2,075,533	2,075,533	0
Total	**2,362,738**	**5,548,122**	**13,130,686**	**16,244,275**	**3,728,440**

Discharges to Meliadine Lake average 0.53 Mm^3/year over 2025-2031, with the peak annual discharge of 1.4 Mm^3 occurring in 2025 prior to the Waterline becoming operational.

The updated model shows slight changes to the annual discharge volumes relative to those presented in Lorax (2024) and summarized as follows:

- An overall decrease in the volume of saline water:
  - Slight increase in saline water generated by mine infrastructure from PUMP Underground inflows, and runoff from the PUMP saline WRSF, ore pad, and additional pit wall and catchment runoff reporting to PUMP02, which functions as a saline pond beginning in 2026 (Figure 3-2); and,
  - However, these increases are offset by the removal of SP6 and surrounding catchment flows from the saline water management system. This change results in a net decrease in saline water volumes requiring treatment (Table 3-2).
- Reduced discharges to Meliadine Lake via the EWTP (Figure 3-4; Table 3-2):
  - Increased proportion of total Waterline discharge comprised of treated surface contact water (via the EWTP; Figure 3-3; Table 3-2)
  - Delayed dewatering of TIRI02 pit allows for the prioritization of surface contact water for discharge to Itivia Harbour (Figure 3-2).

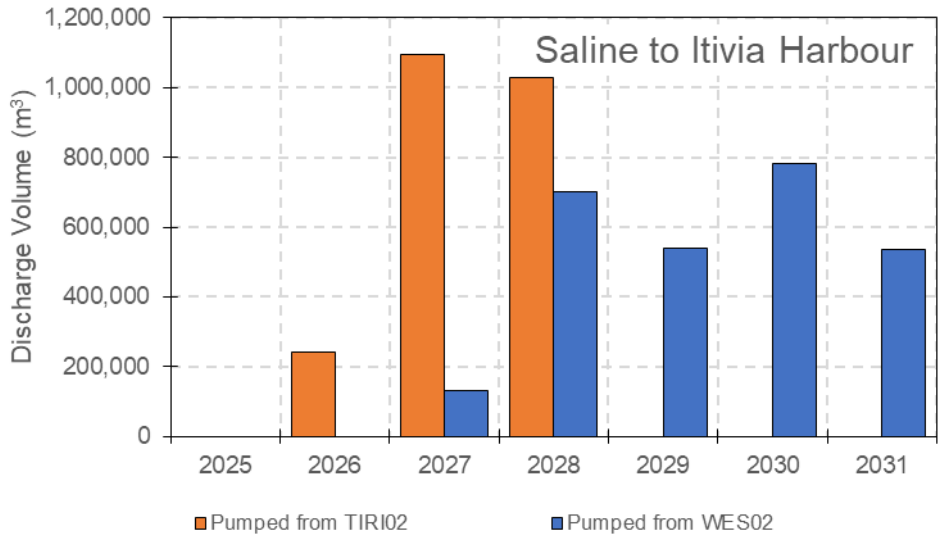

Figure 3-2: Annual saline water discharges to Itivia Harbour.

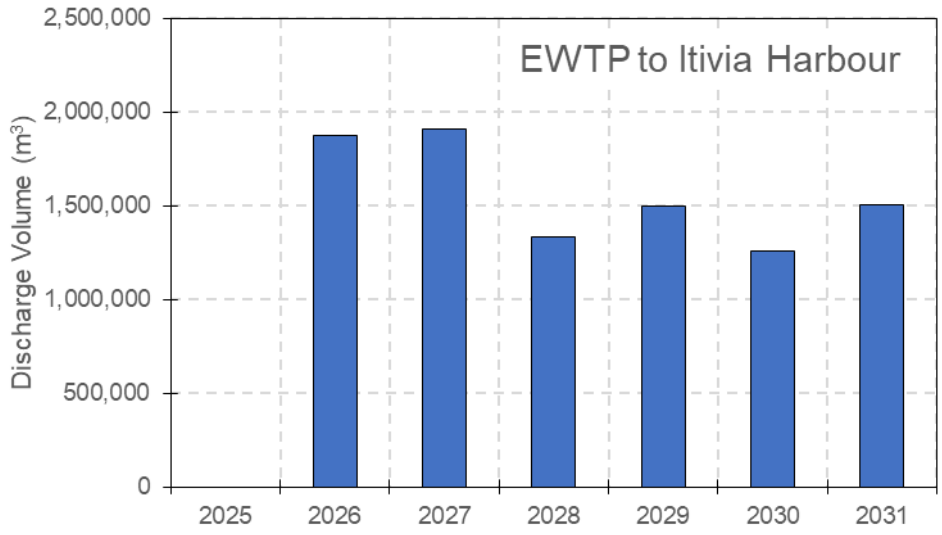

Figure 3-3: Annual surface contact water (EWTP) discharges to Itivia Harbour.

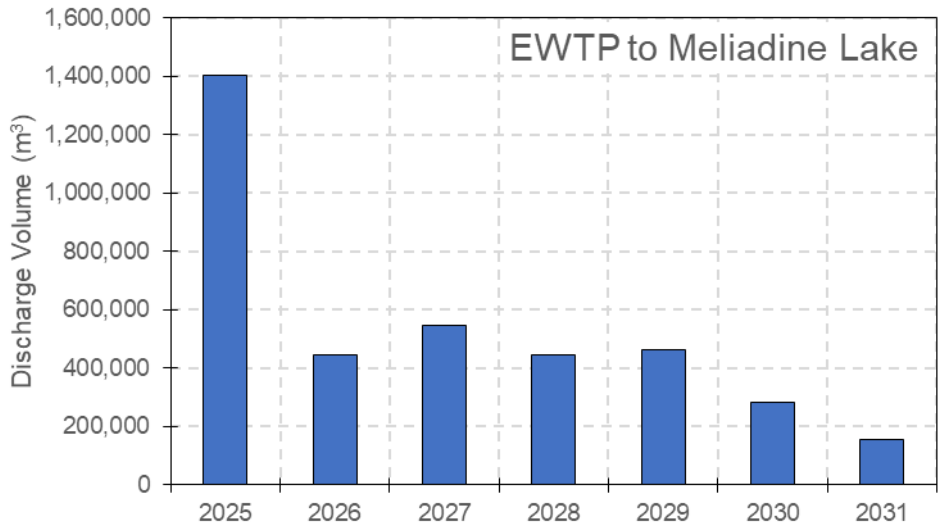

Figure 3-4: Annual EWTP discharges to Meliadine Lake.

Table 3-2:
Annual discharge volumes and sources.

Discharge Metric	Phase	2024 Submission	Current Prediction	Percent Change
		m^3		
Saline Discharge to Itivia Harbour	Operations	7,964,201	5,301,984	-58%
EWTP (Contact Water) to Itivia Harbour	Operations	6,161,855	9,452,000	34%
Total Discharge to Itivia Harbour	Operations	14,126,056	15,022,492	-17%
EWTP (Contact Water) to Meliadine Lake	Operations	6,959,386	3,736,372	-86%
Total Discharge (Saline + Contact Water)	Operations	21,085,441	15,760,469	-34%
Total Discharge (Saline + Contact Water)	Operations + Closure	21,085,441	19,972,715	-6%

3.2 Surface Water Collection Ponds

This section summarizes the water balances for the key surface contact water collection ponds (WES03, SP6 and CP1) for the Operations phase.

3.2.1 WES03

The WES03 pit is mined in 2026 and is dewatered to CP1 during this period. The WES03 pit will have an effective storage volume of 3.1 Mm^3 once mined out, and beginning in 2027, this pit will be utilized as a surface contact water storage reservoir. Discharges from the STP, SP6, CP3, CP4 and CP5 ponds will be routed to this pit, which is pumped out to the SETP for treatment prior to discharge to Itivia Harbour via the Waterline. Note that the new CP2.5 sump that collects TSF contact water is routed to CP3 from 2026 onwards (Figure 2-2).

The predicted daily volume of surface contact water stored in WES03 pit shown in Figure 3-5. In Active Closure, 3.07 Mm^3 of surface contact water is routed through WES03 to the Waterline for discharge to Itivia Harbour over the 2032-2034 period.

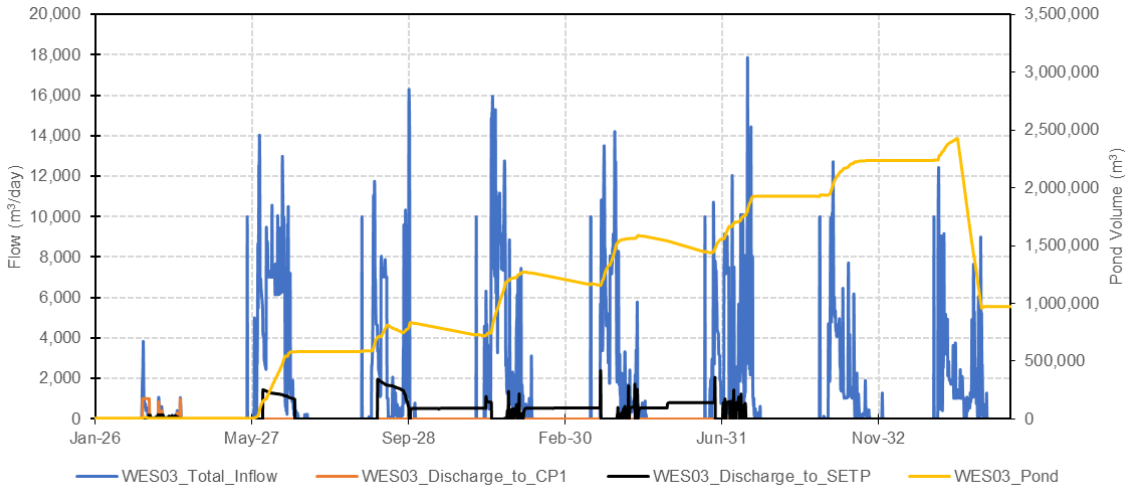

Figure 3-5: Daily time-series of inflows and outflows for the WES03 pit, and corresponding volume of surface contact water stored in pit for the Operations phase.

Table 3-3:
Annual water balance for the WES03 pit.

Year	Annual Volumes (m³)					
	Routed to WES03					Discharge to SETP
	STP	CP3	CP4	CP5	SP6	
2025	109,135	67,346	35,448	131,156	0	0
2026	109,135	77,042	55,256	159,529	0	6,930
2027	109,135	72,393	48,312	188,956	372,000	123,666
2028	109,434	60,900	42,597	141,248	150,000	201,076
2029	109,135	76,356	46,039	273,440	192,000	158,591
2030	109,135	62,884	36,631	236,614	132,000	161,899
2031	109,135	78,652	55,885	280,651	156,000	163,643
2032	109,434	71,580	62,971	139,901	0	0
2033	109,135	78,421	65,343	133,614	0	1,558,000
2034	109,135	71,758	74,661	138,968	0	1,508,542
Average[1]	**109,178**	**70,796**	**45,739**	**201,656**	**200,400**	**431,372**
% Total Inflow[1]	**17%**	**11%**	**7%**	**32%**	**32%**	

Notes:
[1] Average inflows and percent of total inflow calculated as aggregate of all years with water pumped to WES03.

3.2.2 PUMP01/CP9

Once mined out in Q3 2026, the PUMP01 pit is used as a local surface contact water pond (CP9), routing to CP1. On average, 135,000 m³ is pumped from CP9 to CP1 over the 2027 to 2031 period (Figure 3-7).

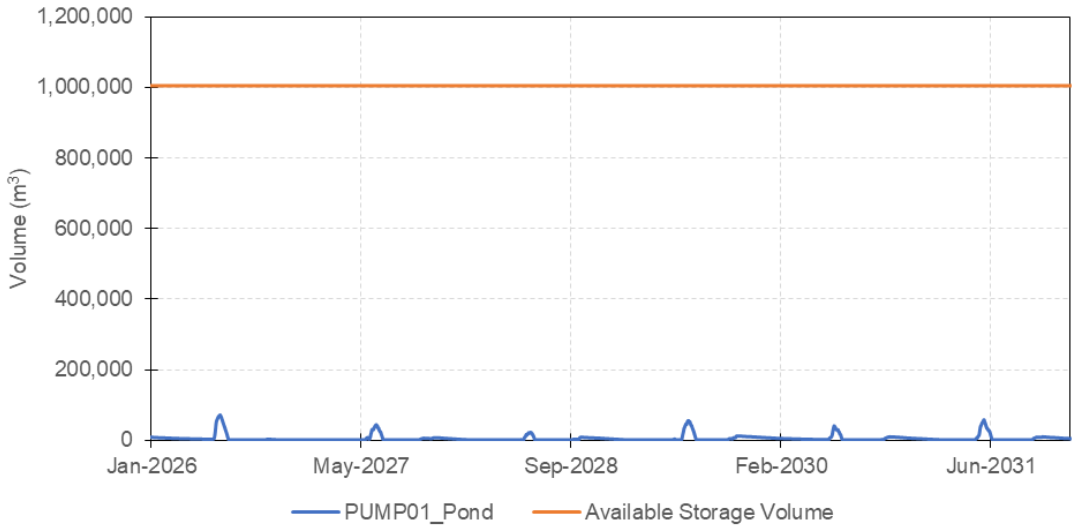

Figure 3-6: PUMP01/CP9 pond volume and available storage volume for Operations phase.

3.2.3 FZONE02

Once mined out in Q3 2028, the FZONE02 pit is used as a local surface contact water pond, routing to CP1. 171,000 m^3 is pumped from FZONE02 to CP1 over the 2028 (Figure 3-7).

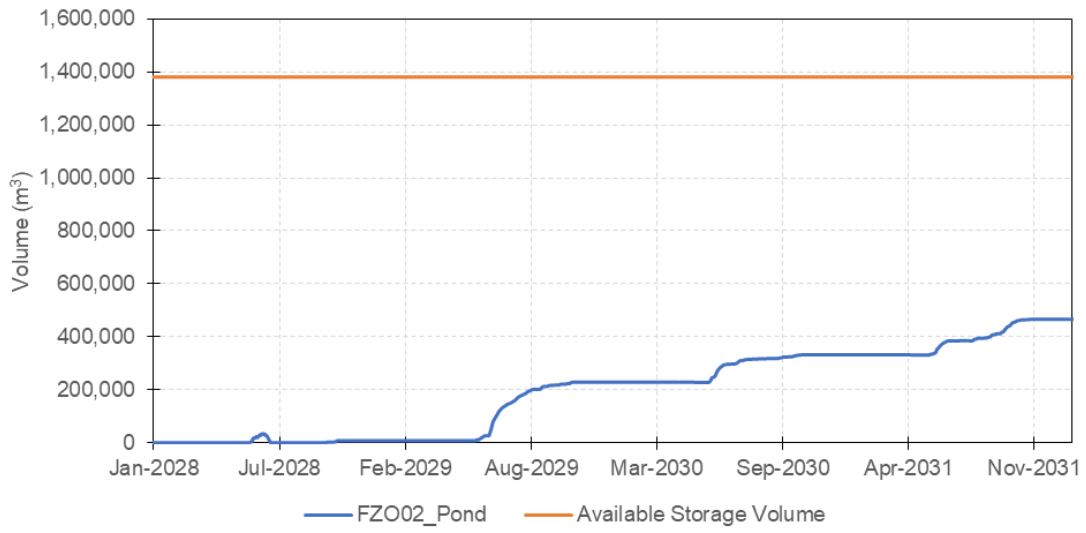

Figure 3-7: FZONE02 pond volume and available storage volume for Operations phase.

3.2.4 Collection Pond CP1

CP1 is currently the primary surface contact water collection pond, with all excess water routed to the EWTP prior to discharge to Itivia Harbour and Meliadine Lake. The maximum predicted storage volume (628,000 m^3; Figure 3-8) occurs in 2027 due to the expanded mine footprint, and priority use of the Waterline for dewatering of TIRI02. The corresponding predicted water level of 65.8 m remains lower than the Maximum Operating Water Level (MOWL) of 66.2 m (742,075 m^3; Figure 3-8). During the Active Closure phase, the mine site is managed as a zero-discharge facility, with all CP1 inflows routed to TIRI02/04 open pit. Beginning in the post-Closure phase, volumes in the CP1 pond are allowed to fluctuate naturally, with outflows reporting via pre-mine drainage pathways to Meliadine Lake.

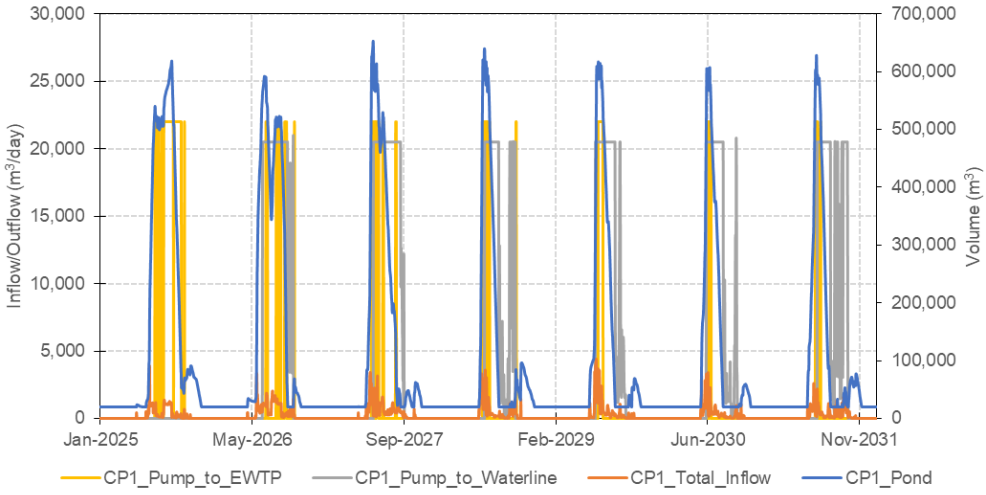

Figure 3-8: Volumes, inflows, and outflows to the CP1 Pond for the Operations phase.

Table 3-4:
Annual water balance for the CP1 pond.

Year	Annual Volumes (m^3)							
	Routed to CP1							
	Runoff[1]	TSF[2]	WRSF1[3]	CP2	CP2.5	CP6	PUMP01/CP9	WES03
2025	265,332	53,400	6,729	108,048	34,750	49,797	56,908	0
2026	255,144	69,715	9,481	110,333	37,933	81,118	128,880	26,152
2027	291,484	111,023	9,285	120,494	36,727	66,496	140,029	0
2028	270,278	93,209	6,337	105,825	31,263	55,658	123,773	0
2029	313,194	134,419	7,325	118,142	37,241	54,702	159,410	0
2030	264,199	107,237	4,202	106,845	31,316	50,844	111,759	0
2031	281,358	70,140	13,805	113,892	38,883	80,983	145,673	0
Average Inflow[1]	**277,284**	**91,306**	**8,166**	**111,940**	**35,445**	**62,800**	**123,776**	**4,359**
% Total Inflow[1]	**39%**	**13%**	**1%**	**16%**	**5%**	**9%**	**17%**	**1%**

Notes:[1] Average inflows and percent of total inflow calculated as aggregate of all years with water pumped to CP1.

3.2.5 Collection Pond SP6

Lake B7 is dewatered in 2027 to serve as a backup surface contact water storage reservoir (SP6). Previously, this pond was intended to function as the primary saline water storage reservoir, but further optimization of the water management plan was undertaken with the objective of reducing the overall volume of saline water requiring discharge via the Waterline, thus freeing up capacity to route additional volumes away from the Meliadine Lake discharge point. Accordingly, water collected in SP6 is routed to WES03 for discharge via the Waterline.

A total of 1 Mm^3 of surface contact water is pumped from SP6 to WES03 over the 2027 to 2031 period, and the maximum predicted volume stored in SP6 over the Operations phase is 225,000 m^3 in 2027 (Figure 3-9).

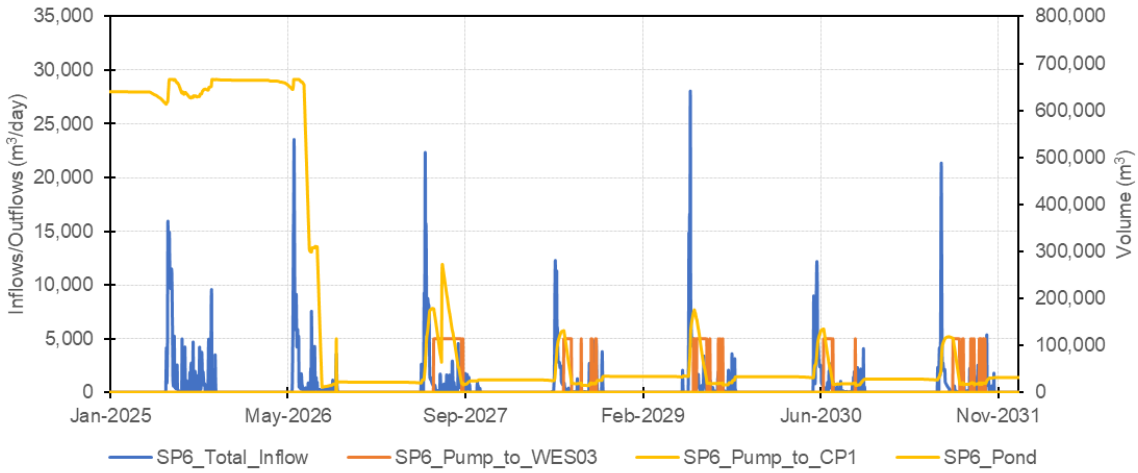

Figure 3-9: Volumes, inflows, and outflows to the SP6 Pond for the Operations phase.

3.3 Saline Water Collection Ponds

This section summarizes the water balances for key saline contact water collection ponds (TIRI02, PUMP02 and WES02) over the Operations phase.

3.3.1 TIRI02

The saline contact water management system collects dewatering flows from the underground operation, PUMP underground WRSF, and ore pads. Early in the Operations phase (up to end-2025), the Waterline is not in place, and WES02, the primary saline contact water storage pond, is not available until the end of 2026. The TIRI02 pit currently serves as the primary saline contact water storage pond until it is fully dewatered in 2028, with a maximum predicted pond volume of 1.49 Mm^3 in June 2027, below the available

storage volume of 1.6 Mm^3 (Figure 3-10). The dewatering of TIRI02 proceeds over a 3-year period from 2026-2028, with a total of 2.36 Mm^3 discharged via the Waterline to Itivia Harbour over this period. The dewatering of TIRI02 is extended in the updated water management plan to free up more capacity in the Waterline, allowing a larger proportion of treated surface contact water to be discharged to Itivia Harbour, thus reducing the overall discharge volumes to Meliadine Lake.

Mining of TIRI02 pit then resumes in 2029-2031, with all pit inflows routed to CP1 (Figure 3-11).

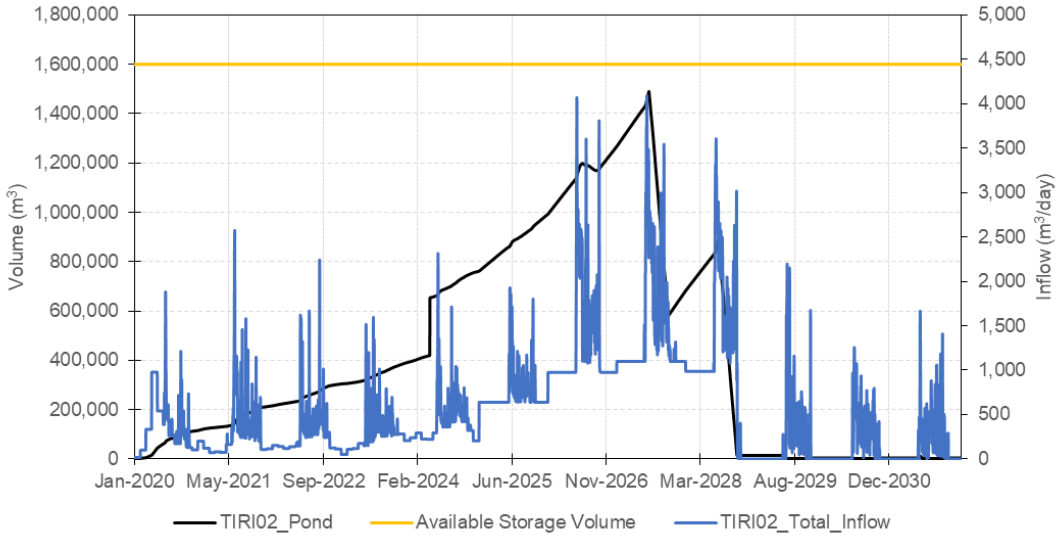

Figure 3-10: Time series of pond volume and inflows for the TIRI02 Pond during early Operations period.

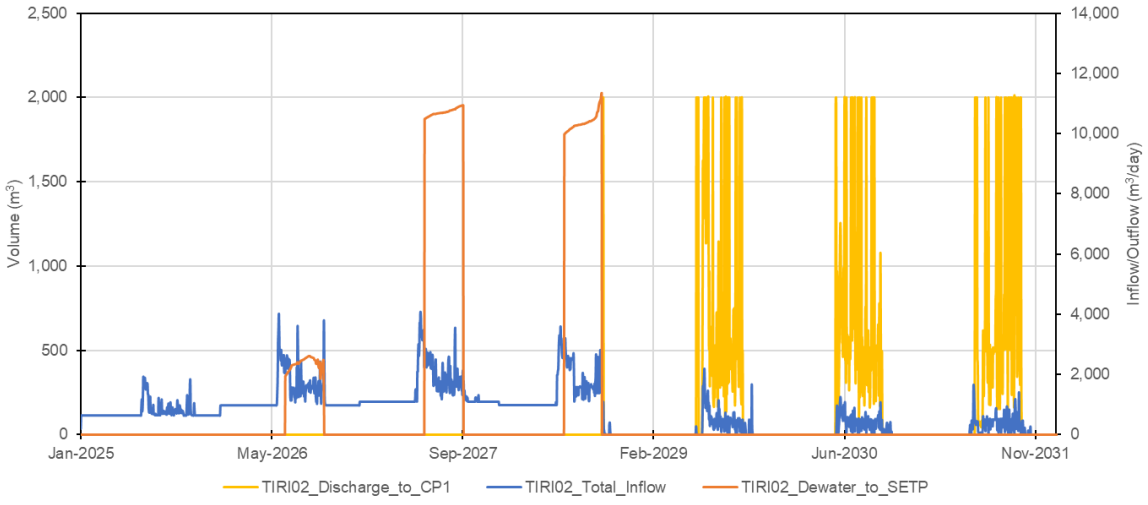

Figure 3-11: Inflows and outflows to the TIRI02 Pit for the Operations phase.

3.3.2 PUMP02

Once mined out in 2026, the PUMP02 pit will have an effective storage volume of 962,000 m^3 and will also be utilized as a saline water reservoir, collecting runoff from the PUMP underground WRSF and excess saline water from the PUMP underground mine (refer to Table 2-4). All saline water collected in PUMP02 is routed to TIRI02 until the end of 2028. Once TIRI02 has been dewatered and mining of this pit has resumed, saline water stored in PUMP02 is routed to WES02 for the remainder of the Operations phase (Appendix B; Figure 2-2). The predicted inflows and volume of surface contact water stored in PUMP02 pit are shown in Table 3-5, Figure 3-12 and Figure 3-13.

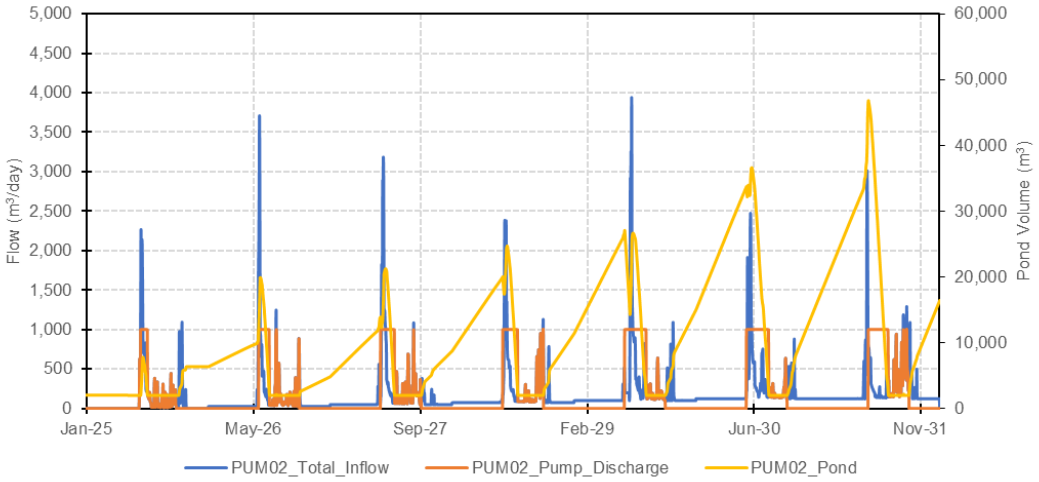

Figure 3-12: Daily time-series of inflows and outflows for the PUMP02 pit, and corresponding volume of saline water stored in pit.

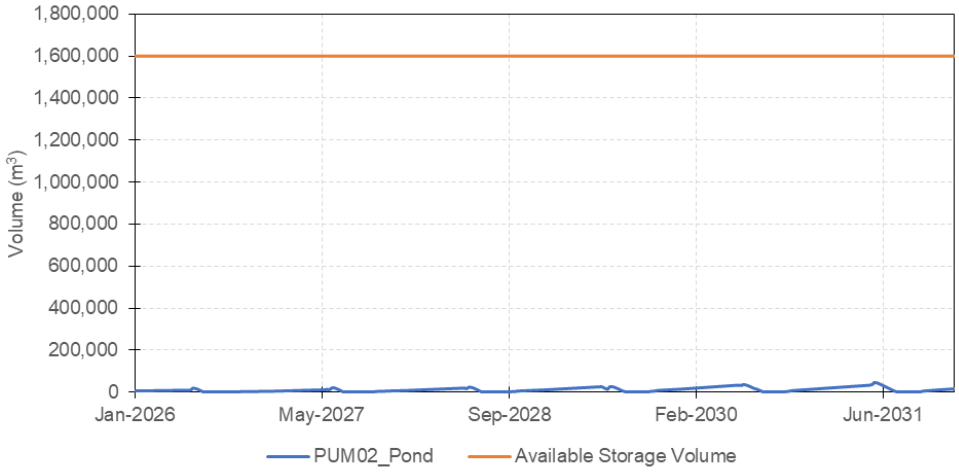

Figure 3-13: PUMP02 pond volume and available storage volume for Operations phase.

3.3.3 WES02

The WES02 pit is mined in 2026, with 113,000 m^3 of pit inflows pumped to CP1 for treatment and discharge. Once WES02 is mined out, it serves as a saline water storage reservoir, in place of SP6, which was previously intended to be the primary saline water storage reservoir in past water management plans. Over the remainder of the Operations phase (2027 to 2031), approximately 2.8 Mm^3 of saline water is routed to WES02 and then transferred to the SETP for treatment and discharge via the Waterline. The predicted volume of water stored in WES02 is shown in Figure 3-15.

The remainder of the saline water stored in the WES02 pit is discharged via the Waterline in 2032 (2.09 Mm^3) and 2033 (520,000 m^3) in the first two years of the Active Closure phase.

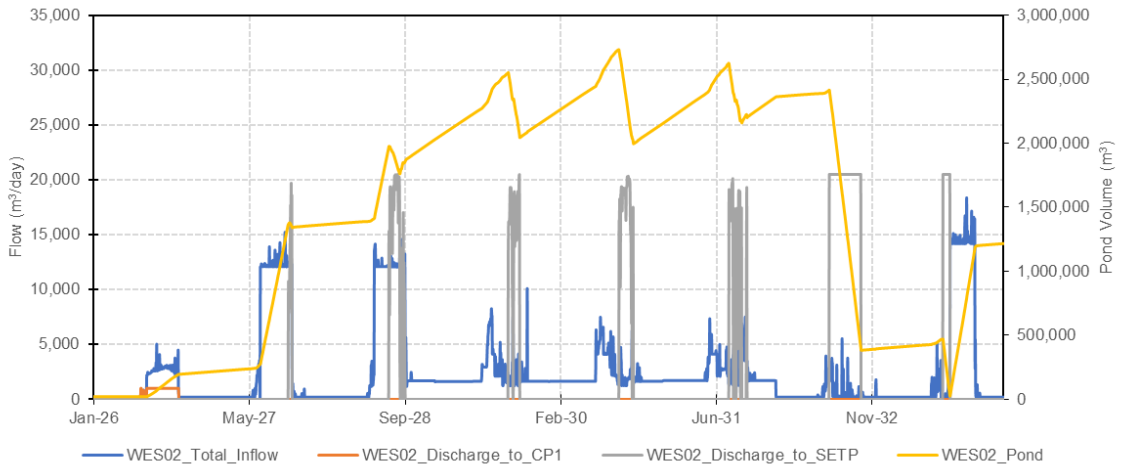

Figure 3-14: Daily time-series of inflows and outflows for the WES02 pit, and corresponding volume of surface contact water stored in pit for the Operations and early Active Closure phases.

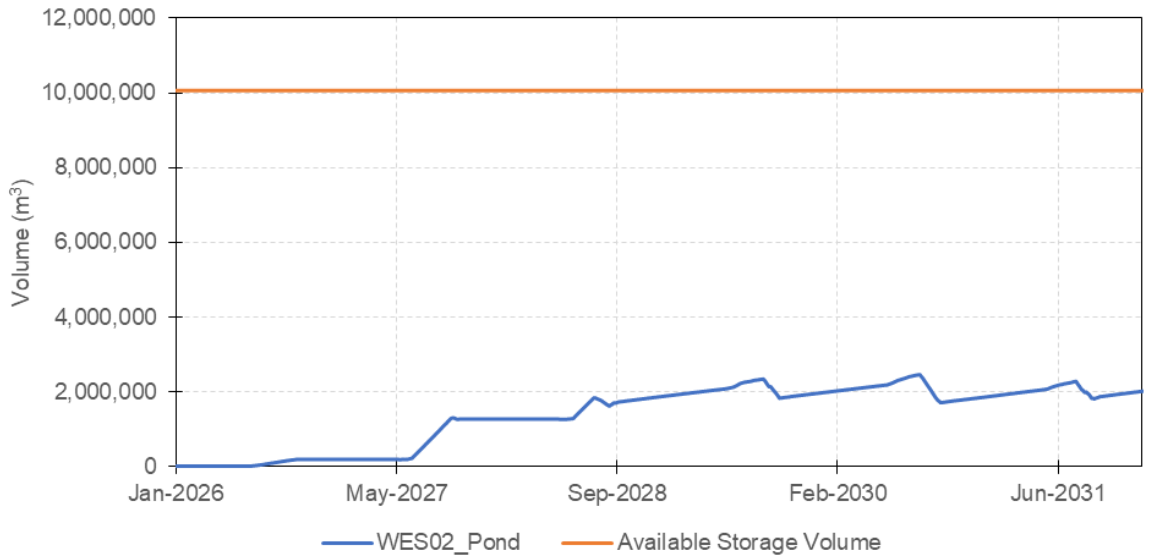

Figure 3-15: WES02 pond volume and available storage volume for Operations phase.

Table 3-5:
Annual water balance for the WES02 pit.

Year	Annual Volumes (m³)				
	Routed to WES02				Discharge to SETP
	TIRI02	PUMP02	CPD1	UG	
2025	0	0	0	0	0
2026	192,985	46,118	0	0	0
2027	1,112,677	57,129	0	0	180,217

Notes:
[1] Average inflows and percent of total inflow calculated as aggregate of all years with water pumped to WES02.

3.4 Open Pit Dewatering During Mining

The annual total pit dewatering volumes during the mining phases of each pit are presented in Table 3-6, along with the dewatering period averages. For the pits that are used as storage reservoirs once mined out (*i.e.*, PUMP01, PUMP02, WES02 and WES03), the volumes shown are representative of only the mining dewatering period. The annual water balances and daily time-series flows for these four pits are presented in separate sections above. For those pits mined over multiple years, the WN01 pit has the highest average dewatering rat, followed by TIRI02 and Discovery Pit. One and two-year average rates are higher for WES02, FZONE01 and FZONE02 pits.

3.5 Active Closure Water Management

During the Active Closure phase, the site is maintained with zero discharge to Meliadine Lake, and 3 years of predicted discharge to Itivia Harbour via the Waterline to drain the accumulated water in PUMP01, WES02, WES03 and WES04. TSF contact water reporting to the CP2.5, CP3, CP4, and CP5 sumps, and any TSF runoff reporting to Channel 1 are pumped to the underground void over the 2032 to 2038 period for permanent storage, totaling 1.07 Mm^3. All remaining surface contact water from the PUMP and FZONE areas is pumped to CP1, which is routed to TIRI02/04 to speed the flooding process. There is no discharge of treated surface contact water to Meliadine Lake over the Active Closure phase.

Given that there are no changes in pit volumes relative to those presented in Lorax (2024), the overall pit flooding strategy and timeline remains the same. Consistent with Lorax (2024), and Condition 2, Part E of Water License 2AM-MEL1631, pumping of Meliadine Lake water remains within the maximum prescribed limit of 8,676,481 m^3/year over the seven-year Active Closure period.

Notes:
[1] TIRI02 pit water (not saline) is discharged to CP8 once mining resumes in 2025.
[2] Averages are calculated for the active dewatering periods only.

4. Water Quality Model Results

AGNICO EAGLE

4. Water Quality Model Results

This section presents water quality model results for the Meliadine Mine NWB WBWQM. Model predictions are compared against applicable guidelines as a screening tool to identify parameters of potential concern (POPCs). During Operations, model predictions at the end-of-pipe (EOP) to Meliadine Lake (EWTP) are screened against effluent discharge limits outlined in the Type A Water License (2AM-MEL1631) for the Meliadine Mine and MDMER, while discharges to Itivia harbour are screened against MDMER only. The complete model outputs for all mine phases are presented in Appendix C.

4.1 Operations

During Operations, TSS in mine effluent will be controlled by the SETP and EWTP for saline and freshwater discharges, respectively. For the purposes of water quality predictions, it is assumed that treated effluent is at the MDMER maximum monthly mean concentration of 15 mg/L TSS. The differences in total and dissolved concentrations generated by this assumption were calculated in Lorax (2022) and are shown in Table 4-1. These values are added to dissolved concentrations predicted for Meliadine Lake and Itivia Harbour discharges. Dissolved and total predictions at EWTP and Waterline are provided in Appendix C.1. Water quality predictions for other model nodes present during Operations are provided in Appendix C.2.

Summary statistics are presented for EWTP and Waterline with comparison to EOP guidelines. Consistent with the January 2024 submission, model predictions for the EWTP remain below MDMER/Water License limits (Table 4-2), while model predictions of untreated water for the Waterline remain below MDMER with the exception of ammonia-N (Table 4-3). Options for treatment are being investigated.

4.2 Active Closure

The Waterline remains available for the first three years of Active Closure (2032 to 2034), with discharges of remaining contact and saline water stored in pits to Itivia Harbour planned in the months of June to September. This is proposed as an adaptive management measure to position the site to meet closure water quality objectives. These assumptions will continue to be refined with site monitoring data and all details will be provided in the Final Closure Reclamation Plan. During Active Closure, the predicted concentrations of POPCs at the Waterline remain below EOP guidelines with the exception of ammonia-N (Table 4-4). It is noted that these results are distinct from the January 2024 submission which show concentrations for all POPCs below EOP guidelines, due to the previous

submission assuming that no saline underground water would be discharged in Active Closure. Similar to the Operations phase Waterline predictions, the ammonia-N concentrations modelled are reflective of no treatment, however, Agnico is actively working on a treatment solution for these discharges. No discharge occurs via the EWTP to Meliadine Lake during the Active Closure phase.

Table 4-1:
Suspended Solids Composition and Contribution to Total Concentrations at End-of-Pipe

Element	Particulate Composition	Particulate Fraction Concentration (mg/L) per 15 mg/L of Total Suspended Solids

2. Un-ionized ammonia-N concentration of 0.5 mg/L.

4.3 Post-Closure

During Post-Closure, mining activity will have ceased, open pits will have been flooded with Meliadine Lake water, and mine site waterbodies will begin to discharge passively. In the absence of mining activities, TSS is expected to return to relatively low baseline values of <3 mg/L. Due to the low TSS baseline conditions, total and dissolved concentrations are anticipated to be similar during Post-Closure. Hence, model results are developed assuming that total concentrations are equal to dissolved concentrations.

Summary statistics are presented for key collection ponds and flooded pits during Post-Closure, with comparison to terrestrial (SP6 only) and aquatic guidelines (Table 4-5 through Table 4-15).

Water quality predictions are summarized starting in June 2039 to reflect open water conditions at the start of Post-Closure and extending to December 2119. The model nodes presented herein show predicted concentrations below the applicable guidelines throughout Post-Closure with the exception of phosphorus. Elevated concentrations of phosphorus are associated with natural runoff and thus phosphorus is not considered a mine related POPC.

Additional monitoring data collected through the life of mine will be used to update Post-Closure model predictions. Monthly water quality predictions for flooded pits and natural lakes during Post-Closure are provided in Appendix D2, predictions for conjoined flooded pits which form during Post-Closure are provided in Appendix D3.

Table 4-5:
SP6 Post Closure Predictions Compared to Terrestrial Guidelines (Aquatic Guidelines are presented for reference)

5. Summary

AGNICO EAGLE

5. Summary

The WBWQM assembled for the January 2024 Type A Water License 2AM-MEL1631 amendment application (Lorax, 2024) was updated to reflect slight changes to the mine plan, as follows:

- The Waterline is online as of June 2026;
- PUMP01 and PUMP02 pits are mined in 2025;
- PUMP UG online in 2026, along with the PUMP underground WRSF and ore pad (Table 2-2);
    - Runoff from these features, along with the saline water encountered in the PUMP UG will be routed to the PUMP02 pit, which is mined out by end-2025. Saline water collected in the PUMP02 pit is then pumped to either TIRI02 pit or WES02 pit, for eventual discharge to Itivia Harbour.
- Collection of contact water from WRSF6 is simplified, with the Phase 1 footprint (2025-2028) runoff directly to PUMP01/CP9 via Channel 11, and runoff from the Phase 2 (2029-2030) footprint routed to either PUMP01 or SUMPP5 via Channel 12;
- The WES02 pit will also be used as a saline water reservoir once mining is complete in 2026, and treated discharges will be sent to Itivia Harbour via the Waterline;
- The WES03 pit will serve as an intermediate surface contact water reservoir, with flows from CP3, CP4, CP5, SP6, and the STP routed here, prior to treatment and discharge to Itivia Harbour via the Waterline;
- Lake B4 is no longer dewatered for use as CP8, resulting in a reduction in total surface contact water volumes requiring management, due to the removal of additional runoff and surface meteoric inputs to this feature;
- Once dewatered, Lake B7 will be utilized as a surge storage reservoir (SP6) for surface contact water during high flow periods, taking the place of CP8 in the previous mine water management plan;
- Sump CP2.5 will be constructed to capture TSF runoff and interflow along the northwestern boundary to prevent these flows from reporting to B7, and instead, will be routed to the saline storage system;
- Contact water from the TSF will be routed to the underground mine void over the Active Closure phase; and,

- The Waterline will be operated for the first three years of Active Closure (2032-2034) to discharge remaining saline and surface contact water to Itivia Harbour.

The mine plan represented in the updated WBWQM remains within the footprint and Meliadine Lake discharge volumes approved by NIRB in 2015, and by the Nunavut Water Board in 2024.

The water balance model assembled for the Meliadine Mine tracks all water types (surface contact, saline and non-contact) across the site on a daily time-step. Lake, pit, and underground dewatering activities are represented, along with the balancing of discharges to Meliadine Lake and Itivia Harbour. Predicted inflows, outflows, and pond volumes for key nodes (CP1, WES03, SP6, PUMP02, TIRI02 and WES02) indicate that the water management infrastructure is capable of routing and storing the saline and surface contact water throughout Operations, under an annually variable RCP4.5 climate scenario. The updated model shows slight changes to the annual discharge volumes relative to those presented in Lorax (2024), summarized as follows:

- An overall decrease in the volume of saline water:
    - Slight increase in saline water generated by mine infrastructure from PUMP Underground inflows, and runoff from the PUMP saline WRSF, ore pad, and additional pit wall and catchment runoff reporting to PUMP02, which functions as a saline pond beginning in 2026; and,
    - However, these increases are offset by the removal of SP6 and surrounding catchment flows from the saline water management system. This change results in a net decrease in saline water volumes requiring treatment.
- Reduced discharges to Meliadine Lake via the EWTP:
    - Increased proportion of total Waterline discharge comprised of treated surface contact water; and,
    - Delayed dewatering of TIRI02 pit allows for the prioritization of surface contact water for discharge to Itivia Harbour (Figure 3-2).

During Operations, model predictions for key parameters (TDS, chloride, ammonia-N, and arsenic) at the main collection ponds and discharge points are generally lower than their respective water quality guidelines. No exceedances of any parameters are predicted in effluent discharged from EWTP during mine Operations. Above guideline concentrations of ammonia are predicted in Waterline discharge, and treatment options are being investigated to mitigate this potential exceedance.
