- Soapstone environmental testing
  - Recently, concerns were raised about the long-term physical properties of Meadowbank's soapstone unit.
  - It was suggested that the resistance to freeze/thaw (F/T) and wet/dry (W/D) cycles had to be evaluated through laboratory testing.

- ᐅᑲᑯᓕᖏᑦ ᐅᑲᑐᕋᐃᓂᖅ

AGNICO EAGLE

- Soapstone environmental testing
  - The average mass losses were 0.04% and 0.16% after 80 F/T and W/D cycle, respectively.
  - The literature suggests that samples showing less than 0.5% mass loss after W/D and F/T weathering tests could be considered as an excellent source for armourstone material (e.g. Lienhart (1998), Latham et al. (2006)).
  - The results suggest that the effects of F/T and W/D cycles on the integrity of the soapstone are small and that Meadowbank's soapstone is a good material for the construction of structures such as a tailings storage facility cover.

WASTE ROCK CHARACTERIZATION – CONSTRUCTION ROCK
ᐊᐢᑕᑯᖅᑕᐅᓪᓚᐃᑦ ᐅᔪᖅᑲᐃᑦ ᖃᓄᐃᓕᓕᐅᔪᓐᓇᖅᑎᑦ - ᐱᓇᓵᓕᓕᐊᓂᖏᓐᓄᑦ ᐅᔪᖅᑲᐃᑦ

AGNICO EAGLE

- Construction material includes rock types:
  - Intermediate Intrusive
  - Southern Greywacke
  - Mafic volcanic rock (away from greywacke and ultramafic units)
- Construction material will consist of non-PAG and low-leaching material mainly from the south portion of the pit
- Continue to evaluate the capping (2- 4m) requirements for closure of WRSF
- Recent analysis suggests 3.3 m active thaw depth, plan for 3.8 m cover thickness
- Ample extra amount of NPAG - low ML waste rock from the open pit to cover entire WRSF and to adjust to greater thickness if required.
- South pit wall push back can be additional source of NPAG – low ML rock if needed.

- Define Quantity /Timing of Waste Rock Availability and Define Uses
  - The mine waste rock production sequence is determined for every mine plan;
  - The material balance is completed for each year of production;
  - This balance indicates the distribution within the following categories of materials by rock type:
    - Mine rock for construction;
    - Mine rock for dams construction;
    - Mine rock for closure capping;
    - Mine rock to WRSF.
- Non PAG/ Non ML waste rock produced by mining activities is used for construction of the remaining mine infrastructures and for closure requirements

EXECUTION OF THE WASTE ROCK MANAGEMENT PLAN

AGNICO EAGLE

STEPS TO WHALE TAIL WASTE ROCK MANAGEMENT

- At baseline stage: identification of waste rock types and use categories by lithology
  - Open Pit Mining Plan pre-populated with lithologies by mining bench
- Verification sampling of blast holes, analysis of reject by on-site Leco furnace:
  - Total sulphur and inorganic carbon to determine acid rock drainage potential
  - Arsenic on subset of selected lithologies
  - Gold value by assay,
- Define ARD potential by comparison of results against previously established Whale Tail specific criteria
- The mine geologist completes daily assessment of categories of rock types mined and transfer of information to shift boss, shovel and truck operators
  - Waste PAG or ML: to WRSF
  - Waste non-PAG, non-ML: to cover pile, for construction or WRSF
  - Ore: to ore stockpile
- The mine surveyor uses this information to delineate the dig limits within the blasted rock pile to guide the shovel and loader operators, direct where rock is to be taken

EXECUTION OF THE WASTE ROCK MANAGEMENT PLAN

AGNICO EAGLE

STEPS TO WHALE TAIL WASTE ROCK MANAGEMENT

- Identification of waste rock types and use categories by lithology
  - Defined by baseline studies
  - Used to populate Mine Bloc Model
  - Addendum to Meadowbank ML/ARD Sampling Plan, EIS Volume 8, Appendix 8-E.5
- Rock classified according to Site-specific ARD and ML criteria

Waste Type	Sampling Frequency	
	ARD Potential	ML Potential[1]
North Wall Ultramafic	No sampling – confirmed ARD/ML	
South Wall Ultramafic	No sampling – confirmed ARD/ML	
Greywacke Central	Every 4th dhole	Every 16th hole
Greywacke South	Every 4th hole	Every 16th hole
Chert	No sampling – confirmed ARD/ML	
Iron Formation	No sampling – confirmed ARD/ML	
Mafic Volcanic	Every 16th hole	Every 4th hole
Intermediate Intrusive	No sampling – confirmed NPAG / not leachable and suitable for construction	

Example of segregation by location

AGNICO EAGLE

- Field sampling of rock material for use in NPR analyses proceeds according to the following guidelines:
  - Drill holes are sampled in accordance with the frequency set out in writing by the Geology Superintendent. The default sampling frequency is the sampling of every fourth drill hole in each drill hole pattern;
  - Each sample should weigh no less that 1 kg;
  - The sample is labeled using a convention that is readily traceable back to the production drill hole numbers;
  - Composite samples are not to be used because they confuse the data and render it more difficult for use in model creation or comparison.

AGNICO EAGLE

- Agnico Eagle will adhere to the effective operational practices adopted from Meadowbank and will follow site specific monitoring plans including:
  - ARD/ ML Sampling
  - Waste Rock Storage Facility Management Plan
  - Water Quality and Flow Management Plan
- Agnico believes that closure of the Waste Rock Storage Facility will be controlled
  - Ongoing research on the effectiveness of the cover and thickness requirements

AGNICO EAGLE

- Following the April Technical Meetings Agnico Eagle completed the following to address intervener technical comments:
  - Thermal modelling analysis that determined a 3.8 m cover thickness may be required at closure for Whale Tail Waste Rock Storage Facility
  - There is sufficient NPAG and non ML material to cap the WRSF
  - Met with INAC and ECCC on various occasions to review waste rock storage segregation and mitigation strategy
- Completed various model sensitivity analyses considering worst case scenarios for waste rock segregation.

WATER QUALITY PREDICTIONS
ᐃᒪᐅᑦ ᖃᓄᐃᓐᓂᒃᓴᓂᑦ ᓇᓪᑕᐅᑦᑐᖅᑕᐅᔪᑦ

AGNICO EAGLE

- Modeling predicts that Arsenic and Phosphorous treatment may be required during operation
- With treatment of Arsenic to 0.10 mg/L:
  - Base Case Model predicts that concentrations at downstream locations are below CEQG-AL for all applicable parameters and SSWQO for As are met at all stages of operations, closure and post-closure
- Post-closure base case prediction that all applicable dissolved and total parameter concentrations are predicted to meet CEQG-AL and arsenic is predicted to meet the SSWQO.
