2007 ANNUAL REPORT TO THE NUNAVUT WATER BOARD (REF. NO. NB102-00181/11-3)

EXECUTIVE SUMMARY

This report to the Nunavut Water Board (NWB) has been prepared to summarize the project activities and monitoring undertaken by Baffinland Iron Mines Corporation (Baffinland) during 2007, in accordance with Part B, Item 2 of Baffinland's current water licence for the Mary River Project, #2BB-MRY0710. A previous licence was issued on February 20, 2007 (as #2BE-MRY0708), with a new licence issued on July 27, 2007 (as #2BB-MRY0710) and Amendment No. 2 issued on February 13, 2008. The current licence, as amended, will expire on December 31, 2010.

Baffinland's water licence includes a sampling program that involves recording the volume of water extracted for any purpose, testing of any effluents (i.e. treated sewage effluents) discharged to the environment, and monitoring water quality at specific project areas (i.e. runoff from bulk sample pits or water from a lined berm). This information is summarized on the completed NWB Annual Report Form and described in more detail in the report. This report also provides an overview of the planned activities in 2008.

Key activities associated with the Mary River Project in 2007 are summarized as follows:

- Permitting and licensing of the exploration and geotechnical drilling program
- Exploration drilling on Deposit Nos. 1 and 3
- Geotechnical drilling at the Mary River site, along the proposed rail alignment, and both land-based and ocean drilling at Milne and Steensby Inlets
- Permitting and licensing of the bulk sampling program
- Delivery of materials, fuel and equipment in support of the exploration, geotechnical, and bulk sampling programs
- Construction activities to initiate the bulk sampling program
- Installation of a wind test tower near the Mary River site

In 2007, fresh water was obtained to sustain two key activities: potable water supply for camp use and drilling operations. Drilling operations included exploration drilling on Deposit Nos. 1 and 3 and geotechnical drilling to support future mine planning. Potable water for camps was obtained using small gasoline pumps positioned adjacent to the shorelines. Water was either pumped directly from the lake source to water storage tanks located at the camp or small containers on the shore were filled which were then flown back to the camp. Once delivered to the camp, the water was transferred to larger holding tanks.

Water for exploration drilling on Deposit Nos. 1 and 3 was obtained from the Mary River. Prior to being supplied to the drills, calcium chloride was added to the water to lower its' freezing temperature and enable drilling in the permafrost.

When possible, the ocean served as a water source for geotechnical drilling operations at Steensby and Milne Inlets. During the summer, lakes and ponds were also used as water sources for the drilling program at Steensby Inlet. Water sources for the proposed rail alignment drilling included Cockburn Lake and various unnamed lakes and ponds along the alignment near the drillholes. Lakes and ponds were chosen in advance and monitored during water withdrawal to ensure that notable drawdown did not occur. Water sources for drilling at the mine site were Sheardown Lake and Mary River tributaries.

Waste management included the handling of latrine waste, greywater, treated sewage effluent, solid waste, hazardous waste and drill waste.

Construction of the Mary River Wastewater Treatment Facility and Milne Inlet Wastewater Treatment Facility was completed in 2007. A Tanks-A-Lot system was installed at Mary River while a rotating biological contactor was installed at Milne Inlet. A polishing/waste stabilization pond was also constructed at each camp.

Since re-activation of exploration activities at the Mary River iron ore deposits 110 exploration holes have been drilled. The majority of the 110 holes drilled have been sampled and sent for analysis to SGS Lakefield for analytical testing. Included in the suite of analysis are those parameters of potential concern for receiving waters and for which are sampled under the current water licence. These parameters include Aluminum as measured by (Al_2O_3), Arsenic (As), Copper (Cu), Lead (Pb), Nickel (Ni), and Zinc (Zn). Drill core was also being tested to determine the potential for metal leaching and/or acid rock drainage.

Prior to 2007, all of the fuel used at the Mary River project site was supplied in 200 litre drums. Fuel re-supply was provided by a combination of airlift directly to the Mary River camp and annual sea-lift re-supply to Milne Inlet. From Milne Inlet, drummed fuel was transported to Mary River by smaller aircraft or via the existing Milne Inlet tote road during winter, frozen conditions. Lined containment areas are in place at Mary River, Milne Inlet and the Steensby Inlet drill camp.

With an increase in site activity in 2007, spill contingency training was developed and delivered to Baffinland spill response team members. Land based spill training was provided by the Qikiqtani Corporation and included classroom work and field drills.

The Mary River Project received formal compliance inspections from the landowners and/or water inspectors: Qikiqtani Inuit Association (QIA) inspectors and an Indian and Northern Affairs Canada (INAC) water resource officer. In general, the QIA inspectors were satisfied with the operation and management of the Project. The water resource inspector provided a number of comments which Baffinland provided responses to.

Updates to a number of plans and reports have been made in response to comments received on the current plans and to reflect changes resulting from the water licence amendment. These plans include the Abandonment and Reclamation Plan, Spill Contingency Plan, Bulk Sampling Management Plan, Site Water Management Plan, QA\QC Plan and Landfill Design and Operations Report.

Progressive reclamation work completed in 2007 included: replacement of culverts, removal of historical barrels and debris, collection and consolidation of existing scrap steel and stockpiling of historic drums.

Consultation on the project first began with the resumption of exploration in 2004, mainly focused on the community of Pond Inlet, the landowners (i.e., the QIA and INAC), and the NWB. Public consultation activities in 2007 increased in scope and outreach to include a number of additional stakeholders. In previous years, consultation efforts were directed primarily at Pond Inlet and the focus was to provide information regarding the exploration work underway, or in September 2006 to obtain feedback on the proposed bulk sampling program.

With a Definitive Feasibility Study (DFS) for mine development at an advanced stage, Baffinland began formal consultation regarding potential full-scale mine development in 2007. Public Meetings were held in the North Baffin communities of Clyde River, Pond Inlet, Arctic Bay, Igloolik, Hall Beach, and Iqaluit in September 2007. The objective of these meetings was to provide the public with information regarding the mine development proposal, and obtain feedback prior to completion of the DFS. Baffinland held a number of meetings with Inuit Organizations, government agencies, and Institutes of Public Government (IPGs) through the second half of 2007, to provide the groups with an early overview of the project, and to initiate dialogue regarding the applicable regulatory processes and information needs.

BAFFINLAND IRON MINES CORPORATION
MARY RIVER PROJECT

2007 ANNUAL REPORT TO THE NUNAVUT WATER BOARD (REF. NO. NB102-00181/11-3)

SECTION 1.0 - INTRODUCTION

1.1 GENERAL BACKGROUND

This report to the Nunavut Water Board (NWB) has been prepared to summarize the project activities and monitoring undertaken by Baffinland Iron Mines Corporation (Baffinland) during 2007, in accordance with Part B, Item 2 of Baffinland's current water licence for the Mary River Project, #2BB-MRY0710. A previous licence was issued on February 20, 2007 (as #2BE-MRY0708), with a new licence issued on July 27, 2007 (as #2BB-MRY0710) and Amendment No. 2 issued on February 13, 2008. The current licence, as amended, will expire on December 31, 2010.

Baffinland's water licence includes a sampling program that involves recording the volume of water extracted for any purpose, testing of any effluents (i.e. treated sewage effluents) discharged to the environment, and monitoring water quality at specific project areas (i.e. runoff from bulk sample pits or water from a lined berm). This information is summarized on the completed NWB Annual Report Form, included in Appendix A, and described in more detail in the following sections. This report also provides an overview of the planned activities in 2008.

Figure 1.1 shows the locations of the key activity areas associated with the Mary River Project. Project activities in 2007 were undertaken at Milne Inlet, along the Milne Inlet Tote Road, at the Mary River site, along the proposed rail alignment, at the proposed Steensby Inlet Port site, at the wind test tower area and at the potential hydroelectric site.

Key activities associated with the Mary River Project in 2007 are summarized as follows:

- Permitting and licensing of the exploration and geotechnical drilling program
- Exploration drilling on Deposit Nos. 1 and 3
- Geotechnical drilling at the Mary River site, along the proposed rail alignment, and both land-based and ocean drilling at Milne and Steensby Inlets
- Permitting and licensing of the bulk sampling program
- Delivery of materials, fuel and equipment in support of the exploration, geotechnical, and bulk sampling programs
- Construction activities to initiate the bulk sampling program
- Installation of a wind test tower near the Mary River site

1.2 BRIEF OVERVIEW OF PROJECT ACTIVITIES IN 2007

The year 2007 was busy for Baffinland, with many programs undertaken, including permitting, hiring, environmental and engineering studies, as well as public and government consultation. A chronological summary of the activities undertaken and submissions made to the Board in 2007 is provided in Table 1.1.

Exploration drilling continued on Deposit Nos. 1 and 3, and geotechnical drilling at project development areas was undertaken. Small drill camps were established in the spring at Milne and Steensby Inlets to support drilling along the proposed rail alignment and at the existing and proposed port sites.

Exploration drilling was initiated on June 21, 2007 and concluded on September 3, 2007. A total of 31 drillholes, with drillhole depths ranging between 83 m and 401 m, were completed using Longyear LY38 and LF70 rock coring drill rigs. A total of 6,567 m was drilled in the two deposits in the 2007 exploration drilling program. A thermistor was installed in the deepest drillhole (401 m), to measure the temperature gradient in bedrock for the purpose of estimating the total thickness of permafrost.

The geotechnical drilling program was conducted to investigate soil, bedrock and permafrost conditions at the mine site, proposed rail alignment and at potential port sites at Milne Inlet and Steensby Inlet. The geotechnical drilling program began on May 6, 2007 and ended for the season on September 23, 2007. A total of 139 drillholes were completed during the program using Longyear LY38, LF70 and LM30 rock coring drill rigs; 12 drillholes were completed at the mine site; 75 along the proposed rail alignment; 46 at the proposed Steensby Inlet port site and 6 at the Milne Inlet port site.

The bulk sampling program was also initiated in 2007, involving the delivery of equipment, materials and fuel to Milne Inlet, the replacement of the small drill camp established earlier in the year at Milne Inlet with a larger fully serviced trailer camp, and the start of road upgrades. Improvements were made to the Mary River Camp, as well as to the airstrips at both the Mary River site and Milne Inlet. Site layouts of Milne Inlet and Mary River camp sites are shown on Figures 1.2 and 1.3, respectively.

New hiring and contracting initiatives were undertaken, as Baffinland sought to extend employment opportunities to the six Baffin Island communities of interest (Pond Inlet, Arctic Bay, Hall Beach, Igloolik, Clyde River and Iqaluit). Baffinland's Inuit contractors received more than 800 resumes from people within the region, with a total of 195 people hired for the project. Within Baffinland itself, the company hired more than 15 people, including four environmental staff (including 2 secondments), five business development and community liaison staff (CLOs), three safety professionals, and two key operations positions. Of Baffinland's recent recruitments, seven staff members are based in Nunavut, including the five CLOs, the Business Development Manager, and the Assistant Operations Manager.

It was also a busy year for consultation with Baffinland's various stakeholders. The company made its first presentation to 66 government officials in Iqaluit in June and subsequent follow up meetings have been held. Baffinland visited its six communities of interest in September for a series of meetings with local officials and the public, and presented its plans for a mine at the Mary River site. The company was very pleased with the high turn-out at the meetings and the interest in the project. The company also hosted site visits for a number of community leaders, Inuit knowledge working groups, and government officials, allowing people to view the current operations first hand.

A comprehensive program of environmental baseline studies continued in the field and within the communities of the region throughout 2007. Additional environmental studies were undertaken in 2007 to monitor project activities, including air and noise monitoring, and to study the response of narwhal in Milne Inlet to sealift traffic from the project. In addition, a wind test tower was installed near the Mary River site. Baseline studies will continue in 2008.

For the purposes of further context, the Board is directed to an Annual Report submitted to the Nunavut Impact Review Board (NIRB 2008) summarizing the results of the exploration and geotechnical drilling programs as well as the bulk sample program. This report is a requirement of the Project Certificate issued through the environmental screening process under the Nunavut Land Claims Agreement (NLCA).

1.3 SUMMARY OF PROJECT PLANS FOR 2008

Project activities for 2008 include the following as it relates to exploration, geotechnical drilling and bulk sample programs:

Exploration Drilling

The 2008 exploration drilling program will continue on mining leases 2483, 2484 and 2485 (Deposit Nos. 1, 2, 3, 3B and 4), with an exploration drilling target of 7,000 to 8,000 m. Drilling on Deposit Nos. 1, 2, 3 and 3B will be supported by the Mary River camp, whereas an 8-12 person camp (included in the scope of previous permit applications but not yet established) will support preliminary exploration activities at Deposit No. 4. Baffinland is also planning to upgrade and extend historic drill roads on Deposit No. 1 to further facilitate efficient program execution (pending QIA approval), and may seek any necessary approvals to extend drill roads on Crown surface lands associated with Deposit Nos. 2, 3 and 3B.

Baffinland plans to replace the existing salt stations with new batch systems designed to reduce opportunities for spillage and reduce water use by utilizing on-demand water pumps, as well as increase brine solution consistency to better manage salt use.

Geotechnical Drilling

Detailed geotechnical investigations (i.e. drilling and test pitting) will continue from March to October in 2008, generally along the proposed rail alignment between Mary River and Steensby Inlet, and for the mine site infrastructure, open pit overburden, potential wind and hydro-electric power sites,

potential borrow pits, quarry sites, and railway ballast, and port facilities at Steensby. Both land-based and on-ice drilling will be conducted. The geographic area of drilling will be reduced, with the removal of plans to drill additional holes at Milne Inlet. Drilling will generally be focussed at Steensby Inlet, the proposed rail alignment and borrow sources. On-ice drilling will be limited to the Steensby Inlet and various other locations which will be drilled under frozen conditions. Locations selected for bridge abutments along the proposed rail alignment will require on-ice drilling.

Bulk Sample Program

The bulk sampling program, started in 2007, will continue and conclude in 2008. The following bullets summarize the key activities that will be undertaken this year.

- Construction of a 100-person all-weather tent camp, maintenance shop, and ancillary facilities at Mary River, next to the existing seasonal exploration camp
- Install a rotating biological contractor (RBC) for treatment of sewage from the all-weather camp, with a sewage outfall constructed into Sheardown Lake
- Grading and contouring of the airstrip at Mary River
- Installation of a helicopter re-fuelling station at Mary River
- Establishment of bulk fuel storage facilities, and lined re-fuelling stations, at the Mary River camp and crusher area
- Parking of a refuge trailer at the crusher location near Deposit No. 1, and the potential establishment of a camp and fuel storage facilities part-way along the Milne Inlet tote road ("Midway camp")
- Establishment of explosives storage and detonator storage magazines near Deposit No. 1 and an associated access road
- The drilling, blasting and stockpiling of 154,000 dry tonnes (t) of weathered surface rock on the top of Deposit No. 1 at Mary River
- The drilling, blasting, and crushing of 250,000 t of iron ore bulk sample from an open pit on Deposit No. 1 at Mary River
- Truck haulage from the bulk sample pit to the crusher, and truck haulage of the bulk sample to Milne Inlet
- Barge loading and ship loading at Milne Inlet
- Temporary stockpiling of the iron ore sample at Milne Inlet
- Loading of iron ore at Milne Inlet on five ships sailing to Europe in August through October 2008
- Construction and operation of a non-hazardous waste landfill at Mary River at a location approved by the Nunavut Water Board
- Application of EK35 to the airstrip at Milne Inlet
- Hercules airlift of materials, and removal of flight simulator
- Fuel haulage up road
- Road maintenance
- Dry cargo and fuel tanker sealifts at Milne Inlet, to re-supply the project with dry goods and fuel to Milne Inlet, with subsequent overland transport to Mary River
- Continued consolidation of historical scrap steel along the Milne Inlet tote road

- Removal of hazardous wastes from Mary River and Milne Inlet by sealift for off-site disposal at a licenced disposal facility
- Contouring of borrow areas along the Milne Inlet tote road

SECTION 2.0 - WATER USE AND WASTE DISPOSAL ACTIVITIES

2.1 WATER USE

In 2007, fresh water was obtained to sustain two key activities: potable water supply for camp use and drilling operations. Drilling operations included exploration drilling on Deposit Nos. 1 and 3 and geotechnical drilling to support future mine planning. The following sections describe water use and the associated sources thereof.

2.1.1 Methods of Obtaining Freshwater for Potable Use (Part B, Item 2 (i)) and Quantities of Water Used (Part B, Item 2 (v))

Water take locations for the various camps are shown on Figures 1.1, 1.3 and 2.1.

Water supply for the Mary River Camp was obtained using a small gasoline pump positioned adjacent to the shoreline of Camp Lake. Water was pumped directly from the lake source to water storage tanks located at the camp.

From April through July, potable water supply for the camp at Milne Inlet was flown in from Camp Lake. A small portable pump was used to withdraw water from the lake and used to fill small containers on the shore which were then flown back to the camp. Once delivered to the camp, the water was transferred to larger holding tanks.

With the initiation of the bulk sample program in August, the camp at Milne Inlet was replaced with a fully serviced trailer camp (piped water and sewage). A water truck was mobilized to site to deliver water to the camp. Similar to the method described above, a small pump was used to deliver water to the water truck which subsequently delivered the water to the camp.

Steensby Inlet Camp water came from an unnamed lake approximately 3 km east of the camp. A small portable pump was used to withdraw water from the lake and used to fill small containers on the shore which were then flown back to the camp. Once delivered to the camp, the water was transferred to larger holding tanks.

In all instances intakes were screened in accordance with the Department of Fisheries and Oceans Freshwater Intake End-of-Pipe Fish Screen Guideline (DFO Guideline) to ensure no entrapment of fish as per Part C, Item 5.

Table 2.1 summarizes potable water used in 2007.

2.1.2 Methods of Obtaining Freshwater for Drilling (Part B, Item 2 (ii)) and Quantities of Freshwater Used (Part B, Item 2 (v))

Water for exploration drilling on Deposit Nos. 1 and 3 was obtained from the Mary River. Deposit Nos. 1 and 3 each had its own water pumping station. Prior to being supplied to

the drills, calcium chloride was added to the water to lower its' freezing temperature and enable drilling in the permafrost. Whereas the pump and associated salt mixing station at Deposit No. 1 remained in a static location throughout the course of the drilling season, the pump and associated salt mixing station for Deposit No. 3 moved part way through the season to remain in proximity of the drilling. The locations of water withdrawal and the associated salt mixing stations are shown in Figure 2.2.

When possible, the ocean served as a water source for geotechnical drilling operations at Steensby and Milne Inlets. During the summer, lakes and ponds were also used as water sources for the drilling program at Steensby Inlet. Water sources for the proposed rail alignment drilling included Cockburn Lake and various unnamed lakes and ponds along the alignment near the drillholes. Lakes and ponds were chosen in advance and monitored during water withdrawal to ensure that notable drawdown did not occur. Water sources for drilling at the mine site were Sheardown Lake and Mary River tributaries. Figures 2.3 through 2.10 show the locations of the drillholes completed in 2007. Coordinates for the drillholes and associated water sources are provided on Table 2.2.

A summary of water use for exploration and geotechnical drilling is provided in Table 2.3.

2.1.3 Freshwater for Other Water Takings (Part B, Item 2 (ii))

No water was taken for other uses with the exception of negligible amounts of water used for dust suppression during upgrades of the Milne Inlet Tote Road. These amounts are included in the numbers provided above in Table 2.1.

2.2 SEWAGE, WASTE AND GREYWATER MANAGEMENT

2.2.1 Sewage and Greywater Management

Latrine toilets serviced camps at Milne Inlet and Steensby Inlet, as well as the Mary River Camp for much of the 2007 calendar year. After initiation of the bulk sample program, mechanical wastewater treatment facilities were commissioned to service the camps at Milne Inlet Camp and the Mary River in October 2007. Polishing ponds were installed along with the treatment plants to provide contingency during start-up and to serve as a repository for the management of sludge generated during operations. The locations of the wastewater treatment plants and associated polishing ponds are shown on Figures 1.2 and 1.3.

Prior to the commissioning of mechanical wastewater treatment facilities, human waste was collected in latrines from the Steensby Inlet Camp and flown back to the Mary River Camp for disposal. In the case of Milne Inlet, some latrine waste was buried in the vicinity of the camp at the direction of the Inspector.

At the Mary River Camp, latrine waste was initially burned in barrels, and at the direction of the Inspector this practice ceased in July. After receiving direction from the Inspector, and

prior to commissioning of the wastewater treatment plant, human waste was instead placed in an excavated trench, and treated with lime. The trench was covered with native material to maintain the natural contours of the land. Residue from waste that was burned remained stored on-site and will be sent by sea-lift in 2008 for off-site disposal at a licenced waste facility yet to be selected. Locations at Milne Inlet and Mary River where latrine wastes were buried are also shown on Figures 1.2 and 2.3 with coordinates provided on Table 2.8. There are currently 40 barrels of waste currently stored on-site awaiting backhaul.

Prior to commissioning of the wastewater treatment facilities, grey water generated at each of Milne, Mary River and the Steensby drill camp was directed to appropriately sized leach pits that were excavated adjacent to the camps. Pits were located remote from surface waters. Once the wastewater treatment systems were commissioned, leach pits at Milne and Mary River Camps ceased to be used.

2.2.2 Treated Sewage Effluent Discharged at Wastewater Treatment Facilities (WWTFs) and Any Waters Discharged From PWSPs (Part B, Item 2 (iii))

The monthly and annual quantities of treated sewage effluent discharged at the Mary River Camp Tanks-A-Lot System (Monitoring Station MRY-4) and at the Milne Inlet Camp RBC System (Monitoring Station MRY-5) are provided on Table 2.4. There were no discharges from either of the corresponding PWSPs in 2007.

2.2.3 Sludge Removed From WWTFs (Part B, Item 2 (iv))

There was no sludge removed from the WWTF at the Mary River site in 2007 while there was one vacuum truck load of sludge removed at Milne Inlet in 2007. This sludge was removed from the RBC System and placed into the PWSP.

2.2.4 Solid and Hazardous Waste Management

Prior to the initiation of the bulk sample program in August 2007, all solid waste generated as part of the work program was returned to Mary River for disposal. Solid waste such as domestic kitchen refuse and paper was incinerated daily at the Mary River Camp in a two-stage commercial incinerator. Upon commencement of the bulk sample program, a commercial two-stage incinerator was also commissioned for use at Milne Inlet.

The current water licence contemplates a solid waste landfill to be developed in the vicinity of the Mary River Camp. In November 2007, Baffinland submitted plans for the development of a non-hazardous waste landfill and is awaiting approval from the Nunavut Water Board accordingly. The updated landfill report is included in Appendix F. In the meantime, non-hazardous wastes generated in 2007 that were too bulky and/or not suitable for incineration are temporarily stored in designated locations at Mary River and Milne Inlet. These wastes generally consist of wood, plastics, metals as well as the ashes generated from the camp incinerators.

Historical waste primarily associated with exploration in the 1960's is present at various locations across the Mary River Property. Baffinland has been working to consolidate much of this waste as part of a commitment to progressive reclamation with the intent of disposing of the wastes in a future solid waste landfill and backhauling waste off-site, as appropriate. A waste 'bone-yard' has been established at the end of the airstrip at the Mary River site. Baffinland intends to engage third-party services to assist with the continued consolidation, characterization, and ultimate disposal of much of this waste in 2008 and 2009.

No potentially hazardous wastes were shipped off-site in 2007. Hazardous waste are collected and stored in lined containment areas awaiting off-site shipment to a licenced waste/recycling facility. Baffinland has engaged third party service providers to inventory, label, and manifest these wastes in preparation for shipment.

Figures 1.2, 1.3 and 2.3 show the following as it relates to solid and hazardous wastes:

- Locations of historic wastes being progressively managed
- Locations of camp incinerators
- Temporary storage locations of non-hazardous wastes awaiting landfill construction
- Location of the proposed landfill
- Lined containment areas where hazardous wastes are stored
- Location of the historic waste 'bone-yard'

Table 2.8 provides coordinates for various temporary and permanent waste storage areas.

2.2.5 Drill Waste

For exploration drilling activities sumps were constructed in the vicinity of the drillholes to intercept drill wastes including drill cuttings and drill water. In some cases, one sump accommodated several drillholes. Silt fences and berms were also used to intercept drill wastes. Locations of these water management structures are shown on Figure 2.2 with some further details provided on Table 2.5.

During geotechnical drilling activities diversion/collection berms and in-ground sumps were used to intercept drill waste. Diversion/collection berms and channels were constructed using native rocks, soil and/or absorbent cloth to form barriers to direct the runoff into natural depressions in the terrain surrounding the drillhole locations or into excavated sumps. On occasions where the terrain did not allow for diversion of the drill waste into a natural depression or where a natural depression of sufficient size was unavailable, shovels and picks were used to excavate small channels and sumps. When large amounts of sediments were collected in the depressions, the sediment was used to backfill the completed drillhole. Sumps for drilling wastes were located in the immediate vicinity of the drillhole, a minimum of 30 m from the ordinary high water mark of any water body. Locations of all geotechnical drillholes are shown on Figures 2.3 through 2.10 while drillhole coordinates are provided on Table 2.2.

2.3 WATER QUALITY OF WATER LICENCE MONITORING LOCATIONS

Results from the Surveillance Network Program (SNP) were provided in monthly reports to the NWB commenced in September 2007 with the granting of water licence 2BB-MRY0710. Monthly SNP reports were not required under the previous licence 2BE-MRY0708.

In 2007, monitoring stations at Mary River and Milne Inlet camps for raw water use and treated sewage effluent to polishing ponds were active. None of the other SNP stations were activated as there were yet any discharges to the environment from these areas. All water licence monitoring locations are provided on Table 2.6 and Figure 2.1.

With the exception of two days in the month of August, water use was within prescribed licence limits. There were 2 days during which reported water use for the purposes of drilling exceeded 455 m^3. Reported water use was intentionally conservative in its measurement.

As of December 2007, treated sewage effluent at Mary River and Milne Inlet camps continued to be discharged to polishing ponds as the treated sewage had yet met criteria established for direct discharge to the receiving environment.

Results for the parameters listed in Part I, Item 3 for monitoring locations MRY-4 and MRY-5 are provided on Table 2.7. Individual grab results for MRY-4 exceeded the allowable maximum average concentration for all parameters listed in the water licence. Results for MRY-5 only exceeded the allowable concentrations for faecal coliforms.

No toxicity testing was conducted in 2007 as there was no discharge to the environment from either waste water treatment system.

SECTION 3.0 - CONSTRUCTION ACTIVITIES (PART B, ITEM 2 (V))

Construction of the following waste water treatment facilities as contemplated by the water licence was completed in 2007:

- Mary River Wastewater Treatment Facility
- Milne Inlet Wastewater Treatment Facility

As discussed in the preceding sections, the wastewater treatment facility at Mary River was commissioned in October 2007. This facility, referred to as the Tanks-A-Lot system was installed as a means of mechanical sewage treatment contemplated by the previous licence and until a permanent facility accompanying camp expansion associated with the bulk sample program could be commissioned. A wastewater management plan for the Tanks-A-Lot facility was submitted to the Board in July 2007. A revised plan was submitted in September 2007 under the terms of the current licence for the installation of the permanent sewage treatment facility.

The sewage treatment facility contemplated under the licence for the Milne Inlet Camp was commissioned in October 2007. This facility consists of a rotating biological contactor (RBC) based treatment plant with trucked and/or piped discharge to a receiving ditch that ultimately reports to the ocean. A polishing/waste stabilization pond was constructed as an element of this facility. A wastewater management plan for this facility was included as part of the September submission described above for the Mary River facility.

As-built reports for each of these facilities along with select photographs are provided in Appendix C.

In 2008, the Tanks-A-Lot sewage treatment facility at Mary River will be replaced with a Rotating Biological Contactor based system similar to that installed at Milne Inlet. A permanent sewage outfall pipe will be extended from the facility to Sheardown Lake, the ultimate receiver of treated effluent. Installation plans are provided in the September 2007 submission referenced above.

SECTION 4.0 - GEOCHEMICAL ANALYSIS OF CORE (PART B, ITEM 2 (VI))

Since re-activation of exploration activities at the Mary River iron ore deposits 110 holes have been drilled for a total meterage of 22,984 m. Table 4.1 provides a breakdown of meterage by year and deposit as well as details of the number of holes drilled each year. Drilling began in 2004 with a focus on Deposit No. 1. This focus continued into the 2005 season. In 2006, the drilling program expanded to include satellite Deposits Nos. 2 and 3. This past season (2007) drilling at Deposit No. 1 continued to be the primary focus with further drilling at Deposit No. 3.

The majority of the 110 holes drilled have been sampled and sent for analysis to SGS Lakefield for analytical testing. Included in the suite of analysis are those parameters of potential concern for receiving waters and for which are sampled under the current water licence. These parameters include, Aluminum as measured by (Al_2O_3), Arsenic (As), Copper (Cu), Lead (Pb), Nickel (Ni), Zinc (Zn). Table 4.2 shows the minimum, maximum and median levels for the listed parameters in each drillhole. A total of 10 holes were not sampled since they did not intersect any iron ore formation, or there were difficulties with drilling equipment and holes were abandoned. Samples were broken out into two (2) metre intervals focusing on the iron ore mineralization. All iron formation is sampled along with ten (10) metres of 'waste' on either side of the iron formation contact. Internal waste units were also sampled at the discretion of the geologist.

It is important to realize that the majority of the trace metals tabulated are locked in silicates or other compounds, and are not easily leached out of the iron oxides. This is precisely the reason that they are considered deleterious elements or penalties in the steel-making process, due to the difficulty in removing them from the final steel product.

During sampling, drill core was cut into half, with one half of the sample being sent for analysis and the other stored on site. Drill core was stored at the core farm located approximately 200 m NNW of the Mary River Camp. Core was stored in wooden boxes with lids and stacked on pallets by hole.

In addition to metals analysis performed by SGS Lakefield, drill core was also being tested to determine the potential for metal leaching and/or acid rock drainage. In July 2007, a field leachate test using drill core and surface grab samples was initiated; this is also being supplemented with acid-base accounting and kinetic tests in a laboratory setting to support mine planning. Results of this work is summarized in the Bulk Sampling Management Plan presented as Appendix F to this report.

SECTION 5.0 - FUEL STORAGE (PART B, ITEM 2 (VII))

Prior to the year 2007, all of the fuel used at the Mary River project site was supplied by 200 litre drums. Fuel re-supply was provided by a combination of airlift directly to the Mary River camp and annual sea-lift re-supply to Milne Inlet. From Milne Inlet, drummed fuel was transported to Mary River by smaller aircraft or via the existing Milne Inlet tote road during winter, frozen conditions.

Fuel for the Mary River project is required for the following activities, including:

- Diesel electric power generation and building heat
- Light and heavy vehicle operation
- Fixed-wing aircraft and helicopter movement
- Exploration and geotechnical drill power and water supply

To protect receiving waters, it is Baffinland's practice to endeavour, as practical, to store drummed fuel, petroleum based wastes, and other potentially hazardous products within lined containment areas. Lined containment areas are in place at Mary River, Milne Inlet and the Steensby Inlet drill camp. Upgrading of existing lined areas and/or the installation of new lined areas is being undertaken at Mary River in compliment to improvements in site infrastructure and accommodations resulting from commencement of the bulk sample program.

With approval to proceed with the bulk sample program, the year 2007 marked a transition to the use of bulk fuel in addition to drummed fuel. A bulk fuel storage facility, with a total storage capacity of approximately 8.25 million litres was constructed at Milne Inlet and received delivery of diesel and Jet-A fuels in early September 2007. The storage facility consists of 74 bladders, each with a rated capacity of 113,560 litres and contained within an impermeable lined earthen berm designed to meet applicable standards and guidelines. An as-built report for this facility submitted to the Board in December 2007 is attached as Appendix C.

A bulk fuel bladder based storage facility is also planned for Mary River in support of the bulk sample program. A total estimated capacity of 1.6 million litres is planned as a repository of fuel transferred from Milne Inlet over the tote road. Work on this facility in 2007 was suspended as the result of cold temperatures negating the ability to weld impermeable liner seams and meet requisite quality control specifications. This facility will be completed in 2008, once weather permits. In the meantime, fuel for use at Mary River camp continued to be supplied via drums and a 75,000 litre pre-engineered steel tank installed in a lined berm.

In December 2007, Baffinland engaged the services of Genivar Engineers formally B.H. Martin to investigate fuel facilities at the Mary River and Milne Inlet camps and to determine if these facilities comply with the CCME "Environmental Code of Practice (2003) for Aboveground and Underground Storage Tank Systems Containing Petroleum and Allied Petroleum Products". A copy of this report and related correspondence is included in Appendix D.

SECTION 6.0 - UNAUTHORIZED DISCHARGES (PART B, ITEM 2 (VIII))

With an increase in site activity in 2007, spill contingency training was developed and delivered to Baffinland spill response team members. Land based spill training was provided by the Qikiqtani Corporation and included classroom work and field drills. Prior to accepting fuel delivery, Baffinland participated in a mock event simulating the spill of fuel during bulk fuel off-loading to the Milne Inlet bulk fuel storage facility. This event was attended by staff from Transport Canada and the Qikiqtani Inuit Association.

The list of unauthorized discharges which occurred in 2007 is provided on Table 6.1. Information such as the date of the spill, the product and quantity spilled, cause of the spill, approximate location, proximity to any waterbody and a summary of follow-up actions taken, is provided on the table.

SECTION 7.0 - INSPECTION AND COMPLIANCE REPORT CONCERNS (PART B, ITEM 2 (IX))

The Mary River Project received the following formal compliance inspections from the landowners and/or water inspectors:

- Qikiqtani Inuit Association (QIA) inspectors inspected the site between November 21 and 23, 2007 (as reported in QIA letter dated December 6, 2007)
- An Indian and Northern Affairs Canada (INAC) water resource officer visited the site on July 14, 2007 (reported on December 10, 2007)

Copies of the inspection reports, and Baffinland's response detailing any follow-up, are included in Appendix E.

In general, the QIA inspectors were satisfied with the operation and management of the Project. The water resource inspector provided a number of comments, which have been summarized with Baffinland's follow-up action and/or response to the inspector, in Table 7.1.

SECTION 8.0 - UPDATES TO PLANS (PART B, ITEM 2 (X))

In March 2008, the Board granted an amendment to the Water Licence in response to an application made by Baffinland in 2007. The granted amendment is in reference to the following program changes in addition to requested minor adjustments and clarifications:

- An additional seasonal camp at a location along the proposed rail alignment between Mary River and Steensby Inlet
- An increase in the size of a seasonal camp at Steensby Inlet
- Expiration date of the licence

In accordance with Part B, Item 2 (x) of the water licence, updates to the following plans have been made in response to comments received on the current Plans and to reflect changes resulting from the above noted amendment:

- Abandonment and Reclamation Plan
- Spill Contingency Plan (referred to in water licence as Emergency Spill Response Plan)
- Bulk Sampling Management Plan (referred to in water licence as Waste Rock and Ore Storage Plan)
- Site Water Management Plan and QA/QC Plan
- Bulk Sampling Program - Landfill Design and Operations

A copy of each of these revised Plans and Reports is provided in Appendix F. A summary table in each Plan and Report provides a summary of salient changes.

SECTION 9.0 - PROGRESSIVE RECLAMATION WORK (PART B, ITEM 2 (XI))

A summary of progressive reclamation work completed in 2007 is provided below.

- A portion of the existing barrel/drum culverts remaining from the 1960s, as well as the eroded water crossings along the Milne Inlet Tote Road, were improved through the installation of engineered culverts in accordance with the Water Licence and DFO authorizations.
- Seven truckloads of historical barrels and debris were removed to Milne Inlet for temporary storage (to be removed during the 2008 sealift).
- A portion of the existing scrap steel at Milne Inlet, as well as various project wastes, were collected and consolidated.
- Drums at the old scrapyard at the Mary River site were stockpiled.

The disposal of historic non-hazardous wastes at the proposed landfill location of the Mary River site, and the off-site disposal of hazardous wastes by sealift, is planned to be initiated in 2008. Work will be ongoing to consolidate wastes into the designated locations in preparation for on-site disposal or off-site disposal and/or recycling. Baffinland is intending to engage the services of a third party contractor to assist in the preparation and execution of this work.

SECTION 10.0 - SUMMARY OF CONSULTATIONS (PART B, ITEM XIV)

10.1 CONSULTATION PRIOR TO 2007

Consultation on the project first began with the resumption of exploration in 2004, mainly focused on the community of Pond Inlet, the landowners (i.e., the QIA and INAC), and the NWB. Public consultation activities in 2007 increased in scope and outreach to include a number of additional stakeholders. In previous years, consultation efforts were directed primarily at Pond Inlet and the focus was to provide information regarding the exploration work underway, or in September 2006 to obtain feedback on the proposed bulk sampling program.

10.2 COMMUNITY CONSULTATION IN 2007

With a Definitive Feasibility Study (DFS) for mine development at an advanced stage, Baffinland began formal consultation regarding potential full-scale mine development in 2007.

In June 2007, a Mineral Development Advisory Group (MDAG) meeting, coordinated by INAC in Iqaluit, brought together a large number of government agencies and Inuit organizations which may be responsible for issuing a permit or approval, and/or that will be involved in an environmental assessment of the project.

Public Meetings were held in the North Baffin communities of Clyde River, Pond Inlet, Arctic Bay, Igloolik, Hall Beach, and Iqaluit in September 2007. The objective of these meetings was to provide the public with information regarding the mine development proposal, and obtain feedback prior to completion of the DFS. The turnout to the public meetings, particularly in the five North Baffin communities, was quite high, and feedback on the proposed mine was balanced. Baffinland has been very encouraged by the level of engagement demonstrated by the communities and looks forward to continued involvement and feedback from the communities.

Baffinland held a number of meetings with Inuit Organizations, government agencies, and Institutes of Public Government (IPGs) through the second half of 2007, to provide the groups with an early overview of the project, and to initiate dialogue regarding the applicable regulatory processes and information needs. At the request of the Hamlet of Pond Inlet and the Municipality of Igloolik, Baffinland executive has been meeting with the community leaderships on a bi-monthly basis since the summer of 2007.

Tables 10.1 and 10.2 provide summaries of these meetings.

2007 ANNUAL REPORT TO THE NUNAVUT WATER BOARD

SUMMARY OF 2007 ACTIVITIES AND SUBMISSIONS

Date	Activity/Submission
February 2007	Submission of annual report (2006)
February 2007	Water License renewal granted (2BE-MRY0708) - exploration and geotechnical drilling program
March 2007	Mobilization to site in preparation for 2007 program execution - Commencement of water use and waste disposal
May 2007	Commencement of 2007 geotechnical drilling program
May 2007	Site Water Management Plan submission
May 2007	Spill Contingency Plan submission (revised for 2007)
June 2007	Abandonment and Reclamation Plan submission (exploration and geotechnical program)
June 2007	Commencement of 2007 exploration drilling program
July 2007	Waste Water Management Plan submission (Tanks-A-Lot system)
July 2007	Water License Inspector site visit
July 2007	Water License amendment granted (2BB-MRY0710) - exploration and geotechnical drilling programs, and bulk sample program
August 2007	Spill Contingency Plan submission (revised to include bulk sample program)
September 2007	Completion of 2007 exploration drilling program
September 2007	Construction completion of Milne Inlet bulk fuel storage facility
September 2007	Sea-lift arrival of bulk fuel
September 2007	Waste Water Management Plan submission (Revised)
September 2007	Completion of 2007 geotechnical drilling program
September 2007	August monthly water license report submission
October 2007	Errata to Water License 2BB-MRY0710 to clarify Part C, Item 1 - Conditions Applying to Water Use
October 2007	Construction completion of Mary River Waste Water Treatment Facility (Tanks-A-Lot System)
October 2007	Restoration liability assessment submission (Revised Abandonment and Restoration Plan)
October 2007	Bulk Sample Management Plan submission
October 2007	Site Water Management Plan (Revised) submission (including Environmental Monitoring Plan)
October 2007	Construction completion of Milne Inlet Waste Water Treatment Facility
October 2007	Surface Water Sampling Program Quality Assurance and Quality Control Plan submission
October 2007	September monthly water license report submission
November 2007	Landfill Ste Design report submission
November 2007	Submission of water license amendment (2BB-MRY0710) - expansion of exploration and geotechnical drilling programs, addition/expansion of camps
December 2007	As-Built plans and drawings submission of Milne Inlet bulk fuel storage facility
December 2007	Receipt of Water License Inspectors Report of July 14, 2007 site visit
December 2007	November monthly water license report submission

28-Mar-08

Notes:
1. Values for April through July are total for the project and are based on an average consumption of 100 litres/person/day.
2. Value for Milne Inlet (MRY-2) are based on truck counts.
3. A flowmeter was installed for the Mary River Camp water source (MRY-1) on August 24th.
4. There was no water usage data provided for July 31st.
5. The total volume of water used for camps for 2007 is 4,038 m^3.

28-Mar-08

Notes for Mine Site drillholes:

1. All drillhole coordinates were obtained from handheld GPS except those in italics, which were given by Aker Kvaerner.
2. Coordinates are given in the UTM grid NAD 83, Zone 17 and in metres.
3. All drillhole collar elevations are based on Eagle Mapping 2005 contour data.
4. MPC-005 was logged by the geomechanical program to provide geomechanical data for foundation recommendations.
5. MBC-003 (2007) was given the year of drilling in its name to differentiate it from the drillhole with the same designation, MBC-003 completed during 2006 site investigation.
6. MBC-004 drillhole log not provided due to nearly 0% recovery on first attempt.
7. MTF-004 was previously mislabelled as MTF-003 in the previously issued memo (Ref. No. NB07-00542).
8. No coordinates recorded, coordinates based on memory.

Notes for Milne Inlet drillholes:

9. All co-ordinates taken from handheld GPS and are approximate.

Notes for Steensby port site drillholes:

10. Coordinates were surveyed with a Total Station with control points surveyed by survey GPS.
11. Coordinates are the intended coordinates provided by Aker Kvaerner.
12. Coordinates and elevations provided by MH Martin survey.
13. All other points were surveyed using a handheld or survey GPS and are approximate.
14. Coordinates are in UTM NAD 83 (Zone 17), in metres.
15. Negative elevations indicate the drillhole was on-ice and correspond to the water depth at the next low tide.
16. All other elevations are from LIDAR.

Notes for South Rail Alignment drillholes:

17. Coordinates are UTM NAD 83, Zone 17 and are in metres.
18. Elevations from Lidar survey contours.
19. All co-ordinates taken from handheld GPS and are approximate.

28-Mar-08

Notes:

1. Water use for geotechnical drilling was calculated by multiplying 10USgpm per drill by the estimated period of drill operation.
2. Water use for exploration drilling was estimated as follows:
   a. Prior to August 24th - calculated by multiplying 12USgpm per drill by the estimated period of drill operation
   b. After August 24th - flow meter measurement
3. Bolded numbers indicate estimated water use exceeded licence limits for drilling.
4. Flow meters were not installed for geotechnical drilling.
5. The total volume of water used for drilling for 2007 is 22,761 m^3.

2007 ANNUAL REPORT TO THE NUNAVUT WATER BOARD

SUMMARY OF UNAUTHORIZED DISCHARGES

Date of Occurrence	Quantity	Product Spilled	Cause of Spill	Approximate Location	Proximity to any Waterbody?	Actions Taken (Summarized)
Sept. 16, 2007	615 L 410 L	P-50 Diesel Jet A	While drums were being slung by a helicopter, the sling on the helicopter failed due to an improper connection.	25 m off the shore of Sheardown Lake, towards Mary River Camp	Sheardown Lake	Excavated an area of 30m X 20m of contaminated soil. 110 drums of contaminated materials have been removed and brought back to Mary River for proper disposal until sea lift season.
Oct. 7, 2007	205 L	Jet A	While transferring 45 gallon drums to the fuel storage laydown a 930 loader punctured a drum.	Approx. 500 yards from beach at Milne Inlet	Milne Inlet	Excavated an area of 4ft X 3ft and placed contaminated soil into waste containment barrels until proper disposal during sea lift season.
Nov. 12, 2007	2700 L	Treated Sewage	Due to high velocity winds during a white out storm, the discharge line on the RBC unit that connects to the storage tank dislodged causing the spill.	RBC Sewage System at Milne Inlet	Milne Inlet	RBC Unit line was repaired and secured. Affected area ($36m^2$) was left in place and allowed to neutralize during the freezing conditions. Area will be monitored in the spring when thaw occurs and liquid vacuumed up.
Nov. 13, 2007	900 L	Treated Sewage	Final effluent tank settled within tanks a lot system and fitting was displaced on final effluent tank causing the spill.	Tanks-a-Lot System at Mary River	Camp Lake	All water was vacuumed and placed in containment drums. The drums will be placed in appropriate containment and removed from site to an approved facility during the next sea lift season.
Nov. 29, 2007	205 L	P-50 Diesel	930 loader punctured drum while placing a pallet of drums on a kenworth truck. Ice build up on forks of loader caused pallet to slip off.	Loading dock at Milne Inlet	Milne Inlet	Spill was cleaned up with spill pads (which were later incinerated) and the contaminated snow was placed into barrels and stored in the containment area until sea lift season.

BAFFINLAND IRON MINES CORPORATION
MARY RIVER PROJECT

2007 ANNUAL REPORT TO THE NUNAVUT WATER BOARD

SUMMARY OF INAC WATER LICENCE INSPECTION AND FOLLOW-UP ACTIONS

No.	Observations made by INAC Inspection during July 14th 2007 Site Visit	Response to INAC Inspector from Baffinland
	Part A: Scope, Definition and Enforcement	
1	No issues were found with respect to the location of the camp as it relates to the information contained within the current license.	Reminders have been noted.
2	It is noted that the current license was issued on February 20th, 2007 and is a renewal of license NWB2MRY0406, issued originally on June 11, 2004. The Licensee submitted a request to renew and amend the license on October 6, 2006. The license expired on December 31, 2006. The Licensee is reminded that the use of water or deposit of waste without a current Water License is an offence under the Nunavut Waters and Nunavut Surface Rights Tribunals Act.	
3	It is noted that the Camp was inspection on July 14th, 2007. Subsequent to the inspection an amendment to the existing type B license was approved by the Nunavut Water Board that modified the type of license from a BE (Exploration- Mining and Milling) to a BB (Bulk Sampling) type. This change along with an additional set of terms and conditions came into effect on July 16th, 2007. The enclosed inspection report will reference where necessary any changes to the requirements for compliance as they relate to specific issues within the report.	
4	The license remains a Type “B” license.	
	Part B: General Conditions	
5	The issues of water use fees and security were not included within the context of this inspection.	
6	A review of the Nunavut Water Board FTP – Public Registry was conducted during the writing of this report. An annual report for the 2006 annum, completed by KNIGHT PIÉSOLD LTD was located.	
7	This report is a requirement under the terms and conditions of the Water License. The annual report must include but should not be limited to those items listed in Section 2 (i) through (ix) of this Part. (Section 5, i-xvi under 2BB-MRY0710) .	
8	Upon review of the report it was noted that the report on file was deficient in the following;	Baffinland has noted concerns with respect to information contained in the 2006 water licence annual report, including details as the management of drill water and cuttings. As requested under the heading of non-compliance in your report, Baffinland has enclosed an attachment detailing the exploration drill program at Mary River for the 2007 drill season.
9	o No mention of what the licensee is doing with the waste/ returned drill water and cuttings is included in the report. Given the total water used for drilling (9,415 Cubic meters) this is of substantial concern for the inspector.	
10	o GPS coordinates and photographic records are not included in the body of the report.	
11	o Specific information regarding the approved waste disposal site to where all hazardous waste, waste oil and non-combustible wastes generated on site are backhauled is not included.	
12	The proponent is reminded that an annual report is required to be filed by March 31st 2008 for the year ending December 31st 2007. The annual report must include but not be limited to those items listed in Section 5 (i) through (Xvi) inclusive, of this part as well as any information required by the Inspector.	
13	Failure to file a complete report as outlined in the license is a violation of the Act and will subject the licensee to the enforcement measures and penalties provided for under the Act.	
14	The licensee is reminded that it is the responsibility of the licensee to ensure that any documentation submitted by the licensee to the Nunavut Water Board is acknowledged by the Manager of Licensing.	
15	During the period of inspection the Inspector noted that flow meters had not been installed on the intake lines.	Since the time of the inspection, the accuracy of water use estimates has been increased through the installation of flow meters
16	It was also noted during the inspection that Paints, solvents and other hazardous materials were stored without the proper secondary containment. This practice must be addressed by the period of the next inspection.	As discussed at the time of the inspection, Baffinland is in the process of consolidating the locations where hazardous and non-hazardous wastes are stored in preparation for backhaul and final disposal and/or recycling as appropriate. Backhaul of these wastes is planned for the summer of 2008. As a general practice, it is Baffinland's intention to store all potentially hazardous wastes, regardless of quantity in lined containment areas. That being said, there currently are wastes at the site that are not stored as such. All wastes are located remote from any surface waters.
17	A review of the Nunavut Water Board FTP site was able to locate the required Site Water Management Plan which, as per section 3 of this Part was to have been submitted October 20th, 2007. An approval of the plan was not located on the FTP site and the Inspector seeks clarification from the Nunavut Water Board regarding the completeness of the plan and the acceptance of the plan by the Board.	
	Part C: Conditions Appling to Water Use	
18	At the time of the inspection the licensee was allocated the use of 475 Cubic meters of water per day for all purposes.	
19	The Licensee is reminded to ensure that the intake hoses are equipped with a screen to prevent the entrapment of fish. Samples of the potable source were collected at the time of the inspection however after three attempts to land a helicopter at the drilling site were aborted because of high winds; no samples of the drilling return were collected. It should be noted that a sump was noted down hill of the drills and that a flow of water was noted below the sump area and above the Mary River. It is unclear if this flow terminated in the river or if it was an above ground flow that terminated prior to the river.	Water intakes are installed with screens to prevent the entrainment of fish.
20	Analytical results received by the inspector did not contain any results in excess of the Canadian Council of Ministers of the Environment (CCME) guidelines for drinking water.	
21	An inspection of the intake system was conducted, a filter system and UV system were both present and in working order.	

Knight Piésold CONSULTING

TABLE 7.1

BAFFINLAND IRON MINES CORPORATION
MARY RIVER PROJECT

2007 ANNUAL REPORT TO THE NUNAVUT WATER BOARD

SUMMARY OF INAC WATER LICENCE INSPECTION AND FOLLOW-UP ACTIONS

No.	Observations made by INAC Inspection during July 14th 2007 Site Visit	Response to INAC Inspector from Baffinland
	Part D: Conditions Applying to Waste Disposal	
22 23	During the inspection of the camp the following items were noted and brought to the attention of Mr. Chubb during the period of inspection. As per section 4 of this Part; Unless otherwise approved by the Board, the Licensee shall not practice open burning or on-site land filling of domestic waste.	Baffinland respectfully notes that the incinerator referenced at the time of the inspection was not being calibrated. At the time of the inspection, observed was an air quality consultant that was retained to test the stack emissions from the incinerator as a means of documenting performance as it related to Canada wide standards. This incinerator was installed in 2006 as a replacement to a previous unit that has since been decommissioned. Since commencement of exploration activities in 2004, Baffinland has employed the use of a commercial incinerator.
24	Additionally, as per section 9 of this Part; Unless otherwise approved by the Board the Licensee shall dispose of all toilet wastes through incineration, chemical or composting toilets for any camp with a design population over 300 and less than 2,000 person days per year, and less than 5,000 person days per year for the life of the camp. Any remaining residue generated through the course of the operation shall be backhauled and disposed of in an approved waste disposal site.	
25	During the period of Inspection, July 14, 2007 the inspector however noted the following;	
26	o Open burning of combustible wastes – Photographed and documented	
27	o Open burning of Human wastes – Photographed and documented	
28	o Consolidation and stockpiling of human wastes – Eventually had to be buried as per direction of Inspector because of the threat to human health.	
29	A new incinerator was found on site during the period of inspection however it was not in use and was only just being calibrated. It is unclear how long the licensee was in the practice of open burning garbage and human wastes in barrels. It is noted that the Licensee in the 2006 annual report states the following;	
30	"Latrine toilets were used at the Mary River camp in 2006, and all sewage was contained in drums and incinerated prior to treatment with lime then covered with native material to maintain the natural contours of the land. Amendment 1 (Part D, Item 5) required that commercial incineration toilet systems be used at full camp capacity, however, operational difficulties were encountered with the propane-fired incineration toilet and as a result use of the latrine toilets continued throughout the season." Pp2 –Waste Disposal Activities	
31	Given the above the Inspector seeks clarification from the Nunavut Water Board regarding the licensee's practice of open burning the Human wastes and then land filling the waste. Was an amendment application or notification of modification, as required by Section 4 of Part B submitted by the Licensee with respect to this practice? Additionally, it is noted that the locations of any trenches or Latrine pits (land filling) of the human wastes is not noted in the annual report.	
32	The licensee is cautioned that they are to incinerate all combustible waste in an approved incinerator that will meet or exceed the Canada-wide Standards for Dioxins and Furans and the Canada-wide Standard for Mercury Emissions. Continued operations in this manner and in contravention of the terms and conditions of the current license will be treated as a continuing violation of the Act and will subject the licensee to the enforcement measures and penalties provided for under the Act.	
33	As per Section 7 of this Part; Unless otherwise approved by the Board, the Licensee shall contain all greywater in a sump located at a distance of at least thirty (30) metres above the ordinary high water mark of any water body, at a site where direct flow into a water body is not possible and no additional impacts are created.	As per Part D, Section 7 of the said water licence, a sump was constructed for the management of grey water from the kitchen and wash tent facilities at the Mary River camp. The lined containment pond located south west of the camp was detailed in the design submission to the Nunavut Water Board required under Section 3 of this part. To date, there has been no discharge to date from this facility to the receiving environment, and its operation is detailed in the most recently submitted Sewage Management Plan submitted to the Nunavut Water Board in accordance with Part D, Section 13 of the now current water licence 2BB-MRY0710.
34	It was noted during the period of inspection that a large lagoon sized area had been excavated adjacent to the camp. It is unclear to the inspector if the new excavation was covered under the existing license at the time. When questioned regarding the construction of this sump and an additional Sewage Lagoon located 150 meters south and west of the camp the Inspector was informed that this was to be covered under the new license which was still in the application stage at that time. The licensee is cautioned that all modifications to the Operations of the camp must be approved by the Nunavut Water Board prior to their construction. A review of the Nunavut water Board FTP site could not located any approval for this work to have been completed prior to the issuance of the new license. Again the licensee is cautioned that continued operations outside the existing terms and conditions of the issued license will result in enforcement actions being undertaken by the inspector and the Department of Indian and Northern Affairs on behalf of the Nunavut Water Board.	
35	The Licensee is reminded to include in the 2007 annual report due on March 31st 2008 a list of hazardous materials shipped out of the camp, and the location of the NWB approved treatment facility, as per section 10 of this Part, to which they were sent. All of the foregoing is required information to be included in the annual report. Shipping and receiving invoices are not required so long as records are available for inspection during the 2008 inspection season.	In 2007, Baffinland obtained a letter from Pond Inlet acknowledging a request for the disposal of non-hazardous waste at the community landfill site and outlining the procedures for approved disposal. Information regarding all wastes disposed of off site in 2007 will be provided as required in the annual report. A copy of the letter from the community of Pond Inlet accepting non-hazardous wastes is attached. At present time, no wastes are transported to Pond Inlet, and inert materials are currently stockpiled in a specified location adjacent to the incinerator as well as the historical bulk steel area, until the on-site landfill has been constructed. Plans were submitted to the Nunavut Water Board for construction of the on-site landfill in accordance with the Water Licence in November 2007.
36	During the review of the Nunavut Water Board FTP site correspondence between the Hamlet of Pond Inlet and Baffinland Iron Miners Corp was noted. A review of the documents to ensure compliance with Section 2 of this Part was inconclusive and the Licensee is asked to provide the appropriate approvals from the Hamlet of Pond Inlet as soon as possible. Additionally, a Design and Operations report consistent with the requirements of Section 3 of this Part was noted. Missing is an approval document from the Nunavut Water Board accepting and approving the completeness of this report. The Nunavut Water Board is asked to provide clarity on this matter.	
	Part E: Conditions for Camps and Access Infrastructure	
37	No issues were noted in the Mary River Camp however the Inspector could not make it to Milne Inlet nor Steensby Inlet and these two sites still require inspection.	Noted

Knight Piésold CONSULTING

TABLE 7.1

BAFFINLAND IRON MINES CORPORATION
MARY RIVER PROJECT

2007 ANNUAL REPORT TO THE NUNAVUT WATER BOARD

SUMMARY OF INAC WATER LICENCE INSPECTION AND FOLLOW-UP ACTIONS

No.	Observations made by INAC Inspection during July 14th 2007 Site Visit	Response to INAC Inspector from Baffinland
	Part F: Conditions Applying to Drilling Operations	
38	As noted, an inspection was not completed at the Mary River Drilling site as high winds prevented the helicopter from landing at the site. It was noted that there was present a flow of water (over land flow) below the drill sumps and traveling down hill toward Mary River. It is unclear if this ground water flow originated in the sump area.	Noted
39	The licensee is reminded to submit, as per Section 3 (a to e) of the is Part, in the 2007 Annual Report the results of the Geochemical analysis of the Drill core currently being generated by the drill program to determine the constituent elements of the core which may be present and may impact water.	
	Part G: Conditions Applying to Contingency Planning	
40	A review of the Water Board FTP site located a 2006 Spill Response Plan which as per Section 1 of this Part is to be on site and available for use within 30 days of the issuance of the current license. The Inspector was not able to locate an approval document from the Nunavut Water Board and is unable to determine if the submitted plan is complete or has been approved by the Board.	The current Spill Contingency Plan, dated August 17, 2007 was approved by the Nunavut Water Board under Motion 2007-14-03. Minor comments on the Plan have been addressed through distribution of an addendum letter, with intentions for the distribution of a revised plan to coincide with the timing of the 2007 annual report.
41	The licensee is reminded that it is the responsibility of the licensee to ensure that any documentation submitted by the licensee to the Nunavut Water Board is acknowledged by the Manager of Licensing.	
42	If the plan is not completed or approved by the Board, the Licensee is directed to provide, as an addendum to the 2007 Annual report due on March 31st 2008, a revised and up to date copy of the Spill Response plan which must include the items outlines in Section 1 (i through xii).	
43	During the same review and in accordance with a review for compliance with Section 3 of this Part a report from Knight Piesold dated April 14th, 2007 was reviewed. This report notes that it is written in response to Section 3 of this Part with requires the licensee to provide, within 90 days of the issuance of the current license a report, to be approved by the Nunavut Water Board, which is appropriately qualified by an engineer registered in Nunavut and which clearly details that the requirements of the CCME guidance document "Aboveground Storage Tank Systems for Petroleum and Allied Petroleum Products (2003)" have been met by the Licensee. It should be noted that this report, if submitted in April of 2007 was submitted 3 months before the current license was even issued.	Baffinland notes that the letter dated April 14th, 2007 referenced in the inspection report was submitted in accordance with water licence 2BE-MRY0708, requiring submission of a report within ninety (90) days of the licence issuance confirming compliance with the said CCME guidance document. At the time of the report, and the inspection, Baffinland did not have bulk fuel storage systems in place. As such, this report referenced only the practice as it related to the management of barrel fuel. Since release of the current water licence 2BB-MRY0710 and relevant to the CCME guidance document, a bulk fuel storage system was commissioned at Milne Inlet in September 2007 and most recently a 75,000 litre double walled fuel storage tank was installed at Mary River in December 2007. A bulk fuel storage system at Mary River is currently under construction. In accordance with Part J, Item 4 of the now current water licence 2BB-MRY0710, an as-built report for the Milne Inlet bulk fuel storage area, dated December 9, 2007 was submitted to the Water Board. This as-built report referenced compliance with the relevant Section of the CCME guidance document. Baffinland will be submitting as-built drawings for the systems as Mary River within ninety (90) days of commissioning, in accordance with the requirements of the water licence. As requested, Baffinland has commissioned the third party preparation of a consolidated report detailing information on any and all fuel storage in a fixed location currently in place as it relates to CCME guidance. This report will be forwarded as soon as possible.
44	The Fuel Storage Review document concludes, based on the fact that the barrels used for fuel storage at the Mary River camp do not hold in excess of 230 L the Licensee is not required to meet the terms and conditions of the guidance document. The inspector does not question this somewhat simplistic conclusion however because the scope of the report did not and does not include fuel storage at either the Milne inlet or Steensby Camps the Inspector is forced to conclude the report is incomplete.	
45	The Licensee is directed to within 30 days of receipt of this report submit for approval to the Nunavut Water Board and the Inspector a report that includes among other things any and all fuel storage at any camp in a fixed location. This revised report must include any and all closed containers, receptacles or bladders currently in use by the licensee.	
46	Additionally, as noted previously for other plans and submitted reports the review of the Nunavut Water Board FTP site did not locate an acceptance or approval for the above noted plan which again appears to have been written and submitted three months in advance of the issuing of the current license.	
47	The Licensee is reminded that as per Section 6 (iii) of this Part the Licensee is required to submit a detailed report on each spill occurrence no later than 30 days following the initial event.	
	Part H: Conditions Applying to Abandonment and Restoration	
48	It was noted that during the period of inspection that a clean-up of the historic waste metals including drums and machinery was on-going.	Baffinland appreciates the comments of support for ongoing efforts of Baffinland to clean-up historic waste metals found around the Mary River site. These efforts will be documented in the annual water licence report to be submitted March 2008.
49	The Inspector strongly encourages the licensee to document and provide reports on any and all proactive reclamation activities undertaken by the licensee over the last year.	
	Part I: Conditions Applying to Monitoring Programs	
50	As per Section 1 of this Part the Licensee is required to measure and record in cubic meters the daily quantities of water utilized for Camp operations and all purposes.	Reminders of monitoring and reporting requirements have been noted.
51	As per Section 2 of this Part the Licensee is required to adhere to the monitoring and reporting requirements contained within section 3 of Part B and Section 3 of Part F.	
52	The Licensee is reminded that failure to comply with the terms and conditions of the issued water license constitutes an offence under the Nunavut Water and Nunavut Surface Rights Tribunals Act.	
53	The Licensee is also required as per section 6 to provide accurate measurements of all waste hauled off site and the location, including the NWB approved location for Hazardous waste treatment.	
54	All this information shall be included in the 2007 annual report.	
	Non-Compliance	
55	During the inspection a number of items were noted as violations of the Act and required remedial actions to be undertaken. It is noted that on August 15th an e-mail from Mr. Chubb detailing the efforts of the Licensee to address items noted during the Inspection was received.	
56	o Open burning of garbage is to cease – Verbal direction provided on July 14th, 2007	The practice of open burning regardless of waste type or volume ceased at the time of the inspection. Baffinland notes that exclusive of human waste, only wood waste that did not fit in the commercial incinerator was being burned on site.
57	o Stockpiling and Open Burning of Human Waste to cease- Verbal Direction in July 14th, 2007	At the direction of the inspector, the open burning and stockpiling of human waste ceased at the time of the inspection.
58	o Location of the NWB approved treatment facility where hazardous wastes generated or marshalled on site are to be shipped- to be included in annual report.	

Knight Piésold CONSULTING

TABLE 7.1

BAFFINLAND IRON MINES CORPORATION
MARY RIVER PROJECT

2007 ANNUAL REPORT TO THE NUNAVUT WATER BOARD

SUMMARY OF INAC WATER LICENCE INSPECTION AND FOLLOW-UP ACTIONS

No.	Observations made by INAC Inspection during July 14th 2007 Site Visit	Response to INAC Inspector from Baffinland
59	o Installation of metering system to accurately record water use.	A flow meter has been installed on the water intake pipe for the Mary River site. Truck counts are being used to record water use for the Milne Inlet camp. As of December 17, 2007 a flow meter was installed at the Milne Inlet camp and volumes are recorded and reported monthly within the SNP Monthly report.
60	o Submission of a revised report on the conformity of the licensee to the CCME's "Aboveground Storage Tank Systems for Petroleum and Allied Petroleum Products 2003" within 30 days of receipt of this report.	Although Baffinland believes that it has to date met the requirements of its water licence regarding the submission of as-built reports for its bulk fuel storage systems, including an assessment of conformance to the above CCME document, a report has been commissioned for completion of a site wide review of CCME conformance of existing site infrastructure. This report is expected imminently and will be forwarded to the inspector upon receipt.
61	o A detailed report, including GPS coordinates and photographs, on the disposal of drill cuttings and wastes associated with drilling at the Mary River Drill site. This report is required within 30 days of receipt of this report.	Report is attached as requested.
62	o Installation of required secondary containment as outlined during the inspection.	As stated above, it is Baffinland's practice to endeavour, as practical, to store barrel fuel, petroleum based wastes, and other potentially hazardous products within lined containment areas. A lined and bermed area at Milne Inlet has been constructed to allow the temporary storage of hazardous materials until shipment off site to an approved facility can occur in 2008. Hazardous materials will be transferred from Mary River to Milne Inlet for storage within the lined facility to ensure proper containment. Fuels and other petroleum based products stored in bulk are installed within lined containment in accordance with the stated CCME guidance document.
63	o Installation of meters on intake systems for properly and accurately recording water use volumes.	
64	o Provide locations and quantities of all human wastes buried as per the terms of this and previous licenses. This is to be provided as an addendum to the 2007 annual report.	To be provided as part of the 2007 annual report to be submitted in March 2008.
65	o Provide documentation of the approved modification or amendment from the Nunavut Water Board permitting the licensee to burn in 45 gallon drums human waste and then deposit it in a land fill location within 30 days of receipt of this report.	Baffinland site supervisors were provided verbal direction at some point in the 2005 season allowing the burning of open burning of latrine wastes in 45 gallon drums and subsequently burying any residual waste. Baffinland is not in possession of any formal documentation in this regard and it is uncertain as to whether it was the Nunavut Water Board, QIA, or GN inspector that provided this direction.
66	o Provide documentation of the approved modification or amendment from the Nunavut Water Board permitting the construction of the sump and sewage lagoon prior to the issuance of the current license within 30 days of receipt of this report.	As stated above, the sump was constructed in accordance with Part D, Item 7 of water licence 2BE-MRY0708 for the management of grey water wastes. As stated above, the lined pond south west of the Mary River camp was constructed as an element of the pre-engineered mechanical sewage treatment facility under Part D, Section 3 of the water licence 2BE-MRY0708.

2007 ANNUAL REPORT TO THE NUNAVUT WATER BOARD

MEETINGS WITH THE PUBLIC AND COMMUNITY GROUPS

Group	Date	Description
	Pond Inlet Public Meetings	
Public	April 20, 2006	Baffinland provided a project update and presentation reviewing exploration and environmental work conducted in 2005, plans for 2006 season
	September 6, 2006	Baffinland provided a project update - Bulk Sample
	April 26, 2007	Baffinland provided a project update
	September 20, 2007	Baffinland presented the mine development proposal
	Pond Inlet Community Groups	
Qarjuq Elders Committee	March 2, 2006	Baffinland consultants Introduced the project, including the environmental and IQ studies
Mitimatillik Hunters and Trappers Organization	April 7, 2006	Baffinland consultants provided a project update/ discussed marine mammals and terrestrial wildlife with the working group, collecting IQ and obtaining feedback on proposed surveys
	June 1, 2006	Baffinland consultants discussed proposed ringed seal surveys
	January 25, 2007	Baffinland consultants provided a project update and discussed the socio-economic program
	January 11, 2008	Baffinland consultants conducted a mapping project
Hamlet of Pond Inlet	January 23-24, 2007	Information meeting
	September 20, 2007	Meeting with hamlet councillors
	December 6, 2007	Project update
Hamlet Economic Development Committee	January 24, 2007	Information meeting
	May 25, 2007	Meeting with councillor and CEDO
	July 17, 2007	Baffinland consultants discussed the socio-economic program
Pond Inlet District Education Authority	January 24, 2007	Baffinland consultants discussed the socio-economic program
Concerned Citizens Group	May 25, 2007	Discussion of community concerns on employment, sampling work, environmental issues
Pisiksik Working Group	March 1-4, 2006	Baffinland consultants chaired the inaugural IQ Working Group meeting; discussion of research agreement
	April 5, 2006	Baffinland consultants provided a project update/Discussed wildlife issues, collecting IQ, and obtaining feedback on proposed surveys
	April 18-22, 2006	Baffinland consultants provided a project update/Baffinland presentation reviewing 2005 work, plans for 2006 season
	June 1, 2006	Baffinland consultants discussed the organization of interviews, use of GIS
	July 28-29, 2006	Baffinland consultants provided a project update, had the research approved
	August 29, 2006	Baffinland consultants discussed future planning

NWB Annual Report **Year being reported:** 2007

License No: 2BB-MRY0710 **Issued Date:** February 20, 2007
Expiry Date: December 31, 2010

Project Name: Mary River Project

Licensee: Baffinland Iron Mines Corporation

Mailing Address: Suite 1016, 120 Adelaide Street West
Toronto, Ontario
M5H 1T1

Name of Company filing Annual Report (if different from Name of Licensee please clarify relationship between the two entities, if applicable):

Same as above

General Background Information on the Project (*optional):

Refer to Section 1.0 of the 2007 Annual Report to the Nunavut Water Board (NWB).

Licence Requirements: the licensee must provide the following information in accodance with

Part B | Select

A summary report of water use and waste disposal activities, including, but not limited to: methods of obtaining water; sewage and greywater management; drill waste management; solid and hazardous waste management.

Water Source(s): Various (refer to Section 2.1 of the 2007 Annual Report)

Water Quantity:

60	Quantity Allowable Domestic (cu.m)
Varies	Actual Quantity Used Domestic (cu.m)
455	Quantity Allowable Drilling (cu.m)
Varies	Total Quantity Used Drilling (cu.m)

Waste Management and/or Disposal

- [x] Solid Waste Disposal
- [x] Sewage
- [x] Drill Waste
- [x] Greywater
- [x] Hazardous
- [ ] Other:

Additional Details:

Refer to Section 2.2 of the 2007 Annual Report

A list of unauthorized discharges and a summary of follow-up actions taken.

Spill No.: See Table 6.1 (as reported to the Spill Hot-line)
Date of Spill: See Table 6.1
Date of Notification to an Inspector: See Table 6.1
Additional Details: (impacts to water, mitigation measures, short/long term monitoring, etc)
Refer to Table 6.1 and Section 6.0 of the 2007 Annual Report

Revisions to the Spill Contingency Plan

SCP addendum attached for Board consideration

Additional Details:
Refer to the Revision Summary Table which accompanies the revised Spill Contingency Plan

Revisions to the Abandonment and Restoration Plan

AR addendum attached for Board consideration

Additional Details:
Refer to the Revision Summary Table which accompanies the revised Abandonment and Reclamation Plan

Progressive Reclamation Work Undertaken

Additional Details (i.e., work completed and future works proposed)
Refer to Section 9.0 of the 2007 Annual Report

Results of the Monitoring Program including:

The GPS Co-ordinates (in degrees, minutes and seconds of latitude and longitude) of each location where sources of water are utilized;

Details attached

Additional Details:
Refer to Tables 2.2 and 2.6 of the 2007 Annual Report

The GPS Co-ordinates (in degrees, minutes and seconds of latitude and longitude) of each location where wastes associated with the licence are deposited;

Details attached

Additional Details:
Refer to Tables 2.5 and 2.8 of the 2007 Annual Report

Results of any additional sampling and/or analysis that was requested by an Inspector

No additional sampling requested by an Inspector or the Board

Additional Details: (date of request, analysis of results, data attached, etc)

Refer to Table 7.1 of the 2007 Annual Report

Any other details on water use or waste disposal requested by the Board by November 1 of the year being reported.

Additional sampling requested by an Inspector or the Board (See below)

Additional Details: (Attached or provided below)

Refer to Table 7.1 of the 2007 Annual Report

Any responses or follow-up actions on inspection/compliance reports

Inspection and Compliance Report received by the Licensee (Date):

Additional Details: (Dates of Report, Follow-up by the Licensee)

Refer to Table 7.1 of the 2007 Annual Report

Any additional comments or information for the Board to consider

The 2007 Annual Report provides further details on water use and waste disposal, construction activities, geochemical analysis of core, fuel storage, unauthorized discharges, inspection and compliance report concerns, updates to plans, progressive reclamation work and consultations.

Subject: Notification requesting water use for domestic camp use at Milne Camp; Licence 2BB-MRY0710, Part C, Item 1

Dear Mr. Cooper;

The Nunavut Water Board ("NWB") would like to acknowledge receipt on October 10, 2007 of the above request for an alternative water source for the purposes of domestic water use for the Mary River Bulk Sampling Project at the Milne Camp. Part C, Item 1 of the Licence states that:

"The Licensee shall obtain all water for domestic purposes from Camp Lake at Monitoring Station MRY-1, Philips Creek at Monitoring Station MRY-2 and Km 99 Lake at Monitoring Station MRY-3 or as otherwise approved by the Board. Total water use for domestic purposes shall not exceed sixty (60) cubic metres per day. Water for the purposes of drilling and other associated uses, shall be obtained from sources adjacent to drill targets and is not to exceed four hundred and fifty five (455) cubic metres per day."

The request was distributed for review and comment to interested persons with a deadline for response of October 17, 2007. A technical review was carried out of the written request and submissions received. No immediate concerns were identified by interested persons during this review period and the Board hereby approves, under Motion No. 2007-30, the addition of the unnamed lake (kilometer 32 lake) for domestic water use as identified in the request.

The Licensee is reminded that the conditions of the Licence 2BB-MRY0710 apply to this additional water source, with emphasis on the conditions of Part C, with respect to the immediate impacts of the use of water.

The Licensee shall include Kilometre 32 Lake and all water obtained from this location in the requirements of Part B, Item 5(i), recording volumes for the purposes of reporting within the Annual Report, the monthly and annual quantities of freshwater obtained for use under this Licence.

The requirements of this approval letter form an integral part of Licence 2BB-MRY0710.

Should you have any further questions, please feel free to contact the undersigned at (780) 443-4406, at your earliest convenience.

Yours truly,

Toronto, Ontario M5H 1T1

Dear Derek,

RE:

MARY RIVER PROJECT- FUEL STORAGE FACILITY
MILNE INLET
OUR REFERENCE NO. 06-090

B. H. Martin Consultants Ltd. was retained by Baffinland Iron Mines Corporation (BIMC) to design containments for their fuel storage at their Milne Inlet site in Nunavut and subsequently compile all as-built conditions of the fuel storage facilitiy.

BACKGROUND

A total of 8,289,000 Litres of fuel will be used during the bulk sampling program. Of this approximately 8 ML is diesel fuel and the remainder is Jet “A” fuel for aviation. All fuel for the project arrives at the Milne Inlet port initially. A temporary fuel storage facility has been built to contain all the required fuel at this location. Approximately 1.6ML of this fuel will be transported by approved fuel trucks to the Mary River Camp (approximately 94 km from Milne Inlet). This fuel will be stored in another temporary storage facility at that site.

PROPOSED DESIGN OF THE FACILITIES

Figure C101 (appendix 1) show the site plan at the Milne Inlet port.

Fuel was shipped via tankers from the port of Montreal. All fuel at Milne inlet is stored in the temporary bulk storage facility consisting of fuel bladders within a lined and bermed containment. Figures C201R1 to C203R1 included in Appendix 1 show the construction details of the fuel facility at Milne Inlet. The fuel bladders are identified in NIRB’s Northern Remote Site Protocols document (Dillon, 1998) and have been used by both private and the federal government in Nunavut, Yukon and other arctic regions of the world. The fuel bladders are supplied by Raymac Industries and engineered by SEI Industries. Detailed arrangement of

the fuel bladders in the containment as well as piping arrangement is included in Appendix 2.

As shown in the related drawings in Appendix 1, each fuel storage facility consists of an earthen berm lined with a petroleum-resistant geomembrane liner (Hazgard HZ-500) that meets ULC/ORD-C58.9-1997 specifications for Underground and Aboveground flammable and combustible liquid storage tanks. The liner is then covered with approximately 300mm of granular material to protect it from damage.

The containments are designed to hold 110% of total aggregate capacity of the fuel facility as per the CCME's "Environmental Code of Practice for Aboveground and Underground Storage Tank Systems containing Petroleum and Allied Petroleum Products" and "National Fire Code of Canada" standards. As well, the containments consist of a sump for collection of precipitation. The containments floors are graded towards the sump. A mobile oil/water separator & pump arrangement (on a trailer) will be brought in to empty the sump periodically to ensure adequate space in the sump. The oil water separator is equipped with filters to separate the oil from the water. The clean water from the oil/water separator is discharged to the outside of the container (a ditch is constructed around the perimeter of the containment to divert water away from the slopes) while the oil which is collected in drums and subsequently shipped offsite for recycling.

The Milne Inlet fuel facility consists of 74 bladders, each containing 113,560 litres. Approximately 71 of the bladders are used for storage of diesel fuel while 3 bladders are used for aviation fuel.

The fuel facility is equipped with dispensers consisting of electric pumps and shut-off valves, and fuelling procedures require full time attendance at all times. Fuel stations also consist of a lined pad backfilled with granular material. The precipitation within this area will be collected in a sump and will be pumped by oil/water separator and pump and discharged in the same fashion as described above. Any fuel spills will be contained within the lined areas which can be excavated, tested and treated if necessary at the end of the bulk sampling program.

AS-CONSTRUCTED CONDITIONS

Containment construction

The containment for the fuel farm was constructed in general conformance with the design. For details on the plans and sections of the containment construction, please refer to as-constructed drawings C201 to C202 (appendix 2). The material used for the containment berms and base was brought from nearby borrow sources. The material was free of any deleterious substances and was approved

by the liner construction staff. A certificate of acceptance is included in Appendix 2 by Raymac/Layfield who is the suppliers and contractor for the lining of the containment.

The liner was installed and welded as per the design criteria as well as liner manufacturer's recommendations. The liner was a nominal 40-mil impermeable material (commercially known as Hazgard 50). Quality Assurance and Quality Control was provided by Layfield (the liner material supplier) and a QA/QC report is included in Appendix 2.

Mechanical (bladders, pipes, valves…)

All mechanical components of the fuel farm including the bladders (fuel tanks), the piping network within the containment, valves, the sump, oil/water separator, and the piping from the shore to the fuel farm was designed by SEI Industries and constructed by Raymac Inc.

As-constructed drawings of the mechanical components of the fuel farm are included in Appendix 2.

It is our understanding that the fuel farm facility was designed and built in general conformance with CCME's "Environmental Code of Practice for Aboveground and Underground Storage Tank Systems Containing Petroleum and Allied Petroleum Products" as well as "National Fire Code of Canada".

The following requirements have either been followed or shall be followed by Baffinland Iron Mines Corporation in order to ensure compliance with CCME and NFC guidelines prior to the operation of the facility:

Tank Registration

Each storage tank will be registered with the Fire Marshal in December, 2007. The registration document will include the name of owner, address of owner, type of facility, location of the tanks, storage capacity of the tank, type of product stored, year of installation, ULC standard of tank (bladder), type of storage material, type of piping material, type of corrosion protection (if any), type of pumps, description of leak detection system, type of secondary containment, name of operator, name of land owner, name of installer, manufacturer of storage tanks as per CCME, item 2.4.2.

Visual Leak Detection

Baffinland conducts a daily visual leak inspection of each fuel farm tank. An inventory reconciliation plan will be devised during the bladder operation as part of the leak detection system.

Spill Contingency plan

The fuel farm operation shall comply with the guidelines set forth by the Spill Contingency Planning and Reporting Regulations. This spill Contingency Plan has been provided by BIMC to the Nunavut Water Board and a copy is available at each site.

Bladder and Product Identification

Each tank/bladder should be identified in conformance with CPPI “using the CPPI Colour-symbol system to mark equipment and vehicles for product identification”.

Fire Protection

At least 2 fire extinguishers, each having a rating of not less than 80-B:C, has been provided at the truck loading pad and at the fuel intake to the fuel farm.

Please note that in all cases, the authority having jurisdiction is as follows:

Fire Marshall
Department of Community Government & Transportation
Government of Nunavut
P.O. Box 1000, Station 700
Iqaluit, Nunavut X0A 0H0
Tel. 879-975-5310
Fax. 867-979-4221

We trust this report is satisfactory and meets your requirements. However, should you have any questions, please do not hesitate to contact the undersigned for further discussion.

Yours truly,

B.H. Martin Consultants Ltd.

CERTIFICATE OF ACCEPTANCE OF SOIL SUBGRADE SURFACE

PROJECT NAME: Fuel Farm
PROJECT NUMBER: 07C-015
OWNER: Baffinlands
LOCATION: Milne Inlet

I, the undersigned, a duly appointed representative of Layfield Environmental Systems Ltd. (LESL), have visually observed the soil subgrade described below, and found it to be an acceptable surface on which to install geomembrane.

This certification is based on observations of the surface of the subgrade only. No subterranean inspections or tests have been performed by Layfield Environmental Systems, and LESL makes no representations or warranties regarding conditions which may exist below the surface of the subgrade. Layfield Environmental Systems accepts no responsibility for conformance of the subgrade to this project's specifications.

The soil subgrade accepted on this date refers to its present condition. Any changes in the subgrade condition that result from the effects of inclement weather and/or other forces beyond the control of Layfield Environmental Systems and remedial work to correct the resulting deficiencies, will be the direct responsibility of the General Contractor.

Area Being Accepted: Area under panels A-1 to A-18, panels B1 to B4. Well compacted surface, some rock. Used LP-16 as an underlay

OWNER: Baffinlands
LOCATION: Milne Inlet

Scope of Installation(s): **THE WORK**
Installed, welded, repaired, tested approx 15,916 m^2 of Hazgard 500. Installed approx. 346,000 sq ft. of LP-16 as an underlay + overlay. Installed 1 sump @ toe.

Part 1 – LAYFIELD ENVIRONMENTAL SYSTEMS LTD.

I, Allan McKinnon, a duly appointed representative of Layfield Environmental Systems Ltd. (LESL), have visually observed the installations (as outlined above), and have found the Work to be complete and free of defects and declare that the Work was completed in accordance with the project specifications, Layfield Environmental Systems' QC program and the terms and conditions of the contract.

INSTALLATION WARRANTY

Customer Reference No. PO# 201738
Layfield Reference No. : 07C-015

LAYFIELD ENVIRONMENTAL SYSTEMS LTD. (LAYFIELD) hereby warrants to Baffinland Iron Mines Corp. ; (the Customer) that the work performed by LAYFIELD on the Installation described as Milne Inlet, Mary River Fuel Farms – Hazgard 500 will:

1. Meet the field seam specifications set out in the contract between LAYFIELD and the Customer (as amended by LAYFIELD's quotation), all workmanship to meet the requirements of LAYFIELD's Field Installation Quality Assurance program, and be free of defects at the time of completion of the Installation; and

2. Be free of installation defects from the date of the completion of the Installation (as identified on the Layfield Certificate of Final Inspection and Acceptance), for a period of 1 year so long as the completed Installation is used for the purposes and in the manner for which the Installation was designed.

Should damage or defects within the scope of the aforesaid warranties occur, LAYFIELD shall repair the damage or defects, PROVIDED THAT the area to be repaired must first be made ready by the Customer and be in a clean, dry, unencumbered condition, free from all water, soil, sludge, residuals, and liquids of any kind.

To enable LAYFIELD to investigate and determine the cause of any alleged damage or defect, notice and details of any claim hereunder must be presented in writing to LAYFIELD within thirty (30) days after the alleged damage or defect was first noticed or observed. Failure to provide such notice and details shall invalidate all warranties provided hereunder.

The liability of LAYFIELD under the aforesaid warranties are subject to the following conditions:

a. LAYFIELD's only obligation shall be to repair or replace any defective workmanship and in no event shall LAYFIELD be liable for any amount in excess of the cost of the Installation;

b. No allowance will be made for repairs, replacements or alterations made by the Customer unless with the prior written consent of LAYFIELD;

c. The warranties hereunder extend only to the Customer and are not transferable;

d. The warranties hereunder shall not apply to any damage or defects resulting from misuse, mechanical abuse by machinery, equipment or persons, excessive pressures or stresses, exposure of the completed Installation of harmful chemicals, unusual weather conditions, casualty catastrophe such as (but not limited to) earthquake, flood, hail, tornado, or any other act of God;

e. Under no circumstances shall LAYFIELD be liable for any special, direct, indirect, or consequential damages including the loss of use of the Installation howsoever caused;

f. All liner materials provided for the Installation are covered by a separate warranty provided by Canadian General-Tower Limited , and LAYFIELD shall not be liable for material failure claims hereunder;

g. The warranties hereunder are given in lieu of all other warranties, express, implied, statutory, or otherwise, and the Customer expressly waives all other warranties and claims whatsoever except those specifically given herein, and the Customer acknowledges that the warranties hereunder are accepted in preference to and to the exclusion of any or all other warranties; and

h. An Installation Warranty will not be provided for lining projects unless the installation is completed by LAYFIELD personnel or designated LAYFIELD subcontractors.

Dear Cheryl,

RE:

MARY RIVER PROJECT
TANKS-A-LOT SEWAGE TREATMENT AND DISCHARGE
AS-CONSTRUCTED REPORT
OUR REFERENCE NO. 06-090

B.H. Martin Consultants was retained by Baffinland Iron Mines Inc. to design the sewage works for their Exploration camp at Mary River Mine site in Nunavut and to complete the as-constructed reports.

The site is located approximately 160km south of Pond Inlet, in the north-eastern section of Baffin Island. Approximate distances from the project site to other communities in the region are 270 km to Arctic Bay, and 415 km to Clyde River.

Presently the site consists of a 100-person camp of predominantly Weatherhaven^{TM} tents, two steel Quonset huts as maintenance facilities, and numerous small wooden outbuildings, situated approximately 200 meters from the shore of Camp Lake.

A Rotating Biological Contactor (RBC System) Sewage Treatment is being constructed for the camp for sewage treatment for the duration of the bulk sampling program. In the meantime, temporary measures were needed for sewage treatment while waiting for the RBC system to be constructed and while exploration is being performed on site.

As-Constructed Conditions

The Owner installed and commissioned a wastewater treatment system (Norweco – Singulair Model 960 Treatment System from Tanks-A-Lot) capable of handling sewage of 460 BOD_5/490 TSS for 50 people generating 227 litres of sewage per day on October 7, 2007. No non-domestic waste or stormwater has been directed to the treatment system. The sewage for the population of more than 50 is by-passed to a Polishing/Waste Stabilization Pond (PWSP) approximately 500 meters from the camp. A schematic of the Tanks-A-Lot Treatment system is included in Appendix 1.

BIMC also constructed the Polishing/Waste Stabilization Pond (PWSP) prior to the commissioning of the Tanks-A-Lot system in order to store the system effluents. The Pond was designed to have a capacity of 3,521 Cubic Meters. Based on the recent survey of the pond, as set out on drawings included in Appendix 1, the installed pond has a capacity of 2,510 Cubic Meters. The pond was lined with the specified liner of EL 6040. The installation of the pond underlying material and the liner installation have been certified by Layfield Industries. The Treatment System as-constructed drawings and the QA/QC report from Layfield is attached to Appendix 1. Photos of the Tanks-A-Lot System are included in Appendix 2.

Since the commissioning of the Tanks-A-Lot System and the Polishing/Waste Stabilization Pond (PWSP) on October 7, 2007 up until December 25, 2007 (80 days) the maximum number of personnel at the site has reached 65 persons. This number was maintained during the Christmas 2007 holidays and is expected to ramp up to 120 people by February 1, 2008. Maximum sewage generation has been measured to be approximately 200 litres per capita per day (200 lpcd) with an average estimated loading of 460 BOD_5 and 490 TSS. This volume of 1,040 (65 persons at 200 lpcd for 80 days) represents the volume of effluent currently stored within the PWSP leaving the available capacity within the constructed PWSP to be 1,470 Cubic Meters.

As discussed in our design Waste Water Management Plan submitted to the NWB, an RBC system capable of handling sewage effluent for 150 people is planned to be constructed as soon as it arrives at the Mary River Site. The RBC system arrived at the Mary River site shortly before Christmas Holidays and is currently being installed and is scheduled for commissioning in January of 2008. Assuming that it takes 21 days for the RBC system to become fully operational, The Tanks-A-Lot system and the PWSP are expected to cease operation after that time. Below is a summary of the volumes of effluent within the PWSP prior to and after the RBC start-up:

Total volume of As-Constructed PWSP (C.M)	**2,510**
Max. no. of people at the site from Oct.7 to Dec. 25, 07	65
Max. Volume of sewage generated per day per person	200
Number of days from commisioning day to Dec. 25, 2007	80.00
Maximum Volume of effluents sent to PWSP before holidays	**1,040.00**
No. of People at the camp (from Dec. 25 to Jan. 7, 08)	65
No. of days from Dec. 25, 2007 to Jan. 7, 2008	13
Max. Volume of sewage generated per day per person	200
Volume of effluent sent to PWSP during the holidays	**169**
Avg. No. of people at camp by the time RBC is fully operational	90
***We have assumed that the 65 people will return immediately after the holidays and then will ramp to 120**	
No. of days from January 7 to RBC operation	30
Max. Volume of sewage generated per day per person	200
Maximum Effluents to be sent to PWSP from Jan. 7 to RBC full operation	**540.0**

Total Estimated Maximum Volume of Effluents in the PWSP by RBC full operation	**1,749.00**
Available capacity within PWSP after the expected RBC full operation	**761**
Equivalent no. of days at 200 lpcd at 120 people	31

Effluent in the PWSP will be tested during the summer and, depending on the test results; the effluent will be either discharged to Sheardown Lake in late summer of 2008 or retained for discharge at a later date depending on the quality of the effluent.

It is currently planned to retain the sewage in the PWSP for at least 12 months. Upon confirmation of acceptable BOD_5, TSS and E.Coli levels, the PWSP shall be discharged in the spring/summer of 2008 via a 75mm forcemain into Sheardown Lake or shall be returned to RBC system for re-treatment prior to discharge to Sheardown Lake.

Prior to the PWSP being discharged to Sheardown Lake, phosphorus removal will be performed by batch dosage of alum prior to discharge to the lake. Assuming that raw sewage contains 7 mg/L of phosphorus and that 15 mg of alum is required to treat 1 mg of phosphorus, 105 mg of alum will be required to treat every litre of sewage. The sampling for Phosphorus level within the pond is planned for spring 2008.

Yours truly,

B.H. Martin Consultants Ltd.

CERTIFICATE OF ACCEPTANCE OF SOIL SUBGRADE SURFACE

PROJECT NAME: Polishing Pond
PROJECT NUMBER: 07C-046
OWNER: Baffinlands
LOCATION: Mary River

I, the undersigned, a duly appointed representative of Layfield Environmental Systems Ltd. (LESL), have visually observed the soil subgrade described below, and found it to be an acceptable surface on which to install geomembrane.

This certification is based on observations of the surface of the subgrade only. No subterranean inspections or tests have been performed by Layfield Environmental Systems, and LESL makes no representations or warranties regarding conditions which may exist below the surface of the subgrade. Layfield Environmental Systems accepts no responsibility for conformance of the subgrade to this project's specifications.

The soil subgrade accepted on this date refers to its present condition. Any changes in the subgrade condition that result from the effects of inclement weather and/or other forces beyond the control of Layfield Environmental Systems and remedial work to correct the resulting deficiencies, will be the direct responsibility of the General Contractor.

Area Being Accepted: Area under Panels 1, 2, 3 & 4. Uncompacted sand with rock, subject to sluffing. Used LP-16 as an underlay

CERTIFICATE OF FINAL INSPECTION AND ACCEPTANCE

PROJECT NAME: Polishing Pond
PROJECT NUMBER: 07C2046 **DATE:** August 30 2007
OWNER: Baffinlands
LOCATION: Mary River.

Scope of Installation(s): **THE WORK**
Installed approx 2690 sq. metres of LP-16 as an underlay. Installed, welded, repaired/tested approx 3,659 sq metres of E.L. 6040.

Part 1 – LAYFIELD ENVIRONMENTAL SYSTEMS LTD.

I, Allan McKinnon, a duly appointed representative of Layfield Environmental Systems Ltd. (LESL), have visually observed the installations (as outlined above), and have found the Work to be complete and free of defects and declare that the Work was completed in accordance with the project specifications, Layfield Environmental Systems' QC program and the terms and conditions of the contract.

Layfield Environmental Systems Representative:
Name: Allan McKinnon
Title: Project Supervisor
Date: August 30, 2007 **Signature:**

Part 2 – OWNER (or Representative)

I, Roland Landry, a duly appointed representative of BAFFINLAND IRON MINES, do hereby take over and accept the installation(s) described above, and confirm that the work has been completed in accordance with the project specifications and the terms of the conditions of the contract.

I have evaluated and measured the work together with the Layfield Environmental Systems representative, and agree that the measurements shown are both true and correct, and that the installation has met our approval.

INSTALLATION WARRANTY

Layfield Reference No: (Job#) 07C-046

LAYFIELD ENVIRONMENTAL SYSTEMS LTD. (LAYFIELD) hereby warrants to Baffinlands ; (the Customer) that the work performed by LAYFIELD on the Installation described as Polishing Ponds (EL 6040, LP16) will:

1. Meet the field seam specifications set out in the contract between LAYFIELD and the Customer (as amended by LAYFIELD's quotation), all workmanship to meet the requirements of LAYFIELD's Field Installation Quality Assurance program, and be free of defects at the time of completion of the Installation; and

2. Be free of installation defects from the date of the completion of the Installation (08/20/07) for a period of 1 year so long as the completed Installation is used for the purposes and in the manner for which the Installation was designed.

Should damage or defects within the scope of the aforesaid warranties occur, LAYFIELD shall repair the damage or defects, PROVIDED THAT the area to be repaired must first be made ready by the Customer and be in a clean, dry, unencumbered condition, free from all water, soil, sludge, residuals, and liquids of any kind.

To enable LAYFIELD to investigate and determine the cause of any alleged damage or defect, notice and details of any claim hereunder must be presented in writing to LAYFIELD within thirty (30) days after the alleged damage or defect was first noticed or observed. Failure to provide such notice and details shall invalidate all warranties provided hereunder.

The liability of LAYFIELD under the aforesaid warranties are subject to the following conditions:

a. LAYFIELD's only obligation shall be to repair or replace any defective workmanship and in no event shall LAYFIELD be liable for any amount in excess of the cost of the Installation;

b. No allowance will be made for repairs, replacements or alterations made by the Customer unless with the prior written consent of LAYFIELD;

c. The warranties hereunder extend only to the Customer and are not transferable;

d. The warranties hereunder shall not apply to any damage or defects resulting from misuse, mechanical abuse by machinery, equipment or persons, excessive pressures or stresses, exposure of the completed Installation of harmful chemicals, unusual weather conditions, casualty catastrophe such as (but not limited to) earthquake, flood, hail, tornado, or any other act of God;

e. Under no circumstances shall LAYFIELD be liable for any special, direct, indirect, or consequential damages including the loss of use of the Installation howsoever caused;

f. All liner materials provided for the Installation are covered by a separate warranty provided by the material manufacturer and LAYFIELD shall not be liable for material failure claims hereunder;

g. The warranties hereunder are given in lieu of all other warranties, express, implied, statutory, or otherwise, and the Customer expressly waives all other warranties and claims whatsoever except those specifically given herein, and the Customer acknowledges that the warranties hereunder are accepted in preference to and to the exclusion of any or all other warranties; and

h. An Installation Warranty will <u>not</u> be provided for lining projects unless the installation is completed by LAYFIELD personnel or designated Layfield subcontractors.

Cheryl Wray
Environmental Superintendent
Baffinland Iron Mines Corporation
Suite 1016, 120 Adelaide Street West
Toronto, Ontario
M5H 1T1

Dear Cheryl,

RE:

MARY RIVER PROJECT
ROTATING BIOLOGICAL CONTACTOR (RBC SYSTEM) SEWAGE TREATMENT AND DISCHARGE- MILNE INLET
AS-CONSTRUCTED REPORT
OUR REFERENCE NO. 06-090

B.H. Martin Consultants was retained by Baffinland Iron Mines Inc. to design the sewage works for their camp at Milne Inlet temporary shipping port in Nunavut and to complete the as-constructed reports.

The site is located approximately 100km north of the Mary River Mine site, in the north-eastern section of Baffin Island. Approximate distances from the project site to other communities in the region are 270 km to Arctic Bay, and 415 km to Clyde River.

Presently the site consists of a 54-person camp of predominantly Atco-Style trailers situated approximately 300 meters from the shore.

A Rotating Biological Contactor (RBC System) Sewage Treatment has been installed and commissioned for the camp for sewage treatment for the duration of the bulk sampling program. It generally takes 3 weeks for any RBC system to operate at full efficiency. In the meantime, a temporary sewage lagoon was constructed for effluent disposal from the RBC while the RBC system became fully operational. Upon satisfactory results of the RBC effluents meeting the required discharge criteria, the RBC effluents are to be transported from the treatment structure to a nearby ditch. This drainage ditch will eventually flow to the Ocean. Details are described in the Sewage Management Plan submitted in September 2007.

As-Constructed Conditions

The Owner installed and commissioned a Rotating Biological Contactor (RBC System) from Seprotech capable of handling sewage of 460 BOD_5/490 TSS for 70 people generating 227 litres of sewage per day on October 23, 2007. No non-domestic waste or

stormwater has been directed to the treatment system. The details of the Seprotech Unit is attached in Appendix 1.

BIMC also constructed the Polishing/Waste Stabilization Pond (PWSP) prior to the commissioning of the RBC system in order to store the system effluents while it becomes fully operational. The Pond was designed to have a capacity of 1,000 Cubic Meters. Based on the recent survey of the pond, as set out on drawings included in Appendix 1, the installed pond has a capacity of 657 Cubic Meters. The pond was lined with a Hazgard 500 impermeable liner. The installation of the pond underlying material and the liner installation have been certified by Layfield Industries. The Treatment System as-constructed drawings and the QA/QC report from Layfield is attached to Appendix 1.

It is currently planned to retain the sewage in the PWSP until the Effluents in the PWSP is tested during the summer and, depending on the test results; the effluent will be either discharged to the nearby ditch in late summer of 2008 or returned to the RBC for re-treatment if not meeting the discharge criteria.

Yours truly,

B.H. Martin Consultants Ltd.

CERTIFICATE OF ACCEPTANCE OF SOIL SUBGRADE SURFACE

PROJECT NAME: Raymac - Milne Inlet Sewage Lagoon
PROJECT NUMBER: 07C-015
OWNER: Baffinland
LOCATION: Milne Inlet

I, the undersigned, a duly appointed representative of Layfield Environmental Systems Ltd. (LESL), have visually observed the soil subgrade described below, and found it to be an acceptable surface on which to install geomembrane.

This certification is based on observations of the surface of the subgrade only. No subterranean inspections or tests have been performed by Layfield Environmental Systems, and LESL makes no representations or warranties regarding conditions which may exist below the surface of the subgrade. Layfield Environmental Systems accepts no responsibility for conformance of the subgrade to this project's specifications.

The soil subgrade accepted on this date refers to its present condition. Any changes in the subgrade condition that result from the effects of inclement weather and/or other forces beyond the control of Layfield Environmental Systems and remedial work to correct the resulting deficiencies, will be the direct responsibility of the General Contractor.

Area Being Accepted: Area under panels B1 & B2, some rock and frozen lumps - used textile for underlay

OWNER: Baffinland
LOCATION: Milne Inlet

Scope of Installation(s): **THE WORK**
Installed approx 2200 sq. metres of LP16 as an overlay & underlay. Installed, welded/tested approx 1100 metres of Hazgard 500 within the confines of the temporary sewage lagoon.

Part 1 – LAYFIELD ENVIRONMENTAL SYSTEMS LTD.

I, Allan McKinnon, a duly appointed representative of Layfield Environmental Systems Ltd. (LESL), have visually observed the installations (as outlined above), and have found the Work to be complete and free of defects and declare that the Work was completed in accordance with the project specifications, Layfield Environmental Systems' QC program and the terms and conditions of the contract.

SKAPS GT-116
Nonwoven Geotextiles

SKAPS **GT-116** is a needle-punched nonwoven geotextile made of 100% polypropylene staple fibers, which are formed into a random network for dimensional stability. SKAPS GT-116 resists ultraviolet deterioration, rotting, biological degradation, naturally encountered basics and acids. Polypropylene is stable within a pH range of 2 to 13. SKAPS GT-116 conforms to the physical values listed below:

INSTALLATION WARRANTY

Customer Reference No. PO# 201738
Layfield Reference No. : 07C-015

LAYFIELD ENVIRONMENTAL SYSTEMS LTD. (LAYFIELD) hereby warrants to Baffinland Iron Mines Corp. ; (the Customer) that the work performed by LAYFIELD on the Installation described as Milne Inlet Sewage Lagoon – Hazgard 500 will:

1. Meet the field seam specifications set out in the contract between LAYFIELD and the Customer (as amended by LAYFIELD's quotation), all workmanship to meet the requirements of LAYFIELD's Field Installation Quality Assurance program, and be free of defects at the time of completion of the Installation; and

2. Be free of installation defects from the date of the completion of the Installation (Aug 25, 2007), for a period of 1 year so long as the completed Installation is used for the purposes and in the manner for which the Installation was designed.

Should damage or defects within the scope of the aforesaid warranties occur, LAYFIELD shall repair the damage or defects, PROVIDED THAT the area to be repaired must first be made ready by the Customer and be in a clean, dry, unencumbered condition, free from all water, soil, sludge, residuals, and liquids of any kind.

To enable LAYFIELD to investigate and determine the cause of any alleged damage or defect, notice and details of any claim hereunder must be presented in writing to LAYFIELD within thirty (30) days after the alleged damage or defect was first noticed or observed. Failure to provide such notice and details shall invalidate all warranties provided hereunder.

The liability of LAYFIELD under the aforesaid warranties are subject to the following conditions:

a. LAYFIELD's only obligation shall be to repair or replace any defective workmanship and in no event shall LAYFIELD be liable for any amount in excess of the cost of the Installation;

b. No allowance will be made for repairs, replacements or alterations made by the Customer unless with the prior written consent of LAYFIELD;

c. The warranties hereunder extend only to the Customer and are not transferable;

d. The warranties hereunder shall not apply to any damage or defects resulting from misuse, mechanical abuse by machinery, equipment or persons, excessive pressures or stresses, exposure of the completed Installation of harmful chemicals, unusual weather conditions, casualty catastrophe such as (but not limited to) earthquake, flood, hail, tornado, or any other act of God;

e. Under no circumstances shall LAYFIELD be liable for any special, direct, indirect, or consequential damages including the loss of use of the Installation howsoever caused;

f. All liner materials provided for the Installation are covered by a separate warranty provided by Canadian General-Tower Limited , and LAYFIELD shall not be liable for material failure claims hereunder;

g. The warranties hereunder are given in lieu of all other warranties, express, implied, statutory, or otherwise, and the Customer expressly waives all other warranties and claims whatsoever except those specifically given herein, and the Customer acknowledges that the warranties hereunder are accepted in preference to and to the exclusion of any or all other warranties; and

h. An Installation Warranty will not be provided for lining projects unless the installation is completed by LAYFIELD personnel or designated LAYFIELD subcontractors.

Re: CCME Conformity Report Reply

Please find attached a report produced by Genivar Engineers formally B.H. Martin to investigate fuel facilities at the Mary River and Milne Inlet Projects and to determine if these facilities comply with the CCME "Environmental Code of Practice (2003) for Aboveground and Underground Storage Tank Systems Containing Petroleum and Allied Petroleum Products".

This letter also provides responses to recommendations brought forth by the report and we trust that this satisfies concerns within the July 14th, 2007 inspection provided to Baffinland on December 10th, 2007.

Milne Inlet:

1. It is Baffinland's policy, to wherever possible, store barrelled fuel in secondary containment. Drums of Jet-A are temporarily stored at Milne Inlet in a safe and secure location away from vehicle traffic and more than 150 meters from any water body and are subject to regular inspections. These drums will be moved to Mary River and placed within lined containment.
2. Although, diagrams are available and pumping systems separate for each type of fuel (P50 and Jet-A) to ensure contamination between the two types of fuel is not possible, Baffinland will identify bladder control valves to ensure that the contents of each bladder is known and identified. The scheduled completion date for this work is February 28th, 2008.
3. Baffinland will place barriers at the fuel dispensing locations of the fuel farms to ensure that vehicle collision cannot occur. Scheduled completion date at the operating fuel dispensing locations is February 15th, 2008.
4. Fire extinguisher maintenance is currently part of Baffinland's Safety Program and is conducted monthly.

Mary River:

1. Drums of contaminated soils from a spill that occurred in September 2007 will be temporarily stored in a lined berm at Milne Inlet to await removable during the 2008 sea lift.
2. Baffinland will investigate the use of non-combustible material to support drums of fuel that are utilized to heat the temporary weather haven tents.
3. Oil heating stoves are the industry standard for remote temporary exploration camps in the high arctic and provide a reliable source of heat. This will continue to be Baffinland's practice for temporary camps.

4. Fire extinguisher maintenance is currently part of Baffinland's Safety Inspections and is conducted monthly.

Should you have any concerns or questions, please do not hesitate to contact the undersigned at cheryl.wray@baffinland.com.

Yours sincerely,

Baffinland Iron Mines Corporation

RE:

MARY RIVER PROJECT- REPORT ON FUEL STORAGE FACILITIES (MILNE INLET & MARY RIVER SITES)
OUR REFERENCE NO. 06-090

B. H. Martin Consultants Ltd. was requested, by Baffinland Iron Mines Corporation (BIMC), to submit this report of the existing fuel storage tanks which are used at the Mary River Project sites in Nunavut. The investigation was undertaken during Jan. 5 to Jan. 8, 2008.

OVERVIEW

The fuel facilities are being reviewed for compliance with the CCME "Environmental Code of Practice (2003) for Aboveground and Underground Storage Tank Systems Containing Petroleum and Allied Petroleum Products." Please note that all fuel storage tanks at the Mary River Project Sites are above ground installations and no underground tanks are installed at any of the sites.

The report will cover the findings first from Milne Inlet, the shipping point for the mining project and secondly, Mary River, the main camp site for the bulk sampling operation.

There are 9 categories which are used to present the information, which are as follows:

- Types of fuel containers
- Secondary containment
- Generator fuel systems
- Clean-up work
- Fuel handling
- Fuel farms

- Protection from vehicular traffic
- Aviation fuel
- On-site fire extinguishers

Wherever the findings indicate that there is a risk of a fuel spill on the ground, this report will make recommendations to reduce the risks involved. Digital photos are attached in appendix 1, to clarify some of the observations which are included in the report. The photos show the site conditions, as found in January 2008.

MILNE INLET CAMP SITE

i) TYPES OF FUEL CONTAINERS

BIMC is using two trucks with storage tanks for delivery of fuel. For information, the capacities are 3000 litres and 8200 litres. Mobile tanks are not included in the CCME code, and as such those details would be outside the scope of this report.

Three empty fuel tanks are on site. These will not be included in the report until they are actually in operation. Presently these 3 tanks are not in use at all.

There are large fuel bladders used at the site which are discussed in section vi).

ii) SECONDARY CONTAINMENT

The Milne Inlet site has (2) areas where drums of fuel (known as P-50) are stored in large quantities. The two areas are built-up with dykes and a protective liner. It is noted that the fuel drums are less-than 230 litres in size, and they are not considered "tanks" under the CCME code.

In the north part of the site, lube oil containers are stored in a dedicated area with dykes and liner as well. Refer to the attached 11 x 17" drawing which shows the site plan in appendix 2.

The lined drum storage area was covered with snow during this site visit. Due to the winter conditions, a visual inspection of the dike area could not be completed.

iii) GENERATOR FUEL SYSTEM

The two generators each have a fuel tank in use. The engine supply tanks are less-than 2000 litres in size, and they are double-wall. One of the tanks is

outdoors, and the other generator has the tank inside a shelter. Both arrangements comply with the CCME code.

iv) CLEAN-UP WORK

In the event of a fuel spill on the ground, the site is equipped to remedy the situation. Baffinland staff (BIMC) have been instructed on the procedures to follow in correcting a fuel spill once it has been detected. The actions in article 8.9 of the CCME code will be followed by site personnel. As well, BIMC has the necessary forms to properly report on the nature of each spill as provided in the "Emergency Spill" documents.

Waste material and soil which is removed after a spill must be stored and then transported to an approved waste handling facility.

v) FUEL HANDLING

The crew at Milne Inlet are required to re-fill the generator fuel tank frequently. This happens at least once per day. This task is done using the mobile fuel trucks.

For pumping P-50, the fuel pumps are located on the east side of the fuel farm. The equipment was included in our report of December 2007, which featured the completed fuel farm. The two activities which occur regularly are: fuelling up the equipment such as loaders, fork lifts and other vehicles; and filling the mobile tanker trucks which have to deliver their load of fuel to other locations.

For pumping aviation fuel, there is a fuel pump/ fuel dispenser on the west side of the fuel farm. During this winter season, it has been taken out-of-service and locked.

Fuelling procedures require full time attendance, with the trained operator in clear view of the filling hose. The dispensing area is used multiple times per day. BIMC contractors are following standard operating procedures for transfers of fuel to-and-from the mobile truck. Personnel have been trained to follow the proper fuel filling and dispensing methods.

The handling of fuel drums will continue as long as the Mary River camp requires them. Fork lifts and other lifting equipment are used to pick up drums while loading them for transportation.

vi) FUEL FARM

As mentioned above, the main fuel storage area was created using flexible bladders which were filled by the tanker ship in 2007.

The Milne Inlet fuel farm consists of 74 bladders, each containing 113,560 litres. Approximately 71 of the bladders are used for storage of P-50/ diesel fuel while 3 bladders are used for aviation fuel. The as-constructed condition of the dyke and Hazgard lining and the mechanical piping within the containment area were documented in a December 2007 report.
Any fuel spills will be contained within the lined areas which can be excavated, tested and treated if necessary at the end of the bulk sampling program.

The fuel facility is equipped with dispensers consisting of electric pumps and shut-off valves. Due to the winter season, we could not visually verify the liner material below the fuel dispensing area.

An oil/water separator is located at the fuel farm. It is ready for use when the dyke area requires drainage work.

vii) PROTECTION FROM VEHICULAR TRAFFIC

The bladders and fuel drums on-site are clear of vehicle hazards when they are in the 'containment areas.'

The fuel pump/ dispensing locations are at risk, however. Physical protection/ barriers must be added in this location, to prevent a vehicle from any collision with the pump equipment or with the flexible fuel piping.

viii) AVIATION FUEL STORAGE

There are drums (205 litres each) of JET-A fuel which are on pallets, and these pallets are temporarily stacked in an area north of the fuel farm. The original shipment was 4000 drums. Some of the drums have been used during the previous six months.
The remaining pallets in this area are not yet placed in a dyke area.

ix) FIRE EXTINGUISHERS

This item falls under the general heading of fire protection. This site is equipped with portable multi-purpose dry chemical extinguishers, by "STRIKE FIRST". The rating of the extinguishers was noted as: 10A-120 B,C.

At least 2 fire extinguishers have been provided at the truck loading pad and at the fuel intake to the fuel farm.

RECOMMENDATIONS

The fuel storage facilities at Milne Inlet are subject to the following recommendations in order to reduce the risk of spills:

1. The drums of JET-A aviation fuel (205 litre size) which are not in a contained area should be moved to a safe location.

2. The bladders used in the main fuel farm should be identified with lettering and colour coding stripes to properly identify the contents of each bladder. This improvement will likely have to wait for warmer weather before it can be accomplished. Until that time, BIMC will keep a written record of the 2 types of bladders involved.

3. Vehicle barriers must be built at each position where there is a significant risk of a vehicle collision or accident. At a minimum, the main fuel dispensing pumps (east of the fuel farm) must be protected. The pumps are arranged by the side of the driveway, and they stretch approximately 12 metres long. A series of pipe-built bollards or a welded steel guard can be considered to protect the dispensers.

4. Fire extinguisher maintenance should be placed on a schedule of regular inspections (6-month intervals may be considered.) This is just to ensure that the correct charge pressure is maintained on all the extinguishers.

MARY RIVER MINING CAMP SITE

i) TYPES OF TANKS

The Mary River Camp is still under construction. New accommodations for the workers are being set-up, and this is indicated on the attached drawing C301B. Currently, this camp has one large size fuel tank: a 75,000 litre double-wall tank made by Northern Steel of Saskatchewan.

The largest number of storage containers occurs on the temporary living tents. Each tent uses a single (205 litre) fuel drum mounted outside on a rack. The drum feeds fuel by gravity through the flexible piping, to the heater in each tent.

Information of the future fuel farm will be found in part vi) below.

ii) SECONDARY CONTAINMENT

Note that the 75,000 litre tank is mounted in a dyke area with a liner, and it complies with the code. This tank will be connected to a camp main generator in the near future. Refer to appendix 2 for a site plan of the camp area.

The Mary river site has (1) area where drums of fuel (known as P-50) are stored in large quantities. This is adjacent to the large tank. The drum area is built-up with dykes and a protective liner.

The fuel drums contain mainly "Jet-A" product and P-50 for heating. The size of each drum is 205 litres. The amount of gasoline stored on-site is negligible.

The lined drum storage area was covered with snow during this site visit. Due to the winter conditions, a visual inspection of the dike area could not be completed.

On the temporary tent heating systems, there is a liner used to protect the ground below each tent fuel drum. The liner has been combined with the support rack which was constructed for each tent drum.

iii) GENERATOR FUEL SYSTEM

The small unit known as CAT-100 is out-of-service. It uses a built-in fuel tank which is double-wall type.

The CAT-500 generator operates with a double-wall tank inside a weather shelter. The engine supply tanks are less-than 1500 litres in size.

The arrangement complies with the CCME code.

iv) CLEAN-UP WORK

These resources are the same as Section 1 of this report. Baffinland staff (BIMC) have been instructed on the procedures to follow in correcting a fuel spill once it has been detected. The actions in article 8.9 of the CCME code will be followed by site personnel. As well, BIMC has the necessary forms to properly report on the nature of each spill as set out in the "Emergency Spill" procedures.

Waste material and soil which is removed after a spill must be stored and then transported to an approved waste handling facility.

v) FUEL HANDLING

The maintenance personnel at Mary River are required to re-fill the generator fuel tank frequently. This happens at least once per day. This task is done using a mobile lift truck and a portable electric pump.

This camp is much more dependent on P-50 heating oil because every one of the temporary tents is heated by an oil fired stove. There are 35 to 40 temporary structures with this type of heating.

For pumping P-50, the crew will usually load 4 fuel drums on a lift truck with the drums mounted on a wood pallet. The lift will drive slowly behind each tent. The workers will check the level in each drum visually. Filling the tent drums is done with the portable electric pump.

Fuelling procedures require full time attendance, with the trained operator in clear view of the filling hose. BIMC contractors are following standard operating procedures for transfers of fuel. Personnel have been trained to follow the proper fuel filling and dispensing methods.

The handling of fuel drums will be on-going at this camp, because of the type of operation that has been planned.

vi) FUEL FARM

The main fuel storage area for Mary River will be created using (16) flexible bladders. Refer to Mary River sketch SK-104-R0 (appendix 2) for a plan of the proposed camp.

The design of the dyke and new lining will involve multiple layers of liner material with geo-textile in combination. Construction is expected to continue in 2008 when weather permits.

Any fuel spills will be contained within the lined areas which can be excavated, tested and treated.

The fuel facility will be equipped with dispensers consisting of electric pumps and shut-off valves.

vii) PROTECTION FROM VEHICULAR TRAFFIC

The tank, bladders and fuel drums on-site are clear of vehicle hazards when they are in the 'containment areas.'

The fuel pump/ dispensing locations will be at risk after they are installed. Physical protection/ barriers must be added to prevent a vehicle from any collision with the pump equipment or with the flexible fuel piping.

viii) AVIATION FUEL STORAGE

JET-A fuel is stored in drums, within the contained area of a dyke. This area will be made to accommodate the extra JET-A drums which are transported from Milne Inlet.

ix) FIRE EXTINGUISHERS

This item falls under the general heading of fire protection. This site is equipped with portable multi-purpose dry chemical extinguishers, by "STRIKE FIRST". The rating of the extinguishers was noted as: 10A-120 B,C.

RECOMMENDATIONS

The fuel storage facilities for Mary River are subject to the following recommendations in order to reduce the risk of spills.

1. At the edge of the camp property, there are drums of waste material which was cleaned up from a fuel spill in 2007. These drums will proceed to a suitable disposal site as soon as transportation is available.

2. The temporary tents each have a rack to support the drum of fuel directly behind each tent. The wooden racks do not meet the requirements of CSA B-139, which applies to Oil-Fired Heating. Alternate racks should be designed using non-combustible material.

3. Some consideration should be made, for alternative heating in the temporary tents. The individual fuel drums are subject to significant risk of (small) fuel spills; in addition to the cost of maintaining up-to 40 heating appliances. If alternative heating is available on the site, then a conversion of those tents is strongly advised.

4. The recommendation for scheduled maintenance on the fire extinguishers is repeated for this camp. (suggest inspections on a 6-month interval)

Aside from the recommendations listed (above) for Milne Inlet and Mary River, we find that the fuel storage tanks do comply with the CCME (2003) Code. Baffinland Iron Mines has constructed a number of containment areas to store the various drums of fuel which they are using. In the future, there are plans to upgrade the lined containment areas at Mary River while the site continues to be developed.

We trust this report and its recommendations will be satisfactory. It is important for BIMC to progressively reduce the risk of fuel spills at the camps. Should you have any questions, please do not hesitate to contact the undersigned for further discussion.

Yours truly,

GENIVAR/ (formerly B.H. Martin Consultants)

Egon Wucher, P.Eng.

RE: Water License Inspection of Mary River Project July 14th, 2007

The Water Resources Officer (WRO) appreciates the assistance and cooperation provided by Mr. Derek Chubb who accompanied the Inspector during the inspection of the site.

The following report is based on observations made at the time of the inspections at the Mary River Project. A review of the terms and conditions of the water license was conducted following the Inspection.

Immediately following the inspection a Water Use Inspection Form outlining the concerns of the inspector was signed off by the parties with the Inspector.

Part A: Scope, Definitions and Enforcement

No issues were found with respect to the location of the camp as it relates to the information contained within the current license.

It is noted that the current license was issued on February 20th, 2007 and is a renewal of license NWB2MRY0406, issued originally on June 11, 2004. The Licensee submitted a request to renew and amend the license on October 6, 2006. The license expired on December 31, 2006. The Licensee is reminded that the use of water or deposit of waste without a current Water License is an offence under the Nunavut Waters and Nunavut Surface Rights Tribunals Act.

It is noted that the Camp was inspection on July 14th, 2007. Subsequent to the inspection an amendment to the existing type B license was approved by the Nunavut Water Board that modified the type of license from a BE (Exploration- Mining and Milling) to a BB (Bulk Sampling) type. This change along with an additional set of terms and conditions came into effect on July 16th, 2007. The enclosed inspection report will reference where necessary any changes to the requirements for compliance as they relate to specific issues within the report.

The license remains a Type “B” license.

Part B: General Conditions

The issues of water use fees and security were not included within the context of this inspection.

A review of the Nunavut Water Board FTP – Public Registry was conducted during the writing of this report. An annual report for the 2006 annum, completed by KNIGHT PIÉSOLD LTD was located.

This report is a requirement under the terms and conditions of the Water License. The annual report must include but should not be limited to those items listed in Section 2 (i) through (ix) of this Part. (Section 5, i-xvi under 2BB-MRY0710)

Upon review of the report it was noted that the report on file was deficient in the following;

- No mention of what the licensee is doing with the waste/ returned drill water and cuttings is included in the report. Given the total water used for drilling (9,415 Cubic meters) this is of substantial concern for the inspector.
- GPS coordinates and photographic records are not included in the body of the report.
- Specific information regarding the approved waste disposal site to where all hazardous waste, waste oil and non-combustible wastes generated on site are backhauled is not included.

The proponent is reminded that an annual report is required to be filed by March 31st 2008 for the year ending December 31st 2007. The annual report **must** include but not be limited to those items listed in Section 5 (i) through (Xvi) inclusive, of this part as well as any information required by the Inspector.

Failure to file a complete report as outlined in the license is a violation of the Act and will subject the licensee to the enforcement measures and penalties provided for under the Act.

The licensee is reminded that it is the responsibility of the licensee to ensure that any documentation submitted by the licensee to the Nunavut Water Board is acknowledged by the Manager of Licensing.

During the period of inspection the Inspector noted that flow meters had not been installed on the intake lines.

It was also noted during the inspection that Paints, solvents and other hazardous materials were stored without the proper secondary containment. This practice must be addressed by the period of the next inspection.

A review of the Nunavut Water Board FTP site was able to locate the required Site Water Management Plan which, as per section 3 of this Part was to have been submitted October 20th, 2007. An approval of the plan was not located on the FTP site and the Inspector seeks clarification from the Nunavut Water Board regarding the completeness of the plan and the acceptance of the plan by the Board.

Part C: Conditions Applying To Water Use

At the time of the inspection the licensee was allocated the use of 475 Cubic meters of water per day for all purposes.

The Licensee is reminded to ensure that the intake hoses are equipped with a screen to prevent the entrapment of fish. Samples of the potable source were collected at the time of the inspection however after three attempts to land a helicopter at the drilling site were aborted because of high winds; no samples of the drilling return were collected. It should be noted that a sump was noted down hill of the drills and that a flow of water was noted below the sump area and above the Mary River. It is unclear if this flow terminated in the river or if it was an above ground flow that terminated prior to the river.

Analytical results received by the inspector did not contain any results in excess of the Canadian Council of Ministers of the Environment (CCME) guidelines for drinking water;

An inspection of the intake system was conducted, a filter system and UV system were both present and in working order.

Part D: Conditions Applying to Waste Disposal

During the inspection of the camp the following items were noted and brought to the attention of Mr. Chubb during the period of inspection.

As per section 4 of this Part;

> Unless otherwise approved by the Board, the Licensee shall not practice open burning or on-site land filling of domestic waste..

Additionally, as per section 9 of this Part;

> Unless otherwise approved by the Board the Licensee shall dispose of all toilet wastes through incineration, chemical or composting toilets for any camp with a design population over 300 and less than 2,000 person days per year, and less than 5,000 person days per year for the life of the camp. Any remaining residue generated through the course of the operation shall be backhauled and disposed of in an approved waste disposal site.

During the period of Inspection, July 14, 2007 the inspector however noted the following;

- Open burning of combustible wastes – Photographed and documented
- Open burning of Human wastes – Photographed and documented
- Consolidation and stockpiling of human wastes – eventually had to be buried as per direction of Inspector because of the threat to human health.

A new incinerator was found on site during the period of inspection however it was not in use and was only just being calibrated. It is unclear how long the licensee was in the practice of open burning garbage and human wastes in barrels. It is noted that the Licensee in the 2006 annual report states the following;

> "Latrine toilets were used at the Mary River camp in 2006, and all sewage was contained in drums and incinerated prior to treatment with lime then covered with native material to maintain the natural contours of the land. Amendment 1 (Part D, Item 5) required that commercial incineration toilet systems be used at full camp capacity, however, operational difficulties were encountered with the propane-fired incineration toilet and as a result use of the latrine toilets continued throughout the season."
> *Pp2 –Waste Disposal Activities*

Given the above the Inspector seeks clarification from the Nunavut Water Board regarding the licensee's practice of open burning the Human wastes and then land filling the waste. Was an amendment application or notification of modification, as required by Section 4 of Part B submitted by the Licensee with respect to this practice? Additionally, it is noted that the locations of any trenches or Latrine pits (land filling) of the human wastes is not noted in the annual report.

The licensee is cautioned that they are to **incinerate** all combustible waste in an approved incinerator that will meet or exceed the Canada-wide Standards for Dioxins and Furans and the Canada-wide Standard for Mercury Emissions. Continued operations in this manner and in contravention of the terms and conditions of the current license will be treated as a continuing violation of the Act and will subject the licensee to the enforcement measures and penalties provided for under the Act.

As per Section 7 of this Part;

> Unless otherwise approved by the Board, the Licensee shall contain all greywater in a sump located at a distance of at least thirty (30) metres above the ordinary high water mark of any water body, at a site where direct flow into a water body is not possible and no additional impacts are created.

It was noted during the period of inspection that a large lagoon sized area had been excavated adjacent to the camp. It is unclear to the inspector if the new excavation was covered under the existing license at the time. When questioned regarding the construction of this sump and an additional Sewage Lagoon located 150 meters south and west of the camp the Inspector was informed that this was to be covered under the

new license which was still in the application stage at that time. The licensee is cautioned that all modifications to the Operations of the camp must be approved by the Nunavut Water Board prior to their construction. A review of the Nunavut water Board FTP site could not located any approval for this work to have been completed prior to the issuance of the new license. Again the licensee is cautioned that continued operations outside the existing terms and conditions of the issued license will result in enforcement actions being undertaken by the inspector and the Department of Indian and Northern Affairs on behalf of the Nunavut Water Board.

The Licensee is reminded to include in the 2007 annual report due on March 31st 2008 a list of hazardous materials shipped out of the camp, and the location of the NWB approved treatment facility, as per section 10 of this Part, to which they were sent. All of the foregoing is required information to be included in the annual report. Shipping and receiving invoices are not required so long as records are available for inspection during the 2008 inspection season.

During the review of the Nunavut Water Board FTP site correspondence between the Hamlet of Pond Inlet and Baffinland Iron Miners Corp was noted. A review of the documents to ensure compliance with Section 2 of this Part was inconclusive and the Licensee is asked to provide the appropriate approvals from the Hamlet of Pond Inlet as soon as possible. Additionally, a Design and Operations report consistent with the requirements of Section 3 of this Part was noted. Missing is an approval document from the Nunavut Water Board accepting and approving the completeness of this report. The Nunavut Water Board is asked to provide clarity on this matter.

Part E: Conditions For Camps and Access Infrastructures

No issues were noted in the Mary River Camp however the Inspector could not make it to Milne Inlet nor Steensby Inlet and these two sites still require inspection.

Part F: Conditions Applying To Drilling Operations

As noted, an inspection was not completed at the Mary River Drilling site as high winds prevented the helicopter from landing at the site. It was noted that there was present a flow of water (over land flow) below the drill sumps and traveling down hill toward Mary River. It is unclear if this ground water flow originated in the sump area.

The licensee is reminded to submit, as per Section 3 (a to e) of the is Part, in the 2007 Annual Report the results of the Geochemical analysis of the Drill core currently being generated by the drill program to determine the constituent elements of the core which may be present and may impact water.

Part G: Conditions Applying To Contingency Planning

A review of the Water Board FTP site located a 2006 Spill Response Plan which as per Section 1 of this Part is to be on site and available for use within 30 days of the issuance of the current license. The Inspector was not able to locate an approval document from the Nunavut Water Board and is unable to determine if the submitted plan is complete or has been approved by the Board.

The licensee is reminded that it is the responsibility of the licensee to ensure that any documentation submitted by the licensee to the Nunavut Water Board is acknowledged by the Manager of Licensing.

If the plan is not completed or approved by the Board, the Licensee is directed to provide, as an addendum to the 2007 Annual report due on March 31st 2008, a revised and up to date copy of the Spill Response plan which must include the items outlines in Section 1 (i through xii).

During the same review and in accordance with a review for compliance with Section 3 of this Part a report from Knight Piesold dated April 14th, 2007 was reviewed. This report notes that it is written in response to Section 3 of this Part with requires the licensee to provide, within 90 days of the issuance of the current license a report, to be approved by the Nunavut Water Board, which is appropriately qualified by an engineer registered in Nunavut and which clearly details that the requirements of the CCME guidance document "Aboveground Storage Tank Systems for Petroleum and Allied Petroleum Products (2003)" have been met by the Licensee. It should be noted that this report, if submitted in April of 2007 was submitted 3 months before the current license was even issued.

The Fuel Storage Review document concludes, based on the fact that the barrels used for fuel storage at the Mary River camp do not hold in excess of 230 L the Licensee is not required to meet the terms and conditions of the guidance document. The inspector does not question this somewhat simplistic conclusion however because the scope of the report did not and does not include fuel storage at either the Milne inlet or Steenby Camps the Inspector is forced to conclude the report is incomplete.

The Licensee is directed to within 30 days of receipt of this report submit for approval to the Nunavut Water Board and the Inspector a report that includes among other things any and all fuel storage at any camp in a fixed location. This revised report must include any and all closed containers, receptacles or bladders currently in use by the licensee.

Additionally, as noted previously for other plans and submitted reports the review of the Nunavut Water Board FTP site did not locate an acceptance or approval for the above noted plan which again appears to have been written and submitted three months in advance of the issuing of the current license.

The Licensee is reminded that as per Section 6 (iii) of this Part the Licensee is required to submit a detailed report on each spill occurrence no later than 30 days following the initial event.

Part G: Conditions Applying To Abandonment And Restoration

It was noted that during the period of inspection that a clean-up of the historic waste metals including drums and machinery was on-going.

The Inspector strongly encourages the licensee to document and provide reports on any and all proactive reclamation activities undertaken by the licensee over the last year.

Part H: Conditions Applying To Monitoring Programs

As per Section 1 of this Part the Licensee is required to measure and record in cubic meters the daily quantities of water utilized for Camp operations and all purposes.

As per Section 2 of this Part the Licensee is required to adhere to the monitoring and reporting requirements contained within section 3 of Part B and Section 3 of Part F.

The Licensee is reminded that failure to comply with the terms and conditions of the issued water license constitutes an offence under the Nunavut Water and Nunavut Surface Rights Tribunals Act.

The Licensee is also required as per section 6 to provide accurate measurements of all waste hauled off site and the location, including the NWB approved location for Hazardous waste treatment.

All this information shall be included in the 2007 annual report.

Non-Compliance:

During the inspection a number of items were noted as violations of the Act and required remedial actions to be undertaken. It is noted that on August 15th an e-mail from Mr. Chubb detailing the efforts of the Licensee to address items noted during the Inspection was received.

- Open burning of garbage is to cease – Verbal direction provided on July 14th, 2007
- Stockpiling and Open Burning of Human Waste to cease- Verbal Direction in July 14th, 2007
- Location of the NWB approved treatment facility where hazardous wastes generated or marshalled on site are to be shipped- to be included in annual report.
- Installation of metering system to accurately record water use.
- Submission of a revised report on the conformity of the licensee to the CCME's "Aboveground Storage Tank Systems for Petroleum and Allied Petroleum Products 2003" within 30 days of receipt of this report.
- A detailed report, including GPS coordinates and photographs, on the disposal of drill cuttings and wastes associated with drilling at the Mary River Drill site. This report is required within 30 days of receipt of this report.
- Installation of required secondary containment as outlined during the inspection
- Installation of meters on intake systems for properly and accurately recording water use volumes.
- Provide locations and quantities of all human wastes buried as per the terms of this and previous licenses. This is to be provided as an addendum to the 2007 annual report.
- Provide documentation of the approved modification or amendment from the Nunavut Water Board permitting the licensee to burn in 45 gallon drums human waste and then deposit it in a land fill location within 30 days of receipt of this report.
- Provide documentation of the approved modification or amendment from the Nunavut Water Board permitting the construction of the sump and sewage lagoon prior to the issuance of the current license within 30 days of receipt of this report.

Re: Water License Inspection of Mary River Project July 14th, 2007-12-18

We thank you for your report dated on December 10th, 2007 for an inspection that occurred on July 14th, 2007. The purpose of this letter is to provide the information requested in the report and to respond to specific items of noted concern. Our letter is presented under the same headings as your inspection report.

Part A: Scope, Definitions, and Enforcement

Reminders have been noted.

Part B: General Conditions

Baffinland has noted concerns with respect to information contained in the 2006 water license annual report, including details as to the management of drill water and cuttings. As requested under the heading of non-compliance in your report, Baffinland has enclosed an attachment detailing the exploration drill program at Mary River for the 2007 drill season.

Since the time of the inspection, the accuracy of water use estimates has been increased through the installation of flow meters.

As discussed at the time of the inspection, Baffinland is in the process of consolidating the locations where hazardous and non-hazardous wastes are stored in preparation for backhaul and final disposal and/or recycling as appropriate. Backhaul of these wastes is planned for the summer of 2008. As a general practice, it is Baffinland's intention to store all potentially hazardous wastes, regardless of quantity in lined containment areas. That being said, there currently are wastes at the site that are not stored as such. All wastes are located remote from any surface water sources.

Part C: Conditions Applying to Water Use

Water intakes are installed with screens to prevent the entrainment of fish.

Part D: Conditions Applying to Waste Disposal

Baffinland respectfully notes that the incinerator referenced at the time of the inspection was not being calibrated. At the time of the inspection, observed was an air quality consultant that was retained to test the stack emissions from the incinerator as a means of documenting performance as it relates to Canada-wide standards. This incinerator was installed in 2006 as

Baffinland Iron Mines Corporation
Suite 1016, 120 Adelaide Street West, Toronto, ON Canada M5H 1T1
Tel: +1 (416) 364-8820 • Fax: +1 (416) 364-0193
www.baffinland.com

a replacement to a previous unit that had since been decommissioned. Since commencement of exploration activities in 2004, Baffinland has employed the use of a commercial incinerator.

As per Part D, Section 7 of the said water license, a sump was constructed for the management of grey water from the kitchen and wash tent facilities at the Mary River camp. The lined containment pond located south west of the camp was detailed in the design submission to the Nunavut Water Board required under Section 3 of this part. To date, there has been no discharge to date from this facility to the receiving environment, and its operation is detailed in the most recently submitted Sewage Management Plan submitted to the Nunavut Water Board in accordance with Part D, Section 13 of the now current water license 2BB-MRY0710.

In 2007, Baffinland obtained a letter from Pond Inlet acknowledging a request for the disposal of non-hazardous waste at the community landfill site and outlining the procedures for approved disposal. Information regarding all wastes disposed of off-site in 2007 will be provided as required in the annual report. A copy of the letter from the community of Pond Inlet accepting non-hazardous wastes is attached. At present time, no wastes are transported to Pond Inlet and inert materials are currently stockpiled in a specified location adjacent to the incinerator as well as the historical bulk steel area, until the on-site landfill has been constructed. Plans were submitted to the Nunavut Water Board for construction of the on-site landfill in accordance with the Water License in November 2007.

Part E: Conditions for Camps and Access Infrastructures

Noted

Part F: Conditions Applying to Drilling Operations

Noted

Part G: Conditions Applying to Contingency Planning

The current Spill Contingency Plan, dated August 17, 2007 was approved by the Nunavut Water Board under Motion 2007-14-03. Minor comments on the Plan have been addressed through distribution of an addendum letter, with intentions for the distribution of a revised plan to coincide with the timing of the 2007 Annual Report.

Baffinland notes that the letter dated April 14th, 2007 referenced in the inspection report was submitted in accordance with water license 2BE-MRY0708, requiring submission of a report within ninety (90) days of the license issuance confirming compliance with the said CCME guidance document. At the time of the report, and the inspection, Baffinland did not have bulk fuel storage systems in place. As such, this report referenced only the practice as it related to the management of barrelled fuel.

Since release of the current water license 2BB-0710 and relevant to the CCME guidance document, a bulk fuel storage system was commissioned at Milne Inlet in September 2007 and

most recently a 75,000 litre double walled fuel storage tank was installed at Mary River in December 2007. A bulk fuel storage system at Mary River is currently under construction.

In accordance with Part J, Item 4 of the now current water license 2BB-0710, an as-built report for the Milne Inlet bulk fuel storage area, dated December 9, 2007 was submitted to the Water Board. This as-built report referenced compliance with the relevant Sections of the CCME guidance document. Baffinland will be submitting as-built drawings for the systems at Mary River within ninety (90) days of commissioning, in accordance with the requirements of the water license.

As requested, Baffinland has commissioned the third party preparation of a consolidated report detailing information on any and all fuel storage in a fixed location currently in place as it relates to CCME guidance. This report will be forwarded as soon as possible.

Part G: Conditions Applying to Abandonment and Restoration

Baffinland appreciates the comments of support for ongoing efforts of Baffinland to clean-up historic waste metals found around the Mary River site. These efforts will be documented in the annual water license report to be submitted in March 2008.

Part H: Conditions Applying to Monitoring Programs

Reminders of monitoring and reporting requirements have been noted.

Non-Compliance

Response to each of the items of note is provided below. Some of these items have been discussed in previous sections of this letter.

- Open burning of garbage is to cease

  The practice of open burning regardless of waste type or volume ceased at the time of the inspection. Baffinland notes that exclusive of human waste, only wood waste that did not fit in the commercial incinerator was being burned on-site.

- Stockpiling and Open Burning of Human Waste

  At the direction of the inspector, the open burning and stockpiling of human waste ceased at the time of the inspection.

- Installation of metering system to accurately record water use

  A flow meter has been installed on the water intake pipe for the Mary River site. Truck counts are being used to record water use for the Milne Inlet camp. As of December 17, 2007 a flow meter was installed at the Milne Inlet camp and volumes are recorded and reported monthly within the SNP Monthly Report.

- Submission of a revised report of conformity to CCME "Aboveground Storage Tank Systems for Petroleum and Allied Petroleum Products 2003".

  Although Baffinland believes that it has to date met the requirements of its water license regarding the submission of as-built reports for its bulk fuel storage systems, including an assessment of conformance to the above CCME document, a report has been commissioned for completion of a site-wide review of CCME conformance of existing site infrastructure. This report is expected imminently and will be forwarded to the inspector upon receipt.

- Submission of a detailed report, including GPS coordinates and photographs, on the disposal of drill cuttings and wastes associated with drilling at the Mary River Drill site.

  Report is attached as requested.

- Installation of secondary containment as outlined during the inspection.

  As stated above, it is Baffinland's practice to endeavour, as practical, to store barrel fuel, petroleum based wastes, and other potentially hazardous products within lined containment areas. A lined and bermed area at Milne Inlet has been constructed to allow the temporary storage of hazardous materials until shipment off site to an approved facility can occur in 2008. Hazardous materials will be transferred from Mary River to Milne Inlet for storage within the lined facility to ensure proper containment. Fuels and other petroleum based products stored in bulk are installed within lined containment in accordance with the stated CCME guidance document.

- Submission in the 2007 annual report the locations and quantities of human wastes buried as per the term of this and previous license.

  To be provided as part of the 2007 annual report to be submitted in March 2008.

- Documentation permitting the burning in 45 gallon drums human waste.

  Baffinland site-supervisors were provided verbal direction at some point in the 2005 season allowing the burning of open burning of latrine wastes in 45 gallon drums and subsequently burying any residual waste. Baffinland is not in possession of any formal documentation in this regard and it is uncertain as to whether it was the Nunavut Water Board, QIA, or GN inspector that provided this direction.

- Documentation permitting the construction of the sump and sewage lagoon prior to issuance of the current license.

  As stated above, the sump was constructed in accordance with Part D, Item 7 of water license 2BE-MRY0708 for the management of grey water wastes.

Baffinland
Iron Mines Corporation

As stated above, the lined pond south west of the Mary River camp was constructed as an element of the pre-engineered mechanical sewage treatment facility under Part D, Section 3 of water license 2BE-MRY0708.

Again, Baffinland appreciates the feedback provided in the inspection report. We have made note of the various items raised in this report and trust that the additional information provided meets your requests.

As stated at the time of the inspection, Baffinland is committed to a high standard of environmental performance through continuous improvement in all of its activities. Should you have any further questions, please do not hesitate to contact our Environmental Superintendent, Ms. Cheryl Wray at Cheryl.Wray@Baffinland.com or the undersigned at Derek.Chubb@Baffinland.com.

Yours sincerely,

Baffinland Iron Mines Corporation

Notes: Thank you, Derek, for your response to my letter of June 22, 2007.

I would appreciate your advising me a day or two prior to your disposal dates as to when you plan to make the disposals, as I would like my Foreman and me to be present.

Thank you.

Grant Scott

Dear Mr. Chubb,

Your letter of May 15, 2007 to the Nunavut Water Board with respect to requesting approval from the Hamlet of Pond Inlet to deposit sewage and solid waste in the Municipal facilities, was discussed this week at the meeting of the Hamlet Council Executive Committee, chaired by Mayor David Qamaniq.

The Executive Committee would like assurance that there will be no hazardous material deposited into the Municipal facilities, and would like some indication of frequency of deposits and quantity of materials.

Pursuant to Hamlet bylaws, there is a charge of .024/l for sewage and $1.00 per bag of solid waste, with a monthly minimum charge of $15.00.

Sincerely,

Grant Scott
Interim Senior Administrative Officer

Re: Use of Hamlet Landfill

Mr. Scott,

Thank you for your letter dated June 22nd, 2007 in reference to a request from Baffinland to periodically dispose of municipal solid waste to the Pond Inlet Landfill. Baffinland confirms that there will be no sewage waste or waste classified as hazardous transported to Pond Inlet for disposal. Our operations personnel estimate that on average, Baffinland may dispose of waste at a frequency of once every other week throughout the course of the year. We will track the waste deposited to landfill and report frequency and quantities to the Hamlet on a monthly basis.

Yours sincerely,

Baffinland Iron Mines Corporation

Derek Chubb

Cheryl,

Re: QIA Inspection Follow-up

QIA would like to thank-you and Mr. Dave McCann for accommodating our recent site visit. As a follow-up to the inspection which took place on November 21st-23rd, QIA would like to touch base with you on the following points.

<u>Project Components Viewed</u>

Milne Inlet

- Fuel Storage; Waste Oil Storage
- Heavy Equipment
- Garage
- Waste Water Treatment Facility, Sewage Spill Site and Polishing Pond
- Sealift Laydown Area
- Hazardous Waste Storage Area
- Non-hazardous Waste Storage Area
- Incinerator

Mary River

- Fuel Storage
- Heavy Equipment
- Garage
- Waste Water Treatment Facility and sewage spill site
- Incinerator
- Non-hazardous Waste Storage Piles

Road

- Road from Milne, just past kilometer 24 sea can bridge
- Drive by of Borrow Site #1

ᑎᑎᖅᑲᑎᕐᓂᖅ 1340, ᐃᖅᓗᐃᑦ, ᓄᓇᕗᑦ X0A 0H0 • ᑲᖅᓕᑲᑦ (867) 979-5391 • ᐊᑭᖅᑎᑦᓯᓄᑦ 1 800-667-2742 • ᓂᖅᑎᓯᓄᑦ (867) 979-3238 • ᖃᓚᖅᑲᓯᓄᑦ qikiqtani.nu.ca
P.O. Box 1340, Iqaluit, Nunavut, X0A 0H0 • Phone: (867) 979-5391 • Toll Free 1 800-667-2742 • Fax: (867) 979-3238 • Website: qikiqtani.nu.ca

Prior to departing the site QIA had a discussion with BIMC representatives and shared with Baffinland the photographic records from the site visit. Based on what was seen, QIA inspectors were satisfied with the operation and management of the Baffinland Project. It is worth noting that many of the planned project activities were on hold due to continued road construction. QIA looks forward to visiting the site once the road is fully operational.

Project Components Not Viewed

Road

- Entire length of road including borrow sites and all water crossings

Mining Area

- Yet to be developed

Drill Sites

- No drilling taking place during visit

Fuel Spill Site

- Visual inspection not possible due to snow cover

Our next inspection is planned to take place during active mining. We understand this is to take place during January 2008. During this inspection we may be accompanied by CLARC members, if they so desire. Should CLARC members wish to attend our inspection, we will give Baffinland prior notice so arrangements can be made to accommodate their presence. For our next inspection, it is QIA's intent to view the entire project as listed above. Should our list of project components change QIA will inform Baffinland in advance so arrangements can be made. Based on the number of project components listed and weather conditions QIA staff may need to be on-site for multiple days in order to complete a full inspection. Given the amount of organization required for the above inspection and site visit to occur, QIA expects prior planning will be required. Please feel free to contact us at any point so we can begin to firm up our plans.

We look forward to continuing our working relationship and are keen to see Baffinland as the best managed project in Nunavut. Should you wish to follow-up with QIA on any item we have raised, please feel free to contact QIA's Land Use Officers at landofficer@qia.ca or landofficer2@qia.ca.

Sincerely,

for

John Amagoalik
