Manager of Licensing
Nunavut Water Board
P.O. Box 119
Gjoa Haven, Nunavut X0B 1J0

Re: Mary River Project
NWB License 2BB-MRY0710
Field Geotechnical Drilling Program

Ms. Beaulieu,

In February 2008, Baffinland Iron Mines Corporation (Baffinland) provided a notice of commencement for its 2008 geotechnical drilling program. Included in the February submission was information specific to the winter portion of the 2008 program. It was noted at that time that further details regarding the open water portion of the 2008 drilling season would be submitted at a later date. The purpose of this submission is to provide these details.

As was the case with the winter portion of the drilling program, specific requirements of the above noted license relating to the planning of the program include:

- ***Part C, Items 3 and 4***, which state that streams can not be used as water sources and that water use volumes can't be used such that draw down of the water source occurs;

- ***Part F, Item 1*** which states that the Licensee shall not conduct any land based drilling within 30 metres of the ordinary high mark of any water body unless approved by the Board;

- ***Part F, Item 2*** which states that for the purpose of geotechnical investigations, drilling can be conducted within 30 metres of the high water mark of any water body, provided that the activities are consistent with the license and that a request has been submitted and received by the NWB at least ten (10) days in advance. The submission must include maps and GPS coordinates of proposed drilling activities along with planned mitigation measures;

- ***Part F, Item 4*** which states that drill wastes will be disposed to a sump or natural depression located at least 30 metres away from the high water mark of any adjacent water bodies;

- ***Part I, Item 17*** which requires submission of GPS locations of all water sources, prior to utilization.

The embedded link, ftp://NWB:wu95hzin@ftp.knightpiesold.com/NWB, is to a series of tables and figures summarizing open water season drillhole locations as currently planned. Included in these tables for the information of the NWB and the Inspector is the location of planned water sources for drilling in accordance with Part I, Item 17. The exact number and locations of drillholes are subject to adjustment based on the information obtained through the course of this program.

In accordance with the intent of Part F, Item 1, planned drillholes for the open water season have been planned, to the extent possible, at locations greater than 30 metres away from the ordinary high water mark of any adjacent water body. There are currently thirty-eight (38) drillholes planned at locations closer than 30 metres from the high water mark of adjacent waters. Mitigating measures as required under Part F, Item 2 are provided in the attached drilling standard.

Water sources to support drilling operations have been selected in concordance with Part C, Items 3 and 4 of the water license. Streams have not been selected as water sources and a desktop threshold of 5% maximum water withdrawal has been used to guide water source selection. The location of water sources is provided in the tables and figures referenced above.

Should you have any comments or concerns, please do not hesitate to contact the undersigned.

Best Regards,

Baffinland Iron Mines Corporation

Derek Chubb
VP, Sustainable Development

Part F, Item 2 - Proposed Mitigation Measures

The following is a summary of the mitigation measures planned to be in place prior to, during and following drilling, as required, to protect waters. This information is primarily required for drillholes which will be situated within 30 m of the ordinary high water mark however similar measures will be taken for all drillholes.

Prior to Drilling Operations

The following mitigation measures will be taken at each drillhole location, prior to drilling operations:

- Any disturbance to the ground surface when setting up the drill area will be minimized as much as practical.
- Once the drill is in place, a temporary sump will be established adjacent to the drill to collect "dirty" drill water and cuttings. This sump may be, but not limited to, a natural depression, a pre-fabricated sump or may be constructed using other materials present on site.
- A sediment disposal location will be identified or established at least 30 m away from the ordinary high water mark and preferably such that any flow toward a surface water body or water coarse is minimized. "Dirty" drill water and cuttings will be relocated to here from the sump.
- Sediment and erosion control measures will be implemented to minimize spillage of sediment and prevent entry of sediment into water. Sediment and erosion control measures may consist of silt fences or diversion/collection channels or berms.
- As a minimum silt fences, diversion channels or berms will be installed downstream of drill rigs if required to contain sediment within the drill water runoff.

During Drilling Operations

The following mitigation measures will be taken at each drillhole location, during drilling operations:

Drill Operations and Movements

- The drilling area will be kept clean and tidy at all times. No littering is permitted - all waste will be collected and packed for disposal at camp.
- No material will be stored on the banks immediately adjacent to streams or lakes, unless that material will be used immediately.
- Operations will be carried out so as to minimize surface disturbance.
- Overland transportation for transport of workers will be minimized due to the potential for ground disturbance.
- Surface vehicles will not be used to move drill rigs or other equipment, without prior authorization of the Environmental Superintendent. The use of any vehicles off approved routes is prohibited.
- Equipment or vehicles will not be moved unless the ground surface is in a state capable of fully supporting the equipment or vehicles without rutting or gouging.
- Fuel will be transported in fuel drums or double walled day tanks. Drip pans will be used under tanks to prevent fuel contamination.
- Emergency spill response equipment (i.e. a spill kit) will be kept with each drill. Spill kits contain the appropriate type, size and quantity of equipment for the volume and type of product present at the storage location as well as the environment likely to be affected by a spill (i.e. ground, lake river, ocean).
- Daily inspections will be carried out for fuel leaks, equipment condition, sediment and erosion control, water intakes and water management. Any leaks will be repaired immediately.

- Drill rigs will be equipped with oil absorbent materials in the event of leaks, releases and spills.
- No streams will be obstructed.
- Sediment and erosion control measures will be maintained during the drilling operation to prevent entry of sediment into water. No erosion is to be caused to the banks of any body of water. Additional erosion control structures may be installed as the land use operation progresses.

Water Use

- Streams will not be used as a water source unless authorized and approved by the Nunavut Water Board.
- Water sources will be visually monitored to confirm that drawdown is not occurring.
- DFO approved screens will be placed over the intake hoses. The pumping rate will be kept sufficiently low to ensure that fish do not become entrained (drawn against the screen) and that water is withdrawn at a rate that fish do not become impinged on the screen.
- No natural materials will be removed below the high water mark of any water source.

Drill Water and Runoff

- Drill water will be contained and recirculated to the fullest extent practicable to prevent it from running into watercourses. Drill water will be disposed of into a properly constructed sump, or a naturally occurring contained depression. Deleterious substances will not be disposed of into any water body.
- Portable containment sumps (e.g. bins) will be used for drill water and cuttings where containment in the ground is impractical.
- Dirty drill water and cuttings will be relocated to the sediment disposal location established >30 m away from the ordinary high water mark of adjacent water bodies.
- The footprint of any drill water and cuttings spillage will be minimized by means of berms and/or other means of containment.
- Drilling waste will not be allowed to spread to the surrounding lands or water bodies; the footprint of any spillage will be minimized to the greatest degree practicable.
- If artesian flow is encountered, drillholes shall be immediately plugged and permanently sealed to prevent induced contamination of groundwater or salinization of surface waters. The artesian occurrence will be reported within 48 hr to the Engineer. All artesian flows, including location (GPS NAD83), will be reported in the annual report to the Project Manager for subsequent reporting to the Nunavut Water Board.

Following Drilling Operations

The following mitigation measures will be taken at each drillhole location, after drilling operations have ceased:

- If there is a spillage of dirty drill water and cuttings at locations within 30 m of a water body, periodic monitoring of the drill site will be conducted and a clean-up crew may be mobilized to the drill site at the direction of the Baffinland Project Manager and Environmental Superintendant.
- No materials (i.e. debris, drill cuttings) will be left within 30 m of the high water mark when there is potential for that material to enter the water.
- All drillholes will be plugged upon completion, and where possible drill cuttings at surface returned to the drillhole at all land-based drilling locations.
- All constructed drill sumps will be restored to the natural surrounding contours of the land upon completion of drilling.
- All other disturbed areas will be contoured and stabilized upon completion of work and restored to a predisturbed state as much as practical.

- Upon completion of a hole in rock, the casing will be removed. If the casing cannot be removed it will be cut off to be flush with surface and backfilled.
- All non-combustible garbage and debris will be removed from the land use area to an approved disposal site.
- Return all combustible waste and petroleum products to camp for proper management.

			Total Summer Drillholes Proposed for 2008 =	**462**										

I:\102-00181-12\Assignment\Data\Work Files\WF12 - 2008 Summer Drillhole and Water Locations [2008 Drillhole and Water Source Locations Rev 2.xls]Summer Drillholes
03-Jun-08

Notes:
1. Coordinates are from UTM (NAD 83) Zone 17 and are in metres.
2. Chainage and offset values were provided by AutoCAD.
3. Approximately 25 alternate (ALT) holes are planned for the alternate route alignments, but these will be assigned at a later date.
4. Actual locations of oriented core holes to be verified based on surface mapping and review of latest proposed design configuration prior to drilling.
5. Thermistors identified with a "*" will be monitored in spring and decommissioned prior to spring runoff.
6. Water source areas were calculated using AutoCAD and ArcView (GIS), and do not include the areas of connected watercourses and waterbodies (as per DFO protocol).
7.Water source volumes are based on a conservative estimate of waterbody depth based on aerial photographs and field experience along the Proposed Rail Alignment.
8. The estimated water volume available for drilling is 5% of the estimated water volume of the source.

Total Summer Drillholes Within 30 m of High Water Mark Proposed for 2008 =			**38**											

I:\102-00181-12\Assignment\Data\Work Files\WF12 - 2008 Summer Drillhole and Water Locations\[2008 Drillhole and Water Source Locations.xls]Summer Holes within 30m
02-Jun-08

Notes:
1. Coordinates are from UTM (NAD 83) Zone 17 and are in metres.
2. Chainage and offset values were provided by AutoCAD.
3. Actual locations of oriented core holes to be verified based on surface mapping and review of latest proposed design configuration prior to drilling.
4. Thermistors identified with a "*" will be monitored in spring and decommissioned prior to spring runoff.
5. Water source areas were calculated using AutoCAD and ArcView (GIS), and do not include the areas of connected watercourses and waterbodies (as per DFO protocol).
6. Water source volumes are based on a conservative estimate of waterbody depth based on aerial photographs and field experience along the Proposed Rail Alignment.
7. The estimated water volume available for drilling is 5% of the estimated water volume of the source.

Notes:
1. Estimated water volume required per drillhole is based on a pump rate of 10 USgpm and a time of 24 hours to drill each hole.
2. The volume of water to be used for drilling is based on the number of holes that are to be drilled using each water source and the volume of water required per hole.
3. The estimated percentage of water source volume to be used for drilling represents the percentage of the estimated total water source volume that is to be used for drilling.
4. The estimated percentage of available water to be used for drilling is the percentage of the available water volume (5% of total volume) that is to be used for drilling.

- River/Stream/Drainage
- Wetland

NOTES:

1. Topography provided by Eagle Mapping (2005).
2. Coordinate grid is shown in UTM (NAD 83) Zone 17 and is in metres.
3. Contours are in metres. Contour interval is 25 metres.
4. Proposed Rail Alignment provided by Canarail on January 11, 2008.
5. Ravn River Alternate Routes provided by Canarail on January 25, 2008.
6. Drillhole and water source locations may vary depending on actual site conditions. Drillhole locations may change due to changes in infrastructure locations.
7. Approximately 25 additional drillholes (ALT–2008) will be proposed to investigate the potential alternate route alignments. The locations of these drillholes are yet to be finalized.
8. Borrow source locations are approximate and final coordinates will be determined pending site reconnaissance.

NOTES:

1. Topography provided by Eagle Mapping (2005).
2. Coordinate grid is shown in UTM (NAD 83) Zone 17 and is in metres.
3. Contours are in metres. Contour interval is 25 metres.
4. Proposed Rail Alignment provided by Canarail on January 11, 2008.
5. Ravn River Alternate Routes provided by Canarail on January 25, 2008.
6. Drillhole and water source locations may vary depending on actual site conditions. Drillhole locations may change due to changes in infrastructure locations.
7. Approximately 25 additional drillholes (ALT-2008) will be proposed to investigate the potential alternate route alignments. The locations of these drillholes are yet to be finalized.
8. Borrow source locations are approximate and final coordinates will be determined pending site reconnaissance.
