At the headquarters for manufacturing and operations in Carencro, Louisiana, CMS focuses on developing and fabricating thermoplastic mat systems for roadways, work pads, surface protection and site access.

Our engineers are delighted to have state of the art equipment to improve and expand our matting product lines, and the marketing and sales teams are eager to show customers our latest products and heightened capabilities.

CMS has succeeded in the market created by **SOL OCO** in the oilfield and utility industries by introducing a thermoplastic mat with interlocking fasteners called the **DURA-BASE® Composite Mat System**. Now in its 7th year of its history, DURA-BASE® has been well received by users as an environmentally compatible alternative to heavier and clumsier materials.

"CMS has taken temporary roadways into the 21st Century", said **Don Covillion**, Marketing Manager, "Now our focus will be to serve our premium markets and to develop a strong network for distribution and sales throughout the world. As people recognize the efficiency and productivity that mats can bring to their operations, demand for a proven product like DURA-BASE will grow."

CMS recently introduced a lightweight, hand portable mat with self-contained fasteners called the **BRAVO Mat® System**. Plans are underway to develop other specialized product lines and to enhance the performance and life span of established products.
