Good afternoon,

Last night at approximately 10:30 PM, a drill encountered an artesian at hole CONT-012 (UTM 550042, 7129642). The artesian was discovered at a depth of 249m with a flow rate of 8 L/min. The initial rate was short-lived and decreased to zero in a matter of minutes. This drill hole has entered mineralization as late as yesterday and the immediate area surrounding the hole has undergone substantial drilling over the last 5 weeks with no other artesian occurrences. Drilling was completed at this location this morning with no re-appearance of the artesian.

Kind regards,

**Curtis Rhinas**
