

Spring/Summary 2008 Exploration Project

Triex Minerals Corporation
P.O. Box 11584
1410 – 650 West Georgia Street
Vancouver, BC, V6B 4N8

Triex Minerals Corporation is an emerging exploration company in search of world class uranium deposits. Triex Minerals Corporation and 50:50 joint venture partner Pitchstone Exploration Ltd. have been exploring for uranium in the Hornby Bay Basin during the last 3 years. The joint venture land holdings total ~221,000 ha and include the Mountain Lake (Mountain Lake Deposit), Dismal Lakes and Kendall River properties. The property is centered about 550 km north of Yellowknife, NWT and 100 km southwest of Kugluktuk, Nunavut. While the properties are held within a 50:50 Joint Venture relationship with Pitchstone Exploration Ltd., Triex Minerals Corp. is the operator of the programs herein summarised.

Access to the property is via fixed wing aircraft or helicopter from Yellowknife or Kugluktuk. Scheduled air service is available between Yellowknife, the major supply base in the area, and Kugluktuk. During winter and spring, an ice strip is constructed on Kirwin or Teewal Lakes next to the Kirwan Lake camp, and can handle heavy cargo aircraft. During the summer month's access to the property is via smaller aircraft on wheels to an esker located 6 km south of camp, on floats to Kirwin or Teewal Lakes, or by larger aircraft to a 1400 m gravel airstrip located 25 km northeast of the camp site, the Hope Lake air strip.

All work in 2008 will be completed out of a camp located at Kirwan Lake, which constructed in 2006. The camp was built to hold a maximum of 30 people but will on average have a population of 20 people. The camp consists of insulated tents with a combination of wood and Jutland frames, with wood floors. This camp will be utilized for the entire 2008 exploration program. A helicopter will be based in camp for the duration of the program and will be used for transportation to all working areas.

The Mountain Lake Claims

The Mountain Lake Claims are located within the Kitikmeot region of Nunavut. The 2008 exploration program will involve diamond drilling, ground geophysics, soil sampling and property scale geological mapping. At this time we anticipate using 1 diamond drill rig to drill approximately 2,000 to 3,000 m. The drill program may result in the need to expand the capacity of the camp located at Kirwan Lake to approximately 25 to 30 people during the peak drilling period (March through to September).

The Dismal Lakes Claims

The Dismal Lake Claims are located northwest of the Mountain Lake Claims and lie within the Kitikmeot region of Nunavut. The 2008 program will primarily be a drill program. At this time we anticipate using 1 diamond drill rig to drill approximately 3,000 to 4,000 m. Additional work may include a geophysics survey.

The Kendall River Claims

The Kendall River Claims are located southeast of the Mountain Lake Claims and lie within the Kitikmeot region of Nunavut. The 2008 program will primarily be a drill program. At this time we anticipate using 1 diamond drill rig to drill approximately 1,000 to 2,000 m. Additional work may include a geophysics survey.

Triex Minerals Corporation is committed to the north and conducting operations in a responsible manner that respects regulations, guidelines, traditional ways of life, archaeological sites and the flora and fauna. We look forward to working with communities and regulatory agencies on a successful endeavour to explore Canada's north for economic uranium deposits.
