

Storm Project

The Storm Project is located in the northern part of Somerset Island approximately 112 km south of Resolute. Previous exploration work by Noranda and Teck-Cominco in the 1990's in this area resulted in the discovery of lead and zinc mineralization at the Seal deposit located near the coast, and copper mineralization at the Storm prospect located about 20 km inland. These companies stopped exploring this area in 2000 due to weak metal prices. Commander acquired this land as prospecting permits in 2008.

Commander is planning on building a small 12 person temporary tent camp on the property, and using this camp to carry out a small drilling program. The drilling will be completed using a portable percussion drill that does not require any water. This drilling program should take 4 to 6 weeks to complete. This program will be carried out either in the summer of 2010, or the summer of 2011. There may also be an airborne geophysical survey carried out over the property to see if there are other areas of interest. Future exploration, including a diamond drilling program, will depend on the results from this work.
