Windy Project - 2012

Bitterroot Resources Ltd. is exploring for economic mineral deposits in northern Canada. As such, Bitterroot Resources is interested in conducting early-stage exploration approximately 330 km west-southwest of Arviat, 5 km North of Kiyuk Lake, and 20 km West of Nueltin Lake on what we refer to as the Windy Project. The project currently consists of 40 mineral claims on Crown Land named KK1- KK40 inclusive, covering 98,657 acres.

Applications for a Land Use Permit and Type B Water License are being applied for in order to conduct the necessary exploration activities. The area is considered prospective for gold.

Bitterroot Resources Ltd. is proposing to carry out early-stage exploration work on the Windy Project.

Geological and geophysical crews will initially be based at Treeline Lodge on Nueltin Lake in Northern Manitoba. Work to be carried out includes airborne geophysical surveys (7,000 line kilometers), lake sediment sampling (about 300 samples), soil sampling (about 5,000 samples), prospecting, rock sampling and geological mapping.

Assuming the early stage exploration described above is successful in locating mineralized zones, additional work could include ground geophysical surveys (100 line kilometers), hand trenching (200 meters), plus additional soil sampling, geological mapping and rock sampling).

If the second-stage exploration is successful, core drilling (diamond drilling) could be conducted at sites yet to be determined.

If the early stage exploration results are favorable, a temporary exploration tent camp suitable for up to 20 personnel will be built on the mineral claims. Exact location will depend upon float plane access along shorelines and proximity to mineralized zones. The camp would include 7 sleeping tents, combination cooks tent/first aid station, kitchen, dry, office, core shack, outhouse, generator shack, and a fuel cache. Specifics of the final layout will be dependent upon the conditions encountered during camp construction.

The project area will be accessed by charter air service from Treeline Lodge, MB, Points North SK or Arviat in Nunavut. Fixed wing aircraft will initially land on the north end of Windy Lake or other nearby lakes. Fixed wing support will mobilize equipment, personnel and supplies. Work specific travel in the work area will be by helicopter or fixed wing aircraft, depending on lake conditions and location.

Geophysical, prospecting, mapping and sampling program expenditures are estimated at \$400,000. An initial planned drill program would require an estimated budget \$1.0 million dollars.

The management of Bitterroot Resources Ltd. recognize the importance of our role in discovering economic mineral deposits for all stakeholders and that our exploration programs must be conducted a socially and environmentally responsible manner. Consultation with the community of Arviat in Nunavut, Lac Brochet and Tadoule Lake in Manitoba will take place in order to provide information and obtain feedback, as well as to learn of opportunities for future modest local employment and business opportunities.

At this time the project is a results-driven, early-stage exploration program and there are limited opportunities for Aboriginal/Inuit firms or employees although every effort will be made to provide them. If the early stage exploration is successful then there will be opportunities for Aboriginal/Inuit firms and for Aboriginal/Inuit employment. Nunavut is currently experiencing the benefits that can result if grass roots projects are allowed to develop and are successful.
