<u>Ulu Exploration Site</u> Reclaim Estimate Basis of Costing

Summary

The Ulu Exploration ("Ulu") site is an advanced exploration property that has seen extensive exploration and development between 1989 and 2006, including 135,713 meters of core drilling and 1.7 kilometres of underground development. Bonito Capital Corporation ("BCC"), a wholly owned subsidiary of Elgin Mining, acquired the property in July 2011.

Ulu is located within the Kitikmeot Region of Nunavut, approximately 530 kilometres north of Yellowknife, and 155 kilometres north of the Lupin Gold Mine, the geographic center of the property is 66° 54′27″ N / 110° 58′24W. The site consists of one renewable 21-year Crown mining lease covering 947.40 hectares. The lease predates the Nunavut Land Claims Agreement, so the terms of the lease are under the jurisdiction of the Canada Lands Act. The lease is surrounded by Inuit Owned Land surface and subsurface rights, which are owned by Nunavut Tunngavik Incorporated; the surface rights are administered by the Kitikmeot Inuit Association (KIA).

The Ulu site is completely self-contained with the exception of the transportation requirements for materials/supplies and workforce mobilization. There are three (3) main location areas as shown in Figure 2: Main Areas Ulu Site:

- 1. Ulu Camp which houses the residential complex consisting of Weatherhaven accommodations, vehicle repair shop, vehicle parking, power house, emergency generators, office and change rooms, fuel storage tank farm, freshwater system, sewage treatment plant and sewage line, incinerator, ore storage area, waste pad, mine portal, mine sump, and access roads;
- 2. Camp 3, which is comprised of fuel tank farm, explosives magazine, detonator magazine, quarry and borrow pit eskers; and
- 3. Airstrip

The site is accessible year round only by aircraft. Bulk items, if required, are brought on site via the winter road. During active exploration activity, all supplies are flown.

History

BHP Minerals Ltd. discovered gold mineralization on the Ulu gold property in 1989, and from discovery to 1994, delineated the extent of mineralization through a campaign of mapping, drilling, geophysical, geochemical and environmental surveys. Echo Bay Mines acquired Ulu in 1995. By 1997, an underground ramp and further development access was excavated, mineralized zones were crosscut by drifting, and significant underground and surface drilling was conducted. The project was shut down in 1997 due to low gold prices.

Kinross Gold Corporation acquired Ulu through a corporate merger in 2002, and subsequently sold it to Wolfden Resources Inc. in February 2004. Wolfden conducted a drilling campaign in 2004, and until 2006 attempted to gain access to the underground. In 2007, Wolfden was acquired by Zinifex of Australia, which subsequently merged with Oxiana Ltd. to become Oz Minerals, which was acquired by MMG Resources Ltd. in 2009.

Current Status

The Ulu exploration site consists of the following items:

- 50 person spring structure camp and kitchen
- Equipment workshop
- Water supply line
- Sewage (RBC) treatment system
- Adit and vent raise
- Underground development storage pad and development rock
- Bulk fuel storage tanks and associated piping
- Power house and equipment
- Working mobile fleet including drill jumbos, ore truck, grader, excavator, dozer, passenger bus, pickups, low bed truck and fuel supply truck
- Airstrip and roads
- Lined and bermed storage areas for fuel tanks
- Miscellaneous small equipment and spares
- Miscellaneous iron and steel scrap
- Miscellaneous wooden pallets

While under care and maintenance BCC:

- Manages snow and storm water in accordance with best management practices (BMPs);
- Maintains secondary containment in petroleum storage areas;
- Prevents the release of petroleum products;
- Implements Ulu Gold Project Spill Contingency Plan, as needed;
- Manages all wastes according to Ulu Gold Project Waste Management Plan;
- Inspects water and domestic sewage pipelines;
- Maintains environmental licenses, permits and authorizations;
- Conducts monitoring programs;
- Regularly reviews and updates contingency and management plans; and
- Continues to back haul as much waste and hazardous materials as possible each year during C&M.

Basis of Reclaim Estimate

A detailed review was undertaken at site by a Contractor experienced in completing reclamation work in Nunavut. The contractor (Delta/Carter) spent several days on site to examine equipment, review the status of the site and to review quantities, potential haul distances, availability to relocate suitable material underground and amount of material that would potentially have to be hauled offsite.

A critical aspect of this review was the state of existing equipment and whether there would be sufficient suitable equipment to perform the reclaim work in an effective, cost efficient manner.

Several suitable pieces are in working order and are available for use as is while several others are available with minimal upgrades and maintenance to perform the work required, these include:

- Front end loader
- Ore truck(s)
- Dozer with ripper
- Grader
- Fuel truck
- Light vehicles for transport
- Drill jumbo
- Scoop tram(s)

Furthermore, a vehicle repair shop complete with serviceable equipment is available to upgrade and maintain this equipment.

The estimate also reviewed the timeframe necessary to carry out the work in order to calculate mobilization and demobilization costs and the required manpower, flights, fuel requirements and camp operations.

Although several of the items at Ulu likely could be sold "as is – where is" since they are in good condition and likely a requirement at other northern exploration projects in the region it has been assumed that there is no salvage value.

The rates used in the estimate are all based on reasonable current rates for materials, labour, supplies and equipment in the north. A range has been included. However, this is a very compact and simple site. There are no major structures and no tailings dams or major storage areas.

Furthermore, there is little or no evidence of major soil contamination or acid or metals mine drainage.

Post Closure

Description of Proposed Reclamation Measures and Assumptions

The project description includes current site disturbance. The Ulu Project is located 155 km north of Lupin, which is 567 km north of Yellowknife. Access to Lupin is by the existing winter road. For this estimate it is assumed that no road exists between Ulu and Lupin so a winter road will be constructed and used over a 1 year period.

Portal Access

The estimate includes removal of approximately 40m3 of waste rock installed in the portal entrance when site was last in care and maintenance. The cost also included removal of any ice in the portal. The portal area will also be properly exhausted and ventilated during this time.

Equipment for Reclamation Work

As discussed above, there is more than sufficient equipment onsite to complete the work. Additional small equipment included in the estimate includes:

- Barrel crusher
- Small oxy/acythene burning equipment to remove structures etc.
- Small tools

Camp and Accommodations

The existing camp will be used during the reclamation work. This camp and kitchen were refurbished and updated in 2012.

Buildings and Equipment

The buildings and equipment include:

- Weather haven Camp (50 person)
- Kitchen
- Trailers
- Bone Yard
- Tank Farm and piping (All fuel tanks will be thoroughly cleaned prior to disposal)

The estimate also includes grading of these areas and also scarifying of roads and removal of culverts. All piping will be cut into sections, and cleaned prior to disposal.

Fuel

For reclamation purposed fuel will be brought to site. The estimate includes 110,000 litres of fuel.

Ore and Waste Rock Disposal

A total of 1,222 m3 of ore will be removed and placed underground. In addition, a certain percentage of the waste onsite is assumed placed underground. The mine plan shows that significant amount of waste developed and mined is non PAG rock. However, it is assumed that 25% of this waste will require disposal underground due to potential PAG. Therefore, a total of 12,000 m3 of ore and waste has been assumed disposed of underground. The unit costs for this work is high due to the need to segregate and place and is more double normal rates for loading and hauling waste rock.

Hydrocarbon Contaminated Soil

A total of 1,074 m3 of hydrocarbon contaminated soil will be disposed of underground.

Roads and Airstrip

There are 14 km of roads and a 1,200 m airstrip which will be required to be scarified and 6 culverts will be removed.

Portal and Vent Raise

Portal will be filled with suitable waste. The vent raise has been capped.

Post Closure Monitoring and Maintenance

Within the post closure phase the reclamation cost estimate includes:

- Water sampling
- Final site audit
- 5 post closure geotechnical inspections and reporting
- Inspections and repairs where necessary

The work and activities described above were to be completed to minimize the post closure liability. No long term monitoring is required of the waste rock or ore pads as this material has been relocated underground.

Contingency

A 15% contingency has been added to the cost estimate.

SUMMARY OF COSTS

Capital Costs

COMPONENT TYPE	COMPONENT NAME	TOTAL COST
OPEN PIT	0	\$0

Chemicals and Soil Contamination:

1

COST UNIT
ACTIVITY/MATERIAL UNITS QUANTITY CODE COST COST

Note: The procedures, equipment and packaging for clean up and removal of chemicals or contaminated soils are highly dependent on the nature of the chemicals and their existing state of containment. Government guidelines should be consulted on an individual chemical basis. Any estimate made here should be considered very rough unless specific evaluations have been conducted.
