

ELGIN MINING INC.
Care and Maintenance Plan
ULU EXPLORATION PROJECT

Contents

1	OBJECTIVE	3
2	Occupation of the Site	3
3	Waste Management.....	4

1 OBJECTIVE

Elgin Mining Inc. recognizes that maintenance of environmental quality is vital to the Company's existence, progress, and continued development. The Company will maintain high environmental standards limited only by technical and economic feasibility. The Company will take positive action to protect the safety of its workers, conserve natural resources, and minimize the impact of its activities on the environment through diligent application of appropriate technology and responsible conduct at all stages of its operations including the care and maintenance stage at the ULU Exploration site.

2 Occupation of the Site

The site will be occupied as needed to carry out the planned work at various times in the year. The number of staff will be commensurate with the tasks that are being carried out at the time. The most critical facility at the site is considered to be the Esker quarry, fuel storage and water and sewage system and the staffing of the site will be planned around maintenance of the integrity of these areas.

This site is an exploration site with full camp, maintenance, water supply, sewage disposal and associated infrastructure including diesel storage, power generation, plant and airstrip. Should any changes be contemplated at the ULU exploration site the Nunavut Water Board will be notified of any such changes and plans shall be submitted to the Nunavut Water Board for review and approval.

The greatest risk during this period is the containment XXXX and release of waters in the fuel secondary storage facility and also to prevent the release of any and all petroleum products. To this end annual physical inspections will be completed and any repairs carried out to ensure that such facilities are maintained to standard.

Other key areas that will be carried out as part of the Care and Maintenance Plan are as follows:

- Control fugitive dust
- Maintain storm water Best Management Practices (BMPs)
- Prevent the release of petroleum products
- Implement Spill Prevention and Contingency Plan

- Manage all wastes according to Waste Management Plan
- Maintain industrial waste landfill
- Inspect water and municipal sewage pipelines
- Operate, maintain and monitor sewage facilities in accordance with this Management Plan
- Maintain secondary containment in petroleum storage areas
- Maintain environmental licenses, permits and authorizations
- Conduct Monitoring programs
- Regularly review and update contingency, mitigation and management plans

3 Waste Management

The ULU exploration site while under care and maintenance shall determine if wastes generated by its operations and activities are hazardous or non hazardous. In order to determine if a solid waste is hazardous the site shall:

1. Check the CCINFO.Website for MSDS if one isn't available on site:
2. The list of Hazardous Materials will be reviewed on an annual basis

Common knowledge can be used to determine that materials such as paper, untreated wood, concrete and food scraps are not hazardous wastes when disposed of.

All hazardous waste will be shipped off site, at which point will be handled by a third party expeditor. A separate Waste Management Plan outlines the requirements for the proper management of all wastes located on site.
