This review by Stantec Architecture Ltd. is for the sole purpose of ascertaining conformance with the general design concept. This review shall not mean that Stantec Architecture Ltd. approves the detail design inherent in the shop drawings, responsibility for which shall remain with the Contractor submitting same, and such review shall not relieve the Contractor of his responsibility for errors or omissions in the shop drawings or of his responsibility for meeting all requirements of the Contract Documents. The Contractor is responsible for dimensions to be confirmed and correlated at the job site, for information that pertains solely to fabrication processes or to techniques of construction and installation and for co-ordination of the work of all subtrades.

INSTALLATION AND OPERATION INSTRUCTIONS

"Model VIP"

CHIMNEY TYPE: FACTORY BUILT CHIMNEY FOR USE ON COMMERCIAL AND INDUSTRIAL POSITIVE PRESSURE, FORCED DRAFT AND NATURAL DRAFT APPLIANCES

SIZE: 6" TO 48" I.D.

A MAJOR CAUSE OF CHIMNEY RELATED FIRES IS FAILURE TO MAINTAIN REQUIRED CLEARANCE (AIR SPACE) TO COMBUSTIBLE MATERIALS. IT IS OF UTMOST IMPORTANCE THAT THIS CHIMNEY BE INSTALLED ONLY IN ACCORDANCE WITH THESE INSTRUCTIONS.

Use only factory supplied components. Failure to do so will void the certification and the warranty of this chimney.

If possible, install the chimney on the interior of the building as it will provide better performance than an exterior chimney. In areas with continuous temperatures below -18 °C (0 °F). The use of an exterior chimney may result in operating problems such as poor draft and excessive condensation of combustion products. If you do install an exterior chimney, we recommend that you install it within an insulated enclosure.

Read these instructions and keep them for future reference. Contact local building or fire officials about restrictions and installation inspection in your area

CANADA

CHIMNEY SIZE 6" - 48"
O. R. DOCUMENT ULC-C-959-RD-87
ULC LISTING # CMH 1428

VIP is pressure tested to the Canadian RD S657 Industrial Chimney Standard.

USA

CHIMNEY SIZE 6" - 36"
STANDARD UL-103
UL-LISTING # MH-16722

VIP is listed to the UL 103 Standard. It is not pressure listed to UL 103.

TECHNICAL SPECIFICATIONS

MATERIALS:

Flue / Casing: 304/304 - 304/Galvalume - 316/304 - 316/316

Insulation: High temperature mineral wool 50mm

ALLOWABLE FLUE GAS TEMPERATURE:

MAXIMUM CONTINUOUS FIRING	1400°F	760°C
BRIEF FORCE FIRING	1700°F	927°C
TESTED TO	1800°F	980°C
MAXIMUM CONTINUOUS FIRING	1000°F	540°C
BRIEF FORCE FIRING	1400°F	760°C
TESTED TO	1700°F	927°C

CLEARANCES:

To Non-Combustible material: No clearance required

To Combustible material: See chart below

CHIMNEY I.D.	CONTINUOUS TEMPERATURE	
(in.)	1000°F	1400°F
6" - 12"	2"	2"
14"	2"	4"
16"	2"	5"
18" - 20"	2"	6"
22"	2"	7"
24"	4"	7"
26" - 28"	5"	7"
30" - 32"	6"	7"
34" - 36"	7"	7"
38" - 48"	8"	8"

INSTALLATION NOTES

GENERAL:

1. The chimney is intended for use with commercial and industrial heating appliances and diesel engine generating positive pressure in the stack. This chimney is NOT for use in single or two family residences.

   Allowable Flue Gas Temperature:

MAXIMUM CONTINUOUS FIRING	1400°F	760°C
BRIEF FORCE FIRING	1700°F	927°C
TESTED TO	1800°F	980°C

2. Size the chimney in accordance with the appliance manufacturer's instructions. ICC will calculate correct chimney sizing on request.

3. The chimney must **NOT** be enclosed in a combustible chase. If it is desirable to enclose the chimney, then the enclosure must be constructed of non combustible materials. The fire rating required is determined by the local building code. A one hour fire rating is accepted in most areas.

4. Do not fill the space around the chimney with insulation or any other material. This space must remain empty.

5. The chimney shall extend at least 3'. above point of contact with the roof and at least 2'. higher than any wall, roof or adjacent building within 10'.

6. The maximum height of unguyed chimney above the roof is 5'.

7. The clearance between single wall connector and unprotected combustible material **must not be** less than 18" (refer to the Building Code in use in your area).

8. Factory built chimneys which extend through any story above that on which the connected appliance is located are to be provided with enclosures having a fire rating equal to or greater than that of the floor or roof assembly through which they pass.

9. A support must be installed on the first chimney section above each vertical tee.

10. **Chimney Cleaning:**

    Keep your chimney clean. Access should be provided for the inspection and cleaning of all sections of the chimney.

    Have your chimney cleaned by a qualified chimney sweep. If you want to clean your chimney yourself, then clean your chimney using a nylon or metal chimney brush of the **CORRECT SIZE. DO NOT** use a brush that will scratch the stainless steel interior of the chimney.

11. **Soot Formation and Need for Removal (oil appliance):**

    Soot can accumulate on the chimney flue when connected to an oil fired appliance. If not removed periodically this deposit can ignite and possibly damage the chimney.

    The chimney should be inspected at least once every year during the heating season to determine if any build-up of soot has occurred.

    If soot has accumulated, it should be removed to reduce the risk of chimney fire.

MODEL "VIP" CHIMNEY

1. The maximum height of chimney supported is:

2. The supports described in this booklet are the only supports which should be used with ICC's MODEL "VIP" Factory Built Chimney.

3. If additional height is required, use an additional support at the specified maximum chimney support height.

Chimney Size (I.D.)		6”	8”	10”	12”	14”	16”	18”	20”

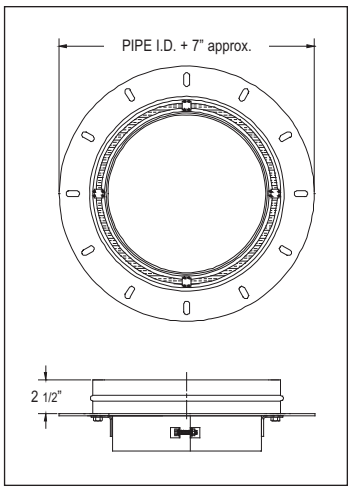
INSTALLATION INSTRUCTIONS

UNIVERSAL ADAPTOR PLATE (AP)

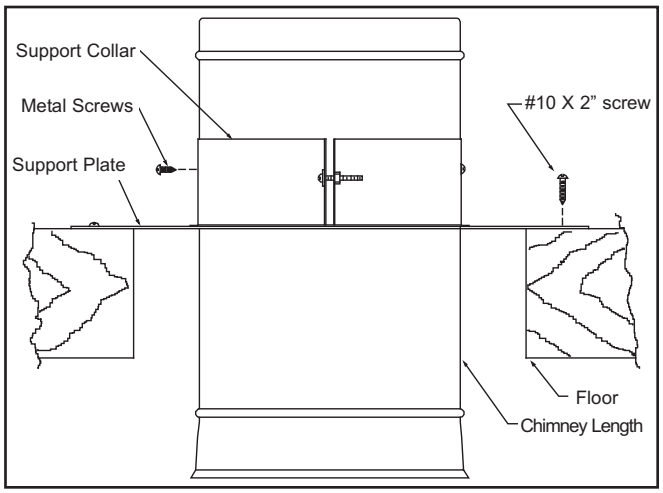
The chimney may be supported directly on top of the appliance. This is achieved by attaching a Universal Adaptor Plate (AP) directly to the outlet of the appliance. There are many flue collar designs as there are boiler manufacturers.



Custom plate sizes and hole patterns are available upon request.

The maximum supported height is the lesser of: the maximum allowable weight that the appliance can support or the height specified in our technical specifications.

1. Attach the adaptor plate to the appliance flue outlet using clamps, bolts or stainless steel metal screws depending on the flue outlet type.



2. Place the first chimney length on the adaptor plate.

3. Attach the chimney length to the adaptor plate using stainless steel metal screws through the adaptor plate retaining brackets.

BASE SUPPORT (BS)

This Support may be attached to a combustible or non-combustible floor or roof.

1. Attach the support to the floor or roof using at least a #10 X 2" screw through each hole in the support.

2. Place the support collar around the chimney length at the desired height. Tighten the ring and then screw the stainless steel metal screws (supplied with support) through the collar and into the chimney casing. Be sure to use a metal screw in each prepunched hole.

3. Place the chimney and collar in the support.

4. Continue installing chimney lengths as required.

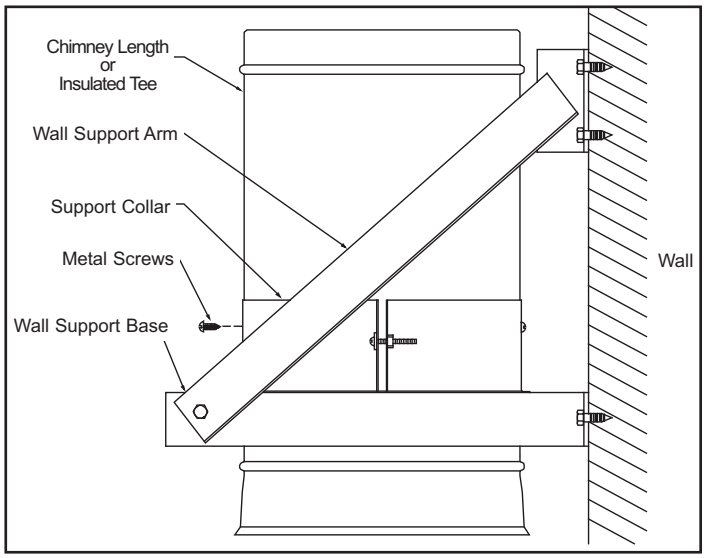
The Minimum Hole Size (1000°F flue gas)

Chimney Size (I.D.)	6”	8”	10”	12”	14”	16”	18”	20”
Combustible	12”	14”	16”	18”	20”	22”	24”	26”
Non-Combustible	9”	11”	13”	15”	17”	19”	21”	23”

Chimney Size (I.D.)	22”	24”	26”	28”	30”	32”	34”	36”
Combustible	28”	34”	38”	40”	44”	46”	50”	52”
Non-Combustible	25”	27”	29”	31”	33”	35”	37”	39”

Chimney Size (I.D.)	38”	40”	42”	44”	46”	48”
Combustible	56”	58”	60”	62”	64”	66”
Non-Combustible	41”	43”	45”	47”	49”	51”

The Minimum Hole Size (1400°F flue gas)



Chimney Size (I.D.)	6”	8”	10”	12”	14”	16”	18”	20”
Combustible	12”	14”	16”	18”	24”	28”	32”	34”
Non-Combustible	9”	11”	13”	15”	17”	19”	21”	23”

Chimney Size (I.D.)	22”	24”	26”	28”	30”	32”	34”	36”
Combustible	38”	40”	42”	44”	46”	48”	50”	52”
Non-Combustible	25”	27”	29”	31”	33”	35”	37”	39”

Chimney Size (I.D.)	38”	40”	42”	44”	46”	48”
Combustible	56”	58”	60”	62”	64”	66”
Non-Combustible	41”	43”	45”	47”	49”	51”

WALL SUPPORT (WS)

This support may be attached to a combustible or non-combustible wall. It may be used to support an Insulated Tee or a Chimney Length.

1. Attach the main support plate to the wall using at least a #10 X 2" screw through each hole in the plate. Make sure the support is horizontal, then attach the angle arms to the wall above the support.

2. Place the support collar around the chimney length at the desired height. Tighten the ring and then screw the stainless steel metal screws (supplied with support) through the collar and into the chimney casing. Be sure to use as many metal screws as there are prepunched holes in the chimney lengths.

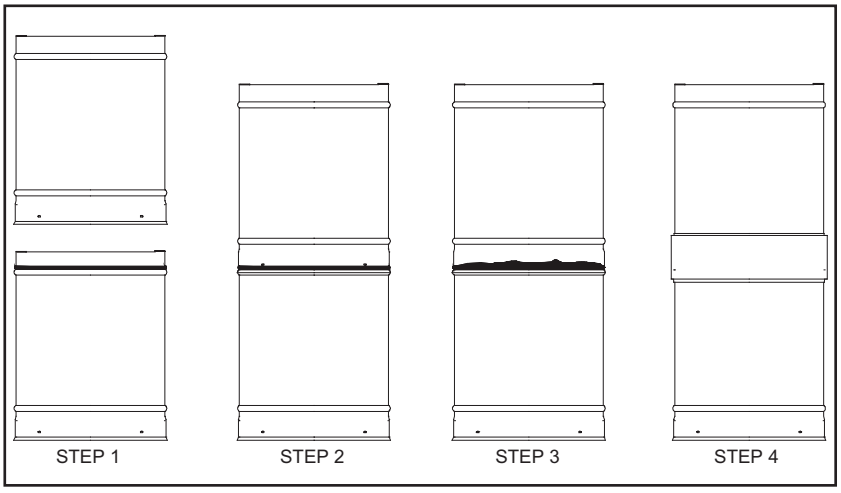
3. Place the chimney and collar in the support.

4. Continue installing chimney lengths as required.

CHIMNEY LENGTHS (L)

Typical for Chimney Length, Tee and Elbow installation.

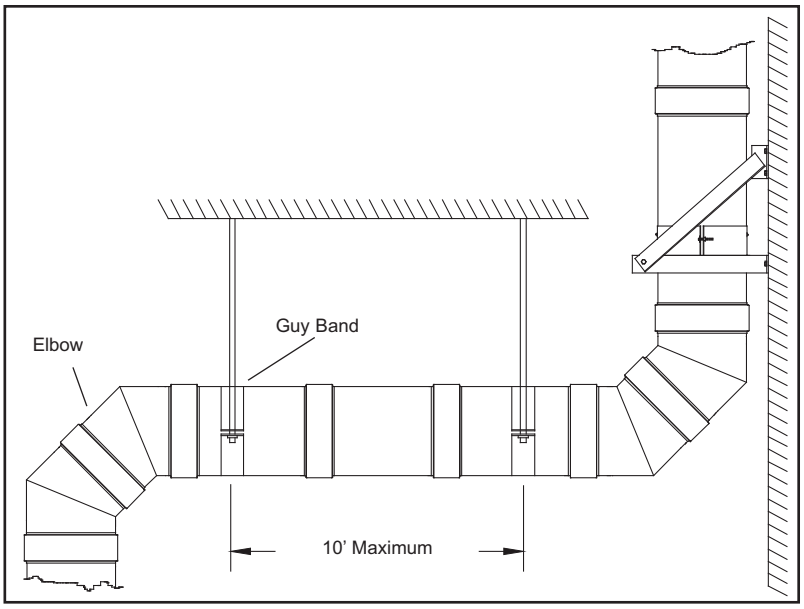
Install Chimney lengths as follows:



1. Before you fasten the chimney sections together apply caulking (apx. 3/16 Ø) above the top bead of the first chimney section.

2. Firmly place the next chimney section on top of the first section. Screw the stainless steel metal screws (supplied with the length) through the prepunched holes in the bottom of the length and into the lower length. Be sure to use a metal screw in each prepunched hole.

3. Wipe the excess caulking over the screw heads and along the joint surface.



4. Install the locking band over the joint. The locking band overlaps one of the beads above and one of the beads below the joint.

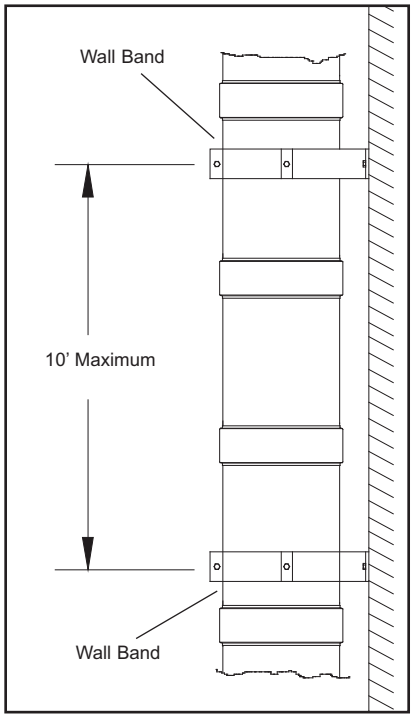
5. Continue until the required chimney height is achieved.

Note: *Only use the Caulking supplied by ICC with your chimney order.*

ELBOWS (E15, E22.5, E30, E45)

Elbows are used to offset the chimney in order to bypass a building obstruction. The number of elbows used and the degree of offset should be kept to a minimum because offsets reduce the draft available to the chimney.

The elbows are attached and sealed in the same manner as the chimney lengths.



A support must be used above any offset.

A Guy Band (GB) must be used for any offset of more than ten feet. Use additional Guy Bands at ten foot intervals of the offset chimney.

1. Place the elbow on the chimney length.

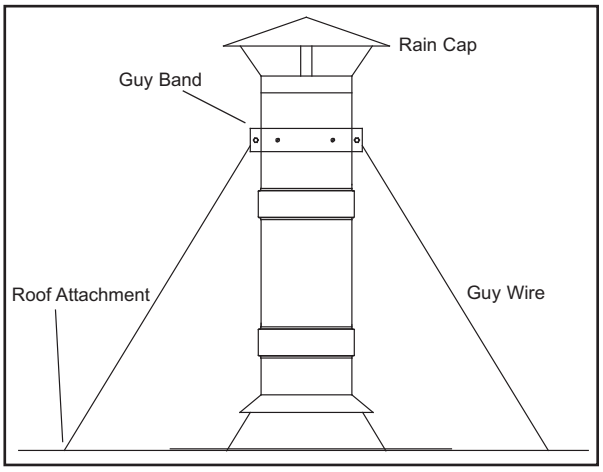
2. Screw the stainless steel metal screws (supplied with the elbow) through the prepunched holes in the bottom of the elbow and into the lower length. Be sure to use a metal screw in each prepunched hole.

WALL BAND (WB)

The Wall Band is used to secure the chimney to an exterior or interior wall. The recommended maximum length of chimney between wall bands is ten feet.

1. Choose a convenient location for the Wall Band.

2. Place the band collar around the chimney length at the desired height. Tighten the ring and then screw the stainless steel metal screws (supplied with wall band) through the collar and into the chimney casing. Be sure to use a metal screw and sealant in each prepunched hole.



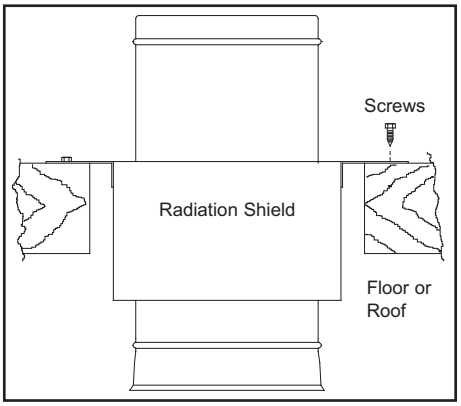
3. Attach the band arms to the collar using the bolts supplied.

4. Attach the band arms to the wall a minimum of #10 X 2" metal screws through each hole in the support.

GUY BAND (GB)

The Guy Band may be used to support an offset chimney. The maximum distance between Guy Bands is ten feet.

The Guy Band may also be used to secure a chimney above the roof. The maximum length of unguyed chimney above the roof is five feet. The maximum length of guyed chimney above the roof is twenty feet. The maximum length of chimney between guy bands is ten feet. If height greater than twenty feet is required above the roof, an engineered support system should be installed.



1. Place the band collar around the chimney length at the desired location. Tighten the ring and then screw the stainless steel metal screws (supplied with the band) through the band and into the chimney casing. Be sure to use a metal screw in each prepunched hole.

2. Attach guy wires to the band and to the roof or ceiling using adequate attachments (not supplied). Tighten the guy wires until the chimney is properly located and secure.

RADIATION SHIELD (RS)

The Radiation Shield is used to shield the chimney when passing through a combustible floor or roof.

1. Install the length of chimney that passes through the floor or roof.

2. Fit the Radiation Shield over the chimney and position it so that the attachment tabs touch the floor or roof.

3. Attach the tabs to the floor or roof using #8 X 2" screws.

The Minimum Hole Size (1000°F flue gas)

Chimney Size (I.D.)	6”	8”	10”	12”	14”	16”	18”	20”
Hole size	12”	14”	16”	18”	20”	22”	24”	26”

Chimney Size (I.D.)	22”	24”	26”	28”	30”	32”	34”	36”
Hole size	28”	34”	38”	40”	44”	46”	50”	52”

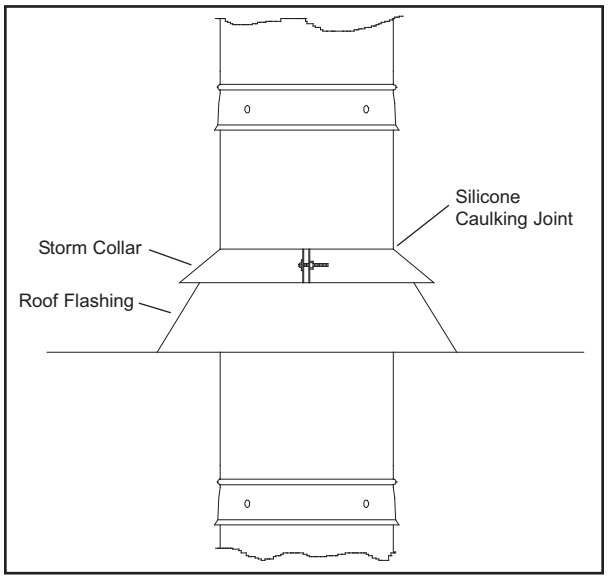
Chimney Size (I.D.)	38”	40”	42”	44”	46”	48”
Hole size	56”	58”	60”	62”	64”	66”

The Minimum Hole Size (1400°F flue gas)

Chimney Size (I.D.)	6”	8”	10”	12”	14”	16”	18”	20”
Hole size	12”	14”	16”	18”	24”	28”	32”	34”

Chimney Size (I.D.)	22”	24”	26”	28”	30”	32”	34”	36”
Hole size	38”	40”	42”	44”	46”	48”	50”	52”

Chimney Size (I.D.)	38”	40”	42”	44”	46”	48”
Hole size	56”	58”	60”	62”	64”	66”



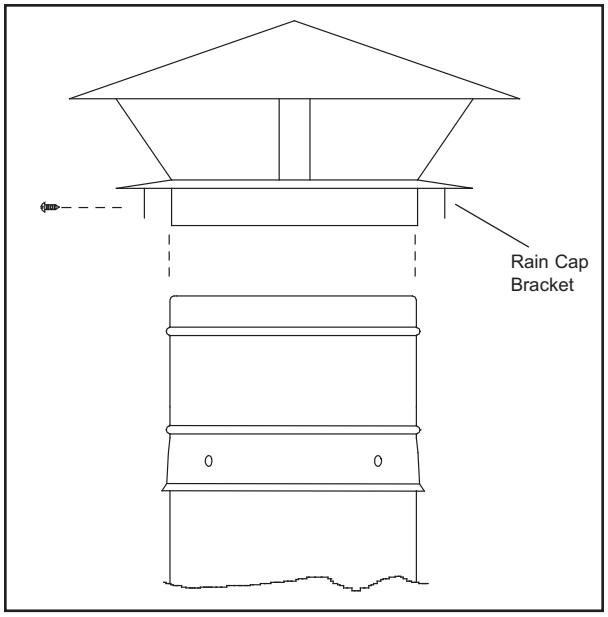
ROOF FLASHING (FF, FA, FB, FC)

1. Put the roof flashing in place. Seal the joint between the roof and the flashing with roofing pitch.

   For sloping roofs, place the flashing under the upper shingles and on the top of the lower shingles.

2. Nail the flashing to the roof using roofing nails.

3. Place the storm collar over the chimney and the flashing. Tighten it with the bolt supplied making sure the joint is properly caulked.



RAIN CAP (RC) AND EXIT CONE (EC)

A chimney must be terminated using either a Rain Cap or an Exit Cone. If an Exit Cone is installed, then a Drain Tee Cap (DT) must be installed.

1. Fit the Cap or Cone on to the top chimney length.

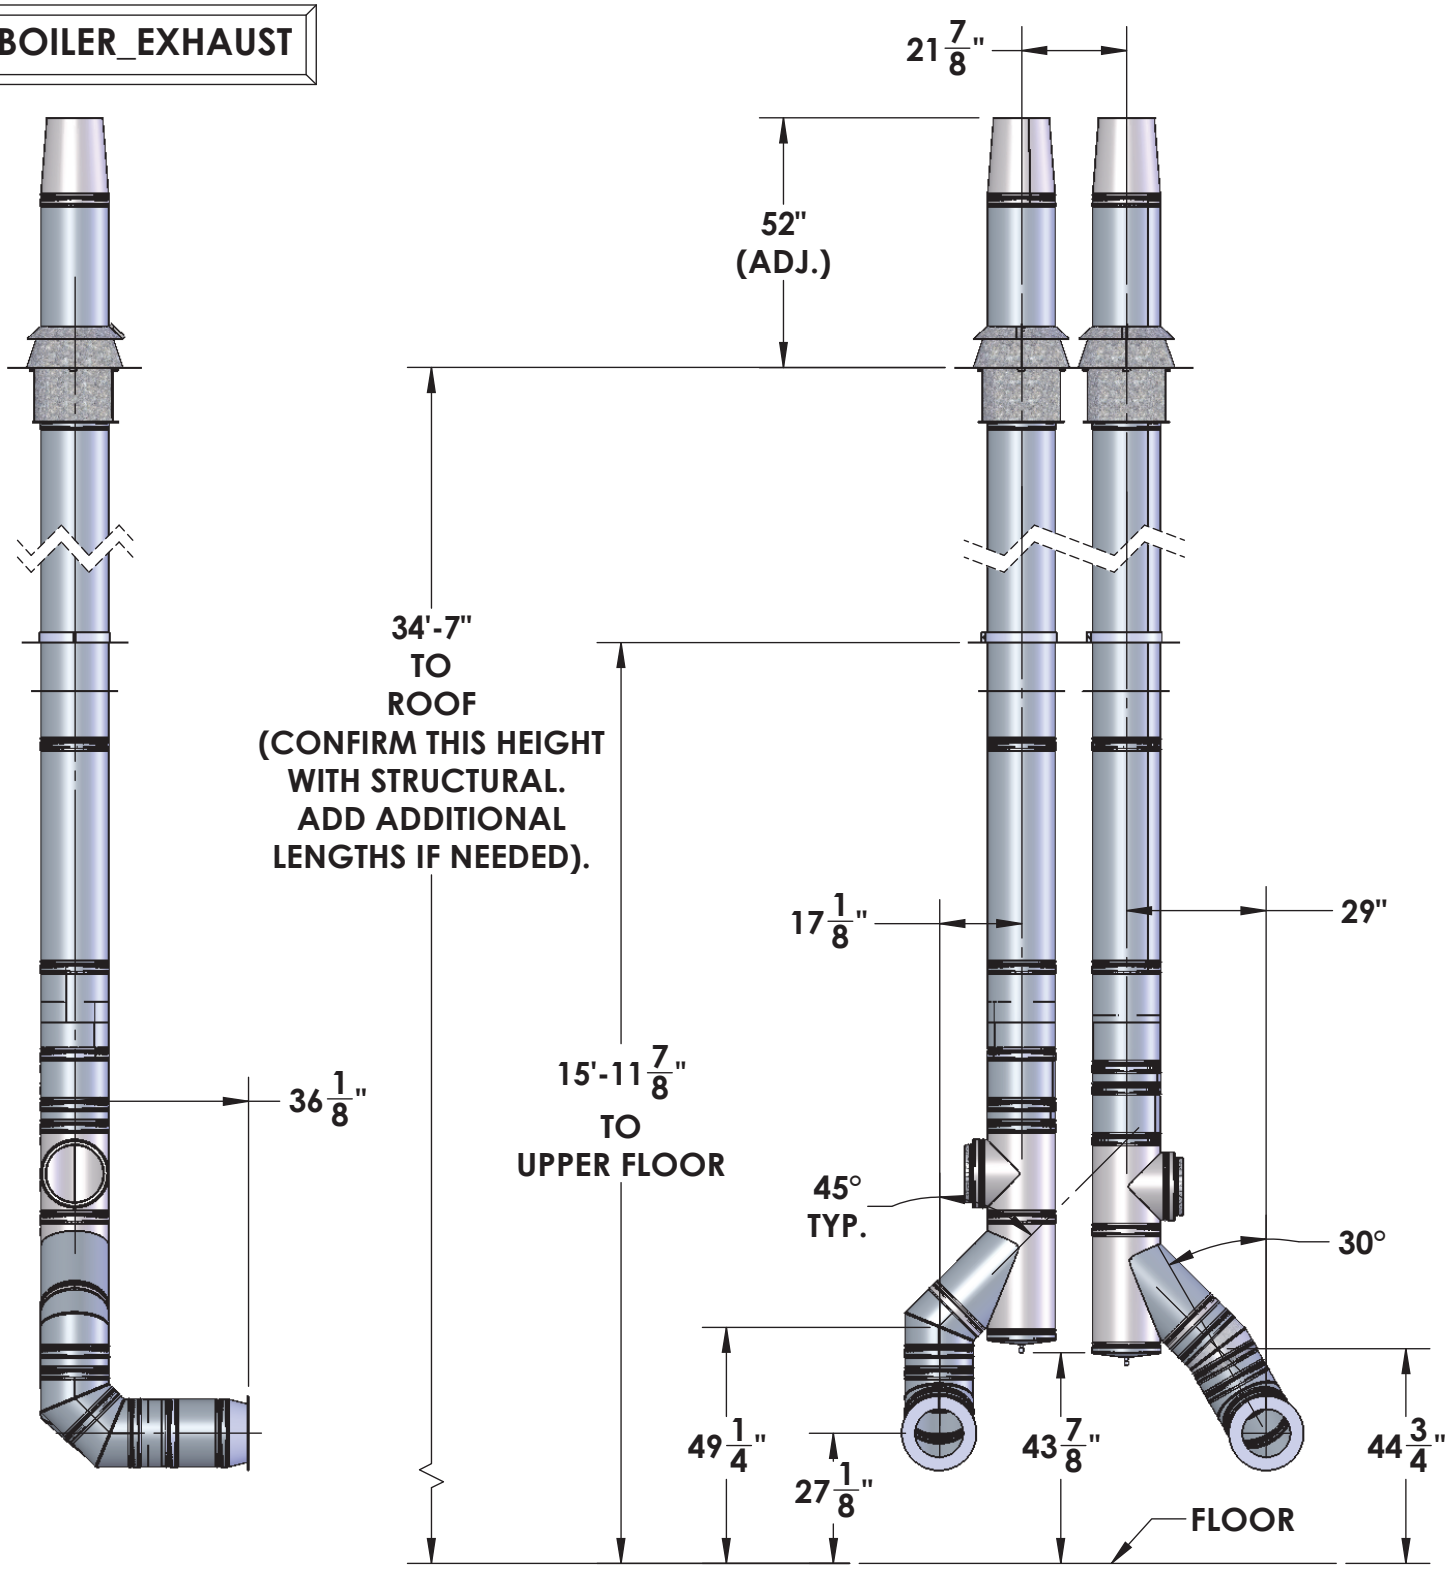
2. Screw the stainless steel metal screws (supplied with the cap) through the prepunched holes in the bottom of the cap and into the lower length. Be sure to use a metal screw in each prepunched hole.

ADJUSTABLE LENGTH (A1, A2)

The adjustable length is to allow the chimney to fit in a fixed distance when a suitable standard length is not available. Typical applications are between two elbows when a fixed offset distance is required or between two boiler outlet flanges which are a fixed distance apart.

The length of the outer casing of the adjustable length must be set before it is installed. The adjustable length is installed by sliding the flue (inner stainless steel) into the section below it after the two piece outer casing has been adjusted to the correct overall length. The adjustable length should be installed with a straight chimney section below it, there is not sufficient room for it to adjust into a tee or elbow.

1. Measure the exact length required, be sure to allow for the overlap between chimney sections.



2. Slide the two piece outer casing together until the correct overall length is achieved.

3. Fasten the two casing sections together using the stainless steel sheet metal screws provided. Be sure to put a screw and sealant in each pre-punched hole.

4. Cut off the exposed insulation. You do not need to remove any extra insulation in order to allow for overlap, the insulation will compress sufficiently when assembled.

5. Slide the flue into the length below it and fasten the exterior together in the same manner as a conventional chimney section. It may require somewhat more effort to connect the adjustable length since you are compressing the insulation at the same time.

HYDRONIC PUMPS

Product photo could vary from the actual product

Product No.: 96402934

The pump is of the canned rotor type, i.e. pump and motor form an integral unit without shaft seal and with only two gaskets for sealing.
The bearings are lubricatd by the pumped liquid.

In order to avoid problems in connection with disposal, great importance has been attached to using as few different materials as possible.

SPEC 23 21 23
PUMP SCHEDULE
DRAWING M802

The pump is characterized by:
* 3 speed motor.
* Ceramic radial bearings.
* Carbon axial bearing.
* Stainless steel rotor can, bearing plate and rotor cladding.
* Aluminium alloy stator housing.
* Bronze pump housing.
* Stator with built-in thermal switch.

The motor is a 3-phase motor.

The pump is supplied with a standard module in the terminal box.
The standard module is to be connected to the mains supply via external contactor.

Controls:

Relay:	without relay

Liquid:

Pumped liquid:	Water
Liquid temperature range:	14 .. 248 °F
Liquid temperature during operation:	140 °F
Density:	61.35 lb/ft³

Technical:

Actual calculated flow:	8.158 l/s
Resulting head of the pump:	2.756 m
Approvals on nameplate:	CUL

Materials:

Pump housing:	Cast Iron DIN W.-Nr. 2.1176.01
Impeller:	Stainless steel DIN W.-Nr. 1.4301 AISI 304

Installation:

Range of ambient temperature:	32 .. 104 °F
Maximum operating pressure:	145.04 psi
Flange standard:	ANSI
Type of connection:	F
Pipe connection:	GF 100

Do not install pump larger than 215JM in vertical piping.

Pressure and drain tap locations are approximate.

Suction and discharge flanges, are cast per 250# ANSI thickness and diameter. All flanges are flat face. Some holes may be threaded because of nut clearances.

NOT FOR CONSTRUCTION, Unless certified and referenced on order

HYDRONIC PUMP

Product photo could vary from the actual product

Product No.: 96404950

The pump is of the canned rotor type, i.e. pump and motor form an integral unit without shaft seal and with only two gaskets for sealing.
The bearings are lubricatd by the pumped liquid.

In order to avoid problems in connection with disposal, great importance has been attached to using as few different materials as possible.

SPEC 23 21 23
PUMP SHEDULE
DRAWING M802

The pump is characterized by:

* 3 speed motor.
* Ceramic radial bearings.
* Carbon axial bearing.
* Stainless steel rotor can, bearing plate and rotor cladding.
* Aluminium alloy stator housing.
* Cast iron pump housing.
* Stator with built-in thermal switch.

The motor is a 3-phase motor.

The pump is supplied with a standard module in the terminal box.
The standard module is to be connected to the mains supply via external contactor.

Controls:

Relay:	without relay

Liquid:

Pumped liquid:	Water
Liquid temperature range:	14 .. 248 °F
Liquid temperature during operation:	140 °F
Density:	61.35 lb/ft³

Technical:

Actual calculated flow:	2.971 l/s
Resulting head of the pump:	6.364 m
Approvals on nameplate:	CUL

Materials:

Pump housing:	Cast iron EN-JL1040 ASTM 35 B - 40 B
Impeller:	Stainless steel DIN W.-Nr. 1.4301 AISI 304

Installation:

Range of ambient temperature:	32 .. 104 °F
Maximum operating pressure:	145.04 psi
Flange standard:	USA Oval
Type of connection:	F

1. Product introduction

Introduction

The Grundfos UP(S) Series 200 line of wet rotor circulators is unique to commercial building services. Most competitor pumps are dry runners. UP(S) wet rotor circulators, on the other hand, are designed so that the water being pumped surrounds the rotor, cooling and lubricating the shaft and bearings.

GrA3223, GrA3217

Fig. 1 Grundfos UP, UPS Series 200 circulator pumps

Wet rotor design eliminates the need for a fan to cool the motor. Fans are often a source of noise and vibrations that can resonate throughout a building via the pipework. Eliminating the fan results in very quiet operation.

UP(S) Series 200 pumps are available in cast iron construction for closed (heating and air conditioning) and bronze construction for open (domestic hot water) systems.

Both cast iron and bronze UP(S) Series 200 pumps utilize laser-welded stainless steel impellers to achieve high pump efficiency.

The standard UP(S) motors are suitable for variable speed drive applications.

Terminal box modules

UPS pumps are equipped with a standard or protection module in the terminal box. Pumps with standard module must be connected to the power supply via an external contactor, whereas pumps with protection module can be connected directly to the power supply.

For further information about the different modules, see pages 17 through 18.

Applications

The pumps are designed for circulation of liquids in heating and air-conditioning systems. They can also be used in domestic hot-water systems.

Applications for the UP(S) pumps include:

- Heating systems for apartments, colleges, hospitals, institutions and schools
- hot water recirculation for hotels, colleges institutions, hospitals, and apartments
- large residential heating
- snow melt.

To ensure optimum operation, the dimensioning range of the system must fall within the performance range of the pump. See sections *6. Operating conditions* on page 13 and *8. Technical data* on page 19.

Pumped liquids

Grundfos UP, UPS Series 200 pumps are suitable for pumping thin, clean, non-aggressive and non-explosive liquids, not containing any solid particles, fibers or mineral oil.

In domestic hot-water systems it is advisable to use bronze pumps only for water with a degree of hardness lower than approx. 14°dH. For water with a higher degree of hardness, a Grundfos TP dry-rotor pump is recommended.

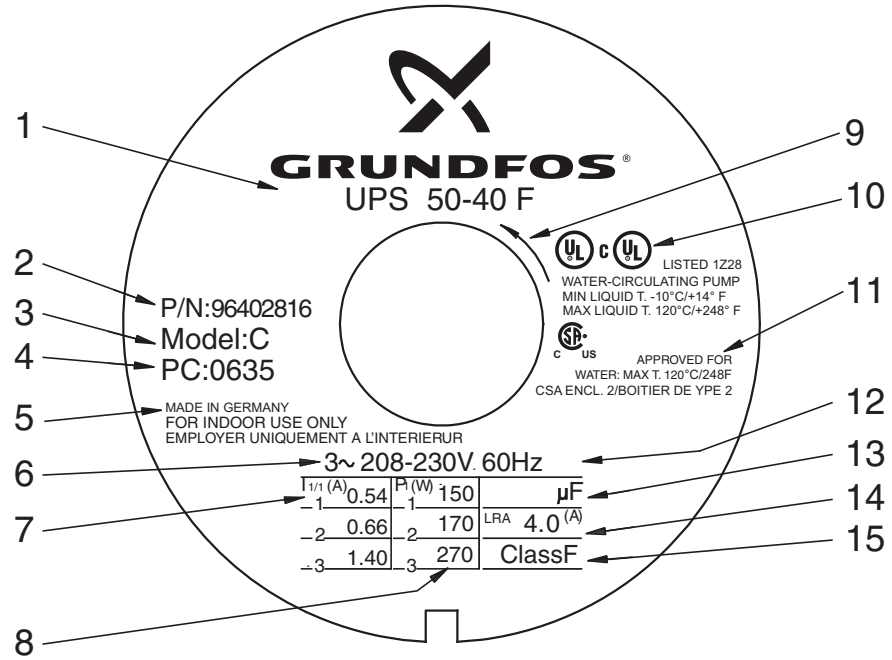
The pumps must **not** be used for the transfer of flammable liquids such as diesel oil and gasoline.

For liquid temperature, see section *6. Operating conditions* on page 13.

Features and benefits

The Grundfos range of UP(S) Series 200 circulator pumps offer many beneficial features:

- Quiet
- maintenance-free
- UPS pumps have a 2 or 3 speed switch, which increases the comfort level for the application
- small profile (one piece vs. three piece)
- sealless, which eliminates worries about hot water leakage
- pumped water lubricates the shaft and bearings so there is no oil to leak
- no couplers to change.



Identification

Type key

Example	UPS	50	-40	(/2)	F	(B)
Type range - UP: Single-speed pump - UPS: Two- or three-speed pump						
Nominal flange diameter [mm]

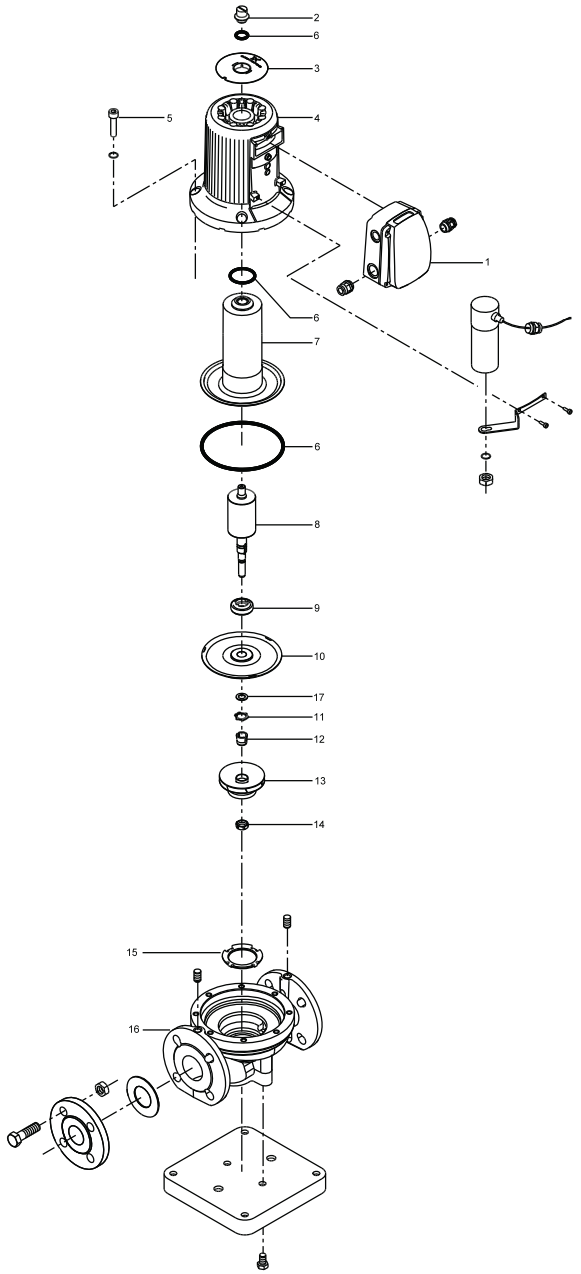
5. Construction

Construction



UP(S) Series 200 pumps are of the canned rotor type, i.e. pump and motor form an integral unit without shaft seal and with only two gaskets for sealing.

The bearings are lubricated by the pumped liquid.

Attention has been focused on using as few materials as possible, and the use of materials that might cause problems in connection with disposal have been omitted.

Features:

- UPS motors are two- or three-speed motors.
  UP motors are single-speed dual-voltage motors.
- Stainless steel rotor can, bearing plate and rotor cladding.
- Stator housing in aluminum alloy.
- Cast iron or bronze pump housing.
- Stator with built-in thermal overload switch.

17	Anti-friction ring	PTFE	
18	Splash protector	Stainless steel	AISI 303

Sectional drawing

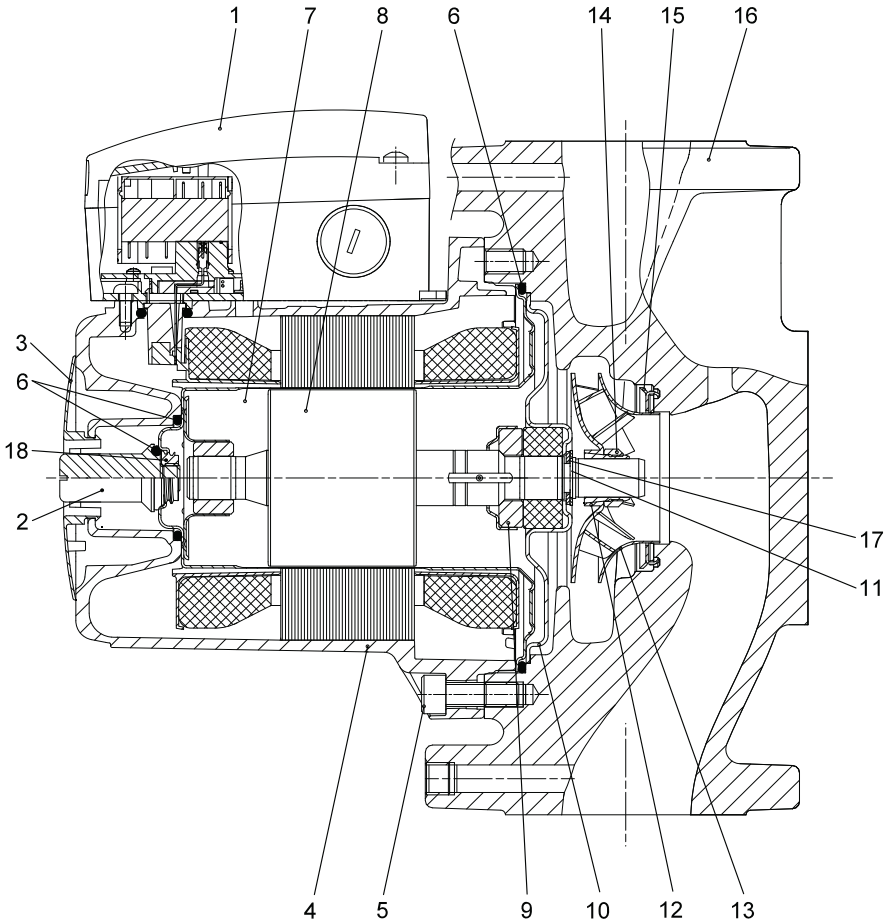

Fig. 3 Sectional view

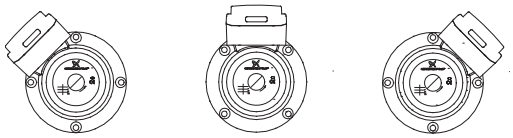
Motor



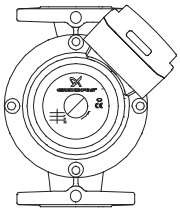
The motor, pos. 4, is a 2- or 4-pole, asynchronous squirrel-cage motor. As the motor is cooled by the pumped liquid, the noise level is very low.

Stator housing

Pressure die-cast aluminum stator housing can be turned to change the position of the terminal box.

The stator housing has eight drain holes to enable condensed water to escape. The vent hole under the terminal box allows the water to evaporate from the stator. The drain holes must point downwards.

The permissible terminal box positions are shown in the drawing below. The positions apply to both vertical and horizontal mounting.



TM02 1398 1101

Fig. 4 Possible terminal box positions

Note: The terminal box must only be turned to the above positions.

The drawing below shows the standard box position.

TM03 2260 4005

Fig. 5 Standard terminal box position

The nameplate can be turned in steps of 45°.

The positions of the terminal box and the nameplate are changed as described above.

The stator wires are self-bonding. The wires and the terminal box are connected by a terminal plug.

The stator incorporates a thermal overload switch for protection of the motor if the winding temperature becomes too high.

Rotor can

The rotor can (pos. 7) is made of drawn steel sheet and fitted with an inspection screw directly at the top.

There is an O-ring seal between the inspection screw and the rotor can. For reasons of safety, the hole for the inspection screw will deflect a possible jet of liquid if the inspection screw is removed.

The outer radial bearing is fitted into the top of the rotor can.

Shaft with rotor

The shaft (pos. 8) is made of stainless steel and equipped with two tungsten carbide bearings.

To further improve the internal circulation of the pumped liquid in the rotor can, the shaft of 4-pole motors is fitted with a small rotor impeller.

The rotor is made of soft-annealed iron lamination and provided with copper or brass bars. The short-circuit rings are made of copper.

The rotor is encapsulated in a thin stainless steel cladding and dynamically balanced.

The thrust bearing is secured to the shaft in a spherically flexible suspension.

Bearing plate

The bearing plate (pos. 10) is made of stainless steel.

The inner radial bearing is pressed into the bearing plate, ground and honed. The relatively large bearing plate surface means that motor heat is effectively carried away by the pumped liquid.

Impeller

The stainless steel impeller (pos. 13) is of the radial type with curved blades. It is secured to the shaft by a split cone and nut (left-hand thread).

Pump housing

The pump housing (pos. 16) is available in cast iron or bronze. All pump housings are flanged for the individual markets.

See also section *4. Cross-reference guide* on page 8 and section *5. Construction* on page 10 concerning flanges and port-to-port lengths.

The pump housing is of the in-line type. A stainless steel/PTFE neck ring minimizes the recirculation and improves pump efficiency.

The bottom of the housing has threaded holes for fastening to a baseplate.

6. Operating conditions

Pumped liquids

CAUTION: This pump is intended for use with water only.

Grundfos UP(S) pumps can be used to circulate

- Potable hot water
- Water for hydronic heating
- Water/glycol mixtures up to 50/50
- Cooling water.

In domestic hot-water systems it is advisable to use a bronze pump (UP(S) model) only for water with a degree of hardness lower than 14 grains per gallon of hardness. For water with a higher degree of hardness, a direct coupled TP pump is recommended.

If the pump is installed **in a heating system**, the water should meet the requirements of accepted standards on water quality in heating systems.

In water/glycol mixtures, in order to prevent the glycol from degrading, temperatures above those for which the fluid is rated should be avoided and time spent at high temperatures minimized.

It is also important that the system is cleaned and flushed prior to the installation of the glycol mixture.

In order to avoid problems with corrosion or precipitation, the glycol fluids should be checked and maintained regularly. If further dilution of the supplied glycol is required, follow the requirements of the supplier of the glycol.

The pump is lubricated and cooled by the liquid being pumped. Therefore, the pumped liquid must always be allowed to circulate through the pump. Extended periods without circulation will cause premature wear to the bearings and excessive motor heat. The pumped liquid must also meet the following requirements.

The pumping of liquids with densities or kinematic viscosities higher than those of water will cause

– a considerable pressure drop
– a drop in the hydraulic performance
– a rise in the power consumption.

In these situations, contact Grundfos for assistance.

Temperature limits

Ambient air temperature	32 °F to 104 °F (0 °C to 40 °C)	
Fluid temperature, open systems	140 °F (60 °C).	
Fluid temperature, closed systems	UPS pumps:	248 °F (120 °C).
	UP pumps:	230 °F (110 °C).

Other technical data

Relative humidity: Max. 95 %.

Sound-pressure level: The sound-pressure level of the pump is lower than 41 dB(A) (reference: 20 mPa).

Max. working pressure: 145 psi (10 bar).

Approvals: See the pump nameplate.

Inlet pressure

To avoid cavitation noise, the following minimum pressures are required at the pump suction flange:

UP(S) model	Liquid temperature					
	167 °F (75 °C)		194 °F (90 °C)		230 °F (110 °C)	
	[psi]	[ft]	[psi]	[ft]	[psi]	[ft]

Electrical data

Supply voltage and frequency

UPS: 115 V, 230 V, 1-phase 60 Hz, 208-230 V, 460 V, 575 V, 3 phase 60 Hz.

UP: 115 V, 230V, 1-phase 60 Hz, 460 V, 575 V, 3-phase 60Hz.

Back-up fuse: Max. 10 A.

Enclosure class: IP 44 indoor use only.

Supply voltage tolerances

The motors meet the requirements to temperature rise at - 6 / +6 %.

Furthermore, the motors have been tested at -10 / +10 % of the voltage range. During these tests, the motors operate without problems and without being thermally cut out.

The motor voltage tolerances are intended for power supply voltage variations. They should not be used for running motors at other voltages than those stated on the name plates.

Variable speed applications

All 3 x 460 V, 3 x 575 V and 3-speed 3 x 208-230 V pumps with standard module are suitable for frequency converter applications. Please refer to section *Variable frequency drive operation* on page 17 for further information.

Terminal box

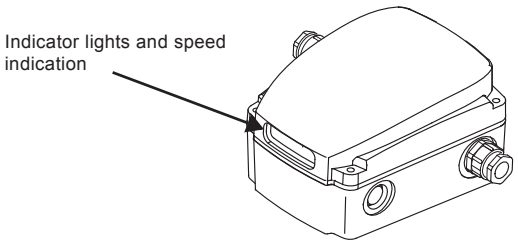

Fig. 6 Terminal box

The terminal box with cover (pos. 1) is made from black composite material.

The terminal box is equipped with:

- 1 x 1½" NPT screwed cable entry for mains connection, to be fitted during installation.
- 1 x M16 screwed cable entry for capacitor connection (only single-phase pumps)
- 2 x indicator lights (single-phase pumps with standard module have just one).
  Note: UPS pumps only.
- window for indication of speed.
  Note: UPS pumps only.

The terminal box is fastened to the stator housing with screws and connected to the stator by a terminal plug.

★ Canada only
■ Standard
Δ The speed is changed by reconfiguring the jumper positions, located in the terminal box.
● Optional
❑ Required
◆ External contactor is not required when using the Protection Module option.
Standard module: Indicator lights with no motor protection. For motor protection, use Protection Module for 1 x 115/230 V and 3 x 208/230 V units or use an external contactor.
Protection module: Indicator lights with built-in motor protection. Connect directly to line voltage.
Note: Pumps with protection module must not be connected to a variable frequency drive (VFD).
Relay module: Indicator lights with signal output for external control or fault indication (1 x 115/230 V or 3 x 208/230 V units only).
External contactor required: Pump must be connected to line voltage via an external contactor. The contactor is to be connected to the pump's build-in thermal overload terminals. The speed is changed by orientation of the internal jumpers.

Description of functions

Three-speed pumps

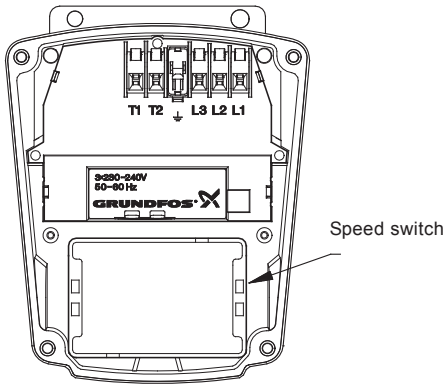

Fig. 7 3 x 208/230V terminal box

By means of the speed switch, the pump performance can be adjusted to suit the system in question.

For 1 x 115/230 V and 3 x 208/230 V three-speed pumps only. The module is located inside the terminal box. It has three positions:

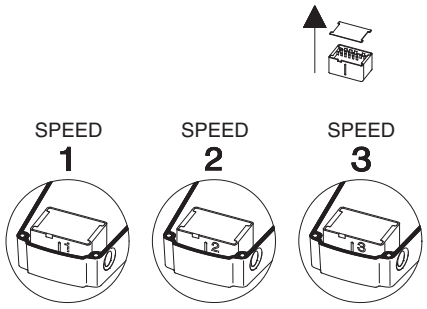

Fig. 8 Speed switch module

Switch position	Speed in % of maximum speed	
	Single-phase pumps	Three-phase pumps
1	approx. 60%	approx. 70%
2	approx. 80%	approx. 85%
3	100%	100%

Note: UP pumps runs at 100%.

Change to a lower speed enables considerable reduction in energy consumption and less noise in the system.

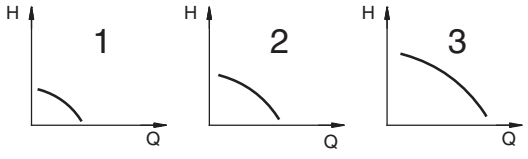

Fig. 9 Pump performance at the three speeds

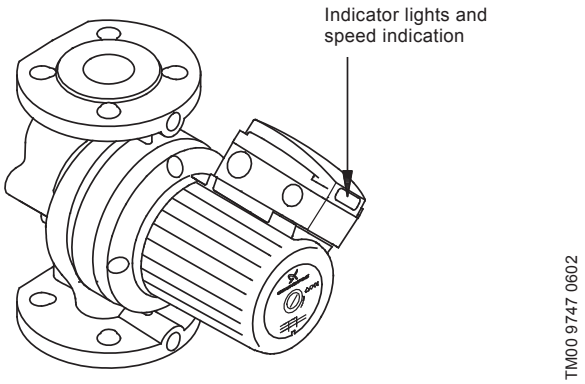

Fig. 10 UPS Series 200 pump with terminal box mounted

Two-speed pumps

All UPS pumps with 3 x 460 V & 575 V terminal boxes are fitted with a special two-speed terminal block.

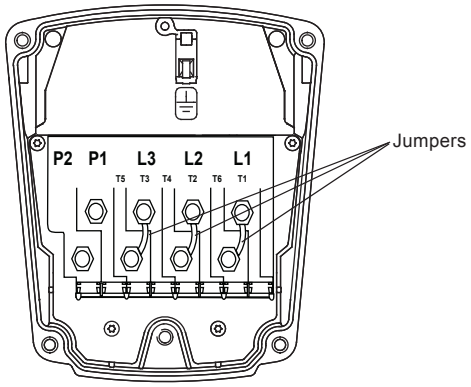

Fig. 11 3 x 460 V & 575 V terminal box

The speed is changed by changing the jumper positions.

The pump must be connected to the mains via an external contactor. The contactor is to be connected to the pump's built-in thermal overload switch (terminals P1 and P2) to protect the pump against overheating at both speeds.

Speed selection (two-speed, 3 x 460 V and 575 V)

The speed setting in the terminal box can be changed to two positions. The speed in the two positions appears in the table below

Speed step	Speed in % of maximum
1	Approx. 75%
2	100%

Single-speed pumps

UP pumps (1 x 115/230 V)

UP pumps are single-speed pumps with a 1 x 115 V/230 V terminal box with a dual-voltage terminal block. See fig. 12.

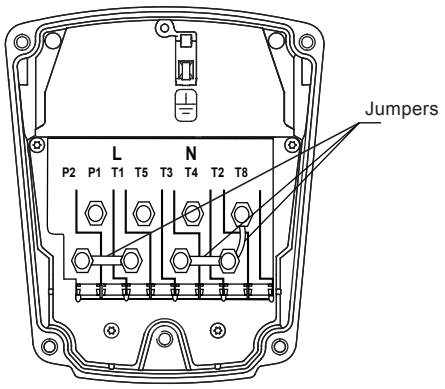

Fig. 12 1 x 115/230 V terminal box

The voltage is changed by changing the orientation of the jumpers. See fig. 12.

The pump must be connected to the power supply via an external switch.

The UP pumps are equipped with a built-in, automatically resetting terminal overload switch, protecting the pump at both 115 V and 230 V. The built-in terminal overload switch (terminals P1 and P2) can optionally be connected to external overload protection.

Pumps with standard module

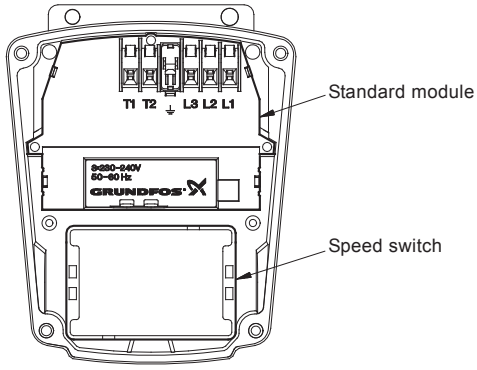

Fig. 13 Terminal box with standard module

The standard module is standard in three-phase pumps with three speeds and forms connection between supply terminals and motor.

The pumps with standard module must be connected to the power supply via an external contactor.

For motor protection the contactor is to be connected to the pump's built-in thermal overload switch to protect the pump against overheating at all three speeds.

Standard module indicator lights

The indicator lights on pumps with standard module show whether the pump is live, or whether the phase sequence of three-phase pumps is wrong.

Single-phase pumps

Single-phase pumps incorporate a green indicator light only:

Indicator light	Description
On	The electricity supply has been switched on.
Off	The electricity supply has been switched off, or the pump has been cut out by the thermal overload switch.

Three-phase pumps

Three-phase pumps have a green and a red indicator light:

Indicator lights		Description
Green	Red	
Off	Off	The electricity supply has been switched off, or the pump has been cut out by the thermal overload switch.
On	Off	The electricity supply has been switched on.
On	On	The electricity supply has been switched on. The direction of rotation is wrong.

Variable frequency drive operation

All 3 x 460 V, 3 x 575 V and 3-speed 3 x 208-230 V pumps with standard module are suitable for variable frequency drive (VFD) applications. Please note the following:

- Even if the red indicator light is on, the pump is operating normally.
- Pumps fitted with other modules than the standard module must not be connected to a VFD.
- Depending on the VFD type, this may cause increased acoustic noise from the motor. Furthermore, it may cause the motor to be exposed to detrimental voltage peaks.
- The motor must be protected against voltage peaks higher than 650 V between the motor terminals.

Acoustic noise and detrimental voltage peaks can be reduced by fitting an LC filter between the VFD and the motor.

Pumps with protection module

The protection module is standard for single-phase UPS pumps and available for 3 x 208-230 V UPS pump models only as an option.

When fitted with a protection module, the pump can be connected directly to the power supply switch as it will be protected by the built-in overload protection.

The protection module incorporates two indicator lights.

Protection module indicator lights

Indicator lights		Description
Green	Red	
Off	Off	The pump has been stopped. The electricity supply has been switched off.
On	Off	The pump is operating.
On	On	Three-phase pumps only: The pump is operating, but the direction of rotation is wrong.
Off	On	The pump has been cut out by the thermal overload switch.

Note: Pumps with protection module must not be connected to a variable frequency drive.

Pumps with relay module

The relay module is available for UPS pumps as an option for 1 x 115/230 V and 3 x 208-230 V units.

The module enables direct connection of the pump to an external power supply switch. Furthermore, the module has a signal output for external operating or fault indication. By means of a selector switch the output can be set to activation during operation or fault.

The pump is connected directly to the power supply as the pump incorporates overload protection at all three speeds.

Note: Pumps with relay module must not be connected to a variable frequency drive (VFD).

If the pump has been cut out by the thermal overload switch, it will restart automatically when it has cooled to normal temperature, provided the external on/off contact is closed.

Note: If the thermal overload switch has cut out the pump three times within a short time, the relay must be reset manually by switching off the electricity supply.

Relay module indicator lights

The relay module indicator lights provides detailed operating and fault indications.

All pumps with relay module incorporate a green and a red indicator light. Functions, see table in Signal output of relay module.

Signal output of relay module

The relay module has a signal output for external operating or fault indication.

By means of the selector switch, the signal output can be set to activation during operation or fault.

Operation: The output functions as operating indication between terminals 2 and 3.

Fault: The output functions as fault indication between terminals 1 and 3.

Indicator lights		Signal output set to		Description
Green	Red	Operation	Fault	
Off	Off			The pump has been stopped. The electricity supply has been switched off, or a phase is missing.
On	Off			The pump is operating.
On	On			**Only three-phase pumps**: The pump is operating, but with wrong direction of rotation.
Off	On			The pump has been cut out by the thermal overload switch.
Flash-ing	Off			The pump has been stopped by an external on/off switch.
Flash-ing	On			The pump is or has been cut out by the thermal overload switch, and it has been stopped by an external on/off switch.

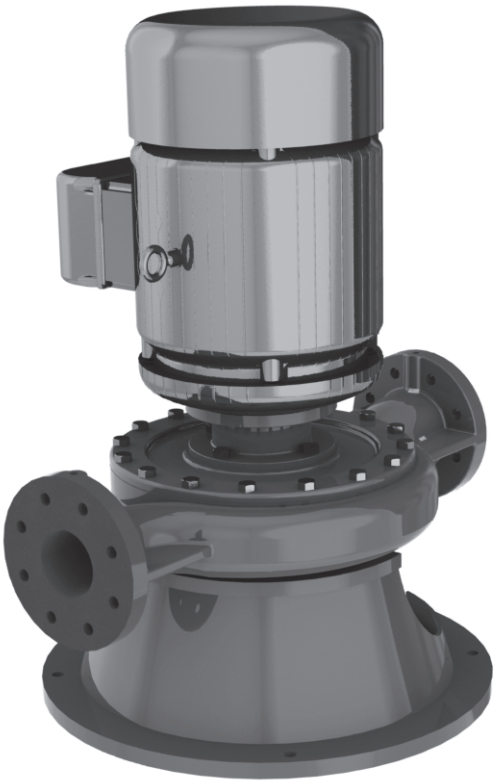
Two pumps plumbed in parallel

Operating modes

Both pumps must be fitted with a relay module.

In addition to the signal functions, the signal output of the relay module for two pumps in parallel can be used for controlling the operating mode of pump 1 and 2.

It is possible to choose between three operating modes:



1. **Alternating operation.** The pumps operate alternately as duty and standby pump, respectively. Changeover takes place every 24 hours. If the duty pump is cut out due to a fault, the standby pump will automatically start. During changeover both pumps will be running for a short period to ensure a low-noise changeover.
2. **Standby operation.** The pumps operate continuously as duty and standby pump, respectively. If the duty pump is cut out due to a fault, the standby pump will automatically start at a signal from the output of the duty pump. The sequence can be changed to make the standby pump operate as duty pump.
3. **Single-pump operation.** The pumps run independently without communicating with each other.

1. Symbols used in this document

The following symbols may be used in this document.

Warning

If these safety instructions are not observed, it may result in personal injury.

Warning

If these instructions are not observed, it may lead to electric shock with consequent risk of serious personal injury or death.

Warning

When pumping hazardous liquids, special attention must be paid to the risk of personal injury.

Warning

The surface of the product may be so hot that it may cause burns or personal injury.

Warning

The sound pressure level is so high that hearing protection must be used.

Caution ***If these safety instructions are not observed, it may result in malfunction or damage to the equipment.***

Note ***Notes or instructions that make the job easier and ensure safe operation.***

2. Terms and conditions of sale

2.1 The contract

The Contract shall be comprised of the following terms, together with such terms and conditions as are set forth in Seller's written proposal or quotation (the "Quotation"), including any documents, drawings or specifications incorporated therein by reference, and any additional or different terms proposed in Buyer's purchase order (the "Purchase Order") that are accepted by Seller in writing, which together shall constitute the entire agreement between the parties, provided, however, that preprinted terms on Buyer's purchase order or invoice shall not apply and Seller gives notice of objection to such terms. An offer by Seller in its Quotation that does not stipulate an acceptance date is not binding. This Contract shall be deemed to have been entered into upon written acknowledgment of the Purchase Order by an officer or authorized representative of Seller, which may not be modified, supplemented, or waived except in a writing executed by an authorized representative of the party to be bound.

2.2 Price

The price quoted in the Quotation shall be the Purchase Price unless otherwise agreed in the Purchase Order. The Purchase Price for equipment shall include packing for shipment.
Field Services shall be provided at Seller's standard rates.
All other costs, including packing for storage, freight, insurance, taxes, customs duties and import/export fees, or any other item not specified in the Contract, shall be paid by Buyer unless separately stated in the Quotation and included in the price quoted. Any sales, use, or other taxes and duties imposed on the transaction or the equipment supplied shall be paid or reimbursed by Buyer.

2.3 Payment terms

Payment shall be due within 30 days of the date of Seller's invoice in U.S. funds unless otherwise agreed. If Buyer does not observe the agreed dates of payment, Buyer shall pay interest to Seller on overdue amounts at a rate that is the higher of: 9 % per annum or a rate 5 % in excess of the rate borne from time to time by new issues of six-month United States Treasury bills.
Seller shall be entitled to issue its invoice for the Purchase Price for equipment upon the earlier of shipment, or notice to Buyer that Seller is ready to ship, and for services, upon completion.
If the Purchase Price exceeds $250,000 USD, Buyer shall pay the Purchase Price in Progress payments as follows: Fifteen percent (15 %) upon submittal of general arrangement drawings, thirty five percent (35 %) after receipt of first Bowl Casting, twenty percent (20 %) after first case/bowl hydro test or bowl machining and thirty percent (30 %) after notification of ready to ship.

2.4 Acceptance and inspection

All equipment shall be finally inspected and accepted by Buyer within 14 days after delivery or such other period of time as is agreed in the Purchase Order. Buyer shall make all claims (including claims for shortages), excepting only those provided for under the warranty clause contained herein, in writing within such 14-day period or they are waived. Services shall be accepted upon completion. Buyer shall not revoke its acceptance. Buyer may reject the equipment only for defects that substantially impair its value, and Buyer's remedy for lesser defects shall be in accordance with section 10, Warranty. If tests are made by Buyer to demonstrate the ability of the equipment to operate under the contract conditions and to fulfill the warranties in section 10, Buyer is to make all preparations and incur all expenses incidental to such tests. Seller will have the right of representation at such tests at its expense, and the right to technically direct the operation of the equipment during such tests, including requiring a preliminary run for adjustments.

2.5 Title and risk of loss

Full risk of loss (including transportation delays and losses) shall pass to Buyer upon delivery, regardless of whether title has passed to Buyer, transport is arranged or supervised by Seller, or start-up is carried out under the direction or supervision of Seller. Delivery shall be ex works, INCOTERMS 2000. Loss or destruction of the equipment or injury or damage to the equipment that occurs while the risk of such loss or damage is borne by Buyer does not relieve Buyer of its obligation to pay Seller for the equipment.

2.6 Patent or trademark information

If the equipment sold hereunder is to be prepared or manufactured according to Buyer's specifications, Buyer shall indemnify Seller and hold it harmless from any claims or liability for patent or trademark infringement on account of the sale of such goods.

2.7 Changes

Buyer may request, in writing, changes in the design, drawings, specifications, shipping instructions, and shipment schedules of the equipment. As promptly as practicable after receipt of such request, Seller will advise Buyer what amendments to the Contract, if any, may be necessitated by such requested changes, including but not limited to amendment of the Purchase Price, specifications, shipment schedule, or date of delivery. Any changes agreed upon by the parties shall be evidenced by a Change Order signed by both parties.

2.8 Cancellation or termination

Buyer shall have the right to cancel the Contract upon 15 days' prior written notice to Seller, and Seller shall stop its performance upon the receipt of such notice except as otherwise agreed with Buyer. If Buyer cancels the Contract, it shall pay: (a) the agreed unit price for equipment or components completed and delivered, (b) additional material and labor costs incurred, and for engineering services supplied by Seller with respect to the canceled items, which shall be charged to Buyer at Seller's rates in effect at the time of cancellation, but which shall not exceed the contract price for such items, and (c) such other costs and expenses, including cancellation charges under subcontracts, as Seller may incur in connection with such cancellation or termination.

2.9 Delivery and delays

Seller shall use its best efforts to meet quoted delivery dates, which are estimated based on conditions known at the time of quotation. Seller shall not be liable for any nonperformance, loss, damage, or delay due to war, riots, fire, flood, strikes or other labor difficulty, governmental actions, acts of God, acts of the Buyer or its customer, delays in transportation, inability to obtain necessary labor or materials from usual sources, or other causes beyond the reasonable control of Seller. In the event of delay in performance due to any such cause, the date of delivery or time for completion will be extended to reflect the length of time lost by reason of such delay. Seller shall not be liable for any loss or damage to Buyer resulting from any delay in delivery.

2.10 Warranty

Seller warrants that the equipment or services supplied will be free from defects in material, and workmanship for a period of 12 months from the date of initial operation of the equipment, or 18 months from the date of shipment, whichever shall first occur. In the case of spare or replacement parts manufactured by Seller, the warranty period shall be for a period of six months from shipment. Repairs shall be warranted for 12 months or, if the repair is performed under this warranty, for the remainder of the original warranty period, whichever is less. Buyer shall report any claimed defect in writing to Seller immediately upon discovery and in any event, within the warranty period. Seller shall, at its sole option, repair the equipment or furnish replacement equipment or parts thereof, at the original delivery point.
Seller shall not be liable for costs of removal, reinstallation, or gaining access. If Buyer or others repair, replace, or adjust equipment or parts without Seller's prior written approval, Seller is relieved of any further obligation to Buyer under this section with respect to such equipment or parts. The repair or replacement of the equipment or spare or replacement parts by Seller under this section shall constitute Seller's sole obligation and Buyer's sole and exclusive remedy for all claims of defects. SELLER MAKES NO OTHER WARRANTY OR REPRESENTATION OF ANY KIND WITH RESPECT TO THE EQUIPMENT OR SERVICES OTHER THAN AS SPECIFIED IN THIS SECTION 10. ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, ARE HEREBY DISCLAIMED. For purposes of this Section, the equipment warranted shall not include equipment, parts, and work not manufactured or performed by Seller.
With respect to such equipment, parts, or work, Seller's only obligation shall be to assign to Buyer any warranty provided to Seller by the manufacturer or supplier providing such equipment, parts or work. No equipment furnished by Seller shall be deemed to be defective by reason of normal wear and tear, failure to resist erosive or corrosive action of any fluid or gas, Buyer's failure to properly store, install, operate or maintain the equipment in accordance with good industry practices or specific recommendations of Seller, or Buyer's failure to provide complete and accurate information to Seller concerning the operational application of the equipment.

2.11 Technical documents

Technical documents furnished by Seller to Buyer, such as drawings, descriptions, designs and the like, shall be deemed provided to Buyer on a confidential basis, shall remain Seller's exclusive property, shall not be provided in any way to third parties, and shall only be used by Buyer for purposes of installation, operation and maintenance. Technical documents submitted in connection with a Quotation that does not result in a Purchase Order shall be returned to Seller upon request.

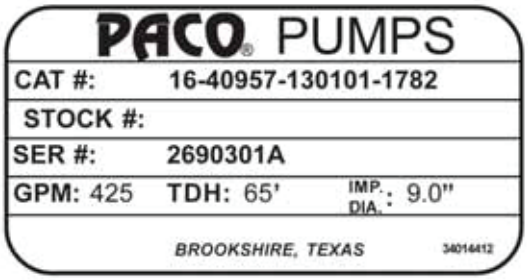
2.12 Limitation of liability

Seller shall in no event be liable for any consequential, incidental, indirect, special or punitive damages arising out of the Contract, or out of any breach of any of its obligations hereunder, or out of any defect in, or failure of, or malfunction of the equipment, including but not limited to, claims based upon loss of use, lost profits or revenue, interest, lost goodwill, work stoppage, impairment of other equipment, environmental damage, nuclear incident, loss by reason of shutdown or nonoperation, increased expenses of operation, cost of purchase of replacement power or claims of Buyer or customers of Buyer for service interruption whether or not such loss or damage is based on contract, tort (including negligence and strict liability) or otherwise. Seller's maximum liability under this Contract shall not exceed the Purchase Order amount of the equipment or portion thereof upon which such liability is based. All such liability shall terminate upon the expiration of the warranty period, if not sooner terminated.

2.13 This company is an equal opportunity employer

This agreement incorporates by reference applicable provisions and requirements of Executive Order 11246 and FAR Section 52.222- 26 (covering race, color, religion, sex and national origin); the Vietnam Era Veterans Readjustment Assistance Act of 1974 and FAR Section 52.222-35 (covering special disabled and Vietnam era veterans); and the Rehabilitation Act of 1973 and FAR Section 52.222- 36 (covering handicapped individuals).
By acceptance of this agreement Buyer certifies that it does not and will not maintain any facilities in a segregated manner, or permit its employees to perform their services at any location under its control where segregated facilities are maintained, and further that appropriate physical facilities are maintained for both sexes. Buyer agrees that it will obtain a similar certificate prior to award of any nonexempt lower-tier subcontracts.

2.14 Law and arbitration



The Contract shall be governed by the law of the State of Texas. Any disputes arising out of this Contract shall be resolved by informal mediation in any manner that the parties may agree within 45 days of written request for mediation by one party to the other. Any dispute that cannot be resolved through mediation shall be resolved by binding arbitration conducted in English in Portland, Oregon under the Commercial Rules of the American Arbitration Association except as otherwise provided in this section. The arbitration shall be conducted by three arbitrators chosen in accordance with said Rules. The arbitrators are not entitled to award damages in excess of compensatory damages. Judgment upon the award may be entered in any court having jurisdiction.

3. Installation - mechanical

Read these instructions thoroughly before installing and operating your PACO Vertical In-line Centrifugal Pump. Successful operation depends on careful attention to the procedures described in the first four sections of this manual. Keep this instruction manual handy for future use.

3.1 Pump identification

All PACO pumps are identified by catalog and serial numbers. These numbers are stamped on the pump nameplate (fig. 1) affixed to each pump volute casing, and should be referred to in all correspondence with the Company.

TM05 4873 2612

Fig. 1 Sample nameplate

The first digits in the Catalog Number (preceding the first hyphen) are known as the Product Code. The Product Code may be 2 or 3 digits in length. This installation and Operation Manual applies to the following Product Codes. NOTE: Hyphens may not appear on the name plate.

Product code	Description
16	Paco type VL, in line Centrifugal pump
17	Paco type VLS, in line Centrifugal pump (split coupled)

3.2 Receiving

Check pumping unit for shortage and damage immediately upon arrival. Pump accessories when required are packaged in a separate container and shipped with the unit. If equipment is damaged in transit, promptly report this to the carrier's agent. Make complete notations on the freight bill to speed satisfactory adjustment by the carrier. Unload and handle the unit with a sling.

Warning

Do not lift pump assembly by motor eye bolts alone. Motor eye bolts are not designed to support weight of entire pump assembly.

3.3 Temporary storage

If pump is not to be installed and operated soon after arrival, store it in a clean, dry area of moderate ambient temperature. Rotate the shaft by hand monthly to coat bearings with lubricant to retard oxidation and corrosion. Follow motor manufacturer's storage recommendations where applicable.

3.4 Location

Locate the pump as close to the suction supply as possible. Use the shortest and most direct suction piping practical. Refer to section *3.10 Suction (inlet) piping*. Locate the pump below system level wherever possible. This will facilitate priming, assure a steady liquid flow, and provide a positive suction head. Make sure sufficient NPSH (Net Positive Suction Head) is provided at the suction end by considering the pump's location in relation to the entire system. Available NPSH must always equal or exceed required NPSH specified on the pump performance curve. Always allow sufficient accessibility for maintenance and inspection. Provide a clear space with ample head room for use of a hoist strong enough to lift the pump/motor assembly. Make sure a suitable power source is available for the pump motor. Electrical characteristics should match those specified on the motor data plate, within the limits covered in sections *4. Installation - electrical* and *5. Operation*. Avoid pump exposure to sub-zero temperatures to prevent pump liquid from freezing. If freezing conditions exist during shutdown periods, see sections *5.7 Short duration shutdown* and *5.8 Extended period shutdown* for specific recommendations.

3.5 Mounting of pump

PACO In-line centrifugal pumps may be mounted on the equipment room floor, or suspended in the piping, depending on the size and configuration of the pump. The following instructions shall apply:

3.6 Floor mounted pumps (VL, VLS)

Pumps mounted on equipment room floors should be permanently installed on a firm, concrete foundation, mounting pad or spring isolation base of sufficient size to dampen any vibration and prevent any deflection. Suitable anchor bolts shall be used to secure the pump assembly to the pad or floor.

3.7 Suspended pumps (VL, VLS)

PACO In-line Centrifugal pumps, when properly supported, may be suspended in system piping. Pipe supports must be used on piping immediately adjacent to the pump. Pipe supports must be adequately sized to support the weight of pump and piping, full of liquid, and shall be designed to eliminate transmission of noise or vibration. PACO In line pumps are designed to be mounted in horizontal pipe runs with motor positioned vertically upward.

3.8 Suspended pumps (VL only)

Pumps with motor frame sizes of 256JM/JP or smaller may be mounted in vertical pipe runs (risers) or in horizontal pipe runs with motors mounted horizontally. Consult PACO Factory for suitability of mounting with larger motors. In no case shall motors be mounted vertically downward (upside down, with motor positioned below the pump).

3.9 Piping - general

Caution

Do not use pump as a support for piping! Use pipe hangers or other supports at proper intervals to provide complete piping support near the pump.

Both suction and discharge piping should be independently supported and properly aligned so that no strain is transmitted to the pump when flange bolts are tightened. Make sure piping is as straight as possible, avoiding unnecessary bends and fittings. Where necessary, use 45 ° or long-sweep 90 ° pipe fittings to decrease friction loss. Where flanged joints are used, make sure that inside diameters properly match and mounting holes are aligned. Do not spring or force piping when making any connections!

3.10 Suction (inlet) piping

The sizing and installation of suction piping is particularly important. It must be selected and installed in a manner that minimizes pressure loss and permits sufficient liquid flow into the pump during starting and operation. Many NPSH problems can be traced directly to improper design of suction piping systems. Observe the following precautions when installing suction piping: Suction piping should be as direct as possible, and ideally the length should be at least ten times the pipe diameter.
Short suction piping can be the same diameter as the suction opening. Longer piping should be one or two sizes larger (depending on length), reducing to the diameter of the pump suction opening. Use an eccentric reducer, with the eccentric side down (fig. 2) when reducing the pipe diameter to the diameter of suction opening.

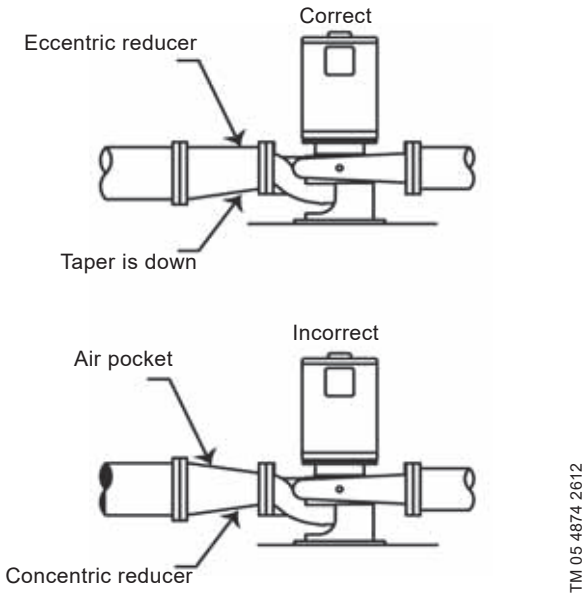


Fig. 2 Eccentric reducer usage

At no point should suction piping be smaller in diameter than the pump suction opening. Avoid any high points, such as pipe loops (fig. 3), that may create air pockets and throttle the system or produce erratic pumping.

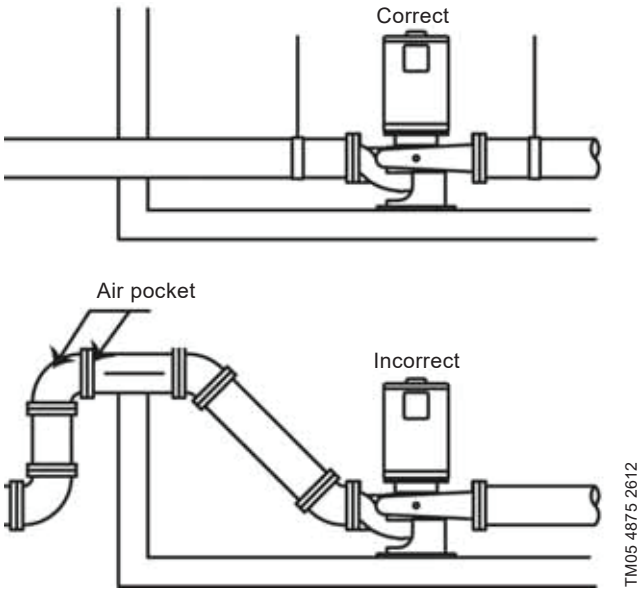

Fig. 3 Eccentric reducer usage

Install a valve in the suction line to isolate the pump during shutdown and maintenance, and facilitate pump removal. Where two or more pumps are connected to the same suction line, install a valve for each pump to isolate pump from the line. Valves should always be installed in positions that avoid air pockets. Globe valves should not be used, particularly when NPSH is critical. During pumping operation, valves on suction line must always be at FULL OPEN. Properly sized pressure gauges can be installed in gauge taps on pump suction and discharge nozzles. Gauges enable the operator to monitor pump performance and determine that the pump conforms to the parameters of the performance curve. If cavitation, vapor binding, or other unstable operation occurs, pressure gauges will indicate wide fluctuation in suction and discharge pressures. Gauge cocks are recommended for use with pressure gauges, to protect gauges from constant wear and vibration when not in use.

3.11 Discharge (outlet) piping

Short discharge piping can be the same diameter as the pump discharge opening. Longer piping should be one or two sizes larger depending on length. An even gradient is best for long horizontal runs of discharge piping. Install a valve near the discharge opening to prime and start the pump. The discharge gate valve is also used to isolate the pump during shutdown, maintenance, and facilitate pump removal. Any high points in discharge piping may entrap air or gas and thus retard pump operation.

3.12 Shaft sealing - general comments

PACO Type VL and VLS pumps are equipped with mechanical shaft seals.

3.13 Mechanical seals

PACO mechanical seals are matched to conditions for which the pump was sold. Unlike packing, mechanical seals require no field adjustments. Observe the following precautions to avoid seal damage and obtain maximum seal life: Do not exceed temperature or pressure limitations for the mechanical seal used.

Caution ***Do not run the pump dry or against a closed valve! Dry operation will cause seal failure within minutes.***

Clean and purge suction piping in new installations before installing and operating pump. Pipe scale, welding slag and other abrasives can cause rapid seal failure.

4. Installation - electrical

Warning

Use only qualified electricians for electrical installation and maintenance.

Refer to manuals provided with electrical accessory components and disconnect power supply as recommended for servicing.

Warning

Never do maintenance work when the unit is connected to power.

4.1 Motor, general

The motor control circuit must have the following components in order to comply with the National Electrical Code Motor Disconnecting Device: A motor disconnecting device must be:

- installed that it is capable of disconnecting both the controller (motor starter) and the motor from their source of power.
- The disconnecting device must be located so that the controller (motor starter) can be seen from the disconnecting means.
- In all cases, the distance from the disconnecting device to the controller must be less than 50'.

In most installations the disconnecting device will be a circuit breaker or fusible disconnect switch. Motor short circuit and ground fault protection: Short circuit and ground fault protection are usually provided by means of a circuit breaker or fusible disconnect switch. The selection of the size of the circuit breaker or fuse must be in accordance with Section 430-52 and Table 430-152 of the National Electrical Code. Motor controller with running over-current protection (magnetic starter) must be installed in accordance with applicable local and state electrical codes in addition to the National Electrical Code. Make sure the motor is properly mounted for easy access to conduit connections, grease fittings and drains. Motor may be rotated upon the bracket of volute casing to achieve a satisfactory position. Starting and overload control devices should match electrical characteristics of motor. For safety and convenience these devices may require installation some distance from the pump. Always follow control manufacturer's instructions for proper installation and connection. Grease lubricated motors are fully lubricated at time of manufacture and do not require further lubrication if prompt installation follows. If motor has been in local storage for six months or longer, refer to section *6.1 Motor lubrication* and lubricate before starting.

4.2 Installation wiring

Motor wiring to be performed by trained, qualified electricians only. Proper electrical lock-out procedures must be used whenever working on equipment.

Mount the control panel or motor starter(s) in close proximity to the pump to provide convenient control and ease of installation. Wire panel or starter(s) to motor(s) and pilot device(s): Wires to each motor must be sized for at least 125 % of the motor nameplate full load amps. AWG #16 Type THW stranded wire is recommended for wiring of pilot devices (float switches). Check incoming power source to ensure that it is the same as the voltage and phase of the motors. Verify that the starters are suitable to operate the pump motors on voltage and phase that is available.

5. Operation

5.1 Priming

The PACO in-line centrifugal pumps are not self priming, and must be completely primed (filled with liquid) before starting. If the pump will operate with a positive suction head, prime by opening the suction valve and allowing liquid to enter pump casing. Open all air vents a the high points of pump and piping to ensure air is forced from pump by liquid. Disconnect the recirculation line at the seal housing and bleed completely of all air. Re-connect the line prior to start-up. Rotate the shaft by hand to free entrapped air from impeller passageways. If pump has a suction lift, priming must be accomplished by other methods. The use of foot valves or ejectors, or manual filling of the pump casing and suction line with liquid are possible methods suggested for this purpose.

Caution ***Never run the pump dry in the hope that it will prime itself! Serious damage to the mechanical seal will result.***

5.2 Pre-start checklist

Make the following inspections before starting your PACO in-line centrifugal pump: Make sure all wiring connections to the motor (and starting device) match the wiring diagram and produce clockwise rotation as viewed from the end of the motor. If the motor has been in storage for an extended length of time, either before or after installation, refer to motor instructions before starting. Check voltage, phase, and line circuit frequency with the motor data plate. Turn rotating element by hand to make sure it rotates freely. Tighten plugs in gauge and drain taps. If pump is fitted with pressure gauges, keep gauge cocks closed when not in use. Check suction and discharge piping for leaks, and make sure all flange bolts are securely tightened.

5.3 Motor rotation

Caution ***Verify driver rotation prior to startup and operation. Failure to do so can result in serious damage to pump and driver if rotation is wrong.***

After the unit has been wired and checked to insure that all components in the system (disconnect device, magnetic starters, pilot devices and motors) are properly connected, check motor rotation as follows: For 3 phase units only-momentarily energize the motors to ensure that the rotation is correct as indicated by the arrow cast into the pump volute. If rotation is incorrect, interchange two wires at the motor starter terminals T1 and T2.

Caution ***The pumps must not be operated while dry. Energize motors only momentarily to determine proper rotation.***

5.4 Starting the pump

1. Install coupling guard on split coupled units.
2. Fully open gate valve (if any) in suction line, and close gate valve in discharge line.
3. Fill suction line with liquid and completely prime pump.
4. Start the motor (pump).
5. Immediately make a visual check of pump and suction piping for pressure leaks.
6. Immediately after pump reaches full operating speed, slowly open the discharge gate valve until complete system flow is achieved.
7. Check discharge piping for pressure leaks.
8. If pump is fitted with pressure gauges, open gauge cocks and record pressure reading for future reference. Verify that the pump is performing in accordance with parameters specified on performance curve.
9. Check and record voltage, amperage per phase, and kilowatts, if a wattmeter is available.

5.5 Voltage regulation

The motor will operate satisfactorily under the following conditions for voltage and frequency variation, but not necessarily in accordance with the standards established for operation under rated conditions: The voltage variation may not exceed 10 % above or below rating specified on the motor data plate.
The frequency variation may not exceed 5 % above or below motor rating. The sum of the voltage and frequency variations may not exceed 10 % above or below motor rating, provided the frequency variation does not exceed 5 %.

5.6 Pump shutdown

The following shutdown procedures will apply in most normal shutdowns for the PACO in-line pump. If pump will be inoperative for an extended length of time, follow storage procedures in Section IC. Always close the discharge gate valve before stopping pump. Close valve slowly to prevent hydraulic shock. Cut power to motor.

5.7 Short duration shutdown

For overnight or temporary shutdown periods under nonfreezing conditions, the pump may remain filled with liquid. Make sure the pump is fully primed before restarting. For short or frequent shutdown periods under freezing conditions, keep fluid moving within pump casing and insulate or heat pump exterior to prevent freezing.

5.8 Extended period shutdown

For long shutdown periods, or to isolate the pump for maintenance, lock-out power to pump and close suction gate valve. If no suction valve is used and the pump has positive suction head, drain all liquid from suction line to terminate liquid flow into pump suction nozzle. Remove plugs in pump drain and vent taps, as required, and drain all liquid from the pump volute casing. If freezing conditions will exist during long shutdown periods, completely drain the pump and blow out all liquid passages and pockets with compressed air. Freezing of pump liquid can also be prevented by filling the pump with antifreeze solution.

6. Maintenance

Warning

Do not attempt any maintenance, inspection, repair or cleaning in the vicinity of rotating equipment. Before attempting any inspection or repair on the pump, the driver controls must be in the "OFF" position, locked and tagged to prevent injury to personnel performing service on the pump. Inspection, maintenance and repair should be performed by trained, qualified personnel only.

6.1 Motor lubrication

To lubricate the motor while running or at rest, remove grease drain plug (if any) and filler plug on grease fitting. Grease with clean lubricant until grease appears at drain hole or along motor shaft. One-half to one cubic inch of grease is sufficient for motors 5 hp and under, with proportionately more grease for greater hp motors.

Recommended lubrication periods

Motor rpm	Motor hp	Operating conditions		
		Standard	**Severe**	**Extreme**
1750 and below	10-40	1 yr	3 mo	6 mo
	50-150	1-3 yrs	6 mo - 1 yr	6 mo - 1 yr
	200 and Up	1 yr	3 mo	6 mo
Above 1750	All hp	1 yr	3 mo	6 mo
		1 yr	3 mo	3 mo

6.1.1 Standard conditions

Eight hours per day operation, normal or light loading, clean air, 100 °F, maximum ambient temperature.

6.1.2 Severe conditions:

Continuous 24-hour operation, shock loading or vibration, poor ventilation, 100-150 °F, ambient temperature.

6.1.3 Extreme conditions

The following are considered Extreme conditions: Continuous operation, heavy shock or vibration, dirt or dust in air, extreme ambient temperature.

To lubricate motor while running or at rest, remove grease drain plug (if any) and filler plug on grease fitting. Grease with clean lubricant until grease appears at drain hole or along motor shaft.

One-half to one cubic inch of grease is sufficient for motors 5 hp and under, with proportionately more grease for greater hp motors. Most fractional and some integral frame motors have "sealed-for-life" bearings, and do not require further lubrication throughout motor life. Always follow motor manufacturer's lubrication instructions, and periodically check grease fittings and drain plugs for leaks. If lubricating instructions do not accompany motor, refer to the following table for recommended lubrication periods.

Recommended bearing Grease for pumps

Manufacturer	Lubricant
Shell	Dolium
Exxon	Polyrex
Chevron	SRI Grease NLGI 22
	Black Pearl NLGI 2
Phillips	Polytrac
Texaco	Polystar RB

This table lists recommended types of grease for both pump and motor lubrication. These types have all been thoroughly tested and should be used whenever possible.

Caution ***Do not lubricate with lithium based grease. Equipment damage will result.***

7. Disassembly

7.1 Preparation for disassembly

Warning

Turn off power, lock-out electrical breaker and provide appropriate "Do Not Operate" or equivalent signage prior to any work on equipment. Verify all power is off at pump using appropriate electrical instrumentation.
Work should be performed only by qualified and trained personnel.

Complete disassembly instructions are outlined below. Proceed only as far as required to perform the maintenance work needed. Close valves on suction and discharge side of pumps and drain pump, taking precautions as necessary based on fluid being pumped. Flush, if necessary. Allow adequate working area around pump for maintenance or disassembly.

7.2 Seal replacement (VL)

1. Complete preparations noted in section *7.1 Preparation for disassembly*, above.
2. Unscrew tubing connector from pipe tee of Air Vent assembly (15A) if equipped.
3. Remove Casing Bolts (8B).
4. Back-pull rotating assembly away from Volute (1A). Make sure external wiring will not be torn from motor leads before pulling.
5. Remove Volute Gasket (11A) from outer face of back plate/ bracket, and discard. New sealing gaskets should always be used whenever pump is reassembled.
6. For replacement of Wear Ring (4A), refer to section *7.5 Wear ring replacement* at this time.
7. For replacement of Seal, Sleeve or for general disassembly, continue with the following instructions
8. Impeller removal procedures vary depending on motor type. Follow appropriate instructions as follows:

Impeller removal- fractional horsepower motors

Impeller (3A) is threaded on to fractional horsepower (56J) motor shaft. Loctite is applied to impeller threads during factory assembly. If adhesive shear strength is too great for disassembly with ordinary hand tools parts must be heated by torch and disassembled while hot. Apply torch heat to impeller eye when unscrewing threaded impellers, axially along shaft sleeve exterior to loosen for removal. Holding power of Loctite decreases as temperature rises, and compound completely decomposes at temperatures above 650 °F. Impeller must be unscrewed, while preventing motor shaft rotation by utilizing a large screwdriver securely in slot at back end of motor shaft while unscrewing impeller.

Caution ***Do not insert screwdriver between impeller vanes to prevent rotation. Use strap wrench around the impeller or shaft to prevent rotation.***

Impeller Removal- Integral Horsepower Motors:

Impeller (3A) is keyed onto integral horsepower (JM & JP) motor shaft. Slide impeller axially off of shaft. If impeller can not be removed by hand, additional leverage may be necessary. Using a gear puller or two pry bars, position the tongs in close proximity to impeller vanes and carefully apply smooth, even force to the impeller. Excessive force will distort and damage the impeller.

1. Remove and discard spring and retainer from seal assembly (14A).
2. Remove seal head assembly manually from Shaft Sleeve (5A). Water-soluble lubricant may be applied to shaft to ease removal of Shaft Seal (14A). Pull seal head assembly manually from shaft, using slight twisting motion (as necessary) to loosen bellows from shaft sleeve.
3. Remove and discard seal seat from Bracket (21A). Thoroughly clean the inside cavity of bracket or cap.
4. For replacement of Shaft Sleeve (5A), refer to section *7.4 Sleeve Replacement (VL)* at this time.
5. Interior surface of bellows on new seal head is coated with bonding agent that adheres to motor shaft. When old seal head is removed, bonding agent no longer exists and bellows may crack or split during removal. Installation of new mechanical seal is always recommended if it becomes necessary to remove existing seal from shaft.
6. Clean and lubricate shaft sleeve (shaft on 56J motors) with water-soluble lubricant and make sure no sharp edges exist which could cut bellows of new seal.
7. Press new seal seat firmly into bracket or cap. Avoid direct contact of seal face with metallic or abrasive objects and wipe clean after installation to ensure abrasive-free sealing surface.
8. Slide new seal head assembly onto shaft by applying even pressure to base of assembly. Make sure sealing faces fit snugly.
9. See Reassembly instructions, section *7.6 Reassembly of pumps*.

7.3 Seal replacement (VLS)

1. Complete preparations noted.
2. Remove coupling guard (34F).
3. Remove coupling bolts (8E). Pry apart the coupling halves (23D), remove keys (12B) and set aside.

Note ***Mark or measure the original position of the pump coupling on the motor side.***

4. Unscrew tubing connector from pipe tee of air vent assembly. Pipe dope is applied to threads during factory assembly, and resulting bond may retard but will not prevent manual disassembly.
5. Remove seal cap bolts and slide seal cap (2N) up shaft to remove.
6. Remove seal head assembly manually from shaft (6A). Water-soluble lubricant may be applied to shaft to ease removal of shaft seal (14A). Pull seal head assembly manually from shaft, using slight twisting motion (as necessary) to loosen bellows from shaft.

7. Remove and discard seal spring and retainer.
8. remove and discard seal seat from seal cap (2N) and thoroughly clean the inside cavity of seal cap.
9. Interior surface of bellows on new seal head is coated with bonding agent that adheres to motor shaft. When old seal head is removed, bonding agent no longer exists and bellows may crack or split during removal. Installation of new mechanical seal is always recommended if it becomes necessary to remove existing seal from shaft.
10. Clean and lubricate shaft (6A) with water-soluble lubricant and make sure no sharp edges exist to cut or scratch bellows of new seal.
11. Press new seal seat firmly into seal cap. Avoid direct contact of seal face with metallic or abrasive objects and wipe clean after installation to ensure abrasive free sealing surface.
12. Slide new seal head assembly onto shaft by applying even pressure to base of assembly.
13. Install seal cap (2N) down shaft.
14. See reassembly instructions.

7.4 Sleeve Replacement (VL)

1. Remove impeller key (12A) from shaft (integral horsepower motors only)
2. Sleeves are bonded to shaft using Loctite. Loctite adhesive compound is a liquid resin that produces a tough bond when applied to threaded and close-fitting connections during assembly. It is used by PACO on shaft sleeves to secure sleeve to shaft.
3. Apply light torch heat axially along shaft sleeve exterior to break the Loctite bond and loosen sleeve for removal. Excessive heating is not necessary, and should be avoided to protect bearings. Remove sleeve.
4. Wipe or brush clean all adhesive surfaces before reapplying Loctite. Use LocQuic Primer or equivalent for preparation of surface. LocQuic Primer is a degreasing agent recommended for use in preparing mating surfaces for Loctite application. Do not use gasoline or other petroleum products for cleaning, because an oily surface will remain. Assemble shaft sleeves with twisting motion to ensure an even hold, and always make sure sleeve is firmly in place against shaft shoulder. Allow a few minutes for Loctite to bond prior to completing assembly.

7.5 Wear ring replacement

1. Complete preparations
2. Back-pull rotating assembly,
3. It may be necessary to remove volute (1A) from piping, to facilitate easy access to interior of volute. If necessary, remove flange bolts at piping.
4. To remove worn Case Wear Ring (4A), drill two holes slightly smaller than width of ring into exposed edge of ring. Once holes are drilled, a chisel may be used to completely sever ring at holes and break ring into two halves for easy removal.
5. Clean the ring cavity in the volute prior to installing wear ring to ensure a properly aligned fit.
6. To reassemble, press fit new wear ring squarely into volute casing cavity. Ring may be tapped into place to make sure it is completely impressed into cavity.

Caution ***Do not use metal tooling against wear ring surfaces. Use only rubber, rawhide, wood or other soft material to prevent damage to ring.***

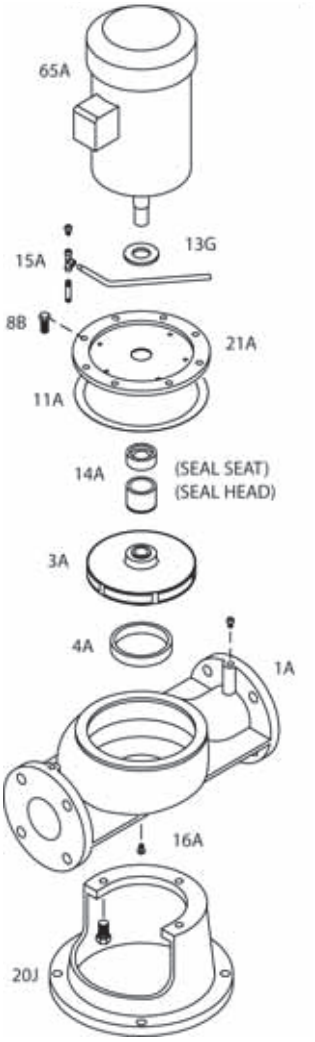
7.6 Reassembly of pumps

1. Clean all parts prior to reassembly, ensuring all contacting surfaces and threads are free of debris. Reassemble pump by following the above instructions in reverse. Inspect and ensure the following:

- All mechanical seal components and shaft sleeve must be in good condition or leakage may result.
- Replacement of complete seal assembly is recommended.
- Appropriate Loctite is used in re-assembly of shaft sleeves.
- Appropriate Loctite is used in re-assembly of threaded impellers.

2. Re-install coupling guards on coupled pumps.

Warning



Type VLS pump is a split coupled pump. Coupling guard must be reinstalled and in place prior to operation.

8. Ordering parts

PACO's commitment to state-of-the-art pump design and quality manufacturing assures maximum user benefits with optimum equipment life at lower cost. PACO's commitment to their customers continues through an extensive service organization. Highly trained technicians can assist customers with initial startup, troubleshooting, repair, and system analysis.
PACO maintains an extensive stock of replacement parts and parts kits for our most popular model pumps. Shipment of these parts is normally made within three days after receipt of an order. On larger pumps, where it is impractical for our factory to inventory low usage parts, replacement parts are normally manufactured and shipped within 15 working days of receipt of an order. In order to reduce pump repair time and shorten inconvenient pump service interruptions, it is suggested that the pump user stock spare parts. For suggested spare parts see Replacement Parts Guide A3b.2, and contact your local PACO Sales Representative (see back cover for the number of your nearest PACO sales office). Since spare parts requirements and quantities vary for specific pump constructions, allow your PACO Representative to help in defining your spare part requirements. To ensure that the proper replacement parts are ordered for your particular pump model, when you call: Identify all pertinent data from the pump name plate (see Pump Identification). This should always include the pump Catalog or Model Number, and the pump Serial Number. For replacement impellers, also include from the nameplate the operating conditions (GPM and TDH) and the impeller diameter. Identify all parts by item number and description as indicated by the appropriate assembly drawing in this manual, for your particular pump model.

10. Troubleshooting

10.1 Cause codes

Symptoms	Cause code
Pump does not deliver any liquid at start-up	1*2*3*4*5*6*7*8*9*10*11*14*16*17*22*23*24*34
Pump stops delivering liquid after start-up	2*3*4*5*6*7*8*9*10*11*12*13*22*23*24*34
Pump overheats and/or ceases to deliver liquid	1*3*9*10*11*21*22*27*29*30*31*33*34*40*41
Insufficient flow rate	2*3*4*5*6*7*8*9*10*11*14*16*17*20*21*22*23*24*25*26*34
Excessive flow rate	15*18*20*34
Discharge pressure is too high	4*14*16*18*20*22*23*24*25*26*34
Shaft seal leaks appreciably, or the packing leaks excessively	27*28*29*30*33*34*35*36*39
Shaft seal or packing fails prematurely	12*13*27*28*29*30*33*34*35*36*37*38*39
Pump uses too much power	15*16*18*19*20*23*25*27*28*31*33*34*35*37*38
Pump runs rough and noisily	2*3*4*5*6*7*8*9*10*11*15*17*18*21*23*24*27*28*29*30*31*32*33*34*40

10.2 Possible causes

1. The pump has not been properly bled of air.
2. The pump suction line has not been completely primed.
3. The suction head (NPSHR) required by the pump is too high, or the net positive suction head available (NPSHA) at your facility is too low.
4. The fluid pumped contains too much entrained air or gas.
5. There are air pockets in the suction line.
6. An entry of air has suddenly occurred in the suction line.
7. An entry of air past the shaft seal into the pump has occurred.
8. The inlet of the suction line is insufficiently submerged.
9. The suction valve is closed or only partially open.
10. The suction strainer is clogged with dirt or debris.
11. The foot valve is clogged or undersized.
12. Little or no cooling fluid supplied to the shaft seals.
13. The lantern ring is not positioned opposite the flushing inlet thereby restricting fluid flow.
14. Pump drive rotational speed too low.
15. Pump drive rotational speed too high.
16. Pump rotation wrong or impeller installed backwards.
17. Total head of installation (back pressure) higher than rated total head of the pump.
18. Total head of installation (back pressure) lower than rated total head of the pump.
19. Density of fluid pumped differs from that specified when the pump was purchased.
20. Viscosity of fluid pumped differs from that specified when the pump was purchased.
21. The pump is operating at too low a rate of flow. The discharge valve may be throttled too much.
22. If pumps are operating in parallel, the pump characteristics may not be suitable for parallel operation.
23. The impeller may be clogged with debris.
24. The impeller may be damaged.
25. The casing and impeller wear rings may be excessively worn.
26. There may be internal leakage from the discharge to the suction compartments as the result of internal gasket failure.
27. There may be a misalignment of the pump shaft.
28. The shaft may chatter because it is bent.
29. The pump may run rough due to improper balancing of the impeller.
30. The shaft may not be running due to worn bearings.
31. The impeller may be rubbing against the inside of the case.
32. The concrete pad might not be of sufficient size to provide pump stability.
33. The pump may have become misaligned during installation.
34. The operating conditions of the installation do not agree with the data specified when the pump was purchased.
35. The shaft seal may be incorrectly installed, or the stuffing box has not been packed correctly.
36. The shaft sleeve may be scored or pitted in the region of the packing due to dirt or abrasive matter in the flushing fluid.
37. Excessive tightening of the packing gland may block the flushing port thereby diminishing the sealing fluid flow.
38. Packing material may have become wedged or extruded between the shaft and the bottom of the stuffing housing due to excessive clearance on the packing backup washer.
39. The mechanical seal may have been damaged by running dry.
40. There may be excessive axial thrust (side loading) due to improper impeller central alignment.

INLINE CENTRIFUGAL PUMPS REPLACEMENT PARTS GUIDE

VL, VLC, VLS, VLSC

This guide is valid for all PACO brand products beginning with product codes 16, 17 and Grundfos prodcut codes 26 and 27 only.
See back cover for explanation and identification.

In-Line Pumps are designed and built to provide maximum life while requiring minimum attention and service, replacement parts may at times be required. **Virtually All Required Parts are Available In Kit Form.**
These kits (easily selected from the charts on the following pages) have been designed to ensure that any parts needed when replacing any Inline Pump component are furnished when you need them, with minimal effort.

GUIDELINES AND SUGGESTIONS:
The pump nameplate and motor frame size supplies all data required in the selection and ordering of the proper replacement parts kit. The **PUMP MODEL AND SERIAL NUMBER** should be referenced whenever any replacement parts kit is ordered, while the **pump conditions** (GPM/TDH) and **impeller trim** are required data for the ordering of replacement impellers.

TO REPLACE A MECHANICAL SEAL
Select the correct Seal Kit, which contains the volute and backplate gaskets as appropriate. Shaft sleeve on type VL/VLC and shaft (type VLS/VLSC) inspection is suggested, and replacement made as indicated.

TO REPLACE SHAFT SLEEVES (Type VL and VLC)
You will need a shaft sleeve Kit. A Seal or Packing Kit will provide other normally needed parts.

TO REPLACE IMPELLER
An Impeller Kit is required; a Wear Ring Kit is highly recommended, and a Seal or Packing Kit will provide all other normally replaced components.

TO REPLACE WEAR RINGS
A Wear Ring Kit is required. A Seal/Packing Kit will provide all other normally replaced components. Shaft Sleeve inspection is suggested.

TO REPLACE GASKETS
Order appropriate individual Gaskets, as needed.

TO REPLACE LOST/DAMAGED HARDWARE
Hardware Kits are available, for 175 PSI units. (For 250 PSI refer to factory).

TO OVERHAUL THE PUMP
You will need an Impeller Kit, a Wear Ring Kit, Sleeve or Shaft Kit, and a Seal kit.

PLACING AN ORDER
After determining and selecting the required Kit(s), or for selection assistance, contact your local Grundfos sales office, representative, or distributor.

PUMP MODEL NO.	PUMP CONST. CODE	IMPELLER KIT (1)			WEAR RING KIT	HARDWARE KIT	SLEEVE	SEAL KIT

NOTES:

(1) Specify Impeller diameter when ordering.

(2) Model 1270-5 is obsolete. Verify trim diameter and conditions and refer to model 12707-7.

(3) Model 1570-7 is obsolete. Verify trim diameter and conditions and refer to model 15707-9.

EXPLANATION OF PUMP CODING-
(REFER TO PUMP NAMEPLATE)

NOTE: This Replacement Parts Guide is valid for products beginning with product codes 16, 17, 26, and 27 only.
Product Code 16= Close coupled Vertical Inline Centrifugal, type VL
Product Code 17= Split coupled Vertical Inline Centrifugal, type VLS
Product Code 26= Vertical Inline Centrifugal with Variable Frequency Drive, type VLC
Product Code 27= Split coupled Vertical Inline Centrifugal with Variable Frequency Drive, type VLSC

KIT COMPONENTS

IMPELLER KIT:
- -Impeller
- -Volute Gasket
- -Backplate Gasket
- -Impeller Cap Screw
- -Impeller Washer
- -Impeller Key
- -Impeller Nut

VL SEAL KIT:
- -Mechanical Seal
- -Volute Gasket
- -Backplate Gasket
- -Seal Cap Gasket
- -Impeller Cap Screw
- -Impeller Washer
- -Impeller Key
- -Impeller Nut

WEAR RING KIT:
- -Wear Rings, Bronze

VLS/VLSC: Seal Kit
- -Mechanical Seal
- -O-Ring

HARDWARE KIT:
- -Cap Screws

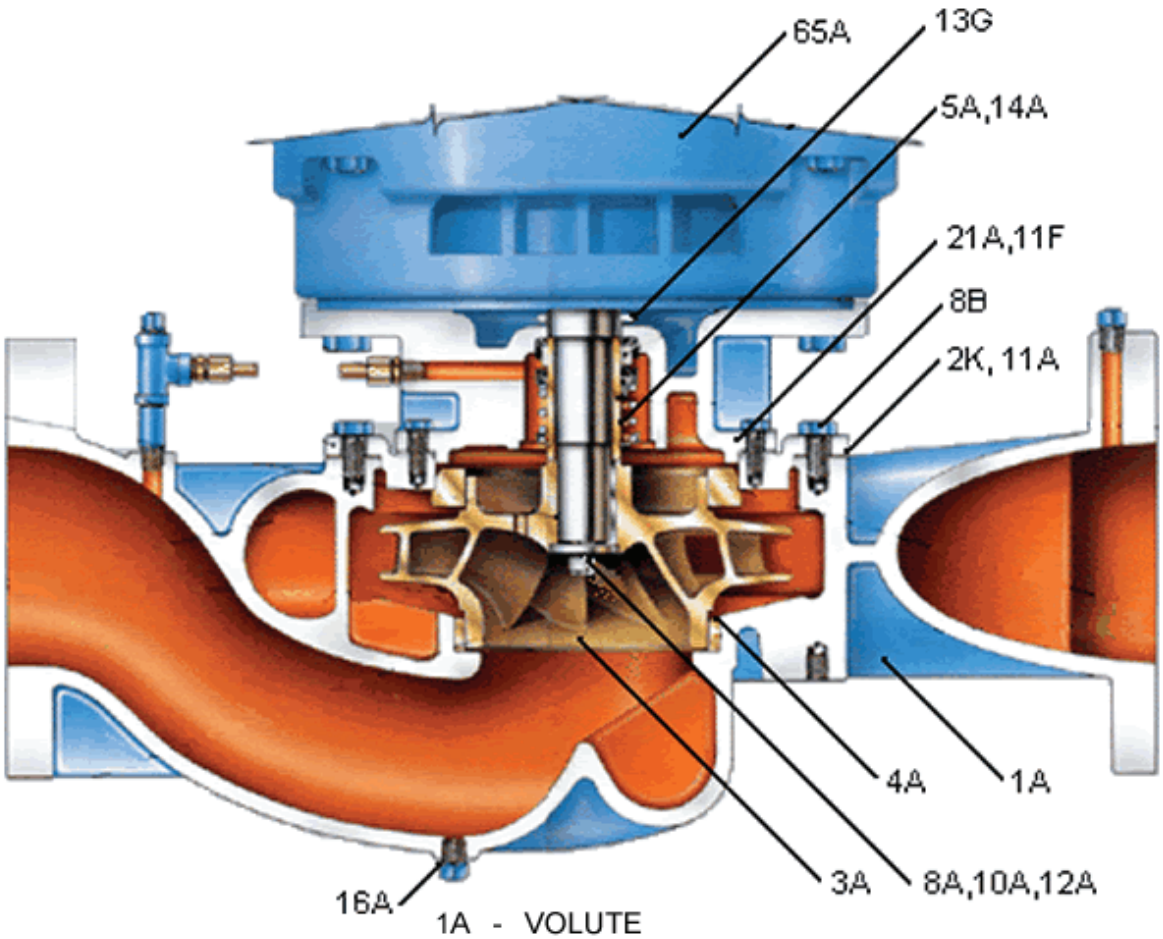
VLS/VLSC: ***(Non-kitted parts)***
- -Seal Cap O-rings
- -Bushings
- -Couplings / Key Sets for Couplings

GASKETS: ***(non-kitted)***
- -Individual

SLEEVES: ***(Not used on Type VLS/VLSC)***
(Non-Kitted)
- -Bronze
- -Stainless Steel

SHAFT KIT: ***(Type VLS/VLSC)***
- -Shaft
- -Bushing
- -Seal Cap Gasket

NOTES:



Kits may not contain all parts listed. They are individually selected for each pump, according to the pump construction and design.

Kits contain gaskets wherever gasket replacement is indicated, as noted above. Should "individual" gaskets be required. See Page 3.

Seal Kits are always recommended as spare parts.

PUMP SCHEDULE M802

Product No.: On request

Single-stage centrifugal volute in-line single-head pump:
- neck rings and impeller made of stainless steel
- cataphoresis treatment
- shell coupling
- top-pull-out principle for easy maintenance
- optimized hydraulics
- in-line design with opposite suction and discharge ports enabling mounting in pipework or on a concrete foundation
- corrosion resistant maintenance-free mechanical shaft seal.

The motor is a 1-phase AC motor.

Liquid:

Pumped liquid:	Water
Liquid temperature range:	5 .. 284 °F
Liquid temperature during operation:	68 °F
Density:	62.29 lb/ft³

Technical:

Speed for pump data:	1770 rpm
Actual calculated flow:	1.7 l/s
Resulting head of the pump:	3.477 m
Primary shaft seal:	BUBE
Approvals on motor nameplate:	UL Recognized Component, CSA
Curve tolerance:	ISO9906:2012 3B

Materials:

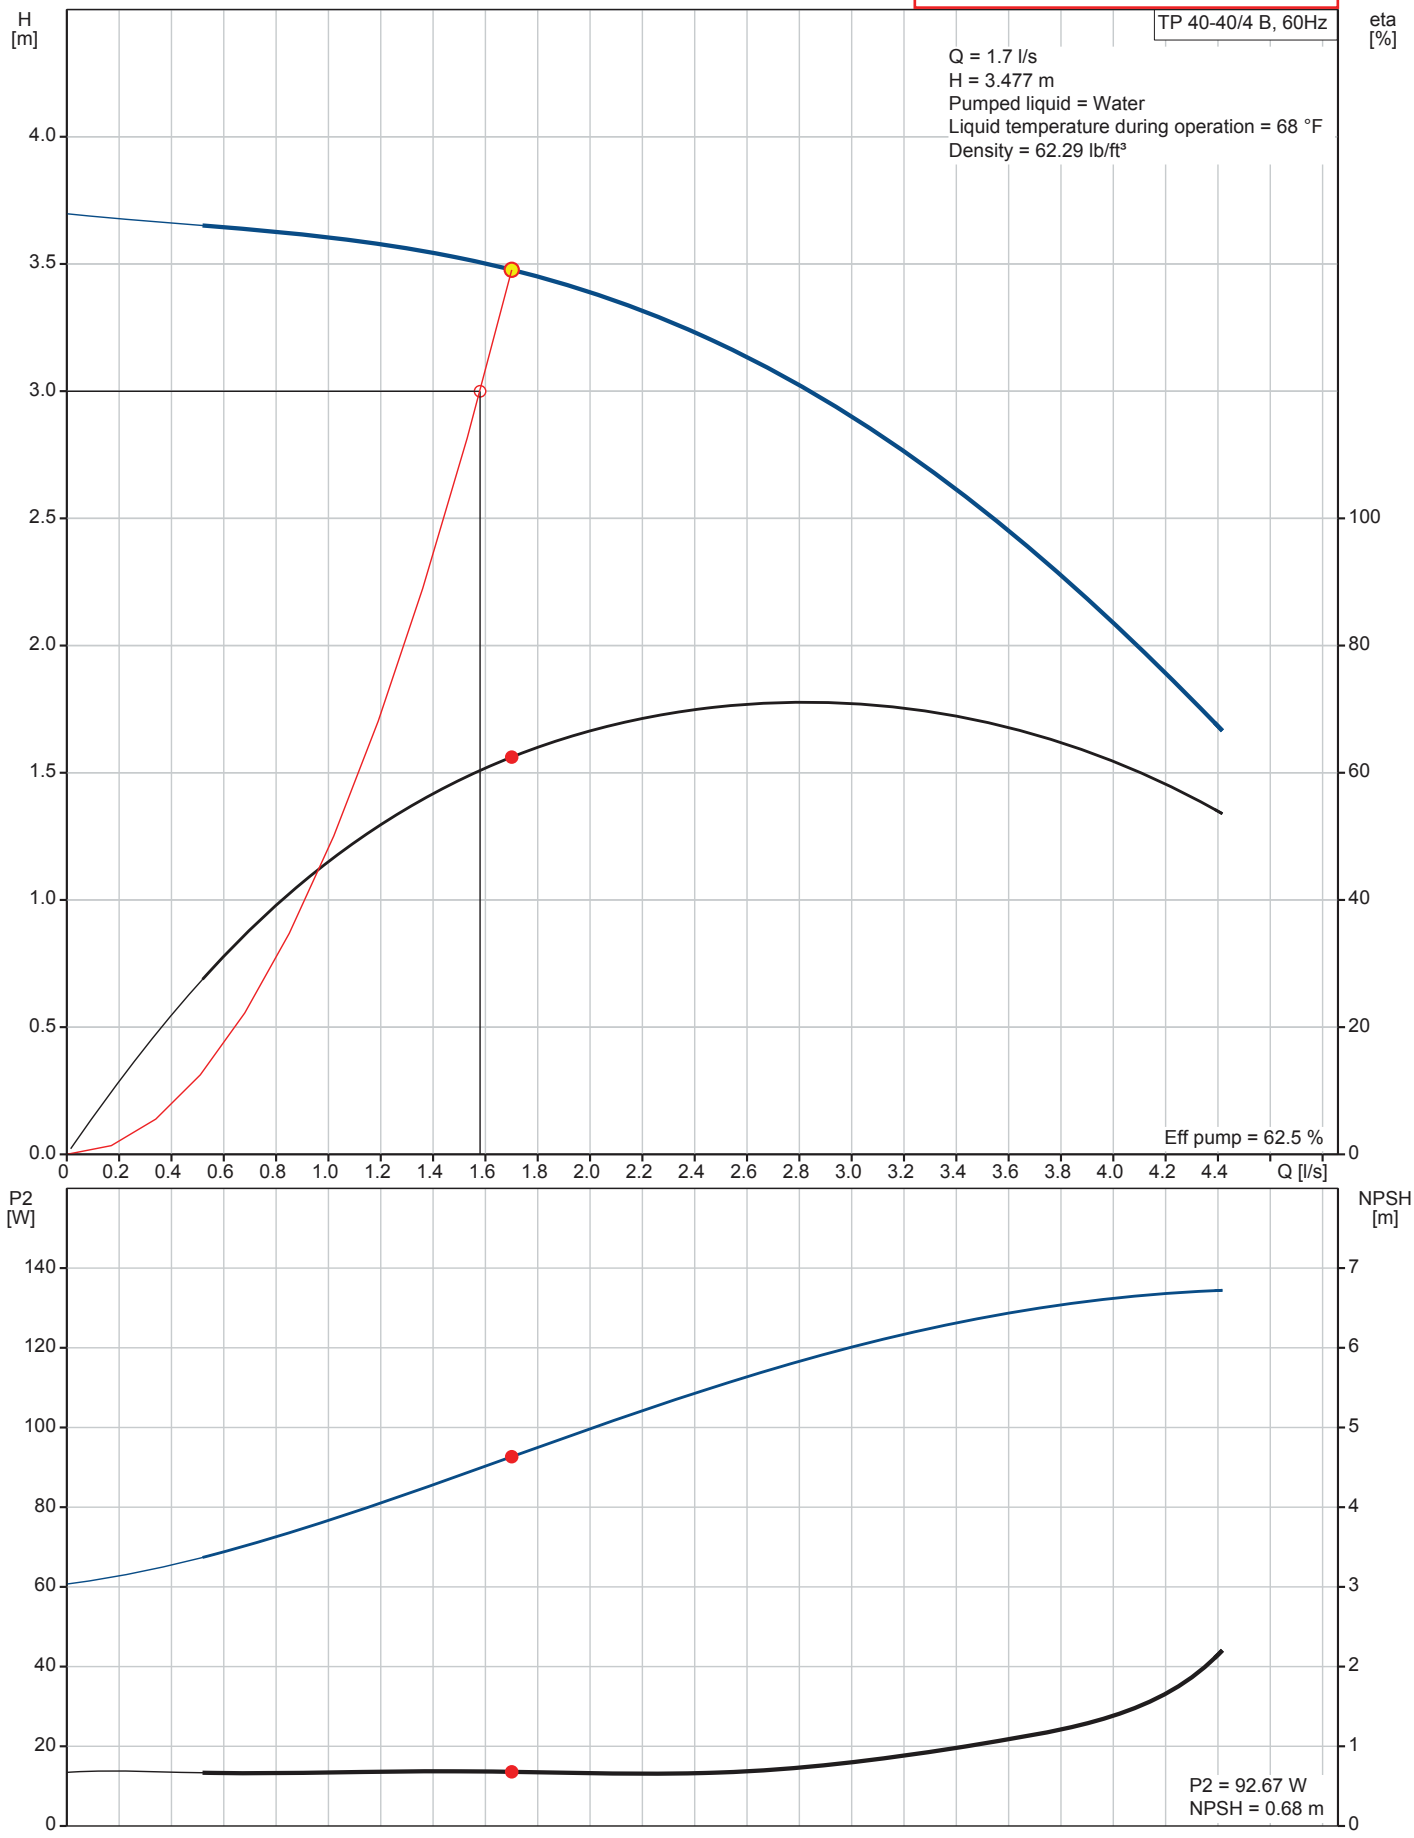
Pump housing:	Bronze DIN W.-Nr. 2.1093
Impeller:	Stainless steel DIN W.-Nr. 1.4301 AISI 304

Installation:

Maximum ambient temperature:	104 °F
Maximum operating pressure:	145.04 psi
Flange standard:	USA
Pipe connection:	1 1/2"

Electrical data:

Motor type:	Baldor, TEFC
Rated power - P2:	0.25 kW
Main frequency:	60 Hz
Rated voltage:	1 x 115/230 V
Service factor:	1,35
Rated current:	6/3 A
Rated speed:	1725 rpm
Number of poles:	4
Insulation class (IEC 85):	B



Others:

Net weight:	60.2 lb
Gross weight:	66 lb
Shipping volume:	1.98 ft³

SPEC 22 10 10 2.1
PUMP SCHEDULE M802

Product No.: 99163937

GRUNDFOS ALPHA2
The next generation of energy efficient circulators.

Grundfos ALPHA2 is versatile and efficient whether you use one of its seven speed or pressure control settings or simply leave it on the factory setting AUTOADAPT™.
The ALPHA2 with its ECM motor design reduces energy consumption by 50%.

In AUTOADAPT mode, the pump will automatically analyze the heating system,
find the optimum setting, continue to adjust its operation to changes in demand, ensuring the lowest possible energy consumption without
sacrificing comfort.

Compact design
With the electronics integrated into the motor housing and standard 2-Bolt flange connection, installation into confined spaces and challenging applications are now possible.
The ALPHA2 materials and design resist blockage from magnetite and iron oxide particles found in closed hydronic systems.

ALPHA2 is complete with an integrated check-valve, foam insulation jacket, and nut captures for flanges. ALPHA2 comes in both cast iron and stainless steel models

Two options for power connections
The large LED display shows the current energy consumption in Watts and estimated flow in gallons per minute For installation, you have the flexibility to use either our unique ALPHA Plug with line cord or the ALPHA2 with
terminal box for conduit connections

One-touch operation
Simple push button control enables the ALPHA2 to be programmed in one of 3-constant speed, 3-constant pressure, or AUTOADAPT control modes. The current operating mode is always visible on the ALPHA2's LED display

LED Display
The easy-to-read LED display indicating power (Watts) consumption and flow (GPM) estimation.

Robust startup
Enables the ALPHA2 to continuously attempt to restart – indefinitely – in blocked rotor conditions

Liquid:

Pumped liquid:	Water
Liquid temperature range:	35.6 .. 230 °F
Liquid temperature during operation:	140 °F
Density:	61.35 lb/ft³

Technical:

TF class:	110
Approvals on nameplate:	ETL, FCC, NSF

Materials:

Pump housing:	Stainless steel EN 1.4308
Impeller:	Composite

Installation:

Range of ambient temperature:	32 .. 104 °F
Maximum operating pressure:	145.04 psi

SPEC 22 10 10 2.2
PUMP SCHEDULE M802

Product photo could vary from the actual product

Product No.: 96402753

The pump is of the canned rotor type, i.e. pump and motor form an integral unit without shaft seal and with only two gaskets for sealing.
The bearings are lubricatd by the pumped liquid.

In order to avoid problems in connection with disposal, great importance has been attached to using as few different materials as possible.

The pump is characterized by:
* 3 speed motor.
* Ceramic radial bearings.
* Carbon axial bearing.
* Stainless steel rotor can, bearing plate and rotor cladding.
* Aluminium alloy stator housing.
* Bronze pump housing.
* Stator with built-in thermal switch.

The motor is a 1-phase motor.

The pump is supplied with a standard module in the terminal box.
The standard module is to be connected to the mains supply via external contactor.

Controls:

Relay:	with relay

Liquid:

Pumped liquid:	Water
Liquid temperature range:	14 .. 248 °F

GRUNDFOS

LIMITED WARRANTY

Products manufactured by GRUNDFOS PUMPS CORPORATION (GRUNDFOS) are warranted to the original user only to be free of defects in material and workmanship for a period of 24 months from date of installation, but not more than 30 months from date of manufacture. GRUNDFOS' liability under this warranty shall be limited to repairing or replacing at GRUNDFOS' option, without charge, F.O.B. GRUNDFOS' factory or authorized service station, any product of GRUNDFOS manufacture. GRUNDFOS will not be liable for any costs of removal, installation, transportation, or any other charges which may arise in connection with a warranty claim. Products which are sold but not manufactured by GRUNDFOS are subject to the warranty provided by the manufacturer of said products and not by GRUNDFOS' warranty. GRUNDFOS will not be liable for damage or wear to products caused by abnormal operating conditions, accident, abuse, misuse, unauthorized alteration or repair, or if the product was not installed in accordance with GRUNDFOS' printed installation and operating instructions.

To obtain service under this warranty, the defective product must be returned to the distributor or dealer of GRUNDFOS products from which it was purchased together with proof of purchase and installation date, failure date, and supporting installation data. Unless otherwise provided, the distributor or dealer will contact GRUNDFOS or an authorized service station for instructions. Any defective product to be returned to GRUNDFOS or a service station must be sent freight prepaid; documentation supporting the warranty claim and/or a Return Material Authorization must be included if so instructed.

GRUNDFOS WILL NOT BE LIABLE FOR ANY INCIDENTAL OR CONSEQUENTIAL DAMAGES, LOSSES, OR EXPENSES ARISING FROM INSTALLATION, USE, OR ANY OTHER CAUSES. THERE ARE NO EXPRESS OR IMPLIED WARRANTIES, INCLUDING MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, WHICH EXTEND BEYOND THOSE WARRANTIES DESCRIBED OR REFERRED TO ABOVE.

Some jurisdictions do not allow the exclusion or limitation of incidental or consequential damages and some jurisdictions do not allow limitations on how long implied warranties may last. Therefore, the above limitations or exclusions may not apply to you. This warranty gives you specific legal rights and you may also have other rights which vary from jurisdiction to jurisdiction.

Please leave these instructions with the pump for future reference.

Safety Warning

Read This Booklet

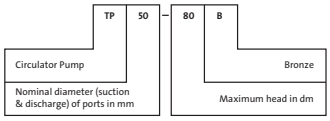
This booklet is designed to help a certified installer begin operation of and trouble-shoot Grundfos VersaFlo™ TP pumps. This booklet should be left with the owner of the pump for future reference and information regarding its operation. Should the owner experience any problems with the pump, a certified professional should be contacted.

Electrical Work

All electrical work should be performed by a qualified electrician in accordance with the latest edition of the National Electrical Code, local codes and regulations.

Shock Hazard

A faulty motor or wiring can cause electrical shock that could be fatal, whether touched directly or conducted through standing water. For this reason, proper grounding of the pump to the power supply's grounding terminal is required for safe installation and operation.



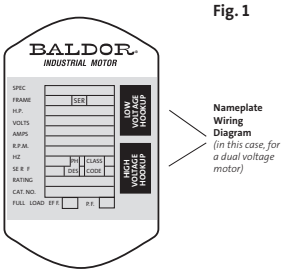
The ground wire should be a copper conductor at least the size of the circuit conductors supplying power to the motor. Do not ground to a gas supply line.

In all installations, the above-ground metal plumbing should be connected to the power supply ground as described in Article 250-80 of the National Electrical Code.

1. Pre-Installation Checklist

1.1 Confirm You Have the Right Pump

- Read the pump nameplate to make sure that it is the correct one.
- Compare the pump's nameplate data and its performance curve (for head, GPM, etc.) with the application in which you plan to install it.
- ***Will the pump do what you expect it to do?***
- The nomenclature for the VersaFlo TP line of Grundfos pumps is:



1.2 Check the Condition of the Pump

The shipping carton your pump came in is designed around your pump during production to prevent damage. As a precaution, it should remain in the carton until you are ready to install it. At that point, look at the pump and examine it for any damage that may have occurred during shipping. Examine any other parts of the shipment as well for any visible damage.

1.3 Electrical Requirements

Check the motor nameplate to determine the proper voltage, phase, and frequency required. The voltage must be within ± 10% of the specified motor nameplate voltage. Dual volt-age motors must be internally wired to match the electrical supply. A wiring connection diagram is affixed to the motor.

Fig. 1

Nameplate Wiring Diagram *(in this case, for a dual voltage motor)*

1.4 Is the Application Correct for This Pump?

Compare the pump's nameplate data or its performance curve with the application in which you plan to install it. Will it perform the way you want it to perform? Also, make sure the application falls within the following limits:

Approved applications:

- Open or closed water systems
- Glycol solutions up to 50% (requires optional RUVV mechanical seal)
- HVAC hot and cooled water
- Condenser or cooling tower heat exchanger circulation
- Commercial solar
- Commercial heating and fan coil systems
- Geothermal systems
- Agricultural temperature conditioning
- Snow melting

Correct it by...
If no voltage at motor, check feeder panel for tripped circuits.
Replace blown fuses or reset circuit breaker. If new fuses blow or circuit breaker trips, the terminal box wiring must be checked.
Replace burned heaters or reset. Inspect starter for other damage. If heater trips again, check the supply voltage and starter holding coil.
If no voltage, check the control circuit fuses. If there is voltage, check the holding coil for shorts. Replace bad coil.
Replace worn or defective parts.
If the motor windings are open or grounded, replace the motor.
When the meter is connected, the needle should jump toward "0" ohms and slowly drift back to infinity. Replace capacitor if defective.
Correct wiring and change leads as required.
Refill the pump, replace lug and start the pump. Long suction lines must be filled before starting the pump.
Clean and replace. Re-prime the pump.
Reduce suction lift by lowering pump, increasing suction line size or by removing high friction-loss fittings.
Repair all leaks and retighten all loose fittings.
Convert PSI to feet (PSI x 2.31 = _____ ft.). Refer to the specific pump curve for shutoff head for that pump model. If actual head is close to curve, the pump is probably OK. If not, remove pump and inspect.
Readjust switch or replace if defective.
Readjust setting (refer to level control manufacturer's data). Replace if defective.
Check diaphragm for leak. Check tank and piping for leaks with soap and water solution. Check air-to-water volume.
Tank volume should be approximately 10 gal. for each gpm of pump capacity. The normal air volume is 2/3 of the total tank volume at the pump cut-in pressure.
If voltage varies more than ±10%, contact power company. Check wire sizing.
Increase heater size or adjust trip setting.
Must be within ±5%. If not, check motor and wiring.
If an open or grounded winding is found, repair or replace the motor.
Tighten loose terminals. Replace damaged wire.
If shaft does not rotate, remove pump and inspect. Disassemble and repair.
When the ohmmeter is connected to the capacitor, the needle should jump towards "0" ohms and slowly drift back to infinity; or, with the capacitor meter the UF reading should be ±10% of capacitor rating. Replace if defective.

5.2 Diagnosing Specific Problems

If the pump...	It may be caused by...	Check this by...
Does not run	1. No power at motor.	Check for voltage at terminal box.
	2. Fuses are blown or circuit breakers are tripped.	Turn off power and remove fuses and check for continuity with an ohmmeter.
	3. Motor starter overloads are burned or have tripped.	Check for voltage on the line and load side of the starter.
	4. Starter does not energize.	Energize control circuit and check for voltage at the holding coil.
	5. Defective controls.	Check all safety and pressure switches for operation. Inspect contact in control devices.
	6. Motor is defective.	Turn off power. Disconnect the wiring. Measure the lead-to-lead resistance with an ohmmeter (set at R x 1). Measure lead-to-ground values with a megohmmeter (R x 100K). Record the measured values.
	7. Defective capacitor. (Single-phase motors)	Turn off the power, then discharge the capacitor. Disconnect the leads and check them with an ohmmeter (R x 100K).
Pump runs, but at a reduced capacity *or* **Doesn't deliver water**	1. Wrong rotation (Three-phase only)	Check for proper electrical connections in terminal box.
	2. Pump is not primed or is air-bound.	Turn pump off, close isolation valves, remove priming plug. Check fluid level.
	3. Strainers, check valves, or foot valves are clogged.	Remove strainer, screen, or valve and inspect.
	4. Suction lift too large.	Install compound pressure gauge at the suction side of the pump. Start pump and compare reading to performance data.
	5. Suction and/or discharge piping leaks.	Pump shaft spins backwards when turned off. Air in suction pipe.
	6. Worn pump.	Install pressure gauge, start the pump, gradually close the discharge valve and read pressure at shut-off.
Pump cycles too much	1. Pressure switch is not properly adjusted or is defective.	Check pressure setting on switch and operation.
	2. Level control is not properly set or is defective.	Check voltage across closed contacts.
	3. Three-phase current is unbalanced.	Check setting and operation.
	4. Tank is too small.	Pump air into tank or diaphragm chamber. Check tank size and air volume in tank.
Fuses blow *or* **Circuit breakers trip**	1. High or low voltage.	Check voltage at the starter panel or terminal box.
	2. Starter overloads are set too low.	Cycle pump and measure amperage.
	3. Three-phase current is unbalanced.	Check the current draw on each lead to the motor.
	4. Motor is shorted or grounded	Turn off power and disconnect incoming power supply from terminal box. Measure winding and lead-to-ground resistance as explained on the previous page.
	5. Wiring or connections are faulty.	Check for proper wiring and loose terminals.
	6. Pump is stuck.	Turn off power and manually rotate pump shaft.
	7. Defective capacitor. (Single-phase only)	Turn off power, discharge capacitor and check with ohmmeter set at highest R value or check with capacitor meter.

Temperature range

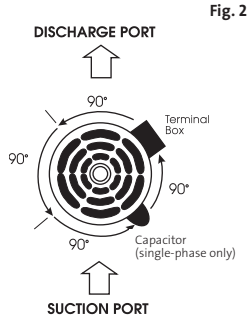
- Minimum +5°F (-15°C)
- Maximum +284°F (140°C)

Maximum working pressure:
145 PSI (10 bars)

1.5 Read This Guide Thoroughly

Even if you are very familiar with the installation of this pump, a quick glance through the remaining sections of this guide may help you avoid a potential problem.

For TPE pump installation, see Grundfos Pumps publication L-EC-TL-001.



2. Installation Procedures

2.1 Electrical Preparation

2.1.1 Terminal Box Position

Before installing the pump, you must determine the most convenient position for the terminal box, which can be rotated in 90° increments. To rotate the terminal box, remove the four bolts securing the motor to the pump, lift and rotate the motor, and retighten the bolts. (See page 9.)

Fig. 2

2.1.2 Single-Phase Motors

These motors are multi-voltage with built-in automatic resetting thermal protection to prevent overheating.

2.1.3 Three-Phase Motors

A motor starter is required to ensure the motor is protected from damage caused by low voltage, phase failure, current imbalance, and overloads.

- Motor starter — should be properly sized, have a manual reset, and ambient-compensated extra quick trip in all three legs.
- Overload — should be sized and adjusted to trip at the full-load current rating of the motor. If the motor is lightly loaded, the overload should be re-sized or adjusted to a lower value. **Under no circumstances should the overloads be set to a higher value than the full load current shown on the motor nameplate.** Overloads for auto transfers and resistant starters should be sized in accordance with the recommendations of the manufacturer.
- Fused disconnect — recommended for each pump where service and standby pumps are installed. An alternating switch should be used so each pump can be equally operated to even the wear.

2.1.4 Other Wiring Considerations

The pump must be grounded. Wire sizes should be based on the ampacity (current carrying properties of a conductor) as required by the latest edition of the National Electrical Code or local regulations.

In most cases, direct on line (D.O.L) starting is approved due to the extremely fast run-up time of the motor and the low moment of inertia of the pump and motor. If D.O.L starting is not acceptable, an auto transformer or resistant starter should be used.

2.2 Piping Considerations

Whenever possible, avoid high pressure-loss fittings (elbows, branch tees, etc) directly on either side of the pump. The pump and piping should be adequately supported on both sides to reduce thermal and mechanical stresses on the pump.

Pipe, valves, and fittings should be at least the same diameter as the discharge pipe to reduce excessive fluid velocities and friction losses. They should also have a pressure rating equal to or greater than the maximum system pressure.

A bypass or pressure relief valve should be installed in the discharge pipe if there is any possibility the pump may operate against a closed valve in the discharge line. Circulation through the pump is required to ensure adequate cooling and lubrication of the pump.

Minimum Pumping Rates:

TP32,TP40,TP50 . . . . . .8 GPM

TP80 . . . . . .12 GPM

TP100 . . . . . 20 GPM

The bypass should be routed back to a heat dissipating source or to drain, depending on the liquid being pumped and local codes.

2.3 Installing the Pump

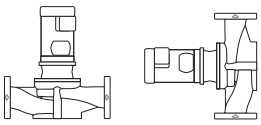
2.3.1 Pump Location

The pump should be installed in a dry, well-ventilated area which is not subject to freezing or large variations in temperature.

The pump should never be mounted within six inches of any obstruction or hot surface.

Pumps to be installed outdoors or in a dusty environment should be ordered with a totally-enclosed-fan-cooled motor (TEFC) attached to prevent motor failure.

2.3.2 Position in Piping System



Do not mount the pump at the highest or lowest point in the piping system.

If the pump is installed at the highest point in the piping system, it may experience reduced performance and increased noise due to air trapped in the pump.

If the pump is located at the lowest point in the piping system, the dirt and sediment in the system may collect inside the pump, causing premature wear to the shaft seal.

2.3.3 Proper Orientation

VersaFlo TP pumps can be mounted either vertically or horizontally, and all positions in between. **However, the motor shaft must never fall below the horizontal plane.**

Recommended

DO NOT mount motor with shaft below horizontal plane

2.3.4 Direction of Flow for Specific Applications

Arrows on the flanges of the pump volute show the flow direction of water through the pump.

Pumps used to circulate domestic water should ALWAYS be installed in a vertical section of the circulating pipe and pump upwards, and an effective air vent should be used in the same vertical section of pipe.

If the pump must be installed in a vertical pipe pumping down, an air vent should be installed at the highest point before the pump.

2.3.5 Suggested Accessories

Isolation valves — should be installed on each side of the pump to avoid having to drain the system if the pump needs to be cleaned or repaired.

Check valve — should be installed in the discharge pipe.

Plugged tee or capped pipe — should be installed in the suction line to fill the pump and pipe before start-up, especially if the system is not pressurized.

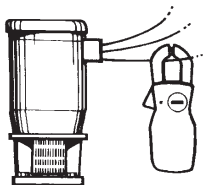
Vibration isolators — should be used in noise-sensitive areas to prevent vibra-tion from being transmitted to the structure.

Relief valve of bypass line — should be installed to allow sufficient water to circulate through the pump to provide adequate cooling and lubrication of the pump's bearings and seals.

2.4 Electrical Hookup

Turn the incoming POWER OFF and make the proper electrical connections according to the diagram on the motor and the latest edition of the National Electrical Code.

Do not start the pump — even to check the direction of rotation — until it has been filled with water. The pump may be seriously damaged if it is run dry.



3. Starting the Pump the First Time

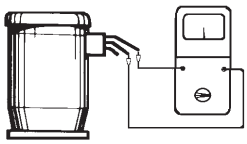
3.1 Prime the Pump

3.1.1. In Closed/Open System Where Water Source is Above the Pump

1. Close the pump isolation valves and open the air vent screw.
2. Gradually open the suction isolation valve until a steady stream of airless water runs out the air vent hole.

Fig. 7

1. Burned contacts on motor starter.
2. Loose terminals in starter/terminal box or possible wire defect.
3. Too high or too low supply voltage.
4. Motor windings are shorted or grounded. Check winding and insulation resistances.
5. Pump is damaged causing a motor overload.



5.1.3 Winding Resistance

5.1.3.1 How to Measure

Turn off power and disconnect the supply power leads in the pump terminal box. Using an ohmmeter, set the scale selector to R x 1 and zero adjust the meter by touching the two ohmmeter leads together.

Touch the leads of the ohmmeter to two motor leads.

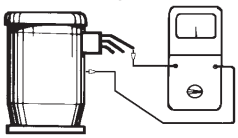
Fig. 8

Single phase motors - touching the leads of the ohmmeter to the two outgoing "hot" motor leads (either a single motor lead or combination of leads joined together) will measure the main winding's resistance.

Three phase motors - touching the leads of the ohmmeter to any two hot leads will measure that winding's resistance. Repeat for all three possible lead combinations (L_1 and L_2, L_2 and L_3, L_1 and L_3).

5.1.3.2 Evaluation

If all ohm values are normal, the motor windings are neither shorted nor open.



If any one ohm value is less than normal (-25%), that motor winding may be starting too short. If any one ohm value is greater than normal (+25%), the winding may be starting too open. If some values are high and some are low, the leads may be connected incorrectly, or they may have a break in the insulating jacket.

5.1.4 Insulation Resistance (Lead to Ground)

5.1.4.1 How to Measure

Turn off power and disconnect the supply power leads in the pump terminal box. Using an ohmmeter, set the scale selector to R x 100 and zero adjust the meter by touching the two ohmmeter leads together. Touch one ohmmeter lead to a motor lead and one to ground. Repeat for each lead.

Fig. 9

5.1.4.2 Evaluation

The resistance values for new motors must exceed 1,000,000 ohms. If they do not, replace the motor.

4.1.8 Service Conditions

Severity of Service	Ambient Temperature (maximum)	Atmospheric Contamination	Grease Interval (hrs.)	Approved Types of Grease
Standard	104°F (40°C)	Clean, little corrosion	5500	Shell Dolium R
Severe	122°F (50°C)	Moderate dirt, corrosion	2750	Chevron SR#2
Extreme	>122°F (50°C) or class H ins.	Severe dirt, abrasive dust, corrosion	550	Or compatible equivalent grease

If the pump fails to operate or there is a loss of performance, refer to the Troubleshooting section on pages 11 through 14.

4.1.9 Rapid Cycling

Pump cycling should be monitored to make sure the pump is not starting more than 20 times per hour. If it is, premature motor failure is quite likely, due to the increased heat build-up in the motor. Make any adjustments to controls ne-cessary to reduce the frequency of stops and starts.

4.1.10 Freeze Protection

If the pump is installed in an area where freezing could occur, the pump and system should be drained during freezing temperatures to avoid damage.

To drain the pump, close both isolation valves and loosen the suction and dis-charge flanges. Allow water to flow out of the pump before reconnecting the pump to the flanges. Do not tighten the flanges completely until the pump is ready to be used again.

5. Troubleshooting

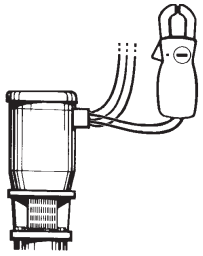
5.1 Preliminary Checks

5.1.1 Supply Voltage

5.1.1.1 How to Measure

Use a volt meter, (set to the proper scale) measure the voltage at the pump terminal box or starter.

On single-phase units, measure between power leads L1 and L2 (or L1 and N for 115 volt units). On three-phase units, measure between:



- Power leads L1 and L2
- Power leads L2 and L3
- Power leads L3 and L1

Evaluation

When the motor is under load, the voltage should be within ±10% of the nameplate voltage. Larger voltage variation may cause winding damage and indicate a poor electrical supply. The pump should not be operated until these variations have been corrected.

If the voltage constantly remains high or low, the motor should be changed to the correct supply voltage.

Fig. 6

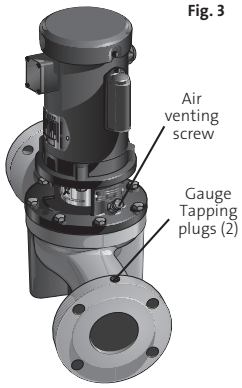
5.1.2 Current Measurement

5.1.2.1 How to Measure

Use an ammeter, (set on the proper scale) to measure the current on each power lead at the terminal box or starter.

Current should be measured when the pump is oper-ating at constant discharge pressure.

5.1.2.2 Evaluation



If the amp draw exceeds the listed service factor amps (SFA) or if the current imbalance is greater than 5% between each leg on three-phase units, check the following:

3. Tighten the air vent screw and completely open the isolation valves.

3.1.2 In Open Systems

1. The suction pipe and pump must be filled and vented of air before starting the pump.
2. Close the discharge side isolation valve and open the air vent screw and suction valve.
3. Fill the suction line through the plugged tee or capped pipe (if one is installed). If not possible, remove one of the gauge tapping plugs in the pump flanges and pour water into the hole using a funnel or hose with an adapter.

Fig. 3

All air in the pump and suction line must be purged before starting the pump.

3.2 Check the Direction of Rotation

a. Switch the POWER OFF.

b. Check to make sure the pump has been filled and vented.

c. Remove the coupling guard and rotate the pump shaft to be certain it turns freely. Replace the coupling guard.

d. Verify that the electrical connections are in accordance with the wiring diagram on the motor.

e. Switch the power on and observe the direction of rotation. When viewed from the motor end, the pump should rotate counter-clockwise.

f. To reverse the direction of rotation, TURN OFF the power supply and complete the following which applies.

- On three-phase motors, interchange any two power leads at the load side of the starter. On single-phase motors, refer to the connection diagram on the motor nameplate. Change the wiring as required.

g. TURN ON the power and again check for proper motor rotation.

3.3 Starting and Adjusting

a. Make sure that:

- The pump has been primed.
- The rotation is counter-clockwise when viewed from the motor end.
- The piping connections are tight and adequately supported.

b. Open the suction line valve completely (if one is installed).

c. Close the isolation valve in the discharge pipe. It should be opened gradually after the pump is turned on. Opening the valve too fast may result in water hammer in the discharge pipe.

d. Start the pump.

e. Gradually open the isolation valve in the discharge piping as explained in step c. Open the valve completely.

f. Check the voltage and amperage at the motor and record them. Adjust the motor overloads if required.

g. If pressure gauges have been installed, check and record the values as the pump operates.

h. Check all controls for proper operation. If the pump is controlled by a pressure switch, check and adjust the cut-in and cut-out pressures. If low-water level controls are used, be sure the low-level switch is properly adjusted so the pump cannot run if the pump breaks suction.

4. Maintenance

4.1 Servicing the Pump Head

4.1.1 Step 1: Remove the Pump Head

1. Turn OFF the power to the motor.
2. Close any isolation valves on either side of the pump.

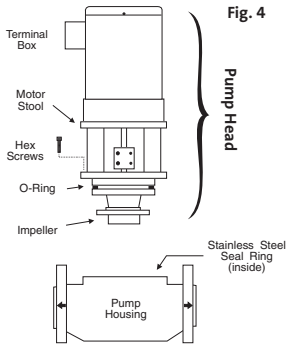


Fig. 4

3. Disconnect the electrical leads and conduit from the terminal box.
4. Loosen and remove the hex bolts connecting the pump head assembly to the pump housing. **Note the position of the motor terminal box relative to the pump housing.**
5. Remove the pump head assembly from the pump housing.
6. Clean the machined surfaces in the pump housing.
7. Inspect the pump housing and stainless steel ring for any damage. Check to be sure the seal ring is mounted securely in the pump housing.
8. Repair or replace parts as needed.

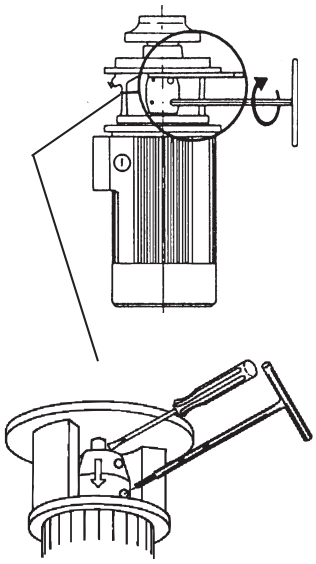
4.1.1.1 Assembly

With the motor/motor stool assembly upside down as shown (fig. 5)

1. Carefully pass the shaft with the rotating shaft seal and impeller through the shaft hole in the motor stool (the seal rings must not be exposed to blows or knocks).
2. Fit the shaft pin in the shaft pin hole.
3. Fit the coupling halves and the coupling allen bolts loosely to the pump and motor shafts so that the gaps on both sides of the coupling halves are even.
4. Insert a screwdriver above the coupling, push the pump shaft towards the motor as far as possible. The pump and motor shaft should touch each other. Tighten coupling allen bolts to the following specifications:

   M6 . . . . . **9.6 ft lbs**

   M8. . . . . **22.6 ft lbs**



5. Clean the recess of the pump housing/ motor stool lubricate o-ring with soapy water if necessary.
6. Fit the pump head in the pump housing with the terminal box in the required position, be careful to align impeller with neck ring.
7. Replace the motor stool bolts and tighten to the following specifications.

   M8. . . . . **18.4 ft lbs**

   M10 . . . . . **34.7 ft lbs**

8. Check the shaft for free rotation and replace the coupling guards.
9. The pump is now completely assembled.

Fig. 5

4.1.2 Step 2: Re-Install the Pump Head

1. Lubricate the O-ring with soapy water.
2. With the motor terminal box in the desired position, carefully place the pump head assembly into the pump housing. Be careful not to damage the impeller or mating seal ring. Once the pump head O-ring is engaged with the pump housing, do not attempt to rotate the pump head, since doing so may damage the O-ring.
3. Make sure the pump head assembly is properly seated on the pump housing. DO NOT force the two together.
4. Tighten two of the hex bolts opposite each other until the pump head is secure to the pump housing.
5. Check to make sure the motor shaft turns freely.
6. Insert and tighten the rest of the hex bolts evenly to secure the pump head assembly.

Hex Bolt	Torque
13 mm	19 ft lbs
17 mm.	35 ft lbs

4.1.3 Motor Replacement

If the motor is damaged due to bearing failure, or electrical failure, the following instructions detail how to remove the motor for replacement. It must be emphasized that motors used on VersaFlo TP pumps are specifically selected to our rigid specifications.

Replacement motors must be of the same NEMA frame size, should be equipped with the same or better bearings and have the same service factor. Failure to follow these recommendations may result in premature motor failure.

4.1.3.1 Disassembly

1. Remove the coupling guard screens.
2. Using the proper metric allen wrench, loosen the four cap screws in the coupling, fully remove coupling halves.
3. With the correct size wrench, loosen and remove the four bolts which hold the motor to the discharge section of the pump end.
4. Lift the motor straight up until the shaft is free from the coupling.

4.1.4 Pump Lubrication

Grundfos VersaFlo TP in-line centrifugal pumps installed in accordance with these instructions and sized for correct performance will operate efficiently and provide years of service.

The pumps are lubricated by the fluid they pump, and do not require any additional lubrication. **However, this also means the pump should never be operated for any prolonged periods of time without fluid flowing through the pump.** The motors will require periodic lubrication as noted in the following paragraphs.

4.1.5 Motor Lubrication

Electric motors are prelubricated at the factory and do not require additional lubrication at start-up. Motors without external grease fittings have sealed bearings that cannot be relubricated. Motors with grease fittings should only be lubricated with approved types of grease.

Do not over grease the bearings. Over greasing will cause increased bearing heat and can result in bearing/motor failure. Do not mix petroleum grease and silicon grease in motor bearings.

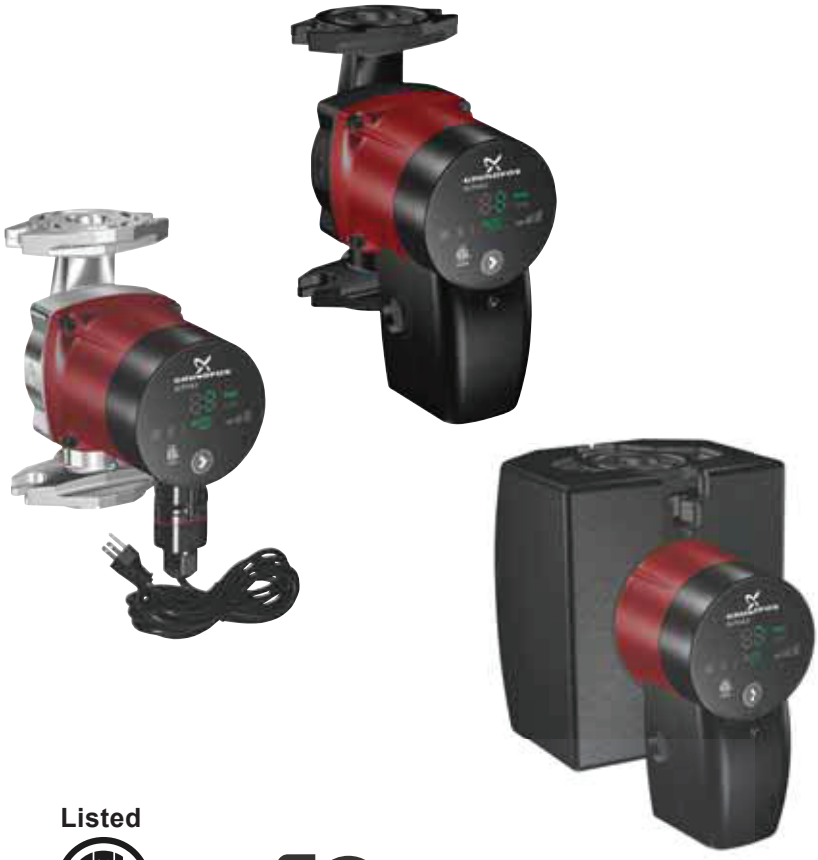
Bearing Grease will lose its lubricating ability over time, not suddenly. The lubricating ability of the grease (over time) depends primarily on the type of grease, the size of the bearings, the speed at which the bearings operate and the severity of the operating conditions.

Good results can be obtained if the following recommendations are used in your maintenance program.

4.1.6 Lubrication Schedule

For motor frame sizes smaller than 210TC, add 0.3 oz. (8.4g) or 0.6 in. (2 tsp.) at the intervals listed above.

4.1.7 Periodic Safety Checks



At regular intervals depending on the conditions and time of operation, the following checks should be made:

1. Pump meets required performance and is operating smoothly and quietly.
2. There are no leaks, particularly at the shaft seal.
3. The motor is not overheating.
4. Remove and clean all strainers or filters in the system.
5. Verify the tripping of the motor overload protection.
6. Check the operation of all controls. Check unit control cycling twice and adjust if necessary.
7. If the pump is not operated for unusually long periods, the unit should be maintained in accordance with these instructions. In addition, if the pump is not drained, the pump shaft should be manually rotated or run for short periods of time at monthly intervals.

Prior to installation, read this document. Installation and operation must comply with local regulations and accepted codes of good practice.

This appliance can be used by children aged from 8 years and above and persons with reduced physical, sensory or mental capabilities or lack of experience and knowledge if they have been given supervision or instruction concerning the use of the appliance in a safe way and understand the hazards involved. Children must not use or play with the appliance. Cleaning and user maintenance shall not be made by children without supervision.

Successful operation depends on careful attention to the procedures described in this manual. Keep this manual for future use.

1. Limited warranty

New equipment manufactured by the seller or service supplied by the seller is warranted to be free from defects in material and workmanship under normal use and service for a minimum of twelve (12) months from the date of installation, eighteen (18) months from the date of shipment, unless otherwise stated in the product warranty guide (available upon request). In the case of spare or replacement parts manufactured by the seller, the warranty period shall be twelve months from shipment. The seller's obligation under this warranty is limited to repairing or replacing, at its option, any part found to its satisfaction to be defective, provided that such part is, upon request, returned to the seller's factory from which it was shipped, transportation prepaid. Parts replaced under the warranty shall be warranted for twelve months from the date of the repair, not to exceed the original warranty period. This warranty does not cover damage to parts resulting from decomposition from chemical action or wear caused by abrasive materials, nor does it cover damage resulting from misuse, accident, neglect, or from improper operation, maintenance, installation, modification or adjustment. This warranty does not cover parts repaired outside the seller's factory without prior written approval. The seller makes no warranty as to starting equipment, electrical apparatus or other material not of its manufacture. If the purchaser or any other party repairs, replaces or adjusts equipment or parts without the seller's prior written approval, the seller is relieved of any further obligation to the purchaser under this paragraph with respect to such equipment or parts, unless such repair, replacement or adjustment was made after the seller, within a reasonable time, failed to satisfy

his obligations under this paragraph. The seller's liability for breach of these warranties (or for breach of any other warranties found by a competent court to have been given by the seller) shall be limited to: (a) accepting return of such equipment exw plant of manufacture, and (b) refunding any amount paid thereon by the purchaser (less depreciation at a rate of 15 % per year if the purchaser has used the equipment for more than thirty [30] days), and canceling any balance still owing on the equipment, or (c) in the case of service, at the seller's option, redoing the service, or refunding the purchase order amount of the service or a portion thereof upon which such liability is based. These warranties are expressly in lieu of any other warranties, express or implied, and the seller specifically disclaims any implied warranty of merchantability or fitness for a particular purpose, and in lieu of any other obligation or liability on the part of the seller, whether a claim is based upon negligence, breach of warranty or any other theory or cause of action. In no event shall the seller be liable for consequential, incidental, indirect, special or punitive damages of any kind. For the purposes of this paragraph, the equipment warranted shall not include equipment, parts and work not manufactured or performed by the seller. With respect to such equipment, parts or work, the seller's only obligation shall be to assign to the purchaser the warranties provided to the seller by the manufacturer or supplier providing such equipment, parts or work. No equipment furnished by the seller shall be deemed to be defective by reason of normal wear and tear, failure to resist erosive or corrosive action of any fluid or gas, the purchaser's failure to properly store, install, operate or maintain the equipment in accordance with good industry practices or specific recommendations of the seller, including, but not limited to the seller's installation and operation manuals, or the purchaser's failure to provide complete and accurate information to the seller concerning the operational application of the equipment.

2. General information

2.1 Symbols used in this document

DANGER

Indicates a hazardous situation which, if not avoided, will result in death or serious personal injury.

WARNING

Indicates a hazardous situation which, if not avoided, could result in death or serious personal injury.

CAUTION

Indicates a hazardous situation which, if not avoided, could result in minor or moderate personal injury.

The text accompanying the three hazard symbols DANGER, WARNING and CAUTION will be structured in the following way:

SIGNAL WORD

Description of hazard

Consequence of ignoring the warning.

- Action to avoid the hazard.

Example

DANGER

Electric shock

Death or serious personal injury.

- Switch off the power supply before starting any work on the product. Make sure that the power supply cannot be accidentally switched on.

A blue or grey circle with a white graphical symbol indicates that an action must be taken to avoid a hazard.

A red or grey circle with a diagonal bar, possibly with a black graphical symbol, indicates that an action must not be taken or must be stopped.

If these instructions are not observed, it may result in malfunction or damage to the equipment.

Notes or instructions that make the work easier and ensure safe operation.

3. Receiving the product

3.1 Inspecting the product

Check that the product received is in accordance with the order.

Check that the voltage and frequency of the product match voltage and frequency of the installation site. See section *7. Identification* for information on the nameplate.

3.2 Scope of delivery

The box contains the following items:

- one Grundfos ALPHA2 pump
- one insulation shell
- one line cord or terminal box
- two gaskets
- installation and operating instructions
- one check valve
- one "Check Valve Installed" sticker.

4. Installing the product

WARNING

Pressurized system

Death or serious personal injury.

- Before dismantling the pump, drain the system or close the isolating valve on either side of the pump before the screws are removed. The pumped liquid may be scalding hot and under high pressure.

DANGER

Electric shock

Death or serious personal injury.

- Switch off the power supply before starting any work on the product. Make sure that the power supply cannot be accidentally switched on.

DANGER

Electric shock

Death or serious personal injury.

- This pump has not been investigated for use in swimming pool or marine areas.

4.1 Quick installation tips

1. To ensure proper air venting of your system, place the pump in "Fixed Speed III" mode until all air has been removed. Isolating zones during this process will ensure proper air removal.
2. For balancing manifold zone(s) applications, utilizing "Constant Pressure mode 1 or 2" and only one zone at a time during balancing will ensure proper flow rate to each zone.
3. Always review your boiler minimum flow rate requirements if utilizing the pump as a primary pump. Select one of the fixed speed modes for boiler primary pump applications.
4. In general, for maximum energy savings and comfort level, start with the AUTO$_{ADAPT}$™ mode.
5. You may change hydraulic selection while pumping. No permanent damage will occur. In fact, Grundfos encourages testing the various hydraulic modes with your hydronic system to ensure maximum energy savings and comfort level.
6. With zone panel control applications, when there is a call for heat and power has been sent to the pump, the pump will remember and restart from the last duty point and hydraulic mode.

4.2 Mechanical installation

When making pipe connections, follow the piping manufacturer's recommendations and all code requirements for the piping material.

- Flush the system of debris before installation.
- Insert the check valve if required. See fig. 1.
- Refer to the arrows on the pump housing indicating the direction of the liquid flow through the pump.
- Install the pump with horizontal motor shaft. See fig. 2.
- Fit the two gaskets supplied to the pump ends.

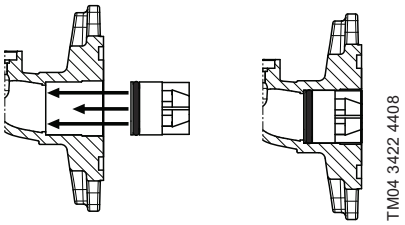

Fig. 1 Check valve installation

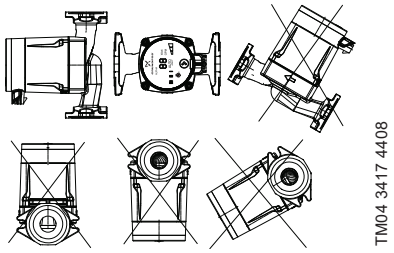

Fig. 2 Installation positions

4.3 Changing the power head position

CAUTION

Hot surface
Minor or moderate personal injury.
- Position the pump so that persons cannot accidentally come into contact with hot surfaces.

DANGER

Electric shock
Death or serious personal injury.
- Switch off the power supply before starting any work on the product. Make sure that the power supply cannot be accidentally switched on.

WARNING

Pressurized system
Death or serious personal injury.
- Before dismantling the pump, drain the system or close the isolating valve on either side of the pump before you remove the screws. The pumped liquid may be scalding hot and under high pressure.

If you change the position of the power head, fill the system with the liquid to be pumped or open the isolating valves.

- Make any change to the power head orientation before filling the system with liquid. You can turn the power head in steps of 90 °.
- See fig. 3 for permissible positions.
- Only use orientations C and D for CSA, enclosure type 2.

Proceed as follows:

1. If liquid is present, drain the liquid from the pump or isolate the liquid from the pump.
2. Remove the four socket head cap screws.
3. Turn the pump head to the desired position. See fig. 3.
4. Cross-tighten the screws to: 7 ft-lbs torque.

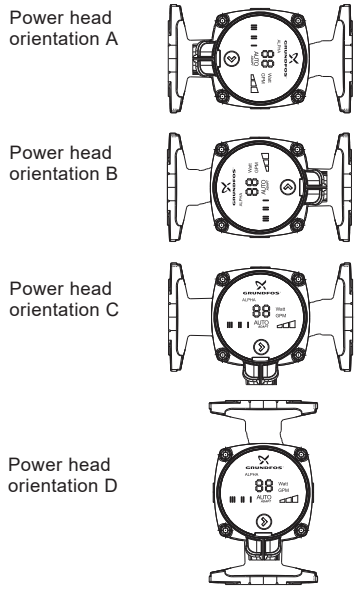

Fig. 3 Changing the power head position

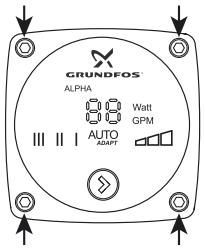

Fig. 4 Remove the four socket head cap screws on the power head to change the power head position

4.4 Insulating the pump housing

TM06 7711 3816

Fig. 5 Insulating the pump housing

Limit the heat loss from the pump housing and pipes.

Do not insulate the control box or cover the control panel.

You can reduce the heat loss from the pump and pipes by insulating the pump housing and the pipes. See figures 5 and 6.

- Insulating shells for pumps in heating systems are supplied with the pump. See fig. 6.
- For pumps in air-conditioning and cooling systems (down to +14 °F (-10 °C)), it is required to apply a silicon sealant to the internal contours of the shell in order to eliminate any air gaps and prevent condensation between the insulating shell and pump housing. Alternatively, you can insulate the pump manually in accordance with standard insulating requirements for heating and cooling systems.
- The fitting of insulating shells will increase the pump dimensions.

TM06 7589 4716

TM06 7588 3516

Fig. 6 Fitting insulating shells to the pump

4.5 Electrical connection

DANGER

Electric shock

Death or serious personal injury.

- All electrical work must be carried out by a qualified electrician in accordance with the latest edition of the National Electric Code and state, local codes and regulations.

DANGER

Electric shock

Death or serious personal injury.

- Switch off the power supply before starting any work on the product. Make sure that the power supply cannot accidentally switched on.

DANGER

Electric shock

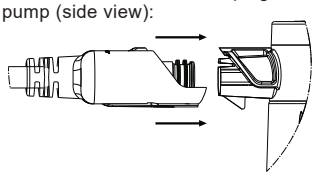
Death or serious personal injury.

- This pump has not been investigated for use in swimming pool or marine areas.

DANGER

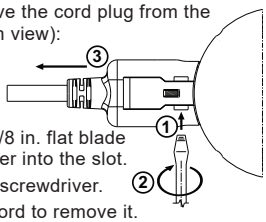
Electric shock

Death or serious personal injury.



- This pump is supplied with a grounding conductor and grounding-type attachment plug. To reduce the risk of electric shock, be certain that it is connected only to a properly grounded, grounding-type receptacle in accordance with the National Electric Code and any state, local governing codes and regulations.

- The motor is protected by the electronics in the control box and requires no external motor protection.
- Check that the supply voltage and frequency correspond to the values stated on the pump.
- Only connect the pump to the power supply with the line cord or through the terminal box supplied with the pump; see sections *4.5.1 For pump models with line cord* and *4.5.2 For pump models with terminal box*.
- Do not modify and only use the line cord supplied.
- The lights on the control panel indicate that the electrical supply has been switched on.



4.5.1 For pump models with line cord

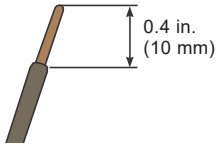
Follow the procedure as shown in fig. 7.

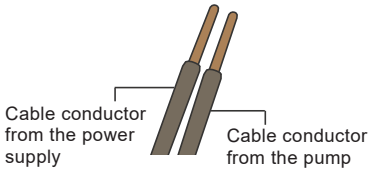
How to insert the line cord plug onto the pump (side view):

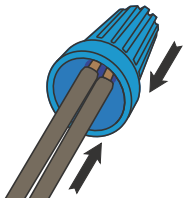
How to remove the cord plug from the pump (bottom view):

1. Insert a 1/8 in. flat blade screwdriver into the slot.
2. Twist the screwdriver.
3. Pull the cord to remove it.

TM04 3420 1010







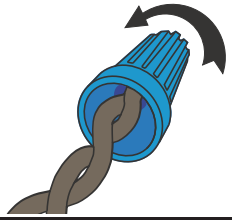


Fig. 7 Connecting and removing the power plug for line cord models

4.5.2 For pump models with terminal box

1. Loosen the terminal box screw from the terminal box cover.
2. Utilize either conduit port for the wiring entrance.
3. Wirethe plug connector as illustrated in the section *Wiring procedure* below, steps 3a-3d. Then complete steps 4-7.

Be sure to connect the ground cable conductor (green) of the pump to the ground cable conductor of the power supply.

Wiring procedure

Step	Action	Illustration
3a	Strip the ends of the cable conductors as illustrated.	 TM06 8250 4816
3b	Align the end of each of the pump's cable conductors, including any frayed strands, with the end of the corresponding cable conductor from the power supply. Green conductor: ground Black conductor: line White conductor: neutral	 TM06 8253 4816
3c	Insert the ends of the cable conductors into the connector. Push the cable conductors fully into the connector.	 TM06 8251 4816
3-d	Twist the connector until you see two twists in the cable conductors.	 TM06 8252 4816

4. Slide the terminal box cover over the terminal box body.
5. Tighten the cross-head screw on the terminal box to 5 in-lbs.
6. Switch on the power supply.
7. The lights on the control panel will then indicate that the power supply has been switched on.

5. Starting up the product

Do not start the pump until the system has been filled with liquid and vented.

The required minimum inlet pressure must be available at the pump inlet.

5.1 Venting the pump

The pump is self-venting. It need not be vented before startup.

The pump must not run dry.

Air in the pump may cause noise. This noise ceases after a few minutes running.

You obtain quick venting of the pump by setting the pump to speed III for a short period. How fast the pump is vented depends on the system size and design.

When you have vented the pump, i.e. when the noise has ceased, set the pump according to the recommendations. See section *8.3 Setting the pump*.

You cannot vent the system through the pump.

5.2 First startup

- The light in the control panel shows that the power supply has been switched on. See fig. 9.
- Factory setting: $AUTO_{ADAPT}$.

6. Product introduction

6.1 Product description

The ALPHA2 circulator pump incorporates a permanent-magnet motor and differential-pressure control enabling continuous adjustment of the pump performance to the actual system requirements.

The pump has a user-friendly front-mounted control panel. See sections *7. Identification* and *8. Control functions*.

When you install an ALPHA2, it means:

- Easy installation and start-up.
  - The pump is easy to install. Thanks to the $AUTO_{ADAPT}$ function (factory setting), you can start the pump, in most cases, without making any settings.
- High degree of comfort.
- Minimum noise from valves, etc.
- Low energy consumption.
  - Low energy consumption compared to conventional circulator pumps.

6.2 Applications

DANGER

Explosion hazard

Death or serious personal injury.

- Do not use the pump for transfer of flammable liquids such as diesel oil, gasoline, and similar liquids.

DANGER

Electric shock

Death or serious personal injury.

- This pump has not been investigated for use in swimming pool or marine areas.

The ALPHA2 circulator pump is designed for the circulation of water in heating systems, domestic hot-water systems as well as air-conditioning and cold-water systems.

Cold-water systems are defined as systems where the ambient temperature is higher than the temperature of the pumped liquid.

The pump is the best choice for the following systems:

- underfloor heating systems
- one-pipe systems
- two-pipe systems.

The pump is suitable for the following:

- systems with constant or variable flows where you want to optimize the setting of the pump duty point.
- systems with variable flow-pipe temperature.
- balancing of domestic heating systems.

6.3 Pumped liquids

For information about pressures and temperatures, see section *10. Technical data*.

CAUTION

Flammable material

Minor or moderate personal injury.

- Do not use the pump for flammable liquids, such as diesel oil and petrol.

WARNING

Biological hazard

Death or serious personal injury.

- In domestic hot-water systems, the temperature of the pumped liquid must always be above 122 °F (50 °C) due to the risk of legionella.

WARNING

Biological hazard

Death or serious personal injury.

- In domestic hot-water systems, the pump is permanently connected to the mains water. Therefore, do not connect the pump by a hose.

CAUTION

Corrosive substance

Minor or moderate personal injury.

- Do not use the pump for aggressive liquids, such as acids and seawater.

In heating systems, the water must meet the requirements of accepted standards on water quality in heating systems.

The pump is suitable for the following liquids:

- Thin, clean, non-aggressive and non-explosive liquids, not containing solid particles or fibers.
- Cooling liquids, not containing mineral oil.
- Domestic hot water
  Maximum: 14 °dH
  Maximum: 149 °F (65 °C)
  Maximum peak: 158 °F (70 °C).
  For water with a higher degree of hardness, contact Grundfos.
- Softened water.

The kinematic viscosity of water is 1 mm^2/s (1 cSt) at 68 °F (20 °C). If the pump is used for a liquid with a higher viscosity, the hydraulic performance of the pump will be reduced.

Example: 50 % glycol at 68 °F (20 °C) means a viscosity of approximately 10 mm^2/s (10 cSt) and a reduction of the pump performance by approximately 15 %.

Do not use additives that can or will disturb the functionality of the pump.

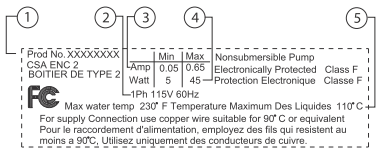
When selecting a pump, take the viscosity of the pumped liquid into consideration.

For technical data, see section *10. Technical data*.

6.3.1 Glycol

The pump is designed for pumping clean water, or up to 50/50 mixtures by weight of glycol and water.

For glycol usage as well as additional liquid information, see section *10. Technical data*.



To prevent the glycol mixture from degrading, avoid temperatures exceeding the rated liquid temperature and minimize the operating time at high temperatures.

It is important to clean and flush the system before adding the glycol mixture.

To prevent corrosion or precipitation, check the glycol mixture and maintain it regularly. If further dilution of the supplied glycol is required, follow the glycol supplier's instructions.

7. Identification

7.1 Nameplate

TM04 3419 3516

Fig. 8 Nameplate

Pos.	Description
1	Product number

FCC sections

Section 15.19 (a) 3

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

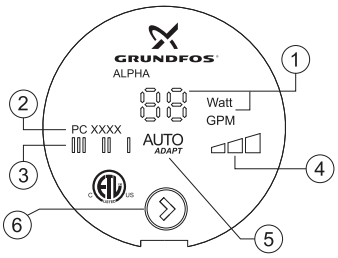
Section 15.21

Any changes or modifications to this equipment not expressly approved by the party responsible for compliance could void the user's authority to operate this equipment void.

Section 15.105 (b)

This equipment has been tested and found to comply with the limits for a class B digital device, pursuant to Part 15 of the FCC Rules.

These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:



- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment to an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/ TV technician for help.

Canadian EMC Standard: ICES-003

This class B digital apparatus complies with Canadian ICES-003.

8. Control functions

8.1 Elements on the control panel

TM04 3421 3511

Fig. 9 Control panel

Pos.	Description
1	Display showing the power consumption in watt or the flow.
	Light field indicating high and low flow
2	Production code:
	• 1st and 2nd figures: year
	• 3rd and 4th figures: week
3	Light field indicating fixed speed
4	Light field indicating constant pressure
5	Light field indicating AUTO$_{ADAPT}$
6	Push-button for selection of pump setting

8.2 Display

The display (1) is on when you have switched on the power supply.

The display shows the actual pump power consumption in watt (integer) or the actual flow during operation.

If a fault is indicated, correct the fault and reset the pump by switching the power supply off and on.

If the pump impeller is rotated, for example when filling the pump with water, sufficient energy can be generated to light up the display even if the power supply has been switched off.

Light field indicating high and low flow

- The light field blinks for low flow
  - – If the flow is lower than 1 gpm, the light field alternately flashes between "0" and "1" randomly.
- The light field shows HI for high flow
  - – If the flow is higher than 12 gpm, the light field shows "HI" on user interface.

8.2.1 Light fields indicating the pump setting

The pump has optional performance settings which you can select with the push-button. See fig. 9.

The pump setting is indicated by light fields in the display. See fig. 10.

TM06 7517 3516

Fig. 10 Light fields

For more information about the function of the settings, see section *9. Fault finding the product*.

8.3 Setting the pump

You can change the pump setting by pressing the push-button.

8.3.1 Factory default setting

The pump's factory default setting is the AUTO$_{ADAPT}$ setting.

8.3.2 Changing from recommended to alternative pump setting

Heating systems are "slow" systems that cannot be set to the optimum operation within minutes or hours.

However, if the recommended pump setting in some applications does not give the desired distribution of heat in the rooms of the house, you can change to an alternative pump setting.

8.4 Selection of control mode by application

Application	Control mode
Floor heating	Constant pressure
Two-pipe system	AUTO$_{ADAPT}$
Ventilation	Speed 1, 2 or 3
Boiler-shunt	Speed 1, 2 or 3
One-pipe system	Speed 1, 2 or 3 or constant pressure
Domestic hot water	Speed 1, 2 or 3

See also sections *8. Control functions* and *8.6 Pump performance and operating mode selection*.

8.5 Pump control

See section *8.6 Pump performance and operating mode selection*.

AUTO$_{ADAPT}$, underfloor heating and two-pipe heating systems

The AUTO$_{ADAPT}$ function adjusts the pump performance to the actual heat demand in the system. As the performance is adjusted gradually, we recommend that you leave the pump in the AUTO$_{ADAPT}$ mode at least one week before changing the pump setting.

If you choose to change back to AUTO$_{ADAPT}$, the pump remembers its last setpoint in AUTO$_{ADAPT}$ and resumes the automatic adjustment of the performance.

Constant-pressure control

In this control mode, a constant differential pressure across the pump is maintained, irrespective of the flow.

See also sections *8. Control functions* and *8.3 Setting the pump*.

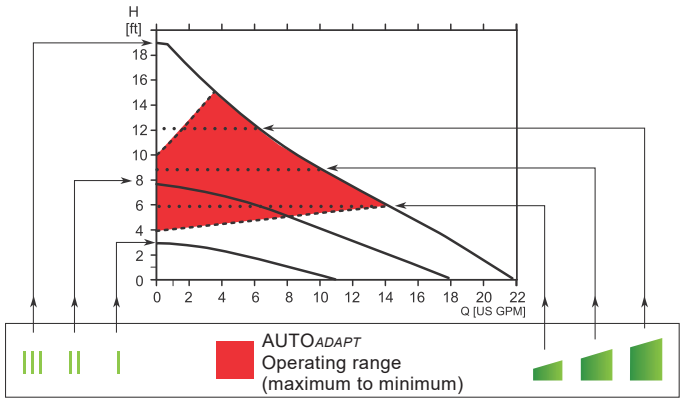
Constant speed control (III, II, or I)

In this control mode, the pump runs at a constant speed and consequently on a constant curve.

- In speed III, the pump is set on the maximum curve under all operating conditions. You can quickly vent the pump by setting the pump to speed III for a short period.
- In speed II, the pump is set on the medium curve under all operating conditions.
- In speed I, the pump is set on the minimum curve under all operating conditions.

Manual summer mode

In manual summer mode, the pump is stopped to save energy and only the electronics are running. To avoid lime deposit that could block the pump, the pump is started every 24 hours for two minutes at a low speed. This is an alternative to shutting down the pump if there is a risk of lime deposit.



The display is turned off. If any faults occur during manual summer mode, the display will show the faults when the pump is taken out of manual summer mode.

If any alarms occur during manual summer mode, no alarms will be shown. When manual summer mode is deactivated again, only the actual alarms will be displayed.

- To activate manual summer mode, press and hold the push-button for three seconds. All light fields will turn off, and the pump will stop. The AUTO$_{ADAPT}$ light field will flash for four seconds.
- To deactivate manual summer mode, press the push-button to return to normal operation.

8.6 Pump performance and operating mode selection

The hydraulic performance shown is without check valve.

TM06 7506 3516

Pos.	Description
	• Push-button for selection of pump setting • Every time you press the push-button, the circulator setting is changed.
III	**High constant speed** • The pump runs at a constant speed and consequently on a constant curve. In speed III, the pump is set on the maximum curve under all operating conditions. You obtain quick vent of the pump by setting the pump to speed III for a short period.
II	**Medium constant speed** • The pump runs at a constant speed and consequently on a constant curve. In speed II, the pump is set on the medium curve under all operating conditions.
I	**Low constant speed** • The pump runs at a constant speed and consequently on a constant curve. In speed I, the pump is set on the minimum curve under all operating conditions.
	Constant pressure I • The duty point of the pump will move left and right along the lowest constant-pressure curve depending on the water demand in the system. The head is kept constant, irrespective of the water demand.
	Constant pressure II • The duty point of the pump will move left and right along the middle constant-pressure curve depending on the water demand in the system. The head is kept constant, irrespective of the water demand.
	Constant pressure III • The duty point of the pump will move left and right along the highest constant-pressure curve depending on the water demand in the system. The head is kept constant, irrespective of the water demand.
AUTO ADAPT	**AUTO$_{ADAPT}$ (factory setting)** • This function controls the pump performance automatically within the defined performance range (shaded area). AUTO$_{ADAPT}$ will adjust the pump performance to system demands over time.
(Hold for 3 sec.)	**Manual summer mode** The pump is stopped to save energy, and only the electronics are running. To avoid liming and blocking of the pump, the pump is started every 24 hours for two minutes at a low speed.

9. Fault finding the product

DANGER

Electric shock

Death or serious personal injury.

- Switch off the power supply before starting any work on the product. Make sure that the power supply cannot be accidentally be switched on.

WARNING

Pressurized system

Death or serious personal injury.

- Before dismantling the pump, drain the system or close the isolating valve on either side of the pump before the screws are removed. The pumped liquid may be scalding hot and under high pressure.

Fault		Control panel			Remedy
1.	The pump does not run.	Light field is off.	a)	The pump is not connected to the power supply.	Connect the pump to the power supply.
			b)	The circuit breaker has tripped.	Cut in the circuit breaker.
			c)	The pump is defective.	Replace the pump.
		Light field is on.	a)	Supply voltage is too high.	Check that the power supply falls within the specified range.
			b)	The rotor is blocked by impurities.	Remove the impurities.
		"▬▬ ▬▬"	a)	Supply voltage is too low.	Switch the power off and on. Check for air, locked rotor and/or voltage. Correct the power supply.
2.	Noise in the system	Light field is on.	a)	There is air in the system.	Install an air eliminator.
			b)	The flow is too high.	Reduce the pump speed.
			c)	Thermal expansion of system components.	Check the mounting brackets for the pipes. Secure loose mounting brackets.
3.	Noise in the pump	Light field is on.	a)	There is air in the pump.	Let the pump run, as it will vent over time. Install an air eliminator.
			b)	The inlet pressure is too low.	Increase the inlet pressure. Check the air volume in the expansion tank, if this is installed. (Pressure leaks in the system can lead to cavitation.)
			c)	No liquid (dry running).	Ensure the system has been filled with liquid and vented. Open the isolating valves.
			d)	The pump is defective.	Replace the pump.

Fault	Control panel		Remedy
4. Insufficient heat	Light field is on.	a) The pump performance is set too low.	Increase the pump speed or constant pressure.
		b) The thermostat is set too low or is not working.	Check to see if the circulator is in the proper operating mode. Check the thermostat to ensure that it is set to the desired temperature and is working. Replace the batteries in the thermostat.
		c) Air or gas in the system.	Vent the air or gas from the system by allowing the pump to run, as it will vent over time. Install an air eliminator. If necessary rework the piping.
		d) The valves are sticking.	Make sure all valves are in good working order, i.e. remove lime deposits.
		e) Wrong direction of flow.	See the direction of flow arrow marked on the pump. Reinstall the pump to correct the direction of flow.
		f) The boiler is not working properly.	Check the water temperature from the boiler and check the boiler functions. Repair the boiler if required.
		g) The pump performance is not adequate for the application.	Check for proper sizing of the circulator and other system components.
		h) The pump performance is not adequate for the application.	Check the ΔT calculation.

10. Technical data

10.1 Operating conditions

Supply voltage

1 x 115 V, + 10 %/- 10 %, 60 Hz.

Motor protection

The pump requires no external motor protection.

Enclosure class

Indoor use only, IP42.

CSA enclosure type 2.

Insulation class

F.

Relative humidity

Maximum 95 %.

Maximum outlet pressure

150 psi (10.34 bar).

Inlet pressure

Liquid temperature	Minimum inlet pressure
167 °F (75 °C)	0.75 psi (0.05 bar)
194 °F (90 °C)	4.06 psi (0.28 bar)
230 °F (110 °C)	15.7 psi (1.08 bar)

Sound pressure level

43 dB (A).

Ambient temperature

32 °F (0 °C) to 104 °F (40 °C).

Liquid temperature

36 °F (2 °C) to 230 °F (110 °C).

To avoid condensation in the control box and stator, the liquid temperature must always be higher than the ambient temperature.

Ambient temperature [°F (°C)]	Liquid temperature	
	Minimum [°F (°C)]	Maximum [°F (°C)]
32 °F (0 °C)	36 °F (2 °C)	230 °F (110 °C)
50 °F (10 °C)	50 °F (10 °C)	230 °F (110 °C)
68 °F (20 °C)	68 °F (20 °C)	230 °F (110 °C)
86 °F (30 °C)	86 °F (30 °C)	230 °F (110 °C)
95 °F (35 °C)	95 °F (35 °C)	194 °F (90 °C)
104 °F (40 °C)	104 °F (40 °C)	158 °F (70 °C)

In domestic hot water systems, keep the liquid temperature below 149 °F (65 °C) to eliminate the risk of lime precipitation.

Glycol

Maximum glycol concentrations with clean water:

50 % glycol @ 36 °F (2 °C).

Hydraulic performance change can be expected.

Watt readings

Accuracy: ± 1 watt.

Flow indicator

Provides a relative indication of flow – should not be used in lieu of a flow meter.

Check valve

Use of a check valve may reduce pump hydraulic performance (up to - 10 %).

Use a check valve in parallel pumping applications.

Curve conditions

Test liquid: Airless water.

Curves apply to a density of 983.2 kg/m^3 and a liquid temperature of 140 °F (60 °C).

All curves show average values and should not be used as guarantee curves. If a specific minimum performance is required, individual measurements must be made.

Curves apply to a kinematic viscosity of 0.474 cSt.

Approximate power usage

Speed setting		Minimum	Maximum
High constant speed	III	39 W	45 W
Medium constant speed	II	15 W	30 W
Low constant speed	I	5 W	8 W
Constant pressure		8 W	45 W
Constant pressure		14 W	45 W
Constant pressure		22 W	45 W
AUTO$_{ADAPT}$		5 W	45 W

11. Disposing of the product

This product or parts of it must be disposed of in an environmentally sound way:

1. Use the public or private waste collection service.
2. If this is not possible, contact the nearest Grundfos company or service workshop.

Subject to alterations.

Warning

Prior to installation, read these installation and operating instructions. Installation and operation must comply with local regulations and accepted codes of good practice.

This booklet should be left with the owner of the pump for future reference and information regarding its operation.

1. Limited warranty

Products manufactured by GRUNDFOS PUMPS CORPORATION (Grundfos) are warranted to the original user only to be free of defects in material and workmanship for a period of 18 months from date of installation, but not more than 24 months from date of manufacture. Grundfos' liability under this warranty shall be limited to repairing or replacing at Grundfos' option, without charge, F.O.B. Grundfos' factory or authorized service station, any product of Grundfos' manufacture. Grundfos will not be liable for any costs of removal, installation, transportation, or any other charges which may arise in connection with a warranty claim. Products which are sold but not manufactured by Grundfos are subject to the warranty provided by the manufacturer of said products and not by Grundfos' warranty. Grundfos will not be liable for damage or wear to products caused by abnormal operating conditions, accident, abuse, misuse, unauthorized alteration or repair, or if the product was not installed in accordance with Grundfos' printed installation and operating instructions.

To obtain service under this warranty, the defective product must be returned to the distributor or dealer of Grundfos' products from which it was purchased together with proof of purchase and installation date, failure date, and supporting installation data. Unless otherwise provided, the distributor or dealer will contact Grundfos or an authorized service station for instructions.

Any defective product to be returned to Grundfos or a service station must be sent freight prepaid; documentation supporting the warranty claim and/or a Return Material Authorization must be included if so instructed.

GRUNDFOS WILL NOT BE LIABLE FOR ANY INCIDENTAL OR CONSEQUENTIAL DAMAGES, LOSSES, OR EXPENSES ARISING FROM INSTALLATION, USE, OR ANY OTHER CAUSES. THERE ARE NO EXPRESS OR IMPLIED WARRANTIES, INCLUDING MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, WHICH EXTEND BEYOND THOSE WARRANTIES DESCRIBED OR REFERRED TO ABOVE.

Some jurisdictions do not allow the exclusion or limitation of incidental or consequential damages and some jurisdictions do not allow limit actions on how long implied warranties may last. Therefore, the above limitations or exclusions may not apply to you. This warranty gives you specific legal rights and you may also have other rights which vary from jurisdiction to jurisdiction.

2. Introduction

2.1 Safety warning

2.1.1 Read this booklet

This booklet is designed to help a certified installer install, begin operation of and troubleshoot the Grundfos UPS pumps.
The booklet should be left with the owner of the pump for future reference and information regarding its operation. Should the owner experience any problems with the pump, a certified professional should be contacted.

2.1.2 Electrical work

Warning

All electrical work should be performed by a qualified electrician in accordance with the latest edition of the National Electrical Code, local codes and regulations.

Warning

A faulty motor or wiring can cause electrical shock that could be fatal, whether touched directly or conducted through standing water. For this reason, proper grounding of the pump to the power supply's grounding terminal is required for safe installation and operation.

In all installations, the above-ground metal plumbing should be connected to the power supply ground as described in Article 250-80 of the National Electrical Code.

3. Pre-installation checklist

3.1 Confirm you have the correct pump

- Read the pump nameplate to make sure it is the one you ordered.
- Compare the pump's nameplate data and its performance curve (for head, gpm, etc.) with the application in which you plan to install it.
- Will the pump do what you expect it to do?

3.2 Check the condition of the pump

The shipping carton your pump came in is specially designed around your pump during production to prevent damage.

As a precaution, it should remain in the carton until you are ready to install it. At that point, look at the pump and examine it for any damage that may have occurred during shipping.

Examine any other parts of the shipment as well for any visible damage.

3.3 Verify electrical requirements

Verification of the electrical supply should be made to be certain the voltage, phase and frequency match that of the pump motor.
The proper operating voltage and other electrical information can be found on the pump nameplate.

These motors are designed to run on + / - 10 % of the nameplate-rated voltage.

Wiring connection diagrams can be found inside the terminal box cover and later in these Installation and Operating Instructions. If voltage variations are larger than + / - 10 %, do not operate the pump.

3.4 Pumped liquid requirements

Caution ***The UPS pump is intended for use with water only.***

The pump can be used to circulate:

- Potable hot water
- Water for hydronic heating
- Water/glycol mixtures up to 50/50
- Cooling water

In domestic hot-water systems it is advisable to use bronze pumps (UPS model) only for water with a degree of hardness lower than 14 grains per gallon of hardness. For water with a higher degree of hardness, a direct-coupled Grundfos TP pump is recommended.

If the pump is installed in a heating system, the water should meet the requirements of accepted standards on water quality in heating systems.

In water/glycol mixtures, in order to prevent the glycol from degrading, temperatures above those for which the fluid is rated should be avoided and time spent at high temperatures minimized.

It is also important that the system is cleaned and flushed prior to the installation of the glycol mixture.

In order to avoid problems with corrosion or precipitation, the glycol fluids should be checked and maintained regularly. If further dilution of the supplied glycol is required, follow the requirements of the supplier of the glycol.

Warning
Glycol with the trade name DEXCOOL® can harm the pump.

DEXCOOL® is a registered trademark of General Motors Corporation, used under license by Texaco Lubricants NA.

The pump is lubricated and cooled by the liquid being pumped. Therefore, the pumped liquid must always be allowed to circulate through the pump. Extended periods without circulation will cause premature wear to the bearings and excessive motor heat. The pumped liquid must also meet the following requirements:

Minimum pump inlet pressure (during operation)

UPS model	At these liquid temperatures					
	167 °F/75 °C		194 °F/90 °C		230 °F/110 °C	
	[psi]	hf	[psi]	hf	[psi]	hf
32-40/4	0.7	1.6	2.2	5.1	21.0	48.5
32-80/2	0.7	1.6	5.1	11.8	23.9	55.2
32-160/2	11.6	26.8	16.0	37.0	34.1	78.8
40-40/4	0.7	1.6	4.4	10.2	23.2	53.6
40-80/4	0.7	1.6	1.5	3.5	18.1	41.8
40-80/2	6.5	15.0	10.9	25.2	29.0	67.0
40-160/2	5.1	11.8	9.4	21.7	27.6	63.8
40-240/2	11.6	26.8	16.0	37.0	34.1	78.8
50-40/4	0.7	1.6	2.9	6.7	21.8	50.4
50-80/4	0.7	1.6	4.4	10.2	23.2	53.6
50-80/2	4.4	10.2	8.7	20.1	26.8	61.9
50-160/2	11.6	26.8	16.0	37.0	34.1	78.8
50-240/2	10.2	23.6	14.5	33.5	32.6	75.3
53-55/57	4.4	10.2	8.7	20.1	26.8	61.9
75-69	11.6	26.8	16	37	34.1	78.8
80-40/4	11.6	26.8	16.0	37.0	34.1	78.8
80-80/4	14.5	33.5	18.9	43.7	37.0	85.5
80-160/2	21.8	50.4	26.1	60.3	43.5	100.5
100-40/4	27.6	63.8	31.9	73.7	50.0	115.5

Liquid temperature range

Continuously:
14 °F (-10 °C) up to 230 °F (110 °C).

Intermittent:
< 284 °F (140 °C) for short periods of time.

Domestic hot water:
< 140 °F (60 °C).

4. Installation procedures

Warning

Never make any connections in the pump terminal box unless the electrical supply has been switched off.

4.1 Electrical preparation

Terminal box position

At the bottom of the stator, closest to the pump housing, there are eight drain holes to allow condensed water to escape. The drain holes shall not be blocked. The drain holes must point downwards. The terminal box must therefore point upwards in one of the positions shown in fig. 1. The following terminal box positions apply whether the piping is mounted vertically or horizontally.

TM03 7296 4706

Fig. 1 Possible terminal box positions

Rotating the terminal box

To change the position of the terminal box, follow these steps:

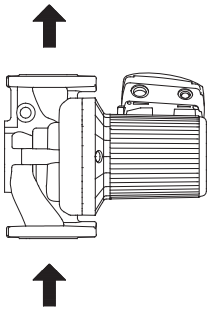
Warning

If the pump is already installed in the system, the system must be drained or the isolation valves on both sides of the pump must be closed before the allen-head screws are removed as the pumped liquid may be scalding hot and/or under pressure.

Do not start the pump until the system has been filled with liquid and vented.

1. Remove the four allen-head screws holding the pump head onto the pump housing.
2. Carefully lift the pump head and rotate it so the terminal box is in the desired position. DO NOT locate the terminal box beneath the pump. Make sure the O-ring is properly seated in the pump housing.
3. Replace the pump head onto the pump housing.
4. Tighten the allen-head screws evenly. Torque:
   8 mm: 15 ft lbs
   10 mm: 25 ft lbs.
5. Check to make sure the rotor turns freely. Do this by removing the vent plug in the middle of the pump nameplate. Insert a medium size flat-blade screwdriver into the slot at the exposed end of the shaft. Gently turn the shaft. If it does not turn easily, repeat steps 1 to 4 above.
6. The position of the nameplate can be changed by easing the outer edge of the plate at the cutout with a screwdriver. Turn the nameplate to the required position and push into place.
7. Refer to page 19 and page 20 for additional instructions.

4.2 Piping considerations



Thoroughly clean and flush all dirt and sediment from the system before attempting to install the pump.

Location in the piping line

The pump should never be located at the lowest point of the piping system, where dirt and sediment collect. Nor should it be located at the highest point of the piping system, where air accumulates.

Mounting positions

The arrows on the flanges of the pump indicate the direction of water flow. Although the UPS may be installed in either vertical or horizontal piping, the motor shaft must always remain horizontal, as shown in fig. 1 and fig. 2.

TM03 7290 4706

Fig. 2 Direction of water flow through the pump

Note

Pumps installed outdoors must be protected by a ventilated, watertight cover to keep out moisture and dirt.

Warning

The pump must be positioned so that someone cannot accidentally come into contact with the hot surfaces of the pump.

4.3 Connect the pump

Install the pump into the piping system.

Grundfos recommends that pressure gauges be installed in the inlet and discharge flanges or pipes to check pump and system performance.

4.4 Electrical connection

The electrical connection and protection should be carried out in accordance with the latest edition of the National Electrical Code, local codes and regulations by a qualified electrician.

Warning

Never make any connections in the pump terminal box unless the electrical supply has been switched off.

The pump must be grounded.

The pump must be connected to an external main power switch.

The operating voltage and frequency are marked on the pump nameplate. Make sure that the motor is suitable for the electrical supply it is being installed to.

The pump should be grounded to protect against indirect contact and a ground fault interrupter can be used as extra protection.

Multi-speed pump (single-phase)

All single-phase pumps are equipped with built-in, automatic resetting, thermal overload protection. The pump is protected at all three speeds.

Multi-speed pump (three-phase)

The pump must be connected to the electrical supply via an external contactor. The contactor must be connected to the built-in thermal overload switch terminals T1 and T2 (3 x 208-230 V) or P1 and P2 (3 x 460 V and 575 V) to protect the pump against overloading at all three speeds.

OR: If the pump is protected by means of a motor starter, the starter must be set to the current consumption of the pump at the selected speed. The motor starter setting must be changed every time the pump speed is changed. The current consumption at the individual speeds is stated on the pump nameplate.

Figures 4, 6, 7, 9, and 10 on the next pages show the possible connections.

4.4.1 UPS 1 x 115 V and 1 x 230 V terminal box

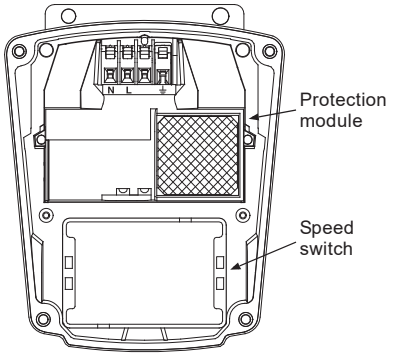


Fig. 3 UPS 1 x 115 V and 1 x 230 V terminal box

All UPS single-phase pumps come with a protection module and a speed switch as shown in fig. 3. All pumps are equipped with built-in, automatic resetting, thermal overload protection. The pump is protected at all three speeds.

Wiring diagrams

Figure 4 shows the electrical connections for a single-phase pump with protection module.

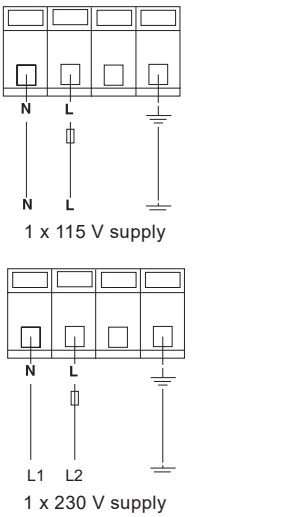

Fig. 4 1 x 115 V and 1 x 230 V supply

Note

Provide electrical disconnect and current protection as per local electrical codes.

K = External contactor sized to FL and LR pump current.

4.4.2 UPS 3 x 208-230 V terminal box

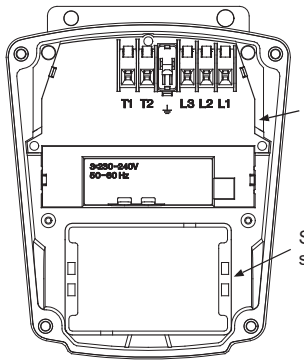

Fig. 5 UPS 3 x 208-230 V terminal box

All UPS pumps with three-phase x 208-230 V come with a standard module and a speed switch as shown in fig. 5. All pumps are equipped with an internal thermal overload switch (terminals T1 and T2, to be connected to an external contactor) to protect the pump at all three speeds.

Wiring diagrams

Figure 6 shows the electrical connections when using an external changeover contact (safety circuit) for start/stop push button station.

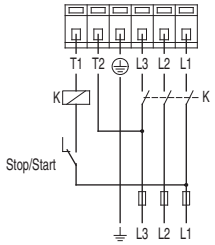

Fig. 6 External changeover contact

Auxiliary contacts rated for supply voltage.

Figure 7 shows the electrical connections when using external impulse contacts (momentary contacts) for start/stop push button station.

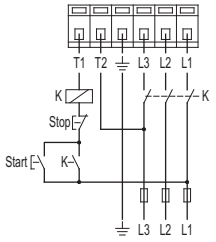

Fig. 7 External impulse contacts

4.4.3 UPS 3 x 460 V and 575 V terminal box

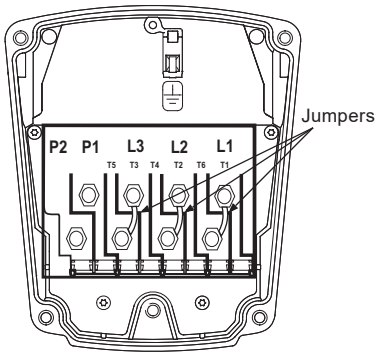

Fig. 8 UPS 3 x 460 V and 575 V terminal box

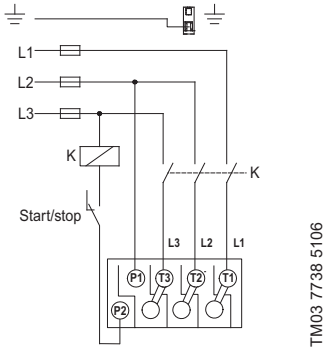
All UPS pumps with three-phase x 460 V and 575 V terminal boxes (fig. 8) come with a special two-speed terminal box. The speed is changed by the orientation of the jumpers as shown on page 12. All pumps are equipped with an internal thermal overload switch (terminals P1 and P2) to be connected to external contactor.

Wiring diagrams

Figure 9 shows the electrical connections when using an external changeover contact (safety circuit) for start/stop push button station.



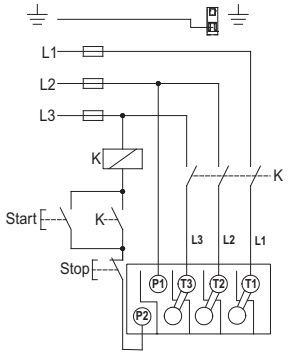


Fig. 9 External changeover contact

Auxiliary contacts rated for supply voltage.

Figure 10 shows the electrical connections when using external impulse contacts (momentary contacts) for start/stop push button station.

TM03 7737 4806

Fig. 10 External impulse contacts

5. Starting the pump

5.1 Vent the piping system

After the pump has been installed and the electrical connections made, the piping system must be vented.

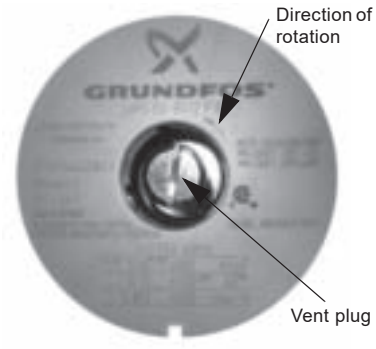
Caution ***Never operate the pump dry - the system must first be filled with liquid and vented.***

Note ***Do not vent the piping system through the pump.***

Instead, follow these steps:

1. Fill and pressurize the system with liquid, and vent all trapped air from the piping by suitable means.
2. If any isolation valves are used, make sure they are OPEN.

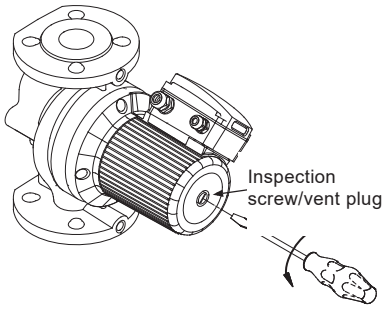
Warning



If the vent screw is to be loosened, care should be taken to ensure that the escaping scalding hot liquid does not cause personal injury or damage to components (see fig. 12).

5.2 Check the direction of shaft rotation

Applies to 460 V and 575 V two-speed models only



(The direction of rotation of three-speed pumps is checked by means of the fault finding chart, page 13 and page 14).

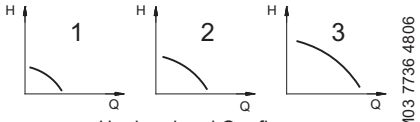
1. Make sure that the power is OFF.
2. Unscrew and remove the vent plug located at the center of the nameplate.
3. Insert a small, flat-blade screwdriver into the slot in the end of the motor shaft (see fig. 12). Rotate the shaft with the screwdriver to make sure it does so freely.
4. Bump the pump and watch to see which direction the shaft rotates. The shaft must rotate in the counterclockwise direction as shown on the nameplate (see fig. 11).
5. If the pump shaft is rotating incorrectly, disconnect the power and interchange any two power leads in the terminal box.
6. Check once again for proper counterclockwise rotation. When it is rotating correctly, replace the vent plug.

TM03 7750 1512

Fig. 11 Vent plug and direction of rotation

TM03 7277 4706

Fig. 12 Removing the vent plug



5.3 Speed selection

5.3.1 Three-speed pumps, all models except 3 x 460 V and 575 V

The speed switch in the terminal box can be turned to three positions. The speed in the three positions appears in the table below (also see fig. 13).

Switch position	Speed in % of maximum speed	
	Single-phase pumps	Three-phase pumps
1	approx. 60 %	approx. 70 %
2	approx. 80 %	approx. 85 %
3	100 %	100 %

Changing to lower speeds offers considerable reduction in energy consumption and less noise in the system.

H = head and Q = flow

Fig. 13 Pump performance at speed settings

Warning

Never make any connections in the pump terminal box unless the electrical supply has been switched off.

Change the pump performance as follows:

1. Switch off the electrical supply to the pump at the main circuit breaker.
   The green indicator light in the terminal box must be off.
2. Remove the terminal box cover by loosening the four screws in the cover.
3. Pull out the speed switch module and re-insert it so that the desired speed is visible through the window in the terminal box (see fig. 14).

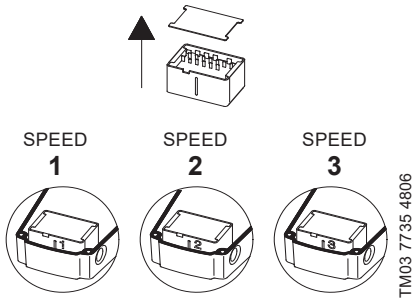


Fig. 14 Speed switch module

Note ***When changing to and from speed 1, the cover of the speed switch module must be removed and fitted on the other side of the switch.***

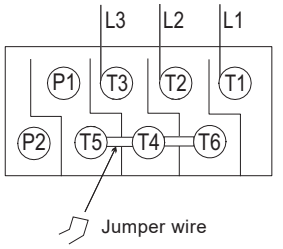
4. Fit the terminal box cover back onto the terminal box and tighten the four screws in the cover.
5. Switch on the electrical supply.
   Check that the green indicator light is permanently on or flashing.

Note ***The speed switch module must never be used as an on/off switch.***

5.3.2 Two-speed pumps, 3 x 460 V and 575 V

The speed setting in the terminal box can be changed to two positions. The speed in the two positions appears in the table below (also see fig. 13 on page 11).

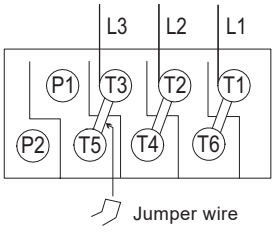
Speed step	Speed in % of max. speed
1	approx. 75 %
2	100 %



Warning

Never make any connections in the pump terminal box unless the electrical supply has been switched off.

Change the pump performance as follows:



The speed is changed by the position of the jumpers in the terminals. The jumpers are fitted according to:

- figure 15 for speed 1 - low speed
- figure 16 for speed 2 - high speed.

TM03 7734 4806

Fig. 15 Speed 1 (low speed)

TM03 7733 4806

Fig. 16 Speed 2 (high speed)

6. Troubleshooting

6.1 Fault finding chart

Warning

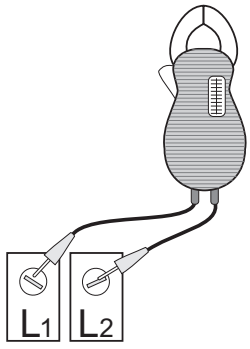
Before removing the terminal box cover, make sure that the electrical supply has been switched off and that it cannot be accidentally switched on.

The pumped liquid may be scalding hot and under high pressure. Before any removal or dismantling of the pump, the system must be drained or the isolation valves on both sides of the pump must be closed.

Fault		Cause		Remedy
1.	The pump does not run. None of the indicator lights are on.	a)	One fuse in the installation is blown.	Replace the fuse.
		b)	External circuit breaker is switched off.	Switch the circuit breaker on.
		c)	Current-/voltage-operated ground fault interrupter has tripped.	Repair the insulation defects and reset the interrupter.
		d)	The pump's internal thermal overload switch has cut out **(standard module only)**.	Check that the liquid temperature falls within the specified range. **With external on/off changeover contact:** The pump will restart automatically when it has cooled to normal temperature. **With external on/off impulse contacts:** The pump can be restarted when it has cooled to normal temperature.
2.	The pump does not run. The green indicator light is on.	a)	Rotor blocked, but the pump hasn't been cut out by the thermal overload switch.	Switch off the electrical supply and clean/repair the pump.
		b)	The speed switch module has not been fitted.	Switch off the electrical supply at the external circuit breaker and fit the speed switch module into position.
3.	**Three-phase pumps only:** The pump is running. The red and green indicator lights are on.	a)	The pump is running with the wrong direction of rotation.	Switch off the electrical supply at the external circuit breaker and interchange any two phases (leads) in the pump terminal box.
4.	Noise in the system. The green indicator light is on.	a)	Air in the system.	Vent the system.
		b)	The pump flow is too high.	Reduce the pump performance.
		c)	The pressure is too high.	Reduce the pump performance.
5.	Noise in the pump. The green indicator light is on.	a)	Air in the pump.	Vent the pump.
		b)	The inlet pressure is too low.	Increase the inlet pressure and/or check the air volume in the expansion tank (if installed).
6.	Insufficient heat in some places in the heating system.	a)	The pump performance is too low.	Increase the pump performance, if possible, or replace the pump with a pump with higher flow.

Fault	Cause	Remedy
7. **Single-phase pumps with protection module (only).** The pump does not run. The red indicator light is on. The green indicator light is off.	a) The pump has been cut out by the thermal overload switch due to high liquid temperature or blocked rotor.	Check that the liquid temperature falls within the specified range. The pump will restart automatically when it has cooled to normal temperature. **NOTE:** If the thermal overload switch has cut out the pump three times within a short period, the pump must be restarted manually by switching off the electrical supply.
	b) The speed switch module has not been fitted.	Switch off the electrical supply by means of the external mains switch and fit the speed switch module.

6.2 Preliminary checks



Supply voltage

To check the voltage being supplied to the motor, use a voltmeter.

Warning

Be careful, since power is still being supplied to the pump. Do not touch the voltmeter leads together while they are in contact with the power lines.

Single-phase motors	Three-phase motors
Touch one voltmeter lead to each of the lines supplying power to the pump: • L and N for 115 V circuits • L1 and L2 for 230 V circuits.	Touch a voltmeter lead to: • Power leads L1 and L2 • Power leads L2 and L3 • Power leads L3 and L1. These tests should give a reading of full line voltage.

TM03 7749 4806

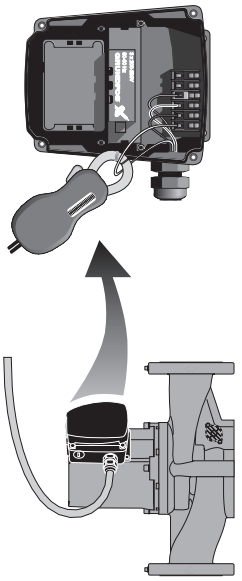
Fig. 17 Checking single-phase power

Evaluation

When the motor is under load, the voltage should be within 10 % (+ or -) of the nameplate voltage. Any variation larger than this may indicate a poor electrical supply and can cause damage to the motor windings. The motor should not be operated under these conditions. Contact your power supplier to correct the problem or change the motor to one requiring the voltage you are receiving.

6.3 Current measurement

To check the current, use an ammeter.



To do so, follow these steps:

1. Make sure the pump is operating.
2. Set the ammeter to the proper scale.
3. Place the tongs of the ammeter around the leg to be measured.
4. Compare the results with the amp draw information on the motor nameplate.
5. Repeat for the other legs.

Evaluation

If the current draw exceeds the listed nameplate amps, or if the current imbalance is greater than 5 % between each leg on three-phase units, then check the following:

- The voltage supplied to the pump may be too high or too low.
- The contacts on the motor starter may be burned.
- The terminals in the starter or terminal box may be loose.
- There may be a winding defect. Check the winding and insulation resistance.
- The motor windings may be shorted or grounded.
- The pump may be damaged in some way and may be causing a motor overload.
- A voltage supply or balance problem may exist.

TM03 7293 4706

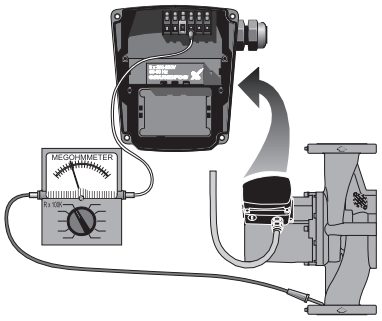


Fig. 18 Current measurement

6.4 Insulation resistance (lead-to-ground)

To check the insulation resistance (lead-to-ground) of the motor and leads, a megohmmeter is required.

To do so, follow these steps:

1. Turn the POWER OFF.
2. Disconnect all electrical leads to the motor.
3. Set the scale selector on the megohmmeter to R x 100K, touch its leads together, and adjust the indicator to zero.
4. Touch the leads of the megohmmeter individually to each of the motor leads and to ground (i.e. L1 to ground; L2 to ground, etc.).

TM03 7293 4706

Fig. 19 Insulation resistance measurement

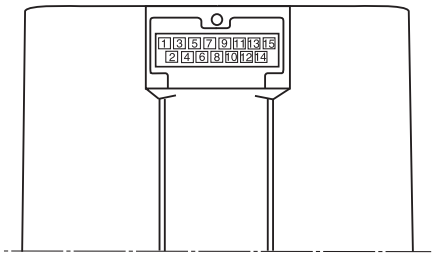
Evaluation

The resistance values for new motors must exceed 1,000,000 ohms. If they do not, replace the motor.

6.5 Winding resistance (line-to-line)

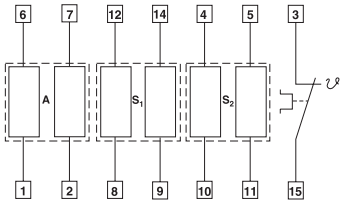
To check the winding resistance of the motor windings, a megohmmeter is required.

To do so, follow these steps:



1. Turn the POWER OFF.
2. Disconnect all electrical leads to the motor.
3. Set the scale selector on the megohmmeter to R x 1, touch its leads together, and adjust the indicator to zero.
4. Using the charts below for reference, touch the leads of the megohmmeter to the appropriate pair of connectors. Check all pairs that are present and write down and label (RA, RS_1, RS_2, R) all readings.
5. Compare your readings to the matching model, phase and voltage on the chart on page 17 and page 18.

Evaluation



The resistance values must fall within the tolerances listed on page 17 or page 18. If they do not, replace the motor.

7. Replacing components

7.1 Removing the pump head

1. Disconnect or TURN OFF the power supply.
2. Close any isolation valves on either side of the pump to avoid draining the system of liquid.
3. Disconnect the electrical leads from the terminal box.
4. Disconnect and remove the conduit from the terminal box.
5. Loosen and remove the four allen-head screws (8 or 10 mm) which connect the pump head housing to the pump housing.
6. Remove the pump head from the pump housing.
7. Clean the machined surfaces in the pump housing of any foreign material.

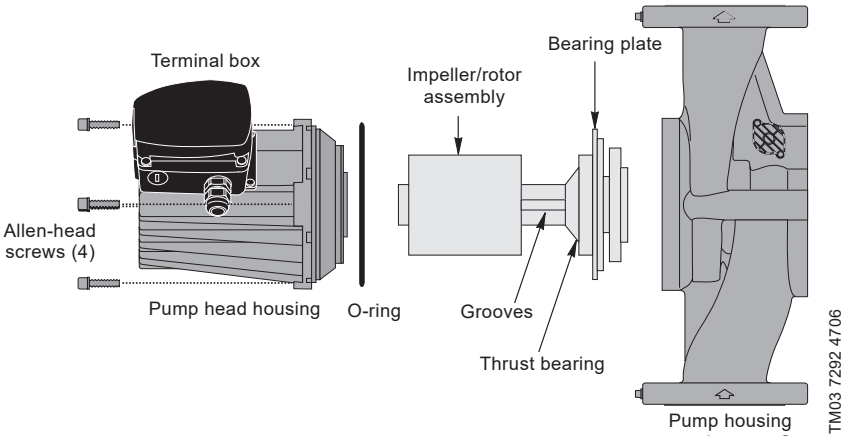

Fig. 20 Removing and fitting the pump head

7.2 Fitting the pump head

1. Carefully remove the new pump head assembly from its packaging. Separate the impeller/rotor assembly from the new pump head.
2. While holding the thrust bearing, carefully place the impeller/rotor assembly into the pump housing. The bearing plate should fit snugly into the lowest machined surface in the pump housing.
3. Make sure that the impeller/rotor assembly can rotate freely.
4. Place the O-ring over the rotor and locate it into the inner diameter of the pump housing.
5. Carefully place the pump head housing over the rotor and rotate it so the terminal box is in the position you wish, see section *4.1* under *Terminal box position*.
6. Make sure the pump head housing is properly seated on the pump housing. **Do not force the two together** - if there is binding, disassemble them and repeat steps 2 to 6. Tighten the allen-head screws evenly to secure the pump head.
   Torque:
   8 mm: 15 ft lb
   10 mm: 25 ft lb.
7. Check to make sure the motor shaft turns freely, as explained in section *4.1* under *Rotating the terminal box*.

7.3 Replacing the terminal box or capacitor

If the terminal box is replaced, make certain the electrical information listed on the new box matches the information listed on the old box, and that it is compatible with the pump and incoming electrical supply.

For all terminal boxes, it is very important to tightly secure the frame grounding screw through the terminal box, so that a proper connection between the terminal box and motor is made.

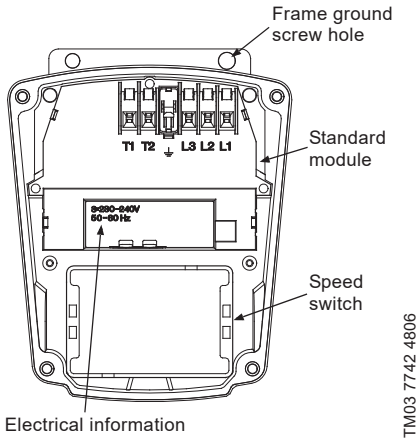

Fig. 21 Terminal box

All	1.	Before replacing the terminal box or capacitor, make sure the power is OFF.
	2.	Remove the terminal box cover by completely loosening all four torx/standard screws.
	3.	Remove the speed switch (noting its position) by pulling firmly and evenly on both sides of it. (Not for 460/575 V).
Capacitor	a.4.	**Capacitor replacement, single-phase pumps only:** Disconnect the two connector clips from the capacitor and unscrew the complete plastic strain relief nut. Remove capacitor wire and strain relief.
	a.5.	Screw in new complete strain relief nut and connect new clip connectors. Pull excess sheathed cable out of terminal box, being sure to leave at least 1/8" of sheath inside of terminal box.
Terminal box	b.4.	**Terminal box replacement:** Disconnect all wiring, remove the three phillips-head screws holding the terminal box in place and remove the terminal box by pulling firmly and evenly on both sides.
	b.5.	Check that the clear rubber gasket is in place around the terminal box connector stem, carefully press the terminal box into the stator socket, replace the three phillips-head terminal box screws and replace wiring.
All	6.	Replace the speed switch to its proper position, making sure to push it all the way in. (Not for 460/575 V).
	7.	Replace the terminal box cover and tighten all four torx/standard screws.
	8.	Switch on electrical power supply. The pump is now ready for operation.

8. Disposal

This product or parts of it must be disposed of in an environmentally sound way:

1. Use the public or private waste collection service.
2. If this is not possible, contact the nearest Grundfos company or service workshop.

Subject to alterations.

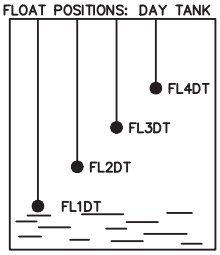
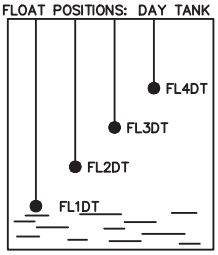
☐UL508A



TERMINAL STRIP



JMP MOTOR1: 120VAC LINE
JMP MOTOR1: 120VAC NEUTRAL
JMP MOTOR2: 120VAC LINE
JMP MOTOR2: 120VAC NEUTRAL

FLOAT POSITIONS: DAY TANK 2

FLOAT POSITIONS: DAY TANK 1

DEVICE AND OPERATION COMMENTS

P1–AUTO–P2: THE LEAD PUMP WILL ALTERNATE AFTER ALL THE PUMPS HAVE STOPPED UNDER NORMAL CONDITIONS IF SELECTOR SWITCH IS PLACED IN AUTO. IF LEAD PUMP FAILS, LAG PUMP WILL START

DT1–AUTO–DT2: DT1 AND DT2 FILL RESPECTIVE DAY TANKS ONLY. AUTO FILLS BOTH TANKS AS REQUIRED.

FL1DT: LOW LEVEL DAY TANK – STARTS LAG PUMP WHEN FLOAT SWITCH CLOSES. ACTIVATES VISUAL ALARM AND ALARM RELAY. ALARM MUST BE MANUALLY RESET

FL2DT: START LEAD PUMP – STARTS LEAD PUMP WHEN FLOAT SWITCH CLOSES. ACTIVATES VISUAL SIGNAL.

FL3DT: STOP ALL PUMPS – STOPS ALL PUMPS IN AUTOMATIC MODE WHEN FLOAT SWITCH OPENS.

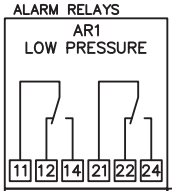
FL4DT: HIGH LEVEL DAY TANK – STOPS ALL PUMPS WHEN FLOAT SWITCH OPENS. ACTIVATES VISUAL ALARM AND ALARY RELAY. ALARM AUTOMATICALLY RESETS..

PS1: LOW PRESSURE – STOPS ALL PUMPS IN AUTO MODE WHEN PRESSURE SWITCH CLOSES AFTER 1 MINUTE OF RUN TIME. ACTIVATES VISUAL ALARM AND ALARM RELAY. ALARM MUST BE MANUALLY RESET.

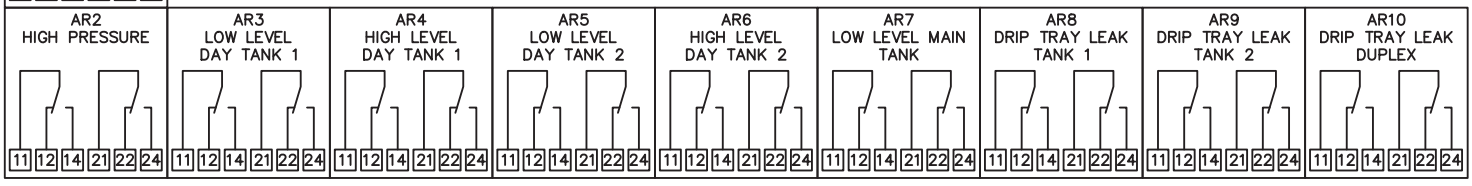
PS2: HIGH PRESSURE – STOPS ALL PUMPS WHEN SWITCH CLOSES. ACTIVATES VISUAL ALARM AND ALARM RELAY. ALARM MUST BE MANUALLY RESET.

SV1: SOLENOID VALVE – ENERGIZED WHEN FILLING DAY TANK 1

SV2: SOLENOID VALVE – ENERGIZED WHEN FILLING DAY TANK 2



FLMT: LOW LEVEL MAIN TANK – ACTIVATES VISUAL ALARM AND ALARM RELAY. ALARM MUST BE MANUALLY RESET



FLDTL1: DRIP TRAY LEAK DUPLEX – ACTIVATES VISUAL ALARM AND ALARM RELAY. ALARM AUTOMATICALLY RESETS.

FLDTL2: DRIP TRAY LEAK MAIN TANK 1 – ACTIVATES VISUAL ALARM AND ALARM RELAY. ALARM AUTOMATICALLY RESETS.

FLDTL3: DRIP TRAY LEAK MAIN TANK 2 – ACTIVATES VISUAL ALARM AND ALARM RELAY. ALARM AUTOMATICALLY RESETS.

VIKING PUMP

VIKING PUMP

Duplex Fuel Oil Packages

Field Start-Up Guide

Bulletin: UDF400
Version: 3
Issued: 23-Mar-2012

IDEX CORPORATION

VIKING PUMP

Viking Duplex Fuel Oil Package Field Start-Up Guide

Before arriving on job site, make sure you have:

- ☐ A copy of the approved drawing or certified print of the Duplex Fuel Oil Pump Package
- ☐ A copy of the approved drawing of the Control Panel.
- ☐ Read all of the instructions, notes, and suggestions in this bulletin to become familiar with the start-up procedures. If you have any questions or require clarification please contact our systems specialist, Scott Ludschuweit at (519) 259-4249 (or North America toll free at 1-888-845-7867 ext. #4249)

When you arrive at the site confirm the following:

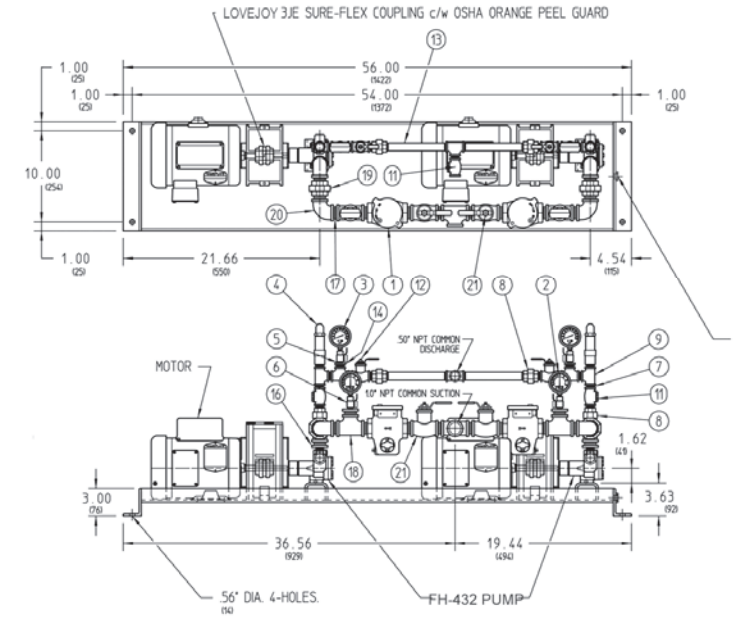
- ☐ Check the name plate rating on the Control Panel and compare with the incoming voltage and motor ratings.
- ☐ The compound gauge should be located on the pump suction or in the suction header (depending on pump size and duplex package configuration layout).
- ☐ The pressure gauge should be on the discharge of the pump or in the discharge header (depending on pump size and duplex package configuration layout).
- ☐ Examine the suction header and confirm that the arrow cast into suction strainer points toward the pump suction.
- ☐ Confirm the sales order number stamped on the serial number plate matches the packing slip. The serial number plate is typically located on the base plate of the unit.
- ☐ On the control panel confirm the voltage, phase, horsepower, certifications and part number stamped on the serial number plate located on the door of the panel match the specifications. Do not open the panel door.

Observations to be made on site:

General Installation

- ☐ The package should be anchor to the ground to prevent movement. If the unit is mounted on a shelf it should be properly bolted.
- ☐ All piping (suction, discharge and relief return lines) should be externally supported to prevent pipe stresses being transferred to the unit. Ideally flexible connections should be used.

Suction Piping



- ☐ If possible follow the suction pipe to the supply tank. The suction line should go around obstacles instead of over them. This is to prevent air lock (the system will not prime if the suction line is air locked).
- ☐ If there are any valves on the suction line they should be in the open position.
- ☐ With long suction pipe there should be a hand operated pump to evacuate the air from the suction line. This pump should be piped parallel to the duplex package.
- ☐ The relief valves piping can not be piped back into the suction piping. Both valves can be piped to a common pipe. But that pipe has to be piped back to the supply tank. There should not be any other valves in this line. If there is any they should be always in the open position.

Discharge Piping

- ☐ The discharge will be piped into a day tank or directly into the diesel generator or boiler depending on the installation.
- ☐ If possible follow the discharge pipe. If there are any valves on the discharge line they should be in the open position.
- ☐ Take a look at the day tank. There should be the line from the duplex pump unit, overflow and floats.

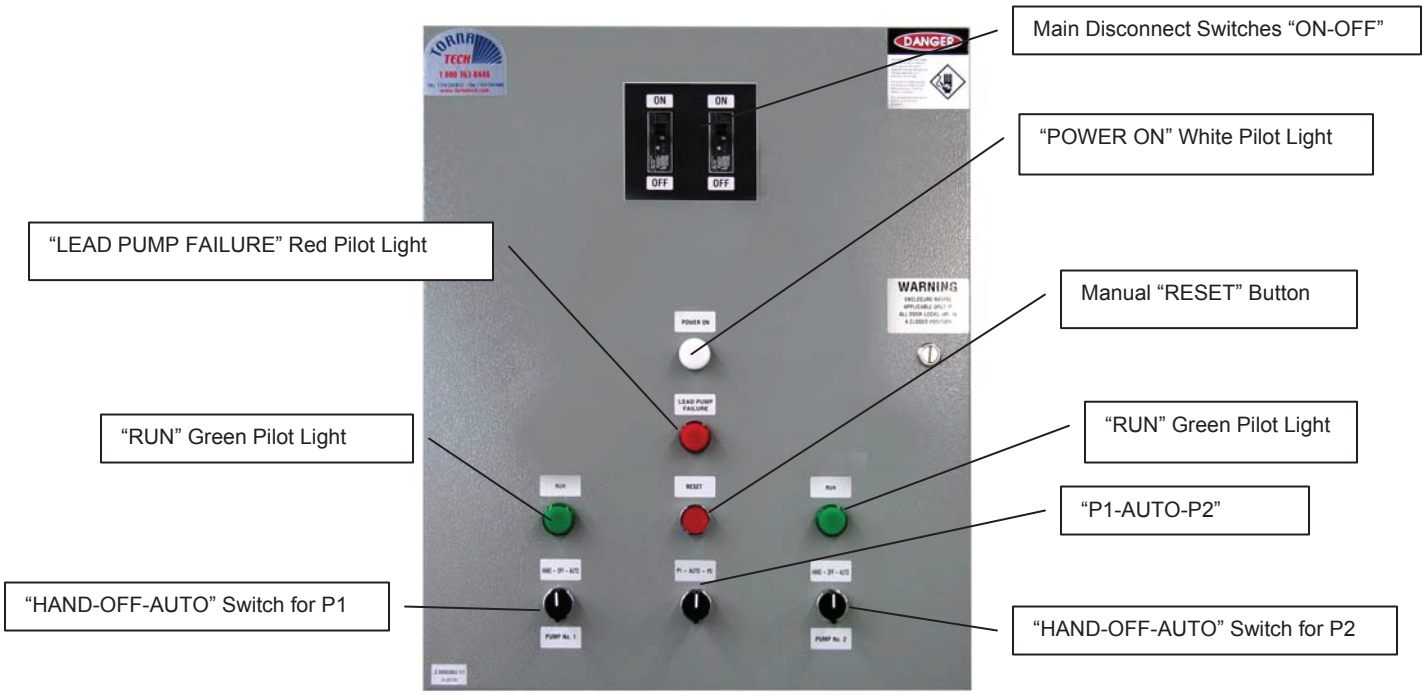

Fig. 3 – Typical Control Panel Cover

Priming the Duplex Fuel Oil Package:

1. On the Control Panel make sure both the Main Disconnect “ON-OFF” switches are in the “OFF” position (power off).

2. Take a look at the suction gauge to see if there is any pressure on the suction line. If there is pressure and the application is not a flooded suction the suction line is pressurized. Carefully remove the drain plug from the basket strainer to release the compressed air.

3. Turn the four ball valves connected to the pressure gauges (suction & discharge gauges) to closed position.

4. Remove the thumbscrew from top of the lid of the basket strainers, rotate the lid counter clockwise until the pin hits and stops, and then remove lid.

5. Open the suction valves.

6. Fill the strainers with diesel (the suction valves should be in open position, as you fill one strainer the liquid level will flow in the other strainer).

7. Reinstall the lid with the tab of the lid just to the left of the boss with the body, rotate the lid clockwise until the holes line up, and reinsert the thumbscrew.

8. Both the suction and discharge ball valves should be in open position.

©2012 VIKING PUMP, INC., All Rights Reserved

9. On the Control Panel, turn the “Hand-Off-Auto” selector switches to “Off” position for both P1 and P2.

10. Turn both the Main Disconnect “On-Off” switches to “ON” position (power on).

11. Turn the “P1-Auto-P2” switch to “P1” position.

12. Have some one observe the motor fan for the next operation.

13. For P1 turn “Hand-Off-Auto” selector switch to “Hand” position and P1 will start.

14. After approximate 3 seconds turn the “Hand-Off-Auto” selector switch for P1 back to “Off” position.

15. Confirm that the motor fan had spun in the proper rotation. If the motors are not rotating properly have an electrician switch the motor leads and check again the rotation of the motors.

16. Repeat steps 11 to 15 for P2.

17. Turn the four ball valves connected to the pressure gauges (suction & discharge gauges) to the open position.

18. For P1 turn “Hand-Off-Auto” selector switch to “Hand” position and P1 will start.

19. Observe the suction compound gauge; it should start pulling a vacuum. The discharge gauge will read 0 psi. Run P1 for no more than 2 minutes then turn it off. Place you hand on the pump (around the seal area) and if it starts heating up, turn off the pump to prevent mechanical seal failure.

20. When the pumps are primed and pumping the discharge gauge will show a positive pressure.

NOTE: If the suction line is long you may have to refill the basket strainer again. Before this is done the suction valves will have to be in the closed position, other wise the vacuum will be lost. Then alternate running P1 and P2 in manual mode.

NOTE: Some local codes specify a anti-siphon valve to be installed on the suction line. It is usually installed close to the main supply tank. In some cases this valve will prevent the pumps from priming. If the pumps don’t prime after a few attempts ask the contractor to loosen the spring in the anti-siphon valve and then after the pumps are primed the spring can be set in order to meet local codes.

NOTE: If the installation has a flooded suction, turn the suction and discharge valves to the open position. The suction pressure gauge should show a positive pressure. If it doesn’t follow the suction line to the supply tank and see if all the valves are open. If all the valves are open and the pressure gauges don’t read a positive pressure there a blockage in the line. The blockage will have to be cleaned before running the pumps.

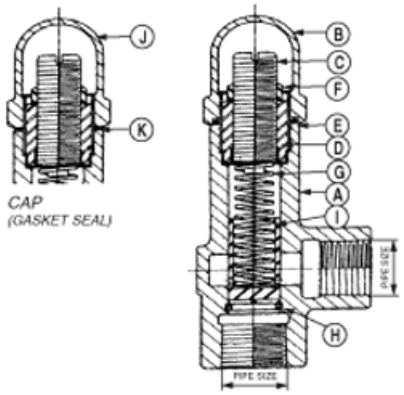
CONTROL PANEL

- Check the name plate rating of the Control Panel and compare with the incoming line voltage and the motors ratings.
- Adjust overload relay setting to full current rating
- Check that motor protector push actuator(s) is (are) in start position.
- Check that float switches are adjusted to the desired levels
- Check that the controller is properly connected to the pump motors
- If motors are rotating in the proper direction (as checked in steps 10 to 16 under Priming section), and all the above checks out correctly, turn the “Hand-Off-Auto” switches for both P1 and P2 to the “Auto” position.
- Activate float switches manually and test if the pumps start and stop at desired levels.
- Once the level falls below the start lead pump level float switch FL2 (as shown in diagram under Float Controls), the pump motor is energized and the lead pump starts pumping fuel into the tank.
- If the lead pump has failed and the level falls below FL2 start lead pump level float switch, the “Lead Pump Failure” red pilot light is turned on and the lag pump motor is energized so that the lag pump keeps pumping fuel into the fuel tank.
- In order to turn off the “Lead Pump Failure” red pilot light, the manual “Reset” red pushbutton must be pressed.
- Once the level reaches the stop all pumps level float switch FL3, the pump motors are de-energized and the pumps stop.
- If the alternation selector switch “P1-Auto-P2” is in the “Auto” position, the stop all pumps float switch FL3 triggers the alternator and reverses the order of the lead and lag pumps. For example, if P1 was the lead pump before the trigger, P2 will become the lead pump after the trigger.

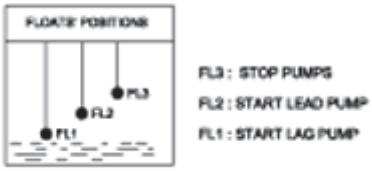
RELIEF VALVES

Checking Relief Valves Current Setting



1. With the pump running notice the reading on the discharge pressure gauge.
2. Slowly close the discharge ball valve.
3. Operate only one pump at a time in manual mode.
4. The reading on the discharge pressure gauge will increase.
5. Make a note of the pressure reading when the valve is fully closed; this value is the pressure relief valve setting. It should be approximate 15 to 20 psi greater than the specified pump discharge pressure.
6. Open the discharge valve and turn the pump off.
7. If the pressure relief setting in satisfactory, repeat for the other pump.

©2012 VIKING PUMP, INC., All Rights Reserved



Setting the Pressure Relief Valves

1. Turn the “Hand-Off-Auto” switches to “OFF” for both P1 and P2.
2. Remove the cap (item J) of the pressure relief valve for pump P1.
3. Loosen the lock nut (item F)
4. Turn the adjusting screw (item C) clockwise to increase the pressure setting or counterclockwise to decrease the pressure setting
5. Tighten the lock nut (item J)
6. Reinstall the cap (item B) onto the valve.
7. Turn the “Hand-Off-Auto” switch for P1 to “HAND” position.
8. Slowly close the discharge ball valve for P1. If the pressure relief setting is not satisfactory repeat the operation to adjust the adjusting screw.
9. Repeat steps 1 to 8 for pump P2.

FLOAT CONTROLS

The standard duplex control panel contains NC relays to operate three float switches (switches supplied by others) for the day tank. If more than three floats are required, the control panel would have to be ordered with optional NC relays.

The top float (FL3) stops both pumps, the middle float (FL2) starts the lead pump and the bottom float (FL1) starts the lag pump.

It may not be practical to fill the day tank to test the operation of the panel. A simpler way is to have the electrician simulate the open and closing contacts of the floats to check the operation sequence. This procedure can be used to check the high and low level alarms (if supplied) in the panel. The electrician can check the conductivity of the float (normally open or normally closed) to see if they are the same as specified. In some cases there is no day tank and the pump duplex unit pumps directly into the diesel generator or boiler. The panel will receive the signal from the generator and start the lead pump.

©2012 VIKING PUMP, INC., All Rights Reserved

PRESSURE SWITCHES

If the duplex unit is supplied with pressure switches (either single or dual stage) they will be installed on the discharge line. The pressure setting will be factory set, but they are field adjustable.

To simulate a low pressure condition on the discharge line, have the control panel on automatic mode and then close the discharge valve of the pump running. The relief valve will open and the pumping liquid will return to the supply tank. The pump will shut down and a red light will come on the panel, the time will be that is set on the timer.

It is difficult to simulate an actual high pressure shut down. Have the electrician simulate by open or closing the contacts in the control panel.

Field adjustment of the pressure setting can be done by the following:

Single Stage Pressure Switch – ASCO 502- PA10A-RE10A21

- See UDF400-1 Single Stage Pressure Switch.pdf

Dual Stage Pressure Switch – ASCO – SC10D-TG10A21

- See UDF400-2 Dual Stage Pressure Switch.pdf

FLOW SWITCHES

If the duplex unit is supplied with a flow switch it will be installed on the discharge line. To simulate a low flow condition on the discharge line, have the control panel on automatic mode and then close the discharge valve of the pump running (either P1 or P2). The relief valve will open and the pumping liquid will return to the supply tank. Within a few minutes (usually 1 to 3 minutes) based on the time set on the timer, the control panel will start the other pump and the “Low Flow” Signal red lights (optional equipment required for installation of low flow switch) will light up on the panel.

©2012 VIKING PUMP, INC., All Rights Reserved

TROUBLESHOOTING

1. No discharge pressure.
    a. Verify Priming Procedure. (Strainers primed, proper motor rotation)
    b. Verify Relief Valve setting procedure.
    c. To test each pump individually. Close valves on pump not being tested. Run pump to be tested and slowly close discharge valve. If pressure increases then there is flow from that pump. Turn pump off and close valves and repeat process for other pump. If gauge still has little to no reading then the operating pressure (especially on short distances) might be 1-5 psi only and not measurable on gauge.
    d. To prove this; run one pump and close off a valve downstream (if available) and pressure should rise to the Relief Valve set point.
2. Panel Alarms
    a. Panel must run in AUTO mode to assure correct operation.
    b. PLC timers run through their time settings or false alarms may show.
    c. Manually jumping floats and pressure/flow switches in the panel is sometimes the only way to test setting due to the design of the entire generator system.
    d. If actual operating pressure is lower than the specified operating pressure located in the title block of the drawing. Confirm that the pressure/flow switches, min and max operating parameters, operate within this range. If the operating pressures do fall within the switches range, then manual adjustments can be made as outlined in the Field Start-Up Guide.
3. Fluid leaking from a small hole located below the pump near the seal.
    a. This is to indicate that the seal has failed and is usually caused by a dry run condition.

A Viking pump that is properly installed and maintained will give long and satisfactory performance.
NOTE: Before making any pump adjustment or opening the pump liquid chamber in any manner, make sure that:

1) Any pressure in the pumping chamber has been vented through the suction or discharge lines or other openings provided for this purpose,
2) The driver has been "locked out" so that it cannot inadvertently be started while work is being done on the pump and
3) The pump has been allowed to cool down to the point where there is no chance of anyone being burned.

If trouble does develop, one of the first steps toward finding the difficulty is to *install a vacuum gauge in the suction port and a pressure gauge in the discharge port*. Readings on these gauges often will give a clue as to where to start looking for the trouble.

Vacuum Gauge - Suction Port

1. High reading would indicate -

a). Suction line blocked - foot valve stuck, gate valve closed, strainer plugged.
b). Liquid too viscous to flow through the piping.
c). Lift too high.
d). Line too small.

2. Low reading would indicate -

a). Air leak in suction line.
b). End of pipe not in liquid.
c). Pump is worn.
d). Pump is dry - should be primed.

©2012 VIKING PUMP, INC., All Rights Reserved

3. Fluttering, jumping, or erratic reading -

a). Liquid vaporizing.
b). Liquid coming to pump in slugs, possibly an air leak insufficient liquid above the end of the suction pipe.
c). Vibrating from cavitation, misalignment, or damage parts.

Pressure Gauge - Discharge Port

1. High reading would indicate -

a). High viscosity and small and/or long discharge line.
b). Gate valve partially closed.
c). Filter plugged.
d). Vertical head did not consider a high specific gravity liquid.
e). Line partially plugged from build up on inside of pipe.
f). Liquid in pipe not up to temperature.
g). Liquid in pipe has undergone a chemical reaction and has solidified.
h). Relief Valve set too high.

2. Low reading would indicate -

a). Relief valve set too low.
b). Relief valve poppet not seating properly.
c). Bypass around the pump partially open.
d). Too much extra clearance.
e). Pump worn.

3. Fluttering, jumping, or erratic reading -

a). Cavitation.
b). Liquid coming to pump in slugs.
c). Air leak in suction line.
d). Vibrating from misalignment or mechanical problems.

Some of the following may also help pinpoint the problem:

A). Pump does not pump.

1. Lost its prime - air leak, low level in tank, foot valve stuck.
2. Suction lift too high.
3. Rotating in wrong direction.
4. Motor does not come up to speed.
5. Suction and discharge valves not open.
6. Strainer clogged.
7. Bypass valve open, relief valve set too low, relief valve poppet stuck open.
8. Pump worn out.
9. Any changes in the liquid system, or operation that would help explain the trouble, e.g. new source of supply, added more lines, inexperienced operators, etc.
10. Too much end clearance.
11. Head position incorrect.

B). Pump starts, then loses its prime.

1. Supply tank empty.
2. Liquid vaporizing in the suction line.
3. Air leaks or air pockets in the suction line; leaking air through packing or mechanical seal.
4. Worn out.

©2012 VIKING PUMP, INC., All Rights Reserved

C). Pump is noisy.

1. Pump is being starved (heavy liquid cannot get to pump fast enough). Increase suction pipe size or reduce length.
2. Pump is cavitating (liquid vaporizing in the suction line). Increase suction pipe size or reduce length; if pump is above the liquid, raise the liquid level closer to the pump; if the liquid is above the pump, increase the head of liquid.
3. Check alignment.
4. May have a bent shaft or rotor tooth. Straighten or replace.
5. Relief valve chatter; increase pressure setting.
6. May have to anchor base or piping to eliminate or reduce vibration.
7. May be a foreign object trying to get into the pump through the suction port.

D). Pump not up to capacity.

1. Starving or cavitating - increase suction pipe size or reduce length.
2. Strainer partially clogged.
3. Air leak in suction piping or along pump shaft.
4. Running too slowly; is motor the correct speed and is it wired up correctly.
5. Bypass line around pump partially open.
6. Relief valve set too low or stuck open.
7. Pump worn out.
8. Too much end clearance.
9. Head position incorrect.

E). Pump takes too much power.

1. Running too fast - Is correct motor speed, reducer ratio, sheave size, etc. being used?
2. Is liquid more viscous than unit sized to handle; heat the liquid, increase the pipe size, slow the pump down, or get a bigger motor.
3. Discharge pressure higher than calculated, check with pressure gauge. Increase size or reduce length of pipe, reduce speed (capacity), or get bigger motor.
4. Packing gland drawn down too tight.
5. Pump misaligned.
6. Extra clearance on pumping elements may not be sufficient for operating conditions. Check parts for evidence of drag or contact in pump and increase clearance where necessary.

F). Rapid Wear.

On most applications the pump will operate for many months or years before it gradually loses its ability to deliver capacity or pressure. Examination of such a pump would show a smooth wear pattern on all parts. Rapid wear, occurring in a few minutes, hours or days, shows up as heavy grooving, galling, twisting, breaking or similar severe signs of trouble. (see Rapid Wear Chart below)

©2012 VIKING PUMP, INC., All Rights Reserved

RAPID WEAR

	CAUSE	EVIDENCE	POSSIBLE SOLUTION
1.	**ABRASIVES**	Gouges or marks made by large, hard particles; a rapid wearing away of bushings from very small abrasives similar to pumice; or anything in between.	Flush the system with the pump removed. Install strainer in suction line. Oftentimes after a system has run for a few cycles or a few days the dirt is pretty well cleaned out and if the pump is rebuilt into good condition it will then last for a long time.
2.	**CORROSION**	Rust, pitting or metal appears to be "eaten" away.	Check the Viking General Catalog Liquid List for materials of construction recommendation. Consider whether all of the materials used in pump construction were attacked; consider other materials used in the system to determine how they resisted the liquid. Check to see whether or not the liquid has been contaminated to make it more corrosive than anticipated.
3.	**EXCEEDING OPERATING LIMITS**	Noisy operation, broken bushings, twisted shaft, parts show evidence of high heat (discoloration).	Review General Catalog for operating limits on particular model involved.
4.	**INSUFFICIENT EXTRA CLEARANCE**	Pump may stall. Evidence of heavy contact between end of rotor teeth and head or other parts.	Increase end clearance and/or contact your distributor or the factory with details of the application so that information regarding proper extra clearance may be provided.
5.	**LACK OF LUBRICATION**	Noisy bearings, localized heating at bearings or lip seal, smoke, rapid bushing wear.	Be sure all grease fittings are greased before starting and instructions for lubrication of drive equipment are followed; consider use of auxiliary lubricating equipment.
6.	**MISALIGNMENT**	Wear on only one part of a surface, e.g., one side of the casing, one side of the packing gland, only a portion of the face of the head.	Double check alignment of drive equipment and piping. Check the alignment under conditions as close to operating conditions as possible.
7.	**RUN DRY**	Pump stalls because parts have uneven expansion caused by frictional heat; galling between surfaces having relative motion; seal seats and idler pins changing colour because of high heat.	Be sure there is liquid in the system at the time of start up. Provide some kind of automatic alarm or shut-off if supply tank runs dry.

©2012 VIKING PUMP, INC., All Rights Reserved

PREVENTATIVE MAINTENANCE

Performing a few preventative maintenance procedures will extend the life of your pump and reduce the overall cost of ownership.

A). Lubrication - Grease all grease nipples after every 500 hours of operation or after 60 days, whichever occurs first. If service is severe, grease more often. Do it gently with a hand gun. Use a NLGI #2 grease for normal applications. For hot or cold applications use appropriate grease. See Engineering Service Bulletin ESB-515.

B). End Clearance Adjustment - After long service the running clearance between the end of the rotor teeth and the head may have increased through wear to the point where the pump is losing capacity or pressure. Resetting end clearance will normally improve pump performance. See TSM on particular model series for procedure on adjusting end clearance for pump involved.

C). Examine Internal Parts - Periodically remove the head, examine idler and bushing and head and pin for wear. Replacing a relatively inexpensive idler bushing and idler pin after only moderate wear will eliminate the need to replace more expensive parts at a later date. See TSM on particular model series for procedure in removing head of the pump. Be sure idler does not slide off idler pin as head is removed and drop and hurt someone or damage the part.

D). Cleaning the Pump - A clean pump is easier to inspect, lubricate, adjust, and runs cooler; plus, it looks better.

E). Storage - If pump is to be stored, or not used for six months or more, pump must be drained and a light coat of non-detergent SAE 30 weight oil must be applied to all internal pump parts. Lubricate fittings and apply grease to pump shaft extension. Viking suggests rotating pump shaft by hand one complete revolution every 30 days to circulate the oil. Retighten all gasketed joints before using the pump.

DO'S AND DON'TS -

Do's and Don'ts for installation, operation, and maintenance of Viking pumps to assure safe, long, trouble-free operation.

INSTALLATION -

1. Do install pump as close to supply tank as possible.
2. Do leave working space around the pumping unit.
3. Do use large, short, and straight suction piping.
4. Do install a strainer in the suction line.
5. Do double check alignment after the unit is mounted and piping is hooked up.
6. Do provide a pressure relief valve for the discharge side of the pump.
7. Do cut out the center of gaskets used as port covers on flanged port pumps.
8. Do record pump model number and serial number and file for future reference.

OPERATION -

1. Don't run pump at speeds faster than shown in the catalogue for your model.
2. Don't require pump to develop pressures higher than those shown in the catalogue for your model.
3. Don't operate pumps at temperatures above or below limits shown in the catalogue for your pump.
4. Don't operate pumps without all guards being in place.
5. Don't operate pump without a relief valve on the pump or in the discharge piping; be sure valve is mounted and set correctly.

©2012 VIKING PUMP, INC., All Rights Reserved

6. Don't exceed catalogue limits for temperature and pressures of fluids in jacketed areas of pump.
7. Don't use the pump in a system, which includes a steam blow or an air or vapour blow or purge **without** provision for over-speed shutdown in case the pump starts to act as a turbine and over-speeds the drive.
8. Don't operate the pump with all of the liquid bypassing through a pump mounted internal type relief valve or without any flow of liquid going through the pump for more than a couple of minutes. Operation under either of these conditions may result in a heat build-up in the pump, which could cause hazardous conditions or happenings.

MAINTENANCE -

1. Do make sure any pump that has residual system pressure in it or that has handled high vapour pressure liquids, e.g., LP-gas, ammonia, Freons, etc. has been vented through the suction or discharge lines or other openings provided for this purpose.
2. Do make sure that if the pump is still hooked to the driver while maintenance is being performed that the driver has been "locked out" so that it cannot be inadvertently started while work is being done on the pump.
3. Do make sure any pump that has handled a corrosive, flammable, hot, or toxic liquid has been drained, flushed, vented and/or cooled before it is disassembled.
4. Don't drop parts during disassembly, e.g., idler can slip from the pin as the head is removed from the pump; it may drop on your foot, plus, it may get nicked or gouged.
5. Don't stick fingers in the ports of a pump! Serious injury may result.
6. Don't spin the idler on the idler pin! Fingers may be jammed between teeth and crescent.
7. Do remember that a few simple preventative maintenance procedures such as periodic lubrication, adjustment of end clearance, examination of internal parts, etc., will extend the service life of your pump.
8. Do **obtain**, read and keep maintenance instructions furnished with your pump.
9. Do have spare parts, pumps or standby units available, particularly if the pump is an essential part of a key operation or process.

VIKING PUMP

WARRANTY

Viking warrants all products manufactured by it to be free from defects in workmanship or material for a period of one (1) year from date of startup, provided that in no event shall this warranty extend more than eighteen (18) months from the date of shipment from Viking. If, during said warranty period, any products sold by Viking prove to be defective in workmanship or material under normal use and service, and if such products are returned to Viking's factory at Windsor, Ontario, transportation charges prepaid, and if the products are found by Viking to be defective in workmanship or material, they will be replaced or repaired free of charge, FOB. Windsor, Ontario.

Viking assumes no liability for consequential damages of any kind and the purchaser by acceptance of delivery assumes all liability for the consequences of the use or misuse of Viking products by the purchaser, his employees or others. Viking will assume no field expense for service or parts unless authorized by it in advance.

Equipment and accessories purchased by Viking from outside sources which are incorporated into any Viking product are warranted only to the extent of and by the original manufacturer's warranty or guarantee, if any.

THIS IS VIKING'S SOLE WARRANTY AND IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, WHICH ARE HEREBY EXCLUDED, INCLUDING IN PARTICULAR ALL WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. No officer or employee of IDEX Corporation or Viking Pump Canada is authorized to alter this warranty.

INSTALLATION AND MAINTENANCE INSTRUCTIONS

TRIPOINT® switches

ADJUSTABLE DEADBAND COMPACT LINE SWITCHES OPEN FRAME, GENERAL PURPOSE OR WATERTIGHT SWITCH ENCLOSURES

SERIES

PA10, PA11, PA16
PA20, PA21, PA26
PA30, PA31, PA36

Form No. P7032

DESCRIPTION

The Adjustable Deadband Compact Line Switch is of rugged aluminum alloy construction. The switch may be provided with a General Purpose NEMA Type 1 Switch Enclosure, a Watertight NEMA Type 3 and 4 Switch Enclosure or an open-frame switch.

The compact line switch may be supplied as a complete unit, that is, the switch assembly unit and the transducer (either pressure, temperature or mechanical transducer) completely assembled or as separate units to be assembled upon installation. The actuation (set) point and the reactuation (reset) point are each independently adjustable over the full range of the switch. The switch assembly can be mated with a wide selection of interchangeable pressure, temperature and mechanical transducers to cover a broad range of pressures, fluids, temperatures and mechanical movements. The switch will control electrical circuits in response to changes in pressure, temperature or mechanical signals.

IMPORTANT: This sheet is designed to cover the installation and use of this switch on pressure transducers, temperature transducers and mechanical transducers. Review this sheet and select the paragraphs that apply to your particular installation and application. Throughout the sheet, the word "signal" will be used in place of pressure, temperature or mechanical changes.

INSTALLATION

Check the nameplate for the correct catalog number, pressure range, temperature range, media and rated over range pressure or temperature. Nameplates are located on cover and on the bottom of the transducer. Check to be sure the third digit in each number is the same. If not, the unit should not be used. (Refer to Figure 2)

IMPORTANT: All internal adjustments have been made at the factory. Any adjustment, alteration or repair to the internal parts of the switch other than stated herein voids all warranties. Signal setting adjustments required are made by the two adjusting nuts on the top of the switch.

TEMPERATURE LIMITATIONS

Maximum ambient temperature is 60°C (140°F). Maximum fluid temperature is 82°C (179°F). For steam service, the fluid temperature with a pigtail (syphon tube or condensate loop) installed directly into the transducer will be below 82°C (179°F). For higher ambient and fluid temperature limitations, consult factory.

ASSEMBLY OF SWITCH AND TRANSDUCER UNITS (Refer to Figure 2)

IMPORTANT: The switch unit and transducer unit may be provided as a complete assembly or as separate units. If separate units are provided, refer to Form No. P7033 for a complete listing of switch unit and transducer unit combinations. Form No. P7033 is provided to insure that the proper switch unit be assembled to the proper transducer unit.

Pay careful attention to exploded view provided in Figure 2 for assembly of switch unit and transducer unit. Proceed in the following manner:

1. CAUTION: The third digit in the catalog number on both the switch unit and the transducer unit must be identical. If not, do not assemble to each other. If the same, proceed.
2. Remove bolts (4) from base of switch unit. On general purpose or watertight constructions, remove switch cover.
3. Remove instruction label and pressure, temperature or mechanical switch range scale from the transducer unit.
4. Place transducer unit on base of switch unit and assemble. Start bolts (4) approximately two turns by hand to avoid the possibility of cross threading. After initial engagement, torque bolts (4) in a crisscross manner to 80 ± 10 inch-pounds.
5. Remove backing paper from range scale and install on the front of the switch body over the left opening and between the two slots with the adjusting indicator points.

POSITIONING

Switch may be mounted in any position.

MOUNTING

For mounting dimensions for general purpose switch enclosures, refer to Figure 3. For all switches, an optional mounting bracket is available. For mounting bracket mounting dimensions, refer to Figure 6.

PIPING/TUBING (PRESSURE TRANSDUCER)

Adequate support of piping and proper mounting of switch should be made to avoid excessive shock or vibration. To minimize the effect of vibration on a switch, mount perpendicular to vibration. Connect piping or tubing to switch at base of transducer. It is recommended that flexible tubing be used whenever possible. Apply pipe compound sparingly to male pipe threads only. If applied to transducer threads, it may enter the transducer and cause operational difficulty. Pipe strain on switch should be avoided by proper support and alignment of piping. When tightening pipe, do not use switch as a lever. Wrenches applied to transducer body or piping are to be located as close as possible to connection point. **IMPORTANT: For steam service, install a condensate loop (pigtail or steam syphon tube) directly into the pressure transducer.**

CAUTION: To avoid damage to the transducer body, DO NOT OVERTIGHTEN PIPE CONNECTIONS. If TEFLON* tape, paste or similar lubricant is used, use extra care due to reduced friction.

*DuPont's Trademark for its TFE-fluorocarbon Resin.

IMPORTANT: To eliminate the effect of undesirable pressure fluctuations in the system, install a surge supressor.

WIRING

Wiring must comply with Local and National Electrical Codes. The general purpose switch enclosure is provided with a 7/8 diameter hole to accommodate 1/2 inch electrical hub or connector. It is recommended that a flexible conduit connection be used. If rigid conduit is used, do not consider it or use it as a means of supporting (mounting). For watertight switch enclosures, a watertight conduit hub must be installed in the 7/8 diameter hole, use conduit hub Part No. PP01 or equivalent. IMPORTANT: Electrical load must be within range stated on nameplate. Failure to stay within the electrical range of the switch rating may result in damage to or premature failure of the electrical switch. Number 14 AWG wire is recommended. CAUTION: Do not exert excessive screwdriver force on snap switch when making terminal connections. When connections are made, be sure there is no stress on the wire leads. Either condition may cause malfunction of switch.

STANDARD SWITCH AND OPTIONAL SWITCH SUFFIX "J" ATMOSPHERE SEALED ELECTRICAL RATING

5 Amps Res., 125, 250 VAC

SCHEMATIC FOR STANDARD, SUFFIX "H" AND SUFFIX "J" SWITCHES

SPDT

(SEE NOTE)

NOTE: Terminal Connections (C, NC & NO) on snap switch are located differently than shown in the schematic above. Common "C" is located at the bottom. Normally Closed "NC" is located in the center. Normally Open "NO" is located at the top.

INSTALLATION OF TEMPERATURE TRANSDUCERS

(Refer to Figure 5)

DIRECT PROBE

The Direct Probe (local) Temperature Transducer is provided with 1/2 inch N.P.T. connection. When installing, do not use switch unit as a lever for tightening. Use wrenching flats provided at base of transducer for tightening.

CAPILLARY AND BULB

The Capillary and Bulb (remote) Temperature Transducers are provided with a length of capillary and a 3/8 inch diameter sensing bulb. CAUTION: Do not bend capillary at sharp angles. For proper operation, be sure sensing bulb is completely immersed in fluid and not in contact with heating element or anything that would directly affect the temperature of the fluid being sensed.

Form No. P7032 PRINTED IN U.S.A. 1978 Automatic Switch Co. FLORHAM PARK, NEW JERSEY 07932

© Automatic Switch Co. 1978, ALL RIGHTS RESERVED

THERMAL WELL (Optional Feature)

A Thermal Well may be used for Capillary and Bulb (remote) or Direct Probe (local) Temperature Transducers. The thermal well affords protection for the sensing bulb and allows removal of the sensing bulb while maintaining a pressure-tight vessel. When installing sensing bulb in thermal well, be sure that it is fully inserted. Where a thermal well already exists, jam nuts may be obtained to adapt the capillary and bulb to the existing thermal well. The existing thermal well must be for a 3/8 diameter sensing bulb.

UNION CONNECTOR (Optional Feature)

A union connector will allow direct mounting of the sensing bulb in the fluid being controlled. Install union into piping connection before tightening union onto bulb. For maximum performance, the bulb should be inserted in the union connection so that the end of the sensing bulb is even with the end of the union connector nut. Do not apply excessive torque when tightening union connector nut.

ADJUSTMENT (SIGNAL SETTING) OF ADJUSTABLE DEADBAND SWITCH

When facing switch in the upright position, the adjusting nut on the highest point controls the high signal setting. The adjusting nut at the lowest point controls low signal setting (Refer to Figure 1). To make adjustments, a 1/4 wrench and a pressure or temperature gage (within suitable range) are required. If electrical connection (to line of final application) of the switch is not desirable, a battery powered test lamp or ohm meter may be used. Pressure, temperature or mechanical range scales should be used for initial signal settings. These will be accurate within 5%. Adjust switch until pointer is in the middle of the solid red line below the desired range. For exact signal settings, proceed as follows:

ADJUSTMENT (SIGNAL SETTING) OF NORMALLY CLOSED AND NORMALLY OPEN ADJUSTABLE DEADBAND SWITCH INCREASING SIGNAL (Refer to Figure 1)

1. If the adjustable deadband switch is in the line of final application when adjustment (signal setting) is made, be sure switch can be test operated without affecting other equipment.
2. On general purpose and watertight constructions, remove switch cover.
3. Turn low adjustment nut until low signal setting indicator is fully down. Turn high adjustement nut until high signal setting indicator is fully up. Use a 1/4 inch wrench for adjusting nuts. **CAUTION: Adjusting nut will turn easily until it hits a stop. Do not over torque; over torquing may cause damage.**
4. Follow steps in chart below to make signal settings.

Steps of Adjustment	Normally Closed		Normally Open	
	Electrical Connection To Switch	Position Of Test Lamp On-Off	Electrical Connection To Switch	Position Of Test Lamp On-Off
1. Starting at zero signal, connect test lamp to common and . . .	Normally Closed Terminal	On	Normally Open Terminal	Off
2. Apply desired actuation signal. Then back off high signal adjusting nut until switch actuates.	Normally Closed Terminal	Off (Switch Open)	Normally Open Terminal	On (Switch Closed)
3. Lower signal to desired reactuation signal. Then advance low signal adjusting nut until switch reactuates.	Normally Closed Terminal	On (Switch Closed)	Normally Open Terminal	Off (Switch Open)

5. Cycle between two desired signals and make minor adjustments to nuts as required to achieve exact signal settings.
6. After settings have been made, make permanent electrical connections. **WARNING: Be sure power is off when electrical connections are made.**

ADJUSTMENT (SIGNAL SETTING) OF NORMALLY CLOSED AND NORMALLY OPEN ADJUSTABLE DEADBAND SWITCH DECREASING SIGNAL (Refer to Figure 1)

1. If the adjustable deadband switch is in the line of final application when adjustment (signal settings) is made, be sure switch can be test operated without affecting other equipment
2. On general purpose and watertight constructions, remove switch cover.
3. Turn low adjustment nut until low signal setting indicator is fully down. Turn high adjustment nut until high signal setting indicator is slightly beyond desired actuation setting. Use a 1/4 inch wrench for adjusting nuts. **CAUTION: Adjusting nut will turn easily until it hits a stop. Do not over torque; over torquing may cause damage.**
4. Follow steps in chart below to make signal settings.

Steps of Adjustment	Normally Closed		Normally Open	
	Electrical Connection To Switch	Position Of Test Lamp On-Off	Electrical Connection To Switch	Position Of Test Lamp On-Off
1. Starting with initial signal above desired actuation, connect test lamp to common and . . .	Normally Closed Terminal	Off	Normally Open Terminal	On
2. Decrease signal to desired actuation signal. Then advance low adjusting nut until switch actuates.	Normally Closed Terminal	On (Switch Closed)	Normally Open Terminal	Off (Switch Open)
3. Apply desired reactuation signal. Then back off high signal adjusting nut until switch reactuates.	Normally Closed Terminal	Off (Switch Open)	Normally Open Terminal	On (Switch Closed)

5. Cycle between two desired signals and make minor adjustments to nuts as required to achieve exact signal settings.
6. After settings have been made, make permanent electrical connections. **WARNING: Be sure power is off when electrical connections are made.**

TESTING OF INSTALLATION

If the adjustment of the switch has been made outside of the line of final application, the switch should be retested when installed in the line of final application. Follow adjustment instructions. Be sure switch can be test operated without affecting other equipment.

MAINTENANCE

WARNING: Turn off electrical power supply and line pressure to switch before removal or inspection.

IMPORTANT: Repair of the switch shall never be attempted in the field. The switch must be returned to the factory (Automatic Switch Company, Florham Park, New Jersey) or serviced only by an authorized factory representative. Address all service inquires to Automatic Switch Company, 50-56 Hanover Road, Florham Park, New Jersey 07932. The only adjustments which may be performed on the switch is changing positions of high and low signal adjusting nuts and replacement of the transducer unit. Replacement of transducer should be done if external leakage is evident.

PREVENTIVE MAINTENANCE

1. While in service, operate (cycle between two desired signals) the adjustable deadband switch at least once a month to insure proper operation. If necessary, electrical wiring and pipe connection should be made so that switch can be test operated without affecting other equipment.
2. Periodic inspection of the switch, external surfaces only, should be carried out. Switch should be kept clean and free from paint, foreign matter, corrosion, icing and freezing conditions.
3. Keep the medium entering the switch as free from dirt and foreign material as possible.

IMPROPER OPERATION

Switch will not actuate or actuates and reactuates undesirably.

1. **Incorrect Electrical Connection:** Check leads to switch. Be sure they are properly connected. Switch is marked "NO" for Normally Open, "NC" for Normally Closed and "C" for Common.
2. **Faulty Control Circuit:** Check electrical power supply to switch. Check for loose or blow-out fuses, open-circuited or grounded wires, loose connections at terminal block or switch. See nameplate for electrical rating and range.
3. **Incorrect Pressure:** Check pressure in system with suitable pressure gage. Pressure must be within range specified on nameplate.
4. **Incorrect Adjustment:** Check high and low adjusting nuts for proper setting. Refer to adjustment instructions.
5. **External Leakage:** Check to see that bolts (4) holding transducer to pressure switch are properly torqued (80 ± 10 inch-pounds). If bolts are tight and leakage is still evident, replace transducer. Refer to paragraph on "Assembly of Switch Unit and Transducer Unit."
6. **Excessive Vibration or Surges Causing Switch to Actuate and Reactuate:** Check for fluctuations in system and install pressure surge suppressor. Check switch mounting and be sure there is no excess vibration.
7. **Incorrect Temperature:** Check temperature in system with suitable thermometer. Temperature must be within range specified on nameplate. Check location of capillary and bulb for incorrect mounting. Refer back to paragraphs on "Installation of Temperature Transducers."

If the operation of the adjustable deadband switch cannot be corrected by the above means, the entire switch unit should be replaced or an authorized factory representative consulted.

FOR SERVICE, REPLACEMENT OR NEW TRANSDUCER
Consult Factory or Authorized Factory Representative or Distributors

ORDERING INFORMATION
For Adjustable Deadband Switch or New Transducer
When Ordering, Specify Catalog Numbers, Fluid, Pressure Range, Temperature Range, Serial Numbers and Maximum Sustained Pressure or Temperature.

NAMEPLATES ARE LOCATED ON SWITCH COVER AND BOTTOM OF TRANSDUCER.

Installation & Maintenance Instructions

ASCO® TRIPOINT® SWITCH UNITS

TWO–STAGE DUAL ADJUSTMENT SWITCH UNIT WITH GENERAL PURPOSE, WATERTIGHT, OR EXPLOSIONPROOF SWITCH ENCLOSURE

SC–SERIES

Form No.V5736R2

DESCRIPTION

The SC–Series Two–Stage Dual Adjustment Switch Units are used with transducer units to make Tripoint Pressure Switches or Temperature Switches. The switch units are made of aluminum alloy and designed for rugged industrial use. The switch units have a general purpose, watertight, or explosionproof enclosure. All wiring terminals, adjustments, and visual scales are accessible from the front of the switch.

The switch may be supplied as a complete unit or with the switch unit and transducer completely assembled. The components may be separate units to be assembled upon installation. There are two electrical snap switches with independently adjustable actuation (set)points, adjustable over the full range of the switch. The reactuation(reset) point of each electrical snap switch is fixed with respect to the actuating point setting for that switch. The switch assembly can be mated with a wide selection of pressure or temperature transducers to cover a broad range of pressures, fluids, or temperatures. The switch will control electrical circuits in response to changes in pressure or temperature.

IMPORTANT: These instructions cover the installation and use of this switch on pressure and temperature transducers. Select the paragraphs that apply to your particular installation and application. The word *signal* is used in place of pressure or temperature changes.

INSTALLATION

Check the nameplate for the correct catalog number, pressure range, temperature range, media, and proof pressure or temperature. Never apply incompatible fluids or exceed the pressure or temperature rating of the switch. Installation and inspection to be performed by qualified personnel.

Nameplates are located on cover and on the bottom of the transducer. Check to be sure the third digit in each number is the same. If not, the unit should not be used. (Refer to Figure 3).

IMPORTANT: All internal adjustments have been made at the factory. Any adjustment, alteration or repair to the internal parts of the switch other than stated herein voids all warranties. The signal setting adjustments required are made by the adjusting nut on the outside of the switch.

Temperature Limitations

Ambient temperature limits are — 4°F(—20°C) to 140°F (60°C). To determine fluid temperature limitations, see form No.V5794 for Pressure Transducer catalog numbers and construction materials, then refer to chart below.

TRANSDUCER CONSTRUCTION MATERIALS	RATINGS FLUID TEMPERATURE
Buna N or Neoprene	–4°F(–20°C) to 179°F(82°C)
VITON*	–4°F(–20°C) to 250°F(121°C)
316 Stainless Steel	–50°F(–45°C) to 300°F(149°C)

For steam service, the fluid temperature with a pigtail (siphon tube or condensate loop) installed directly into the transducer will be below 179°F (82°C).

Assembly of Switch and Transducer Units

IMPORTANT: The switch unit and transducer unit may be provided as a complete assembly or as separate units. If separate units are provided refer to Form No. V5794 for a complete listing of switch unit and transducer unit combinations. Form No.V5794 is provided to ensure that the proper switch unit is assembled to the proper transducer unit. Pay careful attention to exploded views provided in Figure 3 for assembly of switch unit and transducer unit. Proceed in the following manner:

⚠ **CAUTION: The third digit in the catalog number on both the switch unit and transducer unit must be identical. If not, do not assemble to each other. If the same proceed.**

1. Remove special instructions label and switch range scales from transducer unit.
2. For watertight and explosionproof construction place gasket on base of switch unit.
3. Place transducer unit on base of switch unit and assemble. Insert four bolts and torque bolts in a crisscross manner to 80 ± 10 in–lbs [9,0 ± 1,1 Nm].
4. Remove backing paper from range scale and install scale on the switch body behind adjusting nut. The scale is slotted to fit over a raised boss on the body. See Figure 1.

Positioning

Switch may be mounted in any position.

Mounting

Figure 1 shows partial view of switch body for mounting dimensions.

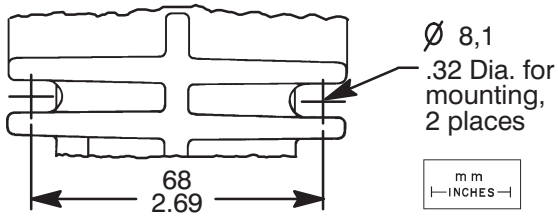

Figure 1. Mounting locations

Piping/Tubing (Pressure Transducer)

Adequate support of piping and proper mounting of switch should be made to avoid excessive shock or vibration. To minimize the effect of vibration on a switch, mount perpendicular to vibration. Connect piping or tubing to switch at base of transducer. It is recommended that flexible tubing be used whenever possible. Apply pipe compound sparingly to male pipe threads only. If applied to female threads, it may enter the transducer and cause operational difficulty. Avoid pipe strain on switch by properly supporting and aligning piping. When tightening pipe, do not use switch as a lever. Wrenches applied to transducer body or piping are to be located as close as possible to connection point.

IMPORTANT: For steam service, install a condensate loop (pigtail or steam syphon tube) directly into the pressure transducer.

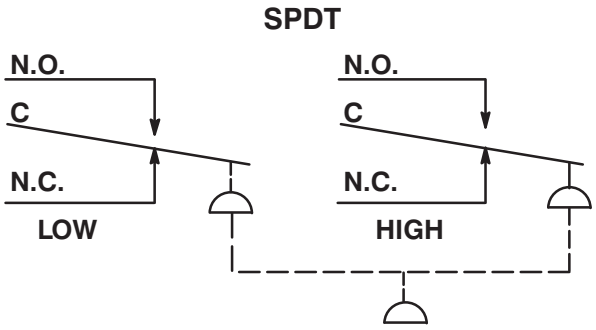
⚠ **CAUTION: To avoid damage to the transducer body, DO NOT OVERTIGHTEN PIPE CONNECTIONS. If TEFLON* tape, paste or similar lubricant is used, use extra care due to reduced friction.**

IMPORTANT: To eliminate undesirable pressure fluctuations in the system, install a surge suppressor.

*DuPont's Registered Trademark

© Automatic Switch Co. MCMXCI All Rights Reserved.

Wiring



Wiring must comply with local codes and the National Electrical Code. All switch enclosures are provided with two 3/4″ NPT conduit hubs with one plugged when not in use. It is recommended that a flexible conduit connection be used. If rigid conduit is used, do not consider it or use it as a means of support (mounting). For general purpose and watertight construction, the switch cover is removed by loosening two screws then twisting slightly and lifting. For explosionproof construction, the cover unscrews. When explosionproof cover is replaced, torque cover to 135 ± 10 in−lbs [10,7 ± 1,1 Nm]. Use No. 14 AWG copper wire rated for 60°C minimum. All switches have a grounding screw and clamp in the enclosure. For factory wired switch, black lead is common, red lead is normally open, blue lead is normally closed, and the green lead wire is a ground.

IMPORTANT: Electrical load must be within range stated on nameplate. Failure to stay within the electrical range of the switch rating may result in damage to or premature failure of electrical switch.

⚠ **CAUTION: Do not exert excessive screw driver force on snap switch when making terminal connections. When connections are made, be sure there is no stress on the wire leads. Either condition may cause malfunction of switch.**

ELECTRICAL RATINGS

Schematic

INSTALLATION OF TEMPERATURE TRANSDUCERS

Direct Probe

The direct probe (local) temperature transducer is provided with 1/2″ NPT connection. When installing, do not use switch unit as a lever for tightening. Use wrenching flats provided at base of transducer for tightening.

Capillary and Bulb

The capillary and bulb (remote) temperature transducers are provided with a length of capillary and a 3/8″ diameter sensing bulb.

⚠ **CAUTION: Do not bend capillary at sharp angles. For proper operation, be sure sensing bulb is completely immersed in fluid and not in contact with heating element or anything that would directly affect the temperature of the fluid being sensed.**

Thermal Well (Optional Feature)

A thermal well may be used for capillary and bulb (remote) or direct probe (local) temperature transducers. The thermal well affords protection for the sensing bulb and allows removal of the sensing bulb while maintaining a pressure tight vessel. When installing sensing bulb in thermal well, be sure that it is fully inserted. Where a thermal well already exists, jam nuts may be obtained to adapt the capillary and bulb to the existing thermal well. The existing thermal well must be for a 3/8″ diameter sensing bulb.

Union Connector (Optional Feature)

A union connector will allow direct mounting of the sensing bulb in the fluid being controlled. Install union into piping connection before tightening union onto bulb. For maximum performance, the bulb should be inserted in the union connection so that the end of the sensing bulb is even with the end of the union connector nut. Do not apply excessive torque when tightening union connector nut.

Adjustment (Signal Setting) of Two−Stage Dual Adjustment Switch

To make adjustments, (signal setting) a 7/16″ wrench and a pressure or temperature gage (within suitable range) are required. If electrical connection (to line of final application) of the switch is not desirable, a battery powered test lamp or ohm meter may be used. Pressure or temperature range scales should be used for initial signal setting. These will be accurate within 5%. Loosen lock ring and turn adjusting nut until red line is even with the desired range. For exact signal setting, proceed as follows:

⚠ **WARNING: To prevent the possibility of personal injury or property damage, turn off electrical power when making permanent electrical connections to switch.**

Adjustment (Signal Setting) of Normally Closed or Normally Open Switch, *Increasing Signal* (Refer to Figure 2)

1. If the switch is in the line of final application when adjustment (signal setting) is made, be sure switch can be test operated without affecting other equipment.
2. Loosen lock ring on adjustment nut and turn low signal adjustment nut full upwards and high signal adjustment full down using a 7/16″ wrench.

⚠ **CAUTION: Adjusting nut will turn easily until it hits a stop. Do not over torque; over torquing may cause internal damage resulting in malfunction.**

3. Remove switch cover to gain access to snap switch. See section on *Wiring* for cover removal.
4. Follow the steps in the chart below to make signal setting:

Adjustment Procedure	NORMALLY CLOSED		NORMALLY OPEN	
	Switch Terminal	Test Lamp On−Off	Switch Terminal	Test Lamp On−Off
1. Starting at zero signal, connect test lamp to common .	NC	On (Closed Circuit)	NO	Off (Open Circuit)
2. Apply desired actuation signal. Then back off signal adjusting nut until switch actuates.	NC	Off (Open Circuit)	NO	On (Closed Circuit)
3. Lower signal to desired reactuation signal.	NC	On (Closed Circuit)	NO	Off (Open Circuit)

5. Cycle between signal settings and make minor adjustments to adjusting nuts as required to achieve the exact signal setting.
6. After setting has been made, make permanent electrical connections.

ASCO Valves Automatic Switch Co. 50−60 Hanover Road, Florham Park, New Jersey 07932

Adjustment (Signal Setting) of Normally Closed or Normally Open Switch, *Decreasing Signal*

(Refer to Figure 2)

1. If the switch is in the line of final application when adjustment (signal setting) is made, be sure switch can be test operated without affecting other equipment.

2. Loosen lock ring on adjustment nuts and turn low signal adjustment nut full upwards and high signal adjustment nut slightly beyond desired actuation setting using a 7/16″ wrench.

⚠ **CAUTION: Adjustment nut will turn easily until it hits a stop. Do not over torque; over torquing may cause internal damage resulting in malfunction.**

3. Remove switch cover to gain access to snap switch. See section on *Wiring* for cover removal.
4. Follow steps in chart below to make signal setting.

Adjustment Procedure	NORMALLY CLOSED		NORMALLY OPEN	
	Switch Terminal	Test Lamp On–Off	Switch Terminal	Test Lamp On–Off
1. Starting with initial signal above desired actuation setting, connect test lamp to common.	NC	Off (Open Circuit)	NO	On (Closed Circuit)
2. Decrease signal to desired actuation signal. Then advance adjusting nut until switch actuates.	NC	On (Closed Circuit)	NO	Off (Open Circuit)
3. Increase signal to check reactuation signal.	NC	Off (Open Circuit)	NO	On (Closed Circuit)

5. Cycle between actuation and reactuation signals and make minor adjustment to adjusting nuts as required to achieve the exact signal settings.
6. After settings have been made, tighten lock rings and make permanent electrical connections.

Testing of Installation

If the adjustment of the switch has been made outside of the line of final application, the switch should be retested when installed in the line of final application. Follow adjustment instructions. Be sure switch can be test operated without affecting other equipment.

MAINTENANCE

⚠ **WARNING: To prevent the possibility of personal injury or property damage, turn off electrical power and depressurize switch unit before inspection or removal.**

IMPORTANT: Switch is not field repairable. The switch must be returned to the factory (Automatic Switch Company, Florham Park, New Jersey) or serviced only by an authorized factory representative. Address all service inquiries to Automatic Switch Company, 50–60 Hanover road, Florham Park, New Jersey 07932, Valve Service Department. The only maintenance which may be performed on the two stage dual adjustment switch is changing the setting of the adjusting nut and replacement of the transducer unit. Replacement of transducer should be done only if external leakage is evident.

Preventive Maintenance

- While in service, operate the switch (cycle between desired signals) at least once a month to insure proper operation. If necessary, electrical wiring and pipe connection should be made so that switch can be test operated without affecting other equipment.
- Periodic inspection of the switch, external surfaces only, should be carried out. Switch should be kept clean and free from paint, foreign matter, corrosion, icing, and freezing conditions.
- Keep the medium entering the transducer as free as possible from dirt and foreign material.

Causes of Improper Operation

Switch will not actuate or actuates and reactuates undesirable.

- **Incorrect Electrical Connection:** Check leads to switch. Be sure they are properly connected. Switch is marked *NO* for Normally Open, *NC* for Normally Closed and *C* for Common.
- **Faulty Control Circuit:** Check electrical power supply to switch. Check for loose or blown fuses, open–circuited or grounded wires, loose connections at terminal block or switch. See nameplate for electrical rating and range.
- **Incorrect Pressure:** Check pressure in system with suitable pressure gage. Pressure must be within range specified on nameplate.
- **Incorrect Adjustment:** Check adjustment nut for proper setting. Refer to adjustment instructions.
- **External Leakage:** Check to see that bolts (4) holding transducer to pressure switch are properly torqued to 80 ± 10 in–lbs [9,0 ± 1,1 Nm]. If bolts are tight and leakage is still evident, replace transducer. Refer to paragraph on *Assembly of Switch Unit and Transducer Unit.*
- **Excessive Vibration or Surges Causing Switch to Actuate and Reactuate:** Check for fluctuations in system and install pressure surge suppressor. Check switch mounting and be sure there is no excessive vibration.
- **Incorrect Temperature:** Check temperature in system with suitable thermometer. Temperature must be within range specified on nameplate. Check location of capillary and bulb for incorrect mounting. Refer to paragraphs on *Installation Of Temperature Transducers.*

If the operation of the switch cannot be corrected by the above means, the entire switch unit should be replaced or an authorized factory representative consulted.

Color Code Identification

When the switch cover is removed, the switch unit may be identified by the color of the sealant used on the locknuts of the snap switch. The color of the sealant will correspond directly to the third digit of the switch catalog number.

Third Digit In Catalog Number	Sealant Color Used On Snap Switch Locknuts
1	Yellow
2	Green
3	Red
4	Blue

Example: If the sealant color on the snap switch was red, this would mean that the third digit in the pressure switch catalog number would be 3, possibly SC[3]0D. It would not be, for example: SC[1]0D, SC[2]0D, or SC[4]0D.

FOR SERVICE REPLACEMENT, OR NEW TRANSDUCER
Consult Factory, or Authorized Factory Representative or Distributors

Commercial Oil-Fired Water Heaters

SPEC 22 30 05 2.1 & 2.2

COMMERCIAL OIL-FIRED WATER HEATERS

FEATURES

MEETS THE THERMAL EFFICIENCY AND STANDBY LOSS REQUIREMENTS OF THE U.S. DEPARTMENT OF ENERGY AND CURRENT EDITION ASHRAE/IESNA 90.1

LIME TAMER™ MODELS INHIBIT LIME AND SEDIMENT BUILDUP—Lime Tamer™ models are warranted against tank failure due to sedimentbuildup for three years.

GLASSLINED TANK — Maximizes tank life. 160psi working pressure.

180° ADJUSTABLE THERMOSTAT— Has upper and lower sensingbulbs to average water temperatures at top and bottom of heater formaximum temperature control (120°-180°).

SAFETY SHUTOFF— Limits temperature buildup.

UL LISTED OIL BURNER— Precision engineered to match the units they are used with; designed to fire 1.75 to 5.0 gallons of oil per hour. All models equipped with single phase continuous duty motor 120 volt AC60 Hz, 3450 rpm with manual overload switch and interrupted ignition. Standard burners equipped with single stage pump with 1 or 2 line capability. Flame retention principle assures high rate of combustion efficiency, yet maintains low operating noise levels. Fuel unit includes pump, strainer, pressure regulating valve and ignition transformer. Transformer rated at 120 volt AC, 60 Hz with 10,000 volt secondary, UL listed for use with No. 1 and 2 commercial grade fuel oil. Burner mounted cadmium cell relay for flame detection - 15 second safety switch timing eliminates the need for RA890F Electronic Safeguard. Complies with UL A708.5-32/33.

EFFICIENT COMBUSTION CHAMBER— Precast, high temperature combustion chamber made of alumina silica ceramic fiber. Engineered for maximum insulation and heat reflection. Unique design assures more complete combustion by stabilizing flame pattern.

INTERRUPTED IGNITION— Reduces electrical consumption.

OIL SOLENOID SAFETY VALVE— Standard on COF-455 and 700.

3/4" DRAIN VALVE— Provided in lower tank for fast draining.

TWO HAND-HOLE CLEANOUTS—Allows easy cleaning on standard models COF-385 and larger and ASME models.

ANODIC PROTECTION—For longer tank life.

FLAME OBSERVATION PORT—Permits convenient flame check.

FOAM INSULATION—Saves fuel, helps maintain constant temperature.

JACKET—Heavy gauge steel with baked enamel finish over bonderized undercoat. Not approved for installation on combustible flooring.

EASY TO INSTALL BURNER—Three bolt mounting of burner assures easy installation.

BAROMETRIC DRAFT REGULATOR

CSA CERTIFIED AND ASME RATED T&P RELIEF VALVE

OTHER FEATURES

- Two Stage Pump - For use with underground oil storage tanks or JP-5 fuel
- ASME Construction Available - All models are rated 160 psi max working pressure
- CAUTION: Units must be installed on noncombustible surface.

THREE-YEAR LIMITED TANK WARRANTY

- Factory Start-Up included - Required for activating warranty and assuring maximum operating performance. Contact your local sales representative or Authorized Start-Up Agent to arrange a FREE Certified Start-Up.
- For complete warranty information, consult written warranty

*Based on No. 2 fuel oil. Capacity rating are actual heater performance at 80% thermal efficiency.
NOTE: Above 2000' altitude, input ratings should be reduced 4% for each 1000' above sea level.

SUGGESTED SPECIFICATION

Water heater(s) shall be commercial oil model number _____ or equivalent. Heater(s) shall have a minimum oil firing rate of _____ gph at 100°F temperature rise and a storage capacity of _____ gallons. The 160 psi working pressure tank shall be glass-lined with the alkaline borosilicate composition being fused to the steel at 1600° and be equipped with 1 1/2" water inlet and outlet openings, and 2 3/4" x 3 3/4" boiler-type hand-hole cleanout (2) on COF-315 and larger or ASME models. The tank shall be insulated with 2" fiber glass insulation. The outer jacket shallhave baked enamel finish over a bonderized undercoating. The burner shall be Underwriters' Laboratories listed and have a _____ (one or two) stage oil pump. The burner shall have flame retention, interrupted ignition and be equipped with primary controls which will provide for 15 second safety shutdown in the event of flame failure. The heater(s) shall be factory equipped with primary controls which will provide for 15 second safety shutdown in the event of flame failure. The heater(s) shall be factory equipped with temperature limiting device, drain valve, flame observation port and 180° adjustable thermostat having upper and lower sensing bulbs which average the water temperatures at the top and bottom of the tank for maximum water temperature control. A CSA Certified and ASME Rated T&P Relief Valve shall be furnished and installed by the factory. Heater tank shall have a 3 year limited warranty against corrosion and tank failure due to sediment buildup as outlined in the warranty.

For Technical Information and Automated Fax Service, call 800-527-1953. A. O. Smith Corporation reserves the right to make product changes or improvements without prior notice.

⚠ CAUTION

TEXT PRINTED OR OUTLINED IN RED CONTAINS INFORMATION RELATIVE TO YOUR SAFETY. PLEASE READ THOROUGHLY BEFORE USING APPLIANCE.

DANGER: If the information in these instructions is not followed exactly, a fire or explosion may result causing property damage, personal injury or death.

— Do not store or use gasoline or other flammable vapors and liquids in the vicinity of this or any other appliance.

— WHAT TO DO IF YOU SMELL GAS

- Do not try to light any appliance.
- Do not touch any electrical switch; do not use any phone in your building.
- Immediately call your gas supplier from a neighbor's phone. Follow the gas supplier's instructions.
- If you cannot reach your gas supplier, call the fire department.

— Installation and service must be performed by a qualified installer, service agency or the gas supplier.

APPROVALS

The burner and controls are listed by Underwriters' Laboratories Inc. Accordingly, the burner bears one of the UL labels indicating periodic inspection of the production of this equipment.

All ASME tanks are built to the standards of Section IV of the American Society of Mechanical Engineers code and are stamped with their symbol. The National Board of Boiler and Pressure Vessel Inspectors papers are furnished upon request. The NB number and HLW symbol (to the right) are on the plate located just below cleanout on tank. (May be viewed by removing cleanout cover on jacket).

IDENTIFICATION

The heater and burner rating plates or labels provide valuable information. When ordering parts or inquiring about a unit, be sure to include all information from the plates. See Figure 1 on page 2 for approximate location of the heater rating plate.

The heater rating plate model number, see fig. 2, includes a series number which identifies the construction of the heater.

A TYPICAL HEATER RATING PLATE
FIGURE 2

OIL BURNER NAMEPLATE DECAL

The oil burner's nameplate decal (see page 2 for the approximate location on the burner) contains a burner code 940 or 941 which should exactly match the model input appearing under the model number of the heater's rating plate.

If these codes do not match, the oil burner may not be the correct model for the heater model purchased, Contact your A.O. Smith dealer for further information and replacement, if required.

FIGURE 3

OIL BURNER SPECIFICATIONS

The oil burner nameplate decal includes a series code which identifies the major features of the oil burner. The series number is the last three digits of the burner code number.

Table 3 below describes the oil burner characteristics for each series number. The burners are to be used with fuel oil not heavier than No. 2.

TABLE 3 SOME NOTABLE OIL BURNER FEATURES

A.O. Smith Burner or Heater Series Number*	R.W. Becket Burner Model Number	Safety Timing+	Oil Pump Type Mode	Suntec Oil Pump	Nozzle Type	
					Spray Pattern	Spray Angle
940	AFG SF	15 Sec.	Single Stage	A2VA 7118 A2YA-7916	Type B Solid Cone	80°
941	AFG SF	15 Sec. 15 Sec.	Two-Stage	B2VA 8216 BY2A 8916	Type B Solid Cone	80°

* To provide the proper firing rate for each model heater, see SPECIFICATIONS: there are burner models for each heater model in table 2. The Burner and heater model numbers must match and the heater (or the burner) series number should indicate the features specified for the installation.

\+ All oil burners have "interrupted ignition" . . . meaning the ignition is on during the flame establishing period only. Ignition is off when the burner is off. Standard safety timing is 15 seconds.

The heater series number determines the type of oil pump supplied with the oil burner. For installations where gravity feed of fuel oil from the storage tank to the heater is practical, an oil burner with a single-stage oil pump can be used. The 940 series of burners have single-stage pumps which are shipped for installation of a supply line to the tank only. A return line back to the storage tank can be installed, if required, by making a small modification to the pump, see the oil burner installation manual.

For installations where gravity feed cannot be employed, (the storage tank is located significantly below, or remote from, the heater) an oil burner with a two-stage oil pump should be used. The 941 series of burners have two-stage pumps which are shipped for installation of a supply and return line to the tank. However, in situations where the return line is not required (low lift installations), the pump may be modified to operate without the line, see the oil burner installation manual.

IMPORTANT

The oil-fired water heater shipment consists of two packages, heater and oil burner. Check to be certain the model number on the heater and oil burner packages match. To assure matching equipment, see preceding information.

TABLE 3A

Model Heater		COF 199	COF 245	COF 315/315A	COF 385/385A	COF 455/455A	COF 700/700/A
Min. Firing Rate In GPH	A.O. Smith Burner	1.42	1.75	2.25	2.75	3.25	5.0
	Non A.O. Smith Burner	1.1	1.5	2.0	2.5	3.0	4.5

SAFETY

DANGER

BE SURE TO TURN OFF POWER WHEN WORKING ON OR NEAR THE ELECTRICAL SYSTEM OF THE HEATER. NEVER TOUCH ELECTRICAL COMPONENTS WITH WET HANDS OR WHEN STANDING IN WATER. WHEN REPLACING FUSES ALWAYS USE THE CORRECT SIZE FOR CIRCUIT.

If it is necessary to reset the safety control, depress red button one time only. If burner does not operate after depressing red button one time, call serviceman.

INSTALLATION

REQUIRED ABILITY

INSTALLATION OF SERVICE OF THIS WATER HEATER REQUIRES ABILITY EQUIVALENT TO THAT OF A LICENSED TRADESMAN IN THE FIELD INVOLVED. PLUMBING, AIR SUPPLY, VENTING , OIL BURNER AND ELECTRICAL WORK REQUIRED.

GENERAL

The installer should be guided by these instructions, local codes and the following publications.

- Standard for the Installation of Oil Burning Equipment, NFPA Standard No. 31, Available from National Fire Protection Association, Batterymarch Park, MA 02269.
- Code for the Installation of Heat Producing Appliances, Available from American Insurance Association, 85 John Street, New York, NY 10038.
- The National Electrical Code, NFPA No. 70. Availability same as NFPA Standard No. 31.
- In Canada - CAN/CSA-B139 Installation Code for Oil Burning Equipment.

When other than an A.O. Smith burner is used, this instruction manual can be used as a general guide. The burner manufacturer's instructions will have to be consulted on specific questions of wiring, air adjustment, etc.

Do not test the burner or control system before the heater is filled with water. Follow the START-UP procedure in this manual.

UNCRATING

Uncrate the heater by removing the outside mat and top locator. The shipping pallet must be removed from the unit. It may be possible to simply unbolt the base from the pallet and, with the help of two or more persons, work the unit off the pallet. Some units will be too heavy and will require the use of jacks or lifting equipment. Safely remove the pallet and move the unit into position. Be Careful When Moving This Heater. It will tip over easily.

LEVELLING

Install the heater plumb to the ground. If it is necessary to adjust the heater, use metal shims under the channel type skid base.

LOCATION

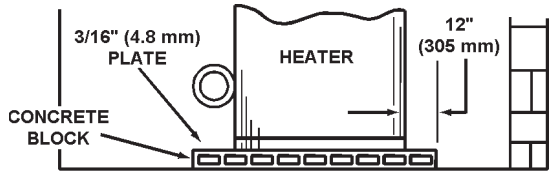
The water heater should not be installed where the combustion air is contaminated, see COMBUSTION AND VENTILATING AIR. Temperature in the location must be above 32°F (0°C) and free of combustible dusts and flammable gases or vapors.

For the best installations, the water heater should be located:

1. On a level surface.
   - Shim the channel type skid base as necessary If leveling is required.
2. Near a floor drain.
   - The heater should be located in an area where leakage of the tank or connections will not result in damage to the area adjacent to the heater or to lower floors of the structure.
   - When such locations cannot be avoided, a suitable drain pan should be installed under the heater.
   - The pan should be at least two inches deep, have a minimum length and width of at least two inches greater than the diameter of the heater and should be piped to an adequate drain. The pan must not restrict combustion air flow.

- The discharge opening of the relief valve should always be piped to an open drain.
- Choose the point of major hot water usage, fuel supply and chimney.
- Try to make hot water and oil piping as short as possible.
- Insulate hot and cold water piping where heat loss and condensation may be a problem.

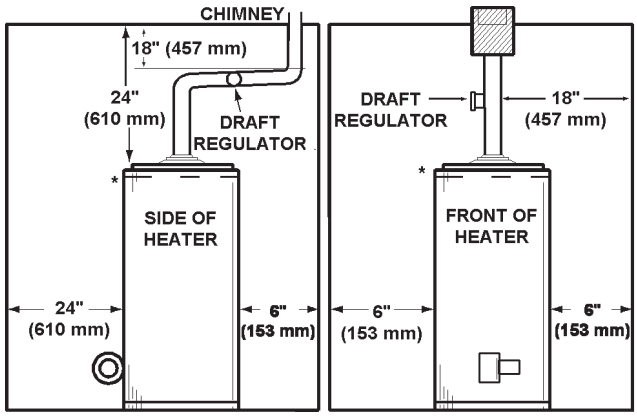
CLEARANCES



The heater has minimum clearances to combustible material, on a non-combustible floor of: 6 inches (152 mm) from the sides and rear, 24 inches (610 mm) from the front, and 18 inches (457 mm) from the vent connector. These clearances are, as shown in fig. 4A to prevent possible fire hazard conditions.

At least 24" (610 mm) of top clearances are recommended for vertical vent installation.

Allow sufficient room at rear of heater for servicing of T&P relief valve.



At least 24" (610 mm) should be provided at front of the unit for proper servicing.

Units which are to be installed on combustible flooring must be supported by a full layer of hollow concrete blocks, fig. 4, from 8" (203 mm) to 12" (305 mm) thick and extending 12" (305 mm) minimum beyond the heater in all directions. The concrete blocks must provide an unbroken concrete surface under the heater, with the hollows running continuous and horizontally. A 3/16" (4.8 mm) steel plate must cover the concrete blocks. See Figure 4.

PROPER INSTALLATION ON COMBUSTIBLE FLOORING
FIGURE 4

NOTE: If electrical conduits run under the floor of the proposed heater location, insulate the floor as recommended above.

PROPER INSTALLATION CLEARANCES FOR TWO DIFFERENT VENTING SYSTEMS
FIGURE 4A

*** HOT WATER OUTLET LOCATION AT FRONT OF HEATER**
- **FACTORY FURNISHED HEATER MANIFOLD KITS (OPTIONAL) ARE DESIGNED FOR 10" (254 mm) SPACING BETWEEN SIDES OF ADJACENT UNITS.**

COMBUSTION AND VENTILATION AIR

GENERAL

The water heater area should have sufficient air for satisfactory combustion of oil, and proper venting and of safe ambient temperature.

When a heater is installed in an area where exhaust or ventilating fans may create unsatisfactory combustion or venting, approved provisions must be made to overcome the problem, see NFPA Standard No. 31, Chapter 1.

CHEMICAL VAPOR CORROSION

Water heater corrosion and component failure can be caused by the heating and breakdown of air borne chemical vapors. Spray can propellants, cleaning solvents, refrigerator and air conditioning refrigerants, swimming pool chemicals, calcium and sodium chlorides, waxes, and process chemicals are typical compounds which are potentially corrosive. These materials are corrosive at very low concentration levels with little or no odor to reveal their presence.

Products of this sort should not be stored near the heater. Also, air which is brought in contact with the water heater should not contain any of these chemicals. If necessary, uncontaminated air should be obtained from remote or outside sources.

UNCONFINED SPACES (Building Construction)

NOTE: An uncontaminated space is defined as a space whose volume is not less than 50 ft^3 per 1000 BTUH (4.83m^3 per kW)of total input of all fuel burning appliances installed in that space. The unconfined space may be thought of as extending to all areas which cannot be separated by a door or door(s). All other spaces not fitting this description, should be thought of as confined space.

1. In unconfined spaces in buildings of conventional frame, brick or stone construction, infiltration will normally supply an adequate amount of air for combustion and ventilation.
2. If the unconfined space is within a building of tight construction, eg. weather stripping, heavy insulation, caulking, vapor barrier, ect., air infiltration may be insufficient to support proper combustion and ventilation, air shall be obtained from outdoors or from spaces freely communicating with the outdoors.

   - Follow the instructions under Part 2 of Confined Spaces (Room Construction)

CONFINED SPACES (Room Construction)

1. All air from inside building (conventionally constructed buildings only): The confined space shall be provided with two permanent openings, one within 12" (305 mm) of the ceiling and one within 12" (305 mm) of the floor, fig. 5.

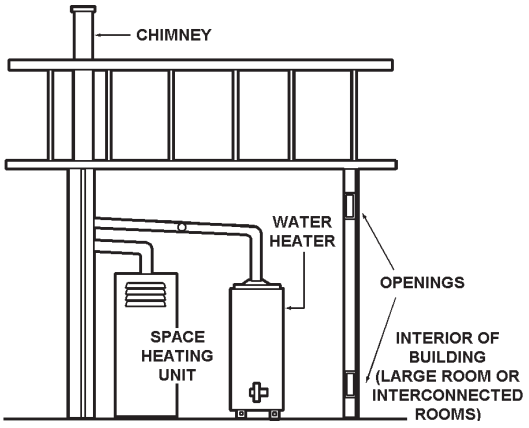


FIGURE 5

   - Each opening shall have a free area of not less than one square inch per 1,000 Btu per hour (140 square inches per gallon of oil consumed per hour) of the total input rating of all appliances in the enclosure, freely communicating with the interior areas having in turn adequate infiltration from the outside. In all cases, each opening shall not have a free area of less than 100 square inches.

2. All Air From Outdoors: The confined space shall be provided with two permanent openings, one in or within 12" of the top of the enclosure and one in or within 12" of the bottom. The openings shall communicate directly, or by means of ducts, with outdoors or such spaces that freely communicate with outdoors.

   - If the appliance room is located against an outside wall and the air openings communicate directly with the outdoors, each opening shall have a free area of not less than one square inch per 4,000 Btu per hour (35 square inches per gallon of oil consumed per hour) of the total input rating of all appliances in the enclosure.

- When communicating with outdoors by means of vertical ducts, each opening shall have a free area of not less than one square inch per 4,000 Btu per hour (551 mm²/kW) (35 square inches per gallon of oil consumed per hour) of total input rating of all appliances in the enclosure.

- If horizontal ducts are used, each opening shall have a free area of not less than one square inch per 2,000 Btu per hour (1,101 mm²/kW) (70 square inches per gallon of oil consumed per hour) of total input of all appliances in the enclosure, fig. 6.

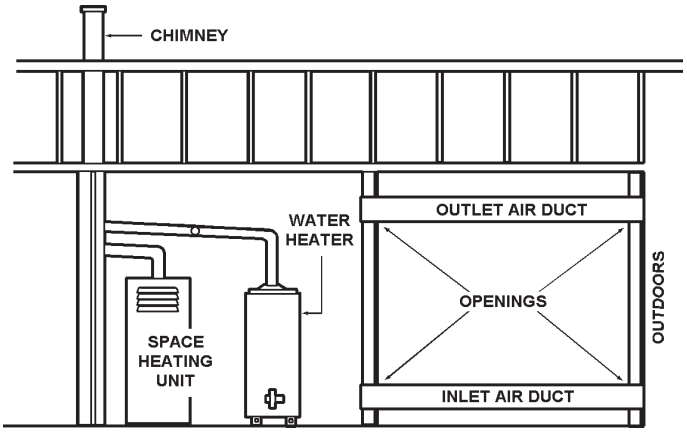

FIGURE 6

FLUE GAS VENTING

In the absence of any local codes, regulations, or vent pipe or chimney manufacturer's recommendations, for oil fired equipment, follow the suggestions below for designing and installing a venting system.

For these water heaters, it is recommended that an adequate chimney be used for venting the flue gases. Type B, double wall, vent pipe should be used as the vent connector pipe. However, where no chimney is available, vent pipe may be used to construct a vent.

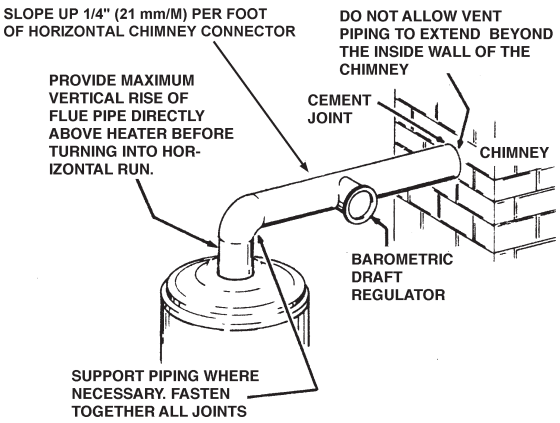
Where an existing chimney or vent is to be used, be sure that the chimney or vent has adequate capacity for the number and sizes of appliances being vented through it. Inspect the chimney or vent and remove all soot or other obstructions which will retard free draft.

VENT CONNECTOR AND DRAFT REGULATOR

The chimney or vent connector diameter should be the same size as the heater flue outlet, see Table 4. A minimum rise of 1/4" per foot (21 mm/M) of horizontal connector length must be maintained between the heater and chimney opening, fig. 7. The connector length should be kept as short as possible.

TABLE 4 SUGGESTED VENT CONNECTOR SIZES

Model Number	Outlet Diameter	
	Inches	(mm)
COF-199*	6	152.4
COF-245	8	203.2
COF-315/315A	8	203.2
COF-385/385A	8	203.2
COF-455/455A	8	203.2
COF-700/700A	10	254



* These models are factory supplied with a flue reducer which should be installed on the top cover.

In venting systems where a continuous or intermittent back (positive) draft is found to exist, the cause must be determined and corrected. In some cases, a special vent cap may be required.

If the back draft cannot be corrected by normal methods or if a suitable draft cannot be obtained, additional make up air must be provided to the room to assure proper venting and combustion.

Note: A negative draft must be maintained in the vent piping.

The barometric draft regulator must be installed in the same room as the heater, fig. 6. Locate the regulator as close as possible to the heater and at least 18" (452 mm) from a combustible ceiling or wall. A manually operated damper should not be placed in the chimney connector.

PROPER VENT CONNECTOR INSTALLATION

FIGURE 7

CHIMNEY

The oil-fired water heater must be connected to a chimney built in accordance with accepted building code practice or listed factory built type, Table 5. The exit point of the chimney flue gas must be at least 3' (0.91M) above the highest point where it passes through the roof of a building. Also, it must be at least 2' (0.61M) higher than any portion of a building within 10' (3.05 M) of the chimney.

TABLE 5 - USUAL CHIMNEY SIZES FOR UNITS

Model Number	Oil Firing Rate		Equivalent Heat Input Rate		Output Heat Rate		Square & Rectangle Stack Dimension		Round Stack Diameter		Minimum Height	
	(GPH)	(LPH)	Btuh	kW	Btuh	kW	Inches	mm	Inches	mm	Feet	Metres
COF-199	1.42	5.38	199,000	58	159,200	47	8 1/2 X 8 1/2	216 x 216	9	228.6	20	6.1
COF-245	1.75	6.62	245,000	72	196,000	57	8 1/2 X 8 1/2	216 x 216	9	228.6	20	6.1
COF-315/315A	2.25	8.52	315,000	92	252,000	74	8 1/2 X 13	216 x 330	10	254	30	9.1
COF-385/385A	2.75	10.41	385,000	113	308,000	90	8 1/2 X 13	216 x 330	10	254	30	9.1

MULTIPLE HEATER FLUES

When two or more oil-fired water heaters are connected to a single chimney or vent there shall be sufficient draft available for safe combustion and removal of combustion products to the outdoors from each heater. Refer to local codes for connection details.

Only one oil-fired water heater should be connected to any one type L venting system.

A draft regulator shall be provided for each oil-fired water heater in a multiple heater system.

DANGER

INCORRECT INSTALLATION CAN CAUSE IMPROPER OPERATION, FIRE, ASPHYXIATION, SERIOUS PERSONAL INJURY OR DEATH. NEVER OPERATE THIS WATER HEATER UNLESS IT IS PROPERLY VENTED TO THE OUTDOORS AND HAS ADEQUATE COMBUSTION AIR SUPPLY.

WATER PIPING

GENERAL

Select the piping diagram for the type of system to be installed from pages 15 through 19. When a circulation pump is used in the system a plug cock should be installed where indicated to regulate water flow through the heater.

RELIEF VALVE

An CSA design-certified and A.S.M.E.-rated temperature and pressure relief valve is installed in the water heater . The relief valve has a discharge capacity exceeding the maximum heater input rating and a pressure rating not exceeding the working pressure shown on the rating plate of the heater.

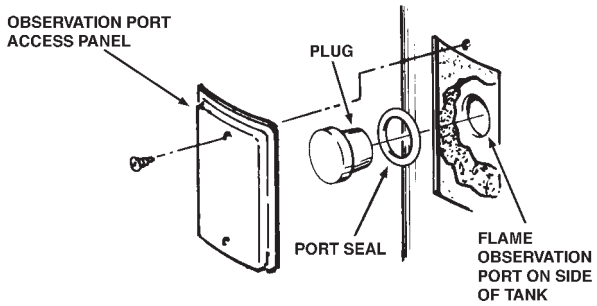
A temperature and pressure relief valve must also be installed on any potable water storage tank. This relief valve should have a temperature rating of 210° F (98.8°C), a pressure rating not exceeding the lowest rated working pressure of any system component, and a discharge capacity exceeding the total input of the water heaters supplying water to the storage tank.

THE PURPOSE OF A RELIEF VALVE IS TO AVOID EXCESSIVE PRESSURE OR TEMPERATURE INTO THE STEAM RANGE, WHICH MAY CAUSE SCALDING AT FIXTURES, TANK EXPLOSION, SYSTEM OR HEATER DAMAGE.

To avoid scalding or water damage, a drain line must be connected to a relief valve to direct discharge to a safe location, A DRAIN LINE MUST NOT BE REDUCED FROM THE SIZE OF THE VALVE OUTLET AND IT MUST NOT CONTAIN ANY VALVES BETWEEN THE HEATER AND THE RELIEF VALVE OR THE RELIEF VALVE AND THE DRAIN LINE EXIT. IN ADDITION, THERE SHOULD NOT BE ANY RESTRICTIONS IN A DRAIN LINE NOR SHOULD IT BE ROUTED THROUGH AREAS WHERE FREEZING CONDITIONS MIGHT OCCUR. DO NOT THREAD OR CAP THE DRAIN LINE EXIT. RESTRICTING OR BLOCKING A DRAIN LINE WILL DEFEAT THE PURPOSE OF THE RELIEF VALVE AND MAY CREATE AN UNSAFE CONDITION. Install a drain line with a downward slope such that it naturally drains itself.

Your local code authority may have other specific relief valve requirements.

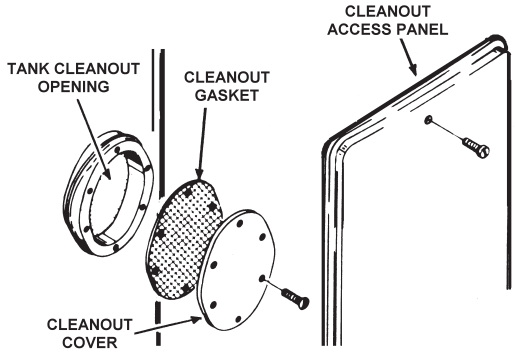
NOTE: These heaters are equipped with an automatic burner shutoff system actuated by high water temperature.



CLOSED WATER SYSTEM

A closed system will exist if a back-flow preventer (check valve), pressure reducing valve, or other similar device is installed in the cold water line between the water heater and the street main (or well). Excessive pressure may develop due to the thermal expansion of heated water causing premature tank failure or intermittent relief valve operation. This type of failure is not covered by the limited warranty. An expansion tank may be necessary in the cold water supply to alleviate this situation, see installation diagrams on pages 15-19. Contact the local plumbing authority.

DRAIN VALVE AND ACCESS PANELS



The heaters are equipped with a 3/4" NPT drain valve mounted above and to the left of the oil burner, see FEATURES, page 2.

An access panel is located above and to the left of the oil burner and covers the flame observation port, fig. 8. A plug is inserted into the flame observation port and must be removed in order to look into the combustion chamber. Always reinstall plug before replacing access panel.

COMBUSTION CHAMBER ACCESS PORT - FIGURE 8

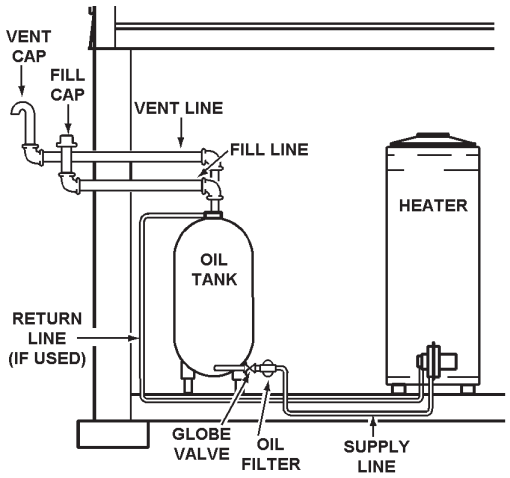
Another access panel is located above and to the right of the oil burner, fig. 9. This panel covers the cleanout opening in the tank which is sealed by a gasket and cover.

TANK CLEANOUT PORT - FIGURE 9

Models having ASME tank construction will have two cleanout ports. One port will be located as indicated above and the other will be located directly opposite.

Occasionally, some water seepage will occur at a cleanout port. To correct this situation, slightly tighten the cleanout cover bolts until the seepage is eliminated. Do not over tighten the bolts or the cleanout gasket will be damaged. Tighten each bolt gradually and alternate between opposed bolts on the cleanout cover.

FUEL SYSTEMS



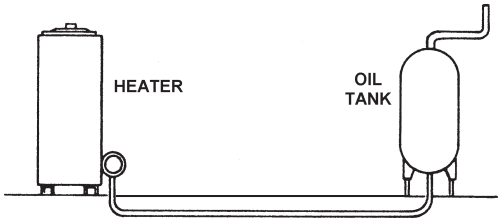
GENERAL

The Standard for the Installation of Oil Burning Equipment-NFPA No. 31, local codes, and these instructions must be followed when installing the tank, piping and burner. In addition, an oil pump installation sheet and oil burner certificate are packed with the burner for use and completion by the installer.

On fuel systems with high pressures, a Webster "OSV" oil safety valve (Webster Electric CO., Racine, Wisc.) will be required to reduce the oil pressure at the burner pump. See FUEL PUMP, page 9, for pressure ratings of the burner's pump.

This manual and the completed oil burner certificate (CS75) are to be left with the user for future reference.

Figure 10 shows a typical single stage one or two line fuel system. When two or more tanks are connected to one burner, the supply line from each tank should run to a header fitted with an approved three-way valve. Normally only one tank may be drawn at a time unless local codes permit simultaneous feeding of two tanks on gravity type installations.

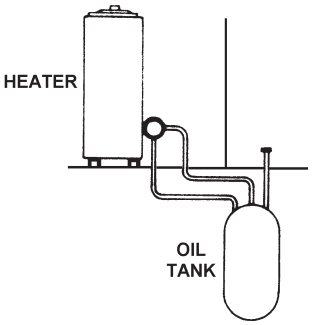


A TYPICAL HEATER INSTALLATION - FIGURE 10

Refer to pages 2, 3, and 4 in this manual for more information about burner series numbers and characteristics for adaptability to the following systems.

SYSTEM TYPES

Single Stage, Supply Line Only: The bottom of the oil storage tank must be above the level of the fuel unit, fig. 11. The fuel oil will flow by gravity to the burner. A single pipe is run between the tank and fuel unit. Burner Series No. 940 is from this type of service as shipped (the bypass plug is not installed).

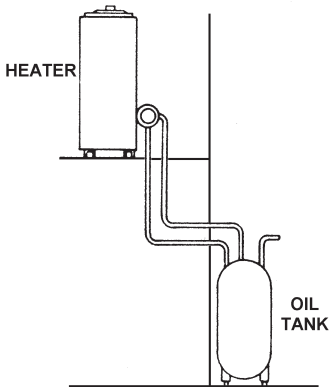


A GRAVITY FEED, SUPPLY LINE ONLY, INSTALLATION FIGURE 11

If the bottom of the oil tank is at least 2 inches (50.8 mm) higher than the plug opening at which the supply line connects to the fuel pump, a single-line gravity-feed system with 3/8" O.D. tubing may be used with a maximum run length of 100 feet.

- A two stage pump may be used on one line, gravity feed installations. The pump will function as a single stage unit when the by-pass plug is not installed.
- Single Stage, Supply and Return Lines. This type of system, fig. 12, is self-priming. Burner Series No. 940 with by-pass plug field installed, is for this type of service.

If the tank bottom is no lower than 10 feet below the plug, a single stage pump may be used but, it must be a two line system with maximum tubing runs (which includes lift) as shown in Table 6.



A SINGLE STAGE (LOW LIFT), SUPPLY AND RETURN LINE INSTALLATION - FIGURE 12

TABLE 6

Distance Tank Bottom Below Pump Plug Ft. (M)	Max. Run length Ft. (M) 3/8" O.D. Tubing	Max. Run length Ft. (M) 1/2" O.D. Tubing	Distance Tank Bottom Below Pump Plug Ft. (M)	Max. Run Length Ft. (M) 3/8" O.D. Tubing	Max. Run Length Ft. (M) 1/2" O.D. Tubing

2 (0.6)	55 (16.7)	100 (30.4)	7 (2.1)	31 (9.4)	100 (30.4)
3 (0.9)	50 (15.2)	100 (30.4)	8 (2.4)	26 (7.9)	100 (30.4)
4 (1.2)	45 (13.7)	100 (30.4)	9 (2.7)	21 (6.4)	83 (25.2)
5 (1.5)	40 (12.1)	100 (30.4)	10 (3.0)	16 (4.8)	64 (19.5)

Two Stage, Supply and Return Lines: This system, fig. 13, is required when long lines and high lifts (requiring up to 20" of vacuum and 10' vertical lift) are encountered. Burner Series No. 941 is used in this service. Bypass plug must be installed.

A TWO STAGE (HIGH LIFT), SUPPLY AND RETURN LINE INSTALLATION - FIGURE 13

If the tank(s) bottom is lower than the plug by more than 10 feet, a two stage pump with a two line system must be used with maximum tubing runs (which includes lift) as shown in Table 7.

TABLE 7

Distance Tank Bottom Below Pump Plug Ft. (M)	Max. Run length Ft. (M) 3/8" O.D. Tubing	Max. Run length Ft. (M) 1/2" O.D. Tubing	Distance Tank Bottom Below Pump Plug Ft. (M)	Max. Run Length Ft. (M) 3/8" O.D. Tubing	Max. Run Length Ft. (M) 1/2" O.D. Tubing

MULTIPLE HEATER FUEL LINES

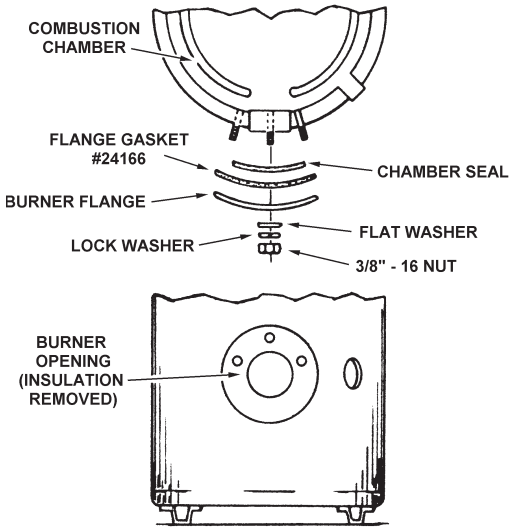
Where two or more heaters form a water heating system, each burner shall have an entirely separate oil supply line from the tank to the burner.

BURNER INSTALLATION

GENERAL

An oil Burner Certificate is packed with the oil burner. Following the burner manual installation the necessary tests shall be performed and results recorded on the certificate, see BURNER CERTIFICATE. The certificate and this instruction manual must be left with user for future reference.

Check to be certain the heater and burner model numbers are alike and the oil pump characteristics are proper for the job. See IDENTIFICATION, page 3.



BURNER

The burner assembly is mounted on the flange of the combustion chamber, fig. 14.

NOTE: Be certain combustion chamber opening is aligned with opening in heater flange, fig. 14, before placing burner into heater .

1. Place the flange gasket over the 3/8" x 1/4" long studs on the flange.

2. Place the burner flange on the studs and into the heater flange opening.

ASSEMBLY OF THE OIL BURNER TO THE HEATER FIGURE 14

3. Place the flat washers and lock washers over the studs and fasten the burner in place with the 3/8" - 16 nuts as shown.

Connect the oil line(s) and electrical wires to the burner as follows:

1. The oil pump manufacturer's instructions should be checked for connection and bleeding information.

- The burner is approved for use with fuel oil not heavier than No. 2.

2. An approved, separately fused circuit with disconnect switch should be available for the oil burner. Using Figure 15, the wiring diagram below as a guide:

    - Route the 120 volt incoming line in the dual bulb thermostat, mounted on the side of the heater.

    - Bring the factory wiring from the high limit /eco and thermostat into the oil burner junction box.

    - Install field and factory wiring as shown in the wiring diagrams, figs. 15. A schematic diagram is also shown for convenience when servicing.

    - Ground the heater in accordance with the NEC code to guard against electrical shock from the heater or water system.

3. All oil burners have "interrupted ignition". . . meaning the ignition is on during the flame establishing period only.

4. Do not "test fire" the heater to complete the oil burner certificate until the tank is filled with water, see the oil burner manual.

The certificate and this manual must be left with the user for future reference.

TABLE 8 - OIL PUMP & NOZZLE SPECIFICATIONS

Heater Model	Fitting Rate (GPH) State Burner	Fitting Rate (GPH) Non State Burner	Oil Burner Pump Non-Setting PSIG	Oil Burner Nozzle Type	Oil Burner Nozzle Rating (GPH)
COF-199	1.42	1.1	110	80ºB	1.35
COF-245	1.75	1.5	100	80ºB	1.75
COF-315/315A	2.25	2.0	100	80ºB	2.25
COF-385/385A	2.75	2.5	100	80ºB	2.75
COF-455/455A	3.25	3.0	100	80ºB	3.25
COF-700/700A	5.00	4.5	100	80ºB	5.00

FUEL PUMP

GENERAL

All heaters are shipped with the pump pressure set at 100 psig except the COF-199 which is set at 110 psig.

All oil pumps are fitted for installation on single fuel line systems. The pump may be adapted for two line service by using the by-pass Plug and pump manufacturer's instructions packed with the burner.

The single-stage pumps are for single-pipe or two-pipe installations, either lift or gravity feed. On gravity feed installations the inlet pressure is not to exceed 3 psig. On one pipe lift installations the lift is not to exceed 8 ft.

The two-stage pumps are for two-pipe lift installations where the inlet vacuum does not exceed 20" hg. vacuum.

AIR BLEED PROCEDURE (Refer to oil burner manual).

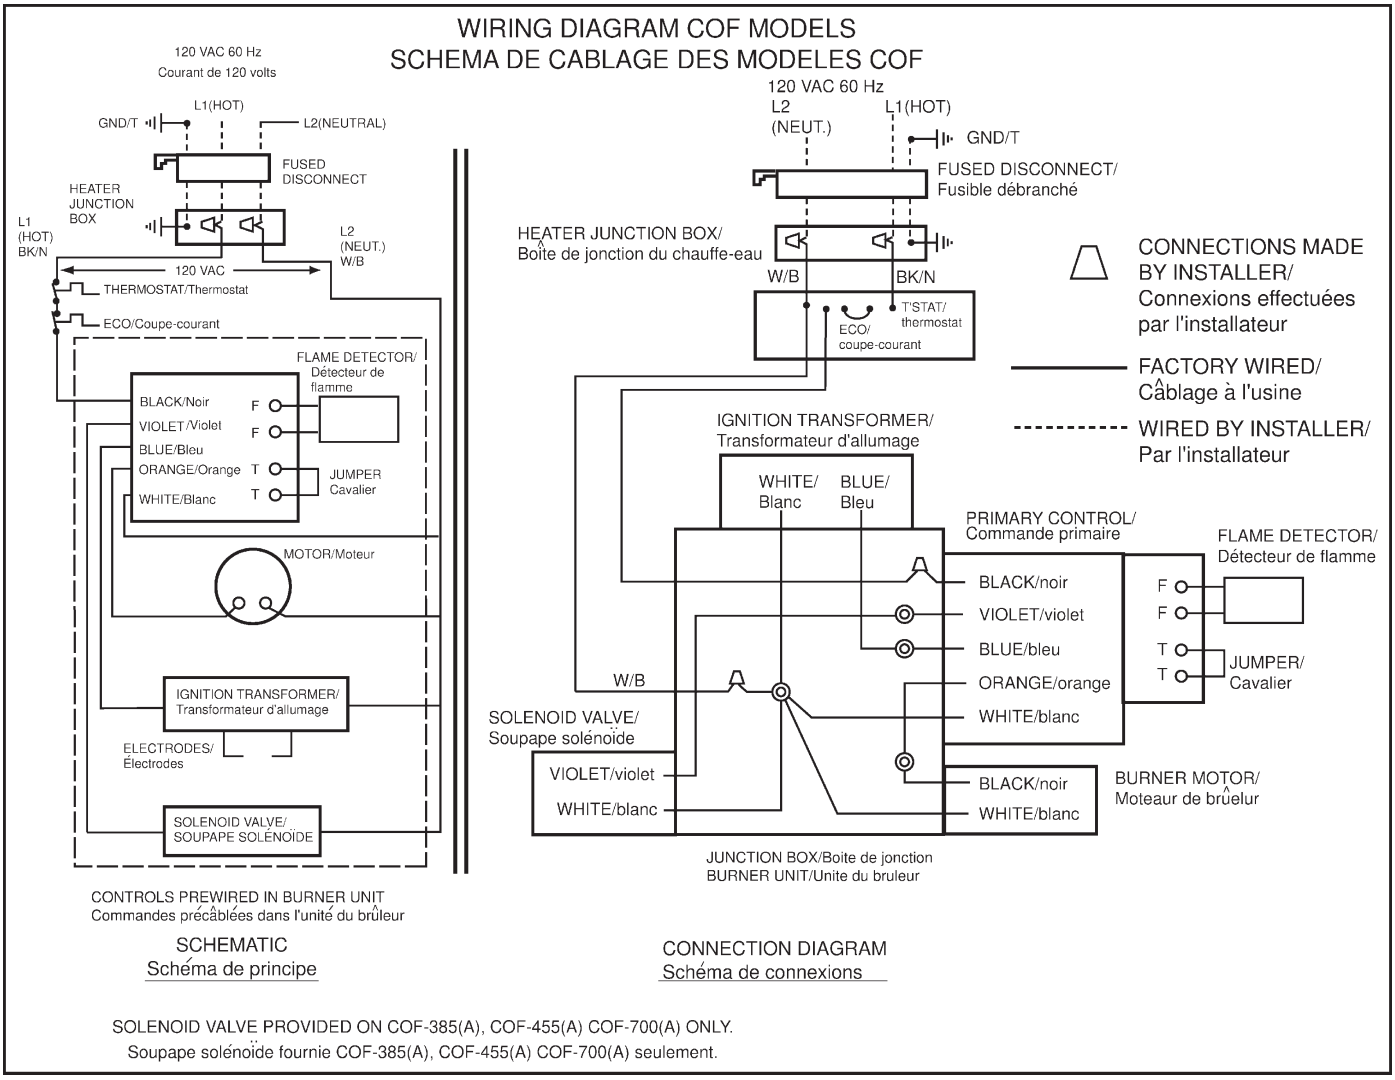


FIGURE 15

OPERATION

GENERAL

Never operate the heater unless the tank is filled with water and a temperature and pressure relief valve is installed.

FILLING

1. Oil burner electrical disconnect switch should be in the "OFF" position
2. Close the heater drain valve.
3. Open a nearby hot water faucet to allow the air in the system to escape.
4. Fully open the cold water inlet valve, filling the heater and piping.
5. Close the hot water faucet as water starts to flow from the opening, Leave the cold water inlet valve fully open. The heater is now ready to start-up if being placed in operation for the first time.

START-UP

Factory Start-Up is required for activating warranty and assuring maximum operating performance. Contact your local sales representative or Authorized Start-Up Agent to arrange a FREE Certified Start-Up.

The following checks should be made by the installer when the heater is placed into operation for the first time:

1. Check all factory and field made water, oil and electrical connections for tightness. Also check flue gas disposal provisions on top the heater.
   - Repair any water and oil leaks. Tighten electrical and flue connections as necessary.
2. Where the water heater or water heating systems includes a circulating pump, it may need to be lubricated before operated. The tube of lubricant supplied with the pump includes directions for use.
   - Field installed circulating pumps should be all bronze construction.

Be sure the oil burner, related piping, valves and controls are in place, adjusted and ready for operation before turning on the electricity.

3. Adjust the heater mounted control as follows:
   - THERMOSTAT (adjustable) set for desired water temperature.
   - It is suggested the thermostat be turned to the lowest setting which satisfies the hot water requirements of the system. This helps minimize scale formation in the heater.
   - HIGH LIMIT (not adjustable, manual reset) factory set to cutout at 195° F (90.5°C).
   - If the high limit is actuated, the safety primary control will cause the oil burner to shut down. See SAFETY PRIMARY CONTROL, page 22.
   - To reset the safety primary control, depress and hold the red button on the control for 30 seconds until the LED flashes twice.
   - Depress red button one time only. If burner does not operate after depressing red button one time, call service man.
4. Turn on the oil burner electrical disconnect switch.
5. The heater will begin normal operation on the thermostat's "call for heat".

6. To turn the heater off, open the electrical disconnect switch. If the heater is to remain inoperative for a long period of time, close the shutoff valve on the oil supply line.

WATER TEMPERATURE CONTROL

DANGER

THIS WATER HEATER IS EQUIPPED WITH AN ADJUSTABLE THERMOSTAT TO CONTROL WATER TEMPERATURE. HOT WATER TEMPERATURES REQUIRED FOR AUTOMATIC DISHWASHER AND LAUNDRY USE CAN CAUSE SCALD BURNS RESULTING IN SERIOUS PERSONAL INJURY AND OR DEATH. THE TEMPERATURE AT WHICH INJURY OCCURS VARIES WITH THE PERSONS AGE AND TIME OF EXPOSURE. THE SLOWER RESPONSE TIME OF CHILDREN, AGED OR DISABLED PERSONS INCREASES THE HAZARDS TO THEM. NEVER ALLOW SMALL CHILDREN TO USE A HOT WATER TAP, OR TO DRAW THEIR OWN BATH WATER. NEVER LEAVE A CHILD OR DISABLED PERSON UNATTENDED IN A BATHTUB OR SHOWER.

THE WATER HEATER SHOULD BE LOCATED IN AN AREA WHERE THE GENERAL PUBLIC DOES NOT HAVE ACCESS TO SET TEMPERATURES.

SETTING THE WATER HEATER TEMPERATURE AT 120°F (48.9°C) WILL REDUCE THE RISK OF SCALDS. Some states require settings at specific lower temperatures.

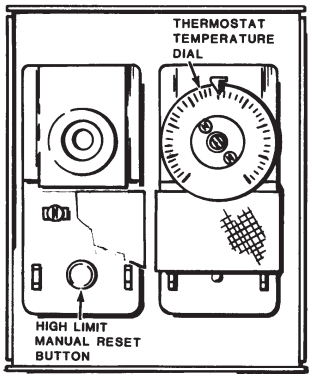
Figure 16 shows the approximate time-to-burn relationship for normal adult skin. Short repeated heating cycles caused by small hot water uses can cause temperatures at the point of use to exceed the thermostat setting by up to 20°F. If you experience this type of use, you should consider using lower temperature settings to reduce scald hazards.

Water Temperature °F	Time for 1st Degree Burns (Less Severe Burns)	Time for Permanent Burns 2nd & 3rd Degree (Most Severe Burns)
110	(normal shower temp.)	
116	(pain threshold)	
116	35 minutes	45 minutes
122	1 minute	5 minutes
131	5 seconds	25 seconds
140	2 seconds	5 seconds
149	1 second	2 seconds
154	instantaneous	1 seconds
(U.S. Government Memorandum, C.P.S.C., Peter L. Armstrong, Sept. 15, 1978)		

FIGURE 16

Valves for reducing point-of-use temperature by mixing cold and hot water are available. Also available are inexpensive devices that attach to faucets to limit hot water temperatures. Contact a licensed plumber or the local plumbing authority.

The water temperature is controlled by a thermostat, fig. 17, which has two sensing elements. One sensor is located near the top of the tank and the other is near the center. The thermostat is set in the lowest position before the heater leaves the factory.



The thermostat temperature dial, fig. 17, is accessible by taking off the access cover and removing the control cover. The dial is adjustable and may be set for 120° (48.9°C) to 180°F (82.2°C) water temperature, but 120°F (48.8°C) is the recommended starting point. It is suggested the dial be placed in the lowest setting which produces an acceptable hot water supply. This will always give the most energy efficient operation. The temperature control has a 4°F (2.2°C) fixed differential.

HIGH LIMIT SWITCH (E.C.O)

The dual bulb controller (fig.17) contains the high limit (energy cutoff) sensor. The high limit switch interrupts main burner gas flow should the water temperature reach 195°F (90.5°C).

In the event of high limit switch operation, the appliance cannot be restarted unless the water temperature is reduced by 20°F (11.1°C) (approx.) and the high limit reset button on front of limit control (fig.17) is depressed.

Continued manual resetting of high limit control, preceded by higher than usual water temperature is evidence of high limit switch operation. Contact your dealer or servicer if continued high limit switch operation occurs.

DUAL-BULB THERMOSTAT (COVER REMOVED)
FIGURE 17

BURNER CERTIFICATE (COMBUSTION TEST)

The Commercial Standard CS75 Oil Burner Certificate form must be filled in and posted in the vicinity of the water heater.

Instructions for filling in certificate are on the back of the certificate. This must be done by the installer at the time the heater is first operated. The certificate is in the oil burner manual.

SELF-CLEANING ELIMINATOR

These units include a self-cleaning eliminator installed in the front water inlet. See figure 18. The eliminator must be oriented correctly for proper function. There is a marked range on the pipe nipple portion of the eliminator, that must be aligned with the top of the inlet spud. A label above the jacket hole has an arrow that will point to the marked portion of the pipe nipple if the orientation is correct. If the arrow does not point within the marked range on the pipe nipple, adjust the pipe nipple to correct. A pipe union is supplied with the eliminator to reduce the probability of misaligning the eliminator accidentally while tightening the connection to the inlet water supply line. Improper orientation of the eliminator can cause poor performance of the heater and can significantly reduce outlet water temperatures during heavy draws.

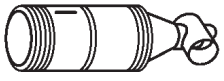


FIGURE 18

DRAINING

The water heater must be drained if it is to be shut down or exposed to freezing temperatures. Maintenance and service procedures may also require draining the heater.

1. Turn off the oil burner electrical disconnect switch.
   - If required by the reason for draining the heater, turn off the oil line supply valve.
2. Close the cold water inlet valve to heater.
3. Open a nearby hot water faucet to vent the system.
4. Open the heater drain valve.
5. If the heater is being drained for an extended shutdown, it is suggested the drain valve be left open during this period.
   - Follow FILLING instructions when restarting hot water service.

MAINTENANCE

GENERAL

Water heater maintenance includes periodic tank flushing and cleaning, and removal of lime scale. The oil burner should be inspected and adjusted to maintain proper combustion. Where used, the water heating system circulating pump should be oiled (See table 9).

The depth of lime buildup should be measured periodically. Heaters will have about 2" (50.8 mm) of lime buildup when the level of lime has reached the bottom of the cleanout opening or about 1" of lime buildup if it has reached the drain valve opening. A schedule for deliming should be setup, based on the amount of time it would take for a 1" (25.4 mm) buildup of lime.

Example 1: Initial inspection shows 1/2" (12.7 mm) of lime accumulation. Therefore, the heater can be delimed once a year.

Example 2: Initial inspection shows 2" (50.8 mm) of lime accumulation. Therefore, the heater should be delimed every 3 months.

Following are the instructions for performing some of the recommended maintenance. Oil burner inspection and adjustment should be performed by a competent technician.

TABLE 9 SUGGESTED MAINTENANCE SCHEDULE

Relief Valve	Lift Lever	Semi-Annually	
Tank	Flushing	Monthly	
	Sediment Removal	Semi-Annually	
	Anode Inspection	Semi Annually	
	Lime Scale Removal	As Required	UN•LIME® Delimer
Circulating Pump	Oiling	Four Months	SAE No. 20 non-detergent motor oil
Oil Burner	Inspection and Adjustment	Semi-Annually	Combustion test kit & test specifications (Page 26)
	Nozzle Replacement	Semi-Annually	New Nozzle
Flue Baffle Pipe	Cleaning	Annually	Wire Brush
Venting System	Inspected	Semi-Annually	

* Replacement gasket, A.O. Smith Part No. 99038

RELIEF VALVES

At least twice a year, the system relief valves should be checked to ensure that they are in operating condition. To check a relief valve, lift the lever at the end of the valve several times. The valve should seat properly and operate freely.

If water does not flow, remove the valve and inspect for obstructions or corrosion. Replace with a new valve of the recommended size as necessary. Inspection of the valve should be performed at least every three years. Do not attempt to repair the valve, as this could result in improper operating and a tank explosion. In areas with poor water conditions, it may be necessary to inspect the T&P valve more often than twice a year.

DANGER

BEFORE MANUALLY OPERATING A RELIEF VALVE, MAKE SURE THAT DRAIN LINE HAS BEEN ATTACHED TO THE VALVE TO DIRECT THE DISCHARGE TO AN OPEN DRAIN. FAILURE TO TAKE THIS PRECAUTION COULD MEAN CONTACT WITH EXTREMELY HOT WATER PASSING OUT OF THE VALVE DURING THIS CHECK OPERATION.

If the temperature and pressure relief valve on the heater discharges periodically or continuously, it may be due to thermal expansion of water in a closed water supply system, or it may be due to a faulty relief valve.

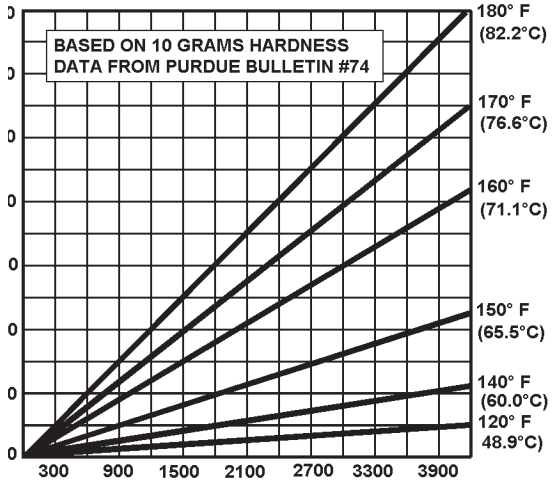
Thermal expansion is the normal response of water when it is heated. In a closed system, thermal expansion will cause the system pressure to build until the relief valve actuation pressure is equaled. Then, the relief valve will open, allowing water to escape, slightly lowering the pressure.

Your water supplier or local plumbing inspector will know how to best correct this situation. Two common corrections are listed in the Checklist and Service Information which appears later in this manual.

ABOVE ALL, DO NOT PLUG THE TEMPERATURE AND PRESSURE RELIEF VALVE. THIS IS NOT A SOLUTION AND CAN CREATE A HAZARDOUS SITUATION.

FLUSHING

1. Turn off the oil burner electrical disconnect switch.
2. Open the drain valve and allow water to flow until it runs clean.
3. Close the drain valve when finished flushing.
4. Turn on the oil burner electrical disconnect switch.



SEDIMENT REMOVAL

Water borne impurities consist of fine particles of soil and sand which settle out and form a layer of sediment on the bottom of the tank.

For convenience, sediment removal and lime scale removal should be performed at the same time.

LIME SCALE REMOVAL

The amount of calcium carbonate (Lime) released from water is in direct proportion to water temperature and usage, see chart. The higher the water temperature or water usage , the more lime deposits are dropped out of the water. This is the lime scale which forms in pipes, heaters and on cooking utensils.

WATER USAGE IN GALLONS PER DAY POUNDS OF LIME DEPOSITED VS. TEMPERATURE AND WATER USAGE

FIGURE 18A.

Lime accumulation not only reduces the life of the equipment but also reduces efficiency of the heater and increases fuel consumption.

The usage of water softening equipment greatly reduces the hardness of the water. However, this equipment does not always remove all of the hardness (lime). For this reason it is recommended that a regular schedule for deliming be maintained.

Sediment and lime scale removal may be accomplished through the cleanout opening furnished on the water heater, see FEATURES, page 2. The heater must be drained, see DRAINING, page 12, before removing cleanout cover on tank.

To dissolve and remove the more stubborn mineral deposits, A. O. Smith UN•LIME® Professional Delimer or equivalent should be used.

A. O. Smith UN•LIME® Delimer is an easy-to-handle patented food grade acid formulated specifically for lime scale removal from all types of water using equipment and is available in 1 gallon (Part No. 4763) and 5 gallon (Part No. 4813) sizes. Hydrochloric base acids are not recommended for use on glass-lined tanks.
UN•LIME® Professional Delimer:
Part No: 9005416105 4 - 1 Gallon (case)
Part No: 9005417105 1 - 5 Gallon

A. O. Smith Form No. 4800, entitles Why? When? & How? describes tank cleaning methods and materials. UN•LIME® and booklet may be obtained through your A.O. Smith dealer or distributor.

To clean heater through cleanout opening, proceed as follows:

1. Turn off water inlet valve, the oil burner electrical disconnect switch and open drain valve and allow all water to be drained from heater.

2. Remove outer cover plate from lower side of heater jacket.

3. Remove six (6) hex head screws securing tank cleanout plate and remove plate.

4. Remove lime, scale. or sediment using care not to damage the glass lining.

5. Inspect cleanout plate gasket. If new gasket is required, replace with A. O. Smith Kit (Part no. 9004099215).

6. Install cleanout plate. Be sure to draw plate up tight by tightening screws securely.

7. Close drain valve, open water inlet line and turn on the oil burner electrical disconnect switch.

8. Check for water leakage.

9. Replace outer jacket cover plate.

Flo-jug Method of Deliming

The Flo-Jug is the standard 5 gallon container for UN•LIME® -or- it is available as a deliming kit with UN•LIME®, hose and fittings. Contact your dealer, distributor or the A. O. Smith Corporation. Figure 18 illustrates most of the ollowing steps.

1. The heater should be prepared for deliming as described in the "Why? When and How" booklet. The relief valve may also be delimed at this time.

2. With the Flow-Jug upright:

   - Take off cap, remove cover under opening and install 3/4" x 4" brass pipe nipple.
   - Drill or punch a 3/16" vent hole in handle. A stainless steel screw is included with the Flo-Jug kit. This screw is to be installed in the vent hole when Flo-Jug is not in use.
   - Remove drain valve from heater and insert a 3/4" x 4" drain nipple.

   - Connect the clamp 1" I. D. x 3" hole to Flo-Jug and drain nipple.

3. Lift the Flo-Jug to the POUR POSITION and permit the UN•LIME® to flow into the heater as rapidly as possible.

   - Be sure to keep the vent just above the liquid level.

4. Place the Flow-Jug in the DELIME POSITION.

   - It may be necessary to place the empty jug on its carton to trap the solution in the heater.

   - Allow the UN•LIME® to attack the water scale for 5 minutes.

5. Lower the Flo-Jug to the DRAIN POSITION and allow the UN•LIME® to flow out of the heater as rapidly as possible.

   - Observe the vent hole and elevate the jug slightly if there is a possibility of spillage.

   - Deliming activity is indicated by foaming on the surface of the solution.

6. Continue the deliming process:

   - Raise jug to POUR POSITION. Allow solution to flood into heater.

   - Place jug to DELIME POSITION for 5 minutes. Solution is at work in heater.

   - Lower jug to DRAIN POSITION and allow solution to flow out. Observe foaming.

DELIMING THE COF WATER HEATER
FIGURE 18

7. After one hour, or earlier if the deliming activity (foaming) stops, inspect the tank interior.

   - Drain the UN•LIME® back into jug, DRAIN POSITION, and then stand jug in DELIME POSITION.

   - Remove clamp, hose and pipe nipple from heater drain opening.

   - Observe interior through opening - a small flashlight works well.

   - If the interior still shows water scale, the deliming process should be continued.

- To check UN•LIME® for continued use or reuse, place some lime scale or white chalk into a glass with a small amount of the solution. If the material is vigorously dissolved by the solution, the UN•LIME® can be reused. If not, then UN•LIME® has been weakened and should be replaced.

8. When deliming has been completed, the heater should be flushed for 3 to 5 minutes with fresh water.

   - Remove the deliming equipment, install the drain valve, open the cold water inlet line and allow water to flow through heater and out the drain valve. Don't forget to plug vent and cap opening in Flo-Jug.

9. When flushing is completed:

   - Fill heater being certain to expel air from tank through a nearby hot water faucet.

   - Replace relief valve, removed for deliming.

   - Restore oil, water and electrical supply to heater.

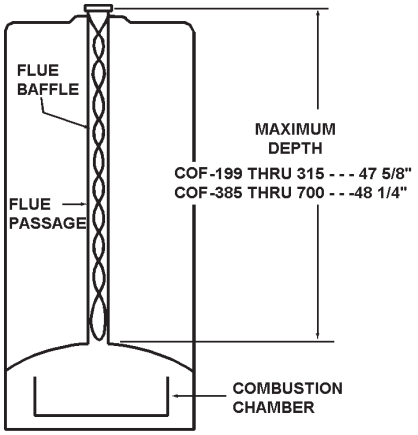
   - Check for water leakage.

10. Flo-Jug Cleanup.

    - Allow scale to separate from UN•LIME® and settle on bottom of Flo-Jug.

    - Pour off UN•LIME® into plastic container and check for reuse.
    - Rinse sediment from Flo-Jug.

    - If UN•LIME® is reusable , pour back into Flo-Jug. Be sure to plug vent and cap opening.



CIRCULATING PUMP

The water heater or water heating system may include a circulating pump. Where used, it may need to be lubricated once every four months with SAE No. 20 non-detergent motor oil or as directed by the manufacturer.

- Place 2 or 3 teaspoons in the bearing oil cup and 10 to 12 drops in the motor oil cups. Lubricate as required by manufacturer.

SOOT REMOVAL

Soot must be removed semi-annually from the heater and flow passages to insure efficient operation of the heater.

A TYPICAL HEATER FLUEWAY AND FLUE BAFFLE
FIGURE 19

1. Remove chimney connector and top cover of heater from heater. Clean out all soot deposits from connector and chimney opening. A wire brush is recommended for this operation.

2. Remove flue baffles by lifting from tank.

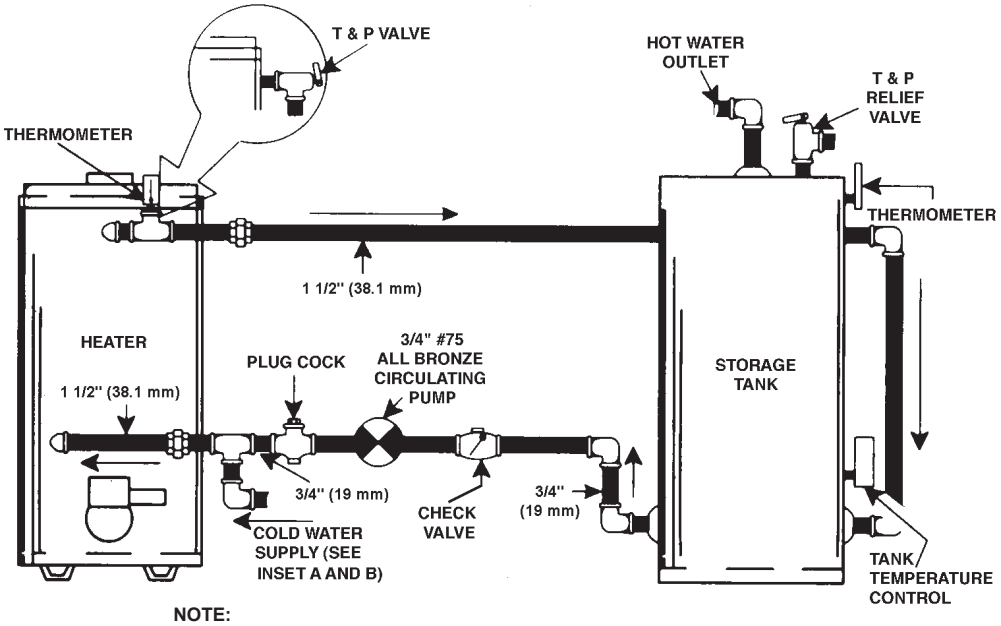
3. Using a wire brush, remove soot from flue passages in heater tank.

CAUTION: While cleaning tank flue passages, care must be taken that brush does not come in contact with the top of the combustion chamber as damage could occur to the combustion chamber lining. Do not allow the brush to enter the heater flue more than noted in fig. 19.

4. Remove oil burner assembly and using a vacuum cleaner, remove all loose soot from combustion chamber area. Avoid contact with combustion chamber as it can be damaged quite easily.

   - If flange gasket is damaged, replace with A. O. Smith Part No. 24165

5. Upon completion of cleaning, reassemble the heater. (It may be necessary to apply new sealer tape to the top cover to ensure proper venting. New sealer tape can be ordered from A. O. Smith Water Products Company).



6. Return the heater to operation by following the start-up instructions on page 11.

VENT SYSTEM

Examine the vent system every six months for obstructions and/or deterioration of vent piping. Remove any soot or obstructions and replace damaged vent piping.

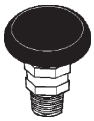
INSTALLATION DIAGRAMS

ONE TEMPERATURE - ONE HEATER VERTICAL STORAGE TANK FORCED CIRCULATION WITH OR WITHOUT BUILDING RECIRCULATION

NOTE:
WHEN USING A A.O. Smith T-140,200,350,OR 400 STORAGE TANK, USE LOWER 3/4" OPENING FOR TANK TEMP.CONTROL

SCALD PREVENTION

HOT WATER CAN SCALD IF USED CARELESSLY OR IN UNANTICIPATED MANNER.



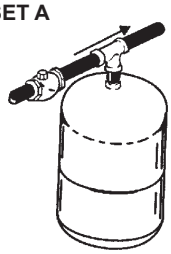
CAUTION

IF BUILDING COLD WATER SUPPLY HAS A BACK FLOW PREVENTER, CHECK VALVE OR WATER METER WITH CHECK VALVE, PROVISIONS FOR THERMAL EXPANSION OF WATER IN THE HOT WATER SYSTEM MUST BE PROVIDED.

NOTE: CONNECT RETURN LINE FROM HOT WATER CIRCULATING LOOP (IF USED) TO COLD WATER INLET LINE.

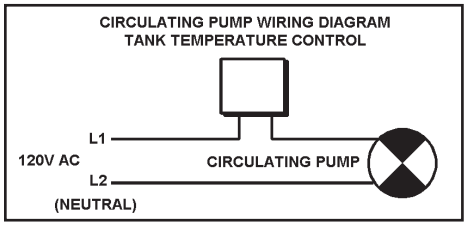
ONE TEMPERATURE - ONE HEATER HORIZONTAL STORAGE TANK FORCED CIRCULATION WITH OR WITHOUT BUILDING RECIRCULATION

INSET B



VACUUM RELIEF VALVE INSTALL PER LOCAL CODES.

* PIPE TO OPEN DRAIN

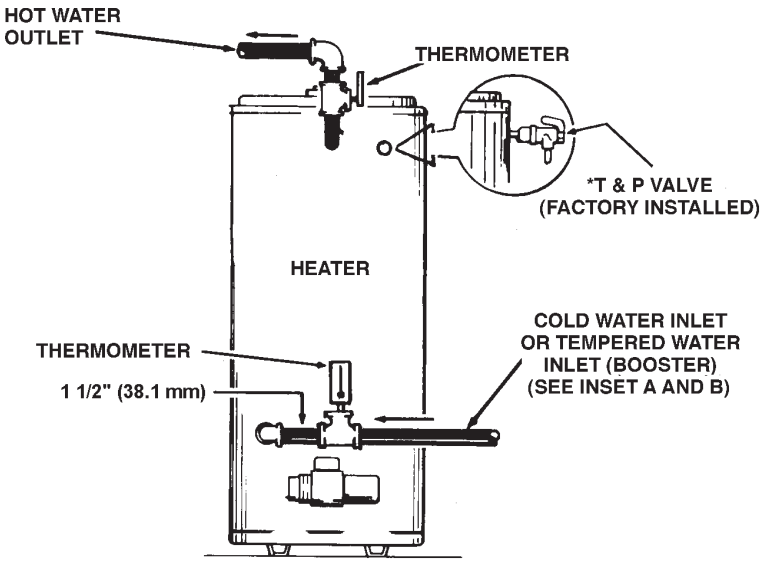


DANGER:

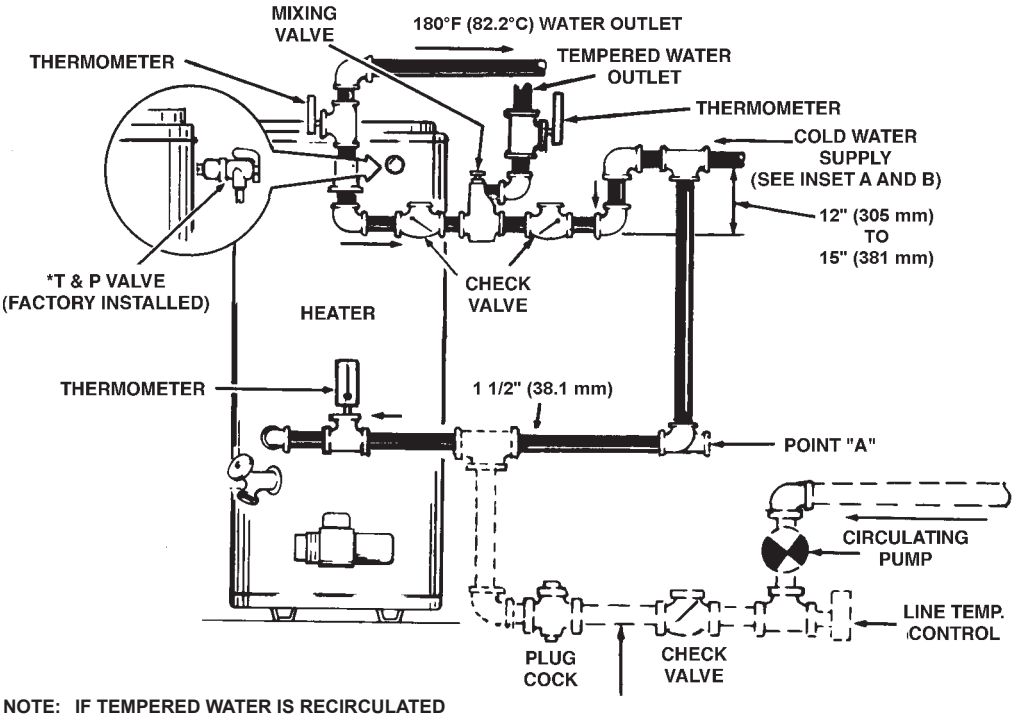
TEMPERATURE SETTING SHOULD NOT EXCEED SAFE TEMPERATURES AT FIXTURES. SEE WATER TEMPERATURE CONTROL WARNING ON PAGE 11. IF HIGHER PREHEAT TEMPERATURES ARE NECESSARY TO OBTAIN ADEQUATE BOOSTER OUTPUT, ADD AN ANTI-SCALD VALVE FOR HOT WATER SUPPLIED TO FIXTURES.

INSET A

INSTALL THERMAL EXPANSION TANK IN COLD WATER SUPPLY LINE, IF CHECK VALVE OR PRESSURE REDUCING VALVE IS USED IN SUPPLY.

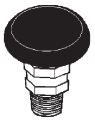


WIRING DIAGRAM FOR HEATER TO TANK LOOP AND /OR HOT WATER LOOP (IF USED)



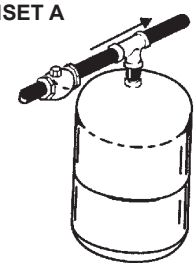
INSTALL IN ACCORDANCE WITH LOCAL CODES

SINGLE TEMPERATURE OR BOOSTER



DANGER:
TEMPERATURE SETTING SHOULD NOT EXCEED SAFE TEMPERATURES AT FIXTURES. SEE WATER TEMPERATURE CONTROL WARNING ON PAGE 11. IF HIGHER PREHEAT TEMPERATURES ARE NECESSARY TO OBTAIN ADEQUATE BOOSTER OUTPUT, ADD AN ANTI-SCALD VALVE FOR HOT WATER SUPPLIED TO FIXTURES.

TWO TEMPERATURE - ONE HEATER HIGH TEMPERATURE STORAGE WITH OR WITHOUT RECIRCULATION

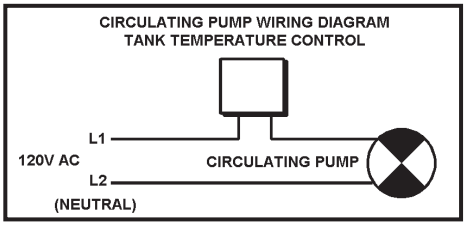


INSET B

VACUUM RELIEF VALVE INSTALL PER LOCAL CODES.

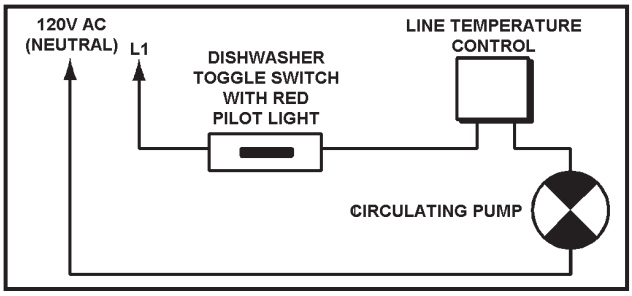
INSET A

INSTALL THERMAL EXPANSION TANK IN COLD WATER SUPPLY LINE, IF CHECK VALVE OR PRESSURE REDUCING VALVE IS USED IN SUPPLY.



NOTE: IF TEMPERED WATER IS RECIRCULATED RETURN LINE SHOULD BE CONNECTED AT POINT "A"

* PIPE TO OPEN DRAIN



RETURN LINE FROM 180°F (82.2°C) CIRCULATING LOOP (IF USED)

INSTALL IN ACCORDANCE WITH LOCAL CODES

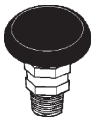
WIRING DIAGRAM FOR 180° LOOP (IF USED)

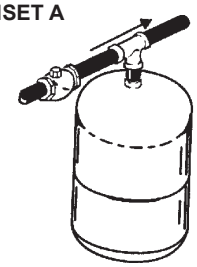
TWO TEMPERTURE - TWO HEATERS HIGH TEMPERATURE STORAGE WITH OR WITHOUT RECIRCULATION



DANGER:
TEMPERATURE SETTING SHOULD NOT EXCEED SAFE TEMPERATURES AT FIXTURES. SEE WATER TEMPERATURE CONTROL WARNING ON PAGE 11. IF HIGHER PREHEAT TEMPERATURES ARE NECESSARY TO OBTAIN ADEQUATE BOOSTER OUTPUT, ADD AN ANTI-SCALD VALVE FOR HOT WATER SUPPLIED TO FIXTURES.

* PIPE RELIEF VALVE TO OPEN DRAIN

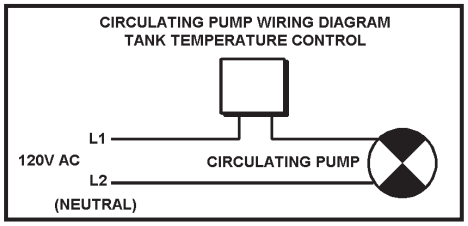
NOTE: IF TEMPERED WATER IS RECIRCULATED, RETURN LINE SHOULD BE CONNECTED AT POINT "A"



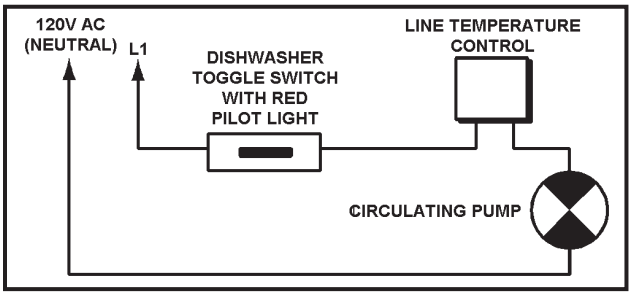
FOR MULTIPLE HEATER INSTALLATION SEE MANIFOLD KIT SPECIFICATIONS, PAGES 22-23

INSET B

VACUUM RELIEF VALVE
INSTALL PER LOCAL CODES.

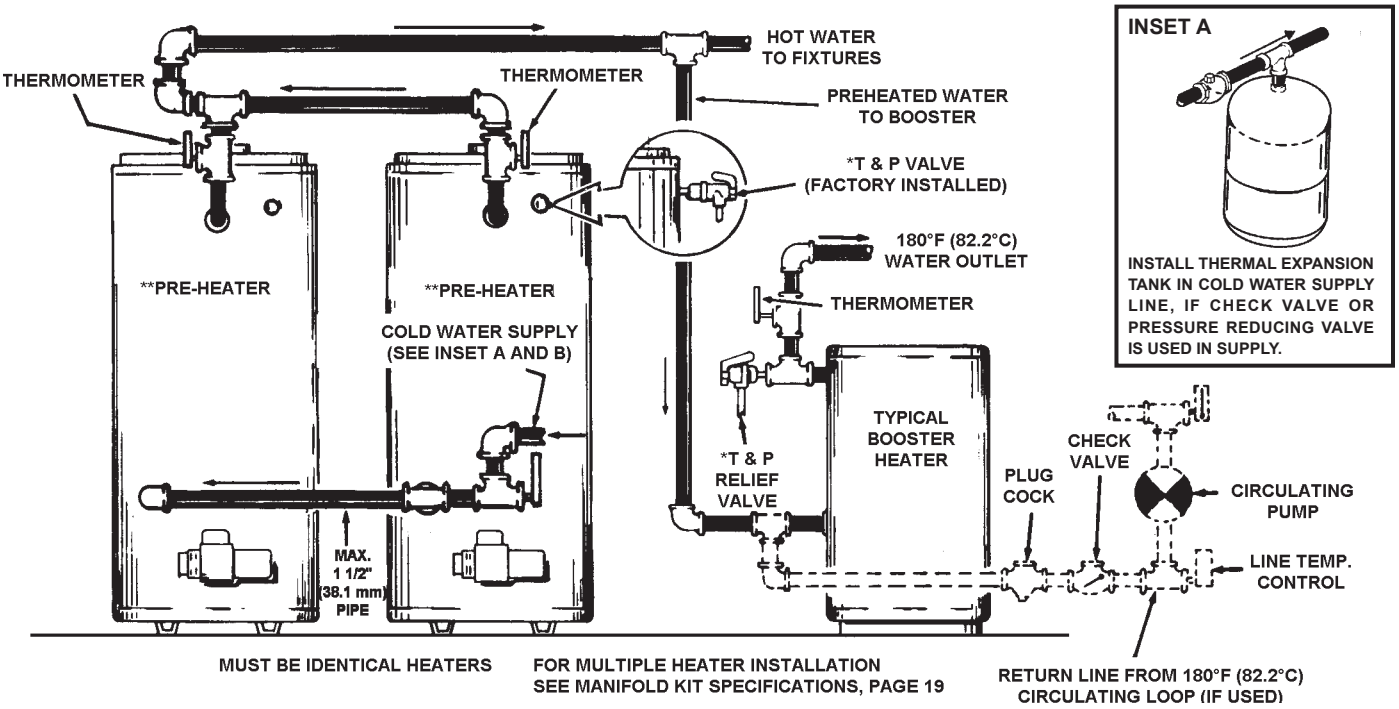


INSET A



INSTALL THERMAL EXPANSION TANK IN COLD WATER SUPPLY LINE, IF CHECK VALVE OR PRESSURE REDUCING VALVE IS USED IN SUPPLY.

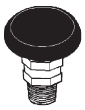
INSTALL IN ACCORDANCE WITH LOCAL CODES



WIRING DIAGRAM FOR TEMPERED WATER LOOP (IF USED)

WIRING DIAGRAM FOR 180° LOOP (IF USED)

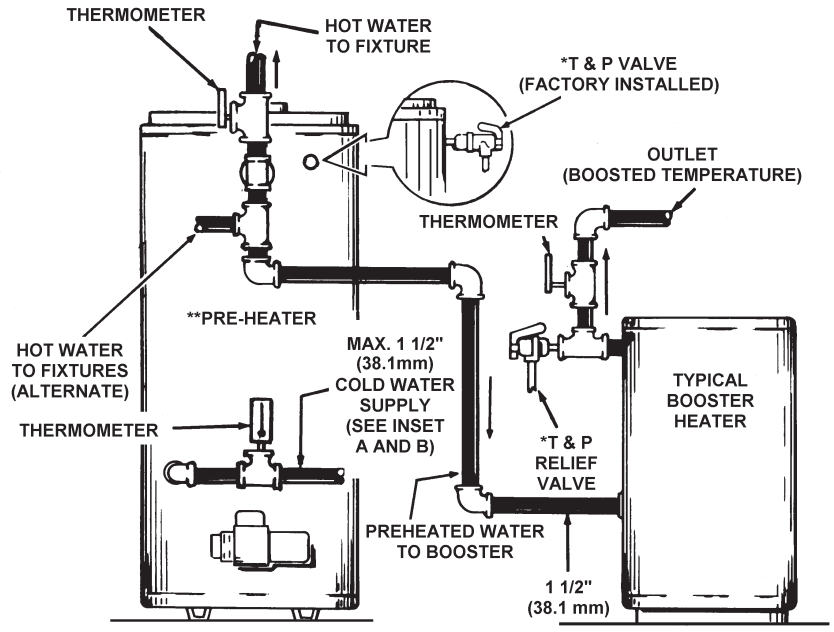
TWO TEMPERATURE - THREE HEATERS (TWO PRE-HEATERS/ONE BOOSTER) WITH OR WITHOUT CIRCULATION



INSET A

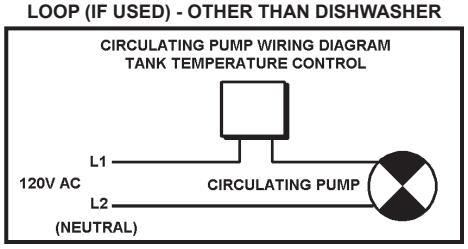
INSTALL THERMAL EXPANSION TANK IN COLD WATER SUPPLY LINE, IF CHECK VALVE OR PRESSURE REDUCING VALVE IS USED IN SUPPLY.

DANGER:

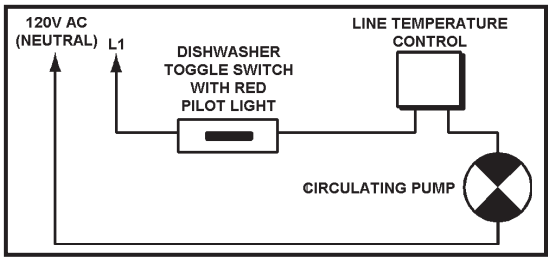


TEMPERATURE SETTING SHOULD NOT EXCEED SAFE TEMPERATURES AT FIXTURES. SEE WATER TEMPERATURE CONTROL WARNING ON PAGE 11. IF HIGHER PREHEAT TEMPERATURES ARE NECESSARY TO OBTAIN ADEQUATE BOOSTER OUTPUT, ADD AN ANTI-SCALD VALVE FOR HOT WATER SUPPLIED TO FIXTURES.

INSET B



VACUUM RELIEF VALVE INSTALL PER LOCAL CODES.



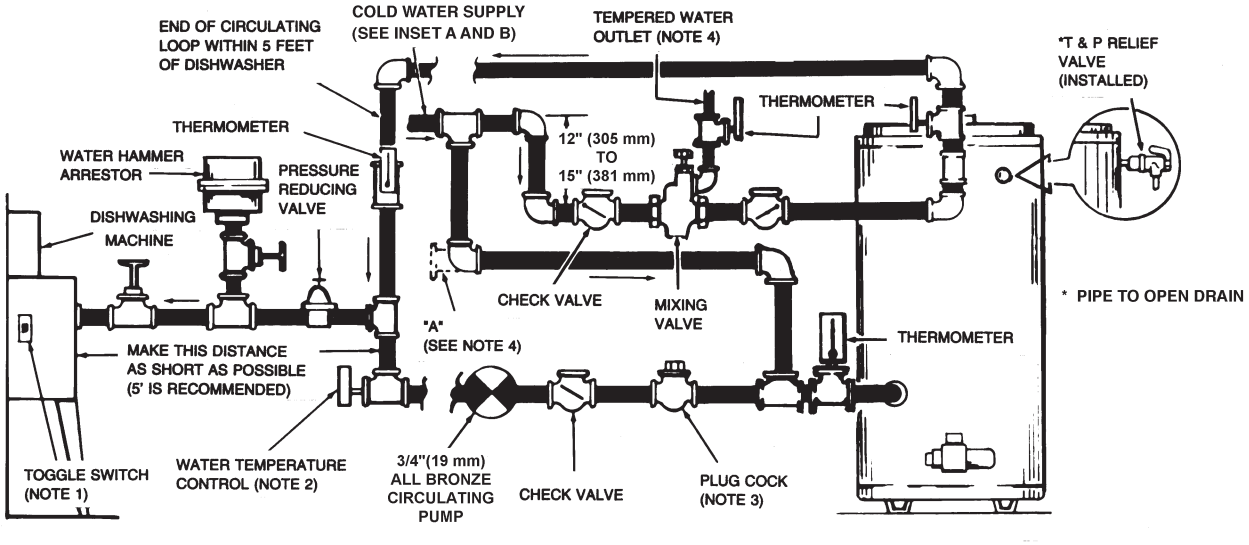
TWO TEMPERATURE - TWO HEATERS (ONE PRE-HEATER/ONE BOOSTER HEATER) WITH OR WITHOUT RECIRCULATION

WIRING DIAGRAM FOR FIXTURE OR BOOSTER LOOP (IF USED) - OTHER THAN DISHWASHER

WIRING DIAGRAM FOR 180° LOOP (IF USED)

INSTALL IN ACCORDANCE WITH LOCAL CODES

* PIPE RELIEF VALVE TO OPEN DRAIN



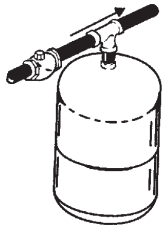
** 140°F TO 150°F SHOULD BE MAXIMUM WATER TEMPERATURE MAINTAINED IN THE PRE-HEATERS.

120°F SHOULD BE THE MINIMUM TEMPERATURE OF WATER STORED IN THE PRE-HEATERS.

CONNECT CIRCULATING LINE FROM FIXTURES, IF USED, TO COLD WATER SUPPLY LINE OF PRE-HEATER.

CONNECT CIRCULATING LINE OF 180°F OR BOOSTED WATER, IF USED, TO INLET WATER LINE TO BOOSTER.

TWO TEMPERATURE-ONE HEATER HIGH TEMPERATURE STORAGE WITH RECIRCULATION OF SANITIZING LOOP



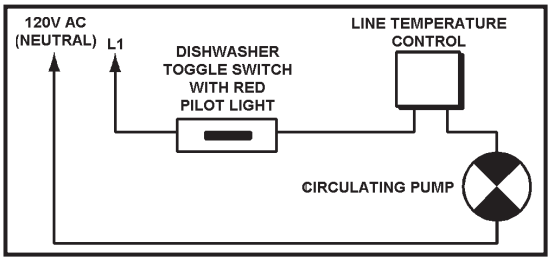
NOTE 1: TOGGLE SWITCH CONTROLS 180°F WATER CIRCULATION. INSTALL ON OR CLOSE TO DISHWASHING MACHINE . TOGGLE SWITCH MUST BE CLOSED (ON) DURING THE RINSE OPERATION AND OPEN (OFF) WHEN DISHWASHER IS NOT OPERATING.

NOTE 2: INSTALL LINE TEMPERATURE CONTROL IN AN UNINSULATED TEE BEYOND THE DISHWASHING MACHINE TAKEOFF IN THE SANITIZING LOOP. CONTROL SHOULD BE SET AT 185°F (85°C).

NOTE 3: ADJUST PLUG COCK SO THE SANITIZING LOOP FLOW RATE DOES NOT CAUSE UNNECESSARY TURBULENCE IN THE TANK.

NOTE 4: IF TEMPERED WATER IS RECIRCULATED, RETURN LINE SHOULD BE CONNECTED AT POINT "A".

INSET A

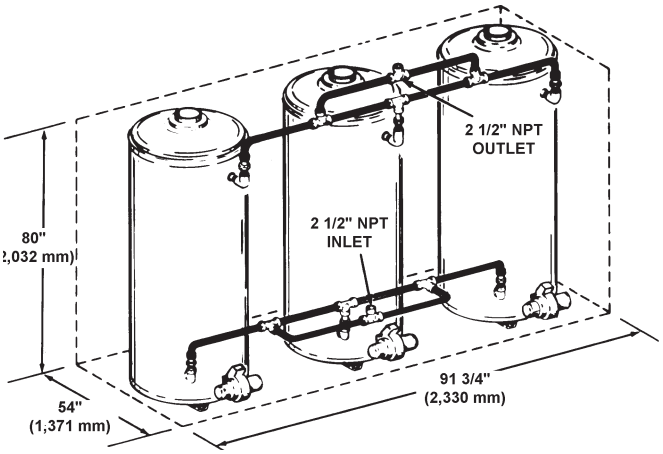


INSTALL THERMAL EXPANSION TANK IN COLD WATER SUPPLY LINE, IF CHECK VALVE OR PRESSURE REDUCING VALVE IS USED IN SUPPLY.

INSET B

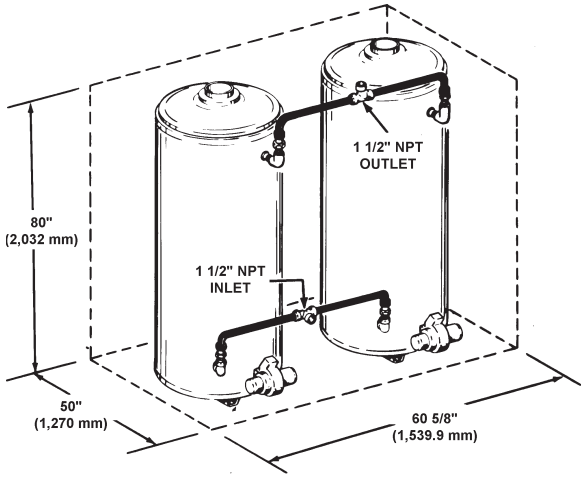
VACUUM RELIEF VALVE INSTALL PER LOCAL CODES.

WIRING DIAGRAM FOR 180° LOOP (IF USED)



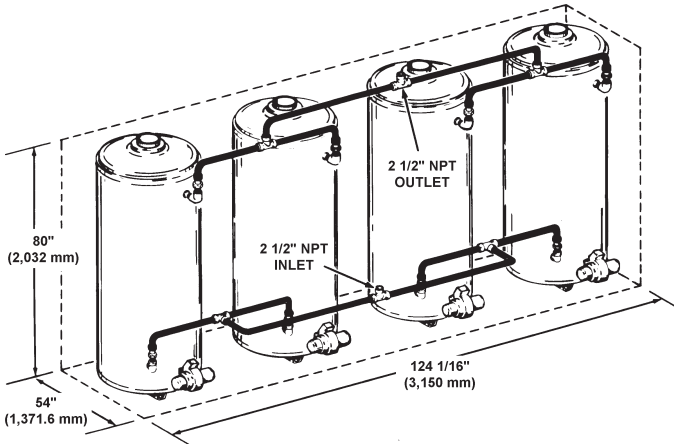
NOTES

MANIFOLD KIT COMMERCIAL OIL FIRED WATER HEATERS



Precision cut type "L" all copper A.O. Smith manifold kits assure water flow balance of all units. Without this balance, the full water heating and storage potential of the system cannot be achieved. Plus, the units with the higher water flow may have a shortened life. Unions and T & P valves shown in piping diagrams are not included in the manifold kits.

Dimensions shown are for minimum space occupied by complete assemblies. Service space in front of units must be added.



DANGER:
TEMPERATURE SETTING SHOULD NOT EXCEED SAFE TEMPERATURES AT FIXTURES. SEE WATER TEMPERATURE CONTROL WARNING ON PAGE 11. IF HIGHER PREHEAT TEMPERATURES ARE NECESSARY TO OBTAIN ADEQUATE BOOSTER OUTPUT, ADD AN ANTI-SCALD VALVE FOR HOT WATER SUPPLIED TO FIXTURES.

THREE UNIT MANIFOLD KIT (PART NO. 9003427205)

TWO UNIT MANIFOLD KIT (PART NO. 9003426205)

FOUR UNIT MANIFOLD KIT (PART NO. 9003428205)

CHECK LIST AND SERVICE INFORMATION

IMPORTANT

The installer may be able to observe and correct certain problems which might arise when the unit is put into operation or when it is refired after a prolonged shut-down. HOWEVER, it is recommended that only qualified servicemen, using appropriate test equipment, be allowed to service the heater.

DANGER
BE SURE TO TURN OFF THE ELECTRICITY WHENEVER POSSIBLE OR APPROPRIATE WHEN CHECKING EQUIPMENT.

ELECTRICAL WIRING REPLACEMENT

If any of the original wiring, as supplied with the appliance, must be replaced, it must be replaced with 16 AWG, or greater, copper conductor with 600V, 105°C rated, thermoplastic insulation.

NOT ENOUGH OR NO HOT WATER

1. Be certain the oil burner electrical disconnect switch serving the water heater is in the ON position.
2. Check the fuses.
   - The oil burner electrical disconnect switch usually contains fuses.
3. The capacity of the heater may have been exceeded by a large demand for hot water.
   - Large demands require a recovery period to restore water temperature.
4. Colder incoming water temperature will lengthen the time required to heat water to the desired temperature.
   - If the heater was installed when incoming water temperature was warm, colder water creates the effect of less hot water.
5. Look for hot water wastage and leaking or open hot water faucets.
6. Sediment or lime scale may be affecting water heater operation. Refer to MAINTENANCE for details.
7. Heater or burner may be dirty.
   - Clean all heater flue pipes and flue connector.
   - Have burner properly cleaned and readjusted.

8. Burner may not be firing at proper rate.
   - Check nozzle size.
   - Check fuel pump pressure setting.
   - COF-199 . . . . . 110 psig
   - All others . . . . . 100 psig
9. Burner may be short cycling. Short cycling (too frequent off and on) of burner will cause sooting. If unit or burner become dirty at frequent intervals, after correcting the dirt condition also correct the control settings (or other cause of the short cycling).
10. Oil burner fan wheel may be dirty.
    - Clean fan wheel with a stiff brush.
11. Draft regulator may be stuck.
    - Check to see if valve swings freely. Clean, if vane is stuck.
12. Priming control safety reset is open.
    - Reset safety switch on burner mounted primary control, see SAFETY PRIMARY CONTROL, page 22.
13. Burner motor safety reset is open.

BURNER STARTS-WON'T OPERATE

1. No oil in tank.
2. Oil line valve closed.
3. Loose connection in primary control.
   - Check and tighten all wire connections, see SAFETY PRIMARY CONTROL, page 22.
4. Electrode out of adjustment.
   - Clean firing head and readjust electrodes.
5. Clogged burner nozzle.
   - Replace with new nozzle, see nozzle chart, page 9, table 8.
   - Nozzle should be replaced semiannually.
6. Dirty filter.
   - Replace element in oil filter.

WATER IS TOO HOT

1. Refer to WATER TEMPERATURE, page 11.

WATER HEATER MAKES SOUNDS

1. Sediment or lime scale accumulations cause noises when the tank bottom should be cleaned. Refer to MAINTENANCE, page 12-13 for details.
2. Some of the electrical components of the water heater makes sounds which are normal.
   - Contacts click or snap as the heater starts and stops.
   - Transformers often hum.

WATER LEAKAGE IS SUSPECTED

1. Check to see if the water heater drain valve is tightly closed.
2. The apparent leakage may be condensation which forms on cool surfaces of the heater and piping.
3. If the outlet of the relief valve is leaking it may represent:
   - Excessive water pressure.
   - Excessive water temperature.
   - Faulty relief valve.

Excessive water pressure is the most common cause of relief valve leakage. It is often caused by a "closed system". If a check valve is in the inlet system it will not permit the expanded hot water volume to equalize pressure with the main. The relief valve must release this water or the water heater or plumbing system will be damaged. This condition is not covered by the limited warranty. The solution is to add a thermal expansion tank between the check valve and the water heater.

BURNER WON'T START

When the thermostat calls for heat but the burner won't start, check to make sure that you have proper voltage to the primary control.

CAUTION

When checking the low voltage circuit at the control, DO NOT TOUCH THERMOSTAT WIRES TO FLAME DETECTOR TERMINALS AS THIS WILL BURN OUT THE SENSOR IN THE SAFETY PRIMARY CONTROL.

If the voltage checks normal:

1. Flame detector may be sooted or seeing false light and will not let the motor replay pull in.
2. Loose wiring.
3. Bad flame detector (mounted inside housing beneath transformer).
4. Reset red safety button (primary control).
5. Defective primary control.
6. Reset motor protector.

BURNER STARTS BUT FAILS TO RUN

When the burner starts (motor running) but flame is not established, the control will lock out on safety in about 15 seconds. If the control does not lock out on safety, then the control is defective and should be replaced. When the motor is running but flame is not established, then the problem becomes:

1. There is insufficient or no oil getting into the combustion chamber.
2. There is no spark to ignite the oil.

If the problem is insufficient or no oil getting into the combustion chamber, check for the following:

1. Dirt or water in the supply line.
2. Slipping coupling between motor and pump.
3. Defective pump.
4. Clogged, defective or too small a nozzle.
5. Oil tank empty.
6. Clogged filter in oil line.
7. Restriction or kink in fuel line.
8. Ice in fuel line.
9. Air leak in inlet connections.

If the problem is not getting a spark to ignite the oil, check for the following:

1. Loose wiring.
2. Bad ignition transformer.
3. Low voltage.
4. Crack in electrode porcelain insulators.
5. Electrodes carboned or out of adjustment.
6. Weak or no contact between bus bars and terminals of transformer.

NORMAL START, BUT LOCKS OUT ON SAFETY

When the thermostat calls for heat and the burner starts normally but the locks out on safety after about 15 seconds:

1. Improper setting of combustion air (too much air).
2. Weak or dirty flame detector.
3. Improper positioning of flame detector.
4. Bad flame detector.
5. Wiring from flame detector to primary not continuous or not making good contact.
6. Bad safety primary control.
7. Clogged, defective or to small sized nozzle.

SAFETY PRIMARY CONTROL

Normal Burner Cycle

Although a normal burner cycle does not create a service problem, it is important to know what happens to better understand the problem when the unit is not operating properly.

The instant the thermostat calls for heat, the flame detector sees darkness and causes the sensor to conduct current. When the sensor conducts current, the motor relay coil pulls in, starting the burner motor and energizing the ignition transformer through the motor relay contacts. At the same instant the motor relay coil pulls in, the safety heater is energized.

When flame is established, the resistance of the flame detector drops (providing the flame detector can see the flame properly) which causes the sensor to block the current. When the sensor blocks, the safety heater drops out of the circuit and the motor relay coil continues to hold in through a set of holding contacts on the motor relay until the thermostat is satisfied and the burner shuts down.

FLAME FAILURE AFTER NORMAL IGNITION

If, for some reason, there is a flame out, the flame detector sees darkness which causes the sensor to conduct current and again energize the safety heater. In approximately 15 seconds the safety contact will open and shut down the burner. The safety contacts of the safety primary control are the manual reset type, which means that the red safety button must be reset before trying again for ignition. When this occurs, allow about 5 minutes for safety heater to cool before depressing the red safety button.

Depress red button one time only. If burner does not operate after depressing red button one time, check combustion chamber. If combustion chamber is soaked with oil the combustion chamber must be replaced.

Some of the possible reasons for flame failure after normal ignition has occurred are:

1. Dirt or water in the supply line.
2. Pump loosing prime.
3. Bad motor.
4. Erratic or low pressure at fuel pump.
5. Defective pump.
6. Loose wiring or connections.
7. Clogged or damaged nozzle.
8. Oil tank empty.
9. Oil tank not vented.
10. Clogged filter in oil line.
11. Ice in fuel line.

COMBUSTION TEST SPECIFICATIONS

GENERAL

A combustion test kit, capable of testing CO_2 content, stack temperature, draft and smoke must be available to aid in adjusting the unit and filling out the Oil Burner Certificate. A pressure gauge is needed to measure and adjust oil pump pressure.

PROCEDURE

1. Check nozzle size, see table on page 9.
2. Open air band about halfway and being certain heater is filled with water, start burner.
3. Check oil pump pressure. It should be 110 psig for the COF-199 and 110 psig for all other models. Adjust setting as necessary.
4. Allow burner to operate for 15 minutes before proceeding with test.
5. After 15 minutes operation, check the draft in chimney connector, about halfway between the heater and the draft regulator and adjust the draft regulator until the correct reading is obtained.

Draft in Chimney after 15 minutes	Reading should be between -0.03 & -0.05 of Water

6. Adjust air band until flame has smoky tips. Immediately increase air supply until the smoky tips just appear.
7. Using combustion test kit, check smoke density and CO_2 in the chimney connector.

Smoke Density	Preferably No. 1 Spot (Not Over No. 2 Spot
CO_2	9% to 12%

- Adjust air supply with air band to achieve the highest CO_2 readings with an acceptable smoke density reading. Test and readjust as necessary.

8. Check the stack temperature halfway between the heater and the draft regulator.

Stack Temperature	Min.	400° F (204°C)
	Max.	600° F (315°C)

- If stack temperature is too high, check for a soot accumulation in heater or excessive oil pump pressure.

9. Recheck combustion efficiency against specifications when final adjustments have been made.

TROUBLESHOOTING

TABLE 10 - OIL BURNER TROUBLESHOOTING

TROUBLE	CAUSE	REMEDY
No Oil Flow at Nozzle	Oil level below intake line in supply tank.	Fill tank with oil.
	Clogged strainer or filter.	Remove and clean strainer. Replace filter element.
	Clogged nozzle.	Replace nozzle.
	Air leak in intake line.	Tighten all fittings in intake line. Tighten unused intake port plug. Check filter cover and gasket.
	Restricted intake line. (High vacuum reading).	Replace any kinked tubing and check any valves in intake line.
	A two line pipe system that becomes air bound.	Check for and insert by-pass plug. Make sure return line is below oil level in tank.
	A single line pipe system that becomes air bound.	Loosen gauge port plug or air bleed valve and bleed oil for 15 seconds after foam is gone in bleed hose, Check intake line fittings for tightness. Check all fuel pump plugs for tightness.
	Slopping or broken coupling.	Replace coupling.
	Rotation of motor and fuel unit pump is not the same as indicated by arrow on the pad at top of unit.	Install fuel pump with correct rotation.
	Frozen fuel pump shaft.	Replace fuel pump. Check for water and dirt in tank.
Oil Leak	Loosen plugs and fittings.	Tighten with good quality thread sealer.
	Leak at pressure adjusting screw or nozzle plug.	Replace fuel pump.
	Blown seal (single-pipe system)	Check to see if by-pass plug has been left in fuel pump. Replace fuel pump.
	Seal leaking.	Replace fuel pump.
	Cover.	Tighten cover screws.
Noisy Operation	Bad coupling alignment.	Loosen fuel pump mounting screws slightly and shift fuel pump in different positions until noise is eliminated. Retighten mounting screws.
	Air in inlet line.	Check all connections. Use only good flare fittings.
	Tank turn on two line pipe system and inside tank.	Install return line hum eliminator.
	Partially clogged strainer or filter.	Remove and clean strainer.
	Air leak in intake line.	Tighten all fittings.
	Air leaking around cover.	Be sure strainer cover screws are tightened securely. Check for damaged cover gasket.
Low Oil Pressure	Defective gauge	Check gauge against master gauge or other gauge.
	Nozzle capacity is greater than fuel pump capacity.	Replace fuel unit with unit of correct capacity.
Improper Nozzle Cut-Off	To determine the cause of improper cut-off, insert a pressure gauge in the nozzle port of the fuel pump. After a minute of operation, shut burner down. If the pressure drops from normal operating pressure and stabilizes, the fuel pump is operating properly and air is the cause of improper cut-off. If, however, the pressure drops to 0 psi, fuel unit should be replaced. NOTE: Never use the amount of pressure drop as an indication of the quality or speed of cut-off.	
	Filter leaks.	Check face of cover and gasket for damage.
	Strainer cover loose.	Tighten 4 screws on cover.
	Air pocket between cut-off valve and nozzle.	Run burner, stopping and starting unit, until smoke and after-fire disappears.
	Air leak in intake line.	Tighten intake fittings. Tighten unused intake port and return plug.
	Partially clogged nozzle strainer.	Clean strainer or change nozzle.
	Leak at nozzle adaptor.	Change nozzle and adaptor.

COMMERCIAL WATER HEATER LIMITED WARRANTY

EFFECTIVE

For 3 Years, in the event of a tank leak, we will repair or, at our discretion, replace the defective water heater.

For 1 Year, in the event of part failure, we will repair or, at our discretion, replace the defective part.

We warrant this product against defects in materials or workmanship as described in this document if installed within the United States or Canada and provided the product remains at its original place of installation.

Warranty coverage begins the date of installation OR the date of manufacture if installation cannot be verified.

WHAT'S COVERED

Subject to these terms, in the event of defect in materials and/or workmanship resulting in a **tank leak** during the **first three years**, we will:

- Replace the water heater should the tank leak.

Subject to these terms, in the event of a defect in materials and/or workmanship appearing during the **first year**, we will:

- Repair or, at our discretion, replace any part of the water heater covered under this limited warranty excluding parts subject to normal maintenance (Example: non-electronic anode rod, filter, etc)

Service/labor, shipping, delivery, installation, handling or any other costs are not covered at any time under this warranty.

Any replacement part or product will be warranted only for the unexpired portion of the original water heater's limited warranty period.

If an identical model is no longer available due to a change in law, regulation, or standard, we will replace the product with one having comparable capacity and input. In these instances, the owner will have the option of paying the difference between what was paid for the original model and the new model with the additional features, or receiving a refund of the portion of the purchase price, on a pro-rata basis allocable to the unexpired portion of the warranty.

WHAT'S NOT COVERED

- Problems caused by improper: gas supply line sizing, gas type, venting, connections, combustion air, voltage, wiring, or fusing
- Failure to follow applicable codes
- Failure to follow printed instructions
- Abuse, misuse, accident, fire, flood, Acts of God
- Improper installation, sizing, delivery, or maintenance
- Claims related to rust, noise, smell, or taste of water
- Failure to conduct authorized factory start up if required
- Alterations to the water heater
- Non-outdoor heaters installed outdoors
- Damages due to a failure to allow for thermal expansion
- Heat exchanger failure due to lack of adequate / proper supply of water
- Heaters moved from their original location
- Service trips to explain proper installation, use, or maintenance of the product/unit or to describe compliance requirements under applicable codes and regulations
- Charges related to accessing your heater including but not limited to door/wall removal, equipment rental, etc.
- Replacement parts after expiration of this warranty

LIMITATIONS

NOTWITHSTANDING ANYTHING ELSE TO THE CONTRARY, THIS IS YOUR SOLE AND EXCLUSIVE WARRANTY. ALL OTHER WARRANTIES INCLUDING A WARRANTY OF MERCHANTABILITY OR FITNESS FOR PARTICULAR PURPOSE ARE EXPRESSLY DISCLAIMED. SELLER SHALL NOT BE LIABLE FOR ANY CONSEQUENTIAL, INCIDENTAL, SPECIAL, PUNITIVE OR OTHER INDIRECT DAMAGES. TOTAL LIABILITY ARISING AT ANY TIME SHALL NOT EXCEED THE PURCHASE PRICE PAID WHETHER BASED ON CONTRACT, TORT, STRICT LIABILITY OR ANY OTHER LEGAL THEORY.

SERVICE INQUIRIES:

For service inquiries call the telephone number listed below. Be prepared to provide the following information: name, address, and telephone number; the model and serial number of the water heater; proof of installation; and a clear description of the problem.

For your records, fill in the product:

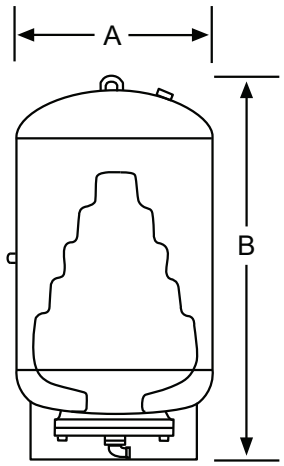
EXTROL®

Hydronic Expansion Tanks: LBC Series ASME

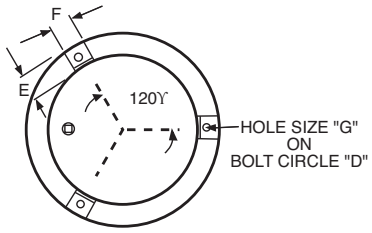
SPEC 23 21 14 2.1



125 PSIG Working Pressure

Construction

Shell	ASME Approved Steel
Bladder Design	Partial Acceptance; Replaceable
Bladder Thickness (models 35-100)	.087 In Minimum
Bladder Thickness (models 130-600)	.100 In Minimum
System Connection	NPTF Malleable Iron
Finish	Red Oxide Primer
Air Valve	Schrader Valve w/EPDM Seats
Factory Precharge	12 PSIG (.8 bar)



Application

- For use in closed, non-potable hydronic heating and chilled water systems.
- Replaceable, partial acceptance bladder design.
- Meets all ASME Code Section VIII, Division 1 standards.
- Available with optional sight glass and seismic restraints.

Performance

Maximum Operating Temperature	240°F (115°C)
Maximum Working Pressure	125 PSIG (8.6 bar)
Warranty	1 Year

Models 35-LBC through 600-LBC

NOTE: Inspect for shipping damage and notify freight carrier or store where purchased immediately if damage is present. To avoid risk of personal injury and property damage, if the product appears to be malfunctioning or shows signs of corrosion, call a qualified professional immediately. Current copies of the Product manual can be viewed at www.amtrol.com. Use proper safety equipment when installing.

THIS IS THE SAFETY ALERT SYMBOL. IT IS USED TO ALERT YOU TO POTENTIAL PERSONAL INJURY AND OTHER HAZARDS. OBEY ALL SAFETY MESSAGES THAT FOLLOW THIS SYMBOL TO REDUCE THE RISK OF PERSONAL INJURY AS WELL AS PROPERTY DAMAGE.

⚠WARNING **READ CAREFULLY THE PRODUCT INSTALLATION & OPERATION INSTRUCTIONS. FAILURE TO FOLLOW THE INSTRUCTIONS AND WARNINGS IN THE MANUAL MAY RESULT IN SERIOUS OR FATAL INJURY AND/OR PROPERTY DAMAGE, AND WILL VOID THE PRODUCT WARRANTY. THIS PRODUCT MUST BE INSTALLED BY A QUALIFIED PROFESSIONAL. FOLLOW ALL APPLICABLE LOCAL AND STATE CODES AND REGULATIONS, IN THE ABSENCE OF SUCH CODES, FOLLOW THE CURRENT EDITIONS OF THE NATIONAL PLUMBING CODE AND NATIONAL ELECTRIC CODE, AS APPLICABLE.**

⚠WARNING **EXPLOSION OR RUPTURE HAZARD. THE EXPANSION TANK MUST BE OPERATED SO THAT THE PRESSURE DOES NOT EXCEED THE MAXIMUM WORKING PRESSURE.**

CALIFORNIA PROPOSITION 65 WARNING! This product contains a chemical known by the State of California to cause cancer and to cause birth defects or other reproductive harm. (California Installer/Contractor - California law requires that this notice be given to consumer/end user of this product.) **For more information: www.amtrol.com/prop65.html**

⚠WARNING **EXPLOSION OR RUPTURE HAZARD** A relief valve must be installed to prevent pressure in excess of local code requirement or maximum working pressure designated in the Product Manual, whichever is less. Do not expose Product to freezing temperatures or temperatures in excess of 240° F. Do not adjust the pre-charge or re-pressure this Product except for any adjustments required at the time of initial installation, especially if Product corroded, damaged or with diminished integrity. Adjustments to pre-charge must be done at ambient temperature only. Failure to properly size the Product or follow these instructions may result in excessive strain on the system lead to Product failure, serious or fatal personal injury, leakage and/or property damage.

⚠WARNING **Potable Water and Radiant Heating Warning.** This Product must not be used in radiant heating, potable water or open systems of any kind. These systems contain oxygenated water which will cause internal corrosion and premature Product failure. Use a Therm-X-Trol® for potable water systems and a Radiant Extrol™ for radiant heating systems. Mount vertically only. Do not install on dead-end pipe.

PLEASE READ THE FOLLOWING INSTRUCTIONS CAREFULLY
IMPORTANT GENERAL SAFETY INFORMATION -
ADDITIONAL SPECIFIC SAFETY ALERTS APPEAR IN THE FOLLOWING INSTRUCTIONS.

⚠WARNING **EXPLOSION HAZARD.** Failure to follow instructions in the accompanying product manual can cause rupture or explosion, possibly causing serious or fatal injury, leaking or flooding and/or property damage.

⚠WARNING **FAILURE TO PROPERLY SEAL VALVE CAP WILL RESULT IN LOSS OF PRECHARGE CAUSING PRODUCT TO FAIL.**

Location of EXTROL® Expansion Tanks

⚠WARNING This Product, like most Products under pressure, may over time corrode, weaken and burst or explode, causing serious or fatal injury, leaking or flooding and/or property damage. To minimize risk, a licensed professional must install and periodically inspect and service the Product. A drip pan connected to an adequate drain must be installed if leaking or flooding could cause property damage. Do not locate in an area where leaking could cause property damage to the area adjacent to the appliance or to lower floors of the structure.

The AMTROL expansion tank may be placed in any convenient position within the mechanical room (or building). If multiple tanks are installed, they should all be on the same level.

Point of Connection

Unlike a conventional tank, the EXTROL sealed air cushion does not require replenishment so DO NOT connect to an air separator or other air collection device.

As with any expansion tank, it is recommended that the EXTROL be connected to the suction side of the pump. This will prevent the pump head from becoming subtractive which may result in entry of air and vapor formation at high points in the system.

By connecting the EXTROL on the boiler return, displacement of coolest system water into tank is ensured reducing energy waste.

Low pressure drop components such as air separators and boilers may be placed between point of connection and pump suction if desired. System design will dictate the feasibility of this.

Natural convection losses and the entry of air into tanks are eliminated by connection to the side or underside of main pipe. The piping should be pitched up and away from the EXTROL to eliminate any potential air traps.

Installation

⚠WARNING **THIS PRODUCT MUST BE INSTALLED BY A QUALIFIED PROFESSIONAL.**

1. Note location of system connection, air charge valve and drain connection on tank.
2. Remove the plug or pipe cap from the system connection.
3. Remove the 1 1/2” NPT plug covering the air charge valve.
4. Before making any connection to the tank, check the tank and air charge (use an accurate pressure gauge). The air pressure must be equal to the minimum system pressure at the tank location.

> **IMPORTANT:** If increasing pre-charge pressure above 55 psig the following steps must be followed:
>
> a. Tank must be connected to the system with the isolation valve open.
> b. System must be pressurized to 13-14 psig, slightly above factory setting.
> c. Isolation valve needs to be shut.
> d. Pre-charge pressure of tank can now be increased to match system fill pressure.
> e. Open isolation valve and start up system.
> **Failure to follow these steps could result in damage to the bladder and void all warranties.**

5. After making sure the air charge is correct, replace the valve cap and the 1 1/2” plug over the air valve.
6. The EXTROL may now be piped to the system (use the suggested EXTROL piping diagrams on the next page).
7. Using the table below, select appropriate pipe size. Connection to each EXTROL must have a lock shield gate valve and union to allow isolation and removal if required. Make up and fill valves, whether manual or automatic, should be tied into the connecting line. This will ensure that pump operation will not affect valve operation.

Operational Limits

Maximum Operating Pressure: As stamped on nameplate

Maximum Operating Temperature: 240 °F

Minimum Operating Temperature: 35°F (non-glycol application)

If unit is being installed in a glycol system where minimum temperatures fall below 35°F, contact the AMTROL technical service department at (401) 535-1216.

Operating Instructions

1. Check the expansion tank pre-charge before the system is filled with water. The charge is 12 psig unless noted otherwise on the tank label. Check to make sure this is the correct pre-charge pressure specified for the system.
2. If the tank pre-charge pressure needs to be changed on a dry system follow the following procedure:
   a. Check the expansion tank air pressures at the pre-charge connection with an accurate tire type pressure gauge. The pre-charge connection is the same kind of connection found on automobile tires.
   b. If the pressure is low, charge the tank with nitrogen gas or with oil free compressed air. Check the pressure frequently during this process as you would when filling a tire with air.

> **DANGER**: Excessive pressure can cause tank to explode. Exercise care when filling a tank with air so the pressure does not exceed that required or does not exceed the working pressure of the tank as stamped on the nameplate. Failure to follow these instructions will result in serious personal injury or death and property damage.

3. If, after the system has been filled with water and operating, it is found that the expansion tank pre-charge must be changed use the following procedure:
   a. Turn off the heat source and allow the system water to cool to ambient temperature.

> **IMPORTANT**: Expansion tank cannot be properly air charged other than at ambient temperature.

   b. Close the lock-shield valve in the tank-to-system piping.
   c. Open the drain valve to empty the water from the tank.
   d. Check the tank air pressure at the pre-charge connection with an accurate tire type air gauge.
   e. Refer to 2b above.
   f. Close the drain valve, open the lock-shield valve and turn on the heat source.
   g. Relock the lock-shield valve.

Firing Rate of Boiler	Length of Pipe Connecting Tank to System:		
MBTU/H	Below 11'	11' – 30'	31' – 100'
2,000	1/2"	3/4"	1"
4,000	3/4"	1"	1 1/4"
8,000	1"	1 1/4"	1 1/2"
12,000	1 1/4"	1 1/2"	2"
16,000	1 1/4"	2"	2 1/2"
20,000	1 1/2"	2"	2 1/2"

Warranty

INSTALLATION & OPERATION INSTRUCTIONS

THERM-X-TROL®

Thermal Expansion Absorbers (ST-5-C Through ST-210V-C)

PLEASE READ THE FOLLOWING INSTRUCTIONS CAREFULLY

⚠WARNING This product must be installed by a qualified professional.

⚠WARNING **EXPLOSION HAZARD.** Failure to follow the instructions in the accompanying product manual can cause a rupture or explosion; possibly causing serious or fatal injury, leaking or flooding and/or property damage.

⚠WARNING Use only potable water. Do not operate in a setting where the temperature can exceed 200° F or fall below 35° F and do not exceed the maximum working pressure specified for this product.

⚠WARNING **RUPTURE OR EXPLOSION HAZARD.** Like most pressurized tanks, this tank can over time corrode, weaken, and burst or explode.

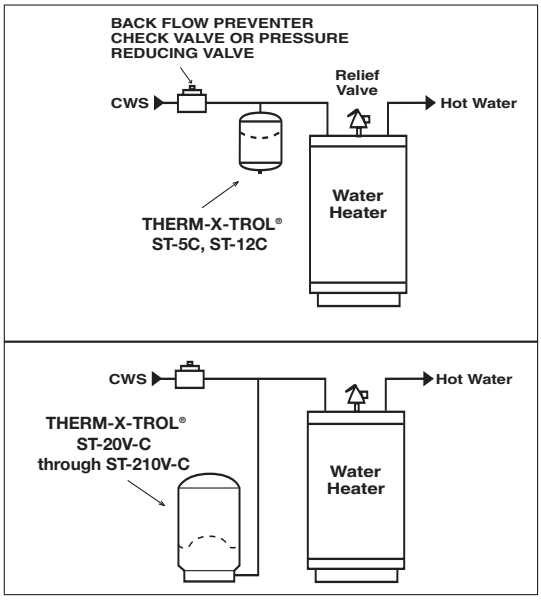
⚠WARNING Do not adjust the pressure or re-pressurize this product except for any adjustments at the time of the initial installation when the product is new.

⚠WARNING Do not locate this product where leaking or flooding could cause damage to the surrounding area.

⚠WARNING **Chlorine & Aggressive Water Warning.** The water quality can significantly influence the life of your product. You should test for corrosive elements, acidity, total solids, and other relevant contaminants, including chlorine and treat your water appropriately to insure satisfactory performance and prevent premature failure.

⚠WARNING State of California Residents. This product contains a chemical known by the State of California to cause cancer. This product contains a chemical known by the State of California to cause birth defects or other reproductive harm.

Pre-Installation



1. Visually inspect THERM-X-TROL for any damage. If damage exists return roduct for replacement.
2. Adjust pre-charge to equal incoming pressure.
3. Replace and tighten plastic cap on air fitting.

For commercial water heater installations, contact AMTROL for information.

Installation

1. Install the THERM-X-TROL on the Cold Water Supply (CWS) line to the water heater at a point between the water heater and backflow preventer, check valve or pressure reducing valve (see Figure 1).
2. Once the THERM-X-TROL is installed, check the CWS line for any leakage. Make repairs if necessary.
3. Before the initial firing of the water heater, open any hot water fixture and draw water until all air is removed from the system. Turn the water heater temperature control to desired ending temperature level, (see water heater instructions).
4. To relieve initial thermal expansion, slightly open a hot water faucet. Continue until water heater aquastat temperature is satisfied. Once heater is at its operating range, no further bleeding of expanded water is required.

Figure 1.

5. The system water heater and THERM-X-TROL will now be operational. The THERM-X-TROL will control temperature and pressure increases caused by thermal expansion to a level well below the water heater relief valve setting.

Maintenance

1. A professional plumber should check the complete heating system, including the THERM-X-TROL, yearly and more frequently as the system ages.

Operation

1. The THERM-X-TROL is installed in the supply line between the backflow preventer and the water heater. Its sealed-in air pre-charge prevents water from entering it until the system pressure exceeds the pre-charge pressure.
2. As the water temperature rises, expanded water enters the THERM-X-TROL's non-corrosive water reservoir. The pre-charged air chamber absorbs the pressure increase, keeping system pressures below the relief valve setting.
3. As hot water is used, the pressure in the air chamber forces water back into the system until the THERM-X-TROL is empty. At this point, the pressure in the air chamber once again equals the supply pressure.
4. Water treatment is not to exceed 200° F or fall below 35° F.

NOTE: Models are listed (ST-5-C thru ST-210V-C) under ANSI/NSF Std 61 and City of Los Angeles.

MARK OF THE ORIGINATOR

*** All ST-C Series models come with a 1 year warranty. See reverse side for warranty information.**

Revised 3/05
Part #9017-091

AMTROL® INC. LIMITED PRODUCT WARRANTY

Products covered: all Products manufactured by AMTROL Inc. ("AMTROL").

This warranty cannot be transferred – it is extended only to the original Purchaser or First User of the Product. By accepting and keeping this Product you agree to all of the warranty terms and limitations of liability described below.

IMPORTANT WARNING – READ CAREFULLY THE INSTALLATION, OPERATING AND MAINTENANCE INSTRUCTIONS MANUAL ("MANUAL") to avoid serious personal injury and/or property damage and to ensure safe use and proper care of this product.

Who Receives AMTROL's Product Warranty

All purchasers or first users of the new Product. The Warranty is non-transferable.

What is covered by this Warranty

AMTROL warrants to the purchaser or first user of the new Product that at the time of manufacture, the Product is free from defects in material and workmanship. **Any warranty claim must be made within one (1) year unless another time period is set forth in the Manual, measured from the time the Product was purchased.**

What AMTROL Will Do If You Have a Covered Warranty Claim

In the event of a breach of the foregoing warranty, AMTROL will at its option either make repairs to correct any defect in material or workmanship or supply and ship either new or used replacement parts or products. AMTROL will not accept any claims for labor or other costs.

What This Warranty Does Not Cover — Exclusions and Limitations

This Warranty does not cover any failure or problem unless it was caused by a defect in material or workmanship. In addition, this Warranty shall not apply:

- if the Product is not correctly installed, operated, repaired or maintained as described in the Manual provided with the Product;
- to any failure or malfunction resulting from abuse (including freezing); improper or negligent: handling, shipping (by anyone other than AMTROL), storage, use, operation, accident; or alteration, lightning, flood or any other environmental condition;
- to any failure or problem resulting from the use of the Product for any purpose other than those specified in the accompanying Manual or alteration of any part of the product;
- if the Product is used anywhere except the United States, its territories or possessions, or Canada;
- this Warranty does not cover labor costs, shipping charges, service charges, delivery expenses, administrative fees or any costs incurred in removing or reinstalling the Product;
- this Warranty does not cover any claims submitted to AMTROL or an AMTROL-authorized distributor or retailer more than 30 days after expiration of the applicable warranty time period described in this Warranty;
- this Warranty also does not cover repair or replacement costs not authorized in advance by AMTROL.

Additional Warranty Limitations

ALL IMPLIED WARRANTIES, INCLUDING THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE SPECIFICALLY DISCLAIMED. Some states do not allow limitations on how long an implied Warranty lasts, so the above limitation may not apply to you.

Limitations of Remedies

THE REMEDIES CONTAINED IN THIS WARRANTY ARE THE PURCHASER'S OR FIRST USER'S EXCLUSIVE REMEDIES. IN NO CIRCUMSTANCES WILL AMTROL BE LIABLE FOR MORE THAN, AND PURCHASER-FIRST USER'S REMEDIES SHALL NOT EXCEED, THE PRICE PAID FOR THE PRODUCT. IN NO CASE SHALL AMTROL BE LIABLE FOR ANY SPECIAL, INDIRECT, INCIDENTAL OR CONSEQUENTIAL DAMAGES, WHETHER RESULTING FROM NONDELIVERY OR FROM THE USE, MISUSE, OR INABILITY TO USE THE PRODUCT OR FROM DEFECTS IN THE PRODUCT OR FROM AMTROL'S OWN NEGLIGENCE OR OTHER TORT. This exclusion applies regardless of whether such damages are sought for breach of warranty, breach of contract, negligence, strict liability, in tort or under any other legal theory. Such damages include, but are not limited to, inconvenience, loss or damage to property, mold, loss of profits, loss of savings or revenue, loss of use of the Products or any associated equipment, facilities, buildings or services, downtime, and the claims of third parties including customers. Some states do not allow the exclusion or the limitation of incidental or consequential damages, so the above limitation or exclusion may not apply to you.

What To Do If You Have a Problem Covered By This Warranty

Any covered Warranty service must be authorized by AMTROL. Contact the person from whom you purchased the Product, who **must** receive authorization from an AMTROL distributor or AMTROL. If you do not receive a prompt response, call AMTROL directly at 877-517-9673. Notice of a Warranty claim should be submitted by the authorized distributor to AMTROL at the following address:

AMTROL Inc.
Warranty Claim Dept.
1400 Division Rd.
West Warwick, RI 02893

Before AMTROL determines to provide any replacement part or Product, it may as a pre-condition to making such a determination require that the warranty claimant ship the Product, postage prepaid to an authorized AMTROL distributor, or to AMTROL and provide proof of purchase evidenced by the original sales receipt or Product registration.

Replacement Product Warranty

In case of replacement of a Product or any component part, AMTROL reserves the right to make changes in the design, construction, or material of the substitute components or products, which shall be subject to all of the terms and limitations of this Warranty, except that the applicable warranty periods shall be reduced by the amount of time the warranty claimant owned the product prior to submitting notification of the warranty claim.

The AMTROL logo and Therm-X-Trol are registered trademarks of AMTROL Inc.

Vortex Air Separators - Models VA / VAS: 4" to 12"

SUBMITTAL

JOB: _____ REPRESENTATIVE: _____

ORDER NO: _____ DATE: _____

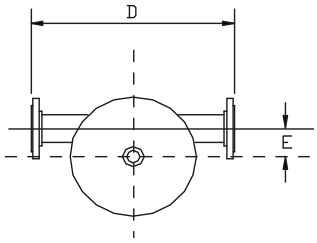
ENGINEER: _____ SUBMITTED BY: _____ DATE: _____

CONTRACTOR: _____ APPROVED BY: _____ DATE: _____

MODEL NO. ORDERED: _____ QTY.: _____

TAG NO.: _____

All models designed and built to ASME Pressure Vessel Code, Section VIII, Division 1.



TYPICAL SPECIFICATION

Furnish & install an Armstrong Vortex® Air Separator, Model ___ VA or Model ___ VAS (with strainer) with flanged tangential connections as shown on plans. The unit shall be designed and built in accordance with the latest revisions of ASME Pressure Vessel Code, Section VIII, Division 1. A blowdown connection is provided for routine cleaning of the unit.

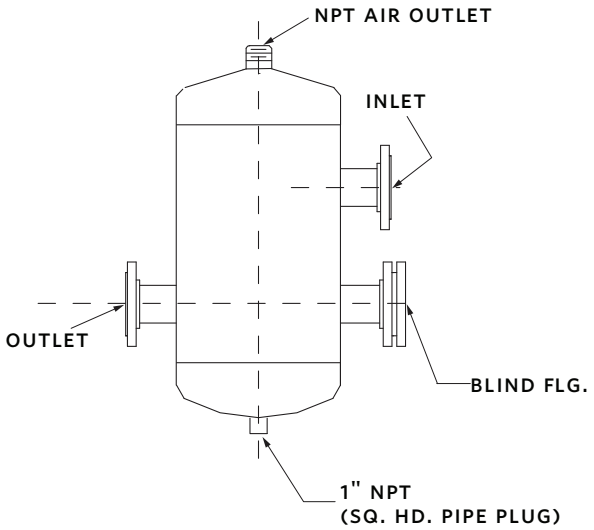
VORTEX AIR SEPARATORS | MODELS VA/VAS |

INSTALLATION AND OPERATING INSTRUCTIONS



File No: 37.874
Date: SEPTEMBER 22, 2016
Supersedes: 37.874
Date: DECEMBER 18, 2007

Sizes: 4" to 6" – Cast Iron
8" to 12" – Fabricated C. Steel

1.0 VESSEL DESCRIPTION

Armstrong VA/VAS Vortex Air Separators eliminate air quickly and efficiently from heating/cooling systems. Water enters and exits through unique **tangential** connections which promote a low velocity swirling effect in the centre of the unit. Centrifugal force moves the water to the outer edges of the unit and a vortex is formed. Entrained air migrates to the eye of the vortex (lower pressure point) and is evacuated at the top of the separator. The water exits the unit near the bottom of the unit, bubble free, protecting the system against the noise, corrosion and damage associated with entrained air.

VAS models are equipped with a stainless steel strainer.

2.0 CONSTRUCTION DETAILS

Materials of construction

Shell: 4" to 6" models: Cast Iron
8" to 12" models: Fabricated steel

Strainer: Stainless steel mesh (¼"× ¾")

Gasket: Non-asbestos

Technical data

Max. working temperature: 375°F (190°C)

Max. working pressure: 4" to 6" models: 160 PSI (1103 kPa)
8" to 12" models: 165 PSI (1140 kPa)

Connection type: 150# Flanged ANSI (RFSO)

3.0 STEPS & PROCEDURE

- Visually inspect the air separator for damage, which may occur during transit.
- A manual drain can be added to help facilitate purging sediment from the air separator.
- VAS models have a strainer that must be removed and cleaned after 24 hours of operation.

DISTANCE REQUIRED TO REMOVE STRAINER

Lot #1 **G515/11-K**

Quantity	Brand	Model	Description
2		ME-BLR	Boiler

Accessories

Buderus	G515/11-K	Cast iron boiler	
Input capacity	1881 Mbh	- Sections	: Field assembly
- Output capacity	: 1582 Mbh	- Item	: 2-51511
- Construction	: 87 Psig	-	:
Conbraco	10-615-10	Safety valve set at 50 Psig (1 x1-1/4)	
Buderus	CB-G515-G615	Cleaning Brush Kit G515 and G615	

Additional Information

The standard safety vale setting is 50 Psig. Other valve settings are available on request. By approving these submittals you are accepting this selection.

Quantity	Brand	Model	Description
2		ME-BUR	Burner

Accessories

Riello	RL50/M-208	Burner	
Fuel	Oil	- Item	: C9513300
- Operation	: Modulation	- PID controller RWF55	: 20094961
- Voltage	: 208V/3Ph/60Hz	-	:
Riello	(C7000327)	Relay	
Type	Relay	- Ring Alarm Bell	: No
- Function	: Power ON	- Dry Contact Seperate	: No

Quantity	Brand	Model	Description
2		ME-LAB	Labour

Specification Sheet

BUDERUS

G315 | G515 | G615

Cast Iron Commercial Boilers

- High Efficiency—Combustion Efficiencies Up to 88.2%
- 350 to 3,982 MBH Output
- Thermostream Design Eliminates Thermal Shock

Superior Equipment by Design

Comfortable. Efficient. Intelligent Heating.

Buderus

G315 | G515 | G615

Thermostream Design

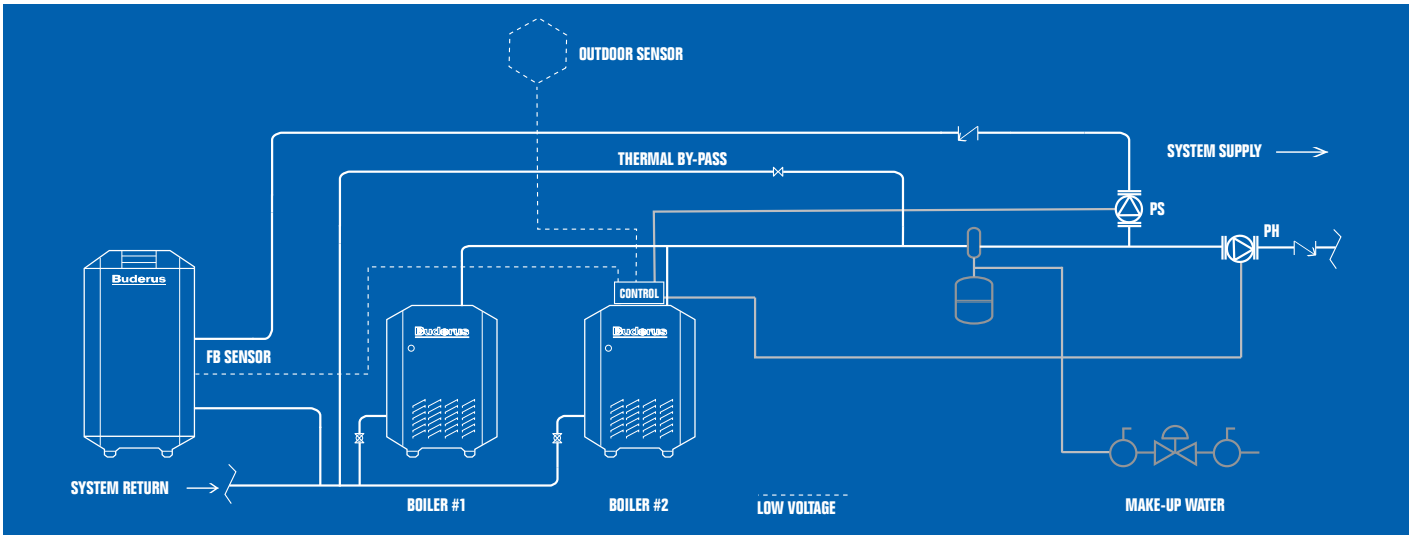
The Buderus developed Thermostream principle is proven for higher efficiency and improved system reliability in high volume heating systems. Condensation and thermal shock are made impossible by design, as cool return water mixes internally and is preheated with supply water before exposure to directly heated surfaces. This process eliminates hot and cold spots in the boiler and balances water flow throughout all boiler sections. The Thermostream design permits continuous low temperature operation under normal return water without requiring a minimum boiler return temperature. Internal water circulation and injection into each boiler section combined with deflection plates ensure condensate free boiler operation—even under no flow conditions.

A Better Way to Heat

The Buderus commercial Thermostream boilers are designed with many physical attributes setting them above the competition and increasing their longevity and efficiency. The burner doors are field adjustable to swing fully open from either side, to enable the boilers to fit in any location. These boilers are shipped knocked down for easy transport, the G315 and the G515 can also be shipped as an assembled block. Due to the unique chamber design, no refractory materials are used. This reduces the number of service calls and maximizes heat transfer. Buderus precision castings eliminate the need for manual grinding. Precision beveled steel push nipples join cast iron sections and high temperature flue sealants are used to sustain pressurized operation.

The G315 and G515 come with a full 3½" of thermal insulation, and the G615 comes with a full 4" of thermal insulation to reduce standby heat loss. All Buderus cast iron commercial boilers are manufactured with the Buderus GL-180M cast iron with a silicone "barrier skin." To streamline the appearance of the boilers, the supply and return connections for the G315 are located at the rear of the boiler, while the G515/G615 have top supply and a rear return. These boilers are for use with hot water and can be installed with gas, oil or dual fuel burners.

Intelligent Heating—by Design



Buderus, the world leader in heating technology, manufactures the highest quality boilers based on centuries of experience. With its innovative design and quality manufacturing, a Buderus boiler will outlast and out-perform virtually any other commercial hot water boiler system in the world.

The G315, G515 and G615 are designed to maximize the heating value of every ounce of fuel and are built with the highest quality materials. Established in 1731, Buderus uses state-of-the-art techniques in the design and manufacturing of its boilers.

Design Benefits

- Eliminates the need for bypass loop or shunt pump
- Eliminates hot and cold spots in the boiler
- Allows operation at low return water temperatures without thermal shock concerns
- Minimum supply temperature of 122°F with standard control
- Ensures balanced water flow through all boiler sections

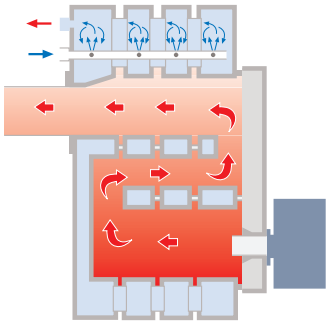
NOTE: This drawing is conceptual in nature and does not purport to address all design, installation or safety considerations.

Boiler Construction

The boiler sections are assembled with beveled, surface-profiled push nipples for long, trouble-free watertight operation. Boiler flueways are manufactured to be gas tight with tongue and groove section design and elastic, high temperature resistant sealing rope. A permanent dry door gasket ensures repeated positive sealing of the full swing burner door. Because flue gases cannot escape through the seams between boiler sections, the boilers are able to retain heat more efficiently.

GL-180M Gray Cast Iron

Buderus GL-180M silicone injected, gray cast iron obtains its superior material characteristics primarily from a high carbon (graphite) and silicone content.



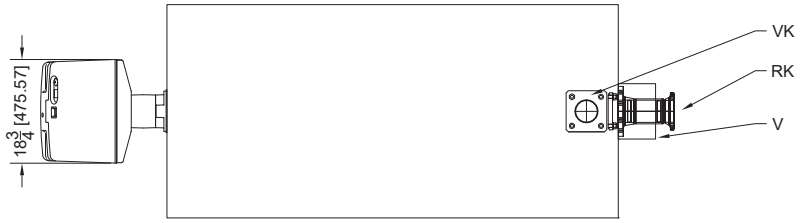
Buderus GL-180M gray cast iron has excellent corrosion resistance, exceptional casting characteristics, 40% greater flexibility and elasticity as well as high thermal conductivity. Buderus developed the special substances that are impregnated during the casting process to improve the mechanical properties of cast iron. The graphite precipitates into smaller, modified flakes which produce GL-180M cast iron with 40% greater elasticity and a high silicone barrier for corrosion protection. All sections are heat treated to relieve thermal stresses. Additional elements further enhance the properties of the GL-180M. The graphite appears in two different forms in the microstructure: nodular form producing excellent tensile strength and great elasticity and graphite flakes producing excellent corrosion resistance against acidic combustion products.

Full Three Pass Design—for High Efficiency

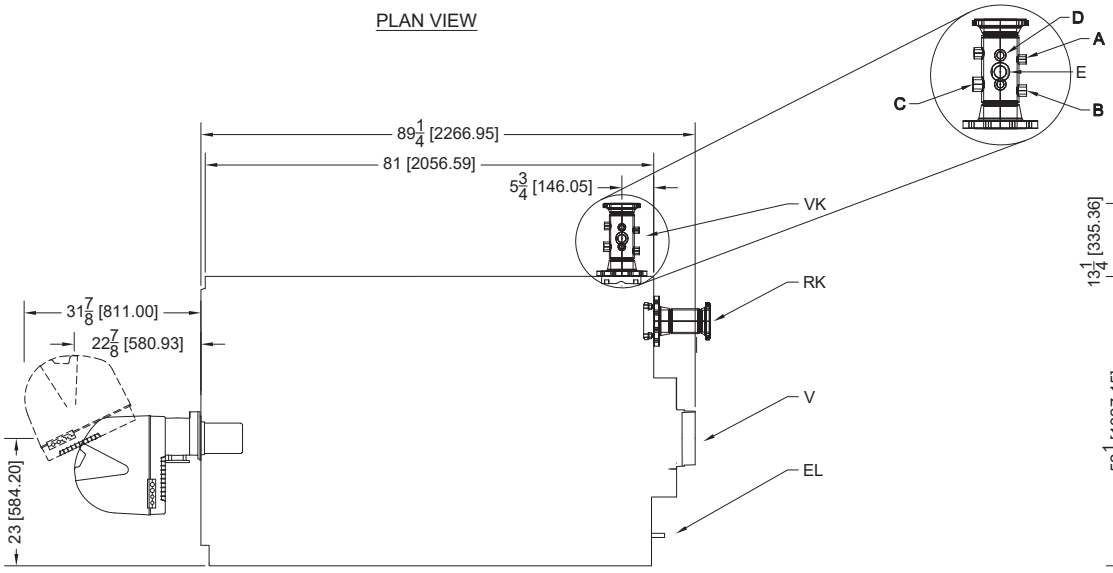
Buderus developed the full three pass system to increase the heat transfer and efficiency of boilers. This design allows more heat to be transferred during all three passes, unlike conventional boilers that only use one pass to transfer heat. This system maximizes the total possible heat available with the lowest fuel consumption possible. To greatly decrease standby loss Buderus has manufactured a 3½" and 4" thick thermal insulation.

The Three-Pass Boiler is Designed for:

- Optimized combustion with positive pressure-fired boilers and tailored chamber geometry—no need for a heat-consuming refractory or target wall eliminating the need for costly repairs
- Minimal stack losses with the modified three-pass flue design's large heat transfer areas
- Low standby losses with a full 3½" to 4" jacket of thermal insulation around the entire block—even underneath the boiler



How it Works



The flame fires into the first chamber. Then the flue products flow through the second pass to the front of the boiler. From there they reverse direction again—moving through the third pass to the back, and finally exiting via the flue connection into the chimney. Because the gases are held in the boiler longer this allows the cast iron to absorb the maximum amount of heat, resulting in a lower stack temperature and a higher efficiency.

SPECIFICATIONS		
BOILER MODEL	G515/11	G515/11
INPUT CAPACITY	13.6 USG/Hr	51.5 L/Hr
GROSS OUTPUT	1 652 MBTU/Hr	483.8 KW

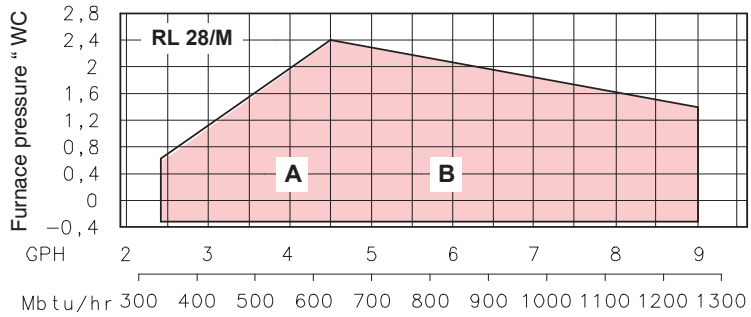
(C)

(1) Blast tube: short - long (obtainable with the kit)

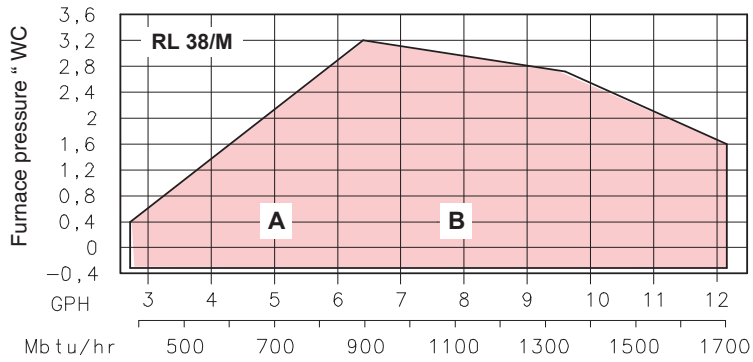
BURNER DESCRIPTION (A)

1 Ignition electrodes
2 Combustion head
3 Screw for combustion head adjustment
4 Photocell (cad cell)
5 Screw for fixing fan to flange
6 Servomotor provides adjustment of fuel delivery regulator and of air damper. When the burner is not operating the air damper is fully closed in order to reduce heat dispersion from the boiler due to the flue draft which draws air from the fan suction inlet.
7 Slide bars for opening the burner and inspecting the combustion head
8 Safety solenoid valve
9 Pump delivery valve
10 Valve on nozzle return
11 Pressure regulator on nozzle return
12 Pump
13 Plate prearranged to drill 4 holes for the passage of hoses and electrical cables.
14 Air damper
15 Non-drip nozzle holder
16 Fan pressure test point
17 Boiler mounting flange
18 Flame stability disk
19 Flame inspection window
20 Power switch for different operation:
automatic - manual - off
Button for:
power increase - power reduction
21 Motor contactor and thermal overload with reset button (RL 38 - 50/M)
22 Extensions for slide bars 7)
23 Flame safeguard with lock-out pilot light and lock-out reset button
24 Terminal strip
25 High oil pressure switch
26 Pump pressure adjustment
27 Pressure gauge for pressure on nozzle return
28 Protection (for RL 50/M single-phase burner)

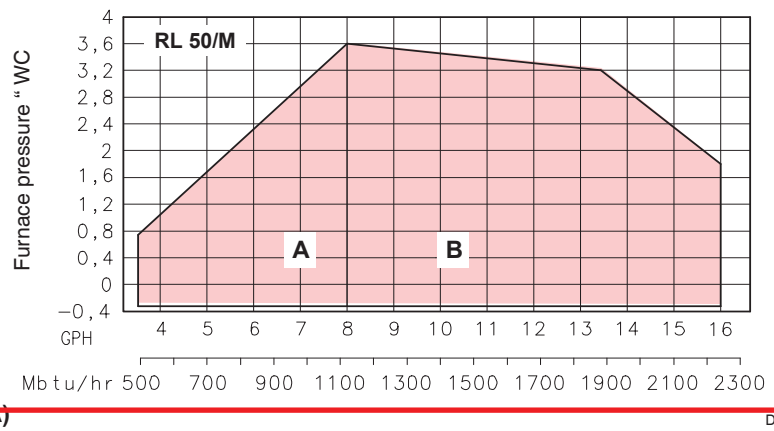
Two types of burner failure may occur:
Flame safeguard lock-out:
If the flame relay 23)(A) pushbutton lights up, it indicates that the burner is in lock-out.
To reset, press the pushbutton.
Motor trip (RL 38 - 50/M):
release by pressing the pushbutton on thermal overload 21)(A).



PACKAGING - WEIGHT (B) - Approximate measurements



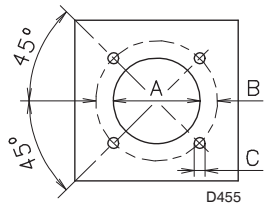
- The burners are shipped in cardboard boxes with the maximum dimensions shown in Table (B).
- The weight of the burner complete with packaging is indicated in Table (B).

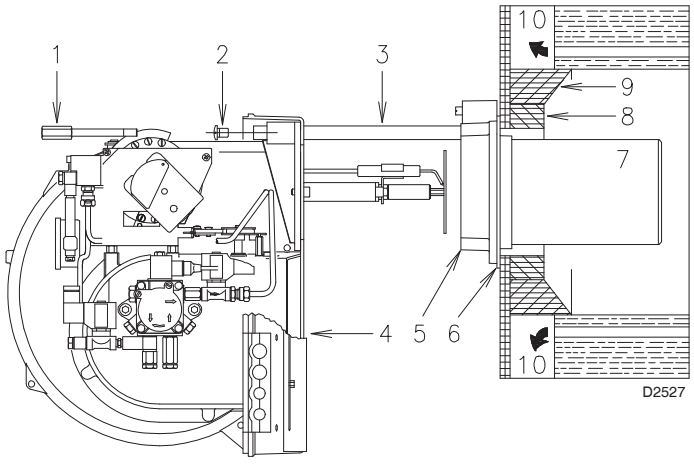


MAX. DIMENSIONS (C) - Approximate measurements
The maximum dimensions of the burner are given in (C).
Inspection of the combustion head requires the burner to be opened and the rear part withdrawn on the slide bars.
The maximum dimension of the burner, without casing, when open is give by measurement H.

STANDARD EQUIPMENT

2 - Flexible hoses
2 - Gaskets for flexible hoses
1 - Burner head gasket
4 - Screws to secure the burner flange to the boiler 3/8 W x 1”
1 - Adaptor G 1/8“ / 1/8“ NPT
1 - Instruction booklet
1 - Spare parts list





(A) D2526

inch	A	B	C

RL 38/M	$6^{5}/_{16}$"	$8^{13}/_{16}$"	$^{3}/_{8}$ W
RL 50/M	$6^{5}/_{16}$"	$8^{13}/_{16}$"	$^{3}/_{8}$ W

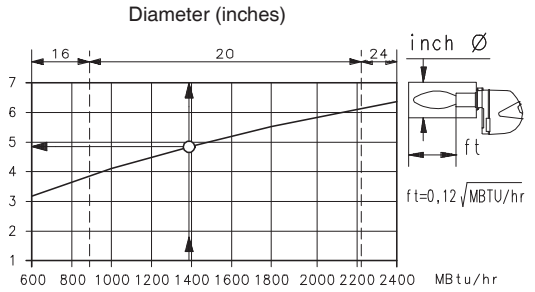
(B)

(C)

FIRING RATES (A)

During operation, burner output varies between:
- **MINIMUM OUTPUT** : area A
- **MAXIMUM OUTPUT** : area B

Graphs (A):
Horizontal axis : Burner output
Vertical axis : Heater furnace pressure
The firing rate may be found by plotting a vertical line from the desired delivery and a horizontal line from the pressure in the combustion chamber. The intersection of these two lines is the firing rate which must lie within area A, for MIN output, and within area B, for MAX output.
Important:
The FIRING RATE area values have been obtained considering a surrounding temperature of 68 °F (20 °C), and an atmospheric pressure of 394" W.C. and with the combustion head adjusted as shown on page 6.



Note:
The FIRING RATE areas given in figure (A) have been reduced by 10% with respect to the maximum range that can be reached.

Consult Appendix on page 22 for operation at different ambient temperatures and / or altitudes.

MINIMUM FURNACE DIMENSIONS

The firing rates were set in relation to certified test boilers.
Figure below indicates the diameter and length of the test combustion chamber.

Example:
output 1388 MBTU/h:
diameter 20 inch - length 4.9 ft.

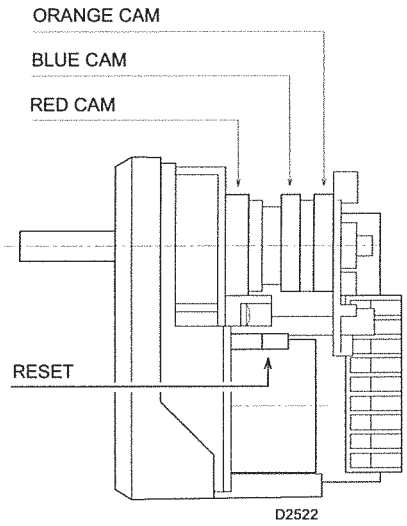
INSTALLATION

BOILER PLATE (B)

Drill the combustion chamber mounting plate as shown in (B). The position of the threaded holes can be marked using the burner head gasket supplied with the burner.

BLAST TUBE LENGTH (C)

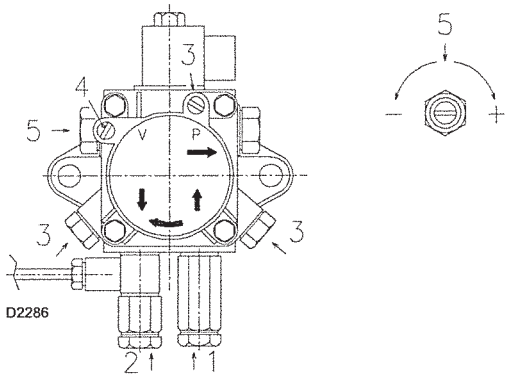
The length of the blast tube 7) must be selected according to the indications provided by the manufacturer of the boiler, and in any case it must be greater than the thickness of the boiler door complete with its insulation. The range of lengths available, (inch), is as follows:



Blast tube 7):	RL 28/M	RL 38/M	RL 50/M
• short	$9^{15}/_{32}$"	$9^{15}/_{32}$"	$9^{15}/_{32}$"
• long	$13^{13}/_{16}$"	$13^{13}/_{16}$"	$13^{13}/_{16}$"

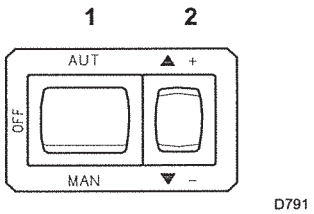
For boilers with front flue passes 10) or flame inversion chambers, protective insulation 8) must be inserted between the boiler refractory 9) and the blast tube 7).
This protective insulation must not compromise the extraction of the blast tube.
For boilers having a water-cooled front the insulation 8)-9)(C) is not required unless it is required by the boiler manufacturer.

SECURING THE BURNER TO THE BOILER (C)



Disassemble the blast tube 7) from the burner 4) by proceeding as follows:
- remove the screws 2) from the two slide bars 3).
- Remove the screw 1) fixing the burner 4) to the flange 5).
- Withdraw the blast tube 7) complete with flange 5) and slide bars 3).

Secure flange 5)(C) to the boiler plate inserting the supplied gasket 6). Use the 4 screws provided after having protected the thread with an antilocking product.
The burner-boiler seal must be airtight.



(A)

E	°F - °C	140 - 60
F	PSI	29
G	PSI	290
H	inch	0,006

(B)

(C)

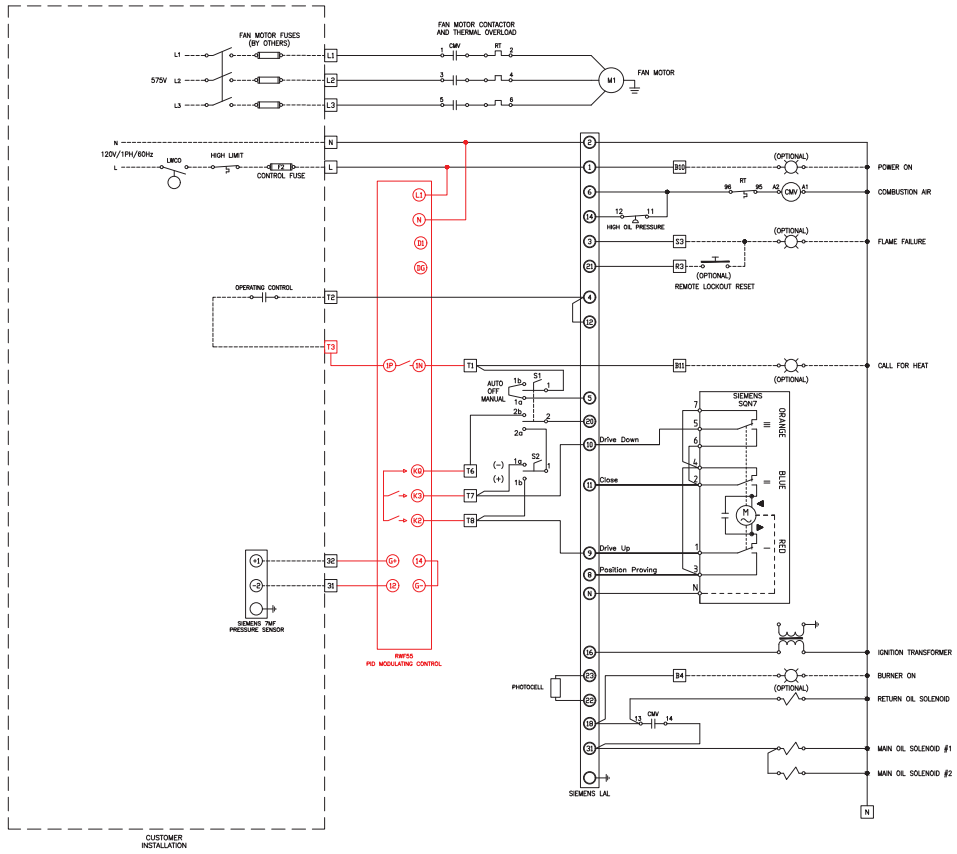
SERVOMOTOR (A)

The servomotor provides simultaneous adjustment of the air damper 11)(B) page 9 and the pressure regulator 9) by means of a double variable profile cam, 4) and 7). The servomotor rotates through 90° in 25 seconds.
Do not alter the factory setting for the cams; simply check that they are set as indicated below:

Red cam : 90°
Limits rotation toward maximum position.
Blue cam : 0°
Limits rotation toward the minimum position. When the burner is shut down the air damper must be closed: 0°.
Orange cam : 15°
Adjusts the ignition position and the MIN output.

PUMP (B)

1 - Suction	1/4" NPT
2 - Return	1/4" NPT
3 - Pressure gauge attachment	G 1/8"
4 - Vacuum gauge attachment	G 1/8"
5 - Pressure adjustment screw	



A - Min. delivery rate at 290 PSI pressure
B - Delivery pressure range
C - Max. suction pressure
D - Viscosity range
E - Max fuel oil temperature
F - Max. suction and return pressure
G - Pressure calibration in the factory
H - Filter mesh width

PUMP PRIMING

- **Before starting the burner, make sure that the tank return line is not clogged. Obstructions in the line could cause the seal located on the pump shaft to break.**
- In order for self-priming to take place, one of the screws 3)(B) of the pump must be loosened to bleed off the air contained in the suction line.
- Start the burner by closing the control circuit switch 1)(C) in the "MAN" position. As soon as the burner starts, check the direction of rotation of the fan blade, by looking through the flame inspection window 19)(A)p.4.
- The pump can be considered primed when the fuel oil starts coming out of the screw 3). Stop the burner: switch 1)(C) set to "OFF" and tighten the screw 3).

The time required for this operation depends upon the diameter and length of the suction tubing. If the pump fails to prime at the first cycle of the burner and the burner locks out, wait approx. 15 seconds, reset the burner, and then repeat the starting operation as often as required. After 5 or 6 starting operations allow 2 or 3 minutes for the transformer to cool.

Important
The priming operation is possible because the pump is already full of fuel when it leaves the factory. If the pump has been drained, fill it with fuel through the opening for the vacuum gauge prior to starting; otherwise, the pump will seize. Whenever the length of the suction piping exceeds 66 - 99 ft, the supply line must be filled using a separate pump.

LEGEND:

RWF55 Control

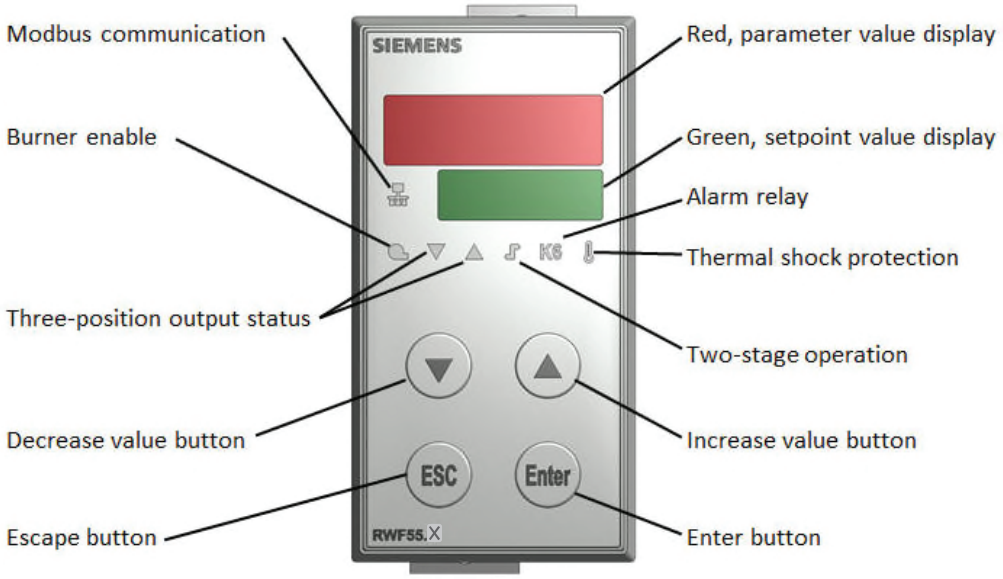
Product Description

The RWF55 is a modulating burner/boiler control designed and engineered specifically for burner/boiler applications. The RS-485 Modbus RTU communications port allows the RWF55 control to communicate with a Building Management System (BMS) or function as an integral part of a PLC or BMS based lead/lag boiler room management system.

Sample Specification

1. The control shall have a four character, bright red LED, continuous display of process variable and a four character, bright green LED, continuous display of process setpoint. Either display shall be configurable to show analog input 1, 2, or 3, output, or thermal shock end value.
2. Active Modbus communication shall be indicated by a flashing green LED.
3. Burner enabled indication shall be indicated by a steady green LED.
4. Three-position output status shall be indicated by two orange LED's.
5. Two-stage operation status shall be indicated by an orange LED.
6. Alarm relay activation shall be indicated by a red LED.
7. Active thermal shock protection shall be indicated by an orange LED.
8. The control shall be equipped with an integral 24 VDC/30 mA power supply.
9. The control shall be configurable to accept the following process variable inputs:
    - Pt100, 2-wire or 3-wire
    - Pt1000, 2-wire or 3-wire
    - LG-Ni1000, 2-wire or 3-wire
    - B, J, K, N, R, S, or T-type thermocouples
    - 0-20 mA or 4-20 mA
    - 0-5 VDC, 1-5 VDC, or 0-10 VDC
    - 0-135 Ω

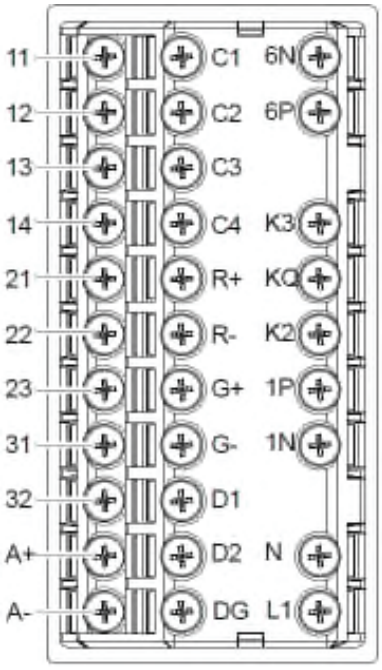
10. The control shall function as a continuously modulating control and provide one of the following selectable output signals:
    - Three-position, floating (bumping)
    - 0-20 mA or 4-20 mA
    - 0-10 VDC
11. The control shall be configurable, via a digital input, to function as either a PID control or two-stage (high/low) control.
12. The control shall provide the burner enable function.
13. The control shall function as a PID control with the following adjustable parameters:
    - Proportional band (Pb.1)
    - Integral action time (rt)
    - Derivative time (dt)
    - Dead band (db)
    - Actuator running time (tt)
14. The control action shall be selectable as either heating (reverse) or cooling (direct).
15. The control shall have a PID “Auto Tune” function that can be enabled to automatically tune the control parameters to the control characteristics of the burner/boiler.
16. The control shall be configurable for one of the following analog input signals to allow remote process setpoint control via BMS or other boiler room management systems:
    - 0-20 mA or 4-20 mA
    - 0-5 VDC, 1-5 VDC, or 0-10 VDC
    - 0-1000 Ω
17. The control shall be programmable with a second setpoint.
18. The control shall be programmable to offset setpoint 1, via digital input contact closure, to provide a dual setpoint.
19. The control shall be programmable with high and low operating limits.
20. The control shall be able to accept either of the following temperature sensing devices to reset the outdoor temperature setpoint:
    - LG-Ni1000, 2-wire
    - Pt1000, 2-wire



21. The control shall allow for time-averaged readings of outdoor temperatures, and configurable parameters for adjusting the slope of the outdoor temperature reset curve.
22. The control shall include adjustable high and low process setpoint limits to prevent the process setpoint from being programmed outside of the defined range by any of the following methods:
    - Manually using a keypad
    - Remotely via the analog process setpoint control input
    - Remotely via Modbus
23. The control shall include thermal shock protection providing configurable field parameters to adjust the slope and tolerance band.
24. Temperature process variables shall be displayed in ˚F or ˚C.
25. The process variable shall be displayed with zero, one, or two digits after the decimal point.
26. The control shall have a manual control feature. The display should alternate between "HAnd" and the output percentage when in manual control mode.
27. The control shall have an intelligent and configurable burner on-off cycle minimizing feature with the following functionality:
    - When demand on the boiler is less than low fire, the control will hold the burner at low fire.
    - When the demand on the boiler increases, the control will release the burner to modulate.
28. The control shall have a configurable alarm relay in relation to any of the analog inputs with the following features:
    - Can be programmed relative to an absolute value, or in relation to the setpoint
    - Configurable to break open or closed
29. The control shall be configurable to retransmit analog input 1, 2, or 3 to the analog output. The analog input can be scaled to produce varying analog outputs.
30. The control shall have three lockable levels of programming access:
    - Configuration menu
    - Parameter and configuration menus
    - Keyboard

31. The control front panel shall be IP66 rated.
32. The control's configuration data shall be stored in EEPROM, ensuring power failure protection.
33. The control shall utilize universal voltage inputs of 110-240 VAC, 48-63 Hz.
34. The control shall have a Modbus communications port with the following features:
    a. Standard RS-485 Modbus RTU communication protocol
    b. Selectable baud rate (4800-38400)
    c. Programmable Modbus address (1-254)
    d. Ability to apply analog inputs 2 and 3 as read only, to perform the following functions:
        i. Input 2 can be connected to a 0-1000 Ω potentiometer, on a firing rate control motor, to transmit the actual firing rate.
        ii. Input 3 can be connected to a temperature sensor to transmit outdoor temperature, boiler water temperature, or stack temperature.
    e. Remote control functions:
        i. Unfiltered, direct reading of analog inputs 1, 2, and 3
        ii. Programmable timer function for fail-safe return to local control, if communications fail
        iii. Burner shutdown capability
        iv. Manual control (floating or analog output)
        v. Control of the alarm relay
35. The control shall return to displaying the process variable and setpoint if none of the buttons on the front panel have been pressed for the duration of a programmable amount of time.
36. The control shall have associated software available to save, adjust, or upload parameter settings.

Technical Specifications



Input Voltage	110-240 VAC (+10/-15%), 48-63 Hz
Power Consumption	Max 20 VA
Operating Temperature	-20 to 50 °C, -4 to 122 °F
Enclosure Rating	IP66 keypad display, rel. humidity <95% (non-condensing)
Aux. DC Power Output	24 VDC, 30 mA
Output Relay Contact Rating	24-240 VAC, 2 A max
Analog Output Rating	0-10 VDC (500 Ω load min), 0-20 mA or 4-20 mA (500 Ω load max)
Modbus RTU Port	Configurable baud rate (4800, 9600, 19200, 38400) Address 1-254
Size	1/8 DIN, 122 mm mounting depth
Data Storage	Non-volatile EEPROM
Approvals	UL, CSA, CE

Low-temperature oil/gas boiler

6 720 642 624-00.1O

WARNING: If installation, adjustment, modification, operation or maintenance of the heating system is carried out by an unqualified person, this may result in personal injury or property damage.
The directions of this installation manual must be followed precisely.
If support or additional information is required, contact a qualified service company, service provider or the gas company.

WARNING:
Observe the safety instructions of this installation manual before placing the heating appliance in operation.
The operating manual is a component of the technical documentation and must be handed over to the operator of the heating system. Explain to the owner or operator how to use the heating system using the operating instructions. Make sure that he has been familiarized with all information required for the operation of the heating system..

NOTICE: If the storage tank will be installed in Massachusetts, it must be installed by an installer or dealer who is registered there.

This manual is available in the English and French language.

Please keep this manual for future reference.

Installation and Service Instructions
Logano G515

Boilers for oil/gas-fired power burners

6 720 647 208 (2014/09) US/CA

Read carefully prior to installation and maintenance.

Buderus

About this manual

The appliance conforms to the basic requirements of the relevant directives.
The conformity has been confirmed.
The corresponding documentation and the original Declaration of Conformity are on file with the manufacturer.

This installation and maintenance instructions contain important information for the safe and proper installation, initial start-up and maintenance of the oil/gas-fired boiler Logano G515.

These installation and maintenance instructions are designed for specialists, who, due to their vocational training and experience, are knowledgeable in handling heating systems and oil and gas installations.

The oil/gas-fired boiler Logano G515 is available in two variants (disassembled and assembled).

These installation and maintenance instructions explain the installation and maintenance of both boiler types.

1 Guideline to symbols and safety instructions

1.1 Guideline to symbols

Warnings

Warnings are indicated in the text by a warning triangle and a gray background.

Signal words at the beginning of a warning are used to indicate the type and seriousness of the ensuing risk if measures for minimizing damage are not taken.

- **NOTICE** indicates that damage to property may occur.
- **CAUTION** indicates possible minor to medium personal injury.
- **WARNING** indicates possible severe personal injury.
- **DANGER** indicates a potential for loss of life.

Important Information

Important information neither indicating personal injury nor damage to property are marked with this symbol. They are separated by lines above and below the text.

Additional symbols

Symbol	Explanation
▶	Sequence of steps
→	Cross-reference to other points in this document or to other documents
•	Listing/list entry
–	Listing/list entry (2nd level)

Table 1

1.2 Safety instructions

Danger from failing to consider your own safety in an emergency such as a fire

- Never risk your own life. Your own safety must always take the highest priority.

Risk due to oil leaks

- When using oil as the fuel, national regulations hold the operator responsible for immediately asking a specialist contractor to remedy oil leaks the moment they are discovered.

If you smell gas

- Close the gas shut-off valve.
- If you hear gas escaping, evacuate the affected area immediately.
- Open the windows.
- Do not operate any electrical switches or equipment such as telephones, power plugs and doorbells.
- Extinguish all open flames.
- Do not smoke.
  Do not use lighters.
- Warn all occupants of the building, but do not ring doorbells.
- Call your gas utility company and your local heating contractor **from outside the building.** If necessary, notify police or the fire department.

If you smell flue gas

- Switch OFF the appliance.
- Open windows and doors.
- Inform a trained and certified heating contractor.

Danger of electric shock when the control panel is open

- Always de-energize the connection before working on electrical parts (circuit breaker).
- Take provisions against unintentional reconnection.

Danger of poisoning from flue gas if supply of combustion air is insufficient

- Safeguard supply of combustion air.
- Do not cover or reduce the size of ventilation openings in doors, windows and walls.
- Safeguard sufficient supply of combustion air also for appliances installed at a later date, e.g. kitchen exhaust fans, clothes dryers, and air conditioning units with vent to the outside.
- Never operate the appliance if the supply of combustion air is insufficient.

Combustion air / room air

To prevent corrosion, keep the supply of combustion air / room air free of corrosive substances (e.g. halogenated hydrocarbons that contain chlorine or fluorine compounds).

Danger of explosion of flammable gases

- Only employ a trained and certified contractor to carry out work on the gas train.

Explosive and easily combustible materials

Never use or store easily combustible materials (paper, thinners, paints, etc.) near the appliance.

Installation, conversion

Only have the appliance installed or modified by a trained and certified heating contractor.

Never modify any parts that carry flue gas.

Never close the outlet of safety valves. Water may be expelled from any safety valve during heat-up.

Inspection and maintenance

The operator is responsible for safety and environmental compliance of the heating system.

Sign a maintenance and inspection contract with a trained and certified contractor, covering an annual inspection and demand-dependent maintenance. This guarantees high efficiency and environmentally sound combustion.

Instructing the customer

- Instruct customers about the functions and operation of the appliance.
- Inform the customer that they must not carry out any modifications or repairs.
- Only use the boiler for its intended purpose and only when it is in working order.

Disposal

- Dispose of packaging in an environmentally responsible manner.
- All heating system components that have to be replaced should be disposed of in environmentally-responsible manner at an authorized disposal site.

Other important information

- If the system overheats or the gas supply does not shut off, do not switch off or disconnect the power supply to the pump. Instead, shut off the gas supply somewhere else separate from the heating system.

2 Product description

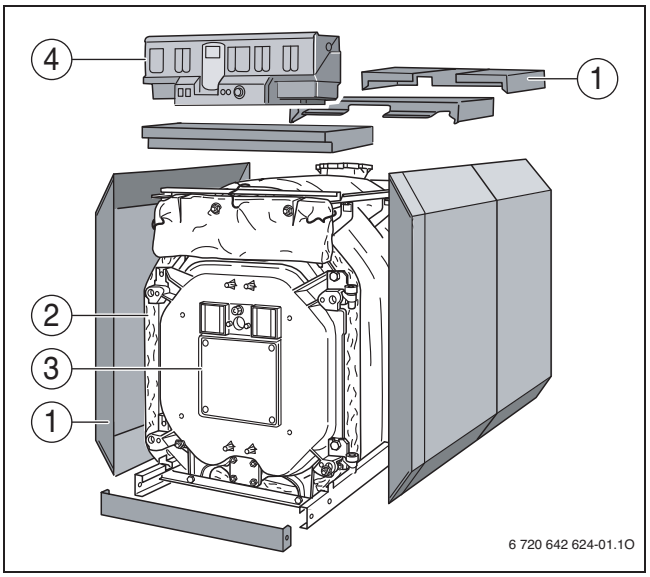

Fig. 1 Oil/gas-fired boiler Logano G515

[1] Boiler shell (jacket)
[2] Thermal insulation
[3] Boiler heat exchanger
[4] Control panel assembly

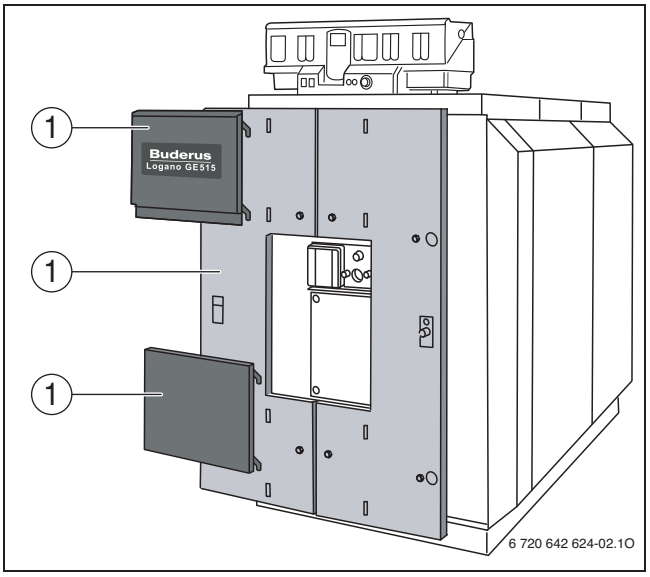

Fig. 2 Front jacket

[1] Boiler shell (jacket)

The Logano G515 oil/gas-fired boiler is supplied with or without a burner You can obtain undrilled or predrilled burner plates (hole pattern depends on burner) as accessories from Buderus.

The predrilled burner plate is included in the scope of delivery for the Logano G515 with oil or gas-fired fan-assisted burners.

NOTICE: Risk of system damage from use of incorrect burner.

- ▶ Only use burners that meet the technical requirements of the oil/gas-fired boiler Logano G515 (→ Chapter 3, page 8).

The main components of the Logano G515 oil/gas-fired boiler are:

- Boiler block (→ Fig. 1, [3]) The boiler heat exchanger transfers the heat generated by the burner to the boiler water.
- Boiler shell (jacket, (→ Fig. 1 [1] and Fig. 2, [1]), thermal insulation (→ Fig. 1, [2]). The boiler jacket and thermal insulation minimize energy loss.
- Control panel (→ Fig. 1, [4]). The control panel is designed to monitor and control all electrical components of the Logano G515 oil/gas-fired boiler.

Observe all standards and guidelines applicable to the installation and operation of the system in your country.
Please observe the information on the boiler rating plate.

To prevent boiler contamination, we recommend installing a dirt trap in the water system.

As a basic rule, flush existing systems before connecting the boiler.
Install a desludging unit in the boiler return to prevent damage to the boiler.

	Fuels		
Logano G515	Heating oil	Liquid propane (LPG)	Natural gas (NG)
Remarks	The Logano G515 boiler can be operated with the specified fuels. Select a burner suitable for use with the fuels specified for the Logano G515 boiler. The output figures shown in the Tab. “Technical Data” are nominal power figures. Carry out maintenance and cleaning procedures annually. Check that the entire system is functioning correctly. Immediately remedy faults. If heating oil is used, shorter maintenance intervals may be necessary depending on the operating time.		

Table 2

2.1 Designated use

The Logano G515 oil/gas-fired boilers have been designed for the heating of water.

The Logano G515 can be operated with oil, gas, and combination burners. For a list of the approved burners, please contact Bosch Thermotechnology Corp.

This boiler can be operated with an aquastat, the Logamatic 4000, and other control systems.

2.2 Operating conditions

Thermostream technology is a unique feature of Buderus cast iron boilers. Return water is preheated and mixed within the boiler before it comes in contact with the heating surface of the combustion chamber. The Thermostream technology ensures there is an even temperature distribution in the boiler and avoids condensate forming within the combustion chamber. This unique feature reduces thermal stress, the main cause of failure of traditional cast iron boilers. The advantage of this technology is the maintenance of the minimum operating temperature of the boiler (→ Tab. 3); this makes the installation of a shunt pump unnecessary. This way, the costs for the pump itself and its power consumption, as well as possible failure costs are saved. The minimum boiler operating temperature as shown in the table below must be reached within 10 minutes and then be maintained while the burner is running.

		Control of all heating zones with Buderus 4000	External controls (BMS) or Aquastat control
Minimum flow rate		none	
Minimum return temperature	°F (°C)	none	
Minimum operating temperature oil boiler[1)]	°F (°C)	122 (50)	
Minimum operating temperature gas boiler[1)]	°F (°C)	122 (50)	140 (60)
Maximum supply temperature	°F (°C)	212[2)]/248[3)] (100[2)]/120[3)])	
Maximum operating pressure	PSI (bar)	87 (6)	
Time constant of the temperature controller	sec	40	
Time constant of the monitor/limiter	sec	40	

Table 3

1) This temperature has to be reached within ten minutes of the burner starting and has to be maintained whilst the burner is firing.

2) The maximum supply temperature is 212 °F (100 °C), if the boiler is operated as hot water boiler.

3) The maximum supply temperature is 248 °F (120 °C), if the boiler is operated as a hot water generator.

This operating condition can be easily achieved by the controls monitoring the boiler temperature and reducing the flow rate through the boiler until the required temperature is reached. This is then maintained by continuing to control flow based on the boiler water temperature. The controls can reduce the flow rate by closing the valves on the mixed heating circuits, modulating the boiler primary pumps or by closing the motorized butterfly valves or by having a motorized valve in the boiler return on a single boiler installation. The Buderus 4000 series control panel can manage this process or it can be completed by the BMS.

If it is not possible for the control panel to regulate the flow sufficiently to meet this operating condition, then a shunt pump circuit must be fitted to avoid the type of thermal stress that all boilers would experience in these conditions. This shunt pump circuit can be controlled either with a Buderus 4000 control panel or with a third-party controller. Failure to ensure that the operating condition is maintained may lead to thermal stress in the boiler and eventual failure of the sections which would be outside the scope of the warranty.

2.3 Compliance with standards and regulations

Installation and operation of the system must comply with all applicable codes, regulations and statutory requirements.

Installation, connection of the fuel supply and flue connector, commissioning, connection of the electrical power supply, servicing and repair may only be carried out by trained and certified heating contractor. Only registered gas fitters may carry out work on the gas train.

The system must be cleaned and serviced once a year. The operation of the complete system must be tested at the same time. Any faults must be corrected immediately.

The design and mode of operation of this boiler comply with the American National Standard ANSI Z21.13/CSA4.9, latest edition for Gas Fired Low Pressure Steam and Hot Water Boilers.

Other confirmed approvals and certifications are indicated by labels on the boiler.

The heat exchanger has been designed and certified in accordance with the ASME Boiler and Vessel Code, Section IV.

Installation of the wall mounted condensing gas boiler must comply with all applicable codes and regulations imposed by the national, Federal or local authorities and bodies. If no specific requirements are defined, in the USA, the latest edition of the National Fuel Gas Code ANSI Z223.1/ NFPA 54 applies. In Canada, installation must comply in all respects with the latest edition of the Installation Code for Gas Burning Appliances and Equipment, CAN/CSA-B.149 and the applicable local regulations and requirements for the appliance category. The relevant authorities and regulatory bodies must be informed before installation starts.

Where required by local regulations, the system must comply with the American Society of Mechanical Engineers Safety Code for Controls and Safety Devices for Automatically Fired Boilers (ASME CSD-1).

The hot water distribution system must comply with all applicable codes and regulations. When replacing an existing boiler, it is important to check the condition of the entire hot water distribution system to ensure safe operation.

In the Commonwealth of Massachusetts, this appliance must be installed by a licensed plumber and gas fitter. Valves external to the boiler must be fitted with T-handles and condensate piping must be installed in accordance with the State Plumbing Code.

2.4 Additional regulations for installations in the Commonwealth of Massachusetts

(a) For all side wall horizontally vented gas fueled equipment installed in every dwelling, building or structure used in whole or in part for residential purposes, including those owned or operated by the Commonwealth and where the side wall exhaust vent termination is less than seven (7) feet above finished grade in the area of the venting, including but not limited to decks and porches, the following requirements shall be satisfied:

- INSTALLATION OF CARBON MONOXIDE DETECTORS. At the time of installation of the side wall horizontal vented gas fueled equipment, the installing plumber or gasfitter shall observe that a hard wired carbon monoxide detector with an alarm and battery back-up is installed on the floor level where the gas equipment is to be installed. In addition, the installing plumber or gasfitter shall observe that a battery operated or hard wired carbon monoxide detector with an alarm is installed on each additional level of the dwelling, building or structure served by the side wall horizontal vented gas fueled equipment. It shall be the responsibility of the property owner to secure the services of qualified licensed professionals for the installation of hard wired carbon monoxide detectors.
  - In the event that the side wall horizontally vented gas fueled equipment is installed in a crawl space or an attic, the hard wired carbon monoxide detector with alarm and battery back-up may be installed on the next adjacent floor level.
  - In the event that the requirements of this subdivision cannot be met at the time of completion of installation, the owner shall have a period of thirty (30) days to comply with the above requirements; provided, however, that during said thirty (30) day period, a battery operated carbon monoxide detector with an alarm shall be installed.
- APPROVED CARBON MONOXIDE DETECTORS. Each carbon monoxide detector as required in accordance with the above provisions shall comply with NPA 720 and be ANSI/UL 2034 listed and IAS certified.
- SIGNAGE. A metal or plastic identification plate shall be permanently mounted to the exterior of the building at a minimum height of eight (8) feet above grade directly in line with the exhaust vent terminal for the horizontally vented gas fueled heating appliance or equipment. The sign shall read, in print size no less than one-half (½) inch in size, “GAS VENT DIRECTLY BELOW. KEEP CLEAR OF ALL OBSTRUCTIONS”.
- INSPECTION. The state or local gas inspector of the side wall horizontally vented gas fueled equipment shall not approve the installation unless, upon inspections, the inspector observes carbon monoxide detectors and signage installed in accordance with the provisions of 248 CRM 5.08(2)(a) 1 through 4.

(b) EXEMPTIONS: The following equipment is exempt from 248 CRM 5.08(2)(a) 1 through 4:

- The equipment listed in Section 10 entitled “Equipment Not Required To Be Vented” in the most current edition of NFPA 54 as adopted by the board; and
- Product Approved side wall horizontally vented gas fueled equipment installed in a room or structure separate from the dwelling, building or structure used in whole or in part for residential purposes.

(c) MANUFACTURERS REQUIREMENTS - GAS EQUIPMENT VENTING SYSTEM REQUIRED. When the manufacturer of Product Approved side wall horizontally mounted gas equipment provides a venting system design or venting system components with the equipment, the instructions provided by the manufacturer for the installation of the equipment and venting shall include:

- Detailed instructions for the installation of the venting system or the venting system components; and
- A complete parts list for the venting system design or venting system.

(d) MANUFACTURERS REQUIREMENTS - GAS EQUIPMENT VENTING SYSTEM NOT PROVIDED. When the manufacturer of Product Approved side wall horizontally vented gas fueled equipment does not provide the parts for the venting of flue gases, but identifies “special venting systems”, the following requirements shall be satisfied by the manufacturer:

- The referenced “special venting systems” shall be included with the appliance or equipment installation instructions; and
- The “special venting systems” shall be Product Approved by the Board, and the instructions for that system shall include a parts list and detailed installation instructions.

(e) A copy of all instructions for all Product Approved side wall horizontally vented gas fueled equipment, all venting instructions, all parts lists for venting instructions, and/or venting design instructions shall remain with the appliance or equipment at the completion of the installation.

3 Specifications

The technical data provides information about the output profile of the Logano G515.

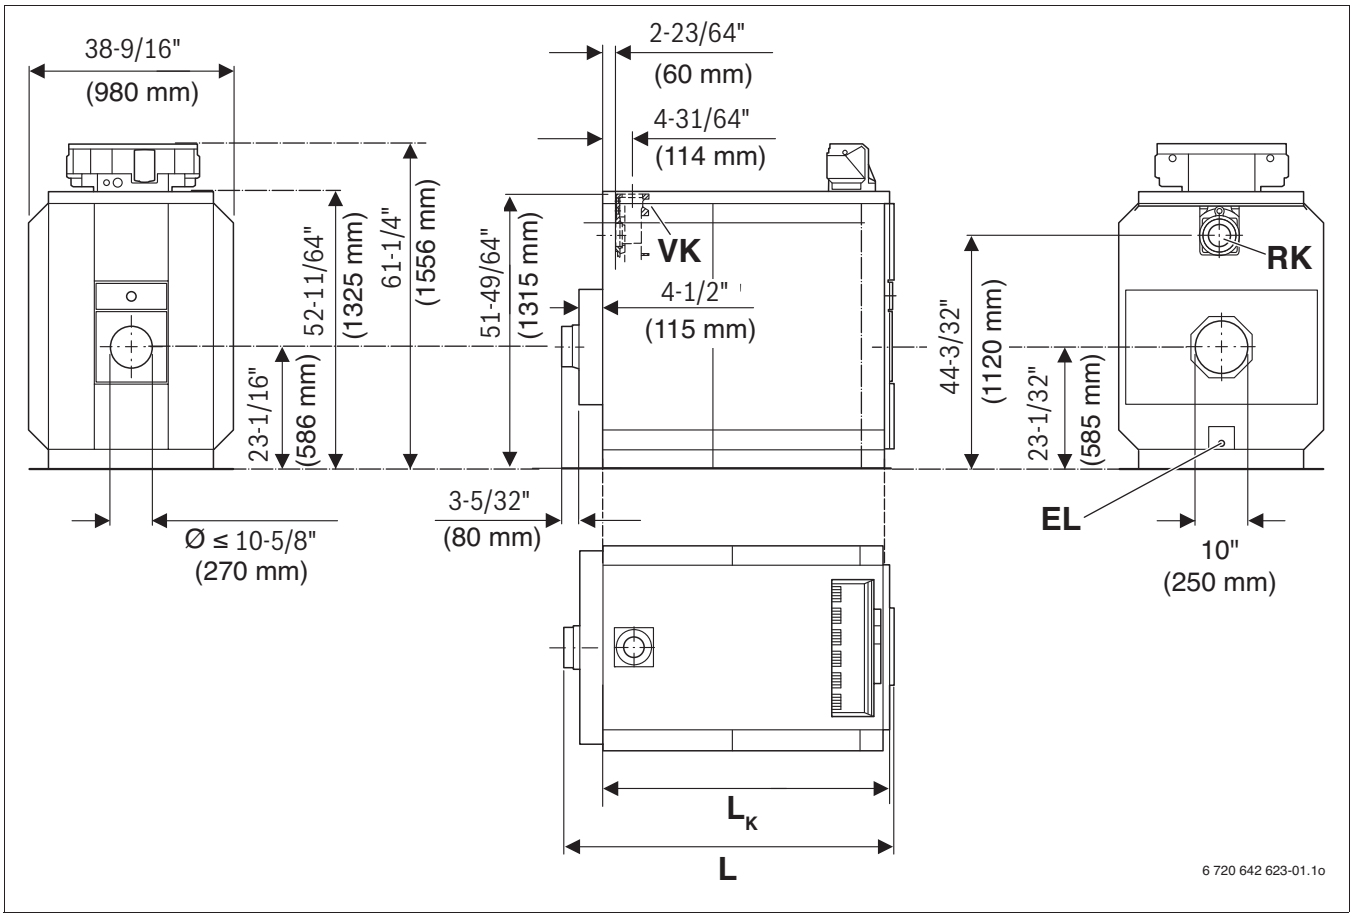

Fig. 3 Technical data for Logano G515 (dimensions in inches (mm))

[EL] Drain valve (Rp ¾)[1)]
[L_K] Boiler heat exchanger length
[L] Overall boiler length
[RK] Return connection on the boiler[2)]
[VK] Supply connection on the boiler[3)]

1) With the drain valve (EL), you may only drain the system, not fill it.
2) The filling of the boiler and the system must be undertaken on a separate connector on the return line.
3) The flange corresponds to the order reduced to 212 (DN100), 176 (DN80) or 149 (DN65).

Logano G515							
Boiler capacity	**Unit**	**240**	**295**	**350**	**400**	**455**	**510**
Maximum permissible supply temperature[3)]	°F (°C)	248 (120)					
Maximum permissible operating pressure	PSI (bar)	87 (6)					
		C SA® US					

Table 4

1) Weight with packaging approx. 6–8% higher.
2) The details relate to the upper and lower rated output range.
3) Safety limit (high limit safety cut-out). Maximum possible supply temperature = safety limit (STB) – 32 °F (–18 K).
Example: Safety limit (STB): = 212 °F (100 °C), max. possible supply temperature = 212–32 = 180 °F (100–18 = 82 °C).

4 Scope of delivery

The Logano G515 can be delivered either as a pre-assembled block or in loose sections.

- ▶ Check that the packaging is undamaged on delivery.
- ▶ Check that the delivery is complete.

4.1 Logano G515 – Delivery as a pre-assembled block

Component	Qty	Packaging
Boiler block with burner door and draft diverter	1	Pallet
Assembly components (longitudinal rails and supply pipe)	1	Box
Jacket Pack A, B, C (according to boiler rating)	1 – 3	Cartons
Thermal insulation	1	PU bag

Table 5

4.2 Logano G515 – Delivery in loose sections

Component	Qty	Packaging
Front and rear section as well as burner door	1	Pallet
Intermediate sections – (depending on boiler size)	1 – 2	Pallet
Fittings	1	Box
Exhaust manifold	1	Box
Tie rods	1	bundle
Assembly components (longitudinal rails and supply pipe)	1	Box
Jacket Pack A, B, C (according to boiler rating)	1 – 3	Cartons
Thermal insulation	1	PU bag

Table 6

5 Transporting the boiler

Use suitable equipment to transport the individual boiler sections (delivery as loose sections) and other individual parts.

WARNING: Risk of injury from improperly secured boiler sections.
- ▶ Use only suitable means of transportation when handling the boiler sections, e.g. a heavy duty hand truck.
- ▶ Secure the individual boiler sections to prevent them from sliding off during transport.

NOTICE: Risk of system damage from impacts.
- ▶ The standard delivery of the Logano G515 oil/gas-fired boiler contains components that are sensitive to shock.
- ▶ During handling protect all electronic and other components against impact.
- ▶ Please observe the transport instructions on the packaging.

NOTICE: Risk of system damage from contamination.
- ▶ If you intend to keep the boiler in storage once it has been assembled, observe the following:
- ▶ Protect the boiler connections against contamination by sealing them off or covering them.

Dispose of packaging in an environmentally responsible manner.

6 Positioning the boiler

This chapter describes how to properly position the Logano G515.

NOTICE: Risk of system damage from freezing.
▶ Install the system in a room free from the danger of freezing.

6.1 Tools and auxiliary materials

The following tools and auxiliary materials are required for the boiler assembly (the listed items must be provided by the installer):

- Boiler assembly tool 2.2 (→ Fig. 4, page 11) or 2.3 (→ Fig. 5, page 11)
- Boiler block support for fitting the boiler sections together
- Steel hammer and wooden or rubber mallet
- Half-round bastard file
- Screwdriver (Philips and flat head)
- Flat chisel
- Metric wrenches
- Support wedge, flat iron
- Cleaning rags and cloth
- Fine emery cloth
- Wire brush
- 3-in-1 oil
- Solvent (gasoline, mineral spirits)
- Spirit level, tape measure, chalk, straight edge
- Blanking flange with vent facility (for pressure test)

6.1.1 Boiler assembly tool size 2.2

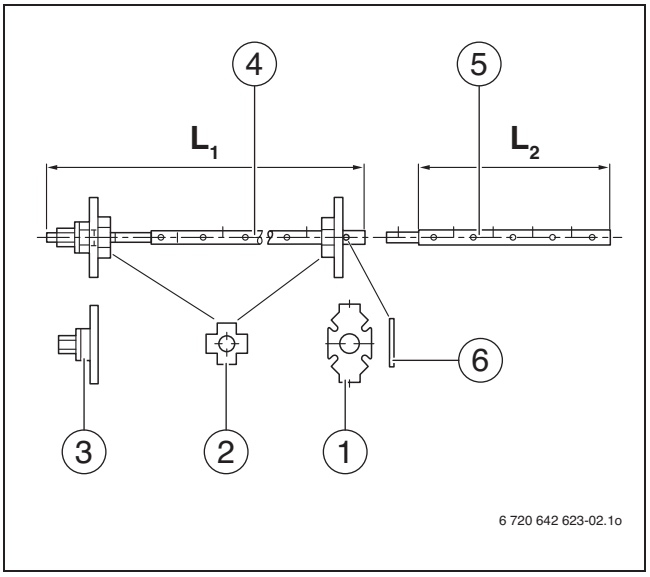

Fig. 4 Boiler assembly tool size 2.2

[1] Mating flange
[2] Additional flange
[3] Compression unit
[4] Tie rod
[5] Extension
[6] Dowel pin (size 2.2)
[L_1] 85" (2160 mm)
[L_2] 23 – 5/8" (600 mm)

Boiler sections	Assembly tool(s) per boiler hub	Extension piece per boiler hub	Length (total) in inches (mm)
7 – 10	1	0	85 – 3/64 (2160)
11 – 12	1	1	108 – 21/32 (2760)

Table 7

For the correct arrangement of the flange during assembly, refer to page 17.

6.1.2 Boiler assembly tool size 2.3 (complete in the toolbox)

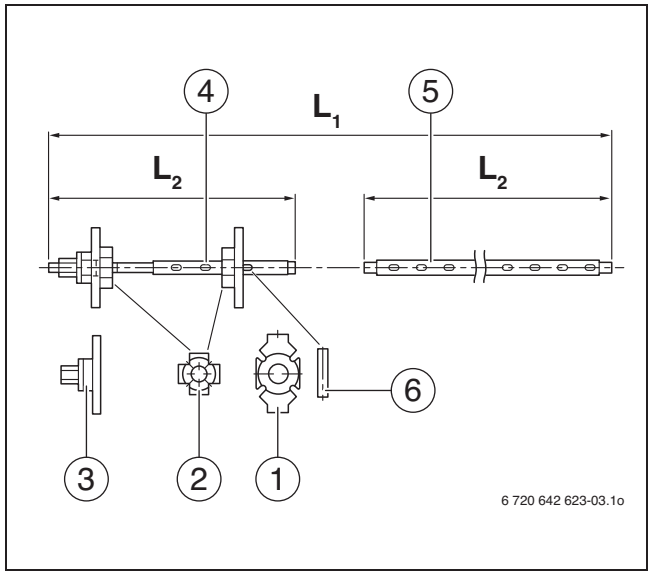

Fig. 5 Boiler assembly tool size 2.3

[1] Mating flange
[2] Additional flange
[3] Compression unit
[4] Tie rod
[5] Extension
[6] Wedge (size 2.3)
[L_1] 121– 1/4" (3080 mm)
[L_2] 31 – 1/2" (800 mm)

Boiler sections	Assembly tool(s) per boiler hub	Extension piece per boiler hub	Length (total) in inches (mm)
7 – 12	1	3	121 – 1/4 (3080)

Table 8

For the correct arrangement of the flange during assembly, refer to page 17.

6.2 Recommended wall clearances

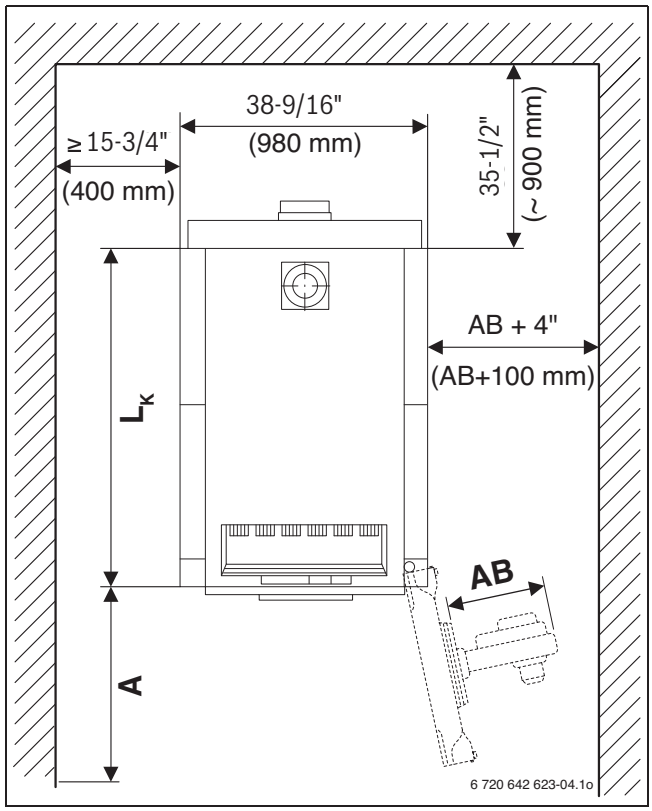

Fig. 6 Installation room with boiler

Observe the recommended wall clearances for complete opening of the burner door, for boiler installation and for cleaning and maintenance (→ Fig. 6 and Tab. 9).

The burner door can be right or left hung/opening (the boiler is always supplied with the door attached on the right).

When installing your boiler maintain the recommended minimum dimensions. Select the recommended clearances between wall and boiler for easy access for installation, maintenance and service work.

The wall clearance on the hinge side must be at least the burner projection (AB). A distance of AB + 3 – 15/16" (AB + 100 mm) from the wall is recommended.

Boiler capacity		Clearance A in inches (mm)	
MBH (kW)	Boiler sections	Recommended	minimum
819 – 1.194 (240 – 350)	7 – 9	66 –15/16" (1700)	39 – 3/8" (1000)
1,365 – 1,740 (400 – 510)	10 – 12	86 – 39/64" (2200)	39 – 3/8" (1000)

Table 9

If you do not observe the recommended minimum clearance (→ Fig. 6), you will not be able to use the cleaning kit (accessory). Alternatively, shorter cleaning devices or wet cleaning may be used. Alternatively shorter cleaning devices or wet cleaning may be used.

6.3 Installing the boiler on a boiler base or foundation

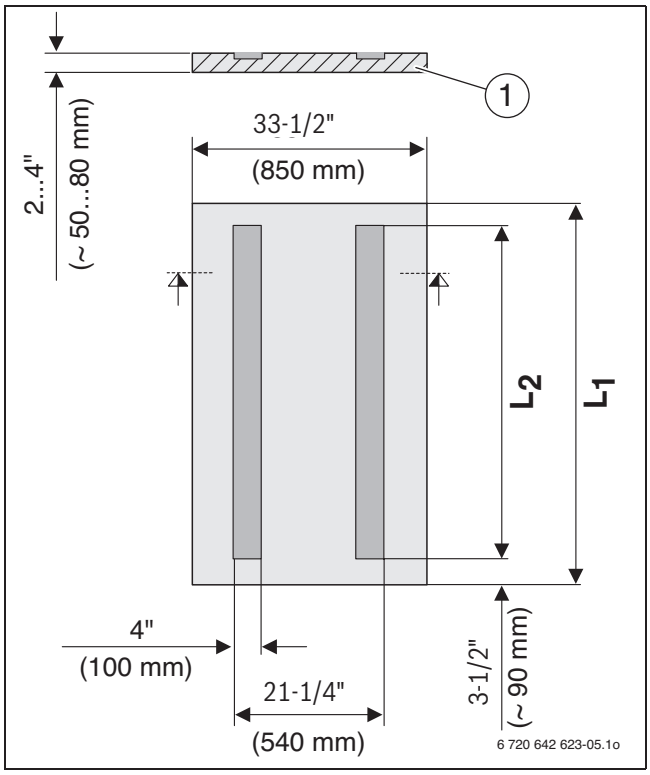

Fig. 7 Base dimensions (dimensions in inches (mm))

A silencing boiler base is available as an accessory from Buderus.

If this boiler base is not used, a concrete foundation can be constructed on-site. When building the base, a
3 – 15/16 × 1 – 31/32 × 5/16 inches (100 × 50 × 8 mm) steel angle or 3 – 15/16 × 13/64 inches (100 × 5 mm) steel flat should be incorporated, to ensure that the boiler sections can slide when the boiler is installed (→ Fig. 7 and Tab. 10).

When building the bases, consider to which side the burner swings out (left or right-hand burner door stop (→ Fig. 6, page 12).

It is advisable to place the boiler on a 2 – 4 inch (50 – 80 mm) tall base (→ Fig. 7, [1]). The installation area must be completely flat and level. The front edge of the boiler should be flush with the edge of the base.

Number of boiler sections	L1 (base) in inch (mm)	L2 (steel section) in inch (mm)
7	53 – 35/64 (1360)	46 – 27/32 (1190)
8	60 – 15/64 (1530)	53 – 35/64 (1360)
9	66 – 59/64 (1700)	60 – 15/64 (1530)
10	73 – 5/8 (1870)	66 – 59/64 (1700)
11	80 – 5/16 (2040)	73 – 5/8 (1870)
12	87 (2210)	80 – 5/16 (2040)

Table 10

7 Boiler block assembly

WARNING: Risk of injury from improperly secured boiler sections.
- ▶ Use only suitable means of transportation when handling the boiler sections, e.g. a heavy duty hand truck with strap or a heavy duty hand truck.
- ▶ Secure the individual boiler sections to prevent them from sliding off during transport.

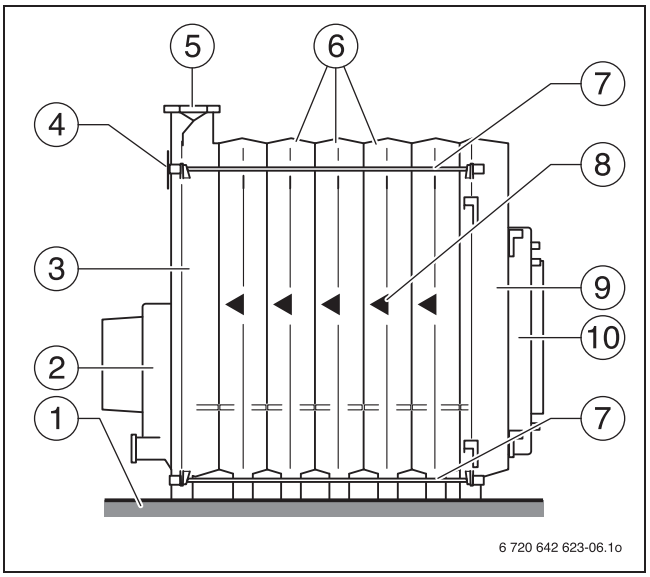

Fig. 8 Boiler heat exchanger

[1] Boiler base or foundation

[4] Return connection
[5] Supply connection
[6] Intermediate section
[7] Tie rod
[8] Sequence of installation
[9] Front section
[10] Burner door with burner plate

Depending on the type of delivery, we distinguish between delivery as disassembled sections and as ready assembled block. When delivered as a block, the boiler sections are already fully assembled and checked for leaks prior to delivery. If the assembled boiler is too large or too heavy to be brought to its final installation location in the building, delivery of the disassembled boiler in sections offers a solution.

For the further installation of a pre-assembled boiler block, see Chapter 7.3, page 18.

7.1 Assembly of a boiler block from sections

WARNING: Risk of injury from inadequately secured boiler sections.
- ▶ Secure boiler sections during assembly and take measures to prevent them from tipping over. The installation aid (accessory) is available from Buderus on request.

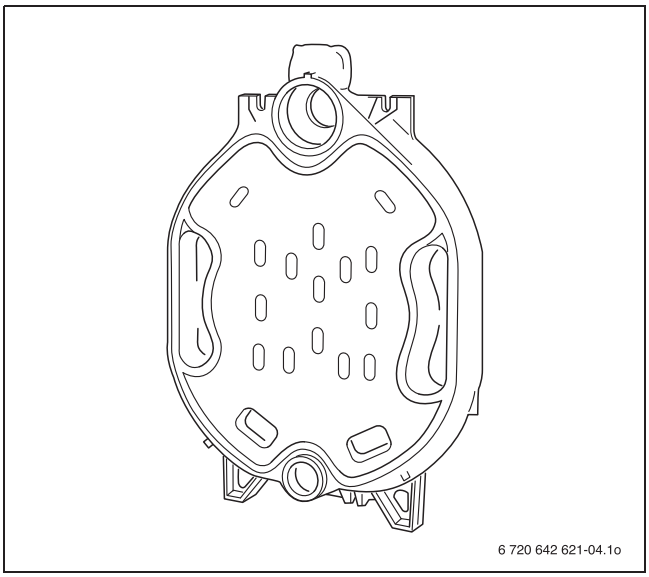

Fig. 9 Rear section

The boiler block is always installed starting from the rear with the rear section (→ Fig. 8, [3], page 13) and working toward the front. The front section (→ Fig. 8, [9], page 13) is always fitted last.

Observe the directional arrows (→ Fig. 8, [8]) during assembly and carry this out in accordance with the following instructions and illustrations.

7.2 Joining the boiler block assembly (delivery as loose sections)

Remove nuts and washers from the studs on the hubs of the boiler sections before attaching the rear section and front section.

If you are using the installation aid, you will need to remove the cleaning access cover before you can attach it to the rear section.

- Unscrew cleanout cover on rear section (→ Fig. 10, [1 and 2]).

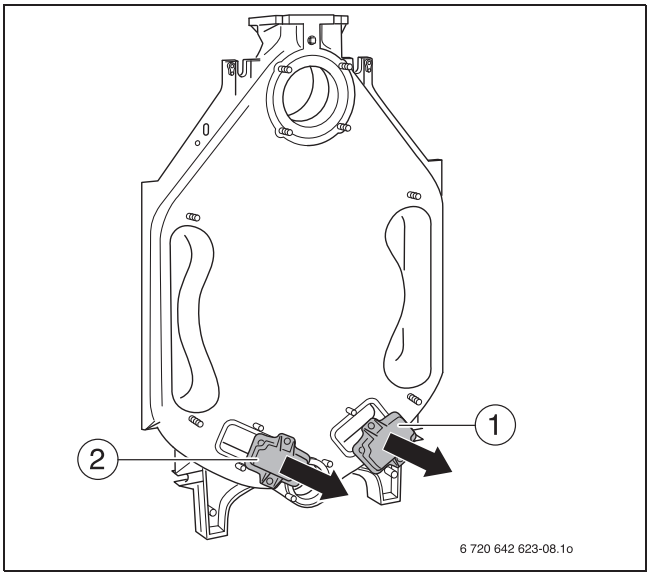

Fig. 10 Removing the cleanout cover.

- Set up the rear section and secure with the installation aid to prevent it from tipping (→ Fig. 11 and Fig. 9 and separate installation instructions for installation aid).

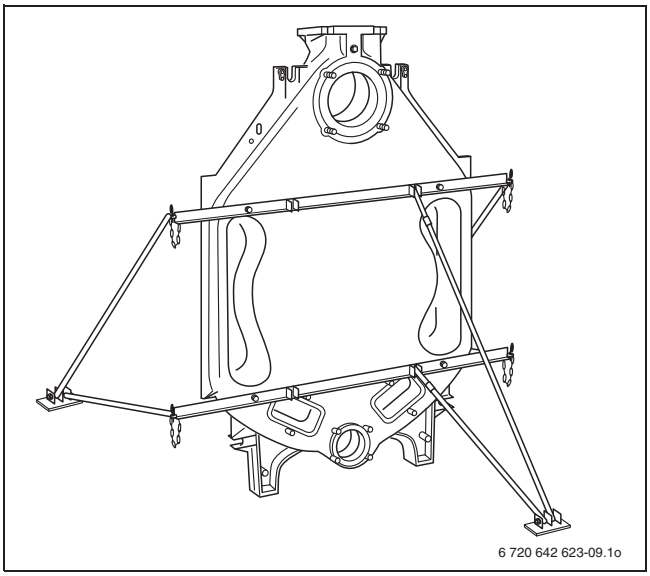

Fig. 11 Fastening the installation aid

- File down any burrs on the hubs (→ Fig. 12).
- Clean the packing grooves where required using a wire brush and cloth (→ Fig. 13, [3]).

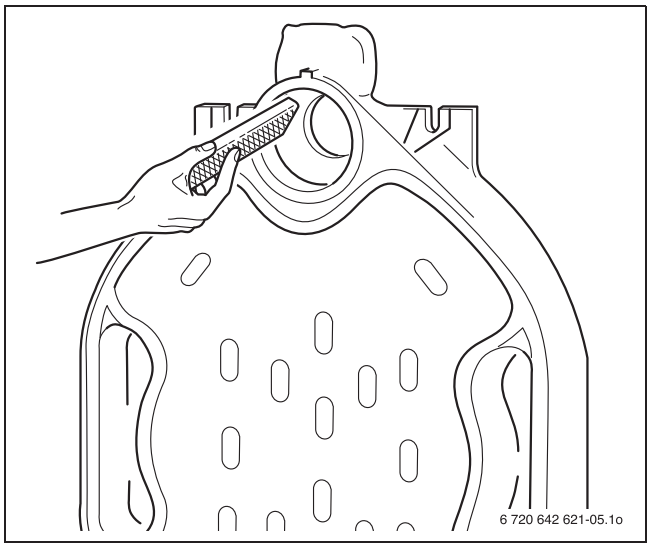

Fig. 12 Remove burrs

WARNING: Danger of fire from combustible cleaning agents.
- When using solvents, avoid open flames, ambers, and sparks.
- Please observe the safety instructions regarding any solvents used.

- Clean the hub sealing faces (→ Fig. 13, [1 and 2]) with a rag soaked in solvents or gasoline.

WARNING: Health hazard from noxious vapors released during material handling.
- Ensure adequate ventilation of the installation area.
- Please note the handling and safety instructions of the product used.

- Evenly coat the hub sealing faces with sealant.

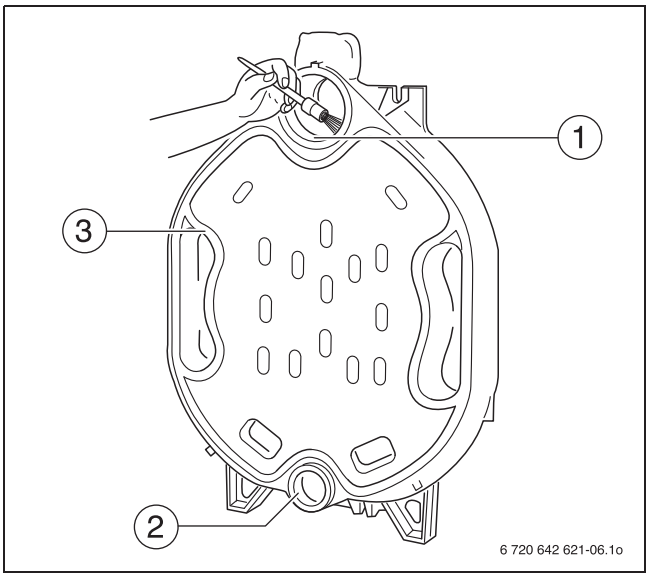

Fig. 13 Prepare packing grooves and hubs

The next step involves preparing the nipples that will eventually seal the boiler sections.

- ▶ Clean nipple with a rag soaked in solvents or gasoline and coat evenly with sealant.
- ▶ Insert the nipple straight into the upper (Sz. 4.181.70) and lower (Sz. 1, 82/50) hub of the rear section and pound home securely with alternate heavy blows. Once pounded in, the upper nipple (→ Fig. 14, [1]) must protrude approx. 1 – 49/64 inches (45 mm) and the lower nipple approx. 1 – 3/8 inches (35 mm) out of the corresponding hubs.
- ▶ Remove any burrs with a file.

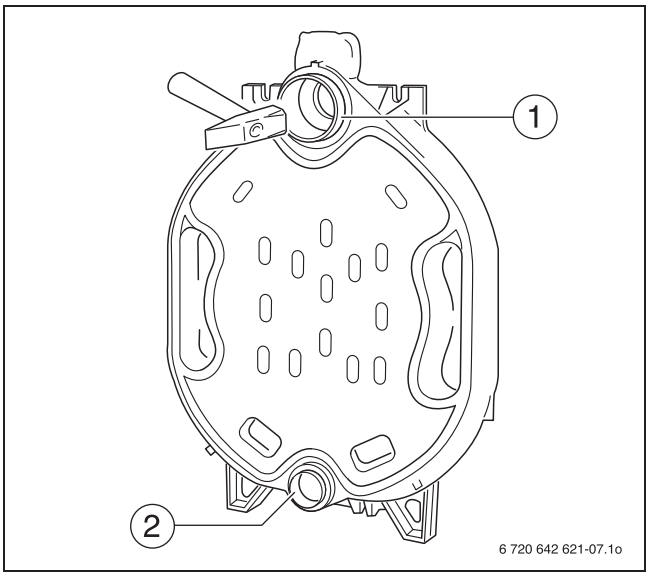

Fig. 14 Driving nipples home

The packing grooves (→ Fig. 15, [1]) must be clean and dry to enable the sealant rope to adhere properly.

- ▶ Coat the packing grooves with adhesive (primer)

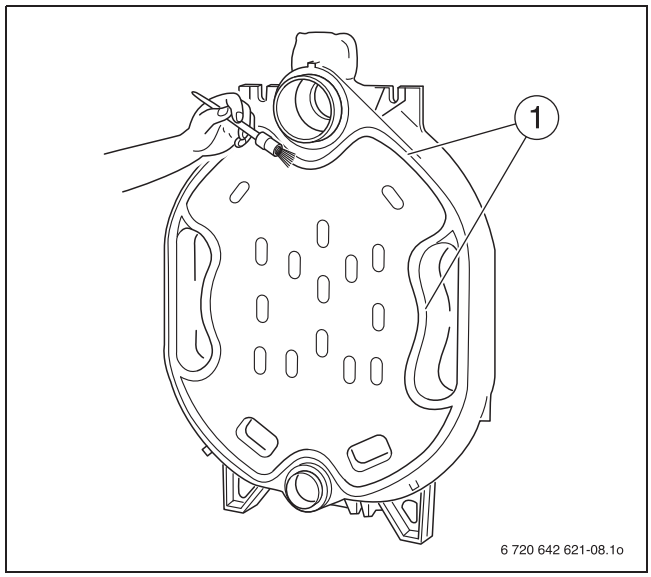

Fig. 15 Coat the packing grooves with adhesive (primer)

- ▶ Insert the flexible sealant rope (→ Fig. 16, [2]) on the front of the rear section, starting around the upper hub, into the packing grooves (→ Fig. 16, [1]) and press in lightly. At the butt joints, overlap the sealant rope by approx. 3/4" (20 mm) and press firmly together.
- ▶ Unroll the required length of sealant rope from the spool supplied.
- ▶ Peel the backing paper from the sealant rope when inserting into the packing groove (do not stretch).

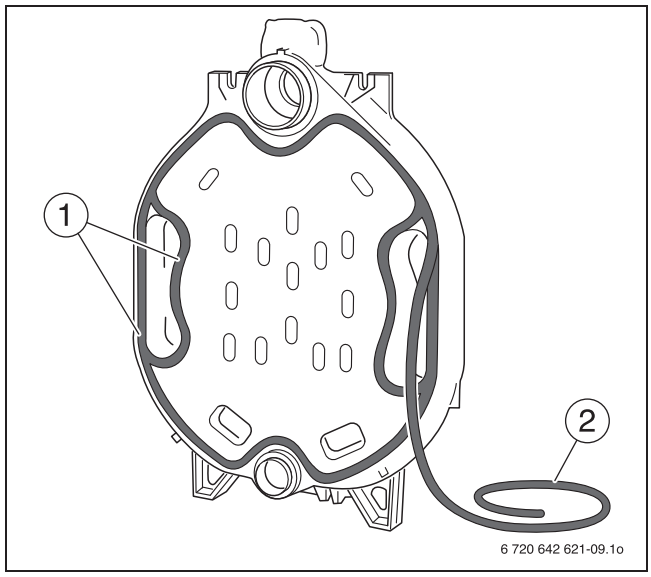

Fig. 16 Inserting sealant rope

Preparation of the first intermediate section:

- ▶ File down any burrs on the hubs (→ Fig. 12, page 14).

The packing springs must be clean and dry. Clean if necessary.

- ▶ Clean the hub sealing faces with a rag soaked in solvents or gasoline.
- ▶ Evenly coat the hub sealing faces with sealant (→ Fig. 17, [1]).
- ▶ Coat the packing springs with primer (→ Fig. 17, [2]).

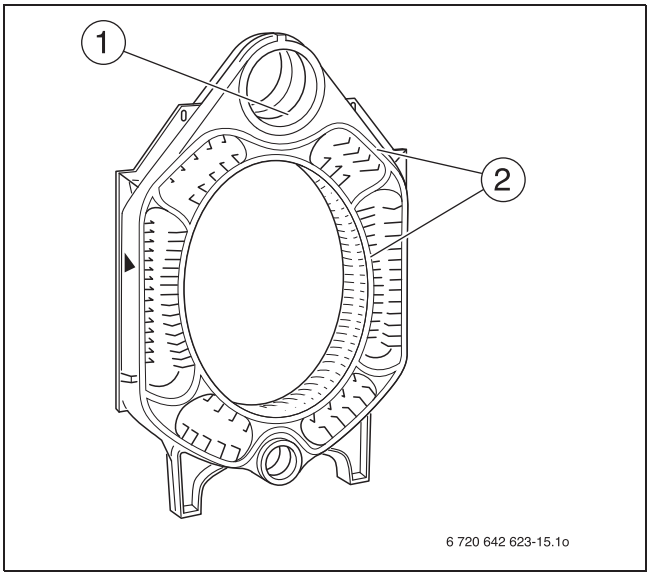

Fig. 17 Preparing the intermediate section

To make installation easier, place the boiler section to be fitted onto the nipple on the upper hub first. Once this has been done, the boiler section can be aligned with the lower hub.

The directional arrow (→ Fig. 18, [3]) must point toward the rear.

- ▶ Position the intermediate section so that the upper and lower hubs (→ Fig. 18, [2 and 4]) fit onto the nipples in the rear section.
- ▶ Drive first intermediate section onto the rear section using a wooden or a rubber mallet (→ Fig. 18, [1]).

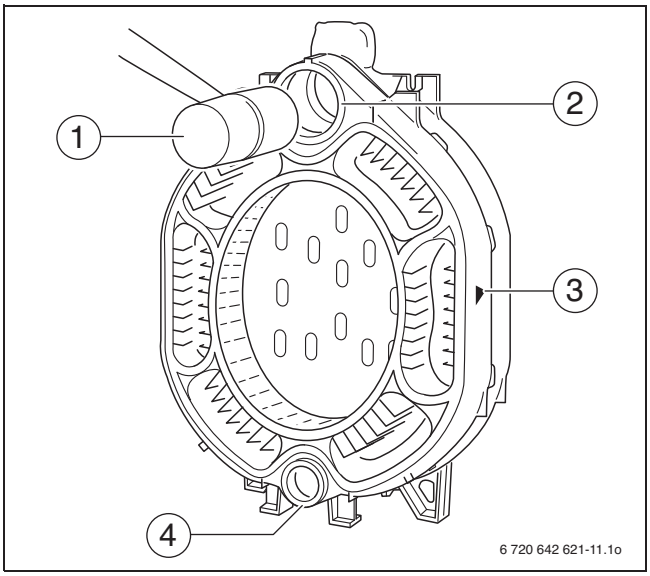

Fig. 18 Pound intermediate section in place

Before the nipples are inserted in the next intermediate section, the part-assembled boiler block must be compressed using the boiler assembly tool.

NOTICE: The boiler can be damaged by pulling the boiler sections together incorrectly or from excessive compression.

- ▶ Ensure that the nipples are positioned straight in the boiler hubs after being pounded in and that they have not been compromised.
- ▶ Never compress more than one nipple joint at a time.
- ▶ Stop compressing the sections when the boiler hubs meet.

NOTICE: Assembly tool damage from loose screw connections of the tie rods.

- ▶ Always check the tie rods before each use and retighten as necessary. The tie rod is correctly positioned if it is fully inserted and no threads are showing (→ Fig. 19, [2]).
- ▶ Always keep the threads (→ Fig. 19, [1]) clean. Dirty threads may damage the assembly tool during assembly.

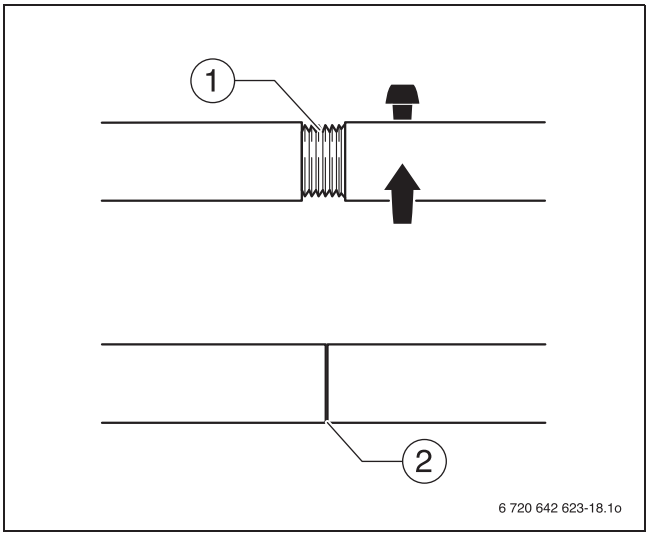

Fig. 19 Boiler assembly tool 2.3

CAUTION: Danger of accident from material fatigue. Improperly used or poorly maintained assembly tools may fail.

- ▶ Never work directly in front of the assembly tool while it is being tensioned.
- ▶ Ensure that no one is standing in front of the assembly tool.

Use a size 2.2 or 2.3 boiler assembly tool (→ Fig. 4, Fig. 5 and Fig. 20 [1 and 2]).

- ▶ Push pressure flanges (→ Fig. 20, [3]) with clamping nuts onto the tie rods (→ Fig. 4, page 11 and Fig. 5, [4]).
- ▶ Push a tie rod through the upper and lower hubs on the boiler.
- ▶ Push mating flanges onto the tie rods and secure each with wedge (dowel pin for assembly tool 2.2).
- ▶ Hold the tie rod in the center of the boiler hubs and slightly draw together the assembly tools using the clamping nut.
- ▶ Place ratchet wrench onto clamping nuts and compress boiler sections by tightening evenly.

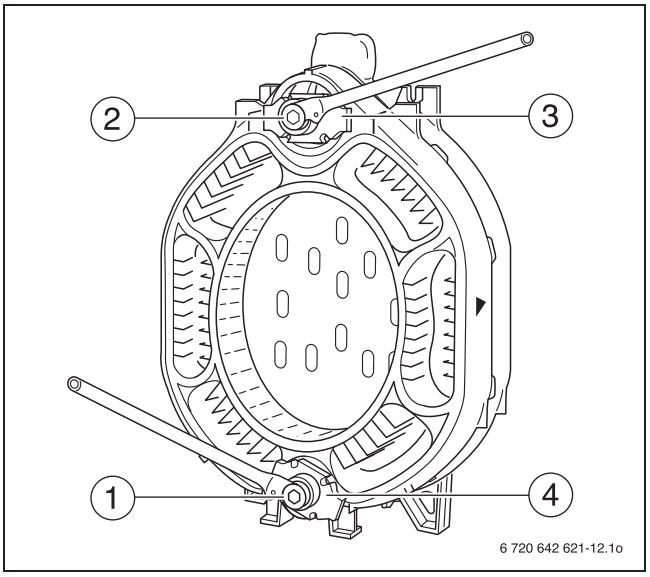

Fig. 20 Using the boiler assembly tool

- ▶ Release and remove the boiler assembly tool.
- ▶ Check nipples are seated correctly.

WARNING: Risk of injury from falling boiler sections.
- ▶ Remove the installation aid first if the partly-assembled boiler consists of at least three boiler sections.

Fig. 21 shows the rear section with intermediate section fitted. The preparations for fitting the next intermediate section have also been made.

The boiler section has been equipped with foot wedges for ease of installation (→ Fig. 21, [1]).

The boiler section foot wedges are also used later for final leveling of the boiler block.

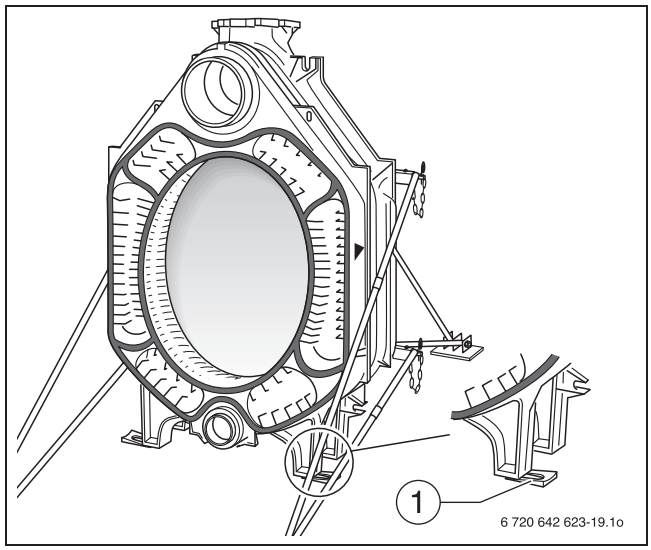

Fig. 21 Using the boiler section foot wedges

Assemble all other boiler sections as described. The front section is fitted last.

After the front section is installed, loosen the assembly tool – but do not remove it. Fit the tie rods first.

- ▶ Insert the tie rods (with spring packs fitted) into the cast lugs on the top left and right, and bottom left and right, next to the boiler hubs (→ Fig. 22, [1 to 4]).

NOTICE: Damage to system through excessively low contact pressure.
- ▶ Do not compress the spring pack. Only use the spring pack in its original state.

- ▶ Tighten the nuts hand-tight.
- ▶ Tighten the nuts on the tie rods 1 to 1½ turns.
- ▶ Level the boiler block vertically and horizontally on the base/ foundation (→ see Chapter 6, page 11).
- ▶ Remove boiler assembly tool.

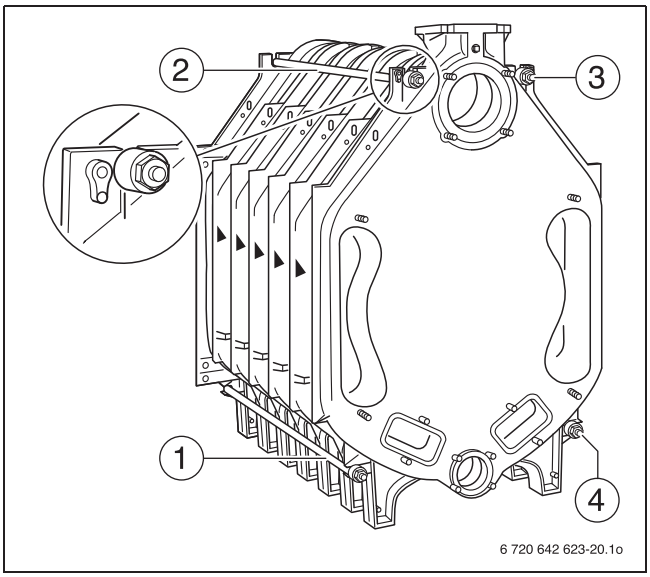

Fig. 22 Fitting the tie rods

The next step describes the installation of the supply pipe (→ Chapter 7.4, page 18).

7.3 Setting up the boiler block – (assembled block)

DANGER: Risk of fatal injury from falling objects.
- ▶ Provide a suitable means of supporting the load.
- ▶ Observe all locally applicable occupational health & safety regulations regarding lifting equipment.

- ▶ Cut the straps (→ Fig. 23, [1]).
- ▶ Remove the pallet prior to positioning the boiler block (→ Fig. 23, [2]).

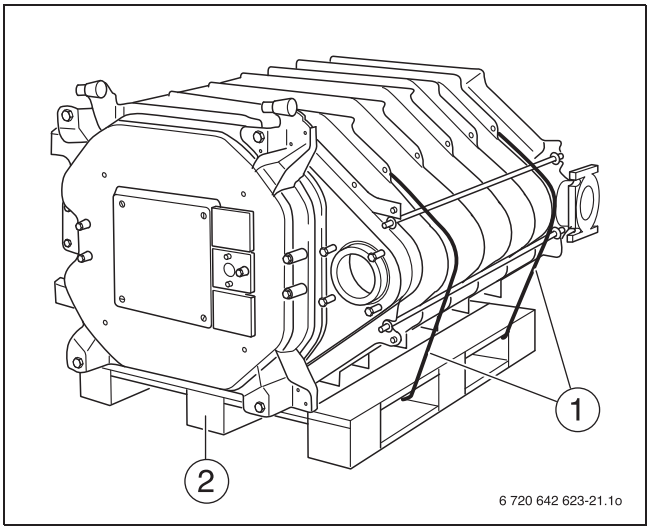

Fig. 23 Boiler block on pallet

- ▶ Level the boiler block vertically and horizontally on the base/impact sound-absorbing base (→ Chapter 6.3, page 12). Use the boiler section foot wedges provided for this purpose.

The following pages describe the installation of the supply pipe and sensor well. You must do both irrespective of whether the boiler is supplied pre-assembled or in separate sections.

7.4 Inserting the supply pipe (parts crate)

The supply pipe (→ Fig. 24, [4]) consists of 2 pieces for boilers with 10 – 12 boiler sections.

- ▶ Push the flat gasket over the supply pipe (→ Fig. 24, [1]).
- ▶ Push the supply pipe from the front into the top boiler hub.
- ▶ Close off with flange cover (→ Fig. 24, [2]).

The supply pipe must be fixed in such a way that the holes on the supply pipe are positioned at the correct angle. This ensures optimum distribution of water in the area of the top boiler hub (Thermostream principle).
- ▶ Make sure that the cam [3] on the end plate of the supply pipe (→ Fig. 24, [3]) fits in the notch in the top boiler hub (→ Fig 24, [5]).

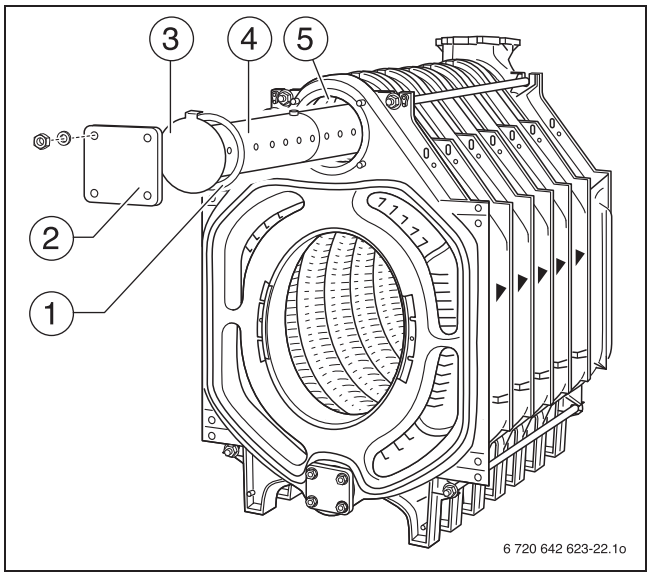

Fig. 24 Installing the supply pipe

7.5 Installing the sensor well

- ▶ Seal and install the sensor well R ¾ from the rear of the boiler (length: 110 mm) into the R ¾ tapped hole of the supply connection (→ Fig. 25, [1]).

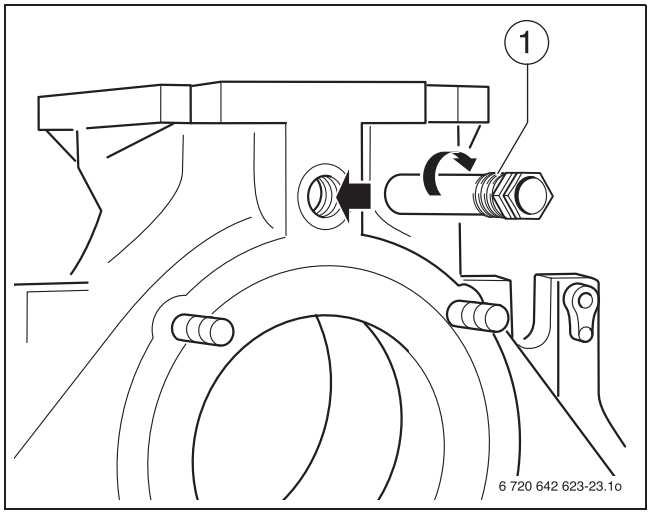

Fig. 25 Fitting the sensor well

7.6 Leak test

Conduct a leak test of the boiler block only when the boiler was delivered disassembled. Pre-assembled sections are leak tested in the factory.

For details of assembling the remainder of the boiler if the block is delivered pre-assembled, see → Chapter 10, page 34.

7.6.1 Carrying out leak test

NOTICE: Risk of system damage from overpressure.
- ▶ Ensure that no pressure, control or safety equipment is fitted during leak tests.

The leak test must be performed with a test pressure of 125 psi (8.6 bar). Use a pressure gauge class 1.0 to measure the pressure.

- ▶ Close off lower boiler hub (→ Fig. 26, [3]) at the front and rear. To do this, place corresponding seal (→ Fig. 26, [1]) on the relevant boiler hub and screw on flange cover with edge length 4 21/64 inches (110 mm). In this case, the flange with the tapped hole (R ¾) for the fill and drain connection (→ Fig. 26, [2]) is mounted on the rear of the boiler.
- ▶ Install the on-site fill and drain valve.
- ▶ Close off supply and return connections (supply connection flange with purger valve).

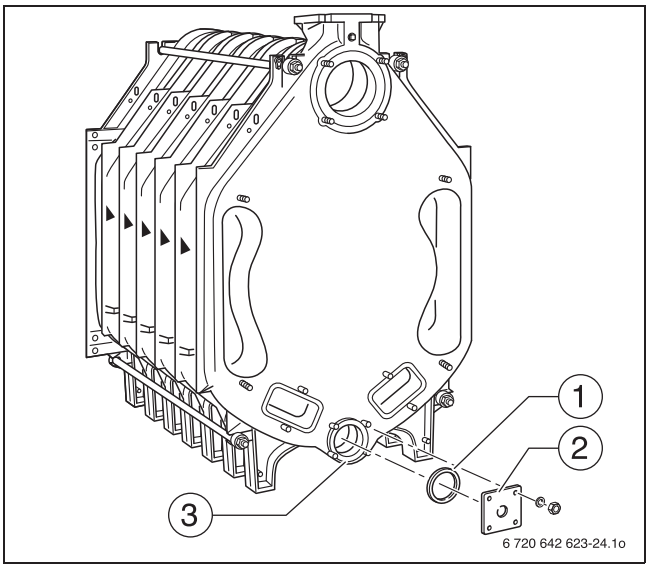

Fig. 26 Fitting the flange

- ▶ Slowly fill the boiler with water via the fill and drain connection. While doing this, purge the air from the boiler via the boiler supply connection with purger.

7.6.2 Sealing leaks

- ▶ If a hub connection is leaking, first drain the water through the fill/ drain valves.
- ▶ Remove supply pipe.
- ▶ Undo nuts on tie rods and remove tie rods.
- ▶ Separate the boiler at the leak location by driving (knocking) in flat wedges or chisels between the sections at the points provided at the top and bottom (→ Fig. 27, [1 and 2], between the sections).

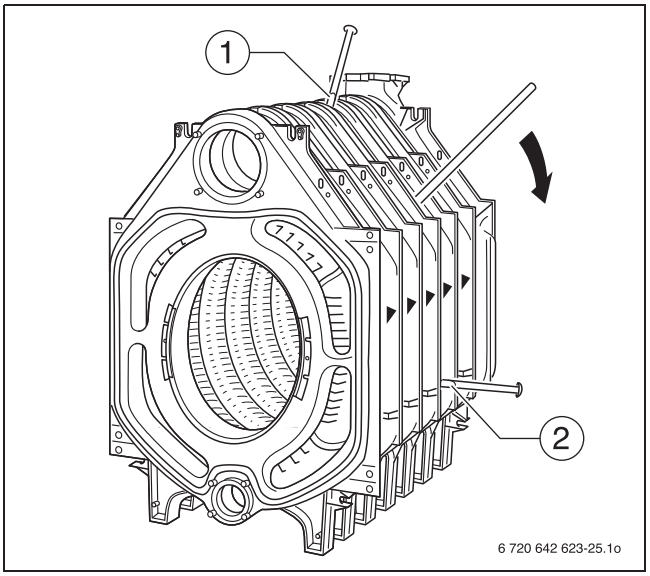

Fig. 27 Separating the boiler block

- ▶ Use new nipples and new sealant rope for reassembly.
- ▶ Pull the boiler back together and repeat the leak test.

7.7 Boiler water connections

Please observe the following information regarding the boiler connection to the system side. These instructions are important for trouble-free operation.

NOTICE: Risk of system damage from leaking connections.
- ▶ All pipe connections to the boiler must be free of stress and tension.

NOTICE: System damage from deposits, local overheating, and corrosion.
- ▶ As a basic rule, clean and flush existing systems thoroughly before connecting the new boiler.
- ▶ Install a desludging unit in the boiler return to prevent damage to the boiler.

The weld neck flange is fitted to the upper boiler hub (→ Fig. 28, [3] – return connection) if the return is connected at a later stage.

The weld neck flange and flat gasket are shown (→ Fig. 28, [4 and 5]).

- ▶ The supply connection flange (→ Fig. 28, [1]) with flat gasket (→ Fig. 28, [2]) is required for connecting the supply at a later stage.

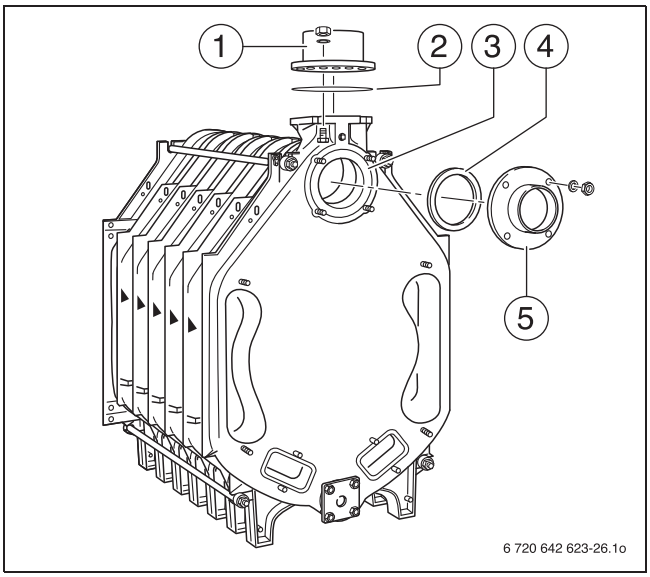

Fig. 28 Fitting a flange

The boiler supply and return manifolds are included in the Buderus scope of delivery.

NOTICE: Risk of system damage from temperature stresses.
- ▶ Install a fill valve on the system side.
- ▶ When the heating system is in operation, do not fill it via the boiler fill & drain valve. Instead, use the fill valve on the system side.

7.8 Installing draft diverter, baffles and burner door

Next step in the assembly process is to install the burner door and draft diverter. The pre-assembled boiler comes with these components already installed.

7.8.1 Positioning the draft diverter

The GP sealant rope (fiberglass cord with silicon casing) which forms a seal is inserted in the draft diverter at the factory.

- ▶ Place the draft diverter onto the four threaded studs on the rear section (→ Fig. 29 [1 to 4]) and secure using washers and nuts.

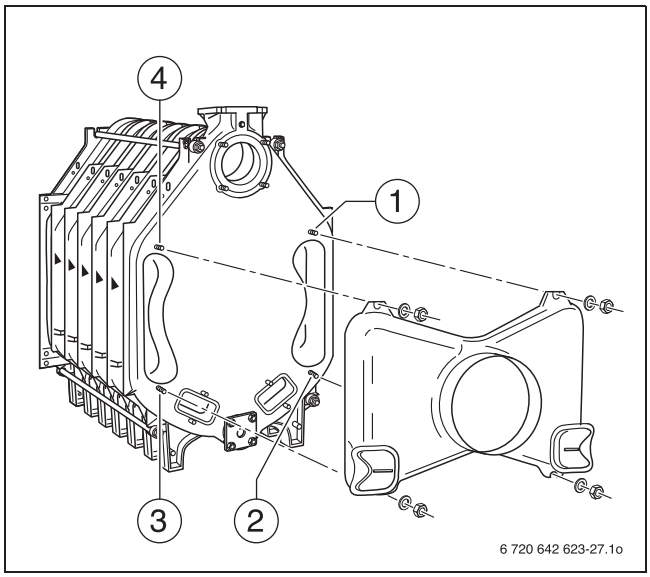

Fig. 29 Fitting the draft diverter

7.8.2 Screwing cleanout cover onto rear section

If the cleanout covers have been removed in order to attach the installation aid to the rear section:

- ▶ Screw the cleanout covers with washers and nuts back onto the rear section (→ Fig. 30, [1 and 2]).

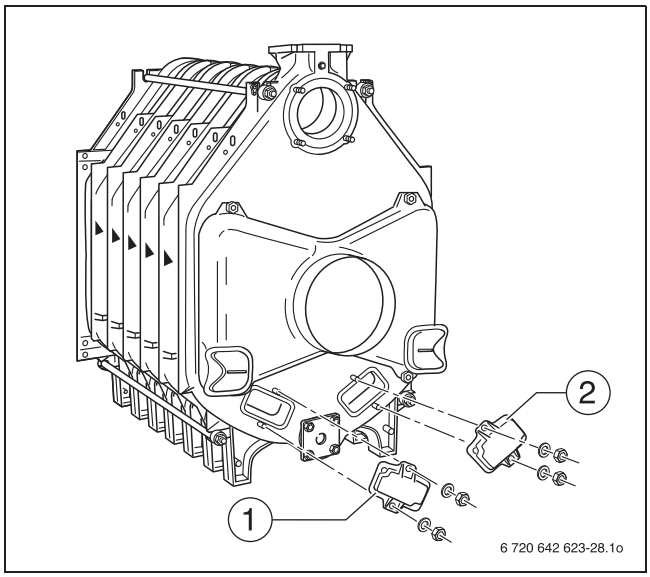

Fig. 30 Fitting the cleanout cover

7.8.3 Fitting the burner door

- Place a few drops of Silastic adhesive 6 inches – 8 inches (15 – 20 cm) apart in the packing grooves (→ Fig. 31, [2]) on the front section (→ Fig. 31).
- Insert GP sealant rope into the packing groove on the front section. The sealant rope joint should be located at the side (→ Fig. 31, [2]).

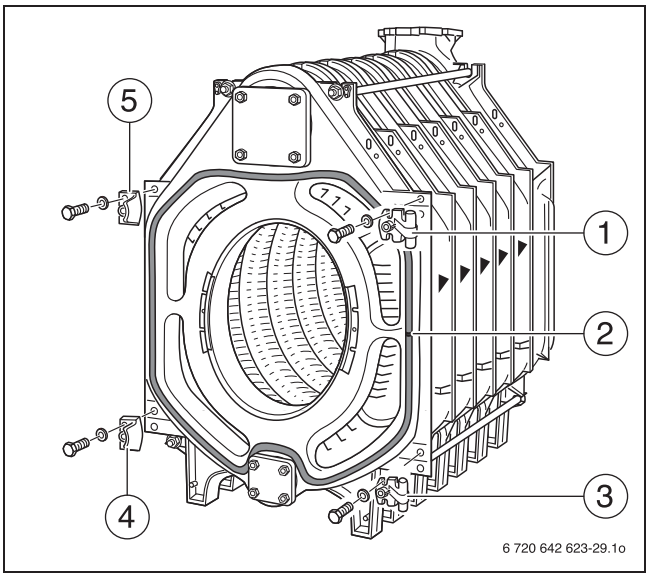

Fig. 31 Fitting the hinge pins and locking brackets

In the factory, both burner door hinge lobes are fitted on the right-hand side (→ Fig. 32 [1 and 2]). For left-hand closing, dismantle the hinge lobes from the right-hand side and reassemble them on the left-hand side of the burner door.

- Screw the hinge pins (right-hand) to the boiler front section with 2 machine screws M12 × 55 in each case (→ Fig. 31, [1 and 3]). For left-hand closing, secure accordingly on the left-hand side.
- Screw on locking brackets with run-on slopes for the burner door (right-hand closing) to the front section with 2 machine screws M12 × 55 (→ Fig. 31, [4 and 5]). For left-hand closing, secure accordingly on the right-hand side.

Make sure the run-on slopes of the locking brackets are on the inside of the boiler.

- Hook the burner door with the hinge lobes into the hinge pins.

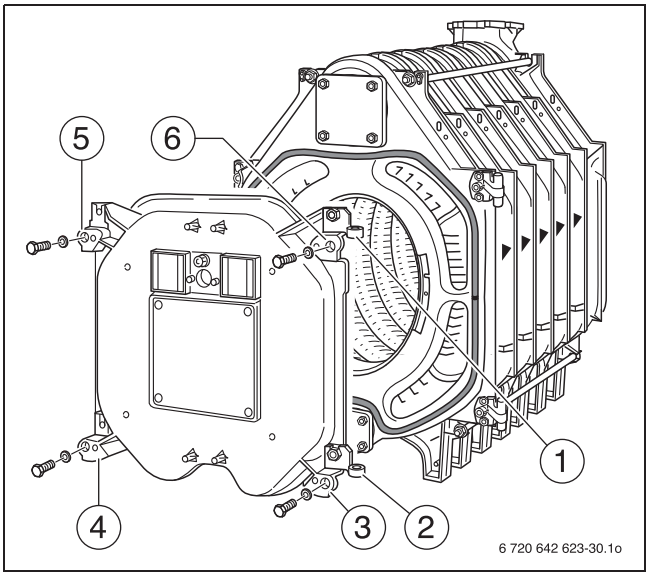

Fig. 32 Hooking in the burner door

7.8.4 Hot gas check plates on front section

The hot gas check plates (→ Fig. 33, [1 and 2]) are each screwed with one hexagon socket screw to the front section at the factory.

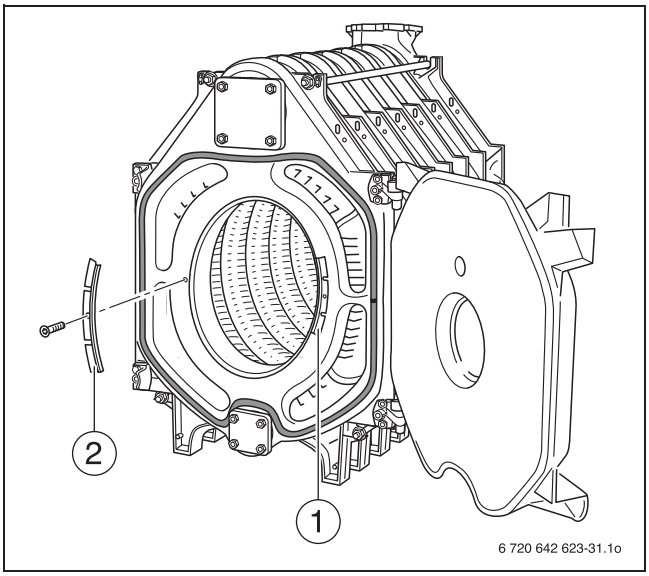

Fig. 33 Position of hot gas check plates

7.8.5 Insert the flue gas baffle plates

In pre-assembled boilers, the flue gas baffles are already fitted.

- ▶ Remove the cardboard transport protectors from the pre-assembled boiler.

- ▶ Take flue gas baffles out of the fittings case and insert into the flue gas passages as indicated by the inscription on them (→ Fig. 34 and Tab. 11).

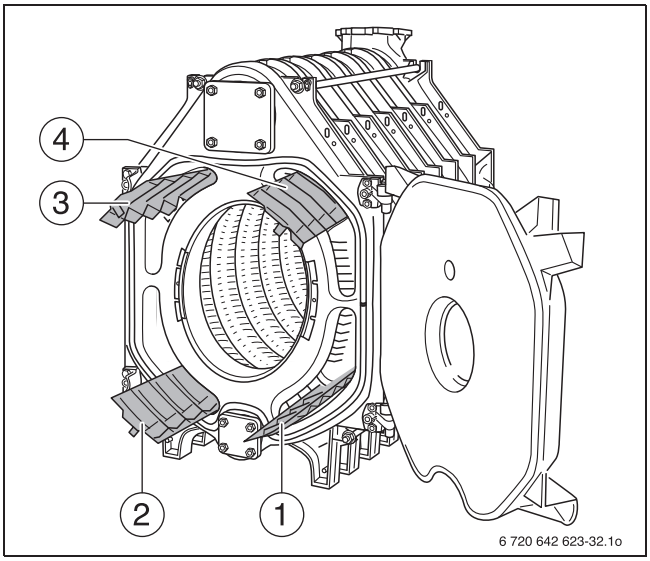

Fig. 34 Heat exchanger baffle plates

[1] Flue gas baffle plates (bottom right)
[2] Flue gas baffle plates (bottom left)
[3] Flue gas baffle plates (top left)
[4] Flue gas baffle plates (top right)

Boiler capacity	Number of boiler sections	Length of flue gas baffle plate in inches (mm)	Installation information on the flue gas baffle plate (→ Fig. 34)
240	7	26 – 25/32 (680)	top right top left bottom right bottom left
295	8		
350	9		
400	10		
455	11	16 – 47/64 (425)	top right top left bottom right bottom left
510	12	–	–

Table 11

7.9 Installation of the boiler jacket

This section describes how to install thermal insulation and jacket components.

- ▶ You must install the cross rails and longitudinal rails before installing the thermal insulation in order to be able to align the brackets correctly.
- ▶ To install the thermal insulation, you need to take the longitudinal rails off again in the following step.

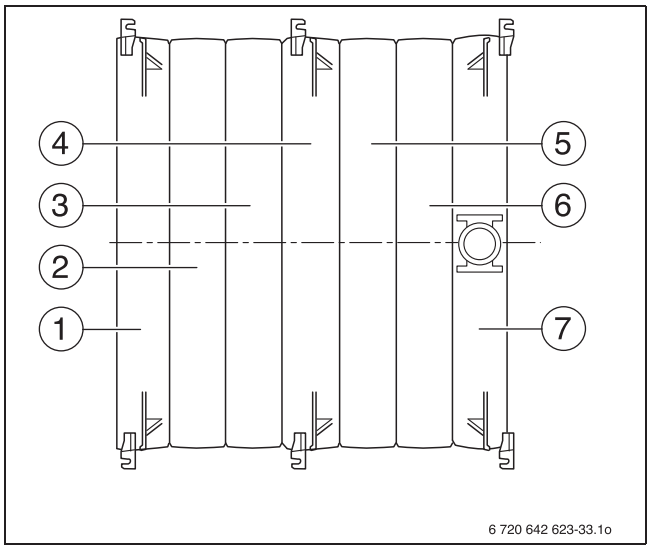

Fig. 35 View from above: boiler block (7 boiler sections) with brackets

7.9.1 Mount the brackets

- ▶ Loosely screw the brackets for the boiler jacket onto the upper ribs of the boiler sections on the left and right (→ Fig. 35, Fig. 36 and Tab. 12).

- ▶ Screw the brackets on the rear section (→ Fig. 36, [2]) to the ribs from behind.
- ▶ Screw the brackets of the front and intermediate sections (→ Fig. 36, [1]) on from the front only.

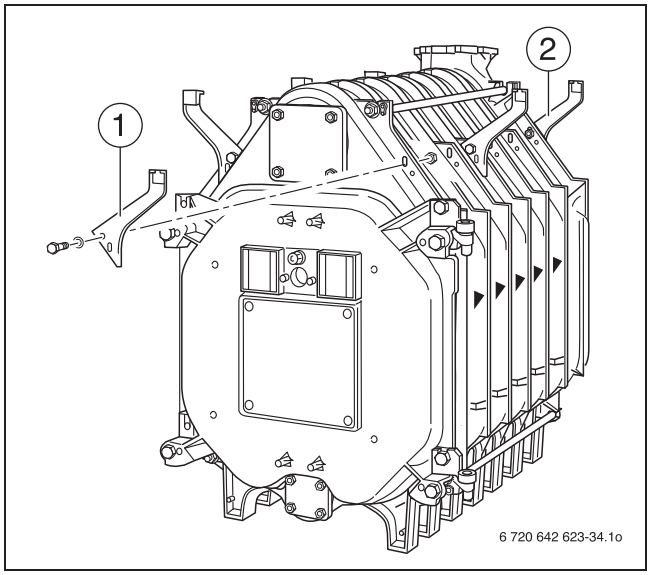

Fig. 36 Installing the mounting brackets

Total number of boiler sections	Right and left-hand installation on...		
	Front section Section no.	Intermediate section Section no.	Rear section Section no.
7	1	4	7
8	1	4	8
9	1	5	9
10	1	5	10
11	1	4 and 7	11
12	1	4 and 8	12

Table 12

7.9.2 Fitting the profile rails

- ▶ Fasten top front crosswise profile rails (→ Fig. 37, [2]) to the cast lugs (→ Fig. 37, [1 and 4]) and screw on hand-tight with hexagon bolts (M8 × 16). The folded edge on the front profile rail must face forward.
- ▶ Fasten top rear crosswise profile rail (→ Fig. 37, [3]) onto the cast lugs and screw in place with hexagon bolts (M8 × 16). The folded edge of the rear profile rail must point toward the rear.

- ▶ You can only align the longitudinal rails or brackets before placing the thermal insulation.
- ▶ Align the longitudinal rails or brackets correctly prior to installation of the side panels, covers and thermal insulation.

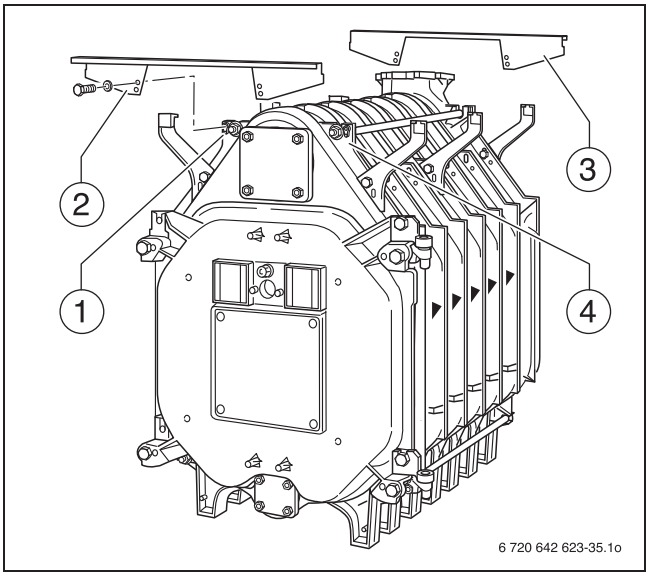

Fig. 37 Fitting the crosswise profile rails

- ▶ Place the longitudinal rails (→ Fig. 38, [1 and 2]) on both brackets on the rear and front section.
- ▶ Push longitudinal rails with pre-fitted screws (→ Fig. 38, [3]) into the notches in the brackets (→ Fig. 38, [4]) and screw together.

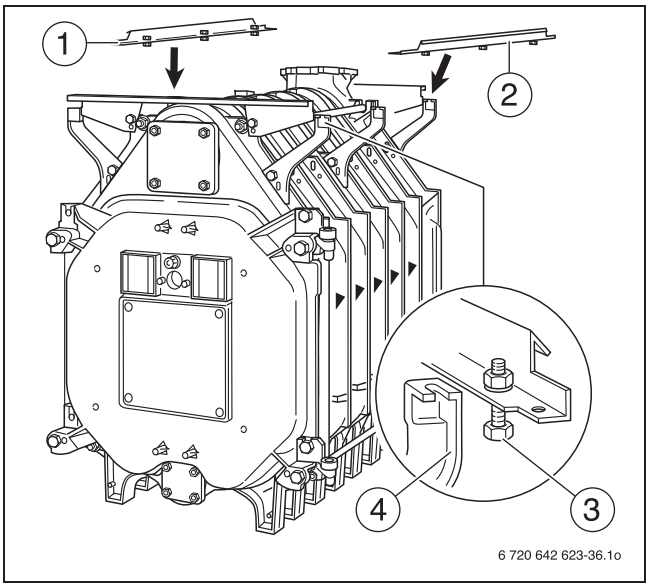

Fig. 38 Installing the longitudinal rails

- ▶ Place longitudinal rail (→ Fig. 39, [1]) with the notch at the front on the notch of the crosswise profile rail (→ Fig. 39, [2]).
- ▶ The longitudinal rail must be pushed from below against the crosswise profile rail at the rear of the boiler.

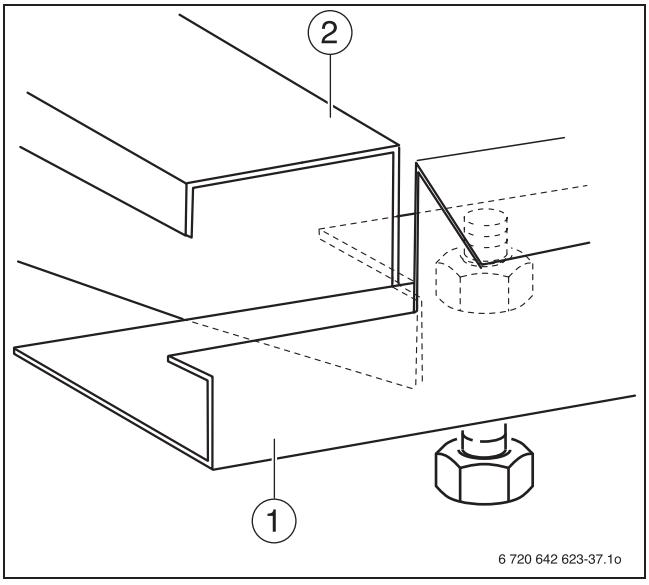

Fig. 39 Place longitudinal rail on crosswise profile rail

- ▶ Align the longitudinal rails, screw on the brackets at the front and/or rear section (→ Fig. 40, [1 and 3]) and fully tighten.
- ▶ Push the center brackets (→ Fig. 40, [2]) against the longitudinal rails from below, then screw onto the boiler block and tighten.

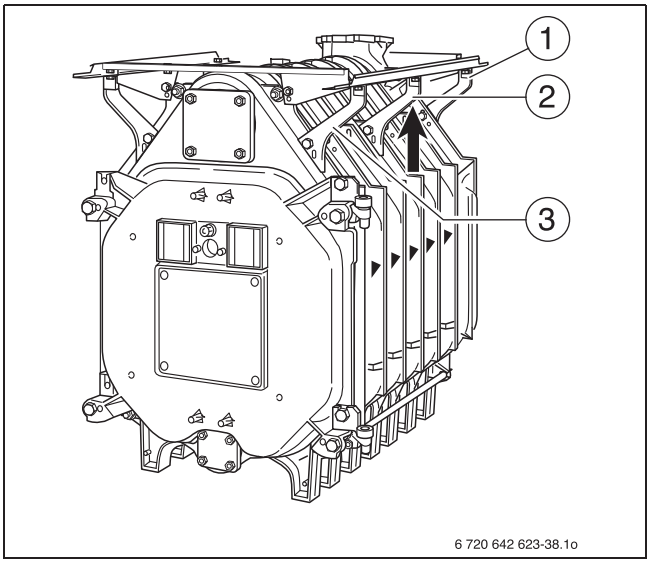

Fig. 40 Aligning the longitudinal rails

7.9.3 Fitting the thermal insulation

First of all, take the longitudinal rails off to install the thermal insulation.

- ▶ The thermal insulation provided (→ Fig. 41, [1]) corresponds to the boiler size. Arrange the thermal insulation on the boiler block as shown in the diagram in Fig. 42 (the numbers above the thermal insulation that is shown spread out correspond to the number of boiler sections).
- ▶ Guide the brackets through the cut-outs in the thermal insulation.
- ▶ Push the thermal insulation under the boiler block in the lower section. The boiler feet are placed in the cut-outs in the thermal insulation.

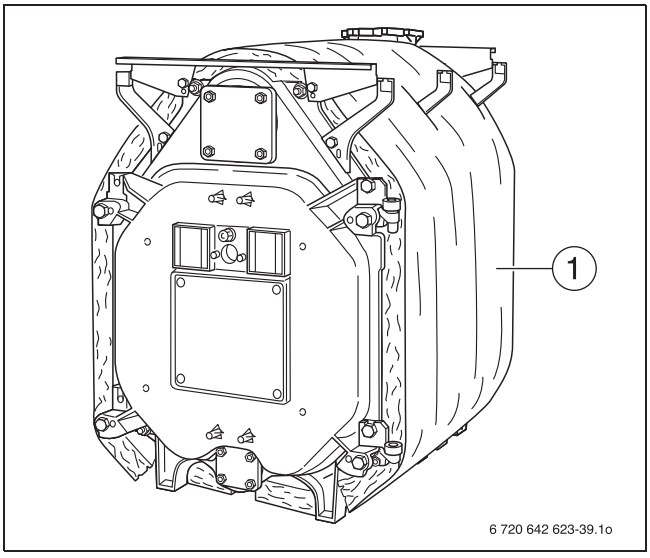

Fig. 41 Boiler block with thermal insulation

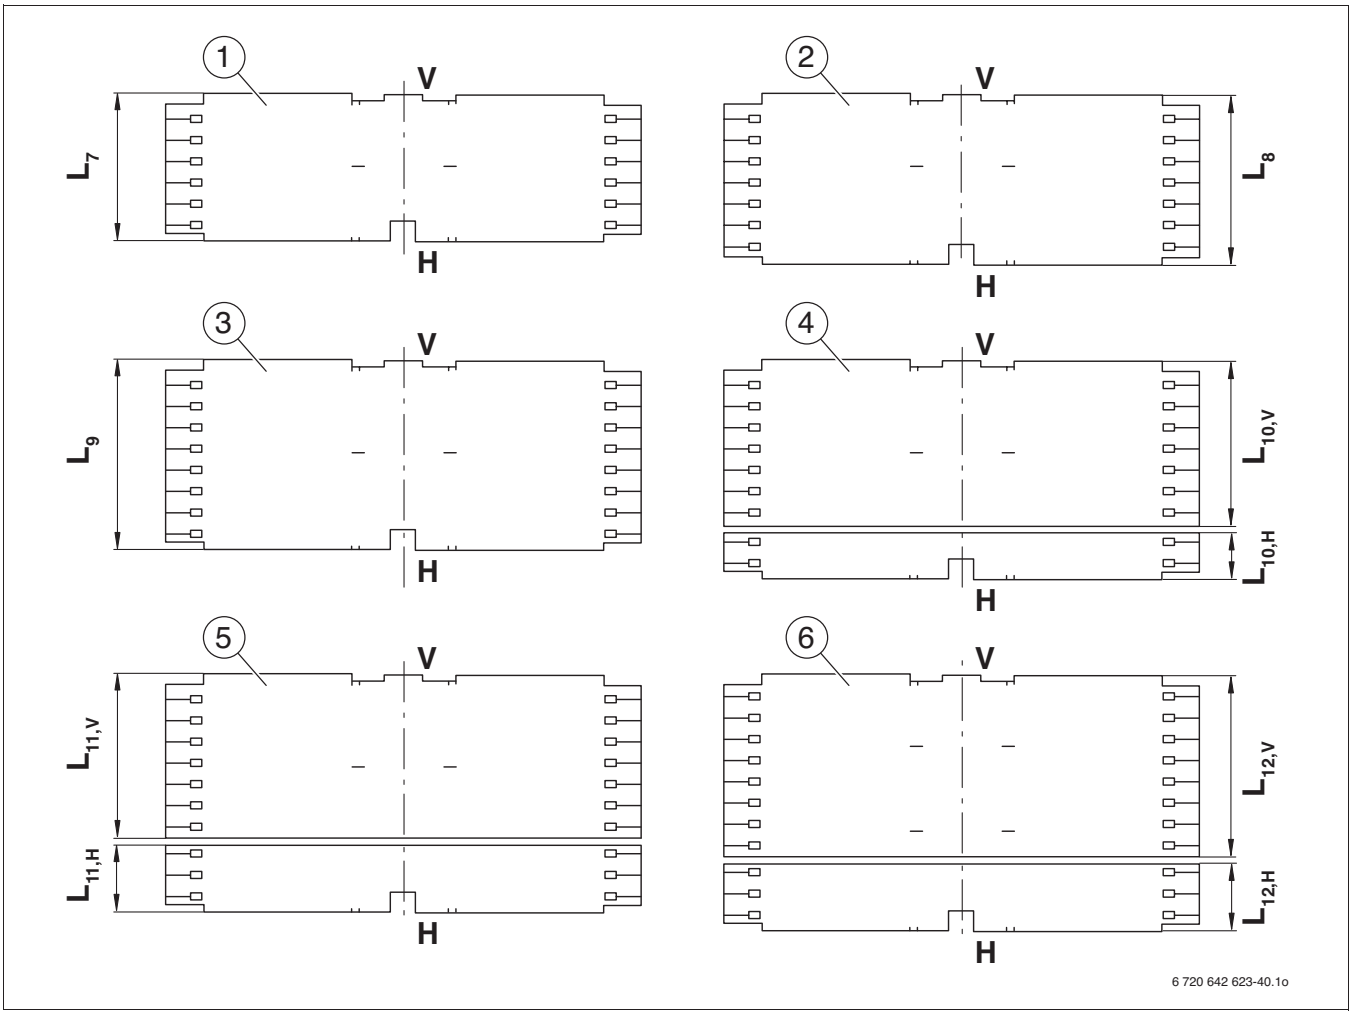

Fig. 42 Thermal insulation for the various boiler sizes

[1] 7 boiler sections
[2] 8 boiler sections
[3] 9 boiler sections
[4] 10 boiler sections
[5] 11 boiler sections
[6] 12 boiler sections
[H] Rear (boiler back)
[L_7] 41 – 3/8" (1050 mm)
[L_8] 52 – 3/4" (1340 mm)
[L_9] 59 – 1/2" (1510 mm)
[$L_{10,H}$] 14 – 3/4" (375 mm)
[$L_{10,V}$] 51 – 3/8" (1305 mm)
[$L_{11,H}$] 21 – 1/2" (545 mm)
[$L_{11,V}$] 51 – 3/8" (1305 mm)
[$L_{12,H}$] 21 – 1/2" (545 mm)
[$L_{12,V}$] 58" (1475 mm)
[V] Front (boiler front)

▶ Screw each lower crosswise profile rail (→ Fig. 43, [1]) at the front and rear to the corresponding boiler feet with two hexagon bolts. The folded edges of these profile rails must face outwards.

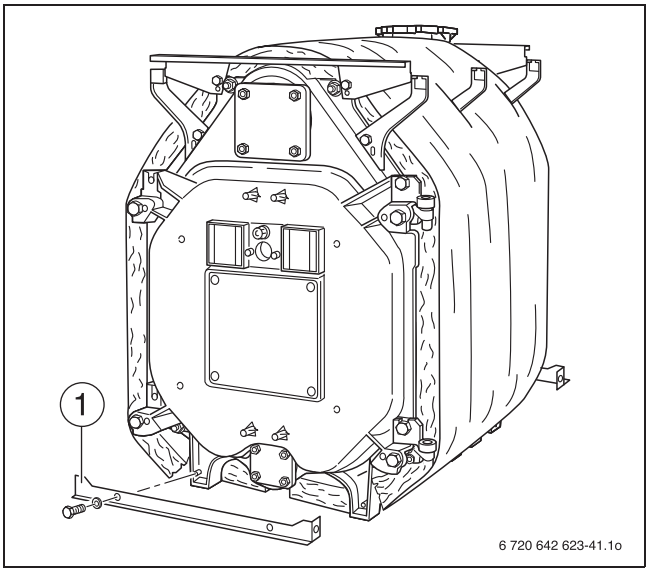

Fig. 43 Fitting the lower crosswise profile rails

- ▶ Fit rectangular thermal insulation (→ Fig. 44. [1]) with the cut-outs facing upwards at the front above the door.
- ▶ Fasten thermal insulation to the block thermal insulation with the 3 spring hooks (→ Fig. 44, [2]).

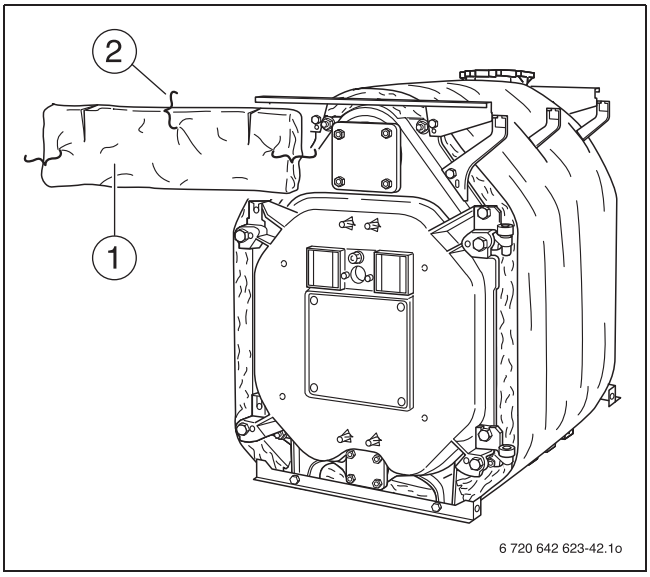

Fig. 44 Installing thermal insulation at the front

- ▶ Push longitudinal rails (→ Fig. 45, [1 and 2]) with pre-fitted screws into the notches in the brackets, as previously described, and screw together.

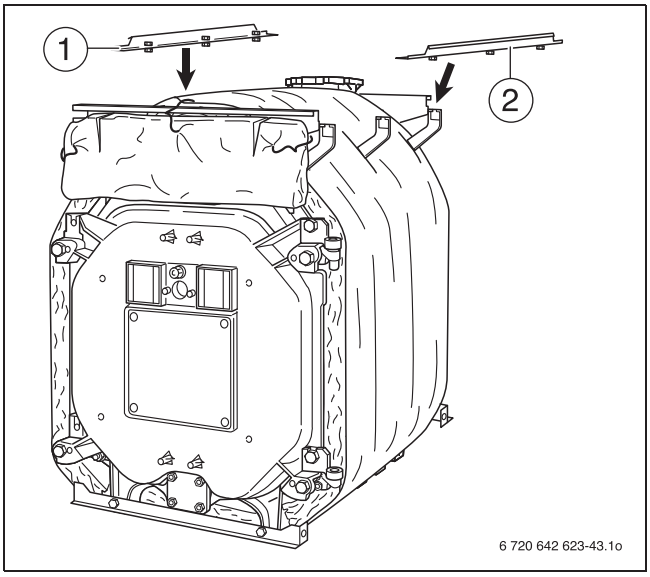

Fig. 45 Installing the longitudinal rails

- ▶ Push back rear section thermal insulation (→ Fig. 46, [1]) onto the flue outlet. The cut-out for the boiler return (→ Fig. 46, [2]) must point upwards.
- ▶ Attach the thermal insulation for the rear section via the four spring hooks to the boiler block thermal insulation.
- ▶ Close the slot below the flue outlet with a spring hook (→ Fig. 46, [3]).

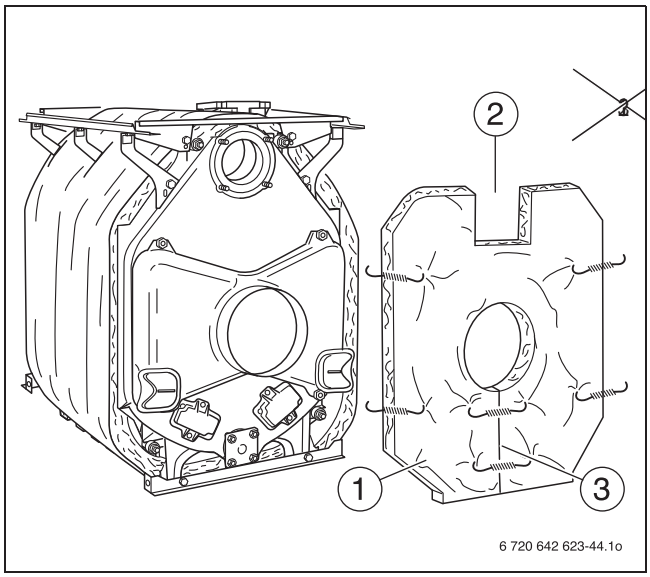

Fig. 46 Fitting the thermal insulation for the rear section

- ▶ Hook each base rail (→ Fig. 47, [1 and 3]) with the long projection facing toward the front (→ Fig. 47, [2]) into the bottom crosswise profile rails.
- ▶ Initially screw the side of the base rails loosely to the crosswise profile rails using self-tapping screws.

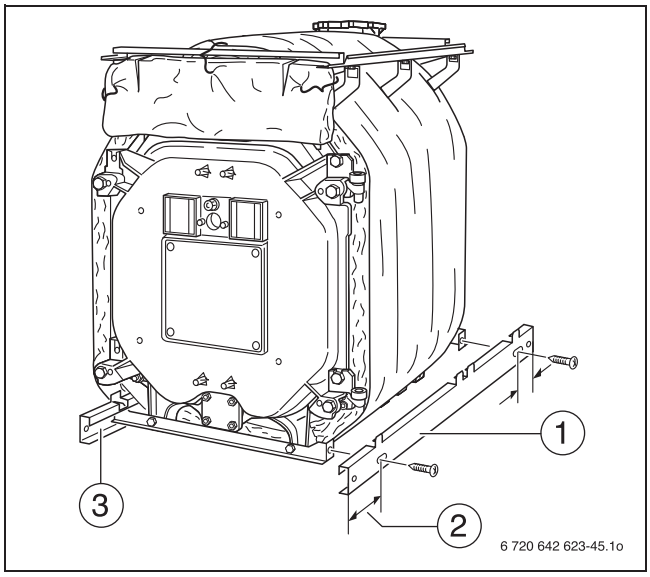

Fig. 47 Mounting the side base rails

7.9.4 Fitting side panels and top covers

▶ Fit all side panels as shown in the diagram (→ Fig. 48).

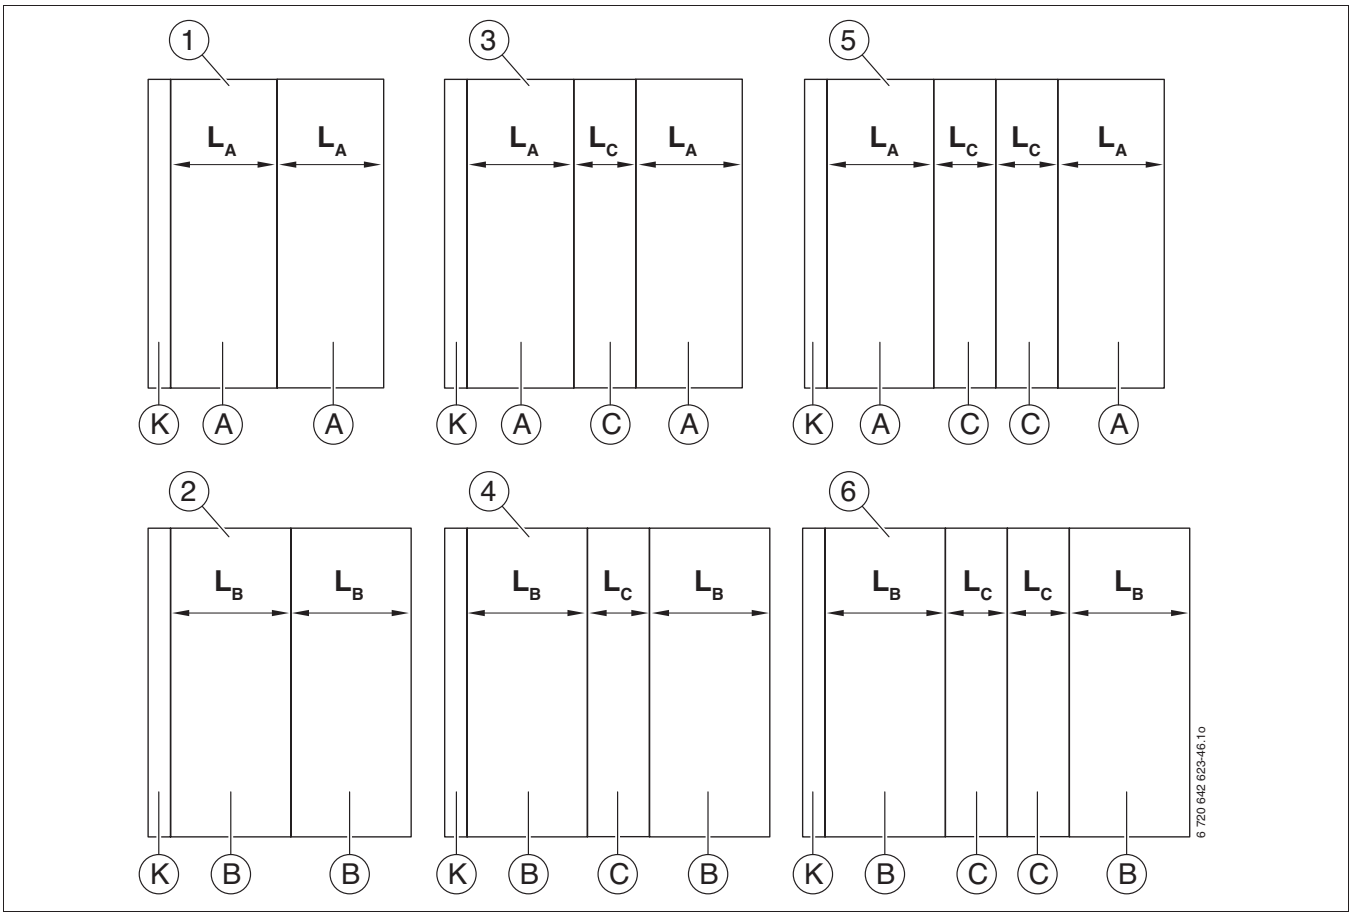

Fig. 48 Arrangement of side panels for the various boiler sizes (dimensions in inches (mm))

[1] 7 boiler sections
[2] 8 boiler sections
[3] 9 boiler sections
[4] 10 boiler sections
[5] 11 boiler sections
[6] 12 boiler sections
[K] Flap 4 – 21/64" (110 mm)
[L_A] 24 – 7/32" (615 mm)
[L_B] 27 – 9/16" (700 mm)
[L_C] 13 – 25/64" (340 mm)

To fit the side panel sections, the side panel flaps must first be fastened to the front side panels.

- ▶ Fasten the hinges to the side panel flaps beforehand using 2 self-tapping screws in each case.
- ▶ Hook the hinge pins (→ Fig. 49, [1]) on the side panel flap into the cut-out of the front side panel and secure with self-tapping screws.
- ▶ Attach tension spring (→ Fig. 49, [2]) to the side panel and side panel flap.

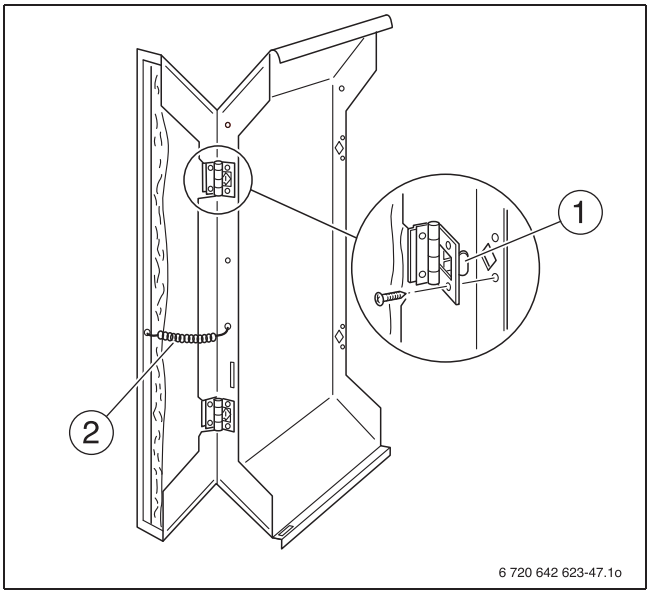

Fig. 49 Fitting the side panel flaps

- ▶ Attach the side panels (→ Fig. 50, [2]) on the bottom left and right to the lugs in the base rails that have been bent upwards (→ Fig. 50, [1]) then push up over the folded edge of the longitudinal rails.

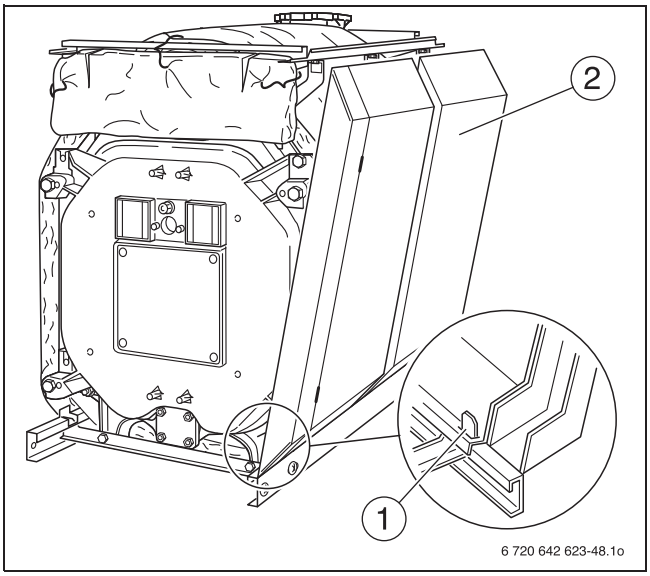

Fig. 50 Attaching the side panel sections

- ▶ Once the side panels (→ Fig. 51 [2]) have been vertically aligned, the self-tapping screws in the base rail (→ Fig. 51, [4]) must be tightened.
- ▶ Push the base rails that run crosswise (→ Fig. 51, [1 and 3]) into the base rails that run lengthwise from the front and back. The folded edge on the cross plate must be at the bottom in each case, and point toward the boiler (→ Fig. 51).

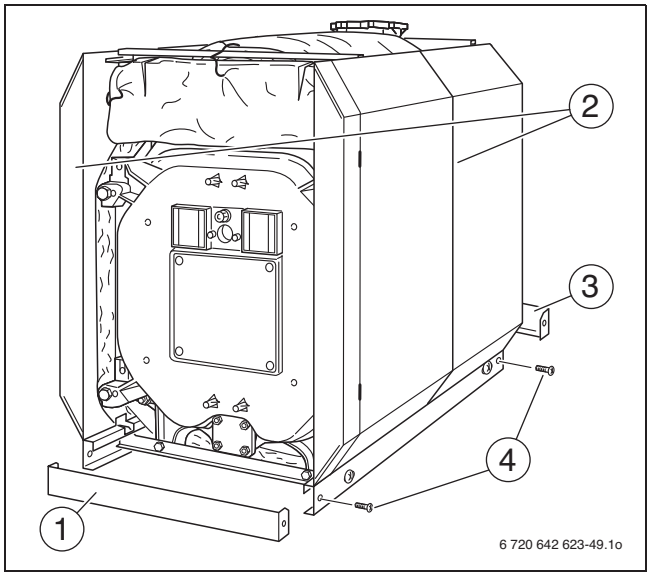

Fig. 51 Mounting the base rails

- ▶ Attach the front cover (→ Fig. 52, [1]) to the front side panels with the two hooks (→ Fig. 52, [3]).
- ▶ Screw the front cover to the longitudinal rails from below with two self-tapping screws (→ Fig. 52, [2]).

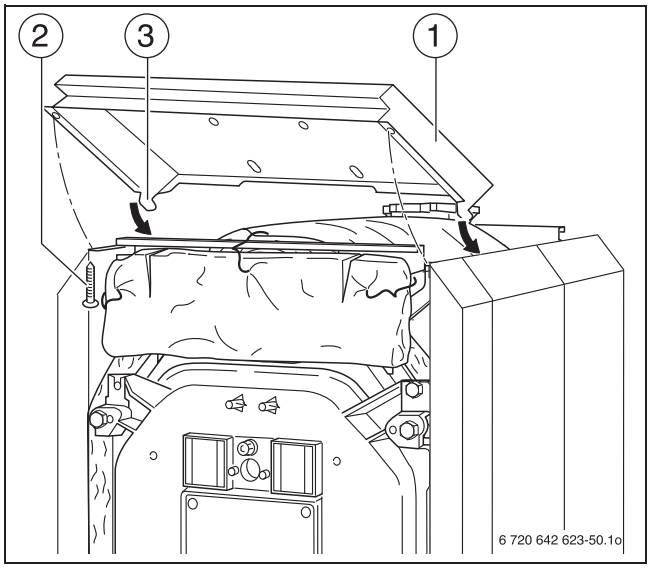

Fig. 52 Fitting the front cover

Before fitting the other parts of the cover, you must first install the control panel, route the capillaries to the sensor well and insert the sensor into the sensor well (→ Chapter 9, page 32).

▶ Push the center boiler cover with the folded edges (→ Fig. 53, [1]) under the front boiler cover and insert into the bead of the side panels.

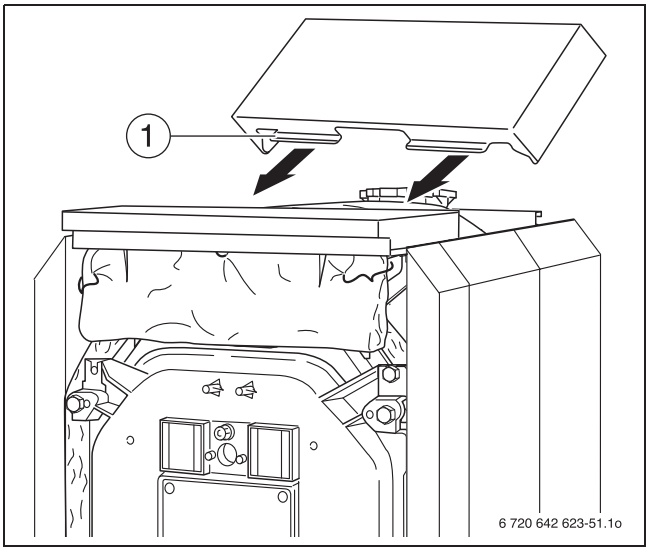

Fig. 53 Fitting the center cover

▶ Fit the rear boiler cover on the side panels with the folded edges and cut-out for the heating circuit flow (→ Fig. 54, [1]) facing toward the front.

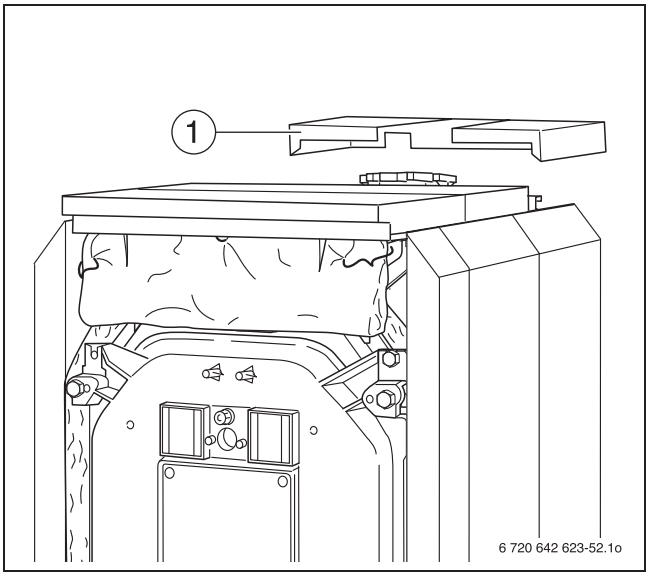

Fig. 54 Fitting the rear cover

▶ Push upper rear boiler panel under the rear boiler cover (→ Fig. 55, [1]) and screw to the side panels from the back using four self-tapping screws (→ Fig. 55, [2]).

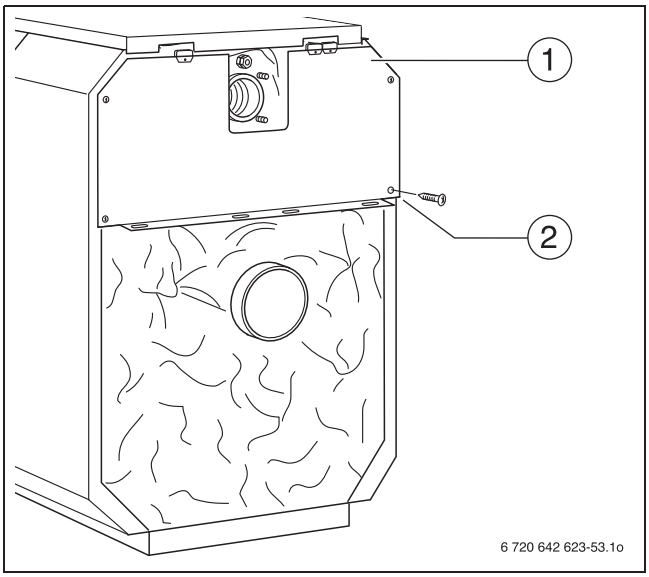

Fig. 55 Fitting the rear boiler panel

▶ Insert snap nuts into the left and right-hand side panels and also the rear boiler panel sections (→ Fig. 56, [1, 3, 4, and 8]).

▶ Hang the bottom rear boiler panel sections on the left and right into the slots in the folded edge of the upper rear boiler panel and the side panel (→ Fig. 56, [5]).

▶ Secure the rear panel sections of the boiler to the side panels with self-tapping screws.

▶ Screw the connecting plate (→ Fig. 56, [2]) below the flue outlet to the rear boiler panel sections using self-tapping screws.

▶ Fasten the plastic cable entries to the left or right-hand side of the upper rear boiler panel (→ Fig. 56, [6 and 7]).

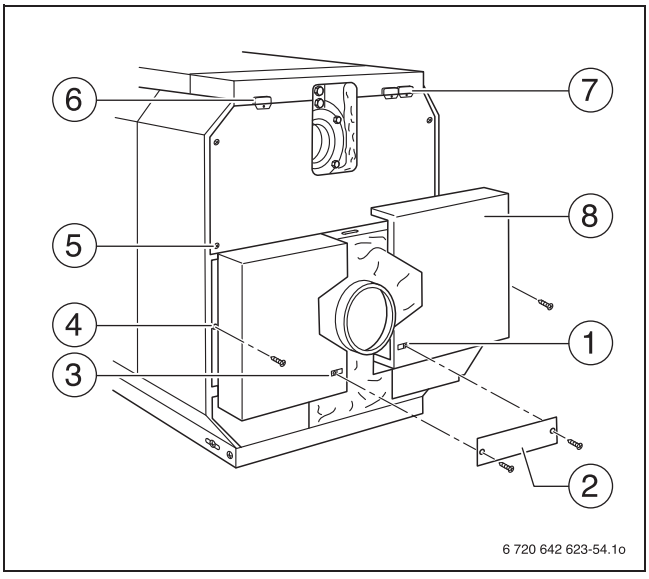

Fig. 56 Installing the rear boiler panel sections

- ▶ Snap burner cable with strain relief into cable entry (→ Fig. 57, [1]).
- ▶ Insert the burner cable with strain relief into the burner door cladding.
- ▶ Route the burner cable up along the folded edge of the burner door cladding and fasten with the cable clamp to ensure the burner cable does not come into hot components of the boiler.
- ▶ Fit the burner door cladding on the burner door from the front and screw on with four machine screws (→ Fig. 57, [2 to 5]).
- ▶ Route the burner cable to the cable entry for the control panel.

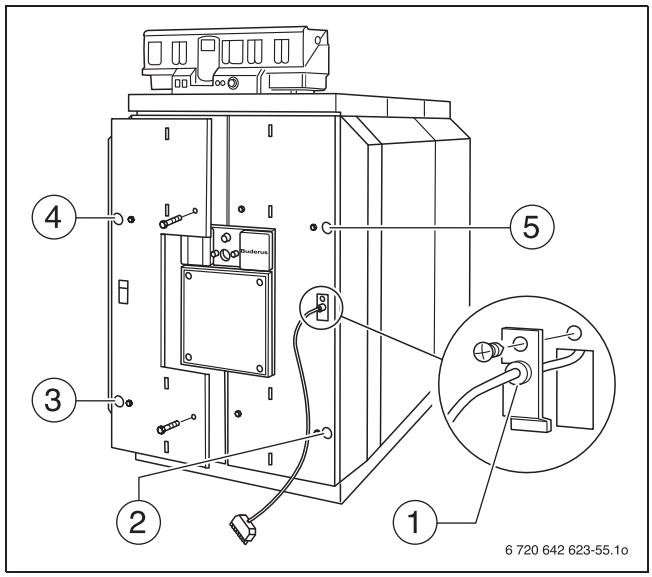

Fig. 57 Installing the burner door cladding

- ▶ Attach the burner door panels to the burner door cladding (→ Fig. 58, [1 and 2]).

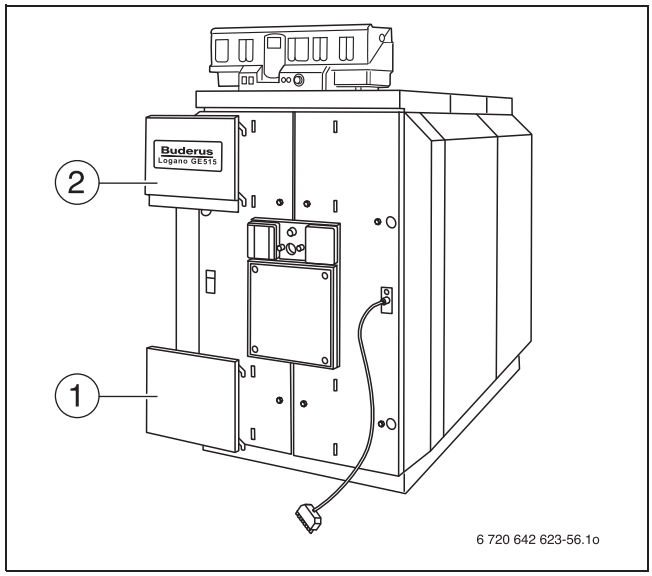

Fig. 58 Attaching the burner door panels

When the boiler is supplied ready-assembled, the type plate can be found in the combustion chamber accompanied by the assembly and maintenance instructions; when the boiler supplied in separate sections, it can be found in the transparent pocket on the burner door.

- ▶ Subject to the boiler location, affix the type plate to the top right or left side panel where it can be clearly seen.

8 Connecting the boiler on the flue gas side

This chapter explains how to connect the boiler on the flue gas side.

8.1 Fitting the vent pipe sealing collar (accessory)

We recommend you use a vent pipe sealing collar (→ Fig. 59, [1]).

- ▶ Push the vent pipe (→ Fig. 59, [4]) as far as possible onto the draft diverter outlet (→ Fig. 59, [6]).
- ▶ Place the vent pipe sealing collar (→ Fig. 59, [1]) around the vent pipe (→ Fig. 59, [4]) and draft diverter (→ Fig. 59, [6]) outlet so that it overlaps at the top.
- ▶ Place hose clamps (→ Fig. 59, [5]) over the vent pipe sealing collar (→ Fig. 59, [1]). One of the hose clamps (→ Fig. 59, [5]) must press onto the draft diverter outlet (→ Fig. 59, [6]) and and one onto the vent pipe (→ Fig. 59, [4]).
- ▶ Tighten hose clamps (→ Fig. 59, [5]). The vent pipe sealing collar (→ Fig. 59, [1] must fit smoothly and firmly in place.

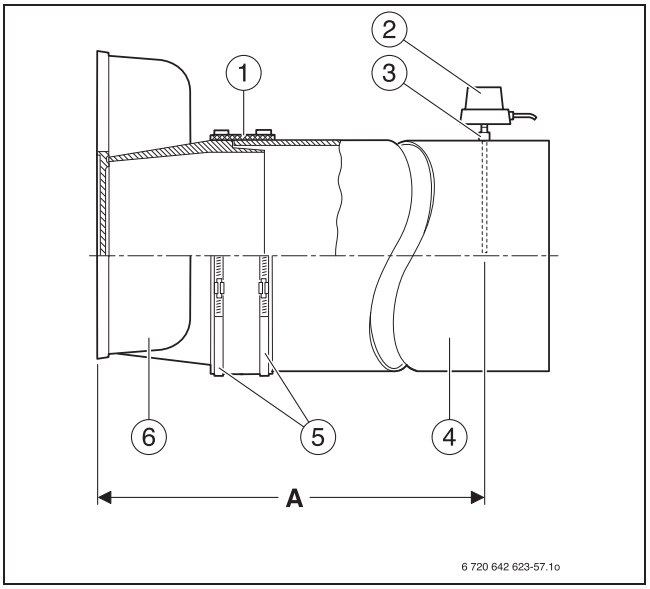

Fig. 59 Installing the vent pipe

[1] Vent pipe sealing collar
[2] Flue gas temperature sensor
[3] Sleeve
[4] Vent pipe
[5] Hose clamps
[6] Exhaust manifold
[A] 2 × Vent pipe diameter, at least 28 – 22/64 inches (720 mm)

Retighten the hose clamps if required.

8.2 Installing a flue gas temperature sensor (accessory)

- ▶ Weld a sleeve (→ Fig. 59, [3]) at a distance of 2 × vent pipe diameters (A) from the draft diverter (→ Fig. 59, [6]) in the vent pipe (→ Fig. 59, [4]).
- ▶ Fit the flue gas temperature sensor (→ Fig. 59, [2]) as described in the separate installation manual.

9 Installing the control panel

This section explains how to install a Logamatic 4000 series control panel and its set of temperature sensors.

9.1 Installing the control panel

Fig. 60 shows the control panel and the top cover "A" from the back.

- ▶ Loosen both screws on top of the control panel (→ Fig. 60, [1]) and remove the top cover.
- ▶ Mounting the control panel in place Fit the control panel at the front by inserting the alignment tabs (→ Fig. 60, [4]) into the oval holes in the front top boiler cover (→ Fig. 60, [5]). Tilt the control panel forward and then tip backward. The flexible hooks (→ Fig. 60, [2]) must engage with the rectangular cutouts in the rear of the front boiler cover (→ Fig. 60, [3]).
- ▶ Attach the base of the control panel to the top cover (→ Fig. 60, [6]) using two self-tapping screws (→ Fig. 60, [7]).

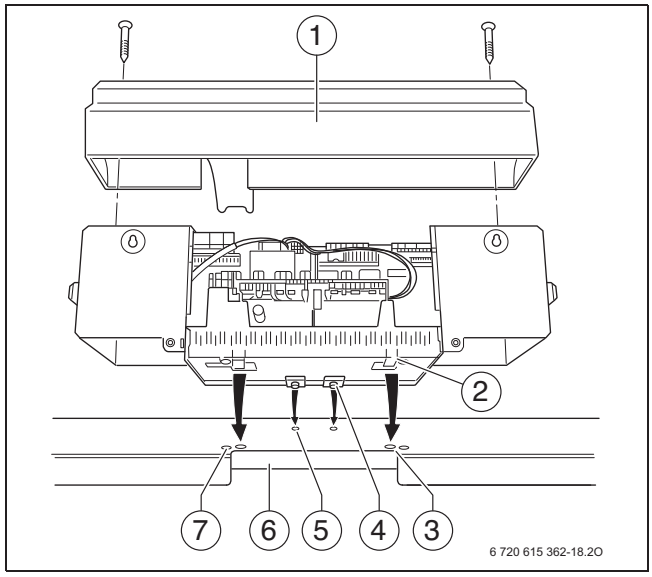

Fig. 60 Installing the control panel

9.2 Fitting temperature sensor assembly and burner cable

Observe the following when connecting the control panel:

- ▶ Lay out cables and capillaries carefully.
- ▶ Do not bend the capillaries during installation.
- ▶ Never carry out any electrical work on the heating system unless you are licensed for this type of work. If you are not suitably qualified, arrange for a qualified electrician to make the electrical connections.
- ▶ Observe the local regulations!

- ▶ If necessary, make knock-outs (→ Fig. 61, [1]) in the rear panel of the cable entry (Logamatic 33xx) or remove the rear panel section (Logamatic 43xx) (→ Fig. 61, [2]).
- ▶ Route the capillaries through the cable entry and unroll to the required length.

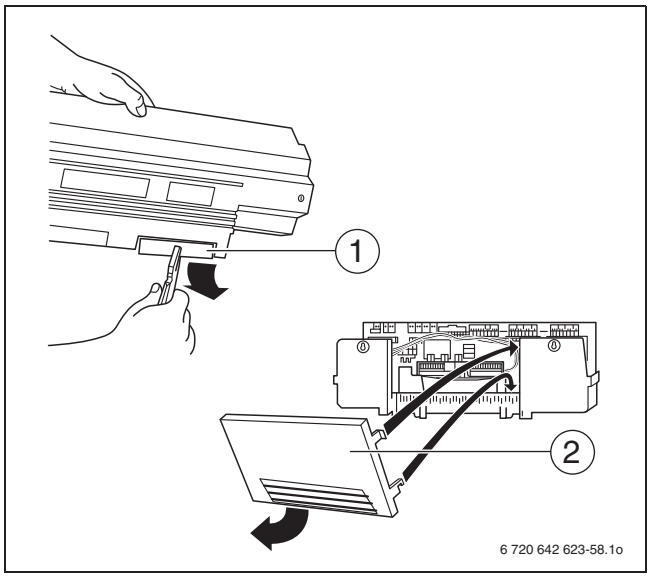

Fig. 61 Preparing the cable entry

The sensor well has already been sealed in the flow connection socket (→ Chapter 7.5, page 18).

The temperature sensor set connected to the control panel (consisting of three temperature sensors and one sensor blind piece → Fig. 62, [1]) is installed in the sensor well R ¾.

- ▶ Route capillary pipe sensor to the measuring port of the boiler and then guide the sensor into the sensor well (→ Fig. 62, [2]) and secure with the retaining clip (→ Fig. 62, [3]).

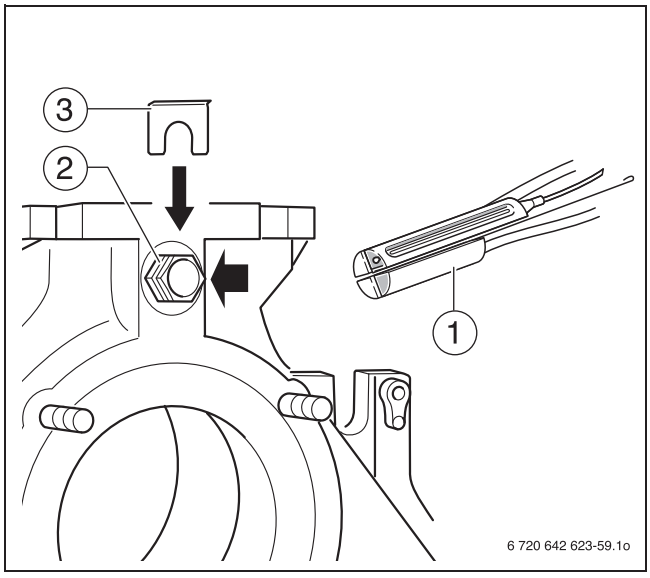

Fig. 62 Installing the temperature sensor assembly

- ▶ Screw cable entry (→ Fig. 63, [1 and 2]) to the left and right of the rear boiler panel.

A permanent connection must be made in accordance with EN 50165 or the relevant national installation standard.

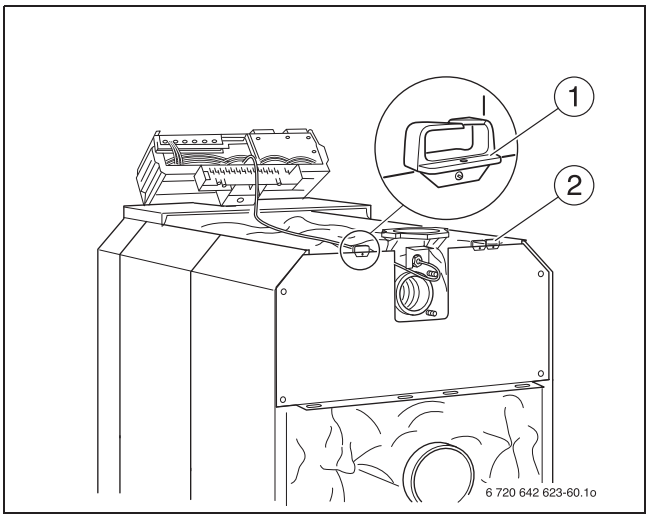

Fig. 63 Making the electrical connections

▶ Connect the electrical cables as shown in the wiring diagram. Take care to ensure proper cable and capillary tube routing.

Secure all cables with cable strain reliefs.

▶ Insert cable strain relief with cable inside into the frame and secure by closing the lever (→ Fig. 64, [1]).

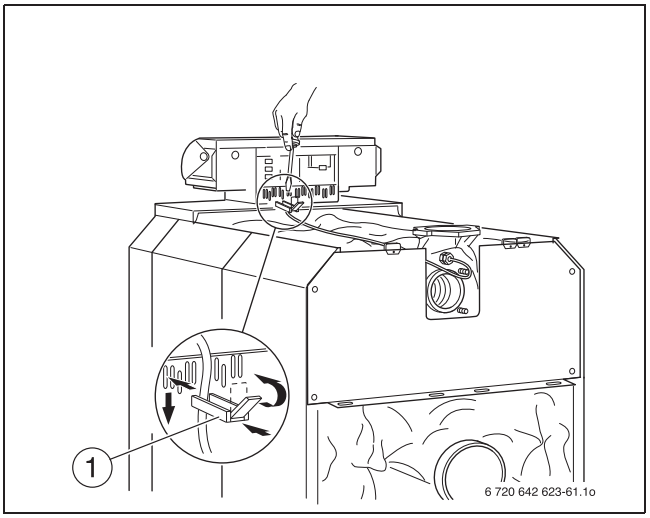

Fig. 64 Fastening the connecting cables

▶ Engage the lower hook of the rear panel (Logamatic 43xx) with the frame at an angle and tilt upward until the upper hooks engage with the side panels (→ Fig. 61, [2]).

▶ Put the top cover in place (→ Fig. 60, [1]) and tighten the screws (→ Fig. 65).

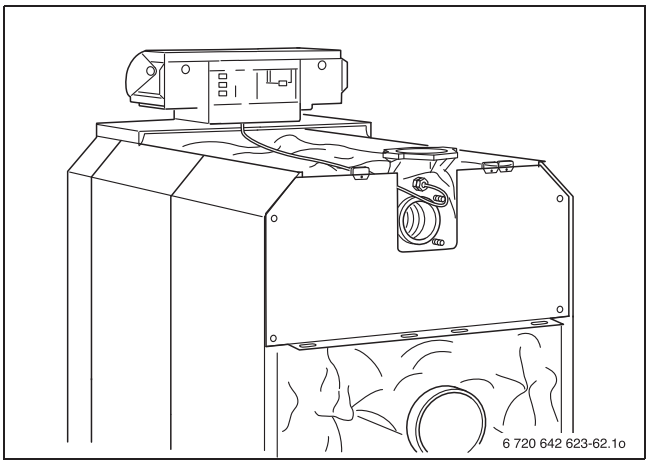

Fig. 65 Boiler with fitted control panel

10 Mounting the burner

This chapter explains the basic steps involved in fitting a burner

NOTICE: Risk of system damage from use of incorrect burner.
- ▶ Only use burners that meet the technical requirements of the oil/gas-fired boiler Logano G515 (→ Chapter 3, page 8).

- ▶ Close the burner door and seal with 4 machine screws (M16 × 140) (→ Chapter 7.8.3, page 21, Fig. 32, [3 to 6]). Tighten the machine screws evenly crosswise.

You can obtain undrilled or predrilled burner plates (hole pattern depends on burner) as accessories from Buderus.

If you have ordered an undrilled burner plate, you will have to machine the plate on site:
- ▶ Drill or cut the burner plate (→ Fig. 66, [1]) to match the required burner tube diameter Ø 10 – 5/8 inches (270 mm).
- ▶ Drill burner attachment holes using the burner flange as a template.
- ▶ Screw burner plate onto the burner door (seal with GP sealant rope; diameter Ø 25/64 inches (10 mm)).
- ▶ Screw the burner to the burner plate.
- ▶ Cut out insulating rings to match the burner tube diameter (→ Fig. 66, [2]).
- ▶ Fill the remaining gap between the burner door thermal insulation and the burner tube → Fig. 66, [4]) using the appropriate insulating rings (→ Fig. 66, [3]).
- ▶ Connect the vent connection to the burner to ensure the inspection window remains free of deposits.

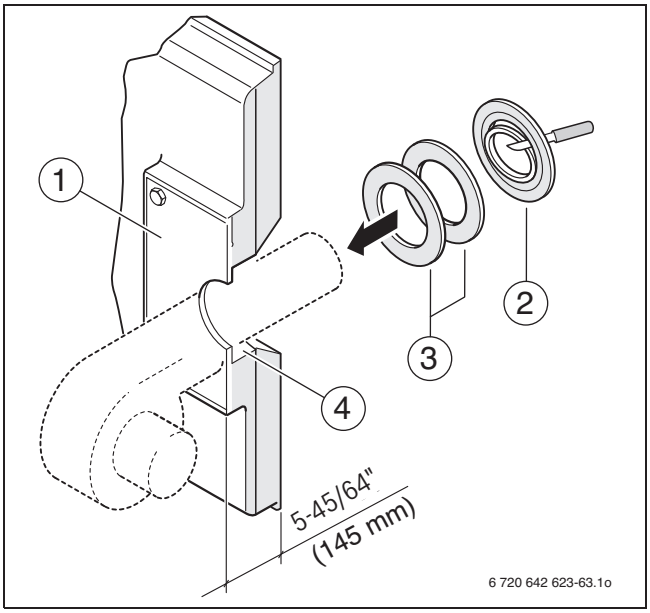

Fig. 66 Mounting the burner

11 System start-up

You can connect control panels of the 4000 series to the Logano G515. The commissioning process for the different types of control panel is the same.

NOTICE: The boiler can be damaged through heavy dust deposits!
- ▶ Do not operate the boiler where heavy dust contamination persists, e.g. through building work inside the boiler room.

11.1 Filling the system

NOTICE: Risk of system damage from temperature stresses.
- ▶ During operation, only fill the heating system via the fill valve on the system side (return).

Refer to the table below for information about correct use and treatment of the fill and make-up water.

▶ Complete the commissioning log (→ Chapter 11.6, page 37).

The pH value of the boiler water increases after the heating system has been filled. After 3 – 6 months (at the time of the first service), check whether the pH value of the boiler water has stabilized.

Overall boiler output MBH (kW)	Ca $(HCO_3)_2$ concentration / grains per gallon[1] (ppm)	Maximum fill and make-up water quantity V_{max} / ft^3 (m^3)	Boiler water pH value
341 < Q ≤ 1,194 (100 < Q ≤ 350)	≤ 11.7 (≤ 2.0)	V_{max} = three times system volume	8.2–9.5
1,194 < Q ≤ 3412 (350 < Q ≤ 1000)	≤ 8.8 (≤ 1.5)		
341 < Q ≤ 1,194 (100 < Q ≤ 350)	> 11.7 (> 2.0)	$V_{max} = 0,0243 \cdot \frac{Q(MBH)}{Ca(HCO_3)_2\left(\frac{gr}{gal}\right)}$ $\left(V_{max} = 0,0313 \cdot \frac{Q(kW)}{Ca(HCO_3)_2\left(\frac{mol}{m^3}\right)}\right)$	8.2–9.5
1,194 < Q ≤ 3412 (350 < Q ≤ 1000)	> 8.8 (> 1.5)		

Table 13 Requirements for fill, make-up and boiler water

1) 1 ft^3 = 7.48 gal

11.2 Commissioning the system

Observe the following when commissioning:

- ▶ Purge the air from your heating system via its radiators prior to commissioning.
- ▶ Check that the hot gas baffle plates are inserted correctly (→ Chapter 7.8.5, page 22).

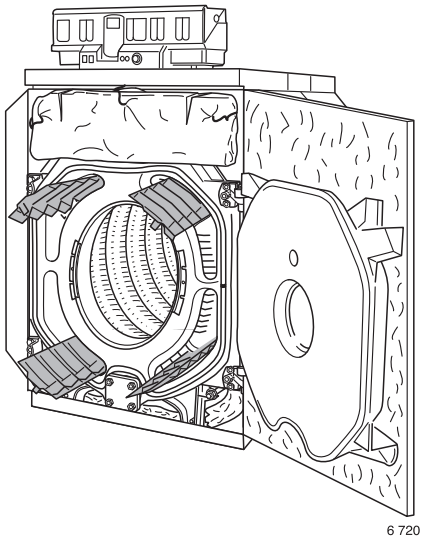

Fig. 67 Check position of heat exchanger baffles

11.3 Start up the control panel

Please see the accompanying technical documentation for the 4000 series control panel you are using for information on how to start it up.

11.4 Initial burner start-up

- ▶ When commissioning the burner, follow the installation and maintenance instructions enclosed with the burner.
- ▶ Fill out the commissioning log in the burner documentation.

If you notice when taking measurements for the commissioning log that the flue gas temperature is too low for the flue pipe (risk of condensation), you can raise the flue gas temperature (→ Chapter 11.5, page 36).

11.5 Raising flue gas temperature

With a new boiler, the flue gas temperature when the boiler temperature is 176 °F (80 °C) will be around 320 – 356 °F (160 – 180 °C), depending on the boiler rating.

In two-stage operation the temperature of the flue gas is lower.

You can increase the flue gas temperature further by removing individual hot gas check plates and hot gas baffle plates or combinations of these.

You should only consider modifying the hot gas check plates as a last resort as once you have reduced the size of the hot gas check plates you cannot change this back.

- Take the boiler out of operation in accordance with the operating instructions.

You can increase the temperature of the flue gas by carrying out the following measures.

11.5.1 Removing heat exchanger baffles

For boilers with 7 – 11 boiler sections (819 – 1,553 MBH or 240 – 455 kW) an increase of the flue gas temperature can be achieved through **pair-wise** removal of the upper or lower flue gas baffles.

11.5.2 Removing hot gas check plates

You can significantly increase the flue gas temperature by removing the hot gas check plates.

- Take the hexagon socket screws out of the hot gas check plates on the left and right and remove the hot gas check plates (→ Fig. 68, [1 and 2]).

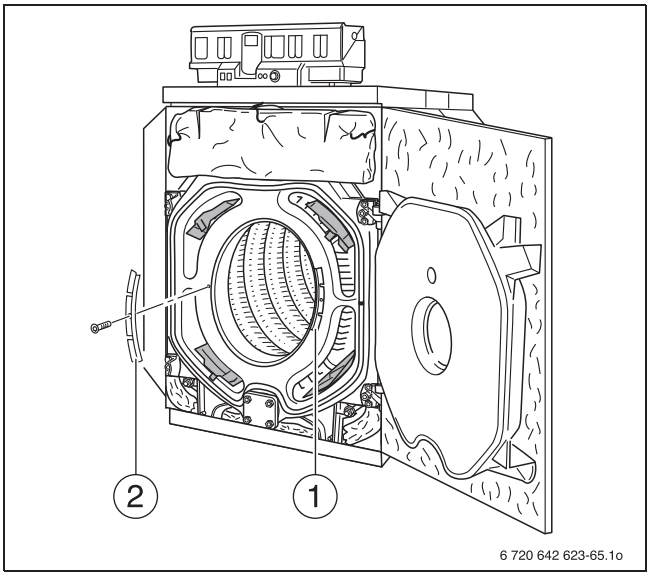

Fig. 68 Position of hot gas check plates

11.5.3 Increasing the flue gas temperature slightly

- Take the hexagon socket screw (→ Fig. 69, [3]) out of the hot gas check plate on the left and right (→ Fig. 69, [1 and 2]) and remove the hot gas check plates.
- Place the hot gas check plate on the support with the channels (→ Fig. 69, [1 and 2]) facing downwards. Knock off one segment of the left and right hot gas check plate with a hammer.
- Screw the hot gas check plate back onto the front section with the hexagon socket screws.

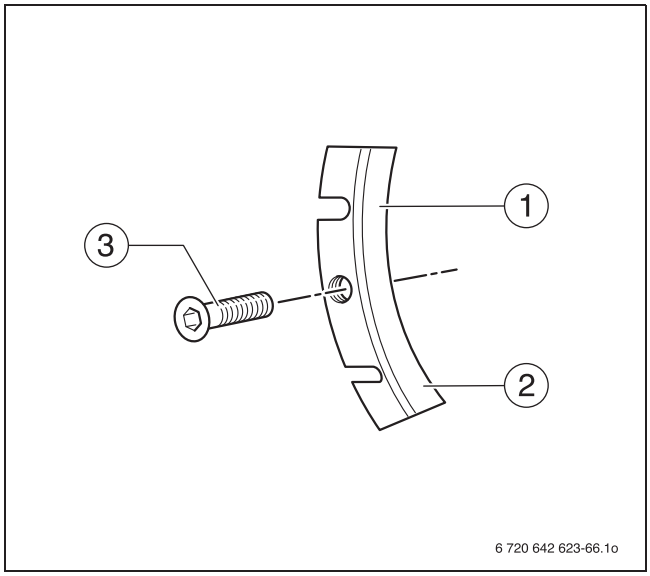

Fig. 69 Hot gas check plate

- If the flue gas temperature increases by an insufficient amount, the second segment on the hot gas check plates can be broken off in the same way, or all hot gas check plates can be removed as described above.

11.6 Commissioning log

The Logano G515 can be used with an oil or gas-fired burner. Fill in the commissioning log for the appropriate type of oil or gas burner carefully.

▶ Sign all start-up work as completed and enter the relevant date.

Commissioning operations		Individual steps	Comments (signature)
1.	Perform leak test of the entire system		
2.	Fill the heating system with water	→ page 35	
3.	Purge the air from the heating system		
4.	Perform the leak test if the boiler was assembled on-site	→ page 19	
5.	Record the filling water quantity and composition in the operator's log (included with the technical documentation).		
6.	Check position of heat exchanger baffles	→ page 22	
7.	Check the fuel line for leaks.		
8.	Start up the control panel	→ page 35	
9.	Initial burner start-up	See burner documentation	
10.	Check the flue gas temperature	→ page 36	
11.	Check vent pipe for leaks.		
12.	Check the boiler and flue gas side for leaks		
13.	Enter the fuel used in the table provided in the operating instructions.		
14.	Inform the owner and operator and hand over technical documentation		
15.	Confirm properly-completed commissioning		

Company stamp/signature/date

12 Shutting down the system

You can connect control panels of the 4000 series to the Logano G515. The shutting down process for the different types of control panel is the same.

NOTICE: Risk of system damage from freezing.

- The heating system can freeze up if it is disabled, e.g. shut down due to a fault.
- Protect the heating system from freezing when temperatures below freezing are expected. Drain the boiler water from the heating system at its lowest point using the drain valve. To do this, open the air vent at the highest point in the system.

12.1 Shutting down the heating system via the control panel

Shut down your boiler via the control panel. Shutting down the control panel automatically also switches off the burner.

- Shut off the fuel supply to the burner.

12.2 Shutting down the system in an emergency

In an emergency disconnect electrical power to the boiler and heating system by shutting off the emergency shut-off switch on the boiler or outside the boiler room, or disengage the heating system circuit breaker.

In other dangerous situations, immediately close the main fuel shut-off valve.

- Shut off the fuel supply to the burner.

13 System inspection and maintenance

13.1 General information

Offer your customer a maintenance contract covering annual inspection and servicing work as required. To find out what a contract for annual inspection and demand-based servicing covers, refer to Chapter 13.7, page 42.

DANGER: Risk of fatal injury from the explosion of flammable gases.

▶ Work on gas components must be carried out by trained and certified personnel only.

Cleaning and maintenance:

If heating oil is being used, cleaning and maintenance must be carried out twice a year. Depending on demand/run time, a shorter cleaning interval may be necessary.

Spare parts can be ordered from the Buderus spare parts catalog.

13.2 Why is regular maintenance important?

You should have your customer's system serviced for the following reasons:

- to achieve a high level of efficiency and to operate the system economically (low fuel consumption),
- to achieve a high level of operational safety and reliability
- to maintain a clean and environmentally-friendly combustion.

13.3 Cleaning the boiler with cleaning brushes

▶ Put the main power switch (→ Fig. 70, [1]) on the control panel in position “0”.

▶ Shut off the fuel supply to the burner.

▶ De-energize the system.

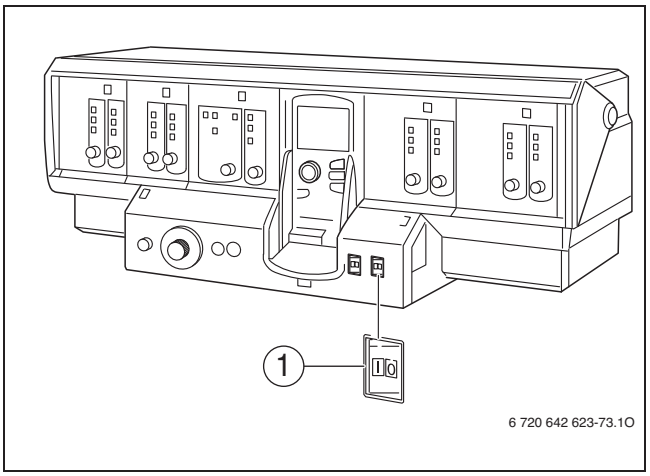

Fig. 70 Logamatic 4311 shown as an example

▶ Undo the four machine screws that fasten the burner door to the front section (→ Fig. 71, [1 to 4]).

▶ Swing out burner door.

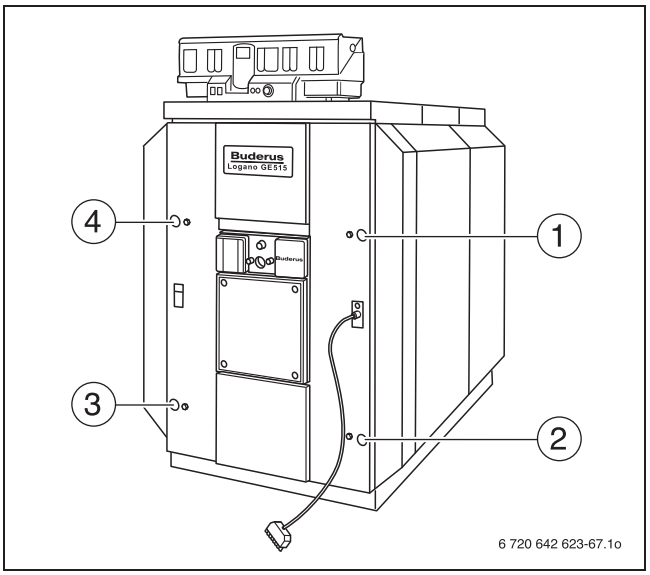

Fig. 71 Fastening the burner door

Boilers rated at 510 with 12 boiler sections are not equipped with flue gas baffle plates. Flue gas baffle plates are not used in boilers rated between 240 – 455 with 7 – 11 boiler sections (→ Chapter 7.8.5, page 22).

▶ Remove the flue gas baffles from the flue gas passages (→ Fig. 72, [1 to 4]).

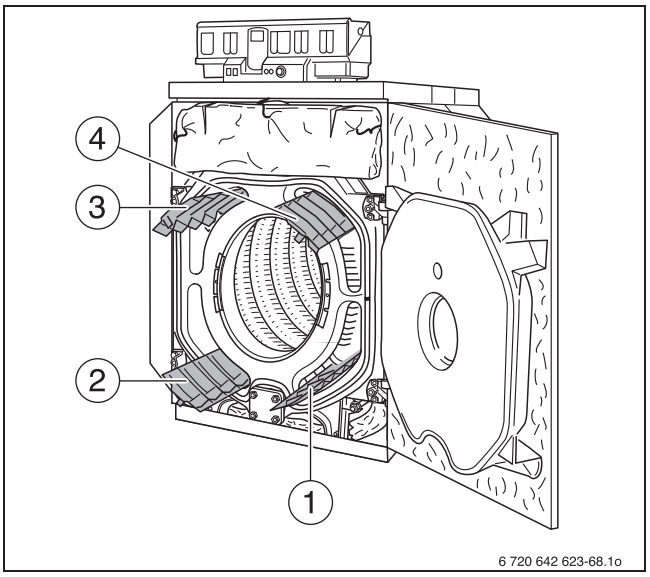

Fig. 72 Flue gas baffles, removing

The various brush types available from Buderus (accessories) are shown in Fig. 73.

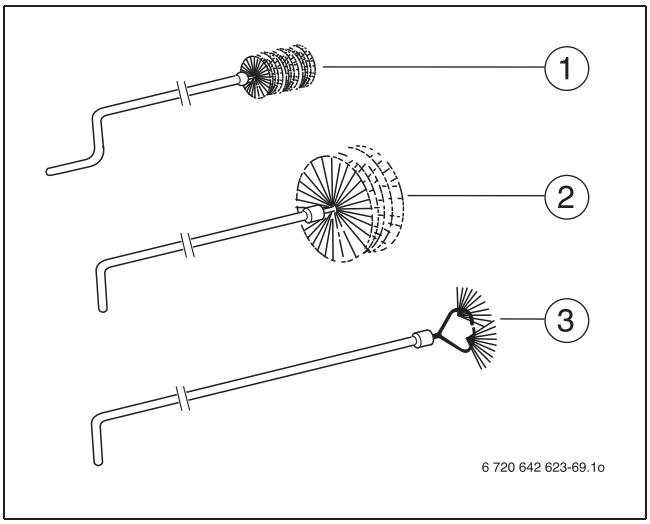

Fig. 73 Cleaning brushes

- ▶ Clean the flue gas passages, starting at the front and working toward the back with cleaning brushes 1 and 2 (→ Fig. 74, [1 and 3]).
- ▶ Clean the rear wall of the combustion chamber with cleaning brush 3.
- ▶ Clean the rest of the combustion chamber (→ Fig. 74, [2]) with cleaning brush 2.

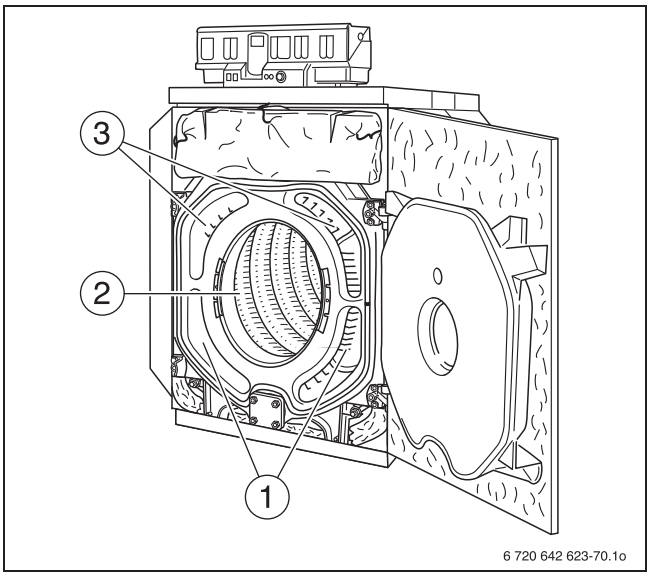

Fig. 74 Heat exchanger flue gas passages, cleaning

- ▶ Undo both self-tapping screws on the connecting plate and remove connecting plate.
- ▶ Remove the two self-tapping screws on the left and right-hand side of the lower rear boiler panel section.
- ▶ Lift up the bottom rear boiler panel sections slightly and take out toward the rear.
- ▶ Undo the spring hooks below the flue outlet, fold up the thermal insulation and attach via the spring hooks (→ Fig. 75, [1]).
- ▶ Remove the cleanout covers from the rear section (→ Fig. 75, [2]) and on the draft diverter (→ Fig. 75, [3]).
- ▶ Remove all loose combustion residues from the combustion chamber, the flue gas passages and the draft diverter.
- ▶ Check sealant ropes on the cleanout openings and burner door. Replace damaged or hardened sealant ropes.

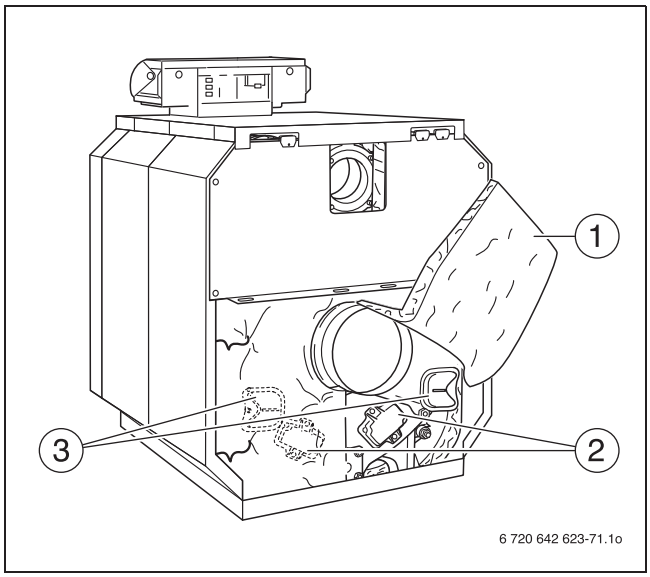

Fig. 75 Removing the cleanout cover.

You can obtain sealant ropes from your local Buderus wholesaler.

- ▶ Clean flue gas baffles with the cleaning brushes.
- ▶ Insert the flue gas baffle plates in the flue gas passages (→ Chapter 7.8.5, page 22).
- ▶ Fasten cleanout cover and tighten the screws evenly.
- ▶ Close the burner door and tighten the screws evenly.
- ▶ Fold the rear section thermal insulation down and pull together under the flue outlet using the spring hook (→ Fig. 76, [1]).

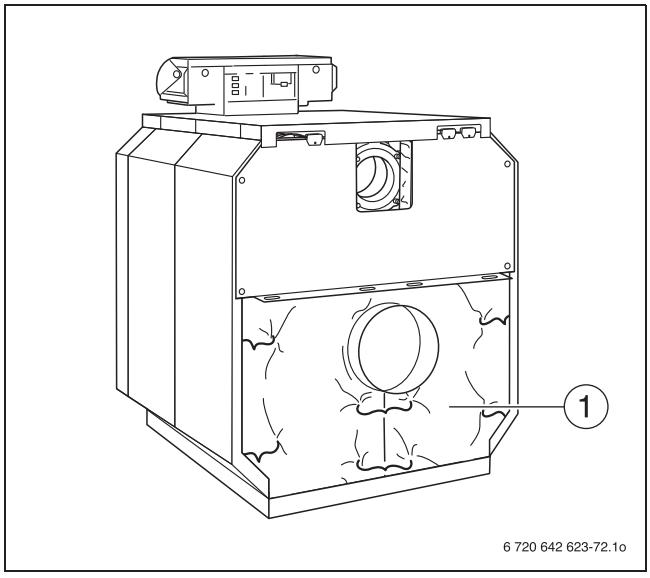

Fig. 76 Pull rear section thermal insulation together

- ▶ Hang the bottom rear boiler panel sections on the left and right into the slots in the folded edge of the upper rear boiler panel and the side panel and screw the connecting plate below the flue outlet onto the bottom rear boiler sections.

13.4 Wet-cleaning the boiler

When wet-cleaning, pick the cleaning agent based on the level of contamination.

Proceed with wet cleaning in the same order as described for cleaning with cleaning brushes (→ Chapter 13.3, page 39).

For wet-cleaning (chemical cleaning), observe the operating instructions of the relevant cleaning equipment and cleaning agent. It may be necessary to vary the wet-cleaning process from that described here.

- ▶ Select a cleaning agent that is appropriate for the type of contamination (soot or encrustation).
- ▶ Cover the control panel with foil to prevent penetration by the cleaning agent.
- ▶ Spray cleaning agent evenly from the top into the flue gas passages
- ▶ Heat up the boiler to a boiler water temperature of at least 158 °F (70 °C).
- ▶ Brush out the heat exchanger heater.

13.5 Checking the operating pressure

The operating pressure must be at least 15 psi (1 bar).

- ▶ Read the current operating pressure (psi) and temperature (°F (°C)) from the temperature/pressure gauge.
- ▶ If the operating pressure drops below 15 psi (1 bar), fill boiler water.

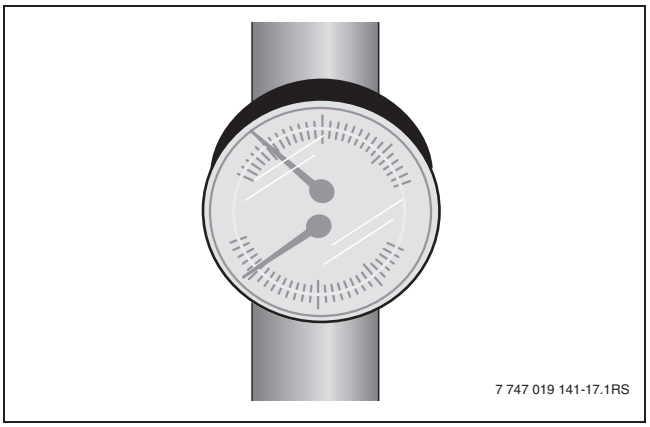

Fig. 77 Pressure/temperature gauge

13.6 Filling with boiler water and purging the system

NOTICE: Risk of system damage from temperature stresses.

- ▶ When the heating system is in operation, do not fill it via the boiler fill & drain valve. Instead, use the fill valve on the system side.

Bring the system up to the required operating pressure.

- ▶ Slowly fill the heating system via the on-site fill valve. During filling, observe the display (pressure gauge).
- ▶ Once the desired operating pressure is reached, stop the procedure.
- ▶ Purge the air from the heating system via the purge valves on the heating bodies.
- ▶ Fill with water again if the operating pressure drops as a result of purging the system.

NOTICE: Risk of system damage from frequent refilling.

- ▶ The system may be damaged, depending on water quality, by corrosion or scaling, if you frequently need to re-fill your system with make-up water.
- ▶ Ensure that your heating system is bled.
- ▶ Check the heating system for leaks and the function of the expansion vessel.

13.7 Inspection and maintenance logs

The inspection and maintenance logs provide an overview of the required inspection and maintenance work.

▶ Initial and date the inspection operations completed.

The inspection and maintenance logs can also be used as templates.

Inspection work		Page	Date:_____	Date:_____
1.	Check general condition of heating system		☐	☐
2.	Visual inspection and function check of the heating system		☐	☐
3.	Check fuel and water-carrying components of the system for: • Leaks during operation • Visible signs of corrosion • Signs of aging		☐	☐
4.	Check the combustion chamber and heating surfaces for contamination. Shut down the heating system first.	→ 39	☐	☐
5.	Check the burner (→ burner documentation)		☐	☐
6.	Check the flue gas and venting system for proper operation and safety (see → burner documentation)		☐	☐
7.	Check the operating pressure and inlet pressure of the diaphragm expansion vessel for heating systems	→ 41	☐	☐
8.	Check the function of indirect-fired heater and rod (→ tank documentation)		☐	☐
9.	Check the control panel setting (see → control panel documentation)		☐	☐
10.	Record the final checks of the inspection work, incl. measurements and test results		☐	☐
	Confirm professional inspection		Company stamp/signature	Company stamp/signature

If during inspection work conditions are identified that require additional service and maintenance, perform this work on an as-needed basis. If make-up water is added, the quality of this water must correspond to the specifications in the enclosed operating manual.

14 Troubleshooting burner faults

Heating system faults are shown on the display of the control panel. You will find detailed information regarding fault displays in the service instructions for the relevant control panel. The burner fault is also indicated by a fault lamp on the burner.

NOTICE: Risk of system damage from freezing.
The heating system can freeze up in cold weather if it has been disabled due to a fault shutdown.

- ▶ Rectify the fault immediately and restart the heating system.
- ▶ If this is not possible, drain the heating and DHW from the system side at the lowest point.

Troubleshooting burner faults

- ▶ Press the burner reset button (see burner operating instructions).

NOTICE: Risk of system damage from too many resets.

- ▶ The burner ignition transformer may be damaged if you press the reset button more than three times in succession when the burner refuses to start.
- ▶ Do not attempt to remedy the fault by pressing the reset button more than three times in succession.

If the burner does not restart after three attempts, refer to the technical documentation provided with the burner to find out how to reset it.

15 Spare Parts

- Request spare parts with name and part number using the spare parts list.

INFORMATION ABOUT THE INSTRUCTION MANUAL

INTRODUCTION

The instruction manual supplied with the burner:

- is an integral and essential part of the product and must not be separated from it; it must therefore be kept carefully for any necessary consultation and must accompany the burner even if it is transferred to another owner or user, or to another system. If the manual is lost or damaged, another copy must be requested from the Technical Assistance Service of the area;
- is designed for use by qualified personnel;
- offers important indications and instructions relating to the installation safety, start-up, use and maintenance of the burner.

DELIVERY OF THE SYSTEM AND THE INSTRUCTION MANUAL

When the system is delivered, it is important that:

- the instruction manual is delivered to the user by the system manufacturer, with the recommendation to keep it in the room where the heat generator is to be installed.
- The instruction manual shows:
  - the serial number of the burner;

    .....
  - the address and telephone number of the nearest Assistance Centre.

    .....
    .....
    .....
- The system supplier must carefully inform the user about:
  - the use of the system;
  - any further tests that may be required before activating the system;
  - maintenance, and the need to have the system checked at least once a year by a representative of the manufacturer or another specialised technician.
    To ensure a periodic check, the manufacturer recommends the drawing up of a Maintenance Contract.

GUARANTEE AND RESPONSIBILITY

The manufacturer guarantees its new products from the installation date, in accordance with the regulations in force and/or the sales contract. At the moment of the first start-up, check that the burner is integral and complete.

Failure to observe the information given in this manual, operating negligence, incorrect installation and carrying out of non authorised modifications will result in the annulment by the manufacturer of the guarantee that it supplies with the burner.

In particular, the rights to the guarantee and the responsibility will no longer be valid, in the event of damage to things or injury to people, if such damage/injury was due to any of the following causes:

- incorrect installation, start-up, use and maintenance of the burner;
- improper, incorrect or unreasonable use of the burner;
- intervention of unqualified personnel;
- carrying out of unauthorised modifications on the equipment;
- use of the burner with safety devices that are faulty, incorrectly applied and/or not working;
- installation of untested supplementary components on the burner;
- powering of the burner with unsuitable fuels;
- faults in the fuel supply system;
- use of the burner even following an error and/or an irregularity;
- repairs and/or overhauls incorrectly carried out;
- modification of the combustion chamber with inserts that prevent the regular development of the structurally established flame;
- insufficient and inappropriate surveillance and care of those burner components most likely to be subject to wear and tear;
- the use of non-original components, including spare parts, kits, accessories and optional;
- force majeure.

The manufacturer furthermore declines any and every responsibility for the failure to observe the contents of this manual.

SAFETY AND PREVENTION

INTRODUCTION

The burners have been designed and built in compliance with current regulations and directives, applying the known technical rules of safety and envisaging all the potential danger situations.

It is necessary, however, to bear in mind that the imprudent and clumsy use of the equipment may lead to situations of death risk for the user or third parties, as well as the damaging of the burner or other items. Inattention, thoughtlessness and excessive confidence often cause accidents; the same applies to tiredness and sleepiness.

It is a good idea to remember the following:

- The burner must only be used as expressly described. Any other use should be considered improper and therefore dangerous.

In particular:

it can be applied to boilers operating with water, steam, diathermic oil, and to other uses expressly named by the manufacturer;

the type and pressure of the fuel, the voltage and frequency of the electrical power supply, the minimum and maximum deliveries for which the burner has been regulated, the pressurisation of the combustion chamber, the dimensions of the combustion chamber and the room temperature must all be within the values indicated in the instruction manual.

- Modification of the burner to alter its performance and destinations is not allowed.
- The burner must be used in exemplary technical safety conditions. Any disturbances that could compromise safety must be quickly eliminated.
- Opening or tampering with the burner components is not allowed, apart from the parts requiring maintenance.
- Only those parts envisaged by the manufacturer can be replaced.

The manufacturer guarantees safety and proper functioning only if all burner components are intact and positioned correctly.

PERSONNEL TRAINING

The user is the person, body or company that has acquired the machine and intends to use it for the specific purpose. He is responsible for the machine and for the training of the people working around it.

The user:

- undertakes to entrust the machine exclusively to suitably trained and qualified personnel;
- undertakes to inform his personnel in a suitable way about the application and observance of the safety instructions. With that aim, he undertakes to ensure that everyone knows the use and safety instructions for his own duties;
- Personnel must observe all the danger and caution indications shown on the machine.
- Personnel must not carry out, on their own initiative, operations or interventions that are not within their province.
- Personnel must inform their superiors of every problem or dangerous situation that may arise.
- The assembly of parts of other makes, or any modifications, can alter the characteristics of the machine and hence compromise operating safety. The manufacturer therefore declines any and every responsibility for any damage that may be caused by the use of non-original parts.

TECHNICAL DATA

(1) Reference conditions: Ambient temperature 68 °F (20 °C) - Barometric pressure 394" W.C. - Altitude 329 ft.
(2) Sound pressure measured in manufacturer's combustion laboratory, with burner operating on test boiler and at maximum rated output.
(3) Equivalent Btu values based on 1 USGPH = 140,000 Btu/hr.

Burner models designations

Model	Code	RBNA Code	Voltage	Flame safeguard
RL 28/M	3471070	C9511300	120/1/60	Burner mounted
RL 38/M	3471270	-	120/1/60	Burner mounted
	3471470	C9512300	208-230/460/3/60	Burner mounted
	3471470	C9512301	575/3/60	Burner mounted
RL 50/M	3471675	-	120/1/60	Burner mounted
	3471670	C9513300	208-230/460/3/60	Burner mounted
	3471670	C9513301	575/3/60	Burner mounted

ACCESSORIES (optional):

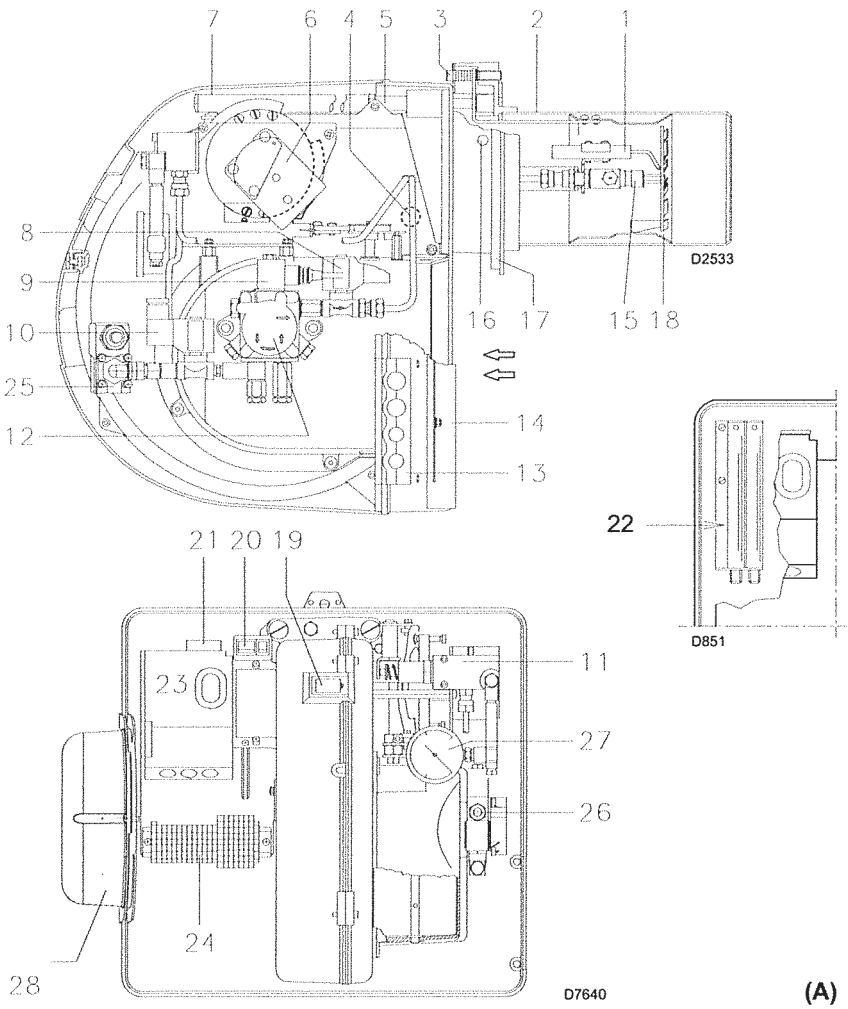
Modulating control kit

Two components should be ordered:

- modulating control to install on the burner;
- probe to install on the boiler.

PARAMETER TO BE CHECKED		PROBE		MODULATING CONTROL	
	Range	Type	Code	Type	Code
Temperature	- 212...+ 932 °F (- 100...+ 500 °C)	PT 100	3010110	RWF40	3010212
Pressure	0...36.3 PSI (0...2.5 bar)	Probe with output	3010213		
	0...232 PSI (0...16 bar)	4...20 mA	3010214		

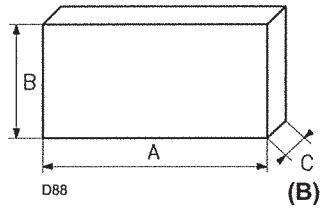
Kit for lengthening the combustion head



L = Standard length
L1 = Length obtainable with the kit

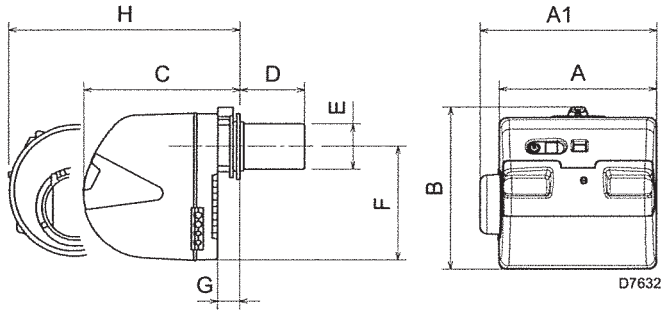
COD. 3010277	L = 9 15/32"	L1 = 13 13/16"	• RL 28/M
COD. 3010278	L = 9 15/32"	L1 = 13 13/16"	• RL 38/M
COD. 3010279	L = 9 15/32"	L1 = 13 13/16"	• RL 50/M

Flame inversion boiler kit



COD. 3010178 • RL 28/M - RL 38/M
COD. 3010179 • RL 50/M

Important:
The installer is responsible for the supply and installation of any safety device(s) not indicated in this manual.



(A)

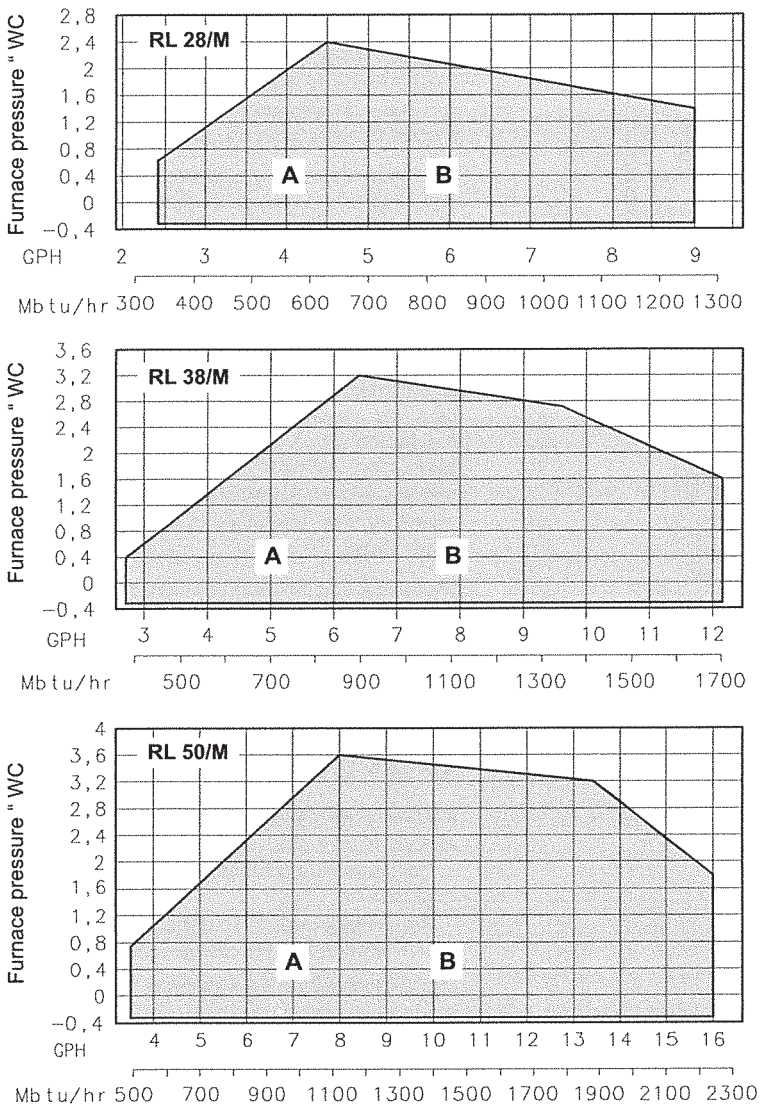
(C)

BURNER DESCRIPTION (A)

1 Ignition electrodes
2 Combustion head
3 Screw for combustion head adjustment
4 Photocell (cad cell)
5 Screw for fixing fan to flange
6 Servomotor provides adjustment of fuel delivery ulator and of air damper. When the burner is no. erating the air damper is fully closed in order to reduce heat dispersion from the boiler due to the flue draft which draws air from the fan suction inlet.
7 Slide bars for opening the burner and inspecting the combustion head
8 Safety solenoid valve
9 Pump delivery valve
10 Valve on nozzle return
11 Pressure regulator on nozzle return
12 Pump
13 Plate prearranged to drill 4 holes for the passage of hoses and electrical cables.
14 Air damper
15 Non-drip nozzle holder
16 Fan pressure test point
17 Boiler mounting flange
18 Flame stability disk
19 Flame inspection window
20 Power switch for different operation:
automatic - manual - off
Button for:
power increase - power reduction
21 Motor contactor and thermal overload with reset button (RL 38 - 50/M)
22 Extensions for slide bars 7)
23 Flame safeguard with lock-out pilot light and lock-out reset button
24 Terminal strip
25 High oil pressure switch
26 Pump pressure adjustment
27 Pressure gauge for pressure on nozzle return
28 Protection (for RL 50/M single-phase burner)

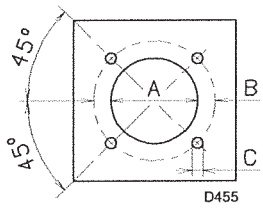
Two types of burner failure may occur:
Flame safeguard lock-out:
If the flame relay 23)(A) pushbutton lights up, it indicates that the burner is in lock-out.
To reset, press the pushbutton.
Motor trip (RL 38 - 50/M):
release by pressing the pushbutton on thermal overload 21)(A).



PACKAGING - WEIGHT (B) - Approximate measurements

- The burners are shipped in cardboard boxes with the maximum dimensions shown in Table (B).
- The weight of the burner complete with packaging is indicated in Table (B).

MAX. DIMENSIONS (C) - Approximate measurements
The maximum dimensions of the burner are given in (C). Inspection of the combustion head requires the burner to be opened and the rear part withdrawn on the slide bars. The maximum dimension of the burner, without casing, when open is give by measurement H.



STANDARD EQUIPMENT

2 - Flexible hoses
2 - Gaskets for flexible hoses
1 - Burner head gasket
4 - Screws to secure the burner flange to the boiler 3/8 W x 1"
1 - Adaptor G 1/8" / 1/8" NPT
1 - Instruction booklet
1 - Spare parts list

D455

(B)

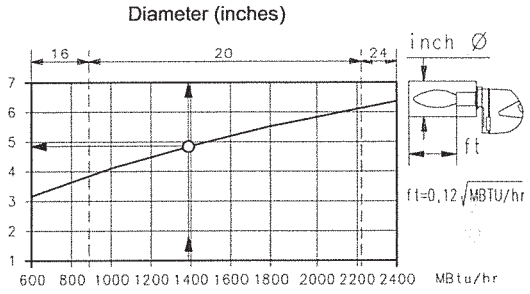
D2527

(C)

FIRING RATES (A)

During operation, burner output varies between:
- **MINIMUM OUTPUT** : area A
- **MAXIMUM OUTPUT** : area B

Graphs (A):
Horizontal axis : Burner output
Vertical axis : Heater furnace pressure
The firing rate may be found by plotting a vertical line from the desired delivery and a horizontal line from the pressure in the combustion chamber. The intersection of these two lines is the firing rate which must lie within area A, for MIN output, and within area B, for MAX output.
Important:
The FIRING RATE area values have been obtained considering a surrounding temperature of 68 °F (20 °C), and an atmospheric pressure of 394" W.C. and with the combustion head adjusted as shown on page 6.



Note:
The FIRING RATE areas given in figure (A) have been reduced by 10% with respect to the maximum range that can be reached.

Consult Appendix on page 22 for operation at different ambient temperatures and / or altitudes.

MINIMUM FURNACE DIMENSIONS

The firing rates were set in relation to certified test boilers.
Figure below indicates the diameter and length of the test combustion chamber.

Example:
output 1388 MBTU/h:
diameter 20 inch - length 4.9 ft.

D2918

INSTALLATION

BOILER PLATE (B)

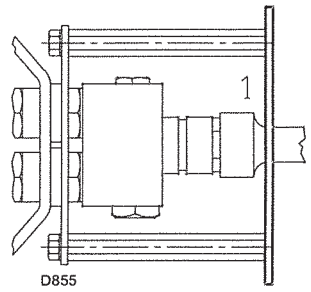
Drill the combustion chamber mounting plate as shown in (B). The position of the threaded holes can be marked using the burner head gasket supplied with the burner.

BLAST TUBE LENGTH (C)

The length of the blast tube 7) must be selected according to the indications provided by the manufacturer of the boiler, and in any case it must be greater than the thickness of the boiler door complete with its insulation.
The range of lengths available, (inch), is as follows:

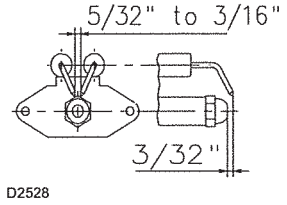
Blast tube 7):	RL 28/M	RL 38/M	RL 50/M
• short	$9^{15}/_{32}$"	$9^{15}/_{32}$"	$9^{15}/_{32}$"
• long	$13^{13}/_{16}$"	$13^{13}/_{16}$"	$13^{13}/_{16}$"

For boilers with front flue passes 10) or flame inversion chambers, protective insulation 8) must be inserted between the boiler refractory 9) and the blast tube 7).
This protective insulation must not compromise the extraction of the blast tube.
For boilers having a water-cooled front the insulation 8)-9)(C) is not required unless it is required by the boiler manufacturer.

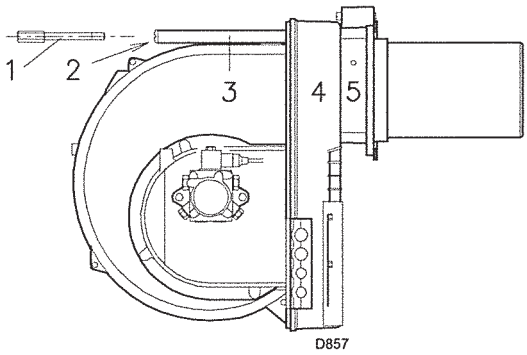


SECURING THE BURNER TO THE BOILER (C)

Disassemble the blast tube 7) from the burner 4) by proceeding as follows:
- remove the screws 2) from the two slide bars 3).
- Remove the screw 1) fixing the burner 4) to the flange 5).
- Withdraw the blast tube 7) complete with flange 5) and slide bars 3).

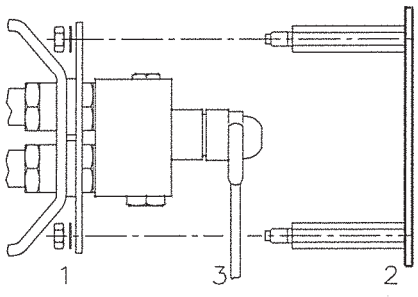


Secure flange 5)(C) to the boiler plate inserting the supplied gasket 6). Use the 4 screws provided after having protected the thread with an antilocking product.
The burner-boiler seal must be airtight.

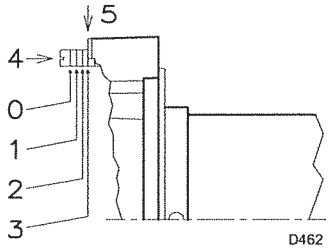


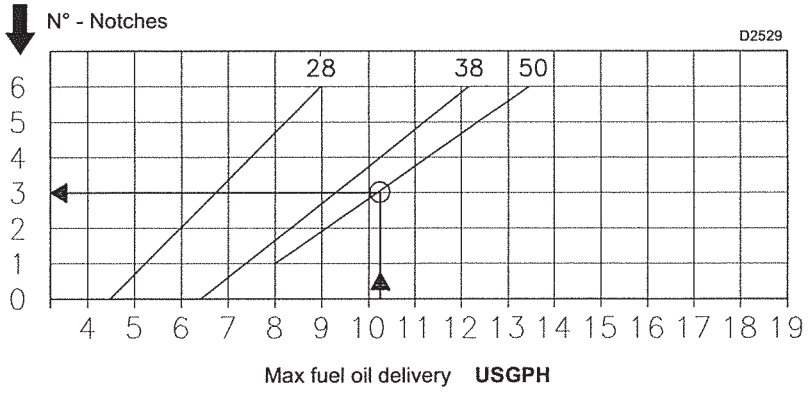
1 A3 - A4	2 GPH	3 PSI	4 PSI
15	4.2	290	246.5
20	6.4	290	246.5
30	7.7	290	217.5
40	9.6	290	232
50	10.6	290	232
60	13.4	290	232
70	16	290	217.5

(A)



(B)





(C) (D)

(E)

(F)

(G)

CHOICE OF NOZZLE (A)

Nozzle must be chosen among those in table (A):

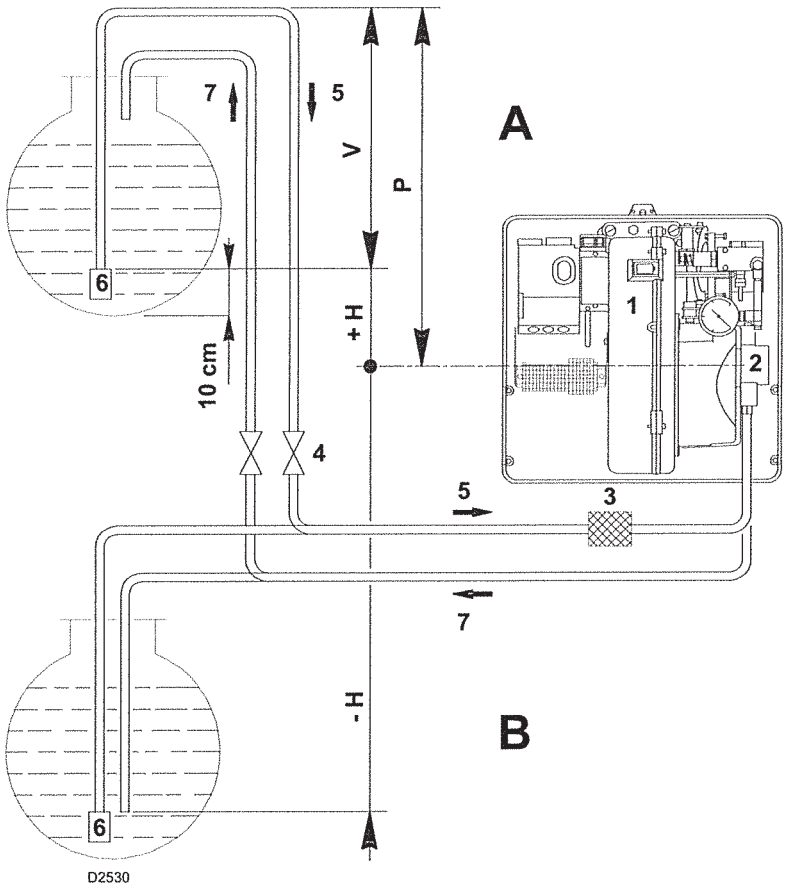
1 = Type A3 or A4 return flow nozzle
2 = MAX nozzle delivery
3 = Pump delivery pressure
4 = MAX pressure on nozzle return

In case an intermediate delivery between the two values indicated in the table is required, a nozzle with higher delivery must be chosen. Delivery reduction will be obtained by means of the pressure regulator.

RECOMMENDED NOZZLES:
Type A4 return flow nozzles - 45° angle.

NOZZLE ASSEMBLY

At this stage of installation the burner is still disassembled from the blast tube; it is therefore possible to install the nozzle with a box wrench 1)(B), fitting the wrench through the central hole in the flame stability disk. Do not use any sealing products such as gaskets, sealing compound, or tape. Be careful to avoid damaging the nozzle sealing seat.

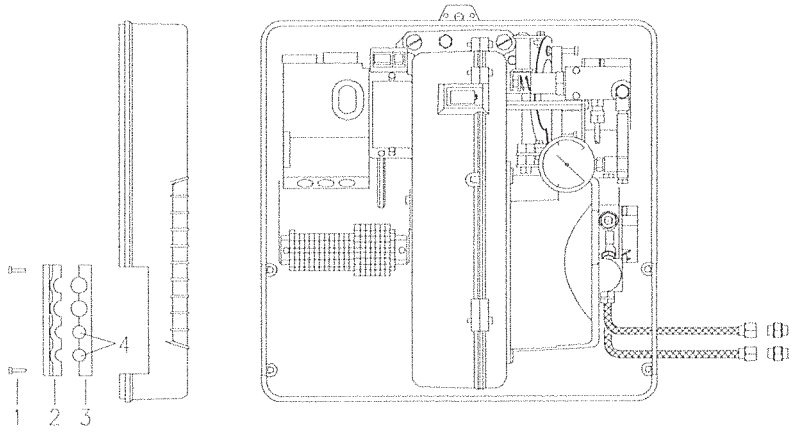


Make sure that the electrodes are positioned as shown in Figure (C).
Finally remount the burner 4)(D) on the slide bars 3) and slide it up to the flange 5), keeping it slightly raised to prevent the flame stability disk from pressing against the blast tube.
Tighten the screws 2) on the slide bars 3) and screw 1) that attaches the burner to the flange.

If it proves necessary to change a nozzle with the burner already fitted to the boiler, proceed as outlined below:
- Pull back the burner on its slide bars as shown in fig. (C)p.5.
- Remove the nuts 1)(E) and the disk 2).
- Use wrench 3)(E) to change the nozzles.

COMBUSTION HEAD SETTING

The setting of the combustion head depends exclusively on the maximum burner delivery at which it will be operating. Turn screw 4)(F) until the notch shown in diagram (G) is level with the front surface of flange 5)(F).



Example:
RL 50/M, maximum fuel oil delivery = 10.2 GPH.
Diagram (G) indicates that for a delivery of 10.2 GPH the RL 50/M Model requires the combustion head to be set to approx. three notches, as shown in Figure (F).

(A)

(B)

D2531

FUEL SUPPLY

Double-pipe circuit (A)

The burner is equipped with a self-priming pump which is capable of supplying itself within the limits listed in the table at the side.

The tank higher than the burner **A**

Distance "P" must not exceed 33 ft in order to avoid subjecting the pump's seal to excessive strain; distance "V" must not exceed 13 ft in order to permit pump self-priming even when the tank is almost completely empty.

The tank lower than the burner **B**

Pump suction values higher than 13 "Hg must not be exceeded because at higher levels gas is released from the fuel, the pump starts making noise and its working life-span decreases.

It is good practice to ensure that the return and suction lines enter the burner from the same height; in this way it will be less probable that the suction line fails to prime or stops priming.

The loop circuit

A loop circuit consists of a loop of piping leaving and returning to the tank with an auxiliary pump that circulates the fuel under pressure. A branch connection from the loop goes to feed the burner. This circuit is extremely useful whenever the burner pump does not succeed in self-priming because the tank distance and/or height difference are higher than the values listed in the Table.

Key

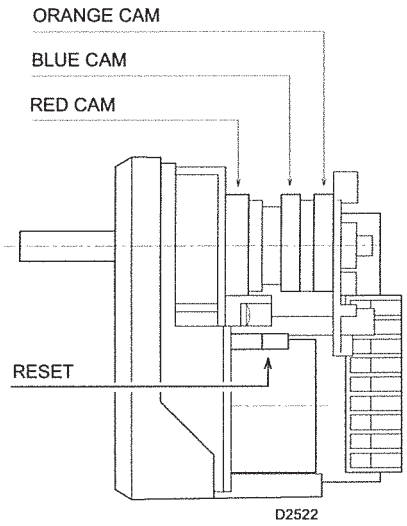
H = Pump/foot valve height difference
L = Piping length
Ø = Inside pipe diameter
1 = Burner
2 = Pump
3 = Filter
4 = Manual on/off valve
5 = Suction line
6 = Foot valve
7 = Return line

HYDRAULIC CONNECTIONS (B)

The pumps are equipped with a by-pass that connects return line to the suction line. The pumps are installed on the burner with the by-pass closed by screw 6)(A)p.12.

It is therefore necessary to connect both hoses to the pump.

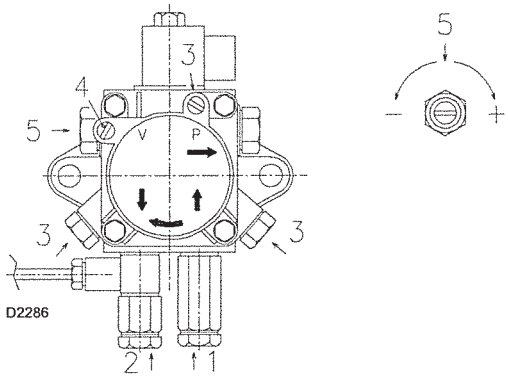
The pump seal will be damaged immediately if it is run with the return line closed and the by-pass screw inserted.



Remove the plugs from the suction and return connections of the pump.

Insert the hose connections with the supplied seals into the connections and tighten.

Take care that the hoses are not stretched or twisted during installation.



Route the hoses through the holes in the plate, preferably using those on the rh side, fig. (B): unscrew the screws 1), now divide the insert piece into its two parts 2) and 3) and remove the thin section blocking the two passages 4). Install the hoses where they cannot be stepped on or come into contact with hot surfaces of the boiler.

Now connect the other end of the hoses to the suction and return lines.

G	PSI	290
H	inch	0,006

(B)

(C)

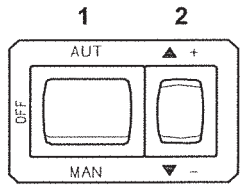
SERVOMOTOR (A)

The servomotor provides simultaneous adjustment of the air damper 11)(B) page 9 and the pressure regulator 9) by means of a double variable profile cam, 4) and 7). The servomotor rotates through 90° in 25 seconds.
Do not alter the factory setting for the cams; simply check that they are set as indicated below:

Red cam : 90°
Limits rotation toward maximum position.
Blue cam : 0°
Limits rotation toward the minimum position. When the burner is shut down the air damper must be closed: 0°.
Orange cam : 15°
Adjusts the ignition position and the MIN output.

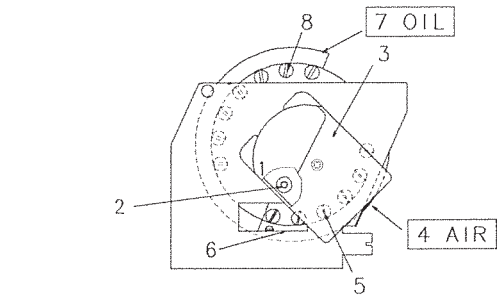
PUMP (B)

1 - Suction	1/4" NPT
2 - Return	1/4" NPT
3 - Pressure gauge attachment	G 1/8"
4 - Vacuum gauge attachment	G 1/8"
5 - Pressure adjustment screw	

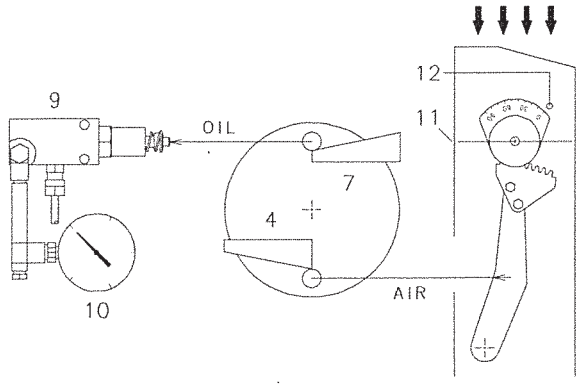


A - Min. delivery rate at 290 PSI pressure
B - Delivery pressure range
C - Max. suction pressure
D - Viscosity range
E - Max fuel oil temperature
F - Max. suction and return pressure
G - Pressure calibration in the factory
H - Filter mesh width

PUMP PRIMING

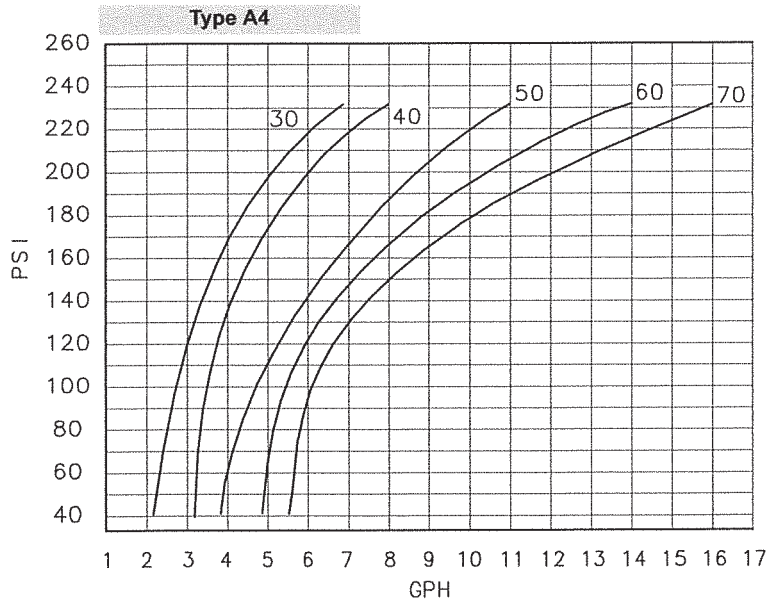


- **Before starting the burner, make sure that the tank return line is not clogged. Obstructions in the line could cause the seal located on the pump shaft to break.**
- In order for self-priming to take place, one of the screws 3)(B) of the pump must be loosened to bleed off the air contained in the suction line.
- Start the burner by closing the control circuit switch 1)(C) in the "MAN" position. As soon as the burner starts, check the direction of rotation of the fan blade, by looking through the flame inspection window 19)(A)p.4.
- The pump can be considered primed when the fuel oil starts coming out of the screw 3). Stop the burner: switch 1)(C) set to "OFF" and tighten the screw 3).



The time required for this operation depends upon the diameter and length of the suction tubing. If the pump fails to prime at the first cycle of the burner and the burner locks out, wait approx. 15 seconds, reset the burner, and then repeat the starting operation as often as required. After 5 or 6 starting operations allow 2 or 3 minutes for the transformer to cool.

Important
The priming operation is possible because the pump is already full of fuel when it leaves the factory. If the pump has been drained, fill it with fuel through the opening for the vacuum gauge prior to starting; otherwise, the pump will seize. Whenever the length of the suction piping exceeds 66 - 99 ft, the supply line must be filled using a separate pump.



(A) D791

(B) D2523

The values indicated in the curves, refer to the data printed on the nozzle.

(C) D2321

BURNER FIRING

Close load controls and set switch 1)(A) to "MAN".
After burner firing a complete burner adjustment should be performed.

BURNER CALIBRATION

The optimum calibration of the burner requires an analysis of the flue gases at the boiler outlet.
The following settings that have already been made do not require modification under normal circumstances:

- Combustion head;
- Servomotor, red and blue cams

The settings listed below must be adjusted in sequence:
1 - MAX burner output
2 - MIN burner output
3 - Intermediate outputs between MAX and MIN output

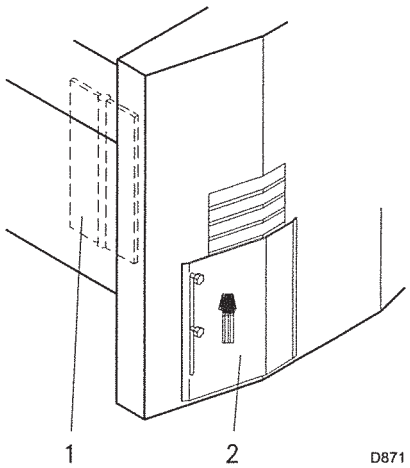
1 - MAX power

Max output of the burner must be set within the firing rate range shown on page 5.
In the above instructions we left the burner running in MIN output operation. Now press button 2)(A) "+" until servomotor arrives at 90°.

Adjusting the nozzle flow rate

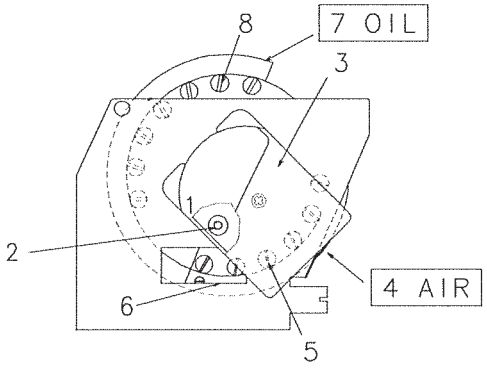
The nozzle flow rate varies according to the fuel pressure on the nozzle return. Diagram (C) indicates this relationship for type A4 return flow nozzles with pump delivery pressure of 290 PSI.

Diagrams (C):
Horizontal axis : GPH, nozzle flow rate
Vertical axis : PSI, nozzle return pressure

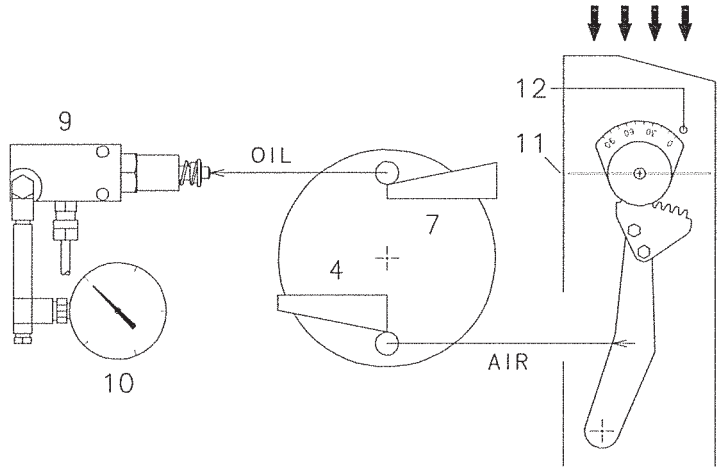


NOTE

With a pump delivery pressure of 290 PSI, the pressure on the nozzle return must not exceed 246.5 PSI.
The pressure difference between pump delivery and nozzle return must be at least 43.5 PSI. With smaller pressure differences, the pressure on the nozzle return can be unstable.



To fix the maximum nozzle flow rate, vary the final profile on the upper cam 7)(B) via the screws 8).
The nozzle return pressure value is indicated by the pressure gauge 10).



Key (B)

1 Servomotor
2 Reset
3 Servomotor cover
4 Cam for controlling air damper
5 Cam 4) adjustable screws

11 Air damper
12 Index

(A) D871

(B) D2523

Adjusting air delivery

Two shutters 1) and 2) are provided to adjust the air. These shutters are factory set to maximum opening.

Firstly,with burner at maximum operation, adjust shutter 2) which must be closed gradually until optimum combustion is obtained. If total closure of shutter 2) is not sufficient, also close shutter 1) (secondly) as follows:

vary the final profile of the lower cam 4)(B) via the screws 5) inside the opening 6).

If the burner is operated at maximum power, the fan air may not be sufficient even with both shutters 1) and 2) fully open. In this case, remove shutter 2) and adjust the air using shutter 1) only as described above.

Cams 7) - 4)(B):

- tighten screws 8)-5) to increase air delivery;
- unscrew screws 8)-5) to reduce air delivery.

2 - MIN power

The MIN power must be chosen from within the working range given on page 5. Press the "-" button 2)(A) page 9 and keep it pressed until the servomotor has reached 15° (factory setting).

Nozzle flow rate adjustment

The nozzle flow rate is given in diagram (C)p.9 corresponding to the pressure on the nozzle return read on the pressure gauge 10)(B). To vary the nozzle minimum flow rate, modify the initial profile of the upper cam 7)(B) via the screws 8).

Adjusting air delivery

Modify the initial profile of the lower cam 4)(B) via the screws 5) inside the opening 6).

If possible, do not rotate the first screw as this is the one that provides for total closure of the air damper.

3 - INTERMEDIATE power

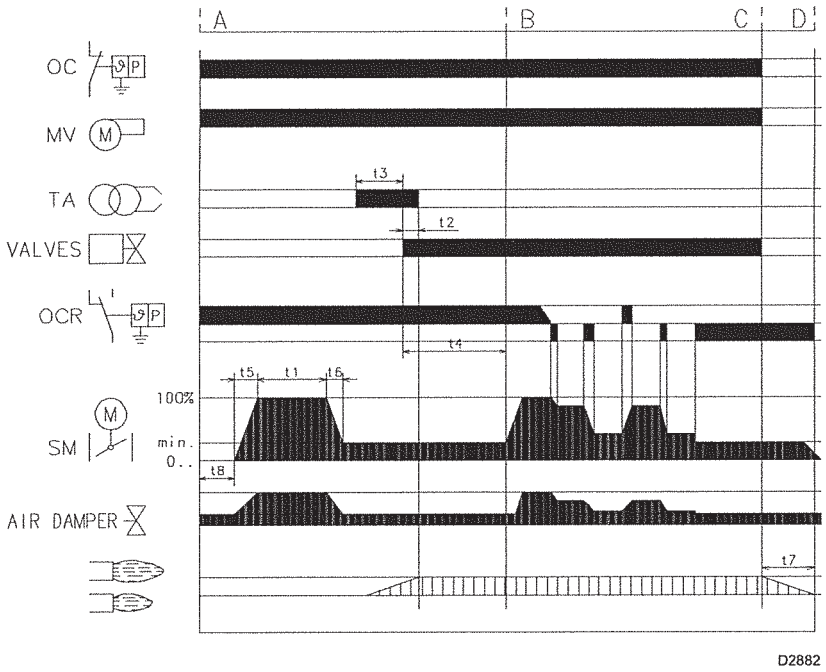
Air/oil flow rate adjustment

Slightly press the "+" button 2)(A) page 9 so that a new screw 5)(B) appears inside the opening 6)(B).

Adjust screw 8)(B) which varies the profile of the upper cam 7) and the corresponding screw 5) which controls the lower cam 4) until you obtain optimum combustion.

Proceed in the same way with the next screws except for the last one, previously adjusted to obtain maximum power.

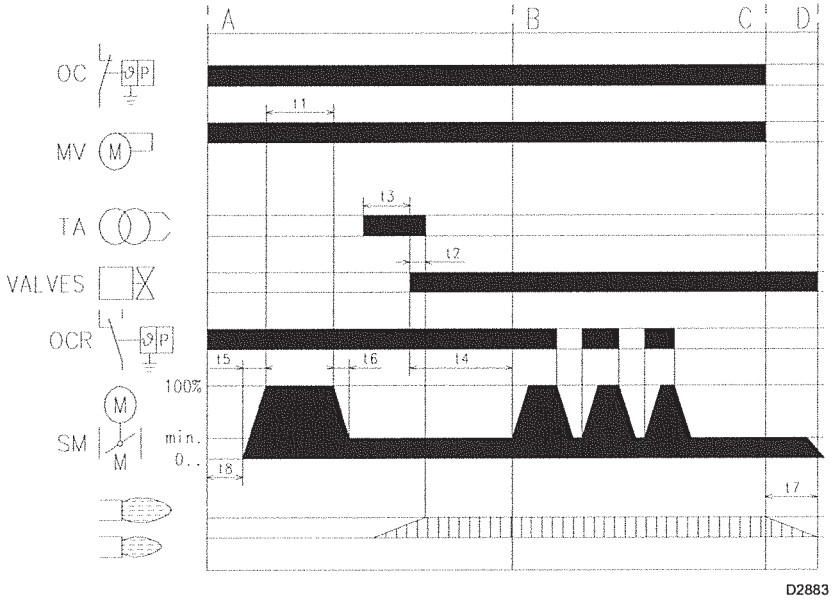
Ensure that variation of the cams profile is gradual.



Turn the burner off via switch 1)(A) page 9, OFF position, release the cam with variable profile by pressing the reset button 2)(B) and check that the movement is smooth by manually rotating the cam backwards and forwards several times.

NOTE

Red and blue cams of the servomotor do not require adjustment. Only orange cam may need adjusting.



The servomotor follows the adjustment of cam III only when the cam angle is reduced. If you need to increase the cam angle (15..16..17°..), first increase the servomotor angle via the "+" button, then increase the angle of orange cam and finally reset the servomotor to the MIN power position via the "-" button.

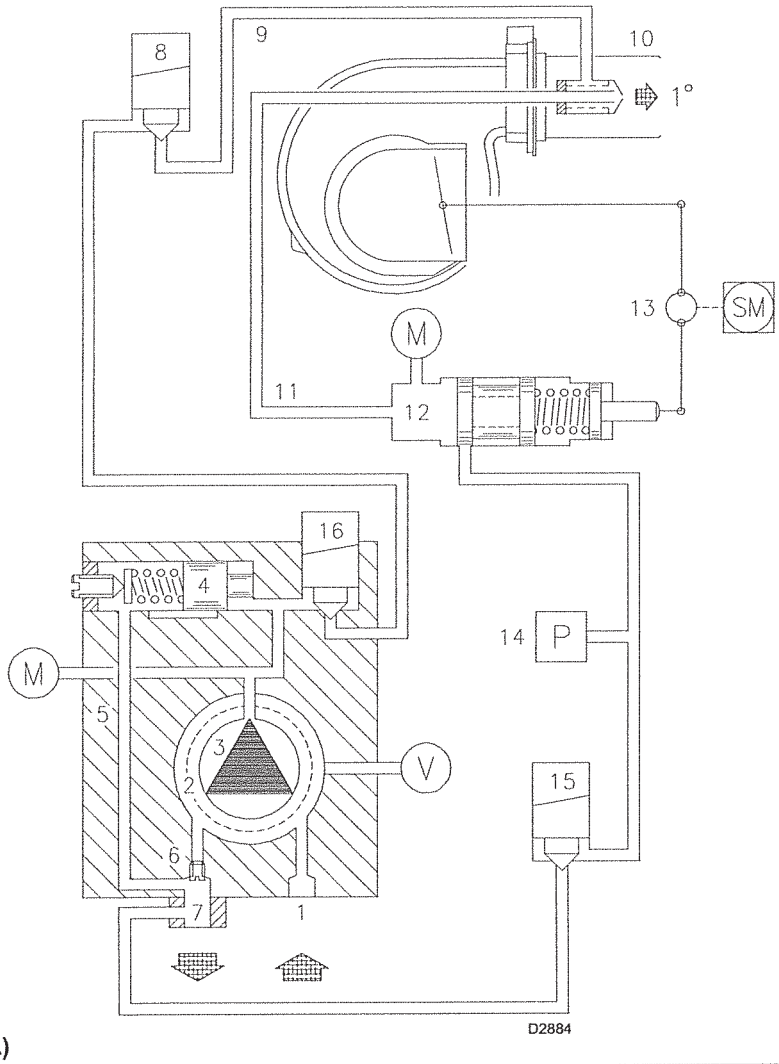
(B)

SEQUENCE OF OPERATION



Switching times are given in seconds, in the burner start-up sequence.

LAL 2.25

t1	18	**t5**	optional
t2	4	**t6**	optional
t3	2	**t7**	12
t4	12	**t8**	4

Legend for the times

- **t1** Pre-purge time with air damper open
- **t2** Safety time
- **t3** Pre-ignition time, short ("Z" connected to terminal "16")
- **t4** Interval between voltage at terminals "18" and "20"
- **t5** Air damper running time to OPEN position
- **t6** Air damper running time to low-flame position (MIN)
- **t7** Permissible after-burn time
- **t8** Interval to the OPEN command for the air damper

(A)

BURNER OPERATION

BURNER STARTING - See figure (A)

Control circuit closes, the motor starts.

The pump 3) sucks the fuel from the tank through the piping 1) and the filter 2) and pumps it under pressure to delivery. The piston 4) rises and the fuel returns to the tank through the piping 5) - 7). The screw 6) closes the bypass heading towards suction and the de-energized solenoid valves 8) - 15) - 16) close the passage to the nozzle.

Servomotor starts: 90° rotation to right, until contact is made on red cam.

The air damper is positioned on MAX. output.

Pre-purge stage with air delivery at MAX. output.

Servomotor rotates to left until contact is made on orange cam.

Air damper and pressure regulator are positioned on MIN output.

Ignition electrode spark.

Solenoid valves 8) - 15) - 16) open; the fuel passes through the piping 9) and filter 10), finally it enters the nozzle.

A part of the fuel is then sprayed out through the nozzle, igniting when it comes into contact with the spark: flame at a low output level, point A; the rest of the fuel passes through piping 11) at the pressure adjusted by the regulator 12), then, through piping 7), it goes back into the tank.

The spark goes out.

The starting cycle ends.

STEADY STATE OPERATION

At the end of the starting cycle, the servo-motor control then passes to load control for boiler pressure or temperature.

- If the temperature or pressure is low, the burner progressively increases output up to MAX.
- If subsequently the temperature or pressure is high, the burner progressively decreases output down to MIN.
- The burner shuts down when demand for heat is less than the heat supplied by the burner in the MIN output. Load control opens. The servomotor returns to the 0° angle limited by contact with blue cam. The air damper closes completely to reduce thermal dispersion to a minimum.

Every time output is changed, the servomotor automatically modifies oil delivery (pressure regulator) and air delivery (fan air damper).

FIRING FAILURE

If the burner does not fire, it goes into lock-out within 5 s of the opening of the fuel oil valve.

FIRING FAILURE

If the flame should go out for accidental reasons during operation, the burner will lock out in 1 s.

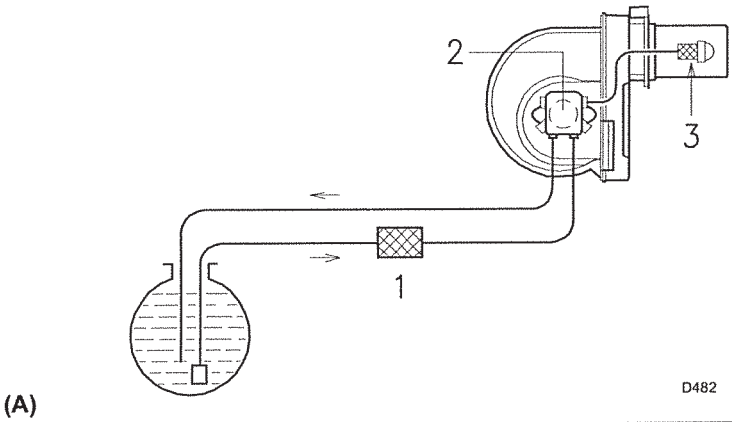
OIL PRESSURE SWITCH

The oil pressure switch 25)(A) page 4 and 14)(A) page 12 is factory set to 43.5 PSI (3 bar). If the gas oil pressure reaches this value in the return piping, the pressure switch stops the burner. Burner starts again automatically if the pressure goes down under 43.5 PSI (3 bar) after burner shut down. If a loop circuit with Px pressure feeds the burner, the pressure switch should be adjusted to Px + 43.5 PSI.

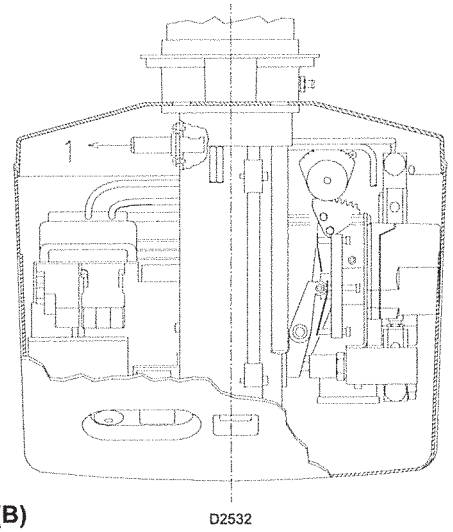
BURNER FAULT INDICATIONS

Control program fault conditions and lock-out indication

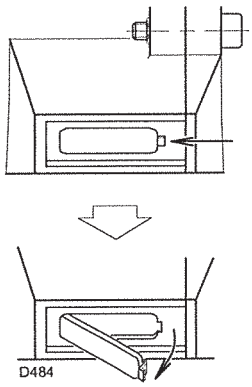
Whenever a fault occurs, the sequence switch stops and with it the lock-out indicator.
The symbol above the reading mark of the indicator gives the type of fault:



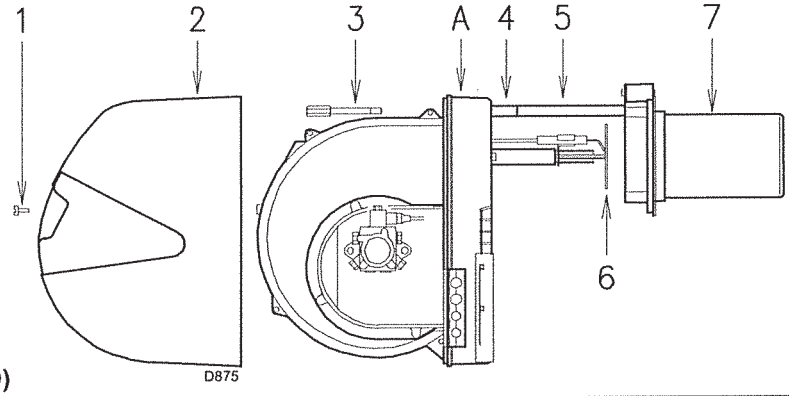
◀	**No start**	One of the contacts has not closed	- Air damper opened. The limit switch (blue cam) for the closed position do not supply voltage from terminal 11 to terminal 8. - The contact of the limit thermostat or any other switching devices in the control loop of terminal 4 to terminal 5 are opened.
		Extraneous light	Lock-out during or after completion of the control program **Examples:** – Flame not extinguished – Leaking fuel valves – Faulty flame supervision circuit
▲	**Interruption of startup sequence**	OPEN signal of changeover limit switch (red cam) has not been delivered to terminal 8	
		Terminals 6, 7 and 15 remain under voltage until fault has been corrected	
■	**Lock-out**		Defect in the flame supervision circuit, faulty flame signal, extraneous light
▼	**Interruption of startup sequence**		Position signal of auxiliary switch (orange cam) for the low flame position has not been delivered to terminal 8
			Terminals 6, 7 and 15 remain under voltage until fault has been corrected
1	**Lock-out**		No flame signal is present on completion of the safety time
I	**Lock-out**		Flame signal has been lost during operation



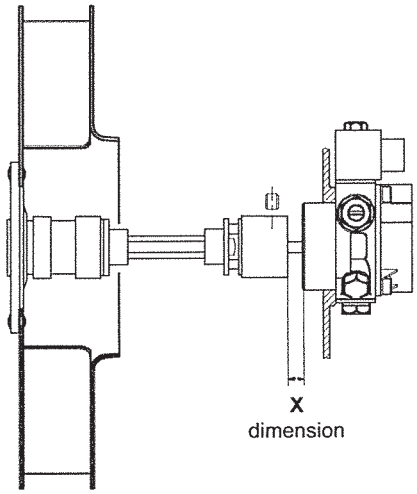
In the event of a burner lockout, more than two consecutive burner reset operations could cause damage to the installation. On the third lockout, contact the Aftersales Service.



If further lockouts or burner faults occur, interventions must only be made by qualified, authorised personnel (as indicated in this manual, and in compliance with the laws and regulations currently in force).



(A)



(B)

(C)

(D)

(E)

MAINTENANCE

Combustion
An analysis of the flue gases at the boiler outlet is required. Significant differences with respect to the previous measurements indicate the points where more care should be exercised during maintenance.

Pump
The pump delivery pressure must be stable at 290 PSI.
The suction must be less than 6.5 PSI.
Unusual noise must not be evident during pump operation.
If the pressure is found to be unstable or if the pump runs noisily, the flexible hose must be detached from the line filter and the fuel must be sucked from a tank located near the burner. This test permits the cause of the anomaly to be traced to either the suction line or the pump.
If the pump is found to be responsible, check to make sure that the filter is not dirty. The vacuum gauge is installed up-line from the filter and consequently will not indicate whether the filter is clogged or not.
If the problem lies in the suction line, check to make sure that the filter is clean and that air is not entering the piping.

Servomotor
Disengage servomotor and turn it backward and forward by hand to make sure it is free moving.

Filters (A)
Check the following filters:
• on line 1) • in pump 2) • at nozzle 3),
and clean or replace as required.
If rust or other impurities are observed inside the pump, use a separate pump to suck out any water and other impurities that may have deposited on the bottom of the tank.

Combustion head
Check to make sure that all the parts of the combustion head are in good condition, positioned correctly, free of all impurities, and that no deformation has been caused by operation at high temperatures.

Nozzle
Do not clean the nozzle orifices.
Replace the nozzles every 2-3 years or whenever necessary. Combustion must be checked after the nozzle have been changed.

Photocell (cad cell) (B)
Clean the glass cover from any dust that may have accumulated. Photocell 1) is held in position by a pressure fit and can therefore be removed by pulling it outward.

Flame inspection window (C)
Clean the glass.

Flexible hoses
Check to make sure that the flexible hoses are still in good condition.

Fuel tank
Every 5 years, or whenever necessary, suck out any water or other impurities present on the bottom of the tank using a separate pump.

Burner
Make sure that the screws are fully tightened.

TO OPEN THE BURNER (D):
- switch off the electrical power.
- Remove screw 1 and withdraw the casing 2).
- Unscrew screw 3).
- Fit the two extensions 4) supplied with the burner onto the slide bars 5) (models with long blast tube).
- Pull part A backward keeping it slightly raised to avoid damaging the disk 6) on blast tube 7).

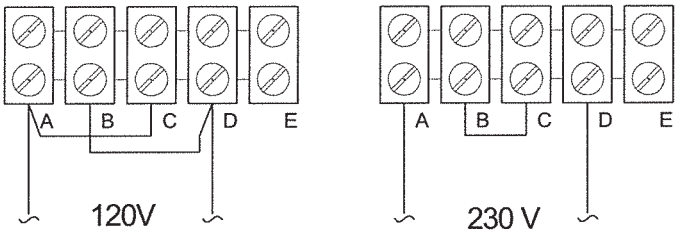
Fuel pump and/or couplings replacement (E)
See fig. (E). Dimension X should be set as follows:
RL28/M - 1/4"
RL38/M - 3/16"
RL50/M - 5/16"

APPENDIX - ELECTRICAL CONNECTIONS

WARNING

NOTES

The electrical wirings must be carried out in conformity with the regulations in force in the countries of destination, and by qualified personnel.
Riello S.p.A. cannot accept any responsibility for modifications or connections other than those shown in these diagrams.



IMPORTANT

The burner is factory set for low - high operation and it must be connected to the OCR control device to control fuel oil valve V2.
If on - off operation is required, instead of control device OCR install a jumper lead between terminals T6 and T8 of burner terminal strip.

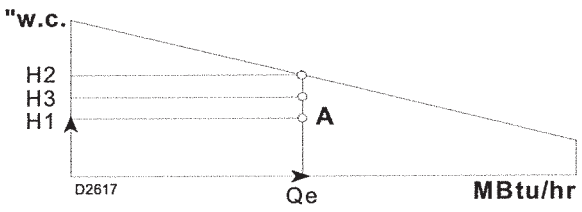
NOTES

FIELD WIRING CONNECTIONS

- For electrical connection use flexible cables according to local Regulations.
- The setting of the thermal overload must be according to the total burner amperage draw.
- The RL 38/M - 50/M three-phase burners leave the factory preset for:
  - **208-230V** power supply: only in this case, if 460V power supply is required, change the fan motor connection from delta to double star and change the setting of the thermal overload as well;
  - or **575V** power supply;
    depending on the burner model (see page 3).
- The RL 50/M single-phase burner leaves the factory preset for **120V** power supply: if 230V power supply is required, change the fan motor connection as shown in Figure below.

The RL 28/M - 38/M - 50/M burners have been type-approved for intermittent operation. This means they should compulsorily be stopped at least once every 24 hours to enable the control box to check its own efficiency at start-up. Burner halts are normally provided for automatically by the boiler load control system.
If this is not the case, a time switch should be fitted in series to **OC** to provide for burner shut-down at least once every 24 hours.

EXTERNAL FUSES (TO SEE THE ELECTRICAL DIAGRAM)



RL 28/M - 38/M - 50/M Single-phase burners				
	RL 28/M	RL 38/M	RL 50/M	
	120V	120V	120V	230V
FU1 (A)	T10	T10	T15	T10
FU2 (A)	T6			
RL 38/M- 50/M Three-phase burners				
	208/230V	460V	575V	
FU1 (A)	T6	T6	T4	
FU2 (A)	T6	T6	T6	

ATTENTION:
- Do not invert the neutral with the phase wire in the electricity supply line.
- Only use original spare parts to replace the components.

APPENDIX - BURNER FIRING RATES ACCORDING TO AIR DENSITY

Above sea level		Average barom. pressure		CORRECTION FACTOR **F**							
				Air temperature °F (°C)							
ft	m	" W.C.	mbar	0 (0°C)	41 (5°C)	50 (10°C)	59 (15°C)	68 (20°C)	77 (25°C)	86 (30°C)	104 (40°F)

6579	2000	313	794	0,852	0,837	0,822	0,808	0,794	0,781	0,768	0,743

The FIRING RATE area values have been obtained considering a surrounding temperature of 68°F (20°C), and an atmospheric pressure of 398" W.C. and with the combustion head adjusted as shown on page 6.
The burner may be required to operate with combustion air at a higher temperature and/or at higher altitudes.
Heating of air and increase in altitude produce the same effect: the expansion of the air volume, i.e. the reduction of air density.
The burner fan's delivery remains substantially the same, but the oxygen content per cubic meter and the fan's head are reduced.
It is therefore important to know if the maximum output required of the burner at a given combustion chamber pressure remains within the burner's firing rate range even at different temperature and altitude conditions. Proceed as follows to check the above:

(B)

1 - Find the correction factor F in the Table (A) for the plant's air temperature and altitude.
2 - Divide the burner's delivery Q by F in order to obtain the equivalent delivery Qe:

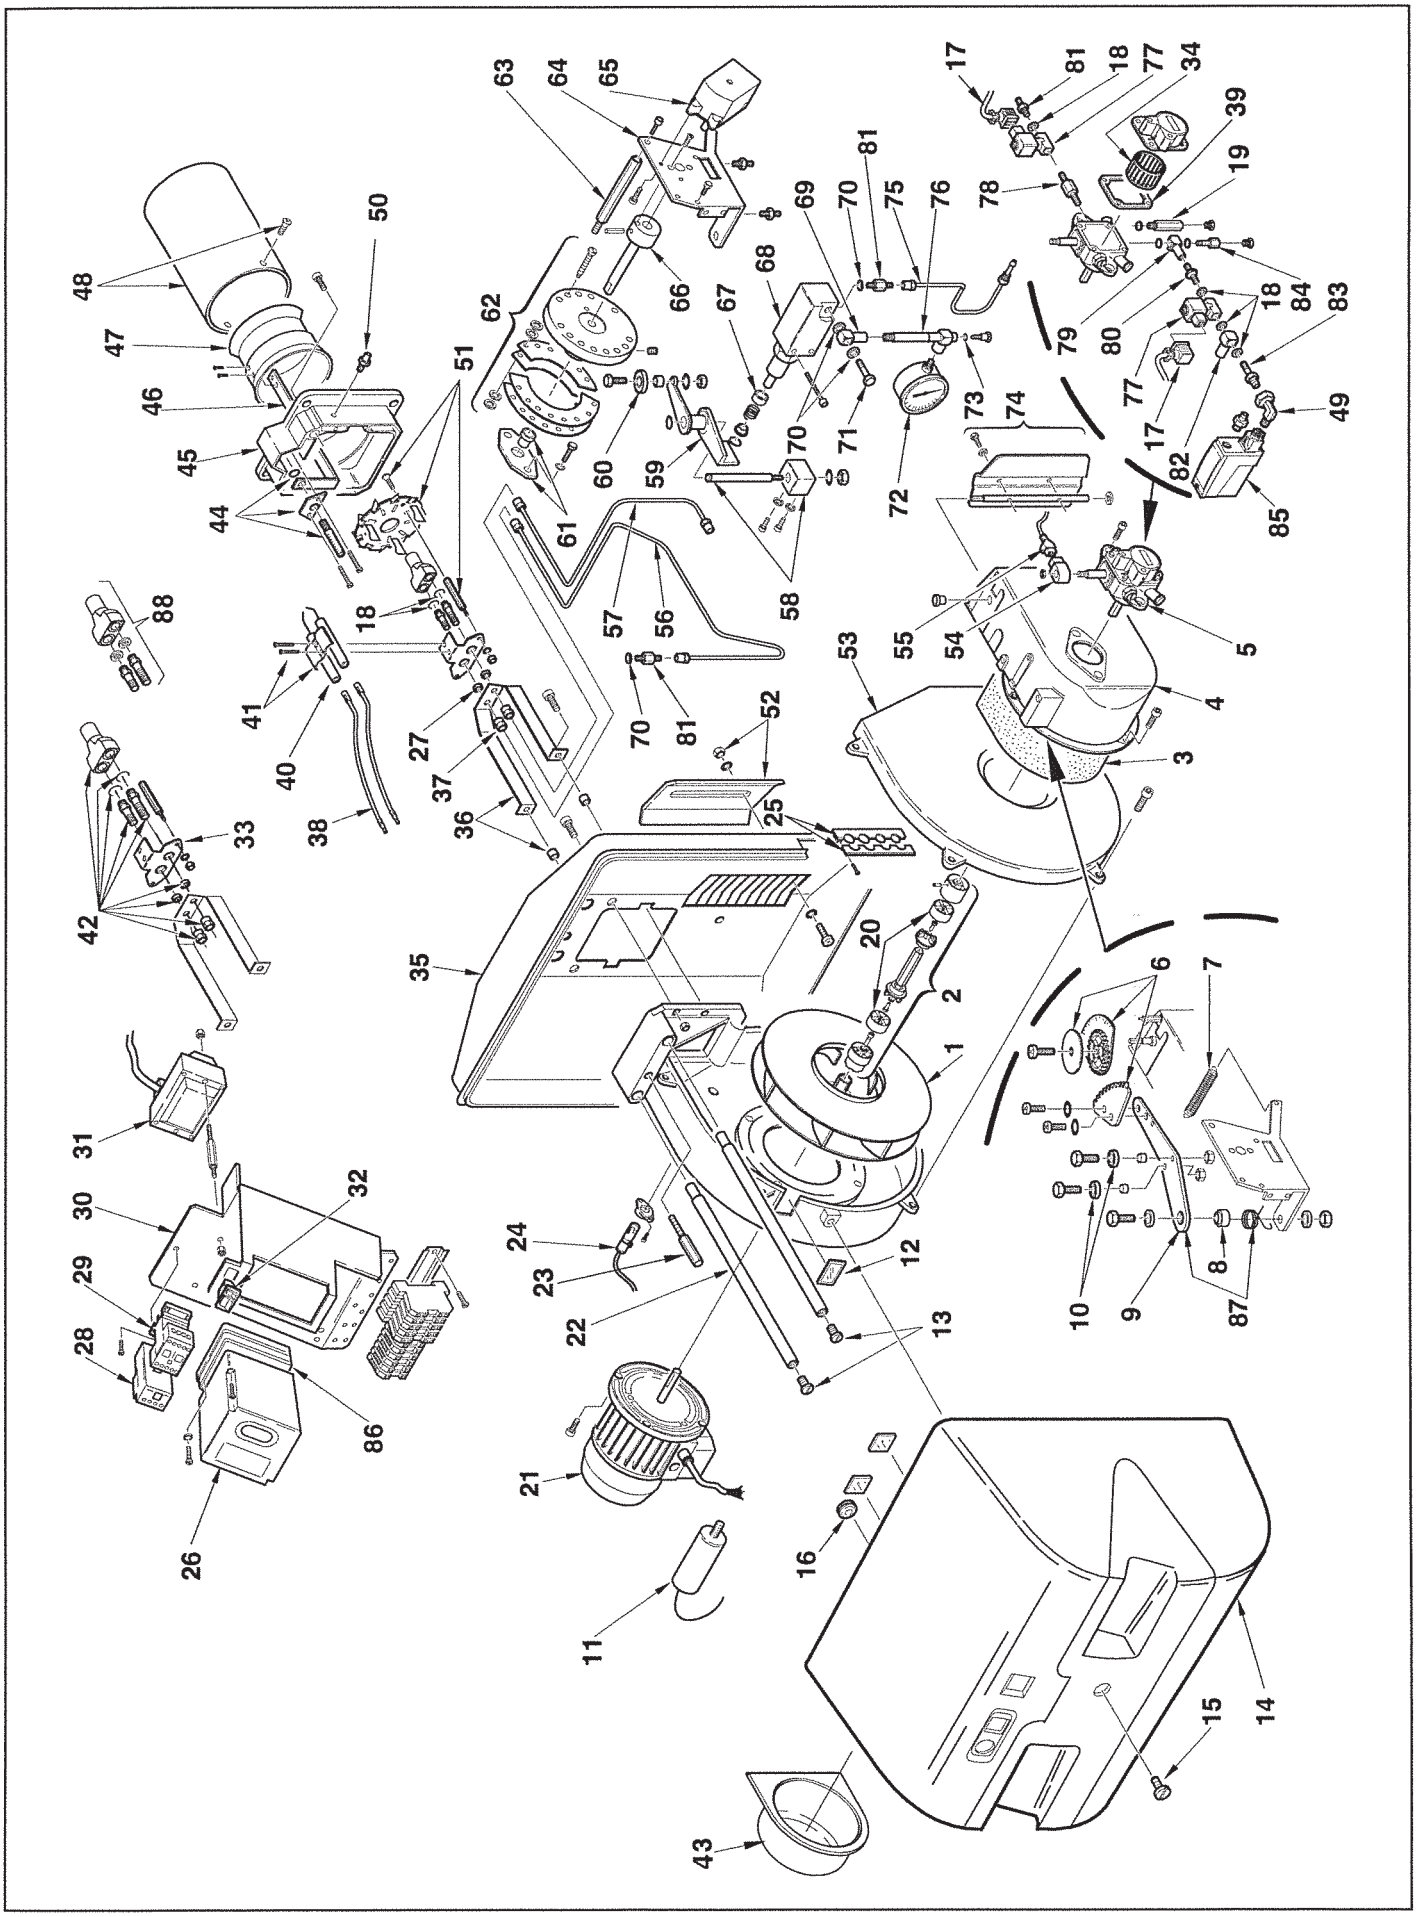
Qe = Q : F (MBtu/hr)

3 - In the firing rate range of the burner, Fig. (B), indicate the work point defined by:
Qe = equivalent delivery
H1 = combustion chamber pressure
The resulting point A must remain within the firing rate range.
4 - Plot a vertical line from Point A as shown in Figure (B) and find the maximum pressure H2 of the firing rate.
5 - Multiply H2 by F to obtain the maximum reduced pressure H3 of the firing rate.

H3 = H2 x F (" W.C.)

If H3 is greater than H1, as shown in Fig. (B), the burner delivers the output required.
If H3 is lower than H1, the burner's delivery must be reduced. A reduction in delivery is accompanied by a reduction of the pressure in the combustion chamber:
Qr = reduced delivery
H1r = reduced pressure

$$H1r = H1 \times \left(\frac{Qr}{Q}\right)^2$$



Example, a 5% delivery reduction:

$Qr = Q \times 0.95$

$H1r = H1 \times (0.95)^2$

Steps 2 - 5 must now be repeated using the new Qr and H1r values.

Important: the combustion head must be adjusted in respect to the equivalent delivery Qe.

NOZZLE SELECTION NOTE:

- NOZZLE MANUFACTURERS:
  2 stages: DELAVAN, HAGO, DANFOSS - modulating: BERGONZO
- NOZZLE SPRAY TYPES - SOLID SPRAY RECOMMENDED
- NOZZLE SIZES & PUMP PRESSURE BASED ON CALCULATED OUTPUT
- RETURN PRESSURES BASED ON BERGONZO A4 NOZZLES CHART

ALL SETTINGS ARE PRELIMINARY COMMISSIONING SETTINGS.
FURTHER ADJUSTMENTS MAY BE NECESSARY DUE TO SITE INSTALLATION AND COMBUSTION CONDITIONS
BREECH PRESSURE RANGE FROM 0.0 TO -0.03 INCHES WC

NOZZLE SELECTION NOTE:

- NOZZLE MANUFACTURERS:
  2 stages: DELAVAN, HAGO, DANFOSS - modulating: BERGONZO
- NOZZLE SPRAY TYPES - SOLID SPRAY RECOMMENDED
- NOZZLE SIZES & PUMP PRESSURE BASED ON CALCULATED OUTPUT
- RETURN PRESSURES BASED ON BERGONZO A4 NOZZLES CHART

GAS MANIFOLD NOTE:

- MANIFOLD PRESSURE PROVIDED BASED ON CHAMBER PRESSURES SHOWN IN CHART
- BASED ON CO_2 LEVELS OF 9 - 10%
- BASED ON SEA LEVEL
- NATURAL GAS HH_V = 1010 BTU PER FT^3/Hr.
- DATA BASED ON 0 INCHES WC BREECH PRESSURE

ALL SETTINGS ARE PRELIMINARY COMMISSIONING SETTINGS.
FURTHER ADJUSTMENTS MAYBE NECESSARY DUE TO SITE INSTALLATION AND COMBUSTION CONDITIONS
BREECH PRESSURE RANGE FROM 0.0 TO -0.03 INCHES WC

Technical Instructions
Document No. 155-714P25
Rev. 1, May, 2002

SQN71...
Reversing Actuators

ISO 9001
REGISTERED FIRM

Description

SQN7... Actuators are used to position flow control valves, butterfly valves, dampers or any application requiring rotary motion.

A synchronous motor drives the shaft and switch cam drum.

The switch cam drum actuates two limit end switches and one auxiliary switch.

The position of each limit end and auxiliary switch can be independently adjusted within a maximum range of 160°.

The drive shaft can be disengaged for manual rotation.

Features

- Line voltage floating or proportional control
- Two-stage or three-stage application
- Torques up to 22 lb-in
- Running times 3.5 seconds, 10 seconds or 25 seconds through 90° ∢
- Two limit end switches and one auxiliary switch
- Shaft disengagement clutch
- Optional single- or double-position feedback potentiometer
- UL Recognized and CSA certified
- 230 Vac models conform to CE for export

1 Introduction

1.1 General notes

Please read this User Manual before switching on the controller. Keep the User Manual in a safe place which can be accessed by all users at all times.

Version!
This User Manual describes all necessary settings (applicable to controller software version XXX.01.01).

⇨ Reference!
See chapter 6.7 *Display of software version.*

1.2 Typographical conventions

1.2.1 Safety notes

This User Manual contains information which must be observed to ensure your own personal safety and to prevent damage to equipment and property. The instructions and notes are highlighted by warning triangles, a hand or arrow symbol and are presented as follows, depending on the hazard level:

Qualified personnel

Only **qualified personnel** are allowed to install and operate the equipment. Qualified personnel in the context of the safety-related notes contained in this document are persons who are authorized to commission, ground and tag devices, systems and electrical circuits in compliance with established safety practices and standards.

Correct use

Note the following:

The controller may only be used on the applications described in the technical documentation and only in connection with devices or components from other suppliers that have been approved or recommended by Siemens.

The product can only function correctly and safely if shipped, stored, set up and installed correctly, and operated and maintained as specified.

1.2.2 Warning symbols

The symbols for **Caution** and **Attention** are used in this User Manual under the following conditions:

Caution

This symbol is used where there may be a **danger to personnel** if the instructions are disregarded or not strictly observed!

Attention

This symbol is used where **damage to equipment or data** can occur if the instructions are disregarded or not strictly observed!

Attention

This symbol is used if **precautionary measures must be taken** when handling electrostatically sensitive components.

1.2.3 Notification symbols

	**Note**	This symbol is used to draw your **special attention** to a remark.
⇨	**Reference**	This symbol refers to **additional information** in other documents, chapters or sections.
abc[1]	**Footnote**	Footnotes are **comments, referring to specific parts of the text.** They consist of 2 parts: 1) **Markings** in the text are arranged as continuous superscript numbers 2) **Footnote text** is placed at the bottom of the page and starts with a number and a period
*	**Action**	An asterisk indicates that **a required action** is described. The individual steps are indicated by asterisks, for example: * Press 

1.2.4 Presentation

	**Buttons**	Buttons are shown in a circle. Either symbols or text are possible. If a button has multiple assignments, the text shown is always the text corresponding to the function currently used.
	**Button combinations**	Two buttons shown in combination with a plus sign means that they must be pressed simultaneously.
ConF → InP → InP1	**Command chain**	Arrows between words serve for finding parameters at the configuration level more easily or for navigating in the ACS411 setup program.

1.3 Description

Use in heating plants

The RWF55 is used primarily for the control of temperature or pressure in oil- or gas-fired heating plants. Depending on the setting, it is employed as a compact 3-position controller or as a modulating controller with an analog output. An external switch is provided to convert it to a 2-position controller for controlling 2-stage burners. The built-in thermostat function switches the burner on and off.

Cooling controller

The controller's operating mode can be changed from heating to cooling, or vice versa.

⇨ Reference!
See chapter 8.4 *Controller* Cntr.

RWF55

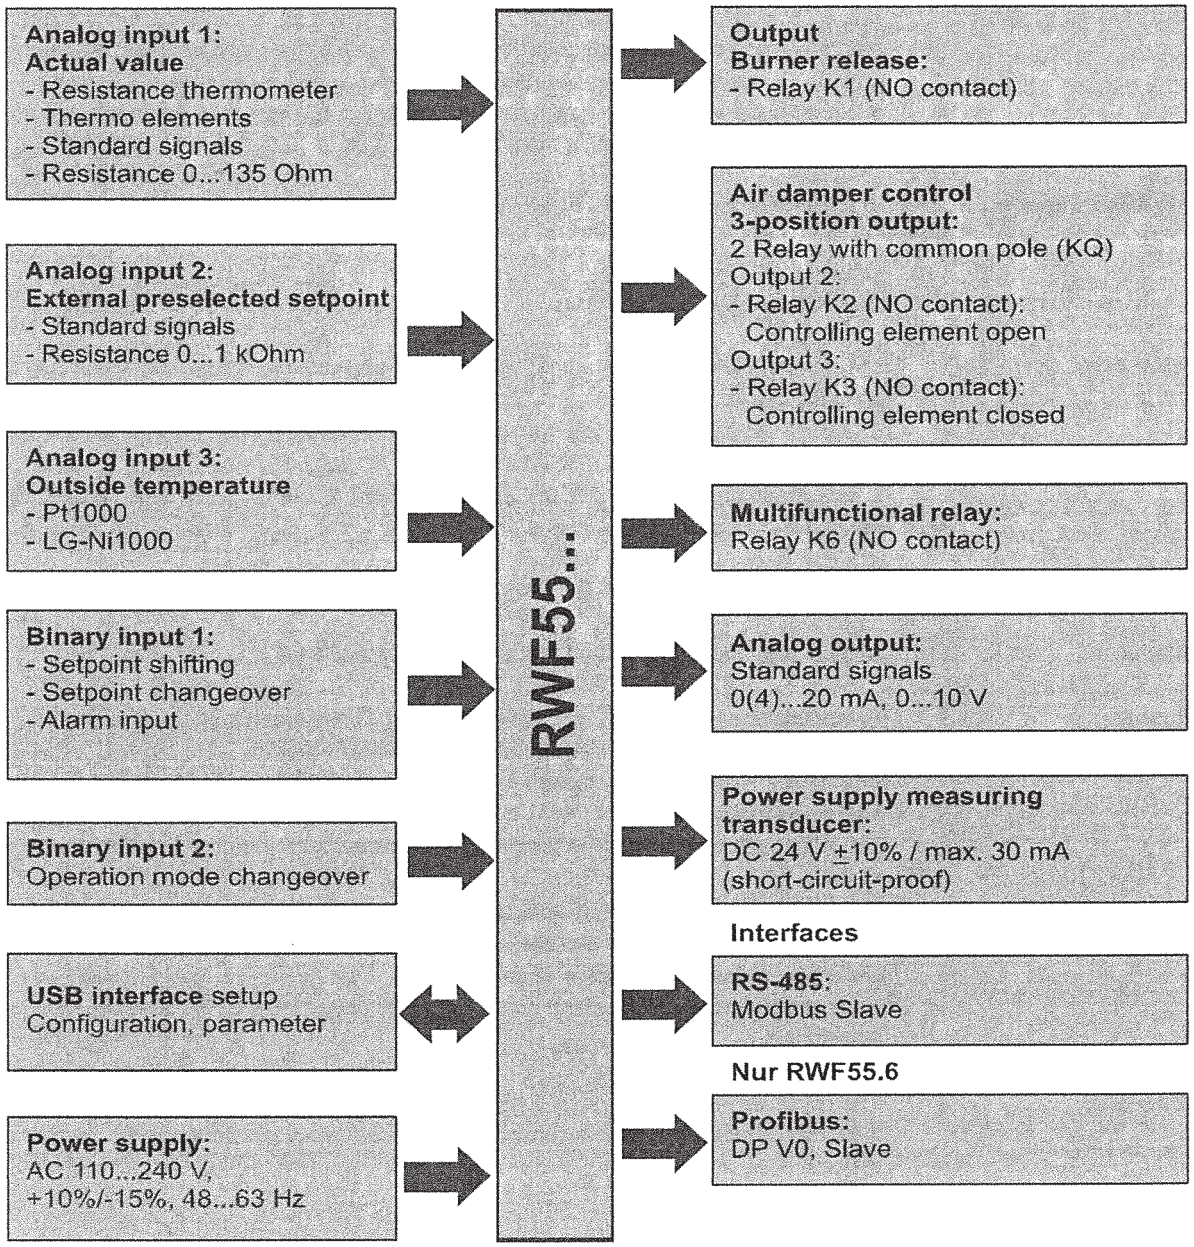
The controllers feature two 4-digit 7-segment displays for the actual value (red) and the setpoint (green).
The RWF55 has a 3-position output consisting of 2 relays to open or close a controlling element.
There is also an analog output and a multifunctional relay (K6), which can be used to set 12 different switching functions.

Interface

The controllers feature an RS-485 interface Modbus slave as standard.

Option

Additionally, the RWF55.6 features a Profibus DP interface.



Control

In modulating mode, the RWF55 operates as a PID controller. In 2-stage mode, the RWF55 provides control based on the set switching threshold.
You have the option of specifying the setpoint of the RWF55 on the controller or externally via an interface.
The user uses it for control the temperature or pressure of a heating boiler or cooling system.
It is possible to adjust the minimum and maximum setpoint limits.
2 binary inputs are used to execute functions such as setpoint changeover, setpoint shifting or operating mode changeover.
Standard feature is a self-setting function used to determine the PID control parameters.

Mounting

The controller insert measures 48 x 96 x 122 mm and is especially suited for installation in control panels. All electrical connections are made via screw terminals at the rear of the unit.

1.4 Block structure

7867d01e/0313

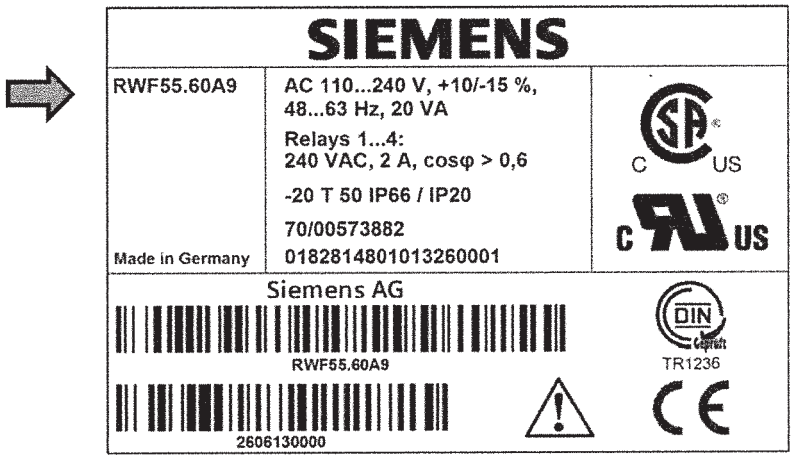


Figure 1: Block structure

2 Identification of product no.

2.1 Type field

Location: The type field is glued onto the housing. The arrow below indicates the product no.

Example

Attention!
Mains supply must correspond to the operating voltage given on the type field.

Product nos.:

Product no.	Description
RWF55.50A9	Full version with 3-position output, analog output, RS-485 – single pack
RWF55.51A9	Full version with 3-position output, analog output, RS-485 – multipack (20 pieces)
RWF55.60A9	Full version with 3-position output, analog output, RS-485 Profibus-DP – single pack
RWF55.61A9	Full version with 3-position output, analog output, RS-485 Profibus-DP – multipack (20 pieces)

2.2 Scope of delivery

- Type of controller as ordered
- User Manual (only single pack)

3 Installation

3.1 Installation site and climatic conditions

- The installation site should be free from vibrations, dust and corrosive media
- The controller should be installed away from sources of electromagnetic fields, such as variable speed drives or high-voltage ignition transformers

Relative humidity: ≤95% (noncondensing)
Ambient temperature: -20...50 °C
Storage temperature: -40...70 °C

3.2 Dimensions

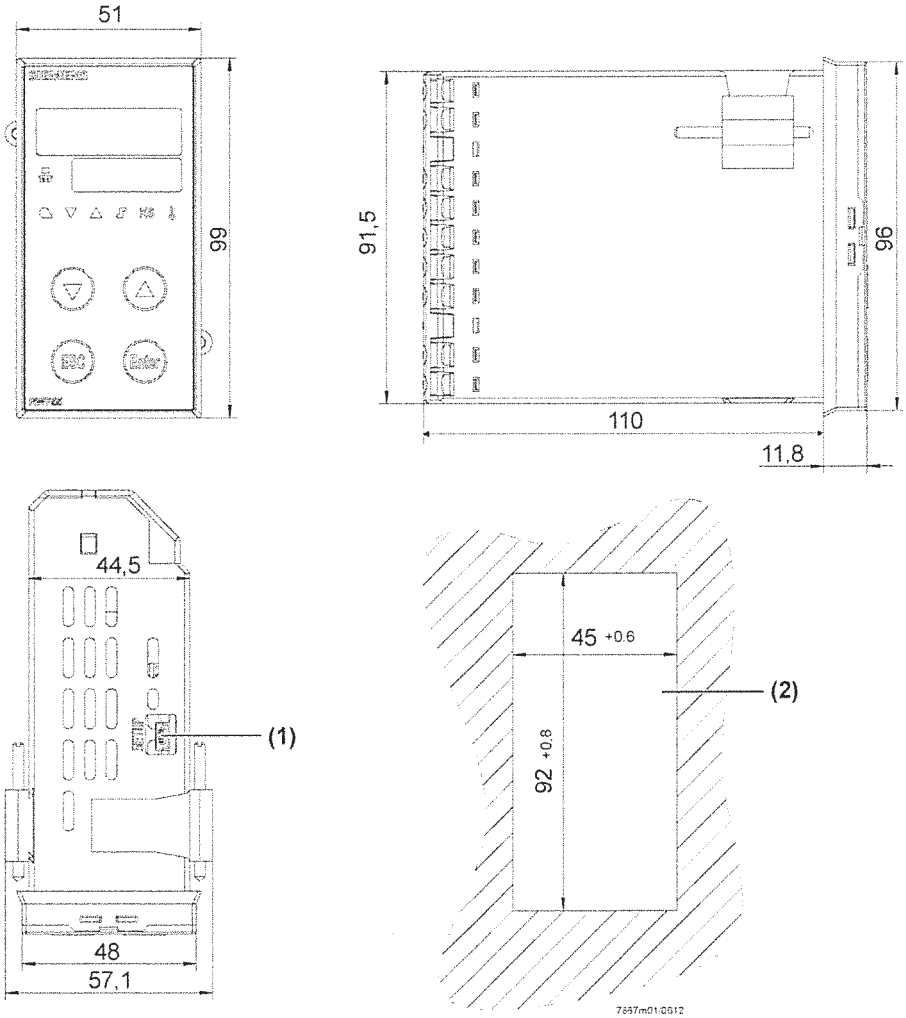

Figure 2: Dimensions of RWF55

Key
(1) USB interface setup
(2) Panel cutout

3.3 Side-by-side mounting

If several controllers are mounted side-by-side or above one another in a control panel, the horizontal distance between panel cutouts must be a minimum of 11 mm and the vertical distance a minimum of 50 mm.

3.4 Mounting the controller in a panel cutout

* Remove the mounting clips

* Fit the seal supplied with the controller

Attention!
The controller must be installed with the seal, preventing water or dirt from entering the housing!

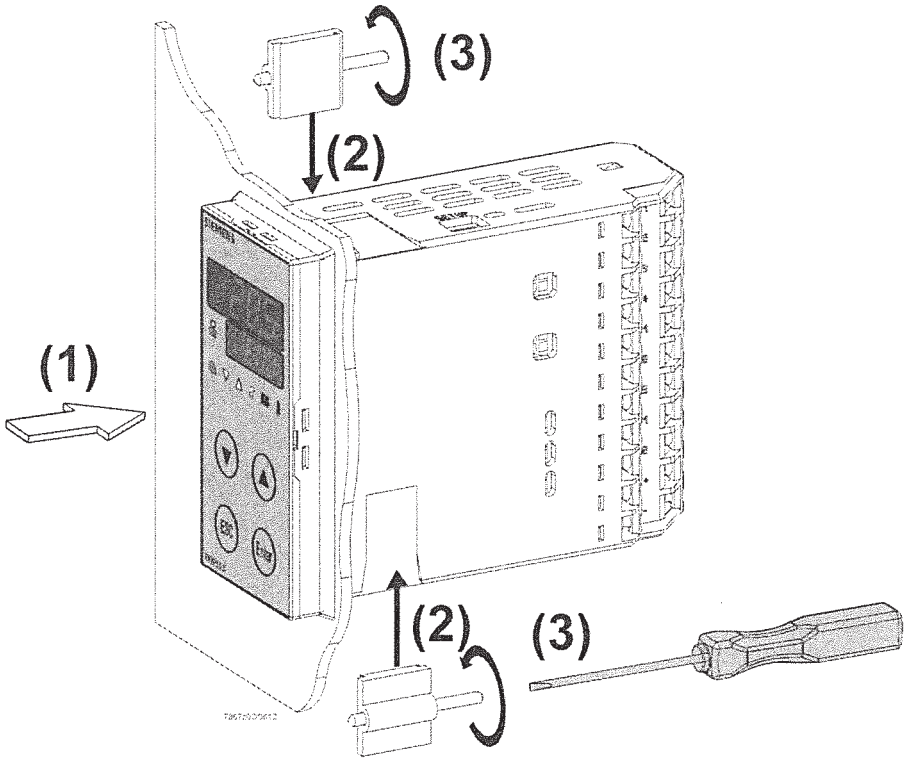

Figure 3: Mounting in a panel cutout

* Insert the controller from the front into the panel cutout (1) and make certain the seal is correctly fitted
* Working from the rear side of the panel, push the mounting clips into the guide slots on the side of the controller (2) and tighten them evenly using a screwdriver (3) until the controller housing is seated firmly in the panel cutout.

3.5 Removing the controller from the panel cutout

Attention!
When removing the controller, make certain that all cables are disconnected and that they do not get squeezed between control panel and housing.

3.6 Cleaning the front

The front of the controller can be cleaned with normal washing/rinsing agents or detergents.

Attention!
The front of the controller is **not** resistant to corrosive acids, caustic solutions and abrasive cleaners. Do not clean with high-pressure cleaners!

4 Electrical connections

4.1 Installation notes

Safety regulations

- The choice of cable, installation and electrical connections of the controller must conform to VDE 0100 *Regulations for the installation of power circuits with nominal voltages below AC 1000 V*, or the relevant local regulations
- The electrical connections must be made by qualified personnel
- If contact with live parts is possible while working on the unit, the controller must be disconnected from power supply (all-polar disconnection)
- When connecting the RWF55 to an external PELV circuit, the existing internal SELV circuit becomes a PELV circuit.
  The protection against electric shock hazard through double or reinforced insulation and voltage limitation is still present.
  No connection to protective earth is required.
- Equipment connected to the SELV circuit must have a safe separation from dangerous contact voltages in accordance with DIN EN 61140 (e.g. through double or reinforced insulation in accordance with DIN EN 60730-1).

Connection of external components

Caution!
When connecting external components to the safety extra low-voltage inputs or outputs of the RWF55 (terminals 11, 12, 13, 14, 21, 22, 23, 31, 32, D1, D2, DG, G+, G-, A+, A- and USB port, RS-485- and Profibus interface), it must be made certain that no dangerous active voltage are introduced to the RWF55.
This can be achieved by using capsulated components with double/reinforced insulation or SELV components, for example. If not observed, there is a risk of electric shock.

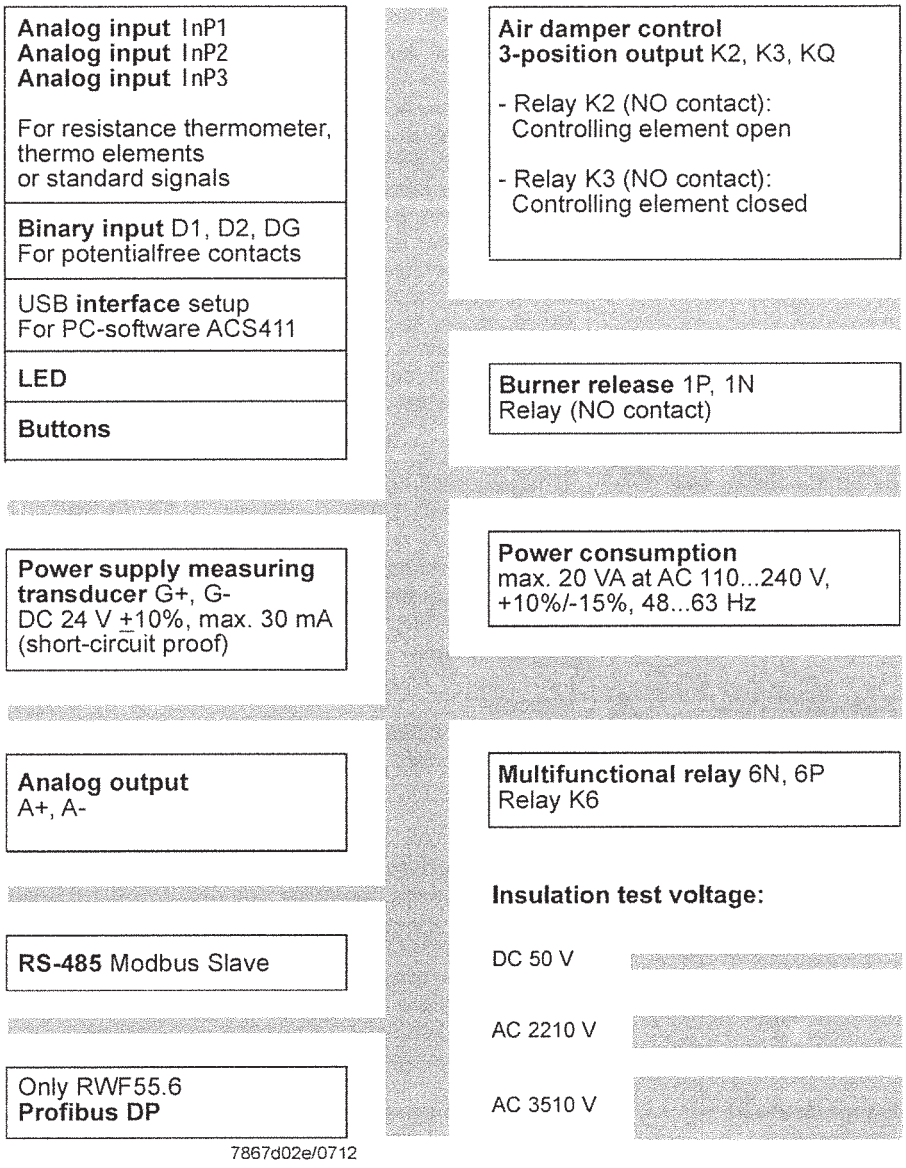
Screw terminals

Caution!
All screw terminals at the rear of the unit must always be properly tightened. This applies to unused terminals as well.

Fusing

Caution!
- Fusing on site must not exceed 20 A
- The fuse on the controller side (AC 250 V/1.6 A slow) conforms to IEC 60127-4
- To prevent the relay contacts from welding in the event of short-circuit in the load circuit, fusing of the output relays must give consideration to the maximum permissible relay current
  ⇨ Reference!
  See chapter 14.3 *Controller outputs* `OutP`.
- No other loads may be connected to the controller's main power supply terminals

Suppression of interference



- The electromagnetic compatibility and interference suppression levels conform to the standards and regulations listed under *Technical data*
  ⇨ Reference!
  See chapter 14.5 *Electrical data*.
- Input, output and supply cables should be routed separately, not parallel to one another
- All input and output lines without connection to the power supply network must be shielded and twisted. They must not be run close to live components or live cables.

Incorrect use

- The controller is not suited for installation in areas with explosion hazard
- Incorrect settings on the controller (setpoint, data of parameter and configuration levels) can affect proper functioning of the process or lead to damage.
  Safety devices independent of the controller, such as overpressure relief valves or temperature limiters/monitors should therefore always be provided, and only be capable of adjustment by qualified personnel. Please observe the relevant safety regulations. Since self-setting cannot be expected to handle all possible control loops, the stability of the resulting actual value should be checked

4.2 Galvanic separation

The illustration shows the maximum test voltages between the electrical circuits.

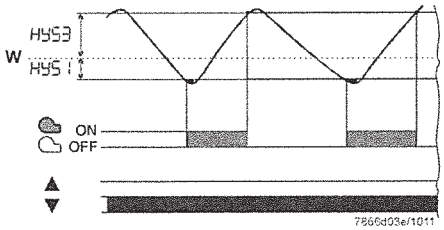
5 Operating modes



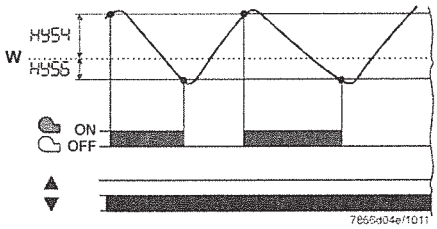
5.1 Low-fire operation

Low-fire operation means that only small amounts of heat are drawn from the boiler. Using relay K1 *Burner release*, the 2-position controller ensures control to the setpoint by switching the burner on and off like a thermostat.

Thermostat function

This mode of control is known as the **thermostat function**. An adjustable switching difference ensures that the burner's switching frequency can be selected, aimed at reducing wear.

Heating controller



Modulating and 2-stage operation:
Actual value lies between switch-on threshold **HYS1** and switch-off threshold **HYS3**.

Figure 6: Control sequence of heating controller

Cooling controller

If the controller is set to cooling mode, temperature limits **HYS4** and **HYS6** apply. In that case, relay K1 *Burner release* is used for controlling the cooling equipment.

Modulating and 2-stage operation:
Actual value lies between switch-on threshold **HYS4** and switch-off threshold **HYS6**.

Figure 7: Control sequence of cooling controller

5.2 High-fire operation

High-fire operation means that large amounts of heat are drawn from the boiler so that the burner runs continuously. If the heating load during low-fire operation rises to a level where the actual value begins to fall below switch-on threshold **HYS1** , the controller will not immediately switch to a higher burner output, but first makes a dynamic test of the control deviation and switches to the higher output only when an adjustable threshold (q) is exceeded (**A**).

⇨ Reference!
See chapter 5.6 *Response threshold (q)*.

Operating mode changeover

- In high-fire operation – depending on the application – the burner can be fired in **modulating** or **2-stage** operation, then burning larger amounts of fuel than in low-fire operation. **Binary input D2** can be used to switch between modulating and 2-stage operation
  - Contacts **D2** and **DG** open: Modulating burner operation
  - Contacts **D2** and **DG** closed: 2-stage burner operation

⇨ Reference!
See chapter 8.8 *Binary functions* `binF`.

5.2.1 Modulating burner, 3-position output

Area (1)

In area (1), the thermostat function is active. The lowest burner stage is switched on below switch-on threshold **HYS1** and switched off above switch-off threshold **HYS3**.

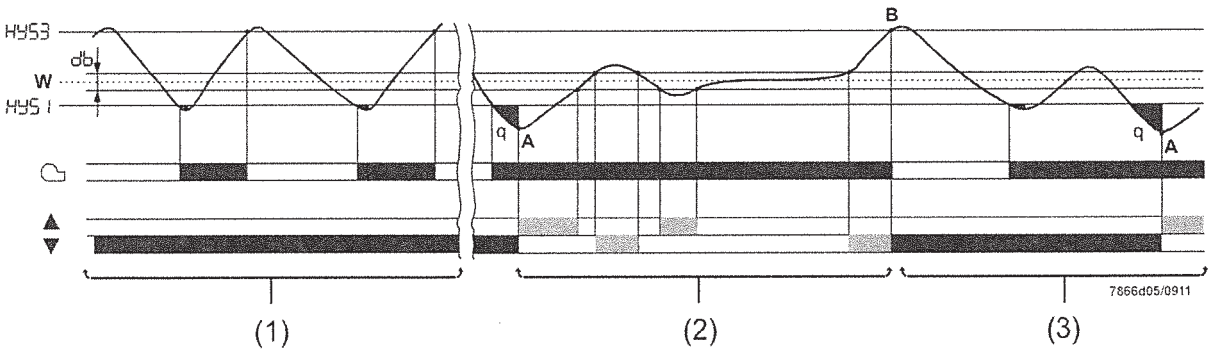


Figure 8: Control sequence of modulating burner, 3-position output

Area (2)

Here, operating mode *Modulating burner* is shown. In high-fire operation, the 3-position controller acts on an actuator via relay K2 (OPEN) and relay K3 (CLOSE). When the actual value falls below the setpoint, the response threshold (q) at point (A) is reached and the controlling element opens (greater heat output). When the actual value lies within the dead band **db**, the controlling element remains inactive. When the actual value exceeds **db**, the controlling element closes (smaller heat output).

Area (3)

If the actual value exceeds the upper switch-off threshold **HYS3** in spite of the lowest heating stage, the controller switches the burner off (B). The controller only starts low-fire operation when the actual value falls below switch-on threshold **HYS1** again. If the response threshold (q) is exceeded, the controller switches to high-fire operation (**A**).

⇨ Reference!
See chapter 5.6 *Response threshold (q)*.

5.2.2 Modulating burner, analog output

Area (1) Thermostat function active.

Area (2) The RWF55 as a modulating controller provides control to the adjusted setpoint. Angular positioning is ensured via the analog output in the form of a standard signal.

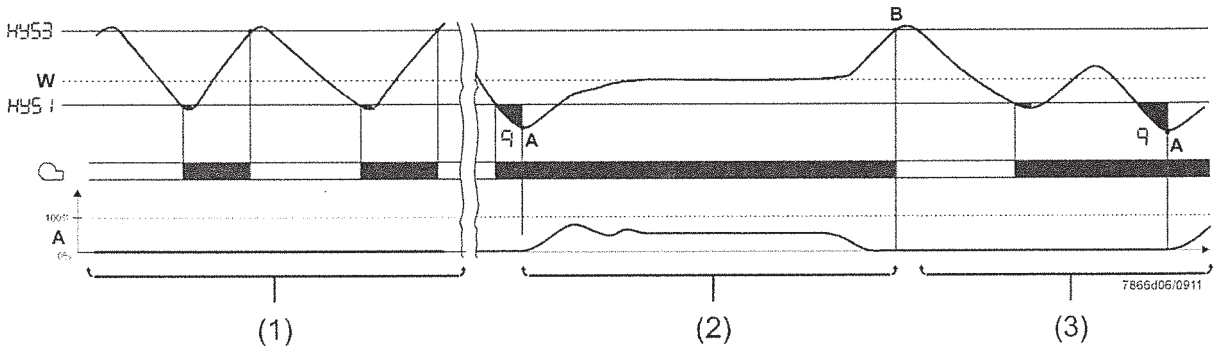

Figure 9: Control sequence of modulating burner, analog output

Area (3) The controller behaves as described in chapter 5.2.1 *Modulating burner, 3-position output*.

Cooling controller If the controller is set to cooling mode, the respective values **HYS4** and **HYS6** apply.

Starting from a high actual value, the controller now controls the connected cooling equipment in low-fire operation. In high-fire operation, the cooling output is controlled via relays K2 and K3 or the analog output. The response threshold (q) calculates automatically (now in the reverse sense) the point from which the cooling output is to be increased.

Output Angular positioning is ensured via the analog output in the form of a standard signal.

Note!
The modulating controller must be configured.

⇨ Reference!
See chapter 8.4 *Controller Cntr*

5.2.3 2-stage burner, 3-position output

In area (1), the thermostat function is active. In area (2), the RWF55 as a **2-position controller** acts on the second stage via relay K2 (OPEN) and relay K3 (CLOSE) by switching on at switch-on threshold **HYS1** and switching off at switch-off threshold **HYS2**.

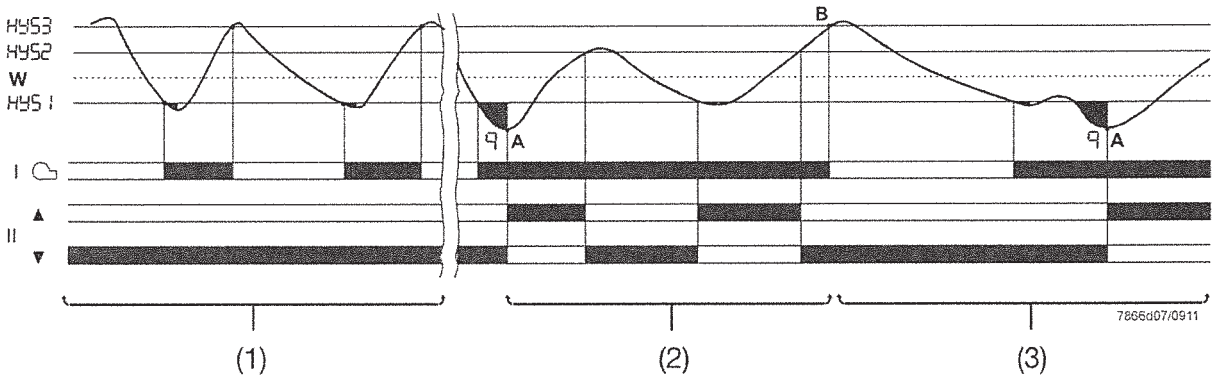

Figure 10: Control sequence of 2-stage burner, 3-position output

In area (3), the actual value exceeds the upper switch-off threshold **HYS3** and the controller shuts down the burner (**B**). The controller only starts low-fire operation when the actual value falls again below switch-on threshold **HYS1**. If the response threshold (q) is exceeded, the controller switches to high-fire operation (**A**).

⇨ Reference!
See chapter 5.6 *Response threshold (q)*.

5.2.4 2-stage burner, analog output

In this case, a digital standard signal switches the second stage on via the analog output (terminals **A+** and **A-**) when reaching switch-on threshold **HYS1** and off at the lower switch-off threshold **HYS2**.

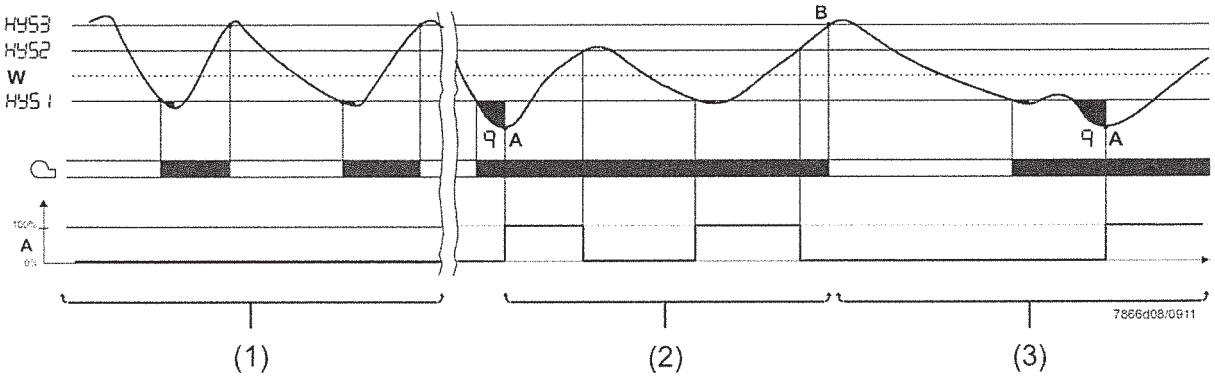

Figure 11: Control sequence of 2-stage burner, analog output

Cooling controller

If the controller is set to cooling mode, the respective values of HYS4, HYS5 and HYS6 apply.

Starting from a high actual value, the controller now controls the connected cooling equipment in low-fire operation. In high-fire operation, the second stage and thus the cooling output are controlled via relays K2 and K3 or the analog output. The response threshold (q) calculates automatically (now in the reverse sense) the point from which the cooling output is to be increased.

5.3 Burner shutdown

In the event of a sensor failure, the controller cannot monitor the actual value of the boiler temperature (analog input InP1). Burner shutdown will automatically be triggered to guard against overheating.
The same applies to acquiring the external setpoint using analog input InP2.

Functions

- Burner off
- 3-position output for closing the controlling element
- Self-setting function is ended
- Manual control is ended

5.4 Predefined setpoint

The setpoints (SP1, SP2 or dSP) are predefined within the selected setpoint limits via the buttons or the ACS411 software.
It is possible to shift the setpoint using either an analog or a binary signal, to change it via an external contact, or to influence it using a weather-compensated method.

⇨ Reference!
See chapter 8.8 *Binary functions* binF.

Setpoint changeover	Shifting	Binary input D1	Information

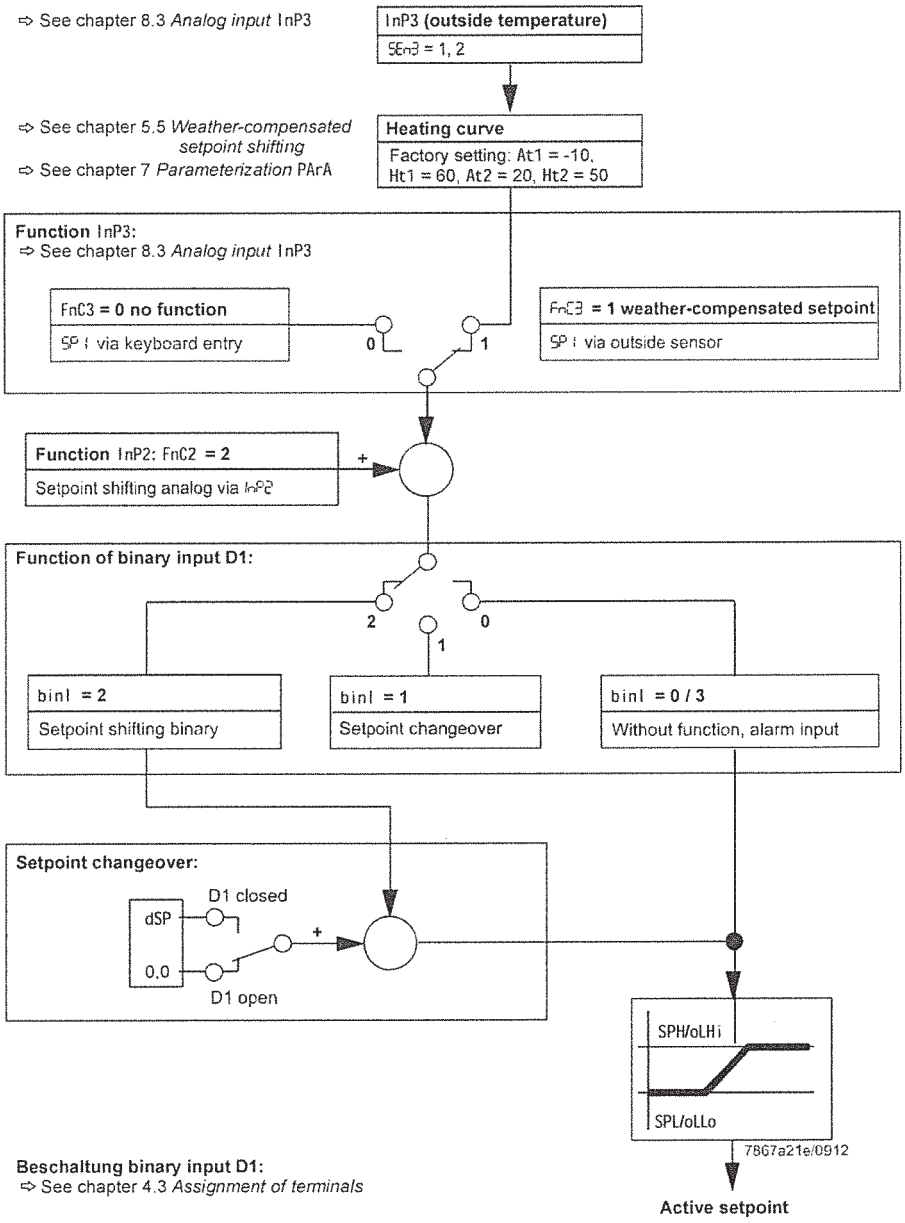

Figure 14: Setpoint shifting analog / binary

5.4.4 External setpoint, setpoint shifting binary via dSP

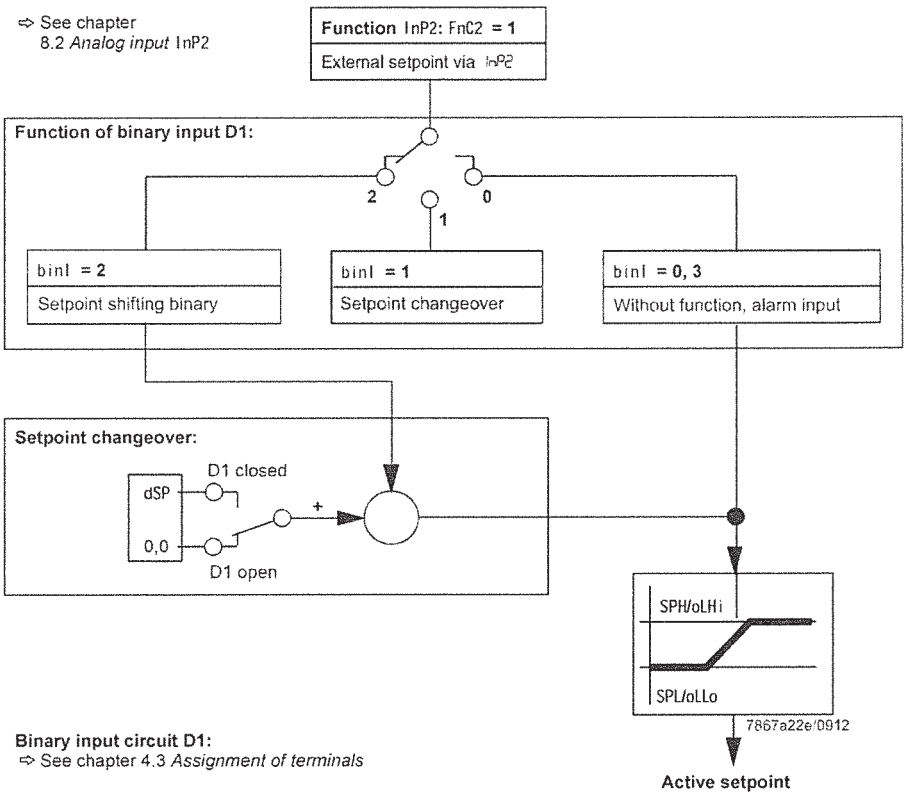

Figure 15: External setpoint, setpoint shifting binary via dSP

5.5 Weather-compensated setpoint shifting

The RWF55 can be configured so that weather-compensated setpoint shifting is activated when an LG-Ni1000 outside sensor or a Pt1000 is connected.

⇨ Reference!
See chapter 8.3 *Analog input* InP3

To take into account the time response of a building, weather-compensated setpoint shifting uses the attenuated outside temperature rather than the current outside temperature.
This attenuated outside temperature is determined on the basis of the current outside temperature and a filter constant. With the RWF55, this filter value (parameter dF3) can be adjusted. In the event of a power failure, this filter is reset. The minimum and maximum setpoints can be set using the lower setpoint limit SPL and the upper setpoint limit SPH.
The system also prevents the lower working range limit oLLo and upper working range limit oLHi from exceeding/dropping below the system temperature limits.

☞ **Note!**
Each RWF55 must have its own separate outside sensor (no parallel connection).
This function has been optimized for heating systems with DHW.

Heating curve

The heating curve describes the relationship between the boiler temperature setpoint and the outside temperature. It is defined by 2 curve points. For 2 outside temperatures, the user defines the boiler temperature setpoint that is required in each case. The heating curve for the weather-compensated setpoint is calculated on this basis. The effective boiler temperature setpoint is limited by the upper setpoint limit SPH and the lower setpoint limit SPL.

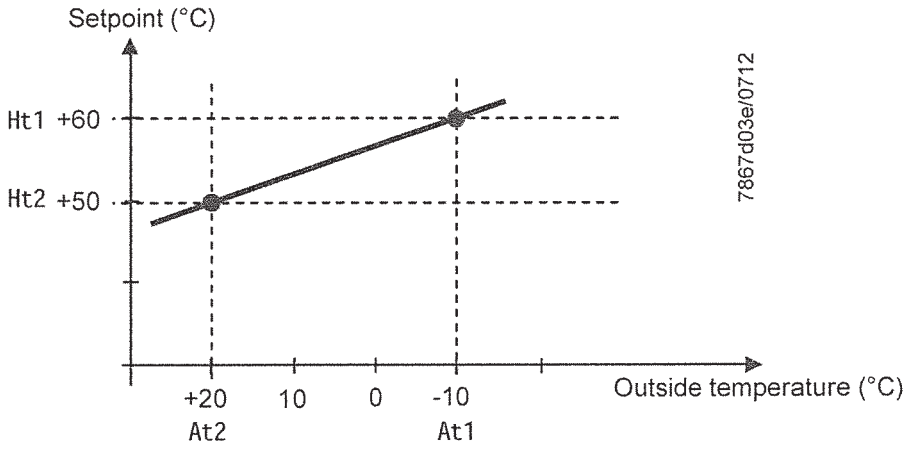

Figure 16: Heating curve slope

The two curve points are set at the parameter level.

⇨ Reference!
See chapter 7 *Parameterization* PArA

5.6 Response threshold (q)

The response threshold (q) defines for what period of time and how much the actual value is allowed to drop before the system switches to high-fire operation.
An internal mathematical calculation using an integration function determines the sum of all areas qeff = q1 + q2 + q3 as shown in the graph. This takes place only when the control deviation (x-w) falls below the value of switch-on threshold HYS1. If the actual value increases, integration is stopped.
If *qeff* exceeds the preset response threshold (q) (can be adjusted at the parameter level), this causes the second burner stage to switch on or – in the case of the 3-position controller/modulating controller – the controlling element to open.
If the current boiler temperature reaches the required setpoint, *qeff* is reset to 0.

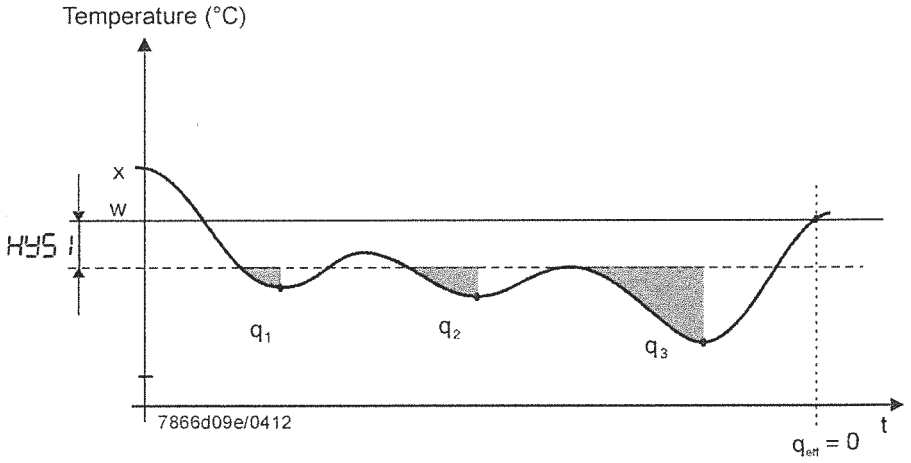

Figure 17: Control sequence response threshold (q)

In contrast to time-dependent switching on, load-dependent switching on offers the advantage of capturing the dynamics of the actual value.
Also, monitoring the progression of the actual value during the change from low-fire to high-fire ensures low switching frequencies to reduce wear and to extend running times.

Cooling controller

The response threshold (q) also works (in the reverse sense) in the case of cooling mode.

5.7 Cold start of plant

Interlocking

Note!
Functions *Cold start of plant* and *Thermal shock protection (TSS)* are interlocked.
Only one function can be activated, but never both at the same time.

Heating controller

When a heating system is switched off for a longer period of time, the actual value will drop of course.
To achieve a faster control response, the controller immediately starts in high-fire operation as soon as the control deviation (x-w) drops below a certain limit value.

This limit is calculated as follows:

Limit value = 2 x (HYS1-HYS3)

In that case, the response threshold (q) is inactive, independent of operating mode and controlled variable (temperature or pressure).

Example

Operating mode: Modulating, 3-position output
HYS1 = -5 K
HYS3 = +5 K
w = 60 °C

Limit value = 2 x (-5 - 5) = 2 x (-10) = -20 K

At an actual value below 40 °C, heating is immediately started in high-fire mode in place of low-fire mode.

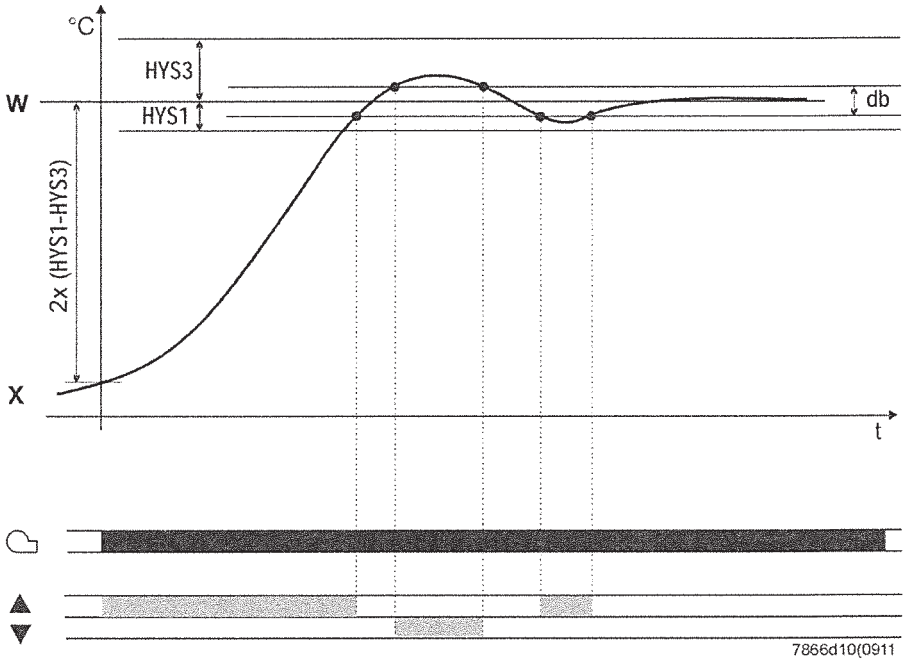

Figure 18: Control sequence *Cold start of plant*

Cooling controller

Cold start of plant also works when the RWF55 is used as a cooling controller.

In that case, the limit value is calculated as follows:
Limit value = 2 x (HYS4-HYS6)

Example

Operating mode: Modulating 3-position output
HYS4 = 5 K
HYS6 = -5 K
w = -30 °C

Limit value = 2 x (5 + 5) = 2 x (10) = +20 K

When the actual value lies above -10 °C, cooling is immediately started in high-fire mode in place of low-fire mode.

5.8 Thermal shock protection (TSS)

Interlocking

Note!
Functions *Cold start of plant* and *Thermal shock protection (TSS)* are interlocked. Only one function can be activated, but never both at the same time.

The controller comes with thermal shock protection (TSS) deactivated; it can be activated at the configuration level.

⇨ Reference!
See chapter 8.5 *Thermal shock protection (TSS)* rAFC.

Function

The function is automatically activated when the actual value drops below the adjustable limit value rAL (exceeds the adjustable limit value with the cooling controller). In that case, the setpoint is approached via a ramp function.
Gradient and slope of the ramp rASL are adjustable. The setpoint ramp has a symmetrical tolerance band toLP. If, during the startup phase, the actual value leaves the tolerance band, the setpoint ramp is stopped until the actual value returns to a level within the tolerance band. The startup phase is ended when the setpoint of the ramp function reaches the final setpoint SP1.

Note!
When thermal shock protection (TSS) is active, the controller operates in low-fire operation. The response threshold (q) is active.

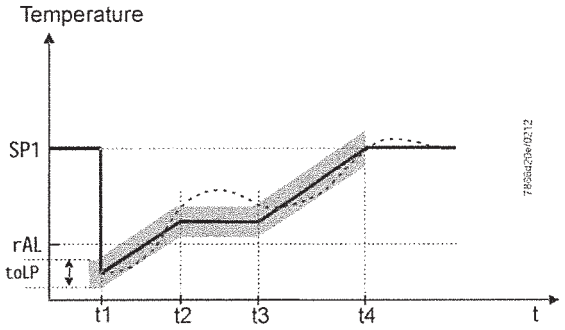

Figure 19: Thermal shock protection (TSS)

Key

Setpoint (w)

6 Operation

6.1 Meaning of display and buttons

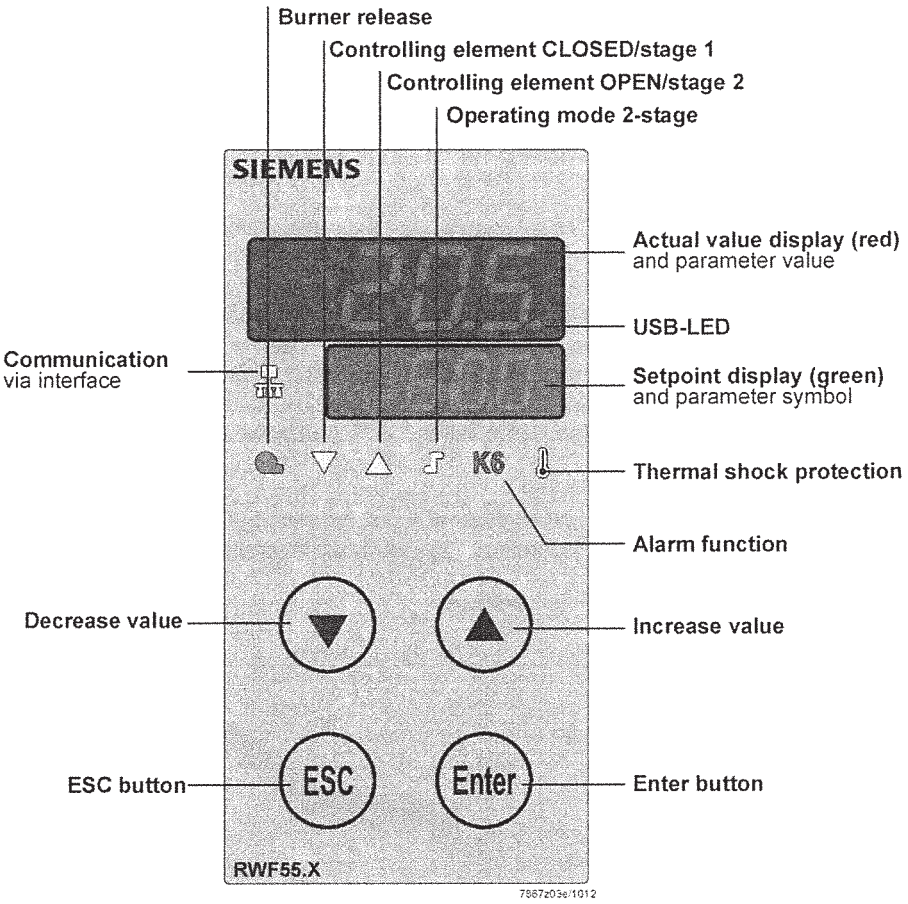

Figure 20: Meaning of display and buttons

Initialization

The two 7-segment displays (red and green) show hyphens and all LEDs light up for about 5 seconds.

Basic display

The upper display (red) shows the actual value.
The lower display (green) shows the setpoint.

⇨ Reference!
See chapter 8.9 *Display* diSP.

Parameter display

When entering parameters, the parameter symbol (green) and the set value (red) appear.

Self-setting function

The actual value is shown on the actual value display (red) and **tUnE** flashes on the setpoint display (green).

⇨ Reference!
See chapter 9.1 *Self-setting function in the high-fire operation.*

Flashing actual value display

The actual value display (red) shows **9999** flashing → Alarm message.

⇨ Reference!
See chapter 13 *What to do if ...*

Manual control

The setpoint display (green) shows **HAnd** flashing.

⇨ Reference!
See chapter 6.4 *Manual control of a modulating burner.*

6.2 Basic display

When switching power on, the displays show hyphens for about 5 seconds.

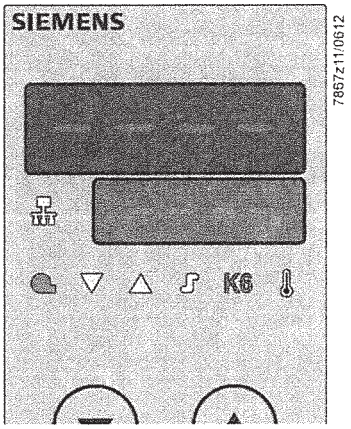

Figure 21: Display start

The state that follows is called *normal display*.
Default display is the actual value and the current setpoint.
Other values can be displayed via configuration level or via PC software ACS411.

⇨ Reference!
See chapter 8.9 *Display* diSP.

Manual control, self-setting, the user level, parameter level and configuration levels can be activated from here.

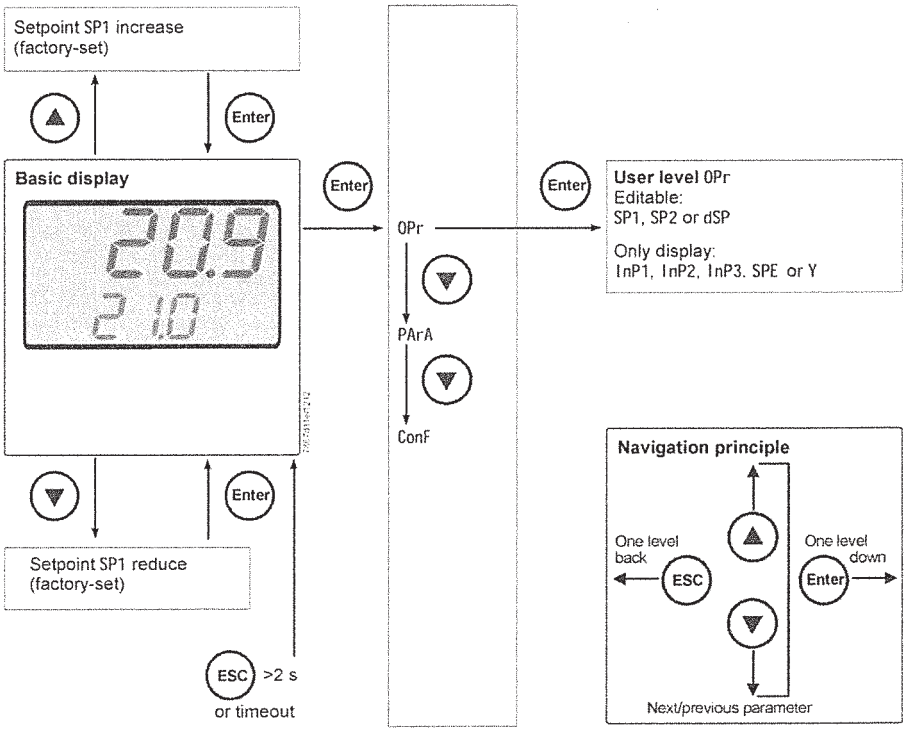

Figure 22: Basic display

6.3 User level

This level is started from the basic display.
Setpoints SP1, SP2 or dSP can be altered.
The values of the analog inputs InP1, InP2, InP3 and SPE (external setpoint) and InP3 (actual angular positioning between 0...100%) can be displayed.

Changing the setpoints

Changing SP1, SP2 or dSP.

* From the basic display, press Enter so that **0Pr** appears

SP1

* Press Enter so that **SP1** appears
* Press Enter and **SP1** flashes
* Press ▲ or ▼ to adjust the required setpoint and press Enter to confirm

SP2

SP2 only appears if **setpoint changeover** is set (binary input bin1 = 1).

* From the basic display, press Enter so that **0Pr** appears
* Press Enter so that **SP1** appears
* Press ▼ to change over to SP2
* Press Enter and **SP2** flashes
* Press ▲ or ▼ to adjust the required setpoint and press Enter to confirm

dSP

dSP only appears if **setpoint shifting** is set (binary input bin1 = 2).

* From the basic display, press Enter so that **0Pr** appears
* Press Enter so that **SP1** appears
* Press ▼ to change over to dSP
* Press Enter and **dSP** flashes
* Press ▲ or ▼ to adjust the required setpoint and press Enter to confirm

Timeout

Timeout after about 180 seconds.

☞ Note!
If the setpoint is not stored, the basic display changes after the timeout tout and the former setpoint is maintained.
The value changes only within the permitted range.

6.4 Manual control, modulating burner

Note!
Manual control can only be activated if the thermostat function **energized** relay K1. If the thermostat function **deenergized** relay K1 during manual control, manual control is ended.

* Press ESC for 5 seconds

HAnd appears on the lower display, alternating with the value for manual control (with continuous controller).

3-position controller

* Open and close fuel-air ratio control by pressing ▲ and ▼

Relay K2 opens the controlling element as long as ▲ is kept depressed.
Relay K3 closes the controlling element as long as ▼ is kept depressed.

The 2 yellow arrows indicate when relay K2 opens or relay K3 closes the controlling element.

Modulating controller

* Change angular positioning by pressing ▲ or ▼

* Adopt flashing new angular positioning by pressing Enter

Per default, the analog output delivers the current angular positioning.

* Return to automatic operation by keeping ESC depressed for 5 seconds

Note!
When activating manual control, angular positioning is set to 0 until another entry is made.

6.5 Manual control, 2-stage burner

Note!
Manual control can only be activated if the thermostat function **active** relay K1. If the thermostat function **inactive** relay K1 during manual control, manual control is ended.

* Press ESC for 5 seconds
* Press ▲ briefly

Relay K2 / K3	Analog output A- / A+
Relay K2 is active Relay K3 is inactive	The analog output delivers the highest value (depending on setting DC 10 V or 20 mA)
Controlling element opens	

* Or press ▼ briefly

Relay K2 / K3	Analog output A- / A+
Relay K2 is inactive Relay K3 is active	The analog output delivers the lowest value (depending on setting DC 0 V, 4 mA, or 0 mA)
Controlling element closes	

* Return to automatic operation by pressing ESC for 5 seconds

6.6 Starting the self-setting function

Start * Press ▲ + ▼ for 5 seconds

Cancel * Cancel with ▲ + ▼

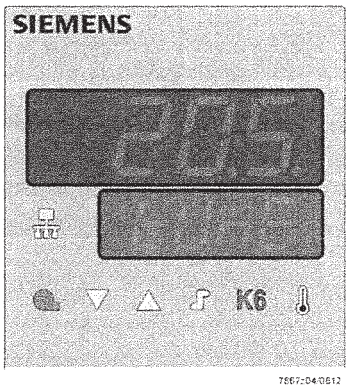

Figure 23: Display of self-setting function

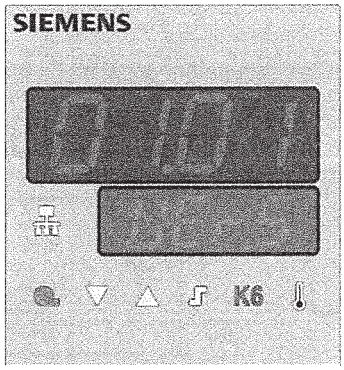


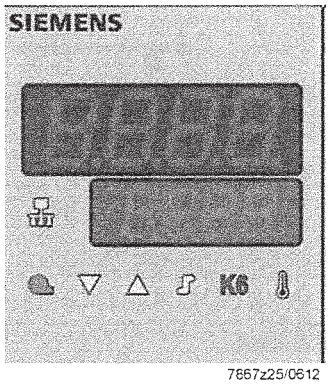
When **tUnE** stops flashing, the self-setting function has been ended.

The parameters calculated by the controller are automatically adopted!

Note!
It is not possible to start **tUnE** in manual control or low-fire operation.

6.7 Display of software version

* Press (Enter) + (▲)



7867z05/0612

Figure 24: Display of software version

Segment test

* Press (Enter) + (▲) again.

7867z25/0612

Figure 25: Display segment test

All display segments and LEDs light up; the actual value display (red) flashes for about 10 seconds.

7 Parameterization PArA

Here, set the parameters associated directly with the controller's adaptation to the controlled system after the plant has been put into operation.

Note!
The display of the individual parameters depends on the type of controller.

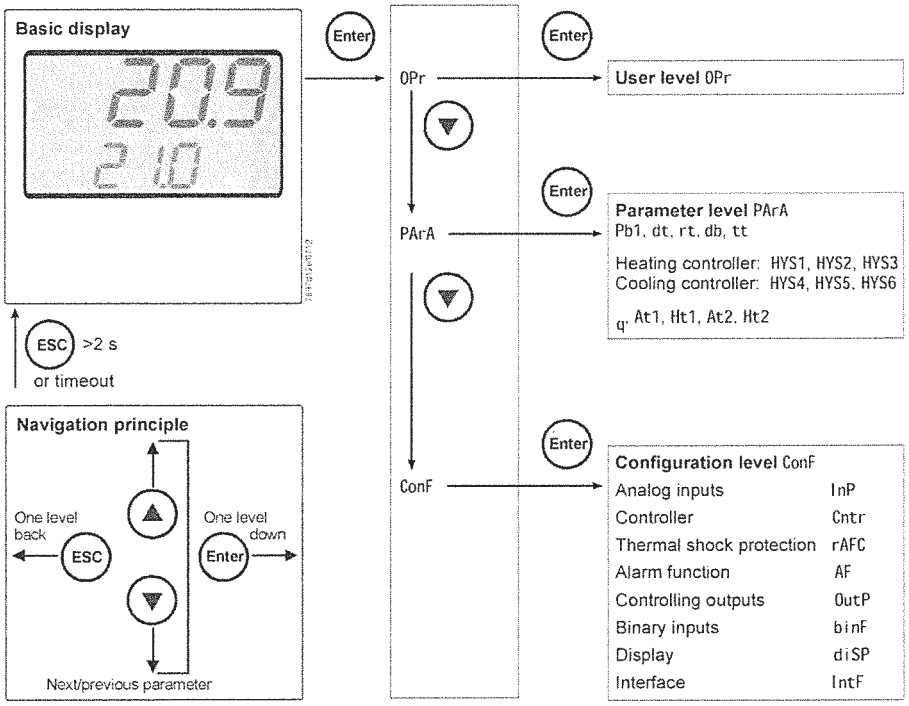


Figure 26: Parameterization

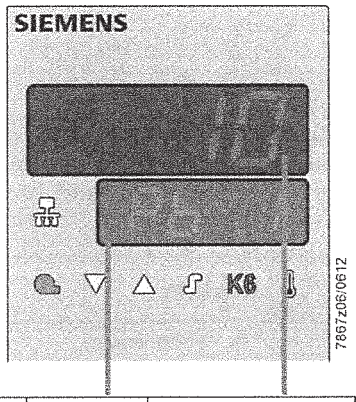
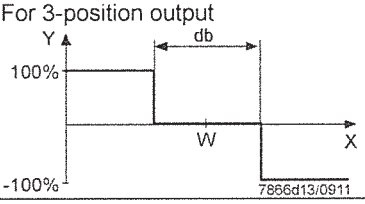
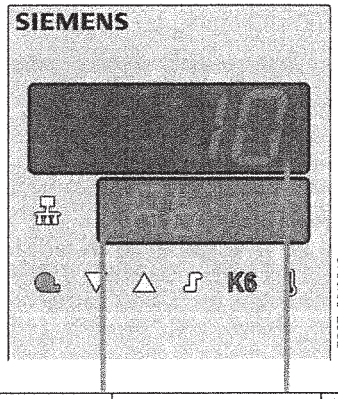


Access to this level can be locked.



Reference!
See chapter 8.9 *Display* diSP.



* From the basic display, press Enter so that **OPr** appears
* Press ▼ so that **PArA** appears
* Press Enter so that the first parameter of the parameter level is displayed

Display of controller parameters

The parameters are shown on the lower setpoint display (green) and their values on the upper/actual value display (red).

Parameter	Display	Value range	Factory setting	Remarks
Proportional band [1]	Pb1	1...9999 digit	10	Influences the controller's P-action
Derivative time	dt	0...9999 s	80	Influences the controller's D-action With dt = 0, the controller has no D-action
Integral action time	rt	0...9999 s	350	Influences the controller's I-action With rt = 0, the controller has no I-action
Dead band (neutral zone) [1]	db	0.0...999.9 digit	1	For 3-position output 
Controlling element running time	tt	10...3000 s	15	Running time of the positioning valve for use with modulating controllers

[1] Setting of decimal place has an impact on this parameter

Note!
When using the RWF55... as a modulating controller only, or as a modulating controller without the burner release function (1P, 1N), parameter HYS1 must be set to 0 and parameters HYS2 and HYS3 must be set to their **maximum** values.

Otherwise, for example, when using default parameter HYS1 (factory setting -5), the 3-position controller is only released when the control deviation reaches -5 K.

8 Configuration ConF

Here, the settings (e.g. acquisition of measured value or type of controller) required directly for commissioning a certain plant are made and, for this reason, there is no need to change them frequently.

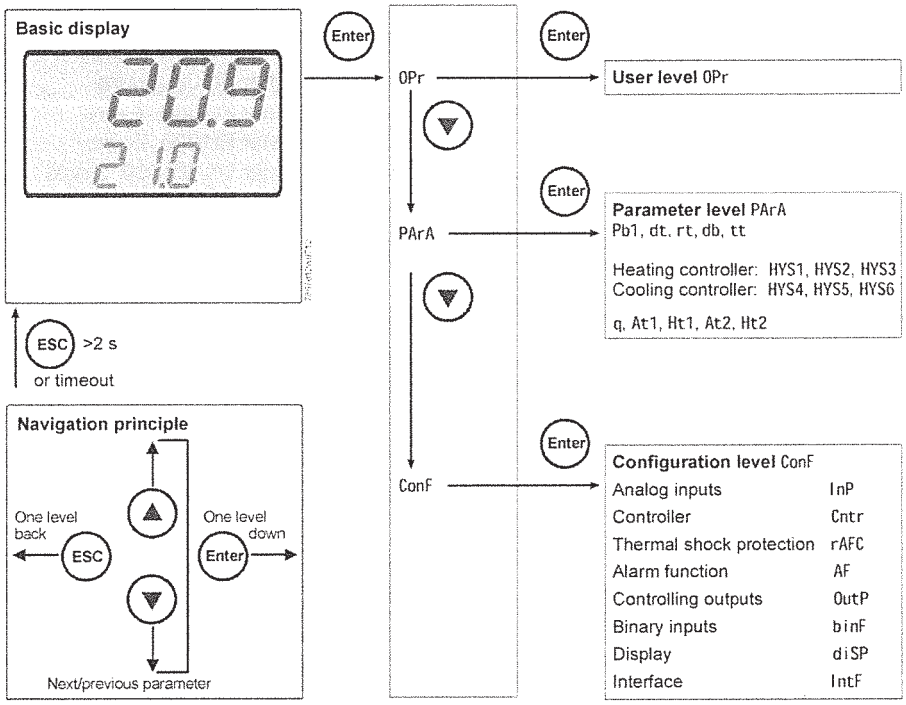

Figure 27: Configure

Access to this level can be locked.

⇨ Reference!
See chapter 8.9 *Display* diSP.

☞ Note!
The following tables show the default settings in columns *Value/selection* and *Description* in **bold** printing.

8.1 Analog input InP1

This input is used to acquire the actual value.

ConF → InP → InP1 →

Parameter	Value/ selection	Description
Sensor type SEn1 Sensor type	**1** 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19	**Resistance thermometer Pt100, 3-wire** Resistance thermometer Pt100, 2-wire Resistance thermometer Pt1000, 3-wire Resistance thermometer Pt1000, 2-wire Resistance thermometer LG-Ni1000, 3-wire Resistance thermometer LG-Ni1000, 2-wire 0...135 Ohm Cu-CuNi T Fe-CuNi J NiCr-Ni K NiCrSi-NiSi N Pt10Rh-Pt S Pt13Rh-Pt R Pt30Rh-Pt6Rh B 0...20 mA 4...20 mA DC 0...10 V DC 0...5 V DC 1...5 V
Correction of measured value OFF1 Offset	-1999... **0...** +9999	Using the measured value correction (offset), a measured value can be corrected to a certain degree, either up or down **Example:** Measured value / Offset / Displayed values 294.7 / +0.3 / 295.0 295.3 / -0.3 / 295.0
⚠ **Caution!** **Measured value correction:** To make the calculation, the controller uses the corrected value (displayed value). This value does not represent the value acquired at the point of measurement. If the measured value correction function is used incorrectly (e.g., overcompensation of measured values → measurement error only present temporarily), this may lead to undesirable plant states.		
Start of display SCL1 Scale low level	-1999... **0...** +9999	In the case of a measuring transducer with standard signal, the physical signal is assigned a display value here Example: 0...20 mA = 0...1500 °C

Self-optimization	**0** 1	**Free** Locked Self-optimization can only be disabled or enabled via the ACS411 setup program If disabled via ACS411 PC software, self-optimization cannot be started via the controller's buttons Setting in the ACS411 setup program ➔ Controller ➔ Self-optimization Self-optimization is also disabled when the parameter level is locked
Lower working range limit oLLo Lower operation range limit	**-1999...** +9999	Note! If the setpoint with the respective hysteresis exceeds the upper working range limit, the switch-on threshold is substituted by the working range limit.
Upper working range limit oLHi Upper working range limit	-1999... **+9999**	Note! If the setpoint with the respective hysteresis drops below the lower working range limit, the switch-off threshold is substituted by the working range limit.

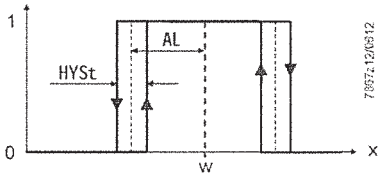
8.5 Thermal shock protection (TSS) rAFC

The RWF55... can be operated as a fixed value controller with or without ramp function.

ConF ➔ rAFC ➔

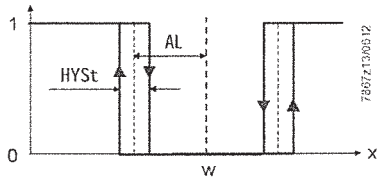
Parameter	Value/ selection	Description
Function FnCt Function	**0** 1 2	**Switched off** Gradient Kelvin/minute Gradient Kelvin/hour ☞ Note! With **FnCt** = 1 or 2, *Thermal shock protection* (TSS) is automatically activated as soon as the actual value drops below the adjustable absolute limit value **rAL** (heating controller) or exceeds it (cooling controller).
Ramp slope rASL Ramp slope	**0.0...** 999.9	Slope of **ramp** slope (only with functions 1 and 2)
Tolerance band ramp toLP Tolerance band ramp	**2 x |HYS1| = 10**...9999	Width of tolerance band (in K) about the setpoint (only with function 1 and 2) Heating controller: Smallest possible factory setting: **2 x |HYS1| = 10 K** To monitor the actual value in connection with thermal shock protection (TSS), a tolerance band can be laid about the setpoint curve. If the limit values are crossed, the ramp is stopped. ⇨ Reference! See chapter 5.8 *Thermal shock protection (TSS).* Cooling controller: Smallest possible factory setting: **2 x |HYS4| = 10 K**
☞ Note! In the event of a faulty sensor or manual control, the ramp function is stopped. The outputs behave the same way they do when the measuring range is crossed (configurable). Functions *Cold start of plant* and *Thermal shock protection (TSS)* are interlocked. Only one function can be activated, but never both at the same time.		
Limit value rAL Ramp limit	0...250	**Heating controller:** If the actual value lies below this limit value, the setpoint is approached in the form of a ramp until final setpoint SP1 is reached. **Cooling controller:** If the actual value lies above this limit value, the setpoint is approached in the form of a ramp until final setpoint SP1 is reached.

8.6 Alarm function AF



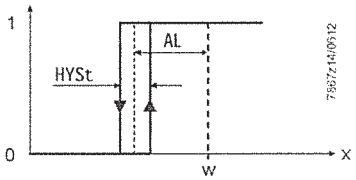
ConF → AF →

The alarm function can be used to monitor the analog inputs. If the limit value is exceeded, multifunctional relay K6 is activated (depending on the switching characteristic). The alarm function can have different switching functions (**Ik1** to **Ik8**) and can be set to a deviation from the active setpoint or to a fixed limit value.

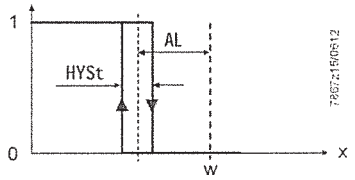


Limit value AL relative to setpoint (w)

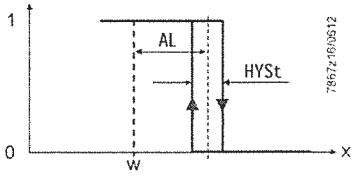
In the case of alarm functions **Ik1** to **Ik6**, the actual value InP1 is monitored in relation to a limit value AL that has to be set (with the absolute value dependent on the setpoint (w)).



Ik1



Ik2

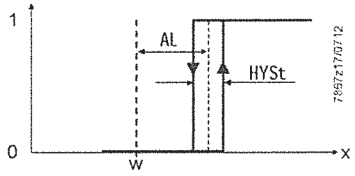


Ik3

Ik4

Ik5

Ik6



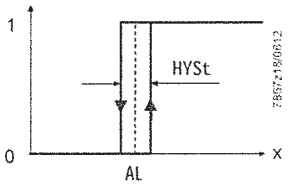


Figure 28: Alarm function Ik1...Ik6

Fixed limit value **AL**

In the case of alarm functions **Ik7** and **Ik8**, all analog inputs InP1...InP3 can be monitored in relation to a fixed limit value AL that has to be set.

Ik7

Ik8

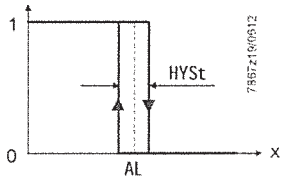

Figure 29: Alarm function Ik7 and Ik8

8.7 Control outputs OutP

For fuel-air ratio control purposes, the RWF55 has the binary outputs (K2, K3) and the analog output (A+, A-).
The burner is released via relay K1.

The switching states of relay K1 *Burner release* (LED green), relay K2 *Controlling element OPEN,* and relay K3 *Controlling element CLOSE* (yellow LED arrows) are indicated on the controller front.

Binary outputs

The binary outputs of the RWF55 offer no setting choices.

Analog output

The RWF55 has an analog output.

The analog output offers the following setting choices:

ConF → OutP →

Parameter	Value/ selection	Description
Function FnCt Function	0 1 2 3 **4**	No function Input InP1 is delivered Input InP2 is delivered Input InP3 is delivered **Controller's angular positioning is delivered (modulating controller)**
Signal type SiGn Type of signal	**0** 1 2	**0...20 mA** 4...20 mA DC 0...10 V Physical output signal
Value when out of range rOut Value when out of range	**0**...101	Signal (in percent) when measuring range is crossed 101 = last output signal
Zero point OPnt Zero point	-1999... **0...** +9999	A value range of the output variable is assigned to a physical output signal
End value End End value	-1999... **100...** +9999	

8.8 Binary input binF

This setting decides on the use of the binary inputs.

⇨ Reference!
See chapter 5.4 *Preselected setpoint*

ConF → binF →

Device address Profibus dP Device address	0...**125**	Only RWF55.6
Remote Detection Timer dtt Remote detection timer	0... **30**... 7200 s	0 = Switched-off

Note!
If communication is taking place via the setup interface, the other interfaces are inactive.

9 Self-setting function

9.1 Self-setting function in high-fire operation

Note!
tUnE is only possible in high-fire operation, in *modulating burner* mode.

Self-setting function **tUnE** is a proper software function unit integrated in the controller. In *modulating* mode, **tUnE** tests in high-fire operation the response of the controlled system to angular positioning steps according to a special procedure. A complex control algorithm uses the response of the controlled system (actual value) to calculate and automatically store the control parameters for a PID or PI controller (set dt = 0!). The **tUnE** procedure can be repeated any number of times.

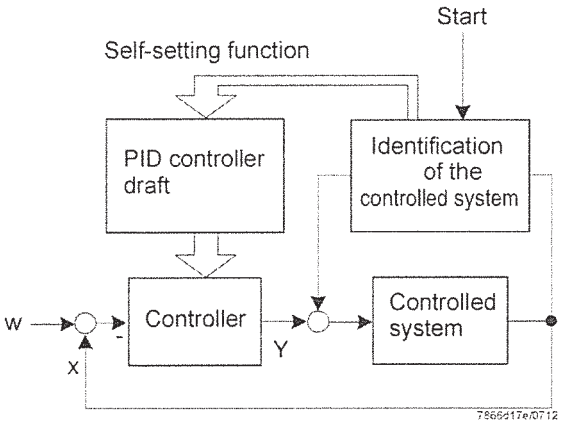

Figure 30: Self-setting function in high-fire operation

2 procedures

The **tUnE** function uses 2 different methods that are automatically selected depending on the dynamic state of the actual value and the deviation from the setpoint at startup. **tUnE** can be started from within any dynamic actual value sequence.
If there is a **great difference between actual value and setpoint** when **tUnE** is activated, a switching line is established about which the controlled variable performs forced oscillations during the self-setting process. The switching line is set to such a level that the actual value should not exceed the setpoint.

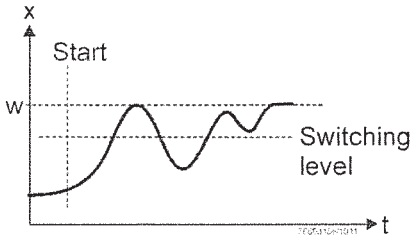

Figure 31: Great difference between actual value and setpoint

With a **small deviation** between setpoint and actual value (after the controlled system has settled, for instance), forced oscillation about the setpoint is performed.

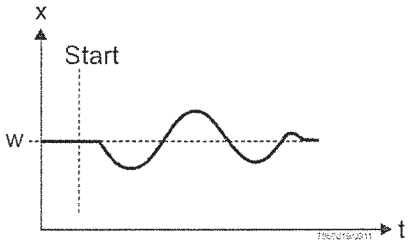

Figure 32: Small control deviation

The data of the controlled system recorded for the forced oscillations are used to calculate the controller parameters **rt**, **dt**, **Pb1** and a filter time constant **dF1** for actual value filtering that is optimized for this controlled system.

Conditions

- High-fire operation in *modulating burner* mode
- The thermostat function (relay K1) must be constantly activated; otherwise **tUnE** will be canceled and no optimized controller parameters will be adopted
- The above mentioned actual value oscillations during the self-setting process must not exceed the upper threshold of the thermostat function (increase if necessary, and lower the setpoint)

Note!
A successfully started *Self-setting* function is automatically aborted after 2 hours. This could occur in the case of a controlled system that responds slowly, for example, where, even after 2 hours, the described procedures cannot be successfully completed.

9.2 Checking the controller parameters

Optimum adjustment of the controller to the controlled system can be checked by recording a startup sequence with the control loop closed. The following diagrams indicate possible incorrect adjustments, and their correction.

Example

The response to a setpoint change is shown here for a 3rd order controlled system for a PID controller. The method used for adjusting the controller parameters can, however, also be applied to other controlled systems. A suitable value for **dt** is **rt/4**.

Pb too small

Optimum adjustment

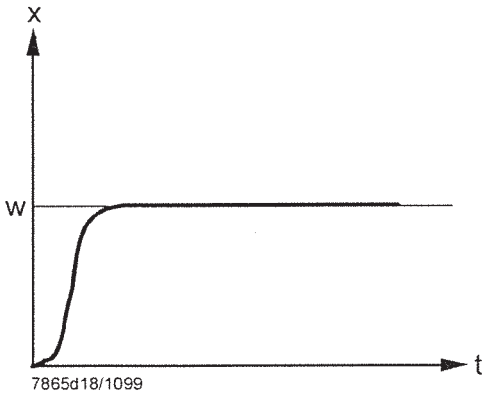

Figure 37: Optimum adjustment

10 PC software ACS411

PC software ACS411 is an operating module for use with the RWF55... universal controller and designed for the following basic tasks:

- Visualization of system state covering the following data:
  - Parameters
  - Process data
  - Configuration and parameterization of the controller (individual parameters)
  - Saving and restoration of parameter sets

A USB cable can be used to establish the connection between PC (USB plug type A, 4 pins) and RWF55 (USB plug type Mini B, 5 pins).

Note!
The cable must be purchased on site.

10.1 Safety notes

Caution!
PC software ACS411 is a convenient tool for use by qualified personnel, designed to commission and optimize the universal controller. Since the required actions and settings are safety-related, the user has a special obligation to exercise due care. Although specific technical measures have been taken to prevent incorrect entry of data and wrong parameter values, the user must check the correct function of the plant in a conventional way both during and after commissioning and – if required – ensure manual shutdown.

10.2 Setting the correct system parameters

Caution!
It should be noted that the characteristics of the universal controller are determined primarily by the parameter settings made, rather than by the type of unit. It is especially the OEM which is responsible for making certain that the controller's parameter settings are in compliance with the standards covering the respective application or type of plant. Responsibility for the parameter settings is assumed by the person who, in accordance with the access rights, makes or has made changes at the respective setting level. The detailed descriptions and safety notes given in the User Manual on the system components must also be observed.

10.3 Changing the parameters or the plant's configuration

Caution!
After changing parameters, all parameters must be checked via the unit's display to ensure they are correctly set – without making use of the PC software ACS411.

10.4 Place of installation

Caution!
PC software ACS411 is designed for use on site, that is, within viewing and hearing distance of the respective combustion plant. This means that remote control is not permitted.

10.5 License and liability regulations

Note!
For ENDUSER LICENSE AGREEMENT for PC software ACS411, refer to program menu item *Info* → *Software documentation.*
IMPORTANT – PLEASE READ CAREFULLY!

10.6 Procurement of PC software ACS411

For ordering the ACS411 software and updates, please contact your supplier or heating engineer.

10.7 Languages

PC software ACS411 is available in English and German. To select the language you require, go to program menu item *File* → *Default settings* → *Program language* (ACS411 setup program must be restarted).

10.8 Operating systems : Operating

- Windows 2000 SP4
- Windows 7 - 32 bit
- Windows 7 - 64 bit
- Windows VISTA
- Windows XP

10.9 Prerequisites for hardware

- Free hard disk memory: 300 MB
- RAM: 512 MB

10.10 Installation

Note!
First, install PC software ACS411; then, connect the controller. If not observed, an error message is delivered.

PC software ACS411 is supplied on a CD.

* Insert CD in the CD or DVD drive.
  Setup starts automatically.

* Follow the instructions appearing on the screen.

* Connect PC and controller via the USB cable.
  New hardware is identified and USB driver installed.
  This may take a few minutes.

* Follow further instructions given on the screen and wait until the installation is successfully completed.

10.11 Others

10.11.1 Use of USB port : Use of

Use

The USB port is intended for temporary use to make the parameter settings, the configuration and for work in connection with commissioning.
When using the USB port, the controller can be securely operated, tested and set with no need for using the mains cable.

10.11.2 Powering the controller via the USB port : Powering the controller via the port

Using the HUB: Using the

If the controller shall be powered via the USB port, a HUB with power supply is required, capable of delivering at least 500 mA at every outlet.

Switching off: Switching off

When supplying power via the USB port, relays and analog output are deenergized to reduce power consumption.

Note!
Check to ensure that power supply to the measuring converter (G+ and G-) is not connected. This increases power usage via the USB port as well.

Measuring accuracy:

The measuring accuracy specified in chapter 12 *Technical data* does not apply when powering the controller via the USB port.

11 Modbus interface

The tables that follow in this chapter specify the addresses of the readable and writable words that the customer is able to access. The customer may read and/or write the values using SCADA programs, PLCs, or similar.

The entries under *Access* have the following meanings:

R/O **R**ead **O**nly, value can only be read
R/W **R**ead/**W**rite, value can be read and written

The number of characters specified under *Data type* in the case of character strings includes the final **\0**.

Example:

Char10 means that the text is up to **9** characters long. The final **\0** character is then added to this.

12 Profibus-DP interface

12.1 RS-485 Technology transfer

Transmission is carried out in accordance with the RS-485 standard. This covers all areas in which high transmission speeds and simple, inexpensive installation technology are required. A twisted, shielded copper cable with a wire pair is used for this purpose.
The bus structure enables non-reacting coupling and decoupling of stations or gradual commissioning of the system. Subsequent extensions have no effect on stations that are already in operation.
A transmission speed of between 9.6 kbit/s and 12 Mbit/s can be selected. This is selected as a standard value for all devices on the bus during system commissioning.

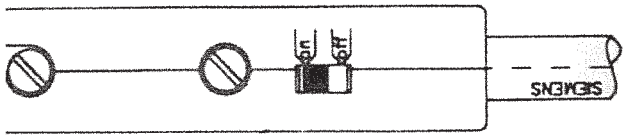
Basic features

Network topology	Linear bus, active bus terminator at both ends, branching only permitted with baud rates of <1.5 Mbit/s
Medium	Shielded, twisted cable
Number of stations	32 stations in each segment without repeaters. With repeaters, can be extended to 126 (maximum of 9 repeaters permitted)
Connectors	Preferably 9-pin D-Sub connectors

Structure

All devices must be connected in a line structure. Up to 32 nodes (masters or slaves) may be interconnected within this kind of segment. If there are more than 32 nodes, repeaters must be used (to increase the number of devices, for example).

Cable length



The maximum cable length depends on the transmission speed. The cable length specified can be increased by using repeaters. It is recommended that you do not connect more than 3 repeaters in series.

Baud rate (kbit/s)	9.6	19.2	93.75	187.5	500	1500	12000
Range/ segment	1200 m	1200 m	1200 m	1000 m	400 m	200 m	100 m

Range in relation to transmission speed.

Bus terminator

At the beginning and end of each segment, the bus is terminated by terminators. To enable fault-free operation, you must ensure that the two bus terminators are constantly supplied with power. The terminators are located in the Profibus connectors and can be activated by moving the slide switch to ON.

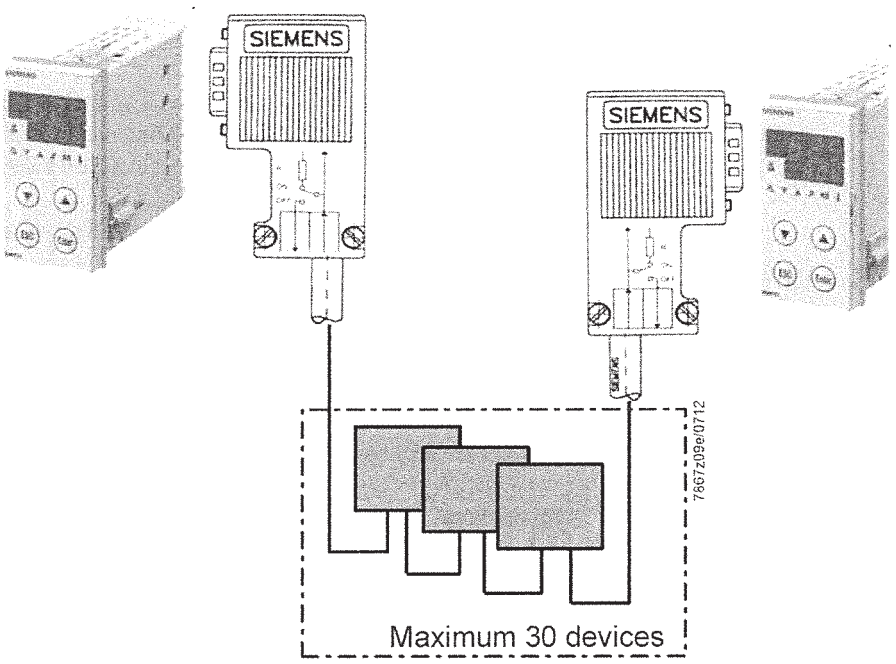


Figure 38: Bus terminator

Cable data

The cable length specifications relate to cable type A described below:

Surge impedance	135...165 Ω
Capacitance per unit length	<30 pf/m
Loop resistance	110 Ω/km
Cross-sectional area	>0.34 mm²

Preferably, a 9-pin D-Sub connector should be used for Profibus networks with RS-485 transmission technology. The pin assignments on the connector and the wiring specifications are listed at the end of this chapter.
Several manufacturers offer Profibus DP cables and connectors. Please consult the Profibus product catalog (www.profibus.com) for designations and reference addresses.

Attention!
When connecting the devices, make sure you do not mix up the data lines. You must use shielded data lines. The braided shield and the foil shield underneath it (where applicable) should be connected at both sides and with a good conductive connection to protective ground.
Additionally, where possible you must ensure that data lines are laid separately from all power cables.

As an example of an appropriate cable, we recommend the following from Siemens:

Simatic Net Profibus 6XV1
Order no.: 830-0AH10
* (UL) CMX 75 °C (Shielded) AWG 22 *

Data rate

With data rates of ≥1.5 Mbit/s, branching must be avoided during installation.

Note!
For additional installation information, please refer to the Profibus DP installation guidelines (order no. 2.111) from the PNO.

Address:
Profibus Nutzorganisation e.V.
Haid- und Neu-Straße 7
76131 Karlsruhe

Internet: www.profibus.com

Recommendation:
Please observe the installation information provided by the PNO, especially in cases where variable speed drives are being used simultaneously.

Wiring and bus termination

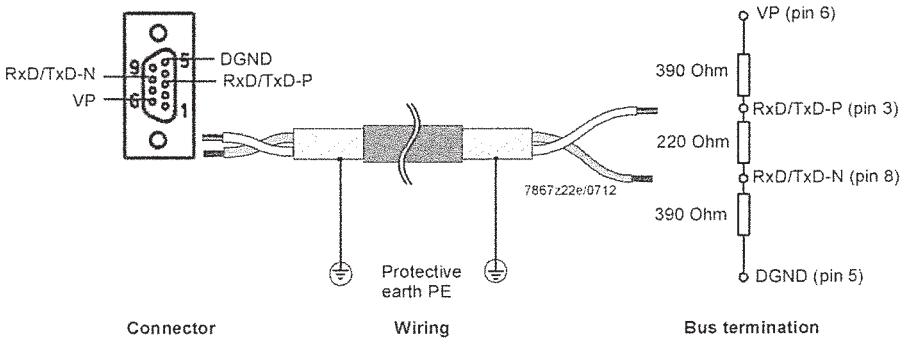

Figure 39: Wiring and bus termination

Profibus DP is designed for fast data exchange at field level. In this case, the central control devices (such as the PLC/PC) communicate with distributed field devices (such as I/Os, screen recorders, and controllers) via a fast serial connection. Data exchange with these distributed devices is usually cyclical.
The communication functions required for this are defined by basic Profibus DP functions in accordance with IEC 61158 and IEC 61784.

Basic functions

The central control device (master) reads input messages from the slaves cyclically and writes output messages to the slaves cyclically. The bus cycle time must be shorter than the program cycle time of the central PLC. As well as cyclical user data transfer, Profibus DP is able to carry out high-performance diagnostics and commissioning functions.

Technology transfer
- RS-485 twisted 2-wire line
- Baud rate of 9.6 kbit/s upto 12 Mbit/s

Bus access
- Master and slave devices, maximum 126 nodes on a bus (with repeater)

Communication
- Point-to-point (user data traffic)
- Cyclical master-slave user data traffic

Operation states
- Operate — Cyclical transfer of input and output data
- Clear — Inputs are read; outputs remain in a safe state
- Stop — Only master-master data transfer is possible

Synchronization
- Sync-Mode — Not supported by the RWF55
- Freeze-Mode — Not supported by the RWF55

Functionality
- Cyclical user data transfer between DP master and DP slave(s)
- Dynamic activation or deactivation of individual DP slaves
- Checking of DP slave configuration
- Address assignment for DP slaves via the bus
- Configuration of DP master via the bus
- Maximum 246 bytes of input/output data possible per DP slave

Protection functions

- Threshold monitoring for DP slaves
- Access protection for inputs/outputs of DP slaves
- Monitoring of user data traffic with adjustable monitoring timer for DP master

Device types

- DP master class 2, e.g., programming/configuration devices
- DP master class 1, e.g., central automation devices such as PLC, PC, etc.
- DP slave, e.g., devices with binary or analog inputs/outputs, controllers, recorders, etc.

Cyclical data traffic

Data traffic between the DP master and DP slaves is automatically processed by the DP master in a fixed, constantly recurring order. The user specifies the assignment of a DP slave to a DP master during bus system configuration. The DP slaves to be included in or excluded from cyclical user data traffic are also defined.
The data traffic between the DP master and DP slaves is divided into parameter setting, configuration, and data transfer phases. Before a DP slave is included in the data transfer phase, the DP master checks (in the parameter setting and configuration phase) whether the desired configuration that has been configured matches the actual device configuration.
As part of this check, the device type, format information, and length information as well as the number of inputs and outputs must match. As a result of this, the user is provided with reliable protection against parameter setting errors. As an addition to the user data transfer function that the DP master performs automatically, it is also possible to send new parameter setting data to the DP slaves if requested by the user.

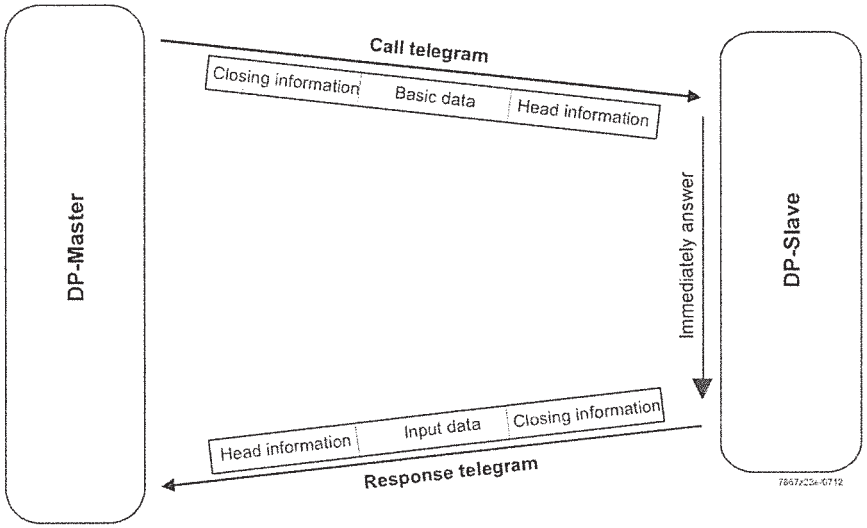

Figure 40: User data transfer with Profibus DP

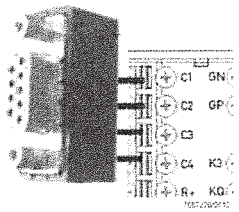
12.2 Wiring

Assignment of 9-pole D-SUB jack



COM2 D-SUB jack		Pin: Signal on the device terminal strip 1	Description

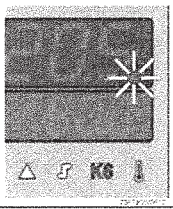
B1	RO	Float	Burner alarm
WR	RO	Float	Actual setpoint



Note!
The respective address ranges are given in the *.gsd file

13 What to do if ...

13.1 Alarm messages

Display	Cause	Remedy
9999 flashing 	**Measured value exceeded limit** The measured value is too great, lies outside the measuring range, or the sensor is faulty (9999 flashing). --- **Measured value dropped below limit** The measured value is too small, lies outside the measuring range, or the sensor has a short-circuit (-1999 flashing).	* Check to see if sensor and connecting line are damaged or have a short-circuit ⇨ Reference! See chapter 4.3 *Assignment of pins* * Check to see if the correct sensor is selected or connected ⇨ Reference! See chapter 14.1.1 *Analog input* InP1 (actual value)
The yellow communication symbol (top left) flashes 	Interface communication via Profibus, Modbus or PC software ACS411 (USB) is active	No remedy required, normal RWF55 behavior.

13.2 Others

Display	Cause	Remedy
On the upper display, the decimal place to the right is lit 	USB connection	Remove USB connection ⇨ Reference! See chapter 10 *PC software ACS411*

14 Technical data

14.1 Inputs

14.1.1 Analog input InP1 (actual value)

For resistance thermometers, thermal elements or standard signals with 2nd order digital filters (configurable).

Sampling time	250 ms

Resistance thermometers

Type	Measuring range	Measuring accuracy [a]	Impact of ambient temperature
Pt100; DIN EN 60751	-200...850 °C (-328...1562 °F)	≤0,05%	50 ppm/K
Pt1000; DIN EN 60751	-200...850 °C (-328...1562 °F)	≤0,05%	50 ppm/K
LG-Ni1000	-50...+160 °C (-58...320 °F)	≤0,05%	50 ppm/K
0...135 Ω		≤0,05%	50 ppm/K

[a] Accuracies relate to the maximum measuring range.

Line resistance	Max. 30 Ω per line with 3-wire circuit
Line balancing	Not required with 3-wire circuits. With 2-wire circuits, line balancing can be performed by making an actual value correction

Thermal elements

Type	Measuring range	Measuring accuracy [a]	Impact of ambient temperature
Fe-CuNi **J** DIN EN 60584	-200...+1200 °C (-328...+2192 °F)	≤0.25%	≤100 ppm/K
NiCr-Ni **K** DIN EN 60584	-200...+1372 °C (-328...+2502 °F)	≤0.25%	≤100 ppm/K
Cu-CuNi **T** DIN EN 60584	-200...+400 °C (-328...+752 °F)	≤0.25%	≤100 ppm/K
NiCrSi-NiSi **N** DIN EN 60584	-100...+1300 °C (-148...+2372 °F)	≤0.25%	≤100 ppm/K
Pt-RhPt **S** DIN EN 60584	-50...+1768 °C (-58...+3214 °F)	≤0.25%	≤100 ppm/K
Pt-RhPt **R** DIN EN 60584	-50...+1768 °C (-58...+3214 °F)	≤0.25%	≤100 ppm/K
Pt-RhPt **B** DIN EN 60584	0...1820 °C (32...3308 °F)	≤0.25%	≤100 ppm/K

[a] Accuracies relate to the maximum measuring range.

Cold-function temperature	Internal

Standard signals

Measuring range	Measuring accuracy [a]	Impact of ambient temperature
Voltage DC 0...5 V Input resistance R_E >2 MΩ	≤0.2%	200 ppm/K
Voltage DC 0...10 V Input resistance R_E >2 MΩ	≤0.1%	100 ppm/K
Voltage DC 1...5 V Input resistance R_E >2 MΩ	≤0.2%	200 ppm/K
Current 0...20 mA Voltage drop ≤2 V	≤0.1%	100 ppm/K
Current 4...20 mA Voltage drop ≤2 V	≤0.1%	100 ppm/K

[a] Accuracies relate to the maximum measuring range.

14.1.2 Analog input InP2 (external setpoint, setpoint shifting)

Resistance measurement 0...1 kΩ or standard signals without linearization.

Sampling time	750 ms

Resistance thermometer

Resistance (2-wire circuit)	0...1 kΩ linear ≤0.05% 50 ppm/K

Standard signals

Measuring range	Measuring accuracy [a]	Impact of ambient temperature
Voltage DC 0...5 V Input resistance RE >2 MΩ	≤0.2%	200 ppm/K
Voltage DC 0...10 V Input resistance RE >2 MΩ	≤0.1%	100 ppm/K
Voltage DC 1...5 V Input resistance RE >2 MΩ	≤0.2%	200 ppm/K
Current 0...20 mA Voltage drop ≤2 V	≤0.1%	100 ppm/K
Current 4...20 mA Voltage drop ≤2 V	≤0.1%	100 ppm/K

[a] Accuracies relate to the maximum measuring range.

14.1.3 Analog input InP3 (outside temperature)

For resistance thermometers in 2-wire circuit, with fixed filter time constant.

Sampling time	6 s

Resistance thermometer

Type	Measuring range	Measuring accuracy [a]	Impact of ambient temperature
Pt1000 DIN EN 60751	-200...+850 °C (-328...+1562 °F)	≤0.05%	50 ppm/K
LG-Ni1000	-50...+160 °C (-58...+320 °F)	≤0.05%	50 ppm/K

[a] Accuracies relate to the maximum measuring range.

14.1.4 Binary input D1

Potentialfree contact for the following functions, depending on the configuration:

- No function
- Setpoint shifting
- Setpoint changeover
- Alarm input

14.1.5 Binary input D2

Potentialfree contact for operating mode changeover:

Burner modulating, if contacts D2 and DG are open	LED for *operating mode 2-stage*, **does not** light up on the front
Burner 2-stage, if contacts D2 and DG are closed	LED for *operating mode, 2-stage*, **lights up** on the front

14.2 Monitoring the measuring circuit

In the event of error, the outputs assume defined states (configurable).

Measuring transducer	Measured value crossed limit	Sensor/line has short-circuit	Sensor/line interrupted
Resistance thermometer	●	●	●
Thermal elements	●	---	●
Voltage			
DC 1...5 V	●	●	●
DC 0...5 V	(●)	---	---
DC 0...10 V	(●)	---	---
Current			
DC 4...20 mA	●	●	●
DC 0...20 mA	(●)	---	---

● = detected

(●) = detected only if measuring range is exceeded

--- = not detected

Relay K1 (NO contact) **1P, 1N** (burner release)	
Contact rating	Max. 2 A at AC 240 V at cosφ >0.6
Contact life	250,000 switching cycles at high-fire
Contact protection	Varistor
Power supply for transducer G+, G-	DC 24 V ±10%/max. 30 mA, short-circuit-proof

The following relay data are those specified by the supplier.

Relay K2, KQ (controlling element OPEN)	
Contact rating	Max. 2 A at AC 240 V and cosφ >0.6
Contact life	200,000 switching cycles at high-fire
Contact protection	RC combination
Relay K3, KQ (controlling element CLOSE)	
Contact rating	Max. 2 A at AC 240 V at cosφ >0.6
Contact life	200,000 switching cycles at high-fire
Contact protection	RC combination
Relay K6 (NO contact), **6P, 6N** (multifunctional relay)	
Contact rating	Max. 2 A at AC 240 V at cosφ >0.6
Contact life	200,000 switching cycles at high-fire
Contact protection	Varistor

Relay data are those specified by the supplier.

Analog output A+, A-	
Voltage	DC 0...10 V short-circuit-proof
Load resistance	R_{Last} ≥500 Ω
Accuracy	≤0.25%, ±50 ppm/K
Current	0...20 mA/4...20 mA
Load resistance	R_{Last} ≤500 Ω
Accuracy	≤0.25%, ±50 ppm/K

Interface RS-485

Baudrate	4800 Baud 9600 Baud 19200 Baud 38400 Baud
Protocol	Modbus
Unit address	1...99

Profibus interface

Only present with RWF55.6!

14.4 Controller

Type of controller	3-position controller and continuous controller
Controller structure	P/PI/PD/PID
Sampling time	250 ms

14.5 Electrical data

Power supply (switching network section)	AC 110...240 V +10/-15% 48...63 Hz
Electrical safety	To DIN EN 60730, part 1 Overvoltage category III Degree of contamination 2
Safety class I	With internal separation from SELV electrical circuits
SELV voltage	Max. 30 V
Power consumption	Max. 20 VA
Data backup	EEPROM
Electrical connection	At the rear via screw terminals
- Cross-sectional area - Stranded wire with	0.25...1.5 mm² fine-wired - Ferrules to DIN 46228 - Pin-type cable socket to DIN 46231 - Crimp-type cable socket in fork-form for M3 thread (dimensions to DIN 46237)
With UL applications	Use of the cable lug or ferrules to UL486A-B (UL listed or recognized)
Tightening torque	0.5 Nm
Electromagnetic compatibility	DIN EN 61326-1
Emitted interference	Class B
Immunity	Meeting industrial requirements

14.6 Housing

Type of housing	Made of Makrolon for control panel mounting to DIN IEC 61554 (use in indoor)
Color	Light-grey RAL7035
Mounting depth	122 mm
Mounting position	Optional
Degree of protection	To DIN EN 60529 Front side IP66 Rear IP20 To UL50E and to NEMA 250 Front side type 5
Weight - RWF55.5 - RWF55.6	(Fully equipped) Approx. 329 g Approx. 342 g

14.7 Environmental conditions

Storage	DIN IEC 60721-3-1
Climatic conditions	Class 1K3
Mechanical conditions	Class 1M2
Temperature range	-40...70 °C
Humidity	<95% r.h.
Transport	DIN IEC 60721-3-2
Climatic conditions	Class 2K2
Mechanical conditions	Class 2M2
Temperature range	-40...70 °C
Humidity	<95% r.h.
Operation	DIN IEC 60721-3-3
Climatic conditions	Class 3K3
Mechanical conditions	Class 3M3
Temperature range	-20...50°C
Humidity	<95% r.h.
Installation altitude	Max. 2000 m above sea level

Attention!
Condensation, formation of ice and ingress of water are not permitted!

14.8 Segment display

Height of numerals	
- Upper display	10 mm
- Lower display	7 mm
Color	
- Upper display	Red
- Lower display	Green
Digits	4 (including 0, 1 or 2 decimal places, configurable)
Range of display	-1999...9999

14.9 Standards and certificates

Applied directives:

- Low-voltage directive 2014/35/EC
- Electromagnetic compatibility 2014/30/EC

Compliance with the regulations of the applied directives is verified by the adherence to the following standards / regulations:

- Temperature control devices and temperature limiters for heat generating systems DIN EN 14597
- Automatic electrical controls for household and similar use Part 1: General requirements DIN EN 60730-1
- Automatic electrical controls for household and similar use Part 2-9: Particular requirements for temperature sensing controls DIN EN 60730-2-9
- Electrical equipment for measurement, control and laboratory use - EMC requirements Part 1: General requirements DIN EN 61326-1

The relevant valid edition of the standards can be found in the declaration of conformity!

Immersion Well Temperature Sensors

Description

The Immersion Well Temperature Sensors monitor and transmit changes in temperature to the building control system. Specific devices within the range are compatible with whatever North American manufactured building automation system you may be installing. They thread into a well in a pipe and sense the medium temperature in the pipe. All sensors incorporate precision temperature sensing elements to accurately and reliably measure temperature.

Features

- Variety of sensing elements
- Suitable for hot or chilled medium
- Responsive to temperature change
- Accurate and reliable indication of temperature
- Familiar installation requires no special tools

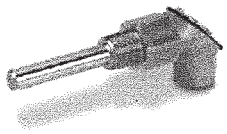

Figure 1. Immersion Well Temperature Sensor.

Specifications

Temperature Range	Controller dependent
Output Signals	Changing resistance
Sensing Element Type	NTC Thermistor, Pt RTD, or Ni RTD
Accuracy	
NTC Thermistors, mid-range	±1.0°F (±0.5°C)
Pt RTD and Ni RTD, mid-range	±0.75°F (±0.4°C)
Installation	
Wiring	2-conductor: 18 to 22 AWG twisted pair (per code requirements)
Calibration Adjustments	NTC: None required RTD: Adjust for increased temperature offset (a constant) as required, related to added resistance of the field wiring
Threads into Immersion Well	1/2-inch – 14 NPSME
Conduit Pipe Threads	1/2-inch – 14 NPSMI
Housing Material	Cast zinc

Compatibility Table

Automation System	Element Type
AET	10K Type III

HVAC WATER TREAMENT SPEC 23 25 000

Water Technologies & Solutions
fact sheet

Ferroquest* FQ7103

neutral pH iron cleaner

description and use

- Removes rust, oil-based coating, organic debris
- Passivates steel surfaces
- Non-corrosive to base metal
- Safe in multimetal systems

description and use

Ferroquest* FQ7103 is a neutral pH cleaner which removes iron deposits, oil-based coatings, and organic debris from metal surfaces. Use of Ferroquest FQ7103 in new systems establishes system cleanliness and protection as the first step toward process efficiency and equipment longevity.

treatment and feeding requirements

Recirculate a 1% Ferroquest FQ7103 solution throughout the system for a minimum of 72 hours. After cleanout, rinse for 24 hours with fresh water, drain, and initiate system treatment. Ferroquest FQ7103 is best fed neat (undiluted) from the storage tank into the system. It can be introduced to the system by means of a chemical pump, bypass feeder or an inductor feeder.

general properties

Physical properties of Ferroquest FQ7103 are shown on the Material Safety Data Sheet, a copy of which is available upon request.

packaging information

Ferroquest FQ7103 is a liquid blend available in a variety of containers and delivery methods. Contact your SUEZ representative for details.

storage and handling

Protect from freezing. If this product is frozen during shipment or storage, slight mixing may be required to ensure homogeneity.

safety precautions

A Material Safety Data Sheet containing detailed information about this product is available upon request.

Find a contact near you by visiting www.suezwatertechnologies.com and clicking on "Contact Us."

Water Technologies & Solutions
fact sheet

CorrShield* MD4102

closed system corrosion inhibitor

- Excellent corrosion protection
- Low toxicity
- Highly buffered
- Easy to apply and control
- Compatible with most corrosion inhibitors

description and use

CorrShield MD4102 is a highly buffered, molybdate based corrosion inhibitor for use in multi-metal closed recirculating water systems that are subjected to air ingress contamination and/or trace acidic contaminants. This product also contains a scale inhibitor to retard the formation of objectionable deposits on high temperature heat exchange surfaces.

CorrShield MD4102 has a high buffering capacity which will maintain the pH of a closed water system in the desirable alkaline pH range, even in the presence of air ingress and/or trace acidic contaminants. Complete protection is provided against corrosion for ferrous and non-ferrous metals in both chilled and hot water heating systems.

treatment and feeding requirements

Maintain a molybdenum residual in the system as specified by your SUEZ representative. CorrShield MD4102 may be added full strength directly to the closed system by means of a by-pass feeder or chemical pump of standard construction. Inject chemical to suction side of recirculating pump or at any convenient location where good mixing is assured.

general properties

Physical properties of CorrShield MD4102 are shown on the Material safety Data Sheet (MSDS), a copy of which is available upon request.

packaging information

CorrShield MD4102 is available in a variety of containers and delivery methods. Contact your SUEZ representative for details.

storage

The product should be stored at moderate temperatures and protected from freezing. If frozen, thaw completely and mix thoroughly prior to use.

safety precautions

An MSDS containing detailed information about this product is available upon request.

Find a contact near you by visiting www.suezwatertechnologies.com and clicking on "Contact Us."

JOB: ***CONTACTOR:*** ***DATE:***

SYSTEM: ***TEST KIT USE:*** ***VOLUME:***

FQ7103 CLOSED SYSTEM CLEANING PROCEDURE

PART 1 - Add FQ7103 Cleaner (*Dosages:* 1L FQ7103 per every 100 L system volume)

1. Fill system with domestic water and establish circulation. Heat the system to maximum 60 degrees Celsius if possible.
2. After 2 hours of circulation, flush dirt legs until no solids are visible, while refilling to maintain the system pressure and circulation.
3. Dosage of closed loop system pipe cleaner **FQ7103** should now be added to the system via the pot feeder or pump, with the quantity determined by the system volume. Typical dosage of **1%** of total system volume is adequate for new installations.
4. Allow solution to circulate for 48 hours if cleaning is done while being heated, allow 72 hours of circulation on cold systems.
5. During the cleaning, periodically do hard short blow downs on low points in the system to remove any sediment accumulations.
6. **Take sample # 1** after the cleaner is completely mixed, before proceeding onto the next stage. Have Specified Technical Sales (STS) perform a laboratory analysis on the sample to confirm that sufficient cleaner has been added to the system. Confirmation that sufficient cleaner has been added to the system must first be received from STS prior to moving onto **PART 2**.

PART 2 – Thoroughly Flush the system to remove the cleaner

7. After the solution has adequately circulated and STS has confirmed that the recommended amount of FQ7103 is present, begin flushing. A gradual process of continuous bleed-off and make-up is recommended. Drain from the lowest available source, at the same rate as the system make-up. Observe the discharge.
8. When the effluent is clean and clear, matching the raw water quality, cease the bleed-off. Check for any remaining sediment or water loss at system drain valves.
9. **Take sample #2.** Have STS perform a laboratory test to confirm that the organo phosphonate levels within the sample show that sufficient FQ7103 cleaner has been removed from the system. (For a successful flush to have been performed < 4 ppm must be achieved). Confirmation that a satisfactory flush was completed must first be received from STS prior to moving onto **PART 3.**

PART 3 – Add Corrshield MD 4102/ Glycol to the system (*Dosages:4 liter per every 1000 liters of system volume)*

10. To provide passivation add the specified dosage of corrosion inhibitor (and glycol if required) as soon as possible, after confirming flush results. Circulate the entire system well to mix the inhibitor. Test the inhibitor concentration with the test kit provided. **Take sample #3**. Have STS perform a laboratory test to evaluate the inhibitor levels, pH, conductivity, and freeze point (if applicable). At this point STS will either provide a final written report confirming that the system is in good starting condition, or advise that insufficient inhibitor is present. If insufficient inhibitor is present an additional sample or samples will be required for laboratory analysis by STS until the recommended levels in the system are achieved. Only at the point where the inhibitor levels achieve the recommended control range criteria can a final written report be provided.
11. Install by-pass filter cartridge to remove any contaminants that remain. Monitor the filter flow and replace cartridge as necessary.
12. Before tying in a new system to an existing system take a sample of the existing system water and return it to STS, for chemical analysis for compatibility and an indication of systems chemical program integrity. **Label sample # 4 (Only if applicable)**

CUSTOMERS RESPONSIBILITIES

1. Customer shall provide STS with full details of the size of the system at the time of quotation for the job to enable an accurate and precise calculation to be made in consideration of the amount of FQ7103 cleaner that will be required to adequately clean the system.
2. Leaving raw water in the system for an extended period of time is not desirable as this may result in flash corrosion occurring in the system, so please submit each water sample to STS for testing without undue delay.

DISCLAIMER

The reports provided are based exclusively on the samples provided.

If at any time the above procedure is not followed or the customers responsibilities are not fulfilled, i.e. samples 1,2,or 3 are not received, all three samples are received at once at the conclusion of the cleaning procedure, samples are received a long time past the date that they were taken, etc; STS reserves the right to decline to issue a final written report attesting that the system is in good starting condition.

Molybdenum (Mo) Test Kit
1 drop = 2, 5, 20, or 50 ppm

STS-6213-TK

FOR BEST ACCURACY (1) ENSURE ACCURATE SAMPLE SIZE. (2) HOLD DROPPER BOTTLE VERTICALLY, NOT AT AN ANGLE.

Testing Tips:

- *Wear appropriate safety equipment.*
- *Read MSDS before use.*
- *Be sure there is adequate lighting during testing.*
- *Hold reagent bottles vertically for best results.*
- *Make sure you have an accurate sample.*

Kit Components:

STS-6213-B	*Molybdenum Buffer, 60 mL*
STS-6213-I	*Molybdenum Indicator, 60 mL*
STS-6213-T	*Molybdenum Titrating Sol., 60 mL*
SY-2005-P	*Syringe, 5 mL*
SY-2001-P	*Syringe, 1 mL*
VL-1005-V	*Vial, 10-50 mL*

EndPoint ID® Test Procedure +PLUS

1 **Select a sample size** based on the desired drop equivalency. Rinse and fill the vial with desired amount.

1 drop = 2 ppm	25 mL sample
1 drop = 5 ppm	10 mL sample
1 drop = 20 ppm	2.5 mL sample*
1 drop = 50 ppm	1.0 mL sample*

For 2.5 and 1.0 mL sample size: Use 5 mL syringe to add sample, then dilute to 10 mL with molybdenum free water.

2 **Add 1 mL of Molybdenum Buffer** (STS-6213-B) to the sample using the 1 mL syringe.

3 **Add 10 drops of Molybdenum Indicator** (STS-6213-I) and swirl to mix. The sample will turn red if molybdenum is present.

4 **Add Molybdenum Titrating Solution** (STS-6213-T) one drop at a time while swirling. Count the number of drops until the sample color changes from red to green and no further color change occurs.

5 Record your results by multiplying by the factor chosen in step 1.

# of drops x factor = ppm Molybdenum (Mo)

Note: To convert Molybdenum (Mo) to Molybdate (MoO_4), multiply by 1.7

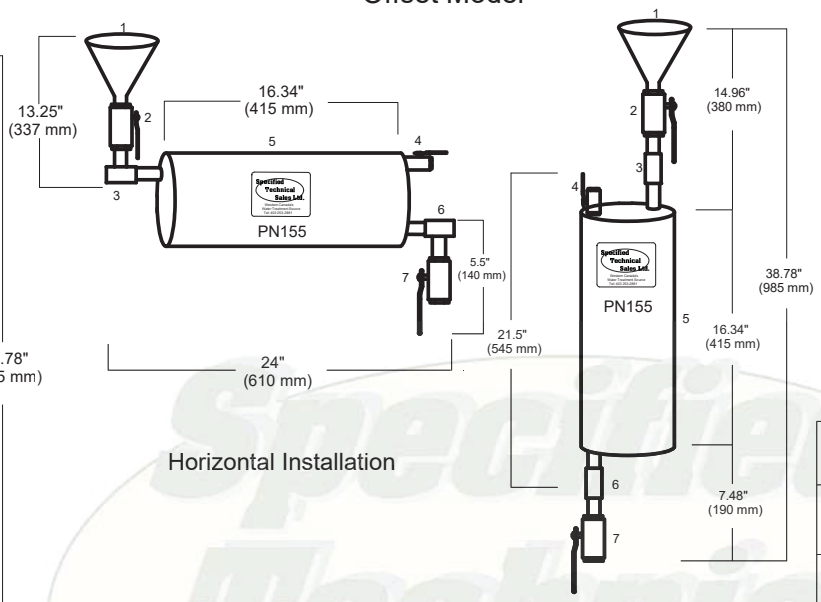
TITLE:



Closed System Water Treatment Equipment, Glycol Feed System for Glycol Systems only.

Drawn by: Christopher Wedge C.E.T. not to scale
Date: October 20/2008 Drawing no GAD19

Base Model

Offset Model

8 Litre Chemical Pot Feeder

ITEM	Description
1	Chemical Feed Funnel
2	3/4" SS ball valve w/ brass housing
3	3/4" N.P.T. outlet connection
4	1/4" air vent
5	8 L Welded Steel, M.A.W.P of 1035 kPa Vessel leak tested to 350kPa prior to assembly
6	3/4" N.P.T. inlet connection
7	3/4" SS ball valve w/ brass housing drain valve

Model Selection

- ☑ Base Model (PN154)
- ☐ Off-Set Model (PN155)

Pressure Rating

- ☑ LP - MAWP of 1035 kPa(150 psi), Vessel Leak tested to 350 kPa(50 psi)
- ☐ HP - MAWP of 2100 kPa(300 psi), Vessel Leak Tested to 700 kPa(100 psi)

Optional Accessories

- ☐ **STS-SAFETY-FLO funnel** -Keeps operator safe from spray of hot or dangerous chemicals

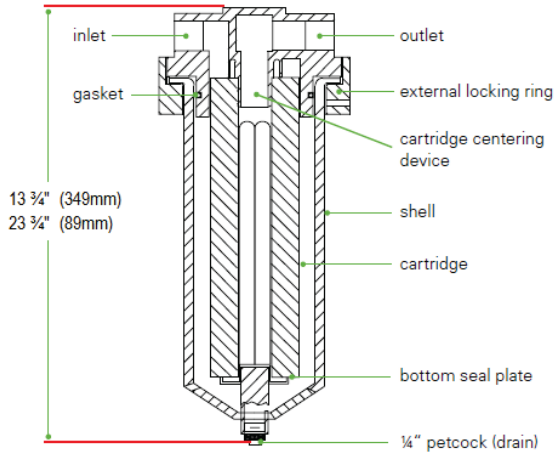
String Wound Tinned Core Cartridges



The **AWP String Wound Tinned Core Cartridges** are a dirt/rust cartridge with a natural cotton string wound media. These string wound cartridges are ideal for point-of-use, point-of-entry or commercial/industrial applications as they can handle a range of flow rates depending on the cartridge size. The natural cotton can be used for treatment of potable liquids, vegetable oils, beverages, organic solvents, water, dilute acids, petroleum oils, and other services. The maximum temperature rating is 150°C (300°F) with a variety of micron sizes to choose from. These ratings range from 1 to 50 microns Specified Technical Sales Ltd. offers a 9 7/8", 20" and 30" cartridge length for application flexibility.

These cartridges are an economical choice for pre-filtration applications.

Specified Technical Sales Ltd.

FEATURES:

- 304 Stainless Steel body and internals.
- Metric and U.S. scales.
- S.S. return spring.
- Fused glass window

BENEFITS:

- Corrosion free service.
- Maximum flow can be set to cartridge manufacturers recommendations eliminating media separation.
- Can be installed vertically or horizontally.
- No gaskets to leak.

SF100 Automatic Glycol Feed System

PUMP PERFORMANCE

0.09 l/s (1.4gpm) @ free flow
0.06 l/s (1.0gpm) @ 345kPa (50psi)

Pump Model

Axiom 8000 Series

Motor

115/60/1, 0.7AMPS

Specification

Hydronic system feeder shall be AXIOM INDUSTRIES LTD. Model SF100. System shall include 208 litre (55 US gallon) storage/mixing tank with cover; pump suction hose with inlet strainer; pressure pump with thermal cut-out; integral pressure switch; integral check valve; cord and plug; pre-charged accumulator tank with EPDM diaphragm; manual diverter valve for purging air and agitating contents of storage tank; pressure regulating valve adjustable (35 – 380 KPa; 5 – 55 psig) complete with pressure gauge; integral replaceable strainer; built-in check valve; union connection; 12 mm (½") x 900 mm (36") long flexible connection hose with check valve; low level pump cut-out. Pressure pump shall be capable of running dry without damage. Power supply 115/60/1 0.7 A. Unit shall be completely pre-assembled and certified by a recognized testing agency to CSA standard C22.2 No 68.

Options

☒ **RIA10-1-SAA-** Low Level Alarm Panel c/w Remote Monitoring Dry Contacts and Selectable Audible Alarm

LIMITED WARRANTY

The SF100 is warranted against defects in materials and workmanship for one year.

Certified to CAN/CSA C22.2 No. 68

ETL LISTED c US

2. Hazard(s) identification

Physical hazards	Not classified.	
Health hazards	Serious eye damage/eye irritation	Category 2
	Specific target organ toxicity, single exposure	Category 3 respiratory tract irritation

Label elements

Signal word	Warning
Hazard statement	Causes serious eye irritation. May cause respiratory irritation.
Precautionary statement	
Prevention	Avoid breathing mist or vapor. Wash thoroughly after handling. Use only outdoors or in a well-ventilated area. Wear eye protection/face protection.
Response	IF INHALED: Remove person to fresh air and keep comfortable for breathing. IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Call a poison center/doctor if you feel unwell. If eye irritation persists: Get medical advice/attention.
Storage	Store in a well-ventilated place. Keep container tightly closed. Store locked up.
Disposal	Dispose of contents/container in accordance with local/regional/national/international regulations.
Other hazards	None known.
Supplemental information	None.

3. Composition/information on ingredients

Mixtures

Components	CAS #	Percent (wt/wt)
PHOSPHATE ESTER POTASSIUM SALT	66057-30-5	2.5 - 10
Sodium sulphite	7757-83-7	2.5 - 10

Composition comments Information for specific product ingredients as required by the WHMIS Regulations is listed. Refer to additional sections of this SDS for our assessment of the potential hazards of this formulation.

4. First-aid measures

Inhalation Remove victim to fresh air and keep at rest in a position comfortable for breathing. Call a POISON CENTER or doctor/physician if you feel unwell.

Skin contact Wash off with soap and water. Get medical attention if irritation develops and persists.

Eye contact Immediately flush eyes with plenty of water for at least 15 minutes. Remove contact lenses, if present and easy to do. Continue rinsing. If eye irritation persists: Get medical advice/attention.

Ingestion Rinse mouth. Get medical attention if symptoms occur.

Most important symptoms/effects, acute and delayed Severe eye irritation. Symptoms may include stinging, tearing, redness, swelling, and blurred vision. May cause respiratory irritation.

Indication of immediate medical attention and special treatment needed Provide general supportive measures and treat symptomatically. Keep victim under observation. Symptoms may be delayed.

General information If you feel unwell, seek medical advice (show the label where possible). Ensure that medical personnel are aware of the material(s) involved, and take precautions to protect themselves.

5. Fire-fighting measures

Suitable extinguishing media Water fog. Foam. Dry chemical powder. Carbon dioxide (CO2).

Unsuitable extinguishing media Do not use water jet as an extinguisher, as this will spread the fire.

Specific hazards arising from the chemical During fire, gases hazardous to health may be formed.

Special protective equipment and precautions for firefighters Wear full protective clothing, including helmet, self-contained positive pressure or pressure demand breathing apparatus, protective clothing and face mask.

Fire fighting equipment/instructions In case of fire and/or explosion do not breathe fumes. Use standard firefighting procedures and consider the hazards of other involved materials. Move containers from fire area if you can do so without risk. Cool containers / tanks with water spray.

Specific methods Use standard firefighting procedures and consider the hazards of other involved materials.

General fire hazards No unusual fire or explosion hazards noted.

6. Accidental release measures

Personal precautions, protective equipment and emergency procedures Keep unnecessary personnel away. Keep people away from and upwind of spill/leak. Wear appropriate protective equipment and clothing during clean-up. Avoid breathing mist or vapor. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Ensure adequate ventilation. Local authorities should be advised if significant spillages cannot be contained. For personal protection, see section 8 of the SDS.

Methods and materials for containment and cleaning up Large Spills: Stop the flow of material, if this is without risk. Dike the spilled material, where this is possible. Absorb in vermiculite, dry sand or earth and place into containers. Following product recovery, flush area with water.

Small Spills: Wipe up with absorbent material (e.g. cloth, fleece). Clean surface thoroughly to remove residual contamination.

Never return spills to original containers for re-use. For waste disposal, see section 13 of the SDS.

Environmental precautions Avoid discharge into drains, water courses or onto the ground.

7. Handling and storage

Precautions for safe handling Avoid breathing mist or vapor. Avoid contact with eyes. Provide adequate ventilation. Wear appropriate personal protective equipment. Observe good industrial hygiene practices.

Conditions for safe storage, including any incompatibilities Store locked up. Store in original tightly closed container. Store away from incompatible materials (see Section 10 of the SDS). Protect from freezing. If frozen, thaw and mix completely prior to use.

8. Exposure controls/personal protection

Occupational exposure limits	No exposure limits noted for ingredient(s).
Biological limit values	No biological exposure limits noted for the ingredient(s).
Appropriate engineering controls	Good general ventilation (typically 10 air changes per hour) should be used. Ventilation rates should be matched to conditions. If applicable, use process enclosures, local exhaust ventilation, or other engineering controls to maintain airborne levels below recommended exposure limits. If exposure limits have not been established, maintain airborne levels to an acceptable level. Provide eyewash station. Good general ventilation should be used. Ventilation rates should be matched to conditions. If applicable, use process enclosures, local exhaust ventilation, or other engineering controls to maintain airborne levels below recommended exposure limits. If exposure limits have not been established, maintain airborne levels to an acceptable level.

Individual protection measures, such as personal protective equipment

Eye/face protection	Wear safety glasses with side shields (or goggles).
Skin protection	
Hand protection	Wear appropriate chemical resistant gloves. The choice of an appropriate glove does not only depend on its material but also on other quality features and is different from one producer to the other. Suitable gloves can be recommended by the glove supplier. Glove selection must take into account any solvents and other hazards present.
Other	Wear suitable protective clothing.
Respiratory protection	If engineering controls do not maintain airborne concentrations below recommended exposure limits (where applicable) or to an acceptable level (in countries where exposure limits have not been established), an approved respirator must be worn.
Thermal hazards	Wear appropriate thermal protective clothing, when necessary.
General hygiene considerations	Always observe good personal hygiene measures, such as washing after handling the material and before eating, drinking, and/or smoking. Routinely wash work clothing and protective equipment to remove contaminants.

9. Physical and chemical properties

Appearance	Liquid
Color	Colorless to light yellow
Odor	Slight
pH (concentrated product)	5.9 Neat
Initial boiling point and boiling range	216 °F (102 °C)
Flash point	> 199 °F (> 93 °C) P-M(CC)
Evaporation rate	Slower than Ether
Flammability (solid, gas)	Not applicable.
Upper/lower flammability or explosive limits	
Explosive limit - lower (%)	Not available.
Explosive limit - upper (%)	Not available.
Vapor pressure	18 mmHg
Vapor pressure temp.	70 °F (21 °C)
Vapor density	< 1
Relative density	1.12
Relative density temperature	70 °F (21 °C)
Solubility(ies)	
Solubility (water)	100 %
Viscosity	20 mPa.s
Viscosity temperature	70 °F (21 °C)
Other information	
Explosive properties	Not explosive.
Oxidizing properties	Not oxidizing.
Pour point	31 °F (-1 °C)
Specific gravity	1.122
VOC	0 % CALCULATED

10. Stability and reactivity

Reactivity	The product is stable and non-reactive under normal conditions of use, storage and transport.
Chemical stability	Material is stable under normal conditions.
Possibility of hazardous reactions	Hazardous polymerization does not occur.
Conditions to avoid	Avoid temperatures exceeding the flash point. Contact with incompatible materials.
Incompatible materials	Strong oxidizing agents.
Hazardous decomposition products	Oxides of carbon, nitrogen, phosphorus, and sulphur evolved in fire.

11. Toxicological information

Information on likely routes of exposure

Inhalation	May cause irritation to the respiratory system.
Skin contact	Prolonged or repeated contact may cause irritation.
Eye contact	Causes serious eye irritation.
Ingestion	Expected to be a low ingestion hazard.
Symptoms related to the physical, chemical and toxicological characteristics	Severe eye irritation. Symptoms may include stinging, tearing, redness, swelling, and blurred vision. May cause respiratory irritation.

Information on toxicological effects

Acute toxicity May cause respiratory irritation.

Product	Species	Test Results
FERROQUEST FQ7103 (CAS Mixture)		
Acute		
Dermal		
LD50	Rabbit	> 5000 mg/kg, (Calculated according to GHS additivity formula)
Oral		
LD50	Rat	> 5000 mg/kg, (Calculated according to GHS additivity formula)

Components	Species	Test Results
Sodium sulphite (CAS 7757-83-7)		
Acute		
Dermal		
LD50	Rabbit	> 2000 mg/kg
Inhalation		
LC50	Rat	> 5.5 mg/l, 4 Hour
Oral		
LD50	Rat	2610 mg/kg

* Estimates for product may be based on additional component data not shown.

Skin corrosion/irritation	Prolonged skin contact may cause temporary irritation.
Serious eye damage/eye irritation	Causes serious eye irritation.

Respiratory or skin sensitization

Respiratory sensitization	This product is not expected to cause respiratory sensitization.
Skin sensitization	This product is not expected to cause skin sensitization.
Germ cell mutagenicity	No data available to indicate product or any components present at greater than 0.1% are mutagenic or genotoxic.
Carcinogenicity	Not classified.

IARC Monographs. Overall Evaluation of Carcinogenicity

Sodium sulphite (CAS 7757-83-7) 3 Not classifiable as to carcinogenicity to humans.

Reproductive toxicity This product is not expected to cause reproductive or developmental effects.

Specific target organ toxicity - single exposure	May cause respiratory irritation.
Specific target organ toxicity - repeated exposure	Not classified.
Aspiration hazard	Based on available data, the classification criteria are not met.

12. Ecological information

Ecotoxicity

Product		Species	Test Results
FERROQUEST FQ7103 (CAS Mixture)			
	0% Mortality	Fathead Minnow	2000 mg/L, Static Renewal Bioassay, 96 hour
Aquatic			
Crustacea	0% Mortality	Daphnia magna	845 mg/L, Static Renewal Bioassay, 48 hour
	30% Mortality	Daphnia magna	1300 mg/L, Static Renewal Bioassay, 48 hour

Bioaccumulative potential	No data available.
Mobility in soil	No data available.
Other adverse effects	Not available.

Persistence and degradability

No data is available on the degradability of this product.

13. Disposal considerations

Disposal instructions	Collect and reclaim or dispose in sealed containers at licensed waste disposal site. Dispose of contents/container in accordance with local/regional/national/international regulations.
Local disposal regulations	Dispose in accordance with all applicable regulations.
Waste from residues / unused products	Dispose of in accordance with local regulations. Empty containers or liners may retain some product residues. This material and its container must be disposed of in a safe manner (see: Disposal instructions).
Contaminated packaging	Since emptied containers may retain product residue, follow label warnings even after container is emptied. Empty containers should be taken to an approved waste handling site for recycling or disposal.

14. Transport information

TDG

Not regulated as dangerous goods.

The goods described above have been classified using a combination of testing, technical data, calculations and manufacturer knowledge in accordance with Part 2, Classification. TDG Classification is valid for road or rail transport only. For shipment by air or water, refer to IATA or IMDG regulations.

DOT

Not regulated as a dangerous good.

Some containers may be exempt from Dangerous Goods/Hazmat Transport Regulations, please check BOL for exact container classification.

IMDG

Not regulated as dangerous goods.

IATA

Not regulated as dangerous goods.

15. Regulatory information

Canadian regulations

Controlled Drugs and Substances Act

Not regulated.

Export Control List (CEPA 1999, Schedule 3)

Not listed.

Greenhouse Gases

Not listed.

2. Hazard(s) identification

Physical hazards	Not classified.	
Health hazards	Skin corrosion/irritation	Category 1B
	Serious eye damage/eye irritation	Category 1

Label elements

Signal word	Danger
Hazard statement	Causes severe skin burns and eye damage. Causes serious eye damage.
Precautionary statement	
Prevention	Do not breathe mist or vapor. Wash thoroughly after handling. Wear eye protection/face protection.
Response	IF SWALLOWED: Rinse mouth. Do NOT induce vomiting. IF ON SKIN (or hair): Take off immediately all contaminated clothing. Rinse skin with water. IF INHALED: Remove person to fresh air and keep comfortable for breathing. IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Immediately call a POISON CENTER/doctor. Wash contaminated clothing before reuse.
Storage	Store locked up.
Disposal	Dispose of contents/container in accordance with local/regional/national/international regulations.
Other hazards	None known.
Supplemental information	None.

3. Composition/information on ingredients

Mixtures

Components	CAS #	Percent (wt/wt)
Boric Acid (hbo2), Sodium Salt, Dihydrate	16800-11-6	2.5 - 10
Morpholine	110-91-8	2.5 - 10

Composition comments Information for specific product ingredients as required by the WHMIS Regulations is listed. Refer to additional sections of this SDS for our assessment of the potential hazards of this formulation.

4. First-aid measures

Inhalation Move to fresh air. Call a physician if symptoms develop or persist.

Skin contact Take off immediately all contaminated clothing. Rinse skin with water/shower. Call a physician or poison control center immediately. Chemical burns must be treated by a physician. Wash contaminated clothing before reuse.

Eye contact Immediately flush eyes with plenty of water for at least 15 minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Call a physician or poison control center immediately.

Ingestion Call a physician or poison control center immediately. Rinse mouth. Do not induce vomiting. If vomiting occurs, keep head low so that stomach content doesn't get into the lungs.

Most important symptoms/effects, acute and delayed Burning pain and severe corrosive skin damage. Causes serious eye damage. Symptoms may include stinging, tearing, redness, swelling, and blurred vision. Permanent eye damage including blindness could result.

Indication of immediate medical attention and special treatment needed Provide general supportive measures and treat symptomatically. Chemical burns: Flush with water immediately. While flushing, remove clothes which do not adhere to affected area. Call an ambulance. Continue flushing during transport to hospital. Keep victim under observation. Symptoms may be delayed.

General information Ensure that medical personnel are aware of the material(s) involved, and take precautions to protect themselves.

5. Fire-fighting measures

Suitable extinguishing media Water fog. Foam. Dry chemical powder. Carbon dioxide (CO2).

Unsuitable extinguishing media Do not use water jet as an extinguisher, as this will spread the fire.

Specific hazards arising from the chemical During fire, gases hazardous to health may be formed.

Special protective equipment and precautions for firefighters Wear full protective clothing, including helmet, self-contained positive pressure or pressure demand breathing apparatus, protective clothing and face mask.

Fire fighting equipment/instructions In case of fire and/or explosion do not breathe fumes. Use standard firefighting procedures and consider the hazards of other involved materials. Move containers from fire area if you can do so without risk. Cool containers / tanks with water spray.

Specific methods Use standard firefighting procedures and consider the hazards of other involved materials.

General fire hazards No unusual fire or explosion hazards noted.

6. Accidental release measures

Personal precautions, protective equipment and emergency procedures Keep unnecessary personnel away. Keep people away from and upwind of spill/leak. Wear appropriate protective equipment and clothing during clean-up. Do not breathe mist or vapor. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Ensure adequate ventilation. Local authorities should be advised if significant spillages cannot be contained. For personal protection, see section 8 of the SDS.

Methods and materials for containment and cleaning up Large Spills: Stop the flow of material, if this is without risk. Dike the spilled material, where this is possible. Absorb in vermiculite, dry sand or earth and place into containers. Following product recovery, flush area with water.

Small Spills: Wipe up with absorbent material (e.g. cloth, fleece). Clean surface thoroughly to remove residual contamination.

Never return spills to original containers for re-use. For waste disposal, see section 13 of the SDS.

Environmental precautions Avoid discharge into drains, water courses or onto the ground.

7. Handling and storage

Precautions for safe handling Do not breathe mist or vapor. Do not get in eyes, on skin, or on clothing. Avoid prolonged exposure. Provide adequate ventilation. Wear appropriate personal protective equipment. Observe good industrial hygiene practices.

Conditions for safe storage, including any incompatibilities Store locked up. Store in original tightly closed container. Store away from incompatible materials (see Section 10 of the SDS).

Morpholine (CAS 110-91-8) Can be absorbed through the skin.

US ACGIH Threshold Limit Values: Skin designation

Morpholine (CAS 110-91-8) Can be absorbed through the skin.

Appropriate engineering controls Good general ventilation (typically 10 air changes per hour) should be used. Ventilation rates should be matched to conditions. If applicable, use process enclosures, local exhaust ventilation, or other engineering controls to maintain airborne levels below recommended exposure limits. If exposure limits have not been established, maintain airborne levels to an acceptable level. Eye wash facilities and emergency shower must be available when handling this product. Good general ventilation should be used. Ventilation rates should be matched to conditions. If applicable, use process enclosures, local exhaust ventilation, or other engineering controls to maintain airborne levels below recommended exposure limits. If exposure limits have not been established, maintain airborne levels to an acceptable level.

Individual protection measures, such as personal protective equipment

Eye/face protection Splash proof chemical goggles. Face shield.

Skin protection

Hand protection Wear appropriate chemical resistant gloves. The choice of an appropriate glove does not only depend on its material but also on other quality features and is different from one producer to the other. Glove selection must take into account any solvents and other hazards present.

Other Wear appropriate chemical resistant clothing.

Respiratory protection	If engineering controls do not maintain airborne concentrations below recommended exposure limits (where applicable) or to an acceptable level (in countries where exposure limits have not been established), an approved respirator must be worn.
Thermal hazards	Wear appropriate thermal protective clothing, when necessary.
General hygiene considerations	Always observe good personal hygiene measures, such as washing after handling the material and before eating, drinking, and/or smoking. Routinely wash work clothing and protective equipment to remove contaminants.

9. Physical and chemical properties

Appearance	Liquid
Color	Colorless to light yellow
Odor	Slight
Odor threshold	Not available.
pH (concentrated product)	10.5
Melting point/freezing point	25 °F (-4 °C)
Initial boiling point and boiling range	212 °F (100 °C)
Flash point	> 200 °F (> 93 °C) P-M(CC)
Evaporation rate	< 1 (Ether = 1)
Flammability (solid, gas)	Not applicable.
Upper/lower flammability or explosive limits	
Flammability limit - lower (%)	Not available.
Flammability limit - upper (%)	Not available.
Explosive limit - lower (%)	Not available.
Explosive limit - upper (%)	Not available.
Vapor pressure	18 mm Hg
Vapor pressure temp.	70 °F (21 °C)
Vapor density	< 1 (Air = 1)
Relative density	1.09
Relative density temperature	70 °F (21 °C)
Solubility(ies)	
Solubility (water)	100 %
Partition coefficient (n-octanol/water)	Not available.
Auto-ignition temperature	Not available.
Decomposition temperature	Not available.
Viscosity	10 cps
Viscosity temperature	70 °F (21 °C)
Other information	
Explosive properties	Not explosive.
Oxidizing properties	Not oxidizing.
Pour point	30 °F (-1 °C)
Specific gravity	1.091
VOC	5 % (Calculated)

10. Stability and reactivity

Reactivity	The product is stable and non-reactive under normal conditions of use, storage and transport.
Chemical stability	Material is stable under normal conditions.
Possibility of hazardous reactions	Hazardous polymerization does not occur.
Conditions to avoid	Avoid temperatures exceeding the flash point. Contact with incompatible materials.
Incompatible materials	Strong acids. Strong oxidizing agents.

Hazardous decomposition products	Elemental oxides.

11. Toxicological information

Information on likely routes of exposure

Inhalation	May cause irritation to the respiratory system. Prolonged inhalation may be harmful.
Skin contact	Causes severe skin burns.
Eye contact	Causes serious eye damage.
Ingestion	Causes digestive tract burns.
Symptoms related to the physical, chemical and toxicological characteristics	Burning pain and severe corrosive skin damage. Causes serious eye damage. Symptoms may include stinging, tearing, redness, swelling, and blurred vision. Permanent eye damage including blindness could result.

Information on toxicological effects

Acute toxicity

Product	Species	Test Results
CORRSHIELD MD4102 (CAS Mixture)		
Acute		
Dermal		
LD50	Rabbit	> 5000 mg/kg, (Estimated value)
Oral		
LD50	Rat	> 5000 mg/kg, (Estimated value)

Components	Species	Test Results
Morpholine (CAS 110-91-8)		
Acute		
Dermal		
LD50	Rabbit	504 mg/kg
Inhalation		
LC50	Rat	8 mg/l, 4 Hour
Oral		
LD50	Rat	1680 mg/kg

* Estimates for product may be based on additional component data not shown.

Skin corrosion/irritation	Causes severe skin burns and eye damage.
Serious eye damage/eye irritation	Causes serious eye damage.
Respiratory or skin sensitization	
Respiratory sensitization	This product is not expected to cause respiratory sensitization.
Skin sensitization	This product is not expected to cause skin sensitization.
Germ cell mutagenicity	No data available to indicate product or any components present at greater than 0.1% are mutagenic or genotoxic.
Carcinogenicity	Not classified.

ACGIH Carcinogens

Morpholine (CAS 110-91-8)	A4 Not classifiable as a human carcinogen.

Canada - Manitoba OELs: carcinogenicity

Morpholine (CAS 110-91-8)	Not classifiable as a human carcinogen.

IARC Monographs. Overall Evaluation of Carcinogenicity

Morpholine (CAS 110-91-8)	3 Not classifiable as to carcinogenicity to humans.

Reproductive toxicity	This product is not expected to cause reproductive or developmental effects.
Specific target organ toxicity - single exposure	Not classified.
Specific target organ toxicity - repeated exposure	Not classified.
Aspiration hazard	Based on available data, the classification criteria are not met.
Chronic effects	Prolonged inhalation may be harmful.

12. Ecological information

Ecotoxicity No ecotoxicity data noted for the ingredient(s).

Bioaccumulative potential

Partition coefficient n-octanol / water (log Kow)

Morpholine	-0.86

Mobility in soil No data available.

Other adverse effects Not available.

Persistence and degradability

13. Disposal considerations

Disposal instructions Collect and reclaim or dispose in sealed containers at licensed waste disposal site. Dispose of contents/container in accordance with local/regional/national/international regulations.

Local disposal regulations Dispose in accordance with all applicable regulations.

Waste from residues / unused products Dispose of in accordance with local regulations. Empty containers or liners may retain some product residues. This material and its container must be disposed of in a safe manner (see: Disposal instructions).

Contaminated packaging Since emptied containers may retain product residue, follow label warnings even after container is emptied. Empty containers should be taken to an approved waste handling site for recycling or disposal.

14. Transport information

TDG

Not regulated as dangerous goods.

The goods described above have been classified using a combination of testing, technical data, calculations and manufacturer knowledge in accordance with Part 2, Classification. TDG Classification is valid for road or rail transport only. For shipment by air or water, refer to IATA or IMDG regulations.

DOT

Not regulated as a dangerous good.

Some containers may be exempt from Dangerous Goods/Hazmat Transport Regulations, please check BOL for exact container classification.

IMDG

Not regulated as dangerous goods.

IATA

Not regulated as dangerous goods.

15. Regulatory information

Canadian regulations This product has been classified in accordance with the hazard criteria of the HPR and the SDS contains all the information required by the HPR.

Controlled Drugs and Substances Act

Not regulated.

Export Control List (CEPA 1999, Schedule 3)

Not listed.

Greenhouse Gases

Not listed.

Precursor Control Regulations

Not regulated.

Inventory status

Country(s) or region	Inventory name	On inventory (yes/no)*
Canada	Domestic Substances List (DSL)	No
Canada	Non-Domestic Substances List (NDSL)	No
United States & Puerto Rico	Toxic Substances Control Act (TSCA) Inventory	No

*A "Yes" indicates that all components of this product comply with the inventory requirements administered by the governing country(s)
A "No" indicates that one or more components of the product are not listed or exempt from listing on the inventory administered by the governing country(s).

16. Other information

SYSTEMS: _____

Specified Technical Sales Ltd.

SUEZ WATER CLOSED SYSTEM HOT WATER HEATING

TREATMENT:	**Corrshield MD4102** as per attached bulletin.
TREATMENT DOSAGE:	4 gallons per 1000 gallons in system. (4 litres/1000 litres)
CONTROL RANGE:	60 to 100 ppm (as molybdenum)
TEST KIT:	#6213 or STS-6213
TEST FREQUENCY:	Weekly until system stabilizes, then twice a month.
MAINTENANCE:	Boiler and/or converter heating systems are closed to the atmosphere and under pressure to prevent air entering the system. Air and water produces corrosion with most metals. All water supplies contain dissolved oxygen and when heated release air to the system(s). DO NOT blow down hot water boiler system(s) as this adds fresh make up water which releases air into the system(s) and increases total dissolved solids (EG: Calcium carbonate scale potential). Bleed system water sparingly for testing, removing low water cut off and boiler sediments and checking relief valves.
PRESSURE:	It is imperative that the highest heating unit and/or heating pipe has minimum pressure of +5 to +10 psi. (+35 to +70 kPa)
Calculating Desired Pressure:	Take elevation of pipe or equipment (in feet) above system pressure gauge divided by 2.3 = PSI plus 5 PSI for positive pressure at the top. OR: Take elevation of pipe or equipment (in metres) above system pressure gauge multiply by 9.81 = kPa plus 35 kPa for positive pressure at the top. This is the pressure gauge with no flow (circulators off). Do not drop automatic feed below 12 PSI (85 kPa) on low buildings.
AIR VENTS:	Check and clean automatic and manual air vents regularly.
AIR CUSHION TANK(S):	If tanks are not Extrol (bladder type) maintain 60 to 80% air in tank(s).

Molybdenum (Mo) Test Kit

1 drop = 2, 5, 20, or 50 ppm

STS-6213-TK

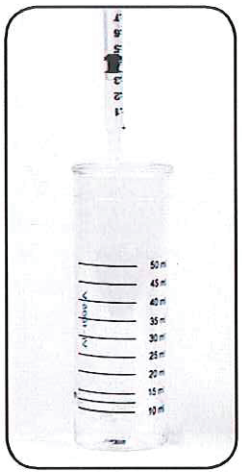
FOR BEST ACCURACY (1) ENSURE ACCURATE SAMPLE SIZE. (2) HOLD DROPPER BOTTLE VERTICALLY, NOT AT AN ANGLE.

Testing Tips:

- *Wear appropriate safety equipment.*
- *Read MSDS before use.*
- *Be sure there is adequate lighting during testing.*
- *Hold reagent bottles vertically for best results.*
- *Make sure you have an accurate sample.*

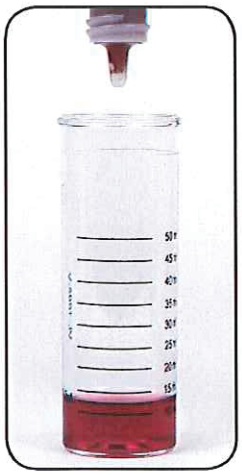
Kit Components:

STS-6213-B	*Molybdenum Buffer, 60 mL*
STS-6213-I	*Molybdenum Indicator, 60 mL*
STS-6213-T	*Molybdenum Titrating Sol., 60 mL*
SY-2005-P	*Syringe, 5 mL*
SY-2001-P	*Syringe, 1 mL*
VL-1005-V	*Vial, 10-50 mL*



EndPoint ID® Test Procedure +PLUS

1 Select a sample size based on the desired drop equivalency. Rinse and fill the vial with desired amount.



1 drop = 2 ppm	25 mL sample
1 drop = 5 ppm	10 mL sample
1 drop = 20 ppm	2.5 mL sample*
1 drop = 50 ppm	1.0 mL sample*

For 2.5 and 1.0 mL sample size: Use 5 mL syringe to add sample, then dilute to 10 mL with molybdenum free water.

2 Add 1 mL of Molybdenum Buffer (STS-6213-B) to the sample using the 1 mL syringe.

3 Add 10 drops of Molybdenum Indicator (STS-6213-I) and swirl to mix. The sample will turn red if molybdenum is present.

4 Add Molybdenum Titrating Solution (STS-6213-T) one drop at a time while swirling. Count the number of drops until the sample color changes from red to green and no further color change occurs.

5 Record your results by multiplying by the factor chosen in step 1.

# of drops x factor = ppm Molybdenum (Mo)

Note: To convert Molybdenum (Mo) to Molybdate (MoO_4), multiply by 1.7

JOB: *CONTACTOR:* *DATE:*

SYSTEM: *TEST KIT USE:* *VOLUME:*

FQ7103 CLOSED SYSTEM CLEANING PROCEDURE

PART 1 - Add FQ7103 Cleaner (*Dosages:* 1L FQ7103 per every 100 L system volume)

1. Fill system with domestic water and establish circulation. Heat the system to maximum 60 degrees Celsius if possible.
2. After 2 hours of circulation, flush dirt legs until no solids are visible, while refilling to maintain the system pressure and circulation.
3. Dosage of closed loop system pipe cleaner **FQ7103** should now be added to the system via the pot feeder or pump, with the quantity determined by the system volume. Typical dosage of **1%** of total system volume is adequate for new installations.
4. Allow solution to circulate for 48 hours if cleaning is done while being heated, allow 72 hours of circulation on cold systems.
5. During the cleaning, periodically do hard short blow downs on low points in the system to remove any sediment accumulations.
6. **Take sample # 1** after the cleaner is completely mixed, before proceeding onto the next stage. Have Specified Technical Sales (STS) perform a laboratory analysis on the sample to confirm that sufficient cleaner has been added to the system. Confirmation that sufficient cleaner has been added to the system must first be received from STS prior to moving onto **PART 2**.

PART 2 – Thoroughly Flush the system to remove the cleaner

7. After the solution has adequately circulated and STS has confirmed that the recommended amount of FQ7103 is present, begin flushing. A gradual process of continuous bleed-off and make-up is recommended. Drain from the lowest available source, at the same rate as the system make-up. Observe the discharge.
8. When the effluent is clean and clear, matching the raw water quality, cease the bleed-off. Check for any remaining sediment or water loss at system drain valves.
9. **Take sample #2.** Have STS perform a laboratory test to confirm that the organo phosphonate levels within the sample show that sufficient FQ7103 cleaner has been removed from the system. (For a successful flush to have been performed < 4 ppm must be achieved). Confirmation that a satisfactory flush was completed must first be received from STS prior to moving onto **PART 3.**

PART 3 – Add Corrshield MD 4102/ Glycol to the system (*Dosages:4 liter per every 1000 liters of system volume)*

10. To provide passivation add the specified dosage of corrosion inhibitor (and glycol if required) as soon as possible, after confirming flush results. Circulate the entire system well to mix the inhibitor. Test the inhibitor concentration with the test kit provided. **Take sample #3**. Have STS perform a laboratory test to evaluate the inhibitor levels, pH, conductivity, and freeze point (if applicable). At this point STS will either provide a final written report confirming that the system is in good starting condition, or advise that insufficient inhibitor is present. If insufficient inhibitor is present an additional sample or samples will be required for laboratory analysis by STS until the recommended levels in the system are achieved. Only at the point where the inhibitor levels achieve the recommended control range criteria can a final written report be provided.
11. Install by-pass filter cartridge to remove any contaminants that remain. Monitor the filter flow and replace cartridge as necessary.
12. Before tying in a new system to an existing system take a sample of the existing system water and return it to STS, for chemical analysis for compatibility and an indication of systems chemical program integrity. **Label sample # 4 (Only if applicable)**

CUSTOMERS RESPONSIBILITIES

1. Customer shall provide STS with full details of the size of the system at the time of quotation for the job to enable an accurate and precise calculation to be made in consideration of the amount of FQ7103 cleaner that will be required to adequately clean the system.
2. Leaving raw water in the system for an extended period of time is not desirable as this may result in flash corrosion occurring in the system, so please submit each water sample to STS for testing without undue delay.

DISCLAIMER

The reports provided are based exclusively on the samples provided.

If at any time the above procedure is not followed or the customers responsibilities are not fulfilled, i.e. samples 1,2,or 3 are not received, all three samples are received at once at the conclusion of the cleaning procedure, samples are received a long time past the date that they were taken, etc; STS reserves the right to decline to issue a final written report attesting that the system is in good starting condition.

Water Technologies & Solutions
fact sheet

Ferroquest* FQ7103

neutral pH iron cleaner

description and use

- Removes rust, oil-based coating, organic debris
- Passivates steel surfaces
- Non-corrosive to base metal
- Safe in multimetal systems

description and use

Ferroquest* FQ7103 is a neutral pH cleaner which removes iron deposits, oil-based coatings, and organic debris from metal surfaces. Use of Ferroquest FQ7103 in new systems establishes system cleanliness and protection as the first step toward process efficiency and equipment longevity.

treatment and feeding requirements

Recirculate a 1% Ferroquest FQ7103 solution throughout the system for a minimum of 72 hours. After cleanout, rinse for 24 hours with fresh water, drain, and initiate system treatment. Ferroquest FQ7103 is best fed neat (undiluted) from the storage tank into the system. It can be introduced to the system by means of a chemical pump, bypass feeder or an inductor feeder.

general properties

Physical properties of Ferroquest FQ7103 are shown on the Material Safety Data Sheet, a copy of which is available upon request.

packaging information

Ferroquest FQ7103 is a liquid blend available in a variety of containers and delivery methods. Contact your SUEZ representative for details.

storage and handling

Protect from freezing. If this product is frozen during shipment or storage, slight mixing may be required to ensure homogeneity.

safety precautions

A Material Safety Data Sheet containing detailed information about this product is available upon request.

Find a contact near you by visiting www.suezwatertechnologies.com and clicking on "Contact Us."

*Trademark of SUEZ; may be registered in one or more countries.
©2017 SUEZ. All rights reserved.

CorrShield* MD4102

closed system corrosion inhibitor

- Excellent corrosion protection
- Low toxicity
- Highly buffered
- Easy to apply and control
- Compatible with most corrosion inhibitors

description and use

CorrShield MD4102 is a highly buffered, molybdate based corrosion inhibitor for use in multi-metal closed recirculating water systems that are subjected to air ingress contamination and/or trace acidic contaminants. This product also contains a scale inhibitor to retard the formation of objectionable deposits on high temperature heat exchange surfaces.

CorrShield MD4102 has a high buffering capacity which will maintain the pH of a closed water system in the desirable alkaline pH range, even in the presence of air ingress and/or trace acidic contaminants. Complete protection is provided against corrosion for ferrous and non-ferrous metals in both chilled and hot water heating systems.

treatment and feeding requirements

Maintain a molybdenum residual in the system as specified by your SUEZ representative. CorrShield MD4102 may be added full strength directly to the closed system by means of a by-pass feeder or chemical pump of standard construction. Inject chemical to suction side of recirculating pump or at any convenient location where good mixing is assured.

general properties

Physical properties of CorrShield MD4102 are shown on the Material safety Data Sheet (MSDS), a copy of which is available upon request.

packaging information

CorrShield MD4102 is available in a variety of containers and delivery methods. Contact your SUEZ representative for details.

storage

The product should be stored at moderate temperatures and protected from freezing. If frozen, thaw completely and mix thoroughly prior to use.

safety precautions

An MSDS containing detailed information about this product is available upon request.

Find a contact near you by visiting www.suezwatertechnologies.com and clicking on "Contact Us."

OPERATION & MAINTENANCE MANUAL

AXIOM SF100

AXIOM INDUSTRIES LIMITED

Installation, Operation & Maintenance Instructions for SF Series Solution Feeders

Axiom Industries Ltd.
2615 Wentz Avenue
Saskatoon, SK
S7K 5J1
Ph: (306) 651-1815
Fax: (306) 242-3373
Email: sales@axiomind.com

Once the system is filled to the correct pressure, ensure that there is an adequate level of fluid (we recommend about 2/3 full) in the storage tank and record the fluid level. The SF100 will now feed solution automatically to maintain the desired system pressure. **The SF100 or SF100-HP has a 55 gallon (208 litre) tank and the SF100L or SF100-HP-L has a 100 gallon (383 litre) tank.**

The diverting valve, which is accessible through the hole on the left hand side of the cover, can be used to agitate or mix the solution in the tank. Turn the valve handle so that it is vertical - the pump will start automatically and re-circulate the solution back into the tank. When the solution is adequately mixed, turn the valve handle back to horizontal. The pump will re-charge the pressure tank and shut off automatically.

Maintenance Instructions

Periodically check the fluid level in the storage tank, and visually examine the SF100 to ensure that it is clean and that all joints are tight. There is a strainer on the bottom of the suction hose inside the tank that should be checked monthly.

Solution Feeder Limited Warranty

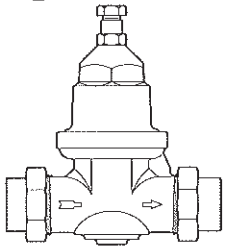
AXIOM Solution Feeder are warranted to be free of defects in material and workmanship under normal use, for a period of one (1) year from the date of manufacture, or one (1) year of use, with proof of purchase. This limited warranty will not exceed two (2) years, in any event.

The limited warranty will not apply to pumps that were improperly installed, misapplied, or incompatible with fluids or components not manufactured by AXIOM. Pump failure due to foreign debris is not covered under the terms of this limited warranty. AXIOM will not warrant any pump, which is damaged or modified outside the AXIOM factory.

Returns are to be shipped postage prepaid to AXIOM Industries. AXIOM shall not be liable for freight damage incurred during shipping, package returns carefully.

AXIOM's obligation under this warranty policy is limited to the repair or replacement of the pump/product. All returns will be tested per AXIOM factory criteria. Products found not defective (under the terms of this limited warranty) are subject to charges paid by the returnee for the testing and packaging of "tested good" non-warranty returns.

No credit or labor allowances will be given for pumps or products returned as defective. Warranty replacements will be shipped on a freight allowed basis. AXIOM reserves the right to choose the method of transportation.



This limited warranty is in lieu of all other warranties, expressed or implied, and no other person is authorized to give any other warranty or assume obligation or liability on AXIOM's behalf. AXIOM shall not be liable for any labor, damage or other expense, nor shall AXIOM be liable for any indirect, incidental or consequential damages of any kind incurred by the reason of the use of sale of any defective product or part. This limited warranty covers products distributed within Canada and the USA. Other world market areas should consult with the distributor for any deviation from this document

WILKINS
A ZURN COMPANY

SPECIFICATION SUBMITTAL SHEET

Model BR4

Water Pressure Reducing Valve

FEATURES

Sizes: ❑ ½" ❑ ¾" ❑ 1"

Maximum working water pressure	400 psi
Maximum working water temperature	180°F
Reduced pressure range	15 to 150 psi
Factory preset	50 psi
Threaded connections (FNPT)	ANSI B1.20.1
Copper connections (FC)	ANSI B16.22

OPTIONS

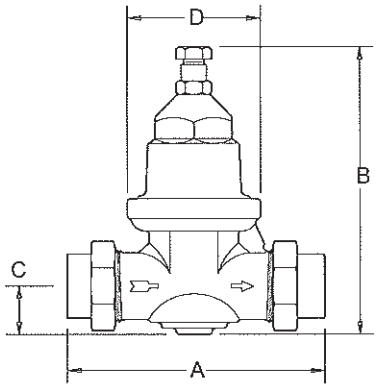
(Suffixes can be combined)

- ❑ - with single union FNPT connection (standard)
- ❑ C - with FC (copper sweat) union connection
- ❑ DU - with double union connection (FNPT)
- ❑ EC - with integral pressure relief valve for water thermal expansion control
- ❑ LU - with integral FNPT connection (no union)
- ❑ PEX - with male barbed connection tailpiece for crossed-linked polyethylene tubing
- ❑ SC - with stainless steel adustment bolt and lock nut for below-ground installations
- ❑ P - tapped and plugged for gauge

ACCESSORIES

- ❑ Repair kit
- ❑ BR4DUSPC special plastic spacer nipple for use with BR4DU (½", ¾" & 1 ¼")
- ❑ 70DUSPC special plastic spacer nipple for use with 70DU (¾", 1" & 1 ¼") and BR4DU (1")
- ❑ SCR In-line strainer screen for DUSPC
- ❑ TPK Tailpiece kit

APPLICATION



Designed for installation on potable water lines to reduce high inlet pressure to a lower outlet pressure. The integral strainer makes this device most suitable for residential and commercial water systems that require frequent cleaning of sediment and debris. The balance piston design enables the regulator to react in a smooth and responsive manner to changes in system flow demand, while at the same time, providing protection from inlet pressure changes.

STANDARDS COMPLIANCE

- ❑ ASSE® Listed 1003
- ❑ IAPMO® Listed
- ❑ CSA® Certified
- ❑ City of Los Angeles Approved

MATERIALS

Main valve body	Cast bronze ASTM B 584
Bell housing	UV resistant polymer composite

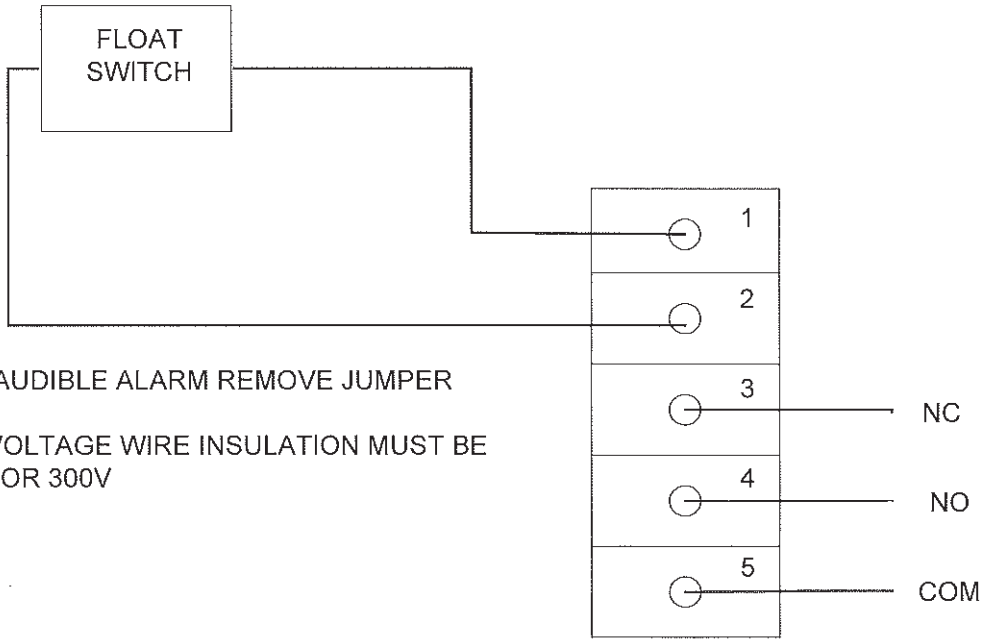
DOCUMENT NO. REG-BR4(SM) REV. 5/00

AXIOM INDUSTRIES LIMITED



Connection Schematic - SF100 Packaged System Feeder

AXIOM INDUSTRIES LIMITED

SF100 Installation Instructions for the RIA10-1-SAA Control Panel

1. Mount the RIA10-1-SAA control panel on a wall next to the SF100 Glycol Feed System.
2. Cut the plug-in end of the tank float cord
3. Push the float cable through strain relief fitting in control panel and connect float wires to terminals 1 and 2 on terminal strip. Connect ground wire to ground connection. Tighten strain relief nut to secure cable into panel.
4. Connect DCS wiring to remote alarm dry contacts as requested to provide alarm signal.
5. To disable the audible alarm, remove the jumper on the control board.
6. Plug pump cord into RIA10-1-SAA panel.

TO DISABLE AUDIBLE ALARM REMOVE JUMPER

NOTE: LOW VOLTAGE WIRE INSULATION MUST BE APPROVED FOR 300V

System pressure to high	Pressure switch not adjusted to proper setpoint	Adjust pressure switch, refer to maintenance manual for instructions
	PRV adjusted to high pressure	Loosen jam nut and adjust hex screw counter clockwise to decrease system pressure
	PRV fast fill valve open	Move fast fill lever to vertical position
	PRV plugged	Open bottom, remove screen if it is still there and clean thoroughly

Pump Cycles Continually	Air is being removed from system and pump is only making up fluid	No action required
	Leak in system	Inspect system and repair leak
	Bladder in expansion tank is broken	Replace expansion tank

Specified Technical Sales Ltd.

M.S.D.S

SAFETY DATA SHEET
FERROQUEST* FQ7103

1. Identification

Product identifier	**FERROQUEST FQ7103**
Other means of identification	None.
Version #	1.1
Prepared by	This SDS has been prepared by SUEZ Regulatory Department (1-215-355-3300).
Revision date	Dec-17-2017
Supersedes date	Aug-01-2016
Recommended use	Cleaner
Recommended restrictions	None known.

Company/undertaking identification

SUEZ Water Technologies & Solutions Canada
3239 Dundas Street West
Oakville, Ontario, L6M 4B2
T 905-465-3030

Emergency telephone

(800) 877-1940

2. Hazard(s) identification

Physical hazards	Not classified.	
Health hazards	Serious eye damage/eye irritation	Category 2
	Specific target organ toxicity, single exposure	Category 3 respiratory tract irritation

Label elements

Signal word	Warning
Hazard statement	Causes serious eye irritation. May cause respiratory irritation.
Precautionary statement	
Prevention	Avoid breathing mist or vapor. Wash thoroughly after handling. Use only outdoors or in a well-ventilated area. Wear eye protection/face protection.
Response	IF INHALED: Remove person to fresh air and keep comfortable for breathing. IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Call a poison center/doctor if you feel unwell. If eye irritation persists: Get medical advice/attention.
Storage	Store in a well-ventilated place. Keep container tightly closed. Store locked up.
Disposal	Dispose of contents/container in accordance with local/regional/national/international regulations.
Other hazards	None known.
Supplemental information	None.

3. Composition/information on ingredients

Mixtures

Components	CAS #	Percent (wt/wt)
PHOSPHATE ESTER POTASSIUM SALT	66057-30-5	2.5 - 10
Sodium sulphite	7757-83-7	2.5 - 10

Composition comments Information for specific product ingredients as required by the WHMIS Regulations is listed. Refer to additional sections of this SDS for our assessment of the potential hazards of this formulation.

4. First-aid measures

Inhalation Remove victim to fresh air and keep at rest in a position comfortable for breathing. Call a POISON CENTER or doctor/physician if you feel unwell.

Skin contact Wash off with soap and water. Get medical attention if irritation develops and persists.

Eye contact Immediately flush eyes with plenty of water for at least 15 minutes. Remove contact lenses, if present and easy to do. Continue rinsing. If eye irritation persists: Get medical advice/attention.

Ingestion Rinse mouth. Get medical attention if symptoms occur.

Most important symptoms/effects, acute and delayed Severe eye irritation. Symptoms may include stinging, tearing, redness, swelling, and blurred vision. May cause respiratory irritation.

Indication of immediate medical attention and special treatment needed Provide general supportive measures and treat symptomatically. Keep victim under observation. Symptoms may be delayed.

General information If you feel unwell, seek medical advice (show the label where possible). Ensure that medical personnel are aware of the material(s) involved, and take precautions to protect themselves.

5. Fire-fighting measures

Suitable extinguishing media Water fog. Foam. Dry chemical powder. Carbon dioxide (CO2).

Unsuitable extinguishing media Do not use water jet as an extinguisher, as this will spread the fire.

Specific hazards arising from the chemical During fire, gases hazardous to health may be formed.

Special protective equipment and precautions for firefighters Wear full protective clothing, including helmet, self-contained positive pressure or pressure demand breathing apparatus, protective clothing and face mask.

Fire fighting equipment/instructions In case of fire and/or explosion do not breathe fumes. Use standard firefighting procedures and consider the hazards of other involved materials. Move containers from fire area if you can do so without risk. Cool containers / tanks with water spray.

Specific methods Use standard firefighting procedures and consider the hazards of other involved materials.

General fire hazards No unusual fire or explosion hazards noted.

6. Accidental release measures

Personal precautions, protective equipment and emergency procedures Keep unnecessary personnel away. Keep people away from and upwind of spill/leak. Wear appropriate protective equipment and clothing during clean-up. Avoid breathing mist or vapor. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Ensure adequate ventilation. Local authorities should be advised if significant spillages cannot be contained. For personal protection, see section 8 of the SDS.

Methods and materials for containment and cleaning up Large Spills: Stop the flow of material, if this is without risk. Dike the spilled material, where this is possible. Absorb in vermiculite, dry sand or earth and place into containers. Following product recovery, flush area with water.

Small Spills: Wipe up with absorbent material (e.g. cloth, fleece). Clean surface thoroughly to remove residual contamination.

Never return spills to original containers for re-use. For waste disposal, see section 13 of the SDS.

Environmental precautions Avoid discharge into drains, water courses or onto the ground.

7. Handling and storage

Precautions for safe handling Avoid breathing mist or vapor. Avoid contact with eyes. Provide adequate ventilation. Wear appropriate personal protective equipment. Observe good industrial hygiene practices.

Conditions for safe storage, including any incompatibilities Store locked up. Store in original tightly closed container. Store away from incompatible materials (see Section 10 of the SDS). Protect from freezing. If frozen, thaw and mix completely prior to use.

8. Exposure controls/personal protection

Occupational exposure limits	No exposure limits noted for ingredient(s).
Biological limit values	No biological exposure limits noted for the ingredient(s).
Appropriate engineering controls	Good general ventilation (typically 10 air changes per hour) should be used. Ventilation rates should be matched to conditions. If applicable, use process enclosures, local exhaust ventilation, or other engineering controls to maintain airborne levels below recommended exposure limits. If exposure limits have not been established, maintain airborne levels to an acceptable level. Provide eyewash station. Good general ventilation should be used. Ventilation rates should be matched to conditions. If applicable, use process enclosures, local exhaust ventilation, or other engineering controls to maintain airborne levels below recommended exposure limits. If exposure limits have not been established, maintain airborne levels to an acceptable level.

Individual protection measures, such as personal protective equipment

Eye/face protection	Wear safety glasses with side shields (or goggles).
Skin protection	
Hand protection	Wear appropriate chemical resistant gloves. The choice of an appropriate glove does not only depend on its material but also on other quality features and is different from one producer to the other. Suitable gloves can be recommended by the glove supplier. Glove selection must take into account any solvents and other hazards present.
Other	Wear suitable protective clothing.
Respiratory protection	If engineering controls do not maintain airborne concentrations below recommended exposure limits (where applicable) or to an acceptable level (in countries where exposure limits have not been established), an approved respirator must be worn.
Thermal hazards	Wear appropriate thermal protective clothing, when necessary.
General hygiene considerations	Always observe good personal hygiene measures, such as washing after handling the material and before eating, drinking, and/or smoking. Routinely wash work clothing and protective equipment to remove contaminants.

9. Physical and chemical properties

Appearance	Liquid
Color	Colorless to light yellow
Odor	Slight
pH (concentrated product)	5.9 Neat
Initial boiling point and boiling range	216 °F (102 °C)
Flash point	> 199 °F (> 93 °C) P-M(CC)
Evaporation rate	Slower than Ether
Flammability (solid, gas)	Not applicable.
Upper/lower flammability or explosive limits	
Explosive limit - lower (%)	Not available.
Explosive limit - upper (%)	Not available.
Vapor pressure	18 mmHg
Vapor pressure temp.	70 °F (21 °C)
Vapor density	< 1
Relative density	1.12
Relative density temperature	70 °F (21 °C)
Solubility(ies)	
Solubility (water)	100 %
Viscosity	20 mPa.s
Viscosity temperature	70 °F (21 °C)
Other information	
Explosive properties	Not explosive.
Oxidizing properties	Not oxidizing.
Pour point	31 °F (-1 °C)
Specific gravity	1.122
VOC	0 % CALCULATED

10. Stability and reactivity

Reactivity	The product is stable and non-reactive under normal conditions of use, storage and transport.
Chemical stability	Material is stable under normal conditions.
Possibility of hazardous reactions	Hazardous polymerization does not occur.
Conditions to avoid	Avoid temperatures exceeding the flash point. Contact with incompatible materials.
Incompatible materials	Strong oxidizing agents.
Hazardous decomposition products	Oxides of carbon, nitrogen, phosphorus, and sulphur evolved in fire.

11. Toxicological information

Information on likely routes of exposure

Inhalation	May cause irritation to the respiratory system.
Skin contact	Prolonged or repeated contact may cause irritation.
Eye contact	Causes serious eye irritation.
Ingestion	Expected to be a low ingestion hazard.
Symptoms related to the physical, chemical and toxicological characteristics	Severe eye irritation. Symptoms may include stinging, tearing, redness, swelling, and blurred vision. May cause respiratory irritation.

Information on toxicological effects

Acute toxicity May cause respiratory irritation.

Product	Species	Test Results
FERROQUEST FQ7103 (CAS Mixture)		
Acute		
Dermal		
LD50	Rabbit	> 5000 mg/kg, (Calculated according to GHS additivity formula)
Oral		
LD50	Rat	> 5000 mg/kg, (Calculated according to GHS additivity formula)

Components	Species	Test Results
Sodium sulphite (CAS 7757-83-7)		
Acute		
Dermal		
LD50	Rabbit	> 2000 mg/kg
Inhalation		
LC50	Rat	> 5.5 mg/l, 4 Hour
Oral		
LD50	Rat	2610 mg/kg

* Estimates for product may be based on additional component data not shown.

Skin corrosion/irritation	Prolonged skin contact may cause temporary irritation.
Serious eye damage/eye irritation	Causes serious eye irritation.

Respiratory or skin sensitization

Respiratory sensitization	This product is not expected to cause respiratory sensitization.
Skin sensitization	This product is not expected to cause skin sensitization.
Germ cell mutagenicity	No data available to indicate product or any components present at greater than 0.1% are mutagenic or genotoxic.
Carcinogenicity	Not classified.

IARC Monographs. Overall Evaluation of Carcinogenicity

Sodium sulphite (CAS 7757-83-7) 3 Not classifiable as to carcinogenicity to humans.

Reproductive toxicity This product is not expected to cause reproductive or developmental effects.

Specific target organ toxicity - single exposure	May cause respiratory irritation.
Specific target organ toxicity - repeated exposure	Not classified.
Aspiration hazard	Based on available data, the classification criteria are not met.

12. Ecological information

Ecotoxicity

Product		Species	Test Results
FERROQUEST FQ7103 (CAS Mixture)			
	0% Mortality	Fathead Minnow	2000 mg/L, Static Renewal Bioassay, 96 hour
Aquatic			
Crustacea	0% Mortality	Daphnia magna	845 mg/L, Static Renewal Bioassay, 48 hour
	30% Mortality	Daphnia magna	1300 mg/L, Static Renewal Bioassay, 48 hour

Bioaccumulative potential	No data available.
Mobility in soil	No data available.
Other adverse effects	Not available.
Persistence and degradability	No data is available on the degradability of this product.

13. Disposal considerations

Disposal instructions	Collect and reclaim or dispose in sealed containers at licensed waste disposal site. Dispose of contents/container in accordance with local/regional/national/international regulations.
Local disposal regulations	Dispose in accordance with all applicable regulations.
Waste from residues / unused products	Dispose of in accordance with local regulations. Empty containers or liners may retain some product residues. This material and its container must be disposed of in a safe manner (see: Disposal instructions).
Contaminated packaging	Since emptied containers may retain product residue, follow label warnings even after container is emptied. Empty containers should be taken to an approved waste handling site for recycling or disposal.

14. Transport information

TDG

Not regulated as dangerous goods.

The goods described above have been classified using a combination of testing, technical data, calculations and manufacturer knowledge in accordance with Part 2, Classification. TDG Classification is valid for road or rail transport only. For shipment by air or water, refer to IATA or IMDG regulations.

DOT

Not regulated as a dangerous good.

Some containers may be exempt from Dangerous Goods/Hazmat Transport Regulations, please check BOL for exact container classification.

IMDG

Not regulated as dangerous goods.

IATA

Not regulated as dangerous goods.

15. Regulatory information

Canadian regulations

Controlled Drugs and Substances Act

Not regulated.

Export Control List (CEPA 1999, Schedule 3)

Not listed.

Greenhouse Gases

Not listed.

Precursor Control Regulations

Not regulated.

Inventory status

Country(s) or region	Inventory name	On inventory (yes/no)*
Canada	Domestic Substances List (DSL)	No
Canada	Non-Domestic Substances List (NDSL)	Yes
United States & Puerto Rico	Toxic Substances Control Act (TSCA) Inventory	Yes

*A "Yes" indicates that all components of this product comply with the inventory requirements administered by the governing country(s)
A "No" indicates that one or more components of the product are not listed or exempt from listing on the inventory administered by the governing country(s).

16. Other information

Issue date Aug-01-2016

Revision date Dec-17-2017

Version # 1.1

List of abbreviations

CAS: Chemical Abstract Service Registration Number
ACGIH: American Conference of Governmental Industrial Hygienists
TWA: Time Weighted Average
STEL: Short Term Exposure Limit
LD50: Lethal Dose, 50%
LC50: Lethal Concentration, 50%
NOEL: No Observed Effect Level
COD: Chemical Oxygen Demand
BOD: Biochemical Oxygen Demand
TOC: Total Organic Carbon
TSRN indicates a Trade Secret Registry Number is used in place of the CAS number.
IATA: International Air Transport Association
IMDG: International Maritime Dangerous Goods Code
TLV: Threshold Limit Value

2. Hazard(s) identification

Physical hazards	Not classified.	
Health hazards	Skin corrosion/irritation	Category 1B
	Serious eye damage/eye irritation	Category 1

Label elements

Signal word	Danger
Hazard statement	Causes severe skin burns and eye damage. Causes serious eye damage.
Precautionary statement	
Prevention	Do not breathe mist or vapor. Wash thoroughly after handling. Wear eye protection/face protection.
Response	IF SWALLOWED: Rinse mouth. Do NOT induce vomiting. IF ON SKIN (or hair): Take off immediately all contaminated clothing. Rinse skin with water. IF INHALED: Remove person to fresh air and keep comfortable for breathing. IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Immediately call a POISON CENTER/doctor. Wash contaminated clothing before reuse.
Storage	Store locked up.
Disposal	Dispose of contents/container in accordance with local/regional/national/international regulations.
Other hazards	None known.
Supplemental information	None.

3. Composition/information on ingredients

Mixtures

Components	CAS #	Percent (wt/wt)
Boric Acid (hbo2), Sodium Salt, Dihydrate	16800-11-6	2.5 - 10
Morpholine	110-91-8	2.5 - 10

Composition comments Information for specific product ingredients as required by the WHMIS Regulations is listed. Refer to additional sections of this SDS for our assessment of the potential hazards of this formulation.

4. First-aid measures

Inhalation Move to fresh air. Call a physician if symptoms develop or persist.

Skin contact Take off immediately all contaminated clothing. Rinse skin with water/shower. Call a physician or poison control center immediately. Chemical burns must be treated by a physician. Wash contaminated clothing before reuse.

Eye contact Immediately flush eyes with plenty of water for at least 15 minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Call a physician or poison control center immediately.

Ingestion Call a physician or poison control center immediately. Rinse mouth. Do not induce vomiting. If vomiting occurs, keep head low so that stomach content doesn't get into the lungs.

Most important symptoms/effects, acute and delayed Burning pain and severe corrosive skin damage. Causes serious eye damage. Symptoms may include stinging, tearing, redness, swelling, and blurred vision. Permanent eye damage including blindness could result.

Indication of immediate medical attention and special treatment needed Provide general supportive measures and treat symptomatically. Chemical burns: Flush with water immediately. While flushing, remove clothes which do not adhere to affected area. Call an ambulance. Continue flushing during transport to hospital. Keep victim under observation. Symptoms may be delayed.

General information Ensure that medical personnel are aware of the material(s) involved, and take precautions to protect themselves.

5. Fire-fighting measures

Suitable extinguishing media Water fog. Foam. Dry chemical powder. Carbon dioxide (CO2).

Unsuitable extinguishing media Do not use water jet as an extinguisher, as this will spread the fire.

Specific hazards arising from the chemical During fire, gases hazardous to health may be formed.

Special protective equipment and precautions for firefighters Wear full protective clothing, including helmet, self-contained positive pressure or pressure demand breathing apparatus, protective clothing and face mask.

Fire fighting equipment/instructions In case of fire and/or explosion do not breathe fumes. Use standard firefighting procedures and consider the hazards of other involved materials. Move containers from fire area if you can do so without risk. Cool containers / tanks with water spray.

Specific methods Use standard firefighting procedures and consider the hazards of other involved materials.

General fire hazards No unusual fire or explosion hazards noted.

6. Accidental release measures

Personal precautions, protective equipment and emergency procedures Keep unnecessary personnel away. Keep people away from and upwind of spill/leak. Wear appropriate protective equipment and clothing during clean-up. Do not breathe mist or vapor. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Ensure adequate ventilation. Local authorities should be advised if significant spillages cannot be contained. For personal protection, see section 8 of the SDS.

Methods and materials for containment and cleaning up Large Spills: Stop the flow of material, if this is without risk. Dike the spilled material, where this is possible. Absorb in vermiculite, dry sand or earth and place into containers. Following product recovery, flush area with water.

Small Spills: Wipe up with absorbent material (e.g. cloth, fleece). Clean surface thoroughly to remove residual contamination.

Never return spills to original containers for re-use. For waste disposal, see section 13 of the SDS.

Environmental precautions Avoid discharge into drains, water courses or onto the ground.

7. Handling and storage

Precautions for safe handling Do not breathe mist or vapor. Do not get in eyes, on skin, or on clothing. Avoid prolonged exposure. Provide adequate ventilation. Wear appropriate personal protective equipment. Observe good industrial hygiene practices.

Conditions for safe storage, including any incompatibilities Store locked up. Store in original tightly closed container. Store away from incompatible materials (see Section 10 of the SDS).

8. Exposure controls/personal protection

Occupational exposure limits

US. ACGIH Threshold Limit Values

Components	Type	Value
Morpholine (CAS 110-91-8)	TWA	20 ppm

Canada. Alberta OELs (Occupational Health & Safety Code, Schedule 1, Table 2)

Components	Type	Value
Morpholine (CAS 110-91-8)	TWA	71 mg/m3 20 ppm

Canada. British Columbia OELs. (Occupational Exposure Limits for Chemical Substances, Occupational Health and Safety Regulation 296/97, as amended)

Components	Type	Value
Morpholine (CAS 110-91-8)	TWA	20 ppm

Canada. Manitoba OELs (Reg. 217/2006, The Workplace Safety And Health Act)

Components	Type	Value
Morpholine (CAS 110-91-8)	TWA	20 ppm

Canada. Ontario OELs. (Control of Exposure to Biological or Chemical Agents)

Components	Type	Value
Morpholine (CAS 110-91-8)	TWA	20 ppm

Canada. Quebec OELs. (Ministry of Labor - Regulation Respecting the Quality of the Work Environment)

Components	Type	Value
Morpholine (CAS 110-91-8)	TWA	71 mg/m3 20 ppm

Biological limit values No biological exposure limits noted for the ingredient(s).

Exposure guidelines

Canada - Alberta OELs: Skin designation
Morpholine (CAS 110-91-8) Can be absorbed through the skin.

Canada - British Columbia OELs: Skin designation
Morpholine (CAS 110-91-8) Can be absorbed through the skin.

Canada - Manitoba OELs: Skin designation
Morpholine (CAS 110-91-8) Can be absorbed through the skin.

Canada - Ontario OELs: Skin designation
Morpholine (CAS 110-91-8) Can be absorbed through the skin.

Canada - Quebec OELs: Skin designation
Morpholine (CAS 110-91-8) Can be absorbed through the skin.

Canada - Saskatchewan OELs: Skin designation
Morpholine (CAS 110-91-8) Can be absorbed through the skin.

US ACGIH Threshold Limit Values: Skin designation
Morpholine (CAS 110-91-8) Can be absorbed through the skin.

Appropriate engineering controls Good general ventilation (typically 10 air changes per hour) should be used. Ventilation rates should be matched to conditions. If applicable, use process enclosures, local exhaust ventilation, or other engineering controls to maintain airborne levels below recommended exposure limits. If exposure limits have not been established, maintain airborne levels to an acceptable level. Eye wash facilities and emergency shower must be available when handling this product. Good general ventilation should be used. Ventilation rates should be matched to conditions. If applicable, use process enclosures, local exhaust ventilation, or other engineering controls to maintain airborne levels below recommended exposure limits. If exposure limits have not been established, maintain airborne levels to an acceptable level.

Individual protection measures, such as personal protective equipment

Eye/face protection Splash proof chemical goggles. Face shield.

Skin protection

Hand protection Wear appropriate chemical resistant gloves. The choice of an appropriate glove does not only depend on its material but also on other quality features and is different from one producer to the other. Glove selection must take into account any solvents and other hazards present.

Other Wear appropriate chemical resistant clothing.

Respiratory protection	If engineering controls do not maintain airborne concentrations below recommended exposure limits (where applicable) or to an acceptable level (in countries where exposure limits have not been established), an approved respirator must be worn.
Thermal hazards	Wear appropriate thermal protective clothing, when necessary.
General hygiene considerations	Always observe good personal hygiene measures, such as washing after handling the material and before eating, drinking, and/or smoking. Routinely wash work clothing and protective equipment to remove contaminants.

9. Physical and chemical properties

Appearance	Liquid
Color	Colorless to light yellow
Odor	Slight
Odor threshold	Not available.
pH (concentrated product)	10.5
Melting point/freezing point	25 °F (-4 °C)
Initial boiling point and boiling range	212 °F (100 °C)
Flash point	> 200 °F (> 93 °C) P-M(CC)
Evaporation rate	< 1 (Ether = 1)
Flammability (solid, gas)	Not applicable.
Upper/lower flammability or explosive limits	
Flammability limit - lower (%)	Not available.
Flammability limit - upper (%)	Not available.
Explosive limit - lower (%)	Not available.
Explosive limit - upper (%)	Not available.
Vapor pressure	18 mm Hg
Vapor pressure temp.	70 °F (21 °C)
Vapor density	< 1 (Air = 1)
Relative density	1.09
Relative density temperature	70 °F (21 °C)
Solubility(ies)	
Solubility (water)	100 %
Partition coefficient (n-octanol/water)	Not available.
Auto-ignition temperature	Not available.
Decomposition temperature	Not available.
Viscosity	10 cps
Viscosity temperature	70 °F (21 °C)
Other information	
Explosive properties	Not explosive.
Oxidizing properties	Not oxidizing.
Pour point	30 °F (-1 °C)
Specific gravity	1.091
VOC	5 % (Calculated)

10. Stability and reactivity

Reactivity	The product is stable and non-reactive under normal conditions of use, storage and transport.
Chemical stability	Material is stable under normal conditions.
Possibility of hazardous reactions	Hazardous polymerization does not occur.
Conditions to avoid	Avoid temperatures exceeding the flash point. Contact with incompatible materials.
Incompatible materials	Strong acids. Strong oxidizing agents.

Hazardous decomposition products	Elemental oxides.

11. Toxicological information

Information on likely routes of exposure

Inhalation	May cause irritation to the respiratory system. Prolonged inhalation may be harmful.
Skin contact	Causes severe skin burns.
Eye contact	Causes serious eye damage.
Ingestion	Causes digestive tract burns.
Symptoms related to the physical, chemical and toxicological characteristics	Burning pain and severe corrosive skin damage. Causes serious eye damage. Symptoms may include stinging, tearing, redness, swelling, and blurred vision. Permanent eye damage including blindness could result.

Information on toxicological effects

Acute toxicity

Product	Species	Test Results
CORRSHIELD MD4102 (CAS Mixture)		
Acute		
Dermal		
LD50	Rabbit	> 5000 mg/kg, (Estimated value)
Oral		
LD50	Rat	> 5000 mg/kg, (Estimated value)

Components	Species	Test Results
Morpholine (CAS 110-91-8)		
Acute		
Dermal		
LD50	Rabbit	504 mg/kg
Inhalation		
LC50	Rat	8 mg/l, 4 Hour
Oral		
LD50	Rat	1680 mg/kg

* Estimates for product may be based on additional component data not shown.

Skin corrosion/irritation	Causes severe skin burns and eye damage.
Serious eye damage/eye irritation	Causes serious eye damage.
Respiratory or skin sensitization	
Respiratory sensitization	This product is not expected to cause respiratory sensitization.
Skin sensitization	This product is not expected to cause skin sensitization.
Germ cell mutagenicity	No data available to indicate product or any components present at greater than 0.1% are mutagenic or genotoxic.
Carcinogenicity	Not classified.

ACGIH Carcinogens

Morpholine (CAS 110-91-8)	A4 Not classifiable as a human carcinogen.

Canada - Manitoba OELs: carcinogenicity

Morpholine (CAS 110-91-8)	Not classifiable as a human carcinogen.

IARC Monographs. Overall Evaluation of Carcinogenicity

Morpholine (CAS 110-91-8)	3 Not classifiable as to carcinogenicity to humans.

Reproductive toxicity	This product is not expected to cause reproductive or developmental effects.
Specific target organ toxicity - single exposure	Not classified.
Specific target organ toxicity - repeated exposure	Not classified.
Aspiration hazard	Based on available data, the classification criteria are not met.
Chronic effects	Prolonged inhalation may be harmful.

12. Ecological information

Ecotoxicity No ecotoxicity data noted for the ingredient(s).

Bioaccumulative potential

Partition coefficient n-octanol / water (log Kow)

Morpholine	-0.86

Mobility in soil No data available.

Other adverse effects Not available.

Persistence and degradability

13. Disposal considerations

Disposal instructions Collect and reclaim or dispose in sealed containers at licensed waste disposal site. Dispose of contents/container in accordance with local/regional/national/international regulations.

Local disposal regulations Dispose in accordance with all applicable regulations.

Waste from residues / unused products Dispose of in accordance with local regulations. Empty containers or liners may retain some product residues. This material and its container must be disposed of in a safe manner (see: Disposal instructions).

Contaminated packaging Since emptied containers may retain product residue, follow label warnings even after container is emptied. Empty containers should be taken to an approved waste handling site for recycling or disposal.

14. Transport information

TDG

Not regulated as dangerous goods.

The goods described above have been classified using a combination of testing, technical data, calculations and manufacturer knowledge in accordance with Part 2, Classification. TDG Classification is valid for road or rail transport only. For shipment by air or water, refer to IATA or IMDG regulations.

DOT

Not regulated as a dangerous good.

Some containers may be exempt from Dangerous Goods/Hazmat Transport Regulations, please check BOL for exact container classification.

IMDG

Not regulated as dangerous goods.

IATA

Not regulated as dangerous goods.

15. Regulatory information

Canadian regulations This product has been classified in accordance with the hazard criteria of the HPR and the SDS contains all the information required by the HPR.

Controlled Drugs and Substances Act

Not regulated.

Export Control List (CEPA 1999, Schedule 3)

Not listed.

Greenhouse Gases

Not listed.

Precursor Control Regulations

Not regulated.

Inventory status

Country(s) or region	Inventory name	On inventory (yes/no)*
Canada	Domestic Substances List (DSL)	No
Canada	Non-Domestic Substances List (NDSL)	No
United States & Puerto Rico	Toxic Substances Control Act (TSCA) Inventory	No

*A "Yes" indicates that all components of this product comply with the inventory requirements administered by the governing country(s)
A "No" indicates that one or more components of the product are not listed or exempt from listing on the inventory administered by the governing country(s).

DRAWING FOR APPROVAL

ENGINEER: **NUNAMI STANTEC LIMITED**

DRAWING #: AD-016

Section	: 22 10 10
Article	: 2.3 & 2.4
Plans	: M-802 PUMP SCHEDULE
Application	: SUMP PUMP SUBMERSIBLE
Brand	: HYDROMATIC
Model	: SPX50 & SK60
Revised #	:
Supplyer	: ATLANTIS POMPES ST-FOY
Date	: **16/06/2018**
By	: Martin Boucher

STANTEC PROJECT #: 110126045
SUBMITTAL # AD-016

This review by Stantec is for general conformance with the design concept of Stantec's design of the:
- ☐ Architectural
- ☐ Structural
- ☑ Mechanical
- ☐ Electrical
- ☐ Other

component(s) only and does not mean that Stantec has verified or approves the shop drawing(s). The Contractor remains solely responsible for the shop drawing(s) and this review by Stantec does not relieve the Contractor of the Contractor's responsibility for errors or omissions in the shop drawing(s) or for meeting all requirements of the contract documents. This review does not mean that Stantec approves the detailed design inherent in the shop drawing, responsibility for which shall remain with the Contractor submitting same, nor does this review mean that Stantec accepts any deviation of the shop drawing(s) from the contract documents. The Contractor is responsible for confirming all dimensions and correlating them at the job site, for all construction means, methods and techniques, and for coordination of construction work of all trades, including coordination of all shop drawings.

SPX50 RPM: **1750** Discharge: **2"** Solids: **2"**
SPX50H RPM: **1750** Discharge: **1 ½"** Solids: **¾"**

TAG : P-2.1 & P-2.2
SUMP (DUPLEX)

THE TRUE COMPLETE NUMBER WITH THE VOLTAGE AND LENGHT OF CABLE IS : SPX50M7-20

The curves reflect maximum performance characteristics without exceeding full load (Nameplate) horsepower. All pumps have a service factor of 1.2. Operation is recommended in the bounded area with operational point within the curve limit. Performance curves are based on actual tests with clear water at 70° F. and 1280 feet site elevation.

MODELS: SPX50/SPX50H

1.01 **GENERAL**

Contractor shall furnish all labor, materials, equipment and incidentals required to provide _____ (Qty.) submersible centrifugal sewage pump(s) as specified herein. The pump models covered in this specification are the SPX50/SPX50H. The pump furnished for this application shall be MODEL _____ as manufactured by Hydromatic Pumps.

2.01 **DESIGN CONDITIONS**

Each pump shall be rated _____ H.P., _____ volts, _____ phase, _____ hertz and operate at _____ RPM.

3.01 **OPERATING CONDITIONS**

The pump shall deliver _____ U.S. GPM/LPS at feet/meters TDH, and handle a _____ inch solid. The curve submitted for approval shall state, in addition to head and capacity performance, solid handling capability, amp rating, and design impeller diameter.

4.01 **CONSTRUCTION**

Each pump shall be of the sealed submersible type, incorporating features normally found in pumps furnished for the residential market.

These features include:

1. The seal housing for the SPX50/SPX50H is corrosion resistant cast iron.
2. The pump inlet shall be open and clear, without screening to provide access for sewage and solids.
3. All external mating parts shall be machined and Buna N, O-Ring sealed.
4. All fasteners exposed to the pumped liquid shall be 300 series stainless steel.
5. All power cords shall be water resistant UL or CSA approved, with double insulation, and sized as a function of Amp. draw.

5.01 **MOTOR AND SHAFT**

The stator, rotor and bearings shall be mounted in a sealed submersible type housing. Single phase motors shall be split phase or capacitor start with centrifugal switch. Three phase motors shall be Polyphase. Full Load and Locked Rotor Amps as well as Start and Run winding resistance shall be tabulated for each pump.

6.01 **BEARINGS, SHAFT AND MECHANICAL SEAL**

An upper radial and lower thrust bearing shall be required. These shall be heavy duty single row ball bearings which are permanently and continuously lubricated and cooled by the dielectric oil which fills the motor housing. The motor shaft shall be stainless steel and sealed from the pumped liquid with a carbon ceramic mechanical seal.

HYDROMATIC®
SPX50/SPX50H
EXPLOSION PROOF, SEWAGE EJECTOR

7.01 **IMPELLER**

The Impeller shall be high capacity, two vane, non clog design with pump out vanes on the back side. These vanes wash out grit and stringy material that will damage the shaft and mechanical seal.

8.01 **AUTOMATIC CONTROL**

All single phase pumps should be capable of automatic operation.

9.01 **MANUAL CONTROL**

The Single Phase pumps are not supplied with any type of automatic control. A super or double wide angle piggy-back float switch can be supplied and fitted to these pumps.

10.01 **PAINTING**

All cast iron parts shall be painted before assembly with a water reducible alkyd air dried enamel. The paint shall be applied in one coat with a minimum thickness of 3 to 4 mils.

TWO COATS OF ENAMEL AS PER 22 10 10 2.3.4

12.01 **TESTING**

All pumps shall be individually tested to include the following:

1. The pump and power cord shall be visually inspected for imperfections, cuts or nicks.
2. The pump shall have a ground continuity check and the motor chamber shall be Hi-potted to test for moisture content and/or insulation defects.
3. The motor and volute housing shall be pressurized and a 10 second air leak decay test run.
4. Oil is added, and the pump is run. Voltage and current are monitored visually, electronically, and the tester listens for any noise or malfunction.

TAG : P-2.1 & P-2.2

HYDROMATIC® SPX50/SPX50H SUBMERSIBLE EXPLOSION-PROOF PUMPS

HYDROMATIC SPX50 and SPX50H are specifically designed to pump contaminated effluent and water. The SPX50/SPX50H is UL and CSA approved (Class 1, Division 1, Group D) to handle a wide variety of pollutants, including gas and oil.

Features

- HYDROMATIC SPX50/SPX50H is recommended to be sold/used with HYDROMATIC'S UL 913 listed control panel.
- Oil-filled motor for maximum heat dissipation and constant bearing lubrication.
- Recessed impeller reduces radial bearing loads, increases bearing life.
- High torque capacitor start, single phase motor for assured starting under heavy load.
- Seal leak probes warn of seal leak condition.
- On winding heat sensors will stop motor in case of over-heating to prevent costly motor damage.

SJE SIGNALMASTER® Control Switch

Mechanically-activated, narrow-angle float switch designed to activate pump control panels and alarms.

This narrow-angle sensing device is used to accurately monitor liquid levels in:

- water
- sewage applications

The SJE SignalMaster® control switch is not sensitive to rotation.

Normally Open Model (high level)
The control switch turns on (closes) when the switch tips slightly **above** horizontal signaling a high level, and turns off (opens) when the switch drops slightly below horizontal.

Normally Closed Model (low level)
The control switch turns on (closes) when the switch tips slightly **below** horizontal signaling a low level, and turns off (opens) when the switch tips slightly above horizontal.

FEATURES

- Mechanically-activated, snap action contacts.
- High impact, corrosion resistant, polypropylene float housing.
- Not sensitive to rotation.
- Control differential of 1.5 inches (4 cm) above or below horizontal.
- Yellow colored cap for easy identification of normally open control switch.
- White colored cap for easy identification of normally closed control switch.
- UL Listed for use in water and sewage.
- CSA Certified.
- Five-year limited warranty.

SSPMA MEMBER

LR54245

LISTED 83N2

Member of: Hydraulic Institute

SPECIFICATIONS

CABLE: flexible 18 gauge, 2 conductor (UL, CSA) SJOW, water-resistant (CPE)

FLOAT: 2.74 inch diameter x 4.83 inch long (7.0 x 12.3 cm) high impact, corrosion resistant, polypropylene housing for use in sewage and water up to 140°F (60°C)

MAXIMUM WATER DEPTH: 30 feet (9 meters), 13 PSI (90 kPa)

ELECTRICAL: 5 amp, 125/250 VAC, 50/60 Hz

NOTE: This switch is not recommended for controlling:

- electric loads less than 100 milliamps, 12 VAC
- non-arcing electric loads

OPTIONS

This switch is available:

- CE certified unit available upon request.
- for normally open (high level) applications or normally closed (low level) applications.
- in standard cable lengths of 10, 15, 20, or 30 feet and 3, 5, 6, or 10 meters (longer lengths available)
- with two mounting options that allow for flexibility in installation:

  Mounting Clamp: for applications where the switch can be attached to a discharge pipe or similar mounting device.

  Externally Weighted: for applications where the switch can be suspended from above.

FLOAT ACCESSORIES

Cable Clamp Assembly, Float Brackets, Pipe Mounting Bracket, Cable Weights, ETM w/ Piggy-Back Plug, Vertical Reed Switch, Anchor and Chain

CABLE WEIGHT

Provides an accurate pivot point for suspended float switches.

U.S. Patent 5,306,885

- Gripper teeth on clip and weight channel securely lock float cable into place
- Cable Weight can be adjusted without the use of tools

HOUSING: 1 pound, 12 ounce (0.8 kgs.), 2.8 inch diameter x 3.3 inch long (7.1 cm diameter x 8.4 cm), impact resistant, non-corrosive, PVC housing for use in liquids up to 140°F (60°C).

CLIP: injection molded acetal plastic
WIRE/CABLE ACCOMMODATED: SJOW, SJTW, 18/2, 18/3, 16/2, 16/3, 14/2 and 14/3
SHIP WEIGHT: 2 lbs. (.907 kgs)

Part Number	Description
1002230	Cable Weight

CABLE WEIGHT MINI

Provides an accurate pivot point for suspended float switches.

- One piece cable weight
- Turn and Lock for easy installation.

HOUSING: 9.6 ounces (0.27 kgs.), 2.5 inch diameter x 2.5 inch long (6.35 cm diameter x 6.35 cm), impact resistant, non-corrosive, PVC housing for use in liquids up to 140°F (60°C)
WIRE/CABLE ACCOMMODATED: SJOW, SJTW, 18/2, 18/3

Part Number	Description
1030356	Cable Weight Mini

ELAPSED TIME METER WITH PIGGY-BACK PLUG

Plugs into switched outlet or piggy-back switch of plugger control panel. Unit must be placed inside an enclosure.

- Screws and mounting adhesive included.

Part Number	Description
1022846	ETM w/120V piggy-back plug
1032834	ETM w/230V piggy-back plug

VERTICAL REED SWITCH

- Control differential: .375 inch (1 cm)
- Maximum angle from vertical: 5°
- Electrical: 250 mAmps, 12-125 VAC, 50/60 Hz
  500 mAmps, 6-12 VDC, 50/60 Hz
- Housing and Float: 1.60 inch diameter x 6.7 inch long (4.06 cm X 17.01 cm), high impact, corrosion resistant PVC for use in sewage and non-potable water up to 120°F (50°C)

Part Number	Description
1011027	10ft VRS 120V Bulk
1016561	15ft VRS 120V Bulk

ANCHOR

- 10 lb. weight
- Yellow, vinyl coated, mushroom style

Part Number	Description
1018687	10 lb. Mushroom Anchor

CHAIN

- 1/8" thickness
- 316 grade stainless steel
- Available in one foot increments

Part Number	Description
1018823	1/8 inch Chain

0929 Series 1/2" - 4" Threaded (FPT)
0929S Series 1/2" - 4" Slip

- 150 PSI Working Pressure @ 73°F (22°C)
- Temperature Rating: 32°F to 122°F (0°C to 50°C)
- EPDM Seats/EPDM O-ring Seal
- White PVC Molded Body with Black PVC Handle

PVC Ball Valves

0921 Series 1/2" - 4" Threaded (FPT)
0921S Series 1/2" - 4" Slip

- EPDM Seats/EPDM O-Ring Seal
- White PVC Body with Black PVC Handle
- NSNSF/ANSI Standard 61 & 372 Certified

0923 Series 1/2" - 2" Threaded (FPT)
0923S Series 1/2" - 2" Slip

- 150 PSI Working Pressure @ 73°F (22°C)
- Temperature Rating: 41°F to 122°F (5°C to 50°C)
- PTFE Seats/Viton O-ring Seal
- White PVC Body with Red PVC Handle

Refer to Temperature Correction Factors

NO LEAD LEAD-FREE — Third Party Certified to NSF / ANSI 372

CPVC Hot Water System Ball Valves

0922CTS Series 1/2" - 2" Threaded (CTS x CTS)

- 150 PSI Working Pressure
- Temperature Rating: Continuous 194°F (90°C)
  Short Hours 212°F (100°C)
- PTFE Seats/EPDM O-ring Seal
- Beige CPVC Molded Body with Red Handle
- NSF/ANSI Standard 61 & 372 Certified

UNION PVC BALL VALVES

PVC Blocked True Union Ball Valves

0924 Series 1/2" - 2" Threaded (FPT)

- Double Union/Double block design permits in-line maintenance without disconnecting pipe
- Bayonet style locks prevent ball from being blown out
- Handle equipped with removable spanner devise
- Full unobstructed flow without any turbulence or pressure drop
- Working Temperature Range: 41°F to 122°F (5°C to 50°C)
- 150 PSI Working Pressure at 73°F (22°C)
- EPDM O-rings
- Suitable for both schedule 40 & 80 PVC pipe

Shipped complete with both thread and slip interchangeable connections

NO LEAD LEAD-FREE — Third Party Certified to NSF / ANSI 372

PVC Blocked True Union Ball Valves

0925NL Series 1/2" - 4" EPDM "O" RING SEAL ← 2"
0926 Series 1/2" - 4" VITON "O" RING SEAL

- 2-Way Blocking True Union Ball Valve - 150 PSI Working Pressure @ 73°F (22°C)
- Unique Double Union/Double Block design permits in-line maintenance without disconnecting pipe
- Both ends blocked with bayonet-style locks which prevent ball from being blown out
- Handle equipped with removable spanner device
- Full, unobstructed flow without any turbulence or pressure drop
- Available with either EPDM or Viton "O"-ring seals
- Self Lubricating PTFE (polytetrafluoroethylene) Seats are corrosion and chemical resistant
- Quick and easy disassembly without use of special tools, hand tighten only
- Suitable for both schedule 40 & 80 PVC pipe

PVC Single Union Ball Valves

0933 Series 1-1/2" - 2" Threaded (FPT)
0933S Series 1-1/2" - 4" Slip

- Threaded or socket
- Working Pressure 150 PSI @ 73°F
- Lightweight and compact design suitable for plumbing, pool and spa field
- PTFE (polytetrafluoroethylene) seat is corrosion and chemical resistantto most chemicals
- Non blocking design
- Suitable for both schedule 40 & 80 PVC pipe

Wholesale Products **Page:** 6290-1
Dated: January 2001
RPM: **1750** Discharge: **2"** Solids: **2"**

TAG : P-2.3 & P-2.4 , P-2.5 & P-2.6

THE TRUE COMPLETE NUMBER WITH THE
VOLTAGE AND LENGHT OF CABLE IS : SK60M6-20

The curves reflect maximum performance characteristics without exceeding full load (Nameplate) horsepower. All pumps have a service factor of 1.2. Operation is recommended in the bounded area with operational point within the curve limit. Performance curves are based on actual tests with clear water at 70° F. and 1280 feet site elevation.

HYDROMATIC®
SK60
SUBMERSIBLE SEWAGE EJECTOR

Wholesale Products Page: 6290-5
Dated: January 2001

MODEL: SK50

1.01 **GENERAL**

Contractor shall furnish all labor, materials, equipment and incidentals required to provide _____ (Qty.) submersible centrifugal sewage ejector pump(s) as specified herein. The pump model covered in this specification is the SK60. The pump furnished for this application shall be MODEL _____ as manufactured by Hydromatic Pumps.

2.01 **DESIGN CONDITIONS**

Each pump shall be rated _____ H.P., _____ volts, _____ phase, _____ hertz and operate at _____ RPM.

3.01 **OPERATING CONDITIONS**

The pump shall deliver _____ U.S. GPM/LPS at feet/meters TDH, and handle a _____ inch solid. The curve submitted for approval shall state, in addition to head and capacity performance, solid handling capability, amp rating, and design impeller diameter.

4.01 **CONSTRUCTION**

Each pump shall be of the sealed submersible type, incorporating features normally found in pumps furnished for the residential market.

These features include:

1. The pump volute, motor, and seal housing shall be high quality gray cast iron, ASTM A-48, Class 30.
2. The pump inlet shall be open and clear, without screening to provide access for sewage and solids.
3. All external mating parts shall be machined and Buna N, O-Ring sealed.
4. All fasteners exposed to the pumped liquid shall be 300 series stainless steel.
5. All power cords shall be water resistant UL or CSA approved, with double insulation, and sized as a function of Amp. draw.

5.01 **MOTOR AND SHAFT**

The stator, rotor and bearings shall be mounted in a sealed submersible type housing. Single phase motors shall be split phase or capacitor start with centrifugal switch. Three phase motors shall be Polyphase. Full Load and Locked Rotor Amps as well as Start and Run winding resistance shall be tabulated for each pump.

6.01 **BEARINGS, SHAFT AND MECHANICAL SEAL**

An upper bushing bearing and lower thrust bearing shall be required. The upper bearing shall be brass while the lower bearing is a heavy duty single row ball. They are both permanently and continuously lubricated and cooled by the dielectric oil which fills the motor housing. The motor shaft shall be stainless steel and sealed from the pumped liquid with a carbon ceramic mechanical seal.

SK60
SUBMERSIBLE SEWAGE EJECTOR

7.01 **IMPELLER**

The Impeller shall be high capacity, two vane, non-clog design with pump out vanes on the back side. These vanes wash out grit and stringy material that will damage the shaft and mechanical seal.

8.01 **AUTOMATIC CONTROL**

All single phase pumps should be capable of automatic operation.

9.01 **PRESSURE SWITCH**

The Single Phase SK60 pump is furnished with a pressure diaphragm switch that features a piggy-back plug that allows the pump to be operated manually without removal from the sump.

10.01 **PAINTING**

All cast iron parts shall be painted before assembly with a water reducible alkyd air dried enamel. The paint shall be applied in one coat with a minimum thickness of 3 to 4 mils.

11.01 **TESTING**

All pumps shall be individually tested to include the following:

1. The pump and power cord shall be visually inspected for imperfections, cuts or nicks.
2. The pump shall have a ground continuity check and the motor chamber shall be Hi-potted to test for moisture content and/or insulation defects.
3. The motor and volute housing shall be pressurized and a 10 second air leak decay test run.
4. Oil is added, and the pump is run. Voltage and current are monitored visually, electronically, and the tester listens for any noise or malfunction.

SJE SIGNALMASTER® Control Switch

Mechanically-activated, narrow-angle float switch designed to activate pump control panels and alarms.

This narrow-angle sensing device is used to accurately monitor liquid levels in:

- water
- sewage applications

The SJE SignalMaster® control switch is not sensitive to rotation.

Normally Open Model (high level)
The control switch turns on (closes) when the switch tips slightly **above** horizontal signaling a high level, and turns off (opens) when the switch drops slightly below horizontal.

Normally Closed Model (low level)
The control switch turns on (closes) when the switch tips slightly **below** horizontal signaling a low level, and turns off (opens) when the switch tips slightly above horizontal.

FEATURES

- Mechanically-activated, snap action contacts.
- High impact, corrosion resistant, polypropylene float housing.
- Not sensitive to rotation.
- Control differential of 1.5 inches (4 cm) above or below horizontal.
- Yellow colored cap for easy identification of normally open control switch.
- White colored cap for easy identification of normally closed control switch.
- UL Listed for use in water and sewage.
- CSA Certified.
- Five-year limited warranty.

SSPMA MEMBER

LR54245

LISTED 83N2

Member of: Hydraulic Institute

SPECIFICATIONS

CABLE: flexible 18 gauge, 2 conductor (UL, CSA) SJOW, water-resistant (CPE)

FLOAT: 2.74 inch diameter x 4.83 inch long (7.0 x 12.3 cm) high impact, corrosion resistant, polypropylene housing for use in sewage and water up to 140°F (60°C)

MAXIMUM WATER DEPTH: 30 feet (9 meters), 13 PSI (90 kPa)

ELECTRICAL: 5 amp, 125/250 VAC, 50/60 Hz

NOTE: This switch is not recommended for controlling:

- electric loads less than 100 milliamps, 12 VAC
- non-arcing electric loads

OPTIONS

This switch is available:

- CE certified unit available upon request.
- for normally open (high level) applications or normally closed (low level) applications.
- in standard cable lengths of 10, 15, 20, or 30 feet and 3, 5, 6, or 10 meters (longer lengths available)
- with two mounting options that allow for flexibility in installation:

  Mounting Clamp: for applications where the switch can be attached to a discharge pipe or similar mounting device.

  Externally Weighted: for applications where the switch can be suspended from above.

FLOAT ACCESSORIES

Cable Clamp Assembly, Float Brackets, Pipe Mounting Bracket, Cable Weights, ETM w/ Piggy-Back Plug, Vertical Reed Switch, Anchor and Chain

CABLE WEIGHT

Provides an accurate pivot point for suspended float switches.

U.S. Patent 5,306,885

- Gripper teeth on clip and weight channel securely lock float cable into place
- Cable Weight can be adjusted without the use of tools

HOUSING: 1 pound, 12 ounce (0.8 kgs.), 2.8 inch diameter x 3.3 inch long (7.1 cm diameter x 8.4 cm), impact resistant, non-corrosive, PVC housing for use in liquids up to 140°F (60°C).

CLIP: injection molded acetal plastic
WIRE/CABLE ACCOMMODATED: SJOW, SJTW, 18/2, 18/3, 16/2, 16/3, 14/2 and 14/3
SHIP WEIGHT: 2 lbs. (.907 kgs)

Part Number	Description
1002230	Cable Weight

CABLE WEIGHT MINI

Provides an accurate pivot point for suspended float switches.

- One piece cable weight
- Turn and Lock for easy installation.

HOUSING: 9.6 ounces (0.27 kgs.), 2.5 inch diameter x 2.5 inch long (6.35 cm diameter x 6.35 cm), impact resistant, non-corrosive, PVC housing for use in liquids up to 140°F (60°C)
WIRE/CABLE ACCOMMODATED: SJOW, SJTW, 18/2, 18/3

Part Number	Description
1030356	Cable Weight Mini

ELAPSED TIME METER WITH PIGGY-BACK PLUG

Plugs into switched outlet or piggy-back switch of plugger control panel. Unit must be placed inside an enclosure.

- Screws and mounting adhesive included.

Part Number	Description
1022846	ETM w/120V piggy-back plug
1032834	ETM w/230V piggy-back plug

VERTICAL REED SWITCH

- Control differential: .375 inch (1 cm)
- Maximum angle from vertical: 5°
- Electrical: 250 mAmps, 12-125 VAC, 50/60 Hz
  500 mAmps, 6-12 VDC, 50/60 Hz
- Housing and Float: 1.60 inch diameter x 6.7 inch long (4.06 cm X 17.01 cm), high impact, corrosion resistant PVC for use in sewage and non-potable water up to 120°F (50°C)

Part Number	Description
1011027	10ft VRS 120V Bulk
1016561	15ft VRS 120V Bulk

ANCHOR

- 10 lb. weight
- Yellow, vinyl coated, mushroom style

Part Number	Description
1018687	10 lb. Mushroom Anchor

CHAIN

- 1/8" thickness
- 316 grade stainless steel
- Available in one foot increments

Part Number	Description
1018823	1/8 inch Chain

COMPACT PVC / CPVC BALL VALVES

PVC Ball Valves

0929 Series 1/2" - 4" Threaded (FPT)
0929S Series 1/2" - 4" Slip

- 150 PSI Working Pressure @ 73°F (22°C)
- Temperature Rating: 32°F to 122°F (0°C to 50°C)
- EPDM Seats/EPDM O-ring Seal
- White PVC Molded Body with Black PVC Handle

PVC Ball Valves

0921 Series 1/2" - 4" Threaded (FPT)
0921S Series 1/2" - 4" Slip

- EPDM Seats/EPDM O-Ring Seal
- White PVC Body with Black PVC Handle
- NSNSF/ANSI Standard 61 & 372 Certified

0923 Series 1/2" - 2" Threaded (FPT)
0923S Series 1/2" - 2" Slip

- 150 PSI Working Pressure @ 73°F (22°C)
- Temperature Rating: 41°F to 122°F (5°C to 50°C)
- PTFE Seats/Viton O-ring Seal
- White PVC Body with Red PVC Handle

Refer to Temperature Correction Factors

NO LEAD LEAD-FREE — Third Party Certified to NSF / ANSI 372

CPVC Hot Water System Ball Valves

0922CTS Series 1/2" - 2" Threaded (CTS x CTS)

- 150 PSI Working Pressure
- Temperature Rating: Continuous 194°F (90°C)
  Short Hours 212°F (100°C)
- PTFE Seats/EPDM O-ring Seal
- Beige CPVC Molded Body with Red Handle
- NSF/ANSI Standard 61 & 372 Certified

UNION PVC BALL VALVES

PVC Blocked True Union Ball Valves

0924 Series 1/2" - 2" Threaded (FPT)

- Double Union/Double block design permits in-line maintenance without disconnecting pipe
- Bayonet style locks prevent ball from being blown out
- Handle equipped with removable spanner devise
- Full unobstructed flow without any turbulence or pressure drop
- Working Temperature Range: 41°F to 122°F (5°C to 50°C)
- 150 PSI Working Pressure at 73°F (22°C)
- EPDM O-rings
- Suitable for both schedule 40 & 80 PVC pipe

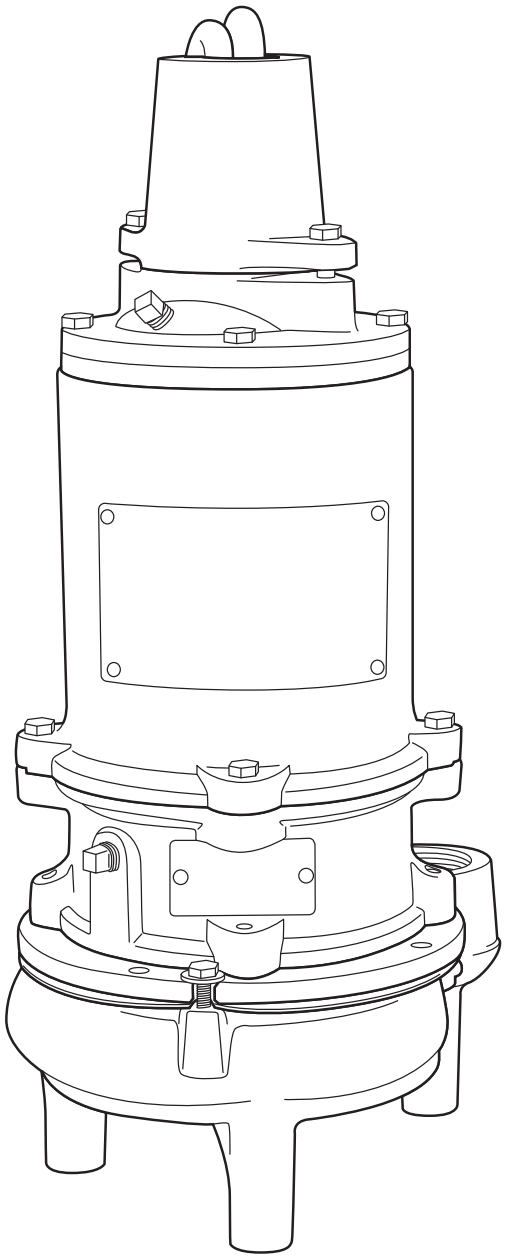
Shipped complete with both thread and slip interchangeable connections

NO LEAD LEAD-FREE — Third Party Certified to NSF / ANSI 372

PVC Blocked True Union Ball Valves

0925NL Series 1/2" - 4" EPDM "O" RING SEAL ← 2"
0926 Series 1/2" - 4" VITON "O" RING SEAL

- 2-Way Blocking True Union Ball Valve - 150 PSI Working Pressure @ 73°F (22°C)
- Unique Double Union/Double Block design permits in-line maintenance without disconnecting pipe
- Both ends blocked with bayonet-style locks which prevent ball from being blown out
- Handle equipped with removable spanner device
- Full, unobstructed flow without any turbulence or pressure drop
- Available with either EPDM or Viton "O"-ring seals
- Self Lubricating PTFE (polytetrafluoroethylene) Seats are corrosion and chemical resistant
- Quick and easy disassembly without use of special tools, hand tighten only
- Suitable for both schedule 40 & 80 PVC pipe



PVC Single Union Ball Valves

0933 Series 1-1/2" - 2" Threaded (FPT)
0933S Series 1-1/2" - 4" Slip

- Threaded or socket
- Working Pressure 150 PSI @ 73°F
- Lightweight and compact design suitable for plumbing, pool and spa field
- PTFE (polytetrafluoroethylene) seat is corrosion and chemical resistantto most chemicals
- Non blocking design
- Suitable for both schedule 40 & 80 PVC pipe

INSTALLATION AND SERVICE MANUAL

NOTE! To the installer: Please make sure you provide this manual to the owner of the equipment or to the responsible party who maintains the system.

Item # E-03-415 | Part # 5625-415-1 | © 2012 Pentair Pump Group, Inc. | 11/12/12

General Information

Thank you for purchasing your Hydromatic® Pump. To help ensure years of trouble-free operation, please read the following manual carefully.

⚠ CAUTION

Read these safety warnings first before installation, servicing or operating any pump. These instructions are written with the understanding that the individuals have experience in building wet wells and installing basins, grinder pumps and pumping equipment. Do not discard or misplace this manual.

CALIFORNIA PROPOSITION 65 WARNING:

⚠WARNING This product and related accessories contain chemicals known to the State of California to cause cancer, birth defects or other reproductive harm.

NOTE: Models with Third Party approval(s) are clearly marked on individual pump nameplates.

Safety Warnings

Before Installation:

This manual contains important information for the safe use of this product. Read this manual completely and follow the instructions carefully. Reasonable care and safe methods relating to the installation and operation of this product should be practiced. Check local codes and requirements before installation.

Must be installed by experienced professionals only.

Hazardous Location Service:

SPX50 pumps are to be used for handling sewage, wastewater and storm water only. **DO NOT** use in other hazardous locations. These motors must be repaired and serviced only at Hydromatic authorized service centers or at the Hydromatic factory.

Any unauthorized field repair voids the warranty, the hazardous location rating and CSA certification.

⚠ DANGER

Risk of Electrical Shock or Electrocution. May result in serious injury or death or fire hazard. Installer must disconnect all electrical sources prior to installation, handling or servicing. Only qualified personnel may install or service this system. NFPA 70/National Electric Code (NEC) or local codes must be followed. System must be properly grounded according to NEC. Do not lift pump by power cord.

⚠ DANGER

Biohazard Risk. Once wastewater source has been connected to system, biohazard risk exists. Installer(s) and/or service personnel must use proper personal protective equipment and follow handling procedures per OSHA 29 CFR 1910.1030 when handling equipment after wastewater source has been connected to system.

⚠ DANGER

Risk of Asphyxiation. Installer(s) and/or service personnel must use proper personal protective equipment and follow OSHA 29 CFR 1910.146 or OSHA 29 CFR 1926. Pump may be installed in a location classified as a confined space. Basin or wet well to be vented per local code.

⚠ DANGER

Risk of Fire or Explosion. Do not smoke or use open flames in or around this system. Do not pump flammable liquids. Consult factory for optional equipment rated for hazardous location use.

⚠ CAUTION

DO NOT modify the cord strain relief. **DO NOT** operate pump with frayed or damaged power cord. **DO NOT** handle cord with wet hands. **DO NOT** let cords lie in water.

⚠ CAUTION

DO NOT run the pump dry. Dry running can overheat the pump (causing burns to anyone handling it) and will void the warranty. The pump normally runs hot. To avoid burns, allow it to cool for 30 minutes after shutdown before handling it.

⚠ CAUTION

Submersible sump and sewage pumps are not approved for use in swimming pools, recreational water installations, decorative fountains or any installation where human contact with the pumped fluid is common.

⚠ WARNING

On three phase pumps only "motor protection" must be provided by the installer. All three phase pumps must be installed with magnetic starters having three leg overload protection in accordance with the national electric code. For installations with more than one pump, each pump motor must have separate overload protection.

⚠ WARNING

Only qualified persons shall conduct services and installations of this pump. The pump must be wired by a qualified electrician, using an approved starter box.

NOTICE: For use with maximum 104°F liquid. Acceptable for indoor use only.

⚠ WARNING

DO NOT exceed working load limit of lifting rope or chain. DO NOT use lifting rope or chain where failure could result in injury or loss of life. Examine all lifting devices, rope or chain for damage before and after each lift.

⚠ CAUTION

DO NOT exceed manufacturer's recommendation for maximum performance, as this could cause the motor to overheat.

⚠ CAUTION

Secure the pump in its operating position so it cannot tip over, fall or slide.

⚠ CAUTION

Keep hands and feet away from impeller when power is connected.

For hazardous locations, use pumps that are listed and classified for such locations.

IMPORTANT: Hydromatic is not responsible for losses, injury or death resulting from failure to observe these safety precautions, misuse or abuse of pumps or equipment.

Pump Information

Pump Models:

These instructions cover the installation and service of the Hydromatic SPX50 and SPX50H series submersible sump pumps.

Motor HP & Voltages:

The SPX50/SPX50H sump pumps are offered in single and three phase. Voltages will vary according to power supplied.

Control Panels:

NOTE: Hydromatic built control panels supply the correct circuitry for moisture and heat sensor connections. Failure to install the correct circuitry with proper connection would negate warranty and CSA certification.

General Hazardous Construction:

These pumps are to be used for handling contaminated septic tank effluent, sewage, and storm water only. The SPX50/SPX50H motor construction is designed to meet CSA requirements for Group 1, Div. 1, Class D wastewater applications. These models are certified and nameplated with this approval. Do not use in other hazardous location environments pumps are not rated for. A cross-sectional view of the internal workings of the pumps can be seen on pages 12 & 13. The motor chamber and seal chamber are filled with a high dielectric type oil for improved lubrication and heat transfer of the bearings and motor. The oil should not require replacement under normal operating conditions. An air space above the oil level in both the seal and motor chambers is provided to allow for the expansion of the oil when at operating temperature.

Internal connection wiring diagrams are shown on page 6.

General Installation:

Various configurations and methods of plumbing this series of sump pumps may be used.

NOTE: If the SPX50 and SPX50H hazardous location pumps are used in conjunction with a rail lift-out system, it must be a UL or CSA approved nonsparking, hazardous location system.

Hydromatic recommends using the rail lift-out system so that no service is required inside the basin.

IMPORTANT: If the following guidelines are not followed, the CSA hazardous location approval is void.

Motor:

Each motor is provided with heat sensor thermostats attached directly to the motor windings. The thermostats open if the motor windings experience excessive heat and, consequently, open the

motor contactor in the control panel, interrupting power to the pump. When the motor is stopped due to an overheat condition, it will not start until the motor has cooled and the heat sensor reset button is manually pushed on the front of the Hydromatic control panel. This circuitry is provided in the Hydromatic control panel designs.

The SPX50 and SPX50H pumps are equipped with internal thermostats. The SPX50 and SPX50H models are designed to meet Class B heat rise of 266°F (130°C).

NOTE: Failure to use proper circuitry and to connect the motor overheat protection in the control panel would negate all warranties and CSA listings.

Motor Seal Failure Warning:

The seal chamber is oil filled and provided with moisture sensing probes to detect water leakage through the lower shaft seal. The probes also detect moisture present in the upper motor housing.

The contamination of water energizes a red seal leak warning light at the control panel. This is a warning light only, and does not stop the motor. It indicates a leak has occurred and the pump must be repaired. Normally, this indicates the outboard seal has leaked. Allowing the unit to operate too long after the warning could cause upper seal leakage along with motor failure.

The resistance across the moisture sensing (seal failure) probes should be checked after a seal leak warning light has been activated. This can be done by disconnecting the red and orange control wires from the control panel and measuring the resistance with an ohmmeter between the wires. For a hazardous location pump the reading should be above 30,000 ohms. If the measured values are below those indicated above, the pump may have a lower seal failure and require service.

On the Hydromatic hazardous location control panels the seal leak test switch tests the seal leak circuit continuity. When pushed, the seal leak test bulb should light. If the test bulb does not light, it means either the wiring circuitry to the seal leak probes has been broken or the bulb has burned out.

Motor Power Cord, Control Cord and Cord Cap Assembly:

Each motor power cord has 4 conductors: white, black, red and green. For a single phase motor the black is connected to the common lead, the white is connected to the main lead, while the red is connected to the start circuitry, and the green is attached to ground. The rotation of a single phase pump is set properly at the factory. For three phase, red, black and white are power leads and green is ground.

Three Phase: When pump is installed to operate on three phase power, pump rotation must be checked. For inside installation where control box is near the sump basin, pump can be laid on side to check rotation before installing in sump.

To check rotation turn Hand-Off-Auto switch to Off position and turn on circuit breaker. Quickly turn H-O-A switch to Hand position, then Off. Note impeller rotation. Impeller must rotate counterclockwise. If rotation is wrong, change any two line leads to motor at control box terminal. Recheck for proper rotation.

Where pump is installed remote from control box in outside installation a different method is used.

Set the pump in the basin and run in some water so pump can operate. Turn H-O-A switch to Hand position and let pump pull water down in basin. When water reaches the bottom of pump, rotation of the water can be observed. Water should rotate in a clockwise direction if pump rotation is correct. If not correct rotation, interchange any two line leads to motor at control panel.

When replacing a pump with a new unit, rotation must be checked.

The control cable has 5 conductors: black, white, red, orange and green. White and black connect to the heat sensor terminals in the control panels; red and orange connect to the seal failure terminals in the control panel; and the green connects to the ground in the control panel.

The cord cap is epoxy potted. This allows the cord cap, with cords, to be removed from the motor. With this arrangement, the cords can be permanently installed in a sealed fitting in the sump. This must be an approved hazardous location junction box for hazardous locations. The control and power cables cannot be spliced!

Electrical Motor Controls:

All electrical controls and motor starting equipment should be purchased from Hydromatic. Consult factory for any acceptable alternatives. Consult national and local codes for proper location of controls and control panels.

Junction Box:

If a junction box is used in a hazardous location, it must follow national and local codes for placement inside a hazardous area.

Level Sensing Controls:

Intrinsically safe-type float controls are recommended for all applications and required for hazardous location service. An intrinsically safe control panel relay will limit the current and voltage to the level controls. A Hydromatic control panel can be supplied with this type circuitry.

The float level controls maintain the basin sewage water level by controlling pump turn-on and turn-off levels.

1. The lower turn-off control should be set so that the pump stops with the water covering the entire motor housing. Consult the factory for any settings below this point.
2. The upper turn-on control should be set above the lower turn-off control. The exact height between the two controls is determined by the number of pump starts desired and the depth of the basin. A maximum of 10 starts per hour should not be exceeded.
3. The override control is set at a specified height above the upper turn-on control.
4. The alarm control is set about 6" to 12" above the override control.
5. No control should be set above the inlet invert.

Electrical Connections:

All electrical wiring must be in accordance with local code and only qualified electricians should make the installations. Complete wiring diagrams are included for use in making the installation. All wires should be checked for shorts to ground with an ohmmeter or Megger after the connections are made. This is important, as one grounded wire can cause failure of the pump, control panel or personal injury.

Pump:

The fluid end of the pump is field serviceable and can be disassembled in case of wear, damage, plugging or outboard seal failure. The following will describe the disassembly and reassembly process.

WARNING: Disconnect the power first.

Disassembly:

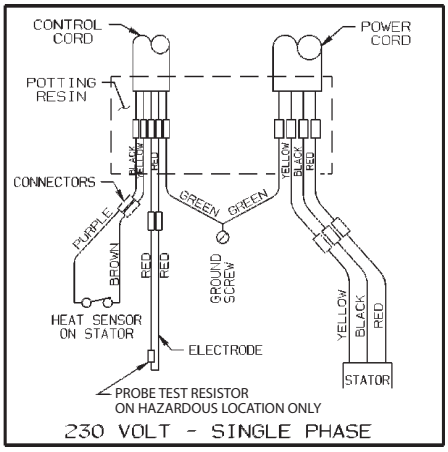
1. With the pump located in a secure place, remove the bolts fastening the seal housing to the volute. The motor and impeller can now be removed as a unit.
2. Lay the unit down on its side. If the lower seal is to be removed, it is recommended that the oil in the seal chamber be drained. This can be done by removing the lower seal chamber plug and draining the oil into a holding container.
3. Using a proper wrench, the impeller retaining nut must be removed. This may require a piece of wood placed between the vanes to keep the impeller from rotating while removing the nut. Loctite™ is used on this bolt and heating to 450°F to 500°F may also be required to loosen. The impeller is mounted on a threaded shaft. To remove impeller, rotate impeller with one hand while holding pump shaft with screwdriver.
4. If the lower seal needs to be removed, first remove the compression spring that rides between the impeller and the seal assembly. Next take a pair of screwdrivers and remove the compression ring that surrounds the rubber bellows on the rotating portion of the seal assembly. Again using the screwdrivers, pry the remaining portion of the rotating seal assembly off the shaft. The ceramic stationary assembly can be removed by placing a screwdriver between the rubber and the ceramic face, and then prying, working around the entire diameter. Note, these parts should be discarded and a new seal assembly installed.
5. If the oil in the seal chamber was drained, examine the contents to determine if the upper seal has been damaged. Signs of grit or other abrasive material may indicate that the upper seal has also been damaged. Pressurizing the motor housing assembly between 7 and 10 psi and observing any drop in pressure will indicate if the upper seal is functioning properly.

NOTE: Upper seal repairs must be done at a Hydromatic authorized service center or at the Hydromatic factory. Any unauthorized field repair voids warranty and the hazardous location approval on the CSA listed pumps.

Reassembly:

1. Remove the ceramic portion of the new seal from the package. Brush new dielectric oil around the rubber portion of the stationary assembly and into the pocket in the seal housing. Note, keep the

oil off the seal face. Without scratching the seal face, press the ceramic stationary portion into the seal housing. Seal installation tool can be ordered from Hydromatic. With clean cloth, lightly wipe the face of the seal surface to make sure it is dirt free. Remove the rotating portion of the seal from the package and lubricate the inside diameter of the rubber bellows and the outside diameter of the shaft. Place the seal over the shaft with the seal installation tool. Evenly press on the body of the rotational assembly and slide it down the shaft until the seal faces meet. Once the seal assembly is in position, place the spring over the register on the rotational portion of the seal.



2. Thread the impeller onto the shaft, making sure that the seal spring is registered properly onto the back side of the impeller. Place the proper Loctite fluid on the impeller retaining nut. Tighten nut on shaft.

3. Fill the seal chamber with new dielectric oil. An air gap of 10–15% volume must be left for the expansion of the oil when it is at operating temperature.

4. The motor and impeller assembly can be installed into the volute, making sure that the units are aligned properly. Install the volute retaining bolts and tighten.

5. Air tends to trap in the pump case when water rises in the sump or when the pump is lowered into the water after service. To vent off this air, a small hole is drilled into the volute casting. Be sure this vent hole is clean after any service work on pump. Air venting is not a problem after initial start.

WIRING DIAGRAMS

Pump Troubleshooting

Checking for Moisture in Motor:

Use an ohmmeter or a Megger and set on highest scale. Readings on the large power cord between any of the conductors red, black or white to the green conductor or to the motor housing should be greater than 1,000,000 ohms (megohm).

A motor will probably run with a lower reading, but if the pump is out of service and the value of the reading is below 1,000,000 ohms (1 megohm), the motor housing and stator should be removed and baked in a drying oven at 220°F. This service work must be done only at an authorized service station.

NOTE: Readings should be taken with the line leads disconnected from the control panel.

Below is a list of troubles and their probable causes:

Red light comes on at control box.

This indicates some water has leaked past the lower seal and has entered the seal chamber and made contact with the electrode probe. Pump must be removed for replacement of lower seal. This preventive repair will save an expensive motor.

Overload trips at control box and alarm buzzer or flashing red light comes on due to high water level in basin.

1. Push in on red reset button to reset overload. If overload trips again after short run, pump has some damage and must be removed from basin for checking.
2. Trouble may be from clogged impeller causing motor to overload or could be from failed motor.
3. Trouble may be from faulty component in control box. Always check control box before removing pump.

Yellow run light stays on continuously.

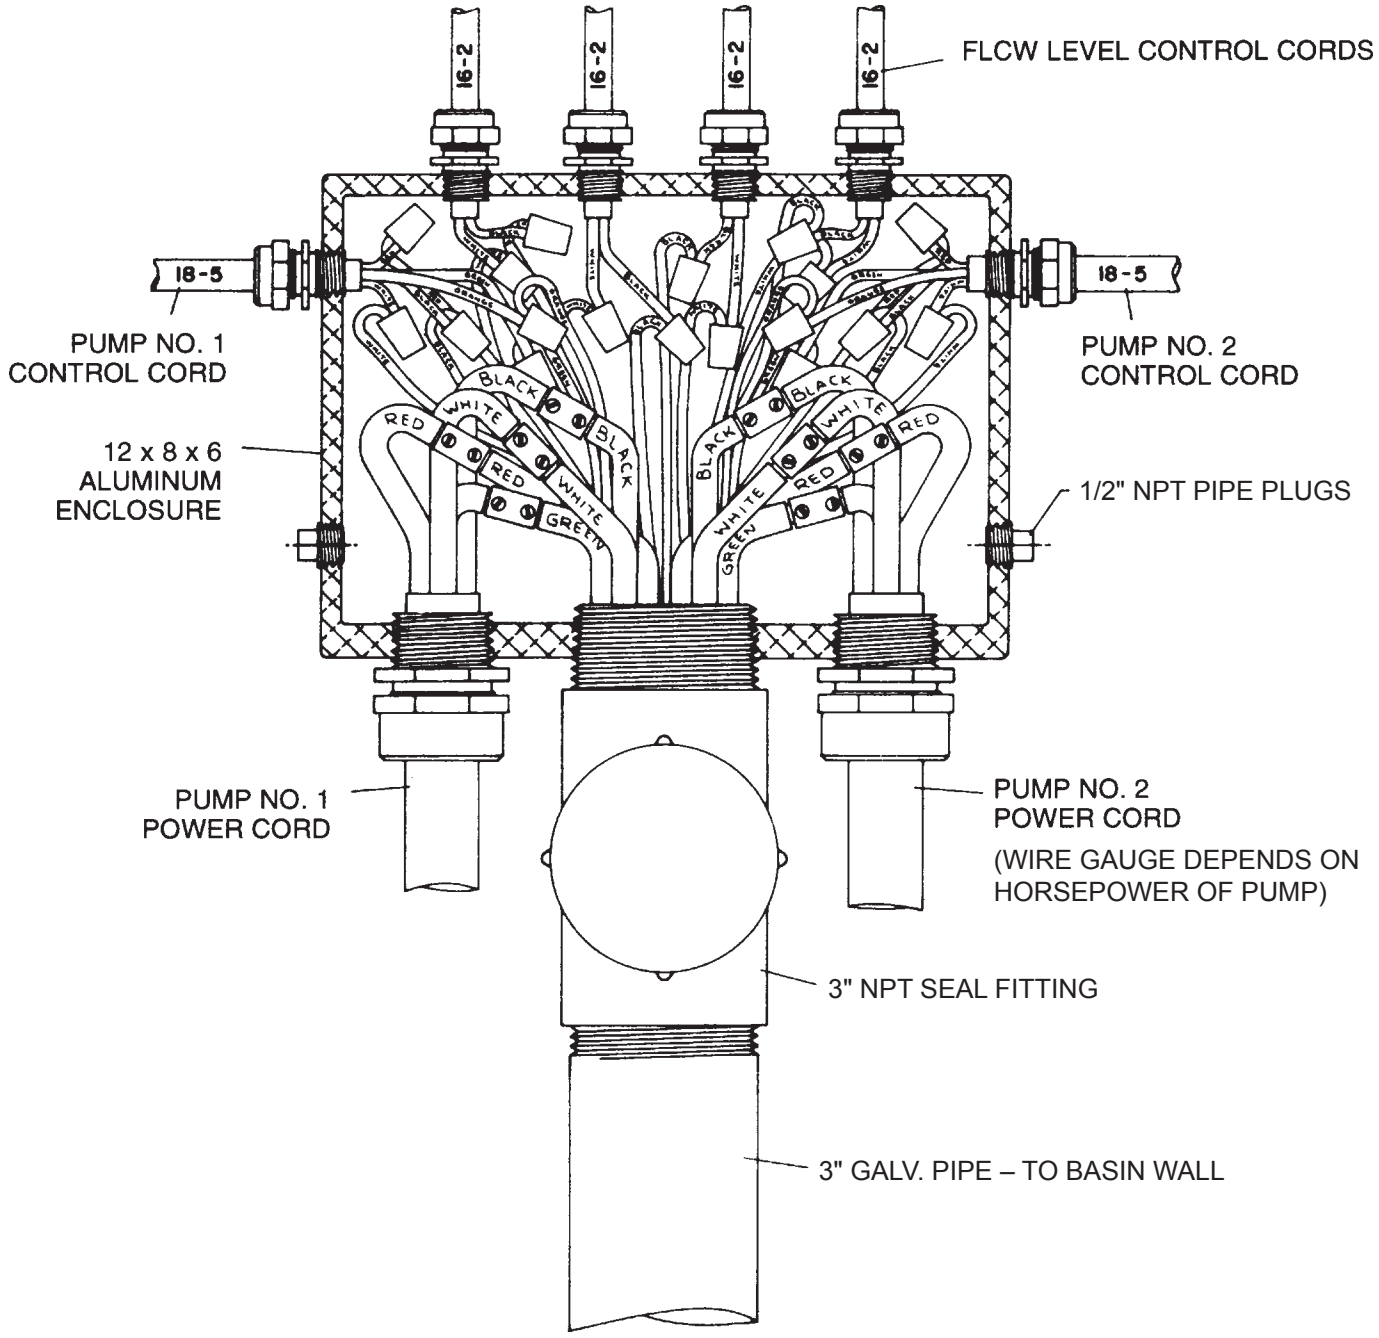
1. Indicates H-O-A switch may be in the Hand position.
2. Level control switch may have failed, causing pump to continue to operate when water is below lower control.
3. Impeller may be partially clogged, causing pump to operate at very reduced capacity.
4. Gate valve or check valve may be clogged, causing low pump flow.
5. Pump may be air logged.

Circuit breaker trips.

1. Reset breaker by pushing completely down on handle

then back to On position. If breaker trips again in few seconds, it indicates excessive load probably caused by a short in the motor or control box. Check out instructions given with control box before pulling pump.

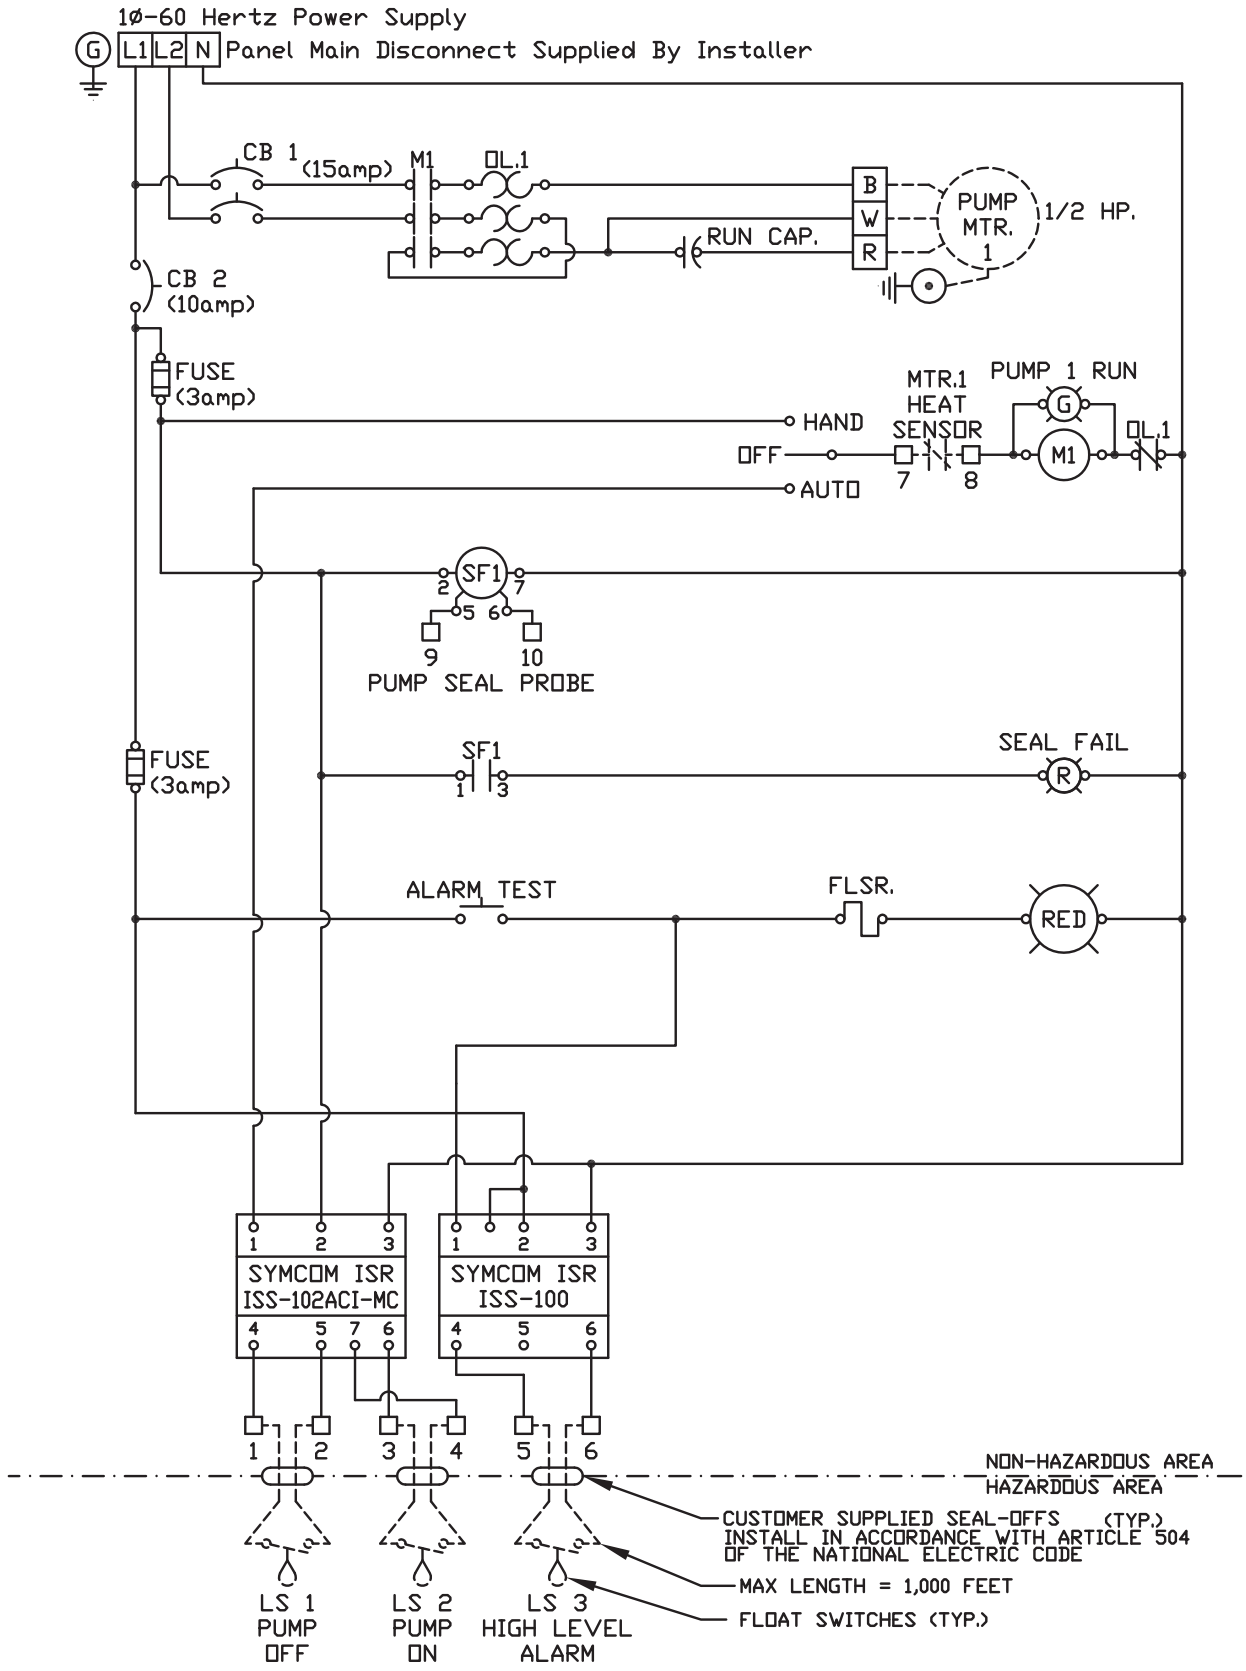
2. If this condition happens after an electrical storm, motor or control box may be damaged by lightning.
3. Resistance reading of the motor with lead wires disconnected from the control box can determine if trouble is in motor or control box.



Pump is noisy and pump rate is low.

Impeller may be partially clogged with some foreign objects, causing noise and overload on the motor.

Grease and solids have accumulated around pump and will not pump out of basin.



1. Lower control switch may be set too high.
2. Run pump on Hand operation for several minutes with small amount of water running into basin to clean out solids and grease. This allows pump to break suction and surge which will break up the solids. If level switch is set properly, this condition generally will not occur.
3. Trash and grease may have accumulated around floats, causing pump to operate erratically.

STANDARD LIMITED WARRANTY

Pentair Hydromatic® warrants its products against defects in material and workmanship for a period of 12 months from the date of shipment from Pentair Hydromatic or 18 months from the manufacturing date, whichever occurs first – provided that such products are used in compliance with the requirements of the Pentair Hydromatic catalog and technical manuals for use in pumping raw sewage, municipal wastewater or similar, abrasive-free, noncorrosive liquids.

During the warranty period and subject to the conditions set forth, Pentair Hydromatic, at its discretion, will repair or replace to the original user, the parts that prove defective in materials and workmanship. Pentair Hydromatic reserves the right to change or improve its products or any portions thereof without being obligated to provide such a change or improvement for prior sold and/or shipped units.

Start-up reports and electrical schematics may be required to support warranty claims. Submit at the time of start up through the Pentair Hydromatic website: http://forms.pentairliterature.com/startupform/startupform.asp?type=h. Warranty is effective only if Pentair Hydromatic authorized control panels are used. All seal fail and heat sensing devices must be hooked up, functional and monitored or this warranty will be void. Pentair Hydromatic will cover only the lower seal and labor thereof for all dual seal pumps. Under no circumstance will Pentair Hydromatic be responsible for the cost of field labor, travel expenses, rented equipment, removal/reinstallation costs or freight expenses to and from the factory or an authorized Pentair Hydromatic service facility.

This limited warranty will not apply: (a) to defects or malfunctions resulting from failure to properly install, operate or maintain the unit in accordance with the printed instructions provided; (b) to failures resulting from abuse, accident or negligence; (c) to normal maintenance services and parts used in connection with such service; (d) to units that are not installed in accordance with applicable local codes, ordinances and good trade practices; (e) if the unit is moved from its original installation location; (f) if unit is used for purposes other than for what it is designed and manufactured; (g) to any unit that has been repaired or altered by anyone other than Pentair Hydromatic or an authorized Pentair Hydromatic service provider; (h) to any unit that has been repaired using non factory specified/ OEM parts.

Warranty Exclusions: PENTAIR HYDROMATIC MAKES NO EXPRESS OR IMPLIED WARRANTIES THAT EXTEND BEYOND THE DESCRIPTION ON THE FACE HEREOF. PENTAIR HYDROMATIC SPECIFICALLY DISCLAIMS THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR ANY PARTICULAR PURPOSE.

Liability Limitation: IN NO EVENT SHALL PENTAIR HYDROMATIC BE LIABLE OR RESPONSIBLE FOR CONSEQUENTIAL, INCIDENTAL OR SPECIAL DAMAGES RESULTING FROM OR RELATED IN ANY MANNER TO ANY PENTAIR HYDROMATIC PRODUCT OR PARTS THEREOF. PERSONAL INJURY AND/OR PROPERTY DAMAGE MAY RESULT FROM IMPROPER INSTALLATION. PENTAIR HYDROMATIC DISCLAIMS ALL LIABILITY, INCLUDING LIABILITY UNDER THIS WARRANTY, FOR IMPROPER INSTALLATION. PENTAIR HYDROMATIC RECOMMENDS INSTALLATION BY PROFESSIONALS.

Some states do not permit some or all of the above warranty limitations or the exclusion or limitation of incidental or consequential damages and therefore such limitations may not apply to you. No warranties or representations at any time made by any representatives of Pentair Hydromatic shall vary or expand the provision hereof.

Important Safety Instructions

SAVE THESE INSTRUCTIONS - This manual contains important instructions that should be followed during installation, operation, and maintenance of the product. Save this manual for future reference.

⚠ This is the safety alert symbol. When you see this symbol on your pump or in this manual, look for one of the following signal words and be alert to the potential for personal injury!

⚠ DANGER indicates a hazard which, if not avoided, *will* result in death or serious injury.

⚠ WARNING indicates a hazard which, if not avoided, *could* result in death or serious injury.

⚠ CAUTION indicates a hazard which, if not avoided, *could* result in minor or moderate injury.

NOTICE addresses practices not related to personal injury.

The manufacturer cannot anticipate every possible circumstance that might involve a hazard. The warnings in this manual, and the tags and decals affixed to the unit are, therefore, not all-inclusive. If you use a procedure or operating technique that the manufacturer does not specifically recommend, you must satisfy yourself that it is safe for you and others. You must also make sure that the procedure or operating technique that you choose does not render the system unsafe.

Electrically powered sewage pumps normally give many years of trouble-free service when correctly installed, maintained, and used. However, unusual circumstances (interruption of power to the pump, large solids in the sump, flooding that exceeds the pump's capacity, electrical or mechanical failure in the pump, etc.) may prevent your pump from functioning normally. To prevent possible damage, consult your dealer about installing a secondary sewage pump or a high water alarm. See *Troubleshooting* in this manual for information about common sewage pump problems and remedies. For more information, see your retailer, call HYDROMATIC® customer service at 1-888-957-8677 or visit our web site at hydromatic.com.

⚠ WARNING Hazardous voltage - risk of electrical shock. Shock can cause serious injury or death. Failure to follow the warnings below can result in fatal electric shock.

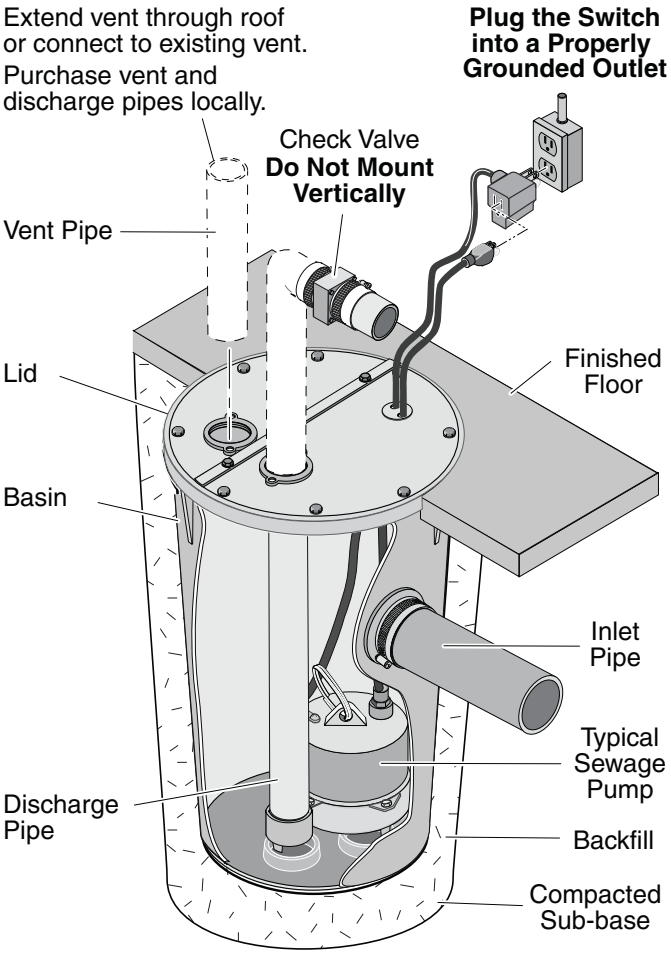
⚠ WARNING Burn Hazard. Motors can operate at high temperatures. Do not touch an operating motor. To do so can cause personal injury.

⚠ CAUTION Risk of flooding. If a flexible discharge hose is used, pump may move around in sump when motor starts. If it moves far enough so that the switch hits the side of sump, the switch may stick and prevent the pump from starting. Make sure the pump is secured so it cannot move around in the sump.

⚠ WARNING Hazardous pressure and gas - risk of explosion and personal injury. Failure to follow the warnings that follow can result in personal injury.

1. If your basement has water or moisture on the floor, do not walk on the wet area until all the power has been turned off. If the shut-off box is in the basement, call the electric company or the hydro authority to shut off the service to the house, or call your local fire department for instructions. Do not handle the pump or pump motor with wet hands or when standing on wet or damp surfaces.2. Connect only to a properly grounded receptacle.
3. All wiring should be performed by a qualified electrician.
4. Protect the electrical cord from sharp objects, hot surfaces, oils, and chemicals. Observe the *Cord Lift Warning* shown below.

5. **Risk of explosion and hazardous gas.** Septic tank must be vented in accordance with local plumbing codes.
   Do not smoke or use sparkable electrical devices or flame in a septic (gaseous) or possible septic sump.
   If a septic sump condition exists and if entry into sump is necessary, then (1) provide proper safety precautions per OSHA requirements and (2) do not enter sump until these precautions are strictly adhered to.
   Do not install pump in location classified as hazardous per N.E.C., ANSI/NFPA 70- 2001.
6. Know the pump application, limitations and potential hazards.
7. Wear safety glasses at all times when working with the pump.
8. Keep the work area clean, uncluttered and properly lighted - secure all unused tools and equipment.
9. Keep visitors at a safe distance from working area.
10. Make the workshop child-proof - with padlocks, master switches, and by removing starter keys.
11. Release all pressure within the system before servicing any component.
12. Provide a means of pressure relief for pumps whose discharge line can be shut-off or obstructed.
13. Periodically inspect the pump and system components. Perform routine maintenance as required.
14. Drain all the liquid from the system before servicing.



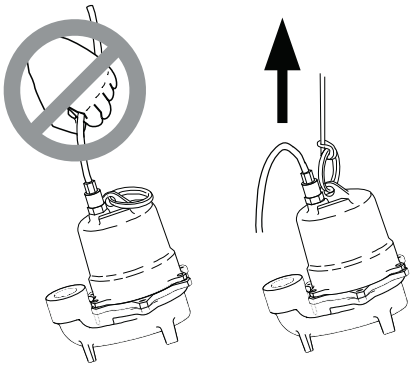
California Proposition 65 Warning

⚠WARNING This product and related accessories contain chemicals known to the State of California to cause cancer, birth defects or other reproductive harm.

Installation

Thank you for purchasing this HYDROMATIC® pump. To help ensure years of trouble-free operation, please read the manual carefully.

Before installation, check your local electrical and plumbing codes. A typical sewage pump installation is shown below.



Cord Lift Warning

⚠WARNING

Risk of electrical shock.
Can burn or kill.
Do not lift pump by power cord.

Risk of electrical shock and fire.

1. Attempting to lift or support the pump by the power cord can damage cord and cord connections, expose bare wires, and cause a fire or electrical shock.
2. Use handle on top of pump for all lifting or lowering of pump. Disconnect the power to the pump before doing any work on it or attempting to remove it from the pit.
3. Lifting or supporting the pump by the power cord will void the warranty.

Follow these guidelines for installation:

1. Provide properly sized sump (see *Specifications*).
2. Do not set pump directly on the bottom of sump pit if it is not solid. Raise the pump by using bricks or concrete blocks underneath it.
3. Make sure sump is free of string, cloth, nails, gravel, etc. before installing pump.
4. Do not remove ground pin from electrical plug.
5. Do not use an extension cord to operate this pump.
6. For proper automatic operation, make sure the pump power cord is plugged into the piggyback receptacle on the switch cord. Three phase models must be properly connected to a suitable control panel.

   Do not cut, crimp, or bend single phase switch power cord (**15**). The vent tube needs to "breathe" for proper operation of switch. This may cause pump failure and void warranty.
7. Use steel or plastic pipe for all connecting lines between pump and sewer outlet.

   NOTICE: Some city regulations do not allow installing a pump with plastic pipe. Check local regulations.
8. Use PTFE pipe thread sealant tape on pipe connections. Do not use ordinary pipe joint compound on plastic pipe or pump. Pipe joint compound can attack plastics and damage pump.
9. In applications where the pump may sit idle for months at a time, it is recommended that the pump(s) be cycled every month to ensure the pumping system is working properly when needed.
10. A check valve should be installed horizontally in discharge pipe.
11. The optional Hydromatic Q Alert is an audible alarm system for high water conditions. It should be installed in every sump for greater protection.

    NOTICE: Q Alert is for indoor use only. Other Q Alarm and control panels are available for outdoor use. Contact your HYDROMATIC distributor for applications.
12. Use pump partially or completely submerged for pumping waterlike liquids. The pump will pump solid materials up to 2″ (spherical) in diameter.

    ⚠ CAUTION **Risk of fire.** Do not pump flammable liquids. Strong chemicals or salt water should not be pumped without consulting your HYDROMATIC distributor for proper seals and coatings.

Operation

NOTICE: Do not allow pump to run in a dry sump. Doing so will void the warranty and may damage the pump.

An automatic overload protector in the motor will protect the motor from burning out due to overheating/ overloading. When the motor cools down, the overload protector will automatically reset.

If overload trips frequently, check for the cause. It could be a stuck impeller, wrong/low voltage, or electrical failure in motor. If an electrical failure in the motor is suspected, have it serviced by a competent repairman.

Maintenance

Read the following instructions carefully before replacing any parts. Reasonable care and safe methods should be practiced. Check local codes and requirements before installation. Only a competent plumber/electrician should make the installations.

Submerge pump in a disinfectant solution (dilute chlorine bleach) for at least one hour before disassembling pump.

Check for an obstruction in the impeller by looking through the suction hole of the pump. The shaft should turn freely if unobstructed. Keep fingers, clothing or any material from suction inlet.

The steps described in this section should be performed only by an authorized service center.

NOTICE: Read all directions before replacing any parts. Remove pump and switch from power source before servicing.

The numbers in parentheses, such as "(**3**)" or "(**16**)", refer to item numbers used on the *Repair Parts* diagram.

Replacing diaphragm switch

From switch housing (**15**) remove screw (**14**) from housing. Replace with new switch. Insert screw (**14**) into housing (**15**) and tighten. Plug pump power cord into the piggyback receptacle on the switch cord, and then switch plug into correct power source.

Checking motor operation

Plug power cord directly in power source to check motor operation. Motor should start and run smoothly. If motor does not start, pump must be dismantled and motor checked. Be certain to unplug cord before disconnecting any wires.

Checking motor stator

Remove plug (**21**) from top of housing (**19**) and pour oil into a clean glass container. There are approximately two quarts of oil in the motor housing. If oil is clear, it will indicate motor is not burned and there has been no water leak into the motor. If oil is black, it will indicate a burned stator. If oil is cloudy, it will indicate water in motor oil, so all seals should be replaced.

Remove bolts (**17**) to separate volute case (**12**) from motor housing. Remove O-ring (**18**) and seal plate (**11**) from motor housing. Remove bolts to separate motor-stator from rotor. If stator is visibly burned, it must be replaced. If stator is not burned but the oil shows signs of water, stator can be checked with the ohmmeter to see if it can be used.

Ground check

Set ohmmeter scale to R X 1 scale and check meter by putting both meter leads together and adjusting the needle knob until meter reads zero. If meter cannot be adjusted to zero, the batteries in meter must be replaced.

NOTICE: Always reset meter to zero [0] when going to a new scale before making any measurements.

If wire is OK, meter needle will go to near zero and stay there. If meter needle does not move, the wire has an open and the wire must be repaired or replaced.

Connect one meter lead to one blade terminal of stator and touch other meter lead to motor stator housing (**4**). If the resistance to the ground is less than 500,000 ohms, stator must be dried out before retesting. To dry out, place pump in 220 degree oven for four hours. Recheck after motor cools.

If motor is thoroughly dry, needle of ohmmeter will not move on the ground check. This indicates a reading of 50 megohms or higher. When making the ground check, if the needle goes to zero, the motor has a wire touching the stator shell at some place and the stator will have to be replaced.

NOTICE: If motor shows a satisfactory ground check then the winding resistance must be checked.

Winding resistance test

Use ohmmeter with scale set to R X 1 scale. On this scale, meter reads directly in ohms. Recheck to zero [0] before making a reading on the winding.

NOTICE: If water is found in motor, seal should be replaced.

Replacing seal

Hold rotor. On 3 phase motors only, remove the impeller screw and impeller washer. Unscrew impeller (**13**). Tap on end of shaft with plastic or rubber hammer. This will push the rotating seal (**10**) from shaft and also push lower bearing from seal plate. Clean seal plate (**11**) and motor housing (**19**) thoroughly. All sand and dirt must be removed. Remove stationary ceramic seat of seal (**10**) from seal plate. Push new ceramic seat into seal plate. Use O-ring Lube on rubber ring. Replace rotor in seal plate (**11**). Use care in putting shaft through ceramic seat to be sure it is not chipped. Inspect seal after shaft is in place. If seal has been chipped it must be replaced. Do not replace rotating part of seal until the balance of the pump is assembled.

Bearings

When the pump rotor has been removed, check bearings before replacing. If bearings are rusted or rough when turned, they should be replaced. When installing a replacement bearing, press only on the inner face. If a press is not available, bearings can be tapped on, using a sleeve that bears only on the inner face.

NOTICE: Never pound on the outer face of the bearing as this will cause bearing damage.

Reassembly

1. Push the new rotor shaft and ball bearing assembly into the seal plate. (Note that the replacement rotor must be of the same manufacture as the existing stator, or vice versa.) Reassemble the motor (**4**) to the seal plate (**11**) with the four long cap screws. Be sure to tighten down the bolts evenly and firmly to prevent cocking of the stator. An uneven assembly can cause the rotor to rub the motor causing the motor to short.
2. Press the new ceramic seal (**10**) in place with the rubber ring facing the impeller. This should have a thin oil (dielectric, same as in motor housing) coating.

   NOTICE: Ceramic must be kept clean. Any dirt will cause seal failure.
3. Start the impeller (**13**) on the shaft one to two turns; then, add a drop of [2]Loctite® #243 to the impeller threads and screw the impeller hand tight. The impeller will force the ceramic seal into position. The shaft should be free of dirt, grease, etc., or the Loctite® will not hold as designed. Replace impeller washer and impeller screw to the shaft on three phase models.

[2] Henkel Corporation, Germany

   NOTICE: Loctite® overrun onto the seal or bearing will result in shaft seizure.

4. Remove the old seal ring (**18**) and stretch on new ring with O-ring lube.

   Do not roll the ring onto seal plate or water leakage into the motor housing will result.

5. Fasten the ground wire inside the motor housing and tuck wires up into the housing to prevent rubbing on the rotor; then assemble housing (**19**) to volute (**12**) with bolts (**17**).

6. Before filling the motor housing with oil, a seal leak test should be performed. Apply 7 to 8 pounds of air pressure in the 1/4" NPT tap (**21**) on the top of the motor cover and seal chamber.

   NOTICE Too much pressure will damage the seal. Seal would have to be replaced.

   Then submerge the pump in water and check for leaks. If a leak occurs, isolate where it is coming from and correct the problem by replacing the failed part.

   HYDROMATIC pumps have a small air vent hole in the impeller cavity to let out trapped air. If this hole becomes plugged, pump may air lock. To break the air lock, use a small screwdriver to clear hole in the impeller cavity.

   As a secondary precaution in installations of this type, an 1/8" hole should be drilled in the discharge pipe just above the volute. The check valve should be at least 12 inches above pump discharge and mounted horizontally. Do not put check valve directly into pump discharge opening.

   NOTICE: In sumps where the pump is operating daily, air locking rarely occurs.

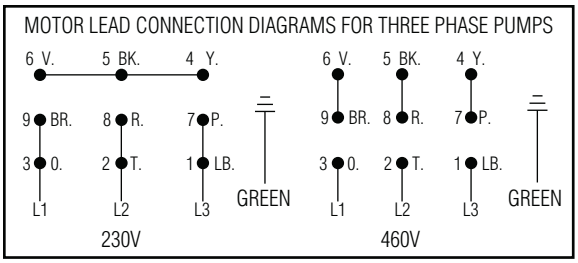
Oil fill

1. After seal leak test is satisfactory, remove unit from water and wipe or blow off any excess water.
2. Do not put oil in motor with any water present in motor cavity.
3. Use refined paraffinic transformer oil, [3]Shellflex™ 2210 or equivalent.

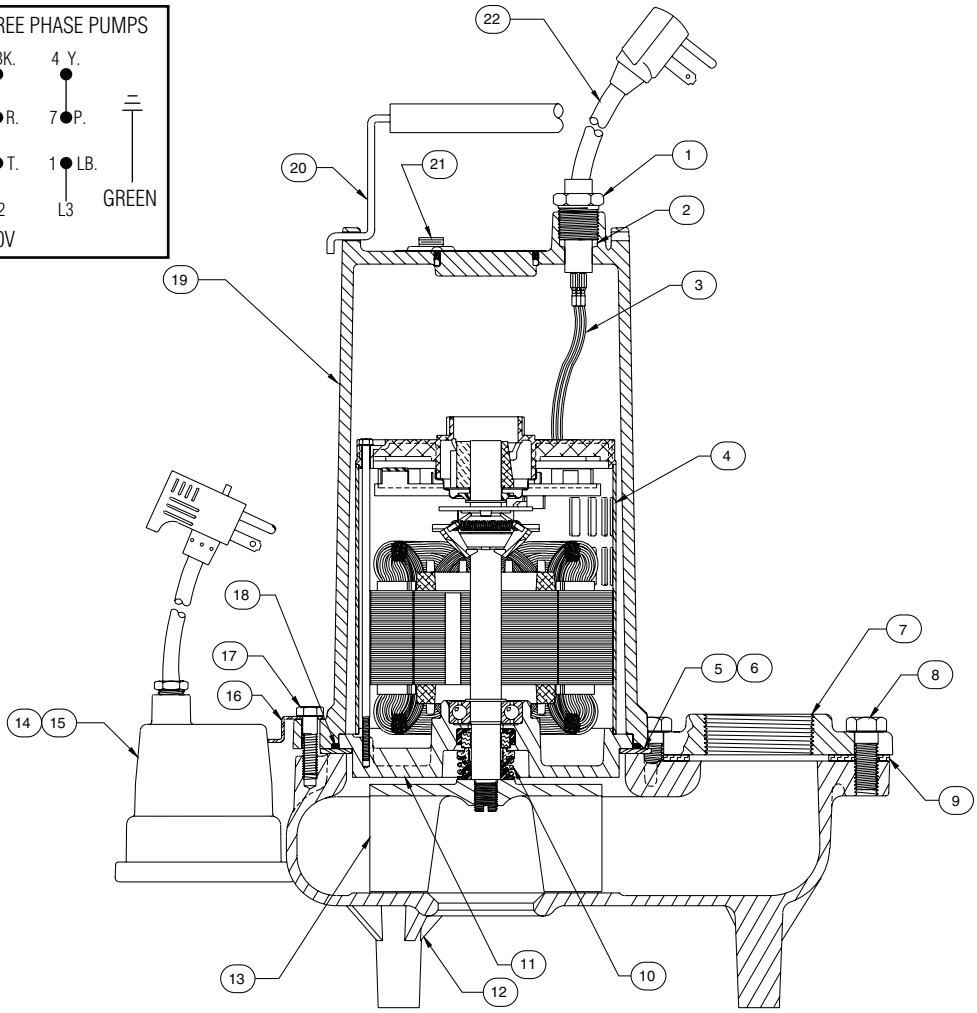
[3] Shell Oil Company, Texas

4. Slowly fill oil to 1/8" over windings in motor housing through opening (**21**). Use an oil fill tube that will go into holes so that air can escape. Replace plug (**21**).

   NOTICE Do not fill the motor housing completely – allow air space for expansion.



5. Connect power cord wires to terminals in panel, or connect power source, and check pump running. Motor should run smoothly and be free of vibration. Pump is ready for operation.



Troubleshooting 7

⚠WARNING Hazardous voltage. Can shock, burn, or kill. Disconnect power before attempting any service or repair work on pump.

⚠WARNING Hazardous impellers and unexpected starts which can cause loss of fingers. Keep hands away from pump suction inlet when working on or servicing pump.

Symptom	Possible Cause(s)	Corrective Action
Motor not running	Motor protector tripped.	Allow motor to cool. Make sure pump is completely submerged. Clear debris from volute and impeller. Check for high amp draw.
	Open circuit breaker or blown fuse.	Replace fuse or reset breaker. If circuit breaker opens repeatedly, don't reset it - call a licensed electrician.
	Impeller clogged or binding.	Check amp draw. If it is more than twice the nameplate amps, the impeller is locked. Bearings and shaft may be damaged. DISCONNECT POWER, clear debris from volute, impeller, and cutter as needed.
	Power cable damaged.	Resistance between power cable and ground should be infinity. If any reading is less than infinity, call a licensed electrician.
	Bad control panel.	Inspect control panel wiring. Call a licensed electrician.
	Defective liquid level switch.	With switch disconnected from power, check continuity through switch while activating liquid level switch. Replace switch if necessary.
	Not enough liquid in wet well to activate controls.	Allow the liquid to rise several inches above the switch-on level.
	Liquid level cords tangled	Untangle cords for free operation.
	Automatic controls defective	Try running pump in manual mode. If it runs, the automatic control is at fault.
Pump runs continuously	Liquid level control cords tangled	Untangle cords for free operation.
	Pump is airlocked.	Stop pump for about one minute, then restart. Repeat stopping and starting until the airlock clears. If the airlock persists, DISCONNECT POWER, pull the pump and drill a 1/8" hole in the discharge pipe between the pump discharge and the check valve.
	Flow in matches or exceeds the pump's capacity.	A larger pump or more pumps may be needed.
Little or no effluent delivered from pump	Check valve plugged, stuck shut, or installed backwards.	Make sure check valve is installed correctly (flow arrow should point away from pump) and functioning correctly.
	System head excessive.	Consult dealer.
	Pump suction plugged.	DISCONNECT POWER, pull pump, inspect, and clear as needed.
	Wrong voltage or not wired correctly.	Check pump's rotation; check nameplate voltage against supply voltage (they must match); consult a licensed electrician.
	Pump is air locked.	Stop pump for about one minute, then restart. Repeat stopping and starting until the airlock clears. If the airlock persists, DISCONNECT POWER, pull the pump and drill a 1/8" hole in the discharge pipe between the pump discharge and the check valve.
	Worn or damaged impeller.	DISCONNECT POWER, pull pump and inspect impeller. Replace if necessary.
	Liquid level controls incorrectly installed or defective.	Reposition or replace as necessary.
Pump cycles constantly	No discharge check valve installed.	Install discharge check valve.
	Discharge check valve stuck open.	Repair or replace check valve as necessary.
	Sewage wetwell too small.	Consult dealer.
	Liquid level controls incorrectly installed or defective.	Reposition or replace as necessary.
	Pump too small for inlet flow.	Consult dealer about larger pump or second pump.

Limited Warranty

HYDROMATIC warrants to the original consumer purchaser ("Purchaser" or "You") of HYDROMATIC Sump Pumps, Effluent Pumps, Sewage Pumps (other than 2-1/2"), and Package Systems, that they will be free from defects in material and workmanship for the Warranty Period of 36 months from date of manufacture.

Our warranty will not apply to any product that, in our sole judgement, has been subject to negligence, misapplication, improper installation, or improper maintenance. Without limiting the foregoing, operating a three phase motor with single phase power through a phase converter will void the warranty. Note also that three phase motors must be protected by three-leg, ambient compensated, extra-quick trip overload relays of the recommended size or the warranty is void.

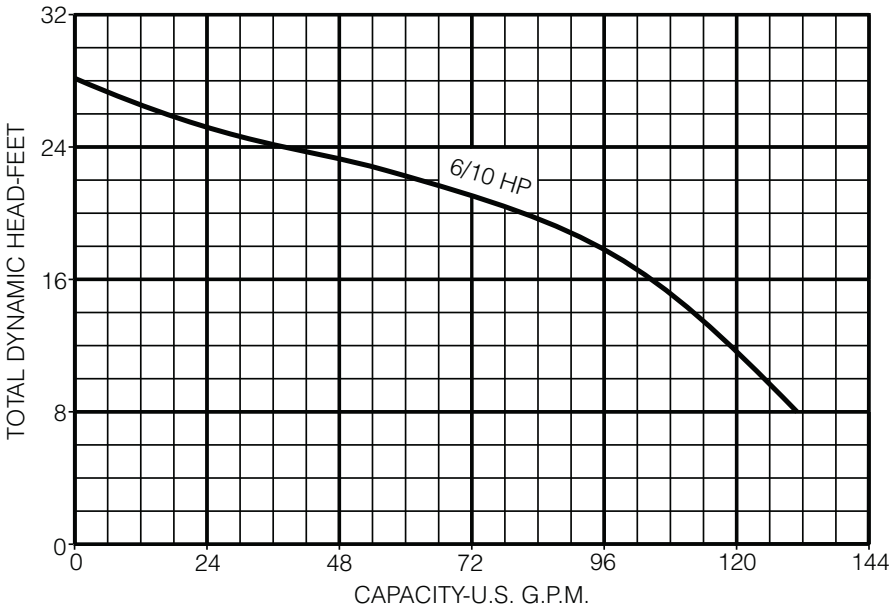
Your only remedy, and HYDROMATIC's only duty, is that HYDROMATIC repair or replace defective products (at HYDROMATIC's choice). You must pay all labor and shipping charges associated with this warranty and must request warranty service through the installing dealer as soon as a problem is discovered. No request for service will be accepted if received after the Warranty Period has expired. This warranty is not transferable.

EXCEPTIONS: Hydromatic Special Application Pumps, Battery Back-Up Sump Pumps, Filtered Effluent Pumps, Grinder Pumps, and 2-1/2" Sewage Pumps are warranted for a period of 12 months from date of purchase or 18 months from date of manufacture, whichever comes first.

HYDROMATIC SHALL NOT BE LIABLE FOR ANY CONSEQUENTIAL, INCIDENTAL, OR CONTINGENT DAMAGES WHATSOEVER.

THE FOREGOING LIMITED WARRANTIES ARE EXCLUSIVE AND IN LIEU OF ALL OTHER EXPRESS AND IMPLIED WARRANTIES, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE FOREGOING LIMITED WARRANTIES SHALL NOT EXTEND BEYOND THE DURATION PROVIDED HEREIN.

Some states do not allow the exclusion or limitation of incidental or consequential damages or limitations on the duration of an implied warranty, so the above limitations or exclusions may not apply to You. This warranty gives You specific legal rights and You may also have other rights which vary from state to state.



This Limited Warranty is effective June 1, 2011 and replaces all undated warranties and warranties dated before June 1, 2011.

Product Specifications

Model Family	SK60
Typical Application:	Sewage, dewatering
Capacities:	up to 130 GPM (8.2 LPS)
Heads:	up to 28 ft (8.5 m)
Electrical:	115V, 1ø, 12.0 FLA, 60Hz; 208V, 1ø, 6.9 FLA, 60Hz; 230V, 1ø, 6.0 FLA, 60Hz; 208V, 3ø, 2.9 FLA, 60Hz; 230V, 3ø, 2.5 FLA, 60Hz; 460V, 3ø, 1.3 FLA, 60Hz; 575V, 3ø, 1.04 FLA, 60Hz
Motor:	(single phase) - 6/10 HP split phase with thermal overload protection, 1750 RPM; (three phase) - 6/10 HP polyphase, 1750 RPM
Intermittent Liquid Temperature:	140°F (60°C)
Minimum Recommended Sump Diameter:	Simplex = 24" (609.6 mm); Duplex = 36" (914.4 mm)
Automatic Operation:	Diaphragm pressure switch (single phase only, manual available)
Materials of Construction:	Class 30 cast iron
Impeller:	Class 30 cast iron two-vane nonclog
Discharge Size:	2″ NPT (50.8 mm); 3" NPT (76.2 mm) optional
Solids Handling:	2″ (50.8 mm)
Power Cord:	1ø, 115V - 10', STW-A (20' optional); other 1ø and all 3ø - 20', STW-A

SPEC 22 42 01 2.13 TAG : EW-1

model 7501

Portable Gravity Fed Eyewash

FEATURES & BENEFITS

CONSTRUCTION

FDA approved high-density green polyethylene tank provides the light and durable construction required in a portable unit.

MOUNTING

J-shaped stainless steel wall bracket makes for a well constructed portable mount for easy removal and re-mount.

FLOW CONTROLS

Pulling down the eyewash arm will begin flushing the 9-gallon (34.1 L) portable tank at .4 gpm (1.5 L) for a full 15 minutes, creating a full patterned flushing of the eyes.

DESIGN

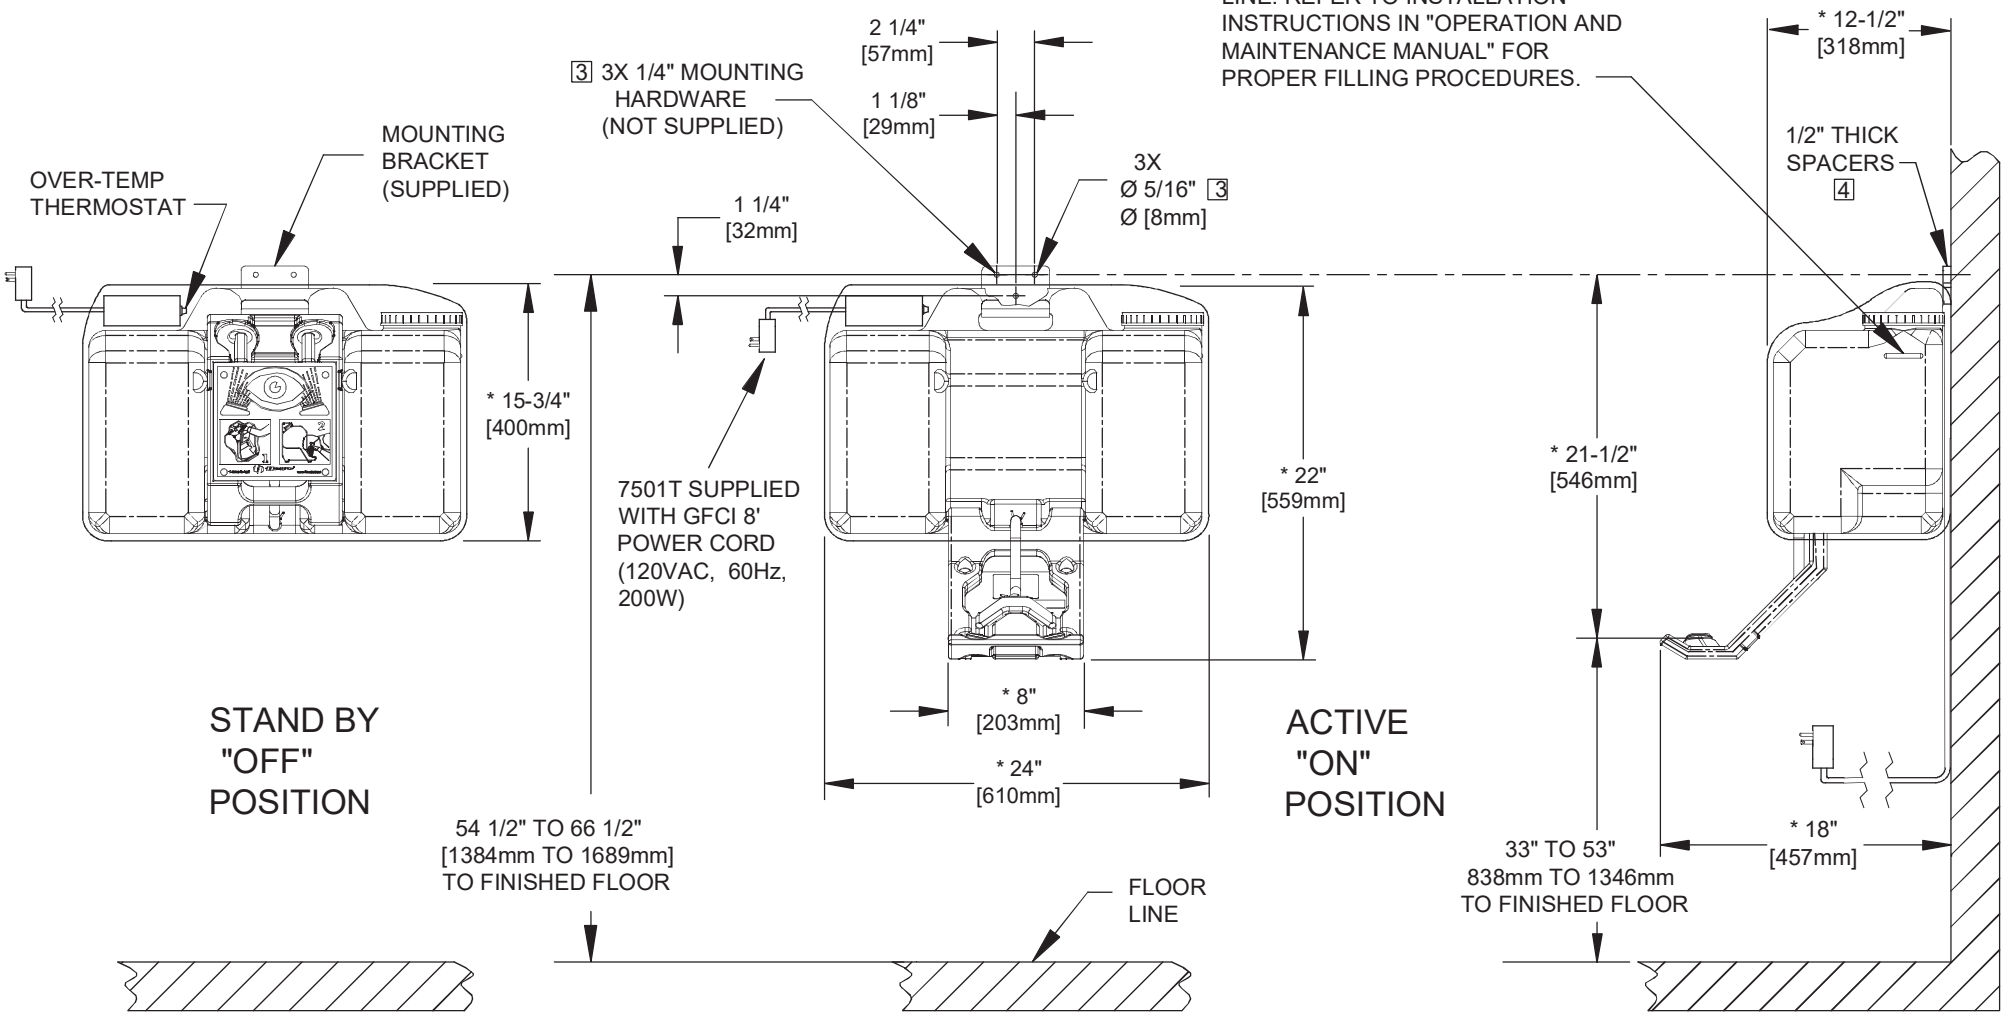
Tank comes complete with a wide-fill opening and threaded cap for quick inspection, cleaning, and filling. Unit also comes equipped with top and side handles making relocation easy.

OPTIONS

- ☐ Water Additive: Model 9082, 'sterile' bacteriostatic preservative for use in portable eyewash stations. One 5 oz. (148 ml) bottle will preserve 5 to 20 gallons (18.9 to 75.7 L) of potable water for up to three months. Four bottles per carton.
- ☐ Waste Container: Model 9009 is a twenty-gallon (75.7 L) wastewater container constructed of tough yellow polymer resin. Unit is used to collect water during weekly testing of emergency equipment.

For more information, visit www.hawsco.com or call (888) 640-4297.

SPECIFICATIONS



Model 7501 portable gravity operated eyewash shall include a FDA approved high-density green polyethylene 9 gallon (34.1 L) tank, ABS plastic eyewash heads with .4 gpm (1.5 L) flow rate over 15 minutes, yellow pull-down activation arm, integral handle on top, wide-fill threaded cap, sign-mounted operating instructions, and stainless steel wall bracket (unit must be hung). Additive not included - Order separately.

APPLICATIONS

Where the eyes of any person may be exposed to injurious or corrosive materials, when suitable facilities for quick flushing of the eyes needs to be provided and a continuous supply of water is not available. Although the 7501 may be installed in a wide variety of locations, it is ideal for remote areas where protective measures are still needed. Emergency eyewash equipment shall be in unobstructed and accessible locations that require no more than 10 seconds for the injured person to reach. Model 7501 is certified by CSA to meet the ANSI Z358.1 Standard for Emergency Eyewash and Shower Equipment.

DISCLAIMER: Continued product improvements make specifications subject to change without notice. Check www.hawsco.com for the latest product information and updates.

THIS DOCUMENT IS TRUE AND CORRECT AT TIME OF PUBLICATION. CONTINUED PRODUCT IMPROVEMENTS MAKE SPECIFICATIONS AND MEASUREMENTS SUBJECT TO CHANGE WITHOUT NOTICE.

NOTES: (CONTINUED FROM SHEET 1 OF 2)

4 LOCATE ONE 1/2" THICK SPACER (QTY. 3 SUPPLIED) BEHIND EACH HOLE IN THE MOUNTING BRACKET AS SHOWN.

5. * DIMENSIONS MAY VARY ±1/2" [12.7mm].
6. **UNIT MUST BE FILLED WITH WATER BEFORE CONNECTING TO POWER SOURCE.**

(FOR MODELS 7501T240 & 7501BL240:)

7. CORD SET SHALL BE LISTED TO UL 817 AND CSA-C22.2 NO. 21 AND PROVIDED WITH 3 WIRE GROUNDING TYPE ATTACHMENT PLUG RATED 240 V, MIN. 15 A.
8. THE FLEXIBLE CORD TYPE SHALL BE TYPE S, SE, SJ, SJE, SJO, SJOO, SJT, SJTO, SJTOO, SO, SOO, ST, STO, OR STOO AND HAVE A TYPE LETTER SUFFIX OF "W," "W-A" OR "OUTDOOR."
9. THE CORD SET SHALL BE MIN. 6 FT IN LENGTH AND MIN 18 AWG SIZE FOR FLEXIBLE POWER SUPPLY CORD.
10. LISTED STRAIN RELIEF BUSHING SUITABLE FOR CORD SET SIZE AND OUTDOOR USE SHALL BE USED.
11. THE FIELD INSTALLED POWER SUPPLY CORD SET NEEDS TO BE INSTALLED BY QUALIFIED PERSONNEL.

TRAP GUARD DRAIN INSERT PROTECTION

CAN BE USED ABOVE OR BELOW GROUND FLOOR

TRAP GUARD INSERT FITTING FITS
INSIDE OF CAST IRON OR PLASTIC PIPE

REVIEWED
by MV

SPEC 22 42 01 2.2

- ☐ PART NO. TG22IP 2" INSERT FITS INSIDE 2" CAST IRON PIPE
- ☐ PART NO. TG22P 2" INSERT FITS INSIDE 2" PVC OR ABS PIPE
- ☐ PART NO. SG22P 2" SUDS GUARD FITS INSIDE 2" PVC OR ABS PIPE
- → ☐ PART NO. TG33IP 3" INSERT FITS INSIDE 3" PVC, ABS OR CAST IRON PIPE
- ☐ PART NO. TG33-WADE 3" INSERT FITS INSIDE 3" WADE DRAIN TAILPIECE.

FOR TRAP GUARDS INSERTING INTO GASKET CONNECTED DRAINS, SEE DRAWING TG-23-G

IMPORTANT NOTES :

1. This insert can be installed into any open ended pipe to prevent sewer gas emission.
2. They can be inserted into an open end pipe that connects larger top floor drains.
3. They can be inserted into open ended pipe that connects floor sinks or hub drains,
4. To make a watertight seal, use an adhesive type caulk under the top flange or if the pipe opening is PVC, a small amount of solvent cement can be used under the flange.

If the trap guard device should get damaged or impaired in any way, the device can be easily removed by using a sharp screw driver under the flange.

Note: Care should be taken not to touch the elastomeric flexible material with the primer.

MAINTENANCE INSTRUCTIONS:

The Trap Guard device should be inspected periodically for build up of any type debris. The device should then be flushed out thoughly with clear warm water.

NO FIRE RATINGS ARE
REQUIRED FOR UNDERGROUND
PIPING OR OPENINGS

Simple washing Station 3/4'' (19mm) for hot or cold water with ball valve and hose rack

FEATURES

- Maximum operating pressure: 150 PSI (1034 kPa).
- Maximum operating temperature: 200°F (93°C).
- Required water pressure: 0 à 150 PSI (0 à 1034 kPa).
- High quality ball valve made of stainless steel.
- **Inlet 3/4'' (19mm) female NPT, Outlet 3/4'' (19mm) female NPT.**
- Rigid stainless steel bracket.
- Stainless steel plate 12'' (30.5mm) x 12'' (30.5mm) x 1/8''(.04 mm) finished # 4
- Stainless steel hose rack. Can hold up to 75 feet (22.9m) of 1/2'' (13mm) hose.

INDUSTRIAL HOSES FOR GENERAL PURPOSE

High quality industrial hoses for general applications. Perfect for transporting air or liquids depending on the needs. Available in several size.

Applications :	General purpose for air or water line inside or outside.				
Cover :	Red smooth weather and abrasion resistant PVC.				
Reinforcement :	Multiple layers of synthetic yarns.				
Tube :	Black oil resistant PVC blend.				
Temperature :	- 30 °C to 70 °C (-22 °F to 160 °F).				
Nominal I. D.	**Nominal O. D.**	**PSI**	**WT. (pound)**	**Standard pkg**	**Part number**
1/4”	0.55”	250	0.13	300’	GP-025-250

T-70 SERIES

INDUSTRIAL AUTOMATIC SPRAY NOZZLE GUN

Ideal for many cleaning tasks in every kind of industrial plants. Easy to use.

NOZZLE GUN : For use with hot and cold water only.
Do not use with steam

T-70 MODEL

T-75 MODEL

T-77 MODEL

FEATURES

- Body made from brass casting. (Alse available in stainless steel in option.)
- Maximum operating pressure : 150 PSI (1034 kPa).
- Maximum operating temperature : 200 °F (93 °C).
- Flow rates : 5-7 GPM (18.9 – 26.5 l/min) under normal operating conditions 50-80 PSI (345 – 552 kPa), 10 GPM (37.9 l/min) @ 150 psi (1034 kPa).
- This gun does a better work with less water flow. The precision of construction of this gun allow the operator to have several types of water jets simply by pressing the handle. This model close automatically when the handle is released, which eliminate any water wasting.

INSTALLATION INSTRUCTIONS
CARE AND MAINTENANCE

American Standard
Style That Works Better

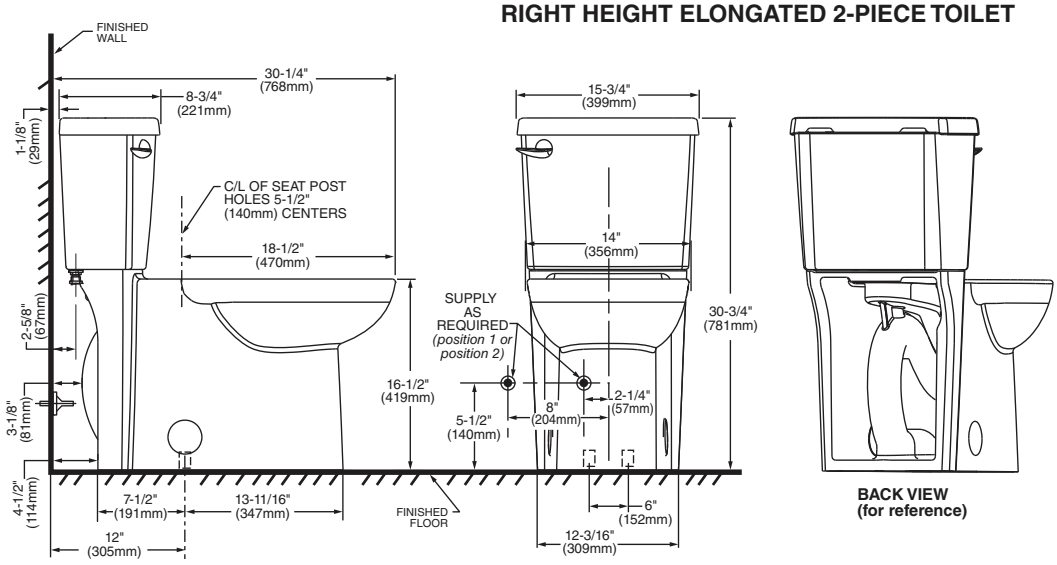
Cadet® 3 Concealed Trapway
Studio® Concealed Trapway
Right Height®, Elongated Model 2985, 2989, 2794
Right Height®, Round Front Model 2984, 2988, 2795

Thank you for selecting American Standard - the benchmark of fine quality for over 100 years. To ensure this product is installed properly, please read these instructions carefully before you begin. (Certain installations may require professional help.) Also be sure your installation conforms to local codes.

⚠ CAUTION: PRODUCT IS FRAGILE. TO AVOID BREAKAGE AND POSSIBLE INJURY HANDLE WITH CARE!
NOTE: *Pictures may not exactly define contour of china and components.*

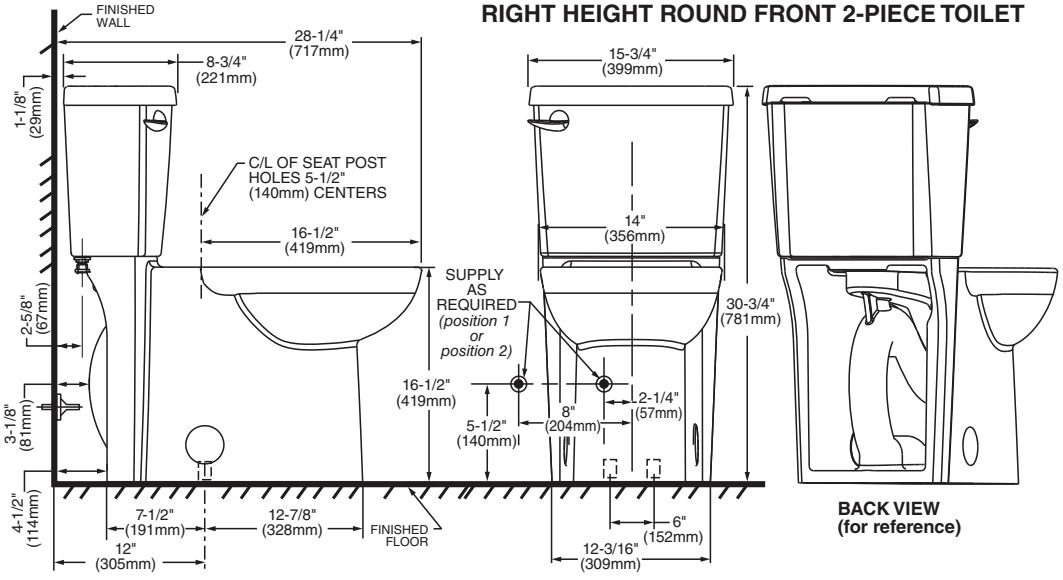
RECOMMENDED TOOLS AND MATERIALS

Putty Knife	Regular Screwdriver	Adjustable Wrench	Sealant	Tape Measure
Hacksaw	Wax Ring/Gasket	Flexible Supply Tube	Closet Bolts	Carpenters Level



1 REMOVE OLD TOILET

a. Close toilet supply valve and flush tank completely. Towel or sponge remaining water from tank and bowl.
b. Disconnect and remove supply line. NOTE: *If replacing valve, first shut off main water supply!*
c. Remove old mounting hardware, remove toilet and plug floor waste opening to prevent escaping sewer gases.
d. Remove closet bolts from flange and clean away old wax, putty, etc. from base area.
NOTE: *Mounting surface must be clean and level* ***before*** *new toilet is installed!*

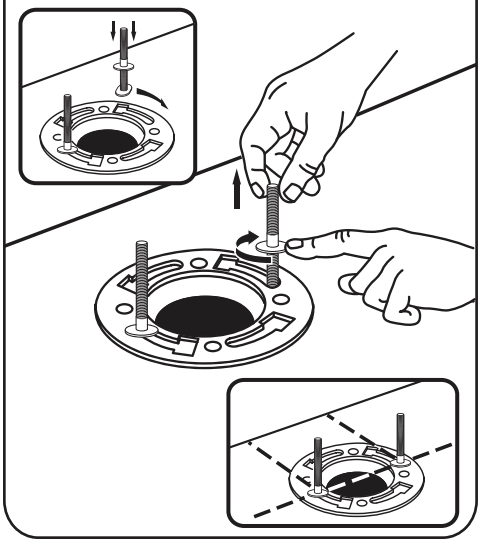


2 ROUGHING-IN DIMENSIONS:

NOTE: *Distance from wall to closet flange centerline must be as listed below:*

RIGHT HEIGHT ELONGATED 2-PIECE TOILET

RIGHT HEIGHT ROUND FRONT 2-PIECE TOILET



IMPORTANT: Water supply on the wall is required at 2-1/4" or 8" from centerline of the toilet (see rough-in). First suggested position is hidden behind the toilet. The geometry of the toilet gives space for this installation. The second suggested position is next to the toilet. Between these two positions, the space for the supply between wall and toilet is limited to 4-1/2". In this case, check your supply and hose dimensions.

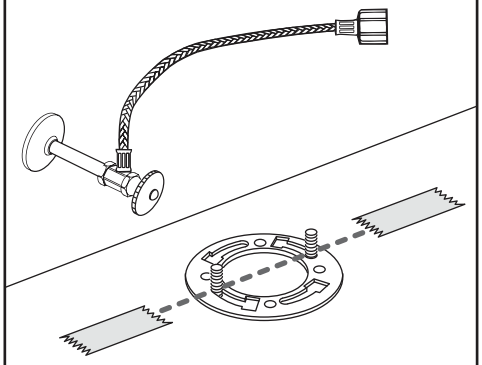
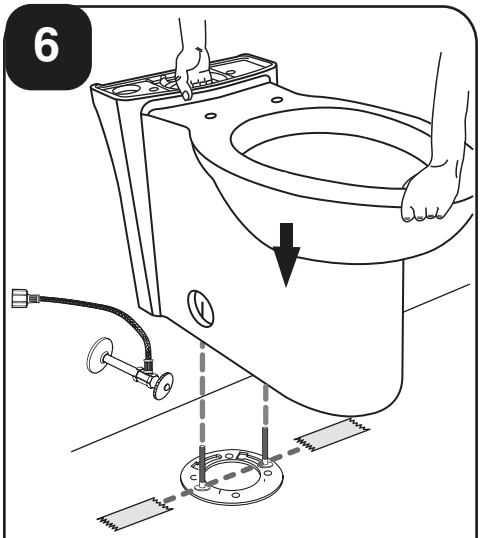
3

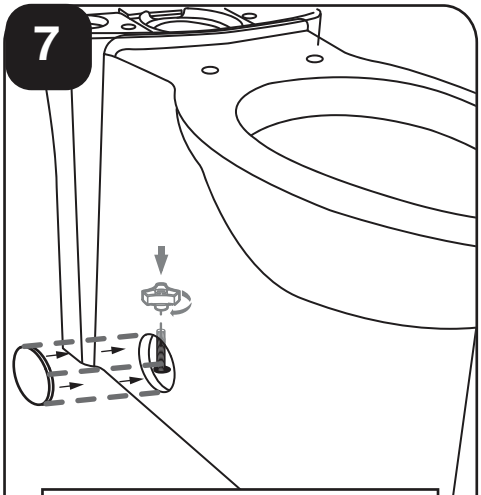


4

Press firmly.

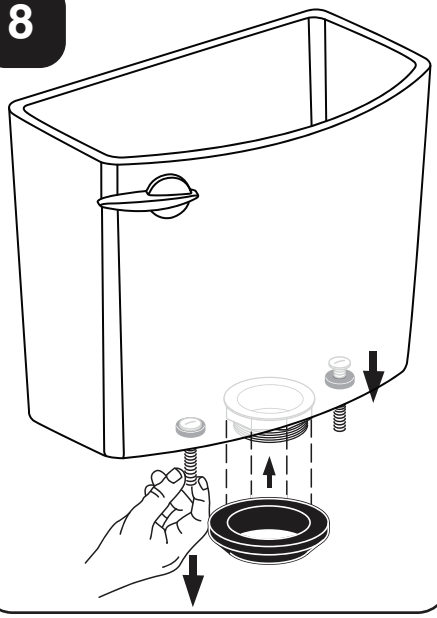


5



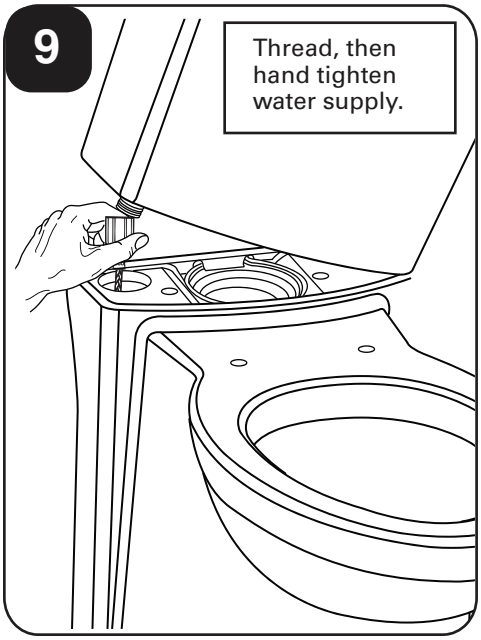
TIP: Place 2 pieces of masking tape on floor (as shown) to help with alignment in step 6.

6



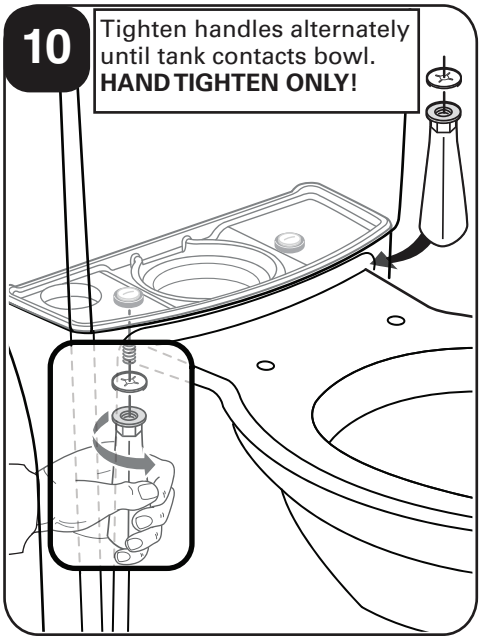
Apply weight evenly. Do not move after placement. Water tight seal may break.

7



⚠ **Hand Tighten Only. Do Not Overtighten.**

8



9

Thread, then hand tighten water supply.

10

Tighten handles alternately until tank contacts bowl. **HAND TIGHTEN ONLY!**

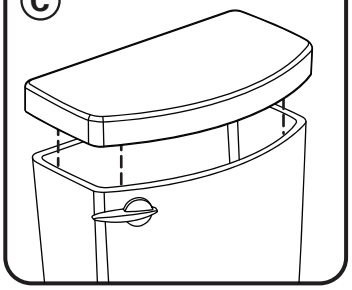
*** For seat installation, see instructions included with seat.**

⚠ WARNING:

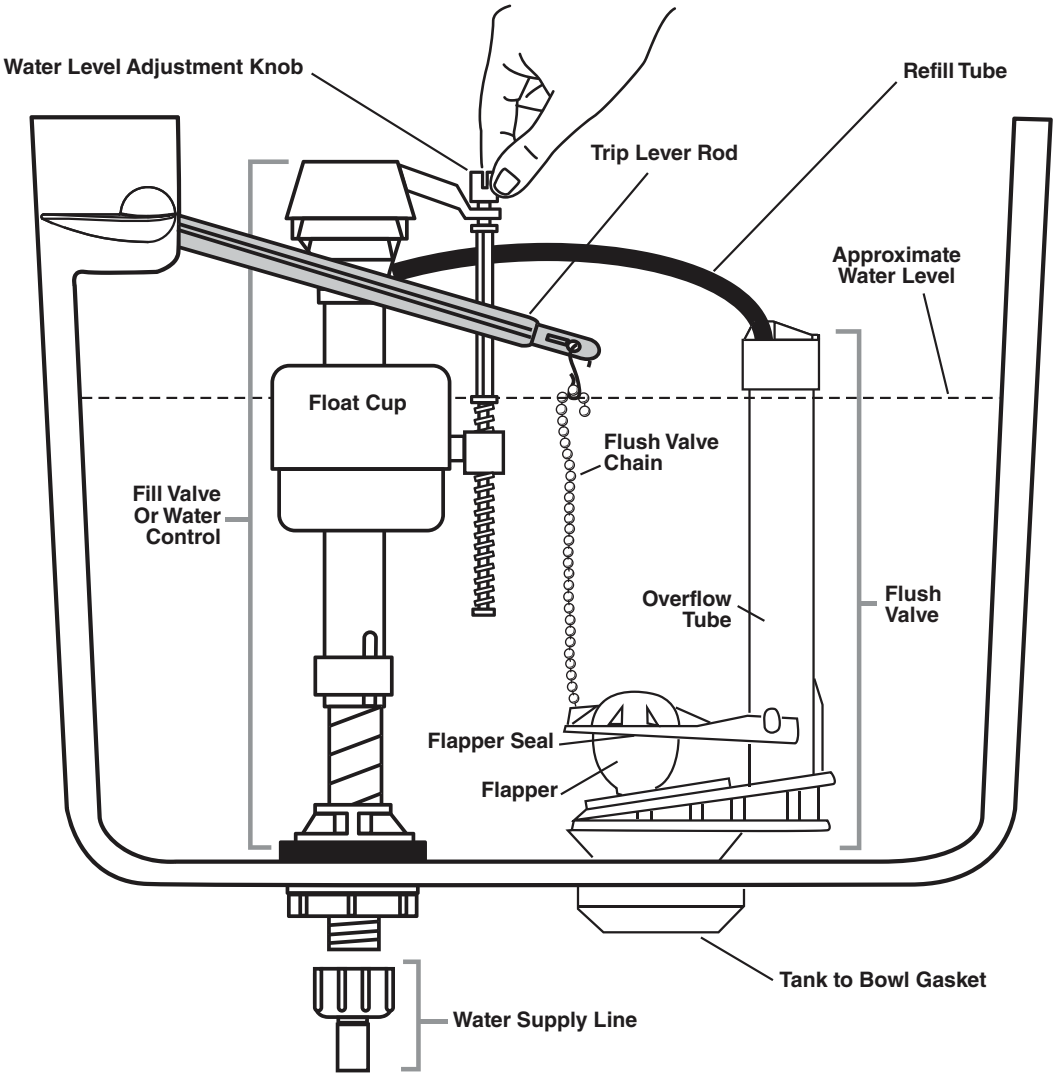
Overtightening of water supply line nuts could result in breakage and potential flooding. If the connection leaks after hand tightening, replace the supply line. Do not use any type of sealant on the water supply connection.

⚠ ***Use of plumber's putty, pipe dope, or any other type of sealant will void the warranty.***

11



A



Turn on water supply.

B

Adjust water level to level indicated on tank by turning water level adjustment knob to move float cup up or down.

C

CARE AND CLEANING:

When cleaning your toilet, wash it with mild, soapy water, rinse thoroughly with clear water and dry with a soft cloth.

WARNING: Do not use in-tank cleaners. These products can seriously corrode fittings in the tank. This damage can cause leakage and property damage.

American Standard shall not be responsible or liable for any damage caused by the use of in-tank cleaners.

REPAIR PARTS LIST

Repair parts are determined by toilet tank number which can be found marked inside tank.
NOTE: *"XXX" represents color or trim finish options. Specify when ordering.*

TROUBLESHOOTING GUIDE

See Step 11 For Diagram

Problem	Possible Cause	Corrective Action
Does not flush	a. Water supply valve closed. b. Supply line blocked. c. Flush valve chain too loose or disconnected. d. Sand or debris lodged in water control.	a. Open valve and allow water to fill tank. b. Shut off water supply, disconnect supply line and inspect all gaskets and washers. Reassemble. c. Readjust chain length as required. d. Shut off water supply. Remove cap and clean as per Fluidmaster maintenance instructions at: www.americanstandard-us.com/enews/fluidmasterguide.pdf
Poor or sluggish flush	a. Bowl water level too low. b. Supply valve partly closed. c. Partially clogged trapway and/or drain pipe and/or vent. d. Supply pressure too low.	a. Check that refill tube is connected to water control and inserted into overflow tube without being kinked or damaged. b. Open supply valve fully. Be sure that proper supply tube size is used. c. Remove obstruction. Consult a plumber if necessary. d. Normal supply pressure must be at least 20 psi.
Toilet leaks	a. Poor supply line connection. b. Poor bowl to tank/floor connection.	a. Review Step 10 of installation procedure. b. Review Step 3 through 8 of installation procedure.
Toilet does not shut off	a. Flapper seal leaking or deformed. b. Sand or debris lodged in water control. c. Flush valve chain too tight, holding flapper open.	a. Clean debris from seal surface. Replace flapper seal as needed. b. Shut off water supply. Remove cap and clean as per Fluidmaster maintenance instructions at: www.americanstandard-us.com/enews/fluidmasterguide.pdf c. Readjust chain length as needed.
Toilet bowl rocks after installation	a. Wax ring not fully compressed. b. Floor not level.	a. Retighten bowl-to-floor knobs. b. Use toilet shims and /or place a bead of caulk around the base of the toilet.

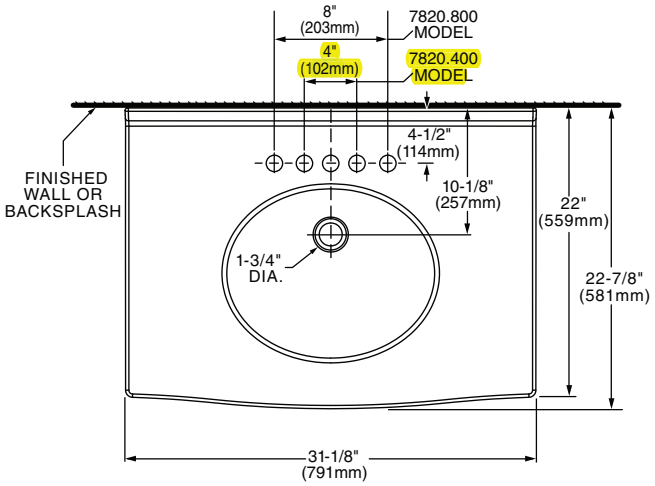
NEWBERN™ VANITY TOP
FINE FIRE CLAY

NEWBERN™ VANITY TOP

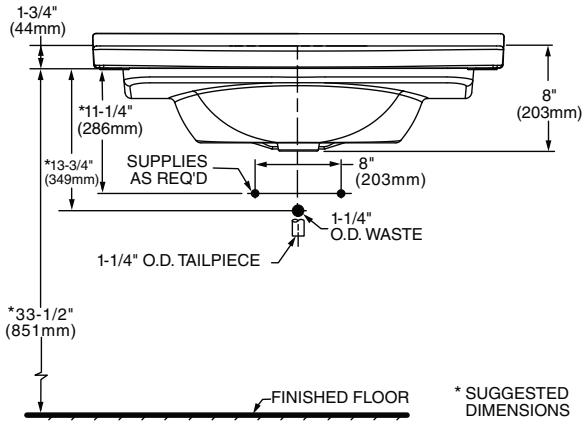
❑ **7820.400** Faucet holes on 4" centers
❑ **7820.800** Faucet holes on 8" centers

- Seamless one piece design made from Fine Fire Clay
- Interior Oval bowl design
- Includes 1" backsplash
- Fits most standard 30" vanities
- Pre-drilled for 4" and 8" faucet holes
- Includes safety overflow design

Nominal Dimensions:
31-1/8" x 22-7/8"
(791 x 581 mm)



Bowl sizes:
16" (406mm) wide
13" (330mm) front to back
6-1/2" (165mm) deep



Compliance Certifications -
Meets or Exceeds the Following Specifications:
- ASME A112.19.9M for Non-Vitreous Ceramic Fixtures

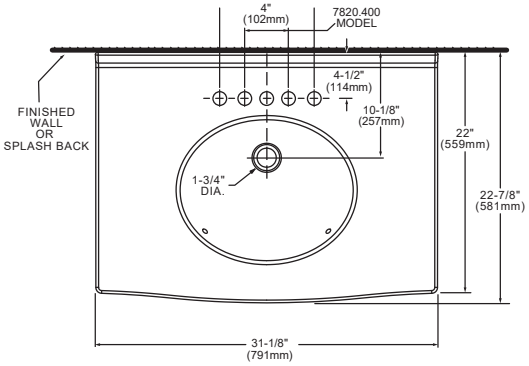
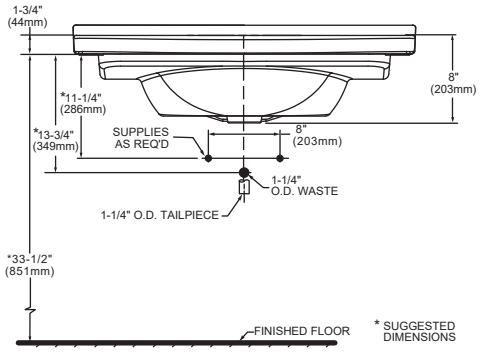
ASSEMBLY & INSTALLATION INSTRUCTIONS

Newbern Vanity Top™ 7820.400

Fits most 30" X 21" Vanity Bases

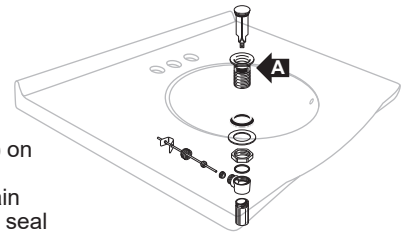


Thank you for selecting our products...products which have been the benchmarks of fine quality for over 100 years. To help insure that the installation process will proceed smoothly, please read these instructions carefully before you begin. Also, review the recommended tools and materials list; carefully unpack and examine your new plumbing fixture.



To maintain the beauty of the finish, avoid placing the furniture in direct sunlight, as sunlight causes fading. Also avoid extreme changes in temperature by arranging furniture away from radiators, heat and air vents, and air conditioning units. Avoid placing furniture directly under windows.

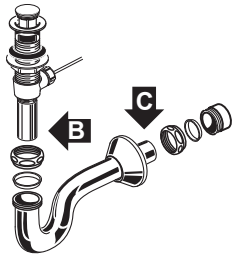
Recommended Tools & Materials



Basin Wrench, Adjustable Wrench, Tubing Cutter, Putty Knife, Channel Locks, Pipe Wrench, Tape Measure, Plumbers' Putty, Silicone Caulk, Level

Roughing-in Dimensions

Vanity Installation



Two people recommended for this installation

Mount the drain assembly (not included) on the sink. Be certain to apply a bead of sealing putty on the underside of the drain (Part "A") in order to ensure a watertight seal between the sink and drain. Remove excess putty after installing the drain on the sink.

Apply a bead of silicone adhesive to the rim of the vanity. Place the top centered left to right on the vanity and with the back edge of the top even with the rear of the vanity. Apply a bead of silicone along the top back edge of the vanity top and the wall. Clean up any excess silicone.

Connect the trap to the drain assembly hand tight to check alignment. It may be necessary to cut off part of the tailpiece (area "B") or part horizontal leg of the trap (area "C").

Connect hot and cold supply lines to the shut off valves. Tighten trap joints for watertight assembly.

CARE AND CLEANING

When cleaning your vanity top, wash it with mild, soapy water, rinse thoroughly with clear water and dry with a soft cloth. Avoid abrasive detergents, disinfectants, or cleaning products in aerosol cans.

AMERICAN STANDARD ONE-YEAR LIMITED WARRANTY

If inspection of this American Standard plumbing product, within one year after its initial purchase, confirms that it is defective in materials or workmanship, American Standard will repair or, at its option, exchange the product for a similar model.

This warranty **does not apply** to local building code compliance. Since local building codes vary considerably, the purchaser of this product should check with a local building or plumbing contractor to insure local code compliance before installation.

This warranty **shall be void** if the product has been moved from its initial place of installation; if it has been subjected to faulty maintenance, abuse, misuse, accident or other damage; if it was not installed in accordance with American Standard's instructions; or if it has been modified in a manner inconsistent with the product as shipped by American Standard.

American Standard's option to repair or exchange the product under this warranty does not cover any labor or other costs of removal or installation, **nor shall American Standard be responsible for any other incidental or consequential damages attributable to a product defect or to the repair or exchange of a defective product, all of which are expressly excluded from this warranty.** (Some states or provinces do not allow the exclusion or limitation of implied warranties, so this exclusion may not apply to you.)

This warranty gives you specific legal rights. You may have other statutory rights that vary from state to state or from province to province, in which case this warranty does not affect such statutory rights.

For service under this warranty, it is suggested that a claim be made through the contractor or dealer from or through whom the product was purchased, or that a service request (including a description of the product model and of the defect) be sent to the following address:

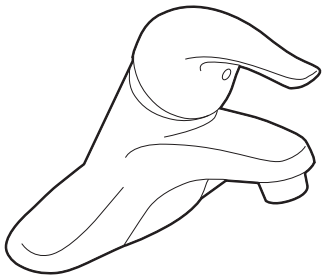
DESCRIPTION
- Metal construction with various finishes identified by suffix
- Flexible supplies with 3/8" compression fittings
- Includes metal or 50/50 pop-up type waste assembly where noted



OPERATION
- Pivot action lever style handle
- Temperature controlled through 100˚ degree arc of handle travel

FLOW
- Flow is limited to 1.5 gpm max (5.7L/min) at 60 psi

CARTRIDGE
- 1255™ Duralast™ cartridge
- Nonmetallic/nonferrous and stainless steel material

STANDARDS
- Third party certified to WaterSense,® CSA B-125.1, ASME A112.18.1 and all applicable requirements referenced therein including NSF61/9
- Contains no more than 0.25% weighted average lead content
- Complies with California Proposition 65 and with the Federal Safe Drinking Water Act
- **ADA** for lever handle

WARRANTY
- Lifetime limited warranty against leaks, drips and finish defects to the original consumer purchaser
- 5 year warranty if used in commercial installations

EngA MODEL: LM8/C/HRA/MV **QTY:** 1 **TAG:** AHU-2

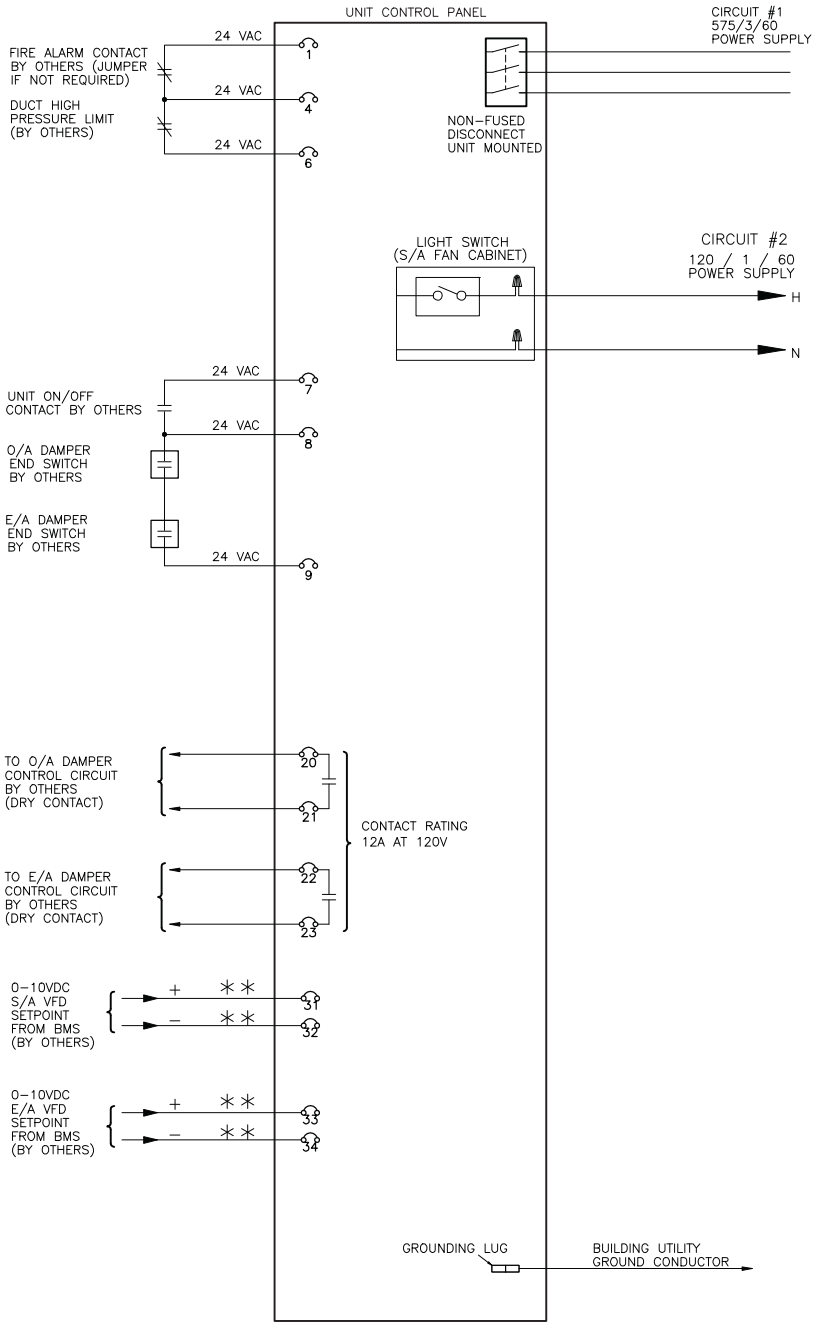
UNIT FUNCTION

Unit mounted non fused disconnect switch 'on', service switch 'on', fire alarm contact (by others) 'closed' (jumper if not required), duct high pressure limit (by others) 'closed', both S/A & E/A VFD fault contacts (by others) 'closed', unit is ready for operation.

Unit on/off contact (by others) 'closed', O/A & E/A dampers (by others) are enabled. After O/A & E/A dampers proven open, blowers start and run continuously down to a minimum airflow of 50% of blower air flow(30 hz VFD speed). Blower/Motor VFD speeds (see note 1) are controlled by 0-10VDC signal (by others).



The Johnson frost controller A350 will modulate HRA face & bypass dampers to maintain the heat exchanger exhaust air leaving temperature above 34°F (1.1°C) (adjustable). If economizer contact 'closed', HRA Face & BP dampers open to 100% BP position.

Auto bypass low limit will stop unit operation if the discharge air temperature falls below 40°F (4.4°C).

If non fused disconnect switch 'open', or service switch 'open', or fire alarm contact 'open', or duct high pressure limit 'open', or S/A VFD fault contact 'open', or E/A VFD fault contact 'open', or unit on/off contact 'open', O/A & E/A dampers are disabled, blowers stop, unit is off.

Note 1 - VFD has an external bypass switch, when activated blower and motor will operate at full speed.
Note 2 - Refer to manuals shipped with unit for a more detailed explanation of maintenance, component(s) and/or controller(s).

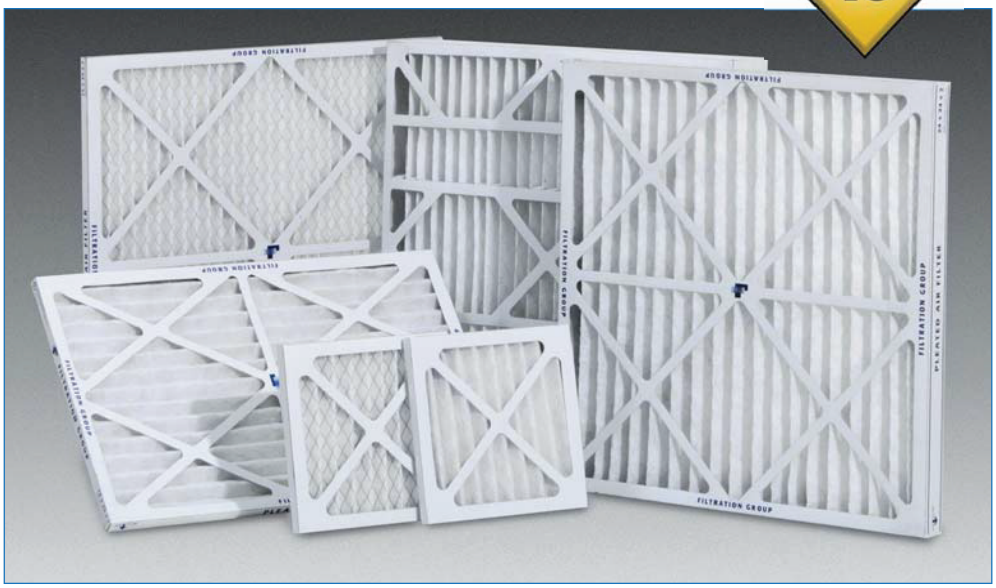
DAFCO FILTRATION GROUP®



SERIES 400 PLEATED AIR FILTER

MERV 10

AEROSTAR®

- *High Capacity achieves MERV 10*
- *Standard Capacity achieves MERV 8*
- *Extremely low resistance to air-flow minimizes energy costs*
- *100% synthetic media is moisture resistant and will not promote biological growth*
- *Advanced media does not rely on electrostatic charge for efficiency*

100% Recycled Paperboard®
MINIMUM 35% POST CONSUMER CONTENT

DESCRIPTION

The Aerostar® Series 400 pleated air filter utilizes a state-of-the-art 100% synthetic media to achieve exceptionally high levels of efficiency with the lowest resistance to air flow available. The media is laminated to an expanded metal grid on the air exiting side to provide exceptional strength during installation. The media support grid prevents fluttering and maintains pleat uniformity for optimum performance. The filter pack is enclosed in a heavy-duty, moisture resistant die-cut frame that will not warp, crack, or distort under normal operating conditions.

The 1" and 2" depth filters handle air velocities up to 500 fpm; 4" depth filters up to 625 fpm. Aerostar Series 400 pleats are recommended for most commercial and industrial applications to protect people and equipment, or as pre-filters to even higher efficiency air filters.

BENEFITS

The improved Aerostar Series 400 pleated filter has independent test lab data confirming exceptionally high levels of airborne particle removal with the lowest resistance to air flow available.

- Series 400 HC model achieves MERV 10
- Series 400 SC model achieves MERV 8
- Series 400 HC model initial resistance of 0.17" w.g. @ 500 fpm
- Series 400 SC model initial resistance of 0.19" w.g. @ 500 fpm
- Higher levels of filtration make the Series 400 extremely effective removing many airborne irritants such as pollens, molds, dander, and dust.
- Low resistance improves air flow and can greatly reduce energy costs
- Series 400 pleat filters can be a valuable tool in achieving points for USGBC - LEED certification projects.

APPLICATIONS

Aerostar Series 400 pleated air filters are designed for use in commercial buildings, hotels, industrial filtration, airports, school and universities, or any application desiring higher levels of air filtration to protect occupants from airborne irritants and protect cooling coils, ductwork, and other components of the HVAC system from dust and dirt.

INITIAL RESISTANCE

FRACTIONAL EFFICIENCY

SERIES 400 ENGINEERING SPECIFICATIONS

1.0 General

1.1 Filters shall be Aerostar® Series 400 extended surface pleated air filters as manufactured by Dafco Filtration Group.
1.2 Filters shall be available in standard and high capacity configurations and available in nominal depths of 1", 2", and 4".
1.3 Underwriters Laboratories classified to UL 900.

2.0 Filter Materials of Construction

2.1 Media shall be 100% synthetic, mechanical media that does not support microbial growth.
2.2 Frame shall be a heavy duty, high strength, moisture resistant paperboard with a cross member design that increases filter rigidity and prevents breaching. Frame shall be made with 100% recycled paperboard with an average of 35% post-consumer content. Frame shall be recyclable.
2.3 Filters shall have an expanded metal support grid bonded to the air-exiting side of the filter to maintain pleat uniformity and prevent fluttering. Metal support grid shall be recyclable and contain a significant amount of post-consumer and pre-consumer content.

3.0 Filter Performance

3.1 Filters shall be MERV 10 in a high capacity configuration and MERV 8 in a standard capacity configuration in all filter depths when fully tested in accordance with the ASHRAE 52.2-2007 Test Standard.
3.2 Initial resistance of filters shall not exceed the following:

Filter Depth	Flow Rate (fpm)	Initial Resistance Standard Capacity Filter	Initial Resistance High Capacity Filter
1"	375	0.18" w.g.	0.15" w.g.

GEOPLEAT®

- *Advanced pleat design for even dust loading and maximum service life*
- *High impact plastic frame for harsh environments*
- *Very low resistance to air flow results in lower energy costs*
- *Underwriters Laboratories classified to UL 900*
- *Robust filter media resists tearing or damage*
- *Lightweight and compact design saves shipping and storage space*
- *Completely incinerable*
- *Sustainable component for a LEED Green Building initiative*
- *Exceeds LEED MERV 13 efficiency requirement*

DESCRIPTION

The new GeoPleat's advanced pleating technology increases media area per filter, reducing resistance to air flow and maximizing service life. The GeoPleat is designed to perform in nearly any HVAC installation and will not warp or collapse over time.

The GeoPleat frame is formed with high impact plastic to precise dimensions for a secure fit in either housing or holding frames. The frame is impervious to moisture, rigid, and exceptionally lightweight for safe and easy handing and installation.

Pleats are thermoformed at the tips to maintain integrity. Uniformed beads of foamed hot-melt separate the pleats to the most efficient and exacting tolerances to lower air drag across the filter. The media pack is adhesively bonded on all four sides of the filter frame, eliminating the possibility of air by-pass around the filter media.

BENEFITS

Low Air Flow Resistance

GeoPleat's improved media and pack design combine for the lowest pressure drop available in a compact rigid box filter. The lower pressure drop leads to considerable energy savings in variable drive HVAC systems.

Longer Filter Life

The New GeoPleat now has 30% more media per filter, lowering media velocity and expanding the dust holding capacity. Increased media and higher DHC extend and maximize the life of the filter. Longer filter life reduces labor and disposal footprint of used filters.

Lightweight

The GeoPleat is extremely light in weight allowing for easier and less expensive transportation, handling, safe installation and removal. GeoPleat weighs up to 75% less than competitive 12" filters. It is specifically recommended for applications with space constraints, roof-top air handling units, or anywhere a safer filter installation is desired.

Robust Media

The media is extremely durable, designed to resist damage from shipping, handling, and installation. The media is resistant to moisture and microbial growth.

EFFICIENCY PER ASHRAE 52.2 (24 x 24 x 4 – BOX STYLE)

GEOPLEAT ENGINEERING SPECIFICATIONS

1.0 General
- 1.1 Filters shall be Aerostar® GeoPleat mini-pleat air filters as manufactured by Filtration Group.
- 1.2 Underwriters Laboratories classified to UL 900 and ULC-S11077.
- 1.3 Filters shall be available in a nominal depth of 4".
- 1.4 Filters are manufactured by an ISO 9001 registered company.

2.0 Filter Material of Construction
- 2.1 Media shall be 100% synthetic gradient dual density media that does not support microbial growth.
- 2.2 Frame shall be constructed with high-impact plastic and impervious to moisture and high humidity.
- 2.3 Media pack shall be adhered to plastic frame on all sides to prevent air by-pass.
- 2.4 Filter shall have a hot melt bead separator to maintain pleat pack stability and ensure consistent pleat spacing for optimum air flow.

3.0 Filter Performance
- 3.1 Filters shall be available in MERV 11 for low efficiency, MERV 13 and MERV 14 for medium efficiency, and MERV 15 for high efficiency when tested in accordance with ASHRAE 52.2-2007 Test Standard.
- 3.2 Initial resistance of filters shall not exceed the following:

Flow Rate	Initial Resistance			
(fpm)	MERV 11	MERV 13	MERV 14	MERV15
500	0.24" w.g.	0.33" w.g.	0.39" w.g.	0.43" w.g.

- 3.3 Filters shall be rated to withstand a continuous operating temperature of up to 150°F.
- 3.4 Filters shall have a max recommended final resistance of 1.5" w.g.
- 3.5 Changing filters at a lower resistance may save operating costs.

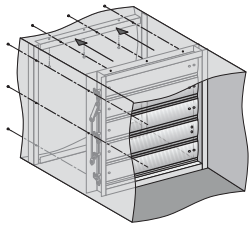
SPECIFICATIONS

SERIES 1000
AIR-FOIL CONTROL DAMPER



- Extruded aluminum (6063T5) damper frame is not less than .080" (2.03mm) in thickness. Damper frame is 4" deep.
- Blades are extruded aluminum (6063T5) profiles.
- Blade gaskets are extruded EPDM. Frame seals are extruded TPE thermoplastic. Gaskets are secured in an integral slot within the aluminum extrusions.
- Bearings are composed of a celcon inner bearing fixed to a 7/16" (11.11mm) aluminum hexagon blade pin rotating within a polycarbonate outer bearing inserted in the frame, resulting in no metal-to-metal or metal-to-plastic contact.
- Linkage hardware is installed in the frame side and constructed of aluminum and corrosion-resistant, zinc-plated steel, complete with cup-point trunnion screws for a slip-proof grip.
- Dampers are designed for operation in temperatures ranging between -40°F (-40°C) and 212°F (100°C).
- Dampers are available with either opposed blade action or parallel blade action.
- Air leakage through a 48" x 48" (1220mm x 1220mm) damper does not exceed 10.3 cfm/ft.² (52 l/s/m²) against 4" (1kPa) w.g. differential static pressure at standard air. Standard air leakage data is certified under the AMCA Ratings Program.
- Pressure drop of a fully open 48" x 48" (1220mm x 1220mm) damper does not exceed .02" (.004 kPa) w.g. at 1000 fpm (5.08 m/s).
- Dampers are made to size required without blanking off free area.
- Dampers are available in two mounting types: i.e., "Installed in Duct" or "Flanged to Duct".
- Installation of dampers must be in accordance with manufacturer's installation guidelines.

"FLANGED TO DUCT" TYPE
2" added to duct width & height dimensions

Note:
- *To reduce pressure drop, use "Flanged to Duct" type for sizes under 9 ft.² (.83m²).*
- *Suitable for operation in breathable air environments within stated temperature range.*
- *Dampers sized for duct openings exceeding 37½" (953mm) in height are equipped with a stiffener bar at mid-height to strengthen and maintain air leakage tolerances.*
- *For open blade clearance in tight spaces, consider the Series 1400 – 4" wide air-foil blade option.*

"INSTALLED IN DUCT" TYPE
½" deducted for clearance from width & height dimensions unless otherwise specified

System 350™ A350P Electronic Proportional Plus Integral Temperature Control

The A350P is an electronic, proportional plus integral temperature control with analog 0 to 10 VDC and 0 to 20 mA outputs. The control is equipped with three user-selectable time integration constants and an adjustable throttling range of 2 to 30F° (1 to 17C°). Two models cover a setpoint range of -30 to 130°F (-35 to 55°C) and 90 to 250°F (32 to 121°C).

As are all System 350™ products, the A350P control is housed in a NEMA 1, high-impact plastic enclosure. The modular design provides easy, plug-together connections for quick installation and future expandability.

Figure 1: A350P Electronic Proportional Plus Integral Temperature Control

Features and Benefits

❑ **Modular Design**	Enables stage, display, and power modules to be purchased and installed as needed
❑ **Plug-Together Connectors and 35 mm DIN Rail Mounting**	Eliminates wiring between modules, which reduces installation costs
❑ **Two Models Cover a Wide Setpoint Range of -30 to 250°F (-35 to 121°C)**	Reduces inventory by encompassing temperature ranges required to support the majority of Heating, Ventilation, Air Conditioning, and Refrigeration (HVAC/R) applications
❑ **Minimum Output Adjustable from 0 to 60%**	Tailors the output to the requirements of the controlled device; can be used to set minimum valve or damper position
❑ **Adjustable Throttling Range of 2 to 30F° (1 to 17C°)**	Enables the user to tune the system for optimum stable performance
❑ **Field-selectable Reverse or Direct Acting Mode**	Works in heating or cooling applications
❑ **Three User-Selectable Integration Time Constants**	Provides selection of the integration constant for applications requiring proportional plus integral control
❑ **Interchangeable Temperature Sensors**	Increase versatility and serviceability

© 2014 Johnson Controls, Inc.
Part No. 24-7664-192, Rev. G
Code No. LIT-930020

Application

The A350P Temperature Control can be used as a standalone device or in conjunction with plug-together accessory modules. The addition of S350 Stage Modules allows for the control of multiple stage HVAC/R applications. Typical application for the A350P includes:

- proportional heating control with staged direct expansion cooling
- simple temperature control for air handling units
- modulating damper actuators for mixed air control
- simple proportional mixed air control

A typical System 350 Temperature Control setup includes the following:

- A350P Temperature Control
- A99B Series Temperature Sensor
- Y350R Power Module (or 24 VAC Class 2 transformer)
- S350 Stage Modules
- D350 Digital Temperature Display Module

Operation

The A350P control operates on 24 VAC/VDC and provides two simultaneous analog outputs: 0 to 10 VDC and 0 to 20 mA. A cover-mounted, 10-segment Light-Emitting Diode (LED) bar graph indicates percentage of output.

Features include:

- adjustable setpoint
- adjustable minimum output
- adjustable throttling range (proportional band)
- selectable integration time constant
- selectable Reverse Acting (RA) or Direct Acting (DA) mode of operation

IMPORTANT:	All System 350 controls are designed for use **only** as operating controls. Where an operating control failure would result in personal injury and/or loss of property, it is the responsibility of the installer to add devices (safety, limit controls) or systems (alarm, supervisory systems) that protect against, or warn of, control failure.

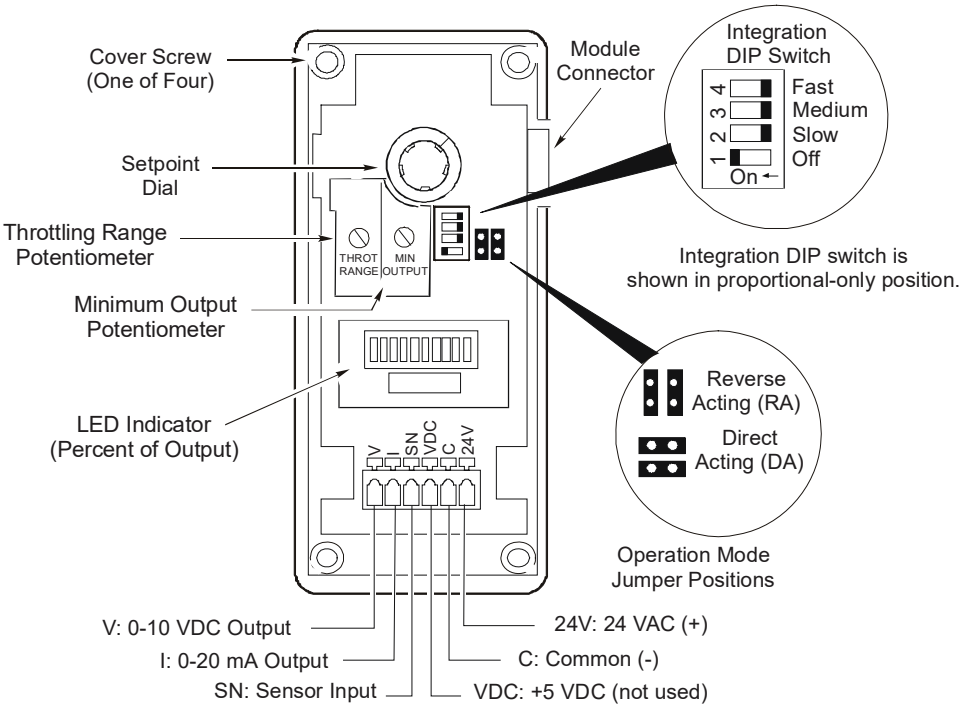

Figure 2: Interior View Showing A350P Control's Features

Minimum Output Adjustment

The minimum output adjustment sets the minimum voltage or milliampere output provided by the A350P control. It can be adjusted from 0 to 60% (0 to 6 VDC or 0 to 12 mA) of the output range.

Example:

A controlled device responding to a 4-20 mA output would require the minimum output to be adjusted to 20% or 4 mA. (See Figure 3.) The minimum output adjustment may also be used to set valves or dampers to minimum positions.

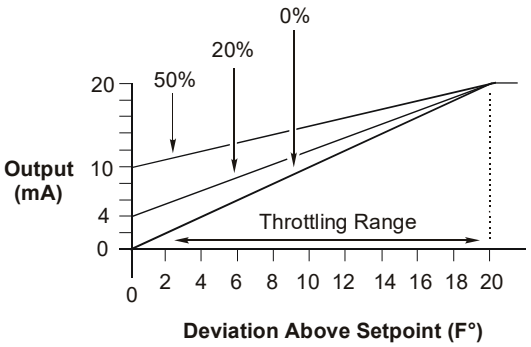

Figure 3: Output vs. Deviation from Setpoint for: Minimum Output = 0, 20, and 50%, Throttling Range = 20°F (DA)

Make the adjustment at the minimum output potentiometer marked as MIN OUTPUT. (See Figure 2.) For each 10% increase in output, the **next** bar on the LED indicator will light (only one bar is lit at any time).

Note: Before setting the minimum output potentiometer, verify that the control reads zero output (that is, no LEDs are lit).

Throttling Range (Proportional Band)

The throttling range is the range over which a control is active. Throttling range for the A350P control can be adjusted from 2 to 30F° (1 to 17C°). Make the adjustment at the throttling range potentiometer marked THROT RANGE (see Figure 2).

Integration Function

Proportional-only controls cannot hold a process at the exact setpoint. A proportional offset is always present because the control output is 0% at setpoint. Any load on the system will cause the control point to be offset from the setpoint. The greater the load on the system, the further the control point will be offset from the setpoint. (This is commonly referred to as proportional offset, and under maximum load this error will approach the throttling range.)

Some proportional-only controls are designed with their setpoint located midway through the proportional band to help compensate for this offset. This results in a plus/minus error from the setpoint rather than a single-ended error. Refer to Figure 4.

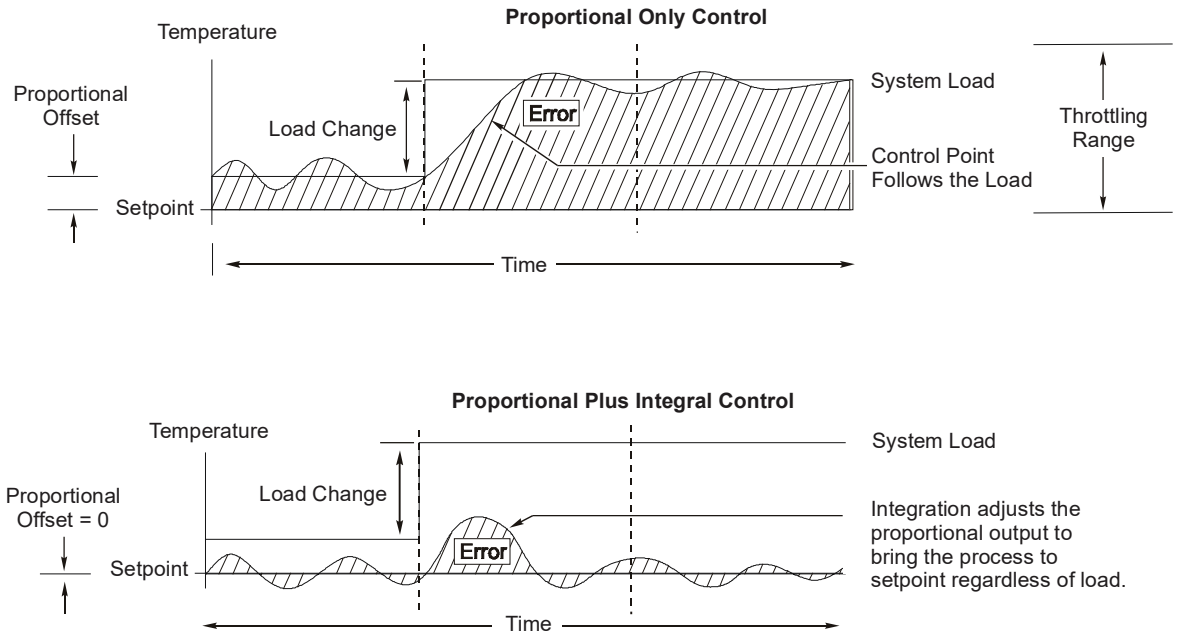

Figure 4: Comparison Between Proportional Only and Proportional Plus Integral Control

The A350P control has an integration feature that forces the control point to match the setpoint. Over time, the A350P will control the heating/cooling equipment to balance the system load at the control setpoint. (See Figure 4.)

On traditional proportional plus integral controls, the amount of correction will become too large if the system load exceeds the capacity of the equipment. When the actuated device (valve or damper) is fully open or closed and the setpoint still cannot be reached, the integration error continues to grow. The result is called *integral windup*.

The A350P control avoids *integral windup* with a patented circuit that puts a dynamic ceiling on the integrator. This resets the integration error when the sensor goes just above the setpoint plus the throttling range (in DA mode) or just below the setpoint minus the throttling range (in RA mode). This allows the process to recover from an out-of-range condition without a large overshoot.

The A350P control has three field-selectable integration constants and an off position. The integration DIP switch selects the integration constant. (See Figure 2 for location.)

The field-selectable integration constants include:

- **OFF: Switch 1 to On position, all others Off** provides proportional-only operation.

Note: In open-loop (without feedback) applications, select OFF (proportional-only) operation.

- **Slow (C3): Switch 2 to On position, all others Off** is the slowest integration constant (26 minute), and is suitable for most proportional plus integral applications. Slow is the recommended initial setting.
- **Medium (C2): Switch 3 to On position, all others Off** selects a 13-minute integration constant. If the rate of system recovery to setpoint is sluggish with the control set to slow, and if the system has enough capacity to drive the process to setpoint at a faster rate, the medium setting may be used.
- **Fast (C1): Switch 4 in On position, all others Off** is the fastest integration constant (6.5 minutes). Use fast only in instances where the rate of change at the sensor is extremely rapid and system capacity can compensate for that rapid change.

Reverse or Direct Acting Operation

With the operation jumpers in the Reverse Acting (RA) position, the analog output increases as the temperature drops below setpoint. (See Figure 5.)

With the operation jumpers in the Direct Acting (DA) position, the analog output will increase as the temperature rises above the setpoint.

Select the RA/DA mode by positioning the operation jumpers vertically or horizontally. (See Figure 2.) Position the operation jumpers vertically for RA and horizontally for DA.

The RA/DA operation jumpers are installed in the RA mode at the factory.

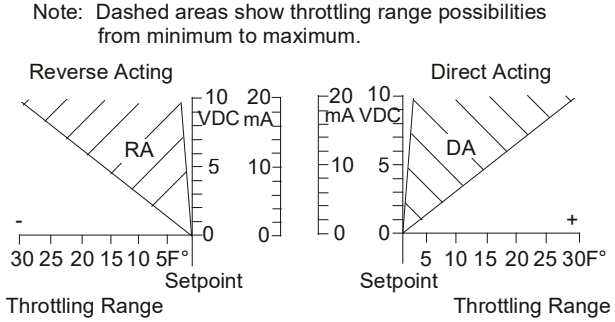

Figure 5: RA and DA Proportional Bands Shown in Proportional-Only Mode

Add-on Modules

The maximum number of add-on modules is listed in Table 1.

Table 1: Maximum Number of S350 Stage Modules per A350P

Power Source	Number of S350A or S350C Stage Modules Allowed	Number of S350A or S350C Modules (with One S350P) Allowed	Number of S350A or S350C Modules (with Two S350Ps) Allowed
Y350R	4	2	0
External Class 2 Transformer	9	8	7

S350A On-Off Stage Modules

S350A On-Off stage modules receive power, setpoint, and sensor input from the A350P control. S350A stage modules perform switching functions based on the control's setpoint and sensor information, as well as the offset and differential selected at the S350A stage module.

For more information on these modules, refer to the *System 350™ S350 Temperature, S351 Humidity, and S352 Pressure On/Off Stage Modules Product/Technical Bulletin (LIT-930080)*.

S350C Slave Stage Module

S350C slave stage modules receive power and sensor input from the A350P control. S350C slave stage modules perform switching functions based upon the control's sensor information, as well as the setpoint and differential selected at the S350C stage module.

For more information on these modules, refer to the *System 350™ S350C Temperature Slave Stage Module Product/Technical Bulletin (LIT-930084)*.

S350P Proportional Stage Modules

S350P proportional stage modules receive power, setpoint, and sensor input from the A350P control. The S350P stage module responds with an analog 0 to 10 VDC and 0 to 20 mA output signal. This is based upon the control's setpoint and sensor information, as well as the offset, throttling range, and minimum output selected at the S350P stage module.

For more information on these modules, refer to the *System 350™ S350P Proportional Plus Integral Temperature Stage Module Product/Technical Bulletin (LIT-930086)*.

Dimensions

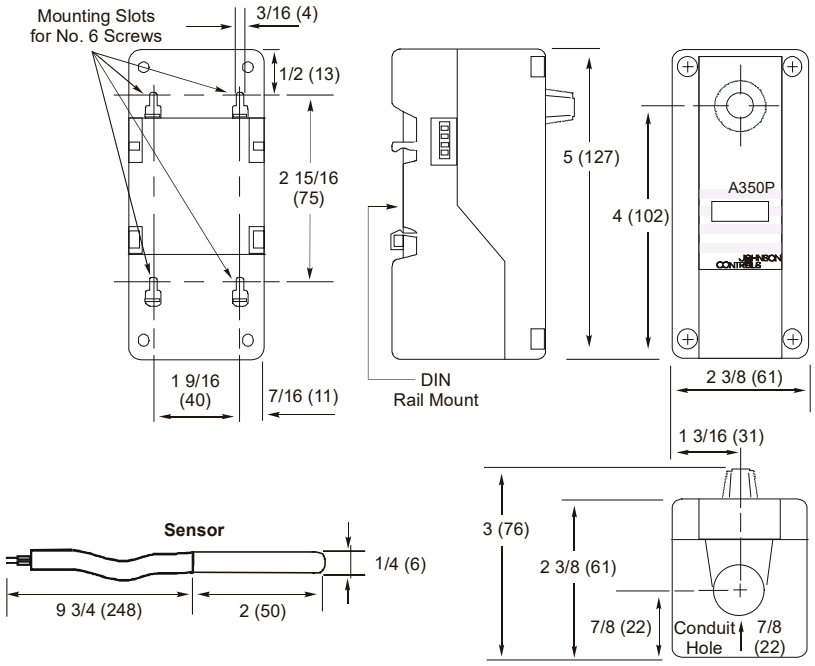

Figure 6: A350P Control and Sensor Dimensions, in. (mm)

Installation and Wiring

Celsius Scale Conversion

A Celsius scale throttling range decal is included with the A350P control. If the Celsius scale is desired:

1. Locate the throttling range and minimum output potentiometers on the main PC board. (See Figure 2.) Carefully remove the knobs and the existing decal.
2. Apply the Celsius scale decal in the same place as the original decal.
3. Rotate both knob stems completely counterclockwise (CCW).
4. Reinstall the potentiometer knobs so the arrows point to the minimum values.

The A350P Temperature Control is housed in a compact NEMA 1 plastic enclosure designed for standard 35 mm DIN rail mounting. Four key-slot mounting holes on the back of the control case are provided should surface mounting be required. If a Y350R is used, it should be mounted immediately to the right of the control. Any S350 modules would follow on the right, with the D350 being the last module mounted, also on the right.

Note: When mounting any System 350 module to rigid conduit, attach the hub to the conduit before securing the hub to the control enclosure.

WARNING: Risk of Electrical Shock.
Disconnect the power supply before making electrical connections. Contact with components carrying hazardous voltage can cause electric shock and may result in severe personal injury or death.

AVERTISSEMENT: Risque de décharge électrique.
Débrancher l'alimentation avant de réaliser tout branchement électrique. Tout contact avec des composants conducteurs de tensions dangereuses risque d'entraîner une décharge électrique et de provoquer des blessures graves, voire mortelles.

Wiring Terminals

Install all wiring to conform to the National Electrical Code and local regulations. For maximum electrical rating of control, refer to the label inside the control cover. Terminals will accept 12 to 26 AWG wire. Use only copper conductors.

1. Use a 1/8 in. (3 mm) flat-blade screwdriver to push the clamp arm down.
2. Insert the appropriate wire into the opening. Refer to Table 2 for terminal designations.
3. Release the clamp arm to secure the wire. See Figure 7.

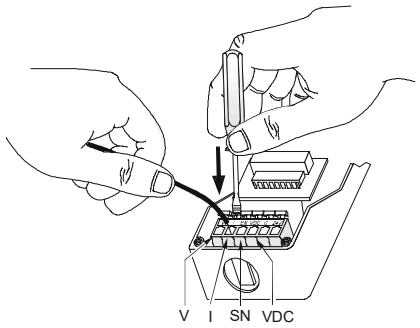

Figure 7: Cage Clamp Terminal Block

Table 2: Terminal Designations

Terminal	Description
V	0 to 10 VDC output
I	0 to 20 mA output
SN	Temperature sensor input
VDC	5 VDC power supply (not used)
C	Common for power supply, temperature sensor, and outputs
24V	24 Volts AC

Note: Output signals from the A350P control vary from 0 to 10 VDC and 0 to 20 mA. (Both outputs can be used simultaneously.) Connections can be made to both the V and I terminals, allowing the control to drive two outputs from the same RA or DA ramp simultaneously. This feature can be used to drive motor actuators of different types in a single application.

Sensor Connection

Shielded cable is not generally required for sensor wiring on runs of less than 50 feet. When using shielded cable, isolate and tape the shield at the sensor. Connect the shield to Terminal C on the A350P control.

Refer to Table 3 for the maximum recommended cable lengths for particular sizes of wire.

Table 3: Maximum Recommended Sensor Cable Lengths

Wire Gauge	Shielded Cable Length	
	Feet	Meters
14 AWG	800	244
16 AWG	500	152
18 AWG	310	94
20 AWG	200	61
22 AWG	124	38

- Various A99B Series Temperature Sensors and mounting hardware are available for use with A350P Series controls.

  The sensor must be connected to Terminals SN and C. (See Figure 2.) The sensors are not polarity sensitive.

- The sensor must be mounted so that it can accurately sense the temperature of the controlled medium.

Table 4: A350P Controls And Sensors

Control	Sensor Included Sensor Lead Length is 9-3/4 in. (0.25 m)
A350PS-1C	A99BB-25C; Range: -40 to 212°F (-40 to 100°C)
A350PS-1CM	A99BB-25C; Range: -40 to 212°F (-40 to 100°C)
A350PS-2C	A99BC-25; Range: -40 to 248°F (-40 to 120°C)
A350PS-2CM	A99BC-25; Range: -40 to 248°F (-40 to 120°C)
A350PT-1C	No Sensor Included
A350BA-2C	A99BC-25; Range: -40 to 248°F (-40 to 120°C)

- For more information regarding sensor options and installation, refer to the *A99B Series Temperature Sensors Product/Technical Bulletin (LIT-125186).*

Adjustments

Follow this procedure to set up the A350P control for the types of operation desired.

1. Remove its cover by loosening the four captive cover screws. (See Figure 2.)
2. Set the RA/DA operation jumpers to the desired mode of operation. Position the operation jumpers vertically for RA (Reverse Acting) or horizontally for DA (Direct Acting). (See Figure 2.)
3. Adjust the throttling range potentiometer to desired setting. Rotate Clockwise (CW) to increase the throttling range.

Notes: Included with the control is a Celsius scale throttling range decal. If the Celsius scale is desired, refer to the *Celsius Scale Conversion* section for decal installation instructions.

If the A350P is to be used in proportional plus integral control, the initial throttling range adjustment is seldom set below 6F° (3C°). A narrow proportional band used in conjunction with the integration may result in unstable control.

4. If minimum output is required, set the minimum output potentiometer (see Figure 2) to the desired position. The 10-segment front LED panel or a voltmeter can be used to read the minimum output. (The minimum setting for the **control** is designated by the 0 on the decal.)

Notes: Before adjusting the minimum output potentiometer, verify that the control reads zero output (that is, no LEDs are lit).

For each 10% increase in output, the **next** bar will light on the LED bar graph (only one bar is lit at anytime). In a milliampere application, each bar equals 2 mA. In a voltage application, each bar equals 1 VDC. (Refer to Figure 3.)

Example:

To set the control for a minimum output of 4 mA, turn the minimum output potentiometer clockwise until the second LED segment just lights.

If the control system does not function properly, verify that the proper operation mode is selected on each module (DA or RA), and perform the following procedures to determine the cause of the problem:

1. Check for proper voltages on the A350P control.
5. Make sure the system is stable in the proportional mode before selecting integration. Refer to the *Checkout Procedure* section.
6. Reinstall the cover and secure in place with the four captive cover screws.
7. Adjust the setpoint dial to the desired setpoint.

   If using the D350 Display Module, press and hold the setpoint button on the D350 while rotating the setpoint dial.

Note: The control's setpoint is factory calibrated at midscale to a tolerance of ±1F° (0.6C°). The setpoint tolerance at the extreme ends of the setpoint scale may be ± 4F° (2.2C°). The D350 Display Module is unaffected by this tolerance shift. Use the D350 for the most accurate setpoint selection.

Checkout Procedure

Follow this procedure to verify the A350P control is connected and functioning properly.

1. Before applying power, make sure that the installation and wiring connections are according to job specifications.
2. Set up the system for proportional mode (Integration = OFF), and make any necessary adjustments to the setpoint, throttling range, and minimum output. Then select Reverse or Direct Acting mode.
3. After making adjustments and electrical connections, apply power to the system, and observe it for stable operation.
4. If integration is required, select the fast (C1), medium (C2), or slow (C3) integration constant. Slow is the recommended initial setting. (Refer to the *Integration Function* section.)
5. Put the system back into operation. If instability occurs, consider increasing the throttling range.

Troubleshooting

a. Connect a digital voltmeter (DVM) between Terminals 24V (+) and C (-) located on the A350P's terminal block. (See Figure 2.)

   If an external transformer is used, select AC volts on the DVM. Verify that the voltage is between 20 and 30 VAC.

If a Y350R Power Module is used, select DC volts on the DVM. Verify that the voltage is between 16 and 38 VDC.

If an external DC power supply is used, select DC volts on the DVM. Verify that the voltage is between 22 and 29 VDC.

b. If the DVM reading is within the indicated voltage range, select DC volts on the DVM (DVM must be accurate to +/-0.01 VDC), and connect the (+) lead to Terminal VDC and the (-) lead to Terminal C.

   If the DVM voltage is between 4.9 and 5.1 VDC, proceed to Step 2.

   If the DVM voltage is above 5.1 VDC, replace the A350P.

c. If the DVM voltage is below 4.9 VDC, check the control using the following procedure.

   Disconnect all loads from the A350P control. (If in Direct Acting mode with power on, the system will go to full output when the sensor is disconnected. Thus, ensure that any loads are disconnected *before* disconnecting the temperature sensor.)

   Disconnect the temperature sensor completely, and recheck the DVM voltage.

   If the DVM voltage rises to a value between 4.9 and 5.1 VDC, replace the sensor.

   If the DVM voltage is still below 4.9 VDC, replace the A350P control.

2. Check sensor for proper resistance at a given temperature. (The resistance across the sensor changes with the temperature of the sensor.)

   a. Disconnect power from the A350P control.

   b. Disconnect the sensor from the control and measure the resistance across sensor leads.

   c. When measuring the sensor's resistance, use an accurate thermometer to measure the temperature at the sensor.

   d. Refer to Figure 8 to determine the optimal resistance for the measured temperature.

   e. If the measured resistance varies substantially from the optimal resistance for that temperature, the sensor or wiring must be replaced.

   f. If the sensor's resistance conforms to the chart in Figure 8, reconnect the sensor to the control.

   g. Reconnect power to the control.

Note: The sensor reading indicated by the D350 may differ somewhat from thermometer readings due to sensor tolerances, time constants, thermometer accuracy, and other factors.

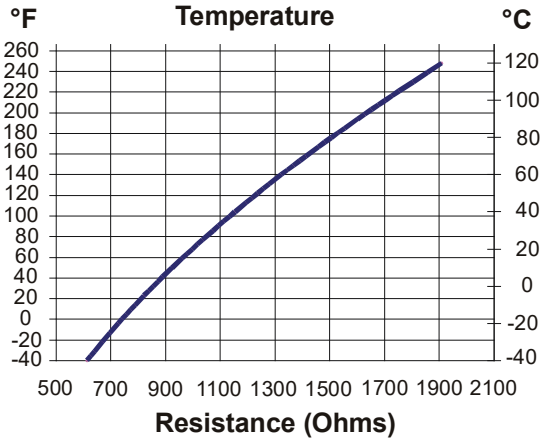

Figure 8: Temperature vs. Resistance Chart for the A99B Series Sensor

3. Check the A350P control for proper operation.

Note: Perform Steps 1 and 2 first.

a. Reconnect the sensor to the control and re-apply power.

b. Turn the throttling range and the minimum output to minimum by turning both potentiometers counterclockwise.

c. Switch off the integration.

d. Select the RA mode.

e. Connect the DVM (+) lead to the A350P control's Terminal SN and the (-) lead to Terminal C.

If the sensor voltage is less than 1.8 VDC on model A350PS-1C or less than 2.3 VDC on model A350PS-2C, go to Step 3g.

f. If the voltage is greater than 1.8 VDC on model A350PS 1C or greater than 2.3 VDC on model A350PS-2C, adjust the setpoint to 120°F (49°C) on model A350PS-1C or 240°F (116°C) on model A350PS-2C.

The output Terminal V should be less than 0.1 VDC, and all LEDs in the bar graph display should be off. If not, replace the A350P.

1. Adjust the minimum output to the maximum by turning the potentiometer CW. As the potentiometer is turned CW, the LEDs in the bar graph should turn on from left to right until the fifth or sixth bar is on. If not, replace the A350P control.

2. Adjust the minimum output to zero again, and select the DA mode.

3. If the right most LED in the bar graph is on (Terminal V = 10 VDC, Terminal I = 20 mA), go to Step 3h. If the LED is not on, replace the A350P.

g. If the sensor voltage is above 1.1 VDC on A350PS-1C or above 1.6 VDC on A350PS-2C, adjust the setpoint to match the actual temperature (T_S). The output Terminal V should be less than 0.1 VDC, and all LEDs in the bar graph should be off.

Note: Some tolerance error is present between the setpoint scale and the setpoint knob pointer. Refer to the *Adjustments* section.

1. Make sure the A350P control is in RA mode.

2. Increase the setpoint in increments of 2F° (1C°).

3. As the setpoint is increased, the control's Terminal V output voltage should go from 0 to 10 VDC, the Terminal I output current should go from 0 to 20 mA, and the LEDs should turn on, one at a time from left to right.

4. If the LEDs do not turn on and if the outputs of terminals V and I do not change as described above, replace the control.

h. Readjust the A350P control to the desired control settings.

Repairs and Replacement

Do not make field repairs or perform calibration. A99B Temperature Sensors and replacement controls are available through the nearest Johnson Controls representative. (See Tables 5 and 6 for ordering information.)

Ordering Information

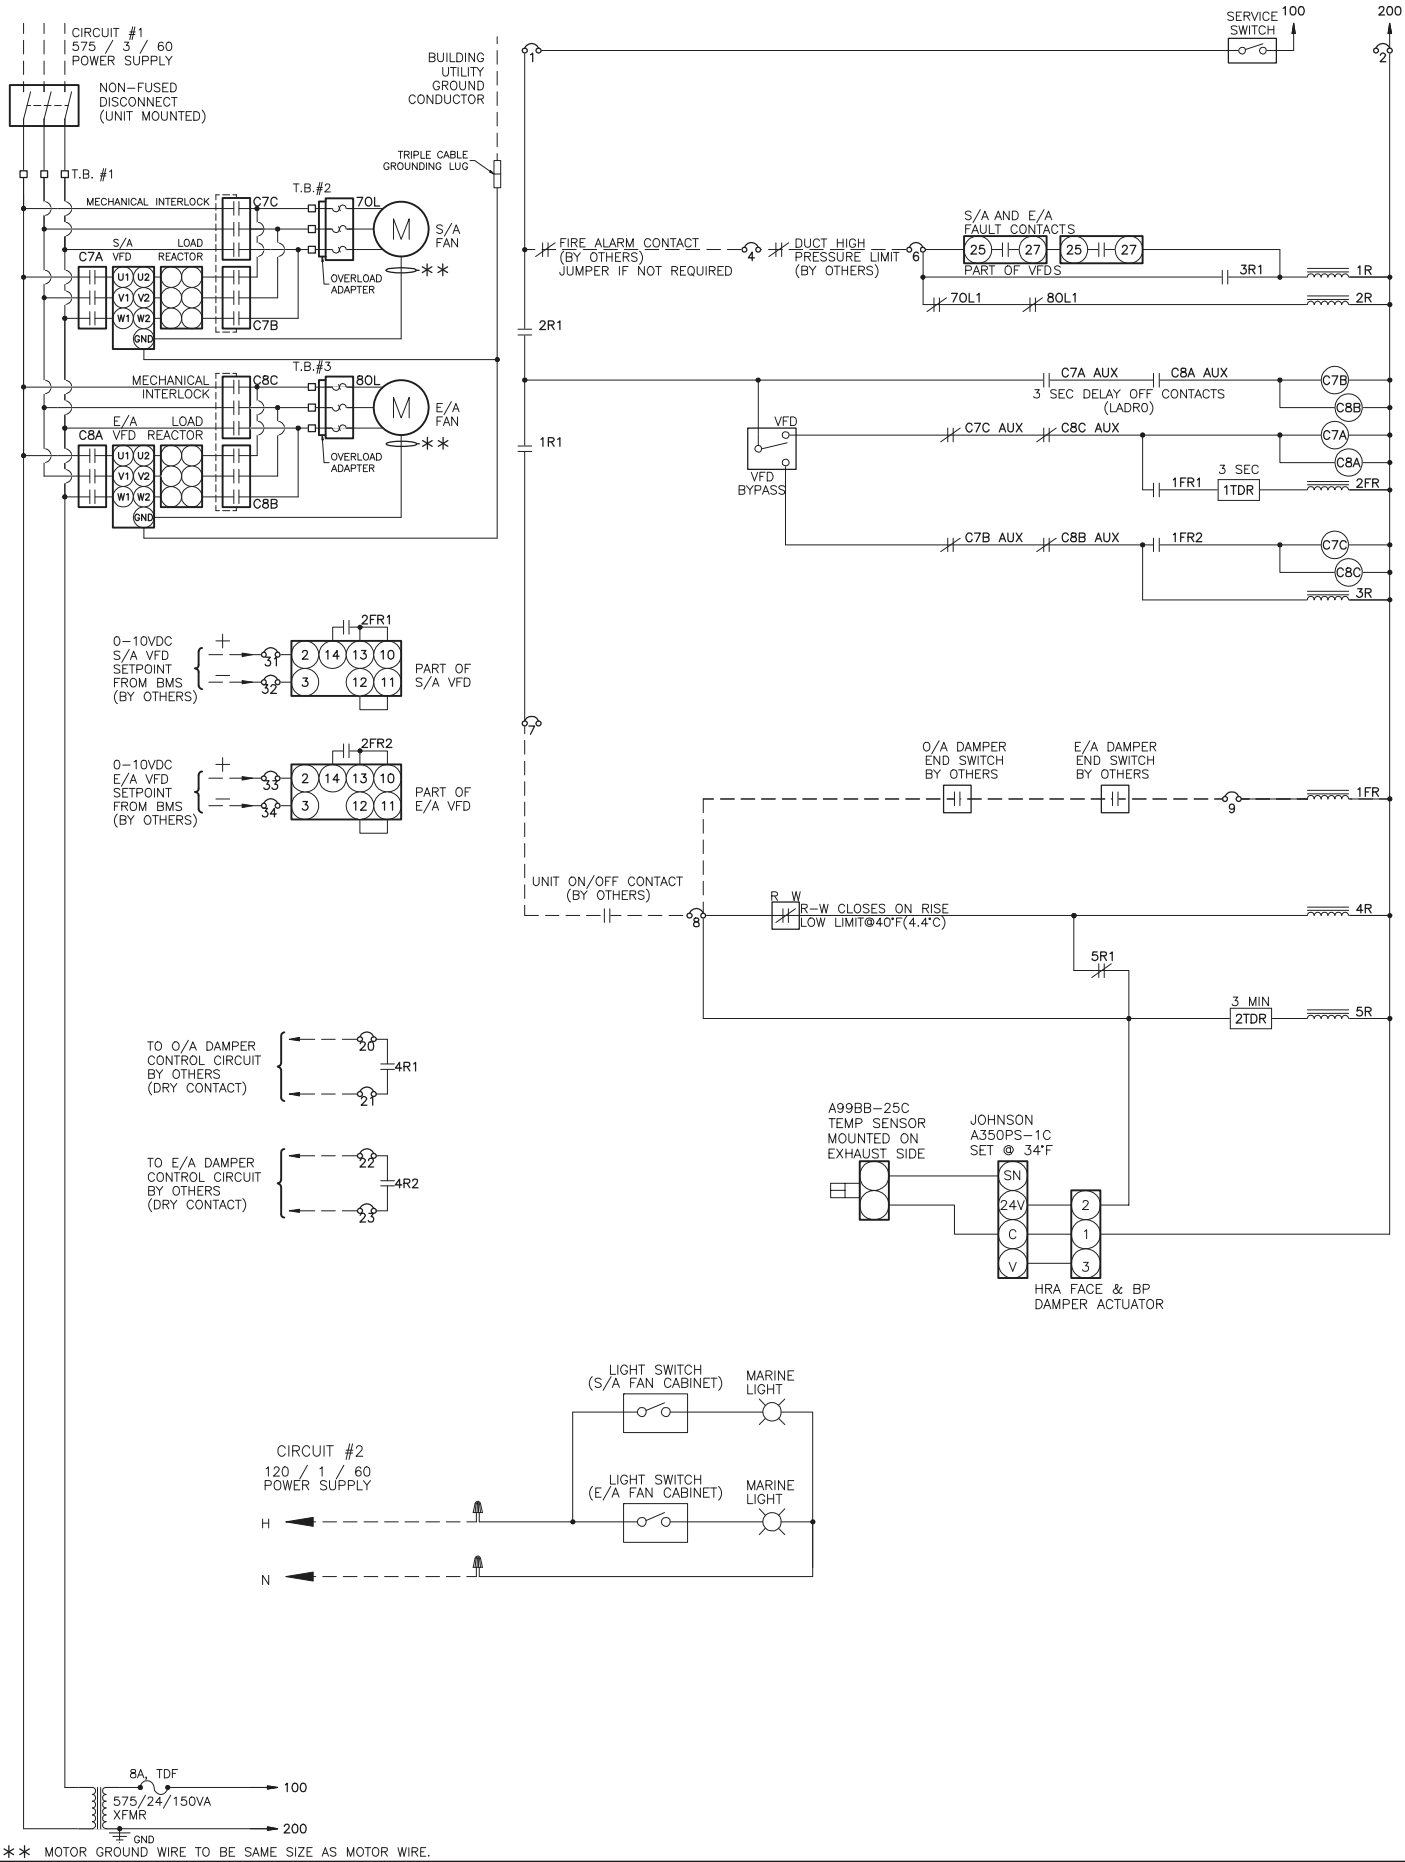
Table 5: System 350 Products

Item	Product Code Number	Description
A350P Proportional Plus Integral Temperature Controls	A350PS-1C	Range: -30 to 130°F (-35 to 55°C) Throttling Range: 2 to 30 F° (1 to 17C°) (Includes the A99BC-25C Temperature Sensor)
	A350PS-2C	Range: 90 to 250°F (30 to 120°C) Throttling Range: 2 to 30 F° (1 to 17C°) (Includes the A99BC-25C Temperature Sensor)
	A350PT-1C	Range: -30 to 130°F (-35 to 55°C) Throttling Range: 2 to 30F° (1 to 17C°) (Sensor not included)
Display Modules	D350AA-1C D350BA-1C	Digital Temperature Display Module (Fahrenheit Scale) Digital Temperature Display Module (Celsius Scale)
On/Off Stage Modules	S350AA-1C S350AB-1C	Fahrenheit Scale Celsius Scale
Slave Stage Module	S350CC-1C	Dual Scale (°F and °C)
Proportional Stage Module	S350PQ-1C	Dual Scale (°F and °C)
Power Module	Y350R-1C	120 or 240 VAC, 50/60 Hz Input, Rectified Class 2, 24 VAC Output

Table 6: System 350 Accessories

Item	Product Code Number	Description
Wall Mount Plate	TE-6001-4	Includes sensor mounting clip
Cover	T-4000-2644	For wall mount plate
Mounting Clip	A99-CLP-1	Surface mounting clip for the A99B Temperature Sensor
Duct Mounting	TE-6001-1	Duct-mounting hardware with handy box
Duct Mounting	TE-6001-11	Duct-mounting hardware without handy box
Conduit Adaptor	ADP11A-600R	1/2 in. snap-fit EMT conduit adaptor (box of 10)
Immersion Well	WEL11A-601R	For liquid sensing applications
Sun Shield	SHL10A-603R	For use with outside sensors in sunny locations
DIN Rail Sections	BKT287-1R BKT287-2R	12 in. (0.3 m) long 39-1/3 in. (1.0 m) long
DIN Rail End Clamp	PLT344-1R	Consists of two end clamps
Cables for Remote Mounting of D350 Display Module	WHA29A-600R* WHA29A-603R WHA29A-604R	3 ft (0.9 m) 25 ft (7.6 m) 50 ft (15.2 m)

*WHA29A-600R may be used to daisy chain S350 modules together.



Specifications

Product	A350P Proportional Plus Time Integral Temperature Control	
Supply Voltage	Y350R Power Module:	Input: 120/240 VAC 50/60 Hz
		Output: 24 VDC, unfiltered, 10 VA
	External Source:	24 VAC, 50/60 Hz, Class 2 (20-30 VAC)
	Note: Only one supply voltage source may be used.	
Power Consumption	3.2 VA maximum	
Ambient Temperature	Operating:	-30 to 150°F (-34 to 66°C)
	Shipping:	-40 to 185°F (-40 to 85°C)
Humidity (all modules)	0 to 95% RH non-condensing; maximum dew point 85°F (29°C)	
Setpoint Adjustment Range	A350PS-1C:	-30 to 130°F (-35 to 55°C)
	A350PS-2C:	90 to 250°F (30 to 120°C)
	A350PT-1C:	-30 to 130°F (-35 to 55°C)
Throttling Adjustment Range	2 to 30F° (1 to 17C°)	
Analog Outputs	0 to 10 VDC (550 ohm load minimum) and 0 to 20 mA (600 ohm load maximum)	
Minimum Output	Adjustable from 0 to 60% of the output	
Output Indication	A ten segment LED bar graph indicates percentage of output.	
Control Action	Direct or reverse action is jumper selectable.	
Integration Constant	Four selectable rates: fast, medium, slow, and off	
Sensor	Replaceable positive temperature coefficient sensor	
	Reference resistance 1035 ohms at 77°F (25°C)	
Material	Case and cover:	NEMA 1 high-impact thermoplastic
Agency Listing	UL Listed, CCN XAPX, File E27734	
	UL Listed for Canada, CCN XAPX7, File E27734

STANTEC PROJECT #: 110126045
SUBMITTAL # AD-019R3

This review by Stantec is for general conformance with the design concept of Stantec's design of the:
☐ Architectural ☐ Structural ☑ Mechanical ☐ Electrical ☐ Other

Stantec

component(s) only and does not mean that Stantec has verified or approves the shop drawing(s). The Contractor remains solely responsible for the shop drawing(s) and this review by Stantec does not relieve the Contractor of the Contractor's responsibility for errors or omissions in the shop drawing(s) or for meeting all requirements of the contract documents. This review does not mean that Stantec approves the detailed design inherent in the shop drawing, responsibility for which shall remain with the Contractor submitting same, nor does this review mean that Stantec accepts any deviation of the shop drawing(s) from the contract documents. The Contractor is responsible for confirming all dimensions and correlating them at the job site, for all construction means, methods and techniques, and for coordination of construction work of all trades, including coordination of all shop drawings.

THREADED WATER HAMMER ARRESTORS

www.pppinc.net

SPEC 22 42 01 2.5

ONLY ONE MOVING PART!

WATER HAMMER ARRESTORS ARE SPECIFIED FOR COMMERCIAL, INDUSTRIAL AND RESIDENTIAL USES.

ON DRAWING M603
DHW & NPW SYSTEM

PPP WATER HAMMER ARRESTORS SPECIFIED FOR MANY INSTALLATIONS!

A maintenance-free installation is assured when using this type of arrestor...the only moving part is the free-moving piston furnished with "O"ring seals which have been tested for reliability in excess of normal operating ranges.

SC-500A - SC-2000F

FLUID HAMMER IN FLUID TRANSMISSION LINES – a definition.
Fluid Hammer is a series of hydraulic shock waves generated within the confines of a piping system due to the sudden stopping of fluid flow. This condition is caused by fast closing of positive valves incorporated within the system. The effect of fluid hammer is damaging if allowed to exist for any length of time and will result in broken pipes and damage to other components in the system.

U.S. Patent No. 3,633,627

40 Years of outstanding performance

LIMITED SBCCI PST&ESI
Low Lead UPC®
Complies with low lead law.

SPECIFICATIONS & INSTALLATIONS

A

B

INSTALLATION: May be installed in new or existing plumbing systems with a standard pipe tee.
MAINTENANCE: Maintenance free – the piston is the only moving part.
TEMPERATURE RANGE: -40º F to + 212º F (-4.4º C to + 100º C)
CONSTRUCTION: Barrel-fabricated of type "L" hard drawn copper.
Cap: Copper or free turning brass.
Piston: Machined of Composite Material
Threaded Adapter: Machined of C69300 Low Lead Brass
Seals: "O"rings: EPDM.
Seal Lubricant: Dow-Corning Silicone Compound #111, FDA listed for use in potable water systems.
Nickel Plated: For Salt Water Application.
OPERATING PRESSURE: Designed to operate on all domestic and commercial systems.
Normal operating pressure 0 to 80 PSIG. Max spike pressure 400 PSIG. System Pressures above 80 PSI consult factory.

MIDWEST Sight Flow Indicators

Inexpensive Protection for Expensive Equipment and Systems

MODEL 100, 100MP

MODEL 300, 300MP

MODEL 360F

MODEL 400

MODEL 700

Patent No. 5,103,757

Midwest Sight Flow Indicators are manufactured of quality materials and safety tested to assure long, dependable service at economical prices. Available in window viewing style in the 100 and 300 Series and tube viewing style in the 400 and 700 Series with connection choices of female NPT, BSPP, or BSPT threaded and flanged. Series 700 has impeller and internal wipers for cleaning sight tube, which is perfect for fluids with suspended solids. Just rotate the glass tube and restore full 360° visibility without disrupting the flow.

Models

- 100 - Single window with impeller
- 300 - Double window with impeller
- 350 - Double window with no indicator
- 360 - Double window with flapper
- 400 - Tube type with no indicator
- 700 - Tube type with impeller and internal wipers to clean glass tube

SFI-100 & SFI-300 SERIES
Window Style with Threaded Connections

SPECIFICATIONS
Service: Compatible gases and liquids.
Wetted Materials: Window: Tempered glass. Body: Bronze or 316 SS. Gasket: Buna-N, Fluoroelastomer, or PTFE. Indicator: ABS or 316 SS impeller (100 and 300), 304 SS or 316 SS Flapper (360).
Temperature Limit: 200°F (93°C).
Pressure Limit: 125 psig (8.62 bar), 150 psig (10.34 bar) on "MP" Models.
Connections: Threaded.

Example	SFI	300	SS	2	G2	SFI-300SS-2-G2 Sight Flow Indicator; double window, temper glass, Fluoroelastomer gaskets, 316SS body, ABS impeller, 2 inch female NPT connections.
Model Designator	SFI					Sight flow indicator, tempered glass standard, Buna-N gaskets standard, female NPT connections standard.
Body Style		100 300 350 360				Single window, bronze body, ABS Impeller Double window, bronze body, ABS Impeller Double window, bronze body, no moving indicator Double window, bronze body, 304SS flapper
Body Options			SS MP			316SS body option for 300, 350, 360 150 psig maximum pressure option, includes Fluoroelastomer gaskets

(Maximum flow on impeller models: 5FPS with liquids, 5000 FPM with gases)

SFI-700 SERIES
Tube Style with Threaded Connections

SPECIFICATIONS
Service: Compatible gases and liquids.
Wetted Materials: Tube: Tempered Borosilicate. Body: Brass or 316 SS. Gasket: Fluoroelastomer. Indicator: Acetal.
Temperature Limit: 212°F (100°C).
Pressure Limit: 230 psig (15.86 bar).
Connections: Threaded.

Example	SFI	700SS	1-1/2		SFI-700SS-1-1/2 Sight Flow Indicator; tube type with 8 blade Acetal impeller and integral wipers to clean tube interior, tempered borosilicate tube, Fluoroelastomer gaskets, 316SS body, 1-1/2 inch female NPT connections
Model Designator	SFI				Sight flow indicator, tube type with 8 blade Acetal impeller and integral wipers to clean tube interior, tempered borosilicate tube, Fluoroelastomer gaskets
Body Style		700 700SS			Brass body 316SS body
Body Size			1/4 3/8 1/2 3/4 1 1-1/4 1-1/2		1/4 inch female NPT connection size 3/8 inch female NPT connection size 1/2 inch female NPT connection size 3/4 inch female NPT connection size 1 inch female NPT connection size 1-1/4 inch female NPT connection size 1-1/2 inch female NPT connection size
Options				BSPT BSPP	BSPT threads BSPP threads

SFI-300F SERIES
Window Style with Flanged Connections

SPECIFICATIONS
Service: Compatible gases and liquids.
Wetted Materials: Window: Tempered glass. Body: Carbon Steel or 316 SS. Gasket: Buna-N, Fluoroelastomer, or PTFE. Indicator: 316 SS Flapper (360).
Temperature Limit: 200°F (93°C).
Pressure Limit: 150 psig (10.34 bar).
Connections: Flanged.

Example	SFI	360FSS	1-1/2	G1	SFI-360FSS-1-1/2-G1 Sight Flow Indicator; double window, tempered glass, PTFE gasket, 316SS body, 304SS flapper, 1-1/2 inch raised face flange connections
Model Designator	SFI				Sight flow indicator, double window, tempered glass, Buna-N gaskets standard, raised face flange connections
Body Style		350FCS 350FSS 360FCS 360FSS			Carbon steel body, no moving indicator 316SS body, no moving 316SS indicator Carbon steel body, 316SS flapper 316SS body, 316SS flapper
Body Size			1-1/2 2 3 4 6		1-1/2 inch raised face flange connection size 2 inch raised face flange connection size 3 inch raised face flange connection size 4 inch raised face flange connection size 6 inch raised face flange connection size
Options				G1 G2	PTFE gasket Fluoroelastomer gasket

SFI-400 SERIES
Tube Style with Threaded or Flanged Connections

SPECIFICATIONS
Service: Compatible gases and liquids.
Wetted Materials: Tube: Borosilicate. Body: Cast Iron or 316 SS. Gasket: PTFE.
Temperature Limit: 200°F (93°C).
Pressure Limit: 50 psig (3.45 bar).
Connections: Threaded or Flanged.

Example	SFI	400	1-1/2	SFI-400SS-1-1/2 Sight Flow Indicator; tube type, borosilicate tube, PTFE gaskets, 316SS body, 1-1/2 inch female NPT connections
Model Designator	SFI			Sight flow indicator, tube type, borosilicate tube, PTFE gaskets
Body Style		400CI 400SS 400F		Female NPT connections, cast iron body (only for 1 through 2 inch sizes) Female NPT connections, 316SS body Raised face flange connection, 316SS body (only for 1 inch and up sizes)
Body Size			1/2 3/4 1 1-1/4 1-1/2 2 3 4	1/2 inch connection size 3/4 inch connection size 1 inch connection size 1-1/4 inch connection size 1-1/2 inch connection size 2 inch connection size 3 inch connection size 4 inch connection size

(Best for use in vertical pipelines where there are no mechanical strains)

LEAD FREE*

Series LF25AUB-Z3

Water Pressure Reducing Valves**

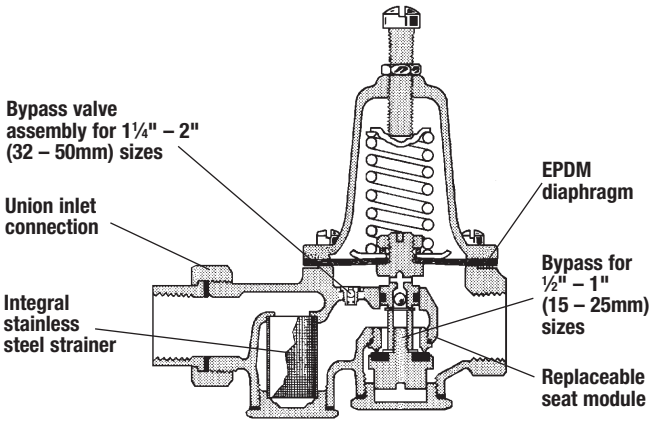
Sizes: ½" – 2" (15 – 50mm)

Series LF25AUB-Z3 Water Pressure Reducing Valves are designed to reduce incoming water pressure to a sensible level to protect plumbing system components and reduce water consumption. This series is suitable for water supply pressures up to 300psi (20.7 bar) and may be adjusted from 25 – 75psi (172 – 517 kPa). The LF25AUB-Z3 features Lead Free* construction to comply with Lead Free* installation requirements. The standard setting is 50psi (345 kPa). All parts are quickly and easily serviceable without removing the valve from the line. The standard bypass feature permits the flow of water back through the valve into the main when pressures, due to thermal expansion on the outlet side of the valve, exceed the pressure in the main supply.

Features

- Standard construction includes Z3 sealed spring cage and stainless steel corrosion resistant adjusting & cage screws for accessible outdoor or pit installations
- Union inlet connection
- Integral stainless steel strainer
- Replaceable seat module
- Lead Free* cast copper silicon alloy construction
- Serviceable in line
- Bypass feature controls thermal expansion pressure***
- High temperature resistant reinforced diaphragm for hot water

Models



LF25AUB-Z3	NPT threaded female union inlet x NPT female outlet
LF25AUB-S-Z3	Solder union inlet x NPT female outlet
LF25AUB-DU-Z3	Double Union – NPT threaded union female inlet and outlet
LF25AUB-S-DU-Z3	Double Union – Solder union inlet and outlet
LF25AUB-DU-THDxPEX-Z3	Double Union – NPT threaded female inlet and PEX union outlet
LF25AUB-DU-LF-Z3	Double union body less fittings (¾", 1", 1¼")
LF25AUB-QC-Z3	Single Union – Quick-Connect union inlet (½", ¾", 1")
LF25AUB-DU-QC-Z3	Double Union – Quick-Connect inlet and outlet (½", ¾", 1")

Specifications

A Water Pressure Reducing Valve with integral strainer shall be installed in the water service pipe near its entrance to the building where supply main pressure exceeds 60psi (413 kPa) to reduce it to 50psi (345 kPa) or lower. The water pressure reducing valve shall be constructed using Lead Free* materials. Lead Free* regulators shall comply with state codes and standards, where applicable, requiring reduced lead content. The valve shall feature a Lead Free* cast copper silicon alloy suitable for water supply pressures up to 300psi (20.7 bar). Provision shall be made to permit the bypass flow of water back through the valve into the main when pressures, due to thermal expansion on the outlet side of the valve, exceed the pressure in the main supply. Water Pressure Reducing Valve with built-in bypass check valves will be acceptable. Approved valve shall be listed to ASSE 1003 and IAPMO and certified to CSA B356. Valve shall be a Watts Series LF25AUB-Z3.

LF25AUB-Z3

DOMESTIC COLD WATER

*The wetted surface of this product contacted by consumable water contains less than 0.25% of lead by weight.

**A water saving test program concluded that reducing the supply pressure from 80-50psi (551-345 kPa) resulted in a water savings of 30%.

***The bypass feature will not prevent the pressure relief valve from opening on the hot water supply system with pressure above 150psi (10.3 bar).

Watts product specifications in U.S. customary units and metric are approximate and are provided for reference only. For precise measurements, please contact Watts Technical Service. Watts reserves the right to change or modify product design, construction, specifications, or materials without prior notice and without incurring any obligation to make such changes and modifications on Watts products previously or subsequently sold.

Pressure Reducing Control Valve

NON-POTABLE WATER 3"

Schematic

- Throttles to reduce high upstream pressure to constant lower downstream pressure
- Reducing setpoint is adjustable

Standard Components

1 – Main Valve (Single Chamber)
2 – Pressure Reducing Control
3 – Fixed Orifice

Options & Accessories

- ○ X – Isolation Cocks *(2)*
- ○ FC – Flo-Clean Strainer *(1)*
- ○ Y – Y-Strainer (Replaces Flo-Clean) *(2)*
- ○ ACS – Adjustable Closing Speed *(3)* (Replaces Fixed Orifice)
- ○ AOS – Adjustable Opening Speed *(1)*
- ○ P – Position Indicator *(3)*
- ○ L – Limit Switch *(3)*

(1) Standard 3" & Smaller
(2) Standard 4" & Larger
(3) Optional All Sizes

Operations

The Watts ACV Pressure Reducing Control Valve is designed to automatically reduce a fluctuating higher upstream pressure to a constant lower downstream pressure regardless of varying flow rates. It is controlled by a normally open, pressure reducing pilot designed to: 1) Open (allowing fluid out of the main valve cover chamber) when downstream pressure is below the adjustable setpoint, and 2) Close (allowing fluid to fill the main valve cover chamber) when downstream pressure is above the adjustable setpoint. A decrease in downstream pressure causes the valve to modulate toward an open position, raising downstream pressure. An increase in downstream pressure causes the valve to modulate toward a closed position, lowering downstream pressure.

***The wetted surface of this product contacted by consumable water contains less than 0.25% of lead by weight.**

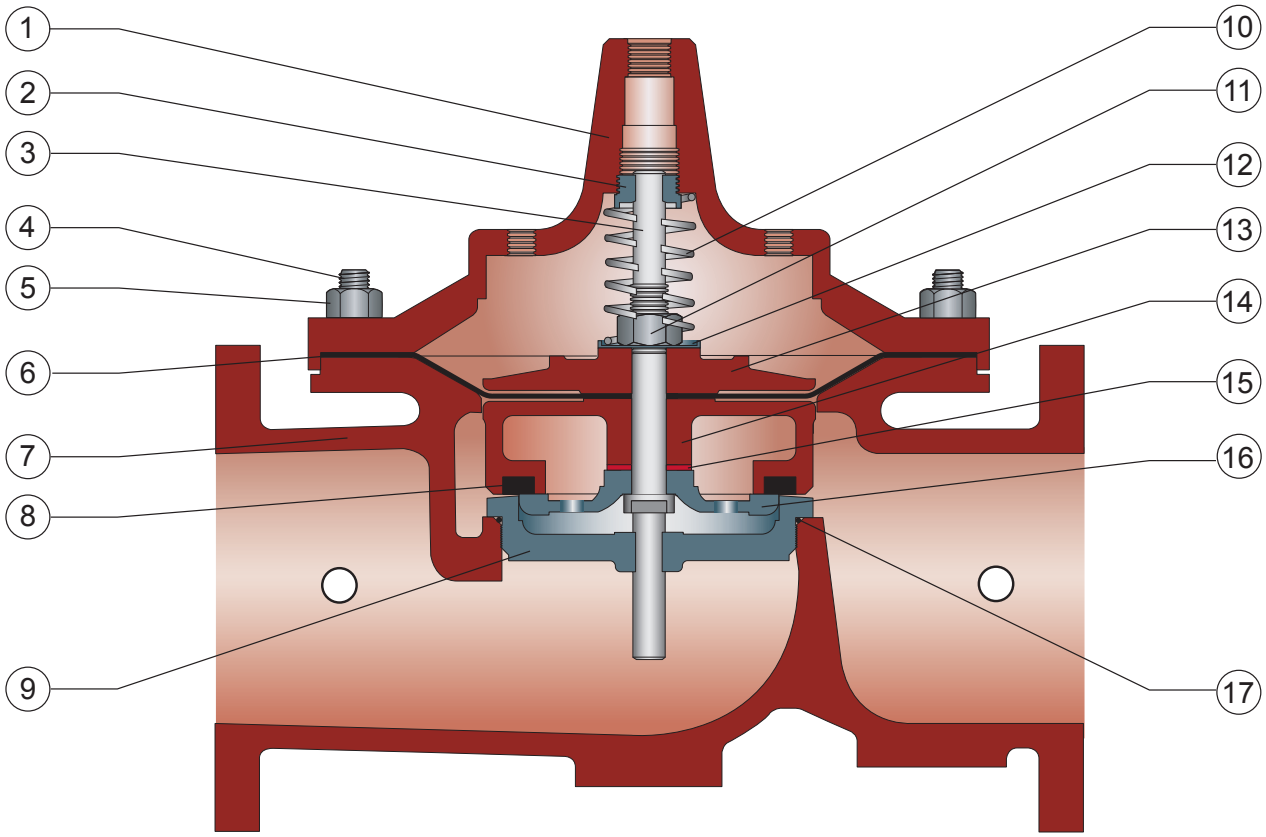
Maximum continuous flow based on velocity of 20 ft. per second.
Maximum intermittent flow based on velocity of 25 ft. per second.
Minimum continuous flow based on velocity of 1 ft. per second.

NOTE: The above chart is a suggested guide. Inlet pressure, outlet pressure, minumum, normal and maximum flow rates should be considered for specific valve sizing. Contact Watts ACV for details.



Cavitation Chart

After selecting the valve size, locate inlet and outlet pressures on this chart. If the intersection point falls in the shaded area, cavitation can occur. Operation of valves continually in the cavitation zone should be avoided. Consult Watts ACV for alternatives.

Series LF009

Reduced Pressure Zone Assemblies

Sizes: ¼" – 3" (8 – 80mm)

Series LF009 Reduced Pressure Zone Assemblies are designed to protect potable water supplies in accordance with national plumbing codes and water authority requirements. This series can be used in a variety of installations, including the prevention of health hazard cross-connections in piping systems or for containment at the service line entrance.The LF009 features Lead Free* construction to comply with Lead Free* installation requirements.

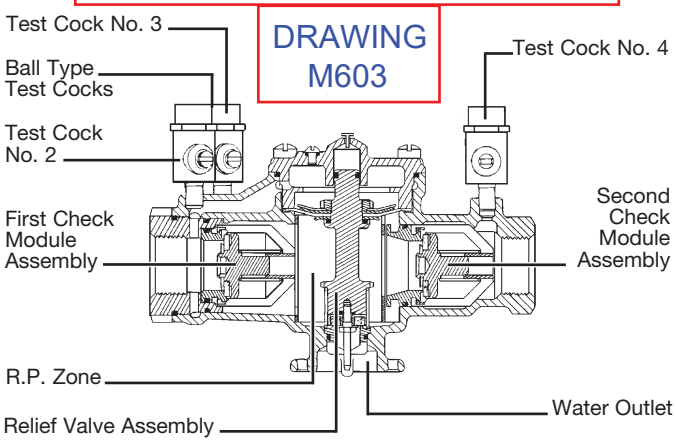
This series features two in-line, independent check valves, captured springs and replaceable check seats with an intermediate relief valve. Its compact modular design facilitates easy maintenance and assembly access. Sizes ¼" – 1" (8 – 25mm) shutoffs have tee handles.

Features

- Single access cover and modular check construction for ease of maintenance
- Top entry - all internals immediately accessible
- Captured springs for safe maintenance
- Internal relief valve for reduced installation clearances
- Replaceable seats for economical repair
- Lead Free* cast copper silicon alloy body construction for durability ¼" – 2" (8 – 50mm)
- Fused epoxy coated cast iron body 2½" and 3" (65 and 80mm)
- Ball valve test cocks — screwdriver slotted ¼" – 2" (8 – 50mm)
- Large body passages provides low pressure drop
- Compact, space saving design
- No special tools required for servicing

Specifications

A Reduced Pressure Zone Assembly shall be installed at each potential health hazard location to prevent backflow due to backsiphonage and/or backpressure. The assembly shall consist of an internal pressure differential relief valve located in a zone between two positive seating check modules with captured springs and silicone seat discs. Seats and seat discs shall be replaceable in both check modules and the relief valve. There shall be no threads or screws in the waterway exposed to line fluids. Service of all internal components shall be through a single access cover secured with stainless steel bolts. Body and shutoffs shall be constructed using Lead Free* cast copper silicon alloy materials. Lead Free* reduced pressure zone assembly shall comply with state codes and standards, where applicable, requiring reduced lead content.



The assembly shall also include two resilient seated isolation valves, four resilient seated test cocks and an air gap drain fitting. The assembly shall meet the requirements of: USC; ASSE Std. 1013; AWWA Std. C511; CSA B64.4. Shall be a Watts Series LF009.

TAG: SECTION 22 42 01 2.6 DAR REDUCED PRESSURE

Available Models: ¼" – 2" (8 – 50mm)

Suffix:

QT – quarter-turn ball valves
S – strainer
LF – without shutoff valves
PC – internal polymer coating

Prefix:

U – union connections

Available Models: 2½" – 3" (65 – 80mm)

Suffix:

NRS – non-rising stem resilient seated gate valves
OSY – UL/FM outside stem and yoke resilient seated gate valves
S-FDA – FDA epoxy coated strainer
QT-FDA – FDA epoxy coated quarter-turn ball valves
LF – without shutoff valves

Note: The installation of a drain line is recommended. When installing a drain line, an air gap is necessary (see ES-AG).

Materials: ¼" – 2" (8 – 50mm)

Lead Free* cast copper silicon alloy body construction, silicone rubber disc material in the first and second check plus the relief valve. Replaceable polymer check seats for first and second checks. Removable stainless steel relief valve seat. Stainless steel cover bolts.

Standardly furnished with NPT body connections.
Model LF009QT furnished with quarter-turn, full port, resilient seated, Lead Free* cast copper silicon alloy body ball valve shutoffs.

Materials: 2½" and 3" (65 – 80mm)

- (FDA approved) Epoxy coated cast iron unibody with plastic seats
- Relief valve with stainless steel seat and trim
- Lead Free cast copper silicon alloy body ball valve test cocks

Pressure / Temperature

Sizes ¼" – 2" (8 – 50mm) Suitable for supply pressure up to 175psi (12 bar). Water temperature: 33°F – 180°F (0.5° – 75°C).

Sizes 2½" and 3" (65 and 80mm) are suitable for supply pressures up to 175psi (12.1 bar) and water temperature at 110°F (43°C) continuous, 140°F (60°C) intermittent.

Standards

Air Gaps, Elbows and Test Cocks

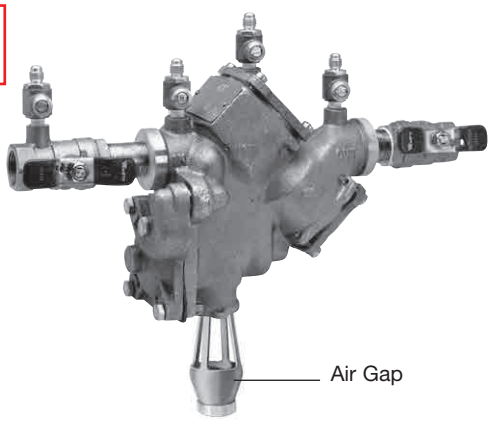
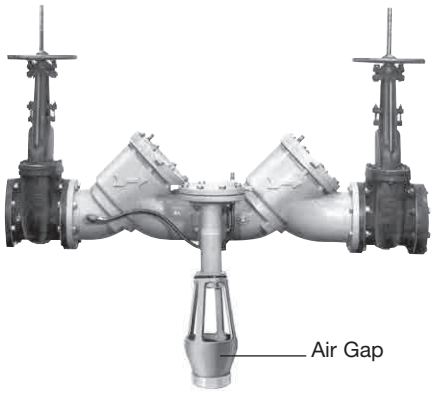
for Reduced Pressure Zone Assemblies



REVIEWED BY MV

Air Gaps

An air gap provides the unobstructed, physical separation between the discharge end of a potable water supply line and an open receiving vessel.



The installation of an air gap and drain line are recommended.

Series 957, 957N, 957Z

Reduced Pressure Zone Assemblies

Sizes: 2½" – 10" (65 – 250 mm)

Series 957, 957N, 957Z Reduced Pressure Zone Assemblies provide protection to the potable water system from contamination in accordance with national plumbing codes. Series 957, 957N, 957Z are normally used in health hazard applications for protection against backsiphonage or backpressure.

Features

- 2½" 3" and 4" (65, 80 and 100mm) sizes available with quarter-turn ball valve shutoffs
- Replaceable check disc rubber
- Extremely compact design
- 70% Lighter than traditional designs
- 304 (Schedule 40) stainless steel housing & sleeve
- Groove fittings allow integral pipeline adjustment
- Patented torsion spring checks provide lowest pressure loss
- Unmatched ease of serviceability
- Bottom mounted cast stainless steel relief valve
- Available with grooved butterfly valve shutoffs

Specifications

The Reduced Pressure Zone Assembly shall consist of two independent torsion spring check modules, a differential pressure relief valve located between and below the two modules, two drip tight shutoff valves, and required torsion spring check modules and relief valve shall be contained with a sleeve accessible single housing constructed from 304 (Schedule 40) stainless steel pipe with groove end connections. Torsion spring checks shall have replaceable elastomer discs and in operation produce drip tight closure against the reverse flow of liquid caused by backpressure or backsiphonage. Assembly shall be a Watts Regulator Company Series 957, 957N, 957Z.

Available Models

Suffix:

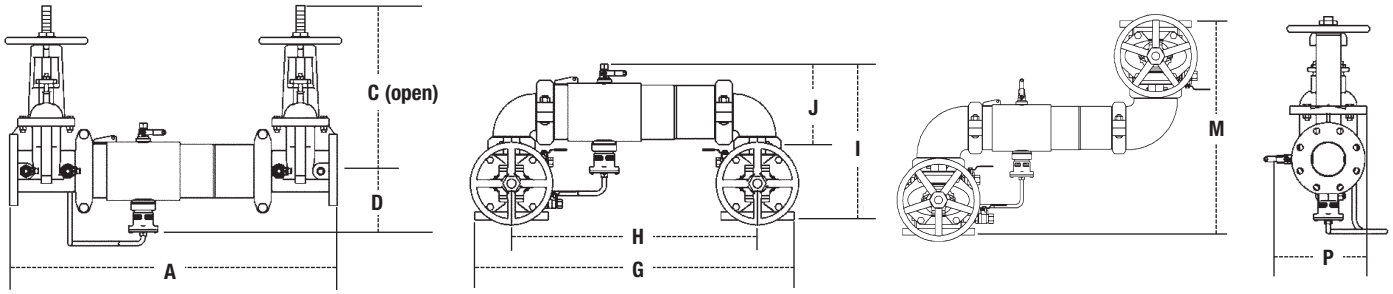
NRS –	non-rising stem, resilient seated gate valves
OSY –	UL/FM outside stem and yoke resilient seated gate valves
BFG –	UL/FM grooved gear operated butterfly valves with tamper switch
QT –	2½" - 4" (65 - 100mm) quarter-turn ball valves
**OSY FxG –	Flanged inlet gate connection and grooved outlet gate connection
**OSY GxF –	Grooved inlet gate connection and flanged outlet gate connection
**OSY GxG –	Grooved inlet gate connection and grooved outlet gate connection

Available with grooved NRS gate valves - consult factory**
Post indicator plate and operating nut available - consult factory**
**Consult factory for dimensions

Note: When installing a drain line on Series 957 backflow preventers, use 957AG air gaps. See ES-AG/EL/TC for additional information.

Materials

Housing & Sleeve: 304 (Schedule 40) Stainless Steel
Elastomers: EPDM, Silicone and Buna-N
Torsion Spring Checks: Noryl®, Stainless Steel
Check Discs: Reversible Silicone or EPDM
Test Cocks: Bronze Body Nickel Plated
Pins & Fasteners: 300 Series Stainless Steel
Springs: Stainless Steel



Pressure — Temperature

Temperature Range: 33°F – 140°F (0.5°C – 60°C)
Maximum Working Pressure: 175psi (12.1 bar)

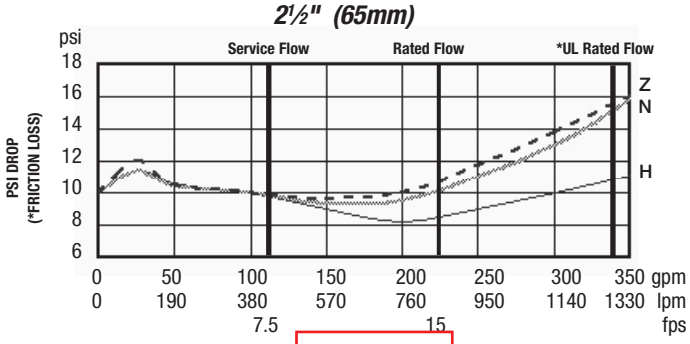
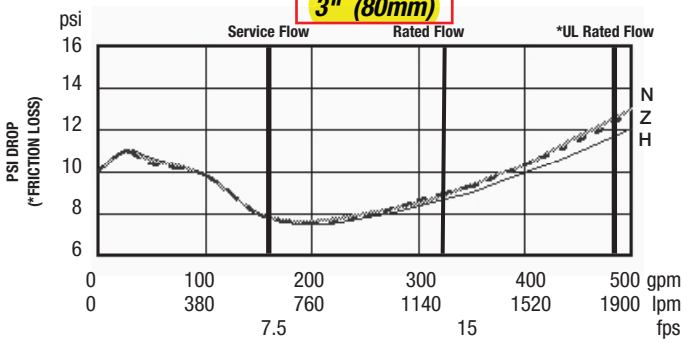
Capacity

Series 957, 957N, 957Z flow curves as tested by Underwriters Laboratory.



Flow characteristics collected using butterfly shutoff valves

——— Horizontal ——— N-Pattern - - - - - Z-Pattern



Flow capacity chart identifies valve performance based upon rated water velocity up to 25fps

- Service Flow is typically determined by a rated velocity of 7.5fps based upon schedule 40 pipe.
- Rated Flow identifies maximum continuous duty performance determined by AWWA.
- UL Flow Rate is 150% of Rated Flow and is not recommended for continuous duty.
- AWWA Manual M22 [Appendix C] recommends that the maximum water velocity in services be not more than 10fps.

ENGLISH INSTRUCTIONS

Installation Instructions

1. The valve should be installed by a licensed contractor in accordance with local codes and ordinances.
2. This valve should be installed where it is accessible with sufficient clearance for cleaning, service, or adjustment.
3. Before installing the valve, be sure that the pipe ends are reamed and threads are cut to size. For valves with Quick-Connect tailpieces refer to "Quick-Connect Installation" instructions below.
4. Flush the lines to remove all loose scale, dirt and other foreign matter that can damage or clog the valve.
5. Install the regulator with the arrow on the body pointing in the direction of the flow.
6. Regulator may be installed vertically or horizontally (upright or inverted).
7. Start Up — Open cold water supply then hot water supply. Inspect for leaks.

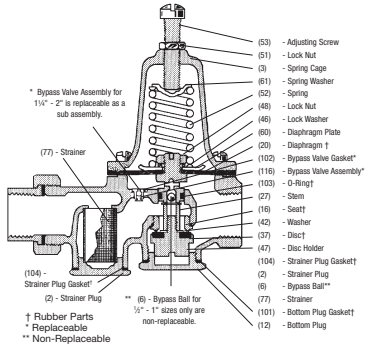
Note: The valve should be inspected annually to assure maximum life and performance.

Note: 25AUB-Z3 or LF25AUB-Z3 valves are suitable for accessible outdoor or pit installations.

Maintenance Instructions

- To clean strainer; shut off inlet water pressure, remove strainer plug (2), remove and clean strainer.
- To replace seat disc; shut off supply, loosen nut (51) and back off adjusting screw (53) remove spring cage (3), spring (52) and washer (62). Remove bottom plug (12) and gasket (101). Insert and hold screw driver in slot on top of stem while loosening seat disc holder (47) from bottom of stem (27).
- To replace diaphragm; loosen lock nut (48) and remove lock washer (46), diaphragm plate (60) and diaphragm (20).
- When reassembling apply a drop of low strength thread lock to disc holder.
- Open inlet water supply slowly.

Adjustment



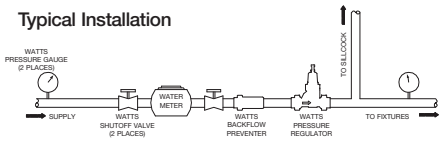
Regulator is factory preset to 50psi (344 kPa). To adjust pressure setting, loosen the lock nut and turn the adjusting bolt clockwise to increase pressure, counterclockwise to decrease pressure.

CAUTION: Any time a reducing valve is adjusted, the use of a pressure gauge is recommended to verify correct pressure setting. Do not bottom out adjusting screw on spring cage.

Bypass Feature*

This regulator has a built-in thermal expansion bypass feature. This feature prevents downstream pressure from rising to more than 10psi above the supply pressure.

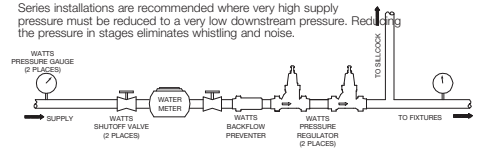
*The bypass feature will not prevent the pressure relief valve from opening on the hot water supply system with pressure above 150psi (10.3 bar).



Repair Kits

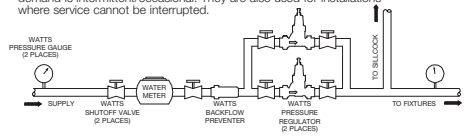
† Kit for Series 25AUB-Z3 includes all items shown above

ORDERING CODE	KIT NO.	SIZE (DN)	
		in	*mm*
0864941	½" 25AUB-RK	½	15
0864943	¾" 25AUB-RK	¾	20
0864942	1" 25AUB-RK	1	25
0864944	1¼" 25AUB-RK	1¼	32
0864945	1½" 25AUB-RK	1½	40
0864946	2" 25AUB-RK	2	50



When Ordering, Specify:
1. Ordering Code
2. Size of Valve
3. Type Number
4. Model shown on Nameplate

Typical Installation

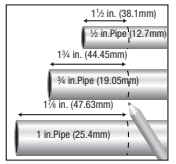


Series Installation

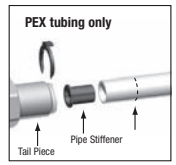
Series installations are recommended where very high supply pressure must be reduced to a very low downstream pressure. Reducing the pressure in stages eliminates whistling and noise.

Parallel Installation

Parallel installations are recommended where high flow or low flow demand is intermittent/occasional. They are also used for installations where service cannot be interrupted.



WARNING!



For valves with CPVC or PEX end connections do not exceed the tubing manufacturers pressure and temperature ratings. Refer to the tubing manufacturers product specifications for that information.

Quick-Connect Installation

To Connect:

1. Mark pipe as shown. This is pipe insertion depth.
2. Clean pipe end.

3. If using PEX tubing, insert pipe stiffener (provided) into end of pipe.
4. Push tubing into tailpiece up to mark.
5. Insert collet clip.

To Disconnect:

1. Remove collet clip.
2. Depress collet.
3. Pull tubing from tailpiece.

Troubleshooting

High System Pressure

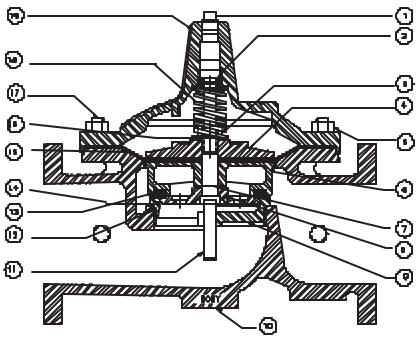
If the downstream system pressure is higher than the set pressure under no flow conditions, the cause could be thermal expansion, pressure creep or dirt/debris on the seat.

Thermal expansion occurs whenever water is heated in a closed system. The system is closed when supply pressure exceeds 150psi, or a check valve or backflow preventer is installed in the supply piping.

You must make provisions for pressure relief protection of your plumbing system and components. The use of a relief valve such as the Watts 530C, BRV, Governor 80, or 3L or potable water expansion tank such as the Watts DET, PLT or DETA may be required.

276H300

To determine if this is the result of thermal expansion, try briefly opening the cold water tap. If the increased pressure is caused by thermal expansion, the pressure will immediately be relieved and the system will return to the set pressure. Watts offers a pressure test gauge, model 276H300 to assist you in determining if you have high water pressure.



The 276H300 when attached to a hose bibb registers the highest pressure reading over the period of time it is left on the system.

Globe **Angle**

Basic Construction

The Basic Valve has three (3) major components: Body, Cover, and the Disc & Diaphragm Assembly. It is available in Globe or Angle patterns, and Full or Reduced port design. Model M100 and M1100 are Full port, Model M6100 and M61100 are Reduced port valves.

Valve Servicing Dimensions

The following tables detail the recommended minimum valve servicing dimensions.

Globe

Size	1-1/4"	1-1/2"	2"	2-1/2"	3"	4"	6"	8"	10"	12"	14"	16"	*20"	*24"
A (in)	16	16	20	22	22	24	32	34	38	44	48	52	56	56
B (in)	10	10	12	14	14	16	24	26	28	30	34	40	48	48

* Model M6100 Reduced Port

Angle

Size	1-1/4"	1-1/2"	2"	2-1/2"	3"	4"	6"	8"	10"	12"	14"	16"
C (in)	16	16	20	22	22	24	32	34	38	44	48	52
D (in)	10	10	12	14	14	16	24	26	28	30	34	40

Installation

1. Prior to installation, flush line to remove debris.
2. Install valve so the flow arrow matches flow through the line, and gauges to monitor valve inlet and outlet pressures. A Position Indicator can be installed to provide visual indication of valve position and operation without disassembly.
3. Install isolation valves upstream and downstream of the main valve.
   Note: If using butterfly valves, ensure valve disc does not contact the main valve.
4. Provide adequate clearance for valve servicing and maintenance. Refer to valve servicing dimensions on Page 1.
5. Avoid installing valves 6" and larger in the vertical position (main valve stem horizontal). Automatic Control Valves (ACVs) are designed for horizontal in-line installation, with the cover facing up (main valve stem vertical). Slow operation or premature stem and guide wear may occur if valve is not installed according to factory recommendations. Consult factory for detailed engineering review prior to ordering if valve is to be installed other than horizontally in-line.
6. If valve is equipped with a pilot control system, extra precautions should be made during installation to protect the piping circuit from damage. Only remove the pilot control system from the valve if necessary. Tubing and fittings should be kept clean, and replaced exactly as removed. Consult appropriate hydraulic schematic to ensure proper re-assembly.
7. After installation, vent entrapped air from valve cover and pilot system by following instructions on Technical Bulletin.

Operation

The main valve, sometimes called a "Basic" or "Bare" valve, does not perform any function until it is commanded to do so by Pilots or Controls. These are connected to the valve by pipe fittings and tubing, and "pilot" or "control" the valve hydraulically to perform various functions. The Pilot Control System allows fluid and pressure to be 1) applied to, 2) exhausted from, or 3) regulated within the sealed chamber above the diaphragm. Depending on the configuration of the Pilot Control System, the valve may act either as an On-Off, a Regulating, or a Combination On-Off and Regulating Control Valve.

On-Off, Regulating, and Combination On-Off and Regulating ACVs operate on the difference in effective areas of the seat and diaphragm, and the forces exerted upon them by inlet and outlet pressures. The diaphragm area is approximately 1-1/2 times the area of the seat. This ratio, commonly referred to as the 1.5 : 1 Ratio, assures that valve will open and close as illustrated in the following example.

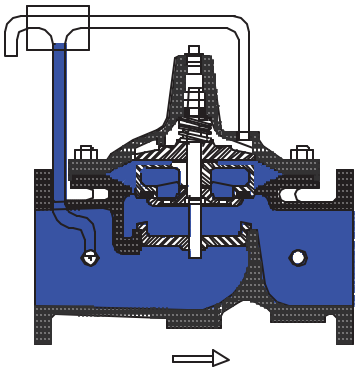

Figure 1

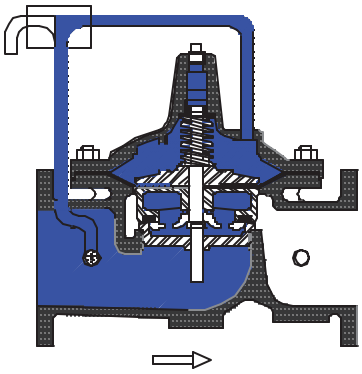

Figure 2

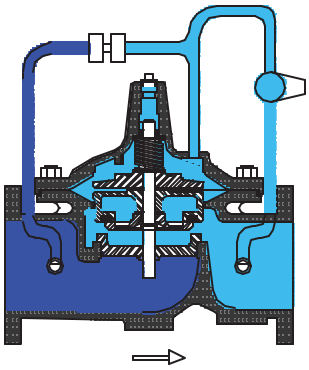

Figure 3

Valve Size: 4"
Diaphragm Area: 19 sq. in.
Seat Area: 13 sq. in.

Inlet Pressure: 100 p.s.i
Flow Direction: Under the Disc

Figure 1: 100 psi enters the valve below the seat, lifting the Disc and Diaphragm Assembly with approximately 1300 lbs of force (area x 100 psi). With no pressure in the cover chamber (above the diaphragm), the valve moves to a wide open position.

Figure 2: The 100 psi is admitted to the cover chamber (above the diaphragm), resulting in a downward force of approximately 1900 lbs (area x 100 psi). The downward force is greater than the upward force by 600 lbs, and the valve now moves to, and will remain in, a closed position due to the 1.5 : 1 ratio. Venting the cover chamber to atmosphere will again result in the valve traveling to a wide open position.

Figure 3: By regulating or balancing the pressure in the cover chamber (above the diaphragm), the valve will hold or modulate at an intermediate position until commanded to regulate open or closed by a modulating control pilot.

Flow Direction

The direction of flow through the valve can be either of two directions: Under-the-Disc or Over-the-Disc.

Under-the-Disc flow is the normal direction of flow through the valve. In the event of a diaphragm failure, the valve will fail to an open position. Over-the-Disc is not standard, however, is available for certain applications. When the valve is configured with Over-the-Disc flow, it will fail to a closed position in event of diaphragm failure.

The valve must be installed according to nameplate data and flow arrow designations.

Valve Travel

The travel or stroke of the valve is approximately 25% of the seat diameter. To properly measure valve travel, a Position Indicator should be installed. If the valve is equipped with a Limit Switch, the actuating stem provides visual indication of valve position and travel. Table 1 details approximate valve travel.

Table 1: Valve Travel (Inches)

Valve Size	1 1/4	1 1/2	2	2 1/2	3	4	6	8	10	12	14	16	20	24
Full Port	3/8	3/8	1/2	5/8	3/4	1	1 1/2	2	2 1/2	3	3 1/2	4		
Reduced Port					1/2	1	1	1 1/2	2	2 1/2		3	4	4

Maintenance

It is recommended that a Periodic Maintenance Schedule be established to inspect the valve stem for calcium or hard water deposits, and the condition of the diaphragm and seat disc. An annual Preventive Maintenance Schedule should help identify potential problem situations before emergency repairs are needed.

The normal replacement parts are the Seat Disc and the Diaphragm. These are available individually or together in a Rubber Repair Kit. Rubber repair kits for Control Pilots are sold separately. For maximum life expectancy, all rubber repair parts should be stored in a cool, dry environment, and not exposed to direct sunlight. In the event a non-rubber component part is required, review the cross-sectional drawing on Page 1 and consult your local representative or the factory.

Disc & Diaphragm Assembly

The valve employs a top and bottom guided stainless steel stem which is guided by a bearing in the valve cover and a bearing which is integral to the valve seat. A *Diaphragm*, consisting of nylon fabric bonded between two sheets of synthetic rubber is sandwiched between the *Diaphragm Washer* and the *Disc Retainer*. The bottom of the Disc Retainer contains a rectangular replaceable synthetic rubber *Seat Disc*. The Seat Disc is securely held in place by a plate called the *Disc Guide*. The Disc Retainer and Disc Guide surrounds the Seat Disc on 3-1/2 sides, preventing it from becoming dislodged. The exposed 1/2 side of the Seat Disc contacts the *Seat Ring*, and seals drip tight. When assembled, these components make what is called the *Disc & Diaphragm Assembly*.

This assembly is the only moving part inside the valve, and can be removed while the body remains in line. When the Disc & Diaphragm Assembly is installed in the valve, the diaphragm forms a seal between the valve body and cover, creating a *Cover Chamber*. Understanding what happens inside the cover chamber is of paramount importance to understanding what action the valve will take. (Refer to Figures 1, 2, and 3).

Disassembly, Inspection, and Re-Assembly

All maintenance and disassembly can be performed while the valve remains installed in the line.

Warning: The valve must be isolated from line pressure and fully depressurized before disassembly to avoid personal injury or equipment damage.

Recommended Tools for Disassembly

- Small & Large Adjustable Wrenches
- Fine Wire Brush
- Hammer & Dull Cold Chisel
- Hexagonal Wrench Set
- Small, Medium, and Large Screwdrivers
- Small and Large Pipe Wrenches
- Bench Vise
- Heavy Duty Ratchet and Socket Set
- Appropriate Technical Bulletin for Proper Start-Up Procedure
- Basic Valve IOM Manual
- 320 Grit (or fine) Emery Cloth
- Machinist Fine Metal File

1. Isolate the valve from line pressure and depressurize it to ensure safe working conditions. Disconnect any electrical connections if so equipped.
2. Carefully remove Position Indicator or Limit Switches if equipped. Remove all tubing, fittings, and Control Pilots necessary to easily access and remove the cover. Remove cover nuts and washers.
3. Remove the cover. If cover is not free to be removed, loosen it by tapping upward along its outside edge with a dull cold chisel (Figure 4). Another method is to carefully admit upstream pressure to the valve by partially opening the upstream isolation valve, allowing water pressure to push the cover upward. Leave at least 4 opposing cover nuts in place approximately 3 to 4 threads above the cover. Extreme caution should be taken when using this method.

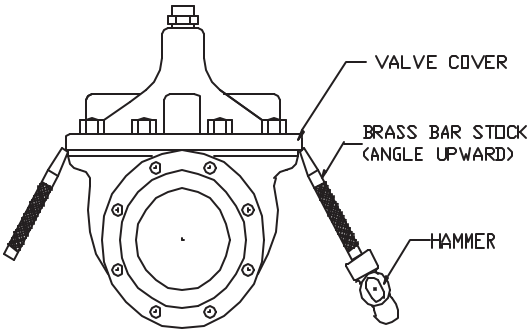

Figure 4

4. Remove the Disc and Diaphragm Assembly from the valve body by lifting straight up. Large diameter valves may require a lifting “eye” bolt to be installed in the valve stem accessory threads located on the very top of the valve stem.

Table 2: Valve Stem Accessory Threads

Valve Size (in)	1 1/4 - 2 1/2	3	4	6	8 - 12	14	16	20	24
Full Port	10-32	1/4-28	1/4-28	3/8-24	3/8-24	3/8-24	1/2-20		
Reduced Port		10-32	1/4-28	1/4-28	3/8-24		3/8-24	1/2-20	1/2-20

5. Before removing Stem Nut, examine stem threads for mineral build-up. Remove deposits with a fine wire brush. Extreme care should be taken not to damage the finish on stem guiding surfaces when disassembling. Avoid applying pipe wrenches to top or bottom stem guide surfaces.
6. After removing the Stem Nut, the remainder of the Disc & Diaphragm Assembly should disassemble easily. Polish stem guide surfaces with fine emery cloth to remove any mineral deposits, and inspect for excessive wear. Remove any mineral build-up from other components with wire brush or by using a Mineral Dissolving Solution. Inspect parts for wear and replace if necessary.
7. Inspect valve seat. If seat is not damaged, removal is not necessary. Valve seats 6” and smaller are threaded into the body of the valve and require a seat removal tool (Figure 5) (Table 3 details the tool dimensions for seat removal). Valve seats 8” and larger are held in the valve body with stainless steel cap screws. Remove seat retaining screws and lift seat straight up (Figure 6).

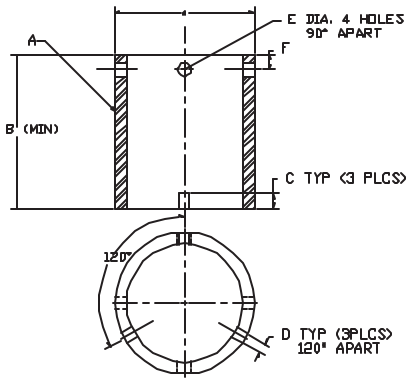

Figure 5

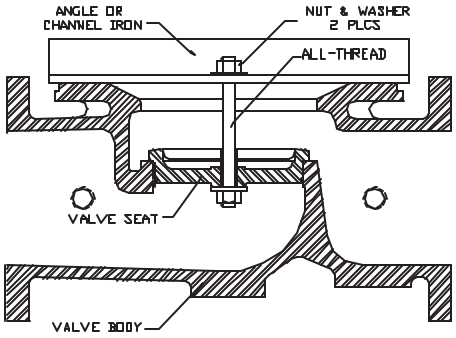

Figure 6

Table 3: Seat Removal Tool Dimensions

Size	A (Pipe Size)*	B (Min. Length)	C	D	E (Dia)	F

* Schedule 40 Steel Pipe

8. Replace Seat Disc, Diaphragm and Spacer Washers provided in Main Valve repair kit (refer to Table 5 or 6 for correct repair kit part number). Re-assemble in the reverse order of disassembly.
9. Re-Install Disc and Diaphragm Assembly in the valve, taking care not to damage the lower guide area in the center of the valve seat.
10. Re-install Cover Spring. Replace Valve Cover and tighten Cover Nuts in a crossing pattern to ensure even distribution. Test the Disc and Diaphragm Assembly for smooth travel by following the Freedom of Movement Test procedure in next Section.
11. Test the integrity of the Seat Seal by following the Seat Seal Test procedure in next Section.
12. Return valve to service by following instructions on the Technical Bulletin matching the valve function.

Troubleshooting

Warning: The valve cannot be serviced under pressure. Upstream and downstream Isolation Valves must be installed to protect system piping. Accurate diagnosis and troubleshooting requires the valve to open fully, and may subject downstream piping and equipment to high pressure and/or flow rates. The downstream Isolation Valve should be kept closed while diagnosing the valve. Extreme caution should be used while performing the troubleshooting techniques listed below.

It is recommended that three (3) pressure gauges be installed on the valve to monitor: 1) valve inlet, 2) valve outlet, and 3) valve cover chamber pressures. A Position Indicator should also be installed to visually determine the position of the Disc & Diaphragm Assembly.

Diaphragm Seal Test

1. Close upstream and downstream isolation valves. Close ball cocks or remove control tubing to isolate cover chamber from receiving fluid and pressure. Remove uppermost Cover Plug, Position Indicator, or Limit Switch.
2. With the cover chamber vented to atmosphere, partially open the upstream Isolation Valve, allowing pressure to lift the Disc & Diaphragm Assembly. A volume of water will be displaced from the cover chamber as the valve opens (Table 4 details approximate full cover capacity). A continuous flow of water from the open port indicates a damaged diaphragm or a loose Disc & Diaphragm Assembly. Disassemble and replace diaphragm or tighten the Disc & Diaphragm Assembly.

Table 4: Cover Volume

Valve Size (in)	1 1/4 -2	2 1/2	3	4	6	8	10	12	14	16	20	24
Full Port (fl. oz)	4	10	10	22	70							
Full Port (U.S gal)						1.25	2.5	4	6.5	9.5		
Reduced Port (fl. oz)			4	10	22	70						
Reduced Port (U.S gal)							1.25	2.5		4	9.5	9.5

Seat Seal Test

1. Close downstream isolation valve, and admit inlet pressure to the Cover Chamber of the valve. Wait for the valve to close.
2. Install a pressure gauge in either of the two outlet ports on the valve, and monitor pressure reading. Gauge pressure should hold steady, and not rise. If gauge pressure rises to match inlet pressure, leakage is occurring through the seat of the valve. Disassemble, inspect, and replace required parts. If gauge pressure rises to match outlet pressure (downstream of closed isolation valve), yet remains below inlet pressure, the isolation valve may be leaking as opposed to the seat of the main valve.

Freedom-of-Movement / Valve Travel Test

1. Close upstream and downstream isolation valves and install Valve Position Indicator. Partially open upstream isolation valve to admit inlet fluid and pressure into the cover chamber closing the valve fully. Mark the Position Indicator's Full Closed position.
2. Isolate cover chamber from receiving fluid and pressure by closing ball cocks or removing control tubing. Carefully vent cover chamber to atmosphere by removing a cover plug, and observe the Valve Position Indicator as the valve travels to the full open position. The Disc & Diaphragm assembly should move freely from the full closed to full open position without binding or grabbing. Close upstream Isolation Valve and depressurize the valve body by opening an isolation ball valve or removing a body plug. The Disc & Diaphragm Assembly should move freely from the full open position to the closed position without binding or grabbing. The Disc & Diaphragm Assembly may momentarily "hesitate" while traveling from the full open to the full closed position. This "hesitation" is a normal characteristic of Diaphragm Control Valves, and does not indicate mechanical binding or improper valve operation.

   Note: A continuous discharge of fluid from the open cover port indicates leakage past the Diaphragm.

   Disassemble, inspect Diaphragm (replace if needed), and retighten Disc & Diaphragm Assembly before proceeding further. Reinstall Pilot Control System.

Repair Kits

Main valve repair kits contain all rubber components (diaphragm, seat disc, spacer washers, and seat O-ring) necessary to repair a basic valve. Repair kits for Pilot Controls are sold separately. Table 5 and 6 detail the part numbers for full port and reduced port Main Valve repair kits.

Table 5: Full Port Valve (M100 / M1100) Repair Kits

Size (in)	1 1/4	1 1/2	2	2 1/2	3	4

Installation, Maintenance, & Repair Series 009 and LF009

Reduced Pressure Zone Assemblies

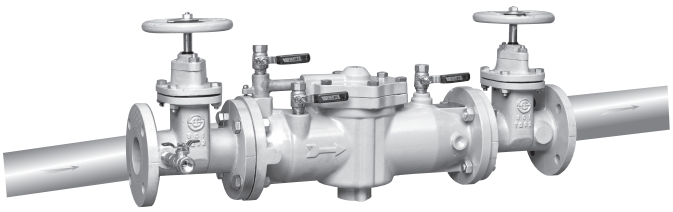
Sizes: ¼" – 3" (8 – 80mm)

⚠ WARNING

Read this Manual BEFORE using this equipment.

Failure to read and follow all safety and use information can result in death, serious personal injury, property damage, or damage to the equipment.

Keep this Manual for future reference.



THINK SAFETY FIRST

Local building or plumbing codes may require modifications to the information provided. You are required to consult the local building and plumbing codes prior to installation. If this information is not consistent with local building or plumbing codes, the local codes should be followed.

Need for Periodic Inspection/Maintenance: This product must be tested periodically in compliance with local codes, but at least once per year or more as service conditions warrant.

If installed on a fire suppression system, all mechanical checks, such as alarms and backflow preventers, should be flow tested and inspected in accordance with NFPA 13 and/or NFPA 25.

Corrosive water conditions, and/or unauthorized adjustments or repair could render the product ineffective for the service intended. Regular checking and cleaning of the product's internal components helps assure maximum life and proper product function.

3" (80mm) 009NRS

NOTICE

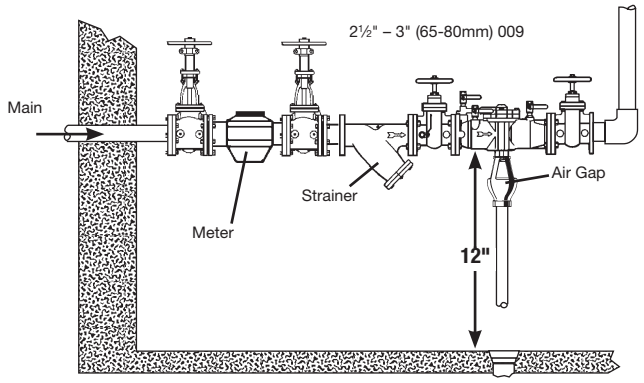
For Australia and New Zealand, line strainers should be installed between the upstream shutoff valve and the inlet of the backflow preventer.

Testing

For field testing procedure, refer to Watts installation sheets IS-TK-DP/DL, IS-TK-9A, IS-TK-99E and IS-TK-99D found on **watts.com.**

For other repair kits and service parts, refer to our Backflow Prevention Products Repair Kits & Service Parts price list PL-RP-BPD found on **watts.com.**

For technical assistance, contact your local Watts representative.



Installation Instructions

Series 009 and LF009

Indoors – Figure 1

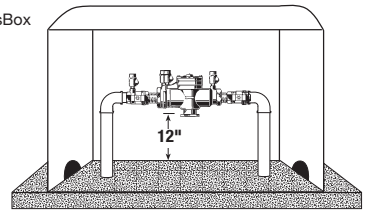
For indoor installations, it is important that the assembly be easily accessible to facilitate testing and servicing. If it is located in a line close to a wall, be sure the test cocks are easily accessible. A drain line and air gap (see literature ES-AG/EL/TC) should be piped from the relief valve connection as shown, where evidence of discharge will be clearly visible and so that water damage will not occur. **Therefore, never install in concealed locations.**

Figure 1

NOTICE

In an area where freezing conditions can occur, Series 009 and LF009 should be installed above ground in an insulated enclosure.

Series 009 and LF009 must be installed in an accessible location to facilitate testing and servicing. A discharge line should be piped from the air gap at the relief valve connection making sure that there is adequate drainage. Never pipe the discharge line directly into a drainage ditch, sewer or sump. Series 009 and LF009 should never be installed where any part of the unit could become submerged in standing water.



Outside – Figure 2

In an area where freezing conditions do not occur, Series 009 and LF009 can be installed outside. The most satisfactory installation is above ground and should be installed in this manner.

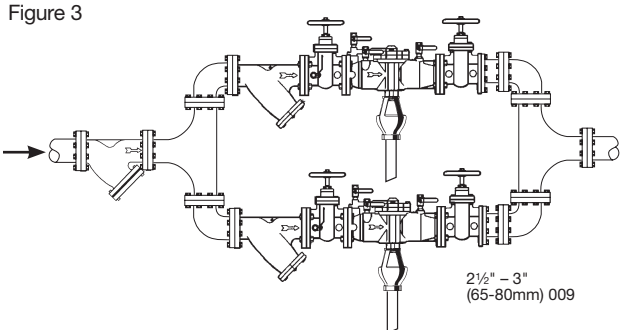
Backflow preventers should not be installed in pits unless approved by local codes. In such cases, a modified pit installation is preferred.

Figure 2

Now available, WattsBox Insulated Enclosures, for more information, send for literature ES-WB.

WATTS®

Installation Instructions
Series 009 and LF009



Parallel – Figure 3

Two or more smaller size assemblies can be piped in parallel (when approved) to serve a large supply pipe main. This type of installation is employed where increased capacity is needed beyond that provided by a single valve and permits testing or servicing of an individual valve without shutting down the complete line.

The number of assemblies used in parallel should be determined by the engineer's judgment based on the operating conditions of a specific installation.

For parallel valve installations, the total capacity of the assemblies should equal or exceed that required by the system.

Figure 3

Annual inspection of all water system safety and control valves is required and necessary. Regular inspection, testing and cleaning assures maximum life and proper product function.

NOTICE

Shutoff Valves: When shutoff valves are removed and reassembly is necessary, the shutoff valve with the test cock is to be mounted on the inlet side of the backflow preventer.

A. The 009 and LF009 should always be installed in an accessible location to facilitate testing and servicing (See page 2). **Check the state and local codes to ensure that the backflow preventer is installed in compliance, such as the proper height above the ground.**

B. We recommend a strainer be installed ahead of 009 and LF009 series assemblies to protect the internal components from unnecessary fouling.

⚠ CAUTION

Do not install with strainer when backflow preventer is used on seldom-used water lines which are called upon only during emergencies, such as fire sprinkler lines.

Start Up: The downstream shutoff should be closed. Open upstream slowly and fill valve. When valve is filled, open the downstream shutoff slowly and fill the water supply system. This is necessary to avoid water hammer or shock damage.

C. Water discharge from the relief valve should be vented in accordance with code requirements. The relief valve should never be solidly piped into a drainage ditch, sewer or sump. The discharge should be terminated approximately 12" above the ground or through an air gap piped to a floor drain.

NOTICE

Relief Valve Discharge Rates

The installation of an air gap with the drain line terminating above a floor drain will handle any normal discharge or nuisance spitting through the relief valve. However, floor drain size may need to be designed to prevent water damage caused by a catastrophic failure condition. Please refer to Figure No. 4 for maximum relief valve discharge rates, size and capacity of typical floor drains.

Do not reduce the size of the drain line from the air gap fitting. Pipe full line size.

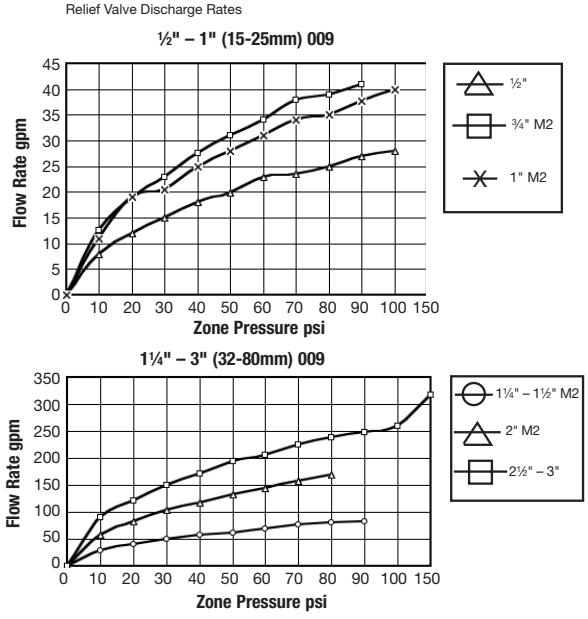
D. After initial installation, a discharge from the relief valve opening may occur due to inadequate initial flushing of pipe lines to eliminate dirt and pipe compounds. If flushing will not clear, remove the first check valve and clean thoroughly.

NOTICE

Periodic relief valve discharge may occur on dead end service applications, such as boiler feed lines or cooling tower makeup lines due to fluctuating supply pressure during a static or no flow condition. To avoid this discharge, install a spring-loaded rubber seated check valve ahead of the backflow assembly to "lock-in" the downstream pressure.

E. Backflow preventers should never be placed in pits unless absolutely necessary and then only when and as approved by local codes. In such cases, provision should be made to always vent above flood level or for a pit drain to ensure an adequate air gap below the relief port.

F. It is important that Series 009 and LF009 backflow preventers be inspected periodically for any discharge from the relief valve which will provide a visual indication of need for cleaning or repair of check valves. Also testing for proper operation of the device should be made periodically in compliance with local codes, but at least once a year or more often, depending upon system conditions.



Relief vent will discharge water when, during no-flow periods, (1) the first check valve is fouled or (2) the inlet pressure to the device drops sufficiently due to upstream pressure fluctuations to affect the required operating differential between the inlet pressure and reduced pressure zone. Otherwise, such relief (spitting) can occur when the second check is fouled during emergency backflow or resulting from a water hammer condition. For Troubleshooting Guide send for S-TSG.

NOTICE

Special considerations are necessary when testing assemblies installed on Fire Prevention Systems.

Fire Protection System Installations: The National Fire protection Agency (NFPA) Guidelines require a confirming flow test be conducted whenever a "main line" valve such as the shutoff valves or a backflow assembly have been operated. Certified testers of backflow assemblies must conduct this confirming test.

Figure 4

TYPICAL FLOW RATES AS SIZED BY FLOOR DRAIN MANUFACTURERS:	
2" (50 mm) 55 GPM	5" (125 mm) 350 GPM
3" (80 mm) 112 GPM	6" (150 mm) 450 GPM
4" (100 mm) 170 GPM	8" (200 mm) 760 GPM

Servicing the Relief Valve

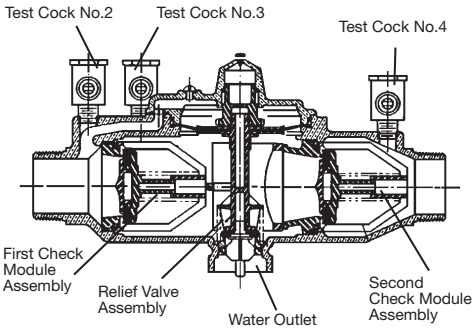
Series 009 and LF009

¼" – 3" (8 – 80mm)

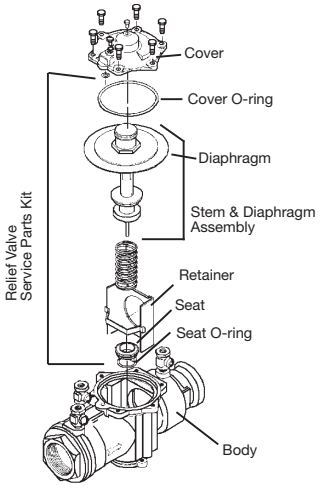
1. Remove the four or six relief valve cover bolts while holding the cover down.
2. Lift the cover straight off. The stem and diaphragm assembly will normally remain with the cover as it is removed. The relief valve spring will be free inside the body at this point.
3. The relief valve seat is located at the bottom of the body bore, and can be removed, if necessary, for cleaning. The disc can be cleaned without disassembly of the relief valve module. If it is determined that the relief valve diaphragm and/or disc should be replaced, the relief valve module can be readily disassembled without the use of special tools.

NOTICE

The disc rubber is molded into the disc holder and is supplied as a disc holder assembly.

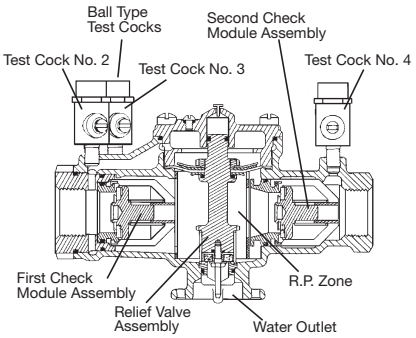


4. To reassemble the relief valve, press the seat firmly into place in the body, center the spring on the seat, and insert the cover and relief valve module as a unit straight into the bore. Press down on the cover to assure proper alignment. Insert and tighten bolts.

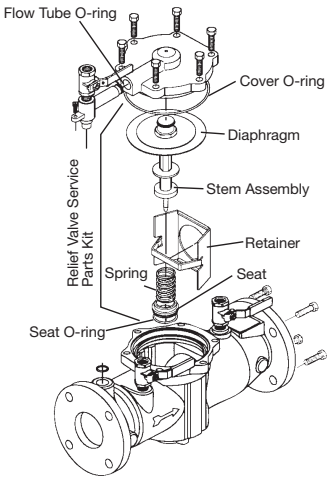


NOTICE

If cover will not press flat against body, stem assembly is crooked and damage can result. Realign stem and cover before bolts are inserted.



NOTICE



No special tools required to service Series 009 2½" – 3" (65 – 80mm).

For repair kits and parts, refer to our Backflow Prevention Products Repair Kits & Service Parts price list PL-RP-BPD found on **watts.com.**

Servicing First & Second Check Valves

Series 009 and LF009

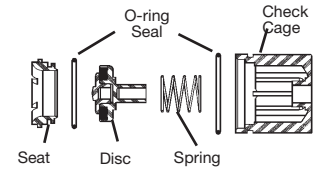
¼" – 3" (8 – 80mm)

1. Remove the relief valve assembly as outlined on page 3.
2. Remove the retainer from the body bore. The check valve modules can now be removed from the valve by hand or with a screwdriver.

NOTICE

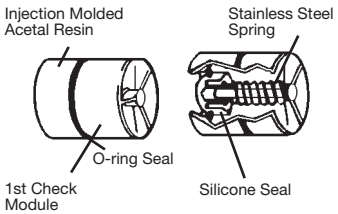
The seats and springs of the first and second check modules are not interchangeable. The heavier spring and smaller diameter seat belong with the first check module.

3. The check seats are attached to the cage with a bayonet type locking arrangement. Holding the cage in one hand, push the seat inward and rotate counterclockwise for 2½", 3"; Clockwise for ¼" – 2" against the cage. The seat, spring cage, spring and disc assembly are now individual components.
4. The disc assembly may now be cleaned and reassembled or, depending on its condition, may be discarded and replaced with a new assembly from the repair kit. O-rings should be cleaned or replaced as necessary and lightly greased with the FDA approved silicon grease. For more information refer to repair parts price list PL-RP-BPD.
5. Reassemble the check valve modules. Check modules are installed in the valve body with the seat facing the valve inlet. The modules must be securely in place before the retainer can be replaced. Replace relief valve assembly.



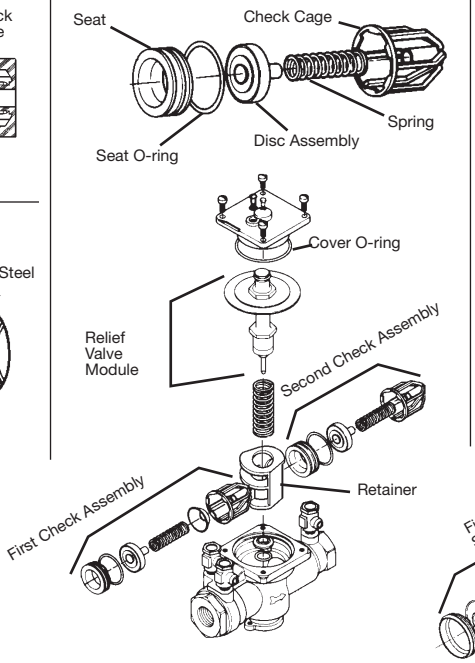
NOTICE

No special tools required to service Series 009 2½" – 3" (65 – 80mm)

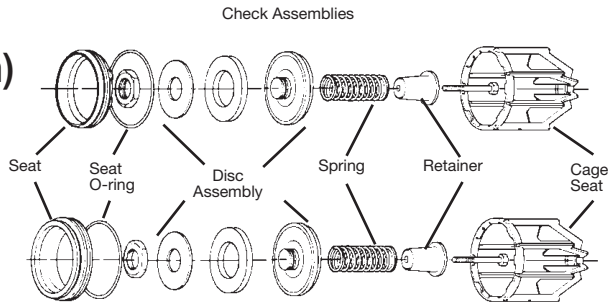


Servicing First & Second Check Valves

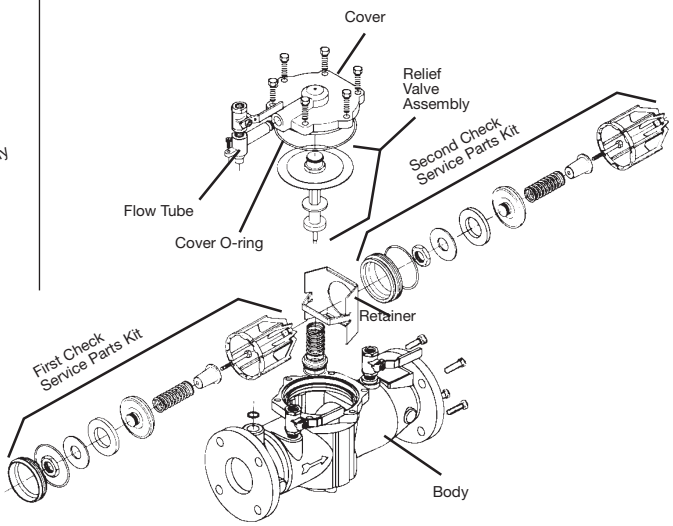
Series 009 and LF009 — ¼" – 3" (8 – 80mm)



CHECK ASSEMBLY ¾" M3



CHECK ASSEMBLY ¼" – ¾"



CHECK ASSEMBLY 1" - 2" (25 – 50mm)

Check Assemblies

For repair kits and parts, refer to our Backflow Prevention Products Repair Kits & Service Parts price list PL-RP-BPD found on **watts.com.**

Watts reserves the right to change or modify product design, construction, specifications, or materials without prior notice and without incurring any obligation to make such changes and modifications on Watts products previously or subsequently sold.

Troubleshooting Guide

Symptom	Cause	Solution
1. Check valve fails to hold 1.0 PSID minimum	a. Debris on check disc sealing surface	Disassemble and clean
	b. Leaking isolation valve	Disassemble and clean or repair
	c. Damaged seat disc or seat o-ring	Disassemble and replace
	d. Damaged guide holding check open	Disassemble and clean or replace
	e. Weak or broken spring	Disassemble and replace spring
2. Chatter during flow conditions	a. Worn, damaged or defective guide	Disassemble and repair or replace guide
3. Low flows passing through mainline valve	a. Mainline check fouled	Disassemble and clean
	b. Meter strainer plugged	Disassemble and clean
	c. Damaged mainline seat disc or seat	Disassemble and replace
	d. Broken mainline spring	Disassemble and replace

Limited Warranty: Watts Regulator Co. (the "Company") warrants each product to be free from defects in material and workmanship under normal usage for a period of one year from the date of original shipment. In the event of such defects within the warranty period, the Company will, at its option, replace or recondition the product without charge.
THE WARRANTY SET FORTH HEREIN IS GIVEN EXPRESSLY AND IS THE ONLY WARRANTY GIVEN BY THE COMPANY WITH RESPECT TO THE PRODUCT. THE COMPANY MAKES NO OTHER WARRANTIES, EXPRESS OR IMPLIED. THE COMPANY HEREBY SPECIFICALLY DISCLAIMS ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.
The remedy described in the first paragraph of this warranty shall constitute the sole and exclusive remedy for breach of warranty, and the Company shall not be responsible for any incidental, special or consequential damages, including without limitation, lost profits or the cost of repairing or replacing other property which is damaged if this product does not work properly, other costs resulting from labor charges, delays, vandalism, negligence, fouling caused by foreign material, damage from adverse water conditions, chemical, or any other circumstances over which the Company has no control. This warranty shall be invalidated by any abuse, misuse, misapplication, improper installation or improper maintenance or alteration of the product.
Some States do not allow limitations on how long an implied warranty lasts, and some States do not allow the exclusion or limitation of incidental or consequential damages. Therefore the above limitations may not apply to you. This Limited Warranty gives you specific legal rights, and you may have other rights that vary from State to State. You should consult applicable state laws to determine your rights. **SO FAR AS IS CONSISTENT WITH APPLICABLE STATE LAW, ANY IMPLIED WARRANTIES THAT MAY NOT BE DISCLAIMED, INCLUDING THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, ARE LIMITED IN DURATION TO ONE YEAR FROM THE DATE OF ORIGINAL SHIPMENT.**

Installation, Maintenance, & Repair Series 957, 957RPDA, LF957RPDA

Reduced Pressure Zone Assemblies
Reduced Pressure Detector Assemblies

Sizes: 2½" – 10" (65 – 250mm)

⚠ WARNING

Read this Manual BEFORE using this equipment.

Failure to read and follow all safety and use information can result in death, serious personal injury, property damage, or damage to the equipment.

Keep this Manual for future reference.

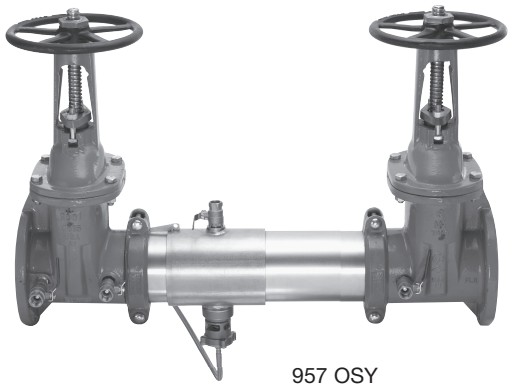
THINK SAFETY FIRST

Local building or plumbing codes may require modifications to the information provided. You are required to consult the local building and plumbing codes prior to installation. If this information is not consistent with local building or plumbing codes, the local codes should be followed.

Need for Periodic Inspection/Maintenance: This product must be tested periodically in compliance with local codes, but at least once per year or more as service conditions warrant. Corrosive water conditions, and/or unauthorized adjustments or repair could render the product ineffective for the service intended. Regular checking and cleaning of the product's internal components helps assure maximum life and proper product function.

NOTICE

For Australia and New Zealand: Pipeline strainers should be installed between the upstream shutoff valve and the inlet of the backflow preventer.



It's important that this device be tested periodically in compliance with local codes, but at least once per year or more as service conditions warrant. If installed on a fire sprinkler system, all mechanical checks, such as alarm checks and backflow preventers, should be flow tested and inspected internally in accordance with NFPA 13 and NFPA 25.

Testing

For field testing procedure, refer to Watts installation sheets IS-TK-DP/DL, IS-TK-9A, IS-TK-99E and IS-TK-99D found on **www.watts.com.**

For other repair kits and service parts, refer to our Backflow Prevention Products Repair Kits & Service Parts price list PL-RP-BPD found on **www.watts.com.**

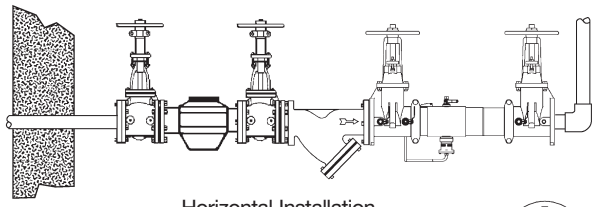
957 OSY

Installation Instructions

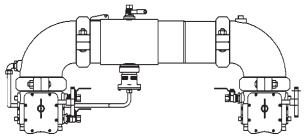
Series 957, 957RPDA, LF957RPDA

Guidelines



1. Most field problems occur because dirt and debris are present in the system at the time of installation and becomes trapped in the #1 check. The system should be flushed before the backflow valve is installed. If the system is not flushed until after the backflow valve is installed, remove both check modules from the valve and open the inlet shutoff to allow water to flow for a sufficient time to flush debris from the water line. If debris in the water system continues to cause fouling, a strainer can be installed upstream of the backflow assembly.
2. Watts Series 957, 957RPDA and LF957RPDA may be installed in either horizontal, "N" pattern, or "Z" pattern position as long as the backflow assembly is installed in accordance with the direction of the flow arrow on the assembly and the local water authority approves the installation.
3. The assembly should be installed with adequate clearance around the valve to allow for inspection, testing and servicing. 12" (305mm) should be the minimum clearance between the lower portion of the assembly and the floor or grade. The valve should be protected from freezing.
4. Installing a backflow preventer in a pit or vault is not recommended.
5. Normal discharge and nuisance spitting are accommodated by the use of a Watts air gap fitting and a fabricated indirect waste line. Floor drains of the same size must be provided in case of excessive discharge.
6. The 957, 957RPDA and LF957RPDA backflow preventer should be tested by a certified tester at the time of installation.

NOTICE



Assembly body should not be painted.

⚠ WARNING

Prior to servicing any Watts valve, it is mandatory to shut down the water system by closing both the inlet and outlet shutoff valves. After shutoff valves are closed, open test cock #2, #3 and #4 to relieve pressure within the backflow assembly.

1. After #3 test cock has been opened to relieve pressure, remove #3 test cock from housing. (Figure A)
2. Insert a #3 screwdriver through the hole on the top of the cover sleeve and using both hands rotate the cover sleeve approximately ¼-turn clockwise and ¼-turn counter-clockwise to break the sleeve O-ring seals. Using the screwdriver, slowly slide the cover sleeve to the downstream side of the housing. (Figure B)
3. Remove the stainless steel check retainer from the housing. (Figure B)
4. Remove the #1 check module (Figure C) by inserting two flat blade screwdrivers into the slots on either side of the check module and gently pry the check module toward the open zone.
5. Remove #2 check module with the same instructions as in #4 above. For servicing 6" (150mm) checks see 8" – 10" (200 – 250mm) instructions on p. 4.
6. To clean or inspect either check module, insert a #3 screwdriver through the downstream side of the check module as shown in Figure D and E. When the screwdriver is in place, remove the E-clip (Figure F) and pin connecting the structural members and the check clapper will open with no tension.
7. Thoroughly clean the seating area. The sealing disc may be removed, if necessary, by removing the screws connecting the keeper plate to the clapper. The sealing disc may be reversed and reinstalled if the elastomer is cut or damaged.
8. Wash check module and O-ring and inspect for any damage. If damaged, reinstall new parts.
9. After thorough cleaning, lubricate O-ring w/FDA approved lubricant, replace pin and E-clip in structural members, remove screw driver and reinstall check modules and assemble housing in reverse order of these instructions.

Maintenance Instructions

Series 957, 957RPDA, LF957RPDA

8" – 10" (200 – 250mm)

Material–Tool Requirements:

- #3 Phillips screwdriver or 5/16" diameter rod, length sufficient to span diameter of check, see Figures A and B.
- 1/2 – 13 x 5 fully threaded hex bolt (Service bolt).
- 3/4" open end or socket wrench.

Instructions

⚠ WARNING

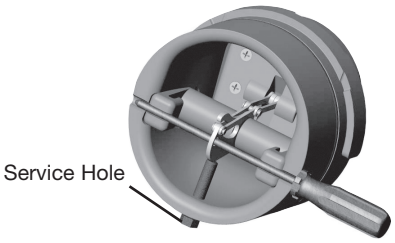
Prior to servicing any Watts valve, it is mandatory to shut down the water system by closing both the inlet and outlet shutoff valves. After shutoff valves are closed, open test cock #2, #3 & #4 to relieve pressure within the backflow assembly.

1. After #3 test cock has been opened to relieve pressure, remove #3 test cock from housing.
   When repairing an 8" or 10" (200 or 250mm) device, remove both Victaulic couplers from body. Slide the downstream Victaulic coupler gasket to the downstream side of the housing. The upstream Victaulic coupler gasket stays in place.
2. Remove checks that are to be serviced.
3. Locate the service hole and thread in the service bolt by hand until it contacts the linkage. (Figure A)
4. Continue to thread in service bolt with the wrench until the service hole in the linkage is aligned with the service notches on the spring arbors. (Figure A)
5. Insert the Phillips screwdriver through the arbors and service hole of the linkage making sure that the tip of the screwdriver extends past the ends of the arbors by a minimum of 1/4" (6mm). (Figure B)
6. Back out the service bolt until load is transferred to the screwdriver. Continue to back out the service bolt until sufficient clearance is achieved to remove the complete spring mechanism.
7. To disconnect linkage, remove retaining clip and pin (store in a safe location for reinstallation).
8. To remove spring mechanism, grasp the screwdriver at the center and pull complete assembly straight out and store in a safe place.
9. Reinstall in reverse order of these instructions.

⚠ WARNING

While the spring mechanism is removed for check servicing; never pull the screwdriver out or off the support notches on the arbors. Doing so may cause bodily injuries.

Figure A



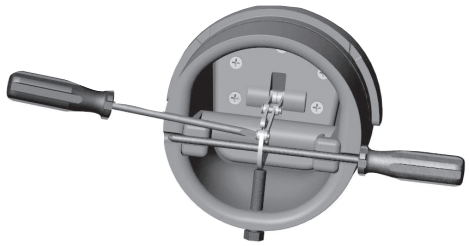


Figure B

Service Relief Valve

Series 957, 957RPDA, LF957RPDA

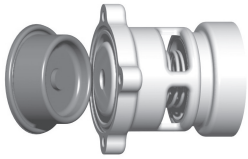
⚠ WARNING

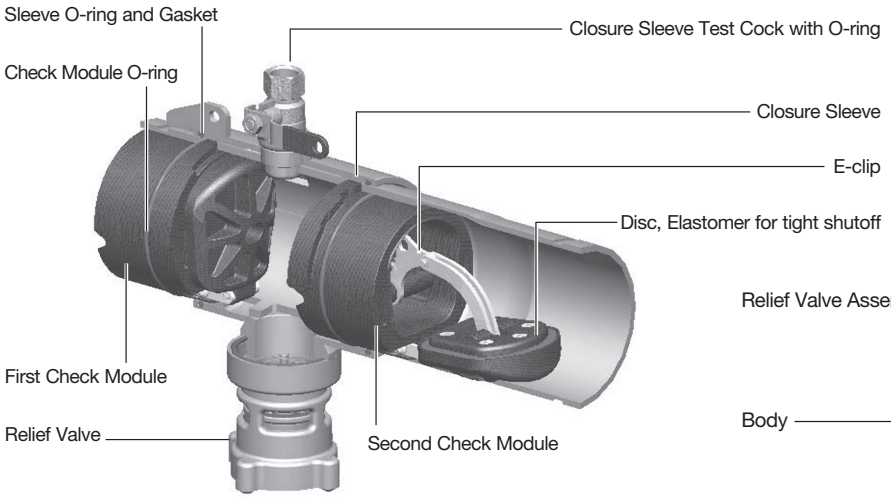
Prior to servicing the relief valve, it is mandatory to shut down water system by closing both the inlet and outlet shutoff valves and relieving pressure within the assembly by opening the #2, #3 and #4 test cocks.

DO NOT REMOVE SPIDER BUSHING FOR SERVICING

1. Disconnect the hose from the bottom cover plate to the relief valve.
2. An O-ring seals the relief valve body to the main housing. It is not necessary to tighten the connection beyond firm hand tightening. The relief valve should be able to be removed by unscrewing the relief valve from the housing.
3. Remove the cover plate of the relief valve by removing the four connecting screws.
4. Remove the rubber diaphragm from the relief valve. Be aware of how the diaphragm is configured so that it can be reinstalled in the same manner. The hard rubber tab in the diaphragm fits into a similar socket in the head of the piston. (Figure 1)
5. Hold the relief valve in both hands with the threaded end up and both thumbs on the head of the piston. Push up on the piston until the piston shaft with the attached E-clip is exposed. Remove the E-clip (Figure 2)
6. Remove the piston and spring from the relief valve housing and thoroughly clean all parts including the diaphragm. Inspect all rubber parts for damage and if damaged, replace them with new parts.
7. Reassemble the relief valve in the reverse order that it was disassembled.

Figure 1





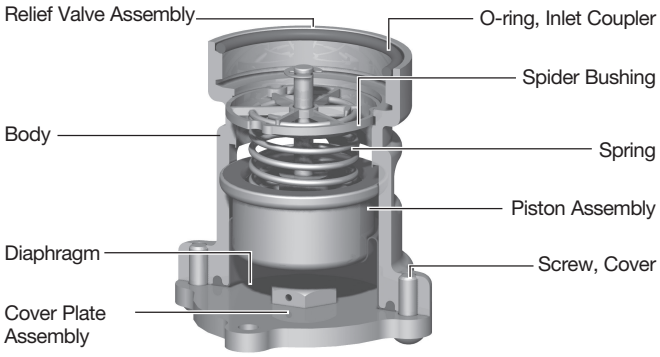


Figure 2

Service, Replacement Parts and Maintenance

For repair kits and parts, refer to our Backflow Prevention Products Repair Kits & Service Parts price list PL-RP-BPD found on **www.watts.com.**

Troubleshooting Guide

Series 957, 957RPDA, LF957RPDA

Symptom	Cause	Solution
1. Relief valve discharges water while system is not flowing	a. #1 check is fouled	Remove and Clean #1 check
	b. Relief valve does not properly close	Service relief valve
	c. Municipal water pressure is fluctuating	Install check valve upstream of backflow assembly
2. Relief valve does not shut off properly	a. Fouled relief valve seat	Service relief valve
	b. Incorrectly Installed diaphragm	Remove diaphragn and correctly install
	c. Damaged rubber surface on piston	Replace with new piston
	d. Damaged or plugged pressure hose

In the event of such defects within the warranty period, the Company will, at its option, replace or recondition the product without charge.
THE WARRANTY SET FORTH HEREIN IS GIVEN EXPRESSLY AND IS THE ONLY WARRANTY GIVEN BY THE COMPANY WITH RESPECT TO THE PRODUCT. THE COMPANY MAKES NO OTHER WARRANTIES, EXPRESS OR IMPLIED. THE COMPANY HEREBY SPECIFICALLY DISCLAIMS ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.
The remedy described in the first paragraph of this warranty shall constitute the sole and exclusive remedy for breach of warranty, and the Company shall not be responsible for any incidental, special or consequential damages, including without limitation, lost profits or the cost of repairing or replacing other property which is damaged if this product does not work properly, other costs resulting from labor charges, delays, vandalism, negligence, fouling caused by foreign material, damage from adverse water conditions, chemical, or any other circumstances over which the Company has no control. This warranty shall be invalidated by any abuse, misuse, misapplication, improper installation or improper maintenance or alteration of the product.
Some States do not allow limitations on how long an implied warranty lasts, and some States do not allow the exclusion or limitation of incidental or consequential damages. Therefore the above limitations may not apply to you. This Limited Warranty gives you specific legal rights, and you may have other rights that vary from State to State. You should consult applicable state laws to determine your rights. **SO FAR AS IS CONSISTENT WITH APPLICABLE STATE LAW, ANY IMPLIED WARRANTIES THAT MAY NOT BE DISCLAIMED, INCLUDING THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, ARE LIMITED IN DURATION TO ONE YEAR FROM THE DATE OF ORIGINAL SHIPMENT.**

Firestop Collar (CP 643N)

Product description

- A ready-to-use firestop collar, made of a galvanized steel housing and intumescent inserts for firestopping combustible pipes

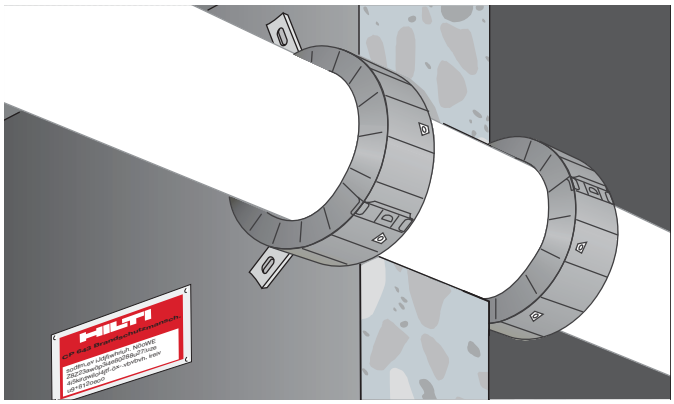
Product features

- Ready-to-use collar
- No construction required
- Fast installation time
- Adjustable mounting tabs
- Low profile for tight installations

Areas of application

- Firestopping combustible pipes up to 6" diameter in penetrations through fire walls and floors
- Suitable for the following pipe materials:
- PVC, CPVC, ABS, PVDF, PP and FRPP

For use with



- Concrete, masonry, wood floor and gypsum wall assemblies
- Wall and floor assemblies rated up to 4 hours

Types of installation

- Wall: two collars, one on each side
- Floor: one collar on underside (bottom)

Example

- Waste water pipes
- Fresh water pipes

Technical Data	CP 643N		
Description	Pipe outside dia (in.)	Collar outside dia. (in.)	Collar Height (in.)	No. of hooks and fasteners
CP 643-50/1.5"N	1.4–2.0	2.8	0.9	2
CP 643-63/2"N	2.0–2.5	3.4	1.3	2
CP 643-90/3"N	2.6–3.6	4.9	1.7	3
CP 643-110/4"N	3.6–4.5	6.0	1.9	3
CP 643-160/6"N	6.6	9.8	1.9	4
Temperature resistance	-40°F to 140°F (–40°C to 60°C)		
Intumescent activation	Approx. 392°F (200°C)		
Expansion ratio (unrestricted)	Up to 1:10		
Tested in accordance with • UL 1479 • ASTM E 814 • ASTM G21 • CAN/ULC-S115			

FIRESTOP DEVICE
FOR USE IN THROUGH-PENETRATION FIRESTOP SYSTEMS

Installation instructions for CP 643N

Notice

- Before handling, read Material Safety Data Sheet and product label for safe usage and health information.
- Instructions below are general guidelines — always refer to the applicable drawing in the UL Fire Resistance Directory or Hilti Firestop Systems Guide for complete installation information

Opening

1. Clean the plastic pipes. Expansion of the intumescent material during a fire acts to close the plastic pipe. Very dirty pipes (ie: with remains of mortar) may lead to a delay in this closing action. Soiled plastic pipes should, therefore, be cleaned in the area where the CP 643N Firestop Collar is to be installed.

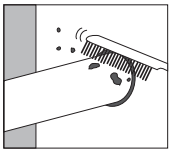
Application of firestop system

2. Seal the opening if required. Gaps may be closed with FS-ONE. The approved methods vary and are given in the specific UL system.
3. Close the CP 643N Firestop Collar. Place the CP 643N Firestop Collar around the plastic pipe and lock the closure by applying firm pressure until it latches.
4. Attach fastening hooks. The fastening hooks can be attached to various points on the metal housing. This allows the fastening points to be made to suit the space available in each case. The hooks must be positioned as symmetrically as possible. The required number of fastening hooks is indicated on the packaging.
5. Fastening the CP 643N Firestop Collar. Only when fastened properly can CP 643N offer protection against fire.

a. Mark the fastening points.

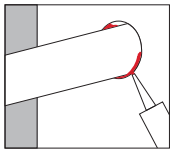
b. Drill holes with a Hilti rotary hammer drill (i.e. TE 4-A18) or, depending on base material, fasten using Hilti powder-actuated tool.

c. To secure the CP 643N Firestop Collar, use Hilti anchors/fasteners.



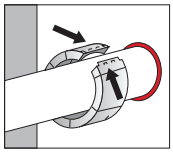
d. For maintenance reasons, a penetration can be permanently marked with an identification plate and fastened in a visible position next to the seal.

Not for use

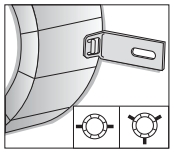


- With metal pipes
- In highly corrosive surroundings
- With unapproved anchors/fasteners

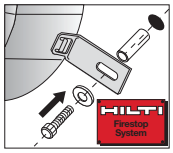
Storage



- Store only in the original packaging in a location protected from moisture



1. Clean plastic pipe.



2. Close remaining gap to provide smoke and gas resistant seal.

3. Close collar.

4. Attach fastening hooks.

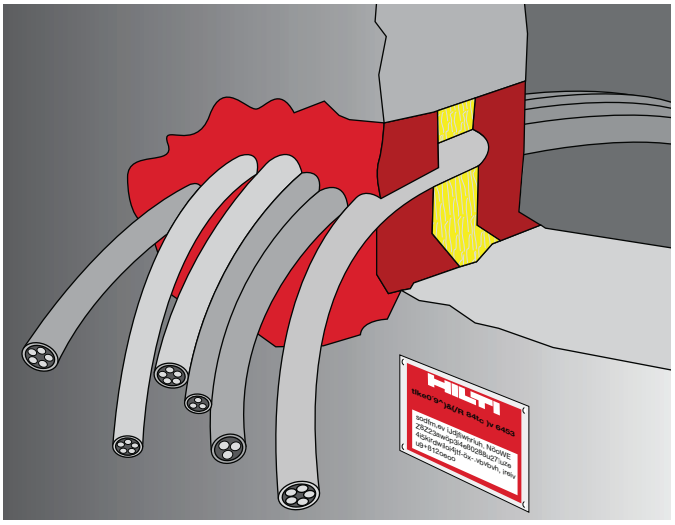
5. Fasten collar and identification plate (if required).

Hilti Firestop
Saving lives through innovation and education

Hilti. Outperform. Outlast.

High performance intumescent firestop sealant FS-ONE MAX

Product description



- Intumescent (expands when exposed to fire) firestop sealant that helps protect combustible and non-combustible penetrations for up to 4 hours fire rating

Applications

- Effectively seals most common through penetrations in a variety of base materials
- For use on concrete, masonry and drywall
- Mixed and multiple penetrations
- Metal pipe penetrations
- Insulated metal pipe penetrations
- Plastic pipe penetrations
- Cable bundles and trays
- HVAC penetrations

Advantages

- One product for a variety of common through penetrations
- Cost-effective and easy-to-use solution
- Water-based and paintable
- W-rated systems available
- Ethylene glycol-free
- Industry leading VOC results
- Convenient multi application firestop solution for penetrations

Technical Data*	
Chemical basis	Water-based acrylic dispersion
Color	Red
Application temperature	41°F to 104°F
Storage and transportation range	41°F to 77°F
Approx. cure time *	4 mm / 3 days
Shelf life	12 months **
Temperature resistance range	-4°F to 212°F
Mold and mildew performance	Class 0 (ASTM G21-13)
Mold and mildew resistant	Yes
Surface burning characteristics (ASTM E 84-14)	Flame Spread: 0 Smoke Development: 10
Approvals	California State Fire Marshal - in progress
Tested in accordance with	ASTM G21 ASTM E 90 CAN/ULC-S115 UL 1479 ASTM E 814 ASTM E84

* At 75°F (24°C) and 50% relative humidity

DESCRIPTION

The Apollo® LD141/WD141 Series Ductile Iron Butterfly Valves are ideal for use in Industrial and HVAC/Mechanical applications. The WD141 Series is a wafer style valve and the LD141 Series is a companion lug style.

FEATURES

- Compatible with ANSI 125# & 150# Flanges
- ISO 5211 Top Plate Allows Choice of Apollo® Pneumatic Actuators and manual operators
- Conforms to MSS SP-67 & API 609
- LD141 Series Suitable for End of Line Service to Rated Pressure (2" - 12")
- 3" -24" meet performance requirements of AWWA C-504

PERFORMANCE RATING

- Pressure Rating: 2" to 12": 200 psi
- Pressure Rating: 14" to 24": 150 psi

APPROVALS

- NSF/ANSI 372 Lead Free
- CRN 0C12102.8CL

MATERIAL OPTIONS

Body
- Ductile Iron ASTM A536, (65-45-12)

Disc Material
- Aluminum Bronze
- Ductile Iron A536 Nickel Plated
- Stainless Steel, CF8M

Seat Material
- EPDM: -20°F to +250°F Intermittent, 225°F Continuous
- BUNA-N: +10°F to +180°F

Operator
- -0 - None
- -1 - 10 Position Handle
- -2 - Gear Operator (12" handwheels)
- -3 - Infinite Position Handle
- -4 - Locking Handle
- -5 - Gear Operator w/ Chain Wheel
- -7 - Locking Gear Operator
- -8 - Locking Gear Operator w/ Chain Wheel

Provide with nickel plated ductile iron disc

Provide with 10 position lever handle

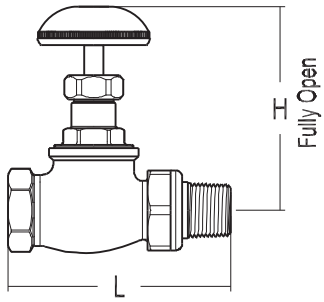
SECTION 23 05 22 2.4 RADIATOR GLOBE VALVES

Dahl Brass Radiator Valves
Heavy Pattern - Straight

TDS-1004
Rev July/10
Replaces: TDS-3



For Steam, Forced Heating or Cooling Systems

- Self-adjusting, spring loaded packing system
- Low friction packing
- Working pressure/temperature: 250 psi / 250°F
- Designed and manufactured in Canada
- Swivel-type disc holder minimizes wear
- Replaceable disc
- Glass-filled Teflon® disc is good for low pressure steam applications (150 WSP / 300 W), standard on all heavy pattern valves

Balancing Valves
TA Series 786/787/788/789 and Series 78K

08.16

Product Description:

Tour & Andersson calibrated balancing valves offer a reliable, simple and cost effective way to measure and balance all flow rates. Full throttling range is achieved by 4, 8, 12, 16, 20 or 22 full turns of the handwheel, enabling a precise setting. This high degree of accurate adjustment means that the system can be balanced precisely.

The actual pressure drops in heating and cooling systems are difficult to establish by calculation because water flows vary from design flows. They can be corrected easily by regulating the desired water flow with Tour & Andersson globe style balancing valves. By measuring the pressure drop across measuring ports at a particular handwheel setting, the water flow for the valve size can be read easily from the appropriate pressure drop graph or flow balancing wheel. If the flow does not conform with that specified, adjust the valve and repeat the measuring procedure until the correct flow has been obtained.

NOTE: All Tour & Andersson balancing valves include a concealed memory feature with a locking tamper-proof setting.

Series 78K and TA Series 786 and 787 valves have an Ametal® body.

TA Series 788 and 789 balancing valves have ductile iron bodies and Ametal or ductile iron trim, depending on size. Test ports feature self-sealing construction for insertion-type pressure or temperature probes.

All valves are rated from –4°F/–20°C to +250°F/+120°C. Service will also be governed by the connecting coupling gasket ratings for grooved and flanged valves.

Insulation kits are available for ½ – 6"/15 – 150 mm sizes for Series 78K and TA Series 786, 787, 788 and 789 balancing valves.

Victaulic Series 799/79V KOIL-KIT™ Coil Pack
Note: TA Series 787 shown, other options available.

Balancing valves can be ordered individually or as a component of the Series 799, 79V, 79B, or 79A KOIL-KIT Coil Pack. See the Series 799/79V/79B/79A Contractor Order Form (A) (publication SF-33) for help ordering your Victaulic KOILKIT Coil Pack.

Victaulic KOIL-KIT Coil Packs provide a simplified, quality coil installation while ensuring optimal hydronic systems design requirements are met. The Series 799/79V is suitable for a variety of hot and cold water applications including treated and untreated water systems.

The Victaulic KOIL-KIT Coil Pack consists of the following components: Series 78Y Y-Strainer/Ball Valve or Series 78T Ball Valve Union Combination, two Coil Hoses, a Series 78U Union Port Fitting and a TA balancing valve. There are two options when ordering a Victaulic KOIL-KIT Coil Pack: Series 799 KOIL-KIT Coil Pack or Series 79V KOIL-KIT Coil Pack with ATC Valve.

The Series 799 and Series 79V comes standard with the components listed above. Additionally, the Series 79V includes the option to have the ATC valve of your choosing assembled and shipped with the Victaulic KOIL-KIT Coil Pack. Please note that when ordering a Series 79V, Victaulic offers one balancing valve, the Series 78K. Specify either Series 799 or Series 79V when ordering.

The Series 79B and Series 79A come standard with the components listed above, however these two packages also include the Bypass Option. When choosing a Victaulic KOIL-KIT Coil Pack with a Bypass Option, the following components are available as options: Series 78Y with Bypass Tee or Series 78T with Bypass Tee, a third coil hose, and a bypass valve. (Bypass valve options consist of Series 78Y, 78T, 78K, 786, 787).

The Series 79A includes the Bypass Option and the option to have the ATC valve of your choosing assembled and shipped with the Victaulic KOIL-KIT Coil Pack.

For added convenience, when coil hoses are ordered as a component of the Series 799 or 79V KOIL-KIT Coil Pack, all hoses can be provided pre-connected to the Series 78Y or 78T on the supply side and the Series 78U on the return side (specify connection preference when ordering).

For information on Victaulic KOIL-KIT Coil Packs in ½ – 2"/15 – 50 mm sizes, refer to publication 08.30.

For information on Victaulic KOIL-KITS for air handling units in 2 ½ – 6"/65 – 150 mm sizes, refer to publication 08.35.

Material Specifications:

Balancing Valves

Body:

Series 78K and TA Series 786, 787: Ametal, (pressure die cast, nonporous copper alloy)

TA Series 788, 789: Ductile iron, ASTM A536 Grade 60-40-18 (BS Grade 400/15)

Body coating:

TA Series 788, 789: 2 ½, 3, 4" – Epoxy resin coated

5 – 16" – painted

Trim: (Bonnet, Stem and Restriction Cone)

Series 78K and TA Series 786, 787: Ametal

TA Series 788, 789:

Bonnet – 2 ½ – 6" – Ametal

Bonnet – 8 – 16" – Ductile Iron

Stem: Ametal

Restriction Cone: Ametal

Union:

Series 78K: Brass with EPDM o-ring

Tailpiece & adapter:

Series 78K: DZR Brass

Seat:

Series 78K, and TA Series 786, 787: Ametal

TA Series 788, 789: Ductile Iron

Seat seal:

Series 78K and TA Series, 786, 787, 788, 789: EPDM

Stem seals:

EPDM

Probe seals:

EPDM

Handwheel:

Series 78K and TA Series 786, 787 – Red Polyamide plastic

TA Series 788, 789: 2 ½ – 6" – Red Polyamide plastic

8 – 16" – Aluminum

Optional Equipment:

☐ TA Series 786, 787: Drain kit-Ametal

☐ TA Series 786, 787: Insulation Kit-Polyurethane.

Also available on TA Series 789 2 ½ – 6" sizes.

Allen wrench sizes:

3 mm memory ½ – 2" TA Series 786, 788 valves

5 mm memory 2 ½ – 12" TA Series 788 & 2 ½ – 6" TA Series 789 valves

8 mm memory 8 – 16" TA Series 789 valves

5 mm drain kit ½ – 2" TA Series 786 valves

Comparison of balancing valve throttling characteristics

This curve illustrates the advantage of the four (4) turn adjustment available with Tour & Andersson balancing valves (½ – 2"/15 – 50 mm). Valves 2 ½"/65 mm) and larger have 8, 12 or 16 turns.

A 90° fully open to closed valve requires just a 12° change in adjustment to equal 30% change of the flow.

Tour & Andersson balancing valves would require a 408° change in adjustment to equal the same 30% change in the flow.

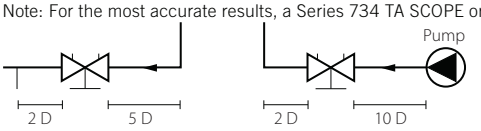
Important Notes:



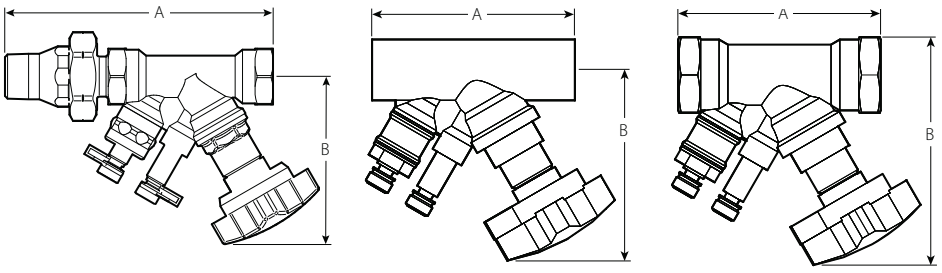
Balancing valves should be sized in accordance with the GPM/LPM flows (and not in relation to pipeline size). Sizing balancing valves based on the minimum or maximum flow rates is not recommended. Valves should be sized using the nominal flow rate only. The Minimum Flow is calculated from the minimum open setting of the valve and a minimum pressure drop 1 Ft. WG (= 3 kPa). The Nominal Flow is calculated from the maximum open setting of the valve and the minimum recommended pressure drop, 2 Ft. WG (= 6 kPa). The Maximum Flow is calculated from the maximum open setting of the valve and the maximum pressure drop, 20 Ft. WG (= 60 kPa). A computer program, TA-Select, is available for calculation of valve handwheel pre-set position and other applications.

Note: For information regarding Allen Wrench sizes see the Material Specifications section on page 3..

Measuring Accuracy:

The hand wheel zero position is calibrated and must not be changed. Valves have an accuracy of flow measurement of 2% to 3% when used within their recommended flow range and installed in accordance with the figure below.

Note: For the most accurate results, a Series 734 TA SCOPE or Series 73M CMI should be used. However, any differential pressure meter may be used.



The illustration relates to the accuracy of differential pressure measurement and is not an installation requirement.

3 Only the TA Series 788 Flanged End Balancing Valves is available in 14-16" / 350-400mm sizes

Important Notes (See page 5 for Balancing Accuracy):

Balancing valves should be sized in accordance with the GPM/LPM flows (and not in relation to pipeline size). Sizing balancing valves based on the minimum or maximum flow rates is not recommended. Valves should be sized using the nominal flow rate only. The Minimum Flow is calculated from the minimum open setting of the valve and a minimum pressure drop 1 Ft. WG (= 3 kPa). The Nominal Flow is calculated from the maximum open setting of the valve and the minimum recommended pressure drop, 2 Ft. WG (= 6 kPa). The Maximum Flow is calculated from the maximum open setting of the valve and the maximum pressure drop, 20 Ft. WG (= 60 kPa).A computer program, TA-Select, is available for calculation of valve handwheel pre-set position and other applications.

Note: For information regarding Allen Wrench sizes see the Material Specifications section on page 3.

Note: For the most accurate results, a Series 734 TA SCOPE or Series 73M CMI should be used. However, any differential pressure meter may be used.

Link Differential Pressure Sensor

TA Series 736

Provides connection between a building's heating and cooling and building's monitoring system (BMS).

Continuously measures the flow and differential pressure through and across the Tour & Andersson balancing valves.

Measurement probes provided for direct connection to the measurement points on all TA Series 786, 787, 788, and 789 balancing valves.

TA Select Computer Program

TA Select helps you choose the right balancing valve, taking the desired flow rate and pressure drop into consideration. The software will advise the correct combination of valve, handwheel position and pipe size to correctly balance the system. A sophisticated viscosity correction procedure displays the density, viscosity, specific heat and freezing point of fluids such as glycols and brines. It also displays the true value of flow through each valve.

The program will also size the pipe, generate Cv values for the ATC valves and give pre-set information for all TA valves on the project.

TA SCOPE

TA Series 734

The TA Series 734 SCOPE is a wireless, handheld device for the swift and accurate measurement of differential pressure, flow, temperature and power.

An independent sensor communicates with the TA SCOPE to deliver data quickly, thereby enabling contractors to balance a system, troubleshoot hydronic problems and log system performance.

The TA Series 734 SCOPE Premium is a more robust case compared to the TA Series 734 SCOPE. See page 12 of this publication for additional details on the TA SCOPE and TA SCOPE Premium.

Differential pressure:
- TA SCOPE: 0-29 psi / 0-200 kPa
- TA SCOPE (High Pressure): 0-145 psi / 0-1000 kPa

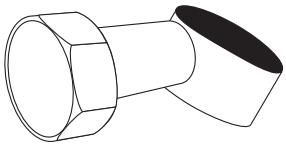
 © 2014 Victaulic Company. All rights reserved.

TA Series 734 SCOPE Premium / SCOPE

TA SCOPE Premium case is a robust partitioned case that includes:

- Combined safety pressure and temperature probe allowing automatic correction for fluid temperatures and easier power measurements
- A large set of accessories
- Extra space for a second (optional) differential pressure sensor and tools.

The TA SCOPE contains a reduced set of accessories compared to the TA SCOPE Premium. All * marked parts are included in both the TA SCOPE Premium and TA SCOPE kits.



1. *Handheld unit (Hh)
2. *Dp Sensor unit (DpS)
3. *Digital Temperature Sensor (DTS)
4. *Measuring hoses, 20 in. red/blue
5. Safety pressure and temperature probe (SPTP)
6. Safety pressure probes (SPP)
7. Measuring hoses with twin needle, 5.9 in
8. Flashlight
9. Mirror
10. Chucks for older valves, red/blue
11. *Allen Keys 3mm/5mm
12. Spanner for measuring points on older valves
13. *Presetting tool TA Series TC/TCM/TCP
14. *Spare filters (4 pcs)
15. Chain for mounting
16. Neckstrap
17. *USB-cables for connection: Hh - DpS and Hh - PC
18. *Multi-charger for handheld, Dp sensor(s) and TA-SCOPE Relays
19. *DC cable (2 PCS)
20. *AC cable (EU, UK, US or AU.NZ)
21. Cable wrapping
22. *Case
23. TA-Select Software
24. User manual
25. *Calibration certificates for DpS, DTS, and SPTP
26. *Quick Guide
27. SPTP/SPP instruction
28. SPTP/SPP stickers

NOTE: * Denotes this part is available in the SCOPE as well as the SCOPE Premium.

Accessories

Drain Kit Series 786-DK

- A separate drain kit with a ¾"/20 mm connection is available for Series 786 and Series 787 valves
- Kit must be field mounted
- Kit comes complete with 2 gaskets and a hexnut.
- Partcode= K-000-786-CBV

Correction Factors:

For liquids other than water, the flow values from the balancing wheel can be adjusted as follows:

Divide the flow rate (as indicated by the balancing wheel) by the square root of the specific gravity.

$$\text{Actual Flow} = \frac{q_{CBI}}{\sqrt{SG}}$$

This applies to liquids having, on the whole, the same viscosity as water, i.e. most water/glycol mixtures and water/brine solutions at room temperature. At low temperatures, the viscosity increases and laminar flow may occur in certain valves. The risk increases with small valves, low settings and low differential pressures.

A computer program (TA-Select) is available for calculation of pre-setting values and other applications. When the flow setting is verified or changed to the final setting, the memory stop should be set. Contact Victaulic for further information.

Correction Factors:

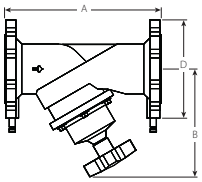
When Δp and the design flow rate are known, use the formula shown to calculate the C_V value or use the graphs on page 17 – 19. The Tour & Andersson balancing wheel can also be used.

$$C_v = 1.52 \frac{q}{\sqrt{\Delta p}}$$

q in GPM, Δp in Ft. of H_2O

$$C_v = \frac{q}{\sqrt{\Delta p}}$$

q in GPM, Δp in psi



A computer program, TA-Select, is available from Victaulic for calculation of pre-setting values and other applications.

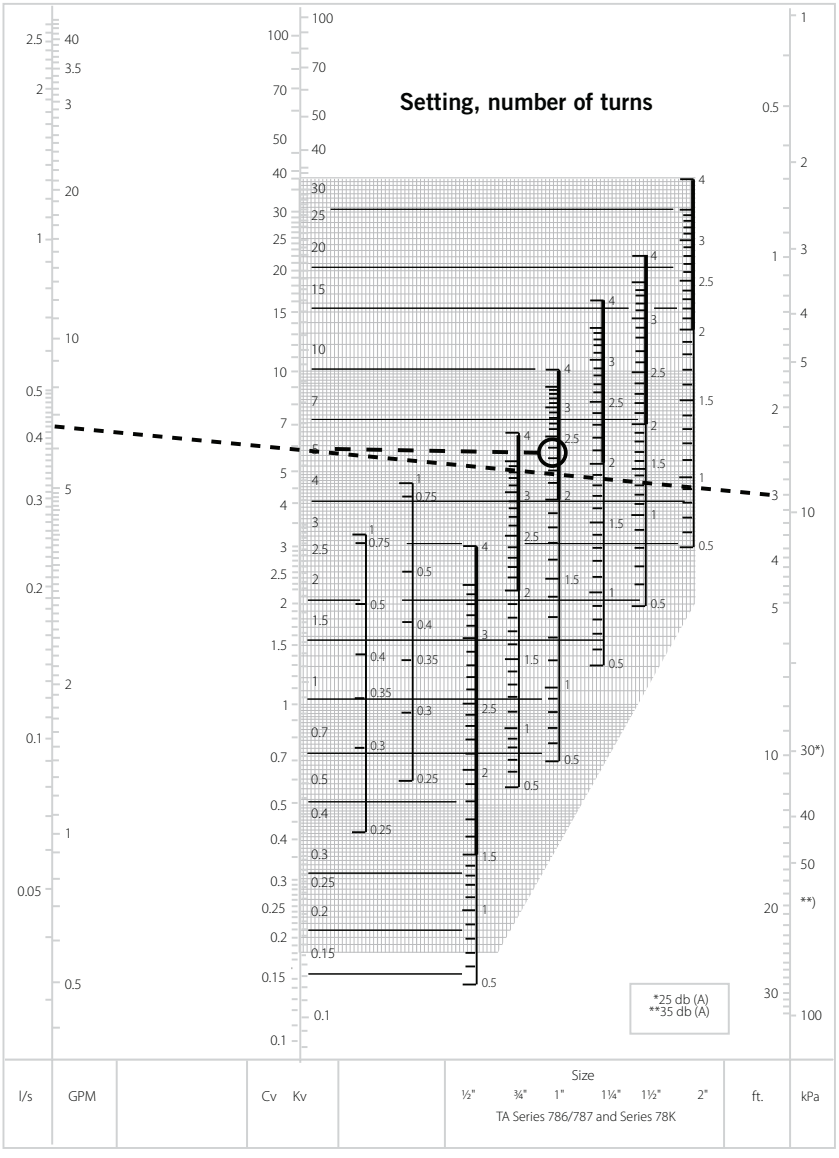
Diagram

TA Series 786/787 and Series 78K

This graph shows the pressure drop across the pressure test points of the valve.

A straight line connecting the bars for flow rate, C_V and pressure drop shows the relationship between these variables. The position for each valve size is arrived at by drawing a horizontal line from the C_V value obtained.



Example:

Wanted: Pre-setting for a 1" valve at a desired flow rate of 6.7 GPM and a pressure drop of 3 ft.

Solution: Draw straight line joining 6.7 GPM and 3 ft. This gives C_V = 5.9. Now draw a horizontal line from C_V = 5.9. This intersects the bar for a 1" valve at the desired pre-setting of 2.35 turns.

Note:

If the flow rate falls outside of the scale in the diagram, the reading can be made as follows: Starting with the example above, we get 3 ft., C_V = 5.9 and the flow rate 6.7 GPM. At 3 ft. and C_V = .59 we get the flow rate .67 GPM. That is, for a given pressure drop, it is possible to read 10 times or 0.1 times the flow and C_V values.

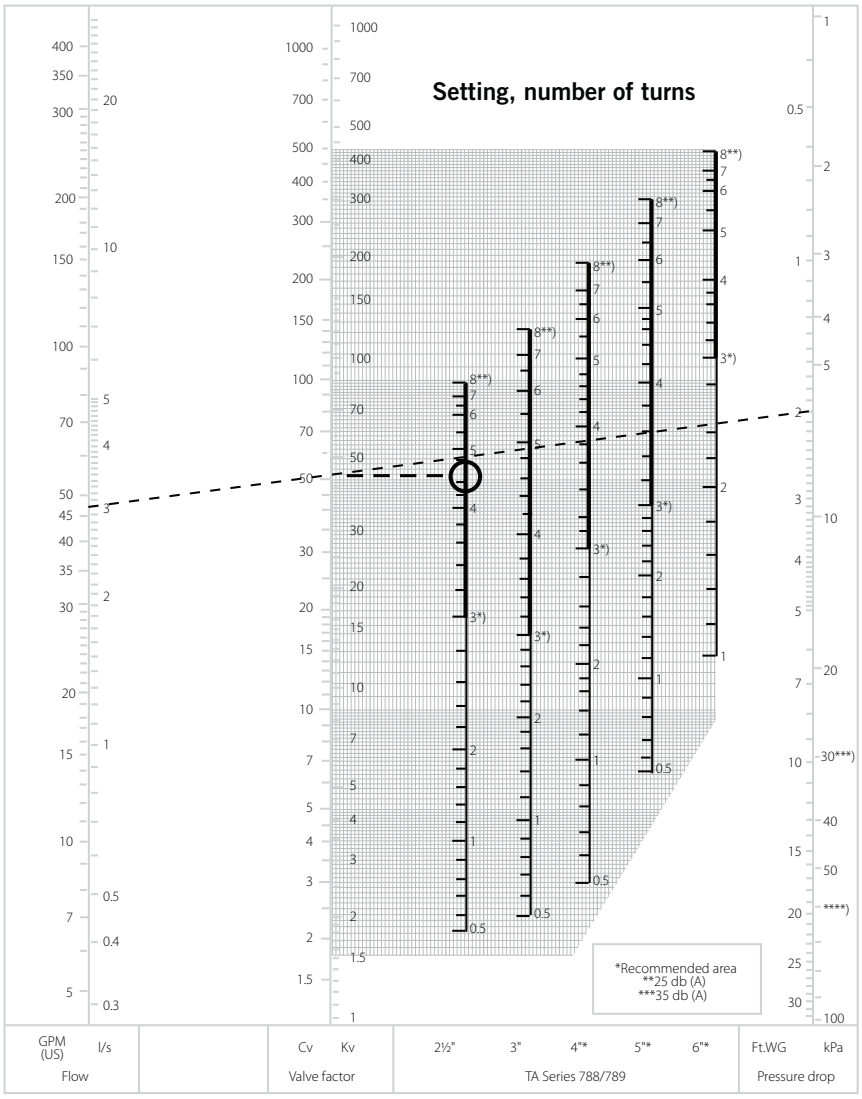
Diagram

TA Series 788/789
Sizes 2½ – 6"/60 – 150 mm

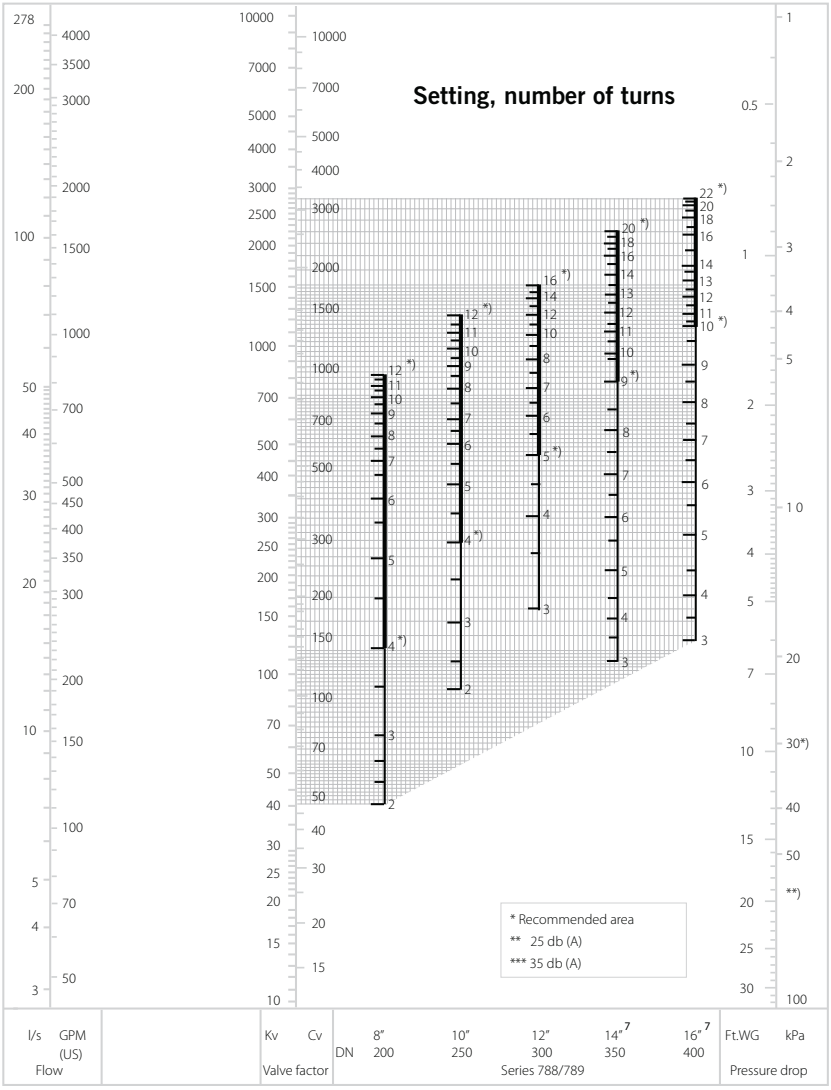


This graph shows the pressure drop across the pressure test points of the valve.

A straight line connecting the flow rate scale, C_V and pressure drop shows the relationship between these variables.

Example:

Wanted: Pre-setting for a TA Series 788 or TA Series 789 2 ½" at a desired flow rate of 47 GPM and a pressure drop of 2 ft. WG.



Solution: Draw straight line joining 47 GPM and 2 ft. WG. This gives C_V = 50. Now draw a horizontal line from C_V = 50. This intersects the flow rate scale for Series 788 2 ½" at the desired pre-setting of 4.5 turns.

Typical Specifications:

SERIES 78K – (½ – 2" M x F)

TA SERIES 786 STAS – (½ – 2" SOLDER WITH DIGITAL HAND WHEEL)

TA SERIES 787 STAD – (½ – 2" NPT)

Furnish and install, as shown on the job plans, TA Series 786/787 Balancing Valves with provision for connecting a portable differential (Ft. of Head) pressure meter. Each meter shall have pressure/temperature probes.

The balancing valves shall be Y-pattern globe style design and all metal parts of nonferrous, pressure die cast, nonporous Ametal. Each valve shall provide four (4) functions:

(1) Precise flow measurement, (2) Precision flow balancing, (3) Positive shut-off with no drip seat, eliminating the need of an additional isolation valve, (4) Drain connection using 3/4 " NPT hose end thread.

These valves shall have four (4) 360° adjustment turns of the handwheel for precise setting with hidden memory to provide a tamper-proof balancing setting. Handwheel shall have digital readout. The handwheel can be installed in any position without affecting performance.

TA SERIES 788 STAF – (2 ½ – 12" FLANGED WITH DIGITAL HAND WHEEL)

TA SERIES 789 STAG – (2 ½ – 12" GROOVED WITH DIGITAL HAND WHEEL)

Furnish and install, as shown on the job plans, TA Series 788/789 Balancing valves with provision for connecting a portable differential (Ft. of Head) pressure meter. Each meter connection shall have pressure/temperature probes.

The balancing valves shall be Y-pattern globe style design with ductile iron body all other wetted parts of nonferrous, pressure die cast Ametal. Each valve shall provide three (3) functions:

(1) Precision flow measurement, (2) Precision flow balancing, (3) Shut-off feature, eliminating the need of an additional isolation valve.

These valves shall have eight (8), twelve (12), sixteen (16) or twenty-two (22) 360° adjustment turns of the handwheel for precise setting with hidden memory feature to program the valve with precision tamper-proof balancing setting. Handwheel shall have digital readout. The handwheel can be installed in any position without affecting performance.

TA Balancing Valves ½" through 2":

300 psi/2065 kPa, y-pattern, globe type with soldered or threaded ends, non-ferrous Ametal® brass copper alloy body, EPDM o-ring seals. 4-turn digital readout handwheel for balancing, hidden memory feature with locking tamper-proof setting, and connections for portable differential meter. TA Series 786 STAS or 787 STAD.

TA Balancing Valves 2 ½" through 16":

250 psi / 1725 kPa (TA Series 788) 350 psi / 2400 kPa (TA Series 789), y-pattern, globe type with flanged or grooved ends, ASTM A536 ductile iron body, all other metal parts of Ametal® brass copper alloy, EPDM O-ring seals. 8, 12, 16, 20 or 22 turn digital readout handwheel for balancing, hidden memory feature with locking tamper-proof setting, and connections for portable differential meter. TA Series 788 STAF or 789 STAG.

Purchased TA CBI-II or TA CMI balancing instruments are to be left with the project owner upon completion of the project.

Balancing Meter:

If a balancing meter is required to be left with the owner after commissioning, the balancing meter shall be from the same provider as the balancing valves, Victaulic/Tour and Andersson. The Series 734 TA-Scope, or TA Series 73M CMI Pressure Differential Meter are acceptable and are manufactured by Tour and Andersson. Needle gauge type meters will not be allowed.

INSULATION:

For insulation against heat loss or condensation. Preformed rigid polyurethane insulation is available for ½ – 2" TA Series 786/787 valves and for 2 ½ – 6" TA Series 788/789 valves.

Installation
Reference should always be made to the current TA Hydronics installation/assembly instructions for the product you are installing. For coupling and strainer installation, reference should always be made to the I-100 Victaulic Field Installation Handbook for the product you are installing. Handbooks are included with each shipment of Victaulic products for complete installation and assembly data, and are available in PDF format on our website at www.victaulic.com

Warranty
Refer to the Warranty section of the current Price List or contact Victaulic for details.

Note
This product shall be manufactured by Victaulic or to Victaulic specifications. Victaulic recommends all products to be installed in accordance with current TA Hydronics installation/assembly instructions. Victaulic and TA Hydronics reserve the right to change product specifications, designs and standard equipment without notice and without incurring obligations.

LD141/WD141 Series

General Purpose **Butterfly Valves**

Job Name:	
Job Location:	
Engineer:	
Contractor:	
Tag:	
PO Number:	
Representative:	
Wholesale Distributor:	

DESCRIPTION

The Apollo® LD141/WD141 Series Ductile Iron Butterfly Valves are ideal for use in Industrial and HVAC/Mechanical applications. The WD141 Series is a wafer style valve and the LD141 Series is a companion lug style.

FEATURES

- Compatible with ANSI 125# & 150# Flanges
- ISO 5211 Top Plate Allows Choice of Apollo® Pneumatic Actuators and manual operators
- Conforms to MSS SP-67 & API 609
- LD141 Series Suitable for End of Line Service to Rated Pressure (2" - 12")
- 3" -24" meet performance requirements of AWWA C-504

PERFORMANCE RATING

- Pressure Rating: 2" to 12": 200 psi
- Pressure Rating: 14" to 24": 150 psi

APPROVALS

- NSF/ANSI 372 Lead Free
- CRN 0C12102.8CL

MATERIAL OPTIONS

Body

- Ductile Iron ASTM A536, (65-45-12)

Disc Material

- Aluminum Bronze
- Ductile Iron A536 Nickel Plated
- Stainless Steel, CF8M

Seat Material

- EPDM: -20°F to +250°F Intermittent, 225°F Continuous
- BUNA-N: +10°F to +180°F

Operator

- -0 - None
- -1 - 10 Position Handle
- -2 - Gear Operator (12" handwheels)
- -3 - Infinite Position Handle
- -4 - Locking Handle
- -5 - Gear Operator w/ Chain Wheel
- -7 - Locking Gear Operator
- -8 - Locking Gear Operator w/ Chain Wheel

provide nickel plated ductile iron disc

provide 10 position lever handle

TAG: SECTION 23 21 14 2.2 AUTOMATIC AIR VENT

ES-FV-4M1

For Hydronic Heating Applications

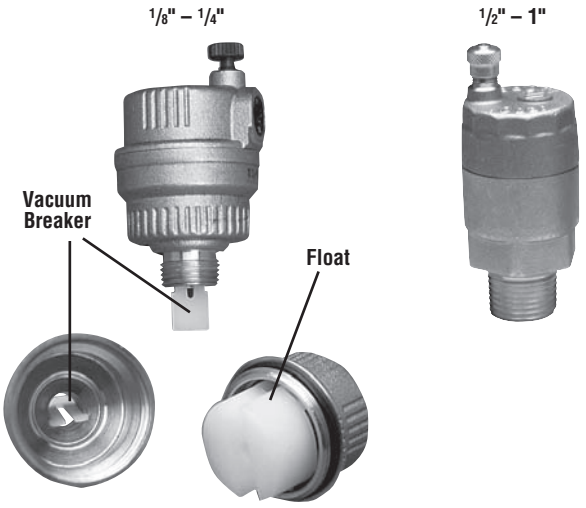
Job Name _____ Contractor _____

Job Location _____ Approval _____

Engineer _____ Contractor's P.O. No. _____

Approval _____ Representative _____

Series FV-4M1



Automatic Air Vent Valves

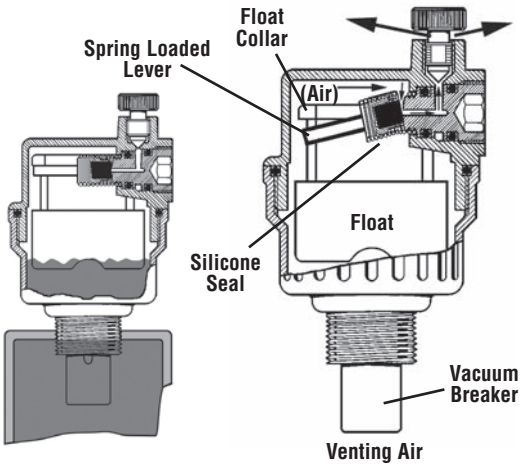
Sizes: ⅛" – 1" (3 – 25mm)

Series FV-4M1 Automatic Air Vent Valves provide automatic air venting for hot or cold water distribution systems. These vents purge air that may be in the water system.

The vent valve utilizes a float to actuate the valve plug which is located at the top of the valve. Once the air is displaced and the system pressure is sustained, the valve plug seals and prevents any water from escaping from the system.

The float vent can also operate as an anti-vacuum device since it will permit air to enter the system when it must be drained. It can also be installed to permit the separation and dispersal of air while fluid is actually circulating in the system.

Features



- Body and cover are brass construction
- Air vent with silicone rubber seal
- Impurities do not usually affect function as maximum float line of water is always lower than the valve seal
- Float is high temperature resistant polyethylene
- Suitable for use with glycol systems
- Can be disassembled for inspection and cleaning

Pressure – Temperature

Minimum working pressure: 1.45psi (10 kPa)

Maximum working pressure: 150psi (10 bars)

Temperature Range: 33˚F – 240˚F (5˚C – 116˚C)

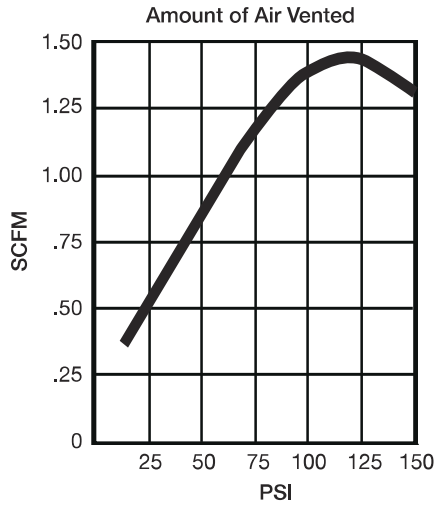


Diagram above shows the quantity of air vented by the "Float Vent" according to the pressure in the system.

Specifications

Air vent shall have brass body & cover and silicone rubber seal. Float shall be constructed of high temperature resistant polyethylene and shall be for use with glycol systems. Air vent shall be Watts Regulator Company Series FV-4M1.

WATTS® REGULATOR

Watts product specifications in U.S. customary units and metric are approximate and are provided for reference only. For precise measurements, please contact Watts Technical Service. Watts reserves the right to change or modify product design, construction, specifications, or materials without prior notice and without incurring any obligation to make such changes and modifications on Watts products previously or subsequently sold.

TAG: SECTION 23 21 14 2.2 AUTOMATIC AIR VENT

Installation

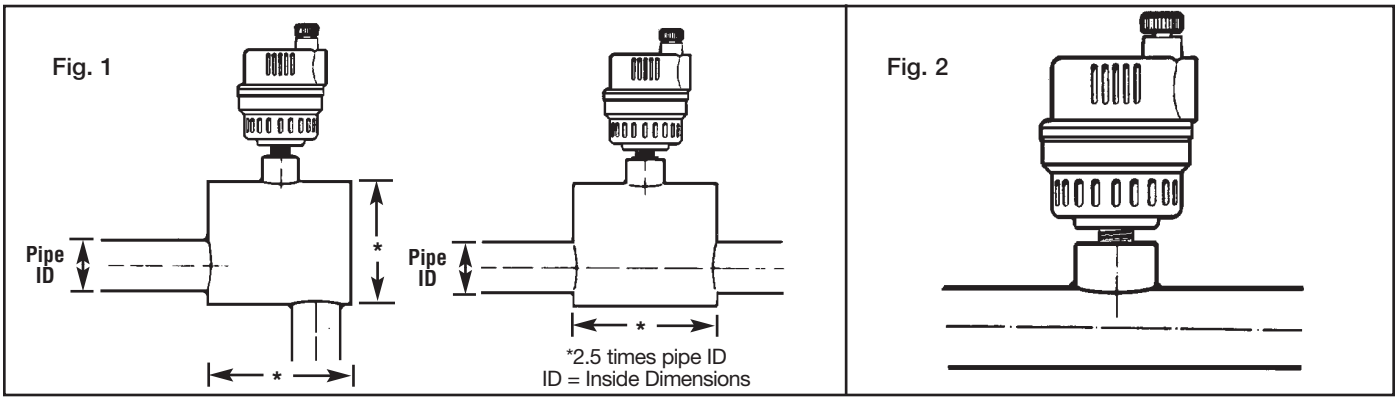

Figure 1 shows the installation of the FV-4M1 for the venting of air while the fluid is circulating in the system. The figure shows the required increase in pipe size in order to obtain proper separation of air from water. Watts Series AS Air Scoop which is designed for efficient separation of air from water in hydronic heating systems can also be installed. See Watts literature S-AS.

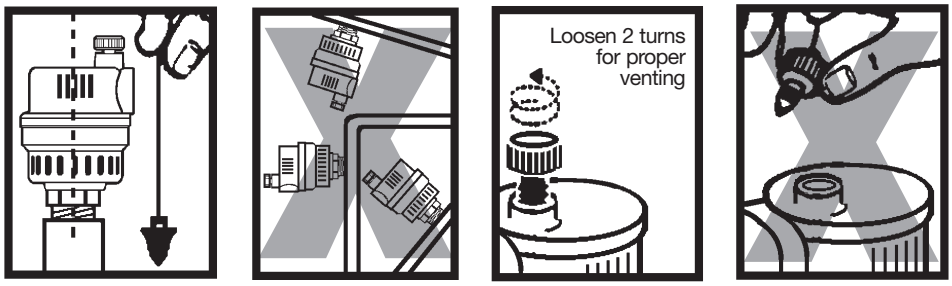
Figure 2 – When the FV-4M1 is installed as shown, the air will not be vented while the fluid is circulating in the system, but it can vent when the system is shut off.

The FV-4M1 should be mounted only in a vertical position as its operation is based on the vertical movement of the float (see Fig. 3).

Note: In order to get the best results in venting air from risers, use connecting pipes of at least ½" diameter between the "Float Vent" valves and the installation.

Maintenance

No maintenance is normally necessary. However, if the FV-4M1 is disassembled for inspection or cleaning it is important that when re-assembling to ensure that the spring loaded lever properly engages under the float collar (see reverse side).



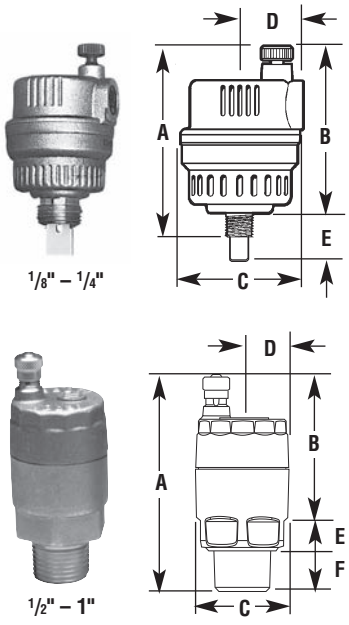


Fig. 3 Fig. 4

Operation: IMPORTANT!

After installing the FV-4M1, back off the small vent cap two turns (see Fig. 4). This is the proper operating setting which will allow air to be vented from the system. It is advisable to leave the cap on to prevent impurities from entering the valve.

Free Floating Lever Air/Gas Vents—Cast Iron

For Pressures to 300 psig (21 bar) or Specific Gravity Down to 0.40

Model 1-AV

Model 2-AV, 3-AV and 6-AV

REVIEWED by MV

Armstrong free floating lever Air/Gas Vents use the same bodies, caps, lever mechanisms, valves and seats of Armstrong inverted bucket steam traps that have been proven in years of service.

Elliptical floats and high leverage make it possible to open large orifices to provide adequate capacity for vent size and weight. The hemispherical valve, seat and leverage are identical in design, materials and workmanship to those for saturated steam service up to 1,000 psig, with the exception of the addition of a guidepost to assure a positive, leaktight valve closing under all conditions.

1-AV—A cast iron air vent that uses a positive-closing free floating lever to ensure leaktight closing under all conditions. This vent is good for low capacity air/gas venting up to 300 psi.

For a fully detailed certified drawing, refer to CD #1070.

2-AV, 3-AV and 6-AV—Cast iron vents using the same proven free floating lever mechanisms used in Armstrong steam traps. For applications where high air/gas venting capacity is required up to 250 psi.

For a fully detailed certified drawing, refer to CD #1034.

STANTEC PROJECT #: 110126045
SUBMITTAL # AD-025

This review by Stantec is for general conformance with the design concept of Stantec's design of the:
☐ Architectural ☐ Structural ☑ Mechanical ☐ Electrical ☐ Other

Stantec

component(s) only and does not mean that Stantec has verified or approves the shop drawing(s). The Contractor remains solely responsible for the shop drawing(s) and this review by Stantec does not relieve the Contractor of the Contractor's responsibility for errors or omissions in the shop drawing(s) or for meeting all requirements of the contract documents. This review does not mean that Stantec approves the detailed design inherent in the shop drawing, responsibility for which shall remain with the Contractor submitting same, nor does this review mean that Stantec accepts any deviation of the shop drawing(s) from the contract documents. The Contractor is responsible for confirming all dimensions and correlating them at the job site, for all construction means, methods and techniques, and for coordination of construction work of all trades, including coordination of all shop drawings.

TAG: SECTION 23 05 21 2.2 DIRECT READING THERMOMETERS

Description & Features:

- A general purpose, versatile 1" (25mm) to 6" (150mm) dial, 304 stainless steel thermometer
- Bi-metallic sensing element for reliable readings
- Back, bottom or adjustable angle connection
- Welded stem length from 2.5" (63mm) and up
- ±1% accuracy
- Anti-parallax dial that reduces operator reading errors
- Re-zero adjustment screws are standard on the 2" (50mm) to 6" (150mm) dials
- 5 year warranty

Applications:

- Industrial process, food processing and wastewater

Specifications	
Dial	1” (25mm), 2” (50mm), 3” (75mm), 4” (100mm), 5” (125mm), 6” (150mm) aluminum with black markings, dish-shaped
Case	AISI 304 SS
Stem	AISI 304 SS welded to socket, centre back, bottom or adjustable angle configurations (316 SS optional*) 2” (50mm): centre back connection only
Recalibrator	Standard**
Lens	1” (25mm): Acrylic Others: Glass standard, hermetically sealed
Ring	AISI 304 SS
Connection	1” (25mm): None 2” (50mm): ¼” NPT standard 3” (75mm), 4” (100mm), 5” (125mm), 6” (150mm): ½” NPT standard
Sensing Element	Bi-metallic coil
Pointer	Aluminum, painted black
Maximum Operating Pressure	125 psi (861 kPa)
Operating Temperature	75% of full scale value (recommended maximum)
Ambient Temperature	-58°F to 248°F (-50°C to 120°C)
Accuracy	±1%
Enclosure Rating	IP68

*Contact Winters for 316 SS requirements
**Not available on 1” pocket and 2” laboratory thermometer
Note: The use of a thermowell is recommended to protect the thermometer in corrosive or pressure applications, as well as to maintain a closed system during its removal from the process

2” Back Connection

3” Adjustable Angle Connection

4” Back Connection

TBR Bi-Metal Threaded Thermowell

TAG: SECTION 23 05 21 2.3 THERMOWELL

RoHS compliant

Description & Features:

- Available in a wide range of materials for use on most applications
- Standard “stepped construction” offering is complemented by an array of custom thermowells including: straight, tapered, sanitary and flanged configurations
- CRN registered
- 1 year warranty

Applications:

- Allows for the creation of a “sealed system”, whereby the thermometer can be removed from the application without the need for shutting down or draining the system
- To protect the thermometer from possible exposure to the process media

Specifications	
Thermometer Connection	½” NPT female connection standard Other thread sizes are available upon request
Process Connection	¾”, ½” or 1” NPT connection standard Other thread sizes are available upon request
Bore	0.260” (6.5mm) bore standard
Construction	Stepped construction standard Tapered construction available upon request
Material	Brass, AISI 304 SS, AISI 316 SS standard Other materials available upon request

Material	Pressure - Temperature Rating (PSI)						
	70°F (21°C)	200°F (93°C)	400°F (204°C)	600°F (316°C)	800°F (427°C)	1000°F (538°C)	1200°F (649°C)

TAG: SECTION 23 05 21 2.3 THERMOWELL

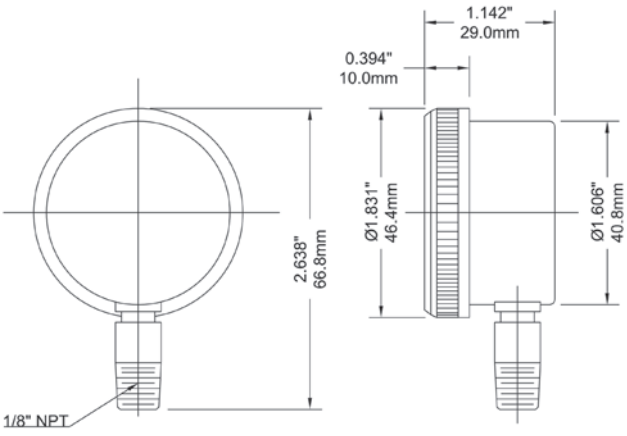
Standard Thermowell without lag

Standard Thermowell with lag

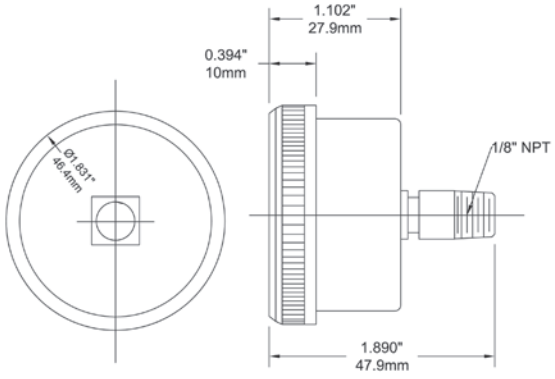
TAG: SECTION 23 05 21 2.4 PRESSURE GAUGES

Description & Features:



- A general-purpose gauge that is serviceable and pulsation resistant
- 1.5” (40mm) to 3.5” (90mm) dial sizes
- Dampened movement combined with a flutterless pointer
- Removable lens
- Zero-adjustment
- ASME B40.100 compliant
- CRN registered
- ±2-1-2% accuracy
- 5 year warranty

Applications:



- Compressors, filters, regulators, water pumps, paint sprayers and a variety of other rapid pressure fluctuation applications
- Suitable for non-clogging and non-corroding media

Specifications	
Dial	1.5” (40mm), 2” (50mm), 2.5” (63mm), 3.5” (90mm) white aluminum with black and red markings
Case	Steel, painted black
Lens	Acrylic, threaded
Socket	Brass
Connection	1/8” NPT or 1/4” NPT standard
Bourdon Tube	Phosphor bronze
Movement	Brass (flutterless) with zero adjustment
Pointer	Aluminum, black
Welding	<1,000 psi: 60% tin 40% lead, ≥1,000 psi: silver alloy
Over-pressure Limit	25% of full scale value
Working Pressure	Maximum 75% of full scale value
Ambient/Process Temperature	-40°F to 150°F (-40°C to 65°C)
Accuracy	±2-1-2% ANSI/ASME Grade A

1.5” Bottom Connection

1.5” Back Connection

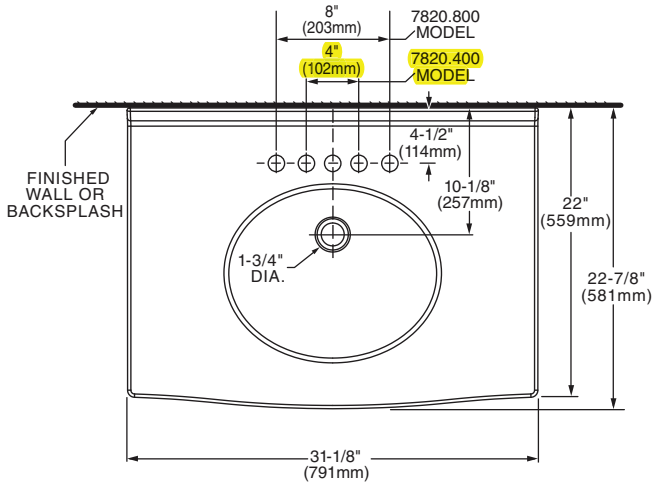
FINE FIRE CLAY

NEWBERN™ VANITY TOP

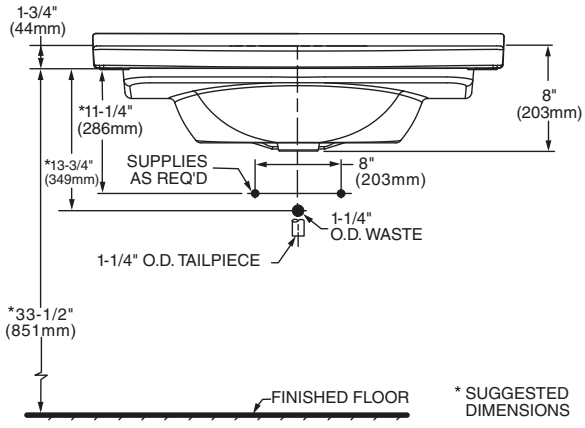
❑ **7820.400** Faucet holes on 4" centers
❑ **7820.800** Faucet holes on 8" centers

- Seamless one piece design made from Fine Fire Clay
- Interior Oval bowl design
- Includes 1" backsplash
- Fits most standard 30" vanities
- Pre-drilled for 4" and 8" faucet holes
- Includes safety overflow design

Nominal Dimensions:
31-1/8" x 22-7/8"
(791 x 581 mm)



Bowl sizes:
16" (406mm) wide
13" (330mm) front to back
6-1/2" (165mm) deep

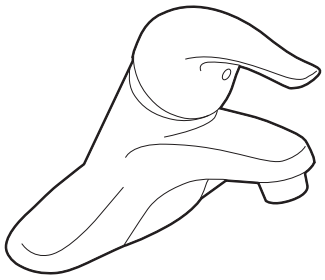


Compliance Certifications -
Meets or Exceeds the Following Specifications:
- ASME A112.19.9M for Non-Vitreous Ceramic Fixtures

To Be Specified
❑ Color: ❑ White
❑ Faucet:
❑ Faucet Finish:
❑ Supplies:
❑ Trap:

* See faucet section for additional models available

NOTES:
* DIMENSIONS SHOWN FOR LOCATION OF SUPPLIES AND "P" TRAP ARE SUGGESTED.
FITTINGS NOT INCLUDED WITH FIXTURE AND MUST BE ORDERED SEPARATELY.
FOR COUNTERTOP CUTOUT AND INSTALLATION INSTRUCTIONS USE TEMPLATE SUPPLIED WITH SINK.



IMPORTANT: Dimensions of fixtures are nominal and may vary within the range of tolerances established by ANSI Standard A112.19.9M. These measurements are subject to change or cancellation. No responsibility is assumed for use of superseded or voided pages.

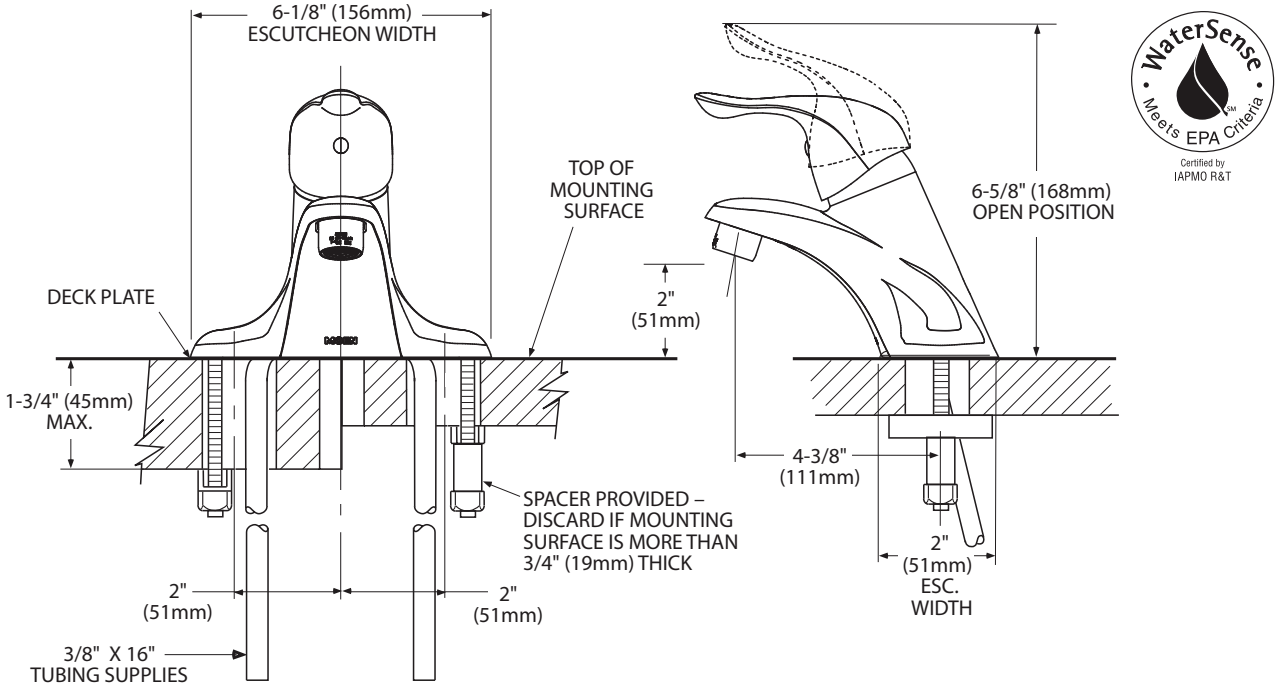
NOTE: THIS FAUCET IS DESIGNED TO BE INSTALLED THRU 3-1" DIA. HOLES, 2" ON CENTER

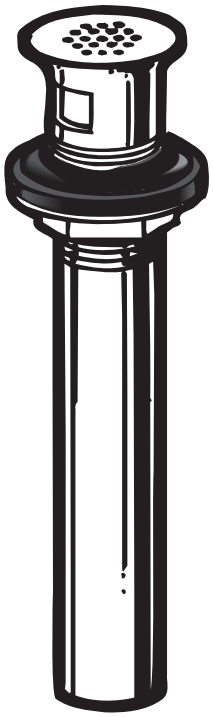
DESCRIPTION
- Metal construction with various finishes identified by suffix
- 16" long 3/8" tubing connections
- Includes metal or 50/50 pop-up type waste assembly where noted



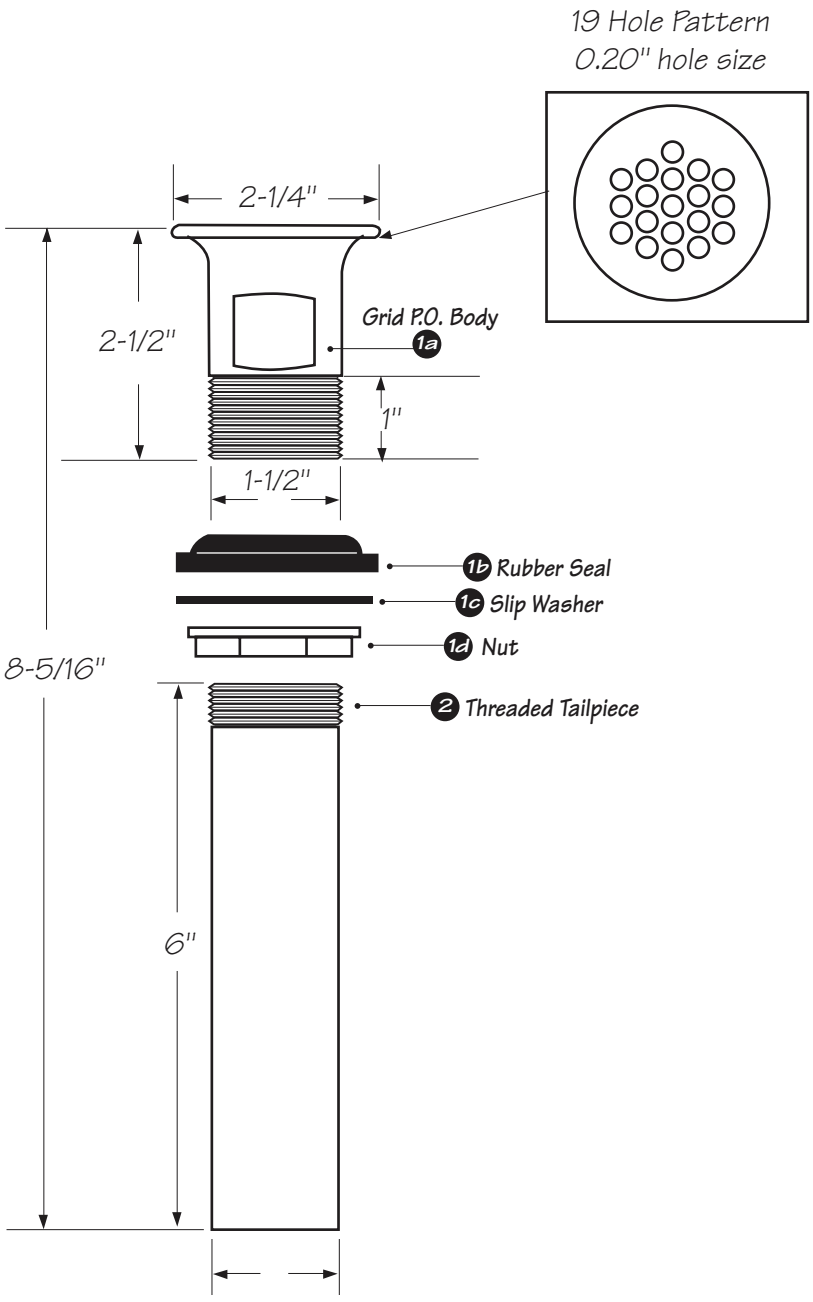
OPERATION
- Pivot action lever style handle
- Temperature controlled through 180˚ degree arc of handle travel

FLOW
- Flow is limited to 1.5 gpm max (5.7L/min) at 60 psi

CARTRIDGE
- 1225 cartridge design
- Nonmetallic/nonferrous and stainless steel material
- Can accommodate reversed piping and back to back installations



STANDARDS
- Third party certified to WaterSense,® CSA B-125.1, ASME A112.18.1 and all applicable requirements referenced therein including NSF61/9
- Complies with California Proposition 65 and with the Federal Safe Drinking Water Act
- **ADA** for lever handle



WARRANTY
- Lifetime limited warranty against leaks, drips and finish defects to the original consumer purchaser
- 5 year warranty if used in commercial installations

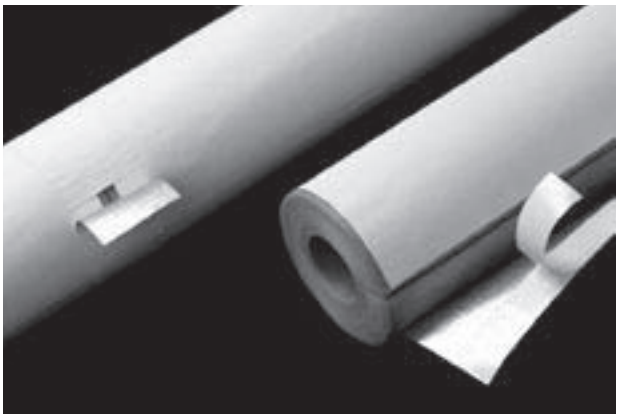
Micro-Lok®

Fiber Glass Pipe Insulation



Description

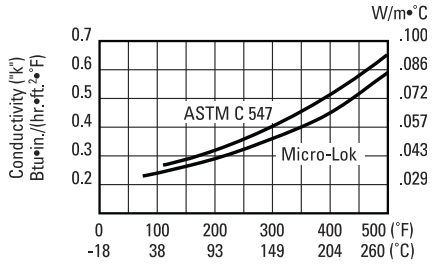
Micro-Lok fiber glass pipe insulation is made from glass fibers bonded with a thermosetting resin and produced in 36" (0.92 m) lengths. Jacketed with a reinforced vapor retarder facing and a factory-applied, longitudinal acrylic adhesive closure system, Micro-Lok is designed for application temperatures from 0°F to 850°F (-18°C to 454°C). Section joints are sealed with butt strips which are supplied from the factory. **Micro-Lok AP-T Plus** may be painted with a latex paint after installation.

The factory-installed tape system permits installation at ambient temperatures down to 15°F (-9°C), and will not soften or separate when exposed to high ambient temperatures and humidity.

Uses

Micro-Lok fiber glass pipe insulation is suitable for installation over hot, cold, concealed and exposed piping systems with operating temperatures up to 850°F (454°C). Weather-protective jacketing is required for outdoor applications. Pipes operating below ambient temperatures require all joints to be sealed with the factory-applied, self-seal lap and butt strips.

Operating Temperature Limits: 0°F to 850°F (-18°C to 454°C)



Specification Compliance

ASTM C 1136 (Jacketing) (Replaces HH-B-100B, Type I & II)
ASTM C 547 Type I (Replaces HH-I-558B, Form D, Type III, Class 12, Class 13 up to 850°F [454°C])
MIL-I-22344C
New York City MEA # 330-85-M
NFPA 90A & 90B, FHC 25/50

Physical Properties

Service Temp. Range	0°F to 850°F (-18°C to 454°C)
Moisture Sorption	<0.2% by volume
Alkalinity	<0.6% expressed as Na_2O
Corrosivity	Does not accelerate
Capillarity	Negligible (after 24 hours)
Shrinkage	None
Fungi & Bacteria Resistance	Does not breed or promote
Surface Burning Characteristics	Composite FHC 25/50 per ASTM E 84, UL 723, NFPA 255, CAN/ULC S102-M88
Limited Combustibility	NFPA 259
Jacketing	ASTM C 1136 (Type I)
Water Vapor Permeance (ASTM E 96 - Procedure A)	.02 perms max.
Beach Puncture (ASTM D 781)	50 oz. in./in. (58 SI) tear min.
Tensile Strength (ASTM D 828)	45 lbs./in. (7.9N/mm) width min. (MD) 30 lbs./in. (5.23N/mm) width min. (CD)

Thermal Conductivity ("k")

Mean Temperature	°F	75	100	200	300	400	500
	°C	24	38	200	149	204	260

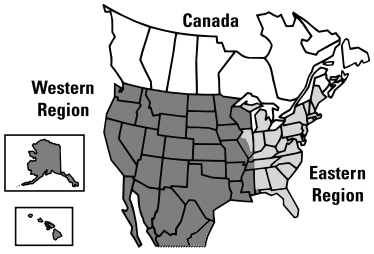
* Contact the nearest Regional Sales Office for availability.

Qualifications for use

A sufficient thickness of insulation must be used to keep the maximum surface temperature of Micro-Lok AP-T Plus below 150°F (66°C). In addition, at operating temperatures above 500°F (260°C), Micro-Lok pipe insulation must be applied in a thickness ranging from 2" (51 mm) minimum to 6" (152 mm) maximum.

During initial heat-up to operating temperatures above 350°F (177°C), an acrid odor and some smoke may be given off as the organic binders used in the fiber glass pipe insulation begin to decompose. When this occurs, caution should be exercised to ventilate the area well. This loss of binder does not directly affect the thermal performance of the pipe insulation, but the compressive strength and resiliency of the product are reduced. For applications with excessive physical abuse or vibration at high temperatures, consult your local Performance Materials Division territory manager for alternate material recommendations.



Application Recommendations.
AP-T Plus Jacket and Butt Strips.

1. Do not apply Micro-Lok insulation with AP-T Plus jacketing if air temperature is below 15°F (-9°C) or above 130°F (54°C) due to the effect of temperature on tape performance. We recommend stapling when application falls outside this temperature range.

2. If stored below 15°F (-9°C) or above 130°F (54°C), insulation cartons should stand within the recommended temperature range for 24 hours prior to application.

3. Once release paper is removed, both adhesive and lap must be kept free of dirt and water, and the lap sealed immediately.

4. When adhered, the lap and butt strips must be pressurized by rubbing firmly with a plastic squeegee or the back of a knife blade to assure positive closure.

Johns Manville

Zeston 2000® Series White PVC Insulated Fitting Covers and Jacketing

Features

- Protect insulated or bare pipes
- Meets most requirements for federal, state and local fire-safety codes
- Accepted for commercial, institutional, industrial and residential projects in all parts of the US
- System is uncomplicated and easy to install
- UV-resistant for outdoor applications
- Long-lasting protection and an attractive finished appearance
- Available with Hi-Lo Temp fiber glass inserts

Applications

- Commercial, institutional and industrial applications

Construction

- Covering and jacketing manufactured from high-impact, gloss white, UV-resistant polyvinyl chloride jacketing

Application Recommendations

- Wrap the Hi-Lo Temp fiber glass insert completely around the pipe fitting without overly compressing it or leaving any voids
- Ensure that the insulation insert covers all exposed surfaces
- Install the Zeston PVC fitting cover over the pipe fitting and fiber glass insert by securing the throat of the Zeston PVC insert using either serrated tacks, Perma-Weld adhesive or Zeston Z-Tape
- If applied in an outdoor setting or exposed to the sun, precautions should be taken to account for expansion joints

ZESTON 2000 SERIES WHITE PVC
INSULATED FITTING COVERS AND JACKETING

22 07 20 2.4
23 07 19 2.6

Johns Manville

Mechanical Insulations

Zeston 2000® Series White PVC Insulated Fitting Covers and Jacketing

Qualifications For Use

Hot Systems

- Use proper insulation thickness to ensure PVC covers are kept below 150°F (66°C)
- PVC covers should be kept away from contact with and/or exposure to sources of direct or radiated heat
- For fittings where operating temperatures exceed 250°F (121°C) or where pipe insulation thickness is greater than 1½" (38mm), two or more layers of Hi-Lo Temp insulation inserts are required beneath the fitting cover (refer to MECH-261 Zeston Hi-Lo Temp Inserts)

Cold Systems

- An approved vapor-barrier compatible with PVC must be applied between pipe insulation and fitting cover and on fitting cover throat overlap seal. Please refer to Insulspec MECH-261 on jm.com
- For fittings where operating temperature is below 45°F (7°C) or where the pipe insulation thickness is greater than 1½ " (38mm), two or more layers of Hi-Lo Temp insulation inserts are required beneath fitting cover (refer to MECH-261 Zeston Hi-Lo Temp Inserts)

Refrigerant Systems and Cold Systems In Severe Ambient Conditioning

- Mitered pipe insulation segments, fabricated or pre-molded insulation shapes may be used in lieu of Hi-Lo temp insulation inserts
- An intermediate vapor-barrier compatible with PVC is required to completely seaL the insulation prior to installing the Zeston 2000 PVC fitting cover
- Care should be taken to ensure the vapor barrier mastic is applied between the pipe insulation and the fitting cover and on the fitting cover throat overlap seam

Totally Sealed Systems (USDA Approval)

- 20 or 30 mil (0.5 mm or 0.8mm) Zeston PVC jacketing should be applied to pipe insulation in conjunction with Zeston PVC fitting covers
- Circumferential and longitudinal jacket and fitting cover seams should be sealed with Zeston Perma-Weld solvent welding adhesive
- Circumferential seams should be a minimum of 1" (25mm) overlap and longitudinal seams should be 1½"- 2" (38mm to 51mm) overlap
- Upon completion, all seams should visually be checked for seal and, if necessary, touched up
- Slip joints are periodically required between fixed supports and on continuous long runs of straight piping.
- To implement a slip joint, increase the circumferential overlap to 8" to 10" (203 mm to 254 mm) and apply a flexible white caulking in the overlap area to maintain a sealed system
- Refer to Zeston installation instructions CI-35 at www.jm.com

PVC FITTING COVERS, PRE-MOLDED, INSULATED
WHITE GLOSS FINISH — INDOOR OUTDOOR GRADE

SUBMITTAL SHEET DOES NOT SUPERCEDE WRITTEN SPECIFICATIONS OR OWNER AGREEMENT.

DESCRIPTION

The Proto Fitting Cover System consists of one piece and two piece pre-molded high impact LoSMOKE® PVC fitting covers with fiberglass inserts and accessories, which include elbows, tee/valves, end caps, mechanical line couplings, specialty fittings, white and indoor color jacketing, Protop® Tank End Panels, tack fasteners, tapes and specialty items.

APPLICATIONS

The Proto Fitting Cover System is used to insulate mechanical piping systems at fitting locations and provide a PVC jacketing for straight run piping. Both give a quality appearance and have excellent durability.

FEATURES AND BENEFITS

25/50 Rated. All Proto PVC Fittings are made of LoSMOKE® grade PVC. Roll Jacketing is available in either 25/50 rated or regular PVC Grade (not 25/50 rated). The 25/50 products meet fire and smoke safety requirements of federal, state and local building codes.

Excellent Appearance. Bright high-gloss white coloring adds a distinct quality appearance to the system. The standard line of Proto Fitting Covers are made in LoSMOKE® PVC designed for indoor and outdoor use. Virtually all sizes pass 25/50 when made of LoSMOKE® PVC. Colored PVC is manufactured from a LoSMOKE® formula that is suitable for indoor use only.

Easy To Clean. Due to the smooth, high gloss finish on Proto PVC Fittings, the product cleans easily with soap and water. This makes the system ideal for food and drug facilities.

Low Cost Installation. Significant cost savings vs. conventional cement, molded sections, and mitered sections.

Fast and Easy. At fitting locations, wrap the fiberglass insert around the pipe fitting, apply the Proto PVC Fitting over the insert and tack or tape in place. Do not use tacks where a vapor retarder is applied.

Wide Temperature Range. May be used for mechanical piping systems operating from -20°F to +140°F surface temperature of insulation. Variety: LoSMOKE®, Indoor/Outdoor, Exod®, Exotuff®. Proto products are also available in LoSMOKE® Indoor colors. Exod® is CPVC, GOOD TO 225° F.

Long Lasting. Can be used more than once on retrofit projects, general maintenance.

Excellent Thermal Value. K value of .26 at 75°F (.037 W/m °C at 24°C) of fiberglass insert, mean temperature assures better thermal efficiency than conventional cement fittings.

Resistance To Fungi and Bacteria. (ASTM G 21, ASTM G 22) Does not promote growth of fungi or bacteria.

U.V. Resistant. Can be used on indoor or outdoor applications, for both (White) LoSMOKE® PVC and Regular PVC. Extra thick fitting covers should be used outdoors. (All Std. Proto Fitting covers are made of LoSMOKE® PVC.)

	250° (121°C)	.44 (.063 W/m. °C)

APPLICATION AND SPECIFICATION GUIDELINES

A. STORAGE

Protect cartons from water damage or other abuse. Proto Fitting Cover cartons are not designed for outside storage.

B. PREPARATION

Proto Fitting Covers should be applied on clean, dry surfaces.

C. APPLICATION

1. **General:** The matching fiberglass insert shall be wrapped completely around the metal fitting leaving no voids. Loose wrappings of twine is helpful in shaping difficult surfaces. The Proto Fitting Cover shall then be applied over the fitting and insert, and the throat secured by either tack fastening or taping.

2. **Cold Pipe:** Fitting systems below ambient temperature must have a continuous vapor retarder or vapor retardant mastic as specified by the engineer. When using Proto PVC Tape, a 2" (51mm) minimum downward overlap is recommended for optimum performance. Care should be taken not to stretch the last 2" (51mm) of Proto PVC Tape, to avoid stretching or creeping.

3. **Hot Pipe:** Insulate as per General Instructions given above. Due to PVC softening point at approximately 159°F (70.6°C), care should be taken to ensure sufficient insulation thicknesses are applied.

For hot piping which requires Pipe Insulation over 1 1/2" (38 mm) wall thickness, an extra fiberglass insert shall be applied for each additional inch of pipe insulation wall thickness. Proto recommends the surface temperature of the Pipe Insulation and PVC to be no higher than 125°F (52°C). To complete application of Proto PVC Fittings on hot piping, the throat seam shall be tack fastened or taped. Seal all laps outdoors and in wash down areas.

CAUTION: During initial heat-up to operating temperatures above 350°F, (177°C) an acrid odor and some smoke may be given off as a portion of the bonding material used in the insulation begins to undergo a controlled decomposition. If natural convection is not adequate in confined areas, forced ventilation should be provided in order to protect against any harmful fumes and vapors that might be generated.

4. **Outdoor Pipe:** Insulate as per above instructions.

Minimum Proto PVC Jacketing thickness for outdoor applications should be .030" (.7 mm). Over 15" O.D., .040 is recommended. Under 3 1/8" O.D., .020 is permitted. The PVC Jacketing shall be overlapped a minimum of 2" (51 mm) on the down side so as to shed water. All long and round joints shall be completely weather sealed with caulk adhesive.

On all piping, insulation shall be of sufficient thickness to keep the surface temperature below 125°F (52°C). Additionally, a slip type expansion joint of 8" (202 mm) minimum width shall be applied at least every 25 lineal feet (6.1 lineal meters) and between fittings.

Painting: Painting must be done only after priming the PVC surface with a suitable primer, such as X-1-M 400W Primer, or a similar, approved product.

Outdoor Painting: Only over White Exotuff® 195°F deflection temp. (modified PVC) or EXOD™225°F deflection temp. CPVC after X-1-M primer, or a similar, approved product. Use PVC compatible paints without strong solvents. Test paint a section before proceeding.

5. **CAUTION:** Fiberglass may cause temporary skin irritation. Wear long-sleeved, loose-fitting clothing, head covering, gloves and eye protection when handling and applying material. Wash with soap and warm water after handling. Wash work clothes separately and rinse washer. A disposable mask designed for nuisance type dusts should be used where sensitivity to dust and airborne particles may cause irritation to the nose or throat.

D. HEAVY INDUSTRIAL APPLICATIONS OUTDOORS

Use .030" or higher PVC Jacketing. Use "heavy duty" two piece fitting covers made from minimum .030" thick to .050" thick PVC sheet depending on size of fitting cover. Jacketing to be cut and oven precurled

E. FIRE TEST RESULTS: PROTO LoSMOKE® — PVC

USA: E-84 25/50 Rated up to .035" thick (The Best Rated PVC)

CANADA: Conforms to CAN 4-S102.2

LoSMOKE® fitting covers conform to virtually all city, state and federal codes, for use in hotel, commercial and industrial buildings.

LoSMOKE® fitting covers will be labeled on the box "Passes ASTM E-84." Flame spread 25; smoke developed 50".

All E-84 ratings shown here were tested on flat sheets from which fitting covers are made.

Virtually all Proto LoSMOKE® fitting covers will pass E-84 25/50 flame spread and smoke development rating requirements.

SUGGESTIONS

Slide Joints: Do not apply PVC Jacketing too tightly. Slide joints plus PVC thickness must work together to prevent cracks and puckering.

Caulk/Adhesives:
Use: Celulon® (Red Devil Inc.) water base "Ultra Clear".
Service temp. -25°F to +175°F

PVC Cement: Avoid use if possible. Heavy application can cause puckering and cracks. Learn how to use it sparingly.

Vapor Retarder: A vapor retarder is required under all fitting covers for systems operating below ambient temperatures, such as chilled water lines, and is recommended for all outdoor applications. The fitting vapor retarder should provide a continuous seal with the adjacent pipe vapor retarder.

Outdoor Fitting Covers: Use extra thick, plastic heavy duty covers.

Outdoor and Indoor Washdown Areas: Use EXOD™ (CPVC) by Proto, for its higher deflection temperature (225°F). It is light grey.

PVC Outdoor Thickness (Reg. PVC Jacketing): Use .030" thick cut and oven precurled jacketing. Use "heavy duty" plastic fitting covers formed from minimum .030" to .050" thick PVC sheet depending on size of fitting cover. On pipe insulation larger than 15" O.D. use .040" thick PVC.

PVC Indoor Thickness: Use white or indoor color LoSMOKE® on piping. Use .020" thick with standard one piece fitting cover, .030" jacketing can also be used.

Vessels and Tank Tops: Use .050" or .060" thick tank panels for outdoor applications and .030" or .040" for indoor tanks. Use .050" thick Protop® segments for tank heads. (Only Proto Corp. has them.) Made of LoSMOKE® PVC.

Pipe Insulation End Caps: Use on all outdoor, indoor washdown areas, and all vapor sealed systems. End caps will be PVC, metal, or gasket materials appropriate for the metal pipe temperatures. Silicone rubber (500°F) can be applied (min. 1/16" thick) as an end cap outdoors.

Indoor hot piping need not be sealed to the end cap. Cap will be sealed or taped to the jacket.

Two-Ply Waterproofing System: Use .010" thick PVC with self-sealing long lap tape, as the first waterproof layer. Overlap ends 3" and PVC tape over. Caulk all openings with Celulon® or similar, approved product. The finished jacketing material should employ staggered joints with at least a .010 mil thick first layer. Recaulk again over last layer. Install slide joints every 25', caulk shut all other seams, openings, or end overlaps with PVC tape or caulk. Use vapor seal jacketing (instead of .010" thick PVC first layer) where a vapor seal system is required.

CPVC-High Chemical Resistance and High Deflection Temperature: Use "Exod®" CPVC jacketing and fitting covers for 225°F deflection temperature and maximum chemical resistance. Offered only by Proto Corp. as a substitute for stainless steel.

Regular PVC Jacketing Outdoors: Use regular PVC jacketing outdoors. It is less expensive, does the same job as LoSMOKE® PVC. Regular PVC has very good fire (self-extinguishing) properties — not as good as the LoSMOKE® PVC used in confined people areas (buildings), however much better than common plastics used outdoors.

Vessels with ends 24" O.D. or larger: Use .040" thick jacketing up to 48" O.D. On sides of vessels larger than 48" O.D. See Protop® brochure for instructions requiring a suspended band system, to hang panels from, (Gerrard & Company or equal). Use thick PVC panels on Outdoor Tanks not PVC Roll Jacketing. See Tank Tops above for end segments.

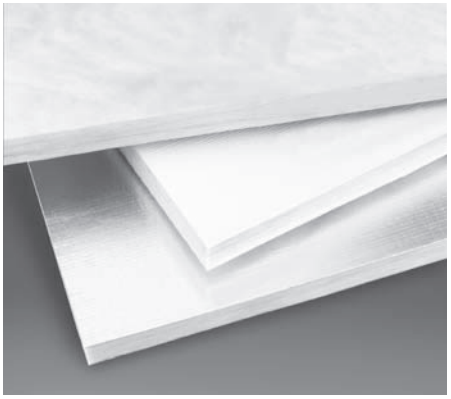
CertaPro™ Commercial Board

1. PRODUCT NAME

CertaPro™ Commercial Board

2. MANUFACTURER

CertainTeed Corporation
P.O. Box 860
Valley Forge, PA 19482-0105
Phone: 610-341-7000
800-233-8990
Fax: 610-341-7571
Website:
www.certainteed.com/insulation



3. PRODUCT DESCRIPTION

Basic Use: CertaPro Commercial Board is used where board stiffness properties are required and also functions as an exterior insulation when covered with a weather barrier. Commercial Board is used in exterior curtain walls, interior walls and floor/ceiling assemblies, and as an exterior insulation on HVAC ducts and plenums or in constructions where framing is not present. It is also used as thermal insulation on tanks and vessels.

All/Service/Jacket (ASJ facing) is not available in Type CB 150.
CB 110, 150 and 600 are not available in FSK, WMP or ASJ facings.

Benefits: CertaPro Commercial Board provides high sound absorption and excellent thermal performance. This product contains a minimum of 60% recycled content. The product is offered in a variety of stiffness properties from flexible to rigid and all can be easily cut, handled, fabricated and installed. The vapor retarder facing provides abuse resistance. The ASJ and FSK facings provide vapor retarder performance and a Class A surface that may be left exposed.

Composition and Materials: The product is composed of glass fibers bonded together with a thermoset binder. It is available unfaced or with a foil-scrim-kraft (FSK) or white kraft-scrim-foil (ASJ) facing adhered to the fiber glass board.

Limitations: Insulation should be kept clean and dry at all times.

Sizes: See table to the left. Contact CertainTeed for other sizes and minimum order quantities.

* Estimated sound absorption coefficents and NRC.
Sound absorption tested in accordance with ASTM C423 using Type A mounting per ASTM E795.

Curtain Walls – CertaPro Commercial Board is applied to spandrel and pre-cast concrete panels with approved adhesives or mechanical fasteners. Boards may also be installed using hat channels or Z studs. Where a vapor retarder is required, all joints, seams and penetrations must be sealed. Exterior applications require the insulation to be covered with appropriate weather barrier finish in addition to the factory-applied vapor retarder facing. Choice of finish depends on mechanical abuse, weather exposure and appearance requirements.

HVAC/Mechanical – All fabrication, application and installation steps should be in accordance with the requirements of the National Commercial and Industrial Installation Standards (current edition) published by the Midwest Insulation Contractors Association (MICA).

These installation recommendations are general in nature. Other methods are acceptable. Please consult your contractor for recommendations best suited to the application.

6. AVAILABILITY AND COST

Manufactured and sold throughout the United States and Canada. For availability and cost, contact your local contractor, distributor or call CertainTeed at 800-233-8990.

7. WARRANTY

Refer to CertainTeed Limited Warranty for Commercial Insulation (30-25-034). Inasmuch as CertainTeed has no control over the installation design, installation workmanship, accessory materials or conditions of application, CertainTeed does not warrant the performance or results of any installation containing its products.

8. MAINTENANCE

An inspection and preventative maintenance program for the insulation and vapor retarder system is recommended to ensure optimum performance.

9. TECHNICAL SERVICES

Technical assistance can be obtained either from the local CertainTeed sales representative, or by calling Sales Support Group at 800-233-8990.

SoftTouch™ Duct Wrap Insulation

Product Name	CertainTeed SoftTouch™ Duct Wrap Insulation
Manufacturer	CertainTeed Corporation
Address	P.O. Box 860 Valley Forge, PA 19482-0105
Phone	610-341-7000 • 800-233-8990
Fax	610-341-7571
Website	www.certainteed.com/insulation

PRODUCT DESCRIPTION

Basic Use: SoftTouch™ Duct Wrap Insulation is used to insulate rectangular and round heating, ventilating and air conditioning ductwork.

Benefits: SoftTouch Duct Wrap Insulation provides thermal efficiency that reduces unwanted heat loss or gain from equipment and ductwork. When properly installed in the correct thickness, this product virtually eliminates condensation problems on cold duct surfaces.

Composition and Materials: SoftTouch Duct Wrap is a blanket-type insulation composed of tan, uniformly textured, inorganic fibrous glass formed with a formaldehyde-free plant-based binding agent. It is available unfaced or with FSK, gray PSK or white PSK vapor retarder facing. On faced products, a stapling/taping tab is provided on one edge.

Limitations: The product should be kept clean and dry from the time of manufacture through job site installation and system operation.

SoftTouch Duct Wrap is suitable for use with most heating, ventilating and air conditioning ductwork operating at temperatures from 35°F to 250°F (1.7°C to 121°C) for faced SoftTouch Duct Wrap, and from 35°F to 450°F (1.7°C to 232°C) for unfaced SoftTouch Duct Wrap.

Sizes: See table on back for available sizes. Contact CertainTeed for other sizes and minimum order quantities.

INSTALLATION

Sheet metal ducts must be clean, dry and sealed tightly prior to insulating with CertainTeed SoftTouch Duct Wrap.

To ensure installed thermal performance, CertainTeed SoftTouch Duct Wrap must be cut to "stretch-out" dimensions. This requires measurement of the duct perimeter, then cutting the duct wrap to the dimensions (perimeter + add-on) indicated in the stretch-out table on the other side. A 2" piece of insulation is removed from the facing at the end of the piece of insulation to form an overlapping stapling and taping flap.

CertainTeed SoftTouch Duct Wrap is installed by wrapping the insulation around the perimeter of the duct with the facing out. Adjacent sections of duct wrap are tightly butted with the 2" taping flap overlapping. Seams must be stapled with outward-clinching staples on approximately 6" centers. When a vapor retarder is required, all seams, joints, tears, punctures and/or other penetrations of the duct wrap must be sealed with a pressure sensitive vapor retarder tape that matches the facing, or a suitable mastic system.

Where rectangular ducts are 24" in width or greater, CertainTeed SoftTouch Duct Wrap must be additionally secured to the bottom of the duct with mechanical fasteners spaced 18" on center to prevent sagging.

For additional installation details, consult the National Commercial and Industrial Insulation Standards (current edition) published by the Midwest Insulation Contractors Association (MICA).

AVAILABILITY AND COST

Manufactured in U.S.A. Available in select Western U.S./Canada regions. For availability and cost contact your local distributor, or call CertainTeed Sales Support Group in Valley Forge, PA at 800-233-8990.

WARRANTY

Refer to CertainTeed's Limited One-Year Warranty for Fiber Glass Duct Wraps (30-29-047).

MAINTENANCE

An inspection and preventative maintenance program for the HVAC system is recommended to ensure optimum performance.

TECHNICAL DATA

Applicable Standards

- Model Building Codes:
  – ICC
- Material Standards:
  – ASTM C1290
    Type I, Unfaced
    Type II, PSK – Grey
    Type III, FSK & PSK – White
  – ASTM C553
    Type I, Type 75 Duct Wrap
    Type II, Type 100 & 150 Duct Wrap
    Type III, Type 150 Duct Wrap
  – CAN/CGSB-51.11-92
  – ASTM C1136: FSK & White PSK, Type II, Gray PSK, Type IV
- Fire Safety Standards:
  – NFPA 90A, NFPA 90B

Fire Resistance

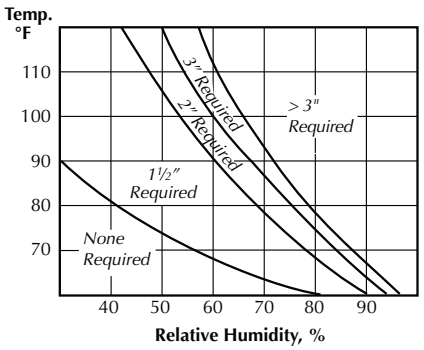
- Fire Hazard Classification:
  – UL 723, ASTM E84, CAN/ULC-S102
    Max. Flame Spread Index: 25
    Max. Smoke Developed Index: 50
- Non-Combustible: ASTM E136 / Meets test requirements

Physical/Chemical Properties

- Thermal Performance: See table on other side
- Operating Limits:
  – Temperature: ASTM C411
    Faced: Max. 250°F / 121°C
    Unfaced: Max. 450°F / 232°C
- Water Vapor Sorption: ASTM C1104 / < 5% by weight
- Water Vapor Transmission – Facing:
  – ASTM E96, Desiccant Method
    FSK and white PSK: Max. 0.02 perms (1.15×10^{-9} g/Pa•s•m²)
    Gray PSK: Max. 0.09 perms (5.17×10^{-9} g/Pa•s•m²)
- Corrosiveness: ASTM C665
  – Pass test requirements
- Fungi Resistance: ASTM C1338
  – Pass test requirements
- Odor Emission: ASTM C1304
  – Pass test requirements

Quality Assurance

CertainTeed's commitment to quality and environmental management has ensured the registration of the Athens, Chowchilla and Kansas City plants to ISO 9001:2000 and ISO 14001:2004 standards. The GREENGUARD® Environmental Institute has certified SoftTouch Duct Wrap Insulation for low emissions of total particle, formaldehyde and other Volatile Organic Compounds (VOCs).



TECHNICAL SERVICES

Technical assistance can be obtained either from your local CertainTeed sales representative, or by calling CertainTeed Sales Support Group in Valley Forge, PA at 800-233-8990.

CONDENSATION CONTROL

This chart is based on indoor conditions so far as wind and other factors are concerned.

To determine thickness to prevent condensation, based on installed thickness at 75% of nominal (out-of-package) thickness and a duct internal air temperature of 55°F, refer to the condensation control chart.

To use: 1) Select maximum relative humidity (%) on lower axis; 2) Read up vertically until that line intersects the maximum ambient air temperature; 3) Select the thickness indicated at the point of intersection.

Tested in accordance with ASTM C518 and/or ASTM C177 at 75°F (24°C) mean temperature. R means resistance to heat flow. The higher the R-value, the greater the insulating power. The installed R-value and K-value based upon 25% compression of the product thickness during installation. To get the installed R-value, it is essential that this insulation be installed properly. If you do it yourself, follow the installation instructions carefully.

*pcf. is pounds per square foot

INSTALLATION STRETCH-OUT DIMENSIONS

Product Label Thickness in.	Product Label Thickness mm	Average Installed Thickness in.	Average Installed Thickness mm	Stretch-Out Dimensions[1] perim.	Round Duct in.	Round Duct mm	Square Duct in.	Square Duct mm	Rectangular Duct in.	Rectangular Duct mm

Venture Tape™ Aluminum Foil Tape 1521CW

Technical Data **April, 2015**

Product Description

3M™ Venture Tape™ Aluminum Foil Tape 1521CW is a high strength dead soft aluminum foil coated with a cold weather solvent acrylic pressure sensitive adhesive.

Product Construction

Backing	Adhesive	Color	Liner	Standard Roll Length
Aluminum Foil	Acrylic	Natural Aluminum	Release Liner	50 yds (45.7 m)

Features

- Excels in demanding temperature and humidity applications
- Conforms well to irregular surfaces
- Specifically designed for cold weather conditions
- Hand tearable

Typical Physical Properties

Note: The following technical information and data should be considered representative or typical only and should not be used for specification purposes.

Test	Typical Value	Typical Value (Metric)	Test Method
Product Thickness	2.7 mils	0.07 mm	PSTC-133
Peel Adhesion	40 oz/in	11.1 N/25 mm	PSTC-101
Shear Adhesion	>24 hrs @ 2.2 psi	>24 hrs @ 15.2 kPa	PSTC-107
Tensile Strength	16 lb/in	72.3 N/25 mm	PSTC-131
Elongation	5%	5%	PSTC-131
Service Temperature	-40° to 250°F	-40° to 121°C	

Application Ideas

- Applies easily to both fibrous and sheet metal ducts

Classifications

- UL723 Classified (5/10 Flame/Smoke Rating) [UL file #R10984]
- U.S. Coast Guard Approved (CGA #164.112/63/0)

3M™ Venture Tape™ Aluminum Foil Tape 1521CW

Storage

Store in a clean, dry place. Temperature of 40-80°F (4-26°C) and 40 to 50% relative humidity are recommended.

Shelf Life

To obtain best performance, use this product within 12 months from date of manufacture

Technical Information

The technical information, recommendations and other statements contained in this document are based upon tests or experience that 3M believes are reliable, but the accuracy or completeness of such information is not guaranteed.

Product Use

Many factors beyond 3M's control and uniquely within user's knowledge and control can affect the use and performance of a 3M product in a particular application. Given the variety of factors that can affect the use and performance of a 3M product, user is solely responsible for evaluating the 3M product and determining whether it is fit for a particular purpose and suitable for user's method of application.

Warranty, Limited Remedy, and Disclaimer

Unless an additional warranty is specifically stated on the applicable 3M product packaging or product literature, 3M warrants that each 3M product meets the applicable 3M product specification at the time 3M ships the product. 3M MAKES NO OTHER WARRANTIES OR CONDITIONS, EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, ANY IMPLIED WARRANTY OR CONDITION OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE OR ANY IMPLIED WARRANTY OR CONDITION ARISING OUT OF A COURSE OF DEALING, CUSTOM OR USAGE OF TRADE. If the 3M product does not conform to this warranty, then the sole and exclusive remedy is, at 3M's option, replacement of the 3M product or refund of the purchase price.

Limitation of Liability

Except where prohibited by law, 3M will not be liable for any loss or damage arising from the 3M product, whether direct, indirect, special, incidental or consequential, regardless of the legal theory asserted, including warranty, contract, negligence or strict liability.

ISO 9001

This Industrial Adhesives and Tapes Division product was manufactured under a 3M quality system registered to ISO 9001 standards.

Combination valve

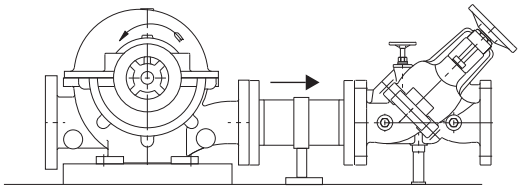
TM 04 7386 2010

Fig. 1 Combination valve

General information

A combination valve fitted between the discharge pipe and the discharge flange of a Grundfos pump gives the following advantages:

- The combination valve combines three valves in one: shut-off valve, balancing valve and check valve.
- The combination valve provides the feature of changing the flange orientation to allow 90 ° pipe connection.
- The combination valve makes it possible to reduce the overall system pressure drop since fewer individual components are needed when installing a pump.
- The combination valve is easy to dismantle and service. Internal parts, such as the disc can be easily removed and/or replaced.
- The combination valve has a built-in bypass valve allowing for drainage of water upstream of the check valve. (See Fig 3. and Fig 4.)
  The bypass valve MUST be CLOSED at all times in normal operation.
  The bypass valve should ONLY be used by authorized personel to drain water from the piping above.



Combination valve range

Combination valves are available with ANSI 125 flanges and ANSI 250 flanges, see technical data below, and a variety of sizes ranging from 2 inches to 14 inches suction and discharge ports, see dimensional table.

Suction diffuser

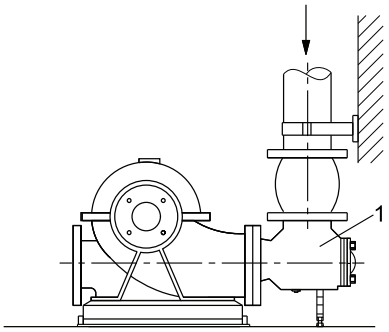
TM04 7049 1510

Fig. 1 Suction diffuser

General information

A suction diffuser fitted between the suction pipe and the suction flange of a Grundfos pump gives the following advantages:

- The suction diffuser provides and ensures a uniform flow pattern to the suction side of the pump. This ensures a stable NPSH.
- The suction diffuser makes it possible to install the pump in a very narrow spacing as no long bends are necessary.
  The suction diffuser may even save floor space - and thus money.
- The suction diffuser incorporates a cylindrical strainer preventing impurities from entering the pump.
- The suction diffuser comes with a disposable, fine mesh, stainless steel start-up screen for capture and removal of foreign particulates in system piping.
- The suction diffuser has an adjustable support for mounting.
- The suction diffuser is easy to dismantle and service. Internal parts such as strainer can be easily removed, cleaned and/or replaced.



Suction diffuser range

Suction diffusers are available in ANSI 125 flanges and ANSI 250 flanges, see technical data below, and a variety of sizes ranging from 1.5 x 2 inches to 12 x 12 inches suction and discharge ports, see dimensional table.

Technical data

	ANSI 125	ANSI 250
Pumped liquid	Water	Water
Max. pressure	175 psi	250 psi
Max. liquid temperature	150 °F	248 °F
Test pressure	265 psi	426 psi

NOTE: Use part no. to order the suction diffuser.
250# flanges are available upon request with 14 weeks delivery.

Pressure drop

In operation the suction diffuser causes a minor pressure drop.

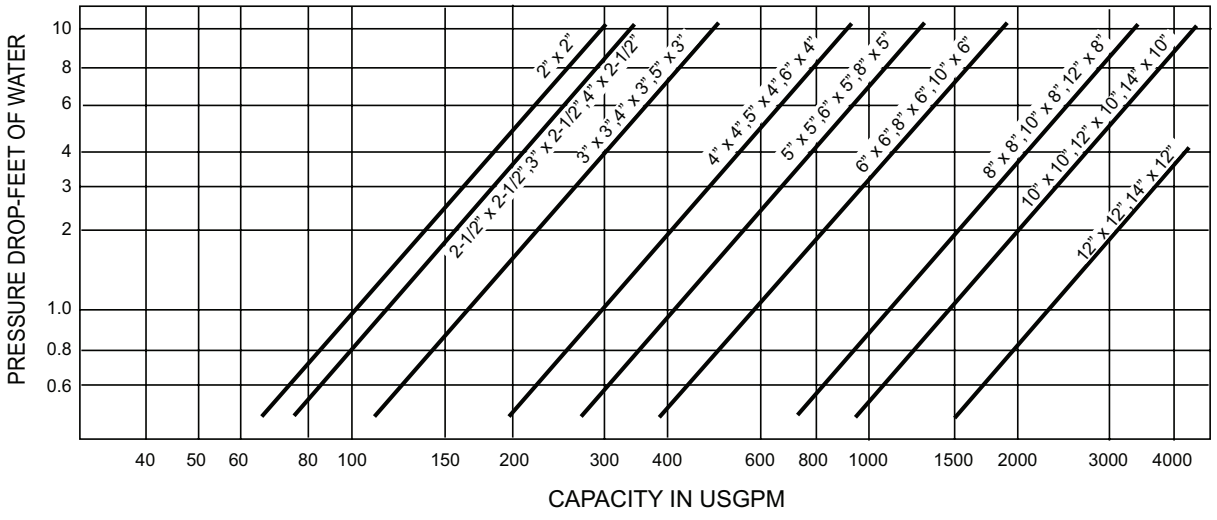

Fig. 5 Pressure drop graph for suction diffusers.

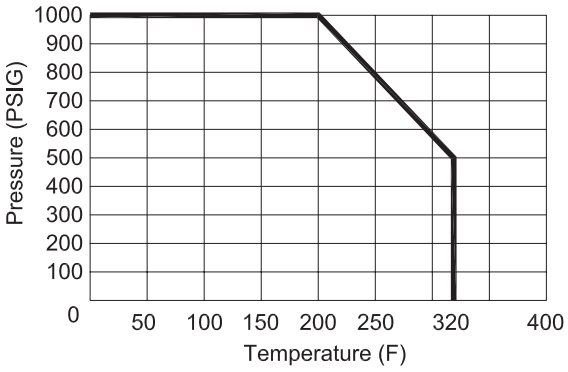
Figure XPTT
GAUGES & THERMOMETERS

FNW™

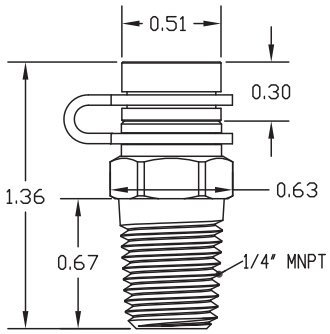
LOW LEAD COMPLIANT PRESSURE/TEMPERATURE TEST PLUG

The figure XPTT lead free brass pressure/temperature test plugs facilitate quick pressure and temperature readings at recommended test points without disturbing the process. They are widely used in the HVAC industry.

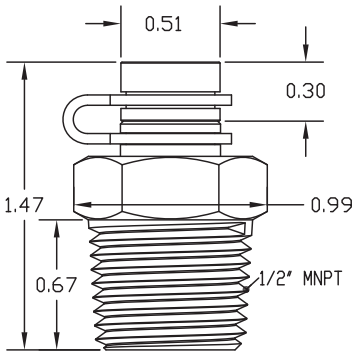
Features:



- 1,000 PSI Maximum Operating Pressure
- 1/4" or 1/2" MNPT End Process Connection
- Lead Free Brass Body
- Complies with Federal Lead-Free Law (Sec. 1417)
- EPDM Diaphragm/Core
- Plastic Cap Retainer
- 320°F (160°C) Process Temperature Limit



Low Lead Compliant: Referring to laws defining "Lead Free" as wetted surface of pipe, fittings and fixtures in potable water systems that have a weighted average lead content ≤ 0.25% per the Safe Drinking Water Act (Sec. 1417) amended 1-4-2011 as well as other state regulations.



LOW LEAD COMPLIANT

Suction diffuser- IOM

Installation

1. Install suction diffuser in piping with proper flow direction as indicated on diffuser.
2. Provide appropriate clearance in back of diffuser for removal of strainer (Fig. 2, Po no. 3).
3. Use support foot to adjust the height (Fig. 2, Po no. 7).
4. Flush system piping and operate pumps for initial circulation of system.
5. After initial system circulation is complete, remove and discard the temporary mesh screen (See Fig. 2, Po no. 6). Do not discard the permanent screen.

Installation

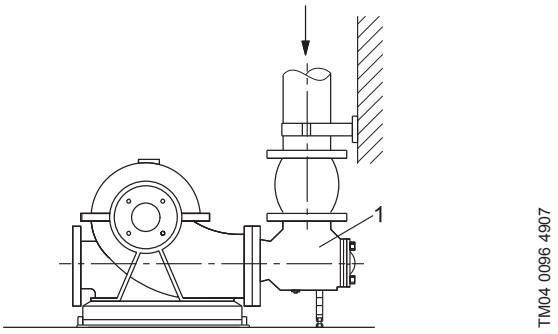

Fig. 1 Pump installation with suction diffuser (1)

Caution ***When using inertia base, the suction diffuser must also be footed on the base along with the pump.***

Operation and Maintenance

Periodically (dependent on system conditions) open the suction diffuser and clean debris from strainer basket. Inspect strainer for holes. Replace if damaged.

7	Bolt, nut (support foot)

Combination valve-IOM

Installation

Install combination valve on discharge side of the pump with proper flow direction as indicated on the valve.

It is not recommended to install the valve directly to the pump. Use a spool piece between the pump and the valve.

Allow enough room around the valve for easy access for removal and repair.

Warning

The bypass valve MUST be CLOSED at all times in normal operation. (See Fig. 4 and Fig. 5.)

Installation

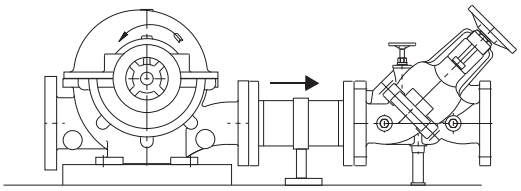

Fig. 1 Pump installation with combination valve

Operation and Maintenance

We suggest you slightly open the valve before starting the pump. Gradually adjust the stem until the proper flow rate is reached.

Procedure for Angle type conversion

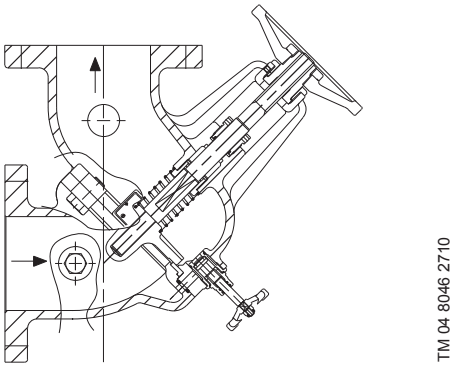

Fig. 2 Angle type combination valve 2" to 8"

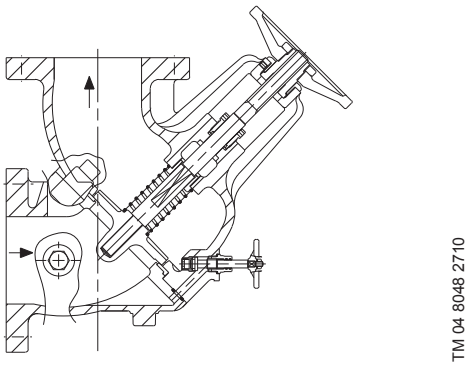

Fig. 3 Angle type combination valve 10" to 14"

Procedure

1. Place valve on an even and clean surface.
2. Open the handle (hand wheel) slightly.
3. Turn the handle so that the handle is facing the ground.
4. Remove bolts that connect upper and lower body. (Remember the original location of the bolts)
5. Rotate the lower body slowly to 180 degree.
6. Tighten the bolts in diagonal order.
7. Make sure all parts are in correct position. (See Fig 4. and Fig 5).

Caution ***Conversion portion should be done by experienced worker.***

Disc, o-ring, spring, and seat should be handled very carefully and should be in right position before installation.

Electrical Metallic Tubing (EMT) and True Color™ EMT

Columbia-MBF™
A PART OF atkore INTERNATIONAL

E-Z Pull™ EMT

- Hot galvanized steel using patented inline Flo-Coat® process for long lasting exterior protection
- E-Z Pull interior coating provides a smooth raceway for fast, easier wire-pulling
- Excellent mechanical protection for conductors
- Ductility for faster and easier bending
- Optimal EMI shielding characteristics
- Listed to Underwriters Laboratories Safety Standard UL 797
- Manufactured in accordance with ANSI C80.3
- Available in sizes 1/2 (16) - 4 (103)

Quality Electrical Metallic Tubing

True Color™ EMT

- All the benefits of E-Z Pull EMT
- Instant identification of multiple circuits
- Fire Alarm® Red EMT
- Healthcare Green EMT
- Data Com Blue EMT
- Available in 8 colors
- Available in sizes 1/2 (16) - 4 (103)

Identify Important Circuits Instantly!

True Color™ Applications

Black EMT
- Blends in dark colored areas

Fire Alarm® EMT
- Emergency circuits
- Fire alarm and Security systems

Orange EMT
- Construction/research areas
- Fiber optic systems
- Auto repair/maintenance

Yellow EMT
- High voltage wiring
- Caution areas
- Special equipment

Green EMT
- Hospital and healthcare areas
- Nurse call stations
- Critical circuits

Blue EMT
- Low voltage wiring
- Data com/video
- Network security

Purple EMT
- Specialty wiring systems
- Security systems

White EMT
- Blends in light colored areas

Silver EMT
- Standard Use
- Contemporary architecture

Electrical Metallic Tubing (EMT) and True Color™ EMT

Columbia-MBF™
A PART OF atkore INTERNATIONAL

FEATURES & SPECIFICATIONS

Manufactured for Long Life

Columbia-MBF® EMT is precision manufactured from high grade mild strip steel for exceptional durability and long-lasting life. Columbia-MBF EMT is hot galvanized using a patented inline Flo-Coat™ process. This process combines zinc, a conversion coating, and a clear organic polymer topcoat to form a triple layer of protection against corrosion and abrasion.

E-Z Pull™ EMT combines strength with ductility, providing easy bending, cutting and joining while resisting flattening, kinking and splitting. Available in sizes 1/2 (16) - 4 (103).

Coatings

Columbia-MBF's EMT (Electrical Metallic Tubing) has a special low friction ID coating called E-Z Pull that greatly improves the slip properties between conduit and wire. With E-Z Pull EMT, wire pulls through the EMT smoothly and easily, making installation easier and faster.

EMI Shielding

Columbia-MBF EMT is very effective in reducing electromagnetic field levels for encased power distribution circuits, shielding computers and other sensitive electronic equipment from the effects of electromagnetic interference.

For more information on EMT shielding, visit www.columbia-mbf.ca to obtain the **GEMI** (**G**rounding and **E**lectro-**M**agnetic **I**nterference) software analysis program.

Codes & Standards Compliance

Columbia-MBF EMT is Certified to Canadian Standards Association C22.2 No.83.1. As a metal raceway, EMT functions as an equipment bonding conductor when installed in compliance with the Canadian Electrical Code (CEC), including Section 10 *Grounding and Bonding* and Section 12-1400 *Electrical Metallic Tubing*. Documentation is available in the GEMI (Grounding and Electro-Magnetic Interference) analysis software and related research studies found at the www.columbia-mbf.ca website.

Installation of EMT shall be in accordance with the Canadian Electrical Code and the CSA Certification information.

Specification Data

To specify Columbia-MBF EMT, include the following: Electrical Metallic Tubing shall be equal to that manufactured by Columbia-MBF Inc. EMT shall be hot galvanized steel O.D. with an organic corrosion resistant I.D. coating, and shall be CSA Certified to Standard C22.2 No. 83.1 and manufactured in accordance with ANSI C80.3.

Cat. No.	Description
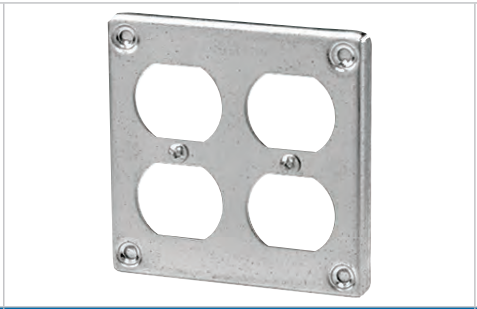
3/8 in. Raised Surface Covers (4.6 cu. in.) **Device Mount**	
BC8361	One toggle switch
BC8362	For 2-5/8 in. diameter 30 / 50 A single receptacle
BC8363	For 1-13/32 in. diameter 15 A single receptacle
BC8364	For 1-19/32 in. diameter 20 / 30 A single locking receptacle
BC8365	One duplex receptacle
BC8366	For 2-9/64 in. diameter 30 A single receptacle
BC8367	Two toggle switches



Complete with device mounting screws

CI4090	4	4,17	4,62	—	4

Utilisés en emplacements secs, ces connecteurs conviennent également aux câbles ACWU90 de diamètres équivalents. Un connecteur et un contre-écrou non ferreux doivent servir au raccord de câbles à monoconducteur lorsque le courant nominal est de plus de 200 ampères.

REMARQUE: Les connecteurs de grosseur nominale de 3/8 po se posent sur une débouchure de 1/2 po.

Dans l'industrie électrique, les améliorations techniques sont chose de tous les jours. Il en va donc de soi que les fabricants de câbles modifient leurs produits de temps à autre. Pour cette raison, il est fortement recommandé de vérifier la grosseur des câbles auprès du fabricant avant de faire le choix d'un connecteur.

Voir le guide technique pour les dimensions (D38-D39).

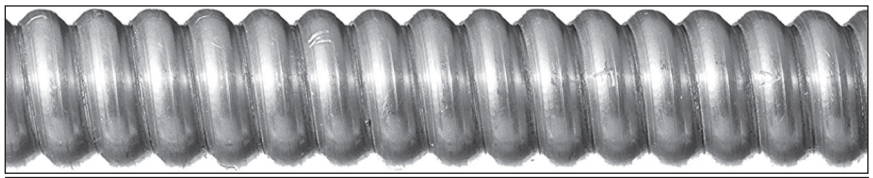
† CSA Certified.



Type ABR
This non-jacketed flexible aluminum conduit has many universal wiring applications. It is often referred to as "Greenfield" or "Reduced Wall Flex".

Construction
Type ABR is formed using a high strength aluminum alloy strip. The result is a conduit with similar characteristics to those of type BR steel but at about 1/3 the weight.

Applications
General Use:
In accordance with CEC Rule 12-1002 (1) the flexible metal conduit is permitted in or on buildings of either combustible or non-combustible constructions.
Restriction and Exception:
CEC Rule 12-1004 (a) states:"12 (3/8) trade size flexible metal conduit shall be permitted to be used for runs of not more than 1.5 m (5 ft) for the connection of equipment." and CEC Rule 12-1004 (b) states:"12 (3/8) trade size liquidtight flexible conduit may be used as permitted by this code."
Securements with straps:
CEC Rule 12-1010 (3) states: "When flexible metal conduit is installed, it shall be secured at intervals not exceeding 1.5 m (5 ft) and within 300 mm (12 in.) on each side of every outlet box or fitting except where flexible metal conduit is fished and except for lengths of not over 900 mm (3 ft) at terminals where flexibility is necessary."
Conductor fill:
CEC Rule 12-1014 defines the maximum number of conductor, the CEC Tables 6 provides the maximum number of conductors of one size in trade sizes of conduit, CEC Table 8 provides the maximum allowable per cent conduit fill, and CEC Table 9 provides the cross-sectional areas of conduit.
Applications: refer to Type BR, p. 140.

Listing / Certification
Listed. (sizes 3/8 through 3 in.). Conforms to UL Standard ANSI/UL-1 for Flexible Metal Conduit.
Certified. (**3/8 inch size only**). Conforms to CSA 22.2 No. 56 for use per CEC C22.1 Section 12-1300.
Meets Federal Specification WW-C-566c Type II

Type ABRH

Trade Size	CSA Metric Desig.	T&B Type	Internal Diameter (in.) Min.	Internal Diameter (in.) Max.	Outer Diameter (in.) Min.	Outer Diameter (in.) Max.	Inside Bend Radius	WT. Lbs. per 100 Ft.	Coil Lenght Mtr.

TYPE - ABRH
This non-jacketed flexible aluminum conduit has many universal wiring applications.

Construction
Type ABRH is formed from a heavy gauge aluminum strip. Its profile and helical shape allow it to withstand substantial impact and crushing forces.

Applications
This conduit is intended as a metal raceway for wires and cable where CSA Certification is required. Suitable for use with connectors intended for "FMC (Flexible Metal Conduit).

Certified
File # LL 18858 Conforms to CSA 22.2 No. 56 for use per the Canadian Electrical Code C22.1 Section 12-1300.

Rigid PVC Conduit Pipe & Fittings

A system for residential, industrial, commercial and institutional applications.

Product Description & Applications

Royal Building Products® Electrical Solutions manufactures a complete line of Rigid PVC Conduit pipe and fittings for electrical applications. Our products are designed to reduce labour and maintenance costs, while offering superior performance.

Products are certified by the Canadian Standards Association (CSA) and Underwriters Laboratories (UL) for use in above and below ground applications. Our Rigid PVC conduit pipe and fittings are available in 12 to 150mm (½- to 6-inch) diameters and 3- or 6-metre (10- or 20-foot) lengths.

Standards and Codes

Royal Electrical Solutions Rigid PVC Conduit pipe and fittings are certified to CSA Standards as noted below. Our Rigid PVC conduit pipe and fittings shall be installed according to the Canadian Electrical Code (CEC) Part I, Rules 12-1100 - 12-1122 and the National Electrical Code (NEC) Article 352.

Pipe	Fittings
C22.2 No. 211.2	C22.2 No. 18.2, 85 (Boxes) No. 40 (Electrical Encl.) No. 42.1 (Covers) No. 85 (Fittings)
UL 651	UL 514C (Boxes) UL 50 (Electrical Encl.) UL 514D (Covers) UL 651 (Fittings)
Conforms to NEMA TC2	

Features and Benefits

Saves Labour

Rigid PVC Conduit pipe and fittings are easy to install, cut and join.

Easy Wire Pulls

The conduit's smooth interior surface reduces friction and prevents damage to wires when pulling wire and conductors for long runs and even through 90° bends.

Lightweight Materials

Rigid PVC Conduit is easier to move and handle because it is approximately one-fifth the weight of steel and half the weight of aluminum.

Approximate Weight Comparison

Size mm (in)	PVC lb/100ft (kg/m)	Aluminum lb/100ft (kg/m)	Steel lb/100ft (kg/m)
12 (½)	16.1 (0.24)	27 (0.40)	79 (1.20)
19 (¾)	21.5 (0.32)	37 (0.55)	105 (1.55)
25 (1)	31.9 (0.47)	53 (0.80)	153 (2.30)
32 (1¼)	43.8 (0.65)	70 (1.05)	201 (3.00)
38 (1½)	52.3 (0.78)	86 (1.30)	249 (3.70)
50 (2)	70.3 (1.05)	116 (1.75)	334 (5.00)
63 (2½)	112.0 (1.61)	183 (2.75)	527 (7.85)
75 (3)	146.7 (2.18)	239 (3.55)	690 (10.25)
90 (3½)	176.4 (2.63)	288 (4.30)	831 (12.40)
100 (4)	208.9 (3.11)	340 (5.10)	982 (14.60)
125 (5)	283.4 (4.22)	465 (6.90)	1,344 (20.40)
150 (6)	368.0 (5.48)	613 (9.10)	1,771 (26.35)

Simplifies Direct Burial

Royal Electrical Solutions Rigid PVC Conduit does not require additional protection for direct burial installations according to the Canadian Electrical Code (CEC) and the National Electrical Code (NEC). Normal construction practices should be followed for trenching and backfill operations.

Non-Conductive

Rigid PVC Conduit is non-conductive.

Long Life

Royal Rigid PVC Conduit and fittings resist acids, alkalis, salt solutions and most other chemicals. (Refer to the Royal Chemical Resistance Guide for detailed information.) There is no risk of corrosion when exposed to naturally corrosive soil conditions, electrochemical or galvanic environments. Royal's Rigid PVC Conduit has achieved sunlight resistance as per the requirements of the Electrical Code.

FT-4 Rating

Rigid PVC Conduit pipe has an FT-4 Rating and can be used in non-combustible construction as per Part 3 of the National Building Code of Canada (NBC).

Installation Guidelines

Cutting

Royal Rigid PVC Conduit can easily be cut with a hacksaw, a fine-toothed handsaw or PVC conduit cutters. For conduit with more than a 50mm (2-inch) diameter, use a mitre box or saw guide to ensure a square cut. Deburr the end using a knife or file.

Bending

It may be necessary to create bends in the field by heating and deforming Rigid PVC Conduit. To accomplish this, the following guidelines should be followed:

• For heating the Rigid PVC Conduit, use a heat gun or some other flameless heat source. Do not use an open flame to heat the conduit. Rigid PVC Conduit must be heated to approximately 127°C (260°F) in order to bend without kinking.

• Heat a length of conduit equal to approximately 10 times the nominal diameter.

• Once the Rigid PVC Conduit has been adequately heated, bend it to the required angle plus 3 extra degrees. The additional angle will accommodate the "spring back" which will occur during cooling.

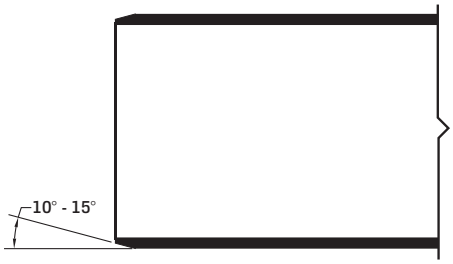
• After bending of the conduit is completed, immediately cool the bend using water or cold air.

• According to the Canadian Electrical Code (CEC) and the National Electrical Code (NEC), the minimum bending radius for rigid conduit is as shown in the table below.

Nominal Size mm (in)	Min. Radius to Centre of Conduit or Tubing mm (in)
16 (½)	102 (4.016)
21 (¾)	114 (4.489)
27 (1)	146 (5.748)
35 (1¼)	184 (7.244)
41 (1½)	210 (8.268)
53 (2)	241 (9.488)
63 (2½)	267 (10.512)
78 (3)	330 (12.992)
91 (3½)	381 (14.606)
103 (4)	406 (15.984)
129 (5)	610 (24.016)
155 (6)	762 (30.000)

Procedure for Solvent Welding Joints

• Use solvent cement and primer prior to expiration date marked on container.
• Above 0° C ambient temperature, joints may be assembled without the use of primer, provided adequate penetration and softening of the pipe/fitting surface can be achieved with solvent cement alone.



1. Assemble materials for the job, including correct solvent cement, primer and correctly sized applicator.

2. Cut pipe as square as possible using a hand saw and miter box or mechanical saw. Do not use a diagonal cut, as it reduces the bonding area in the joint.

3. If plastic tubing cutters are used, care must be taken to remove any raised bead at the end of the pipe, caused by cutting. A file or reamer may be used to remove the bead.

4. Use a knife, file or reamer to remove burrs from the inside and outside of the pipe end, as these will hinder the integrity of the joint. All sharp edges should be removed from the inside and outside edges of the pipe to prevent the pipe from pushing the solvent cement into the fitting socket, thereby causing a weak spot to form. The pipe end should be chamfered, as shown below.

Chamfered Pipe

Procedure for Solvent Welding Joints Continued

5. All dirt, grease and moisture should be removed from the pipe and socket by thoroughly wiping with a clean, dry cloth.

6. Dry fit pipe and fitting joints prior to cementing. For proper interference fit, the pipe should go easily into the socket approximately ⅓ to ⅔ of the socket depth. If this is not the case, other pipe or fittings should be used.

7. The applicator should be sized according to the size of pipe and fittings being joined. The brush width of the applicator should be equal to approximately ½ of the pipe diameter.

8. Primer is used to penetrate and soften the surfaces so that they will fuse together under a wide variety of conditions. The penetration or softening can be checked by dragging the edge of a knife or sharp object over the coated surface. If a few thousandths of an inch of the primed surface can be scratched or scraped away, proper penetration has occurred. Varying weather conditions affect priming and cementing action and may require more time or repeated applications to either or both surfaces.

9. If using primer, use the correct applicator size (see #7) and aggressively work the primer into the socket, keeping the surface and applicator wet until the surface has softened, re-dipping the applicator as required. When the surface is primed, remove any puddles of primer from the socket.

10. Aggressively work the primer on to the end of the pipe, to a point ½" beyond the depth of the socket.

11. Perform a second application of primer in the socket.

12. While the surfaces are still wet, the appropriate solvent cement should be applied.

13. Using the correct applicator size, aggressively work a full, even layer of cement onto the pipe end to a point equal to the depth of the socket. Do not brush out to a thin paint type layer, as this will dry within a few seconds.

14. Aggressively work a medium layer of cement into the fitting socket; avoid puddling cement in the socket. On the pipe end, do not coat beyond the socket depth or allow cement to run down into the pipe beyond the socket.

15. Apply a second full, even layer of cement on the pipe.

16. Immediately, while the cement is still wet, assemble the joint. Use enough force to ensure that the pipe is fully inserted into the socket. Twist the pipe a ¼ turn as it is being inserted.

17. Hold the joint together for approximately 30 seconds to avoid push out.

18. After assembly, inspect the joint to ensure that there is a ring or bead of cement completely around the juncture of the pipe and socket. If there are voids in this ring, sufficient cement was not applied and the joint may be defective.

19. Remove the excess cement from the pipe and socket (including the ring or bead) using a cloth. Avoid disturbing or moving the joint.

20. Handle newly cemented joints with care until initial set has taken place. Follow set and cure times before handling or testing the system.

Pipe Dimensions

Nominal Size mm (in)	Avg. Outside Diameter mm (in)	Avg. Inside Diameter mm (in)	Avg. Wall Thickness mm (in)	Approx. Weight lb/100ft (kg/m)
12 (½)	21 (0.840)	15 (0.608)	3 (0.116)	16.1 (0.24)
19 (¾)	27 (1.050)	21 (0.810)	3 (0.120)	21.5 (0.32)
25 (1)	33 (1.315)	26 (1.033)	4 (0.141)	31.9 (0.47)
32 (1¼)	42 (1.660)	35 (1.362)	4 (0.149)	43.8 (0.65)

125 (5)	141 (5.565)	127 (5.017)	7 (0.274)	283.4 (4.22)
150 (6)	168 (6.625)	153 (6.031)	8 (0.297)	368.0 (5.48)

Specification

All wiring shall be installed in Royal Electrical Solutions Rigid PVC Conduit and secured with proper fittings. All conduit and fittings shall be manufactured by Royal Building Products, Pipe & Fittings Solutions. All outlets, pull boxes and junction points shall be Royal products.

Exposed conduit shall be securely attached and supported with straps that are installed at the recommended spacing specified in CEC Section 12-1114. The straps must allow for linear expansion and contraction of the conduit due to temperature change. If the variance in temperature exceeds 14°C (25°F), expansion joints shall be installed according to the manufacturer's recommendations.

If Rigid PVC Conduit is embedded in concrete or direct buried, support straps are not required.

Solvent Cementing

All connections should be made using and applying Royal Electrical Solutions solvent cement.

Set Times

Average Initial Set Times			
Temperature Range	Pipe Sizes ½" to 1¼"	Pipe Sizes 1½" to 2"	Pipe Sizes 2½" to 6"
15°C to 40°C	2 min.	5 min.	30 min.
5°C to 15°C	5 min.	10 min.	2 hrs.
-16°C to 5°C	10 min.	15 min.	12 hrs.

Joint Cure Schedule

Average Joint Cure Times			
Temperature Range During Assembly & Cure Periods	Pipe Sizes ½" to 1¼"	Pipe Sizes 1½" to 2"	Pipe Sizes 2½" to 6"
15°C to 40°C	2 min.	5 min.	30 min.
5°C to 15°C	5 min.	10 min.	2 hrs.
-16°C to 5°C	10 min.	15 min.	12 hrs.

In damp or humid weather allow 50% more cure time.

Estimated Solvent Cement Requirements

Average Number of Joints per Litre of Solvent Cement									
Pipe/Fitting Diameter	½"	¾"	1"	1½"	2"	2½"	3"	4"	6"
Number of Joints	300	200	125	90	60	40	40	30	10

Estimated Primer Requirements

Average Number of Joints per Litre of Primer									
Pipe/Fitting Diameter	½"	¾"	1"	1½"	2"	2½"	3"	4"	6"
Number of Joints	600	400	250	180	120	80	80	60	20

Solvent Cementing in Cold Weather:

- Store pipe and fittings in a heated area. Prefabricate as much of the system as possible in a heated area.
- When not in use, store sealed solvent cement and primer between 5°C and 21°C. Do not use open flame or electric heaters to warm cements and primers.
- Take care to remove moisture, ice and snow from the mating surfaces.

Solvent Cementing in Hot Weather:

- At the time of assembly, the surface temperature of the mating surfaces should not exceed 45°C. Shade or shelter the joint surfaces from direct sunlight for at least 1 hour prior to joining and during the joining process. If necessary, swab the mating surfaces with clean, wet rags to reduce the surface temperature (thoroughly dry surfaces before applying primer or cement).
- Make joints during the cooler early morning hours.
- Apply cement quickly and join pipe to fitting as quickly as possible after applying the cement.
- Keep solvent cement container closed or covered when not in use, to minimize solvent loss.

Solvent Cementing in Wet Conditions:

- Mating surfaces must be dry when the joint is made.
- Work under a cover or canopy to keep rain off pipe and fittings.
- Work quickly after drying the pipe and fitting to avoid condensation.
- Allow a longer cure time before the system is tested or used.

Storage and Handling of Solvent Cement and Primer:

- Solvent cement and primer contain highly flammable solvents. Follow all specific safety precautions provided on container label and Material Safety Data Sheet.
- Keep primer and solvent cement away from heat, sparks and open flame.
- Keep containers tightly closed except when in use.
- Ensure proper ventilation of work area and avoid inhaling solvent vapours.
- Where the possibility of splashing exists, wear proper eye protection or a face shield.
- Avoid contact with skin.

Support Straps

Rigid PVC conduit must be supported with straps when installed in above ground applications. These straps should be installed snugly, while allowing linear movement of the conduit. See the table below for recommended maximum spacing of support straps.

Maximum Recommended Spacing of Support Straps		
Nominal Size mm (in)	CEC Recommended Spacing ft (m)	NEC Recommended Spacing ft (m)
16 (½)	2½ (0.75)	3 (0.91)
21 (¾)	2½ (0.75)	3 (0.91)
27 (1)	2½ (0.75)	3 (0.91)
35 (1¼)	4 (1.20)	5 (1.50)
41 (1½)	4 (1.20)	5 (1.50)
53 (2)	6 (1.80)	5 (1.50)
63 (2½)	6 (1.80)	3 - 6 (1.80)
78 (3)-129 (5)	7 (2.10)	3½ - 5 (2.10)
155 (6)	8 (2.50)	8 (2.50)

Storing Conduit Pipe and Fittings

Store Rigid PVC conduit pipe and fittings at the same temperature. Otherwise they may expand and contract at different rates and become incompatible.

Maximum Operating Temperatures

According to the Canadian Electrical Code (CEC), Rigid PVC conduit is intended for use at a continuous operating temperature of 75°C (167°F). For US applications, our Rigid PVC conduit is rated for use with 90°C wiring, according to the requirements of the NEC.

Ambient Temperatures

Royal Electrical Solutions Rigid PVC Conduit and fittings can be installed in locations with an ambient temperature not exceeding 50°C (122°F).

Expansion Joints

According to the CEC, if the amount of expansion expected due to temperature variance during and after construction is more than 45mm, expansion joints must be used.

Expected Expansion

The coefficient of linear expansion for Rigid PVC conduit is as follows:

3×10^{-5} in (expansion/contraction) / in (pipe length) /°F (change in temperature),

5.4×10^{-5} mm (expansion/contraction)/mm (pipe length)/°C (change in temperature)

Note:

The following chart shows the amount of expansion expected with various pipe lengths/temperature changes. If the Rigid PVC Conduit is installed in an exposed location, 17°C (30°F) should be added to the amount of temperature change (ΔT) due to the effects of radiant heat.

Expansion/Contraction of PVC (mm)

Length of Pipe Run (m)

ΔT (°C)	2	4	6	8	10	12	14	16	18	20

35	0.06	0.13	0.19	0.25	0.32	0.38	0.44	0.50	0.57	0.63
40	0.07	0.14	0.22	0.29	0.36	0.43	0.50	0.58	0.65	0.72
45	0.08	0.16	0.24	0.32	0.41	0.49	0.57	0.65	0.73	0.81
50	0.09	0.18	0.27	0.36	0.45	0.54	0.63	0.72	0.81	0.90

Required Number of Expansion Joints

The following table shows the amount of travel that is available with each trade size of Royal Electrical Solutions Rigid PVC conduit expansion joints:

Part Number	Description in	Travel Allowance mm (in)
REJ10	½" Expansion Joint	102 (4)
REJ15	¾" Expansion Joint	102 (4)
REJ20	1" Expansion Joint	102 (4)
REJ25	1¼" Expansion Joint	102 (4)
REJ30	1½" Expansion Joint	102 (4)
REJ35	2" Expansion Joint	102 (4)
REJ40	2½" Expansion Joint	102 (4)
REJ45	3" Expansion Joint	204 (8)
REJ50	3½" Expansion Joint	204 (8)
REJ55	4" Expansion Joint	204 (8)
REJ60	5" Expansion Joint	204 (8)
REJ65	6" Expansion Joint	204 (8)

The required number of expansion joints can be calculated using the following formula:

$$\#\ \text{Expansion Joints Required} = \frac{\text{Total Expected Amount of Expansion (in)}}{\text{Expansion Joint Travel Allowance (in)}}$$

$$\#\ \text{Expansion Joints Required} = \frac{\text{Total Expected Amount of Expansion (mm)}}{\text{Expansion Joint Travel Allowance (mm)}}$$

The number of expansion joints calculated above should be rounded up to the nearest whole number.

Setting the Piston Opening

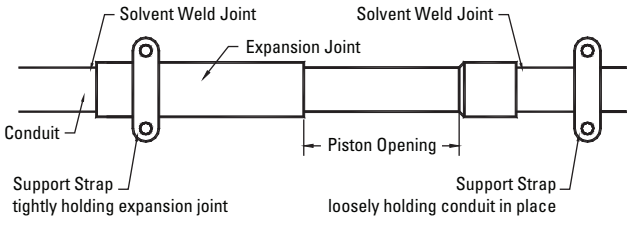
Expansion joints must be installed such that they allow for both expansion and contraction of the conduit. The piston of the expansion joint must be set at the correct position to allow for this linear movement. To determine the correct position for the piston at the time and temperature of installation, the following formula should be used:

$$\text{Piston Setting (in)} = \frac{\text{(Max. Temp. (°F) – Install. Temp. (°F))}}{\text{Total Expected Temperature Change (°F)}} \times \left[\text{Expansion Joint Expansion Allow. (in)}\right]$$

$$\text{Piston Setting (mm)} = \frac{\text{(Max. Temp. (°C) – Install. Temp. (°C))}}{\text{Total Expected Temperature Change (°C)}} \times \left[\text{Expansion Joint Expansion Allow. (mm)}\right]$$

Installation Guidelines

• Securely fasten the expansion joint barrel so that it does not shift. Loosely connect the conduit so that it is free to move.



• To function properly, expansion joints should be installed near a fixed point.

• It is better to use more expansion joints than not enough, since problems are difficult to correct after conductors and wires have been pulled through the conduit.

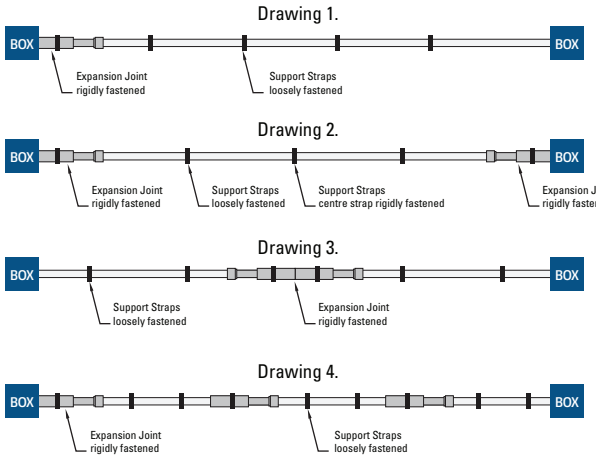
• Ensure that the barrel and piston are aligned and level.

• For vertical installations of expansion joints, install with the piston at the bottom to prevent dirt and water from getting inside the joint and causing it to malfunction.

Installation Example

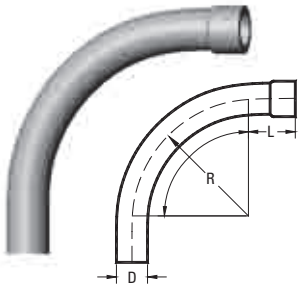
If one expansion joint is required:
Securely fasten the barrel of the expansion joint close to one of the boxes. Support the conduit with straps, but allow free movement of the conduit for expansion and contraction. (See Drawing 1)

If two expansion joints are required:
There are two options available:

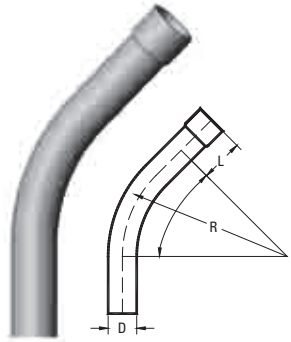


1. Firmly fasten one expansion joint near each end of the run and firmly fasten the conduit at the centre. Support the rest of the conduit with straps allowing for movement of the conduit. (See Drawing 2)

2. Firmly fasten the expansion joints back-to-back at the centre of the run. The conduit should be supported with straps to allow free movements as it expands and contracts. (See Drawing 3)



If three or more expansion joints are required:
Evenly space the expansion joints along the run of Rigid PVC conduit. Tightly fasten each expansion joint and support the conduit with straps. Do not restrict the movement of the conduit.



*For information on Maximum Recommended Spacing of Support Straps, see page 4.

Rigid PVC Conduit Pipe & Fittings

A system for residential, industrial, commercial and institutional applications.

Product Description & Applications

Royal Building Products® Electrical Solutions manufactures a complete line of Rigid PVC Conduit pipe and fittings for electrical applications. Our products are designed to reduce labour and maintenance costs, while offering superior performance.

Products are certified by the Canadian Standards Association (CSA) and Underwriters Laboratories (UL) for use in above and below ground applications. Our Rigid PVC conduit pipe and fittings are available in 12 to 150mm (½- to 6-inch) diameters and 3- or 6-metre (10- or 20-foot) lengths.

Standards and Codes

Royal Electrical Solutions Rigid PVC Conduit pipe and fittings are certified to CSA Standards as noted below. Our Rigid PVC conduit pipe and fittings shall be installed according to the Canadian Electrical Code (CEC) Part I, Rules 12-1100 - 12-1122 and the National Electrical Code (NEC) Article 352.

Pipe	Fittings
C22.2 No. 211.2	C22.2 No. 18.2, 85 (Boxes) No. 40 (Electrical Encl.) No. 42.1 (Covers) No. 85 (Fittings)
UL 651	UL 514C (Boxes) UL 50 (Electrical Encl.) UL 514D (Covers) UL 651 (Fittings)
Conforms to NEMA TC2	

Features and Benefits

Saves Labour

Rigid PVC Conduit pipe and fittings are easy to install, cut and join.

Easy Wire Pulls

The conduit's smooth interior surface reduces friction and prevents damage to wires when pulling wire and conductors for long runs and even through 90° bends.

Lightweight Materials

Rigid PVC Conduit is easier to move and handle because it is approximately one-fifth the weight of steel and half the weight of aluminum.

Approximate Weight Comparison

Size mm (in)	PVC lb/100ft (kg/m)	Aluminum lb/100ft (kg/m)	Steel lb/100ft (kg/m)
12 (½)	16.1 (0.24)	27 (0.40)	79 (1.20)
19 (¾)	21.5 (0.32)	37 (0.55)	105 (1.55)
25 (1)	31.9 (0.47)	53 (0.80)	153 (2.30)
32 (1¼)	43.8 (0.65)	70 (1.05)	201 (3.00)
38 (1½)	52.3 (0.78)	86 (1.30)	249 (3.70)
50 (2)	70.3 (1.05)	116 (1.75)	334 (5.00)
63 (2½)	112.0 (1.61)	183 (2.75)	527 (7.85)
75 (3)	146.7 (2.18)	239 (3.55)	690 (10.25)

Simplifies Direct Burial

Royal Electrical Solutions Rigid PVC Conduit does not require additional protection for direct burial installations according to the Canadian Electrical Code (CEC) and the National Electrical Code (NEC). Normal construction practices should be followed for trenching and backfill operations.

Non-Conductive

Rigid PVC Conduit is non-conductive.

Long Life

Royal Rigid PVC Conduit and fittings resist acids, alkalis, salt solutions and most other chemicals. (Refer to the Royal Chemical Resistance Guide for detailed information.) There is no risk of corrosion when exposed to naturally corrosive soil conditions, electrochemical or galvanic environments. Royal's Rigid PVC Conduit has achieved sunlight resistance as per the requirements of the Electrical Code.

FT-4 Rating

Rigid PVC Conduit pipe has an FT-4 Rating and can be used in non-combustible construction as per Part 3 of the National Building Code of Canada (NBC).

Installation Guidelines

Cutting

Royal Rigid PVC Conduit can easily be cut with a hacksaw, a fine-toothed handsaw or PVC conduit cutters. For conduit with more than a 50mm (2-inch) diameter, use a mitre box or saw guide to ensure a square cut. Deburr the end using a knife or file.

Bending

It may be necessary to create bends in the field by heating and deforming Rigid PVC Conduit. To accomplish this, the following guidelines should be followed:

• For heating the Rigid PVC Conduit, use a heat gun or some other flameless heat source. Do not use an open flame to heat the conduit. Rigid PVC Conduit must be heated to approximately 127°C (260°F) in order to bend without kinking.

• Heat a length of conduit equal to approximately 10 times the nominal diameter.

• Once the Rigid PVC Conduit has been adequately heated, bend it to the required angle plus 3 extra degrees. The additional angle will accommodate the "spring back" which will occur during cooling.

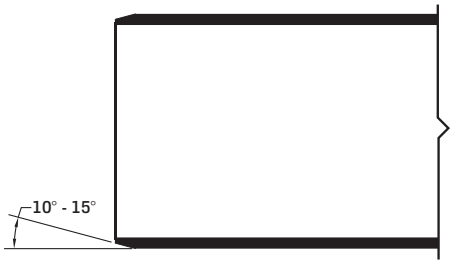
• After bending of the conduit is completed, immediately cool the bend using water or cold air.

• According to the Canadian Electrical Code (CEC) and the National Electrical Code (NEC), the minimum bending radius for rigid conduit is as shown in the table below.

Nominal Size mm (in)	Min. Radius to Centre of Conduit or Tubing mm (in)
16 (½)	102 (4.016)
21 (¾)	114 (4.489)
27 (1)	146 (5.748)
35 (1¼)	184 (7.244)
41 (1½)	210 (8.268)
53 (2)	241 (9.488)
63 (2½)	267 (10.512)
78 (3)	330 (12.992)
91 (3½)	381 (14.606)
103 (4)	406 (15.984)
129 (5)	610 (24.016)
155 (6)	762 (30.000)

Procedure for Solvent Welding Joints

• Use solvent cement and primer prior to expiration date marked on container.
• Above 0° C ambient temperature, joints may be assembled without the use of primer, provided adequate penetration and softening of the pipe/fitting surface can be achieved with solvent cement alone.



1. Assemble materials for the job, including correct solvent cement, primer and correctly sized applicator.

2. Cut pipe as square as possible using a hand saw and miter box or mechanical saw. Do not use a diagonal cut, as it reduces the bonding area in the joint.

3. If plastic tubing cutters are used, care must be taken to remove any raised bead at the end of the pipe, caused by cutting. A file or reamer may be used to remove the bead.

4. Use a knife, file or reamer to remove burrs from the inside and outside of the pipe end, as these will hinder the integrity of the joint. All sharp edges should be removed from the inside and outside edges of the pipe to prevent the pipe from pushing the solvent cement into the fitting socket, thereby causing a weak spot to form. The pipe end should be chamfered, as shown below.

Chamfered Pipe

Procedure for Solvent Welding Joints Continued

5. All dirt, grease and moisture should be removed from the pipe and socket by thoroughly wiping with a clean, dry cloth.

6. Dry fit pipe and fitting joints prior to cementing. For proper interference fit, the pipe should go easily into the socket approximately ⅓ to ⅔ of the socket depth. If this is not the case, other pipe or fittings should be used.

7. The applicator should be sized according to the size of pipe and fittings being joined. The brush width of the applicator should be equal to approximately ½ of the pipe diameter.

8. Primer is used to penetrate and soften the surfaces so that they will fuse together under a wide variety of conditions. The penetration or softening can be checked by dragging the edge of a knife or sharp object over the coated surface. If a few thousandths of an inch of the primed surface can be scratched or scraped away, proper penetration has occurred. Varying weather conditions affect priming and cementing action and may require more time or repeated applications to either or both surfaces.

9. If using primer, use the correct applicator size (see #7) and aggressively work the primer into the socket, keeping the surface and applicator wet until the surface has softened, re-dipping the applicator as required. When the surface is primed, remove any puddles of primer from the socket.

10. Aggressively work the primer on to the end of the pipe, to a point ½" beyond the depth of the socket.

11. Perform a second application of primer in the socket.

12. While the surfaces are still wet, the appropriate solvent cement should be applied.

13. Using the correct applicator size, aggressively work a full, even layer of cement onto the pipe end to a point equal to the depth of the socket. Do not brush out to a thin paint type layer, as this will dry within a few seconds.

14. Aggressively work a medium layer of cement into the fitting socket; avoid puddling cement in the socket. On the pipe end, do not coat beyond the socket depth or allow cement to run down into the pipe beyond the socket.

15. Apply a second full, even layer of cement on the pipe.

16. Immediately, while the cement is still wet, assemble the joint. Use enough force to ensure that the pipe is fully inserted into the socket. Twist the pipe a ¼ turn as it is being inserted.

17. Hold the joint together for approximately 30 seconds to avoid push out.

18. After assembly, inspect the joint to ensure that there is a ring or bead of cement completely around the juncture of the pipe and socket. If there are voids in this ring, sufficient cement was not applied and the joint may be defective.

19. Remove the excess cement from the pipe and socket (including the ring or bead) using a cloth. Avoid disturbing or moving the joint.

20. Handle newly cemented joints with care until initial set has taken place. Follow set and cure times before handling or testing the system.

Pipe Dimensions

Nominal Size mm (in)	Avg. Outside Diameter mm (in)	Avg. Inside Diameter mm (in)	Avg. Wall Thickness mm (in)	Approx. Weight lb/100ft (kg/m)

Specification

All wiring shall be installed in Royal Electrical Solutions Rigid PVC Conduit and secured with proper fittings. All conduit and fittings shall be manufactured by Royal Building Products, Pipe & Fittings Solutions. All outlets, pull boxes and junction points shall be Royal products.

Exposed conduit shall be securely attached and supported with straps that are installed at the recommended spacing specified in CEC Section 12-1114. The straps must allow for linear expansion and contraction of the conduit due to temperature change. If the variance in temperature exceeds 14°C (25°F), expansion joints shall be installed according to the manufacturer's recommendations.

If Rigid PVC Conduit is embedded in concrete or direct buried, support straps are not required.

Solvent Cementing

All connections should be made using and applying Royal Electrical Solutions solvent cement.

Set Times

Average Initial Set Times			
Temperature Range	Pipe Sizes ½" to 1¼"	Pipe Sizes 1½" to 2"	Pipe Sizes 2½" to 6"
15°C to 40°C	2 min.	5 min.	30 min.
5°C to 15°C	5 min.	10 min.	2 hrs.
-16°C to 5°C	10 min.	15 min.	12 hrs.

Joint Cure Schedule

Average Joint Cure Times			
Temperature Range During Assembly & Cure Periods	Pipe Sizes ½" to 1¼"	Pipe Sizes 1½" to 2"	Pipe Sizes 2½" to 6"
15°C to 40°C	2 min.	5 min.	30 min.
5°C to 15°C	5 min.	10 min.	2 hrs.
-16°C to 5°C	10 min.	15 min.	12 hrs.

In damp or humid weather allow 50% more cure time.

Estimated Solvent Cement Requirements

Average Number of Joints per Litre of Solvent Cement									
Pipe/Fitting Diameter	½"	¾"	1"	1½"	2"	2½"	3"	4"	6"
Number of Joints	300	200	125	90	60	40	40	30	10

Estimated Primer Requirements

Average Number of Joints per Litre of Primer									
Pipe/Fitting Diameter	½"	¾"	1"	1½"	2"	2½"	3"	4"	6"
Number of Joints	600	400	250	180	120	80	80	60	20

Solvent Cementing in Cold Weather:

- Store pipe and fittings in a heated area. Prefabricate as much of the system as possible in a heated area.
- When not in use, store sealed solvent cement and primer between 5°C and 21°C. Do not use open flame or electric heaters to warm cements and primers.
- Take care to remove moisture, ice and snow from the mating surfaces.

Solvent Cementing in Hot Weather:

- At the time of assembly, the surface temperature of the mating surfaces should not exceed 45°C. Shade or shelter the joint surfaces from direct sunlight for at least 1 hour prior to joining and during the joining process. If necessary, swab the mating surfaces with clean, wet rags to reduce the surface temperature (thoroughly dry surfaces before applying primer or cement).
- Make joints during the cooler early morning hours.
- Apply cement quickly and join pipe to fitting as quickly as possible after applying the cement.
- Keep solvent cement container closed or covered when not in use, to minimize solvent loss.

Solvent Cementing in Wet Conditions:

- Mating surfaces must be dry when the joint is made.
- Work under a cover or canopy to keep rain off pipe and fittings.
- Work quickly after drying the pipe and fitting to avoid condensation.
- Allow a longer cure time before the system is tested or used.

Storage and Handling of Solvent Cement and Primer:

- Solvent cement and primer contain highly flammable solvents. Follow all specific safety precautions provided on container label and Material Safety Data Sheet.
- Keep primer and solvent cement away from heat, sparks and open flame.
- Keep containers tightly closed except when in use.
- Ensure proper ventilation of work area and avoid inhaling solvent vapours.
- Where the possibility of splashing exists, wear proper eye protection or a face shield.
- Avoid contact with skin.

Support Straps

Rigid PVC conduit must be supported with straps when installed in above ground applications. These straps should be installed snugly, while allowing linear movement of the conduit. See the table below for recommended maximum spacing of support straps.

Maximum Recommended Spacing of Support Straps		
Nominal Size mm (in)	CEC Recommended Spacing ft (m)	NEC Recommended Spacing ft (m)
16 (½)	2½ (0.75)	3 (0.91)
21 (¾)	2½ (0.75)	3 (0.91)
27 (1)	2½ (0.75)	3 (0.91)
35 (1¼)	4 (1.20)	5 (1.50)
41 (1½)	4 (1.20)	5 (1.50)
53 (2)	6 (1.80)	5 (1.50)
63 (2½)	6 (1.80)	3 - 6 (1.80)
78 (3)-129 (5)	7 (2.10)	3½ - 5 (2.10)
155 (6)	8 (2.50)	8 (2.50)

Storing Conduit Pipe and Fittings

Store Rigid PVC conduit pipe and fittings at the same temperature. Otherwise they may expand and contract at different rates and become incompatible.

Maximum Operating Temperatures

According to the Canadian Electrical Code (CEC), Rigid PVC conduit is intended for use at a continuous operating temperature of 75°C (167°F). For US applications, our Rigid PVC conduit is rated for use with 90°C wiring, according to the requirements of the NEC.

Ambient Temperatures

Royal Electrical Solutions Rigid PVC Conduit and fittings can be installed in locations with an ambient temperature not exceeding 50°C (122°F).

Expansion Joints

According to the CEC, if the amount of expansion expected due to temperature variance during and after construction is more than 45mm, expansion joints must be used.

Expected Expansion

The coefficient of linear expansion for Rigid PVC conduit is as follows:

3×10^{-5} in (expansion/contraction) / in (pipe length) /°F (change in temperature),

5.4×10^{-5} mm (expansion/contraction)/mm (pipe length)/°C (change in temperature)

Note:

The following chart shows the amount of expansion expected with various pipe lengths/temperature changes. If the Rigid PVC Conduit is installed in an exposed location, 17°C (30°F) should be added to the amount of temperature change (ΔT) due to the effects of radiant heat.

Expansion/Contraction of PVC (mm)

Length of Pipe Run (m)

ΔT (°C)	2	4	6	8	10	12	14	16	18	20

45	0.08	0.16	0.24	0.32	0.41	0.49	0.57	0.65	0.73	0.81
50	0.09	0.18	0.27	0.36	0.45	0.54	0.63	0.72	0.81	0.90

Required Number of Expansion Joints

The following table shows the amount of travel that is available with each trade size of Royal Electrical Solutions Rigid PVC conduit expansion joints:

Part Number	Description in	Travel Allowance mm (in)
REJ10	½" Expansion Joint	102 (4)
REJ15	¾" Expansion Joint	102 (4)
REJ20	1" Expansion Joint	102 (4)
REJ25	1¼" Expansion Joint	102 (4)
REJ30	1½" Expansion Joint	102 (4)
REJ35	2" Expansion Joint	102 (4)
REJ40	2½" Expansion Joint	102 (4)
REJ45	3" Expansion Joint	204 (8)
REJ50	3½" Expansion Joint	204 (8)
REJ55	4" Expansion Joint	204 (8)
REJ60	5" Expansion Joint	204 (8)
REJ65	6" Expansion Joint	204 (8)

The required number of expansion joints can be calculated using the following formula:

$$\#\ \text{Expansion Joints Required} = \frac{\text{Total Expected Amount of Expansion (in)}}{\text{Expansion Joint Travel Allowance (in)}}$$

$$\#\ \text{Expansion Joints Required} = \frac{\text{Total Expected Amount of Expansion (mm)}}{\text{Expansion Joint Travel Allowance (mm)}}$$

The number of expansion joints calculated above should be rounded up to the nearest whole number.

Setting the Piston Opening

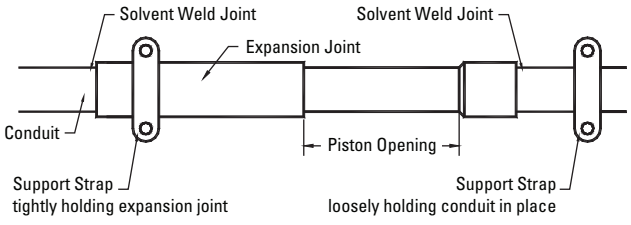
Expansion joints must be installed such that they allow for both expansion and contraction of the conduit. The piston of the expansion joint must be set at the correct position to allow for this linear movement. To determine the correct position for the piston at the time and temperature of installation, the following formula should be used:

$$\text{Piston Setting (in)} = \frac{\text{(Max. Temp. (°F) – Install. Temp. (°F))}}{\text{Total Expected Temperature Change (°F)}} \times \left[\text{Expansion Joint Expansion Allow. (in)}\right]$$

$$\text{Piston Setting (mm)} = \frac{\text{(Max. Temp. (°C) – Install. Temp. (°C))}}{\text{Total Expected Temperature Change (°C)}} \times \left[\text{Expansion Joint Expansion Allow. (mm)}\right]$$

Installation Guidelines

• Securely fasten the expansion joint barrel so that it does not shift. Loosely connect the conduit so that it is free to move.



• To function properly, expansion joints should be installed near a fixed point.

• It is better to use more expansion joints than not enough, since problems are difficult to correct after conductors and wires have been pulled through the conduit.

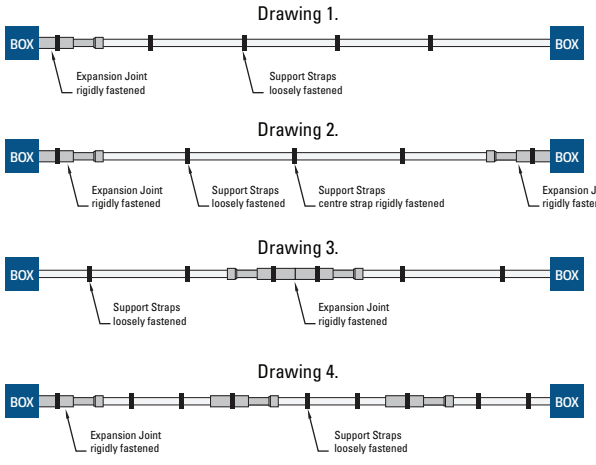
• Ensure that the barrel and piston are aligned and level.

• For vertical installations of expansion joints, install with the piston at the bottom to prevent dirt and water from getting inside the joint and causing it to malfunction.

Installation Example

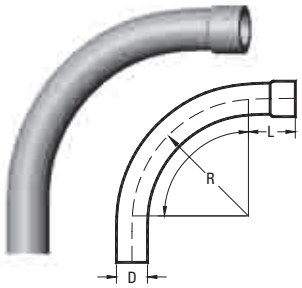
If one expansion joint is required:
Securely fasten the barrel of the expansion joint close to one of the boxes. Support the conduit with straps, but allow free movement of the conduit for expansion and contraction. (See Drawing 1)

If two expansion joints are required:
There are two options available:

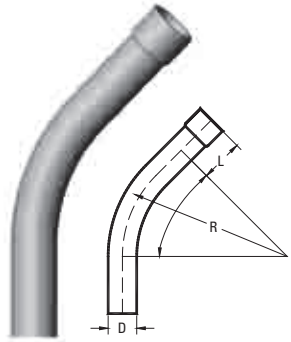


1. Firmly fasten one expansion joint near each end of the run and firmly fasten the conduit at the centre. Support the rest of the conduit with straps allowing for movement of the conduit. (See Drawing 2)

2. Firmly fasten the expansion joints back-to-back at the centre of the run. The conduit should be supported with straps to allow free movements as it expands and contracts. (See Drawing 3)



If three or more expansion joints are required:
Evenly space the expansion joints along the run of Rigid PVC conduit. Tightly fasten each expansion joint and support the conduit with straps. Do not restrict the movement of the conduit.



*For information on Maximum Recommended Spacing of Support Straps, see page 4.

ROYAL® Building Products

Pipe & Fittings Solutions | Municipal Plumbing Electrical Industrial Irrigation

Rigid PVC Conduit Pipe & Fittings

A system for residential, industrial, commercial and institutional applications.

Product Description & Applications

Royal Building Products® Electrical Solutions manufactures a complete line of Rigid PVC Conduit pipe and fittings for electrical applications. Our products are designed to reduce labour and maintenance costs, while offering superior performance.

Products are certified by the Canadian Standards Association (CSA) and Underwriters Laboratories (UL) for use in above and below ground applications. Our Rigid PVC conduit pipe and fittings are available in 12 to 150mm (½- to 6-inch) diameters and 3- or 6-metre (10- or 20-foot) lengths.

Standards and Codes

Royal Electrical Solutions Rigid PVC Conduit pipe and fittings are certified to CSA Standards as noted below. Our Rigid PVC conduit pipe and fittings shall be installed according to the Canadian Electrical Code (CEC) Part I, Rules 12-1100 - 12-1122 and the National Electrical Code (NEC) Article 352.

Pipe	Fittings
C22.2 No. 211.2	C22.2 No. 18.2, 85 (Boxes) No. 40 (Electrical Encl.) No. 42.1 (Covers) No. 85 (Fittings)
UL 651	UL 514C (Boxes) UL 50 (Electrical Encl.) UL 514D (Covers) UL 651 (Fittings)
Conforms to NEMA TC2	

Features and Benefits

Saves Labour

Rigid PVC Conduit pipe and fittings are easy to install, cut and join.

Easy Wire Pulls

The conduit's smooth interior surface reduces friction and prevents damage to wires when pulling wire and conductors for long runs and even through 90° bends.

Lightweight Materials

Rigid PVC Conduit is easier to move and handle because it is approximately one-fifth the weight of steel and half the weight of aluminum.

Approximate Weight Comparison

Size mm (in)	PVC lb/100ft (kg/m)	Aluminum lb/100ft (kg/m)	Steel lb/100ft (kg/m)
12 (½)	16.1 (0.24)	27 (0.40)	79 (1.20)
19 (¾)	21.5 (0.32)	37 (0.55)	105 (1.55)
25 (1)	31.9 (0.47)	53 (0.80)	153 (2.30)
32 (1¼)	43.8 (0.65)	70 (1.05)	201 (3.00)
38 (1½)	52.3 (0.78)	86 (1.30)	249 (3.70)
50 (2)	70.3 (1.05)	116 (1.75)	334 (5.00)
63 (2½)	112.0 (1.61)	183 (2.75)	527 (7.85)
75 (3)	146.7 (2.18)	239 (3.55)	690 (10.25)
90 (3½)	176.4 (2.63)	288 (4.30)	831 (12.40)
100 (4)	208.9 (3.11)	340 (5.10)	982 (14.60)
125 (5)	283.4 (4.22)	465 (6.90)	1,344 (20.40)
150 (6)	368.0 (5.48)	613 (9.10)	1,771 (26.35)

Simplifies Direct Burial

Royal Electrical Solutions Rigid PVC Conduit does not require additional protection for direct burial installations according to the Canadian Electrical Code (CEC) and the National Electrical Code (NEC). Normal construction practices should be followed for trenching and backfill operations.

Non-Conductive

Rigid PVC Conduit is non-conductive.

Long Life

Royal Rigid PVC Conduit and fittings resist acids, alkalis, salt solutions and most other chemicals. (Refer to the Royal Chemical Resistance Guide for detailed information.) There is no risk of corrosion when exposed to naturally corrosive soil conditions, electrochemical or galvanic environments. Royal's Rigid PVC Conduit has achieved sunlight resistance as per the requirements of the Electrical Code.

FT-4 Rating

Rigid PVC Conduit pipe has an FT-4 Rating and can be used in non-combustible construction as per Part 3 of the National Building Code of Canada (NBC).

Installation Guidelines

Cutting

Royal Rigid PVC Conduit can easily be cut with a hacksaw, a fine-toothed handsaw or PVC conduit cutters. For conduit with more than a 50mm (2-inch) diameter, use a mitre box or saw guide to ensure a square cut. Deburr the end using a knife or file.

Bending

It may be necessary to create bends in the field by heating and deforming Rigid PVC Conduit. To accomplish this, the following guidelines should be followed:

• For heating the Rigid PVC Conduit, use a heat gun or some other flameless heat source. Do not use an open flame to heat the conduit. Rigid PVC Conduit must be heated to approximately 127°C (260°F) in order to bend without kinking.

• Heat a length of conduit equal to approximately 10 times the nominal diameter.

• Once the Rigid PVC Conduit has been adequately heated, bend it to the required angle plus 3 extra degrees. The additional angle will accommodate the "spring back" which will occur during cooling.

• After bending of the conduit is completed, immediately cool the bend using water or cold air.

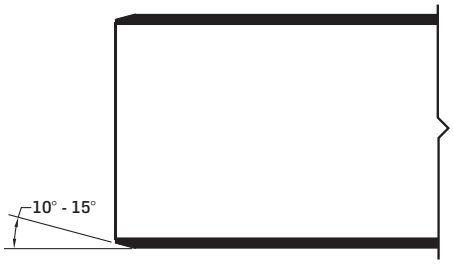
• According to the Canadian Electrical Code (CEC) and the National Electrical Code (NEC), the minimum bending radius for rigid conduit is as shown in the table below.

Nominal Size mm (in)	Min. Radius to Centre of Conduit or Tubing mm (in)
16 (½)	102 (4.016)
21 (¾)	114 (4.489)
27 (1)	146 (5.748)
35 (1¼)	184 (7.244)
41 (1½)	210 (8.268)
53 (2)	241 (9.488)
63 (2½)	267 (10.512)
78 (3)	330 (12.992)
91 (3½)	381 (14.606)
103 (4)	406 (15.984)
129 (5)	610 (24.016)
155 (6)	762 (30.000)

Procedure for Solvent Welding Joints

• Use solvent cement and primer prior to expiration date marked on container.

• Above 0° C ambient temperature, joints may be assembled without the use of primer, provided adequate penetration and softening of the pipe/fitting surface can be achieved with solvent cement alone.



1. Assemble materials for the job, including correct solvent cement, primer and correctly sized applicator.

2. Cut pipe as square as possible using a hand saw and miter box or mechanical saw. Do not use a diagonal cut, as it reduces the bonding area in the joint.

3. If plastic tubing cutters are used, care must be taken to remove any raised bead at the end of the pipe, caused by cutting. A file or reamer may be used to remove the bead.

4. Use a knife, file or reamer to remove burrs from the inside and outside of the pipe end, as these will hinder the integrity of the joint. All sharp edges should be removed from the inside and outside edges of the pipe to prevent the pipe from pushing the solvent cement into the fitting socket, thereby causing a weak spot to form. The pipe end should be chamfered, as shown below.

Chamfered Pipe

Procedure for Solvent Welding Joints Continued

5. All dirt, grease and moisture should be removed from the pipe and socket by thoroughly wiping with a clean, dry cloth.

6. Dry fit pipe and fitting joints prior to cementing. For proper interference fit, the pipe should go easily into the socket approximately ⅓ to ⅔ of the socket depth. If this is not the case, other pipe or fittings should be used.

7. The applicator should be sized according to the size of pipe and fittings being joined. The brush width of the applicator should be equal to approximately ½ of the pipe diameter.

8. Primer is used to penetrate and soften the surfaces so that they will fuse together under a wide variety of conditions. The penetration or softening can be checked by dragging the edge of a knife or sharp object over the coated surface. If a few thousandths of an inch of the primed surface can be scratched or scraped away, proper penetration has occurred. Varying weather conditions affect priming and cementing action and may require more time or repeated applications to either or both surfaces.

9. If using primer, use the correct applicator size (see #7) and aggressively work the primer into the socket, keeping the surface and applicator wet until the surface has softened, re-dipping the applicator as required. When the surface is primed, remove any puddles of primer from the socket.

10. Aggressively work the primer on to the end of the pipe, to a point ½" beyond the depth of the socket.

11. Perform a second application of primer in the socket.

12. While the surfaces are still wet, the appropriate solvent cement should be applied.

13. Using the correct applicator size, aggressively work a full, even layer of cement onto the pipe end to a point equal to the depth of the socket. Do not brush out to a thin paint type layer, as this will dry within a few seconds.

14. Aggressively work a medium layer of cement into the fitting socket; avoid puddling cement in the socket. On the pipe end, do not coat beyond the socket depth or allow cement to run down into the pipe beyond the socket.

15. Apply a second full, even layer of cement on the pipe.

16. Immediately, while the cement is still wet, assemble the joint. Use enough force to ensure that the pipe is fully inserted into the socket. Twist the pipe a ¼ turn as it is being inserted.

17. Hold the joint together for approximately 30 seconds to avoid push out.

18. After assembly, inspect the joint to ensure that there is a ring or bead of cement completely around the juncture of the pipe and socket. If there are voids in this ring, sufficient cement was not applied and the joint may be defective.

19. Remove the excess cement from the pipe and socket (including the ring or bead) using a cloth. Avoid disturbing or moving the joint.

20. Handle newly cemented joints with care until initial set has taken place. Follow set and cure times before handling or testing the system.

Pipe Dimensions

Nominal Size mm (in)	Avg. Outside Diameter mm (in)	Avg. Inside Diameter mm (in)	Avg. Wall Thickness mm (in)	Approx. Weight lb/100ft (kg/m)

Specification

All wiring shall be installed in Royal Electrical Solutions Rigid PVC Conduit and secured with proper fittings. All conduit and fittings shall be manufactured by Royal Building Products, Pipe & Fittings Solutions. All outlets, pull boxes and junction points shall be Royal products.

Exposed conduit shall be securely attached and supported with straps that are installed at the recommended spacing specified in CEC Section 12-1114. The straps must allow for linear expansion and contraction of the conduit due to temperature change. If the variance in temperature exceeds 14°C (25°F), expansion joints shall be installed according to the manufacturer's recommendations.

If Rigid PVC Conduit is embedded in concrete or direct buried, support straps are not required.

Solvent Cementing

All connections should be made using and applying Royal Electrical Solutions solvent cement.

Set Times

Average Initial Set Times			
Temperature Range	Pipe Sizes ½" to 1¼"	Pipe Sizes 1½" to 2"	Pipe Sizes 2½" to 6"
15°C to 40°C	2 min.	5 min.	30 min.
5°C to 15°C	5 min.	10 min.	2 hrs.
-16°C to 5°C	10 min.	15 min.	12 hrs.

Joint Cure Schedule

Average Joint Cure Times			
Temperature Range During Assembly & Cure Periods	Pipe Sizes ½" to 1¼"	Pipe Sizes 1½" to 2"	Pipe Sizes 2½" to 6"
15°C to 40°C	2 min.	5 min.	30 min.
5°C to 15°C	5 min.	10 min.	2 hrs.
-16°C to 5°C	10 min.	15 min.	12 hrs.

In damp or humid weather allow 50% more cure time.

Estimated Solvent Cement Requirements

Average Number of Joints per Litre of Solvent Cement									
Pipe/Fitting Diameter	½"	¾"	1"	1½"	2"	2½"	3"	4"	6"
Number of Joints	300	200	125	90	60	40	40	30	10

Estimated Primer Requirements

Average Number of Joints per Litre of Primer									
Pipe/Fitting Diameter	½"	¾"	1"	1½"	2"	2½"	3"	4"	6"
Number of Joints	600	400	250	180	120	80	80	60	20

Solvent Cementing in Cold Weather:

- Store pipe and fittings in a heated area. Prefabricate as much of the system as possible in a heated area.
- When not in use, store sealed solvent cement and primer between 5°C and 21°C. Do not use open flame or electric heaters to warm cements and primers.
- Take care to remove moisture, ice and snow from the mating surfaces.

Solvent Cementing in Hot Weather:

- At the time of assembly, the surface temperature of the mating surfaces should not exceed 45°C. Shade or shelter the joint surfaces from direct sunlight for at least 1 hour prior to joining and during the joining process. If necessary, swab the mating surfaces with clean, wet rags to reduce the surface temperature (thoroughly dry surfaces before applying primer or cement).
- Make joints during the cooler early morning hours.
- Apply cement quickly and join pipe to fitting as quickly as possible after applying the cement.
- Keep solvent cement container closed or covered when not in use, to minimize solvent loss.

Solvent Cementing in Wet Conditions:

- Mating surfaces must be dry when the joint is made.
- Work under a cover or canopy to keep rain off pipe and fittings.
- Work quickly after drying the pipe and fitting to avoid condensation.
- Allow a longer cure time before the system is tested or used.

Storage and Handling of Solvent Cement and Primer:

- Solvent cement and primer contain highly flammable solvents. Follow all specific safety precautions provided on container label and Material Safety Data Sheet.
- Keep primer and solvent cement away from heat, sparks and open flame.
- Keep containers tightly closed except when in use.
- Ensure proper ventilation of work area and avoid inhaling solvent vapours.
- Where the possibility of splashing exists, wear proper eye protection or a face shield.
- Avoid contact with skin.

Support Straps

Rigid PVC conduit must be supported with straps when installed in above ground applications. These straps should be installed snugly, while allowing linear movement of the conduit. See the table below for recommended maximum spacing of support straps.

Maximum Recommended Spacing of Support Straps		
Nominal Size mm (in)	CEC Recommended Spacing ft (m)	NEC Recommended Spacing ft (m)
16 (½)	2½ (0.75)	3 (0.91)
21 (¾)	2½ (0.75)	3 (0.91)
27 (1)	2½ (0.75)	3 (0.91)
35 (1¼)	4 (1.20)	5 (1.50)
41 (1½)	4 (1.20)	5 (1.50)
53 (2)	6 (1.80)	5 (1.50)
63 (2½)	6 (1.80)	3 - 6 (1.80)
78 (3)-129 (5)	7 (2.10)	3½ - 5 (2.10)
155 (6)	8 (2.50)	8 (2.50)

Rigid PVC Conduit Pipe & Fittings

A system for residential, industrial, commercial and institutional applications.

Product Description & Applications

Royal Building Products® Electrical Solutions manufactures a complete line of Rigid PVC Conduit pipe and fittings for electrical applications. Our products are designed to reduce labour and maintenance costs, while offering superior performance.

Products are certified by the Canadian Standards Association (CSA) and Underwriters Laboratories (UL) for use in above and below ground applications. Our Rigid PVC conduit pipe and fittings are available in 12 to 150mm (½- to 6-inch) diameters and 3- or 6-metre (10- or 20-foot) lengths.

Standards and Codes

Royal Electrical Solutions Rigid PVC Conduit pipe and fittings are certified to CSA Standards as noted below. Our Rigid PVC conduit pipe and fittings shall be installed according to the Canadian Electrical Code (CEC) Part I, Rules 12-1100 - 12-1122 and the National Electrical Code (NEC) Article 352.

Pipe	Fittings
C22.2 No. 211.2	C22.2 No. 18.2, 85 (Boxes) No. 40 (Electrical Encl.) No. 42.1 (Covers) No. 85 (Fittings)
UL 651	UL 514C (Boxes) UL 50 (Electrical Encl.) UL 514D (Covers) UL 651 (Fittings)
Conforms to NEMA TC2	

Features and Benefits

Saves Labour

Rigid PVC Conduit pipe and fittings are easy to install, cut and join.

Easy Wire Pulls

The conduit's smooth interior surface reduces friction and prevents damage to wires when pulling wire and conductors for long runs and even through 90° bends.

Lightweight Materials

Rigid PVC Conduit is easier to move and handle because it is approximately one-fifth the weight of steel and half the weight of aluminum.

Approximate Weight Comparison

Size mm (in)	PVC lb/100ft (kg/m)	Aluminum lb/100ft (kg/m)	Steel lb/100ft (kg/m)
12 (½)	16.1 (0.24)	27 (0.40)	79 (1.20)
19 (¾)	21.5 (0.32)	37 (0.55)	105 (1.55)
25 (1)	31.9 (0.47)	53 (0.80)	153 (2.30)
32 (1¼)	43.8 (0.65)	70 (1.05)	201 (3.00)
38 (1½)	52.3 (0.78)	86 (1.30)	249 (3.70)
50 (2)	70.3 (1.05)	116 (1.75)	334 (5.00)
63 (2½)	112.0 (1.61)	183 (2.75)	527 (7.85)
75 (3)	146.7 (2.18)	239 (3.55)	690 (10.25)
90 (3½)	176.4 (2.63)	288 (4.30)	831 (12.40)
100 (4)	208.9 (3.11)	340 (5.10)	982 (14.60)
125 (5)	283.4 (4.22)	465 (6.90)	1,344 (20.40)
150 (6)	368.0 (5.48)	613 (9.10)	1,771 (26.35)

Simplifies Direct Burial

Royal Electrical Solutions Rigid PVC Conduit does not require additional protection for direct burial installations according to the Canadian Electrical Code (CEC) and the National Electrical Code (NEC). Normal construction practices should be followed for trenching and backfill operations.

Non-Conductive

Rigid PVC Conduit is non-conductive.

Long Life

Royal Rigid PVC Conduit and fittings resist acids, alkalis, salt solutions and most other chemicals. (Refer to the Royal Chemical Resistance Guide for detailed information.) There is no risk of corrosion when exposed to naturally corrosive soil conditions, electrochemical or galvanic environments. Royal's Rigid PVC Conduit has achieved sunlight resistance as per the requirements of the Electrical Code.

FT-4 Rating

Rigid PVC Conduit pipe has an FT-4 Rating and can be used in non-combustible construction as per Part 3 of the National Building Code of Canada (NBC).

Installation Guidelines

Cutting

Royal Rigid PVC Conduit can easily be cut with a hacksaw, a fine-toothed handsaw or PVC conduit cutters. For conduit with more than a 50mm (2-inch) diameter, use a mitre box or saw guide to ensure a square cut. Deburr the end using a knife or file.

Bending

It may be necessary to create bends in the field by heating and deforming Rigid PVC Conduit. To accomplish this, the following guidelines should be followed:

• For heating the Rigid PVC Conduit, use a heat gun or some other flameless heat source. Do not use an open flame to heat the conduit. Rigid PVC Conduit must be heated to approximately 127°C (260°F) in order to bend without kinking.

• Heat a length of conduit equal to approximately 10 times the nominal diameter.

• Once the Rigid PVC Conduit has been adequately heated, bend it to the required angle plus 3 extra degrees. The additional angle will accommodate the "spring back" which will occur during cooling.

• After bending of the conduit is completed, immediately cool the bend using water or cold air.

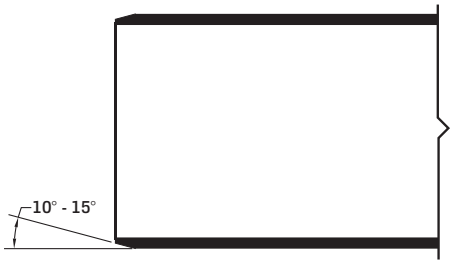
• According to the Canadian Electrical Code (CEC) and the National Electrical Code (NEC), the minimum bending radius for rigid conduit is as shown in the table below.

Nominal Size mm (in)	Min. Radius to Centre of Conduit or Tubing mm (in)
16 (½)	102 (4.016)
21 (¾)	114 (4.489)
27 (1)	146 (5.748)
35 (1¼)	184 (7.244)
41 (1½)	210 (8.268)
53 (2)	241 (9.488)
63 (2½)	267 (10.512)
78 (3)	330 (12.992)
91 (3½)	381 (14.606)
103 (4)	406 (15.984)
129 (5)	610 (24.016)
155 (6)	762 (30.000)

Procedure for Solvent Welding Joints

• Use solvent cement and primer prior to expiration date marked on container.

• Above 0° C ambient temperature, joints may be assembled without the use of primer, provided adequate penetration and softening of the pipe/fitting surface can be achieved with solvent cement alone.



1. Assemble materials for the job, including correct solvent cement, primer and correctly sized applicator.

2. Cut pipe as square as possible using a hand saw and miter box or mechanical saw. Do not use a diagonal cut, as it reduces the bonding area in the joint.

3. If plastic tubing cutters are used, care must be taken to remove any raised bead at the end of the pipe, caused by cutting. A file or reamer may be used to remove the bead.

4. Use a knife, file or reamer to remove burrs from the inside and outside of the pipe end, as these will hinder the integrity of the joint. All sharp edges should be removed from the inside and outside edges of the pipe to prevent the pipe from pushing the solvent cement into the fitting socket, thereby causing a weak spot to form. The pipe end should be chamfered, as shown below.

Chamfered Pipe

Procedure for Solvent Welding Joints Continued

5. All dirt, grease and moisture should be removed from the pipe and socket by thoroughly wiping with a clean, dry cloth.

6. Dry fit pipe and fitting joints prior to cementing. For proper interference fit, the pipe should go easily into the socket approximately ⅓ to ⅔ of the socket depth. If this is not the case, other pipe or fittings should be used.

7. The applicator should be sized according to the size of pipe and fittings being joined. The brush width of the applicator should be equal to approximately ½ of the pipe diameter.

8. Primer is used to penetrate and soften the surfaces so that they will fuse together under a wide variety of conditions. The penetration or softening can be checked by dragging the edge of a knife or sharp object over the coated surface. If a few thousandths of an inch of the primed surface can be scratched or scraped away, proper penetration has occurred. Varying weather conditions affect priming and cementing action and may require more time or repeated applications to either or both surfaces.

9. If using primer, use the correct applicator size (see #7) and aggressively work the primer into the socket, keeping the surface and applicator wet until the surface has softened, re-dipping the applicator as required. When the surface is primed, remove any puddles of primer from the socket.

10. Aggressively work the primer on to the end of the pipe, to a point ½" beyond the depth of the socket.

11. Perform a second application of primer in the socket.

12. While the surfaces are still wet, the appropriate solvent cement should be applied.

13. Using the correct applicator size, aggressively work a full, even layer of cement onto the pipe end to a point equal to the depth of the socket. Do not brush out to a thin paint type layer, as this will dry within a few seconds.

14. Aggressively work a medium layer of cement into the fitting socket; avoid puddling cement in the socket. On the pipe end, do not coat beyond the socket depth or allow cement to run down into the pipe beyond the socket.

15. Apply a second full, even layer of cement on the pipe.

16. Immediately, while the cement is still wet, assemble the joint. Use enough force to ensure that the pipe is fully inserted into the socket. Twist the pipe a ¼ turn as it is being inserted.

17. Hold the joint together for approximately 30 seconds to avoid push out.

18. After assembly, inspect the joint to ensure that there is a ring or bead of cement completely around the juncture of the pipe and socket. If there are voids in this ring, sufficient cement was not applied and the joint may be defective.

19. Remove the excess cement from the pipe and socket (including the ring or bead) using a cloth. Avoid disturbing or moving the joint.

20. Handle newly cemented joints with care until initial set has taken place. Follow set and cure times before handling or testing the system.

Pipe Dimensions

Nominal Size mm (in)	Avg. Outside Diameter mm (in)	Avg. Inside Diameter mm (in)	Avg. Wall Thickness mm (in)	Approx. Weight lb/100ft (kg/m)

Specification

All wiring shall be installed in Royal Electrical Solutions Rigid PVC Conduit and secured with proper fittings. All conduit and fittings shall be manufactured by Royal Building Products, Pipe & Fittings Solutions. All outlets, pull boxes and junction points shall be Royal products.

Exposed conduit shall be securely attached and supported with straps that are installed at the recommended spacing specified in CEC Section 12-1114. The straps must allow for linear expansion and contraction of the conduit due to temperature change. If the variance in temperature exceeds 14°C (25°F), expansion joints shall be installed according to the manufacturer's recommendations.

If Rigid PVC Conduit is embedded in concrete or direct buried, support straps are not required.

Solvent Cementing

All connections should be made using and applying Royal Electrical Solutions solvent cement.

Set Times

Average Initial Set Times			
Temperature Range	Pipe Sizes ½" to 1¼"	Pipe Sizes 1½" to 2"	Pipe Sizes 2½" to 6"
15°C to 40°C	2 min.	5 min.	30 min.
5°C to 15°C	5 min.	10 min.	2 hrs.
-16°C to 5°C	10 min.	15 min.	12 hrs.

Joint Cure Schedule

Average Joint Cure Times			
Temperature Range During Assembly & Cure Periods	Pipe Sizes ½" to 1¼"	Pipe Sizes 1½" to 2"	Pipe Sizes 2½" to 6"
15°C to 40°C	2 min.	5 min.	30 min.
5°C to 15°C	5 min.	10 min.	2 hrs.
-16°C to 5°C	10 min.	15 min.	12 hrs.

In damp or humid weather allow 50% more cure time.

Estimated Solvent Cement Requirements

Average Number of Joints per Litre of Solvent Cement									
Pipe/Fitting Diameter	½"	¾"	1"	1½"	2"	2½"	3"	4"	6"
Number of Joints	300	200	125	90	60	40	40	30	10

Estimated Primer Requirements

Average Number of Joints per Litre of Primer									
Pipe/Fitting Diameter	½"	¾"	1"	1½"	2"	2½"	3"	4"	6"
Number of Joints	600	400	250	180	120	80	80	60	20

Solvent Cementing in Cold Weather:

- Store pipe and fittings in a heated area. Prefabricate as much of the system as possible in a heated area.
- When not in use, store sealed solvent cement and primer between 5°C and 21°C. Do not use open flame or electric heaters to warm cements and primers.
- Take care to remove moisture, ice and snow from the mating surfaces.

Solvent Cementing in Hot Weather:

- At the time of assembly, the surface temperature of the mating surfaces should not exceed 45°C. Shade or shelter the joint surfaces from direct sunlight for at least 1 hour prior to joining and during the joining process. If necessary, swab the mating surfaces with clean, wet rags to reduce the surface temperature (thoroughly dry surfaces before applying primer or cement).
- Make joints during the cooler early morning hours.
- Apply cement quickly and join pipe to fitting as quickly as possible after applying the cement.
- Keep solvent cement container closed or covered when not in use, to minimize solvent loss.

Solvent Cementing in Wet Conditions:

- Mating surfaces must be dry when the joint is made.
- Work under a cover or canopy to keep rain off pipe and fittings.
- Work quickly after drying the pipe and fitting to avoid condensation.
- Allow a longer cure time before the system is tested or used.

Storage and Handling of Solvent Cement and Primer:

- Solvent cement and primer contain highly flammable solvents. Follow all specific safety precautions provided on container label and Material Safety Data Sheet.
- Keep primer and solvent cement away from heat, sparks and open flame.
- Keep containers tightly closed except when in use.
- Ensure proper ventilation of work area and avoid inhaling solvent vapours.
- Where the possibility of splashing exists, wear proper eye protection or a face shield.
- Avoid contact with skin.

Support Straps

Rigid PVC conduit must be supported with straps when installed in above ground applications. These straps should be installed snugly, while allowing linear movement of the conduit. See the table below for recommended maximum spacing of support straps.

Maximum Recommended Spacing of Support Straps		
Nominal Size mm (in)	CEC Recommended Spacing ft (m)	NEC Recommended Spacing ft (m)
16 (½)	2½ (0.75)	3 (0.91)
21 (¾)	2½ (0.75)	3 (0.91)
27 (1)	2½ (0.75)	3 (0.91)
35 (1¼)	4 (1.20)	5 (1.50)
41 (1½)	4 (1.20)	5 (1.50)
53 (2)	6 (1.80)	5 (1.50)
63 (2½)	6 (1.80)	3 - 6 (1.80)
78 (3)-129 (5)	7 (2.10)	3½ - 5 (2.10)
155 (6)	8 (2.50)	8 (2.50)

Storing Conduit Pipe and Fittings

Store Rigid PVC conduit pipe and fittings at the same temperature. Otherwise they may expand and contract at different rates and become incompatible.

Maximum Operating Temperatures

According to the Canadian Electrical Code (CEC), Rigid PVC conduit is intended for use at a continuous operating temperature of 75°C (167°F). For US applications, our Rigid PVC conduit is rated for use with 90°C wiring, according to the requirements of the NEC.

Ambient Temperatures

Royal Electrical Solutions Rigid PVC Conduit and fittings can be installed in locations with an ambient temperature not exceeding 50°C (122°F).

Expansion Joints

According to the CEC, if the amount of expansion expected due to temperature variance during and after construction is more than 45mm, expansion joints must be used.

Expected Expansion

The coefficient of linear expansion for Rigid PVC conduit is as follows:

3×10^{-5} in (expansion/contraction) / in (pipe length) /°F (change in temperature),

5.4×10^{-5} mm (expansion/contraction)/mm (pipe length)/°C (change in temperature)

Note:

The following chart shows the amount of expansion expected with various pipe lengths/temperature changes. If the Rigid PVC Conduit is installed in an exposed location, 17°C (30°F) should be added to the amount of temperature change (ΔT) due to the effects of radiant heat.

Expansion/Contraction of PVC (mm)

REJ50	3½" Expansion Joint	204 (8)
REJ55	4" Expansion Joint	204 (8)
REJ60	5" Expansion Joint	204 (8)
REJ65	6" Expansion Joint	204 (8)

The required number of expansion joints can be calculated using the following formula:

$$\#\ \text{Expansion Joints Required} = \frac{\text{Total Expected Amount of Expansion (in)}}{\text{Expansion Joint Travel Allowance (in)}}$$

$$\#\ \text{Expansion Joints Required} = \frac{\text{Total Expected Amount of Expansion (mm)}}{\text{Expansion Joint Travel Allowance (mm)}}$$

The number of expansion joints calculated above should be rounded up to the nearest whole number.

Setting the Piston Opening

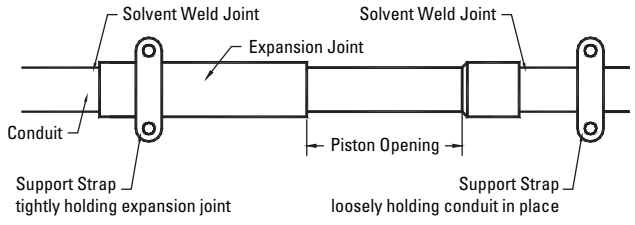
Expansion joints must be installed such that they allow for both expansion and contraction of the conduit. The piston of the expansion joint must be set at the correct position to allow for this linear movement. To determine the correct position for the piston at the time and temperature of installation, the following formula should be used:

$$\text{Piston Setting (in)} = \frac{\text{(Max. Temp. (°F) – Install. Temp. (°F))}}{\text{Total Expected Temperature Change (°F)}} \times \left[\text{Expansion Joint Expansion Allow. (in)}\right]$$

$$\text{Piston Setting (mm)} = \frac{\text{(Max. Temp. (°C) – Install. Temp. (°C))}}{\text{Total Expected Temperature Change (°C)}} \times \left[\text{Expansion Joint Expansion Allow. (mm)}\right]$$

Installation Guidelines

• Securely fasten the expansion joint barrel so that it does not shift. Loosely connect the conduit so that it is free to move.



• To function properly, expansion joints should be installed near a fixed point.

• It is better to use more expansion joints than not enough, since problems are difficult to correct after conductors and wires have been pulled through the conduit.

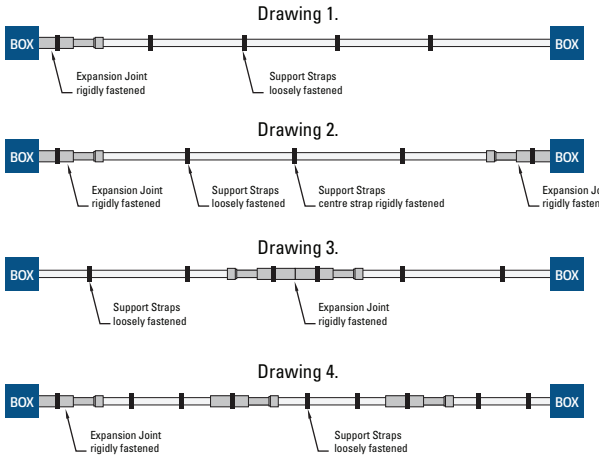
• Ensure that the barrel and piston are aligned and level.

• For vertical installations of expansion joints, install with the piston at the bottom to prevent dirt and water from getting inside the joint and causing it to malfunction.

Installation Example

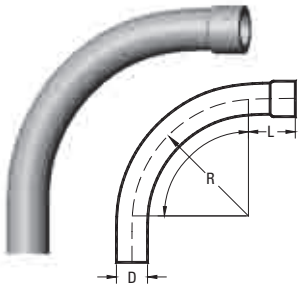
If one expansion joint is required:
Securely fasten the barrel of the expansion joint close to one of the boxes. Support the conduit with straps, but allow free movement of the conduit for expansion and contraction. (See Drawing 1)

If two expansion joints are required:
There are two options available:

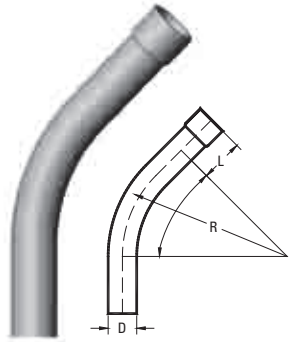


1. Firmly fasten one expansion joint near each end of the run and firmly fasten the conduit at the centre. Support the rest of the conduit with straps allowing for movement of the conduit. (See Drawing 2)

2. Firmly fasten the expansion joints back-to-back at the centre of the run. The conduit should be supported with straps to allow free movements as it expands and contracts. (See Drawing 3)



If three or more expansion joints are required:
Evenly space the expansion joints along the run of Rigid PVC conduit. Tightly fasten each expansion joint and support the conduit with straps. Do not restrict the movement of the conduit.



*For information on Maximum Recommended Spacing of Support Straps, see page 4.

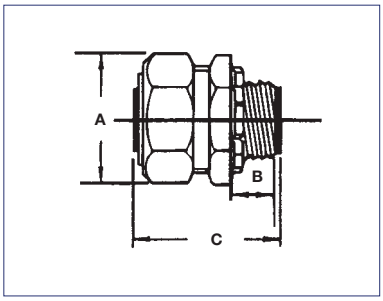
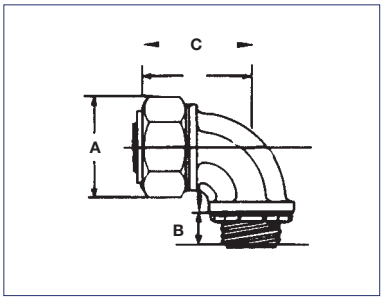
Liquid-Tight Conduit
Malleable Iron Connectors



Technical Specifications

- Heavy duty malleable iron.
- Zinc electroplated for corrosion resistance.
- Tapered threaded hub complete with nitrile “O” ring and steel locknut.

CI6103 (-IT) / CI6116 (-IT)



IT: with insulated throat.

* See p. G27 for label and packaging detail

Squarelock with Filler
5/16 in. - 2 in.

Interlock
2-1/2 in. - 6 in.

Type LT

A general purpose, flexible liquidtight steel conduit designed for a variety of installations requiring motion, vibration and bending. It offers good mechanical and moisture protection to enclosed conductors.

Construction

The flexible inner core is made from a spiral wound strip of corrosion resistant plating steel. The 1/4 through 2 inch trade sizes are squarelock formed and, with the exception of the 1/4 inch size, contain a nylon cord packing within the convolutions.

The larger sizes are constructed with a fully interlocked strip to add strength and to prevent unraveling.

A flexible yet durable PVC jacket is extruded over this core creating a liquidtight conduit resistant to most oils, acids and vapors present in industrial environments.

Refer to the Conduit — Chemical Resistance Chart beginning on p. G30.

Applications

This conduit is used extensively in the machine tool and other industrial environments where flexibility is necessary for installation and maintenance or where vibration and movement must be absorbed. The inherent sunlight resistance of PVC enables this product to be used in outdoor applications. Compatible with standard liquidtight fittings. The construction of this conduit conforms to, and is suitable for use with Sections 16 & 17.7 of the Electrical Standard for Industrial Machinery (ANSI/NFPA-79).

Working Temperatures

-20°C to 80°C

Listing / Certification

JIC — manufactured in accordance with the dimensions and specifications as outlined by the Joint Industrial Council Standard for Mass Production Equipment and Machine Tools.

Standard Colours

Machine tool grey and black. Other colours available upon request. Part numbers listed designate grey jacket.

Type LOR

JIC

This product is offered as a non-UL oil-resistant conduit that incorporates a high quality PVC jacket.

Applications

The LOR is ideally used in situations where a UL listing or CSA certification is not a factor but where a flexible conduit must withstand exposure to many harsh chemicals, oils, UV, etc. This conduit conforms to Section 17.7 of the Electrical Standard for Industrial Machinery. (ANSI/NFPA-79) Compatible with Standard Liquidtight Fittings.

Working Temperatures

-20°C to 60°C intermitting to 90°C

Standard Colours

Machine tool grey and black. Other colours available upon request. Part numbers listed designate grey jacket.

Note

For a UL listed version, consult your Regional Sales Office for Type LA/LOR.

Type EF

JIC

This flexible liquidtight conduit is a competitive grade version of our Type LT. It conforms to both the JIC standards for dimensions and general construction, and to Section 17.7 of the Electrical Standard for Industrial Machinery (ANSI/NFPA-79).

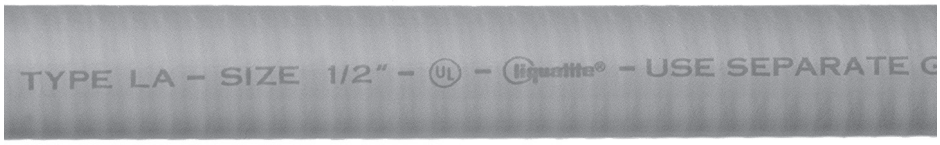
Construction

The flexible inner core is constructed from a helically formed strip of corrosion resistant steel. A liquidtight PVC jacket is then extruded over the core.

Applications

General installations requiring some movement and protection for contained conductors. Forms a liquidtight system when installed with standard fittings for use indoors or out.

Working Temperatures



-20°C to 80°C

Standard Colour

Machine tool grey

Squarelock with filler
3/8 in. - 1-1/4 in.

Interlock
1-1/2 in. - 4 in.

Type LA

A flexible liquidtight steel conduit which is both listed UL and certified CSA. It offers outstanding protection against wet, oily conditions and is permitted for use in exposed or concealed locations.

Construction

The flexible inner core is made from a spiral wound strip of heavy gauge, corrosion resistant, hot-dipped galvanized steel. The 3/8 through 1-1/4 inch trade sizes are square lock formed and include an integral bonding strip of copper that is enclosed within the convolutions throughout its entire length. The 1-1/2 through 4 inch trade sizes are designed with a fully interlocked strip.

The liquidtight jacketing material is of a high quality, rugged, flame retardant flexible PVC compound which resists oils, mild acids and exposure to sunlight. For further information, refer to the Conduit — Chemical Resistance chart beginning on p. G30.

Applications

This conduit is intended for installation with Rule 12-1300 of Canadian Electrical Code (CEC) Part I 2009.

The use of a separate bonding conductor is mandatory in accordance with CEC Rule 12-1306 for Ordinary locations.

The use of Liquidtight Flexible Conduit with sign and Outline Lighting are in accordance with CEC Rule 34-400 (2):

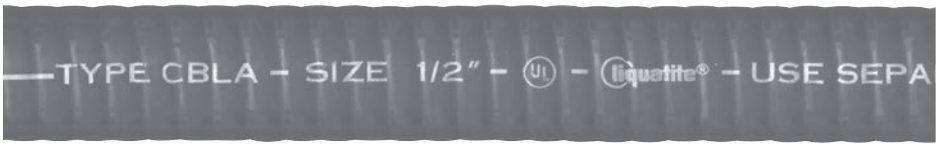
- Listed and marked for direct burial and in poured concrete
- For containment of 600-volt and lower potential circuits
- Sunlight resistant

Working Temperatures

-30 ºC to 80 ºC (dry) / 60 ºC (wet) and 70 ºC (oil)

Listing / Certification

Certified. Conforms to CSA 22.2 No. 56 for use per CEC C22.1 Section 12-1300.



Listed. Conforms to UL Standard ANSI/UL-360 for Liquidtight Flexible Steel Conduit.

Standard Colours

Machine tool grey, and black. Other colours available upon request. Blue is commonly used for computer room installations.
See TYPE CBLA on p. G8.

Type CBLA

Computer Blue LA is a liquidtight flexible steel conduit commonly used for computer room installations. The blue jacket colour easily identifies circuitry for computer power wiring.

Construction

CBLA has a flexible inner core made from a spiral wound strip of heavy gauge, hot-dipped galvanized steel. The 3/8 through 1-1/4 inch trade sizes contain an integral bonding strip of copper. The 1-1/2 and larger sizes are designed with a fully interlocked strip.

The jacketing material is a rugged flame retardant flexible blue PVC. For installations which do not allow the use of PVC, see TYPE ZHLA on p. G12.

Applications

Listed and marked for direct burial and in poured concrete.

Working Temperatures

-20°C to 60°C

Listing / Certification

Certified. Conforms to CSA 22.2 No. 56 for use per CEC C22.1 Section 12-1300

Listed. Conforms to UL Standard ANSI/UL-360 for Liquidtight Flexible Steel Conduit

Type CSA

This flexible liquidtight steel conduit is certified CSA. Its design and function is similar to that of type LA except that it cannot be used as a ground return path per CEC. It also offers a wider operating temperature range.

Construction

The flexible inner core is made from a spiral wound strip of heavy gauge, corrosion resistant, hot-dipped galvanized steel. The 3/8 through 1-1/4 inch trade sizes are cord packed.

The durable PVC flame retardant jacket is designed for good flexibility and impact resistance at low temperatures.

Applications

This conduit is intended for use according to CEC as described in section 12-1300 for dry, damp or wet locations where flexibility is necessary.

This conduit is intended for installation with Rule 12-1300 of Canadian Electrical Code (CEC) Part I 2009.

The use of a separate bonding conductor is mandatory in accordance with CEC Rule 12-1306 for Ordinary Locations.

The use of Liquidtight Flexible Conduit with sign and Outline Lighting are in accordance with CEC Rule 34-400 (2)

Working Temperatures

-40°C to 75°C

Listing / Certification

Certified. Conforms to CSA Standard C22.2, No. 56. Flame Test Rating FT-4 per CSA Standard C22.2, No. 0.3.

Standard Colour

Type ATLA

A liquidtight flexible steel conduit designed specifically for extreme hot or cold environments. The flexible inner core is identical to that found in Type LA. The specially formulated PVC jacket remains flexible at low temperatures and resists ageing at elevated temperatures. It is listed UL and certified CSA.

Construction

ATLA has a flexible inner core made from a spiral wound strip of heavy gauge, hot-dipped galvanized steel. The 3/8 through 1-1/4 inch trade sizes contain an integral bonding strip of copper. The 1-1/2 and larger sizes are designed with a fully interlocked strip.

The jacketing material is a rugged flame retardant flexible PVC resistant to weathering, UV, oils and many chemicals. Refer to the Conduit — Chemical Resistance Guide beginning on p. G30.

Applications

Designed to be used with high temperature machine tool wiring. Ideal for outdoor installations in cold
climates. This conduit is intended for installation with Rule 12-1300 of Canadian Electrical Code (CEC) Part I 2002.

The use of a separate bonding conductor is mandatory in accordance with CEC Rule 12-1306 for Ordinary locations.

The use of Liquidtight Flexible Conduit with sign and Outline Lighting are in accordance with CEC Rule 34-400 (2).

- Listed and marked for direct burial and in poured concrete
- For containment of 600-volt and lower potential circuits

Working Temperatures

-55°C to 105°C Air / 60°C Wet / 70°C Oil

Listing / Certification

Certified. Conforms to CSA 22.2 No. 56 for use per the CEC C22.1 Section 12-1300

Listed. Conforms to UL Standard ANSI/UL-360 for Liquidtight Flexible Steel Conduit

Conforms to the requirements of Section 16 & 17.7 of the ANSI/NFPA-79 Electrical Standard for Industrial Machinery.

Standard Colour

Machine tool grey

Type AT

A flexible steel conduit which uses a jacketing material specifically designed for hot or cold environments.

Applications

Type AT is well suited for exposure to extreme climatic conditions. It is also widely used on industrial process equipment such as annealing ovens, lumber kilns, foundries and refrigeration, etc. The construction of this conduit conforms to, and is suitable for use with Sections 16 and 17.7 of the Electrical Standard for Industrial Machinery (ANSI/NFPA-79). Uses standard liquidtight fittings.

Working Temperatures

-55°C to 105°C intermitting to 120°C

Standard Colour

Machine tool grey

Note

For a UL listed and CSA certified version, see TYPE ATLA on p. G10.

Type ATX

A conduit designed to withstand an extreme temperature range.

Construction

Utilizes the flexibility of our standard LT core, coupled with the advantage of a thermoplastic rubber jacket that is virtually unaffected by temperature extremes and contains no halogens. The material has a UL 94-HB flammability rating.

Applications

Used in situations where there are concerns of resistance to temperature exposure. These include heavy outdoor equipment, boilers and furnaces, etc. Refer to the Conduit — Chemical Resistance Guide beginning on p. G30.

Working Temperatures

-60°C to 150°C intermitting to 165°C

Standard Colour

Black

Type ZHLA

Non-halogen, low smoke and low flame spread are what makes Type ZHLA a proven choice for applications where limiting toxic combustion materials is an important issue. Since ZHLA is also UL Listed, it is ideal for field installation in confined, public areas such as subways, tunnels, etc.

Construction

ZHLA has a flexible inner core made from a spiral wound strip of heavy gauge, hot-dipped galvanized steel. The 3/8 in. through 1-1/4 in. trade sizes contain an integral bonding strip of copper. The 1-1/2 in. and larger sizes are designed with a fully interlocked strip. The specially formulated thermoplastic black polyurethane jacket has excellent flame resistance and low smoke and toxicity generation characteristics. It is also resistant to ozone, hydrocarbons, moderate chemicals, oils and fuels. Refer to the Conduit — Chemical Resistance Guide beginning on p. G30.

Applications

There are many situations and areas where PVC is not allowed for electrical construction. The jacketing material used for ZHLA virtually eliminates the release of acidic gases found in PVC products.

- Meets the requirements of Bombardier SMP 800-C for Toxic Gas Generation
- Meets the requirements of both ASTM E162 for Flame Spread and ASTM E662 for Smoke Generation.
- Listed and marked for direct burial and in poured concrete.
- For containment of 600 V and lower potential circuits.
- Sunlight resistant

Working Temperatures

-40°C to 80°C Air / 60°C Wet / 70°C Oil

Listing / Certification

Certified. Conforms to CSA 22.2 No. 56 for use per the CEC C22.1 Section 12-1300

Listed. Conforms to UL Standard ANSI/ UL-360 for Liquidtight Flexible Steel Conduit

Standard Colour

Black

Type CEA

This liquidtight flexible steel conduit is designed for applications where safety concerns exist regarding a material's reaction in a fire situation.

Construction

The flexible inner core of this product is made from a galvanized steel strip. As in type LT, this core contains string packing between the helical convolutions in trade sizes 3/8 in. through 2 in. The specially formulated thermoplastic polyurethane jacket has excellent flame retardant characteristics as well as low smoke and toxicity generation characteristics. Acidic gases such as hydrogen chloride, hydrogen fluoride and hydrogen bromide are virtually eliminated as products of combustion.

Applications

This product is ideally suited for installation in confined or enclosed areas where construction materials must generate very little smoke, and have a low flame spread as well as low toxic gas emissions in the event of fire. Such applications include mass transit vehicles where CEA is extensively used for wiring harnesses within and under passenger rail cars. Other applications include use in underground subway structures and tunnels.

Working Temperatures

-40°C to 80°C

Standard Colours

Grey and black. Other colours available upon request. Part numbers listed designate grey jacket.

Steel Core

Type BR

Type BR

This non-jacketed flexible steel conduit has many universal wiring applications. It is often referred to as "Greenfield" or "Reduced Wall Flex".

Construction

Type BR is formed from high corrosion resistant hot-dipped galvanized steel. Its profile and helical shape allow it to withstand impact and crushing forces.

Applications

General Use: In accordance with CEC Rule 12-1002 (1) the flexible metal conduit is permitted in or on buildings of either combustible or non-combustible constructions.

Restriction and Exception:

CEC Rule 12-1004 (a) states:"12 (3/8) trade size flexible metal conduit shall be permitted to be used for runs of not more than 1.5 m (5 ft.) for the connection of equipment." and CEC Rule 12-1004 (b) states:"12 (3/8) trade size liquidtight flexible conduit may be used as permitted by this code."

Securements with straps:

CEC Rule 12-1010 (3) states: "When flexible metal conduit is installed, it shall be secured at intervals not exceeding 1.5 m (5 ft.) and within 300 mm (12 in.) on each side of every outlet box or fitting except where flexible metal conduit is fished and except for lengths of not over 900 mm (3 ft) at terminals where flexibility is necessary."

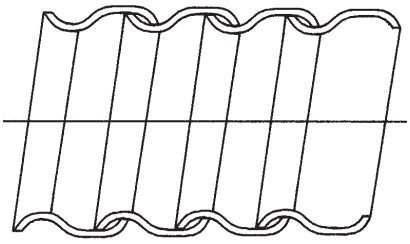
Conductor fill:

CEC Rule 12-1014 defines the maximum number of conductor, the CEC Tables 6 provides the maximum number of conductors of one size in trade sizes of conduit, CEC Table 8 provides the maximum allowable per cent conduit fill, and CEC Table 9 provides the cross-sectional areas of conduit.

Specific Use and applications:

Elevators, Hoistways, in accordance with CEC Rules 38-021 (1) (a) (1) and 38-021 (1) (a) (iv) Elevators, Cars, in accordance with CEC Rules 38-021 (1) (b) (v) Elevators, Within Machine Rooms, Control Rooms and Machinery Spaces and Control Spaces, in accordance with CEC Rule 38-021 (1) (c) (i) Elevators, Conterweights, in accordance with CEC Rule 38-021 (1) (d) Escalators, in accordance with CEC Rule 38-021 (2) Lifts for persons with physical disabilities, in accordance with CEC Rule 38-021 (3) Theater installation, in accordance with CEC Rule 44-102 (1)

Listing / Certification



Certified. (3/8 inch size only). Conforms to CSA 22.2 No. 56 for use per CEC C22.1 Section 12-1000. Meets Federal Specification WW-C-566c Type II

Listed. (sizes 3/8 through 3 in.). Conforms to UL Standard ANSI/UL-1 for Flexible Metal Conduit.

Flexible metal conduit is also permitted for use on industrial machinery where temperatures exceed the limits of liquidtight flexible conduit. (ANSI/NFPA-79) Section 16.3.4 (exception) and Section 17.9.

Type SL

This “extra-flexible” product, available in the smaller diameters, is designed for tightspot installation and where continuous flexing is required of a steel wound hose.

Construction

Type SL is helically wound from a formed strip of Electrogalvanized steel. It is sized to be used with a variety of set-screw and clamp type fittings.

Applications

Offers good mechanical protection to wiring in a variety of O.E.M. applications

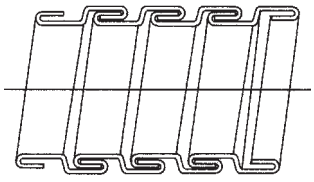
Note: Trade sizes do not apply to Type UG

Type UG



A fully-interlocked flexible steel conduit designed for high strength in “tight-spot” installations.

Construction

This conduit is manufactured from a bright tin plated steel strip which is fully interlocked at the edges to produce a strong, yet flexible product. The interlock feature does not allow the conduit to unravel if twisted and permits the conduit to retain its shape when bent. This lightweight product is compatible with many set-screw and clamp type fittings.

Applications

The bright appearance of the finished product lends itself to installations where the conduit may be visible after final assembly.

Squarelock — Type USL

Type USL

This extra-flexible steel conduit is recognized UL and CSA for use within listed and certified assemblies.

Construction

Helically formed from hot-dipped galvanized steel, type USL offers good corrosion resistance and provides excellent mechanical protection to enclosed circuits.

Applications

This product is intended as a factory installed component of various assemblies. Typical uses include modular office partitions, showcase lighting, range tops and other appliances. For component applications within Canada, ask for CSA Report #LO 4000-4875.

* Reels available, consult your Regional Sales Office

Type VJC

Vacuum jacketed steel conduit for high-flex installations

Construction

A unique vacuum extrusion process allows this product to have a thin PVC jacket which does not restrict the great flexibility characteristics of the inner core. The core material is the same as type SL. VJC is designed with dimensions that will accept standard liquid-tight fittings.

Applications

VJC is suitable for use in both static applications where a tight bend diameter is needed and in dynamic use such as machining centers and robotics.

Working Temperatures

-20°C to 80°C

Standard Colour

Black. Other colours available upon request. Consult your Regional Sales Office for details.

3F Condulet® Conduit Outlet Boxes With Covers

GUA Series

Cl. I, Div. 1 & 2, Groups B*, C, D
Cl. II, Div. 1, Groups E, F, G
Cl. II, Div. 2, Groups F, G
Cl. III
NEMA 3, 4, 7CD, 9EFG

Explosionproof
Dust-Ignitionproof
Raintight
Wet Locations

Applications:

GUA series conduit outlet boxes are installed within hazardous area conduit systems to:

- Protect conductors in threaded rigid conduit
- Act as pull and splice boxes
- Connect lengths of conduit
- Change conduit direction
- Provide access to conductors for maintenance and future system changes
- Act as mounting outlets for fixtures (with appropriate covers)
- Act as sealing fittings (with appropriate covers)

Features:

GUA conduit boxes have:

- Neoprene "O" ring standard to meet NEMA 4 requirements
- Cast ears on cover to permit easy removal and tightening
- Internal green ground screw
- Four standard mounting pads except for boxes with bottom hubs
- Threaded cover openings
- Ten different hub arrangements
- Taper threaded hubs to provide grounding continuity
- Smooth integral hub bushing protects conductor insulation when pulling
- Surface covers furnished with boxes
- Sealing covers, dome covers, and fixture hanger covers are available
- Cover threads are 12 pitch standard, 16 pitch on select aluminum shapes and sizes

Certifications and Compliances:

- NEC/CEC:
  - Class I, Division 1 & 2, Groups B*, C, D
  - Class II, Division 1, Groups E, F, G
  - Class II, Division 2, Groups F, G
  - Class III
- UL Standard: 1203
- ANSI Standard: C33.27
- CSA Standard: C22.2 No. 30
- NEMA/EEMAC 3, 4

Standard Materials:

- Bodies – *Feraloy* iron alloy
- Covers – Copper-free aluminum

Standard Finishes:

- *Feraloy* iron alloy – electrogalvanized and aluminum acrylic paint
- Aluminum – natural

Size Ranges:

- Hub – ½" to 2"
- Cover opening – 2" to 5" dia.

Options:

Description	Suffix
• Bodies – copper-free aluminum	**SA†**
• Covers – *Feraloy* iron alloy – electrogalvanized and aluminum acrylic paint	**WOD**
• GUA Form 6 (with 3" cover opening) are available with optional cover with viewing window	**VW**
• *Corro-free*™ epoxy powder coat	**S752**
• To order box less cover, add "0" to end of catalog number (i.e. GUAT260)	
• Factory installed terminal blocks mounted to DIN Rail (see page 53 for ordering information)	**DIN12-112**
• Factory installed terminal blocks directly mounted to outlet box (see page 53 for ordering information	**TB14-112**

When assembled with sealing type cover, GUA series outlet boxes provide adequate sealing for 40% fill in hazardous areas – Class I, Groups C, D; Class II, Groups E, F, G; and Class III. Seals can be made in either horizontal or vertical positions. Use *Chico*® "A" sealing compound or *Chico*® SpeedSeal only. Conductor splices or connections must not be made in enclosures where sealing compound is to be used per NEC.

For GUA Condulet® Conduit Outlet Boxes

Applications:

Threaded covers, canopies and extensions are used:

- To provide a seal in hazardous areas (sealing cover). See note below.
- To mount pendant lighting fixtures such as EVA listed in lighting section (fixture canopy)
- To mount EVA pendant lighting fixtures on cover which is then screwed into outlet box without twisting conductors (union hub cover)
- To mount pendant lighting fixtures on cover which is then screwed into outlet box as above, for wiring after fixture stem is installed (nipple cover)
- To provide means of increasing outlet box depth (threaded extension)

Features:

- Surface covers are supplied with GUA boxes
- Sealing cover has removable plug for filling enclosure with sealing compound after installation. Sealing cover meets 40% fill requirement of the NEC®. See note below.
- Fixture canopy has a threaded cover in its side to provide access for making splices or taps. Fixture with its conduit stem and canopy can be assembled and wired before installation and conductors can be spliced in canopy after it has been screwed into the body
- Cover threads are 12 pitch.

Standard Materials:

- Surface and dome covers, union hub covers, nipple covers – copper-free aluminum
- Sealing covers, fixture canopies, threaded extensions – *Feraloy*® iron alloy

Standard Finishes:

- Aluminum – natural
- *Feraloy* iron alloy – electrogalvanized and aluminum acrylic paint

Options:

Description	Suffix
Corro-free™ epoxy powder coat	**S752**
To order an iron surface cover	**WOD**

Size Ranges:

- Fixture stems – ¾"
- Body openings – 2" to 5"

Note: Depth of sealing compound in body must satisfy requirements of NEC section 501.15(C)(3). Splices and taps in sealing fittings are prohibited by NEC.

Crimp Terminals, Disconnects, and Splices

Thomas & Betts is pleased to introduce Spec-Kon® crimp terminals, disconnects, and splices. Ideal for OEM applications, the Spec-Kon® line can be used anywhere a high number of terminations are required every day, such as the wiring harness, panelboard, telecommunications, and automotive industries.

The Spec-Kon® terminal offering includes:

- A broad selection of bulk-packaged loose piece terminals in non-insulated and insulated varieties, including male and female disconnects, rings, forks, pins, blades, butt splices, wire joints and bullet connectors.
- Terminals on mylar tape for automated applications, including the new KT-2500 power tool for frequent, repeated crimps.
- The ERG-2500 ergonomic hand tool, which crimps all sizes of insulated barrel-style Spec-Kon® wire termination products.

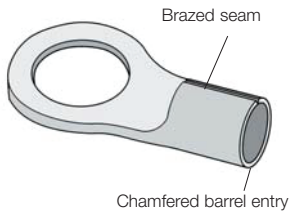
Features and Benefits of Spec-Kon® Terminals

- *Internal barrel serrations*—During crimping, the wire will cold flow into serrations, giving lower resistance connections and improving tensile strength.
- *Size marking*—Wire range is stamped on the tongue (metric and English) for easy access to the terminal size without drawings/packaging.
- *Electro tin plating*—Provides excellent corrosion resistance, superior finish for better-looking installation.
- *Ergonomic hand tool*—Ergonomically designed ERG-2500 completes a UL listed crimp while requiring substantially lower handle forces.
- *One tool for all insulated products*—Thomas & Betts offers a single tool that crimps the entire range of standard insulated terminals, disconnects, and butt splices. Many competitors require 2 to 4 tools to cover the same range.
- *Color coding*—Insulators are color coded for specific wire size (red=22-16AWG, blue=16-14AWG, yellow=12-10AWG). Red=8AWG, blue=6AWG.

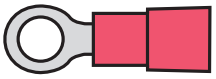


Nylon Insulated Terminals

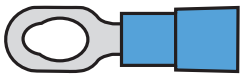
- *Sleeved barrel*—Ensures barrel does not separate during crimping.
- *Molded insulators*—Molded insulators ensure consistent shape and quality, shaped entry speeds installation and reduces wire hang up.
- *Metal insulation sleeve*—Sleeve crimps wire insulation, providing high-vibration resistance and conductor strain relief.
- *Nylon material*—Ideal for harsh environments. Provides excellent chemical, impact and abrasion resistance.
- *Ratings*—UL Listed, cULus Listed, CSA, 600 V at 105ºC.

Vinyl Insulated Terminals

- *Brazed seam*—Ensures barrel does not separate during crimping.
- *Molded funnel entry insulators*—Funnel entry speeds installation and reduces wire hang up. Molded insulators ensure consistent shape and quality every time.
- *Insulation crimp*—The insulator mouth is flared to speed installation and accommodate thicker insulated wires. Also, provides insulation support strain relief in high-vibration applications.
- *Vinyl material*—Economical, moisture resistant and flame retardant (UL94V-0)
- *Ratings*—UL Listed, cULus Listed, CSA, 600 V at 105ºC.



Non-Insulated Terminals



- *Brazed seam*—Ensures barrel does not separate during crimping.
- *Chamfered barrel entry*—Smoothing the barrel entry edge facilitates wire insertion.
- *Ratings*—UL Listed, cULus Listed, CSA, 2000 V.

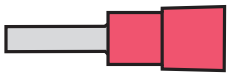
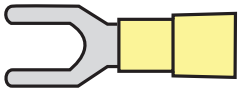
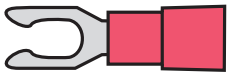
Design Features of Spec-Kon® Terminals



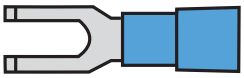
Rings
Provides the most secure and reliable connection available



Multiple-Stud Rings
Special tongue style that accommodates 3 stud sizes with one terminal



Pins
Standard insulation-style terminals for use on DIN-style/metric terminal blocks



Blades
Standard insulation-style terminals for use on DIN-style/metric terminal blocks

Forks
Fast and easy to install without removing the terminal block screw

Locking Forks
Offers the secure connection of a ring terminal with the fast and easy installation of a fork terminal

Flanged Forks
Turned-up toes provide secure connections in high-vibration applications

- Brazed Seam
- Internal Barrel Serrations

Box Quantity: (W)=250; (D)=500
For mylar tape, replace box quantity with (T). Example: KN8-8R-T.

See pages in back of catalog for complete tool information.
Tool and Die Selection Chart on page M42.

Maximum Electrical Rating: 105°C 600 Volts Max.
Terminal Material: Copper

#8 AWG on mylar tape is UL Listed.
#6 AWG on mylar tape is UL Listed.

UL File #E9809
CSA File #LR4503

Spec-Kon®
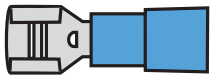
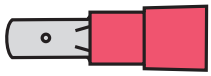
Disconnects

Features and Benefits

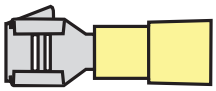


Nylon and Vinyl Disconnects

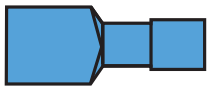
- *Sleeved barrel*—Ensures barrel does not separate during crimping.
- *Funnel entry insulators*—Funnel entry speeds installation and reduces wire hang up.
- *Partial and fully insulated*—Offers a wide range of products to meet virtually any application



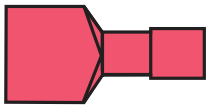
- *Metal insulation sleeve*—Sleeve crimps wire insulation, providing high-vibration resistance and conductor strain relief.
- *Ratings*—UL Listed, cULus Listed, CSA, 600 V at 105ºC for nylon and vinyl.



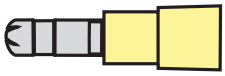
Design Features of Spec-Kon® Disconnects



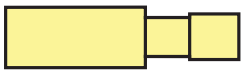
Female Disconnect
Provides easy installation and removal from male tabs and auxiliary equipment



Male Disconnect
Tab-style male disconnects are fast and reliable



Female Piggy Back
Provides the option for multiple circuits using one termination point



Fully Insulated Female
Standard female tab with the safety and reliability of complete insulation

Fully Insulated Male
Standard male tab with the safety and reliability of complete insulation

Bullet Disconnect and Receptacle
Fast and reliable alternative to the tab style featuring a lower profile to reduce space requirements

M

Spec-Kon®

Performance Requirements

Description	Wire Size (AWG)

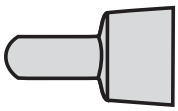
Features and Benefits



Splices / Wire Joints / Quick Splices

- Ideal for in-line splicing.
- Butt Splices available in Nylon, Vinyl, and non-insulated types.
- Vinyl Quick Splices are color-coded for wire ranges, and provide quick, easy in-line splicing and tapping.
- Nylon wire joint provides long-lasting, durable connection and can accommodate multiple leads. Rated 300 V at 105ºC.
- Available in 22-10 AWG.

Design Features of Splices, Wire Joints and Quick Splices

Butt Splice
Ideal for in-line splicing applications

Wire Joints
Provides terminating point for a group of wires running in one direction

Quick Splices
Great for quick in-line splicing and tapping without stripping the wire insulation

ERG2500

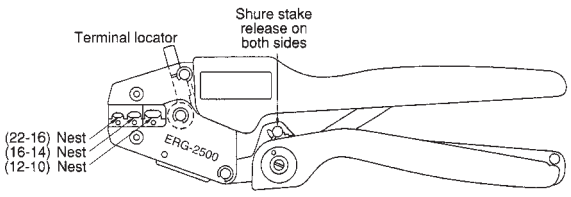
Comfort Crimp® Terminal Tools
ERG-2500, ERG-2500F, ERG-2002, ERG-2500WJ

Ergonomic ratchet style hand tool used for installing insulated Spec-Kon® terminals. Specially designed ergonomic handles distributes the crimping force evenly across the user's hands. Helps reduce the risk of Carpal Tunnel Syndrome, the cause of almost one of every two industrial injuries. Ratchet design greatly reduces handle forces over conventional hand tools and incorporates the Shure-Stake® mechanism which ensures full compression every time. Color coded die nests (insulated only) facilitates getting the right terminal in the right nest.

ERG2002



ERG2500WJ

Catalog Number	Terminal Style	Wire Range
ERG-2500	All Insulated Terminals, Splices, & Disconnects (except Flags)	22 - 10 AWG
ERG-2002	All Non-Insulated Terminals, Splices, & Disconnects	22 - 10 AWG
ERG-2500F	Nylon Fully Insulated Female Flag Disconnects	22 - 14 AWG
ERG-2500WJ	Nylon Insulated Wire Joint	22 - 10 AWG

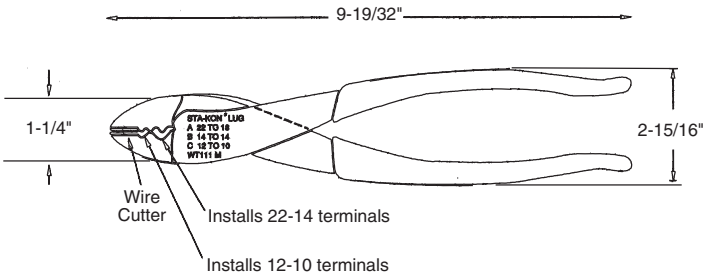
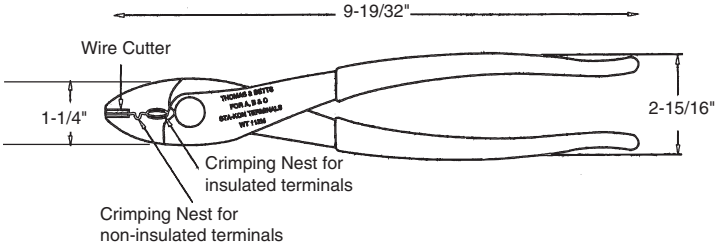
Plier Type Tools
WT111M and WT112M

WT111M



WT112M



Economical plier type hand tool used for installing non-insulated and insulated Spec-Kon® terminals. Range of sizes include 22 AWG through 10 AWG. Nose of the tool is equipped with wire cutters for convenience.

Catalog Number	Description	Std. Pkg	Wt. each
WT111M	Non-Insulated Plier Tool with Cutter for 22-10 AWG	1	1
WT112M	Insulated and Non-Insulated Plier Tool with Cutter for 22-10 AWG	1	1

- These tools are designed with wire cutters for customer convenience.

- WT111M - Installs 22-10 AWG non-insulated Spec-Kon® Terminals
- Gauging for 22-14 AWG 0.027 - 0.053 in.
- Gauging for 12-10 AWG 0.072 - 0.098 in.

- WT112 M - Installs insulated and non-insulated Spec-Kon® terminals, splices, disconnects, and wire joints 22-10 AWG
- Gauging for insulated terminals .092 - .104
- Gauging for non-insulated terminals .044 - .056

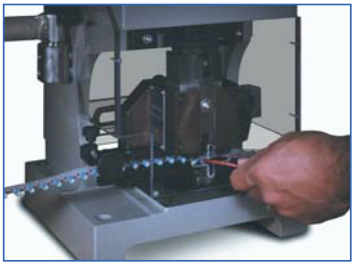
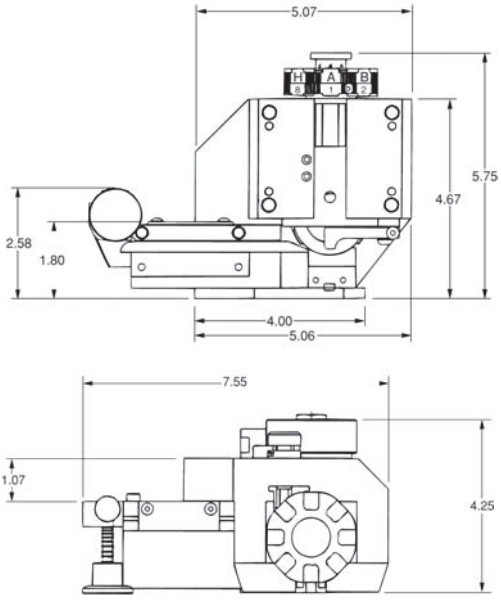
Universal Applicator



The Universal Applicator from Thomas & Betts offers a unique opportunity to use the range of quality Spec-Kon tape-mounted terminals on your own machine. If you have the press already, there's no need for additional costly investments on your plant floor to convert to another terminal. Our applicator will handle the entire range of Mylar-tape fed terminals offered in the Spec-Kon product line, and allows you more flexibility on your production line. Fast and simple. If you have the press, we've got the applicator.

The new Spec-Kon Universal Applicator is designed for quick terminal conversions in plant equipment such as the Applitek press.



Spec-Kon® Universal Applicator includes these prominent features:

- Allows industry-standard presses to use Spec-Kon® Terminal Products (AMP-compatible).
- Includes stand-alone presses.
- Also compatible with major brands of wire processing equipment.
- One single part – no additional accessories needed (excluding dies).
- Quick-change of tooling / dies in minutes – simply done with an Allen wrench.
- Convenient Crimp Height adjustment for range of crimping force fine-tuning.
- 22-10 AWG Range.
- Crimps Insulated and Uninsulated Spec-Kon® terminals.
- Crimps Nylon and Vinyl insulation terminals.
- All-metallic construction for years of use.
- Creates UL Listed Crimps.
- One year warranty, excluding dies.

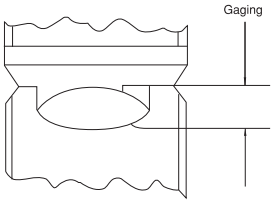
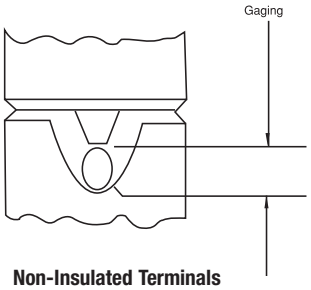
KT-2500 with reel and foot switch

Bench Mounted Tool for Mylar Tape – KT-2500



Compact, pneumatically operated bench mounted tool for crimping insulated and non-insulated Spec-Kon® terminals on mylar tape. Dies are color coded to match terminal insulation. Unit comes with fully guarded foot pedal and clear plastic safety guard over the die area for added safety. Unit incorporates the Shure-Stake® mechanism which ensures full compression every time.

Catalog Number	Description	Std. Pkg
KT-2500	Bench Mounted Crimping Tool for Mylar Tape	1



Space Requirement: 30"w x 20"h x 20"d
Weight: 55 lbs.
Wire Range: 22-10 AWG
Air Pressure: 90-125 psi input air supply

Installing Dies

ERG3000 Battery Powered Tool

Compact, portable, battery operated tool for crimping loose piece insulated and non-insulated Spec-Kon® terminals. Dies are color coded to match terminal insulation. Multi-nested die used for non-insulated which reduces setup time. Unit incorporates the Shure-Stake® mechanism which ensures full compression every time.

Catalog Number	Description	Wt. (lb.)
Standard Components	*Note: The part number ERG-3000 refers to a complete kit consisting of one ERG-3001,one ERG-3002, two ERG-3003, one ERG-3004, and one ERG-3005.*	
ERG-3001	Base Unit	11.0
ERG-3002	Hose & Tool Head Assembly	3.5
ERG-3003	NiCd Battery	1.3
ERG-3004	15 min. Battery Charge	3.0
ERG-3005	Carrying Case	6.3
ERG-3006	AC Adapter	7.0
ERG-3007	Benchmount	1.0
ERG-3008	Switch	2.5
ERG-3000	Complete Kit (see note below)	26.4

- Start button initiates crimping work cycle.
- Safety catch protects fingers when changing die sets.
- Compact tool head operates in tight spaces and weighs just 1.65 pounds to reduce fatigue.
- Swivel head improves access to small spaces.
- Control lever opens jaws for terminal installation and die change.
- Interchangeable dies accommodate Spec-Kon® terminals from 22-10 AWG.
- Easy-to-see indicator lamps show when ERG 3000 is ready to operate or in a work cycle.
- Portable base power unit houses the battery, hydraulic pump, fluid reservoir, and electronic control unit.
- Durable, flexible 8.2 foot hose connects the tool head to the base power unit for extra reach.

Technical Data

Base Unit

Working pressure	3625 psi
Power supply	NiCd Battery 12 V DC or AC/DC converter 110 V 60 Hz
Work cycle	1.5-3 seconds
Weight (with battery)	11 lb. (without tool/hose pack)
Dimensions	13.77"L x 7.28" W x 5.12" D
Temperature range	-4° to 122°F

Tool Head Assembly

Press force	3371 lbf
Weight (tool only)	1.65 lb.
Diameter of handle	1.61 in.
Length of handle	8.86 in.
Length of hose	7.22 ft.

Battery

Type	NiCd 12 V, rechargeable
Recharging time	15 min.
Number of recharges	1000

FS Boxes and Covers

Applications :

- FS boxes are CSA approved for wet locations
- FS device boxes are installed in applications that require a rugged unit to accept wiring devices, switches, electronic components and terminal blocks
- FS device boxes provide spacious accessible wiring chambers that are a convenient location to maintain or change a system; pull conductors; make splices or branch conduits
- FS device boxes, when used with an appropriate cover, provide a raintight installation
- Both weatherproof and dry location covers are available

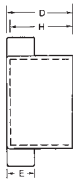
Features/Benefits :

- FS device boxes are sand casted or die casted using copper free (less than 0.004 copper content) aluminum alloys.
- FS device boxes incorporate external hub design that provides maximum wiring capacity
- FS device boxes have precision molded NPT threaded hubs allowing trouble-free field installation of rigid conduit
- FS device boxes are available in 1-7/8 in. and 2-5/8 in. depth
- Carlon® nonmetallic weatherproof FS covers are UV resistant, flame retardant and non-corrosive

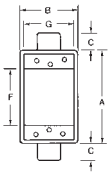
Standard Materials :

- CIFS and CIFD device boxes: sand cast, copper free aluminum (less than 0.004 copper content)
- CIFSU: die cast, copper free aluminum (less than 0.004 copper content)
- FS covers: die cast aluminum, sand cast aluminum or nonmetallic

Compliances :



Compliances as noted on each page of the catalogue include:



- CSA Certified
- UL Listed

FS Boxes and Covers

Applications :

- FS boxes are CSA approved for wet locations
- FS device boxes are installed in applications that require a rugged unit to accept wiring devices, switches, electronic components and terminal blocks
- FS device boxes provide spacious accessible wiring chambers that are a convenient location to maintain or change a system; pull conductors; make splices or branch conduits
- FS device boxes, when used with an appropriate cover, provide a raintight installation
- Both weatherproof and dry location covers are available

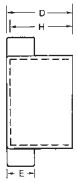
Features/Benefits :

- FS device boxes are sand casted or die casted using copper free (less than 0.004 copper content) aluminum alloys.
- FS device boxes incorporate external hub design that provides maximum wiring capacity
- FS device boxes have precision molded NPT threaded hubs allowing trouble-free field installation of rigid conduit
- FS device boxes are available in 1-7/8 in. and 2-5/8 in. depth
- Carlon® nonmetallic weatherproof FS covers are UV resistant, flame retardant and non-corrosive

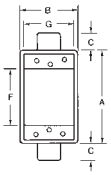
Standard Materials :

- CIFS and CIFD device boxes: sand cast, copper free aluminum (less than 0.004 copper content)
- CIFSU: die cast, copper free aluminum (less than 0.004 copper content)
- FS covers: die cast aluminum, sand cast aluminum or nonmetallic

Compliances :



Compliances as noted on each page of the catalogue include:



- CSA Certified
- UL Listed

Star Teck® (ST) – Series Fittings for Teck and ACWU Cable

Materials and Finishes
Available in a broad range of materials and finishes. Aluminum, steel, stainless steel, PVC coated.

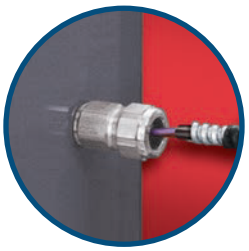
Easy Installation and Dependable Grounding
Exclusive power-grip. Provides a grip that's high up on the cable—not on the first convolution—so precise cable preparation is not critical.

Dependable Grounding
Power-Grip grounding ring is non-magnetic stainless steel. Provides 360° long-term dependable grounding. It makes immediate contact with the cable.

Dependable Service
Stainless steel retaining ring. Withstands corrosive environments. Non-magnetic.

Built-in O-Ring
provides 360° seal even when enclosure surface is rough or uneven.

Sharp Biting Teeth
provide superior electrical bonding and allow corrosive liquids to drain away quickly.



Watertight
Tapered bushing. Cone shaped to provide a secure, tight fit while eliminating cupping or water in vertical installations.

Easy to Install in Tight Spaces
Low profile gland nut fits tight spaces. Has grooves for screwdriver installation, and flats for a wrench. Durable and reusable with funnel entry for easy cable insertion.

Easy Installation

1. Prepare cable

2. Insert cable

3. Tighten gland nut

Warning:

Always ensure that the system is de-energized before performing any installation.

Suggested specifications for metal-clad cable or teck cable fittings in hazardous locations:

1. All metal-clad cable fittings for jacketed and non-jacketed interlocked armour cable, continuous corrugated cable or teck cable shall be approved by a nationally recognized testing laboratory, inspection agency or product evaluation organization.
2. Where corrugated-jacketed, metal-clad cable exposed to intermittent or continuous moisture is terminated into a threaded opening, the fitting shall be watertight type furnished with:

a. an elastomeric beveled bushing.

b. a funnel entry, splined gland nut.

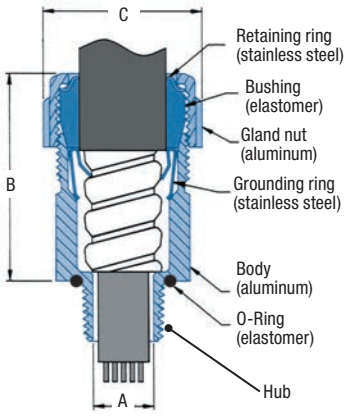
c. a non-magnetic, stainless steel grounding device with dual grounding action.

d. a taper threaded hub.

e. a hexagonal body and gland nut as manufactured by Thomas & Betts (aluminum Series ST050-464).

f. a built in sealing O-ring on hub side.

3. With single conductor cable and/or in corrosive environments, aluminum fittings such as Thomas & Betts Series ST050-464 shall be installed. Where explosion-proof or dust-ignition-proof boxes are required by the code, Star Teck® fittings must be used in conjunction with an approved sealing fitting.



Star Teck® (ST) – Series Fittings for Teck and ACWU Cable

3.5

Star Teck® (ST Series)

Star Teck® cable fittings are designed to accommodate a broad range of cables, thereby minimizing the possibility of mismatched cables and fittings in the field. They are available in hub sizes from 1/2 to 4 inches, and will handle outer jacket diameters from 0.525 to 4.340 inches.

† Only available in steel

Materials

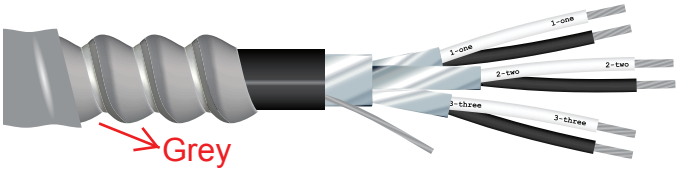
Aluminum: The above listed catalogue numbers relate to aluminum fittings. The body and gland nut on hub sizes 1/2 to 1 inch are machined from copper-free bar stock and 1-1/4 to 4 inches are made of cast copper-free aluminum

Steel: To order a steel or malleable iron fitting, add the suffix "S" to the catalogue number (example ST050-464S). The body and gland nut on hub sizes 1/2 to 1 inch are made of steel and 1-1/4 to 4 inches are made of malleable iron. Plating is electro-deposited zinc

Stainless Steel: To order a 316 stainless steel fitting, add the suffix "SS" to the catalogue number (example ST050-464SS). Only available for 1/2 thru 2 inch hub sizes

PVC-Coated Aluminum and Steel: To order, add the suffix "PVC" to the catalogue number (example ST050-464PVC or ST050-464SPVC)

Note - When using fittings on single conductor cable, aluminum fittings and aluminum locknuts must be used



Certifications

Type HLA. CSA Certified Class II, Divisions 1 and 2, Groups E, F, and G; Class III and Enclosure Type 4, Type 4X, Classes I, II and III. Suitable for Class I Division 1 locations when used in combination with a certified Class I sealing fitting. Also suitable for Class I Division 2 when installed in accordance with the applicable electrical code

Complies with IEC requirements for Class I, Zones 1 and 2, when used in combination with a certified Class I hazardous location sealing fitting

UL Listed Class I, Division 2; Class II, Division 2 and Class III. Meets sealing requirements for type 4 enclosures
PVC-coated fittings are only approved for ordinary location areas (OLA)

IQALUIT WWTP UPGRADE

DRAWING FOR APPROVAL

Ingineer : NUNAMI STANTEC

DRAWING #: AD-030

Section 23 21 16
Article 2.2.2.2 2.3.5
Plans M-302 M-500 M-602
Application : ROLL GROOVED COUPLINGS & FITTINGS
Brand : GRUVLOK
Model : 7401,7012, 7045 ,7046 & GROOVED FITTINGS
Revised # :
Supplyer : Deschenes

Acceptable for use of Div 23 piping. If intended for Div 22 piping use gaskets to be NSF 61 approved.

Pages incl. 22
Date : **2018-07-18**
By : **Mécanique Nordique Inc.**

PRODUCTS FOR GROOVED PIPING SYSTEM

The Gruvlok® System has been manufactured since the late 1960's. The Gruvlok product line has grown from standard couplings and fittings to today's extensive range of grooved product, plain-end product, butterfly valves, check valves, pump protection components, pipe preparation tools and various accessories.

Gruvlok is part of our overall commitment to provide today's piping industry with tomorrow's products.

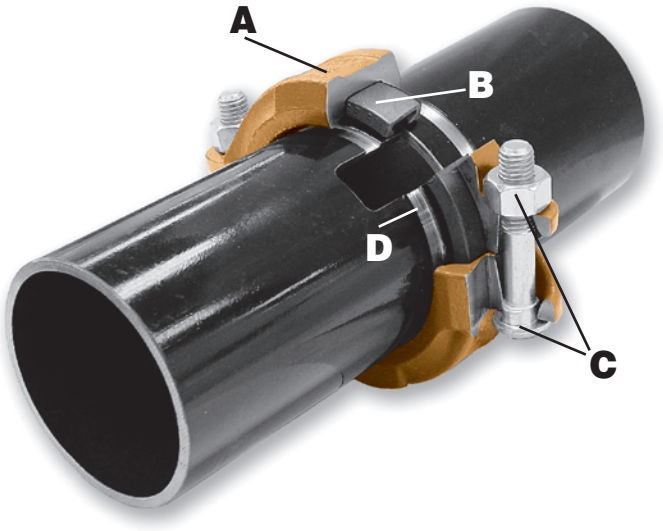
GRUVLOK® – THE ENGINEERED COUPLING



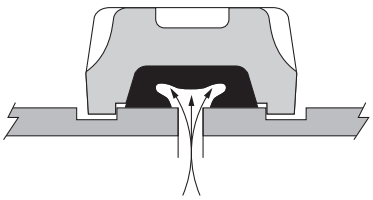
HOUSING (A) FLEXIBLE OR RIGID

The Gruvlok Coupling housing is designed to self-center around the pipe. The housing encircles and retains the gasket against the application of internal system pressure or vacuum.

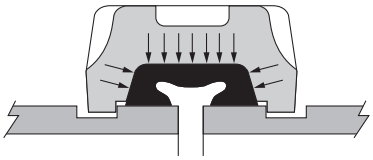
The housing key sections fit into and engage the pipe-end grooves around the entire pipe circumference, thus restraining the pipe ends from separation due to the application of internal pressure.

Flexible Couplings provide designed-in clearances between the housing key sections and the pipe grooves to permit both angular and longitudinal movement of the pipe. Rigid couplings grip the pipe and lock the joint into position.

All housings are coated with paint for general service applications. The paint serves to provide protection against normal atmospheric corrosion. However, for couplings used in corrosive environments, hot-dip galvanizing, and stainless steel are available.



GASKET (B)



The unique single piece "C" style design of the gasket has been engineered to provide a pressure responsive, leak-tight seal in both pressure and vacuum applications without the aid of external forces. The "lips" of the gasket are molded so that upon installation onto the pipe ends they provide compression against the pipe surface to establish the leak-tight seal.

The gasket cavity functions as a "pressure reservoir". Pressure within the pipe system is applied to the internal surfaces of the gasket which increases the sealing force and enhances the leak-tight seal. In vacuum systems, non-pressure-responsive seals tend to "lift off" the pipe, producing leak paths. However, the Gruvlok gasket reacts to the negative pressure (higher outside atmospheric pressure) as to improve the sealing capability of the gasket.

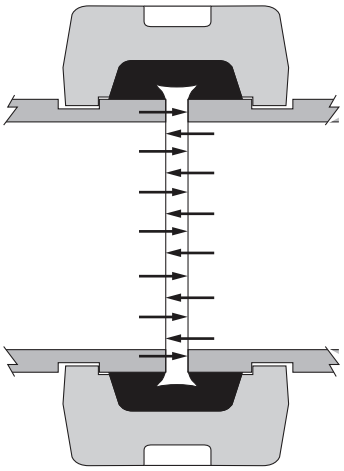
Gasket Reaction to Pressure

Gasket Reaction to Vacuum

BOLTS AND NUTS (C)

Heat treated oval neck track head bolts serve to connect and secure the housing segments together. The oval neck design prevents turning of the bolt while tightening the hex nut with a single wrench. The bolt size and corresponding wrench (or socket) size for the hex nuts are shown in the chart below.

ANSI



Bolt Size	3/8	1/2	5/8	3/4	7/8	1	1 1/4
Wrench Size	11/16	7/8	1 1/16	1 1/4	1 7/16	1 5/8	2

METRIC

Bolt Size	M10	M12	M16	M20	M22
Wrench Size	16	22	24	30	34

GROOVED PIPE ENDS (D)

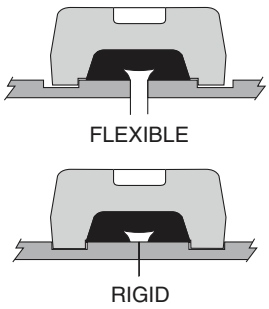
The ends of the pipe must have a groove in them which may be either cut grooved or roll grooved. The grooved pipe ends engage the coupling keys, thus, providing a self-restraining, mechanical joint capable of resisting the separation of the pipe ends due to the application of system pressure. The groove diameters must be dimensionally accurate to obtain the maximum benefit of the Gruvlok Coupling.

THE GRUVLOK® PIPING METHOD

Gruvlok couplings and grooved-end fittings are widely used for joining pipe in a wide variety of piping systems. Gruvlok couplings for grooved-end pipe are designed to provide a self-centering joint which accommodates the application of pressure, vacuum and other external forces, while limiting the burdensome need for special supports, expansion joints, etc.

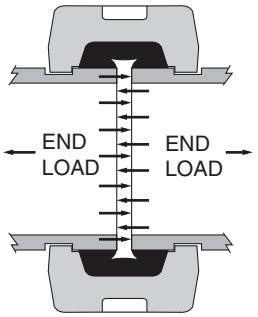
The Gruvlok piping method offers many mechanical design features which benefit the design engineer, the contractor, and the end user. Utilization of the functional characteristics of the Gruvlok coupling will aid in pipe system design and must be considered for proper installation, assembly and performance.

The design factors presented in the Gruvlok technical data section should always be referenced to when designing any grooved piping system to obtain the maximum benefit of the Gruvlok piping method.



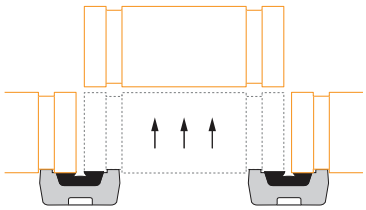
GRUVLOK FEATURES

RIGIDITY OR FLEXIBILITY



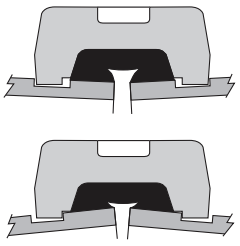
Couplings are available where rigid connections are required. Rigid couplings are clearly marked with an "X" for identification.

Couplings with flexible design allow for pipe expansion and contractions with temperature changes. The need for an expansion joint is minimized or eliminated.



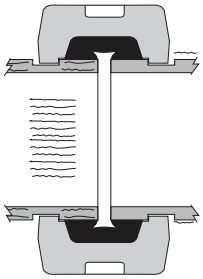
SELF RESTRAINED JOINT

The couplings engage the pipe around the entire circumference and restrain the pipe ends from separation due to pressure and other forces, up to the maximum coupling rated working pressure.



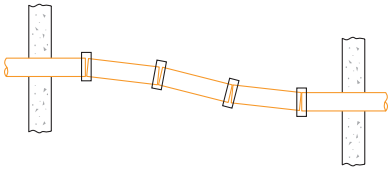
UNION AT EVERY JOINT

Gruvlok couplings can be disassembled easily permitting maintenance and servicing of the piping system. It will facilitate periodic rotation of pipe to distribute internal wear from slurries or other abrasive media.



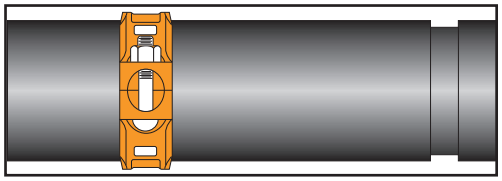
STRESS-FREE SYSTEM

Flexibility designed in the Gruvlok coupling absorbs and eliminates stress from settlement of buried pipe or those induced by seismic tremors.



MINIMIZES NOISE & VIBRATION

The resilient elastomeric gasket and pre-designed gap of the Gruvlok coupling help isolate and absorb noise and vibration, this minimizes vibration transmission.



ACCOMMODATES MISALIGNMENT AND JOINT DEFLECTION

The flexibility designed into the Gruvlok coupling will accommodate misalignments caused by imprecise location of pipe opening through walls and floors, will provide pitch for drainage piping systems and facilitate laying pipe on uneven terrain, thus permitting deflection in any direction.

GRUVLOK® COUPLINGS FOR GROOVED-END PIPE

Gruvlok couplings for grooved-end pipe are available in nominal pipe sizes 1" thru 60" and metric sizes. The variety of coupling designs provide a universal means for the connection of pipe, fittings and pipe system components. The wide assortment of Gruvlok couplings and gaskets permit selection of the most suitable combination for a specific application, thus providing the most versatile and economical pipe system installation.

MATERIAL SPECIFICATIONS

BOLTS:
SAE J429, Grade 5, Zinc Electroplated
ISO 898-1, Class 8.8, Zinc Electroplated followed by a Yellow Chromate Dip

HEAVY HEX NUTS:
ASTM A563, Grade A, Zinc Electroplated
ISO 898-2, Class 8.8, Zinc Electroplated followed by a Yellow Chromate Dip

STAINLESS STEEL BOLTS & NUTS:
Stainless steel bolts and nuts are available for the Fig. 7001, 7401, 7401-2, 7001-2, 7004, 7000 and 7400 couplings in standard 304SS, (316SS available as special order)

HOUSING:
Ductile Iron conforming to ASTM A 536, Grade 65-45-12

COATINGS:
Rust inhibiting paint Color: ORANGE (standard)
Hot Dipped Zinc Galvanized (optional)
Other Colors Available (IE: RAL3000 and RAL9000)
For other Coating requirements contact an Anvil Representative.

GASKETS: Materials
Properties as designated in accordance with ASTM D 2000

GRADE "EP" EPDM (Green/Red color code) NSF-61 Certified
-40°F to 250°F (Service Temperature Range)(-40°C to 121°C)
Recommended for water service, diluted acids, alkalies solutions, oil-free air and many other chemical services.
NOT FOR USE IN PETROLEUM APPLICATIONS.

GRADE "E" EPDM (Green color code) NSF-61 Certified
-40°F to 230°F (Service Temperature Range)(-40°C to 110°C)
Recommended for water service, diluted acids, alkalies solutions, oil-free air and many chemical services.
NOT FOR USE IN PETROLEUM APPLICATIONS.

GRADE "T" Nitrile (Orange color code)
-20°F to 180°F (Service Temperature Range)(-29°C to 82°C)
Recommended for petroleum applications. Air with oil vapors and vegetable and mineral oils.
NOT FOR USE IN HOT WATER OR HOT AIR

GRADE "O" Fluoro-Elastomer (Blue color code)
Size Range: 1" - 12" (C style only)
20°F to 300°F (Service Temperature Range)(-29°C to 149°C)
Recommended for high temperature resistance to oxidizing acids, petroleum oils, hydraulic fluids, halogenated hydrocarbons and lubricants

GRADE "L" Silicone (Red color code)
Size Range: 1" - 12" (C style only)
-40°F to 350°F (Service Temperature Range)(-40°C to 177°C)
Recommended for dry, hot air and some high temperature chemical services

GASKET TYPE:
Standard C Style
Flush Gap: 1" - 24"
End Guard: 1" - 12" (Fig. 7004 and 7377)
SlideLOK: 2" - 8"

LUBRICATION:
Standard Gruvlok
Gruvlok Xtreme™ (Do Not use with Grade "L")

WORKING PRESSURE, END LOAD, PIPE END SEPARATION & DEFLECTION FROM CENTER LINE:
Based on standard wall steel pipe with cut or roll grooves in accordance with Gruvlok specifications. Pressure ratings for light wall, stainless steel, aluminum, and ISO pipe available. See technical data section.

1 Gruvlok Couplings are identified by either the nominal ANSI pipe size in inches or pipe O.D. in millimeters (see column 2).

2 Nominal Outside Diameter of Pipe.

3 Maximum line pressure, including surge, to which a joint can be subjected. Working pressure ratings are based on standard wall steel pipe with standard cut or roll grooves in accordance with Gruvlok specifications. For Performance Data on other than standard wall pipe, refer to Technical data section. **NOTE: For one time field test only, the maximum joint working pressure may be increased to 1.5 times the figure shown unless otherwise noted.**

4 Maximum end load from all interior and/or exterior forces to which the joint can be subjected are based on standard wall steel pipe with standard cut or roll grooves in accordance with Gruvlok specifications.

5 Range of pipe end separation for roll grooved pipe, Double values shown when using cut groove pipe; see page 222 for details.

6 Maximum allowable angular deflection values from centerline when using standard roll grooved pipe; Double values shown when using cut groove pipe; see page 222 for details.

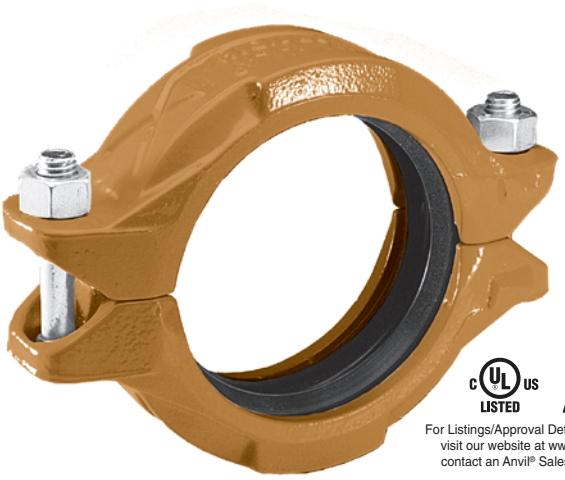
7 "X", "Y", and "Z" are external dimensions for reference purposes only.

8 The quantity of bolts per coupling.

9 Nuts must be tightened alternating and evenly to the specified bolt torque. See individual product installation instructions for additional important information.

10 Approximate weight for a fully assembled coupling with gasket, bolts, and nuts.

FIG. 7401



Rigidlok® Coupling

The Fig. 7401 Rigidlok Coupling is an ideal connector for service and applications that require a rigid connection.

The Fig. 7401 Rigidlok coupling utilizes a technologically advanced housing design that conforms to and grips the pipe.

Coupling installation is fast and easy, remove only one nut and swing the housing over the gasket and into the grooves. The exclusive Guidelok® feature automatically separates the grooved pipe ends and guides the coupling into position as the bolts are tightened. Precisely sized and oriented tines in the housing key section firmly grip the pipe. The combination of these designed in features produce a secure, rigid pipe joint connection.

The Fig. 7401 Rigidlok Coupling is designed for use with roll grooved or cut grooved standard weight and roll grooved lightweight pipe, as well as with grooved-end fittings and valves. The Rigidlok Coupling provides a rigid pipe connection allowing pipe hanging practices per ASME B31 pipe codes.

c UL us LISTED FM APPROVED

For Listings/Approval Details and Limitations, visit our website at www.anvilintl.com or contact an Anvil® Sales Representative.

The Fig. 7401 Rigidlok Coupling allows for a maximum working pressure of 750 psi (51.7 bar) when used on standard wall roll or cut grooved pipe.

MATERIAL SPECIFICATIONS

BOLTS:
SAE J429, Grade 5, Zinc Electroplated
ISO 898-1, Class 8.8, Zinc Electroplated followed by a Yellow Chromate Dip

HEAVY HEX NUTS:
ASTM A563, Grade A, Zinc Electroplated
ISO 898-2, Class 8.8, Zinc Electroplated followed by a Yellow Chromate Dip

STAINLESS STEEL BOLTS & NUTS:
304SS bolts and nuts are available as a standard option.
(316SS are available for special order).

HOUSING:
Ductile Iron conforming to ASTM A 536, Grade 65-45-12

COATINGS:
Rust inhibiting paint – Color: ORANGE (standard)
Hot Dipped Zinc Galvanized (optional)
Other Colors Available (IE: RAL3000 and RAL9000)
For other Coating requirements contact an Anvil Representative.

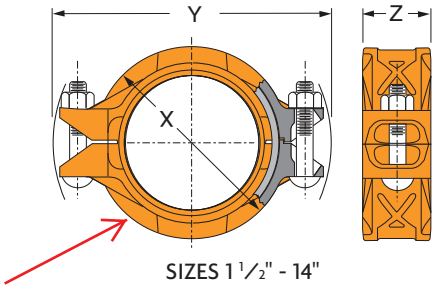
GASKETS: Materials
Properties as designated in accordance with ASTM D 2000

Grade "EP" EPDM (Green and Red color code)
-40°F to 250°F (Service Temperature Range)(-40°C to 121°C)
Recommended for water service, diluted acids, alkalies solutions, oil-free air and many other chemical services.
NOT FOR USE IN PETROLEUM APPLICATIONS.

For hot water applications the use of Gruvlok Extreme Temperature lubricant is recommended. NSF-61 Certified for cold and hot water applications up through 12".

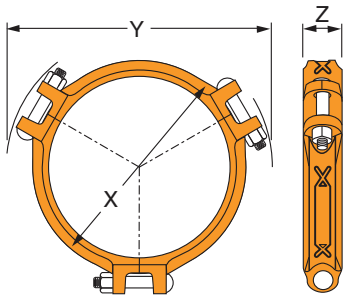
Grade "T" Nitrile (Orange color code)
-20°F to 180°F (Service Temperature Range)(-29°C to 82°C)
Recommended for petroleum applications. air with oil vapors and vegetable and mineral oils.
NOT FOR USE IN HOT WATER OR HOT AIR

Grade "O" Fluoro-Elastomer (Blue color code)
Size Range: 1" - 12" (C style only)
20°F to 300°F (Service Temperature Range)(-29°C to 149°C)
Recommended for high temperature resistance to oxidizing acids, petroleum oils, hydraulic fluids, halogenated hydrocarbons and lubricants.



Grade "L" Silicone (Red color code)
Size Range: 1" - 12" (C style only)
-40°F to 350°F (Service Temperature Range)(-40°C to 177°C)
Recommended for dry, hot air and some high temperature chemical services. Contact an Anvil Representative for availability.

GASKET TYPE:
C Style (1" - 24")
Flush Gap (1" - 24")



LUBRICATION:
Standard
Gruvlok Xtreme™ (Do Not use with Grade "L")

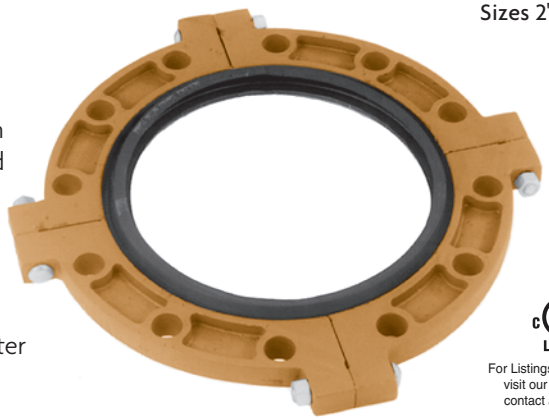
NOTE:

Range of Pipe End Seperation values are for roll grooved pipe and may be doubled for cut groove pipe.

†Maximum Working Pressure Rating is for schedule 40 steel pipe. For light wall, stainless steel, aluminum and ISO pipe pressure ratings, please refer to the technical data section.

For additional details see "Coupling Data Chart Notes" on page 17.
* Available in ANSI or metric bolt sizes only as indicated.
§ – For additional Bolt Torque information, see page 222.
See Installation & Assembly directions on page 183.
Not for use in copper systems.

FIG. 7012
Gruvlok Flanges



Sizes 2" - 12"

The Gruvlok® Fig. 7012 Flange allows direct connection of Class 125 or Class 150 flanged components to a grooved piping system. The two interlocking halves of the 2" thru 12" sizes of the Gruvlok Flange are hinged for ease of handling, and are drawn together by a latch bolt which eases assembly on the pipe. Precision machined bolt holes, key and mating surfaces assure concentricity and flatness to provide exact fit-up with flanged, lug, and wafer styles of pipe system equipment. A specially designed gasket provides a leak-tight seal on both the pipe and the mating flange face.

The 14" thru 24" sizes of the Gruvlok Fig. 7012 Flange are cast in four segments. A sleek profile gasket design allows quick and easy assembly of the Gruvlok Flange onto the pipe.

All Gruvlok Fig. 7012 Flanges have designed-in anti-rotation tines which bite into and grip the sides of the pipe grooves to provide a secure, rigid connection.

The Gruvlok Fig. 7012 Flange requires the use of a steel adapter insert when used against rubber faced surfaces, wafer/lug design valves and serrated or irregular sealing surfaces. In copper systems a phenolic adapter insert is required, in place of the steel adapter insert. (See Installation and Assembly Instructions Section or contact your Anvil Rep. for details.)

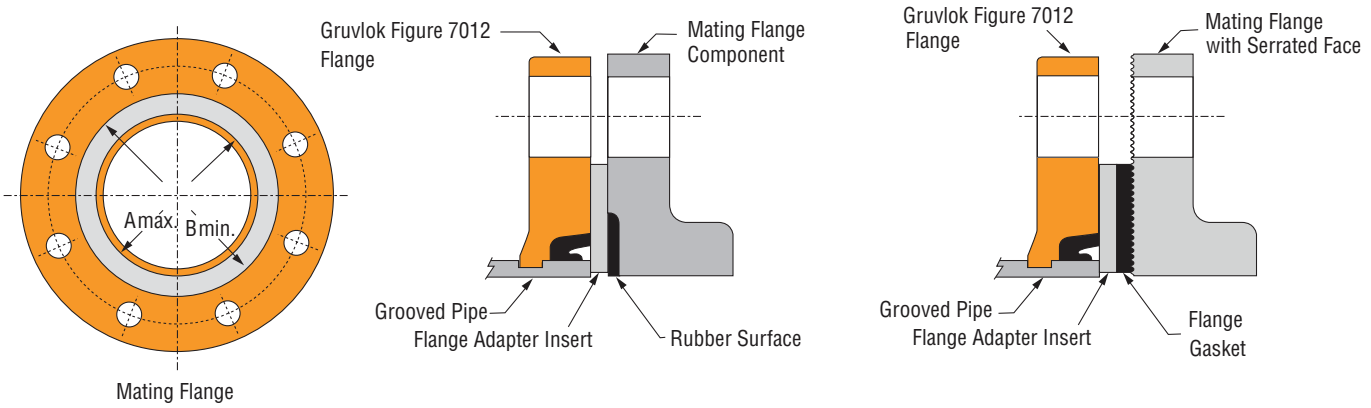
NOTES:

†Maximum Working Pressure Rating is for schedule 40 steel pipe. For light wall, stainless steel, aluminum and ISO pipe pressure ratings, please refer to the technical data section.



The Gruvlok Flange bolt hole pattern conforms to ANSI Class 150 and Class 125 flanges.

To avoid interference issues, flanges cannot be assembled directly to Series 7700 butterfly valve. Flange can be assembled to one side of series 7500 and 7600 valve only.

Mating flange bolts must be at least Intermediate Strength Bolting per ASME B16.5. Bolts with material properties equal or greater than SAE J429 Grade 5 are acceptable.

For additional details see "Coupling Data Chart Notes" on page 17.
+ PN 16 uses M24 x 90 (PN) Dimensions for bolt circle PN 10 & 16 Flange.
* Available in ANSI or metric bolt sizes only as indicated.
▼ Based on use with standard wall pipe.
§ – For additional Bolt Torque information, see page 222.
See Installation & Assembly directions on page 198-200.

FIG. 7012
Gruvlok Flanges

A. The sealing surfaces A Max. to B Min. of the mating flange must be free from gouges, undulations and deformities of any type to ensure proper sealing of the gasket.

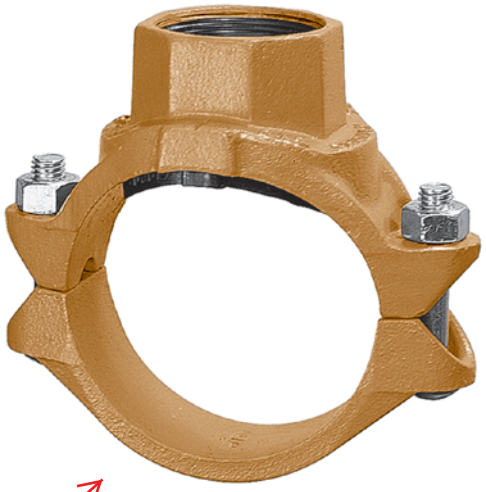
B. Gruvlok Flanges are to be assembled on butterfly valves so as not to interfere with actuator or handle operation.

C. Do not use Gruvlok Flanges within 90 degrees of one another on standard fittings because the outside dimensions may cause interference.

D. Gruvlok Flanges should not be used as anchor points for tierods across non-restrained joints.

E. Fig. 7012 Gruvlok Flange sealing gaskets require a hard flat surface for adequate sealing. The use of a Gruvlok Flange Adapter Insert is required for applications against rubber faced valves or other equipment. The Gruvlok Flange Adapter Insert is installed between the Gruvlok Flange sealing gasket and the mating flange or surface to provide a good sealing surface area.

F. Gruvlok Flanges are not recommended for use against formed rubber flanges.



G. Contact an Anvil Representative for Di-Electric Flange connections.

Applications which require a Gruvlok Flange Adapter Insert (page 49):

1. When mating to a wafer valve (lug valve), if the valve is rubber faced in the area designated by the sealing surface dimensions (A Max. to B Min.), place the Gruvlok Flange Adapter Insert between the valve and the Gruvlok flange.
2. When mating to a rubber-faced metal flange, the Gruvlok Flange Adapter Insert is placed between the Gruvlok Flange and the rubber-faced flange.
3. When mating to a serrated flange surface, a standard full-faced flange gasket is installed against the serrated flange face and the Gruvlok Flange Adapter Insert is placed between the Gruvlok Flange and the standard Flange gasket.
4. When mating to valves or other component equipment where the flange face has an insert, use procedure described in note 3.

FIG. 7045

Clamp-T, FPT Branch

c UL us LISTED FM APPROVED

For Listings/Approval Details and Limitations, visit our website at www.anvilintl.com or contact an Anvil® Sales Representative.

The Gruvlok Clamp-T provides a quick and easy outlet at any location along the pipe. A hole drilled or cut in the pipe to receive the locating collar of the Clamp-T is all that is required. The full, smooth outlet area provides for optimum flow characteristics.

The Clamp-T housing is specially engineered to conform to the pipe O.D. and the Clamp-T gasket providing a leak tight reliable seal in both positive pressure and vacuum conditions. The maximum working pressure for all sizes is 500 PSI (34.5 bar) when assembled on standard wall steel pipe.

The Gruvlok Clamp-T provides for a branch or cross connection in light wall or standard wall steel pipe.

The Fig. 7045 Clamp-T female pipe thread branch is available with NPT or ISO 7/1 connection and the Fig. 7046 Clamp-T has grooved-end branch connection.

Clamp-T cross connections are available in various sizes allowing greater versatility in piping design.

NOTE: Variable End Configurations are Possible — Thd x Thd and Gr. x Thd.
Sizes — 2" x 1/2" through 8" x 4"

NOTES:
2½", 5" and 6" Nom. Run pipe size Clamp-T may be used on 3" O.D., 5½" O.D. and 6½" O.D. pipe.
• Cannot be used in cross configuration.

▼ Based on use with standard wall pipe.
§ – For additional Bolt Torque information, see page 222.
See Installation & Assembly directions on page 202.
Not for use with copper systems.

GRUVLOK FITTINGS FOR GROOVED-END PIPE

Gruvlok fittings are available through 24" nominal pipe size in a variety of styles. Use the Fitting Size Table to convert nominal pipe size to corresponding pipe O.D.

These fittings are designed to provide minimum pressure drop and uniform strength.

Depending on styles and size, Gruvlok fittings are provided in various materials including ductile iron, forged steel or fabricated steel.

Pressure ratings of Gruvlok standard fittings conform to those of Fig. 7001 Gruvlok coupling.

Not for use in copper systems.

NSF/ANSI 61 UPC

Galvanized Gruvlok Fittings are NSF-61 and Low Lead Approved

c UL us LISTED FM APPROVED

For Listings/Approval Details and Limitations, visit our website at www.anvilintl.com or contact an Anvil® Sales Representative.

For the reducing tee and branches, use the value that is corresponding to the branch size. For example: for 6" x 6" x 3" tee, the branch value of 3" is 12.8 ft (3.9).

MATERIAL SPECIFICATIONS

CAST FITTINGS:

~~Ductile iron conforming to ASTM A 536, Grade 65-45-12~~

Malleable iron conforming to ASTM A 47

FABRICATED FITTINGS:

1-12" Carbon steel, Schedule 40, conforming to ASTM A 53, Grade B

14-24" Carbon steel, 0.375 wall, conforming to ASTM A 53, Grade B

COATINGS:

Rust inhibiting paint – Color: ORANGE (standard)

Hot Dipped Zinc Galvanized conforming to ASTM A 153 (optional)

Other Colors Available (IE: RAL3000 and RAL9000)

MULTI-PURPOSE

MP MULTI-PURPOSE

FOR SEALING JOINTS AND SEAMS OF HEATING & VENTILATION DUCTWORK

MULTI-PURPOSE SEALANT
"One Sealant does it all."

EXCLUSIVE FEATURES

FLEXIBLE

NON TOXIC

FLAME RESISTANT

DEPENDABILITY

FIREPROOF

ULC S-102 LISTED
FILE CR 1207

SMOKE PROOF

BELOW FREEZING APPLICATION

EACH GALLON BEARS A U.L.C. LABEL

- Will always remain flexible - 600% Elongation Cured Film.
- Will resist up to 25" Static Pressure.
- Will adhere to most dirty surfaces without conventional cleaning measures.
- No dangerous smell causing -
  Oxygen starvation
  Increased pulsation
  Eliminates headaches
- Will not flash or burn in the wet or dry state.
- Does not require special storage
- Special precautions not necessary. No fear of explosions.
- You have now solved your sealing problems with Multi-Purpose - economically and certain of no leaks.

MULTI-PURPOSE®

FLAME RESISTANT DUCT SEALANT

For High, Medium, or Low Velocity Connections

Technical Data And Characteristics

Solid Content: 55%
Viscosity: 1,000,000 cps
Storage life: 1 years
Flexibility: excellent
Cured film: 600% elongation
Application temperature: 5°C to 28°C / 40°F to 82°F
Service temperature range: -30°C to 65°C / -22°F to 150°F
Freeze/thaw stability: passes 5 cycles
Color: grey
Coverage: up to 600 lineal feet per gallon
Static pressure: up to 25 inch
Drying time: 24-72 hours (ambient)
Clean up: warm water
Toxicity: Non toxic. No dangerous smell causing oxygen starvation. No increased pulsation, eliminates headaches.

Tested in accordance with U.L.I. 723 and U.L.C. S-102	
Flame Spread Classification	7
Smoke Developed	0
Fuel contributed	0
Flash Point (Open Cup)	Nil

"The longer it's on, the stronger it gets!"

Advantages

Testing under normal conditions. Seals upon contact. Not necessary to seal the inside of ducts and joints. Will adhere to most dirty surfaces without conventional cleaning measures. Time saving application method. Once cured no possibility of leaks through drying or moisture reaction. Cleans up in moments with water, no solvents are necessary. Application of sealer after ducts are installed.

Specification

Seal all joints with a water based sealant which shall be non-toxic, non-combustible and flame resistant in a wet or dry state and in order for acceptance it shall be tested in accordance with U.L.C. S-102 / U.L.I. 723 surface burning tests. Flame spread shall not exceed 25, and smoke developed shall not exceed 50. Flash point (open cup) shall be nil. Conforms to National Building Code standard 6.2.4.6.(2).

Standard of Acceptance: Multi-Purpose® as provided by Trans Continental Equipment Ltd, Montreal, Oshawa.

240 Cordova Road, Oshawa, On, Canada L1J 1N9 Tel.: 905 579-0878 Toll Free: 800 314-9845 Fax: 905 579-2589

ChimneyFLEXible, ClipCap, ClipFlashing, ClipTee, Drop-In, Drop-Up and Quadralock are registered and/or trademarks of Trans Continental Equipment Ltd. ClipCap/ClipFlashing locking system is patented U.S. Pat No. 6145258 and Can. Pat. No. 2276674. ClipSnoutTee Patent Pending
Prices subject to inadvertent error or change without notice.

TESTED APPLICATIONS

a) High and Low Velocity Ducts, Chambers and Plenums. Sealing of all beads & joints. All types of flexible hoses.
b) Galvanized, Steel, Copper, Aluminum, PVC, Plastic, Lead, Asbestos cement, Chipboard fiber and Fibreglass ductwork and Plenums.
c) All types of insulating materials.
d) Repair of leaks on systems which are operating.
e) Repair of pipe insulation, magnesium, asbestos, fibreglass and cork.

ADVANTAGES OVER CONVENTIONAL SEALERS

1) Installation in temperatures below freezing.
2) Testing under normal conditions.
3) Seals upon contact.
4) Not necessary to seal the inside of ducts and joints.
5) Will adhere to most dirty surfaces without conventional cleaning methods.
6) Time saving application method.
7) Once cured no possibility of leaks through dryout or moisture reaction.
8) Clean up in moments with water, no solvents are necessary.
9) Application of sealer after ducts are installed.

METHOD OF APPLICATION

a) Apply a liberal coat of MP Sealant over the area to be sealed. Let dry and test up to 6" Static Pressure (S.P.)
b) Over 6" S.P. follow step #a, then wrap our special open weave tape over the area to be sealed. Overlap 2", pull tightly and then apply a second liberal coat covering all the weave tape.Let dry and test up to 25" S.P.
c) You now have a sealed joint which will be ready for testing in 24 - 72 hours.

TECHNICAL DATA

MP Sealer is a specially prepared sealant which adheres to almost anything. Once dry it is no longer soluble.
When necessary, the combination of Multi-Purpose sealer and Multi-Purpose open weave tape sets into a flexible air tight seal, which is exceptionally durable. Multi-Purpose is not intended for use as an insulating material and has no K factor.

TEMPERATURE RANGE

TEMPERATURE RANGE -	4° to 300°F / -15° to 150°C
STATIC PRESSURE -	up to 25" S.P.
FLEXIBILITY -	excellent (cured film 600% elongation)
WATER RESISTANCE -	very good
DRYING TIME -	24 - 72 hours
STORAGE LIFE -	24 months
COVERAGE -	600 Linear ft. per gal x 3" wide
COLOR -	green

SPECIFICATIONS:

FOR HIGH OR LOW VELOCITY

LOOK FOR THE LABEL

Seal all joints with a water based sealant which shall be non-toxic, non-combustible and flame resistant in a wet or dry state and in order for acceptance shall be tested in accordance with U.L.C. (S-102) (M-1980). Flame spread shall not exceed 25, and smoke developed shall not exceed 50. Flash point (open cup) - Nil. Conforms to National Building Code standard (see paragraph 6.2.4.6.(2). Each gallon shall bear a U.L.C. label.

Standard of acceptance -

MULTI-PURPOSE®

OPEN WEAVE TAPE

For H.V.A.C. Systems operating at 6"+ Static pressure

MULTI-PURPOSE® NEW OPEN WEAVE TAPE

This new tape has the following advanced properties:

a) is made of a cotton/poly or fiberglass material.
b) more open area perforation, allows Multi-Purpose® sealant to flow through the pores and homogenize with both layers.
c) this allows quicker drying time because the outside air can get to the inner layer much quicker.
d) gives a stronger and even more flexible joint.
e) Our 3" permascreen tape is one inch wider than normal permascreen tape and instead of supplying a 50 yard roll, it comes in a 100 yard roll which means you don't have to wrap around the duct joint twice, therefore you save on cutting and installation or wrapping time.

PLEASE NOTE

One gallon of MULTI-PURPOSE® sealant covers 300 linear feet x 3 inches wide (2 coats), and one roll of MULTI-PURPOSE® NEW OPEN WEAVE TAPE also covers 300 lineal feet x 3 inches wide.

With our NEW Open Weave tape, inter-action with the sealant takes place resulting in a **STRONGER** and more **FLEXIBLE** joint. This results in **ONE COMPLETE FLEXIBLE BOND.**

MULTI-PURPOSE®

DUCT SEALANT

Bulletin
Workplace Hazardous Material Information System (W.H.M.I.S.)

The new Canadian legislation and regulations concerning worker's right-to-know come into effect on October 31,1988. This system has as its key elements cautionary labelling of containers of hazardous materials, provision of Material Safety Data Sheets(MSDS's) and provision of worker's education.

Because of the difficulty of meeting the October 31, 1988 implementation date, Secondary Suppliers (users of chemical raw materials) have been granted an extention to March 15, 1989 for implementation. Reference:
Canada Gazette, Part 1, August 27, 1988.

Prior to the March 15, 1989 implementation date, to assist you in your compliance with W.H.M.I.S., Trans Continental Equipment Ltd. will apply a classified "workplace" label to all controlled products (where applicable) that we supply you with. (See note).

Also prior to March 15, 1989 you can refer to existing Trans Continental Equipment Ltd. MSDS's for precautionary and first aid measures.

NOTE: Product used by you: MULTI-PURPOSE® DUCT SEALER (GREEN or GREY).
This product does not fall under the ingredients disclosure list of over one thousand seven hundred (1700) ingredients and subsequently does not require any "workplace" label. Congratulations on using the **safest duct sealer**. Your men will be grateful knowing that special precautionary measures need not be applied when using or storing Multi-Purpose®.

May 1991.

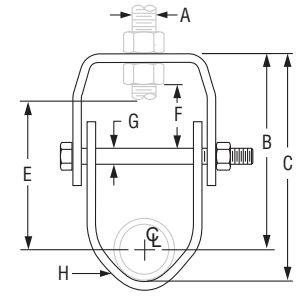
DATE 2018-07-26

BY Brendan Zrum, P.Eng

Fig. 260 (Formerly Afcon Fig. 371) Adjustable Clevis Hanger

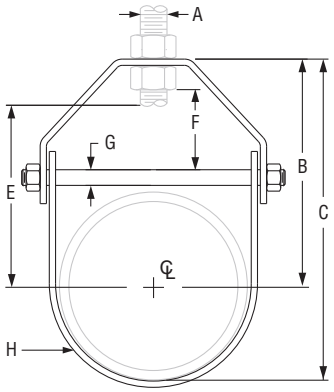
Size Range: 1/2" through 30"
Material: Carbon steel
Finish: ☐ Plain, ☑ 8" & Smaller: Zinc Plated (Hot-Dip Galvanized optional), 10" & Larger: Hot-Dip Galvanized with Zinc Plated Bolts & Nuts, or ☐ Primed, also available in ☐ Plastic or ☐ Epoxy Coated.
Service: Recommended for the suspension of stationary pipe lines.
Maximum Temperature: Plain 650° F, Galvanized and Epoxy 450° F
Approvals: Complies with Federal Specification A-A-1192A (Type 1), *WW-H-171-E (Type 1)*, ANSI/MSS SP-69 and MSS SP-58 (Type 1). FM Approved (Sizes 3/4" through 8"), UL and ULC Listed (Sizes 1/2" through 8")
Installation: Hanger load nut *above* clevis must be tightened securely to assure proper hanger performance.
Adjustment: Vertical adjustment without removing pipe may be made from 3/8" through 5 1/8", varying with the size of clevis. Tighten upper nut after adjustment.
Features:

- Design has yoke on outside of lower U-strap so yoke cannot slide toward center of bolt, thus bending of bolt is minimized.
- Sizes 5" and up have rod and two nuts instead of bolt and nut; thread length on clevis rod is such that the thread locks the nuts in place, and threads are not in shear plane.



Ordering: Specify pipe size, figure number, name and finish.
Notes:

- Punched forming holes may be present on certain sizes of this clevis hanger. These holes are solely for the purpose of manufacturing, and do not effect the structural integrity or load carrying capacities of these hangers.
- For insulated line options without shields, see Figures 260 ISS and Figure 300. For insulated line options with shields, see Figures 167 and 168. For ductile iron pipe sizes, see Figure 590.
- Fig. 260F (Felt lined) – available for use for suspension of copper (or other material) so as to prevent electrolysis between the dissimilar metals of the hanger and the pipe, tube or conduit.



Caution: When an oversize clevis is used, a pipe spacer or multispacer should be placed over clevis bolt to ensure that the lower U-strap will not move in on the bolt.

"Span" represents the maximum recommended distance between hangers on a continuous and straight run of horizontal standard weight steel pipe filled with water. In all cases, verify that chosen location of hangers does not subject hangers to a load greater than the maximum recommended load shown above. *Indicates that span represents the maximum span for water filled pipe.

* The 24" pipe size assembly includes a 1 1/4" SCH 40 pipe spacer over the 7/8" threaded rod.

** 30" pipe size: When assembled, the U-strap sits outside of the yoke.

Fig. 181

Adjustable Steel Yoke Pipe Roll

Size Range: 2 1/2" through 24"

Material: Cast iron roll; carbon steel yoke, roll rod and hex nuts

Finish: ☐ Plain, ☑ Hot-Dip Galvanized Yoke with Zinc Plated Parts or ☐ Resilient Coated

Service: For suspension of pipe from a single rod where longitudinal movement may occur because of expansion or contraction.

Maximum Temperature: 400° F at roller, 300° F at resilient coated roller.

Approvals: Complies with Federal Specification A-A-1192A (Type 43), *WW-H-171-E (Type 44)*, ANSI/MSS SP-69 and MSS SP-58 (Type 43).

Features: Advantages of pipe rollers with a protective resilient coated covering.

- Non conductive pipe rollers - prevent the passing of current from pipeline to structure.
- Corrosion resistant - for protection against severe weather conditions, moderate corrosive conditions such as marine atmospheres and weather resistant to ultra-violet radiation.
- Low coefficient of friction between pipe and resilient coated pipe roller.

How to size: If the roll is to support bare pipe, select the size directly from nominal pipe size (see below). If used with pipe covering protection saddle, see Figure 160 to 166A for size of pipe roll to be used.

Ordering: Specify pipe roll size, figure number, name and finish. Be certain to order oversized rolls when insulation and protection saddles are required.

Pipe Covering Protection Saddle

For Nominal Thickness of Covering Shown

☐ Fig. 160: 1"
☑ Fig. 161: 1½"
☐ Fig. 162: 2"
☐ Fig. 163: 2½"
☐ Fig. 164: 3"
☐ Fig. 165: 4"
☐ Fig. 165A: 4" (Alloy)
☐ Fig. 166A: 5½" (Alloy)

Size Range: ¾" through 36"

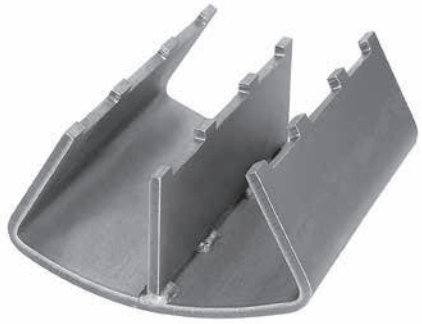
Material:

- Figs. 160, 161, 162, 163, 164, and 165 are curved carbon steel plate.
- Figs. 165A and 166A are alloy steel manufactured from ASTM A 387 Grade 22 Chrome Molybdenum steel plate.
- Figs. 165A and 166A have a welded-in center plate in all sizes.
- All other saddles have a welded-in center plate for pipe sizes 12" and larger.
- All saddles are 12" long with side edges turned up.

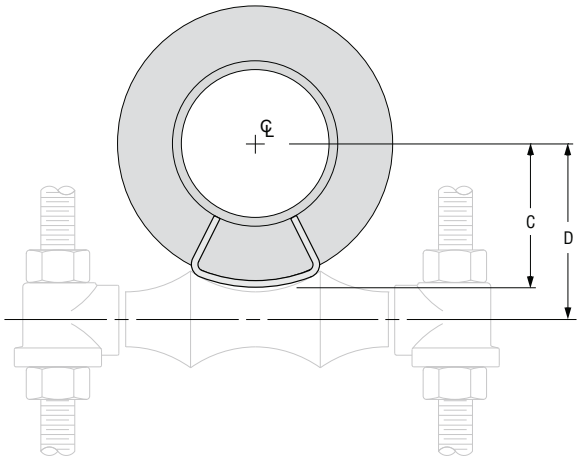
Finish: Plain

Service: Designed for use on insulated high temperature systems where heat losses are to be kept to a minimum and to protect insulation against damage.

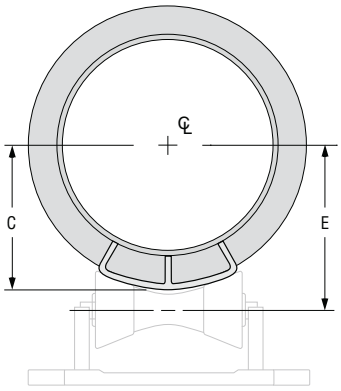
Maximum Temperature: 650° F carbon steel, 950° F alloy steel.



Approvals: Complies with Federal Specification A-A-1192A (Type 39A & 39B), *WW-H-171-E (Type 40A & 40B)*, ANSI/MSS SP-69 and MSS SP-58 (Type 39A & 39B).



Features: Permits finished, weather tight covering at all points of pipe support.



Ordering: Specify pipe size, figure number and name. Data for 42" size available on request.

Installation: It is recommended that saddle be welded to the pipe.

■ Maximum recommended loads are applicable only when saddle is used on a flat bearing surface or roller hangers and tack welded to pipe. When saddle is used with a pipe roll, the maximum load for the assembly is the smaller of the two loads.

• Saddles may require notching when used with a U-bolt.

REVIEWED by MV

Fig. 261 (Formerly Afcon Fig. 400) Extension Pipe or Riser Clamp

Size Range: 3/4" through 24"
Material: Carbon steel
Finish: ☐ Plain, ☐ Hot-Dip Galvanized with Zinc Plated Bolts & Nuts, ☑ Epoxy Coated or ☐ Painted.
Service: For support of stationary steel pipe risers, cast iron pipe or conduit. This product is not intended for use with hanger rods. For this application refer to Fig. 40 Riser Clamp, page 49.
Maximum Temperature: Plain 650° F, Galvanized and Epoxy 450° F
Approvals: Complies with Federal Specification A-A-1192A (Type 8) *WW-H-171-E (Type 8)*, ANSI/MSS SP-69 and MSS SP-58 (Type 8). UL, ULC Listed (Sizes 1 1/2" - 8").
Installation: Clamp is fitted and bolted preferably below a coupling, hub or welded lugs on steel pipe. Bolt torques should be per industry standards (see page 248). Clamp is designed for standard steel pipe O.D. and this must be considered in sizing the riser for other types of piping.
Ordering: Specify pipe size, figure number, name and finish.

Note: Refer to Technical Data Section of the Pipe Hanger Catalog for cast iron soil pipe data.

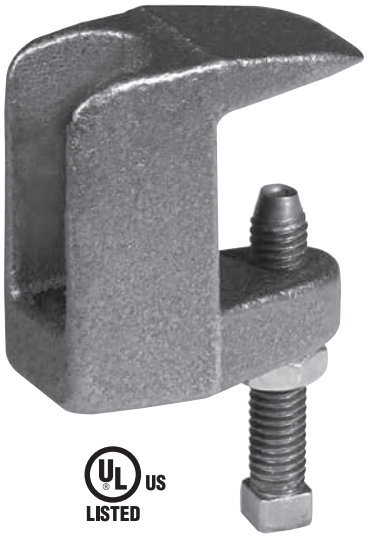

Fig. 94

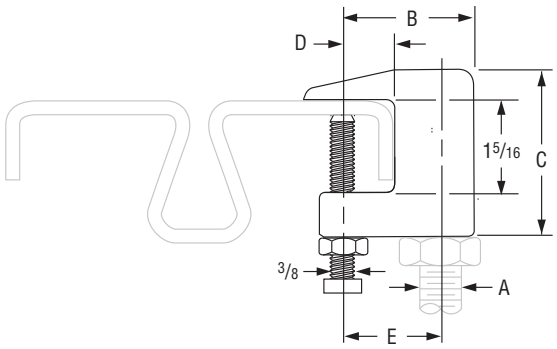
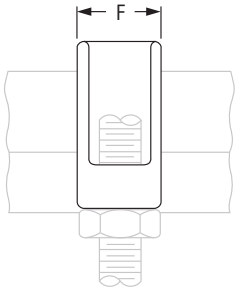
Wide Throat Top Beam C-Clamp



Size Range: 5/8" and 3/4"
Material: Ductile iron body, hardened steel cup point set screw and locknut.
Finish: ☐ Plain or ☑ Zinc Plated (Hot-Dip Galvanized optional)
Service: Recommended for use under roof installations with bar joist type construction, or for attachment to the top flange of structural shapes where the vertical hanger rod is required to be offset from the edge of the flange and where the thickness of joists or flange does not exceed 1 5/16".
Approvals: Complies with Federal Specification A-A-1192A (Type 19) *WW-H-171-E (Type 19)*, ANSI/MSS SP-69 and MSS SP-58 (Type 19), UL Listed.
How to size: Size of clamp is determined by size of rod to be used.
Installation: Follow maximum recommended set screw torque values per MSS-SP-69.
Features:



- Provides clamping to bar joists which are directly under roof installations.
- Provides for vertical hanger rod installed offset from the edge of the beam flange.
- Malleable iron body assures full thread engagement of rod.

Ordering: Specify rod size, figure number, name of clamp and finish.

PART 1: HEATING AND PLUMBING SUSPENDED PIPING

GENERAL NOTES FOR SUSPENDED PIPING

1- For individual supports, seismic restraints are required if the distance between the top of the pipe and it's attachment to the structure measures 12'' or more.

2- For suspended trapezes, seismic restraints are required if the length of the threaded rods measures 12'' or more.

3- Outside of a mechanical room, seismic restraints are required for pipes with a diameter of 2 ½'' or more.

4- Inside of a mechanical room, seismic restraints are required for pipes with a diameter of 1 ¼'' or more.

5- For natural gas, compressed air, medical gases and all other dangerous, explosive, flammable or life safety components, Seismic restraints are required regardless of the pipes diameter.

6- Each straight run with 2 or more supports requires a minimum of 2 transversal restraints and 1 longitudinal restraint.

7- The position, spacing and methods for seismic restraints have to be decided by Gestion Sismique Inc. engineers only.

8- Once decided, seismic restraints must always be installed on or next to an existing support with a threaded rod in place at maximum 4'' allowing a rod stiffener to be efficient.

9- There are flexible restraints and rigid restraints. It is forbidden to mix both of them on the same straight run.

10- For a system, it is forbidden to have restraints on two different part of a building, like anchoring to a wall and a ceiling.

RECOMMENDED SEISMIC ANCHORS FOR THREADED RODS

KWIK HUS-EZ I (KH-EZ I) Carbon Steel Screw Anchor 3.3.7

3.3.7.1 Product description

KWIK HUS-EZ I (KH-EZ I) anchors are comprised of a body with an internally threaded hex washer head. The anchor is manufactured from carbon steel and is heat treated. It has a minimum 0.0003 inch (8 µm) zinc coating in accordance with DIN EN ISO 4042. The internally threaded head is larger than the diameter of the anchor and is formed with serrations on the underside. The anchor body is formed with threads running most of the length of the anchor body. The anchor is installed in a predrilled hole with a powered impact wrench or torque wrench. The anchor threads cut into the concrete on the sides of the hole and interlock with the base material during installation. Applicable base materials include normal-weight concrete, structural lightweight concrete and lightweight concrete over metal deck.

Guide specifications

Screw anchors shall be KWIK HUS-EZ I as supplied by Hilti, Inc. Anchors shall be manufactured from heat treated carbon steel material, zinc plated to a minimum thickness of 8 µm. Anchors shall be installed using a drill bit of same nominal diameter as anchor.

Product features

- Suitable for cracked and uncracked normal-weight and lightweight concrete, and lightweight concrete over metal deck.
- Suitable for seismic and nonseismic loads.
- Quick and easy to install
- Thread design enables quality setting and exceptional load values in wide variety of base material strengths.
- Anchor is fully removable
- Anchor size is same as drill bit size.
- Suitable for reduced edge distances and spacing.

3.3.7.2 Material specifications

KWIK HUS-EZ I anchors are manufactured from carbon steel. The anchors are bright zinc plated to a minimum thickness of 8 µm.

3.3.7.3 Technical data

3.3.7.3.1 ACI 318-14 Chapter 17 design

The technical data contained in this section are Hilti Simplified Design Tables. The load values were developed using the design parameters and variables of ESR 3027 and the equations of ACI 318-14 Chapter 17. For a detailed explanation of the Hilti Simplified Design Tables, refer to section 3.1.8. Data tables from ESR 3027 are not contained in this section, but can be found at www.icc-es.org or at www.hilti.com.

PART 2: SUSPENDED HVAC DUCTS

GENERAL NOTES FOR SUSPENDED HVAC DUCTS

1- For suspended trapezes with hvac ducts, seismic restraints are required if the length of the threaded rods measures 12'' or more.

2- Seismic restraints are required on rectangular ducts with 6 square feet or more of diameter.

3- Seismic restraints are required on circular ducts with 28 inches or more of diameter.

4- Chimneys and systems with hazardous or toxic gas, needs to be restrained regardless of its diameter.

5- When installing restraints on hvac ducts, the duct needs to be squeezed with a support over and under the duct and the supports needs to be secured with metal screws every 12 inches.

6- Each straight run with 2 or more supports requires a minimum of 2 transversal restraints and 1 longitudinal restraint.

7- The position, spacing and methods for seismic restraints have to be decided by Gestion Sismique Inc. engineers only.

8- Once decided, seismic restraints must always be installed on or next to an existing support with a threaded rod in place at maximum 4'' allowing a rod stiffener to be efficient.

9- There are flexible restraints and rigid restraints. It is forbidden to mix both of them on the same straight run.

10- For a system, it is forbidden to have restraints on two different part of a building, like anchoring to a wall and a ceiling.

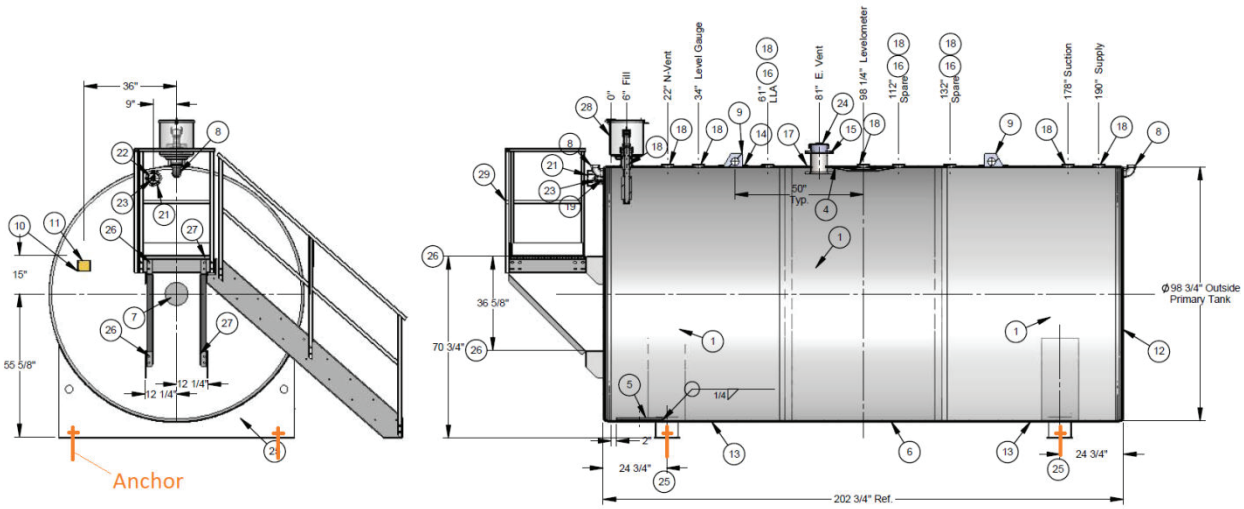
PART 3: SUSPENDED AND GROUND UNITS

1. Earthquake data

City:	***IQALUIT, Nunavut***
Latitude, Longitude	***63.748041, -68.506128***
Risk Category:	***post-disaster***
Geotechnical Site Class:	***B***
Importance factor, IE:	***1,5***
Design spectral response acceleration, Sa(0.2):	***0,087***
Acceleration-based site coefficient, Fa:	***0,8***

2. Oil Tank (25000 L)

A) Coefficient of the Lateral Seismic Force (CLS) and Seismic Force:



- Coefficient of the Lateral Seismic Force (CLS):

Equipment:	***Oil Tank***
Mass (pound):	***64665***
Location	***Exterior***
Equipment:	***Standard***
Element or Component Category:	***11B***
Element or Component Seismic Coefficient, Cp:	***1***
Response Amplification Factor, Ar:	***2,5***
Height Coefficient, Ax:	***1***
Element or Component Response Modification Coefficient, Rp:	***2,5***
Modification Factor, Sp:	***1***
Coefficient of the Lateral Seismic Force (CLS):	***0,031***

- Seismic Force:
Lateral Seismic Force = CLS* mass = **3376** pound

- Lateral Seismic Force per support point (4 support points):
Tensile force = **0** pound
Shear force = **844** pound

B) Anchorages

CONCLUSION :

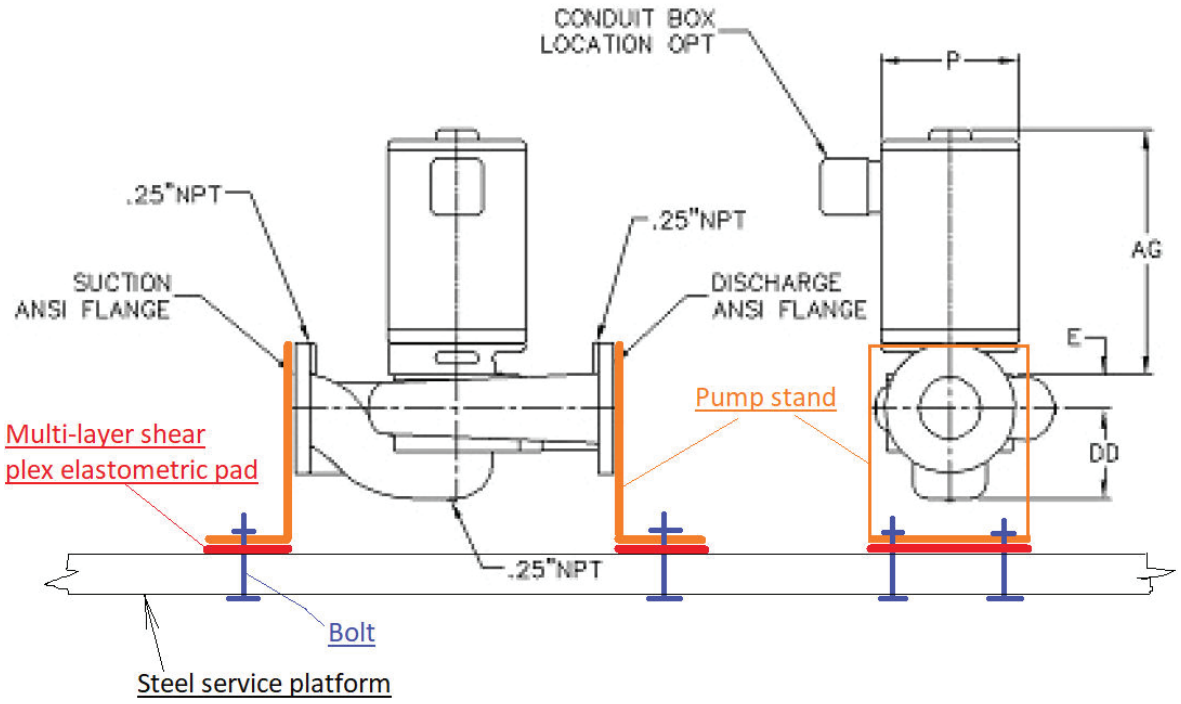
4 seismic anchors of 3/4'' diameter x 6'' embedment.
Minimum thickness of floor: 8''
Minimum edge distance: 6''

3. Pumps P-1.1 and P-1.2 (165 pound); P-1.3 and P-1.4 (142 pound);

A) Coefficient of the Lateral Seismic Force (CLS) and Seismic Force:

- Coefficient of the Lateral Seismic Force (CLS):

Equipment: ***Pump P-1.1 (165lbs)***
Mass (pound): ***165***
Location: ***Mechanical room***



Equipment: ***Standard***
Element or Component Category: ***11B***
Element or Component Seismic Coefficient, Cp: ***1***

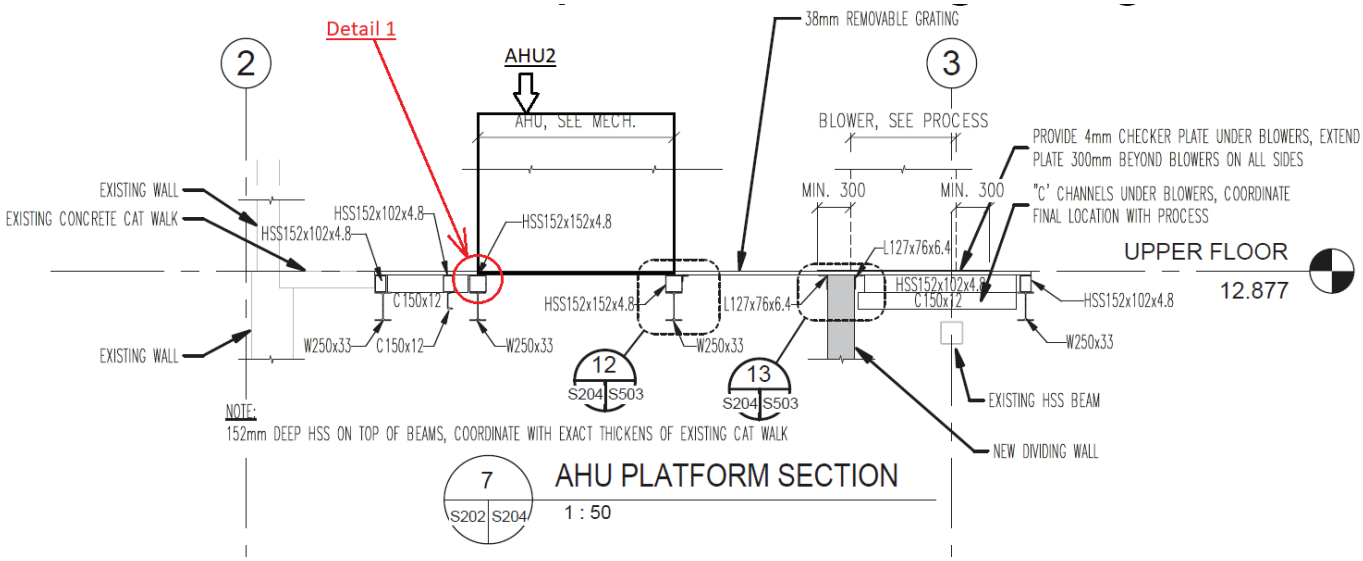
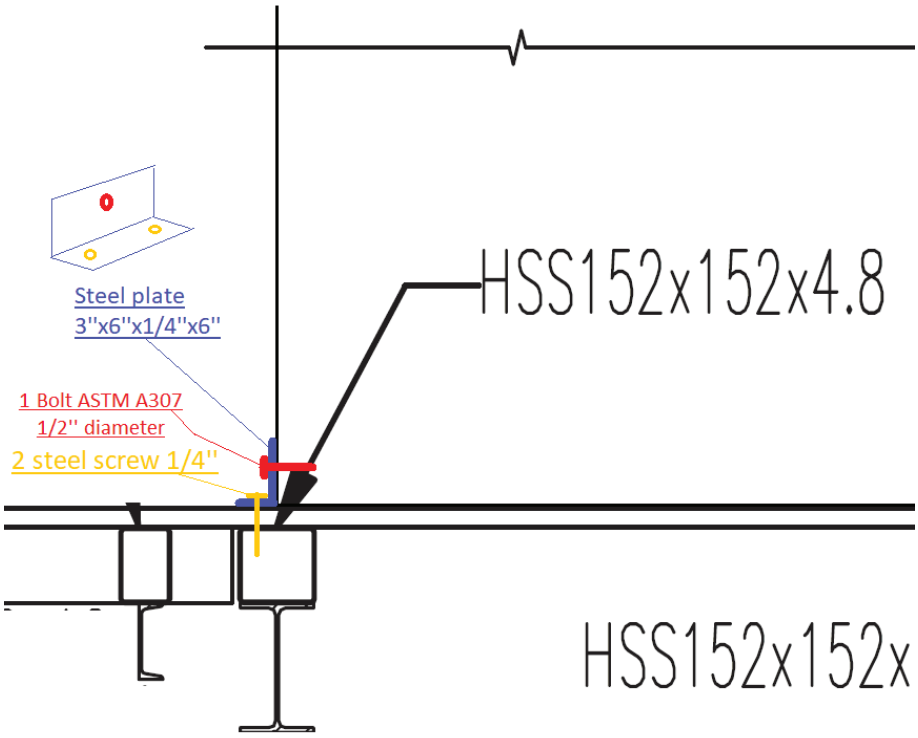
Lateral Seismic Force = CLS* mass = **462** pound
- Lateral Seismic Force per support point (8 support points):
Tensile force = **0** pound
Shear force = **57** pound

B) Anchorages

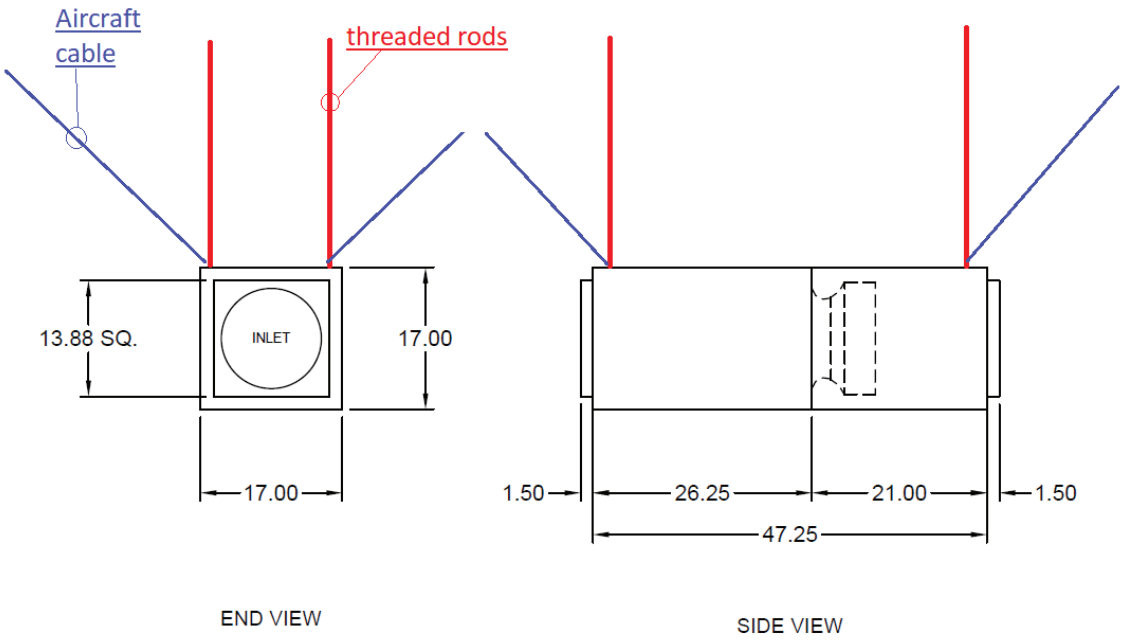


Elevation



Plan view

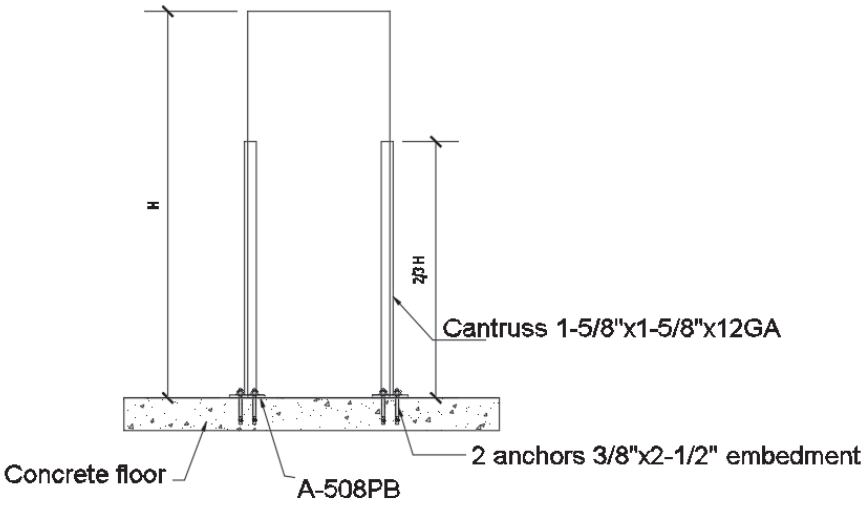
- The AHU2 is to be installed on an existing steel structure.



- Detail 1:

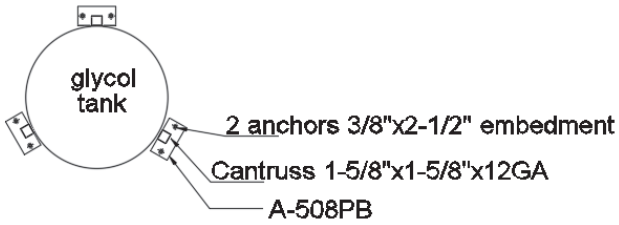
8. Fans CF-1 et CF-2; CFS=0.211; Maximum mass: 79 pound

Suspension system:
The fans need to be attached to the steel structure:
+ 4 threaded rods 3/8'' with rod stiffeners
+ 4 aircraft cables in 45 degrees 7x19 of 1/8'' diameter



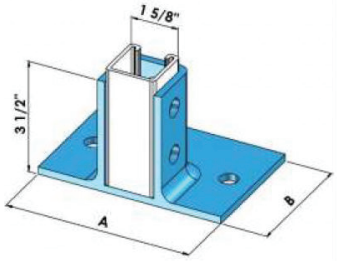
9. Heat recovery ventilator HRV-1; CLS=0.094; maximum mass: 65 pound
Seismic installation is not required. Follow the manufacturer's recommendations for installation.

10. Oil pumps P-4.1 and P-4.2; CLS=0.094; maximum mass: 100 pound (to be confirmed by contractor)
Secure the pump to the wall (in the metal studs) with 4 metal screws of 1/4'' diameter.



11. Brazed plate heat exchanger HEX-3.1 and HEX-3.2; CLS=0.094; maximum mass: 42 pound
Seismic installation is not required. Follow the manufacturer's recommendations for installation.

12. Tank of HVAC water treament systems; CLS=0.094; maximum mass: 460 pound



Diameter: 24'' ; Hight: 49'' ; Capacity: 208 Liters

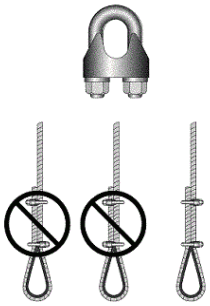
PART 4: GENERAL NOTES FOR CABLE AND ROD STIFFENER INSTALLATION



1. *Plates and cable installation*

Type of steel: 44W

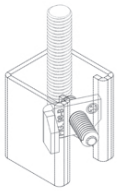
- Cable plates must be bended in 45 degrees.
- Cable plates must have a minimum of ¼ '' of thickness.
- Cable plates must be installed in the beginning of the threaded rods for seismic restraint and also installed to the concrete slab for restraint and anchorage.

2. *Cable U-bolts required installation*

2 serres-câbles minimum par câbles par extrémités et doivent être installé de la façon suivante :

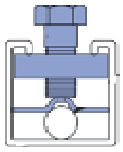
- A minimum of 2 u-bolts are required and must be installed as per above image

3. *Cable protectors*



- Cable protectors must be installed every time a cable passes through a cable plate

4. Notes on rod stiffeners

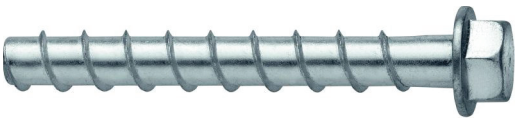


Attachment type 1:

Attachment type 2:

- Rod stiffeners must be installed on threaded rods only where seismic restraints are required and when rod length is 16'' or more for a 3/8'' rod.
- Rod stiffeners are made of a strut channel 1'' 5/8 X 1'' 5/8
- A minimum of 3 attachment are required in a rod stiffener even if the rod length is only 16''
- The first and the last attachment must begin at 2'' of the bottom and the top of the strut channel
- The spacing between attachments for a 3/8'' rod is 13''

Type of bolts: ASTM A307



PART 5: SEISMIC ANCHORS

1. ***Seismic Anchor list***

1- Simpson Strong-Tie model : Strong-bolt 2 ou Titen HD.
2- Powers Fasteners model : Power-Stud + SD2 ou Wedge-Bolt +.
3- Hilti model : Kwik Bolt TZ ou Kwik HUS-EZ mâle.
4- ITW Red-Head model : Trubolt +
5- Wej-it fastening systems Systems model : ANKR-Tite CCAT.

** Please contact us before using any other seismic anchor for verification and validation.

Seismic male screw anchor :

Seismic female screw anchor for threaded rod only:

Seismic expansion anchor :

DOWFROST HD

Inhibited Propylene Glycol-based Heat Transfer Fluid

DOWFROST* HD heat transfer fluid is a formulation of 94.0 percent propylene glycol and a specially designed package of industrial corrosion inhibitors. The fluid is dyed bright yellow to aid in leak detection. Solutions in water provide freeze protection to below -50°C (-60°F) and burst protection to below -73°C (-100°F).

Recommended use temperature range: -45°C (-50°F) to 160°C (325°F)

Suitable applications: single fluid process heating and cooling, closed-loop, water-based HVAC applications where propylene glycol solutions are preferred or required.

For health and safety information for this product, contact your Dow sales representative or call the number for your area on the second page of this sheet for a Material Safety Data Sheet (MSDS).

Typical Concentrations of DOWFROST HD Fluid Required to Provide Freeze and Burst Protection at Various Temperatures

Temperature °C (°F)	Percent DOWFROST HD Fluid Concentration Required	
	For Freeze Protection Volume %	For Burst Protection Volume %
-7 (20)	18	12
-12 (10)	29	20
-18 (0)	36	24
-23 (-10)	42	28
-29 (-20)	46	30
-34 (-30)	50	33
-40 (-40)	54	35
-46 (-50)	57	35
-51 (-60)	60	35

NOTE: These figures are examples only and may not be appropriate to your situation. Generally, for an extended margin of protection, you should select a temperature in this table that is at least 3°C (5°F) lower than the expected lowest ambient temperature. Inhibitor levels should be adjusted for solutions of less than 20% glycol. Contact Dow for information on specific cases or further assistance.
ATTENTION: These are typical numbers only and are not to be regarded as specifications. As use conditions are not within its control, Dow does not guarantee results from use of the information or products herein; and gives no warranty, express or implied.

95.0	95.0	a	a	b	154.4 (310)	52.8	1.4315

† Typical properties, not to be construed as specifications.

†† Degree Brix is a measure of the sugar concentration in a fluid and is important in fermentation and syrups applications. Although there is no sugar present in DOWFROST heat transfer fluids, the glycol affects the refractive index of the fluid in a similar fashion.

[a] Propylene glycol concentrations greater than 94% are not attainable with DOWFROST HD fluid.

[b] Freezing points are below -50°C (-60°F).

NOTE: Generally, for an extended margin of protection, you should select a temperature in this table that is at least 3°C (5°F) lower than the expected lowest ambient temperature. Inhibitor levels should be adjusted for solutions of less than 20% glycol. Contact Dow for information on specific cases or further assistance.

Non-ASME THERM-X-TROL®

General Usage

- Residential Water Heaters
- Office Buildings
- Apartment Buildings
- Dormitories
- Elderly Housing
- Extended Care Facilities
- Condominiums/Multiple Residential
- Food Service
- Laundromats
- Hospitals
- Other General-Use Hot Water Systems

ST-5, ST-8, ST-12

ST-25V through ST-210V

THERM-X-TROL Non-ASME Specifications

Maximum Working Pressure: 150 PSI. All Models listed by NSF/ANSI 61® (excluding ST-451 – ST-457);
Maximum Allowable Working Temperature: ST-5 through ST-210V: 200°F; ST-451 through ST-457: 240°F;
Standard Factory Precharge: 40 PSIG (ST-5 – ST-210V); 55 PSIG (ST-451 – ST-457)

THERMAL EXPANSION TANKS

FOR POTABLE WATER

INSTALLATION & OPERATION INSTRUCTIONS

AMTROL®

Models ST-5 through ST-210V
Models T-5 through T-12

NOTE: Inspect for shipping damage. Notify freight carrier or store where purchased immediately if damage is present. To avoid risk of personal injury and property damage, if the product appears to be malfunctioning or shows signs of corrosion, call a qualified professional immediately. Current copies of the product manual can be viewed at www.amtrol.com. Use proper safety equipment when installing.

THIS IS THE SAFETY ALERT SYMBOL. IT IS USED TO ALERT YOU TO POTENTIAL PERSONAL INJURY AND OTHER HAZARDS. OBEY ALL SAFETY MESSAGES THAT FOLLOW THIS SYMBOL TO REDUCE THE RISK OF PERSONAL INJURY AS WELL AS PROPERTY DAMAGE.

⚠WARNING **USE ONLY WITH RESIDENTIAL POTABLE WATER SYSTEMS.** Do not operate in a setting with freezing temperatures or where the temperature can exceed **200°F** and do not exceed the maximum working pressure specified for this Product. Do not use on a system with ASME-rated vessels.

⚠WARNING **READ CAREFULLY THE PRODUCT INSTALLATION, OPERATING AND MAINTENANCE MANUAL. FAILURE TO FOLLOW THE INSTRUCTIONS AND WARNINGS IN THE MANUAL MAY RESULT IN SERIOUS OR FATAL INJURY AND/OR PROPERTY DAMAGE, AND WILL VOID THE PRODUCT WARRANTY. THIS PRODUCT MUST BE INSTALLED BY A QUALIFIED PROFESSIONAL. FOLLOW ALL APPLICABLE LOCAL AND STATE CODES AND REGULATIONS, IN THE ABSENCE OF SUCH CODES, FOLLOW THE CURRENT EDITIONS OF THE NATIONAL PLUMBING CODE AND NATIONAL ELECTRIC CODE, AS APPLICABLE.**

⚠WARNING This Product, like most Products under pressure, may over time corrode, weaken and burst or explode, causing serious or fatal injury, leaking or flooding and/or property damage. To minimize risk, a licensed professional must install and periodically inspect and service the Product. A drip pan connected to an adequate drain must be installed if leaking or flooding could cause property damage. Do not locate in an area where leaking could cause property damage to the area adjacent to the appliance or to lower floors of the structure.

CALIFORNIA PROPOSITION 65 WARNING! This product contains a chemical known by the State of California to cause cancer and to cause birth defects or other reproductive harm. (California Installer/Contractor - California law requires that this notice be given to consumer/end user of this product.) **For more information: www.amtrol.com/prop65.html**

⚠WARNING **RUPTURE OR EXPLOSION HAZARD.** Do not expose Product to freezing temperatures or temperatures in excess of **200°F**. Do not adjust the pre-charge or re-pressure this Product except during installation or regular inspection. Replace the Product and do not adjust the precharge if corroded, damaged or with diminished integrity. Adjustments to pre-charge must be done at ambient temperature only. Failure to properly size the Product or follow these instructions may result in excessive strain on the system and may lead to Product failure, serious or fatal personal injury, leakage and/or property damage.

⚠WARNING A relief valve must be installed to prevent pressure in excess of local code requirement or maximum working pressure designated in the Product Manual, whichever is less. At least once every 3 years or if discharge is present, a licensed contractor should inspect the temperature and pressure relief valve and replace if corrosion is evident or the valve does not function. **FAILURE TO INSPECT THIS VALVE AS DIRECTED COULD RESULT IN UNSAFE TEMPERATURE OR PRESSURE BUILD-UP WHICH CAN RESULT IN PRODUCT FAILURE, SERIOUS INJURY OR DEATH AND/OR SEVERE PROPERTY DAMAGE AND VOID THE PRODUCT WARRANTY.**

⚠WARNING **Chlorine & Aggressive Water:** The water quality can significantly influence the life of this Product. You should test for corrosive elements, acidity, total solids and other relevant contaminants, including chlorine and treat your water appropriately to insure satisfactory performance and prevent premature failure.

PLEASE READ THE FOLLOWING INSTRUCTIONS CAREFULLY

IMPORTANT GENERAL SAFETY INFORMATION -
ADDITIONAL SPECIFIC SAFETY ALERTS APPEAR IN THE FOLLOWING INSTRUCTIONS.

Pre-Installation

1 Ensure expansion tank is sized properly for application (Figure 1).
2. Remove plastic cap from air valve.
3. With tank empty of water, adjust air precharge to match cold water supply pressure.
4. Replace and tighten plastic cap on air valve.
5. Therm-X-Trol® ST-5, ST-8, ST-12 only: Insert Turbulator into connector (optional).

⚠WARNING **FAILURE TO PROPERLY SEAL VALVE CAP WILL RESULT IN LOSS OF PRECHARGE CAUSING PRODUCT TO FAIL.**

Installation

1. Install the expansion tank on the cold water supply line to the water heater at a point between the water heater and backflow preventer or other one-way device (Figure 2).

⚠WARNING Mount tank vertically in downward position only. Ensure the piping can support the entire weight of the tank when full of water.

⚠WARNING Models ST-25V through ST-210V are floor standing and may not be hung from the piping.

2. Once the expansion tank is installed, check the cold water supply line for any leakage. Make repairs if necessary.
3. Before the initial firing of the water heater, open any hot water fixture and draw water until all air is removed from the system. Turn the water heater temperature control to desired ending temperature (see water heater instructions). Do not set temperature higher than the expansion tank maximum.
4. To relieve initial thermal expansion, slightly open a hot water faucet. Continue until water heater aquastat temperature is satisfied. Once heater is at its operating range, no further bleeding of expanded water is required.
5. The water heater and expansion tank will now be operational. The expansion tank will control pressure increases caused by thermal expansion to a level below the water heater relief valve setting.

Maintenance

A professional plumber should check the complete system, including the expansion tank, yearly and more frequently as the system ages. Checking the precharge allows a small quantity of air to escape and can result in an insufficient air charge. Always check the precharge while the tank is isolated and empty of water, and be sure to maintain the proper precharge whenever the tank is inspected.

Warranty

ST-5 through ST-25V Models: Five (5) Year Limited Warranty
ST-30V through ST-210V Models: One (1) Year Limited Warranty
T-5 through T-12 Models: One (1) Year Limited Warranty
Visit www.amtrol.com for complete warranty details.

TRI-PLEAT ULTRA

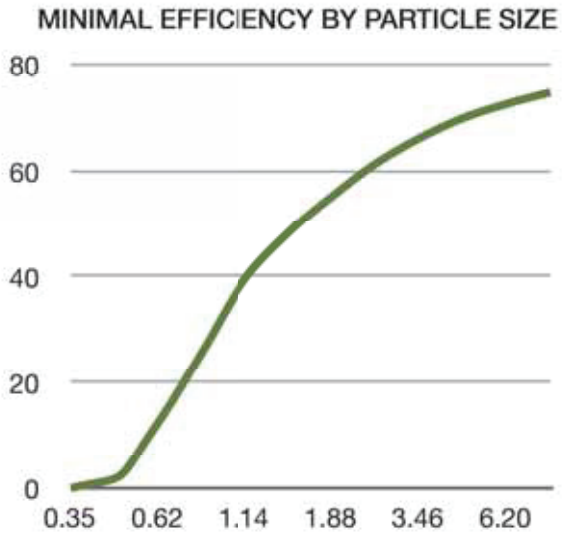
TRI DIM
FILTER CORPORATION

REACHING NEW HEIGHTS

- Mechanical MERV 8
- Low Pressure Drop

LOW RESISTANCE

TRI-PLEAT ultra



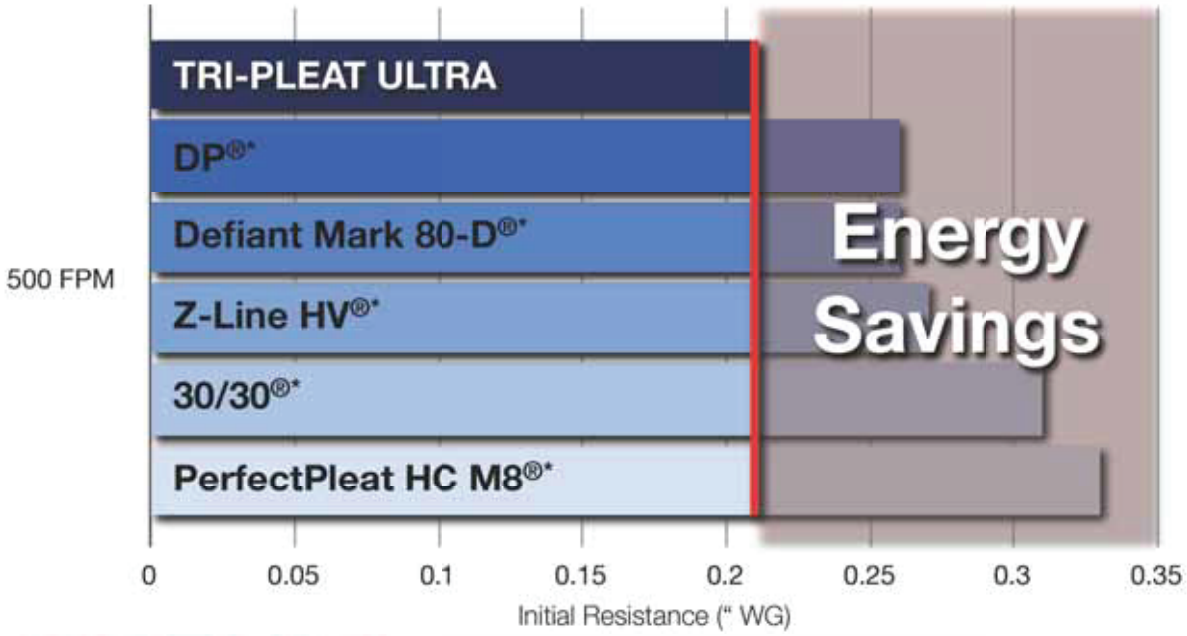
Mechanical MERV 8
Low Pressure Drop

TRI-PLEAT ULTRA OFFERS A NEW LEVEL OF PERFORMANCE

... a new benchmark for pleated air filters - featuring mechanical MERV 8 performance at a very low, energy saving pressure drop - setting the standard for performance.

MECHANICAL MEDIA

- most synthetic medias rely on an electrostatic enhancement to achieve their rated efficiency levels - this enhancement only provides high efficiency for a short period of time before it dissipates. So the performance that you paid for was not delivered.



In order to ensure the promised performance is delivered the TRI-PLEAT ULTRA was tested via ASHRAE 52.2 Appendix J. The graph (upper right) shows the results of an ASHRAE 52.2 Appendix J test that dissipates the electrostatic charge - results document a MERV 8 after the electrostatic charge is dissipated.

Why is important to you? Because you deserve the efficiency that you are paying from day 1 till the filter is changed out.

MECHANICAL

LOW PRESSURE DROP - TRI-PLEAT ULTRA offers ultra low resistance 0.21"WG at 2000 CFM (for a 24x24x2) - this is up to 50% lower than comparable products (see chart below). This equals a significant reduction in operating resistance which equals energy savings.

CONSTRUCTION - TRI-PLEAT ULTRA utilizes a moisture resistance 28-point die-cut frame with diagonal supports bonded to the media pack for extra strength and to maintain proper pleat spacing. The pleat pack is bonded to a two piece frame. The media is also bonded to a metal grid that maintains pleat shape and adds stability to the media through changes in airflow.

In addition the four-inch deep filters also use additional cardboard 'fingers' for additional strength and stability. All Tri-Pleat die cut frames are treated with an Aqua Coat treatment for added moisture resistance.

CAPACITY LEVELS - The TRI-PLEAT ULTRA is offered in two different capacities, the ULTRA ME filters are the High Capacity series manufactured with the maximum amount of media, 15 pleats per foot. The high capacity series offers the lowest resistance, highest dust holding capacity and the longest service life. The ULTRA LE filters are the Standard Capacity series and offer 11 pleats per foot. The standard capacity series offers extended surface area, long service life and high dust holding capacity.

SECTION 2
INTRODUCTION LETTER

INTRODUCTION

The intent of this manual is to familiarize the maintenance personnel with the operation, routine maintenance and minor troubleshooting of the various mechanical systems installed in the building.

Included are many section of documentation that will allow the maintenance personnel to do minor repairs and adjustments necessary to maintain the mechanical systems operating in a satisfactory manner. Used properly, the instructions included in this manual will extend the useful life of the mecanical equipment in the building, prevent breakdowns and maintain fuel and power efficiency.

Contact Johnson Controls to obtain information on specialized maintenance literature, tools and service provided.

Controls System Description

Controls for the building are provided through a digital based building management system (BMS) with local zone control.

The BMS uses separate standalone digital controllers called CPU's to control discrete building system elements. The CPUs are microprocessor based controllers with full digital programming. What this entails is that each unit is designed to control a specific mechanical system and its components. The controls sequences have been generated in a visual software language by the equipment manufacturer, controls vendor or controls contractor and downloaded to the controllers. When the sequences are run, similar to operating a digital program on a home computer, inputs and outputs from/to control devices are controlled by the sequence and hence operate the equipment.

The controllers are all interconnected on a C-bus local area network (LAN). This allows the controllers to communicate designated information, i.e. fan on, OAT, etc. To monitor and adjust the control system an operator workstation has been provided and is connected to the same network. This station is similar to a home computer with both laser and dot matrix printers plus network and dialup communication capability. The workstation operates on the Windows Professional operating system and has been loaded with Microsoft office Netscape Communicator, FTP program, and Norton Anti Virus software plus the BMS operating software and visual programming package. All components of the main mechanical systems can be monitored and alarmed through the desktop workstation using simple pull down menus and point and click graphic control. Heating system and ventilation systems controllers are standalone units with monitoring points available to the BMS Operator Work Station (OWS). These controllers have limited controllability from the BMS, however they can be adjusted at the individual controllers. The remainder of the systems, such as plumbing and fuel oil are monitored, controlled and alarmed through the BMS OWS. It is important to understand that the operator workstation does not run the building mechanical systems. It is rather the main man-machine interface for the building that allows operators to access the controllers that do the actual control.

The controllers and the system are all designed for peerless fail-safe operation. In the event that one controller fails it will not effect the operation of the other controllers in the building. In addition if the network fails the operation of each controller will not be affected. Finally in the event that a controller fails equipment will go into a fail-safe operating mode, i.e. the heating system will be enabled and the pumps and boilers will operate.

Control of the zone thermostats is not by the main digital system. Instead proportional floating or two position system microprocessor thermostats and corresponding control valves have been provided. These thermostats operate independent of each other based on the room set point. The thermostats are, however, interconnected through a single zone night set back signal from the zone digital controllers. When in night set back the local zone control can be overridden by a local switch on the thermostat.

The controls system is extensively described in Section 3.19 of the manual. Operators should review the controls sequences and system architecture to familiarize themselves with the system design, limitations and operating principals.

Finally one of the most important features of any digital control system is the ability of the system to report system status and easy modification of controls sequences. If there are problems in the controls sequences, either due to the algorithms or the design base the sequences can easily be modified under service contracts by approved contractors or by operations personnel whom have completed the required training.

1. Running Metasys Using Launcher

1.1. Downloading and Installing Launcher

- Go to the URL for your Metasys SMP, you will be greeted with the following screen to download launcher directly. The depends if you are local or remote and is written on the first page.

Otherwise you can download the launcher from the internet at:
http://www.johnsoncontrols.com/content/dam/WWW/jci/be/launcher/Launcher.msi

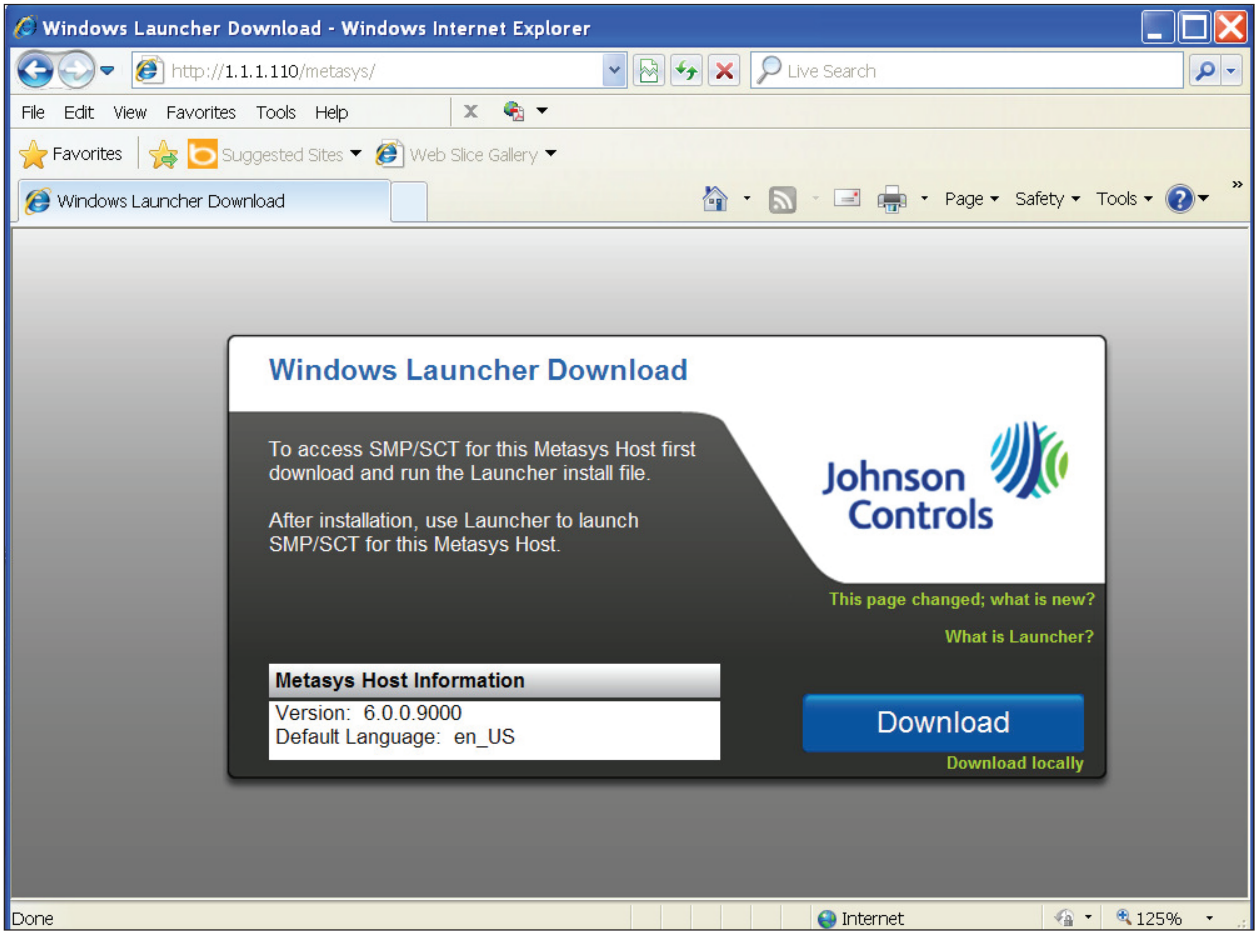

Figure 1: Launcher Download Screen

- Once downloaded, click RUN to install the Launcher program. This will require administrator privileges that can be obtained through the I.T. Department. You should have these privileges if you are using your own personal computer.
- Consult your Johnson Controls Rep if you have a MAC (Apple) Computer.

1.2. Adding A Site to Launcher

- Once installed log in to Windows with your normal username and password. You should find a link to the launcher program on the desktop. Run this link and the Launcher window will open.

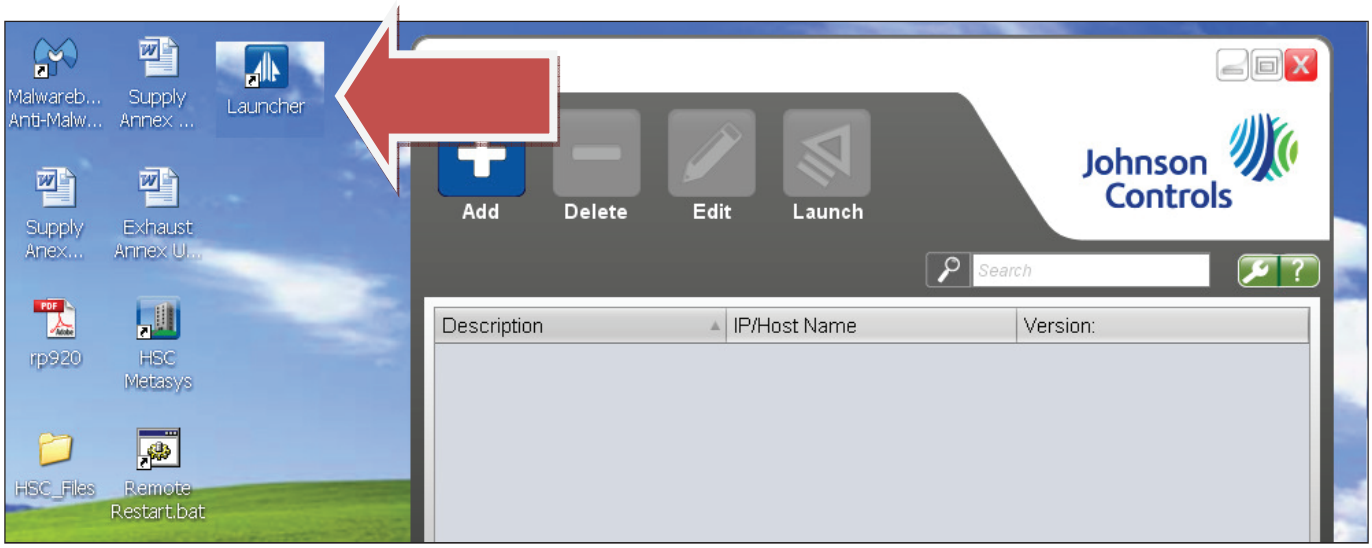

Figure 2: Desktop Launcher Icon

- Once open proceed to add your site by clicking the "Add" Button.

Figure 3: Adding a Metasys SMP to Launcher

- In the "Add New" window you can enter the Host Name or IP address of your ADS server. This will be the IP address written on the first page and depends on local or remote access. Press "Discover" to find your site and make sure your connection is working.

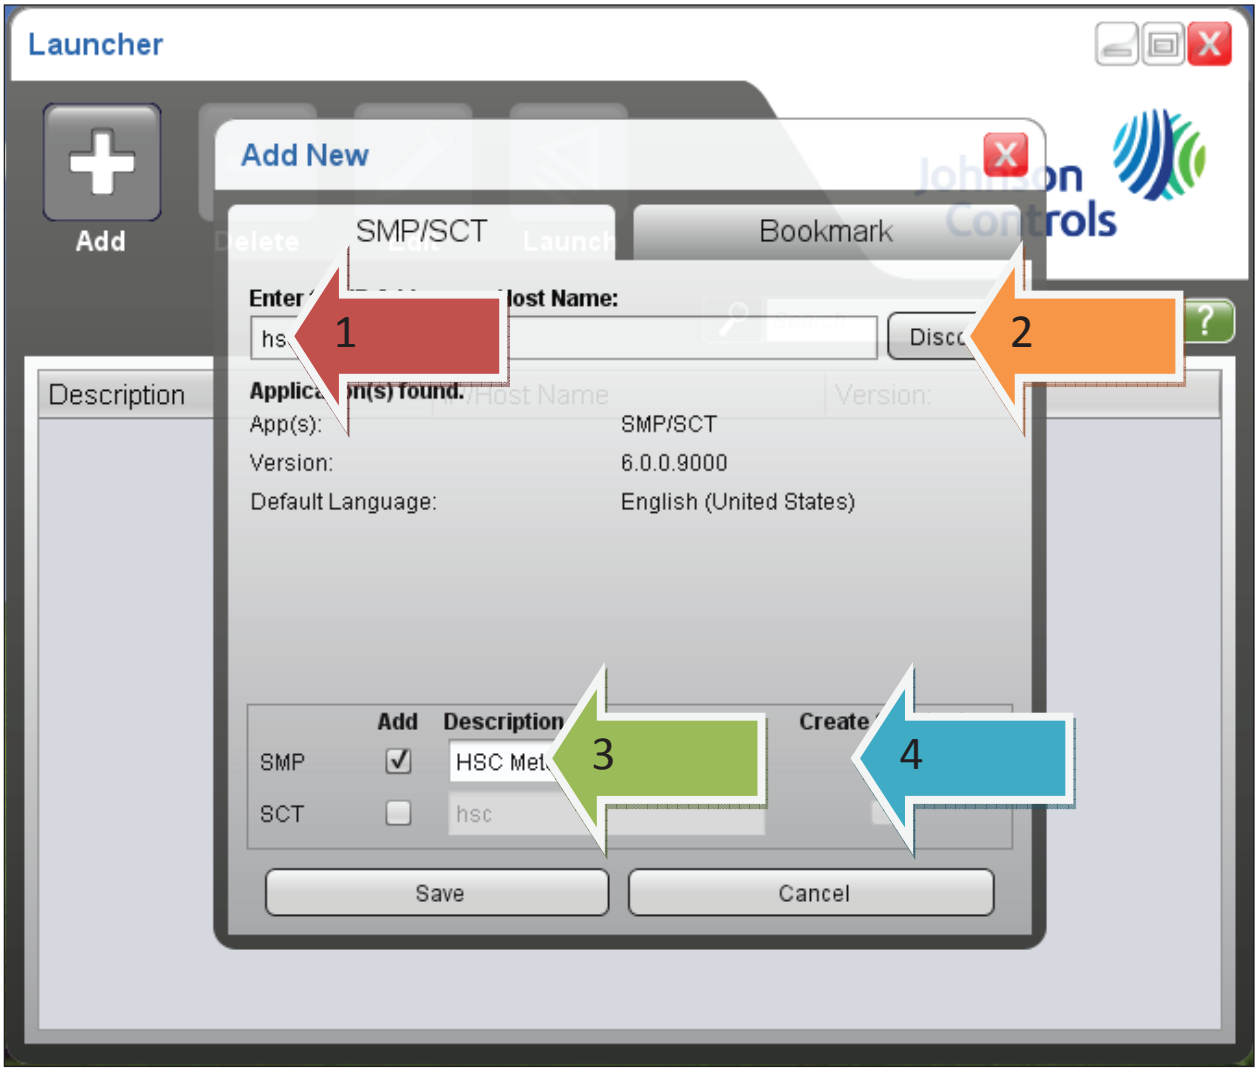

Figure 4: Launcher Add New Screen

- Once your site is found the middle section will populate with information retrieved from your site. At the bottom you can change the description and choose to create a short cut on the desktop that will be the link to your site SMP. Once ready press the save button.

- Once saved, the Launcher will download the java files required from the server. This may take a minute to download and install.

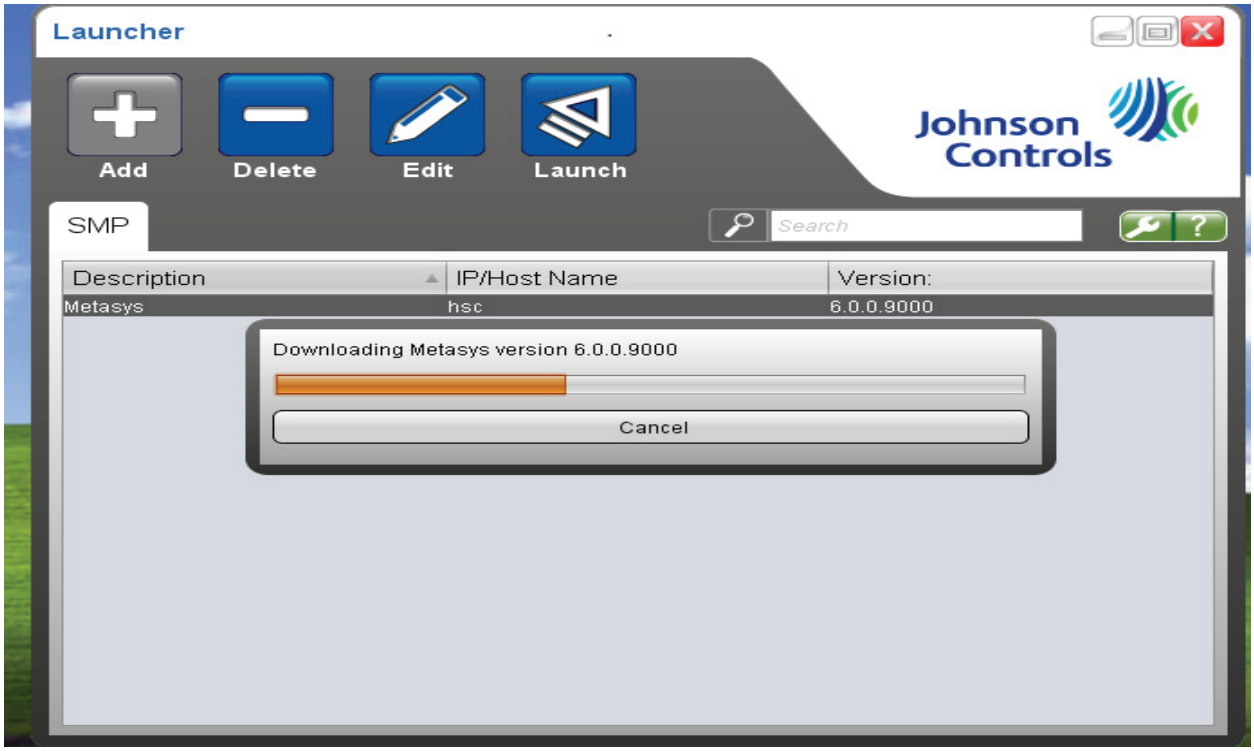

Figure 5: Downloading Private Java from Site Director

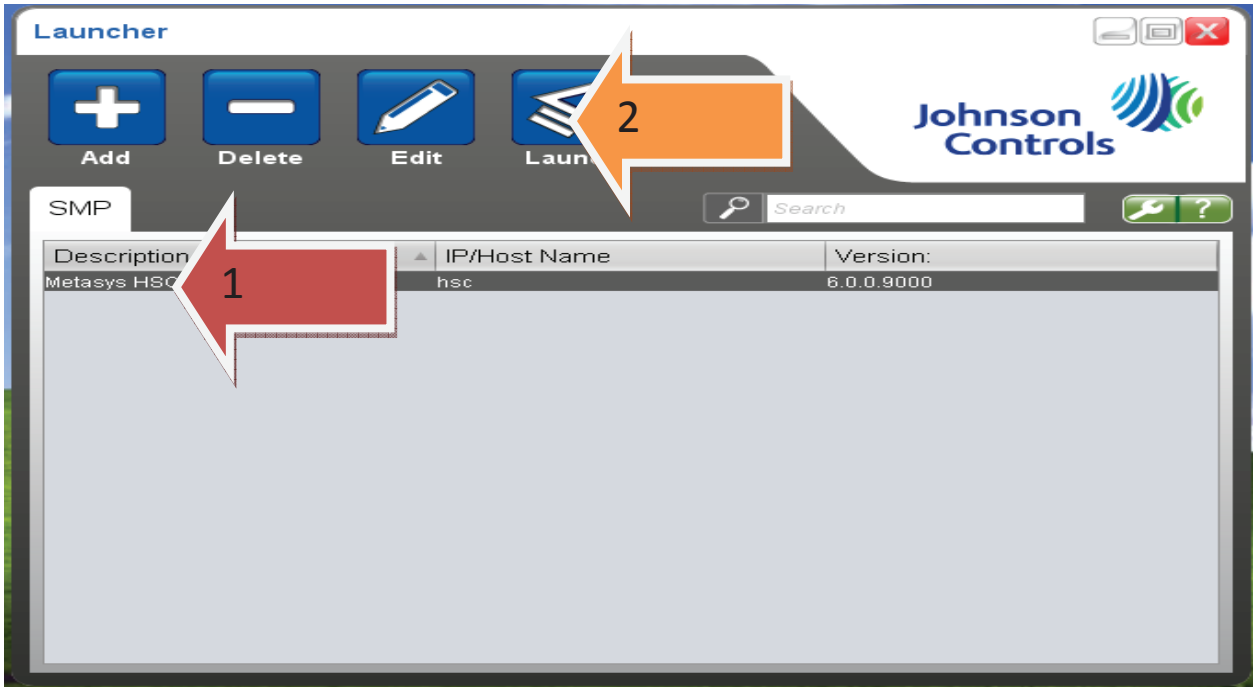
1.3. Launching your Metasys Site

- When the Site has been downloaded, your site will be shown in the Site Management Portal (SMP) tab. You can highlight and press the "Launch" button from here or use the shortcut created on your desktop. You will not have to download Metasys again on this computer.



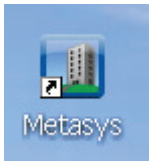


Figure 6: Launching a Site (Highlight it first)

- Normally you can just start Metasys from the desktop shortcut. The icon used will always look the same on any computer you install Launcher on.

- When Metasys is Launched, You will need a username and password to login. Obtain this from the Johnson Controls rep.

1.4. Adding Bookmarks to Launcher

- When adding a site there is a tab for adding bookmarks as well. This can be used to add any website you frequently use included adding links for Metasys RAP.

2. Metasys Application Window

2.1. Metasys Symbols

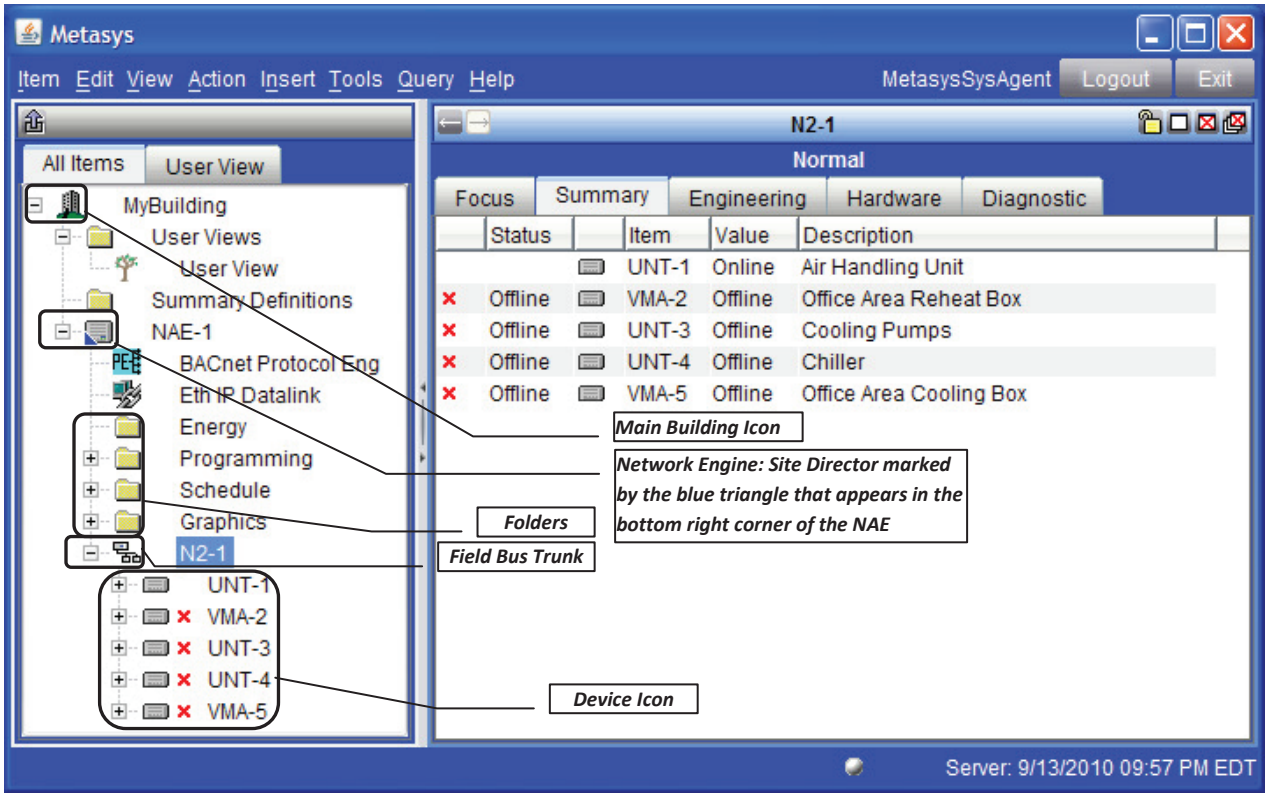

Figure 7: Displaying some of the more common symbols

- The Navigation tree and user view tabs are on the left while the focus window is on the right.
- To populate the focus window the object in the left hand window the user may:
- Select the object and then double left click this object.
- Select the object and while keeping the left mouse key pressed, move the mouse pointer to the focus window.

Symbol	Description
	Analog Input
	Analog Output
	Analog Variable
	Binary Input
	Binary Output
	Binary Variable
	Multi state Object
	Calendar Object
	Schedule Object

2.2. Panel Layout

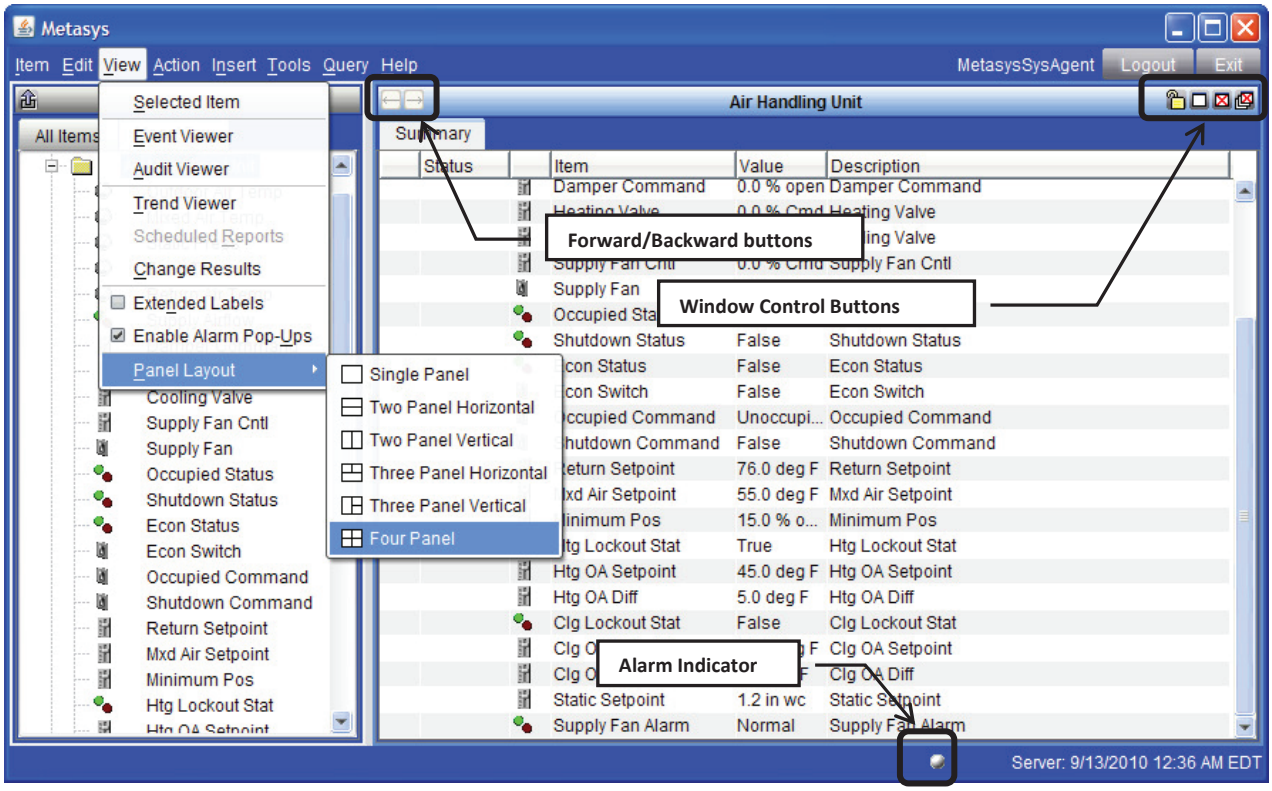

Figure 8: Panel Layout.

- To populate the focus window, a single point or folder may be either, double clicked or dragged in the right hand window.
- The panels of the focus window may be modified to view it a variety of different layouts.
- The 'Forward/Backward' navigation buttons ( ) in the top left corner of the focus window will allow the user to move back and forth up to five screens. If grayed out as seen above then the option is not available.
- The window control buttons ( ) are located in the top right corner of the focus window.
  - - Clicking on this symbol will lock the current window. Clicking on this while in the single Panel Layout mode will lock the only window into which folders and points may be brought over into.
  - - Clicking on the symbol will maximize the window. This function is only relevant when using one of the multiple panel layouts.
  - - Clicking on this symbol will close the displayed window. It will clear the contents of the window and display the previous window. If there are no nested screens the window will go blank.
  - - Clicking on the symbol will close all the focus windows that are nested within the given box, leaving a blank window.

- The Alarm Indicator () will blink red when an un-acknowledged alarm is present on the system
- In the event that the '**Snooze All**' button is clicked on the alarm pup up window that this will be indicated in the status bar as follows - 

- To disable the alarm pop-ups:
  - Click on '**View**'.
  - Clear the check box beside - 

  - Once this is done it will be indicated as follows in the status bar - 
- When the pop-ups are disabled no alarms will pop up.

2.3. Password Change

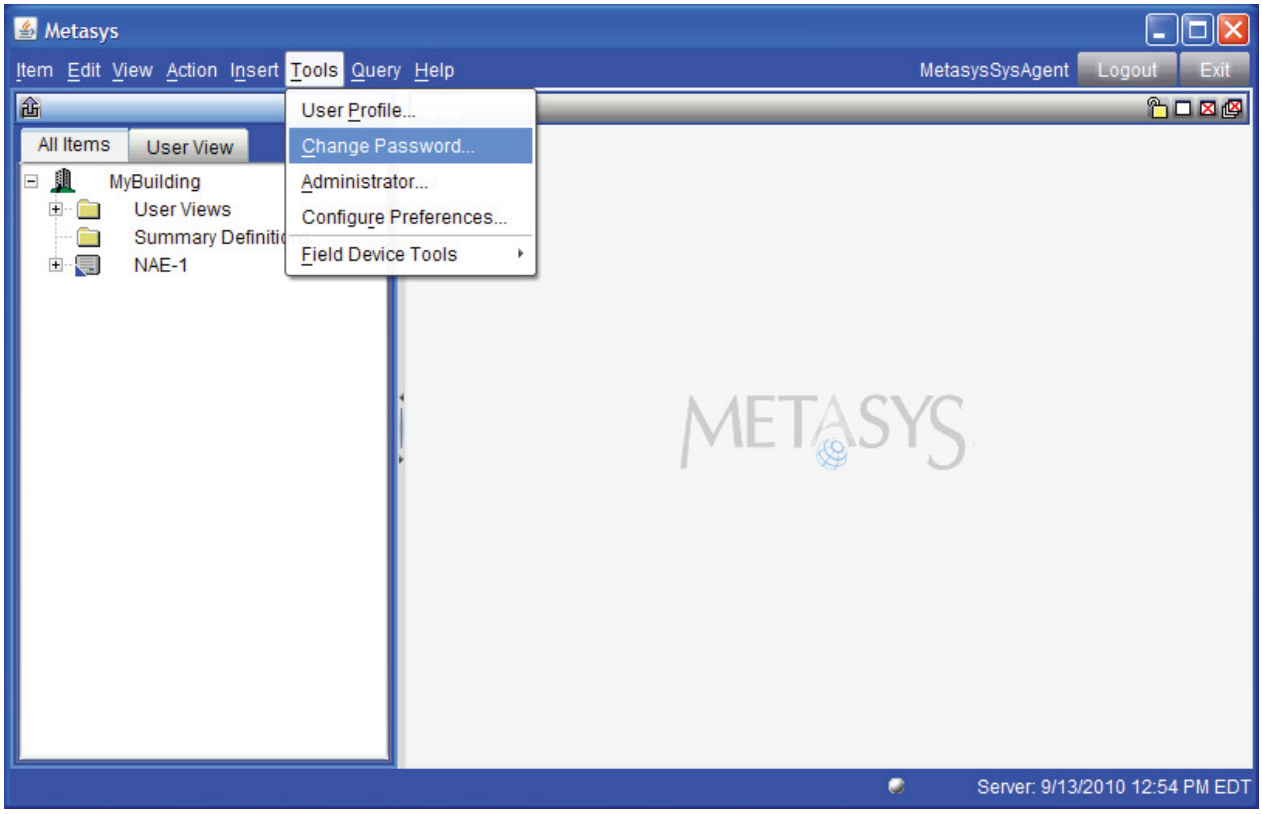

Figure 9: Changing the Metasys log in password for the current user.

- Click on '**Tools**' and then select '**Change Password…**'. If this option is grayed out then the current user does not have the privileges set to allow password change.

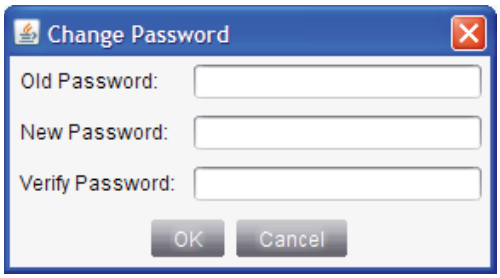

Figure 10: Password change window

- Follow the instructions – the user name is not case sensitive, but the password is.
- If a user forgets a password it can never be retrieved, the only option is for the user with administrator rights to log in and reset the password and force the user to create a new one.

3. Object Types

3.1. Analog Input

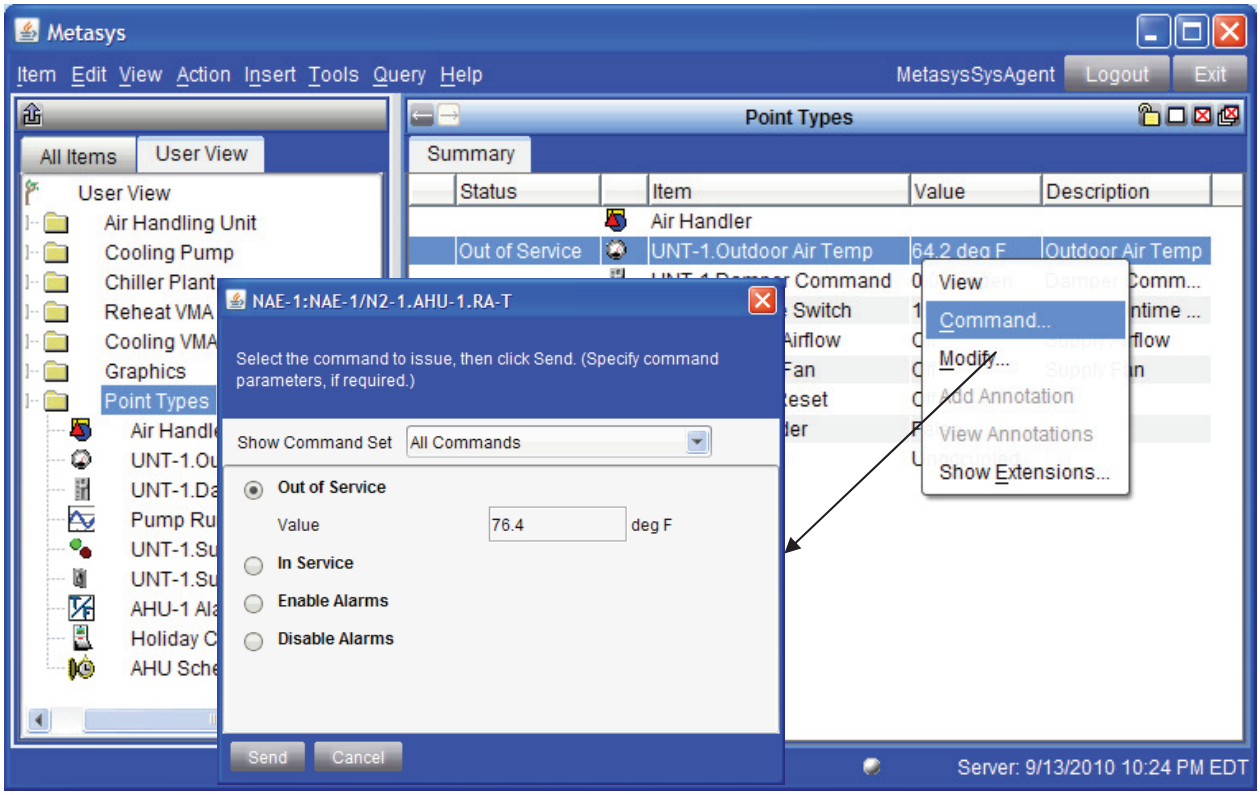

Figure 11: Analog Input

- Single left click on the analog point to select it and then right click to open up the available options. From this list clicking on '**Command…**' will open up the dialog window seen above.
- In each box there are four options:
  - '**Out of Service**'
    - This will send a manual override to the given point. If the controller to which the point is mapped will allow such a command then it will disable communication from the sensor.
    - The point must be put back 'In Service' in order to prevent potential control problems.
  - '**In Service**'
    - This will remove the manual override and allow the field device to communicate its true value back to the controller.
  - **'Enable Alarms'**
    - This will enable the alarm feature for this point.
  - '**Disable Alarms**'
    - This will disable the alarm feature for this point.

3.2. Analog Output

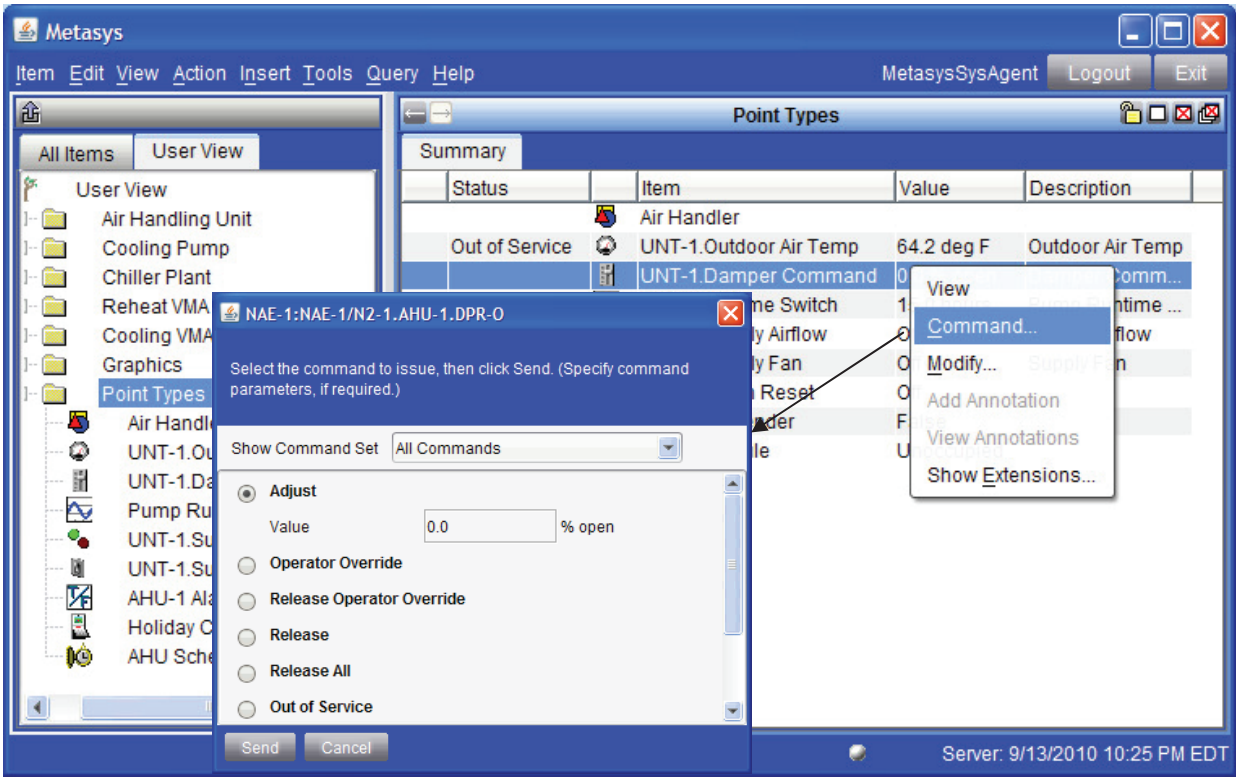

Figure 12: Analog Output

- When you select an analog output point (left-click) and then right-click the following dialog box will appear.
- There are a number of methods to command an analog output point
  - '**Adjust**'
    - The value entered here will be sent to the controller replacing the existing set point. However, if the point in question is not recommended for an 'adjust' command then you will not be able to 'send'. The example of such a point is a control valve. Adjusts are not allowed so that the field controller has priority of the command going to this point.
    - This may be used when changing setpoints on a more permenant bases.
  - '**Operator Overide'**
    - The value entered here will not replace the original value, but store it in memory while issued this commad to the point. This may be used to test a demand output.
  - '**Release Operator Override'**
    - This command when sent release the override that was issued in the previous step, retoring the the original setpoint, or releasing a point to go back into control.
  - '**Release'**
    - The 'Release' command is used to release a command that was issued at the given priority level.
  - '**Release All'**
    - The 'Release All' releases all commands setting the point back to it's default value.

3.3. Analog Variable

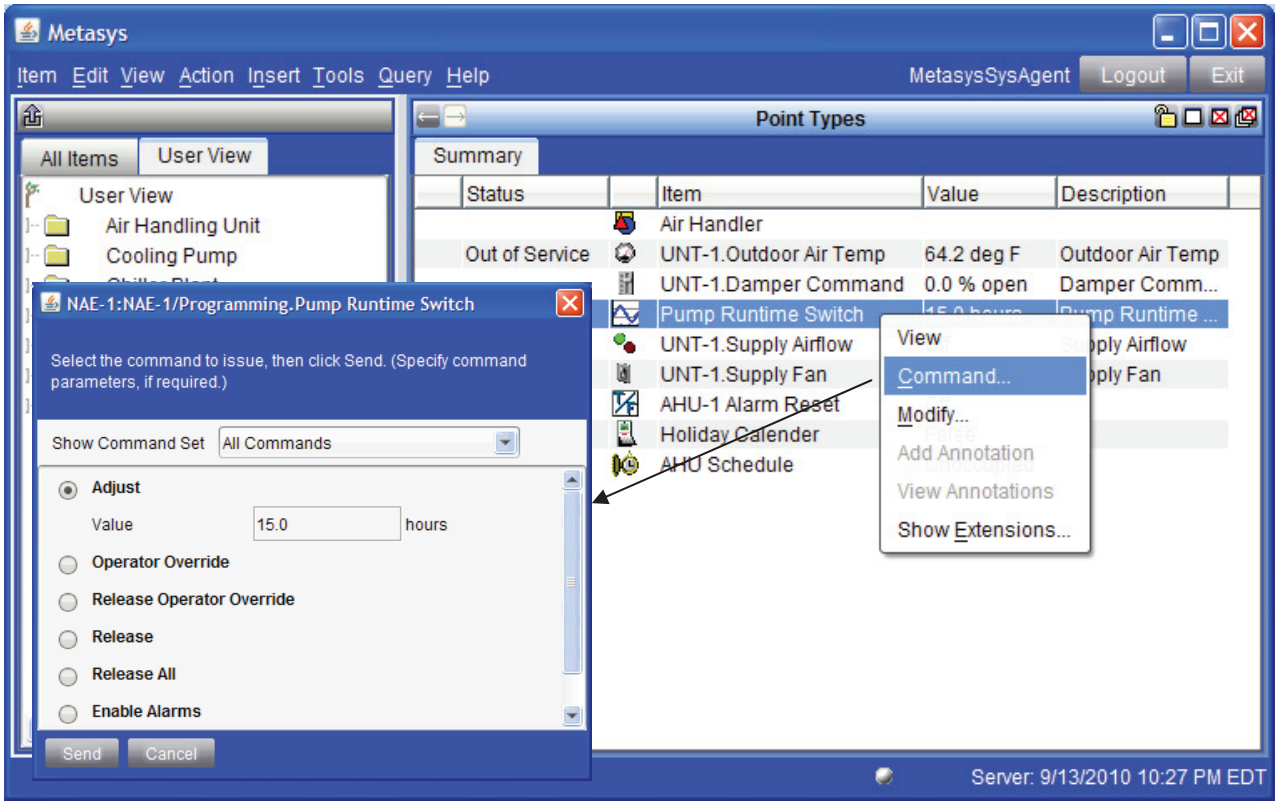

Figure 13: Analog Variable

- When you select an analog value point (left-click) and then right-click the following dialog box will appear.
- There are a number of methods to command an analog output point
  - '**Adjust**'
    - The value entered here will be sent to the controller replacing the existing set point. However, if the point in question is not recommended for an 'adjust' command then you will not be able to 'send'. The example of such a point is a control valve. Adjusts are not allowed so that the field controller has priority of the command going to this point.
    - This may be used when changing setpoints on a more permenant bases.
  - '**Operator Overide'**
    - The value entered here will not replace the original value, but store it in memory while issued this commad to the point. This may be used to test a demand output.
  - '**Release Operator Override'**
    - This command when sent release the override that was issued in the previous step, retoring the the original setpoint, or releasing a point to go back into control.
  - '**Release**'
    - The 'Release' command is used to release a command that was issued at the given priority level.
  - '**Release All'**
    - The 'Release All' releases all commands setting the point back to it's default value.

3.4. Binary Input

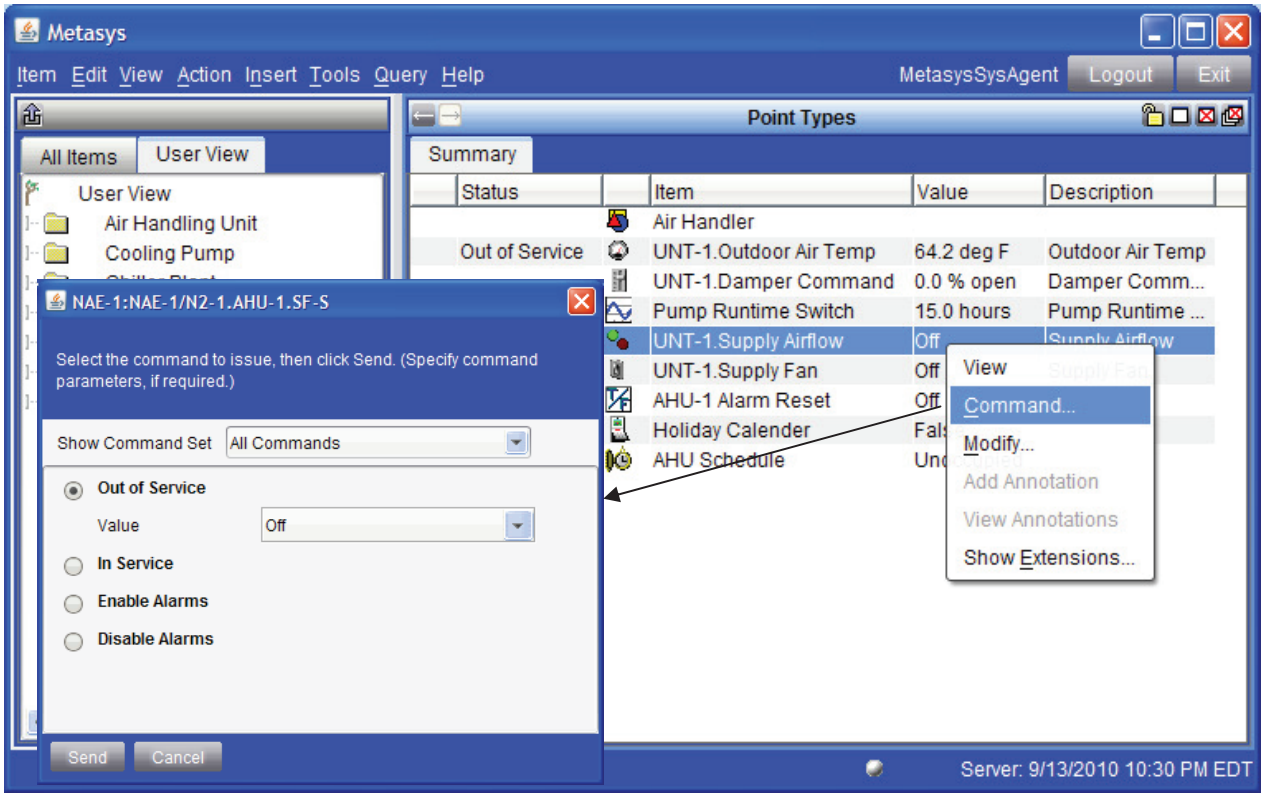

Figure 14: Binary Input

- When you select an Analog or Binary input point (left-click) and then right-click the following dialog box will appear.
- In each box there are two options:
  - **'Out of Service'**
    - This will send a manual override to the given point. If the controller to which the point is mapped will allow such a command then it will disable communication from the sensor.
    - If the point is not put back 'In Service' then there may be control problems.
  - **'In Service'**
    - This will remove the manual override and allow the field device to communicate its true value back to the controller.
  - **'Enable Alarms'**
    - This will enable the alarm feature for this point.
  - **'Disable Alarms'**
    - This will disable the alarm feature for this point.

3.5. Binary Output

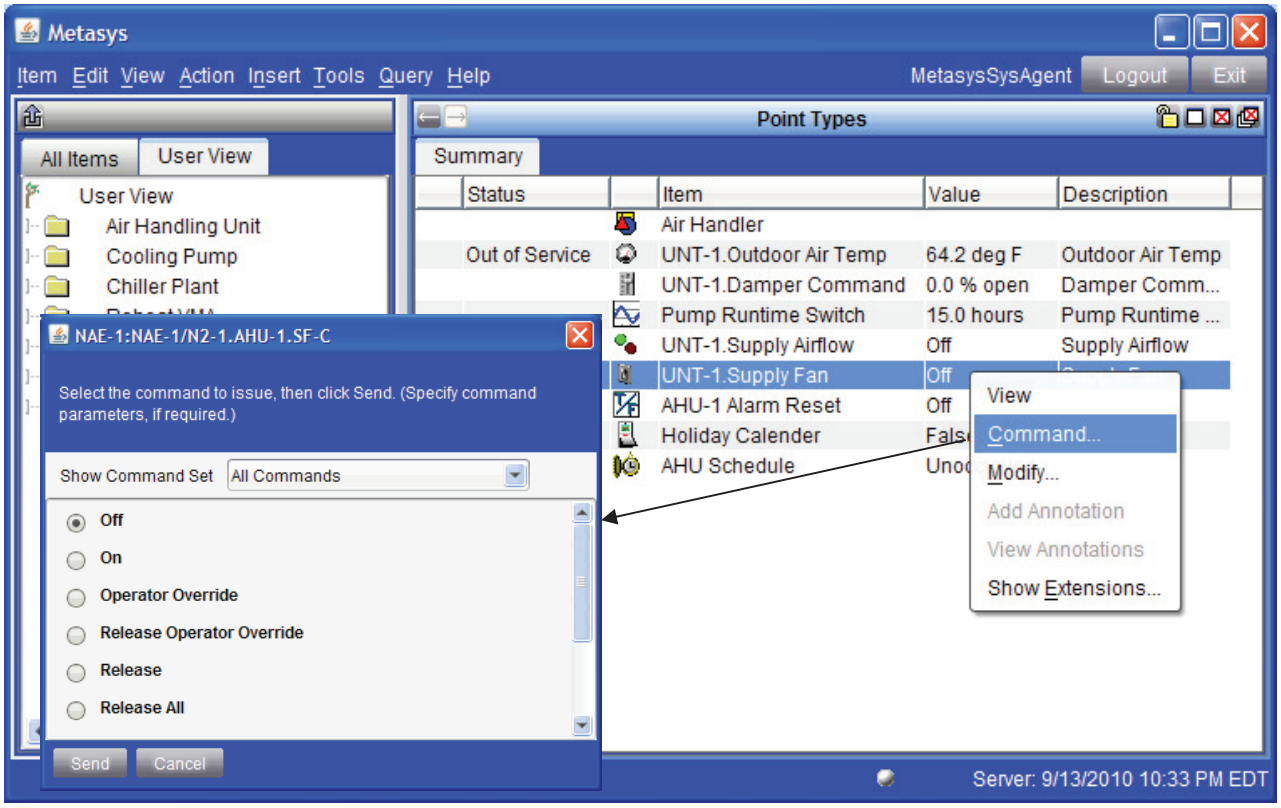

Figure 15: Binary Output

- When you select a command point (left-click) and then right-click the following dialog box will appear
- There are a number of options available:
  - The first two options, in this case 'Off' and 'On', are commands that the operator can send at the priority level 16 (lowest priority).
  - **'Operator Overide'**
    - The value entered here will not replace the original value, but store it in memory while issueing this commad to the point. This may be used to test a fan stop/start.
    - This command may be used for short term changes in commands as well.
  - **'Release Operator Override'**
    - This command when sent release the override that was issued in the previous step, retoring the the original command, or releasing the point to go back on to control.
  - **'Release'**
    - The 'Release' command is used to release a command that was issued at the given priority level.
  - **'Release All'**
    - The 'Release All' releases all commands setting the point back to it's default value.

3.6. Binary Variable

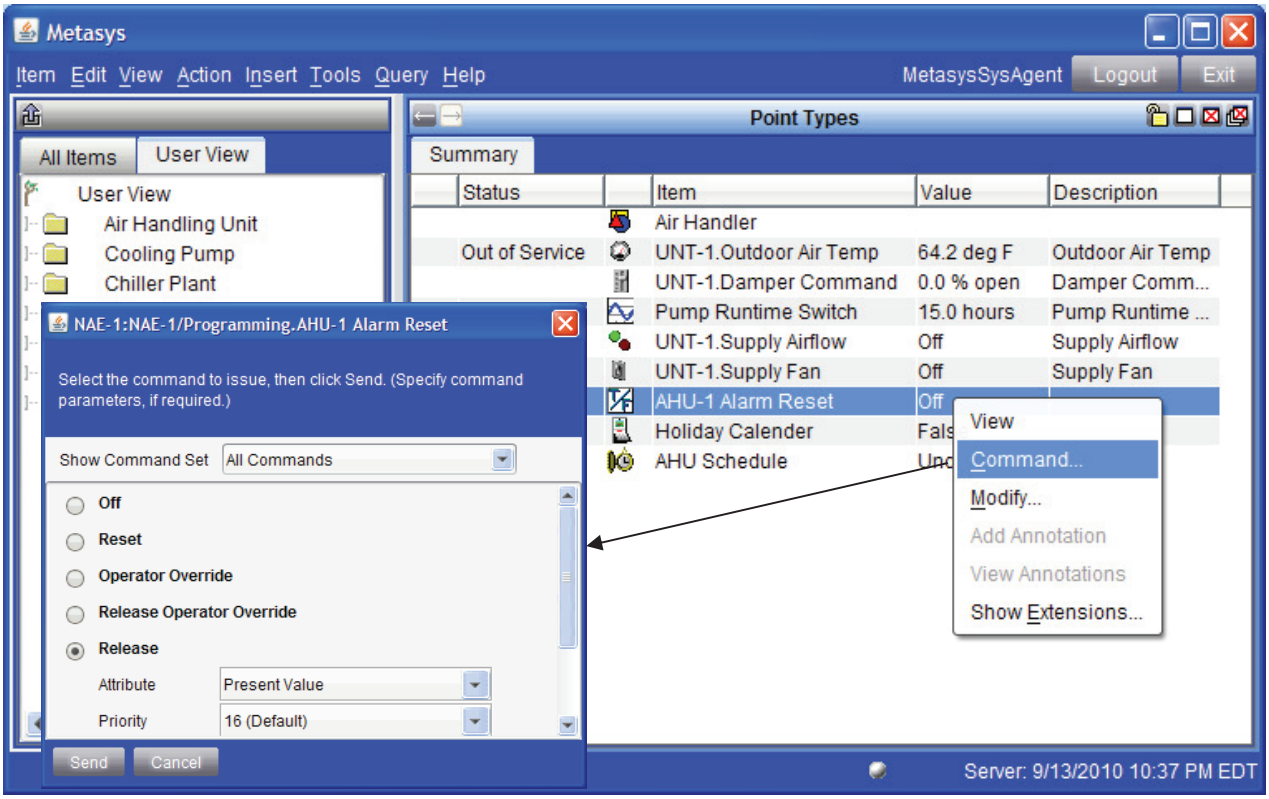

Figure 16: Binary Variable

- When you select a Binary Value point (left-click) and then right-click the following dialog box will appear
- There are a number of options available:
  - The first two options, in this case '**Off**' and '**On**', are commands that the operator can send at the priority level 16 (lowest priority).
  - '**Operator Overide'**
    - The value entered here will not replace the original value, but store it in memory while issueing this commad to the point. This may be used to test a fan stop/start.
    - This command may be used for short term changes in commands as well.
  - '**Release Operator Override'**
    - This command when sent release the override that was issued in the previous step, retoring the the original command, or releasing the point to go back on to control.
  - '**Release**'
    - The 'Release' command is used to release a command that was issued at the given priority level.
  - '**Release All'**
    - The 'Release All' releases all commands setting the point back to it's default value.

4. Object Extensions

4.1. Adding a Trend Extension to an Analog Object:

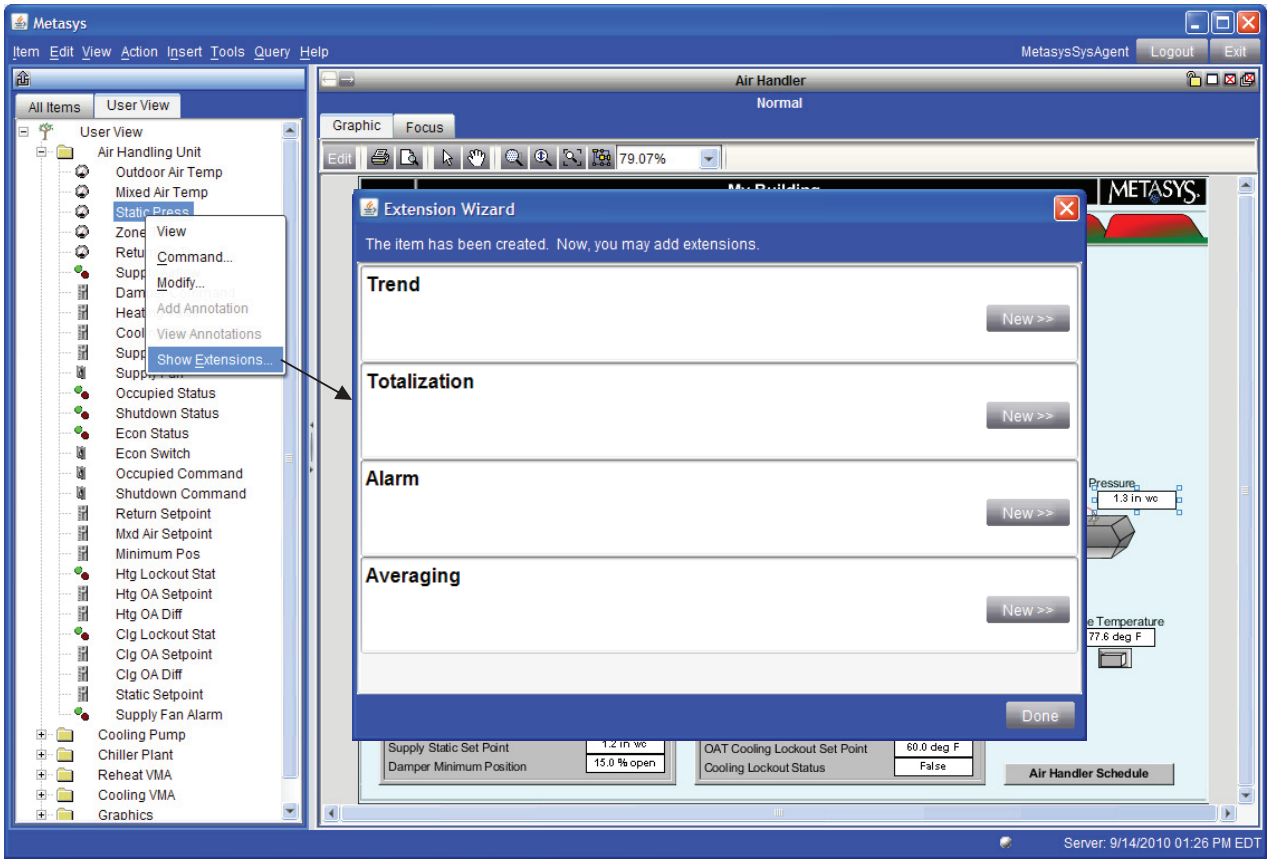

Figure 17: Viewing the extension wizard on an analog object

- To add a trend to an Analog Object select the '**User View**' tab where the system resides. Navigate into the system folder and single left click on the point in question.
- When the '**Extension Wizard**' dialog box opens click on '**New**' in the '**Trend**' section of the window.

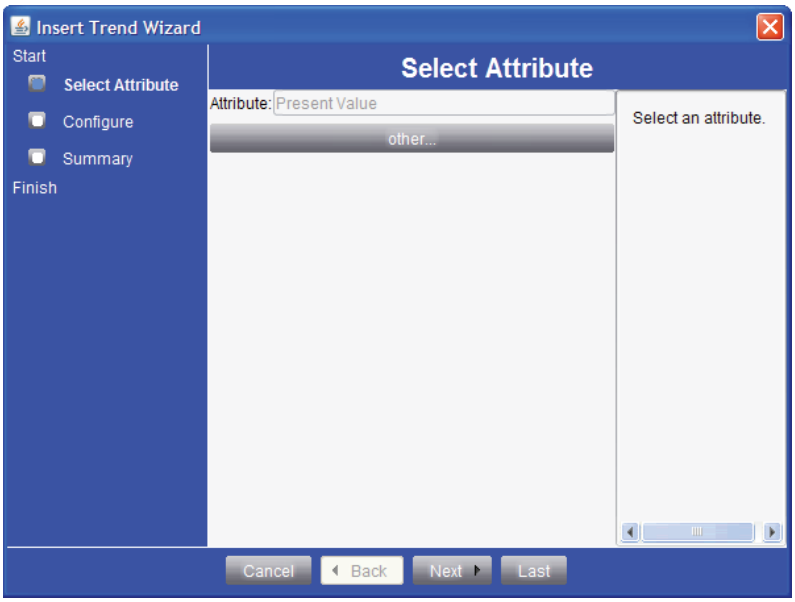

Figure 18: Selecting the attribute to be trended.

- If the trend to be collected is for the '**Present Value**' for the point then no changes need to be made at this stage. Click on '**Next**'.

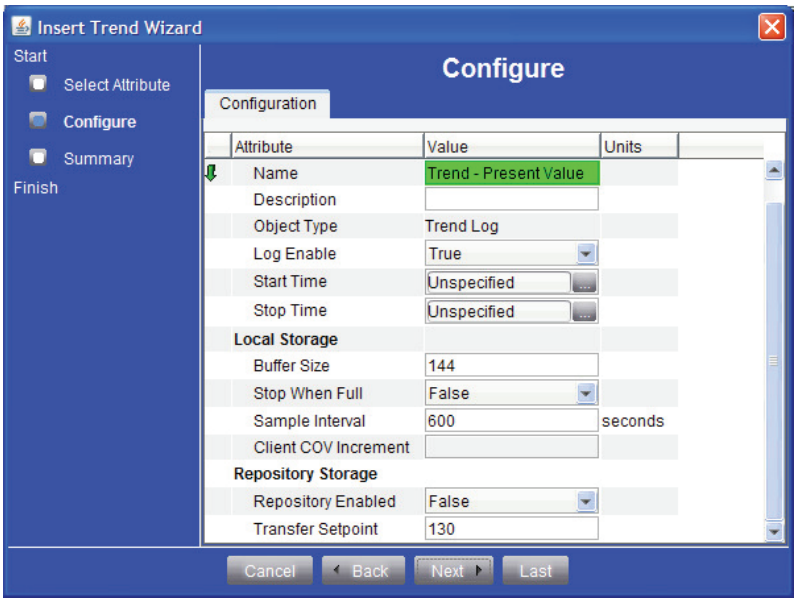

Figure 19: Configuration Page of an analog Trend object

- The trended data resides in the NAE and the number of trends being kept is defined by the '**Buffer Size**'.
- Set the '**Sample Interval**' for the trend, the system defaults to 5 minutes – 600 seconds. For a trend similar to those in the old PMI system, use an interval of 1800 seconds with a buffer size of 48 and transfer setpoint of 43.
- Set '**Repository Enabled**' to '**True**' only if a server exists. The system defaults to '**False**', leave it as such if this is site has NAE's only.
- In the event that a server exists the trend data is sent to the server when the number of samples reaches the '**Transfer Setpoint**'

- Click '**Next**' when the configuration is complete.

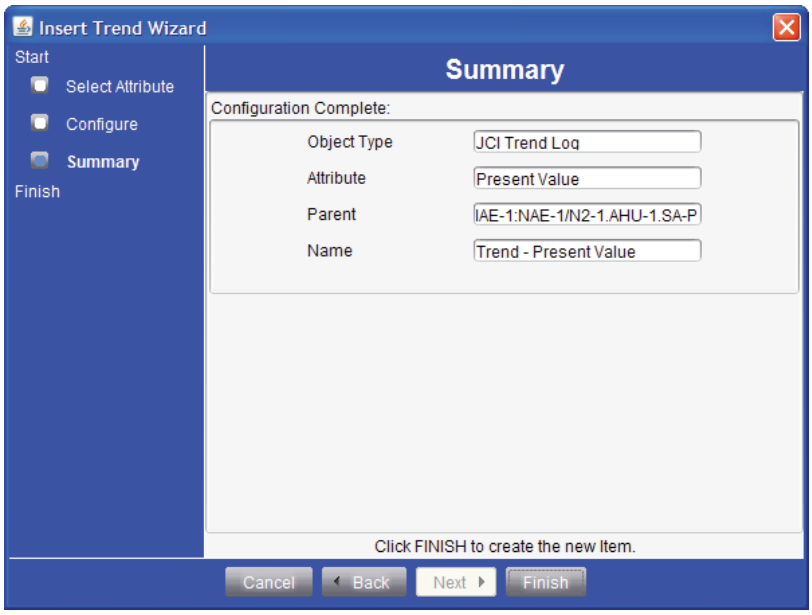

Figure 20: Finishing Trend creation...

- To complete the trend creation click on '**Finish**'.

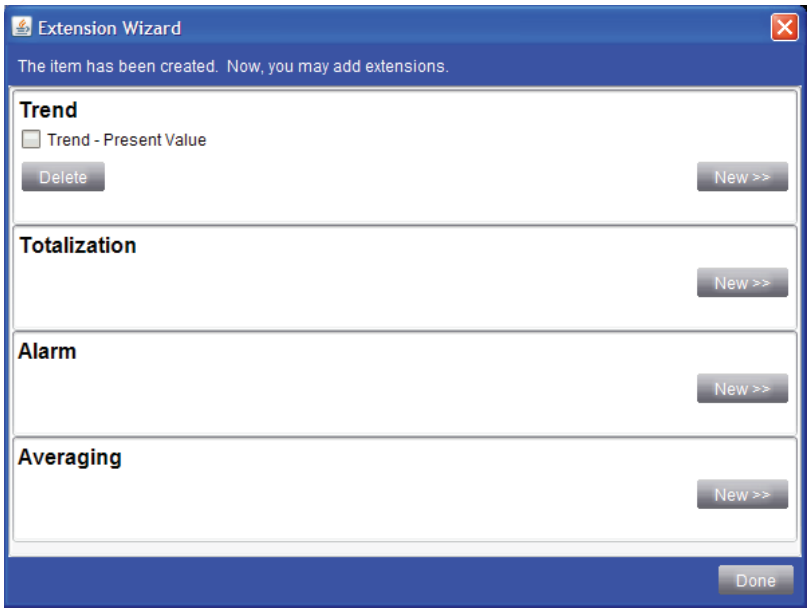

Figure 21: Extension Wizard box after the creation

- The '**Extension Wizard**' box re-appears and the newly added trend appears in the Trend section. Click '**Done**' to close the wizard.
- **NOTE:** Any extension may be deleted by checking the box beside the extension name and then clicking on '**Delete**'. If a Trend is deleted any data not transferred to the Server will be lost.

4.2. Adding a Trend Extension to a Binary Object:

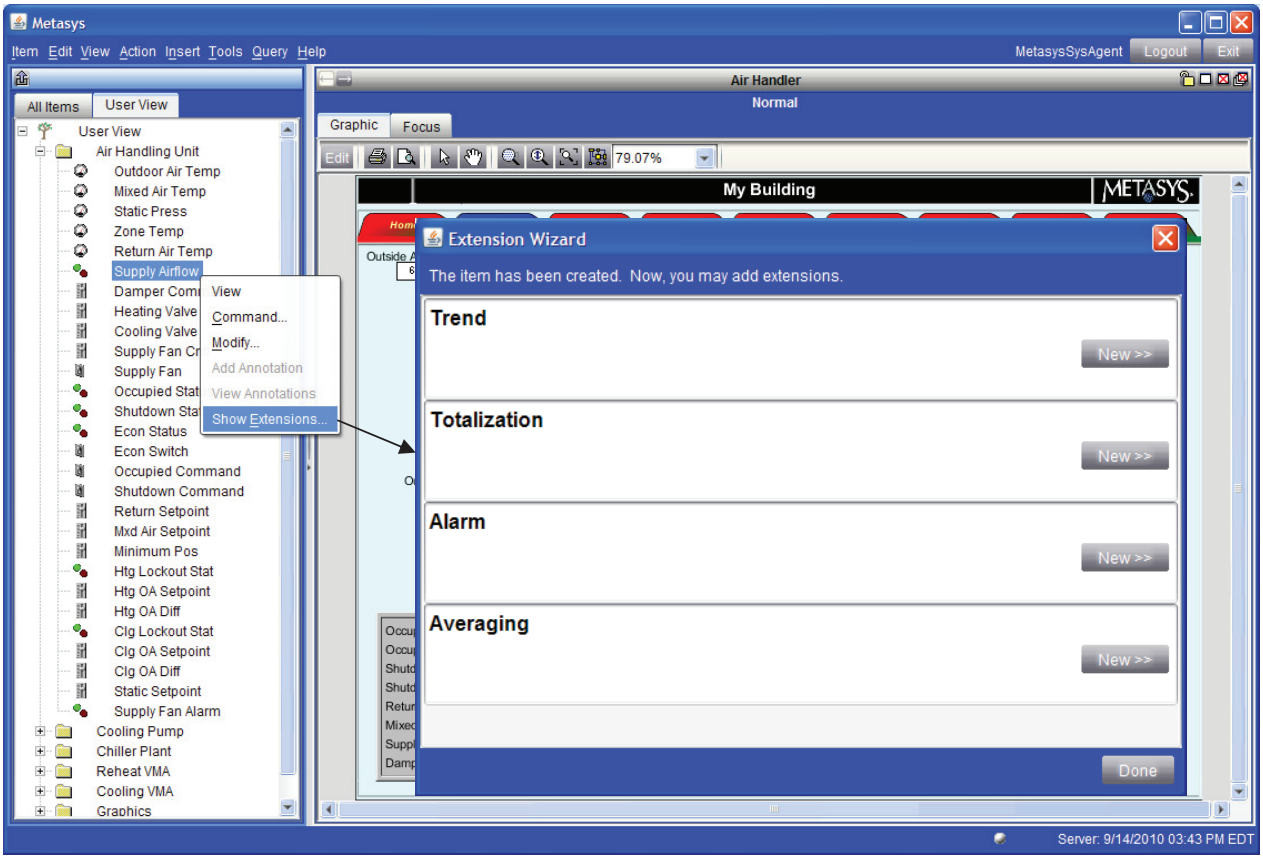

Figure 22: Viewing the extension wizard on a binary object

- To add a trend to a Binary Object select the '**User View**' tab where the system resides. Navigate into the system folder and single left click on the point in question.
- When the '**Extension Wizard**' dialog box opens click on '**New**' in the '**Trend**' section of the window.

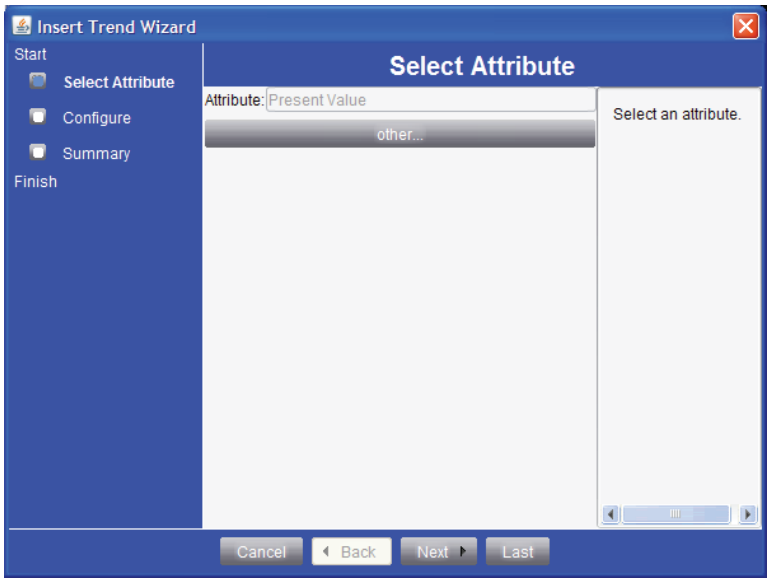

Figure 23: Selecting the attribute to be trended

- If the trend to be collected is for the '**Present Value**' for the point then no changes need to be made at this stage. Click on '**Next**'.

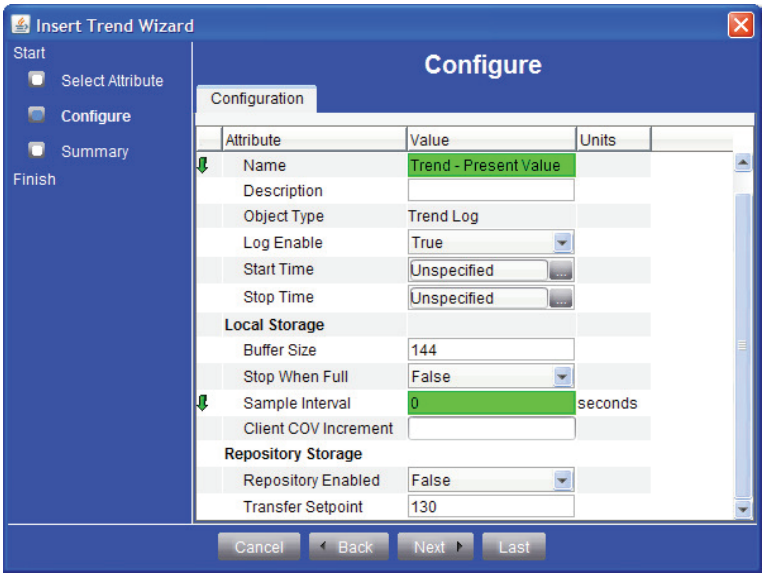

Figure 24: Configuration Page of an analog Trend object

- The trended data resides in the NAE and the number of trends being kept is defined by the '**Buffer Size**'.
- Set the '**Sample Interval**' for the trend to '**0**' to record the instance that the point changes state, the system defaults to 5 minutes – 600 seconds.
- Set '**Repository Enabled**' to '**True**' only if a server exists. The system defaults to '**False**', leave it as such if this is site has NAE's only.
- In the event that a server exists the trend data is sent to the server when the number of samples reaches the '**Transfer Setpoint**'. For a Binary Point, the Buffer size should be 10 and transfer setpoint 9.
- Click '**Next**' when the configuration is complete

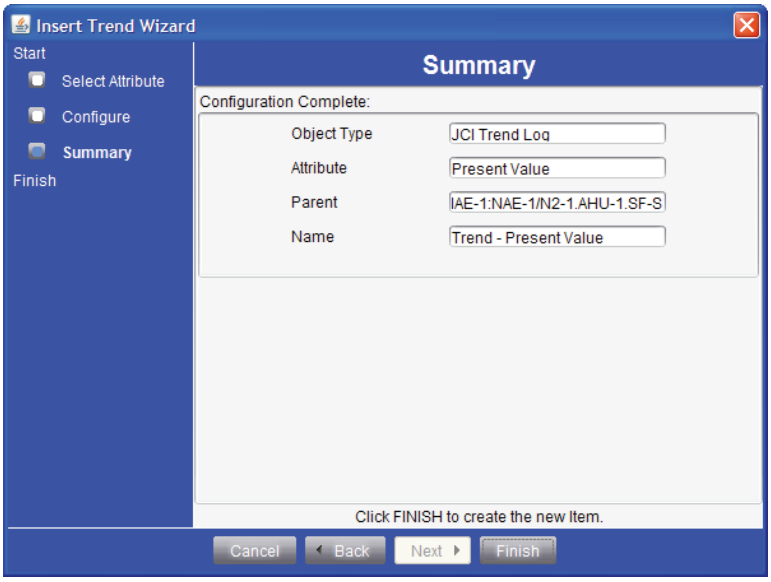

Figure 25: Finishing Trend creation...

- To complete the trend creation click on '**Finish**'

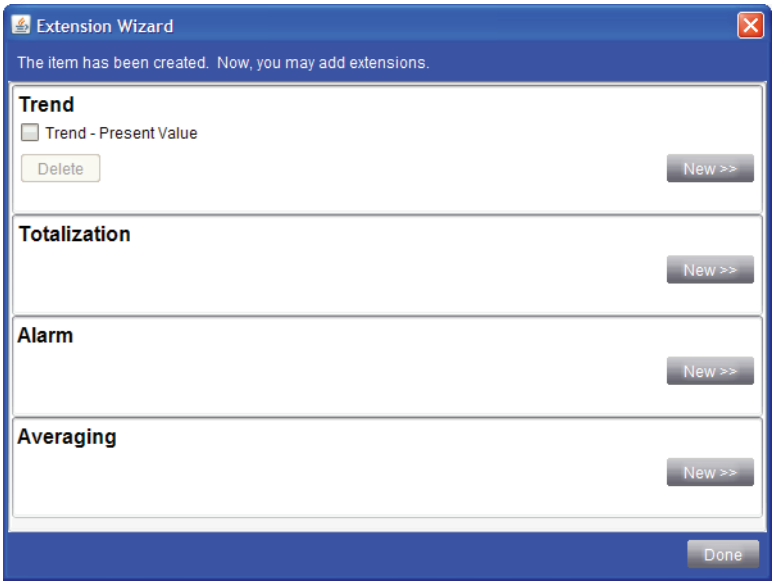

Figure 26: Extension Wizard box after the creation

- The '**Extension Wizard**' box re-appears and the newly added trend appears in the Trend section. Click '**Done**' to close the wizard.
- **NOTE:** Any extension may be deleted by checking the box beside the extension name and then clicking on '**Delete**'. If a Trend is deleted any data not transferred to the Server will be lost.

4.3. Adding an Alarm Extension to an Analog Object:

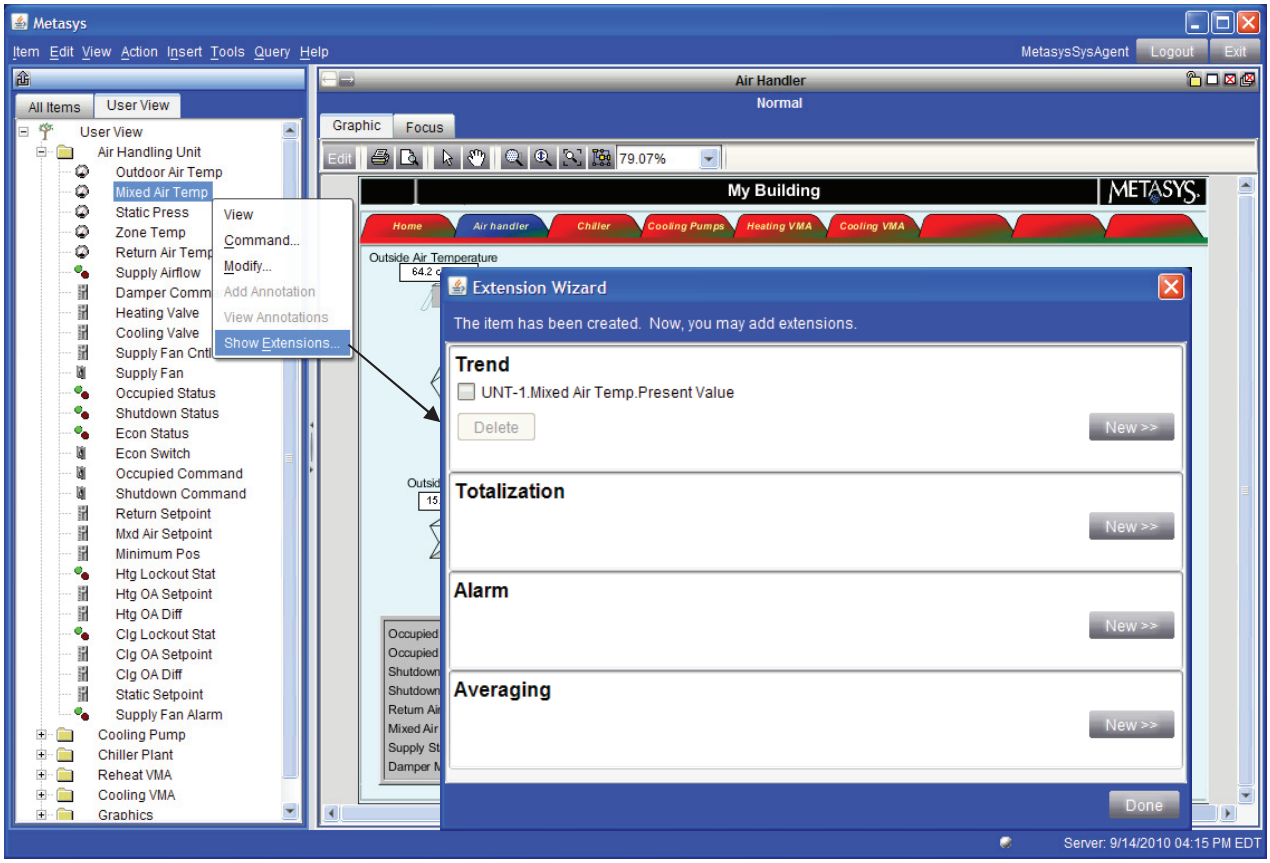

Figure 27: Viewing the extension wizard on an analog object

- To add an alarm to an Analog Object select the '**User View**' tab where the system resides. Navigate into the system folder and single left click on the point in question.
- When the '**Extension Wizard**' dialog box opens click on '**New**' in the '**Alarm**' section of the window.

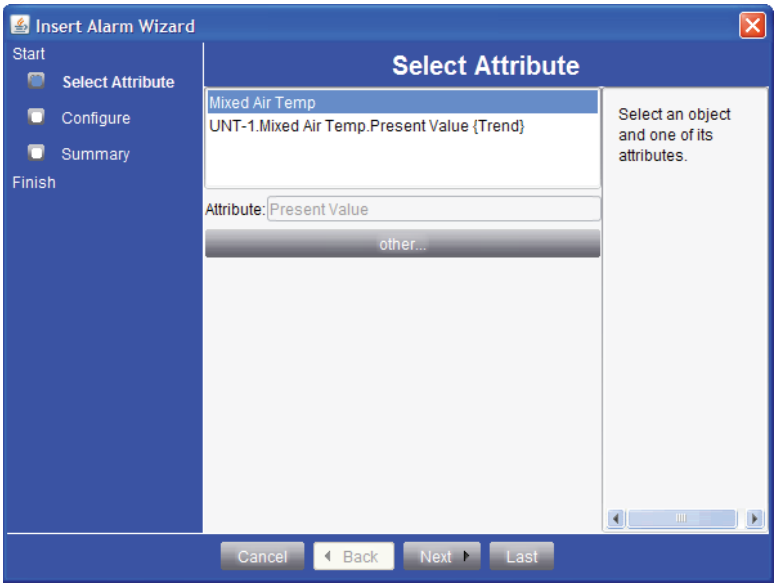

Figure 28: Selecting the attribute to be monitored.

- If the alarm is to monitor the '**Present Value**' for the point then no changes need to be made at this stage. Click on '**Next**'.

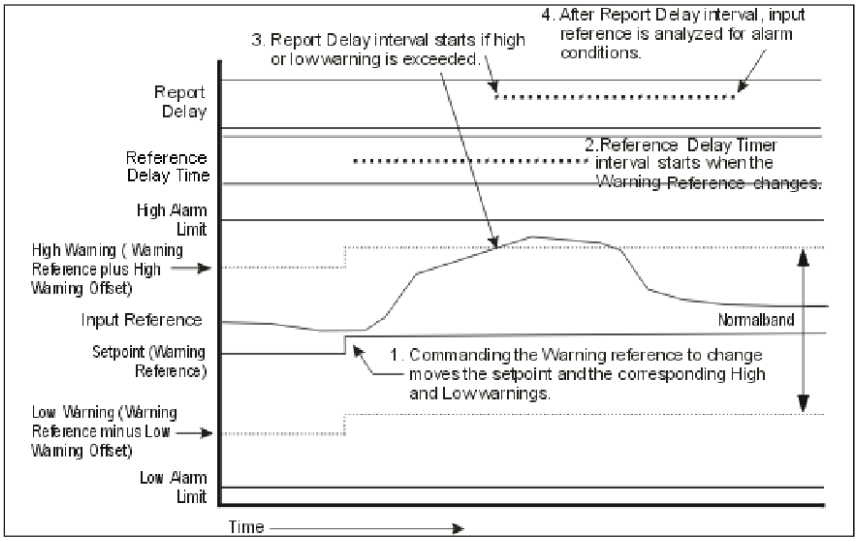

Figure 29: Alarm Delay interaction (LIT1201793 pg130)

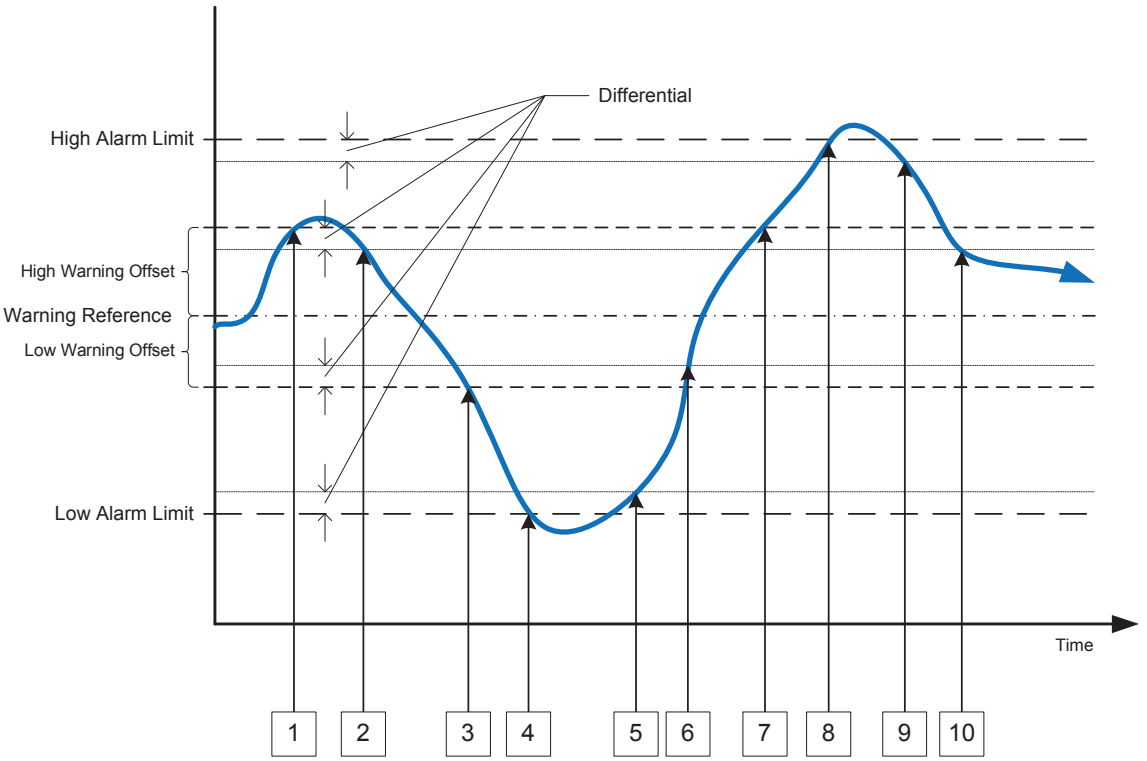
Delay Timer Interaction



There are two timers used to delay the analysis or reporting of an alarm. These timers are used to allow normal functions to occur before an object's behavior appears abnormal and generates an alarm. The first timer is the **Alarm State: Reference Delay Timer**, which allows a preset amount of time to pass between commanding an object and making sure that the commanded object has obeyed the command before considering an alarm condition to be present. The second timer is the **Alarm State: Report Delay Timer**, which prevents the analysis of an object's condition until the preset time has passed after that object has appeared to obey a command.

The length of the reference delay time is a combination of the reference delay time and the report delay time settings. If you change the warning reference, both delays go active and if the reference delay time is greater than or equal to the report delay time, then the total delay is the sum of both timer settings; however, if the reference delay time is less than the report delay time, then the delay is equal to the report delay time setting.

The delay timers of the alarm extensions interact as follows:

Note: If no Warning Limits are defined, the Reference Delay Time and Reference Delay Timer Active attributes do not apply.

Figure 30: Excerpt regarding Alarm delays from LIT 1201793 pg129

Point	Flags	Timer Interaction	Change Of Point Status
1	High Warning Flag Set	Reference Delay Timer Activated	Normal to High Warning
2	High Warning Flag Released	Reference Delay Timer Released	High Warning to Normal
3	Low Warning Flag Set	Reference Delay Timer Activated	Normal to Low Warning
4	Low Alarm Flag Set	Alarm Delay Timer Activated	Low Warning to Low Alarm
5	Low Alarm Flag Released	Alarm Delay Timer Released	Low Alarm to Low Warning
6	Low Warning Flag Released	Reference Delay Timer Released	Low Warning to Normal
7	High Warning Flag Set	Reference Delay Timer Activated	Normal to High Warning
8	High Alarm Flag Set	Alarm Delay Timer Activated	High Warning to High Alarm
9	High Alarm Flag Released	Alarm Delay Timer Released	High Alarm to High Warning
10	High Warning Flag Released	Reference Delay Timer Released	High Warning to Normal

Figure 25a: The above shows the interaction between the analog point and the various warning and alarm limits.

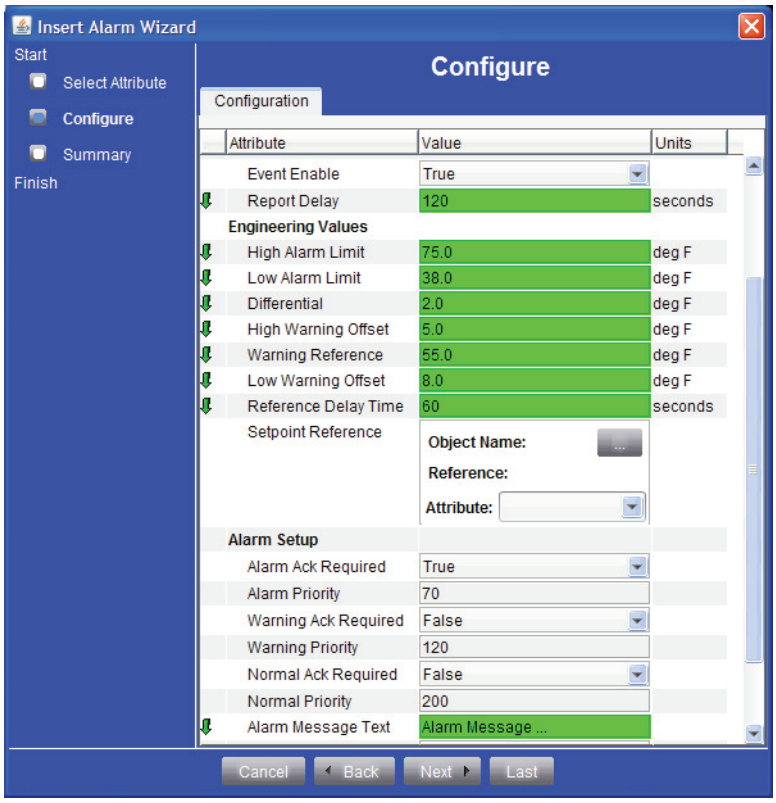


Figure 31: Configuration page

- '**Report Delay**' is the timer that must time out before the Alarm Pop Up is generated.
- '**High Alarm Limit**' is analog level at which a **High Alarm** is triggered for the object.
- '**Low Alarm Limit**' is analog level at which a **Low Alarm** is triggered for the object.
- '**Differential**' see Figure 26.
- '**High Warning Offset**' value by which the analog object must rise above the **Warning Reference** to trigger a **High Warning** for the object.
- '**Warning Reference**' the normal value for the Analog Object.
- '**Low Warning Offset**' value by which the analog object must drop below the **Warning Reference** to trigger a **Low Warning** for the object.
- '**Reference Delay Time**' is the timer that must time out before a warning flag is set.
- '**Alarm Message Text**' is the message that would appear in the pop up alarm box. This can also appear in emails/pager alarms if selected to do so.
- Click on '**Last**' once the configuration is complete.

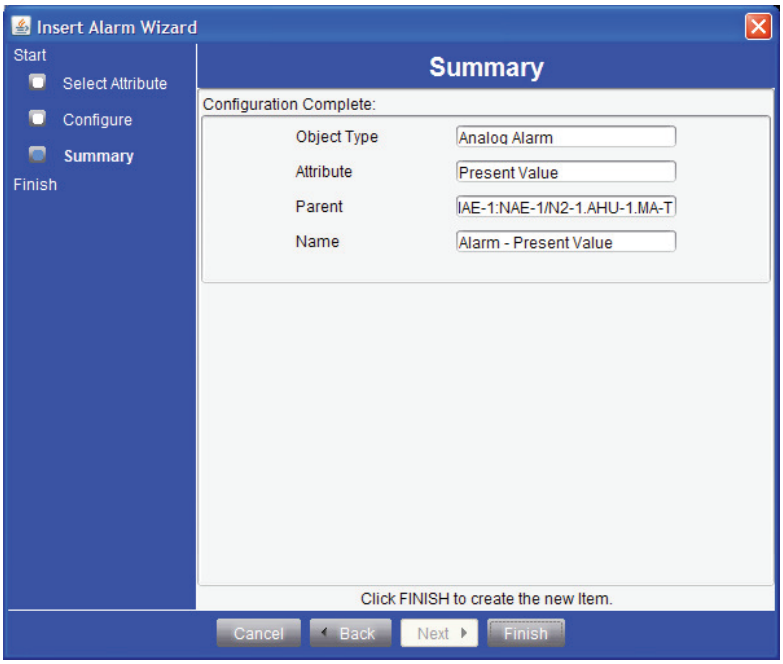

Figure 32: Finishing Alarm creation...

- To complete the trend creation click on '**Finish**'

Figure 33: Extension Wizard box after the creation

- The '**Extension Wizard**' box re-appears and the newly added alarm appears in the Alarm section. Click '**Done**' to close the wizard.

4.4. Adding an Alarm Extension to a Binary Object:

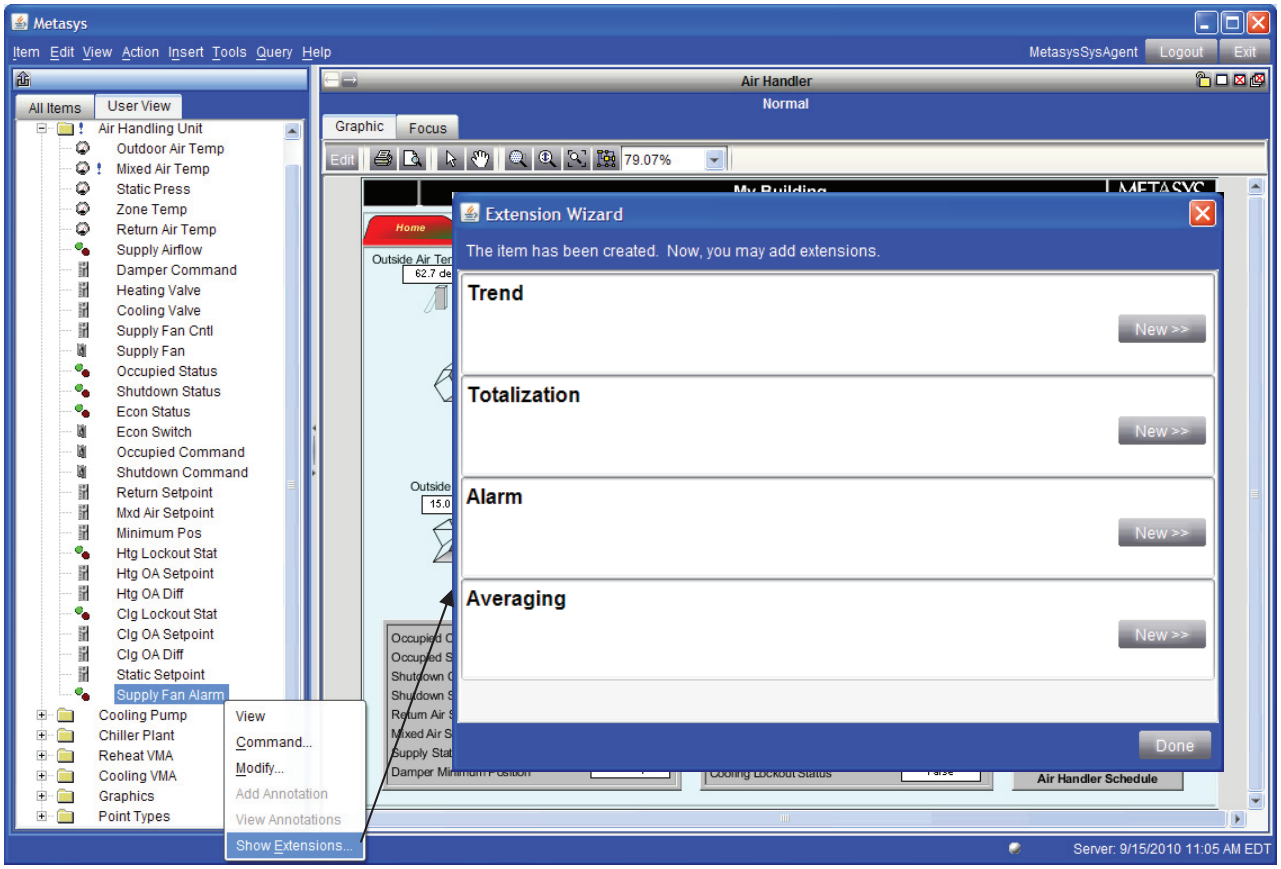

Figure 34: Viewing the Extensions of a Binary Object

- To add an alarm to a Binary Object select the '**User View**' tab where the system resides. Navigate into the system folder and single left click on the point in question.
- When the '**Extension Wizard**' dialog box opens click on '**New**' in the '**Alarm**' section of the window.

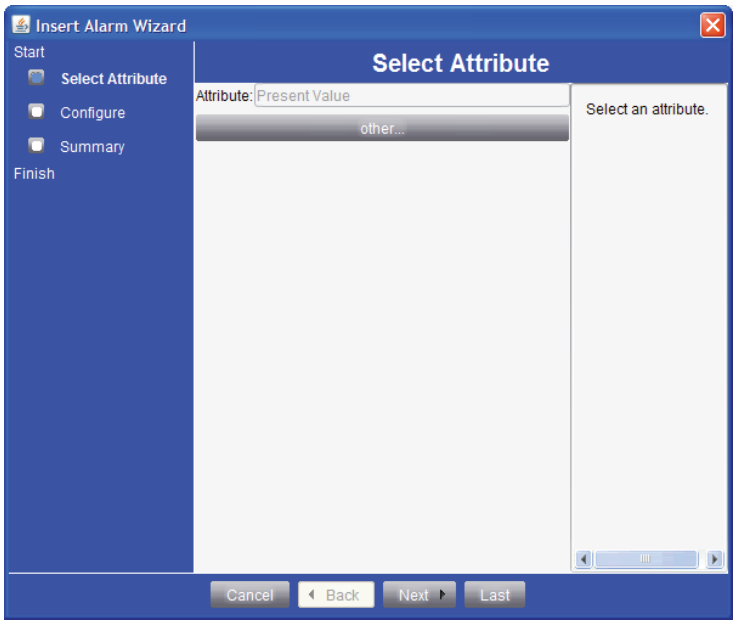

Figure 35: Selecting the attribute to be monitored.

- If the alarm is to monitor the '**Present Value**' for the point then no changes need to be made at this stage. Click on '**Next**'.

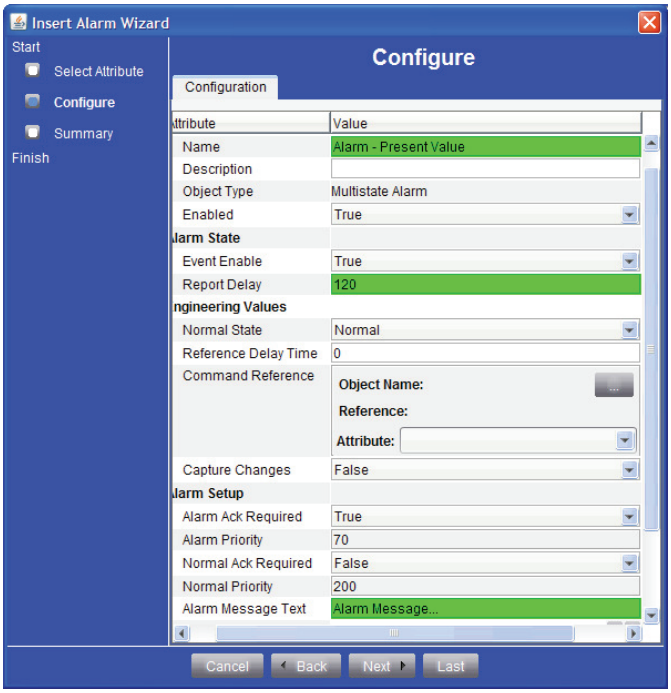

Figure 36: Binary Alarm Configuration Page

- '**Report Delay**' is the timer that must time out before the Alarm Pop Up is generated.
- '**Normal State**' is the state the point must be in to keep the status as '**Normal**'.
- '**Reference Delay Time**' is the timer that must time out before the '**Report Timer**' is activated.
- '**Alarm Message Text**' is the message that would appear in the pop up alarm box.
- Click on '**Last**' once the configuration is complete.

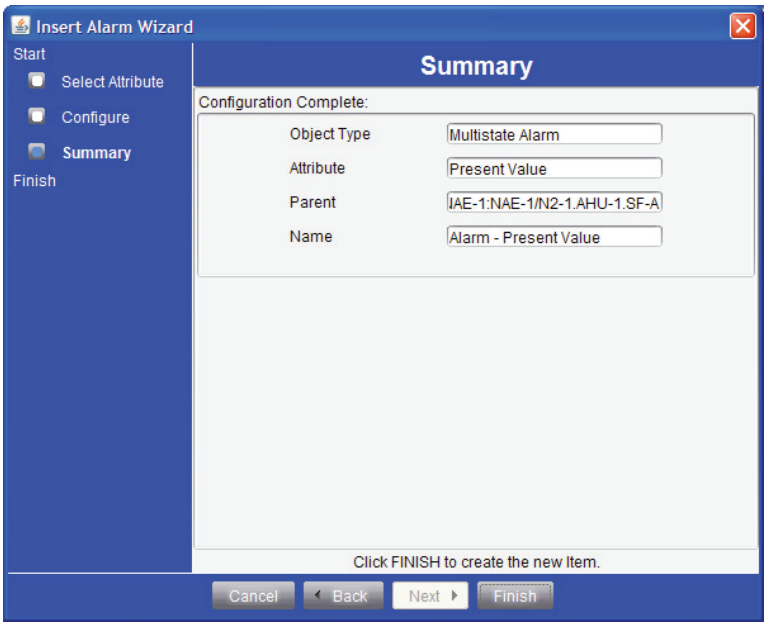

Figure 37: Finishing Alarm creation...

- To complete the trend creation click on '**Finish**'

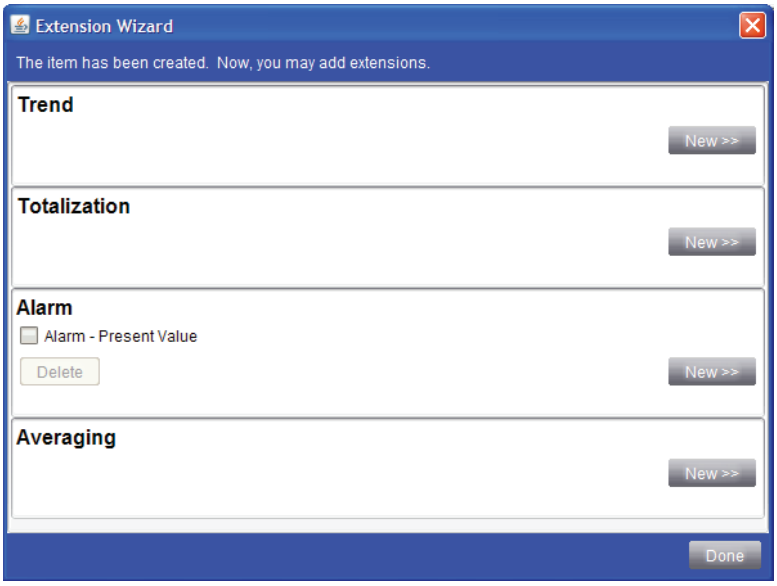

Figure 38: Extension Wizard box after the creation

- The '**Extension Wizard**' box re-appears and the newly added alarm appears in the Alarm section. Click '**Done**' to close the wizard.

4.5. Adding a Totalization Extension to an Analog Object:

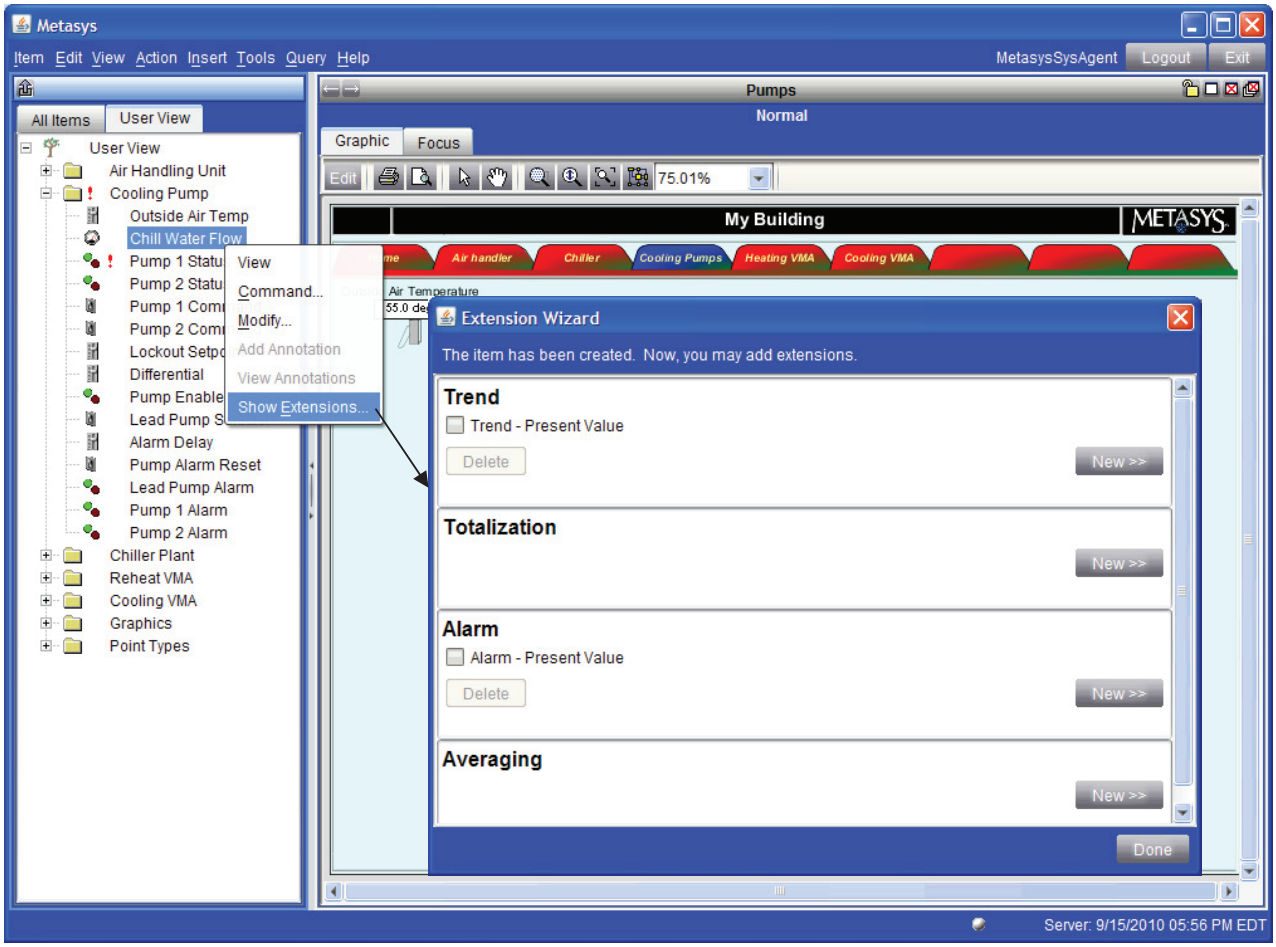

Figure 39: Viewing the Extension Wizard for an Analog Point

- To add a Totalization to an Analog Object select the '**User View**' tab where the system resides. Navigate into the system folder and single left click on the point in question.
- When the '**Extension Wizard**' dialog box opens click on '**New**' in the '**Totalization**' section of the window.

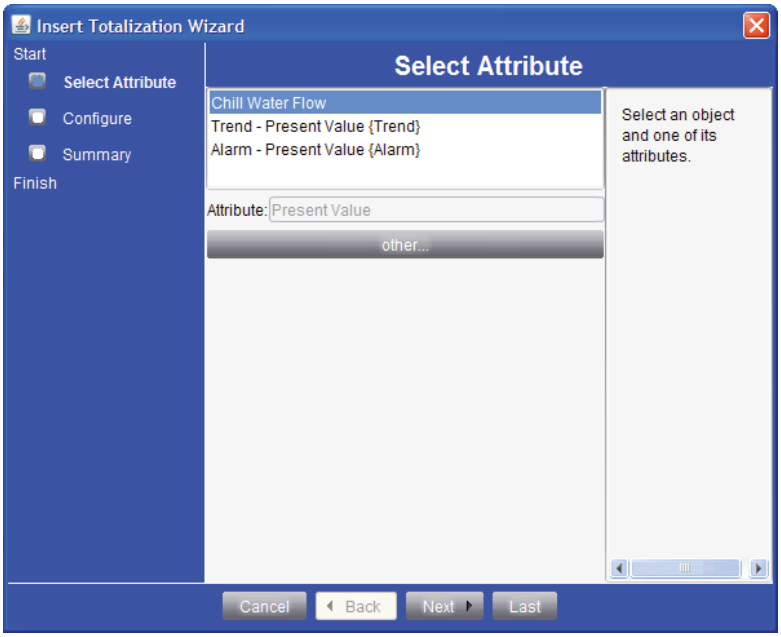

Figure 40: Selecting the attribute to be totalized

- Select the '**Present Value**' from the list of attributes and then click on '**Next**'.

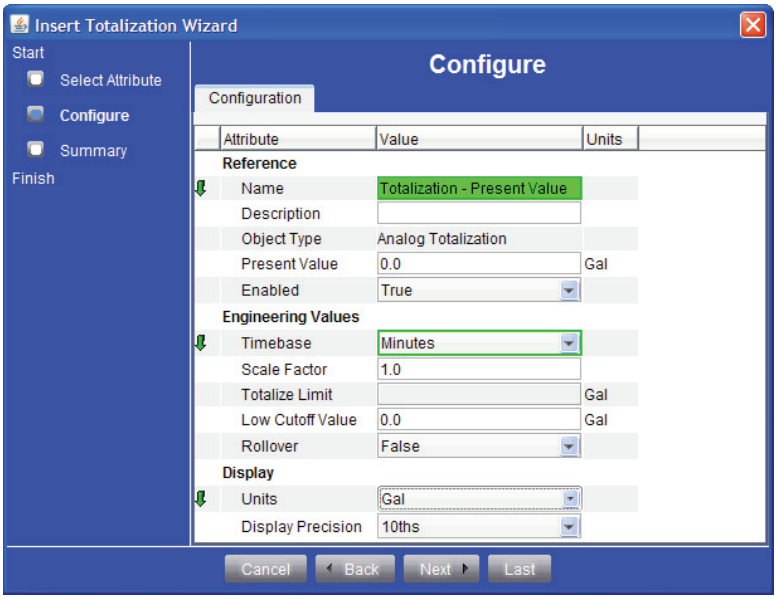

Figure 41: Totalization Configuration Page

- '**Time base**' - Establishes the time frame on which the calculated totalization value is based.
- '**Scale Factor**' - Indicates the value used to scale the totalized value to either a larger or smaller value than otherwise results
- '**Units**' – Select the appropriate unit for the extension value.
- Click '**Last**' once the configuration is complete

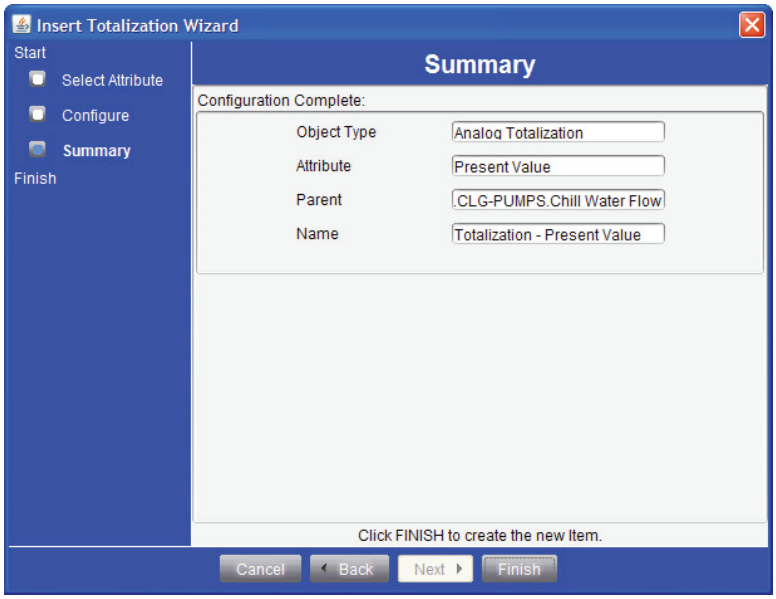

Figure 42: Finishing the Extension Creation

- To complete the totalization creation click on '**Finish**'

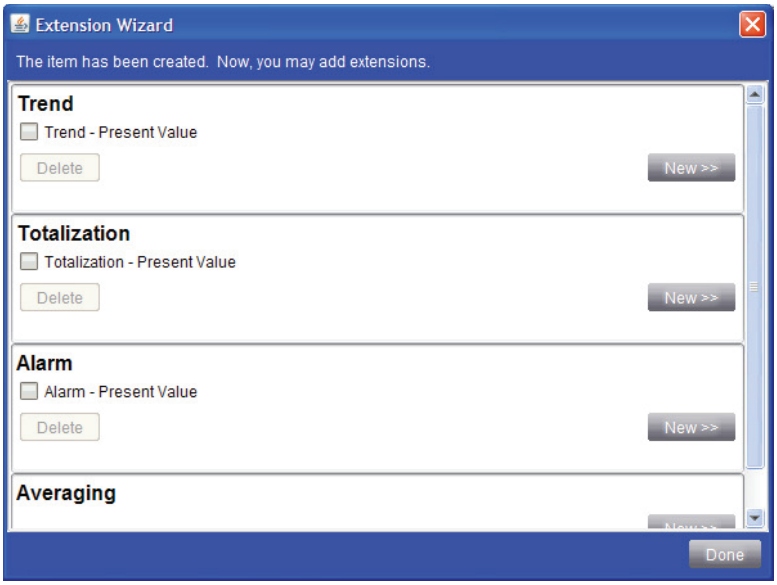

Figure 43: Extension Wizard box after the creation

- The '**Extension Wizard**' box re-appears and the newly added Totalization appears in the Totalization section. Click '**Done**' to close the wizard.

4.6. Adding a Totalization Extension to a Binary Object:

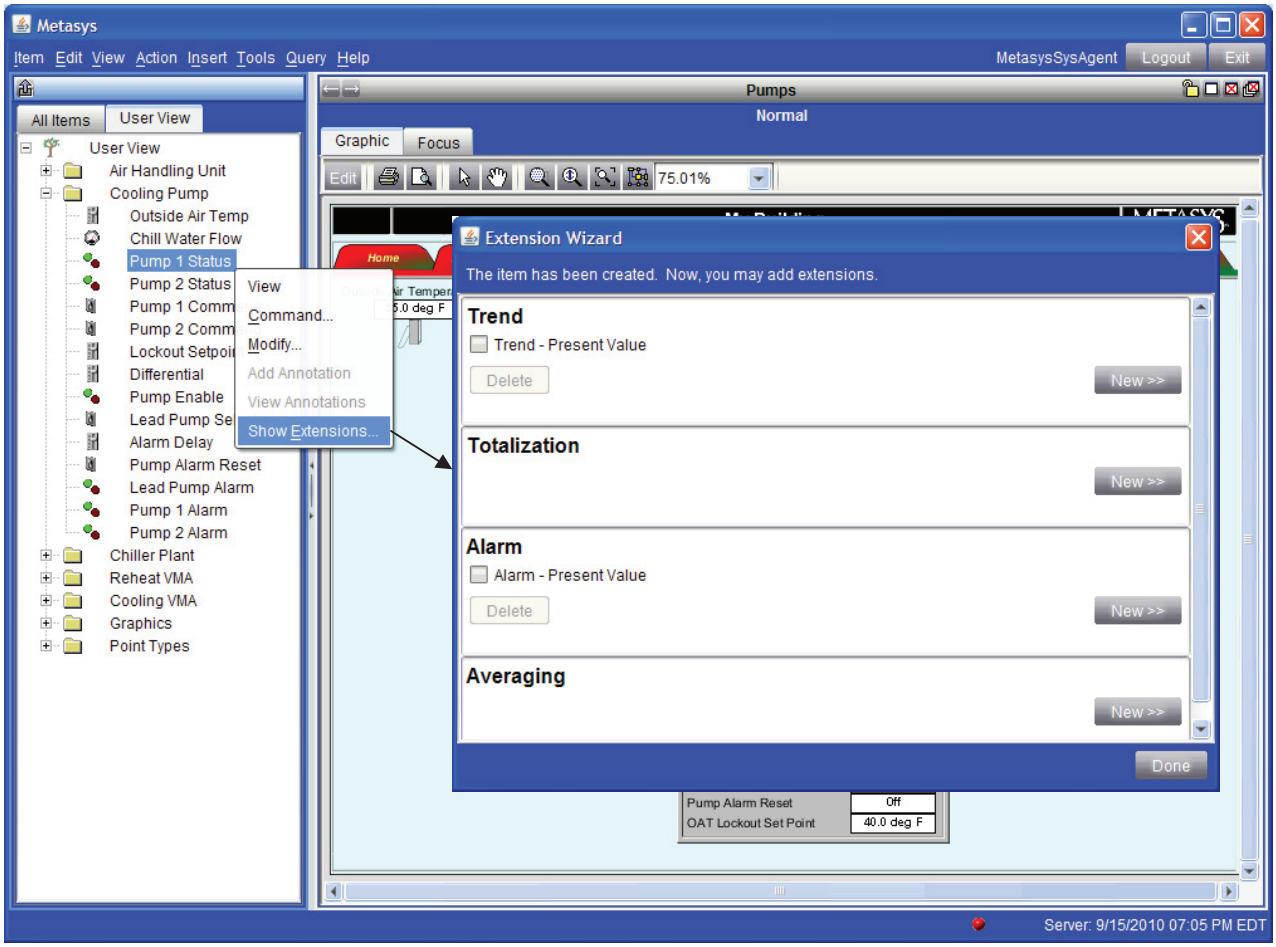

Figure 44: Viewing the Extension Wizard for a Binary Object.

- To add a Totalization to a Binary Object select the '**User View**' tab where the system resides. Navigate into the system folder and single left click on the point in question.
- When the '**Extension Wizard**' dialog box opens click on '**New**' in the '**Totalization**' section of the window.

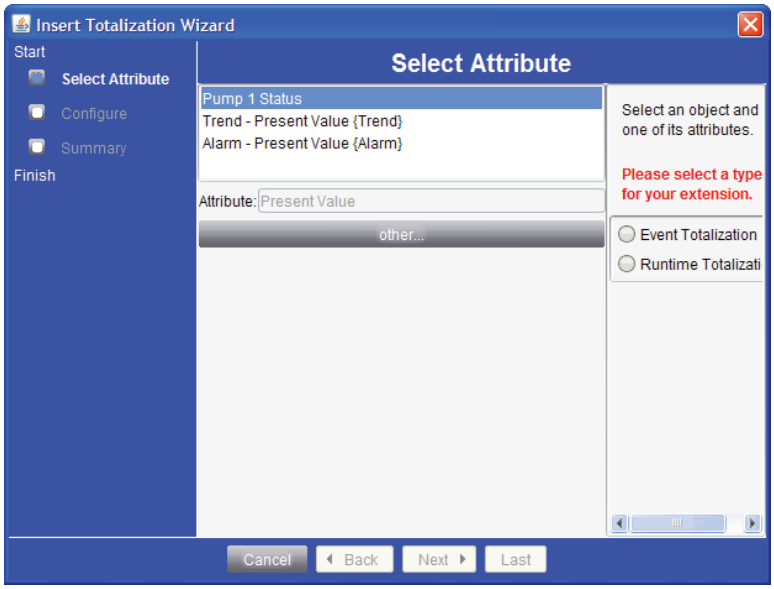

Figure 45: Select the attribute

- Select the '**Present Value**' from the list of attributes.
- Then select the type of '**Totalization'**:
  - **Event Totalization**
    - This tracks the number of binary events or pulses over time, meaning it counts the number of transitions that occur at an input reference. Unlike other types of totalization, event totalization increases the value each time the event occurs, instead of calculating the value once each minute. These three essential parameters determine the Event Totalization extension's mode of operation:
      - The Input Reference to be monitored.
      - The types of Transitions or events to be recorded.
      - The Value per Pulse (event) to be recorded.
  - **Runtime Totalization**
    - This tracks the time that elapses while a designated input, such as a binary or multistate value, matches a specified state. These two essential parameters determine the Runtime Totalization extension's mode of operation:
      - The Input Reference being monitored.
      - The Reference (state) that identifies active runtime.
- Click on '**Next**' once the selection has been made.

EVENT TOTALIZATION CONFIGURATION

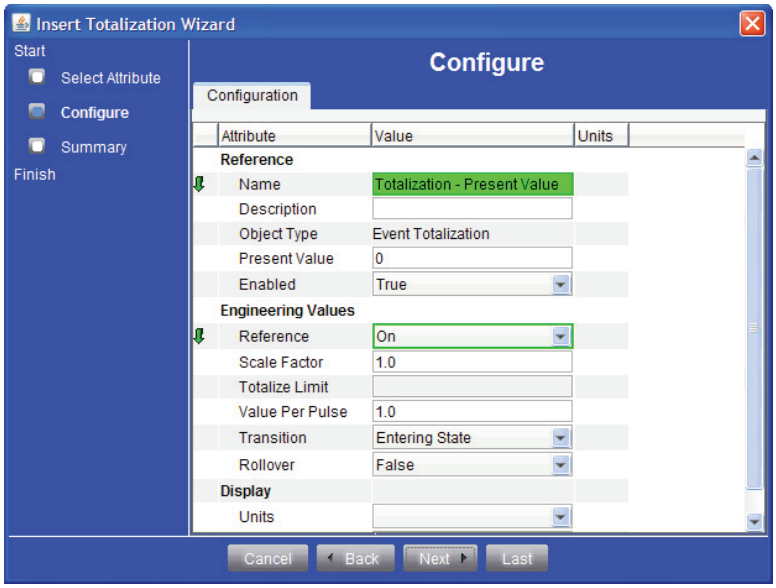

Figure 46: Setting up an Event Totalization

- '**Reference**' - choose the state that is to be totalized.
- '**Scale Factor**' - Indicates the value used to scale the totalized value to either a larger or smaller value than would otherwise result.
- '**Value per Pulse**' - Indicates the unit value of the Input Reference for pulse totalization. For the event totalization, the value is 1.
- Once the Totalization is configured click on '**Next**'

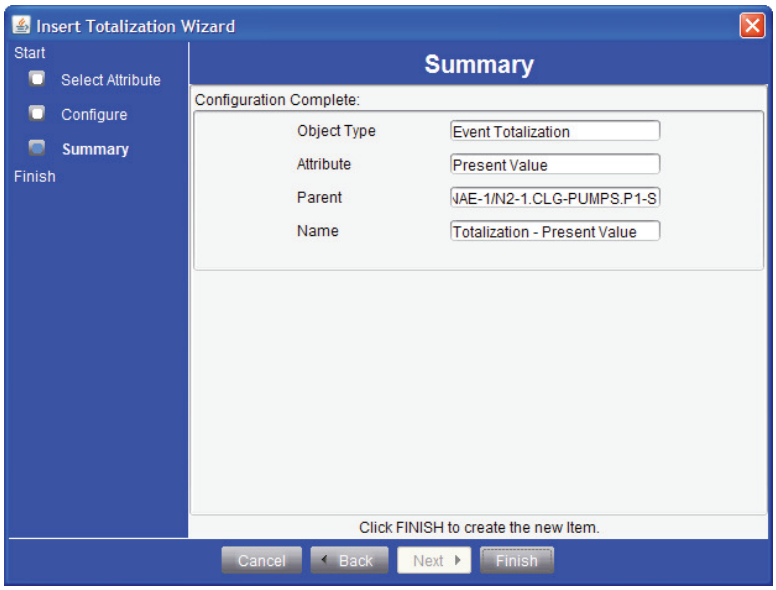

Figure 47: Finishing the Event Totalization Extension

- Click '**Finish**' to complete the extension set up.

RUNTIME TOTALIZATION CONFIGURATION

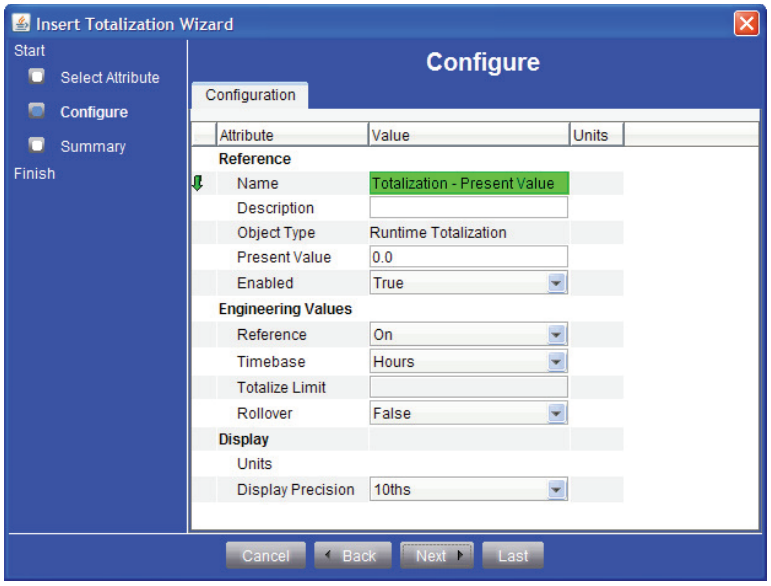

Figure 48: Setting up a Runtime Totalization

- '**Reference**' - choose the state that is to be totalized.
- '**Time base**' – Select the appropriate time base for the runtime of the binary object.
- Once the Totalization is configured click on '**Next**'.

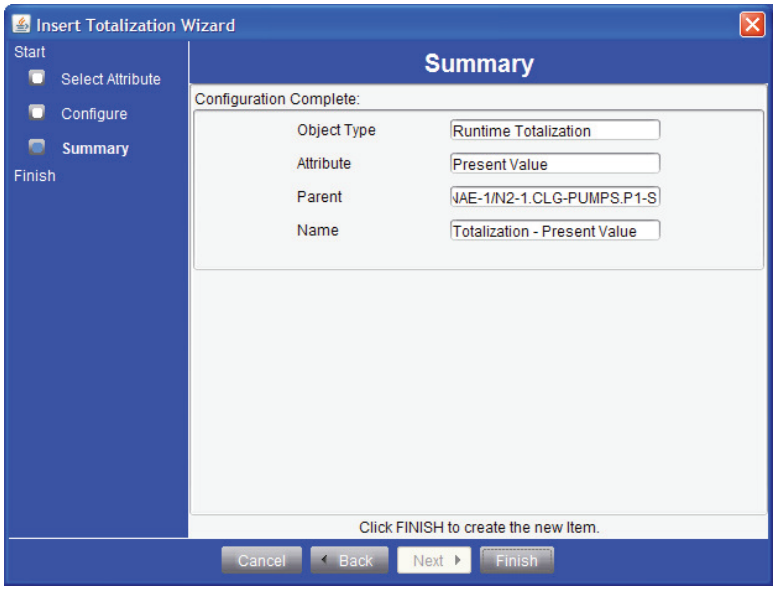

Figure 49: Finishing the Runtime Totalization Extension

- Click '**Finish**' to complete the extension set up.

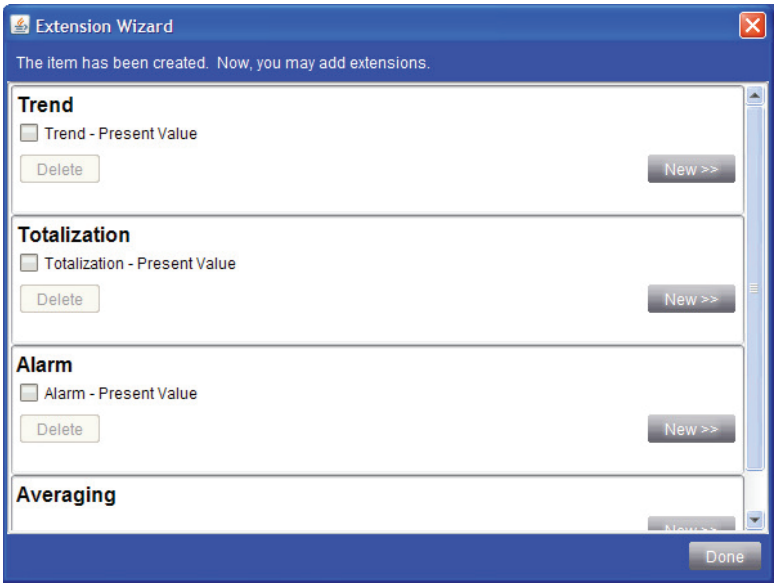

Figure 50: Extension Wizard after the extension was created.

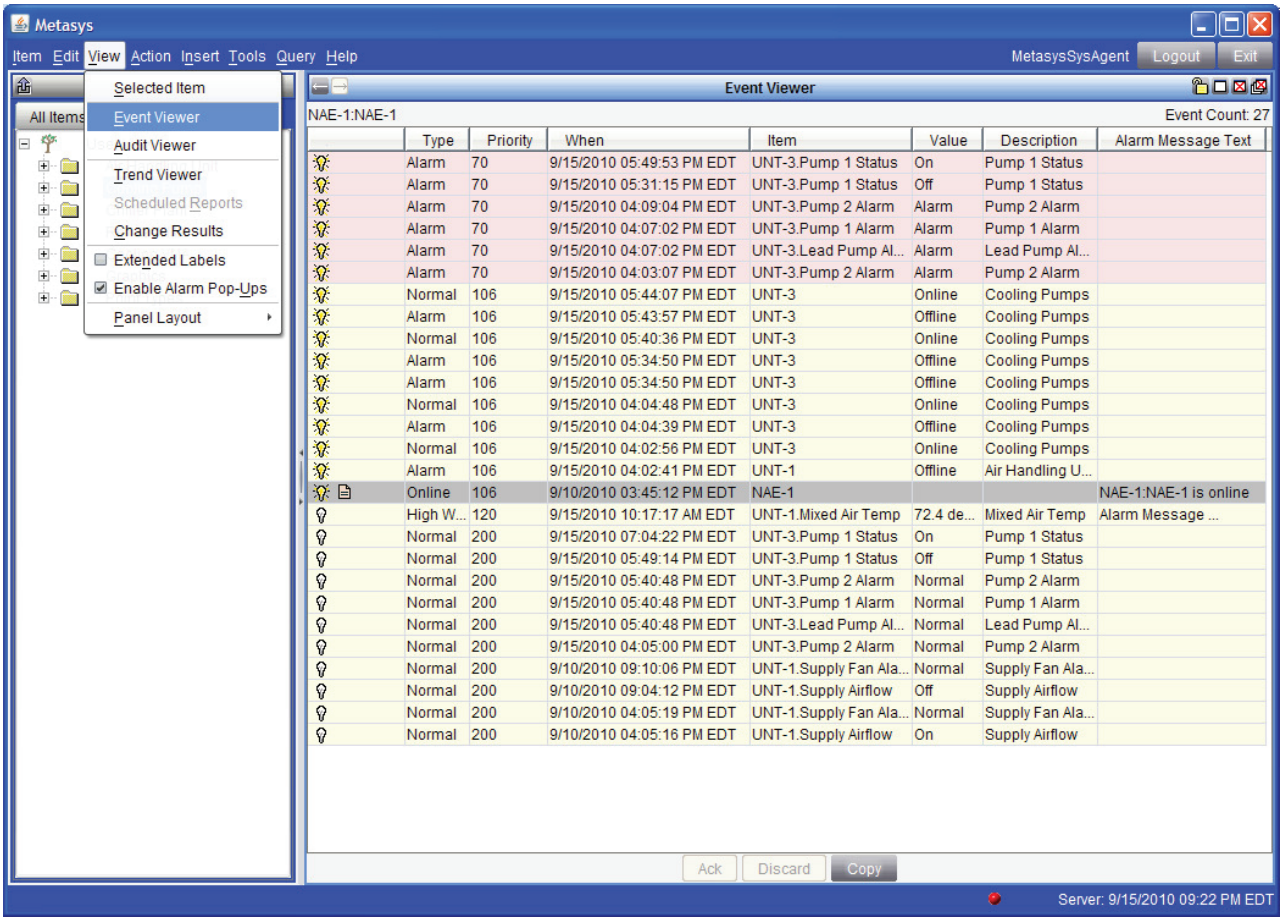
- The '**Extension Wizard**' box re-appears and the newly added totalization appears in the Totalization section. Click '**Done**' to close the wizard.
- **NOTE:** Any extension may be deleted by checking the box beside the extension name and then clicking on '**Delete**'. If a Totalization is deleted all data will be lost.

5. Event Viewer



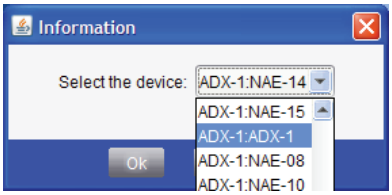


Figure 51: Viewing the Event Viewer for a single NAE site

- To open the '**Event Viewer**', click on '**View**' and then '**Event Viewer**'.
- If the Site has a single NAE then the '**Event Viewer**' will open in the right hand window.
- If the site has multiple NAEs then a dialog box will open similar to the one shown here.

- Scroll down to the site director in the list, select it and click '**Ok**'.
- Similarly if the site has an ADS/ADX then scroll down to this object and click '**Ok**'.
- Once open the data displayed is all the alarms on the system.
  -  - This indicates acknowledged alarms.
    - These may be discarded or copied to a word document.
  -  - This indicates unacknowledged alarms.
    - These may be acknowledged, discarded or copied to a word document.

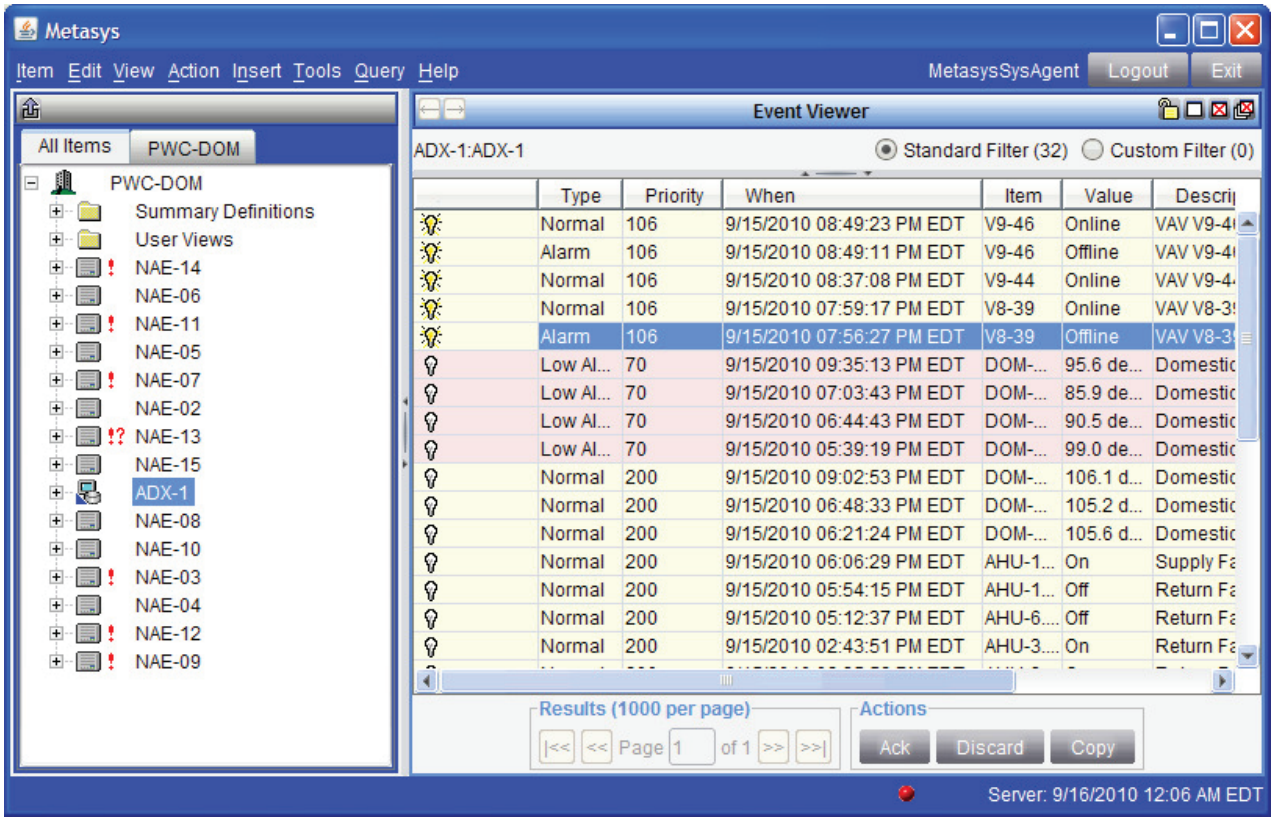

Figure 52: Event Viewer for a Site with an ADS/ADX as the Site Director

- The initial screen shown in the event viewer uses a Standard Filter that shows the most recent alarms (up to the first 1000).
  - If there are more than 1000 alarms then use the icons in the '**Results (1000 per page)**' to navigate through the events
- Filters:
  - **Standard filter** – shows all the events.
  - **Custom Filter** – to be discussed later – see page 43.
- To '**Acknowledge**' or '**Discard**' an Event you must highlight the event above and then select the appropriate action, either '**Acknowledge**' or '**Discard**'. Keep in mind that discarding an event will delete it from the event viewer. To select multiple alarms to discard; hold down the '**Ctrl**' Key and select multiple items or highlight one item and press '**Ctrl**'+'**A**' to select all items on the screen.

CUSTOM FILTERS IN THE EVENT VIEWER

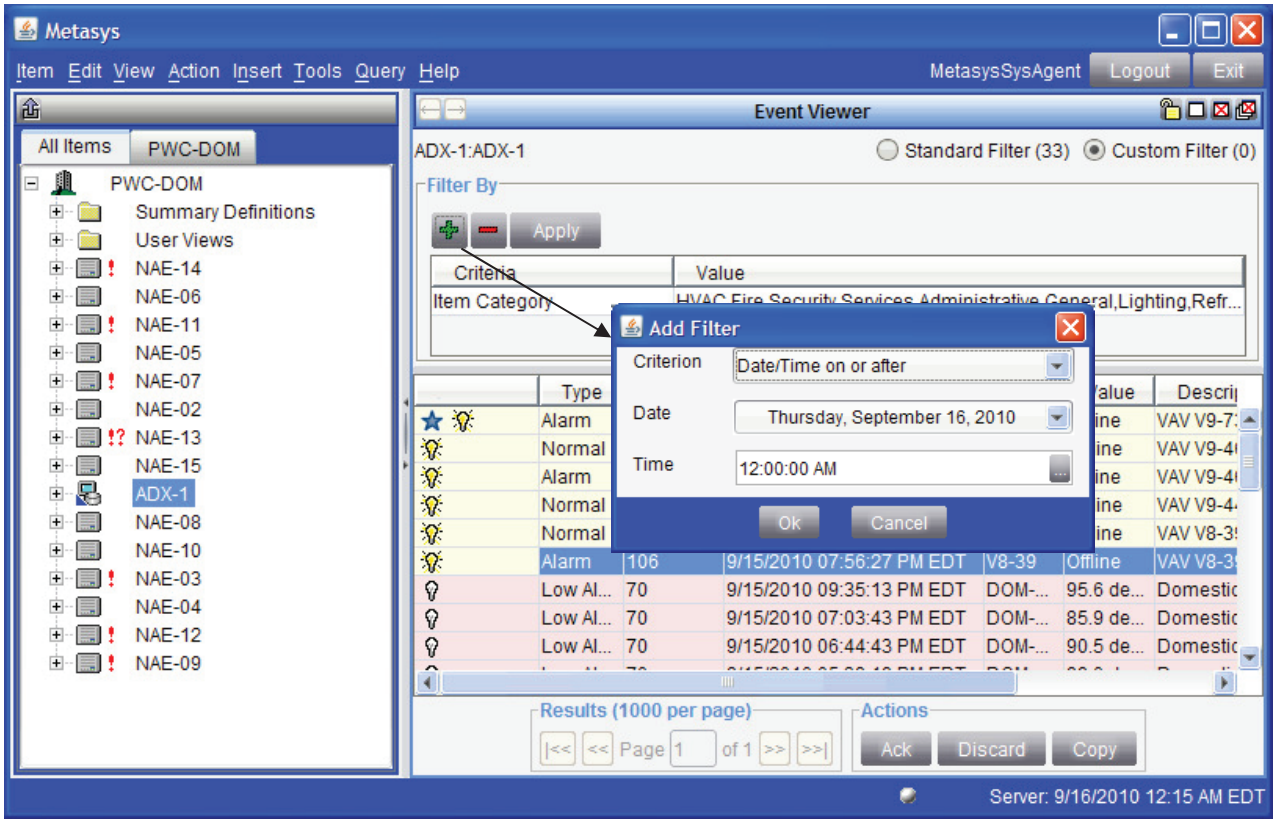

Figure 53: Using Custom Filters within the Event Viewer

- Use the icon to '**Add Filter**'
  - A number of different '**Criterions**' can be selected from; each selection of criterion will update the box, requesting relevant details.
  - Click '**Ok**' once the selections have been made.
- Use the icon to remove the selected filter. Click on '**Apply**' to update the data list.
- Once added the filter will show in the list, to update the event log click on '**Apply**'. The system will filter out the data that does not match the criterion.
- To '**Acknowledge**' or '**Discard**' an Event you must highlight the event above and then select the appropriate action, either '**Acknowledge**' or '**Discard**'. Keep in mind that discarding an event will delete it from the event viewer. To select multiple alarms to discard; hold down the '**Ctrl**' Key and select multiple items or highlight one item and press '**Ctrl**'+'**A**' to select all items on the screen.

6. Trend Viewer

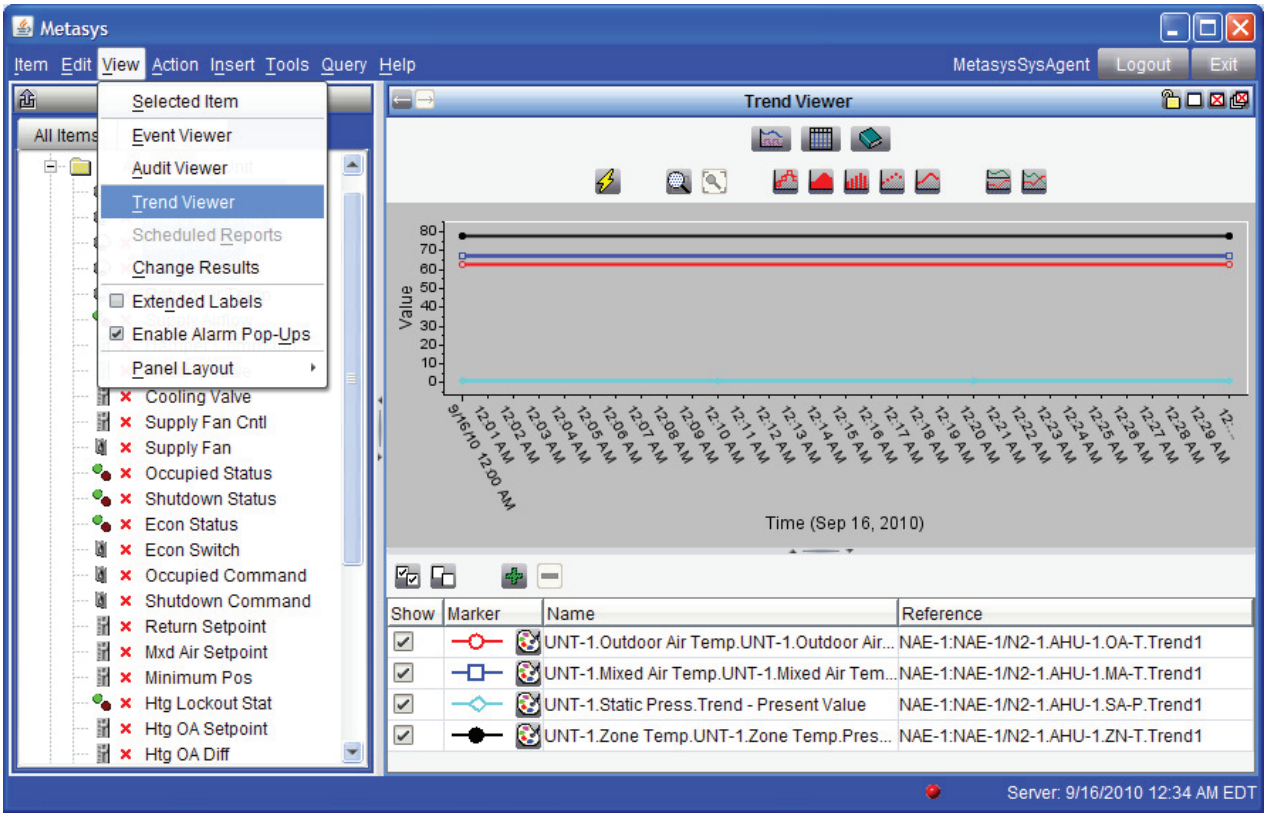

Figure 54: Opening the Trend Viewer.

- Select the '**User View**' tab where the system resides. Navigate into the system folder and single left click on the point in question, use '**Ctrl**' to select multiple points, preferably of the same type.
- Click on '**View**' and then select '**Trend Viewer**', the data will populate the right hand window.
- Display Options:
  -  - Displays the trend data graphically.
  -  - Displays the trend data in table form.
  -  - Display the definition view of the trend viewer.
- Other Icons:
  -  - Forces an update from the field points.
  -  - Zoom features of the trend viewer.
  -  - Graphically the data may be displayed as:
    - Points-Line Graph
    - Area Graph
    - Bar Chart
    - Points Graph
    - Line Graph

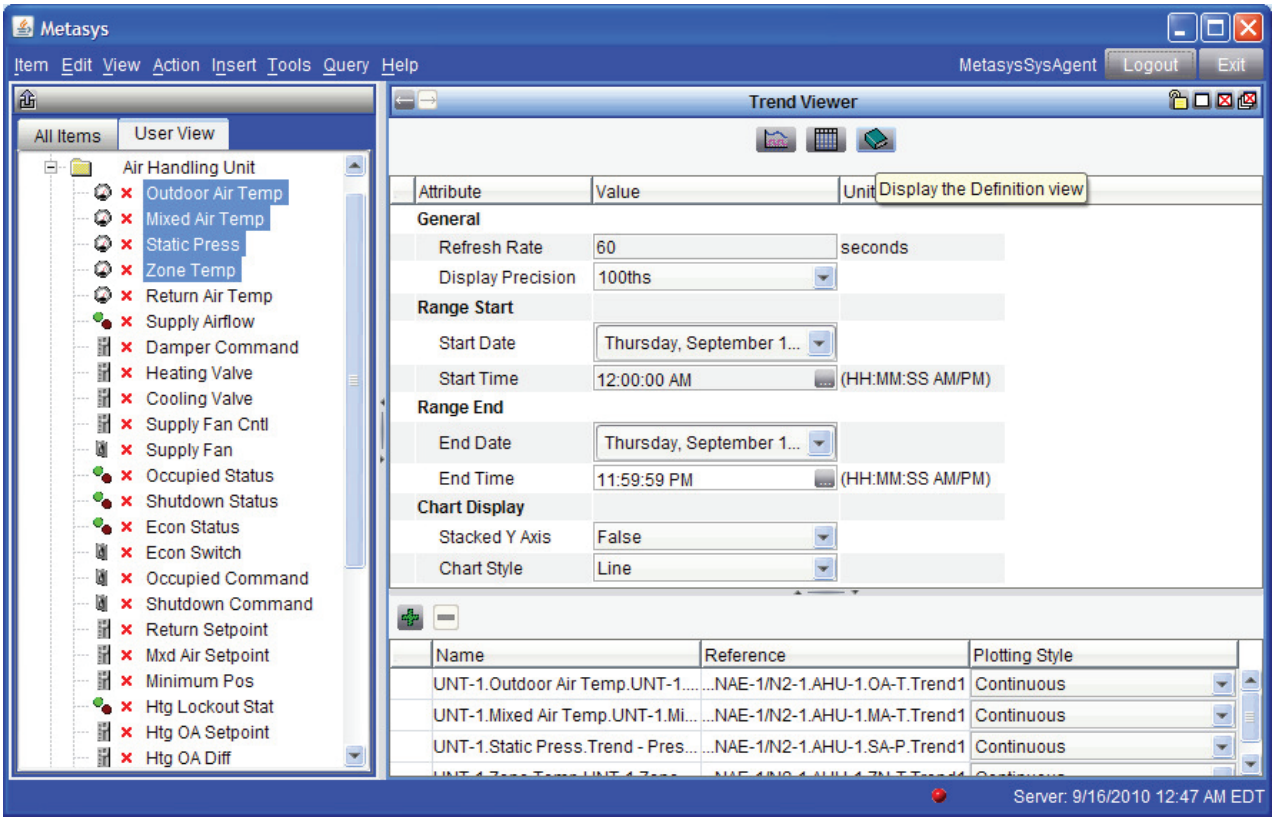

Figure 55: Displaying the Trend Viewer Definitions

- Change the '**Range Start**' and '**Range End**' dates needed to display the data required. The changes take effect immediately.
- Click on '  ' or '  ' to view the updated data.
- In the tabular view the data may be copied to a word pad document.

7. Schedule & Calendar Objects

7.1. Adding a Calendar Object

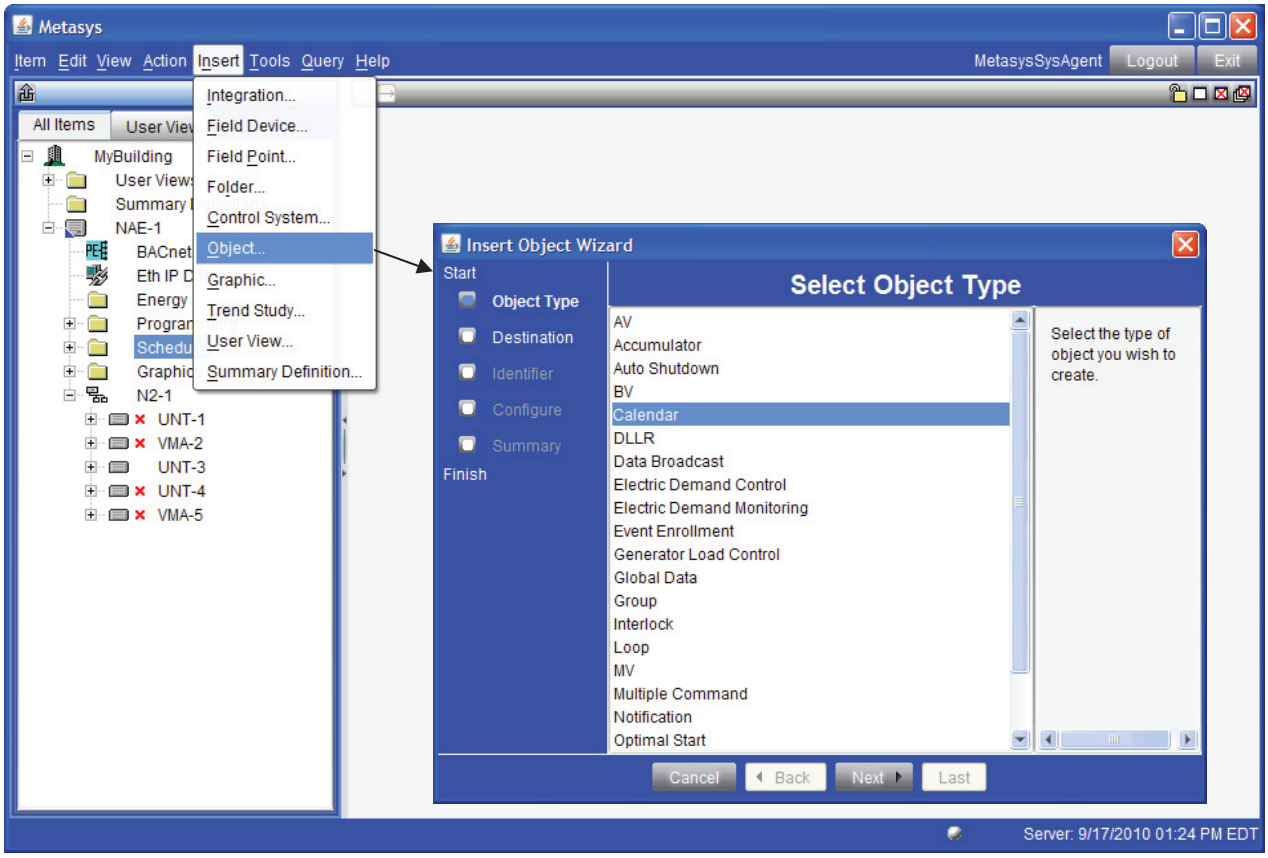

Figure 56: Inserting a Calendar Object – object selection.

- In the NAE to which the schedule is to be added expand the NAE to reveal the '**Schedule**' folder and then select it with a single left click.
- From the tool bar select '**Insert**' and then select '**Object**'.
- From the list of possible object click on '**Calendar**' and the '**Next**'.

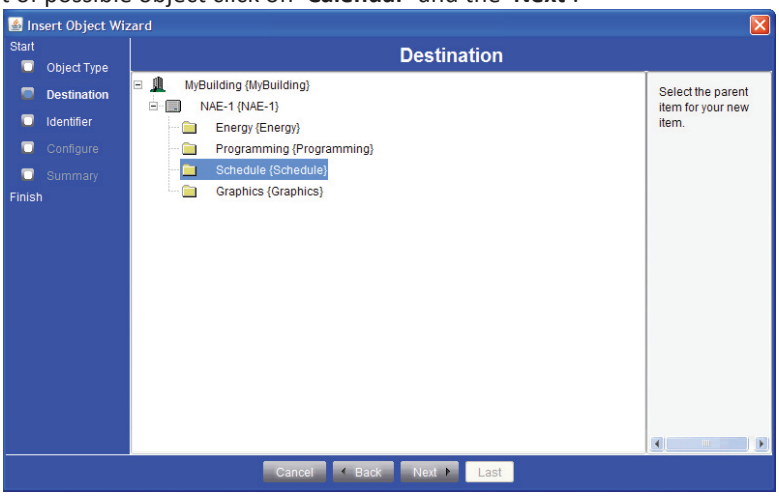

Figure 57: Destination of the Object

- Verify the destination of the '**Calendar**' Object and then click '**Next**'.

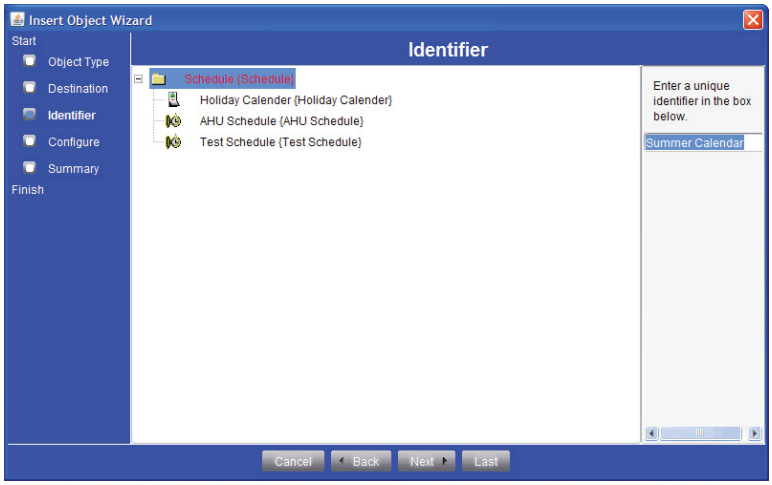

Figure 58: Naming the Calendar Object

- Enter a unique name for the calendar and then click on '**Next**'.

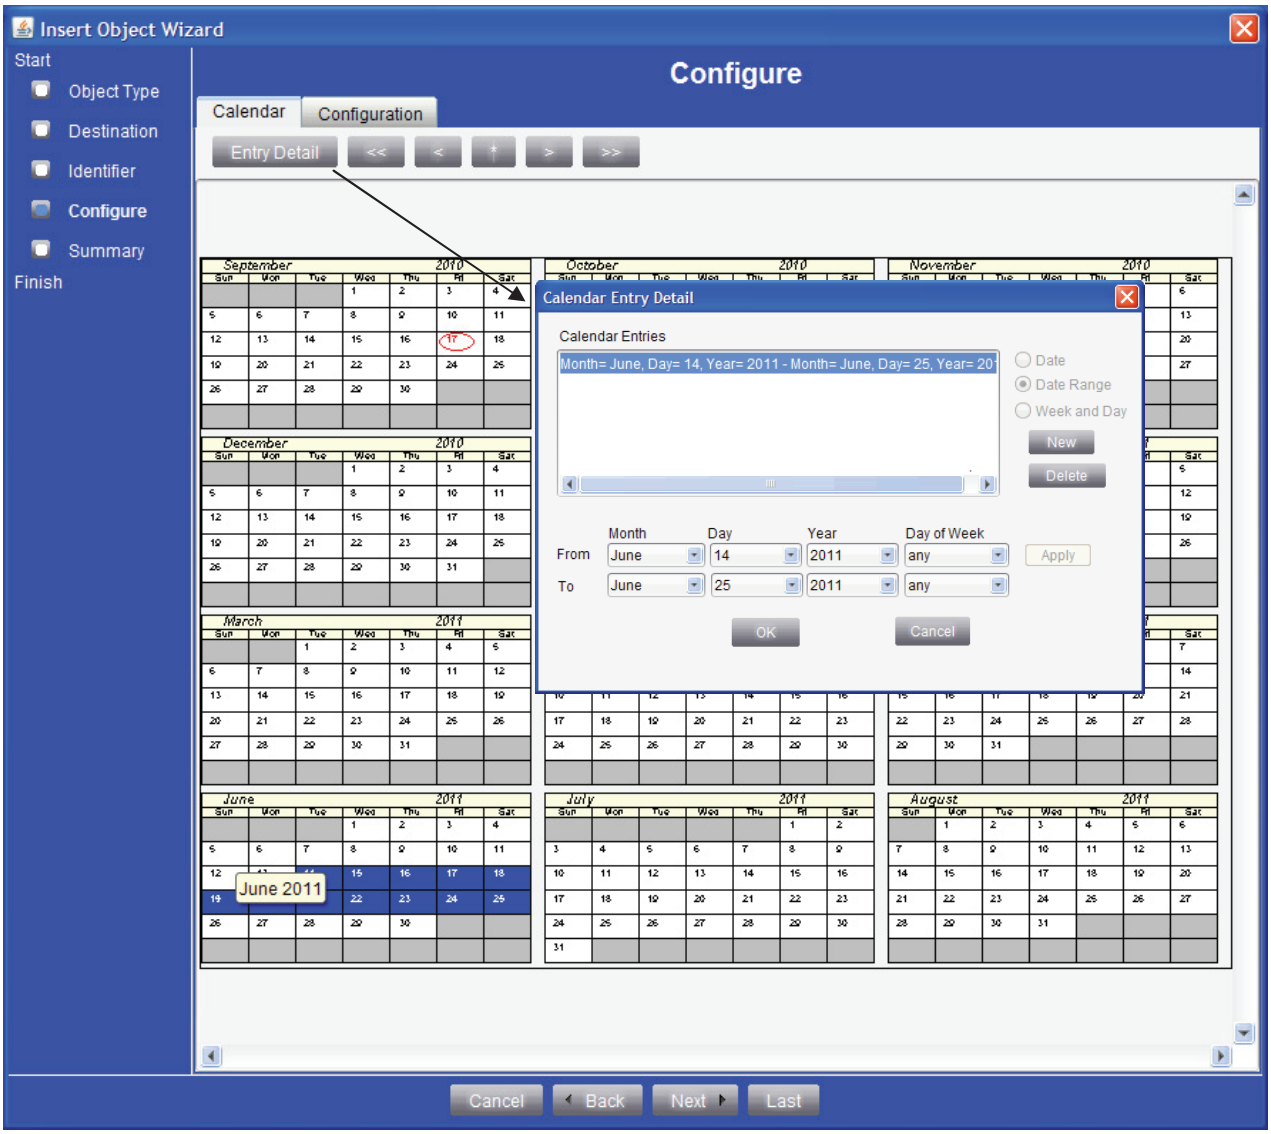

Figure 59: Configuration stage of the Calendar Object

- On this page click on the calendar dates as needed, the activated dates will turn dark blue as seen above. It is on these dates that an exception schedule referencing this calendar will be active.
- Calendar dates that appear in light blue occur every year on the same date.
- Another method of adding dates to this calendar is to use the '**Entry Detail**'. (Light blue days must be changed using this method.)
- Use these navigation buttons - << < > >> - to navigate back and forth. The calendar can be set up for many years in advance.
- Once the configuration is complete click on '**Next**'.

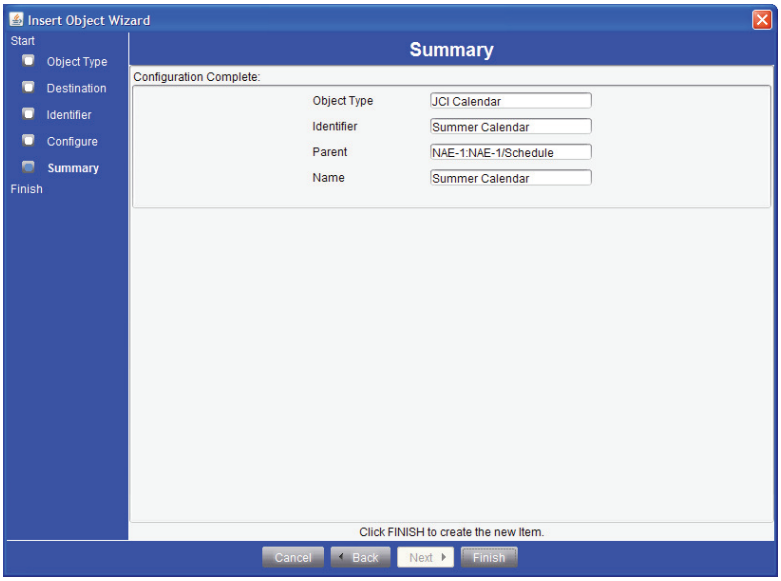

Figure 60: Completing the Calendar insertion process.

- Click on '**Finish**' and then '**Done**'.

7.2. Editing a Calendar Object

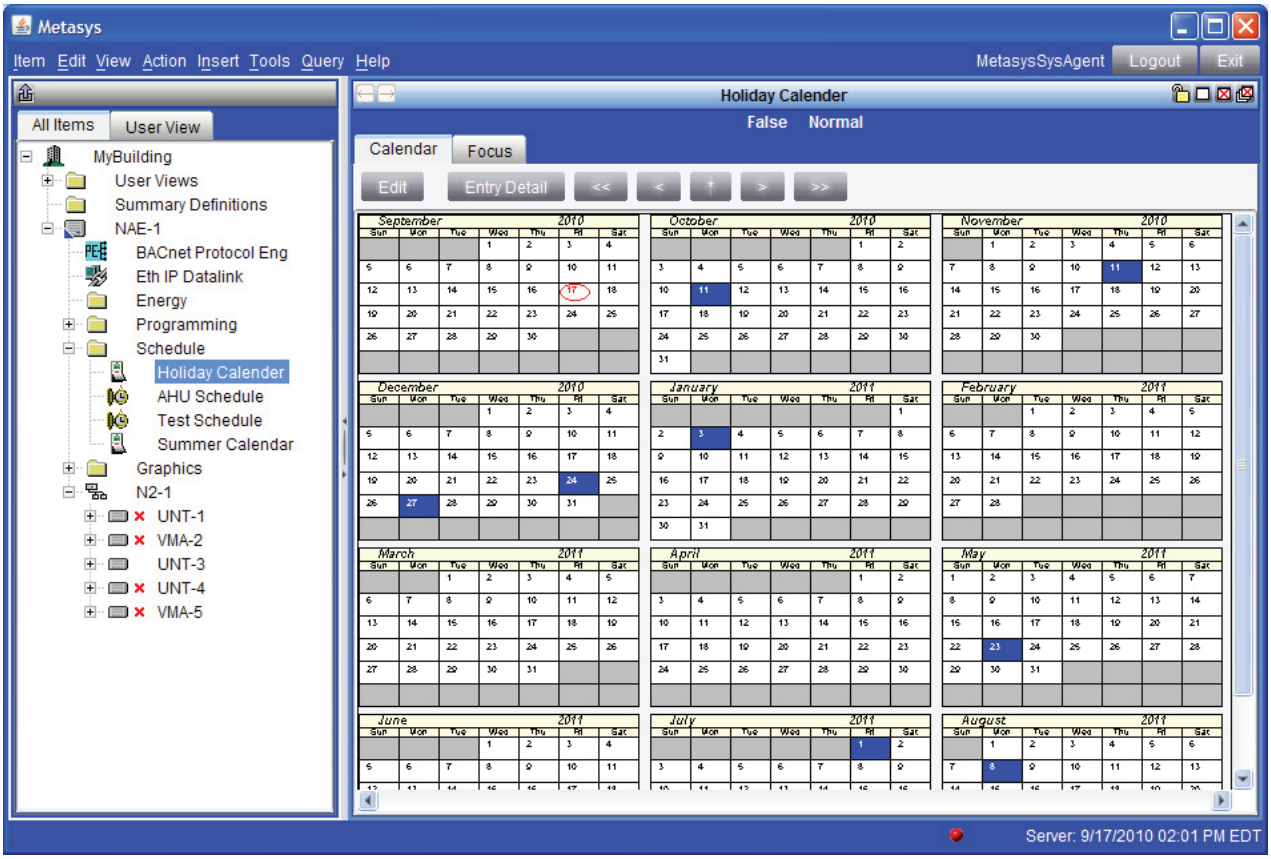

Figure 61: Editing an existing Calendar Object

- In the '**User View**' or the '**All Items**' tabs locate the calendar object to be edited and then double left click.
- The Calendar will populate the right hand window as seen above.
- To make changes to the calendar click on '**Edit**' and then single left mouse click on the dates to be added to the calendar object. These dates will appear in dark blue and are only for the current year. Adding days that are on the same date every year (Light blue) must be added/edited with the '**Entry Detail**' button.
- Use these navigation buttons -  - to navigate back and forth. The calendar can be set up for many years in advance.
- Once the changes are complete click on '**Save**'. – The '**Edit**' Button becomes a '**Save**' button.
- The modifications are complete

7.3. Adding a Schedule Object

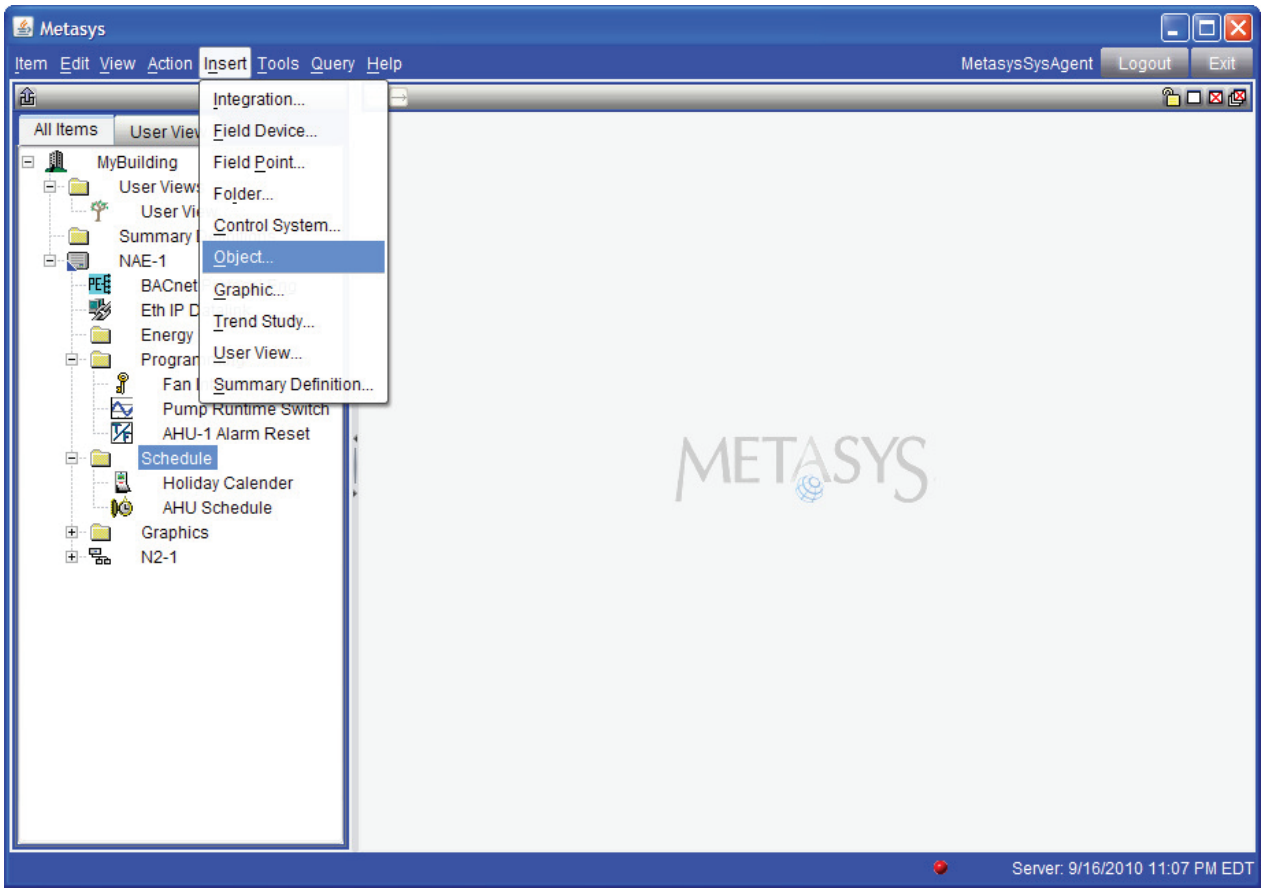

Figure 62: Creating a Schedule Object

- You must know which NAE the point you want to schedule is situated on before you begin. You must also have access to the All Items tree.
- In the NAE to which the schedule is to be added expand the NAE to reveal the '**Schedule**' folder and then select it with a single left click.
- From the tool bar select '**Insert**' and then select '**Object**'.

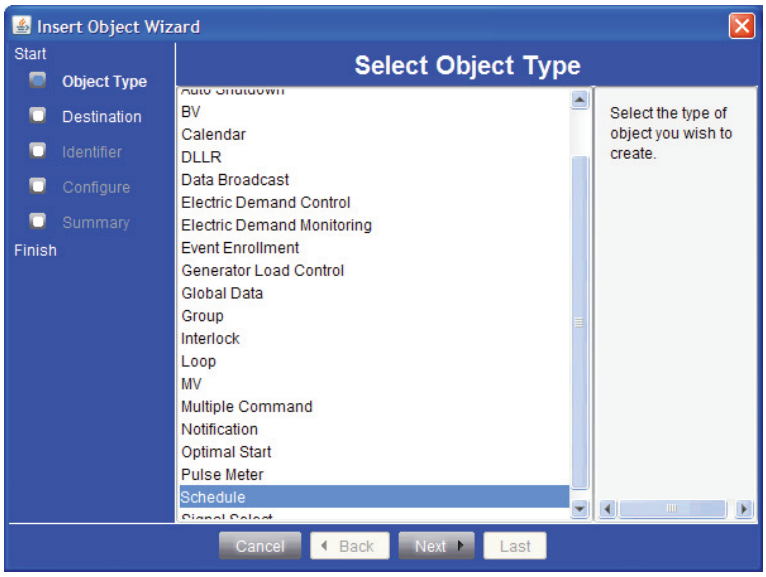

Figure 63: Select the object type

- From the list that appears select the '**Schedule**' object and then click '**Next**'.

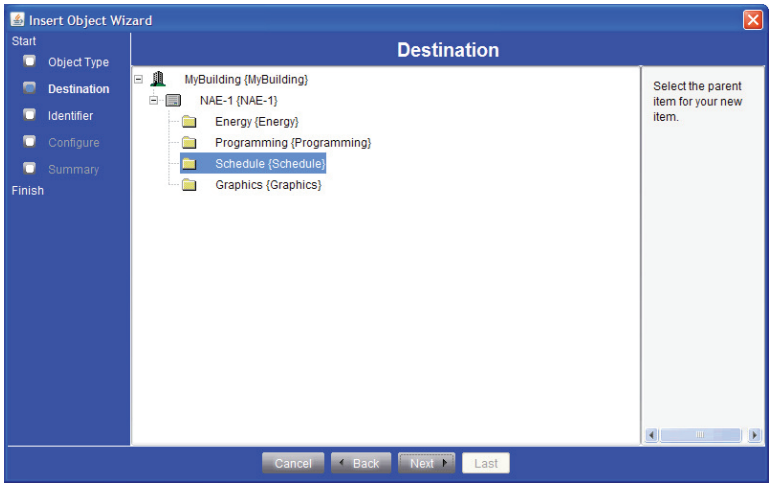

Figure 64: Schedule Objects Destination

- Select the folder in which the object will reside. The click '**Next**'

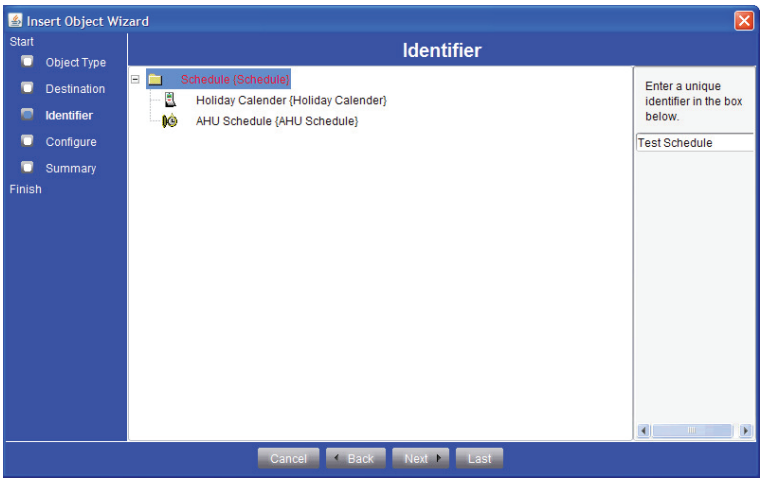

Figure 65: Naming new Schedule

- Give the schedule a unique name and the click '**Next**'

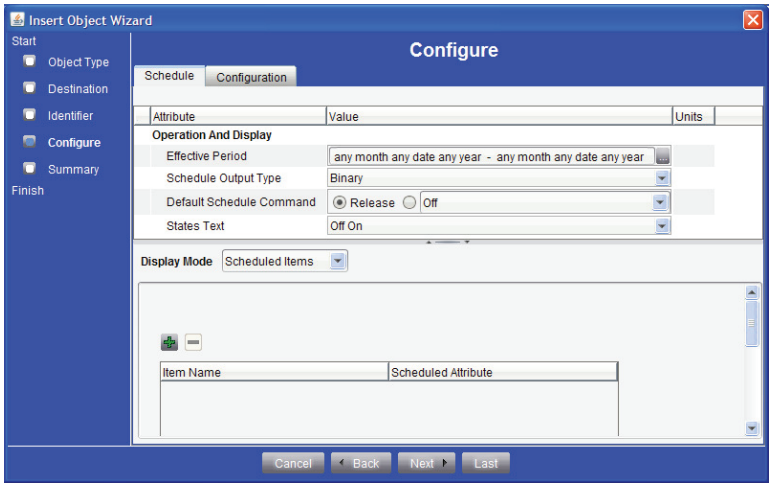

Figure 66: Select the scheduled Item(s)

- To indicate the point to be scheduled click on '  ' to open the '**Select Item**' dialog box
- Using either the '**All Items**' (if visible) or the user views select the point to be added. Multiple points can be added to the same schedule as long as they all have the same units (i.e.: all Off/On or all Start/Stop)
- Click on the '**Display Mode**' drop down box and select weekly schedule and edit it as needed.

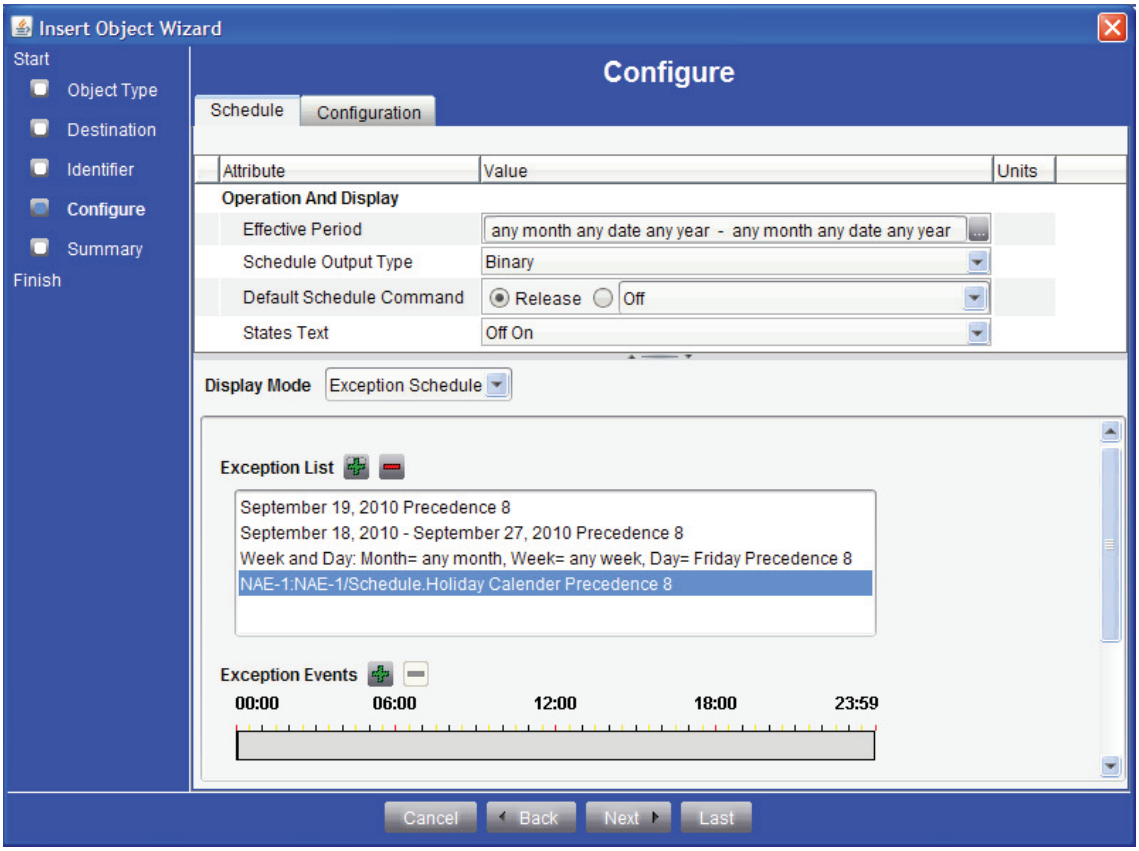

Figure 67: Adding the exception schedule.

- Click on '  ' to add to the list of exceptions, there are four options

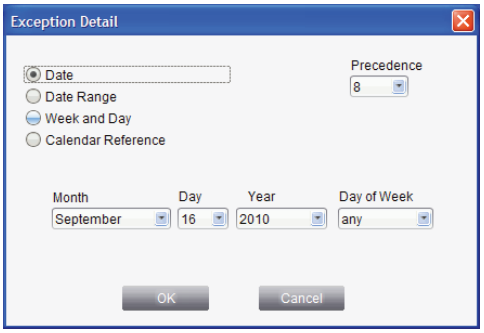

Figure 68: Single Date – Sept 16, 2010

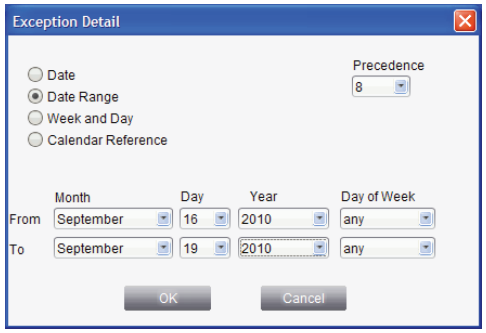

Figure 69: Date Range – Sept 16 to 19, 2010

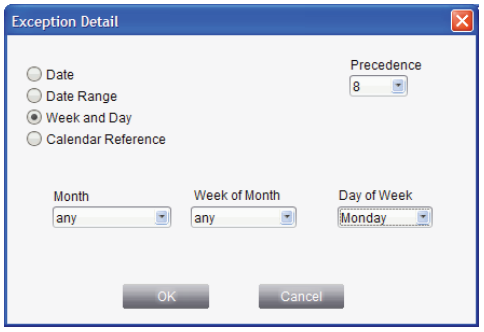

Figure 70: Week & Day - Every Monday

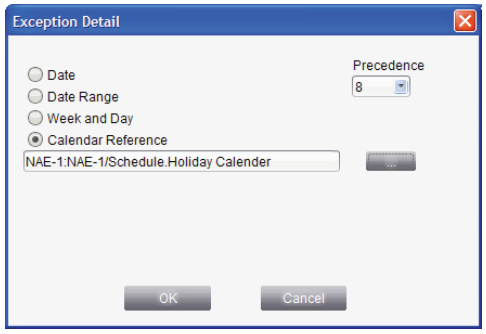

Figure 71: Calendar Reference – See Calendar

- For all four options, the event must also be set up before clicking '**Next**' then '**Finish**' and then '**Done**'

7.4. Editing a Schedule Object

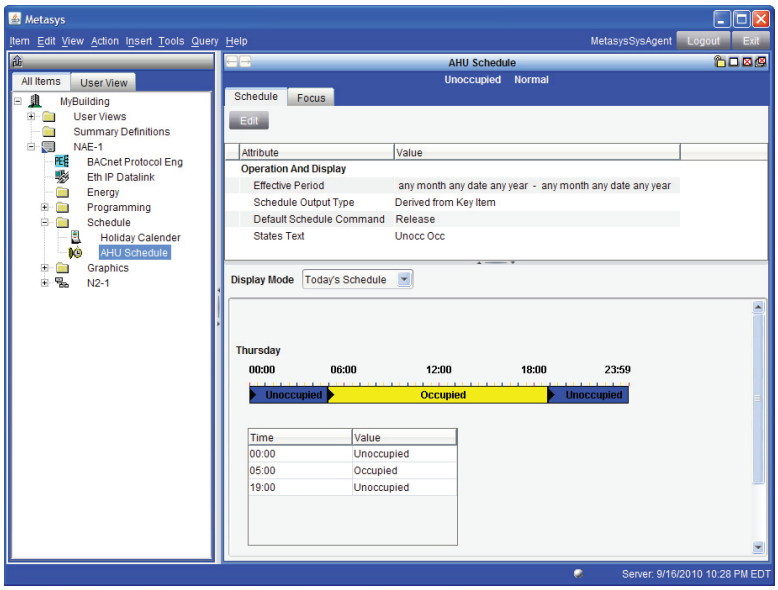

Figure 72: Default view when displaying a schedule item

- In the '**User View**' or the '**All Items**' tabs locate the Schedule object to be edited and then double left click.
- The Schedule will populate the right hand window as seen above.
- To make changes to the Schedule click on '**Edit**'
- Click on the drop down '**Display Mode**' and then choose '**Weekly Schedule**'
- Now click on '**Edit**' and the display reverts to the weekly schedule view.
- Make the necessary changes to the weekly schedule and then click on '**Save**' or select '**Exception Schedule**' from the drop down menu.

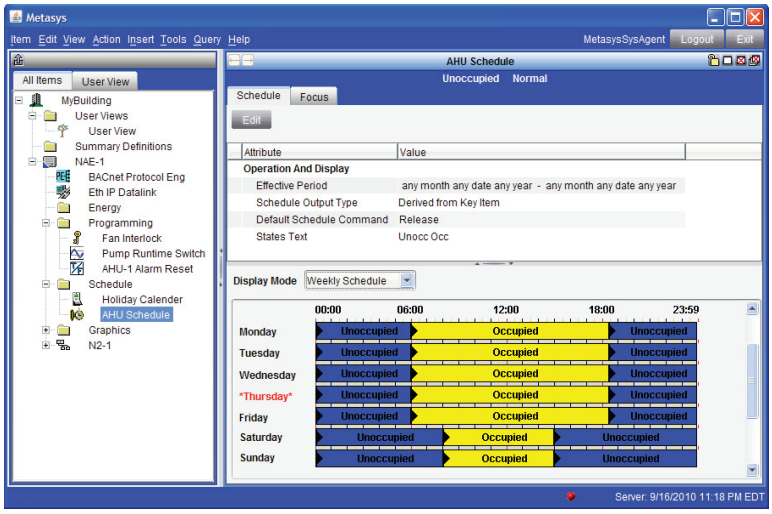

Figure 73: Weekly Schedule view of the Schedule object

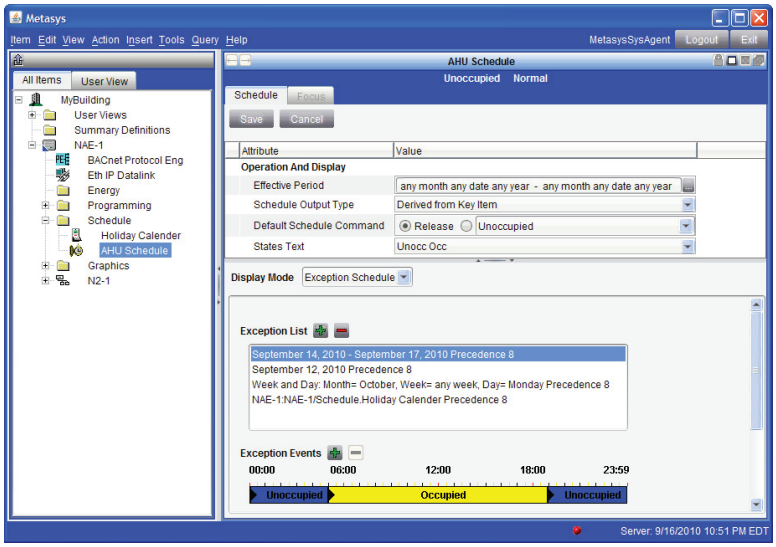

Figure 74: Viewing the Exception schedule set-up

- Click on '' to add to the list of exceptions, there are four options

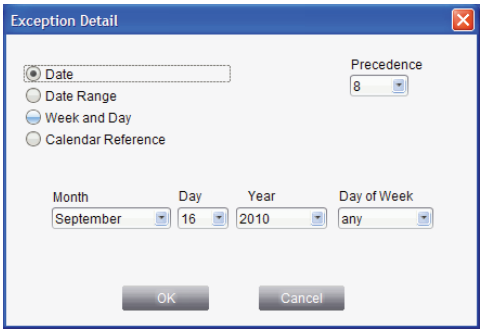

Figure 75: Single Date – Sept 16, 2010

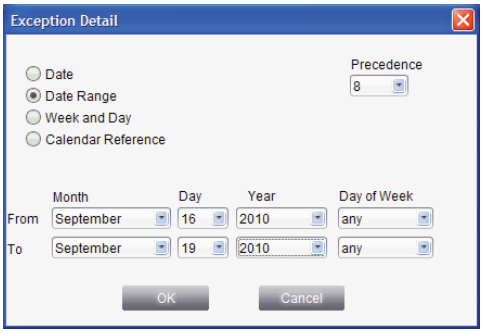

Figure 76: Date Range – Sept 16 to 19, 2010

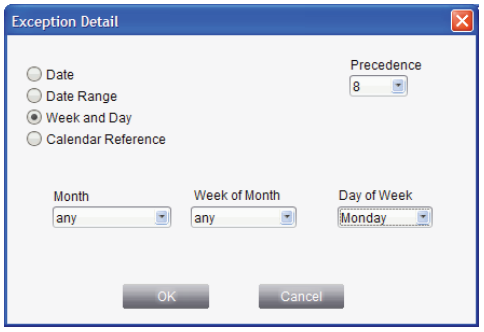

Figure 77: Week & Day - Every Monday

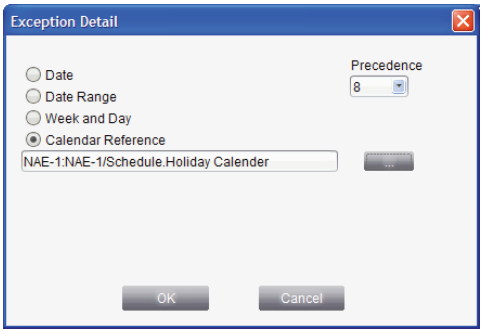

Figure 78: Calendar Reference – See Calendar

- For all four options, the event must also be set up before clicking '**Save**'

8. Tailored Summaries

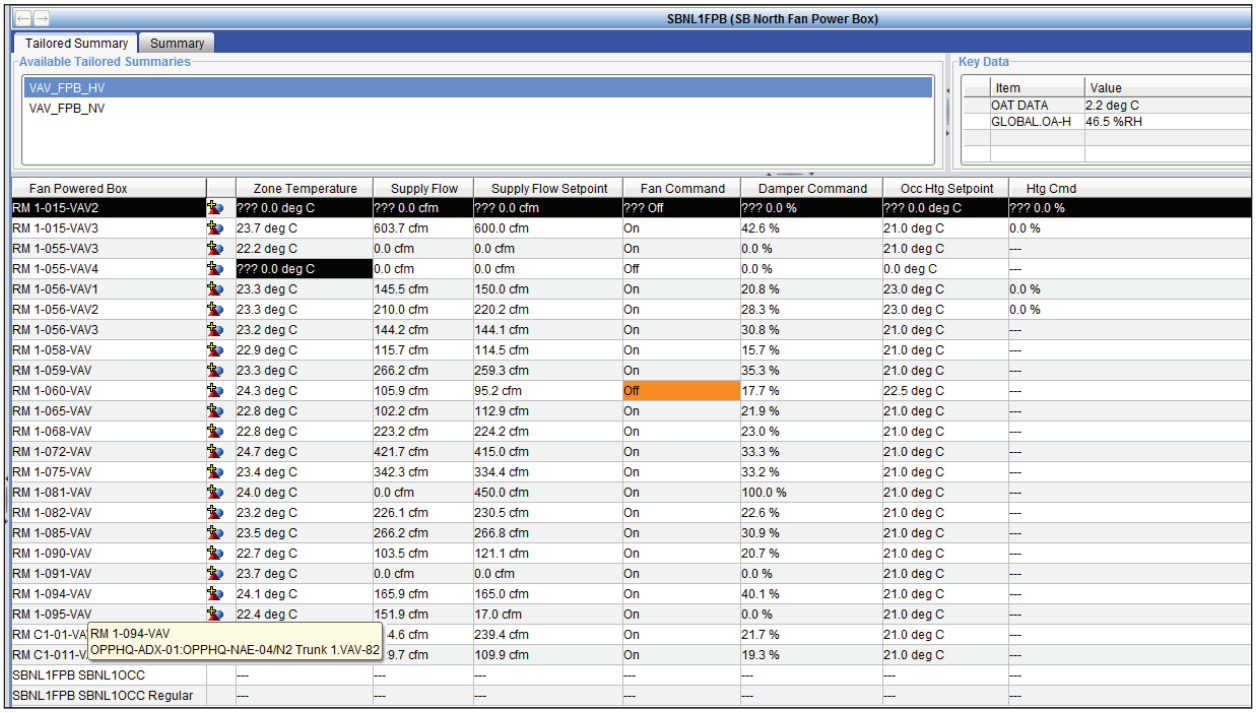

Figure 79: Sample view of a Tailored Summary

- Tailored Summaries are used to view the important points of devices. For example, we can display the points of multiple VAV boxes in an area.
- We can get a great amount of information into the tailored summary using the multiple columns and multiple tailored summaries with different points on the same devices.

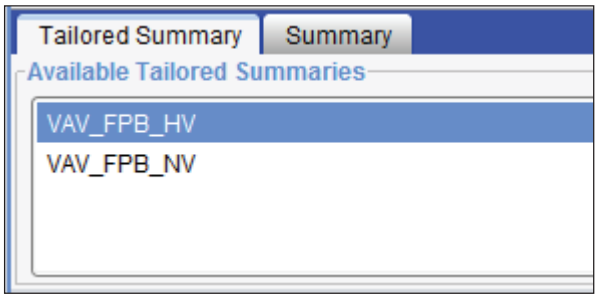

Figure 80: Viewing Multiple Tailored Summaries

- When multiple tailored summaries are available, they will be listed in the top left corner. Clicking on these other summaries will refresh the table with their updated columns.

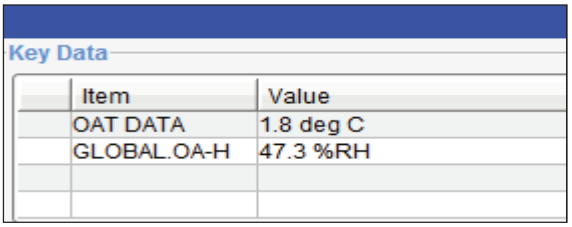

Figure 81: Key Data for Tailored Summaries

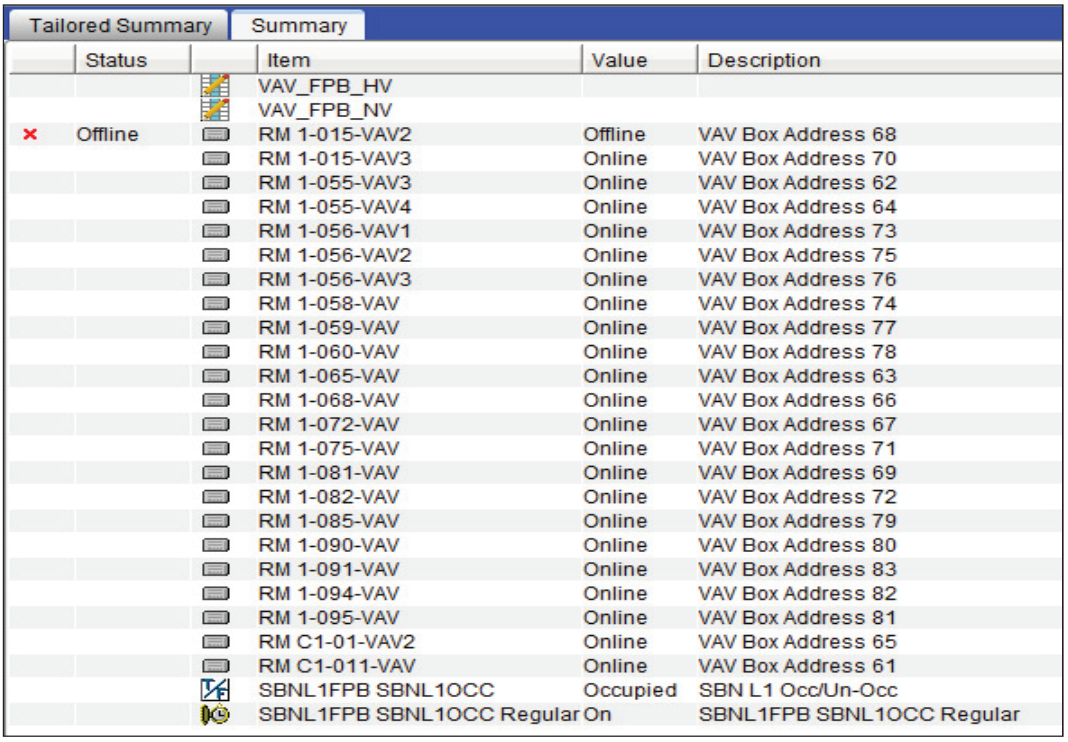
- In the top right corner of the summary lies the Key Data section. This is where pertinent information for the site can be added. In this case, the Outdoor Air Temperature and Humidity are always available for quick reference.



Fan Powered Box		Zone Temperature	Supply Flow	Supply Flow Setpoint	Fan Command	Damper Command	Occ Htg Setpoint	Htg Cmd
RM 1-015-VAV2		??? 0.0 deg C	??? 0.0 cfm	??? 0.0 cfm	??? Off	??? 0.0 %	??? 0.0 deg C	??? 0.0 %
RM 1-015-VAV3		23.7 deg C	594.3 cfm	600.0 cfm	On	42.6 %	21.0 deg C	0.0 %

RM 1-056-VAV3		23.2 deg C	143.1 cfm	150.9 cfm	On	30.8 %	21.0 deg C	---

Figure 82: Tailored Summaries Columns and Rows

- The columns display the live values and the rows are for each device. They can be sorted and moved around at will. Certain cells will light up in different colours depending on their condition. Red indicates an alarm, Yellow a warning, and Orange and operator override. Items in Black with question marks are offline or unreliable. When a column indicates – as a value, this means the device does not have that point.

Work with the Tailored Summary table as follows:

- To issue commands, select one or more items (that is, select the table cells), then right-click and select Command. To command all the items in a column, right-click the column header, and select Command. . For example, use this process to send an operator override command to multiple items. .
- To view an item, select an item and right-click and select View. The item appears in the display panel.
- To resize a column, place the cursor on the vertical line between the column headers so that the cursor has double-sided arrows (⟷). Click and drag the column to the desired width.
- To sort the column data alphanumerically, click a column header. Click the column header again to sort in the reverse order.
- To rearrange the order of the columns while viewing the Tailored Summary, select a column header and use drag-and-drop functionality to move it to the desired location.
- To keep a snapshot of the Tailored Summary's data for later comparison, select and copy the table data. Then paste it into a program such as Microsoft Excel. Use the keyboard shortcuts Ctrl A, Ctrl C, and Ctrl V.
- To view a graphic associated with field controller, double-click the graphic icon that appears in the second column of the table (by default). The graphic appears in the display panel.

2. REFER DWG 006007 FOR SAFETY WIRING DETAILS.
3. REFER DWG 006007 FOR XFILT-DP AND HEAD-P SENSOR WIRING DETAILS.
4. BELOW ARE THE DEVICES THAT WILL BE PANEL MOUNTED. EXPLOSION PROOF DEVICES ARE NOT CONSIDERED FOR THEM AS THESE ARE PANEL MOUNTED. EA-VP, SA-VP, EF-HISPD, EF-LOSPD, SF-HISPD, SF-LOSPD, SDR-1, SAFETY RELAY RB-1.

GAS DETECTION SYSTEM

ZONE CLASSIFICATION AREA: UPPER LEVEL, CLASS-1, ZONE-2, CATEGORY-1 AREA

NOTES:
1. DAMPERS & ACTUATORS ARE EXISTING & TO BE REUSED. FIELD TO CHECK IF EXISTING ACTUATORS NEEDS EXPLOSION PROOF HOUSING. PRESENTLY WE HAVE NOT CONSIDER ANY EXPLOSION PROOF HOUSING FOR EXISTING ACTUATORS.

2. SUPPLY AND EXHAUST FAN STATUS SWITCH (SF-S, EF-S) WILL BE MOUNTED INSIDE STARTER ENCLOSURE. HENCE NO EXPLOSION PROOF DEVICE SELECTED FOR THESE DEVICES.

③ AIR HANDLING UNIT SCHEDULE

SR. NO.	SYSTEM NAME	SERVICE	S/A AIRFLOW (L/s)	E/A AIRFLOW (L/s)	SUPPLY FAN ESP (Pa)	SF HP	EXHAUST FAN ESP (Pa)	EF HP	ELEC V/PH/HZ
1	AHU-3 (EXISTING)	EXISTING HEADWORKS RM-101, 102	2740	3040	500	5	438	5	575/3/60

NOTES:
1. DAMPER & ACTUATOR ARE EXISTING AND WILL BE RE-USED. OA & EA DAMPER WILL BE COMMANDED FROM BAS.
2. DEVICES SHOWN IN GRAY ARE EXISTING AND WILL BE REUSED.
3. AHU-3 IS EXISTING UNIT INSTALLED ON THE MAIN FLOOR OF EXISTING HEADWORKS. AHU-3 CONTROL WILL BE MIGRATED TO NEW DDC.
4. DRY CONTACT "INTRDET-S" PROVIDED BY OTHERS WILL BE MONITORED ON BAS TO DETERMINE BUILDING OCCUPANCY.
5. INTERNAL AUXILIARY SWITCH OF AN EXISTING DAMPER ACTUATOR WILL BE USED FOR DAMPER STATUS MONITORING. FIELD TO VERIFY THE AVAILABILITY OF INTERNAL AUXILIARY SWITCH.
6. FIELD TO VERIFY EXACT LOCATION TO INSTALL LT-A.
7. FIRE ALARM (NO) CONTACT WILL PROVIDED BY FAS CONTRACTORS.

Contract Number
8N0Y-0079

Drawing Number
006.008

H:\8N0Y0079\Drawings\AHU-3 Hardware Schedule.vsd

SEQUENCE OF OPERATION:

GENERAL:
AHU-3 IS AN EXISTING CUSTOM BUILT 100% OUTDOOR AIR UNIT COMPLETE WITH TWO (2) TWO-SPEED FANS, AN AIR-TO-AIR FIXED PLATE HEAT EXCHANGER, DEFROST BYPASS DAMPERS, A REHEAT HYDRONIC HEATING COIL AND EXHAUST AND OUTDOOR AIR DAMPERS. THE UNIT IS INSTALLED ON THE MAIN FLOOR OF THE EXISTING HEADWORKS BUILDING AND SERVICES THE EXISTING HEADWORKS ROOM.

SUPPLY & EXHAUST FAN CONTROL (SF, EF):
1. EXISTING AHU-3 CONSISTS OF A TWO SPEED SUPPLY AND EXHAUST AIR FAN, REHEAT COIL, DEFROST BYPASS, HEAT RECOVERY SECTION AND FILTER SECTION.

2. AHU-3 AIR SYSTEM TO OPERATES CONTINUOUSLY. AHU-3 WILL NORMALLY OPERATE WITH THE SUPPLY FANS AND EXHAUST FAN AT 50% SPEED TO PROVIDE 6 ACH OF CONTINUOUS VENTILATION.

3. WHEN INTRUSION DETECTION SYSTEM IS DISABLED DETECTED BY "INTRDET-S" (I.E. WHEN BUILDING IS OCCUPIED) OR WHEN THE GAS DETECTION SYSTEM IS ACTIVATED, OR WHEN THE OUTSIDE AIR TEMPERATURE IS ABOVE 10 DEG C, THE SUPPLY FAN AND EXHAUST FAN WILL SWITCH TO SPEED 2 (100% SPEED) TO PROVIDE 12 ACH OF CONTINUOUS VENTILATION. FINAL FAN SPEEDS TO BE DETERMINED DURING COMMISSIONING.

4. GAS DETECTION BY PLC CONTRACTOR. INTERLOCK PLC I/O WITH DDC AHU CONTROLS.

5. IN EVENT OF EITHER SUPPLY FAN FAILURE OR EXHAUST FAN FAILURE, ALARM TROUBLE AT OWS.

6. FAN STATUS AT OPERATOR WORKSTATION WILL BE SHOWN.

7. AIR CHANGE PER HOUR (ACH) RATE AT OPERATOR WORKSTATION WILL BE SHOWN.

8. RELATIVE SPACE PRESSURE AT OPERATOR WORKSTATION WILL BE SHOWN.

9. AIR FILTER DP AT OPERATOR WORKSTATION WILL BE SHOWN.

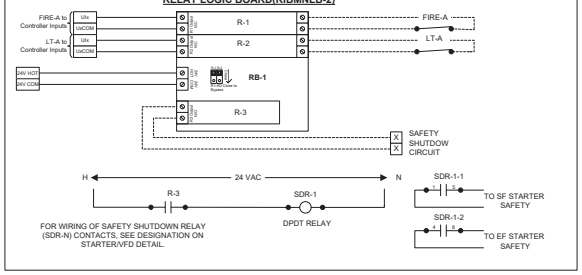
10. AHU-3 HEAT TRANSFER CORE "DEFROST MODE" BYPASS DAMPERS ARE NORMALLY CLOSED (FULL AIR FLOW THROUGH HEAT EXCHANGER). BAS TO SWITCH AHU-3 TO DEFROST MODE WHEN SUPPLY AIR TEMPERATURE DOWNSTREAM OF HEX AND UPSTREAM OF REHEAT COIL IS LESS 5 DEG C AS SENSED BY AVERAGING TYPE DUCT TEMPERATURE SENSOR. IN "DEFROST MODE", BAS MODULATES AHU-3 FACE AND BYPASS DAMPERS TO MAINTAIN EXHAUST AIR TEMPERATURE ABOVE 2 DEG C.

REHEAT COIL:
1. NEW 3-WAY CONTROL VALVE FOR AHU-3 IS PROVIDED.

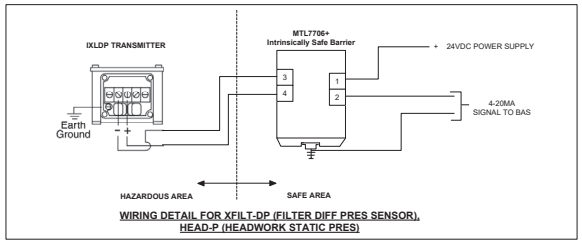
2. BAS WILL MODULATE AHU-3 REHEAT COIL 3-WAY CONTROL VALVE TO SATISFY SUPPLY AIR TEMPERATURE (DA-T) SETPOINT. INITIAL SETPOINT = 10 DEG C.

IN EVENT THAT SAT TEMPERATURE IS LESS THAN 5 DEG C AS SENSED BY DUCT MOUNTED AVERAGING TYPE TEMPERATURE SENSOR, ALARM TROUBLE AT OWS.

SAFETY INTERLOCK:
1 *1. OUTSIDE AIR AND EXHAUST AIR DAMPER STATUS WILL BE MONITORED AT BAS. SUPPLY FAN AND EXHAUST FAN WILL BE ENABLED ONCE BOTH OUTSIDE AIR AND EXHAUST AIR DAMPER OPEN STATUS IS PROVEN AT BAS.*



2. LOW TEMPERATURE ALARM (LT-A) - WHEN IN "ALARM", THE CONTROL SEQUENCE WILL STOP RUNNING, THE VALVE(S) WILL OPEN AND THE FAN(S) WILL BE DISABLED VIA A HARD WIRED SHUTDOWN CIRCUIT.



3. FIRE ALARM CONTACT WILL BE HARDWIRED INTERLOCKED WITH SUPPLY FAN AND EXHAUST FAN STARTER I.E. WHEN IN ALARM, FANS WILL GET SHUT-DOWN.

MONITORING POINTS FROM BAS:
1. OUTDOOR AIR TEMPERATURE (OA-T)
2. HR EXHAUST AIR TEMPERATURE (HREA-T)
3. RETURN AIR TEMPERATURE (RA-T)
4. SUPPLY AIR FLOW (DA-VP)
5. EXHAUST AIR FLOW (EA-VP)
6. LOW TEMPERATURE ALARM (LT-A)
7. SUPPLY AIR TEMPERATURE (DA-T).

AHU-3 SAFETY WIRING DETAILS

RELAY LOGIC BOARD(RIBMNLB-2)

WIRING DETAIL FOR XFILT-DP (FILTER DIFF PRES SENSOR), HEAD-P (HEADWORK STATIC PRES)

Notes:
1 SEQUENCE OF OPERATION IN ITALIC IS BE PROPOSED BY JCI. PROPOSED SEQUENCE TO BE VERIFIED BY FIELD BEFORE PROGRAMMING.

IN CONSIDERATION OF THE RECEIPT OF THIS DOCUMENT, THE RECIPIENT AGREES NOT TO REPRODUCE, COPY, USE OR TRANSMIT THIS DOCUMENT AND/OR THE INFORMATION THEREIN CONTAINED, IN WHOLE OR IN PART, OR TO SUFFER SUCH ACTION BY OTHERS, FOR ANY PURPOSE, EXCEPT WITH THE ADVANCE WRITTEN PERMISSION OF JOHNSON CONTROLS, INC. Network Automation Engine Catalog Page

MS-NAE35xx-x, MS-NAE45xx-x, MS-NAE55xx-x, MS-NAE551S-2, NAE8500-0

Code No. LIT-1900195
Software Release 9.0
Issued May 2018

Refer to the QuickLIT website for the most up-to-date version of this document.

Network Automation Engines (NAEs) provide comprehensive equipment monitoring and control, through key features such as scheduling, alarm and event management, energy management, data exchange, data trending, and data storage. These tools help reduce operation and energy costs for any type of building.

This line of NAEs features and leverages IP connectivity and web-based access to *Metasys*® Building Management Systems, including the BACnet® protocol, the LonWorks® network, and the N2 Bus protocol, to monitor and supervise a wide variety of HVAC, lighting, security, and fire safety equipment.

With the embedded Site Management Portal user interface, NAEs can support multiple concurrent web browser sessions with password and permission access control. To further enhance IT compatibility, NAEs employ standard IT security best practices.

NAEs have an embedded UI and the capability to connect to and communicate with cloud-based applications. NAEs support concurrently connected web browsers.

Encrypted and trusted communication is now implemented on NAEs that are upgraded to the new release. Private and secure communication is provided by Transport Layer Security (TLS 1.2), which is a protocol that eliminates all clear text communications between *Metasys* servers, devices, and the browser client. Greater protection from unauthorized users and computer hackers on the *Metasys* system network is now assured.

Specific features of NAE models include the following:

- NAE55 models support a comprehensive set of supervisory features and functions for large and technically advanced buildings and controllers.
- The NAE-S (MS-NAE551S-2) is a secure version of the standard NAE55 network engine that uses embedded encryption technology to protect and secure the building management system at the endpoint. At its initial release, the NAE-S is loaded with *Metasys* Release 8.0 firmware, but is field upgradeable to the latest release. The NAE-S is only available in North America and Canada. Refer to the *Secure Network Automation Engine Catalog Page (LIT-1900996)* for more information.
- NAE35/NAE45 models enable cost-effective NAE connectivity and control in smaller facilities and can increase distribution of control in larger facilities.
- The NAE85 is a software-only, high-capacity NAE that is designed to provide supervisory level control of *Metasys* networks that include a large number of BACnet IP devices.

Refer to the *Network Engines Product Bulletin (LIT-12012138)* for important product application information.

Figure 1: NAE55 Network Automation Engine

Repair Information

If the NAE fails to operate within its specifications, replace the unit. For a replacement NAE, contact the nearest Johnson Controls® representative.

Features and Benefits

- **Communication Using Commonly Accepted IT Standards, Including Web Services, at the Automation and Enterprise Level**—Allows you to install a system on your existing IT infrastructure within a building or enterprise and use standard IT communication services over the company intranet, WAN, or public Internet with VPN tunnel and firewall protection. Network engines also support the ability to optionally authenticate non-local users through a Remote Authentication Dial-in User Services (RADIUS) server and Syslog DDA for network logging of *Metasys* audits and events. Hypertext Transfer Protocol Secure (https) is employed to provide encrypted communication between the NAE and its clients.
- **Secure Web-Based User Interface**—Allows you to access system data in the NAEs from any supported web browser device connected to the network, including remote users connected by dial-up telephone or an Internet service provider (ISP). All network engines upgraded to Release 8.1 firmware have self-signed certificates that provide for encrypted communication. Optionally, you can deploy trusted certificates to network engines. The customer's IT department or Certificate Authority (CA) can provide trusted certificates.
- **Site Director Function**—Allows you to access all data on one site through one device. The device designated as the Site Director coordinates the display of data from multiple NAE devices for easy navigation through the entire site. This capability is only available on some network engine models.
- **Embedded Site Management Portal System Configuration Software**—Gives you access to system configuration, monitoring, commanding, diagnosis, and a cloud-based application from any device with web browser software without the need for separate workstation software.
- **Embedded User Interface and Online System Configuration Software**—Lets you enable, configure, commission, archive data, monitor, command, and perform system diagnosis from any device by using a web browser, without the need for separate workstation software.

- **Supervision of Field Controller Networks Including BACnet MS/TP, N2 Bus LonWorks Network, and BACnet IP Devices**—Supports connectivity to open network standards for complete flexibility in the selection of field devices. Supported protocols include BACnet® MS/TP, BACnet IP, LonWorks, and N2 Bus.
- **Multiple Connection Options for Data Access**—Allow connection of a web browser through the IP network using the Ethernet port. For a dial-up connection, use the optional internal or external modem.
- **Building Management Security with the NAE-S**—Uses embedded encryption technology with a built-in firewall and can function as a secure network engine reporting to an Application and Data Server (ADS) Site Director. Or, the NAE-S can serve as a BACnet® Building Controller (B-BC) network engine that can communicate with a BACnet Operator Workstation (B-OWS) or BACnet Advanced Operator Workstation (B-AWS). The NAE-S is Common Criteria Certified and meets the Federal Information Processing Standard (FIPS)-140-2, Level 2.

Ordering Information

Contact the nearest Johnson Controls representative to order an NAE. The following tables list the product code numbers for all available network engines based on model. For network engine accessories, see *Table 9*.

Table 1: NAE35 Ordering Information

Product Code Number [1]	Description
MS-NAE35xx-x (Base Features of Each NAE35)	NAE35 Network Automation Engines: Requires a 24 VAC power supply. Each model includes one RS-232-C serial port, one USB serial port, one Ethernet port, and an MS-BAT1020-0 Data Protection Battery. Supports a BACnet IP network.
MS-NAE3510-2	Supports one N2 Bus or BACnet MS/TP (RS-485) trunk; includes an additional RS-232-C serial port for optional external modem; supports a maximum of 50 devices on the N2 Bus or BACnet MS/TP trunk.
MS-NAE3511-2	Supports one N2 Bus or BACnet MS/TP (RS-485) trunk; includes an internal modem; supports a maximum of 50 devices on the N2 Bus or BACnet MS/TP trunk.
MS-NAE3514-2	Supports one N2 Bus or BACnet MS/TP (RS-485) trunk; limited to Basic Access support; includes an additional RS-232-C serial port for optional external modem; supports a maximum of 50 devices on the N2 Bus or BACnet MS/TP trunk.
MS-NAE3515-2	Supports one N2 Bus or BACnet MS/TP (RS-485) trunk; limited to Basic Access support; includes an internal modem; supports a maximum of 50 devices on the N2 Bus or BACnet MS/TP trunk.
MS-NAE3520-2	Supports one LonWorks trunk; includes an additional RS-232-C serial port for optional external modem. Supports a maximum of 64 devices on the LonWorks port.
MS-NAE3521-2	Supports one LonWorks trunk; includes an internal modem. Supports a maximum of 64 devices on the LonWorks port.
MS-NAE3524-2	Supports one LonWorks trunk; limited to Basic Access support; and includes an additional RS-232-C serial port for optional external modem. Supports a maximum of 64 devices on the LonWorks trunks.
MS-NAE3525-2	Supports one LonWorks trunk; limited to Basic Access support; and includes an internal modem. Supports a maximum of 64 devices on the LonWorks trunks.

1 Some models are also available in Buy American version (add G after the code number). For repair parts, add -702 after the code number (for example, MS-NAE3525-702).

Table 2: NAE45 Ordering Information

Product Code Number[1]	Description
MS-NAE45xx-x (Base Features of Each NAE45)	NAE45 Network Automation Engines: Requires a 24 VAC power supply. Each model includes one RS-232-C serial port, one USB serial port, one Ethernet port, and an MS-BAT1020-0 Data Protection Battery. Supports a BACnet IP network.
MS-NAE4510-2	Supports one N2 Bus or BACnet MS/TP (RS-485) trunk; includes an additional RS-232-C serial port for optional external modem; supports a maximum of 100 devices on the N2 Bus or BACnet MS/TP trunk.
MS-NAE4511-2	Supports one N2 Bus or BACnet MS/TP (RS-485) trunk; includes an internal modem; supports a maximum of 100 devices on the N2 Bus or BACnet MS/TP trunk.
MS-NAE4520-2	Supports one LonWorks trunk, includes an additional RS-232-C serial port for optional external modem; supports a maximum of 127 devices on the LonWorks trunk.
MS-NAE4521-2	Supports one LonWorks trunk, includes an internal modem; supports a maximum of 127 devices on the LonWorks trunk.

1 Some models are also available in Buy American version (add G after the code number). For repair parts, add -702 after the code number (for example, MS-NAE4521-702).

Table 3: NAE55-2 Ordering Information

Product Code Number	Description
MS-NAE55xx-x (Base Features of Each NAE55)	NAE55 Network Automation Engines: Requires a 24 VAC power supply. Each model includes two RS-232-C serial ports, two USB serial ports, two RS-485 ports, one Ethernet port, and one MS-BAT1010-0 Data Protection Battery. Supports a BACnet IP network.
MS-NAE5510-2U	Supports two N2 Bus or two BACnet MS/TP (RS-485) trunks (or one N2 Bus trunk and one BACnet MS/TP trunk); supports a maximum of 100 devices on each N2 Bus or BACnet MS/TP trunk. **Note:** This model is UL 864 **10th Edition** UUKL/ORD-C100-13 UUKLC Standard for Smoke Control Equipment for Release 8.1 only. Refer to the *Metasys® System UL 864 10th Edition UUKL/ORD-C100-13 UUKLC Smoke Control System Technical Bulletin (LIT-12012487)* for detailed specifications, requirements, and procedures for installing and operating UUKL 864 Listed *Metasys* system devices. For example, in order to be UL/cUL compliant, this model must be pre-installed and pre-wired in a standard or custom panel built at the Johnson Controls Reynosa factory.
MS-NAE5510-2UW	Supports two N2 Bus or two BACnet MS/TP (RS-485) trunks (or one N2 Bus trunk and one BACnet MS/TP trunk); supports a maximum of 100 devices on each N2 Bus or BACnet MS/TP trunk. **Note:** This model is UL 864 **9th Edition** UUKL/ORD-C100-13 UUKLC Standard for Smoke Control Equipment for Release 5.2 only, offered as a replacement controller for the original MS-NAE5510-2U model as prescribed by *Product Update Notice (PU) 17-03*. Refer to the *Metasys® System UL 864 9th Edition UUKL/ORD-C100-13 UUKLC Smoke Control System Technical Bulletin (LIT-12011252)* for detailed specifications, requirements, and procedures for installing and operating UUKL 864 Listed *Metasys* system devices.

Table 4: NAE55-3[1] Ordering Information

Product Code Number[2]	Description
MS-NAE55xx-x (Base Features of Each NAE55)	NAE55 Network Automation Engines: Requires a 24 VAC power supply. Each model includes two RS-232-C serial ports, two USB serial ports, two RS-485 ports, one Ethernet port, and one MS-BAT1010-0 Data Protection Battery. Supports up to 100 devices on each N2 or BACnet MS/TP trunk. Supports a BACnet IP network.
MS-NAE5510-3	Supports two N2 or two BACnet MS/TP (RS-485) trunks (or one N2 trunk and one BACnet MS/TP trunk).
MS-NAE5510-3U	Supports two N2 Bus or two BACnet MS/TP (RS-485) trunks (or one N2 Bus trunk and one BACnet MS/TP trunk). **Note:** This model is UL 864 **10th Edition** UUKL/ORD-C100-13 UUKLC Standard for Smoke Control Equipment for Release 8.1 only. Refer to the *Metasys® System UL 864 10th Edition UUKL/ORD-C100-13 UUKLC Smoke Control System Technical Bulletin (LIT-12012487)* for detailed specifications, requirements, and procedures for installing and operating UUKL 864 Listed *Metasys* system devices. For example, in order to be UL/cUL compliant, this model must be pre-installed and pre-wired in a standard or custom panel built at the Johnson Controls Reynosa factory.
MS-NAE5511-3	Supports two N2 or two BACnet MS/TP (RS-485) trunks (or one N2 trunk and one BACnet MS/TP trunk); includes an internal modem.
MS-NAE5520-3	Supports a LonWorks trunk and two N2 trunks or two BACnet MS/TP (RS-485) trunks (or one N2 trunk and one BACnet MS/TP trunk). Supports up to 255 devices on the LonWorks trunk.
MS-NAE5521-3	Supports a LonWorks trunk, and two N2 trunks or two BACnet MS/TP (RS-485) trunks (or one N2 trunk and one BACnet MS/TP trunk); includes an internal modem. Supports up to 255 devices on the LonWorks trunk.

1 This model is only supported for *Metasys* 7.0.7 or later.
2 Some models are also available in Buy American version (add G after the code number). For the European versions of the NAE55, add an E after the code number. For repair parts, add -703 after the code number (for example, MS-NAE5521-703).

Table 5: NAE-S Ordering Information

Product Code Number	Description
MS-NAE551S-2	Secure NAE-S Network Automation Engine with 4 Gb flash memory and 1 Gb SDRAM. Requires a 24 VAC power supply. This model is the secure version of the standard NAE55 network engine that uses embedded encryption technology and includes an Ethernet port, one MS-BAT1010-0 Data Protection Battery, power supply, power cable, and a reset tool. Supports up to 100 devices on each N2 or BACnet MS/TP trunk.
MS-NAE551S-702	Replacement NAE-S network engine (MS-NAE551S-2 model).
MS-BAT1010-0	Replacement data protection battery for secure NAE-S. Rechargeable gel cell battery with a typical life of 3 to 5 years at 70°F (21°C).
DRP-24V48W1AZ (rev04)	DeltaPSU 24 VDC power supply provided for powering the crypto module in the secure NAE-S. Includes power cable.
MS-NAESCBL-0	Configuration cable and non-metallic reset probe.

Table 6: NAE-S Control Panel Ordering Information

Product Code Number	Description
MS-NAE5510-ER2 **(United States and Canada)**	**Enclosure:** 24 in. W x 24 in. H x 6.6 in. D (609 mm W x 609 mm H x 167 mm D) **Controllers:** MS-NAE551S-2 and MS-FEC1611-1 **Power Supplies:** PAN-PWRSP-0 and DRP-24V48W1AZ (Rev04).

Table 7: NXE5xx-x Series Windows Embedded Standard 2009 Image Files

Product Code Number	Description
MS-NXE5-1WES-10	10 Licenses—operating system upgrade from Windows XP Embedded to Windows Embedded Standard 2009
MS-NXE5-1WES-25	25 Licenses—operating system upgrade from Windows XP Embedded to Windows Embedded Standard 2009
MS-NXE5-1WES-50	50 Licenses—operating system upgrade from Windows XP Embedded to Windows Embedded Standard 2009
MS-NXE5-1SWO-6	Software Only (no licenses)—upgrade software for previously purchased software and license part numbers MS-NSE5-1WES-xx

Note: These product codes apply to NxE55-1 engines only. They provide a paid license upgrade from the Windows XP® embedded operating system to the WES2009 embedded operating system.

Table 8: NAE85 Ordering Information

Product Code Number	Description
MS-NXE85SW-0[1]	NAE85 or NIE85 (mode is selectable during initial configuration). For new installations/projects.
MS-NXE85SW-6[1]	NAE85 or NIE85 (mode is selectable during the initial configuration). For upgrading existing installations/projects.

1 Standard NxE85 models support up to 10,000 objects; an expansion upgrade is available to support an additional 15,000 objects. The NAE85 will display as unlicensed if the object count goes above 25,000. See the NAE Accessories Ordering Information table for more information.

Table 9: NAE Accessories Ordering Information

Product Code Number	Description
MS-BAT1010-0	Replacement data protection battery for NAE55 and NIE55. Rechargeable gel cell battery: 12 V, 1.2 Ah, with a typical life of 3 to 5 years at 21°C (70°F)
MS-BAT1020-0	Replacement data protection battery for NAE35, NAE45, and NCE25. Rechargeable NiMH battery: 3.6 V 500 mAh, with a typical life of 5 to 7 years at 21°C (70°F)
MS-15KUPG-0	15,000 object expansion upgrade for NxE85 (only one expansion per NxE85)
MS-MULTENGSW-6	Contains ToggleTunnel utility for converting an NAE55/NIE55 to an NAE55 model with the N2 Tunneling features enabled. Not for use with MS-NAE5510-1U or MS-NAE5510-2U.
MS-EXPORT-0	Export Utility extracts historical trend, alarm, and audit data from the system and presents the historical data in a variety of formats. **Note:** This option is not necessary for sites that have an ADS/ADX that is the Site Director because Export Utility is provided with the ADS/ADX solution.
AS-XFR100-1	Power transformer (Class 2, 24 VAC, 92 VA maximum output), with enclosure
AS-XFR010-1	Power transformer (Class 2, 24 VAC, 92 VA maximum output), no enclosure
SC450RM1U (OEM Part No.)	Recommended UPS for NxE85 model: APC® Smart-UPS SC 450 VA, 280 W, 120 VAC input/output with NEMA 5-15R output connections

Technical Specifications

Table 10: NAE35 and NAE45

Power Requirement	Dedicated nominal 24 VAC, Class 2 power supply (North America), safety extra-low voltage (SELV) power supply (Europe), at 50/60 Hz (20 VAC minimum to 30 VAC maximum)
Power Consumption	25 VA maximum
Ambient Operating Conditions	0 to 50°C (32 to 122°F); 10 to 90% RH, 30°C (86°F) maximum dew point
Ambient Storage Conditions	-40 to 70°C (-40 to 158°F); 5 to 95% RH, 30°C (86°F) maximum dew point
Data Protection Battery	Supports data protection on power failure. Rechargeable NiMH battery: 3.6 VDC 500 mAh, with a typical life of 5 to 7 years at 21°C (70°F); Product Code Number: MS-BAT1020-0
Processor	192 MHz Renesas® SH4 7760 RISC processor
Memory	128 MB flash nonvolatile memory for operating system, configuration data, and operations data storage and backup 128 MB synchronous dynamic random access memory (SDRAM) for operations data dynamic memory
Operating System	Microsoft® Windows® Embedded CE 6.0

Table 10: NAE35 and NAE45

Network and Serial Interfaces	One Ethernet port; connects at 10 or 100 Mbps; 8-pin RJ-45 connector One optically isolated RS-485 port; 9.6k, 19.2k, 38.4k, or 76.8k baud (depending on protocol); with a pluggable and keyed 4-position terminal block (FC Bus available on NAE351x and NAE451x models only) One LonWorks port; FTT10 78 Kbps; pluggable, keyed 3-position terminal block (LonWorks port available on NAE352x-x and NAE452x models only). One RS-232-C serial port with standard 9-pin sub-D connector that supports standard baud rates. A second serial port, on models without an internal modem, that supports an optional, user-supplied external modem. One USB serial port with standard USB connector that supports an optional, user-supplied external modem. Option: One telephone port for internal modem; up to 56 Kbps; 6-pin modular connector (NAE models with an optional internal modem have one RS-232-C serial port only.)
Housing	Plastic housing material: ABS polycarbonate UL94-5VB Protection: IP20 (IEC 60529)
Mounting	On flat surface with screws on three mounting clips or a single 35 mm DIN rail
Dimensions (Height x Width x Depth)	131 x 270 x 62 mm (5-3/16 x 10-5/8 x 2-1/2 in.) Minimum space for mounting NAE35 and NAE45: 210 x 350 x 110 mm (8-3/16 x 13-13/16 x 4.-5/16 in.)
Shipping Weight	1.2 kg (2.7 lb)
Compliance CE	**United States:** UL Listed, File E107041, CCN PAZX, UL 916, Energy Management Equipment; FCC Compliant to CFR47, Part 15, Subpart B, Class A
	Canada: UL Listed, File E107041, CCN PAZX7, CAN/CSA C22.2 No. 205, Signal Equipment; Industry Canada Compliant, ICES-003
	Australia and New Zealand: RCM Mark, Australia/NZ Emissions Compliant
	Europe: CE Mark – Johnson Controls declares that this product is in compliance with the essential requirements and other relevant provisions of the EMC Directive.
	BACnet International: BACnet Testing Laboratories™ (BTL) 135-2010 Listed BACnet Building Controller (B-BC)

The MS-NAE5510-2U and MS-NAE5510-3U network engines with Release 8.1 software comply with UL 864 10th Edition UUKL/ORD-C100-13 UUKLC Smoke Control Listing for United States and Canada. Refer to the *Metasys® System UL 864 10th Edition UUKL/ORD-C100-13 UUKLC Smoke Control System Technical Bulletin (LIT-12012487)* for specific UL 864 UUKL listing guidelines that must be followed per UL 864.

Table 11: MS-NAE5510-2U

Power Requirement	Dedicated nominal 24 VAC, Class 2 power supply (North America) at 50/60 Hz (20 VAC minimum to 30 VAC maximum)
Power Consumption	50 VA maximum
Ambient Operating Conditions	0 to 50°C (32 to 122°F); 10 to 90% RH, 30°C (86°F) maximum dew point
Ambient Storage Conditions	-40 to 70°C (-40 to 158°F); 5 to 95% RH, 30°C (86°F) maximum dew point
Data Protection Battery	Supports data protection on power failure. Rechargeable gel cell battery: 12 V, 1.2 Ah, with a typical life of 3 to 5 years at 21°C (70°F); Product Code Number: MS-BAT1010-0
Clock Battery	Maintains real-time clock through a power failure. Onboard cell; typical life 10 years at 21°C (70°F)
Processor	1.6 GHz Intel® Atom™ processor
Memory	4 GB flash nonvolatile memory for operating system, configuration data, and operations data storage and backup. 1 GB SDRAM for operations data dynamic memory for all models
Operating System	Johnson Controls OEM Version of Microsoft Windows Standard 2009
Network and Serial Interfaces	One Ethernet port; 10/100/1,000 Mbps; 8-pin RJ-45 connector Two optically isolated RS-485 ports; 9,600, 19.2k, 38.4k, or 76.8k baud; pluggable and keyed 4-position terminal blocks Two RS-232-C serial ports, with standard 9-pin sub-D connectors, that support all standard baud rates Two USB serial ports; standard USB connectors (use is not supported on Smoke Control NAEs)
Housing	Plastic housing with internal metal shield Plastic material: ABS + polycarbonate
Mounting	On flat surface with screws on four mounting feet or on dual 35 mm DIN rail
Dimensions(Height x Width x Depth)	226 x 332 x 96.5 mm (8.9 x 13.1 x 3.8 in.) including mounting feet Minimum space for mounting: 303 x 408 x 148 mm (12.0 x 16.1 x 5.8 in.)
Shipping Weight	2.9 kg (6.4 lb)

Table 11: MS-NAE5510-2U

Compliance	**United States**: UL Listed, File E107041, CCN PAZX, UL 916, Energy Management Equipment; FCC Compliant to CFR47, Part 15, Subpart B, Class A
	UL Listed, File S4977, UL 864 UUKL/UUKLC 10th Edition Listed, Smoke Control Units and Accessories for Fire Alarm Systems Equipment
CE	**Canada**: UL Listed, File E107041, CCN PAZX7, CAN/CSA C22.2 No. 205, Signal Equipment, Industry Canada Compliant, ICES-003
	UL Listed, File S4977, UL 864 UUKL/ORD-C100-13 10th Edition Listed, Smoke Control Units and Accessories for Fire Alarm Systems
	Europe: CE Mark - Johnson Controls, Inc. declares that this product is in compliance with the essential requirements and other relevant provisions of the EMC Directive.
	Australia and New Zealand: RCM Mark, Australia/NZ Emissions Compliant
	BACnet International: BACnet Testing Laboratories™ (BTL) 35-2004 Listed BACnet Building Controller (B-BC)

Table 12: NAE55xx-3 and NIE55xx-3

Power Requirement	Dedicated nominal 24 VAC, Class 2 power supply (North America), SELV power supply (Europe), at 50/60 Hz (20 VAC minimum to 30 VAC maximum)
Power Consumption	50 VA maximum
Ambient Operating Conditions	0 to 50°C (32 to 122°F); 10 to 90% RH, 30°C (86°F) maximum dew point
Ambient Storage Conditions	-40 to 70°C (-40 to 158°F); 5 to 95% RH, 30°C (86°F) maximum dew point
Data Protection Battery	Supports data protection on power failure. Rechargeable gel cell battery: 12 V, 1.2 Ah, with a typical life of 3 to 5 years at 21°C (70°F); Product Code Number: MS-BAT1010-0
Clock Battery	Maintains real-time clock through a power failure. Onboard cell; typical life 10 years at 21°C (70°F)
Processor	1.46 GHz Intel® Atom® Bay Trail E3815 processor for MS-NAE55xx-3 models
Memory	16 GB flash nonvolatile memory for operating system, configuration data, and operations data storage and backup for MS-NAE55xx-3 models.
	2 GB DDR3 SDRAM for operations data dynamic memory for all models
Operating System	Johnson Controls OEM Version of Microsoft Windows Embedded Standard 7 with SP1 (WES7)
Network and Serial Interfaces	One Ethernet port; 10/100/1,000 Mbps; 8-pin RJ-45 connector
	Two optically isolated RS-485 ports; 9,600, 19.2k, 38.4k, or 76.8k baud; pluggable and keyed 4 position terminal blocks (RS-485 terminal blocks available on NAE55 models only)
	Two RS-232-C serial ports, with standard 9-pin sub-D connectors, that support all standard baud rates
	Two USB 2.0 serial ports; standard USB connectors support an optional, user-supplied external modem
	Options: One telephone port for internal modem; up to 56 kbps; 6-pin RJ-12 connector
	One LonWorks port; FTT10 78 Kbps; pluggable, keyed 3-position terminal block (LonWorks port available on NAE552x-x models only)
Housing	Plastic housing with internal metal shield
	Plastic material: ABS + polycarbonate; Protection: IP20 (IEC 60529)
Mounting	On flat surface with screws on four mounting feet or on dual 35 mm DIN rail
Dimensions (Height x Width x Depth)	226 x 332 x 96.5 mm (8.9 x 13.1 x 3.8 in.) including mounting feet
	Minimum space for mounting: 303 x 408 x 148 mm (12.0 x 16.1 x 5.8 in.)
Shipping Weight	2.9 kg (6.4 lb)
Compliance	**United States**: UL Listed, File E107041, CCN PAZX, UL 916, Energy Management Equipment, FCC Compliant to CFR47, Part 15, Subpart B, Class A

	BACnet International: BACnet Testing Laboratories™ (BTL) 135-2010 Listed BACnet Building Controller (B-BC)

Table 13: NAE-S Technical Specifications (North America and Canada Only)

Power Requirements	**NAE551S-2 Engine:** Dedicated nominal 24 VAC, Class 2 power supply (North America), at 50/60 Hz (20 VAC minimum to 30 VAC maximum) **Internal Module with Embedded Encryption Technology:** Input: Dedicated nominal 100–240 VAC, Class 1 power supply (North America), at 50/60 Hz (85 VAC minimum to 264 VAC maximum) Output: 24 VDC (22 VDC minimum to 26 VDC maximum)
Power Consumption	50 VA maximum
Power Specifications for Encryption Board	Dedicated nominal 24 VDC, input voltage range 85–264 VAC (120–375 VDC), output current 2.0A
Ambient Operating Conditions	32 to 122°F (0 to 50°C); 10 to 90% RH, 86°F (30°C) maximum dew point
Ambient Storage Conditions	-40 to 158°F (-40 to 70°C); 5 to 95% RH, 86°F (30°C) maximum dew point
Data Protection Battery	Supports data protection on power failure. Rechargeable gel cell battery: 12 V, 1.2 Ah, with a typical life of 3 to 5 years at 70°F (21°C); Product Code Number: MS-BAT1010-0
Clock Battery	Maintains real-time clock through a power failure. Onboard cell; typical life 10 years at 70°F (21°C)
Processor	1.6 GHz Intel Atom® processor
Memory	4 GB flash nonvolatile memory for operating system, configuration data, and operations data storage and backu 1 GB SDRAM for operations data dynamic memory for all models
Network and Serial Interfaces	One Ethernet port; 10/100/1000 Mbps; 8-pin RJ-45 connector Two optically isolated RS-485 ports; 9600, 19.2k, 38.4k, or 76.8k baud; pluggable and keyed 4 position terminal blocks (RS-485 terminal blocks available)
Housing	Plastic housing with internal metal shield Plastic material: ABS + polycarbonate; Protection: IP20 (IEC 60529)
Mounting	Must be mounted in a locked, secure panel using four mounting feet or dual 35 mm DIN rails.
Dimensions (Height x Width x Depth)	8.9 x 13.1 x 3.8 in. (226 x 332 x 96.5 mm) including mounting feet Minimum space for mounting: 12.0 x 16.1 x 5.8 in. (303 x 408 x 148 mm)
Shipping Weight	10.4 lb (3.88 kg)
Shipping Restriction	The Bureau of Industry and Security of the U.S. Department of Commerce has regulated this shipment under 740.17(b)(2) of the EAR and restricted the shipment of this product to the following countries: Cuba, Iran, North Korea, Sudan, and Syria.
Compliance	**United States**: UL 508A and CCN NITW Industrial Control Panel Listed, FCC Compliant to CFR47, Part 15, Subpart B, Class A
	Canada: cUL CSA-C22.2 No. 14, CCN NITW7, Industrial Control Equipment; IC Compliant to ICES-003 Class A
	BACnet International: BACnet Testing Laboratories™ (BTL) 135-2010 Listed BACnet Building Controller (B-BC)

Table 14: NAE85 Software System Recommendations for Installation/Upgrade

Recommended Computer Platform	Intel Xeon® E5506, 2.13 GHz, 4 MB Cache 2 x 160 GB 7.2K , 8.9 cm (3.5 in.) Cabled 3 Gbps, RAID 1 configuration with add-in SAS6/iR (SATA/SAS Controller)
Recommended Memory	2 GB RAM minimum
Hard Disk	160 GB minimum
Supported Operating Systems and Software	Windows® Server® 2016 (64-bit) Windows® Server® 2012 R2 with Update 1 (64-bit) Windows® Server® 2012 (64-bit) **Note:** The NAE85 software requires two Windows components: Microsoft .NET Framework Version 3.5 SP1 and Microsoft .NET Framework Version 4.6.1.

Table 14: NAE85 Software System Recommendations for Installation/Upgrade

Supported Operating Systems for *Metasys* Client Computers	Windows® 10 Pro and Enterprise Editions with Anniversary Update (version 1607) (64-bit) Windows® 8.1 Pro and Enterprise Editions with Update 1 (64-bit) Windows® 7 Professional, Enterprise, and Ultimate Editions with SP1 (64-bit) Windows® 7 Professional, Enterprise, and Ultimate Editions with SP1 (32-bit) Apple® macOS® 10.12 Sierra Apple® OS X® 10.11 El Capitan **Notes:** • Apple® operating systems are supported for *Metasys* client computers only. • In Apple® OS X®, you cannot view Graphics+ graphics in the Site Management Portal UI.
Internal Optical Drive	DVD ROM, SATA
Recommended Antivirus Software	Symantec Endpoint Protection version 12
Supported Web Browser Software for *Metasys* Client Computers	Windows® Internet Explorer® 11.0.9600.18449 Update version 11.0.35 or later **Note:** In Internet Explorer 11, select the Use Microsoft compatibility lists option, found under **Tools > Compatibility View Settings**, to ensure that websites appear and function correctly. Google® Chrome™ version 54 or later Apple® Safari® 10 or later (Other browsers, such as Mozilla® Firefox®, may also be used but are not fully supported.) **Note:** You use the web browser to download the Launcher application. After you install the Launcher application, you use the Launcher, not the web browser, to log in to *Metasys* Site Management Portal (SMP) UI.
Supported Virtual Environments	Microsoft Hyper-V™, VMware®
Network Communication	Network Interface: 1 Gbps Ethernet network interface card connects at 10 Mbps, 100 Mbps, or 1 Gbps (100 Mbps or better recommended)
Recommended Data Protection	UPS for NxE85 model: APC Smart-UPS SC 450VA, 280 W, 120 VAC input/output, National Electrical Manufacturers' Association (NEMA) 5-15R output connections, OEM Part No. SC450RM1U

The performance specifications are nominal and conform to acceptable industry standard. For application at conditions beyond these specifications, consult the local Johnson Controls office. Johnson Controls shall not be liable for damages resulting from misapplication or misuse of its products.

Field Equipment Controller (FEC) Series Catalog Page

Code No. LIT-1900346
Issued June 2018

Refer to the QuickLIT website for the most up-to-date version of this document.

The Field Equipment Controller (FEC) Series products are programmable controllers that can be switched between BACnet® MS/TP and N2 communications protocols. When they are used as BACnet MS/TP devices, they are BACnet Application Specific Controllers (B-ASCs) with integral MS/TP communications. In N2 mode, they can be used to modernize sites with legacy Johnson Controls® controllers.

FECs feature 32-bit microprocessor architecture, patented continuous tuning adaptive control, and peer-to-peer communications, and are available with an optional built-in LCD screen local UI.

A full range of FEC models combined with the Input/Output Module (IOM) models can be applied to a wide variety of building applications ranging from simple fan coil or heat pump control to advanced central plant management. All FEC Series Controllers configured for BACnet support wireless communications using the ZFR System accessories.

Important:	You cannot purchase a similar third-party device and install it in a UL/cUL Listed smoke control system. Doing so voids the UL/cUL Smoke Control Listing. Third-party devices must be provided and labeled by the factory as described in the UL/cUL Smoke Control Listing.

Important:	Only those Johnson Controls products identified for use in smoke control applications have been tested and listed by UL for use in a *Metasys* system UL/cUL 864 10th Edition UUKL/ORD-C100-13 UUKLC Smoke Control System. Installation of a product that is not UL/cUL Listed and labeled for this application prevents the entire system from being UL/cUL Listed for smoke control.

Refer to the *Metasys® System Field Equipment Controllers and Related Products Product Bulletin (LIT-12011042)* for product application details.

If the product fails to operate within its specifications, replace the product. For a replacement product, contact the nearest Johnson Controls® representative.

Features

- **Switchable Communications Protocols**—Provides flexibility with a choice between BACnet MS/TP and N2 communication
- **Standard BACnet® Protocol**—Provides interoperability with other Building Automation System (BAS) products that use the widely accepted BACnet standard.
- **Standard Hardware and Software Platform**—Uses a common hardware design throughout the family line to support standardized wiring practices and installation workflows. Also uses a common software design to support use of a single tool for control applications, commissioning, and troubleshooting to minimize technical training.
- **ZFR Wireless Field Controller (FC) or Sensor/Actuator (SA) Bus Interface**—Provides a wireless alternative to hard-wired *Metasys*® system counterparts with either the ZFR1800 Series Wireless Bus or the WNC1800/ZFR182x Pro Series Wireless Field Bus (ZFR Pro), offering application flexibility and mobility with minimal disruption to building occupants.

Figure 1: Field Equipment Controllers

- **Bluetooth® Wireless Commissioning**—Provides an easy-to-use connection to the configuration and commissioning tool.
- **Auto-Tuned Control Loops**—Reduce commissioning time, eliminate change-of-season re-commissioning, and reduce wear and tear on mechanical devices.
- **Universal Inputs, Configurable Outputs, and Point Expansion Modules**—Allows multiple signal options to provide input/output flexibility.
- **Optional Local User Interface Display** —Allows convenient monitoring and adjusting capabilities at the local device.
- **BACnet® Testing Laboratories (BTL) Listed**—Ensures interoperability with other BTL-listed devices. BTL is a third-party agency, which validates that BAS vendor products meet the BACnet industry-standard protocol.
- **32-bit Microprocessor**—Ensures optimum performance and meets industry specifications.
- **BACnet Automatic Discovery**—Supports easy controller integration into a *Metasys* BAS.
- **End-of-Line (EOL) Switch in MS/TP Field Controllers** — Enables field controllers to be terminating devices on the communications bus.
- **Pluggable Communications Bus and Supply Power Terminal Blocks**—Expedites installation and troubleshooting.
- **Patented proportional adaptive control (P-Adaptive) and Pattern Recognition Adaptive Control (PRAC) technologies**—Provide continuous loop tuning.
- **Wireless Connectivity through the ZFR1800 Series or the WNC1800/ZFR182x Pro Series Wireless Field Bus Systems in MS/TP Controllers**—Enables wireless mesh connectivity to supervisory controllers, facilitating easy initial location and relocation.
- **Writable Flash Memory**—Allows standard or customized applications to be downloaded from the Controller Configuration Tool (CCT) and enables persistent application data.
- **Large Product Family**—Provides a wide range of point mix to meet application requirements and allows for the addition of one or more Input/Output Module (IOM) and Network Sensors to provide even more I/O capacity.
- **User-Friendly Graphic Theme and Clear Pushbutton Identification**—Facilitate easy navigation of the integral or optional UI/display.

Table 1: FEC Series Model Information (Including Point Type Counts)

		FEC2511[1]	FEC16	FEC26
Communication Protocol		BACnet MS/TP, N2		
Engines		All Model types. Some NIE models support MS/TP and N2 devices. Refer to the *Network Engines Product Bulletin (LIT-12012138)* for details.		
Modular Jacks		6-pin SA Bus Modular Port supports one communicating sensor. **Or** you can wire up to four communicating sensors to the SA Bus Terminal Block. They cannot be used at the same time.		
			6-pin FC Bus for tool support	
Point Types	**Signals Accepted**			
Universal Input (UI)	Analog Input, Voltage Mode, 0–10 VDC Analog Input, Current Mode, 4–20 mA[2] Analog Input, Resistive Mode, 0–2k ohm, resistance temperature detector (RTD) (1k NI [Johnson Controls], 1k PT, A99B SI), negative temperature coefficient (NTC) (10k Type L, 2.252k Type 2) Binary Input, Dry Contact Maintained Mode	4 (Does not support Current Mode)	2	6
Binary Input (BI)	Dry Contact Maintained Mode Pulse Counter/Accumulator Mode (High Speed), 100 Hz	6	1	2
Analog Output (AO)	Analog Output, Voltage Mode, 0–10 VDC Analog Output, Current Mode, 4–20 mA	2 (Does not support Current Mode)		2
Binary Output (BO)	24 VAC Triac	2 (External Power Only)	3	3
Configurable Output (CO)	Analog Output, Voltage Mode, 0–10 VDC Binary Output Mode, 24 VAC Triac	2	4	4

1 The FEC2511 is currently only available in Europe. Contact your local Johnson Controls representative for more information.
2 Analog Input, Current Mode is set by hardware for the FEC26, and by software for the FEC16.

Table 2: FEC Series Ordering Information

Product Code Number	Description
MS-FEC1611-1	10-Point Field Equipment Controller with 2 UI, 1 BI, 3 BO, and 4 CO; 24 VAC; FC and SA Bus Support
MS-FEC1611-1ET	10-Point Field Equipment Controller Extended Temperature controller for rooftop applications. Supports Operational Temperature Range of -40 to 70°C (-40 to 158°F).
MS-FEC1621-1	10-Point Field Equipment Controller with 2 UI, 1 BI, 3 BO, and 4 CO; 24 VAC; FC and SA Bus Support; Integral Display and 6-Button Navigation Touchpad
MS-FEC2511-0[1]	16-Point Field Equipment Controller with 4 UI, 6 BI, 2 AO, 2 BO, and 2 CO; 24 VAC; FC and SA Bus Support. The FEC2511 model does not support current mode.
MS-FEC2611-0	17-Point Field Equipment Controller with 6 UI, 2 BI, 3 BO, 2 AO, and 4 CO; 24 VAC; FC and SA Bus Support
MS-FEC2611-0ET	FEC2611 Extended Temperature controller for rooftop applications. Supports Operational Temperature Range of -40 to 70°C (-40 to 158°F).
MS-FEC2621-0	17-Point Field Equipment Controller with 6 UI, 2 BI, 3 BO, 2 AO, and 4 CO; 24 VAC; FC and SA Bus Support; Integral Display and 6-Button Navigation Touchpad

1 This model is currently only available in Europe. Contact your local Johnson Controls representative for more information.

Table 3: FEC Series for Smoke Control Ordering Information

Product Code Number[1,2]	Description
MS-FEC1611-1U	10-Point Field Equipment Controller with 2 UI, 1 BI, 3 BO, and 4 CO; 24 VAC, FC and SA Bus, with Mounting Base
MS-FEU1610-0U	10-Point Field Equipment Controller with 2 UI, 1 BI, 3 BO, and 4 CO; 24 VAC; FC and SA Bus Support; with Mounting Base
MS-FEC2611-0U	17-Point Field Equipment Controller with 6 UI, 2 BI, 3 BO, 2 AO, and 4 CO; 24 VAC, FC and SA Bus, with Mounting Base

Table 3: FEC Series for Smoke Control Ordering Information

Product Code Number[1,2]	Description
MS-FEC2621-0U	17-Point Field Equipment Controller with 6 UI, 2 BI, 3 BO, 2 AO, and 4 CO; 24 VAC; FC and SA Bus Support; Integral Display and 6-Button Navigation Touchpad
MS-FEU2610-0U	17-Point Field Equipment Controller with 6 UI, 2 BI, 3 BO, 2 AO, and 4 CO; 24 VAC; FC and SA Bus Support; with Mounting Base

1 These devices are UL/ULC 864 Listed, File S4977, 10th Edition UUKL/ORD-C100-13 UUKLC Smoke Control System. These devices must be ordered in a Smoke Control UUKL listing.

2 All field controllers in a smoke control system must be mounted in Johnson Controls custom or standard UL 864 panels or in panels that are ordered from Johnson Controls. If these field controllers are used with panels that are not supplied by Johnson Controls, they are not compliant with the UL 864 10th Edition UUKL/ORD-C100-13 UUKLC Smoke Control System listing.

Accessories

Table 4: FEC Accessories

Product Code Number	Description
Mobile Access portal (MAP) Gateway[1]	Refer to the *Mobile Access Portal Gateway Catalog Page (LIT-1900869)* to identify the appropriate product for your region.
MS-DIS1710-0	Local Controller Display: Refer to *Local Controller Display Product Bulletin (LIT-12011273)* for more information.
MS-BTCVT-1[1]	Wireless Commissioning Converter with Bluetooth Technology
MS-BTCVTCBL-700[1]	Cable Replacement Set for the MS-BTCVT-1 or the NS-ATV7003-0; Includes One 5 ft (1.5 m) Retractable Cable
WRZ Series Wireless Room Sensors[1]	Refer to the *WRZ Series Wireless Room Sensors Product Bulletin (LIT-12011653)* for specific sensor model descriptions.
ZFR1800 Series Wireless Field Bus System[1]	This system is used for installations that only support BACnet MS/TP. Refer to the *WNC1800/ZFR182x Pro Series Wireless Field Bus System Product Bulletin (LIT-12012320)* for a list of available products.
NS Series Network Sensors	Refer to the *NS Series Network Sensors Product Bulletin (LIT-12011574)* for specific sensor model descriptions.
Y64T15-0[1]	Transformer, 120/208/240 VAC Primary to 24 VAC Secondary, 92 VA, Foot Mount, 30 in. Primary Leads and 30 in. Secondary Leads, Class 2
Y65A13-0[1]	Transformer, 120 VAC Primary to 24 VAC Secondary, 40 VA, Foot Mount (Y65AS), 8 in. Primary Leads and 30 in. Secondary Leads, Class 2
Y65T42-0	Transformer, 120/208/240 VAC Primary to 24 VAC Secondary, 40 VA, Hub Mount (Y65SP+), 8 in. Primary Leads and Secondary Screw Terminals, Class 2
Y65T31-0[1]	Transformer, 120/208/240 VAC Primary to 24 VAC Secondary, 40 VA, Foot Mount (Y65AR+), 8 in. Primary Leads and Secondary Screw Terminals, Class 2
AP-TBK4SA-0	Replacement MS/TP SA Bus Terminal, 4-Position Connector, Brown (Bulk Pack of 10)
AP-TBK4FC-0	Replacement MS/TP FC Bus Terminal, 4-Position Connector (Bulk Pack of 10)
AP-TBK3PW-0	Replacement Power Terminal, 3-Position Connector, Gray (Bulk Pack of 10)
AS-CBLTSTAT-0	Cable adapter that provides a connection between 8-pin TE-6700 Series sensors and field controllers that do not have a 8-pin sensor connection.
ZFR-USBHA-0[1]	ZFR USB Dongle provides a wireless connection through CCT to allow wireless commissioning of the wirelessly enabled FEC, Advanced Application Field Equipment Controller (FAC), IOM, and VMA16 controllers. Also allows use of the ZFR Checkout Tool (ZCT) in CCT. **Note:** The ZFR-USBHA-0 replaces the IA OEM DAUBI_2400 ZigBee® USB dongle. For additional information on the ZFR-USBHA-0 ZigBee dongle, refer to the *ZFR1800 Series Wireless Field Bus System Technical Bulletin (LIT-12011295)* or *ZFR1800 Series Wireless Field Bus System Quick Reference Guide (LIT-12011630)*.
TL-BRTRP-0[1]	Portable BACnet IP to MS/TP Router

1 This accessory is not qualified for use with a UL 864 UUKL/UUKLC 10th Edition Listed Smoke Control system.

Table 5: FEC Series Technical Specifications

Product Code Numbers	**MS-FEC1611-1:**10-Point FEC **MS-FEC1611-1ET:** FEC1611 Extended Temperature controller for rooftop applications. Supports Operational Temperature Range of -40 to 70°C (-40 to 158°F). **MS-FEC1621-1:** 10-Point FEC with Integral Display and Pushbutton User Interface **MS-FEC2511-0**[1]**:** 16-Point FEC, only available in Europe **MS-FEC2611-0:** 17-Point FEC **MS-FEC2611-0ET:** FEC2611 Extended Temperature controller for rooftop applications. Supports Operational Temperature Range of -40 to 70°C (-40 to 158°F). **MS-FEC2621-0:** 17-Point FEC with Integral Display and Push Button User Interface
	Smoke Control Models: **MS-FEC1611-0U:** 10-Point FEC **MS-FEU1610-0U:** 10-Point FEC **MS-FEC2611-0U:** 17-Point FEC **MS-FEU2610-0U:** 17-Point FEC
Supply Voltage	**MS-FEC1611-x, MS-FEC1611-1ET, MS-FEC2511-0**[1]**, MS-FEC2611-0, MS-FEC2611-0ET, MS-FECx611-0U, and MS-FEUx610-0U:** 24 VAC (nominal, 20 VAC minimum/30 VAC maximum), 50/60 Hz, Power Supply Class 2 (North America), Safety, Extra-Low Voltage (SELV) (Europe)
Power Consumption	**MS-FEC2511-0**[1] **:** 14 VA maximum (no integral display) **MS-FEC1621-1 and MS-FEC2621-0 (with integral display):** 20VA maximum **Note:** VA ratings do not include any power supplied to the peripheral devices connected to Binary Outputs (BOs) or Configurable Outputs (COs), which can consume up to 12 VA for each BO or CO, for a possible total consumption of an additional 84 VA (maximum).
Ambient Conditions	**Operating:** 0 to 50°C (32 to 122°F); 10 to 90% RH noncondensing **Storage:** -40 to 80°C (-40 to 176°F); 5 to 95% RH noncondensing **Note:** FEC models with an -xET suffix have an operating temperature range of -40 to 70°C (-40 to 158°F).
Controller Addressing	**For BACnet-configured controllers:** DIP switch set; valid field controller device addresses 4–127 (device addresses 0–3 and 128-255 are reserved) **For N2-configured controllers:** DIP switch set; valid control device addresses 1–255
Communications Bus[2]	RS-485, field selectable between BACnet MS/TP and N2 communications: 3-wire FC Bus between the supervisory controller and field controllers 4-wire SA Bus between field controller, network sensors, and other sensor/actuator devices, includes a lead to source 15 VDC supply power (from field controller) to bus devices
Processor	**MS-FEC16, MS-FEC26, MS-FEU16, and MS-FEU26 models:** H8SX/166xR Renesas® 32-bit microcontroller **MS-FEC2511-0**[1]**:** RX631 Renesas, 32-bit microcontroller
Memory	**MS-FEC16, MS-FEC26, MS-FEU16, and MS-FEU26 models:** 1 MB Flash Memory and 512 KB RAM **MS-FEC2511-0**[1]**:** 4 MB Flash Memory and 8 MB SDRAM

Series TTE Explosion-Proof RTD Temperature Transmitter

Specifications - Installation and Operating Instructions

The **Series TTE Explosion-Proof RTD Temperature Transmitter** is the ideal product for hazardous temperature measurement applications. The TTE series has seven pre-programmed temperature ranges that are selectable via an internal dip switch. For those applications that need a custom range, the transmitter can be easily configured for any range between -30 to 250°F with a minimum span of 40°F. The span and zero can be quickly adjusted with a simple push button design. This unit has optional listings of FM for use in Class I, Division 1, Groups B, C and D, Class II, Division 1, Groups E, F and G and Class III atmospheres or ATEX (Directive 2014/34/EU) for CE Ex II 2 G Ex db IIC T6...T4 Gb (-20°C ≤ Ta ≤ + 70°C), CE Ex II 1 D Ex ta IIIC T111°C Da (-20°C ≤ Ta ≤ + 70°C) and IECEx for Ex db IIC T6...T4 Gb (-20°C ≤ Ta ≤ + 70°C), Ex ta IIIC T111°C Da (-20°C ≤ Ta ≤ + 70°C). The compact housing allows for the transmitter to be mounted in virtually any application.

The Series TTE is ideally suited for refrigeration, building automation, commercial hot water heaters and boilers, and water chillers applications.

MODEL CHART

Example	TTE	1	04	W	LCD	Explosion-proof RTD temperature transmitter, FM rated, 4″ probe, with LCD display
Series	TTE					Series TTE explosion-proof RTD temperature transmitter
Agency		1 2				FM* ATEX/IECEx flameproof
Probe Length			02 04 06 09 12 15 18			2″ probe 4″ probe 6″ probe 9″ probe 12″ probe 15″ probe 18″ probe
Construction				W		Well probe
Options					Blank BSPT C5 LCD M20	No LCD display 1/2 male BSPT process connection C5-M housing paint specification LCD display Female M20 thread electrical connection

*Options that do not have ATEX and IECEx.

Attention: Units without the "2" suffix following "TTE" are not directive 2014/34/EU (ATEX) Complaint. These units are not intended for use in potentially hazardous atmospheres in the EU. These units may be CE marked for other directives of the EU.

SPECIFICATIONS

Temperature Sensor: Pt1000, 0.00385 DIN.
Output Temperature Ranges: User selectable – any range between -30 to 250°F with a minimum span of 40°F.
Temperature Limits: Ambient: -4 to 158°F (-20 to 70°C); Process: -30 to 250°F (-34.4 to 120°C).
Accuracy: Transmitter ±0.1% FS; Probe ±0.3% FS.
Thermal Drift Effects: ±0.02%/°C max.
Response Time: 250 ms.
Wetted Materials: 316 stainless steel.
Process Connection: 1/2″ male NPT or 1/2 male BSPT.
Conduit Connection: 1/2″ female NPT or M20.
Probe Length: 2″ to 18″ (depending on model).
Pressure Limits: 2000 PSI.
Power Requirements: 10 to 35 VDC.
Output Signal: 4-20 mA (two wire loop powered).
Optional Display: 2 lines X 8 character LCD.
Enclosure Rating: Weatherproof and Explosion-proof. Listed with FM for Class I, Division 1, Groups B, C and D, and dust-ignitionproof for Class II, Division 1, Groups E, F and G and Class III atmospheres.
ATEX Certified: CE 0518 Ex II 2 G Ex db IIC T6...T4 Gb, CE Ex II 1 D Ex ta IIIC T111°C Da, T6 Process Temp ≤80°C, Temperature Class T5 Process Temp ≤95°C, Temperature Class T4 Process Temp ≤120°C as defined on nameplate. EU-type Cerificate No.: EMT17ATEX0021 X.
ATEX Standards: EN 60079-0:2012+A11:2013; EN 60079-1:2015; EN 60079-31:2014.
IECEx Certified: For Ex db IIC T6...T4 Gb, Ex ta IIIC T111°C Da, T6 Process Temp ≤80°C, Temperature Class T5 Process Temp ≤95°C, Temperature Class T4 Process Temp ≤120°C as defined on nameplate.
IECEx Certificate of Conformity: Element IECEx EMT 17.0007X; IECEx Standards: IEC 60079-0:2011 (Edition 6); IEC 60079-1:2014 (Edition 7); IEC 60079-31:2013 (Edition 2).
Weight: 2 lb 8 oz (1134 g).
Agency Approvals: FM, CE, ATEX/IECEx.

DWYER INSTRUMENTS, INC.
P.O. BOX 373 • MICHIGAN CITY, INDIANA 46360, U.S.A.
Phone: 219/879-8000 www.dwyer-inst.com
Fax: 219/872-9057 e-mail: info@dwyermail.com

INSTALLATION

1. **Location:** Select a location where the temperature of the transmitter will be between -4 and 158°F. Distance from the receiver is limited only by total loop resistance.
2. **Position:** The transmitter is not position sensitive. Units with the optional display should be mounted for ease of viewing the display.
3. **Electrical Connection: Wire Length** - The maximum length of wire connecting the transmitter and receiver is a function of wire size and receiver resistance. Wiring should not contribute more than 10% of the receiver resistance to total loop resistance. For extremely long runs (over 1000 feet), choose receivers with lower resistance to minimize the size and cost of connecting leads.

Current (4-20 mA) Output Operation

An external power supply is required. See Figure A for diagram of the connection of the power supply, transmitter and receiver. The range of appropriate receiver load resistance (RL) for the DC power supply voltage available is expressed by the formula:

$$R_L = \frac{V_{ps} - 10}{20\ \text{mADC}}$$

Shielded cable is recommended for control loop wiring.

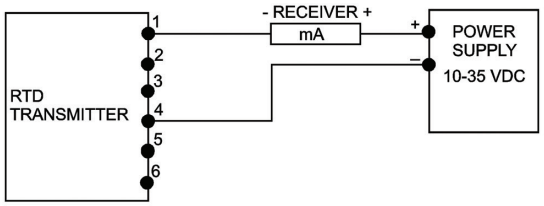

Figure A

FM Explosion-Proof Installation Notes:

1. Install in accordance with any applicable national electric code.
2. Plug unused conduit openings. Plug must engage a minimum of 5 threads.
3. Use a conduit seal within 18 inches of conduit entry.
4. Disconnect power before servicing.

Electrical connections to the RTD Transmitter are made to the terminal block located inside the housing. Unscrew and remove the cover. Wire as shown in Figure B.

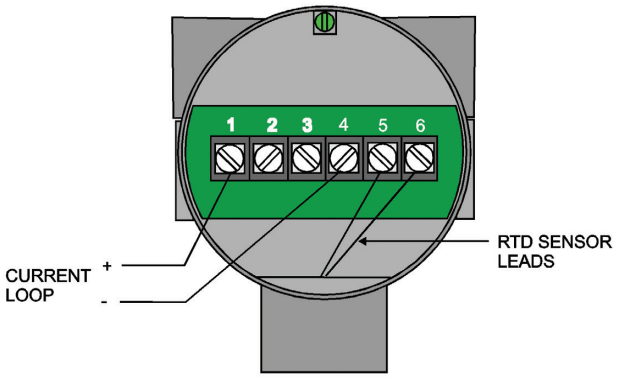

Figure B

Temperature Range Selection

The RTD Transmitter has 7 built in temperature ranges and a user settable range that are selectable by setting the Dip Switch located inside the housing (Figure C). Switches 2, 3, and 4 are used to set the range. To set the desired range, unscrew and remove the cover and set the Dip Switch according to the following table:

	Dip Switch		
Selectable Ranges	2	3	4
40 to 90°F (4.4 to 32.2°C)	OFF	OFF	OFF
-20 to 140°F (-28.9 to 60°C)	ON	OFF	OFF
0 to 100°F (-17.8 to 37.8°C)	OFF	ON	OFF
30 to 240°F (-1.1 to 115.6°C)	ON	ON	OFF
32 to 212°F (0 to 100°C)	OFF	OFF	ON
32 to 122°F (0 to 50°C)	ON	OFF	ON
-30 to 65°C (-1.1 to 18.3°C)	OFF	ON	ON
User Settable	ON	ON	ON

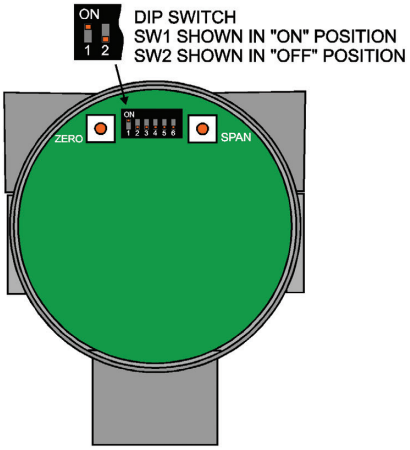

Figure C

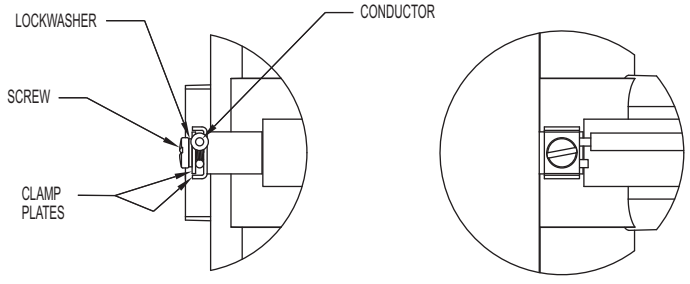
Setting and Calibrating the User Settable Range
By setting SWITCH 2, 3, and 4 on, the RTD Transmitter may be adjusted to a custom user specified range. The range may be any values between –30°F and +250°F (-34 to +121°C) with a MINIMUM SPAN of 40°F (22°C).

Equipment Required
In order to calibrate the unit for a custom range, a precision RTD simulator that can simulate a 1000 OHM DIN type RTD or precision decade box is required. The device must be capable of generating the correct RTD resistance to 0.1% or better.

Calibration Procedure
1. Set DIP SWITCHES 2, 3 and 4 ON.
2. Remove the RTD sensor leads from terminals 5 and 6 (Figure B). Connect the precision RTD simulator or decade box to terminals 5 and 6.
3. Wire instrument as previously discussed. A current meter may be wired in series with the unit to verify the correct current output, but this is not necessary for calibration. Apply power to the unit.
4. If a precision RTD simulator is used, make sure it is set to simulate a 1000 OHM DIN 0.00385 RTD. Then set it to the desired minimum temperature. If a decade box is used refer to the table in Appendix A (°F) or Appendix B (°C) and set it to the resistance that represents the desired minimum temperature.
5. Press the ZERO button. If the unit has the optional LCD, the display will read ZERO OK momentarily. If a current meter is wired, it will read 4.00mA.
6. Repeat step 4 using the value for the maximum desired temperature.
7. Press the SPAN button. If the unit has the optional LCD, the display will read SPAN OK momentarily. If a current meter is wired, it will read 20.00mA.
8. Turn off power to the unit. Disconnect the RTD simulator or decade box and reconnect the RTD sensor to terminals 5 and 6. Calibration is complete.

Note: The calibration procedure does not effect the calibration of any of the built in ranges.



°F and °C Selection
If the unit has the optional LCD display, DIP SWITCH 1 sets the display to read in °F or °C. SWITCH 1 “OFF” = °F
SWITCH 1 “ON” = °C.

Output Current Display
If the unit has the optional LCD display, the lower display will show the output current if DIP SWITCH 5 is “ON”. Setting DIP SWITCH 5 “OFF” causes the lower display to be blank.

Open RTD Protection
Upon detecting an open RTD, the unit may be set to force the output to read 3.5mA or 21mA based upon the setting of DIP SWITCH 6.
SWITCH 6 “OFF”, output forced to 3.5mA
SWITCH 6 “ON”, output forced to 21mA

Calibration
The unit requires no calibration. An internal precision resistor continually self calibrates the unit. Calibration may be verified by removing the sensor leads and testing the unit against a precision RTD simulator or a precision decade box. If the unit is found to be out of calibration it must be returned to the factory for service.

ELECTRICAL CONNECTIONS
Connect wire leads in accordance with local electrical codes. For units supplied with both internal ground and external bonding terminals, the ground screw inside the housing must be used to ground the control. The external bonding screw is for supplementary bonding when allowed or required by local code. When external bonding conductor is required, conductor must be wrapped a minimum of 180° about the external bonding screw. See below.

BOTTOM VIEW DETAIL FRONT VIEW DETAIL

EU-Type Certificate, IECEx Installation Instructions:
Cable Connection
The cable entry device shall be certified in type of explosion protection flameproof enclosure “db”, suitable for conditions of use and correctly installed. For ta ≥ 70°C cable and cable gland rated ≥ 75°C (MIN.) shall be used.

Conduit Connection
An Ex db certified sealing device such as a conduit seal with setting compound shall be provided immediately to the electrical entrance of the transmitter housing. For ta ≥ 70°C wiring and setting compound, in the conduit seal, rated ≥ 75°C shall be used.

Unused entries shall be sealed with an Ex certified blanking device rated for the appropriate zone, equipment group and temperature classification and shall be installed per manufacturer instructions.

Note: For ATEX/IECEx units only: When employed in a Zone 1, EPL Gb (db) application, the temperature class is determined by the maximum ambient and or process temperature. Units are intended to be used in ambient of -20°C≤ Tamb ≤70°C. Units may be used in process temperatures up to 120°C providing the enclosure temperature do not exceed 70°C. The standard Temperature Class is T6 Process Temp ≤80°C. Remaining temperature classes are, Temperature Class of T5 Process Temp ≤95°C and Temperature Class T4 Process Temp ≤ 120°C. Refer to Certificate No: Element IECEx EMT17.0007X for conditions of safe use for IECEx compliant units. All wiring, conduit and enclosures must meet applicable codes for hazardous areas. Conduits and enclosures must be properly sealed. For outdoor or other locations where temperatures vary widely, precautions should be taken to prevent condensation inside enclosure. Electrical components must be kept dry at all times.

When employed in a Zone 20, EPL Da (ta) application, the equipment is to be used with a power source rated for a prospective short circuit current of 10 kA. If the power source is rated for a prospective short circuit current of less than 10 kA, the end user or installer must mark the equipment with the prospective short circuit current rating of the power supply it is used in conjunction with.

CAUTION: To prevent ignition of hazardous atmospheres, disconnect the device from the supply circuit before opening. Keep assembly tightly closed when in use.

MAINTENANCE
Inspect and clean wetted parts at regular intervals. The cover should be in place at all times to protect, the internal components from dirt, dust and weather and to maintain hazardous location ratings. Disconnect device from the supply circuit before opening to prevent ignition of hazardous atmosphere. Repairs to be conducted by Dwyer Instruments, Inc (field repair should not be attempted and may void warranty).

⚠ WARNING Repairs to electrical connection, process connection and flameproof joints are prohibited to maintain safe use of the product.

Units in need of repair should be returned to the factory prepaid. Be sure to include a brief description of the problem plus any relevant application notes. Contact customer service to receive a return goods authorization number for shipping.

Émetteur de température RTD antidéflagration de série TTE

Spécifications - Installation et mode d'emploi

L'émetteur de température RTD antidéflagration de **série TTE** est le produit idéal pour les applications de mesure des températures à risque. La série TTE possède sept plages de mesure de température pré-programmées sélectionnables par l'intermédiaire d'un commutateur dip interne. Pour les applications qui nécessitent une plage personnalisée, l'émetteur peut facilement être configuré pour tout type de plage allant de -30 à 250 °F (-34,4 à 120 °C). avec une étendue minimale de 40 °F (4,44 °C). L'étendue et le zéro peuvent être rapidement réglés par simple pression d'un bouton. Cet appareil possède des listes FM optionnelles pour une utilisation en atmosphères Classe I, Division 1, Groupes B, C et D, Classe II, Division 1, Groupes E, F et G et Classe III ou ATEX (Directive 2014/34/UE) pour CE Ex II 2 G Ex db IIC T6...T4 Gb (-20°C ≤ Ta ≤ + 70°C), CE Ex II 1 D Ex ta IIIC T111°C Da (-20°C ≤ Ta ≤ + 70°C) et IECEx pour Ex db IIC T6... T4 Gb (-20°C ≤ Ta ≤ + 70°C), Ex ta IIIC T111°C Da (-20°C ≤ Ta ≤ + 70°C). Le boîtier compact permet à l'émetteur d'être installé sur quasi toutes les applications.

La série TTE est idéale pour les applications de réfrigération, l'automatisation des bâtiments, les chaudières et les ballons d'eau chaude commerciale et les refroidisseurs d'eau.

TABLEAU DU MODÈLE

Options					Vierge BSPT C5 LCD M20	Nombre d'écran LCD Processus de raccordement BSPT mâle de 1/2 po (19 mm) Caractéristiques de la peinture du boîtier C5-M Écran LCD Raccordement électrique fileté femelle M20

*Options qui ne sont pas homologuées ATEX ni IECEx.

Attention : Les unités sans le suffixe "2" après la mention "TTE" ne sont pas homologuées par la directive 2014/34/EU (ATEX). Ces unités ne sont pas conçues pour une utilisation en atmosphère potentiellement dangereuses au sein de l'Union Européenne. Ces unités peuvent être estampillées CE pour d'autres directives de l'Union Européenne.

SPÉCIFICATIONS

Capteur de température : Pt1000, 0.00385 DIN.
Plages de température de sortie : Sélectionnable par l'utilisateur – n'importe quelle plage entre -30 à 250 °F (-34,4 à 120 °C). avec une étendue minimale 40 °F.
Limites de température : Ambiante : -4 à 158 °F (-20 à 70 °C) ; en fonction : -30 à 250 °F (-34,4 à 120 °C).
Précision : Émetteurs ±0,1 % FS; Sonde ±0,3 % FS.
Effets de dérive thermique : ±0,02 %/°C max.
Temps de réaction : 250 ms.
Matériaux mouillés : Acier inoxydable 316.
Processus de raccordement : Raccordement mâle NPT 1/2 po (19 mm) ou mâle BSPT 1/2 po (19 mm).
Raccord des conduits : Raccod femelle NPT 1/2 po (19 mm) ou M20.
Longueur de sonde : 2 po à 18 po (5,08 cm à 45,72 cm) (selon le modèle).
Limites de pression : 2000 PSI (137,89 bar).
Puissance électrique nécessaire : 10 à 35 VDC.
Signal en sortie : 4-20 mA (deux boucles de courant alimentées).
Écran en option : Écran LCD 2 lignes X 8 caractères.
Indice de protection du boîtier : Étanche et antidéflagration Approuvé FM pour classe I, division 1, groupes B, C et D et protection contre les coups de poussière pour Classe II, Division 1, Groupes E, F et G et atmosphères classe III.
Certifié ATEX : CE 0518 Ex II 2 G Ex db IIC T6...T4 Gb, CE Ex II 1 D Ex ta IIIC T111°C Da, T6 Température de fonctionnement ≤80 °C, Température Classe T5 Température de fonctionnement ≤95 °C, Température Classe T4 Température de fonctionnement ≤120 °C comme indiqué sur la plaque signalétique. Numéro de certificat de type UE : EMT17ATEX0021 X.
Normes ATEX : EN 60079-0:2012+A11:2013; EN 60079-1:2015; EN 60079-31:2014.
Certifié IECEx : Pour Ex db IIC T6...T4 Gb, Ex ta IIIC T111°C Da, T6 Température de fonctionnement ≤80 °C, Température Classe T5 Température de fonctionnement ≤95 °C, Température Classe T4 Température de fonctionnement ≤120 °C comme indiqué sur la plaque signalétique.
Certificat de conformité IECEx : Normes élément IECEx EMT 17.0007X; IECEx : CEI 60079-0:2011 (Edition 6); CEI 60079-1:2014 (Edition 7);
CEI 60079-31:2013 (Edition 2).
Poids : 2 livres 8 onces (1 134 g).
Homologations : FM, CE, ATEX/IECEx.

INSTALLATION

1. **Emplacement :** Sélectionner un emplacement où la température de l'émetteur se situera entre -4 et 158°F (-20 et 70 °C). La distance à partir du récepteur est uniquement limitée par la résistance totale de la boucle.
2. **Position :** L'émetteur peut se positionner librement. Les appareils avec d'écran doivent être montés de façon à faciliter la lecture de l'affichage.
3. **Raccordement électrique :** Longueur de câble - La longueur maximale du câble de raccordement de l'émetteur au récepteur dépend de la taille du câble et de la résistance du récepteur. Le câblage ne doit pas contribuer à plus de 10 % de la résistance du récepteur par rapport à la résistance totale de la boucle. Pour les longues distances (supérieures à 1 000 pieds (304,8 m)), choisir des récepteurs avec une résistance plus basse afin de réduire la taille et le coût des câbles de raccordement.

Fonctionnement du courant de sortie (4-20 mA)

Un dispositif d'alimentation électrique externe est nécessaire. Voir figure A pour le schéma de raccordement à l'alimentation électrique, émetteur et récepteur. La plage de charge de résistance appropriée du récepteur (RL) pour la tension d'alimentation CC disponible s'exprime par la formule suivante :

$$R_L = \frac{V_{ps} - 10}{20\ \text{mADC}}$$

L'utilisation d'un câble blindé est recommandé pour le câblage à boucle de contrôle.

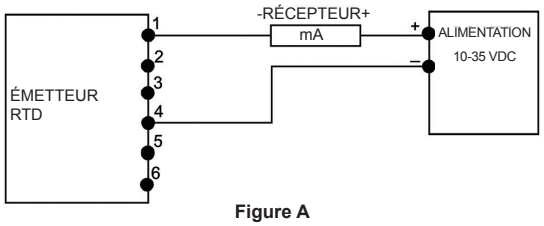

Figure A

Remarques concernant l'installation FM antidéflagration :

1. Installer selon les codes électriques nationaux en vigueur.
2. Brancher toutes les ouvertures de conduit non utilisées. Le branchement doit comporter un minimum de 5 fils.
3. Utiliser un joint de conduit à 18 pouces (45,72 cm) de l'entrée du conduit.
4. Couper l'alimentation électrique avant toute intervention.

Les raccordement électriques vers l'émetteur RTD sont réalisés sur le bornier situé à l'intérieur du boîtier. Dévisser et retirer le couvercle. Brancher comme indiqué sur la figure B.

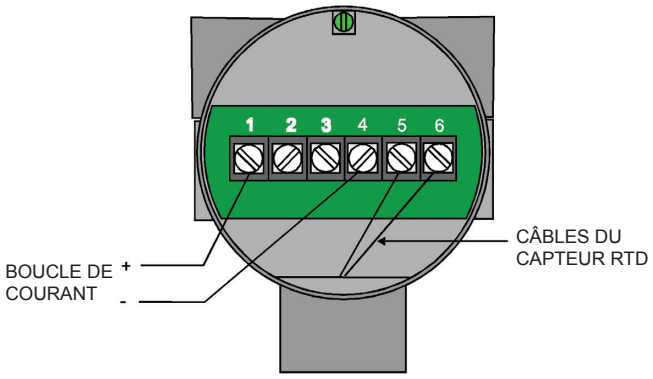

Figure B

Sélection de la plage de températures

L'émetteur RTD possède 7 plages de température pré-programmées ainsi qu'une plage réglable par l'utilisateur au moyen du commutateur Dip situé à l'intérieur du boîtier (figure C). Les commutateurs 2, 3, et 4 sont utilisés pour configurer la plage. Pour configurer la plage souhaitée, dévisser et retirer le couvercle et régler le commutateur Dip selon le tableau suivant :

	Commutateur Dip		
Plages sélectionnables	2	3	4
40 à 90 °F (4,4 à 32,2 °C)	OFF (hors tension)	OFF (hors tension)	OFF (hors tension)
-20 à 140 °F (-28,9 à 60 °C)	ON (sous tension)	OFF (hors tension)	OFF (hors tension)
0 à 100 °F (-17,8 à 37,8 °C)	OFF (hors tension)	ON (sous tension)	OFF (hors tension)
30 à 240 °F (-1,1 à 115,6 °C)	ON (sous tension)	ON (sous tension)	OFF (hors tension)
32 à 212 °F (0 à 100 °C)	OFF (hors tension)	OFF (hors tension)	ON (sous tension)
32 à 122 °F (0 à 50 °C)	ON (sous tension)	OFF (hors tension)	ON (sous tension)
-30 à 65 °F (-1,1 à 18,3 °C)	OFF (hors tension)	ON (sous tension)	ON (sous tension)
Réglable par l'utilisateur	ON (sous tension)	ON (sous tension)	ON (sous tension)

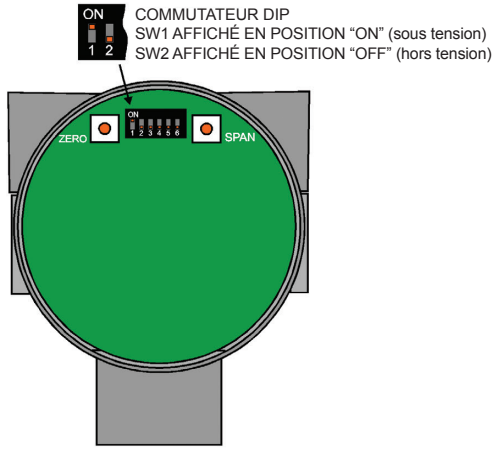

Figure C

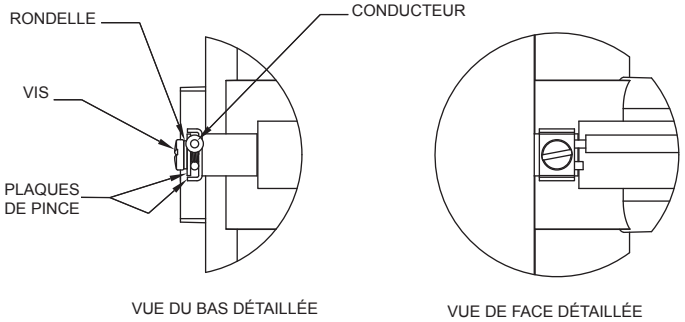
Configuration et étalonnage de la plage réglable par l'utilisateur
En configurant le COMMUTATEUR 2, 3 et 4, l'émetteur RTD peut être réglée sur une plage personnalisée par l'utilisateur. La plage peut être configurée avec n'importe quelle valeur comprise entre –30 °F et +250 °F (-34 à +121 °C) avec une ÉTENDUE MINIMALE de 40 °F (22 °C).

Équipement nécessaire
Pour étallonner l'appareil pour une plage personnalisée, il faut utiliser un simulateur RTD de précision pouvant simuler un RTD de type 1000 OHM DIN ou une boîte à décades de précision. Le dispositif doit être capable de générer la résistance RTD correcte à 0,1 % près ou mieux.

Procédure d'étalonnage
1. Régler les COMMUTATEURS DIP 2, 3 et 4 sur ON (sous tension).
2. Retirer les câbles du capteur RTD des bornes 5 et 6 (Figure B). Brancher le simulateur de précision RTD ou la boîte à décades des bornes 5 et 6.
3. Brancher l'instrument comme indiqué précédemment. Un courantomètre peut être branché en série avec l'unité pour vérifier que le courant de sortie est correct, mais cela n'est pas nécessaire pour l'étalonnage. Mettre l'unité sous tension.
4. Si un simulateur de précision RTD est utilisé, vérifier qu'il est réglé pour simuler un RTD 1000 OHM DIN 0.00385. Puis, régler à la température minimale souhaitée. Si une boîte à décades est utilisée, consulter le tableau de l'annexe A (°F) ou de l'annexe B (°C) puis régler à la résistance correspondant à la température souhaitée.
5. Appuyer sur le bouton ZERO (Zéro). Si l'appareil possède un écran LCD, l'écran affiche temporairement ZERO OK (Zéro OK). Si le courantomètre est branché, il affiche 4,00 mA.
6. Répéter l'étape 4 en utilisant la valeur correspondant à la température maximale souhaitée.
7. Appuyer sur le bouton SPAN (étendue). Si l'appareil possède un écran LCD, l'écran affiche temporairement SPAN OK (étendue ok). Si le courantomètre est branché, il affiche 20,00 mA.
8. Mettre l'untié hors tension. Débrancher le simulateur RTD ou la boîte à décades et rebrancher le capteur RTD aux bornes 5 et 6. L'étalonnage est terminé.

Remarque : La procédure d'étalonnage n'affecte pas l'étalonnage des plages pré-programmées.



Sélection °F et °C
Si l'appareil possède un écran LCD, le COMMUTATEUR DIP 1 règle l'affichage pour une lecteur en °F ou en °C. COMMUTATEUR 1 “OFF (hors tension)” = °F
COMMUTATEUR 1 “ON (sous tension)” = °F

Affichage du courant de sortie
Si l'appareil possède un écran LCD, l'écran du bas affiche le courant de sortie si le COMMUTATEUR DIP 5 est sur "ON". Si le COMMUTATEUR DIP 5 est sur "OFF", l'écran inférieur est vide.

Protection contre les RTD ouverts
Lorsque qu'un RTD ouvert est détecté, l'unité peut être réglé pour forcer la sortie à afficher 3,5 mA ou 21 mA selon le réglage du COMMUTATEUR DIP 6.
COMMUTATEUR 6 “OFF”, sortie forcée sur 3,5 mA
COMMUTATEUR 6 “ON”, sortie forcée sur 21 mA

Étalonnage
L'appareil ne requiert aucun étalonnage. Une résistance de précision interne étalonne automatiquement l'unité. L'étalonnage peut être vérifié en retirant les câbles du capteur et en testant l'appareil à l'aide d'un simulateur de précision RTD ou dune boîte à décades. Si l'appareil est déréglé, il doit être renvoyé à l'usine pour réparation.

RACCORDEMENTS ÉLECTRIQUES
Brancher les câbles électriques conformément aux codes électriques locaux en vigueur. Pour les unités fournies avec, à la fois, des bornes de terre internes et des bornes de raccordement externes, la vis de terre située dans le boîtier doit être utilisée pour relier le contrôle à la terre. La borne à vis externe permet un raccordement supplémentaire quand cela est possible ou quand cela est exigé par le code local. Quand un conducteur d'équipotentialité est requis, le conducteur doit être enroulé à 180° autour de la borne à vis externe. Voir ci-dessous.

VUE DU BAS DÉTAILLÉE

VUE DE FACE DÉTAILLÉE

Instructions d'installation conformes aux exigences du certificat type CE et IECEx.
Connexion par câble
Le dispositif d'entrée du câble doit être équipé d'un boîtier de protection certifié type « db » en ce qui concerne la protection contre les explosions et les flammes. Il doit être adapté aux conditions d'utilisation et installé correctement. Utiliser un câble et un passe-câbles de cote ≥ 75 °C (MIN) pour une Ta ≥ 70 °C
Raccord des conduits
Un dispositif de scellement certifié Ex db, comme par exemple un joint avec composé durcissable, doit immédiatement être posé à l'entrée du boîtier de l'émetteur. Pour une Ta ≥ 70 °C, à l'intérieur du dispositif de scellement, utiliser un câblage et un composé durcissable de cote ≥ 75 °C.

Les entrées non utilisées doivent être scellées à l'aide d'un dispositif d'obturation certifié Ex adapté à la zone, à la classification du groupe d'appareil et de température appropriée et doit être installé conformément aux instructions du fabricant.

Remarque : Pour unités ATEX et IECEx uniquement : Lorsqu'il est utilisé dans le cadre d'une application Zone 1 EPL Gb (db), la classe de température est déterminée par la température maximale ambiante ou par la température de fonctionnement. Les unités sont conçues pour être utilisées à des températures ambiantes correspondant à -20 °C≤ Tamb ≤70 °C. Les unités peuvent être utilisées à des températures de fonctionnement allant jusqu'à 120 °C à condition que la température du corps du boîtier et du flussostat ne dépasse pas 70 °C. La classe de température standard est la T6 Temp. de fonctionnement ≤80 °C. Les classes de températures restantes sont la classe de température T5 de température de fonctionnement ≤ 95 °C et la classe de température T4 de température de fonctionnement ≤ 120 °C. Consulter les certificats n° : Élement IECEx EMT17 0007 X pour les conditions de sécurité concernant les unités conformes aux exigences IECEx. Tous les câbles, conduites et boîtiers doivent être conformes aux codes en vigueur en matière de zones dangereuses. Les conduites et les boîtiers doivent être correctement scellés. Pour les installations en extérieur ou emplacements où les températures varient largement, des précautions doivent être prises afin d'éviter la condensation à l'intérieur du commutateur ou du boîtier. Les composants électriques doivent être maintenus secs en toute circonstance.

Lorsqu'il est utilisé dans le cadre d'une application de Zone 20 EPL Ea (ta), l'appareil doit être utilisé avec une source d'alimentation évaluée pour d'éventuels courts circuits de 10 kA. Si la source d'alimentation a été évaluée pour d'éventuels courts circuits de moins de 10 kA, l'utilisateur final ou l'installateur doit marquer l'appareil avec le courant nominal de court circuit éventuel de la source d'alimentation avec lequel il fonctionne.

MISE EN GARDE : Pour éviter toute ignition en atmosphère dangereuse, débrancher le dispositif de l'alimentation électrique avant de l'ouvrir. Maintenir l'assemblage bien fermé lors de l'utilisation.

ENTRETIEN
Inspecter et nettoyer les parties mouillées à intervalles réguliers. Le couvercle doit resté en place afin de protéger les composants internes des saletés, de la poussière et du climat et de respecter les règles en matière de risques dus aux emplacements dangereux. Débrancher le dispositif de l'alimentation électrique avant de l'ouvrir afin d'éviter toute ignition en atmosphère dangereuse. Les réparations doivent être conduites par Dwyer Instruments, Inc. (les tentatives de réparation peuvent annuler la garantie).

AVERTISSEMENT Les réparations des raccordements électriques, du raccordement de fonctionnement et des joints ignifuges sont interdites afin de garantir une utilisation sûre du produit.

Les unités nécessitant des réparations doivent être renvoyées à l'usine, aux frais de l'utilisateur. Prendre soin d'inclure une brève description du problème ainsi que toute remarque utile sur les conditions d'utilisation. Contacter le service client pour recevoir un numéro d'autorisation de retour de marchandise.

Serie TTE explosionsgeschützter RTD-Temperatursender

Technische Daten – Montage- und Betriebsanleitung

Der **Serie TTE** explosionsgeschützte RTD-Temperatursender ist das ideale Produkt für gefährliche Temperaturmessanwendungen. Die TTE-Serie hat sieben vorprogrammierte Temperaturbereiche, die über einen internen Kippschalter ausgewählt werden können. Anwendungen, die einen benutzerdefinierten Bereich erfordern, kann der Sender auf einfache Weise auf jeden Bereich zwischen -30 bis 250 °F (-34,4 bis 120 °C) mit einer Mindest 40 °F (4,44 °C). Die Spanne und Null können leicht über ein einfaches Druckschalterdesign angepasst werden. Dieses Gerät hat optionale FM-Protokolle zur Verwendung in Klasse I, Division 1, Gruppen B, C und D, Klasse II, Division 1, Gruppen E, F und G und Klasse III-Atmosphären oder ATEX (Direktive 2014/34/EU) für CE Ex II 2 G Ex db IIC T6...T4 Gb (-20°C ≤ Ta ≤ + 70°C), CE Ex II 1 D Ex ta IIIC T111°C Da (-20°C ≤ Ta ≤ + 70°C) und IECEx für Ex db IIC T6...T4 Gb (-20°C ≤ Ta ≤ + 70°C), Ex ta IIIC T111°C Da (-20°C ≤ Ta ≤ + 70°C). Durch das kompakte Gehäuse kann der Sender bei beinahe jeder Anwendung angebracht werden.

Die Serie TTE ist hervorragend geeignet für Kühlung, Gebäudeautomatisierung, handelsübliche Warmwasserbereiter und Boiler, sowie Wasserkühler.

TABELLE

Beispiel	TTE	1	04	W	LCD	Explosionsgeschützter RTD-Temperatursender, FM-Stufe, 4"-Sonde mit LCD-Anzeige

			12			12″ (30,48 cm) Sonde
			15			15″ (38,10 cm) Sonde
			18			18″ (45,72 cm) Sonde
Bauweise				W		Trockenlaufsonde
Optionen					Leer	Keine LCD-Anzeige
					BSPT	1/2 Prozessanschluss mit BSPT-Außengewinde
					C5	Farbspezifikationen C5-M-Gehäuse
					LCD	LCD-Anzeige
					M20	Elektrischer Anschluss mit M20-Innengewinde

*Optionen ohne ATEX- und IECEx-Schutz.

Achtung: Geräte ohne die Erweiterung „2“ nach „TTE“ erfüllen nicht die Direktive 2014/34/EU (ATEX). Diese Geräte sind für den Einsatz in explosionsgefährdeten Räumen nicht geeignet. Sie sind nur nach CE getestet.

TECHNISCHE DATEN

Temperatursensor: Pt1000, 0.00385 DIN.
Ausgabetemperaturbereiche: Benutzerdefiniert – beliebiger zwischen -30 bis 250 °F (-34,4 bis 120 °C) mit einem Mindestbereich von 40°F.
Temperaturbereich: Umgebungstemp.: -4 bis 158 °F (-20 bis 70 °C); Prozesstemp: -30 bis 250 °F (-34,4 bis 120 °C).
Genauigkeit: Sender ±0,1 % FS; Sonde ±0,3% FS.
Thermodriftwirkung: ±0,02 %/ °C max.
Reaktionszeit: 250 ms.
Mediumberührende Teile: Edelstahl 316.
Prozessanschluss: 1/2″ (1,27 cm) NPT-Außengewinde oder 1/2" (1,27 cm) BSPT-Außengewinde.
Kabeleingang: 1/2″ (1,27 cm) NPT-Innengewinde oder M20.
Sondenlänge: 2″ (5,08 cm) bis 18″ (45,72 cm) (modellabhängig).
Druckbereich: 2000 PSI.
Leistungsbedarf: 10 bis 35 VDC.
Ausgangssignal: 4-20 mA (betrieben mit Zweileitertechnik).
Optionale Anzeige: LCD mit 2 Zeilen X 8 Zeichen.
Gehäuse: Wettergeschützt und explosionsgeschützt. Aufgeführt mit FM für Klasse I, Division 1, Gruppen B, C und D und staubexplosionsgeschützt für Klasse II, Division 1, Gruppen E, F und G und Klasse-III-Atmosphären.
ATEX Zertifiziert: CE 0518 Ex II 2 G Ex db IIC T6...T4 Gb, CE Ex II 1 D Ex ta IIIC T111°C Da, T6 Prozesstemp ≤80°C, Temperaturklasse T5 Prozesstemp ≤95°C, Temperaturklasse T4 Prozesstemp ≤120°C wie auf dem Typenschild definiert. EU-Typ Zertifikatnr.: EMT17ATEX0021 X.
ATEX-Standards: EN 60079-0:2012+A11:2013; EN 60079-1:2015; EN 60079-31:2014.
IECEx Zertifiziert: Für Ex db IIC T6...T4 Gb, Ex ta IIIC T111°C Da, T6 Prozesstemp ≤80°C, Temperaturklasse T5 Prozesstemp ≤95°C, Temperaturklasse T4 Prozesstemp ≤120°C wie auf dem Namensschild definiert.
IECEx-Konformitätszertifikat: Element IECEx EMT 17.0007X; IECEx-Normen: IEC 60079-0:2011 (Edition 6); IEC 60079-1:2014 (Edition 7); IEC 60079-31:2013 (Edition 2).
Gewicht: 2 lb 8 oz (1134 g).
Zulassungen: FM, CE, ATEX/IECEx.

DWYER INSTRUMENTS, INC.
P.O. BOX 373 • MICHIGAN CITY, INDIANA 46360, USA
Tel.: +1 - 219/879-8000 **www.dwyer-inst.com**
Fax: +1 - 219/872-9057 **E-Mail: info@dwyermail.com**

MONTAGE

1. **Aufstellungsort:** Wählen Sie einen Aufstellungsort, bei dem die Temperatur des Sender zwischen -4 und 158 °F liegt. Der Abstand vom Empfänger wird nur durch die Gesamtschleifenwiderstand begrenzt.
2. **Position:** Der Sender ist nicht ortsempfindlich. Gerät mit der optionalen Anzeige müssen so angebracht werden, dass die Anzeige leicht abzulesen ist.
3. **Elektrischer Anschluss: Kabellänge** - Die maximale Länge des Kabels, das Sender und Empfänger verbindet, ist eine Funktion aus Kabelgröße und Empfängerwiderstand. Das Kabel sollte nicht mehr als 10 % des Empfängerwiderstands zum Gesamtschleifenwiderstand beitragen. Wählen Sie für extrem lange Strecken (über 1000 Fuß) Empfänger mit niedrigem Widerstand, um die Größe und Kosten der Verbindungskabel zu minimieren.

Strom (4-20 mA) Ausgabevorgang

Es wird eine externe Stromquelle benötigt. Siehe Abbildung A für eine Darstellung der Verbindung zu Stromquelle, Sender und Empfänger. Der Bereich des geeigneten Empfängerlastwiderstands (RL) für die verfügbare Spannung der Gleichstromversorgung wird durch die folgende Formel ausgedrückt:

$$R_L = \frac{V_{ps} - 10}{20\ \text{mADC}}$$

Für die Steuerringleitung sollten abgeschirmte Kabel verwendet werden.

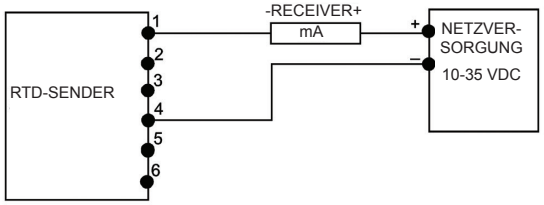

Abbildung A

Hinweise zur explosionsgeschützten FM-Montage:

1. Montieren Sie gemäß aller geltenden nationalen elektrischen Normen.
2. Verschließen Sie nicht verwendete Kabeleinführungen. Stecker muss mindestens 5 Gewinde abdecken.
3. Verwenden Sie ein Kabelsiegel innerhalb von 18 Zoll vom Kabeleingang.
4. Trennen Sie das Gerät vor Wartungsarbeiten von der Stromversorgung.

Elektrische Verbindungen zum RTD-Sender werden an der Klemmleiste ausgeführt, die sich im Gehäuse befindet. Lösen Sie die Schrauben und entfernen Sie die Abdeckung. Verkabeln Sie wie in Abbildung B gezeigt.

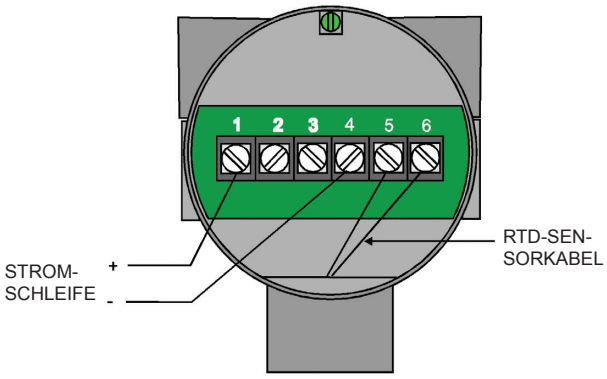

Abbildung B

Auswahl des Temperaturbereichs

Der RTD-Sender hat 7 eingebaute Temperaturbereiche und einen benutzerdefinierten Bereich, der durch Festlegung des Kippschalters im Gehäuse (Abbildung C) ausgewählt wird. Mit den Schaltern 2, 3 und 4 wird der Bereich festgelegt. Um den gewünschten Bereich festzulegen, lösen Sie die Schrauben, entfernen die Abdeckung und stellen den Kippschalter gemäß der folgenden Tabelle ein:

Auswählbare Bereiche	**Kippschalter**		
	2	3	4
40 bis 90 °F (4,4 bis 32,2 °C)	AUS	AUS	AUS
-20 bis 140 °F (-28,9 bis 60 °C)	EIN	AUS	AUS
0 bis 100 °F (-17,8 bis 37,8 °C)	AUS	EIN	AUS
30 bis 240 °F (-1,1 bis 115,6 °C)	EIN	EIN	AUS
32 bis 212 °F (0 bis 100 °C)	AUS	AUS	EIN
32 bis 122 °F (0 bis 50 °C)	EIN	AUS	EIN
-30 bis 65 °F (-1,1 bis 18,3 °C)	AUS	EIN	EIN
Benutzerdefiniert	EIN	EIN	EIN

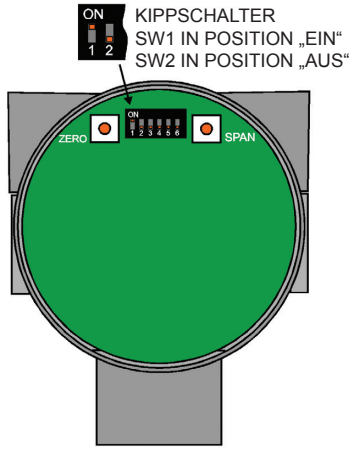

Abbildung C

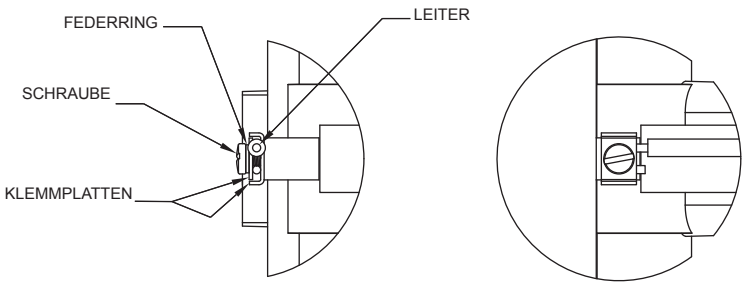
Einstellung und Kalibrierung des benutzerdefinierten Bereichs
Durch Aktivierung von SCHALTER 2, 3 und 4 kann der RTD-Sender auf einen benutzerdefinierten Bereich eingestellt werden. Der Bereich kann Werte zwischen -30 °F und +250 °F (-34 bis +121 °C) mit einem MINDESTBEREICH von 40 °F (22 °C) liegen.

Erforderliche Geräte
Um das Gerät auf einen benutzerdefinierten Bereich einzustellen, ist ein RTD-Präzisionssimulator, der einen 1000 OHM DIN-RTD oder Präzisionswiderstandsdekade simulieren kann, erforderlich. Das Gerät muss den korrekten RTD-Widerstand auf 0,1 % oder besser erzeugen können.

Kalibrierungsverfahren
1. KIPPSCHALTER 2, 3 und 4 auf EIN stellen.
2. Entfernen Sie die RTD-Sensorkabel von den Klemmen 5 und 6 (Abbildung B). Schließen Sie den RTD-Präzisionssimulator oder Widerstandsdekade an die Klemmen 5 und 6 an.
3. Verkabeln Sie das Instrument wie bereits erwähnt. Ein Stromzähler kann mit dem Gerät in Reihe verkabelt werden, um die korrekte Stromausgabe zu überprüfen, dies ist allerdings für die Kalibrierung nicht erforderlich. Schließen Sie das Gerät an den Strom an.
4. Wird ein RTD-Präzisionssimulator verwenden, müssen Sie sicherstellen, dass er auf die Simulation eines 1000 OHM DIN 0,00385 RTD eingestellt ist. Legen Sie danach die gewünschte Mindesttemperatur fest. Wird eine Widerstandsdekade verwendet, siehe in der Tabelle in Anhang A (°F) oder Anhang B (°C) und stellen Sie ihn auf den Widerstand, der die gewünschte Mindesttemperatur darstellt.
5. Drücken Sie auf den Schalter ZERO (NULL). Hat das Gerät einen optionalen LCD-Bildschirm, ist auf ihm kurz ZERO OK (NULL OK) zu sehen. Ist ein Stromzähler angeschlossen, zeigt er 4,00 mA an.
6. Wiederholen Sie Schritt 4 mit dem Wert für die gewünschte Höchsttemperatur.
7. Drücken Sie die Taste SPAN (SPANNE). Hat das Gerät einen optionalen LCD-Bildschirm, ist auf ihm kurz SPAN (SPANNE) zu sehen. Ist ein Stromzähler angeschlossen, zeigt er 20,00 mA an.
8. Schalten Sie das Gerät aus. Trennen Sie den RTD-Simulator oder Widerstandsdekade und schließen Sie den RTD-Sensor wieder an die Klemmen 5 und 6 an. Die Kalibrierung ist abgeschlossen.

Hinweis: Das Kalibrierungsverfahren hat keinen Einfluss auf die Kalibrierung der anderen eingebauten Bereiche.



Auswahl von °F und °C
Hat das Gerät einen optionalen LCD-Bildschirm, legt der KIPPSCHALTER 1 die Anzeige in °F oder °C fest. SCHALTER 1 „AUS“ = °F
SCHALTER 1 „EIN“ = °C

Anzeige des Ausgabestroms
Hat das Gerät einen optionalen LCD-Bildschirm, zeigt der untere Teil den Ausgabestrom, wenn der KIPPSCHALTER 5 „AN“ ist. Ist die Einstellung für KIPPSCHALTER 5 „AUS“, bleibt der untere Bildschirm leer.

Offener RTD-Schutz
Nach Erkennung eines offenen RTD, kann das Gerät so eingestellt werden, dass die Ausgabe 3,5 mA oder 21 mA je nach Einstellung von KIPPSCHALTER 6 anzeigt.
SCHALTER 6 „AUS“, Ausgabe muss 3,5 mA sein
SCHALTER 6 „EIN“, Ausgabe muss 21 mA sein

Kalibrierung
Das Gerät muss nicht kalibriert werden. Ein interner Präzisionswiderstand führt eine Selbstkalibrierung des Geräts durch. Die Kalibrierung kann überprüft werden, indem die Sensorkabel entfernt und das Gerät mit einem RTD-Präzisionssimulator oder einer Widerstandsdekade geprüft wird. Stellt sich heraus, dass das Gerät kalibriert ist, muss es zur Wartung an den Hersteller geschickt werden.

ELEKTRISCHE ANSCHLÜSSE
Verbinden Sie die Kabel entsprechend den örtlichen Regularien. Bei Geräten mit interner Erdungsschraube und externer Verbindungsschraube muss die innere Erdungsschraube zur Erdung des Signales verwendet werden. Die externe Verbindungsschraube dient zur zusätzlichen Erdung, falls von örtlichen Regularien erlaubt oder erfordert. Ist ein externer Verbindungsleiter erforderlich, muss der Leiter mindestens 180° um die externe Verbindungsschraube gewickelt sein. Siehe unten.

ANSICHT VON UNTEN DETAIL

VORDERANSICHT DETAIL

EU-Zertifizierung, IECEx-Installationsanweisungen:
Kabelanschluss
Das Kabeleingangsgerät muss in der Kategorie "Explosionsschutz" als feuersicheres Gehäuse der Klasse “db” zugelassen sein, für die Einsatzbedingungen geeignet sein und korrekt installiert werden. Bei ta ≥ 70 °C sind Kabel und Kabelverschraubungen für ≥ 75° C (MIN.) zu verwenden.

Gehäuseverschraubung
Am elektrischen Eingang des Sendergehäuses ist umgehend eine Dichtungsvorrichtung mit Ex-db-Zertifizierung wie beispielsweise ein Kabelschutzrohr mit Justierung anzubringen. Bei ta ≥ 70 °C muss das Kabelmaterial in der Durchgangsdichtung mindestens bis ≥ 75 °C geeignet sein.

Nicht verwendete Eingänge müssen mit einem Stopfen mit Ex-Zertifizierung, der für die passende Zone, Gerätegruppe und Temperaturklassifizierung geeignet ist, versiegelt und gemäß der Herstelleranleitung montiert werden.

Hinweis: Nur für ATEX-/IECEx-Geräte: Bei der Anwendung in einer Zone 1, EPL Gb (db), wird die Temperaturklasse entweder durch die max. Umgebungstemperatur oder durch die Prozesstemperatur bestimmt. Die Geräte sind für eine Umgebungstemperatur von -20 °C ≤ Tamb ≤ 70 °C bestimmt. Die Instrumente können bis zu einer Prozesstemperatur von 120 °C eingesetzt werden, vorausgesetzt das Gehäuse erreicht keine Temperaturen über 70 °C. Die Standardtemperaturklasse T6 ist bei einer Prozesstemperatur von ≤80 °C. Die verbleibenden Temperaturklassen sind Temperaturklasse T5 Prozesstemp ≤95 °C und Temperaturklasse T4 Prozesstemp ≤ 120 °C. Siehe Zertifikatnr: Element IECEx EMT17.0007X zu Informationen zum sicheren Umgang mit IECEx-Geräten. Alle Verdrahtungen und Gehäuse müssen den entsprechenden Regularien für explosionsgefährdete Umgebungen entsprechen. Die Gehäuse müssen ordnungsgemäß abgedichtet werden. Bei Außenanwendungen oder anderen Anwendungen, bei denen die Temperaturen stark schwanken, müssen Vorkehrungen zur Vermeidung von Kondensation innerhalb des Gehäuses getroffen werden. Alle elektrischen Komponenten sind vor Feuchtigkeit zu schützen.

Bei der Anwendung in einer Zone 20, EPL Da (ta), muss das Gerät mit einer Stromquelle verwendet werden, die für einen prospektiven Kurzschlussstrom von 10 kA zugelassen ist. Ist die Stromquelle für einen prospektiven Kurzschlussstrom von weniger als 10 kA zugelassen, muss der Endbenutzer oder Monteur das Gerät mit der prospektiven Kurzschlussstromklassifizierung der Stromquelle kennzeichnen, mit der es in Verbindung steht.

VORSICHT: Zur Vermeidung von Bränden in explosionsgefährdeten Umgebungen unterbrechen Sie die Spannungsversorgung, bevor Sie den Durchflusswächter öffnen. Halten Sie das Gerät beim Arbeiten immer geschlossen.

Wartung
Reinigen und kontrollieren Sie die mediumberührenden Teile in regelmäßigen Abständen. Die Abdeckung muss immer verschlossen sein, um die internen Teile vor Schmutz, Staub und Wettereinflüssen zu schützen. Lösen Sie immer die Spannungsversorgung, bevor Sie den Schalter öffnen, um Arbeiten an der Elektrik vorzunehmen. Reparaturen müssen von Dwyer instruments Inc durchgeführt werden (Feldreparaturen dürfen nicht durchgeführt werden und können die Garantie nichtig machen).

⚠ WARNUNG Reparaturen elektrischer Verbindungen, Prozessverbindungen und feuersicherer Gelenke sind verboten, um die sichere Verwendung des Produkts sicherzustellen.

Zu reparierende Geräte sollten im Voraus bezahlt ans Werk geschickt werden. Fügen Sie außerdem eine kurze Erläuterung des Problems sowie relevante Anmerkungen bei. Bevor Sie das Produkt einschicken, holen Sie sich bitte beim Kundendienst eine Warenrücksendenummer.

Transmisor de temperatura a prueba de explosión RTD Series TTE

Especificaciones - Instrucciones de instalación y uso

El transmisor de temperatura a prueba de explosión RTD **Series TTE** es el producto ideal para aplicaciones peligrosas de medición de temperatura. Las series TTE tienen rangos de temperatura preprogramados que se seleccionan mediante un interruptor DIP interno. Para aquellas aplicaciones que necesitan un rango personalizado, el transmisor puede configurarse fácilmente para cualquier rango de entre -30 y 250 °F (-34,4 °C y 121 °C) con una amplitud mínima de 40 °F (4,44 °C). La amplitud y el cero pueden ajustarse rápidamente con solo pulsar un botón. Esta unidad tiene listados opcionales de FM para usar en clase I, división 1, grupos B, C y D, clase II, división 1, grupos E, F y G y atmósferas clase III o ATEX (directiva 2014/34/EU) para CE Ex II 2 G Ex db IIC T6...T4 Gb (-20°C ≤ Ta ≤ + 70°C), CE Ex II 1 D Ex ta IIIC T111 °C Da (-20°C ≤ Ta ≤ + 70°C) y IECEx para Ex db IIC T6...T4 Gb (-20°C ≤ Ta ≤ + 70°C), Ex ta IIIC T111 °C Da (-20°C ≤ Ta ≤ + 70°C). La carcasa compacta permite montar el transmisor virtualmente en cualquier aplicación.

Las series TTE son adecuadas para refrigeración, automatización edilicia, calentadores y calderas comerciales, y aplicaciones de enfriamiento de agua.

TABLA DE MODELOS

*Opciones que no tienen ATEX ni IECEx.

Atención: Las unidades sin el sufijo “2” después de “TTE” no cumplen la directiva 2014/34/EU (ATEX). Estas unidades no están indicadas para usarse en atmósferas potencialmente peligrosas en la UE. Estas unidades pueden tener el marcado CE para otras Directivas de la UE.

ESPECIFICACIONES TÉCNICAS

Sensor de temperatura: Pt1000, 0.00385 DIN.
Rangos de temperatura de salida: A elegir por el usuario – Cualquier rango entre -30 y 250 °F (-34,4 y 121 °C) con una amplitud mínima de 40 °F (4,4 °C).
Límites de temperatura: Ambiente: -4 a 158 °F (-20 a 70 °C); proceso: -30 a 250 °F (-34,4 a 120 °C).
Precisión: Transmisor ±0,1 % FS; Sonda ±0,3 % FS.
Efectos de deriva térmica: ±0,02 %/°C máx..
Tiempo de respuesta: 250 ms
Materiales mojados: Acero inoxidable 316.
Conexión del proceso: NPT macho de 1/2″ (1,27 cm) o BSPT macho de 1/2″ (1,27 cm)
Conexión de conductos: NPT hembra de 1/2″ (1,27 cm) o M20.
Longitud de sonda: De 2″ (5,08 cm) a 18″ (45,72 cm), según el modelo.
Límites de presión: 2000 PSI.
Requisitos eléctricos: De 10 a 35 V CC.
Señal de salida: 4-20 mA (alimentado por un circuito de dos hilos).
Pantalla opcional: LCD de 2 lineas X 8 caracteres.
Clasificación de la carcasa: Resistente a la intemperie y a prueba de explosiones: Listado con FM para clase I, división 1, grupos B, C y D, y a prueba de polvo y de ignición para clase II, división 1, grupos E, F y G, y atmósferas de clase III.
Certificado ATEX: CE 0518 Ex II 2 G Ex db IIC T6...T4 Gb, CE Ex II 1 D Ex ta IIIC T111°C Da, T6 temp. del proceso ≤80 °C, clase de temperatura T5 temp. del proceso ≤95 °C, clase de temperaturaT4 temp. del proceso ≤120 °C como se indica en la placa.
Certificado tipo UE n.º: EMT17ATEX0021 X.
Normativas ATEX: EN 60079-0:2012+A11:2013; EN 60079-1:2015; EN 60079-31:2014.
Certificación IECEx: Para Ex db IIC T6...T4 Gb, Ex ta IIIC T111°C Da, T6 temp. del proceso ≤80 °C, clase de temperatura T5 temp del proceso ≤95 °C, clase de temperatura T4 temp. del proceso ≤120 °C tal como se indica en la placa.
Certificado de cumplimiento IECEx: Elemento IECEx EMT 17.0007X; normativas IECEx: IEC 60079-0:2011 (Edición 6); IEC 60079-1:2014 (Edición 7); IEC 60079-31:2013 (Edición 2).
Peso: 2 lb 8 oz (1134 g).
Aprobaciones de agencias: FM, CE, ATEX/IECEx.

DWYER INSTRUMENTS, INC.
P.O. BOX 373 • MICHIGAN CITY, INDIANA 46360, U.S.A.

Fax: +1 219/872-9057 **Correo electrónico: info@dwyermail.com**

INSTALACIÓN

1. **Ubicación:** Seleccione una ubicación en la que la temperatura del transmisor esté entre -4 y 158 °F (-20 y 70 °C). la distancia del receptor solo está limitada por la resistencia de bucle total.
2. **Posición:** el transmisor no es sensible a las posiciones. Las unidades con pantalla opcional deben montarse de forma que tenga una visualización fácil.
3. **Conexión eléctrica: Longitud del cable** - La longitud máxima del cable que conecta el transmisor y el receptor va en función del tamaño del cable y de la resistencia del receptor. El cableado no debe contribuir en más del 10 % de la resistencia del receptor a la resistencia de bucle total. Para distancias extremadamente largas (más de 1000 pies [304 m]), elija receptores con resistencia más baja para minimizar el tamaño y el coste de los cables de conexión.

Funcionamiento de corriente de salida (4-20 mA)

Se necesita una fuente de energía externa. Vea en la figura A el diagrama de conexión de la fuente de energía, el transmisor y el receptor. El rango de resistencia de carga del receptor (RL) para el voltaje de alimentación de CC disponible se expresa mediante la siguiente fórmula:

$$R_L = \frac{V_{ps} - 10}{20\ mA\ CC}$$

Para controlar el cableado de bucle se recomienda un cable apantallado.

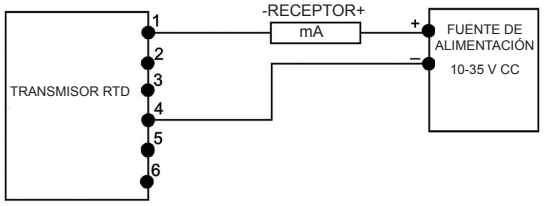

Figura A

Notas de instalación FM a prueba de explosiones:

1. Instalar según el código eléctrico nacional de aplicación.
2. Tapar las aperturas de canalización sin utilizar. Al tapar se deben incluir un mínimo de 5 hilos.
3. Utilizar un sello de canalización a 18 pulgadas de la entrada de canalización.
4. Desconectar la alimentación antes de la reparación.

Las conexiones eléctricas al transmisor RTD se hacen a un bloque terminal ubicado dentro de la carcasa. Desatornillar y retirar la cubierta. Cablear como se muestra en la figura B.

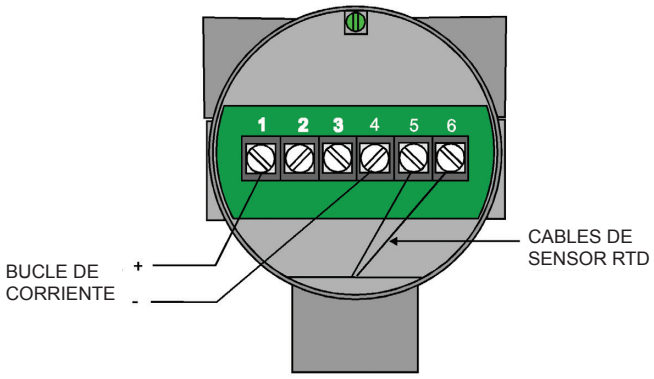

Figura B

Selección del rango de temperatura

El transmisor RTD tiene 7 rangos de temperatura incluidos y un rango configurable por el usuario que se pueden seleccionar ajustando el interruptor DIP ubicado dentro de la carcasa (figura C). Los interruptores 2, 3 y 4 se utilizan para ajustar el rango. Para ajustar al rango deseado, desatornille y retire la cubierta y ajuste el interruptor DIP según la siguiente tabla:

	Interruptor DIP		
Rangos seleccionables	2	3	4
DE 40 a 90 °F (de 4,4 a 32,2 °C)	APAGADO	APAGADO	APAGADO
De -20 a 140 °F (de -28,9 a 60 °C).	ENCENDIDO	APAGADO	APAGADO
De 0 a 100 °F (de -17,8 a 37,8 °C)	APAGADO	ENCENDIDO	APAGADO
De 30 a 240 °F (de -1,1 a 115,6 °C)	ENCENDIDO	ENCENDIDO	APAGADO
De 32 a 212 °F (de 0 a 100 °C)	APAGADO	APAGADO	ENCENDIDO
De 32 a 122 °F (de 0 a 50 °C)	ENCENDIDO	APAGADO	ENCENDIDO
De -30 a 65 °F (de -1,1 a 18,3 °C)	APAGADO	ENCENDIDO	ENCENDIDO
Configurable por el usuario	ENCENDIDO	ENCENDIDO	ENCENDIDO

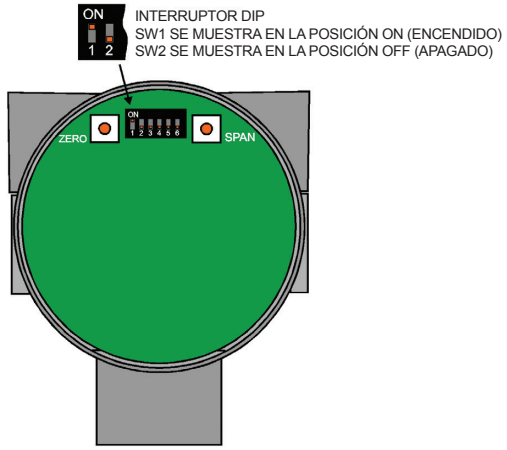

Figura C

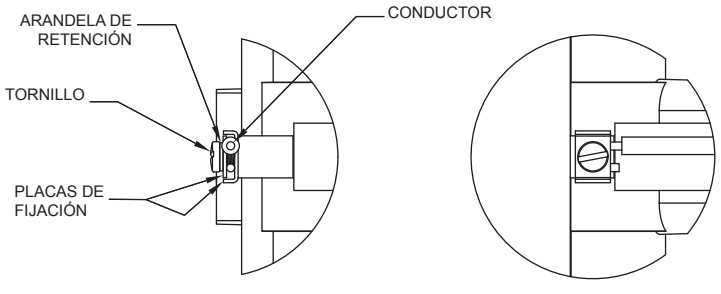
Ajustar y calibrar el rango ajustable por el usuario
Ajustando los INTERRUPTORES 2, 3 y 4, el transmisor RTD puede ajustarse al rango específico personalizado por el usuario. El rango puede estar entre los valores –30 °F y +250 °F (de -34 a +121 °C) con una AMPLITUD MÍNIMA de 40 °F (22 °C).

Equipo necesario
Para calibrar la unidad a un rango personalizado, se necesita un estimulador RTD que pueda estimular una RTD de 1000 OHM tipo DIN o una caja de década de precisión. El dispositivo debe ser capaz de generar la resistencia RTD hasta un 0,1 % o mejor.

Procedimiento de calibración
1. Ajuste los interruptores DIP 2, 3 y 4 a ON (ENCENDIDO).
2. Retire los cables del sensor RTD desde las terminales 5 y 6 (figura B). Conecte el simulador RTD de precisión o la caja de década a los terminales 5 y 6.
3. Cablee el instrumento como se indicó anteriormente. Puede instalarse un medidor de corriente en serie con la unidad para comprobar la salida de corriente correcta, pero no es necesario para la calibración. Conecte la unidad a la fuente de alimentación.
4. Si se utiliza un simulador RTD, asegúrese de que está ajustado para simular una RTD de 1000 OHM DIN 0,00385. Luego, ajústelo a la temperatura mínima deseada. Si se usa una caja de década, consulte la tabla en el apéndice A (°F) o en el apéndice B (°C) y ajústela a la resistencia que represente la temperatura mínima deseada.
5. Presione el botón ZERO (CERO). Si la unidad tiene la LCD opcional, mostrará ZERO OK (CERO CORRECTO) de forma momentánea. Si hay un medidor de corriente conectado, marcará 4,00 mA.
6. Repita el paso 4 utilizando el valor de la temperatura máxima deseada.
7. Presione el botón SPAN (AMPLITUD). Si la unidad tiene la LCD opcional, mostrará SPAN (AMPLITUD CORRECTA) de forma momentánea. Si hay un medidor de corriente conectado, marcará 20,00 mA.
8. Apague la unidad. Desconecte el simulador RTD o una caja de década y reconecte el sensor RTD a las terminales 5 y 6. Se ha terminado la calibración.

Nota: el procedimiento de calibración no afecta la calibración de ninguno de los rangos incorporados.



Selección de °F y °C
Si la unidad tiene una pantalla LCD opcional, el INTERRUPTOR DIP 1 ajusta la pantalla para que de la lectura en °F o °C. INTERRUPTOR 1 “OFF” (APAGADO) = °F
INTERRUPTOR 1 “ON” (ENCENDIDO) = °C.

Pantalla de corriente de salida
Si la unidad tiene una pantalla LCD opcional, la pantalla más baja mostrará la corriente de salida si el INTERRUPTOR DIP 5 esté “ON”. Si el INTERRUPTOR DIP 5 está “OFF”, la pantalla más baja estará vacía.

Protección RTD abierta
Al detectar una RTD abierta, la unidad debe ajustarse para forzar a que en la salida se indique 3,5 mA o 21 mA en base al ajuste del INTERRUPTOR DIP 6.
INTERRUPTOR 6 “OFF”, salida forzada a 3,5 mA
INTERRUPTOR 6 “ON”, salida forzada a 21 mA

Calibración
La unidad no necesita calibración. Un resistor de precisión interno autocalibra la unidad continuamente. Puede comprobarse la calibración retirando las sondas y probando la unidad frente al simulador de precisión RTD o una caja de década de precisión. Si la unidad se encuentra sin calibrar, debe devolverse a la fábrica para su reparación.

CONEXIONES ELÉCTRICAS
Conecte los cables conductores de acuerdo con los códigos eléctricos locales. Para los equipos que se suministren con tomas de tierra interna y externa, el tornillo de tierra del interior de la caja debe usarse para conectar el control a tierra. El tornillo de conexión externo es para realizar una conexión adicional cuando sea permitido o requerido por las normas locales. Si es necesario usar el conductor a tierra externo, el conductor deberá anudarse al menos 180° alrededor del tornillo de conexión exterior. Ver a continuación.

DETALLE DE LA VISTA INFERIOR

DETALLE DE LA VISTA FRONTAL

Instrucciones de instalación del certificado tipo EC e, IECEx:
Conexión del cable
El dispositivo de entrada de cable debe tener certificación para carcasa resistente al fuego con protección contra explosiones tipo “db”, adecuada para las condiciones de uso e instalada correctamente. Si la ta es ≥ 70 °C , debe utilizar se un cable y un prensacables aprobado para temperaturas ≥ 75 °C (MÍN.).

Conexión de conductos
Inmediatamente después de la entrada a la carcasa eléctrica debe utilizarse un dispositivo de sellado con la certificación Ex d, como un sello de conductos con un compuesto endurecedor adecuado para las condiciones de uso y correctamente instalado. Si la temperatura ambiente es ≥ 70 °C, se deben utilizar un cableado y un compuesto endurecedor en el sello de conductos certificados para ≥ 75 °C.

Las entradas no utilizadas deben sellarse con un dispositivo obturador con certificación Ex calificado para la zona apropiada, clasificación de temperatura y del grupo del equipo, y debe instalarse según las instrucciones del fabricante.

Note: solo para equipos ATEX/IECEx: Cuando se emplean en la zona 1, aplicación EPL Gb (db), la clase de temperatura se determina por la temperatura de ambiente máxima o de proceso. Las unidades están hechas para usarse en ambientes de -20 °C≤ temp. amb. ≤70 °C. Las unidades pueden usarse en temperaturas de proceso de hasta 120 °C siempre que la temperatura de la carcasa no supere los 70 °C. La clase de temperatura estándar es T6, temp. de proceso ≤80 °C. Las clases de temperatura restantes son: clase de temperatura T5, temp. del proceso ≤95 °C y clase de temperatura T4, temp. del proceso ≤ 120 °C. Consulte el certificado n.º: Elemento IECEx EMT17.0007X para conocer las condiciones de uso seguro de las unidades conforme a IECEx. Todos los cables, conductos y cajas deben cumplir los códigos vigentes para áreas peligrosas. Los conductos y las cajas deben estar adecuadamente sellados. Para exteriores o para otros lugares en los que las temperaturas varíen ampliamente, se deben tomar las precauciones necesarias para evitar la condensación en el interior del interruptor o de la caja. Los componentes eléctricos se deben mantener secos en todo momento.

Cuando se emplea en la zona 20, aplicación EPL Da (ta), el equipo se utilizará con una fuente de alimentación calificada para una corriente prevista de cortocircuito de 10 kA. Si la fuente de alimentación se califica para una corriente prevista de cortocircuito de 10 kA, el usuario final o el instalador debe marcar al equipo con la calificación de corriente prevista de cortocircuito de la fuente de alimentación con la que se utiliza.

PRECAUCIÓN: Para evitar incendios en atmósferas peligrosas, desconecte el dispositivo del circuito de la fuente de alimentación antes de abrirlo. Mantenga el conjunto herméticamente cerrado cuando esté en uso.

Mantenimiento
Inspeccione y limpie las piezas mojadas a intervalos regulares. La tapa debe estar colocada en todo momento, a fin de proteger los componentes internos de la suciedad, el polvo, el clima, y para mantener las clasificaciones para ubicaciones peligrosas. Desconecte el dispositivo del circuito de la fuente antes de abrirlo para evitar el encendido de atmósfera peligrosa. Las reparaciones las realizará Dwyer Instruments, Inc (no deben intentarse las reparaciones en campo y pueden anular la garantía).

⚠ ADVERTENCIA Están prohibidos las reparaciones de las conexiones eléctricas, la conexión del proceso y las juntas antideflagrantes para hacer un uso seguro del producto.

Las unidades que necesiten reparación deberán enviarse a fábrica con portes prepagados. Asegúrese de incluir una breve descripción del problema además de cualquier nota relevante sobre la aplicación. Póngase en contacto con el servicio de atención al cliente para obtener un número de autorización de devolución de productos para el envío.

AUTROL® America
SMART TRANSMITTERS

APT3100

SMART PRESSURE TRANSMITTER

For Differential/Gauge/Absolute/High Pressure Measurement

Application Areas:

- *Nuclear*
- *Water & Wastewater*
- *Chemicals*
- *Petrochemical*
- *Oil & Gas*
- *Pulp & Paper*
- *Food & Beverage,*
- *Pharmaceutical*
- *Power*
- *Renewable Energy*
- *Alternate Fuel*

SMART PRESSURE TRANSMITTER

"Autrol America Inc. (AAI) range of transmitters includes a complete range of "intelligent" high performance transmitters for Temperature, Gauge, Absolute, Vacuum & Differential pressure measurements for standalone monitoring and/or closed loop control applications. These "intelligent" microprocessor-based "Smart" transmitters features a two-wire loop powered 4 to 20mA current outputs with "Digital" HART as standard (Foundation Fieldbus optional) communication(s) for seamless integration with a host control system such as DCS, PLC, SCADA, AMS, PDM and/or a local Hand Held Communicator(HHC)."

Description of Product

The APT3100 series of smart transmitters have excellent stability, high accuracy and include features that facilitate easy installation, start up and minimum maintenance thereby lowering process downtime and overall cost of ownership in the long run.

Autrol transmitters are equipments with analog (4/20mA- 2 wire) and digital (HART or Foundation Fieldbus) communication protocols for seamless integration with a host Control System such as DCS, PLC, SCADA, AMS, PDM and/or Hand Held Communicator (HHC). Through Digital HART Protocol one can easily acquire process measured variable, configure and modify its various Parameters (Range, Tag Name and Damping, Transfer Function, Trimming).

These transmitters are equipped with an automatic temperature compensation function integrated into its advanced signal processing circuitry to ensure high reliability and performance corresponding to change of ambient temperature.

Features

- Superior Performance
- High Reference Accuracy :+/-0.075% of Calibrated Span
- Long-Term Stability
- High Rangeability (100 : 1)
- Flexibility
- Data Configuration with HART Configurator
- Zero Point Adjustment
- Reliability
- Continuous Self-Diagnostic Function
- Automatic Ambient Temperature Compensation
- Fail-mode Process Function
- EEPROM Write Protection
- CE EMC Conformity Standards(EN5081-2, EN50082-2)

Function

- Flexible Sensor Input : DP, GP, AP, Vacuum
- Various Output : 4 ~20mA , Digital Signals
- Setting Various Parameters : Zero/Span,
- Trim, Unit, Fail-mode, etc
- Self Diagnostic Function : Sensor, Memory
- A/D Converter, Power, etc
- Digital Communication with HART protocol
- Explosion-proof Approval & Intrinsic Safety Approval : KOSHA, KTL, CSA,FM, ATEX

www.autroltransmitters.com

TRUE SMART

The heart of Autrol smart transmitter is a microprocessor-based high performance module. In addition, each transmitter is ambient temperature characterized using state-of-art technologies to ensure maximum transmitter accuracy and minimized drift over a wide range of operating temperatures.

On integrated sensor models such as in APT3100 series transmitters the characteristics data of its sensor are stored in internal non-volatile EEPROM to minimize measuring error. On non sensor transmitter models such as ATT2100 temperature transmitters, it has a linearization table built in wherein user can modify the various necessary values in field per the added temperature sensor (RTD or T/C) characteristics to get better accuracy from the overall measurement system. Its integral microprocessor module then automatically converts the required value referring to the customized linearization table.

All transmitters include advanced self diagnostic functions for detecting any malfunctions of sensor and/or fault of A/D converter, internal memory and microprocessor. All diagnostic/error status is transmitted to a connected Master by analog current signal (fail mode current 3.75mA or 22mA) or digital HART (or FF) communication.

The transmitters have Last Value Status (L V S) function for safety of instrumentation. When the sensor input occurs in abnormal status, output is fixed to the previous value and when the recovery to normal status, output is updated to the current value. If abnormal status of sensor is being continued during the defined interval, the fault is recognized as a sensor failure & reported accordingly for corrective action.

OPEN ARCHITECTURE

Using a Device Master (AMS, PMD etc) or a hand-held terminal, PC configuration program or HART Compatible DCS, PLC or SCADA the user can change, modify and review parameters of smart transmitter through HART communication. There functions provide convenience for your calibration and maintenance practice.

FIELD PROGRAMMABLE

All Autrol transmitter have a fully programmable front panel from which users can directly input values (e.g. range, zero/span, sensor type, thermocouples, RTD and mV and automatic temperature compensation) to reduce cost of installation and commissioning eliminating need of a additional configuration tools.

Stable Measurable Accurate Reliable Transmitters

For application support, quotations, pricing and lead times please contact our sales department directly at sales@autroltransmitters.com. Additional details including product technical specifications can be found online at www.autroltransmitters.com

Electronics Module

The Electronics module consists of a circuit board sealed in an enclosure. There is a MCU module, a power module, an analog module, a LCD module and a terminal module included within the transmitter.All circuit boards are tropicalised suitable for hot and humid, and damp and cold climates.
The MCU modules acquire the digital value from the analog module and apply correction coefficients selected from EEPROM. The output section of the power module converts the digital signal to a 4~20 mA output. The MCU module communicates with the HART-based Configurator or Control Systems such as DCS. The Power modules have a DC-to-DC Power conversion circuit and an Input/output isolation circuit. An optional LCD module plugs into the MCU module and displays the digital output in user-configured unit.

Sensor Inputs

The model APT3100-D, G, H is available in a differential pressure sensor of a capacitance type.
The capacitance pressure sensor measures differential and gauge pressure and is commonly used in flow and level applications. Both sides in the capacitance sensor transmit process pressure from the process isolators to the sensor.

The model APT3100-A is available in an absolute pressure sensor of a piezo-resistive type and measures absolute pressure.

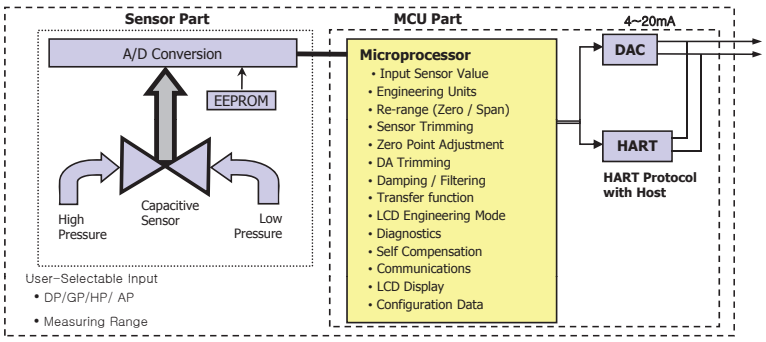
The sensor module converts the capacitance or the resistance to the digital value. The MCU module calculates the process pressure based on the digital value.

The sensor modules include the following features

- +/-0.075%accuracy, the most accurate sensor in the industry.
- The software of the transmitter compensates for the thermal effects, improving performance.
- Precise Input Compensation during operation is achieved with temperature and pressure correction coefficients that are characterized over the range the transmitter and stored in the sensor module EEPROM memory.
- EEPROM stores sensor information and correction coefficients separately from MCU module, allowing for easy repair, reconfiguration and replacement

Basic Setup

ATP3100 Pressure transmitter can be easily configured from any host that supports the HART protocol.



- Operational Parameters
- Operational Parameters.
- 4~20mA Points (Zero/Span)
- Engineering Units
- Damping Time: 0.25 ~ 60 sec
- Tag: 8 alphanumeric characters
- Descriptor: 16 characters
- Message: 32 characters.
- Date: day/month/year

Calibration and Trimming

- Lower/Upper Range (zero/span)
- Sensor Zero Trimming
- Zero Point Adjustment
- DAC Output Trimming
- Transfer Function
- Self-Compensation

Self-Diagnosis and Others

- CPU & Analog Module Fault Detection
- Communication Error
- Fail-mode Handling
- LCD Indication
- Temperature Measurement of Sensor Module

www.autroltransmitters.com

Range and Sensor Limits
Refer to Table 1

Zero and Span Adjustment Limits
- Zero and span values can be set anywhere within the range limits stated in Table 1.
- Span must be greater than or equal to the minimum span stated in Table 1

Output (Analog Current and Digital Data)
- Two wire 4~20mA user-configurable for linear or square root output, digital process value superimposed on 4~20mA signal, available to any host that conforms to the HART protocol

Power Supply & Load Requirement •
- **External power supply required**
  Transmitters operate on 11.9 to 45 V dc.
  * 250 ohm load-- 17.4 Vdc
  * Up to a 550 ohm load -- 24 Vdc
  Max. Loop Resistance = (E - 11.9)/0.022
  (E = Power Supply Voltage)
- **Supply Voltage**
  11.9 ~ 45 Vdc -- operation
  17.4 ~ 45 Vdc -- HART Communications
  11.9 ~ 42 Vdc -- CSA Approval
- **Loop Load**
  0 ~ 1500 ohm – Operation
  250 ~ 550 ohm -- HART Communications

EMC Conformity Standards
- EMI (Emission) – EN50081-2:1993
- EMS (Immunity) – EN50082-2:1995

Update Time and Turn-On Time Update
- Time : 0.12 seconds
- Turn-On Time : 3 seconds

Failure Mode
- Fail High : Current ≥ 21.75 mA
- Fail Low : Current ≤ 3.75 mA

Storage Temperature -40℃ to 85℃ (without condensing)

Process Temperature Limits
- (Range codes and approval codes may affect limits)
- -40℃ to 120℃ (-40 to 248 ℉)

Isolation
- Input/output isolated to 500Vrms (707 Vdc)

Working Pressure Limits (silicone oil)

Model DP & GP	0 ~ 13.79 MPa ----------	# 3 ~ 8
Model GP	0 ~ 80.00 MPa ----------	# 9
	0 ~ 80.00 MPa ----------	# 0
Model HP	0 ~ 3 1.02 MPa ----------	# 4 ~ 7
Model AP	0 ~ 700 KPa ----------	# 4
	0 ~ 4000 KPa ----------	# 5
	0 ~ 7000 KPa ----------	# 6

Hydrostatic Test Pressure

Model DP	3000 psi (20.7 MPa)	
Model HP	6750 psi (46.5 MPa)	
Model GP	2000 psi (13.8 MPa)	-- # 3 ~ 8
	11600 psi (80.0 MPa)	--- # 9
	11600 psi (80.0 MPa)	--- # 0
Model AP	101.5 psi (700 KPa)	--- # 4
	580 psi (4000 KPa)	--- # 5
	1015 psi (7000 KPa)	--- # 6

Burst Pressure

Model DP, GP & HP	10000 psi (68.9MPa)
Model AP	2000 psi (13.8MPa)

5 Digits LCD
- Expresses all pressure unit and flow unit in 5 digits.
- Select decimal place (0 to 4)

Physical Specifications

Wetted Materials

- Isolating Diaphragms ----316L SST, Monel, Tantalum, HAST-C
- Drain/Vent Valves --------316 SST, HAST-C
- Flanges and Adapters----316 SST, HAST-C
- O-ring ----------Viton, PTFE)

Non-wetted materials

- Fill Fluid ----------Silicone oil or Inert fill
- Bolts ----------Stainless Steel
- Electronics Housing -----Aluminum, Flameproof and Waterproof (IP67)
- Cover O-ring ----------Buna-N
- Paint ----------Epoxy-Polyester or Polyurethane
- Mounting Bracket --------2-inch Pipe, 304 SST, Painted
- Carbon Steel with 304 SST U-bolt
- Nameplate ----------304 SST

Electrical connections

- 1/2-14 NPT conduit with M4 Screw Terminals

Process Connections

- 1/4-18 NPT on 2.126 inch (54.0 mm) centers on flanges for Standard
- 1/2-14 NPT on Process Adapter (option) *Refer to drawing in the last page*

Weight

- 3.9 kg (excluding options)

Hazardous Location Certifications (option)

CSA (Canadian Standards Association) Approvals
C1 Code:
"SEAL NOT REQUIRED"
Explosion proof for Class I, Division 1, Groups A, B, C & D
Dust-ignition proof for Class II, Division 1, Groups E, F & G; Class III
Flameproof for Class I, Zone 1: Ex d IIC
"T6, See Instruction for temperature code if process temperature above 85 °C"
Class I, Division 2, Groups A, B, C, and D;
Class II, Division 2, Groups E, F, G;
Class IIIT4
Non sparking Equipment for Class I Zone 2: Ex nA IIC T4
Enclosure: Type 4x, IP66
Power Supply: 11.9 to 42 Vdc Max.
Output Signal: 4 to 20 mA + HART
Ambient Temp. : -20 to 60 °C

KOSHA Approvals (KOSHA: Korea Occupational Safety & Health Agency)
K1 Code:
Flameproof for Class I, Zone 1: Ex d ⅡC T6, IP67
Ambient Temperature: -20 to 60 °C
Max. Process Temperature: 80 °C
Power Supply: Max. 45 Vdc
Output: 4 to 20 mA + HART, Max. 22 mA

KTL Certification (KTL: Korea Testing Laboratory)
K2 Code:
Intrinsic Safety: Ex ia IIC T5
Ambient Temperature: -20 to 60 °C
Max. Process Temperature: Max. 100 °C
Entity Parameter: Umax=40Vdc, IMAX=165mA, Pmax = 0.9W

FM (Factory Mutual explosion proof) Approvals
F1 Code:
Explosion proof for Class I, Division 1 Groups A, B, C and D
Dust-ignition proof for Class II, Division 1, Groups E, F and G
Dust-ignition proof for Class II, Division 1
"T6, see instruction for temperature code if process temperature above 85°C"
Ambient Temperature: -20 to 60°C
Enclosure: indoors and outdoors, NEMA Type 4X
Conduit seal required within 18" for Group A only.
Nonincendive for Class I, Division 2, Groups A, B, C & D
Class II, Division 2, Groups E, F & G; and Class III, Division 1,
Temperature Code T4
Ambient Temperature: -20 to 60°C
Enclosure: indoors and outdoors, NEMA Type 4X

ATEX Approvals
E1 Code:
ATEX Certificate number: KEMA07ATEX0103
CE0344 Ⓔx II 2 G Ex d IIC T6 or T5

Operating Temperature: -20°C ≤ Tamb ≤ +60°C
T6 for process < 85°C; T5 for process < 100°C

ORDERING INFORMATION

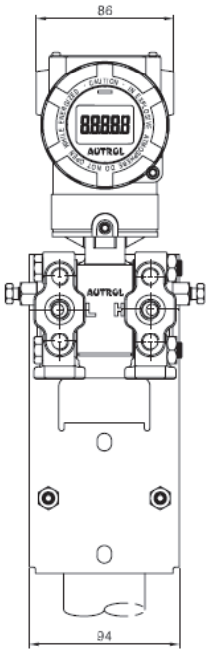
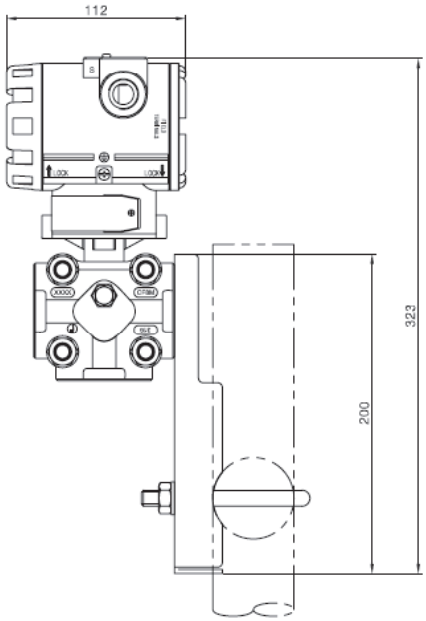
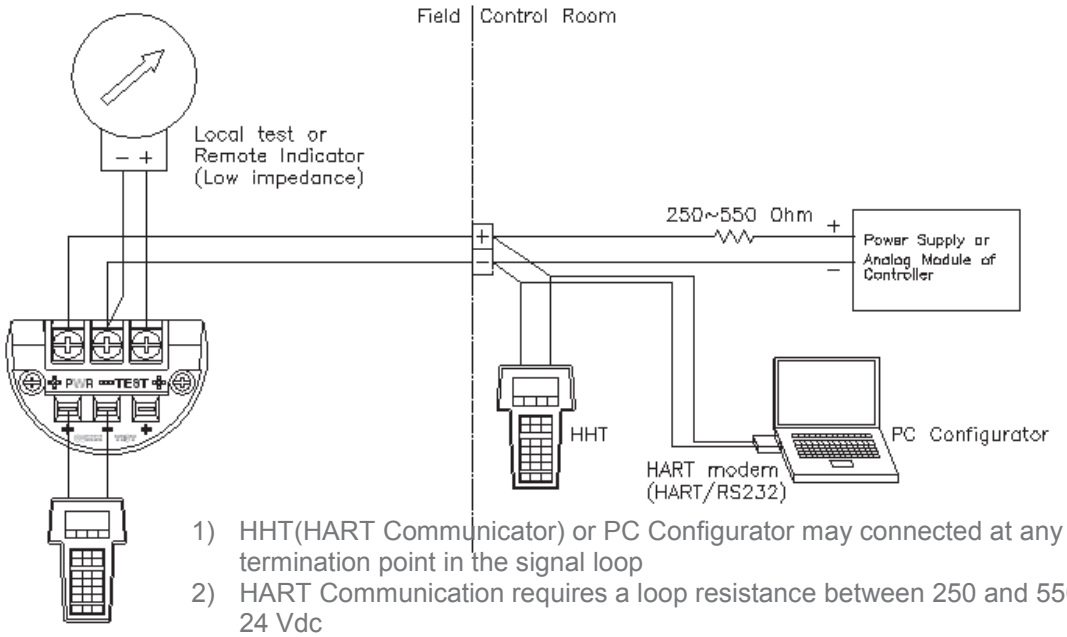
1) "-" - Not Available for selected configuration
2) CF- Consult Factory . Minimum order quantities may apply.
3) 'EA'- Enhanced Accuracy of 0.04% caliberated span is available for below range codes only:
APT3100-D/F:3, 4, 5, 6
APT3100-G:3, 4, 5, 6
APT3200-G: 3, 4, 5
Turn Down ratio 100:1, 3 years stability.
4) DXC1- Requires full model code refer DXC1 sheet
5) Use ' O' for Oval Flange Adapter for 1/2" NPTF Process Connections
6) Use 'F1' & 'F2' quote only if "side" drain/vent is required. All APT3100 transmitters are shipped standard with "Rear" Drain/Vent
7) Use 'MP' option to select a direct replacement for the Coplaner style transmitters with vertical mount and bottom process connections
8) Use 'T' Teflon O-Ring for corrosive services. APT3100 transmitters are shipped standard with VITON O-Rings in contact with process.
9) Standard Warranty is two (2) years from supply
10) Information included on Certified Drawing will be:
Customer: PO Number, Customer Name :*, Project : (if applicable), MODEL /OPTION code: (model code being ordered), TAG or TAG(s) : if applicable*
Calibration Range : Shipped Cal Range
** Hence if ordering for specific end user/project please include this information else we will use default (PO #)*
11) Angle/Flat Bracket Shipped Loose, separate bo-(6-5-4), includes bracket + U Bolt + Mounting Screws for 3100&3200/2100
12) LV - 1-5V is currently available on on 3200G series and requires special HART modem (to be purchased directly) to be used with the STT20



Installation with mounting bracket



2” Pipe Mounting Bracket Model Angle Type



2” Pipe Mounting Bracket Model Flat Type

Connection Diagram of Signal, Power, HHT for Transmitter

1) HHT(HART Communicator) or PC Configurator may connected at any termination point in the signal loop
2) HART Communication requires a loop resistance between 250 and 550 ohm @ 24 Vdc
3) Transmitter operates on 11.9 to 45.0 Vdc transmitter terminal voltage.
   [Applied Power]
   * 11.9 ~ 45.0 Vdc for General Operation
   * 17.4 ~ 45.0 Vdc for HART Communication
   * 17.4 ~ 42.0 Vdc for CSA Approval (Power supply must not exceed 42.0 Vdc)

EXPLOSION PROOF HIGH AND LOW LIMIT CONTROLS

HZLIM SERIES

DESCRIPTION

The **Kele HZLIM Series explosion proof high and low limit controls** are field-assembled combinations of industry standard controls, heavy duty explosion proof enclosures, and seals for use in atmospheres that may contain hazardous gases or dusts (Groups B, C, D, E, F).

The **HZLIM-LO-A** includes the ultra reliable A11A-1 manual reset low limit control, a **XJA7514C2M2M** explosion proof enclosure, two EYM-75 conduit seals, and an ACK6F fiber/cement kit.

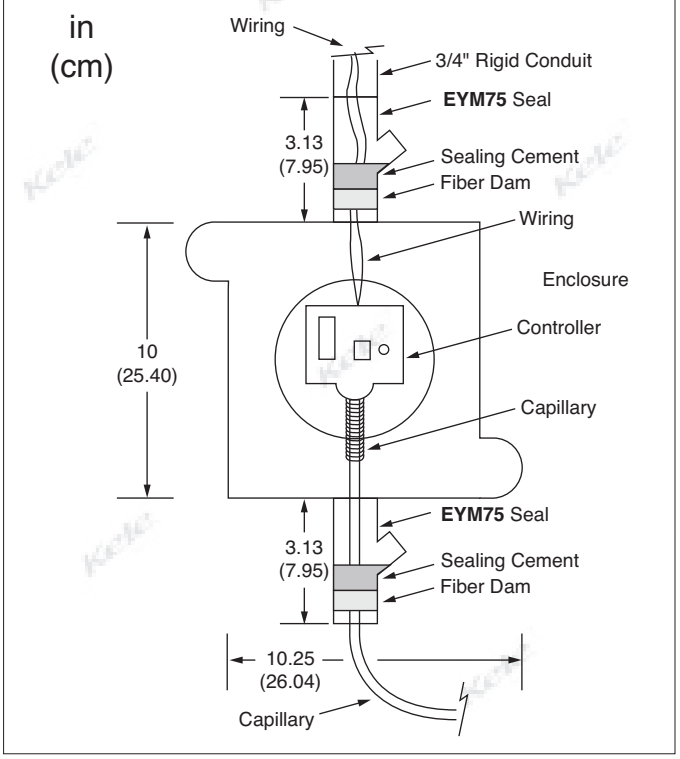
The **HZLIM-LO-B** is identical to the **HZLIM-LO-A** but includes the equally reliable A11B-1 automatic reset low limit control instead of the A11A-1.

The **HZLIM-HI** is also identical to the **HZLIM-LO-A** but includes the time proven A70KA-1 manual reset high limit control in place of the A11A-1.

HZLIM Series

FEATURES

- ***Class I Division 1 Groups B, C, D***
- ***Class II Division 1 Groups E, F,G***
- ***NEMA 7BCD, 9EFG***
- ***Long life, snap acting contacts***
- ***Easy set point adjust***
- ***Freeze protection for hazardous locations***
- ***Code required AHU high limit protection for hazardous locations***



SPECIFICATIONS

Refer to the A70 and A11 Series in the Thermostats and Controllers section for specifications, capillary, installation and wiring information.

CAUTION: Conduit seal MUST be installed within code-required distance from junction box to maintain explosion proof rating. For Group B and C atmospheres, conduit seals must be installed within 2" (5.08 cm) of the enclosure regardless of less stringent code requirements.

WARNING: All circuits MUST be de-energized before opening the cover of this device for any purpose, including resetting a manual reset controller or adjusting a set point. If work must be performed with an energized circuit, the atmosphere inside and outside the enclosure must be proven safe with a listed intrinsically safe combustible gas detector.

DIMENSIONS

HAZARDOUS LOCATIONS

EXPLOSION PROOF HIGH AND LOW LIMIT CONTROLS

HZLIM SERIES

INSTALLATION / MOUNTING

OPERATION

Install the XJATS14C2M2N1 enclosure, included with each kit, in its intended location. Install the two EYM75 conduit seals in the two tapped holes of the XJATS14C2M2N1 enclosure, making sure to engage a minimum of five full threads. Also be sure that the plugs on the conduit seals are both facing up and to the front (cement will be poured into them later). The male nipple, supplied with fittings, can be easily removed and replaced in the opposite side for proper orientation.

Unpack the A11 or A70 controller, and fully uncoil the capillary tubing. Place plastic bushings in both openings inside the enclosure and also in the bottom of the lower conduit seal. Gently feed the end of the capillary (or capillary and bulb) through the bottom opening and conduit seal from inside the XJATS14C2M2N1 enclosure, taking care not to nick or kink the capillary. Once the end is out, slowly feed the rest of the capillary fully through to the outside of the conduit seal. Use an assistant, if needed, to make sure that the inner and outer plastic bushings stay in place to protect the capillary from damage. Once this is accomplished, mount the A11 or A70 controller to the panel inside the enclosure. Install the capillary (or capillary and bulb) on the equipment according to the included instructions. Install rigid conduit and wiring as required by code from the upper conduit seal, engaging a minimum of five full threads at each joint. Only individual insulated conductors may pass through the conduit seal. If jacketed cable is used, the jacket must be stripped back beyond the seal or else a listed cable seal must be applied within the enclosure. Remove the plugs from the two conduit seals. Make sure that the wires and capillary are centered in the seals. Then install fiber dams and sealing compound in each according to the included instructions (minimum 0.75"/2 cm cement depth), and replace the plugs. Adjust the setpoint on the controller, install the cover for the XJATS14C2M2N1 enclosure, and tighten securely.

ORDERING INFORMATION

MODEL	DESCRIPTION
HZLIM-HI	Kit with one A70KA-1 manual reset high limit control, one XJATS14C2M2N1 enclosure, two EYM75 conduit seals, three plastic conduit bushings, and one ACK6F sealing kit Weight: 26.9 lb (12.2 kg)
HZLIM-LO-A	Kit with one A11A-1 manual reset low limit control, one XJATS14C2M2N1 enclosure, two EYM75 conduit seals, three plastic conduit bushings, and one ACK6F sealing kit Weight: 25.7 lb (11.7 kg)
HZLIM-LO-B	Kit with one A11B-1 automatic reset low limit control, one XJATS14C2M2N1 enclosure, two EYM75 conduit seals, three plastic conduit bushings, and one ACK6F sealing kit Weight: 25.7 lb (11.7 kg)

RELATED PRODUCTS

ACK6F	Cement: 1.9 lb * (0.85kg) Fiber: 0.3 lb (0.19 kg), 25 cu in (410 cu cm) volume when set * Consists of five 0.4 lb (0.19 kkg) cement pouches
EYM-75	3/4" size, 1.19" turning radius, 2 oz Kwiko cement required, Malleable Iron construction

Code No. LIT-1901029
Issued September 2017

CSDSC Current Switch Devices

Description

The Current Switch Devices Self-Calibrating (CSDSC) Series of Current Switch Devices provide reliable verification of electrical equipment operation in a variety of applications, including fans and pumps. CSDSC current switch devices use a single-turn dial to select motor full load amps, eliminating the need for live calibration and significantly reducing installation time compared to traditional current switches.

CSDSC switches use full load amps instead of horsepower, eliminating the need for separate part numbers as a function of line voltage. CSDSC current switches are installed when the panel is de-energized. The ability to preset the sensor eliminates the need for Personal Protective Equipment (PPE) that is required by OSHA when working with a live panel.

Refer to the *CSDSC and CSDECM Current Switch Devices Product Bulletin (LIT-12012403)* for important product application information.

Features

- **Split and Solid Core Models with Mini-Sized Variants—**Fit in tight enclosures.
- **Monitored Load**—Supplies power without a power supply.
- **Optional N.O. Relay—**Adds 10 A at 125 VAC switching power with a choice of 24 or 12 V coil.
- **Polarity Insensitive Output—**Provides easier wiring.
- **Low Turn on Current—**Extends use to sub-fractional HP motors.
- **LED Indication of Switch Status—**Allows you to easily check the switch's on/off status.

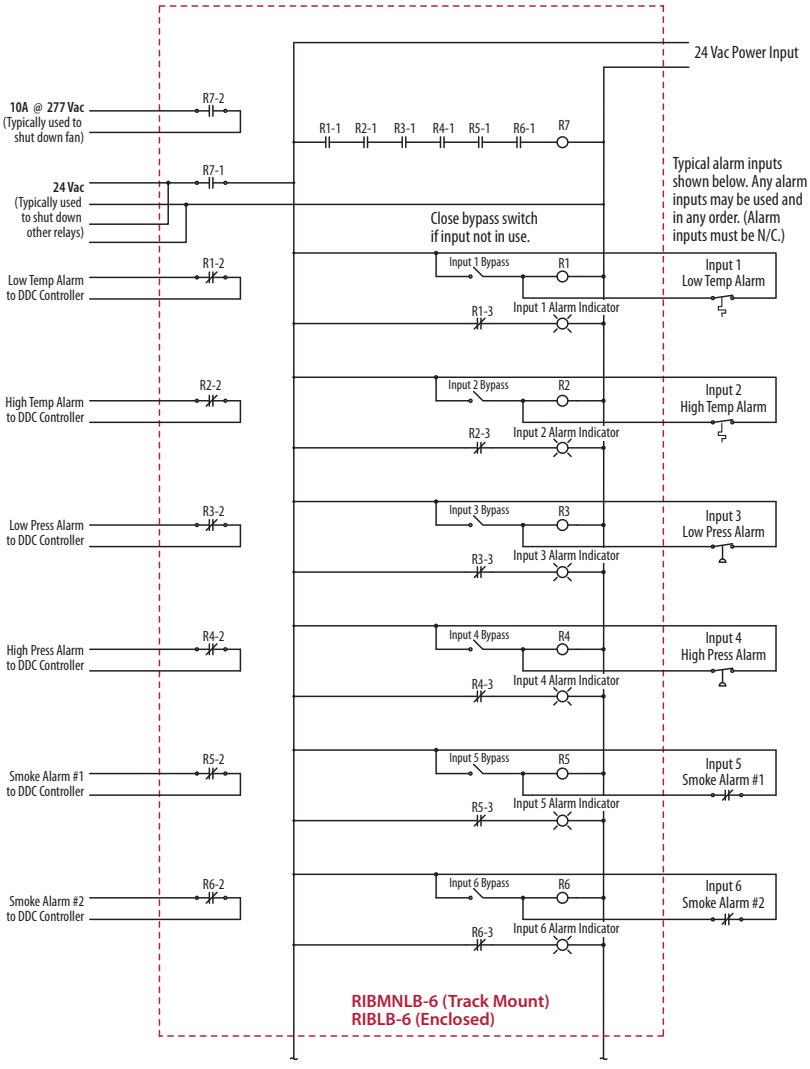
RELAYS

SPECIFICATIONS



Expected Relay Life: 10 million cycles minimum mechanical
Operating Temperature: -30 to 140° F
Humidity Range: 5 to 95% (noncondensing)
Operate Time: 8ms
Power Input: 4 Amp max. @ 24 Vac/dc ; 50-60 Hz
Alarm Status: LED On = Activated
Dimensions: 6.200˝ x 2.750˝ x 1.750˝ (RIBMNLB-6)
4.600˝ x 2.750˝ x 1.750˝ (RIBMNLB-4)
3.000˝ x 2.750˝ x 1.750˝ (RIBMNLB-2)
4.28˝ x 7.00˝ x 2.00˝ with .75˝ NPT Nipple (RIBLB-6/-4/-2)
Track Mount: MT212-6 Mounting Track Provided (RIBMNLB-6)
MT212-4 Mounting Track Provided (RIBMNLB-4, RIBMNLB-2)
Approvals: UL Listed, UL916, UL864, C-UL, CE, RoHS
Housing Rating: UL Listed, NEMA 1, C-UL, CE Approved, UL Accepted for Use in Plenum
Gold Flash: No
Override Switch: No

Notes:

- Track mount models shown above.
- RIBMNLB-6 and RIBLB-6 have six Alarm Inputs and one Master Alarm. RIBMNLB-4 and RIBLB-4 have four Alarm Inputs and one Master Alarm. RIBMNLB-2 and RIBLB-2 have two Alarm Inputs and one Master Alarm.

Models RIBMNLB-6, RIBMNLB-4, and RIBMNLB-2; and RIBLB-6, RIBLB-4, and RIBLB-2 are simply devices that combine a common relay-logic function into a small, easy-to-install, and less expensive form.

A master relay will open if any one of the normally-closed (N/C) inputs open. There are six, four, or two inputs depending on the model chosen. LED status of all inputs, the master relay, and power input is provided. Bypass of un-used inputs is also provided. The RIBMNLB series is provided with mounting track for mounting in user-provided electrical enclosures. The RIBLB series is enclosed in a NEMA-1, 4˝ x 7˝ enclosure with a clear lid to allow viewing of the status LEDs. The master relay has three general-purpose outputs: two 24 V output terminals and one dry-contact output rated up to 10 Amp @ 277 Vac (terminals on RIBMNLB series, wires on RIBLB series.) The most common application is an Air Handling Unit (AHU) fan-safety-shutdown where the master relay is used to shutdown the fan. Contact closure outputs are provided so that a DDC controller can determine the cause of a shutdown.

SELECTION GUIDE

Model#	Inputs	
RIBMNLB-6	6	MT212 Mounting Track
RIBMNLB-4	4	MT212 Mounting Track
RIBMNLB-2	2	MT212 Mounting Track

VG1000 Series Three-Way, Stainless Steel Trim, NPT End Connections Ball Valves with Spring-Return Electric Actuators without Switches

Description

VG1000 Series Ball Valves are designed to regulate the flow of hot or chilled water and, for some models, low-pressure steam in response to the demand of a controller in HVAC systems. Available in sizes 1/2 through 2 in. (DN15 through DN50), this family of two- and three-way forged brass valves is factory or field mounted to Johnson Controls® VA9104, M9106, M9109, and M9100 Series Non-Spring-Return and VA9203 and VA9208 Series Spring Return Electric Actuators for on/off, floating, or proportional control.

Refer to the *VG1000 Series Forged Brass Ball Valves Product Bulletin (LIT-977132)* for important product application information.

Features

- Forged Brass Body — provides 580 psig static pressure rating.
- 300 Series Stainless Steel Ball and Stem Assembly — tolerates high-temperature water or 15 psi saturated steam with fluid temperatures of -22 to 284°F (-30 to 140°C) or where a higher degree of corrosion protection is desired.
- 500:1 Rangeability — provides accurate control under all load conditions.
- Maintenance-Free Design — performs without failure in excess of 200,000 full stroke cycles in iron-oxide contaminated water.

Repair Information

If the VG1000 Series Ball Valve fails to operate within its specifications, replace the valve body, actuator, or entire assembly. For replacement parts, contact the nearest Johnson Controls representative.

VG1000 Series Three-Way, Spring-Return, Stainless Steel Ball and Stem Ball Valve Assemblies without End Switches

Selection Charts

VG1000 Series Three-Way, Stainless Steel Trim, NPT End Connections Ball Valves with Spring-Return Electric Actuators without Switches (Continued)

Technical Specifications

VG1000 Series Three-Way, Stainless Steel Trim, NPT End Connections Ball Valves with Spring-Return Electric Actuators without Switches		
Service[1]		Hot Water, Chilled Water, 50/50 Glycol Solutions, and 15 psig (103 kPa) Saturated Steam for HVAC Systems
Fluid Temperature Limits	**Water**	-22 to 284°F (-30 to 140°C)
	Steam	15 psig (103 kPa) at 250°F (121°C)
Maximum Actuator Fluid Temperature Limits	**212°F (100°C)**	VA9203 Series Spring-Return Actuators VA9208 Series Spring-Return Actuators
	284°F (140°C)	VA9203 Series Spring-Return Actuators with M9000-561 Thermal Barrier Installed VA9208 Series Spring-Return Actuators with M9000-561 Thermal Barrier Installed
Valve Body Pressure Rating	**Water**	580 psig (4,000 kPa) at 203°F (95°C) (PN40) 464 psig (3,196 kPa) at 284°F (140°C) (PN40)
	Steam	15 psig (103 kPa) Saturated Steam (Applies to VA9208 Series Spring Return Actuator with M9000-561 Thermal Barrier Installed)
Maximum Closeoff Pressure		200 psid (1,378 kPa)
Maximum Recommended Operating Pressure Drop		50 psid (340 kPa)
Flow Characteristics	**Three-Way**	Equal Percentage Flow Characteristics of In-Line Port A (Coil) and Linear Flow Characteristics of Angle Port B (Bypass)
Rangeability[2]		Greater than 500:1
Minimum Ambient Operating Temperature	**-22°F (-30°C)**	VA9203 Series Spring-Return Actuators
	-40°F (-40°C)	VA9208 Series Spring-Return Actuators
Maximum Ambient Operating Temperature[3] **(Limited by the Actuator and Linkage)**	**Direct Mount**	140°F (60°C): VA9208 Series Spring-Return Actuators

Compliance CRN		0C16910.5C

1. Proper water treatment is recommended; refer to the VDI 2035 Guideline.
2. Rangeability is defined as the ratio of maximum controllable flow to minimum controllable flow.
3. In steam applications, install the valve with the stem horizontal to the piping and wrap the valve and piping with insulation.

The performance specifications are nominal and conform to acceptable industry standards. For applications at conditions beyond these specifications, consult the local Johnson Controls office. IDEC GENERAL-PURPOSE RELAYS

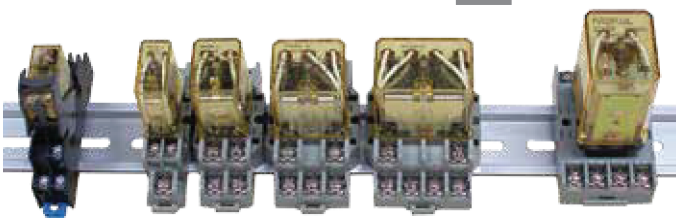
RH, RJ, RR SERIES



DESCRIPTION

The IDEC general-purpose relays are available in the **RH Series** blade-style relays and the **RR Series** pin-style relays and the **RJ Series** compact relays.

The **RH Series** features a 10A switching capacity. They are available in SPDT, DPDT, 3PDT, and 4PDT contact configurations, driven by AC or DC coils, and they have blade terminals for socket mounting.

The **RR Series** has a 10A contact rating. The **RR Series** relays are available in SPDT, DPDT, and 3PDT configurations driven by AC or DC coils, and they have pin or blade terminals for socket mounting.

The **RJ Series** is compact to reduce space requirements. They are available in a 12A SPDT version and an 8A DPDT version. They are driven by AC or DC coils and have blade terminals for socket mounting.

RJ Series RH Series RR Series

FEATURES

- ***Blade style, pin style, and compact models***
- ***Indicator light and/or check button available***
- ***Surface or DIN rail mount***
- ***UL recognized, CSA certified***

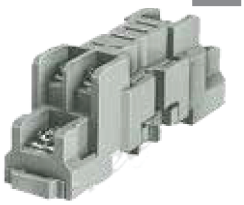
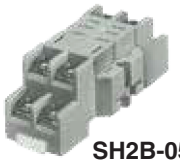
IDEC RELAY SOCKETS



SH, SJ, SR SERIES

DESCRIPTION

The **IDEC SH and SR Series** relay sockets are for use with the IDEC **RH / RR Series** relays and **RTE Series** timers. The **SH** and **SR Series** include both blade and pin style sockets and are available for one, two, three and four pole relays. The **SH** and **SR** sockets can be DIN rail or surface mounted. The **SJ Series** of IDEC relay sockets are for use with the IDEC **RJ1S** and **RJ2S Series** relays. They can be DIN rail or surface mounted.



SJ1S, SJ2S

NOTES:

1. LINE SIZE IS NOT AVAILABLE IN MECHANICAL DRAWINGS. FIELD TO VERIFY LINE SIZE. VALVE IS SELECTED BASED ON FLOW DATA. FIELD TO VERIFY VALVE SELECTION BEFORE MATERIAL ORDERING.
2. FLOW (LIS) VALUE IS NOT PROVIDED IN MECHANICAL DRAWINGS. 2-POSITION VALVE IS SELECTED BASED ON AVAILBLE LINE SIZE. FIELD TO VERIFY VALVE FLOW AND LINE SIZE DATA BEFORE ORDERING.
3. FLOW VALUES PROVIDED FOR HRV-1 VALVES PH-O AND RH-O ARE VERY SMALL. 1/2" VALVES ARE SELECTED FOR THESE APPLICATION. AUTHORITY VALUES FOR 1/2" VALVES ARE NOT COMING WITHIN THE ACCEPTABLE RANGE FOR PROPER CONTROL. FIELD TO VERIFY FLOW DATA AND VALVE SELECTION BEFORE ORDERING THE VALVES.
4. FIELD TO VERIFY SIGNAL FOR HEAT VENT VALVE (HTVENT-VLV) BEFORE MATERIAL ORDERING. PROVIDED IS 2-POSITION VALVE WITH 24VAC ON/OFF SIGNAL.
5. FLOW VALUE PROVIDED FOR HEATING COIL HC1.3 IS VERY SMALL. 1/2" VALVE IS SELECTED FOR THIS APPLICATION WHICH PROVIDES BETTER VALVE AUTHORITY FOR PROPER CONTROL. FIELD TO DETERMINE LIZE SIZE, FLOW DATA FOR THE HEATING COIL HC1.3 AND VALVE SELECTION TO BE VERIFIED BEOFRE MATERIAL ORDERING.
6. NEW CONTROL VALVE IS PROVIDED FOR RADIATORS IN UPPER LEVEL (RAD-1 & RAD-2). FIELD TO VERIFY IF NEW VALVE IS REQUIRED OR EXISTING TO BE REUSED.

SECTION 8
CERTIFICATION AND TESTING

SECTION 9
MAINTENANCE

METASYS™ SYSTEM MAINTENANCE FOR IQALUIT WASTE WATER TREATMENT PLAN

Your Metasys™ system is the brain of your building. Therefore, great care must be taken to make sure it is in the best health possible.

It is our pleasure to present you a service plan for your Metasys™ that will allow you to have your building perform at it's full potential with as less disruptions as possible for years to come.

Items	Quantity of items	Frequency / years
1. Hardware & Software Inspections		
1.1 Critical Air Systems	1	1
2. Calibration of Critical Sensors		
2.1 Air Pressure Sensors	2	1

HVAC control systems are often run by programmable thermostats that schedule heating and cooling for different times of day and days of the week. Such schedules should be set to match the occupancy and activity schedules of different spaces. These schedules change over the years as building use changes, and controls schedules should change to match.

Sensors for HVAC controls, such as temperature and humidity sensors, or occupancy sensors, should be regularly checked for proper operation. Sensors that start shutting off or turning on heating or cooling at the wrong times make people too hot or too cold, and can waste energy.

Control systems that function but are not tuned according to occupant preferences may get manually disabled by them. Such systems are obviously no longer able to do their jobs, and the result is wasted energy.

Building Automation Systems & Controls

Services for equipment and supervisory controllers; operator workstations and servers; thermostats and other field devices; and pneumatic systems.

	SERVICE COMPLETE

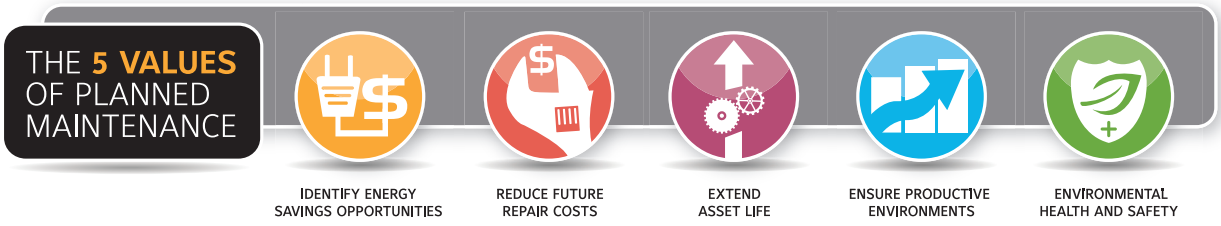
PRODUCTIVITY – OPTIONS



Services that will help you enhance your facility and keep it running smoothly:

- Support center database (Metasys® only)
- Software update subscriptions (Metasys only)
- Ultrasonic leak testing
- ENERGY STAR® benchmarking
- Consultative services
- Training
- Panoptix®

REMOTE MONITORING – OPTIONS

Services that use our 24/7 Remote Operations Center to identify potential problems and corrective actions:

- HVAC/BAS monitoring
- Remote operations
- Critical facility management

There are five reasons to choose planned maintenance: to identify energy savings opportunities, reduce future repair costs, extend asset life, ensure productive environments, and improve environmental health and safety. All of the services we perform on your controls and equipment are aligned with "The 5 Values of Planned Maintenance."

Johnson Controls

A strategy to meet your needs

The goal of an optimized maintenance strategy is to develop a sustainable maintenance program for your building automation system and controls that helps extend asset life and reduce overall facility costs. We'll develop a service strategy around your requirements, the level of service and technology you want, and the goals you want to achieve. This strategy can combine reactive, planned and predictive service support, as well as advanced technology options for monitoring and analysis.

Productivity Options

Support center database (Metasys only) – This subscription allows online access to thousands of solutions to Johnson Controls product questions, available 24/7 to any customers who want to get the most out of their BAS investment.

Software update subscriptions (Metasys only) – Stay current with Metasys revisions with a software subscription. By subscribing, you'll receive all releases of software, ensuring your system has the latest features.

Ultrasonic leak testing –** Ultrasonic leak testing can locate leaks in your pneumatic controls system that may be wasting energy and impacting the performance of your system. Our technicians will test your system, tag the leaks, and provide a report quantifying the energy and greenhouse gas savings.

ENERGY STAR benchmarking – If you are interested in better understanding your facility's energy performance, or are required to benchmark your facility due to local or state regulations, we can perform the benchmark, provide you a summary report, and keep your information up-to-date.

Consultative services and training – Upon request, our technicians can help your staff troubleshoot tough problems or conduct on-site training.

Panoptix – With the Panoptix building efficiency platform, you can review equipment performance, pinpoint wasted energy, assess effectiveness, monitor and report on carbon emissions and energy efficiency, and much more. Data is pulled from multiple systems, like Metasys®, and presented in a way that lets you act on the information.

** Pneumatic systems only.

Remote Monitoring Options

Our remote monitoring options leverage the power of our Remote Operations Center (ROC), a 5-Diamond Certified center from the Central Station Alarm Association. Less than 5% of monitoring facilities have achieved this prestigious designation.

HVAC/BAS monitoring* –** Let our ROC watch over your building automation system 24/7. This service allows you to define which HVAC/BAS alarms are important to you and how you'd like us to respond, giving you peace of mind that critical issues won't be missed whether you're in the facility or away.

Remote operations – Remote operations take HVAC/BAS monitoring to the next step – providing you with facilities operations support to assist with tasks ranging from scheduling and set-point adjustments to control strategy optimization. A great option to augment your staff after-hours or in satellite locations.

Critical facility management* –** Critical facility management delivers key benefits to owners and operators of data center facilities: higher reliability, better planning and forecasting, and lower operating costs. By connecting the mechanical and electrical systems supporting the critical load to our ROC, we can provide centralized data collection and diagnostic services, which allow our facility experts to provide recommendations to improve both capacity and performance.

*** May not be compatible with all controls systems.
Contact your Johnson Controls sales representative for more details.

Customer Portal

With a Planned Service Agreement, the customer portal is the way to view all service requests, invoices and activities for your site locations. Access reports, request service, and review past, present and future service jobs, all at the click of a button. And better yet, you can retrieve all of this information on your time, when you need it.

Project Warranty : Iqaluit WasteWater Treatment Plant Upgrade
Our File Project : 8N0Y-0079

Your control system has been installed as per the contract and specifications and calibrated by people fully trained to provide you its efficient operations. Our mission at Johnson Controls is to provide installation and maintenance services of a high quality and to your full satisfaction. The final adjustments to provide specific requirements for building occupants is provided through your building operating staff – a responsibility that requires skill and a thorough knowledge of controls and mechanical systems.

The Johnson Controls warranty in your building is for a period of one year, commencing on substantial completion. The specific warranty terms are provided in the contract and specifications.
The general terms of our warranty are as follows:

1. Johnson Controls is responsible for repair and replacement of any defective equipment or workmanship.
2. Owner is responsible for preventative maintenance, inspections, calibration, and other general maintenance tasks.
3. Warranty work will be performed during regular working hours, and is subject to availability of personnel on a first call first response basis.
4. Johnson Controls is not responsible for warranty coverage on any equipment repaired by others, abused, altered, misused, damaged by fire, flood, or act of God, or which has not been reasonably and properly maintained.
5. A service call is payable by the owner if the problem is determined to be outside the scope of warranty coverage, in which case a written description of the problem encountered and corrective work performed will be provided.

Please note, your warranty protects you against defects in material and workmanship, but we recommend Preventative Maintenance coverage in addition to your warranty. This is your assurance against subjecting your control system to neglect – neglect, which could shorten equipment life expectancy and affect warranty claims.

Johnson Controls offers planned service agreements to customers whose equipment is in warranty. The coverage includes preventative maintenance visits to inspect and calibrate the system, as well as guarantee service call response time on an around the clock basis, if desired. Seasonal adjustments may be required during the warranty period. We also offer, for an additional cost, 24-hour off-site monitoring. Alarm conditions are handled as you advise. Activity is then compiled into a biweekly report.
We thank you for selecting a Johnson Controls system for this project. If you require additional information or have any questions, please call 1-866-668-0949.

Sincerely,

Philippe Cernosek
Project Owner

BUILDING HVAC CONTROLS SEQUENCES OF OPERATION

Part 1 General

1.1 REFERENCES

.1 Canadian Standards Association (CSA)

.1 CSA C22.2-94. 0-M91, Canadian Electrical Code, Part II, General Requirements.

.2 CAN/CSA-Z234.1-89, Canadian Metric Practice Guide.

.2 American National Standards Institute (ANSI)

.1 ANSI/ISAS5.5-1985, Graphic Symbols for Process Displays.

.2 ANSI/IEEE260-1978, Letter Symbols for SI and Certain Other Units of Measurements.

1.2 DESIGN DOCUMENTATION

.1 Design documentation for each system to include, as a minimum:

.1 Narrative type of Sequence of Operation.

.2 Control Description Logic (CDL).

.3 Input/Output Summary Schedules.

.4 Schematics.

Part 2 Products

2.1 NOT USED

Part 3 Execution

3.1 GENERAL

.1 Provide all wiring, conduit, relays, starters, electronics, etc., not indicated or specified but required for a complete and functional automatic control system.

.2 Location of controllers and panels not indicated or not as per drawing locations to be approved by Engineer prior to installation.

.3 All scales to be in SI units.

.4 Operating range to suit application range.

3.2 INSTALLATION

.1 Install all systems and hardware in accordance with the requirements of this specification, good controls practice and the requirements of Division 26.

.2 Install all equipment, components so that manufacturer's and CSA labels are visible and legible after commissioning is complete.

.3 Follow building lines.

.4 Run all systems exposed and do not pass thru or touch un-heated ducts or enclosures.

.5 Locate thermostat sensors 1500 mm above floor as indicated. When conflict occurs follow Engineer's instructions.

.6 All wiring to be in conduit. Wiring,conduit connections and fittings to be as per the requirements of Division 26.

.7 Wiring of line voltage mechanical equipment as per Division 26.

3.3 ELECTRICAL GENERAL

.1 Complete installation in accordance with requirements of:

.1 Division 26, this specification.

.2 ANSI/NFPA 70-1996SB.

.3 ANSI C2-1997.

.2 Fully enclose or properly guard electrical wiring, terminal blocks, all high voltage above 70 V contacts and mark to prevent accidental injury.

.3 Conform to all manufacturer's recommendations for storage, handling and installation.

.4 Check all factory connections and joints. Tighten where necessary to ensure continuity.

.5 Install electrical equipment between 1000 and 2000 mm above finished floor wherever possible and adjacent to related equipment.

.6 Shield and mark all live parts "LIVE 120 VOLTS" or other appropriate voltage.

.7 Holes through exterior wall and roofs: flash and make weatherproof.

.8 All digital controllers to be connected to dedicated surge and transient protected power supply. Reference Division 26.

3.4 CONTROL LOGIC - HW SYSTEM

.1 Building heating water system includes three modulating oil fired hydronic heating water boilers, primary recirculation pumps, packaged glycol fill system and secondary heating water pumps.

.2 The primary heating system consists of 2 glycol boilers B-1 and B-2 each complete with a circulation pump P-1.1 and P-1.2 respectively.

.3 Each boiler is supplied with a digital universal controller. The boiler burner includes local burner management controls that control boiler firing. The controls contractor shall provide boiler staging, boiler circulation pump control and boiler setpoint reset and all safety or operational interlocks to the boiler burner as required.

.4 Primary HW System

.1 The primary heating system is to be enabled when the outdoor air temperature is below 16 degC. An anti short cycle time delay is to be provided.

.2 The heating boilers shall operate in cascade sequence and rotate while maintaining modulation of each boiler as follows:

.1 Once the lead boiler firing rate is greater than 95% for x minutes (time to be determined during commissioning), the lag boiler circulation pump and associated boiler shall be enabled.

.2 The boilers shall be unloaded in reverse order when their firing rate is less than minimum firing rate for x minutes (time to be determined during commissioning).

.3 Provide a dead band between enabling and disabling of the boiler. Dead band to be determined during commissioning to prevent excessive cycling.

.4 Only after the pump status is proven can the associated boiler be enabled.

.5 When a boiler is disabled, its circulation pump shall continue to operate for 5 minutes to dissipate any residual heat in the boiler.

.6 Should the running boiler or circulation pump fail, the other boiler and pump shall be enabled and the previous boiler circulation pump and boiler shall be disabled. Upon a failure of the pump or associated boiler, an alarm shall be generated at the OWS.

.7 The lead boiler is to rotate on a duty run time every week.

.8 Boiler burners to operate using packaged boiler operating controls. Packaged controls modulate burner to satisfy HWST setpoint.

.9 The reset ratio and set points are to be adjustable by graphic operator interface at the OWS rather than at the boiler controller. The HWS temperature is to reset based on O/A temp. Initial HWS reset schedule setpoints:
At OAT < -30 deg C, HWS = 82 deg.C
At OAT > +16 deg C, HWS = 60 deg C

.10 When lead boiler energized, associated boiler primary circulation pump energized. Primary pump status by pump current. On failure of pump, indicate alarm at OWS. Boiler controller to sequence to next scheduled boiler.

.11 Low water cutoff (LWCO) to disable boiler in event of low heating water level.

.12 High limit controller with manual reset to disable boiler in event of high heating water temperature. Setpoint = 93 deg C.

.13 Indicate boiler inlet and outlet water temperatures, temperature differential, set point temperatures, set point differential, outdoor air temperature, and reset temperatures at OWS.

.14 Indicate trouble at OWS in event that HWS temperature is 10 deg C less than HWST setpoint for perdiod greater than 10 minutes.

.5 Secondary HW System

.1 The secondary heating system consists of two pumps sized for 100%

of their respective load. The pump speeds are controlled by variable frequency drive complete with BACnet cards (allow for 5 mapped points) and are normally activated via the control system when the primary heating system is enabled.

.2 Secondary HW Pumps to operate lead/standby. Lead secondary pump to start when primary HW enabled. See Primary HW controls. Lead secondary pumps to alternate on total run time duty cycle. Alternate main pump after 168hrs operation. Indicate transfer.

.3 On pump start lead secondary HW pump to start at 30% flow condition. Modulate pump speed to maintain secondary HWST at reset HW supply temperature and secondary HWRT at maximum 16.7 deg C temperature differential to maximum pump speed 1800rpm. In event of lead HW pump failure auto-change to lag pump and indicate failure.

.4 In event of lead pump and lag pump failure or failure of either pump when both pumps to be operating indicate failure and send signal to station process control PLC.

.5 In event of lead pump failure as sensed by current sensor, alarm lead pump failure at pump sequencer and energize lag pump.

.6 Pumps run continuous until outdoor air temperature greater than 16 deg C for 2 hours. Minimum deadband = 3 deg C.

.6 Terminal Heating

.1 Unit Heaters

.1 Line voltage thermostat cycles blower to satisfy thermostat setpoint.

.2 Initial setpoint = 10 deg C.

.2 Radiation (perimeter baseboards):

.1 Low Voltage thermostat cycles normally open two position zone valve to satisfy thermostat setpoint.

.2 Initial setpoint = 20 deg C.

.3 TWAS Tank Vent heat trace

.1 Normally open two-position zone valve cycles opens when outdoor air temp less than 1 deg C. An anti short cycle time delay is to be provided.

.4 Mech Room Heating Coil

.1 Normally closed two-position zone valve cycles opens when room temperature below 10 degC.

.2 When room temperature is below thermostat heating setpoint, intially set at 10 deg C, energize Mech room cooling.

.1 Energize Mech Room cooling fan

.2 EMCS to modulate normally closed two way control valve

to maintain minimum SAT setpoint. Inital setpoint = 10 deg C.

3.5 CONTROL LOGIC - FUEL SYSTEM

.1 General:

.1 Fuel oil for the WWTP heating plant and the generator is transfered from a single above ground primary fuel oil tank via two (2) fuel oil transfer pumps P-4.1 and P-4.2 to two (2) fuel oil auxilliary day tanks- one for heating plant and second tank for the generator..

.2 The system shall cycle based on fuel demand of either of the two FO day tanks. Upon system start up, the anti-siphon valve and respective tank fuel line solenoid valves open. The lead pump shall operate continuously with auto transfer on lead pump failure. If fuel demand cannot be met after more than 15min, enable the second FO pump. Once the fuel load is met, close anti-siphon valve and tank fuel line solenoid valves, disable the pumps.

.3 The fuel oil transfer pumps operate as lead/lag with the pumps alternating after each duty cycle.

.4 The fuel oil pump status is to monitored and in event of lead pump failure autochange to the lag pump and alarm failure to the OWS.

.5 If both the lead and lag pumps fail, alarm to the OWS and alarm to process control PLC.

.6 If the second tank level control calls for fuel while the lead pump is already ON, delay second tank fill operation until first tank fill complete. FO transfer pump OFF when all the tank levels satisfied.

.7 On high fuel oil level at any day tank, a hardwired override shall shut the transfer pumps off. The pumps shall not restart until the high limit condition is corrected.

.8 On low or high fuel oil level a critical alarm shall be generated. Alarm conditions shall be monitored by the process control PLC.

.9 In event of fuel leak at either auxilliary day tank as sensed by leak detection device, alarm trouble at OWS.

3.6 CONTROL LOGIC - WATER SUPPLY & RECIRCULATION SYSTEM

.1 A new piped potable water system will be provided for the WWTP. The WWTP water supply system includes two domestic water recirculation pumps and a hydronic indirect heat injection system.

.2 Water Supply Recirculation:

.1 Water recirculation pumps are energized and run continuously during the winter months and shoulder seasons. Recirculation pumps are not required when MONTH equals June, July or August.

.2 Pumps P-3.1 and pump P-3.2 operate as duty/standby pumps. Only one (1) pump operates at any time.

.3 Duty pump alternates weekly every 168 hours.

.4 Indicate pump status at OWS.

.5 In event of duty pump failure as sensed by CT current sensor, EMCS to energize standby pump and alarm trouble at OWS.

.6 Indicate entering water temperature and leaving water temperaure at OWS.

.7 In event that leaving water temperature less than 5 deg C (user adjustable at OWS), alarm at OWS.

.3 Water Supply Recirculation Heat Injection System

.1 The heat injection system includes a double walled stainless steel plate heat exchanger designated HEX-3.2 and two (2) injection pumps P-3.4 and P-3.5. The intent is to sidestream and heat recirculation water that is then blended with reciculation water to ensure that recirculation lines does not freeze. The heat injection pumps are interlocked with pumps P-3.1 and P-3.2.

.2 Pumps P-3.4 and P-3.5 operate as duty/standby pumps. Only one (1) pump operates at any time.

.3 Duty pump alternates weekly every 168 hours.

.4 Indicate pump status at OWS

.5 In event of duty pump failure as sensed by CT current sensor, EMCS to energize standby pump and alarm trouble at OWS.

.6 2-way modulating control valve installed on hot side of HEX-3.2 modulates HW flow through HEX-3.2 to maintain water supply recirculation temperature. Initial setpoint = 5 deg C.

.7 Alarm trouble at OWS if water supply return temperature less than 3 deg C.

3.7 CONTROL LOGIC - DOMESTIC HOT WATER and BOOSTER SYSTEM

.1 Domestic Hot Water

.1 Packaged controls on oil fired domestic hot water heater to cycle burner to satisfy DHWH setpoint. Initial setpoint = 60 deg C.

.2 Indicate DHW tank temperature at OWS

.3 DHWR pump P-3.3 to be interlocked with HRV-1. P-3.3 ON when HRV-1 ON.

.4 Indicate DHWH pump status at OWS. In event of P-3.3 failure as sensed by CT sensor, indicate failure at OWS

.5 Alarm trouble at OWS if DHW supply temperature over 65degC for 20 minutes.

.6 Lock out DHWH and alarm trouble at OWS if DHWH temperature above 65degC for 5 minutes.

.2 DHW Booster

.1 HEX-3.1 is installed to boost the DHW temperature to the primary filters. The system includes a flow switch, normal closed modulating two-way control valve and a temperature transmitter.

.2 On call for Primary Filter DHW by PLC, flow switch installed on DHW supply proves DHW flow to filters. On proof of flow, normal closed control valve energized and modulates HW flow through hot side of heat exchanger to achieve DHW supply temperature to Primary filter. Initial setpoint = 80 deg C.

.3 Indicate control valve status and DHW boost temperature at OWS.

3.8 CONTROL LOGIC - SUMP PUMPS

.1 General:

.1 Existing sump pumps P-2.1, P-2.2, P-2.3 and P-2.4 are existing submersible pumps that will be replaced as part of this Contract. The existing pump control panel for each pair of pumps will also be replaced.

.2 Sump Pumps P-2.5 and P-2.6 are new submersible sump pumps. New control panels are to be provided for each pair of sump pumps.

.2 Sump pumps operate as duty/standby. Duty pump switches after each run cycle.

.3 Sump pump controls includes four (4) level switches.

.1 Duty pump ON when Pump Start sump level switch enabled.

.2 Duty pump OFF when Pump Stop sump level switch enabled.

.3 Standby pump ON when 3rd sump level switch (high level) enabled so both pumps ON. Both pump OFF when PUMP Stop sump level switch enabled.

.4 Alarm high level when sump high level switch enabled.

.4 Indicate sump pump status at OWS.

3.9 CONTROL LOGIC - VENTILATION

.1 General:

.1 Ventilation system includes AHU-2, AHU-3 (existing), HRV-1, CF-1 and CF-2

.2 AHU-2 is custom built 100% outdoor air unit complete with two (2) VFD type fans, an air-to-air fixed plate heat exchanger, face and bypass dampers, preheat and reheat hydronic heating coils and exhaust and outdoor air dampers. The unit is installed in above the MBBR cells and provides fresh air to the unclassified areas including the MBBR and upper DAF tank area, upper level mezzanine, Belt Filter Press area, polymer mizing area, process blower area, lower DAF tank area, and the sludge trailer room.

.3 AHU-3 is an existing custom built 100% outdoor air unit complete with two (2) two-speed fans, an air-to-air fixed plate heat exchanger, defrost bypass dampers, a reheat hydronic heating coil and exhaust and outdoor air dampers. The unit is installed on the main floor of the existing headworks building and services the existing headworks room. The controls contractor shall migrate the existing controls to the new control system.

.4 HRV-1 is a light commercial packaged heat recovery ventilator installed on the secondfloor above the office/lab area.

.5 CF-1: Economizer cooling system consisting of in-line cooling fan, and modulating control dampers.

.6 CF-2: Economizer cooling system consisting of in-line cooling fan, and modulating control dampers.

.2 AHU-2

.1 AHU-2 air system operates continuously. AHU-2 shall normally operate with the supply fans and exhaust fan at 50% speed to provide a minimum of 3 ACH of continuous ventilation.

.2 When the AHU-2 area space lights are ON, or when the gas detection system is activated, or when the outside air temperature is above 10° C, the supply and exhaust air fans shall be ramped up to 100% to provide 6 ACH of continuous ventilation. Final fan speeds to be determined during commissioning.

.3 Preliminary calculations indicate that there may be condensation issues at lower air change rates. In the event that condensation is a problem at 3 ACH, Contractor to ramp up lower fan speed so that condensation is avoided.

.4 Gas detection by PLC contractor. Interlock PLC I/O with DDC AHU controls.

.5 Upon system start-up, the unit outdoor air and exhaust air dampers shall be energized open. Once the damper end switches indicates that the dampers are full open, the EMCS shall start the exhaust fan to 3 ACH/50% airflow. Once Exhaust fan status proven, supply fan to start.

.6 The EMCS system shall modulate the exhaust fan as required to maintain the space pressure under positive pressure of 25 Pa (field adjustable) relative to ambient. Final fan speed to be determined during comissioning.

.7 In event of either supply fan failure or exhaust fan failure, alarm trouble at OWS.

.8 Show fan status at OWS.

.9 Show air change per hour (ACH) rate at OWS.

.10 Show relative space pressure at OWS.

.11 Show various air filter DP values at OWS.

.12 Preheat Coil:

.1 Pre-heat coil recirculation pump P-1.6 ON when OAT less than 5 dec C.

.2 EMCS to modulate two way control valve to maintain mimum SAT setpoint after heat transfer core. Inital setpoint = -10C.

.13 Reheat Coil:

.1 EMCS to modulate two way control valve to maintain SAT setpoint to space. Inital setpoint = +10C.

.14 In event that SAT temperature is less than 5 deg C as sensed by duct mounted temperature sensor, alarm trouble at OWS.

.15 AHU heat transfer core bypass dampers are normally closed (full heat recovery mode). EMCS to open dampers fully when OAT greater than 5 deg C (partial heat recovery). When OAT greater than 10 deg C, close heat core face dampers (no heat recovery). Provide anti short-cycle time delay.

.3 AHU-3

.1 Existing AHU-3 consists of a two speed supply and return air fan, reheat coil, defrost bypass, heat recovery section and filter section. AHU-3 is controlled from the current WWTP PLC system located in the office. The Controls Contractor under this Contract shall migrate the existing AHU-3 control field devices to the new WWTP DDC system.

.2 AHU-3 air system to operates continuously. AHU-3 shall normally operate with the supply fans and exhaust fan at 50% speed to provide 6 ACH of continuous ventilation.

.3 During occupied period when existing headworks area lights are ON or when the gas detection is activated, or when the outside air temperature is above 10°C, the supply fan and exhaust fan shall switch to speed 2 (100% speed) to provide 12 ACH of continuous ventilation. Final fan speeds to be determined during commissioning.

.4 Gas detection by PLC contractor. Interlock PLC I/O with DDC AHU controls.

.5 In event of either supply fan failure or exhaust fan failure, alarm trouble at OWS.

.6 Show fan status at OWS.

.7 Show air change per hour (ACH) rate at OWS.

.8 Show relative space pressure at OWS.

.9 Show air filter DP at OWS.

.10 AHU-3 heat transfer core "Defrost Mode" bypass dampers are normally closed (full air flow through heat exchanger). EMCS to switch

AHU-3 to Defrost Mode when supply air temperature down stream of HEX and upstream of reheat coil is less 5 deg C as sensed by averaging type duct temperature sensor. In "Defrost Mode", EMCS modulates AHU-3 Face and Bypass dampers to maintain exhaust air temperature above 2 deg C.

.11 Reheat Coil

.1 Provide new 3-way control valve for AHU-3.

.2 EMCS to modulate AHU-3 reheat coil 3-way control valve to satisfy SAT temperature setpoint. Initial setpoint = 10C.

.12 In event that SAT temperature is less than 5 deg C as sensed by duct mounted averaging type temperature sensor, alarm trouble at OWS.

.4 Mechanical Room Cooling

.1 The air system provides economizer free cooling to Mechanical Room.

.2 When room temperature is above thermostat cooling setpoint, intially set at 24 deg C, energize cooling system.

.3 On call for cooling, energize cooling fan, modulate exhaust air, return air and outdoor air dampers to satisfy T-stat.

.4 If the discharge air temp is less than 5degC for greater than five(5) minutes, lock out the cooling fan, de-energize dampers and alarm at OWS. The alarm suppression time is to be adjustable at the OWS.

.5 If the Mechanical Room temperature exceeds 38degC for longer than 15min, alarm to the OWS.

.6 On a high-pressure drop at the filters alarm to the OWS. Set point to befield determined and adjustable at OWS.

.5 Electrical Room Cooling

.1 As per mechanical room cooling

.6 Generator Cooling

.1 The EG has been provided with a ventilation system to provide economizer free cooling while the generator is operating and the UH provides heating while the generator is OFF. When the generator starts the UH is to be locked out and the two position combustion air damper opens fully. If the damper does not open alarm to the OWS and open the main O/A dampers to minimum 15% open.

.2 While the generator is operating, the O/A, R/A and E/A dampers are to modulate in economizer mixing mode to maintain both the generator radiator discharge air temperature at a maximum 30degC and also the space temperature at set point.

.3 If the generator is ON and the space temp is above 38degC, alarm to the OWS and signal PLC controller.

.4 After the generator is staged OFF, if the space temperature is less than

30deg C, dampers to normal positions. If the space temperature is greater than 30degC, continue to enable and modulate the economizer dampers to maintain space temperature at a maximum 30degC. After cool down is completed dampers to normal position.

.7 HRV-1

.1 HRV provides fresh air and exhaust air for the normally occupied area of the WWTP including the office, washroom and laboratory. The HRV system includes the HRV, outdoor air 2-position normal closed damper, hydronic pre-heat heating coil and hydronic re-heat heating coil.

.2 Time Schedule: Schedule to be fully adjustable at the OWS. HRV-1 operates based on a 365 day time based schedule. Initial time-based setpoint (confirm with Owner):

.1 HRV-1 ON: Mon-Fri @ 0730hrs

.2 HRV-1 OFF: Mon-Fri @ 1700hrs, Sat-Sun

.3 On start-up, HRV outdoor air damper opens fully. When damper position proven by end-switch, energize HRV.

.4 Preheat Coil

.1 EMCS to modulate two way control valve to maintain minimum SAT setpoint into heat transfer core. Inital setpoint = -10 deg C.

.5 Reheat Coil

.1 EMCS to modulate two way control valve to maintain minimum SAT setpoint. Inital setpoint = 18 deg C.

.6 In event that SAT temperature is less than 10 deg C as sensed by duct mounted averaging type temperature sensor, alarm trouble at OWS.

3.10 LOW BUILDING TEMPERATURE ALARM

.1 In event of low building temperature as sensed by temperature sensor and 15 minute time delay, signal process control PLC.

.2 Initial setpoint = 5 deg C

.3 Low temperature sensors located in Mech room, Lower DAF tank area, and near HEX-3.1 on upper level.
