Hello,

After a discussion with the City of Iqaluit it appears they're uncertain which parameters in Table 2 of the licence they need to sample for while discharging from the final point of control into the receiving environment.

The licensee understands that station IQA-08 is the sampling station from the containment pond within the landfill to containment ponds outside the landfill, it requires the licensee to sample before, during and after the discharge which is usually for discharges into the environment. Can you please clarify what sampling station and sampling parameters are required while discharging from "pond 2" to the receiving environment.

If you have any questions or concerns please contact me with the information undersigned.

Regards,

Jonathan Meshier
