

K-Monitoring Stn-July06

Monitoring Stations at the Kugluktuk treatment facilities

Following the upgrade of the proposed sewage and solid waste facilities for the Hamlet of Kugluktuk, there is a requirement for additional monitoring stations to enable the water samples to be collected and sent for analysis.

As these new expanded facilities come into operation, new locations are required for the waste inflows and outflows following appropriate treatment.

The following stations are described and shown in attached Figures. Please note that these stations have been re-numbered and supercede that shown in the Figure 3/Detail Design Report.

<u>Location</u>	<u>Existing</u>	<u>New Additions</u>
Raw Water Supply/Coppermine river intake	KUG-1	'as is'
Effluent discharge from final discharge point of solid waste facilities	KUG-2	KUG-2A
Raw sewage at truck off-loading point	KUG-3	KUG-3A
Effluent discharge from sewage treatment facility	KUG-4	KUG-4A
