| <b>Q</b> Comments and/or recommendations<br>Fuel tank is indoors and driver must fill tank blindly. Intake pipe is at 90° and with limited control of fuel flow speed, fuel spills out of intake pipe (please see attached picture). Unless the intake pipe or elbow is changed to (as a suggestion only) 45° angle, fuel will spill at fill-up easily possibly occur.<br><br>The overflow outer pipe is the only way for driver to know if tank is full when filling up alone without RCMP resident. Driver could not hear resident saying the tank is close to being full, and only when fuel spilled out from outland pipe did he know tank was full and stopped fill-up procedures. Maybe 1-2 litres spilled. |  |                                                                                                                      |  |                                                       |  |
