Parameter	Description	User interface
Value	Shows the value of the device variable recorded by the HART input.	Signed floating-point number
Status	Shows the status of the device variable recorded by the HART input.	▪ Manual/Fixed ▪ Good ▪ Poor accuracy ▪ Bad

10.4.12 Configuring the relay output

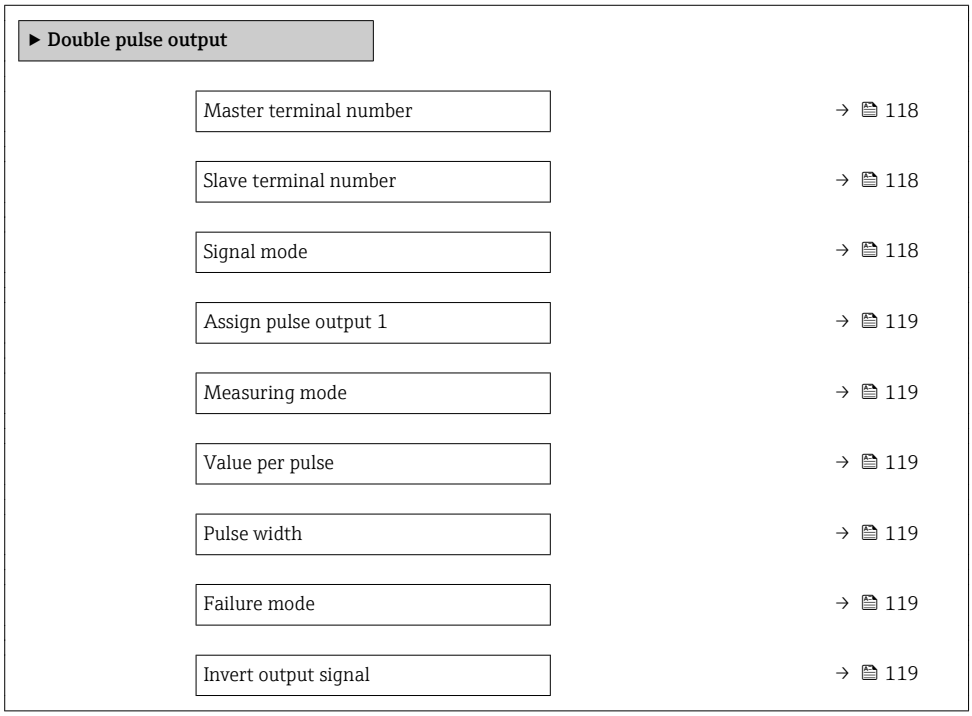
The **Relay output** wizard guides the user systematically through all the parameters that have to be set for configuring the relay output.

Navigation
"Setup" menu → Relay output 1 to n

Parameter overview with brief description

Parameter	Prerequisite	Description	Selection / User interface / User entry	Factory setting
Relay output function	–	Select the function for the relay output.	▪ Closed ▪ Open ▪ Diagnostic behavior ▪ Limit ▪ Flow direction check ▪ Digital Output	Closed
Terminal number	–	Shows the terminal numbers used by the relay output module.	▪ Not used ▪ 24-25 (I/O 2) ▪ 22-23 (I/O 3) ▪ 20-21 (I/O 4)	–
Assign flow direction check	In the **Relay output function** parameter, the **Flow direction check** option is selected.	Select process variable for flow direction monitoring.	▪ Off ▪ Volume flow ▪ Mass flow ▪ Corrected volume flow	Volume flow
Assign limit	The **Limit** option is selected in the **Relay output function** parameter.	Select process variable for limit function.	▪ Off ▪ Volume flow ▪ Mass flow ▪ Corrected volume flow ▪ Flow velocity ▪ Conductivity * ▪ Totalizer 1 ▪ Totalizer 2 ▪ Totalizer 3 ▪ Electronic temperature	Volume flow
Assign diagnostic behavior	In the **Relay output function** parameter, the **Diagnostic behavior** option is selected.	Select diagnostic behavior for switch output.	▪ Alarm ▪ Alarm or warning ▪ Warning	Alarm
Assign status	In the **Relay output function** parameter, the **Digital Output** option is selected.	Select device status for switch output.	▪ Partially filled pipe detection ▪ Low flow cut off	Partially filled pipe detection
Switch-off value	In the **Relay output function** parameter, the **Limit** option is selected.	Enter measured value for the switch-off point.	Signed floating-point number	Country-specific: ▪ 0 l/h ▪ 0 gal(us)/min
Switch-off delay	In the **Relay output function** parameter, the **Limit** option is selected.	Define delay for the switch-off of status output.	0.0 to 100.0 s	0.0 s
Switch-on value	The **Limit** option is selected in the **Relay output function** parameter.	Enter measured value for the switch-on point.	Signed floating-point number	Country-specific: ▪ 0 l/h ▪ 0 gal(us)/min

Parameter	Prerequisite	Description	Selection / User interface / User entry	Factory setting
Switch-on delay	In the **Relay output function** parameter, the **Limit** option is selected.	Define delay for the switch-on of status output.	0.0 to 100.0 s	0.0 s
Failure mode	–	Define output behavior in alarm condition.	▪ Actual status ▪ Open ▪ Closed	Open



* Visibility depends on order options or device settings

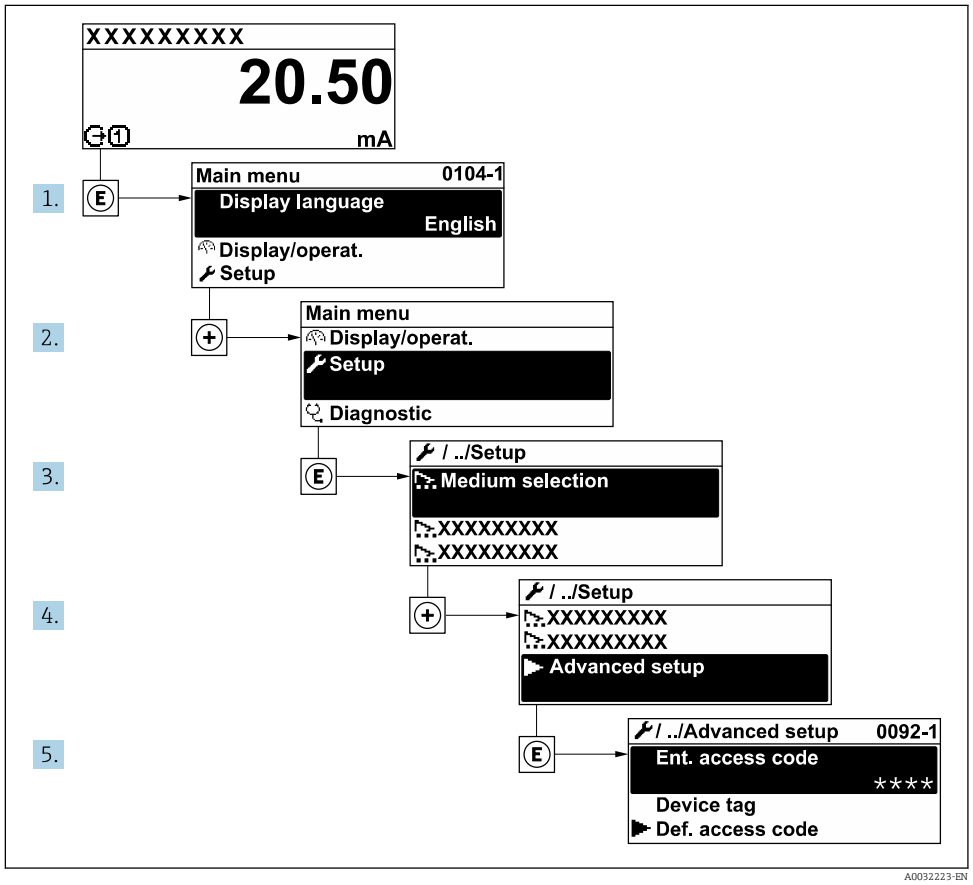
10.4.13 Configuring the double pulse output

The **Double pulse output** submenu guides the user systematically through all the parameters that have to be set for configuring the double pulse output.

Navigation

"Setup" menu → Double pulse output

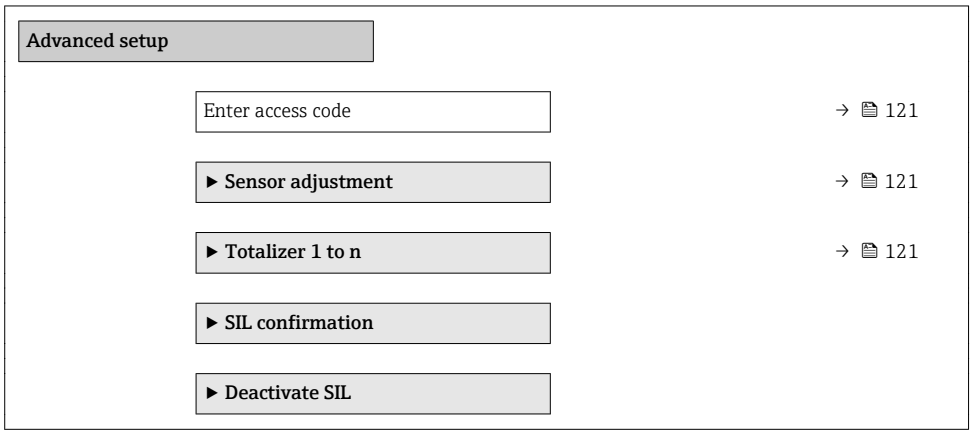
Parameter overview with brief description



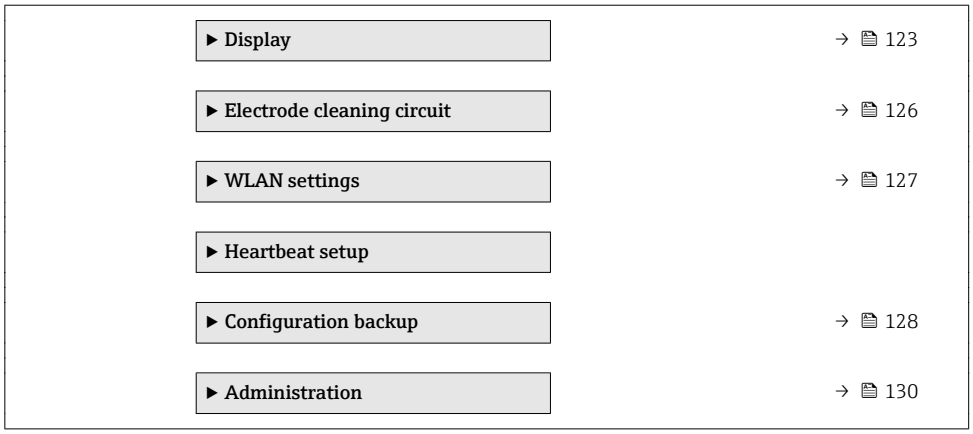
Parameter	Description	Selection / User interface / User entry	Factory setting
Signal mode	Select the signal mode for the double pulse output.	▪ Passive ▪ Active ▪ Passive NAMUR	Passive
Master terminal number	Shows the terminal numbers used by the master of the double pulse output module.	▪ Not used ▪ 24-25 (I/O 2) ▪ 22-23 (I/O 3)	–
Slave terminal number	Shows the terminal numbers used by the slave of the double pulse output module.	▪ Not used ▪ 24-25 (I/O 2) ▪ 22-23 (I/O 3)	–

Parameter	Description	Selection / User interface / User entry	Factory setting
Assign pulse output 1	Select process variable for pulse output.	▪ Off ▪ Volume flow ▪ Mass flow ▪ Corrected volume flow	Off
Measuring mode	Select measuring mode for pulse output.	▪ Forward flow ▪ Forward/Reverse flow ▪ Reverse flow ▪ Reverse flow compensation	Forward flow
Value per pulse	Enter measured value at which a pulse is output.	Signed floating-point number	Depends on country and nominal diameter
Pulse width	Define time width of the output pulse.	0.5 to 2 000 ms	0.5 ms
Failure mode	Define output behavior in alarm condition.	▪ Actual value ▪ No pulses	No pulses
Invert output signal	Invert the output signal.	▪ No ▪ Yes	No

10.5 Advanced settings



The **Advanced setup** submenu together with its submenus contains parameters for specific settings.



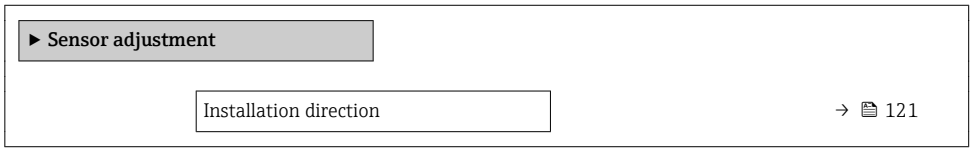
Navigation to the "Advanced setup" submenu

The number of submenus can vary depending on the device version. Some submenus are not dealt with in the Operating Instructions. These submenus and the parameters they contain are explained in the Special Documentation for the device.

Navigation
"Setup" menu → Advanced setup

10.5.1 Using the parameter to enter the access code

Navigation
"Setup" menu → Advanced setup



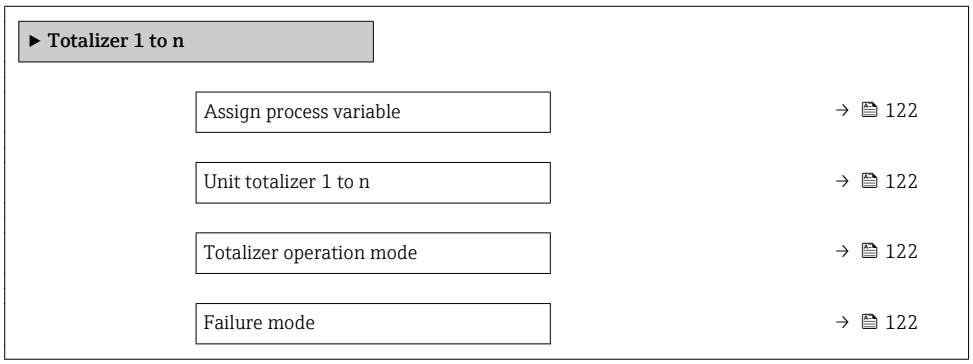
Parameter overview with brief description

Parameter	Description	User entry
Enter access code	Enter access code to disable write protection of parameters.	Max. 16-digit character string comprising numbers, letters and special characters

10.5.2 Carrying out a sensor adjustment

The **Sensor adjustment** submenu contains parameters that pertain to the functionality of the sensor.

Navigation
"Setup" menu → Advanced setup → Sensor adjustment



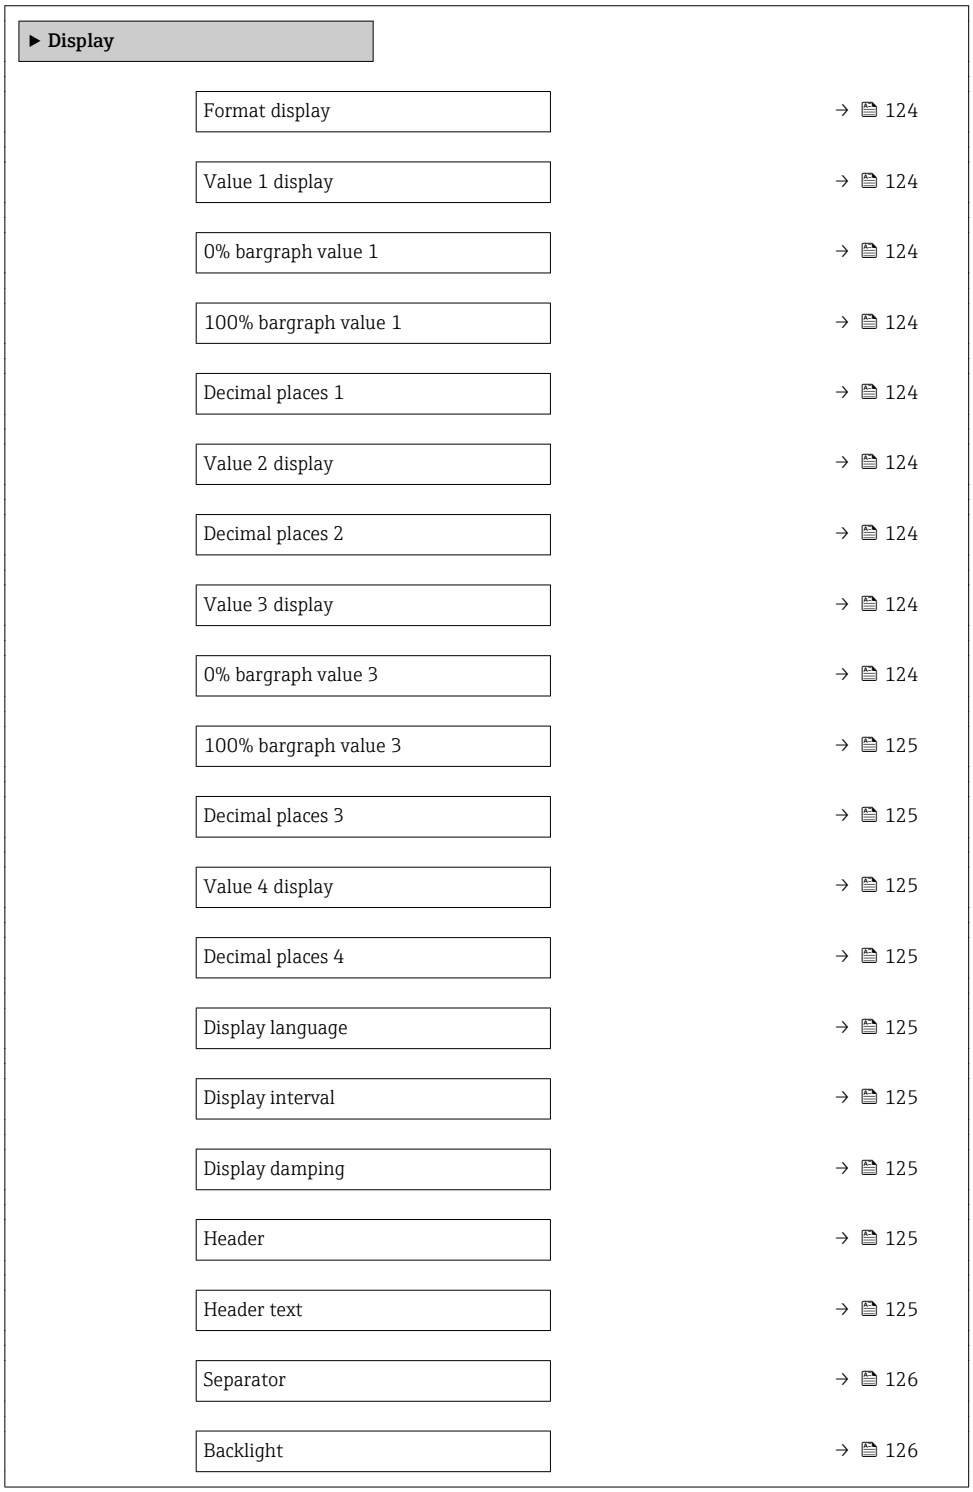
Parameter overview with brief description

Parameter	Description	Selection	Factory setting
Installation direction	Set sign of flow direction to match the direction of the arrow on the sensor.	▪ Flow in arrow direction ▪ Flow against arrow direction	Flow in arrow direction

10.5.3 Configuring the totalizer

In the **"Totalizer 1 to n" submenu** the individual totalizer can be configured.

Navigation
"Setup" menu → Advanced setup → Totalizer 1 to n



Parameter overview with brief description

Parameter	Prerequisite	Description	Selection	Factory setting
Assign process variable	–	Select process variable for totalizer.	▪ Off ▪ Volume flow ▪ Mass flow ▪ Corrected volume flow	Volume flow
Unit totalizer 1 to n	A process variable is selected in the **Assign process variable** parameter (→ 122) of the **Totalizer 1 to n** submenu.	Select process variable totalizer unit.	Unit choose list	l
Totalizer operation mode	A process variable is selected in the **Assign process variable** parameter (→ 122) of the **Totalizer 1 to n** submenu.	Select totalizer calculation mode.	▪ Net flow total ▪ Forward flow total ▪ Reverse flow total	Net flow total
Failure mode	A process variable is selected in the **Assign process variable** parameter (→ 122) of the **Totalizer 1 to n** submenu.	Define totalizer behavior in alarm condition.	▪ Stop ▪ Actual value ▪ Last valid value	Stop

10.5.4 Carrying out additional display configurations

In the **Display** submenu you can set all the parameters associated with the configuration of the local display.

Navigation
"Setup" menu → Advanced setup → Display

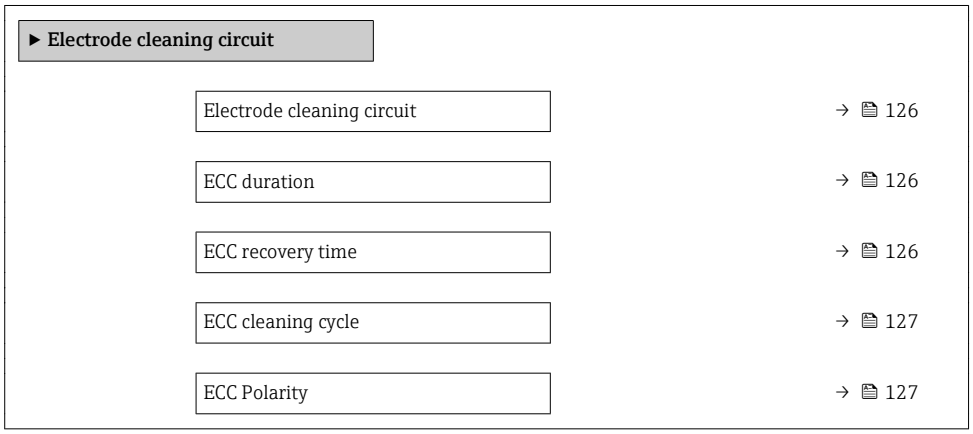
Parameter overview with brief description

Parameter	Prerequisite	Description	Selection / User entry	Factory setting
Format display	A local display is provided.	Select how measured values are shown on the display.	▪ 1 value, max. size ▪ 1 bargraph + 1 value ▪ 2 values ▪ 1 value large + 2 values ▪ 4 values	1 value, max. size
Value 1 display	A local display is provided.	Select the measured value that is shown on the local display.	▪ Volume flow ▪ Mass flow ▪ Corrected volume flow ▪ Flow velocity ▪ Totalizer 1 ▪ Totalizer 2 ▪ Totalizer 3 ▪ Current output 1 * ▪ Current output 2 * ▪ Current output 3 * ▪ Current output 4 * ▪ Electronic temperature ▪ Noise * ▪ Coil current shot time * ▪ Reference electrode potential against PE * ▪ Coating measured value * ▪ Test point 1 ▪ Test point 2 ▪ Test point 3	Volume flow
0% bargraph value 1	A local display is provided.	Enter 0% value for bar graph display.	Signed floating-point number	Country-specific: ▪ 0 l/h ▪ 0 gal/min (us)
100% bargraph value 1	A local display is provided.	Enter 100% value for bar graph display.	Signed floating-point number	Depends on country and nominal diameter
Decimal places 1	A measured value is specified in the **Value 1 display** parameter.	Select the number of decimal places for the display value.	▪ x ▪ x.x ▪ x.xx ▪ x.xxx ▪ x.xxxx	x.xx
Value 2 display	A local display is provided.	Select the measured value that is shown on the local display.	For the picklist, see the **Value 2 display** parameter (→ 112)	None
Decimal places 2	A measured value is specified in the **Value 2 display** parameter.	Select the number of decimal places for the display value.	▪ x ▪ x.x ▪ x.xx ▪ x.xxx ▪ x.xxxx	x.xx
Value 3 display	A local display is provided.	Select the measured value that is shown on the local display.	For the picklist, see the **Value 2 display** parameter (→ 112)	None
0% bargraph value 3	A selection was made in the **Value 3 display** parameter.	Enter 0% value for bar graph display.	Signed floating-point number	Country-specific: ▪ 0 l/h ▪ 0 gal/min (us)

Parameter	Prerequisite	Description	Selection / User entry	Factory setting
100% bargraph value 3	A selection was made in the **Value 3 display** parameter.	Enter 100% value for bar graph display.	Signed floating-point number	0
Decimal places 3	A measured value is specified in the **Value 3 display** parameter.	Select the number of decimal places for the display value.	▪ x ▪ x.x ▪ x.xx ▪ x.xxx ▪ x.xxxx	x.xx
Value 4 display	A local display is provided.	Select the measured value that is shown on the local display.	For the picklist, see the **Value 2 display** parameter (→ 🖹 112)	None
Decimal places 4	A measured value is specified in the **Value 4 display** parameter.	Select the number of decimal places for the display value.	▪ x ▪ x.x ▪ x.xx ▪ x.xxx ▪ x.xxxx	x.xx
Display language	A local display is provided.	Set display language.	▪ English ▪ Deutsch ▪ Français ▪ Español ▪ Italiano ▪ Nederlands ▪ Portuguesa ▪ Polski ▪ русский язык (Russian) ▪ Svenska ▪ Türkçe ▪ 中文 (Chinese) ▪ 日本語 (Japanese) ▪ 한국어 (Korean) ▪ العَرَبِيَة (Arabic) * ▪ Bahasa Indonesia ▪ ภาษาไทย (Thai) * ▪ tiếng Việt (Vietnamese) ▪ čeština (Czech)	English (alternatively, the ordered language is preset in the device)
Display interval	A local display is provided.	Set time measured values are shown on display if display alternates between values.	1 to 10 s	5 s
Display damping	A local display is provided.	Set display reaction time to fluctuations in the measured value.	0.0 to 999.9 s	0.0 s
Header	A local display is provided.	Select header contents on local display.	▪ Device tag ▪ Free text	Device tag
Header text	In the **Header** parameter, the **Free text** option is selected.	Enter display header text.	Max. 12 characters such as letters, numbers or special characters (e.g. @, %, /)	----------

Parameter	Prerequisite	Description	Selection / User entry	Factory setting
Separator	A local display is provided.	Select decimal separator for displaying numerical values.	▪ . (point) ▪ , (comma)	. (point)
Backlight	One of the following conditions is met: ▪ Order code for "Display; operation", option **F** "4-line, illum.; touch control" ▪ Order code for "Display; operation", option **G** "4-line, illum.; touch control +WLAN"	Switch the local display backlight on and off.	▪ Disable ▪ Enable	Enable

* Visibility depends on order options or device settings



10.5.5 Performing electrode cleaning

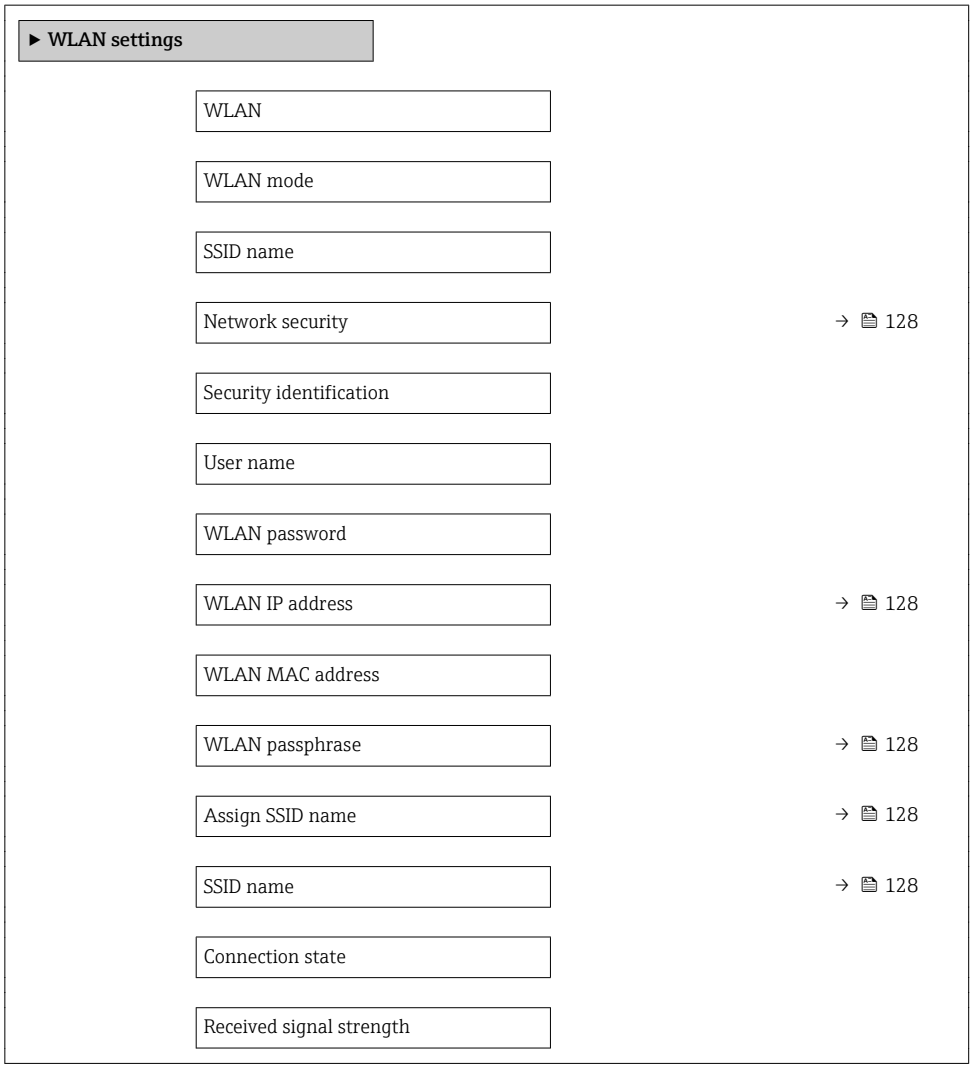
The **Electrode cleaning circuit** submenu contains parameters that must be configured for the configuration of electrode cleaning.

The submenu is only available if the device was ordered with electrode cleaning.

Navigation

"Setup" menu → Advanced setup → Electrode cleaning circuit

Parameter overview with brief description



Parameter	Prerequisite	Description	Selection / User entry / User interface	Factory setting
Electrode cleaning circuit	For the following order code: "Application package", option **EC** "ECC electrode cleaning"	Enable the cyclic electrode cleaning circuit.	▪ Off ▪ On	Off
ECC duration	For the following order code: "Application package", option **EC** "ECC electrode cleaning"	Enter the duration of electrode cleaning in seconds.	0.01 to 30 s	2 s
ECC recovery time	For the following order code: "Application package", option **EC** "ECC electrode cleaning"	Define recovery time after electrode cleaning. During this time the current output values will be held at last valid value.	1 to 600 s	60 s

Parameter	Prerequisite	Description	Selection / User entry / User interface	Factory setting
ECC cleaning cycle	For the following order code: "Application package", option **EC** "ECC electrode cleaning"	Enter the pause duration between electrode cleaning cycles.	0.5 to 168 h	0.5 h
ECC Polarity	For the following order code: "Application package", option **EC** "ECC electrode cleaning"	Select the polarity of the electrode cleaning circuit.	▪ Positive ▪ Negative	Depends on the electrode material: ▪ Platinum: **Negative** option ▪ Tantalum, Alloy C22, stainless steel: **Positive** option

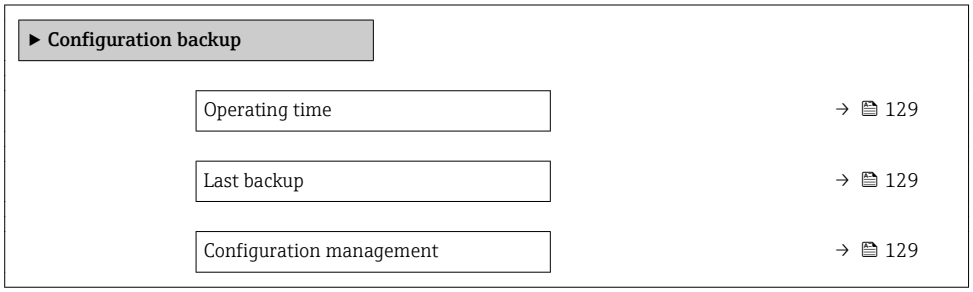
10.5.6 WLAN configuration

The **WLAN Settings** submenu guides the user systematically through all the parameters that have to be set for the WLAN configuration.

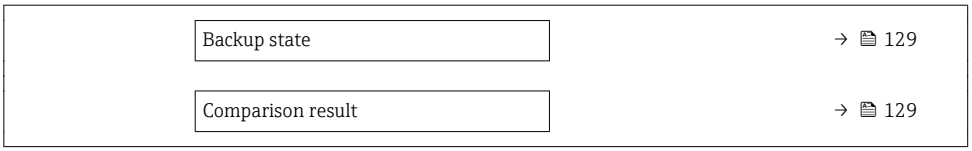
Navigation
"Setup" menu → Advanced setup → WLAN settings

Parameter overview with brief description

Parameter	Prerequisite	Description	User entry / Selection	Factory setting
WLAN IP address	–	Enter IP address of the WLAN interface of the device.	4 octet: 0 to 255 (in the particular octet)	192.168.1.212
Network security	–	Select the security type of the WLAN network.	▪ Unsecured ▪ WPA2-PSK ▪ EAP-PEAP with MSCHAPv2 * ▪ EAP-PEAP MSCHAPv2 no server authentic. * ▪ EAP-TLS *	WPA2-PSK
WLAN passphrase	The **WPA2-PSK** option is selected in the **Security type** parameter.	Enter the network key (8 to 32 characters). The network key supplied with the device should be changed during commissioning for security reasons.	8 to 32-digit character string comprising numbers, letters and special characters (without spaces)	Serial number of the measuring device (e.g. L100A802000)
Assign SSID name	–	Select which name will be used for SSID: device tag or user-defined name.	▪ Device tag ▪ User-defined	User-defined
SSID name	▪ The **User-defined** option is selected in the **Assign SSID name** parameter. ▪ The **WLAN access point** option is selected in the **WLAN mode** parameter.	Enter the user-defined SSID name (max. 32 characters). The user-defined SSID name may only be assigned once. If the SSID name is assigned more than once, the devices can interfere with one another.	Max. 32-digit character string comprising numbers, letters and special characters	EH_device designation_last 7 digits of the serial number (e.g. EH_Promag_500_A802000)
Apply changes	–	Use changed WLAN settings.	▪ Cancel ▪ Ok	Cancel



* Visibility depends on order options or device settings



10.5.7 Configuration management

After commissioning, you can save the current device configurationor restore the previous device configuration.

You can do so using the **Configuration management** parameter and the related options found in the **Configuration backup** submenu.

Navigation
"Setup" menu → Advanced setup → Configuration backup

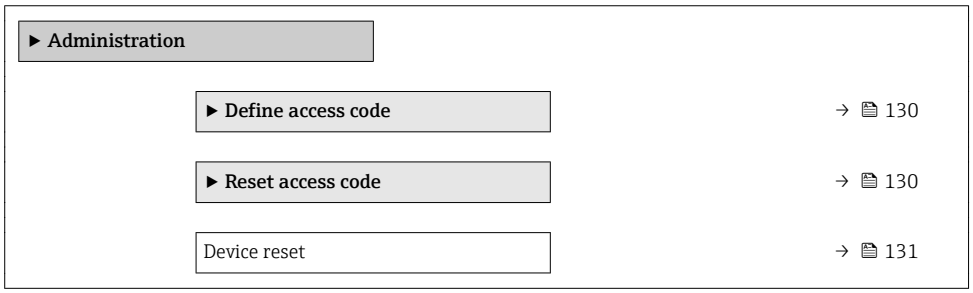
Parameter overview with brief description

Parameter	Description	User interface / Selection	Factory setting
Operating time	Indicates how long the device has been in operation.	Days (d), hours (h), minutes (m) and seconds (s)	–
Last backup	Shows when the last data backup was saved to HistoROM backup.	Days (d), hours (h), minutes (m) and seconds (s)	–
Configuration management	Select action for managing the device data in the HistoROM backup.	▪ Cancel ▪ Execute backup ▪ Restore * ▪ Compare * ▪ Clear backup data	Cancel
Backup state	Shows the current status of data saving or restoring.	▪ None ▪ Backup in progress ▪ Restoring in progress ▪ Delete in progress ▪ Compare in progress ▪ Restoring failed ▪ Backup failed	None
Comparison result	Comparison of current device data with HistoROM backup.	▪ Settings identical ▪ Settings not identical ▪ No backup available ▪ Backup settings corrupt ▪ Check not done ▪ Dataset incompatible	Check not done

* Visibility depends on order options or device settings

Function scope of the "Configuration management" parameter

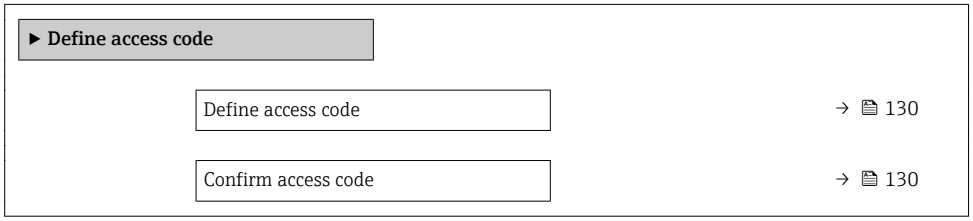
Options	Description
Cancel	No action is executed and the user exits the parameter.
Execute backup	A backup copy of the current device configuration is saved from the HistoROM backup to the memory of the device. The backup copy includes the transmitter data of the device.
Restore	The last backup copy of the device configuration is restored from the device memory to the device's HistoROM backup. The backup copy includes the transmitter data of the device.
Compare	The device configuration saved in the device memory is compared with the current device configuration of the HistoROM backup.
Clear backup data	The backup copy of the device configuration is deleted from the memory of the device.



HistoROM backup
A HistoROM is a "non-volatile" device memory in the form of an EEPROM.

While this action is in progress, the configuration cannot be edited via the local display and a message on the processing status appears on the display.

10.5.8 Using parameters for device administration

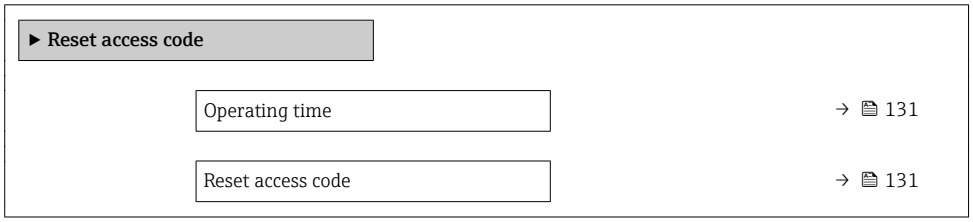


The **Administration** submenu systematically guides the user through all the parameters that can be used for device administration purposes.

Navigation
"Setup" menu → Advanced setup → Administration

Using the parameter to define the access code

Navigation
"Setup" menu → Advanced setup → Administration → Define access code



Parameter overview with brief description

Parameter	Description	User entry
Define access code	Restrict write-access to parameters to protect the configuration of the device against unintentional changes.	Max. 16-digit character string comprising numbers, letters and special characters
Confirm access code	Confirm the entered access code.	Max. 16-digit character string comprising numbers, letters and special characters

Using the parameter to reset the access code

Navigation
"Setup" menu → Advanced setup → Administration → Reset access code

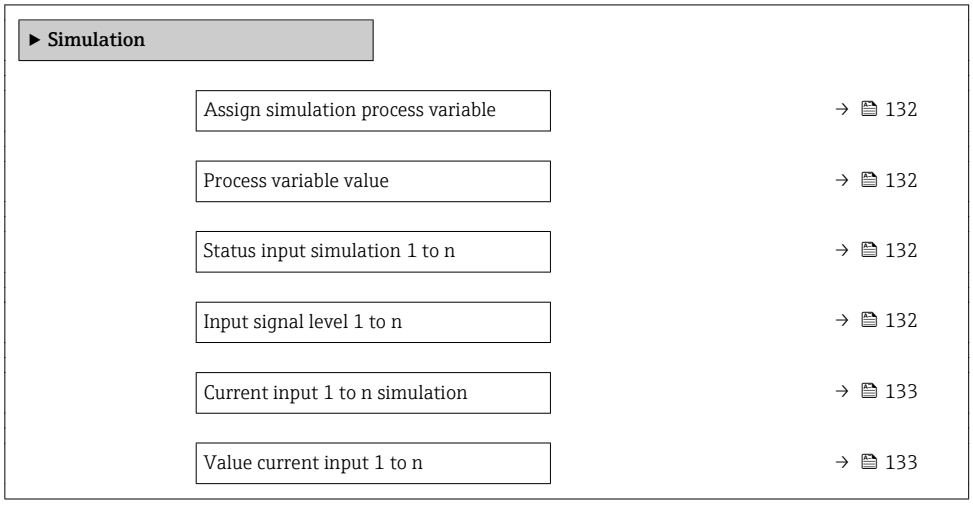
Parameter overview with brief description

Parameter	Description	User interface / User entry	Factory setting
Operating time	Indicates how long the device has been in operation.	Days (d), hours (h), minutes (m) and seconds (s)	–
Reset access code	Reset access code to factory settings. For a reset code, contact your Endress+Hauser service organization. The reset code can only be entered via: ▪ Web browser ▪ DeviceCare, FieldCare (via service interface CDI-RJ45) ▪ Fieldbus	Character string comprising numbers, letters and special characters	0x00

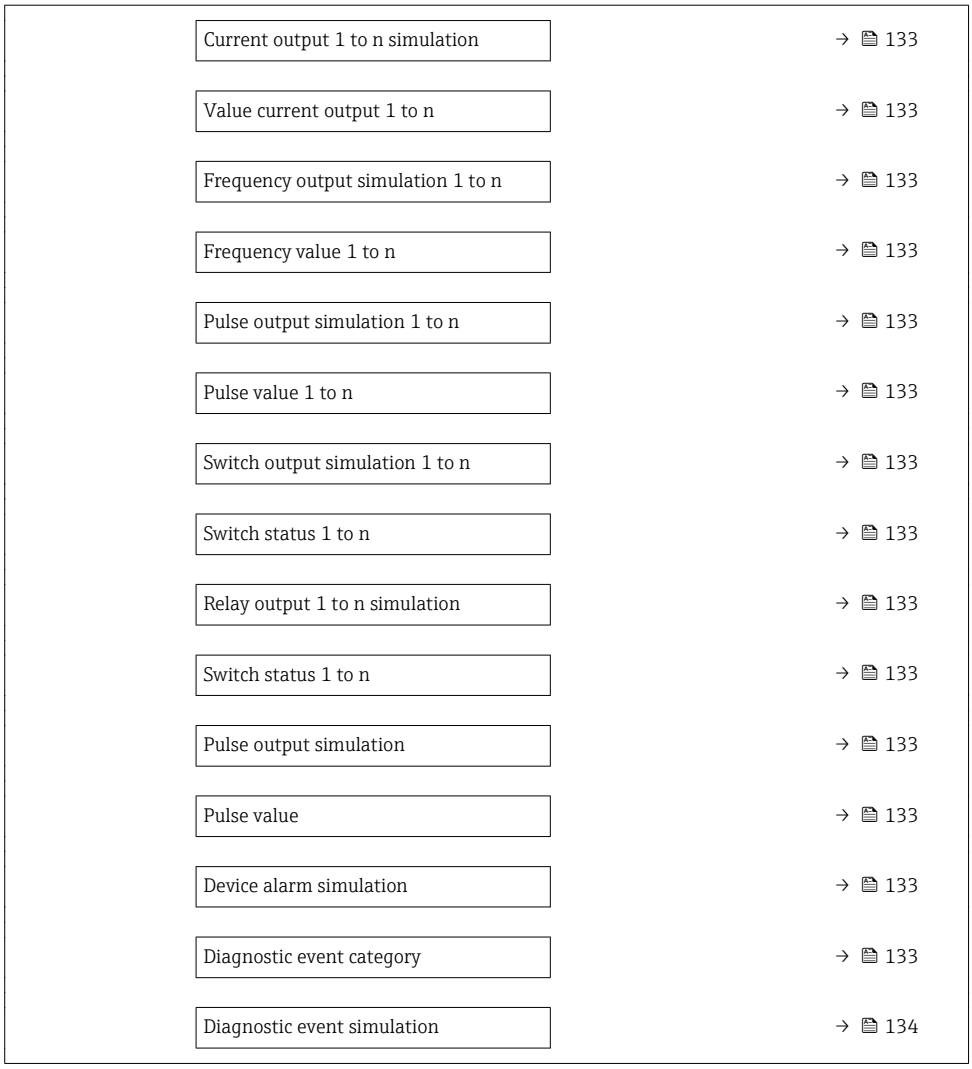
Using the parameter to reset the device

Navigation
"Setup" menu → Advanced setup → Administration

Parameter overview with brief description



Parameter	Description	Selection	Factory setting
Device reset	Reset the device configuration - either entirely or in part - to a defined state.	▪ Cancel ▪ To delivery settings ▪ Restart device ▪ Restore S-DAT backup *	Cancel



* Visibility depends on order options or device settings

10.6 Simulation

The **Simulation** submenu enables you to simulate, without a real flow situation, various process variables in the process and the device alarm mode and to verify downstream signal chains (switching valves or closed-control loops).

Navigation
"Diagnostics" menu → Simulation

Parameter overview with brief description

Parameter	Prerequisite	Description	Selection / User entry / User interface	Factory setting
Assign simulation process variable	–	Select a process variable for the simulation process that is activated.	▪ Off ▪ Volume flow ▪ Mass flow ▪ Corrected volume flow ▪ Flow velocity ▪ Conductivity *	Off
Process variable value	A process variable is selected in the **Assign simulation process variable** parameter (→ 132).	Enter the simulation value for the selected process variable.	Depends on the process variable selected	0
Status input simulation 1 to n	–	Switch simulation of the status input on and off.	▪ Off ▪ On	Off
Input signal level 1 to n	In the **Status input simulation** parameter, the **On** option is selected.	Select the signal level for the simulation of the status input.	▪ High ▪ Low	High

Parameter	Prerequisite	Description	Selection / User entry / User interface	Factory setting
Current input 1 to n simulation	–	Switch simulation of the current input on and off.	▪ Off ▪ On	Off
Value current input 1 to n	In the **Current input 1 to n simulation** parameter, the **On** option is selected.	Enter the current value for simulation.	0 to 22.5 mA	0 mA
Current output 1 to n simulation	–	Switch the simulation of the current output on and off.	▪ Off ▪ On	Off
Value current output 1 to n	In the **Current output 1 to n simulation** parameter, the **On** option is selected.	Enter the current value for simulation.	3.59 to 22.5 mA	3.59 mA
Frequency output simulation 1 to n	In the **Operating mode** parameter, the **Frequency** option is selected.	Switch the simulation of the frequency output on and off.	▪ Off ▪ On	Off
Frequency value 1 to n	In the **Frequency output simulation 1 to n** parameter, the **On** option is selected.	Enter the frequency value for the simulation.	0.0 to 12 500.0 Hz	0.0 Hz
Pulse output simulation 1 to n	In the **Operating mode** parameter, the **Pulse** option is selected.	Set and switch off the pulse output simulation. For **Fixed value** option: **Pulse width** parameter (→ 106) defines the pulse width of the pulses output.	▪ Off ▪ Fixed value ▪ Down-counting value	Off
Pulse value 1 to n	In the **Pulse output simulation 1 to n** parameter, the **Down-counting value** option is selected.	Enter the number of pulses for simulation.	0 to 65 535	0
Switch output simulation 1 to n	In the **Operating mode** parameter, the **Switch** option is selected.	Switch the simulation of the switch output on and off.	▪ Off ▪ On	Off
Switch status 1 to n	–	Select the status of the status output for the simulation.	▪ Open ▪ Closed	Open
Relay output 1 to n simulation	–	Switch simulation of the relay output on and off.	▪ Off ▪ On	Off
Switch status 1 to n	The **On** option is selected in the **Switch output simulation 1 to n** parameter parameter.	Select status of the relay output for the simulation.	▪ Open ▪ Closed	Open
Pulse output simulation	–	Set and switch off the pulse output simulation. For **Fixed value** option: **Pulse width** parameter defines the pulse width of the pulses output.	▪ Off ▪ Fixed value ▪ Down-counting value	Off
Pulse value	In the **Pulse output simulation** parameter, the **Down-counting value** option is selected.	Set and switch off the pulse output simulation.	0 to 65 535	0
Device alarm simulation	–	Switch the device alarm on and off.	▪ Off ▪ On	Off
Diagnostic event category	–	Select a diagnostic event category.	▪ Sensor ▪ Electronics ▪ Configuration ▪ Process	Process

Parameter	Prerequisite	Description	Selection / User entry / User interface	Factory setting
Diagnostic event simulation	–	Select a diagnostic event to simulate this event.	▪ Off ▪ Diagnostic event picklist (depends on the category selected)	Off
Logging interval	–	Define the logging interval tlog for data logging. This value defines the time interval between the individual data points in the memory.	1.0 to 3 600.0 s	–

* Visibility depends on order options or device settings

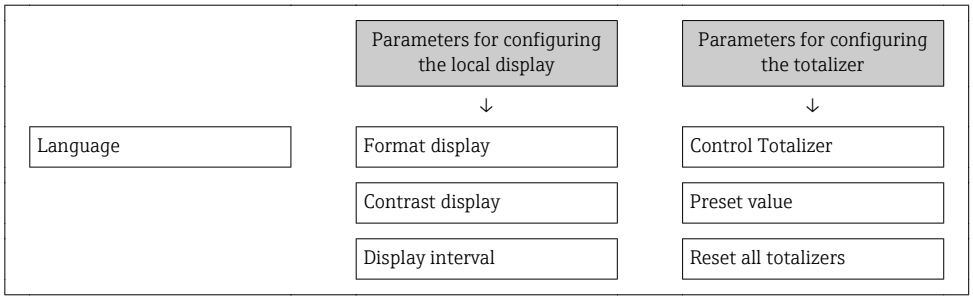
10.7 Protecting settings from unauthorized access

The following write protection options exist in order to protect the configuration of the measuring device from unintentional modification:
- Protect access to parameters via access code → 134
- Protect access to local operation via key locking → 77
- Protect access to measuring device via write protection switch → 135

10.7.1 Write protection via access code

The effects of the user-specific access code are as follows:
- Via local operation, the parameters for the measuring device configuration are write-protected and their values can no longer be changed.
- Device access is protected via the Web browser, as are the parameters for the measuring device configuration.
- Device access is protected via FieldCare or DeviceCare (via CDI-RJ45 service interface), as are the parameters for the measuring device configuration.

Defining the access code via local display



1. Navigate to the **Define access code** parameter (→ 130).
2. Define a max. 16-digit character string comprising numbers, letters and special characters as the access code.
3. Enter the access code again in the **Confirm access code** parameter (→ 130) to confirm the code.
   ↳ The -symbol appears in front of all write-protected parameters.

The device automatically locks the write-protected parameters again if a key is not pressed for 10 minutes in the navigation and editing view. The device locks the write-protected parameters automatically after 60 s if the user skips back to the operational display mode from the navigation and editing view.

- If parameter write protection is activated via an access code, it can also only be deactivated via this access code → 76.
- The user role with which the user is currently logged on via the local display → 76 is indicated by the **Access status** parameter. Navigation path: Operation → Access status

Parameters which can always be modified via the local display

Certain parameters that do not affect the measurement are excepted from parameter write protection via the local display. Despite the user-specific access code, they can always be modified, even if the other parameters are locked.

Defining the access code via the Web browser

1. Navigate to the **Define access code** parameter (→ 130).
2. Define a max. 16-digit numeric code as an access code.
3. Enter the access code again in the **Confirm access code** parameter (→ 130) to confirm the code.
   ↳ The Web browser switches to the login page.

If no action is performed for 10 minutes, the Web browser automatically returns to the login page.

- If parameter write protection is activated via an access code, it can also only be deactivated via this access code → 76.
- The user role with which the user is currently logged on via Web browser is indicated by the **Access status** parameter. Navigation path: Operation → Access status

Resetting the access code

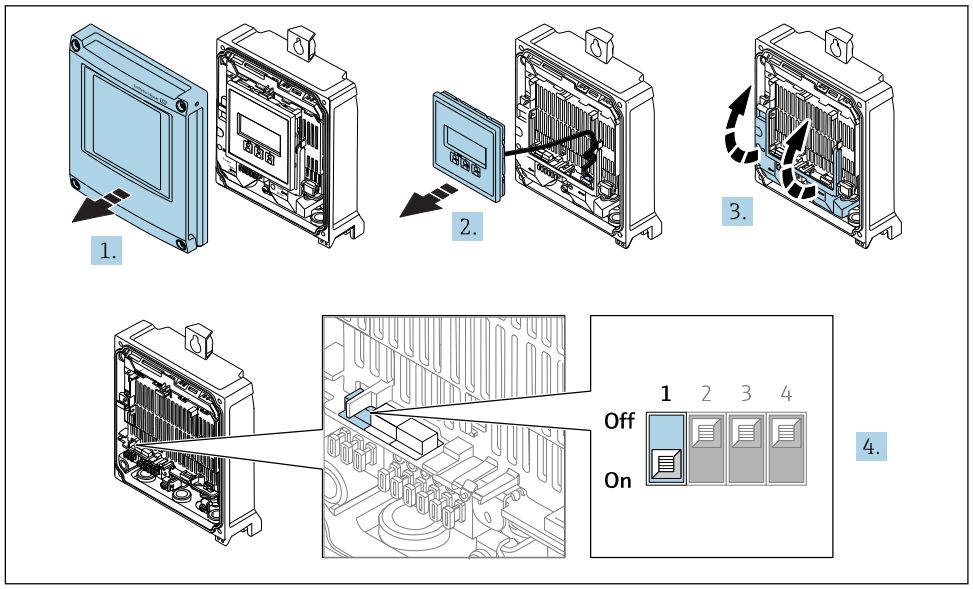
If you misplace the user-specific access code, it is possible to reset the code to the factory setting. A reset code must be entered for this purpose. The user-specific access code can then be defined again afterwards.

Via Web browser, FieldCare, DeviceCare (via CDI-RJ45 service interface), fieldbus

For a reset code, contact your Endress+Hauser service organization.

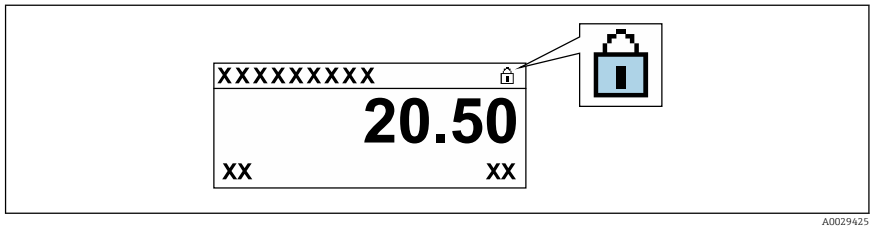
1. Navigate to the **Reset access code** parameter (→ 131).
2. Enter the reset code.
   ↳ The access code has been reset to the factory setting **0000**. It can be redefined → 134.

10.7.2 Write protection via write protection switch



Unlike parameter write protection via a user-specific access code, this allows write access to the entire operating menu - except for the **"Contrast display" parameter** - to be locked.

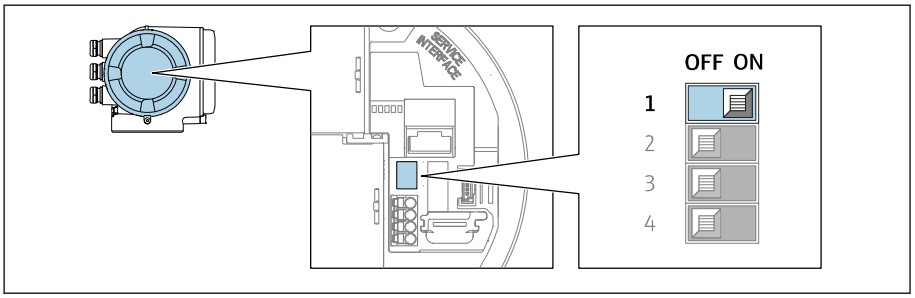
The parameter values are now read only and cannot be edited any more (exception **"Contrast display" parameter**):
- Via local display
- Via HART protocol



Proline 500 – digital

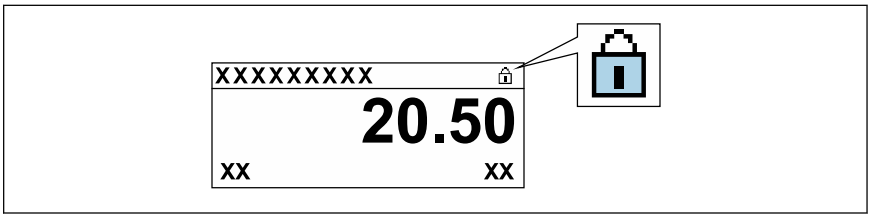
WARNING

Excessive tightening torque applied to the fixing screws!
Risk of damaging the plastic transmitter.
► Tighten the fixing screws as per the tightening torque: 2 Nm (1.5 lbf ft)



1. Open the housing cover.
2. Remove the display module.
3. Fold open the terminal cover.
4. Setting the write protection (WP) switch on the main electronics module to the **ON** position enables hardware write protection.
   ↳ In the **Locking status** parameter the **Hardware locked** option is displayed → 138. In addition, on the local display the -symbol appears in front of the parameters in the header of the operational display and in the navigation view.

5. Setting the write protection (WP) switch on the main electronics module to the **OFF** position (factory setting) disables hardware write protection.
   ↳ No option is displayed in the **Locking status** parameter → 138. On the local display, the -symbol disappears from in front of the parameters in the header of the operational display and in the navigation view.



Proline 500

1.

Setting the write protection (WP) switch on the main electronics module to the **ON** position enables hardware write protection.

↳ In the **Locking status** parameter the **Hardware locked** option is displayed → 138. In addition, on the local display the -symbol appears in front of the parameters in the header of the operational display and in the navigation view.

2. Setting the write protection (WP) switch on the main electronics module to the **OFF** position (factory setting) disables hardware write protection.

↳ No option is displayed in the **Locking status** parameter → 138. On the local display, the -symbol disappears from in front of the parameters in the header of the operational display and in the navigation view.

11 Operation

11.1 Reading the device locking status

Device active write protection: **Locking status** parameter

Operation → Locking status

Function scope of the "Locking status" parameter

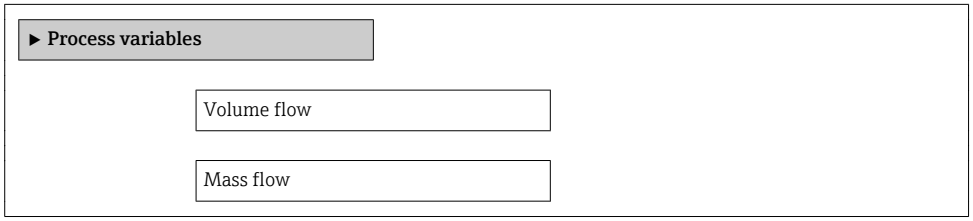
Options	Description
None	The access status displayed in the **Access status** parameter applies → 📄 76. Only appears on local display.
Hardware locked	The DIP switch for hardware locking is activated on the PCB board. This locks write access to the parameters (e.g. via local display or operating tool) → 📄 135.
SIL locked	The SIL mode is enabled. This locks write access to the parameters (e.g. via local display or operating tool).
Temporarily locked	Write access to the parameters is temporarily locked on account of internal processes running in the device (e.g. data upload/download, reset etc.). Once the internal processing has been completed, the parameters can be changed once again.

11.2 Adjusting the operating language

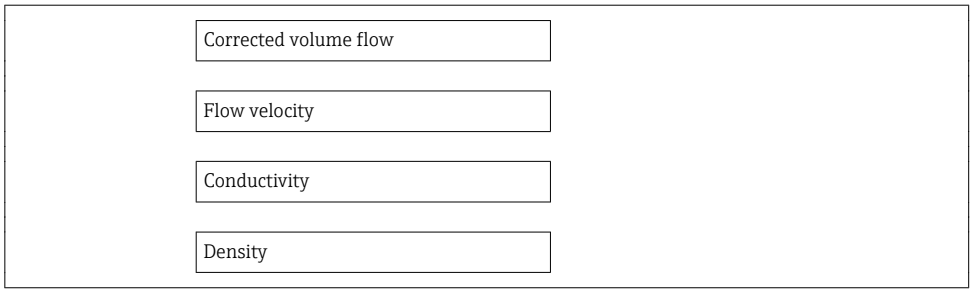
Detailed information:
- To configure the operating language → 📄 95
- For information on the operating languages supported by the measuring device → 📄 201

11.3 Configuring the display

Detailed information:
- On the basic settings for the local display → 📄 111
- On the advanced settings for the local display → 📄 123



11.4 Reading measured values



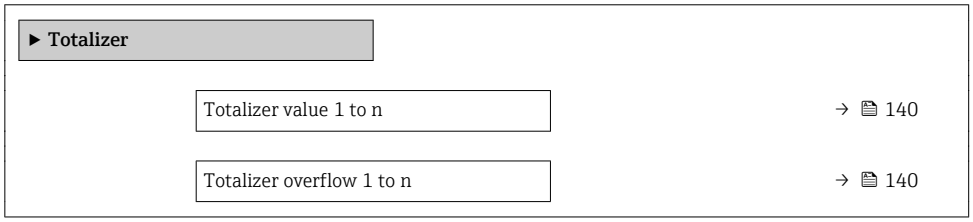
With the **Measured values** submenu, it is possible to read all the measured values.

11.4.1 "Process variables" submenu

The **Process variables** submenu contains all the parameters needed to display the current measured values for each process variable.

Navigation
"Diagnostics" menu → Measured values → Process variables

Parameter overview with brief description



Parameter	Description	User interface
Volume flow	Displays the volume flow that is currently measured. *Dependency* The unit is taken from the **Volume flow unit** parameter (→ 🖹 98).	Signed floating-point number
Mass flow	Displays the mass flow currently calculated. *Dependency* The unit is taken from the **Mass flow unit** parameter (→ 🖹 98).	Signed floating-point number
Corrected volume flow	Displays the corrected volume flow that is currently calculated. *Dependency* The unit is taken from the **Corrected volume flow unit** parameter (→ 🖹 99).	Signed floating-point number
Flow velocity	Displays the flow velocity that is currently calculated.	Signed floating-point number
Conductivity	Displays the conductivity that is currently measured. *Dependency* The unit is taken from the **Conductivity unit** parameter (→ 🖹 98).	Signed floating-point number
Density	Displays the current fixed density or density read in from an external device. *Dependency* The unit is taken from the **Density unit** parameter.	Signed floating-point number

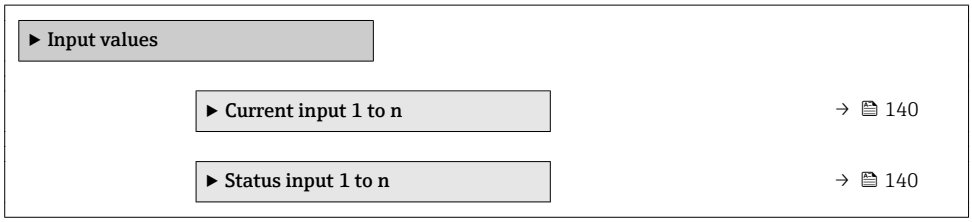
11.4.2 "Totalizer" submenu

The **Totalizer** submenu contains all the parameters needed to display the current measured values for every totalizer.

Navigation

"Diagnostics" menu → Measured values → Totalizer

Parameter overview with brief description



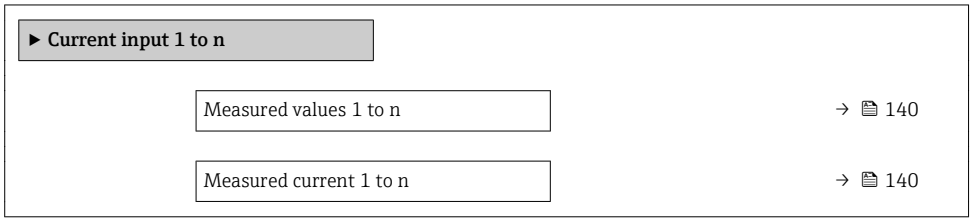
Parameter	Prerequisite	Description	User interface
Totalizer value 1 to n	A process variable is selected in the **Assign process variable** parameter (→ 122) of the **Totalizer 1 to n** submenu.	Displays the current totalizer counter value.	Signed floating-point number
Totalizer overflow 1 to n	A process variable is selected in the **Assign process variable** parameter (→ 122) of the **Totalizer 1 to n** submenu.	Displays the current totalizer overflow.	Integer with sign

11.4.3 "Input values" submenu

The **Input values** submenu guides you systematically to the individual input values.

Navigation

"Diagnostics" menu → Measured values → Input values

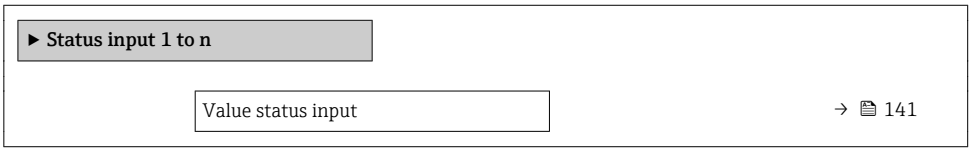


Input values of current input

The **Current input 1 to n** submenu contains all the parameters needed to display the current measured values for every current input.

Navigation

"Diagnostics" menu → Measured values → Input values → Current input 1 to n



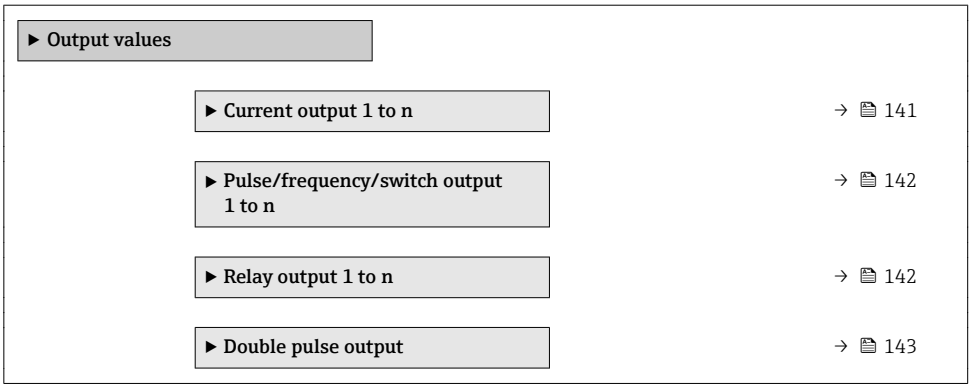
Parameter overview with brief description

Parameter	Description	User interface
Measured values 1 to n	Displays the current input value.	Signed floating-point number
Measured current 1 to n	Displays the current value of the current input.	0 to 22.5 mA

Input values of status input

The **Status input 1 to n** submenu contains all the parameters needed to display the current measured values for every status input.

Navigation
"Diagnostics" menu → Measured values → Input values → Status input 1 to n

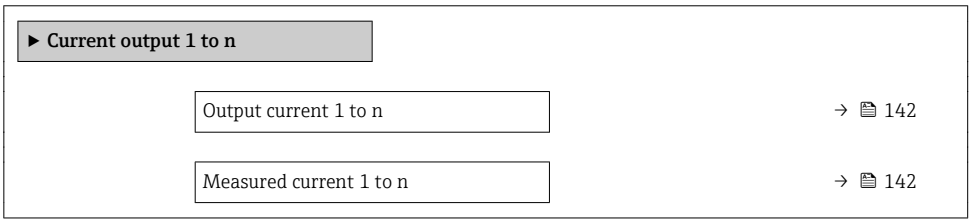


Parameter overview with brief description

Parameter	Description	User interface
Value status input	Shows the current input signal level.	▪ High ▪ Low

11.4.4 Output values

The **Output values** submenu contains all the parameters needed to display the current measured values for every output.



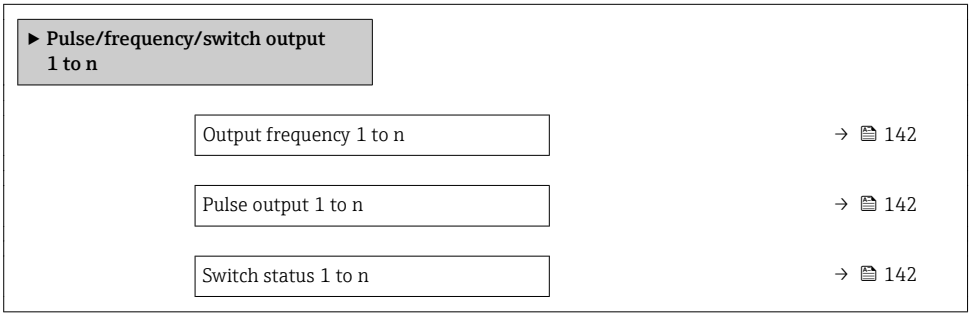
Navigation
"Diagnostics" menu → Measured values → Output values

Output values of current output

The **Value current output** submenu contains all the parameters needed to display the current measured values for every current output.

Navigation
"Diagnostics" menu → Measured values → Output values → Value current output 1 to n

Parameter overview with brief description



Parameter	Description	User interface
Output current 1	Displays the current value currently calculated for the current output.	3.59 to 22.5 mA
Measured current	Displays the current value currently measured for the current output.	0 to 30 mA

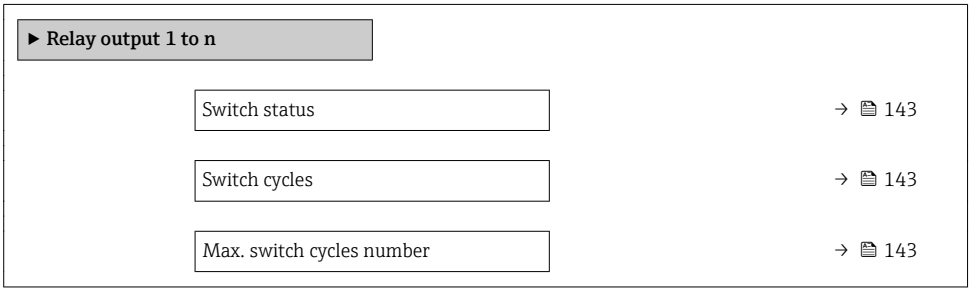
Output values for pulse/frequency/switch output

The **Pulse/frequency/switch output 1 to n** submenu contains all the parameters needed to display the current measured values for every pulse/frequency/switch output.

Navigation

"Diagnostics" menu → Measured values → Output values → Pulse/frequency/switch output 1 to n

Parameter overview with brief description



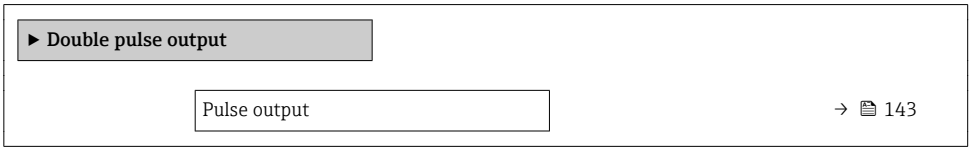
Parameter	Prerequisite	Description	User interface
Output frequency 1 to n	In the **Operating mode** parameter, the **Frequency** option is selected.	Displays the value currently measured for the frequency output.	0.0 to 12 500.0 Hz
Pulse output 1 to n	The **Pulse** option is selected in the **Operating mode** parameter parameter.	Displays the pulse frequency currently output.	Positive floating-point number
Switch status 1 to n	The **Switch** option is selected in the **Operating mode** parameter.	Displays the current switch output status.	▪ Open ▪ Closed

Output values for relay output

The **Relay output 1 to n** submenu contains all the parameters needed to display the current measured values for every relay output.

Navigation

"Diagnostics" menu → Measured values → Output values → Relay output 1 to n



Parameter overview with brief description

Parameter	Description	User interface
Switch status	Shows the current relay switch status.	▪ Open ▪ Closed
Switch cycles	Shows number of all performed switch cycles.	Positive integer
Max. switch cycles number	Shows the maximal number of guaranteed switch cycles.	Positive integer

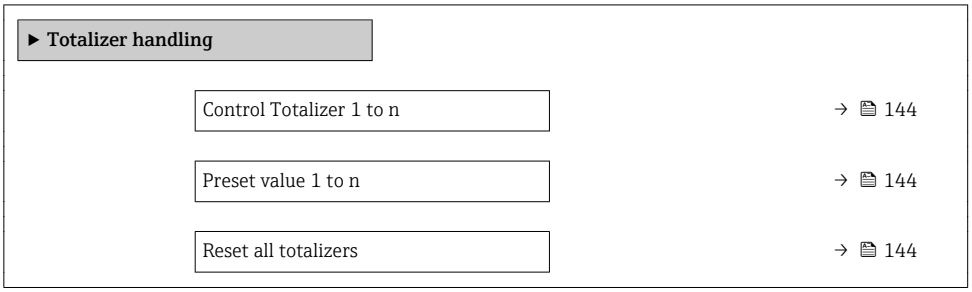
Output values for double pulse output

The **Double pulse output** submenu contains all the parameters needed to display the current measured values for every double pulse output.

Navigation
"Diagnostics" menu → Measured values → Output values → Double pulse output

Parameter overview with brief description

Parameter	Description	User interface
Pulse output	Shows the currently output pulse frequency.	Positive floating-point number



11.5 Adapting the measuring device to the process conditions

The following are available for this purpose:
- Basic settings using the**Setup** menu (→ 95)
- Advanced settings using the**Advanced setup** submenu (→ 120)

11.6 Performing a totalizer reset

The totalizers are reset in the **Operation** submenu:
- Control Totalizer
- Reset all totalizers

Navigation
"Operation" menu → Totalizer handling

Parameter overview with brief description

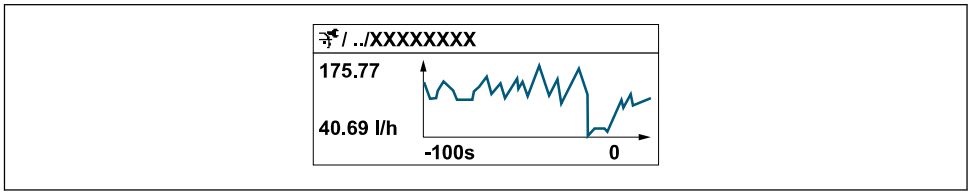
Parameter	Prerequisite	Description	Selection / User entry	Factory setting
Control Totalizer 1 to n	A process variable is selected in the **Assign process variable** parameter (→ 122) of the **Totalizer 1 to n** submenu.	Control totalizer value.	▪ Totalize ▪ Reset + hold * ▪ Preset + hold * ▪ Reset + totalize ▪ Preset + totalize * ▪ Hold *	Totalize
Preset value 1 to n	A process variable is selected in the **Assign process variable** parameter (→ 122) of the **Totalizer 1 to n** submenu.	Specify start value for totalizer. *Dependency* The unit of the selected process variable is specified for the totalizer in the **Unit totalizer** parameter (→ 122).	Signed floating-point number	0 l
Reset all totalizers	–	Reset all totalizers to 0 and start.	▪ Cancel ▪ Reset + totalize	Cancel

* Visibility depends on order options or device settings

11.6.1 Function scope of the "Control Totalizer" parameter

Options	Description
Totalize	The totalizer is started or continues running.
Reset + hold	The totaling process is stopped and the totalizer is reset to 0.
Preset + hold	The totaling process is stopped and the totalizer is set to its defined start value from the **Preset value** parameter.
Reset + totalize	The totalizer is reset to 0 and the totaling process is restarted.
Preset + totalize	The totalizer is set to the defined start value from the **Preset value** parameter and the totaling process is restarted.
Hold	Totalizing is stopped.

11.6.2 Function scope of the "Reset all totalizers" parameter

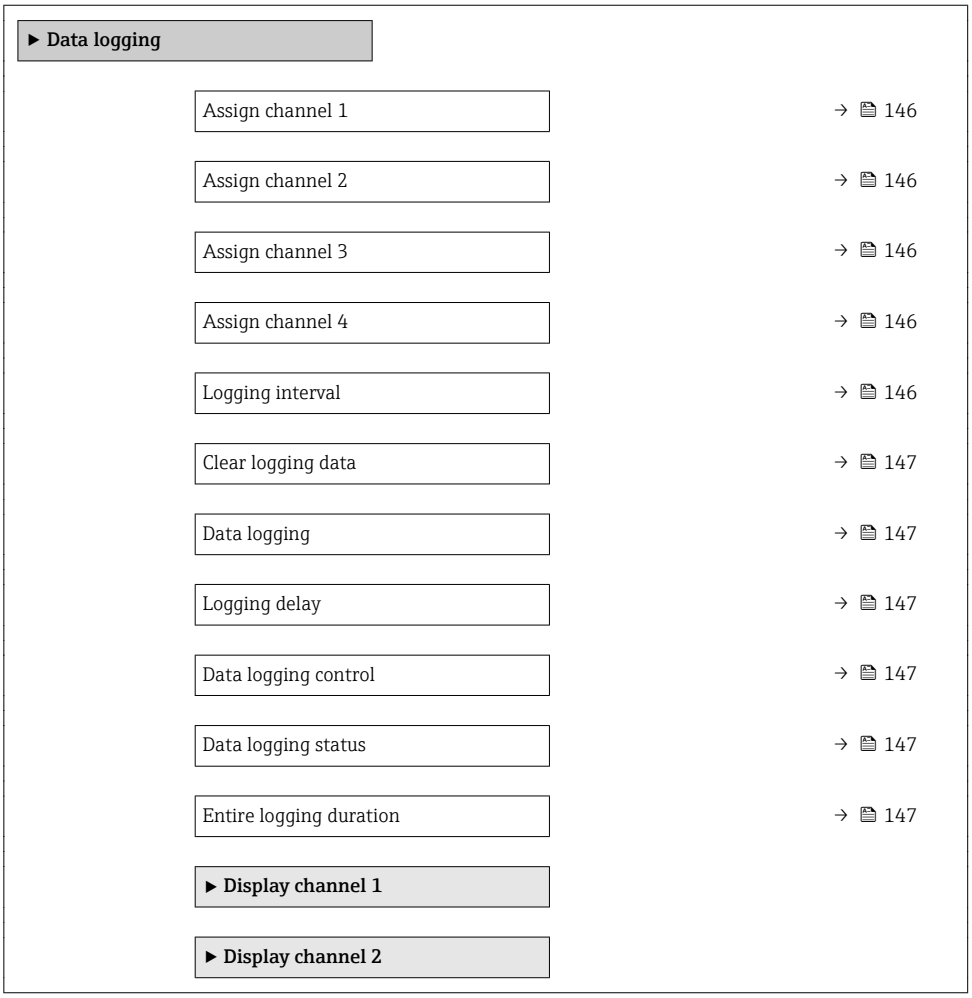


Options	Description
Cancel	No action is executed and the user exits the parameter.
Reset + totalize	Resets all totalizers to 0 and restarts the totaling process. This deletes all the flow values previously totalized.

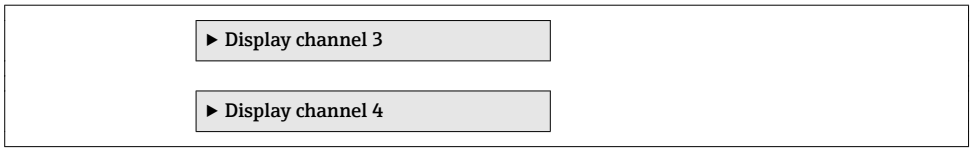
11.7 Showing data logging

The **Extended HistoROM** application package must be enabled in the device (order option) for the **Data logging** submenu to appear. This contains all the parameters for the measured value history.

Data logging is also available via:
- Plant Asset Management Tool FieldCare → 88.
- Web browser



Function range
- A total of 1000 measured values can be stored
- 4 logging channels
- Adjustable logging interval for data logging
- Displays the measured value trend for each logging channel in the form of a chart



- x-axis: depending on the number of channels selected displays 250 to 1000 measured values of a process variable.
- y-axis: displays the approximate measured value span and constantly adapts this to the ongoing measurement.

If the length of the logging interval or the assignment of the process variables to the channels is changed, the content of the data logging is deleted.

Navigation
"Diagnostics" menu → Data logging

Parameter overview with brief description

Parameter	Prerequisite	Description	Selection / User entry / User interface	Factory setting
Assign channel 1	The **Extended HistoROM** application package is available.	Assign process variable to logging channel.	▪ Off ▪ Volume flow ▪ Mass flow ▪ Corrected volume flow ▪ Flow velocity ▪ Conductivity * ▪ Electronic temperature ▪ Current output 1 * ▪ Current output 2 * ▪ Current output 3 * ▪ Current output 4 * ▪ Noise * ▪ Coil current shot time * ▪ Reference electrode potential against PE * ▪ Coating measured value * ▪ Test point 1 ▪ Test point 2 ▪ Test point 3	Off
Assign channel 2	The **Extended HistoROM** application package is available. The software options currently enabled are displayed in the **Software option overview** parameter.	Assign process variable to logging channel.	Picklist, see **Assign channel 1** parameter (→ 146)	Off
Assign channel 3	The **Extended HistoROM** application package is available. The software options currently enabled are displayed in the **Software option overview** parameter.	Assign process variable to logging channel.	Picklist, see **Assign channel 1** parameter (→ 146)	Off
Assign channel 4	The **Extended HistoROM** application package is available. The software options currently enabled are displayed in the **Software option overview** parameter.	Assign process variable to logging channel.	Picklist, see **Assign channel 1** parameter (→ 146)	Off
Logging interval	The **Extended HistoROM** application package is available.	Define the logging interval for data logging. This value defines the time interval between the individual data points in the memory.	0.1 to 3 600.0 s	1.0 s

Parameter	Prerequisite	Description	Selection / User entry / User interface	Factory setting
Clear logging data	The **Extended HistoROM** application package is available.	Clear the entire logging data.	▪ Cancel ▪ Clear data	Cancel
Data logging	–	Select the data logging method.	▪ Overwriting ▪ Not overwriting	Overwriting
Logging delay	In the **Data logging** parameter, the **Not overwriting** option is selected.	Enter the time delay for measured value logging.	0 to 999 h	0 h
Data logging control	In the **Data logging** parameter, the **Not overwriting** option is selected.	Start and stop measured value logging.	▪ None ▪ Delete + start ▪ Stop	None
Data logging status	In the **Data logging** parameter, the **Not overwriting** option is selected.	Displays the measured value logging status.	▪ Done ▪ Delay active ▪ Active ▪ Stopped	Done
Entire logging duration	In the **Data logging** parameter, the **Not overwriting** option is selected.	Displays the total logging duration.	Positive floating-point number	0 s

* Visibility depends on order options or device settings

12 Diagnostics and troubleshooting

12.1 General troubleshooting

For local display

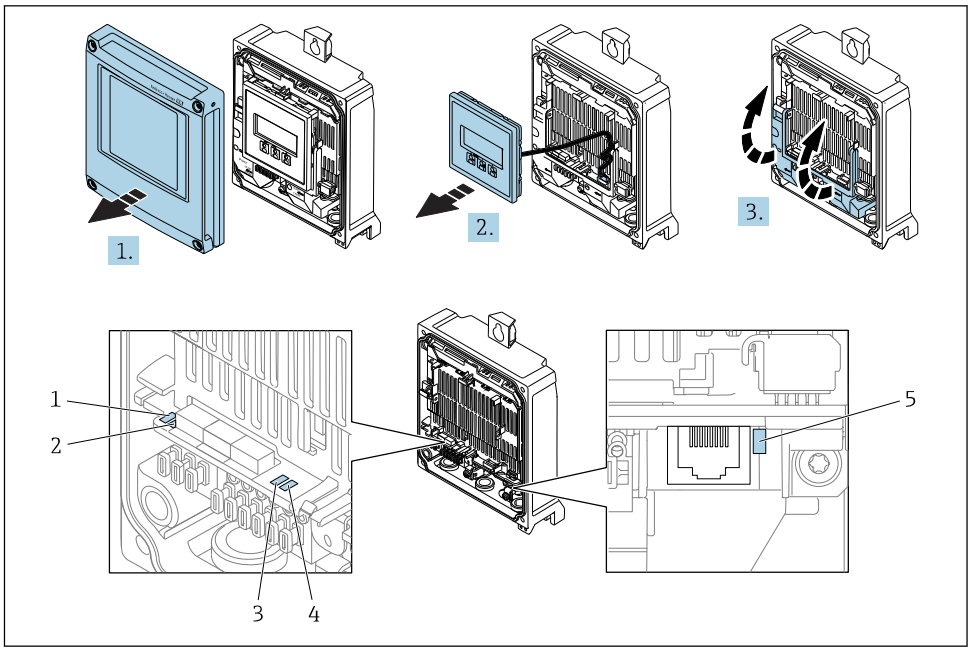
Error	Possible causes	Solution
Local display dark and no output signals	Supply voltage does not match the value indicated on the nameplate.	Apply the correct supply voltage .
Local display dark and no output signals	The polarity of the supply voltage is wrong.	Correct the polarity.
Local display dark and no output signals	No contact between connecting cables and terminals.	Check the connection of the cables and correct if necessary.
Local display dark and no output signals	Terminals are not plugged into the I/O electronics module correctly. Terminals are not plugged into the main electronics module correctly.	Check terminals.
Local display dark and no output signals	I/O electronics module is defective. Main electronics module is defective.	Order spare part → 174.
Local display dark and no output signals	The connector between the main electronics module and display module is not plugged in correctly.	Check the connection and correct if necessary.
Local display dark and no output signals	The connecting cable is not plugged in correctly.	1. Check the connection of the electrode cable and correct if necessary. 2. Check the connection of the coil current cable and correct if necessary.
Local display is dark, but signal output is within the valid range	Display is set too bright or too dark.	▪ Set the display brighter by simultaneously pressing ⊞ + Ⓔ. ▪ Set the display darker by simultaneously pressing ⊟ + Ⓔ.
Local display is dark, but signal output is within the valid range	The cable of the display module is not plugged in correctly.	Insert the plug correctly into the main electronics module and display module.
Local display is dark, but signal output is within the valid range	Display module is defective.	Order spare part → 174.
Backlighting of local display is red	Diagnostic event with "Alarm" diagnostic behavior has occurred.	Take remedial measures → 160
Text on local display appears in a foreign language and cannot be understood.	Incorrect operating language is configured.	1. Press ⊟ + ⊞ for 2 s ("home position"). 2. Press Ⓔ. 3. Set the desired language in the **Display language** parameter (→ 125).
Message on local display: "Communication Error" "Check Electronics"	Communication between the display module and the electronics is interrupted.	▪ Check the cable and the connector between the main electronics module and display module. ▪ Order spare part → 174.

For output signals

Error	Possible causes	Solution
Signal output outside the valid range	Main electronics module is defective.	Order spare part → 🖹 174.
Signal output outside the valid current range (< 3.6 mA or > 22 mA)	Main electronics module is defective. I/O electronics module is defective.	Order spare part → 🖹 174.
Device shows correct value on local display, but signal output is incorrect, though in the valid range.	Configuration error	Check and correct the parameter configuration.
Device measures incorrectly.	Configuration error or device is operated outside the application.	1. Check and correct parameter configuration. 2. Observe limit values specified in the "Technical Data".

For access

Error	Possible causes	Solution
No write access to parameters	Hardware write protection enabled	Set the write protection switch on main electronics module to the **OFF** position → 🖹 135.
No write access to parameters	Current user role has limited access authorization	1. Check user role → 🖹 76. 2. Enter correct customer-specific access code → 🖹 76.
No connection via HART protocol	Communication resistor missing or incorrectly installed.	Install the communication resistor (250 Ω) correctly. Observe the maximum load → 🖹 184.
No connection via HART protocol	Commubox ▪ Connected incorrectly ▪ Configured incorrectly ▪ Drivers not installed correctly ▪ USB interface on computer configured incorrectly	Observe the documentation for the Commubox. FXA195 HART: Document "Technical Information" TI00404F
Not connecting to Web server	Web server disabled	Using the "FieldCare" or "DeviceCare" operating tool, check whether the Web server of the measuring device is enabled, and enable it if necessary→ 🖹 83.
	Incorrect setting for the Ethernet interface of the computer	1. Check the properties of the Internet protocol (TCP/IP) → 🖹 79→ 🖹 79. 2. Check the network settings with the IT manager.
Not connecting to Web server	Incorrect IP address	Check the IP address: 192.168.1.212 → 🖹 79→ 🖹 79
Not connecting to Web server	Incorrect WLAN access data	▪ Check WLAN network status. ▪ Log on to the device again using WLAN access data. ▪ Verify that WLAN is enabled on the measuring device and operating device → 🖹 79.
	WLAN communication disabled	–
Not connecting to Web server, FieldCare or DeviceCare	No WLAN network available	▪ Check if WLAN reception is present: LED on display module is lit blue ▪ Check if WLAN connection is enabled: LED on display module flashes blue ▪ Switch on instrument function.



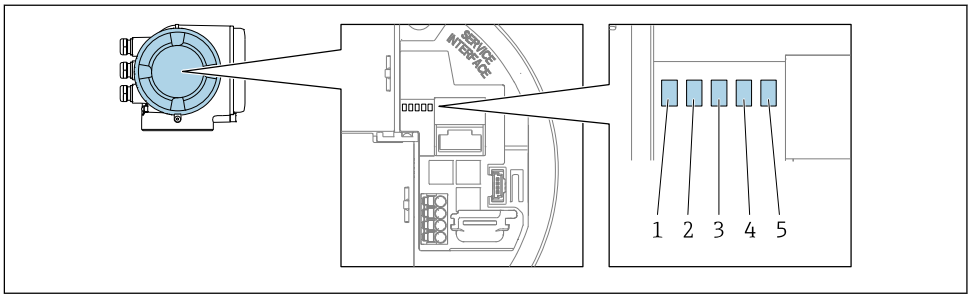
Error	Possible causes	Solution
Network connection not present or unstable	WLAN network is weak.	▪ Operating device is outside of reception range: Check network status on operating device. ▪ To improve network performance, use an external WLAN antenna.
	Parallel WLAN and Ethernet communication	▪ Check network settings. ▪ Temporarily enable only the WLAN as an interface.
Web browser frozen and operation no longer possible	Data transfer active	Wait until data transfer or current action is finished.
	Connection lost	1. Check cable connection and power supply. 2. Refresh the Web browser and restart if necessary.
Content of Web browser incomplete or difficult to read	Not using optimum version of Web server.	1. Use the correct Web browser version → 🖹 78. 2. Clear the Web browser cache and restart the Web browser.
	Unsuitable view settings.	Change the font size/display ratio of the Web browser.
No or incomplete display of contents in the Web browser	▪ JavaScript not enabled ▪ JavaScript cannot be enabled	1. Enable JavaScript. 2. Enter http://XXX.XXX.X.XXX/basic.html as the IP address.
Operation with FieldCare or DeviceCare via CDI-RJ45 service interface (port 8000)	Firewall of computer or network is preventing communication	Depending on the settings of the firewall used on the computer or in the network, the firewall must be adapted or disabled to allow FieldCare/DeviceCare access.
Flashing of firmware with FieldCare or DeviceCare via CDI-RJ45 service interface (via port 8000 or TFTP ports)	Firewall of computer or network is preventing communication	Depending on the settings of the firewall used on the computer or in the network, the firewall must be adapted or disabled to allow FieldCare/DeviceCare access.

12.2 Diagnostic information via light emitting diodes

12.2.1 Transmitter

Proline 500 – digital

Different LEDs in the transmitter provide information on the device status.



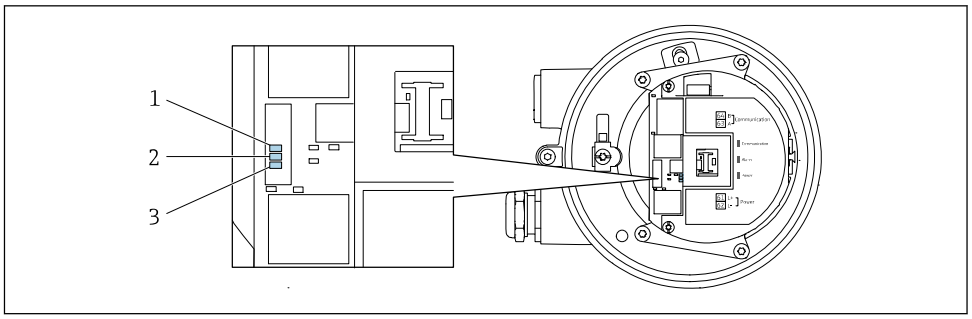
1 Supply voltage
2 Device status
3 Not used
4 Communication
5 Service interface (CDI) active

1. Open the housing cover.
2. Remove the display module.
3. Fold open the terminal cover.

LED		Color	Meaning
1	Supply voltage	Off	Supply voltage is off or too low.
		Green	Supply voltage is ok.
2	Device status (normal operation)	Off	Firmware error
		Green	Device status is ok.
		Flashing green	Device is not configured.
		Flashing red	A diagnostic event with "Warning" diagnostic behavior has occurred.
		Red	A diagnostic event with "Alarm" diagnostic behavior has occurred.
		Flashing red/green	The device restarts.
2	Device status (during start-up)	Flashes red slowly	If > 30 seconds: problem with the boot loader.
		Flashes red quickly	If > 30 seconds: compatibility problem when reading the firmware.
3	Not used	–	–
4	Communication	Off	Communication not active.
		White	Communication active.
5	Service interface (CDI)	Off	Not connected or no connection established.
		Yellow	Connected and connection established.
		Flashing yellow	Service interface active.

Proline 500

Different LEDs in the transmitter provide information on the device status.



1 *Supply voltage*
2 *Device status*
3 *Not used*
4 *Communication*
5 *Service interface (CDI) active*

LED		Color	Meaning
1	Supply voltage	Off	Supply voltage is off or too low.
		Green	Supply voltage is ok.
2	Device status (normal operation)	Off	Firmware error
		Green	Device status is ok.
		Flashing green	Device is not configured.
		Red	A diagnostic event with "Alarm" diagnostic behavior has occurred.
		Flashing red	A diagnostic event with "Warning" diagnostic behavior has occurred.
		Flashing red/green	The device restarts.
2	Device status (during start-up)	Flashes red slowly	If > 30 seconds: problem with the boot loader.
		Flashes red quickly	If > 30 seconds: compatibility problem when reading the firmware.
3	Not used	–	–
4	Communication	Off	Communication not active.
		White	Communication active.
5	Service interface (CDI)	Off	Not connected or no connection established.
		Yellow	Connected and connection established.
		Flashing yellow	Service interface active.

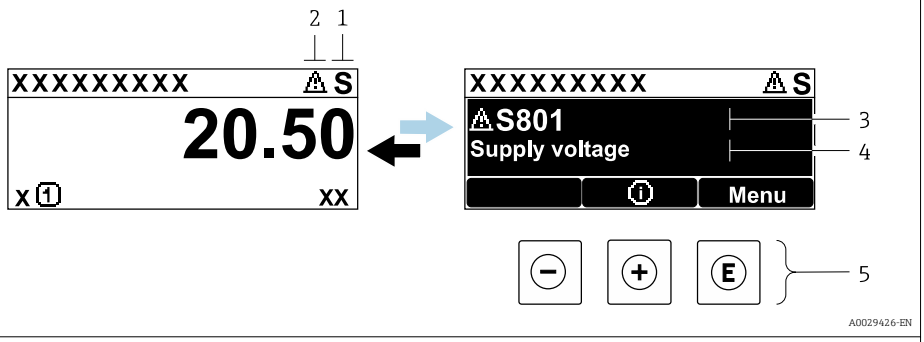
12.2.2 Sensor connection housing

Proline 500 – digital

Various light emitting diodes (LED) on the ISEM electronics (Intelligent Sensor Electronic Module) in the sensor connection housing provide information on the device status.

A0029699

1 Communication
2 Device status
3 Supply voltage



LED		Color	Meaning
1	Communication	White	Communication active.
2	Device status (normal operation)	Red	Problem
		Flashing red	Warning
2	Device status (during start-up)	Flashes red slowly	If > 30 seconds: problem with the boot loader.
		Flashes red quickly	If > 30 seconds: compatibility problem when reading the firmware.
3	Supply voltage	Green	Supply voltage is ok.
		Off	Supply voltage is off or too low.

12.3 Diagnostic information on local display

12.3.1 Diagnostic message

Faults detected by the self-monitoring system of the measuring device are displayed as a diagnostic message in alternation with the operational display.

Operational display in alarm condition	Diagnostic message

1 *Status signal*
2 *Diagnostic behavior*
3 *Diagnostic behavior with diagnostic code*
4 *Short text*
5 *Operating elements*

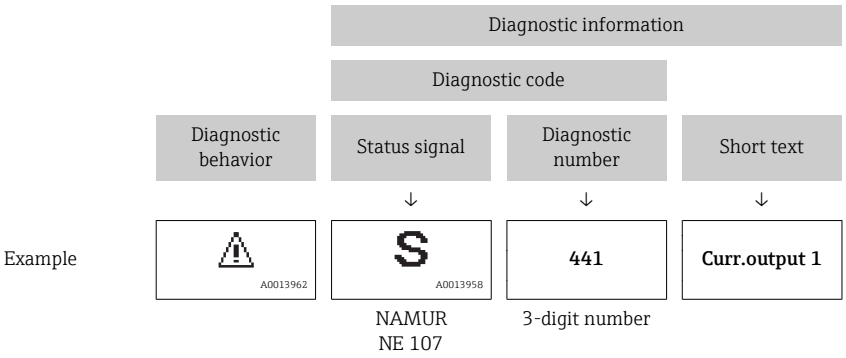
If two or more diagnostic events are pending simultaneously, only the message of the diagnostic event with the highest priority is shown.

Other diagnostic events that have occurred can be displayed in the **Diagnostics** menu:
- Via parameter → 164
- Via submenus → 165

Status signals

The status signals provide information on the state and reliability of the device by categorizing the cause of the diagnostic information (diagnostic event).

The status signals are categorized according to VDI/VDE 2650 and NAMUR Recommendation NE 107: F = Failure, C = Function Check, S = Out of Specification, M = Maintenance Required

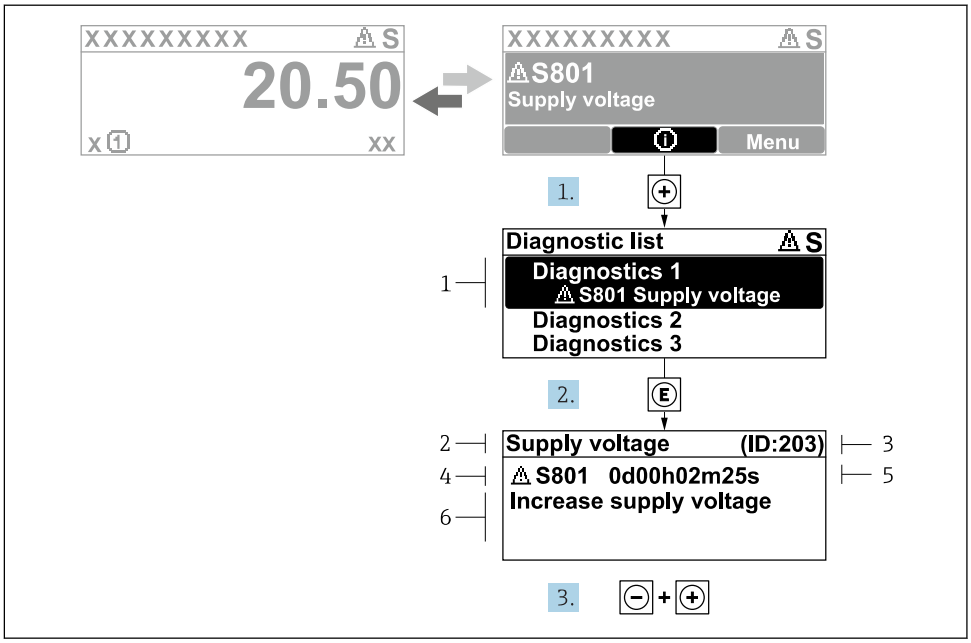


Symbol	Meaning
F	**Failure** A device error has occurred. The measured value is no longer valid.
C	**Function check** The device is in service mode (e.g. during a simulation).
S	**Out of specification** The device is operated: ▪ Outside its technical specification limits (e.g. outside the process temperature range) ▪ Outside of the configuration carried out by the user (e.g. maximum flow in parameter **20 mA value**)
M	**Maintenance required** Maintenance is required. The measured value remains valid.

Diagnostic behavior

Symbol	Meaning
	**Alarm** ▪ Measurement is interrupted. ▪ Signal outputs and totalizers assume the defined alarm condition. ▪ A diagnostic message is generated.
	**Warning** Measurement is resumed. The signal outputs and totalizers are not affected. A diagnostic message is generated.

Diagnostic information



The fault can be identified using the diagnostic information. The short text helps you by providing information about the fault. In addition, the corresponding symbol for the diagnostic behavior is displayed in front of the diagnostic information on the local display.

Operating elements

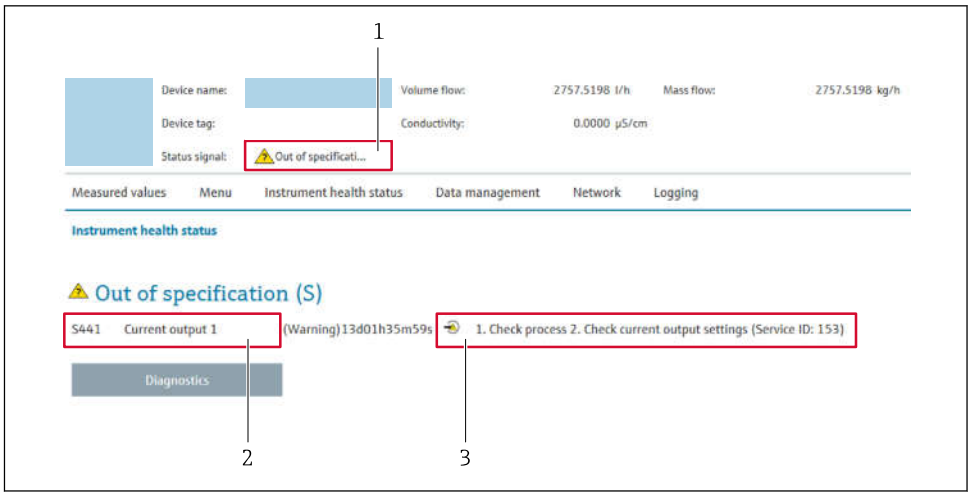
Key	Meaning
	**Plus key** *In a menu, submenu* Opens the message about remedy information.
	**Enter key** *In a menu, submenu* Opens the operating menu.

12.3.2 Calling up remedial measures

43 *Message about remedial measures*

1 *Diagnostic information*
2 *Short text*
3 *Service ID*
4 *Diagnostic behavior with diagnostic code*
5 *Operation time of occurrence*
6 *Remedial measures*

1. The user is in the diagnostic message.
   Press ⊞ (ⓘ symbol).
   ↳ The **Diagnostic list** submenu opens.
2. Select the desired diagnostic event with ⊞ or ⊟ and press Ⓔ .
   ↳ The message about the remedial measures opens.
3. Press ⊟ + ⊞ simultaneously.
   ↳ The message about the remedial measures closes.



The user is in the **Diagnostics** menu at an entry for a diagnostics event, e.g. in the **Diagnostic list** submenu or **Previous diagnostics** parameter.

1. Press Ⓔ.
   ↳ The message for the remedial measures for the selected diagnostic event opens.
2. Press ⊟ + ⊞ simultaneously.
   ↳ The message for the remedial measures closes.

12.4 Diagnostic information in the Web browser

12.4.1 Diagnostic options

Any faults detected by the measuring device are displayed in the Web browser on the home page once the user has logged on.

1 Status area with status signal
2 Diagnostic information
3 Remedy information with Service ID

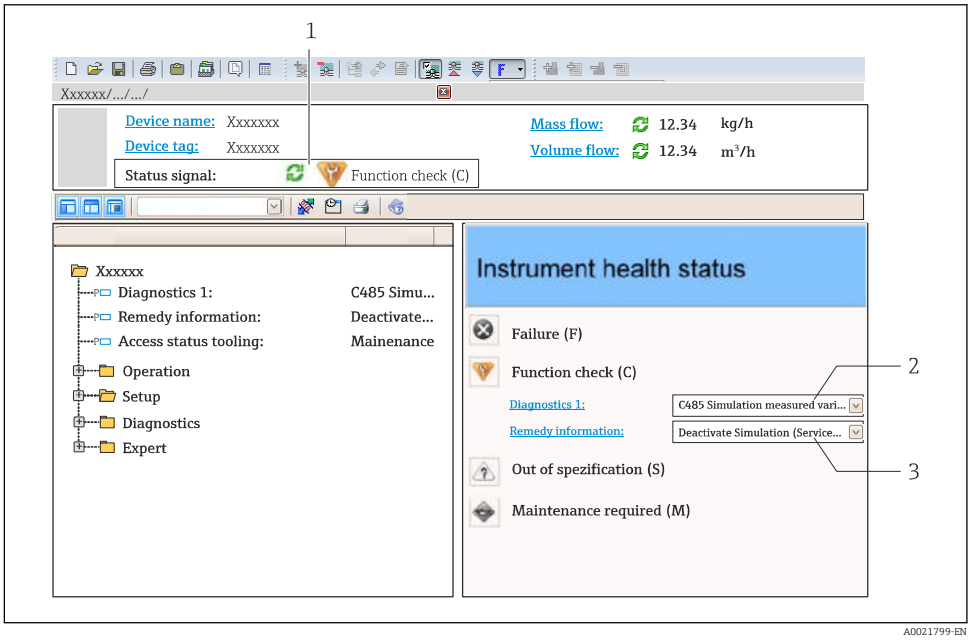
In addition, diagnostic events which have occurred can be shown in the **Diagnostics** menu:
- Via parameter → 164
- Via submenu → 165

Status signals

The status signals provide information on the state and reliability of the device by categorizing the cause of the diagnostic information (diagnostic event).

Symbol	Meaning
	Failure A device error has occurred. The measured value is no longer valid.
	Function check The device is in service mode (e.g. during a simulation).
	Out of specification The device is operated: ▪ Outside its technical specification limits (e.g. outside the process temperature range) ▪ Outside of the configuration carried out by the user (e.g. maximum flow in parameter **20 mA value**)
	Maintenance required Maintenance is required. The measured value is still valid.

The status signals are categorized in accordance with VDI/VDE 2650 and NAMUR Recommendation NE 107.



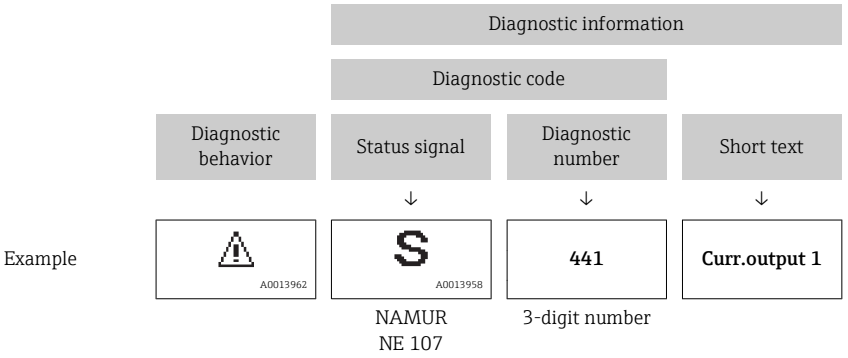
12.4.2 Calling up remedy information

Remedy information is provided for every diagnostic event to ensure that problems can be rectified quickly. These measures are displayed in red along with the diagnostic event and the related diagnostic information.

12.5 Diagnostic information in FieldCare or DeviceCare

12.5.1 Diagnostic options

Any faults detected by the measuring device are displayed on the home page of the operating tool once the connection has been established.



1 *Status area with status signal* → 🖹 *154*
2 *Diagnostic information* → 🖹 *155*
3 *Remedy information with Service ID*

In addition, diagnostic events which have occurred can be shown in the **Diagnostics** menu:
- Via parameter → 🖹 164
- Via submenu → 🖹 165

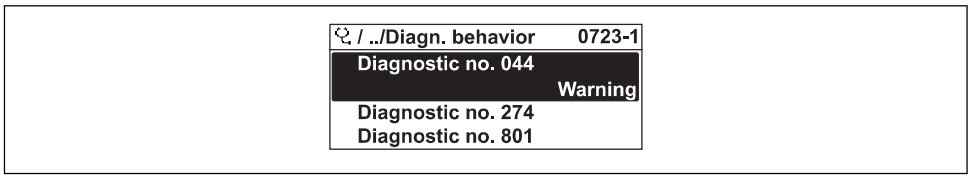
Diagnostic information

The fault can be identified using the diagnostic information. The short text helps you by providing information about the fault. In addition, the corresponding symbol for the diagnostic behavior is displayed in front of the diagnostic information on the local display.

12.5.2 Calling up remedy information

Remedy information is provided for every diagnostic event to ensure that problems can be rectified quickly:
- On the home page
  Remedy information is displayed in a separate field below the diagnostics information.
- In the **Diagnostics** menu
  Remedy information can be called up in the working area of the user interface.

The user is in the **Diagnostics** menu.



1. Call up the desired parameter.
2. On the right in the working area, mouse over the parameter.
   ↳ A tool tip with remedy information for the diagnostic event appears.

12.6 Adapting the diagnostic information

12.6.1 Adapting the diagnostic behavior

Each item of diagnostic information is assigned a specific diagnostic behavior at the factory. The user can change this assignment for specific diagnostic information in the **Diagnostic behavior** submenu.

Expert → System → Diagnostic handling → Diagnostic behavior

44 Taking the example of the local display

You can assign the following options to the diagnostic number as the diagnostic behavior:

Options	Description
Alarm	The device stops measurement. The signal outputs and totalizers assume the defined alarm condition. A diagnostic message is generated. The background lighting changes to red.
Warning	The device continues to measure. The signal outputs and totalizers are not affected. A diagnostic message is generated.
Logbook entry only	The device continues to measure. The diagnostic message is displayed only in the **Event logbook** submenu (**Event list** submenu) and is not displayed in alternation with the operational display.
Off	The diagnostic event is ignored, and no diagnostic message is generated or entered.

12.6.2 Adapting the status signal

Each item of diagnostic information is assigned a specific status signal at the factory. The user can change this assignment for specific diagnostic information in the **Diagnostic event category** submenu.

Expert → Communication → Diagnostic event category

Available status signals

Configuration as per HART 7 Specification (Condensed Status), in accordance with NAMUR NE107.

Symbol	Meaning
 A0013956	**Failure** A device error is present. The measured value is no longer valid.
 A0013959	**Function check** The device is in service mode (e.g. during a simulation).
 A0013958	**Out of specification** The device is being operated: ▪ Outside its technical specification limits (e.g. outside the process temperature range) ▪ Outside of the configuration carried out by the user (e.g. maximum flow in parameter **20 mA value**)
 A0013957	**Maintenance required** Maintenance is required. The measured value is still valid.
 A0023076	Has no effect on the condensed status.

12.7 Overview of diagnostic information

The amount of diagnostic information and the number of measured variables affected increase if the measuring device has one or more application packages.

In the case of some items of diagnostic information, the status signal and the diagnostic behavior can be changed. Change the diagnostic information → 159

Diagnostic number	Short text	Remedy instructions	Status signal [from the factory]	Diagnostic behavior [from the factory]
Diagnostic of sensor				
043	Sensor short circuit	1. Check sensor cable and sensor 2. Execute Heartbeat Verification 3. Replace sensor cable or sensor	S	Warning [1]
082	Data storage	1. Check module connections 2. Contact service	F	Alarm
083	Memory content	1. Restart device 2. Restore HistoROM S-DAT backup ('Device reset' parameter) 3. Replace HistoROM S-DAT	F	Alarm
168	Coating detected	Clean measuring tube	M	Warning
169	Conductivity measurement failed	1. Check grounding conditions 2. Deactivate conductivity measurement	M	Warning
170	Coil resistance	Check ambient and process temperature	F	Alarm
180	Temperature sensor defective	1. Check sensor connections 2. Replace sensor cable or sensor 3. Turn off temperature measurement	F	Warning
181	Sensor connection	1. Check sensor cable and sensor 2. Execute Heartbeat Verification 3. Replace sensor cable or sensor	F	Alarm

Diagnostic number	Short text	Remedy instructions	Status signal [from the factory]	Diagnostic behavior [from the factory]
Diagnostic of electronic				
201	Device failure	1. Restart device 2. Contact service	F	Alarm
242	Software incompatible	1. Check software 2. Flash or change main electronics module	F	Alarm
252	Modules incompatible	1. Check electronic modules 2. Check if correct modules are available (e.g. NEx, Ex) 3. Replace electronic modules	F	Alarm
252	Modules incompatible	1. Check if correct electronic modul is plugged 2. Replace electronic module	F	Alarm
262	Sensor electronic connection faulty	1. Check or replace connection cable between sensor electronic module (ISEM) and main electronics 2. Check or replace ISEM or main electronics	F	Alarm
270	Main electronic failure	Change main electronic module	F	Alarm
271	Main electronic failure	1. Restart device 2. Change main electronic module	F	Alarm
272	Main electronic failure	1. Restart device 2. Contact service	F	Alarm
273	Main electronic failure	Change electronic	F	Alarm
275	I/O module 1 to n defective	Change I/O module	F	Alarm
276	I/O module 1 to n faulty	1. Restart device 2. Change I/O module	F	Alarm
283	Memory content	1. Reset device 2. Contact service	F	Alarm
302	Device verification active	Device verification active, please wait.	C	Warning
303	I/O 1 to n configuration changed	1. Apply I/O module configuration (parameter 'Apply I/O configuration') 2. Afterwards reload device description and check wiring	M	Warning
311	Electronic failure	1. Do not reset device 2. Contact service	M	Warning
332	Writing in HistoROM backup failed	Replace user interface board Ex d/XP: replace transmitter	F	Alarm
361	I/O module 1 to n faulty	1. Restart device 2. Check electronic modules 3. Change I/O Modul or main electronics	F	Alarm
372	Sensor electronic (ISEM) faulty	1. Restart device 2. Check if failure recurs 3. Replace sensor electronic module (ISEM)	F	Alarm
373	Sensor electronic (ISEM) faulty	1. Transfer data or reset device 2. Contact service	F	Alarm

Diagnostic number	Short text	Remedy instructions	Status signal [from the factory]	Diagnostic behavior [from the factory]
375	I/O- 1 to n communication failed	1. Restart device 2. Check if failure recurs 3. Replace module rack inclusive electronic modules	F	Alarm
376	Sensor electronic (ISEM) faulty	1. Replace sensor electronic module (ISEM) 2. Turn off diagnostic message	S	Warning [1)]
377	Sensor electronic (ISEM) faulty	1. Activate empty pipe detection 2. Check partial filled pipe and installation direction 3. Check sensor cabling 4. Deactivate diagnostic 377	S	Warning [1)]
378	Supply voltage ISEM faulty	Check supply voltage to the ISEM	F	Alarm
382	Data storage	1. Insert T-DAT 2. Replace T-DAT	F	Alarm
383	Memory content	1. Restart device 2. Delete T-DAT via 'Reset device' parameter 3. Replace T-DAT	F	Alarm
387	HistoROM data faulty	Contact service organization	F	Alarm
512	Sensor electronic (ISEM) faulty	1. Check ECC recovery time 2. Turn off ECC	F	Alarm
Diagnostic of configuration				
330	Flash file invalid	1. Update firmware of device 2. Restart device	M	Warning
331	Firmware update failed	1. Update firmware of device 2. Restart device	F	Warning
410	Data transfer	1. Check connection 2. Retry data transfer	F	Alarm
412	Processing download	Download active, please wait	C	Warning
431	Trim 1 to n	Carry out trim	C	Warning
437	Configuration incompatible	1. Restart device 2. Contact service	F	Alarm
438	Dataset	1. Check data set file 2. Check device configuration 3. Up- and download new configuration	M	Warning
441	Current output 1 to n	1. Check process 2. Check current output settings	S	Warning [1)]
442	Frequency output 1 to n	1. Check process 2. Check frequency output settings	S	Warning [1)]
443	Pulse output 1 to n	1. Check process 2. Check pulse output settings	S	Warning [1)]
444	Current input 1 to n	1. Check process 2. Check current input settings	S	Warning [1)]
453	Flow override	Deactivate flow override	C	Warning
484	Failure mode simulation	Deactivate simulation	C	Alarm
485	Measured variable simulation	Deactivate simulation	C	Warning

Diagnostic number	Short text	Remedy instructions	Status signal [from the factory]	Diagnostic behavior [from the factory]
486	Current input 1 to n simulation	Deactivate simulation	C	Warning
491	Current output 1 to n simulation	Deactivate simulation	C	Warning
492	Simulation frequency output 1 to n	Deactivate simulation frequency output	C	Warning
493	Simulation pulse output 1 to n	Deactivate simulation pulse output	C	Warning
494	Switch output simulation 1 to n	Deactivate simulation switch output	C	Warning

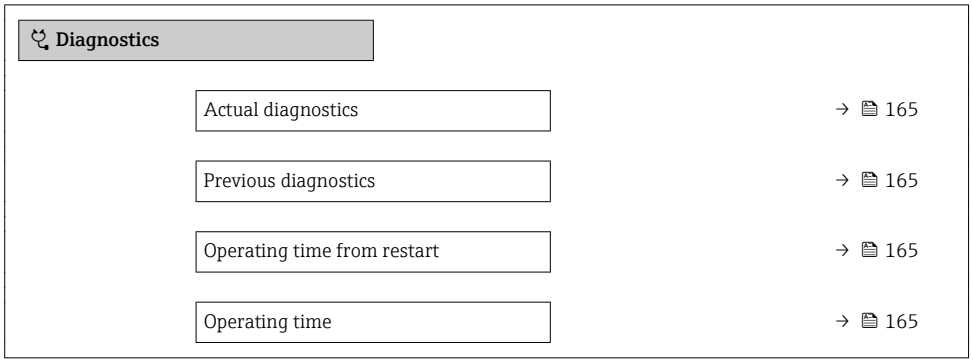
502	CT activation/ deactivation failed	Follow the sequence of the custody transfer activation/deactivation: First authorized user login, then set the DIP switch on the main electonic module	C	Warning
511	ISEM settings faulty	1. Check measuring period and integration time 2. Check sensor properties	C	Alarm
520	I/O 1 to n hardware configuration invalid	1. Check I/O hardware configuration 2. Replace wrong I/O module 3. Plug the module of double pulse output on correct slot	F	Alarm
530	Electrode cleaning is running	Turn off ECC	C	Warning
531	Empty pipe adjustment faulty	Execute EPD adjustment	S	Warning [1)]
537	Configuration	1. Check IP addresses in network 2. Change IP address	F	Warning
540	Custody transfer mode failed	1. Power off device and toggle DIP switch 2. Deactivate custody transfer mode 3. Reactivate custody transfer mode 4. Check electronic components	F	Alarm
543	Double pulse output	1. Check process 2. Check pulse output settings	S	Warning [1)]
593	Double pulse output simulation	Deactivate simulation pulse output	C	Warning
594	Relay output simulation	Deactivate simulation switch output	C	Warning
599	Custody transfer logbook full	1. Deactivate custody transfer mode 2. Clear custody transfer logbook (all 30 entries) 3. Activate custody transfer mode	F	Warning
Diagnostic of process				
803	Current loop	1. Check wiring 2. Change I/O module	F	Alarm
832	Electronic temperature too high	Reduce ambient temperature	S	Warning [1)]
833	Electronic temperature too low	Increase ambient temperature	S	Warning [1)]

Diagnostic number	Short text	Remedy instructions	Status signal [from the factory]	Diagnostic behavior [from the factory]
834	Process temperature too high	Reduce process temperature	S	Warning [1]
835	Process temperature too low	Increase process temperature	S	Warning [1]
842	Process limit	Low flow cut off active! 1. Check low flow cut off configuration	S	Warning [1]
882	Input signal	1. Check input configuration 2. Check external device or process conditions	F	Alarm
937	Sensor symmetry	1. Eliminate external magnetic field near sensor 2. Turn off diagnostic message	S	Warning [1]
938	EMC interference	1. Check ambient conditions regarding EMC influence 2. Turn off diagnostic message	F	Alarm [1]
961	Electrode potential out of specification	1. Check process conditions 2. Check ambient conditions	S	Warning [1]
962	Pipe empty	1. Perform full pipe adjustment 2. Perform empty pipe adjustment 3. Turn off empty pipe detection	S	Warning [1]

1) Diagnostic behavior can be changed.



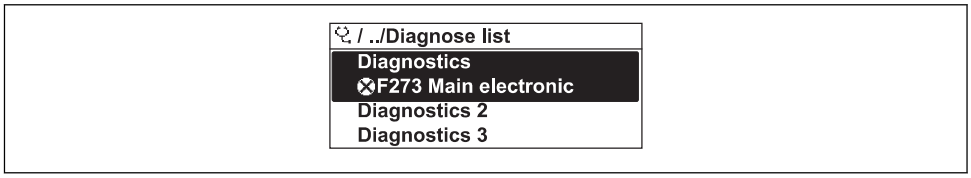
12.8 Pending diagnostic events

The **Diagnostics** menu allows the user to view the current diagnostic event and the previous diagnostic event separately.

To call up the measures to rectify a diagnostic event:
- Via local display → 156
- Via Web browser → 157
- Via "FieldCare" operating tool → 159
- Via "DeviceCare" operating tool → 159

Other pending diagnostic events can be displayed in the **Diagnostic list** submenu → 165

Navigation
"Diagnostics" menu



Parameter overview with brief description

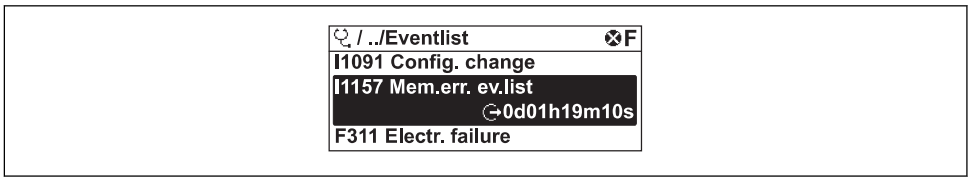
Parameter	Prerequisite	Description	User interface
Actual diagnostics	A diagnostic event has occurred.	Shows the current occured diagnostic event along with its diagnostic information. If two or more messages occur simultaneously, the message with the highest priority is shown on the display.	Symbol for diagnostic behavior, diagnostic code and short message.
Previous diagnostics	Two diagnostic events have already occurred.	Shows the diagnostic event that occurred prior to the current diagnostic event along with its diagnostic information.	Symbol for diagnostic behavior, diagnostic code and short message.
Operating time from restart	–	Shows the time the device has been in operation since the last device restart.	Days (d), hours (h), minutes (m) and seconds (s)
Operating time	–	Indicates how long the device has been in operation.	Days (d), hours (h), minutes (m) and seconds (s)

12.9 Diagnostic list

Up to 5 currently pending diagnostic events can be displayed in the **Diagnostic list** submenu along with the associated diagnostic information. If more than 5 diagnostic events are pending, the events with the highest priority are shown on the display.

Navigation path
Diagnostics → Diagnostic list

45 *Taking the example of the local display*



To call up the measures to rectify a diagnostic event:
- Via local display → 156
- Via Web browser → 157
- Via "FieldCare" operating tool → 159
- Via "DeviceCare" operating tool → 159

12.10 Event logbook

12.10.1 Reading out the event logbook

A chronological overview of the event messages that have occurred is provided in the **Events list** submenu.

Navigation path
Diagnostics menu → **Event logbook** submenu → Event list

46 *Taking the example of the local display*

- A maximum of 20 event messages can be displayed in chronological order.
- If the **Extended HistoROM** application package (order option) is enabled in the device, the event list can contain up to 100 entries .

The event history includes entries for:
- Diagnostic events → 160
- Information events → 166

In addition to the operation time of its occurrence, each event is also assigned a symbol that indicates whether the event has occurred or is ended:
- Diagnostic event
  - : Occurrence of the event
  - : End of the event
- Information event
  : Occurrence of the event

To call up the measures to rectify a diagnostic event:
- Via local display → 156
- Via Web browser → 157
- Via "FieldCare" operating tool → 159
- Via "DeviceCare" operating tool → 159

For filtering the displayed event messages → 166

12.10.2 Filtering the event logbook

Using the **Filter options** parameter you can define which category of event message is displayed in the **Events list** submenu.

Navigation path
Diagnostics → Event logbook → Filter options

Filter categories
- All
- Failure (F)
- Function check (C)
- Out of specification (S)
- Maintenance required (M)
- Information (I)

12.10.3 Overview of information events

Unlike a diagnostic event, an information event is displayed in the event logbook only and not in the diagnostic list.

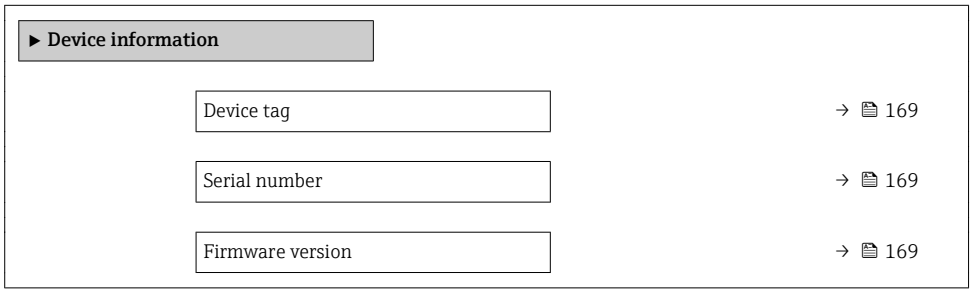
Info number	Info name
I1000	--------(Device ok)
I1079	Sensor changed
I1089	Power on
I1090	Configuration reset
I1091	Configuration changed

Info number	Info name
I1092	HistoROM backup deleted
I1137	Electronic changed
I1151	History reset
I1155	Reset electronic temperature
I1156	Memory error trend
I1157	Memory error event list
I1256	Display: access status changed
I1264	Safety sequence aborted
I1278	I/O module restarted
I1335	Firmware changed
I1351	Empty pipe detection adjustment failure
I1353	Empty pipe detection adjustment ok
I1361	Web server: login failed
I1397	Fieldbus: access status changed
I1398	CDI: access status changed
I1443	Coating thickness not determined
I1444	Device verification passed
I1445	Device verification failed
I1457	Measurement error verification failed
I1459	I/O module verification failed
I1461	Sensor verification failed
I1462	Sensor electronic module verific. failed
I1512	Download started
I1513	Download finished
I1514	Upload started
I1515	Upload finished
I1517	Custody transfer active
I1518	Custody transfer inactive
I1554	Safety sequence started
I1555	Safety sequence confirmed
I1556	Safety mode off
I1618	I/O module 2 replaced
I1619	I/O module 3 replaced
I1621	I/O module 4 replaced
I1622	Calibration changed
I1624	Reset all totalizers
I1625	Write protection activated
I1626	Write protection deactivated
I1627	Web server: login successful
I1628	Display: login successful
I1629	CDI: login successful
I1631	Web server access changed
I1632	Display: login failed

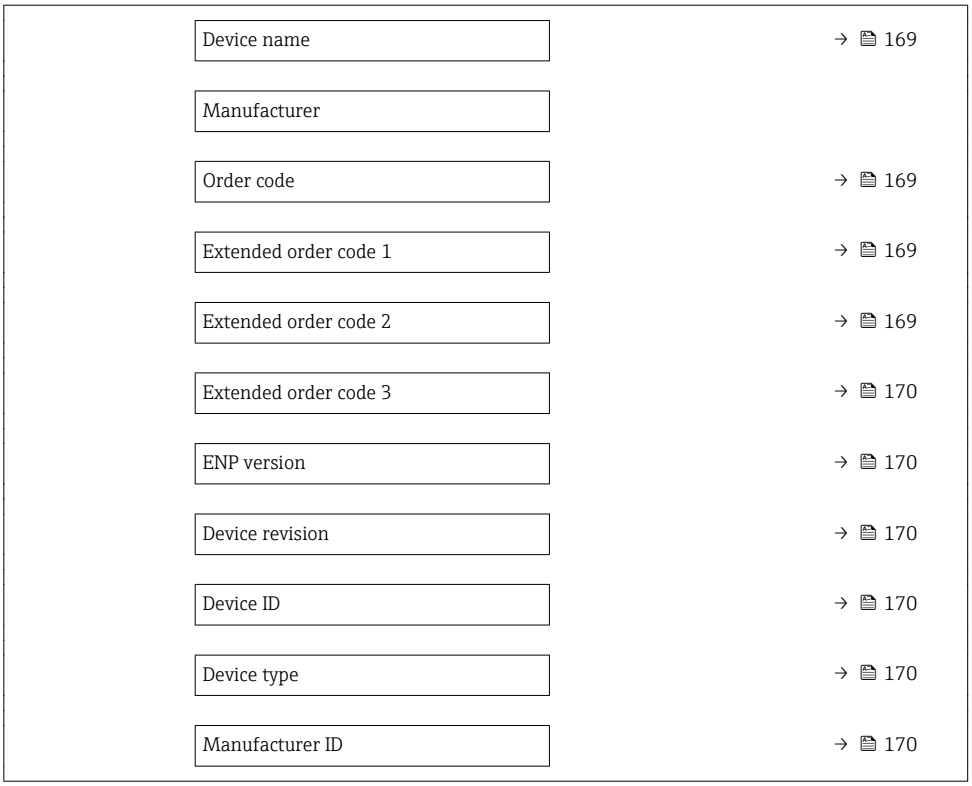
Info number	Info name
I1633	CDI: login failed
I1634	Reset to factory settings
I1635	Reset to delivery settings
I1639	Max. switch cycles number reached
I1643	Custody transfer logbook cleared
I1649	Hardware write protection activated
I1650	Hardware write protection deactivated
I1651	Custody transfer parameter changed
I1712	New flash file received
I1725	Sensor electronic module (ISEM) changed
I1726	Configuration backup failed

12.11 Resetting the measuring device

Using the**Device reset** parameter (→ 131) it is possible to reset the entire device configuration or some of the configuration to a defined state.



12.11.1 Function scope of the "Device reset" parameter



Options	Description
Cancel	No action is executed and the user exits the parameter.
To delivery settings	Every parameter for which a customer-specific default setting was ordered is reset to this customer-specific value. All other parameters are reset to the factory setting.
Restart device	The restart resets every parameter whose data are in the volatile memory (RAM) to the factory setting (e.g. measured value data). The device configuration remains unchanged.
Restore S-DAT backup	Restore the data that are saved on the S-DAT. The data record is restored from the electronics memory to the S-DAT. This option is displayed only in an alarm condition.

12.12 Device information

The **Device information** submenu contains all parameters that display different information for device identification.

Navigation
"Diagnostics" menu → Device information

Parameter overview with brief description

Parameter	Description	User interface	Factory setting
Device tag	Shows name of measuring point.	Max. 32 characters, such as letters, numbers or special characters (e.g. @, %, /).	Promag
Serial number	Shows the serial number of the measuring device.	Max. 11-digit character string comprising letters and numbers.	–
Firmware version	Shows the device firmware version installed.	Character string in the format xx.yy.zz	–
Device name	Shows the name of the transmitter. The name can be found on the nameplate of the transmitter.	Promag 300/500	–
Order code	Shows the device order code. The order code can be found on the nameplate of the sensor and transmitter in the "Order code" field.	Character string composed of letters, numbers and certain punctuation marks (e.g. /).	–
Extended order code 1	Shows the 1st part of the extended order code. The extended order code can also be found on the nameplate of the sensor and transmitter in the "Ext. ord. cd." field.	Character string	–
Extended order code 2	Shows the 2nd part of the extended order code. The extended order code can also be found on the nameplate of the sensor and transmitter in the "Ext. ord. cd." field.	Character string	–

Parameter	Description	User interface	Factory setting
Extended order code 3	Shows the 3rd part of the extended order code. The extended order code can also be found on the nameplate of the sensor and transmitter in the "Ext. ord. cd." field.	Character string	–
ENP version	Shows the version of the electronic nameplate (ENP).	Character string	2.02.00
Device revision	Shows the device revision with which the device is registered with the HART Communication Foundation.	2-digit hexadecimal number	6
Device ID	Shows the device ID for identifying the device in a HART network.	6-digit hexadecimal number	–
Device type	Shows the device type with which the measuring device is registered with the HART Communication Foundation.	2-digit hexadecimal number	0x3A (for Promag 500)
Manufacturer ID	Shows the manufacturer ID device is registered with the HART Communication Foundation.	2-digit hexadecimal number	0x11 (for Endress+Hauser)

12.13 Firmware history

Release date	Firmware version	Order code for "Firmware version"	Firmware changes	Documentation type	Documentation
09.2019	01.05.zz	Option **64**	Various improvements	Operating Instructions	BA01399D/06/EN/02.19

10.2017	01.01.zz	Option **68**	▪ OPC-UA with Security new
			▪ Local display - enhanced performance and data entry via text editor
			▪ Optimized keypad lock for local display
			▪ Web server feature update
			  ▪ Support for trend data function
			  ▪ Heartbeat function enhanced to include detailed results (page 3/4 of the report)
			  ▪ Device configuration as PDF (parameter log, similar to FDT print)
			▪ Network capability of Ethernet (service) interface
			▪ Comprehensive Heartbeat feature update
			▪ Local display - support for WLAN infrastructure mode
			▪ Implementation of reset code
				Operating Instructions	BA01399D/06/EN/02.17

08.2016	01.00.zz	Option **76**	Original firmware	Operating Instructions	BA01399D/06/EN/01.16

It is possible to flash the firmware to the current version or the previous version using the service interface. For the compatibility of the firmware version, see the "Device history and compatibility" section → 172

For the compatibility of the firmware version with the previous version, the installed device description files and operating tools, observe the information about the device in the "Manufacturer's information" document.

The manufacturer's information is available:
- In the Download Area of the Endress+Hauser web site: www.endress.com → Downloads

- Specify the following details:
  - Product root: e.g. 5P5B
    The product root is the first part of the order code: see the nameplate on the device.
  - Text search: Manufacturer's information
  - Media type: Documentation – Technical Documentation

12.14 Device history and compatibility

The device model is documented in the order code on the nameplate of the device (e.g. 8F3BXX-XXX....XXXA1-XXXXXX).

Device model	Release	Change compared with earlier model	Compatibility with earlier model
A2	09.2019	I/O module with enhanced performance and functionality: see device firmware 01.05.zz → 🖹 171	No
A1	08.2016	–	–

13 Maintenance

13.1 Maintenance tasks

No special maintenance work is required.

13.1.1 Exterior cleaning

When cleaning the exterior of measuring devices, always use cleaning agents that do not attack the surface of the housing or the seals.

13.1.2 Interior cleaning

No interior cleaning is planned for the device.

13.1.3 Replacing seals

The sensor's seals (particularly aseptic molded seals) must be replaced periodically.

The interval between changes depends on the frequency of the cleaning cycles, the cleaning temperature and the medium temperature.

Replacement seals (accessory part) → 207

13.2 Measuring and test equipment

Endress+Hauser offers a wide variety of measuring and test equipment, such as W@M or device tests.

Your Endress+Hauser Sales Center can provide detailed information on the services.

List of some of the measuring and testing equipment: → 176

13.3 Endress+Hauser services

Endress+Hauser offers a wide variety of services for maintenance such as recalibration, maintenance service or device tests.

Your Endress+Hauser Sales Center can provide detailed information on the services.

14 Repair

14.1 General notes

14.1.1 Repair and conversion concept

The Endress+Hauser repair and conversion concept provides for the following:
- The measuring devices have a modular design.
- Spare parts are grouped into logical kits with the associated Installation Instructions.
- Repairs are carried out by Endress+Hauser Service or by appropriately trained customers.
- Certified devices can only be converted to other certified devices by Endress+Hauser Service or at the factory.

14.1.2 Notes for repair and conversion

For repair and modification of a measuring device, observe the following notes:
- ▶ Use only original Endress+Hauser spare parts.
- ▶ Carry out the repair according to the Installation Instructions.
- ▶ Observe the applicable standards, federal/national regulations, Ex documentation (XA) and certificates.
- ▶ Document every repair and each conversion and enter them into the *W@M* life cycle management database.

14.2 Spare parts

Measuring device serial number:
Can be read out via the **Serial number** parameter (→ 169) in the **Device information** submenu.

14.3 Endress+Hauser services

Endress+Hauser offers a wide range of services.

Your Endress+Hauser Sales Center can provide detailed information on the services.

14.4 Return

The requirements for safe device return can vary depending on the device type and national legislation.

1. Refer to the website for more information:
   http://www.endress.com/support/return-material
2. Return the device if repairs or a factory calibration are required, or if the wrong device was ordered or delivered.

14.5 Disposal

14.5.1 Removing the measuring device

1. Switch off the device.

⚠ WARNING

Danger to persons from process conditions.

- Beware of hazardous process conditions such as pressure in the measuring device, high temperatures or aggressive fluids.

2. Carry out the mounting and connection steps from the "Mounting the measuring device" and "Connecting the measuring device" sections in reverse order. Observe the safety instructions.

14.5.2 Disposing of the measuring device

⚠ WARNING

Danger to personnel and environment from fluids that are hazardous to health.

- Ensure that the measuring device and all cavities are free of fluid residues that are hazardous to health or the environment, e.g. substances that have permeated into crevices or diffused through plastic.

Observe the following notes during disposal:

- Observe valid federal/national regulations.
- Ensure proper separation and reuse of the device components.

15 Accessories

Various accessories, which can be ordered with the device or subsequently from Endress +Hauser, are available for the device. Detailed information on the order code in question is available from your local Endress+Hauser sales center or on the product page of the Endress+Hauser website: www.endress.com.

15.1 Device-specific accessories

15.1.1 For the transmitter

Accessories	Description
Transmitter ▪ Proline 500 – digital ▪ Proline 500	Transmitter for replacement or storage. Use the order code to define the following specifications: ▪ Approvals ▪ Output ▪ Input ▪ Display/operation ▪ Housing ▪ Software ▪ Proline 500 – digital transmitter: Order code: 5X5BXX-*********A ▪ Proline 500 transmitter: Order code: 5X5BXX-*********B Proline 500 transmitter for replacement: It is essential to specify the serial number of the current transmitter when ordering. Based on the serial number, the device-specific data (e.g., calibration factors) of the replacement device can be used for the new transmitter. ▪ Proline 500 – digital transmitter: Installation Instructions EA01151D ▪ Proline 500 transmitter: Installation Instructions EA01152D
External WLAN antenna	External WLAN antenna with 1.5 m (59.1 in) connecting cable and two angle brackets. Order code for "Accessory enclosed", option P8 "Wireless antenna wide area". ▪ The external WLAN antenna is not suitable for use in hygienic applications. ▪ Further information on the WLAN interface → 🖹 86. Order number: 71351317 Installation Instructions EA01238D
Pipe mounting set	Pipe mounting set for transmitter. Proline 500 – digital transmitter Order number: 71346427 Installation Instructions EA01195D Proline 500 transmitter Order number: 71346428
Protective cover Transmitter ▪ Proline 500 – digital ▪ Proline 500	Is used to protect the measuring device from the effects of the weather: e.g. rainwater, excess heating from direct sunlight. ▪ Proline 500 – digital transmitter Order number: 71343504 ▪ Proline 500 transmitter Order number: 71343505 Installation Instructions EA01191D

Display guard Proline 500 – digital	Is used to protect the display against impact or scoring from sand in desert areas. Order number: 71228792 Installation Instructions EA01093D
Ground cable	Set, consisting of two ground cables for potential equalization.
Connecting cable Proline 500 – digital Sensor – Transmitter	The connecting cable can be ordered directly with the measuring device (order code for "Cable, sensor connection) or as an accessory (order number DK5012). The following cable lengths are available: order code for "Cable, sensor connection" ▪ Option B: 20 m (65 ft) ▪ Option E: User configurable up to max. 50 m ▪ Option F: User configurable up to max. 165 ft Maximum possible cable length for a Proline 500 – digital connecting cable: 300 m (1000 ft)
Connecting cable Proline 500 Sensor – Transmitter	The connecting cable can be ordered directly with the measuring device (order code for "Cable, sensor connection) or as an accessory (order number DK5012). The following cable lengths are available: order code for "Cable, sensor connection" ▪ Option 1: 5 m (16 ft) ▪ Option 2: 10 m (32 ft) ▪ Option 3: 20 m (65 ft) ▪ Option 4: User configurable cable length (m) ▪ Option 5: User configurable cable length (ft) Reinforced connecting cable with an additional, reinforcing metal braid: ▪ Option 6: User configurable cable length (m) ▪ Option 7: User configurable cable length (ft) Possible cable length for a Proline 500 connecting cable: depends on the medium conductivity, max. 200 m (660 ft)

15.1.2 For the sensor

Accessories	Description
Ground disks	Are used to ground the medium in lined measuring tubes to ensure proper measurement. For details, see Installation Instructions EA00070D

15.2 Communication-specific accessories

Accessories	Description
Commubox FXA195 HART	For intrinsically safe HART communication with FieldCare via the USB interface. Technical Information TI00404F
HART Loop Converter HMX50	Is used to evaluate and convert dynamic HART process variables to analog current signals or limit values. ▪ Technical Information TI00429F ▪ Operating Instructions BA00371F
Fieldgate FXA320	Gateway for the remote monitoring of connected 4-20 mA measuring devices via a Web browser. Technical Information TI00025S Operating Instructions BA00053S
Fieldgate FXA520	Gateway for the remote diagnostics and remote configuration of connected HART measuring devices via a Web browser. Technical Information TI00025S Operating Instructions BA00051S

Field Xpert SFX350	Field Xpert SFX350 is a mobile computer for commissioning and maintenance. It enables efficient device configuration and diagnostics for HART devices and can be used in non-hazardous areas. Operating Instructions BA01202S
Field Xpert SFX370	Field Xpert SFX370 is a mobile computer for commissioning and maintenance. It enables efficient device configuration and diagnostics for HART devices and can be used in the non-hazardous area and in the hazardous area. Operating Instructions BA01202S
Field Xpert SMT70	The Field Xpert SMT70 tablet PC for device configuration enables mobile plant asset management in hazardous and non-hazardous areas. It is suitable for commissioning and maintenance staff to manage field instruments with a digital communication interface and to record progress. This tablet PC is designed as an all-in-one solution with a preinstalled driver library and is an easy-to-use, touch-sensitive tool which can be used to manage field instruments throughout their entire life cycle. ▪ Technical Information TI01342S ▪ Operating Instructions BA01709S ▪ Product page: www.endress.com/smt70

15.3 Service-specific accessories

Accessories	Description
Applicator	Software for selecting and sizing Endress+Hauser measuring devices: ▪ Choice of measuring devices for industrial requirements ▪ Calculation of all the necessary data for identifying the optimum flowmeter: e.g. nominal diameter, pressure loss, flow velocity and accuracy. ▪ Graphic illustration of the calculation results ▪ Determination of the partial order code, administration, documentation and access to all project-related data and parameters over the entire life cycle of a project. Applicator is available: ▪ Via the Internet: https://portal.endress.com/webapp/applicator ▪ As a downloadable DVD for local PC installation.
W@M	W@M Life Cycle Management Improved productivity with information at your fingertips. Data relevant to a plant and its components is generated from the first stages of planning and during the asset's complete life cycle. W@M Life Cycle Management is an open and flexible information platform with online and on-site tools. Instant access for your staff to current, in-depth data shortens your plant's engineering time, speeds up procurement processes and increases plant uptime. Combined with the right services, W@M Life Cycle Management boosts productivity in every phase. For more information, visit www.endress.com/lifecyclemanagement
FieldCare	FDT-based plant asset management tool from Endress+Hauser. It can configure all smart field units in your system and helps you manage them. By using the status information, it is also a simple but effective way of checking their status and condition. Operating Instructions BA00027S and BA00059S
DeviceCare	Tool to connect and configure Endress+Hauser field devices. Innovation brochure IN01047S

15.4 System components

Accessories	Description
Memograph M graphic data manager	The Memograph M graphic data manager provides information on all the relevant measured variables. Measured values are recorded correctly, limit values are monitored and measuring points analyzed. The data are stored in the 256 MB internal memory and also on a SD card or USB stick. ▪ Technical Information TI00133R ▪ Operating Instructions BA00247R

16 Technical data

16.1 Application

The measuring device is only suitable for flow measurement of liquids with a minimum conductivity of 5 µS/cm.

Depending on the version ordered, the measuring device can also measure potentially explosive, flammable, poisonous and oxidizing media.

To ensure that the device remains in proper operating condition for its service life, use the measuring device only for media against which the process-wetted materials are sufficiently resistant.

16.2 Function and system design

Measuring principle

Electromagnetic flow measurement on the basis of *Faraday's law of magnetic induction*.

Measuring system

The measuring system consists of a transmitter and a sensor. The transmitter and sensor are mounted in physically separate locations. They are interconnected by connecting cables.

For information on the structure of the device → 14

16.3 Input

Measured variable

Direct measured variables

- Volume flow (proportional to induced voltage)
- Electrical conductivity

Calculated measured variables

- Mass flow
- Corrected volume flow

Measuring range

Typically v = 0.01 to 10 m/s (0.03 to 33 ft/s) with the specified accuracy

Flow characteristic values in SI units: DN 15 to 125 (½ to 4")

Nominal diameter		Recommended flow	Factory settings		
		min./max. full scale value (v ~ 0.3/10 m/s)	Full scale value current output (v ~ 2.5 m/s)	Pulse value (~ 2 pulse/s)	Low flow cut off (v ~ 0.04 m/s)
[mm]	[in]	[dm³/min]	[dm³/min]	[dm³]	[dm³/min]
15	½	4 to 100	25	0.2	0.5
25	1	9 to 300	75	0.5	1
32	–	15 to 500	125	1	2
40	1 ½	25 to 700	200	1.5	3
50	2	35 to 1 100	300	2.5	5
65	–	60 to 2 000	500	5	8

Nominal diameter		Recommended flow	Factory settings		
		min./max. full scale value (v ~ 0.3/10 m/s)	Full scale value current output (v ~ 2.5 m/s)	Pulse value (~ 2 pulse/s)	Low flow cut off (v ~ 0.04 m/s)
[mm]	[in]	[dm³/min]	[dm³/min]	[dm³]	[dm³/min]
80	3	90 to 3 000	750	5	12
100	4	145 to 4 700	1200	10	20
125	–	220 to 7 500	1850	15	30

Flow characteristic values in SI units: DN 150 to 600 (6 to 24")

Nominal diameter		Recommended flow	Factory settings		
		min./max. full scale value (v ~ 0.3/10 m/s)	Full scale value current output (v ~ 2.5 m/s)	Pulse value (~ 2 pulse/s)	Low flow cut off (v ~ 0.04 m/s)
[mm]	[in]	[m³/h]	[m³/h]	[m³]	[m³/h]
150	6	20 to 600	150	0.03	2.5
200	8	35 to 1 100	300	0.05	5
250	10	55 to 1 700	500	0.05	7.5
300	12	80 to 2 400	750	0.1	10
350	14	110 to 3 300	1 000	0.1	15
400	16	140 to 4 200	1 200	0.15	20
450	18	180 to 5 400	1 500	0.25	25
500	20	220 to 6 600	2 000	0.25	30
600	24	310 to 9 600	2 500	0.3	40

Flow characteristic values in US units: ½ - 24" (DN 15 - 600)

Nominal diameter		Recommended flow	Factory settings		
		min./max. full scale value (v ~ 0.3/10 m/s)	Full scale value current output (v ~ 2.5 m/s)	Pulse value (~ 2 pulse/s)	Low flow cut off (v ~ 0.04 m/s)
[in]	[mm]	[gal/min]	[gal/min]	[gal]	[gal/min]
½	15	1.0 to 27	6	0.1	0.15
1	25	2.5 to 80	18	0.2	0.25
1 ½	40	7 to 190	50	0.5	0.75
2	50	10 to 300	75	0.5	1.25
3	80	24 to 800	200	2	2.5
4	100	40 to 1 250	300	2	4
6	150	90 to 2 650	600	5	12
8	200	155 to 4 850	1200	10	15
10	250	250 to 7 500	1500	15	30
12	300	350 to 10 600	2400	25	45
14	350	500 to 15 000	3600	30	60
16	400	600 to 19 000	4800	50	60

Nominal diameter		Recommended flow	Factory settings		
		min./max. full scale value (v ~ 0.3/10 m/s)	Full scale value current output (v ~ 2.5 m/s)	Pulse value (~ 2 pulse/s)	Low flow cut off (v ~ 0.04 m/s)
[in]	[mm]	[gal/min]	[gal/min]	[gal]	[gal/min]
18	450	800 to 24 000	6000	50	90
20	500	1 000 to 30 000	7500	75	120
24	600	1 400 to 44 000	10500	100	180

Recommended measuring range

Flow limit → 196

Operable flow range

Over 1000 : 1

Input signal

External measured values

To increase the accuracy of certain measured variables or to calculate the mass flow, the automation system can continuously write different measured values to the measuring device:
- Medium temperature to increase the accuracy of the electrical conductivity (e.g. iTEMP)
- Reference density for calculating the mass flow

Various pressure transmitters and temperature measuring devices can be ordered from Endress+Hauser: see "Accessories" section → 179

It is recommended to read in external measured values to calculate the corrected volume flow.

HART protocol

The measured values are written from the automation system to the measuring device via the HART protocol. The pressure transmitter must support the following protocol-specific functions:
- HART protocol
- Burst mode

Current input

The measured values are written from the automation system to the measuring device via the current input → 182.

Current input 0/4 to 20 mA

Current input	0/4 to 20 mA (active/passive)
Current span	▪ 4 to 20 mA (active) ▪ 0/4 to 20 mA (passive)
Resolution	1 µA
Voltage drop	Typically: 0.6 to 2 V for 3.6 to 22 mA (passive)
Maximum input voltage	≤ 30 V (passive)
Open-circuit voltage	≤ 28.8 V (active)
Possible input variables	▪ Pressure ▪ Temperature ▪ Density ▪

Status input

Maximum input values	▪ DC −3 to 30 V ▪ If status input is active (ON): R_i >3 kΩ
Response time	Configurable: 5 to 200 ms
Input signal level	▪ Low signal: DC −3 to +5 V ▪ High signal: DC 12 to 30 V
Assignable functions	▪ Off ▪ Reset the individual totalizers separately ▪ Reset all totalizers ▪ Flow override

16.4 Output

Output signal

Current output 4 to 20 mA HART

Order code	"Output; Input 1" (20): Option BA: current output 4 to 20 mA HART
Signal mode	Can be set to: ▪ Active ▪ Passive
Current range	Can be set to: ▪ 4 to 20 mA NAMUR ▪ 4 to 20 mA US ▪ 4 to 20 mA ▪ 0 to 20 mA (only with signal mode active) ▪ Fixed current value
Open-circuit voltage	DC 28.8 V (active)
Maximum input voltage	DC 30 V (passive)
Load	250 to 700 Ω
Resolution	0.38 µA
Damping	Configurable: 0 to 999 s
Assignable measured variables	▪ Volume flow ▪ Mass flow ▪ Corrected volume flow ▪ Flow velocity ▪ Conductivity ▪ Electronics temperature

Current output 4 to 20 mA HART Ex i

Order code	"Output; Input 1" (20) can be set to: ▪ Option CA: current output 4 to 20 mA HART Ex i passive ▪ Option CC: current output 4 to 20 mA HART Ex i active
Signal mode	Depending on the ordered variant.
Current range	Can be set to: ▪ 4 to 20 mA NAMUR ▪ 4 to 20 mA US ▪ 4 to 20 mA ▪ 0 to 20 mA (only with signal mode active) ▪ Fixed current value
Open-circuit voltage	DC 21.8 V (active)
Maximum input voltage	DC 30 V (passive)
Load	▪ 250 to 400 Ω (active) ▪ 250 to 700 Ω (passive)
Resolution	0.38 µA
Damping	Configurable: 0 to 999 s
Assignable measured variables	▪ Volume flow ▪ Mass flow ▪ Corrected volume flow ▪ Flow velocity ▪ Conductivity ▪ Electronics temperature

Current output 4 to 20 mA

Order code	"Output; Input 2" (21), "Output; Input 3" (022) or "Output; Input 4" (023): Option B: current output 4 to 20 mA
Signal mode	Can be set to: ▪ Active ▪ Passive
Current range	Can be set to: ▪ 4 to 20 mA NAMUR ▪ 4 to 20 mA US ▪ 4 to 20 mA ▪ 0 to 20 mA (only with signal mode active) ▪ Fixed current value
Maximum output values	22.5 mA
Open-circuit voltage	DC 28.8 V (active)
Maximum input voltage	DC 30 V (passive)
Load	0 to 700 Ω
Resolution	0.38 µA
Damping	Configurable: 0 to 999 s
Assignable measured variables	▪ Volume flow ▪ Mass flow ▪ Corrected volume flow ▪ Flow velocity ▪ Conductivity ▪ Electronics temperature

Current output 4 to 20 mA Ex i passive

Order code	"Output; Input 2" (21), "Output; Input 3" (022): Option C: current output 4 to 20 mA Ex i passive
Signal mode	Passive
Current range	Can be set to: ▪ 4 to 20 mA NAMUR ▪ 4 to 20 mA US ▪ 4 to 20 mA ▪ Fixed current value
Maximum output values	22.5 mA
Maximum input voltage	DC 30 V
Load	0 to 700 Ω
Resolution	0.38 µA
Damping	Configurable: 0 to 999 s
Assignable measured variables	▪ Volume flow ▪ Mass flow ▪ Corrected volume flow ▪ Flow velocity ▪ Conductivity ▪ Electronics temperature

Pulse/frequency/switch output

Function	Can be set to pulse, frequency or switch output
Version	Open collector Can be set to: ▪ Active ▪ Passive ▪ Passive NAMUR Ex-i, passive
Maximum input values	DC 30 V, 250 mA (passive)
Open-circuit voltage	DC 28.8 V (active)
Voltage drop	For 22.5 mA: ≤ DC 2 V
Pulse output	
Maximum input values	DC 30 V, 250 mA (passive)
Maximum output current	22.5 mA (active)
Open-circuit voltage	DC 28.8 V (active)
Pulse width	Configurable: 0.05 to 2 000 ms
Maximum pulse rate	10 000 Impulse/s
Pulse value	Adjustable
Assignable measured variables	▪ Volume flow ▪ Mass flow ▪ Corrected volume flow
Frequency output	
Maximum input values	DC 30 V, 250 mA (passive)
Maximum output current	22.5 mA (active)
Open-circuit voltage	DC 28.8 V (active)
Output frequency	Adjustable: end value frequency 2 to 10 000 Hz (f_{max} = 12 500 Hz)
Damping	Configurable: 0 to 999 s
Pulse/pause ratio	1:1
Assignable measured variables	▪ Volume flow ▪ Mass flow ▪ Corrected volume flow ▪ Flow velocity ▪ Conductivity ▪ Electronics temperature
Switch output	
Maximum input values	DC 30 V, 250 mA (passive)
Open-circuit voltage	DC 28.8 V (active)
Switching behavior	Binary, conductive or non-conductive
Switching delay	Configurable: 0 to 100 s

Number of switching cycles	Unlimited

Assignable functions	▪ Off
	▪ On
	▪ Diagnostic behavior
	▪ Limit value:
	  ▪ Off
	  ▪ Volume flow
	  ▪ Mass flow
	  ▪ Corrected volume flow
	  ▪ Flow velocity
	  ▪ Conductivity
	  ▪ Totalizer 1-3
	  ▪ Electronics temperature
	▪ Flow direction monitoring
	▪ Status
	  ▪ Empty pipe detection
	  ▪ Low flow cut off

Double pulse output

Function	Double pulse
Version	Open collector Can be set to: ▪ Active ▪ Passive ▪ Passive NAMUR
Maximum input values	DC 30 V, 250 mA (passive)
Open-circuit voltage	DC 28.8 V (active)
Voltage drop	For 22.5 mA: ≤ DC 2 V
Output frequency	Configurable: 0 to 1 000 Hz
Damping	Configurable: 0 to 999 s
Pulse/pause ratio	1:1
Assignable measured variables	▪ Volume flow ▪ Mass flow ▪ Corrected volume flow ▪ Flow velocity ▪ Conductivity ▪ Electronics temperature

Relay output

Function	Switch output
Version	Relay output, galvanically isolated
Switching behavior	Can be set to: ▪ NO (normally open), factory setting ▪ NC (normally closed)

Maximum switching capacity (passive)	▪ DC 30 V, 0.1 A ▪ AC 30 V, 0.5 A

Assignable functions	▪ Off
	▪ On
	▪ Diagnostic behavior
	▪ Limit value:
	  ▪ Off
	  ▪ Volume flow
	  ▪ Mass flow
	  ▪ Corrected volume flow
	  ▪ Flow velocity
	  ▪ Conductivity
	  ▪ Totalizer 1-3
	  ▪ Electronic temperature
	▪ Flow direction monitoring
	▪ Status
	  ▪ Empty pipe detection
	  ▪ Low flow cut off

User-configurable input/output

One specific input or output is assigned to a user-configurable input/output (configurable I/O) during device commissioning.

The following inputs and outputs are available for assignment:
- Choice of current output: 4 to 20 mA (active), 0/4 to 20 mA (passive)
- Pulse/frequency/switch output
- Choice of current input: 4 to 20 mA (active), 0/4 to 20 mA (passive)
- Status input

Signal on alarm

Depending on the interface, failure information is displayed as follows:

Current output 0/4 to 20 mA

4 to 20 mA

Failure mode	Choose from: ▪ 4 to 20 mA in accordance with NAMUR recommendation NE 43 ▪ 4 to 20 mA in accordance with US ▪ Min. value: 3.59 mA ▪ Max. value: 22.5 mA ▪ Freely definable value between: 3.59 to 22.5 mA ▪ Actual value ▪ Last valid value

0 to 20 mA

Failure mode	Choose from: ▪ Maximum alarm: 22 mA ▪ Freely definable value between: 0 to 20.5 mA

Pulse/frequency/switch output

Pulse output	
Failure mode	Choose from: ▪ Actual value ▪ No pulses
Frequency output	

Failure mode	Choose from: ▪ Actual value ▪ 0 Hz ▪ Defined value (f_{max} 2 to 12 500 Hz)
Switch output	
Failure mode	Choose from: ▪ Current status ▪ Open ▪ Closed

Relay output

Failure mode	Choose from: ▪ Current status ▪ Open ▪ Closed

Local display

Plain text display	With information on cause and remedial measures
Backlight	Red backlighting indicates a device error.

Status signal as per NAMUR recommendation NE 107

Interface/protocol

- Via digital communication:
  HART protocol
- Via service interface
  - CDI-RJ45 service interface
  - WLAN interface

Plain text display	With information on cause and remedial measures

Web browser

Plain text display	With information on cause and remedial measures

Light emitting diodes (LED)

Status information	Status indicated by various light emitting diodes The following information is displayed depending on the device version: ▪ Supply voltage active ▪ Data transmission active ▪ Device alarm/error has occurred Diagnostic information via light emitting diodes → 🖹 150

Low flow cut off	The switch points for low flow cut off are user-selectable.
Galvanic isolation	The outputs are galvanically isolated from one another and from earth (PE).

Protocol-specific data

Manufacturer ID	0x11
Device type ID	0x3C
HART protocol revision	7
Device description files (DTM, DD)	Information and files under: www.endress.com
HART load	Min. 250 Ω
System integration	Information on system integration → 🖹 91. ▪ Measured variables via HART protocol ▪ Burst Mode functionality

16.5 Power supply

Terminal assignment

→ 🖹 42

Supply voltage

Order code for "Power supply"	Terminal voltage		Frequency range
Option **D**	DC24 V	±20%	–
Option **E**	AC100 to 240 V	−15…+10%	50/60 Hz, ±4 Hz
Option **I**	DC24 V	±20%	–
	AC100 to 240 V	−15…+10%	50/60 Hz, ±4 Hz

Power consumption

Transmitter

Max. 10 W (active power)

switch-on current	Max. 36 A (<5 ms) as per NAMUR Recommendation NE 21

Current consumption

Transmitter

- Max. 400 mA (24 V)
- Max. 200 mA (110 V, 50/60 Hz; 230 V, 50/60 Hz)

Power supply failure

- Totalizers stop at the last value measured.
- Depending on the device version, the configuration is retained in the device memoryor in the pluggable data memory (HistoROM DAT).
- Error messages (incl. total operated hours) are stored.

Electrical connection

→ 🖹 51

Potential equalization

→ 🖹 56

Terminals

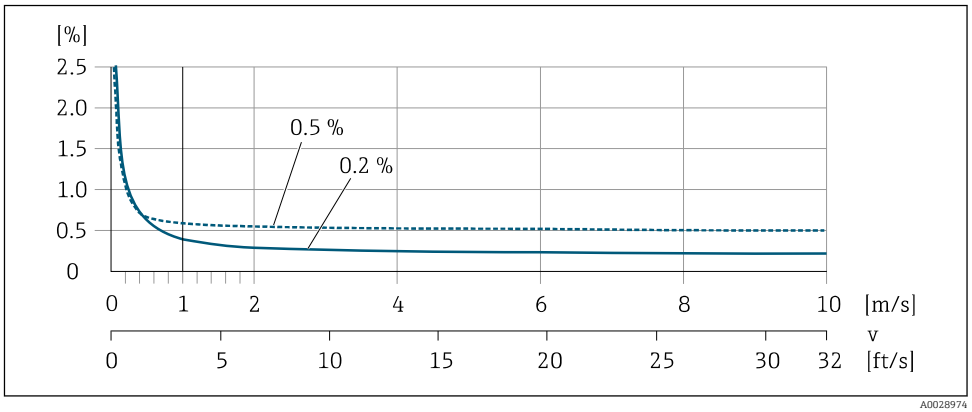
Spring-loaded terminals: Suitable for strands and strands with ferrules.
Conductor cross-section 0.2 to 2.5 mm² (24 to 12 AWG).

Cable entries
- Cable gland: M20 × 1.5 with cable Ø 6 to 12 mm (0.24 to 0.47 in)
- Thread for cable entry:
  - NPT ½"
  - G ½"
  - M20

Cable specification
→ 38

16.6 Performance characteristics

Reference operating conditions
- Error limits following DIN EN 29104, in future ISO 20456
- Water, typically: +15 to +45 °C (+59 to +113 °F); 0.5 to 7 bar (73 to 101 psi)
- Data as indicated in the calibration protocol
- Accuracy based on accredited calibration rigs according to ISO 17025



Maximum measured error

Error limits under reference operating conditions

o.r. = of reading

Volume flow
- ±0.5 % o.r. ± 1 mm/s (0.04 in/s)
- Optional: ±0.2 % o.r. ± 2 mm/s (0.08 in/s)

Fluctuations in the supply voltage do not have any effect within the specified range.

47 *Maximum measured error in % o.r.*

Electrical conductivity
Max. measured error not specified.

Accuracy of outputs

The outputs have the following base accuracy specifications.

Current output

Accuracy	±5 µA

Pulse/frequency output

o.r. = of reading

Accuracy	Max. ±50 ppm o.r. (over the entire ambient temperature range)

Repeatability

o.r. = of reading

Volume flow
Max. ±0.1 % o.r. ± 0.5 mm/s (0.02 in/s)

Electrical conductivity
Max. ±5 % o.r.

Influence of ambient temperature

Current output

Temperature coefficient	Max. 1 µA/°C

Pulse/frequency output

Temperature coefficient	No additional effect. Included in accuracy.

16.7 Installation

"Mounting requirements" → 23

16.8 Environment

Ambient temperature range

→ 25

Temperature tables

Observe the interdependencies between the permitted ambient and fluid temperatures when operating the device in hazardous areas.

For detailed information on the temperature tables, see the separate document entitled "Safety Instructions" (XA) for the device.

Storage temperature

The storage temperature corresponds to the operating temperature range of the transmitter and the sensor → 25.

- Protect the measuring device against direct sunlight during storage in order to avoid unacceptably high surface temperatures.
- Select a storage location where moisture cannot collect in the measuring device as fungus or bacteria infestation can damage the liner.
- If protection caps or protective covers are mounted these should never be removed before installing the measuring device.

Degree of protection

Transmitter
- As standard: IP66/67, type 4X enclosure
- When housing is open: IP20, type 1 enclosure
- Display module: IP20, type 1 enclosure

Sensor
As standard: IP66/67, type 4X enclosure

External WLAN antenna
IP67

Vibration- and shock-resistance

Vibration sinusoidal, in accordance with IEC 60068-2-6

Order code for "Sensor junction housing", option L "Cast, stainless" and order code for "Sensor option", option CG "Extended neck for insulation"
- 2 to 8.4 Hz, 3.5 mm peak
- 8.4 to 2 000 Hz, 1 g peak

Order code for "Sensor connection housing", option A "Alu, coated"
- 2 to 8.4 Hz, 7.5 mm peak
- 8.4 to 2 000 Hz, 2 g peak

Vibration broad-band random, according to IEC 60068-2-64

Order code for "Sensor junction housing", option L "Cast, stainless" and order code for "Sensor option", option CG "Extended neck for insulation"
- 10 to 200 Hz, 0.003 g^2/Hz
- 200 to 2 000 Hz, 0.001 g^2/Hz
- Total: 1.54 g rms

Order code for "Sensor connection housing", option A "Alu, coated"
- 10 to 200 Hz, 0.01 g^2/Hz
- 200 to 2 000 Hz, 0.003 g^2/Hz
- Total: 2.70 g rms

Shock half-sine, according to IEC 60068-2-27

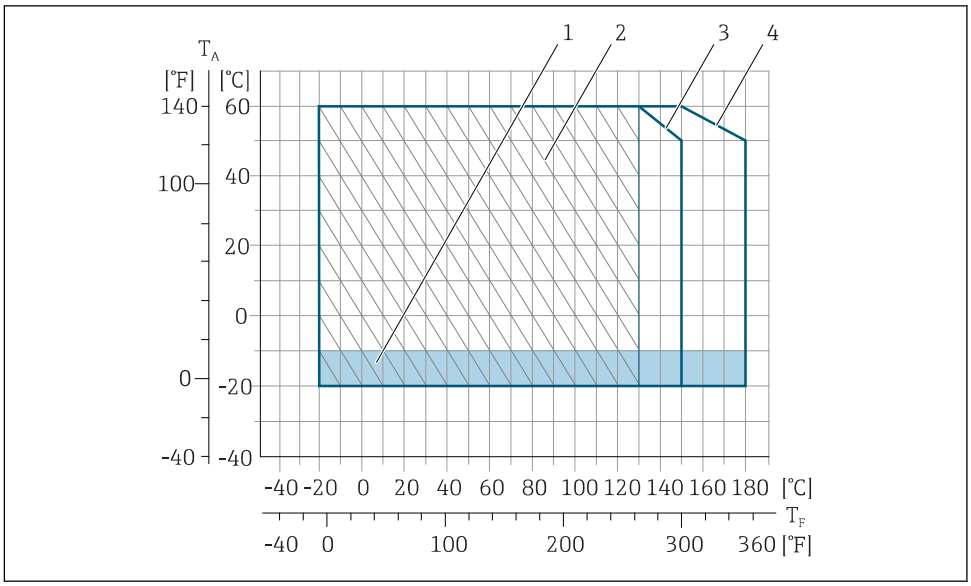
- Order code for "Sensor junction housing", option L "Cast, stainless" and order code for "Sensor option", option CG "Extended neck for insulation"
  6 ms 30 g
- Order code for "Sensor connection housing", option A "Alu, coated"
  6 ms 50 g

Rough handling shocks according to IEC 60068-2-31

Mechanical load

- Protect the transmitter housing against mechanical effects, such as shock or impact.
- Never use the transmitter housing as a ladder or climbing aid.

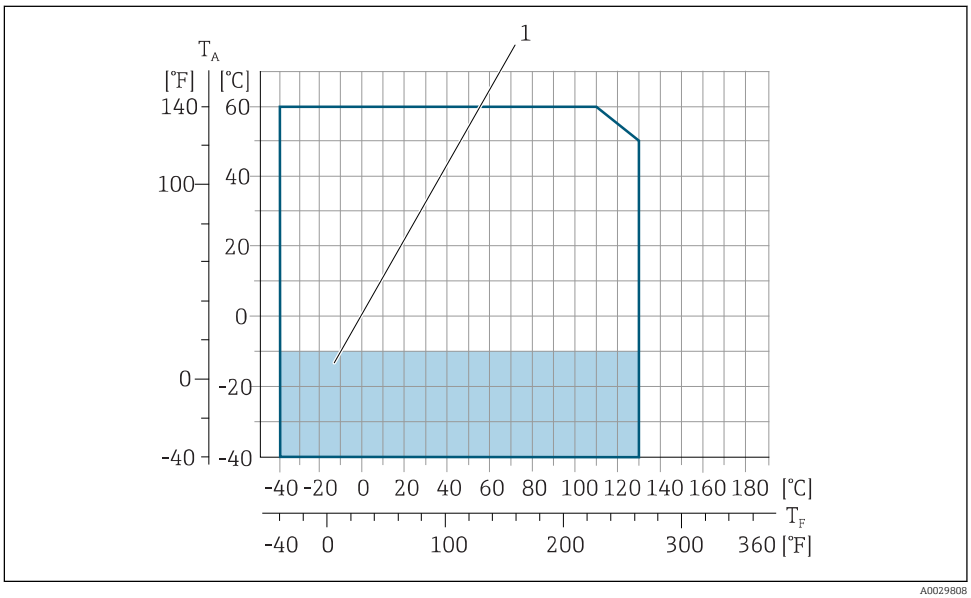
Electromagnetic compatibility (EMC)



As per IEC/EN 61326 and NAMUR Recommendation 21 (NE 21)

Details are provided in the Declaration of Conformity.

16.9 Process



Medium temperature range

- −20 to +150 °C (−4 to +302 °F) for PFA, DN 25 to 200 (1 to 8")
- −20 to +180 °C (−4 to +356 °F) for PFA high-temperature, DN 25 to 200 (1 to 8")
- −40 to +130 °C (−40 to +266 °F) for PTFE, DN 15 to 600 (½ to 24")

48 PFA

T_A Ambient temperature
T_F Medium temperature
1 Colored area: the ambient temperature range −10 to −20 °C (+14 to −4 °F) applies to stainless flanges only
2 Hatched area: harsh environment only for medium temperature range −20 to +130 °C (−4 to +266 °F)
3 −20 to +150 °C (−4 to +302 °F) for PFA, DN 25 to 200 (1 to 8")
4 −20 to +180 °C (−4 to +356 °F) for PFA high-temperature, DN 25 to 200 (1 to 8")

49 PTFE

T_A Ambient temperature
T_F Medium temperature
1 Colored area: the ambient temperature range of −10 to −40 °C (+14 to −40 °F) applies to stainless flanges only

Conductivity

≥ 5 µS/cm for liquids in general.

Proline 500
The necessary minimum conductivity also depends on the cable length .

Pressure-temperature ratings

An overview of the pressure-temperature ratings for the process connections is provided in the "Technical Information" document

Pressure tightness

Liner: PFA

Nominal diameter		Limit values for absolute pressure in [mbar] ([psi]) for medium temperatures:		
[mm]	[in]	+25 °C (+77 °F)	+80 °C (+176 °F)	+100 to +180 °C (+212 to +356 °F)
25	1	0 (0)	0 (0)	0 (0)
32	–	0 (0)	0 (0)	0 (0)

250	10	330 (4.79)	–	400 (5.80)	530 (7.69)
300	12	400 (5.80)	–	500 (7.25)	630 (9.14)
350	14	470 (6.82)	–	600 (8.70)	730 (10.6)
400	16	540 (7.83)	–	670 (9.72)	800 (11.6)
450	18	No negative pressure permitted!			
500	20				
600	24				

Flow limit

The diameter of the pipe and the flow rate determine the nominal diameter of the sensor. The optimum velocity of flow is between 2 to 3 m/s (6.56 to 9.84 ft/s). Also match the velocity of flow (v) to the physical properties of the fluid:
- v < 2 m/s (6.56 ft/s): for abrasive fluids (e.g. potter's clay, lime milk, ore slurry)
- v > 2 m/s (6.56 ft/s): for fluids producing buildup (e.g. wastewater sludge)

A necessary increase in the flow velocity can be achieved by reducing the sensor nominal diameter.

For an overview of the full scale values for the measuring range, see the "Measuring range" section

Pressure loss

- No pressure loss occurs if the sensor is installed in a pipe with the same nominal diameter.
- Pressure losses for configurations incorporating adapters according to DIN EN 545 → 27

System pressure

→ 26

Vibrations

→ 26

16.10 Mechanical construction

Design, dimensions

For the dimensions and installation lengths of the device, see the "Technical Information" document, "Mechanical construction" section.

Weight

All values (weight exclusive of packaging material) refer to devices with flanges of the standard pressure rating.
The weight may be lower than indicated depending on the pressure rating and design.

Transmitter
- Proline 500 – digital polycarbonate: 1.4 kg (3.1 lbs)
- Proline 500 – digital aluminum: 2.4 kg (5.3 lbs)
- Proline 500 aluminum: 6.5 kg (14.3 lbs)
- Proline 500 cast, stainless: 15.6 kg (34.4 lbs)

Sensor
- Sensor with aluminum connection housing version: see the information in the following table
- Sensor with cast connection housing version, stainless: +3.7 kg (+8.2 lbs)

Weight in SI units

Nominal diameter		EN (DIN), AS [1]		ASME		JIS

Materials

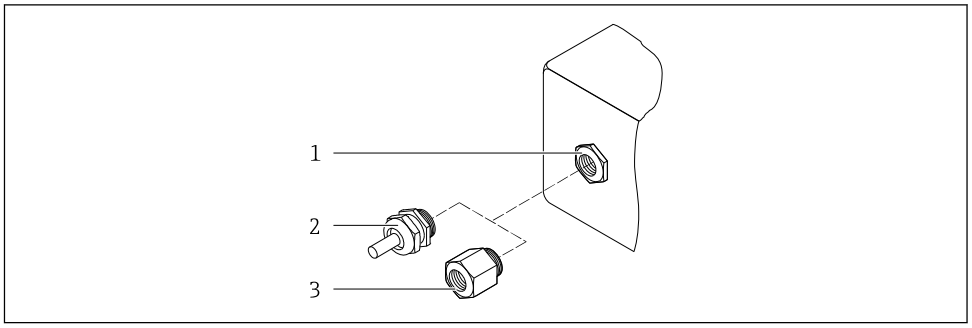
Transmitter housing

Housing of Proline 500 – digital transmitter

Order code for "Transmitter housing":
- Option **A** "Aluminum coated": aluminum, AlSi10Mg, coated
- Option **D** "Polycarbonate": polycarbonate

Housing of Proline 500 transmitter

Order code for "Transmitter housing":
- Option **A** "Aluminum coated": aluminum, AlSi10Mg, coated
- Option **L** "Cast, stainless": cast, stainless steel, 1.4409 (CF3M) similar to 316L



Window material

Order code for "Transmitter housing":
- Option **A** "Aluminum, coated": glass
- Option **D** "Polycarbonate": plastic
- Option **L** "Cast, stainless": glass

Sensor connection housing

Order code for "Sensor connection housing":
- Option **A** "Aluminum coated": aluminum, AlSi10Mg, coated
- Option **L** "Cast, stainless": 1.4409 (CF3M) similar to 316L

Cable entries/cable glands

50 *Possible cable entries/cable glands*

1 Female thread M20 × 1.5
2 Cable gland M20 × 1.5
3 Adapter for cable entry with internal thread G ½" or NPT ½"

Cable entries and adapters	Material
Cable gland M20 × 1.5	Plastic
▪ Adapter for cable entry with internal thread G ½" ▪ Adapter for cable entry with internal thread NPT ½" Only available for certain device versions: ▪ Order code for "Transmitter housing": ▪ Option **A** "Aluminum, coated" ▪ Option **D** "Polycarbonate" ▪ Order code for "Sensor connection housing": ▪ Proline 500 – digital: Option **A** "Aluminum coated" Option **L** "Cast, stainless" ▪ Proline 500: Option **A** "Aluminum coated" Option **L** "Cast, stainless"	Nickel-plated brass
▪ Adapter for cable entry with internal thread G ½" ▪ Adapter for cable entry with internal thread NPT ½" Only available for certain device versions: ▪ Order code for "Transmitter housing": Option **L** "Cast, stainless" ▪ Order code for "Sensor connection housing": Option **L** "Cast, stainless"	Stainless steel, 1.4404 (316L)

Connecting cable

UV rays can impair the cable outer sheath. Protect the cable from exposure to sun as much as possible.

Connecting cable for sensor - Proline 500 – digital transmitter

PVC cable with copper shield

Connecting cable for sensor - Proline 500 transmitter

- Standard cable: PVC cable with copper shield
- Reinforced cable: PVC cable with copper shield and additional steel wire braided jacket

Sensor housing

- DN 15 to 300 (½ to 12"): coated aluminum AlSi10Mg
- DN 350 to 600 (14 to 24"): carbon steel with protective varnish

Measuring tubes

Stainless steel, 1.4301/304/1.4306/304L
For flanges made of carbon with Al/Zn protective coating (DN 15 to 300 (½ to 12")) or protective varnish (DN 350 to 600 (14 to 24"))

Liner

- PFA
- PTFE

Process connections

EN 1092-1 (DIN 2501)
Stainless steel, 1.4571; carbon steel, E250C [3]/S235JRG2/P245GH

ASME B16.5
Stainless steel, F316L; carbon steel, A105 [3]

JIS B2220
Stainless steel, F316L [3]; carbon steel, A105/A350 LF2

AS 2129 Table E
- DN 25 (1"): carbon steel, A105/S235JRG2
- DN 40 (1 ½"): carbon steel, A105/S275JR

AS 4087 PN 16
Carbon steel, A105/S275JR

Electrodes

Stainless steel, 1.4435 (F316L); Alloy C22, 2.4602 (UNS N06022); platinum; tantalum; titanium

Seals

As per DIN EN 1514-1, form IBC

Accessories

Protective cover

Stainless steel, 1.4404 (316L)

External WLAN antenna

- Antenna: ASA plastic (acrylic ester-styrene-acrylonitrile) and nickel-plated brass
- Adapter: Stainless steel and nickel-plated brass
- Cable: Polyethylene
- Plug: Nickel-plated brass
- Angle bracket: Stainless steel

Ground disks

Stainless steel, 1.4435 (F316L); Alloy C22, 2.4602 (UNS N06022); tantalum; titanium

Fitted electrodes

Measuring electrodes, reference electrodes and electrodes for empty pipe detection:
- Standard: stainless steel, 1.4435 (F316L); Alloy C22, 2.4602 (UNS N06022); tantalum, titanium
- Optional: only platinum measuring electrodes

3) DN 15 to 300 (½ to 12") with Al/Zn protective varnish; DN 350 to 600 (14 to 24") with protective varnish

Process connections

- EN 1092-1 (DIN 2501)
- ASME B16.5
- JIS B2220
- AS 2129 Table E
- AS 4087 PN 16

For information on the different materials used in the process connections → 200

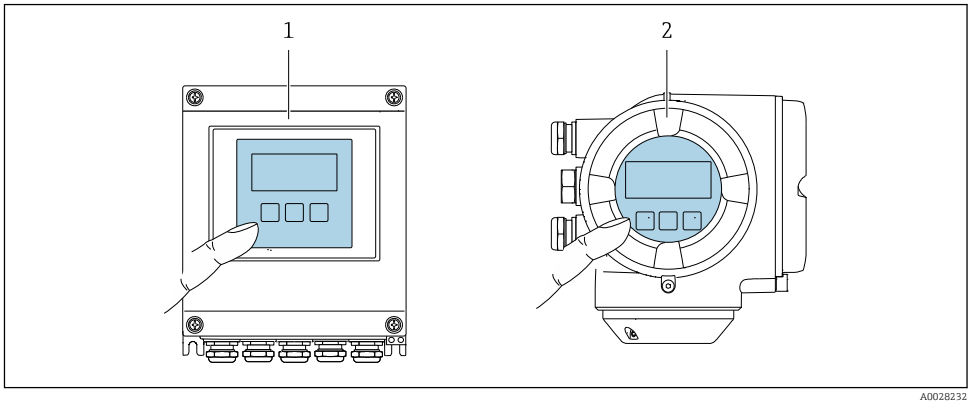
Surface roughness

Stainless steel electrodes, 1.4435 (F316L); Alloy C22, 2.4602 (UNS N06022); platinum; tantalum; titanium:
≤ 0.3 to 0.5 µm (11.8 to 19.7 µin)
(All data relate to parts in contact with fluid)

Liner with PFA:
≤ 0.4 µm (15.7 µin)
(All data relate to parts in contact with fluid)

16.11 Human interface

Languages



Can be operated in the following languages:
- Via local operation
  English, German, French, Spanish, Italian, Dutch, Portuguese, Polish, Russian, Turkish, Chinese, Japanese, Korean, Bahasa (Indonesian), Vietnamese, Czech, Swedish
- Via Web browser
  English, German, French, Spanish, Italian, Dutch, Portuguese, Polish, Russian, Turkish, Chinese, Japanese, Korean, Bahasa (Indonesian), Vietnamese, Czech, Swedish
- Via "FieldCare", "DeviceCare" operating tool: English, German, French, Spanish, Italian, Chinese, Japanese

Local operation

Via display module

Equipment:
- Order code for "Display; operation", option F "4-line, illuminated, graphic display; touch control"
- Order code for "Display; operation", option G "4-line, illuminated, graphic display; touch control + WLAN"

Information about WLAN interface → 86

51 *Operation with touch control*

1 Proline 500 – digital
2 Proline 500

Display elements

- 4-line, illuminated, graphic display
- White background lighting; switches to red in event of device errors
- Format for displaying measured variables and status variables can be individually configured
- Permitted ambient temperature for the display: −20 to +60 °C (−4 to +140 °F)
  The readability of the display may be impaired at temperatures outside the temperature range.

Operating elements

- External operation via touch control (3 optical keys) without opening the housing: ⊞, ⊟, Ⓔ
- Operating elements also accessible in the various zones of the hazardous area

Remote operation

→ 🖹 84

Service interface

→ 🖹 85

Supported operating tools

Different operating tools can be used for local or remote access to the measuring device. Depending on the operating tool used, access is possible with different operating units and via a variety of interfaces.

Supported operating tools	Operating unit	Interface	Additional information
Web browser	Notebook, PC or tablet with Web browser	▪ CDI-RJ45 service interface ▪ WLAN interface	Special Documentation for device
DeviceCare SFE100	Notebook, PC or tablet with Microsoft Windows system	▪ CDI-RJ45 service interface ▪ WLAN interface ▪ Fieldbus protocol	→ 🖹 178
FieldCare SFE500	Notebook, PC or tablet with Microsoft Windows system	▪ CDI-RJ45 service interface ▪ WLAN interface ▪ Fieldbus protocol	→ 🖹 178
Device Xpert	Field Xpert SFX 100/350/370	HART and FOUNDATION Fieldbus fieldbus protocol	Operating Instructions BA01202S Device description files: Use update function of handheld terminal

Other operating tools based on FDT technology with a device driver such as DTM/iDTM or DD/EDD can be used for device operation. These operating tools are available from the individual manufacturers. Integration into the following operating tools, among others, is supported:

- FactoryTalk AssetCentre (FTAC) by Rockwell Automation → www.rockwellautomation.com
- Process Device Manager (PDM) by Siemens → www.siemens.com
- Asset Management Solutions (AMS) by Emerson → www.emersonprocess.com
- FieldCommunicator 375/475 by Emerson → www.emersonprocess.com
- Field Device Manager (FDM) by Honeywell → www.honeywellprocess.com
- FieldMate by Yokogawa → www.yokogawa.com
- PACTWare → www.pactware.com

The associated device description files are available at: www.endress.com → Downloads

Web server

Thanks to the integrated Web server, the device can be operated and configured via a Web browser and via a service interface (CDI-RJ45) or via a WLAN interface. The structure of the operating menu is the same as for the local display. In addition to the measured values, status information on the device is also displayed and allows the user to monitor the status of the device. Furthermore the device data can be managed and the network parameters can be configured.

A device that has a WLAN interface (can be ordered as an option) is required for the WLAN connection: order code for "Display; operation", option G "4-line, illuminated; touch control + WLAN". The device acts as an Access Point and enables communication by computer or a mobile handheld terminal.

Supported functions
Data exchange between the operating unit (such as a notebook for example) and the measuring device:
- Upload the configuration from the measuring device (XML format, configuration backup)
- Save the configuration to the measuring device (XML format, restore configuration)
- Export event list (.csv file)
- Export parameter settings (.csv file or PDF file, document the measuring point configuration)
- Export the Heartbeat verification log (PDF file, only available with the "Heartbeat Verification" application package)
- Flash firmware version for device firmware upgrade, for instance
- Download driver for system integration
- Visualize up to 1000 saved measured values (only available with the **Extended HistoROM** application package → 📄 206)

Web server special documentation → 📄 208

HistoROM data management

The measuring device features HistoROM data management. HistoROM data management comprises both the storage and import/export of key device and process data, making operation and servicing far more reliable, secure and efficient.

When the device is delivered, the factory settings of the configuration data are stored as a backup in the device memory. This memory can be overwritten with an updated data record, for example after commissioning.

Additional information on the data storage concept

There are different types of data storage units in which device data are stored and used by the device:

	Device memory	T-DAT	S-DAT
Available data	▪ Event logbook such as diagnostic events for example ▪ Parameter data record backup ▪ Device firmware package	▪ Measured value logging ("Extended HistoROM" order option) ▪ Current parameter data record (used by firmware at run time) ▪ Peakhold indicator (min/max values) ▪ Totalizer values	▪ Sensor data: nominal diameter etc. ▪ Serial number ▪ Calibration data ▪ Device configuration (e.g. SW options, fixed I/O or multi I/O)
Storage location	Fixed on the user interface board in the connection compartment	Attachable to the user interface board in the connection compartment	In the sensor plug in the transmitter neck part

Data backup

Automatic
- The most important device data (sensor and transmitter) are automatically saved in the DAT modules
- If the transmitter or measuring device is replaced: once the T-DAT containing the previous device data has been exchanged, the new measuring device is ready for operation again immediately without any errors
- If the sensor is replaced: once the sensor has been replaced, new sensor data are transferred from the S-DAT in the measuring device and the measuring device is ready for operation again immediately without any errors
- If exchanging the electronics module (e.g. I/O electronics module): Once the electronics module has been replaced, the software of the module is compared against the current device firmware. The module software is upgraded or downgraded where necessary. The electronics module is available for use immediately afterwards and no compatibility problems occur.

Manual
Additional parameter data record (complete parameter settings) in the integrated device memory HistoROM backup for:
- Data backup function
  Backup and subsequent restoration of a device configuration in the device memory HistoROM backup
- Data comparison function
  Comparison of the current device configuration with the device configuration saved in the device memory HistoROM backup

Data transfer

Manual
Transfer of a device configuration to another device using the export function of the specific operating tool, e.g. with FieldCare, DeviceCare or Web server: to duplicate the configuration or to store in an archive (e.g. for backup purposes)

Event list

Automatic
- Chronological display of up to 20 event messages in the events list
- If the **Extended HistoROM** application package (order option) is enabled: up to 100 event messages are displayed in the events list along with a time stamp, plain text description and remedial measures
- The events list can be exported and displayed via a variety of interfaces and operating tools e.g. DeviceCare, FieldCare or Web server

Data logging

Manual
If the **Extended HistoROM** application package (order option) is enabled:
- Record up to 1 000 measured values via 1 to 4 channels
- User configurable recording interval
- Record up to 250 measured values via each of the 4 memory channels
- Export the measured value log via a variety of interfaces and operating tools e.g. FieldCare, DeviceCare or web server

16.12 Certificates and approvals

Currently available certificates and approvals can be called up via the product configurator.

CE mark	The device meets the legal requirements of the applicable EU Directives. These are listed in the corresponding EU Declaration of Conformity along with the standards applied. Endress+Hauser confirms successful testing of the device by affixing to it the CE mark.
RCM-tick symbol	The measuring system meets the EMC requirements of the "Australian Communications and Media Authority (ACMA)".
Ex approval	The devices are certified for use in hazardous areas and the relevant safety instructions are provided in the separate "Safety Instructions" (XA) document. Reference is made to this document on the nameplate.
Pharmaceutical compatibility	▪ FDA ▪ USP Class VI ▪ TSE/BSE Certificate of Suitability
Functional safety	The measuring device can be used for flow monitoring systems (min., max., range) up to SIL 2 (single-channel architecture; order code for "Additional approval", option LA) and SIL 3 (multichannel architecture with homogeneous redundancy) and is independently evaluated and certified by the TÜV in accordance with IEC 61508. The following types of monitoring in safety equipment are possible: Functional Safety Manual with information on the SIL device → 208
HART certification	**HART interface** The measuring device is certified and registered by the FieldComm Group. The measuring system meets all the requirements of the following specifications: ▪ Certified according to HART 7 ▪ The device can also be operated with certified devices of other manufacturers (interoperability)
Radio approval	The measuring device has radio approval. For detailed information regarding radio approval, see Special Documentation
Pressure Equipment Directive	▪ With the identification PED/G1/x (x = category) on the sensor nameplate, Endress+Hauser confirms conformity with the "Essential Safety Requirements" specified in Appendix I of the Pressure Equipment Directive 2014/68/EU. ▪ Devices not bearing this marking (PED) are designed and manufactured according to good engineering practice. They meet the requirements of Article 4 paragraph 3 of the Pressure Equipment Directive 2014/68/EU. The range of application is indicated in tables 6 to 9 in Annex II of the Pressure Equipment Directive 2014/68/EU.
Measuring instrument approval	The measuring device is qualified to OIML R117 and has an OIML Certificate of Conformity (optional).
Additional certification	**PWIS-free** PWIS = paint-wetting impairment substances

Order code for "Service":
- Option **HC**: PWIS-free (version A)
- Option **HD**: PWIS-free (version B)
- Option **HE**: PWIS-free (version C)

For more information on PWIS-free certification, see "Test specification" document TS01028D

Other standards and guidelines

- EN 60529
  Degrees of protection provided by enclosures (IP code)
- EN 61010-1
  Safety requirements for electrical equipment for measurement, control and laboratory use - general requirements
- IEC/EN 61326
  Emission in accordance with Class A requirements. Electromagnetic compatibility (EMC requirements).
- NAMUR NE 21
  Electromagnetic compatibility (EMC) of industrial process and laboratory control equipment
- NAMUR NE 32
  Data retention in the event of a power failure in field and control instruments with microprocessors
- NAMUR NE 43
  Standardization of the signal level for the breakdown information of digital transmitters with analog output signal.
- NAMUR NE 53
  Software of field devices and signal-processing devices with digital electronics
- NAMUR NE 105
  Specifications for integrating fieldbus devices in engineering tools for field devices
- NAMUR NE 107
  Self-monitoring and diagnosis of field devices
- NAMUR NE 131
  Requirements for field devices for standard applications

16.13 Application packages

Many different application packages are available to enhance the functionality of the device. Such packages might be needed to address safety aspects or specific application requirements.

The application packages can be ordered with the device or subsequently from Endress+Hauser. Detailed information on the order code in question is available from your local Endress+Hauser sales center or on the product page of the Endress+Hauser website: www.endress.com.

Diagnostics functions

Package	Description
Extended HistoROM	Comprises extended functions concerning the event log and the activation of the measured value memory. Event log: Memory volume is extended from 20 message entries (standard version) to up to 100 entries. Data logging (line recorder): ▪ Memory capacity for up to 1000 measured values is activated. ▪ 250 measured values can be output via each of the 4 memory channels. The recording interval can be defined and configured by the user. ▪ Measured value logs can be accessed via the local display or operating tool e.g. FieldCare, DeviceCare or Web server.

Heartbeat Technology

Package	Description
Heartbeat Verification +Monitoring	**Heartbeat Verification** Meets the requirement for traceable verification to DIN ISO 9001:2008 Chapter 7.6 a) "Control of monitoring and measuring equipment". ▪ Functional testing in the installed state without interrupting the process. ▪ Traceable verification results on request, including a report. ▪ Simple testing process via local operation or other operating interfaces. ▪ Clear measuring point assessment (pass/fail) with high test coverage within the framework of manufacturer specifications. ▪ Extension of calibration intervals according to operator's risk assessment. **Heartbeat Monitoring** Continuously supplies data, which are characteristic of the measuring principle, to an external condition monitoring system for the purpose of preventive maintenance or process analysis. These data enable the operator to: ▪ Draw conclusions - using these data and other information - about the impact process influences (such as corrosion, abrasion, buildup etc.) have on the measuring performance over time. ▪ Schedule servicing in time. ▪ Monitor the process or product quality, e.g. gas pockets.

Cleaning

Package	Description
Electrode cleaning circuit (ECC)	The electrode cleaning circuit (ECC) function has been developed to have a solution for applications where magnetite (Fe_3O_4) deposits frequently occur (e.g. hot water). Since magnetite is highly conductive this build up leads to measuring errors and ultimately to the loss of signal. The application package is designed to AVOID build up of highly conductive matter and thin layers (typical of magnetite).

OPC-UA server

Package	Description
OPC-UA-Server	The application package provides the user with an integrated OPC-UA server for comprehensive instrument services for IoT and SCADA applications. Special Documentation for the "OPC-UA-Server" application package → 208.

16.14 Accessories

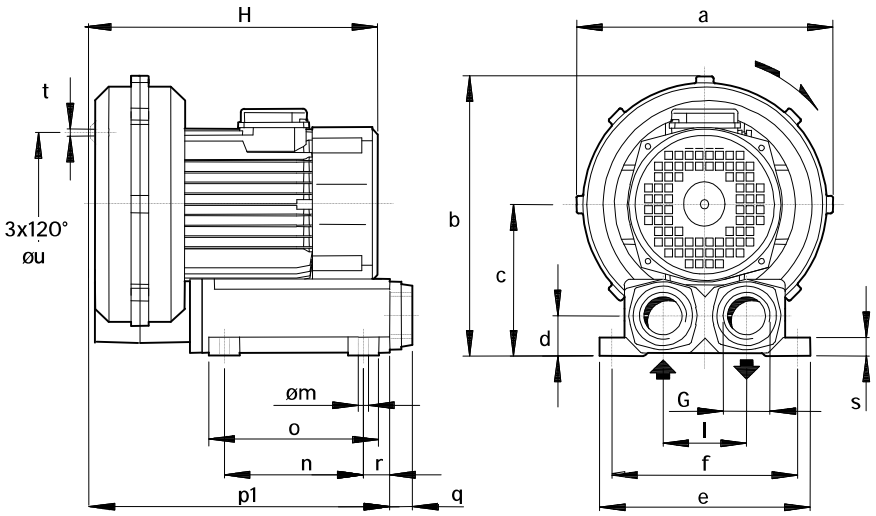
Section 3.6.7

Sludge Blower



SCL R20 / R30 / R40
MD SERIES

SN 2464-7 1/2

STANDARD FEATURES
- Low weight cast aluminum construction.
- Quiet operation with integral inlet and outlet muffling.
- Recognized TEFC - cURus motor.
- High efficiency / low noise impeller design.
- No lubrication / maintenance required.
- Allowed ambient: +5 °F to +104 °F.
- Mountable in any plane.

OPTIONS
- Remote drive models (belt or coupling).
- Special voltages.
- Surface treatment or plating.
- Gas tight sealing.
- Special designs available.

ACCESSORIES
- Inlet and/or inline filters.
- Additional inlet/outlet silencers.
- Relief valves.
- Flow converting devices.
- Optionals connectors

Dimensions in inches.
Dimension for reference only.

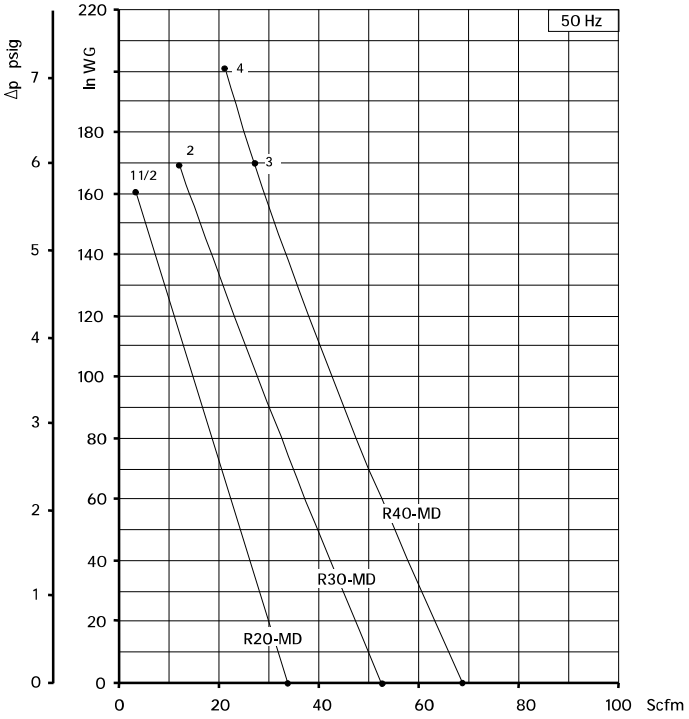
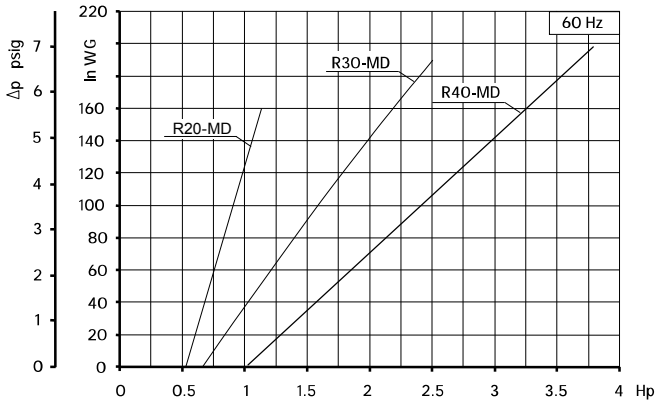
(1) Noise measured at 1 m distance with inlet and outlet ports piped, in accordance to ISO 3744.

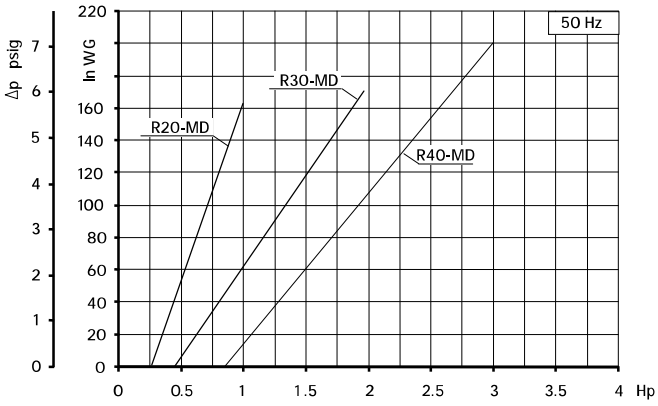


- For proper use, the blower should be equipped with inlet filter and relief valve; other accessories available on request.
- Ambient temperaturefrom +5° to +104°F.
- Specifications subject to change without notice.

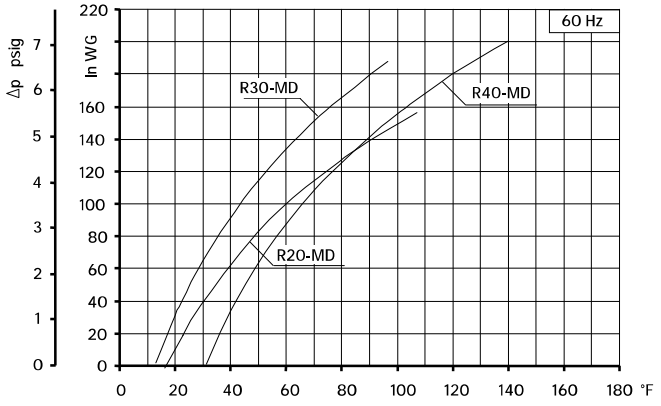
SCL R20 / R30 / R40 MD SERIES

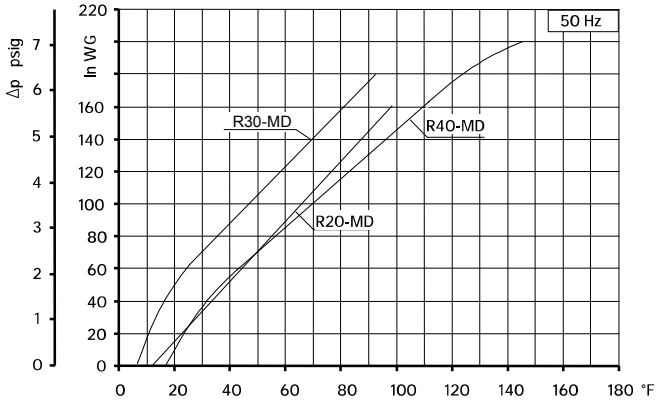


SN 2464-7 2/2



CAPACITY





ABSORBED POWER

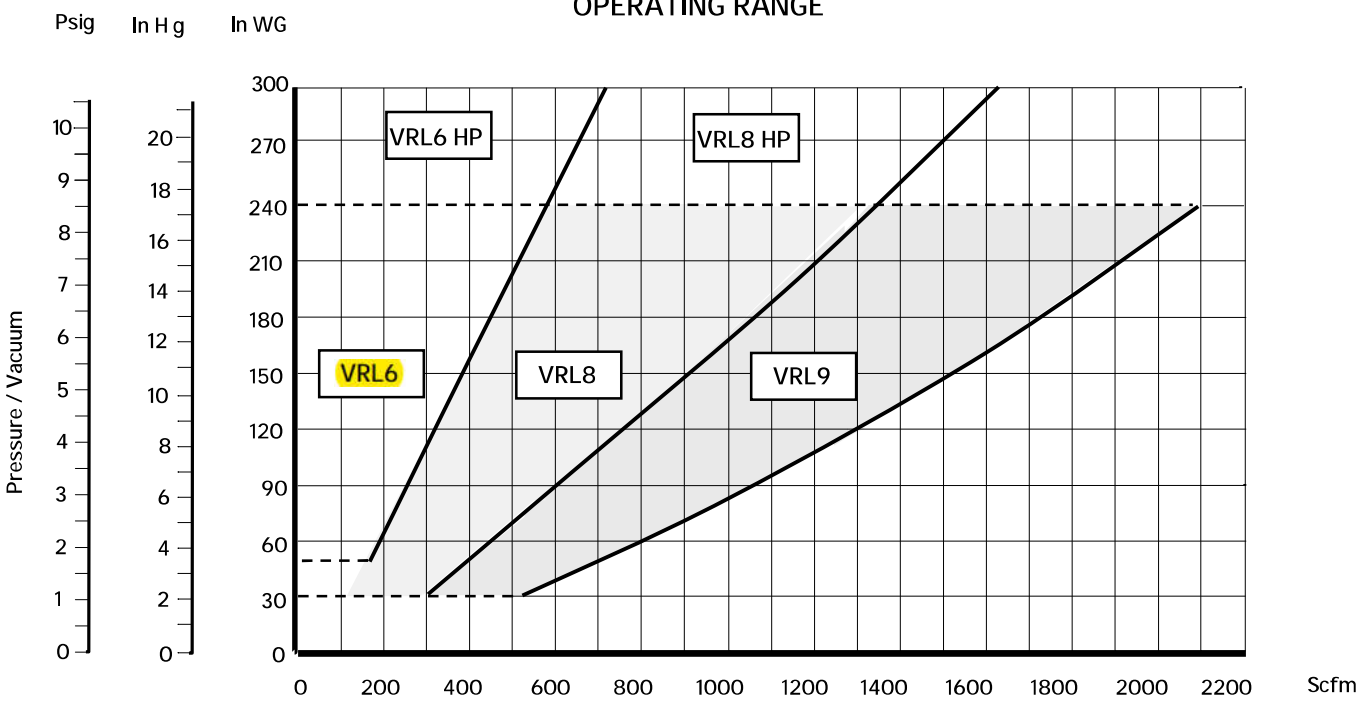
TEMPERATURE INCREASE

Curves refer to air at 68°F temperature and 29.92 In Hg atmospheric pressure (abs) measured at inlet port.
Values for flow, power consumption and temperature rise: +/-10% tolerance.
Data subject to change without notice.

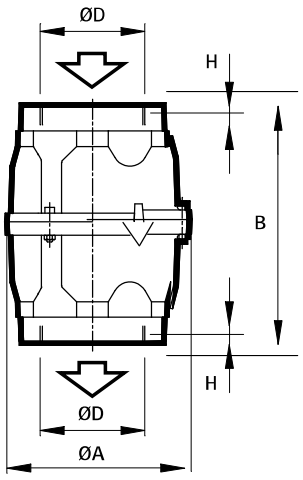
Safety Valves

SN 1733 -7 1/1

The VRL valves are designed to protect blowers and / or motors from over pressurization or excess vacuum. When there is over pressurization, the valve opens and discharges to the outside. When there is excess in vacuum, the valve opens and takes flow from outside.



The valves have been designed for low pressure / low vacuum, with minimal difference between the initial value at which the valve begins to open and its fully opened position. The valves are supplied with 2 different springs to maximize their efficiency.
These compact valves, made of aluminum alloy, are both easy to install and calibrate, and operate in a wide range of capacities.
The VRL can be plumbed to divert excess primary flow through a secondary external outlet when working in pressure conditions, or to pipe in a secondary flow when working in vacuum.
"HP" valves are used for pressures >240" H2O.



Maximum efficiency is achieved by keeping operating values (flow versus pressure or vacuum) within the operating range (shaded area on graph). Capacity refers to air having a density equal to 0.075 lbs./cu.ft .

VRL6 VRL6 HP | VRL8 VRL8 HP | VRL9

OPERATING RANGE

OVERALL DIMENSIONS

TYPE	ND	D	A	B	H	WEIGHT (Lbs)
VR6 & VRL6 HP	2"	2" NPT	4.02	6.90	0.47	1.9

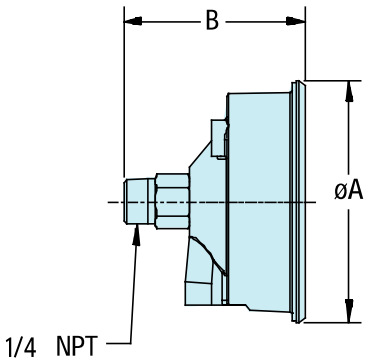
VRL9	4"	4" NPT	6.30	8.11	0.71	5.7

- Dimensions in inches.
- Specifications subject to change without prior notice.



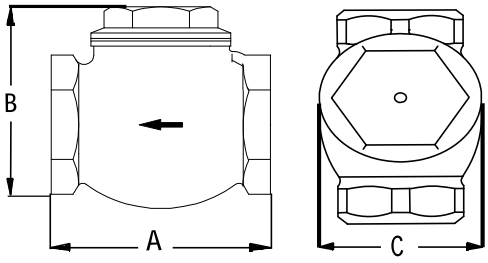
VRL valves are supplied uncalibrated - contact FPZ for calibration options.

FPZ, Inc. 150 N. Progress Drive Saukville, WI 53080 USA Tel. (262) 268-0180 usa@fpz.com www.fpzusa.com

Gauges, Check Valves, Silencers, Enclosures

SS1708

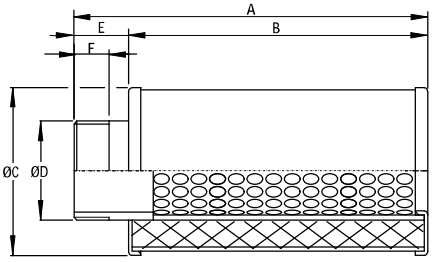
Gauges



Gauges are important for monitoring the operating pressure or vacuum of the blower. Gauges should be positioned as close to the blower as possible.

*				

Dimensions in inches. Tolerance on given values ± 10% - unbinding and can be changed without prior notice.
*

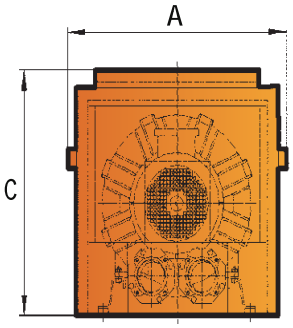


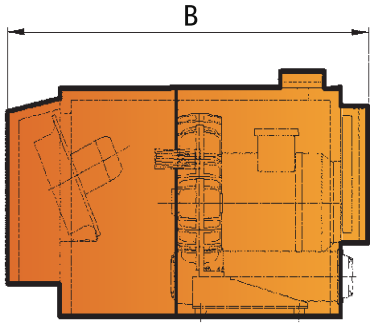
Check Valves

Swing check valves allow air to flow in one direction. These valves prevent backflow into the blower and are supplied in bronze or brass.

Dimensions in inches. Tolerance on given values ± 10% - unbinding and can be changed without prior notice.

Silencers



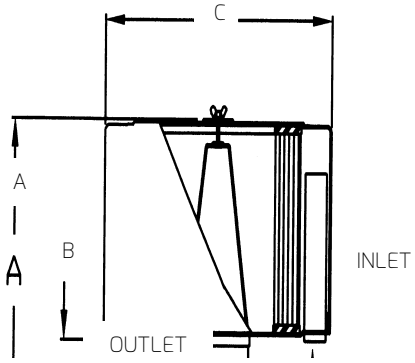


Silencers provide additional sound attenuation.

TYPE	D	A	B	C	E	F	lbs
SS 4	1" 1/4	7.5	5.5	2.8	2	0.6	0.8
SS 5	1" 1/2	7.9	6.7	3.1	1.2	0.8	1.1
SS 6	2"	9.1	7.9	3.5	1.2	0.8	1.3
SS 8	3"	19.1	15.7	6.0	3.3	0.8	4.8
SS 9	4"	18.3	16.9	6.7	1.1	0.8	9.9

Steel manufactured (apart from SI 9 / SS 9 - entirely in aluminium) with sound absorbing polyurethane element.
Dimensions in inches. Tolerance on given values ± 10% - unbinding and can be changed without prior notice.

Sound Enclosures



Part #	Used on models	A	B	C
IH1	SCL KO3-MS	13.4	18.2	15.8

IH12	SCL K11-TD	31.7	67.2	30
IH13	SCL KO9-11 TS	31.7	67.2	31.5

Dimensions in inches - unbinding and can be changed without prior notice.

Inlet Filters

SS1905

FPZ inlet filters are used for pressure applications. The inlet filters combine filtration and sound attenuation into a compact package. Inlet filters consist of a filter cartridge enclosed by a carbon steel weather hood. Elements are easily serviceable by simply removing the weather hood.

Dimension tolerance ± 1/8"

VG-020-013

FEATURES & SPECIFICATIONS

- Polyester: 99%+ removal efficiency standard to 5 micron. (Other media available upon request.)
- Fully drawn weather hood - no welds to rust or vibrate apart
- Tubular silencing design - tube is positioned to maximize sound attenuation and air flow while minimizing pressure drop
- Durable carbon steel construction with baked enamel finish
- Filter change out differential: 10"-15" H_2O Over Initial Delta P.

OPTIONAL DIRTY FILTER INDICATOR

The **VG-020-013** dirty filter indicator is used to maximize filter life for pressure applications only. The yellow indicator in the site window drops as dirt accumulates on the filter element. The element is ready for change out or servicing when the yellow indicator reaches the red zone. The filter condition can be determined without removing the weather hood even after the blower has been shut down.

The indicator can be mounted in the inlet piping between the blower and filter or directly to the filter housing by having a 1/8" npt tap installed in the hood. If a tap is required, FPZ part number **M020*** should be ordered.

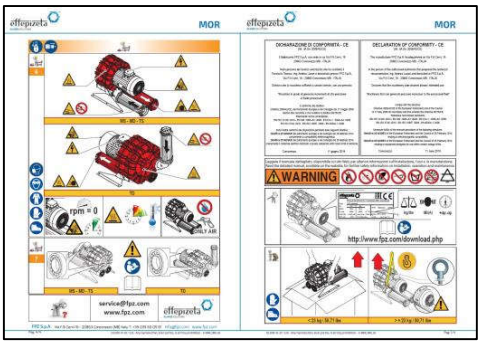
1 GENERAL INFORMATION

Read the manual for safety information on correct installation, operation and maintenance.

1.1 PURPOSE OF MANUAL

- The purpose of the manual is to complete the information contained in the *operative instructions* (Figure 1*)* supplied with the blower in order to give "instructions for use" to the skilled operator to prevent and minimize risks during the interaction between man and machine.
- For safe installation, carefully read this manual before installing the product and follow all instructions exactly as shown.
- The information was prepared by the manufacturer in the original language (ITALIAN) considering the content communication effectiveness for the interested parties also depending on the operator's qualifications and perspicacity.
- Keep the *operative instructions* (Figure 1*)* for the entire service life of the unit in a known and easy to access place to make it always at hand for reference.
- Any observations made by recipients can be an important contribution to improve the after-sales services provided by the manufacturer.
- The information contained in this manual is intended for use by specialized operators whose definition is contained in the document MAN_PIC (Figure 2).
- For electric components and motors that may be installed to the blower, please refer to the manuals of their own manufacturers.



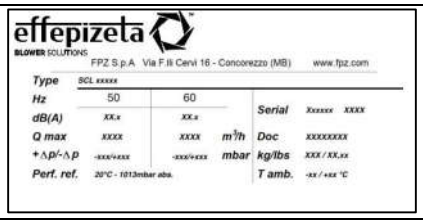


Figure 1 – *Operating Instruction*

Figure 2 - Document MAN_PIC

1.2 TECHNICAL DATA – NAMEPLATE

On the product nameplate are stated:

• Unit description • Performance (Noise [dB], Flow [m^3/h] and Pressure [mbar]) at 50 Hz and 60 Hz frequency referring to 20°C and 1013 mbar abs. • Serial number and year of manufacture • Reference Doc. (*Operating Instruction)* • Weight [kg/lbs] • Reference temperature for the working blower (T. amb.)	

It is strictly forbidden to remove or tamper with the product label.

1.3 TESTING, WARRANTY AND LIABILITY

Testing and inspection

- The entire unit is sent to the customer ready for installation, after passing the tests and inspections required by the manufacturer, in conformity with the applicable laws and the mandatory technical standards.

Warranty

- Warranties are defined in the general terms and conditions of sale.

Liability

- See document MAN_PIC.

2 SAFETY RULES

2.1 IMPORTANT SAFETY INFORMATION

WARNING	**The instructions listed below must be read carefully and become a fundamental part of daily procedures in the normal use and maintenance of all the equipment, in order to prevent any kind of personal or domestic animals (even serious) injury (or death) or damage to equipment.**

- Do not start the unit until its operation is clearly understood.
- All installation, commissioning and maintenance operations must be carried out by specialized operators only (see doc MAN_PIC).
- Keep the area around the unit constantly free of obstructions.
- Use appropriate PPE (Personal Protective Equipment) such as boots, gloves, goggles and work clothes.
- Pay attention to all danger and caution signs placed on the unit.
- Do not wear clothes, jewellery or accessories that can get caught in the cooling fan of the electric motor or that can be sucked into the blower.
- Do not modify the electrical connections on the unit.
- Observe all local, state and national electrical codes.
- Before starting the unit and/or with weekly frequency, the operator must check the efficiency of the devices that ensure the operation of the unit and any other unit defects. In case of any defects, immediately notify FPZ S.p.A.
- Devices that ensure the operation of the unit must never be removed or rendered useless.
- During maintenance or repair work, it may be necessary to exclude some mentioned devices from the service. This operation must be carried out by specialized operators only (see doc MAN_PIC).
- Always apply and enforce the safety rules; in case of any doubts, always consult this manual before acting.

WARNING	**Non-compliant installation with the unit's intended use can cause personal (even serious) injury (or death) or damage to equipment.**

The unit must only be started:

- in conformity with the purposes of use, transport and handling specified in "FORESEEN USE";
- respecting the values given in the nameplate data.

2.2 PROHIBITIONS

WARNING	**Failure to comply the following PROHIBITIONS can cause personal (even serious) injury (or death) or damage to equipment.**

- NEVER suck up and convey aggressive, corrosive, and/or harmful fluids.
- NEVER use the unit under conditions that differ from those indicated on the nameplate.
- NEVER use the unit without having installed a suction filter.
- NEVER operate with the suction and/or delivery openings closed.
- NEVER make conversions or changes to the unit, maintenance or repair work on one's own initiative or not envisaged in the manual. Maintenance work can be carried out only in compliance with what is described in this user manual, exclusively by specialized operators (see document MAN_PIC).
- NEVER use the unit in places where ATEX classification does not comply with Annex II of Directive 1999/92/EC.
- NEVER use the unit without having first installed and connected the sensors and/or regulators required to the plant and correctly installed and checked the seal system of the machine.
- NEVER use the unit with ambient temperatures below -15°C (+5°F) and above +40°C (+104°F).
- NEVER use the unit before ensuring correspondence between grid voltage and motor label voltage.

3 PROPER AND IMPROPER USE

3.1 OPERATING CONDITIONS

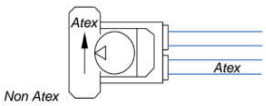
WARNING **Failure to observe the temperature, altitude, differential pressure and filtering modes for design and operation specifications there can be an impeller break which can cause personal (even serious) injury (or death) or damage to equipment .**

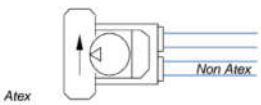
- The maximum permissible differential pressure indicated on the product nameplate must never be exceeded.
- It is important to install the unit at a maximum altitude of 1000 m (3300 ft.) above sea level, for higher altitudes contact FPZ.
- The unit is designed to operate at ambient temperature between -15°C (+5°F) and +40°C (+104°F).
- In case of suction in the environment or on the plant, protect the suction pipe using a suitable filter with a maximum degree of filtration of 25µm. Contact FPZ for filters with a different filtration degree. Check the compliance with the data of maximum pressure/vacuum listed on the nameplate. For ATEX blower we recommend an ATEX filter with a filtration degree of 20 µm / 25 µm.
- Installation, operation and maintenance of the blower must be carried out by specialized operators (see document MAN_PIC). Due to incorrect maintenance or an unauthorized modification, a non-compliant condition of use is determined, so the responsibility lies with the customer or end user.

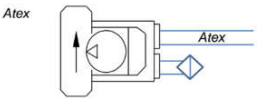
NOTICE If installed outdoors, protect the unit against exposure to sunlight and to atmospheric agents.
If the flow rate has to be reduced, use a draw-off valve rather than throttling back the suction or delivery lines.

3.2 STANDARD SIDE CHANNEL BLOWER

FPZ side channel blowers / exhausters are designed to generate vacuum and overpressure for conveying non-explosive, non-flammable, non-dangerous gases and air in continuous use in a non-explosive environment. Side channel blowers are not designed to transport dusts of any grain size.







FPZ side channel blowers / exhausters are designed and built for use in industrial plants and are equipped with three-phase or single-phase asynchronous bipolar electric motors in compliance with IEC 60034-1.

3.3 ATEX BLOWERS (Category 3GD – Category 2G)

Atex blowers are designed and built in accordance with 2014/34/UE Directive and European standards EN 1127-1, EN 80079-36, EN 80079-37, EN 14986, considering the compatibility of unit components with treated fluids (contact FPZ for components compatibility details). Accessories and monitoring systems linked to the unit have to be compliant with 2014/34/UE Directive.
It is recommended that the connections and suction and delivery pipes are in metal or antistatic material.

Units are group II devices for use in environments classified as explosive for the presence of Gas (G) zone 1/2 and/or Dust (D) zone 22.

- For motors that may be installed to the blower refer to the Atex complementary instructions of the motor manufacturer.
- In case the blower is disposed vertically, thus standing on the cover, foreign objects shall be prevented from falling into the ventilation openings. If necessary the motor can be provided of a fan cover with protecting canopy.
- If not specifically indicated, the ATEX label refers to the equipment “indoor” and “outdoor” area.
- In the case of a double indication separated by the “/” symbol, the first number indicates the “indoor” category (internal surface of the blower), the second number the “outdoor” category (outside of the blower, including the electric motor).
- The blower protection mode is constructive (“EX **c**”).
- Electric motors have different protection modes depending on the category and the environment they are designed for.
- All “2G” e “3/2G” configurations have explosion-proof motors (EX d protection).
- Classification of work zones:

1	Use of blower for conveying flammable gas	**Equipment with internal potentially explosive atmospheres, intended for use in areas that are not classified**	
2	Use of blower for conveying non-hazardous fluids in ATEX classified environment	**Equipment with internal non-explosive atmospheres and intended for use in areas that are classified**	
3	Use of blower with suction of ambient air and operating in a classified zone	**Equipment with internal explosive atmospheres, interfaced with process atmospheres and intended for use in areas that are classified**	

3.4 IMPROPER USE AND ASSOCIATED RISKS

WARNING **Non-compliance with the unit's intended use or with prohibitions/obligations can cause personal (also serious) injury (or death) or equipment damage.**

- Listed below are some improper uses, identified through risk assessment and experiences. Improper uses are subdivided according to the conditions that they may generate.
- The list is a non-exhaustive and representative example of improper use and associated risks.

IMPROPER USE	POSSIBLE CONSEQUENCES	RISKS
IMPROPER USE LINKED TO NORMAL OPERATION		
Absence of cyclic monitoring and control.	Anomalous operation not detected / hidden.	Risk of damage to the unit, with possible injury (or death) for the operator if present nearby.
Different installation with respect to manufacturer's suggestion.	Yielding / break of fastening points.	Risk of damage to the unit, with possible injury (or death) for the operator if present nearby. The unit may fall or be subject to damage due to incorrect load at support.
Operation outside the performance indicated on the blower and electric nameplate.	Seizure of the impeller.	Risk of damage to the unit, with possible injury (or death) for the operator if present nearby. The unit may break.
Proceeding at all stages without consulting the *operating instructions* and this manual.	Using the unit for unforeseen purposes and without considering the associated risk factors.	Risk of damage to the unit, with possible injury (or death) for the operator if present nearby.
IMPROPER USE LINKED TO METHODS OF USE		
Use of a fluid different from that indicated / forbidden.	Incorrect workload.	Risk of damage to the unit, with possible injury (or death) for the operator if present nearby. The unit may break.
Physical load applied to the machine (no element excluded).	Breakage and/or presence of leakage of fluid collected.	Risk of damage to the unit, with possible injury (or death) for the operator if present nearby due to inhalation of harmful substances.
IMPROPER USE LINKED TO THE STOPPAGE OF A BLOWER		
Manipulation of the machine still rotating / moving.	Direct contact of the operator with moving parts and with the surface unit still hot.	Risk of possible injury for the operator such as burns and entanglement.
Disconnecting the unit from the electricity with the voltage inserted.	Direct contact of the operator with the live parts.	Risk of possible injuries for the operator through electrocution.
IMPROPER USE LINKED TO MAINTENANCE WORK		
Handling the machine differently from instructions for use.	Falling or sudden movement of the unit.	Risk of damage to the unit, with possible injury for the operator if present nearby.
Use of liquid during unit cleaning operations.	In case of stagnation, characteristics of the material may be compromised.	Risk of damage to the unit, with possible injury for the operator if present nearby.
Use of types of spare parts different to those supplied by FPZ.	Different performance from design (pressure, noise, vibration, sealing).	Risk of damage to the unit, with possible injury for the operator if present nearby.
BREAKDOWN AND EMERGENCY CONDITIONS		
Not stopping the machine when it is making an unusual noise.	Seizure of the impeller and overheating of the unit and of the electric motor.	Risk of damage for the unit, with possible injury (or death) for the operator if present nearby. The unit may break down.

4 STORAGE AND TRANSPORT

4.1 RECEIPT AND CHECK OF THE PACKAGE

- When receiving the unit, it is necessary to check that the packaging is intact and free from signs of damage due to transport or storage conditions.
- In the case of damage to the packaging, immediately inform the shipping agent and the manufacturer.

4.2 HANDLING AND TRANSPORT

Danger of crushing and / or impacting various parts of the body

During the transport and handling phases due to the sudden drop or displacement of the packaging, there may be a risk of crushing and / or impacting various parts of the body. During the activities around the unit, the operator may fall due to stumbling or slipping.
Use equipment compliant with the laws and follow the handling and manual handling procedures described in the operating manual, based on the weight indications on the packaging and in accordance with applicable regulations in the state in which this activity takes place. Use safety shoes during this phase.

4.3 STORAGE

- Store in a dry place, possibly keeping the machine in the packaging.
- Do not remove the protective covers of the openings.
- In the event of long-term storage, remove dust deposits on external surfaces and, before commissioning, check the unit's functional status with a start-up test.

5 INSTALLATION

5.1 INSTALLATION CONDITIONS

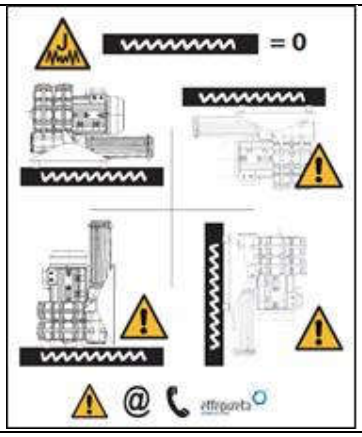
Commissioning and operation must only take place under the following installation conditions:

- The unit must be completely assembled and intact (not damaged or tampered).
- Silencers must be connected to the pipe system (see *operating instructions*); if silencers are not present, make sure that the connection is made by flexible sleeve.
- The machine must be securely fastened to the predetermined site and in the recommended modes (see *operating instructions*).
- The motor must be connected to a suitable control panel.
- Ensure the visibility of the unit installed from the position of the control elements.

Danger of ejection of objects

The entry of foreign bodies into the unit, even if very small, can cause personal serious injury (or death) and/or equipment damage with probable breakage of the impeller blades, including the danger of debris can be thrown out of the machine violently.
Remove the closure caps from the silencers and connect the pipes of the system, making sure to carry out the operation in a non-dusty area to prevent the entry of foreign bodies.

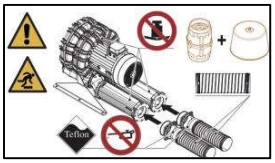
Danger of crushing and / or impacting various parts of the body



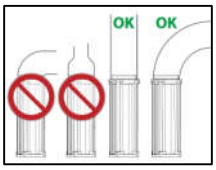
During the installation phase due to the sudden drop or displacement of the packaging, there may be a risk of crushing and / or impacting various parts of the body. During work around the unit, the operator may fall due to stumbling or slipping. Use the appropriate device (e.g. toe) to hook and lift the unit properly.

Danger of injury to upper limbs

The risk of injury to upper limbs may arise due to a combination of hazards during the mechanical assembly phase and the connection of the machine to the piping. Observe the operating manual to install the unit safely.



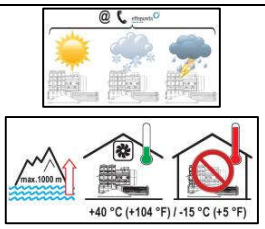
- The support surface of the unit must be flat, robust, stable and absolutely levelled.
- It is important that the unit is installed on supports that do not transmit vibration for example structures or antivibration



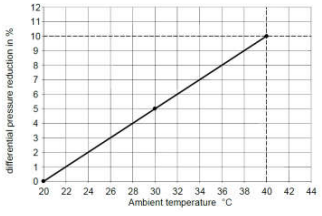
- Connect the pipes with flexible sleeves and avoid the unit bears pipes weight; except for the filter in the case of suction in the environment.

Size the pipes and choose accessories that minimize the load losses, therefore:

- do not fit pipes with diameters smaller than those of the machine's outlets and inlets;
- install multiple machines in parallel, sizing the manifold and main line proportionally;
- do not use angle-pipe, but bends with a large radius of curvature;
- do not install valves with passages smaller than the nominal value and check valves with a stopper pushed by a spring (the check valve with the lowest load loss is the type with a light disc);
- in the case of use for oxygenation, choose low-resistance diffusers (low load loss).



⚠WARNING	To avoid overloads caused by pressure variations, it's recommended that you install a relief valve on aspiration in the case of operation as suction, and on discharge in the case of operation as a compressor.
⚠WARNING	If you need to reduce the flow rate, use a branch valve instead of throttling the suction or discharge.
⚠WARNING	Protect the intake duct with a suitable filter with a filtration degree of 25 µm. Foreign bodies are: dust, sand, calcite, impurities in the pipes, cutting blades and shavings, drops and waste from welding, metal burrs, and residues of sealants produced during connection of pipes. Replace the filters regularly.



- When installing outdoors, protect the unit against direct exposure to the sun and atmospheric agents. For outdoor installations without the use of protections contact FPZ S.p.A..
- Ventilation of the motor must not be hampered by obstacles placed in the immediate vicinity. For this purpose, the electric motor air intake must remain free and a minimum distance between the electric motor fan cover and any other structure as defined by the manufacturer of electric motor.
- The unit must be installed at a maximum height of 1000 m a.s.l., for different conditions contact FPZ S.p.A..

The ambient temperature, and the conveyed gas intake temperature, is permissible inside the range -15°C (+5°F) ÷ +40°C (+104°F) with the following provisions:

- For ambient temperature +30°C (+86°F) **reduce** the maximum pressure differential given in the Data Sheet by 5%;
- For ambient temperature +40°C (+104°F) **reduce** the maximum pressure differential given in the Data Sheet 10%.

The graph on the right has to be used to reduce the maximum pressure differential in case of ambient temperature between +21°C and +40°C (+70°F and +104°F)

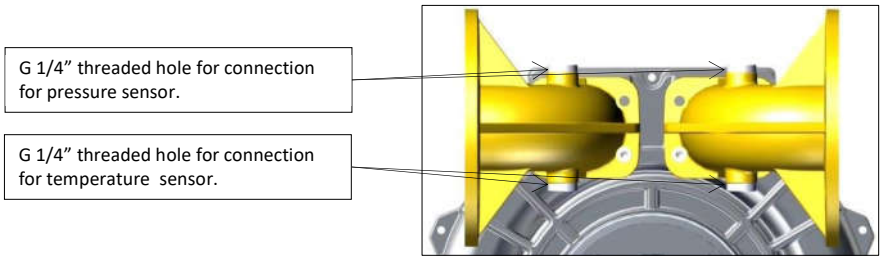
- Check dimensions to allow adequate space for installing the unit with its accessories and ensure sufficient ventilation of the electric motor.

⚠WARNING	In the case of ATEX side channel blower intended for classified areas, the unit must be installed outdoors or in an air conditioned environment.

5.2 BLOWER WITHOUT ELECTRIC MOTOR (GOR – GVR EXECUTION)

NOTICE

Units supplied without an electric motor, GOR execution (with horizontal coupling) or GVR (with vertical coupling) are considered as partly completed machinery, so the designer has to check the compatibility of the electric motor chosen with the data in the data sheets downloadable from the website.
During installation and maintenance, to install or dismantle the elastomeric coupling; it is recommended not to use a hammer, but pushers or extractors, to fit or remove the coupling flanges from the shaft. . Percussion can damage the slope of the bearings by reducing their durability. Coupling requires axial and angular alignment accuracy. Also refer to the coupling instruction manual.



5.3 ATEX 2G BLOWER (EXCLUDED TMD VERSION)

The blower is arranged for the installation of measurement/control systems in order to prevent machine faults that can produce potential sources of triggering:

- pressure sensor
- temperature sensor.

Danger of explosion. The unit is designed to convey flammable gas and is sealed. Do not start the machine before connecting and activating the unit and surveillance system

Pressure sensor

ALWAYS use a pressure sensor

Given the likelihood of an explosive atmosphere, the use of pressure measuring instruments is compulsory in order to check that the difference between the delivery and suction pressures respects the levels given in the "specifications" and on the machine's rating plate.

NOTICE

The use of an alarm and stop device (non-automatic reset) that automatically shuts off the power to the machine is advisable.

Temperature sensor

A possible temperature sensor is deemed functional for the customer's measurement needs, but can in any way replace the pressure sensor for monitoring any dangerous machine conditions.

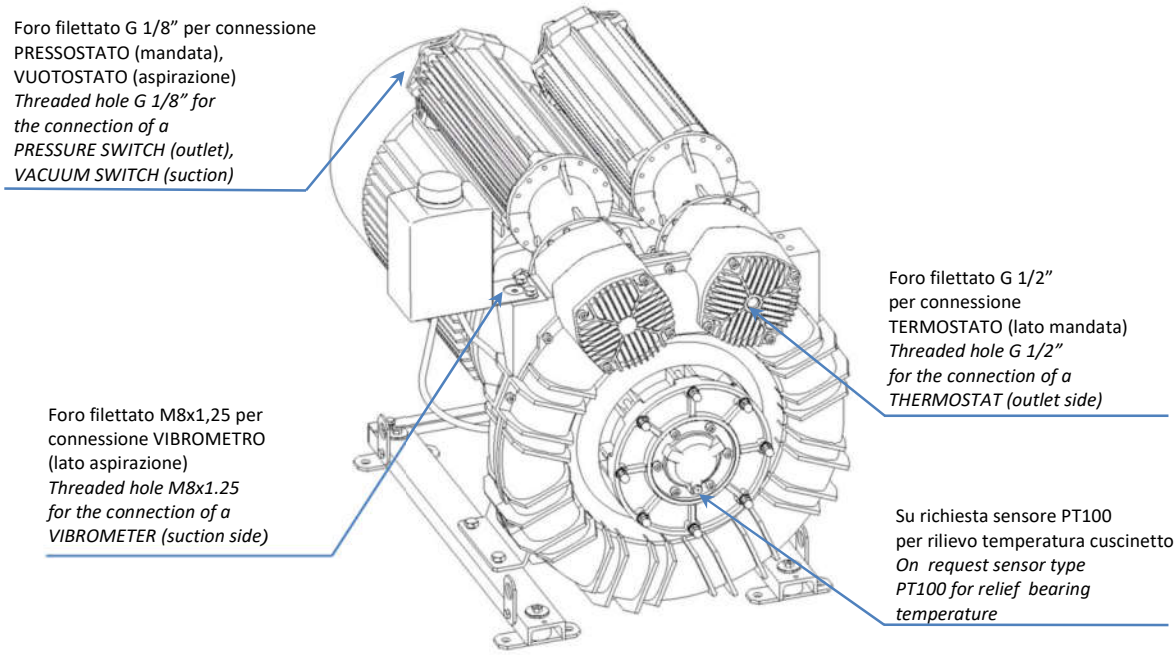
WARNING

All the sensors must be protected against possible impacts, damage and atmospheric agents.

5.4 GOR TMD ATEX 2G BLOWER

The blower is designed for the installation of control systems which must be set up by the installer for the purpose of monitoring machine breakdowns which could produce possible sources of combustion:

- vibration sensor;
- pressure switch / vacuum switch;
- thermostat.



The mechanical seal installed also requires the following operations:

- refilling of the oil tray, as indicated below;
- connection of the oil level sensor.

If necessary, in order to avoid overloads caused by pressure variations, provide a vent device in conformity with EN 1127-1 branching off from the suction pipe, in the case of operation as a suction pump, and on the delivery pipe, in the case of operation as a compressor.

5.4.1 INSTALLATION OF SENSOR GOR TMD ATEX 2G BLOWERS

Install the machine on the plant. Fit the sensors (suitable for the purpose and especially for the Atex environment in question) in their places and connect them to the control system as specified in the instructions provided with the sensors and as required in the plant diagram:

- Vibration sensor

The signal from the sensor must monitor the vibrations of the machine constantly. This signal must be connected to an alarm and block device with manual reset, which automatically interrupts the power supply to the compressor/suction pump at the moment the level of the vibration signal exceeds the predetermined limits.

Effective vibration velocity value [mm/s]	***Class I*** (≤ 15kW)
a<**2.2**	***A***

Effective vibration velocity value [mm/s]	***Class II*** (> 15kW)
a<**3.5**	***A***

- Pressure switch and vacuum switch

The pressure or vacuum switch installed must be calibrated to the maximum pressure or vacuum level specified on the plate of the machine or in accordance with the operating limits of the plant.
The signal must be connected to an alarm and block device, with manual reset, that automatically interrupts the power supply to the machine.

- Thermostat

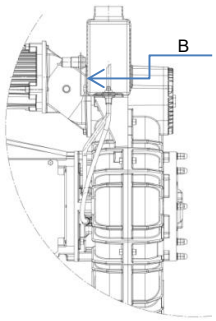
The thermostat must be set to come on at a temperature not exceeding 125°C to interrupt the power supply to the machine automatically.
The signal must be connected to an alarm and block device, with manual reset, that automatically interrupts the power supply to the machine.

⚠WARNING **All sensors installed must be protected against impact, damage and weathering**. FPZ can supply a protective casing, on request and after receiving the dimensions of the sensors installed.

5.4.2 CONNECTION OF THE MECHANICAL SEAL FOR GOR TMD ATEX 2G BLOWER

	**Danger of slipping**
Oil spills can make the floor slippery. Clean the floor with absorbent and /or degreasing products.	

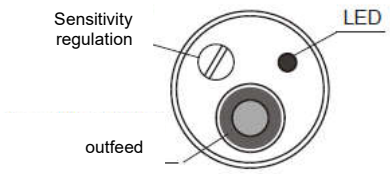
	**Danger of electrostatic charges**
Do not clean or rub the oil reservoir with dry clothes.	



- Refilling the cooling oil tray

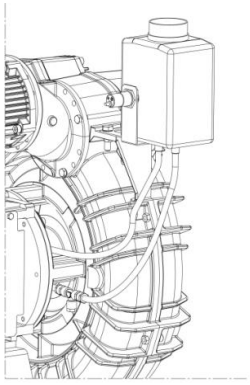
Refill the cooling circuit of the mechanical seal. For good circulation of the cooling liquid, it is important not to have air bubbles inside the circuit. To achieve this, refill by pouring the liquid into the vessel repeatedly in small amounts without exceeding level (B) of the return line. Top up completely only when the level at the return line has covered the bottom of the vessel.

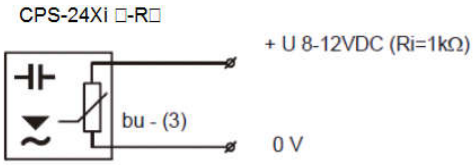
The cooling liquid must be kept at least 10 mm above the level of the return line (B); top up as necessary.



Recommended cooling liquid:	SAE 10W-40 oil Or SAE 5W-40 oil
First filling quantity:	Approx. 1,5 kg

A small leak of fluxing liquid is normal, especially when the seals are settling down.





- Connection of the cooling oil level sensor

The capacitive oil level sensor consists of a stainless steel cylindrical body and is suitable for use in explosion risk zones. It is fitted with a potentiometer to regulate sensitivity and a LED display on the back end, which is normally on.

This sensor must be connected to an alarm and block system with manual reset which automatically interrupts the power supply to the machine. Connect the sensor to the control system following the specific instructions enclosed with this manual.

Note: the connection cable must not be cut or tampered with.

5.5 ELECTRIC MOTOR

WARNING	**Comply with safety measures and instructions indicated in the instruction manual for the electric motor.**

Before starting working on the unit or system, the following precautions must be taken:

- make sure that the unit is NOT connected to electrical power mains;
- take precautions to prevent electricity from being reconnected;
- open the terminal box only after making sure that there is absolutely no live current.

	Danger due to electricity

- If connecting operations are carried out without removing the voltage from the electrical system or without setting up a system to avoid reinsertion, direct contact between the operator and the live parts can occur. This can also cause personal serious injury (or death).
- Work on electrical equipment (installation and maintenance) has to be done only by specialized operators (see document MAN_PIC), wearing PPE.
- In the event of contact with a defective unit there is a risk of electrocution. Always have seals and electrics checked regularly by a specialized operator (see document MAN_PIC).
  - The terminal box must not contain foreign bodies, impurities or humidity. Close the terminal box with the cover, and seal the cable gland openings to prevent dust, water and humidity from getting inside.

NOTICE	In the case of several motor starts during an hour, there is a limitation of 6 start-ups per hour, evenly distributed; failure to respect this can severely damage the unit.

5.5.1 ELECTRIC CONNECTION

Incorrect motor connection may seriously damage the unit.

- Check that the details on the data plate are compatible with the line voltage and frequency.
- Always connect the motor's earth cable to the relevant terminal marked with this symbol before connecting to the mains supply and check the dispersion capacity. The earth cable can be recognized by its color (yellow/green).
- Connect the machine to the earth system too, using the specific hole (marked with the relative symbol) located on the base of the unit. Connection to the power grid must be carried out in compliance with what is shown in the diagram inside the terminal box.
- Use the cable gland openings to allow power supply cables to pass into the terminal box.
- Proceed to tighten the power supply cables, taking the section of the electrical cables into account each time.
- The terminal boards for the electrical connections must be tightened properly to avoid high contact resistances and resulting overheating.
- Check that the insulation gaps between the various conductors are kept in the air and between surfaces, as indicated in the standards.
- All the screws used to close the terminal board must be tightened properly. Damaged screws must be replaced immediately, using screws of the same or better quality.

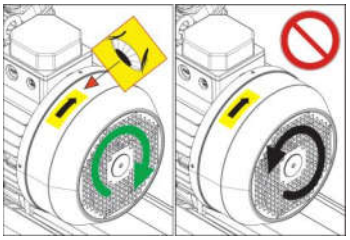
The connection must guarantee:

- long-lasting safety;
- that no wire ends are sticking out;
- protection with a (thermal or amperometric) trip switch is essential for dealing with risks of overloading, a loss of one phase in the mains supply, excessive voltage fluctuations, or the rotor getting stuck;
- that the motor trip switch has been set to a value that does not exceed the maximum current level shown on the nameplate. Warning: the trip switch does not always protect the blower in case the maximum pressure differential is exceeded. Verify the maximum pressure or vacuum as per chapter 6.2.
- motors may be equipped with thermal protectors PTO or PTC. To avoid that the motor is damaged by temperature rise over the admissible limit: PTO or PTC have to be connected to a suitable cut off device that opens the line that feed the motor itself.
- if the application requires protection against accidental start-up, this must be carried out on the electrical control circuit of the motor.

5.5.2 ELECTRIC MOTOR POWERED BY FREQUENCY CONVERTER

The unit's nominal pressure or vacuum characteristics for service at mains frequency cannot be maintained if the unit is powered via a frequency converter. Contact FPZ S.p.A. for information about the performance of a unit powered by a frequency converter. Download from the website www.fpz.com the "RPM Table" of your blower and do not exceed the maximum pressure differentials shown for every rotation speed.

When power is supplied with a frequency converter, the installer is responsible for:



- respecting the laws;
- checking with FPZ assistance if the motor can be powered by a frequency converter, if it doesn't appear on data sheet;
- checking and making any measures necessary to comply with the immunity and emission limits set by the standards;
- checking the suitability of the plant and the frequency converter for operation with standard motors (class F), or the need to use specific motors for these types of operation.

5.5.3 ROTATION DIRECTION

The machines must be used respecting the rotation direction indicated by the arrow on the electric motor fan cover.

- To check the rotation direction, switch the motor on briefly and observe the fan.
- To change the rotation direction, invert the power cable connections, leaving the earth connection unchanged.

Refer to the connection diagram located inside the terminal box and to this section.

6 START UP AND NORMAL OPERATION

6.1 PRELIMINARY CHECKS

WARNING! Before starting the machine for use, carry out the following preliminary checks:

- if the unit has not been started up for some time, check its condition and, if necessary, remove any dust from the external surfaces, to avoid compromising the heat dissipation during the unit work;
- deactivate/open any pipe closing devices (shut-off valves, solenoid valves, etc.) before starting the unit;
- never start and operate the unit with the inlet and/or outlet ports closed;
- make sure the ambient and conveyed gas suction temperatures come within the levels: -15°C (+5 °F)÷ +40°C (+104 °F);
- check the operation of any flow control/limiting devices (not supplied).

6.2 OPERATION

- If the side channel blower is put into operation without being fixed to a surface, a sudden displacement of the starting torque on ignition of the electric motor may occur.
- The information on the product nameplate must always be considered when commissioning and operating.

The unit can be started for use after carrying out the preliminary checks

- Start the unit by switching on the power to the electric motor.
- Respect the maximum pressure differential stated in the blower's nameplate.
  To evaluate the pressure differential Δp across the blower take into account:
  - For compression operating: add up to the outlet pressure the inlet vacuum if applied.
  - For vacuum operation: add up to the inlet vacuum the outlet pressure if applied.
- Pressure losses in the pipes are often underestimated but are decisive factors for the operating differential pressure.
- Measure the motor absorption and check compliance with the rated nameplate value. An amperage below nameplate does not always guarantee that the blower is not exceeding the maximum permitted pressure differential.

WARNING	**Non-compliance with the unit's use or with prohibitions/obligations can cause personal (also serious) injury (or death) or equipment damage**

	Danger of burns

Danger of burns caused by contact with hot surfaces of the unit, which at start-up and operation may reach high surface temperatures, as specified on the product nameplate.
Apply adequate PPE against the risk of burns.

Danger of suction

Danger of injury due to depression, which can cause a sudden suction of objects, hair and clothes.
Start the machine only if it is properly connected to the system.

Danger of vibration

Regularly check that the unit is firmly fixed to the support frame.
Excessive vibration of the unit can cause serious damage to the machine, such as the seizure of the impeller.

Danger due to noise

Some machines can produce loud noise, even over 80 dB (A).
Reference levels are shown on the table of characteristic data that does not consider environmental reverb.
Warning to be taken:
Measure the acoustic pressure of the machine in the installation environment.
In the case of levels above the threshold defined by local standards:

- report the noise hazard
- prepare the use of PPE
- isolate the environment

Danger of ejection of objects

- Danger due to exceeding performance levels that may cause seizure of the impeller.
  Check that operating conditions are in accordance with values declared on the nameplate.
  Avoid operating with the inlet and/or outlet ports closed even temporarily.
  Install a limit valve or equivalent circuit that can avoid excessive vacuum and / or overpressure and allow the compliance with levels shown on the product plate
- Danger of injury due to objects and fluids aspirated and thrown at high speed (injury to the skin or eyes).
  Only start the unit (first start) if it is properly connected and check it accurately.
  In the case of unusual noise from the impeller, switch off the unit immediately and check it accurately.

Danger of injury to upper limbs

During the start-up (first start) phase due to a combination of hazards, the risk of injury to upper limbs may arise.

Danger of sudden leakage and/or aspiration of fluids (even harmful ones)

They could cause damage to the respiratory system due to the leakage of gas while the unit is in use and/or the slowing down of connection to the gas flow circuit.

Danger due to a limited view of the place in which the unit is installed.

Make sure you always have the unit installed in your sight while carrying out any activities close to it.

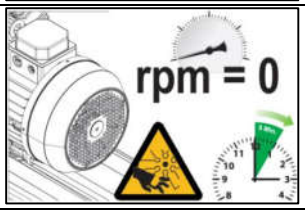
6.3 STOPPING

- The unit must be stopped by switching off the power supply to the motor.
- On shutdown, make sure to operate the unit with open outlet (suction / delivery) for about 20 minutes. This operation allows the removal of any condensation inside.

7 MAINTENANCE

In order to prevent faults and damage it is important to check periodically the units in operation; therefore it is advisable to adopt a maintenance plan in line with this manual, providing for:

- periodical checks;
- periodical maintenance.



7.1 MAINTENANCE AND FAILURE CONDITIONS

WARNING **Before starting any maintenance, either periodical or due to malfunction, take the following safety measures in order to prevent personal (also serious) injury (or death) or equipment damage:**

- unplug the unit from the power supply by unplugging the main switch;
- apply a sign to the system and to the control unit **"DANGER! Maintenance work in progress";**
- cool the unit for at least 15 minutes;

- wait until the unit has completely stopped, checking through the motor fan that the impeller is not rotating;

- make sure that there is no depression or overpressure in the unit through a pressure gauge and make sure that no fluid can escape from the unit (through its stopping) and / or the system (through its insulation).

Danger due to electricity

- If connecting operations are carried out without removing the voltage from the electrical system or without setting up a system to avoid reinsertion, a direct contact of the operator with live parts can occur. This can also cause personal serious injury (or death).
- Work on electrical equipment (installation and maintenance) must be done only by specialized operators (see document MAN_PIC), wearing PPE.
- In the event of contact with a defective unit there is a risk of electrocution.

Danger of moving parts

High risk of cuts caused by rotating impellers. By removing the manifolds or blind flanges, it is possible to access the rotating impeller through the openings of the body and the cover of the side channel blower.
Never put your hands or objects through the openings.

Danger of burns

Danger of burns caused by contact with hot surfaces of the unit, which at startup and in operation may reach high surface temperatures, as specified on the product nameplate.
Apply adequate PPE against the risk of burns.

Danger of injury to upper limbs

During the maintenance phase due to use of improper tools, lack of PPE, bad illumination of the workplace or unauthorized start-up, the operator fails to perform the required procedures, the machine can be put into unmanaged operation, and the risk of injury to upper limbs may arise.

Danger due to noise

Some machines can produce loud noise, even over 80 dB (A) therefore the operator may be subject to acoustic pressure which may cause buzzing in the headset and reduced attention.

WARNING **Danger of sudden spillage of gas (also harmful) suction**

Respiratory damage could occur due to gas leakage during operation and / or loosening of the connections to the gas flow circuits.

7.2 PERIODICAL CHECKS

In order to avoid any defects that may directly or indirectly cause damage, it is important that the unit is inspected by specialized operators (see document MAN_PIC).

A) When the unit is running, routinely carry out the following checks:

- delivery temperature;
- operating pressure and/or vacuum;
- electric motor current absorption;
- vibrations;
- state of the filter and related load loss.

WARNING	**Danger of seizure of the impeller due to excess vibration. Vibrations above the threshold (see table below) are considered NOT eligible and can cause damage to the machine and consequently personal injury even serious (or death) and / or damage to things.** **In the event of unusual noise and / or vibration over parameters, that may indicate the possibility the impeller is seizing up, turn off the unit immediately.**

Class I (Blower with electric motor of power ≤15kW)	Class II (Blower with electric motor of power >15kW)
a > 2,2	a > 3,5
a = effective vibration speed level [mm/s]	

Changes to normal working conditions (power ups, abnormal noise, vibrations, excessive overheating of the service fluid) are indications that the units is not working properly.

B) With the unit stopped and cooled, periodically carry out the following checks:

- dust: check and remove deposits from the external surfaces of the unit;
- suction filter (if fitted): every 10-15 days, check and clean or replace the filter cartridge. The dirty cartridge creates strong suction resistance and consequently a higher pressure differential, power absorption and operating temperature;
- for unit supplied with elastic joint, check the condition of the elastic joint as indicated in its operating manual;
- condensation discharge (if present): every 8-10 days, turn the yellow valve counterclockwise 90° to allow draining of the condensation that has built up inside the blower;
- check for oil leaks (TMD version) near the joint; if leaks are found, maintenance work must be scheduled to replace the seals.

7.3 ROUTINE MAINTENANCE REPAIR OF BREAKDOWNS

See the following chapter “TROUBLESHOOTING” for identifying possible critical situations and types of breakdowns.
Always disconnect the unit and remove it from the plant to do routine maintenance, cleaning and replacing components and in the event of a breakdown.

WARNING	**Danger due to residual overpressure or drop in pressure:**

- with residual overpressure, process fluids can leak, with the risk of injury to the skin and eyes;
- with a drop in pressure there is the risk that hair and clothes can be trapped;
- disconnect the unit only after closing and bleeding the system connected to it.

7.4 LIFESPAN OF BEARINGS

Under normal operating conditions, the bearings of the unit must be replaced by a specialized operator (see document MAN_PIC), after a time fixed by the manufacturer (see details in the table below).

NOT ATEX BLOWERS

Every model, except the models at the following line	25000 hours or 3 years
e07 / e08 / e09 / e10 / e11 MS – TS – TD	40000 hours or 5 years

SOFFIANTI ATEX

Every Atex model	18000 hours or 3 years

NOTICE Replace the bearings of the unit only if you have all the instructions, the parts list and the section/explosion of the unit

7.5 DISMANTLING AND DEMOLITION

Danger of crushing and / or impacting various parts of the body

During the dismantling and demolition phases due to the sudden drop or displacement of the packaging, there may be a risk of crushing and / or impacting various parts of the body. During work around the unit, the operator may fall due to stumbling or slipping.

8 RESIDUAL RISKS

During the design of the machines or system on which the blower will be installed, the following residual risks should be considered.

Danger during the transport phase

Danger of crushing or slipping during the unit transport steps. The *operating instructions* (attached to the unit) and this manual describe how to carry out safe transport operations according to tested procedures.

Danger during the installation phase

Danger of crushing or slipping during the installation phases of the unit. The *operating instructions* (attached to the unit) and this manual describes how to carry out safe installation operations and according to tested procedures.

Danger during the start-up and operating phase

Danger of electrocution, burns, noise, unauthorized start-up of the unit, and ejection of objects or fluids during the start-up and operation phases of the unit. The *operating instructions* (attached to the unit) and this manual describe how to perform the operations mentioned safely and according to tested procedures.

Danger during maintenance and dismantling phases

Danger of electrocution, burns, noise, unauthorized start-up of the unit, and ejection of objects or fluids during the maintenance and dismantling phases of the unit. The *operating instructions* (attached to the unit) and this manual describe how to perform the operations mentioned safely and according to tested procedures.

9 TROUBLESHOOTING

Problem	Serious code	Cause	Solution	Precaution
The unit does not start	F	Electrical wiring incorrect	The electrical connection has to be checked by a technician referring to the wiring diagram contained in the terminal board box	Turn off the power to the electrical system or set up a system that avoids reinsertion
	F	Power supply voltage unsuitable	Check that the power supply voltage, measured at the motor terminals, is within +/- 10% of the rated voltage	Use PPE against the electrical hazards
	G	The impeller is stuck	Call FPZ assistance to repair the unit	
No or insufficient air flow	G	The suction filter is clogged	A specialized operator (see MAN_PIC) has to clean or replace the cartridge	Avoid entering foreign bodies into the unit
	G	Wrong frequency (for units powered through an inverter)	Correct the frequency	Check the rating plate
	G	Profile of the impeller blades modified (due to deposits on the profile)	Call FPZ assistance personnel to check the impeller	
No or insufficient pressure differential	F	Incorrect direction of rotation	The direction of rotation has to be inverted by a specialized operator (see MAN_PIC) switching two of the electrical power supply wires.	Turn off the power to the electrical system or set up a system that avoids reinsertion
	G	Leaks in the plant	Locate the leak and seal	Use proper sealants
Current absorption exceeding the admissible level	F	Electrical wiring incorrect	The electrical connection has to be checked by a technician referring to the wiring diagram contained in the terminal board box	Take off the power to the electrical system or set up a system that avoids reinsertion
	F	Drop in mains supply voltage	The power supply voltage has to be restored by a specialized operator (see MAN_PIC) at the terminals and at the established values.	
	G	The suction filter is clogged	The cartridge has to be cleaned or replaced by a specialized operator (see MAN_PIC)	Avoid entering foreign bodies into the unit.
	G	The unit has accumulated deposits inside	Call FPZ assistance personnel to clean the inside of the unit	Avoid entering foreign bodies into the unit.
	G	The unit is operating at a pressure and/or vacuum that exceeds the admissible level	Adjust the system and/or the regulating valve to lower pressure differentials.	Use appropriate PPE to operate near the unit
High delivery air temperature	G	The suction filter is clogged	Adjust the system and/or the regulating valve to lower pressure differentials.	Use appropriate PPE (surge protectors, gloves) to operate near the unit
	G	The suction filter is clogged	The cartridge has to be cleaned or replaced by a specialized operator (see MAN_PIC)	Avoid entering foreign bodies into the unit.
	G	The unit has accumulated deposits inside	The unit has to be cleaned inside by a specialized operator (see MAN_PIC).	Avoid entering foreign bodies into the unit.
	G	Suction and/or delivery piping obstructed.	Obstructions have to be removed by a specialized operator (see MAN_PIC).	Avoid entering foreign bodies into the unit.
	G	Suction air temperature exceeds 40°C (+104°F)	Use heat exchangers to reduce the suction air temperature	
Abnormal noise	F	The soundproofing material is damaged	Soundproofing cloth has to be replaced by a technician.	Avoid entering foreign bodies into the unit.
	G	The impeller scrapes against the casing. - The unit is operating at a pressure and/or vacuum that exceeds the admissible level	Reduce the pressure differentials in the plant	Use appropriate PPE (surge protectors, gloves) to operate near the unit
	G	- Reduction of assembly tolerances due to internal deposits (dust, impurities in the pipes, process residues, etc.)	The unit has to be cleaned inside by a specialized operator (see MAN_PIC).	Avoid entering foreign bodies into the unit.
	G	Worn bearing	Bearings have to be replaced by a specialized operator (see MAN_PIC).	
	F	Unit's installation position unsuitable	The unit has to be installed by a technician on structures that cannot transmit or amplify noise (tanks, steel plating, etc.)	Use proper anti-vibration and move the units according to local regulations

Abnormal vibrations	G	The impeller is damaged	The impeller has to be replaced by a specialized operator (see MAN_PIC).	
	G	The impeller has accumulated deposits	The unit has to be cleaned inside by a specialized operator (see MAN_PIC).	Avoid entering foreign bodies into the unit
	G	Unit anchored without anti-vibration insulators	The unit has to be anchored with anti-vibration insulators by specialized operator (see MAN_PIC).	Use proper anti-vibration and move the units according to local regulations
	F	Rigid connection to the plant	Flexible hoses between the unit and the piping have to be fitted by a specialized operator (see MAN_PIC).	Carry out the activity only if the unit is disconnected to the power supply.
	G	Bearing on the blower or motor side defective	Bearings have to be replaced by a specialized operator (see MAN_PIC).	

Leaks	G	Defective silencer gaskets	Gaskets have to be checked by a specialized operator (see MAN_PIC), and if necessary have to be replaced.	Avoid entering foreign bodies into the unit.
	G	Defective casing gaskets	Gaskets have to be cleaned by a specialized operator (see MAN_PIC), and if necessary have to be replaced.	Avoid entering foreign bodies into the unit.

Seriousness: F for functional fault and G for serious fault.

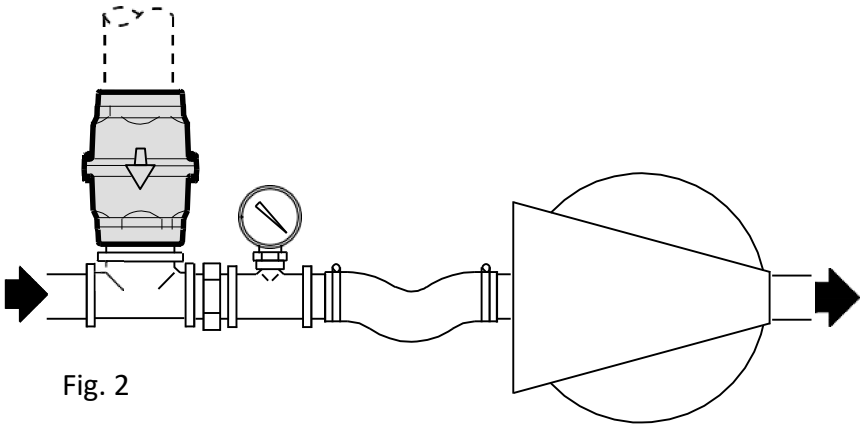

Fig. 2

INSTALLATION SKETCH – VACUUM RELIEF VALVE

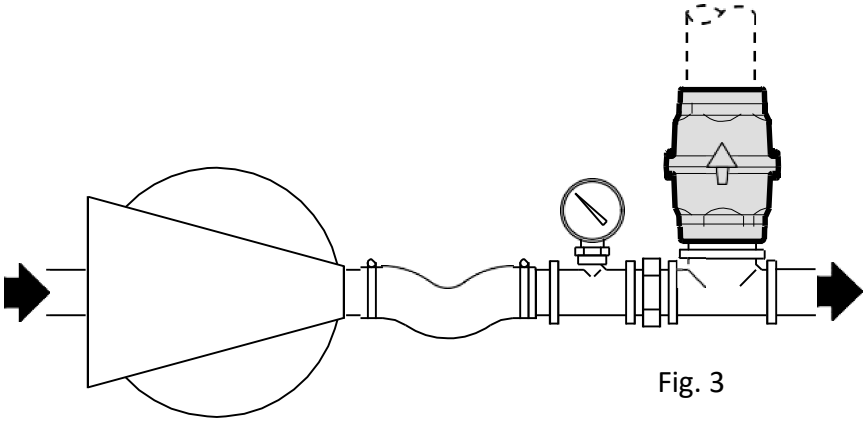

Fig. 3

INSTALLATION SKETCH – PRESSURE RELIEF VALVE

1. CHOICE OF SPRING

The valve is supplied with 2 different springs; each spring is to be used within a specific pressure-vacuum operating range. For the VRL8 and VRL9 there is the possibility to use both springs working in parallel.
Referring to the SELECTION DIAGRAM, check that the valve is correctly sized and depending where the operating point (area A, B,…H) is located, choose one or two springs according to SPRING SELECTION CHART.
The valve is supplied with spring # I installed. If spring needs to be replaced or a supplementary spring is needed to be added (for VRL8 / VRL9), proceed to point # 2 otherwise, adjust valve as per point #3.

2. INSTRUCTIONS FOR SPRING REPLACEMENT (OR MOUNTING ADITIONAL SPRING FOR VRL8 / VRL9)

- Remove the two plastic caps on valve.
- **Ensure stop-nut 923 is locked on the upper housing 106.**
- Unscrew screw 903 from nut 903.1.
- Remove cover 107 from housing 106.
- Unscrew spring guide disc 433 taking it out from shutter guide 434.
- Remove spring 700 (only in case of replacement).
- Install the appropriate spring into shutter 165.
- Compress spring and screw spring guide disc 433 on shutter guide 434 for at least 20 full thread terms
- Check that both ends of the spring are properly positioned within their seats.
- Install the cover 107 on the housing 106 inserting:
  - for VRL6: the sliding guide on the slot in spring guide disc 433
  - for VRL8 and VRL9: dowel pin 562 on the slot in spring guide disc 433.
- Tighten screw 903 on nut 903.1

3. VALVE SETTING

A) Setting-up at allowed vacuum level

- Remove the two plastic caps on valve, if any.
- Position valve on the suction by-pass and connect a vacuum gage as close as possible to the exhauster inlet (Fig. 2).
- Unscrew nut 923.
- Relieve spring tension by backing off upper grub screw 904.1 with the fit key.
- Turn on exhauster. Induce highest attainable vacuum by throttling air intake upstream relief valve (normally reducing throttle to fully-closed).
- Adjust upper grub screw 904.1 until maximum allowable vacuum level is reached.
- Tighten nut 923 keeping blocked upper grub screw 904.1.
- Open suction line.

Double-check vacuum gauge to ensure no additional losses are induced by pipes or filters installed upstream relief valve

B) Setting-up at allowed pressure level

- Remove the two plastic caps on valve, if any.
- Remove nut 923 from upper grub screw 904.1 and place it on to the lower grub screw 904.2. Do not tighten.
- Position valve on the discharge by-pass and connect a pressure gage as close as possible to the blower outlet (Fig. 3).
- Relieve spring tension by backing on lower grub screw 904.2 with the fit key.
- Turn on blower. Induce highest attainable pressure by throttling air discharge downstream of the valve (normally reducing throttle to fully-closed).
- Unscrew lower grub screw 904.2 until maximum allowable pressure level is reached.
- Tighten nut 923 keeping blocked lower grub screw 904.2.
- Open discharge line.

Double-check pressure gauge to ensure no additional losses are induced by pipes or filters installed downstream the valve

Technical Information
Waterpilot FMX21

Hydrostatic level measurement

Compact transmitter for level measurement

Application

The Waterpilot FMX21 is a pressure sensor for hydrostatic level measurement.

Endress+Hauser offers three different versions of the device:
- FMX21 with a stainless steel housing, external diameter of 22 mm (0.87 in): This version is excellently suited to drinking water applications and for use in bore holes and wells with small diameters
- FMX21 with a stainless steel housing, external diameter of 42 mm (1.65 in): Heavy-duty version and easy to clean thanks to flush-mounted process isolating diaphragm, ideally suited to wastewater and wastewater treatment plants
- FMX21 with plastic insulation, external diameter of 29 mm (1.14 in): Robust version for use in salt water and excellently suited to applications on ships (e.g. ballast water tanks)

Your benefits

- High resistance to overload
- High-precision, robust ceramic measuring cell with long-term stability
- Climate proofed sensor thanks to completely potted electronics and 2-filter pressure compensation system
- Simultaneous measurement of level and temperature with optionally integrated Pt100 temperature sensor
- Accuracy
  - Standard reference accuracy ±0.2 %
  - PLATINUM version ±0.1 %
- Automatic density compensation to increase accuracy
- Usage in drinking water: KTW, NSF, ACS
- Approvals: ATEX, FM, CSA
- Marine approvals: GL, ABS, BV, DNV
- Extensive range of accessories provides complete measuring point solutions

About this document

Document function

The document contains all the technical data on the device and provides an overview of the accessories and other products that can be ordered for the device.

Symbols used

Safety symbols

Symbol	Meaning
DANGER	**DANGER!** This symbol alerts you to a dangerous situation. Failure to avoid this situation will result in serious or fatal injury.
WARNING	**WARNING!** This symbol alerts you to a dangerous situation. Failure to avoid this situation can result in serious or fatal injury.
CAUTION	**CAUTION!** This symbol alerts you to a dangerous situation. Failure to avoid this situation can result in minor or medium injury.
NOTICE	**NOTE!** This symbol contains information on procedures and other facts which do not result in personal injury.

Electrical symbols

Symbol	Meaning	Symbol	Meaning
⎓	Direct current	~	Alternating current
⎓ ~	Direct current and alternating current	⏚	**Ground connection** A grounded terminal which, as far as the operator is concerned, is grounded via a grounding system.
⏚	**Protective ground connection** A terminal which must be connected to ground prior to establishing any other connections.	⏚	**Equipotential connection** A connection that has to be connected to the plant grounding system: This may be a potential equalization line or a star grounding system depending on national or company codes of practice.

Symbols for certain types of information

Symbol	Meaning
✓	**Permitted** Procedures, processes or actions that are permitted.
✓✓	**Preferred** Procedures, processes or actions that are preferred.
✗	**Forbidden** Procedures, processes or actions that are forbidden.
i	**Tip** Indicates additional information.

Brief Operating Instructions (KA): getting the 1st measured value quickly

FMX21 4 to 20 mA Analog - KA01244P:

FMX21 4 to 20 mA HART - KA01189P:

The Brief Operating Instructions contain all the essential information from incoming acceptance to initial commissioning.

Operating Instructions (BA): your comprehensive reference

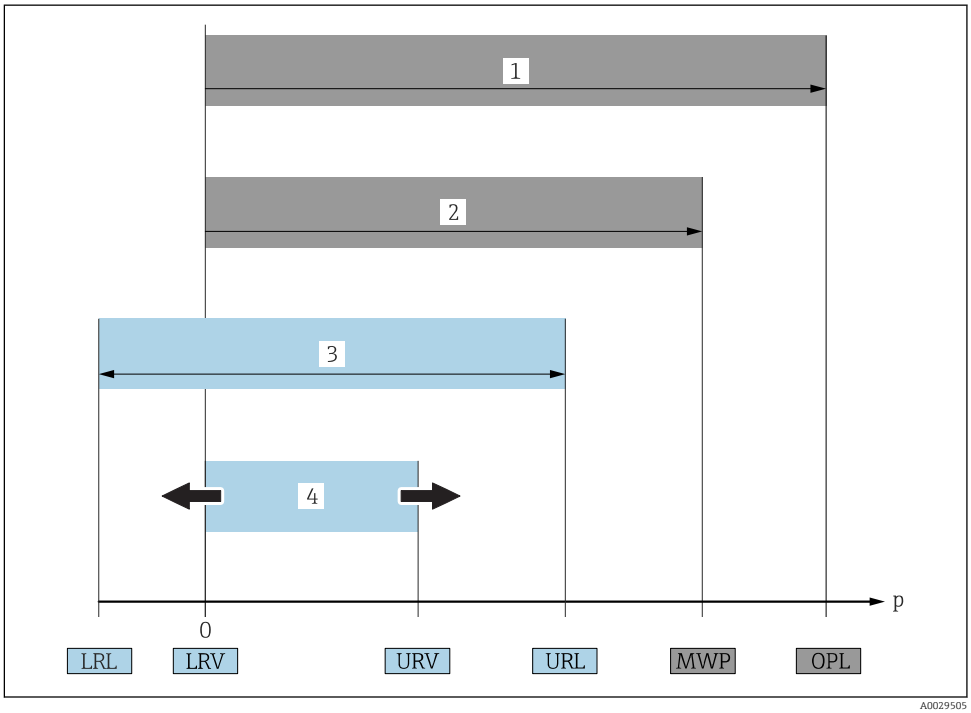
FMX21 4 to 20 mA Analog - BA01605P:

FMX21 4 to 20 mA HART - BA00380P:

RIA15 - BA01170K:

These Operating Instructions contain all the information that is required in various phases of the life cycle of the device: from product identification, incoming acceptance and storage, to mounting, connection, operation and commissioning through to troubleshooting, maintenance and disposal.

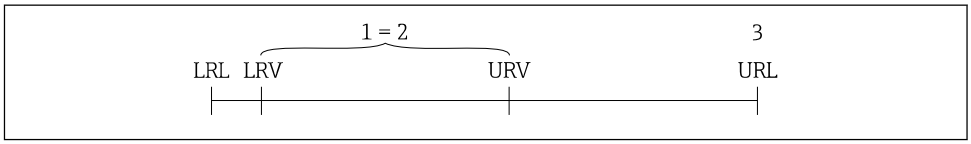
Safety Instructions (XA)



Depending on the approval, the following Safety Instructions (XA) are supplied with the device. They are an integral part of the Operating Instructions.

Directive	Type of protection	Category	Documentation	Option [1]
ATEX	Ex ia IIC	II 2 G	XA00454P	BD
ATEX	Ex nA IIC	II 3 G	XA00485P	BE
IECEx	Ex ia IIC	n/a	XA00455P	IC
CSA C/US	Ex ia IIC	n/a	ZD00232P (960008976)	CE
FM	AEx ia IIC	n/a	ZD00231P (960008975)	FE
NEPSI	Ex ia IIC	n/a	XA00456P	NA
INMETRO	Ex ia IIC	n/a	XA01066P	MA

1) Product Configurator order code for "Approval"



The nameplate indicates the Safety Instructions (XA) that are relevant to the device.

Terms and abbreviations

Item	Term/abbreviation	Explanation
1	OPL	The OPL (over pressure limit = sensor overload limit) for the measuring device depends on the lowest-rated element, with regard to pressure, of the selected components, i.e. the process connection has to be taken into consideration in addition to the measuring cell. Also observe pressure-temperature dependency. The OPL may only be applied for a limited period of time.
2	MWP	The MWP (maximum working pressure) for the sensors depends on the lowest-rated element, with regard to pressure, of the selected components, i.e. the process connection has to be taken into consideration in addition to the measuring cell. Also observe pressure-temperature dependency. The MWP may be applied at the device for an unlimited period. The MWP can also be found on the nameplate.
3	Maximum sensor measuring range	Span between LRL and URL This sensor measuring range is equivalent to the maximum calibratable/adjustable span.
4	Calibrated/adjusted span	Span between LRV and URV Factory setting: 0 to URL Other calibrated spans can be ordered as customized spans.
p	-	Pressure
-	LRL	Lower range limit
-	URL	Upper range limit
-	LRV	Lower range value
-	URV	Upper range value
-	TD (turn down)	Turn down Example - see the following section.
-	PE	Polyethylene
-	FEP	Fluorinated ethylene propylene
-	PUR	Polyurethane

Turn down calculation

1 Calibrated/adjusted span
2 Zero point-based span (4 to 20 mA Analog: customer-specific span can only be set at the factory when ordered)
3 URL sensor

Example

- Sensor:10 bar (150 psi)
- Upper range value (URL) = 10 bar (150 psi)

Turn down (TD):

$$TD = \frac{URL}{|URV - LRV|}$$

$$TD = \frac{10\ \text{bar (150 psi)}}{|5\ \text{bar (75 psi)} - 0\ \text{bar (0 psi)}|} = 2$$

In this example, the TD is 2:1.
This span is based on the zero point.

- Calibrated/adjusted span: 0 to 5 bar (0 to 75 psi)
- Lower range value (LRV) = 0 bar (0 psi)
- Upper range value (URV) = 5 bar (75 psi)

Function and system design

	 A0018640	 A0018641	 A0018642
Field of application	Hydrostatic level measurement in deep wells e.g. drinking water	Hydrostatic level measurement in wastewater	Hydrostatic level measurement in saltwater
	NOTICE **The Waterpilot is not suitable for use in biogas plants since the gases can diffuse through the elastomers (seals, cable).** ▶ For applications involving biogas, Endress+Hauser offers the Deltapilot level measuring device.		
Process connection	▪ Suspension clamp ▪ Cable mounting screw with G 1½" A or NPT 1½" thread		
Extension cable	PE, PUR, FEP → 🖹 45		
Seals	▪ FKM Viton ▪ EPDM [1]	FKM Viton	▪ FKM Viton ▪ EPDM [1]
Measuring ranges	▪ Relative pressure: 0 to 0.1 bar (0 to 1.5 psi) to 0 to 20 bar (0 to 300 psi) ▪ Absolute pressure: 0 to 2 bar (0 to 30 psi) to 0 to 20 bar (0 to 300 psi)		▪ Relative pressure: 0 to 0.1 bar (0 to 1.5 psi) to 0 to 4 bar (0 to 60 psi) ▪ Absolute pressure: 0 to 2 bar (0 to 30 psi) to 0 to 4 bar (0 to 60 psi)
	▪ Customer-specific measuring ranges; factory-calibrated. ▪ The following output units can be configured: %, mbar, bar, kPa, MPa, mmH_2O, mH_2O, inH_2O, ftH_2O, psi and numerous level units.		
Overload	to 40 bar (600 psi)		to 25 bar (375 psi)
Process temperature range	−10 to +70 °C (+14 to +158 °F)		0 to +50 °C (+32 to +122 °F)
Reference accuracy	▪ ±0.2 % of the set span ▪ Optional: ±0.1 % of set span (PLATINUM version)		
Supply voltage	10.5 to 35 V DC, Ex: 10.5 to 30 V DC		
Output	▪ 4 to 20 mA Analog ▪ 4 to 20 mA HART (can be inverted) with superimposed digital communication protocol HART 6.0, 2-wire		
Options	Drinking water approval	—	
	▪ Wide range of approvals, including ATEX, FM, CSA ▪ Numerous accessories ▪ Integrated Pt100 temperature sensor and TMT181 temperature head transmitter (4 to 20 mA) ▪ Integrated Pt100 temperature sensor and TMT182 temperature head transmitter (4 to 20 mA HART) ▪ Marine approval		
Specialties	▪ High-precision, robust ceramic measuring cell with long-term stability ▪ Automatic density compensation ▪ Customer-specific cable marking		

1) Recommended for drinking water applications, not suitable for use in hazardous areas.

Measuring principle

The ceramic measuring cell is a dry measuring cell i.e. the pressure acts directly on the robust, ceramic process isolating diaphragm of the Waterpilot FMX21. Changes in air pressure are guided via a pressure compensation tube through the extension cable to the rear of the ceramic process isolating diaphragm and are compensated for. A pressure-dependent change in capacitance, caused by the movement of the process isolating diaphragm, is measured at the electrodes of the ceramic carrier. The electronics unit then converts this to a signal that is proportional to the pressure and linear to the level.

1 Ceramic measuring cell
2 Pressure compensation tube
h Height level
p Total pressure = atmospheric pressure + hydrostatic pressure
ρ Density of the medium
g Acceleration due to gravity
$P_{hydr.}$ Hydrostatic pressure
P_{atm} Atmospheric pressure
P_{sens} Pressure displayed on the sensor

Temperature measurement with optional Pt100 resistance thermometer [1)]

For simultaneous measurement of level and temperature, Endress+Hauser offers the Waterpilot FMX21 with an optional 4-wire Pt100 resistance thermometer → 52. The Pt100 is categorized as Accuracy Class B as per DIN EN 60751.

Temperature measurement with optional Pt100 and TMT181 temperature head transmitter for FMX21 4 to 20 mA Analog [1)]

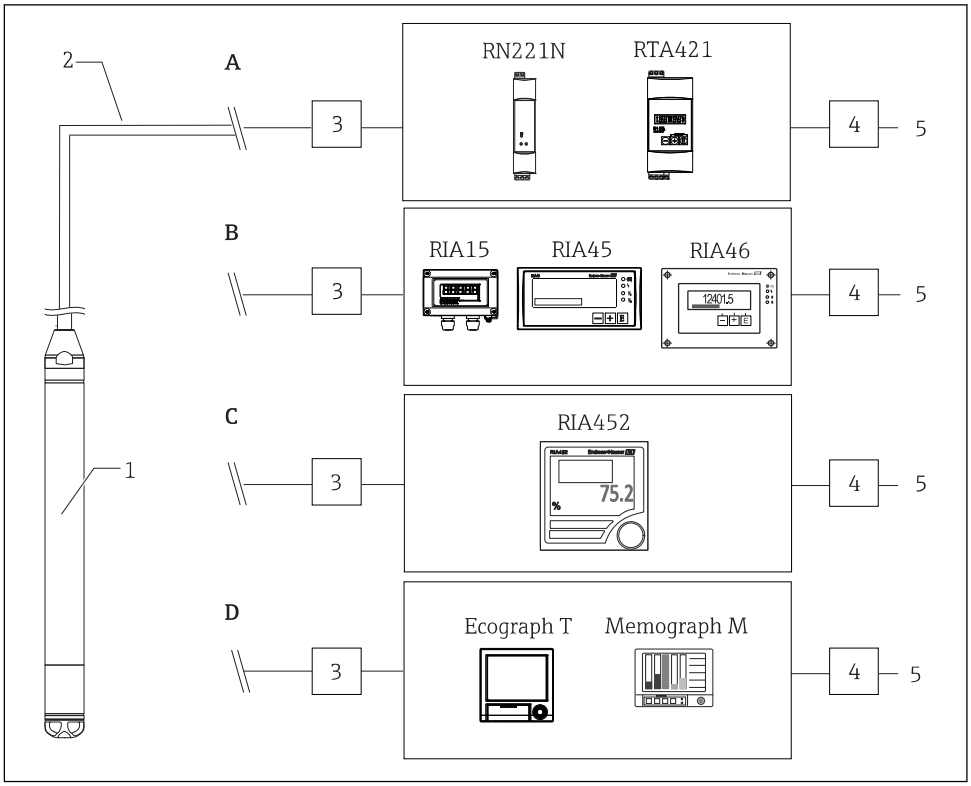
To convert the temperature signal to an analog, scalable 4 to 20 mA output signal, Endress+Hauser also offers the TMT181 temperature head transmitter.

Ordering information: → 50; "Accessories" → 52. Technical Information TI00070R.

Temperature measurement with optional Pt100 and TMT182 temperature head transmitter for FMX21 4 to 20 mA HART [1)]

Endress+Hauser also offers the TMT182 temperature head transmitter with HART protocol for converting the temperature signal to an analog, scalable 4 to 20 mA output signal superimposed with HART 6.0. See also: "Density compensation with Pt100 temperature sensor" → 12

Ordering information: → 50; "Accessories" → 52. Technical Information TI00078R.



1) Not for use in hazardous areas.

Measuring system

Application examples

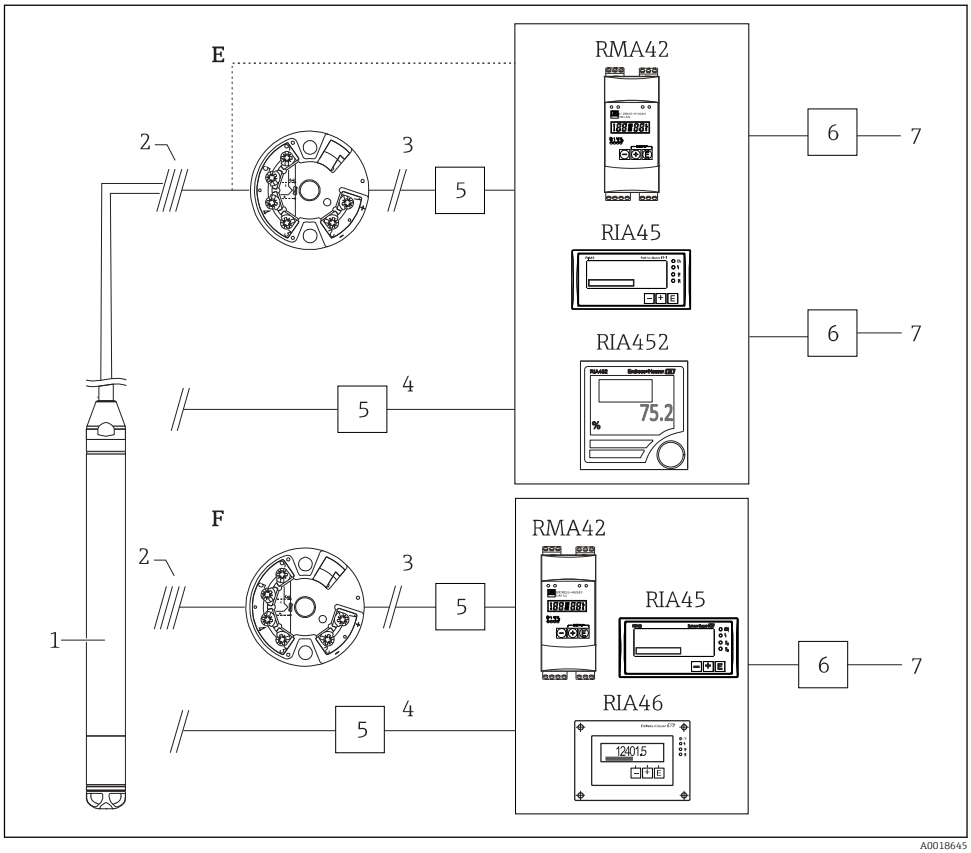
As standard, the complete measuring system consists of a Waterpilot FMX21 and a transmitter power supply unit with a supply voltage of 10.5 to 30 V DC (hazardous areas) or 10.5 to 35 V DC (non-hazardous areas).

Possible measuring point solutions with a transmitter and evaluation units from Endress+Hauser:

1 Waterpilot FMX21
2 4 to 20 mA or 4 to 20 mA HART
3+4 Overvoltage protection, e.g. HAW from Endress+Hauser (not for use in hazardous areas) HAW562; for DIN rail: HAW562/intrinsically safe HAW562Z. Selection in accordance with supply voltage.
5 Power supply

A: Easy and cost-effective measuring point solution: power supplied to the Waterpilot in hazardous and non-hazardous areas via the RN221N active barrier. Power supply and additional control of two appliances, such as pumps, via the RTA421 limit value switch with local display.

B: The RIA45 evaluation unit (for panel mounting) or the RIA46 evaluation unit (for field installation) offers power supply, local display and two switch outputs. If the RIA15 is used, the basic settings for the FMX21 HART can be made via the display module.



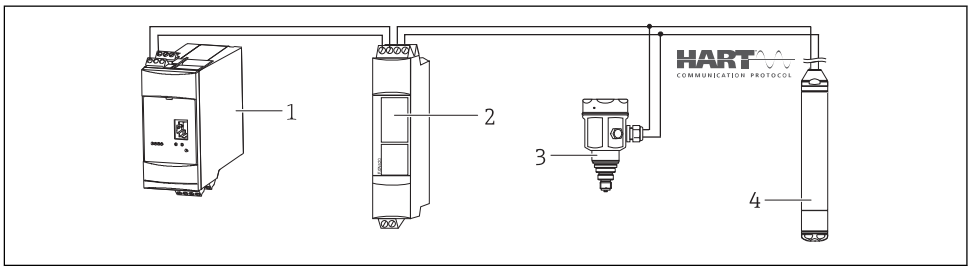
C: If several pumps are used, the pump service life can be prolonged by alternate switching. With alternating pump control, the pump which was out of service for the longest period of time is switched on. The RIA452 evaluation unit (for panel mounting) offers this option in addition to numerous other functions.

D: State-of-the-art recording technology with graphic display recorders from Endress+Hauser, such as Ecograph T, Memograph M for documentation, monitoring, visualization and archiving purposes.

Application examples with the Pt100

As standard, the complete measuring system consists of a Waterpilot FMX21 and a transmitter power supply unit with a supply voltage of 10.5 to 30 V DC (hazardous areas) or 10.5 to 35 V DC (non-hazardous areas).

Possible measuring point solutions with a transmitter and evaluation units from Endress+Hauser:



1 *Waterpilot FMX21*
2 *Connection for integrated Pt100 in the FMX21*
3 *Temperature for 4 to 20 mA or 4 to 20 mA HART*
4 *Level for 4 to 20 mA or 4 to 20 mA HART*
5 *Overvoltage protection, e.g. HAW from Endress+Hauser (not for use in hazardous areas) on the sensor side for field installation: HAW569; for DIN rail: HAW562/intrinsically safe HAW562Z. Selection in accordance with supply voltage.*
6 *Overvoltage protection, e.g. HAW from Endress+Hauser (not for use in hazardous areas) on the supply side for DIN rail: HAW561 (115/230 V) and HAW561K (24/48 V AC/DC). Selection in accordance with supply voltage.*
7 *Power supply*

E: If you wish to measure, display and evaluate the temperature as well as the level, e.g. to monitor the temperature in fresh water for the purpose of detecting temperature limits for germ formation, the options available to you include the following: The optionally available TMT182 temperature head transmitter can convert the Pt100 signal to a 4 to 20 mA signal or a 4 to 20 mA HART signal and transfer it to any commonly used evaluation unit. The RMA42, RIA45 and RIA452 evaluation units also offer a direct input for the Pt100 signal.

F: If you wish to record and evaluate the level and temperature measured value with one device, use the RMA42, RIA45 and RIA46 evaluation units with two inputs. It is even possible to mathematically link the input signals with this unit. These evaluation units are HART-compatible.

Level measurement with absolute pressure probe and external pressure signal for FMX21 4 to 20 mA HART

A0018757

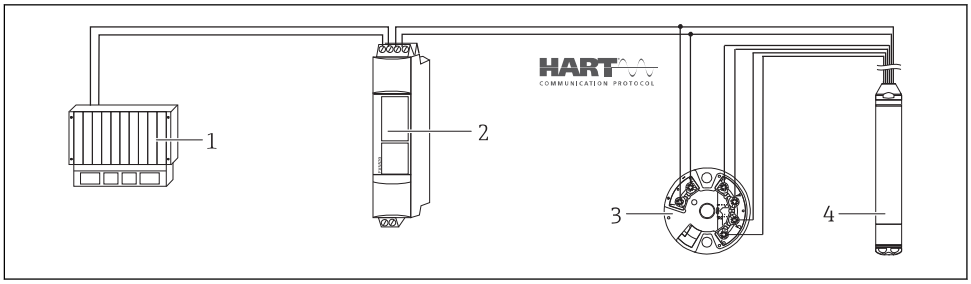
1 Fieldgate FXA520
2 Multidrop Connector FXN520
3 Cerabar
4 Waterpilot FMX21 4 to 20 mA HART

It is advisable to use an absolute pressure probe for applications in which condensation can occur. For level measurement using an absolute pressure probe, the measured value is affected by fluctuations in the ambient pressure. To correct the resulting measured error, you can connect an external absolute pressure sensor (e.g. Cerabar) to the HART signal line, switch the Waterpilot to burst mode and operate the Cerabar in the "Electr. Delta P" mode. The external absolute pressure sensor then calculates the difference between the two pressure signals and can thus determine the level precisely. Only one level measured value can be corrected in this way.

If using intrinsically safe devices, the regulations for interconnecting intrinsically safe circuits as stipulated in IEC60079-14 (proof of intrinsic safety) must be observed.

Density compensation with the Pt100 temperature sensor for FMX21 4 to 20 mA HART

The Waterpilot FMX21 4 to 20 mA HART can correct measured errors that result from fluctuations in the density of the water caused by temperature. Users can choose from the following options:



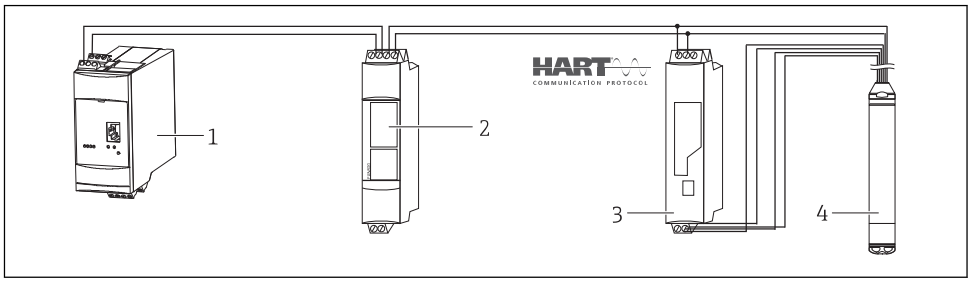
Use the internally measured sensor temperature of the FMX21

The internally measured sensor temperature is calculated in the Waterpilot FMX21 4 to 20 mA HART for density compensation. The level signal is thus corrected according to the density characteristic line of water.

Use the optional internal temperature sensor for density compensation in a suitable HART master (e.g. PLC)

The Waterpilot FMX21 4 to 20 mA HART is optionally available with a Pt100 temperature sensor. To convert the Pt100 signal to a 4 to 20 mA HART signal, Endress+Hauser also offers the TMT182 temperature head transmitter.

The temperature and pressure signals are queried by a HART master (e.g. PLC), where a corrected level value can be generated using a stored linearization table or density function (of a chosen medium).



A0018763

1 HART master, e.g. PLC (programmable logic controller)
2 FXN520 Multidrop Connector
3 TMT182 temperature head transmitter
4 Waterpilot FMX21 4 to 20 mA HART

Use an external temperature signal, which is transmitted to the FMX21 4 to 20 mA HART via the HART burst mode

The Waterpilot FMX21 4 to 20 mA HART is optionally available with a Pt100 temperature sensor. With this option, the signal of the Pt100 is evaluated with a HART-compliant temperature transmitter (min. HART 5.0) that supports the BURST mode. The temperature signal can thus be transmitted to the FMX21 4 to 20 mA HART. The FMX21 4 to 20 mA HART uses this signal for density correction of the level signal.

The TMT182 temperature head transmitter is not suitable for this configuration.

A0018764

1 Fieldgate FXA520
2 Multidrop Connector FXN520
3 HART-compatible temperature transmitter (e.g. TMT82)
4 Waterpilot FMX21 4 to 20 mA HART

Without additional compensation due to the anomaly of water, errors of up to 4% may occur at a temperature of 70 °C (158 °F), for example. With density compensation, this error can be decreased to 0.5 % in the entire temperature range from 0 to +70 °C (+32 to +158 °F).

More information can be found in the Technical Information:

- TI01010T: TMT82 temperature transmitter (4 to 20 mA HART)

3) These measuring ranges are not available for the special version with plastic insulation, external diameter of 29 mm (1.14 in).

Input signal

FMX21 + Pt100 (optional)

- Change in capacitance
- Pt100: Change in resistance

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

Pt100 resistance signal, 4 wire

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

Pt100 resistance signal, 4 wire

Output

Output signal

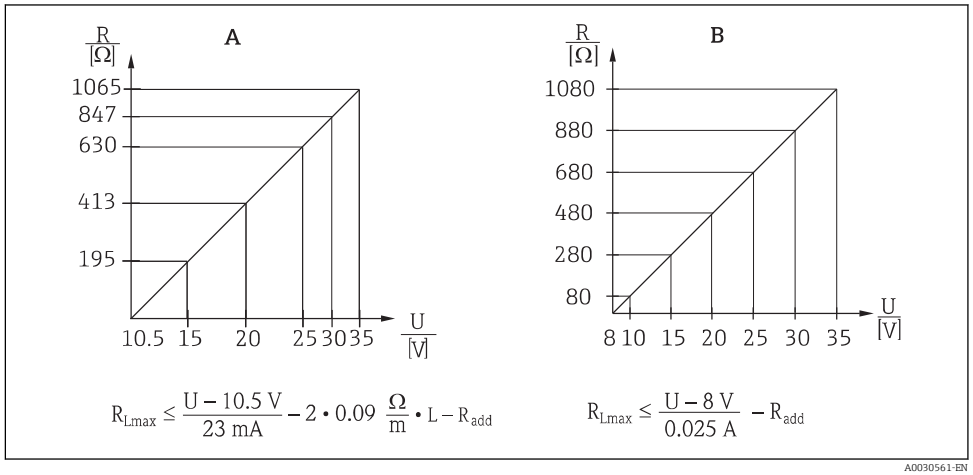
FMX21 + Pt100 (optional)

- 4 to 20 mA Analog, 2-wire for hydrostatic pressure measured value.
  Ordering information: Product Configurator order code for "Output", option "1"
- 4 to 20 mA HART with superimposed digital communication protocol HART 6.0, 2-wire for hydrostatic pressure measured value.
  Ordering information: Product Configurator order code for "Output", option "2"
  Options:
  – Max. alarm (factory setting 22mA): can be set from 21 to 23 mA
  – Hold measured value: last measured value is held
  – Min. alarm: 3.6 mA
- Pt100: temperature-dependent resistance value

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

4 to 20 mA Analog for temperature measured value, 2-wire

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART



4 to 20 mA HART with superimposed digital communication protocol HART 5.0 for temperature measured value, 2-wire

Signal range

3.8 mA to 20.5 mA

Maximum load for FMX21 4 to 20 mA Analog

The maximum load resistance depends on the supply voltage (U) and must be determined individually for each current loop, see formula and diagrams for FMX21 and temperature head transmitter. The total resistance resulting from the resistances of the connected devices, the connecting cable and, where applicable, the resistance of the extension cable may not exceed the load resistance value.

A FMX21 4 to 20 mA Analog load chart for estimating the load resistance. Additional resistances, such as the resistance of the extension cable, have to be subtracted from the value calculated as shown in the equation.

WARNING

Electrical safety is compromised by an incorrect connection!

- When using the measuring device in a hazardous area, the relevant national standards and guidelines as well as the Safety Instructions (XAs) or installation or control drawings (ZDs) must be adhered to. All data relating to explosion protection can be found in separate documentation which is available on request. This documentation is supplied with the devices as standard → 5

Supply voltage

FMX21 + Pt100 (optional)

- 10.5 to 35 V (not hazardous areas)
- 10.5 to 30 V (hazardous areas)

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

8 to 35 V DC

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

11.5 to 35 V DC

Power consumption

FMX21 + Pt100 (optional)

- ≤ 0.805 W at 35 V DC (non-hazardous area)
- ≤ 0.690 W at 30 V DC (hazardous area)

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

≤ 0.875 W at 35 V DC

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

≤ 0.805 W at 35 V DC

Current consumption

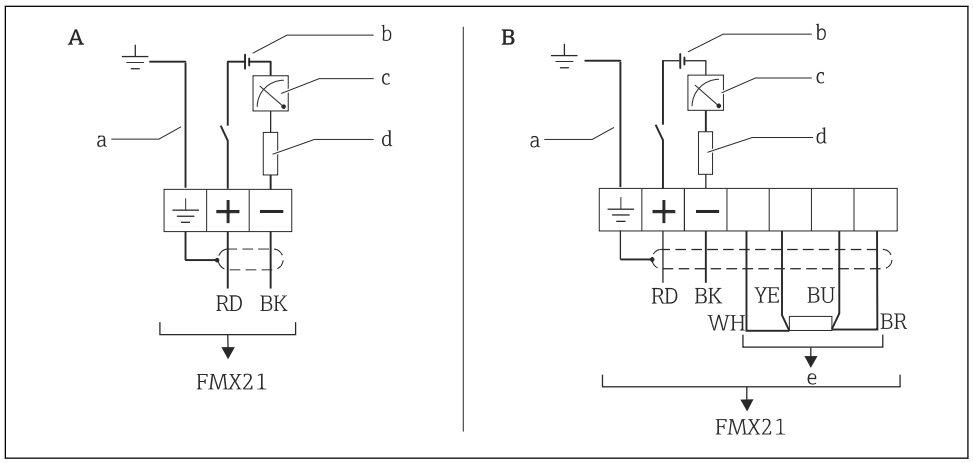
FMX21 + Pt100 (optional)

Max. current consumption: ≤ 23 mA
Min. current consumption: ≥ 3.6 mA

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

- Max. current consumption: ≤ 25 mA
- Min. current consumption: ≥ 3.5 mA

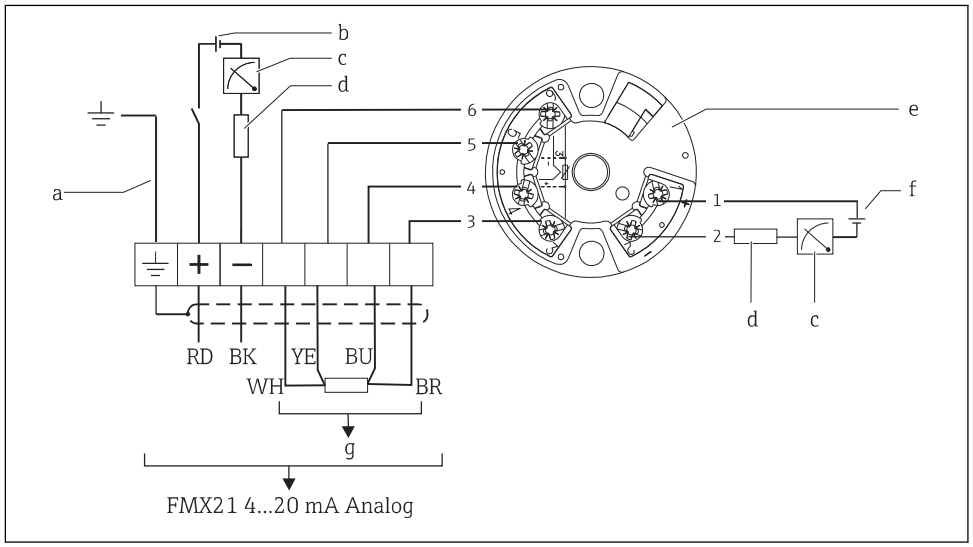
TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART



- Max. current consumption: ≤ 23 mA
- Min. current consumption: ≥ 3.5 mA

Connecting the device

- Waterpilot
  Reverse polarity protection is integrated in the Waterpilot FMX21 and the temperature head transmitter. Changing the polarities will not result in damage to the devices.
- The cable must end in a dry room or a suitable terminal box. The terminal box (IP66/IP67) with GORE-TEX® filter from Endress+Hauser is suitable for outdoor installation. The terminal box may be ordered as an accessory using the order code for the FMX21, Product Configurator order code for "Accessories enclosed", option "PS".



The electrical connection is established with the corresponding wires of the probe cable and with the optional use of the terminal box → 37 and a power supply (e.g. RN221N active barrier → 10).

Waterpilot with Pt100

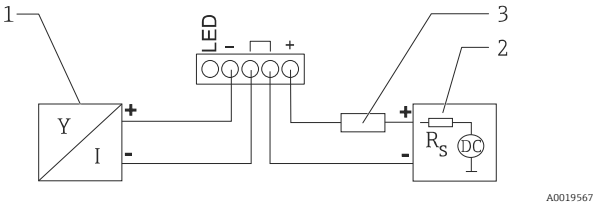
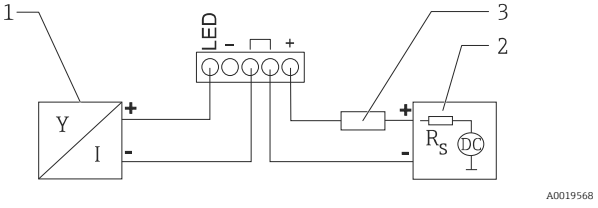
Waterpilot FMX21 with RIA15





The RIA15 remote display can be ordered together with the device.

Product structure, feature 620 "Accessory enclosed":
- Option R4 "Remote display RIA15 non-hazardous area, field housing"
- Option R5 "Remote display RIA15 Ex= explosion protection approval, field housing"

Compensation of the atmospheric pressure must be ensured for the installation. A black, vented cable gland is supplied for this purpose.

The RIA15 process display unit is loop-powered and does not require any external power supply.

The voltage drop to be taken into account is:
- ≤1 V in the standard version with 4 to 20 mA communication
- ≤1.9 V with HART communication
- and an additional 2.9 V if display light is used

Wire colors

RD = red, BK = black, WH = white, YE = yellow, BU = blue, BR = brown

Connection data

Connection classification as per IEC 61010-1:
- Overvoltage category 1
- Pollution level 1

Connection data in the hazardous area

See relevant XA.

Terminals in the terminal box

- Three terminals as standard in the terminal box (terminal box can optionally be ordered as an enclosed accessory → 52)
- 4-terminal strip can be ordered as an accessory, order number: 52008938 cable cross-section 0.08 to 2.5 mm^2 (28 to 14 AWG)

The 4-terminal strip is not designed for use in hazardous areas incl. CSA GP.

Probe cable

- Overall external diameter: 8 mm (0.31 in) ±0.25 mm (0.01 in)
- Pressure compensation tube with Teflon filter: External diameter of 2.5 mm (0.1 in), internal diameter of 1.5 mm (0.06 in)

Cross-section

- FMX21: 3 x 0.2 mm^2 (3 x 26 AWG) + pressure compensation tube with Teflon filter
- FMX21 with Pt100 (optional): 7 x 0.2 mm^2 (7 x 26 AWG) + pressure compensation tube with Teflon filter

Cable resistance

per wire: ≤ 0.09 Ω/m

Cable specifications

Endress+Hauser recommends using shielded, twisted-pair two-wire cables.

The probe cables are shielded for device versions with outer diameters of 22 mm (0.87 in) and 42 mm (1.65 in).

FMX21 + Pt100 (optional)

- Commercially available instrument cable
- Terminals, terminal box: 0.08 to 2.5 mm^2 (28 to 14 AWG)

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

- Commercially available instrument cable
- Terminals, terminal box: 0.08 to 2.5 mm^2 (28 to 14 AWG)
- Transmitter connection: max. 1.75 mm^2 (15 AWG)

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

- Commercially available instrument cable
- Terminals, terminal box: 0.08 to 2.5 mm^2 (28 to 14 AWG)
- Transmitter connection: max. 1.75 mm^2 (15 AWG)

Residual ripple for FMX21 4 to 20 mA Analog

FMX21 + Pt100 (optional)

No impact on the 4 to 20 mA signal up to ±5 % residual ripple within the permitted voltage range.

TMT181 temperature head transmitter (optional)

$U_{ss} \geq 5$ V at $U \geq 13$ V, $f_{max.} = 1$ kHz

Residual ripple for FMX21 4 to 20 mA HART

FMX21 + Pt100 (optional)

No impact on the 4 to 20 mA signal up to ±5 % residual ripple within the permitted voltage range (according to HART Hardware Specification HCF_SPEC-54 (DIN IEC 60381-1)).

TMT182 temperature head transmitter (optional)

$U_{ss} \geq 3$ V at $U \geq 13$ V, $f_{max.} = 1$ kHz

Performance characteristics

Reference operating conditions

FMX21 + Pt100 (optional)

- As per IEC 60770
- Ambient temperature T_U = constant, in the range of +21 to +33 °C (+70 to +91 °F)
- Humidity φ = constant, in the range of 20 to 80 % rH
- Ambient pressure p_U = constant, in the range of 860 to 1060 mbar (12.47 to 15.37 psi)
- Position of measuring cell constant, vertical in the range of ±1°
- Input of LOW SENSOR TRIM and HIGH SENSOR TRIM for lower range value and upper range value (only for HART)
- Supply voltage constant: 21 V DC to 27 V DC
- Load with HART: 250 Ω
- Pt100: DIN EN 60770, T_U = +25 °C (+77 °F)

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

Calibration temperature +23 °C (+73 °F) ±5 K

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

Calibration temperature +25 °C (+77 °F) ±5 K

Reference accuracy

FMX21 + Pt100 (optional)

The reference accuracy comprises the non-linearity after limit point configuration, hysteresis and non-reproducibility in accordance IEC 60770.

Standard version [2]:
Setting ±0.2 %
– to TD 5:1: < 0.2 % of set span
– from TD 5:1 to TD 20:1 ±(0.02 x TD+0.1)

Platinum version [3]:
- Setting ±0.1 % (optional)
  – to TD 5:1: < 0.1 % of set span
  – from TD 5:1 to TD 20:1 ±(0.02 x TD)
- Class B as per DIN EN 60751
  Pt100: max. ±1 K

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

- ±0.2 K
- With Pt100: max. ±0.9 K

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

- ±0.2 K
- With Pt100: max. ±0.9 K

Resolution

Current output: 1 µA

Reading cycle

HART commands: on average 2 to 3 per second

2) Ordering information: Product Configurator order code for "Reference accuracy", option "G"
3) Ordering information: Product Configurator order code for "Reference accuracy", option "D"

Long-term stability

FMX21 + Pt100 (optional)

- ≤ 0.1 % of URL/year
- ≤ 0.25 % of URL/5 years

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

≤ 0.1 K per year

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

≤ 0.1 K per year

Influence of medium temperature

- Thermal change in the zero output and the output span:
  0 to +30 °C (+32 to +86 °F): < (0.15 + 0.15 x TD)% of set span
  −10 to +70 °C (+14 to +158 °F): < (0.4 + 0.4 x TD)% of set span
- Temperature coefficient (T_K) of the zero output and the output span
  −10 to +70 °C (+14 to +158 °F): 0.1 % / 10 K of URL

Warm-up period

FMX21 + Pt100 (optional)

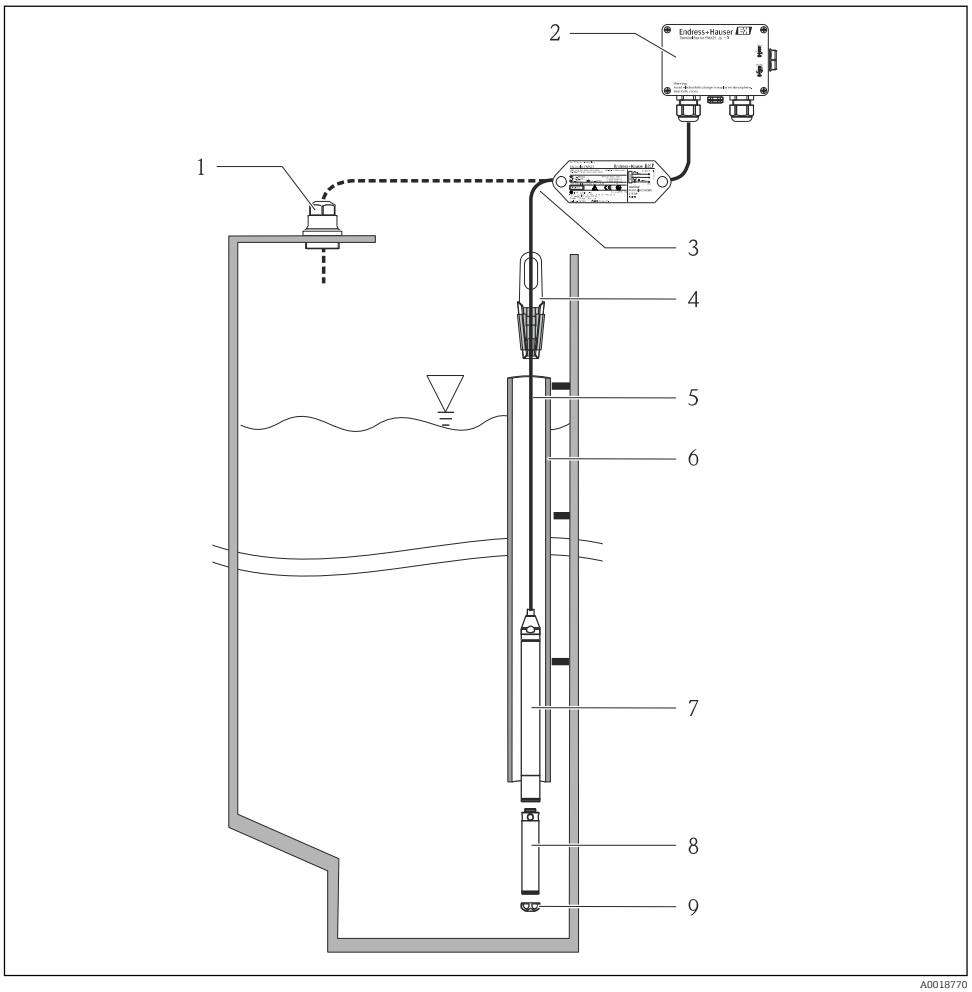
- FMX21: < 6 s
- Pt100: 300 s

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

4 s

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

4 s



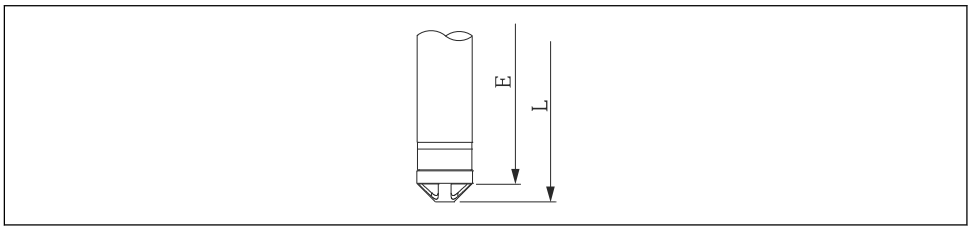
Response time

FMX21 + Pt100 (optional)

- FMX21: 400 ms (T90 time), 500 ms (T99 time)
- Pt100: 160 s (T90 time), 300 s (T99 time)

Installation

Installation instructions

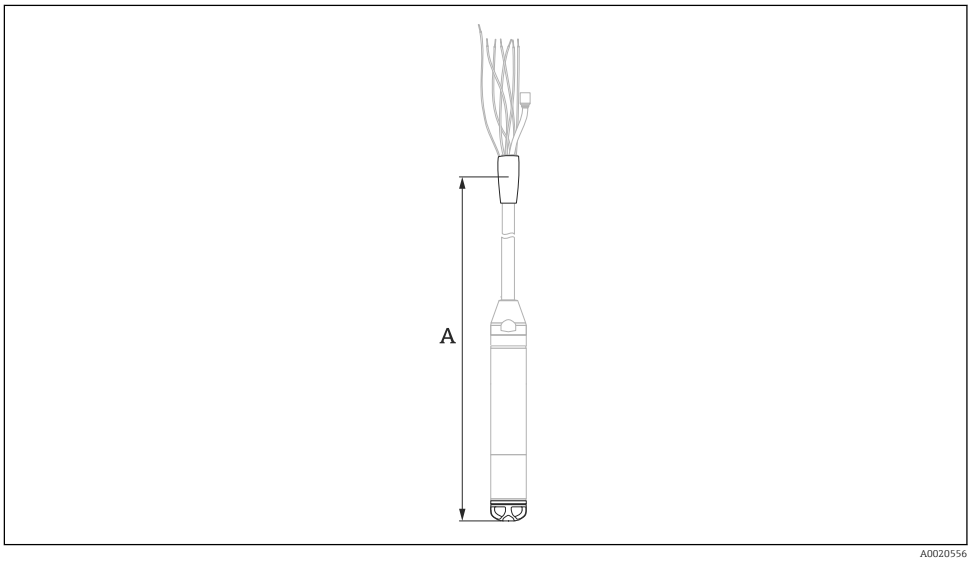


1 *Cable mounting screw can be ordered via the order code or as an accessory → 52*
2 *Terminal box can be ordered via the order code or as an accessory → 52*
3 *Bending radius of extension cable > 120 mm (4.72 in)*
4 *Mounting clamp can be ordered via the order code or as an accessory → 52*
5 *Extension cable, cable length → 28*
6 *Guide tube*
7 *Waterpilot FMX21*
8 *Additional weight can be ordered as an accessory for the FMX21 with external diameter of 22 mm (0.87 in) and 29 mm (1.14 in)→ 52*
9 *Protection cap*

Additional installation instructions

- Sideways movement of the level probe can result in measuring errors. For this reason, install the probe at a point free from flow and turbulence, or use a guide tube. The internal diameter of the guide tube should be at least 1 mm (0.04 in) greater than the external diameter of the selected FMX21.
- To avoid mechanical damage to the measuring cell, the device is equipped with a protection cap.
- The cable must end in a dry room or a suitable terminal box. The terminal box from Endress +Hauser provides humidity and climatic protection and is suitable for installation outdoors → 52.
- Cable length tolerance: < 5 m (16 ft): ±17.5 mm (0.69 in); > 5 m (16 ft): ±0.2 %
- If the cable is shortened, the filter at the pressure compensation tube must be reattached. Endress +Hauser offers a cable shortening kit for this purpose → 52 (documentation SD00552P/00/A6).

- Endress+Hauser recommends using twisted, shielded cable.
- In shipbuilding applications, measures are required to restrict the spread of fire along cable looms.
- The length of the extension cable depends on the intended level zero point. The height of the protection cap must be taken into consideration when designing the layout of the measuring point. The level zero point (E) corresponds to the position of the process isolating diaphragm. Level zero point = E; tip of probe = L (see the following diagram).
  For dimensions, see "Mechanical construction" section.



A0026013

Cable length

- Pay attention to the "Load"
- Cable lengths available for order
  - Customer-specific in meters or feet
  - Limited cable length when performing installation with freely suspended device with cable mounting screw or mounting clamp, as well as for Ex approval: max. 300 m (984 ft).

When using the measuring device in hazardous areas, installation must comply with the corresponding national standards and regulations and the Safety Instructions or Installation or Control Drawings.

A0020556

A Length of extension cable

Cable	Option [1]
10 m cable, can be shortened, PE	10
20 m cable, can be shortened, PE	11
..... m cable, can be shortened, PE	15
30 ft cable, can be shortened, PE	20
60 ft cable, can be shortened, PE	21

60 ft cable, can be shortened, PUR	61
..... ft cable, can be shortened, PUR	65

1) Ordering information: Product Configurator order code for "Probe connection"

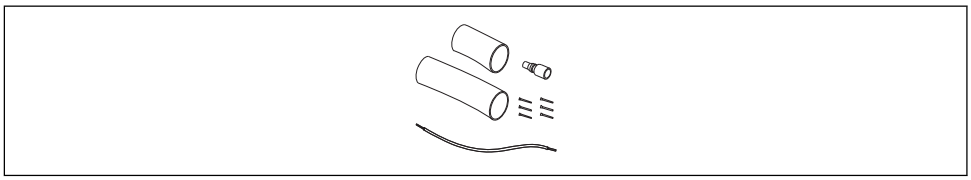
Technical data for cable

- Minimum bending radius: 120 mm (4.72 in)
- Tensile strength: max. 950 N (213.56 lbf)
- Cable extraction force (= tensile force required to extract the cable from the probe):
  - PE, FEP: typically ≥ 400 N (89.92 lbf), PUR: typically ≥ 150 N (33.72 lbf)
  - when used in hazardous area: ≥ 100 N (73.75 lbf)
- UV-resistant (UV = ultraviolet)
- PE: For use in drinking water

Cable marking

A0030955

- To make installation easier, Endress+Hauser marks the extension cable if a customer-specific length has been ordered.
  Ordering information: Product Configurator order code for "Service", option "IR" or "IS".
- Cable marking tolerance (distance to lower end of level probe):
  Cable length < 5 m (16 ft): ±17.5 mm (0.69 in)
  Cable length > 5 m (16 ft): ±0.2 %
- Material: PET, stick-on label: acrylic
- Immunity to temperature change: −30 to +100 °C (−22 to +212 °F)



NOTICE

The marking is used exclusively for installation purposes.

▶ The mark must be thoroughly removed without trace in the case of devices with drinking water approval. The extension cable must not be damaged in the process.

Not for use of the FMX21 in hazardous areas.

Cable shortening kit

A0030948

The cable shortening kit is used to shorten a cable easily and professionally.

The cable shortening kit is not designed for the FMX21 with FM/CSA approval.

- Ordering information: Product Configurator order code for "Accessories enclosed", option "PW"
- Associated documentation SD00552P/00/A6.

Environment

Ambient temperature range

FMX21 + Pt100 (optional)

- With external diameter of 22 mm (0.87 in) and 42 mm (1.65 in):
  −10 to +70 °C (+14 to +158 °F) (= medium temperature)
- With external diameter of29 mm (1.14 in):
  0 to +50 °C (+32 to +122 °F) (= medium temperature)

Cable

(when mounted in a fixed position)
- With PE: −30 to +70 °C (−22 to +158 °F)
- With FEP: −40 to +70 °C (−40 to +158 °F)
- With PUR: −40 to +70 °C (−40 to +158 °F)

Terminal box

−40 to +80 °C (−40 to +176 °F)

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

−40 to +85 °C (−40 to +185 °F)

Temperature head transmitter 2-wire, configured for a measuring range of −20 to +80 °C (−4 to +176 °F). This configuration offers a temperature range of 100 K which can be easily mapped. Please note that the Pt100 resistance temperature detector is suitable for a temperature range of −10 to +70 °C (14 to +158 °F)

The TMT181 temperature head transmitter is not designed for use in hazardous areas incl. CSA GP.

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

−40 to +85 °C (−40 to +185 °F)

Temperature head transmitter 2-wire, configured for a measuring range of −20 to +80 °C (−4 to +176 °F). This configuration offers a temperature range of 100 K which can be easily mapped. Please note that the Pt100 resistance temperature detector is suitable for a temperature range of −10 to +70 °C (14 to +158 °F)

The TMT182 temperature head transmitter is not designed for use in hazardous areas incl. CSA GP.

Storage temperature range

FMX21 + Pt100 (optional)

−40 to +80 °C (−40 to +176 °F)

Cable

(when mounted in a fixed position)
- With PE: −30 to +70 °C (−22 to +158 °F)
- With FEP: −30 to +80 °C (−22 to +176 °F)
- With PUR: −40 to +80 °C (−40 to +176 °F)

Terminal box

−40 to +80 °C (−40 to +176 °F)

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

−40 to +100 °C (−40 to +212 °F)

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

−40 to +100 °C (−40 to +212 °F)

Degree of protection

FMX21 + Pt100 (optional)

IP68, permanently hermetically sealed at 20 bar (290 psi) (~200 m H_2O)

Terminal box (optional)

IP66, IP67

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

IP00, condensation permitted

When installed in the optional terminal boxes: IP66/IP67

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

IP00, condensation permitted

Electromagnetic compatibility (EMC)

FMX21 + Pt100 (optional)

- EMC in accordance with all relevant requirements of EN 61326 series. For details, refer to the Declaration of Conformity.
- Maximum deviation: < 0.5 % of span.

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

Interference emission to EN 61326 Class B equipment, interference immunity to EN 61326 Appendix A (Industrial). For details, refer to the Declaration of Conformity.

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

EMC in accordance with all relevant requirements of EN 61326 series. For details, refer to the Declaration of Conformity.

Overvoltage protection

FMX21 + Pt100 (optional)

- Integrated overvoltage protection as per EN 61000-4-5 (500 V symmetrical/1000 V asymmetrical)
- Overvoltage protection ≥ 1.0 kV, external if necessary

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

Provide overvoltage protection, externally if necessary → 10.

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

Provide overvoltage protection, externally if necessary → 10.

Process

Medium temperature range

FMX21 + Pt100 (optional)

- With external diameter of 22 mm (0.87 in) and 42 mm (1.65 in):
  −10 to +70 °C (+14 to +158 °F)
- With external diameter of 29 mm (1.14 in):
  0 to +50 °C (+32 to +122 °F)

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA Analog

−40 to +85 °C (−40 to +185 °F)

(= ambient temperature), install temperature head transmitter outside the medium.

Temperature head transmitter 2-wire, configured for a measuring range of −20 to +80 °C (−4 to +176 °F). This configuration offers a temperature range of 100 K which can be easily mapped. Please note that the Pt100 resistance temperature detector is suitable for a temperature range of −10 to +70 °C (14 to +158 °F)

The TMT181 temperature head transmitter is not designed for use in hazardous areas incl. CSA GP.

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

−40 to +85 °C (−40 to +185 °F)

(= ambient temperature), install temperature head transmitter outside the medium.

Temperature head transmitter 2-wire, configured for a measuring range of −20 to +80 °C (−4 to +176 °F). This configuration offers a temperature range of 100 K which can be easily mapped. Please note that the Pt100 resistance temperature detector is suitable for a temperature range of −10 to +70 °C (14 to +158 °F)

The TMT182 temperature head transmitter is not designed for use in hazardous areas incl. CSA GP.

Medium temperature limit

FMX21 + Pt100 (optional)

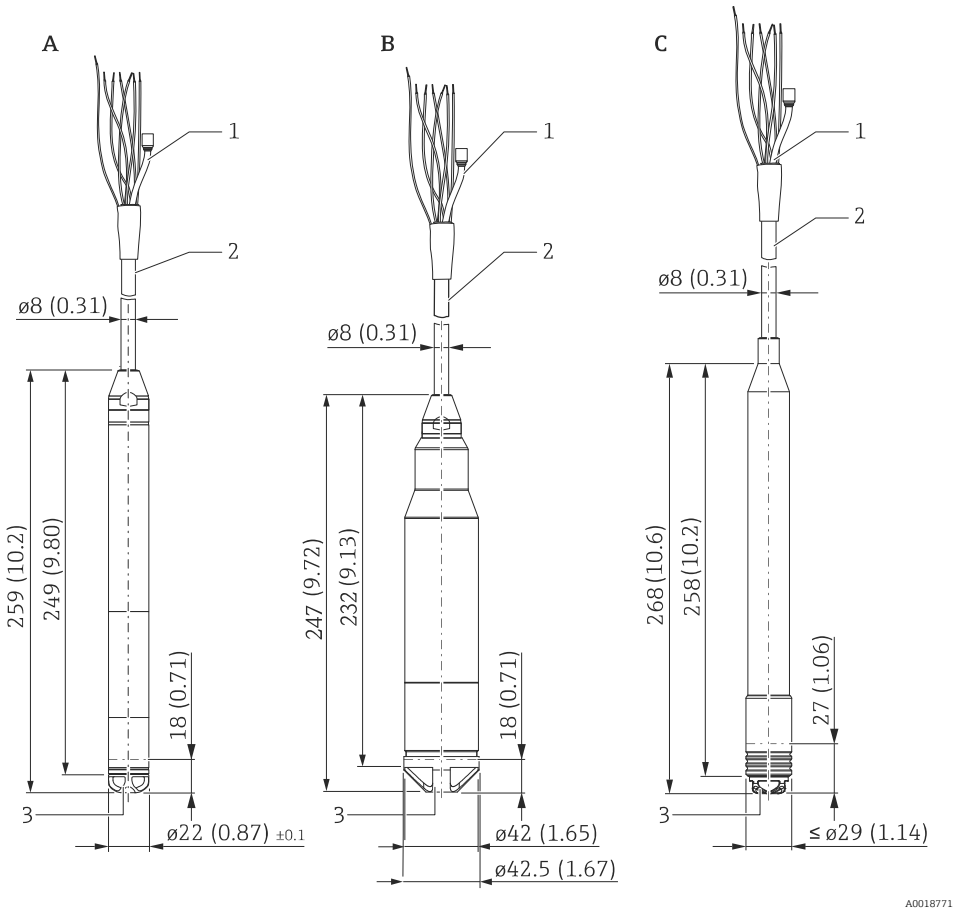
With external diameter of 22 mm (0.87 in) and 42 mm (1.65 in):
−20 to +70 °C (−4 to +158 °F)

In hazardous areas incl. CSA GP, the medium temperature limit is −10 to +70 °C (+14 to +158 °F).

With external diameter of29 mm (1.14 in): 0 to +50 °C (+32 to +122 °F)

The FMX21 may be operated in this temperature range. The specification values, such as accuracy, may be exceeded.

Pressure specifications



⚠ WARNING

The maximum pressure for the measuring device depends on the lowest-rated element with regard to pressure.

- For pressure specifications, see the "Measuring range" section and the "Mechanical construction" section.
- The measuring device must be operated only within the specified limits!
- The Pressure Equipment Directive (2014/68/EU) uses the abbreviation "PS". The abbreviation "PS" corresponds to the MWP (maximum working pressure) of the measuring device.
- MWP (maximum working pressure): The MWP (maximum working pressure) is specified on the nameplate. This value refers to a reference temperature of +20 °C (+68 °F) and may be applied to the device for an unlimited time. Observe temperature dependency of the MWP.
- OPL (Over Pressure Limit = sensor overload limit): The test pressure corresponds to the over pressure limit of the sensor and may only be applied for a limited time period to ensure measurement within specification and in order to avoid permanent damage. In the case of sensor range and process connections where the over pressure limit (OPL) of the process connection is smaller than the nominal value of the sensor, the device is set at the factory, at the very maximum, to the OPL value of the process connection. If you want to use the entire sensor range, select a process connection with a higher OPL value.
- avoid steam hammering! Steam hammering can cause zero point drifts. Recommendation: Residue (such as condensation or drops of water) can remain on the process isolating diaphragm after CIP cleaning and lead to local steam hammering if steam cleaning is performed again. In practice, drying the process isolating diaphragm (e.g. by blowing) has proved to prevent steam hammering.

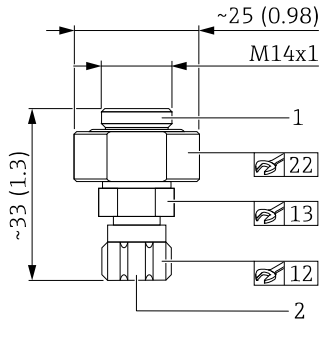
Additional weight

For FMX21 with external diameter of 22 mm (0.87 in) or 29 mm (1.14 in)

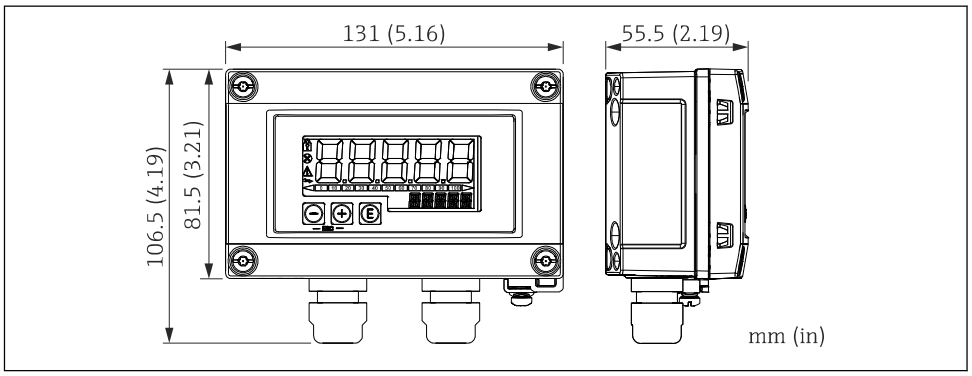
- Endress+Hauser offers additional weights to prevent sideways movement that results in measuring errors, or to make it easier to lower the device in a guide tube. You can screw several weights together. The weights are screwed directly onto the FMX21. For the FMX21 with external diameter of 29 mm (1.14 in), a maximum of 5 weights may be screwed on. In conjunction with the Ex nA approval, a maximum of one additional weight is permitted for the FMX21 with external diameter of 29 mm (1.14 in).
- Order number: 52006153 Ordering information: Product Configurator order code for "Accessories enclosed", option "PU"



Engineering unit mm (in)

Testing adapter

For FMX21 with external diameter of 22 mm (0.87 in) or 29 mm (1.14 in)

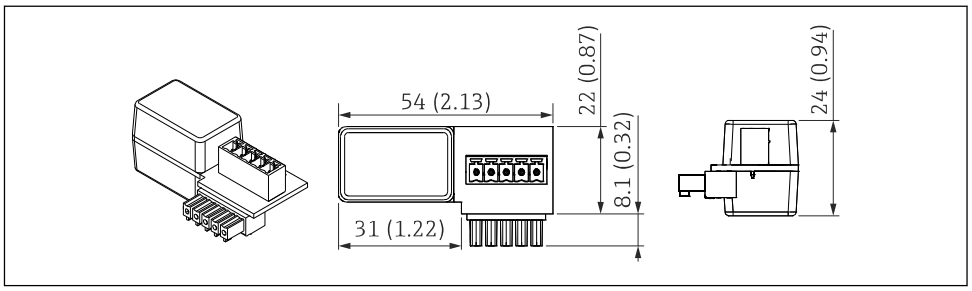


- Endress+Hauser offers a testing adapter to ease function-testing of the level probes.
- Observe the maximum pressure for compressed air hose and maximum overload for level probe → 🖹 14
- Maximum pressure for the quick coupling piece provided: 10 bar (145 psi)
- Adapter material: 304 (1.4301)
- Material of quick coupling piece: anodized aluminum
- Order number 52011868
  Ordering information: Product Configurator order code for "Accessories enclosed", option "PV"

1 FMX21 level probe connection
2 Compressed air hose connection, internal diameter, quick coupling piece 4 mm (0.16 in)

Engineering unit mm (in)

RIA15 in the field housing



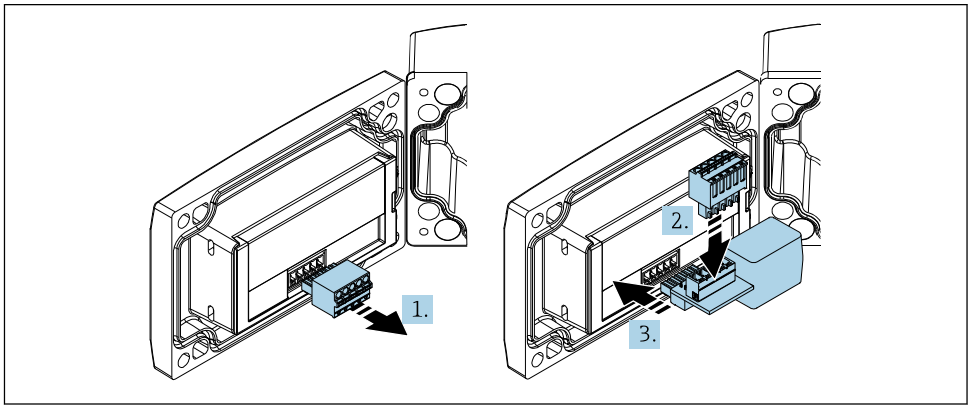
5 *Dimensions of RIA15 in field housing, engineering unit: mm (in)*

The RIA15 remote display can be ordered together with the device. Product structure, feature 620 "Accessories enclosed":

- Option R4 "Remote display RIA15 non-hazardous area, field housing"
- Option R5 "Remote display RIA15 Ex= explosion protection approval, field housing"

Alternatively available as an accessory, for details see Technical Information TI01043K and Operating Instructions BA01170K

HART communication resistor

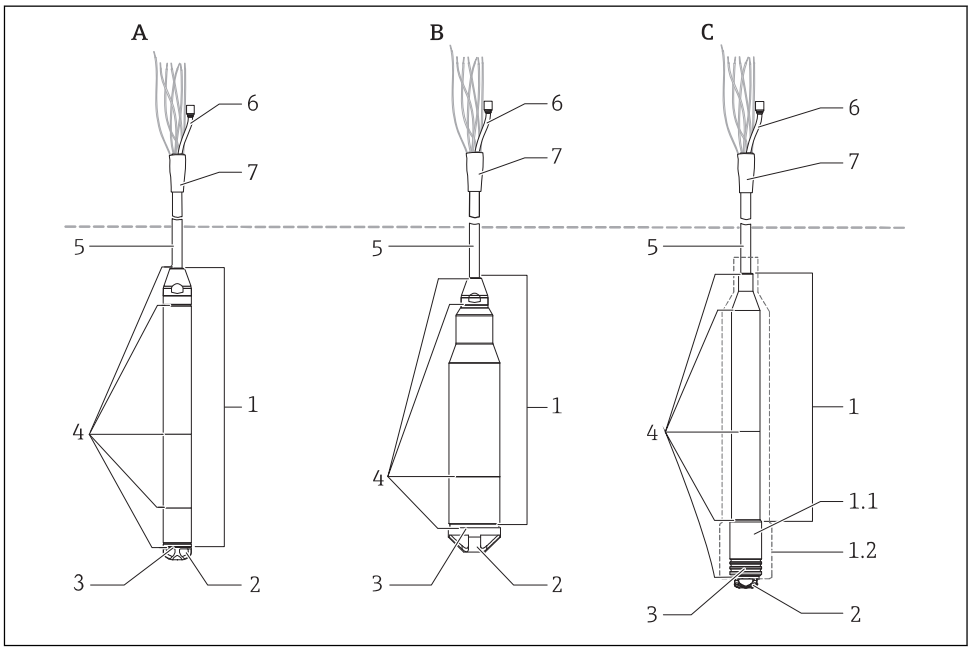


6 *Dimensions of HART communication resistor, engineering unit: mm (in)*

A communication resistor is required for HART communication. If this is not already present (e.g. in the power supply RMA, RN221N, RNS221, ...), it can be ordered with the device via the product structure, feature 620 "Accessories enclosed": option R6 "HART communication resistor hazardous / non-hazardous area".

Alternatively available as an accessory, for details see Technical Information TI01043K and Operating Instructions BA01170K

The HART communication resistor is specially designed for use with the RIA15 and can be attached easily.



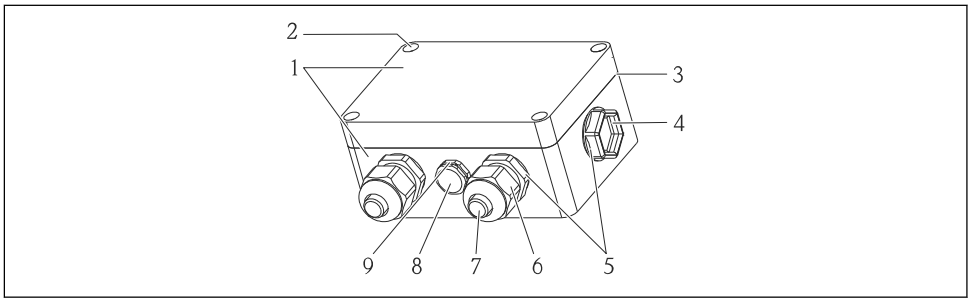
1. Disconnect plug-in terminal block.
2. Insert the terminal block into the slot provided on the HART communication resistor module.
3. Insert the HART communication resistor in the slot in the housing.

Weight

Component part		Weight
Level probe, external diameter of 22 mm (0.87 in)		344 g (12.133 oz)
Level probe, external diameter of 42 mm (1.65 in)		1376 g (48.532 oz)
Level probe, external diameter of 29 mm (1.14 in)		394 g (13.896 oz)
Extension cable	PE	52 g/m (0.035 lbs/1 ft)
	PUR	60 g/m (0.040 lbs/1 ft)
	FEP	108 g/m (0.072 lbs/1 ft)
Suspension clamp		170 g (5.996 oz)
Cable mounting screw G 1½" A		770 g (27.158 oz)
Cable mounting screw NPT 1½"		724 g (25.535 oz)
Terminal box		235 g (8.288 oz)
TMT181 temperature head transmitter		40 g (1.411 oz)
TMT182 temperature head transmitter		40 g (1.411 oz)
Additional weight		300 g (10.581 oz)
Testing adapter		39 g (1.376 oz)

Materials

Materials in contact with process



Item number	Component part	Material
1	▪ A: Level probe, external diameter of 22 mm (0.87 in) ▪ B: Level probe, external diameter of 42 mm (1.65 in) ▪ C: Level probe, max. external diameter of 29 mm (1.14 in)	316L (1.4404/1.4435) [1]
1.1	Sensor sleeve	PPS (Polyphenylene sulfide)
1.2	Heat-shrink tube	Polyolefin and hot melt adhesive
	The heat-shrink tube around the level probe acts as insulation. It prevents electrical contact between the level probe and the tank. Electrochemical corrosion is thus avoided.	
2	Protection cap for A and C: with outer diameter 22 mm (0.87 in) and 29 mm (1.14 in) (order number: 52008999)	POM
	Protection cap for B: device with outer diameter 42 mm (1.65 in) (order number: 917755-0000)	PFA
3	Process ceramic	Al_2O_3 (Aluminum oxide ceramic)
4	Seal	EPDM [2]
		FKM Viton [3]
5	Extension cable insulation Additional information	Choose from: ▪ PE-LD (Low-density polyethylene) ▪ FEP (Fluorinated ethylene propylene) ▪ PUR (Polyurethane)

1) Material 316L (1.4404/1.4435) is not in contact with the process in the case of level probe C
2) Product Configurator order code for "Seal", option "H"
3) Product Configurator order code for "Seal", option "A"

Adapter material: 304 (1.4301)

Material of quick coupling piece: anodized aluminum

Extension cable

PE	PUR	FEP
▪ Abrasion-resistant extension cable with strain-relief members made of high-strength PE fibers ▪ Shielded (aluminum) ▪ Insulated with polyethylene (PE), black ▪ Copper wires, twisted ▪ Pressure compensation tube with Teflon filter	▪ Abrasion-resistant extension cable with strain-relief members made of high-strength PE fibers ▪ Shielded (aluminum) ▪ Insulated with polyurethane (PUR), black ▪ Copper wires, twisted ▪ Pressure compensation tube with Teflon filter	▪ Abrasion-resistant extension cable ▪ Shielded with galvanized steel wire netting ▪ Insulated with fluorinated ethylene propylene (FEP), black ▪ Copper wires, twisted ▪ Pressure compensation tube with Teflon filter

Operability

FMX21 4 to 20 mA Analog

No display or other operation facility is required to operate the device. However, the measured values can be read out with optional evaluation units.

FMX21 4 to 20 mA HART

FieldCare

FieldCare is an Endress+Hauser asset management tool based on FDT technology. With FieldCare, you can configure all Endress+Hauser devices as well as devices from other manufacturers that support the FDT standard.

FieldCare supports the following functions:
- Configuration of transmitters in online and offline mode
- Loading and saving device data (upload/download)
- Documentation of the measuring point

Connection options:
- Via Commubox FXA195 and the USB interface of a computer
- Via Fieldgate FXA520

For additional information and free download of FieldCare, see → www.de.endress.com → Download → Text Search: FieldCare

DeviceCare

Function scope

Tool for connecting and configuring Endress+Hauser field devices.

The fastest way to configure Endress+Hauser field devices is with the dedicated "DeviceCare" tool. Together with the device type managers (DTMs) it presents a convenient, comprehensive solution.

For details, see Innovation brochure IN01047S

Field Xpert SFX

Field Xpert SFX is an industrial PDA with integrated 3.5" touchscreen from Endress+Hauser based on Windows Mobile. It offers wireless communication via the optional VIATOR® Bluetooth ® modem as a point-to-point connection to a HART device, or via WiFi and Endress+Hauser's Fieldgate FXA520 to one or more HART devices. Field Xpert also works as a stand-alone device for asset management applications. For details, refer to BA00060S/04/EN.

RIA15

The RIA15 can be used as a local display unit and for the basic commissioning of the Waterpilot FMX21 hydrostatic level sensor via HART.

Certificates and approvals

CE mark

The device meets the legal requirements of the relevant EC directives. Endress+Hauser confirms that the device has been successfully tested by applying the CE mark.

RCM-Tick marking

The supplied product or measuring system meets the ACMA (Australian Communications and Media Authority) requirements for network integrity, interoperability, performance characteristics as well as health and safety regulations. Here, especially the regulatory arrangements for electromagnetic compatibility are met. The products are labelled with the RCM- Tick marking on the name plate.

A0029561

Ex approvals

- ATEX
- CSA C/US
- FM
- IEC
- NEPSI
- INMETRO

- The approvals apply exclusively to the Waterpilot FMX21 without Pt100 and without TMT181/TMT182.
- Waterpilot FMX21 is only available for use in hazardous areas with the FKM Viton seal.
- All explosion protection data are given in separate documentation which is available upon request. The Ex documentation is supplied as standard with all Ex-systems → 📄 5.

EAC conformity

The measuring system meets the legal requirements of the applicable EAC guidelines. These are listed in the corresponding EAC Declaration of Conformity together with the standards applied.

Endress+Hauser confirms successful testing of the device by affixing to it the EAC mark.

Drinking water approval

For FMX21 with an external diameter of 22 mm (0.87 in) with EPDM seal

Designation	Option [1]
KTW	LQ
NSF61	LR
ACS	LS

1) Product Configurator order code for "Additional ordering information (optional)"

Marine approval

For FMX21 with outer diameter 22 mm (0.87 in).

Designation	Option [1]
GL	LE
ABS	LF
BV	LH
DNV	LI

1) Product Configurator order code for "Additional ordering information (optional)"

Other standards and guidelines

The applicable European guidelines and standards can be found in the relevant EU Declarations of Conformity. The following were also applied:

DIN EN 60770 (IEC 60770):

Transmitters for use in industrial process control systems Part 1: Methods for performance evaluation

Methods for evaluating the performance of transmitters for control and regulation in industrial process control systems.

DIN 16086:

Electrical pressure measuring instruments, pressure sensors, pressure transmitters, pressure measuring instruments, concepts, specifications on data sheets

Procedure for writing specifications in data sheets for electrical pressure measuring instruments, pressure sensors and pressure transmitters.

EN 61326:

Electrical equipment for measurement, control and laboratory use – EMC requirements

EN 61010-1 (IEC 61010-1):

Protection Measures for Electrical Equipment for Measurement, Control, Regulation and Laboratory Procedures

EN 60529:

Degrees of protection provided by enclosures (IP code)

Calibration

Designation	Option [1]
Factory calibration certificate, 5-point	F1

1) Product Configurator order code for "Calibration"

Pressure Equipment Directive 2014/68/EU (PED)

Pressure equipment with allowable pressure ≤ 200 bar (2 900 psi)

Pressure equipment (with a maximum allowable pressure PS ≤ 200 bar (2 900 psi)) can be classified as pressure accessories in accordance with Pressure Equipment Directive 2014/68/EU. If the maximum allowable pressure is ≤ 200 bar (2 900 psi) and the pressurized volume of the pressure equipment is ≤ 0.1 l, the pressure equipment is subject to the Pressure Equipment Directive (cf. Pressure Equipment Directive 2014/68/EU, Article 4, point 3). The Pressure Equipment Directive only requires that the pressure equipment shall be designed and manufactured in accordance with the "sound engineering practice of a Member State".

Reasons:

- Pressure Equipment Directive (PED) 2014/68/EU Article 4, point 3
- Pressure equipment directive 2014/68/EU, Commission's Working Group "Pressure", Guideline A-05 + A-06

Note:

A partial examination shall be performed for pressure instruments that are part of safety equipment for the protection of a pipe or vessel from exceeding allowable limits (safety accessory in accordance with Pressure Equipment Directive 2014/68/EU, Article 2, point 4).

Calibration unit

Designation	Option [1]
Sensor range; %	A
Sensor range; mbar/bar	B
Sensor range; kPa/MPa	C
Sensor range; mm/m H2O	D
Sensor range; in H2O/ft H2O	E

Designation	Option [1]
Sensor range; psi	F
Customized pressure; see additional specification	J
Customized level; see additional specification	K

1) Product Configurator order code for "Calibration; unit"

Service

Designation	Option [1]
Configured min alarm current	IA
Adjusted HART Burst Mode PV	IB
Adjusted density compensation	IC
... m cable marking>installation	IR
... ft cable marking>installation	IS
Special version	I9

1) Product Configurator order code for "Service"

Downloading the Declaration of Conformity

http://www.endress.com/en/download

1. Select "Approvals & Certificates"
2. Select "Manufact. Declaration"
3. Enter the required product code
4. Click "Search"

The available downloads are displayed.

Ordering information

Detailed ordering information is available from the following sources:
- In the Product Configurator on the Endress+Hauser website: www.endress.com -> Click "Corporate" -> Select your country -> Click "Products" -> Select the product using the filters and search field -> Open product page -> The "Configure" button to the right of the product image opens the Product Configurator.
- From your Endress+Hauser Sales Center: www.addresses.endress.com

Product Configurator - the tool for individual product configuration
- Up-to-the-minute configuration data
- Depending on the device: Direct input of measuring point-specific information such as measuring range or operating language
- Automatic verification of exclusion criteria
- Automatic creation of the order code and its breakdown in PDF or Excel output format
- Ability to order directly from the Endress+Hauser Online Shop

Scope of delivery

- Measuring device
- Optional accessories
- Brief Operating Instructions
- Certificates

Configuration data sheet

Level

The following configuration data sheet must be completed and included with the order if option "K: customized level" has been selected for order code "090: Calibration; unit" in the product structure.

Pressure unit				**Output unit (scaled unit)**				
				Mass	Lengths	Volume	Volume	Percent
❑ mbar	❑ mmH_2O	❑ mmHg	❑ Pa	❑ kg	❑ m	❑ l	❑ gal	❑ %
❑ bar	❑ mH_2O		❑ kPa	❑ t	❑ dm	❑ hl	❑ Igal

1 About this document

1.1 Document function

These Operating Instructions contain all the information that is required in various phases of the life cycle of the device: from product identification, incoming acceptance and storage, to mounting, connection, operation and commissioning through to troubleshooting, maintenance and disposal.

1.2 Symbols used

1.2.1 Safety symbols

Symbol	Meaning
DANGER	**DANGER!** This symbol alerts you to a dangerous situation. Failure to avoid this situation will result in serious or fatal injury.
WARNING	**WARNING!** This symbol alerts you to a dangerous situation. Failure to avoid this situation can result in serious or fatal injury.
CAUTION	**CAUTION!** This symbol alerts you to a dangerous situation. Failure to avoid this situation can result in minor or medium injury.
NOTICE	**NOTE!** This symbol contains information on procedures and other facts which do not result in personal injury.

1.2.2 Electrical symbols

Symbol	Meaning	Symbol	Meaning
⎓	Direct current	~	Alternating current
⎓ ~	Direct current and alternating current	⏚	**Ground connection** A grounded terminal which, as far as the operator is concerned, is grounded via a grounding system.
⏚	**Protective ground connection** A terminal which must be connected to ground prior to establishing any other connections.	⏚	**Equipotential connection** A connection that has to be connected to the plant grounding system: This may be a potential equalization line or a star grounding system depending on national or company codes of practice.

1.2.3 Tool symbols

Symbol	Meaning
 A0011220	Flat blade screwdriver
 A0011219	Phillips screwdriver

Symbol	Meaning
 A0011221	Allen key
 A0011222	Open-ended wrench

1.2.4 Symbols for certain types of information

Symbol	Meaning
	**Permitted** Procedures, processes or actions that are permitted.
	**Preferred** Procedures, processes or actions that are preferred.
	**Forbidden** Procedures, processes or actions that are forbidden.
	**Tip** Indicates additional information.

1.4 Supplementary documentation

The document types listed are available:
In the Download Area of the Endress+Hauser Internet site: www.endress.com → Download

1.4.1 Technical Information (TI): planning aid for your device

Waterpilot: TI00431P

RIA15: TI01043K

The document contains all the technical data on the device and provides an overview of the accessories and other products that can be ordered for the device.

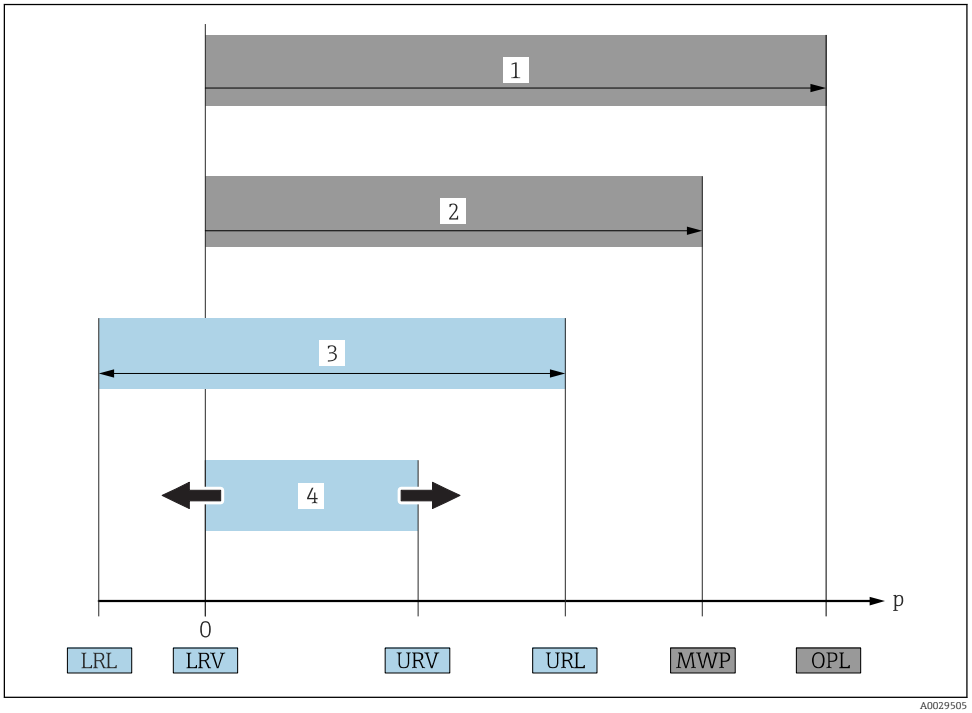
1.4.2 Brief Operating Instructions (KA): getting the 1st measured value quickly

FMX21 4 to 20 mA HART - KA01189P:

The Brief Operating Instructions contain all the essential information from incoming acceptance to initial commissioning.

1.4.3 Safety Instructions (XA)

Depending on the approval, the following Safety Instructions (XA) are supplied with the device. They are an integral part of the Operating Instructions.

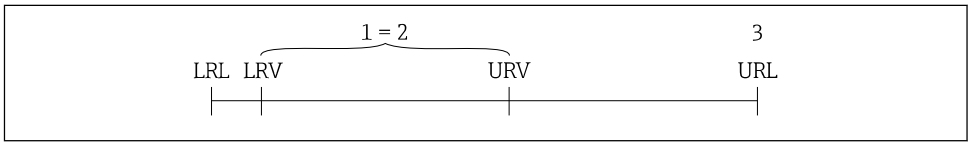


Directive	Type of protection	Category	Documentation	Option [1)]
ATEX	Ex ia IIC	II 2 G	XA00454P	BD
ATEX	Ex nA IIC	II 3 G	XA00485P	BE
IECEx	Ex ia IIC	n/a	XA00455P	IC
CSA C/US	Ex ia IIC	n/a	ZD00232P (960008976)	CE
FM	AEx ia IIC	n/a	ZD00231P (960008975)	FE

Directive	Type of protection	Category	Documentation	Option [1]
NEPSI	Ex ia IIC	n/a	XA00456P	NA
INMETRO	Ex ia IIC	n/a	XA01066P	MA

1) Product Configurator order code for "Approval"

The nameplate indicates the Safety Instructions (XA) that are relevant to the device.



1.5 Terms and abbreviations

Item	Term/abbreviation	Explanation
1	OPL	The OPL (over pressure limit = sensor overload limit) for the measuring device depends on the lowest-rated element, with regard to pressure, of the selected components, i.e. the process connection has to be taken into consideration in addition to the measuring cell. Also observe pressure-temperature dependency. The OPL may only be applied for a limited period of time.
2	MWP	The MWP (maximum working pressure) for the sensors depends on the lowest-rated element, with regard to pressure, of the selected components, i.e. the process connection has to be taken into consideration in addition to the measuring cell. Also observe pressure-temperature dependency. The MWP may be applied at the device for an unlimited period. The MWP can also be found on the nameplate.
3	Maximum sensor measuring range	Span between LRL and URL This sensor measuring range is equivalent to the maximum calibratable/adjustable span.
4	Calibrated/adjusted span	Span between LRV and URV Factory setting: 0 to URL Other calibrated spans can be ordered as customized spans.
p	-	Pressure
-	LRL	Lower range limit
-	URL	Upper range limit
-	LRV	Lower range value

Item	Term/abbreviation	Explanation
-	URV	Upper range value
-	TD (turn down)	Turn down Example - see the following section.
-	PE	Polyethylene
-	FEP	Fluorinated ethylene propylene
-	PUR	Polyurethane

1.6 Turn down calculation

1 Calibrated/adjusted span
2 Zero point-based span
3 URL sensor

Example

- Sensor:10 bar (150 psi)
- Upper range value (URL) = 10 bar (150 psi)

Turn down (TD):

$$TD = \frac{URL}{|URV - LRV|}$$

$$TD = \frac{10\ bar\ (150\ psi)}{|5\ bar\ (75\ psi) - 0\ bar\ (0\ psi)|} = 2$$

In this example, the TD is 2:1.
This span is based on the zero point.

- Calibrated/adjusted span: 0 to 5 bar (0 to 75 psi)
- Lower range value (LRV) = 0 bar (0 psi)
- Upper range value (URV) = 5 bar (75 psi)

2 Basic safety instructions

2.1 Requirements concerning the staff

The personnel for installation, commissioning, diagnostics and maintenance must fulfill the following requirements:
- Trained, qualified specialists: must have a relevant qualification for this specific function and task
- Are authorized by the plant owner/operator
- Are familiar with federal/national regulations
- Before beginning work, the specialist staff must have read and understood the instructions in the Operating Instructions and supplementary documentation as well as in the certificates (depending on the application)
- Following instructions and basic conditions

The operating personnel must fulfill the following requirements:
- Being instructed and authorized according to the requirements of the task by the facility's owner-operator
- Following the instructions in these Operating Instructions

2.2 Designated use

2.2.1 Application and media

The Waterpilot FMX21 is a hydrostatic pressure sensor for measuring the level of fresh water, wastewater and salt water. The temperature is measured simultaneously in the case of sensor versions with a Pt100 resistance thermometer.

An optional temperature head transmitter converts the Pt100 signal to a 4 to 20 mA signal with superimposed digital communication protocol HART 6.0.

2.2.2 Incorrect use

The manufacturer is not liable for damage caused by improper or non-designated use.

Verification for borderline cases:
- For special fluids and fluids for cleaning, Endress+Hauser is glad to provide assistance in verifying the corrosion resistance of fluid-wetted materials, but does not accept any warranty or liability.

2.3 Workplace safety

For work on and with the device:
- Wear the required personal protective equipment according to federal/national regulations.
- Switch off the supply voltage before connecting the device.

2.4 Operational safety

Risk of injury!
- Operate the device in proper technical condition and fail-safe condition only.
- The operator is responsible for interference-free operation of the device.

Modifications to the device

Unauthorized modifications to the device are not permitted and can lead to unforeseeable dangers.
- If, despite this, modifications are required, consult with Endress+Hauser.

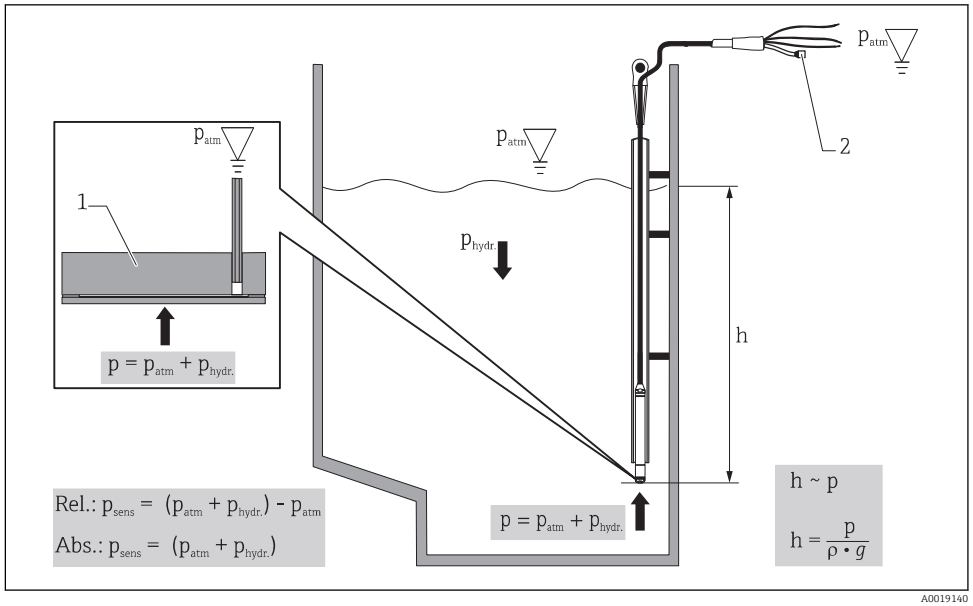
Repairs

To ensure continued operational safety and reliability,
- Carry out repairs on the device only if they are expressly permitted.
- Observe federal/national regulations pertaining to repair of an electrical device.
- Use original spare parts and accessories from Endress+Hauser only.

Hazardous area

To eliminate danger to persons or the facility when the device is used in the approval-related area (e.g. explosion protection, pressure vessel safety):
- Check the nameplate to verify if the device ordered can be put to its intended use in the approval-related area.
- Observe the specifications in the separate supplementary documentation that is an integral part of these Instructions.

2.5 Product safety

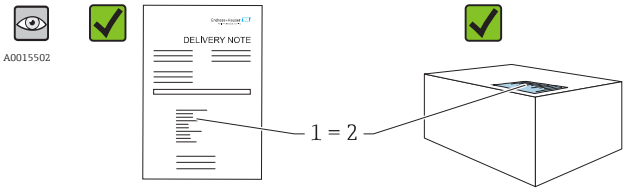


This measuring device is designed in accordance with good engineering practice to meet state-of-the-art safety requirements, has been tested, and left the factory in a condition in which it is safe to operate.

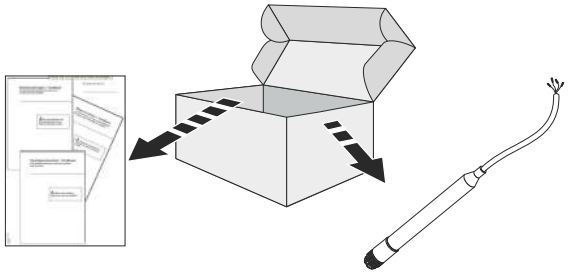
It meets general safety standards and legal requirements. It also complies with the EC directives listed in the device-specific EC Declaration of Conformity. Endress+Hauser confirms this by affixing the CE mark to the device.

3 Product description

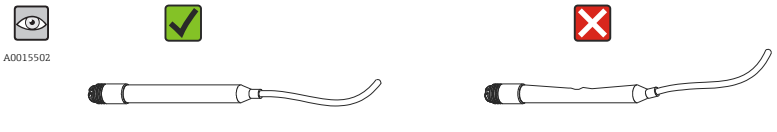
3.1 Function



The ceramic measuring cell is a dry measuring cell i.e. the pressure acts directly on the robust, ceramic process isolating diaphragm of the Waterpilot FMX21. Changes in air pressure are guided via a pressure compensation tube through the extension cable to the rear of the ceramic process isolating diaphragm and are compensated for. A pressure-dependent change in capacitance, caused by the movement of the process isolating diaphragm, is measured at the electrodes of the ceramic carrier. The electronics unit then converts this to a signal that is proportional to the pressure and linear to the level.

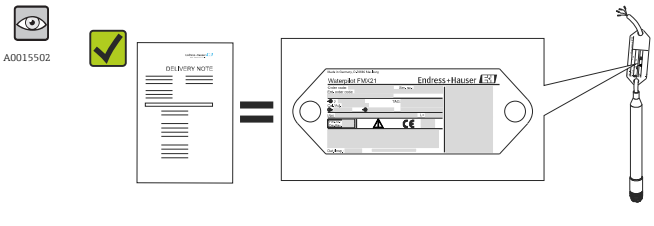


1 Ceramic measuring cell
2 Pressure compensation tube
h Height level
p Total pressure = atmospheric pressure + hydrostatic pressure
ρ Density of the medium
g Acceleration due to gravity
$P_{hydr.}$ *Hydrostatic pressure*
P_{atm} *Atmospheric pressure*
P_{sens} *Pressure displayed on the sensor*



4 Incoming acceptance and product identification

4.1 Incoming acceptance



Is the order code on the delivery note (1) identical to the order code on the product sticker (2)?

Are the goods undamaged?

Do the data on the nameplate correspond to the order specifications and the delivery note?

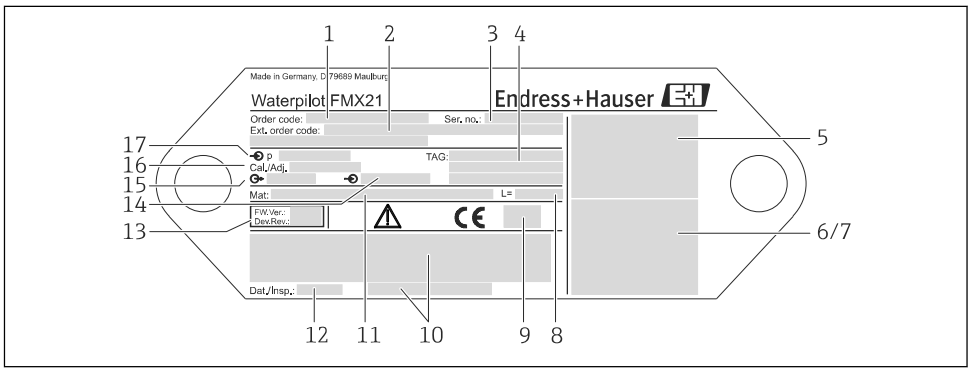
Is the documentation available?
If required (see nameplate): Are the safety instructions (XA) present?

If one of these conditions does not apply, please contact your Endress+Hauser sales office.

4.2 Product identification

The following options are available for identification of the measuring device:
- Nameplate specifications
- Order code with breakdown of the device features on the delivery note
- Enter serial number of nameplates in *W@M Device Viewer* (www.endress.com/deviceviewer): All details on the measuring device are displayed.

For an overview of the technical documentation provided, enter the serial number from the nameplates in the *W@M Device Viewer* (www.endress.com/deviceviewer)

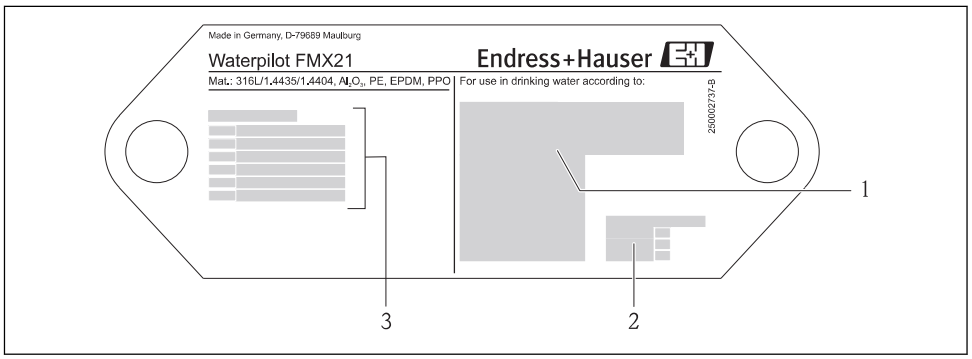


4.2.1 Manufacturer address

Endress+Hauser SE+Co. KG
Hauptstraße 1
79689 Maulburg, Germany

Address of the manufacturing plant: See nameplate.

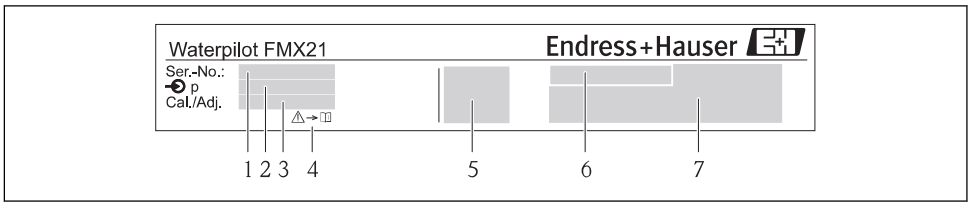
4.3 Nameplates



4.3.1 Nameplates on extension cable

A0018802

1 *Order code (shortened for reordering); The meaning of the individual letters and digits is explained in the order confirmation details.*
2 *Extended order number (complete)*
3 *Serial number (for clear identification)*
4 *TAG (device tag)*
5 *FMX21 connection diagram*
6 *Pt100 connection diagram (optional)*
7 *Warning (hazardous area), (optional)*
8 *Length of extension cable*
9 *Approval symbol, e.g. CSA, FM, ATEX (optional)*
10 *Text for approval (optional)*
11 *Materials in contact with process*
12 *Test date (optional)*
13 *Software version/device version*
14 *Supply voltage*
15 *Output signal*
16 *Set measuring range*
17 *Nominal measuring range*



Additional nameplate for devices with approvals

A0018805

1 *Approval symbol (drinking water approval)*
2 *Reference to associated documentation*
3 *Approval number (marine approval)*

4.3.2 Additional nameplate for devices with external diameter 22 mm (0.87 in) and 42 mm (1.65 in)

1 *Serial number*
2 *Nominal measuring range*
3 *Set measuring range*
4 *CE mark or approval symbol*
5 *Certificate number (optional)*
6 *Text for approval (optional)*
7 *Reference to documentation*

4.4 Identification of sensor type

With gauge pressure or absolute pressure sensors, the "Pos. zero adjust" parameter is displayed in the operating menu. With absolute pressure sensors, the "Calib. offset" parameter is displayed in the operating menu.

4.5 Storage and transport

4.5.1 Storage conditions

Use original packaging.

Store the measuring device in clean and dry conditions and protect from damage caused by shocks (EN 837-2).

Storage temperature range

FMX21 + Pt100 (optional)

−40 to +80 °C (−40 to +176 °F)

Cable

(when mounted in a fixed position)
- With PE: −30 to +70 °C (−22 to +158 °F)
- With FEP: −30 to +80 °C (−22 to +176 °F)
- With PUR: −40 to +80 °C (−40 to +176 °F)

Terminal box

−40 to +80 °C (−40 to +176 °F)

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

−40 to +100 °C (−40 to +212 °F)

4.5.2 Transporting the product to the measuring point

⚠ WARNING

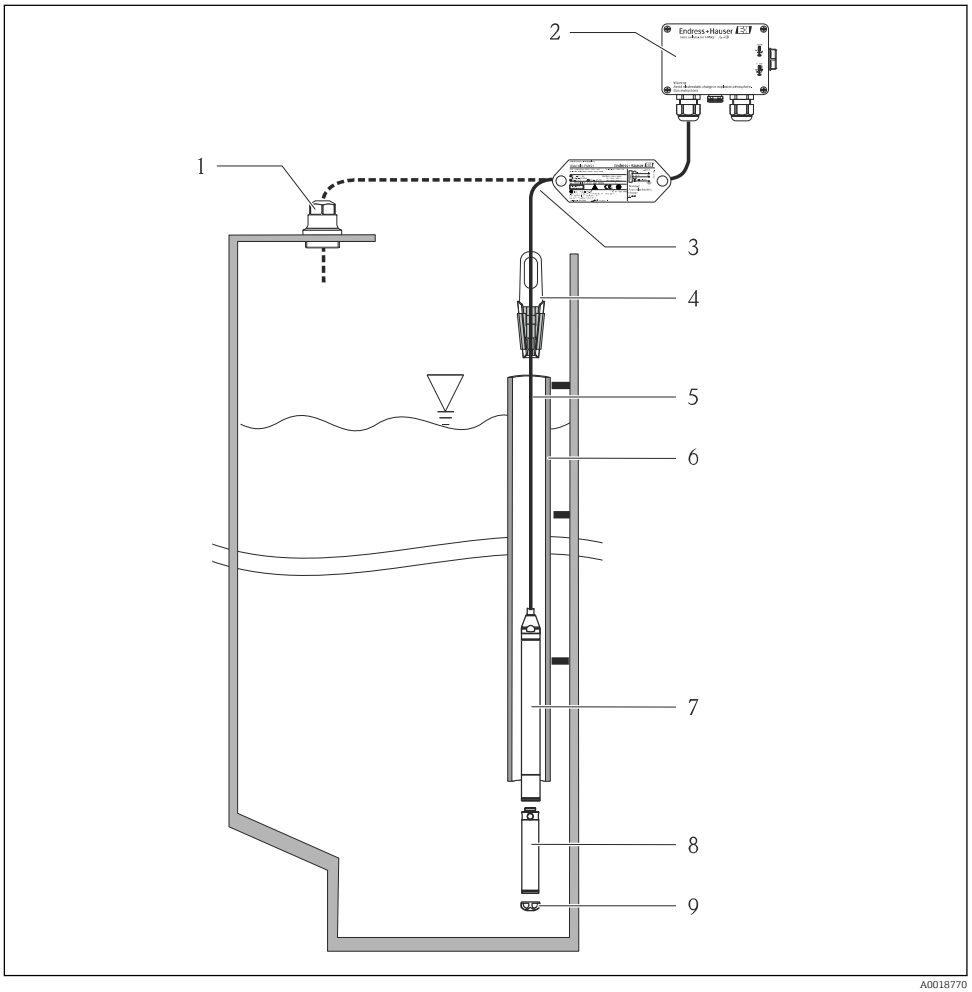
Incorrect transport!

Device or cable may become damaged, and there is a risk of injury!

- ▶ Transport measuring device in the original packaging.
- ▶ Follow the safety instructions and transport conditions for devices weighing more than 18 kg (39.6 lbs).

4.6 Scope of delivery

The scope of delivery comprises:

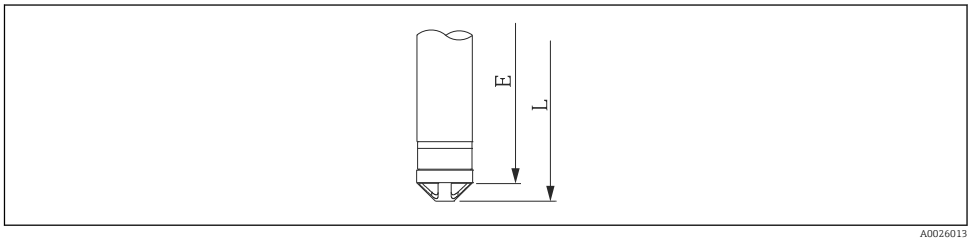


- Waterpilot FMX21, optionally with integrated Pt100 resistance thermometer
- Optional accessories

Documentation supplied:

- The Operating Instructions BA00380P are available on the internet. → see: www.de.endress.com → Downloads.
- Brief Operating Instructions KA01189P
- Final inspection report
- Drinking water approvals (optional): SD00289P, SD00319P, SD00320P
- Devices that are suitable for use in hazardous areas: Additional documentation e.g. Safety instructions (XA, ZD)

5 Installation

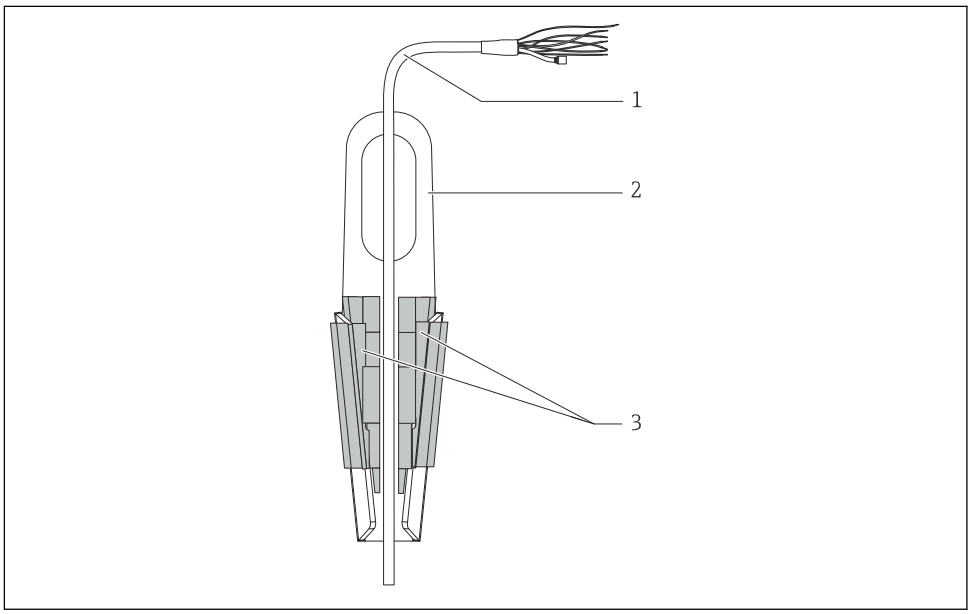


5.1 Installation conditions

1 *Cable mounting screw (can be ordered as an accessory)*
2 *Terminal box (can be ordered as an accessory)*
3 *Bending radius of extension cable > 120 mm (4.72 in)*
4 *Mounting clamp (can be ordered as an accessory)*
5 *Extension cable*
6 *Guide tube*
7 *Waterpilot FMX21*
8 *Additional weight can be ordered as an accessory for the FMX21 with external diameter of 22 mm (0.87 in) and 29 mm (1.14 in)*
9 *Protection cap*

5.2 Additional mounting instructions

- Cable length
  - Customer-specific in meters or feet.
  - Limited cable length when performing installation with freely suspended device with cable mounting screw or mounting clamp, as well as for FM/CSA approval: max. 300 m (984 ft).
- Sideways movement of the level probe can result in measuring errors. For this reason, install the probe at a point free from flow and turbulence, or use a guide tube. The internal diameter of the guide tube should be at least 1 mm (0.04 in) greater than the external diameter of the selected FMX21.
- To avoid mechanical damage to the measuring cell, the device is equipped with a protection cap.
- The cable must end in a dry room or a suitable terminal box. The terminal box from Endress+Hauser provides humidity and climatic protection and is suitable for installation outdoors → 🖹 124.
- Cable length tolerance: < 5 m (16 ft): ±17.5 mm (0.69 in); > 5 m (16 ft): ±0.2 %
- If the cable is shortened, the filter at the pressure compensation tube must be reattached. Endress+Hauser offers a cable shortening kit for this purpose → 🖹 124 (documentation SD00552P/00/A6).
- Endress+Hauser recommends using twisted, shielded cable.
- In shipbuilding applications, measures are required to restrict the spread of fire along cable looms.
- The length of the extension cable depends on the intended level zero point. The height of the protection cap must be taken into consideration when designing the layout of the measuring point. The level zero point (E) corresponds to the position of the process isolating diaphragm. Level zero point = E; tip of probe = L (see the following diagram).

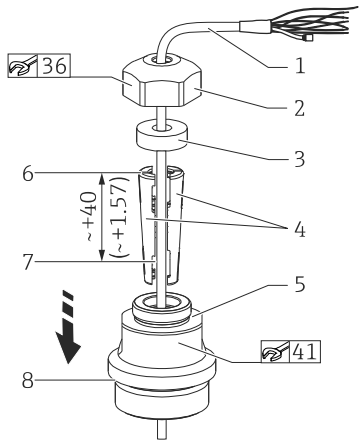


A0026013

5.3 Dimensions

For dimensions, please refer to the Technical Information TI00431P/00/EN, "Mechanical construction" section (see also: www.de.endress.com → Downloads → Media Type: Documentation).

5.4 Mounting the Waterpilot with a mounting clamp



1 Extension cable
2 Suspension clamp
3 Clamping jaws

5.4.1 Mounting the suspension clamp:

1. Mount the suspension clamp (item 2). Take the weight of the extension cable (item 1) and the device into account when selecting the fastening point.
2. Push up the clamping jaws (item 3). Place the extension cable (item 1) between the clamping jaws as shown in the graphic.
3. Hold the extension cable (item 1) in position and push the clamping jaws (item 3) back down. Tap the clamping jaws gently from above to fix them in place.

5.5 Mounting the Waterpilot with a cable mounting screw

1 *Extension cable*
2 *Cover for cable mounting screw*
3 *Sealing ring*
4 *Clamping sleeves*
5 *Adapter for cable mounting screw*
6 *Top edge of clamping sleeve*
7 *Desired length of extension cable and Waterpilot probe prior to assembly*
8 *After assembly, item 7 is located next to the mounting screw with G 1½" thread: height of sealing surface of the adapter or NPT 1½" thread height of thread run-out of adapter*

Engineering unit mm (in). Illustrated with G 1½" thread.

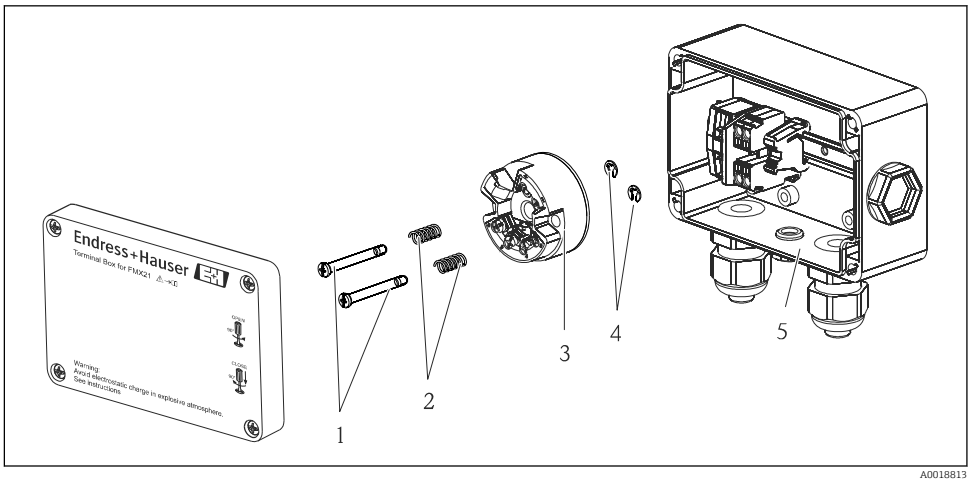
If you want to lower the level probe to a certain depth, position the top edge of the clamping sleeve 40 mm (4.57 in) higher than the required depth. Then push the extension cable and the clamping sleeve into the adapter as described in Step 6 in the following section.

5.5.1 Mounting the cable mounting screw with a G 1½" or NPT 1½" thread:

1. Mark the desired length of extension cable on the extension cable.
2. Insert the probe through the measuring aperture and carefully lower on the extension cable. Fix the extension cable to prevent it from slipping.
3. Slide the adapter (item 5) over the extension cable and screw it tightly into the measuring aperture.
4. Slide the sealing ring (item 3) and cover (item 2) onto the cable from above. Press the sealing ring into the cover.
5. Place the clamping sleeves (item 4) around the extension cable (item 1) at the marked point as illustrated in the graphic.
6. Slide the extension cable with the clamping sleeves (item 4) into the adapter (item 5)
7. Fit the cover (item 2) with the sealing ring (item 3) onto the adapter (item 5) and securely screw together with the adapter.

To remove the cable mounting screw, perform this sequence of steps in reverse.

⚠ CAUTION



Risk of injury!

▶ Use only in unpressurized vessels.

5.6 Mounting the terminal box

The optional terminal box is mounted using four screws (M4). For the dimensions of the terminal box, please see the Technical Information TI00431P/00/ EN, "Mechanical construction" section (see also: www.de.endress.com → Downloads → Media Type: Documentation).

5.7 Mounting the TMT182 temperature head transmitter with terminal box

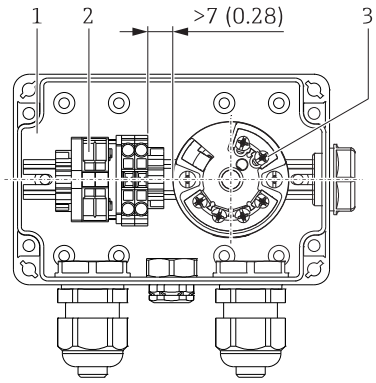
1 *Mounting screws*
2 *Mounting springs*
3 *TMT182 temperature head transmitter*
4 *Circlips*
5 *Terminal box*

Only open the terminal box with a screwdriver.

⚠ WARNING

Risk of explosion!

▶ The TMT182 is not designed for use in hazardous areas.



5.7.1 Mounting the temperature head transmitter:

1. Guide the mounting screws (item 1) with the mounting springs (item 2) through the bore of the temperature head transmitter (item 3)
2. Secure the mounting screws with the circlips (item 4). Circlips, mounting screws and springs are included in the scope of delivery for the temperature head transmitter.
3. Screw the temperature head transmitter into the field housing tightly. (Width of screwdriver blade max. 6 mm (0.24 in))

NOTICE

Avoid damage to the temperature head transmitter.

▶ Do not overtighten the mounting screw.

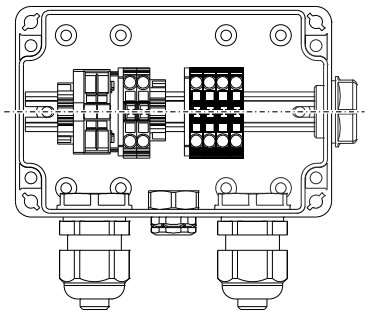
1 Terminal box
2 Terminal strip
3 TMT182 temperature head transmitter

Engineering unit mm (in)

NOTICE

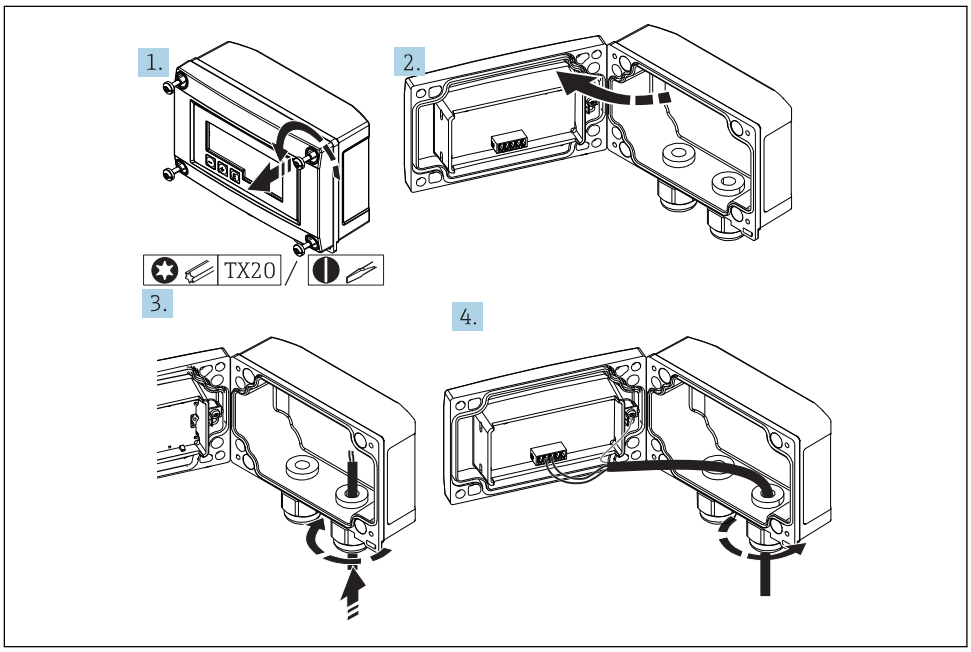
Incorrect connection!

- A distance of >7 mm (> 0.28) must be maintained between the terminal strip and the TMT182 temperature head transmitter.



5.8 Mounting the terminal strip for the Pt100 passive (without TMT182)

If the FMX21 with optional Pt100 is supplied without the optional TMT182 temperature head transmitter, a terminal strip is provided with the terminal box for the purpose of wiring the Pt100.



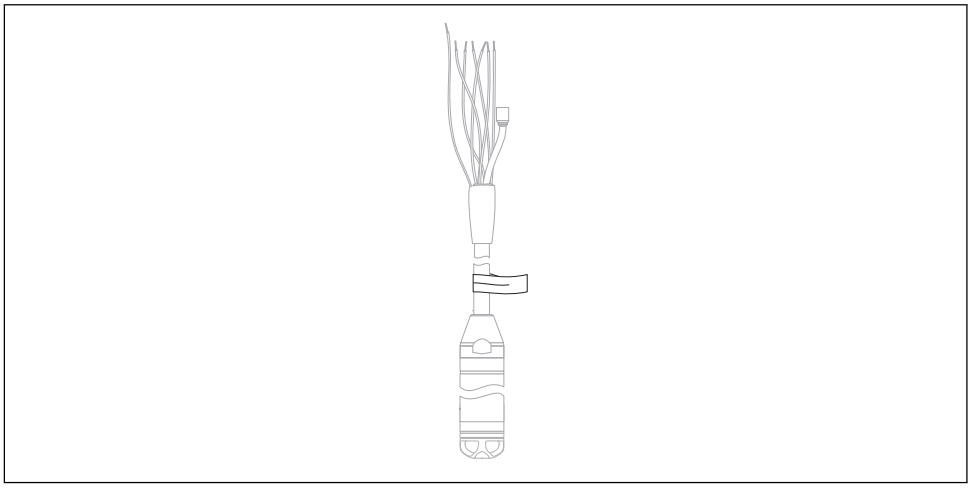
⚠ WARNING

Risk of explosion!

- The Pt100, as well as the terminal strip, are not designed for use in hazardous areas.

5.9 Inserting the cable into the RIA15 field housing

A0017830



Inserting the cable, field housing, connection without transmitter power supply (example)

1. Release the housing screws
2. Open the housing
3. Open the cable gland (M16) and insert the cable
4. Connect the cable including the functional grounding and close the cable gland

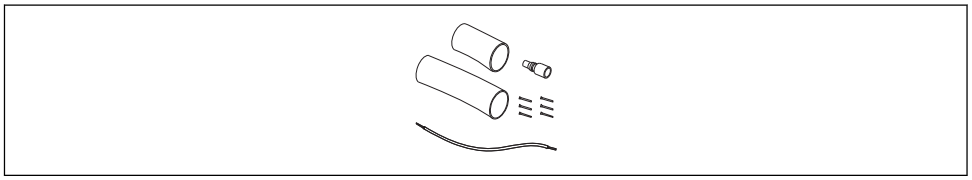
Compensation of the atmospheric pressure must be ensured for the installation. A black, vented cable gland is supplied for this purpose.

If using the communication resistor module in the RIA15, the cable of the FMX21 must be inserted into the right gland when connecting the FMX21 so that the integrated pressure compensation tube is not pinched.

5.10 Cable marking

A0030955

- To make installation easier, Endress+Hauser marks the extension cable if a customer-specific length has been ordered.
  Ordering information: Product Configurator order code for "Service", option "IR" or "IS".
- Cable marking tolerance (distance to lower end of level probe):
  Cable length < 5 m (16 ft): ±17.5 mm (0.69 in)
  Cable length > 5 m (16 ft): ±0.2 %
- Material: PET, stick-on label: acrylic
- Immunity to temperature change: −30 to +100 °C (−22 to +212 °F)



NOTICE

The marking is used exclusively for installation purposes.

▶ The mark must be thoroughly removed without trace in the case of devices with drinking water approval. The extension cable must not be damaged in the process.

Not for use of the FMX21 in hazardous areas.

5.11 Cable shortening kit

A0030948

The cable shortening kit is used to shorten a cable easily and professionally.

The cable shortening kit is not designed for the FMX21 with FM/CSA approval.

- Ordering information: Product Configurator order code for "Accessories enclosed", option "PW"
- Associated documentation SD00552P/00/A6.

5.12 Post-installation check

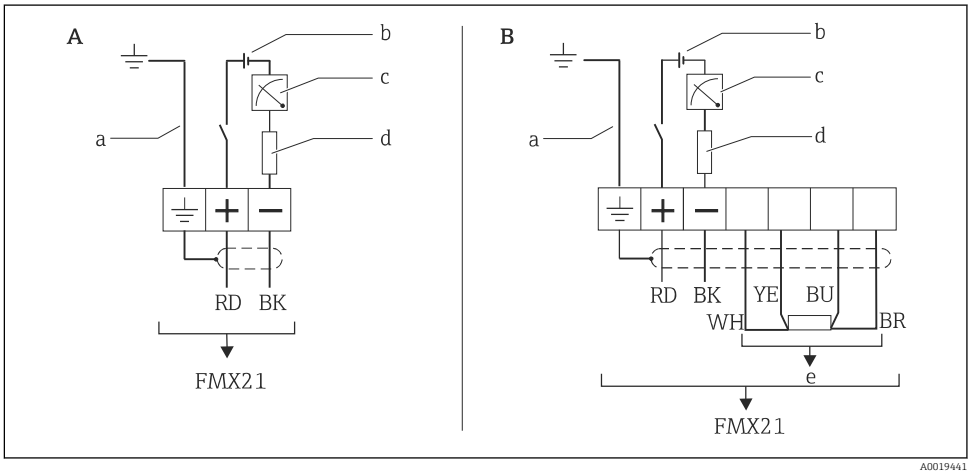
❑	Is the device undamaged (visual inspection)?
❑	Does the device conform to the measuring point specifications? For example: ▪ Process temperature ▪ Process pressure ▪ Ambient temperature ▪ Measuring range
❑	Are the measuring point identification and labeling correct (visual inspection)?
❑	Check that all screws are firmly seated.

6 Electrical connection

WARNING

Electrical safety is compromised by an incorrect connection!

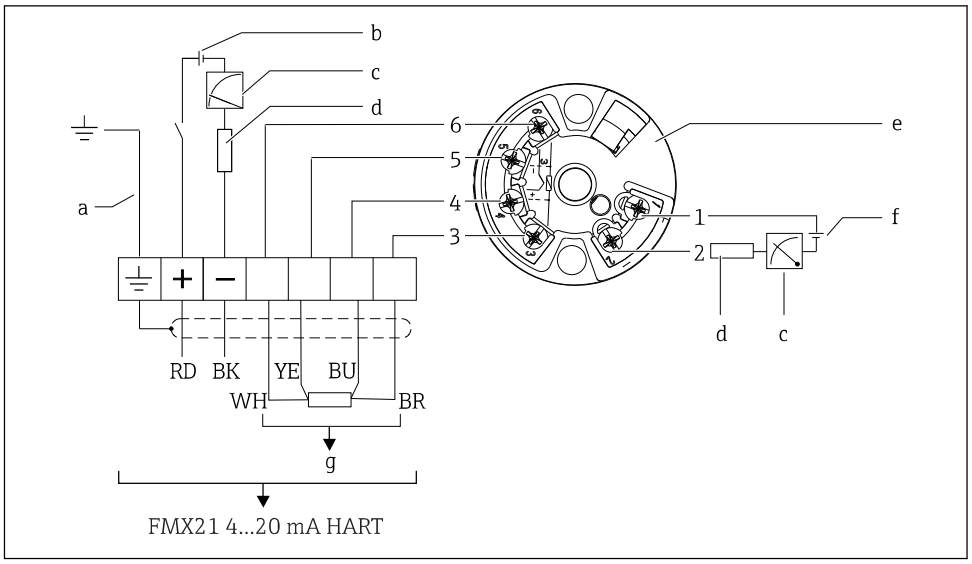
- When using the measuring device in a hazardous area, the relevant national standards and guidelines as well as the Safety Instructions (XAs) or installation or control drawings (ZDs) must be adhered to. All data relating to explosion protection can be found in separate documentation which is available on request. This documentation is supplied with the devices as standard → 7



6.1 Connecting the device

WARNING

Electrical safety is compromised by an incorrect connection!



- The supply voltage must match the supply voltage specified on the nameplate → 15
- Switch off the supply voltage before connecting the device.
- The cable must end in a dry room or a suitable terminal box. The IP66/IP67 terminal box with GORE-TEX® filter from Endress+Hauser is suitable for outdoor installation.→ 22
- Connect the device in accordance with the following diagrams. Reverse polarity protection is integrated in the Waterpilot FMX21 and the temperature head transmitter. Changing the polarities will not result in the destruction of the devices.
- A suitable circuit breaker should be provided for the device in accordance with IEC/EN 61010.

6.1.1 Waterpilot with Pt100

A Waterpilot FMX21
B Waterpilot FMX21 with Pt100 (not for use in hazardous areas); option "NB", Product Configurator order code for "Accessories"
a Not for the FMX21 with external diameter of 29 mm (1.14 in)
b 10.5 to 30 V DC (hazardous area), 10.5 to 35 V DC
c 4...20 mA
d Resistance (R_L)
e Pt100

6.1.2 Waterpilot with Pt100 and TMT182 temperature head transmitter for FMX21 4 to 20 mA HART

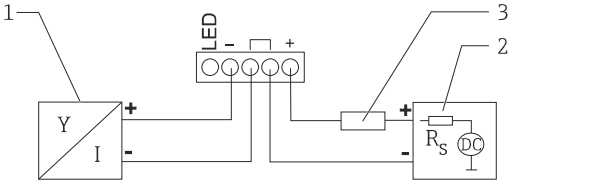
a Not for the FMX21 with external diameter of 29 mm (1.14 in)
b 10.5 to 35 V DC
c 4...20 mA
d Resistance (R_L)
e TMT182 temperature head transmitter (4 to 20 mA) (not for use in hazardous areas)
f 11.5 to 35 V DC
g Pt100
1...6 Pin assignment

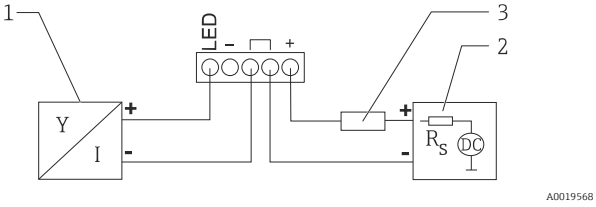
Ordering information:

Pt100: Product Configurator order code for "Accessories mounted", option "NB"

TMT182: Product Configurator order code for "Accessories enclosed", option "PT"

6.1.3 Waterpilot FMX21 with RIA15





The RIA15 remote display can be ordered together with the device.

Product structure, feature 620 "Accessory enclosed":
- Option R4 "Remote display RIA15 non-hazardous area, field housing"
- Option R5 "Remote display RIA15 Ex= explosion protection approval, field housing"

Compensation of the atmospheric pressure must be ensured for the installation. A black, vented cable gland is supplied for this purpose.

The RIA15 process display unit is loop-powered and does not require any external power supply.

The voltage drop to be taken into account is:
- ≤1 V in the standard version with 4 to 20 mA communication
- ≤1.9 V with HART communication
- and an additional 2.9 V if display light is used

	Circuit diagram / Description
Waterpilot FMX21 connection, HART communication and RIA15 **without** backlight	 *1 Waterpilot FMX21 block diagram, HART with RIA15 process display unit without light* *1 Waterpilot FMX21* *2 Power supply* *3 HART resistance*
Waterpilot FMX21 connection, HART communication and RIA15 **with** backlight	 *2 Waterpilot FMX21 block diagram, HART with RIA15 process display unit with light* *1 Waterpilot FMX21* *2 Power supply* *3 HART resistance*

6.1.4 Waterpilot FMX21, RIA15 with installed HART communication resistor module

The HART communication module for installation in the RIA15 can be ordered together with the device.

Product structure, feature 620 "Accessory enclosed":
- Option R6 "HART communication resistor hazardous / non-hazardous area"
- The **voltage drop** to be taken into account is max. **7 V**

Compensation of the atmospheric pressure must be ensured for the installation. A black, vented cable gland is supplied for this purpose.

	Circuit diagram / Description
Waterpilot FMX21 connection and RIA15 **without** backlight	 3 *Waterpilot FMX21 block diagram, RIA15 without light, HART communication resistor module* *1 HART communication resistor module* *2 Waterpilot FMX21* *3 Power supply*
Waterpilot FMX21 connection and RIA15 **with** backlight	 4 *Waterpilot FMX21 block diagram, RIA15 with light, HART communication resistor module* *1 HART communication resistor module* *2 Waterpilot FMX21* *3 Power supply*

6.1.5 Wire colors

RD = red, BK = black, WH = white, YE = yellow, BU = blue, BR = brown

6.1.6 Connection data

Connection classification as per IEC 61010-1:
- Overvoltage category 1
- Pollution level 1

Connection data in the hazardous area

See relevant XA.

6.2 Supply voltage

WARNING

Supply voltage might be connected!
Risk of electric shock and/or explosion!

- When using the measuring device in hazardous areas, installation must comply with the corresponding national standards and regulations as well as the Safety Instructions.
- All explosion protection data are given in separate documentation which is available upon request. The Ex documentation is supplied as standard with all devices approved for use in explosion hazardous areas.

6.2.1 FMX21 + Pt100 (optional)

- 10.5 to 35 V (not hazardous areas)
- 10.5 to 30 V (hazardous areas)

6.2.2 TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

11.5 to 35 V DC

6.3 Cable specifications

Endress+Hauser recommends using shielded, twisted-pair two-wire cables.

The probe cables are shielded for device versions with outer diameters of 22 mm (0.87 in) and 42 mm (1.65 in).

6.3.1 FMX21 + Pt100 (optional)

- Commercially available instrument cable
- Terminals, terminal box: 0.08 to 2.5 mm^2 (28 to 14 AWG)

6.3.2 TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

- Commercially available instrument cable
- Terminals, terminal box: 0.08 to 2.5 mm^2 (28 to 14 AWG)
- Transmitter connection: max. 1.75 mm^2 (15 AWG)

6.4 Power consumption

6.4.1 FMX21 + Pt100 (optional)

- ≤ 0.805 W at 35 V DC (non-hazardous area)
- ≤ 0.690 W at 30 V DC (hazardous area)

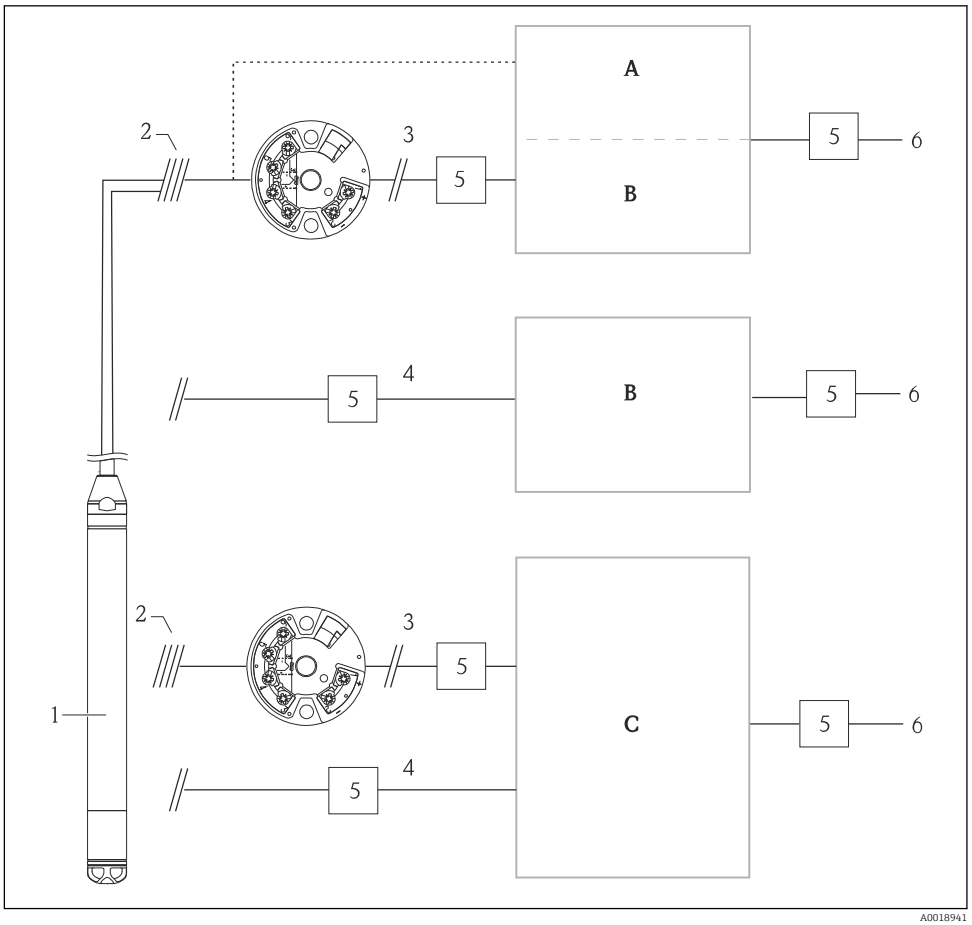
6.4.2 TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

≤ 0.805 W at 35 V DC

6.5 Current consumption

6.5.1 FMX21 + Pt100 (optional)

Max. current consumption: ≤ 23 mA
Min. current consumption: ≥ 3.6 mA



6.5.2 TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

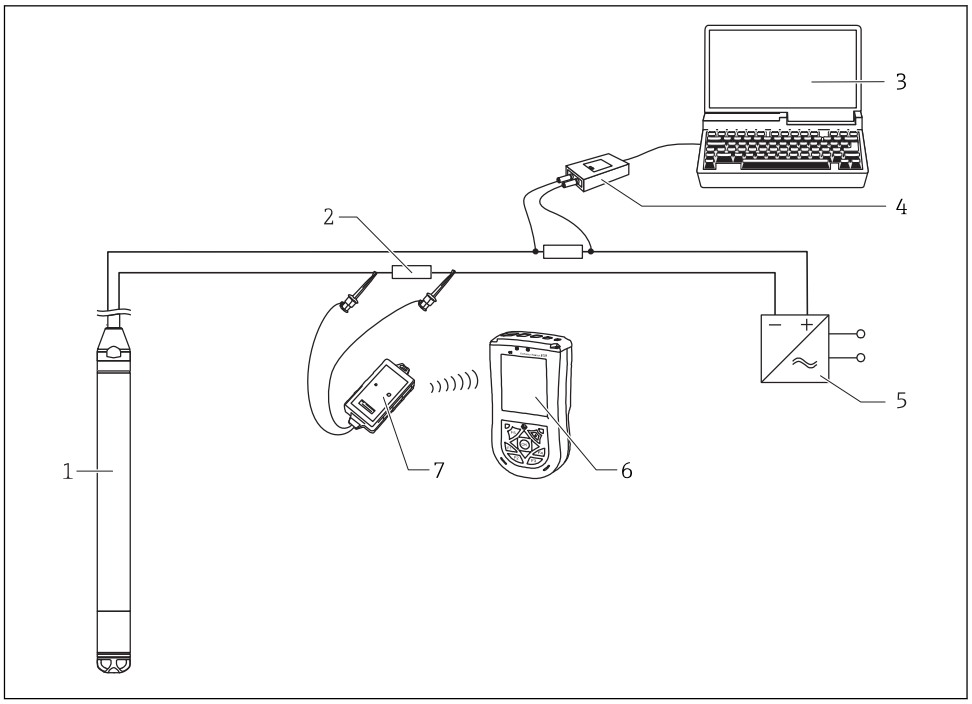
- Max. current consumption: ≤ 23 mA
- Min. current consumption: ≥ 3.5 mA

6.6 Connecting the measuring unit

6.6.1 Overvoltage protection

To protect the Waterpilot and the TMT182 temperature head transmitter from large interference voltage peaks, Endress+Hauser recommends installing overvoltage protection upstream and downstream of the display and/or evaluation unit as shown in the graphic.

A Power supply, display and evaluation unit with one input for Pt100
B Power supply, display and evaluation unit with one input for 4 to 20 mA
C Power supply, display and evaluation unit with two inputs for 4 to 20 mA
1 Waterpilot FMX21 HART
2 Connection for integrated Pt100 in the FMX21
3 4 to 20 mA HART (temperature)
4 4 to 20 mA HART (level)
5 Overvoltage protection, e.g. HAW from Endress+Hauser (not for use in hazardous areas.)
6 Power supply



Further information on the TMT182 temperature head transmitter for HART applications from Endress+Hauser can be found in the Technical Information TI00078R/09/EN.

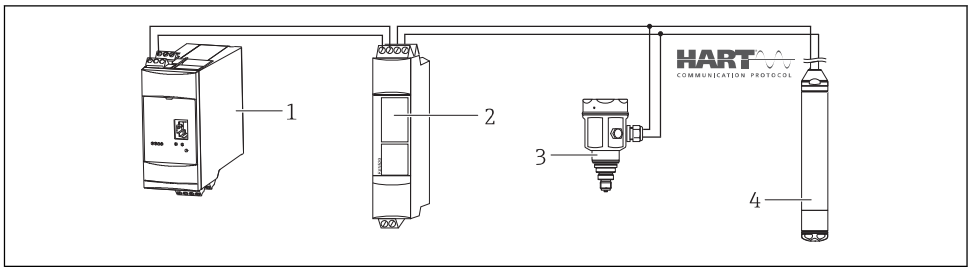
6.6.2 Connecting the Commubox FXA195

The Commubox FXA195 connects transmitters with the HART protocol to the USB interface of a computer. This enables remote operation of the transmitter using the Endress+Hauser operating program FieldCare/DeviceCare. Power is supplied to the Commubox via the USB port. The Commubox is also suitable for connecting to intrinsically safe circuits. For further information, see the Technical Information TI00404F/00/EN.

6.6.3 Connecting the Field Xpert SFX

Compact, flexible and robust industrial handheld terminal for remote configuration and for obtaining measured values via the HART current output (4 to 20 mA). For details, see Operating Instructions BA00060S/04/EN.

1 *Waterpilot FMX21*
2 *Required communication resistor ≥ 250 Ω*
3 *Computer with operating tool (e.g. FieldCare)*
4 *Commubox FXA195 (USB)*
5 *Transmitter power supply unit, e.g. RN221N (with communication resistor)*
6 *Field Xpert SFX*
7 *VIATOR Bluetooth modem with connecting cable*



Only use certified operating devices in hazardous area!

WARNING

Risk of explosion!

- Do not change the battery of the handheld terminal in the hazardous area.
- When using the measuring device in hazardous areas, installation must comply with the corresponding national standards and regulations and the Safety Instructions (XAs) or the Installation or Control Drawings (ZDs).

6.6.4 Connecting for air pressure compensation with external measured value

1 *Fieldgate FXA520*
2 *Multidrop Connector FXN520*
3 *Cerabar*
4 *Waterpilot FMX21*

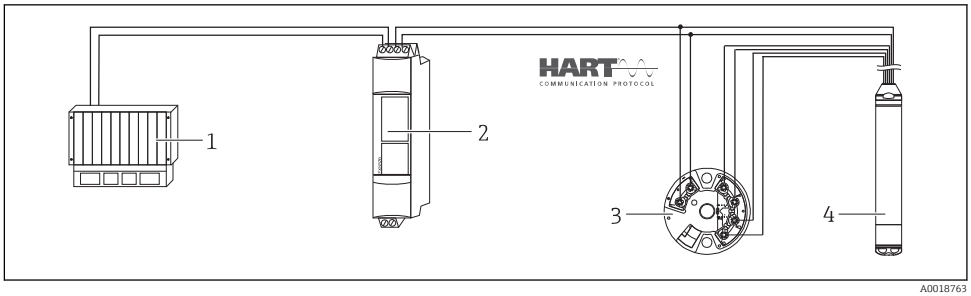
For applications in which condensation may occur, the use of an absolute pressure probe is recommended. For level measurement using an absolute pressure probe, the measured value is affected by fluctuations in the ambient air pressure. To correct the resulting measured error, you can connect an external absolute pressure sensor (e.g. Cerabar) to the HART signal line, switch the Waterpilot to burst mode and operate the Cerabar in the "Electr. Delta P" mode.

When you switch on the "Electr. Delta P" application, the external absolute pressure sensor calculates the difference between the two pressure signals and can thus determine the level precisely. Only one level measured value can be corrected in this way.

For additional information, see → 57.

If using intrinsically safe devices, the regulations which apply to interconnecting intrinsically safe circuits as outlined in IEC 60079-14 (proof of intrinsic safety) must be observed.

6.6.5 Connecting an external temperature sensor/temperature head transmitter for density compensation



The Waterpilot FMX21 can correct measured errors that result from fluctuations in the density of the water caused by temperature. Users can choose from the following options:

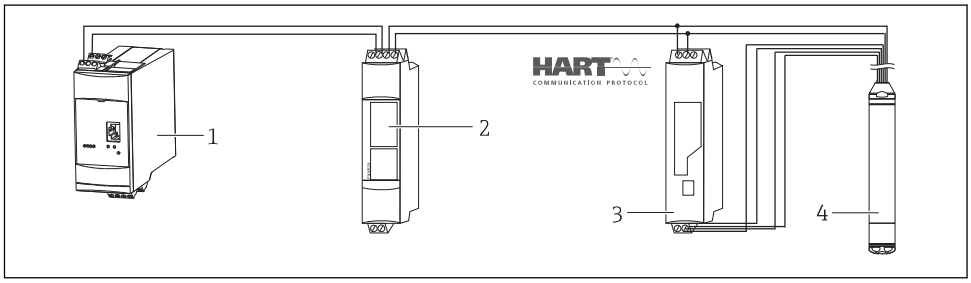
Use the internally measured sensor temperature of the FMX21

The internally measured sensor temperature is calculated in the Waterpilot FMX21 for density compensation. The level signal is thus corrected according to the density characteristic line of water.

Use the optional internal Pt100 temperature sensor for density compensation in a suitable HART master (e.g. PLC)

The Waterpilot FMX21 is available with an optional Pt100 temperature sensor. Endress +Hauser additionally offers the TMT182 temperature head transmitter to convert the Pt100 signal to a 4 to 20 mA HART signal. The temperature and pressure signal is queried by a HART master (e.g. PLC), where a corrected level value can be generated using a stored linearization table or density function (of a chosen medium).

A0018763



1 *HART master, e.g. PLC (programmable logic controller)*
2 *Multidrop Connector FXN520*
3 *TMT182 temperature head transmitter*
4 *Waterpilot FMX21*

Use an external temperature signal which is transmitted to the FMX21 via HART burst mode

The Waterpilot FMX21 is available with an optional Pt100 temperature sensor. With this option, the signal of the Pt100 is evaluated with a HART-compliant temperature head transmitter (min. HART 5.0) that supports the burst mode. The temperature signal can

thus be transmitted to the FMX21. The FMX21 uses this signal for density correction of the level signal.

The TMT182 temperature head transmitter is not suitable for this configuration.

1 Fieldgate FXA520
2 Multidrop Connector FXN520
3 HART-compatible temperature transmitter (e.g. TMT82)
4 Waterpilot FMX21

Without additional compensation due to the anomaly of water, errors of up to 4% may occur at a temperature of +70 °C (+158 °F), for example. With density compensation, this error can be decreased to 0.5 % in the entire temperature range from 0 to +70 °C (+32 to +158 °F).

For additional information, see → 59.

For further information on the devices, please refer to the relevant Technical Information:
- TI01010T: TMT82 temperature transmitter (4 to 20 mA HART)
- TI00369F: Fieldgate FXA520
- TI00400F: Multidrop Connector FXN520

6.7 Post-connection check

❑	Is the device or cable undamaged (visual check)?
❑	Do the cables comply with the requirements ?
❑	Do the cables have adequate strain relief?
❑	Are all cable glands installed, securely tightened and leak-tight?
❑	Does the supply voltage match the specifications on the nameplate?
❑	Is the terminal assignment correct ?

7 Operation options

Endress+Hauser offers comprehensive measuring point solutions with display and/or evaluation units for the Waterpilot FMX21 HART and TMT182 temperature head transmitter.

Your Endress+Hauser service organization would be glad to be of service if you have any other questions. Contact addresses can be found on the website at www.endress.com/worldwide

7.1 Overview of operating options

7.1.1 Operation using Endress+Hauser operating program

FieldCare

The FieldCare operating program is an Endress+Hauser asset management tool based on FDT technology. With FieldCare, you can configure all Endress+Hauser devices as well as devices from other manufacturers that support the FDT standard.

Hardware and software requirements can be found on the Internet:

www.de.endress.com → Search: FieldCare → FieldCare → Technical data.

FieldCare supports the following functions:
- Configuration of transmitters in online/offline mode
- Loading and saving device data (upload/download)
- Documentation of the measuring point

Connection options:
- HART via Commubox FXA195 and USB interface of a computer
- HART via Fieldgate FXA520

- Further information on FieldCare and software download can be found on the internet (www.de.endress.com ® Downloads ® Text Search: FieldCare).
- Connecting the Commubox FXA195
- As not all internal device dependencies can be mapped in offline operation, the consistency of the parameters must be checked once again before they are transmitted to the device.

DeviceCare

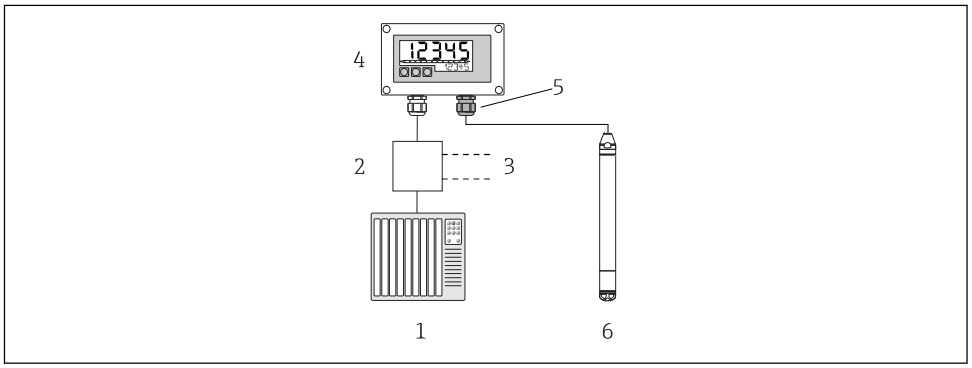
Function scope

Tool for connecting and configuring Endress+Hauser field devices.

The fastest way to configure Endress+Hauser field devices is with the dedicated "DeviceCare" tool. Together with the device type managers (DTMs) it presents a convenient, comprehensive solution.

For details, see Innovation brochure IN01047S

7.1.2 Operation via Field Xpert SFX



Compact, flexible and robust industrial handheld terminal for remote configuration and for obtaining measured values via the HART current output or FOUNDATION Fieldbus. For details, see the Operating Instructions BA00060S/04.

7.1.3 Operation via RIA15

The RIA15 can be used as a local display unit and for the basic configuration of the Waterpilot FMX21 hydrostatic level sensor via HART.

The following parameters can be configured on the FMX21 using the 3 operating keys on the front of the RIA15:
- Pressure engineering unit, level, temperature
- Zero adjustment (only for gauge pressure sensors)
- Empty and full pressure adjustment
- Empty and full level adjustment
- Reset to factory defaults

Further information on the operating parameters → 67

5 Remote operation of the Waterpilot FMX21 via the RIA15

1 PLC
2 Transmitter power supply, e.g. RN221N (with communication resistor)
3 Connection for Commubox FXA195 and Field Communicator 375, 475
4 RIA15 loop-powered process display unit
5 Cable gland M16 with pressure compensation membrane
6 Waterpilot FMX21

7.2 Operating concept

Operation with an operating menu is based on an operation concept with "user roles" .

User role	Meaning
Operator	Operators are responsible for the devices during normal "operation". This is usually limited to the reading of process values. If the work with the devices goes beyond reading, it concerns simple, application-specific functions that are used in operation. Should an error occur, these users simple forward the information on the errors but do not intervene themselves.
Maintenance	Service engineers usually work with the devices in the phases following device commissioning. They are primarily involved in maintenance and troubleshooting activities for which simple settings have to be made at the device. Technicians work with the devices over the entire life cycle of the product. Thus, commissioning and advanced settings and configurations are some of the tasks they have to carry out.
Expert	Experts work with the devices over the entire life cycle of the device, but, in part, have high requirements on the devices. Individual parameters/functions from the overall functionality of the devices are required for this purpose time and again. In addition to technical, process-oriented tasks, experts can also perform administrative tasks (e.g. user administration). "Experts" can avail of the entire parameter set.

7.3 Structure of the operating menu

User role	Submenu	Meaning/use
Operator	Display/ operat.	Contains parameters that are needed to configure the measured value display (selecting the values displayed, display format, etc.). With this submenu, users can change the measured value display without affecting the actual measurement.
Maintenance	setup	Contains all the parameters that are needed to commission measuring operations. This submenu has the following structure: ▪ **Standard setup parameters** A wide range of parameters, which can be used to configure a typical application, is available at the start. The measuring mode selected determines which parameters are available. After making settings for all these parameters, the measuring operation should be completely configured in the majority of cases. ▪ **"Extended setup" submenu** The "Extended setup" submenu contains additional parameters for more in-depth configuration of the measurement operation, for conversion of the measured value and for scaling the output signal. This menu is split into additional submenus depending on the measuring mode selected.
Maintenance	Diagnosis	Contains all the parameters that are needed to detect and analyze operating errors. This submenu has the following structure: ▪ **Diagnostic list** contains up to 10 currently pending error messages. ▪ **Event logbook** contains the last 10 error messages (no longer pending). ▪ **Instrument info** contains information for identifying the device. ▪ **Measured values** contains all current measured values. ▪ **Simulation** Is used to simulate pressure, level, current and alarm/warning. ▪ **Enter reset code**
Expert	Expert	Contains all the parameters of the device (including those already in one of the submenus). The "Expert" submenu is structured by the function blocks of the device. It thus contains the following submenus: ▪ **System** contains all device parameters that do not affect either measurement or integration into a distributed control system. ▪ **Measurement** contains all parameters for configuring the measurement. ▪ **Output** contains all parameters for configuring the current output. ▪ **Communication** contains all parameters for configuring the HART interface. ▪ **Diagnosis** contains all parameters required to detect and analyze operating errors.

7.4 Locking/unlocking operation

Once you have entered all the parameters, you can lock your entries against unauthorized and undesired access.

The "Operator code" parameter is used to lock/unlock the device.

Operator code

Navigation Setup → Extended setup → Operator code

Read permission Operator/Service engineers/Expert

Write permission Operator/Service engineers/Expert

Description Use this function to enter a code to lock or unlock operation.

User entry
- To lock: Enter a number ≠ the release code (value range: 1 to 65535).
- To unlock: Enter the release code.

Factory setting 0

Note The release code is "0" in the order configuration. Another release code can be defined in the "Code definition" parameter. If the user has forgotten the release code, the release code can be visible by entering the number "5864".

The release code is defined in the "Code definition" parameter.

Code definition

Navigation Setup → Extended setup → Code definition

Read permission Operator/Service engineers/Expert

Write permission Operator/Service engineers/Expert

Description Use this function to enter a release code with which the device can be unlocked.

User entry A number from 0 to 9999

Factory setting 0

Note The device setup can also be disabled on the RIA15 via a 4-digit user code.
Additional information is available in the RIA15 Operating Instructions BA01170K.

7.5 Resetting to factory settings (reset)

By entering a certain code, you can completely or partially reset the entries for the parameters to the factory settings [1]. Enter the code via the "Enter reset code" parameter (menu path: "Diagnosis" → "Enter reset code").

There are various reset codes for the device. The following table illustrates which parameters are reset by the particular reset codes. To perform a reset, operation must be unlocked (see the "Locking/unlocking operation" section).→ 38

Any customer-specific configuration carried out at the factory is not affected by a reset (customer-specific configuration remains). If you want to change the customer-specific configuration carried out at the factory, please contact Endress+Hauser Service. As there is no separate service level, the order code and serial number can be changed without a specific release code.

1) . The factory setting for the individual parameters is specified in the parameter description

Reset code [1]	Description and effect
62	**PowerUp reset (warm start)** ▪ The device is restarted. ▪ Data is read back anew from the EEPROM (process is reinitialized). ▪ Any simulation which may be running is ended.
333	**User reset** ▪ This code resets all the parameters apart from: - Device tag - Linearization table - Operating hours - Event logbook - Curr. trim 4 mA - Curr. trim 20 mA ▪ Any simulation which may be running is ended. ▪ The device is restarted.
7864	**Total reset** ▪ This code resets all the parameters apart from: - Operating hours - Event logbook ▪ Any simulation which may be running is ended. ▪ The device is restarted.

1) To be entered in "System" → "Management" → "Enter reset code"

After a "Total reset" in FieldCare you have to press the "refresh" button in order to ensure that the measuring units are also reset.

8 Integrating device via HART® protocol

Version data for the device

Firmware version	01.00.zz	▪ On the title page of the Operating instructions ▪ On nameplate → 🖹 15 ▪ **Firmware Version** parameter Diagnosis→ Instrument info → Firmware version
Manufacturer ID	17 (0x11)	**Manufacturer ID.** parameter Diagnosis → Instrument info→ Manufacturer ID
Device type code	36 (0x24)	**Device type code** parameter Diagnosis → Instrument info → Device type code
HART protocol revision	6.0	---
Device revision	1	▪ On nameplate → 🖹 15 ▪ **Device revision** parameter Diagnosis→ Instrument info → Device revision

The suitable device description file (DD) for the individual operating tools is listed in the table below, along with information on where the file can be acquired.

Operating tools

Operating tool	Reference sources for device descriptions (DD and DTM)
FieldCare	▪ www.endress.com → Downloads area ▪ CD–ROM (contact Endress+Hauser) ▪ DVD (contact Endress+Hauser)
AMS Device Manager (Emerson Process Management)	www.endress.com → Downloads area
SIMATIC PDM (Siemens)	www.endress.com → Downloads area
Field Communicator 375, 475 (Emerson Process Management)	Use update function of handheld terminal

8.1 HART process variables and measured values

The following numbers are assigned to the process variables in the factory:

Process variable	Pressure	Level	
		Linear	Table active
First process variable (Primary variable)	0 (Pressure measured)	8 (Level before linearization)	9 (Tank content)
Second process variable (Secondary variable)	2 (Corrected press.)	0 (Pressure measured)	8 (Level before linearization)

Process variable	Pressure	Level	
		Linear	Table active
Third process variable (Tertiary variable)	3 (Sensor pressure)	2 (Corrected press.)	0 (Pressure measured)
Fourth process variable (Quaternary variable)	4 (Sensor temp.)		

The assignment of the device variables to the process variable is displayed in the **Expert → Communication → HART output** menu.

The assignment of the device variables to the process variable (SV, TV, QV) can be changed using HART command 51.

An overview of the possible device variables can be found in the following section.

8.2 Device variables and measured values

The following measured values are assigned to the individual device variables:

Device variable code	Device variable	Measured value	Operating mode
0	PRESSURE_1_FINAL_VALUE	Pressure measured	All
1	PRESSURE_1_AFTER_DAMPING	Pressure af.damp	All
2	PRESSURE_1_AFTER_CALIBRATION	Corrected press.	All
3	PRESSURE_1_AFTER_SENSOR	Corrected press.	All
4	MEASURED_TEMPERATURE_1	Sensor temp.	All
8	MEASURED_LEVEL_AFTER_ SIMULATION	Level before lin.	Only level
9	MEASURED_TANK_CONTENT_AFTER_ SIMULATION	Tank content	Only level
10	CORRECTED_MEASUREMENT_ DENSITY	Process density	Only level
12	HART_INPUT_VALUE [1)]	HART input val.	-
251	None (no device variable is mapped)	-	All (but only for quaternary variable)

1) Cannot be selected as an output

The device variables can be queried from a HART® master using HART® command 9 or 33.

9 Commissioning

NOTICE

If a pressure smaller than the minimum permitted pressure or greater than the maximum permitted pressure is present at the device, the following messages are output in succession:

- "S140 Working range P" or "F140 Working range P" (depending on the setting in the "Alarm behav. P" parameter)
- "S841 Sensor range" or "F841 Sensor range" (depending on the setting in the "Alarm behav. P" parameter)
- "S971 Adjustment" (depending on setting in "Alarm behav. P" parameter

9.1 Post-installation check and function check

Before commissioning your measuring point, ensure that the post-installation and post-connection check have been performed.

- "Post-installation check" checklist→ 25
- "Post-connection check" checklist→ 35

9.2 Unlocking/locking configuration

If the device is locked to prevent configuration, it must first be unlocked.

9.2.1 Locking/unlocking software

If the device is locked via the software (device access code), the key symbol appears in the measured value display. If an attempt is made to write to a parameter, a prompt for the device access code appears. To unlock, enter the user-defined device access code.

9.3 Commissioning

Commissioning comprises the following steps:

- Function check→ 43
- Selection of the measuring mode and pressure unit → 43
- Position adjustment → 44
- Configuring measurement:
  - Pressure measurement→ 46
  - Level measurement → 48

9.4 Measuring mode selection

The device is configured for the "Pressure" measuring mode as standard. The measuring range and the unit in which the measured value is transmitted correspond to the data on the nameplate.

WARNING

Changing the measuring mode affects the span (URV)

This situation can result in product overflow.

- If the measuring mode is changed, the setting for the span (URV) must be checked in the "Setup" operating menu and readjusted if necessary.

Measuring mode

Navigation Setup → Measuring mode

Write permission Operator/Service engineers/Expert

Description Select the measuring mode.
The operating menu is structured differently depending on the measuring mode selected.

Options
- Pressure
- Level

Factory setting Level

9.5 For selecting the pressure engineering unit

Press. eng. unit

Navigation Setup → Press. eng. unit

Write permission Operator/Service engineers/Expert

Description Select the pressure engineering unit. If a new pressure engineering unit is selected, all pressure-specific parameters are converted and displayed with the new unit.

Options
- mbar, bar
- mmH2O, mH2O, inH2O
- ftH2O
- Pa, kPa, MPa
- psi
- mmHg, inHg
- kgf/cm^2

Factory setting mbar or bar depending on the nominal measuring range of the sensor module, or as per order specifications.

9.6 Position adjustment

The pressure resulting from the orientation of the device can be corrected here.

Pos. zero adjust (gauge pressure sensor)

Navigation Setup → Pos. zero adjust

Write permission Operator/Service engineers/Expert

Description Position adjustment – the pressure difference between zero (set point) and the measured pressure need not be known.

Options
- Confirm
- Cancel

Example
- Measured value = 2.2 mbar (0.033 psi)
- You correct the measured value via the "Pos. zero adjust" parameter with the "Confirm" option. This means that you are assigning the value 0.0 to the pressure present.
- Measured value (after pos. zero adjust) = 0.0 mbar
- The current value is also corrected.

Factory setting Cancel

Calib. offset

Write permission Service engineers/Expert

Description Position adjustment – the pressure difference between the set point and the measured pressure must be known.

Example
- Measured value = 982.2 mbar (14.73 psi)
- You correct the measured value with the value entered (e.g. 2.2 mbar (0.033 psi)) via the "Calib. Offset" parameter. This means that you are assigning the value 980.0 (14.7 psi) to the pressure present.
- Measured value (after pos. zero adjust) = 980.0 mbar (14.7 psi)
- The current value is also corrected.

Factory setting 0.0

9.7 Configuring the damping

The output signal follows measured value changes with the delay time. This can be configured via the operating menu.

Damping

Navigation Setup → Damping

Write permission Operator/Service engineers/Expert
(if the "Damping" DIP switch is set to "on")

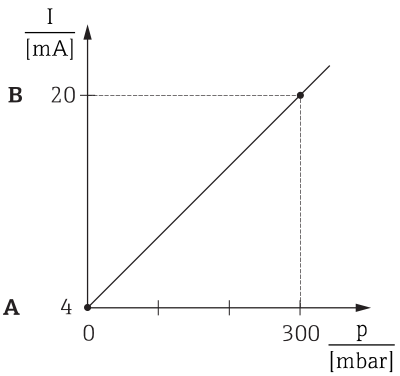
Description Enter damping time (time constant τ) ("Damping" DIP switch set to "on")
Display damping time (time constant τ) ("Damping" DIP switch set to "off").
The damping affects the speed at which the measured value reacts to changes in pressure.

Input range 0.0 to 999.0 s

Factory setting 2.0 sec. or according to order specifications

9.8 Configuring pressure measurement

9.8.1 Calibration with reference pressure (wet calibration)



Example:

In this example, a device with a 400 mbar (6 psi) sensor module is configured for the 0 to +300 mbar (0 to 4.5 psi) measuring range, i.e. 0 mbar and 300 mbar (4.5 psi) are assigned, respectively, to the 4 mA value and the 20 mA value.

Prerequisite:

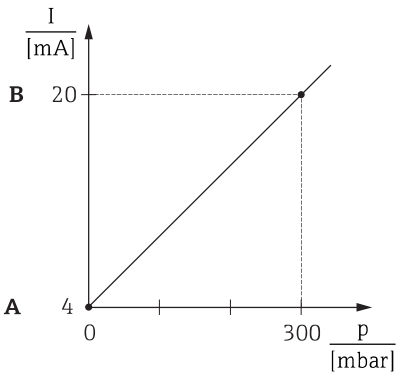
The pressure values 0 mbar and 300 mbar (4.5 psi) can be specified. For example, the device is already installed.

Due to the orientation of the device, there may be pressure shifts in the measured value, i.e. the measured value is not zero in a pressureless condition. For information on how to perform position adjustment, see → 44.

	Description	
1	Select the "Pressure" measuring mode via the "Measuring Mode" parameter. Menu path: Setup → Measuring mode **WARNING** **Changing the measuring mode affects the span (URV)** This situation can result in product overflow. ▶ If the measuring mode is changed, the setting for the span (URV) must be checked in the "Setup" operating menu and readjusted if necessary.	 A0031032 *A* *See table, step 3.* *B* *See table, step 4.*
2	Select a pressure unit via the "Press eng. unit" parameter, here "mbar" for example. Menu path: Setup → Press. eng. unit	
3	The pressure for the LRV (4 mA value) is present at the device, here 0 mbar for example	
	Select the "Get LRV" parameter. Menu path: Setup → Extended setup → Current output → Get LRV	
	Confirm the present value by selecting "Apply". The present pressure value is assigned to the lower current value (4 mA).	
4	The pressure for the URV (20 mA value) is present at the device, here 300 mbar (4.5 psi) for example.	
	Select the "Get URV" parameter. Menu path: Setup → Extended setup → Current output → Get URV	
	Confirm the present value by selecting "Apply". The present pressure value is assigned to the upper current value (20 mA).	
5	Result: The measuring range is configured for 0 to +300 mbar (0 to 4.5 psi).	

9.8.2 Calibration without reference pressure (dry calibration)

Example:



In this example, a device with a 400 mbar (6 psi) sensor module is configured for the 0 to +300 mbar (0 to 4.5 psi) measuring range, i.e. 0 mbar and 300 mbar (4.5 psi) are assigned, respectively, to the 4 mA value and the 20 mA value.

Prerequisite:

This is a theoretical calibration, i.e. the pressure values for the lower and upper range are known.

Due to the orientation of the device, there may be pressure shifts in the measured value, i.e. the measured value is not zero in a pressureless condition. For information on how to perform position adjustment, see → 44.

	Description
1	Select the "Pressure" measuring mode via the "Measuring Mode" parameter. Menu path: Setup → Measuring mode **WARNING** **Changing the measuring mode affects the span (URV)** This situation can result in product overflow. ► If the measuring mode is changed, the setting for the span (URV) must be checked in the "Setup" operating menu and readjusted if necessary.
2	Select a pressure unit via the "Press eng. unit" parameter, here "mbar" for example. Menu path: Setup → Press. eng. unit
3	Select the "Set LRV" parameter. Menu path: Setup → Extended setup → Current output → Set LRV
	Enter the value for the "Set LRV" parameter (here 0 mbar) and confirm. This pressure value is assigned to the lower current value (4 mA).
4	Select the "Set URV" parameter. Menu path: Setup → Extended setup → Current output → Set URV
	Enter the value for the "Set URV" parameter, here 300 mbar (4.5 psi), and confirm. This pressure value is assigned to the upper current value (20 mA).
5	Result: The measuring range is configured for 0 to +300 mbar (0 to 4.5 psi).

A See table, step 3.
B See table, step 4.

9.9 Configuring level measurement

9.9.1 Information on level measurement

You have a choice of two methods for calculating the level: "In pressure" and "In height". The table in the "Overview of level measurement" section that follows provides you with an overview of these two measuring tasks.

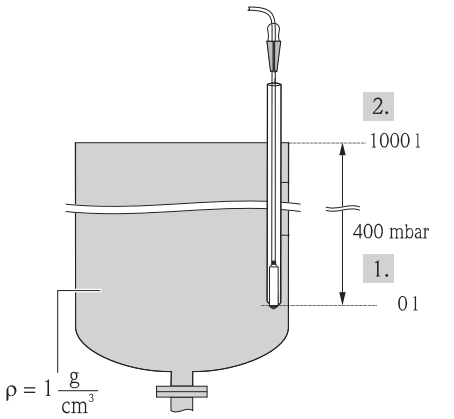
- The limit values are not checked, i.e. the values entered must be appropriate for the sensor module and the measuring task for the device to be able to measure correctly.
- Customer-specific units are not possible.
- The values entered for "Empty calib./Full calib.", "Empty pressure/Full pressure", "Empty height/Full height" and "Set LRV/Set URV" must be at least 1% apart. The value will be rejected, and a message displayed, if the values are too close together.

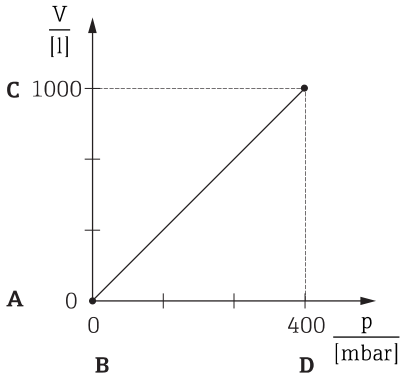
9.9.2 Overview of level measurement

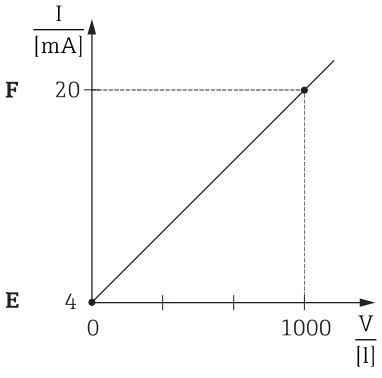
Measuring task	Level selection	Measured variable options	Description	Measured value display
Calibration is performed by entering two pressure-level value pairs.	"In pressure"	Via the "Output unit" parameter: %, level, volume or mass units	▪ Calibration with reference pressure (wet calibration) → 🖹 50 ▪ Calibration without reference pressure (dry calibration)→ 🖹 48	The measured value display and the "Level before lin" parameter display the measured value.
Calibration is performed by entering the density and two height-level value pairs.	"In height"		▪ Calibration with reference pressure (wet calibration) → 🖹 54 ▪ Calibration without reference pressure (dry calibration)→ 🖹 52	

9.9.3 "In pressure" level selection Calibration without reference pressure (dry calibration)

Example:







In this example, the volume in a tank should be measured in liters. The maximum volume of 1 000 l (264 gal) corresponds to a pressure of 400 mbar (6 psi).

The minimum volume of 0 liters corresponds to a pressure of 0 mbar since the process isolating diaphragm of the probe is at the start of the level measuring range.

Prerequisite:

- The measured variable is in direct proportion to the pressure.
- This is a theoretical calibration i.e. the pressure and volume values for the lower and upper calibration point must be known.

- The values entered for "Empty calib./Full calib.", "Empty pressure/Full pressure" and "Set LRV/Set URV" must be at least 1% apart. The value will be rejected, and a message displayed, if the values are too close together. Further limit values are not checked, i.e. the values entered must be appropriate for the sensor module and the measuring task for the device to be able to measure correctly.
- Due to the orientation of the device, there may be pressure shifts in the measured value, i.e. when the vessel is empty or partly filled, the measured value is not zero. For information on how to perform position adjustment, see → 🖹 44.

	Description	
1	Select the "Level" measuring mode via the "Measuring mode" parameter. Menu path: Setup → Measuring mode **⚠ WARNING** **Changing the measuring mode affects the span (URV)** This situation can result in product overflow. ▶ If the measuring mode is changed, the setting for the span (URV) must be checked in the "Setup" operating menu and readjusted if necessary.	 *1 See table, steps 6 and 7.* *2 See table, steps 8 and 9.*
2	Select a pressure unit via the "Press eng. unit" parameter, here "mbar" for example. Menu path: Setup → Press. eng. unit	
3	Select the "In pressure" level mode via the "Level selection" parameter. Menu path: Setup → Extended setup → Level → Level selection.	
4	Select a volume unit via the "Output unit" parameter, here "l" (liters) for example. Menu path: Setup → Extended setup → Level → Output unit	
5	Select the "Dry" option via the "Calibration mode" parameter. Menu path: Setup → Extended setup → Level → Calibration mode	  *A See table, step 6.* *B See table, step 7.* *C See table, step 8.* *D See table, step 9.* *E See table, step 11* *F See table, step 12*
6	Enter the volume value for the lower calibration point via the "Empty calib." parameter, here 0 liters for example. Menu path: Setup → Extended setup → Level → Empty calib.	
7	Enter the pressure value for the lower calibration point via the "Empty pressure" parameter, here "0 mbar" for example. Menu path: Setup → Extended setup → Level → Empty pressure	
8	Enter the volume value for the upper calibration point via the "Full calib." parameter, here 1 000 l (264 gal) for example. Menu path: Setup → Extended setup → Level → Full calib.	
9	Enter the pressure value for the upper calibration point via the "Full pressure" parameter, here 400 mbar (6 psi) for example. Menu path: Setup → Extended setup → Level → Full pressure	
10	"Adjust density" contains the factory setting 1.0 but can be changed if required. The value pairs subsequently entered must correspond to this density. Menu path: Setup → Extended setup → Level → Adjust density	
11	Set the volume value for the lower current value (4 mA) via the "Set LRV" parameter (0 l). Menu path: Setup → Extended setup → Current output → Set LRV	
12	Set the volume value for the upper current value (20 mA) via the "Set URV" parameter(1 000 l (264 gal)). Menu path: Setup → Extended setup → Current output → Set URV	

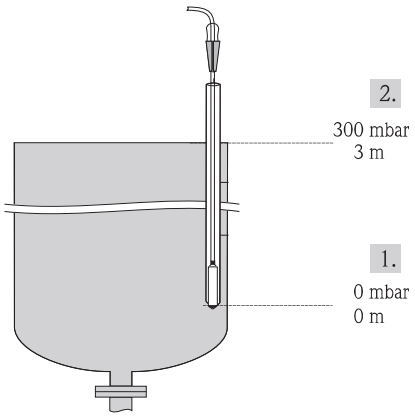
	Description	
13	If the process uses a medium other than that on which the calibration was based, the new density must be specified in the "Process density" parameter. Menu path: Setup → Extended setup → Current output → Process density.	
14	If density correction is required, assign the temperature probe in the "Auto dens. corr." parameter. A density correction is only possible for water. A temperature-density curve that is saved in the device is used. For this reason, the "Adjust density" (step 10) and "Process density" (step 13) parameters are not used here. Menu path: Expert → Application → Level → Auto dens. corr.	
15	Result: The measuring range is configured for 0 to 1 000 l (0 to 264 gal).	

For this level mode, the measured variables %, level, volume and mass are available, see "Output unit" → 94.

9.9.4 "In pressure" level selection Calibration with reference pressure (wet calibration)

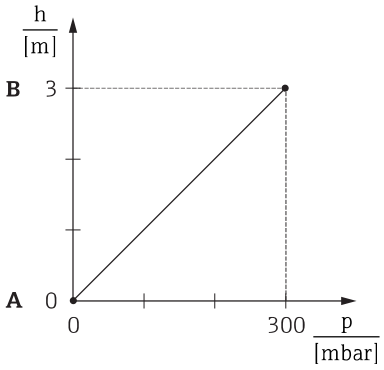
Example:

In this example, the level in a tank should be measured in "m". The maximum level is 3 m (9.8 ft).

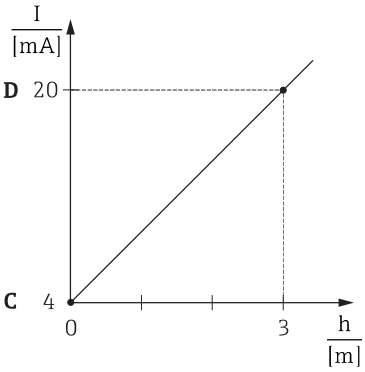


The pressure range is derived from the level and the density of the medium. In this situation, the device sets the pressure range to 0 to +300 mbar (0 to 4.5 psi).

Prerequisite:



- The measured variable is in direct proportion to the pressure.
- The tank can be filled and emptied.



The values entered for "Empty calib./Full calib." and" Set LRV/Set URV" and the pressures present must be at least 1% apart. The value will be rejected, and a message displayed, if the values are too close together. Other limit values are not checked, i.e. the values entered must be appropriate for the sensor and the measuring task for the device to be able to measure correctly.

	Description
1	Perform "position adjustment"→ 🖹 44.
2	Select the "Level" measuring mode via the "Measuring mode" parameter. Menu path: Setup → Measuring mode **⚠ WARNING** **Changing the measuring mode affects the span (URV)** This situation can result in product overflow. ▶ If the measuring mode is changed, the setting for the span (URV) must be checked in the "Setup" operating menu and readjusted if necessary.
3	Select a pressure unit via the "Press eng. unit" parameter, here "mbar" for example. Menu path: Setup → Press. eng. unit
4	Select the "In pressure" level mode via the "Level selection" parameter. Menu path: Setup → Extended setup → Level → Level selection.
5	If density correction is required, assign the temperature probe in the "Auto dens. corr." parameter. Menu path: Expert → Application → Auto dens. corr. A density correction is only possible for water. A temperature-density curve that is saved in the device is used. For this reason, the "Adjust density" (step 8) and "Process density" (step 13) parameters are not used here.
6	Select a level unit via the "Output unit" parameter, here "m" for example. Menu path: Setup → Extended setup → Level → Output unit
7	Select the "Wet" option via the "Calibration mode" parameter. Menu path: Setup → Extended setup → Level → Calibration mode
8	If the calibration is performed with a medium other than the process medium, enter the density of the calibration medium in the "Adjust density" parameter. Menu path: Setup → Extended setup → Level → Adjust density ℹ The process density can be changed only if automatic density correction is switched off (see step 5).
9	The hydrostatic pressure for the lower calibration point is present at the device, here "0 mbar" for example.
	Select the "Empty calib." parameter. Menu path: Setup → Extended setup → Level → Empty calib.
	Enter the level value, here 0 m for example. The pressure value present is assigned to the lower level value by confirming the value.
10	The hydrostatic pressure for the upper calibration point is present at the device, here 300 mbar (4.35 psi) for example.

1 See table, step 9.
2 See table, step 10.

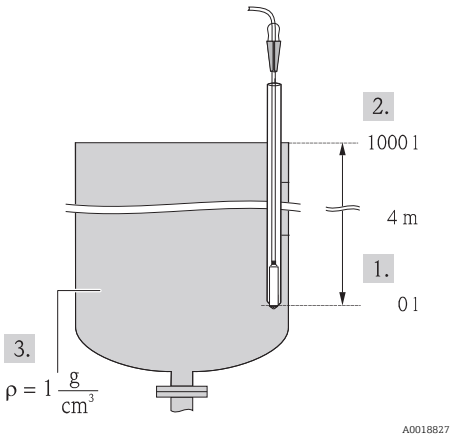
A See table, step 9.
B See table, step 10.
C See table, step 11.
D See table, step 12.

	Description	
	Select the "Full calib." parameter. Menu path: Setup → Extended setup → Level → Full calib.	
	Enter the level value, here 3 m (9.8 ft) for example. The pressure value present is assigned to the upper level value by confirming the value.	
11	Use the "Set LRV" parameter to set the level value for the lower current value (4 mA), here "0 m" for example. Menu path: Setup → Extended setup → Current output → Set LRV	
12	Use the "Set URV" parameter to set the upper current value (20 mA) (3 m (9.8 ft)). Menu path: Setup → Extended setup → Current output → Set URV	
12	If the process uses a medium other than that on which the calibration was based, the new density must be specified in the "Process density" parameter. Menu path: Setup → Extended setup → Level → Process density. The process density can be changed only if automatic density correction is switched off (see step 5).	
13	Result: The measuring range is configured for 0 to 3 m (0 to 9.8 ft).	

For this level mode, the measured variables %, level, volume and mass are available, see "Output unit". → 94.

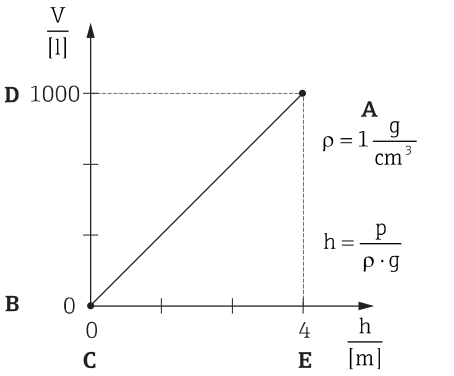
9.9.5 "In height" level selection Calibration without reference pressure (dry calibration)

Example:

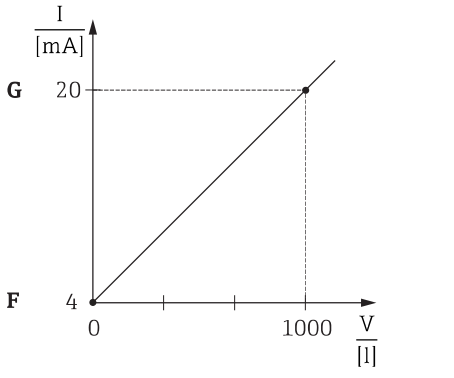


In this example, the volume in a tank should be measured in liters. The maximum volume of 1 000 l (264 gal) corresponds to a level of 4 m (13 ft). The minimum volume of 0 liter corresponds to a level of 0 m since the process isolating diaphragm of the probe is at the start of the level measuring range.

Prerequisite:



- The measured variable is in direct proportion to the pressure.
- This is a theoretical calibration i.e. the height and volume values for the lower and upper calibration point must be known.



- The values entered for "Empty calib./Full calib.", "Empty height/Full height" and" Set LRV/Set URV" must be at least 1% apart. The value will be rejected, and a message displayed, if the values are too close together. Other limit values are not checked, i.e. the values entered must be appropriate for the sensor and the measuring task for the device to be able to measure correctly.
- Due to the orientation of the device, there may be pressure shifts in the measured value, i.e. when the vessel is empty or partly filled, the measured value is not zero. For information on how to perform position adjustment, see → 44.

	Description
1	Select the "Level" measuring mode via the "Measuring mode" parameter. Menu path: Setup → Measuring mode **⚠ WARNING** **Changing the measuring mode affects the span (URV)** This situation can result in product overflow. ▶ If the measuring mode is changed, the setting for the span (URV) must be checked in the "Setup" operating menu and readjusted if necessary.
2	Select a pressure unit via the "Press eng. unit" parameter, here "mbar" for example. Menu path: Setup → Press. eng. unit
3	Select the "In height" level mode via the "Level selection" parameter. Menu path: Setup → Extended setup → Level → Level selection.
4	If density correction is required, assign the temperature probe in the "Auto dens. corr." parameter. Menu path: Setup → Extended setup → Level → Level selection.
4	Select a volume unit via the "Output unit" parameter, here "l" (liters) for example. Menu path: Setup → Extended setup → Level → Output unit A density correction is only possible for water. A temperature-density curve that is saved in the device is used. For this reason, the "Adjust density" (step 12) and "Process density" (step 15) parameters are not used here.
5	Select a volume unit via the "Output unit" parameter, here "l" (liters) for example. Menu path: Setup → Extended setup → Level → Output unit
6	Select a level unit via the "Height unit" parameter, here "m" for example. Menu path: Setup → Extended setup → Level → Height unit
7	Select the "Dry" option via the "Calibration mode" parameter. Menu path: Setup → Extended setup → Level → Calibration mode
8	Enter the volume value for the lower calibration point via the "Empty calib." parameter, here 0 liters for example. Menu path: Setup → Extended setup → Level → Empty calib.
9	Enter the height value for the lower calibration point via the "Empty height" parameter, here 0 m for example. Menu path: Setup → Extended setup → Level → Empty height
10	Enter the volume value for the upper calibration point via the "Full calib." parameter, here 1 000 l (264 gal) for example. Menu path: Setup → Extended setup → Level → Full calib.

1 See table, steps 10 and 11.
2 See table, steps 13 and 14.
3 See table, step 12

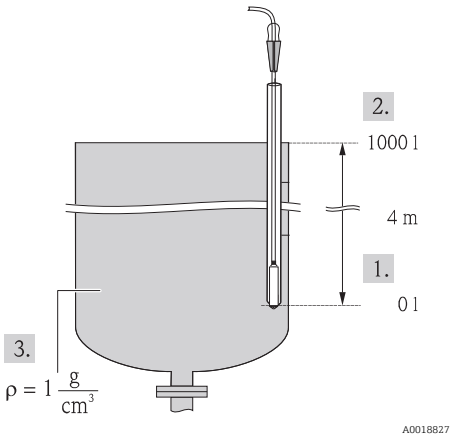
A See table, step 12.
B See table, step 8.
C See table, step 9.
D See table, step 10.
E See table, step 11.
F See table, step 13.
G See table, step 14.

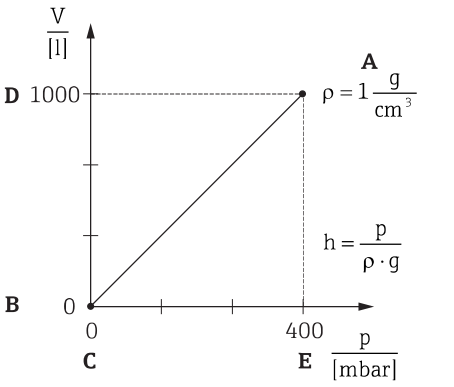
	Description	
11	Enter the height value for the upper calibration point via the "Full height" parameter, here 4 m (13 ft) for example. Menu path: Setup → Extended setup → Level → Full height	
12	Enter the density of the medium via the "Adjust density" parameter, here "1 g/cm³" (1 SGU) for example. Menu path: Setup → Extended setup → Level → Adjust density	
13	Set the volume value for the lower current value (4 mA) via the "Set LRV" parameter (0 l). Menu path: Setup → Extended setup → Current output → Set LRV	
14	Set the volume value for the upper current value (20 mA) via the "Set URV" parameter (1 000 l (264 gal)). Menu path: Setup → Extended setup → Current output → Set URV	
15	If the process uses a medium other than that on which the calibration was based, the new density must be specified in the "Process density" parameter. Menu path: Setup → Extended setup → Current output → Process density. The process density can only be changed if automatic density correction is switched off (see Step 4).	
16	Result: The measuring range is configured for 0 to 1 000 l (0 to 264 gal).	

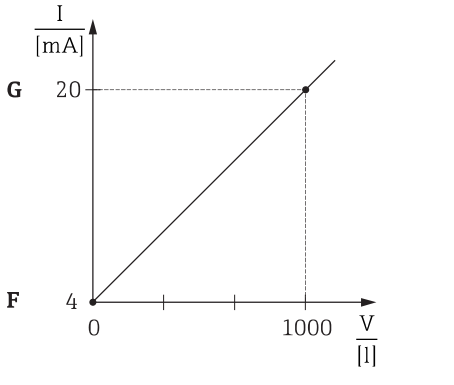
For this level mode, the measured variables %, level, volume and mass are available, see "Output unit". → 94.

9.9.6 "In height" level selection Calibration with reference pressure (wet calibration)

Example:







In this example, the volume in a tank should be measured in liters. The maximum volume of 1 000 l (264 gal) corresponds to a level of 4 m (13 ft).

The minimum volume of 0 liter corresponds to a level of 0 m since the process isolating diaphragm of the probe is at the start of the level measuring range. The density of the fluid is 1 g/cm³ (1 SGU).

Prerequisite:

- The measured variable is in direct proportion to the pressure.
- The tank can be filled and emptied.

The values entered for "Empty calib./Full calib." and" Set LRV/Set URV" and the pressures present must be at least 1% apart. The value will be rejected, and a message displayed, if the values are too close together. Other limit values are not checked, i.e. the values entered must be appropriate for the sensor and the measuring task for the device to be able to measure correctly.

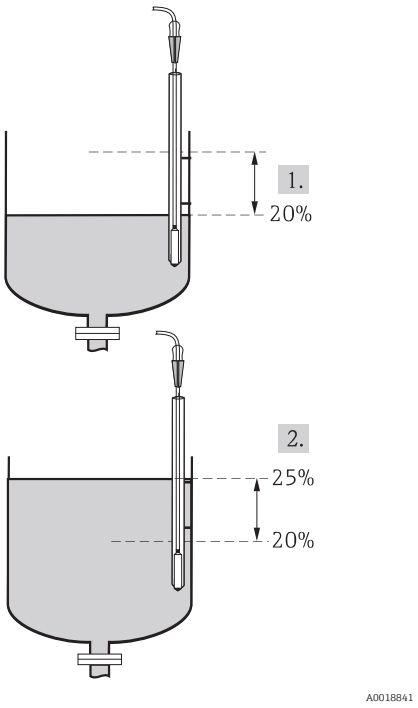
	Description	
1	Perform "position adjustment"→ 🖹 44.	 A0018827 *1 See table, step 9.* *2 See table, step 10.* *3 See table, step 11.*
2	Select the "Level" measuring mode via the "Measuring mode" parameter. Menu path: Setup → Measuring mode **⚠ WARNING** **Changing the measuring mode affects the span (URV)** This situation can result in product overflow. ▶ If the measuring mode is changed, the setting for the span (URV) must be checked in the "Setup" operating menu and readjusted if necessary.	
3	Select the "In height" level mode via the "Level selection" parameter. Menu path: Setup → Extended setup → Level → Level selection.	
4	If density correction is required, assign the temperature probe in the "Auto dens. corr." parameter. Menu path: Expert → Application → Auto dens. corr. A density correction is only possible for water. A temperature-density curve that is saved in the device is used. For this reason, the "Adjust density" (step 11) and "Process density" (step 14) parameters are not used here.	
5	Select a pressure unit via the "Press eng. unit" parameter, here "mbar" for example. Menu path: Setup → Press. eng. unit	 A0031097
6	Select a volume unit via the "Output unit" parameter, here "l" (liters) for example Menu path: Setup → Extended setup → Level → Output unit	
7	Select a height unit via the "Height unit" parameter, here "m" for example. Menu path: Setup → Extended setup → Level → Height unit	
8	Select the "Wet" option via the "Calibration mode" parameter. Menu path: Setup → Extended setup → Level → Calibration mode	
9	The hydrostatic pressure for the lower calibration point is present at the device, here "0 mbar" for example.	 A0031067 *A See table, step 11.* *B See table, step 9.* *C See table, step 9.* *D See table, step 10.*
	Enter the volume value for the lower calibration point via the "Empty calib." parameter, here "0 liters" for example. Menu path: Setup → Extended setup → Level → Empty calib.	
10	The hydrostatic pressure for the upper calibration point is present at the device, here "400 mbar (6 psi)" for example.	
	Enter the volume value for the upper calibration point via the "Full calib." parameter, here 1 000 l (264 gal) for example. Menu path: Setup → Extended setup → Level → Full calib.	

	Description	
11	If the calibration is performed with a medium other than the process medium, enter the density of the calibration medium in the "Adjust density" parameter, here 1 g/cm³ (1 SGU) for example. Menu path: Setup → Extended setup → Level → Adjust density The process density can only be changed if automatic density correction is switched off (see Step 4).	*E See table, step 10.* *F See table, step 12.* *G See table, step 13.*
12	Set the volume value for the lower current value (4 mA) via the "Set LRV" parameter (0 l). Menu path: Setup → Extended setup → Current output → Set LRV	
13	Set the volume value for the upper current value (20 mA) via the "Set URV" parameter(1 000 l (264 gal)). Menu path: Setup → Extended setup → Current output → Set URV	
14	If the process uses a medium other than that on which the calibration was based, the new density must be specified in the "Process density" parameter. Menu path: Setup → Extended setup → Level → Process density. The process density can only be changed if automatic density correction is switched off (see Step 4).	
15	Result: The measuring range is configured for 0 to 1 000 l (0 to 264 gal).	

For this level mode, the measured variables %, level, volume and mass are available, see "Output unit". → 94.

9.9.7 Calibration with partially filled vessel (wet calibration)

Example:



This example explains a wet calibration for cases in which it is not possible to empty the vessel and then fill it to 100%.

During this wet calibration, a level of 20% is used as the calibration point for "Empty" and a level of "25%" is used as the calibration point for "Full".

The calibration is then extended to 0% to 100% and lower range-value (LRV)/upper range-value (URV) are adapted accordingly.

Prerequisite:

- The default value in level mode for the calibration mode is "Wet".
- This value can be adjusted: Menu path: Setup → Extended setup → Level → Calibration mode

	Description	
1	Select the "Level" measuring mode via the "Measuring mode" parameter. Menu path: Setup → Measuring mode **⚠ WARNING** **Changing the measuring mode affects the span (URV)** This situation can result in product overflow. ▶ If the measuring mode is changed, the setting for the span (URV) must be checked in the "Setup" operating menu and readjusted if necessary.	 *1 See table, step 2* *2 See table, step 3*
2	Set the value for "Empty calib." with the acting pressure for the level, e.g. 20% Menu path: Setup → Extended setup → Level → Empty calib.	
3	Set the value for "Full calib." with the acting pressure for the level, e.g. 25%. Menu path: Setup → Extended setup → Level → Full calib.	
4	The values for the pressure when the vessel is full or empty are measured automatically during adjustment. The transmitter automatically sets the pressure values that are most suitable for "Empty calib." and "Full calib." as the minimum and maximum pressure which generates the output current. For this reason, the correct upper-range value (URV) and the correct lower-range value (LRV) must be set.	

If the process uses a medium other than that on which the calibration was based, the new density must be specified in the "Process density" parameter. In this case, you have to enter the various densities via the following menu path:
- Setup → Extended setup → Level→ Adjust Density (034) (e.g. 1.0 kg/l for water)
- Setup → Extended setup → Level → Process Density (035) (e.g. 0.8 kg/l for oil)

9.9.8 Level measurement with absolute pressure probe and external pressure signal (electrical differential pressure)

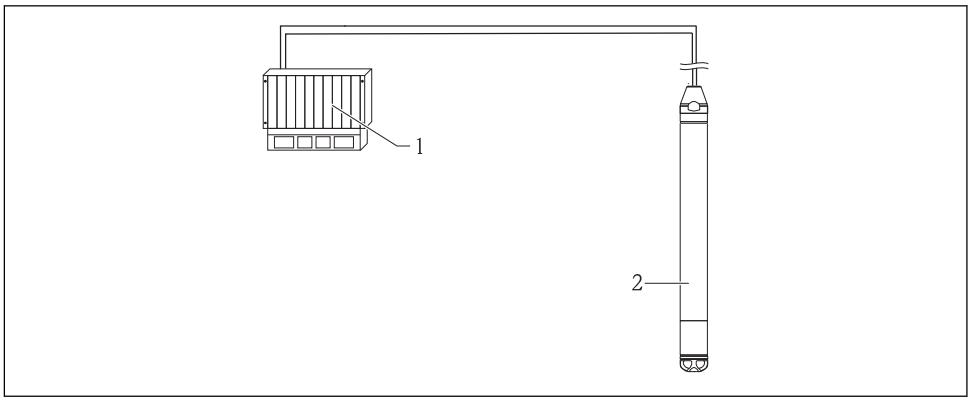
Example:

In this example, a Waterpilot FMX21 and a Cerabar M (each with an absolute pressure measuring cell) are connected via the common communication bus. The level can thus be measured in a deep well, with simultaneous compensation for the effect of atmospheric pressure.

1 *Fieldgate FXA520*
2 *Multidrop Connector FXN520*
3 *Terminal box (can be ordered as an accessory)*
4 *Cerabar M absolute pressure (level)*
5 *Waterpilot absolute pressure (pressure)*

	Sensor level adjustment (Waterpilot)
1	Select the "Pressure" measuring mode via the "Measuring Mode" parameter. Menu path: Setup → Measuring mode **⚠ WARNING** **Changing the measuring mode affects the span (URV)** This situation can result in product overflow. ► If the measuring mode is changed, the setting for the span (URV) must be checked in the "Setup" operating menu and readjusted if necessary.
2	Select a pressure unit via the "Press eng. unit" parameter, here "mbar" for example. Menu path: Setup → Press. eng. unit
3	The sensor is unpressurized, perform a position adjustment → 📄 44
4	Switch on burst mode via the "Burst mode" parameter. Menu path: Expert → Communication → HART config
5	Set the output current to "Fixed" 4.0 mA via the "Current Mode" parameter. Menu path: Expert → Communication → HART config
6	Configure an address ≠0 using the "Bus address" parameter, e.g. bus address = 1. (HART 5.0 master: Range 0 to 15, where address = 0 calls up the "Signaling" setting; HART 6.0 master: Range 0 to 63) Menu path: Expert → Communication → HART config

	Sensor level adjustment (Cerabar)
1	Select the "Level" measuring mode via the "Measuring mode" parameter. Menu path: Setup → Measuring mode **⚠ WARNING** **Changing the measuring mode affects the span (URV)** This situation can result in product overflow. ▶ If the measuring mode is changed, the setting for the span (URV) must be checked in the "Setup" operating menu and readjusted if necessary.
2	Select a pressure unit via the "Press eng. unit" parameter, here "mbar" for example. Menu path: Setup → Press. eng. unit
3	The sensor is unpressurized, perform a position adjustment → 📄 44
4	Set the output current to "Fixed" 4.0 mA via the "Current Mode" parameter. Menu path: Expert → Communication → HART config
5	Configure an address ≠0 using the "Bus address" parameter, e.g. bus address = 2. (HART 5.0 master: Range 0 to 15, where address = 0 calls up the "Signaling" setting; HART 6.0 master: Range 0 to 63) Menu path: Expert → Communication → HART config
6	Activate the reading of a value sent externally in burst mode via the "Electr. Delta P" parameter. Menu path: Expert → Application
7	Perform level adjustment (wet or dry)
8	Result: The measured value output by the atmospheric pressure sensor equals the level in the deep well (differential signal) and can be read out by means of a HART request for the address of the atmospheric pressure sensor.



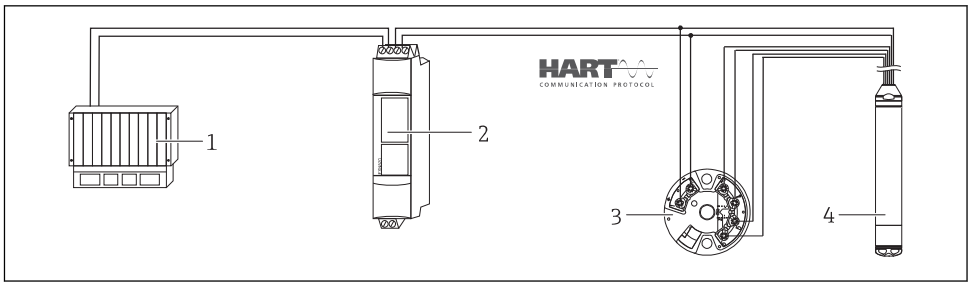
- It is not permissible to reverse the assignment of the measuring points to the direction of communication.
- The measured value of the transmitting device (via burst) must always be greater than the measured value of the receiving device (via "Electr. Delta P" mode).
- Adjustments that involve an offset in the pressure values (e.g. position adjustment, trim) must always suit the individual sensor and the sensor's orientation irrespective of the "Electr. Delta P" application.
- Other settings result in non-permitted use of the "Electr. Delta P" mode and can lead to incorrect measured values.

9.10 Automatic density compensation

9.10.1 Automatic density compensation with the internally measured sensor temperature

Example:

In this example, a Waterpilot FMX21 is used for level measurement in water. The change in the water density caused by changing temperatures is automatically factored into the level signal by activating the automatic density compensation.



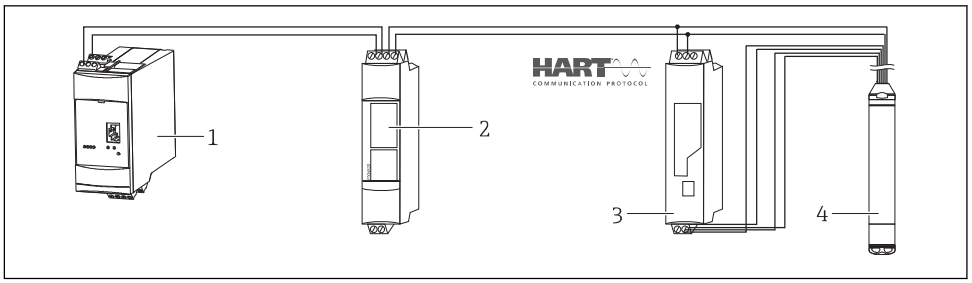
1 HART master, e.g. PLC (programmable logic controller)
2 Waterpilot FMX21

	Waterpilot adjustment for level measurement
1	Select the "Level" measuring mode via the "Measuring mode" parameter. Menu path: Setup → Measuring mode **⚠ WARNING** **Changing the measuring mode affects the span (URV)** This situation can result in product overflow. ▶ If the measuring mode is changed, the setting for the span (URV) must be checked in the "Setup" operating menu and readjusted if necessary.
2	Select a pressure unit via the "Press eng. unit" parameter, here "mbar" for example. Menu path: Setup → Press. eng. unit
3	The sensor is unpressurized, perform a position adjustment → 🖹 44
4	Set the "Auto dens. corr." parameter to Sensor temperature. Menu path: Expert → Application
5	Perform level adjustment (wet or dry)
6	Result: The measured value output by the Waterpilot corresponds to the level in the deep well corrected by means of the density characteristic line of water.

9.10.2 Automatic density compensation using an integrated Pt100 for calculation in a suitable HART master (e.g. PLC)

Example:

In this example, the FMX21 with an integrated Pt100 is connected via the common communication bus to any temperature head transmitter with HART communication (e.g. TMT182). The temperature and pressure signal is transmitted to the HART master (e.g. PLC), where a corrected level value can be generated using a stored linearization table or density function (of a chosen medium). A pressure signal and a temperature signal can thus be generated with a chosen density function to compensate for a level.



1 HART master, PLC (programmable logic controller)
2 Multidrop Connector FXN520
3 TMT182 temperature head transmitter
4 Waterpilot FMX21

	Waterpilot adjustment for level measurement
1	Select the "Level" measuring mode via the "Measuring mode" parameter. Menu path: Setup → Measuring mode **⚠ WARNING** **Changing the measuring mode affects the span (URV)** This situation can result in product overflow. ▶ If the measuring mode is changed, the setting for the span (URV) must be checked in the "Setup" operating menu and readjusted if necessary.
2	Select a pressure unit via the "Press eng. unit" parameter, here "mbar" for example. Menu path: Setup → Press. eng. unit
3	The sensor is unpressurized, perform a position adjustment → 📄 44
4	Set the output current to "Fixed" 4.0 mA via the "Current Mode" parameter. Menu path: Expert → Communication → HART config
5	Perform level adjustment (wet or dry)
6	Configure an address ≠0 using the "Bus address" parameter, e.g. bus address = 1. (HART 5.0 master: Range 0 to 15, where address = 0 calls up the "Signaling" setting; HART 6.0 master: Range 0 to 63) Menu path: Expert → Communication → HART config ℹ The output current of the temperature head transmitter used must also be set to "Fixed" and have a HART address other than zero (e.g. address = 2).
7	Switch on burst mode via the "Burst mode" parameter. Menu path: Expert → Communication → HART config
8	Result: by balancing the pressure signal and temperature signal in a suitable HART master (e.g. PLC), a corrected level value can be determined for any medium by using a suitable density function.

9.10.3 Automatic density compensation using an external temperature signal for calculation in the FMX21

Example:

In this example, the FMX21 with an integrated Pt100 is connected to a HART-compliant temperature transmitter via the common communication bus. With this option, the signal of the Pt100 is evaluated with a HART-compliant temperature head transmitter (min. HART 5.0) that supports the burst mode. The change in the water density caused by changing temperatures is automatically factored into the level signal by activating the automatic density compensation.

1 *Fieldgate FXA520*
2 *Multidrop Connector FXN520*
3 *HART-compatible temperature transmitter (e.g. TMT82)*
4 *Waterpilot FMX21*

	Configuring the HART-compliant temperature head transmitter (min. HART 5.0) with burst function
	The output current of the temperature transmitter used should be set to "Fixed" and a HART address other than zero (e.g. address = 1) must be set. The burst function must then be switched on with HART command 1. This step should be performed before the procedure described below in order to avoid a HART input error of the FMX21 being output during commissioning.
1	Select the "Level" measuring mode via the "Measuring mode" parameter. Menu path: Setup → Measuring mode **⚠ WARNING** **Changing the measuring mode affects the span (URV)** This situation can result in product overflow. ► If the measuring mode is changed, the setting for the span (URV) must be checked in the "Setup" operating menu and readjusted if necessary.
2	Select a pressure unit via the "Press eng. unit" parameter, here "mbar" for example. Menu path: Setup → Press. eng. unit
3	The sensor is unpressurized, perform a position adjustment → 📄 44
4	Set the "Auto dens. corr." parameter to "External value". Menu path: Expert → Application
5	Perform level adjustment (wet or dry)
	Result: The measured value output by the Waterpilot corresponds to the level in the deep well corrected by means of the density characteristic line of water.

The TMT182 temperature head transmitter is not suitable for this configuration.

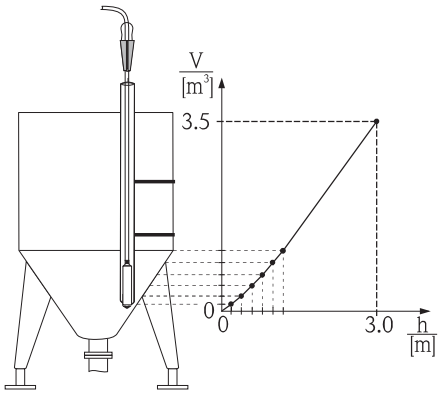
9.11 Linearization

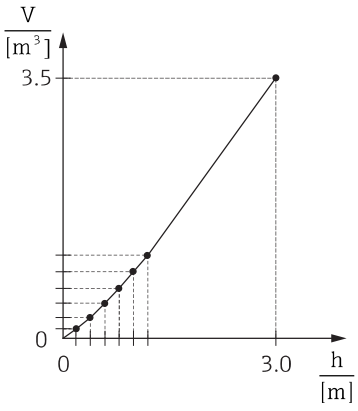
9.11.1 Semi-automatic entry of a linearization table

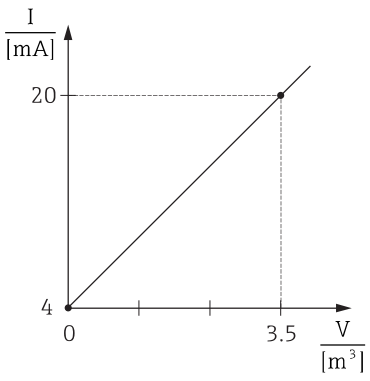
Example:

In this example, the volume in a tank with a conical outlet should be measured in m^3.

Prerequisite:







- The tank can be filled or emptied. The linearization characteristic must rise or fall continuously.
- The "Level" measuring mode has been selected.
- A level calibration has been performed.
- For a description of the parameters mentioned, see the "Description of device parameters" section→ 86.

WARNING

Changing the measuring mode affects the span (URV)

This situation can result in product overflow.

▶ If the measuring mode is changed, the setting for the span (URV) must be checked in the "Setup" operating menu and readjusted if necessary.

	Description	
1	Select the "Semiautom. entry" option via the "Lin. mode" parameter. Menu path: Setup → Extended setup → Linearization → Lin. mode	 A0018843
2	Select using the "Unit before lin." e.g. m^3. Menu path: Setup → Extended setup → Linearization → Unit after lin.	
3	Fill the tank to the height of the 1st point.	
4	Enter the number of the point in the table using the "Line-numb" parameter e.g. 1. Menu path: Setup → Extended setup → Linearization → Line numb	 A0031098
	The current level is displayed via the "X-value" parameter. Menu path: Setup → Extended setup → Linearization → X-val	
	Using the "Y-val." parameter, enter the corresponding volume value, here 0 m^3 for example, and confirm the value. Menu path: Setup → Extended setup → Linearization → Y-val	
5	To enter another point in the table, continue filling the tank and select the "Next point" option via the "Edit table" parameter. Enter the next point as explained in Step 4. Menu path: Setup → Extended setup → Linearization → Edit table	 A0031031

	Description	
6	Once all the points have been entered in the table, select the "Activate table" option via the "Lin. mode" parameter. Menu path: Setup → Extended setup → Linearization → Lin. mode	
7	Result: Result: The measured value after linearization is displayed.	

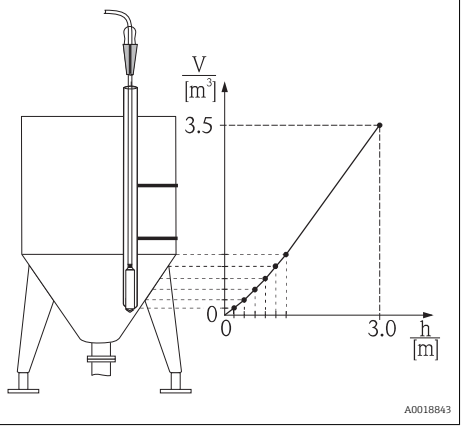
- Error message F510 "Linearization" and alarm current as long as the table is being entered and until the table is activated.
- The lower-range value (= 4mA) is defined by the smallest point in the table. The upper-range value (= 20mA) is defined by the largest point in the table.
- Using the parameters "Set LRV" and "Set URV", you can change the allocation of the volume/mass values to the current values.

9.11.2 Manual entry of a linearization table

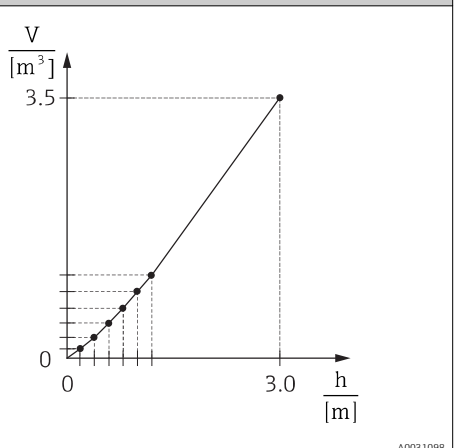
Example:

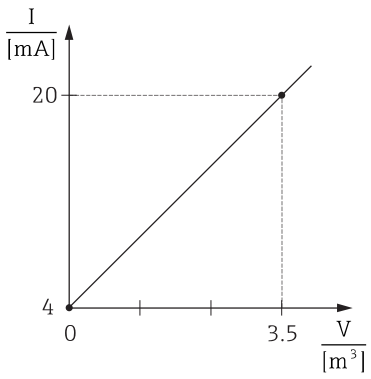
In this example, the volume in a tank with a conical outlet should be measured in m^3.

Prerequisite:



- This is a theoretical calibration, i.e. the points for the linearization table are known.
- The "Level" measuring mode has been selected.
- A level calibration has been performed.
- The linearization characteristic must rise or fall continuously.
- For a description of the parameters mentioned, see the "Description of device parameters" section→ 86.





WARNING

Changing the measuring mode affects the span (URV)

This situation can result in product overflow.

► If the measuring mode is changed, the setting for the span (URV) must be checked in the "Setup" operating menu and readjusted if necessary.

	Description	
1	Select the "Manual entry" option via the "Lin. mode" parameter. Menu path: Setup → Extended setup → Linearization → Lin. mode	
2	Select using the "Unit after lin." e.g. m^3. Menu path: Setup → Extended setup → Linearization → Unit after lin.	

	Description	
3	Enter the number of the point in the table using the "Line-numb" parameter e.g. 1. Menu path: Setup → Extended setup → Linearization → Line numb	 A0031098  A0031031
	The level is entered via the "X-value" parameter, here 0 m for example. Confirm your entry. Menu path: Setup → Extended setup → Linearization → X-val	
	Using the "Y-val." parameter, enter the corresponding volume value, here 0 m^3 for example, and confirm the value. Menu path: Setup → Extended setup → Linearization → Y-val	
4	To enter another point in the table, select the "Next point" option via the "Edit table" parameter. Enter the next point as explained in Step 3. Menu path: Setup → Extended setup → Linearization → Edit table	
5	Once all the points have been entered in the table, select the "Activate table" option via the "Lin. mode" parameter. Menu path: Setup → Extended setup → Linearization → Lin. mode	
6	Result: Result: The measured value after linearization is displayed.	

- Error message F510 "Linearization" and alarm current as long as the table is being entered and until the table is activated.
- Error message F511/F512 "Linearization" and alarm current as long as the linearization table consists of fewer than 2 points.
- The lower-range value (= 4mA) is defined by the smallest point in the table. The upper-range value (= 20mA) is defined by the largest point in the table.
- Using the parameters "Set LRV" and "Set URV", you can change the allocation of the volume/mass values to the current values.

9.12 Manual entry of a linearization table via operating tool

Using an operating tool based on FDT technology (e.g. FieldCare), you can enter linearization using a module specially designed for this purpose. This provides you with an overview of the selected linearization, even during entry. In addition, it is possible to configure different tank shapes in FieldCare ("Device operation" → "Device functions" → "Additional functions" → "Linearization table" menu).

The linearization table may also be entered manually point by point in the operating tool menu (see Section → 86).

9.13 Backing up or duplicating the device data

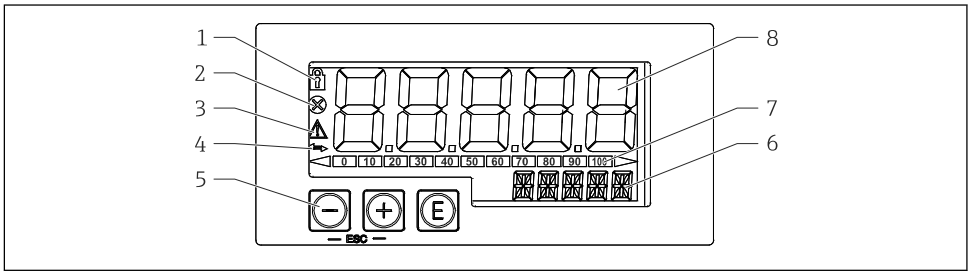
The following options are available to you with an operating tool that is based on FDT technology (e.g. FieldCare):
- Storage/recovery of configuration data.
- Duplication of device parameters.
- Transfer of all relevant parameters when replacing electronic inserts.

Use the following parameter for this:

Download select. (visible only in FieldCare)

Navigation Expert → System → Management → Download select.

Write permission Operator/Service engineers/Expert



Description Selection of data packages for up/download function in Fieldcare and PDM.

Prerequisite DIP switch set to "SW" and "Damping" set to "on". If you download using the factory setting "Configuration copy", all parameters required for a measurement will be downloaded. The functionality of the "Electronics replace" setting is reserved for Endress+Hauser Service and can be accessed only if the correct device access code is entered.

Options
- Configuration copy: This option overwrites general configuration parameters with the exception of the serial number, order number, calibration, pos. zero adjust, application and day information.
- Device replacement: This option overwrites general configuration parameters with the exception of the serial number, order number, calibration and position adjustment.
- Electronics replace: This option overwrites general configuration parameters.

Factory setting Configuration copy

9.14 Operation and settings via RIA15

6 Display and operating elements of the process display unit

1 Symbol: operating menu disabled
2 Symbol: error
3 Symbol: warning
4 Symbol: HART communication active
5 Operating keys "-", "+", "E"
6 14-segment display for unit/TAG
7 Bar graph with indicators for under range and over range
8 5-digit 7-segment display for measured value, digit height 17 mm (0.67 in)

The device is operated using three operating keys on the front of the housing. The device setup can be disabled with a 4-digit user code. If the setup is disabled, a padlock symbol appears on the display when an operating parameter is selected.

 A0017716	Enter key; calling up the operating menu, confirming the option/setting parameters in the operating menu
 A0017715	Selecting and setting/changing values in the operating menu; pressing the '-' and '+' keys simultaneously takes the user back up a menu level. The configured value is not saved.
 A0017714	

9.14.1 Operating functions

The operating functions of the process display unit are divided into the following menus. The individual parameters and settings are described in the "Commissioning" section.

If the operating menu is disabled by means of a user code, the individual menus and parameters can be displayed but not changed. To change a parameter, the user code must be entered. As the display unit can only display digits in the 7-segment display and not alphanumeric characters, the procedure for number parameters is different to that for text parameters. If the operating position contains only numbers as parameters, the operating position is displayed in the 14-segment display and the configured parameter is displayed in the 7-segment display. To edit, press the 'E'-button followed by the user code. If the operating position contains text parameters, only the operating position is initially displayed in the 14-segment display. If the 'E' button is pressed again, the configured parameter is displayed in the 14-segment display. To edit, press the '+' button followed by the user code.

Setup (SETUP)	Basic device settings
Diagnostics (DIAG)	Device information, display of error messages
Expert (EXPRT)	Expert settings for device setup. The Expert menu is protected from editing by an access code (default 0000).

9.14.2 Operating modes

The process display unit can be used in two different operating modes:

- 4 to 20 mA mode:
  In this operating mode, the process display unit is incorporated into the 4 to 20 mA current loop and measures the transmitted current. The variable calculated based on the current value and range limits is displayed in digital form on the 5-digit LCD. In addition, the associated unit and a bar graph can be displayed.
- HART mode:
  The display unit is powered via the current loop.
  The FMX21 can be adjusted under the "Level" menu (see operating matrix). The measured value displayed corresponds to the measured level.
  HART communication operates according to the master/slave principle.

For additional information, see BA01170K.

9.14.3 Operating matrix

After power-up:

- ▶ Press the E key twice
  - ↳ The "Level" menu is then available

Using the following operating matrix, a display in percent can be set. To do this, select "Mode" parameter => 4-20 and "Unit" parameter =>%

Setup -> Level (LEVEL) menu					
The LEVEL menu is only visible if the RIA15 has been ordered with the "Level" option and the display unit is operated in the HART mode (MODE = HART). The basic settings for the Waterpilot FMX21 level sensor can be made via the RIA15 with this menu.					
RIA15 parameter		**Corresponds to parameter of FMX21**	**Values (default=bold)**	**Visible with**	**Description**
LEVEL [1]		Level before linearization		Level option MODE = HART FMX21 connected	This menu contains the parameters for configuring the pressure measuring device for hydrostatic level measurement, FMX21. The basic settings for the FMX21 can be made via the RIA15 with this menu. Once the LEVEL menu item is opened, the following parameters are automatically adjusted for easier operation: ▪ Measuring mode: Level ▪ Calibration mode: Dry ▪ Level selection: In pressure ▪ Lin mode: Linear It is possible to reset these parameters to the factory default settings by performing a reset.
	PUNIT	Press. eng. unit	**mbar** [2] **bar** [2] kPa PSI		Use this function to select the unit for pressure
	LUNIT	Output unit	**%** m inch feet		Use this function to select the unit for level
	TUNIT	Temperature unit	**°C** °F K		Use this function to select the unit for temperature
	ZERO	Pos. zero adjust	**NO** YES	Gauge pressure sensor	For performing a position adjustment (gauge pressure sensor). The value 0.0 is assigned to the pressure value present. The current value is also corrected.
	P_LRV	Empty pressure	-1999.9 to 9999.9 Default: Gauge pressure sensor: Sensor LRL Absolute pressure sensor: 0		Pressure empty calibration using keys -,+,E More in-depth description / valid value range: any value in the range indicated [1] [3] Number of decimal places depends on the configured pressure unit.
	P_URV	Full pressure	-1999.9 ... 9999.9 Default: Sensor URL		Pressure full calibration using keys -,+,E More in-depth description / valid value range: any value in the range indicated [1] [3] Number of decimal places depends on the configured pressure unit.
	EMPTY	Empty calib.	-1999.9 to 9999.9 Default: 0		Level empty calibration using keys -,+, E More in-depth description / valid value range: any value in the range indicated [1] [3] Number of decimal places depends on the configured level unit.
	FULL	Full calib.	-1999.9 ... 9999.9 Default: 100		Level full calibration using keys -,+, E More in-depth description / valid value range: any value in the range indicated [1] [3] Number of decimal places depends on the configured level unit.

Setup -> Level (LEVEL) menu					
The LEVEL menu is only visible if the RIA15 has been ordered with the "Level" option and the display unit is operated in the HART mode (MODE = HART). The basic settings for the Waterpilot FMX21 level sensor can be made via the RIA15 with this menu.					
RIA15 parameter		**Corresponds to parameter of FMX21**	**Values (default=bold)**	**Visible with**	**Description**
	LEVEL	Level before linearization	Measured value		Displays the measured level Number of decimal places depends on the configured level unit.
	RESET	Enter reset code	**NO** YES		Reset the FMX21 to factory defaults

1) If the measured value that is read out is too large, it is displayed as "9999.9", for example. To display a valid measured value, the pressure unit (PUNIT) (or level unit (LUNIT)) must be set to suit the measuring range.
2) Default: depends on the sensor nominal range or as per order specifications
3) The values entered for "Empty calib./Full calib.", "Empty pressure/Full pressure" and "Set LRV/Set URV" must be at least 1% apart. The value will be rejected, and a message displayed, if the values are too close together. Further limit values are not checked, i.e. the values entered must be appropriate for the sensor module and the measuring task for the device to be able to measure correctly.

Any additional settings such as linearizations must be made using FieldCare or DeviceCare.

Additional information is available in the RIA15 Operating Instructions BA01170K.

10 Diagnostics and troubleshooting

10.1 Troubleshooting

General errors

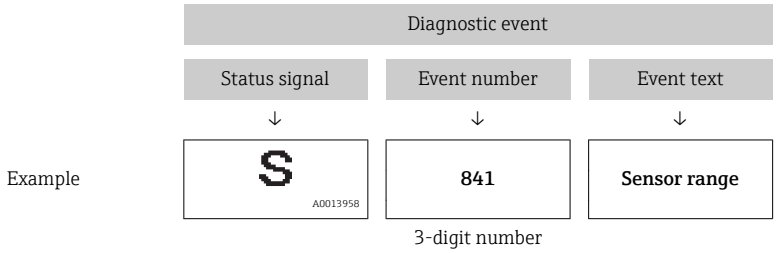
Error	Possible cause	Solution
Device is not responding.	Supply voltage does not match the specification on the nameplate.	Apply correct voltage.
	Supply voltage has incorrect polarity.	Reverse polarity of supply voltage.
	Connecting cables are not in contact with the terminals.	Check the connection of the cables and correct if necessary.
Output current < 3.6 mA	Signal line is not wired correctly. Electronics unit is defective.	Check wiring.
Device measures incorrectly.	Configuration error.	Check and correct parameter configuration (see below).
HART communication is not working.	Communication resistor missing or incorrectly installed.	Install the communication resistor (250 Ω) correctly.
	Commubox is connected incorrectly.	Connect Commubox correctly.
	Commubox is not set to "HART".	Set Commubox selector switch to "HART".
RIA15 no display	The polarity of the supply voltage is wrong	Correct the polarity
RIA15 no display	The cables do not contact the terminals properly	Ensure electrical contact between the cable and the terminal
RIA15 no display	RIA15 defective	Replace RIA15
RIA15 start sequence keeps running through	Supply voltage too low	▪ Increase supply voltage ▪ Switch off backlight

10.2 Diagnostic events in the operating tool

10.2.1 Diagnostic message

Faults detected by the self-monitoring system of the measuring device are displayed as a diagnostic message in alternation with the measured value display.

Status signals



The table → 📄 71 lists the messages that may occur. The ALARM STATUS parameter shows the message with the highest priority. The device has four different status information codes according to NE107:

F A0013956	**"Failure"** A device error has occurred. The measured value is no longer valid.
M A0013957	**"Maintenance required"** Maintenance is required. The measured value remains valid.
C A0013959	**"Function check"** The device is in service mode (e.g. during a simulation).
S A0013958	**"Out of specification"** The device is being operated: ▪ Outside its technical specifications (e.g. during warm-up or cleaning). ▪ Outside of the configuration carried out by the user (e.g. level outside configured span)

Diagnostic event and event text

The fault can be identified by means of the diagnostic event.

The event text helps you by providing information on the fault.

If two or more diagnostic events are pending simultaneously, only the diagnostic message with the highest priority is shown.

Other diagnostic messages that are pending can be viewed in the **Diagnostic list** submenu → 120.

Past diagnostic messages that are no longer pending are shown in the **Event logbook** submenu→ 121.

10.2.2 Diagnostic event in the RIA15

A diagnostic event of the Waterpilot FMX21 is not directly shown in the RIA15. The fault F911 only appears directly on the RIA15 in the event of an Waterpilot FMX21 alarm.

Displaying a FMX21 diagnostic event in the RIA15

1. Navigate to: DIAG/TERR
2. Press E
3. Press +
4. Press E
5. Press + 3 times
6. Press E
   ↳ The diagnostic event from the Waterpilot FMX21 is shown on the RIA15 display.

10.2.3 List of diagnostic events

General messages

Diagnostic event		Reason	Corrective measure
Code	Description		
0	No error	-	-

"F" messages

Diagnostic event		Reason	Corrective measure
Code	Description		
F002	Sensor unknown	Sensor does not suit the device (electronic sensor nameplate).	Contact Endress+Hauser Service
F062	Sensor conn.	▪ Faulty sensor. ▪ Electromagnetic effects are greater than specifications in the technical data. This message appears for a short time only.	▪ Check the sensor module cable ▪ Contact Endress+Hauser Service
F081	Initialization	▪ Faulty sensor. ▪ Electromagnetic effects are greater than specifications in the technical data. This message appears for a short time only.	▪ Check sensor cable ▪ Contact Endress+Hauser Service
F083	Memory content	▪ Faulty sensor. ▪ Electromagnetic effects outside the permitted range. This message appears for a short time only.	▪ Restart the device ▪ Contact Endress+Hauser Service
F140	Working range P	▪ Overpressure and low pressure present. ▪ Electromagnetic effects outside the permitted range. ▪ Faulty sensor.	▪ Check the process pressure ▪ Check sensor range
F261	Electronic module	▪ Main electronics defective. ▪ Fault in the main electronics.	Restart the device
F282	Memory	▪ Fault in the main electronics. ▪ Main electronics defective.	Restart the device
F283	Memory content	▪ Main electronics defective. ▪ Electromagnetic effects are greater than specifications in the technical data. ▪ The supply voltage is disconnected when writing. ▪ An error occurred when writing.	Perform a reset
F411	Up-/download	▪ File is defective. ▪ During the download, the data are not correctly transmitted to the processor, e.g. because of open cable connections, spikes (ripple) on the supply voltage or electromagnetic effects.	▪ Repeat download ▪ Use other file ▪ Perform a reset
F510	Linearization	The linearization table is being edited.	▪ Conclude entries ▪ Select "linear"
F511	Linearization	The linearization table consists of less than 2 points.	▪ Table too small ▪ Correct table ▪ Activate table
F512	Linearization	The linearization table is not monotonic increasing or decreasing.	▪ Table not monotonic ▪ Correct table ▪ Activate table
F841	Sensor range	▪ Overpressure or low pressure present. ▪ Faulty sensor.	▪ Check the pressure value ▪ Contact Endress+Hauser Service
F882	Input signal	External measured value is not received or displays a failure status.	▪ Check the bus ▪ Check source device ▪ Check the setting

"M" messages

Diagnostic event		Reason	Corrective measure
Code	Description		
M002	Sens. unknown	Sensor does not suit the device (electronic sensor nameplate). Device continues measuring.	Contact Endress+Hauser Service
M283	Memory content	▪ Cause as indicated for F283. ▪ Correct measurement can continue as long as you do not need the peakhold indicator function.	Perform a reset
M431	Adjustment	The calibration performed would cause the sensor nominal range to be exceeded or undershot.	▪ Check the measuring range ▪ Check position adjustment ▪ Check the setting
M434	Scaling	▪ Values for calibration (e.g. lower range value and upper range value) are too close together. ▪ Lower-range value and/or upper-range value exceed or fall below the range limits of the sensor. ▪ The sensor was replaced and the customer-specific configuration does not suit the sensor module. ▪ Unsuitable download carried out.	▪ Check the measuring range ▪ Check the setting ▪ Contact Endress+Hauser Service
M438	Data set	▪ The supply voltage is disconnected when writing. ▪ An error occurred when writing.	▪ Check the setting ▪ Restart the device
M882	Input signal	External measured value displays a warning status.	▪ Check the bus ▪ Check the source device ▪ Check the setting

"C" messages

Diagnostic event		Reason	Corrective measure
Code	Description		
C412	Backup in prog.	Downloading.	Wait for download to complete.
C482	Simul. output	Simulation of the current output is switched on, i.e. the device is not measuring at present.	End the simulation
C484	Error simul.	Fault state simulation is switched on, i.e. the device is not measuring at present.	End the simulation
C485	Measure simul.	Simulation is switched on, i.e. the device is not measuring at present.	End the simulation
C824	Process pressure	▪ Overpressure or low pressure present. ▪ Electromagnetic effects outside the permitted range. This message appears for a short time only.	▪ Check the pressure value ▪ Restart the device ▪ Perform a reset

"S" messages

Diagnostic event		Reason	Corrective measure
Code	Description		
S110	Operational range T	▪ High temperature or low temperature present. ▪ Electromagnetic effects outside the permitted range. ▪ Faulty sensor.	▪ Check process temperature ▪ Check the temperature range
S140	Working range P LP/HP	▪ Overpressure or low pressure present. ▪ Electromagnetic effects outside the permitted range. ▪ Faulty sensor.	▪ Check the process pressure ▪ Check sensor range

Diagnostic event		Reason	Corrective measure
Code	Description		
S822	Process temp. LP/HP	▪ The temperature measured in the sensor is higher than the upper nominal temperature of the sensor. ▪ The temperature measured in the sensor is lower than the lower nominal temperature of the sensor.	▪ Check temperature ▪ Check the setting
S841	Sensor range	▪ Overpressure or low pressure present. ▪ Faulty sensor.	▪ Check the pressure value ▪ Contact Endress+Hauser Service
S971	Adjustment	▪ The current is outside the permitted range from 3.8 to 20.5 mA. ▪ The present pressure value is outside the configured measuring range (but within the sensor module range, if applicable). ▪ The calibration performed would cause the sensor nominal range to be exceeded or undershot.	▪ Check the pressure value ▪ Check the measuring range ▪ Check the setting

10.3 Troubleshooting specific to Waterpilot FMX21 with optional Pt100

Error description	Reason	Corrective action
No measuring signal	4 to 20 mA cable not connected correctly	Connect device as per → 📄 26.
	No power supplied via the 4 to 20 mA cable	Check current loop.
	Supply voltage too low (min. 10.5 V DC)	▪ Check supply voltage. ▪ Overall resistance greater than max. load resistance
	Waterpilot is defective	Replace the Waterpilot.
Temperature measured value is inaccurate/incorrect (only for Waterpilot FMX21 with Pt100)	Pt100 connected in 2-wire circuit, cable resistance was not compensated for	▪ Compensate the cable resistance. ▪ Connect Pt100 as 3-wire or 4-wire circuit.

10.4 Troubleshooting specific to TMT182 temperature head transmitter

Error description	Reason	Corrective action
No measuring signal	4 to 20 mA cable not connected correctly	Connect device as per → 📄 26.
	No power supplied via the 4 to 20 mA cable	Check current loop.
	Supply voltage too low (min. 10.5 V DC)	▪ Check supply voltage. ▪ Overall resistance greater than max. load resistance
Failure current ≤ 3.6 mA or ≥ 21 mA	Pt100 not connected correctly	Connect device as per → 📄 26.
	4 to 20 mA cable not connected correctly	Connect device as per → 📄 26.
	Pt100 resistance thermometer defective	Replace the Waterpilot.

Error description	Reason	Corrective action
	Temperature head transmitter defective	Replace the temperature head transmitter.
Measured value is inaccurate/ incorrect	Pt100 connected in 2-wire circuit, cable resistance was not compensated for (for more information see BA00139R)	▪ Compensate the cable resistance. ▪ Connect Pt100 as 3-wire or 4-wire circuit.

10.5 Response of output to errors

The behavior of the current output in case of fault is defined by the following parameters:

- "Alarm behav. P (050)"
- "Output fail mode (190)"
- "Max. alarm curr. (052)"

10.6 Firmware history

Date	Firmware version	Modifications	Documentation
05.2009	01.00.zz	Original firmware.	BA00380P/00/EN/03.09
		Compatible with: ▪ FieldCare version 2.02.00 and higher ▪ Field Communicator DXR375 with Device Rev.: 1, DD Rev.: 1	BA00380P/00/EN/07.09
			BA00380P/00/EN/08.09
			BA00380P/00/EN/13.11
			BA00380P/00/EN/14.13
			BA00380P/00/EN/15.15
			BA00380P/00/EN/16.16
			BA00380P/00/EN/17.16
			BA00380P/00/EN/18.18

11 Maintenance

- Terminal box: Keep the GORE-TEX® filter free from contamination
- FMX21 extension cable: Keep the Teflon filter in the pressure compensation tube free from contamination
- Check the process isolating diaphragm for buildup at suitable intervals.

11.1 Exterior cleaning

Please note the following points when cleaning the device:

- The cleaning agents used should not corrode the surface and the seals.
- Mechanical damage to the process isolating diaphragm, e.g. due to sharp objects, must be avoided.
- Only clean the terminal box with water or with a cloth dampened with very diluted ethanol.

12 Repairs

12.1 General notes

12.1.1 Repair concept

Repairs are not possible.

12.1.2 Replacing a device

Once a complete device has been replaced, the parameters can be transferred back into the device using FieldCare:

Prerequisite: The configuration of the old device was saved previously to the computer using FieldCare.

You can continue to measure without performing a new calibration.

12.2 Spare parts

All the spare parts for the measuring device along with the order code are listed In the *W@M Device Viewer* (www.endress.com/deviceviewer) and can be ordered. If available, users can also download the associated Installation Instructions.

Measuring device serial number:
- Is located on the nameplate of the device.
- Can be read out via the "Serial number" parameter in the "Instrument info" submenu.

12.3 Return

The measuring device must be returned in the event of a factory calibration, or if the wrong device has been ordered or delivered.

As an ISO-certified company and also due to legal regulations, Endress+Hauser is obliged to follow certain procedures when handling any returned products that have been in contact with medium. To ensure swift, safe and professional device returns, please read the return procedures and conditions on the Endress+Hauser website at www.services.endress.com/return-material

▶ Select country.
  ↳ The web site of the responsible sales office opens with all of the relevant information relating to returns.

1. If the desired country is not listed:
   Click on the "Choose your location" link.
   ↳ An overview of Endress+Hauser sales offices and representatives opens.
2. Contact your Endress+Hauser sales office or representative.

12.4 Disposal

When disposing, separate and recycle the device components based on the materials.

13 Overview of the operating menu

Depending on the parameter configuration, not all submenus and parameters are available. Information on this can be found in the parameter description under "Prerequisite".

Setup	Description
Operating mode	→ 89
Press. eng. unit	→ 91

14 Description of device parameters

14.1 Expert → System

Operator code

Write permission Operators/Service engineers/Expert

Description Use this function to enter a code to lock or unlock operation.

User entry
- To lock: Enter a number ≠ the release code (value range: 1 to 9999).
- To unlock: Enter the release code.

Note The release code is "0" in the order configuration. Another release code can be defined in the "Code definition" parameter. If the user has forgotten the release code, the release code can be visible by entering the number "5864".

Factory setting 0

Code definition

Write permission Operators/Service engineers/Expert

Description Use this function to enter a release code with which the device can be unlocked.

Options A number from 0 to 9999

Factory setting 0

14.2 Expert → System → Instrument info

Cust. tag number

Write permission Operators/Service engineers/Expert

Description Enter the device tag, e.g. TAG number (max. 8 alphanumeric characters).

Factory setting No entry or according to order specifications

Device tag

Write permission Operators/Service engineers/Expert

Description Enter the device tag, e.g. TAG number (max. 32 alphanumeric characters).

Factory setting No entry or according to order specifications

Serial number

Write permission Parameter is read only. Only Endress+Hauser Service has write permission.

Description Displays the serial number of the device (11 alphanumeric characters).

Firmware Version

Write permission No write permissions. Parameter is read only.

Description Displays the firmware version.

Ext. order code

Write permission Parameter is read only. Only Endress+Hauser Service has write permission.

Description Displays extended order number.

Factory setting According to order specifications

Order identifier

Write permission Parameter is read only. Only Endress+Hauser Service has write permission.

Description Displays the order identifier.

Factory setting According to order specifications

ENP version

Write permission No write permissions. Parameter is read only.

Description Displays the ENP version
(ENP = electronic nameplate)

Electr.serial no.

Write permission No write permissions. Parameter is read only.

Description Displays the serial number of the main electronics (11 alphanumeric characters).

Sensor serial no.

Write permission No write permissions. Parameter is read only.

Description Displays the serial number of the main electronics (11 alphanumeric characters).

14.3 Expert → System → Management

Enter reset code

Write permission Operators/Service engineers/Expert

Description Reset parameters completely or partially to the factory values or order configuration by entering a reset code, see "Resetting to factory settings (reset)" section.→ 39

Factory setting 0

14.4 Expert → Measurement → Measuring mode

Measuring mode

WARNING

Changing the measuring mode affects the span (URV)
This situation can result in product overflow.
- If the measuring mode is changed, the setting for the span (URV) must be checked in the "Setup" operating menu and readjusted if necessary.

Write permission Operators/Service engineers/Expert

Description Select the measuring mode. The operating menu is structured differently depending on the measuring mode selected.

Options
- Pressure
- Level

Factory setting Pressure or according to order specifications

14.5 Expert → Measurement → Basic setup

Pos. zero adjust

Write permission Operators/Service engineers/Expert

Description Position adjustment – the pressure difference between zero (set point) and the measured pressure need not be known.

Example
- Measured value = 2.2 mbar (0.033 psi)
- You correct the measured value via the "Pos. zero adjust" parameter with the "Confirm" option. This means that you are assigning the value 0.0 to the pressure present.
- Measured value (after position adjustment) = 0.0 mbar
- The current value is also corrected.

Options
- Confirm
- Cancel

Factory setting Cancel

Calib. offset

Write permission Service engineers/Expert

Description Position adjustment – the pressure difference between the set point and the measured pressure must be known.

Example
- Measured value = 982.2 mbar (14.73 psi)
- You correct the measured value with the value entered (e.g. 2.2 mbar (0.033 psi)) via the "Calib. Offset" parameter. This means that you are assigning the value 980.0 (14.7 psi) to the pressure present.
- Measured value (after pos. zero adjust) = 980.0 mbar (14.7 psi)
- The current value is also corrected.

Factory setting 0.0

Damping

Write permission Operators/Service engineers/Expert
(if the "Damping" DIP switch is set to "on")

Description Enter damping time (time constant τ).
The damping affects the speed at which the measured value reacts to changes in pressure.

Input range 0.0 to 999.0 s

Factory setting 2.0 sec. or according to order specifications

Press. eng. unit

Write permission
Operators/Service engineers/Expert

Description
Select the pressure engineering unit. If a new pressure engineering unit is selected, all pressure-specific parameters are converted and displayed with the new unit.

Options
- mbar, bar
- mmH2O, mH2O, inH2O
- ftH2O
- Pa, kPa, MPa
- psi
- mmHg, inHg
- kgf/cm^2

Factory setting
mbar or bar depending on the nominal measuring range of the sensor module, or as per order specifications

Temp. eng. unit

Write permission
Service engineers/Expert

Description
Select the unit for the temperature measured values.

Options
- °C
- °F
- K

Note
The setting affects the unit for the "Sensor temp." parameter.

Factory setting
°C

Sensor temp.

Write permission
No write permissions. Parameter is read only.

Description
Displays the temperature currently measured in the sensor module. This can deviate from the process temperature.

14.6 Expert → Measurement → Pressure

Set LRV

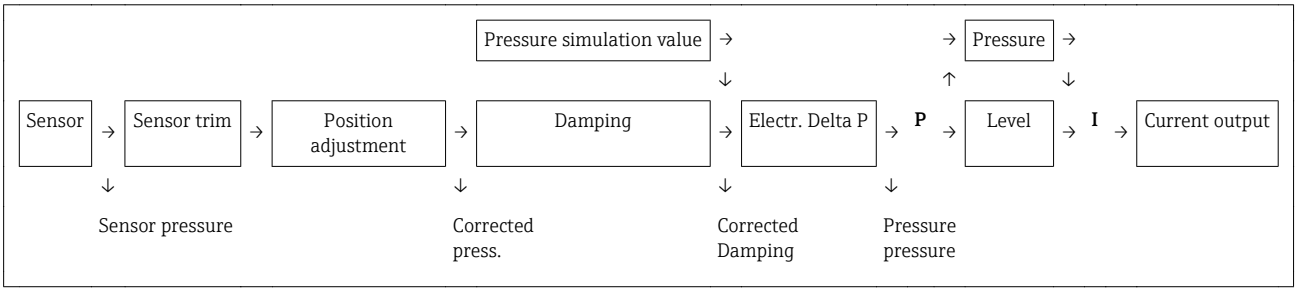
Write permission Operators/Service engineers/Expert

Description Set the pressure value, level or content for the lower current value (4 mA).

Factory setting
- 0.0 % in Level measuring mode
- 0.0 mbar/bar or in accordance with ordering information in Pressure measuring mode

Set URV

Write permission Operators/Service engineers/Expert



Description Set the pressure value, level or content for the upper current value (20 mA).

Factory setting
- 100.0 % in Level measuring mode
- URL Sensor or according to ordering information in Pressure measuring mode

Meas. pressure

Write permission No write permissions. Parameter is read only.

Description Displays the measured pressure after sensor trim, position adjustment and damping.

Sensor pressure

Write permission No write permissions. Parameter is read only.

Description Displays the measured pressure before the sensor trim.

Corrected press.

Write permission No write permissions. Parameter is read only.

Description Displays the measured pressure after sensor trim and position adjustment.

Pressure af.damp

Write permission No write permissions. Parameter is read only.

Description Displays the measured pressure after sensor trim, position adjustment and damping.

14.7 Expert → Measurement → Level

Level selection

Write permission Operators/Service engineers/Expert

Description Select the method for calculating the level

Options
- In pressure
  If this option is selected, specify two pressure/level value pairs. The level value is displayed directly in the unit that you select via the "Output unit" parameter.
- In height
  If this option is selected, specify two height/level value pairs. From the measured pressure, the device first calculates the height using the density. This information is then used to calculate the level in the "Output unit" selected using the two value pairs specified.

Factory setting In pressure

Output unit

Description Select the unit for the measured value display for the level before linearization.

Note The selected unit is used only to describe the measured value i.e. when a new output unit is selected, the measured value is not converted.

Example
- Current measured value: 0.3 ft
- New output unit: m
- New measured value: 0.3 m

Options
- %
- mm, cm, dm, m
- ft, inch
- m^3, in^3
- l, hl
- ft^3
- gal, Igal
- kg, t
- lb

Factory setting %

Height unit

Write permission Operators/Service engineers/Expert

Description Select the height unit. The measured pressure is converted to the selected height unit using the "Adjust Density" parameter.

Prerequisite "Level selection" = "In height"

Options
- mm
- m
- in
- ft

Factory setting m

Calibration mode

Write permission Operators/Service engineers/Expert

Description Select the calibration mode.

Options
- Wet
  Wet calibration takes place by filling and emptying the vessel. In the case of two different levels, the level, volume, mass or percentage value entered is assigned to the pressure measured at this point in time ("Empty calib." and "Full calib." parameters).
- Dry
  Dry calibration is a theoretical calibration. For this calibration, you specify two pressure-level value pairs or height-level value pairs via the following parameters: "Empty calib.", "Empty pressure", "Empty height", "Full calib.", "Full pressure", "Full height".

Factory setting Wet

Empty calib.

Write permission Operators/Service engineers/Expert

Description Enter the output value for the lower calibration point (vessel is empty). The unit defined in "Output unit" must be used.

Note
- In the case of wet calibration, the level (e.g. vessel empty or partially filled) must actually be available. The associated pressure is then automatically recorded by the device.
- In the case of dry calibration, the level (vessel empty) does not have to be available. For the "In pressure" level selection, the associated pressure must be entered in the "Empty pressure" parameter. The associated height must be entered in the "Empty height" parameter for the "In height" level selection.

Factory setting 0.0

Empty pressure

Write permission Operators/Service engineers/Expert

Description Enter the pressure value for the lower calibration point (vessel empty). See also "Empty calib.".

Prerequisite
- "Level selection" = In pressure
- "Calibration mode" = Dry -> entry
- "Calibration mode" = Wet -> display

Factory setting 0.0

Empty height

Write permission Operators/Service engineers/Expert

Description Enter the height value for the lower calibration point (vessel empty). The unit is selected via the "Height unit" parameter.

Prerequisite
- "Level selection" = "In height"
- "Calibration mode" = Dry -> entry
- "Calibration mode" = Wet -> display

Factory setting 0.0

Full calib.

Write permission Operators/Service engineers/Expert

Description Enter the output value for the upper calibration point (vessel full). The unit defined in "Output unit" must be used.

Note
- In the case of wet calibration, the level (e.g. vessel full or partially filled) must actually be available. The associated pressure is then automatically recorded by the device.
- In the case of dry calibration, the level (vessel full) does not have to be available. For the "In pressure" level selection, the associated pressure must be entered in the "Full pressure" parameter. The associated height has to be entered in the "Full height" parameter for the "In height" level selection.

Factory setting 100.0

Full pressure

Write permission Operators/Service engineers/Expert

Description Enter the pressure value for the upper calibration point (vessel full). See also "Full calib.".

Prerequisite
- "Level selection" = In pressure
- "Calibration mode" = Dry -> entry
- "Calibration mode" = Wet -> display

Factory setting URL of the sensor module

Full height

Write permission Operators/Service engineers/Expert

Description Enter the height value for the upper calibration point (vessel full). The unit is selected via the "Height unit" parameter.

Prerequisite
- "Level selection" = "In height"
- "Calibration mode" = Dry -> entry
- "Calibration mode" = Wet -> display

Factory setting URL is converted to a level unit

Density unit

Write permission Service engineers/Expert

Description Displays the density unit. The measured pressure is converted to a height using the "Height unit", "Adjust density" and "Process density" parameters.

Options
- g/cm^3
- kg/m^3
- kg/dm^3
- lb/in^3
- lb/ft^3

Factory setting g/cm^3

Adjust density

Write permission Operators/Service engineers/Expert

Description Enter the density of the medium used to perform the calibration. The measured pressure is converted to a height using the "Height unit" and "Adjust density" parameters.
Input: Auto dens. corr. = Off
Display: Auto dens. corr. ≠ Off

Factory setting 1.0

Process density

Write permission Operators/Service engineers/Expert

Description Enter a new density value for density correction. The calibration was carried out with the medium water, for example. Now the vessel is to be used for another medium with another density. The calibration is corrected appropriately by entering the new density value in the "Process Density" parameter.
Input: Auto dens. corr. = Off
Display: Auto dens. corr. ≠ Off

Note If, after completing a wet calibration, you change to dry calibration using the "Calibration mode" parameter, the density for the "Adjust density" and "Process density" parameters must be entered correctly before changing the calibration mode.

Factory setting 1.0

Level before lin.

Write permission No write permissions. Parameter is read only.

Description Displays the level value prior to linearization.

14.8 Expert → Measurement → Linearization

Lin. mode

Write permission Operators/Service engineers/Expert

Description Select the linearization mode.

Options
- Linear
  The level is output without being converted beforehand. "Level before lin" is output.
- Erase table
  The existing linearization table is deleted.
- Manual entry (sets the table to edit mode, an alarm is output):
  The value pairs of the table (X-value and Y-value) are entered manually.
- Semi-automatic entry (sets the table to edit mode, an alarm is output):
  The vessel is emptied or filled in stages in this entry mode. The device automatically records the level value (X-value). The associated volume, mass or % value is entered manually (Y-value).
- Activate table
  The table entered is activated and checked with this option. The device shows the level after linearization.

Factory setting Linear

Unit after lin.

Write permission Operators/Service engineers/Expert

Description Select volume unit, mass, height or % (unit of the Y-value).

Options
- %
- cm, dm, m, mm
- hl
- in^3, ft^3, m^3,
- l
- in, ft
- kg, t
- lb
- gal
- Igal

Factory setting %

Line-numb

Write permission Operators/Service engineers/Expert

Description Enter the number of the current point in the table. Subsequent entries in "X-val" and "Y-val" relate to this point.

Input range 1...32

X-val

Write permission Operators/Service engineers/Expert

Description Enter the X-value (level before linearization) for the specific point in the table and confirm.

Note
- If "Lin. mode" = "Manual", the level value must be entered.
- If "Lin. mode" = "Semiautomatic", the level value is displayed and must be confirmed by entering the paired Y-value.

Y-value

Write permission Operators/Service engineers/Expert

Description Enter the Y-value (value after linearization) for the specific point in the table. The unit is determined by "Unit after lin.".

Note The linearization table must be monotonic (increasing or decreasing).

Edit table

Write permission Operators/Service engineers/Expert

Description Select the function for entering the table.

Options
- Next point: Enter the next point.
- Current point: stay on the current point to correct a mistake for example.
- Last input point: skip back to previous point to correct a mistake for example.
- Insert point: Insert an additional point (see example below).
- Delete point: Delete the current point (see example below).

Example

Add point, in this case between the 4th and 5th point for example
- Select point 5 via the "Line-numb" parameter.
- Select the "Insert point" option via the "Edit table" parameter.
- Point 5 is displayed for the "Line-numb" parameter. Enter new values for the "X-val" and "Y-val" parameters.

Delete point, in this case the 5th point for example
- Select point 5 via the "Line-numb" parameter.
- Select the "Delete point" option via the "Edit table" parameter.
- The 5th point is deleted. All of the following points are pushed up one number i.e. following deletion, the 6th point becomes Point 5.

Factory setting Current point

Tank description

Write permission Operators/Service engineers/Expert

Description Enter the tank description (max. 32 alphanumeric characters)

Tank content

Write permission No write permissions. Parameter is read only.

Description Displays the level value after linearization.

14.9 Expert → Measurement → Sensor limits

LRL sensor

Write permission No write permissions. Parameter is read only.

Description Displays the lower-range limit of the sensor.

URL sensor

Write permission No write permissions. Parameter is read only.

Description Displays the upper-range limit of the sensor.

14.10 Expert → Measurement → Sensor trim

Lo trim measured

Write permission Parameter is read only. Only Endress+Hauser Service has write permission.

Description Displays the reference pressure present to be accepted for the lower calibration point.

Hi trim measured

Write permission Parameter is read only. Only Endress+Hauser Service has write permission.

Description Displays the reference pressure present to be accepted for the upper calibration point.

Lo trim sensor

Write permission No write permissions. Parameter is read only.

Description Sensor module recalibration by entering a target pressure while simultaneously and automatically accepting a reference pressure present for the lower calibration point.

Hi trim sensor

Write permission No write permissions. Parameter is read only.

Description Sensor module recalibration by entering a target pressure while simultaneously and automatically accepting a reference pressure present for the upper calibration point.

14.11 Expert → Output → Current output

Output current

Write permission Operators/Service engineers/Expert

Description Displays the current current value.

Alarm behav. P

Write permission Operators/Service engineers/Expert

Description Configure the response of the current output if sensor module limits are overshot or undershot.

Options
- Warning
  The device continues to measure. An error message is displayed.
- Alarm
  The output signal assumes a value that can be specified by the "Output fail mode" function.

Factory setting Warning

Output fail mode

Write permission Operators/Service engineers/Expert

Description Select Output fail mode. In the event of an alarm, the current assumes the current value specified with this parameter.

Options
- Max: can be set from 21 to 23 mA, see also "High alarm curr."
- Hold: last measured value is held.
- Min: 3.6 mA

Factory setting Max (22 mA)

Max. alarm curr.

Write permission Operators/Service engineers/Expert

Description Enter the current value for maximum alarm current. See also "Output fail mode".

Input range 21 to 23 mA

Factory setting 22 mA

Set min. current

Write permission Operators/Service engineers/Expert

Description Enter lower current limit.
Some switching units accept no current smaller than 4.0 mA.

Options
- 3.8 mA
- 4.0 mA

Factory setting 3.8 mA

Get LRV

Write permission Operators/Service engineers/Expert

Description Set the lower-range value – reference pressure is present at the device. The pressure for the lower current value (4 mA) is present at the device. Use the "Confirm" option to assign the lower current value to the applied pressure value.

Prerequisite: Pressure measuring mode

Options
- Cancel
- Confirm

Factory setting Cancel

Set LRV

Write permission Operators/Service engineers/Expert

Description Set the pressure value, level or content for the lower current value (4 mA).

Factory setting
- 0.0 % in Level measuring mode
- 0.0 mbar/bar or in accordance with ordering information in Pressure measuring mode

Get URV (pressure measuring mode)

Write permission Operators/Service engineers/Expert

Description Set the upper-range value – reference pressure is present at the device. The pressure for the upper current value (20 mA) is present at the device. Use the "Confirm" option to assign the applied pressure value to the upper current value.

Prerequisite: Pressure measuring mode

Options
- Cancel
- Confirm

Factory setting Cancel

Set URV

Write permission Operators/Service engineers/Expert

Description Set the pressure value, level or content for the upper current value (20 mA).

Factory setting
- 100.0 % in Level measuring mode
- URL Sensor or according to ordering information in Pressure measuring mode

Startcurrent

Write permission Service engineers/Expert

Description Entry of the start current. This setting also applies in the HART Multidrop mode.

Options
- 12 mA
- Max alarm (22 mA, cannot be set)

Factory setting 12 mA

Curr. trim 4mA

Write permission Service engineers/Expert

Description Enter the pressure value for the lower point (4 mA) of the current partial regression lines. Using this parameter and "Curr. trim 20 mA", you can adapt the current output to the transmission conditions.

Options Carry out the current trim for the lower point as follows.
- Select the "Current" option in the "Simulation mode" parameter.
- In the "Sim current" parameter, configure the "4 mA value".
- Enter the current value measured using the switching unit in the "Curr. trim 4mA" parameter.

Input range Measured current ±0.2 mA

Factory setting 4 mA

Curr. trim 20mA

Write permission Service engineers/Expert

Description Enter the pressure value for the upper point (20 mA) of the current partial regression lines. Using this parameter and "Curr. Trim 4 mA", you can adapt the current output to the transmission conditions.

Options Carry out the current trim for the upper point as follows:
- Select the "Current" option in the "Simulation mode" parameter.
- In the "Sim current" parameter, configure the value "20 mA".
- Enter the current value measured using the switching unit in the "Curr. trim 20mA" parameter.

Input range Measured current ±1 mA

Factory setting 20 mA

Offset trim 4mA

Write permission Service engineers/Expert

Description Display/enter the difference between 4 mA and the value entered for the parameter "Curr. trim 4mA".

Factory setting 0

Offset trim 20mA

Write permission Service engineers/Expert

Description Display/enter the difference between 20 mA and the value entered for the parameter "Curr. trim 20mA".

Factory setting 0

14.12 Expert→ Communication → HART config.

Burst mode

Write permission Service engineers/Expert

Description Switching burst mode on and off.

Options
- On
- Off

Factory setting Off

Burst option

Write permission Service engineers/Expert

Description You can use this parameter to define which command is sent to the master.

Options
- 1 (HART command 1)
- 2 (HART command 2)
- 3 (HART command 3)
- 9 (HART command 9)
- 33 (HART command 33)

Factory setting 1 (HART command 1)

Current mode

Write permission Service engineers/Expert

Description Configure current mode for HART communication.

Options
- Signaling
  Measured value transmission by the current value
- Fixed
  Fixed current 4.0 mA (Multidrop mode)
  (Measured value transmission via HART digital communication only)

Factory setting Signaling

Bus address

Write permission	Service engineers/Expert
Description	Use this function to enter the address via which a data exchange is to take place via HART protocol. (HART 5.0 master: Range 0 to 15, where address = 0 calls up the "Signaling" setting; HART 6.0 master: Range 0 to 63)
Factory setting	0

Preamble number

Write permission	Service engineers/Expert
Description	Use this function to enter the number of preambles in the HART protocol. (Synchronization of the modem components along a transmission path, each modem component could "swallow" one byte, at least 2 bytes must be the preamble.)
Input range	2...20
Factory setting	5

14.13 Expert→ Communication → HART info

Device type code

Write permission No write permissions. Parameter is read only.

Description Display of the numerical ID of the device
Waterpilot FMX21: 36

Device revision

Write permission No write permissions. Parameter is read only.

Description Display of Device Revision (e.g. 1)

Manufacturer ID

Write permission No write permissions. Parameter is read only.

Description Displays the HART manufacturer ID in a decimal digit format.
Here: 17 (Endress+Hauser)

HART version

Write permission No write permissions. Parameter is read only.

Description Displays HART version .
Waterpilot FMX21: 6

Description

Write permission Service engineers/Expert

Description Enter the tag description (max. 16 alphanumeric characters)

HART message

Write permission Service engineers/Expert

Description Enter the message (max. 32 alphanumeric characters) Upon request from the master, this message is sent via the HART protocol.

HART date

Write permission Service engineers/Expert

Description Enter the date of the last configuration change.

Factory setting DD/MM/YY (date of the final test)

14.14 Expert→ Communication → HART output

Primary value is

Write permission No write permissions. Parameter is read only.

Description Indicates which measured value is transmitted via the HART protocol as the primary process value.

Factory setting Depending on the selected measuring mode, the following measured values can be displayed:
- "Pressure" measuring mode: "Meas. pressure"
- "Level" measuring mode, Lin. mode "Linear": "Level before Lin"
- "Level" measuring mode, Lin. mode "Activate table": "Tank content"

Primary value

Write permission No write permissions. Parameter is read only.

Description The primary value is displayed.

Secondary val.is

Write permission No write permissions. Parameter is read only.

Description Indicates which measured value is transmitted via the HART protocol as the secondary process value. The process value is configured via HART command 51.

Factory setting
- "Pressure" measuring mode: "Corrected press."
- "Level" measuring mode, "Linear" lin. mode: "Meas. pressure"
- "Level" measuring mode, Lin. mode "Activate table": "Level before linearization"

Display Depending on the selected measuring mode, the following measured values can be displayed:
- "Meas. pressure"
- "Sensor pressure"
- "Corrected press."
- "Pressure af.damp"
- "Sensor temp."
- "Level before Lin"
- "Tank content"
- "Process density" (corrected)

Secondary value

Write permission No write permissions. Parameter is read only.

Description The secondary value is displayed.

Third value is

Write permission No write permissions. Parameter is read only.

Description Indicates which measured value is transmitted via the HART protocol as the third process value. The process value is configured via HART command 51.

Factory setting
- "Pressure" measuring mode: "Sensor pressure"
- "Level" measuring mode, "Linear" lin. mode: "Corrected press."
- "Level" measuring mode, "Activate table" lin. mode: "Meas. pressure"

Display Depending on the selected measuring mode, the following measured values can be displayed:
- "Meas. pressure"
- "Sensor pressure"
- "Corrected press."
- "Pressure af.damp"
- "Sensor temp."
- "Level before Lin"
- "Tank content"
- "Process density" (corrected)

Third value is

Write permission No write permissions. Parameter is read only.

Description The third value is displayed.

4th value is

Write permission No write permissions. Parameter is read only.

Description Indicates which measured value is transmitted via the HART protocol as the fourth process value. The process value is configured via HART command 51.

Factory setting
- "Pressure" measuring mode: "Sensor temp"
- "Level" measuring mode, "Linear" lin. mode: "Sensor temp."
- "Level" measuring mode, "Activate table" lin. mode: "Sensor temp."

Display Depending on the selected measuring mode, the following measured values can be displayed:

- "Meas. pressure"
- "Sensor pressure"
- "Corrected press."
- "Pressure af.damp"
- "Sensor temp."
- "Level before Lin"
- "Tank content"
- "Process density" (corrected)

4th value

Write permission No write permissions. Parameter is read only.

Description The fourth value is displayed.

14.15 Expert→ Communication → HART input

HART input value

Write permission No write permissions. Parameter is read only.

Description Display of the HART input value

HART input stat.

Write permission No write permissions. Parameter is read only.

Description Display of the HART input status
Bad / Uncertain / Good

HART input unit

Write permission No write permissions. Parameter is read only.

Description Display of the unit for the HART input value.

Display
- Unknown
- mbar, bar
- mmH2O, ftH2O, inH2O
- Pa, hPa, kPa, MPa
- psi
- mmHg, inHg
- Torr
- g/cm^2, kg/cm^2
- lb/ft^2
- atm
- °C, °F, K, R

Factory setting Unknown

HART input form.

Write permission Operators/Service engineers/Expert

Description Number of decimal places of the displayed input value.

Options

- x.x
- x.xx
- x.xxx
- x.xxxx
- x.xxxxx

Factory setting

x.x

14.16 Expert → Application

Electr. Delta P

Write permission Operators/Service engineers/Expert

Description For switching the Electr. Delta P application off or on with an external or constant value.

Options
- Off
- External value
- Constant

Factory setting Off

Fixed ext. value

Write permission Operators/Service engineers/Expert

Description Use this function to enter the constant value. The value refers to "HART input unit"

Factory setting 0.0

Auto dens. corr.

Write permission Operators/Service engineers/Expert

Description For switching the auto dens. corr. application off or on with an external or internal temperature value.
Before performing a calibration (dry or wet), auto-density compensation must be switched on if this function is to be used. As soon as "Auto dens. corr." is switched on, the field for entering the "Process density" and "Adjust density" is disabled.
The calibration density remains the last value until it is overwritten by a calibration. The process density remains the last value until it is overwritten when the system recalculates the value.
Automatic density compensation is performed for the 0 to 70 °C (32 to 158 °F) temperature range. The density values for water are used for this density compensation.

Prerequisite Level mode

Options
- Off
- Sensor temperature
- External value (only if Off or Constant is selected for Electr. Delta P)

Factory setting
- Off
- On (if the option "IC" was selected in the "Service" order code when ordering)

14.17 Expert → Diagnosis

Diagnostic code

Write permission No write permissions. Parameter is read only.

Description Displays the diagnostic message with the highest priority currently present.

Last diag. code

Write permission No write permissions. Parameter is read only.

Description Displays the last diagnostic message that occurred and was rectified.

Note
- Digital communication: the last message is displayed.
- Use the "Reset logbook" parameter to clear the messages listed in the parameter "Last diag. code".

Reset logbook

Write permission Service engineers/Expert

Description Use this parameter to reset all messages of the parameter "Last diag. code" and the event logbook "Last diag. 1" to "Last diag. 10".

Options
- Cancel
- Confirm

Factory setting Cancel

Min. meas. press.

Write permission No write permissions. Parameter is read only.

Description Displays the lowest pressure value measured (peakhold indicator). You can reset this indicator by means of the "Reset peakhold" parameter.

Max. meas. press.

Write permission No write permissions. Parameter is read only.

Description Displays the highest pressure value measured (peakhold indicator). You can reset this indicator by means of the "Reset peakhold" parameter.

Reset peakhold

Write permission Service engineers/Expert

Description You can reset the "Min. meas. press." and "Max. meas. press." indicators with this parameter.

Options
- Cancel
- Confirm

Factory setting Cancel

Operating hours

Write permission No write permissions. Parameter is read only.

Description Displays the hours of operation. This parameter cannot be reset.

Config. counter

Write permission Operators/Service engineers/Expert

Description Displays the configuration counter.
This counter is increased by one every time a parameter or group is changed. The counter counts up to 65535 and then starts again at zero.

14.18 Expert → Diagnosis → Diagnostic list

Diagnostic 1 (075)
Diagnostic 2 (076)
Diagnostic 3 (077)
Diagnostic 4 (078)
Diagnostic 5 (079)
Diagnostic 6 (080)
Diagnostic 7 (081)
Diagnostic 8 (082)
Diagnostic 9 (083)
Diagnostic 10 (084)

Write permission No write permissions. Parameter is read only.

Description This parameter contains up to ten diagnosis messages that are currently pending, arranged in order of priority.

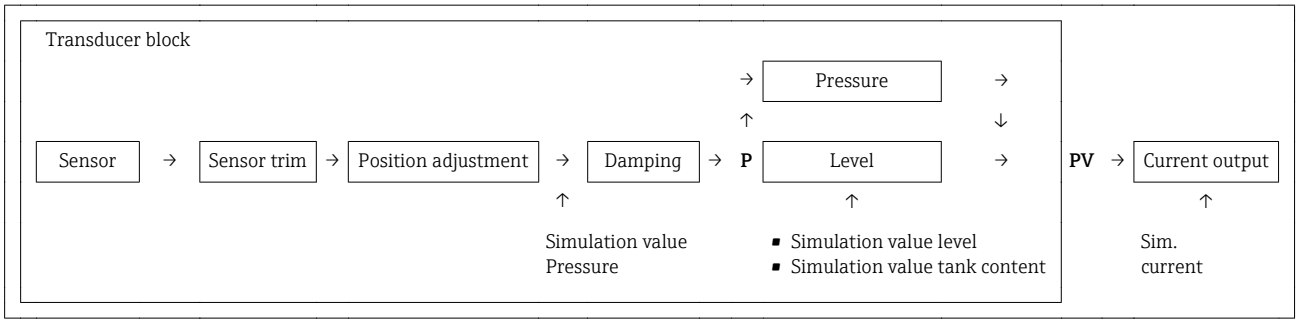
14.19 Expert → Diagnosis→ Event logbook

Last diag. 1 (085)
Last diag. 2 (086)
Last diag. 3 (087)
Last diag. 4 (088)
Last diag. 5 (089)
Last diag. 6 (090)
Last diag. 7 (091)
Last diag. 8 (092)
Last diag. 9 (093)
Last diag. 10 (094)

Write permission
No write permissions. Parameter is read only.

Description
This parameter contains the last 10 diagnosis messages to occur and be rectified. They can be reset using the "Reset logbook" parameter.
Errors which have occurred multiple times are displayed once only.
Errors may also appear multiple times if another error has occurred in the meantime. The messages are displayed in chronological order.

14.20 Expert → Diagnosis → Simulation



Simulation mode

Write permission Operators/Service engineers/Expert

Description Switch on simulation and select the simulation mode. When changing the measuring mode or the "Lin. mode" level type or when the device is restarted, any simulation that may be running is switched off.

Options
- None
- Pressure →see this table, "Sim. pressure" parameter
- Level, → see this table, "Sim. level" parameter
- Tank content, → see this table, "Sim. tank cont." parameter
- Current, → see this table, "Sim. current" parameter
- Alarm/warning, → see this table, "Sim. error no."

Factory setting None

Sim. pressure

Write permission Operators/Service engineers/Expert

Description Enter the simulation value. See also "Simulation mode".

Prerequisite "Simulation mode" = Pressure

Value at switch-on Current pressure measured value

Sim. level

Write permission Operators/Service engineers/Expert

Description Enter the simulation value. See also "Simulation mode".

Prerequisite "Measuring mode" = Level and "Simulation mode" = Level

Value at switch-on Current level measured value

Sim. tank cont.

Write permission Operators/Service engineers/Expert

Description Enter the simulation value. See also "Simulation mode".

Prerequisite "Measuring Mode" = level, Lin mode "Activate table" and "Simulation Mode" = Tank content

Value at switch-on Current tank content

Sim. current

Write permission Operators/Service engineers/Expert

Description Enter the simulation value. See also "Simulation mode".

Prerequisite "Simulation Mode" = Current value

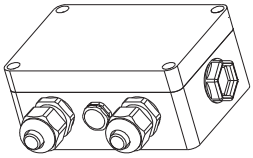
Value at switch-on Current current value

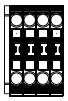
Sim. alarm/warning

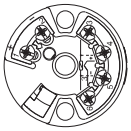
Write permission Operators/Service engineers/Expert

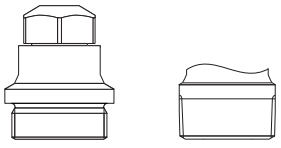
Description Enter the simulation value. See also "Simulation mode".

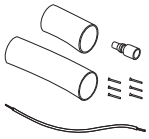
Prerequisite "Simulation Mode" = Alarm/Warning



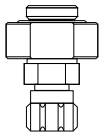


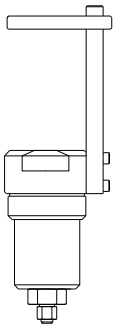


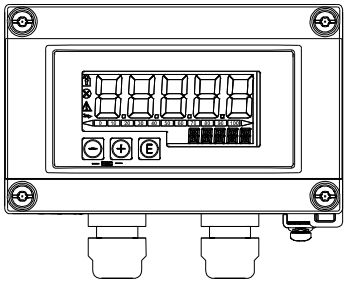


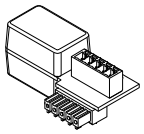


Factory setting: 484 (Simulation active)









15 Accessories

⚠ CAUTION

Observe the additional information in the individual sections!

- For additional information, see the sections "Mechanical construction" (in Technical Information TI00431P), "Environment", → 134, "Process" → 136 and "Installation" → 18.

Designation	Diagram	Description	Order number / ordering information
Suspension clamp	 A0030950	For easy installation of the FMX21, Endress+Hauser offers a mounting clamp .	▪ 52006151 ▪ Product Configurator order code for "Accessory enclosed", option "PO"
Terminal box	 A0030967	Terminal box for terminal strip, temperature head transmitter and Pt100.	▪ 52006152 ▪ Product Configurator order code for "Accessories enclosed", option "PS"
4-terminal strip/terminals	 A0030951	4-terminal strip for wiring	52008938
TMT182 temperature head transmitter for FMX21 4 to 20 mA HART	 A0030952	PC-programmable (PCP) temperature head transmitter for the conversion of various input signals	▪ 51001023 ▪ Product Configurator order code for "Accessories enclosed", option "PT"
Cable mounting screws	A B  A0030953 *A G 1½" A* *B NPT 1½"*	Endress+Hauser offers a cable mounting screw for easy FMX21 mounting and to seal the measuring aperture.	▪ G 1½" A – 52008264 – Product Configurator order code for "Accessories enclosed", option "PQ" ▪ NPT 1½" – 52009311 – Product Configurator order code for "Accessories enclosed", option "PR"
Additional weight for FMX21 with outer diameter 22 mm (0.87 in) or 29 mm (1.14 in)	 A0030954	Endress+Hauser offers additional weights to prevent sideways movement that results in measuring errors, or to make it easier to lower the device in a guide tube.	▪ 52006153 ▪ Product Configurator order code for "Accessories enclosed", option "PU"
Cable shortening kit	 A0030948	The cable shortening kit is used to shorten a cable easily and professionally.	▪ 71222671 ▪ Product Configurator order code for "Accessories enclosed", option "PW"

Designation	Diagram	Description	Order number / ordering information
Testing adapter for FMX21 with outer diameter 22 mm (0.87 in) or 29 mm (1.14 in)	 A0030956	Endress+Hauser offers a testing adapter to ease function-testing of the level probes.	▪ 52011868 ▪ Product Configurator order code for "Accessories enclosed", option "PV"
Testing adapter for FMX21 with outer diameter 42 mm (1.65 in)	 A0030957	Endress+Hauser offers a testing adapter to ease function-testing of the level probes. ▪ Observe the maximum pressure for compressed air hose and maximum overload for level probe ▪ Maximum pressure for the quick coupling piece provided: 10 bar (145 psi)	71110310
RIA15 in the field housing	 A0036164	Remote display RIA15 non-hazardous	Product structure, feature 620 "Accessory enclosed", option R4 "Remote display RIA15 non-hazardous area, field housing"
		Remote display RIA15 hazardous	Product structure, feature 620 "Accessory enclosed", option R5 "Remote display RIA15 Ex= explosion protection approval, field housing"
HART communication resistor	 A0036165	HART communication resistor, hazardous / non-hazardous area, for use with RIA15	Product structure, feature 620 "Accessory enclosed", option R6 "HART communication resistor hazardous / non-hazardous area"

15.1 Service-specific accessories

Accessories	Description
DeviceCare SFE100	Configuration tool for HART, PROFIBUS and FOUNDATION Fieldbus field devices Technical Information TI01134S DeviceCare is available for download at www.software-products.endress.com. You need to register in the Endress+Hauser software portal to download the application.
FieldCare SFE500	FDT-based plant asset management tool FieldCare can configure all smart field units in your plant and helps you manage them. By using the status information, FieldCare is also a simple but effective way of checking the status and condition of the field devices. Technical Information TI00028S

16 Technical data

16.1 Input

16.1.1 Measured variable

FMX21 + Pt100 (optional)

- Hydrostatic pressure of a liquid
- Pt100: Temperature

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

Temperature

16.1.2 Measuring range

- Customer-specific measuring ranges or calibration that has been preset in the factory
- Temperature measurement of −10 to +70 °C (+14 to +158 °F) with Pt100 (optional)

Relative pressure

Sensor measuring range [bar (psi)]	Lowest calibratable span [1] [bar (psi)]	Vacuum resistance [bar_{abs} (psi_{abs})]	Option [2]
0.1 (1.5)	0.01 (0.15)	0.3 (4.5)	1C
0.2 (3.0)	0.02 (0.3)	0.3 (4.5)	1D
0.4 (6.0)	0.04 (1.0)	0	1F
0.6 (9.0)	0.06 (1.0)	0	1G
1.0 (15.0)	0.1 (1.5)	0	1H
2.0 (30.0)	0.2 (3.0)	0	1K
4.0 (60.0)	0.4 (6.0)	0	1M
10.0 (150) [3]	1.0 (15)	0	1P
20.0 (300) [3]	2.0 (30)	0	1Q

1) Largest turn down that can be configured at the factory: 10:1, higher turn down can be configured on request or in the device (for FMX21 4 to 20 mA HART).
2) Product Configurator order code for "Sensor range"
3) These measuring ranges are not available for the special version with plastic insulation, external diameter of 29 mm (1.14 in).

Absolute pressure

Sensor measuring range [bar (psi)]	Lowest calibratable span [1] [bar (psi)]	Vacuum resistance [bar_{abs} (psi_{abs})]	Option [2]
2.0 (30.0)	0.2 (3.0)	0	2K
4.0 (60.0)	0.4 (6.0)	0	2M

Sensor measuring range [bar (psi)]	Lowest calibratable span [1] [bar (psi)]	Vacuum resistance [bar_{abs} (psi_{abs})]	Option [2]
10.0 (150) [3]	1.0 (15)	0	2P
20.0 (300) [3]	2.0 (30)	0	2Q

1) Largest turn down that can be configured at the factory: 10:1, higher turn down can be configured on request or in the device (for FMX21 4 to 20 mA HART).
2) Product Configurator order code for "Sensor range"
3) These measuring ranges are not available for the special version with plastic insulation, external diameter of 29 mm (1.14 in).

16.1.3 Input signal

FMX21 + Pt100 (optional)

- Change in capacitance
- Pt100: Change in resistance

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

Pt100 resistance signal, 4 wire

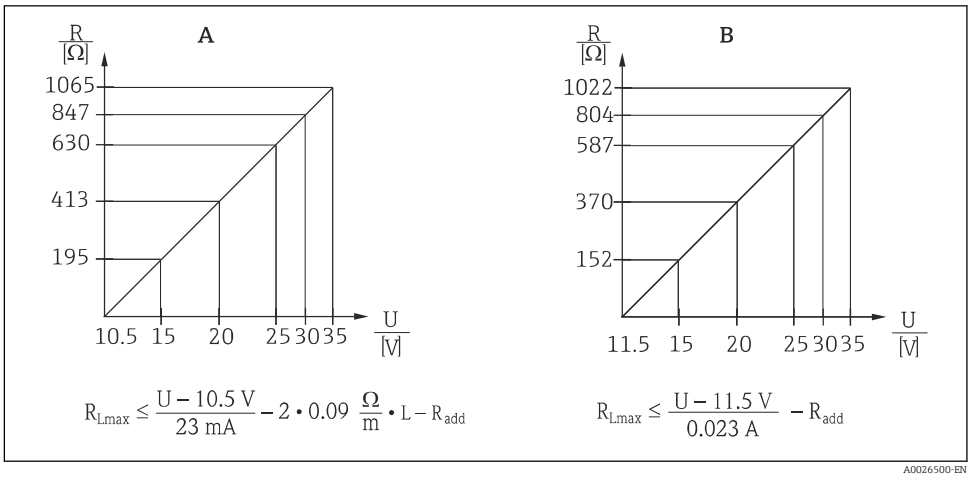
16.2 Output

16.2.1 Output signal

FMX21 + Pt100 (optional)

- 4 to 20 mA HART with superimposed digital communication protocol HART 6.0, 2-wire for hydrostatic pressure measured value.
  Ordering information: Product Configurator order code for "Output", option "2"
  Options:
  – Max. alarm (factory setting 22mA): can be set from 21 to 23 mA
  – Hold measured value: last measured value is held
  – Min. alarm: 3.6 mA
- Pt100: temperature-dependent resistance value

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART



4 to 20 mA HART with superimposed digital communication protocol HART 5.0 for temperature measured value, 2-wire

16.2.2 Signal range

3.8 mA to 20.5 mA

16.2.3 Maximum load for FMX21 4 to 20 mA HART

The maximum load resistance depends on the supply voltage (U) and must be determined individually for each current loop, see formula and diagrams for FMX21 and temperature head transmitter. The total resistance resulting from the resistances of the connected devices, the connecting cable and, where applicable, the resistance of the extension cable may not exceed the load resistance value.

A FMX21 4 to 20 mA HART load chart for estimating the load resistance. Additional resistances, such as the resistance of the extension cable, have to be subtracted from the value calculated as shown in the equation.

B Load diagram for TMT182 temperature head transmitter for estimating the load resistance. Additional resistances must be subtracted from the value calculated as shown in the equation

R_{Lmax} Max. load resistance [Ω]

R_{add} Additional resistances such as resistance of evaluating device and/or display unit, cable resistance [Ω]

U Supply voltage [V]

L Basic length of extension cable [m] (cable resistance per wire 0.09 Ω/m)

- When using the measuring device in hazardous areas, installation must comply with the corresponding national standards and regulations and the Safety Instructions or Installation or Control Drawings (XA).
- When operating via a handheld terminal or via a PC with an operating program, a minimum communication resistance of 250 Ω must be taken into account.

16.2.4 Protocol-specific data for FMX21 4 to 20 mA HART

Manufacturer ID	17 (11 hex)
Device type code	25 (19 hex)
Device revision	01 (01 hex) - SW version 01.00.zz
HART specification	6
DD revision	01
Device description files (DTM, DD)	Information and files under: ▪ www.endress.com ▪ www.fieldcommgroup.org
HART load	Min. 250 Ω
HART device variables	The dynamic variables SV, TV and QV may be assigned to any device variable: **Standard process values for SV, TV (second and third device variable) are dependent on the measuring mode:** ▪ Pressure ▪ Level **Standard process value for QV (fourth device variable) is the sensor temperature:** Temperature **Measured values for PV (first device variable) are dependent on the measuring mode:** ▪ Pressure ▪ Level ▪ Tank content
Supported functions	▪ Burst mode ▪ Additional transmitter status ▪ Device locking ▪ Alternative measuring modes ▪ Catch variable ▪ Long tag

16.3 Performance characteristics

16.3.1 Reference operating conditions

FMX21 + Pt100 (optional)

- As per IEC 60770
- Ambient temperature T_U = constant, in the range of +21 to +33 °C (+70 to +91 °F)
- Humidity φ = constant, in the range of 20 to 80 % rH
- Ambient pressure p_U = constant, in the range of 860 to 1060 mbar (12.47 to 15.37 psi)
- Position of measuring cell constant, vertical in the range of ±1°
- Input of LOW SENSOR TRIM and HIGH SENSOR TRIM for lower range value and upper range value (only for HART)
- Supply voltage constant: 21 V DC to 27 V DC
- Load with HART: 250 Ω
- Pt100: DIN EN 60770, T_U = +25 °C (+77 °F)

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

Calibration temperature +25 °C (+77 °F) ±5 K

16.3.2 Reference accuracy

FMX21 + Pt100 (optional)

The reference accuracy comprises the non-linearity after limit point configuration, hysteresis and non-reproducibility in accordance IEC 60770.

Standard version [2]:
Setting ±0.2 %
– to TD 5:1: < 0.2 % of set span
– from TD 5:1 to TD 20:1 ±(0.02 x TD+0.1)

Platinum version [3]:
- Setting ±0.1 % (optional)
  – to TD 5:1: < 0.1 % of set span
  – from TD 5:1 to TD 20:1 ±(0.02 x TD)
- Class B as per DIN EN 60751
  Pt100: max. ±1 K

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

- ±0.2 K
- With Pt100: max. ±0.9 K

16.3.3 Resolution

Current output: 1 µA

Reading cycle

HART commands: on average 2 to 3 per second

2) Ordering information: Product Configurator order code for "Reference accuracy", option "G"
3) Ordering information: Product Configurator order code for "Reference accuracy", option "D"

16.3.4 Long-term stability

FMX21 + Pt100 (optional)

- ≤ 0.1 % of URL/year
- ≤ 0.25 % of URL/5 years

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

≤ 0.1 K per year

16.3.5 Influence of medium temperature

- Thermal change in the zero output and the output span:
  0 to +30 °C (+32 to +86 °F): < (0.15 + 0.15 x TD)% of set span
  −10 to +70 °C (+14 to +158 °F): < (0.4 + 0.4 x TD)% of set span
- Temperature coefficient (T_K) of the zero output and the output span
  −10 to +70 °C (+14 to +158 °F): 0.1 % / 10 K of URL

16.3.6 Warm-up period

FMX21 + Pt100 (optional)

- FMX21: < 6 s
- Pt100: 300 s

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

4 s

16.3.7 Response time

FMX21 + Pt100 (optional)

- FMX21: 400 ms (T90 time), 500 ms (T99 time)
- Pt100: 160 s (T90 time), 300 s (T99 time)

16.4 Environment

16.4.1 Ambient temperature range

FMX21 + Pt100 (optional)

- With external diameter of 22 mm (0.87 in) and 42 mm (1.65 in):
  −10 to +70 °C (+14 to +158 °F) (= medium temperature)
- With external diameter of29 mm (1.14 in):
  0 to +50 °C (+32 to +122 °F) (= medium temperature)

Cable

(when mounted in a fixed position)
- With PE: −30 to +70 °C (−22 to +158 °F)
- With FEP: −40 to +70 °C (−40 to +158 °F)
- With PUR: −40 to +70 °C (−40 to +158 °F)

Terminal box

−40 to +80 °C (−40 to +176 °F)

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

−40 to +85 °C (−40 to +185 °F)

Temperature head transmitter 2-wire, configured for a measuring range of −20 to +80 °C (−4 to +176 °F). This configuration offers a temperature range of 100 K which can be easily mapped. Please note that the Pt100 resistance temperature detector is suitable for a temperature range of −10 to +70 °C (14 to +158 °F)

The TMT182 temperature head transmitter is not designed for use in hazardous areas incl. CSA GP.

16.4.2 Storage temperature range

FMX21 + Pt100 (optional)

−40 to +80 °C (−40 to +176 °F)

Cable

(when mounted in a fixed position)
- With PE: −30 to +70 °C (−22 to +158 °F)
- With FEP: −30 to +80 °C (−22 to +176 °F)
- With PUR: −40 to +80 °C (−40 to +176 °F)

Terminal box

−40 to +80 °C (−40 to +176 °F)

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

−40 to +100 °C (−40 to +212 °F)

16.4.3 Degree of protection

FMX21 + Pt100 (optional)

IP68, permanently hermetically sealed at 20 bar (290 psi) (~200 m H_2O)

Terminal box (optional)

IP66, IP67

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

IP00, condensation permitted

16.4.4 Electromagnetic compatibility (EMC)

FMX21 + Pt100 (optional)

- EMC in accordance with all relevant requirements of EN 61326 series. For details, refer to the Declaration of Conformity.
- Maximum deviation: < 0.5 % of span.

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

EMC in accordance with all relevant requirements of EN 61326 series. For details, refer to the Declaration of Conformity.

16.4.5 Overvoltage protection

FMX21 + Pt100 (optional)

- Integrated overvoltage protection as per EN 61000-4-5 (500 V symmetrical/1000 V asymmetrical)
- Overvoltage protection ≥ 1.0 kV, external if necessary

TMT182 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

Provide overvoltage protection, externally if necessary (see Technical Information).

16.5 Process

16.5.1 Medium temperature range

FMX21 + Pt100 (optional)

- With external diameter of 22 mm (0.87 in) and 42 mm (1.65 in):
  −10 to +70 °C (+14 to +158 °F)
- With external diameter of 29 mm (1.14 in):
  0 to +50 °C (+32 to +122 °F)

TMT181 temperature head transmitter (optional) for FMX21 4 to 20 mA HART

−40 to +85 °C (−40 to +185 °F)

(= ambient temperature), install temperature head transmitter outside the medium.

Temperature head transmitter 2-wire, configured for a measuring range of −20 to +80 °C (−4 to +176 °F). This configuration offers a temperature range of 100 K which can be easily mapped. Please note that the Pt100 resistance temperature detector is suitable for a temperature range of −10 to +70 °C (14 to +158 °F)

The TMT182 temperature head transmitter is not designed for use in hazardous areas incl. CSA GP.

16.5.2 Medium temperature limit

FMX21 + Pt100 (optional)

With external diameter of 22 mm (0.87 in) and 42 mm (1.65 in):
−20 to +70 °C (−4 to +158 °F)

In hazardous areas incl. CSA GP, the medium temperature limit is −10 to +70 °C (+14 to +158 °F).

With external diameter of29 mm (1.14 in): 0 to +50 °C (+32 to +122 °F)

The FMX21 may be operated in this temperature range. The specification values, such as accuracy, may be exceeded.

16.5.3 Pressure specifications

⚠ WARNING

The maximum pressure for the measuring device depends on the lowest-rated element with regard to pressure.

- For pressure specifications, see the "Measuring range" section and the "Mechanical construction" section.
- The measuring device must be operated only within the specified limits!
- The Pressure Equipment Directive (2014/68/EU) uses the abbreviation "PS". The abbreviation "PS" corresponds to the MWP (maximum working pressure) of the measuring device.
- MWP (maximum working pressure): The MWP (maximum working pressure) is specified on the nameplate. This value refers to a reference temperature of +20 °C (+68 °F) and may be applied to the device for an unlimited time. Observe temperature dependency of the MWP.
- OPL (Over Pressure Limit = sensor overload limit): The test pressure corresponds to the over pressure limit of the sensor and may only be applied for a limited time period to ensure measurement within specification and in order to avoid permanent damage. In the case of sensor range and process connections where the over pressure limit (OPL) of the process connection is smaller than the nominal value of the sensor, the device is set at the factory, at the very maximum, to the OPL value of the process connection. If you want to use the entire sensor range, select a process connection with a higher OPL value.
- avoid steam hammering! Steam hammering can cause zero point drifts. Recommendation: Residue (such as condensation or drops of water) can remain on the process isolating diaphragm after CIP cleaning and lead to local steam hammering if steam cleaning is performed again. In practice, drying the process isolating diaphragm (e.g. by blowing) has proved to prevent steam hammering.

1 Introduction and Safety

1.1 Introduction

Purpose of the manual

The purpose of this manual is to provide necessary information for installation, operation, and maintenance of the unit.

Read and keep the manual

Save this manual for future reference, and keep it readily available at the location of the unit.

CAUTION:

Read this manual carefully before installing and using the product. Improper use of the product can cause personal injury and damage to property, and may void the warranty.

The equipment, and its functioning, may be impaired if used in a manner not specified by the manufacturer.

Intended use

WARNING:

Operating, installing, or maintaining the unit in any way that is not covered in this manual could cause death, serious personal injury, or damage to the equipment and the surroundings. This includes any modification to the equipment or use of parts not provided by Xylem. If there is a question regarding the intended use of the equipment, please contact a Xylem representative before proceeding.

1.2 Safety terminology and symbols

About safety messages

It is extremely important that you read, understand, and follow the safety messages and regulations carefully before handling the product. They are published to help prevent these hazards:

- Personal accidents and health problems
- Damage to the product and its surroundings
- Product malfunction

Hazard levels

Hazard level		Indication
	DANGER:	A hazardous situation which, if not avoided, will result in death or serious injury
	WARNING:	A hazardous situation which, if not avoided, could result in death or serious injury
	CAUTION:	A hazardous situation which, if not avoided, could result in minor or moderate injury

Hazard level	Indication
NOTICE:	Notices are used when there is a risk of equipment damage or decreased performance, but not personal injury.

Special symbols

Some hazard categories have specific symbols, as shown in the following table.

Electrical hazard	Magnetic fields hazard
 Electrical Hazard:	 CAUTION:

1.3 User safety

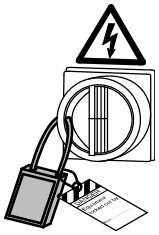
Introduction

All government regulations, local health and safety directives must be observed.

Prevent danger due to electricity

All danger due to electricity must be avoided. Electrical connections must always be carried out in compliance with the following:

- The standard connections shown in the product documentation that is delivered together with the product
- All international, national, state, and local regulations. (For details, consult the regulations of your local electricity supplier.)



For more information about requirements, see sections dealing specifically with electrical connections.

1.3.1 Power lock-out

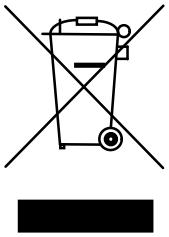
DANGER: Electrical Hazard

Before starting work on the unit, make sure that the unit and the control panel are isolated from the power supply and cannot be energized. This applies to the control circuit as well.

1.3.2 Qualification of personnel

WARNING: Electrical Hazard

Risk of electrical shock or burn. A certified electrician must supervise all electrical work. Comply with all local codes and regulations.



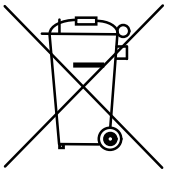
All work on the product must be carried out by certified electricians or Xylem authorized mechanics.

Xylem disclaims all responsibility for work done by untrained, unauthorized personnel.

1.4 End of life product disposal

Handle and dispose of all waste in compliance with local laws and regulations.

EU only: Correct disposal of this product – WEEE Directive on waste electrical and electronic equipment



This marking on the product, accessories or literature indicates that the product should not be disposed of with other waste at the end of its working life.

To prevent possible harm to the environment or human health from uncontrolled waste disposal, please separate these items from other types of waste and recycle them responsibly to promote the sustainable reuse of material resources.

Waste from electrical and electronic equipment can be returned to the producer or distributor.

EU only: Correct disposal of batteries in this product

This marking on the battery, manual or packaging indicates that the batteries in this product should not be disposed of with other waste at the end of its working life. Where marked, the chemical symbols Hg, Cd or Pb indicate that the battery contains mercury, cadmium or lead above the reference levels in EC Directive 2006/66. If batteries are not properly disposed of, these substances can cause harm to human health or the environment.

To protect natural resources and to promote material re-use, please separate batteries from other types of waste and recycle them through your local, free battery return system.

1.5 Spare parts

CAUTION:

Only use the manufacturer's original spare parts to replace any worn or faulty components. The use of unsuitable spare parts may cause malfunctions, damage, and injuries as well as void the warranty.

1.6 Warranty

For information about warranty, see the sales contract.

1.7 Support

Xylem only supports products that have been tested and approved. Xylem does not support unapproved equipment.

2 Product Description

2.1 Introduction

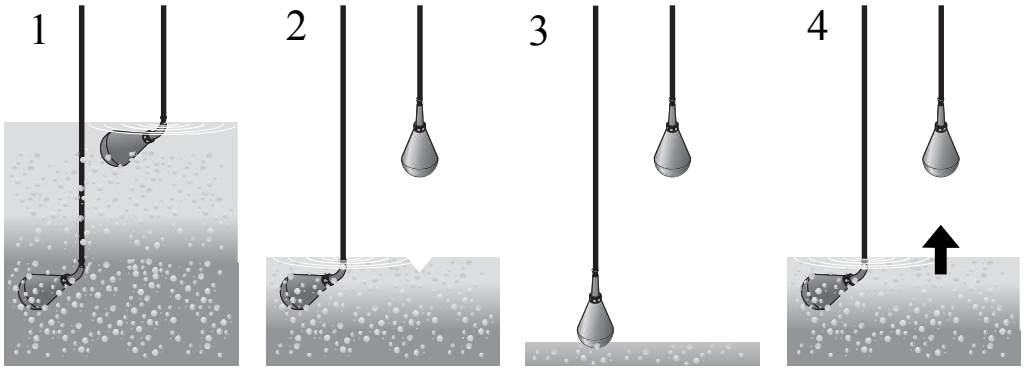
Product description

The product is the simplest possible method for level control. A mechanical switch in a plastic casing, freely suspended at the desired height from its own cable. When the liquid level reaches the regulator, the casing will tilt and the mechanical switch will close or break the circuit, thereby starting or stopping a pump or actuating an alarm device. No wear, no maintenance. In sewage pumping stations, for ground water and drainage pumping – in fact, for most level control applications – the product is the ideal solution.

Liquid density

The product is available in different versions for different liquid densities.

Temperature limit



The regulator can withstand up to 60°C (140°F).

Manual coverage

This manual is applicable for the version shown in the following table:

Version	Casing
Standard	Red

2.2 Process description

WS004996A

1. When the pumped media reaches a predetermined level, the upper level regulator tips over to horizontal position and the pump starts to drain the basin.
2. The basin is drained of fluid.
3. The pump stops when the lower level regulator returns to the vertical position.
4. The basin fills up again. The process restarts.

2.3 Technical data

Materials

Denomination	Standard version
Regulator casing	Polypropylene
Bend relief	EPDM rubber

Denomination	Standard version
Cable sheath	PVC

The plastic components are welded and screwed together.

Lengths

Lengths		Part numbers
Meters	Feet	
13.2	42	594 79 43
20.2	65.6	594 79 44
30.7	100	594 79 46

For liquids with specific density between 0.95 and 1.10 g/cm^3, the following cables are available:

Lengths	
meters	feet
6	20
13	42
20	65
30	100
50	167

Diameter

The cable diameter for all product variants is 6.7 mm (0.26 in), +/- 0.2 mm (0.00787 in).

2.4 Electrical data

Country	Electrical data
Denmark	10 A, 250 V, AC
Switzerland	6 A, 250 V, AC
Sweden	10 A, 230 V, AC Resistive load 3 A, 250 V, AC Inductive load 5 A, 30 V, DC Resistive load

Micro switch

The level regulator contains a micro switch, max rated 250 VAC/10 A.

Low-voltage supply

In many cases, local codes require that the regulator is connected to a low-voltage supply, even though it is approved for a higher voltage.

It is recommended that the regulator is connected to a low-voltage supply, 48 V or 24 V, and a protective transformer.

2.5 Approvals and standards

Standard approvals

- LVD approval according to EN61058.
- CE

3 Mechanical Installation

3.1 Precautions

Before starting work, make sure that the safety instructions in the chapter *Introduction and Safety* on page 2 have been read and understood.

3.2 General

To conform to local regulations, the regulators are normally connected through a transformer to a low-tension control circuit.

Make sure that two regulators are used, one for starting and one for stopping.

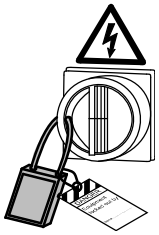
If an alarm is required at a given level, then connect a third regulator.

Identical regulators can be used for all functions.

Make sure that the cables do not become tangled during the installation.

The regulator cables must hang freely from each other.

4 Electrical Installation



4.1 Precautions

Before starting work, make sure that the safety instructions in the chapter *Introduction and Safety* on page 2 have been read and understood.

DANGER: Electrical Hazard

Before starting work on the unit, make sure that the unit and the control panel are isolated from the power supply and cannot be energized. This applies to the control circuit as well.

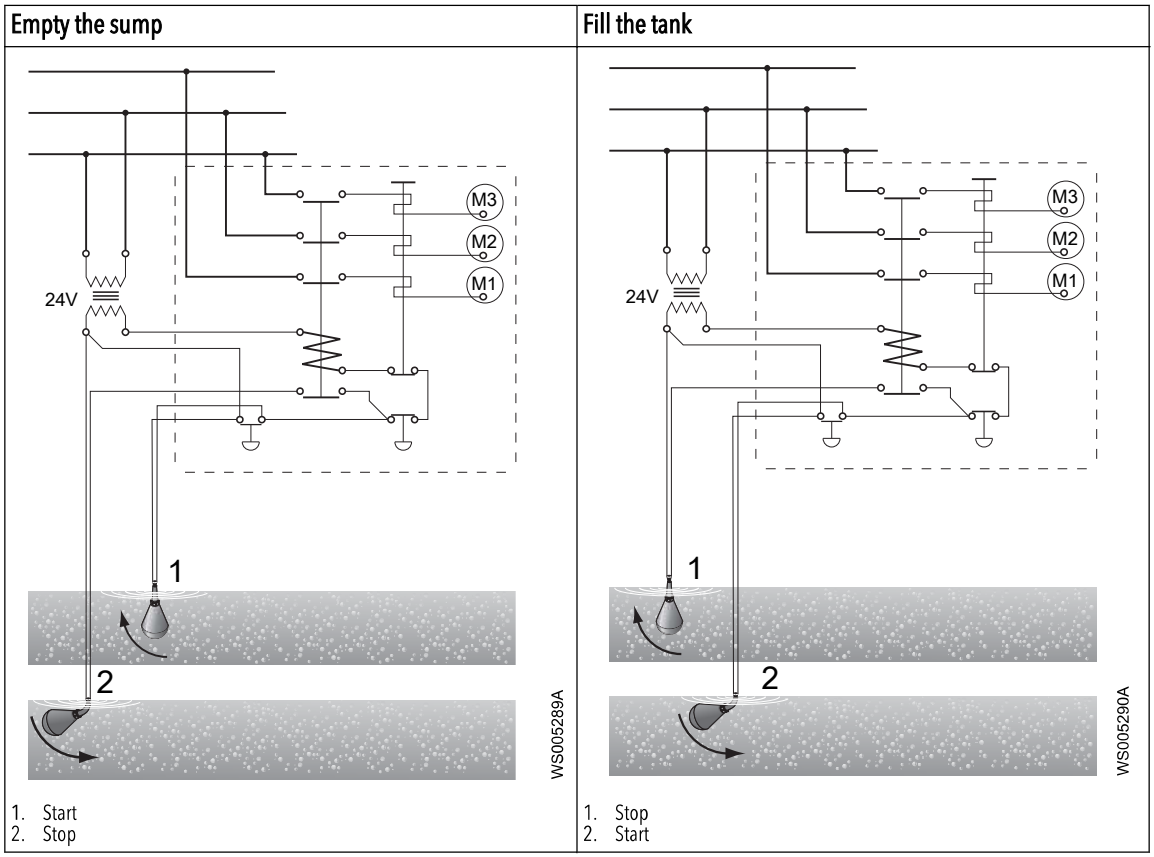
DANGER: Electrical Hazard

All electrical equipment must be grounded (earthed). Test the ground (earth) lead to verify that it is connected correctly and that the path to ground is continuous.

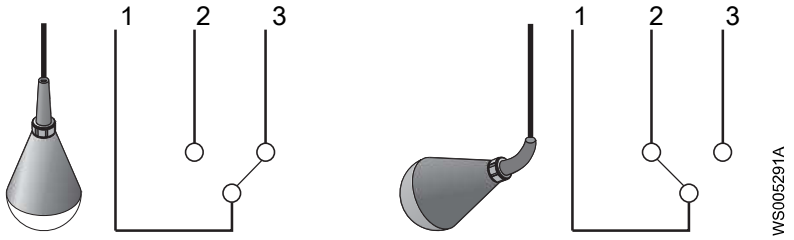
WARNING: Electrical Hazard

Risk of electrical shock or burn. A certified electrician must supervise all electrical work. Comply with all local codes and regulations.

WARNING: Electrical Hazard



There is a risk of electrical shock or explosion if the electrical connections are not correctly carried out, or if there is fault or damage on the product. Visually inspect equipment for damaged cables, cracked casings or other signs of damage. Make sure that electrical connections have been correctly made.

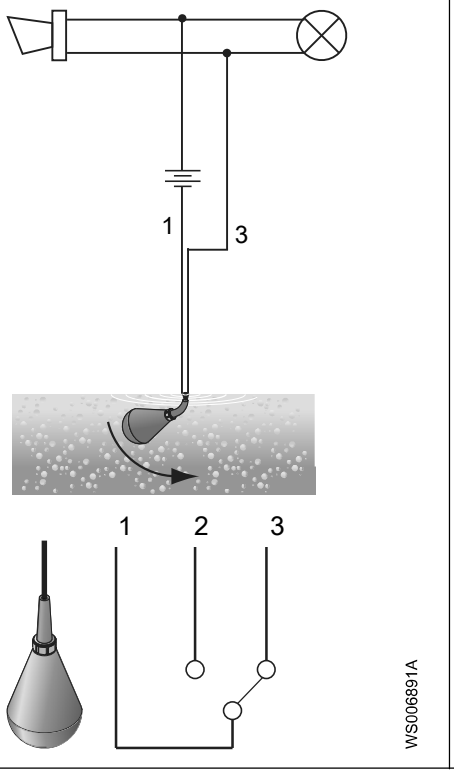


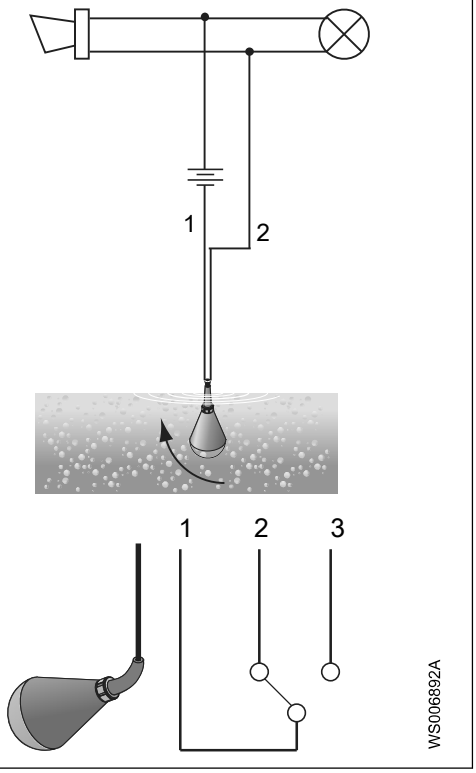
CAUTION: Electrical Hazard

Prevent cables from becoming sharply bent or damaged.

4.2 Wiring diagrams

Connection table





Cable	Connections to empty a sump	Connections to fill a tank
1	X	X
2	X	Insulate
3	Insulate	X

Alarm low level	Alarm high level
	

Description of position

Cable	1	2	3
Alarm high level	X	X	Insulate
Alarm low level	X	Insulate	X

Color code

Cable	1	2	3
Color	Grey	Black	Brown

5 Maintenance

5.1 General

To ensure its continual operation:

- Clean the product, especially when fat/grease covers the plastic surface
- Make an occular inspection of the regulator. Make sure neither cable, protective sleeve or plastic casing show any signs of damage.
- A damaged regulator cannot be repaired in any way, due to the hermetic encapsulation. If the product is found to be damaged, replace it with a new one.

Section 3.6.10

Dewatering Filtrate AOD Pumps

OPERATOR'S MANUAL PD05P-XXX-XXX-B

INCLUDING: OPERATION, INSTALLATION & MAINTENANCE

RELEASED: 8-27-08
REVISED: 10-16-09
(REV. 04)

1/2" DIAPHRAGM PUMP
1:1 RATIO (NON-METALLIC)

READ THIS MANUAL CAREFULLY BEFORE INSTALLING, OPERATING OR SERVICING THIS EQUIPMENT.

It is the responsibility of the employer to place this information in the hands of the operator. Keep for future reference.

SERVICE KITS

Refer to Model Description Chart to match the pump material options.
637427-XX for fluid section repair (see page 4).
637428 for air section repair (see page 6).

PUMP DATA

OPERATING AND SAFETY PRECAUTIONS

READ, UNDERSTAND AND FOLLOW THIS INFORMATION TO AVOID INJURY AND PROPERTY DAMAGE.

EXCESSIVE AIR PRESSURE
STATIC SPARK

HAZARDOUS MATERIALS
HAZARDOUS PRESSURE

⚠WARNING EXCESSIVE AIR PRESSURE. Can cause personal injury, pump damage or property damage.

- Do not exceed the maximum inlet air pressure as stated on the pump model plate.
- Be sure material hoses and other components are able to withstand fluid pressures developed by this pump. Check all hoses for damage or wear. Be certain dispensing device is clean and in proper working condition.

⚠WARNING STATIC SPARK. Can cause explosion resulting in severe injury or death. Ground pump and pumping system.

- PD05P-XDS-XXX-B and PD05P-XES-XXX-B Groundable Acetal pumps: Use the pump ground lug provided. Connect to a 12 ga. (minimum) wire (kit is included) to a good earth ground source.
- Sparks can ignite flammable material and vapors.
- The pumping system and object being sprayed must be grounded when it is pumping, flushing, recirculating or spraying flammable materials such as paints, solvents, lacquers, etc. or used in a location where surrounding atmosphere is conducive to spontaneous combustion. Ground the dispensing valve or device, containers, hoses and any object to which material is being pumped.
- Secure pump, connections and all contact points to avoid vibration and generation of contact or static spark.
- Consult local building codes and electrical codes for specific grounding requirements.
- After grounding, periodically verify continuity of electrical path to ground. Test with an ohmmeter from each component (e.g., hoses, pump, clamps, container, spray gun, etc.) to ground to insure continuity. Ohmmeter should show 0.1 ohms or less.
- Submerse the outlet hose end, dispensing valve or device in the material being dispensed if possible. (Avoid free streaming of material being dispensed.)
- Use hoses incorporating a static wire.
- Use proper ventilation.
- Keep inflammables away from heat, open flames and sparks.
- Keep containers closed when not in use.

⚠WARNING Pump exhaust may contain contaminants. Can cause severe injury. Pipe exhaust away from work area and personnel.

- In the event of a diaphragm rupture, material can be forced out of the air exhaust muffler.
- Pipe the exhaust to a safe remote location when pumping hazardous or inflammable materials.
- Use a grounded 3/8" minimum i.d. hose between the pump and the muffler.

⚠WARNING HAZARDOUS PRESSURE. Can result in serious injury or property damage. Do not service or clean pump, hoses or dispensing valve while the system is pressurized.

- Disconnect air supply line and relieve pressure from the system by opening dispensing valve or device and / or carefully and slowly loosening and removing outlet hose or piping from pump.

⚠WARNING HAZARDOUS MATERIALS. Can cause serious injury or property damage. Do not attempt to return a pump to the factory or service center that contains hazardous material. Safe handling practices must comply with local and national laws and safety code requirements.

- Obtain Material Safety Data Sheets on all materials from the supplier for proper handling instructions.

⚠WARNING EXPLOSION HAZARD. Models containing aluminum parts cannot be used with 1,1,1-trichloroethane, methylene chloride or other halogenated hydrocarbon solvents which may react and explode.

- Check pump motor section, fluid caps, manifolds and all wetted parts to assure compatibility before using with solvents of this type.

⚠WARNING MISAPPLICATION HAZARD. Do not use models containing aluminum wetted parts with food products for human consumption. Plated parts can contain trace amounts of lead.

⚠ CAUTION Verify the chemical compatibility of the pump wetted parts and the substance being pumped, flushed or recirculated. Chemical compatibility may change with temperature and concentration of the chemical(s) within the substances being pumped, flushed or circulated. For specific fluid compatibility, consult the chemical manufacturer.

⚠ CAUTION Maximum temperatures are based on mechanical stress only. Certain chemicals will significantly reduce maximum safe operating temperature. Consult the chemical manufacturer for chemical compatibility and temperature limits. Refer to PUMP DATA on page 1 of this manual.

⚠ CAUTION Be certain all operators of this equipment have been trained for safe working practices, understand it's limitations, and wear safety goggles / equipment when required.

⚠ CAUTION Do not use the pump for the structural support of the piping system. Be certain the system components are properly supported to prevent stress on the pump parts.

- Suction and discharge connections should be flexible connections (such as hose), not rigid piped, and should be compatible with the substance being pumped.

⚠ CAUTION Prevent unnecessary damage to the pump. Do not allow pump to operate when out of material for long periods of time.

- Disconnect air line from pump when system sits idle for long periods of time.

⚠ CAUTION Use only genuine ARO® replacement parts to assure compatible pressure rating and longest service life.

NOTICE Install the pump in the vertical position. The pump may not prime properly if the balls do not check by gravity upon start-up.

NOTICE Re-torque all fasteners before operation. Creep of housing and gasket materials may cause fasteners to loosen. Re-torque all fasteners to insure against fluid or air leakage.

NOTICE Replacement warning labels are available upon request: "Static Spark" pn 93616-1, Diaphragm Rupture" pn 93122.

⚠WARNING	= Hazards or unsafe practices which could result in severe personal injury, death or substantial property damage.
⚠ CAUTION	= Hazards or unsafe practices which could result in minor personal injury, product or property damage.
NOTICE	= Important installation, operation or maintenance information.

GENERAL DESCRIPTION

The ARO diaphragm pump offers high volume delivery even at low air pressure and a broad range of material compatibility options are available. Refer to the model and option chart. ARO pumps feature stall resistant design, modular air motor / fluid sections.
Air operated double diaphragm pumps utilize a pressure differential in the air chambers to alternately create suction and a positive fluid pressure in the fluid chambers, ball checks insure a positive flow of fluid.
Pump cycling will begin as air pressure is applied and will continue to pump and keep up with the demand. It will build and maintain line pressure and will stop cycling once maximum line pressure is reached (dispensing device closed) and will resume pumping as needed.

AIR AND LUBE REQUIREMENTS

⚠WARNING EXCESSIVE AIR PRESSURE. Can cause pump damage, personal injury or property damage.

- A filter capable of filtering out particles larger than 50 microns should be used on the air supply. There is no lubrication required other than the "O" ring lubricant which is applied during assembly or repair.
- If lubricated air is present, make sure that it is compatible with the "O" rings and seals in the air motor section of the pump.

OPERATING INSTRUCTIONS

- Always flush the pump with a solvent compatible with the material being pumped if the material being pumped is subject to "setting up" when not in use for a period of time.
- Disconnect the air supply from the pump if it is to be inactive for a few hours.
- The outlet material volume is governed not only by the air supply, but also by the material supply available at the inlet. The material supply tubing should not be too small or restrictive. Be sure not to use hose which might collapse.
- When the diaphragm pump is used in a forced-feed (flooded inlet) situation, it is recommended that a "check valve" be installed at the air inlet.
- Secure the diaphragm pump legs to a suitable surface to insure against damage by vibration.

MAINTENANCE

- Certain ARO "Smart Parts" are indicated which should be available for fast repair and reduction of down time.
- Provide a clean work surface to protect sensitive internal moving parts from contamination from dirt and foreign matter during service disassembly and reassembly.
- Keep good records of service activity and include the pump in preventive maintenance program.
- Service kits are available to service two separate diaphragm pump functions: 1. AIR SECTION, 2. FLUID SECTION. The Fluid Section is divided further to match typical part Material Options.
- Before disassembling, empty captured material in the outlet manifold by turning the pump upside down to drain material from the pump.

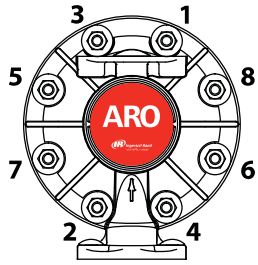
❷ "Smart Parts", keep these items on hand in addition to the service kits for fast repair and reduction of down time.

FOR THE AIR MOTOR SECTION, SEE PAGES 6 AND 7.

☞ ASSEMBLY TORQUE REQUIREMENTS ☜

NOTE: DO NOT OVERTIGHTEN FASTENERS.



(6) diaphragm nut, 95 - 105 in. lbs (10.7 - 11.9 Nm).

(26) bolt and (29) nut, 50 - 60 in. lbs (5.6 - 6.8 Nm), alternately and evenly, then re-torque after initial run-in.

LUBRICATION / SEALANTS

① **Apply Lubriplate FML-2 grease to all "O" rings, "U" cups and mating parts.**
② **Apply pipe sealant to threads.**
③ **Apply anti-seize compound to threads and bolt and nut flange heads which contact pump case when using stainless steel fasteners.**
④ **Apply Loctite® 242® to threads.**

Note: Lubriplate FML-2 is a white food grade petroleum grease.

Torque Sequence

PARTS LIST / PD05P-XXX-XXX-B AIR MOTOR SECTION

❸ Indicates parts included in 637428 air section service kit.

AIR MOTOR PARTS LIST

Item	Description (size)	Qty	Part No.	Mtl
101	Center Body	(1)	96315	[PPG]
103R	Cover (right side)	(1)	96091	[D]
103L	Cover (left side)	(1)	96351	[D]
107	Plug, Small	(1)	96353	[D]
111	Major Valve Spool	(1)	95919	[D]
118	Actuator Pin	(2)	97111	[SS]
❸ 121	Washer	(2)	96092	[D]
123	Screw (#4 - 20 x 1/2")	(8)	96093	[SS]
129	Muffler Assembly	(1)	67367	[PPG]
❹ 129	Exhaust Cover (optional)	(1)	67366	[PPG]
❹ 130	Gasket (optional)	(1)	93107	[Sy]
❸ 132	Air Manifold Gasket	(1)	96214-1	[B]
134	Flange Bolt (1/4" - 20 x 5-3/4")	(4)	94871	[SS]
135	Valve Block	(1)	96204	[PPG]
136	Plug, Large	(1)	96352	[D]
❸ 137	"O" Ring (1/16" x 1-5/8" o.d.)	(3)	Y325-29	[B]
❸ 138	"U" Cup Packing (1/8" x 1" o.d.)	(1)	94395	[U]
❸ 139	"U" Cup Packing (1/8" x 1-7/16" o.d.)	(1)	96383	[U]
140	Valve Insert	(1)	93276	(Ck)
141	Valve Plate	(1)	96173	(Ck)
❶❸ 144	"U" Cup Packing (3/16" x 1" o.d.)	(2)	Y187-48	[B]
❸ 166	"O" Ring (1/16" x 1-1/4" o.d.)	(1)	Y325-24	[B]
❸ 167	Pilot Piston (includes 168 and 169)	(1)	67382	[D]
168	"O" Ring (1/16" x 7/16" o.d.)	(2)	96459	[U]
169	"U" Cup Packing (1/8" x 5/8" o.d.)	(1)	96384	[U]
170	Spool Bushing	(1)	96090	[D]
❸ 171	"O" Ring (1/16" x 13/16" o.d.)	(2)	Y325-17	[B]
❸ 173	"O" Ring (3/32" x 7/8" o.d.)	(2)	Y325-115	[B]
❶❸ 174	"O" Ring (3/32" x 11/32" o.d.)	(2)	Y325-105	[B]
❸ 200	Porting Gasket	(1)	96364	[B]
201	Muffler (optional)	(1)	93110	[C]
❹ 232	"O" Ring (1/16" x 3/8" o.d.) (optional)	(4)	Y325-10	[B]
❹	Ported Exhaust Kit (includes items 129, 130 and 232) (optional)	(1)	637438	---
❶ ❸	Lubriplate FML-2 grease	(1)	94276	
	Lubriplate Grease Packets (10)		637308	

❶ Items included in fluid section service kit, see page 4.

MATERIAL CODE

[B] = Nitrile
[C] = Carbon Steel
[Ck] = Ceramic
[D] = Acetal
[PPG] = Glass filled Polypropylene
[SS] = Stainless Steel
[Sy] = Syn-Seal
[U] = Polyurethane

DIAPHRAGM PUMP SERVICE

GENERAL SERVICE NOTES:

- Inspect and replace old parts with new parts as necessary. Look for deep scratches on metallic surfaces, and nicks or cuts in "O" rings.
- Tools needed to complete disassembly and repair:
  - 7/8" socket or wrench, 1/2" socket or wrench, 3/8" socket or wrench, 3/8" Allen wrench, T-10 Torx screwdriver, torque wrench (measuring inch pounds), "O" ring pick.

FLUID SECTION DISASSEMBLY

1. Remove (61) top manifold.
2. Remove (19) "O" rings, (21) seats and (22) balls.
3. Remove (60) bottom manifold.
4. Remove (19) "O" rings, (21) seats and (22) balls.
5. Remove (15) fluid caps.
6. Remove (6) diaphragm nut, (7) or (7 / 8) diaphragms and (5) washer.
7. Remove (1) connecting rod from air motor.
8. Carefully remove remaining (6) diaphragm nut, (7) or (7 / 8) diaphragms and (5) washer from (1) connecting rod. Do not mar surface of connecting rod.

FLUID SECTION REASSEMBLY

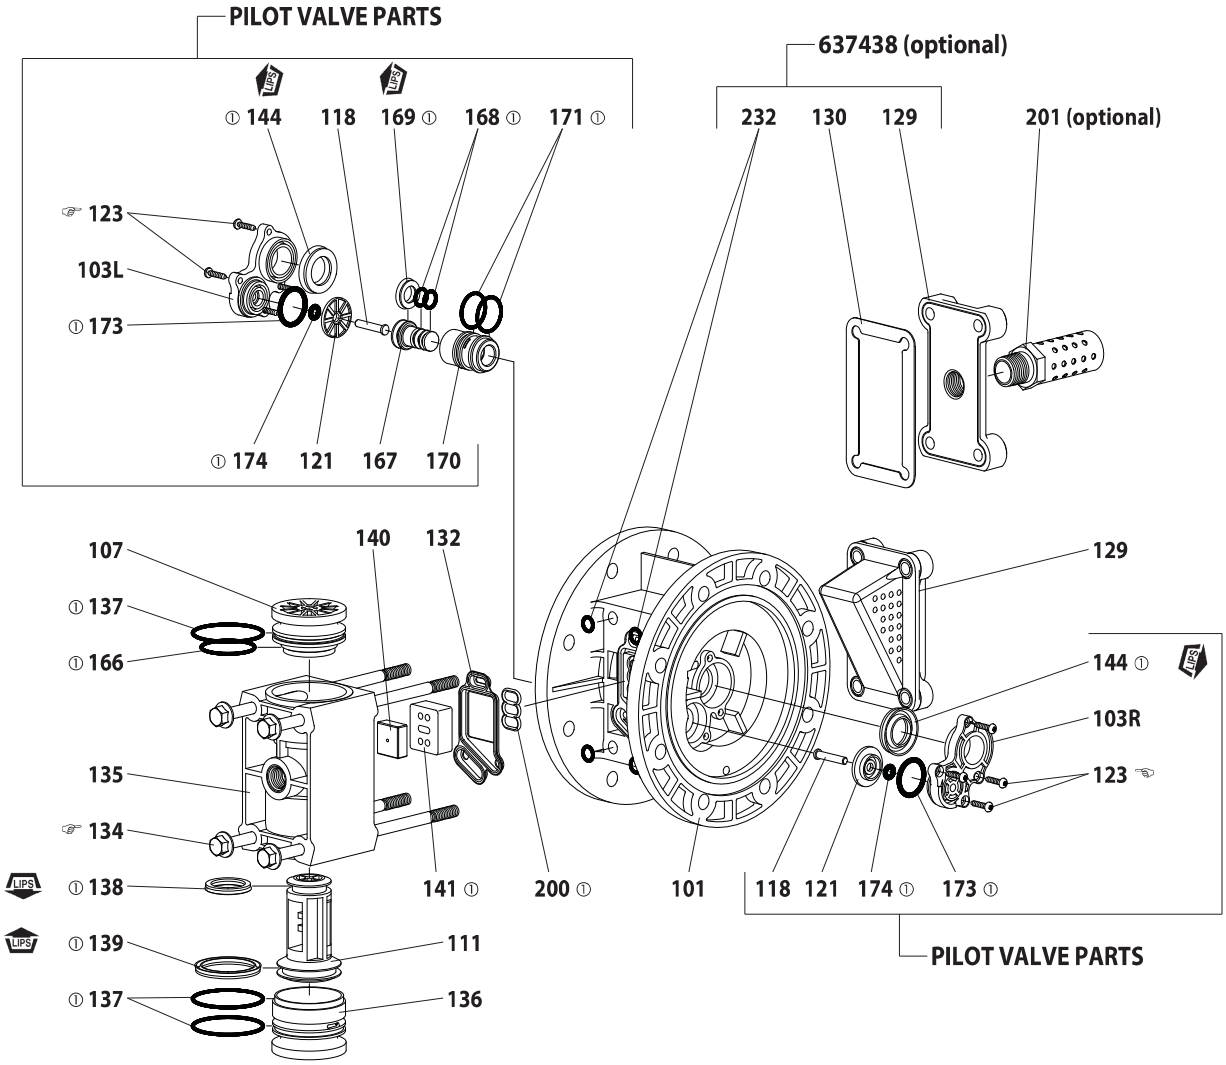
- Reassemble in reverse order.
- Lubricate (1) connecting rod with Lubriplate or equivalent "O" ring lubricant.
- Connecting rod (1) should be installed using 96571 bullet, included in service kit.
- Install (5) washers with i.d. chamfer toward diaphragm.
- When replacing Teflon diaphragms, install the 93465 Santoprene diaphragm behind the Teflon diaphragm.

AIR MOTOR SECTION SERVICE

Service is divided into two parts - 1. Pilot Valve, 2. Major Valve.

- Air Motor Section service is continued from Fluid Section repair.

PILOT VALVE DISASSEMBLY



1. Remove (123) screws, releasing (103) covers, (121) washers, (118) actuator pins and (167) pilot piston.
2. Remove (170) spool bushing and inspect inner bore of bushing for damage.

PILOT VALVE REASSEMBLY

1. Clean and lubricate parts not being replaced from service kit.
2. Assemble (171) "O" rings to (170) bushing and assemble bushing into (101) center body.
3. Lubricate and assemble (167) pilot piston assembly into (170) bushing.
4. Assemble (173 and 174) "O" rings and (121) washers to (103) covers, then insert (118) actuator pins through assembly.
5. Assemble (144) "U" cups (note the lip direction) and (103) covers to (101) center body, securing with (123) screws. NOTE: tighten (123) screws to 4 - 6 in. lbs (0.45 - 0.68 Nm).

MAJOR VALVE DISASSEMBLY

1. Unthread (134) bolts, releasing (129) muffler assembly.
2. Pull (135) valve block and components from (101) center body.
3. Remove (132) gasket, (141) valve plate and (140) valve insert from (135) valve block.
4. Remove (134) bolts, releasing (107 and 136) plugs and (111) spool.

MAJOR VALVE

Figure 4

☞ ASSEMBLY TORQUE REQUIREMENTS ☜

NOTE: DO NOT OVERTIGHTEN FASTENERS.

(123) screw, 4 - 6 in. lbs (0.45 - 0.68 Nm).

(134) bolt, torque to 15 - 20 in. lbs (1.7 - 2.3 Nm), wait 10 minutes, then re-torque to 15 - 20 in. lbs (1.7 - 2.3 Nm).

LUBRICATION / SEALANTS

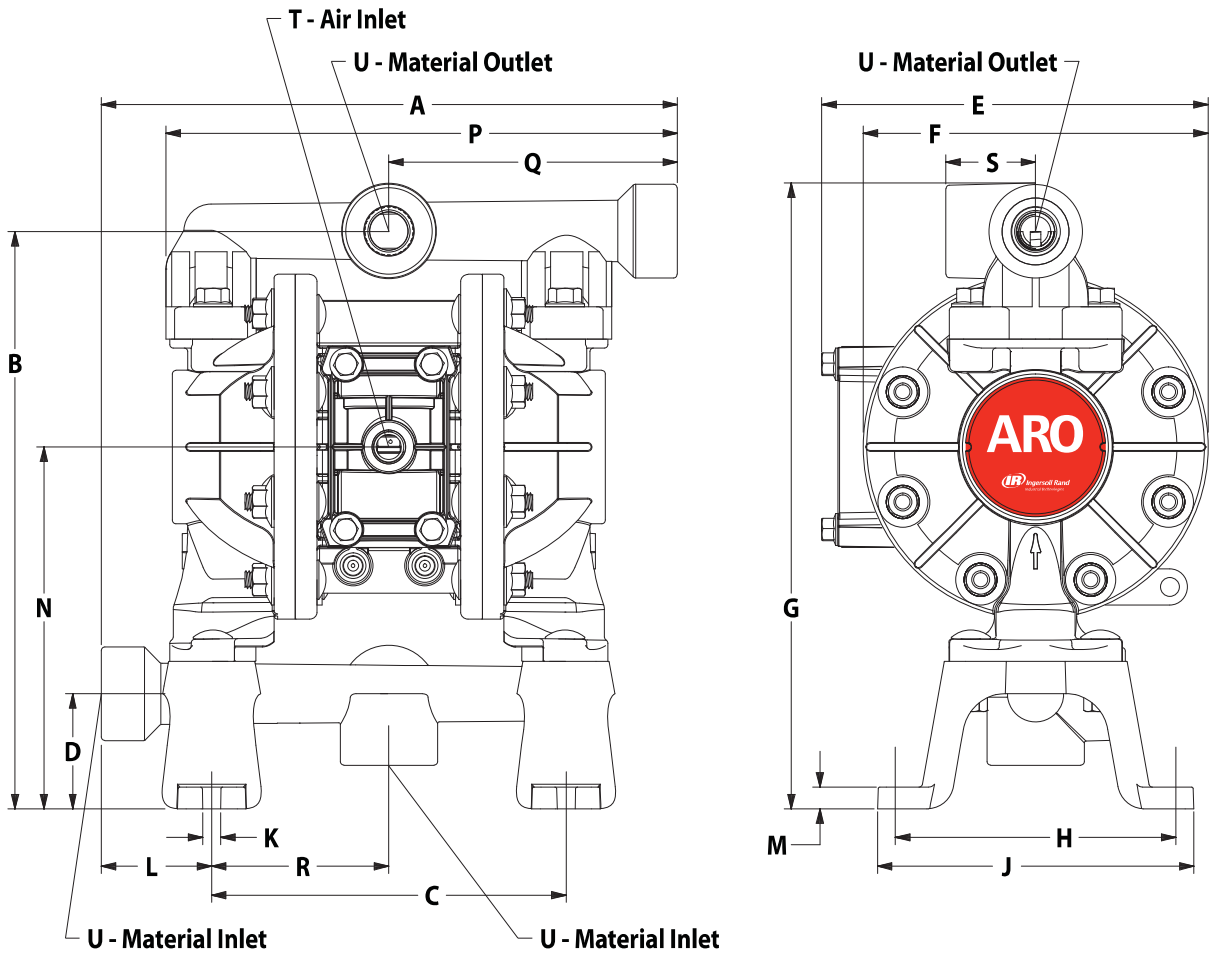
① Apply Lubriplate FML-2 grease to all "O" rings, "U" cups and mating parts.

MAJOR VALVE REASSEMBLY

1. Assemble new (139 and 138) "U" cups on (111) spool - **LIPS MUST FACE EACH OTHER**.
2. Assemble (137) "O" rings to (136) large plug.
3. Assemble (137 and 166) "O" rings to (107) small plug.
4. Insert (111) spool into (136) large plug, then insert (136) large plug into (135) valve block, being sure the (111) spool is rotated to accept (140) valve insert.
5. Assemble (107) small plug into (135) valve block.
6. Assemble (140) valve insert and (141) valve plate to (135) valve block. NOTE: Assemble (140) valve insert with "dished" side toward (141) valve plate. Assemble (141) valve plate with identification dot toward (132) gasket.
7. Assemble (132 and 200) gaskets, (135) valve block and (129) muffler assembly to (101) center body, securing with (134) bolts. NOTE: Tighten (134) bolts to 15 - 20 in. lbs (1.7 - 2.3 Nm).

TROUBLE SHOOTING

Product discharged from exhaust outlet.
- Check for diaphragm rupture.
- Check tightness of (6) diaphragm nut.



Air bubbles in product discharge.
- Check connections of suction plumbing.
- Check "O" rings between intake manifold and fluid caps.
- Check tightness of (6) diaphragm nut.

Motor blows air out main exhaust when stalled on either stroke.
- Check "U" cups on (111) spool in major valve.
- Check (141) valve plate and (140) insert for wear.
- Check (169) "U" cup on (167) pilot piston.

Low output volume.
- Check air supply.
- Check for plugged outlet hose.
- For the pump to prime itself, it must be mounted in the vertical position so that the balls will check by gravity.
- Check for pump cavitation - suction pipe should be sized at least as large as the inlet thread diameter of the pump for proper flow if high viscosity fluids are being pumped. Suction hose must be a non-collapsing type, capable of pulling a high volume.
- Check all joints on the inlet manifolds and suction connections. These must be air tight.
- Inspect the pump for solid objects lodged in the diaphragm chamber or the seat area.

DIMENSIONAL DATA

Dimensions shown are for reference only, they are displayed in inches and millimeters (mm).

DIMENSIONS

A - 10-1/32" (254.8 mm)	F - 6-1/32" (153.1 mm)	L - 1-15/16" (48.9 mm)	R - 3-3/32" (78.5 mm)
B - 10-3/32" (256.1 mm)	G - 10-29/32" (276.8 mm)	M - 3/8" (9.6 mm)	S - 1-9/16" (39.7 mm)

Dewatering System Level Switch

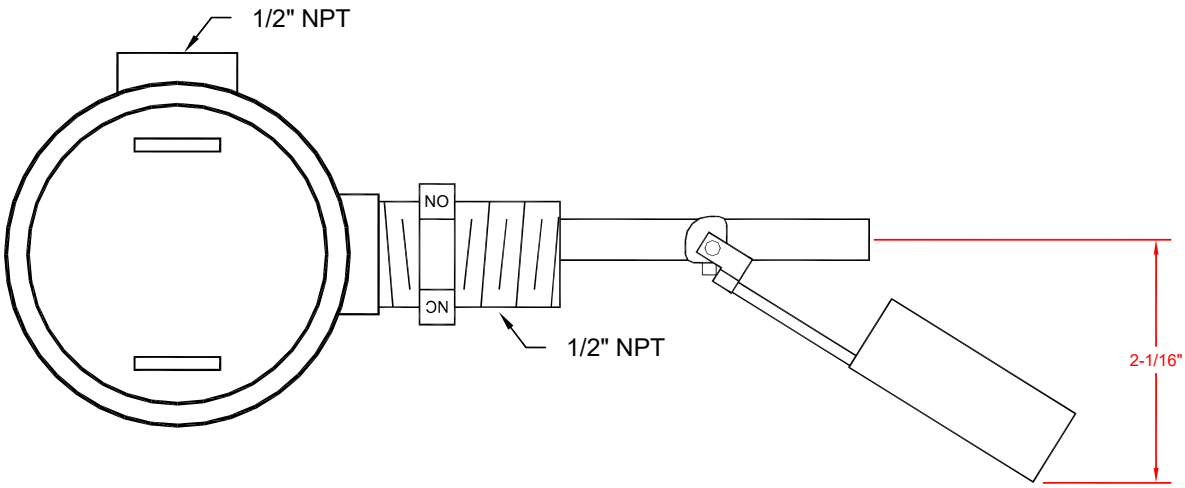
Ktech INDUSTRIAL PRODUCTS INC.

Model SM4001 Overfill Protection Device Installation Instructions
Part No.: SM4001-CXEP

CAUTION: REFER TO INSTRUCTIONS BEFORE OPERATING OR SERVICING SWITCH.
Construction: 316 stainless steel body with a .66" dia. stainless steel float, ½" NPT bushing, explosion proof J-Box.
The contact arrangement can be changed from Normally Open (NO) to Normally Closed (NC). The nut is marked with NC and NO. Tighten the switch such that the desired arrangement is indicated on the top face of the nut. The conductors are colour coded to identify each switch. The switch must be connected in series with a load.

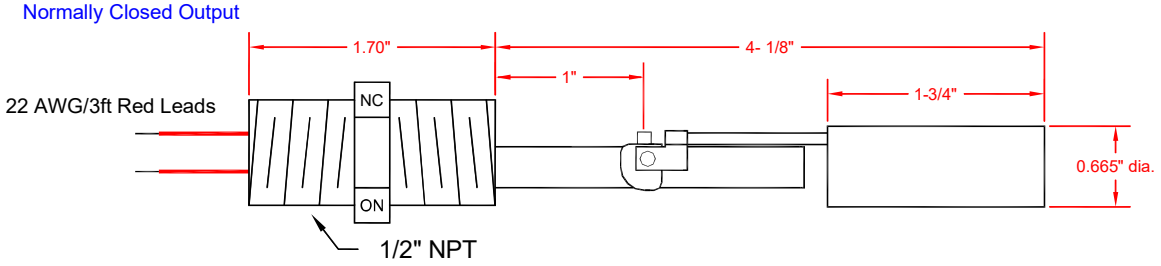
DO NOT CONNECT THE SWITCH DIRECTLY ACROSS THE POWER SUPPLY.
The voltage / current product must not exceed the power rating.

Electrical Specifications



Maximum Switching Voltage Volts DC/AC	120
Maximum Switching Current Amps DC/AC	0.4
Maximum Switching Power Volt/Amps DC/AC	50
Operating Temperature Range	-25˚C to 125˚C -13˚F to 257˚F

LISTED
OVERFILL
PROTECTION
DEVICES
4YC9



Meets Standards:
Class 1 Division 1, Groups B,C,D
CSA C22.2 No. 1010-1 and ANSI/I SA S82-03
CSA C22.2 No. 30 and UL1203
Factory Sealed

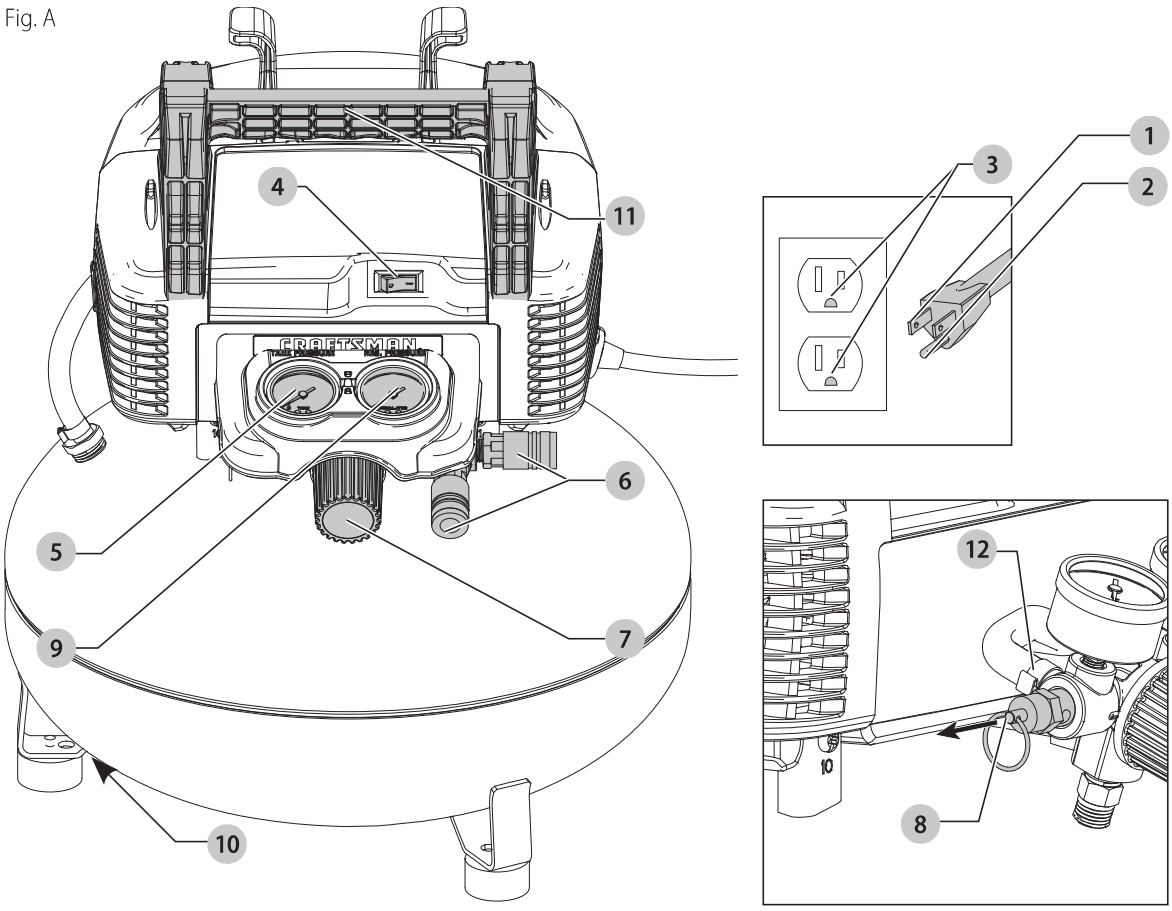
Definitions: Safety Alert Symbols and Words

This instruction manual uses the following safety alert symbols and words to alert you to hazardous situations and your risk of personal injury or property damage.

DANGER: *Indicates an imminently hazardous situation which, if not avoided,* ***will*** *result in* ***death or serious injury****.*



WARNING: *Indicates a potentially hazardous situation which, if not avoided,* ***could*** *result in* ***death or serious injury****.*

CAUTION: *Indicates a potentially hazardous situation which, if not avoided,* ***may*** *result in* ***minor or moderate injury****.*

(Used without word) Indicates a safety related message.

NOTICE: *Indicates a practice* ***not related to personal injury*** *which, if not avoided,* ***may*** *result in* ***property damage****.*

Fig. A

Components

1. Plug
2. Grounding pin
3. Grounded outlet
4. On/Off switch
5. Tank pressure gauge
6. Quick connects
7. Regulator knob
8. Safety valve
9. Outlet pressure gauge
10. Drain valve (not pictured)
11. Handle
12. Hose clamp

WARNING: Read all safety warnings and all instructions. *Failure to follow the warnings and instructions may result in electric shock, fire and/or serious injury.*

WARNING: *Never modify the product or any part of it. Damage or personal injury could result.*

WARNING: *To reduce the risk of injury, read the instruction manual.*

If you have any questions or comments about this or any product, call CRAFTSMAN toll free at: 1-888-331-4569.

Air Compressor
CMEC6150

IMPORTANT SAFETY INSTRUCTIONS

SAVE ALL WARNINGS AND INSTRUCTIONS FOR FUTURE REFERENCE

⚠ *DANGER: RISK OF EXPLOSION OR FIRE*

What can happen	How to prevent it
It is normal for electrical contacts within the motor and pressure switch to spark.	Always operate the compressor in a well ventilated area free of combustible materials, gasoline, or solvent vapors.
If electrical sparks from compressor come into contact with flammable vapors, they may ignite, causing fire or explosion.	If spraying flammable materials, locate compressor at least 20 feet (6.1 m) away from spray area. An additional length of hose may be required.
	Store flammable materials in a secure location away from compressor.
Restricting any of the compressor ventilation openings will cause serious overheating and could cause a fire.	Never place objects against or on top of compressor pump.
	Operate compressor in an open area at least 12" (30.5 cm) away from any wall or obstruction that would restrict the flow of fresh air to the ventilation openings.
	Operate compressor in a clean, dry well ventilated area. Do not operate unit indoors or in any confined area.
Unattended operation of this product could result in personal injury or property damage. To reduce the risk of fire, do not allow the compressor to operate unattended.	Always remain in attendance with the product when it is operating.
	Always turn off and unplug unit when not in use.

⚠ *CAUTION: RISK FROM NOISE*

What can happen	How to prevent it
Under some conditions and duration of use, noise from this product may contribute to hearing loss.	Always wear certified safety equipment: ANSI S12.6 (S3.19) hearing protection.

⚠ *DANGER: RISK TO BREATHING*
(Asphyxiation)

What can happen	How to prevent it
The compressed air directly from your compressor is not safe for breathing. The air stream may contain carbon monoxide, toxic vapors, or solid particles from the air tank. Breathing these contaminants can cause serious injury or death.	Air obtained directly from the compressor should never be used to supply air for human consumption. In order to use air produced by this compressor for breathing, suitable filters and in-line safety equipment must be properly installed. In-line filters and safety equipment used in conjunction with the compressor must be capable of treating air to all applicable local and federal codes prior to human consumption.
Exposure to chemicals in dust created by power sanding, sawing, grinding, drilling, and other construction activities may be harmful.	Work in an area with good ventilation. Read and follow the safety instructions provided on the label or safety data sheets for the materials you are spraying. Always use certified safety equipment: OSHA/MSHA/NIOSH respiratory protection designed for use with your specific application.
Sprayed materials such as paint, paint solvents, paint remover, insecticides, weed killers, may contain harmful vapors and poisons.	

⚠ *WARNING: RISK OF BURSTING*

Air Tank: On February 26, 2002, the U.S. Consumer Product Safety Commission published Release # 02-108 concerning air compressor tank safety:

Air compressor receiver tanks do not have an infinite life. Tank life is dependent upon several factors, some of which include operating conditions, ambient conditions, proper installations, field modifications, and the level of maintenance. The exact effect of these factors on air receiver life is difficult to predict.

If proper maintenance procedures are not followed, internal corrosion to the inner wall of the air receiver tank can cause the air tank to unexpectedly rupture allowing pressurized air to suddenly and forcefully escape, posing risk of injury to consumers.

Your compressor air tank must be removed from service by the end of the year shown on your tank warning label.

The following conditions could lead to a weakening of the air tank, and result in a violent air tank explosion:

⚠ ***WARNING:*** *Some dust contains chemicals known to the State of California to cause cancer, birth defects or other reproductive harm such as asbestos and lead in lead based paint.*

What can happen	How to prevent it
Failure to properly drain condensed water from air tank, causing rust and thinning of the steel air tank.	Drain air tank daily or after each use. If air tank develops a leak, replace it immediately with a new air tank or replace the entire compressor.
Modifications or attempted repairs to the air tank.	Never drill into, weld, or make any modifications to the air tank or its attachments. Never attempt to repair a damaged or leaking air tank. Replace with a new air tank.
Unauthorized modifications to the safety valve or any other components which control air tank pressure.	The air tank is designed to withstand specific operating pressures. Never make adjustments or parts substitutions to alter the factory set operating pressures.
Attachments & Accessories:	
Exceeding the pressure rating of air tools, spray guns, air operated accessories, tires, and other inflatables can cause them to explode or fly apart, and could result in serious injury.	Follow the equipment manufacturers recommendation and never exceed the maximum allowable pressure rating of attachments. Never use compressor to inflate small low pressure objects such as children's toys, footballs, basketballs, etc.
Tires:	
Over inflation of tires could result in serious injury and property damage.	Use a tire pressure gauge to check the tires pressure before each use and while inflating tires; see the tire sidewall for the correct tire pressure. **NOTE:** Air tanks, compressors and similar equipment used to inflate tires can fill small tires similar to these very rapidly. Adjust pressure regulator on air supply to no more than the rating of the tire pressure. Add air in small increments and frequently use the tire gauge to prevent over inflation.

WARNING: RISK OF ELECTRICAL SHOCK

What can happen	How to prevent it
Your air compressor is powered by electricity. Like any other electrically powered device, If it is not used properly it may cause electric shock.	Never operate the compressor outdoors when it is raining or in wet conditions.
	Never operate compressor with protective covers removed or damaged.
Repairs attempted by unqualified personnel can result in serious injury or death by electrocution.	Any repairs required on this product should be performed by authorized service center personnel.
Electrical Grounding: Failure to provide adequate grounding to this product could result in serious injury or death from electrocution. See ***Grounding Instructions*** under **Installation**.	Make certain that the electrical circuit to which the compressor is connected provides proper electrical grounding, correct voltage and adequate fuse protection.

WARNING: RISK FROM FLYING OBJECTS

What can happen	How to prevent it
The compressed air stream can cause soft tissue damage to exposed skin and can propel dirt, chips, loose particles, and small objects at high speed, resulting in property damage or personal injury.	Always wear certified safety equipment: ANSI Z87.1 eye protection (CAN/CSA Z94.3) with side shields when using the compressor.
	Never point any nozzle or sprayer toward any part of the body or at other people or animals.
	Always turn the compressor off and bleed pressure from the air hose and air tank before attempting maintenance, attaching tools or accessories.

WARNING: RISK OF HOT SURFACES

What can happen	How to prevent it
Touching exposed metal such as the compressor head, engine head, engine exhaust or outlet tubes, can result in serious burns.	Never touch any exposed metal parts on compressor during or immediately after operation. Compressor will remain hot for several minutes after operation. Do not reach around protective shrouds or attempt maintenance until unit has been allowed to cool.

WARNING: RISK OF INJURY FROM LIFTING

What can happen	How to prevent it
Serious injury can result from attempting to lift too heavy an object.	The compressor is too heavy to be lifted by one person. Obtain assistance from others before lifting.

WARNING: RISK FROM MOVING PARTS

What can happen	How to prevent it
Moving parts such as the pulley, flywheel, and belt can cause serious injury if they come into contact with you or your clothing.	Never operate the compressor with guards or covers which are damaged or removed
	Keep your hair, clothing, and gloves away from moving parts. Loose clothes, jewelry, or long hair can be caught in moving parts.
	Air vents may cover moving parts and should be avoided as well.

Attempting to operate compressor with damaged or missing parts or attempting to repair compressor with protective shrouds removed can expose you to moving parts and can result in serious injury.	Any repairs required on this product should be performed by authorized service center personnel.

WARNING: RISK OF UNSAFE OPERATION

What can happen	How to prevent it
Unsafe operation of your air compressor could lead to serious injury or death to you or others.	Review and understand all instructions and warnings in this manual.
	Become familiar with the operation and controls of the air compressor.
	Keep operating area clear of all persons, pets, and obstacles.
	Keep children away from the air compressor at all times.
	Do not operate the product when fatigued or under the influence of alcohol or drugs. Stay alert at all times.
	Never defeat the safety features of this product.
	Equip area of operation with a fire extinguisher.
	Do not operate machine with missing, broken, or unauthorized parts.
	Never stand on the compressor.

WARNING: RISK OF FALLING

What can happen	How to prevent it
A portable compressor can fall from a table, workbench, or roof causing damage to the compressor and could result in serious injury or death to the operator.	Always operate compressor in a stable secure position to prevent accidental movement of the unit. Never operate compressor on a roof or other elevated position. Use additional air hose to reach high locations.

Specifications

Model	CMEC6150
Bore	1.875" (47.6 mm)
Stroke	1.250" (31.8 mm)
Voltage/Hz–Single Phase	120/60
Minimum Branch Circuit Requirement	15 amps
Fuse Type	Time Delay
Air Tank Capacity	6 Gallons (22.7 liters)
Approximate Cut-in Pressure	120 psig
Approximate Cut-out Pressure	150 psig
SCFM @ 40 psig	3.7 *
SCFM @ 90 psig	2.6 *
Regulated Pressure Rating (Approximate)	3–150 psi
Quick Connect Type	1/4" (6.4 mm) Industrial
Duty Cycle	5 minutes on/5 minutes off

*Tested per ISO 1217

Refer to ***Glossary*** for abbreviations.

Glossary

Become familiar with these terms before operating the unit.

CFM: Cubic feet per minute.

SCFM: Standard cubic feet per minute; a unit of measure of air delivery.

PSIG: Pounds per square inch gauge; a unit of measure of pressure.

Code Certification: Products that bear one or more of the following marks: UL®, CUL, CULUS, ETL®, CETL, CETLUS, have been evaluated by OSHA certified independent safety laboratories and meet the applicable Standards for Safety.

Cut-In Pressure: While the motor is off, air tank pressure drops as you continue to use your accessory. When the tank pressure drops to a certain lower level the motor will restart automatically. The low pressure at which the motor automatically restarts is called "cut-in" pressure.

Cut-Out Pressure: When an air compressor is turned on and begins to run, air pressure in the air tank begins to build. It builds to a certain high pressure before the motor automatically shuts off, protecting your air tank from pressure higher than its capacity. The high pressure at which the motor shuts off is called "cut-out" pressure.

Branch Circuit: Circuit carrying electricity from electrical panel to outlet.

Duty Cycle: For proper operation of your air compressor, it is recommended that a 50% duty cycle be maintained; that is, the air compressor should not run more than 5 minutes in any 10 minute period.

ASSEMBLY AND ADJUSTMENTS

WARNING: To reduce the risk of serious personal injury, turn unit off and disconnect it from power source before making any adjustments or removing/installing attachments or accessories.
An accidental start-up can cause injury.

WARNING: Risk of unsafe operation. Unit cycles automatically when power is on. When performing maintenance, you may be exposed to voltage sources, compressed air, or moving parts. Personal injuries can occur. Before performing any maintenance or repair, disconnect power source from the compressor and bleed off all air pressure.

UNPACKING

Remove unit from carton and discard all packaging.

INSTALLATION

How To Set Up Your Unit

Location of the Air Compressor

- Locate the air compressor in a clean, dry and well ventilated area.
- The air compressor should be located at least 12" (30.5 cm) away from the wall or other obstructions that will interfere with the flow of air.
- The air compressor pump and shroud are designed to allow for proper cooling. The ventilation openings on the compressor are necessary to maintain proper operating temperature. Do not place rags or other containers on or near these openings.

Grounding Instructions (Fig. A)

WARNING: Risk of Electrical Shock. In the event of a short circuit, grounding reduces the risk of shock by providing an escape wire for the electric current. This air compressor must be properly grounded.

The portable air compressor is equipped with a cord having a grounding wire with an appropriate grounding plug ❶.

1. The cord set and plug ❶ with this unit contains a grounding pin ❷. This plug MUST be used with a grounded outlet ❸.
   IMPORTANT: The outlet being used must be installed and grounded in accordance with all local codes and ordinances.
2. Make sure the outlet being used has the same configuration as the grounded plug. DO NOT USE AN ADAPTER. Refer to Fig. A.
3. Inspect the plug and cord before each use. Do not use if there are signs of damage.
4. If these grounding instructions are not completely understood, or if in doubt as to whether the compressor is properly grounded, have the installation checked by a qualified electrician.

DANGER: Risk of Electrical Shock. IMPROPER GROUNDING CAN RESULT IN ELECTRICAL SHOCK.

- ***Do not modify the plug provided. If it does not fit the available outlet, a correct outlet should be installed by a qualified electrician.***
- ***Repairs to the cord set or plug MUST be made by a qualified electrician.***

Extension Cords

If an extension cord must be used, be sure it is:

- a 3-wire extension cord that has a 3-blade grounding plug, and a 3-slot receptacle that will accept the plug on the product
- in good condition
- no longer than 50' (15.2 m)
- 12 gauge (AWG) or larger. (Wire size increases as gauge number decreases. 10 AWG and 8 AWG may also be used. DO NOT USE 14 OR 16 AWG.)

NOTICE: *Risk of Property Damage. The use of an undersized extension cord will cause voltage to drop resulting in power loss to the motor and overheating. Instead of using an extension cord, increase the working reach of the air hose by attaching another length of hose to its end. Attach additional lengths of hose as needed.*

Voltage and Circuit Protection

Refer to ***Specifications*** for the voltage and minimum branch circuit requirements.

WARNING: *Risk of Overheating. Certain air compressors can be operated on a 15 amp circuit if the following conditions are met.*

- *Voltage supply to circuit must comply with the National Electrical Code.*
- *Circuit is not used to supply any other electrical needs.*
- *Extension cords comply with specifications.*
- *Circuit is equipped with a 15 amp circuit breaker or 15 amp time delay fuse.*
  NOTE: *If compressor is connected to a circuit protected by fuses, use only time delay fuses. Time delay fuses should be marked "D" in Canada and "T" in the US.*

If any of the above conditions cannot be met, or if operation of the compressor repeatedly causes interruption of the power, it may be necessary to operate it from a 20 amp circuit. It is not necessary to change the cord set.

OPERATION

WARNING: To reduce the risk of serious personal injury, turn unit off and disconnect it from power source before making any adjustments or removing/installing attachments or accessories. *An accidental start-up can cause injury.*

WARNING: Risk of unsafe operation. Unit cycles automatically when power is on. When performing maintenance, you may be exposed to voltage sources, compressed air, or moving parts. Personal injuries can occur. Before performing any maintenance or repair, disconnect power source from the compressor and bleed off all air pressure.

Know Your Air Compressor

READ THIS OWNER'S MANUAL AND SAFETY RULES BEFORE OPERATING YOUR UNIT. Compare the illustrations with your unit to familiarize yourself with the location of various controls and adjustments. Save this manual for future reference.

Description of Operation (Fig. A)

Become familiar with these controls before operating the unit.

On(I)/Off(O) Switch: Place this switch 4 in the On(I) position to provide automatic power to the pressure switch and Off(O) to remove power at the end of each use.

Pressure Switch (not shown): The pressure switch automatically starts the motor when the air tank pressure drops below the factory set "cut-in" pressure. It stops the motor when the air tank pressure reaches the factory set "cut-out" pressure.

Safety Valve: If the pressure switch does not shut off the air compressor at its "cut-out" pressure setting, the safety valve 8 will protect against high pressure by "popping out" at its factory set pressure (slightly higher than the pressure switch "cut-out" setting).

Tank Pressure Gauge: The tank pressure gauge 5 indicates the reserve air pressure in the tank.

Outlet Pressure Gauge: The outlet pressure gauge 9 indicates the air pressure available at the outlet side of the regulator. This pressure is controlled by the regulator and is always less than or equal to the tank pressure.

Regulator: Controls the air pressure shown on the outlet pressure gauge. Turn regulator knob 7 clockwise to increase pressure and counterclockwise to decrease pressure.

Cooling System (not shown): This compressor contains an advanced design cooling system. At the heart of this cooling system is an engineered fan. It is perfectly normal for this fan to blow air through the vent holes in large amounts. You know that the cooling system is working when air is being expelled.

Air Compressor Pump (not shown): Compresses air into the air tank. Working air is not available until the compressor has raised the air tank pressure above that required at the air outlet.

Drain Valve: The drain valve 10 is located at the base of the air tank and is used to drain condensation at the end of each use.

Check Valve (not shown): When the air compressor is operating, the check valve is "open", allowing compressed air to enter the air tank. When the air compressor reaches "cut-out" pressure, the check valve "closes", allowing air pressure to remain inside the air tank.

Motor Overload Protector (not shown): The motor has a thermal overload protector. If the motor overheats for any reason, the overload protector will shut off the motor. The motor must be allowed to cool down before restarting. To restart:

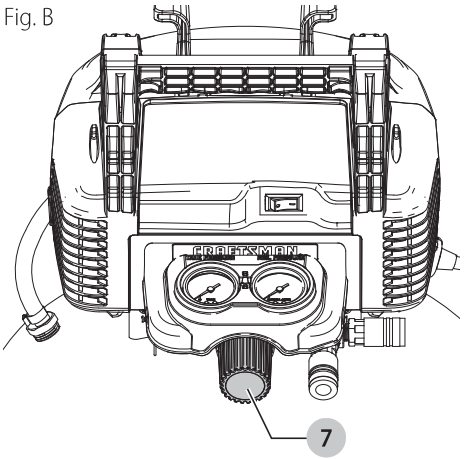
1. Set the On/Off switch to "Off" and unplug unit.
2. Allow the motor to cool.
3. Plug the power cord into the correct branch circuit receptacle.
4. Set the On/Off switch to "On" position.

Quick Connects : The quick connects 6 accepts industrial quick connect plugs. The two quick connect bodies allow the use of two tools at the same time.

How to Use Your Unit (Fig. A, B)

How to Stop

1. Set the On/Off switch 4 to "Off".
2. Unplug unit when not in use.



Before Starting

WARNING: Do not operate this unit until you read this instruction manual for safety, operation and maintenance instructions.

Before Each Start-Up

1. Set the On/Off switch 4 to "Off".
2. Plug the power cord into the correct branch circuit receptacle. (Refer to ***Voltage and Circuit Protection*** paragraph in the **Installation** section of this manual.)
3. Turn regulator knob 7 counterclockwise until fully closed. Ensure regulated pressure gauge reads 0 PSI (0 kPa).

Fig. B

4. Attach hose and accessories.
5. Ensure all covers and labels are in place, legible (for labels) and securely mounted. Do not use compressor until all items have been verified.

WARNING: Risk of unsafe operation. Firmly grasp air hose in hand when installing or disconnecting to prevent hose whip.

WARNING: Risk of unsafe operation. Do not use damaged or worn accessories.

NOTE: This unit is equipped with quick connects 6. The hose or accessory being connected will require a quick connect plug.

WARNING: Risk of Bursting. Too much air pressure causes a hazardous risk of bursting. Check the manufacturer's maximum pressure rating for air tools and accessories. The regulator outlet pressure must never exceed the maximum pressure rating.

NOTICE: *Risk of property damage. Compressed air from the unit may contain water condensation and oil mist. Do not spray unfiltered air at an item that could be damaged by moisture. Some air tools and accessories may require filtered air. Read the instructions for the air tools and accessories.*

How to Start

1. Set the On/Off switch 4 to "On" and allow tank pressure to build. Motor will stop when tank pressure reaches "cut-out" pressure.
2. Turn regulator knob 7 clockwise to increase pressure and stop when desired pressure is reached.

WARNING: Risk of unsafe operation. If any unusual noise or vibration is noticed, stop the compressor immediately and have it checked by a trained service technician.

The compressor is ready for use.

MAINTENANCE

WARNING: To reduce the risk of serious personal injury, turn unit off and disconnect it from power source before making any adjustments or removing/installing attachments or accessories. *An accidental start-up can cause injury.*

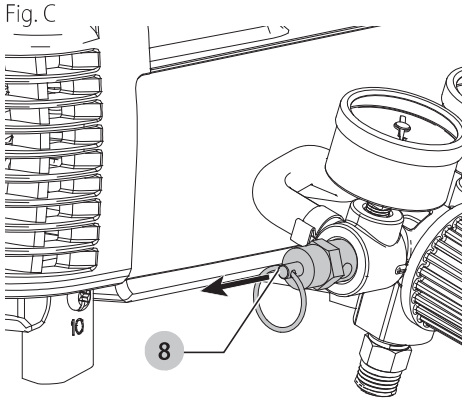
WARNING: Risk of unsafe operation. Unit cycles automatically when power is on. When performing maintenance, you may be exposed to voltage sources, compressed air, or moving parts. Personal injuries can occur. Before performing any maintenance or repair, disconnect power source from the compressor and bleed off all air pressure.

Customer Responsibilities

	Before each use	Daily or after each use	See tank warning label
Check Safety Valve	X		
Drain Tank		X	
Remove tank from service			X[1]

1- For more information, call our Customer Care Center at 1–888–331–4569

NOTE: See **Operation** section for the location of controls.



To Check Safety Valve (Fig. C)

WARNING: Risk of Bursting. If the safety valve does not work properly, over-pressurization may occur, causing air tank rupture or an explosion.

WARNING: Risk from Flying Objects. Always wear certified safety equipment: ANSI Z87.1 eye protection (CAN/CSA Z94.3) with side shields.

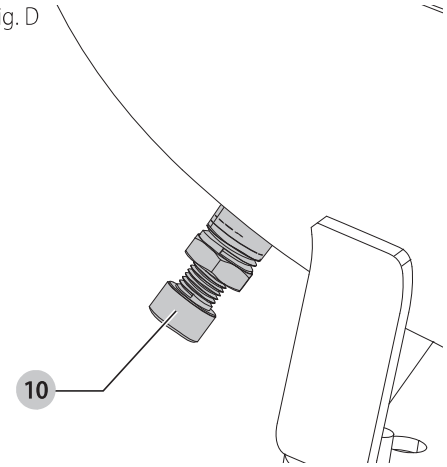
Before starting compressor, pull the ring on the safety valve 8 to make sure that the safety valve operates freely. If the valve is stuck or does not operate smoothly, it must be replaced with the same type of valve.

Fig. C

To Drain Tank (Fig. A, D)

WARNING: Risk of Unsafe Operation. Air tanks contain high pressure air. Keep face and other body parts away from outlet of drain. Use ANSI Z87.1 eye protection (CAN/CSA Z94.3) when draining as debris can be kicked up into face.

WARNING: Risk from noise. Always wear proper hearing protection during use. Under some conditions and duration of use, noise from this product may contribute to hearing loss.



NOTE: All compressed air systems generate condensate that accumulates in any drain point (e.g., tanks, filter, aftercoolers, dryers). This condensate contains lubricating oil and/or substances which may be regulated and must be disposed of in accordance with local, state, and federal laws and regulations.

WARNING: Risk of Bursting. Water will condense in the air tank. If not drained, water will corrode and weaken the air tank causing a risk of air tank rupture.

NOTICE: *Risk of Property Damage. Drain water from air tank may contain oil and rust which can cause stains.*

1. Set the On/Off switch 4 to "Off".
2. Turn the regulator knob 7 counterclockwise to set the outlet pressure to zero.
3. Remove the air tool or accessory.
4. Place a suitable container under the drain valve to catch discharge.
5. Pull ring on safety valve 8 allowing air to bleed from the tank until tank pressure is approximately 20 psi. Release safety valve ring.
6. Drain water from air tank by opening drain valve 10 on bottom of tank.

Fig. D

7. After the water has been drained, close the drain valve. The air compressor can now be stored.

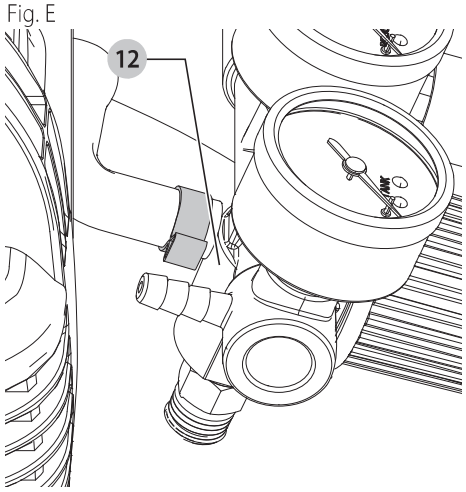
NOTE: If drain valve is plugged, release all air pressure. The valve can then be removed, cleaned, the reinstalled.

Cleaning

WARNING: *Blow dirt and dust out of all air vents with clean, dry air at least once a week. To minimize the risk of eye injury, always wear ANSI Z87.1 approved eye protection when performing this.*

WARNING: *Never use solvents or other harsh chemicals for cleaning the non-metallic parts of the tool. These chemicals may weaken the plastic materials used in these parts. Use a cloth dampened only with water and mild soap. Never let any liquid get inside the tool; never immerse any part of the tool into a liquid.*

Repairs



WARNING: *To assure product SAFETY and RELIABILITY, repairs, maintenance and adjustment (including brush inspection and replacement, when applicable) should be performed by a CRAFTSMAN factory service center or a CRAFTSMAN authorized service center. Always use identical replacement parts.*

WARNING: *Risk of Unsafe Operation. Unit cycles automatically when power is on. When servicing, you may be exposed to voltage sources, compressed air, or moving parts. Before servicing unit unplug or disconnect electrical supply to the air compressor, bleed tank of pressure, and allow the air compressor to cool.*

To Replace Regulator (Fig. A, E)

1. Release all air pressure from air tank. See ***To Drain Tank*** in the **Maintenance** section.
2. Unplug unit.
3. Remove the console cover.
4. Using an adjustable wrench remove the safety valve **8** from the regulator manifold **7**.
5. Remove the hose by removing the hose clamp **12**. **NOTE:** The hose clamp is not reusable. You must purchase a new hose clamp.

Fig. E

6. Remove three pump mounting screws securing pump.
7. Carefully lift pump up away from brackets and out of the way.
8. Using an adjustable wrench remove the regulator knob **7**.
9. Apply pipe sealant to new regulator manifold and assemble, tighten with wrench.
10. Reapply pipe sealant to safety valve.
11. Reassemble all components in reverse order of removal. Make sure to orient gauges to read correctly and use wrenches to tighten all components.

Storage

Before you store the air compressor, make sure you do the following:

1. Review the **Maintenance** section on the preceding pages and perform scheduled maintenance as necessary.
2. Drain water from air tank. See ***To Drain Tank*** under **Maintenance**.

WARNING: Risk of Bursting. Water will condense in the air tank. If not drained, water will corrode and weaken the air tank causing a risk of air tank rupture.

3. Protect the electrical cord and air hose from damage (such as being stepped on or run over). Wind air hose loosely around the compressor handle. Wrap electrical cord onto the cord wrap.
4. Store the air compressor in a clean and dry location.

Accessories

WARNING: *Since accessories, other than those offered by CRAFTSMAN, have not been tested with this product, use of such accessories with this tool could be hazardous. To reduce the risk of injury, only CRAFTSMAN recommended accessories should be used with this product.*

Recommended accessories for use with your tool are available at extra cost from your local dealer or authorized service center. If you need assistance in locating any accessory, please contact CRAFTSMAN, call **1-888-331-4569**.

Register Online

Thank you for your purchase. Register your product now for:

- **WARRANTY SERVICE:** Registering your product will help you obtain more efficient warranty service in case there is a problem with your product.
- **CONFIRMATION OF OWNERSHIP:** In case of an insurance loss, such as fire, flood or theft, your registration of ownership will serve as your proof of purchase.
- **FOR YOUR SAFETY:** Registering your product will allow us to contact you in the unlikely event a safety notification is required under the Federal Consumer Safety Act.

Register online at **www.craftsman.com/registration**

One Year Limited Warranty

CRAFTSMAN will repair or replace, without charge, any defects due to faulty materials or workmanship for one year from the date of purchase. This warranty does not cover part failure due to normal wear or tool abuse. For further detail of warranty coverage and warranty repair information, visit **www.craftsman.com** or call **1-888-331-4569**. This warranty does not apply to accessories or damage caused where repairs have been made or attempted by others. THIS LIMITED WARRANTY IS GIVEN IN LIEU OF ALL OTHERS, INCLUDING THE IMPLIED WARRANTY OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, AND EXCLUDES ALL INCIDENTAL OR CONSEQUENTIAL DAMAGES. Some states do not allow limitations on how long an implied warranty lasts or the exclusion or limitation of incidental or consequential damages, so these limitations may not apply to you. This warranty gives you specific legal rights and you may have other rights which vary in certain states or provinces.

90 DAY MONEY BACK GUARANTEE

If you are not completely satisfied with the performance of your CRAFTSMAN Power Tool or Nailer for any reason, you can return it within 90 days from the date of purchase with a receipt for a full refund – no questions asked.

LATIN AMERICA: This warranty does not apply to products sold in Latin America. For products sold in Latin America, see country specific warranty information contained either in the packaging, call the local company or see website for warranty information.

TROUBLESHOOTING

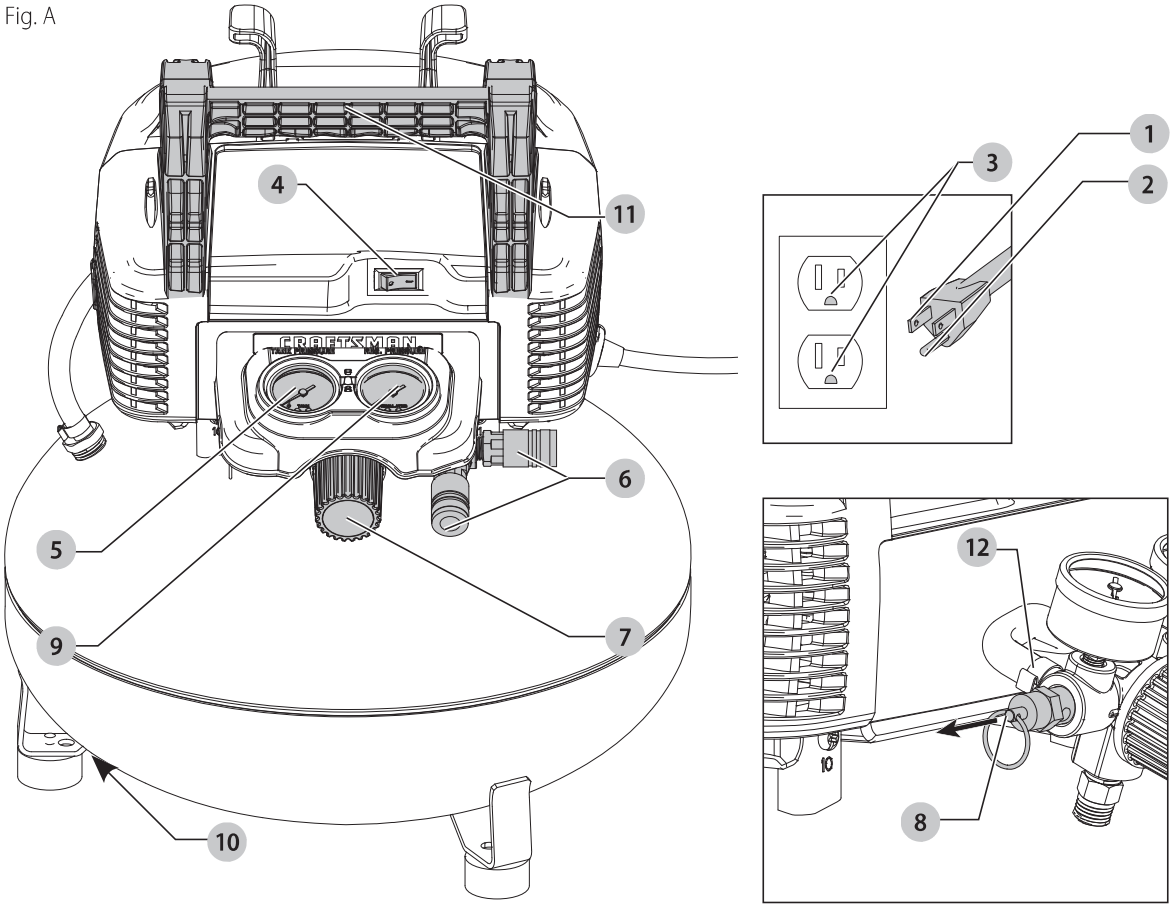
WARNING: Risk of Unsafe Operation. Unit cycles automatically when power is on. When servicing, you may be exposed to voltage sources, compressed air, or moving parts. Before servicing unit unplug or disconnect electrical supply to the air compressor, bleed tank of pressure, and allow the air compressor to cool.

PROBLEM	CAUSE	CORRECTION
Excessive tank pressure – safety valve pops off.	Pressure switch does not shut off motor when compressor reaches "cut-out" pressure.	Move On/Off lever to the "Off" position, if the outfit does not shut off contact a Trained Service Technician.
	Pressure switch "cut-out" too high.	Contact a Trained Service Technician.
Air leaks at fittings.	Tube fittings are not tight enough.	Tighten fittings where air can be heard escaping. Check fittings with soapy water solution. **Do Not Overtighten.**
Air leaks in air tank or at air tank welds.	Defective air tank.	Air tank must be replaced. Do not repair the leak. ***WARNING: Risk bursting. Do not drill into, weld or otherwise modify air tank or it will weaken. The tank can rupture or explode.***
Air leaks between head and valve plate.	Leaking seal.	Contact a Trained Service Technician.
Air leak from safety valve.	Possible defect in safety valve.	Operate safety valve manually by pulling on ring. If valve still leaks, it should be replaced.
Knocking Noise.	Possible defect in safety valve.	Operate safety valve manually by pulling on ring. If valve still leaks, it should be replaced.
Pressure reading on the regulated pressure gauge drops when an accessory is used.	It is normal for "some" pressure drop to occur.	If there is an excessive amount of pressure drop when the accessory is used, adjust the regulator following the instructions in the ***Description of Operation*** paragraph in the **Operation** Section. **NOTE:** Adjust the regulated pressure under flow conditions (while accessory is being used).
Compressor is not supplying enough air to operate accessories.	Prolonged excessive use of air.	Decrease amount of air usage.
	Compressor is not large enough for air requirement.	Check the accessory air requirement. If it is higher than the SCFM or pressure supplied by your air compressor, you need a larger compressor.
	Hole in hose.	Check and replace if required.
	Check valve restricted.	Have checked by a Trained Service Technician.
	Air leaks.	Tighten fittings.
Regulator knob has continuous air leak.	Damaged regulator.	Replace.
Regulator will not shut off air outlet.	Damaged regulator.	Replace.
Motor will not run.	Fuse blown, circuit breaker tripped.	Check fuse box for blown fuse and replace as necessary. Reset circuit breaker. Do not use a fuse or circuit breaker with higher rating than that specified for your particular branch circuit.
		Check for proper fuse. You should use a time delay fuse.
		Check for low voltage problem.
		Check the extension cord.
		Disconnect the other electrical appliances from circuit or operate the compressor on its own branch circuit.
	Extension cord is wrong length or gauge.	Check the extension cord.
	Loose electrical connections.	Check wiring connection inside terminal box.
	Faulty motor.	Have checked by a Trained Service Technician.
	Motor overload protection switch has tripped.	Refer to ***Motor Overload Protector*** under **Description of Operation**. If motor overload protection trips frequently, contact a Trained Service Technician.

Définitions : symboles et termes d'alarmes sécurité

Ces guides d'utilisation utilisent les symboles et termes d'alarmes sécurité suivants pour vous prévenir de situations dangereuses et de risques de dommages corporels
ou matériels.

DANGER : *indique une situation dangereuse imminente qui, si elle n'est pas évitée,* ***entraînera*** *la* ***mort ou des blessures graves****.*



AVERTISSEMENT : *indique une situation potentiellement dangereuse qui, si elle n'est pas évitée,* ***pourrait*** *entraîner la* ***mort ou des blessures graves****.*

ATTENTION : *indique une situation potentiellement dangereuse qui, si elle n'est pas évitée,* ***pourrait*** *entraîner des* ***blessures légères ou modérées****.*

(Si utilisé sans aucun terme) Indique un message propre à la sécurité.

AVIS : *indique une pratique ne posant* ***aucun risque de dommages corporels*** *mais qui par contre, si rien n'est fait pour l'éviter,* ***pourrait*** *poser des* ***risques de dommages matériels****.*

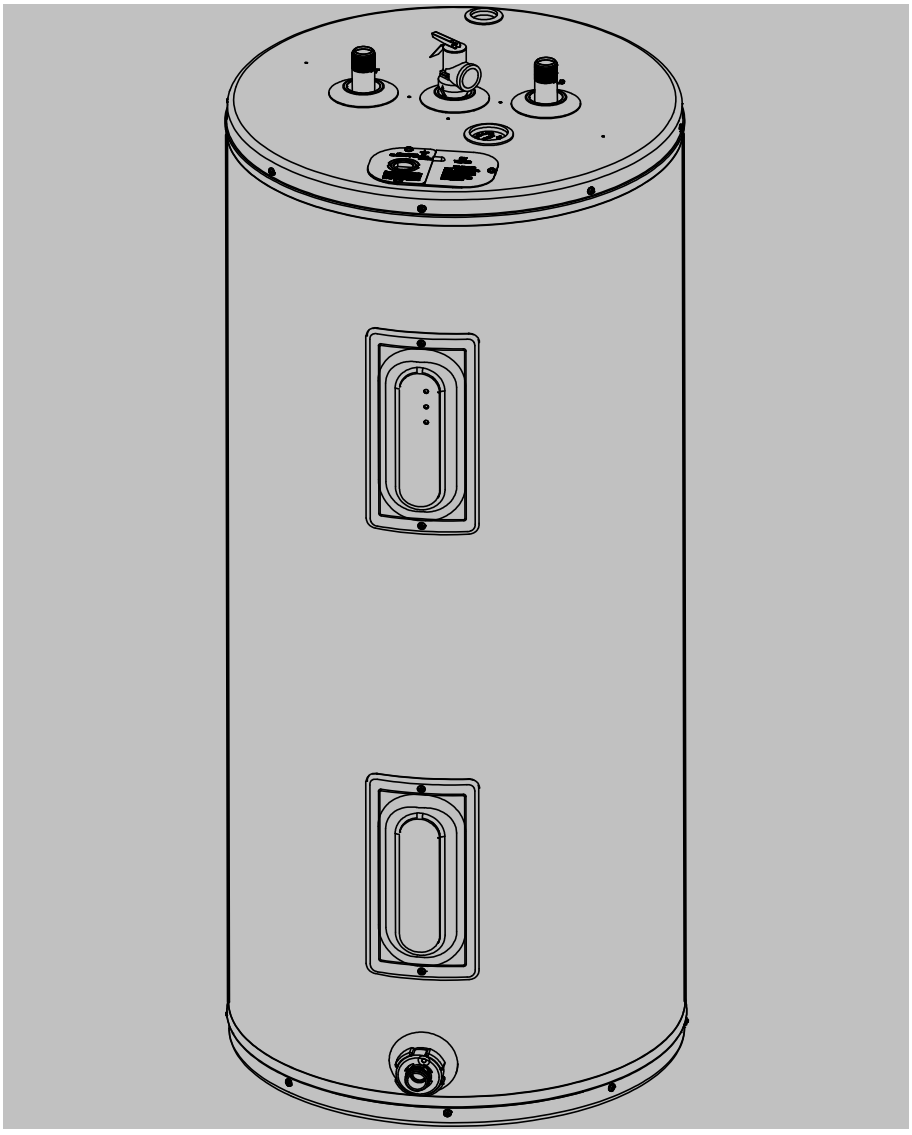
Section 3.7.2

Water Heater

Section 3.7.2.1



Tank Water Heater

Use & Care Manual
With Installation Instructions for the Installer

Electric Residential

Water Heaters

Double Element Residential Electric Models

The purpose of this manual is twofold: one, to provide the installer with the basic directions and recommendations for the proper installation and adjustment of the water heater; and two, for the owner–operator, to explain the features, operation, safety precautions, maintenance and troubleshooting of the water heater. This manual also includes a parts list.

It is imperative that all persons who are expected to install, operate or adjust this water heater read the instructions carefully so they may understand how to perform these operations. If you do not understand these instructions or any terms within it, seek professional advice.

Any questions regarding the operation, maintenance, service or warranty of this water heater should be directed to the seller from whom it was purchased. If additional information is required, refer to the section on “If you need service.”

Do not destroy this manual. Please read carefully and keep in a safe place for future reference.

Recognize this symbol as an indication of Important Safety Information!

FOR YOUR RECORDS

Write the model and serial numbers here:

#

#

You can find them on a label on the appliance.

Staple sales slip or cancelled cheque here.

Proof of the original purchase date is needed to obtain service under the warranty.

READ THIS MANUAL

Inside you will find many helpful hints on how to use and maintain your water heater properly. Just a little preventive care on your part can save you a great deal of time and money over the life of your water heater.

You'll find many answers to common problems in the Before You Call For Service section. If you review our chart of Troubleshooting Tips first, you may not need to call for service at all.

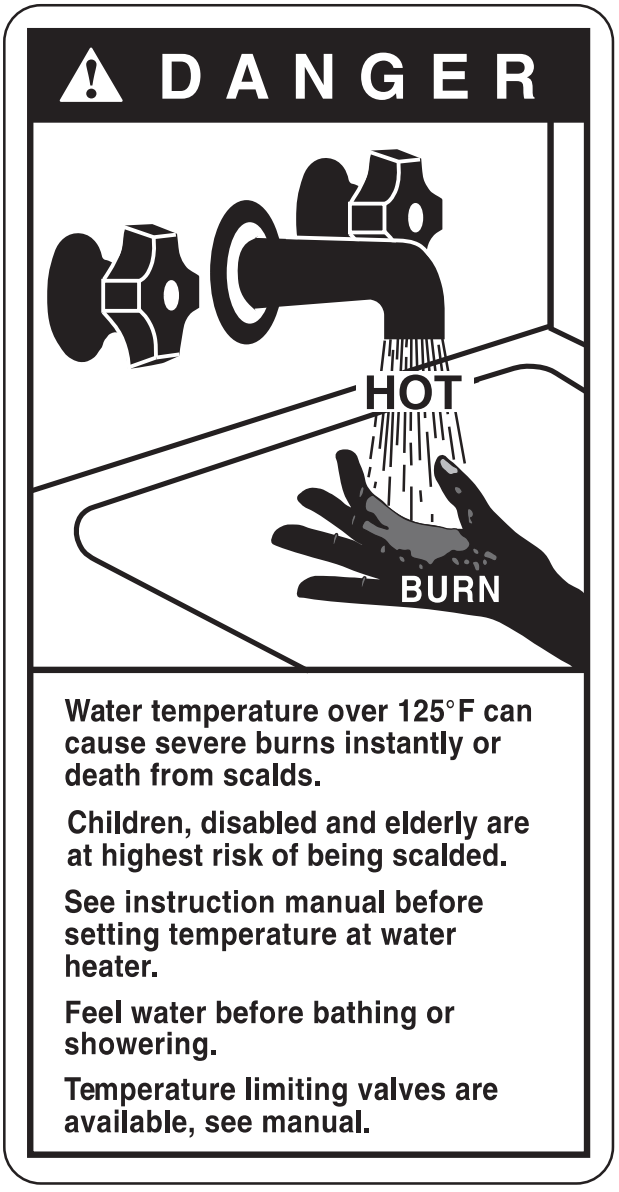
READ THE SAFETY INFORMATION

Your safety and the safety of others are very important. There are many important safety messages in this manual and on your appliance. Always read and obey all safety messages.

This is the safety alert symbol. Recognize this symbol as an indication of Important Safety Information! This symbol alerts you to potential hazards that can kill or hurt you and others.

All safety messages will follow the safety alert symbol and either the word "DANGER", "WARNING", "CAUTION" or "NOTICE".

These words mean:



DANGER	An imminently hazardous situation that will result in death or serious injury.
WARNING	A potentially hazardous situation that could result in death or serious injury and/or damage to property.
CAUTION	A potentially hazardous situation that may result in minor or moderate injury.
Notice:	Attention is called to observe a specified procedure or maintain a specific condition.

IMPORTANT SAFETY INFORMATION. READ ALL INSTRUCTIONS BEFORE USING.

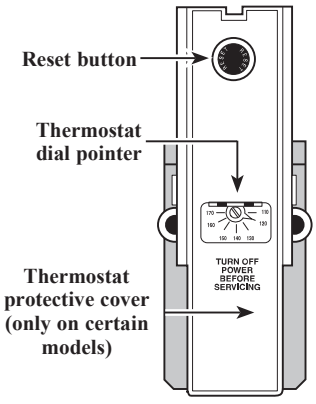
⚠WARNING!

WATER TEMPERATURE ADJUSTMENT

Safety and energy conservation are factors to be considered when selecting the water temperature setting of water heater's thermostat. Water temperatures above 52°C (125°F) can cause severe burns or death from scalding. Be sure to read and follow the warnings outlined on the label pictured below. This label is also located on the water heater near the thermostat access panel.

NOTICE: Mixing valves are recommended for reducing point of use water temperature by mixing hot and cold water in branch water lines. It is recommended that a mixing valve complying with the Standard for Temperature Actuated Mixing Valves for Hot Water Distribution Systems, ASSE 1017 be installed. See page 13 for more details and contact a licensed plumber or the local plumbing authority for further information.

Time/Temperature Relationship in Scalds



Temperature	Time To Produce a Serious Burn
49°C (120°F)	More than 5 minutes
52°C (125°F)	$1\frac{1}{2}$ to 2 minutes
54°C (130°F)	About 30 seconds
57°C (135°F)	About 10 seconds
60°C (140°F)	Less than 5 seconds
63°C (145°F)	Less than 3 seconds
66°C (150°F)	About $1\frac{1}{2}$ seconds
68°C (155°F)	About 1 second

Table courtesy of Shriners Burn Institute

The chart shown above may be used as a guide in determining the proper water temperature for your home.

NOTICE: Households with small children, disabled, or elderly persons may require a 49°C (120°F) or lower thermostat setting to prevent contact with "HOT" water.

The temperature of the water in the heater is regulated by the adjustable surface mounted thermostat(s) located behind the jacket access panel(s). Dual element heaters have two thermostats. The thermostat(s) were set at 60°C (140°F) before the water heater was shipped from the factory.

The illustration at the left shows the temperature adjustment dial used for setting the water temperature.

Refer to the Operating Instructions in this manual for detailed instructions in how to adjust the thermostat(s).

⚠DANGER: Hotter water increases the potential for Hot Water SCALDS.

IMPORTANT SAFETY INFORMATION. READ ALL INSTRUCTIONS BEFORE USING.

⚠WARNING!

For your safety, the information in this manual must be followed to minimize the risk of fire or explosion, electric shock, or to prevent property damage, personal injury, or loss of life.

Be sure to read and understand the entire Use and Care Manual before attempting to install or operate this water heater. It may save you time and cost. Pay particular attention to the Safety Instructions. Failure to follow these warnings could result in serious bodily injury or death. Should you have problems understanding the instructions in this manual, or have any questions, STOP, and get help from a qualified service technician, or the local electric utility.

SAFETY PRECAUTIONS

Have the installer show you the location of the circuit breaker and how to shut it off if necessary. Turn off the circuit breaker if the water heater has been subjected to overheating, fire, flood, physical damage or if the ECO fails to shut off.

- Read this manual entirely before installing or operating the water heater.
- Use this appliance only for its intended purpose as described in this Use and Care Manual.
- Be sure your appliance is properly installed in accordance with local codes and the provided installation instructions.
- **DO NOT** attempt to repair or replace any part of your water heater unless it is specifically recommended in this manual. All other servicing should be referred to a qualified technician.

READ AND FOLLOW THIS SAFETY INFORMATION CAREFULLY.

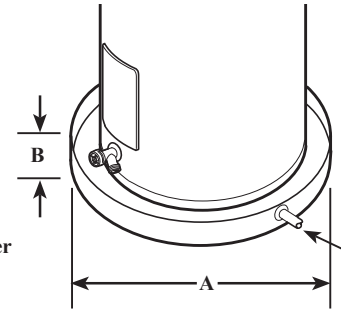
SAVE THESE INSTRUCTIONS

Installing the water heater.

The location chosen for the water heater must take into consideration the following:

Local Installation Regulations

This water heater must be installed in accordance with these instructions, local authorities and codes, utility codes or utility company requirements, which must be followed and take precedent over any recommendation in this manual.



Location

Locate the water heater in a clean dry area as near as practical to the area of greatest heated water demand. Long uninsulated hot water lines can waste energy and water.

Place the water heater in such a manner that the thermostat and element access panels can be removed to permit inspection and servicing such as removal of elements or checking controls.

The water heater and water lines should be protected from freezing temperatures. **DO NOT** install the water heater in outdoor, unprotected areas.

⚠CAUTION: The water heater should not be located in an area where leakage of the tank or connections will result in damage to the area adjacent to it or to lower floors of the structure. Where such areas cannot be avoided, it is recommended that a suitable catch pan, adequately drained, be installed under the water heater.

A—Diameter of water heater plus 5 cm (2″) min.

B—Maximum 5 cm (2″)

NOTICE: Auxiliary catch pan MUST conform to local codes.

Catch Pan Kits are available from the store where the water heater was purchased, or any water heater distributor.

Inspect Shipment

Inspect the water heater for possible damage. Check the markings on the rating plate of the water heater to be certain the power supply corresponds to the water heater requirements.

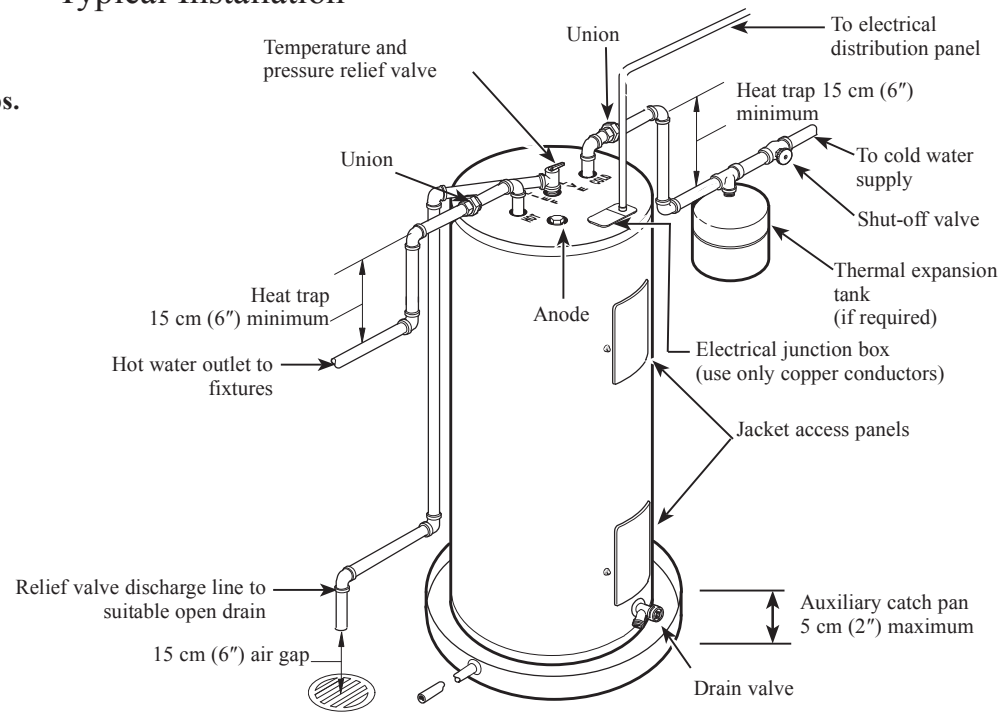
Installing the water heater.

Thermal Expansion

Determine if a check valve exists in the inlet water line. It may have been installed in the cold water line as a separate back flow preventer, or it may be part of a pressure reducing valve, water meter or water softener. A check valve located in the cold water inlet line can cause what is referred to as a **"closed water system"**. A cold water inlet line with no check valve or back flow prevention device is referred to as an "open" water system.

As water is heated, it expands in volume and creates an increase in the pressure within the water system. This action is referred to as **"thermal expansion"**. In an "open" water system, expanding water which exceeds the capacity of the water heater flows back into the city main where the pressure is easily dissipated.

A **"closed water system"**, however, prevents the expanding water from flowing back into the main supply line, and the result of **"thermal expansion"** can create a rapid and dangerous pressure increase in the water heater and system piping. This rapid pressure increase can quickly reach the safety setting of the relief valve, causing it to operate during each heating cycle. Thermal expansion, and the resulting rapid and repeated expansion and contraction of components in the water heater and piping system can cause premature failure of the relief valve, and possibly the heater itself. Replacing the relief valve **will not** correct the problem!



The suggested method of controlling thermal expansion is to install an expansion tank in the cold water line between the water heater and the check valve (refer to the illustration below). The expansion tank is designed with an air cushion built in that compresses as the system pressure increases, thereby relieving the over pressure condition and eliminating the repeated operation of the relief valve. Other methods of controlling thermal expansion are also available. Contact your installing contractor, water supplier or plumbing inspector for additional information regarding this subject.

Water Supply Connections

NOTICE: DO NOT apply heat to the HOT or COLD water connections. If sweat connections are used, sweat tubing to adapter before fitting adapter to the water connections on heater. Any heat applied to the water supply fittings will permanently damage the dip tube and or heat traps.

Refer to the illustration below for suggested typical installation. The installation of unions or flexible copper connectors is recommended on the hot and cold water connections so that the water heater may be easily disconnected for servicing if necessary. The HOT and COLD water connections are clearly marked and are 3/4″ NPT on all models. Install a shut-off valve in the cold water line near the water heater.

Typical Installation

*** Some models are constructed with a side cold water inlet and will not have an opening on the top of the water heater.**

A new combination temperature and pressure relief valve, complying with the Standard for Relief Valves and Automatic Gas Shut-Off Devices for Hot Water Supply Systems, ANSI Z21.22/CSA 4.4 M99, must be installed in the opening provided and marked for the purpose on the water heater. No valve of any type should be installed between the relief valve and the tank. Local codes shall govern the installation of relief valves.

Relief Valve

⚠WARNING: The pressure rating of the relief valve must not exceed 1 034 kPa (150 PSI), the maximum working pressure of the water heater as marked on the rating plate.

The BTU/h rating of the relief valve must not be less than the input rating of the water heater as indicated on the rating label located on the front of the heater (1 watt=3.412 BTU/h).

Connect the outlet of the relief valve to a suitable open drain so that the discharge water cannot contact live electrical parts or persons and to eliminate potential water damage.

Piping used should be of a type approved for hot water distribution. The discharge line must be no smaller than the outlet of the valve and must pitch downward from the valve to allow complete drainage (by gravity) of the relief valve and discharge line. The end of the discharge line should not be threaded or concealed and should be protected from freezing. No valve of any type, restriction or reducer coupling should be installed in the discharge line.

To Fill the Water Heater

⚠WARNING: The tank must be full of water before heater is turned on. The water heater warranty DOES NOT cover damage or failure resulting from operation with an empty or partially empty tank.

Make certain the drain valve is completely closed.

Open the shut-off valve in the cold water supply line.

Open each hot water faucet slowly to allow the air to vent from the water heater and piping.

A steady flow of water from the hot water faucet(s) indicates a full water heater.

Condensation

Condensation can form on the tank when it is first filled with water. Condensation might also occur with a heavy water draw and very cold inlet water temperature.

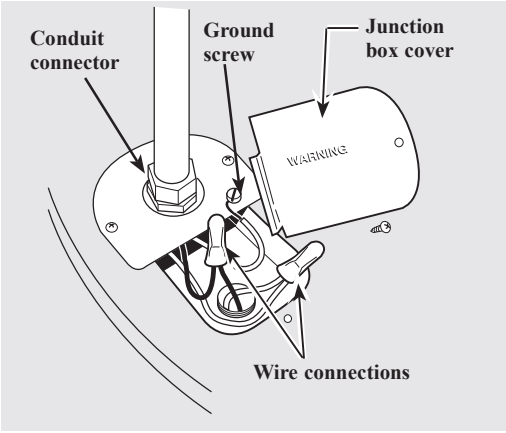
This condition is not unusual, and will disappear after the water becomes heated. If, however, the condensation continues, examine the piping and fittings for possible leaks.

Installing the water heater.

⚠CAUTION: The presence of water in the piping and water heater does not provide sufficient conduction for a ground. Non-metallic piping, dielectric unions, flexible connectors etc. can cause the water heater to be electrically isolated.

Electrical Connections

A separate branch circuit with copper conductors, overcurrent protective device and suitable disconnecting means must be provided by a qualified electrician.



All wiring must conform to local codes, or the latest edition of the Canadian Electrical Code. Refer to wiring diagrams in the back of this manual for wiring connections.

The voltage requirements and wattage load for the water heater are specified on the rating plate on the front of the water heater.

The water heater is completely wired to the junction bracket inside the top access panel on front of the water heater. An opening for 1.2 cm (1/2”) or 1.9 cm (3/4”) electrical fitting is provided for field wiring connections.

The branch circuit wiring should include either:

1. Metallic conduit or metallic sheathed cable approved for use as a grounding conductor and installed with fittings approved for the purpose.
2. Non-metallic sheathed cable, metallic conduit or metallic sheathed cable not approved for use as a ground conductor shall include a separate conductor for grounding. It should be attached to the ground terminals of the water heater and the electrical distribution box.

Water heater junction box

NOTICE: This guide recommends minimum branch circuit sizing and wire size. Refer to wiring diagrams in this manual for field wiring connections.

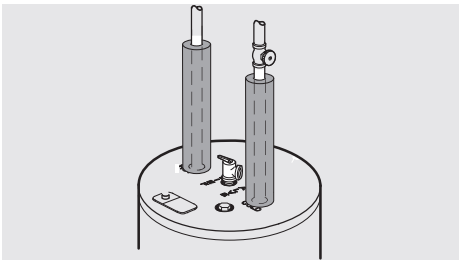
Branch Circuit Sizing and Wire Size Guide

Total Water Heater Wattage	Recommended Over Current Protection (fuse or circuit breaker amperage rating)				Copper Wire Size AWG Based on N.E.C. Table 310-16 (75°C)			
	208V	240V	277V	480V	208V	240V	277V	480V
3,000	20	20	---	---	12	12	---	---
3,800	25	20	---	---	10	12	---	---
4,000	25	25	---	---	10	10	---	---
4,500	30	25	---	---	10	10	---	---

Insulation Blankets

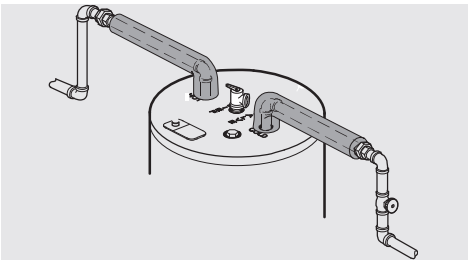
⚠WARNING: If local codes require external application of insulation blanket kits the manufacturer's instructions included with the kit must be carefully followed.

Insulation blankets, available to the general public, for external use on electric water heaters are not necessary. The purpose of an insulation blanket is to reduce the standby heat loss encountered with storage tank heaters. This water heater meets or exceeds CSA standards, with respect to insulation and standby loss requirements making an insulation blanket unnecessary.



The manufacturer's warranty does not cover any damage or defect caused by installation, attachment or use of any type of energy saving or other unapproved devices (other than those authorized by the manufacturer) into, onto or in conjunction with the water heater. The use of unauthorized energy saving devices may shorten the life of the water heater and may endanger life and property.

The manufacturer disclaims any responsibility for such loss or injury resulting from the use of such unauthorized devices.



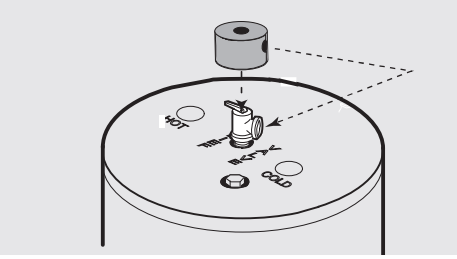
⚠CAUTION: If local codes require the application of an external insulation blanket to this water heater, pay careful attention to the following so as not to restrict the proper function and operation of the water heater:

- **DO NOT** cover the operating or warning labels attached to the water heater or attempt to relocate them on the exterior of insulation blanket.
- **DO NOT** apply insulation to the top of the water heater this could interfere with the safe operation of the electrical junction box.
- **DO NOT** cover the jacket access panel(s) to the thermostat(s) and heating element(s), or pressure and temperature relief valve.
- Inspect the insulation blanket frequently.

Hot and Cold Pipe Insulation Installation

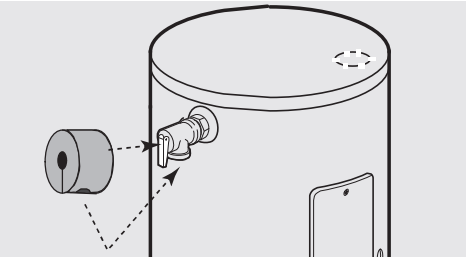
Typical vertical piping arrangement

Typical horizontal piping arrangement



For increased energy efficiency, some water heaters have been supplied with two 61cm (24") sections of pipe insulation.

Please install the insulation, according to the illustrations above, that best meets your requirements.



Installing the water heater.

Relief Valve Insulation Installation

⚠CAUTION: Ensure the T&P Valve opening is not obstructed by the insulation.

Typical top connection arrangement

Typical side connection arrangement

For increased energy efficiency, some water heaters have been supplied with a 6cm (2-3/8”) section of pipe insulation.

Please install the insulation, according to the illustrations above, that best meets your requirements.

Slip the insulation cover over the T&P Valve through the center hole and align the hole in the side with the opening of the T&P Valve.

Heat Trap

For increased energy efficiency, some water heaters have been supplied with factory installed internal or external heat traps in the hot outlet line and cold water inlet openings.

NOTICE: DO NOT apply heat to the HOT or COLD water connections. If sweat connections are used, sweat tubing to adapter before fitting adapter to the water connections on heater. Any heat applied to the water supply fittings will permanently damage the dip tube and/or heat traps.

Installation Checklist

A. Water Heater Location

- ❑ Close to area of heated water demand.
- ❑ Indoors and protected from freezing temperatures.
- ❑ Area free of flammable vapours.
- ❑ Provisions made to protect area from water damage.
- ❑ Sufficient room to service heater.

B. Water Supply

- ❑ Water heater completely filled with water.
- ❑ Air purged from water heater and piping.
- ❑ Water connections tight and free of leaks.

C. Relief Valve

- ❑ Temperature and Pressure Relief Valve properly installed and discharge line run to open drain.
- ❑ Discharge line protected from freezing.

D. Wiring

- ❑ Power Supply voltage agrees with water heater rating plate.
- ❑ Branch circuit wire and fusing or circuit breaker of proper size.
- ❑ Electrical connections tight and unit properly grounded.

Operating the water heater.

⚠CAUTION: Hydrogen gas can be produced in a hot water system served by this water heater that has not been used for a long period of time (generally two weeks or more). HYDROGEN GAS IS EXTREMELY FLAMMABLE!! To dissipate such gas and to reduce risk of injury, it is recommended that the hot water faucet be opened for several minutes at the kitchen sink before using any electrical appliance connected to the hot water system. If hydrogen is present, there will be an unusual sound such as air escaping through the pipe as the water begins to flow. DO NOT smoke or use an open flame near the faucet at the time it is open.

Safety Precautions

- **A** **Do** turn off power to water heater if it has been subjected to over heating, fire, flood, physical damage.
- **B** **DO NOT** turn on water heater unless it is filled with water.
- **C** **DO NOT** turn on water heater if cold water supply shut-off valve is closed.
- **D** If there is any difficulty in understanding or following the Operating Instructions or the Care and Cleaning section, it is recommended that a qualified person or serviceman perform the work.

Safety Controls

⚠WARNING: If the water heater has been subjected to flood, fire, or physical damage, turn off power and water to the water heater.

DO NOT operate the water heater again until it has been thoroughly checked by qualified service personnel.

The water heater is equipped with a combination thermostat and temperature limiting control (ECO) that is located above the heating element in contact with the tank surface. If for any reason the water temperature becomes excessively high, the temperature limiting control (ECO) breaks the power circuit to the heating element. Once the control opens, it must be reset manually.

⚠CAUTION: The cause of the high temperature condition must be investigated by qualified service technician and corrective action must be taken before placing the water heater in service again.

To reset the temperature limiting control:

1. Turn off the power to the water heater.
2. Remove the jacket access panel(s) and insulation.

   The thermostat protective cover should not be removed. (Only on certain models).
3. Press the red RESET button.
4. Replace the insulation and jacket access panel(s) before turning on the power to the water heater.

Water Temperature Setting

⚠DANGER: There is a hot water scald potential if the thermostat is set too high. Households with small children, disabled, or elderly persons may require a 49°C (120°F) or lower thermostat setting to prevent contact with HOT water.

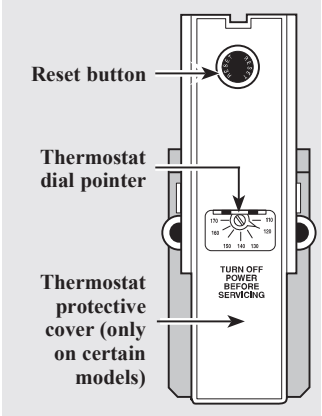
The temperature of the water in the water heater can be regulated by setting the temperature dial of the adjustable surface mounted thermostat(s) located behind the jacket access panel(s).

Dual element heaters have two thermostats.

Safety and energy conservation are factors to be considered when selecting the water temperature setting of the water heater's thermostat(s). The lower the temperature setting, the greater the savings in energy and operating costs.

The thermostat(s) are factory set at 60°C (140°F) or less where local codes require. This is the recommended starting point.

Water temperatures above 52°C (125°F) can cause severe burns or death from scalding. Be sure to read and follow the warnings outlined in this manual and on the label on the water heater. This label is located on the water heater near the thermostat access panel.



Mixing valves are recommended for reducing point of use water temperature by mixing hot and cold water in branch water lines. It is recommended that a mixing valve complying with the Standard for Temperature Actuated Mixing Valves for Hot Water Distribution Systems, ASSE 1017 be installed. See page 3 for more details and contact a licensed plumber or the local plumbing authority for further information.

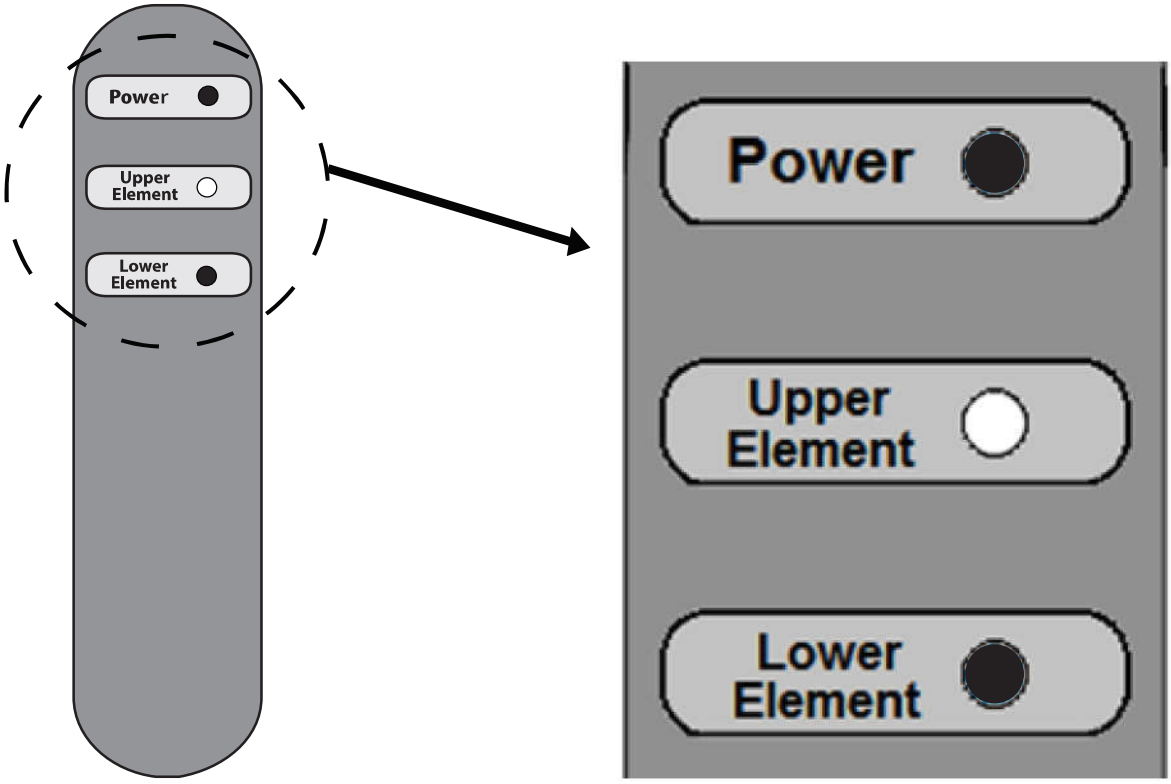
The chart below may be used as a guide in determining the proper water temperature for your home.

Time/Temperature Relationship in Scalds

Temperature	Time To Produce a Serious Burn
49°C (120°F)	More than 5 minutes
52°C (125°F)	$1\frac{1}{2}$ to 2 minutes
54°C (130°F)	About 30 seconds
57°C (135°F)	About 10 seconds
60°C (140°F)	Less than 5 seconds
63°C (145°F)	Less than 3 seconds
66°C (150°F)	About $1\frac{1}{2}$ seconds
68°C (155°F)	About 1 second

Table courtesy of Shriners Burn Institute

Thermostat and protective cover.



If adjustment is necessary…

1. Turn off the power to the water heater.
2. Remove the jacket access panel(s) and insulation exposing the thermostat(s).

   The thermostat protective cover(s) should not be removed (Only on certain models).
3. Using a small screwdriver, set the thermostat(s) dial pointer(s) to the desired temperature.
4. Replace the insulation and jacket access panel(s). Turn on the power to the water heater.

Status Lights and Diagnostics (if installed)

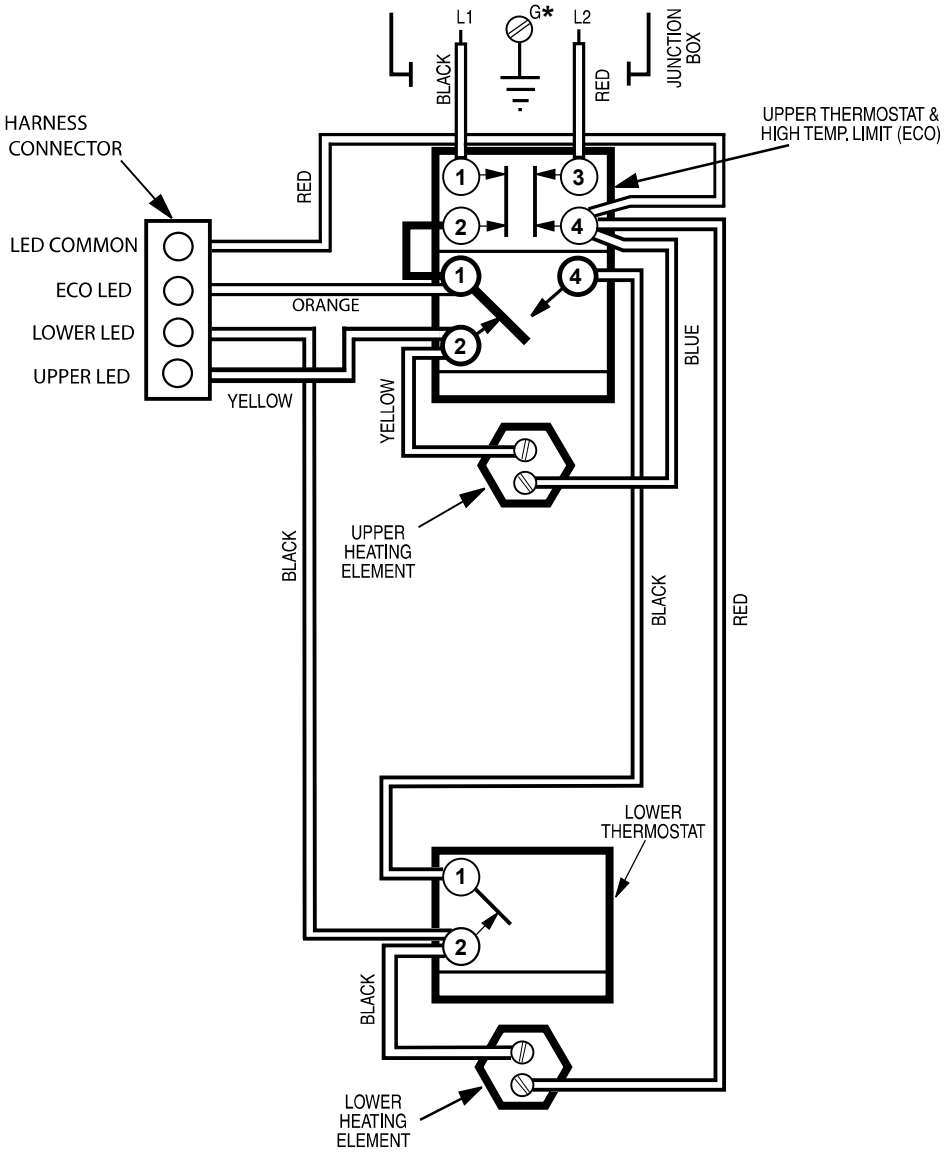
This water heater may be equipped with status lights located on the top cavity cover. The purpose of these lights is to indicate the power and element status of the water heater.

Possible light combinations and methods to determine proper function of water heater are shown below.

1) Power is on and no element is heating the water. Full of hot water.

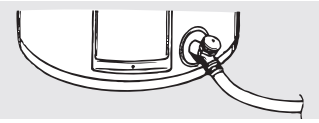
1) Power is on and the bottom element is heating the water.

1) Power is on and the top element is heating the water.



2) Reduced amount of hot water with this status means the bottom element has failed. Call service.
3) Cold water with this condition means the top element has failed. Call service.

1) Power is off. Check power source or connections.
2) Emergency Cut Off has been activated. Turn off power supply and have a qualified person reset the ECO.
3) Call service.



Status Light Wiring Diagram (if installed)

When factory installed with the System Sentinel feature, the wiring will feature four additional wires to connect to the top cavity cover light system. The four added wires are shown below attached to the harness connector.

Care and cleaning of the water heater.

Draining the Water Heater

⚠CAUTION: Shut off power to the water heater before draining water.

⚠DANGER: Before manually operating the relief valve, make certain no one will be exposed to the hot water released by the valve. The water drained from the tank may be hot enough to present a scald hazard and should be directed to a suitable drain to prevent injury or damage.

In order to drain the water heater, turn off the cold water supply. Open a hot water faucet or lift the handle on the relief valve to admit air to the tank.

Attach a garden hose to the drain valve on the water heater and direct the stream of water to a drain. Open the valve.

Vacation and Extended Shut-Down

NOTICE: Refer to the Hydrogen Gas Caution in the Operating Instructions.

If the water heater is to remain idle for an extended period of time, the power and water to the appliance should be turned off to conserve energy and prevent a build-up of dangerous hydrogen gas.

The water heater and piping should be drained if they might be subjected to freezing temperatures.

After a long shut-down period, the water heater's operation and controls should be checked by qualified service personnel. Make certain the water heater is completely filled again before placing it in operation.

Routine Preventative Maintenance

⚠DANGER: Before manually operating the relief valve, make certain no one will be exposed to the danger of coming in contact with the hot water released by the valve. The water may be hot enough to create a scald hazard. The water should be released into a suitable drain to prevent injury or property damage.

NOTICE: If the temperature and pressure relief valve on the hot water heater discharges periodically, this may be due to thermal expansion in a closed water system. Contact the water supplier or your plumbing contractor on how to correct this. DO NOT plug the relief valve outlet.

Properly maintained, your water heater will provide years of dependable trouble-free service.

It is suggested that a routine preventive maintenance program be established and followed by the user.

It is further recommended that a periodic inspection of the operating controls, heating element and wiring should be made by service personnel qualified in electric appliance repair.

Most electrical appliances, even when new, make some sound when in operation. If the hissing or singing sound level increases excessively, the electric heating element may require cleaning. Contact a qualified installer or plumbing contract to inspect.

At least once a year, lift and release the lever handle on the temperature pressure relief valve, located near the top of the water heater, to make certain the valve operates freely. Allow several litres to flush through the discharge line to an open drain.

A water heater's tank can act as a settling basin for solids suspended in the water. It is therefore not uncommon for hard water deposits to accumulate in the bottom of the tank. It is suggested that a few litres of water be drained from the water heater's tank every month to clean the tank of these deposits.

Rapid closing of faucets or solenoid valves in automatic water using appliances can cause a banging noise heard in a water pipe. Strategically located risers in the water pipe system or water hammer arresting devices can be used to minimize the problem.

The anode rod should be removed from the water heater's tank annually for inspection and replaced when more than 15 cm (6") of core wire is exposed at either end of the rod.

Make sure the cold water supply is turned off before removing anode rod.

NOTICE: DO NOT remove the anode rod from the water heater's tank, except for inspection and/or replacement, as operation with the anode rod removed will greatly shorten the life of the glass lined tank and will exclude warranty coverage.

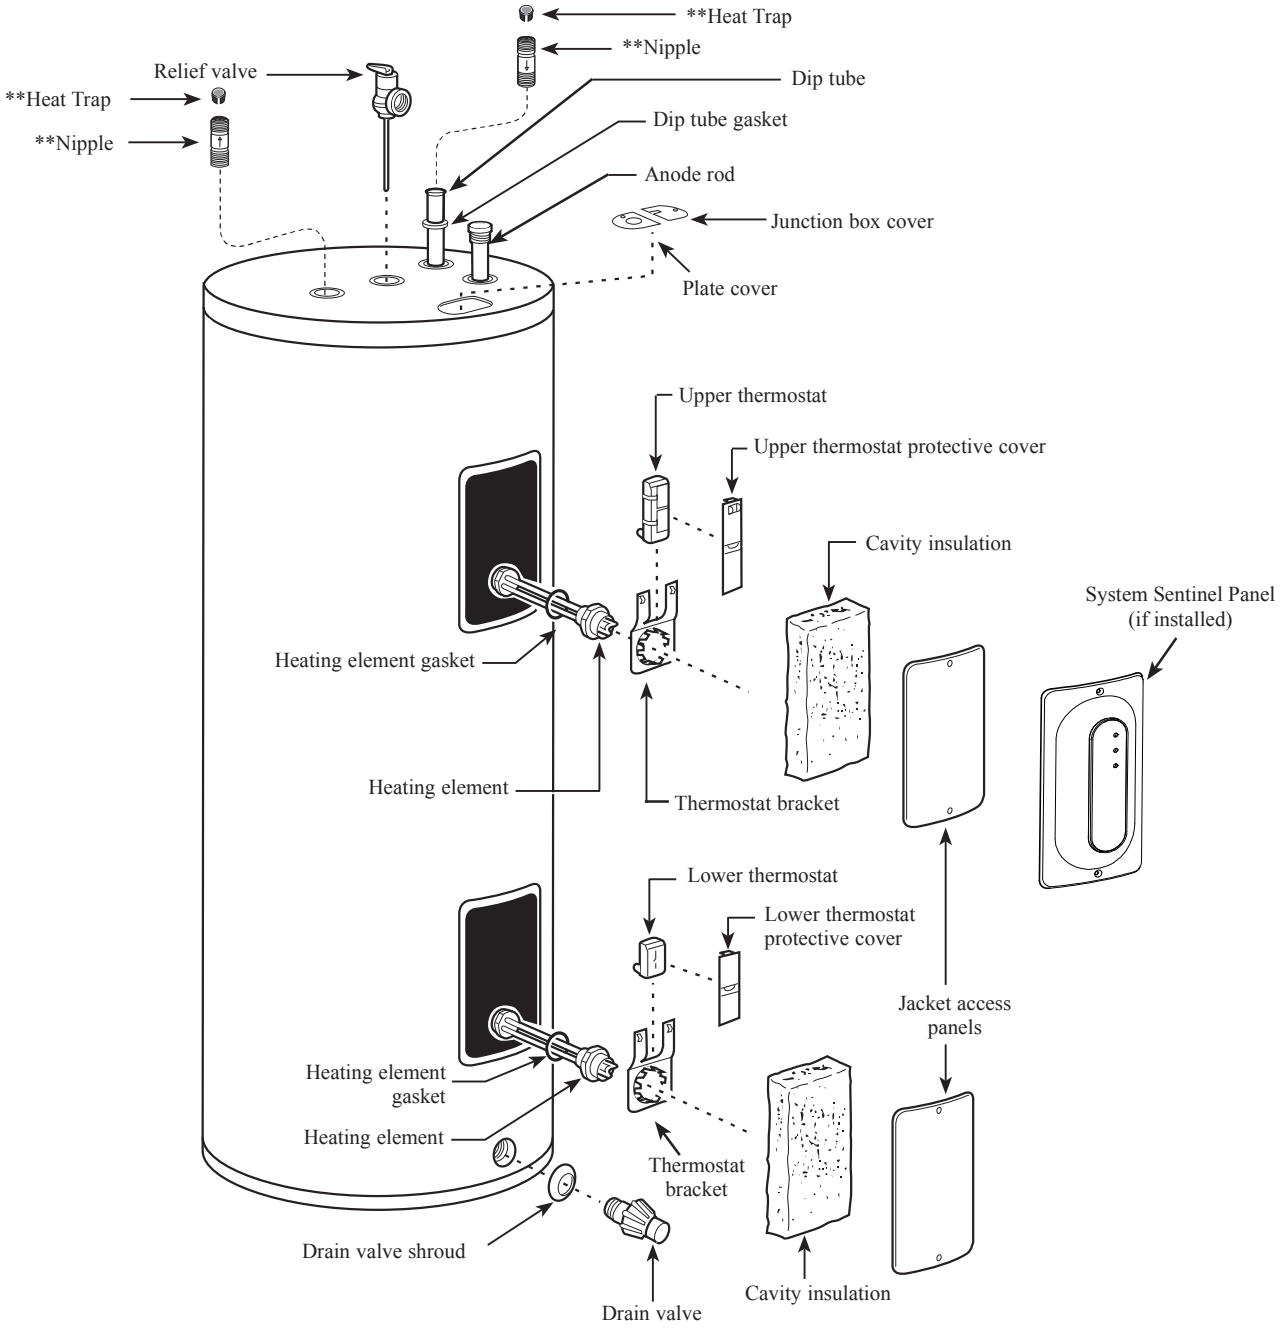
Before You Call For Service…

Troubleshooting Tips
Save time and money! Review the chart on this page first and you may not need to call for service.

Problem	Possible Causes	What To Do
Rumbling noise	Water conditions in your home caused a build up of scale or mineral deposits on the heating elements.	● Remove and clean the heating elements.
Relief valve producing popping noise or draining	Pressure build up caused by thermal expansion in a closed system.	● This is an unacceptable condition and must be corrected. Contact the water supplier or plumbing contractor on how to correct this. Do not plug the relief valve outlet.
Rattling noise during periods of water usage	Internal heat trap fittings in operation.	● This is normal for heat trap fittings when in operation and does not indicate a need for service.
Not enough or no hot water	Water usage may have exceeded the capacity of the water heater.	● Wait for the water heater to recover after an abnormal demand.
	A fuse is blown or a circuit breaker tripped.	● Replace fuse or reset circuit breaker.
	Electric supply may be off.	● Make sure electric supply to water heater and disconnect switch, if used, are in the ON position.
	The thermostat may be set too low.	● See the Temperature regulation of the water heater section of this manual.
	Leaking or open hot water faucets.	● Make sure all faucets are closed.
	Electric service to your home may be interrupted.	● Contact the local electric utility.
	Improper wiring.	● See the Installing the water heater section of this manual.
	Manual reset limit (ECO).	● See the Temperature regulation of the water heater section of this manual.
	Cold water inlet temperature may be colder during the winter months.	● This is normal. The colder inlet water takes longer to heat.
Water is too hot	The thermostat is set too high.	● See the Temperature regulation of the water heater section of this manual.

⚠**CAUTION: For your safety DO NOT attempt repair of electrical wiring, thermostats, heating elements or other safety devices. Refer repairs to qualified service personnel.**

Replacement Parts.



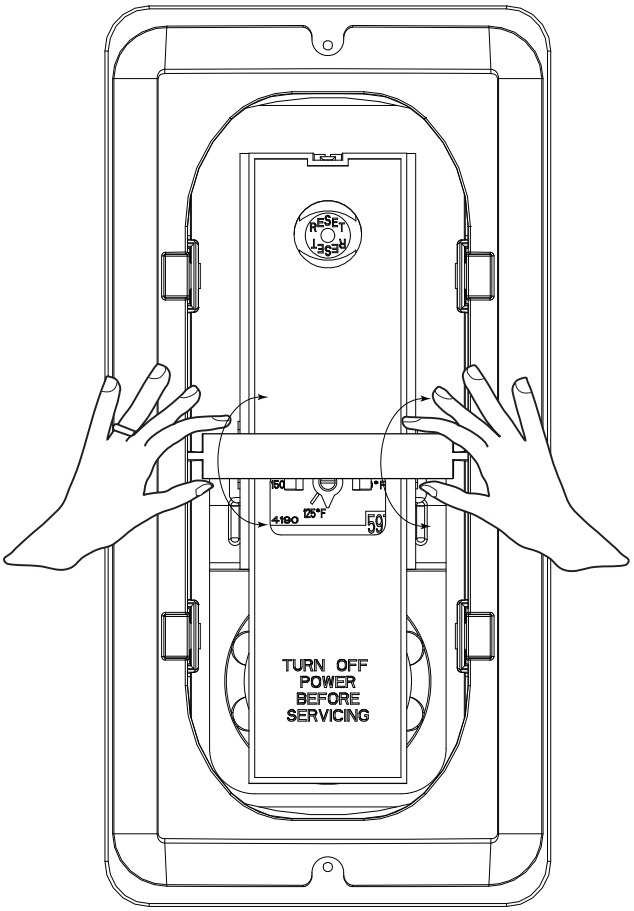
Instructions For Placing a Parts Order

Address parts orders to the distributor or store where the heater was purchased.

All parts orders should include:

1. The model and serial number of the water heater from the rating plate.
2. Specify voltage and wattage as marked on the rating plate.
3. Part description (as noted below) and number of parts desired.

⚠CAUTION: For your safety DO NOT attempt repair of electrical wiring, thermostat(s), heating elements or other operating controls. Refer repairs to qualified service personnel.



NOTICE: Some parts may vary in appearance from model to model.

**Not supplied on all models

Cavity Insert Instructions (for certain models)

The following instructions are intended for qualified service personnel ONLY, and should only be done when necessary.

In order to replace the thermostat or heating element, remove the cavity insert crossbar by following the instructions below:

1. Turn off the power to the water heater.
2. Remove the jacket access panel(s) and insulation.
3. Rotate the crossbar up and down until it breaks away from the remainder of the cavity insert. (See illustration to the left)

   Discard the crossbar. It cannot and need not be replaced.
4. Replace the thermostat and/or element as necessary.
5. Replace the insulation and jacket access panel(s) before turning on the power to the water heater.

NOTICE: The cavity insert crossbar is necessary for the manufacturing process only. The removal of the crossbar will not interfere with the operation of the water heater.

IF YOU NEED SERVICE

1. Should you have any questions about your new water heater, or if it requires adjustment, repair, or routine maintenance, it is suggested that you first contact your installer, plumbing contractor or previously agreed upon service agency. In the event the firm has moved, or is unavailable, refer to the telephone directory, commercial listings or local utility for qualified service assistance.

2. Should your problem not be solved to your complete satisfaction, you should then contact the Manufacturer's National Service Department at the following address:

   Rheem Canada Ltd./Ltée.
   125 Edgeware Road, Unit 1
   Brampton, ON L6Y OP5
   Customer Service: 1-800-268-6966 - please request a Customer Service Representative (CSR)
   Warranty: 1-800-263-8342

   When contacting the manufacturer, the following information will be requested:

a. Model and serial number of the water heater as shown on the rating plate attached to the jacket of the heater.
b. Address where the water heater is located and physical location.
c. Name and address of installer and any service agency who performed service on the water heater.
d. Date of original installation and dates any service work was performed.
e. Details of the problems as you can best describe them.
f. List of people, with dates, who have been contacted regarding your problem.

Tankless Water Heater

PERFORMANCE™

The new degree of comfort.™

PERFORMANCE™ tankless electric water heaters offer continuous hot water quick and on demand for single point-of-use or multiple applications

Performance Features

- On demand, consistent and endless hot water
- Compact and stylish with digital temperature control in increments of 1°F ranging from 80°F to 140°F*
- 99.8% Energy efficient
- Robust copper immersion heating elements with brass top increases durability and are threaded for easy replacement
- Simple Installation
- Digital temperature display
- External controls to adjust temperature in increments of 1°F*

Applications

- Whole-Home – up to 6 GPM
- Water-Saver Shower Head – 1.5 GPM
- Standard Shower Head – 2.0 GPM
- Standard Hand Sink – 0.5 GPM
- Kitchen Sink – 1 to 2 GPM
- Bath Tub – ≥ 4 GPM
- Dishwasher – 1 to 2 GPM
- Washing Machine – 1 to 1.5 GPM

Average Gallons Per Minute (GPM) based on 2010 Plumbing Standards

Warranty

- 5-Year heating chamber and 1-year parts limited warranty

See written warranty for complete details

PERFORMANCE™ **tankless electric water heaters**

RETEX-04, RETEX-06

Unique Features:
- External Digital Display – shows outlet temperature
- Durable Copper Immersion single heating element, field serviceable
- Simple Installation – 3 Foot electric cable included; Bottom 1/2" NPT water connections

RETEX-08, RETEX-11 RETEX-13

Unique Features:
- External Adjustable Digital Thermostatic Control with LED display (+/- 1 degree accuracy)
- Durable Copper Immersion two heating elements, field serviceable
- Simple Installation – 3 Foot electric cable included; Side 1/2" compression water connections

RETEX-18

Unique Features:
- External Digital Thermostatic Control with LED display (+/- 1 degree accuracy)
- Most advanced self-modulation, adjust power to meet hot water demand
- Durable Copper Immersion two heating elements, field serviceable
- Simple Installation – Bottom 3/4" NPT water connections

RETEX-24, RETEX-27

Unique Features:
- External Digital Thermostatic Control with LED display (+/- 1 degree accuracy)
- Most advanced self-modulation, adjust power to meet hot water demand
- Durable Copper Immersion three heating elements, field serviceable
- Simple Installation – Bottom 3/4" NPT water connections

RETEX-36

Unique Features:
- External Digital Thermostatic Control with LED display (+/- 1 degree accuracy)
- Most advanced self-modulation, adjust power to meet hot water demand
- Durable Copper Immersion four heating elements, field serviceable
- Simple Installation – Bottom 3/4" NPT water connections

The new degree of comfort.™

PERFORMANCE™ **tankless electric water heaters**

Product Specifications (all models)	**Rated Pressure**	25 PSI min., 150 PSI max.
	Certifications	ETL Listed to UL 499 and CSA
	Std. Temp. Settings	120°F (Adjustable 80°F-140°F)
	Temp. Accuracy	+/–1° at steady state flow
	Turn-On	0.3 GPM

Suggested Specifications
Unit shall have copper clad immersion heating element(s) with brass terminations for increased durability. External temperature control and display adjustable in 1° increments with a range of 80°-140°F. Display shall be capable of displaying setpoint temperature in Celsius or Fahrenheit temperature scales. Unit shall utilize a flow meter with a 0.3 gpm activation point and manage power based on actual flow rate and inlet temperature. Values should be processed 60 times per second. Unit shall be WQA certified lead free, certified to UL499 and CSA22.2.

Optional Inline Flow Regulator

- Enhanced outlet temperature control
- Install on the outlet side of the heater
- Limit maximum volume to the specified flow rate to ensure exiting temperature is within an acceptable range
- Flow Regulators for ½" and ¾" plumbing connections
- Flow range: 1 to 5 gallons per minute

RHEEM PART NUMBER	GPM RATING OF INSERTS PROVIDED	CONNECTION SIZE

Electric Tankless Water heaters

INSTALLATION INSTRUCTIONS & HOME OWNERS MANUAL

IMPORTANT SAFETY INFORMATION

When installing or using any high voltage electrical appliance, basic safety precautions should always be followed. Under no circumstance should you attempt to clean, install, inspect, repair, disassemble or otherwise service this water heater, without first shutting off **all** power to the unit directly at the circuit breaker box. **SERIOUS BODILY INJURY OR DEATH COULD OCCUR IF YOU IGNORE THIS WARNING.**

THIS PRODUCT SHOULD BE INSTALLED BY A QUALIFIED ELECTRICIAN AND A QUALIFIED PLUMBER IN ACCORDANCE WITH ALL NATIONAL, STATE, PROVINCIAL AND LOCAL ELECTRICAL & PLUMBING CODES.

PLEASE READ THESE INSTRUCTIONS THOROUGHLY AND COMPLETELY PRIOR TO INSTALLATION & USE. FAILURE TO DO SO COULD CAUSE PROPERTY DAMAGE, SERIOUS INJURY, OR DEATH.

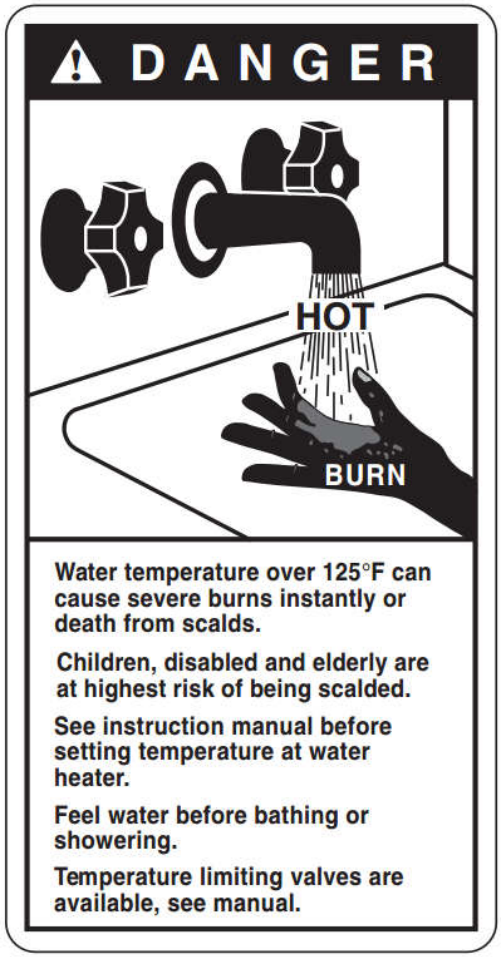
This manual should be given to the homeowner after installation and should be retained for future reference.

Proposition 65 Warning: This product contains chemicals known to the State of California to cause cancer, birth defects or other reproductive harm

Tested and certified by the Water Quality Association against NSF/ANSI 372 for lead free compliance.

Recognize this symbol as an indication of Important Safety Information!

DO NOT destroy this manual. Please read carefully and keep it in a safe place for future reference



IMPORTANT SAFETY INFORMATION.
READ ALL INSTRUCTIONS BEFORE USING

DANGER!

WATER TEMPERATURE SAFETY SETTING

Safety and energy conservation are factors to be considered when selecting the water temperature setting of water heater's thermostat. Water temperatures above the 125°F (52°C) can cause severe burns or death from scalding. Be sure to read and follow the warnings outlined on the label pictured below. This label is also located on the water heater near the thermostat access panel.

Notice: Mixing valves are recommended for reducing point of use water temperature by mixing hot and cold water in branch water lines. It is recommended that a mixing valve complying with the Standard for Temperature Actuated Mixing Valves for Hot Water Distribution Systems, ASSE 1017 be installed.

Time/Temperature Relationship in Scalds

Water Temperature	Time to Produce a Serious Burn
120°F (49°C)	More than 5 minutes
125°F (52°C)	1 1/2 to 2 minutes
130°F (54°C)	About 30 seconds
135°F (57°C)	About 10 seconds
140°F (60°C)	Less than 5 seconds
145°F (63°C)	Less than 3 seconds
150°F (66°C)	About 1 1/2 seconds
155°F (68°C)	About 1 second

Table courtesy of Shriners Burn Institute

The chart shown above may be used as a guide in determining the proper water temperature for your home.

DANGER Once the unit is installed and checked for water leaks turn the breaker on and push the power button to activate heater. Heater can be deactivated by pushing the power button one more time. When the heater is powered on the electronic control will automatically power the element when it senses water flow.

The temperature of the hot water delivered by the heater depends on the wattage of the heating element, temperature of the incoming cold water and the water flow rate through the water heater. Reducing the flow rate increase the outlet temperature and increasing the flow rate reduces the outlet temperature.

It is important to keep in mind that all tankless water heaters are subject to a maximum flow rate. The heater will not be capable of heating water to desired temperature if the flow rate exceeds heaters capability. In order for the heater to operate properly, it must be carefully matched to its application and aerators should be used to limit water flow. See the Table I to determine the maximum flow rates and temperature rise for each model.

CAUTION Outlet water temperature may be higher when using the tankless heater at low flow rates or when used with high inlet water temperature.

ABOUT YOUR TANKLESS WATER HEATER

Congratulations on the purchase of your Electric Tankless Water Heater!

To get the best performance and energy savings from your electric tankless water heater, it is important that it be installed in accordance with our instructions and the electrical and plumbing codes applicable to your area, and that you read this manual thoroughly for important operating instructions and tips.

If you have questions at any time, please contact us directly at:

Manufacturer's National Service Department
400 Captain Neville Dr. Waterbury, CT 06705 Phone: 1-(800)-374-8806.

CONTENTS

1. BEFORE INSTALLATION
2. SELECTING A LOCATION TO INSTALL
3. MOUNTING YOUR WATER HEATER
4. PLUMBING INSTALLATION
5. ELECTRICAL INSTALLATION
6. SIZING GUIDE
7. GENERAL OPERATING INSTRUCTIONS
8. MAINTENANCE
9. TROUBLE SHOOTING GUIDE
10. USER INTERFACE

1- BEFORE INSTALLATION

PLEASE READ THESE INSTRUCTIONS THOROUGHLY AND COMPLETELY PRIOR TO INSTALLATION & USE. FAILURE TO FOLLOW INSTRUCTIONS COULD CAUSE PROPERTY DAMAGE, SERIOUS PERSONAL INJURY, OR DEATH.

By installing this product, you acknowledge the terms of the manufacturer's warranty. Once the heater is installed, do not return product to the place of purchase. If you have any questions regarding the warranty or product return policies, please contact Manufacturer's national service department at 1-(800) 374-8806.

Inspect all components. The contents of your box should include one of the following units:

- 3.5kW
- 5.5kW

2- SELECTING A LOCATION TO INSTALL

This product is designed to be installed **indoors only**.

⚠ **DO NOT** install this product in a location where it may be subjected to freezing temperatures. If the water inside your tankless water heater freezes, it can cause severe and permanent damage that is not covered under your warranty.

⚠ **DO NOT** locate the water heater in a location that is difficult to access.

Make sure that the water heater and hot water outlet pipe are out of reach of children so they are unable to tamper with the temperature controls or injure themselves by touching the hot water outlet pipe. The outlet water pipe can get very hot.

This product does NOT require venting.

Avoid installing your tankless water heater in a location prone to excessive humidity, moisture, or dust, or in an area where it may be splashed with water or other liquids. DO NOT install under water pipes or air conditioning lines that might leak or condense moisture that could then drip onto the heater. DO NOT install above electrical boxes or junctions.

⚠ **CAUTION** The water heater should not be located in an area where leakage will result in damage to the area adjacent to it or to lower floors of the structure. Where such areas cannot be avoided, it is recommended that a suitable catch pan, adequately drained, be installed under the water heater. Make sure to follow all code requirements for such installations as required for your area. We recommend that you install a drip pan (connected to a safe drain) below the water heater to avoid property damage in the unlikely event of a leak. Alternatively, you can install an active water leak detector and shutoff valve designed to turn off your water supply in the event that a leak is ever detected.

3- MOUNTING YOUR WATER HEATER

Your tankless water heater should be secured to the mounting surface with 4 screws (minimum 1” (25.4mm) long) follow the installation template for heaters. Make sure that the mounting surface is solid and secure, and ensure that the unit is level prior to securing the screws. For ease of installation and servicing, we recommend that this product be installed in an upright position with the inlet and outlet water connections at the bottom of the unit.

Recommended Clearances: 6” (304.8mm) above and below the heater

6” (152.4mm) in front of and to the sides of the heater

⚠ **Flammable materials should be kept at least 24” (609.6mm) away from your water heater and the hot water outlet pipe.**

4- PLUMBING INSTALLATION

Please follow all plumbing instructions carefully. We recommend that this product be installed by a licensed and qualified plumber in accordance with all applicable national, state, provincial, and local plumbing codes.

Installation Instructions

This water heater is supplied with ½" NPT fittings, DO NOT weld or use paste.

STEP 1: Thoroughly flush cold supply line of debris and connect the HOT WATER line to the water heater OUTLET located on the left side of the heater when facing unit. Connect the COLD WATER line to the water heater marked COLD WATER INLET on the right side when facing unit.
STEP 2: After tightening both fittings at the water heater, open several hot water faucets and allow water to run though the water heater for at least 2 to 3 minutes. This process purges all the air from the water lines and MUST be performed prior to turning on the power at the unit. FAILURE TO FOLLOW THIS STEP CAN CAUSE PERMANENT DAMAGE TO THE HEATING ELEMENTS. If any maintenance is performed on the water heater or the home's plumbing system that may introduce air into the plumbing pipes, it is important to turn the power off to the water heater and purge the air out of the lines before allowing the unit to power up.
STEP 3: Carefully inspect all connections, unions, and the pressure relief valve (if installed) for leaks.

IMPORTANT NOTES:

1. Do not solder any pipes with the unit connected to pipes – heat from soldering may damage the flow sensor. Doing so will void the warranty.

2. This automatic tankless water heater is equipped with both computer-controlled and electro-mechanical auto resetting thermostat switches for high-limited temperature protection. Since this product does not use a storage tank, the use of a temperature pressure relief valve (T&P) is not required for most installations. UL Standard 499 does NOT require that a pressure relief valve be used. However, a T&P valve may be required to meet installation codes in your area. If one is required, install the pressure relief valve in accordance with local codes and ensure that it operates correctly and that air is purged from the valve prior to installing the water heater. When connecting to Flex or High Temperature CPVC pipe, we recommend that a T&P valve be used for added safety.
   Please note: Installations in the Commonwealth of Massachusetts and State of Kentucky require a pressure relief valve. Please check your local installation codes for any special requirements.

3. The maximum operating water pressure is 150 PSI (1035 kPa). If the water pressure is higher, a pressure reducing valve must be installed on the main incoming water supply line prior to installing the electric tankless water heater.

4. Flexible water heater hoses are recommended to be used with your water heater as part of the installation. When connecting the inlet water pipe to the unit, make sure to use a wrench to hold the unit's connection, and another wrench to tighten, so that the flow sensor on the unit will not be loosened or damaged. Serious internal damage to the water heater can occur if the inlet or outlet connections are over tightened or if solder connections were made.

5. We recommend that a manual shut-off valve (ball valve) is installed on the inlet and outlet of the water heater so that there is a convenient shut-off point available in the event that future maintenance or servicing is required. It is extremely important to flush the lines to eliminate all plumbing paste or residue in the lines caused by any welding or soldering before connecting pipes to the water heater.

We recommend that all the water pipes or hoses within 3' (1m) of the inlet and outlet connections be rated for high temperature applications with a 150°F (66°C) minimum.

⚠ **WARNING CHECK FOR LEAKS BEFORE PROCEEDING TO ELECTRICAL INSTALLATION**

5- ELECTRICAL INSTALLATION

⚠ **WARNING** Manufacturer recommends that this product be installed by a licensed and qualified electrician in accordance with all applicable national, state, provincial, and local electrical codes. As with all electrical appliances, under no circumstances should you attempt to install, repair or disassemble this water heater without first shutting off all power to the unit directly at the fuse or breaker box. **Make sure to shut off all breakers. SERIOUS BODILY INJURY OR DEATH COULD OCCUR IF YOU IGNORE THIS WARNING.**

All wiring (wire gauge) and circuit protection (breakers) must comply with the U.S. National Electrical Code (NEC) in the USA, or the Canadian Electrical Code (CEC) in Canada. Failure to do so could result in property damage and/or personal injury, and void your warranty. Note: The Canadian Electrical Code generally requires that all supply wires and corresponding circuit protection used for domestic hot water heating and hydronic heating applications be sized to a minimum of 125% of the maximum current rating of the heater (see heater specifications below for details).

Before installing this product, ensure that the home has sufficient electrical power available to handle the maximum amperage load of the applicable heater.

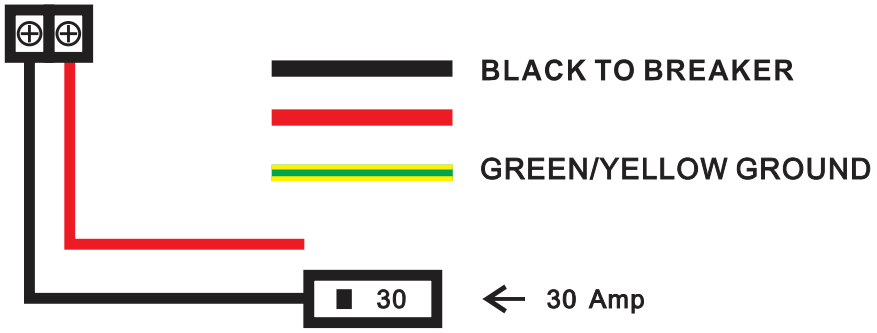
IMPORTANT NOTES:

3.5 and 6.0 kW heaters require 1 set of wire and ground **(see wiring diagram)**

Please see electrical specifications by heater input and wiring diagram on the next page for additional electrical information.
Each set of wires must be connected to its own individual double pole breaker.

Installation Instructions

STEP 1: Take each wire pair and connect them to one breaker (see wiring diagram). Make sure that each breaker is connected with one black wire and one red wire
STEP 2: Using a suitable wire gauge that meets all applicable electrical codes for the size of the breakers used, run the correct sets of wire from the home's main breaker panel to the tankless water heater.
STEP 3: A separate ground conductor for each incoming circuit is required.
STEP 4: DOUBLE CHECK the electrical connections to make sure they are correct and that all wire connections are tight and secure. Also confirm that the correct breaker size and wire gauge has been used and confirm that the unit has been connected to a ground in accordance with applicable codes.
STEP 5: Confirm that all the air has been purged from the water lines prior to turning on power to the unit. Refer to STEP 2 in the plumbing installation section.



⚠ **CAUTION** Ensure that you have made the correct connections. You must follow the wire connection as shown to ensure proper operation of the unit. If you mix up one set of wires with another, the unit will not operate correctly even though it turns on and otherwise appears to function properly.

The water heater is now installed and ready to use! Follow the General Operating Instructions to complete the setup. We highly recommend that this is done with the homeowner present.

AERATOR SUPPLIED IS .5GPM/ 1.9LPM

To ensure the optimal temperature output and overall performance of your tankless water heater an aerator supplied with heater should be installed.

⚠ **DANGER INCREASING THE FLOW RATE REDUCES THE OUTLET TEMPERATURE. PLEASE BE SURE TO PROPERLY SIZE YOUR AERATOR TO PREVENT SCALDING**

7- GENERAL OPERATING INSTRUCTIONS

Operating your new tankless water heater is similar to using any traditional water heating system. However, it is very important that you carefully read all of the setup procedures and operating instructions and tips to ensure the maximum performance and energy savings from your new water heater. We recommend that all members of the household read these General Operating Instructions.

How your new water heater works:

This tankless water heater differs from a conventional storage water heater as it does not store hot water, but heats water as it flows through the heater.

The temperature of the hot water delivered by the heater depends on the wattage of the heating element, temperature of the incoming cold water and the water flow rate through the water heater.

It is important to keep in mind that all tankless water heaters are subject to a maximum flow rate. The heater will not be capable of heating water to desired temperature if the flow rate exceeds heaters capability. In order for the heater to operate properly, it must be carefully matched to its application and aerators should be used to limit water flow. See the Table I to determine the maximum flow rates and temperature rise for each model.

⚠ **CAUTION Outlet water temperature may be higher when using the tankless heater at low flow rates or when used with high inlet water temperature.**

Water Quality: Quality of water should be taken into consideration when installing and maintaining the water heater. Water conditions outside the recommended levels outlined below are not permitted and can damage the water heater. Manufacture reserves the right to deny any warranty claim regarding damage suffered due to use in water conditions not in accordance with the table below.
If water heater is installed in an area that is known to have hard water that cause scale build-up, the water must be treated and/or the heater exchanger flushed regularly to prevent damage to heat exchanger and/or heating elements.
A water treatment device or water softener should be installed to maintain optimal performance of the water heater in hard water areas. Contact customer service for additional information on these accessory kits.

Chart for Recommended Water Quality Levels

pH	Total Dissolved Solids (TDS)	Free Carbon Dioxide (CO2)	Total Hardness	Aluminum	Chloride	Copper	Iron	Manganese	Zinc
6.5 - 8.5	Up to 500 mg/L	Up to 500 mg/L	Up to 200 mg/L	0.05 to 0.2 mg/L	Up to 250 mg/L	Up to 1.0 mg/L	Up to 0.3 mg/L	Up to 0.05 mg/L	Up to 5 mg/L

8- MAINTENANCE

To ensure maximum performance of your water heater and to reduce the risk of a water leak, we recommend the following maintenance:

Inspect the connections on the inlet and outlet of the water heater at least on an annual basis for any signs of damage or failure. Any signs of damage, cracks, leakage or weakness should be addressed. Take care not to over tighten the connections. Serious internal damage to your water heater can occur if you over tighten the water heater connections at the unit.

IMPORTANT NOTES:

⚠ **DANGER** As with all electrical appliances, under no circumstances should you attempt to install, repair or disassemble this water heater without first shutting off all power to the unit directly at the fuse or circuit breaker. **SERIOUS BODILY INJURY OR DEATH COULD OCCUR IF YOU IGNORE THIS WARNING.**

When any maintenance is performed on the water heater or the home's plumbing system that may introduce air into the plumbing pipes, it is important to turn the power off to the water heater and purge the air out of the lines before allowing the unit to power up. FAILURE TO DO SO COULD CAUSE PERMANENT DAMAGE TO THE HEATING ELEMENT AND VOID YOUR WARRANTY.

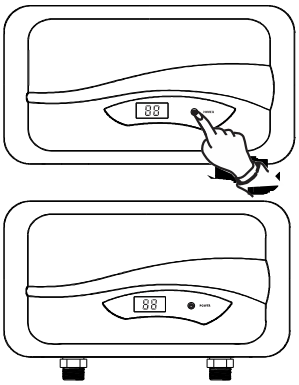
If you have a water supply with a high level of mineralization (hard water), you should increase the frequency of your maintenance.

9- TROUBLE SHOOTING GUIDE

Are you having problems with your water heater?

Please call or email our customer service and technical support team for any help you may need.

TOLL FREE 1-(800) 374-8806



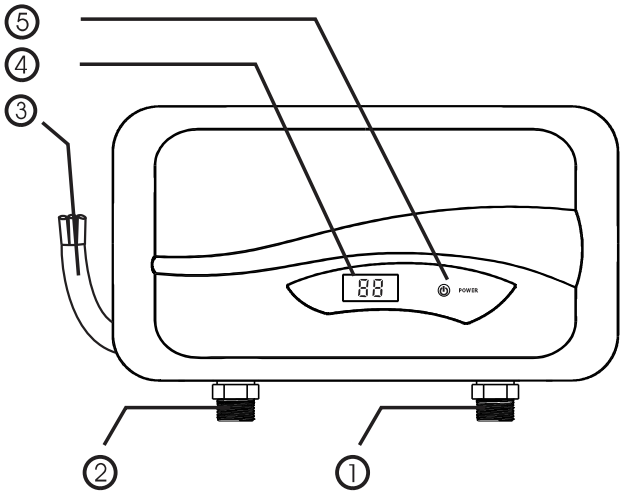
The following table represents some of the most common technical support questions we receive. Before calling us, please read thoroughly to see if your question or problem is addressed.

PROBLEM	POSSIBLE CAUSE	SOLUTION
Water heater is not heating at all (water is flowing but the unit is not heating - the outgoing water temperature is the same as the cold water supply) - the digital display does NOT light up.	No power or incorrect wiring.	Make sure the breakers at main electrical panel are ON. You may have a faulty breaker or unit may be wired incorrectly.
	Flow rate is too low / water pressure is too low.	Your water heater has an activation flow rate of approximately 0.3 GPM (1.1 LPM). If your water flow rate is less than this level, your unit will not activate. Increase the flow rate.
Water heater is not heating at all (water is flowing but the unit is not heating - the outgoing water temperature is the same as the cold water supply) The digital display DOES light up.	Internal part failure.	Please call us for technical assistance.
Water heater is heating, but the water temperature is not hot enough.	Flow rate is too high.	Depending on your incoming water temperature and the kW of your heater, your water flow rate may exceed the physical heating capacity of your water heater. Reduce the flow rate by installing an aerator
	Crossed wires.	If it's a new installation, have your electrician double check the wiring. Is possible that the wiring is incorrect.
	Voltage less than 120 or 240 volts.	The heating elements on your water heater are design for 120 or 240 volts. When used with a lower voltage, they produce less heating power. You may need to upgrade to a larger input heater.
	Mixing too much cold water.	You do not need to mix as much cold water with your tankless water heater compared to when you use a conventional water heater. You may also have an anti-scald feature on your faucet that is mixing cold water. These types of faucets can usually be adjusted to reduce the amount of cold water mixed.
	Voltage less than 120 or 240 volts.	The computer chips in your tankless water heater are programmed with the expectation that your incoming line voltage is 120 or 240 volts. If you have less than 120 or 240 volts, it may affect the reading on your water heater's digital display and cause it to read slightly higher than the actual output temperature. To compensate for this, increase the setting on your water heater if you need / want hotter water.
The water temperature at the faucet is less or greater than the temperature setting of my water heater.	Anti-Scald pressure/balancing valve or tempering valve.	Your faucet may have an anti-scald feature or a tempering valve that automatically mixes cold water even when you turn your control lever or handle to full hot. These devices are usually adjustable so you can turn off the cold mix completely. You can compensate for this by increasing the setting on your water heater if you need/want hotter water.
	Thermal loss due to long pipe run	As the hot water from the heater runs through the hot water delivery system to your faucet, some heat will be lost especially if it has long distance to travel or the pipes are cold. This is normal. You can compensate for this by increasing the setting on your water heater if you need/want hotter water.
	Water temperature at the faucet is too hot	Check your flow for too little flow, wrong aerator size, or internal part failure. Call us for technical assistance.

10- USER INTERFACE

Power

- Push the power button, the display will turn on
- Push the power button again, the display will turn off



DANGER Hotter water increases the potential for Hot Water SCALDS

CAUTION – removing the cover to change the temperature set point exposes electrical shock and burn hazards, which can cause INJURY or DEATH. Adjustment should only be done by a licensed plumber or electrician.

Heater input: 3.5 kW -6.0kW

① Cold water Inlet
② Hot water outlet
③ 10 AWG Wire
④ Outlet Temp. Display
⑤ POWER button

www.HazlocHeaters.com

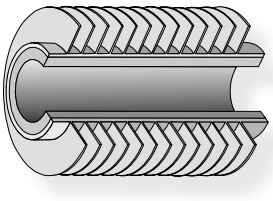
Hazloc Heaters™ is a manufacturer of industrial-grade unit heaters suitable for hazardous and severe-duty locations.

The **XEU1** series of explosion-proof electric air heaters is designed to meet the most demanding requirements of heavy industry. The harsh operating conditions of this industry require heating equipment that is safe, reliable, dependable, and available when you need it. **XEU1** unit heaters are designed to provide primary or supplementary heating for comfort or freeze protection in areas that are classified as hazardous locations (Gas and Dust atmospheres).

Designed for hazardous locations!

All ***Hazloc Heaters™*** **XEU1** models are **designed to meet U.S. and Canadian certification standards and the spark-resistant fan assembly is also compliant to AMCA 99-10, Type B.** The three sizes of **XEU1** heaters include our ***ExCaliber™*** high performance liquid-to-air heat-exchanger cores that are available in **35 model choices** of voltage and heat output combinations to meet your specific requirements.

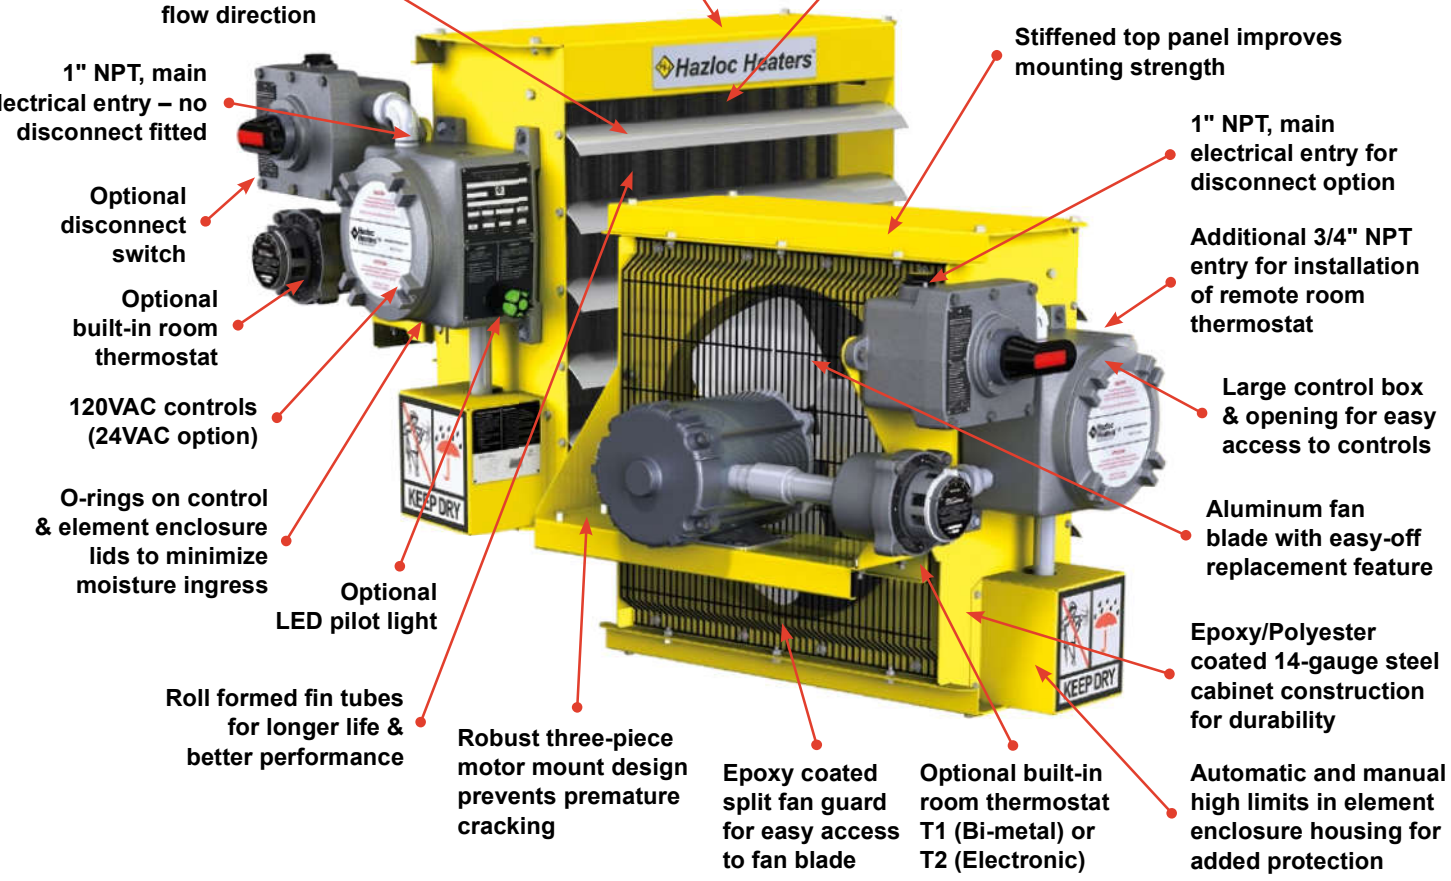
The rugged and versatile **XEU1** heater incorporates a high quality immersion heater, high performance fan and motor assembly, a sturdy 14 GA steel cabinet with epoxy/polyester powder-coating for corrosion resistance, large control enclosure with an extra port for convenient wiring of an external room thermostat, and enclosure O-rings to minimize moisture ingress.



XEU1 heaters are suitable for a wide variety of applications that include but are not limited to oil & gas drilling rigs, petrochemical facilities, refineries, chemical storage and handling facilities, paint storage areas, sewage treatment plants, aircraft servicing areas, grain elevators, coal preparation areas, and other areas containing combustible dusts (flour, wood, plastics, chemicals, etc.).

Rugged design, but easily maintained!

All **XEU1** heaters are designed for industrial applications with all features being heavy-duty to meet your most demanding environments and long-life expectations. Even with heavy-gauge steel construction used throughout the heater it does not inhibit maintenance of the product since the **XEU1** has been designed for easy field servicing with a removable heat exchanger core assembly, split fan guard, and replaceable automatic and manual reset high-limits. An added benefit is our 36-month heater warranty!



Maximum durability… rugged fin tubes!

All **XEU1** ***ExCaliber™*** liquid-to-air heat-exchanger cores are evacuated & sealed and are constructed using rugged carbon-steel tubes with copper-free, roll-formed aluminum fins to maximize heat transfer and carbon-steel headers for **maximum durability, resistance to corrosion, and longer life** in your demanding applications.

"Safe heat when you need it!"

Dedicated to Performance and Reliability!

NOTE: **XEU1 heaters must not be exposed to rain or snow. This applies to both installed and stored heaters.**

Suitable for the following hazardous location classifications:

- **Class I, Division 1 & 2, Groups C & D, T3B (3kW/35kW = T3A)**
- **Class II, Division 1 & 2, Groups F & G, T3B (3kW/35kW = T3A)**
- **Class I, Zone 1 & 2, Groups IIA & IIB, T3**

Limited 36-month Warranty

ExCaliber™ heat-exchanger core is easy to remove

The ***ExCaliber***™ vacuum sealed liquid-to-air heat exchanger core is constructed using rugged, copper-free, roll-formed aluminum fins and protected by a pressure relief device, automatic reset high limit, and a back-up manual reset high limit.

The **XEU1** heater has the highest air temperature rise, on average, in the industry across our complete kW range.

Cabinet	Cabinet Material	14-gauge (0.075 in.) (1.9 mm) steel. Yellow epoxy/polyester powder coated with five-stage pretreatment, including iron phosphate.
	Fan Guard	Split design with close wire spacing. A 3/8 in. (9.5 mm) diameter probe will not enter. Black polyester powder coated.
	Louver Blades	Anodized extruded aluminum.
	Conduit Materials & Fittings	Plated steel and aluminum alloy for corrosion resistance.
	Fasteners	Zinc plated steel for corrosion resistance.
	Enclosures	Cast aluminum (non-copper alloy) NEMA 7 & 9 type with O-ring.
	Mounting Holes	9/16” diameter holes – Four located on the top face of heater.
Motor/Fan	Motor Type	Explosion-proof, thermally protected, 1725 RPM permanently lubricated ball bearing type with 56 frame and “easy-off” fan blade replacement feature.
	Fan	Three-blade spark-resistant aluminum, steel spider and hub with 5/8 in. bore.
	Fan Shroud	Spark-resistant aluminum. Compliant to AMCA 99-10, Type B.
Heat Exchanger	Heating Elements	Long-life, low watt-density, high grade metal-sheathed
	Heat Transfer Fluid	Ethylene glycol and water including corrosion inhibitors.
	Header Material	Carbon steel.
	ExCaliber™ Core	Carbon steel headers and element housing with O-ring. Fin tubes are carbon steel tubes with copper-free, roll-formed aluminum fins @ 10 fins per in. Vacuum sealed. Coated with black, high-heat enamel.
Protection	Temperature High Limits	One automatic reset rated for 100,000 cycles, and one manual reset. Both are snap-action bimetal type, open on temperature rise.
	Pressure Relief	High-quality stainless steel pressure relief device.
Controls	Control Circuit	Built-in 120VAC or 24VAC control (24VAC recommended).
	Control Contactor	40 FLA (50A resistive per pole) Definite Purpose. Rated for 500,000 mechanical operations.
	Control Transformer	Multitap primary, 120VAC or 24VAC secondary.
	Fuse Protection	Thermal delay fuse with spare, .25” x 1.25” , 120VAC = 1/4A, 24VAC = 1A.
	Room Thermostat With Lockable Temperature Dial (option code T1 or T2)	Built-in, **BTX1-N-A (T1) or XET1-1-N-A (T2)** explosion-proof thermostat, 40°F to 80°F (5°C to 25°C). Conduit is factory sealed between enclosures. Wall mount thermostats also available. See Page 8. *Note: Optional **BLK1-N-A** thermostat conversion kit allows simple interchangeability from a built-in to a wall mount configuration.*
Load Isolation	Disconnect Switch (option code D)	Built-in, **XDC-01** explosion-proof disconnect switch, 600VAC, 50A max with lock-out feature. Conduit is factory sealed between enclosures. Also available in a wall mount version.
Additional Options	Pilot Light (option code P)	Built-in “Heat on” Green LED pilot light with lens guard.
	Continuous Fan (option code F)	Continuous fan operation. Circulates air and prevents gas pockets from forming.
	Heresite Coating (option code H1, H2, H3)	H1 = Heresite Core; or H2 = Heresite Cabinet (includes louvers & fan blade); or H3 = Heresite Core and Cabinet. *Note: Contact factory for Heresite delivery lead time.*
Operating Limits	Ambient Temperature	-40°F to 104°F (-40°C to 40°C). Storage: -58°F to 140°F (-50°C to 60°C)
	Maximum Altitude	10,000 ft (3048 m) above sea level.

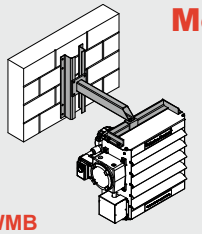
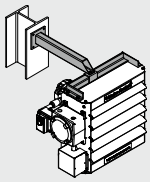
Nomenclature/Useful Formulas/Conversions



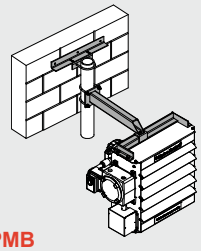
1 kW = 3,414 btu/hr; Final air temp. = Entering air temp. + Temp. rise; °C = 5/9 (°F - 32)

AC/DC Formulas			
To Find	**Direct Current**	**AC - 1 phase**	**AC - 3 phase**
Amps when horsepower is known	$\frac{HP \times 746}{E \times Eff}$	$\frac{HP \times 746}{E \times Eff \times PF}$	$\frac{HP \times 746}{1.73 \times E \times Eff \times PF}$
Amps when kilowatts is known	$\frac{kW \times 1000}{E}$	$\frac{kW \times 1000}{E \times PF}$	$\frac{kW \times 1000}{1.73 \times E \times PF}$
Amps when kVA is known	$\frac{KVA \times 1000}{E}$	$\frac{kVA \times 1000}{E}$	$\frac{kVA \times 1000}{1.73 \times E}$
Kilowatts	$\frac{I \times E}{1000}$	$\frac{I \times E \times PF}{1000}$	$\frac{I \times E \times 1.73\ PF}{1000}$
Kilovolt-Amps	$\frac{I \times E}{1000}$	$\frac{I \times E}{1000}$	$\frac{I \times E \times 1.73}{1000}$
Horsepower (output)	$\frac{I \times E \times Eff}{746}$	$\frac{I \times E \times Eff \times PF}{746}$	$\frac{I \times E \times Eff \times 1.73 \times PF}{746}$

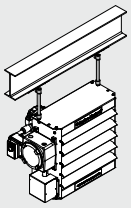


Where **I** = amps; **E** = phase-to-phase volts; **Eff** = efficiency expressed as a decimal; **PF** = power factor expressed as a decimal; **kW** = kilowatts; **KVA** = kilovolt amperes; **HP** = horsepower.

Accessories



Mounting Brackets



WMB
Wall Mounting Bracket
For use in buildings that have substantial walls. The Z sections provide additional support where necessary.

BMB
Basic Mounting Bracket
For applications where the support arm can be bolted or welded directly to structural steel or concrete.

PMB
Pipe Mounting Bracket
For buildings with insufficient strength to use other types of mounting brackets. Requires 3 in. pipe (3.5 in. O.D., min. Sch. 40, not supplied).

HMB
Hanging Mounting Bracket
Ideal and economical if adequate overhead structure exists. Requires 1/2 in. pipe, cut and threaded (min. Sch. 40 not supplied).

Note: When ordering mounting brackets, please specify the type of bracket preferred and the basic model code of the heater to be mounted. Example, **PMB-XEU1-16.** Mounting kits are made of carbon steel and coated with black enamel. Structural support of heater and bracket during transit is required.

Explosion-proof ExCaliber™ Series Thermostats, Remote Mount

BTX1-N-A (SPDT) Heating or Cooling (Bi-metal thermostat used on XEU1 heaters with built-in option code (T1) selected)

Class I, Division 1 & 2, Groups C & D
Class II, Division 1, Groups E, F & G
Class II, Division 2, Groups F & G; Class III; T6
-50°C ≤ T amb ≤ +40°C, IP66, Type 4
Class I, Zone 1 & 2, Ex db, Groups IIA, IIB, T6, Gb
Class I, Zone 1 & 2, AEx db, Groups IIA, IIB, T6, Gb
Class II, Zone 21 & 22, Ex tb, Groups IIIA, IIIB & IIIC, T85°C, Db
Class II, Zone 21 & 22, AEx tb, Groups IIIA, IIIB & IIIC, T85°C, Db
Temperature adjustment range: 40°F to 80°F (5°C to 25°C); 3/4" - NPT conduit opening on top and bottom; Ship wt - 3.5 lbs (1.6 kg)
22 Amps Resistive Load, 480VAC Max; 1/2HP @ 125VAC; 1HP @ 250VAC (suitable for 24VAC or 120VAC control circuit)

XET1-1-N-A (Electronic) Heating only (24VAC required)

Class I, Division 1 & 2, Groups B, C & D
Class II, Division 1, Groups E, F & G
Class II, Division 2, Groups F & G; Class III; T6
-50°C ≤ T amb ≤ +40°C, IP66, Type 4

Ship wt – 12.0 lbs (5.4 kg)

XEU1 Engineering Specifications

1.0 General

1.1 The explosion-proof unit heater(s) shall be supplied and installed, in accordance with the plans and specifications, with ratings as listed in the schedule of electrical heating equipment, and shall be Hazloc Heaters' XEU1 series.

1.2 The unit heater(s) shall be $_{C}CSA_{US}$ certified for use in Class I, Divisions 1 & 2, Groups C & D; Class II, Divisions 1 & 2, Groups F & G; and Class I, Zones 1 & 2, Groups IIA & IIB Hazardous Locations and shall be rated for National Electric Code and Canadian Electric Code Temperature Code T3B, 165°C (329°F); [3kW/35kW = T3A, 180°C (356°F)] for Division System and T3, 200°C (392°F) for Zone System.

2.0 Heat Exchanger

2.1 The Heat Exchanger shall be a liquid-to-air type consisting of steel tubes with integral aluminum fins @ 10 fins per inch and be evacuated, sealed and painted with black, high heat enamel.

2.2 The heat exchanger shall be protected by a high-quality stainless steel pressure relief device with no serviceable parts.

2.3 The Heat Exchanger shall be filled and sealed to design level with a custom-blended, long-life solution of ethylene-glycol and water including inhibitors to provide superior corrosion protection.

2.4 The Heat Exchanger shall include heavy-duty immersion heating elements brazed into a heavy steel flange. The elements shall consist of high-quality resistance wire embedded in a magnesium oxide refractory and sheathed in a metal tubing. The heater is to be protected by two snap-action bimetal temperature high-limit cutouts. The primary high-limit shall be an automatic reset type rated for 100,000 cycles, and the secondary high-limit a manual reset type and will shut off the heater if the fluid temperature rises due to a lack of heat dissipation. The high-limits shall not be effected by altitude or changes in atmospheric pressure.

3.0 Fan and Motor Assembly

3.1 The Fan Assembly shall include a ball bearing, permanently lubricated, thermally protected explosion-proof motor rated for continuous duty at 40°C (104°F). The motor shaft shall provide a method for easy field replacement of fan blade assembly without the use of special tools.

3.2 The Fan and Fan Shroud shall be aluminum to prevent sparking and be compliant to AMCA 99-10, Type B. The assembly shall be directly connected to the motor, dynamically balanced, and designed specifically for the heater application.

3.3 The Fan shall be shielded with a heavy-duty steel wire, polyester-coated guard. To provide easy maintenance and cleaning of the fan and motor, the fan guard shall be of a two piece construction. The guard shall not allow a 3/8 in. (9.5 mm) probe to enter.

4.0 Control Center

4.1 The Control Center shall be completely factory pre-wired and tested, and enclosed in a NEMA 7 and 9 type of explosion-proof control enclosure with O-ring and a large threaded cover for easy access.

4.2 The Control Center shall include a 40 FLA (50A resistive per pole) Definite Purpose magnetic contactor sized to handle the heater and motor current, and shall be rated for 500,000 cycles operation. The encapsulated severe-duty coil shall be rated 120VAC or 24VAC (specify one) and separately fuse protected.

4.3 The Control Center shall include a control voltage transformer, the primary voltage being the same as the heater voltage and the secondary to be 120VAC or 24VAC (specify one).

4.4 The Control Center shall include a terminal block for thermostat connection.

4.5 The Control Center shall include in-line thermal delay fuse protection on secondary side of transformer. The fuse holder shall be mounted on the printed circuit board and contain both an operating fuse and a spare fuse.

5.0 Cabinet Assembly

5.1 The Cabinet Assembly shall be fabricated from 14 gauge steel with a baked epoxy/polyester powder coating over a 5-stage pretreatment including iron phosphate, for protection from corrosive atmospheres.

5.2 The Cabinet shall include four 9/16 inch (14.3 mm) mounting holes located on top face of heater.

5.3 Louver blades shall be individually adjustable and made of anodized extruded aluminum.

6.0 Mounting Brackets

6.1 The heater shall be provided with a steel Mounting Bracket, coated with black enamel, specifically designed to bear the weight of the heater assembly.

6.2 The Mounting Bracket shall be – (select one):

- ☐ Type WMB – Wall Mounting Bracket
- ☐ Type BMB – Basic Mounting Bracket
- ☐ Type PMB – Pipe Mounting Bracket
- ☐ Type HMB – Hanging Mounting Bracket

7.0 Room Thermostat Options

7.1 The heater shall be supplied with (select one):

- ☐ Option Code T1. Built-in BTX1-N-A Bi-metal explosion-proof room thermostat mounted on the control enclosure side of the heater.
- ☐ Option Code T2. Built-in XET1-1-N-A Electronic explosion-proof room thermostat mounted on the control enclosure side of the heater (requires 24VAC control option).
- ☐ Field installed remote mount BTX1-N-A Bi-metal explosion-proof thermostat.
- ☐ Field installed remote mount XET1-1-N-A Electronic explosion-proof thermostat (requires 24VAC control option).

8.0 Disconnect Switch Options

8.1 The heater shall be supplied with (select one):

- ☐ Built-in XDC-01 explosion-proof disconnect switch mounted on the control enclosure side of the heater.
- ☐ Field installed remote mount XDC-01 explosion-proof disconnect switch.

9.0 Additional Options

9.1 The heater shall be supplied with (select one or more):

- ☐ Built-in Pilot light (Heat On) mounted on front of control enclosure.
- ☐ Continuous fan operation.
- ☐ Heresite coated core.
- ☐ Heresite coated cabinet (includes louvers & fan blade).

Guide to Hazardous Locations
North America/ATEX/IECEx

Classification of Divisions and Zones			
Hazard Level	**Division Scheme**	**Zone Scheme**	**Definitions**
Continuous Hazard	Division 1	Zone 0 / Zone 20	A location in which an explosive atmosphere is continually present.
Intermittent Hazard		Zone 1 / Zone 21	A location in which an explosive atmosphere is likely to occur in normal operation.
Hazard Under Abnormal Conditions	Division 2	Zone 2 / Zone 22	A location in which an explosive atmosphere is not likely to occur in normal operation, but may occur for short periods.

Atmosphere Groups			
Substance	**Hazard Class**	**Division Groups**	**Zone Groups**
Acetylene	Class I Flammable Gases	Group A	IIC
Hydrogen		Group B	IIB+H_2
Ethylene		Group C	IIB
Propane		Group D	IIA
Methane		Group D	IIA[#]
Combustible Metal Dusts	Class II Combustible Dusts	Group E*	IIIC
Combustible Carbonaceuous Dusts		Group F	IIIB
Combustible Dusts not in Group E or F (Flour, Grain, Wood, Plastics, Chemicals)		Group G	IIIB
Combustible Fibers and Flyings	Class III Fibers and Flyings	Not Applicable	IIIA

* Group E is applicable to Class II, Division 1 only
[#] Methane is a Group IIA gas for non-mining applications

Temperature Codes		
Max. Surface Temperature	**NEC® 500 / CEC®**	**NEC® 500 / IEC – Group II**
450°C (842°F)	T1	T1
300°C (572°F)	T2	T2
280°C (536°F)	T2A	
260°C (500°F)	T2B	
230°C (446°F)	T2C	
215°C (419°F)	T2D	
200°C (392°F)	T3	T3
180°C (356°F)	T3A	
165°C (329°F)	T3B	
160°C (320°F)	T3C	
135°C (275°F)	T4	T4
120°C (248°F)	T4A	
100°C (212°F)	T5	T5
85°C (185°F)	T6	T6

Note: Consult the current NEC and CEC codes for the latest technical and installation information

North American transition to the zone system

The U.S. and Canada have recently revised installation codes to recognize an international 3-Zone area classification system for equipment used in hazardous locations.

In Canada, all new installations must use the 3-Zone system. Existing installations may continue to use the 2-Division system or opt to re-classify using the 3-Zone system.

In the U.S., all installations (both new and existing) can either use the 2-Division system or use the 3-Zone system.

Additional Products Available

Hazloc Heaters™ offers a wide variety of steam/hydronic air heaters, explosion-proof electric air heaters, washdown/corrosion resistant air heaters, non-hazardous area air heaters, air sensing thermostats, disconnect switches and other related accessories.

Please visit **www.HazlocHeaters.com** and click on the *Products* link.

Hazloc Heaters™ ***"Safe heat when you need it!"***

Quality Mission Statement

Quality is… customers that come back, and products that don't.

Limited 36-Month Warranty

Hazloc Heaters™ warrants all **XEU1** series of explosion-proof electric heaters against defects in materials and workmanship under normal conditions of use for a period of thirty-six (36) months from date of purchase based on the following terms:

1. The heater must not be modified in any way.
2. The heater must be stored, installed and used only in accordance with the owner's manual and attached data plate information.
3. Replacement parts will be provided free of charge as necessary to restore any unit to normal operating condition, provided that the defective parts be returned to us freight prepaid and that the replacement parts be accepted freight collect.
4. The complete heater may be returned to our manufacturing plant for repair or replacement (at our discretion), freight charges prepaid.
5. Contamination by dirt, dust, etc. or corrosion will not be considered as defects.
6. This warranty shall be limited to the actual equipment involved and, under no circumstances, shall include or extend to installation or removal costs, or to consequential damages or losses.

Notes

1. Net weight

Without Disconnect Switch
3, 5 & 7.5kW = 129 lbs (58.5 kg)
10 kW = 133 lbs (60.3 kg)

With Disconnect Switch
3, 5 & 7.5kW = 142 lbs (64.4 kg)
10 kW = 146 lbs (66.2 kg)

2. Shipping Weight

Without Disconnect Switch
3, 5 & 7.5kW = 188 lbs (85.3 kg)
10 kW = 192 lbs (87.1 kg)

With Disconnect Switch
3, 5 & 7.5kW = 201 lbs (91.2 kg)
10 kW = 205 lbs (93.0 kg)

3. Ambient Temperature Limits and Altitude

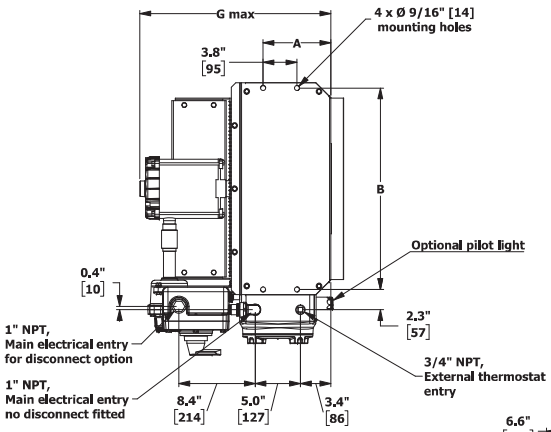
Operating: -40°F to 104°F (-40°C to 40°C)
Storage: -58°F to 140°F (-50°C to 60°C)
Maximum Altitude: 10,000 ft (3048 m) ASL

4. Air Delivery

3 kW = 350 cfm (595 m^3/hr)
5 kW = 400 cfm (680 m^3/hr)
7.5 kW = 600 cfm (1019 m^3/hr)
10 kW = 800 cfm (1359 m^3/hr)

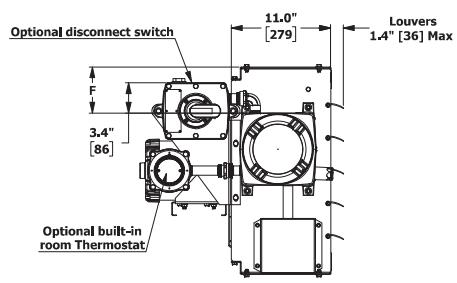
Note:
The fan shroud is made of spark resistant aluminum compliant to AMCA 99-10, Type B

5. Hazardous Location Classification



Class I, Divisions 1 & 2, Groups C & D
Class II, Divisions 1 & 2, Groups F & G
Temperature Code T3B (3kW = T3A)
Class I, Zones 1 & 2 , Groups IIA & IIB, T3

6. Materials



Cabinet: 14 Ga, Yellow Epoxy/Polyester Powder Coated
Core: Carbon Steel with Copper-free Integral Aluminum Fins Coated with Black, High Heat Enamel (Heresite coated core and/or cabinet available)

Features

Color
- Standard: white, almond.
- Optional (upcharge applicable): metallic silver, bronze, metallic charcoal, aluminum, semi-gloss black, sand.
- Custom colors available upon request.

Finish
- Standard: epoxy/polyester powder paint.

Voltage
- 208V, 240V, 277V, 347V, 480V, 600V, 1 or-3 phase.

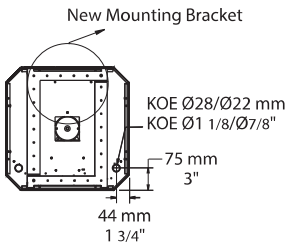
Construction
- Outlet grille made of flat ribbon wire. 1
- High-limit temperature control with automatic reset. 2

Fan
- Totally enclosed and lifetime-lubricated ball bearing motor.
- Fan delay purges heater of residual heat. 3

Heating element
- Three stainless steel tubular heating elements with aluminum fins. 5

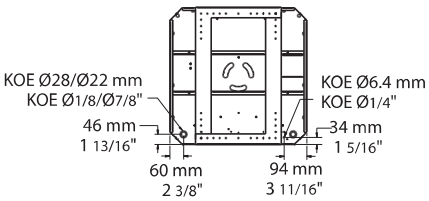
Control
- 240/208V control circuit standard (except for 2 to 5kW at 277V have 277V control standard).
- Built-in 240V contactor for some models (see table).
- 24V and 120V control circuit available.
- Built-in tamperproof thermostat available.
- 24V relay (with or without transformer) available.
- Continuous circulation controlled by a built-in switch with power-on indicator light available (-CV).

Any remote thermostat or relay must be connected to the heater control terminal block. 4



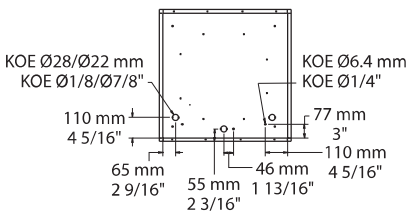
Installation
- Recommended height: between 8 ft. (2.4 m) and 12 ft. (3.6 m).
- Recessed into insulated or T-bar ceiling (ODSR).
- Surface mounting (ODSA and ODSB), T-BAR adaptor optional.

Note: We recommend installing this product on an outside ceiling to avoid vibrations spreading to an adjacent room.

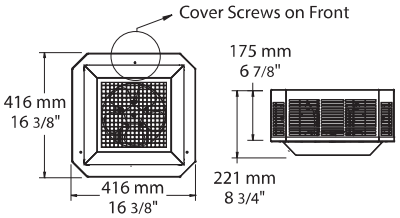


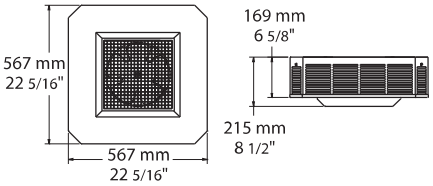
Warranty
- 3-year warranty against defects.
- 10-year warranty on the heating elements.

Application
- Apartment building, commercial building, drop ceiling, stairwell, garage.

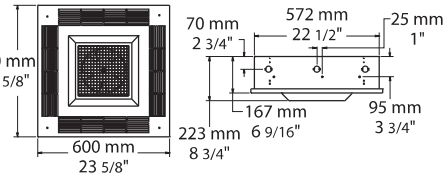


ODSA - Surface
2-5kW, 25 lbs (11.4 kg)





ODSB - Surface
7.5-10kW, 34 lbs (15.5 kg)



ODSR - Recessed
2-5kW, 31 lbs (14.1 kg)

Exhaust Fan – Explosion Proof

FRONT VIEW

EXPLOSION PROOF STANDARD WALL EXHAUST FANS

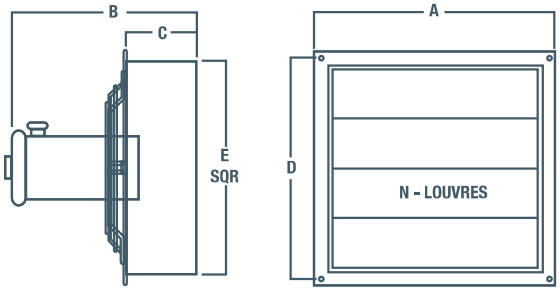
Efficient, low maintenance and easy to install.

Canarm LFI's explosion proof fans follow a tradition of quality in design, materials and construction. Using our quality "Standard Fan" housing and motor mount as the basis for design, we have developed an efficient, economically priced Explosion Proof Fan. All Explosion Proof Fans have a single speed, dual voltage explosion proof motor that meets and conforms to all the standards that are listed below.

CLASS I, GROUP C *Atmospheres containing ethyl ether, ethylene, gases or vapors of equivalent hazard.*

CLASS I, GROUP D *Atmospheres such as acetone, ammonia, benzene, butane, cyclopropane, ethanol, gasoline, hexane, methane, natural gas, naphtha, propane, or gasses or vapors of equivalent hazard.*

CLASS II GROUP F *Atmospheres containing carbonaceous dust, including carbon black, charcoal, coal, or coke dusts that have more than 8% total entrapped volatiles, or dusts that have been sensitized by other materials so that they present an explosion hazard.*



CLASS II GROUP G *Atmospheres containing combustible dusts not included in group E or F, including flour, grain, wood, plastic and chemicals.*

FEATURES

- Totally enclosed, ball bearing motor with thermal overload protection.
- The fan blades are well-balanced, heavy gauge aluminum.
- The rugged steel welded box housing has a durable powder coated finish.
- Aluminum louver shutters are supported by long life nylon bushings.
- Heavy wire chrome plated OSHA guards on intake side of fan.
- All fans are shipped completely assembled.

NOTE: RPM Min (Minimum) is determined when louvres are opened one inch.
Note: Wind has a significant effect on exhaust fans. A 10 mph wind creates a 0.05" pressure against the fan. A 20 mph wind creates 0.20" pressure and 30 mph a 0.45" pressure. These pressures are in addition to the static pressure in the building. Wind blocks or hoods should be included in all designs where fans will be subjected to winds above 10 mph.

CANARM®

OPERATION INSTRUCTIONS AND PARTS MANUAL

READ AND SAVE THESE INSTRUCTIONS

WARRANTY

CANARM Ltd. warrants every new fan to be free of defects in material and workmanship, to the extent that, within a period of one year from the date of purchase CANARM Ltd. shall either repair or replace at CANARM's option, any unit or part thereof, returned freight prepaid, and found to be defective.

This warranty does not include any labour or transportation costs incidental to the removal and reinstallation of the unit at the user's premises. Components repaired or replaced are warranted through the remainder of the original warranty period only.

This warranty applies to the original purchaser-user only; it is null and void in case of alteration, accident, abuse, neglect, and operation not in accordance with instructions.

NOTICE: No warranty claims will be honored by CANARM Ltd. unless prior authorization is obtained.

INSTALLATION OR PRODUCT PROBLEMS? DO NOT RETURN TO STORE OF PURCHASE.
CONTACT CANARM SERVICE AT 1-800-265-1833 (CANADA) 1-800-267-4427 (U.S.A.)

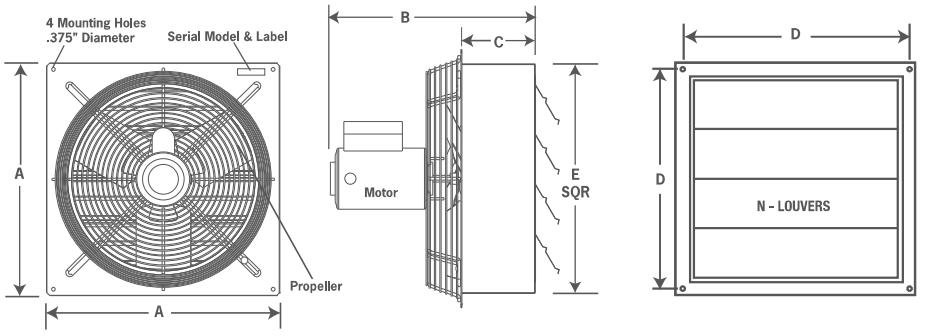
INSTRUCTION MANUAL FOR STANDARD EXHAUST FANS



READ INSTRUCTIONS COMPLETELY BEFORE INSTALLATION & SAVE FOR REFERENCE

Congratulations on the purchase of your quality built direct drive, wall exhaust ventilation fan. All of these models use totally enclosed motors with thermal over load protection. Variable speed motors are high efficiency motors which save on electrical costs and can be run as a single speed motor. The motors are mounted on heavy gauge welded steel rod motor mounts that have a Bright Zinc finish. Fans come fully assembled and 100% of fans are tested for proper operation before shipping.

THESE ARE GENERAL INSTRUCTIONS WHICH COVER OUR SINGLE, VARIABLE AND TWO SPEED STANDARD FANS, AS WELL AS OUR SINGLE SPEED EXPLOSION PROOF MODELS..

STANDARD FANS:

These models have a rugged, welded steel box housing with a powder coated finish and aluminum or plastic exhaust louvers that are supported by long life nylon bushings. The louvers open automatically when the fan starts up and close when the fan stops

Fan Size	A	B	C	D (c/c)	E	N	Framing
8"	13 1/4"	11"	4"	12"	10 3/4"	2	11 X 11

EXPLOSION PROOF FANS:

Explosion proof fans are equipped with single speed explosion proof motors and aluminum blades so sparks cannot occur if a metal object obstructs the blade path. Explosion proof fans have the same quality welded steel box housing and heavy gauge welded guard as the standard fans. These fans should be used to ventilate hazardous areas. Locations are considered hazardous if the atmosphere contains or may contain gas, vapor, or dust in explosive quantities.

THE MOTOR AMBIENT TEMPERATURE IS NOT TO EXCEED +40°C OR -25°C UNLESS THE MOTOR NAMEPLATE SPECIFICALLY PERMITS ANOTHER VALUE. THE FOLLOWING TABLE INDICATES WHICH HAZARDOUS CLASSIFICATIONS CANARM EXPLOSION PROOF FANS DO AND DO NOT MEET.

Canarm explosion proof fans DO meet the following hazardous classifications.

CLASS 1, DIVISION 1 (GASES, VAPORS)

GROUP C Acetaldehyde, cyclopropane, diethlether, Ethylene, isoprene

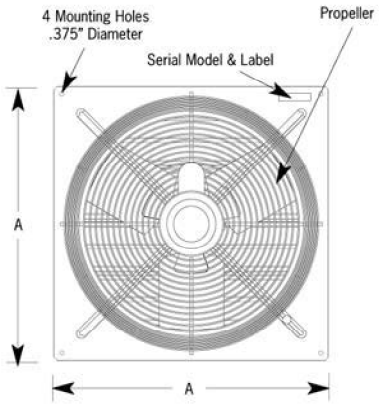
GROUP D Acetone, acrylonitrile, ammonia, benzene, butane, ethylene dichloride, gasoline, hexane, methane, methanol, naphtha, propane, propylene styrene, toluene, vinyl, acetate, vinyl chloride, xylene

CLASS 2, DIVISION 1 (COMBUSTIBLE DUSTS)

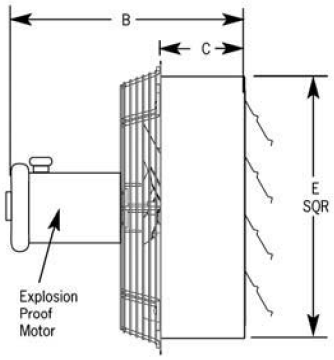
GROUP F Carbon black, coke or coal dust

GROUP G Flour, starch or graindust

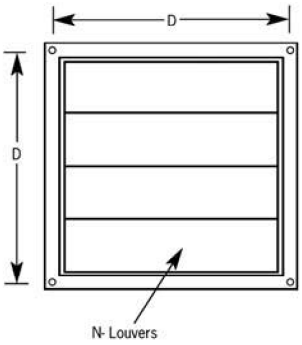
Canarm explosion proof fans DO NOT meet the following hazardous classifications.



CLASS 1, DIVISION 1 (GASES, VAPORS)



GROUP A Acetylene



GROUP B Butadiene, ethylene oxide, hydrogen, propylene oxide

CLASS 2, DIVISION 1 (COMBUSTIBLE DUSTS)

GROUP E Aluminum, magnesium and other metal dusts with similar characteristics

Fan Size	A	B	C	D (c/c)	E	N	Framing
12"	17 1/4"	17"	6"	16"	14 3/4"	3	15 X 15
18"	23 1/4"	15"	6"	22"	20 3/4"	4	21 X 21
24"	29 1/4"	18"	6"	28"	26 3/4"	5	27 X 27

INSTALLATION

Installation is fast and simple. A sturdy framed wall opening should be prepared in advance to the size indicated for your fan in the charts above. With lag bolts for wooden frames or nut, bolt and lock washers for steel frames, secure the fan using the four mounting holes provided, one in each corner of the fan.

ELECTRICAL CONNECTIONS

WARNING: BE SURE POWER IS OFF AT THE ELECTRICAL PANEL BEFORE WIRING.

WARNING: ALL ELECTRICAL WORK SHOULD BE PERFORMED BY A QUALIFIED ELECTRICIAN.

These fans are supplied with single, two or variable speed motors. Single and two speed motors are 120V only. Variable speed motors are dual voltage. All dual voltage motors are pre-wired at 240V in our factory. Rewire motor as per motor nameplate if running fan at 120V. Please see the motor nameplate for wiring diagram. Make electrical connections in motor connection box as per the motor nameplate. Follow ***Chart #1*** for wire sizes. Two speed fans require a two speed control or 3 position toggle switch to change from high/ low/off. See wiring diagram with control for 2 speed wiring instructions.

CHART#1

Table A **Minimum Wire Sizes for Three-Phase Motors**

1/2	12	14(18)*	8	14	6	12	4	3	8
3/4	10	14(16)*	6	12	4	10	2	1	6
1	10	14(16)*	6	12	4	10	2	1	6
1 1/2	8	14	6	12	3	8	1	1/0	6
2	6	14	4	10	2	8	1/0	2/0	4
3	6	12	3	8	1/0	6	2/0	4/0	3

NOTE:
- NEC Article 310-5 - *Minimum conductor size for general wiring at 115-440VAC is number 14AWG.
- Above wire sizes based on approximate 5% voltage drop during starting: copper conductors: and 75°C type THHW, THW, THWN, RH, RHW insulation etc. For aluminum wire, increase two wire size steps minimum. See NEC Article 310 for ampacities of aluminum conductors.
- Type S, SO, SJ, SJO, etc. flexible cable wire sizes. See NEC article 400 for ampacity.

OPERATION

WARNING: VARIABLE SPEED FANS SHOULD HAVE THE MINIMUM SPEED SET TO OPEN LOUVERS AT LEAST ONE INCH FOR PROPER MOTOR COOLING AND TO PREVENT MOTOR FAILURE.

All fans are direct drive. Fans with variable speed motors can be operated as an energy efficient single speed fan or in variable operation with the proper controller. As mentioned above two speed fans require a two speed control or 3 position toggle switch to change from high speed to low and off.

WARNING: GUARDING SHOULD BE USED IF FANS ARE MOUNTED LOWER THAN SEVEN FEET (2 METRES) OFF FLOOR OR GROUND LEVEL.

ACCESSORIES

Canarm provides a complete line of manual and thermostatic controls. Canarm also offers wall mount exhaust shutter kits, replacement shutter sets, and weather protection hoods.

MAINTENANCE

MOTORS ARE EQUIPPED WITH AUTOMATIC OVERLOAD PROTECTION AND MAY RESTART WITHOUT WARNING. ALWAYS DISCONNECT FROM POWER BEFORE ATTEMPTING SERVICE. Motor, blade and louvers should be kept clean of any buildup to prevent premature motor failure and to achieve proper performance. Automatic louvers should be kept operating freely. As with all mechanical equipment scheduled inspections should include checking that all hardware is secure and blade set screws are tight.

WARRANTY

CANARM Ltd. warrants every new fan to be free of defects in material and workmanship, to the extent that, within a period of one year from the date of purchase CANARM Ltd. shall either repair or replace at CANARM's option, any unit or part thereof, returned freight prepaid, and found to be defective. This warranty does not include any labour or transportation costs incidental to the removal and reinstallation of the unit at the user's premises. Components repaired or replaced are warranted through the remainder of the original warranty period only. This warranty applies to the original purchaser-user only; it is null and void in case of alteration, accident, abuse, neglect, and operation not in accordance with instructions.
NOTICE: NO WARRANTY CLAIMS WILL BE HONORED BY CANARM LTD. UNLESS PRIOR AUTHORIZATION IS OBTAINED.

Canarm/LFI's standard fans follow a tradition of quality in design, materials and construction. All our standard fans are developed to be efficient and economically priced. Fans are available in single, two and variable speed models. All variable speed standard fans use an energy efficient variable speed, dual voltage motor and blade combination. To determine the proper Canarm/LFI fan for your applications, use the formula and table shown on back of page.

FEATURES

8" & 10" Models *New Features!*

- Smooth, quiet, reliable, maintenance-free operation
- Durable steel construction with grey powder coat finish
- 2 speed fan with high efficiency Euro design external rotor motor
  - Totally enclosed with sealed ball bearings
  - Pull chain speed control
  - 9 foot cord with 115 volt, 3-prong plug
- Swept back, high efficiency, low noise blade design
- Quiet, aluminum shutters with tie bar to maximize airflow and a magnet to prevent flapping and provide a superior seal
- Zinc plated OSHA guard
- Fans shipped completely assembled
- Easy to install! Mount fan using four screws, plug it in and turn it on

12" to 48" Models

- Single, two and variable speed models are available.
- All fans use a totally enclosed, thermally protected motor.
- Rugged steel welded box housing has a durable powder coated finish.
- Aluminum louver shutters are supported by long life nylon bushings (30", 36", 42" & 48" have PVC louvers).
- 12" - 24" models have heavy wire chrome plated OSHA guards on intake side of fan.
  30", 36", 42" & 48" models have grey powder coated guards.
- All fans are shipped completely assembled.

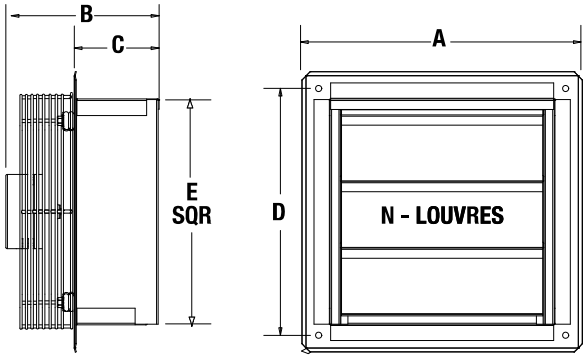
NEW	**SD48-H1D**	Single	48"	850	1	230	5.0	140	84	17200	15300	14800	12500	51" X 51"

Some models are available with explosion proof motors. Please see next page.

NOTE: RPM Min (Minimum) is determined when louvres are opened one inch.
Note: Wind has a significant effect on exhaust fans. A 10 mph wind creates a 0.05" pressure against the fan. A 20 mph wind creates 0.20" pressure and 30 mph a 0.45" pressure. These pressures are in addition to the static pressure in the building. Wind blocks or hoods should be included in all designs where fans will be subjected to winds above 10 mph.

AIR CHANGES PER MINUTE

To determine the proper Canarm/LFI fan for your applications, use the following formula.
Number of cubic feet in room / Number of minutes per air change = Required C.F.M. Capacity



EXAMPLE: A general office, (see chart) which requires an air change every ten minutes, would require the following fan capacity.
If office is 100' x 40' x 10' = 40,000 cubic ft; 40,000 cubic ft / 10 minutes per air change = 4000 Required C.F.M.
From the chart, you would select a fan that is rated at 4000 C.F.M. at 1/8" S.P. (Static Pressure)

Application	Minutes per Air Change	Application	Minutes per Air Change	Application	Minutes per Air Change	Application	Minutes per Air Change
Assembly Hall	7	Church	15	Foundry	4	Pressing Room	1
Attic	2	Classroom	6	Garage	5	Projection Booth	2

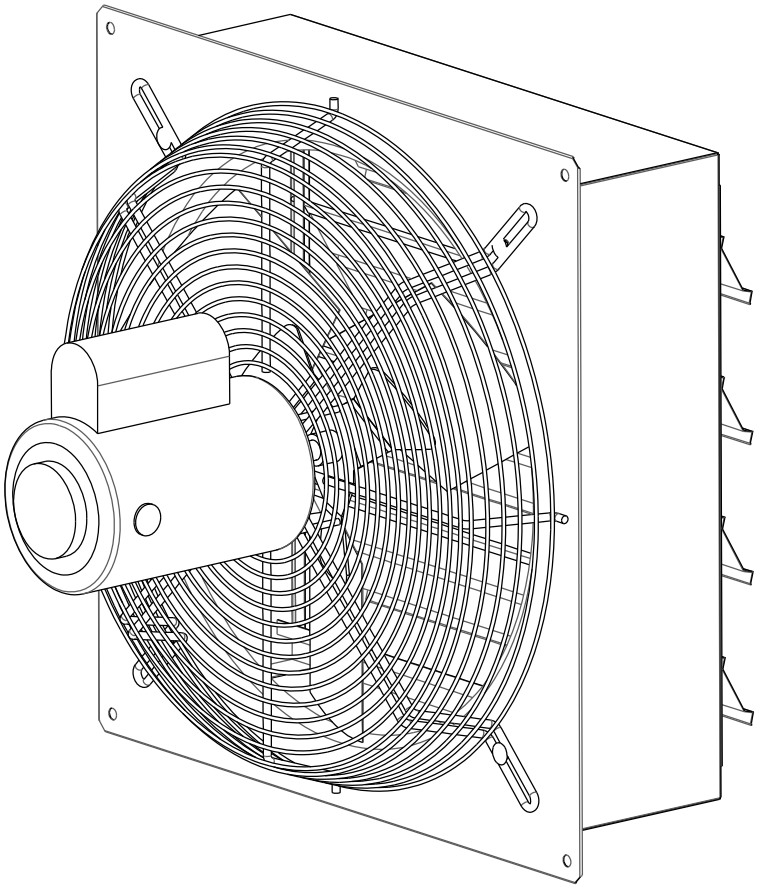
ACCESSORIES

- Grey plastic weather hood
- Galvanized metal hood
- MC type & wet locations controls.



For a complete listing on all available accessories, see page D17.
For a complete listing of all available hoods, see page D11.
For all available control options, see Controls & Thermostats tab.

STANDARD EXHAUST FANS

CANARM®

OPERATION INSTRUCTIONS AND PARTS MANUAL

READ AND SAVE THESE INSTRUCTIONS

WARRANTY

CANARM Ltd. warrants every new fan to be free of defects in material and workmanship, to the extent that, within a period of one year from the date of purchase CANARM Ltd. shall either repair or replace at CANARM's option, any unit or part thereof, returned freight prepaid, and found to be defective.

This warranty does not include any labour or transportation costs incidental to the removal and reinstallation of the unit at the user's premises. Components repaired or replaced are warranted through the remainder of the original warranty period only.

This warranty applies to the original purchaser-user only; it is null and void in case of alteration, accident, abuse, neglect, and operation not in accordance with instructions.

NOTICE: No warranty claims will be honored by CANARM Ltd. unless prior authorization is obtained.

INSTALLATION OR PRODUCT PROBLEMS? DO NOT RETURN TO STORE OF PURCHASE.
CONTACT CANARM SERVICE AT 1-800-265-1833 (CANADA) 1-800-267-4427 (U.S.A.)

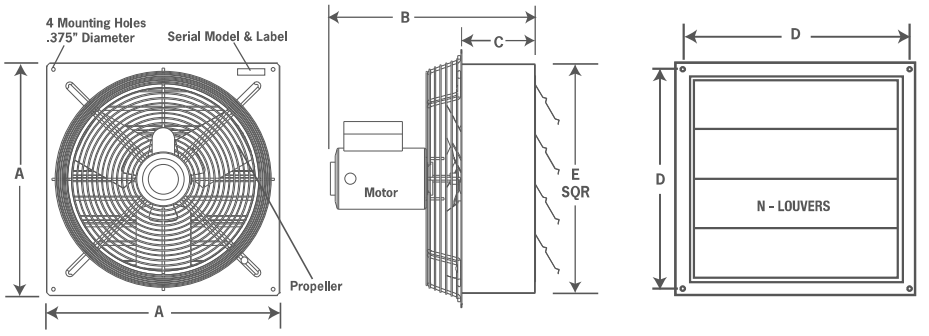
INSTRUCTION MANUAL FOR STANDARD EXHAUST FANS



READ INSTRUCTIONS COMPLETELY BEFORE INSTALLATION & SAVE FOR REFERENCE

Congratulations on the purchase of your quality built direct drive, wall exhaust ventilation fan. All of these models use totally enclosed motors with thermal over load protection. Variable speed motors are high efficiency motors which save on electrical costs and can be run as a single speed motor. The motors are mounted on heavy gauge welded steel rod motor mounts that have a Bright Zinc finish. Fans come fully assembled and 100% of fans are tested for proper operation before shipping.

THESE ARE GENERAL INSTRUCTIONS WHICH COVER OUR SINGLE, VARIABLE AND TWO SPEED STANDARD FANS, AS WELL AS OUR SINGLE SPEED EXPLOSION PROOF MODELS..

STANDARD FANS:

These models have a rugged, welded steel box housing with a powder coated finish and aluminum or plastic exhaust louvers that are supported by long life nylon bushings. The louvers open automatically when the fan starts up and close when the fan stops

Fan Size	A	B	C	D (c/c)	E	N	Framing
8"	13 1/4"	11"	4"	12"	10 3/4"	2	11 X 11

48"	53 1/4"	19"	6 3/4"	52"	50 5/8"	26	51 X 51

EXPLOSION PROOF FANS:

Explosion proof fans are equipped with single speed explosion proof motors and aluminum blades so sparks cannot occur if a metal object obstructs the blade path. Explosion proof fans have the same quality welded steel box housing and heavy gauge welded guard as the standard fans. These fans should be used to ventilate hazardous areas. Locations are considered hazardous if the atmosphere contains or may contain gas, vapor, or dust in explosive quantities.

THE MOTOR AMBIENT TEMPERATURE IS NOT TO EXCEED +40°C OR -25°C UNLESS THE MOTOR NAMEPLATE SPECIFICALLY PERMITS ANOTHER VALUE. THE FOLLOWING TABLE INDICATES WHICH HAZARDOUS CLASSIFICATIONS CANARM EXPLOSION PROOF FANS DO AND DO NOT MEET.

Canarm explosion proof fans DO meet the following hazardous classifications.

CLASS 1, DIVISION 1 (GASES, VAPORS)

GROUP C Acetaldehyde, cyclopropane, diethlether, Ethylene, isoprene

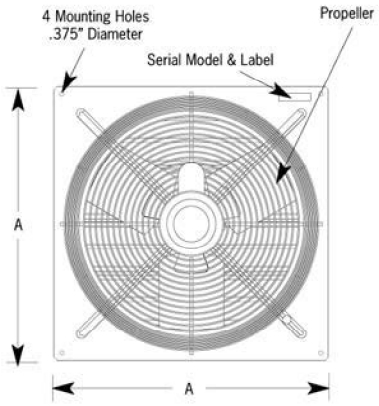
GROUP D Acetone, acrylonitrile, ammonia, benzene, butane, ethylene dichloride, gasoline, hexane, methane, methanol, naphtha, propane, propylene styrene, toluene, vinyl, acetate, vinyl chloride, xylene

CLASS 2, DIVISION 1 (COMBUSTIBLE DUSTS)

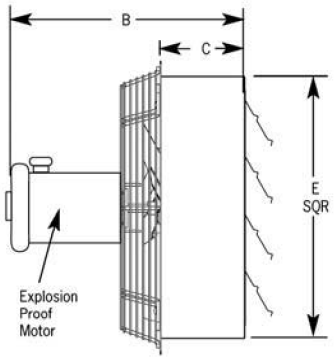
GROUP F Carbon black, coke or coal dust

GROUP G Flour, starch or graindust

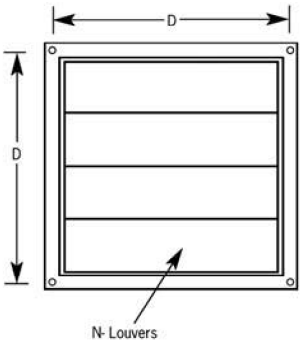
Canarm explosion proof fans DO NOT meet the following hazardous classifications.



CLASS 1, DIVISION 1 (GASES, VAPORS)



GROUP A Acetylene



GROUP B Butadiene, ethylene oxide, hydrogen, propylene oxide

CLASS 2, DIVISION 1 (COMBUSTIBLE DUSTS)

GROUP E Aluminum, magnesium and other metal dusts with similar characteristics

Fan Size	A	B	C	D (c/c)	E	N	Framing
12"	17 1/4"	17"	6"	16"	14 3/4"	3	15 X 15
18"	23 1/4"	15"	6"	22"	20 3/4"	4	21 X 21
24"	29 1/4"	18"	6"	28"	26 3/4"	5	27 X 27

INSTALLATION

Installation is fast and simple. A sturdy framed wall opening should be prepared in advance to the size indicated for your fan in the charts above. With lag bolts for wooden frames or nut, bolt and lock washers for steel frames, secure the fan using the four mounting holes provided, one in each corner of the fan.

ELECTRICAL CONNECTIONS

WARNING: BE SURE POWER IS OFF AT THE ELECTRICAL PANEL BEFORE WIRING.

WARNING: ALL ELECTRICAL WORK SHOULD BE PERFORMED BY A QUALIFIED ELECTRICIAN.

These fans are supplied with single, two or variable speed motors. Single and two speed motors are 120V only. Variable speed motors are dual voltage. All dual voltage motors are pre-wired at 240V in our factory. Rewire motor as per motor nameplate if running fan at 120V. Please see the motor nameplate for wiring diagram. Make electrical connections in motor connection box as per the motor nameplate. Follow ***Chart #1*** for wire sizes. Two speed fans require a two speed control or 3 position toggle switch to change from high/ low/off. See wiring diagram with control for 2 speed wiring instructions.

CHART#1

2	6	14	4	10	2	8	1/0	2/0	4
3	6	12	3	8	1/0	6	2/0	4/0	3

NOTE:
- NEC Article 310-5 - *Minimum conductor size for general wiring at 115-440VAC is number 14AWG.
- Above wire sizes based on approximate 5% voltage drop during starting: copper conductors: and 75°C type THHW, THW, THWN, RH, RHW insulation etc. For aluminum wire, increase two wire size steps minimum. See NEC Article 310 for ampacities of aluminum conductors.
- Type S, SO, SJ, SJO, etc. flexible cable wire sizes. See NEC article 400 for ampacity.

OPERATION

WARNING: VARIABLE SPEED FANS SHOULD HAVE THE MINIMUM SPEED SET TO OPEN LOUVERS AT LEAST ONE INCH FOR PROPER MOTOR COOLING AND TO PREVENT MOTOR FAILURE.

All fans are direct drive. Fans with variable speed motors can be operated as an energy efficient single speed fan or in variable operation with the proper controller. As mentioned above two speed fans require a two speed control or 3 position toggle switch to change from high speed to low and off.

WARNING: GUARDING SHOULD BE USED IF FANS ARE MOUNTED LOWER THAN SEVEN FEET (2 METRES) OFF FLOOR OR GROUND LEVEL.

ACCESSORIES

Canarm provides a complete line of manual and thermostatic controls. Canarm also offers wall mount exhaust shutter kits, replacement shutter sets, and weather protection hoods.

MAINTENANCE

MOTORS ARE EQUIPPED WITH AUTOMATIC OVERLOAD PROTECTION AND MAY RESTART WITHOUT WARNING. ALWAYS DISCONNECT FROM POWER BEFORE ATTEMPTING SERVICE. Motor, blade and louvers should be kept clean of any buildup to prevent premature motor failure and to achieve proper performance. Automatic louvers should be kept operating freely. As with all mechanical equipment scheduled inspections should include checking that all hardware is secure and blade set screws are tight.

WARRANTY

CANARM Ltd. warrants every new fan to be free of defects in material and workmanship, to the extent that, within a period of one year from the date of purchase CANARM Ltd. shall either repair or replace at CANARM's option, any unit or part thereof, returned freight prepaid, and found to be defective. This warranty does not include any labour or transportation costs incidental to the removal and reinstallation of the unit at the user's premises. Components repaired or replaced are warranted through the remainder of the original warranty period only. This warranty applies to the original purchaser-user only; it is null and void in case of alteration, accident, abuse, neglect, and operation not in accordance with instructions.
NOTICE: NO WARRANTY CLAIMS WILL BE HONORED BY CANARM LTD. UNLESS PRIOR AUTHORIZATION IS OBTAINED.

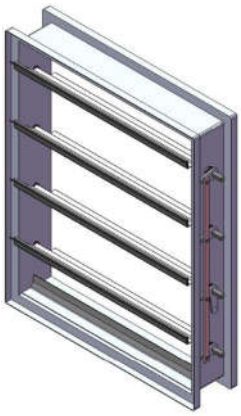
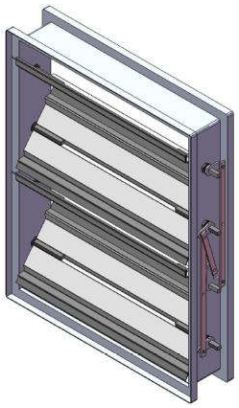
Recommended Specification

Furnish and install stationary louver models 2220 / 2225 as manufactured by Ventex, Bolton Ontario. Louvers shall be 2 inches (50.8 mm) deep. Blades shall be 0.062 Inches (1.57 mm), frame shall be 0.062 (1.57 mm) extruded aluminium, alloy 6063-T5.



Louvers shall have a 19 guage galvanized 1/2 x 1/2 birdscreen. All materials shall be factory finished after assembly with Polyester Baking Enamel in a color selected from the Ventex Color Chart.

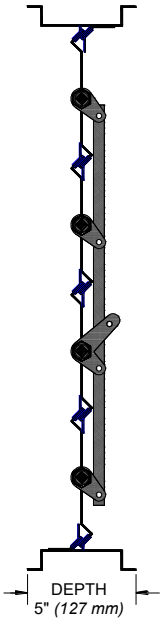
ALUMAVENT
CONTROL DAMPERS & FIRE DAMPERS



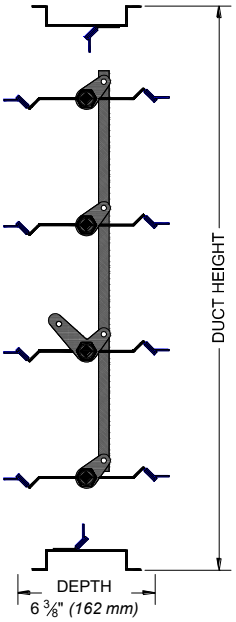
4100 SERIES
STEEL CONTROL DAMPERS
MODEL 4100 • LOW LEAKAGE

PARALLEL BLADE (PB)

OPPOSED BLADE (OB)



4100 Low Leakage Steel Control Damper



STANDARD CONSTRUCTION

Frame Depth: 5" *(127 mm)*
Depth (blades open): 6 3/8" *(162 mm)*
Frame Thickness: 16 Ga. galvanized steel
Blade Thickness: 16 Ga. galvanized steel
Blade Seals: Co-extruded Santoprene vinyl
Jamb Seals: Stainless steel compression spring
Bearings: Oilite self-lubricating bronze
Axles: 3/8" square polycarbonate
Frame Style: Hat channel for in-duct mount
Minimum Height: 8" *(203 mm)* Single blade
14" *(356 mm)* Multiple blade
Maximum Panel Width: 48" *(1219 mm)*
Maximum Panel Height: 72" *(1829 mm)*
Maximum System Pressure: 5" w.g. for 12" (*305 mm)* wide damper
Leakage: Does not exceed 10 CFM/ft^2 (50.8 L/s/m^2) against 4" w.g *(1 kPa)* differential static pressure at -40° F
Linkage: Concealed in frame
Standard Finish: Mill galvanized
Standard Motor Installation: Side shaft direct drive (extendable up to 8")
Temperature Range: -40°F to +180°F (-40C to +82C)

AVAILABLE ACCESSORIES

- Factory supplied actuators
- Stainless Steel axle bearings
- Jack Shafts
- Hand Quadrants
- Chain Operator for manual operation, spring closed

LF120 (-S) US / LF230 (-S) US

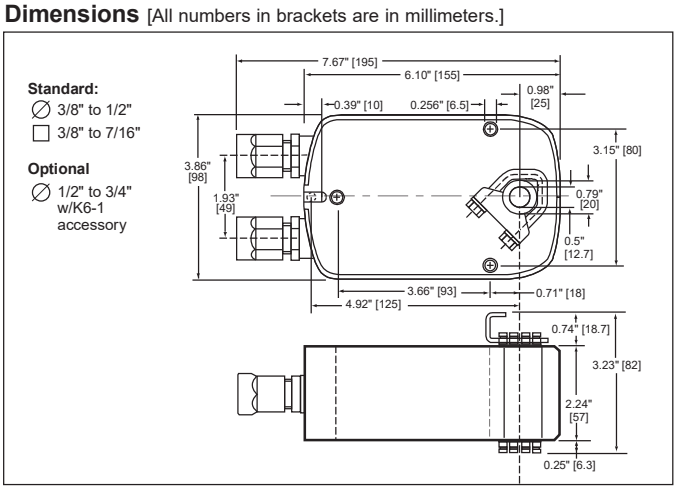
On-off, spring return failsafe, 120/230 VAC

Torque min. 35 in-lb, for control of air dampers

Application

For on-off, fail-safe control of dampers in HVAC systems. Actuator sizing should be done in accordance with the damper manufacturer's specifications. Control is on-off from an auxiliary contact, or a manual switch.

The actuator is mounted directly to a damper shaft from 3/8" up to 1/2" in diameter by means of its universal clamp, 1/2" shaft centered at delivery. For shafts up to 3/4" use K6-1 accessory. A crank arm and several mounting brackets are available for applications where the actuator cannot be direct coupled to the damper shaft.



Operation

The LF series actuators provide true spring return operation for reliable fail-safe application and positive close off on air tight dampers. The spring return system provides consistent torque to the damper with, and without, power applied to the actuator. The LF series provides 95° of rotation and is provided with a graduated position indicator showing 0° to 95°.
The actuator may be stalled anywhere in its normal rotation without the need of mechanical end switches. Power consumption is reduced in holding mode. The actuator is double insulated so an electrical ground connection is not necessary.

The LF120-S US and LF230-S US versions are provided with 1 built-in auxiliary switch. This SPDT switch is provided for safety interfacing or signaling, for example, for fan start-up. The switching function is adjustable between 0° and 95°.

Technical Data	LF120 (-S) US	LF230 (-S) US
Power supply	120 VAC ± 10% 50/60 Hz	230 VAC ± 10% 50/60 Hz
Power consumption	running: 5.5 W holding: 3.5 W	5 W 3 W
Transformer sizing	7.5 VA	7 VA
Electrical connection	3 ft, 18 GA appliance cable (-S models have 2 cables) 1/2" conduit connector	
Overload protection	electronic throughout 0 to 95° rotation	
Electrical protection	actuators are double insulated	
Angle of rotation	max 95°, adjust. with mechanical stop	
Torque	35 in-lb [4 Nm] constant torque	
Direction of rotation	reversible with cw/ccw mounting	
Position indication	visual indicator, 0° to 95° (0° is spring return position)	
Auxiliary switch (-S models)	1 x SPDT 6A (1.5A) @ 250 VAC, UL listed adjustable 0° to 95°	
Electrical protection	actuators are double insulated	
Running time (nominal)	motor: < 40 to 75 sec spring: < 25 sec @-4°F to +122°F [-20°C to +50°C] < 60 sec @-22°F [-30°C]	
Humidity	5 to 95% RH non-condensing	
Ambient temperature	-22°F to +122°F [-30°C to +50°C]	
Storage temperature	-40°F to +176°F [-40°C to +80°C]	
Housing	NEMA type 2 / IP54	
Housing material	zinc coated steel	
Agency listings	UL 873, CSA C22.2 No. 24 Certified, CE [LF230(-S) US]	
Noise level	max: running < 50 db (A) spring return 62 dB (A)	
Servicing	maintenance free	
Quality standard	ISO 9001	
Weight	LF120/230 3.4 lbs (1.54 kg.) LF120/230-S 3.5 lbs (1.60 kg.)

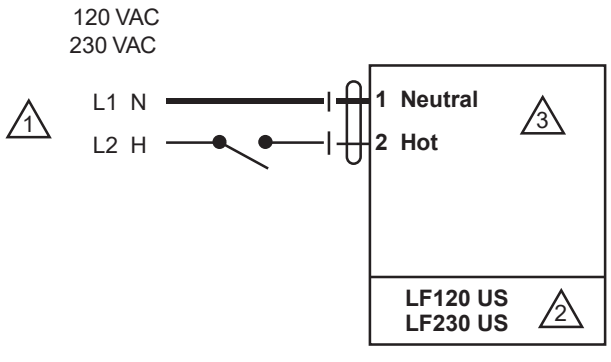
Accessories



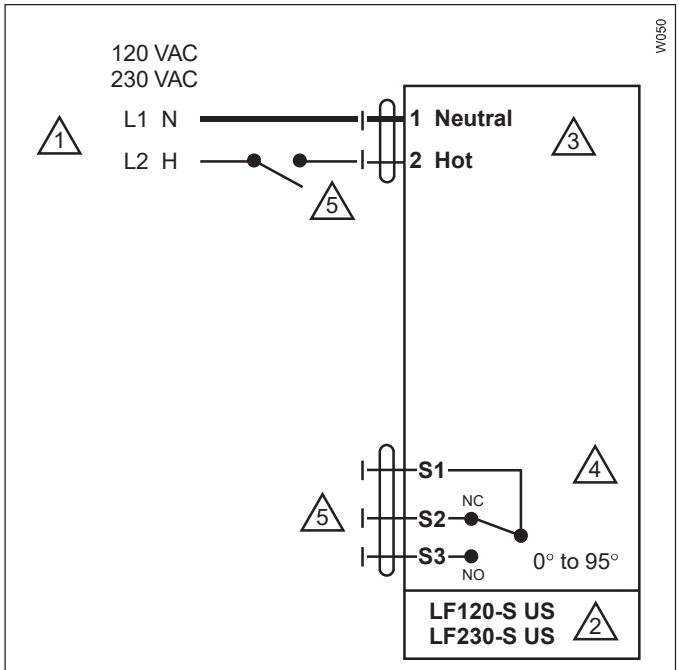
AV 10-18	Shaft extension (K6-1 is required)
IND-LF	Damper position indicator
K6-1	Universal clamp for up to 3/4" diameter shafts
KH-LF	Crankarm for up to 1/2" round shaft
Tool-06	8mm and 10 mm wrench
ZG-LF2	Crankarm adaptor kit for LF
ZG-112	Mounting bracket for Honeywell Mod IV, M6415 type actuators, and new installations
ZG-LF112	Crankarm adaptor kit for Honeywell Mod IV, M6415 type actuators, and new installations
ZS-100	Weather shield (metal)
ZS-150	Weather shield (polycarbonate)
ZS-260	Explosion-proof housing

Note: When using LF120/230 US and LF120-S/230-S US actuators, only use accessories listed on this page.

LF120 (-S) US / LF230 (-S) US Typical Specification

On-off spring return damper actuators shall be direct coupled type which require no crankarm and linkage and be capable of direct mounting to a shaft up to a 3/4" diameter and center a 1/2" shaft. The actuators must be designed so that they may be used for either clockwise or counterclockwise fail-safe operation. Actuators shall be protected from overload at all angles of rotation. If required, 1 SPDT auxiliary switch shall be provided having the capability of being adjustable. Actuators must be constructed to meet the requirements for Double Insulation so an electrical ground is not required to meet agency listings. Actuators shall be UL listed and CSA certified, have a 5 year warranty, and be manufactured under ISO 9001 International Quality Control Standards. Actuators shall be as manufactured by Belimo.

Wiring diagrams



1 Provide overload protection and disconnect as required.

2 Actuators may be connected in parallel. Power consumption must be observed.

3 No ground connection is required.

On-off wiring for LF120 US / LF230 US

1 Provide overload protection and disconnect as required.

2 Actuators may be connected in parallel. Power consumption must be observed.

3 No ground connection is required.

4 For end position indication, interlock control, fan start-up, etc., LF120-S US and LF230-S US incorporate one built-in auxiliary switch: 1 x SPDT, 6A (1.5A) @250 VAC, UL listed, adjustable 0° to 95°.

5 Meets UL and CSA requirements without the need of an electrical ground connection.

On-off wiring for LF120-S US / LF230-S US

BELIMO

Protective Housing ZS-260
For GK, GM, AM, AF, NF, NK, LF FSAF, FSNF, FSLF Series Acutators

Application

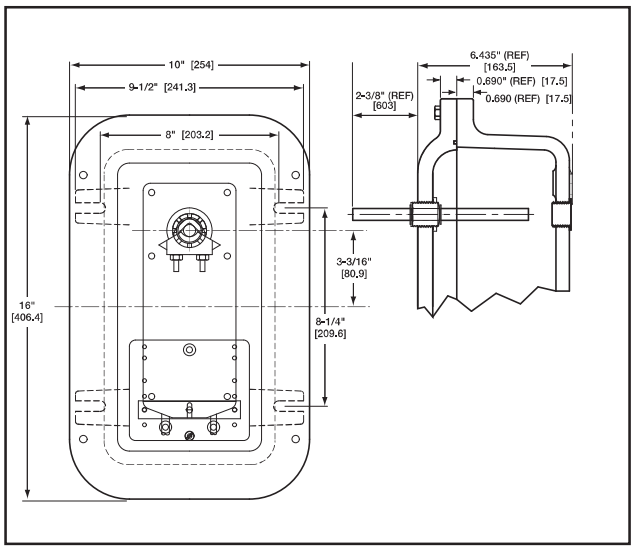
The ZS-260 explosion-proof housing may be used with the GK, GM, AM, AF, NF, NK, LF, FSAF, FSNF, FSLF series actuators. This housing is not designed for direct coupling. UL and CSA; Class I, Zone 1&2, Groups B, C, D, (NEMA 7), Class II, Division 1&2, Groups E, F and G, (NEMA 9), Class III, Hazardous (classified) Locations, outdoor application NEMA 4.

Operation

The ZS-260 enclosure is designed so that the required actuator may be easily field mounted into the enclosure. The actuator is fastened on to the internal portion of the operating shaft and secured at the end with an anti-rotation strap. A crank-arm, such as the KH8, is mounted to the external portion of the operating shaft for connection to connection to the damper linkage. ZG-109 right angle, and ZG-110 standoff mounting brackets may be used (see back).

The ZS-260 is designed so that the operating shaft can be mounted on either the front or rear side of the housing.

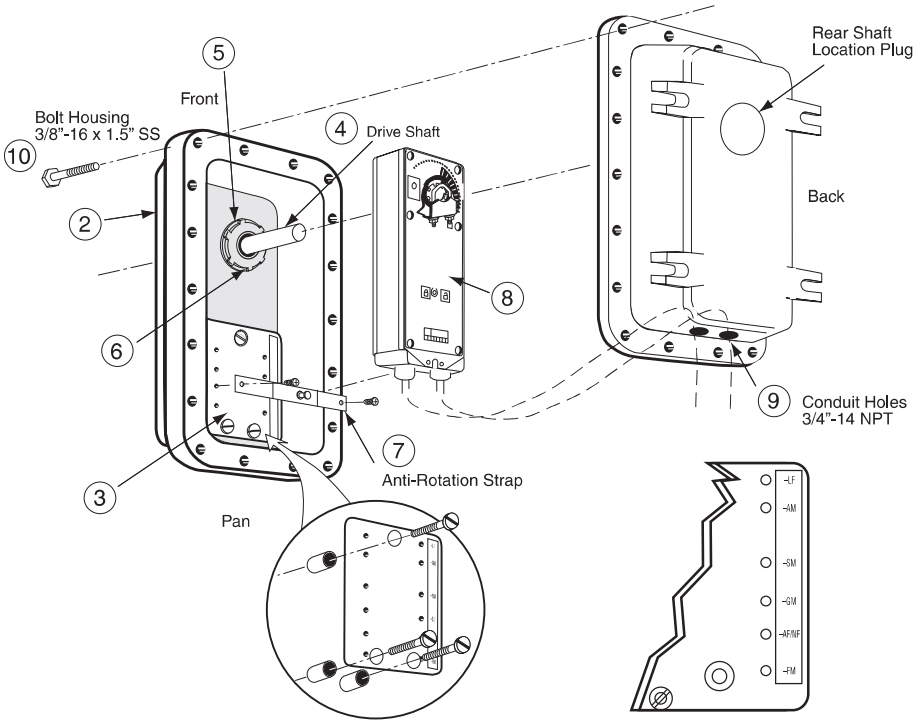
Accessories



KH8	Universal crankarm
KG8	Universal ball joint
KG10	Universal ball joint
ZG-109	Right angle mounting bracket
ZG-110	Stand-off mounting bracket

Technical Data	
Material	Housing: cast, copper-free, aluminum Cover bolts: stainless steel Operating shaft: stainless steel
Conduit Holes	¾"–14 NPT (2 supplied) see Note 1
Operating Shaft Diameter	1/2 inch [12.7]
Operating Shaft Location	Front or rear side of housing (field selected)
Housing Cover Bolts	3/8"-16 x 1.5" SS
Approved Applications	UL and CSA; Class I, Zone 1&2, Groups B, C, D, (NEMA 7), Class II, Zone 1&2, Groups E, F and G, (NEMA 9), Class III, Hazardous (classified) Locations, outdoor application NEMA 4.
Weight	31.0 lb. (14.0 kg) without actuator

Note 1: Fittings that meet the requirements of the hazardous location must be used. All applications must comply with applicable local and/or national electric code.



Note: Since conditions of use of this product are outside the control of Belimo, the purchaser should determine suitability of the product for their intended use, and assumes all risk and liability in connection therewith.

Dimensions (All ratings in brackets are metric.)

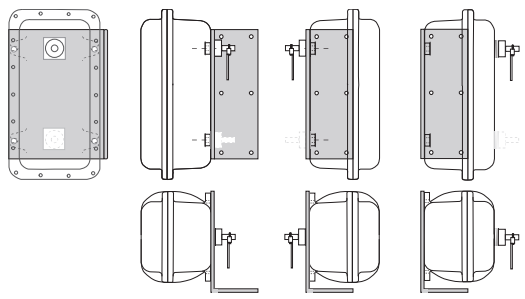
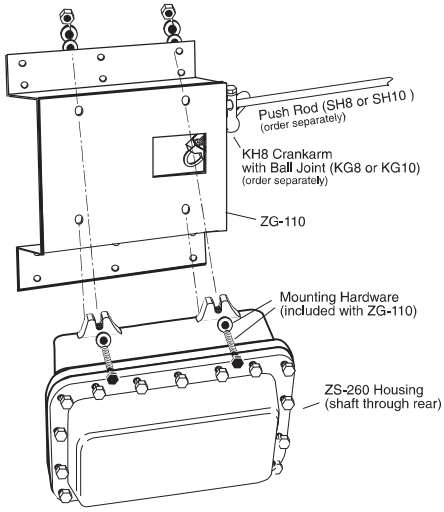
Protective Housing ZS-260
Mounting Instructions



ZS-260 Mounting Instructions



1. Determine proper operating shaft location.
2. Remove threaded plug from the hole in which the operating shaft will be mounted.
3. Install the anti-rotation strap, mounting plate, to the side of the housing where the operating shaft will be mounted.
4. From the inside surface of the housing, insert the operating shaft, short length first, into the mounting hole.
5. Hand tighten the shaft bushing into the housing until the star nut/seal is in contact with the face of the housing.
6. Using a screw driver blade, drive the star nut/seal clockwise until the bushing is locked into place.
7. Install the anti-rotation strap into the mounting plate at the designated holes for the actuator to be used.
8. Install actuator.
9. Wire actuator (per electrical code).
10. Bolt housing together.

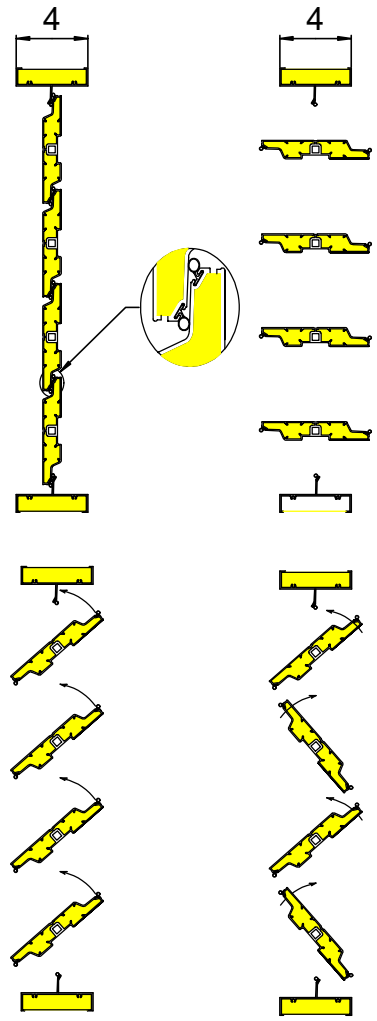
Recommended Specification



Furnish and install stationary louver models 2220 / 2225 as manufactured by Ventex, Bolton Ontario. Louvers shall be 2 inches (50.8 mm) deep. Blades shall be 0.062 Inches (1.57 mm), frame shall be 0.062 (1.57 mm) extruded aluminium, alloy 6063-T5.

Louvers shall have a 19 guage galvanized 1/2 x 1/2 birdscreen. All materials shall be factory finished after assembly with Polyester Baking Enamel in a color selected from the Ventex Color Chart.

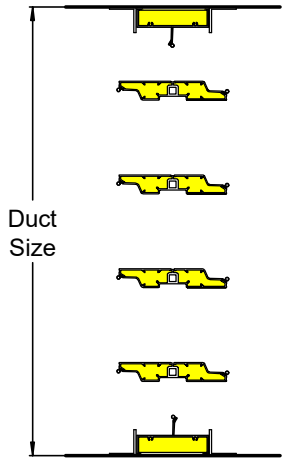
ALUMAVENT ©

MODEL: 3960/3965- OB/PB Insulated Extruded Aluminium Control Damper

Parallel Blade

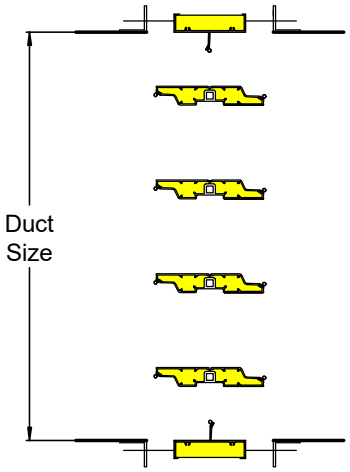
Opposed Blade

Quantity	Ref. #	Width (W)* Opening Size	Height (H)* Opening Size	Frame	Accessories
PROJECT NAME:					**ENGINEER:**
CONTRACTOR:					**SUBMITTAL DATE:**



MODEL: 3960/3965- OB/PB Insulated Extruded Aluminium Control Damper

STANDARD CONSTRUCTION



Depth: 4 Inches (101 mm)
Depth Blades Open: 6 1/8 Inches (156 mm)
Frame Thickness: 0.081"
Blade Thickness: 0.081"
Frame Style: Specify "DM" for Duct Mount Frame
Specify "FM" for Flange Mount Frame

Material:
Frame & Blades: Extruded 6063-T5 Aluminium

Frame Insulation: Polystyrene Insulation
Blade Insulation: Blades are thermally broken.
High density polyurethane non-CFC foam (R-2.25)
Seals: Vinyl Blade and Jamb Seals
Bearings: Dual Bearing system, consists of
Engineered thermoplastic bearings (Acetal)
Axles: 3/8" Aluminium Square Bar

Duct Mount (3960)
(Under Cut 1/4" for Damper Size)

Flange Mount (3965)
(Add 2" for Damper Size)

Minimum Height:
8 Inches (203 mm) Single Blade
15 Inches (381 mm) Multiple Blade
Maximum Panel Width: 48 Inches (1219 mm)
Maximum Panel Height: 60 Inches (1524 mm)
Maximum Panel Size: 20 Sq Ft
Maximum System Pressures: 4" w.g
Operating Temperature: -40° F to +200 ° F

Leakage:
Does not exceed 10 cfm/ft² (34l/s/m²) against 4"w.g.(1 kPa) differential static pressure at -40° F(-40° C).

Linkage: Concealed in Frame
Standard Finish: Mill
Available Finish: Clear Anodized
Standard Motor Installation: Side Shaft Direct Drive
Extendable up to 12"

AVAILABLE ACCESSORIES

- Actuators
  Multiproducts, Belimo, Honeywell and Siemens
  Available Upon request
- End Switch for signalling peripheral devices
- Jack Shaft
- Hand Quadrants
- Chain Operation for manual operation spring closed
- Salt Water Construction

DWG 3960 Date: Aug 2005

LF120 (-S) US / LF230 (-S) US

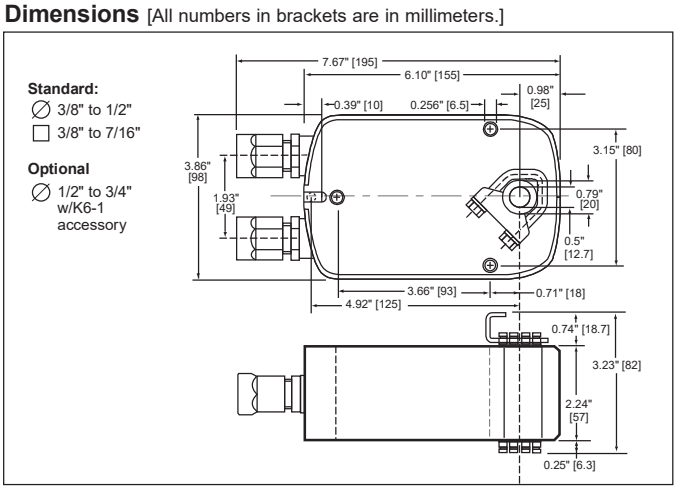
On-off, spring return failsafe, 120/230 VAC

Torque min. 35 in-lb, for control of air dampers

Application

For on-off, fail-safe control of dampers in HVAC systems. Actuator sizing should be done in accordance with the damper manufacturer's specifications. Control is on-off from an auxiliary contact, or a manual switch.

The actuator is mounted directly to a damper shaft from 3/8" up to 1/2" in diameter by means of its universal clamp, 1/2" shaft centered at delivery. For shafts up to 3/4" use K6-1 accessory. A crank arm and several mounting brackets are available for applications where the actuator cannot be direct coupled to the damper shaft.



Operation

The LF series actuators provide true spring return operation for reliable fail-safe application and positive close off on air tight dampers. The spring return system provides consistent torque to the damper with, and without, power applied to the actuator. The LF series provides 95° of rotation and is provided with a graduated position indicator showing 0° to 95°.
The actuator may be stalled anywhere in its normal rotation without the need of mechanical end switches. Power consumption is reduced in holding mode. The actuator is double insulated so an electrical ground connection is not necessary.

The LF120-S US and LF230-S US versions are provided with 1 built-in auxiliary switch. This SPDT switch is provided for safety interfacing or signaling, for example, for fan start-up. The switching function is adjustable between 0° and 95°.

Technical Data	LF120 (-S) US	LF230 (-S) US
Power supply	120 VAC ± 10% 50/60 Hz	230 VAC ± 10% 50/60 Hz
Power consumption	running: 5.5 W holding: 3.5 W	5 W 3 W
Transformer sizing	7.5 VA	7 VA
Electrical connection	3 ft, 18 GA appliance cable (-S models have 2 cables) 1/2" conduit connector	
Overload protection	electronic throughout 0 to 95° rotation	
Electrical protection	actuators are double insulated	
Angle of rotation	max 95°, adjust. with mechanical stop	
Torque	35 in-lb [4 Nm] constant torque	
Direction of rotation	reversible with cw/ccw mounting	
Position indication	visual indicator, 0° to 95° (0° is spring return position)	
Auxiliary switch (-S models)	1 x SPDT 6A (1.5A) @ 250 VAC, UL listed adjustable 0° to 95°	
Electrical protection	actuators are double insulated	
Running time (nominal)	motor: < 40 to 75 sec spring: < 25 sec @-4°F to +122°F [-20°C to +50°C] < 60 sec @-22°F [-30°C]	
Humidity	5 to 95% RH non-condensing	
Ambient temperature	-22°F to +122°F [-30°C to +50°C]	
Storage temperature	-40°F to +176°F [-40°C to +80°C]	
Housing	NEMA type 2 / IP54	
Housing material	zinc coated steel	
Agency listings	UL 873, CSA C22.2 No. 24 Certified, CE [LF230(-S) US]	
Noise level	max: running < 50 db (A) spring return 62 dB (A)	
Servicing	maintenance free	
Quality standard	ISO 9001	
Weight	LF120/230 3.4 lbs (1.54 kg.) LF120/230-S 3.5 lbs (1.60 kg.)	

Dimensions [All numbers in brackets are in millimeters.]

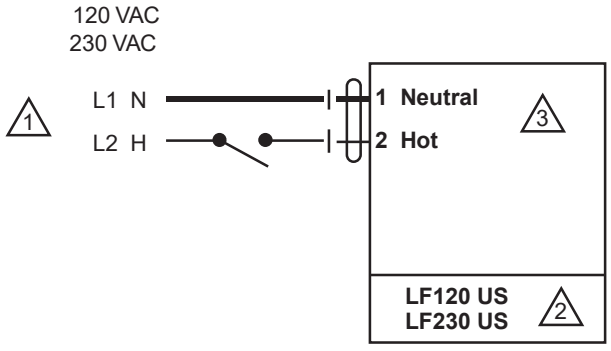
Accessories



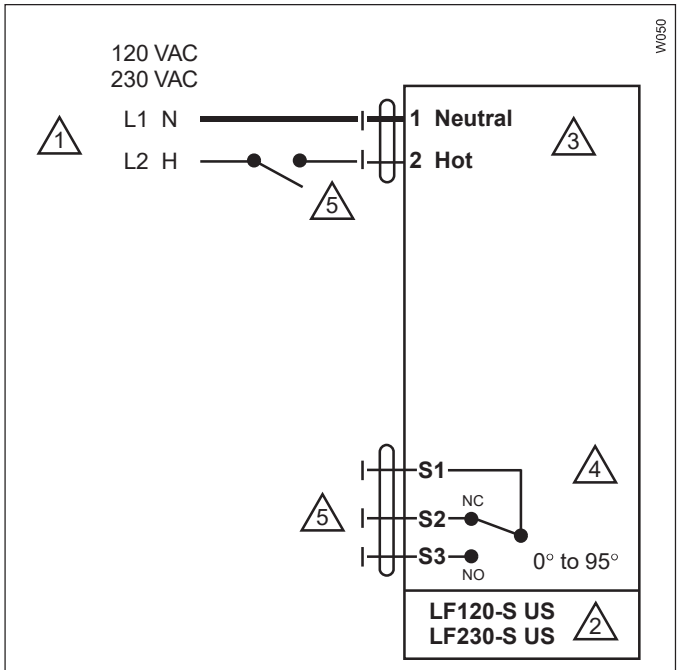
AV 10-18	Shaft extension (K6-1 is required)
IND-LF	Damper position indicator
K6-1	Universal clamp for up to 3/4" diameter shafts
KH-LF	Crankarm for up to 1/2" round shaft
Tool-06	8mm and 10 mm wrench
ZG-LF2	Crankarm adaptor kit for LF
ZG-112	Mounting bracket for Honeywell Mod IV, M6415 type actuators, and new installations
ZG-LF112	Crankarm adaptor kit for Honeywell Mod IV, M6415 type actuators, and new installations
ZS-100	Weather shield (metal)
ZS-150	Weather shield (polycarbonate)
ZS-260	Explosion-proof housing

Note: When using LF120/230 US and LF120-S/230-S US actuators, only use accessories listed on this page.

LF120 (-S) US / LF230 (-S) US Typical Specification

On-off spring return damper actuators shall be direct coupled type which require no crankarm and linkage and be capable of direct mounting to a shaft up to a 3/4" diameter and center a 1/2" shaft. The actuators must be designed so that they may be used for either clockwise or counterclockwise fail-safe operation. Actuators shall be protected from overload at all angles of rotation. If required, 1 SPDT auxiliary switch shall be provided having the capability of being adjustable. Actuators must be constructed to meet the requirements for Double Insulation so an electrical ground is not required to meet agency listings. Actuators shall be UL listed and CSA certified, have a 5 year warranty, and be manufactured under ISO 9001 International Quality Control Standards. Actuators shall be as manufactured by Belimo.

Wiring diagrams



1 Provide overload protection and disconnect as required.

2 Actuators may be connected in parallel. Power consumption must be observed.

3 No ground connection is required.

On-off wiring for LF120 US / LF230 US

1 Provide overload protection and disconnect as required.

2 Actuators may be connected in parallel. Power consumption must be observed.

3 No ground connection is required.

4 For end position indication, interlock control, fan start-up, etc., LF120-S US and LF230-S US incorporate one built-in auxiliary switch: 1 x SPDT, 6A (1.5A) @250 VAC, UL listed, adjustable 0° to 95°.

5 Meets UL and CSA requirements without the need of an electrical ground connection.

On-off wiring for LF120-S US / LF230-S US

Section 3.7.6

Pressure Gauge

Stainless Steel Liquid Filled Gauge, Lead Free Stainless Steel Liquid Filled Gauge

PFQ, PFQ-LF

1. Optional U-Clamp
2. Optional Front Flange

LEAD FREE

RoHS compliant

Note; RoHS applies SS internals only

Description & Features:

- Pulsation resistant, liquid filled stainless steel case
- Glycerin filled standard
- Brass, lead free brass or stainless steel internals
- Restricted orifice standard on dual scale
- Ventable plug on 2.5” (63mm) and 4” (100mm) bottom mount (excluding SAE connection)
- Crimp-On bezel
- Single (psi) or dual scale (psi/kPa)/(psi/bar) available
- Optional U-Clamps and front flanges
- Dry case available
- ASME B40.100 compliant (EN837-1 available on 2” (50mm) dial and up)
- CRN registered
- 5 year warranty

Applications:

- Ideal for pumps, compressors, hydraulic presses, machinery, pneumatic equipment and motors in harsh environments
- Use where harmful vibration and pulsation are present
- Lead free version for potable water systems

Specifications	
Dial	1.5” (40mm), 2” (50mm), 2.5” (63mm), 4” (100mm), white aluminum with black and red markings
Case	AISI 304 SS
Lens	Polycarbonate
Ring	AISI 304 SS, Crimp-On
Socket	PFQ: OT 58 brass or AISI 316 SS PFQ-LF: Lead free brass
Connection	1/8”, 1/4” or 1/2” NPT or 7/16-20 SAE standard with restricted orifice
Fill Liquid	Glycerin
Bourdon Tube	1.5” (40mm), 2” (50mm): Phosphor bronze C or coil shaped for brass socket SS C or coil shaped for 316 SS socket 2.5” (63mm), 4” (100mm): Phosphor bronze or lead free phosphor bronze C or coil shaped for brass socket, AISI 316 SS C or coil shaped for 316 SS socket
Movement	OT 59 brass or SS
Pointer	Aluminum, anodized black
Welding	Brass: Silver alloy, 316SS: TIG
Over-pressure Limit	25% for pressures up to 1,450 psi (9,998 kPa), 15% for pressures over 1,450 psi (9,998 kPa)
Socket Gasket	Buna N for two-piece internal socket seal
Fill Plug	Buna N
Lens Ring Gasket	Silicone rubber
Working Pressure	Maximum 75% of full scale value
Ambient/Process Temperature	Dry: -40°F to 200°F (-40°C to 93°C) Glycerin Filled: -4°F to 150°F (-20°C to 65°C)
Accuracy	1.5” (40mm), 2” (50mm): ±2.5% of full scale value 2.5” (63mm), 4” (100mm): ±1.5% of full scale value
Enclosure Rating	IP65

Dual Scale Order Codes (products in bold are normally stock in North America)

Back Flow Preventor

For Non-Health Hazard Applications

Job Name _____ Contractor _____

Job Location _____ Approval _____

Engineer _____ Contractor's P.O. No. _____

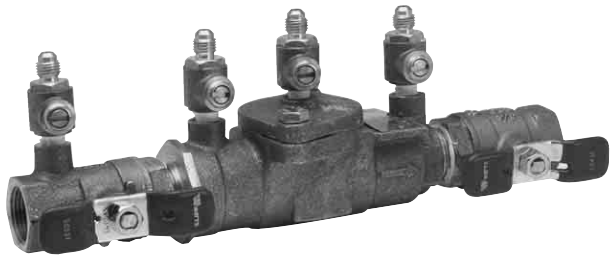
Approval _____ Representative _____

Series 007
Double Check Valve Assemblies

Sizes: ½" – 3" (15 – 80mm)

Series 007 Double Check Valve Assemblies shall be installed at referenced cross-connections to prevent the backflow of polluted water into the potable water supply. Only those cross-connections identified by local inspection authorities as non-health hazard shall be allowed the use of an approved double check valve assembly.

Check with local authority having jurisdiction regarding vertical orientation, frequency of testing or other installation requirements.

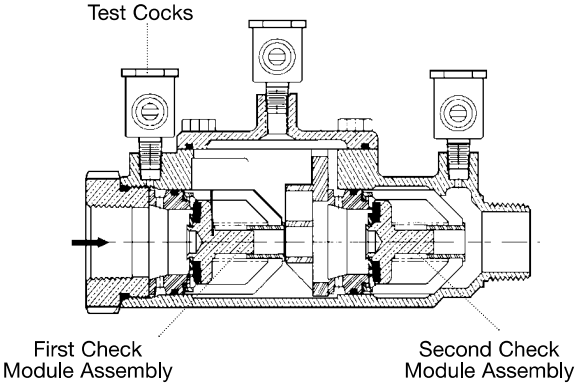


The valve shall meet the requirements of ASSE Std. 1015 and AWWA Std. C510. Approved by the Foundation for Cross-Connection Control and Hydraulic Research at the University of Southern California.

Features

- Ease of maintenance — only one cover
- Top entry
- Replaceable seats and seat discs
- Modular construction
- Compact design
- Cast bronze body construction — ½" – 2" (15 – 50mm)
- Fused epoxy coated cast iron body — 2½" – 3" (65 – 80mm)
- Top mounted ball valve test cocks
- Low pressure drop
- No special tools required for servicing
- ½" – 1" (15 – 25mm) have tee handles

Specifications



A Double Check Valve Assembly shall be installed at each noted location. The assembly shall consist of two positive seating check modules with captured springs and rubber seat discs. The check module seats and seat discs shall be replaceable. Service of all internal components shall be through a single bronze or stainless steel access cover secured with stainless steel bolts. The assembly shall also include two resilient seated isolation valves; four top mounted, resilient seated test cocks. The assembly shall meet the requirements of ASSE Std. 1015 and AWWA Std. C510. Approved by the Foundation for Cross-Connection Control and Hydraulic Research at the University of Southern California. Assembly shall be a Watts Series 007.

¾" (20mm) 007M3QT

2" (50mm) 007M1QT HC

The 007 Series features a modular design concept which facilitates complete maintenance and assembly by retaining the spring load.

Now Available
WattsBox Insulated Enclosures.
For more information, send for literature ES-WB.

IMPORTANT: *INQUIRE WITH GOVERNING AUTHORITIES FOR LOCAL INSTALLATION REQUIREMENTS*

Watts product specifications in U.S. customary units and metric are approximate and are provided for reference only. For precise measurements, please contact Watts Technical Service. Watts reserves the right to change or modify product design, construction, specifications, or materials without prior notice and without incurring any obligation to make such changes and modifications on Watts products previously or subsequently sold.

Pressure — Temperature

½" – 2" (15 – 50mm)

Temperature Range: 33°F – 180°F (0.5°C – 82°C).

Maximum Working Pressure: 175psi (12.1 bar).

2½" – 3" (65 – 80mm)

Temperature Range: 33°F – 110°F (0.5°C – 43°C) continuous, 140°F (60°C) intermittent.

Maximum Working Pressure: 175psi (12.1 bar).

Standards

ASSE Std. 1015, AWWA Std. C510

IAPMO PS31, CSA B64.5

Approvals

† ASSE, AWWA, IAPMO, CSA, UPC

▲ Approved by the Foundation for Cross-Connection Control and Hydraulic Research at the University of Southern California.

• Models LF and S are not listed.

◆ UL Classified (LF models only) ¾" – 2" (20 – 50mm) (except 007M3LF)

◆ UL Classified with OSY gate valves (2½" and 3" horizontal only.)

* Horizontal and vertical "flow up" approval on all sizes

Suffix:

S - bronze strainer

LF - without shutoff valves

LH - locking handle ball valves (open position)

SH - stainless steel ball valve handles

HC - 2½" inlet/outlet fire hydrant fittings (2" valve)

Prefix:

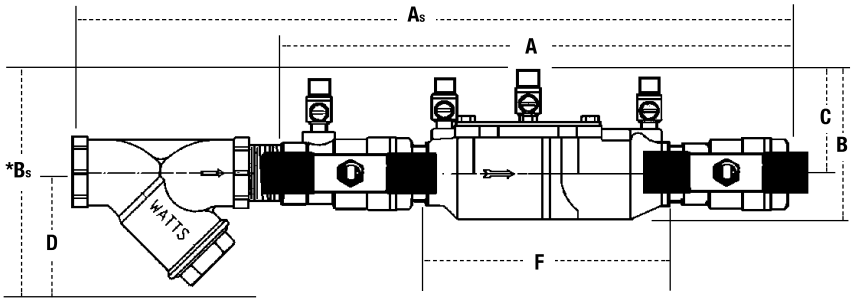
U - Union connections

2½" – 3" (65 – 80mm)

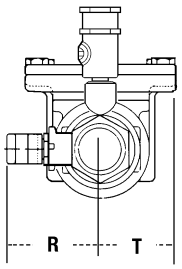
Suffix:

NRS - non-rising stem resilient seated gate valves

OSY - UL/FM outside stem and yoke resilient seated gate valves



LF - without shutoff valves



QT-FDA - FDA epoxy coated quarter-turn ball valves

Installation, Maintenance, & Repair
Series 007 and LF007
Double Check Valve Assemblies

Sizes: ½" – 3" (15 - 80mm)

¾" 007M3QT

⚠ WARNING

You are required to thoroughly read all installation instructions and product safety information before beginning the installation of this product. **FAILURE TO COMPLY WITH PROPER INSTALLATION AND MAINTENANCE INSTRUCTIONS COULD RESULT IN PRODUCT FAILURE WHICH CAN CAUSE PROPERTY DAMAGE, PERSONAL INJURY AND/OR DEATH.** Watts is not responsible for damages resulting from improper installation and/or maintenance.

Local building or plumbing codes may require modifications to the information provided. You are required to consult the local building and plumbing codes prior to installation. If this information is not consistent with local building or plumbing codes, the local codes should be followed.

Need for Periodic Inspection/Maintenance: This product must be tested periodically in compliance with local codes, but at least once per year or more as service conditions warrant. Corrosive water conditions, and/or unauthorized adjustments or repair could render the product ineffective for the service intended. Regular checking and cleaning of the product's internal components helps assure maximum life and proper product function.

NOTE: For Australia and New Zealand, line strainers should be installed between the upstream shutoff valve and the inlet of the backflow preventer.

Watts product specifications in U.S. customary units and metric are approximate and are provided for reference only. For precise measurements, please contact Watts Technical Service. Watts reserves the right to change or modify product design, construction, specifications, or materials without prior notice and without incurring any obligation to make such changes and modifications on Watts products previously or subsequently sold.

Testing

For field testing procedure, send for IS-TK-DL, IS-TK-7, IS-TK-9A, IS-TK-99E AND IS-TK-99D.

For other repair kits and service parts, send for PL-RP-BPD.

For technical assistance, contact your local Watts representative.

WATTS®

Installation Instructions

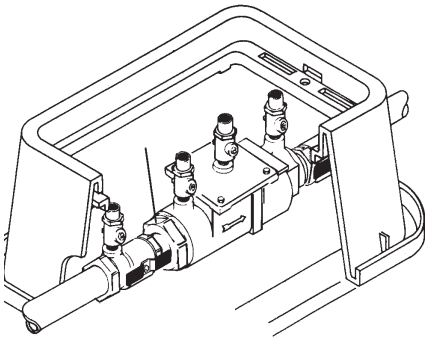
Series 007 and LF007

½" - 2" (15 - 50mm)

Indoors - Figure 1

Check local codes for installation requirements. Pipe lines should be thoroughly flushed to remove foreign material before installing the unit. A strainer should be installed as shown, ahead of backflow preventer to prevent disc from unnecessary fouling. Install valve inline with arrow on valve body pointing in the direction of flow.

For indoor installations, it is important that the valve be easily accessible to facilitate testing and servicing. Do not install in a concealed location.



CAUTION:

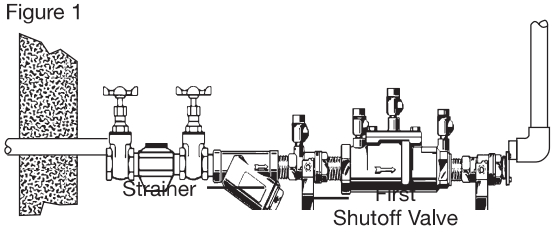
Do not install with strainer when backflow preventer is used on seldom-used water lines which are called upon during emergencies, such as fire sprinkler lines, etc.

It is important that Series 007 and LF007 be tested periodically in compliance with local codes, but at least once a year or more often depending upon system conditions. Regular inspection, testing and cleaning assures maximum life and proper product function.

NOTE: Fire Protection System Installations

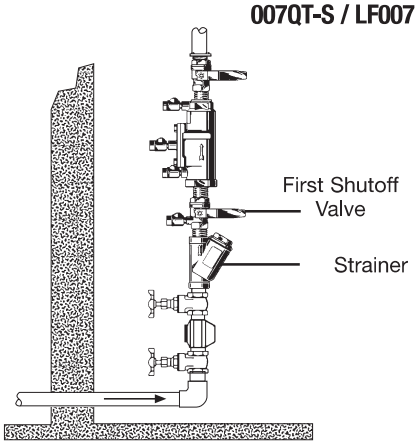
The National Fire Protection Agency (NFPA) Guidelines require a confirming flow test to be conducted whenever a "main line" valve such as the shutoff valves or a backflow assembly have been operated. Certified testers of backflow assemblies must conduct this test. The trim valves of the confirming flow test. When the test is completed, the trim valves must be returned to a fully open position.

Meter Box Installation



Parallel - Figure 3

Two or more Series 007 and LF007 smaller size valves may be piped in parallel (where approved) to serve a larger supply pipe main. This type of installation is employed whenever it is vital to maintain a continuous supply of water/where interruptions for testing and servicing would be unacceptable. It also has the advantage of providing increased capacity where needed beyond that provided by a single valve and permits testing or servicing of an individual valve without shutting down the complete line.



For two valve installations the total capacity of the devices should equal or exceed that required by the system.

The quantity of valves used in parallel should be determined by the engineers judgement based on the operating conditions of a specific installation.

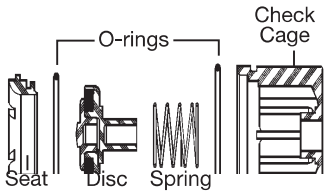
Service, Replacement Parts and Maintenance

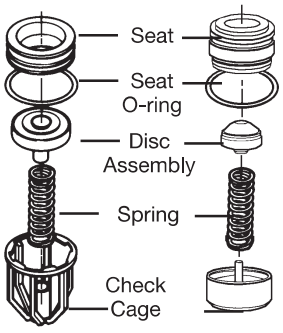
Series 007 and LF007

Servicing the First and Second Check Valves

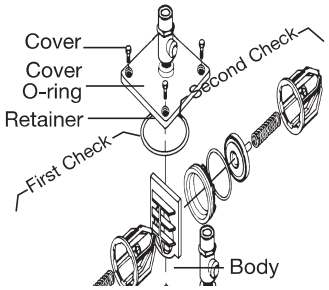
NOTE: Before servicing, ensure supply water is turned off or shutoff valves are in the closed position.



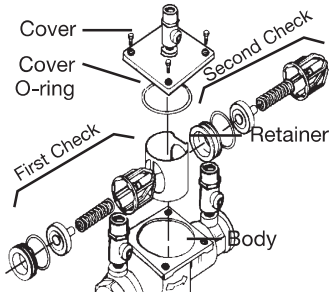
1. Remove the cover, then remove the retainer from the body valve. The check valve modules can now be removed from the valve by hand or with a screwdriver.



NOTE: For Series 007 and LF007 sizes ½" - 2" (15-50mm), the seats and springs of the first and second check modules are not interchangeable. The heavier spring and smaller diameter seat belong with the first check module. Series 007M1 sizes ¾" - 1" (20-25mm) and Series 007M2 ¾" (20mm) have interchangeable seats and springs.



2. The check seats are attached to the cage with a bayonet type locking arrangement. Holding the cage in one hand, push the seat inward and rotate clockwise against the cage. For ¾" (20mm) Series 007M2/LF007M2 and LF007 pull apart seat and cage. The seat, cage, spring and disc assembly are now individual components.



3. The disc assembly may now be cleaned and reassembled or, depending on its condition, it may be discarded and replace with a new assembly from the repair kit. O-rings should be cleaned or replaced as necessary.

4. Reassemble the check valve module in the reverse order. Check modules are installed in the valve body with the seats facing the valve inlet. The modules must be securely in place before the retainer can be replaced. On the ¾" - 1" (20-25mm) size, this retainer may have to be tilted slightly into place. Replace cover.

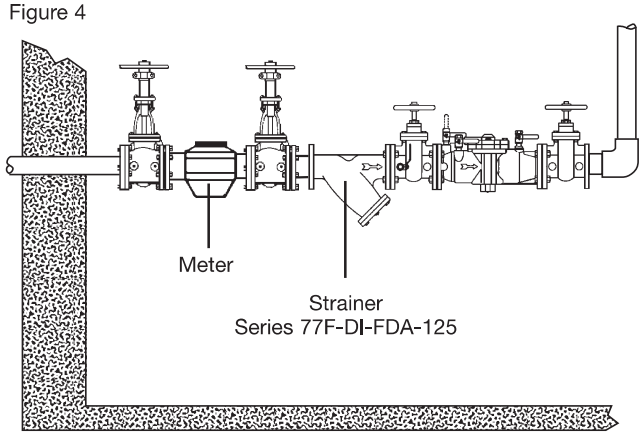
Installation Instructions

Series 007 and LF007

2½" and 3"

Indoors - Figure 4



Series 007 may be installed in either a vertical or horizontal position. Pipe lines should be thoroughly flushed to remove foreign material before installing the unit. A strainer should be installed as shown, ahead of backflow preventer to prevent disc from unnecessary fouling. Install valve inline with arrow on valve body pointing in the direction of flow.
For indoor installations, it is important that the valve be easily accessible to facilitate testing and servicing. Do not install in a concealed location.

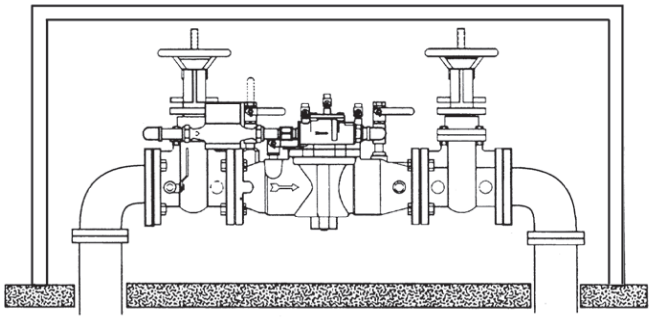
CAUTION:

Do not install with strainer when backflow preventer is used on seldom-used water lines which are called upon during emergencies, such as fire sprinkler lines, etc.
It is important that Series 007 and LF007 be tested periodically in compliance with local codes, but at least once a year or more often depending upon system conditions.

NOTE: Fire Protection System Installations
The National Fire Protection Agency (NFPA) Guidelines require a confirming flow test to be conducted whenever a "main line" valve such as the shutoff valves or a backflow assembly have been operated. Certified testers of backflow assemblies must conduct this test. The trim valves of the detector meter bypass line, on assemblies so equipped, should be shutoff during the confirming flow test. When the test is completed, the trim valves must be returned to a fully open position.

Figure 4

2½", 3" 007 / LF007



Outside Building Above Ground -

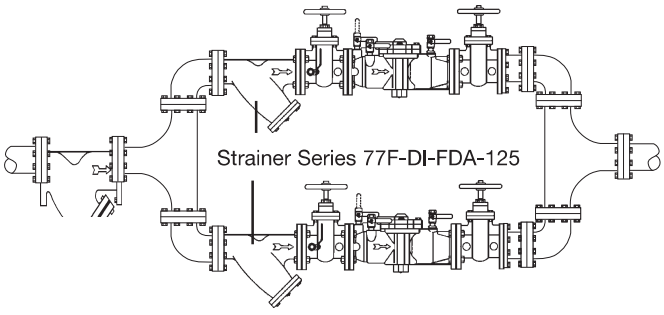
Figure 5

In an area where freezing conditions do not occur, Series 007 and LF007 can be installed outside of a building. The most satisfactory installation is above ground and should be installed in this manner whenever possible. In an area where freezing conditions can occur, Series 007 and LF007 should be installed above ground in an insulated enclosure.

Annual inspection of all water system safety and control valves is required and necessary. Regular inspection, testing and cleaning assures maximum life and proper product function.

Figure 5

WattsBox Insulated Enclosures
Available in Aluminum or Fiberglass.
For more information, send for ES-WB.



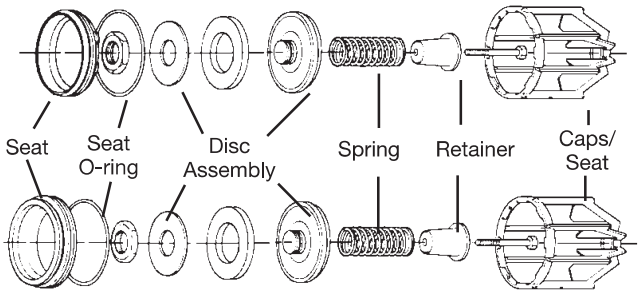
Parallel - Figure 6

Consult Local codes for Approval

Two or more Series 007 and LF007 smaller size valves may be piped in parallel (where approved) to serve a larger supply pipe main. This type of installation is employed whenever it is vital to maintain a continuous supply of water/where interruptions for testing and servicing would be unacceptable. It also has the advantage of providing increase capacity where needed beyond that provided by a single valve and permits testing or servicing of an individual valve without shutting down the complete line. For two valve installations the total capacity should equal or exceed that required by the system.
The quantity of valves used in parallel should be determined by the engineer's judgement based on the operating conditions of a specific installation. (See F-FC regarding flow curves)

INSTALLATION NOTE: The flange gasket bolts for the gate valves should be retightened during installation as the bolts may have loosened due to storage and shipping.

Figure 6



2½", 3" 007 / LF007

Servicing First and Second Check Valves

Series 007 and LF007

2½" and 3"

1. Remove cover bolts and cover.
2. Remove the retainer from the body bore. The check valve modules can now be removed from the valve by hand or with a screwdriver.
3. The check seats are attached to the cage with a bayonet type locking arrangement. Holding the cage in one hand, push the seat inward and rotate counterclock-wise against the cage. The seat, spring cage, spring and disc assembly are now individual components.
4. The disc assembly may now be cleaned and reassembled or depending on its condition, may be discarded and replaced with a new assembly from the repair kit. O-rings should be cleaned or replaced as necessary. For more information, refer to repair parts price list PL-RP-BPD.
5. Reassemble the Check valve modules. Check modules are installed in the valve body with the seats facing the valve inlet. The modules must be securely in place before the retainer can be replaced.

Check Assemblies

NOTE: No special tools required to service Series 007 and LF007.

First Check Kit				
	0887285	RK 007 CK1	2½, 3	65, 80
LEAD FREE*	0794006	LFRK 007 CK1	2½, 3	65, 80
Kit Includes: Seat, seat o-ring, disc assembly, spring, spring retainer, check cage and cover o-ring.				
Second Check Kit				
	0887286	RK 007 CK2	2½, 3	65, 80
LEAD FREE*	0794008	LFRK 007 CK2	2½, 3	65, 80
Kit Includes: Seat, seat o-ring, disc assembly, spring, spring retainer, check cage and cover o-ring.				
Complete Rubber Parts				
	0887287	RK 007 RT	2½, 3	65, 80
Kit Includes: Two seat discs, two seat o-rings, two cover o-rings.				
Cover Kit				
LEAD FREE*	0887288	RK 007 C	2½, 3	65, 80
Kit includes: Cover and cover o-ring.				
Seat Kit				
LEAD FREE*	0887289	RK 007 S	2½, 3	65, 80
	0887280	RK 007 S2	2½, 3	65, 80
Kit Includes: Seat and seat o-ring.				

"Use only original equipment manufactured parts to protect the validated warranty."

***The wetted surface of this product contacted by consumable water contains less than 0.25% of lead by weight.**

Troubleshooting Guide

Series 007 and LF007

Symptom	Cause	Solution
1. Check valve fails to hold 1.0 PSID minimum	a. Debris on check disc sealing surface	Disassemble and clean
	b. Leaking gate valve	Disassemble and clean or repair
	c. Damaged seat disc or seat o-ring	Disassemble and replace
	d. Damaged guide holding check open	Disassemble clean or replace
	e. Weak or broken spring	Disassemble and replace spring
2. Chatter during flow conditions	a. Worn, damaged or defective guide	Disassemble and repair or replace guide
3. Low flows passing through mainline valve	a. Mainline check fouled	Disassemble and clean
	b. Meter strainer plugged	Disassemble and clean
	c. Damaged mainline seat disc or seat	Disassemble and replace
	d. Broken mainline spring	Disassemble and replace

For additional cross-connection control information, send for F-50 brochure.

CALIFORNIA PROPOSITION 65 WARNING

WARNING: This product contains chemicals known to the State of California to cause cancer and birth defects or other reproductive harm.

(California law requires this warning to be given to customers in the State of California.)

For more information: www.watts.com/prop65

Limited Warranty: Watts Regulator Co. (the "Company") warrants each product to be free from defects in material and workmanship under normal usage for a period of one year from the date of original shipment. In the event of such defects within the warranty period, the Company will, at its option, replace or recondition the product without charge.

THE WARRANTY SET FORTH HEREIN IS GIVEN EXPRESSLY AND IS THE ONLY WARRANTY GIVEN BY THE COMPANY WITH RESPECT TO THE PRODUCT. THE COMPANY MAKES NO OTHER WARRANTIES, EXPRESS OR IMPLIED. THE COMPANY HEREBY SPECIFICALLY DISCLAIMS ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

The remedy described in the first paragraph of this warranty shall constitute the sole and exclusive remedy for breach of warranty, and the Company shall not be responsible for any incidental, special or consequential damages, including without limitation, lost profits or the cost of repairing or replacing other property which is damaged if this product does not work properly, other costs resulting from labor charges, delays, vandalism, negligence, fouling caused by foreign material, damage from adverse water conditions, chemical, or any other circumstances over which the Company has no control. This warranty shall be invalidated by any abuse, misuse, misapplication, improper installation or improper maintenance or alteration of the product.

Some States do not allow limitations on how long an implied warranty lasts, and some States do not allow the exclusion or limitation of incidental or consequential damages. Therefore the above limitations may not apply to you. This Limited Warranty gives you specific legal rights, and you may have other rights that vary from State to State. You should consult applicable state laws to determine your rights. **SO FAR AS IS CONSISTENT WITH APPLICABLE STATE LAW, ANY IMPLIED WARRANTIES THAT MAY NOT BE DISCLAIMED, INCLUDING THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, ARE LIMITED IN DURATION TO ONE YEAR FROM THE DATE OF ORIGINAL SHIPMENT.**

404-Series Specifications

1.01 GENERAL:

The contractor shall provide labor, material, equipment, and incidentals required to provide_____(QTY) commercial drain pumps as specified herein. The pump models covered in this specification are Series 404 single phase pumps. The pump furnished for this application shall be model _____as manufactured by Liberty pumps, and have a maximum fluid temperature rating of 140 degrees F.

2.01 OPERATING CONDITIONS:

Each drain pump shall be rated at 1/3 hp_____volts, single phase, 60 Hz. 3450 RPM. The unit shall produce_____G.P.M. at_____ feet of total dynamic head.

The drain pump shall be capable of handling effluent with 3/8" solid handling capability. The drain pump shall have a shut-off head of 21 feet and a maximum flow of 38 GPM @ 5 feet of total dynamic head.

The pump shall be controlled with a piggy back style on/off float switch.

3.01 CONSTRUCTION:

Each drain pump shall be equal to the Series 404 with c SA us Certified pump as manufactured by Liberty Pumps, Bergen NY. The motor housing shall be constructed of a deep finned powder coated aluminum. The motor housing shall be oil filled to dissipate heat. Air filled motors shall not be considered equal since they do not properly dissipate heat from the motor. All mating parts shall be machined and sealed with a Buna-N O-ring. All fasteners exposed to the liquid shall be stainless steel. The motor shall be protected on the top side with sealed cord entry plate with molded pins to conduct electricity eliminating the ability of water to enter internally through the cord. The motor shall be protected on the lower side with an engineered double lip seal with stainless steel springs. The tank shall be made of polypropylene.

4.01 ELECTRICAL POWER CORD

The drain pump shall be supplied with 10 feet of multiconductor power cord. It shall be cord type SJTW, capable of continued exposure to the pumped liquid. The power cord shall be sized for the rated full load amps of the pump in accordance with the National Electric Code. The power cable shall not enter the motor housing directly but will conduct electricity to the motor by means of a water tight compression fitting cord plate assembly, with molded pins to conduct electricity. This will eliminate the ability of water to enter internally through the cord, by means of a damaged or wicking cord.

5.01 MOTORS

Single phase motors shall be oil filled, permanent split capacitor, class B insulated, NEMA B design, rated for continuous duty. At maximum load the winding temperature shall not exceed 130 degrees C unsubmerged. Since air filled motors are not capable of dissipating heat they shall not be considered equal. The pump motor shall have an integral thermal overload switch in the windings for protecting the motor. The capacitor circuit shall be mounted internally in the pump.

6.01 BEARINGS AND SHAFT

Upper and lower ball bearings shall be required. The bearings shall be a single ball / race type bearing. Both bearings shall be permanently lubricated by the oil, which fills the motor housing. The motor shaft shall be made of 300 or 400 series stainless steel and have a minimum diameter of .311".

©Copyright 2017 Liberty Pumps Inc. All rights reserved. Specifications subject to change without notice.

7.01 SEALS

The pump shall have an engineered double lip seal with stainless steel springs. The motor plate / housing interface shall be sealed with a Buna-N o-ring.

8.01 IMPELLER

The impeller shall be molded engineered polymer, with pump out vanes on the back shroud to keep debris away from the seal area. It shall be threaded to the motor shaft.

9.01 CONTROLS

All units are supplied with CSA and UL approved automatic wide angle tilt float switches. The switches shall be equipped with piggy back style plug that allows the pump to be operated manually without the removal of the pump in the event that a switch becomes inoperable. The switches shall be mounted under a separately sealed access cover and tethered to a removable stainless steel rod for easy removal and serviceability.

10.01 PAINT

The exterior of the casting shall be protected with powder coat paint.

11.01 SUPPORT

The polyolefin tank shall be a free standing unit.

12.01 SERVICEABILTY

Components required for the repair of the pump shall be shipped within a period of 24 hours.

13.01 TESTING

The pump shall have a ground continuity check and the motor chamber shall be Hi-potted to test for electrical integrity, moisture content and insulation defects. The motor and volute housing shall be pressurized, and an air leak decay test is performed to ensure integrity of the motor housing. The pump shall be run, voltage current monitored, and the tester checks for noise or other malfunction.

14.01 QUALITY CONTROL

The pump shall be manufactured in an ISO 9001 certified Facility.

15.01 WARRANTY

Standard limited warranty shall be 3 years.

Safety Guidelines

	This safety alert symbol is used in the manual and on the pump to alert of potential risk for serious injury or death.
	This safety alert symbol identifies **risk of electric shock**. It is accompanied with an instruction intended to minimize potential risk of electric shock.
	This safety alert symbol identifies **risk of fire**. It is accompanied with an instruction intended to minimize potential risk of fire.
	This safety alert symbol identifies **risk of serious injury or death**. It is accompanied with an instruction intended to minimize potential risk of injury or death.
⚠DANGER	Warns of hazards, which if not avoided, **will** result in serious injury or death.
⚠WARNING	Warns of hazards, which if not avoided, **could** result in serious injury or death.
⚠CAUTION	Warns of hazards, which if not avoided, could result in minor or moderate injury.
NOTICE	Signals an important instruction related to the pump. Failure to follow these instructions could result in pump failure or property damage.

⚠WARNING	**Read every supplied manual before using pump system. Follow all the safety instructions in manual(s) and on the pump. Failure to do so could result in serious injury or death.**
NOTICE	**Installer: manual must remain with owner or system operator/maintainer.**

Keep this manual handy for future reference.

For replacement manual, visit libertypumps.com, or contact Liberty Pumps at 1-800-543-2550.

Retain dated sales receipt for warranty.

Safety Precautions

⚠WARNING ⚠ RISK OF ELECTRIC SHOCK

- Accidental contact with electrically live parts, items, fluid, or water can cause serious injury or death.
- Always disconnect pump(s) from power source(s) before handling or making any adjustments to either the pump(s), the pump system, or the control panel.
- All installation and maintenance of pumps, controls, protection devices, and general wiring shall be done by qualified personnel.
- All electrical and safety practices shall be in accordance with the National Electrical Code®, the Occupational Safety and Health Administration, or applicable local codes and ordinances.
- Pump shall be properly grounded using its supplied grounding conductor. Do not bypass grounding wires or remove ground prong from attachment plugs. Failure to properly ground the pump system can cause all metal portions of the pump and its surroundings to become energized.
- Do not handle or unplug the pump with wet hands, when standing on damp surface, or in water unless wearing Personal Protective Equipment.
- Always wear dielectric rubber boots and other applicable Personal Protective Equipment (PPE) when water is on the floor and an energized pump system must be serviced, as submerged electrical connections can energize the water. Do not enter the water if the water level is higher than the PPE protection or if the PPE is not watertight.
- Do not lift or carry a pump or a float assembly by its power cord. This will damage the power cord, and could expose the electrically live wires inside the power cord.
- The electrical power supply shall be located within the length limitations of the pump power cord, and for below grade installations, it shall be at least 4 ft (1.22 m) above floor level.
- Do not use this product in applications where human contact with the pumped fluid is common (such as swimming pools, fountains, marine areas, etc.).
- Protect the power cord from the environment. Unprotected power and switch cords can allow water to wick through ends into pump or switch housings, causing surroundings to become energized.
- This pump is supplied with a grounding conductor and grounding-type attachment plug. To reduce the risk of electric shock, be certain that it is connected to a Ground Fault Circuit Interrupter (GFCI) receptacle that meets the latest requirements per UL 943 including Auto-Monitoring or Self-Test Function and Reverse Line-load Miswire Function – Repeated.

⚠WARNING ⚠ RISK OF FIRE

- Do not use an extension cord to power the product. Extension cords can overload both the product and extension cord supply wires. Overloaded wires will get very hot and can catch on fire.
- This product requires a separate, properly fused and grounded branch circuit, sized for the voltage and amperage requirements of the pump, as noted on the nameplate. Overloaded branch circuit wires will get very hot and can catch on fire.
- Explosion hazard during installation. PVC cleaners, primers, and cements can release explosive vapors. These heavier-than-air vapors can accumulate in the tank. The heat of soldering or sweating copper or other metal pipe can ignite these vapors causing a violent explosion. If the unit is to be connected to copper discharge or vent piping, all solvent-welded PVC joints must be allowed to cure a ***minimum*** of 24 hours. The access cover must be removed to allow the tank to be thoroughly ventilated prior to sweating copper pipe near the unit.
- For cord replacement: power cord must be of the same length and type as originally installed on the Liberty Pumps' product. Use of incorrect cord may lead to exceeding the electrical rating of the cord and could result in death, serious injury, or other significant failure.
- Do not use this product with or near flammable or explosive fluids such as gasoline, fuel oil, kerosene, etc. If rotating elements inside pump strike any foreign object, sparks may occur. Sparks could ignite flammable liquids.
- These pumps are not to be installed in locations classified as hazardous in accordance with the National Electric Code®, ANSI/NFPA 70.

⚠WARNING ⚠ RISK OF SERIOUS INJURY OR DEATH

- Do not modify the pump/pump system in any way. Modifications may affect seals, change the electrical loading of the pump, or damage the pump and its components.
- All pump/pump system installations shall be in compliance with all applicable Federal, State, and Local codes and ordinances.
- Do not allow children to play with the pump system.
- Do not allow any person who is unqualified, to have contact with this pump system. Any person who is unaware of the dangers of this pump system, or has not read this manual, can easily be injured by the pump system.
- Do not remove any tags or labels from the pump or its cord.
- Keep clear of suction and discharge openings. To prevent injury, never insert fingers into pump while it is connected to a power source.
- Do not use this product with flammable, explosive, or corrosive fluids. Do not use in a flammable and/or explosive atmosphere as serious injury or death could result.
- California Proposition 65 Warning: This product contains chemicals known to the State of California to cause cancer, birth defects, or other reproductive harm. For more information, go to www.p65warnings.ca.gov.

NOTICE

- **Model 404:** Do not use pumps with fluid over 140°F (60°C). Operating the pump in fluid above this temperature can overheat the pump, resulting in pump failure.
- **Model 405:** Do not use pumps with fluid over 180°F (82°C). Operating the pump in fluid above this temperature can overheat the pump, resulting in pump failure.
- Do not dispose of materials such as paint thinner or other chemicals down drains. Doing so could chemically attack and damage pump system components and cause product malfunction or failure.
- Do not use pump system with mud, sand, cement, hydrocarbons, grease, or chemicals. Pump and system components can be damaged from these items causing product malfunction or failure. Additionally, flooding can occur if these items jam the impeller or piping.
- Do not run dry.

Copyright © Liberty Pumps, Inc. 2018 All rights reserved.

Dimensions

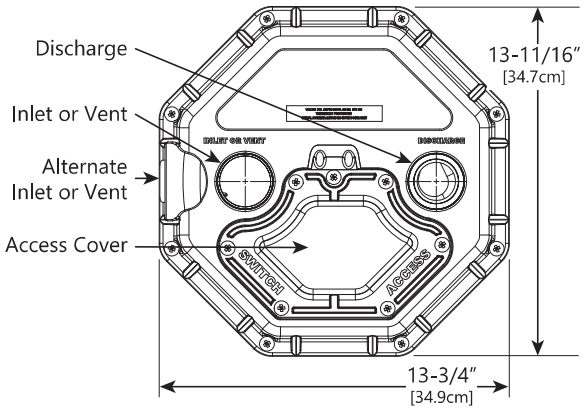

Figure 1. Model 404 and 405 Cover Dimensions

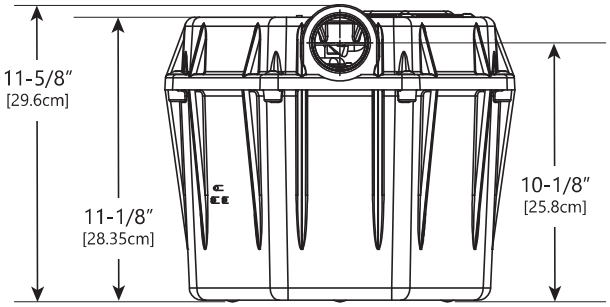

Figure 2. Model 404 Basin Dimensions

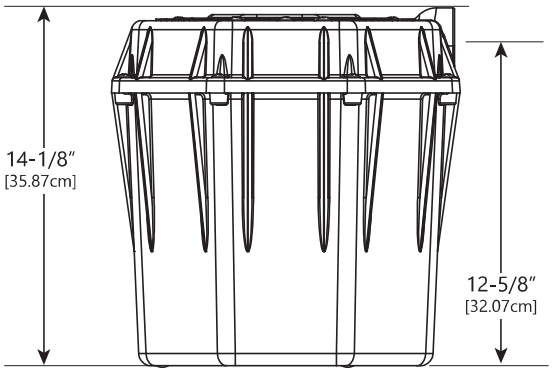

Figure 3. Model 405 Basin Dimensions

Application

The Model 404 and 405-Series drain pumps are designed for use in gray wastewater applications. They will handle small debris and solids, such as laundry lint (up to 3/8″), associated with normal gray water drainage from a sink. Larger solids should be kept out of the pump system. The 405-Series is designed for commercial applications where higher temperature drain water (up to 180°F) may be used.

Installation

Inlet

The drain pump has two available ports: one on the top, the other on the side. Either can be used as a vent or inlet. Using the appropriate piping (1-1/2″ on 404 and 404CV models and 2″ on 404L and all 405 models), connect the fixture (i.e., laundry tub, basement sink, washing machine) to the pump. Refer to Figure 4 for a typical installation.

NOTICE

- **Hand-tighten only**
- **Do not cross thread**

A trap shall be used between the fixture and pump; a flange type is recommended. Hand-tighten trap to pump.

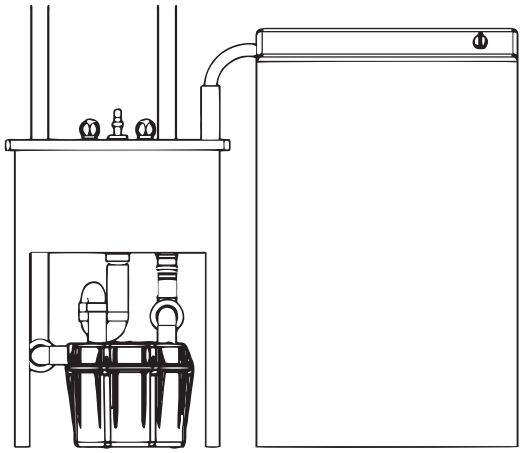

Figure 4. Typical Residential Installation

Discharge

NOTICE

- **Hand-tighten only**
- **Use appropriate thread sealing tape**
- **Do not cross thread**

Install a union just above the pump to facilitate removal, if necessary, for cleaning or service. Install a check valve (**not included** except for CV models listed below) just above the union and as close to the pump as possible to prevent the backflow of water after each pump cycle.

Check Valve for CV Models

Models 404/CV, 404CV/A, and 404CV/A-EYE come with a check valve in order to meet ASME A112.3.4/CSA B45.9. This check valve must be threaded into the discharge port of the 404 cover.

Vent

NOTICE

- **Hand-tighten only**
- **Do not cap-off vent**
- **Do not use one-way quick-vents or air admittance valves** as they will not guarantee proper fixture performance

Provision is made for a vent stack to allow extra volume for high suds conditions, and to ensure proper drainage of the fixture. The vent pipe should have a union to facilitate removal, if required, and shall be connected directly to a building or house vent.

Copyright © Liberty Pumps, Inc. 2018 All rights reserved.

Inlet Air Hole (Alarm Units Only)

If the top port (hole) is used for the vent, the potential exists for an air pocket to form that would prevent the alarm float from activating. After the vent pipe has been installed, it is recommended that a 1/8" hole is drilled through both the unit and vent pipe to allow air to escape. Refer to Figure 5.

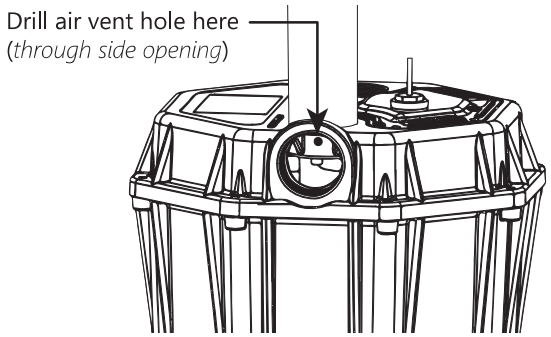

Figure 5. Air Vent Hole Location (Alarm units only)

Power Cord

⚠WARNING **RISK OF ELECTRIC SHOCK**

- All electrical and safety practices shall be in accordance with the National Electrical Code®, the Occupational Safety and Health Administration, or applicable local codes and ordinances.
- Always disconnect pump(s) from power source(s) before handling or making any adjustments to either the pump(s), the pump system, or the control panel.
- Pump shall be properly grounded using its supplied grounding conductor. Do not bypass grounding wires or remove ground prong from attachment plugs. Failure to properly ground the pump system can cause all metal portions of the pump and its surroundings to become energized.
- The electrical power supply shall be located within the length limitations of the pump power cord, and for below grade installations, it shall be at least 4 ft (1.22 m) above floor level.

⚠WARNING **RISK OF FIRE**

- Do not use an extension cord to power the product. Extension cords can overload both the product and extension cord supply wires. Overloaded wires will get very hot and can catch on fire.

The pump power cord is equipped with a grounding-type 3-prong plug. It must be connected to a separately fused, grounded, 3-wire grounding-type receptacle of 15-amp capacity with the proper pump voltage (all models are 115V, except the 405HV which is 230V). Refer to the pump nameplate to verify electrical specifications.

Alarm

Models 404 and 405 with /A or /A-EYE come with a Liberty Pumps alarm. For instructions on using this alarm, refer to the included alarm manual.

Operation

The Model 404 and 405-Series pumps come factory-equipped with a float switch mounted in the tank. There are two controlling cords—one to the float switch (float switch shown in Figure 7) and the other to the pump motor. The float switch cord has a series (piggyback) plug enabling the pump motor cord to be plugged into the back of it (see Figure 6). The purpose of this design is to allow temporary manual operation of the pump.

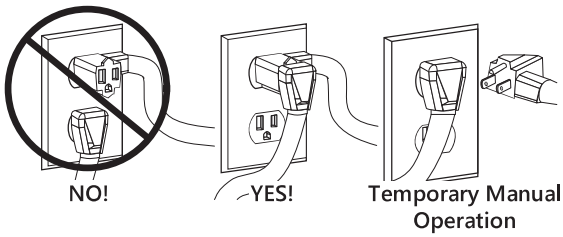

Figure 6. Piggyback Plug Installation

For automatic operation using Liberty Pumps' supplied switch, the two cords must be interconnected and plugged into a separately fused, grounded outlet.

For manual operation, or in the event of switch failure, the pump cord can be separated and plugged into the electrical outlet, directly bypassing the switch. **Note:** Model 405HV should only be operated without the float switch by using the circuit breaker or panel disconnect.

Maintenance and Troubleshooting

⚠WARNING **RISK OF ELECTRIC SHOCK**

- Always disconnect pump(s) from power source(s) before handling or making any adjustments to either the pump(s), the pump system, or the control panel.

Each unit is individually factory-tested to ensure proper adjustment and operation. If the unit fails to operate properly, re-read the instructions to verify they have been followed correctly. Replacement parts for this product are available at http://www.libertypumps.com/Services/Replacement-Parts.

Routine maintenance is not required on the pump itself, but associated connections may require occasional attention. Lint and foreign objects should be removed from the trap periodically. The check valve on the discharge should also be checked for freedom of operation at the same time.

The pump is automatically turned on and off by use of a float switch mounted within the tank. This switch can be easily removed and checked for operation by removing the access cover located on top of the unit. Once the access cover has been removed, a rubber plug must be lifted to free up the switch cord. The switch is mounted to a rod which can be removed by lifting or pulling upward.

IMPORTANT: Do not adjust the tether length (*tether length is the distance of cord measured between the clamp and top of float switch*). If replacing the switch, make sure to maintain the correct tether length for the model. Refer to Figure 7.

Table 1. Troubleshooting Matrix

Problem	Possible Cause	Correction
Pump will not turn on or shut off.	Tripped circuit breaker, tripped GFCI, blown fuse, or other interruption of power.	Reset tripped circuit breaker, reset GFCI, replace blown fuse with properly sized fuse, check that the unit is securely plugged in, investigate power interruption.
	Improper voltage.	Have an electrician check all wiring for proper connections and adequate capacity.
	Plugged vent, or quick-vent in use.	Verify that an unrestricted vent at least 1-¼" in diameter is in use. ***Quick-vents shall not be used.***
	Defective float switch or build-up on tank wall restricting free movement of float switch.	*****Remove access cover and check that float is free to move. If build-up restricts float, clean and reinstall. If defective, replace switch.
Pump runs or hums but does not pump.	Discharge is blocked or restricted.	Check the discharge line for blockage, including ice if the line passes through or into cold areas.
	Check valve is stuck closed or installed wrong.	Remove and examine for freedom of operation and proper installation.
	Total head (lift height) has been reached (refer to Figure 8)	Try routing pipe to a lower level. If not possible, another pumping station may be required at a level of roughly half the total head (lift).
	Pump impeller is jammed.	*****Disassemble unit to expose pump impeller. Remove foreign material. Reassemble.
	Trap or inlet piping is clogged.	Check the trap and inlet piping for restrictions.
Pump short-cycles.	Plugged vent, or quick-vent in use.	Verify that an unrestricted vent at least 1-¼" in diameter is in use. ***Quick-vents shall not be used.***
	Defective float switch.	*****Remove access cover and check that float is free to move. If build-up restricts float, clean and reinstall. If defective, replace switch.
	Check valve was not installed, is stuck open, or is leaking.	Remove and examine for freedom of operation and proper installation.
Pump runs periodically when fixtures are not in use.	Check valve was not installed, is stuck open, or is leaking.	Remove and examine for freedom of operation and proper installation.
	Faucets are dripping.	Repair faucets to eliminate dripping.
Water or soap suds come out of vent pipe.	Vent pipe is too short or too small in diameter.	Verify that an unrestricted vent at least 1-¼" in diameter is in use.
	Defective float switch.	*****Remove tank cover and check that float is free to move. If build-up restricts float, clean and reinstall. If defective, replace switch.
	Rate of inflow exceeds pump output.	Use valve on the inlet to reduce rate of inflow.
Pump operates noisily.	Foreign objects in impeller cavity.	*****Disassemble unit to expose pump impeller. Remove foreign material. Reassemble.
	Piping to house structure is too rigid.	Replace a portion of the discharge pipe with rubber hose to absorb noise.

*****NOTE: Liberty Pumps, Inc. assumes no responsibility for damage or injury due to disassembly beyond float removal in the field. Disassembly, other than at Liberty Pumps or its authorized service centers, automatically voids warranty.

Warranty

Liberty Pumps Wholesale Products Limited Warranty

Liberty Pumps, Inc. warrants that Liberty Pumps wholesale products are free from all factory defects in material and workmanship for a period of three (3) years from the date of purchase (excluding batteries). The date of purchase shall be determined by a dated sales receipt noting the model and serial number of the pump. The dated sales receipt must accompany the returned pump if the date of return is more than three years from the date of manufacture noted on the pump nameplate.

The manufacturer's sole obligation under this Warranty shall be limited to the repair or replacement of any parts found by the manufacturer to be defective, provided the part or assembly is returned freight prepaid to the manufacturer or its authorized service center, and provided that none of the following warranty-voiding characteristics are evident:

The manufacturer shall not be liable under this Warranty if the product has not been properly installed, operated, or maintained per manufacturer instructions; if it has been disassembled, modified, abused, or tampered with; if the electrical cord has been cut, damaged, or spliced; if the pump discharge has been reduced in size; if the pump has been used in water temperatures above the advertised rating; if the pump has been used in water containing sand, lime, cement, gravel, or other abrasives; if the product has been used to pump chemicals, grease, or hydrocarbons; if a non-submersible motor has been subjected to moisture; or if the label bearing the model and serial number has been removed.

Liberty Pumps, Inc. shall not be liable for any loss, damage, or expenses resulting from installation or use of its products, or for indirect, incidental, and consequential damages, including costs of removal, reinstallation or transportation.

There is no other express warranty. All implied warranties, including those of merchantability and fitness for a particular purpose, are limited to three years from the date of purchase. This Warranty contains the exclusive remedy of the purchaser, and, where permitted, liability for consequential or incidental damages under any and all warranties are excluded.

Section 3.7.9

Temperature Switch

Section 3.7.9.1

Temperature Switch – Explosion Proof

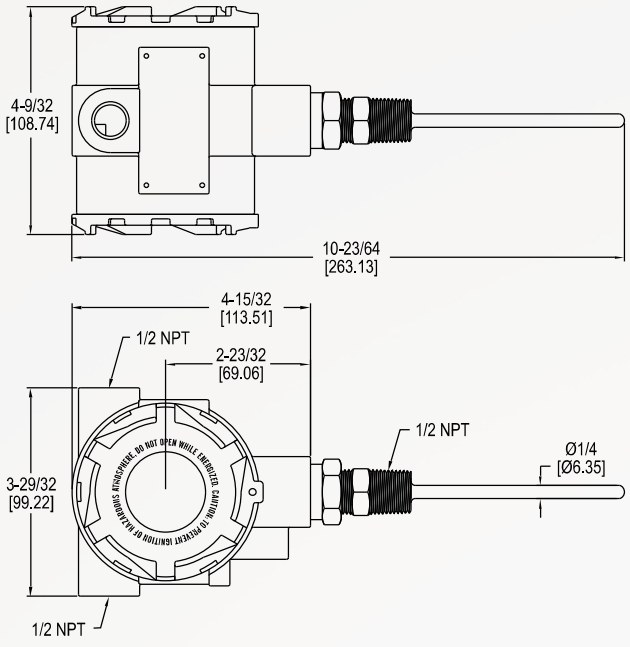
SERIES TTE | EXPLOSION-PROOF RTD TEMPERATURE TRANSMITTER

BENEFITS/FEATURES

- **FM approved for Class I, Groups B, C, D; Class II, Groups E, F, G classified explosive environments**
- **Optional LCD**
- **Output span selected from seven common ranges or user determined**

APPLICATIONS

- Explosive process environments
- Offshore HVAC monitoring



DESCRIPTION

The **Series TTE Explosion-Proof RTD Temperature Transmitter** is the ideal product for hazardous temperature measurement applications. The TTE series has seven pre-programmed temperature ranges that are selectable via an internal dip switch. For those applications that need a custom range, the transmitter can be easily configured for any range between -30 to 250°F with a minimum span of 40°F. The span and zero can be quickly adjusted with a simple push button design. The compact housing allows for the transmitter to be mounted in virtually any application.

SPECIFICATIONS

Temperature Sensor	Pt1000, 0.00385 DIN.
Output Temperature Ranges	User selectable – any range between -30 to 250°F with a minimum span of 40°F.
Temperature Limits	Ambient: 0 to 158°F (-18 to 70°C); Process: -30 to 250°F (-34.4 to 121.1°C).
Accuracy	Transmitter ±0.1% FS; Probe ±0.3% FS.
Thermal Drift Effects	±0.02%/°C max.
Response Time	250 ms.
Wetted Materials	316 SS.
Process Connection	1/2″ male NPT.
Conduit Connection	1/2″ female NPT.
Probe Length	2″ to 18″ (depending on model).
Pressure Limits	2000 psi (137.9 bar).
Power Requirements	10-35 VDC.
Output Signal	4-20 mA (2-wire loop powered).
Optional Display	2 lines X 8 character LCD.
Enclosure Rating	Weatherproof NEMA 4X (IP66) and Explosion-proof. Listed with FM for Class I, Division 1, Groups B, C and D, and dust-ignitionproof for Class II, Division 1, Groups E, F and G and Class III atmospheres.
Weight	2 lb 8 oz (1134 g).
Agency Approvals	CE, FM.

SERIES TTE

EXPLOSION-PROOF RTD TEMPERATURE TRANSMITTER

User Selectable Ranges, Optional LCD Display

*Shown with optional LCD display

The **Series TTE Explosion-Proof RTD Temperature Transmitter** is the ideal product for hazardous temperature measurement applications. The TTE series has seven pre-programmed temperature ranges that are selectable via an internal dip switch. For those applications that need a custom range, the transmitter can be easily configured for any range between -30 to 250°F with a minimum span of 40°F. The span and zero can be quickly adjusted with a simple push button design. This unit has optional listings of FM for use in Class I, Division 1, Groups B, C and D, Class II, Division 1, Groups E, F and G and Class III atmospheres or ATEX (Directive 2014/34/EU) for CE Ex II 2 G Ex db IIC T6...T4 Gb (-20°C ≤ Ta ≤ + 70°C), CE Ex II 1 D Ex ta IIIC T111°C Da (-20°C ≤ Ta ≤ + 70°C) and IECEx for Ex db IIC T6...T4 Gb (-20°C ≤ Ta ≤ + 70°C), Ex ta IIIC T111°C Da (-20°C ≤ Ta ≤ + 70°C). The compact housing allows for the transmitter to be mounted in virtually any application.

FEATURES/BENEFITS

- FM approved for Class I, Groups B, C, D; Class II, Groups E, F, G classified explosive environments
- Optional LCD
- Output span selected from seven common ranges or user determined

APPLICATIONS

- Explosive process environments
- Offshore HVAC monitoring

SPECIFICATIONS

Temperature Sensor: Pt1000, 0.00385 DIN.
Output Temperature Ranges: User selectable – any range between -30 to 250°F with a minimum span of 40°F.
Temperature Limits: Ambient: -4 to 158°F (-20 to 70°C); Process: -30 to 250°F (-34.4 to 120°C).
Accuracy: Transmitter ±0.1% FS; Probe ±0.3% FS.
Thermal Drift Effects: ±0.02%/°C max.
Response Time: 250 ms.
Wetted Materials: 316 stainless steel.
Process Connection: 1/2″ male NPT or 1/2 male BSPT.
Conduit Connection: 1/2″ female NPT or M20.
Probe Length: 2″ to 18″ (depending on model).
Pressure Limits: 2000 PSI.
Power Requirements: 10 to 35 VDC.
Output Signal: 4-20 mA (two wire loop powered).
Optional Display: 2 lines X 8 character LCD.
Enclosure Rating: Weatherproof and Explosion-proof. Listed with FM for Class I, Division 1, Groups B, C and D, and dust-ignitionproof for Class II, Division 1, Groups E, F and G and Class III atmospheres.
ATEX Certified: CE 0518 Ex II 2 G Ex db IIC T6...T4 Gb, CE Ex II 1 D Ex ta IIIC T111°C Da, T6 Process Temp ≤80°C, Temperature Class T5 Process Temp ≤95°C, Temperature Class T4 Process Temp ≤120°C as defined on nameplate. EU-type Cerificate No.: EMT17ATEX0021 X.
ATEX Standards: EN 60079-0:2012+A11:2013; EN 60079-1:2015; EN 60079-31:2014.

Temperature Switch – Non-explosion Proof

EWSA Series

Rugged, Weatherproof Temperature Sensors and Transmitters

INSTRUCTION SHEET

M5732/0119

Shop online at omega.com e-mail: info@omega.com
For latest product manuals: www.omegamanual.info

1.0 Description

The EWSA air temperature sensors are designed for wall or pipe mounting in harsh indoor or outdoor environments.

A rugged 6mm diameter sheathed RTD probe is housed in the center of a 12.7 mm dia. outer protection tube. The RTD sensor terminal block or optional transmitter are housed in a tough aluminum alloy enclosure, rated to IP65.

An M20 cable gland is fitted to the left hand side of the enclosure, suitable for cables from 2.5 to 6.5 mm diameter.

2.0 Receiving and Unpacking

Please inspect the packaging and sensor thoroughly for any signs of transit damage. Please notify Omega customer service if any damage is found.

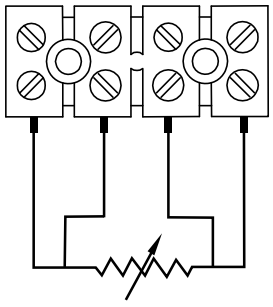
3.0 Specifications

Dimensions:
Box: 80 W x 75 H x 58 mm D
Sensors: 75 mm long x 12.7 mm O.D
Cable Entry: M20 gland for 2.5 to 6.5 O.D cable

EWSA-Pt100 Sensor Only Model:
Sensor Type:
- Pt100 class A 4-wire standard
- Pt1000 on request

Ambient Temperature Range:
- 50 to 100°C

Electrical Conection:
Screw terminal block



EWSA-Pt100-TX:
Ambient Temperature Range:
-40 to 85°C at 10 to 90% RH non condensing
Standard Transmitter Scaling:
4 mA at -25°C, 20 mA at 75°C
Electrical Connection:
Screw terminals, 2-wire
Power Supply:
10 to 30Vdc, loop powered
Power Supply:
[(V supply-10)/20] KΩ. eg. 700Ω @ 24V

4.0 Mechanical Installation

The EWSA has been designed for wall or pipe mounting.
For wall fixing the drilling dimensions are provided on the base of the enclosure.

5.0 Electrical Installation

For the EWSE-Pt100-TX temperature sensor with transmitter please refer to the transmitter manual M4561 for wiring and scaling information. The standard EWSA-Pt100 model features a 4 way screw terminal block for connection to the 4-wire Pt100 sensor.

The information contained in this document is believed to be correct, but OMEGA accepts no liability for any errors it contains, and reserves the right to alter specifications without notice.

WARRANTY/DISCLAIMER

OMEGA ENGINEERING, INC. warrants this unit to be free of defects in materials and workmanship for a period of **13 months** from date of purchase. OMEGA's WARRANTY adds an additional one (1) month grace period to the normal **one (1) year product warranty** to cover handling and shipping time. This ensures that OMEGA's customers receive maximum coverage on each product.

If the unit malfunctions, it must be returned to the factory for evaluation. OMEGA's Customer Service Department will issue an Authorized Return (AR) number immediately upon phone or written request. Upon examination by OMEGA, if the unit is found to be defective, it will be repaired or replaced at no charge. OMEGA's WARRANTY does not apply to defects resulting from any action of the purchaser, including but not limited to mishandling, improper interfacing, operation outside of design limits, improper repair, or unauthorized modification. This WARRANTY is VOID if the unit shows evidence of having been tampered with or shows evidence of having been damaged as a result of excessive corrosion; or current, heat, moisture or vibration; improper specification; misapplication; misuse or other operating conditions outside of OMEGA's control. Components in which wear is not warranted, include but are not limited to contact points, fuses, and triacs.

OMEGA is pleased to offer suggestions on the use of its various products. However, OMEGA neither assumes responsibility for any omissions or errors nor assumes liability for any damages that result from the use of its products in accordance with information provided by OMEGA, either verbal or written. OMEGA warrants only that the parts manufactured by the company will be as specified and free of defects. OMEGA MAKES NO OTHER WARRANTIES OR REPRESENTATIONS OF ANY KIND WHATSOEVER, EXPRESSED OR IMPLIED, EXCEPT THAT OF TITLE, AND ALL IMPLIED WARRANTIES INCLUDING ANY WARRANTY OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE HEREBY DISCLAIMED. LIMITATION OF LIABILITY: The remedies of purchaser set forth herein are exclusive, and the total liability of OMEGA with respect to this order, whether based on contract, warranty, negligence, indemnification, strict liability or otherwise, shall not exceed the purchase price of the component upon which liability is based. In no event shall OMEGA be liable for consequential, incidental or special damages.

CONDITIONS: Equipment sold by OMEGA is not intended to be used, nor shall it be used: (1) as a "Basic Component" under 10 CFR 21 (NRC), used in or with any nuclear installation or activity; or (2) in medical applications or used on humans. Should any Product(s) be used in or with any nuclear installation or activity, medical application, used on humans, or misused in any way, OMEGA assumes no responsibility as set forth in our basic WARRANTY/DISCLAIMER language, and, additionally, purchaser will indemnify OMEGA and hold OMEGA harmless from any liability or damage whatsoever arising out of the use of the Product(s) in such a manner.

RETURN REQUESTS / INQUIRIES

Direct all warranty and repair requests/inquiries to the OMEGA Customer Service Department. BEFORE RETURNING ANY PRODUCT(S) TO OMEGA, PURCHASER MUST OBTAIN AN AUTHORIZED RETURN (AR) NUMBER FROM OMEGA'S CUSTOMER SERVICE DEPARTMENT (IN ORDER TO AVOID PROCESSING DELAYS). The assigned AR number should then be marked on the outside of the return package and on any correspondence.

The purchaser is responsible for shipping charges, freight, insurance and proper packaging to prevent breakage in transit.

FOR **WARRANTY** RETURNS, please have the following information available BEFORE contacting OMEGA:

1. Purchase Order number under which the product was PURCHASED,
2. Model and serial number of the product under warranty, and
3. Repair instructions and/or specific problems relative to the product.

FOR **NON-WARRANTY** REPAIRS, consult OMEGA for current repair charges. Have the following information available BEFORE contacting OMEGA:

1. Purchase Order number to cover the COST of the repair,
2. Model and serial number of the product, and
3. Repair instructions and/or specific problems relative to the product.

OMEGA's policy is to make running changes, not model changes, whenever an improvement is possible. This affords our customers the latest in technology and engineering. OMEGA is a trademark of OMEGA ENGINEERING, INC.

Section 3.7.10

H2S & Methane Sensor

XNX™ Universal Transmitter

Honeywell

A universal transmitter for toxic, oxygen and combustible gas detection compatible with all Honeywell gas sensing technologies

Transmitter & Methane Sensor Combo

XNX Universal Transmitter

High performance
- Flammable gas detection 0 to 100% LFL/LEL
- Point IR with heated optics provides immunity to poisoning and no hidden faults
- Open-path IR flammable gas detection in LEL-m measurement
- Electrochemical cell offers toxic gas detection in ppm
- IR cell provides CO_2 and combustible gas monitoring
- Robust and reliable operation in explosive areas and harsh environments

Flexible Operation
- 3 versions - supports mV (Catalytic Bead and IR Cell), Electrochemical Cell and IR (point and open-path) gas detection
- Multi-Purpose Detector (MPD) with field serviceable mV, Catalytic bead and IR Cell capability
- 4-20mA with HART® as standard
- Multiple communications options include up to 3 relays, MODBUS® and FOUNDATION® H1 Fieldbus (pending)
- Optional local IS port for handheld HART configurator

Easy to Use
- Large, backlit, easy-to-view LCD display offers multi-sensory indicators (visual icons, colored buttons, text, etc.) to display gas and sensor readings
- User interface supported by 8 selectable languages (English, Spanish, German, Italian, Portuguese, French, Russian, Chinese)
- Self-test and fault indication features
- Non-intrusive, one-man operation
- Quick calibration with auto-inhibit

Easy to Install
- 3 or 4 wire operation, source, sink or isolated
- Use with conduit or cable installations
- Simple plug-in sensors and replaceable cells
- NEMA 4X IP66 rated for rugged indoor/outdoor use

Cost Effective
- Minimal training required
- One-man operation
- Plug-in sensor replacement
- All necessary accessories included

Applications
- Offshore Oil & Gas production platforms
- Onshore Oil terminals
- Refineries
- Gas Transmission
- Gas Distribution
- LNG terminals
- Gas storage terminals
- Chemical plants
- Petrochemical plants
- Solvent recovery operations

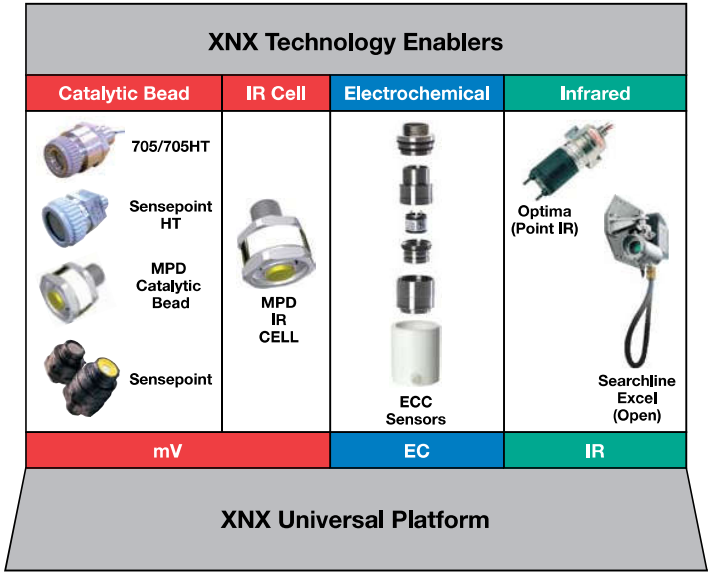
The XNX Universal Transmitter marks a new turn in gas detection from Honeywell Analytics. It supports the widest range of sensors on a common platform and offers a modular choice of inputs and outputs.

Universal Gas Sensing Platform

Bringing together the best solutions in gas detection

Electrochemical
- Proven electrochemical sensing technology
- Surecell™ electrochemical cells are ideal for hot and humid environments
- Long life sensing cells (typical >2 years)
- Patented 'Reflex' sensing element verification diagnostics
- Sensor recognition software auto configures transmitter
- Plug and play factory configured sensors
- Intrinsically safe sensor connection permits hot swap, reducing down time

Catalytic Bead
- Supports Honeywell Analytics 705, 705HT, Sensepoint, Sensepoint HT and MPD sensors
- Fast response to wide range of hydrocarbons and flammables



Infrared (Open Path IR, Point IR, IR Cell)
- Supports Honeywell Analytics Searchline Excel, Searchpoint Optima Plus
- Failsafe operation
- Fast speed of response
- Reduced routine maintenance
- Immune to catalytic poisons
- Long operating life
- Works in inert atmospheres

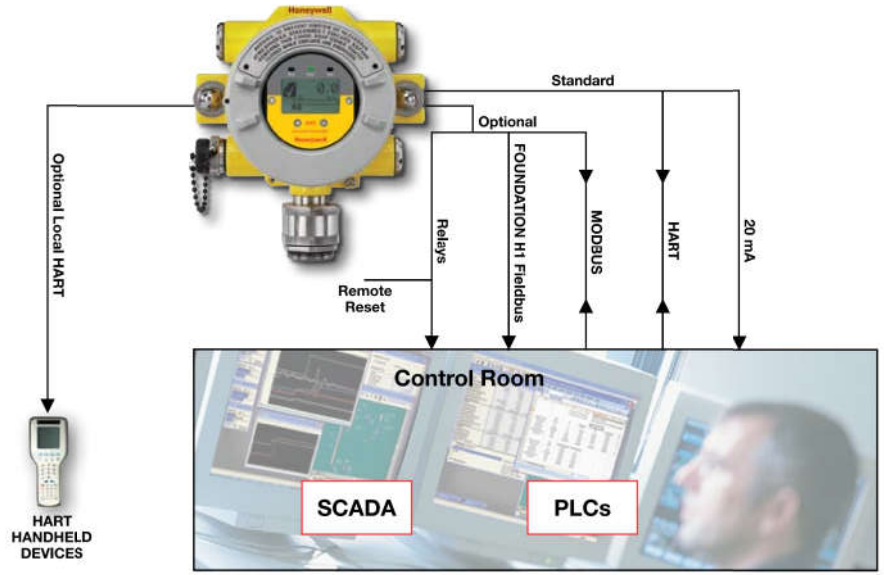
XNX is designed for flexible integration, simple installation, user friendly operation and straight-forward maintenance. It is ideal for use with a range of gas monitoring controllers or industry standard PLCs. Users are assured of being protected in all conditions with Honeywell Analytics gas monitoring solutions.

XNX's modular design enables Honeywell Analytics to offer appropriate, cost effective solutions to a wide range of gas detection requirements.

The XNX Universal Transmitter is an excellent choice for those who want a total integrated monitoring and safety solution for an industrial plant.

With the XNX, you are freed from the need to add extra controllers, junction boxes, relays, monitors and other equipment accessories.

Photos not to scale.

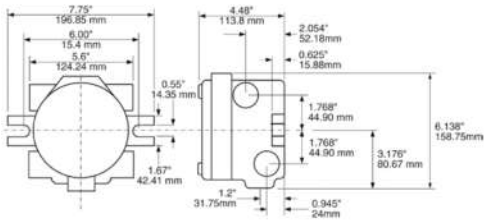


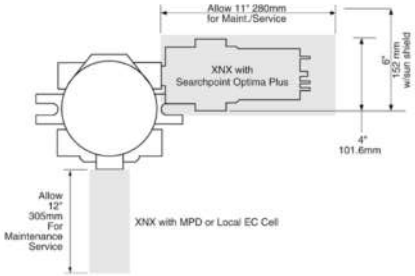
Communications

The XNX's powerful advanced communications module adds increased functionality and flexibility to a gas detection network. Standard HART communications, along with optional Modbus, Foundation Fieldbus (pending) or relays, interface with a PLC and a host of other protocol compatible devices found in industrial applications.

Back-lit, easy-to-read LCD display with icons includes a broad range of language options including English, Spanish, French, Italian, Portuguese, German, Russian and Chinese to meet global requirements.

Installation Details





Mechanical

The XNX enclosure is available in a painted stainless steel or aluminum housing with a marine grade coating. Five threaded conduits/cable entries are available in Metric or NPT versions, and ruggedized mounting options provide ultimate installation flexibility. Instrumentation built on various sensing technologies can be attached locally to the transmitter or remotely with the appropriate accessories. Inside, customer and sensor connections to the unit are designed to protect against dangerous electrical misconnections. With pending approvals to UL, CSA and ATEX requirements for Hazardous Locations, and IP66/67 rating to protect against dirt/water ingress, the XNX serves the most demanding industrial environments.

Ordering Information

The XNX part numbering system contains all necessary information to convey the product configuration including options. Agency, Port Thread, Enclosure Material, Sensor Personality define the standard unit. Three option fields are used to define optional Relay or Fieldbus interfaces and factory installed local HART®. To order XNX parts, call 800-538-0363.

Technical Summary

XNX Transmitter			
Material	LM25 Aluminum, painted (SS316 painted optional)		
Cable Entries	5 conduits/cable entries – (2 right, 2 left, 1 bottom) Available in ¾" NPT, or M25		
Termination	Cage Clamp pluggable Terminal Blocks with retaining screws, 0.5 to 2.5mm (12-28 AWG)		
Mounting	XNX Enclosure Bracket (ears on casting for u-bolt). Integral cast mounting flanges provide secure mounting to surfaces, channels or up to 6" Pipe. Optional Remote sensor (up to 50 ft / 15.2 M) for Cat Bead and Toxic		
User interface	Standard Custom Backlit LCD. 2.5" High Resolution DOT Matrix Display. Discrete Alarm and Status indication. Reliable Non-Intrusive 4 button interface magnetic wand access. Optional HART Handheld with IS Port		
Signal	Standard HART over 3-wire 4-20mA (sink or source). Optional Modbus over RS-485 and Foundation Fieldbus		
Environmental			
Temperature	-40°C to +65°C / -40°F to +149°F (sensor dependent)		
Humidity	20 to 90% RH non-condensing		
IP Rating	NEMA 4X IP65		
Options			
	Form C and SPDT 3 Relays, 240 VAC, 5A (2 Alarm, 1 Fault) (Mutually exclusive with Modbus and Fieldbus Options)		
Power			
	18V to 32V (24V nominal)		
Hazardous Area Approvals (Pending)			
	ATEX: Ex II 2 G D, EEx [ia] IIC T5 (Tamb -40°C to +65°C) UL: Class I, Div 1, Groups B, C, and D / Class 1, Zone 1 AEx d IIC T5 (Tamb -40°C to +65°C) CSA: Class I, Div 1, Groups B, C, and D T5 (Tamb -40°C to +65°C)		
Performance Approvals (Pending)	EU – ATEX, EN45544, EN50104, EN50270, EN50271, EN13980, EN60079, EN60079-18, -1, -7, -29-1, EN45544-1, -2 NA – UL 913, UL 1203, CSA 22.2 No. 152 Other – IEC61508 (SIL Assessment, SIL 2), IECEx OD 005		

Display Module & User Interface (Standard)		
Display Type	Backlit LCD	
Information Displayed	Base Information:	Gas Reading Gas Name and Units of measurement Fault and Alarm Status Large Numeric concentration or LEL display Bar graph showing current reading, set points and full scale.
	Fault/Alarm and Operating Status Indication:	Security settings allow multi level operator access for set-up, configuration and calibration Event history stores Time and Date of all Alarm, Diagnostic, Configuration events
Interface	Magnetic wand with terminal screwdriver (supplied each unit)	

4-20mA & HART (Standard Supply)			
Description	Fully configurable isolated 4-20mA & HART output module providing current sink, current source and isolated modes of operation. (supports HART 6.0 protocol)		
Non-intrusive Interface	Optional local IS port to enable HOT connection of a HART handheld configurator		
Operating Modes	Current sink / Current source / Isolated current sink /Conventional or with HART data		
Output Range	0 to 22mA		
4-20mA Signal Accuracy	+/- 1% FS		
Max loop resistance	600 Ohms at 24Vdc loop supply		
Functions Supported via HART	Gas Reading Gas Name and Units of measurement 4-20mA signal level General/Device Information Installation Configuration Forcing of 4-20mA output	Detailed Sensor Information Including: Optical Signal Level Dynamic Reserve (Excel Only) Raw reading 24V supply voltage Temperature	RTC (Excel Only) Calibration and Configuration status Detailed Fault and Warning Information Fault and Alarm History Zero Calibration

Local IS HART Port (Optional)	
Description	Provides externally accessible IS connections to the XNX transmitter to enable HOT connection of HC275/375 HART or equivalent hand held configurator.
Installation	Fitted to one of the cable entries on the XNX transmitter.
Environmental Protection	Terminals protected by cover to IP 66 when not in use

Technical Summary

Relay Module (Optional)			
Description	Provides three fully user configurable relay outputs that can be switched based on the current gas level and/or status of the transmitter. Provides 2 x SPCO alarm and 1 x SPCO fault relays. Single Pole Double Throw SPDT. Option PCB Factory installed in display module.		
Installation	Fitted into housing base either at the factory or in the field by qualified service engineer.		
Rating	Maximum: 240VAC, 5A (non inductive load)	Minimum: 5V, 10mA (non inductive load)	
Electrical Connections	Fault: Common, Normally Open, Normally Closed Alarm 1: Common, Normally Open, Normally Closed Alarm 2: Common, Normally Open, Normally Closed		
Configuration	**Default**	**Configurable Options**	
	Fault Relay: Normally energized Non latching Signal Inhibit as fault	Fault Relay: Normally energized / normally de-energized None Enable/disable	
	Alarm 1 / 2 Relays: Normally de-energized Non latching Alarm rising on gas reading Alarm level 20% and 40% of scale Hysteresis of 2% of scale	A1 / A2 Relays: Normally energized / de-energized Latching / non latching Alarm on rising / falling Alarm level 10% to 90% of full scale	
Re-setting of Latched Relays	Easily accessible interface on display (if used) or via HART interface (local or remote)		
Note	Use of the Relay Module or 'Other' Communications Module (E.g. Foundation Fieldbus) is mutually exclusive. However, relay function may be used in conjunction with standard communication output i.e. 4-20mA with HART.		
Relay Specific Functions via HART Interface	Relay status information / Reset of latched conditions / Configuration of relays Forcing of relay state Reset through non intrusive User Interface. Remote Switch closure using Remote Reset input Remotely through HART		

Foundation Fieldbus Module (Optional)			
Description	Foundation Fieldbus compliant digital communications interface enables connection of the XNX transmitter to a multi-drop Foundation Fieldbus H1 network.		
Installation	Fitted into housing base either at the factory or in the field by qualified service engineer.		
Connections	Sig+, Sig- and Screen		
Physical Layer	Conforms to IEC 1158-2 and ISA 50.02, 31.25Kbits/s		
Maximum No. of Nodes	32		
Functions Supported	Gas Reading Gas Name and Units of measurement Instrument status (OK, warning, fault, over-range) General/Device Information Remote zero and span calibration (detector dependent)	Detailed Sensor Information Including: Optical Signal Level Dynamic Reserve (Excel Only) Raw reading 24V supply voltage Temperature RTC (Excel Only) Calibration and Configuration status	Detailed Fault and Warning Information: Fault and Alarm History Zero Calibration

Modbus RTU Module (Optional)	
Description	The Modbus output module provides an Isolated RS485 output to enable the connection of the XNX transmitter to a multi-drop Modbus network
Installation	Fitted into housing base either at the factory or in the field by qualified service engineer.
Connections	RS485+, RS485-, Drain
Physical Layer	Isolated RS485, 1200 to 19.2K Baud
Maximum No. of Nodes	254 XNX compatible transmitters only
Protocol	Modbus RTU
Functions Supported	As per Foundation Fieldbus Module (Optional) - see above

Further information is available upon request.

* Foundation Fieldbus not available at time of publication. Please call your Honeywell Analytics sales person.

Honeywell Analytics Lines of Business

Commercial

Vulcain-brand gas detection from stand-alone units to fully engineered, multi-point systems, all offering cost-effective regulatory compliance

» Applications: parking structures, chillers, mechanical rooms, office towers, commercial buildings, shopping centers, swimming pools, golf courses, schools and universities, laboratories

Industrial

Renowned Sieger and Manning gas detection systems with advanced electrochemical, infrared and open path sensing technologies

» Applications: oil and gas, cold storage, water/wastewater treatment, chemicals, engine rooms, plastics and fibers, agriculture, printing and light industrial

Portables

Single or multi-gas Lumidor and other premium detectors with compact, lightweight designs ranging from simple alarm only units to advanced, fully configurable and serviceable instruments

» Applications: underground utility and electricity ducts, boiler rooms, post-fire sites, sewers, industrial plants, industrial hygiene, first responder teams, remote fleets

High Tech/Government

A complete portfolio of gas and chemical detection instrumentation including infrared spectroscopy (MST) with no cross interference, to Chemcassette paper-based solutions (MDA Scientific) offering detection down to parts per billion

» Applications: semiconductor manufacturing and nanotechnology, aerospace propulsion and safety, specialty chemicals industry, research laboratories, emergency response

Technical Services

24/7 global network includes post-sales service and Systems Integration teams

» Emergency call out, service contracts, on/off-site repair, training and commissioning

» Complete range of spares, consumables and accessories

Please Note:
While every effort has been made to ensure accuracy in this publication, no responsibility can be accepted for errors or omissions. Data may change, as well as legislation, and you are strongly advised to obtain copies of the most recently issued regulations, standards, and guidelines. Communications

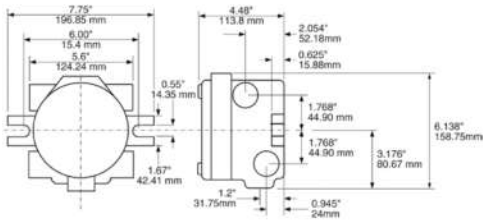
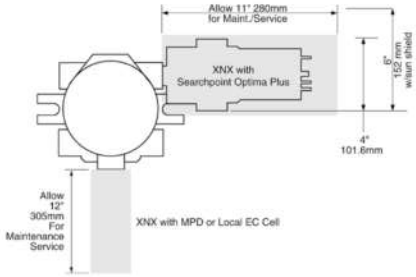
The XNX's powerful advanced communications module adds increased functionality and flexibility to a gas detection network. Standard HART communications, along with optional Modbus, Foundation Fieldbus (pending) or relays, interface with a PLC and a host of other protocol compatible devices found in industrial applications.

Back-lit, easy-to-read LCD display with icons includes a broad range of language options including English, Spanish, French, Italian, Portuguese, German, Russian and Chinese to meet global requirements.

Installation Details





Mechanical

The XNX enclosure is available in a painted stainless steel or aluminum housing with a marine grade coating. Five threaded conduits/cable entries are available in Metric or NPT versions, and ruggedized mounting options provide ultimate installation flexibility. Instrumentation built on various sensing technologies can be attached locally to the transmitter or remotely with the appropriate accessories. Inside, customer and sensor connections to the unit are designed to protect against dangerous electrical misconnections. With pending approvals to UL, CSA and ATEX requirements for Hazardous Locations, and IP66/67 rating to protect against dirt/water ingress, the XNX serves the most demanding industrial environments.

Ordering Information

The XNX part numbering system contains all necessary information to convey the product configuration including options. Agency, Port Thread, Enclosure Material, Sensor Personality define the standard unit. Three option fields are used to define optional Relay or Fieldbus interfaces and factory installed local HART®. To order XNX parts, call 800-538-0363.

H2S Sensor Cartridge Datasheet

Manufacturer	: Honeywell
Product No.	: XNXXSH1SS
Product type	: Cartridges
Usage	: Analytics XNX Universal Transmitter Fixed Systems Gas Monitors
Type	: Hydrogen sulfide (H2S)
Range / Resolution	: Hydrogen sulfide (H2S) 0-15 ppm (10 to 50 ppm, 1 ppm)
Gas	: H2S | Hydrogen Sulfide
Operating Pressure	: 80 kPa ~ 120 kPa
Operating Air Speed	: 0 ~ 6 m/sec
Warm-up Time (minimum)	: 60 sec.

Safety

Read and understand this manual before installing, operating, or maintaining the XNX Transmitter. Pay particular attention to the warnings and cautions below. All of the warnings and cautions shown here are repeated in the appropriate sections of the manual.

Warnings: Identify hazardous or unsafe practices which could result in severe injury or death.

Warnings

- Installation must be in accordance with the recognized standards of the appropriate authority in the country concerned.
- Access to the interior of the sensor, when carrying out any work, must only be conducted by trained personnel.
- Before carrying out any work ensure local regulations and site procedures are followed. Appropriate standards must be followed to maintain the overall certification of the sensor.
- To reduce risk of ignition of hazardous atmospheres, conduit runs must have a seal fitting connected within 18 inches (45 cm) of the enclosure.
- To reduce the risk of ignition of hazardous atmosphere, disconnect the equipment from the supply circuit before opening the sensor enclosure. Keep assembly tightly closed during operation.
- Never open the XNX enclosure under power unless the area is known to be non hazardous.
- The sensor must be earthed/grounded for Intrinsic Safety, electrical safety and to limit the effects of radio frequency interference. Earth/ground points are provided inside and outside the unit. EMI note for applications using shielded cable: Cable shield terminations must be made at the cable glands with suitable EMI type glands. Avoid terminating cable shields at the Earth ground lug inside the XNX enclosure. In cases where wiring is in pipe, a shielded cable is not required. The external terminal is only a supplemental bonding connection where local authorities permit or require such a connection.
- Take care when handling EC sensor cells as they may contain corrosive solutions.
- Do not tamper or in any way disassemble the sensor cells.
- Do not expose to temperatures outside the recommended range.
- Do not expose the sensor to organic solvents or flammable liquids.
- At the end of their working lives, sensors must be disposed of in an environmentally safe manner, in accordance with local waste management requirements and environmental legislation. Do NOT incinerate sensors as they may emit toxic fumes.
- High off-scale readings may indicate an explosive concentration of gas.
- Verify all outputs, including display, after installation, after service events, and periodically to ensure the safety and integrity of the system.
- Do not use the XNX Universal Transmitter in oxygen-enriched atmospheres. Concentrations displayed will be adversely affected by oxygen depletion.
- After changing parameters with a handheld device, verify that the parameter settings are correct at the transmitter.
- The factory-set passcodes must be reset to prevent unauthorized access to the transmitter's menus.

- When the transmitter is equipped with the optional Remote Mount Kit, the remote sensor must be securely mounted in a fixed position. The Remote Sensor kit is not intended to be used as a hand-held sensor.
- Enclosures of remotely mounted sensors contain aluminum. Be careful to avoid ignition hazards due to impact or friction when installed in Zone 1 locations.
- Install the junction box according to local codes and manufacturer's requirements.
- The enclosures of remotely mounted 705HT sensors contain aluminum. Be careful to avoid ignition hazards due to impact or friction when installed in Zone 1 locations.
- Power off the transmitter before changing S3 or S4. Both switches must be set in either Source or Sink prior to applying power.
- Minimum and maximum controller alarm levels should not be set at less than 10% or greater than 90% of the full scale range of the sensor. Limits are 60% LEL or 0.6mg/m^3 for agency performance certification.
- When configuring or communicating with the transmitter using the front panel displays, resume monitoring by exiting all menus and returning to the General Status menu manually. No time outs are invoked.
- When selecting a new target gas for units with a Searchpoint Optima Plus, the sensor must be recalibrated.
- XNX Universal Transmitters carrying UL/CSA/FM approvals that are configured for devices measuring %LEL will not allow adjustments to the full scale value. The range is fixed at 100%.
- There is a potential loss of sensitivity during exposure to high concentrations of H2S. Under these conditions, set the control unit to latch at overrange. In standalone configuration, set alarms to latching. When resetting the overrange or alarm, verify correct operation of the transmitter.
- Keep the passwords in a secure area to prevent unauthorized access to the transmitter. If the passwords are lost, resetting the XNX transmitter will require a service technician.
- When the XNX transmitter is placed in Inhibit Mode, alarms are silenced. This will prevent an actual gas event from being reported. Inhibit Mode must be limited to testing and maintenance only. Exit Inhibit Mode after testing or maintenance activities.
- Honeywell recommends periodic bump tests (every 30 days or in accordance with customer site procedures) to the sensor to insure proper operation and compliance with the functional safety rating of the installation.
- As some test gases are hazardous, exhaust the flow housing outlet to a safe area. Do not use the XNX Universal Transmitter in oxygen-enriched atmospheres. (In oxygen-enriched atmospheres, the electrical safety is not given.)
- Exposure to desensitizing or contaminating substances or concentrations causing operation of any alarm may affect sensor sensitivity. Following such events, it is recommended to verify sensor performance by performing a functional gas test (bump test).
- When servicing or replacing sensors, reduce the risk of ignition of hazardous atmosphere by declassifying the area or disconnecting the equipment from the supply circuit before opening the sensor enclosure. Keep the assembly tightly closed during operation.
- Take appropriate precautions when using toxic, flammable, and pressurized cylinders.
- Delays resulting from transmission errors between sensor and transmitter extend response times T90 by more than one-third. The period until fault indication is 10 seconds.
- The HART interface is subject of this EC-type examination certificate only for the purpose of configuration and maintenance.

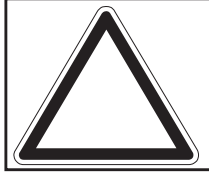
- The options “Modbus interface” and “Foundation Fieldbus interface” are not subject of this EC-type examination certificate.
- Long-term exposure (> 20 minutes) to concentrations exceeding the fullscale range of the H2S sensor type 2 can cause it to lose sensitivity. The measured value may decrease even though high levels of toxic gas are still present. If such conditions can occur, set the control unit to latch at overrange. In standalone operation, set alarms to latching. When resetting the overrange or alarm, verify correct operation of the transmitter.

Hazardous Location Installation Requirements (UL/CSA)

- To reduce risk of ignition of hazardous atmospheres, conduit runs must have a pour gland installed within 18 inches (457mm) of enclosure.
- All ¾ inch NPT conduit, stopping plugs and adapters must be installed with 5¼ threads (minimum) engaged to maintain Explosion Proof rating.
- Stopping Plugs supplied (Honeywell Part Number 1226-0258) are approved for use ONLY with the XNX Universal Transmitter.
- For units fitted with the Optional Relay Module: Relay Contact Ratings are 250 VAC 5A, 24 VDC 5A Resistive Loads Only.
- Terminal block screws should be tightened to 4.5 lb/in (max).
- Reference XNX Control Drawing 1226E0402 or 1226E0454 for additional information regarding IS function (Local HART and EC Personality).

Hazardous Location Installation Requirements (ATEX)

- Read and understand this manual prior to installation and use.
- Use only certified M25 cable glands for installation.
- Shielded armored cable is required for CE compliance.



- **Special Conditions for Safe Use**
  - The following applies to the HART Barrier intrinsically safe circuits: For installations in which both the Ci and Li of the intrinsically safe apparatus exceeds 1% of the Co and Lo parameters of the associated apparatus (excluding the cable), then 50% of Co and Lo parameters are applicable and shall not be exceeded, i.e. the Ci of the device plus the C of the cable must be less than or equal to 50% of the Co of the associated apparatus, and the Li of the device plus the L of the cable must be less than or equal to 50% of the Lo of the associated apparatus.
  - For circuits connected to the EC barrier in which the capacitance and inductance exceed 1% of the permitted values, then the maximum permitted capacitance is limited to 600nF for group IIC and 1uF for group IIIC.
  - The connection to the HART circuit shall be rated a minimum of IP 6X.

Cautions

Cautions: Identify hazardous or unsafe practices which could result in damage to property or to the product.

Notes

Notes: Additional useful information.

Information

Honeywell Analytics assumes no responsibility for equipment that is not installed and used following the procedures in the Technical Manual.

The reader of this manual should ensure that the appropriate equipment has been installed. If in doubt, contact Honeywell Analytics.

Every effort has been made to ensure the accuracy of our documents, however, Honeywell Analytics can assume no responsibility for any errors or omissions in its documents or their consequences. Honeywell Analytics greatly appreciates being informed of any errors or omissions that may be found in the contents of any of its documents. For information not covered in this document, or if there is a requirement to send comments/corrections about this document, please contact Honeywell Analytics using the contact details given on the back cover of this document.

Honeywell Analytics reserves the right to change or revise the information supplied in this document without notice and without obligation to notify any person or organization of such revision or change. If information is required that does not appear in this document, contact the local distributor/agent or Honeywell Analytics.

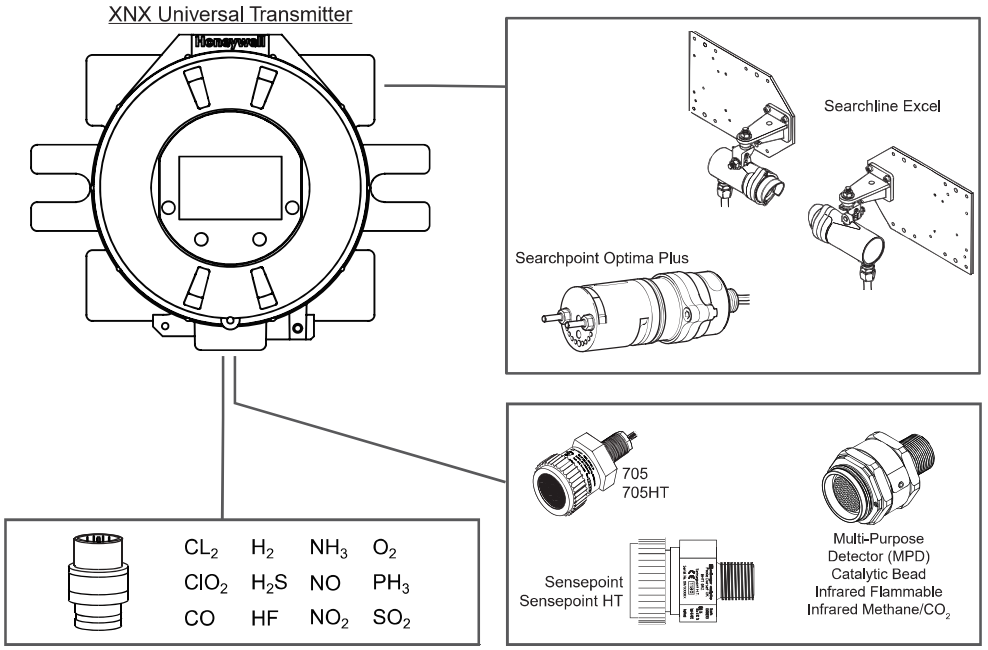
1 Introduction

1.1 Product Description

1.1.1 The XNX® Universal Transmitter

The XNX Universal Transmitter is a comprehensive gas detection system designed to operate in hazardous locations[1] and utilize multiple sensor technologies, catalytic bead, electrochemical (EC), or infrared (IR) to detect toxic gases, flammable gases, and oxygen depletion gas hazards. Each technology has a dedicated personality board.



Catalytic bead technology is used with the XNX mV personality board. Catalytic bead sensors respond to a wide variety of combustibles so are typically used for flammable gas detection.

Electrochemical technology is used with the XNX electrochemical board. EC sensors measure toxic gases in low concentrations. The XNX EC sensors employ the patented Reflex™ cell fault diagnosis routine. Reflex™ checks for cell presence, cell dry-out, and cell open or short circuit. Reflex™ is automatically initiated by the transmitter at eight-hour intervals. It is also initiated on power up or sensor exchange. In the event of a cell failing this test, a sensor fault code is displayed. Reflex™ diagnostics occur in the first minutes of the power up sequence.

Infrared technology is used with the XNX IR board. IR sensors optically absorb gases that fall into the infrared spectrum.

For additional information about any of the three sensor types, refer to the applicable data sheet for the supported sensor in Figure 1.

The XNX Universal Transmitter also allows for an optional communication board. There are three types of boards: relay, Modbus®, or Foundation™ Fieldbus. See Section 1.1. 2 Communications for additional information.

Personality	Sensor Type	Supported Sensors
IR	Point and Open-Path Infrared	Searchpoint Optima Plus, Searchline Excel
mV	Flammable and Toxic	705, 705HT, Sensepoint, Sensepoint HT, MPD (Catalytic Bead Flammable, IR Flammable and IR CO_2)
XNX EC	Toxic and O_2 Sensing	Electrochemical sensors, with Hot Swap, pre-calibrated through Intrinsically Safe (IS) barrier

Figure 1. XNX Universal Transmitter and supported sensing technologies

The XNX Universal Transmitter relies on 4-20mA output, refreshed at least every two seconds (once per second is typical), in which the output is proportional to the gas concentration.

[1]There are three main types of gas hazards: flammable, toxic, and asphyxiant. A flammable gas hazard is one in which there is a risk of fire and/or explosion (e.g., a situation in which a gas such as methane, butane, or propane is present). A toxic gas hazard is one in which there is a risk of poisoning (e.g., a gas such as carbon monoxide, hydrogen sulfide, or chlorine is present). An asphyxiant hazard would include a risk of suffocation through oxygen deficiency. (Oxygen can be consumed or displaced by another gas.)

1.1.2 20 mA/HART® Output

All XNX Transmitters provide a 20mA Current Loop with HART Digital Communication which can be user configured for Sink, Source (3-Wire) or Isolated (4-Wire) electrical interface based on installation requirements.

The 20mA current loop output provides an analog indication of special states, a proportional output to gas concentration and over range indication per the table below. In the event of a simultaneous alarm and fault, an alarm condition will always override a warning state.

Output	Description*	Notes
1.0 mA	Fault	Special State Indication
2.0 mA	Warm-up Inhibit Bump Test Calibration	
3.0 mA	Warning	
4-20 mA	Gas Concentration	
21 mA	Over Range	

*Alarm conditions always take priority over faults and warnings.

HART Protocol provides digital communications with the XNX from a remote control system for Configuration, Status and Diagnostics. (See Appendix A HART Protocol for additional information)

1.1.3 Communications

The XNX Universal Transmitter is registered with the HART Communication Foundation.

The transmitter uses HART over 4-20mA as the standard communications protocol. Additional optional communication interfaces are available: relay communication, Modbus, or Foundation Fieldbus. Each communication option has a dedicated option board. For additional information, refer to Section 1.3 Options.

1.1.4 Certifications

XNX-UT**-****** Versions are UL classified and CSA listed for installation in Class I, Division 1, Groups A, B, C and D Hazardous Locations. FM Approvals evaluation includes Class I, Zone 1, Groups B, C, D, as well as performance tests for specific sensor/transmitter combinations. CSA/FM certification does not cover daisy-chained XNX combustible gas transmitters, the use of HART, Modbus, or Foundation Fieldbus protocols for combustible gas performance. HART, Modbus, or Foundation Fieldbus protocols can be used only for data collection or record keeping with regards to combustible gas. The EC cartridge[2] and EC remote mount kit are UL classified to Canandian and US standards.

XNX-AM **-***** versions are certified to comply with the European Community ATEX Directive and the prescribed protection methods for installation in Potentially Explosive Atmospheres.

XNX-BT**.***** and XNX-UT**.***** versions are UL classified and INMETRO approved (TÜV Rhineland) for compliance with both U.S. and Brazilian standards.

See Section 6.2 for additional information on applicable approvals by part number and Section 6.2.1 for marking.

[2]"Cartridge" and "sensor" are used interchangeably in this document.

1.1.5 Patents

This table shows details about XNX-related patents.

Patents Applicable to the XNX Universal Transmitter		
Patent Number	**Description**	**Application**
6,123,818	Reflex patent	Implemented in XNX
6,251,232	Reflex patent	Implemented in XNX
6,351,982	Flammable sensor housing	XNX accepts this sensor
6,395,230	Pellistor	Sensor used in XNX
7,225,661	Gas calibration adapter	Applicable to XNX
7,716,962	Method of gas calibration	Used to calibrate XNX ECC cartridges

1.2 Product Overview

The XNX transmitter is comprised of the main parts shown below.

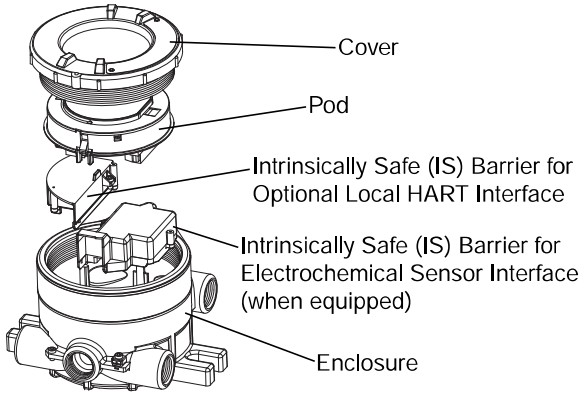


Figure 2. XNX Exploded View

A complete description of XNX accessories can be found in publication 1998-0807 XNX Universal Transmitter Parts List.

1.2.1 Enclosure

Available in either Stainless Steel or Aluminum, with 3/4" NPT (UL/CSA or UL/ INMETRO) or M25 (ATEX/IECEx only) threaded cable/conduit ports, the XNX Universal Transmitter enclosure is explosion-proof and suitable for use in -40°F to +149°F (-40°C to +65°C) operating conditions. A 5-coat marine finishing process provides the highest degree of corrosion protection. For more information on performance specifications, see Section 6 - Specifications.

The XNX enclosure is equipped with five threaded cable/conduit ports providing functional and flexible configurations based on sensor and option choices. See Figure 5 for cable/conduit port assignments and restrictions.

Stopping plugs (HA PN# 1226-0257 or 1226-0258) have been provided to seal unused cable/conduit ports and have been Agency evaluated/approved for use with the XNX enclosure only. The number of stopping plugs varies among available configurations.

Caution: The stopping plugs are for use only with the XNX Transmitter and should not be used with any other device.

Mounting lugs integral to the XNX enclosure allow easy installation on a flat surface or 2"-6" (50-150mm) diameter pipe with the optional Pipe Mount Kit or Ceiling Mount Bracket Kit.

1.2.2 Cover

The transmitter cover is supplied in the identical material specified for the enclosure.

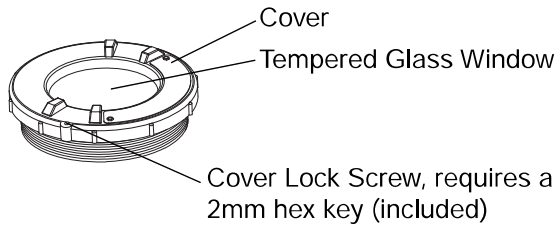

Figure 3. XNX components

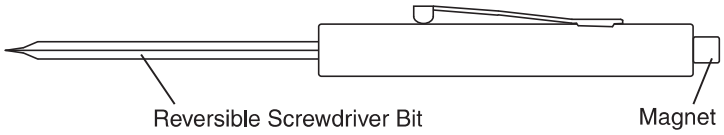
A tempered glass window requires the use of the supplied magnetic wand/screwdriver to activate the four user interface switches that are located on the front of the display module. This allows for non-intrusive setup and operation.

A locking screw integrated into the cover provides positive locking that can be removed by using the supplied 2mm hex key[3].



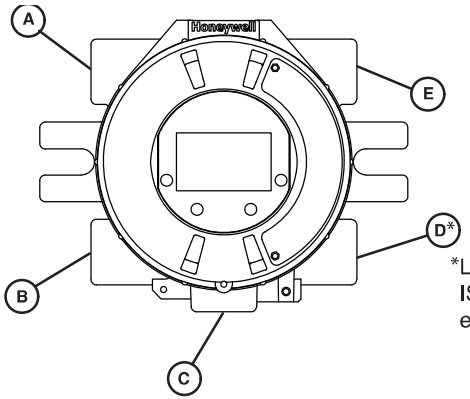


Figure 4. Magnetic Wand/Screwdriver

Note: When attaching the cover or stopping plugs, coat the threads to prevent corrosion.

[3]See the *XNX Universal Transmitter Parts List* (document 1998-0807) for a description of all of the parts that are shipped with the transmitter.

While relay wiring can use any available cable/conduit port in the XNX enclosure, do not use the same cable/conduit port for both relay reset and relay signal lines to avoid electrical noise.

*Limited access due to IS barrier if equipped with electrochemical cell.

Option	Position
Local HART Option	B
XNX Electrochemical Sensor - Local/Remote	C
MPD, 705 Series, Sensepoint Series	C
Searchpoint Optima Plus	A or E
Searchline Excel	Typically C
Remote Sensor Connection (except EC)	Any remaining
Searchpoint Optima Plus - Remote	Any remaining
Modbus	Any remaining
Relays	Any remaining
Power	Any remaining

Figure 5. XNX Universal Transmitter Cable/Conduit Port Assignments

1.2.3 POD

The POD (Personality, Options, and Display) encloses circuit boards for the personality module, optional interfaces, and display.

The personality module, or circuit board, determines the transmitter behavior based on the sensor type attached to the transmitter (electrochemical cell, catalytic bead sensor, or infrared) and provides the necessary interface. Connection to the attached sensor is made through the sensor connector accessed via a slot in the POD housing.

The optional communication boards vary depending on the option selected when ordered. Only one of the three available interface options (relays, Modbus, or Foundation Fieldbus) can be attached to the XNX transmitter.

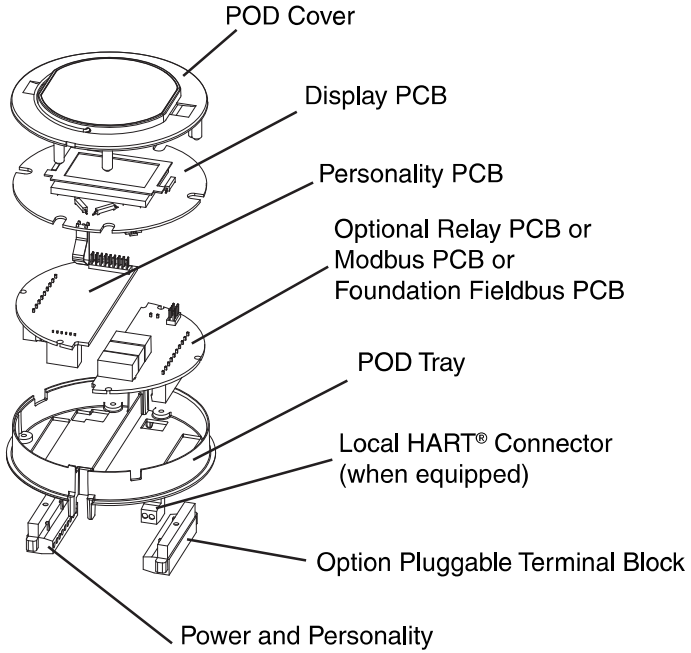

Figure 6. POD, exploded View

1.3 Options

1.3.1 Local HART

Available with any sensor technology or personality, an external access to the HART interface in the XNX transmitter is provided. An intrinsically safe (IS) barrier inside the transmitter gives the user full control using a hand-held interrogator for programming and configuration. The external interface is installed in the lower left cable/conduit port of the transmitter and is intrinsically safe. For more information, see Appendix A - HART Protocol.

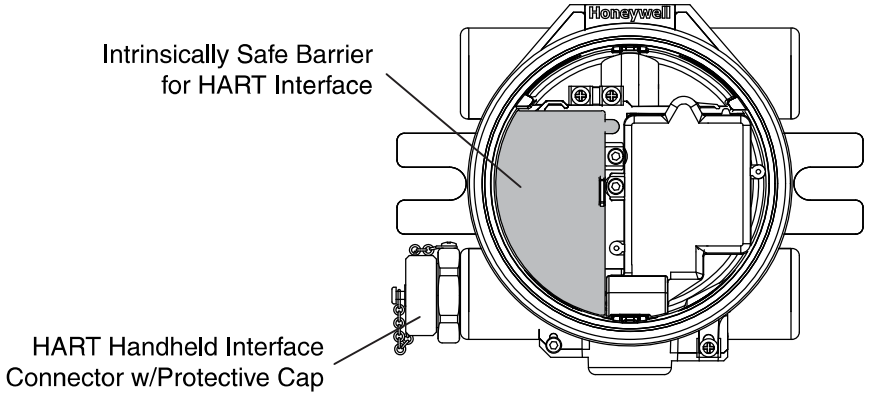

Figure 7. XNX Universal Transmitter with HART Interface IS Barrier

1.3.2 Relays

The relay option (XNX-Relay) provides 3 form “C” (SPDT) normally open/normally closed (NO/NC) contacts for alarm and fault indication. A remote reset input is provided (TB4). Momentarily closing the the circuit between the pins of TB4 performs the same function as the Reset Alarms & Faults command.

The XNX transmitter has three relays: relay 1 is for alarm level 1, relay 2 is for alarm level 2, and relay 3 is for faults and special

states. Two alarm levels can be set, allowing, for example, a level 1 alarm for the immediate area when a certain gas concentration is detected and a plant-wide level 2 alarm when a greater gas concentration is detected.

The maximum refresh rate of the relays is 2 seconds. See Set Alarm Values for more information.

1.3.3 Modbus

The optional Modbus interface allows the XNX to connect to a bus of devices and transmit data to PLCs or controllers. (For more information, see the Modbus Protocol Manual). Connections to the XNX are made through a pluggable terminal block on the Modbus interface circuit board. Modbus RTU protocol uses ASCII/Hex protocols for communication.

Note: POD options are either relay, Modbus, or Foundation Fieldbus.

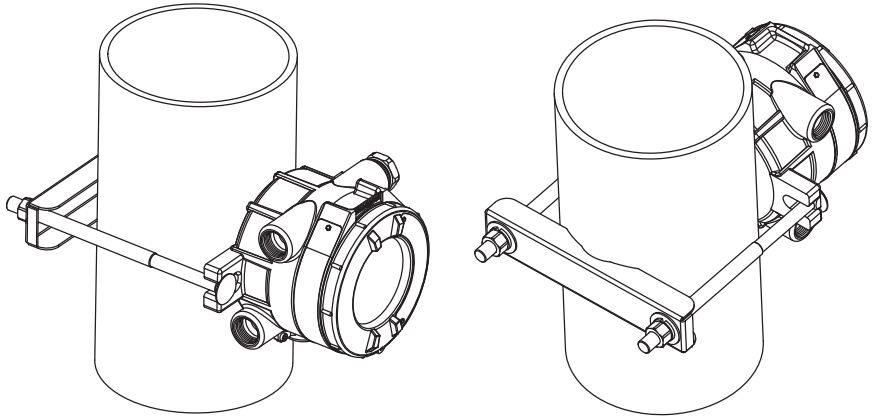
1.3.4 Foundation Fieldbus

Foundation Fieldbus is a digital communication system which supports several types of messages. Unlike many traditional systems which require a set of wires for each device, multiple Foundation Fieldbus devices can be connected with a single set of wires. Foundation Fieldbus overcomes some of the disadvantages of proprietary networks by providing a standardized network for connecting systems and devices.

1.3.5 XNX Accessories

Pipe Mount Kit

The Pipe Mount kit (1226A0358) allows the XNX to be mounted to pipe from 2”-6” (50-150mm) in diameter. The kit includes the pipe mount bracket, two carriage bolts, nuts, and lock washers.



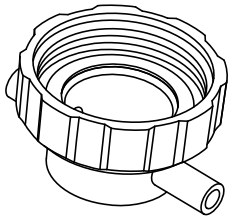


Figure 8. Pipe-mounted XNX Transmitters

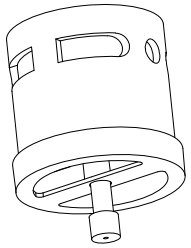
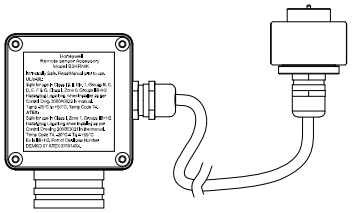
Calibration Gas Flow Adapter



The calibration gas flow adapter is used to apply calibration test gas to the sensor. It attaches to the bottom of the sensor and can be fitted without removing the weatherproof cover. See Section 3 - Calibration for further details on gas calibration.

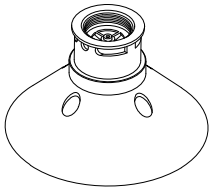
Sensor	Flow Adapter P/N
XNX EC	S3KCAL
MPD	1226A0411
Sensepoint	02000-A-1645
705	00780-A-0035



Weatherproof Cap

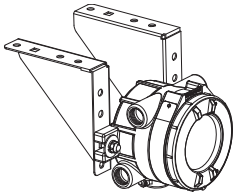
The weatherproof cap protects XNX sensors from harsh weather.

Sensor	Weatherproof Cap P/N
XNX EC	Included
MPD	02000A1640
Sensepoint	02000-A-1640
705	00780-A-2076
MPD-*TCB1	SPXCDWP (included)



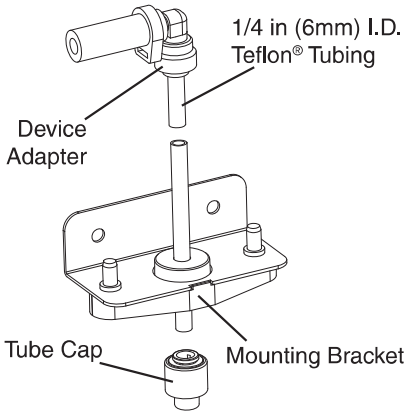
Remote Sensor Mounting Kit for XNX EC Sensors

The remote sensor mounting kit (S3KRMK) allows XNX EC sensors to be remotely mounted via an IS cable kit, up to 50 feet (15 meters) from the transmitter. The kit includes 50 feet of shielded cable, cable glands, and remote terminal box. The cable can be cut to the required length then terminated at the remote terminal box.



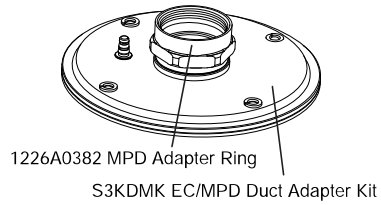
Collecting Cone

The collecting cone improves detection of lighter-than-air gases such as hydrogen and methane.



Sensor	Collecting Cone P/N
XNX EC	S3KCC
MPD	02000-A-1642
Sensepoint	02000-A-1642
705	02000-A-1642

Ceiling Mount Bracket Kit



The optional Ceiling Mount Bracket Kit (1226A0355) allows the XNX Transmitter to be mounted to the ceiling. The kit includes two stainless steel ceiling mount brackets, bolts, and nuts.

Remote Gassing Kit

The Remote Gassing Kit (1226A0354) enables gas to be applied remotely for performing functional response checks (bump tests). The kit Includes: 50’ Teflon® tubing, a mounting bracket, a tube cap, and device adapters in 1/4” and 1/8” (6.3 mm and 3.2 mm) ID to attach to bump test ports on the weatherproof cap of the device.

Duct Mount Kit

The duct mounting kit (S3KDMK) can be used with the EC sensor to allow detection of O_2, CO, H_2 and H_2S gases in ducts. When combined with the MPD Interface Adapter (1226A0382), the duct mounting kit can accommodate the MPD to detect flammable gases in a duct application. The duct mount kit includes the adapter, gasket and required fasteners. The MPD Interface Adapter includes only the adapter and requires the S3KDMK duct mount kit.

Weather Protector

The Extreme Weather Protector (SPXCDWP) is designed to protect the sensor from environmental conditions in outdoor exposure applications.

1.4 The XNX Front Panel

The XNX Transmitter uses magnetic switches to enable non-intrusive operation. To activate a magnetic switch, hold the magnetic end of the screwdriver up to the glass window and slowly swipe the magnet directly over the shaded area.

For best results, hold the screwdriver as illustrated in Figure 9.

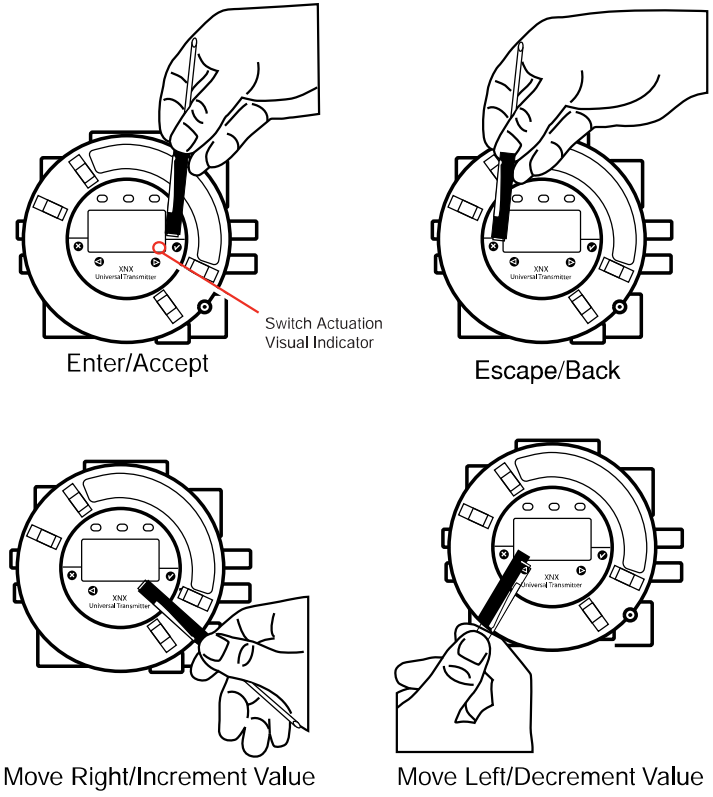


Figure 9. Using the magnetic wand

A decal illustrating the proper method for actuating the magnetic switches is placed on the POD of each transmitter.

Figure 10. Operation decal

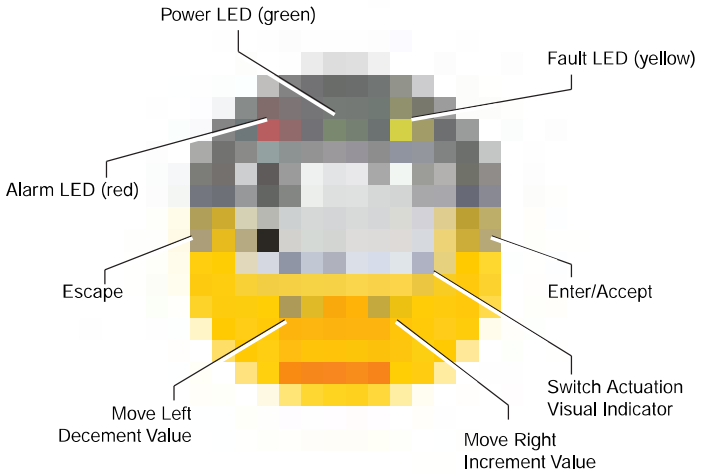

Figure 11. Front panel display of the XNX transmitter

The switch is actuated by the flux lines between the poles of the magnet. This actuation method provides the most consistent response.

A visual indication of the switch actuation will appear in the lower right corner of the XNX display each time the switch is activated.

In some menus where displayed values can be changed, the magnet must be swiped over the switch to cause the numeral on the display to advance through the available values. Use the ⊗ switch to return to a previous menu or field.

For the purposes of this manual, the instruction to use ✓, ⊗, ◀ or ▶, means to activate the relevant magnetic switch as described above.

1.4.1 Controls and Navigation

Command	Description
✓ Enter/Accept	The Enter/Accept switch is used to access menus, accept changes and to answer “yes” to system prompts.
⊗ Escape/Back	The Escape/Back switch is used to return to previous menus or to answer “no” to system prompts.
◀ Move Left/ Decrement Value	The Left/Decrement arrow is used to move through menu options or decrement values when entering text or numbers.
▶ Move Right/ Increment Value	The Right/Increment arrow is used to move through menu options or increment values when entering text or numbers.

1.4.2 The General Status Screen

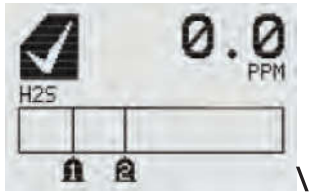

Figure 12. General Status screen[4]

The General Status Screen shows the status of the XNX Transmitter.

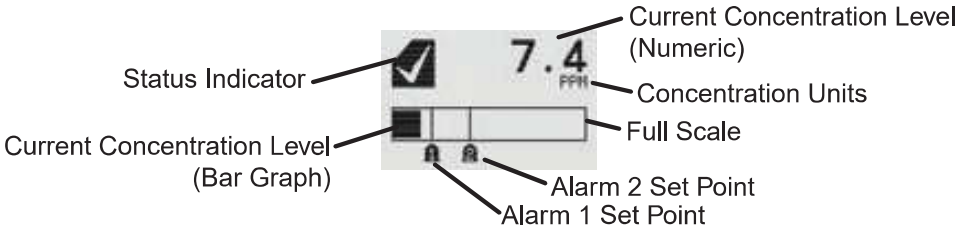

Figure 13. General Status screen, normal operating mode

The Normal Operating Mode icon ☑ indicates proper operation. The XNX display also shows the concentration level of the target gas in two ways. In the first, a numeric value is shown in the upper right corner of the display in the units selected (ppm, %LEL, %VOL). The second concentration display is shown in the form of a bar graph representing the current concentration against full scale and in relation to the defined alarm levels. For more information on setting range and alarm levels, see Section 2.6.2 Range/Alarm Settings. See Section 6.2.2, Section 6.2.3, and Section 6.2.4 for negative drift and zero deviation values.

[4]The LCD screen's refresh rates are 500 milliseconds (when the LCD heater is off) and 1 second (when the heater is on).

When a warning is triggered, the warning icon ⚠ appears and information is displayed on the General Status Screen. The information displayed alternates between screens displaying the gas concentration and the warning code. See Section 5 - Warnings/Faults for more warning code information.

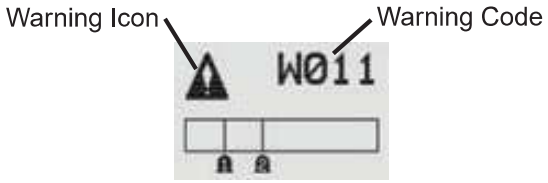

Figure 14. General Status Warning detail

If the Fault icon ⊗ is displayed, a fault condition has been triggered and the display will alternate between the target gas concentration and the fault code. See Section 5 - Warnings/Faults for more fault code information.

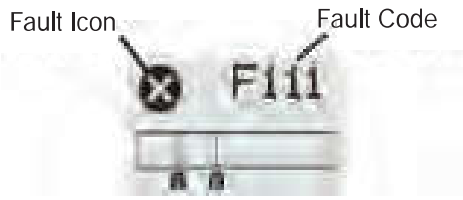

Figure 15. General Status Fault detail

In the event of multiple warnings or faults, the user can view all messages with the transmitter's Event History function.

When an Alarm icon 🔔 is displayed, the target gas concentration exceeds one or both preset alarm levels. The General Status Screen displays the gas concentration and the alarm level exceeded.

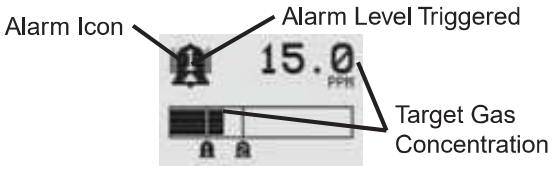

Figure 16. General Status Alarm detail

In an over range condition, the alarm icon will display and the target gas concentration bar graph and alarm setpoints will flash.

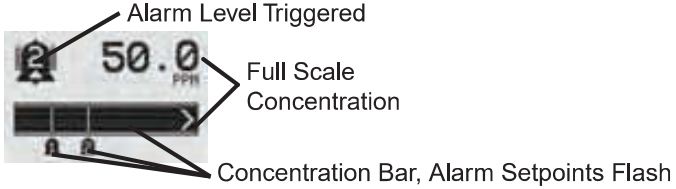

Figure 17. General Status Over Range detail

Negative values are not displayed and do not appear on the 4-20 mA output, but they are indicated by faults or warnings when preset thresholds are exceeded. (See zero deviation in Section 6.1.1)

In addition to the graphic alarm, fault, and warning indicators, the LEDs on the front panel flash in these patterns based on the condition:

Condition	LED[1]		
	Red	Green	Yellow
Alarm 1	Solid		
Alarm 2	Flashing		
Warning			Solid
Fault			Flashing[2]
Health		Flashing	

[1]The refresh rate of the LEDs is 0.5 second.

[2]Special states (Warmup, Inhibit) are not indicated by the Fault LED.

1.4.3 Entering the Menu Structure

Swiping the magnet over the magnetic switch ✓ or ✗ allows the user to reset faults or alarms, display current settings, or make adjustments to the device.

Note: If the Easy Reset option is set to Lock, alarms and faults cannot be reset without logging in or entering a passcode. For more information, see Section 2.5.1 Configure Security.

Swiping the ✗ or "escape" magnetic switch activates the Alarm Re-set screen and allows alarms to be silenced and faults to be reset.

The ✓ switch resets all alarms and faults and returns to the General Status Screen. Use the ✗ switch to return to the General Status Screen without resetting the alarms and faults.

Figure 18. Alarm Reset screen

Two authorization levels control access based upon the security level of the user: Level 1 (routine maintenance) and Level 2 (technician and password administrator). The default passcodes for both levels are "0000" and must be reset after installation to control access (see Section 2.5.1 Configure Security). In general, access to neither security level restricts the user to viewing the transmitter's display. If desired, the Easy Reset from Main Status option allows alarm and fault resets without requiring access to either security level.

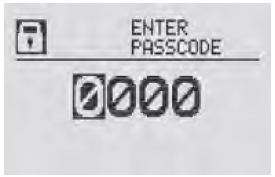

Figure 19. Passcode screen

Warning: The factory-set passcodes must be reset to prevent unauthorized access to the transmitter's menus.

When the Passcode Screen is displayed, the first passcode digit is highlighted. Use the ◀ ▶ switches to increment or decrement through the values. Once the correct value is displayed for the first digit, ✓ accepts the value and moves to the next digit or ✗ moves to the previous digit of the passcode.

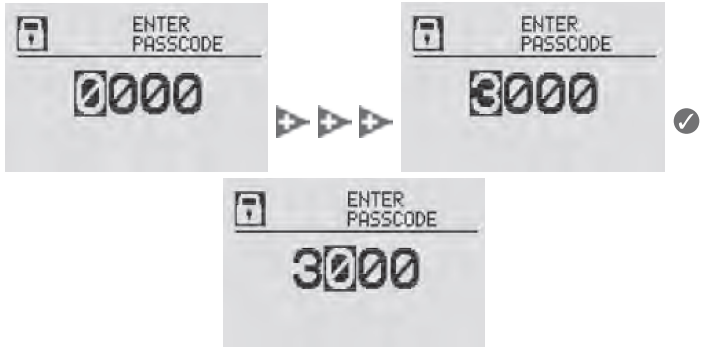

Figure 20. Entering the passcode

Repeat for each of the remaining digits in the passcode. If the passcode is not entered correctly, the Invalid Passcode screen is displayed and the user is returned to the General Status screen.

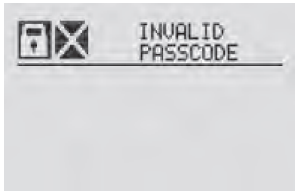

Figure 21. Invalid Passcode screen

1.4.4 Displaying Transmitter Information

While in the General Status display, swipe the magnet over the magnetic switch ▶ to display information about the transmitter. The General Status display will replace the bar graph in the lower portion of the screen with the unit's serial number, the date and time, and the unit's part number.

Figure 22. General Status Screen with Unit Information

1.5 Main Menu

Once the proper passcode has been entered, the transmitter displays the Main Menu.

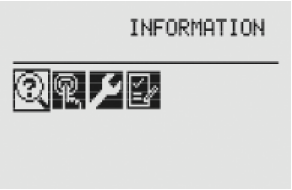

Figure 23. The Main Menu

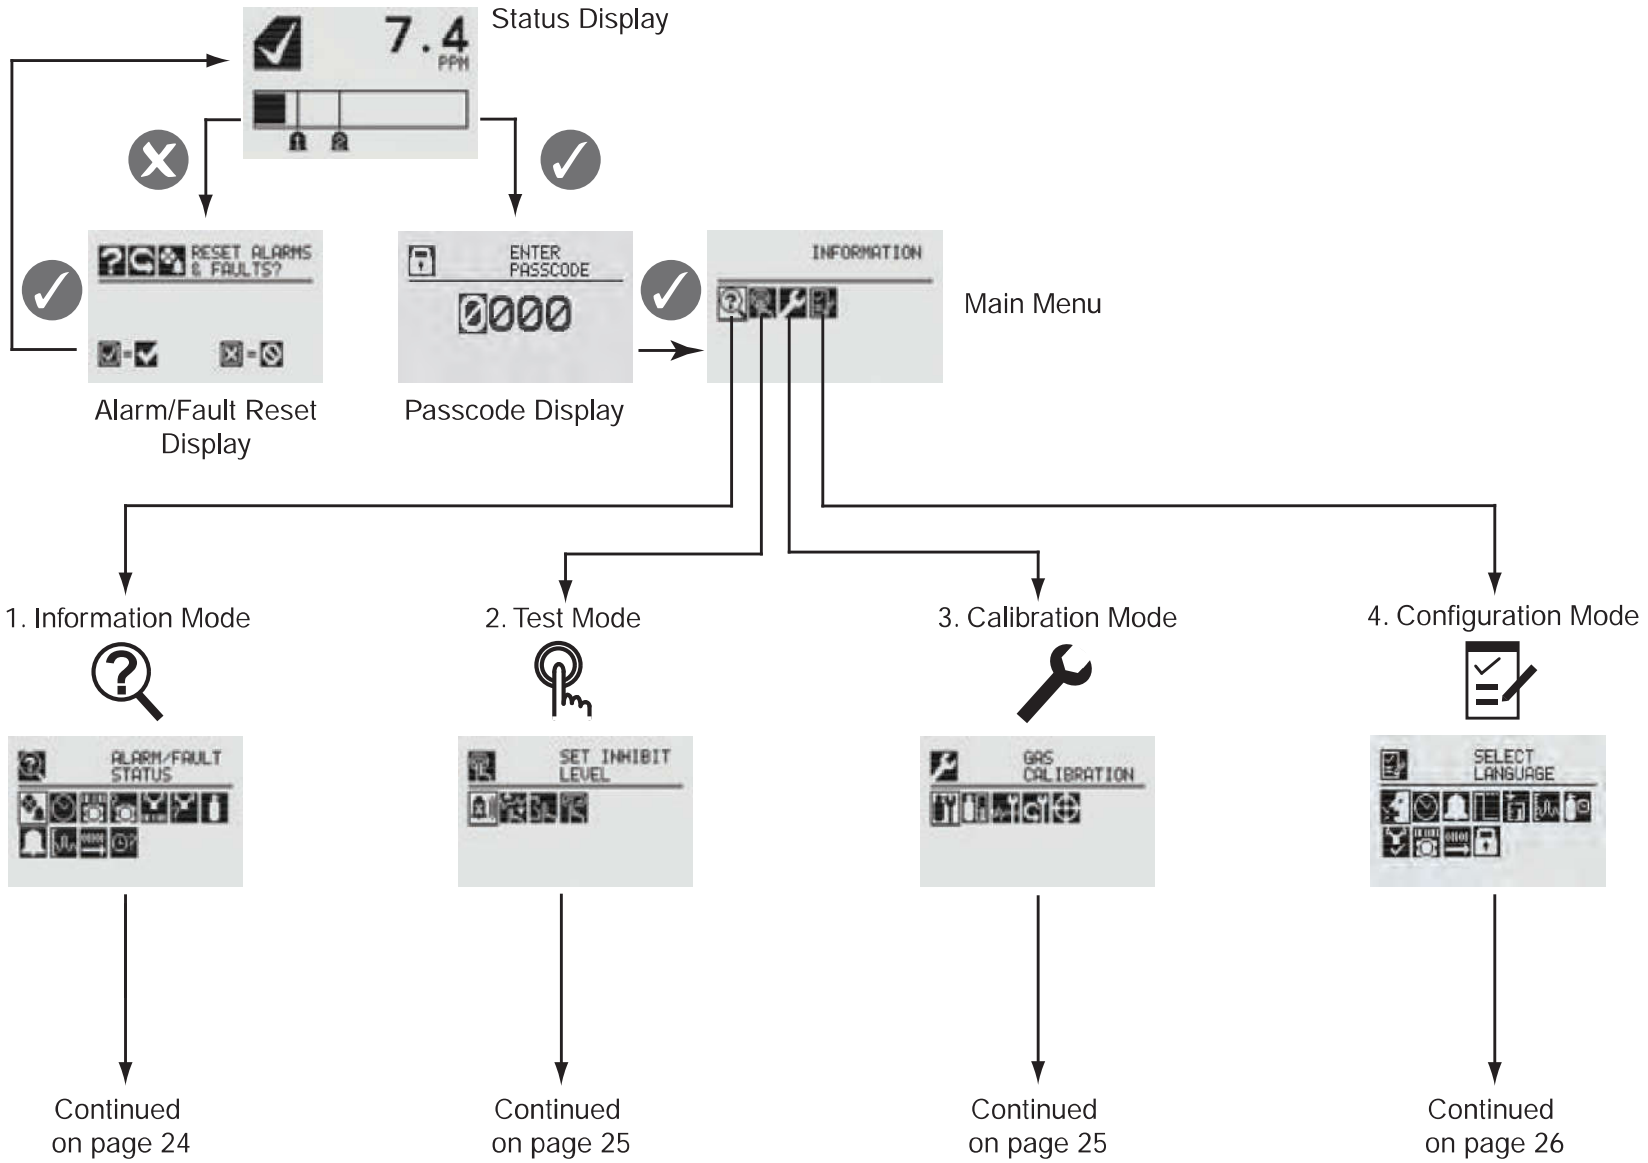
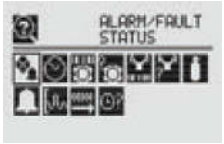


From the Main Menu, a Level 1 user can:



- display the current settings/configuration
- test the transmitter
- calibrate and bump test the transmitter
- configure the unit for language, date and time

The Main Menu consists of these options:

Menu		Description	See Section...
	Configure	Provides access to settings to configure the transmitter and connected devices	2.5.1
	Test	Provides access to tools and settings to allow simulation of gas events to test the system	2.6.1
	Information	Displays current settings for the XNX transmitter including optional relays and Modbus	2.6.2
	Gas Calibration	Displays the XNX interface to calibrate sensors attached directly to the transmitter	3.1

Honeywell

2 Installation and Operation

2.1 Mounting and Location of Sensors

Caution: Locate transmitters and sensors in accordance with relevant local and national legiislation, standards, and codes of practice.

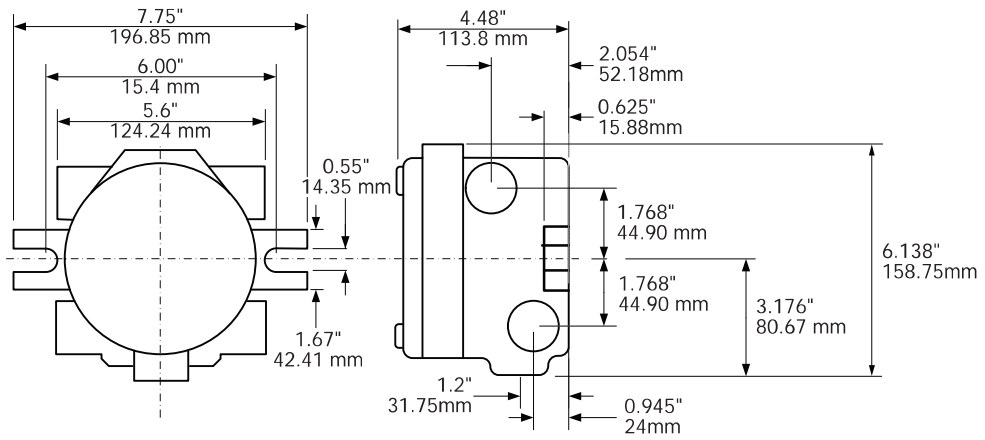
The placement of sensors should be determined following the advice of experts having specialist knowledge of gas dispersion, experts having knowledge of the process plant system and equipment involved, and safety and engineering personnel. The agreement reached on the location of sensors should be recorded. Consider these factors when locating gas sensors:

- possible damage caused by natural events such as rain or flooding
- ease of access for functional testing and servicing
- how escaping gas may behave due to natural or forced air currents.

2.1.1 Mounting the XNX® Universal Transmitter

The transmitter can be mounted in a number of ways using the integral mounting tabs. The transmitter can be attached to flat wall surfaces or to Unistrut®. With the optional Pipe Mount kit, the unit can be mounted to pipe of diameter 2” to 6” (50 to 150mm). A ceiling mount bracket kit (1226A0358) is also available.

Note: Agency certifications require that EC and mV sensors face down. Optima sensors must be mounted horizontally.



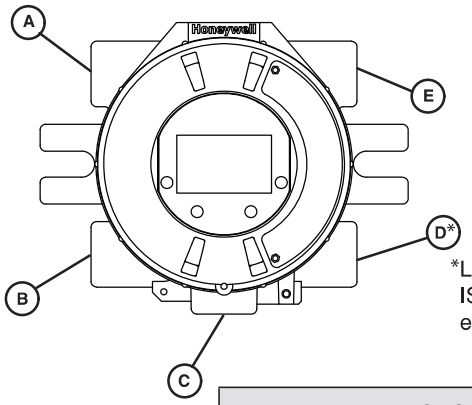


Figure 24. XNX Universal Transmitter mounting dimensions and clearances

Warning: When the transmitter is equipped with the optional Remote Mount Kit, the remote sensor **must** be securely mounted in a fixed position. The Remote Sensor kit is not intended to be used as a hand-held sensor.

The transmitter is configured with five cable/conduit ports built into the housing for wiring and mounting sensors. Figure 25 provides the guidelines to proper installation of the XNX.

While relay wiring can use any available cable/conduit port in the XNX enclosure, do not use the same cable/conduit port for both relay reset and relay signal lines to avoid electrical noise.

*Limited access due to IS barrier if equipped with electrochemical cell.

Option	Position
Local HART® Option	B
XNX Electrochemical Sensor - Local/Remote	C
MPD, 705 Series, Sensepoint Series	C
Searchpoint Optima Plus	A or E
Searchline Excel	Typically C
Remote Sensor Connection (except EC)	Any remaining
Searchpoint Optima Plus - Remote	Any remaining
Modbus	Any remaining
Relays	Any remaining
Power	Any remaining

Figure 25. XNX Universal Transmitter cable/conduit port assignments

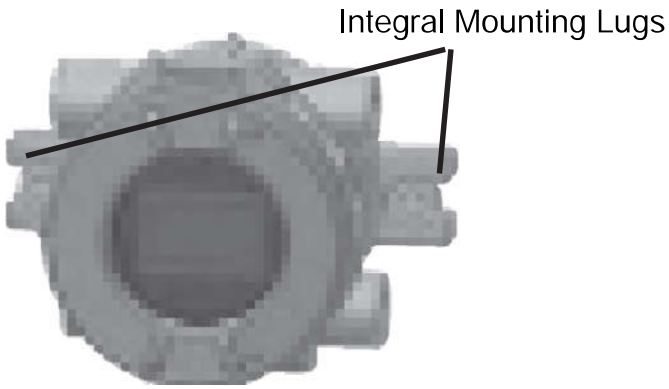

Figure 26. XNX Universal Transmitter mounting lugs

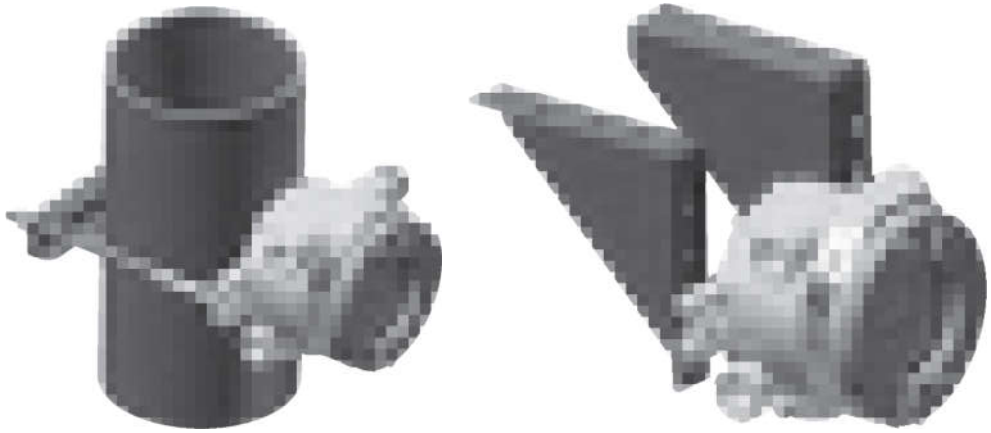

Figure 27. Optional pipe and ceiling mounts

2.2 Wiring the XNX Transmitter

The XNX transmitter is available in sensor technologies, or personality options, which support a variety of sensors and applications. Each of the personalities use dedicated interface boards. Pluggable terminal blocks are used for easy connection and service. The personality boards and optional communication interfaces are enclosed in plastic housings comprising the electronics POD (**P**ersonality, **O**ptions, and **D**isplay). The Personality circuit board determines the XNX behavior based on the sensor type attached to the XNX interface (Figure 35). See Specifications for drift and zero deviation values.

This table illustrates the three XNX transmitter configurations and the sensors each support.

XNX IR Personality		XNX EC Personality
		
Searchline Excel	Searchpoint Optima Plus Local/ Remote	XNX EC Sensor
Generic mA Sensors		XNX EC Sensor Remote Mount Kit

XNX mV Personality		
		
705 Local / Remote	MPD Local (cat bead and IR)	Sensepoint Local / Remote
705HT Local / Remote	MPD Remote	Sensepoint PPM Local/Remote
		Sensepoint HT Remote

Figure 28. XNX Transmitter personalities

Caution: Before wiring the transmitter, confirm that the correct personality and communication boards are installed.

2.2.1 General Wiring Considerations

For proper operation of the XNX Universal Transmitter and sensor technologies, consideration of wiring-induced voltage drops, transient electrical noise, and dissimilar earth ground potentials is imperative in the design and installation of the system.

EMI note for applications using shielded cable: Cable shield must provide 90% coverage of the wiring. Cable shield terminations must be made at the cable glands with suitable EMI-type glands. Avoid terminating cable shields at the earth ground lug inside the XNX enclosure.

Loading

When wiring for DC power, 4-20mA signal, remote wiring to sensors must be sized sufficiently to provide adequate voltages for the line length and the loads that will be used.

Isolation

Isolating power and signal carrying conductors is recommended.

Circuit Protection

Supply circuits must provide over current protection. Class 2 power supplies are required for 24 volt DC supply. Consider inrush current in specifying any DC supply. Power supply range

is 16 to 32 VDC for EC and mV versions, 18 to 32 VDC for Searchpoint Optima Plus and Searchline Excel, and 16 to 32 VDC depending on the limitations of the device for the generic 4-20mA input.

Loads

The use of high inrush or inductive loads may affect the performance of the transmitter. For best reliability use resistive loads only.

2.2.2 Distance Considerations for Installation

Providing power to the transmitter is the factor that will determine the maximum distance of the installation. The 4-20 mA output signal will easily handle the distance back to the control equipment.

The primary factors determining distance are the minimum operating voltage of the transmitter and/or sensor; the maximum current draw of the transmitter/sensor, the resistance of the wire used, the power supply voltage, and the current capacity of power supply.

An additional consideration is the type of installation; specifically, how many transmitters/sensors are drawing power from the same power supply and whether these transmitters are using the same pair of wires (“daisy-chain”) or have their own connections.

Types of Installations

There are three basic types of installation: a single transmitter; multiple transmitters connected to a single power source; and multiple transmitters connected in a “daisy-chain” configuration.

Single Transmitter

This is the simplest type of installation. It consists of a single XNX transmitter installation per power source.

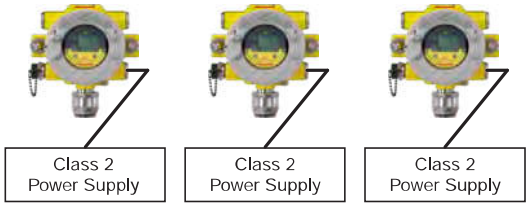

Figure 29. Single Transmitter Installation

Advantages:

- Maximum distance between power source and transmitter
- Smaller power source
- If a power source fails, only one monitoring point fails.

Disadvantage:

- Multiple transmitters require multiple power sources.

Multiple Transmitters Connected to a Single Power Source

This is two or more transmitters sharing a single power source with each transmitter having its own dedicated wiring to the power source.

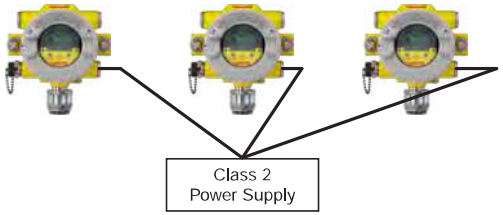

Figure 30. Multiple Transmitters Powered by a Single Power Supply

Advantages:

- Maximum distance between power source and transmitters

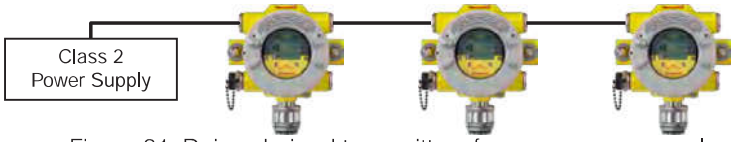
- Fewer power sources.

Disadvantages:

- Larger power source will be needed
- If a power source fails, several monitoring points fail.

Multiple Transmitters Connected in a "Daisy-Chain" Configuration

This configuration consists of two or more transmitters installed in a line. The power connections are installed as an extension of the previous transmitter, with the first transmitter being the only one actually wired to the power source.



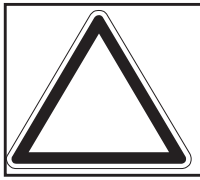


Figure 31. Daisy-chained transmitters from one power supply

Advantages:

- Less wire needed for installation
- Fewer power sources.

Disadvantages:

- Requires a larger power source
- Shorter distance between power source and transmitters.
- If a power source fails, several monitoring points fail.

Note: CSA/FM certification does not cover daisy-chained XNX combustible gas transmitters.

Power Source Selection

For each type of installation, selection of power supply is important. Power supplies are rated by voltage and power. The nominal voltage for all XNX transmitters is 24V with the power required depending on the number of points using the same power supply.

XNX Universal Transmitter Maximum Power Consumption				
Configuration	-40°C to +65°C		-10°C to +65°C	
	HART over 4-20mA (watts)	HART over 4-20mA with Relay, Modbus®, or Foundation™ Fieldbus (watts)	HART over 4-20mA (watts)	HART over 4-20mA with Relay, Modbus, or Foundation Fieldbus (watts)
XNX with toxic sensors	5.1	6.2	3.4	4.5
XNX with catalytic sensors	5.4	6.5	3.7	4.8
XNX with infrared cartridge	5.4	6.5	3.7	4.8
XNX with Searchpoint Optima Plus	8.6	9.7	6.9	8.0
XNX with Searchline Excel	12.1	13.2	10.4	11.5

As a general guideline, the power supply should be capable of providing more power than is required by the installation. A 10 watt power supply is fine for a single XNX mV with catalytic sensor (6.5 watts required, see the following table) but is inadequate for a single XNX IR with Searchpoint Optima Plus (10 watts required).

To determine the wattage required, add the maximum power requirements of all the points that will share the power supply. For example, consider a system with two XNX mV transmitters with catalytic sensors (6.5 watts each) and one XNX IR with

Searchpoint Optima Plus (10 watts). A 25 watt power supply would probably handle this installation, but a 30 watt power supply would be a better choice.

Wire Selection

The type of wire used for connections has an effect on the distance of the installation. This is because some of the voltage is lost in the wire on the way to the transmitter.

Thinner wire (i.e., 18 AWG) will lose more voltage than thicker wire (i.e., 12 AWG). The amount of voltage lost depends on how much power is being drawn through the wire; more power means more loss. If too much voltage is lost in the wiring, there may not be enough at the distant point to allow the transmitter to operate.

Distance Chart for Single Transmitter Distances

For installations that have dedicated wiring between the transmitter and the power supply, use the following chart. These distances assume stranded wire is used. If multiple transmitters are using the same power supply, make sure the power supply wattage rating is high enough to power all transmitters simultaneously.

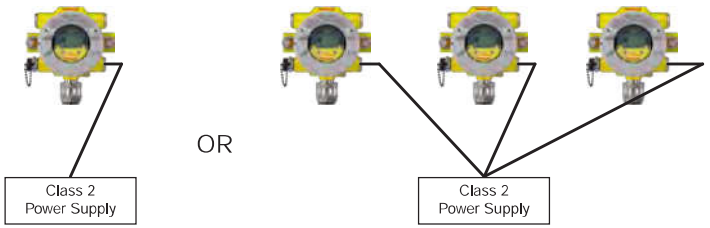

Figure 32. Single transmitter distances

Single Transmitter Distances				
Configuration	**18 AWG [1.0 mm2]**	**16 AWG [1.5 mm2]**	**14 AWG [2.0 mm2]**	**12 AWG [3.5 mm2]**
XNX mV or EC With Sensor	1140 feet [347 meters]	1810 feet [551 meters]	2890 feet [880 meters]	4620 feet [1408 meters]
XNX IR with Searchpoint Optima Plus	660 feet [201 meters]	1060 feet [323 meters]	1690 feet [515 meters]	2690 feet [820 meters]
XNX IR with Searchline Excel	550 feet [168 meters]	890 feet [270 meters]	1410 feet [430 meters]	2260 feet [690 meters]

Daisy-Chained Transmitter Distances

It is difficult to calculate distances for this configuration. There are many factors to be considered: distance from control room to first transmitter, distance between transmitters, sensor types, etc. A few scenarios are presented here to provide a base to work from.

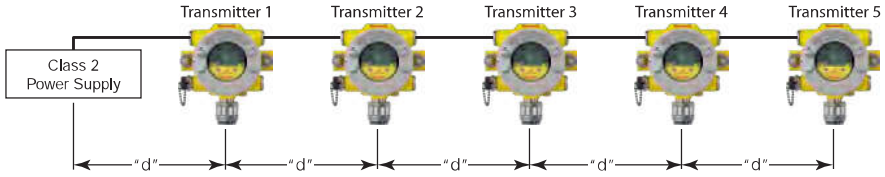

Figure 33. Daisy-chained transmitter distances

1. Several transmitters equally spaced from themselves and the power source.

2 Transmitters - Distance "d"				
Configuration	**18 AWG [1.0 mm2]**	**16 AWG [1.5 mm2]**	**14 AWG [2.0 mm2]**	**12 AWG [3.5 mm2]**
XNX mV or EC With Sensor	380 feet [115 meters]	600 feet [183 meters]	960 feet [292 meters]	1540 feet [469 meters]
XNX IR with Searchpoint Optima Plus	220 feet [67 meters]	350 feet [106 meters]	560 feet [170 meters]	900 feet [274 meters]
XNX IR with Searchline Excel	185 feet [56 meters]	295 feet [90 meters]	470 feet [143 meters]	750 feet [229 meters]

Ensure that wiring is adequately protected from mechanical failure in installation. Specific shorted or open circuit conditions of wiring to the MPD **I sensors may result in full scale concentration readings prior to, or preventing the internal diagnostic routines from identifying the external installation fault.**

2.2.3 POD Connections

This illustration shows the connections available on each of the terminal blocks for each type of personality board.

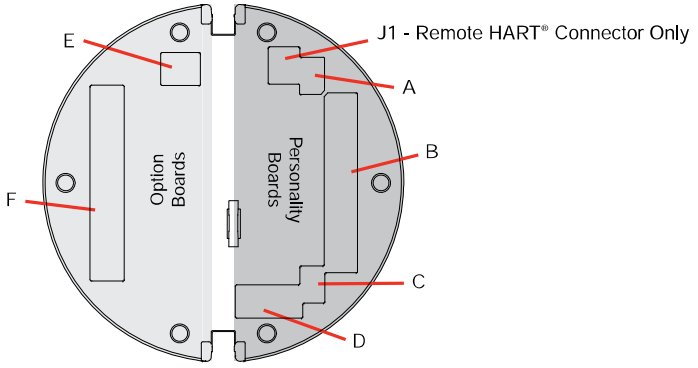

Figure 35. XNX Personality Board Terminal Block Legend

Each of the personalities use a single terminal block for connection with the exception of the IR personality, which requires a second terminal block.

The personality boards also provide a dedicated pair of jumper switches to define output of the transmitter as isolated 4-20mA, Sink 20mA, or Source 20mA as well as a service jumper to allow power to the loop to continue when the transmitter is being serviced. A separate connector is used to activate local HART (see Section 2.3.1).

Local HART provides an external access to control the transmitter. An intrinsically safe (IS) barrier inside the transmitter allows the user to attach an external hand-held interrogator for programming and configuration. The external interface is intrinsically safe. It is installed in the transmitter's lower left cable/conduit port.

Table A

Board Type	Function		S1	S2

Foundatin Fieldbus	SW5	Simulation Mode

Table F

Board Type	Connection	Function
Relay	TB3	Relay Output
Modbus	TB3	Data Connection
Foundation Fieldbus	TB3	Data connection

Note: Open loop faults are not available due to HART, Modbus, and Foundation Fieldbus interfaces where a 4-20 signal cannot be used. In this case, open loop, 0mA must be used as the diagnostic.

The Option circuit boards vary depending upon the option selected when ordered. Only one of the three available interface options (relays, Modbus, or Foundation Fieldbus) can be attached to the XNX transmitter. When installed, connections to the options are made to connectors at the bottom of the POD.

2.2.4 4-20mA Output, Common Connections, and Power Settings

The XNX Universal Transmitter allows the user to configure the 4-20mA output to Sink, Source, or Isolated mode operation via two programming switches on the POD[1]. The Switch Configuration table shows the S1 and S2 setting and corresponding output configuration.

Switch Configuration		
Mode	**S1**	**S2**
Source	Down	Up
Sink	Up	Down
Isolated	Down	Down

Most controllers in the market will accept source-configured devices. Sink-configured signals are used in older technology controllers, which reduce the need for complete system upgrades.In isolated-signal devices, if the controller fails or the mA signal wires are disconnected or broken, the field device will remain operational. Most controllers in the market will accept isolated configured devices.

Power and 4-20mA connections are made at TB-1 and are identical for the EC, IR, and mV Personality Boards. For user convenience, a second set of +Ve and -Ve power terminals have been provided to eliminate the need for a secondary junction box in multi-node systems when used with the supplied terminal jumpers.

The total load resistance for the 4-20mA output should be kept lower than 500Ω, including the resistance of the properly selected 4-20mA cable and input impedance of the equipment to be connnected. The minimum loop impedence is 200 ohms; the maximum is 500 ohms. If the 20 mA output is not used, a 500 ohm resistor must be installed.

The XNX Universal Transmitter power consumption is dependent on the sensor and options for the specific configuration. For proper operation, the input voltage must be maintained at 16 to 32 VDC for EC and mV units and 18 to 32 VDC for IR units.

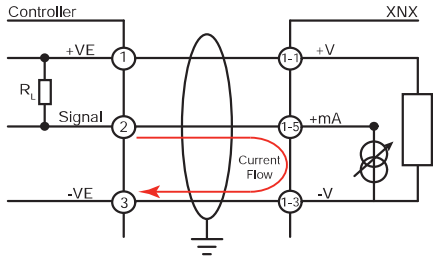

Figure 36. Sink wiring for XNX

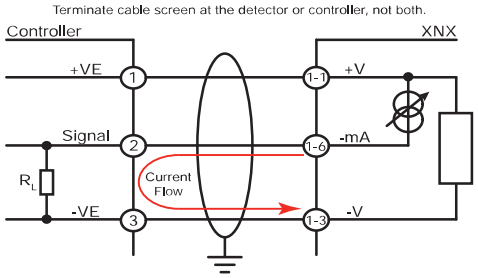

Figure 37. Source wiring for XNX

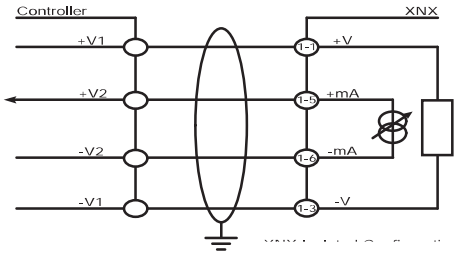

Figure 38. Isolated wiring for XNX

1 The 4-20 mA output state is refreshed at least every two seconds (once per second is typical).

Labels applied to the back of the POD identify each of the connection points.

Note: Pins 2 and 4 of terminal block TB1 have no internal connection on the personality board. When used with the terminal block jumpers, pins 2 and 4 can provide additional 4-20mA connections or supply power for daisy-chained units.

2.2.5 Foundation Fieldbus Wiring

Foundation Fieldbus connections to the XNX transmitter are made through a pluggable terminal block on the Foundation Fieldbus option board, shown in Figure 39. A simulation switch (SW5) is included on the board to enable/disable simulation mode. Terminals 3-1 through 3-4 are provided to facilitate bus wiring; there is no internal connection to other XNX circuitry. Terminal 3-1 is connected internally to 3-2. Similarly, terminal 3-3 is connected internally to 3-4.

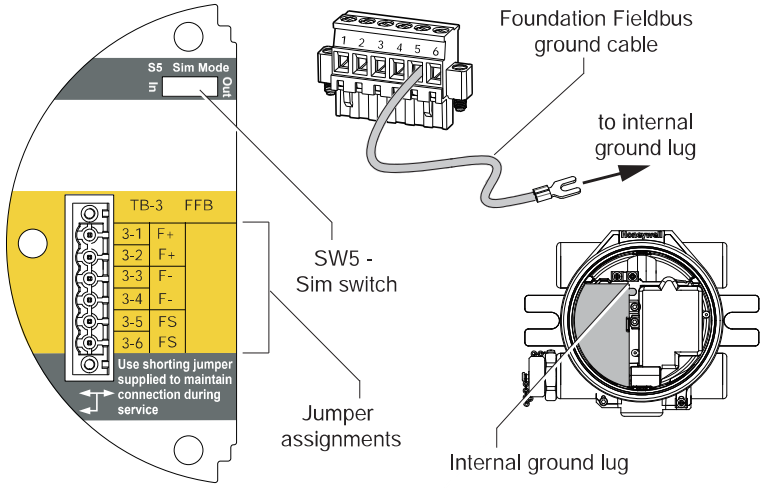

Figure 39. XNX Foundation Fieldbus option board and terminal block

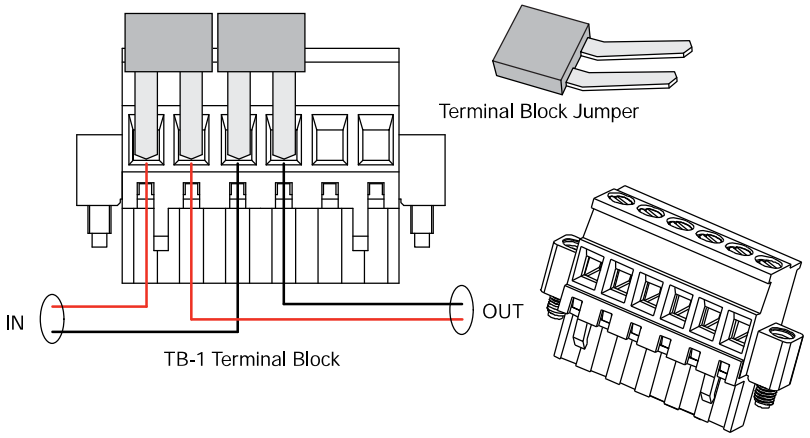
2.2.6 Terminal Block Connections

Connections to the transmitter are made via pluggable terminal blocks secured to the back of the POD. The terminal blocks are keyed and polarized. A color coded label assists in wiring when the block is removed from the POD.

The terminals are suitable for use with 12 to 28 AWG or 0.8 to 2.5mm^2 wire. Wire insulation must be stripped 5/16" (0.312") or 8mm. Tighten each terminal to a maximum of 4.5 in-lbs (0.51 Nm). Up to four terminal blocks are provided; each having 2, 6, 9, or 10 positions (see the *XNX Quick Start Guide* for additional details).

Two terminal block jumpers are included to provide an electrical connection without connection to the Personality Board. Install the jumpers between pins 1 and 2 and between pins 3 and 4 to support multi-node wiring.

Warning: When the transmitter is equipped with the optional Remote Mount Kit, the remote sensor must be securely mounted in a fixed position. The Remote Sensor kit is not intednded to be used as a hand-held sensor.



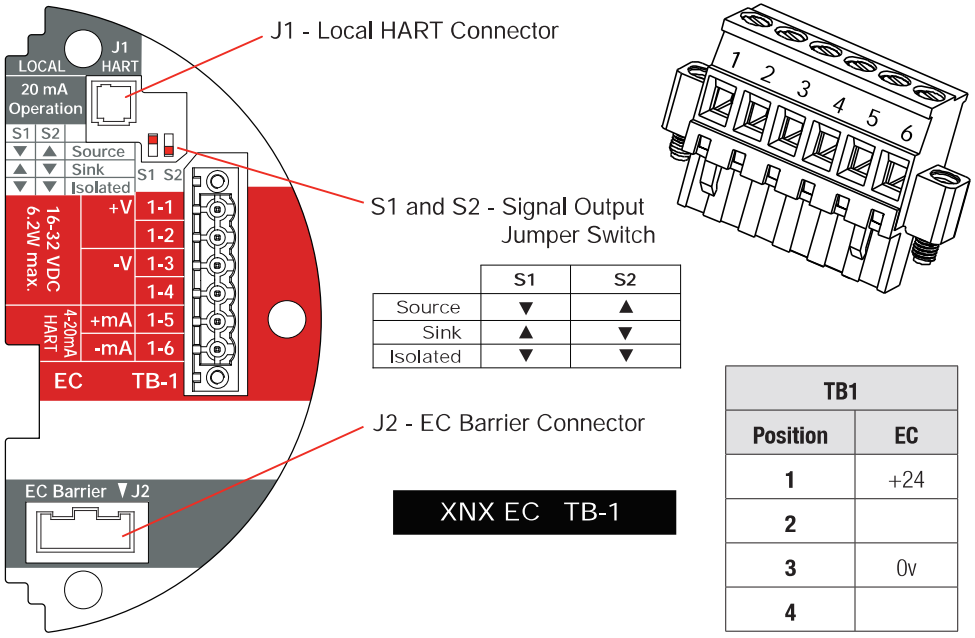


Figure 40. Pluggable Terminal Block and Terminal Block Jumper

2.2.7 EC Personality Wiring

Caution: Do not force the POD into the enclosure. Doing so may result in damage to the wiring or the POD or may alter the switch settings. If resistance is felt, wires may be preventing the POD from being properly positioned.

Figure 41. XNX EC Personality Board Terminal Blocks and Jumper Switches and Terminal Block Assignments

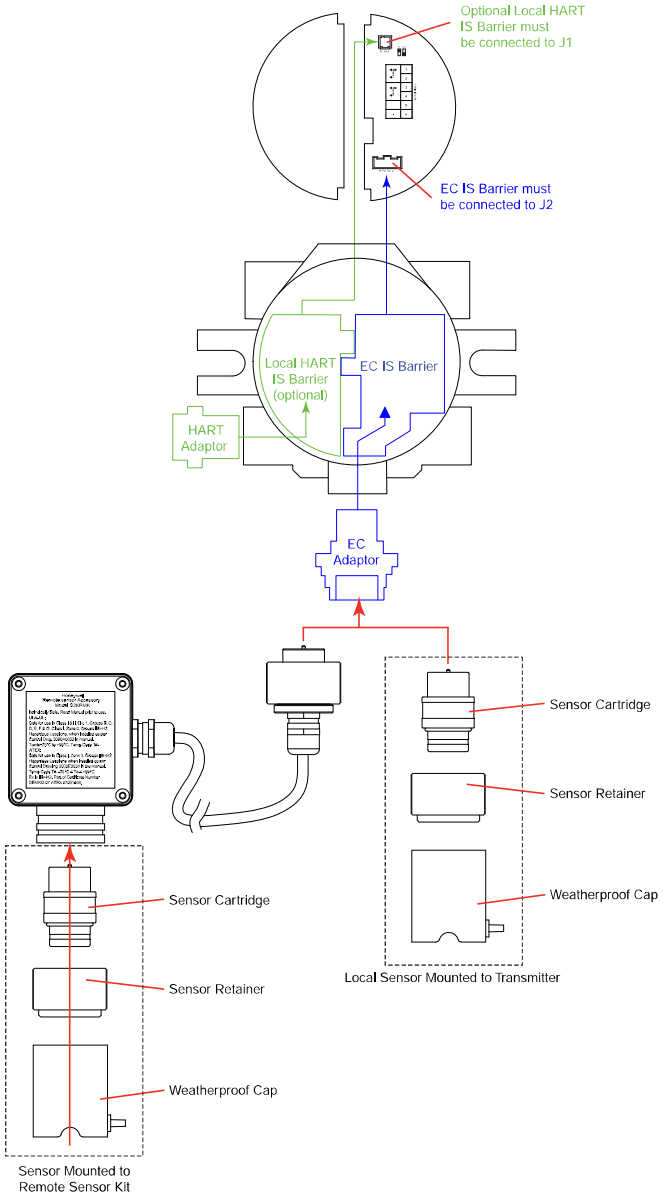

Figure 42. EC Personality Wiring

XNX Electrochemical Sensor Installation

EC Sensor Installation

Caution: A missing oxygen cell will result in 0% V/V O_2 gas concentration, thus triggering alarm events. In this situation, check the connection of the EC cell to the sensor connector board.

Caution: For biased sensors (e.g., nitrogen dioxide) remove the sensor stabilizer from the bottom of the sensor prior to installation.

Using Figure 42 as a guide, follow this procedure:

1. Verify that the label on the new sensor is the correct gas type.
2. Unscrew the weatherproof cover, loosen the retainer locking screw with the supplied hex key, and unscrew the sensor retainer.
3. Plug in the new sensor. Take care to align the sensor pins with the connector.
4. Refit the sensor retainer, tighten the locking screw with the hex key, and refit the weatherproof cover. Countdown time of up to 180 seconds (depending on the sensor type) will be displayed.
5. Acknowledgement of the gas type will be required before proceeding. For more information on setting gas type, see Section 2.5.1 Gas Selection.

6. After the sensor is installed and the gas type is confirmed, the range, alarm levels, and other important settings must be set; see Section 2.5.
7. After the transmitter has been configured, calibrate the sensor following the procedures in Section 3 - Calibrations.

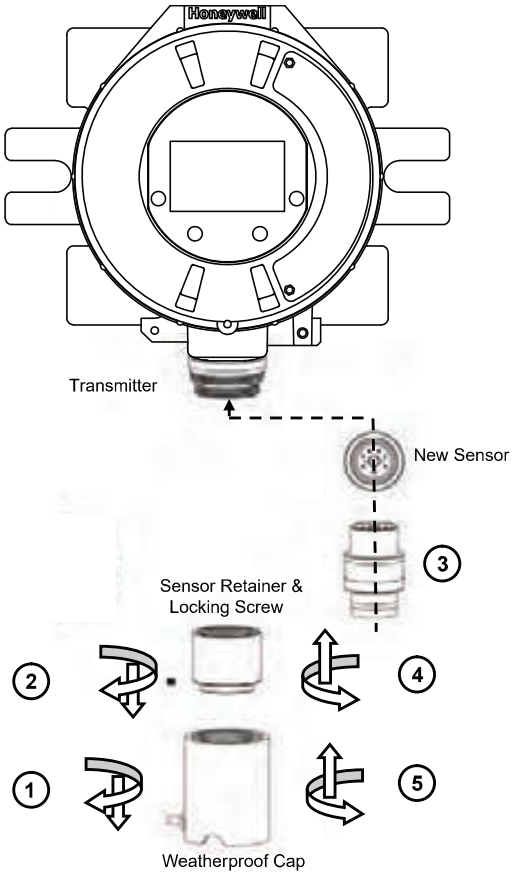

Figure 43. Installing Plug In Sensor

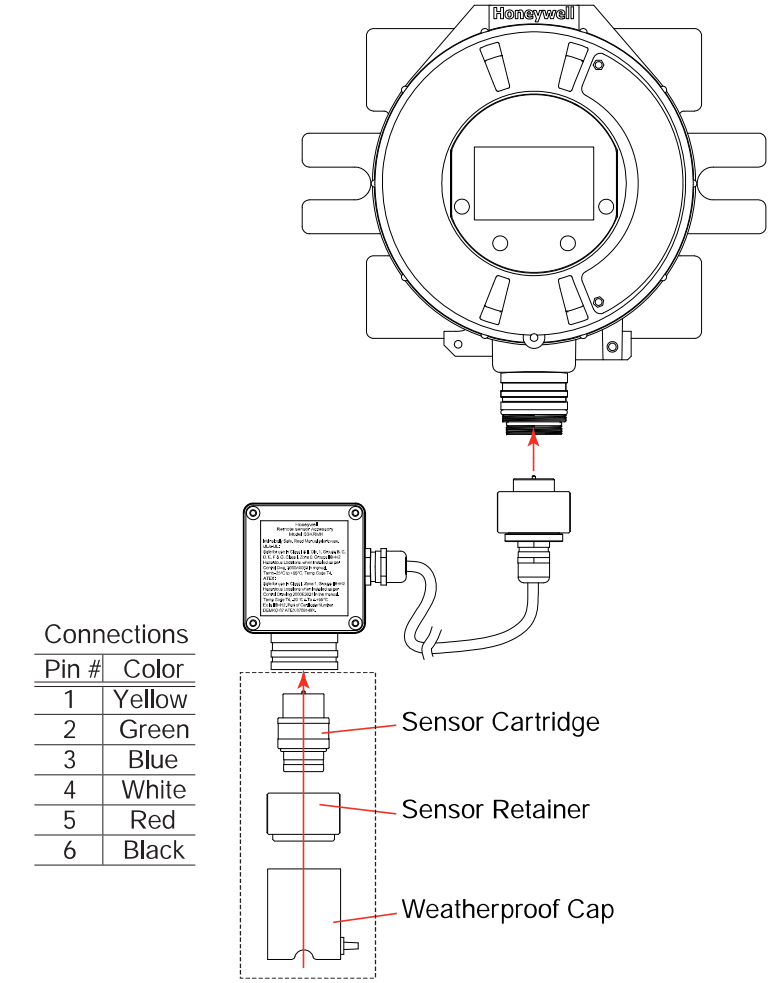
Note: Reference Control Drawing 3000E3157 and 3000E3159 for install requirements on EC cells and remote mounting.

XNX EC Sensor Remote Mounting Kit



The remote sensor mounting kit is used to mount the XNX EC sensor up to 50 feet away from the transmitter. To mount the sensor remotely, follow this procedure:

1. Unscrew the weatherproof cover, loosen the retainer locking screw and unscrew the sensor retainer.
2. Remove the sensor by pulling without twisting.
3. Plug the remote sensor cable connector into the bottom of the transmitter.
4. Route the cable to the location where the remote sensor is to be mounted.
5. Optional: make a loop of cable at the junction box. This will provide some slack for any future re-terminations.
6. If necessary, cut the cable to the required length.

Caution: Take care not to cut the cable too short. Once cut, additional lengths of cable cannot be added as this would invalidate the intrinsically safe certification.

Warning: Enclosures of remotely mounted sensors contain aluminum. Be careful to avoid ignition hazards due to impact or friction when installed in Zone 1 locations.

7. Mount the remote sensor junction box ensuring enough room below to fit the sensor and weatherproof cover. See control drawing 3000E3157 in Section 7.2 for specific mounting information.
8. Attach the cable to the remote terminal box via the gland provided.
9. Make the wiring connections as shown in Figure 43.
10. Fit the Terminal box lid.
11. Plug the sensor into the socket at the bottom of the terminal box.
12. Fit the sensor retainer, tighten the locking screw, and fit the weatherproof cover.
13. Calibrate the sensor following the procedure in Section 3.2.1.

Connections

6	Black

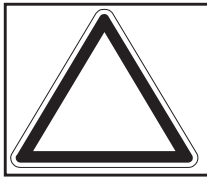
Sensor Mounted to Remote Sensor Kit

Figure 44. Installing Remote Sensor Mounting Kit

2.2.8 mV Personality Wiring

XNX Universal Transmitter with the mV personality Board allows interface to HA's Multi Purpose Detector (MPD) and field proven 705 and Sensepoint devices.

Caution: See Section 6 - Specifications to ensure that the transmitter and the mV sensor have the appropriate approvals prior to commissioning.



Caution: Verify that the mV sensor being installed has compatible threads (3/4 NPT or M25).

Read Section 2.2 which defines the XNX power and 4-20mA output connections that are common to all personalities.

Connections from the mV Sensor to the XNX are made via a single pluggable terminal block allowing ease of installation and service. Honeywell Analytics recommends that an 8" (203 mm) service length for wiring be maintained. The wire colors for the connections for each sensor type are shown in the following Wire Color from Sensor table.

Verify that wires for 4-20mA outputs are routed away from sources of noise such as relay wires.

Note: The black and red wires from the MPD are not used with the XNX mV personality board. Ensure that they are properly isolated from live connections. Do NOT cut the wires.

Caution: Do not force the POD into the enclosure. Doing so may result in damage to the wiring or the POD or may alter the switch settings. If resistance is felt, wires may be preventing the POD from being properly positioned.

Caution: Be certain to dress the wires properly to ensure cabling does not contact switches 1-2 on the back of the POD.

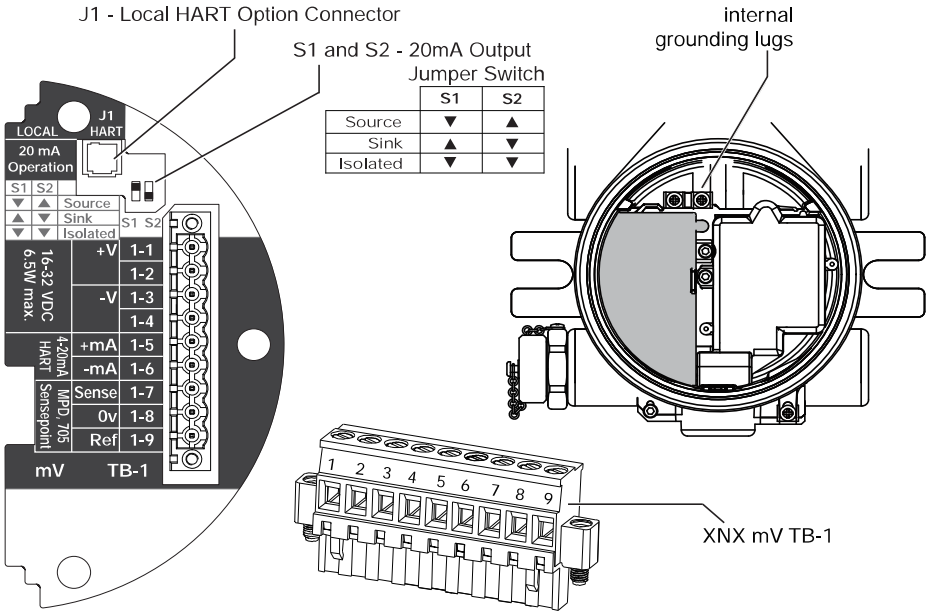


Figure 45. mV personality board terminal blocks and jumper switches.

TB-1	Desc.	Wire Color from Sensor

8	0v	White			Green	White		
9	Ref	Blue			Blue	Blue		

*Internal earth ground; approximately one inch of the black sheath that contains the Sensepoint PPM's four wires (red, blue, green, silver) must be split to allow the silver grounding wire to reach the internal grounding lugs.

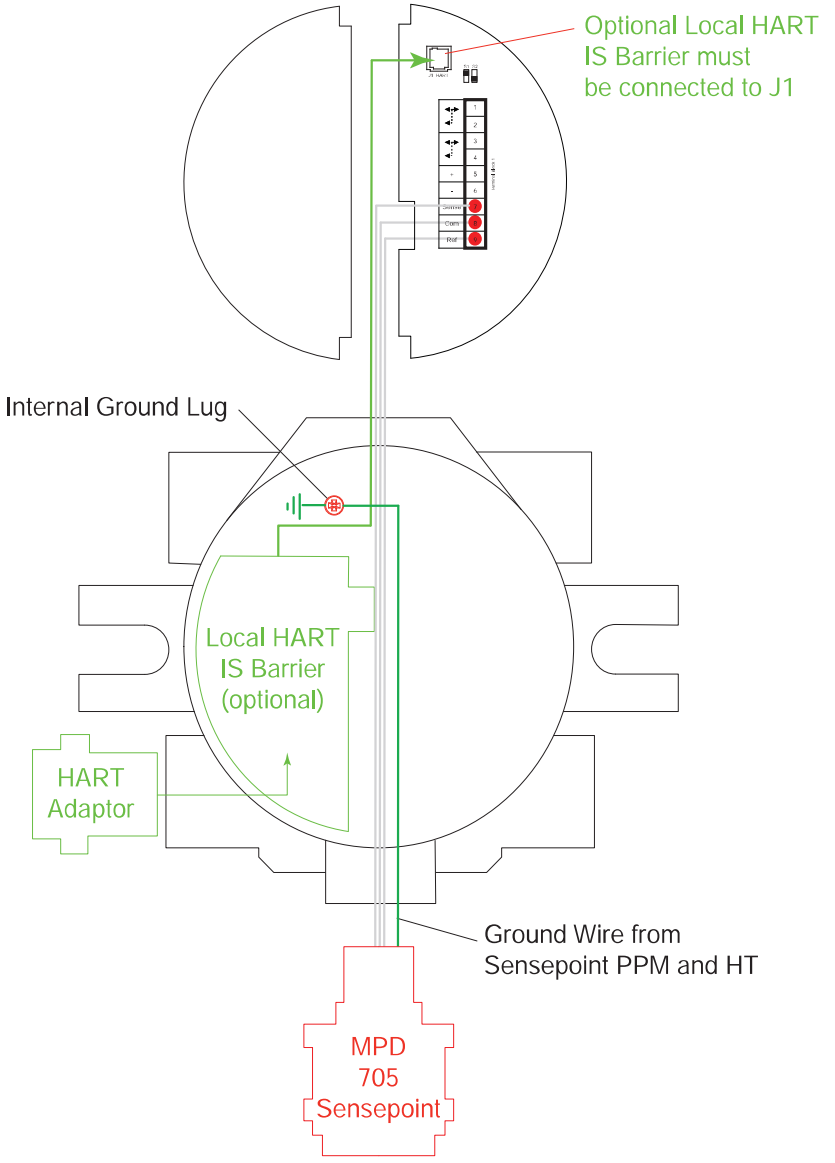

Figure 46. mV Personality Wiring

mV Remote Sensor Mounting

The sensor can be mounted remotely from the transmitter; the installation will vary by installed location, sensor and thread type used. To remotely mount the sensor, follow this procedure:

1. Unscrew the transmitter's weatherproof cover and loosen the retainer locking screw with the supplied hex key.
2. Run conduit from one of the transmitter's available conduit ports to the location of the remote terminal housing.

   A terminal housing provides a mounting base for the sensor. The installation wiring enters the terminal housing via conduit.

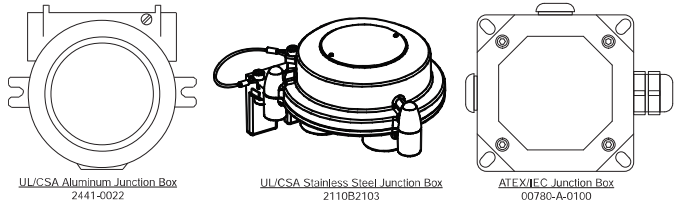

Figure 47. Remote Terminal Housings

The distance between the XNX Transmitter and remote installation must comply with these parameters to insure proper operation. Distances are dependent on sensor types and the wire gauge used.

AWG	Metric Wire Gauge	MPD CB1, 705 Series. Sensepoint Series Sensors	MPD IC1, IV1 & IF1 Sensors
24	0.25 mm^2	12m (47 ft.)	30m (97 ft.)
22		20m (65 ft.)	50m (162 ft.)
20	0.5 mm^2	30m (97 ft.)	80m (260 ft.)
18		50m (162 ft.)	120m (390 ft.)*
16	1.0 mm^2	80m (260 ft.)*	200m (650 ft.)*

* Frequency of Zero calibration may increase due to the changes in wire resistance from changing temperature.

3. Wire the pluggable terminal block as shown in Figure 45 then plug the connector into the back of the mV personality board. In remote mount MPD configurations, the 3 wires connecting the pluggable terminal block and the remote MPD must be routed through the supplied ferrite bead (Honeywell Analytics part no. 0060-1051, supplied in the accessory kit) as shown in Figure 48.

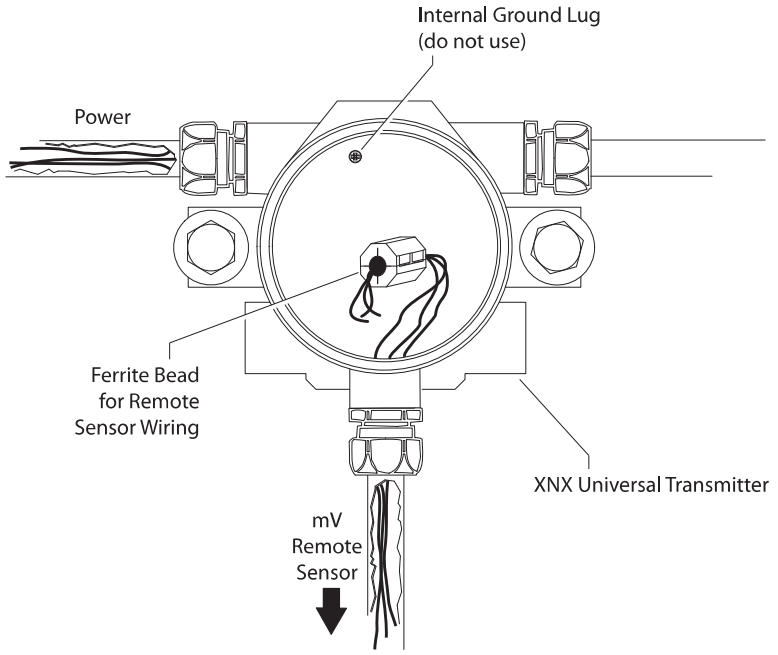

Figure 48. Ferrite bead wiring

4. Mount the remote sensor junction box with sufficient room below to fit the sensor and weatherproof cover.

Warning: Install the junction box according to local codes and manufacturer's requirements.

5. Attach the conduit to the remote terminal box.
6. In the remote junction box, connect the wires from the transmitter to the 3-way terminal block in the terminal box.

Note: The black and red wires from the MPD are not used with the XNX mV personality board. Ensure that they are properly isolated from live connections. Do NOT cut the wires.

Warning: The enclosures of remotely mounted 705HT sensors contain aluminum. Be careful to avoid ignition hazards due to impact or friction when installed in Zone 1 locations.

All cable port devices and blanking elements shall be certified in type of explosion protection flameproof enclosure “Ex d” or “Ex e”, suitable for the conditions of use and correctly installed.

7. Attach and wire the sensor in the terminal box.
8. Fit the terminal box lid.
9. Fit the sensor.
10. Calibrate the sensor following the procedure in Section 3.2 - Calibration.

2.2.9 IR Personality Wiring

The XNX Universal Transmitter allows local programming and configuration through the local LCD display as well as through the HART protocol. Gas concentrations can be read at the transmitter from Searchpoint Optima Plus or Searchline Excel, via 4-20mA output as well as from the digital communication connection on TB2 that can provide additional diagnostic information. The gas concentration is taken from the digital communication line as long as it is in agreement with the 4-20 mA output, otherwise the 4-20mA output takes precedence.

Caution: Dress the wires properly so that cabling does not contact switches 1-4 on the back of the POD.

The transmitter provides a 4-20mA output reflecting the input received. It also offers diagnostic information or data via HART or any of the additional communication options offered.

Read Section 2.2 which defines the XNX power and 4-20mA output connections that are common to all personalities.

Warning: Power off the transmitter before changing S3 or S4. Both switches must be set in either Source or Sink prior to applying power.

Caution: Do not force the POD into the enclosure. Doing so may result in damage to the wiring or the POD or may alter the switch settings. If resistance is felt, wires may be preventing the POD from being properly positioned.

Do not adjust switch settings while power is applied to the transmitter; doing so will cause permanent damage.

Connecting a Searchpoint Optima Plus or Searchline Excel

Connections from the Searchpoint Optima Plus or Searchline Excel to the transmitter are made via two pluggable terminal blocks allowing ease of installation and service (see Figure 49). HA recommends that an 8” service length of wiring be maintained.

In remote mount configurations, the maximum distance between

the XNX Transmitter and Optima Plus or Excel is 100 feet (33 meters) using 0.75 mm² (18 AWG) wire minimum.

Note: A second, black-handled screwdriver is included for use on terminal blocks 2 and 4. This tool is smaller than the magnetic wand and is designed to fit into the terminal connections on TB2 and TB4.

The Searchpoint Optima Plus or Searchline Excel can be supplied in either Sink or Source mode operation and is typically labeled on the white wire exiting the Searchpoint Optima Plus or Searchline Excel. Use the table in Figure 50 to set S3 and S4 to the same output type that appears on the wire tag of the IR device.

For more information see the Searchpoint Optima Plus Operating Instructions (2104M0508) or the Searchline Excel Technical Manual (2104M0506).

Connecting Generic mA Devices

Use the following schematics to set switches S3 and S4 They *must* be set to the same output type (which appears on the wire tag of the mA device).

The IR personality type provides for a generic mA input under sensor type configuration. The transmitter can be used to convert the mA input to be read over HART or optional Modbus or Foundation Fieldbus protocols and set optional relays (if equipped). Additional configuration of gas type and unit ID for reporting is required (see Gas Selection). For Generic mA devices, input values below 3mA will generate Fault 155.

XNX S3 and S4 must be in the UP position
Set mA Device and XNX to the same output type.

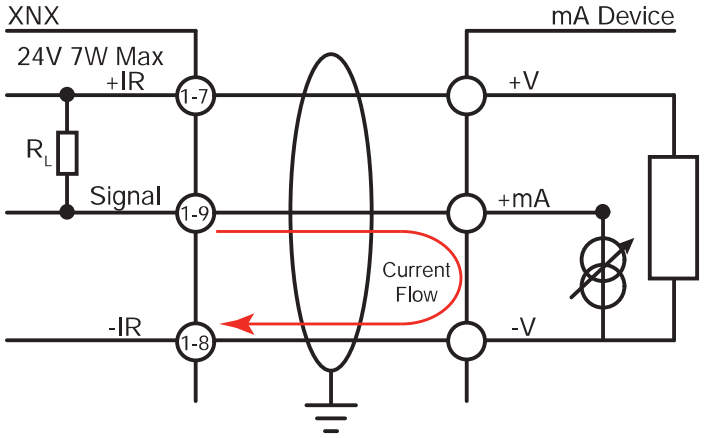

Figure 49. XNX mA input sink configuration

XNX S3 and S4 must be in the DOWN position

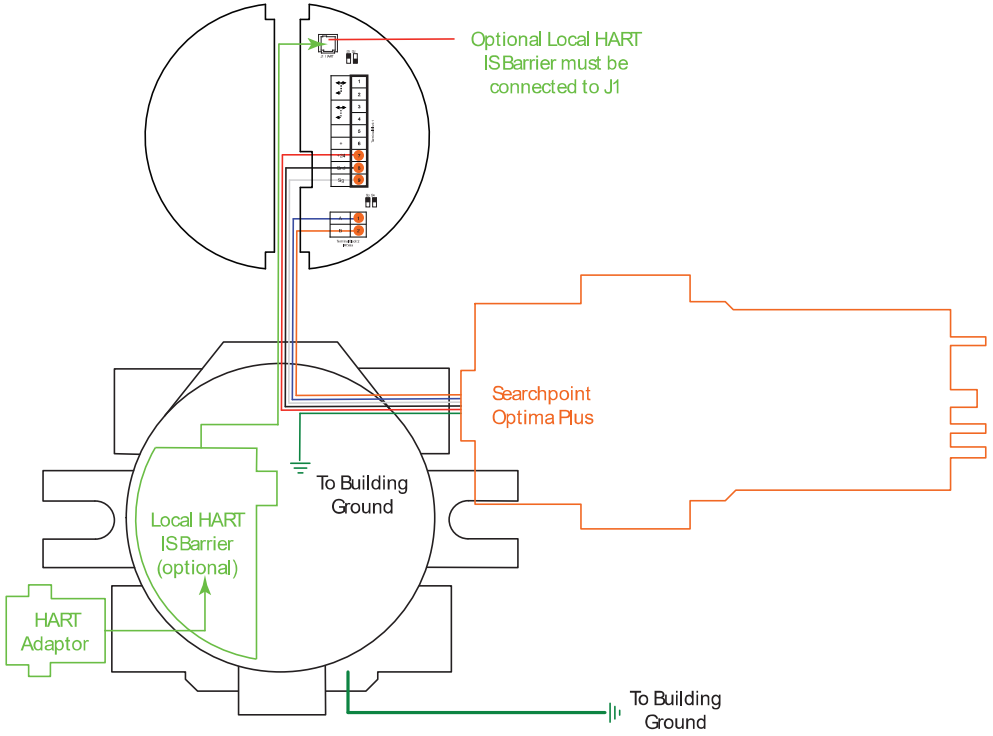

Figure 52. IR Personality Wiring - Searchpoint Optima Plus

Note:
Honeywell Aanalytics recommends that Excel or Optima and the XNX transmitter be wired to building ground. The system should be grounded at only one point.

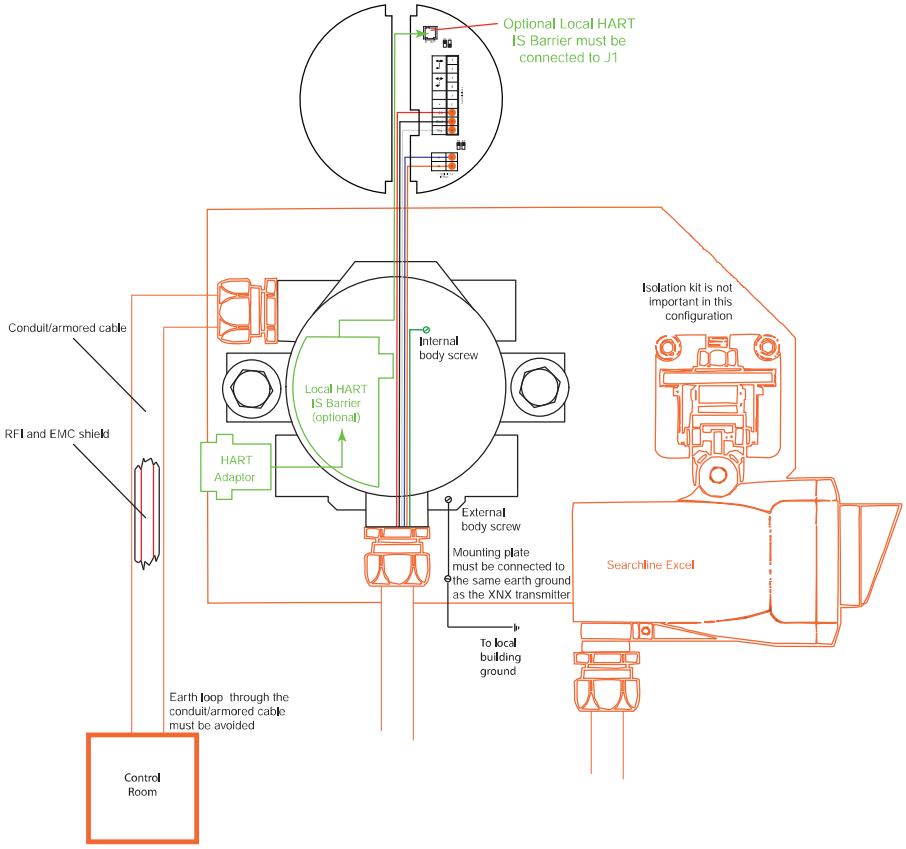

Figure 53. IR Personality Wiring - Searchline Excel

Attaching the Searchpoint Optima Plus to the XNX Universal Transmitter

For M25 entries, insert the seal (P/N 1226-0410) into the proper cable/conduit opening then thread the locknut (P/N 1226-0409) onto the Optima to the end of the threads. Thread the Optima body into the transmitter until the seal compresses and/or the Optima bottoms out. Reverse until the semi-circular pattern of holes on the front of the weather protection are on the bottom (see below). Tighten the locknut to the XNX body.

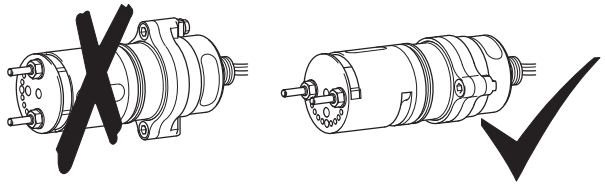

Figure 54. Searchpoint Optima Plus orientation

The 3/4” NPT ports do not require the seal and locknut. The form of the threads provide positive locking and sealing.

Note: When attaching the Searchpoint Optima Plus, coat the threads with an anti-seize compound to prevent corrosion.

Searchline Excel and Searchpoint Optima Plus Remote Installation

Junction Boxes are available for the Searchline Excel and Searchpoint Optima Plus to facilitate remote mounting from the XNX Universal Transmitter. Junction boxes are available for installations requiring UL/CSA or ATEX approvals. Consult

the Searchline Excel Technical Handbook (2104M0506) or Searchpoint Optima Plus Operating Instructions (2104M0508) for specifics on remote installations or contact your Honeywell Analytics representative for more information.

Searchpoint Optima Plus or Searchline Excel Wiring Recommendations

When wiring the XNX transmitter and the Searchpoint Optima Plus or Searchline Excel for remote applications, the general recommendations of the ANSI/TIA/EIA-485-A standard must be adhered to with the following additions:

1. When mounting the Searchline Excel or Searchpoint Optima Plus, run wiring connections between each Excel or Optima and the transmitter in a dedicated separate conduit.
2. Use 18 AWG twisted shielded cable for the RS485 connection between Excel or Optima and the XNX. Make sure that the shield of the cable is grounded to earth and XNX ground on one end ONLY.
3. Avoid running wiring near main cables or other high voltage equipment.
4. Do *not* apply 120 ohm terminating resistors. These resistors are not required due to low data rates.
5. Honeywell Analytics recommends that Excel or Optima sensors and the XNX transmitter be wired to building ground. The system should be grounded at one point only.

INSTALLATION TIP:

Always perform a soft reset after connecting the Searchpoint Optima and XNX transmitter for the first time. The soft reset is performed by accessing the transmitter's Calibration Menu.

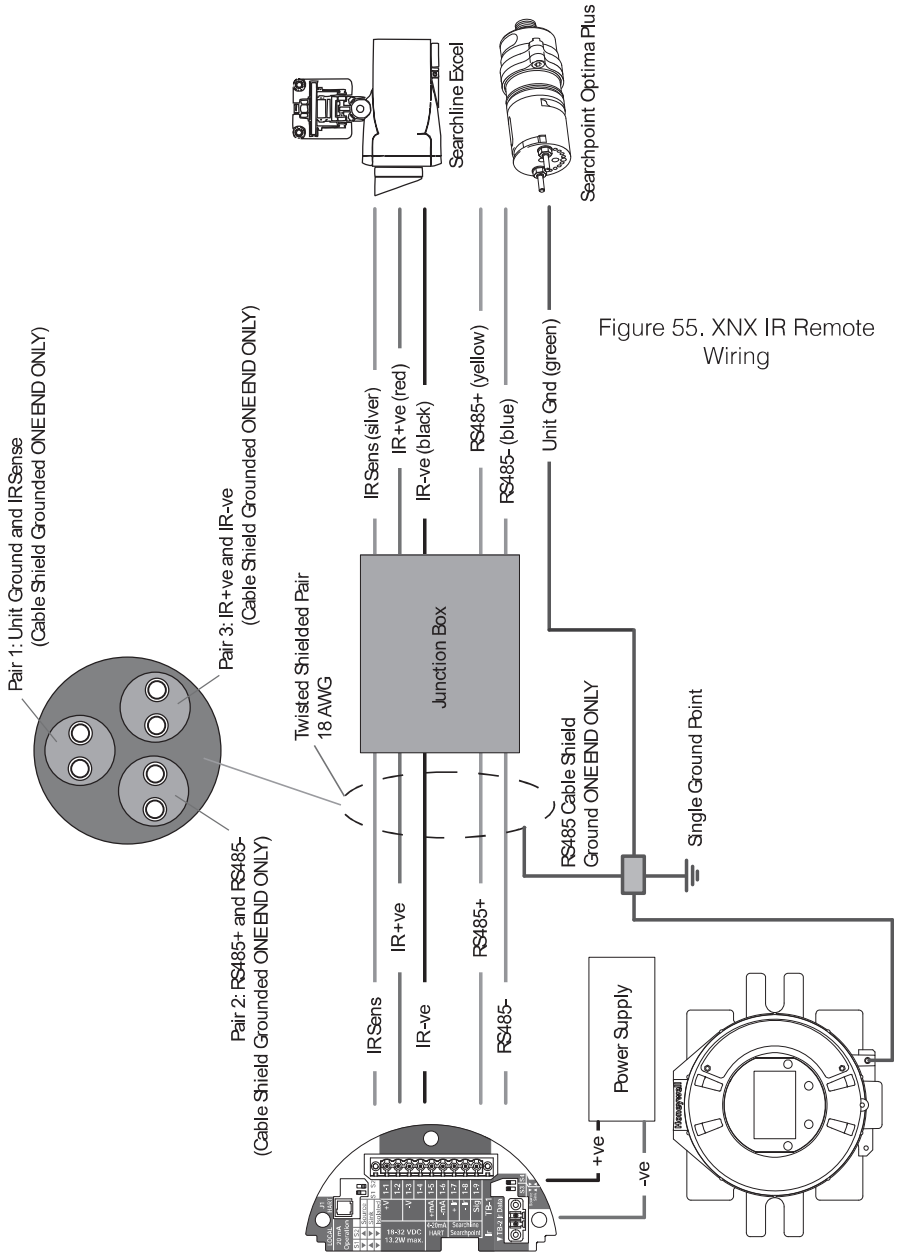

Figure 55. XNX IR Remote Wiring

2.3 Options

2.3.1 Local HART Interface

Available with any sensor technology or option, this option provides an external access to the HART interface in the transmitter. An IS barrier inside the transmitter allows the user to attach an external hand-held interrogator for programming and configuration. The external interface is installed in the lower left cable/conduit port of the transmitter and is intrinsically safe (IS).

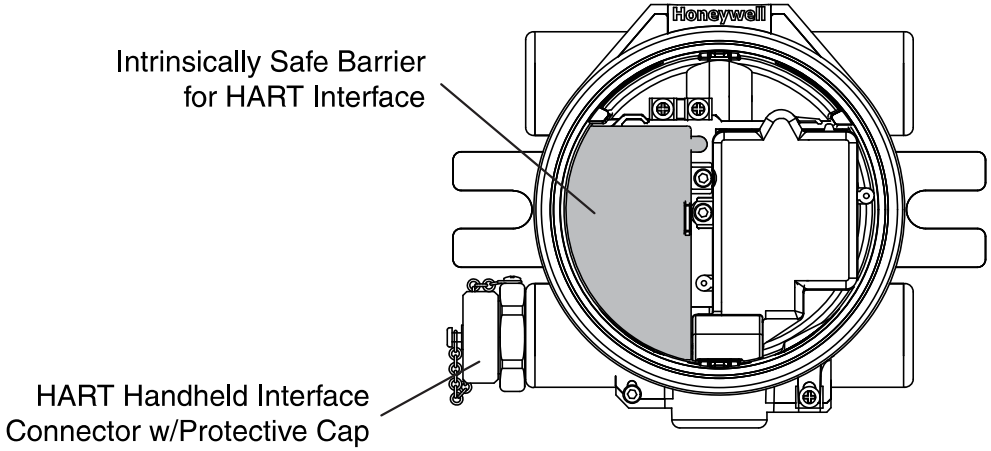

Figure 56. XNX Universal Transmitter with HART Interface IS Barrier installed

The HART protocol is a communication technology used with smart process instrumentation, providing two-way digital communication simultaneously with the 4-20mA analog signaling used by traditional instrumentation equipment. For more detailed information on HART, see the HART Protocol and www.hartcomm.org.

Implementation of the HART protocol in the XNX transmitter:

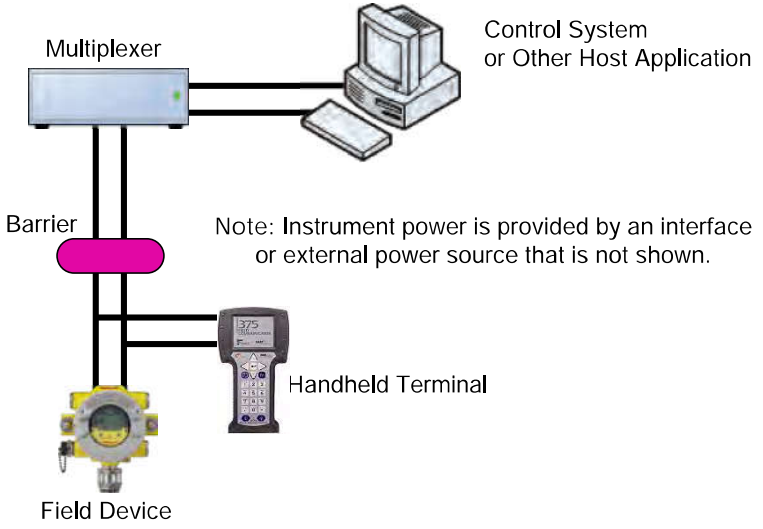
- Meets HART 6.0 physical layer specification
- The physical layer is tested according to HART Physical Layer Test Procedure, HCF_TEST-2.
- Data transfer rate: 1200 bps.

HART devices can operate in point-to-point or multidrop configurations.

Caution: Device address changes must be performed only by qualified service personnel.

Point-to-Point Mode

In point-to-point mode, the 4–20 mA signal is used to communicate one process variable, while additional process variables, configuration parameters, and other device data are transferred digitally via HART protocol (Figure 57). The 4–20 mA analog signal is not affected by the HART signal.



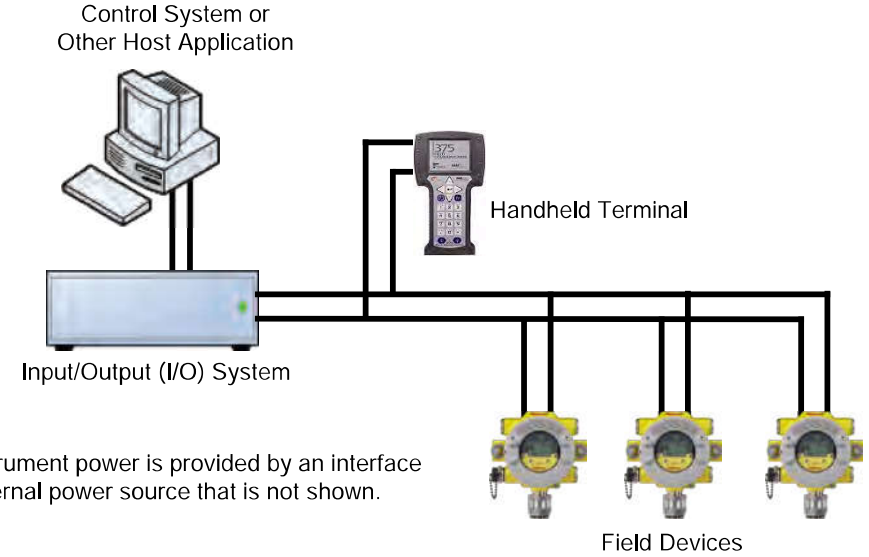


Figure 57. Point-to-Point Mode of Operation

Multidrop Mode

The multidrop mode of operation requires only a single pair of wires and, if applicable, safety barriers and an auxiliary power supply for up to 8 field devices (Figure 58). All process values are transmitted digitally. In multidrop mode, all field device polling addresses are >0, and the current through each device is fixed at a minimum value (typically 4 mA).

Note: Instrument power is provided by an interface or external power source that is not shown.

Figure 58. Multidrop Mode of Operation

Note: Use multidrop connection for supervisory control installations that are widely spaced, such as pipelines, custody transfer stations, and tank farms.

In general, the installation practice for HART devices is the same as conventional 4-20mA instrumentation. Individually shielded twisted pair cable, either in single-pair or multi-pair varieties, is the recommended wiring practice. Unshielded cables may be used for short distances if ambient noise and cross-talk will not affect communication.

The minimum conductor size is 0.51mm diameter (#24 AWG) for cable runs of less than 5,000 ft (1,524m) and 0.81mm diameter (#20 AWG) for longer distances.

Cable Length

Most installations are well within the 10,000 ft (3,000 m) theoretical limit for HART communication. However, the electrical characteristics of the cable (mostly capacitance) and the combination of connected devices can affect the maximum allowable cable length of a HART network. The table below shows the effect of cable capacitance and the number of network devices on cable length. The table is based on typical installations of HART devices in non-IS environments, i.e. no miscellaneous series impedance.

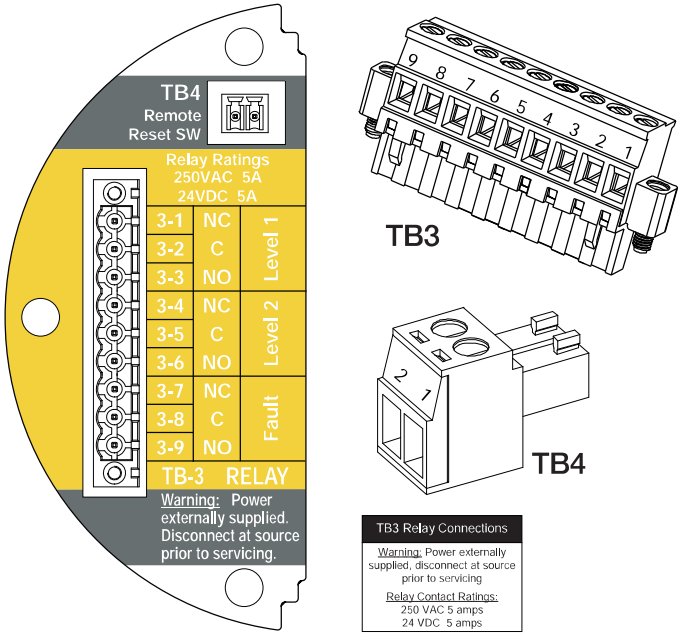
Detailed information for determining the maximum cable length for any HART network configuration can be found in the HART Physical Layer Specifications.

Cable Capacitance – pf/ft (pf/m) Allowable Cable Lengths for 1 mm (18 AWG) Shielded Twisted Pair – feet (meters)				
Number of Network Devices	**20 pf/ft (65 pf/m)**	**30 pf/ft (95 pf/m)**	**50 pf/ft (160 pf/m)**	**70 pf/ft (225 pf/m)**
1	9,000 ft (2,769 m)	6,500 ft (2,000 m)	4,200 ft (1,292 m)	3,200 ft (985 m)
5	8,000 ft (2,462 m)	5,900 ft (1,815 m)	3,700 ft (1,138 m)	2,900 ft (892 m)
8	7,000 ft (2,154 m)	5,200 ft (1,600 m)	3,300 ft (1,015 m)	2,500 ft 769 m)

2.3.2 Relays

The relay option (XNX-Relay) provides 3 form “C” SPCO contacts for alarm and fault indication. TB4 allows alarms to be reset remotely.

Note: This option is not available when the Modbus or Foundation Fieldbus options are installed.



Wiring for the relays is through an available cable/conduit port to a pluggable terminal block. See Figure 35 for the terminal block legend.

Note: A second, black-handled screwdriver is included for use on terminal blocks 2 and 4. This tool is smaller than the magnetic wand and is designed to fit into the terminal connections on TB4.

The XNX transmitter has three relays: relay 1 is for alarm level 1, relay 2 is for alarm level 2, and relay 3 is for faults and special states. All special states are indicated by the fault relay.

Honeywell Analytics recommends that the fault relay be used in all installations to maintain safe operation. See Set Alarm Values for more information.

The relay state is refreshed every 2 seconds. The fault relay is normally energized indicating proper operation. In the event of power failure or fault, the C-NO connection will open.

Figure 59. XNX Relay Option Board Terminal Blocks

2.3.3 Modbus

The optional Modbus interface allows all transmitter local user interface (LUI) functions and parameter settings to be transmitted.

Modbus is a master-slaves protocol. Only one master (at a time) is connected to the bus. Up to 247 slave nodes are also connected to the same serial bus. Modbus communication is always initiated by the master. The slave nodes never transmit data without receiving a request from the master node. The slave nodes never communicate with each other. The master node initiates only one Modbus transaction at a time.

Terminals 3-1 through 3-4 are provided to facilitate bus wiring; there is no internal connection to other XNX circuitry. Terminal 3-1 is connected internally to 3-2. Similarly, terminal 3-3 is connected to 3-4

Figure 60. XNX Modbus Option Board Terminal Block / Jumper Switch

Modbus connections to the XNX are made through a pluggable terminal block on the Modbus interface circuit board. Modbus RTU protocol uses ASCII/Hex protocols for communication. See Figure 35 for the terminal block legend. A loop termination point (SW5) is included on the Modbus interface board to provide termination of the Modbus loop.

2.3.4 Foundation Fieldbus

Foundation Fieldbus connections to the XNX transmitter are made through a pluggable terminal block on the Foundation Fieldbus option board, shown in Figure 60. A simulation switch (SW5) is included on the board to enable/disable simulation mode. Terminals 3-1 through 3-4 are provided to facilitate bus wiring; there is no internal connection to other XNX circuitry. Terminal 3-1 is connected internally to 3-2. Similarly, terminal 3-3 is connected internally to 3-4.

Figure 61. Foundation Fieldbus Option Board, Terminal Block, Jumper Switch

2.4 Powering the XNX for the First Time

2.4.1 XNX Units Configured for EC, mV, and IR (except Searchline Excel)

After mounting, wiring the transmitter, wiring the specific mV or IR sensor or installing the EC cartridge, the installation is visually and electrically tested as described below.

Warning: Minimum and maximum controller alarm levels should not be set at less than 10% or greater than 90% of the full scale range of the sensor. CSA and FM agency limits are 60% LEL or 0.6mg/m^3.

1. Verify that the transmitter is wired correctly according to this manual and the associated control equipment manual.
2. If equipped, unscrew the weatherproof cover, loosen the sensor retainer locking screw, and unscrew the retainer.
3. For EC sensors, plug in the sensor cartridge, taking care to align the sensor pins with the connector holes in the PCB.

Caution: For toxic sensors, remove the shorting clip from the bottom of the sensor prior to installation. No shorting clip is provided with O_2 sensors.

4. Refit the sensor retainer, tighten the locking screw and refit the weatherproof cover.

Note: Before replacing the cover on the transmitter housing, coat the threads with anti-seize compound to prevent corrosion buildup.

Note: Inspect the cover O-ring for cracking or any other defects that might compromise the integrity of the seal. If it is damaged, replace with the O-ring supplied in the accessory kit.

5. Apply power to the transmitter. This will in turn provide power to the sensor.
6. During warmup, the XNX transmitter will be forced to 2mA (inhibit mode).
7. The transmitter will enter a boot-up routine displaying the initialization screen. The transmitter loads its operating system, data from the sensor, sensor software version numbers, gas type, the detection range and span calibration gas level, estimated time to next calibration due, and self test result. This will take about 45 seconds.

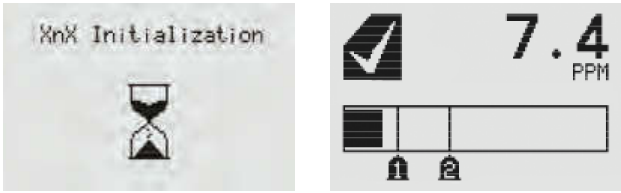

Figure 62. XNX Initialization and General Status Screens

In the final stages of boot-up, warnings and faults may be observed until the user performs the proper configuration, calibration, and reset activities described in the following sections. See Section 5 for descriptions of warnings and faults.

Once the General Status screen appears, the transmitter and sensor are in normal monitoring mode.

Note: Calibration of sensors attached to the transmitter is mandatory before the sensor can be used for gas monitoring. Refer to Section 3 - Calibration for the procedure.

Note: For initial commissioning, refer to EN 60079-29-2.

2.4.2 LCD and LED Test

The LCD and LED test is performed in the initialization after powering on. All LCD pixels and LEDs (red, green, and yellow) are turned on for 1.5 seconds. The LCD then goes blank and the LEDs turn off.

2.4.3 XNX IR Units Configured for Searchline Excel

When powering the transmitter fitted with a Searchline Excel sensor, the following procedure must be followed to assure proper installation.

1. Verify that the transmitter is wired correctly according to this manual and the associated control equipment manual.
2. Apply power to the XNX transmitter. This will in turn provide power to the sensor.
3. The sensor output will be forced to 2mA (default fault/ inhibit).
4. The XNX transmitter will enter a boot-up routine, displaying the initialization screen. The transmitter will load its operating system, data from the sensor, sensor software version numbers, gas type, the detection range and span calibration gas level, estimated time to next calibration due, and self test result. This will take about 45 seconds.

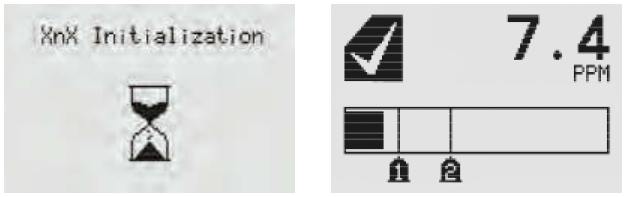

Figure 63. XNX Initialization and General Status Screens

In the final stages of boot-up, warnings and faults may be observed until the user performs the proper configuration, calibration, and reset activities described in the following sections. See Section 5 for descriptions of warnings and faults.

5. When the XNX completes boot-up, perform a soft reset (see Section 3.6 Soft Reset) on the Excel sensor from the Calibration Menu. When the soft reset is intitated, the RS-485 communication will be temporarily interrupted and faults F120 and/or F161 may be observed. The RS-485 communication will be re-established in a few minutes and the faults will automatically be reset in the Non-Latching mode. F120 and/or F161 must be reset manually in the Latching mode.
6. Set the Path Length for the application, then align the transmitter and receiver (see Section 3.5 Align Excel).
7. Once the alignment is complete, a Zero Calibration must be performed on the Excel sensor to complete the commissioning process. (See the Searchline Excel

Technical Manual for calibration information P/N 2104M0506).

8. Reset any faults that appear in the transmitter's display. The XNX transmitter and Searchline Excel sensor are now ready to monitor.

2.5 Configuring the XNX Universal Transmitter

The XNX Universal Transmitter can be configured via the front panel by using the menus available in Configure Menu. For information on accessing and navigating the menus, see Section 1.4.1.

2.5.1 Configure Menu

Functions in the Configure Menu and the security levels required to change them are explained in this table.

Symbol	Description	Security Level
	Select Language	1
	Set Date & Time	1
	Set mV Sensor Type	2
	Set mA Sensor Type	2
	Gas Selection	2
	Range & Alarms	2
	Latching/Non-latching	2
	Set Units	2
	mA Levels	2

Symbol	Description	Security Level
	Calibration Interval	2
	Accept New Sensor Type	2
	Beam Block Options	2
	Path Length	2
	Unit ID	2
	Relay Options	2
	Fieldbus Options	2
	Configure Security	2

Warning: When configuring or communicating with the transmitter using the front panel displays, resume monitoring by exiting all menus and returning to the General Status menu manually. No time outs are invoked.

Note: With the exception of Inhbit Mode, gas measurement continues in the background allowing users to navigate screens without taking the transmitter offline.

Select Language

Available languages for the XNX transmitter are English, Italian, French, German, Spanish, Russian, Mandarin, and Portuguese.

Figure 64. Select Language Menu

Different screens are used to display each of the eight available languages, one language per screen. Each language screen will appear in three languages: the selected language, Russian, and Mandarin. To select a new display language, use the ◀ ▶ switches to navigage through the selections. Use ✓ to make the selection or ✗ to discard the selection and return to the previous menu.

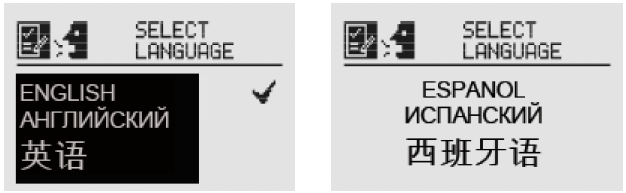

Figure 65. Language Selection Screen

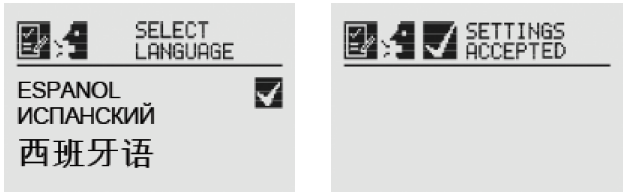

Figure 66. Accept Language Change Screen

Set Date & Time

Figure 67. Set Date & Time Menu

Select “Set Date and Time” to change the date format and set the current time/date into the XNX.

Set Date Format

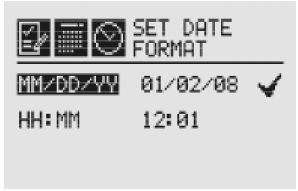

Figure 68. Set Date Format Menu

Use the ◀ ▷ switches to highlight “MM/DD/YY.” Select ✓ to set the date format.

Set Date

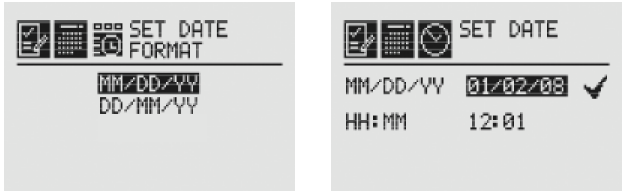

Figure 69. Set Date Format Screen / Set Date Menu

Use the Set Date selection to set the current date. Use the ◀ ▷ switches to select the year, month, and day. Select ✓ to set the desired date.

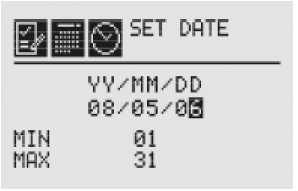

Figure 70. Setting the Date Screen

Use the ◀ ▷ switches to decrement or increment the values until the desired value appears. Select ✓ to set the value and move to the next character. Repeat for each character to be changed.

Set Time

Figure 71. Set Time Menu

Use the ◀ ▷ switches to decrement or increment the values until the desired value appears. Use ✓ to select the value and move to the next character. Repeat for each character to be changed.

Figure 72. Set Time Screen

Use the ◀ ▶ switches to navigate to the ✓. Select it to save the changes. If ✓ is not selected, no changes will be saved.

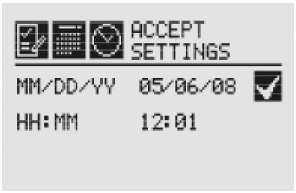

Figure 73. Accept Time-Date Changes

When the new settings have been saved, the “Settings Accepted” screen will be displayed.

Figure 74. Time-Date Settings Accepted

The remainder of this section requires **Level 2** security access.

Set mV Sensor Type

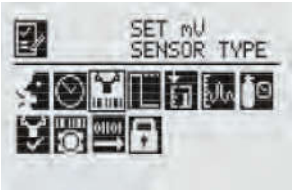

Figure 75. Set mV Sensor Type Screen

Set mV Sensor Type sets the identity of the type of mV sensor attached to the transmitter. The available mV sensor type selections are:

Sensor	Description
MPD-IC1 (5%V)	MPD Carbon Dioxide 5%Vol
MPD-IV1 (5%V)	MPD Methane 5%Vol
MPD-IV1 (100%L)	MPD Methane 100%LEL
MPD-IF1 (100%L)	MPD Flammable 100%LEL
MPD-CB1 (100%L)	MPD Flammable 100%LEL
705-HT (20%L)	705 Flammable 20%LEL (High-Temp)
705-HT (100%L)	705 Flammable 100%LEL (High-Temp)
705-STD (100%L)	705 Flammable 100%LEL
SP-HT (20%L)	Sensepoint Flammable 20%LEL (High-Temp)
SP-HT (100%L)	Sensepoint Flammable 100%LEL (High-Temp)
SP-STD (100%L)	Sensepoint Flammable 100%LEL
SP-PPM (10%L)	Sensepoint Flammable PPM (10%LEL equiv)
SP-PPM	Sensepoint Flammable PPM
SP-HT-NH3	Sensepoint Ammonia 30,000 PPM

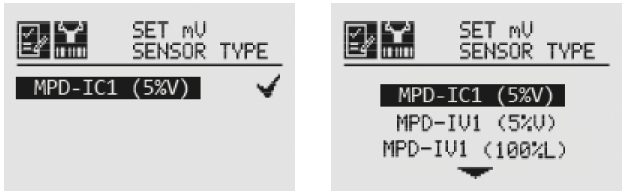

Figure 76. Current configured mV sensor and mV Available Sensor List

The first screen displays the currently configured sensor. Select ✓ to navigate to the Sensor Selection screen. To select a new mV sensor, use the ◁ ▷ switches to scroll through the list. Use ✓ to select a sensor or ✗ to discard the sensor selection, retaining the previously selected sensor, and return to the previous menu.

Set mA Sensor Type

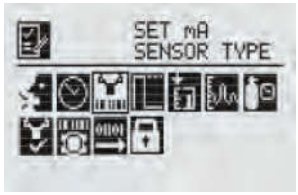

Figure 77. Set mA Sensor Type Screen

Set mA Sensor Type identifies the type of mA sensor attached to the transmitter. The available mA sensor choices are “Excel/ Optima” and “Other mA Sensor.”

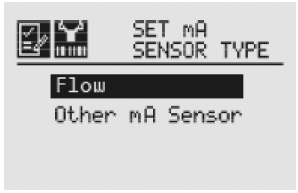

Figure 78. mA Available Sensor List

To select a new mA sensor, use the ◁ ▷ switches to move through the list. Use ✓ to make the selection or ✗ to discard the selection, retain the previously selected sensor, and return to the previous menu.

Note: This configuration option is not available for XNX transmitters with EC sensors.

Gas Selection

Gas Selection sets the target gas for sensors capable of detecting multiple gases. The available gases for each of the capable sensors is determined by the device connected to the XNX transmitter.

Figure 79. Gas Selection Menu

After selecting Gas Selection, the initial screen displays the current target gas. Select ✓ to display the list of available gases for the configured sensor. Use the ◁ ▷ switches to scroll through the list. A sample of the list is shown in Figure 81.

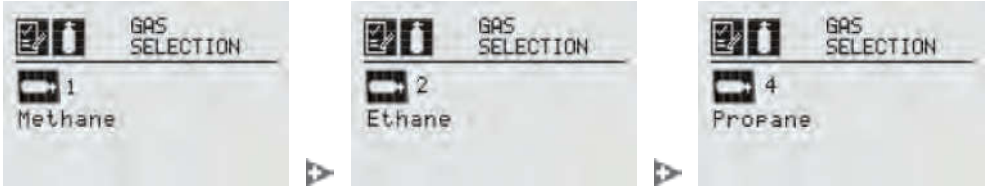

Figure 80. Available Target Gas List

Use ✓ to select the new gas or ✗ to discard the selection, retain the previously selected gas, and return to the previous menu.

When a new gas is selected, these screens are displayed:

Figure 81. Select New Target Gas

Note: The gas selections available will vary with different types of sensors. Gases listed with a "-2" suffix are compliant with 60079-20-1 LEL levels.

Warning: When selecting a new target gas for units with a Searchpoint Optima Plus, the sensor must be recalibrated.

These are the XNX transmitter's selectable gases:

- Butane (C_4H_{10})
- Carbon Dioxide (CO_2)
- Ethanol (C_2H_5OH)
- Ethylene (C_2H_4)
- Hexane (C_6H_{14})
- Hydrogen (H_2)
- Methane (CH_4)
- Methanol (CH_3OH)
- Propane (C_3H_8)
- Star 1 through Star 8[1]

Warning: Do not use the XNX Universal Transmitter in oxygen-enriched atmospheres. Concentrations displayed will be adversely affected by oxygen depletion.

[1]In nonane detection applications, if an MPD-CB1 sensor is employed, use star rating 2; with SP-HT sensors, use star rating 4.

Changing the Gas or Units Name

If "Other mA Sensor" has been selected as the sensor type, the existing gas and units can be renamed. From the Gas Selection menu, select ✓ to open the Gas Name menu. Select ✓ again to open the Gas Name editing display. The first letter of the current selection will be highlighted (Figure 82).

Figure 82. Gas Name Screen / Gas Name editing screen

Use the ◀ ▶ switches to cycle through the 76 options (26 capital letters, 26 lower case letters, 10 numbers, 13 typographic characters, and a space). When the first character of the new gas name has been reached, select ✓ to advance to the second character. Repeat this procedure with each character until the new gas name is displayed. In this example, "mA Sensor" has been changed to "Flow Sensor" (Figure 83). The name can be up to 15 characters long. Select ✓ to return to the Gas Name screen. The new name will be displayed in reverse (light characters on a dark background). Select the ▶ switch twice to display the Accept Settings screen. Select ✓ to accept the new gas name. A "Settings Accepted" screen will be displayed briefly, followed by the Gas Selection menu.

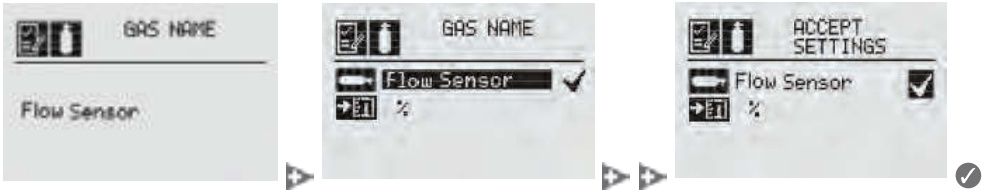

Figure 83. Accepting the New Gas Name

Follow the same procedure to rename the units ("%" in the illustrations). The units name can be up to 5 characters long.

Gas Selections and Alarm Limits Based on mV Sensor Type

The following tables show the tranmsitter's programmable alarm limits.

Note: -2 Gas Selection %LEL values are per IEC 60079-20-1:2010

	MPD-IC1 (5%V)
	Carbon Dioxide
Lower Alarm Limit (% Vol)	0.5
Upper Alarm Limit (% Vol)	5.0

	MPD-IV1 (5%V/V, 100%LEL)		
	Methane	Methane-1	Methane-2
Lower Alarm Limit	0.5% Vol	10% LEL	10% LEL

Range & Alarms

Warning: XNX Universal Transmitters carrying UL/CSA approvals that are configured for devices measuring %LEL will not allow adjustments to the full scale value. The range is fixed at 100%.

The Range & Alarms option applies only to units with certifications otherF than UL/CSA.

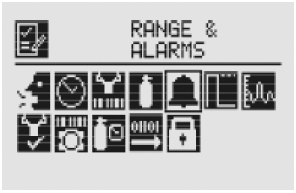

Figure 84. Range & Alarms Menu

Set Range (full-scale)

Range is sensor dependent. The Set Range option allows the full-scale range to be set for the sensor which is attached to the transmitter. The full-scale range is based on the capability of the sensor. The selectable range for EC sensors is defined in the Selectable Range column of the table in Section 6.3.2. The selectable range for catalytic bead sensors is defined in the Selectable Range column of the table in Section 6.3.5.

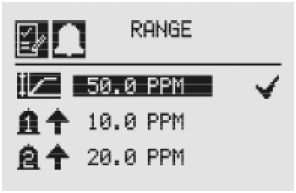

Figure 85. Range Option

When the Range option is highlighted, use the ◁ ▷ switches to decrement or increment the value. Use ✓ to accept the displayed value and move to the next field. When all fields have been updated, use the ▷ switch to highlight ✓ on the right side of the display. Use ✓ to accept the changes.

Figure 86. Setting the Range Value

When complete, the display will return to the Range Option screen.

Set Alarm Values

Set Alarm Values allows the values for Alarm Direction and Alarm Limits for both Alarm 1 and Alarm 2 to be set.

Caution: Alarm 1 and Alarm 2 values *must* be less than the Upper Limit value.

Use Alarm Direction to establish whether the alarm is to be triggered by rising or falling gas concentrations. Alarms for most target gases are triggered by rising concentration levels but certain gases; e.g., oxygen, can be measured for depletion levels. When the XNX transmitter is configured with mV or OPTIMA sensors and the meaurement units are LEL, the alarm level setting is limited to 60%LEL.

If the concentration of the target gas remains above the alarm values for 3 seconds or more, an alarm will be triggered.

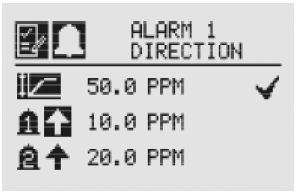

Figure 87. Alarm Direction

The icons next to the bell images indicate whether the alarm has been triggered by rising (↑) or falling (↓) gas concentrations. Use the ◁ ▷ switches to highlight the appropriate trigger. Use ✓ to make the selection or ✗ to discard it.

Figure 88. Setting Alarm Rising/Falling

The Alarm Limits selection sets the alarm trigger level for both alarms.

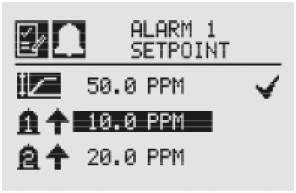

Figure 89. Alarm Limits

Use ◁ ▷ to set the desired alarm limit and ✓ select it. Repeat for each alarm.

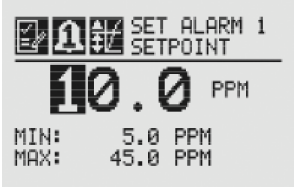

Figure 90. Setting an Alarm Setpoint

When complete, the display will return to the main Range & Alarm screen. When all settings have been made, use ◁ ▷ to move to the ✓ on the display to Accept Settings.

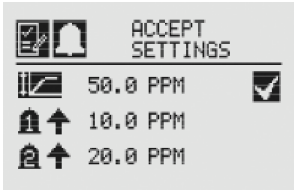

Figure 91. Accept Settings

When the settings have been saved, the following screen will appear on the display.

Figure 92. Settings Accepted Screen

See Section 6.1 Product Specifications for EC cell information.

Selecting the Numeric Format

If "Other mA Sensor" has been selected as the sensor type, the transmitter's output can be displayed in one of three numeric formats. From the Ranges & Alarms menu, select the ✓ switch to open the Range menu (Figure 93). Select the ✓ switch again to display the Range Lower Limit menu. Select the ▷ switch twice to open the first Numeric Format menu.

Figure 93. Navigating to the first Numeric Format menu

Select the ✓ switch to open the second Numeric Format menu, which displays the formats available for numerical display (see Figure 94).

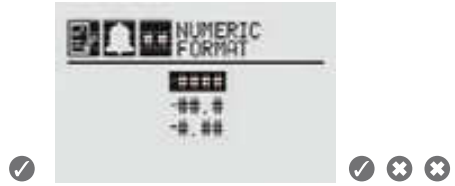

Figure 94. Navigating to the second Numeric Format menu

Select ◁ or ▷ to cycle through the three options. When the desired format is highlighted, select the ✓ switch to make the selection the default display format. Select ✗ twice to return to the Ranges & Alarms menu.

Latching / Non-Latching

Warning: There is a potential loss of sensitivity during exposure to high concentrations of H_2S. Under these conditions, set the control unit to latch at overrange. In standalone configuration, set alarms to latching. When resetting the overrange or alarm, verify correct operation of the transmitter.

Latching / Non-Latching is used to control whether Alarms 1 and 2 and faults will latch alarms.

Figure 95. Alarm Latching/Non-Latching Screen

Figure 96. Alarm Latching

Select the ⎍ or ⎍ icon beside the alarm limit to display the Alarm Latching/Unlatching screen. Alarm latching determines whether alarms that are triggered are automatically reset when the condition dissipates (latching off ⎍) or remain active until an operator resets them manually (latching on ⎍). Highlight the desired latching option with the ◁ ▷ switches. Use ✓ to accept it.

Figure 97. Setting Alarm Latching/Unlatching

Use the same procedure to set the desired values for Alarm 2 and Faults. When all settings have been made, use ◀ ▶ to navigate to the ✓ on the display. Use ✓ to accept settings.

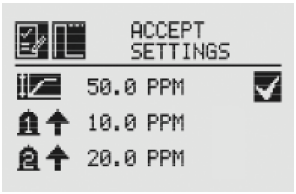

Figure 98. Accept Settings

When the settings have been saved, the following screen is displayed.

Figure 99. Settings Accepted Screen

Note: When non-latching is selected, external alarm latching is recommended.

Set Units

The Set Units menu allows the units of measurement displayed on the XNX main menu to be set. This option also sets the units transmitted via HART, Modbus, or Foundation Fieldbus sensors attached to the XNX transmitter, reporting concentrations in PPM or %VOL (except oxygen).

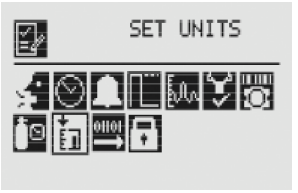

Figure 100. Set Units Menu

To change the units, use the ◀ ▶ switches to highlight the units icon. Use ✓ to select it. The transmitter's display will change to the Display Unit Selection screen which shows the available choices for the sensor type installed. Use the ◀ ▶ switches to highlight the desired unit of measurement. Use ✓ to select it or ✗ to discard the selection.

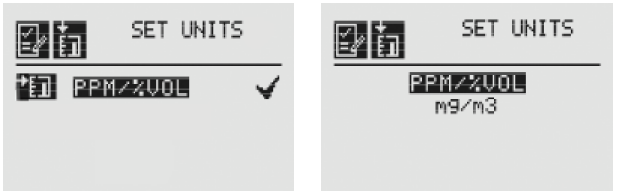

Figure 101. Display Unit Selection Screen

Caution: When changing units of measure, check alarm level settings for the proper units and change as necessary.

Once the units of measurement have been set, use the ◀ ▶ switches to navigate to the '✓' to accept the values.

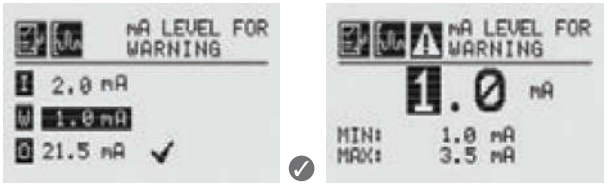
mA Levels

This option allows the user to select mA output levels for inhibit, fault, and over range. Beam block and low signal apply to

Searchline (see the table in the next column).

Figure 102. mA Levels Menu

Using the ◀ ▶ switches, move to the mA output to be changed and use ✓ to select it.



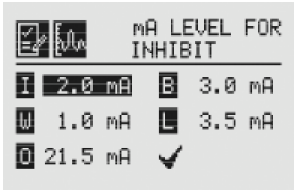


Figure 103. Set mA Levels for Warning

Use the ◀ ▶ switches to decrement or increment the value until the desired value appears. Use ✓ to select the value and move to the next setting. Repeat for each setting to be changed.

The default values and available output ranges for Inhibit, Warning, Overrange, Beam Blocked, and Low Signal are shown in the following table. See Section 5 Warnings/Faults for more information.

Signal		Output (mA)		
		Default	Min	Max
I	Inhibit	2.0	1.0	3.5
W	Warning	3.0	1.0	3.5
O	Overrange	21.0	20	22
B	Beam Blocked	1.0	1.0	4.0
L	Low Signal	1.0	1.0	4.0

Figure 104. Set mA Levels for Inhibit

After all changes have been made, use the ◀ ▶ switches to move to the '✓' and use ✓ on the front panel to accept and save the settings. If '✓' is not selected, none of the changes will be saved.

Figure 105. mA Settings Saved

Calibration Interval

Calibration Interval allows a desired interval for sensor calibration to be set for sensors attached to the transmitter. The transmitter will generate a warning when the interval is reached.

Figure 106. Calibration Interval Menu

Calibration Interval will not appear when an IR personality board is attached and the mA sensor type is set as 'Other mA Sensor'.

The default calibration values for the "Calibration Required" diagnostic vary based on sensor type. This value can be reprogrammed in accordance with site requirements to ensure the highest level of safety. Correct operation of each sensor should be confirmed using calibration with a certified gas of known concentration before commissioning.

Although the calibration Interval can be set to any value between 0 and 360 days, Honeywell Analytics recommends that the interval for electrochemical and catalytic sensors be set to 180

days (or fewer, in accordance with customer site procedures) to assure the highest level of safety.

Use the ◀ ▶ switches to highlight the current interval and use ✓ to select it.

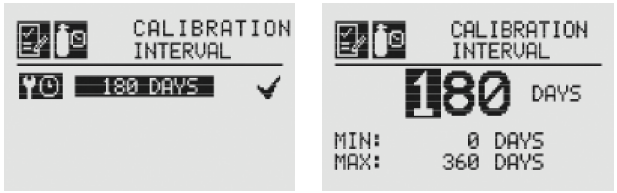

Figure 107. Edit Interval and Setting Interval Value Screens

Use the ◀ ▶ switches to move to the desired position. Use ✓ to select it. Use the ◀ ▶ switches to decrement or increment the value until the desired value is reached. (The minimum number of days is 0; the maximum number is defined by the sensor type.) Use ✓ to select the value and move to the next field. Repeat for each field. When all of the fields have been updated, use the ◀ ▶ switches to highlight the '✓' on the right side of the display. Use ✓ on the front panel to save the settings.

Caution: Setting the Calibration Interval to zero turns off the calibration notification. This can seriously affect sensor performance.

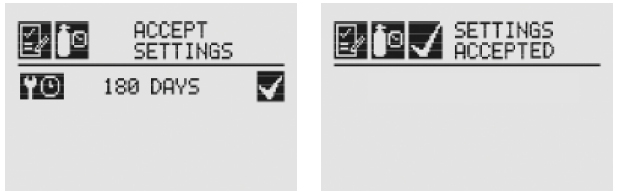

Figure 108. Saving New Interval and New Interval Accepted Screens

Accept New Sensor Type

When replacing EC cells or mV sensors, use Accept New Sensor Type to load default parameters into the XNX transmitter for calibration and sensor life. Accept New Sensor Type is also used when replacing an EC cell with another EC cell for a different target gas. (See Section 4.2.2).

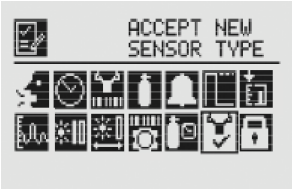

Figure 109. Accept New Sensor Type Menu

When changing the target gas by inserting a new sensor, the transmitter will prompt the user for a confirmation of the change before adjusting to the properties of the new sensor.

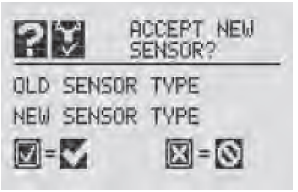

Figure 110. Select New Sensor

In the display of the XNX transmitter, the old sensor type and the new sensor type will be displayed. Use ✓ to accept the new sensor or ✗ to reject it.

Beam Block Options

The Beam Block Options menu is available only if the XNX transmitter is connected to a Searchline Excel sensor.

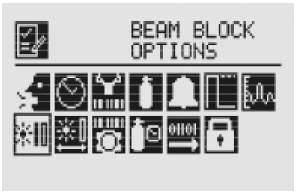

Figure 111. Beam Block Menu

If the infrared beam from the Excel transmitter is blocked or inhibited in such a way that the intensity of the beam drops to a level below the readable threshold set by the receiver, a warning will be generated by the XNX transmitter. The Beam Block Options menu allows the user to define the maximum period of time the infrared beam can be blocked and the percentage of signal loss before generating a warning through the transmitter.

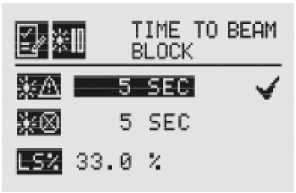

Figure 112. Beam Block Warning Time

Use the ◀ ▶ switches to move to the desired beam block time option and use ✓ to select it. Use the ◀ ▶ switches to decrement or increment the value until the desired value appears. Use ✓ to select the value and move to the next setting.

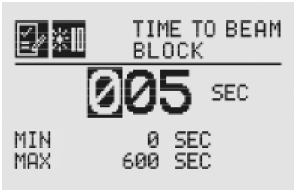

Figure 113. Setting Beam Block Warning Time

When the beam is blocked longer than the value set in Time to Beam Block, a fault is generated by the transmitter.

Set Time to Fault sets the minimum time the beam is blocked before generating a fault.

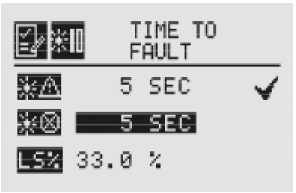

Figure 114. Beam Block Fault Time

Use the ◀ ▶ switches to move to the desired beam block time option and use ✓ to select it. Use the ◀ ▶ switches to decrement or increment the value until the desired value appears. Use ✓ to select the value and move to the next setting.

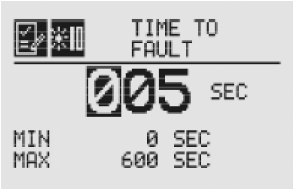

Figure 115. Setting Beam Block Fault Time

When the beam is blocked longer than the value set in Time to Fault, a fault is generated by the transmitter.

Low Signal Percentage sets the minimum percentage value of the beam that is not blocked. When the percentage decreases below the defined percentage, a fault is generated.

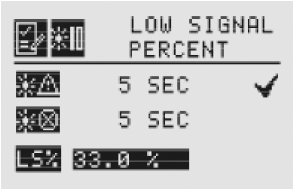

Figure 116. Low Signal Percentage

Use the ◀ ▶ switches to move to the desired Low Signal Percentage and use ✓ to select it. Use the ◀ ▶ switches

to decrement or increment the value until the desired value appears. Use ✓ to select the value and move to the next setting.

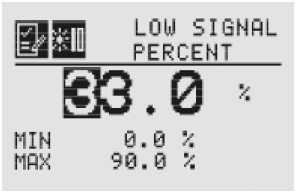

Figure 117. Setting the Low Signal Percentage

Once the values for Beam Block Warning, Beam Block Fault and Low Signal Percentage have been set, use the ▷ switch to highlight the '✓' on the right side of the display. Then use ✓ to accept the changes to the XNX. If '✓' is not highlighted, none of the changes will be saved.

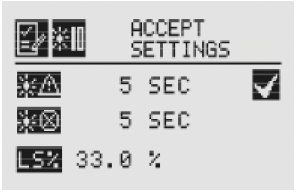

Figure 118. Accept Beam Block Changes

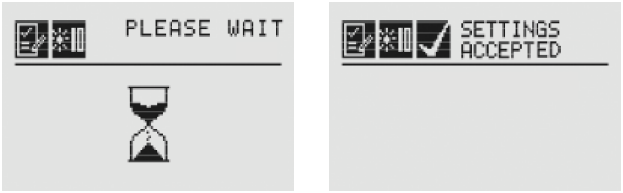

Figure 119. Beam Block Changes Accepted

Path Length

The distance (in meters) between the transmitter and the receiver is set through the Path Length menu. This menu is available only if the transmitter is connected to a Searchline Excel sensor.

Figure 120. Path Length Menu

Setting the Path Length or distance between the transmitter and receiver of the Excel lets the devices determine the optimum settings for the beam strength for the application.

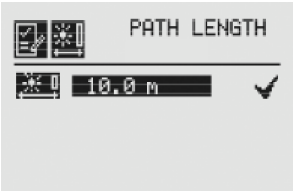

Figure 121. Current Path Length Setting

Use the ◁ ▷ switches to move to the desired Path Length setting and use ✓ to select it. Use the ◁ ▷ switches to decrement or increment the value until the desired value appears. Use ✓ to select the value and move to the next setting.

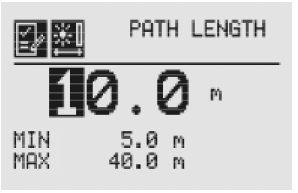

Figure 122. Setting Path Length

Once the values for Path Length have been set, use the ▷ switch to highlight the '✓' on the right side of the display. Use the ✓ to accept the changes.

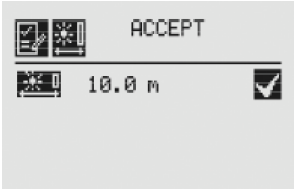

Figure 123. Accepting Path Length Changes

Figure 124. Path Length Changes Accepted

Unit ID

The Unit ID option allows a unique unit ID of up to 18 characters to be set for each XNX transmitter. This character string can be broadcast over any of the supported communication options, providing a means to create a unique identification for each XNX transmitter for accurate reporting. Available characters are A-Z, a-z, 0-9 and special characters ? ! * % ( ) : & / , # + -

Figure 125. Unit ID Menu

Note: The XNX Unit ID is not the same as the HART tag in XNX applications using HART protocol.

Edit ID

Each XNX is assigned a default Unit ID from the factory. The Edit ID menu allows the assigned ID to be modified.

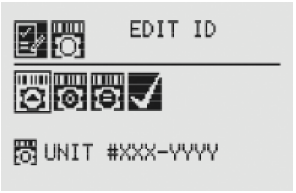

Figure 126. Edit Unit ID Screen

From the Edit ID Screen, use the ◀ ▶ switches and ✓ to select Edit ID. The current Unit ID is displayed. When editing an existing ID, the list of available characters begins at the value displayed.

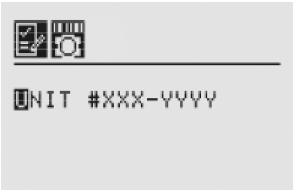

Figure 127. Editing the Unit ID

Use the ✓ switch to highlight the first character to be changed. Use the ◀ ▶ switches to decrement or increment the value until the desired value appears. Use ✓ to accept the new value and move to the next character. Repeat for each character to be changed. The Unit ID can be up to18 characters long.

Clear ID

This option clears the current set Unit ID.

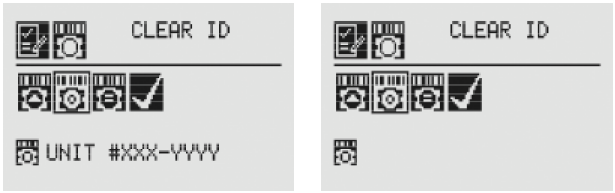

Figure 128. Clear Unit ID and Cleared Unit ID Screens

Set ID to Default

The Set ID to Default option returns the Unit ID to the factory default.

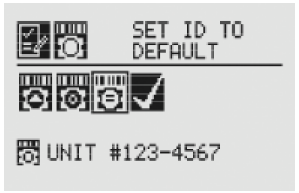

Figure 129. Set ID to Default Screen

Once all changes have been made, Accept Settings must be selected before exiting the Unit ID menu. When all changes are saved, the transmitter will display the Settings Accepted screen.

Figure 130. Accept Settings and Accepted Screens

Relay Options

The Relay Options menu allows the relays for both alarm levels to be configured. This menu is available only if the XNX transmitter is equipped with the optional relays.

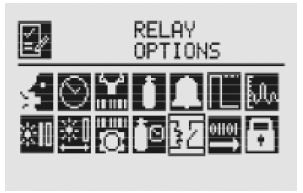

Figure 131. Relay Options Screen

XNX relays can be set to Energized or De-energized. The default is De-energized. The two states for each relay are represented by the symbols for energized and for de-energized.

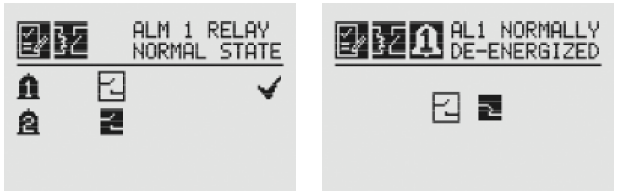

Figure 132. Alarm 1 Relay Current State and Setting New State

Use the switches to move to the desired alarm and use to select it. Use the switches to change the state of the relay. Use to accept the new state. Once the XNX transmitter has accepted the new information, a Settings Accepted screen appears.

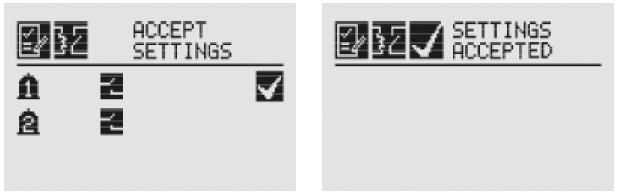

Figure 133. Accept New Alarm Relay Settings and new Settings Accepted

Fieldbus Options

The Fieldbus Options menu allows configuration of the HART address or the optional Modbus fieldbus address and baud rate.

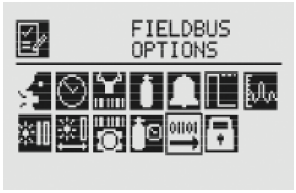

Figure 134. Fieldbus Options Screen

Select the Fieldbus Options icon to activate the HART/Modbus screens to allow selection of the protocols to be configured or changed. If the XNX is configured without HART or Modbus, only the installed options will be visible.

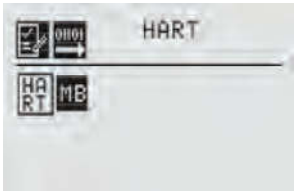

Figure 135. HART Options Screen

The HART menu provides the ability to select the HART mode. From the HART screen, use the ◁ ▷ switches to highlight the HART option, then select ✓. This displays the HART address screen where the device address and whether the HART protocol is active in the unit can be set. To set the address, use the ◁ ▷ switches to highlight the number in the top line (between 0 and 63) and use ✓ to select it. Use the ◁ ▷ switches to decrement or increment the value until the desired value appears. Use ✓ to select the value and move to the next setting.

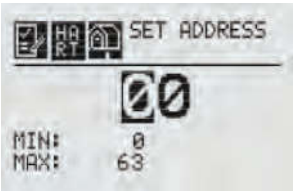

Figure 136. HART Address and Address Value Screens

Use the ◁ ▷ switches to move to the HART option and use ✓ to select it. Use the ◁ ▷ switches to scroll through the options until the desired option is highlighted. Use ✓ to accept the new state. See Section 2.3.1 and Appendix A for more information on available HART modes.

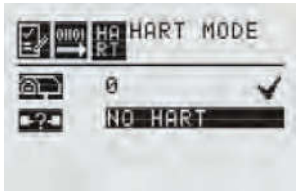

Figure 137. HART Mode Screens

Once the values for the HART address and Mode have been set, use the ◁ ▷ switches to navigate to the '✓' then select it to save the changes to the XNX.

Figure 138. HART Settings Accepted

When the Modbus option is available, use the ◁ ▷ switches to move to the Modbus icon and use ✓ to select it. The Modbus option allows the address and communication baud rate to be set.

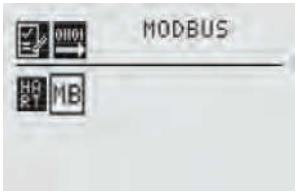

Figure 139. Modbus Options Screen

From the Set Fieldbus Address screen, select ✓. To set the Fieldbus address, use the ◀ ▶ switches to move to the desired position and use ✓ to select it. Use the ◀ ▶ switches to decrement or increment the value until the desired value appears. Use ✓ to select the value and moves to the next setting.

Figure 140. Set Fieldbus Address and Address Value Screens

The communications baud rate can be set from this screen. Use the ◀ ▶ switches to highlight the proper baud rate and select ✓.

Figure 141. Set Baud Rate Screens

Once the values for the Fieldbus address have been set, use the ◀ ▶ switches to navigate to the '✓' then select it to save the changes.

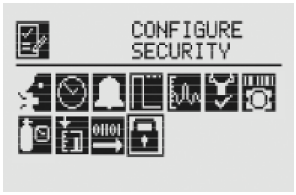

Figure 142. Accept Settings and Fieldbus Address Settings Accepted

Configure Security

Configure Security is used to set or reset the level 1 and level 2 passcodes that control access to the configuration menus of the XNX transmitter.

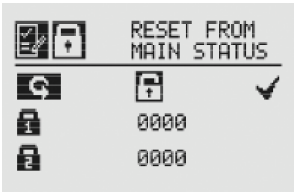

Figure 143. Configure Security Screens

Easy Reset from Main Status

The Easy Reset from Main Status option controls the ability to reset faults, warnings, and alarms from the General Status screen (see Section 1.4.2).

Use the ◀ ▶ switches and ✓ to select the lock icon. The Lock/Unlock screen will be displayed. Choose 'Lock' to prevent reset without password access. The 'Unlock' choice allows resets without requiring login or a passcode.

Figure 144. Lock/Unlock Screen

Level 1 and Level 2 Passcode

Level 1 and 2 passcode screens give the administrator the ability to assign new passcodes for either or both access levels.

From the Configure Security Screen, use the ◀ ▶ switches to highlight Passcode 1. Use ✓ to choose the first digit and the ◀ ▶ switches to decrement or increment the values. Use ✓ to accept the new value and move to the next digit. Repeat until all four digits have been selected. Follow the same procedure to change the Level 2 passcode.

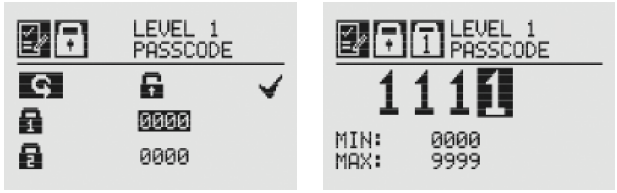

Figure 145. Setting Level 1 Passcode

Use the ◀ ▶ switches to move to “Accept Settings” on the display. Choose ✓ to save the settings to the transmitter.

Figure 146. Accept Settings and Security Settings Accepted Screens

2.6 Verifying the XNX Configuration

2.6.1 Test Menu

The test menu icons are shown in this table:

Symbol	Description	Symbol	Description
	Inhibit		Force Relay
	Force mA Output		Alarm/Fault Simulation

Warning: Keep the passwords in a secure area to prevent unauthorized access to the transmitter. If the passwords are lost, resetting the XNX transmitter will require a service technician.

Inhibit

Warning: When the XNX transmitter is placed in Inhibit Mode, alarms are silenced. This will prevent an actual gas event from being reported. Inhibit Mode must be limited to testing and maintenance only. Exit Inhibit Mode after testing or maintenance activities.

Figure 147. Inhibit Screen

The Inhibit mode is designed to prevent alarms from being triggered during testing or maintenance.

Figure 148. Inhibit Menu

Use the ◀ ▶ switches to inhibit alarms by selecting Inhibit On with the ✓. The confirmation screen appears.

Figure 149. Confirm Inhibit On

Select ✓ to place the transmitter alarms into inhibit mode. Select ✗ will cancel the choice and leave the alarms in normal operating mode.

Figure 150. Confirm Inhibit Off

To return from Inhibit mode to to the normal monitoring mode, select Inhibit Off with the ✓. A confirmation screen appears.

Select ✓ to remove the XNX from Inhibit mode. Select 'X" to cancel the choice and leave the alarms in Inhibit mode.

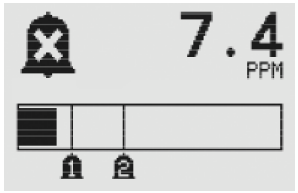

Figure 151. Inhibit Status Screen

When the XNX transmitter is in Inhibit mode, the General Status display will display the inhibit icon.

Force mA Output

Caution: The mA output set in this menu will revert to the normal operating values when exiting the Test Menu. For more information on setting the mA output levels for normal operation, see mA Levels.

Force mA Output allows peripheral devices driven by mA output from the XNX transmitter to be tested. Based on the mA output values set in the mA Levels option (see mA Levels), the operator chooses the mA level to output to the device.

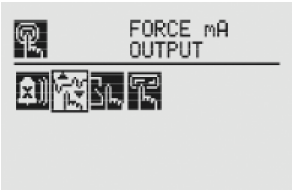

Figure 152. Force mA Output Screen

The New mA Output screen shows the current mA output in the left column. The output can be controlled by changing the value in the column on the right.

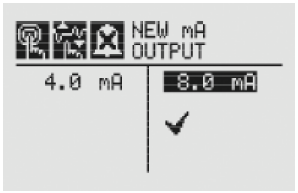

Figure 153. New mA Output Screen

Once the new value is input, use the ◀ ▶ switches to move to the '✓' and use the ✓ magnetic switch on the front panel to set the mA output.

Force Relays

Caution: Any relay conditions set in this menu will revert to the normal operating values when exiting the Test Menu. For more information on setting the relay options for normal operation, see Relay Options.

The Force Relay menu allows peripheral devices driven by relays from the transmitter to be tested. Depending on the relay options set in the Relay Options menu (see Relay Options), the relay will be open or closed.

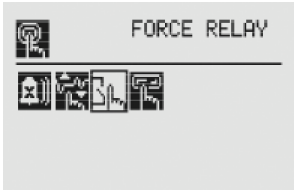

Figure 154. Force Relays Screen

The Relay State screen shows the current relay configuration in the left column. The output can be controlled by changing the value in the column on the right.

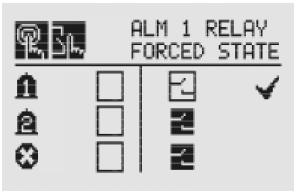

Figure 155. Relay State Screen

Once the new value is input, use the ◀ ▶ switches to move to the '✓' and use the ✓ magnetic switch on the front panel to change the condition of the relay.

Alarm/Fault Simulation

Alarm and Fault simulation work in tandem with the previous sections (Force mA Output and Force Relays) to allow thorough testing of the XNX transmitter and the peripheral warning and safety devices attached. Figure 156 shows the menu choices for selecting an alarm or fault simulation.

Figure 156. Alarm/Fault Simulation Screen

Selecting an alarm level to simulate activates a confirmation screen.

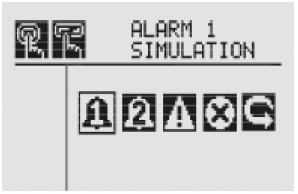

Figure 157. Alarm/Fault Simulation Menu

Figure 158. Confirmation

Selecting ✓ will simulate the alarm from the transmitter. If the ✗ is selected, the simulation will be aborted.

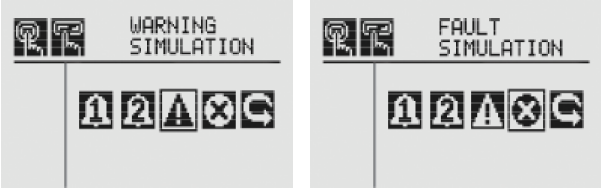

Figure 159. Warning and Fault Simulation Screens

To simulate a Warning or Fault from the transmitter, select the appropriate icon from the menu.

Figure 160. Fault Simulation Confirmation

A confirmation screen will appear. Select ✓ to simulate the warning or fault from the transmitter. If the ✗ is selected, the simulation will be aborted. Use Alarm/Fault Reset to reset alarms, faults, or warnings generated by the simulation.

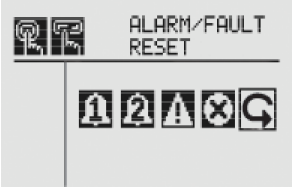

Figure 161. Alarm/Fault Reset Screen

A confirmation screen will appear.

Figure 162. Alarm/Fault Reset Screen

Select ✓ to reset the alarms, faults, or warnings generated by the simulation. If the ✗ is selected, the simulation continues.

Caution: Relays and LEDs will return to their initial states after simulations are completed unless faults and alarms are set to latching by the user.

Warning: After changing parameters with a handheld device, verify that the parameter settings are correct at the transmitter.

2.6.2 Information Menu

The Information Menu Displays the current status information for these parmeters:

Symbol	Description
	Show Alarm/Fault Status
	Show Date/Time
	Show Transmitter Data
	Show Transmitter Status
	Show Sensor Data
	Show Sensor Status

Symbol	Description
	Show Gas Data
	Show Range/Alarm Settings
	Show mA Level Settings
	Show Relay Settings
01101	Show Fieldbus Settings
	Show Event History

Alarm/Fault Status

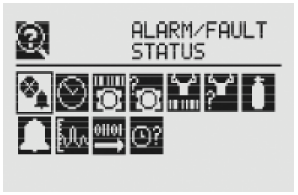

Figure 163. Alarm/Fault Status Screen

Select Alarm/Fault Status to display the Alarm/Fault Status screen allowing faults and alarms to be reset.

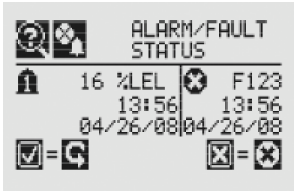

Figure 164. Alarm/Fault Status Screen

The '✓' will be highlighted. Select ✓ to reset all faults and alarms generated by the transmitter then return to the Alarm/Fault Status screen. Select the ✕ switch to return to the Alarm/Fault Status screen without resetting faults or alarms.

Date & Time

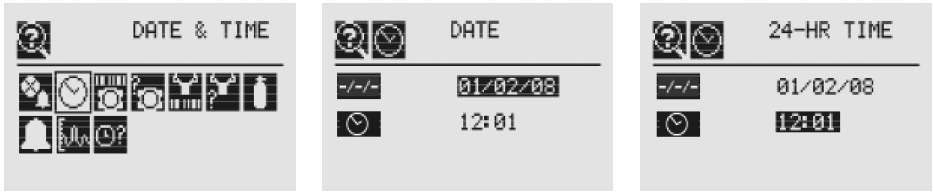

Figure 165. Date/Time Screens

The Date and Time screens display the date and time in the formats currently set on the transmitter. To set the time and date see Set Date & Time.

Transmitter Data

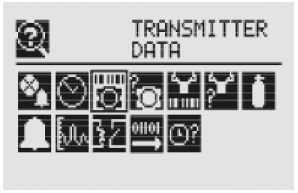

Figure 166. Transmitter Data Screen

Using the ◀ ▶ switches, the Transmitter Data displays the ID, part number, serial number, and version number of the firmware.

Figure 167. Transmitter ID, Part Number and Serial Number Screens

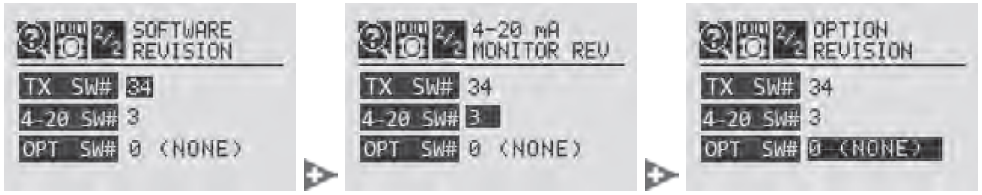

Figure 168. Transmitter Software, 4-20 Monitor and Option Version

Transmitter Data is also used to update the configuration of the XNX when an option board is added or changed. To add the new option, use the ◀ ▶ switches to navigate to the Option Revision screen, then swipe the ✓ magnetic switch on the front panel to display the Accept New Option Screen. The screen will show the current option (if any) and the newly installed option. Use the ◀ ▶ switches to highlight the option then swipe the ✓ magnetic switch on the front panel to accept the change. The transmitter will update the part number of the unit. The new option will then be operational.

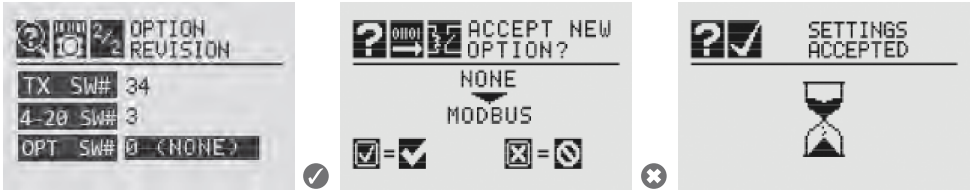

Figure 169. Updating The XNX for Option Boards Added or Changed

Transmitter Status

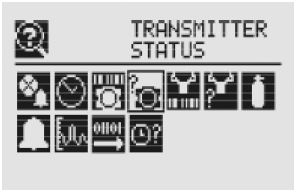

Figure 170. Transmitter Status Screen

Transmitter Status displays information about the XNX unit including temperature, 4-20 mA output value, and supply voltage.

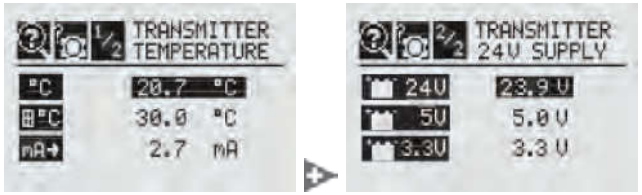

Figure 171. Transmitter Temperature and Supply Voltage Screens

Sensor Data

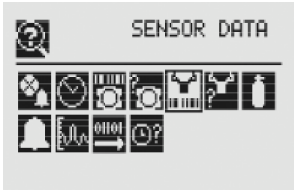

Figure 172. Sensor Data Screen

Sensor Data displays information about the transmitter including sensor type and sensor software revision.

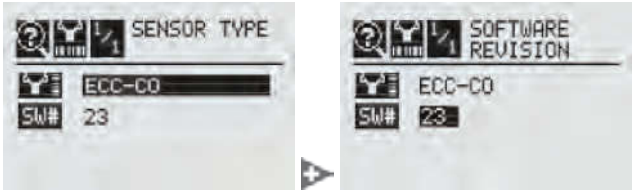

Figure 173. Sensor Type and Software Screens

Sensor Status

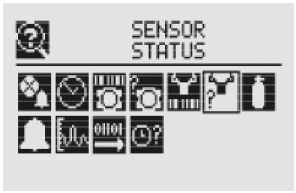

Figure 174. Sensor Status Screen

Sensor Status displays the temperature of the sensor attached to the transmitter. When equipped with an EC or mV sensor, sensor life is also displayed.

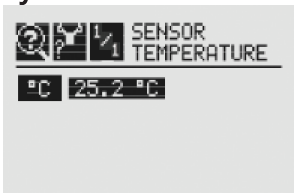

Figure 175. Sensor Temperature Screen

Gas Data

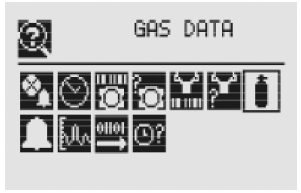

Figure 176. Gas Settings Screen

Gas Data displays the current detectable gas as configured for the attached sensor.

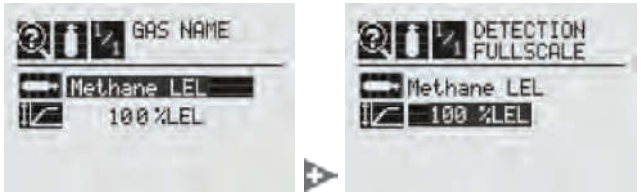

Figure 177. Gas Abbreviation and Full Scale Screens

Range/Alarm Settings

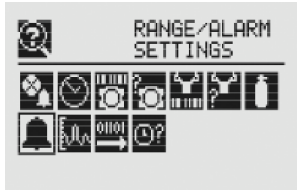

Figure 178. Range/Alarm Settings Screen

Range/Alarm Settings displays the currently configured alarm information.

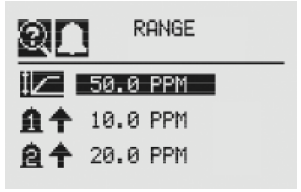

Figure 179. Alarm Display Range Screen

mA Level Settings

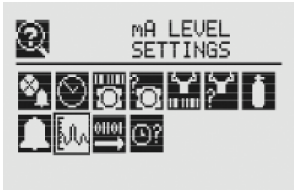

Figure 180. mA Level Settings Screen

mA Level Settings shows the current values for mA output for Inhibit, Warning, and Overrange output.

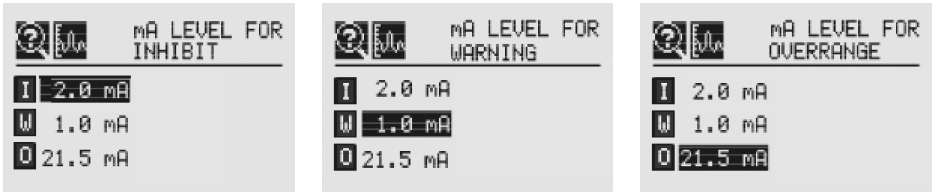

Figure 181. mA Output Inhibit, Warning and Overrange Screens.

Fieldbus Settings

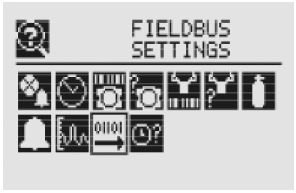

Figure 182. Fieldbus Settings

Fieldbus Settings displays the current configuration of both HART and Modbus. To change the settings see Fieldbus Options. HART displays the current HART address assigned to the transmitter.

Figure 183. HART Configuration Settings

Modbus displays the current address and communication data rate assigned to the transmitter.

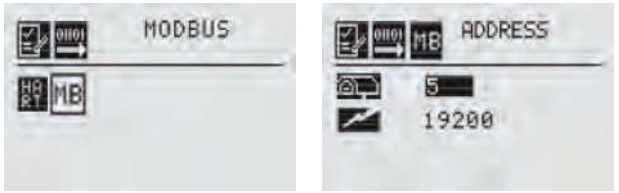

Figure 184. Modbus Configuration Display Screen

Relay Data

The Relay Menu is enabled only if the XNX transmitter is equipped with the optional relays.

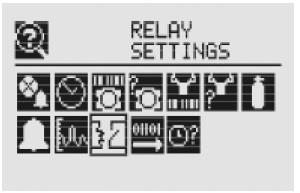

Figure 185. Relay Data Screen

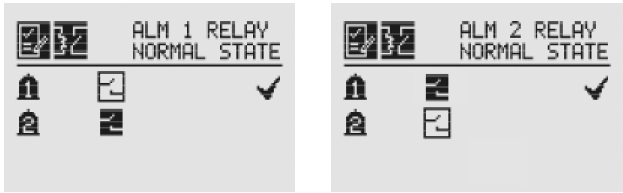

Figure 186. Relay State Screens

Relay Data displays the current setting of the optional relays on the transmitter. To change the relay settings, see Relay Options.

Event History

The Event History screen lists all events that are activated by the transmitter's settings. Five types of events are recorded: reset messages, alarm messages, warning messages, fault messages, and informational messages. The events are listed in chronological order beginning with the latest.

Events can be displayed through five browsing modes:

- all events in order of occurrence
- all events by hour
- all events by day
- only the alarm events, in order of occurrence
- only the fault events, in order of occurrence

The Event History screen groups events into chronological order (beginning from the unit's installation). Events can also be viewed by hour or by date.

Events listed in *hour* order are grouped without regard to date. For example, all events that have occurred between noon and 1:00 o'clock since the transmitter's installation can be isolated. To view all events in hour order:

1. Use the magnetic wand to filter the display by hour.
2. Navigate through the displayed times.

To isolate all of the events from a specific *day*:

1. Use the magnetic wand to filter the display by day.
2. Navigate through the displayed days.
3. Filter the list by all events. This will display all events that occurred on that day.

When the transmitter is configured with the Searchline Excel or Searchpoint Optima, the data reported in the event will be the fault code from the Searchline Excel or Searchpoint Optima.

The transmitter records up to 1280 events in a circular buffer. When event 1281 is recorded, the oldest event will be bumped from the list.

Note: The leading zeros of faults and warnings are not displayed in the event list; i.e., Fault 011 will be displayed as Fault 11.

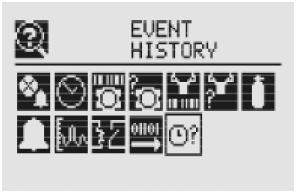

Figure 187. Event History Screen

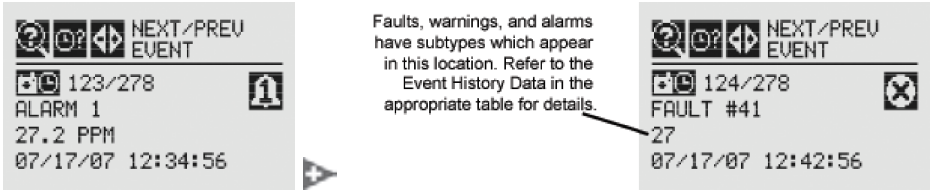

Figure 188. Chronological Event List

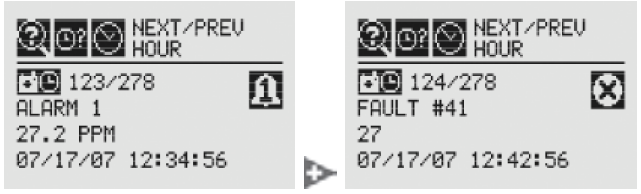

Figure 189. Chronological Event List by Hour

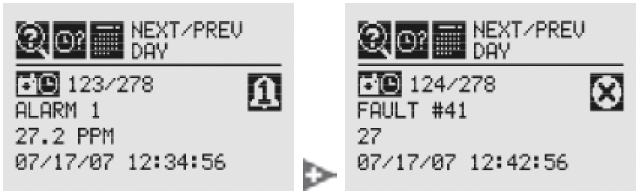

Figure 190. Chronological Event List by Day

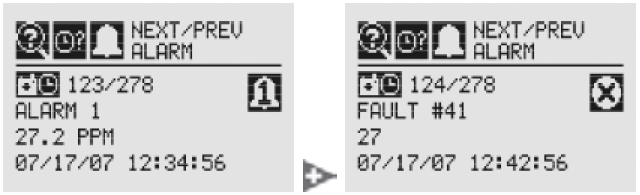

Figure 191. Chronological Alarm List

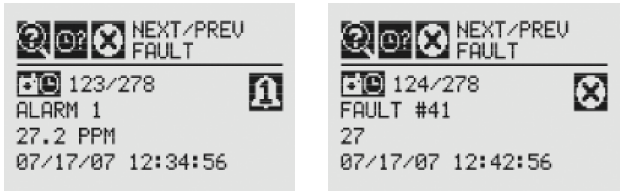

Figure 192. Chronological Fault List

The transmitter is configured with five cable/conduit ports built into the housing for wiring and mounting sensors.

3 Calibration

3.1 Gas Calibration Menu

Each of the sensor technologies supported by the XNX® Universal Transmitter uses unique calibration procedures. The description provided illustrates the XNX interface with the sensor. The description does not replace the procedures found in each sensor's operating manual.

The Gas Calibration menu is used for Zero and Span calibration as well as functional gas testing (bump test). The Gas Calibration menu is accessed from the Main Menu.

This table shows the Gas Calibration menu icons:

Symbol	Description
	Gas Calibration
	Bump Test
	Calibrate mA Output
	Soft Reset
	Align Excel

Figure 193. Gas Calibration Menu

3.2 Calibration

Warning: Do not use the XNX Universal Transmitter in oxygen-enriched atmospheres. Concentrations displayed will be adversely affected by oxygen depletion.

Caution: The calibration procedure should be performed only by qualified personnel. Take appropriate precautions with cylinders of flammable and toxic gases.

The default calibration values for the "Calibration Required" diagnostic vary based on sensor type. This value can be reprogrammed in accordance with site requirements to ensure the highest level of safety. Correct operation of each sensor should be confirmed before each use by calibration with a certified test gas of known concentration before commissioning. See Section 6 - Specifications for calibration gas specifications.

Caution: Recalibrate if the temperature of local environment has varied by more than ±15°C from the temperature of calibration.

Warning: Honeywell recommends periodic bump tests (every 30 days or in accordance with customer site procedures) to the sensor to insure proper operation and compliance with the functional safety rating of the installation.

3.2.1 Zero and Span Calibration for XNX EC Sensors, mV Sensors, and Searchpoint Optima

Caution: Before initial calibration, allow the sensor to stabilize for 30 minutes after applying power. When in Zero and Span Calibration modes, the current output from the sensor is inhibited (default 2mA) to avoid false alarms.

Caution: For most sticky gases (e.g., HCl, Cl_2) use PTFE tubing with short pieces of rubber tube for the final connection (due to the inflexibility of PTFE). This minimizes adhesion of the gas to the tube surface and allows more accurate measurement.

To calibrate the sensor, use an appropriate span gas cylinder, tubing, magnet, and calibration gas flow housing. Set the flow regulator to 300-375 ml/min for XNX EC sensors or 500 ±200 ml/min for XNX mV sensors. A compressed gas cylinder (20.9%Vol oxygen) should be used to perform the zero calibration if the area where the sensor is located contains any residual amount of the target gas. If no residual gas is present, background air can be used to perform the zero calibration. Contact a Honeywell Analytics representative for details about suitable calibration kits. To calibrate the sensor, follow the procedure in Section 3.2.2.

Note: The oxygen sensor does not require a zeroing procedure. Background air (20.9%Vol oxygen) can be used to span the oxygen sensor in place of a compressed air cylinder (20.9%Vol oxygen). See Section 6.3.2 for other sensors.

Note: EN performance standards require 10 minutes stabilization time for application of zero and span gas for performance-approved EC, mV, and IR sensors prior to calibration.

3.2.2 Calibration Procedure

This section outlines the steps for calibrating the transmitter's attached sensors.

Note: The Zero Calibration procedure should be performed prior to the Span Calibration procedure.

1. If using a compressed gas cylinder, push the calibration gas flow housing onto the bottom of the sensor and apply the gas.
2. Access the Gas Calibration Menu.

Figure 194. Gas Calibration Menu

Note: The Gas Calibration menu is for both Zero Calibration and Span Calibration.

Zero Calibration

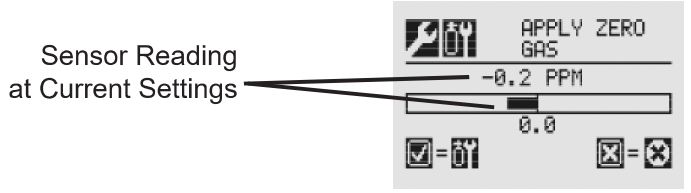

Figure 195. Zero Calibration Screen

As the sensor detects the gas and the concentration increases, the values displayed will reflect the changing concentration. When the concentration values are stable, 3 minutes, select ✓ to allow the transmitter to calculate the zero adjustment. Selecting ✗ will return to the Gas Calibration menu.

Figure 196. Zero Calibration in Progress

3. If the zero calibration is successful, the transmitter will display the Zero Passed screen.

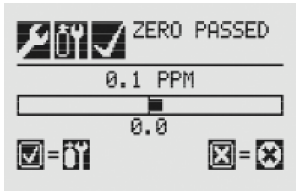

Figure 197. Zero Calibration Passed

Span Calibration

If a Span Calibration is not required, select the ✗ to skip the Span Calibration and return to the Calibration menu.

4. When the Zero Calibration is complete, the Span Concentration screen appears. The gas concentration for the Span Gas Calibration can be changed. If the Span Calibration is skipped, the Gas Calibration screen displays.

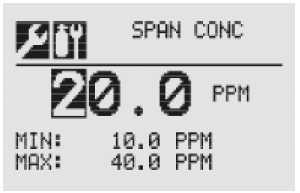

Figure 198. Span Gas Concentration Screen

5. Enter the concentration of the span gas by selecting ✓ to choose the first digit. Use the ◀ ▶ switches to increment or decrement the values. Use ✓ to accept the new value and move to the next digit. Continue until all digits have been selected.

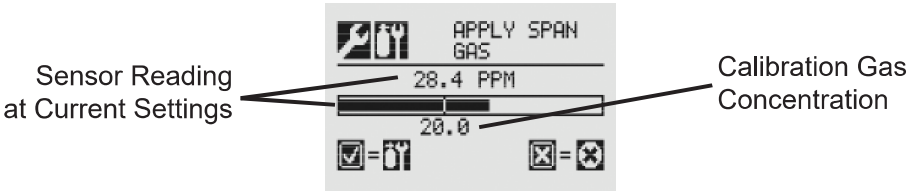

Figure 199. Span Calibration Screen

6. Apply the span gas. As the sensor detects the gas and the concentration increases, the values displayed will reflect the changing concentration. When the concentration values are stable, select ✓ to perform the span. The Span Calibration process also determines whether the sensor is within the proper range to accurately detect the target gas.

   Selecting ✗ will cancel the span calibration and return to the Gas Calibration menu.

7. When the sensor has completed the calibration and the span algorithms have determined that it is within range, the Span Passed screen will appear.

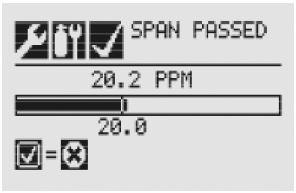

Figure 200. Span Passed Screen

If the calibration is not successful, the Span Failed screen will display. Selecting ✓ will return to the Span Concentration screen to begin the span calibration again. Selecting ✗ will exit Span Calibration and return to the Gas Calibration Menu.

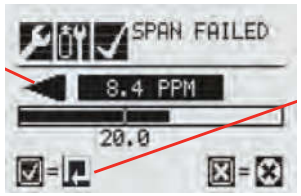

Figure 201. Span Calibration Failed

Once the Zero Gas and Span calibrations are completed successfully, the user will be prompted to:

- exit with inhibit off
- exit with inhibit on, or
- not exit.

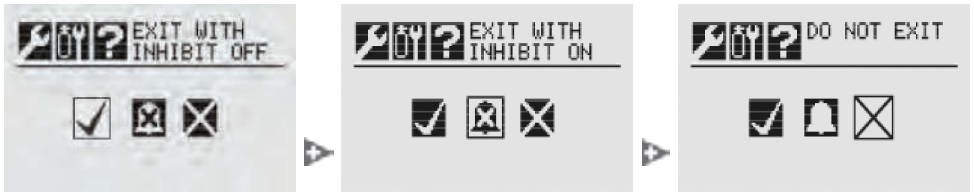

Figure 202. Span Calibration Failed

Warning: When the XNX transmitter is placed in Inhibit Mode, alarms are silenced. This will prevent an actual gas event from being reported. Inhibit Mode must be limited to testing and maintenance only. Exit Inhibit Mode after testing or maintenance activities.

3.2.3 Using the Calibration Cup

Refer to Figure 203 to attach the calibration cup:

1. Snap the calibration cup into the weather protector. The two protrusions on the cup fit into recesses in the weather protector.
2. Attach the hose from the gas cylinder to the calibration cup. Note that the cup's flow is unidirectional. There is an arrow on the bottom showing flow direction
3. Adjust the calibration flow rate[1].

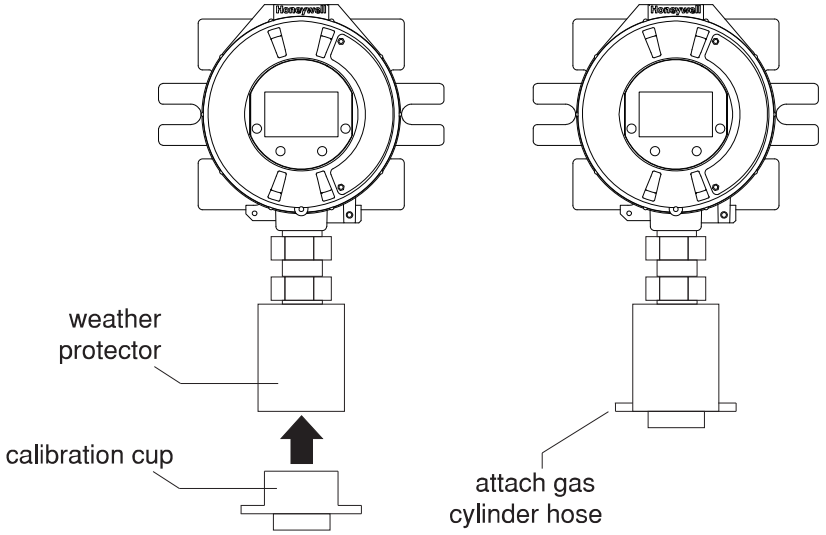

Figure 203. Attaching the Calibration Cup

1 300-375 ml/min for XNX EC sensors, 500 ±200 ml/min for XNX mV sensors, unless otherwise directed

3.2.4 Zero and Span Calibration of XNX EC Hydrogen Sulfide (H_2S) Sensors

Caution: Before initial calibration, allow the sensor to stabilize for 30 minutes after applying power. When in zero and span calibration modes, the current output from the sensor is inhibited (default 2mA) to avoid false alarms.

Caution: Recalibrate if the temperature of local environment has varied by more than ±15°C from the temperature of calibration.

Hydrogen Sulfide sensors can be affected by extreme humidity changes. A sudden increase in ambient humidity can result in a short-term positive drift in the instrument's reading. A sudden decrease in ambient humidity can result in a short-term negative drift in the instrument's reading. These are most likely to be noticed during calibration with dry or cylinder gas.

When calibrating hydrogen sulfide cartridges, the following should be taken into account while following the procedure in Section 3.2.2.

1. To zero the sensor, use a compressed gas cylinder of 20.9%Vol oxygen (not nitrogen). Do not use background air.

If a span calibration is to be performed, the span calibration gas should be applied to the sensor immediately after the zeroing procedure. Do not allow the sensor to return to ambient air conditions.

Warning: Long-term exposure (> 20 minutes) to concentrations exceediing the full-scale range of the sensor can cause it to lose sensitivity. The ouput of the sensor may then decrease in value even though high levels of toxic gas are still present. Before re-calibrating the transmitter, verify the absence of gas.

3.2.5 705/705HT Calibrating

For complete calibration and configuration information, see the Type 705 Operating Instructions (P/N: 00705M5002).

3.2.6 Sensepoint/Sensepoint HT Calibrating

For complete calibration and configuration information, see the Sieger Sensepoint Technical Handbook (P/N: 2106M0502).

3.2.7 Calibrating the Searchpoint Optima Plus

Complete calibration and configuration information can be found in the Searchpoint Optima Plus Operating Instructions (P/N:2108M0501). If properly installed and maintained, the Searchpoint Optima Plus sensor will not require routine calibration. This is due to the inherent stability of the IR absorption process and the unit's fully compensated optical configuration.

1. From the Calibration menu, select the Gas Calibration option.

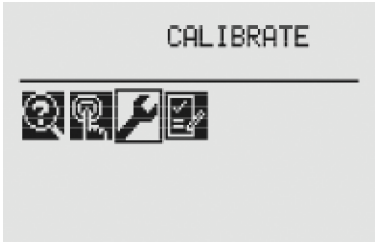

Figure 204. Calibration menu

Figure 205. Gas Calibration menu

2. Perform a zero calibration. When concentration values are stable, select ✓ for XNX to calculate the zero adjustment

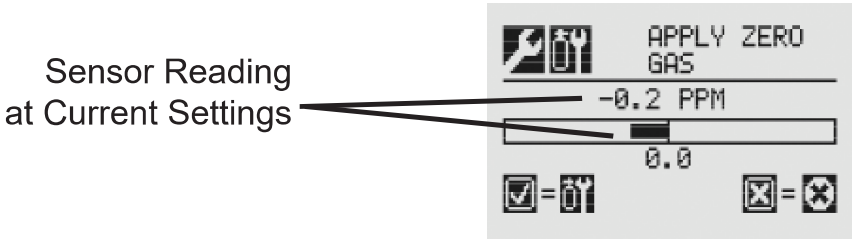

Figure 206. Apply Zero Gas screen

3. Select ✗ to return to the Gas Calibration menu. If the zero calibration was successful, the transmitter will display the Zero Passed screen

Figure 207. Zero Calibration screens

4. Begin the span calibration by entering the concentration value of the calibration gas: Select ✓ to choose the first digit. Use +/- to increment/decrement values. Select ✓ to accept the value and move to the next digit. Use calibration cover P/N 2108B0272 to perform span calibration at a flow regulator of 1 LPM. (If a span calibration is not required, select ✗ to return to the calibration menu.)

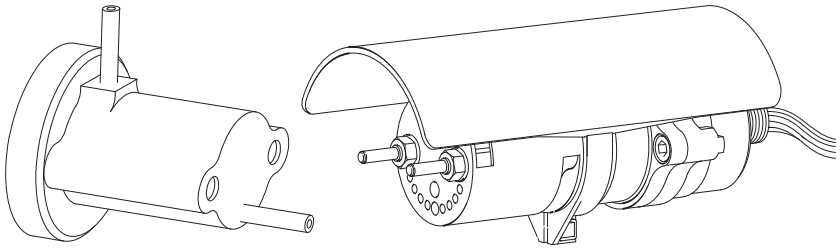

Figure 208. Searchpoint Optima Plus

5. Continue until all three digits have been entered.

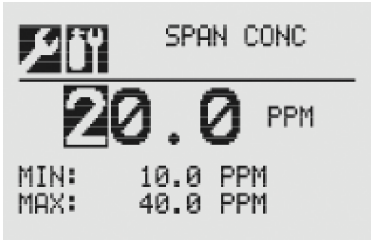

Figure 209. Span Concentration screen

6. Apply the span gas. When concentration values are stable, select ✓ to calculate the span adjustment. This process also determines if the sensor is within range to accurately detect the target gas.

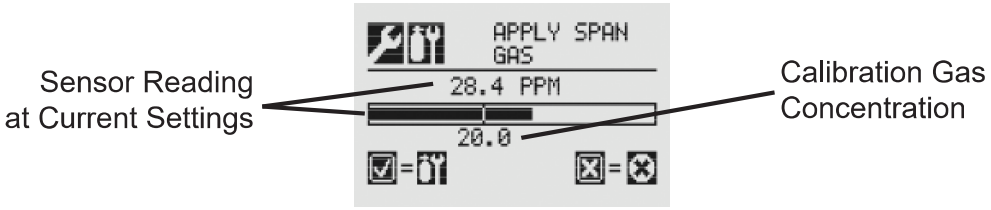

Figure 210. Span adjustment calculation

7. Select ✖ to return to the Gas Calibration menu. If the calibration is not successful, the Span Failed screen will be displayed.

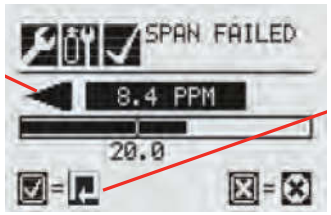

Figure 211. Span Failed screen

Select ✔ to return to the Span Concentration screen to repeat the span calibration.

Select ✖ to exit Span Calibration and return to main Calibrate screen. If Span Calibration is exited, the previous calibration values will be used. Select ✔ to return to the Span Concentration screen.

If the calibration is successful, the Span Passed screen will be displayed.

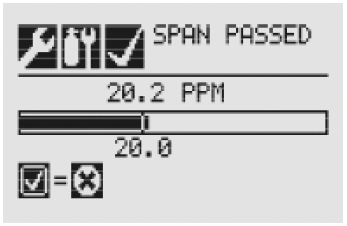

Figure 212. Span Passed screen

8. Exit the Calibration Menu. After the zero and span calibrations have been successfully completed, the user will be prompted to:
   - Exit and turn alarm and fault inhibit off,
   - Exit and leave the transmitter in inhibit mode. or
   - Not exit

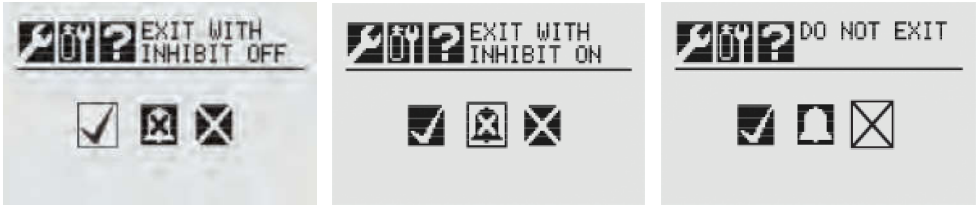

Figure 213. Calibration exit options

Warning: When the XNX transmitter is placed in Inhibit Mode, alarms are silenced. This will prevent an actual gas event from being reported. Inhibit Mode must be limited to testing and maintenance only. Exit Inhibit Mode after testing or maintenance activities.

3.2.8 Zero and Span Calibration for MPD Sensors

Caution: Extended or frequent exposure to elevated concentrations of combustible gases may affect sensor sensitivity. Verify sensor performance by frequent calibration.

Caution: Before initial calibration allow the sensor to stabilize for 30 minutes after applying power. When in zero and span calibration modes, the current output from the sensor is inhibited (default 2mA) to avoid false alarms.

The Gas Calibration menu is for both zero and span calibrations. This section describes how to calibrate MPD flammable sensors fitted to the transmitter. The calibration adjustments are made on the transmitters display. Gassing is performed at the sensor, which may be locally or remotely located.

The following equipment is required:

- Flow housing (P/N: 1226A0411)
- Test gas
- Regulator

Note: Zero gas and Span gas should be at about the same humidity levels to avoid erroneous cell responses.

1. At the MPD, remove the weatherproof cap, if equipped.
2. Fit the flow housing onto the MPD.

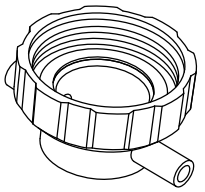

Figure 214. Flow Housing

3. Reverse the cap removal procedure. Figure 215 shows the flow housing accessory fitted to the MPD.

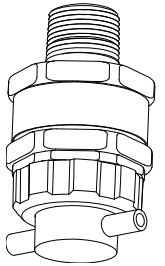

Figure 215. MPD with Flow Housing

4. Connect the flow housing (using either gas pipe) to the regulated cylinder containing a known concentration of the target gas at approximately the sensor alarm point, e.g., 50% LEL methane in air.

Warning: As some test gases are hazardous, exhaust the flow housing outlet to a safe area.

5. Follow the procedure in Section 3.2.1 for both zero and span calibrations.
6. Apply the target gas to the sensor. Pass the gas through the flow housing at a rate of 300-375 ml/min for XNX EC sensors or 500 ±200 ml/min for XNX mV sensors.

Sensors should be calibrated at concentrations representative of those to be measured. It is always recommended that the sensor be calibrated with the target gas it is to detect.

Caution: Responsibility for identifying and recording a sensor calibration made with a different gas rests with the user. Refer to local regulations where appropriate.

Ensure that the sensor and the vicinity around it is clear of all traces of the calibration gas before continuing. This is to avoid triggering spurious alarms.

If calibration fails at any point, discard the cartridge and replace it with a new one (see Section 4.1) .

7. Remove the test equipment, refit the weatherproof cap to the sensor (if previously removed for the test), and return the system to normal operation.

3.2.9 MPD Flammable Sensor Operational Life

The pellistors used in flammable gas sensors can suffer from a loss of sensitivity when in the presence of poisons or inhibitors, e.g., silicones, sulfides, chlorine, lead, or halogenated hydrocarbons. The pellistors are poison resistant to maximize the operational life of the flammable sensor. The typical operating life of the pellistor sensor used in the MPD-CB1 is 60 months.

3.2.10 XNX EC Sensor Operational Life

The typical life of a toxic gas sensor dependst on the application, frequency, and amount of gas exposure. Under normal conditions (3 month visual inspection and 6 month test/recalibration) the toxic sensor has an expected life equal to or greater than these lifetimes:

- 12 months for ammonia, hydrogen chloride, and hydrogen fluoride sensors (see further ammonia information below).
- 24 months for chlorine dioxide, oxygen, and other toxic sensors.

See Section 4 - Maintenance for sensor replacement procedures.

Caution: Oxygen deficient atmospheres (less than 6%V/V) may result in inaccurate readings and performance.

Ammonia electrochemical cells are reliable and suitable for applications where no background concentration of ammonia exists. Under these conditions the cells are expected to operate for 12 to 24 months.

These ammonia cells are of the consumptive type. Their operating life can be adversely affected by continuous or excessive exposure to ammonia, or by prolonged exposure to high temperatures and moisture.

To ensure continued detection availability, bump test the sensors regularly and implement an appropriate cell replacement program.

3.3 Functional Gas Testing (Bump Testing)

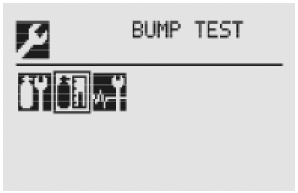

Figure 216. Bump Test Menu

Warning: Exposure to desensitizing or contaminating substances or concentrations causing operation of any alarm may affect sensor sensitivity. Following such events, it is recommended to verify sensor performance by performing a functional gas test (bump test).

It is recommended that the sensor be tested frequently to ensure that the system is operating properly. Different sensor types may require more frequent maintenance, depending on the environmental conditions and the gases present. The weatherproof cover has a spigot for attaching tubing from a gas cylinder. This may be used for a simple functional (bump) test of the sensor. However, environmental conditions may make this unsuitable for some gas typesor applications. It is the responsibility of the user to ensure suitability of this method for each application.

1. When bump gas is applied to the sensor, the bump test screen displays the current reading of the sensor and the peak reading that occurred during the bump test.

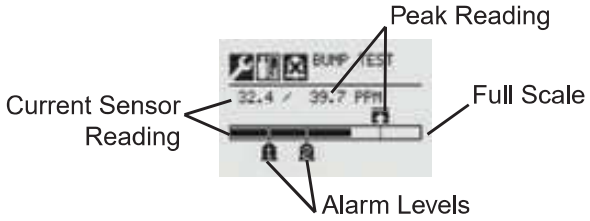

Figure 217. Bump Test Screen

2. If the difference between the reading and the applied gas concentration is outside the acceptable limits for the application, follow the procedures for zeroing and calibrating the sensor (see Section 3.2.1).
3. If the reading is still inaccurate, replace the sensor (see Section 4.1).

Once the bump test is completed successfully, the transmitter will exit the calibration procedure. Before returning to the Gas Calibration menu, the user will be prompted to exit and turn alarm and fault inhibit off, exit and leave the transmitter in inhibit mode, or not exit.

Caution: Exiting before the gas level has fallen below the level of Alarm 1 will cause the transmitter to go into alarm.

Figure 218. Exiting the calibration procedure

3.4 Calibrate mA Output

Use Calibrate mA Output to adjust the milliamp output to provide the correct output levels at peripheral devices connected to the transmitter.

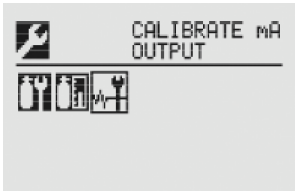

Figure 219. Calibrate mA Output Menu

To adjust the 4mA output, use the ◀ ▶ switches to increase or decrease the output, then use ✔ to accept the new value and move to the 20mA setting or ✖ to discard the selection and return to the previous menu.

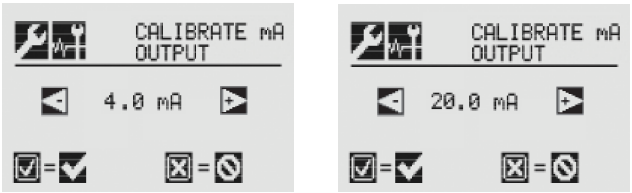

Figure 220. Calibrate mA Output Screens

During installation, an mA meter must be connected in series with the 4-20 mA loop as shown below.

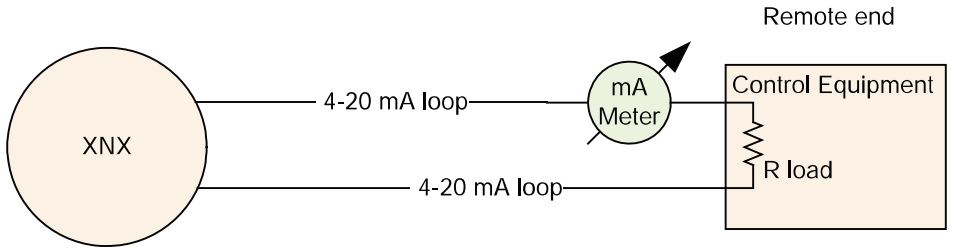

Figure 221. 4-20 mA loop with mA meter

Note: Calibrated mA output is required for proper operation of internal diagnostics.

An F165 fault will be reported if the 4-20 mA calibration fails.

3.5 Align Excel (Searchline Excel)

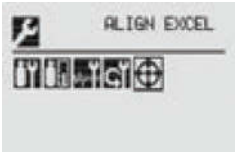

Figure 222. Align Excel Menu

For detailed information on Aligning the Searchline Excel, see the Searchline Excel Technical Manual (P/N: H-MAN0530-V1).

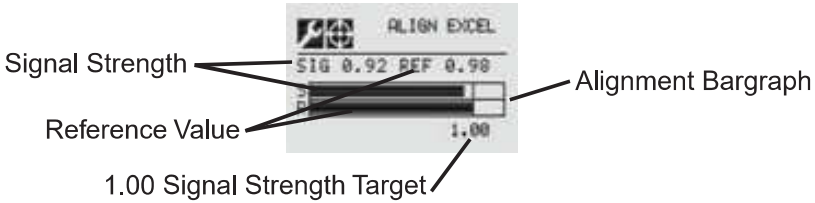

Figure 223. Align Excel Screen

Align the unit using the information found in the Searchline Excel manual. As the alignment is performed, the transmitter display will indicate the signal strength in the form of a bar graph. Align the Excel until the signal strength bar graph reaches or exceeds 1.00 as shown on the display.

3.6 Soft Reset

(Searchline Excel and Searchpoint Optima Plus only)

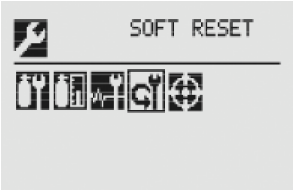

Figure 224. Soft Reset Menu

For transmitters connected to a Searchline Excel or Searchpoint Optima Plus sensor, the Soft Reset sends these infrared devices a signal to restart the sensor.

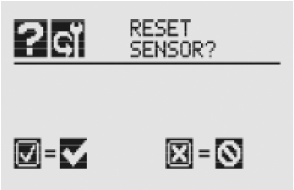

Figure 225. Soft Reset Sensor Screen

4 Maintenance

Warning: When servicing or replacing sensors, reduce the risk of ignition of hazardous atmosphere by declassifying the area or disconnecting the equipment from the supply circuit before opening the sensor enclosure. Keep the assembly tightly closed during operation.

Warning: Take care when handling sensors as they may contain corrosive solutions. Do not tamper or in any way disassemble the sensor cell. Do not expose to temperatures outside the recommended range. Do not expose the sensor to organic solvents or flammable liquids.

Warning: At the end of their working lives, sensors must be disposed of in an environmentally safe manner, in accordance with local waste management requirements and environmental legislation. Sensors should NOT be incinerated as they may emit toxic fumes.

Warning: Verify all outputs, including display, after installation, after service events, and periodically to ensure the safety and integrity of the system.

Caution: The following procedure should be followed carefully and performed only by suitably trained personnel. A fault condition will be signaled by the sensor if it is removed with the unit under power.

Note: If the power-on self-test was skipped during maintenance activities, restart the transmitter.

4.1 MPD Sensor Cartridge Replacement

Using Figure 226 as a guide, follow this procedure:

1. Verify that the label on the new sensor is the correct gas type.
2. Remove power from the transmitter.
3. Unscrew the weatherproof cover (if equipped), loosen the retainer locking screw, and unscrew the sensor retainer.
4. Remove the old sensor by pulling without twisting.
5. Slide the replacement cell into the MPD body taking care to align the tab with the alignment slot, then press the cell firmly to seat it into the body.
6. Refit the sensor retainer, tighten the locking screw and refit the weatherproof cover (if equipped).
7. Recalibrate the sensor following the procedures in Section 3.2.2.

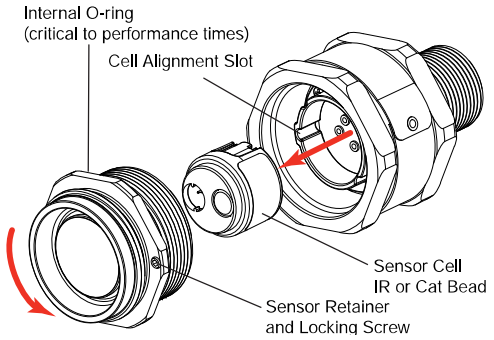

Figure 226. Removing the Plug-in Sensor

4.2 XNX® EC Sensor Cartridge Replacement

Caution: For toxic sensors, remove the shorting clip from the bottom of the sensor prior to installation. No shorting clip is provided with oxygen sensors.

The serviceable sensor allows replacement of the cell inside the sensor. The sensor cell can be replaced with a cell of the same type or changed to detect a different target gas. Both procedures follow.

When replacing oxygen (O_2) sensor cells, the initial warm-up time is between 10 and 15 minutes. This warm-up is required only after sensor cell replacement.

4.2.1 Replacing with the Same Cartridge Type

To replace the cell follow this procedure:

1. Unscrew the weatherproof cover, loosen the sensor retainer locking screw, and unscrew the sensor retainer.
2. Remove the old sensor by pulling without twisting.
3. Unscrew the sensor cap.
4. Remove the old cell by pulling without twisting.
5. Verify that the new cell is the same type as the old one.
6. Plug the new cell into the sensor, taking care to align the sensor pins with the connector holes in the PCB.
7. Refit the sensor retainer, tighten the locking screw, and refit the weatherproof cover.
8. Sensor warm-up will begin and the XNX display will alternate between two screens: “Fault 151” and “WARM.”

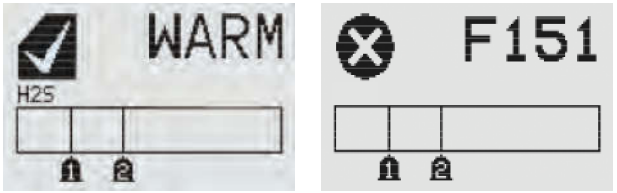

Figure 227. Sensor screens during warmup

9. Follow the procedure to accept the new sensor in Accept New Sensor Type.
10. Recalibrate the sensor following the procedures in Section 3.2.1.

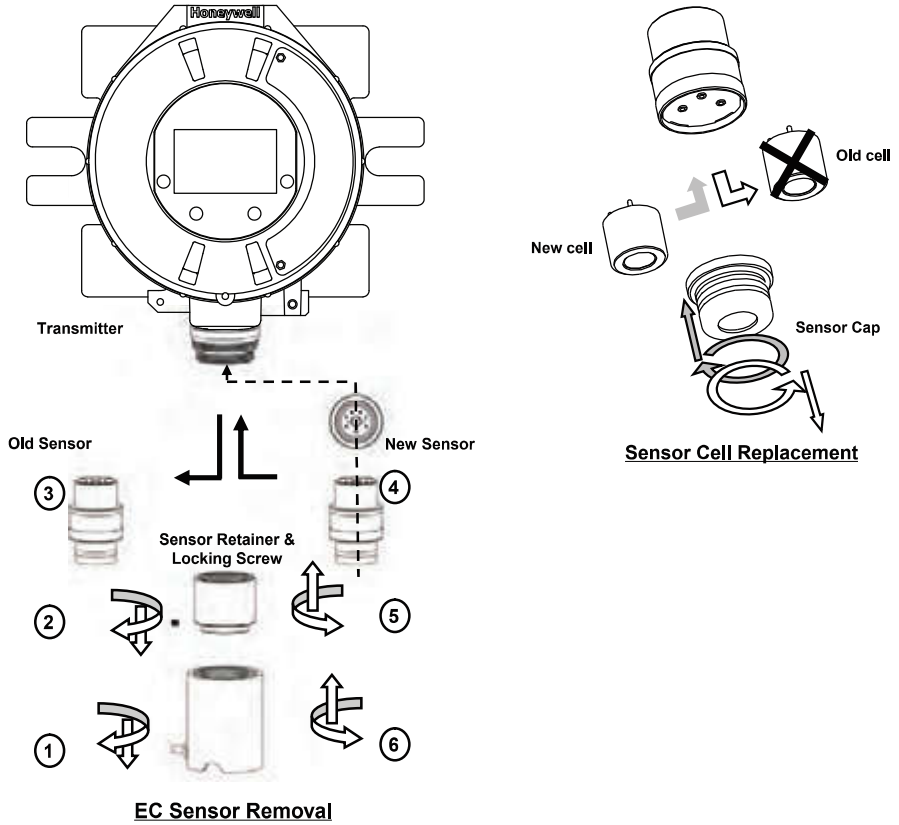

Figure 228. XNX EC Sensor Cell Replacement

4.2.2 Replacing with a Different Cartridge Type

To replace the cell with a cell for a different gas, follow this procedure:

1. Unscrew the weatherproof cover, loosen the sensor retainer locking screw, and unscrew the sensor retainer.
2. Remove the old sensor by pulling without twisting.
3. Unscrew the sensor cap.
4. Remove the old cell by pulling without twisting.
5. Plug the new cell into the sensor, taking care to align the sensor pins with the connector holes in the PCB.
6. Refit the sensor, taking care to align the sensor pins with the connector.
7. Refit the sensor retainer, tighten the locking screw, and refit the weatherproof cover.
8. The transmitter will enter sensor warm-up mode. However, due to the change in sensor cell type, the transmitter will not enter monitor mode until the unit has been reconfigured. The display will show the sensor warm-up screen:

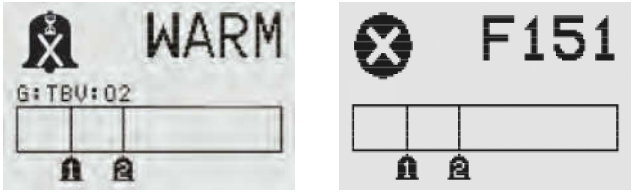

Figure 229. Sensor screens during warmup

Note the message “G:TBV:O2”. “TBV” indicates that the operator must reconfigure the transmitter to recognize the new sensor cell. “O2” will reflect the target gas of the new cell, i.e., H2S, NO2, etc. The display will also alternate the warm-up screen with the Fault 151 screen. This indicates that the communication between the transmitter and the original cell is no longer recognized. This fault condition will clear after the transmitter has been properly reconfigured.

The reconfiguration of the XNX for a new cell/target gas is achieved through Accept New Sensor Type. Recalibrate the sensor following the procedures in Section 3.2.2.

5 Warnings and Faults

5.1 Warning Messages

Warning	Description	Applicable Sensors	Latching / Non-Latching	Frequency of Diagnostic	Event History Data	Action For Resolution
W001	XNX® 24 VDC Supply Bad	All	Non-latching	2 seconds	XNX supply voltage x1000	Check wire of 24V power supply to XNX as well as power supply operation.
W002	XNX Temperature Error	All	Non-latching	2 seconds	XNX temperature (Celsius)	Check location for heat sources. Fit with sunshade or other protection. Change location of XNX. Check temperature in Info->Transmitter Status to ensure temperature is being measured properly.
W003	Simulated Warning/Fault	All	Non-latching	Enabled by user	0	Performing an alarm/fault reset will clear all simulation.
W005	Sensor Temperature Error	Optima	Non-latching	XNX polls sensor every 2 seconds, diagnostic frequency controlled by sensor	Sensor fault or warning code (Note 4)	Check location for heat sources. Fit with sunshade or other protection. Change location of XNX. Check temperature in Info->Sensor Status to ensure temperature is being measured properly.
	Sensor Temperature Error	Excel	Non-latching	XNX polls sensor every 2 seconds, diagnostic frequency controlled by sensor	Sensor fault or warning code (Note 4)	Check location for heat sources. Fit with sunshade or other protection. Change location of XNX. Check temperature in Info->Sensor Status to ensure temperature is being measured properly.
	Sensor Temperature Error	ECC	Non-latching	2 seconds	Sensor temperature (Celsius)	Check location for heat sources. Fit with sunshade or other protection. Change location of XNX. Check temperature in Info->Sensor Status to ensure temperature is being measured properly.
W006	Negative Drift	ECC, mV	Non-latching	2 seconds	Raw gas concentration of sensor	Check sensor location for external interference. Perform zero calibration. If problem persists after zero calibration and no interference exists, replace sensor.
	Negative Drift	Optima, Excel	Non-latching	XNX polls sensor every 2 seconds, diagnostic frequency controlled by sensor	Sensor fault or warning code	Check sensor location for external interference. Perform zero calibration. If problem persists after zero calibration and no interference exists, replace sensor.
W007	Calibration Required	All	Non-latching	2 seconds	Number of days remaining until calibration expires, negative = number of days expired	Time since the last span calibration has exceeded a defined limit. Performing a successful span calibration will clear the condition. The limit is the user-defined calibration interval. W007 can be disabled by setting the calibration interval to 0.

Warning	Description	Applicable Sensors	Latching / Non-Latching	Frequency of Diagnostic	Event History Data	Action For Resolution
W009	Sensor 24 VDC Supply Bad	Optima, Excel	Non-latching	XNX polls sensor every 2 seconds, diagnostic frequency controlled by sensor	Sensor fault or warning code (Note 4)	Check wire of 24V power supply to XNX as well as power supply operation. Also check wiring between XNX and Optima/Excel.
W010	Sensor Path Obscured	Optima	Non-latching	XNX polls sensor every 2 seconds, diagnostic frequency controlled by sensor	Sensor fault or warning code (Note 4)	Check location for external interference. Check sensor for dirty windows.
	Beam Block	Excel	Non-latching	XNX polls sensor every 2 seconds, diagnostic frequency controlled by sensor	Sensor fault or warning code (Note 4)	Check location for external interference or obstructions in the IR path. Check sensor for dirty windows. Check Excel alignment.
W011	Sensor Internal Lamp Issue	Optima	Latching	XNX polls sensor every 2 seconds, diagnostic frequency controlled by sensor	Sensor fault or warning code (Note 4)	Remove and return to Honeywell for repair.
W012	Excessive Float	Optima, Excel	Non-latching	XNX polls sensor every 2 seconds, diagnostic frequency controlled by sensor	Sensor fault or warning code (Note 4)	Check sensor location for external interference, check sensor for operation and re-zero where appropriate.
W013	Sensor Loop Failure, (Sensor is losing/ has lost mA output signal. These are detected by Optima and Excel.	Optima, Excel	Latching	XNX polls sensor every 2 seconds, diagnostic frequency controlled by sensor	Sensor fault or warning code (Note 4)	Check that supply voltage is stable. Check wiring between Optima/ Excel and XNX. Check loop impedance of wiring. Check that switches S3 and S4 are set correctly. If the switch settings need to be changed, power down the transmitter before changing the switch settings. Once the problem has been resolved, a Soft Reset must be performed for the Calibration menu to clear W013.
W014	Sensor Real Time Clock issue	Excel	Non-latching	XNX polls sensor every 2 seconds, diagnostic controlled by sensor	Sensor fault or warning code (Note 4)	Reset “date and time” in Excel, re-cycle Excel power and confirm “date and time.” If not retained, remove and return to Honeywell for repair.

Warning	Description	Applicable Sensors	Latching / Non-Latching	Frequency of Diagnostic	Event History Data	Action For Resolution
W015	Sensor Internal Failure	Optima, Excel	Latching and Non-latching	XNX polls sensor every 2 seconds, diagnostic frequency controlled by sensor	Sensor fault or warning code (Note 4)	Remove and return to Honeywell for repair.
	Sensor has an internal software error	Excel	Latching	XNX polls sensor every 2 seconds, diagnostic frequency controlled by sensor	Sensor fault or warning code (Note 4)	Cycle Excel power and confirm “fault cleared.” If not, replace sensor.
W016	Sensor Installation Not Complete	Excel	Non-latching	XNX polls sensor every 2 seconds, diagnostic frequency controlled by sensor	Sensor fault or warning code (Note 4)	Check Excel alignment. Perform a zero calibration.
W018	General Diagnostics	Optima, Excel	Non-latching	XNX polls sensor every 2 seconds, diagnostic frequency controlled by sensor	Sensor fault or warning code (Note 4)	Check sensor connections, check sensor operation, fit replacement sensor, replace personalty board.
W019	Sensor Internal 5V Power Supply Defect	Excel	Non-latching	XNX polls sensor every 2 seconds, diagnostic frequency controlled by sensor	Sensor fault or warning code (Note 4)	Remove and return to Honeywell for repair.
W020	Forced mA Timeout	All	Latching	1 second	Forced mA	Indicates that a forced mA condition was left on for more than 15 minutes. No action required as mA operation will be returned to normal automatically.
W021	Forced Relay Timeout	All	Latching	1 second	Forced relay status, 1=Alarm1 on, 2=Alarm2 on, 4=Fault on	Indicates that a forced relay condition was left on for more than 15 minutes. No action required as relay operation will be returned to normal automatically.
W022	mV Sensor Calibration Needed	mV	Latching	When user changes sensor type or gas	1=new sensor, 2=changed personality, 3=changed gas	Generated after accepting a new mV sensor or changing the mV sensor type or changing the mV gas selection. This is a warning to user that a span calibration should be performed. If a span calibration is not performed, the default calibration values will be used.

Warning	Description	Applicable Sensors	Latching / Non-Latching	Frequency of Diagnostic	Event History Data	Action For Resolution
W023	Low Optical Sample Signal	Excel	Non-latching	XNX polls sensor every 2 seconds, diagnostic frequency controlled by sensor	Sensor fault or warning code (Note 4)	Check location for external interference or obstructions in the IR path. Check sensor for dirty windows. Check Excel alignment. Check Beam Block Low Signal Percentage setting in the transmitter.
W024	Reflex Failure Warning	ECC	Latching	Dependent on sensor, typically 8 hours; Once fault is detected: every 15 minutes	0	ECC sensor is nearing end of life. Replace sensor.
W025	Safety variable fail warning	All	Latching	2 seconds	Note 3	Contact Honeywell Analytics Service Department.

NOTES

Note 3:

Subtypes	Decimal	Description
Fault 2 Event Bits	1	CRC error in safety critical RAM block
	2	Error reloading safety critical RAM block from EEPROM
	4	Error loading data from Personality board
	8	Excel signal level has been below the low signal level threshold for at least 24 hours
	16	Excel beam blocked
	32	Personality board error code > 0
	64	Option board error code > 0
	128	IR mA input > 1 mA and < 3.4 mA
	256	IR mA input < 1.0 mA
	512	IR forced 10 mA not within +/-1 mA
	1024	gains from PGA don't match local copy
	2048	error reading or writing EEPROM
	4096	ECC reflex failure
	8192	RAM test failure
	16384	Program memory CRC failure
	32768	Op code test failure
Fault 3 Event Bits	1	Interrupt integrity test failure

Note 4:

Optima and Excel fault and warning codes are displayed in the Event History data field.

5.2 Fault Messages

Fault	Description	Applicable Sensors	Latching / Non-Latching	Frequency of Diagnostic	Event History Data	Action For Resolution
F101	Unexpected Sensor Reset	All	Non-latching	ECC & mV: main loop x2; Optima & Excel: 2 seconds	Note 2. Optima or Excel: Sensor fault or warning code (Note 4)	If repeated, check supply voltage, check cable loop impedance, check terminal connections
F103	XNX Temperature Error	All	Non-latching	2 seconds	XNX temperature (Celsius)	Check location for heat sources. Fit with sunshade or other protection. Change the transmitter's location. Check temperature in Info->Transmitter Status to ensure temperature is being measured properly.
F104	XNX 24 VDC Supply Bad	All	Non-latching	2 seconds	XNX supply voltage x1000	Check the wire of the 24V power supply to the transmitter and the power supply operation.
F105	3.3VDC Supply Bad on XNX, personality board, or option board	All	Non-latching	2 seconds	1=XNX, 2=Personality board, 3=Option board	Check Transmitter Status
F106	XNX Real Time Clock Failure	All	Non-latching	2 seconds	Total seconds since Jan 1, 1970	Either clock was incorrectly set or the battery for the clock has failed. Note: the clock will stop running on January 1, 2036.
F107	XNX Internal Failure (RAM, ROM, EEPROM, Opcode)	All	Non-latching except for EEPROM error	At power up and 8 hours	Note 3	Contact Honeywell Analytics' Service Department.
F108	XNX mA Output Loop Failure	All	Latching	2 seconds	mA output error (measured mA - set mA)	Check wiring of mA output from XNX. Check that switches S1 and S2 are set correctly. Note that if F108 is not resolved quickly, an F149 (Internal Communication Failure - mA) will also be generated. When the cause of F108 is resolved, both the F108 and F149 will be cleared.
F109	Simulated Warning/Fault	All	Non-latching	Enabled by user	0	Performing an alarm/fault reset will clear all simulation.
F110	Sensor software mismatch	Optima	Latching	Only checked at power up	Sensor firmware version x10	Contact Honeywell Analytics' Service Department.
F111	Negative Drift	ECC, mV	Non-latching	2 seconds	Raw gas concentration of sensor	Check sensor location for external interference. Perform zero calibration. If problem persists after zero calibration and no interference exists, replace sensor.
	Negative Drift; may indicate a failed IR sensor	Optima, Excel	Non-latching	XNX polls sensor every 2 seconds, diagnostic frequency controlled by sensor	Sensor fault or warning code	Check sensor location for external interference. Perform zero calibration. If problem persists after zero calibration and no interference exists, replace sensor.

Fault	Description	Appli-cable Sensors	Latching / Non-Latching	Frequency of Diagnostic	Event History Data	Action For Resolution
F112	Sensor 24 VDC Supply Bad	Optima, Excel	Non-latching	XNX polls sensor every 2 seconds, diagnostic fre-quency controlled by sensor	Sensor fault or warn-ing code (Note 4)	Check the wire of the 24V power supply to the transmitter and the power supply operation. Also check the wiring between the transmitter and the Optima/Excel.
F113	Sensor Internal 5V Power Supply Defect	Excel	Non-latching	XNX polls sensor every 2 seconds, diagnostic fre-quency controlled by sensor	Sensor fault or warn-ing code (Note 4)	Remove and return to Honeywell for repair.
F114	Sensor Internal Lamp Issue	Optima	Latching	XNX polls sensor every 2 seconds, diagnostic fre-quency controlled by sensor	Sensor fault or warn-ing code (Note 4)	Remove and return to Honeywell for repair.
F116	Sensor Internal Failure	Optima, Excel	Non-latching	XNX polls sensor every 2 seconds, diagnostic fre-quency controlled by sensor	Sensor fault or warn-ing code (Note 4)	Remove and return to Honeywell for repair.
F117	Sensor Loop Failure, (Sensor is losing/has lost mA output signal. These are detected by Optima and Excel, F161 is de-tected by XNX and will usually occur before F117.)	Optima, Excel	Latching	XNX polls sensor every 2 seconds, diagnostic fre-quency controlled by sensor	Sensor fault or warn-ing code (Note 4)	Check that supply voltage is stable. Check wiring between Optima/Excel and the transmitter. Check loop impedance of wiring. Check that switch-es S3 and S4 are set correctly. If the switch settings need to be changed, power down the transmitter before changing the switch settings. Once the problem has been resolved, a Soft Reset must be performed for the Calibration menu to clear F117.
F118	Sensor Real Time Clock issue	Excel	Non-latching	XNX polls sensor every 2 seconds, diagnostic con-trolled by sensor	Sensor fault or warn-ing code (Note 4)	Reset “date and time” in Excel, recycle Excel power, and confirm “date and time. If not retained, remove and return to Honeywell for repair.

Fault	Description	Applicable Sensors	Latching / Non-Latching	Frequency of Diagnostic	Event History Data	Action For Resolution
F119	Cartridge Internal Electrical Failure	ECC, mV	Non-latching	XNX polls sensor every 2 seconds, diagnostic frequency controlled by sensor	Note 5	Check cartridge connections, check sensor operation, fit replacement cartridge, replace personality board.
F120	No Sensor	ECC, mV, Optima, Excel	Non-latching	2 seconds	Note 2	Indicates a loss of communication with the sensor. Check that the sensor type indicated in the part number matches the installed hardware. Check the wiring between ECC sensors or Optima/Excel and the XNX.
F121	Wrong Cartridge, error loading sensor parameters	All	Non-latching	At power up and when cartridge is changed	0	Contact Honeywell Analytics' Service Department.
F122	General Diagnostics	Optima, Excel	Non-latching	XNX polls sensor every 2 seconds, diagnostic frequency controlled by sensor	Sensor fault or warning code (Note 4)	Check sensor connections, check sensor operation, fit replacement sensor, replace personalty board.
F123	Sensor Temperature Error	Optima	Non-latching		Sensor fault or warning code (Note 4)	Check location for heat sources. Fit with sunshade or other protection. Change location of the transmitter. Check temperature in Info->Sensor Status to ensure temperature is being measured properly.
	Sensor Temperature Error	Excel	Non-latching	XNX polls sensor every 2 seconds, diagnostic frequency controlled by sensor	Sensor fault or warning code (Note 4)	Check location for heat sources. Fit with sunshade or other protection. Change location of the transmitter. Check temperature in Info->Sensor Status to ensure temperature is being measured properly.
	Sensor Temperature Error	ECC	Non-latching	2 seconds	Sensor temperature (Celsius)	Check location for heat sources. Fit with sunshade or other protection. Change location of XNX. Check temperature in Info->Sensor Status to ensure temperature is being measured properly.
F125	Calibration Required	All	Non-latching	2 seconds	Number of days remaining until calibration expires, negative = number of days expired	Time since the last span calibration has exceeded a defined limit. Performing a successful span calibration will clear the condition. The limit is the maximum calibration interval.

Fault	Description	Applicable Sensors	Latching / Non-Latching	Frequency of Diagnostic	Event History Data	Action For Resolution
F126	Sensor Path Obscured	Optima	Non-latching	XNX polls sensor every 2 seconds, diagnostic frequency controlled by sensor	Sensor fault or warning code (Note 4)	Check location for external interference. Check sensor for dirty windows.
F127	Beam Block	Excel	Non-latching	XNX polls sensor every 2 seconds, diagnostic frequency controlled by sensor	Sensor fault or warning code (Note 4)	Check location for external interference or obstructions in the IR path. Check sensor for dirty windows. Check Excel alignment.
F128	Sensor Installation Not Complete	Excel	Non-latching	XNX polls sensor every 2 seconds, diagnostic frequency controlled by sensor	Sensor fault or warning code (Note 4)	Check Excel alignment. Perform a zero calibration.
F130	Option Communication Failure	All	Non-latching	2 seconds	Option module ID: 0=None, 1=Foundation™ Fieldbus, 2=Modbus®, 3=Relay	Check that installed option matches the option indicated in the XNX part number. If the option has been changed, the new option must be set up in Information->Transmitter Data as described in the manual.
F133	Not used					
F143	Stabilization Timeout	All	Latching	2 seconds	Warm up time (seconds x100)	Cycle power, contact Honeywell Analytics' Service Department if problem persists.
F145	Reflex Failure	ECC	Non-latching	Dependent on sensor, typically 8 hours; Once fault is detected: every 15 minutes	nA/mV	ECC sensor is no longer functioning properly. Replace sensor.
F146	Unknown Sensor Failure	Optima, Excel	Non-latching	2 seconds	Sensor fault or warning code (Note 4)	Contact Honeywell Analytics' Service Department.
F148	Internal option board hardware failure	All	Non-latching	2 seconds	Option board error status (Note 6)	Contact Honeywell Analytics' Service Department.

Fault	Description	Appli-cable Sensors	Latching / Non-Latching	Frequency of Diagnostic	Event History Data	Action For Resolution
F149	Internal 4-20 mA monitoring circuit communication failure	All	Non-latching	3.366 seconds	0	Contact Honeywell Analytics' Service Department.
F150	mA Output Monitor Communications Watchdog Error	All	Non-latching	138 us	Communication error count	Contact Honeywell Analytics' Service Department.
F151	Sensor Module Type Changed	ECC	Non-latching	2 seconds	Module type: 0=None, 1=ECC, 2=mV, 3=Excel, 4=Optima, 5=Generic mA	For ECC: Perform Accept New Sensor function, if problem persists contact Honeywell Analytics' Service Department. For others, contact Honeywell Analytics' Service Department.
F152	Option Module Configuration Error	All	Latching	Only at powerup or every 125 ms when no option board detected	Option module ID: 0=None, 1=Founda-tion Fieldbus, 2=Mod-bus, 3=Relay	Confirm option properly installed, reconfigure unit.
F153	Signal/Data mis-match error on IR personality	Optima, Excel	Non-latching	2 seconds	Digital sensor reading	Check wiring to Optima/Excel. In particular, check the white wire be-tween XnX and Optima/Excel. Note: power must be cycled to reset F153 after correcting the cause.
F154	mA Input Diagnos-tic Failure	Optima, Excel	Latching	5 minutes after power up and then every 8 hours	Input mA	Contact Honeywell Analytics' Service Department.
F155	Generic mA Sensor Type Error	Generic mA	Non-latching	2 seconds	Input mA	Indicates that mA input from sensor is less than 3 mA. Check wiring between XNX and sensor. Also check the switches S3 and S4 are set correctly. If the switch settings need to be change, power down the XNX before changing the switch settings. If wiring and switches are okay, replace sensor.
F156	mV Current Control Failure	mV	Non-latching	Main loop x16	constant current A/D input mV	Check that correct mV sensor type is selected. Check wiring between XNX and sensor. If sensor type and wiring are okay, replace sensor.
F157	Sensor Drift Fault	ECC, mV	Non-latching	2 seconds	Current baseline	Perform zero calibration. If problem persists, replace sensor.
F158	Sensor/Personal-ity Part Number mismatch	All	Non-latching	"ECC & mV: main loop x2; Optima & Excel: 2 seconds"	Entire personality part #	Check that installed option matches the option indicated in the XNX part number, check wiring to Optima/Excel.

Fault	Description	Appli-cable Sensors	Latching / Non-Latching	Frequency of Diagnostic	Event History Data	Action For Resolution
F159	Option Part Num-ber Mismatch	All	Non-latching	Only at powerup or every 125 ms when no option board detected	Entire option part #	Check that installed option matches the option indicated in the XNX part number, check wiring to Optima/Excel.
F160	Hardware Diagnos-tic Failure	ECC, mV	Non-latching	Main loop x2	Gain1 high byte, Gain2 low byte	Replace defective EC cartridge or mV personality board.
F161	mA Input Indicates Fault	Optima, Excel	Non-latching	1 second	Input mA	Indicates mA input from Optima/Excel is below 1 mA, indicating a fault in the sensor. Any other fault will also trigger this fault, so check for addi-tional faults in event history to determine specific issue. If no other faults indicated, check wiring between Optima/Excel and XNX. Also check that switches S3 and S4 are set correctly.
F162	Error reloading safety critical RAM block	All	Non-latching	2 seconds	Note 3	Contact Honeywell Analytics' Service Department.
F163	Interrupt integrity fault	All	Non-latching	Main loop	Note 3	XNX will reset if more than 600,000 successive errors occur.
F164	mV Sensor failure	mV	Latching	1 second	mV bridge voltage or bridge current that caused fault	Indicates that the sensor was changed or is bad. If the fault will not clear, replace the sensor.

Fault	Description	Appli-cable Sensors	Latching / Non-Latching	Frequency of Diagnostic	Event History Data	Action For Resolution
F165	mA Calibration failure	all	Latching	2 seconds	DAC: Digital to Analog Converter (4-20 mA output) ADC: Analog to Digital Converter (4-20 mA internal feedback) 0 OK 1 DAC 4 mA point is too low 2 DAC 4 mA point is too high 4 DAC 20 mA point is too low 8 DAC 20 mA point is too high 16 ADC 4 mA point is too low 32 ADC 4 mA point is too high 64 ADC 20 mA point is too low 128 ADC 20 mA point is too high	Indicates that 4-20 mA calibration failed and discarded. Events history parameter indicates which calibration point has failed. If 4-20 mA calibration fails with F165, no changes take place so the 4-20 mA calibration output stays as it was. Check 4-20 mA loop resistance. Repeat 4-20 mA calibration. The fault clears itself after a successful 4-20 mA calibration.

NOTES

Note 2:

Spi Event Bits	
Decimal	**Description**
1	SPI1 Starting TX
2	SPI1 transmitting
4	falling clock edge, 0 = rising edge
8	SPI1 port open, 0 = closed
16	SPI1 no response
32	SPI1 ECC no response
64	SPI1 missing data
128	Not used
256	SPI3 Starting TX
512	SPI3 transmitting
1024	falling clock edge, 0 = rising edge
2048	SPI3 port open, 0 = closed
4096	Not used
8192	
16384	
32768	SPI2 Starting TX

Note 3:

Subtypes	Decimal	Description
Fault 2 Event Bits	1	CRC error in safety critical RAM block
	2	Error reloading safety critical RAM block from EEPROM
	4	Error loading data from Personality board
	8	Excel signal level has been below the low signal level threshold for at least 24 hours
	16	Excel beam blocked
	32	Personality board error code > 0
	64	Option board error code > 0
	128	IR mA input > 1 mA and < 3.4 mA
	256	IR mA input < 1.0 mA
	512	IR forced 10 mA not within +/-1 mA
	1024	gains from PGA don't match local copy
	2048	error reading or writing EEPROM
	4096	ECC reflex failure
	8192	RAM test failure
	16384	Program memory CRC failure
	32768	Op code test failure
Fault 3 Event Bits	1	Interrupt integrity test failure

Note 4:

Optima and Excel fault and warning codes are displayed in the Event History data field.

Note 5:

Subtypes	Decimal	Description
ECC Fault Subtypes	1	I2C error reading or writing EEPROM
	2	GALPAT RAM test failure
	4	Program memory CRC failure
	8	Opcode test failure
	16	Can't adjust PGA or EEPROM value doesn't match digital pot
	32	Reserved
	64	Reserved
	128	GALPAT RAM test failure in common area
mV Fault Subtypes	1	I2C error reading or writing EEPROM
	2	GALPAT RAM test failure
	4	Program memory CRC failure
	8	Opcode test failure
	16	Can't adjust PGA or EEPROM value doesn't match digital pot
	32	RAM safety variable failure
	64	Interrupts integrity failure
	128	Stack overflow/underflow failure

Note 6:

Relay Option Board Error Status		
	Decimal	**Description**
Relay Option Board Error Status	1	Didn't receive STX or ETX
	2	Received undefined command
	4	Exceeded maximum data bytes
	8	Write collision or buffer overrun
	16	CRC error in SPI packet
	32	Stack overflow or underflow
	64	Program memory CRC error
	128	Galpat RAM test failure

5.3 Informational Messages

Number	Description	Contents of Data Field

6 Specifications

6.1 Product Specifications

Electrical			
Operating Voltage	EC/mV: 16V to 32V (24V nominal) ** Startup/Normal values ** IR: 18V to 32V (24V nominal) ** Startup/Normal values **		
Power Consumption	**Configuration**	**Max Power**	**Inrush**
	XNX EC	6.2 w	<1A, <10ms@24VDC
	XNX mV	6.5 w	<750mA <2ms@24VDC
	XNX IR (Optima)	9.7w	<1A, <10ms@24VDC
	XNX IR (Excel)	13.2w	<1A, <10ms@24VDC
Termination	Crimp style pluggable with retaining screws, 12-28 AWG (2.5 to 0.5mm^2) with Shorting Jumpers: 14-28 AWG (2.0 to 0.5mm^2) **NOTE:** To maintain EMC integrity, wiring must be shielded by either an integral shield or run through conduit or pipe. Shield should provide 90% coverage		
20 mA Signal	HART® over 3-wire 4-20mA (sink, source, or isolated) compliant with NAMUR NE43		
Cable Ports	5 – (2 right, 2 left, 1 bottom) Available in ¾" NPT, or M25		
Recommended Cable	See Section 2.2.2 Distance Considerations for Installation.		
Construction			
Material	LM25 Aluminum, (SS316 painted optional)		
Dimensions	159 x 197 x 113.8 mm / 6.138 x 7.75 x 4.48 inches		
Weight	2.27 kg (5 lb) Aluminum 5 kg (11 lb) Stainless		
Mounting			
XNX® Enclosure	Integral Mounting Lugs for Wall- or Optional Pipe-Mount, Optional Wall/Ceiling Bracket		

User Interface	
Standard	Custom Backlit LCD, magnetic wand access
Optional	HART Handheld with IS Port
Environmental - Transmitter Operating	
IP Rating	IP66
Temperature*	-40°C to +65°C / -40°F to +149°F
Humidity	0 to 99% RH non-condensing
*Operating temperatures will be limited by the sensors. See tables 6.2.2, 6.2.3, and 6.2.4 for more information.	
Environmental - Transmitter Storage	
Temperature	-40°C to +65°C / -40°F to +149°F
Humidity	0 to 99% RH non-condensing
Unpowered battery life: (Real Time Clock) 3 years at rated storage temperature	

Hazardous Area Approvals [See Section 6.2 Certifications by Part Number for other approvals (pending)]

NOTES:
1. The temperature class (T6) is limited to T4 when the MPD sensor is attached locally to the transmitter.
2. XNX EC cartridges and Remote Mount Kit have been evaluated by Underwriters Laboratories (UL) to Canadian National Standards.
3. Peer to peer and multi-drop network (daisy chained) HART, Modbus®, and FoundationTM Fieldbus configurations have not been evaluated by CSA to the requirements of CSA 22:2 No. 152 for Combustible Gas Detection and may be used only for diagnostics and data collection.

Performance Approvals

Communication Options	
Relays	Type: 3 form "C" SPCO contacts for alarm and fault indication. Rating: 250 VAC, 5A/24 VDC, 5A (2 Alarm, 1 Fault) A remote reset is provided to silence alarms. (The Foundation Fieldbus, relay, and Modbus options are mutually exclusive.)
Modbus	Modbus/RTU over RS-485 physical layer. Interface isolated; includes switchable 120 Ohm termination resistor. Baud rates: 1200 to 38,400; 19,200 default. (The Foundation Fieldbus, relay, and Modbus options are mutually exclusive.)
Foundation Fieldbus	H1 Physical Layer. 31.25 kbit/s Manchester encoded signal. AMIS-49200 Fieldbus MAU (media access unit). SPC4-2 Fieldbus Controller. Do not use Fieldbus communication in hazardous areas. The Foundation Fieldbus, Relay, and Modbus options are mutually exclusive.

See Section 6.2 Certifications by Part Number for other approvals

6.2 Sensor Data

6.2.1 Operating and Storage Conditions for Performance Tested EC Cartridges

Gas		Cartridge P/N	Operating Pressure	Operating Air Speed	Warm-up Time (minimum)	Storage Conditions*			
						Temperature	Pressure	Humidity	Time**
O_2	Oxygen	XNXXSO1SS XNXXSO1FM	80 kPa ~ 120 kPa	0 ~ 6 m/sec	60 sec.	0 to 20°C, 32 to 68°F	80 to 120 KPa	5 to 95% RH	6 months
H_2S	Hydrogen Sulfide	XNXXSH1SS XNXXSH1FM	80 kPa ~ 120 kPa	0 ~ 6 m/sec	60 sec.	0 to 20°C, 32 to 68°F	70 to 110 KPa	30 to 70% RH	6 months
H_2S (High)	Hydrogen Sulfide	XNXXSH2SS	80 kPa ~ 120 kPa	0 ~ 6 m/sec	60 sec.	0 to 20°C, 32 to 68°F	70 to 110 KPa	30 to 70% RH	6 months
CO	Carbon Monoxide	XNXXSC1SS XNXXSC1FM	80 kPa ~ 120 kPa	0 ~ 6 m/sec	60 sec.	0 to 20°C, 32 to 68°F	70 to 110 KPa	30 to 70% RH	6 months

*Store in sealed packages **Check cartridge certificates

6.2.2 EC Sensor Performance Data, Factory Mutual Verified (see Section 6.3)

Gas		Cartridge P/N	Selectable Full Scale Range (Display and 4-20mA Full Scale)	Default Range	Range Increments	Lower Alarm Limit	Lower Detection Limit	Lower Explosive Limit (% Vol)	Zero Deviation	Selectable Cal Gas Range	Default Cal Point	Response Time (T50) sec	Response Time (T90) sec	Accuracy	Operating Temperature		Operating Humidity	
															Min	Max	Min	Max
O_2	Oxygen	XNXXSO1FM	n/a	23.0% Vol	n/a	5.0%Vol	5% Vol	n/a	n/a	20.9 %Vol (fixed)	20.9 %Vol	T20 <10	<30	<+/-0.5 %Vol	-30°C / -34°F	55°C /131°F	15% RH	90% RH
H_2S	Hydrogen Sulfide	XNXXSH1FM	10.0 to 50.0 ppm	15.0 ppm	0.1 ppm	5.0 ppm	1.5 ppm	n/a	-2.5 ppm	30 to 70% of the selected full scale range	10 ppm	<20	<30	2 ppm or 10% of reading, whichever is greater	-40°C / -40°F	55°C / 131°F	15% RH	90% RH
CO	Carbon Monoxide	XNXXSC1FM[1]	100 to 1000 ppm	300 ppm	100 ppm	30 ppm	15 ppm	na/	-25 ppm		100 ppm	<15	<30	See footnote 1	-40°C / -40°F	55°C / 131°F	15% RH	90% RH

FOOTNOTES:

1. XNXXSC1FM accuracy over temperature <±10% of reading 20°C/68°F to 55°C/131°F, <±20% of reading 20°C/68°F to -10°C/14°F, <±30% of reading -10°C/14F to -20°C/-4°F. Recalibration is recommended if the temperature of the local environment has varied by more than -30°C.

NOTES:

- Performance figures are measured by test units calibrated at 50% of full scale, at ambient conditions of 20°C, 50% RH, with the EC weatherproof cover attached
- IP rating of FM Cartridges is IP63.
- Barometric pressure effects on the O_2 sensor: The output from the O_2 sensor has pressure effects of <0.1% change of output per % change in pressure. When the barometric pressure changes by ±20% the output from the O_2 sensor changes <±0.4%Vol. However, the oxygen sensor shows transient behavior when subjected to a rapid change in ambient pressure due to either weather or altitude. For example, a 10KPa instantaneous positive pressure step change may cause an overscale alarm condition for a period of about 12 seconds.
- Operating the XNX EC sensor at extended temperature ranges for a prolonged time period exceeding 12 hours my cause deterioration in the sensor performance and shorten sensor life. Extended temperature range for XNX EC sensors is -40°C ot -20°C.
- Response times may increase at lower temperatures.
- FM performance verification is limited to the requirements of the standards identified in Table 6.3 for each cartridge.
- Contact Honeywell Analytics for additional data or details.

6.2.3 EC Sensor Performance Data, DEKRA EXAM verified (see Section 6.3)

Gas		Cartridge P/N	Selectable Full Scale Range (Display and 4-20mA Full Scale)	Default Range	Range Increments	Lower Alarm Limit	Lower Detection Limit	Zero Variation	Selectable Cal Gas Range	Default Cal Point	Response Time (T50) (sec)	T90 Response T10 Recovery Time (sec)	Accuracy[1]	Operating Temperature		Operating Humidity	
														Min	Max	Min	Max
O_2	Oxygen	XNXXSO1SS	n/a	25.0 %Vol	n/a	5.0%Vol	3.5 %Vol	n/a	20.9 %Vol (fixed)	20.9 %Vol	T20 <10	<30	<+/-0.6 %Vol	-30°C / -34°F	55°C /131°F	15% RH	90% RH
H_2S	Hydrogen Sulfide	XNXXSH1SS	10.0 to 50.0 ppm	15.0 ppm	0.1ppm	3.0 ppm	1.0 ppm	2.0 ppm	30 to 70% of the selected full scale range	10 ppm	<20	<30	<+/-0.3 ppm	-40°C / -40°F	55°C / 131°F	15% RH	90% RH
H_2S (High)	Hydrogen Sulfide	XNXXSH2SS	50 to 500 ppm	100 ppm	10 ppm	5 ppm	1 ppm	2 ppm		50 ppm	<20	<30	<+/-5 ppm	-40°C / -40°F	55°C / 131°F	15% RH	90% RH
CO	Carbon Monoxide	XNXXSC1SS	100 to 500 ppm	300 ppm	100 ppm	15 ppm	5 ppm	10 ppm		100 ppm	<15	<30	<+/-2 ppm	-40°C / -40°F	55°C / 131°F	15% RH	90% RH

FOOTNOTE:

1. Accuracy of reading at default Alarm 1 concentration (typically 10% FS or defined minimum alarm level setting, whichever is greater) when operated at default full scale.

NOTES:

- Sensor drift between LDL and negative drift fault limits (typcially > negative zero variation) appear as 0 on the display and outputs of the device.
- Long-term drift: XNXXSC1SS <5%/year, XNXXSO1SS <4%/year, XNXXSH1SS and XNXXSH2SS <2%/month.
- Performance figures are measured by test units calibrated at 50% of full scale, at ambient conditions of 20°C, 50% RH, with the EC weatherproof cover attached.
- Operating the XNX EC sensor at extended temperature ranges for a prolonged time period exceeding 12 hours may cause deterioration in sensor performance and shorten sensor life. Extended temperature ranges for XNX EC sensor cartridges are -40°C to -20°C.
- Barometric pressure effects on the O_2 sensor: The output from the O_2 sensor has pressure effects of <0.1% change of output per % change in pressure. When the barometric pressure changes by ±20%, the output from the O_2 sensor changes <±0.4%Vol. However, the oxygen sensor shows transient behavior when subjected to a rapid change in ambient pressure due to either weather or altitude. For example, a 10KPa instantaneous positive pressure step change may cause an overscale alarm condition for a period of about 12 seconds.
- Response times may increase at lower temperatures.
- Contact Honeywell Analytics for any additional data or details.

6.2.4 Other EC Sensors

Gas		Cartridge P/N	Selectable Full Scale Range (Display and 4-20mA Full Scale)	Default Range	Range Incre-ments	Lower Alarm Limit	Lower Detection Limit	Zero Deviation	Selectable Cal Gas Range	Default Cal Point	Response Time (T50) sec	Response Time (T90) sec	Accuracy[1]	Typical Accuracy @ Lowest Alarm Level	Operating Temperature		Operating Humidity

see footnotes and notes on following page

FOOTNOTES (SEE TABLE ON PREVIOUS PAGE):

1. Accuracy of reading at default Alarm 1 concentration (typically 10%FS or defined minimum alarm level setting, whichever greater) when operated at default full scale.
2. System conditioning may be required to achieve stated results. Contact Honeywell Analytics for details.
3. Measured using calibration flow housing at calibration flow rate (300-375 ml/min) with dry gas.

NOTES (SEE TABLE ON PREVIOUS PAGE):

- Data taken at ambient conditions of 20°C, 50% RH.
- Data represents typical values of freshly calibrated sensors without optional accessories attached.
- Performance figures are measured by test units calibrated at 50% of full scale.
- Standard temperature range for XNX EC Sensors is -20°C to +55°C; ATEX, IECEx.
- Extended temperature ranges for the XNX EC Sensors are -40°C to -20°C
- Accuracy between the temperatures of -40°C and -20°C is ±30% at the applied gas concentration.
- Operating the XNX EC Sensors at extended temperature ranges for a prolonged time period exceeding 12 hours may cause deterioration in sensor performance and shorter sensor life.
- Barometric pressure effects on the O_2 sensor: The output from the O_2 sensor has pressure effects of <0.1% change of output per % change in pressure. When the barometric pressure changes by ±20% the output from the O_2 sensor changes <±0.4%Vol. However, the oxygen sensor shows transient behavior when subjected to a rapid change in ambient pressure due to either weather or altitude. For example, a 10KPa instantaneous positive pressure step change may cause an overscale alarm condition for a period of about 12 seconds.
- Recalibration is recommended if the temperature of local environment has varied by more than ±15°C from the temperature of calibration.
- Response times may increase at lower temperatures.
- Contact Honeywell Analytics for any additional data or details.

6.2.5 XNX EC Sensor Cross-sensitivity

Gas type	Part Number	Gas Type Applied	Concentration	Unit	Reading	Unit

NOTES:

- The figures of cross-sensitivity are typical values and should not be used as a basis for cross calibration.
- Cross-sensitivities may not be linear and should not be scaled.
- For some cross-interferents breakthrough may occur if gas is applied a longer time period.
- There are many gases and vapors that can poison electochemical cells. It is difficult to give a complete and exclusive list of all species which will have an effect on the sensors. However, these are some common substances which should be avoided:
- Airborne greases - These may block gas access into the sensors and therefore reduce sensitivity.
- Silicone compounds - These are often found in sprays, aerosols, lubricants, polishes, adhesives, sealants, zebra strip, cleaning agents, and floor waxes. These compounds tend to reduce the sensitivity of the sensors and generally will have a permanent effect.
- Solvents and organic vapors - Many organic vapors will damage the sensors. Some common ones are IPA, toluene, xylene, other benzine derivatives, petrol, and diesel. It is difficult to give a full list of organic vapors, as there are so many of them. Generally, any organic vapor should be avoided.

6.2.6 XNX MPD Sensor Performance Data

Sensor Type	Gas	Typical Response Time (T50) sec	Typical Response Time (T90) sec	Maximum Range	Accuracy (% of full scale or % of applied gas)	Drift Over Time	Operating Humidity	Operating Temperature		Operating Pressure	Operating Air Speed
								Min	Max		
MPD-IC1	Carbon Dioxide	<30	<70	5.00 %Vol	±5%FS or ±15%	< 3%/yr	0-95% RH non-condensing	-20°C / -4°F	+50°C / 122°F	80kPa ~ 110kPa	0 ~ 6m/sec
MPD-IV1	Methane	<15	<30	5.00 %Vol	±5%FS or ±15%	< 3%/yr		-20°C / -4°F	+50°C / 122°F	80kPa ~ 110kPa	0 ~ 6m/sec
MPD-IF1	Propane	<15	<30	100 %LEL	±5%FS or ±15%	< 3%/yr		-20°C / -4°F	+50°C / 122°F	80kPa ~ 110kPa	0 ~ 6m/sec
MPD-CB1	Propane	<15	<30	100 %LEL	±5%FS or ±15%	< 3%/yr		-40°C / -40°F	+65°C / 149°F	80kPa ~ 120kPa	0 ~ 6m/sec
	Methane	<10	<30								
	Hydrogen	<10	<30								
	Butane-2	<15	<40								
	Nonane	<20	<50								

NOTES:

- Response times may vary depending upon molecular weight, size, and structure.
- CSA approved hydrogen sensors are MPDUT-CB1 and 705 STD.
- DEKRA EXAM approved sensors are MPDAM CB1 and SPHT
- Data taken at 20-25°C. Contact Honeywell Analytics for additional data or details.
- Response times may increase at lower temperatures.
- Data represents typical values without optional accessories attached.
- System conditioning may be required to achieve stated results. Contact Honeywell Analytics for details.
- Performance figures are measured using a sample humidity of 50% RH.
- Performance figures are measured between 40 and 60% of full scale.
- Performance figures are measured by test units calibrated at 50% of full scale.
- Use of the weatherproof cap will increase response times.
- FM 6340 performance approval based on MPD-IC1 with SPXCDWP T50<60 T90<150.
- Use of the weatherproof cap will increase response times.
- FM 6340 performance approval based on MPD-IC1 with SPXCDWP T50<60 T90<150.

6.2.7 EN60079-29-1 Performance Approved Gases for mV Sensor Types

Sensor Type	EN60079-29-1 Reference	Verified Gas Selections					
		Hydrogen	Methane-2	Propane-2	Butane-2	Star 2	Star 4
MPD AMCB1	Standard Test Gas		●	●			
	Other Gases	●			●	n-nonane	
SP-HT	Standard Test Gas		●	●			
	Other Gases	●			●		n-nonane
Max Zero Deviation (see note 1)		-7% LEL				-9% LEL	-7% LEL
LDL (see note 2)		3% LEL				5% LEL	3% LEL

NOTES:

1. Readings < 0% LEL are not displayed or indicated on the 20 mA output. Values exceeding the zero deviation limit will result in F111 faults.
2. Readings < LDL are shown as 0% on the display and 20 mA output.

6.2.8 Other Sensor Performance Data

Performance data for other supported sensors is available in their respective technical manuals.

6.3 XNX Certifications by Part Number Series

Only models XNX – UT are eligible to bear the CSA logo.

Only Eligible for UL MARK, ABS, FF AND HART

Only models with suffixes CB1, IC1, IC2, or NNN are eligible to bear the CSA Logo.
Only models with suffixes CB1, IC1 or NNN are eligible to bear the FM Logo.

"*" May be marked –55 when neither the HART nor EC barrier is provided
Only eligible for the UL mark FF and HART when marked –55

Consider Related Drawings when revising. This item is controlled by regulatory certificates. Any revision must consider certification body requirements and approvals. No Regulatory marks may be added to tag w/o agency review.
Regulatory marks and their specific approval information may be removed per customer request

6.4 Product Identification

6.4.1 XNX Universal Transmitter

The XNX part numbering system contains all of the information necessary to convey the product configuration, including options. Agency, port thread, enclosure material, and sensor personality define the standard unit. Three option fields define optional relay or fieldbus interfaces and factory installed local HART. The sensor and range field is used exclusively by millivolt units to assemble the defined MPD sensor type and corresponding thread to the transmitter. Agency approvals of the MPD sensor are unique by device and part number. Ensure that the approvals of both the transmitter and the MPD sensor meet the requirements of the installation.

	Enclosure Options (See Section 6.2 for Agency Approvals)									
	Model	Port Thread	Material	Sensor		Interface Option	Local HART	MPD Type Installed		
XNX -	▼	▼	▼	▼	-	▼	▼	▼	▼	▼

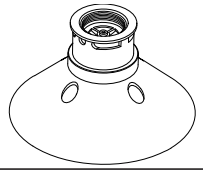
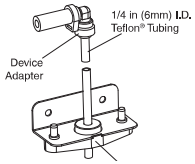
S3KH1SS	H_2S	Hydrogen Sulfide (Low Range)	XNXXSH3SS
S3KH1SS S3KH1SS	H_2S	Hydrogen Sulfide	XNXXSH1SS XNXXSH1FM
S3KH2SS	H_2S	Hydrogen Sulfide (High Range)	XNXXSH2SS
S3KC1SS	CO	Carbon Monoxide	XNXXSC1SS XNXXSC1FM
S3KS1SS	SO_2	Sulfur Dioxide	XNXXSS1SS
S3KS1SS	SO_2	Sulfur Dioxide (High Range)	XNXXSS2SS
S3KA1SS	NH_3	Ammonia	XNXXSA1SS
S3KA2SS	NH_3	Ammonia (High Range)	XNXXSA2SS
S3KL1SS	Cl_2	Chlorine	XNXXSL2SS
S3KL1SS	Cl_2	Chlorine (High Range)	XNXXSL1SS
S3KX1SS	ClO_2	Chlorine Dioxide	XNXXSX1SS
S3KM1SS	NO	Nitrogen Monoxide	XNXXSM1SS
S3KN1SS	NO_2	Nitrogen Dioxide	XNXXSN1SS
S3KG1SS	H_2	Hydrogen (Low Range)	XNXXSG1SS
S3KG2SS	H_2	Hydrogen (High Range)	XNXXSG2SS
S3KR1SS	HCl	Hydrogen Chloride	XNXXSR1SS
S3KY1SS	HCN	Hydrogen Cyanide	XNXXSY1SS
S3KF1SS	HF	Hydrogen Fluoride	XNXXSF1SS
S3KZ1SS	O_3	Ozone	XNXXSZ1SS
S3KP1SS	PH_3	Phosphine	XNXXSP1SS

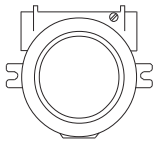
6.4.4 Multi Purpose Detector (MPD)

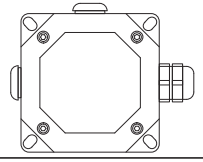
Similar to the XNX Transmitter, the MPD part numbering system defines the agency approval and thread type. The only material selection is Stainless Steel. Four sensor selections are available. Agency Approvals are specific to the 4 sensor types. Ensure the approval of the specific sensor type meets the requirements of the installation.

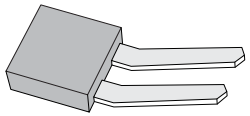
	Model Type (See Section 6.2 for Agency Approvals)	Port Config	Installed Sensor		Range
MPD -	▼	▼	▼	▼	▼
	AM	M25	**CB** - Catalytic Bead %LEL		**1** - Default
	UT	3/4" NPT	**IF** - IR %LEL Flammable		**2 to 9** - Future
	BT	3/4" NPT	**IV** - IR Methane 0-5% Vol		
			IC - R Carbon Dioxide 0-5% Vol		



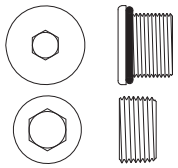


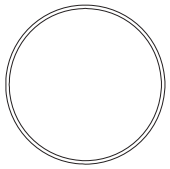


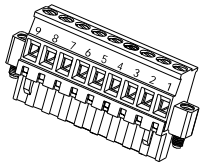


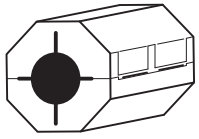


6.4.5 XNX Catalytic Bead and IR Replacement Sensor Cartridges

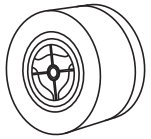








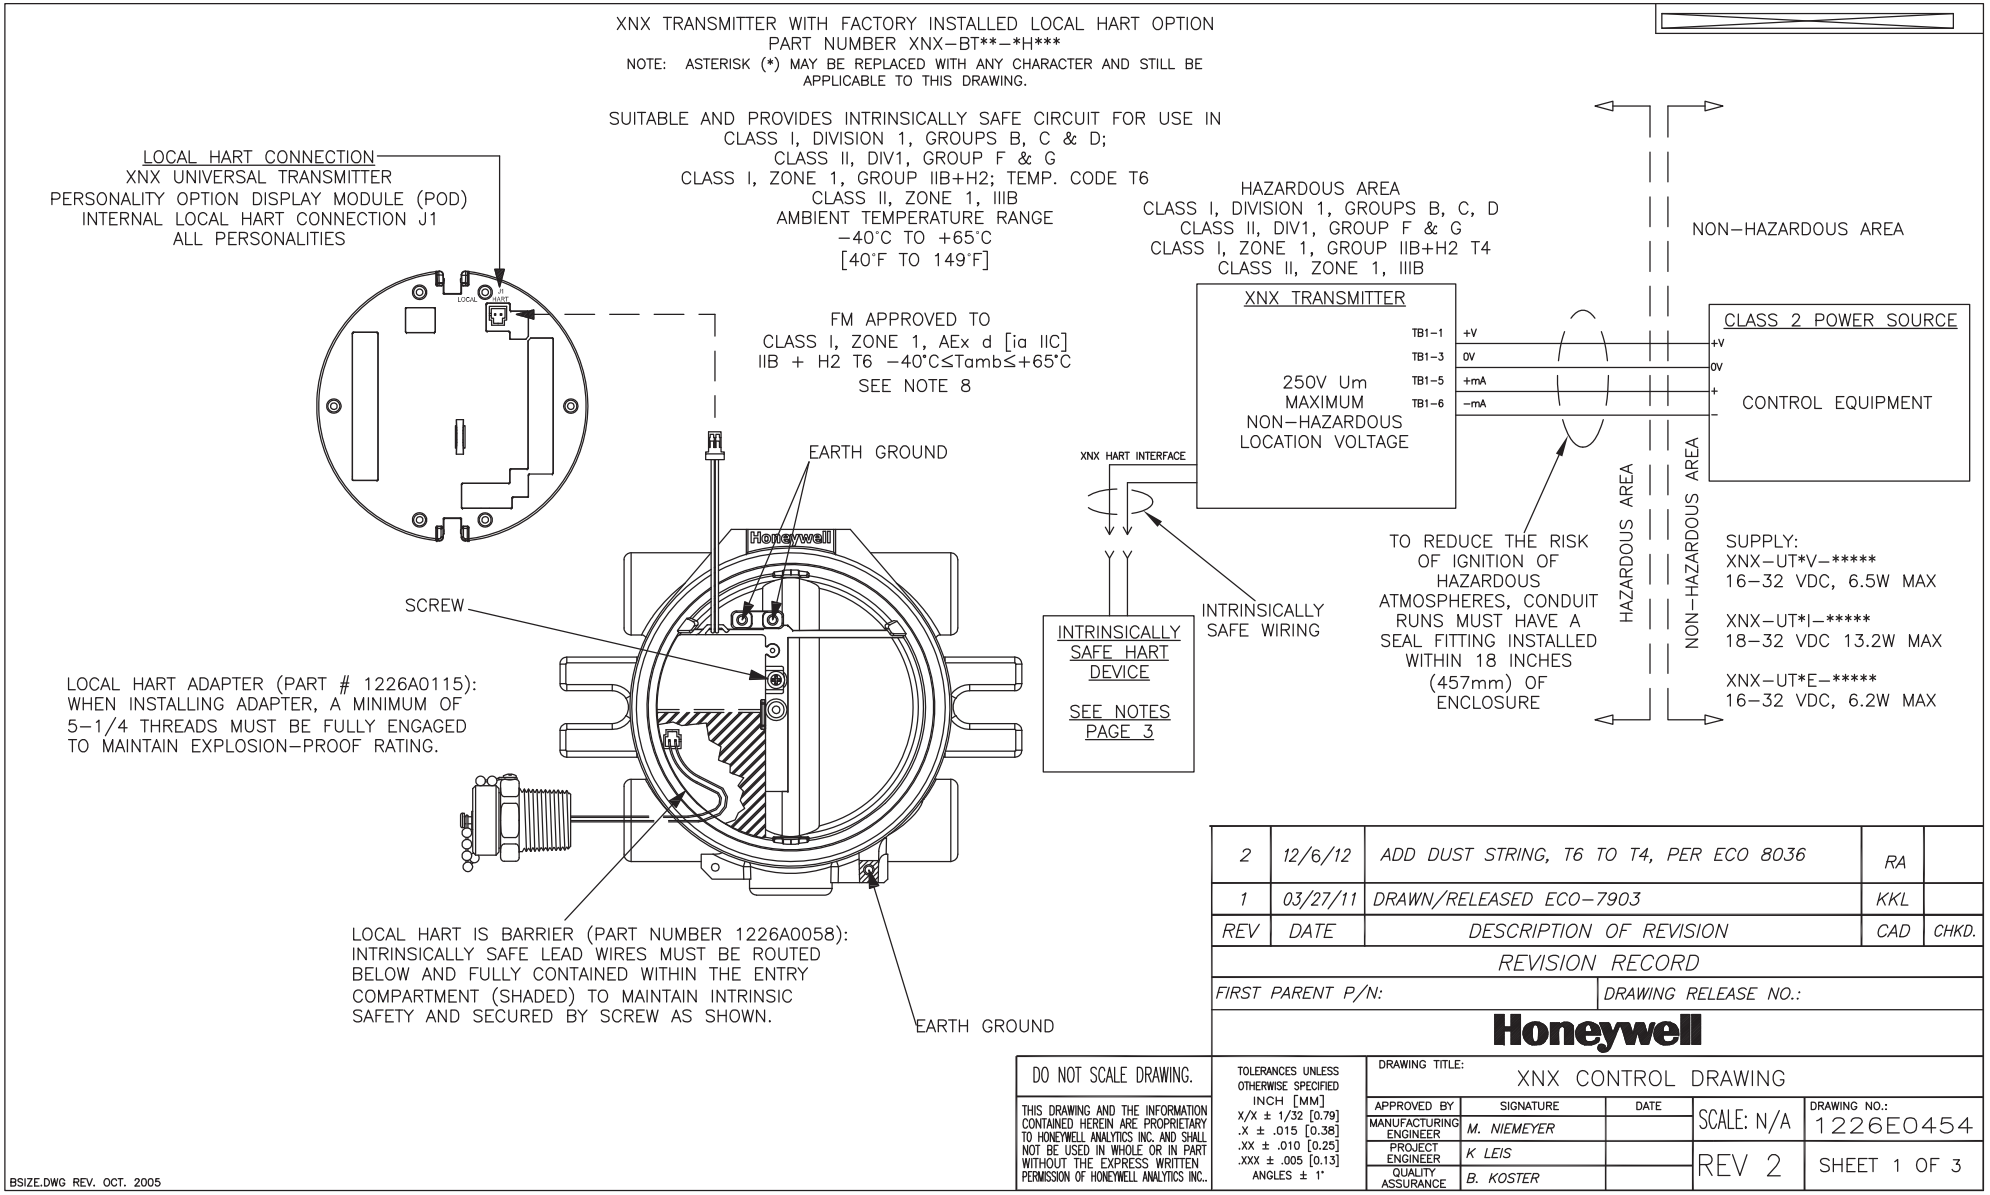
Sensor Type[1,2]	Target Gas	Cartridge Part No	Operating Pressure Range (kPa)	Operating Humidity Range (% RH non-condensing)	Air Speed (m/s)	Maximum Range	Selectable Range[3]	Increment	Default Range	Cal Gas Range	Cal Gas P/N	Cal Gas Description
MPD-IC1	Carbon Dioxide	1226-0301	80 - 110	see footnote 4	0 - 6	5.00 %Vol	1.00 to 5.00 %Vol	1.00 %Vol	5.00 %Vol	1.50 to 3.5 %Vol	Contact HA	2.5 %VOL CO_2 in Air
MPD-IV1	Methane	1226-0299	80 - 110	0 - 95	0 - 6	5.00 %Vol	1.00 to 5.00 %Vol	1.00 %Vol	5.00 %Vol	1.50 to 3.5 %Vol	GFV352	2.5 %VOL CH_4 in Air
	Methane	1226-0299	80 - 110	0 - 95	0 - 6	100 %LEL	1.00 to 5.00 %Vol	1.00 %Vol	5.00 %Vol	1.50 to 3.5 %Vol	GFV352	2.5 %VOL CH_4 in Air
MPD-IF1	Flammables	1226-0300	80 - 110	0 - 95	0 - 6	100 %LEL	20 to 100 %LEL[3]	10 %LEL	100 %LEL	30 to 70 %LEL	GFV406	1 %VOL C_3H_8 in Air
MPD-CB1	Flammables	1226A0359	80 - 120	see footnote 5	0 - 6	100 %LEL	20 to 100 %LEL[3]	10 %LEL	100 %LEL	30 to 70 %LEL	GFV352	50 %LEL CH_4 in Air



1. Agency approved hydrogen sensors are MPD-CB1 and 705 STD.
2. When ordering replacement MPD sensor cartridges, the replacement cartridge must be the same type as factory configured. Substituting a different cartridge will void agency certification.
3. On XNX %LEL units carrying UL/CSA certifications, the range is fixed at 100%LEL and is not adjustable.
4. Humidity: 5% to 95% RH non-condensing
5. Humidity: 0 to 99% RH non-condensing

6.4.6 Accessories/Spares

Accessory/Spare		Part Number	Description
	Pipe Mount Kit	1226A0358	For use on pipes from 2-6 inches (50-150mm) in diameter. Kit includes: Pipe Mount Bracket, (2) Carriage Bolts, Nuts and Lock Washers.
	Remote EC Sensor Mounting Kit	S3KRMK	The remote sensor mounting kit (S3KRMK) allows the XNX EC sensors to be remotely mounted via an IS cable kit, up to 50 feet (15 meters) from the transmitter. The kit includes 50 feet of shielded cable, cable glands and remote terminal box. The cable can be cut to the required length and terminated at the remote terminal box.
	Ceiling Mount Bracket Kit	1226A0355	The optional Ceiling Mount Bracket Kit allows the XNX to be mounted to the ceiling. Kit includes: (2) Stainless Steel Ceiling Mount Brackets, bolts and nuts.
	Duct Mount Kit	S3KDMK	The duct mounting kit (S3KDMK) can be used with the EC sensor to allow detection of O2, CO, H2 and H2S gases in ducts. When combined with the MPD Interface Adapter (1226A0382), the duct mounting kit can accommodate the MPD to detect flammable gases in a duct application. The duct mount kit includes the adapter, gasket and required fasteners. The MPD Interface Adapter includes only the adapter and requires the S3KDMK duct mount kit.
	MPD Interface Adapter	1226A0382	
	Calibration Gas Flow Adapter	1226A0411	MPD
		02000-A-1645	Sensepoint HT
		00780-A-0035	705
	Calibration Cup	S3KCAL	XNX EC - The calibration cup is used to apply calibration test gas to the sensor. It push fits onto the bottom of the sensor and can be fitted without removing the weatherproof cover.



Accessory/Spare		Part Number	Description	
	Weatherproof Cap	Included	XNX EC	The weatherproof cap protects the XNX sensors from harsh weather.
		02000-A-1640	MPD	
		02000-A-1640	Sensepoint	
		02000-A-1635	705	
	Extreme Weather Protector	SPXCDWP	Sensor XNX-EC or MPD; the weather protection is designed to protect the sensor from environmental conditions in outdoor exposure applications.	
	Collecting Cone	S3KCC	XNX EC	The collecting cone improves detection of lighter-than-air gases such as hydrogen and methane.
		02000-A-1642	MPD	
		02000-A-1642	Sensepoint	
		02000-A-1642	705	
	Remote Gassing Kit	1226A0354	The Remote Gassing Kit enables gas to be applied remotely for performing functional response checks. Kit Includes: 50' Teflon® tubing, mounting bracket, tube cap and device adapters in 1/4" and 1/8" ID to attach to bump test ports on the weatherproof cap of your device.	
	Remote MPD Mounting	2441-0022	UL/CSA Aluminum Junction Box	
		00780-A0100	ATEX/IEC Junction Box (3) M20, (1) M25 entries. "Ex e" ATEX IEC Approval	
	Terminal Block/Shorting Jumpers	Contact HA	Terminal block jumpers provide an electrical connection without connection to the Personality Board. Install the jumpers between pins 1 and 2 and between pins 3 and 4 to support multi-node wiring.	

Accessory/Spare		Part Number	Description
	Stopping Plugs	1226-0257	M25 Plug w/protective cap and O-ring. (Certified for use with XNX Universal Transmitter only)
		1226-0258	3/4 NPT w/protective cap. (Certified for use with XNX Universal Transmitter only)
	Replacement Cover O-ring	0235-1266	Replacement O-ring for the XNX front cover
	Pluggable Terminal Blocks	1226A0302	Terminal Block Ass'y 6-Pin XNX EC
		1226A0304	Terminal Block Ass'y 9-Pin XNX mV
		1226A0305	IR Terminal Block Kit Includes: 9-Pin and 2-Pin Terminal Blocks
		1226A0306	Relay Terminal Block Kit Includes: 9-Pin and 2-Pin Terminal Blocks
		1226A0307	Terminal Block Ass'y 10-Pin XNX Modbus
		1226A0303	Terminal Block Ass'y 6-Pin FFB
	Magnetic Wand/Screwdriver	1226-0254	Replacement wand for front panel access
	Ferrite Bead	0060-1051	Bead Ferrite MV XNX
	Foundation Fieldbus Ground Cable	0310-0041	Cable Ground Foundation Fieldbus XNX
	Small Screwdriver	1226-0408	Replacement screwdriver for use on Terminal Block TB2 and TB4 (IR Personality and Relay Option)

Accessory/Spare		Part Number	Description
	Weather Housing	0200-A-1635	For use with Series 2000, SensePoint, and SignalPoint EEC Sensor Products
	Weather Housing	0200-A-1640	For use with Series 2000, SensePoint, and SignalPoint Combustible Sensor Products

XNX TRANSMITTER WITH FACTORY INSTALLED LOCAL HART OPTION

1. ENTITY PARAMETERS OF XNX UNIVERSAL TRANSMITTER LOCAL HART INTERFACE

OUTPUT	INPUT
Uo = 24.15V	Ui = 21.85V
Io = 136mA	Ii = 120mA
Po = 0.82W	PI = 1.0W
Lo = 1.4mH	LI = 0.0mH
Co = 0.122uF	CI = 0.0uF

2. THE LOCAL HART DEVICE CONNECTED MUST BE THIRD PARTY LISTED AS INTRINSICALLY SAFE FOR THE APPLICATION, AND HAVE INTRINSICALLY SAFE ENTITY PARAMETERS CONFORMING WITH TABLE 1 BELOW.

TABLE 1

IS HART DEVICE		XNX HART INTERFACE
INPUT		OUTPUT
V max (or Ui)	≥	Voc or Vt (or Uo)
I max (or Ii)	≥	Isc or It (or Io)
P max, PI	≥	Po
CI + Ccable	≤	Ca (or Co)
Li + Lcable	≤	La (or Lo)
OUTPUT		INPUT
Voc or Vt (or Uo)	≤	V max (or UI)
Isc or It (or Io)	≤	I max (or II)
Po	≤	P max, PI
Ca (or Co)	≥	CI + Ccable
La (or Lo)	≥	LI + Lcable

XNX UNIVERSAL TRANSMITTER WITH EC PERSONALITY

1. ENTITY PARAMETERS OF XNX UNIVERSAL TRANSMITTER EC ADAPTER

OUTPUT		INPUT
Voc or Vt (or Uo) = 5.88 V	≤	V max (or Ui)
Isc or It (or Io) = 84 mA	≤	I max (or Ii)
Po = 123 mW	≤	P max, PI
Ca (or Co) = 10uF	≥	CI + Ccable
La (or Lo) = 1 mH	≥	Li + Lcable

XNX UNIVERSAL TRANSMITTER WITH EC PERSONALITY AND/OR LOCAL HART

1. THE OUTPUT CURRENT OF THE LOCAL HART AND EC IS BARRIERS ARE LIMITED BY A RESISTOR SUCH THAT THE OUTPUT VOLTAGE–CURRENT PLOT IS A STRAIGHT LINE DRAWN BETWEEN OPEN–CIRCUIT VOLTAGE AND SHORT–CIRCUIT CURRENT.
2. THE ASSOCIATED APPARATUS MAY ALSO BE CONNECTED TO SIMPLE APPARATUS AS DEFINED IN ARTICLE 504.2 AND INSTALLED AND TEMPERATURE CLASSIFIED IN ACCORDANCE WITH ARTICLE 504.10(B) OF THE NATIONAL ELECTRICAL CODE (ANSI/NFPA 70), OR OTHER LOCAL CODES, AS APPLICABLE.
3. CAPACITANCE AND INDUCTANCE OF THE FIELD WIRING FROM THE INTRINSICALLY SAFE EQUIPMENT TO THE ASSOCIATED APPARATUS SHALL BE CALCULATED AND MUST BE INCLUDED IN THE SYSTEM CALCULATIONS AS SHOWN IN TABLE 1. CABLE CAPACITANCE, Ccable, PLUS INTRINSICALLY SAFE EQUIPMENT CAPACITANCE, Ci MUST BE LESS THAN THE MARKED CAPACITANCE, Ca (OR Co), SHOWN ON ANY ASSOCIATED APPARATUS USED. THE SAME APPLIES FOR INDUCTANCE (Lcable, Li AND La OR Lo, RESPECTIVELY). WHERE THE CABLE CAPACITANCE AND INDUCTANCE PER FOOT ARE NOT KNOWN, THE FOLLOWING VALUES SHALL BE USED: Ccable = 60 PF/FT., Lcable = 0.2 µH/FT.
4. THE ASSOCIATED APPARATUS MUST BE CONNECTED TO A SUITABLE GROUND ELECTRODE PER THE NATIONAL ELECTRICAL CODE (ANSI/NFPA 70), THE CANADIAN ELECTRICAL CODE, OR OTHER LOCAL INSTALLATION CODES, AS APPLICABLE. THE RESISTANCE OF THE GROUND PATH MUST BE LESS THAN 1 OHM.
5. INTRINSICALLY SAFE CIRCUITS MUST BE WIRED AND SEPARATED IN ACCORDANCE WITH ARTICLE 504.20 OF THE NATIONAL ELECTRICAL CODE (ANSI/NFPA 70), OR OTHER LOCAL CODES, AS APPLICABLE. REFER TO ARTICLE 504.30(B) OF THE NATIONAL ELECTRICAL CODE (ANSI/NFPA 70) AND INSTRUMENT SOCIETY OF AMERICA RECOMMENDED PRACTICE ISA RP12.6 FOR INSTALLING INTRINSICALLY SAFE EQUIPMENT.
6. THIS ASSOCIATED APPARATUS HAS NOT BEEN EVALUATED FOR USE IN COMBINATION WITH ANOTHER ASSOCIATED APPARATUS.
7. CONTROL EQUIPMENT MUST NOT USE OR GENERATE MORE THAN 250 V RMS OR DC WITH RESPECT TO EARTH.

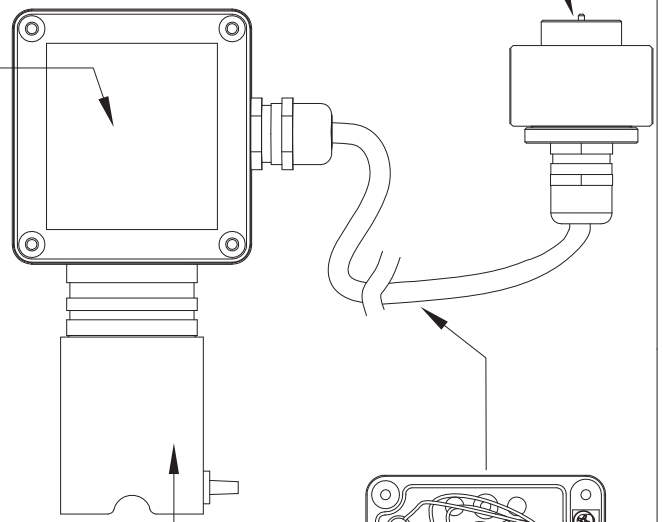
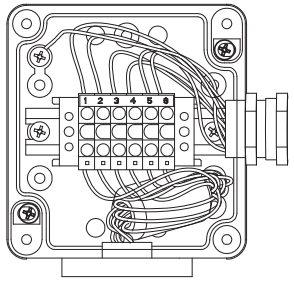
   Vmax Imax Pmax Li=Lcable Ci+Ccable
   Entity Parameters for Cartridge and Remote Accessory with Cable
   Ui=5.88V; Ii=0.124A; Pi=0.183W; Li=10uH Ci=5.003uf
   Vmax Imax Pmax Li=Lcable Ci+Ccable
2. Associated apparatus output current must be limited by a resistor such that the output voltage-current plot is a straight line drawn between open-circuit voltage and short-circuit current.
   TABLE 1:

I.S. Equipment		Associated Apparatus
V max (or Ui)	≥	Voc or Vt (or Uo)
I max (or Ii)	≥	Isc or It (or Io)
P max (or Pi)	≥	Po
Ci + Ccable	≥	Ca (or Co)
Li + Lcable	≤	La (or Lo)



3. Selected associated apparatus must be third party listed as providing intrinsically safe circuits for the application, and have Voc or Vt not exceeding Vmax (or Uo not exceeding Ui), Isc or It not exceeding Imax (or Io not exceeding Ii), and the Po of the associated apparatus must be less than or equal to the Pmax or Pi of the intrinsically safe equipment, as shown in Table above.
4. Control equipment must not use or generate more than 250V rms or dc with respect to earth.
5. Associated apparatus may be in a Division 2 or Zone 2 location if so approved.
6. Associated apparatus must be installed in accordance with its manufacturer's control drawing and Article 504 of the National Electrical Code (ANSI/NFPA 70) for installation in the United States, or Section 18 of the Canadian Electrical Code for Installations in Canada.
7. When required by the manufacturer's control drawing, the associated apparatus must be connected to a suitable ground electrode per the National Electrical Code (ANSI/NFPA 70), the Canadian Electrical Code, or other local installation codes, as applicable. The resistance of the ground path must be less than 1 ohm.
8. Refer to following table for Specific Part Numbers in this listing.
9. XNXXSC1FM, XNXXSH1FM and XNXXSO1FM shall be installed in accordance with XNX Control Drawing 1226E0402



Gas Type	Sensor Part No.	Gas Type	Sensor Part No.	Gas Type	Sensor Part No.

Appendix A - HART® Protocol

A.1 HART® Interface

The XNX Universal Transmitter is registered with the HART Communication Foundation.

Note: Only qualified service personel should perform the procedures in this section.

Every XNX® gas sensor can communicate using the HART protocol (defined by the HART Communication Foundation at http://www.hartcomm.org). HART is unique among fieldbuses in that the digital signal is superimposed on a traditional 4-20 mA current loop. This provides the reliability of analog signaling with the advanced diagnostic capability of a digital device.

HART devices are usually connected as point-to-point networks. The analog output of the XNX transmitter can also be disabled to facilitate construction of multidrop, all-digital HART networks.

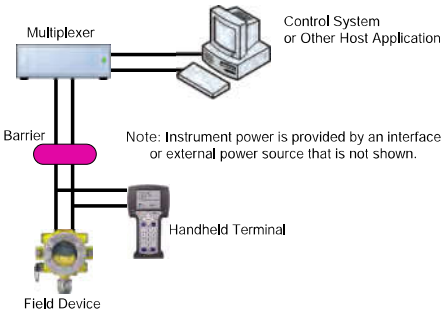

Figure 233. HART Point-to-point Mode

If HART is not needed, the unit can be used as a 4-20 mA transmitter. Since the transmitter is a slave, the internal modem will remain silent if no master signal is present. Additionally the HART signal is at too high a frequency (1200 Hz) to interfere with analog control equipment. Another novel feature of HART networks is that two masters can be present. The primary master is usually a distributed control system (DCS), programmable logic controller (PLC), or a personal computer (PC). The secondary master can be a handheld terminal. The XNX transmitter has been tested with the handheld Emerson field communicator.

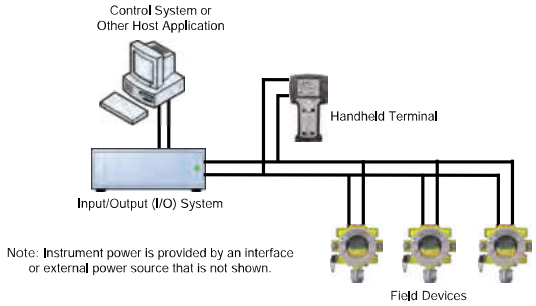

Figure 234. HART Multi-point Mode

The XNX device descriptor (DD) file provides HART users with data on the capabilities and features of the XNX Universal Transmitter. Select HART enabled devices are able to interface with XNX transmitters when connected via HART communication. A copy of the file is included on the Documentation CD. This DD file can be installed on HART-enabled Emerson field communicators using the Emerson Easy Upgrade Utility. The DD files located on the resource CD are compatible with the software integral to the transmitter. Older transmitters using earlier versions of software require previous versions of the DD files. Contact your local Honeywell representative with any questions regarding software compatibility.

During manufacturing, Honeywell configures the 8-digit HART tag to the XNX serial number. This can be used to confirm correct wiring from the transmitter to the control system. If desired, the HART tag can be modified. The fixed XNX serial number can also be read over HART.

For convenience, the transmitter presents the HART signal on two interfaces. The 1200 Hz AC signal is capacitively coupled to the main 20 mA analog output. This may be monitored at the control system

or at any point along the 20 mA loop. Additionally, the optional local HART interface (P/N: XNX-HIF) permits temporary connection of a HART terminal to the transmitter. This local HART port is transformer-coupled to the main 20 mA output. This port is intrinsically safe and polarity insensitive. See Section 2.3.1 for more information.

The internal HART modem functions as a high-impedance current source. Thus transferring the HART signal requires a certain minimum loop resistance between the slave and a low-impedance power supply.

Normally, this resistance is supplied by the control system and so need not be explicitly added. However, special treatment is needed when the 20 mA output is not used and the local HART interface is needed. (An installer might choose to communicate using relays, Modbus®, or Foundation™ Fieldbus instead.) In this case, the supplied 510 ohm resistor must be fitted to create an "artificial" 20 mA loop. The resistor should be connected between TB-1 terminal 1-3 and terminal 1-6. Additionally, S1 and S2 should be placed in "source" configuration. This is shown schematically in Figure 237.

The digital HART interface provides all of the capabilities of the local user interface. The XNX transmitter has been designed to use the portable Emerson field communicator with DevCom2000 software for Microsoft Windows® and Emerson AMS Intelligent Device Manager. Using HART, a service person can display information, test, calibrate, and configure. A map of the HART menus is provided in Section A.1.3.

ATEX Conditions for Safe Use of Intrinsically Safe HART Handheld Devices

For installations in which both the Ci and Ii of the intrinsically safe apparatus exceeds 1% of the Co and Io parameters of the associated apparatus (excluding the cable), 50% of Co and Io parameters are applicable and shall not be exceeded, i.e., the Ci of the device plus the C of the cable must be less than or equal to 50% of the Co of the associated apparatus, and the Ii of the device plus the I of the cable must be less than or equal to 50% of the Io of the associated apparatus.

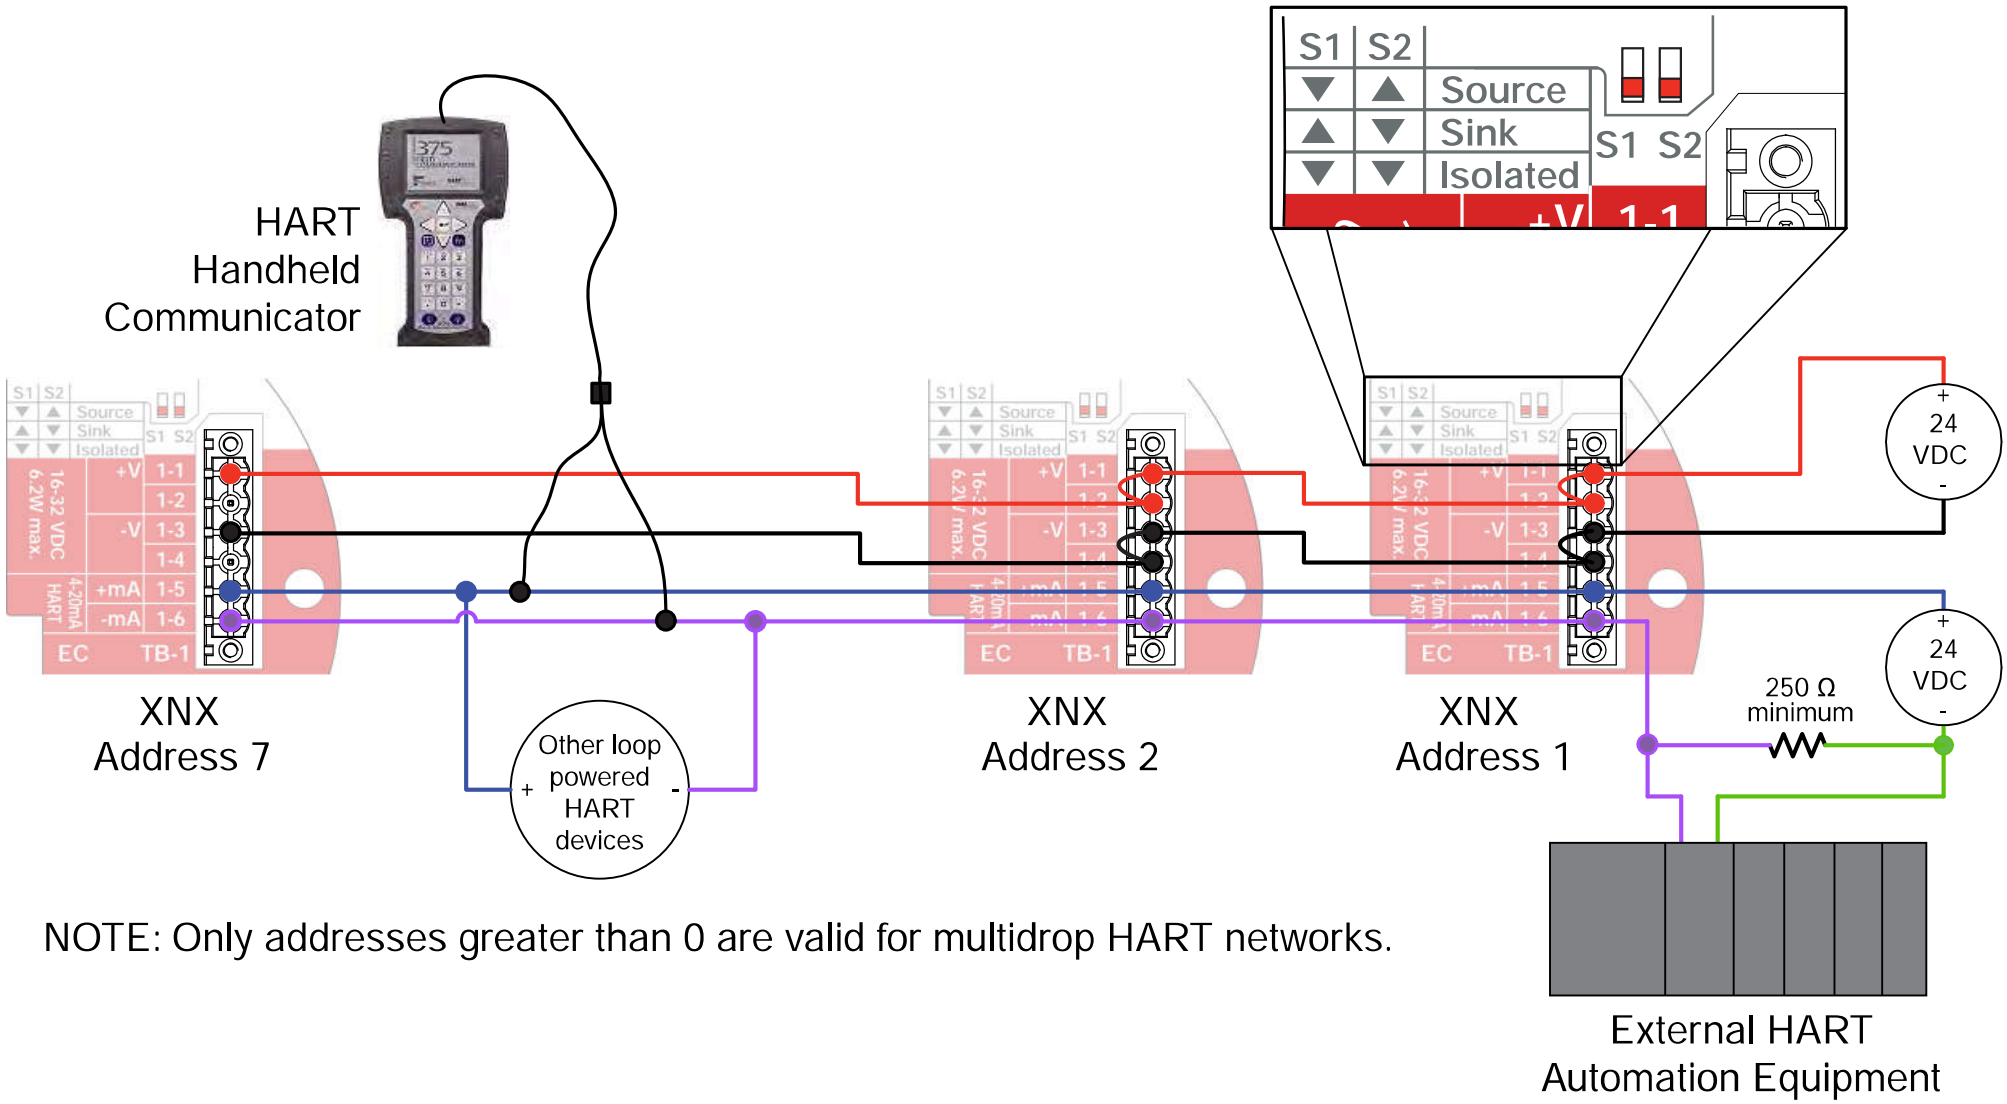
A.1.1 HART Sink, Source, and Isolated Wiring

The following figures illustrate the proper HART Multidrop wiring for the XNX.



NOTE: Only addresses greater than 0 are valid for multidrop HART networks.

Figure 236. XNX Multidrop HART Network Wiring - XNX Sink

NOTE: Only addresses greater than 0 are valid for multidrop HART networks.

Figure 237. XNX Multidrop HART Network Wiring - XNX Source

NOTE: Only addresses greater than 0 are valid for multidrop HART networks.

Figure 238. XNX Multidrop HART Network Wiring - Isolated

A.1.2 DevComm PC-based HART Interface

Overview

The XNX-HART interface facilitates remote access to all features of the local user interface including displaying status, testing, calibrating, and configuring. A device descriptor (DD) file is available to adapt standard tools for use with the transmitter.

Warning: After changing parameters with a handheld device, verify that the parameter settings are correct at the transmitter.

The following screens show some of the features of these two interfaces for the XNX transmitter.

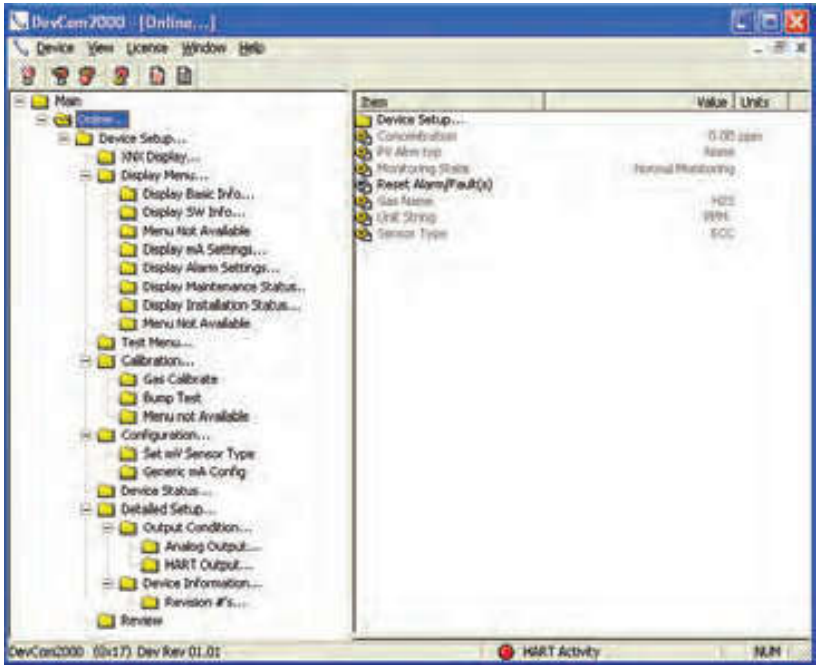


Figure 239. Presentation of XNX Data by DevComm2000

Figure 240. XNX data displayed on an Emerson field communicator

Security level 1 is required to select the display language and to adjust the date and time. All other configuration options require security level 2 access.

Functions in the Configure Menu and the security levels required to change them are explained in this table.

Symbol	Description	Security Level

Functions

Configuration Summary

All of the HART status information can be extracted from the transmitter as a PDF or text file. This includes voltages, signal strengths, and configuration settings. An example summary, which required only 5 mouse clicks, is shown below.

Figure 241. HART status information

Information Screens

All of the information in the Configuration Summary can be viewed live on various informational displays. For example, alarm settings are shown in Figure 242.

Figure 242. Typical Alarm Settings Display

Event History

The XNX transmitter maintains a record of all significant events. All alarms, all warnings, and all faults are recorded. Additionally, over sixty types of informational events are defined to record important transactions such as recalibrations or configuration changes. One-thousand records are maintained and every event has a timestamp.

Figure 243. HART Event History Display

Test

The test menu provides methods for inhibiting the output, exercising the analog output, or simulating alarms or faults. These methods simplify common tasks by providing a simple user interface.

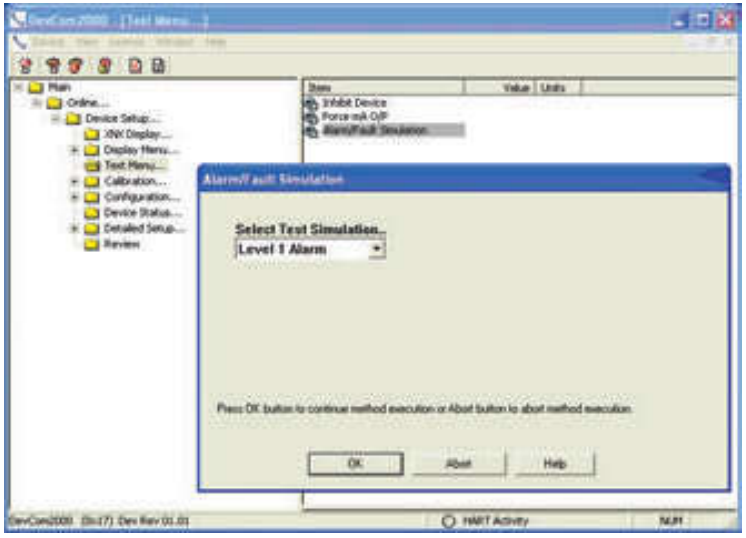

Figure 244. Alarm Simulation

Calibration

The calibration menu permits calibrating zero or span and bump testing. Additionally, when fitted with a Searchline EXCEL sensor, the Calibrate menu displays the optical signal strength for mechanical alignment. The gas calibrate operation is shown below.

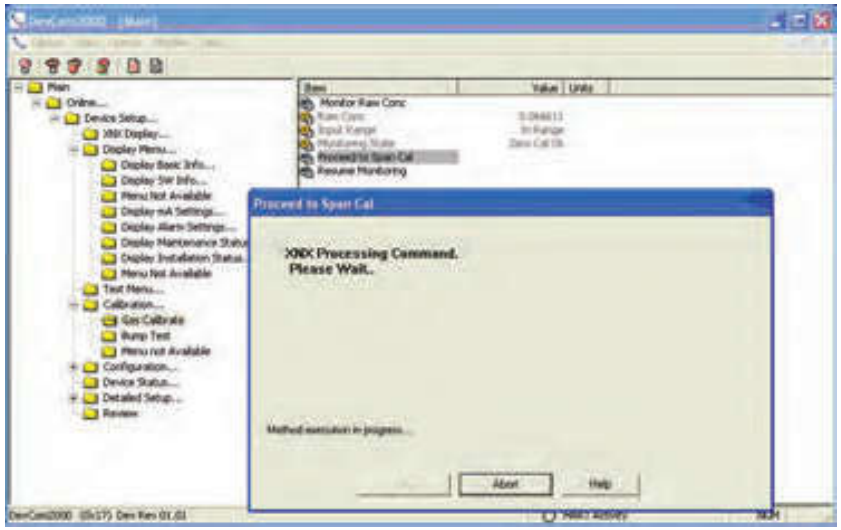

Figure 245. Gas Calibrate Method

Caution: Do not back out of a menu selection while a calibration is in progress.

Configuration

All user settings of the XNX transmitter can be made either at the local user interface or over HART. The configuration menu facilitates convenient setup of alarm levels as shown in Figure 246. Methods are also provided to set time, units, and other parameters.

Figure 246. Set Range and Alarm

Conclusion

The XNX HART interface adds value by facilitating remote operation of Honeywell Analytics gas sensors. All functions available locally are also available over HART.

A.1.3 Handheld Online Menu

When HART communication is established with the XNX, the Root menu is displayed:

Honeywell

Appendix B - Modbus® Protocol

B.1 Modbus and the XNX transmitter

The XNX® gas sensor may be fitted with the optional Modbus® interface card (P/N XNX-MB). Authoritative information on the Modbus protocol can be found at www.modbus.org. The XNX supports Modbus/RTU over an RS-485 physical layer. The interface is isolated and includes a switchable 120 Ohm termination resistor. Baud rates from 1200 to 38,400 are supported with 19,200 as the default (8 data bits, even parity, 1 stop bit).

Most of the operations that are possible with the HART® and local user interfaces can also be performed using the Modbus interface. This includes test, calibration and configuration operations. This appendix describes only how to monitor XNX status using Modbus.

The zero calibration procedure should be performed prior to the span calibration. The calibration procedure is in Section 3.2.1.

Some of the relevant Modbus holding registers are listed in the following table. In most installations, the XNX transmitter reads only the first five registers (four data). The assignment of the first eight registers (or six data) is identical to the Honeywell Analytics XCD gas sensor.

Building an effective Modbus automatic gas detection system requires checking for faults (using iFaultWarnNumber or iAlmFltLev) and checking iMonitoringState to confirm that the XNX is not inhibited or in calibration. The pseudo code example in Figure 247 suggests computation that should be made in external automation equipment.

See Section 2.3.4 for information on installing the optional Modbus hardware. See Section 2.5.1 for information on setting the Modbus baud rate and address using the local user interface. See Section A.1.1 for information on setting the Modbus parameters using the HART interface.

```
if(
       ((fCurrentConc < TLV) or (iAlmFltLev &  3 == 0))
// low concentration
       and
       ((iFaultWarnNumber < 1000) or (iAlmFltLev & 64 == 0))
// no fault
       and
     ((iMonitoringState == 1) or (iMonitoringState == 7))
// not inhibited
     and
     (
        (Transport layer SW indicates good Comm.)
         or
        (iHeartBeat changes every 5 seconds)
     )                // Modbus link healthy
  ) Then the area is safe.
```

Figure 247. Modbus Pseudo Code Example

Modbus connections are shown in the flollowing figure.

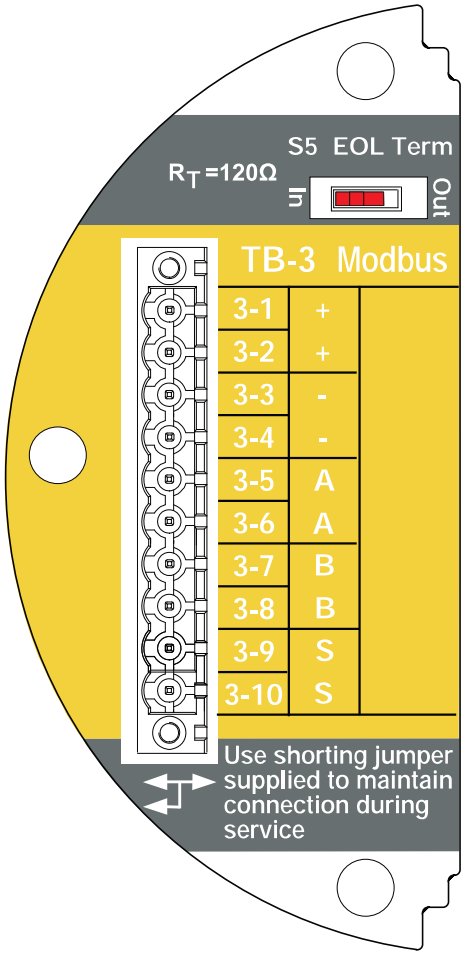

Figure 248. Modbus connections

B.2 Modbus Registers

Modbus Holding Register Address	Datatype	Variable Name	Description
40001	Int16	ID	MSB always 0x24 to facilitate automatic identification. LSB repeat of Modbus address.
40002	Int16	ID	Identical to 40001
40003 to 40004	Float32	fCurrentConc	The reported gas concentration in current measurement units. For example, methane at 50% LEL would be reported as 50.0 here. This concentration is forced to zero during inhibit mode.
40005	int16	iFaultWarnNumber	This is the integer representation of the fault status. If any fault exists this will take a value in the range 1000 to 1999. Otherwise, if any warning exists, this will take a value in the range 1 to 999. Normally, this has the value zero. For example, if the XNX temperature is out of range, this will take the value 1103.
40006	int8	iAlmFltLev	This register contains 4 meaningful bits regarding the presence of alarms or faults. The bit assignments are as follows: Bit 0: AL1 active Bit 1: AL2 active Bit 4: Warning active Bit 6: Fault Active All others: For future expansion

Modbus Holding Register Address	Datatype	Variable Name	Description
40007	uint8	iMonitoringState	This has the following meanings: 0 reserved 1 normal monitoring 2 in warm-up 3 long-term inhibit 4 alarm simulation 5 fault simulation 6 Loop current stimulated 7 in warning MFlt 8 in Instrument Flt 9 in beam block 10 in bump test 11 short-term inhibit 12 performing zero calibration 13 performing span calibration 14 in pre-zero calibration 15 in pre-span calibration 16 in post-zero calibration, successful 17 in post-span calibration, successful 18 in post-zero calibration, failed 19 in post-span calibration, failed 20 in align Excel mode 21-255 for future expansion
40008	int16	iHeartBeat	This Heartbeat is provided to facilitate detection of communications problems in programming environments where the transport-layer communication error information is unavailable. This increments approximately every 5 seconds. It is the responsibility of the system integrator to notify plant personnel if a Modbus master fails to communicate with the XNX. This register can facilitate this notification.
40009 to 40010	float32	fSensorLifeDays	This indicates the time remaining before the ECC sensor must be calibrated or replaced.

Modbus Holding Register Address	Datatype	Variable Name	Description
40011	int8	iMeasurementUnits	The meaning of this datum is as enumerated below: 0 Default 1 mg/m3 2 g/m3 3 %vol 4 ppm 5 %LEL 6 UEG 7 Ratio 8 %LEL*M 9 ppm*m 10 EG*m 11 %vol * meter 12 to 255 for future expansion
40012 to 40014	string[5]	strGenericUnits	User-defined 5 character string description for installed generic mA sensor
40015	int8	iWinTemp	If a Searchline Excel is fitted, this is the temperature of the window. Otherwise, this is the temperature of the window.
40016	int8	iTransTemp	Temperature of the XNX in Celcius.
40017	int8	iSensorTemp	Temperature of the sensor (Optima, Excel, ECC, etc)
40018 to 40026	string[18]	strTransmitterID	User-configured transmitter name.
40027 to 40035	string[18]	sDateTime	Format is “mm/dd/yy hh:mm:ss”. Month and day inverted if so configured.
40036	int8	iSensorType	The meaning of this datum is as enumerated below 1 mV Bridge 2 Electrochemical Cell with toxic cartridge 3 Electrochemical Cell with O2 cartridge 4 Optima 5 Excel 7 generic mA input Others for future expansion
40037	float32	f_mA_Out	The current produced by the XNX in milliamperes.

Modbus Holding Register Address	Datatype	Variable Name	Description
40038	int16	iTransVoltage24000	The voltage supplied to the XNX at the nominal 24.0 volt input, in millivolts.
40039	int16	iTransVoltage_3300	The voltage on a nominal 3.3 volt supply in the XNX, in millivolts.
40041	int16	iOptional3300	The voltage on a nominal 3.3 volt supply in the XNX option board, in millivolts.
40042	int16	iPersonality3300	The voltage on a nominal 3.3 volt supply in the XNX personality board, in millivolts.
40043	int16	iPersonality5000	The voltage on a nominal 5.0 volt supply in the XNX personality board, in millivolts.
40044	int16	iSensVoltage24000	The voltage supplied to an Optima or Excel sensor at the nominal 24.0 volt input, in millivolts.
40045	int16	iSensVoltage_5000	The voltage on a nominal 5.0 volt supply in Optima or Excel, in millivolts.
40046 to 40079	Contact HA for details.		
40080 to 40081	int32	iTransSn	Serial number of XNX.
40082 to 40083	int32	iSensSn	Serial number of Optima, Excel, or ECC cartridge.
40084	int8	iSensSwVer	Integer representation of software version in external sensor or mV personality module
40085	int8	iTransSwVer	Software version of XNX.
40086 to 40155	Contact HA for details.		

Appendix C - Warranty

Warranty Statement

All products are designed and manufactured to the latest internationally recognized standards by Honeywell Analytics under a Quality Management System that is certified to ISO 9001.

The XNX® Universal Transmitter is warranted by Honeywell Analytics (herein referred to as 'HA') to be free from defects in material or workmanship under normal use and service for:

Device	Warranty Terms
XNX Universal Transmitter (excludes consumables)	**36 months** from date of shipment to buyer
XNX Electrochemical Sensors (Part Number XNX-XS****) **Multi-Purpose Detector (MPD)**	**12 months** from date of commissioning by an approved Honeywell Analytics representative or **18 months** from date of shipment from Honeywell Analytics, whichever is sooner

Service in the field or at the customer's premises is not covered under these warranty terms. Time and travel expenses for on-site warranty services will be charged at Honeywell Analytics' normal billing rates. Contact your Honeywell Analytics Service Representative for information on Service Contracts.

Warranty Conditions

1. The Honeywell Analytics (HA) Limited Product Warranty only extends to the sale of new and unused products to the original buyer where purchased from HA or from a HA authorized distributor, dealer or representative. Not covered are: consumable items such as dry-cell batteries, filters and fuses or routine replacement parts due to the normal wear and tear of the product; any product which in HA's opinion has been altered, neglected, misused or damaged by accident or abnormal conditions of operation, handling, use or severe sensor poisoning; defects attributable to improper installation, repair by an unauthorized person or the use of unauthorized accessories/parts on the product
2. Any claim under the HA Product Warranty must be made within the warranty period and as soon as reasonably possible after a defect is discovered. If a Warranty claim is being sought it is the responsibility of the buyer to obtain a Service Event number (SE#) from HA and if practical return the product clearly marked with the SE# and a full description of the fault.
3. HA, at its sole discretion, may elect to send replacement goods to buyer prior to receipt of the defective goods. Buyer agrees to return defective goods with in 30 days or to pay for the replacement goods.
4. Buyer is responsible for transportation costs from the buyer's location to HA. HA is responsible for transportation costs from HA's location to the buyer.
5. If in the case of a fixed installation or when it is not practical to return the product, the buyer should submit a claim to HA Service Department. A service engineer will attend on site on a day rate basis. Where a valid warranty claim is identified, the faulty product will be repaired or replaced free of charge. A warranty claim will be accepted if all conditions contained within this Warranty are met.
6. When, in the opinion of HA, a warranty claim is valid, HA will repair or replace the defective product free of charge and send it or any replacement back to the buyer. If, in the opinion of HA the warranty claim is not valid, HA will, at the option of the buyer, return the unit unaltered at the buyer's expense, repair the unit at the then prevailing rates, replace the unit with an appropriate replacement item at the then prevailing price, or discard the unit. HA reserves the right to charge for any attendance by its service engineer at the usual rates in force at the time the claim was received.
7. In no event shall HA's liability exceed the original purchase price paid by the buyer for the product.

Consumer Claims

If you purchased your HA product as a consumer, the above warranty conditions do not affect your rights under any applicable consumer protection legislation.

Honeywell Analytics reserves the right to change this policy at any time. Contact Honeywell Analytics for current warranty information.

Overview

The AdaptaBeacon line of flashing or steady lights is designed to give a visual indication or provide a supplementary audible warning sound depending on the model selected. The cast zinc base may also double for use as a junction box. 120 and 240VAC beacons are CSA certified.

Shatter resistant Lexan® lenses and domes. Stainless steel clamp rings. Easy lamp replacement with bayonet base type bulbs. Special optics in the impact resistant Lexan lenses ensure light is efficiently dispersed. Available in six colors: red, amber, blue, green, magenta or clear.

Applications

These lights are particularly effective in high noise level areas, especially where ear protection must be worn and audible signals may not be heard or misunderstood. They can advise personnel in manufacturing and process areas when an operation is starting or stopping. They can signal malfunctions in equipment, such as assembly line jams, or blocked ventilator. They can warn personnel that they are entering a restricted area or an area of high danger.

Installation

For indoor installation it can be mounted in any direction. For weatherproof and outdoor installation lens must face directly up. A standard base design allows installation directly to surface or to a 4" octagon box or on a 1/2" NPT conduit.

Standard Features

- **CSA Certified (120 and 240VAC models only)**
- **Weatherproof -35°C to +66°C (-31°F to 150°F)**
- **Three styles to choose from:**
  - Flashing or Steady Light
  - Flashing Light with Horn
  - Flashing Light with Protective Dome Cover
- **Direct or pipe mounting or mounting on a 4" octagon box**

50CSIN Steady Beacon Light

Direct or Pipe Mount - 120VAC

When activated, provides a continuous on visual alarm indication.

49C Flashing Beacon Light

with Protective Dome Cover - Direct or Pipe Mount - 120 or 240VAC

Flashing light with protective acrylic dome cover provides easy cleaning in dusty or sooty environments.

50C Flashing Beacon Light

Direct or Pipe Mount - 24/120/240VAC

Same features as the 49C less protective Dome.

51C Flashing Beacon Light

with Warning Horn - Direct or Pipe Mount 12Vdc, 24Vdc, 24VAC, 120VAC

Combines low cost, flashing light with self contained base mounted flashing warning horn, rated at 85dB at 10 feet. Ideally suited for signalling the stoppage of equipment, or pinpointing a problem location.

51XBR Flashing LED Beacon Light

Edwards 51XBR Series XTRA-BRITETM LED beacons are combination visual and audible signaling devices, designed for indoor or outdoor applications. The integrated horn is synchronized with the flashing LED light source. The unit features a cast metal base that can be used as a junction box. The double fresnel lens is made of shatter-resistant poly carbonate, and is designed to magnify the superbright LED light source.

Continental Carbon Group

SECTION 1

GENERAL INFORMATION

SECTION 1 – GENERAL INFORMATION

INTRODUCTION

This manual is intended to serve as a reference guide for the operation of the Ventsorb PE Emission Control System. Continental Carbon Group advises operators to read through the manual to become familiar with the equipment and its safe operation. Careful consideration should be given to:

- Section 2 -- Installation and Operation
- Section 3 -- Carbon Information

This system is designed for the removal of noxious, unhealthy or unpleasant odors and organic chemical emissions emanating from a variety of sources. If solvent type compounds are known to be present in the air stream, problems related to polyethelene and polypropylene materials of construction may result. The Continental Carbon Technical Sales Representative or Local Sales Agent should be consulted prior to operation. The phone numbers are provided in the Contact Information Section.

EQUIPMENT DESCRIPTION

Continental Carbon Group offers the Ventsorb PE in three typical configurations: Canister only, Skid mounted with fan, and Top Fan Mounted. Please consult your purchase order along with the drawing at the end of this manual for the specific equipment purchased.

The system is shipped, less carbon, and ready for installation. The Ventsorb is fabricated from high density polyethylene (HDPE). The canister inlet nozzle and outlet nozzle are 4” FNPT (with the option of providing a flange or a Rain Tee). A drain/fill fitting and regeneration water overflow fitting are set into the canister sidewall.

A centrifugal blower, (if provided by CCG), can either be installed upstream of the canister or mounted on top of the canister to provide source air to the carbon bed.

HF-C STAND ALONE CANISTER
- HIGH FLOW canister PPL/PE construction (with UV inhibitor)
- Stainless steel ground rod assembly
- Initial load of activated carbon
- Combined drain/water regeneration fitting with ball valve
- Water regeneration over flow fitting
- Lockable removable canister top of manway (HF2000/3000)
- Flanged inlet air nozzle (ANSI 150 flange, undrilled)
- Plain-end outlet air nozzle

HF-S SKID-MOUNTED SYSTEM
- HIGH FLOW stand alone canister (with HF-C features above)
- Initial load of activated carbon
- FRP fan with TEFC motor
- Combination motor starter, NEMA 4X
- Transition duct, flex connector, and flow control water regeneration valve
- Pressure differential indicator
- Skid mount for all items above

HF-T TOP-MOUNTED FAN SYSTEM
- HIGH FLOW stand alone canister (with HF-C features above)
- Initial load of activated carbon
- Cast aluminum fan with TEFC motor
- Pressure differential indicator

DESCRIPTION
Continental Carbon Group's HIGH FLOW and VENTSORB® PE Series Odor Control Systems represent a perfect fit for odor control applications where space is at a premium and simplicity is a must. They have one of the smallest footprints of any odor control system, considerably smaller than most biofilter and wet scrubbing systems. Within this small footprint, Continental Carbon Group can provide a total package complete with fan, controls, and all of the accessories required. All the owner needs to do is make a few utility connections and flip a switch.

FLEXIBILITY
Both the HIGH FLOW and VENTSORB® PE can be configured in a number of ways in order to solve an odor problem. There are three basic models to choose from:
- A simple, passive, stand-alone canister
- Skid-mounted system complete with fan and controls
- A top-mounted fan system

APPLICATIONS
Due to the relatively small sizes, the HIGH FLOW and VENTSORB® PE are ideally suited for municipal wastewater collection system facilities such as pump stations and lift stations, where space is usually at a premium. They are also well suited to point source applications within the wastewater treatment plant itself. When filled with CENTAUR® HSV water regenerable catalytic activated carbon, the HIGH FLOW and VENTSORB® PE treat hydrogen sulfide (H_2S), as well as, odorous organic sulfur compounds such as methyl mercaptan and dimethyl disulfide. For the treatment of low H_2S and organic sulfur compounds, the HIGH FLOW or VENTSORB® PE can be filled with one of our other activated carbons. With higher levels of H_2S, please consider our MINI-PHOENIX® PLUS and PHOENIX® odor control systems, designed for the control of heavy hydrogen sulfide loadings.

For applications other than continuous operation at the design air flow rate, contact Continental Carbon Group for review and recommendation.

HF-1000-S

HF-400-T

VSPE-200-C

WARRANTY

WARRANTIES: Seller warrants that the carbon adsorption system sold hereunder shall be free from defects in materials and workmanship for a period of one (1) year from the date of system start-up or eighteen (18) months from date of system shipment, whichever comes first. The warranty does not apply to problems associated with normal wear and tear, improper maintenance, negligence, misuse, or the failure to operate the system in strict accordance with the operating and maintenance plan provided. For those items provided by, but not directly manufactured by the Seller, the manufacturer's warranty shall apply provided warranty coverage exceeds that which is provided by the Seller. All other warranties, either express or implied, are hereby disclaimed including but not limited to the warranty of merchantability and fitness for a particular purpose.

Seller warrants that any/all activated carbon provided hereunder shall conform to the specifications for such grade as published from time to time by the Seller. There are no warranties made with regard to the activated carbon or system to be sold hereunder other than those contained in this paragraph or stated elsewhere in the proposal. All other warranties express or implied, are hereby disclaimed including, but not limited to, the warranty of merchantability and fitness for a particular purpose.

This warranty is limited to the replacement and/or repair by the Seller of any parts or materials which in the Seller's determination are defective. This warranty does not cover any charges by the Buyer for replacement of parts, adjustments or repairs, or any other work unless such charges shall be assumed or authorized in advance in writing by the Seller.

LIMITATION OF LIABILITY: Seller's liability and the Buyer's exclusive remedy for any cause of action arising out of this transaction, including but not limited to breach of warranty, negligence and/or indemnification is expressly limited to a maximum of the purchase price of the carbon adsorption system sold hereunder. All claims of whatsoever nature shall be deemed waived unless made in writing within forty-five (45) days of the occurrence giving rise to the claim. In no event shall the Seller for any reason or pursuant to any provision of these warranties be liable for incidental or consequential damages, or damages in excess of the purchase price of the system supplied, nor shall the Seller be liable for loss of profits or fines imposed by Governmental agencies.

FORCE MAJEURE: Except as otherwise provided hereafter, neither party shall be liable to the other party for failure to perform any of its obligations hereunder due to Act of God, accident, fire, flood, riot, war, sabotage, explosion, strike, labor disturbance, national defense requirements, governmental law, ordinance, rule or regulation, whether valid or invalid, extraordinary failure of equipment or apparatus, inability to obtain electricity or other type of energy, raw material, labor, equipment or transportation, or any similar or different contingency beyond the party's reasonable control which would make performance impractical whether or not the contingency is of the same class as those enumerated above. The party invoking Force Majeure shall provide the other party of its estimate as to when the Force Majeure condition will end. The minimum term of this agreement shall be extended by the duration of any Force Majeure period.

SECURITY INTEREST: Buyer represents that the System is equipment to be used for business, and shall remain personal property. Buyer grants the Seller a security interest in the System to secure the payment of the purchase price. Buyer will not sell, lease, transfer or encumber the System and will keep it free from any and all liens and security interests until the Seller has been paid in full and shall execute any and all necessary documents to protect such security interests.

MODIFICATION OR WAIVER OF PROVISIONS: This proposal cannot be modified except by agreement in writing signed by the Seller. A waiver or repeated waiver by the Seller of any provision or the breach of any provision shall not constitute a further waiver of such provision or breach.

ENTIRE AGREEMENT: The proposal, as signed by both parties, including the General Terms of Sale and any attachments referenced in the proposal, embodies the entire agreement between Buyer and Seller. The parties shall not be bound by or liable for any statement, representation, promise or understanding not set forth herein. Nothing contained in correspondence or discussions prior to the date of the agreement has any effect on this agreement unless specifically incorporated herein. No changes, modifications of, or additions to any portion of the agreement shall be valid unless reduced to writing, agreed to and signed by both parties, and incorporated into the agreement.

PERFORMANCE STANDARDS

CONTINENTAL CARBON GROUP
VAPOR PHASE ODOR CONTROL- PERFORMANCE STANDARDS

DATE: MAY 2017

Continental Carbon Group (CCG) activated carbon based vapor phase adsorption media and systems are designed and optimized to remove or reduce odorous contaminants from air streams. For air stream odors due primarily to Hydrogen Sulfide (H2S), CCG guarantees that for the range of 2.5 to 50 ppmV H2S, its vapor phase activated carbon systems, operating within the design limits, will remove up to 99 % TWA of incoming H_2S. At less than 2.5 ppmV H2S, the effluent discharge will be no greater than 25 ppbV of H_2S.[1] Due to variation in process streams and operating conditions, this performance guarantee applies to testing performed at startup of media or system operation. This guarantee is applicable to all CCG vapor phase activated carbon system designs, using the CCG activated carbon recommended for the specific application.

Due to the typical complexity and variability of many odorous air streams containing non-regenerable organic contaminants, such as encountered in sewage and wastewater treatment facilities, removal efficiencies are achieved but sometimes for a very short period of time. There are certain volatile odorous or organic contaminants, (e.g., ammonia, carbonyl sulfide, etc.,) that have very low capacity on activated carbons, or due to operating conditions, (e.g., liquid or solids carryover or condensation, insufficient contact time, etc.,) that can result in rapid odor breakthrough and detection from activated carbon beds. Detailed air stream analysis or pilot column testing may be required to estimate overall odor removal efficiency for a carbon bed system desgin and bed life. Therefore, it is required/recommended that the design and selection of vapor phase carbon adsorption systems for critical applications, such as odor control, be based on a thorough evaluation of the source and air stream to be treated.

Note:

1. In-situ regenerated activated carbon systems, using either water or chemicals, may have a lowered removal efficiency following a regeneration. Depending on the relative humidity of the inlet air stream, this time will vary and removal efficiencies will be less than stated above. Similarly, systems that are not designed, installed, or operated properly, for example by introduction of liquid or solid contaminants, may not consistently achieve the guaranteed removal efficiency or bed life estimates.

Continental Carbon Group

SECTION 2

INSTALLATION & OPERATION

SECTION 2 – INSTALLATION AND OPERATION

INSTALLATION INSTRUCTIONS

The Ventsorb PE is shipped, ready to install and should be placed on a firm and level accessible area as near as possible to the emission source.

Prior to connection of the unit remove the canister lid and inspect the interior. The internal diffuser assembly (which may have become dislodged in shipment) should be in place and firmly seated.

Next add the granular activated carbon to the canister, leveling the top surface once it is filled. Note the considerations and precautions in Section 3, Safety Precautions With Activated Carbon. Handling dry carbon may cause localized dust problems. Place the lid on the canister and firmly set, or clamp in place, using the hold down clips provided. Ensure that any outlet ducting is separately supported from the canister.

Electrical power must be made available to the fan motor starter (if provided). All electrical connections should be in accordance with applicable codes.

Connect a flexible hose or duct from the source to the fan or canister inlet.

Prior to operating the unit ensure the blower rotation is correct. Make certain there is no loose material in the ductwork leading to the fan, and suction connections are properly sealed.

Note: The following describes the start-up and shutdown procedures for the Ventsorb PE, some of the equipment mentioned may not be provided by Continental Carbon Group.

CONTINENTAL CARBON GROUP ♦ COPYRIGHT 2022 ♦ ALL RIGHTS RESERVED

INITIAL START-UP

The unit can be put in operation by initiating the blower operation and adjusting the inlet flow control damper (if installed) to the desired flow. Damper position may need to be set at less than 100% open since a fresh fill of carbon has less pressure drop. Periodic adjustment of the damper position will be required to maintain the desired flow as the bed becomes densely packed over time.

Note: Canisters should not be subjected to a static pressure or vacuum of more than ten (10) inches water gauge or operating temperature of 150° F.

SHUTDOWN PROCEDURE

Once the need has been determined to shut the system down for either routine or emergency reasons, this can be accomplished by the following:

a. De-energize electrical power to the system and secure according to plant practices.
b. Allow fan to come to a complete stop.
c. Close the inlet flow control damper completely.

CAUTIONS: Due to the heat of adsorption, if the adsorber had been recently exposed to high concentrations of organic compounds and hydrogen sulfide, it is recommended that the adsorber be exposed to fresh (ambient) air for a period of time to ensure media has cooled sufficiently if to be shut down for longer than 6 hours.

CARBON REPLACEMENT / REPLACEMENT OF VENTSORB PE CANISTER

Once it has been determined that the carbon is no longer removing the odorous compounds, it may be replaced with a fresh fill of activated carbon. The outlet rain tee or discharge ducting should be disconnected. Remove the canister lid and transfer the spent carbon to another container for safe disposal. Use caution in handling spent activated carbon. Inspect the internals to insure that they are not damaged. Recharge the canister with carbon in accordance with the carbon installation instructions. Replace the lid on the canister and reinstall the outlet ducting or rain tee.

Alternatively, the spent carbon and plastic Ventsorb PE canister can be sent directly to landfill. A replacement Ventsorb PE canister pre-filled with suitable media can be ordered from CCG to replace the spent canister.

SAFETY PRECAUTIONS WITH ACTIVATED CARBON

OXYGEN DEMAND CREATED BY ACTIVATED CARBON IN CONFINED VESSELS

It has been confirmed that wet granular activated carbon confined in vessels creates an oxygen demand which is hazardous to human health and can cause death unless proper safety precautions are taken.

Studies conducted in vessels have shown that *low oxygen content exists* in vessels containing wet carbon. Laboratory experiments conducted also have revealed that commercial activated carbons in a wet or moist condition will lower the oxygen content of an isolated space. Preliminary indications of this research are:

a. The phenomenon occurs with wet activated carbon of all common types.

b. The rate of oxygen uptake naturally varies with the degree of exposure of the wet carbon to the air. Thus it is relatively rapid in a drained enclosure.

c. There is some indication of a limit to carbon's capacity for oxygen, but until more is known, it would be prudent to assume that all carbon (fresh, used, reactivated) will also exhibit this characteristic. Similarly, although these tests were run with water, it should be assumed that the phenomenon will occur in other liquid and vapor systems.

All confined spaces, including those containing activated carbon, should be presumed to be hazardous. Appropriate safety measures should always be taken before entering, as well as when workers are in, a confined space. OSHA regulations applicable to respiratory protection in oxygen-deficient atmospheres should be strictly adhered to.

CARBON DISPOSAL PROCEDURE

Spent carbon acceptance **must** be obtained prior to the carbon being sent off site for disposal. It is the responsibility of the generator to decide whether the spent carbon is non-hazardous or hazardous as defined by Part 261 of the Resource Conservation and Recovery Act (RCRA).

Please contact your local waste broker for assistance in profiling and disposing of the spent carbon.

CARBON INFORMATION

Continental Carbon Group

PRODUCT DATA SHEET

CC-IPH Pelletized Impregnated Activated Carbon

DESCRIPTION:

CC-IPH is a bituminous coal-based activated carbon that is specially impregnated for the desulfurization of gases and the removal of all acidic contaminants such as hydrogen sulfide (H_2S), hydrogen chloride (HCl) and mercaptans (thiols).

STANDARD PACKAGING:

CC-IPH is available in 55 lb. bags or 1,100 lb. bulk bags. Other sizes available upon request.

SPECIFICATIONS:

- Particle type: Pelletized, 4.0 mm x 6.0 mm
- Mean particle diameter: 4.7 mm (min)
- CCl_4 activity: 60 % (min)
- Iodine no: 1000 mg/g (min)
- Surface area: 1000 m^2/g (min)
- Hardness: 95% (min)
- Bulk density: 0.55 g/cc
- Moisture (as packaged): 15% (max)
- Typical hydrogen sulfide breakthrough capacity, g H_2S/cc carbon: 0.16
- Max. head loss @ 50 fpm superficial velocity through a dense packed bed, in wc/ft: 1.9 (max)

SAFETY MESSAGE

Wet activated carbon removes oxygen from air, causing a severe hazard to workers inside carbon vessels. Confined space/low oxygen procedures should be put in place before any entry is made. Such procedures should comply with all applicable local, provincial/state and federal guidelines.

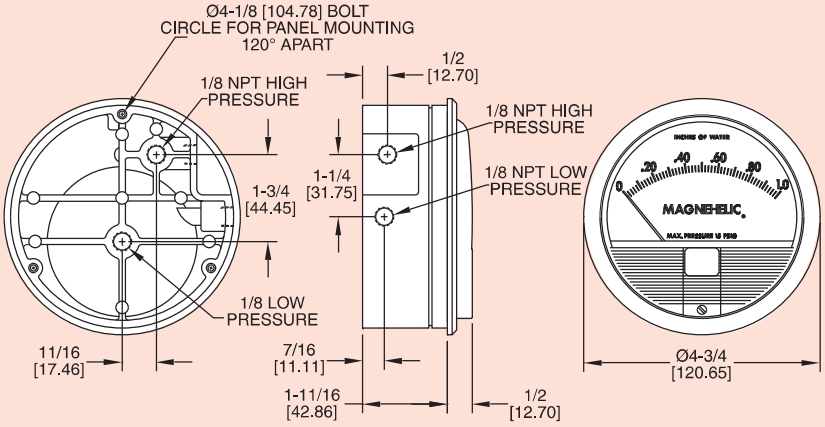
1. DIFFERENTIAL PRESSURE GAUGE

Dwyer®



Series 2000 Magnehelic® Differential Pressure Gages

Indicate Positive, Negative or Differential, Accurate within 2%

Patent Nos. 4,030,365
5,012,678

Standard Magnehelic® Pressure Gage has a large, easy-to-read 4" dial.

Dimensions, Standard Series 2000 Magnehelic® Pressure Gages. (Slightly different on medium and high pressure models)

Select the Dwyer Magnehelic® gage for high accuracy — guaranteed within 2% of full scale — and for the wide choice of 81 models available to suit your needs precisely. Using Dwyer's simple, frictionless Magnehelic® movement, it quickly indicates low air or non-corrosive gas pressures — either positive, negative (vacuum) or differential. The design resists shock, vibration and over-pressures. No manometer fluid to evaporate, freeze or cause toxic or leveling problems. It's inexpensive, too.

The Magnehelic® is the industry standard to measure fan and blower pressures, filter resistance, air velocity, furnace draft, pressure drop across orifice plates, liquid levels with bubbler systems and pressures in fluid amplifier or fluidic systems. It also checks gas-air ratio controls and automatic valves, and monitors blood and respiratory pressures in medical care equipment.

Note: May be used with Hydrogen where pressures are less than 35 psi.

Flush ...Surface...or Pipe Mounted

MOUNTING. A single case size is used for most models of Magnehelic® gages. They can be flush or surface mounted with standard hardware supplied. With the optional A-610 Pipe Mounting Kit they may be conveniently installed on horizontal or vertical 1¼″ - 2″ pipe. Although calibrated for vertical position, many ranges above 1″ may be used at any angle by simply re-zeroing. However, for maximum accuracy, they must be calibrated in the same position in which they are used. These characteristics make Magnehelic® gages ideal for both stationary and portable applications. A 4⅜″ hole is required for flush panel mounting. Complete mounting and connection fittings plus instructions are furnished with each instrument.

VENT VALVES

In applications where pressure is continuous and the Magnehelic® gage is connected by metal or plastic tubing which cannot be easily removed, we suggest using Dwyer A-310A vent valves to connect gage. Pressure can then be removed to check or re-zero the gage.

HIGH AND MEDIUM PRESSURE MODELS

Installation is similar to standard gages except that a 4⅜″ hole is needed for flush mounting. The medium pressure construction is rated for internal pressures up to 35 psig and the high pressure up to 80 psig. Available for all models. Because of larger case, the medium pressure and high pressure models will not fit in a portable case size. Installation of the A-321 safety relief valve on standard Magnehelic® gages often provides adequate protection against infrequent overpressure.

SPECIFICATIONS

Service: Air and non-combustible, compatible gases. (Natural Gas option available.)
Wetted Materials: Consult factory.
Housing: Die cast aluminum case and bezel, with acrylic cover. Exterior finish is coated gray to withstand 168 hour salt spray corrosion test.
Accuracy: ±2% of full scale (±3% on - 0, -100 Pa, -125 Pa, 10MM and ±4% on - 00, -60 Pa, -6MM ranges), throughout range at 70°F (21.1°C).
Pressure Limits: -20″ Hg. to 15 psig.† (-0.677 bar to 1.034 bar); MP option: 35 psig (2.41 bar), HP option: 80 psig (5.52 bar).
Overpressure: Relief plug opens at approximately 25 psig (1.72 bar), standard gages only.
Temperature Limits: 20 to 140°F.* (-6.67 to 60°C).
Size: 4″ (101.6 mm) Diameter dial face.
Mounting Orientation: Diaphragm in vertical position. Consult factory for other position orientations.
Process Connections: 1/8″ female NPT duplicate high and low pressure taps - one pair side and one pair back.
Weight: 1 lb 2 oz (510 g), MP & HP 2 lb 2 oz (963 g).
Standard Accessories: Two 1/8″ NPT plugs for duplicate pressure taps, two 1/8″ pipe thread to rubber tubing adapter and three flush mounting adapters with screws. (Mounting and snap ring retainer substituted for 3 adapters in MP & HP gage accessories.)
*Low temperature models available as special option.
†For applications with high cycle rate within gage total pressure rating, next higher rating is recommended. See Medium and High pressure options at lower left.

OPTIONS AND ACCESSORIES

Transparent Overlays

Furnished in red and green to highlight and emphasize critical pressures.

Adjustable Signal Flag

Integral with plastic gage cover. Available for most models except those with medium or high pressure construction. Can be ordered with gage or separate.

LED Setpoint Indicator

Bright red LED on right of scale shows when setpoint is reached. Field adjustable from gage face, unit operates on 12-24 VDC. Requires MP or HP style cover and bezel.

Portable Units

Combine carrying case with any Magnehelic® gage of standard range, except high pressure connection. Includes 9 ft. (2.7 m) of ⅜″ I.D. rubber tubing, standhang bracket and terminal tube with holder.

Air Filter Gage Accessory Package

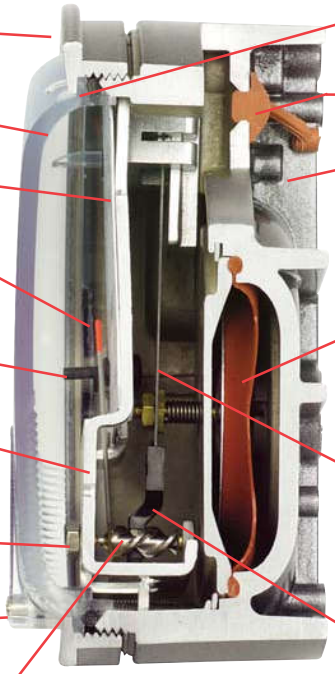
Adapts any standard Magnehelic® for use as an air filter gage. Includes aluminum surface mounting bracket with screws, two 5 ft. (1.5 m) lengths of ¼″ aluminum tubing two static pressure tips and two molded plastic vent valves, integral compression fittings on both tips and valves.

Quality design and construction features

Bezel provides flange for flush mounting in panel.

Clear plastic face is highly resistant to breakage. Provides undistorted viewing of pointer and scale.

Precision litho-printed scale is accurate and easy to read.



Red tipped pointer of heat treated aluminum tubing is easy to see. It is rigidly mounted on the helix shaft.

Pointer stops of molded rubber prevent pointer over-travel without damage.

"Wishbone" assembly provides mounting for helix, helix bearings and pointer shaft.

Jeweled bearings are shock-resistant mounted; provide virtually friction-free motion for helix. Motion damped with high viscosity silicone fluid.

Zero adjustment screw is conveniently located in the plastic cover, and is accessible without removing cover. O-ring seal provides pressure tightness.

O-ring seal for cover assures pressure integrity of case.

Blowout plug of silicone rubber protects against overpressure on 15 psig rated models. Opens at approximately 25 psig.

Die cast aluminum case is precision made and iridite-dipped to withstand 168 hour salt spray corrosion test. Exterior finished in baked dark gray hammerloid. One case size is used for all standard pressure options, and for both surface and flush mounting.

Silicone rubber diaphragm with integrally molded O-ring is supported by front and rear plates. It is locked and sealed in position with a sealing plate and retaining ring. Diaphragm motion is restricted to prevent damage due to overpressures.

Calibrated range spring is flat spring steel. Small amplitude of motion assures consistency and long life. It reacts to pressure on diaphragm. Live length adjustable for calibration.

Samarium Cobalt magnet mounted at one end of range spring rotates helix without mechanical linkages.

Helix is precision made from an alloy of high magnetic permeability. Mounted in jeweled bearings, it turns freely, following the magnetic field to move the pointer across the scale.

NOTES:
1.) THREAD WHITE PLUGS INTO COUPLINGS, USE TEFLON TAPE ON THREADS TO MAKE A WATER TIGHT SEAL.
2.) PROCESS AIR INLET STREAM SHOULD BE NON–CONDENSING & PARTICULATE FREE FOR LONGEVITY OF THE CARBON ODOR CONTROL SYSTEM. OTHERWISE A GREASE FILTER/DEMISTER UNIT IS RECOMMENDED.

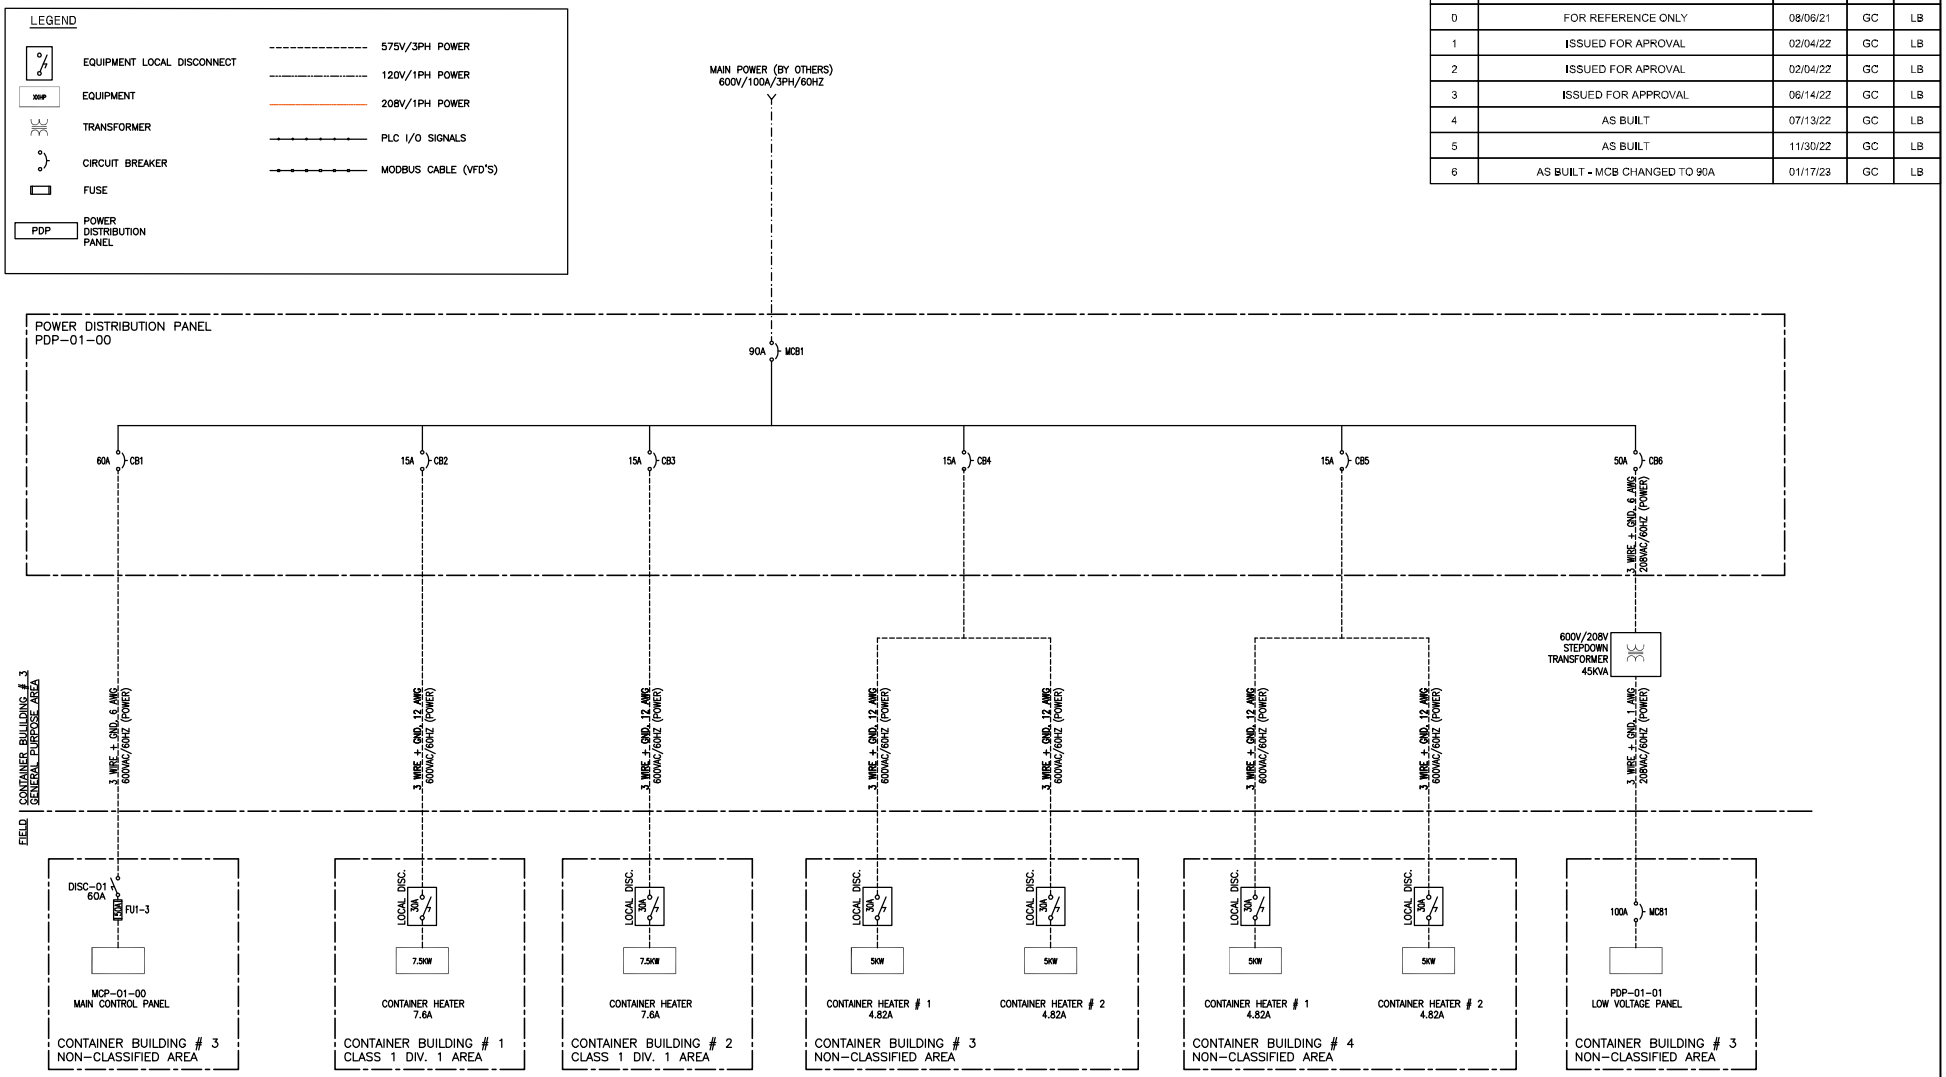
Safety Equipment

Each container equipped with:

- **Eye wash stations are located in each container**
- **Smoke detectors:**
  - Container 1: SD-07-41
  - Container 2: SD-03-09
  - Container 3: SD-05-06
  -
  - Container 4: SD-07-22
- **Wall-mounted temperature sensors:**
  - Container 1: TT-01-14
  - Container 2: TT-03-11
  - Container 3: TT-06-06
  - Container 4: TT-07-06
- **Wall-mounted H_2S sensors:**
  - Container 1: AE-01-15
  - Container 2: AE-03-11
- **Wall-mounted CH4 sensors:**
  - Container 1: AE-01-15A
  - Container 2: AE-03-11A
- **Space heaters:**
  - Container 1: HTR-01-38
  - Container 2: HTR-03-49
  - Container 3: HTR-05-09



- Container 4: HTR-07-20

Poweron CONTROL SYSTEMS LTD.
www.poweron.ca
248741
Assembled in Canada
Serial: 26330001

Industrial Control Panel
Manufactured for : H2FLOW
Model : EUREKA STP CONTAINERIZED MBBR
Drawing # : 2633
Supply : 600VAC, 3Ø , 60Hz, 50AMP, 3-WIRE

Enclosure :TYPE 4
Temp :0-40 °C
SCR : 22 kA
F.L.A : 38.52 A
Largest Motor F.L.A. : 2.4 A
Mfg. Date. : 06/2022

Intrinsic Electrical Rating : 24VDC / 178.4mA

NOTE: FOR FIELD WIRING INSTALLATION INSTRUCTIONS REFER DRAWING:

CAUTION FOR CONTAINER #1

H2S GAS & METHANE GAS MAY BE PRESENT.

DO NOT ENTER THIS AREA

WITHOUT FOLLOWING THE ENTRY PROCEDURE:

ENTRY PROCEDURE

1. THE EXHAUST FAN (FAN-02-33) MUST REMAIN **ON** BEFORE ENTRY.
   BEFORE ENTERING INTO CONTAINER#1, THE **'TIMER FOR FAN-02-33'** LOCATED IN CONTAINER #3 MUST BE ADJUSTED TO **ZERO SECONDS**.
2. DOOR MUST BE KEPT OPEN FOR VENTILATION.
3. BEFORE ENTERING, YOU MUST HAVE A VISUAL THAT THE FAN IS **ON** BEFORE ENTERING.
4. IF THE FAN TURNS OFF WHILE INSIDE, YOU MUST LEAVE THE ROOM IMMEDIATELY. (VERIFY IF STEP 2 HAS BEEN FOLLOWED)
5. PUT BACK THE TIMER TO ITS ORIGINAL SETTINGS AFTER EXITING.

ATTENTION POUR LE CONTENANT #1

GAZ H2S & GAZ MÉTHANE PEUVENT ÊTRE PRÉSENTS.

NE PAS ENTRER DANS CETTE ZONE

SANS SUIVRE LE PROCÉDURE D'ENTRÉE :

PROCEDURE D'ENTRE

1. LE VENTILATEUR D'ÉVACUATION (FAN-02-33) DOIT RESTER EN MARCHE AVANT L'ENTRÉE. AVANT D'ENTRER DANS LE CONTENEUR #1, LA « MINUTERIE POUR FAN-02-33 » SITUÉE DANS LE CONTENEUR #3 DOIT ÊTRE AJUSTÉE À ZÉRO SECONDE.
2. LA PORTE DOIT RESTER OUVERTE POUR LA VENTILATION.
3. AVANT D'ENTRER, VOUS DEVEZ AVOIR UN VISUEL QUE LE VENTILATEUR EST EN MARCHE AVANT D'ENTRER.
4. SI LE VENTILATEUR S'ÉTEINT À L'INTÉRIEUR, VOUS DEVEZ QUITTER LA PIÈCE IMMÉDIATEMENT. (VÉRIFIER SI L'ÉTAPE 2 A ÉTÉ SUIVIE)
5. REMETTRE LA MINUTERIE À SES RÉGLAGES D'ORIGINE APRÈS LA SORTIE.

CAUTION FOR CONTAINER #2

H2S GAS & METHANE GAS MAY BE PRESENT.

DO NOT ENTER THIS AREA

WITHOUT FOLLOWING THE ENTRY PROCEDURE:

ENTRY PROCEDURE

1. THE EXHAUST FAN (FAN-03-50) MUST REMAIN **ON** BEFORE ENTRY. BEFORE ENTERING INTO CONTAINER#1, THE **'TIMER FOR FAN-03-50'** LOCATED IN CONTAINER #3 MUST BE ADJUSTED TO **ZERO SECONDS**.
2. DOOR MUST BE KEPT OPEN FOR VENTILATION.
3. BEFORE ENTERING, YOU MUST HAVE A VISUAL THAT THE FAN IS **ON** BEFORE ENTERING.
4. IF THE FAN TURNS OFF WHILE INSIDE, YOU MUST LEAVE THE ROOM IMMEDIATELY. (VERIFY IF STEP 2 HAS BEEN FOLLOWED)
5. PUT BACK THE TIMER TO ITS ORIGINAL SETTINGS AFTER EXITING.

ATTENTION POUR LE CONTENANT #2

GAZ H2S & GAZ MÉTHANE PEUVENT ÊTRE PRÉSENTS.

NE PAS ENTRER DANS CETTE ZONE

SANS SUIVRE LE PROCÉDURE D'ENTRÉE :

PROCEDURE D'ENTRE

1. LE VENTILATEUR D'ÉVACUATION (FAN-03-50) DOIT RESTER EN MARCHE AVANT L'ENTRÉE. AVANT D'ENTRER DANS LE CONTENEUR #1, LA « MINUTERIE POUR FAN-03-50 » SITUÉE DANS LE CONTENEUR #3 DOIT ÊTRE AJUSTÉE À ZÉRO SECONDE.
2. LA PORTE DOIT RESTER OUVERTE POUR LA VENTILATION.
3. AVANT D'ENTRER, VOUS DEVEZ AVOIR UN VISUEL QUE LE VENTILATEUR EST EN MARCHE AVANT D'ENTRER.
4. SI LE VENTILATEUR S'ÉTEINT À L'INTÉRIEUR, VOUS DEVEZ QUITTER LA PIÈCE IMMÉDIATEMENT. (VÉRIFIER SI L'ÉTAPE 2 A ÉTÉ SUIVIE)
5. REMETTRE LA MINUTERIE À SES RÉGLAGES D'ORIGINE APRÈS LA SORTIE.

EXHAUST FAN (FAN-02-33)

SYSTEM NAMEPLATE WASTEWATER TREATMENT SYSTEM

Model: CX-027 Serial: Q-285-20 Date: JULY 2022

CAUTION/ATTENTION:

THIS EQUIPMENT CREATES A HAZARDOUS CLASSIFIED AREA.
HAZARDOUS AREA CLASSIFIED STAMPED H2FLOW DRAWING Q-28520-50-20 Rev. 0,
MUST BE CONSULTED FOR INSTALLATION, DISTANCES,
VENTILATION REQUIREMENTS, AND USE.

CET ÉQUIPEMENT CRÉE UNE ZONE CLASSIFIÉE DANGEREUSE.
RAPPORT / DESSINS CLASSÉS SUR LES ZONES DANGEREUSES Q-28520-50-20 Rev. 0,
PAR H2FLOW DOIT ÊTRE CONSULTÉ
POUR L'INSTALLATION, LES DISTANCES, LES EXIGENCES DE VENTILATION ET L'UTILISATION.

Hazardous Location Rating: Class I Div 1 Groups C & D T1

Note: These containers has a section referred to as 'CONTAINER #1 & CONTAINER #2' by the manufacturers building drawings that has a Hazardous Location defined as Class I, Division 1 Groups C, D T1.

X- There are Conditions of Use associated with this equipment – See Below.
-MUSTS FOLLOW HAZLOC ROOM CONTAINER #1 & #2 ENTRY PROCEDURE BEFORE ENTERING

Évaluation des emplacements dangereux **: Class I Div 1 Groups C & D T1**

Remarque : Ce conteneur comporte une section appelée « CONTAINER #1 & CONTAINER #2» par les dessins de construction des fabricants qui a un emplacement dangereux défini comme Classe I, Division 1 Groupes C, D T1.

X- Il existe des conditions d'utilisation associées à cet équipement - voir ci-dessous.
-DOIT SUIVRE LA PROCÉDURE D'ENTRÉE DANS LA CONTAINER #1&#2 DE LA SALLE AVANT D'ENTRER

Environmental Ratings: Internal 10°C ≤ T amb ≤ 25°C External -40°C ≤ T amb ≤ 40°C Outdoor Use Only.
Electrical Ratings: 600VAC 200A 3Phase/3Wire 60Hz Power Distribution Panel PDP-01-00
Largest Motor : 3HP SCCR : 5kA
*See Schematics : H2F-28520-40-00 (SINGLE LINE DIAGRAM)
Drawing # 2633 (CONTROL PANEL SCHEMATIC)

CAUTION/ATTENTION

THIS EQUIPMENT MAY REQUIRE ADDITIONAL GROUNDING OR BONDING AS PER CANADIAN ELECTRICAL CODE.

CET ÉQUIPEMENT PEUT NÉCESSITER UNE MISE À LA TERRE OU UNE LIAISON SUPPLÉMENTAIRE CONFORMÉMENT AU CODE CANADIEN DE L'ÉLECTRICITÉ.

Risk Assessment

Project Name: Eureka STP - Containerized MBBR
Project Number: Q-285-20
Document Name: Risk Assessment (Hazardous Area: Class 1 Division 1 Groups C and D T1)

Hazards Identified	Potential injuries/Damage Severity (1, 2 or 3)	Measures to prevent Injury/Damage	Likelihood of Occurrence
Accidental start of Screw Screen (during maintenance)	1, Operator Injury	Emergency Stop installed inside the screen room	Unlikely
Screens A & B to overflow	2, Hazardous wastewater to spill outside the screen room	1. 2 point level monitoring installed. At high level will stop the pump	Medium
EQ tank to overflow	2, Hazardous wastewater to spill outside the screen room	1. Pressure transducer installed for level moniutoring and control. At high level will stop wastewater feed to screens. 2. High Level Float Switch installed. At high level alarm, will stop wasterwater feed to screens (in the event of pressure transducer failure)	Medium
Hydrogen Sulfide (H2S) and Methane (CH4) generated inside the screen room (container 1) and MBBR room (container 2)	2, Injury to operator inside and within the identified hazardous area	1. Exhaust fan installed to run on a scheduled basis to ensure H2S and CH4 is vented out of the screen room and MBBR room on a regular basis. 2. Warning signs provided outside of the screen room and MBBR room.	Medium
Unauthorized personnel entering the Hazardous Rooms (Screen room and MBBR room)	2, Injury to operator	1. Warning sign provided. "Hazardous Area. Authorized Personnel Only"	Medium
Entering the Hazardous Room (Screen room and MBBR room) with a presence of Hydrogen Sulphide (H2S) and Methane (CH4)	2, Injury to operator	1. If Hazloc room exhaust fan is **NOT RUNNING**, adjust the fan OFF timer (located in Blower room/Electrical room - Container 3) to 0 minutes and ensure that the fan is running before entering the Hazloc rooms.	Medium
Entering the Hazardous Room (Screen room and MBBR room) with unpleasant odor	2, Injury to operator	1. Drum activated carbon absorbers are installed in MBBR room and operates on schedule as set up in the PLC program. This is to ensure that no unpleasant odors are present before entering the Hazloc	Medium
Transfer tank to overflow	2, Clarified water to spill outside the MBBR room	1. 4 point float level switches are installed for tank level monitoring and pump control.	Medium
Treated Effluent tank to overflow	2, Treated Effluent water to spill outside the MBBR room	1. 4 point float level switches are installed for tank level monitoring and pump control.	Medium
Hazardous gas migration to non-hazloc containers (containers 3 and 4)	2, Injury to operator	1. Ensure proper sealing of all process piping and electrical penetrations to non-hazloc containers (containers 3 and 4)	Medium

Section 6

Recommended spare parts list

Project Name: Eureka wastewater treatment system

Section 7

Commissioning Plan

Preamble

The purpose of this document is to give a guidance for plant testing and commissioning procedure, but it will not replace the instruction manuals supplied by the equipment manufacturer which are the first place of reference for problems by the operators.

In addition to the present sections of this document, the commissioning plant operation is based on the following documents:

- Process Flow Diagram (PFD).
- Piping and Instrumentation Diagram (P&ID).
- General Arrangement Drawings (GA Drawings)
- Supplier's manuals. (Refer operation and Maintenance manuals)

SAFETY 

All forms of wastewater (raw or even treated) pose a potential risk.

Some chemicals used in the Wastewater Water Treatment Plant (WWTP) are extremely dangerous.

WARNING 

All safety precautions must be strictly followed.

SAFETY 

Safety Precautions Prior Wastewater System Start-up:

- Conduct a thorough safety briefing and training with all personnel involved in the commissioning process.
- Ensure that all safety equipment's are readily available and functional.
- Ensure that the recommendations in the **Appendix A: Guidance for Reducing Health Risk for Workers Handling Sewage**, page **25** has been implemented prior starting the commissioning. The provincial health guidelines are essential to follow. Any additional recommendations/ good practices are encouraged to be added.
- It is important to perform detailed visual inspections of all components, including tanks, pumps, valves, and pipelines, to detect any signs of corrosion, wear, or damage. In general, all rectifications should be done first prior to star-up. If the damage can be isolated without compromising the plant, then the plant can be started

1.0 *General Initial Start-up Procedure*

WARNING ⚠

Prior to starting of the system, all components should be individually inspected and tested according to the manufacturers' operating instructions. Pre-commissioning start-up checklist is provided to facilitate the commissioning; nevertheless, it doesn't replace the supplier's manual.

Operators should read all manufacturers' manuals, and familiarize themselves with the components, before attempting to operate a system.

SAFETY 👁

Before attempting to commission a Wastewater Treatment Plant (WWTP), the safety aspect must be always considered first and safe disposal of products used during testing as well. It means that all safety devices have to be activated and tested before attempting to bring dangerous chemicals or makeup water on site. The overflow network and the drainage system must be completed enough to allow safe disposal of the wastewater used during the test without risk of accidental flooding/ contaminating the environment. Chemicals used during commissioning shall be stored in a proper manner and handled safely. Material Safety Data Sheet (MSDS) must be always displayed near the product. Handling of chemicals will be done in accordance with the MSDS and the safety procedures used in the plant. All operators/ personnel require to have their proper training prior handling any chemicals.

Short list of items to keep in mind

1. Never enter a "Confined space" area without following the plant safety procedures.
2. When handling chemicals always protect yourself and others. Follow specific instructions and Material Safety Data Sheet (MSDS).
3. Ensure that personnel and obstructions are clear of all active equipment.

4. Ensure that all guards and covers are in place before starting any equipment. If inspection or cleaning is required, turn system power off and lock out power sources before disassembly.
5. Keep hands, accessories and loose clothing away from moving equipment.
6. Do not poke or prod material in the equipment with a bar or a stick.
7. Do not overload equipment. Maintain operating speeds below the specified maximum.
8. Close all access man ways and inspection hatches to prevent injuries.
9. Post warning signs in hazardous areas.

It is suggested that a dry run (equipment and control sequence test without product flowing) be performed before start-up with product. For that, recheck starter basic operations: Manual operation, automatic operation, safety interlocks, and emergency stop push button if any, when the starter is in test mode (No power applied to the drive).

General Sequence

- Carry out any necessary final hydrotest for treatment structures, pipes and chemical units. Initial hydrotest on equipment inside the containers has been performed at H2Flow facility before shipment. Hydrotests for lift station, EQ tank, MBBR tanks, clarifier, transfer tank, treated effluent tank, and sludge tank have been performed at fabricators' facilities. However, a final hydrotest on will be performed during the start-up and commissioning period by H2Flow technician in the field.

- If necessary, lubricate compressors in accordance with manufacturer's recommendations. Blowers already have been lubricated and oil has been filled to recommended level by manufacturer. H2Flow has verified the blowers' operational condition and oil level before shipment of containers to site. However, a final check should be done prior commissioning.

- Carry out electrical tests, including the direction of rotation of motors. Check that all control devices are providing the correct signals to the control panels. These tests must cover:

    - Inspection and test of Local Control Panel before energization.

    - VFD parameters adjustment.

    - Cables addressing inspection and continuity test (Power and control cables) as per interconnection drawings.

    - PLC input/output test.

    - Instruments loop test according to supplier's documentation and electrical drawings.

- Automatic valves test, with adjustment of limit switches if required. Valve actuators should be activated in all positions to ensure that wiring is placed correctly.
- Check carefully protection devices such as pressure/ level switches on all pump suctions, mixers and specifically LL levels that keep the pumps/ mixers from running dry.
- Check the condition of flowmeters, DO sensors, pH sensors, Level sensors/ transmitters. These instruments have been factory calibrated and ready to use in the field.
- Check controls, automatic sequences and programming of each system.
- Test each machine individually (field test). Measure and record the operating parameters such as the drawn current, voltage, flow, and pressure to ensure that each machine functions as designed. Correct any abnormality (leakage, vibration etc.).

Ensure also that the following verifications are completed before undertaking start-up of the plant:

1. Ensure water and wastewater pipelines have been installed and tested.
2. Ensure all tanks' overflow and drains are connected.
3. Ensure an adequate water supply is available.
4. After repairing leaks, if any, repeat the testing procedure, as outlined above, until all the leaks have been corrected. Repeat leak repairs as required.

- Organize three temporary submersible pumps and ten flexible hoses.
- Organize the supply of these chemicals:
  - Carbon source.
  - Nitrogen source.
  - Phosphorous source.
  - Alkalinity source (bicarbonate).
  - Citric Acid.
  - Antifoaming agent.
  - Polymer (the type of polymer is to be determined based on jar test).

- *Avoid these chemicals: Sulfuric acid, hydrochloric acid, caustic soda, and lime. They can negatively interfere with the start-up.*
- Procure portable wastewater analyzer that can measure the constitutes of concern.
- Follow the recommended process for start-up the wastewater treatment plant (decision is to be made whether seeding / no seeding sequence).
    - Note the time required for each option.

2.0 INTRODUCTION

The aim of the Eureka Wastewater Treatment Plant (WWTP) is to treat the wastewater to the safe limits prior discharging to the environment.

This document introduces the necessary steps and information for the operation team of the wastewater treatment plant, which must be followed during the normal operation in the plant and must be considered during any start up also.

WARNING ⚠

For general Before pumping the raw wastewater toward the plant, the raw wastewater full analysis must be done in a laboratory to ensure that it is compatible with the design basis of the plant. It is essential to make sure there are no toxic material that can negatively interfere with the biological activities. The best course of action is to take representative samples over several months to establish enough confidence in the characteristics of the wastewater being sent to the plant. This confirms no changes from the design stage. This system is supplied based on design criteria supplied by client. Due to remote jobsite location there are no analysis performed before pumping wastewater.

It is crucial to consult with professional chemical suppliers or environmental specialists regarding any chemicals that are sent to the drain and make their way to the wastewater treatment plant. These experts can recommend alternatives that are safe for wastewater treatment systems, particularly during start-up, to minimize disruption to biological processes.

It is important for these suppliers to provide clear guidance on:

1. ***The chemical composition and its compatibility with biological systems.***
2. ***Alternative options to minimize disruption to biological processes.***
3. ***The minimum required dilution to avoid adversely affecting microbial activity.***

Adhering strictly to these recommendations will help maintain the balance in the wastewater system and ensure its optimal performance.

Equipment outside of H2Flow's Scope of Supply is not under the control of H2Flow. A fault signal is generated within the WWTP can be used to control the equipment outside of H2Flow WWTP.

Detailed Commissioning Management Plan

It is important to collect all observation during all stages by taking notes, photos and videos. These records will allow easier follow up and better evaluation plant performance.

Stage 1: Pre-Commissioning Inspection and Checklist at Site

- Review overall installation for completeness and verify that all items contained in the Installation Instructions provided have been completed, including the following:
  - Rigging, placement, and anchoring of below ground Lift station, and above ground containers.
    - After construction, make sure all debris is removed from the Lift station and vents are open and clear (check vents in the containers).
    - Check all flanges for gaskets and bolt tightness.
    - Check the MBBR inlet and outlet screens for gaskets and bolts for tightness (if applicable).
    - If installed, check the MBBR drain screen and piping for gaskets and bolts for tightness. Make sure the drain valve on the piping outside the tank is operable and is closed.
  - Installation of components supplied loose, such as level switches and/or sensors for outdoor tanks, submersible pumps, and DO sensors for MBBR tanks.
  - Field Piping Schedule:
    - Assure that piping is installed correctly and properly supported.
    - Make sure there are no high points in the influent piping where air could get trapped and affect flow volume.
- Review PFD, PID and GA drawings and verify that the installed equipment are in the right sequence with correct pipe sizes and valve placements.
- Review scope of supply to ensure all equipment is installed and accounted for.
- Check all motor and pump nameplates against the record. Use project management equipment list.
- If needed, lubricate electro-mechanical equipment in accordance with manufacturer's recommendations.
- Confirm all overloads and disconnects are OFF before applying power to the main control panel.

- Detailed site acceptance test (SAT) checklist is provided separately for whole system.
- Check carefully protection devices such as pressure/level switches on all pump suctions and mixers:
    - Specifically, LL levels that keep the pumps from running dry.
- Flowmeters are installed & connected. Make sure installation inside the containers did not come loose during the shipment.
- Pressure sensors are installed & connected. Make sure installation inside the containers did not come loose during the shipment.
- All the valves are installed & connected. Make sure installation inside the containers did not come loose during the shipment.
- After put the system to manual mode, Check rotation of all pumps (Bump Test).
- Control panel digital and analog wiring is completed. Make sure installation inside the containers did not come loose during the shipment.
- Verify panels have power and turn power on.

Prior moving to the next step, complete commissioning checklists for the supplied equipment, this can be found in separate SAT test.

Stage 2: System Start-up with Clean Water

Process Note:

It is important to procure/ arrange clean water prior start-up. Usually, the first start-up requires big amount of water. Three to five times the plant capacity is a good estimate as a starting point. This is the responsibility of the site/client.

1. Prior to introducing water, it is noted that all free chlorine must be removed as chlorine will severely hinder the microorganisms growth.
2. If none-chlorinated water is not possible to procure, a de-chlorination is essential. Prior introducing the wastewater, make sure there is no chlorine residual in the system.

Tanks Test and Start-up with Clean Water

1. Start by examining the aeration grid in Equalization Tank (TK-01-13), and Sludge Holding Tank (TK-02-01):
    a. Check the Air diffusion pipes inside the equalization and sludge holding tanks are connected properly and as per the detailed installation drawings.
    b. Check welding, distribution of pipes, holes etc.
    c. Confirm isolation valves are in proper order.
2. Make sure that the tanks are completely cleaned.
3. Fill the EQ (TK-01-13) and sludge holding tank (TK-02-01) with clean water in order to cover the air diffusers by 2 – 3 feet (60.0 – 90.0 cm).
4. Operate the air blowers (BL-04-02 and BL-04-01) and check the air pattern inside the tanks:
    a. The air diffusers should cover the entire tank area and evenly distributed to provide optimum mixing.
    b. Check if there is any leakage in the pipes, fittings etc.
5. If any problem found in the air diffusers/ aeration grid, it should be solved at this stage (repeat steps 1 to 4 until no issues found).

6. Fill the tanks to the design operating water level (side water depth (SWD)) or usually little below the high-high level switch. verify the aeration system integrity one more time.

7. Verify the positions of the level switches/ level sensor (if any) in all tanks.

MBBR Tanks (MBBR-03-01 and MBBR-03-02) Commissioning Procedure

1. Fill the water to the operating level.
    a. The system is designed based on design temperature between 7 – 20 °C. *It is noted that lower water temperature than design temprature will significantly hinder the commissioning process.* Blower air introduction will raise the water temp over time.
    b. The maximum allowed water temperature should not exceed of 30 °C prior introducing to the tank with media.
    c. If influent temprature is lower, then client should supply immersion heater to raise the water temperature as long as it will not damage/ deform the media.
2. Run the air blower (BL-04-03) on manual mode on 100%. The heat generated from the blower will raise the water temp over time, if there is not heater present.
3. Continue aeration until good mixing is obtained, meaning visible movement of media on the surface.
    a. Good mixing is normally obtained after 2 to 3 days.
    b. During that time, make sure the water temprature stays within the design range. Blower air should keep the temperature in range.
4. If clumps persist for more than 3 days:
    a. Verify the second air blower (BL-04-04) can run with no equipment/ piping overheating.
    b. Whistling throughout the pipe can be an issue, hearing protection equipment is advised prior commencing this step.
    c. Run both blowers (BL-04-03/04) at the same time on manual mode, target 65% of maximum flow each. This will provide more air of around 30%.
5. If clumps are still observed for more than a week, a help of citric acid might be necessary. *Please contact H2Flow prior applying these steps:*
    a. Verify the second air blower can run with no equipment/ piping overheating.
        i. Whistling throughout the pipe can be an issue, hearing protection equipment is advised prior commencing this step.

ii. Run both blowers (BL-04-03/04) at the same time on manual mode, target 65% of maximum flow each. This will provide more air of around 30%.

b. Temporary plug the effluent of the tank (TK-03-07) in order to protect downstream equipment from overflowing.

c. Check the water level inside the tank and estimate the amount of water in the tank. Record that level and calculate the estimated volume.

i. At the start, ensure the tank level is maintained at 70% as the starting point, this level will be used to establish how much acid solution is to be added.

ii. Filling to the top at the end of the acid introduction procedure.

d. Raise the water temperature in the tank (MBBR-03-01 and MBBR-03-02) to 20 – 25 °C. This can be done with either introducing a heat exchanger or with brining hot water source:

i. The hot water from the hot water tank can be blended with another source of water. The maximum blended water should not exceed of 30 °C prior introducing to the tank with media. ***Don't introduce water higher than 30 °C into the system as this will damage the media and cause it to deform.***

ii. It is possible to use an immersion heater to raise the water temperature as long as it will not damage/ deform the media.

e. Prepare the citric acid:

1. Recommended concentration is 5% w/v; Please follow the following safety procedure:

i. Materials Needed:

- Citric acid.
- Distilled Water.
- Personal protective equipment (PPE): Gloves, safety goggles, and lab coat.
- A mixing container: Non-metallic, such as plastic or glass.
- Scale and measuring tools.
- Mixing rod or stirrer.

ii. Safety Precautions:

- Work in a well-ventilated area.
- Avoid inhaling the citric acid powder.
- Always add the solid to water, not water to the solid, to ensure even dissolution.

iii. Procedure:

- Determine the Amount of Citric Acid: The formula for dilution is based on the target solution's weight/volume (w/v) percentage:
- Weight of citric acid needed = Concentration (%) × Final Volume (mL) / 100

  Example: To prepare 1 liter (1000 mL) of 5% citric acid solution:

  Weight = 5 × 1000/100 = 50 grams
- Prepare the Mixing Container:

  Pour 950 mL of water into the container to allow room for the solid.
- Add Citric Acid:

  Gradually add 50 grams of citric acid to the water while stirring.
- Stir Until Fully Dissolved:

  Ensure the citric acid dissolves completely to create a clear solution.
- Adjust the Volume:

  Add water as needed to reach exactly 1000 mL (1 liter).

f. Take a water sample of known volume, record this volume and gradually add citric acid to the sample while measuring the pH to reach the range between 5 – 5.5. Record that volume of acid (or the final volume of water + acid then subtract the initial water volume).

i. For example, for a water of 1000 mL, a 100 mL of diluted acid was needed to reach the pH of 5.5.

ii. Then, for the tank (the volume is 2.93 m^3), it would be around 0.293 m^3 of diluted citric acid.

iii. We can use a temporary tank to prepare the required amount of citric acid solution that will be needed.

1. Isolate tank.
2. Drop pump from the top of the tank.
3. Pump to be lowered; the attached garden hose outlet to go back into tank instead of going into MBBR. This will allow proper mixing of acid.
4. Once done, the tank has to be flushed before commissioning full system, in consideration of effluent pH.

g. Slowly add the citric acid into the points (inlet, inspection hatches at both tanks).

i. Start by adding totally 25% of the needed volume.

ii. Allow 30 minutes to mix, measure the pH at several points in the tank. If it reads similar pH, continue adding the citric acid. If pH reads different, keep mixing and measure again until it is uniform.

iii. Once at 75%, need to slow down volume input to less than 25% increments to avoid dropping below 5.

h. If the final water level is less than the operating volume, keep adding water and acid until the water is almost at the outlet level. Ensure volume addition of water considers addition of acid to maintain 5.5 pH.

i. Measure the pH and make sure it stays within the range, replenish if necessary. The media should declutter within few hours to overnight soak (depending on the severity). Keep the blowers running all the time.

System Run through all Process Steps with Clean Water

- Check for proper voltage to each motor.
- Adjust the air valves as required for proper aeration. Operate each VFD in Hand mode and check for proper speed control of the blower motors.
- System will be put on the Auto Mode (except air blowers will require a manual override). *Run the system at the lowest flowrate as possible*. Clean water flows from Screw Screen, EQ tank, MBBR Pumps, MBBR tanks, Clarifier, UV Feed Pumps, and finally to Treated Effluent Pumps.
- Check for leakage in the interconnecting piping
- Make sure equipment and instrument are properly working together without any alarms.
- Run the system in the Auto Mode for an hour without mixing as blowers are off in override situation.

When there are no further issues with clean water, the WWTP is ready for wastewater.

Stage 3: System Start-up with Wastewater

Process Notes:

1. The time required for biofilm generation on carrier elements will vary depending upon type of wastewater, temperature and the biodegradability of the constitutes as well as the absence/ presence of toxic materials.
2. The biofilm will become more efficient and robust as time goes by. In general, it requires around one year of good operation to reach its maximum potential capacity.
3. Severe foaming is usually encountered in the initial phases of treatment:
    a. This disappears after some weeks of operation as the system gets acclimatized to the situation.
    b. It is noted that foaming does not hinder treatment (make sure to keep an eye over the MBBR media not to leave the tanks ((MBBR-03-01 and MBBR-03-02))).
    c. Cover all the holes/ pipes and vents with temporary screens to prevent media from escaping the tanks.
    d. An antifoam can be added if the foaming is severe. It is recommended not to add the defoamer at the start up as it will slightly interfere (in a negative way) with the commissioning.

SAFETY 

Follow all safety requirements as needed. The operator will be exposed to raw wastewater, activated sludge, and potentially hazardous chemicals.

If in doubt, *do not* proceed prior asking and clarifying all the points.

WARNING ⚠

Untreated wastewater and activated sludge are recognized as sources of pathogens (disease-causing organisms). Before proceeding, ensure you have received proper safety training, are equipped with the necessary safety gear, and are following provincial guidelines, OHS regulations, and all instructions outlined in Appendix A: Guidance for Reducing Health Risk for Workers Handling Sewage, page 25.

Some chemicals used in wastewater are extremely dangerous. Do not proceed without proper safety training, safety equipment, following OHS instructions as well as all instructions given by employer.

SLUDGE DEWATERING BAGS FROM SLUDGE SYSTEM SHOULD BE HANDLED AND DISPOSED OF AS PER APPLIACABLE LOCAL REQUIREMENTS.

Fresh Wastewater Start-up

This start-up procedure is the preferred method as it cultivates the same microorganisms in the wastewater, it takes longer period of time and is subject to fail if operated incorrectly.

Process Notes:

1. ***Prior to introducing the wastewater, ensure there are no toxins that may kill/ inhibit the bacteria. Confirm excess cleaners and biocides are not being used upstream.***
2. It is important to pass the wastewater throughout the pre-treatment process (i.e. screen (SCR-01-01 OR SCR-01-02) and equalization tank (TK-01-13)) prior MBBR (MBBR-03-01).
3. Set up the plant in a way to allow the wastewater to keep recirculating after the clarifier. Portable pumps may be used at this time, or insure continuous flow.
4. Ensure to have 200% of the required / calculated nutrients: for example, if the calculated required nitrogen in wastewater is 28 mg/L, ensure to have 56 mg/L.

The reactor will start as continuous mode targeting 80%-100% of the full flow; the sequence is as follows:

1. Set the plant to 80%-100% of the maximum design wastewater flow:
    a. Check BOD, COD, NH_4, Alkalinity, pH and TP of the wastewater daily (or as frequent as possible based on site conditions) (influent only).
    b. Keep the D.O. operating at 4 mg/L minimum ***at all times:***
        i. If the dissolved oxygen level in the bioreactor is less than 4 mg/L, increase the airflow.
        ii. At the start, it is normal to have elevated D.O. at start-up, as high as 14.0 mg/L. The D.O. will drop eventually as the microorganisms are getting acclimatized and activated. At a certain point, a huge dip in the D.O. may happen.
        iii. It is important to keep the air blowers running for the full aeration period. A manual override may be needed.
        iv. Foaming is most likely going to happen after two weeks of operation:
            1. Foaming is not a process problem.
            2. The aeration can be decreased if the foaming becomes a huge problem. Contact H2Flow prior decreasing aeration.

3. Foaming has to be monitored frequently during startup, by looking in to the reactor(s).
4. Foam inhibitor (chemicals) may be dosed during this period. Contact H2Flow prior adding any defoamer.
5. The foaming problem will decrease as the biofilm matures.

c. Ensure the pH is in the healthy range (pH 6.5 – 8):

i. Initially, the pH may drop down, this point is to be recorded.

ii. Correct the pH and check the alkalinity of the system.

iii. Another common problem is the pH may rise to alkaline values, correct the pH and check the alkalinity of the system. This point is to be recorded.

iv. If that happened, the pH will go through this cycle one more time, usually indicating that the system has fully acclimatized and ready for continuous operation.

2. After 5 hours:

a. Check the aeration pattern and make adjustments if required (an even distribution of the air over the whole reactor volume).

b. If the water level is increasing beyond screen spool outlet, stop the influent flow, lower the water level in the bioreactor and inspect the carrier retention screens.

c. Ensure that the carrier retention screens are clean and free from debris.

3. Repeat step 2 after 10 hours and 20 hours (from first introducing the wastewater).

4. If MBBR media are not completely mixed and/or accumulations of biofilm carriers are floating on top, increase the airflow until the biofilm carriers are completely mixed and there are no accumulations of carriers floating on the surface (check once a day minimum). The second air blower may be used as needed.

5. All treated effluent is to be sent to a temporary holding tank. That has to be hauled away and sent to a well-established plant. There is no temporary tank for this plant.

6. Repeat steps 1 to 4 until there is enough confidence that there are microorganisms on the media (usually it takes around 30 days) or if the dissolved oxygen level in the bioreactors reaches more

than 6 mg/L (whichever is earlier). ***Verify the visual inspection with influent and effluent BOD and COD analysis.***

a. Check if sludge started developing on the MBBR media, a sample from the aeration tank is required. A visual inspection to see if there are any signs of microorganisms on the media.

b. Collect and analyze the samples from ***both influent and effluent***:

1. If BOD doesn't meet the design criteria, stay in this stage until BOD meets the criteria.

2. If it met the criteria, check visually the difference between raw wastewater, biologically treated wastewater and clarified effluent.

7. Make the first increment in the flow:

a. After 5 hours, check visually the difference between raw wastewater, biologically treated wastewater and clarified effluent and compare between that and the one done earlier.

b. Repeat that visual check after 10, 24 and 48 hours. Note any potential difference as that would be a sign that the bacteria is getting washed out.

c. After 48 hours passes, collect and analyze the samples from ***both influent and effluent***:

i. If BOD doesn't meet the design criteria, stay at the set value in step 7.

ii. If BOD meets the criteria, increase the influent flow by 50%: for example, if the initial influent flow is 10% of the design capacity, it would be increased to 15% of the design capacity in the first increment, then to 22.5%... etc.

iii. Keep the D.O. operating at 4 mg/L minimum ***at all times***. Also, ensure to have the pH within 6.5 – 8.5 ***at all times***.

8. After adjusting the flow. Collect and analyze the samples from both influent and effluent.

9. Repeat steps 7 and 8 until 100% of the design influent flow rate is achieved. Total acclimation time will be site specific.

Notes:

1. COD can be used as a way to gauge the plant performance. However, these results should be always double checked with the BOD.

2. All drained wastewater should be sent to a temporary holding tank. This wastewater is to be hauled away as there is no way at site to treat that wastewater.

3. Nitrification may take a while to get fully commissioned. This is due to the fact that nitrifying bacteria are slow. It may take for nitrifiers up to 6 months to be fully functional.

4. The aeration must operate during the aeration period continuously in this stage in the aeration tank:

    a. It is normal to have foaming as the system is getting acclimatized. The foaming intensity, and color are to be recorded throughout the start-up and the entire operation.

    b. Turning the aeration system off may kill the sludge biology and complicate the situation.

Stage 4: Full System Run-through and Final Functional Test

Forward Flow with Wastewater – Run through all Process Steps

- System will be put on the Auto Mode. Raw wastewater flows from screw screen, through EQ tank (TK-01-13), MBBR tanks (MBBR-03-01 and MBBR-03-02) , Clarifier (CLR-03-03) , finally to effluent tank (TK-03-07) and UV (UVT-05-04/05).
- Make sure equipment and instrument are properly working together without any alarms.
- Take samples from raw wastewater, screened wastewater, after EQ, after MBBR and after clarifier daily.
- Record online oxygen sensor (AE-03-57), check aeration tank, frequency regulated blower, level transmitter… etc. This step is to be kept for at least the first year. There should be a log-book which all the data and observations are written down on a regular basis.
- Operators' training happens at this stage.

Activity	Frequency	Comment
Log-book: - Operator should walk around and if possible, take instrument reading manually; this will give you a quick indication if something is not right. - Document and analyze results.	Every day	It is imperative to document all actions which may affect the treatment plant. Keep the log-book safe and clean. Keep all records (pre-start-up, start-up, and everyday activity).
Air distribution in Aeration Tank and condition of media / wastewater mixing	Every day – first year Twice a week after	
Cleaning of DO-online instrument.	Once a month	The D.O. control the air blower. Cleaning the D.O. frequently ensure correct aeration throughout the system.
Cleaning of pH-online instrument.	Once a month	Check if calibration is needed.

Sampling and Effluent Monitoring

- There are not any online analyzers to monitor the effluent quality. Discharge quality and process effectiveness should be monitored through scheduled samplings.
- H2Flow recommends effluent sampling frequency should be once a day for the first year of successful commissioning. This can be reduced to minimum twice a week afterwards.
- BOD, un-ionized ammonia, TSS, total and fecal coliform should be monitored and also any other parameters that local environmental monitoring agency asked for.
- Sampling and analysis of those samples should be done by a trained technician. Customer or system operator should form a contract with wastewater quality assessment laboratory and check what are the requirements of the sample.

Spill Management Inside the Container

Each compartment of containers has floor drains. Any leakage or drained wastewater will be collected through floor drain and then directed to the lift station upstream.

Appendix A: Guidance for Reducing Health Risk for Workers Handling Sewage

Introduction

The presence of pathogens in wastewater, whether it is in its raw or treated form, poses a potential risk. These guidelines are applicable to various individuals and situations, including but not limited to:

1. Employees (including temporary ones) working at sewage treatment plants (where municipal wastewater is processed).
2. Employees working at sewage treatment plants where municipal wastewater is processed.
3. Personnel responsible for managing and dealing with biosolids. This includes workers at the plant, visitors to the facility, and individuals involved in the transportation of biosolids.
4. Visitors to sewage treatment plants.
5. Laboratory staff members who handle samples of untreated or treated effluents and biosolids.
6. Plumbers, irrigators, and other individuals engaged in maintenance tasks related to wastewater systems.

Sources of Hazards in Sewage

The sources of hazards in sewage can be primarily categorized into two sources:

1. Biological Hazards: commonly referred to as "pathogens": they are organisms that have the potential to cause diseases in humans. This includes viruses, bacteria, protozoa, and other similar microorganisms. The guidelines provided here specifically address the risks associated with human exposure to these biological hazards.
2. Chemical Hazards; usually are found at the plant upstream. This includes, but not limited to methane, carbon monoxide, hydrogen sulfide and ammonia. Sewage may also contain harmful chemicals, such as solvents, organic chemicals, heavy metals… etc.

The primary routes of exposure are absorption (by either skin or contact), inhalation, or ingestion.

Employer's Responsibilities

- Ensure the implementation of safe work practices and provide necessary information, instructions, training, and supervision to employees. This includes, but not limited to mandatory Occupational Health and Safety training.
- Foster a culture of consultation and cooperation among workers.
- Provide personal protective equipment (PPE) and establish systems for inspecting, maintaining, cleaning, and storing PPE.
- Offer or support occupational immunizations based on risk assessment:
    - Develop vaccination recommendations or prerequisites for workers exposed to sewage or human waste in collaboration with local health authorities.
    - If local authorities do not have specific recommendations, follow the guidelines provided by the Centers for Disease Control and Prevention (CDC):
        - Tetanus (up to date).
        - Polio.
        - Typhoid fever.
        - Hepatitis A and Hepatitis B.
    - Consult with a qualified health and safety professional to create site-specific worker health and safety plans.
- Ensure the provision of hand washing facilities, showers, change rooms, equipment storage areas and eating facilities. For workers in the field, provide portable sanitation equipment with clean water and soap.
- Provide appropriate labels and warning signs.
- Provide first aid supplies and offer first aid training based on the risk level.
- Ensure the provision of separate areas for storage of clean and contaminated equipment.
- Establish clear procedures for reporting incidents, injuries, and diseases. Develop and implement policies and operational procedures for managing and handling hazardous materials.

- Provide eye wash stations in splash hazard areas or areas where chemicals are handled.

Training

The employer has the responsibility to ensure that all workers, including operators and site visitors, receive adequate and regular training. This training should cover the following information:

- Proper hygiene practices and the reasons behind their importance.
- Safe work practices related to human effluent, biosolids, and recycled water, relevant to the specific site.
- Appropriate use, storage, cleaning, and disposal of contaminated personal protective equipment (PPE) and other equipment.
- Procedures for reporting damaged PPE and other equipment, incidents, and potential work-related illnesses or symptoms.
- How to recognise the signs and symptoms of waterborne diseases and the necessary notification procedures.
- Evacuation and emergency procedures in case of fire or explosion risks in the workplace.
- Relevant confined space procedures, if applicable.
- Workers transporting sewage should be trained on how the truck operates, procedures to safely handle the product including methods for venting vacuum pump exhaust vapours and how to drive safely with hazardous materials.

The employer must ensure that this training is comprehensive and provided regularly to all individuals within their organization.

Personal Protective Equipment (PPE)

Employers have the responsibility to provide appropriate personal protective equipment (PPE) to workers based on the specific tasks they are performing. When working with human effluent, biosolids, or recycled water, the following PPE is typically required:

1. Liquid-repellent coveralls.
2. Enclosed liquid repellent shoes or rubber boots with non-slip soles.

3. Waterproof gloves: These gloves should be worn whenever handling pumps, filters, screens, effluent, recycled water, biosolids, or grit.

4. Eye protection must be worn at all times in situations where there is a risk of exposure to dust, flying particles, or splashes. This includes, but not limited to goggles and face mask/ shield.

5. In certain circumstances, such as when dealing with raw sewage or confined spaces, additional PPE may be necessary. This can include, but not limited to, disposable or reusable respirators, and H_2S sensors. Air purifying respirators may be used to filter out particulates and/or gases. However, in confined spaces or areas with a risk of low oxygen levels, an air supplied respirator may be required.

Any other PPE that is identified as necessary during the risk assessment process should also be provided.

Workers' Responsibilities

General

Workers handling human waste or sewage are expected to adhere to certain requirements and responsibilities to ensure their own safety and the safety of others. These include:

- Following safe systems of work as directed by the employer: Workers should comply with the established procedures, protocols, and guidelines provided by the employer for handling human waste or sewage.
- Using personal protective equipment (PPE) as trained: Workers must utilize the provided PPE, such as gloves, eye protection, or respiratory protection, in the manner instructed during their training. This ensures they have appropriate protection against potential hazards.
- Reporting hazards or work-related injuries or illnesses: If workers identify any hazards, work-related injuries, or illnesses, they should promptly report them to their employer. This allows for appropriate actions to be taken to mitigate risks and ensure the well-being of the workers.
- Avoiding actions or omissions that may present hazards: Workers are responsible for their own safety and the safety of others. They should avoid any actions or omissions that could potentially create hazardous conditions or endanger themselves or their colleagues. This includes following safety protocols: such as complying with no smoking zones, maintaining awareness of their surroundings, and exercising caution throughout their work.
- Workers are responsible tell their medical practitioner about their work environment and seek further consult.

Basic Hygiene Practices

Workers should adhere to the following minimum practices to minimize health risks:

- Even with PPE, avoid (or minimize if not possible) direct contact with sewage or recycled water and unnecessary exposure to sprays and aerosols.
    - For example: use scoop/Beaker sampler to minimize direct contact with wastewater.
- Wash hands thoroughly with soap and clean water immediately after working and consistently throughout the work period.
- Maintain short fingernails and scrub them well with soap after work. Use nailbrushes if needed.
- Ensure hands are clean before eating, drinking, smoking, or using the toilet.

- Refrain from touching the face, mouth, eyes, nose, ears, genitalia, or open sores and cuts when handling sewage, biosolids, or recycled water.
- Before eating, remove work clothes, wash hands and face, and consume food only in designated areas away from sewage-contaminated areas.
- Keep open sores, cuts, lacerations, abrasions, and wounds covered with clean, dry bandages or waterproof dressings.
- Rinse eyes gently with drinking water if there is contact with sewage or recycled water.
- Remove work clothing at the end of the shift and, if possible, leave it at the workplace.
- Ensure the soles of boots are clean to minimize the spread of biosolids beyond the designated application areas. If possible, remove the boots before leaving the worksite.
- Keep work clothes separate from other clothes.
- Whenever feasible, launder and store work clothes separately.
- Clean work clothing daily using a 0.05% chlorine solution (1 part bleach to 100 parts water).
- Clean work tools after use.
    - Wipe down any submerged cables and hoses with an antibacterial solution when retracting them.
    - Sanitize door handles, controls, keyboards/mice and work surfaces.
- Shower after work and change into clean clothes before leaving the work area.
- Do not smoke or chew tobacco or gum while handling human waste or sewage. Minimize talking as well.

Work related symptoms

Workers should visit the medical practitioner if they have one or more of the symptoms below:

- ➔ Cramping stomach.
- ➔ Fever.
- ➔ Nausea.
- ➔ Diarrhoea.

- ➔ Vomiting.
- ➔ Yellowing of the skin.
- ➔ Symptoms of breathlessness, chest tightness and wheezing.
- ➔ Redness and pain of the eyes.
- ➔ Skin rash and/or pain.

Workers are required to follow the reporting protocol provided by the employer and follow the guidelines provided by the employer and medical practitioner.

Appendix B: Seeding Guidelines with Wastewater Available

MLSS from RAS (mg/L)	Required RAS Volume (m^3)	Required *WASTEWATER* Volume (m^3)	Final MLSS Concentration (mg/L)

Notes:

1. It is highly recommended to get sludge from MBR RAS.
2. For any values in between, use linear interpolation.

Notes:

1. It is highly recommended to get sludge from MBBR RAS.
2. For any values in between, use linear interpolation.
3. It is important to verify that the prepared wastewater will have the healthy pH (range 6.5 – 8.5)
4. For continuous operation with no wastewater during commissioning, please follow the same increment given in Appendix B: Seeding Guidelines with Wastewater Available, page 33. Keep in mind the following:
    a. Always make sure to have 100 C:8 N:2 P ratio; i.e. if the required BOD is 300 mg/L, then nitrogen should be 24 mg/L and phosphorous is 6 mg/L. This is during commissioning only.
    b. Recall the following ratios:
        i. Minimum C : N : P ratio at all time is 100 C: 4 N: 1 P (during plant operation).
        ii. 1 kg of micro-C yields 0.5492 kg of BOD.

iii. 1 kg of urea (at 100%) yields 0.466 kg of Nitrogen.

iv. 1 kg of phosphoric acid (at 100%) yields 0.316 kg of Phosphorous.

v. 1 kg of sodium bicarbonate (at 100%) yields 0.595 kg of alkalinity as $CaCO_3$.

vi. 1 kg of Nitrogen requires 7.14 kg of alkalinity as $CaCO_3$.

vii. It is recommended to have final alkalinity in the effluent of a minimum of 80 mg/L as $CaCO_3$.

Appendix D: MBBR Start-up Troubleshooting

MBBR Toxicity:

Microbial Toxicity due to Chemical Inhibitors

Chemical inhibitors may enter the system from various sources, including industrial discharges, cleaning agents, or even accidental spills. These chemicals can inhibit microbial activity, affecting the biofilm's ability to degrade organic matter. The most common ones are chlorinated compounds, biocides and other industrial chemicals (such as solvents and surfactants).

Remedy:

Check with chemical suppliers about alternatives. Prevent these chemicals from entering the wastewater.

Oil Spells

Oil coats the biofilm carriers, blocking substrate and oxygen from reaching microorganisms.

Remedy:

Prevent the source is the best option. If not possible, Install Oil-Water Separators, Coalescing Filters, or add pre-treatment.

Sulfide Toxicity

The most common toxicity source in MBBR is sulfide formation. Sulfide may originate from outside the system, from septic influent wastewater or from septage disposal, or when no enough dissolved oxygen in the system.

Remedy:

Add alkaline agent (try to avoid lime) to the aeration basin to raise the pH to 7.5 or above if sulfide toxicity is occurring.

Low pH Toxicity

Low pH happens when extensive nitrification combined with low wastewater alkalinity.

Remedy:

This can be solved by reducing aeration and/ or add alkaline agent.

Foaming

Foaming is one of the most common problems seen with the MBBR operations.

Foam Description	Cause(s)
Thin, white to grey foam	Low cell residence time or "young" sludge (startup foam)
White, frothy, billowing foam, stable with a creamy texture	Nonbiodegradable detergents/ surfactants in wastewater.
Light-colored and fluffy, resembling shaving cream combined with a yeasty or musty odor.	Biological imbalance in the microbial community or excessive growth of filamentous bacteria. Insufficient mixing or aeration in the MBBR system.
Thick, pasty or slimy, greyish foam	Insufficient nutrients.
Thick, brownish foam with a foul odor	High organic compounds in the influent wastewater. High fats, oils, and grease (FOG) values. Incomplete degradation of organic matter by microorganisms due to overloading shock.
Dense, stringy foam with a spiderweb-like appearance.	Overgrowth of filamentous bacteria, such as Microthrix parvicella, Nocardia spp. Presence of surfactants or organic compounds that promote the growth of filamentous bacteria.
Thin, white foam on the surface of the MBBR reactor or in downstream process units	Hydraulic surges or fluctuations in flow rate within the MBBR system. This foam dissipates relatively quickly once hydraulic conditions stabilize.
