Problem	Serious code	Cause	Solution	Precaution
The unit does not start	F	Electrical wiring incorrect	The electrical connection has to be checked by a technician referring to the wiring diagram contained in the terminal board box	Turn off the power to the electrical system or set up a system that avoids reinsertion
	F	Power supply voltage unsuitable	Check that the power supply voltage, measured at the motor terminals, is within +/- 10% of the rated voltage	Use PPE against the electrical hazards
	G	The impeller is stuck	Call FPZ assistance to repair the unit	
No or insufficient air flow	G	The suction filter is clogged	A specialized operator (see MAN_PIC) has to clean or replace the cartridge	Avoid entering foreign bodies into the unit
	G	Wrong frequency (for units powered through an inverter)	Correct the frequency	Check the rating plate
	G	Profile of the impeller blades modified (due to deposits on the profile)	Call FPZ assistance personnel to check the impeller	
No or insufficient pressure differential	F	Incorrect direction of rotation	The direction of rotation has to be inverted by a specialized operator (see MAN_PIC) switching two of the electrical power supply wires.	Turn off the power to the electrical system or set up a system that avoids reinsertion
	G	Leaks in the plant	Locate the leak and seal	Use proper sealants
Current absorption exceeding the admissible level	F	Electrical wiring incorrect	The electrical connection has to be checked by a technician referring to the wiring diagram contained in the terminal board box	Take off the power to the electrical system or set up a system that avoids reinsertion
	F	Drop in mains supply voltage	The power supply voltage has to be restored by a specialized operator (see MAN_PIC) at the terminals and at the established values.	
	G	The suction filter is clogged	The cartridge has to be cleaned or replaced by a specialized operator (see MAN_PIC)	Avoid entering foreign bodies into the unit.
	G	The unit has accumulated deposits inside	Call FPZ assistance personnel to clean the inside of the unit	Avoid entering foreign bodies into the unit.
	G	The unit is operating at a pressure and/or vacuum that exceeds the admissible level	Adjust the system and/or the regulating valve to lower pressure differentials.	Use appropriate PPE to operate near the unit
High delivery air temperature	G	The suction filter is clogged	Adjust the system and/or the regulating valve to lower pressure differentials.	Use appropriate PPE (surge protectors, gloves) to operate near the unit
	G	The suction filter is clogged	The cartridge has to be cleaned or replaced by a specialized operator (see MAN_PIC)	Avoid entering foreign bodies into the unit.
	G	The unit has accumulated deposits inside	The unit has to be cleaned inside by a specialized operator (see MAN_PIC).	Avoid entering foreign bodies into the unit.
	G	Suction and/or delivery piping obstructed.	Obstructions have to be removed by a specialized operator (see MAN_PIC).	Avoid entering foreign bodies into the unit.
	G	Suction air temperature exceeds 40°C (+104°F)	Use heat exchangers to reduce the suction air temperature	
Abnormal noise	F	The soundproofing material is damaged	Soundproofing cloth has to be replaced by a technician.	Avoid entering foreign bodies into the unit.
	G	The impeller scrapes against the casing. - The unit is operating at a pressure and/or vacuum that exceeds the admissible level	Reduce the pressure differentials in the plant	Use appropriate PPE (surge protectors, gloves) to operate near the unit
	G	- Reduction of assembly tolerances due to internal deposits (dust, impurities in the pipes, process residues, etc.)	The unit has to be cleaned inside by a specialized operator (see MAN_PIC).	Avoid entering foreign bodies into the unit.
	G	Worn bearing	Bearings have to be replaced by a specialized operator (see MAN_PIC).	
	F	Unit's installation position unsuitable	The unit has to be installed by a technician on structures that cannot transmit or amplify noise (tanks, steel plating, etc.)	Use proper anti-vibration and move the units according to local regulations

Abnormal vibrations	G	The impeller is damaged	The impeller has to be replaced by a specialized operator (see MAN_PIC).	
	G	The impeller has accumulated deposits	The unit has to be cleaned inside by a specialized operator (see MAN_PIC).	Avoid entering foreign bodies into the unit
	G	Unit anchored without anti-vibration insulators	The unit has to be anchored with anti-vibration insulators by specialized operator (see MAN_PIC).	Use proper anti-vibration and move the units according to local regulations
	F	Rigid connection to the plant	Flexible hoses between the unit and the piping have to be fitted by a specialized operator (see MAN_PIC).	Carry out the activity only if the unit is disconnected to the power supply.
	G	Bearing on the blower or motor side defective	Bearings have to be replaced by a specialized operator (see MAN_PIC).	

Leaks	G	Defective silencer gaskets	Gaskets have to be checked by a specialized operator (see MAN_PIC), and if necessary have to be replaced.	Avoid entering foreign bodies into the unit.
	G	Defective casing gaskets	Gaskets have to be cleaned by a specialized operator (see MAN_PIC), and if necessary have to be replaced.	Avoid entering foreign bodies into the unit.

Seriousness: F for functional fault and G for serious fault.

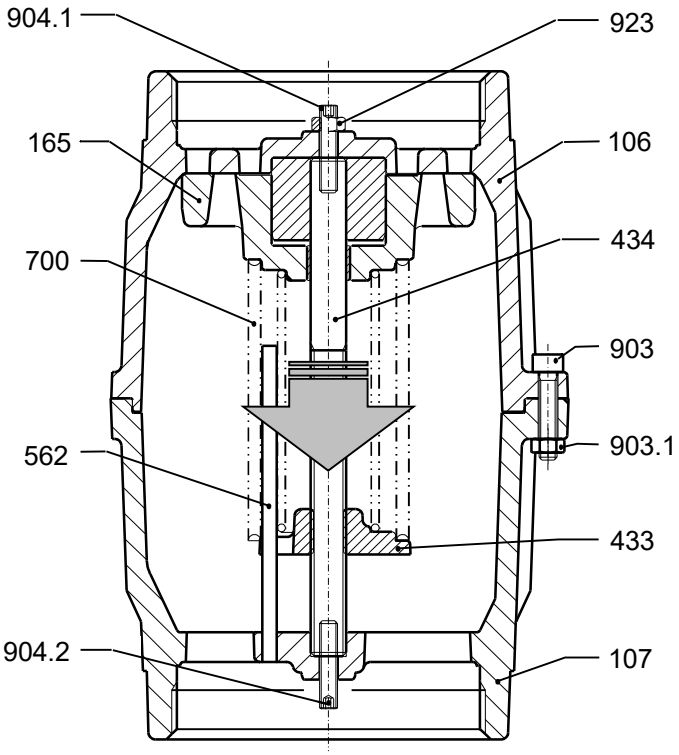
SAFETY VALVE VRL USE INSTRUCTIONS

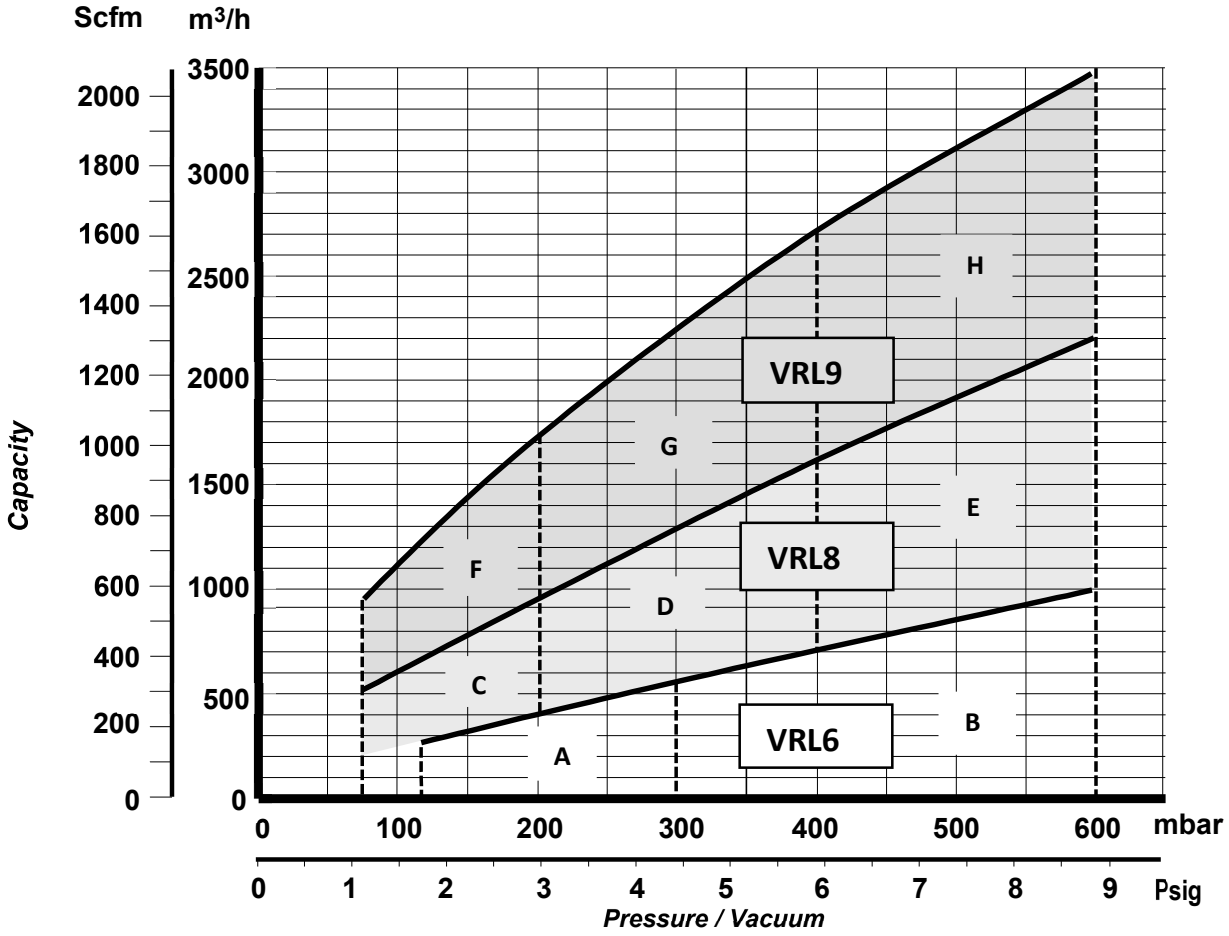


CAUTION! THE VALVE IS SUPPLIED NOT CALIBRATED

PLEASE READ CAREFULLY ALL INSTRUCTIONS AND KEEP THEM FOR FUTURE REFERENCE

VRL6
Fig. 1a

VRL8 - VRL9
Fig. 1b



Description

106	*Housing*	700	*Spring*
107	*Cover*	903	*Screw*
165	*Shutter*	903.1	*Nut*
433	*Spring guide disc*	904.1	*Upper grub screw*
434	*Shutter guide*	904.2	*Lower grub screw*
562	Dowel pin	923	*Nut*

GB CONDITIONS OF USE

- ***THE VRL VALVES ARE DESIGNED FOR THE HANDLING OF AIR OR NON-EXPLOSIVE, NON-HAZARDOUS AND NON-FLAMMABLE GASES IN NON-EXPLOSIVE ENVIRONMENTS. THE GAS INLET TEMPERATURE MUST BE IN THE RANGE OF -15 TO +160 °C.***
- ***RELIEF VALVES ARE DESIGNED AND MANUFACTURED TO LIMIT THE OPERATING PRESSURE IN LOW PRESSURE/VACUUM APPLICATIONS. THEY ARE FOR USE SPECIFICALLY ON LOW PRESSURE BLOWERS AND VACUUM PUMPS ONLY;***
- ***THE VALVE CANNOT WITHSTAND HIGH INTERNAL PRESSURE, DESIGN MAXIMUM OF 2.8 bar A;***
- ***THERE IS SMALL LOSS OF THE AIR/GAS BEING HA***
- ***SOLID PARTICULES, HOWEVER SMALL, INCLUDING DIRT CAN CAUSE SERIOUS DAMAGE; THEREFORE IT IS ESSENTIAL THAT SUCH SUBSTANCES SHOULD BE REMOVED FROM THE GAS BY SUITABLE FILTERS UPSTREAM OF THE INLET.***

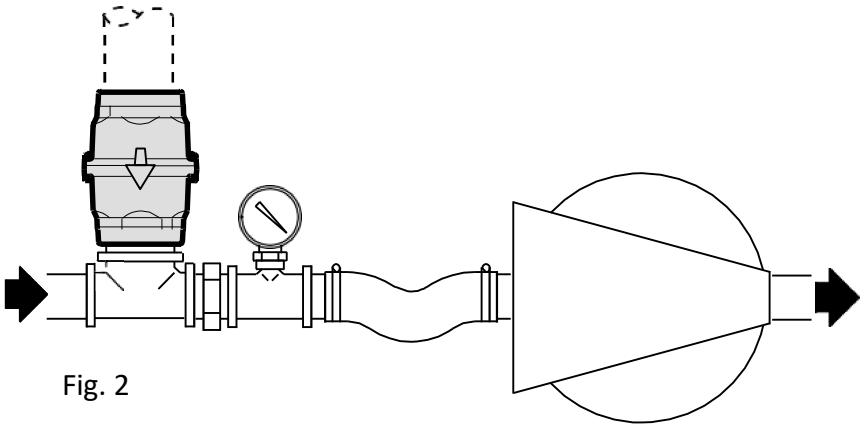

Fig. 2

INSTALLATION SKETCH – VACUUM RELIEF VALVE

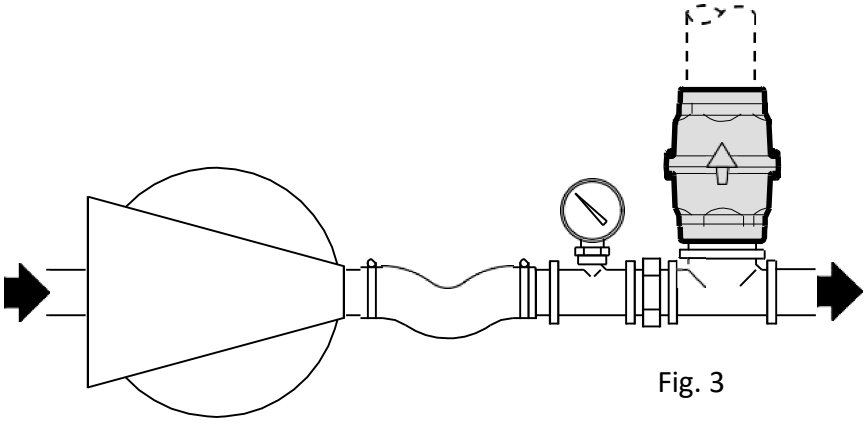

Fig. 3

INSTALLATION SKETCH – PRESSURE RELIEF VALVE

1. CHOICE OF SPRING

The valve is supplied with 2 different springs; each spring is to be used within a specific pressure-vacuum operating range. For the VRL8 and VRL9 there is the possibility to use both springs working in parallel.
Referring to the SELECTION DIAGRAM, check that the valve is correctly sized and depending where the operating point (area A, B,…H) is located, choose one or two springs according to SPRING SELECTION CHART.
The valve is supplied with spring # I installed. If spring needs to be replaced or a supplementary spring is needed to be added (for VRL8 / VRL9), proceed to point # 2 otherwise, adjust valve as per point #3.

2. INSTRUCTIONS FOR SPRING REPLACEMENT (OR MOUNTING ADITIONAL SPRING FOR VRL8 / VRL9)

- Remove the two plastic caps on valve.
- **Ensure stop-nut 923 is locked on the upper housing 106.**
- Unscrew screw 903 from nut 903.1.
- Remove cover 107 from housing 106.
- Unscrew spring guide disc 433 taking it out from shutter guide 434.
- Remove spring 700 (only in case of replacement).
- Install the appropriate spring into shutter 165.
- Compress spring and screw spring guide disc 433 on shutter guide 434 for at least 20 full thread terms
- Check that both ends of the spring are properly positioned within their seats.
- Install the cover 107 on the housing 106 inserting:
  - for VRL6: the sliding guide on the slot in spring guide disc 433
  - for VRL8 and VRL9: dowel pin 562 on the slot in spring guide disc 433.
- Tighten screw 903 on nut 903.1

3. VALVE SETTING

A) Setting-up at allowed vacuum level

- Remove the two plastic caps on valve, if any.
- Position valve on the suction by-pass and connect a vacuum gage as close as possible to the exhauster inlet (Fig. 2).
- Unscrew nut 923.
- Relieve spring tension by backing off upper grub screw 904.1 with the fit key.
- Turn on exhauster. Induce highest attainable vacuum by throttling air intake upstream relief valve (normally reducing throttle to fully-closed).
- Adjust upper grub screw 904.1 until maximum allowable vacuum level is reached.
- Tighten nut 923 keeping blocked upper grub screw 904.1.
- Open suction line.

Double-check vacuum gauge to ensure no additional losses are induced by pipes or filters installed upstream relief valve

B) Setting-up at allowed pressure level

- Remove the two plastic caps on valve, if any.
- Remove nut 923 from upper grub screw 904.1 and place it on to the lower grub screw 904.2. Do not tighten.
- Position valve on the discharge by-pass and connect a pressure gage as close as possible to the blower outlet (Fig. 3).
- Relieve spring tension by backing on lower grub screw 904.2 with the fit key.
- Turn on blower. Induce highest attainable pressure by throttling air discharge downstream of the valve (normally reducing throttle to fully-closed).
- Unscrew lower grub screw 904.2 until maximum allowable pressure level is reached.
- Tighten nut 923 keeping blocked lower grub screw 904.2.
- Open discharge line.

Double-check pressure gauge to ensure no additional losses are induced by pipes or filters installed downstream the valve

1. Safety Information

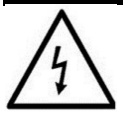
	This safety alert symbol in your manual and on the pump is intended to alert you to a potential risk for injury or death.
	This is a safety alert symbol identifying **risk of electric shock**. It will be accompanied with an instruction intended to minimize your potential risk of electric shock.
	This is a safety alert symbol identifying **risk of fire**. It will be accompanied with an instruction intended to minimize your potential risk of fire.
	This is a safety alert symbol identifying **risk of injury or death**. It will be accompanied with an instruction intended to minimize your potential risk of injury or death.
⚠ DANGER	Warns of hazards that **will** cause serious injury or death.
⚠ WARNING	Warns of hazards that **can or will** cause minor or moderate injury.
⚠ CAUTION	Warns of hazards that **can** cause personal injury, death, or property damage.
NOTICE	Signals an important instruction related to the pump. Failure to follow these instructions could result in pump component failure, or improper operation of the unit, possibly resulting in property damage .

⚠ WARNING



RISK OF ELECTRIC SHOCK - Accidental contact with electrically live parts, items, fluid, or water can cause serious injury or death.

- ALWAYS disconnect the supplied pump(s) from their power sources before handling or making any adjustments to either the pump(s), the pump system, or the control panel.
- Only qualified personnel should complete fixed wiring and electrical connections, according to all local and national electrical codes, during a pump system installation.
- After installation, be certain that the pump is properly grounded, using its supplied grounding conductor. Failure to properly ground the pump system can cause all metal portions of the pump and its surroundings to become energized.
- During flood conditions, submerged electrical connections can energize the water. Always wear dielectric rubber boots and other applicable Personal Protective Equipment (PPE) when water is on the floor and you must service an energized pump system. DO NOT ENTER THE WATER if the water level is higher than that of the protection your PPE offers or if your PPE is not watertight.
- NEVER lift or carry a pump or a float assembly by its power cord. This will damage the power cord, and could expose the electrically live wires inside the power cord.
- DO NOT bypass grounding wires.
- The electrical power supply shall be located within the length limitations of the pump power cord, and for below grade installations it shall be at least 1.22 m (4 ft) above the floor level.
- NEVER use this product in applications where human contact with the pumped fluid is common (such as swimming pools, fountains, marine areas, etc.).

©Copyright 2017 Liberty Pumps Inc. All rights reserved.

WARNING

RISK OF ELECTRIC SHOCK - continued

- During construction, if the pump system is installed before its power cord can be plugged in or direct wired, all power cords must be protected from the environment to prevent water from wicking through the cord end into the pump or switch housings. If water enters these housings, an electrical short can occur from the pump or switch to its surroundings, which will energize the surroundings.

WARNING

RISK OF FIRE

- DO NOT use an extension cord to power the product. Extension cords can overload both the product and extension cord supply wires. Overloaded wires will get very hot and can catch on fire.
- This product requires a separate, properly fused and grounded branch circuit, sized for the voltage and amperage requirements of the pump, as noted on the nameplate. Overloaded branch circuit wires will get very hot and can catch on fire.
- NEVER use this product with or near flammable liquids. If the rotating elements inside this pump strike any foreign object, sparks may occur. Sparks could ignite flammable liquids.

WARNING

RISK OF SERIOUS INJURY OR DEATH

- This pump system must be installed in accordance with all applicable codes and ordinances.
- DO NOT allow children to play with the pump system.
- DO NOT allow children, or any person who is unqualified, to use this pump system. Any person who is unaware of the dangers of this pump system, or whom has not read this manual, can easily be injured by the pump system.
- Wear adequate PPE when working on pumps or piping that have been exposed to wastewater. Sump and sewage pumps often handle materials which can transmit illness or disease upon contact with your skin and other tissues.

NOTICE

- NEVER dispose of materials such as paint thinner or other chemicals down drains. Doing so could chemically attack and damage pump system components and cause product malfunction or failure.
- DO NOT use pumps with fluid over 40°C. Operating the pump in fluid above this temperature can overheat the pump, resulting in pump failure.
- DO NOT use pump system with mud, sand, cement, oil or chemicals. Pump and system components can be damaged from these items causing product malfunction or failure. Additionally, flooding can occur if these items jam the impeller or piping.
- DO NOT modify the pump system in any way. Modifications may affect seals, change the electrical loading of the pump, or damage the pump and its components. Modifications can void your warranty on this product.
- DO NOT run this pump system dry.

©Copyright 2017 Liberty Pumps Inc. All rights reserved.

2. General Information

These pumps are to be used for handling septic tank effluent, sewage, and drain (storm) water. X-Series pumps are CSA Certified to UL778 and CSA C22.2 no. 108, and tested to FM standards for Hazardous (Classified) Locations.

Improper installation, use, or operation of products in a Hazardous (classified) Locations can result in explosion and fire. All components must be installed in accordance with best practices to minimize the possibility of ignition. All wiring and electrical installation shall be in accordance with Federal, State, and Local codes by trained professionals.

The pump must be serviced at a qualified hazardous motor enclosure repair facility approved by Liberty Pumps. Any unauthorized field repairs voids warranty and hazardous location ratings. Contact Liberty Pumps at 1-800-543-2550 to locate the closest repair facility.

Table 1

Notes:

X-Series Grinder pumps require the use of a separate control panel. Panels designed for use with the X-Series pumps are available from Liberty Pumps, and standard models are outlined below.

Single phase pumps require the use of a panel-mounted start circuit consisting of a start and run capacitor and a motor start relay. These components are available as kits from Liberty Pumps. Please see the table below to identify the correct kit for the pump being controlled.

All models have a surface temperature (T) class rating of T4; if thermostat is not connected on three phase units, the temperature rating drops to T3. The float switches must be connected to an intrinsically safe circuit in the control panel. The minimum water depth for proper motor cooling shall be set at 13”.

The use of Non-Liberty panels on 3-phase pumps must have provisions for the thermostat that open the motor contactors in order to maintain the T4 temperature class. Do not exceed voltage / current combinations for the thermostat: 16 VDC / 20 Amps, 115 VAC / 22 Amps, 277 VAC / 8 Amps, and 600 VAC / 4 Amps.

Table 2

©Copyright 2017 Liberty Pumps Inc. All rights reserved.

Seal Leak Detection:

All X-Series Grinder pumps are equipped with two mechanical face seals with an intermediate oil chamber between them. This ensures lubrication for the seals, shaft flame path, and as a barrier to the motor chamber in the event the lower seal should become compromised. A seal fail or moisture sensing device is located in the mid oil chamber and continuously monitors for leakage. In the event of a seal failure, moisture mixes with the oil tripping the seal leak circuit. In a failure condition, a fault light will illuminate and the pump will continue to run; service should be scheduled as soon as possible.

The ISS and ISD panels by Liberty Pumps have a seal leak test button that tests the integrity of the seal leak circuit continuity. When pressed, the light should illuminate. If it does not, either the light is burned out or the circuitry is open. The seal leak module is located inside the panel and requires adjustment upon installation. The seal leak relay adjustment dial should be set to 75; for best results turn the dial until the light turns on around 125 then turn it back to 75.

Thermal Protection:

The X-Series Grinder pumps are protected from overheating by means of thermal switches located in the motors. For single phase (1ph) models, a hermetically sealed thermal overload device is mounted on the motor windings and wired directly in series with the motor's winding, interrupting power in a high heat condition. Three phase (3ph) models utilize two thermostats mounted in series directly on the motor windings. The thermostat circuit must be connected to a control panel which will stop power to the pump in a high temperature condition. Both single and three phase (1ph & 3ph) pumps are constructed with class F materials, with a maximum operation temperature of 311°F or 155°C. Failure to use the proper circuitry and connection of the thermostat will drop temperature class from T4 to T3 on three phase units.

Note: when connecting a X-Series Grinder pump to an existing control panel, make certain the panel is correctly sized for the pump. Many panels have a manual reset button for the thermostats on three phase units; this button must be pressed to reset the system after the pump has cooled. Single phase units automatically reset after the pump has cooled.

Control Panels:

All X-Series grinders shall be installed with controls equipped with correctly sized and adjusted overload protection devices. The control panel must be installed outside the hazardous area and appropriately isolated and sealed to prevent any potential ignition or explosion. Only approved controls that have intrinsically safe float switch connections may be used for X-Series Grinder pumps. The control and power cables cannot be spliced; a junction box may be used providing it is rated for hazardous locations and has approved cord connectors.

Pump Installation:

When connecting an explosion-proof pump in hazardous locations using a rail system, it must be of a non-sparking type design. Contact Liberty Pumps for available models such as GR20NS.

The water level in the sump is determined by the placement of the control floats and should be positioned such that the pump is completely submerged; if submersion isn't possible, the minimum water depth shall be no less than the depth defined from the bottom of the pump legs. The upper water level should be positioned to minimize pump starts. The alarm float shall be above the turn on float switch but below any inlets. No control should be set above the inlet to the sump.

After the pump(s) have been mounted and the cover sealed, install the remaining discharge line. Piping above the cover should include a union to facilitate pump removal. A check valve is recommended after the union to prevent the backflow of liquid after each pumping cycle. A gate valve should follow the check valve to allow periodic cleaning of the check valve or removal of the pump. The remainder of the discharge line should be as short as possible with a minimum number of turns, to minimize friction head loss. Do not restrict the discharge to anything smaller than the discharge connection of the pump. Larger pipe sizes may be required to eliminate friction head loss over long runs. Contact Liberty Pumps or other qualified person if there are questions regarding proper pipe size and flow rates.

3. Installation Instructions

WARNING

RISK OF ELECTRIC SHOCK - Accidental contact with electrically live parts, items, fluid, or water can cause serious injury or death.

- Always disconnect the pump from its power source before handling.
- All electrical connections must be wired and grounded in accordance with the National Electrical Code and all applicable local codes and ordinances.
- Risk of electrical shock – Do not remove the power supply cord. All repairs and service must be performed by a repair facility approved by Liberty Pumps and certified to work on explosion proof motor enclosures.
- If power or control cord are damaged, or in need of replacement, contact Liberty Pumps for closest approved repair facility.
- All installations of pumps, controls, protection devices and general wiring should be done by a qualified licensed electrician. All electrical and safety codes should be followed for the National Electrical Code (NEC), the Occupational Safety and Health Administration (OSHA) and applicable local codes.
- Refer to articles 500 through 503 of the National Electric Code (NEC) for all electrical and wiring requirements in hazardous locations.

WARNING

RISK OF FIRE

- Risk of explosion or fire—hazardous locations contain explosive gases which can be detonated by sparking or electric shock.
- All terminations and penetrations of conduit or cable shall be done using approved materials and methods intended for use to mitigate the potential for explosion.
- All personnel shall be trained for safe work practices and procedures.
- All installations shall be in compliance with all applicable Federal, State, and Local codes for hazardous locations.

Electrical Installation Procedure

1. Verify that the pump model and control panel are the correct configuration and voltage. If using Liberty control panel, confirm that the panel is sized appropriately for the pump being controlled. See Table 2.
2. Terminate the leads for the power and control cords from the pump to the appropriate terminal blocks in the control panel. Reference wiring diagrams on the following page and control panel schematics provided with panel.
3. Install and wire the start relay and capacitors in the control panel. Refer to panel schematics for the proper connections.

©Copyright 2017 Liberty Pumps Inc. All rights reserved.

4. Connect the leads for the seal leak detection and the thermal overloads (3-phase models) to the panel. Proceed to set the seal leak relay by rotating adjustment clockwise until LED turns red, then turn adjustment counter clockwise slightly until LED has just changed back to green.
5. Route float wires and terminate to the corresponding terminals on the intrinsically safe (IS) barrier.
6. With main power disconnected, connect the pump power and control power to the panel according to schematics provided. Be certain that the power available will work with the power required by the controls and the pump.
7. With all electrical connections complete and secure, turn on power and verify operation of the pump, floats, and alarm circuits.
8. Verify that the rotation of the pump is in the correct direction as shown in figure 1. If correct, proceed to step 9.
9. If rotation is incorrect for a 3-phase pump, switch two power leads to the motor to reverse direction; for a single phase product please contact the factory.
10. Proceed with mechanical installation.
11. Route float wires and terminate to the corresponding terminals on the intrinsically safe (IS) barrier.
12. With main power disconnected, connect the pump power and control power to the panel according to schematics provided. Be certain that the power available will work with the power required by the controls and the pump.
13. With all electrical connections complete and secure, turn on power and verify operation of the pump, floats, and alarm circuits.
14. Verify that the rotation of the pump is in the correct direction as shown in figure 1. If correct, proceed to step 9.

⚠ CAUTION

CAUTION - Check 3-phase pumps for proper rotation prior to installing pump(s) in basin. To change rotation, reverse any two of the three power leads to the pump. Code the wires for reconnection after installation.

WARNING

RISK OF FIRE - When working in a hazardous location, all precautions to minimize ignition sources such as spark and flame should be minimized to limit the potential for fire or explosion.

- Use non-sparking components to mitigate the risk of spark and explosion in hazardous locations.
- All electrical terminations shall be made according to Federal, State, and Local codes for hazardous or classified locations.
- All mechanical penetrations to the basin by cables or conduit shall be made according to specification and best practices associated with hazardous locations.
- Conduit, junction boxes, and associated components shall be approved for use with hazardous locations and installed according to specifications.

WARNING

RISK OF ELECTRIC SHOCK - Always disconnect the pump from power source prior to handling, set-up, or maintenance.

Mechanical Installation Procedure

1. Record the pump model, serial number, manufacture date, and installation date on the front page of this manual.
2. Complete a visual inspection of the pump prior to installation. Address any loose fasteners and missing or damaged parts. Contact Liberty Pumps with any concerns.
3. Complete an inspection of the tank or basin where the pump will be installed. Remove any construction debris or foreign material from the vessel.
4. If the pump is to be installed using a guide rail and base, verify the installation is correct and that all mounting hardware is tight.
5. Mount the guide rail claw components to the pump, being certain to tighten all fasteners as specified. Be sure all gaskets and components are present.
6. For installations not using a guide rail, complete all pump mounted plumbing at this time being sure to use all necessary sealants and hardware.
7. Place pump in basin, being sure the mounting interface (guide rail, torque stop, etc.) is engaged correctly.
8. Verify that all plumbing components in the tank or basin are installed correctly and that they are functional. Validate that any valves are open and ready for pump use.
9. Set the floats heights to control pump operation. The minimum process fluid level for safe pump operation shall not be less than 13 inches.
10. Complete any final connections to the pump.
11. Engage power to panel and pump
12. Run several cycles of water through the system to verify correct control operation for the installation. Be certain to complete adequate testing, especially on systems with multiple pumps or custom control configurations.

©Copyright 2017 Liberty Pumps Inc. All rights reserved.

4. Maintenance and Troubleshooting

Troubleshooting:

Many common operation issues are outlined in the troubleshooting matrix at the end of this section. Use this resource to diagnose and solve common problems which may occur with the pump or system. If problems persist, please contact your Liberty Pumps authorized representative.

Maintenance:

The pump must be serviced at a qualified hazardous motor enclosure repair facility approved by Liberty Pumps. Any unauthorized field repairs voids warranty and hazardous location ratings. Contact Liberty Pumps at 1-800-543-2550 to locate the closest repair facility.

The pump must be pulled from the sump; prior to any service - disengage electrical power to the pump prior to performing any work.

⚠ CAUTION

CAUTION - Sewage water gives off methane and hydrogen sulfide gases which are poisonous. Proper personal protection equipment should be worn.

In the event the pump becomes clogged, the inlet screen can be removed to gain access to the pump's impeller. Once the obstruction is removed the anti air lock hole should be cleaned.

The lower shaft seal is field serviceable; a certified repair shop should perform this task because they have the capability to clean and flush the mid oil chamber.

This is the only work or maintenance that can be performed. All other maintenance or service such as cord replacement requires a certified repair shop. Contact Liberty Pumps at 1-800-543-2550 to locate the closest authorized hazardous duty motor repair shop.

***NOTE:** Liberty Pumps, Inc. assumes no responsibility for damage or injury due to disassembly in the field. Disassembly, other than at Liberty Pumps or its authorized service centers, automatically voids warranty.

⚠ WARNING

RISK OF ELECTRIC SHOCK - Accidental contact with electrically live parts, items, fluid, or water can cause serious injury or death.

Power cord and control cord replacement:

The power cord and control cord are not field replaceable. If either cord is compromised the entire pump must be brought to a qualified hazardous motor enclosure repair facility approved by Liberty Pumps. Any unauthorized field repairs voids warranty and hazardous location ratings. Contact Liberty Pumps at 1-800-543-2550 to locate the closest repair facility.

Problem	Cause	Correction
Pump will not run.	• Tripped breaker or other interruption of power; improper voltage.	• Reset breaker by pushing completely down on the handle then back to the on
		• Have an electrician check all wiring for proper connections and adequate voltage
	• Switch is unable to move to the “turn on” position due to interference with the side	• Position the pump or switch so that it has adequate clearance for free operation.
	• Insufficient liquid level.	• Make sure the liquid level is allowed to rise enough to activate switch(s).
	• Defective switch.	• Remove and replace switch.
	• Internal motor short.	• Requires an authorized service center.
Pump will not turn off.	• Switch(s) unable to move to the “turn off” position due to interference with the side of basin or other obstacle.	• Position the pump or switch so that it has adequate clearance for free operation.
	• Defective switch.	• Remove and replace switch.
Pump runs or hums, but does not pump.	• Stuck / defective motor contactor.	• Replace motor contactor in panel.
	• Discharge is blocked or restricted.	• Check the discharge line for foreign material, including ice if the discharge line
	• Check valve is stuck closed or installed backwards.	• Remove check valve(s) and examine for freedom of operation and proper installation.
	• Gate or ball valve is closed.	• Open gate or ball valve.
	• Total lift is beyond pump's capability.	• Try to route piping to a lower level. If not possible, a larger pump may be required.
	• Pump impeller is jammed or volute casing is plugged.	• Remove the pump from the basin. Detach the pump base and clean the area around the impeller. Reassemble and
	• Pump is air locked.	• Clear anti-air lock hole.
		• Add baffle to reduce entrained air bub-
	• Capacitor failure.	• Check caps and replace if needed.
Pump runs periodically when fixtures are not in use.	• Check valve was not installed, is stuck open or is leaking.	• Remove check valve(s) and examine for freedom of operation and proper installation.
	• Fixtures are leaking.	• Repair fixtures as required to eliminate
Pump operates noisily.	• Foreign objects in the impeller cavity.	• Remove the pump from the basin. Detach the pump base and clean the area around the impeller. Reassemble and
	• Broken impeller.	• Consult the factory for information regard-
	• Worn bearings.	• Return pump to the factory or authorized
	• Piping attachments to building are too rigid.	• Replace a portion of the discharge line with rubber hose or connector.
Seal fail light is illuminated.	• Lower seal has been compromised.	• Replace lower seal.
	• Relay sensitivity is incorrect.	• Decrease sensitivity by turning the dial. Proper range is 75 to 125.

5. 3-Year Limited Warranty

Liberty Pumps, Inc. warrants that its products are free from all factory defects in material and workmanship for a period of 3 years from the date of purchase. The date of purchase shall be determined by a dated sales receipt noting the model and serial number of the pump. The dated sales receipt must accompany the returned pump if the date of return is more than 3 years from the "CODE" (date of manufacture) number noted on the pump nameplate.

The manufacturer's sole obligation under this warranty shall be limited to the repair or replacement of any parts found by the manufacturer to be defective, provided the part or assembly is returned freight prepaid to the manufacturer or its authorized service center, and provided that none of the following warranty-voiding events have taken place.

The manufacturer shall not be liable under this warranty if the product has not been properly installed; if it has been disassembled, modified, abused or tampered with; if the electrical cord has been cut, damaged or spliced; if the pump discharge has been reduced in size; if the pump has been used in water temperatures above the advertised rating, or in water containing sand, lime, cement, gravel or other abrasives; if the product has been used to pump chemicals or hydrocarbons; if a non-submersible motor has been subjected to excessive moisture; or if the label bearing the serial, model and code number has been removed. Liberty Pumps, Inc. shall not be liable for any loss, damage or expenses resulting from installation or use of its products, or for indirect, incidental, and consequential damages, including costs of removal, reinstallation or transportation.

THE WARRANTIES SET FORTH ABOVE ARE IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING WITHOUT LIMITATION, ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, AND ALL SUCH OTHER WARRANTIES ARE HEREBY DISCLAIMED AND EXCLUDED BY LIBERTY PUMPS, INC.

Section 3.3.4

Level Switch

Ktech INDUSTRIAL PRODUCTS INC.

Model FS401 Overfill Protection Device Installation Instructions
Part No.: FS401E-4

CAUTION: REFER TO INSTRUCTIONS BEFORE OPERATING OR SERVICING SWITCH.
Construction: ½" O.D. ss stem, 2" dia. 316 ss float, 2" NPT bushing, explosion proof J-box. Switch set-point distances are measured from the underside of the 2" NPT bushing to the center of the float at the level where the switch is activated. Switch set-point distances are not field adjustable. They are factory-set as specified on the purchase order. The contact arrangement may be changed from normally open (NO) to normally closed (NC) and vice versa. Turn over the float and return the stop collars to their original positions. If the contact arrangement is altered, use an ohmmeter to test that the switch operates correctly. Screw the float switch into the 2" NPT opening on top of the tank. The conductors are colour coded to identify each switch. The switch must be connected in series with a load.

DO NOT CONNECT THE SWITCH DIRECTLY ACROSS THE POWER SUPPLY.
The voltage / current product must not exceed the power rating.

Electrical Specifications

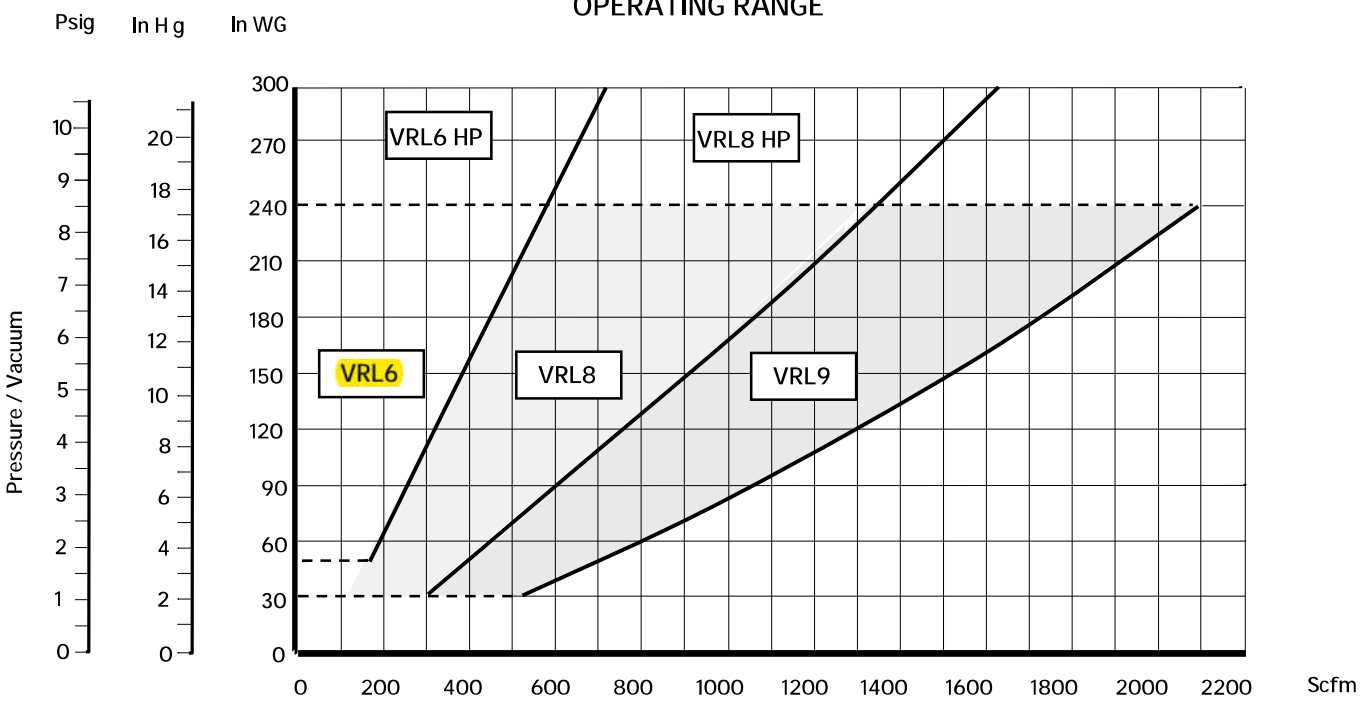
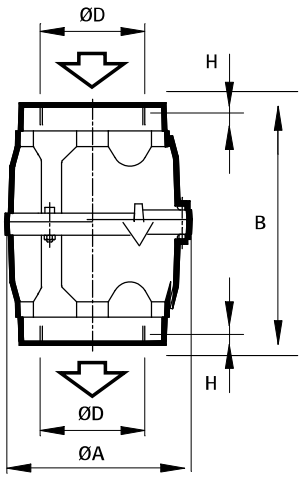
Safety Valves

SN 1733 -7 1/1

The VRL valves are designed to protect blowers and / or motors from over pressurization or excess vacuum. When there is over pressurization, the valve opens and discharges to the outside. When there is excess in vacuum, the valve opens and takes flow from outside.



The valves have been designed for low pressure / low vacuum, with minimal difference between the initial value at which the valve begins to open and its fully opened position. The valves are supplied with 2 different springs to maximize their efficiency.
These compact valves, made of aluminum alloy, are both easy to install and calibrate, and operate in a wide range of capacities.
The VRL can be plumbed to divert excess primary flow through a secondary external outlet when working in pressure conditions, or to pipe in a secondary flow when working in vacuum.
"HP" valves are used for pressures >240" H2O.



Maximum efficiency is achieved by keeping operating values (flow versus pressure or vacuum) within the operating range (shaded area on graph). Capacity refers to air having a density equal to 0.075 lbs./cu.ft .

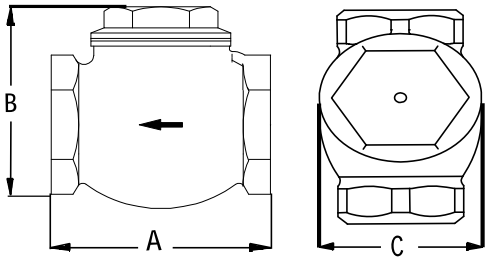
Gauges, Check Valves, Silencers, Enclosures

SS1708

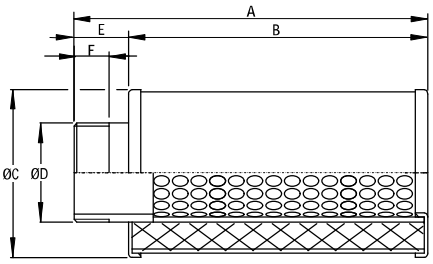
Gauges



Gauges are important for monitoring the operating pressure or vacuum of the blower. Gauges should be positioned as close to the blower as possible.

*				

Dimensions in inches. Tolerance on given values ± 10% - unbinding and can be changed without prior notice.
*

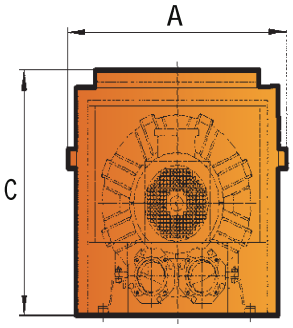


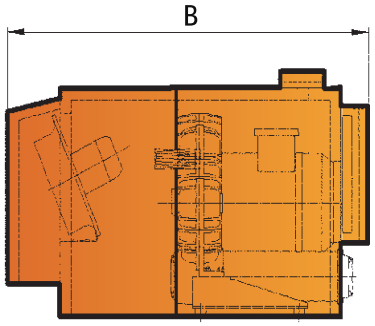
Check Valves

Swing check valves allow air to flow in one direction. These valves prevent backflow into the blower and are supplied in bronze or brass.

Dimensions in inches. Tolerance on given values ± 10% - unbinding and can be changed without prior notice.

Silencers





Silencers provide additional sound attenuation.

Dimensions in inches - unbinding and can be changed without prior notice.

Inlet Filters

SS1905

FPZ inlet filters are used for pressure applications. The inlet filters combine filtration and sound attenuation into a compact package. Inlet filters consist of a filter cartridge enclosed by a carbon steel weather hood. Elements are easily serviceable by simply removing the weather hood.

Dimension tolerance ± 1/8"

VG-020-013

FEATURES & SPECIFICATIONS

- Polyester: 99%+ removal efficiency standard to 5 micron. (Other media available upon request.)
- Fully drawn weather hood - no welds to rust or vibrate apart
- Tubular silencing design - tube is positioned to maximize sound attenuation and air flow while minimizing pressure drop
- Durable carbon steel construction with baked enamel finish
- Filter change out differential: 10"-15" H_2O Over Initial Delta P.

OPTIONAL DIRTY FILTER INDICATOR

The **VG-020-013** dirty filter indicator is used to maximize filter life for pressure applications only. The yellow indicator in the site window drops as dirt accumulates on the filter element. The element is ready for change out or servicing when the yellow indicator reaches the red zone. The filter condition can be determined without removing the weather hood even after the blower has been shut down.

The indicator can be mounted in the inlet piping between the blower and filter or directly to the filter housing by having a 1/8" npt tap installed in the hood. If a tap is required, FPZ part number **M020*** should be ordered.

Polyester Element	NPT	Dimensions (Inches) A	B	C	Used on Models	Approx Wt. Lbs
FS-15-050	½"	4	1 ½	6	10DL	2

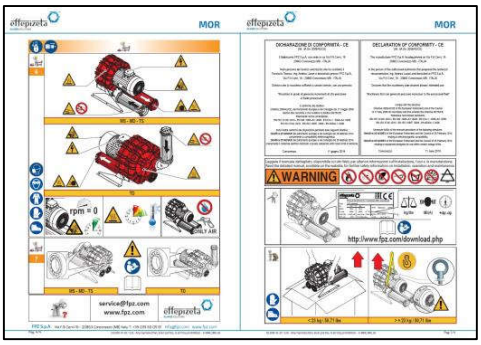
1 GENERAL INFORMATION

Read the manual for safety information on correct installation, operation and maintenance.

1.1 PURPOSE OF MANUAL

- The purpose of the manual is to complete the information contained in the *operative instructions* (Figure 1*)* supplied with the blower in order to give "instructions for use" to the skilled operator to prevent and minimize risks during the interaction between man and machine.
- For safe installation, carefully read this manual before installing the product and follow all instructions exactly as shown.
- The information was prepared by the manufacturer in the original language (ITALIAN) considering the content communication effectiveness for the interested parties also depending on the operator's qualifications and perspicacity.
- Keep the *operative instructions* (Figure 1*)* for the entire service life of the unit in a known and easy to access place to make it always at hand for reference.
- Any observations made by recipients can be an important contribution to improve the after-sales services provided by the manufacturer.
- The information contained in this manual is intended for use by specialized operators whose definition is contained in the document MAN_PIC (Figure 2).
- For electric components and motors that may be installed to the blower, please refer to the manuals of their own manufacturers.



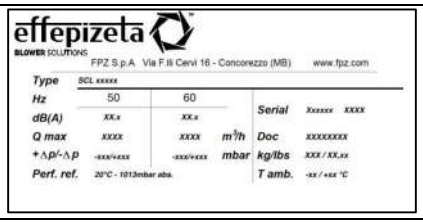


Figure 1 – *Operating Instruction*

Figure 2 - Document MAN_PIC

1.2 TECHNICAL DATA – NAMEPLATE

On the product nameplate are stated:

• Unit description • Performance (Noise [dB], Flow [m^3/h] and Pressure [mbar]) at 50 Hz and 60 Hz frequency referring to 20°C and 1013 mbar abs. • Serial number and year of manufacture • Reference Doc. (*Operating Instruction)* • Weight [kg/lbs] • Reference temperature for the working blower (T. amb.)	

It is strictly forbidden to remove or tamper with the product label.

1.3 TESTING, WARRANTY AND LIABILITY

Testing and inspection

- The entire unit is sent to the customer ready for installation, after passing the tests and inspections required by the manufacturer, in conformity with the applicable laws and the mandatory technical standards.

Warranty

- Warranties are defined in the general terms and conditions of sale.

Liability

- See document MAN_PIC.

2 SAFETY RULES

2.1 IMPORTANT SAFETY INFORMATION

WARNING	**The instructions listed below must be read carefully and become a fundamental part of daily procedures in the normal use and maintenance of all the equipment, in order to prevent any kind of personal or domestic animals (even serious) injury (or death) or damage to equipment.**

- Do not start the unit until its operation is clearly understood.
- All installation, commissioning and maintenance operations must be carried out by specialized operators only (see doc MAN_PIC).
- Keep the area around the unit constantly free of obstructions.
- Use appropriate PPE (Personal Protective Equipment) such as boots, gloves, goggles and work clothes.
- Pay attention to all danger and caution signs placed on the unit.
- Do not wear clothes, jewellery or accessories that can get caught in the cooling fan of the electric motor or that can be sucked into the blower.
- Do not modify the electrical connections on the unit.
- Observe all local, state and national electrical codes.
- Before starting the unit and/or with weekly frequency, the operator must check the efficiency of the devices that ensure the operation of the unit and any other unit defects. In case of any defects, immediately notify FPZ S.p.A.
- Devices that ensure the operation of the unit must never be removed or rendered useless.
- During maintenance or repair work, it may be necessary to exclude some mentioned devices from the service. This operation must be carried out by specialized operators only (see doc MAN_PIC).
- Always apply and enforce the safety rules; in case of any doubts, always consult this manual before acting.

WARNING	**Non-compliant installation with the unit's intended use can cause personal (even serious) injury (or death) or damage to equipment.**

The unit must only be started:

- in conformity with the purposes of use, transport and handling specified in "FORESEEN USE";
- respecting the values given in the nameplate data.

2.2 PROHIBITIONS

WARNING	**Failure to comply the following PROHIBITIONS can cause personal (even serious) injury (or death) or damage to equipment.**

- NEVER suck up and convey aggressive, corrosive, and/or harmful fluids.
- NEVER use the unit under conditions that differ from those indicated on the nameplate.
- NEVER use the unit without having installed a suction filter.
- NEVER operate with the suction and/or delivery openings closed.
- NEVER make conversions or changes to the unit, maintenance or repair work on one's own initiative or not envisaged in the manual. Maintenance work can be carried out only in compliance with what is described in this user manual, exclusively by specialized operators (see document MAN_PIC).
- NEVER use the unit in places where ATEX classification does not comply with Annex II of Directive 1999/92/EC.
- NEVER use the unit without having first installed and connected the sensors and/or regulators required to the plant and correctly installed and checked the seal system of the machine.
- NEVER use the unit with ambient temperatures below -15°C (+5°F) and above +40°C (+104°F).
- NEVER use the unit before ensuring correspondence between grid voltage and motor label voltage.

3 PROPER AND IMPROPER USE

3.1 OPERATING CONDITIONS

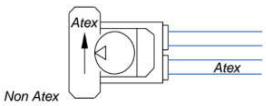
WARNING **Failure to observe the temperature, altitude, differential pressure and filtering modes for design and operation specifications there can be an impeller break which can cause personal (even serious) injury (or death) or damage to equipment .**

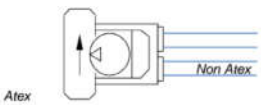
- The maximum permissible differential pressure indicated on the product nameplate must never be exceeded.
- It is important to install the unit at a maximum altitude of 1000 m (3300 ft.) above sea level, for higher altitudes contact FPZ.
- The unit is designed to operate at ambient temperature between -15°C (+5°F) and +40°C (+104°F).
- In case of suction in the environment or on the plant, protect the suction pipe using a suitable filter with a maximum degree of filtration of 25µm. Contact FPZ for filters with a different filtration degree. Check the compliance with the data of maximum pressure/vacuum listed on the nameplate. For ATEX blower we recommend an ATEX filter with a filtration degree of 20 µm / 25 µm.
- Installation, operation and maintenance of the blower must be carried out by specialized operators (see document MAN_PIC). Due to incorrect maintenance or an unauthorized modification, a non-compliant condition of use is determined, so the responsibility lies with the customer or end user.

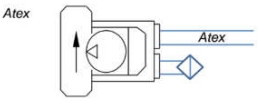
NOTICE If installed outdoors, protect the unit against exposure to sunlight and to atmospheric agents.
If the flow rate has to be reduced, use a draw-off valve rather than throttling back the suction or delivery lines.

3.2 STANDARD SIDE CHANNEL BLOWER

FPZ side channel blowers / exhausters are designed to generate vacuum and overpressure for conveying non-explosive, non-flammable, non-dangerous gases and air in continuous use in a non-explosive environment. Side channel blowers are not designed to transport dusts of any grain size.







FPZ side channel blowers / exhausters are designed and built for use in industrial plants and are equipped with three-phase or single-phase asynchronous bipolar electric motors in compliance with IEC 60034-1.

3.3 ATEX BLOWERS (Category 3GD – Category 2G)

Atex blowers are designed and built in accordance with 2014/34/UE Directive and European standards EN 1127-1, EN 80079-36, EN 80079-37, EN 14986, considering the compatibility of unit components with treated fluids (contact FPZ for components compatibility details). Accessories and monitoring systems linked to the unit have to be compliant with 2014/34/UE Directive.
It is recommended that the connections and suction and delivery pipes are in metal or antistatic material.

Units are group II devices for use in environments classified as explosive for the presence of Gas (G) zone 1/2 and/or Dust (D) zone 22.

- For motors that may be installed to the blower refer to the Atex complementary instructions of the motor manufacturer.
- In case the blower is disposed vertically, thus standing on the cover, foreign objects shall be prevented from falling into the ventilation openings. If necessary the motor can be provided of a fan cover with protecting canopy.
- If not specifically indicated, the ATEX label refers to the equipment “indoor” and “outdoor” area.
- In the case of a double indication separated by the “/” symbol, the first number indicates the “indoor” category (internal surface of the blower), the second number the “outdoor” category (outside of the blower, including the electric motor).
- The blower protection mode is constructive (“EX **c**”).
- Electric motors have different protection modes depending on the category and the environment they are designed for.
- All “2G” e “3/2G” configurations have explosion-proof motors (EX d protection).
- Classification of work zones:

1	Use of blower for conveying flammable gas	**Equipment with internal potentially explosive atmospheres, intended for use in areas that are not classified**	
2	Use of blower for conveying non-hazardous fluids in ATEX classified environment	**Equipment with internal non-explosive atmospheres and intended for use in areas that are classified**	
3	Use of blower with suction of ambient air and operating in a classified zone	**Equipment with internal explosive atmospheres, interfaced with process atmospheres and intended for use in areas that are classified**	

3.4 IMPROPER USE AND ASSOCIATED RISKS

WARNING **Non-compliance with the unit's intended use or with prohibitions/obligations can cause personal (also serious) injury (or death) or equipment damage.**

- Listed below are some improper uses, identified through risk assessment and experiences. Improper uses are subdivided according to the conditions that they may generate.
- The list is a non-exhaustive and representative example of improper use and associated risks.

IMPROPER USE	POSSIBLE CONSEQUENCES	RISKS
IMPROPER USE LINKED TO NORMAL OPERATION		
Absence of cyclic monitoring and control.	Anomalous operation not detected / hidden.	Risk of damage to the unit, with possible injury (or death) for the operator if present nearby.
Different installation with respect to manufacturer's suggestion.	Yielding / break of fastening points.	Risk of damage to the unit, with possible injury (or death) for the operator if present nearby. The unit may fall or be subject to damage due to incorrect load at support.
Operation outside the performance indicated on the blower and electric nameplate.	Seizure of the impeller.	Risk of damage to the unit, with possible injury (or death) for the operator if present nearby. The unit may break.
Proceeding at all stages without consulting the *operating instructions* and this manual.	Using the unit for unforeseen purposes and without considering the associated risk factors.	Risk of damage to the unit, with possible injury (or death) for the operator if present nearby.
IMPROPER USE LINKED TO METHODS OF USE		
Use of a fluid different from that indicated / forbidden.	Incorrect workload.	Risk of damage to the unit, with possible injury (or death) for the operator if present nearby. The unit may break.
Physical load applied to the machine (no element excluded).	Breakage and/or presence of leakage of fluid collected.	Risk of damage to the unit, with possible injury (or death) for the operator if present nearby due to inhalation of harmful substances.
IMPROPER USE LINKED TO THE STOPPAGE OF A BLOWER		
Manipulation of the machine still rotating / moving.	Direct contact of the operator with moving parts and with the surface unit still hot.	Risk of possible injury for the operator such as burns and entanglement.
Disconnecting the unit from the electricity with the voltage inserted.	Direct contact of the operator with the live parts.	Risk of possible injuries for the operator through electrocution.
IMPROPER USE LINKED TO MAINTENANCE WORK		
Handling the machine differently from instructions for use.	Falling or sudden movement of the unit.	Risk of damage to the unit, with possible injury for the operator if present nearby.
Use of liquid during unit cleaning operations.	In case of stagnation, characteristics of the material may be compromised.	Risk of damage to the unit, with possible injury for the operator if present nearby.
Use of types of spare parts different to those supplied by FPZ.	Different performance from design (pressure, noise, vibration, sealing).	Risk of damage to the unit, with possible injury for the operator if present nearby.
BREAKDOWN AND EMERGENCY CONDITIONS		
Not stopping the machine when it is making an unusual noise.	Seizure of the impeller and overheating of the unit and of the electric motor.	Risk of damage for the unit, with possible injury (or death) for the operator if present nearby. The unit may break down.

4 STORAGE AND TRANSPORT

4.1 RECEIPT AND CHECK OF THE PACKAGE

- When receiving the unit, it is necessary to check that the packaging is intact and free from signs of damage due to transport or storage conditions.
- In the case of damage to the packaging, immediately inform the shipping agent and the manufacturer.

4.2 HANDLING AND TRANSPORT

Danger of crushing and / or impacting various parts of the body

During the transport and handling phases due to the sudden drop or displacement of the packaging, there may be a risk of crushing and / or impacting various parts of the body. During the activities around the unit, the operator may fall due to stumbling or slipping.
Use equipment compliant with the laws and follow the handling and manual handling procedures described in the operating manual, based on the weight indications on the packaging and in accordance with applicable regulations in the state in which this activity takes place. Use safety shoes during this phase.

4.3 STORAGE

- Store in a dry place, possibly keeping the machine in the packaging.
- Do not remove the protective covers of the openings.
- In the event of long-term storage, remove dust deposits on external surfaces and, before commissioning, check the unit's functional status with a start-up test.

5 INSTALLATION

5.1 INSTALLATION CONDITIONS

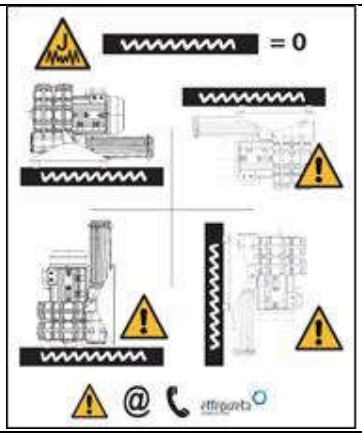
Commissioning and operation must only take place under the following installation conditions:

- The unit must be completely assembled and intact (not damaged or tampered).
- Silencers must be connected to the pipe system (see *operating instructions*); if silencers are not present, make sure that the connection is made by flexible sleeve.
- The machine must be securely fastened to the predetermined site and in the recommended modes (see *operating instructions*).
- The motor must be connected to a suitable control panel.
- Ensure the visibility of the unit installed from the position of the control elements.

Danger of ejection of objects

The entry of foreign bodies into the unit, even if very small, can cause personal serious injury (or death) and/or equipment damage with probable breakage of the impeller blades, including the danger of debris can be thrown out of the machine violently.
Remove the closure caps from the silencers and connect the pipes of the system, making sure to carry out the operation in a non-dusty area to prevent the entry of foreign bodies.

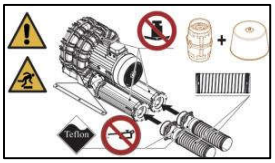
Danger of crushing and / or impacting various parts of the body



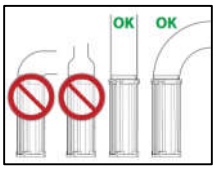
During the installation phase due to the sudden drop or displacement of the packaging, there may be a risk of crushing and / or impacting various parts of the body. During work around the unit, the operator may fall due to stumbling or slipping. Use the appropriate device (e.g. toe) to hook and lift the unit properly.

Danger of injury to upper limbs

The risk of injury to upper limbs may arise due to a combination of hazards during the mechanical assembly phase and the connection of the machine to the piping. Observe the operating manual to install the unit safely.



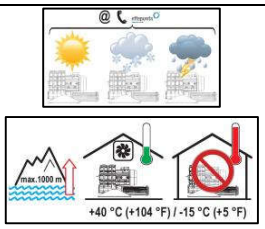
- The support surface of the unit must be flat, robust, stable and absolutely levelled.
- It is important that the unit is installed on supports that do not transmit vibration for example structures or antivibration



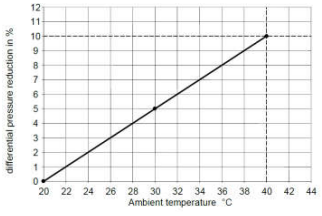
- Connect the pipes with flexible sleeves and avoid the unit bears pipes weight; except for the filter in the case of suction in the environment.

Size the pipes and choose accessories that minimize the load losses, therefore:

- do not fit pipes with diameters smaller than those of the machine's outlets and inlets;
- install multiple machines in parallel, sizing the manifold and main line proportionally;
- do not use angle-pipe, but bends with a large radius of curvature;
- do not install valves with passages smaller than the nominal value and check valves with a stopper pushed by a spring (the check valve with the lowest load loss is the type with a light disc);
- in the case of use for oxygenation, choose low-resistance diffusers (low load loss).



⚠WARNING	To avoid overloads caused by pressure variations, it's recommended that you install a relief valve on aspiration in the case of operation as suction, and on discharge in the case of operation as a compressor.
⚠WARNING	If you need to reduce the flow rate, use a branch valve instead of throttling the suction or discharge.
⚠WARNING	Protect the intake duct with a suitable filter with a filtration degree of 25 µm. Foreign bodies are: dust, sand, calcite, impurities in the pipes, cutting blades and shavings, drops and waste from welding, metal burrs, and residues of sealants produced during connection of pipes. Replace the filters regularly.



- When installing outdoors, protect the unit against direct exposure to the sun and atmospheric agents. For outdoor installations without the use of protections contact FPZ S.p.A..
- Ventilation of the motor must not be hampered by obstacles placed in the immediate vicinity. For this purpose, the electric motor air intake must remain free and a minimum distance between the electric motor fan cover and any other structure as defined by the manufacturer of electric motor.
- The unit must be installed at a maximum height of 1000 m a.s.l., for different conditions contact FPZ S.p.A..

The ambient temperature, and the conveyed gas intake temperature, is permissible inside the range -15°C (+5°F) ÷ +40°C (+104°F) with the following provisions:

- For ambient temperature +30°C (+86°F) **reduce** the maximum pressure differential given in the Data Sheet by 5%;
- For ambient temperature +40°C (+104°F) **reduce** the maximum pressure differential given in the Data Sheet 10%.

The graph on the right has to be used to reduce the maximum pressure differential in case of ambient temperature between +21°C and +40°C (+70°F and +104°F)

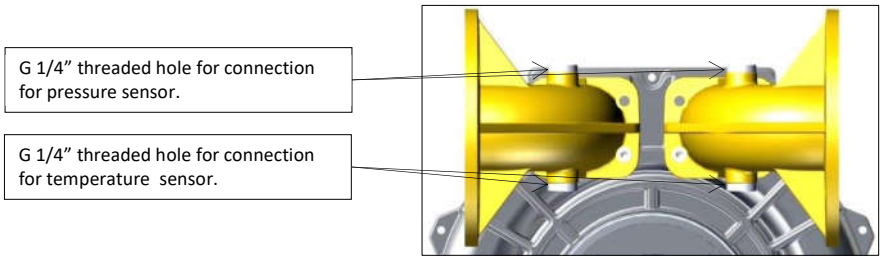
- Check dimensions to allow adequate space for installing the unit with its accessories and ensure sufficient ventilation of the electric motor.

⚠WARNING	In the case of ATEX side channel blower intended for classified areas, the unit must be installed outdoors or in an air conditioned environment.

5.2 BLOWER WITHOUT ELECTRIC MOTOR (GOR – GVR EXECUTION)

NOTICE

Units supplied without an electric motor, GOR execution (with horizontal coupling) or GVR (with vertical coupling) are considered as partly completed machinery, so the designer has to check the compatibility of the electric motor chosen with the data in the data sheets downloadable from the website.
During installation and maintenance, to install or dismantle the elastomeric coupling; it is recommended not to use a hammer, but pushers or extractors, to fit or remove the coupling flanges from the shaft. . Percussion can damage the slope of the bearings by reducing their durability. Coupling requires axial and angular alignment accuracy. Also refer to the coupling instruction manual.



5.3 ATEX 2G BLOWER (EXCLUDED TMD VERSION)

The blower is arranged for the installation of measurement/control systems in order to prevent machine faults that can produce potential sources of triggering:

- pressure sensor
- temperature sensor.

Danger of explosion. The unit is designed to convey flammable gas and is sealed. Do not start the machine before connecting and activating the unit and surveillance system

Pressure sensor

ALWAYS use a pressure sensor

Given the likelihood of an explosive atmosphere, the use of pressure measuring instruments is compulsory in order to check that the difference between the delivery and suction pressures respects the levels given in the "specifications" and on the machine's rating plate.

NOTICE

The use of an alarm and stop device (non-automatic reset) that automatically shuts off the power to the machine is advisable.

Temperature sensor

A possible temperature sensor is deemed functional for the customer's measurement needs, but can in any way replace the pressure sensor for monitoring any dangerous machine conditions.

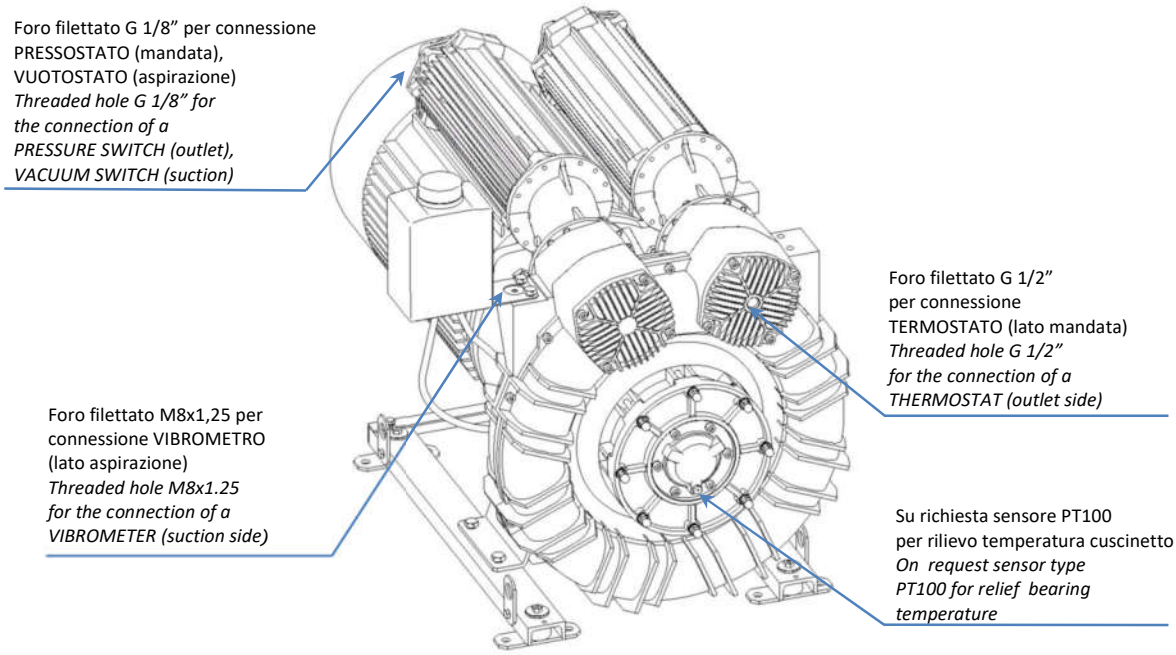
WARNING

All the sensors must be protected against possible impacts, damage and atmospheric agents.

5.4 GOR TMD ATEX 2G BLOWER

The blower is designed for the installation of control systems which must be set up by the installer for the purpose of monitoring machine breakdowns which could produce possible sources of combustion:

- vibration sensor;
- pressure switch / vacuum switch;
- thermostat.



The mechanical seal installed also requires the following operations:

- refilling of the oil tray, as indicated below;
- connection of the oil level sensor.

If necessary, in order to avoid overloads caused by pressure variations, provide a vent device in conformity with EN 1127-1 branching off from the suction pipe, in the case of operation as a suction pump, and on the delivery pipe, in the case of operation as a compressor.

5.4.1 INSTALLATION OF SENSOR GOR TMD ATEX 2G BLOWERS

Install the machine on the plant. Fit the sensors (suitable for the purpose and especially for the Atex environment in question) in their places and connect them to the control system as specified in the instructions provided with the sensors and as required in the plant diagram:

- Vibration sensor

The signal from the sensor must monitor the vibrations of the machine constantly. This signal must be connected to an alarm and block device with manual reset, which automatically interrupts the power supply to the compressor/suction pump at the moment the level of the vibration signal exceeds the predetermined limits.

Effective vibration velocity value [mm/s]	***Class I*** (≤ 15kW)
a<**2.2**	***A***

Effective vibration velocity value [mm/s]	***Class II*** (> 15kW)
a<**3.5**	***A***

- Pressure switch and vacuum switch

The pressure or vacuum switch installed must be calibrated to the maximum pressure or vacuum level specified on the plate of the machine or in accordance with the operating limits of the plant.
The signal must be connected to an alarm and block device, with manual reset, that automatically interrupts the power supply to the machine.

- Thermostat

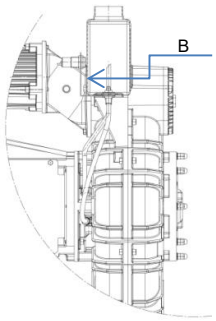
The thermostat must be set to come on at a temperature not exceeding 125°C to interrupt the power supply to the machine automatically.
The signal must be connected to an alarm and block device, with manual reset, that automatically interrupts the power supply to the machine.

⚠WARNING **All sensors installed must be protected against impact, damage and weathering**. FPZ can supply a protective casing, on request and after receiving the dimensions of the sensors installed.

5.4.2 CONNECTION OF THE MECHANICAL SEAL FOR GOR TMD ATEX 2G BLOWER

	**Danger of slipping**
Oil spills can make the floor slippery. Clean the floor with absorbent and /or degreasing products.	

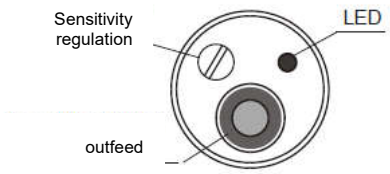
	**Danger of electrostatic charges**
Do not clean or rub the oil reservoir with dry clothes.	



- Refilling the cooling oil tray

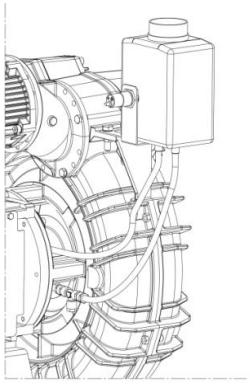
Refill the cooling circuit of the mechanical seal. For good circulation of the cooling liquid, it is important not to have air bubbles inside the circuit. To achieve this, refill by pouring the liquid into the vessel repeatedly in small amounts without exceeding level (B) of the return line. Top up completely only when the level at the return line has covered the bottom of the vessel.

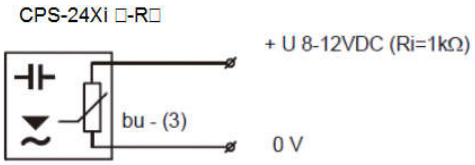
The cooling liquid must be kept at least 10 mm above the level of the return line (B); top up as necessary.



Recommended cooling liquid:	SAE 10W-40 oil Or SAE 5W-40 oil
First filling quantity:	Approx. 1,5 kg

A small leak of fluxing liquid is normal, especially when the seals are settling down.





- Connection of the cooling oil level sensor

The capacitive oil level sensor consists of a stainless steel cylindrical body and is suitable for use in explosion risk zones. It is fitted with a potentiometer to regulate sensitivity and a LED display on the back end, which is normally on.

This sensor must be connected to an alarm and block system with manual reset which automatically interrupts the power supply to the machine. Connect the sensor to the control system following the specific instructions enclosed with this manual.

Note: the connection cable must not be cut or tampered with.

5.5 ELECTRIC MOTOR

WARNING	**Comply with safety measures and instructions indicated in the instruction manual for the electric motor.**

Before starting working on the unit or system, the following precautions must be taken:

- make sure that the unit is NOT connected to electrical power mains;
- take precautions to prevent electricity from being reconnected;
- open the terminal box only after making sure that there is absolutely no live current.

	Danger due to electricity

- If connecting operations are carried out without removing the voltage from the electrical system or without setting up a system to avoid reinsertion, direct contact between the operator and the live parts can occur. This can also cause personal serious injury (or death).
- Work on electrical equipment (installation and maintenance) has to be done only by specialized operators (see document MAN_PIC), wearing PPE.
- In the event of contact with a defective unit there is a risk of electrocution. Always have seals and electrics checked regularly by a specialized operator (see document MAN_PIC).
  - The terminal box must not contain foreign bodies, impurities or humidity. Close the terminal box with the cover, and seal the cable gland openings to prevent dust, water and humidity from getting inside.

NOTICE	In the case of several motor starts during an hour, there is a limitation of 6 start-ups per hour, evenly distributed; failure to respect this can severely damage the unit.

5.5.1 ELECTRIC CONNECTION

Incorrect motor connection may seriously damage the unit.

- Check that the details on the data plate are compatible with the line voltage and frequency.
- Always connect the motor's earth cable to the relevant terminal marked with this symbol before connecting to the mains supply and check the dispersion capacity. The earth cable can be recognized by its color (yellow/green).
- Connect the machine to the earth system too, using the specific hole (marked with the relative symbol) located on the base of the unit. Connection to the power grid must be carried out in compliance with what is shown in the diagram inside the terminal box.
- Use the cable gland openings to allow power supply cables to pass into the terminal box.
- Proceed to tighten the power supply cables, taking the section of the electrical cables into account each time.
- The terminal boards for the electrical connections must be tightened properly to avoid high contact resistances and resulting overheating.
- Check that the insulation gaps between the various conductors are kept in the air and between surfaces, as indicated in the standards.
- All the screws used to close the terminal board must be tightened properly. Damaged screws must be replaced immediately, using screws of the same or better quality.

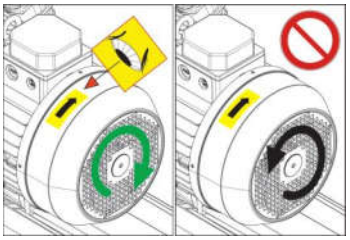
The connection must guarantee:

- long-lasting safety;
- that no wire ends are sticking out;
- protection with a (thermal or amperometric) trip switch is essential for dealing with risks of overloading, a loss of one phase in the mains supply, excessive voltage fluctuations, or the rotor getting stuck;
- that the motor trip switch has been set to a value that does not exceed the maximum current level shown on the nameplate. Warning: the trip switch does not always protect the blower in case the maximum pressure differential is exceeded. Verify the maximum pressure or vacuum as per chapter 6.2.
- motors may be equipped with thermal protectors PTO or PTC. To avoid that the motor is damaged by temperature rise over the admissible limit: PTO or PTC have to be connected to a suitable cut off device that opens the line that feed the motor itself.
- if the application requires protection against accidental start-up, this must be carried out on the electrical control circuit of the motor.

5.5.2 ELECTRIC MOTOR POWERED BY FREQUENCY CONVERTER

The unit's nominal pressure or vacuum characteristics for service at mains frequency cannot be maintained if the unit is powered via a frequency converter. Contact FPZ S.p.A. for information about the performance of a unit powered by a frequency converter. Download from the website www.fpz.com the "RPM Table" of your blower and do not exceed the maximum pressure differentials shown for every rotation speed.

When power is supplied with a frequency converter, the installer is responsible for:



- respecting the laws;
- checking with FPZ assistance if the motor can be powered by a frequency converter, if it doesn't appear on data sheet;
- checking and making any measures necessary to comply with the immunity and emission limits set by the standards;
- checking the suitability of the plant and the frequency converter for operation with standard motors (class F), or the need to use specific motors for these types of operation.

5.5.3 ROTATION DIRECTION

The machines must be used respecting the rotation direction indicated by the arrow on the electric motor fan cover.

- To check the rotation direction, switch the motor on briefly and observe the fan.
- To change the rotation direction, invert the power cable connections, leaving the earth connection unchanged.

Refer to the connection diagram located inside the terminal box and to this section.

6 START UP AND NORMAL OPERATION

6.1 PRELIMINARY CHECKS

WARNING! Before starting the machine for use, carry out the following preliminary checks:

- if the unit has not been started up for some time, check its condition and, if necessary, remove any dust from the external surfaces, to avoid compromising the heat dissipation during the unit work;
- deactivate/open any pipe closing devices (shut-off valves, solenoid valves, etc.) before starting the unit;
- never start and operate the unit with the inlet and/or outlet ports closed;
- make sure the ambient and conveyed gas suction temperatures come within the levels: -15°C (+5 °F)÷ +40°C (+104 °F);
- check the operation of any flow control/limiting devices (not supplied).

6.2 OPERATION

- If the side channel blower is put into operation without being fixed to a surface, a sudden displacement of the starting torque on ignition of the electric motor may occur.
- The information on the product nameplate must always be considered when commissioning and operating.

The unit can be started for use after carrying out the preliminary checks

- Start the unit by switching on the power to the electric motor.
- Respect the maximum pressure differential stated in the blower's nameplate.
  To evaluate the pressure differential Δp across the blower take into account:
  - For compression operating: add up to the outlet pressure the inlet vacuum if applied.
  - For vacuum operation: add up to the inlet vacuum the outlet pressure if applied.
- Pressure losses in the pipes are often underestimated but are decisive factors for the operating differential pressure.
- Measure the motor absorption and check compliance with the rated nameplate value. An amperage below nameplate does not always guarantee that the blower is not exceeding the maximum permitted pressure differential.

WARNING	**Non-compliance with the unit's use or with prohibitions/obligations can cause personal (also serious) injury (or death) or equipment damage**

	Danger of burns

Danger of burns caused by contact with hot surfaces of the unit, which at start-up and operation may reach high surface temperatures, as specified on the product nameplate.
Apply adequate PPE against the risk of burns.

Danger of suction

Danger of injury due to depression, which can cause a sudden suction of objects, hair and clothes.
Start the machine only if it is properly connected to the system.

Danger of vibration

Regularly check that the unit is firmly fixed to the support frame.
Excessive vibration of the unit can cause serious damage to the machine, such as the seizure of the impeller.

Danger due to noise

Some machines can produce loud noise, even over 80 dB (A).
Reference levels are shown on the table of characteristic data that does not consider environmental reverb.
Warning to be taken:
Measure the acoustic pressure of the machine in the installation environment.
In the case of levels above the threshold defined by local standards:

- report the noise hazard
- prepare the use of PPE
- isolate the environment

Danger of ejection of objects

- Danger due to exceeding performance levels that may cause seizure of the impeller.
  Check that operating conditions are in accordance with values declared on the nameplate.
  Avoid operating with the inlet and/or outlet ports closed even temporarily.
  Install a limit valve or equivalent circuit that can avoid excessive vacuum and / or overpressure and allow the compliance with levels shown on the product plate
- Danger of injury due to objects and fluids aspirated and thrown at high speed (injury to the skin or eyes).
  Only start the unit (first start) if it is properly connected and check it accurately.
  In the case of unusual noise from the impeller, switch off the unit immediately and check it accurately.

Danger of injury to upper limbs

During the start-up (first start) phase due to a combination of hazards, the risk of injury to upper limbs may arise.

Danger of sudden leakage and/or aspiration of fluids (even harmful ones)

They could cause damage to the respiratory system due to the leakage of gas while the unit is in use and/or the slowing down of connection to the gas flow circuit.

Danger due to a limited view of the place in which the unit is installed.

Make sure you always have the unit installed in your sight while carrying out any activities close to it.

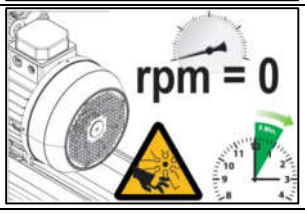
6.3 STOPPING

- The unit must be stopped by switching off the power supply to the motor.
- On shutdown, make sure to operate the unit with open outlet (suction / delivery) for about 20 minutes. This operation allows the removal of any condensation inside.

7 MAINTENANCE

In order to prevent faults and damage it is important to check periodically the units in operation; therefore it is advisable to adopt a maintenance plan in line with this manual, providing for:

- periodical checks;
- periodical maintenance.



7.1 MAINTENANCE AND FAILURE CONDITIONS

WARNING **Before starting any maintenance, either periodical or due to malfunction, take the following safety measures in order to prevent personal (also serious) injury (or death) or equipment damage:**

- unplug the unit from the power supply by unplugging the main switch;
- apply a sign to the system and to the control unit **"DANGER! Maintenance work in progress";**
- cool the unit for at least 15 minutes;

- wait until the unit has completely stopped, checking through the motor fan that the impeller is not rotating;

- make sure that there is no depression or overpressure in the unit through a pressure gauge and make sure that no fluid can escape from the unit (through its stopping) and / or the system (through its insulation).

Danger due to electricity

- If connecting operations are carried out without removing the voltage from the electrical system or without setting up a system to avoid reinsertion, a direct contact of the operator with live parts can occur. This can also cause personal serious injury (or death).
- Work on electrical equipment (installation and maintenance) must be done only by specialized operators (see document MAN_PIC), wearing PPE.
- In the event of contact with a defective unit there is a risk of electrocution.

Danger of moving parts

High risk of cuts caused by rotating impellers. By removing the manifolds or blind flanges, it is possible to access the rotating impeller through the openings of the body and the cover of the side channel blower.
Never put your hands or objects through the openings.

Danger of burns

Danger of burns caused by contact with hot surfaces of the unit, which at startup and in operation may reach high surface temperatures, as specified on the product nameplate.
Apply adequate PPE against the risk of burns.

Danger of injury to upper limbs

During the maintenance phase due to use of improper tools, lack of PPE, bad illumination of the workplace or unauthorized start-up, the operator fails to perform the required procedures, the machine can be put into unmanaged operation, and the risk of injury to upper limbs may arise.

Danger due to noise

Some machines can produce loud noise, even over 80 dB (A) therefore the operator may be subject to acoustic pressure which may cause buzzing in the headset and reduced attention.

WARNING **Danger of sudden spillage of gas (also harmful) suction**

Respiratory damage could occur due to gas leakage during operation and / or loosening of the connections to the gas flow circuits.

7.2 PERIODICAL CHECKS

In order to avoid any defects that may directly or indirectly cause damage, it is important that the unit is inspected by specialized operators (see document MAN_PIC).

A) When the unit is running, routinely carry out the following checks:

- delivery temperature;
- operating pressure and/or vacuum;
- electric motor current absorption;
- vibrations;
- state of the filter and related load loss.

WARNING	**Danger of seizure of the impeller due to excess vibration. Vibrations above the threshold (see table below) are considered NOT eligible and can cause damage to the machine and consequently personal injury even serious (or death) and / or damage to things.** **In the event of unusual noise and / or vibration over parameters, that may indicate the possibility the impeller is seizing up, turn off the unit immediately.**

Class I (Blower with electric motor of power ≤15kW)	Class II (Blower with electric motor of power >15kW)
a > 2,2	a > 3,5
a = effective vibration speed level [mm/s]	

Changes to normal working conditions (power ups, abnormal noise, vibrations, excessive overheating of the service fluid) are indications that the units is not working properly.

B) With the unit stopped and cooled, periodically carry out the following checks:

- dust: check and remove deposits from the external surfaces of the unit;
- suction filter (if fitted): every 10-15 days, check and clean or replace the filter cartridge. The dirty cartridge creates strong suction resistance and consequently a higher pressure differential, power absorption and operating temperature;
- for unit supplied with elastic joint, check the condition of the elastic joint as indicated in its operating manual;
- condensation discharge (if present): every 8-10 days, turn the yellow valve counterclockwise 90° to allow draining of the condensation that has built up inside the blower;
- check for oil leaks (TMD version) near the joint; if leaks are found, maintenance work must be scheduled to replace the seals.

7.3 ROUTINE MAINTENANCE REPAIR OF BREAKDOWNS

See the following chapter “TROUBLESHOOTING” for identifying possible critical situations and types of breakdowns.
Always disconnect the unit and remove it from the plant to do routine maintenance, cleaning and replacing components and in the event of a breakdown.

WARNING	**Danger due to residual overpressure or drop in pressure:**

- with residual overpressure, process fluids can leak, with the risk of injury to the skin and eyes;
- with a drop in pressure there is the risk that hair and clothes can be trapped;
- disconnect the unit only after closing and bleeding the system connected to it.

7.4 LIFESPAN OF BEARINGS

Under normal operating conditions, the bearings of the unit must be replaced by a specialized operator (see document MAN_PIC), after a time fixed by the manufacturer (see details in the table below).

NOT ATEX BLOWERS

Every model, except the models at the following line	25000 hours or 3 years
e07 / e08 / e09 / e10 / e11 MS – TS – TD	40000 hours or 5 years

SOFFIANTI ATEX

Every Atex model	18000 hours or 3 years

NOTICE Replace the bearings of the unit only if you have all the instructions, the parts list and the section/explosion of the unit

7.5 DISMANTLING AND DEMOLITION

Danger of crushing and / or impacting various parts of the body

During the dismantling and demolition phases due to the sudden drop or displacement of the packaging, there may be a risk of crushing and / or impacting various parts of the body. During work around the unit, the operator may fall due to stumbling or slipping.

8 RESIDUAL RISKS

During the design of the machines or system on which the blower will be installed, the following residual risks should be considered.

Danger during the transport phase

Danger of crushing or slipping during the unit transport steps. The *operating instructions* (attached to the unit) and this manual describe how to carry out safe transport operations according to tested procedures.

Danger during the installation phase

Danger of crushing or slipping during the installation phases of the unit. The *operating instructions* (attached to the unit) and this manual describes how to carry out safe installation operations and according to tested procedures.

Danger during the start-up and operating phase

Danger of electrocution, burns, noise, unauthorized start-up of the unit, and ejection of objects or fluids during the start-up and operation phases of the unit. The *operating instructions* (attached to the unit) and this manual describe how to perform the operations mentioned safely and according to tested procedures.

Danger during maintenance and dismantling phases

Danger of electrocution, burns, noise, unauthorized start-up of the unit, and ejection of objects or fluids during the maintenance and dismantling phases of the unit. The *operating instructions* (attached to the unit) and this manual describe how to perform the operations mentioned safely and according to tested procedures.

9 TROUBLESHOOTING

Problem	Serious code	Cause	Solution	Precaution
The unit does not start	F	Electrical wiring incorrect	The electrical connection has to be checked by a technician referring to the wiring diagram contained in the terminal board box	Turn off the power to the electrical system or set up a system that avoids reinsertion
	F	Power supply voltage unsuitable	Check that the power supply voltage, measured at the motor terminals, is within +/- 10% of the rated voltage	Use PPE against the electrical hazards
	G	The impeller is stuck	Call FPZ assistance to repair the unit	
No or insufficient air flow	G	The suction filter is clogged	A specialized operator (see MAN_PIC) has to clean or replace the cartridge	Avoid entering foreign bodies into the unit
	G	Wrong frequency (for units powered through an inverter)	Correct the frequency	Check the rating plate
	G	Profile of the impeller blades modified (due to deposits on the profile)	Call FPZ assistance personnel to check the impeller	
No or insufficient pressure differential	F	Incorrect direction of rotation	The direction of rotation has to be inverted by a specialized operator (see MAN_PIC) switching two of the electrical power supply wires.	Turn off the power to the electrical system or set up a system that avoids reinsertion
	G	Leaks in the plant	Locate the leak and seal	Use proper sealants
Current absorption exceeding the admissible level	F	Electrical wiring incorrect	The electrical connection has to be checked by a technician referring to the wiring diagram contained in the terminal board box	Take off the power to the electrical system or set up a system that avoids reinsertion
	F	Drop in mains supply voltage	The power supply voltage has to be restored by a specialized operator (see MAN_PIC) at the terminals and at the established values.	
	G	The suction filter is clogged	The cartridge has to be cleaned or replaced by a specialized operator (see MAN_PIC)	Avoid entering foreign bodies into the unit.
	G	The unit has accumulated deposits inside	Call FPZ assistance personnel to clean the inside of the unit	Avoid entering foreign bodies into the unit.
	G	The unit is operating at a pressure and/or vacuum that exceeds the admissible level	Adjust the system and/or the regulating valve to lower pressure differentials.	Use appropriate PPE to operate near the unit
High delivery air temperature	G	The suction filter is clogged	Adjust the system and/or the regulating valve to lower pressure differentials.	Use appropriate PPE (surge protectors, gloves) to operate near the unit
	G	The suction filter is clogged	The cartridge has to be cleaned or replaced by a specialized operator (see MAN_PIC)	Avoid entering foreign bodies into the unit.
	G	The unit has accumulated deposits inside	The unit has to be cleaned inside by a specialized operator (see MAN_PIC).	Avoid entering foreign bodies into the unit.
	G	Suction and/or delivery piping obstructed.	Obstructions have to be removed by a specialized operator (see MAN_PIC).	Avoid entering foreign bodies into the unit.
	G	Suction air temperature exceeds 40°C (+104°F)	Use heat exchangers to reduce the suction air temperature	
Abnormal noise	F	The soundproofing material is damaged	Soundproofing cloth has to be replaced by a technician.	Avoid entering foreign bodies into the unit.
	G	The impeller scrapes against the casing. - The unit is operating at a pressure and/or vacuum that exceeds the admissible level	Reduce the pressure differentials in the plant	Use appropriate PPE (surge protectors, gloves) to operate near the unit
	G	- Reduction of assembly tolerances due to internal deposits (dust, impurities in the pipes, process residues, etc.)	The unit has to be cleaned inside by a specialized operator (see MAN_PIC).	Avoid entering foreign bodies into the unit.
	G	Worn bearing	Bearings have to be replaced by a specialized operator (see MAN_PIC).	
	F	Unit's installation position unsuitable	The unit has to be installed by a technician on structures that cannot transmit or amplify noise (tanks, steel plating, etc.)	Use proper anti-vibration and move the units according to local regulations

Abnormal vibrations	G	The impeller is damaged	The impeller has to be replaced by a specialized operator (see MAN_PIC).	
	G	The impeller has accumulated deposits	The unit has to be cleaned inside by a specialized operator (see MAN_PIC).	Avoid entering foreign bodies into the unit
	G	Unit anchored without anti-vibration insulators	The unit has to be anchored with anti-vibration insulators by specialized operator (see MAN_PIC).	Use proper anti-vibration and move the units according to local regulations
	F	Rigid connection to the plant	Flexible hoses between the unit and the piping have to be fitted by a specialized operator (see MAN_PIC).	Carry out the activity only if the unit is disconnected to the power supply.
	G	Bearing on the blower or motor side defective	Bearings have to be replaced by a specialized operator (see MAN_PIC).	

Leaks	G	Defective silencer gaskets	Gaskets have to be checked by a specialized operator (see MAN_PIC), and if necessary have to be replaced.	Avoid entering foreign bodies into the unit.
	G	Defective casing gaskets	Gaskets have to be cleaned by a specialized operator (see MAN_PIC), and if necessary have to be replaced.	Avoid entering foreign bodies into the unit.

Seriousness: F for functional fault and G for serious fault.

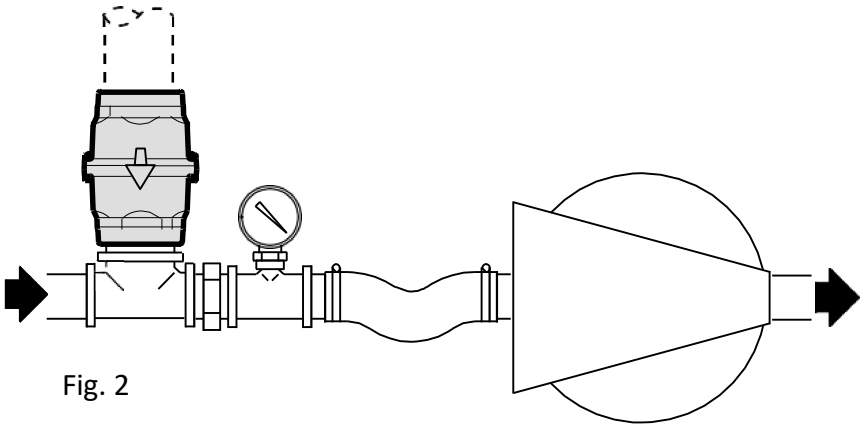

Fig. 2

INSTALLATION SKETCH – VACUUM RELIEF VALVE

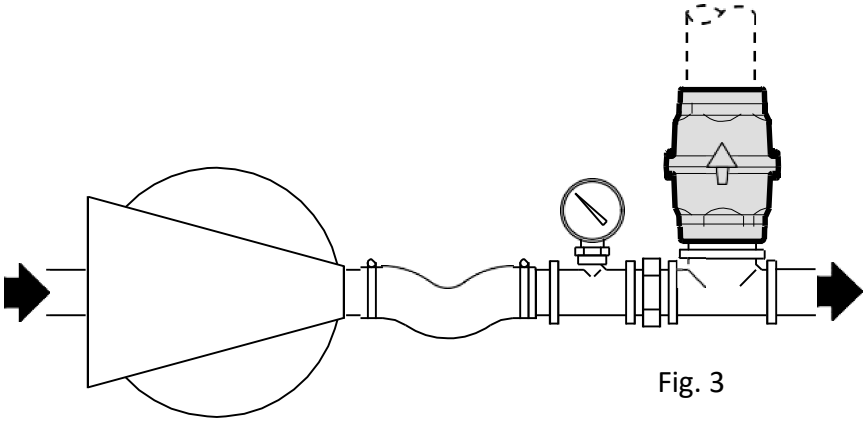

Fig. 3

INSTALLATION SKETCH – PRESSURE RELIEF VALVE

1. CHOICE OF SPRING

The valve is supplied with 2 different springs; each spring is to be used within a specific pressure-vacuum operating range. For the VRL8 and VRL9 there is the possibility to use both springs working in parallel.
Referring to the SELECTION DIAGRAM, check that the valve is correctly sized and depending where the operating point (area A, B,…H) is located, choose one or two springs according to SPRING SELECTION CHART.
The valve is supplied with spring # I installed. If spring needs to be replaced or a supplementary spring is needed to be added (for VRL8 / VRL9), proceed to point # 2 otherwise, adjust valve as per point #3.

2. INSTRUCTIONS FOR SPRING REPLACEMENT (OR MOUNTING ADITIONAL SPRING FOR VRL8 / VRL9)

- Remove the two plastic caps on valve.
- **Ensure stop-nut 923 is locked on the upper housing 106.**
- Unscrew screw 903 from nut 903.1.
- Remove cover 107 from housing 106.
- Unscrew spring guide disc 433 taking it out from shutter guide 434.
- Remove spring 700 (only in case of replacement).
- Install the appropriate spring into shutter 165.
- Compress spring and screw spring guide disc 433 on shutter guide 434 for at least 20 full thread terms
- Check that both ends of the spring are properly positioned within their seats.
- Install the cover 107 on the housing 106 inserting:
  - for VRL6: the sliding guide on the slot in spring guide disc 433
  - for VRL8 and VRL9: dowel pin 562 on the slot in spring guide disc 433.
- Tighten screw 903 on nut 903.1

3. VALVE SETTING

A) Setting-up at allowed vacuum level

- Remove the two plastic caps on valve, if any.
- Position valve on the suction by-pass and connect a vacuum gage as close as possible to the exhauster inlet (Fig. 2).
- Unscrew nut 923.
- Relieve spring tension by backing off upper grub screw 904.1 with the fit key.
- Turn on exhauster. Induce highest attainable vacuum by throttling air intake upstream relief valve (normally reducing throttle to fully-closed).
- Adjust upper grub screw 904.1 until maximum allowable vacuum level is reached.
- Tighten nut 923 keeping blocked upper grub screw 904.1.
- Open suction line.

Double-check vacuum gauge to ensure no additional losses are induced by pipes or filters installed upstream relief valve

B) Setting-up at allowed pressure level

- Remove the two plastic caps on valve, if any.
- Remove nut 923 from upper grub screw 904.1 and place it on to the lower grub screw 904.2. Do not tighten.
- Position valve on the discharge by-pass and connect a pressure gage as close as possible to the blower outlet (Fig. 3).
- Relieve spring tension by backing on lower grub screw 904.2 with the fit key.
- Turn on blower. Induce highest attainable pressure by throttling air discharge downstream of the valve (normally reducing throttle to fully-closed).
- Unscrew lower grub screw 904.2 until maximum allowable pressure level is reached.
- Tighten nut 923 keeping blocked lower grub screw 904.2.
- Open discharge line.

Double-check pressure gauge to ensure no additional losses are induced by pipes or filters installed downstream the valve

Section 3.3.6

DO Sensor

TWO-WIRE TRANSMITTERS FOR pH, ORP, CONDUCTIVITY, OXYGEN, OZONE, AND CHLORINE

5081 Family of Two-wire Transmitters

- CHOICE OF COMMUNICATION PROTOCOL: HART® or FOUNDATION Fieldbus.
- LARGE, EASY-TO-READ two-line display shows the process measurement and temperature.
- SIMPLE MENU STRUCTURE.
- ROBUST TYPE 4X ENCLOSURE.
- INTRINSICALLY SAFE DESIGN allows the transmitter to be used in hazardous environments (with appropriate safety barriers).
- NON-VOLATILE MEMORY retains program settings and calibration data during power failures.

FEATURES AND APPLICATIONS

The 5081 family of transmitters can be used to measure pH, ORP, conductivity (using either contacting or toroidal sensors), resistivity, oxygen (ppm and ppb level), free chlorine, total chlorine, and ozone in a variety of process liquids. The 5081 is compatible with most Rosemount Analytical sensors. See the Specification sections for details.

The transmitter has a rugged, weatherproof, corrosion-resistant enclosure

The transmitter has a two-line seven-segment display. The main measurement appears in 0.8-inch (20 mm) high numerals. The secondary measurement, temperature (and pH if free chlorine is being measured), appears in 0.3-inch (7 mm) high digits.

Two digital communication protocols are available: HART (model option -HT) and Foundation Fieldbus (model options -FF or -FI). Digital communications allows access to AMS (Asset Management Solutions). Use AMS to set up and configure the transmitter, read process variables, and troubleshoot problems from a personal computer or host anywhere in the plant.

A handheld infrared remote controller or the HART and Foundation Fieldbus 375 communicator can also be used for programming and calibrating the transmitter. The remote controller works from as far away as six feet.

5081-P pH/ORP Transmitter

- CHANGING FROM pH TO ORP operation takes only seconds.
- AUTOMATIC TWO-POINT BUFFER CALIBRATION reduces errors.
- SOLUTION TEMPERATURE COMPENSATION converts measured pH to the pH at 25°C.
- CONTINUOUS DIAGNOSTICS monitor sensor performance and warn the user of failure (FAULT) or approaching failure (WARNING).

5081-C Contacting Conductivity Transmitter

- MEASURES CONDUCTIVITY, RESISTIVITY, OR CUSTOM CURVE VARIABLE.
- AUTOMATIC TC RECOGNITION simplifies start up.
- AUTOMATIC/MANUAL TEMPERATURE COMPENSATION ensures accurate monitoring and control.
- AUTOMATIC COMPENSATION FOR SENSOR CABLE RESISTANCE improves accuracy of high conductivity/ low resistivity measurements.
- BUILT-IN TEMPERATURE COMPENSATION ALGORITHMS include straight slope, ultra-pure water, cation conductivity, and no compensation.

5081-T Toroidal Conductivity Transmitter

- MEASURES CONDUCTIVITY, PERCENT CONCENTRATION, OR CUSTOM CURVE VARIABLE.
- AUTOMATIC TC RECOGNITION simplifies start up.
- AUTOMATIC/MANUAL TEMPERATURE COMPENSATION ensures accurate monitoring and control.
- BUILT-IN CONCENTRATION CURVES FOR 0-12% NaOH, 0-15% HCl, 0-25% and 96-99.7% H_2SO_4.
- PROGRAMMABLE REFERENCE TEMPERATURE enables temperature compensation to temperatures other than 25 degrees Celsius.
- AUTOMATIC COMPENSATION FOR SENSOR CABLE RESISTANCE improves accuracy of high conductivity measurements.

5081-A Amperometric Transmitter

- MEASURES dissolved oxygen (ppm and ppb level), free chlorine, total chlorine, and ozone.
- SECOND INPUT FOR A pH SENSOR ALLOWS AUTOMATIC pH CORRECTION for free chlorine measurement. No expensive, messy reagents needed.
- AUTOMATIC BUFFER RECOGNITON FOR pH CALIBRATION.

SPECIFICATIONS - GENERAL

Housing: Cast aluminum with epoxy coating. Type 4X (IP65). Neoprene O-ring cover seals. 160.5 mm x 175.3 mm x 161.3 mm (6.3 in. x 6.9 in. x 6.4 in.)

Dimensions: See drawing.

Conduit Openings: ¾-in. NPT

Ambient Temperature: -4 to 149°F (-20 to 65°C)

Storage Temperature: -22 to 176°F (-30 to 80°C)

Relative Humidity: 0 to 95% (non-condensing)

Weight/Shipping Weight: 10 lb/11 lb (4.5/5.0 kg)

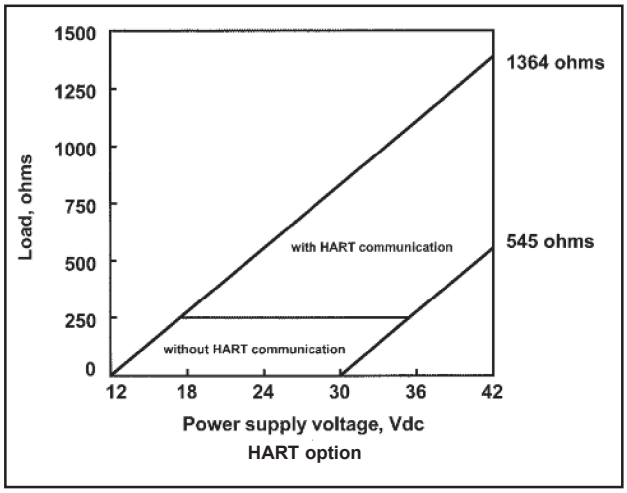
Display: Two-line LCD; first line shows process variable (pH, ORP, conductivity, % concentration, oxygen, ozone, or chlorine), second line shows process temperature and output current. For pH/chlorine combination, the second line can be toggled to show pH. Fault and warning messages, when triggered, alternate with temperature and output readings.

First line: 7 segment LCD, 0.8 in. (20 mm) high.

Second line: 7 segment LCD, 0.3 in. (7mm) high.

Display board can be rotated 90 degrees clockwise or counterclockwise.

During calibration and programming, messages and prompts appear in the second line.



Temperature resolution: 0.1°C

Hazardous Location Approval: For details, see specifications for the measurement of interest.

RFI/EMI: EN-61326 CE

Digital Communications: For details, see specifications for the measurement of interest.

Specifications subject to change without notice.

HART —
Power & Load Requirements:
Supply voltage at the transmitter terminals should be at least 12 Vdc. Power supply voltage should cover the voltage drop on the cable plus the external load resistor required for HART communications (250 Ω minimum). Minimum power supply voltage is 12 Vdc. Maximum power supply voltage is 42.4 Vdc (30 Vdc for intrinsically safe operation). The graph shows the supply voltage required to maintain 12 Vdc (upper line) and 30 Vdc (lower line) at the transmitter terminals when the current is 22 mA.

Analog Output: Two-wire, 4-20 mA output with superimposed HART digital signal. Fully scalable over the operating range of the sensor.

Output accuracy: ±0.05 mA

FOUNDATION fieldbus —

Power & Load Requirements: A power supply voltage of 9-32 Vdc at 22 mA is required.

Fieldbus **I**ntrinsically **S**afe **CO**ncept/FISCO-compliant versions of 5081 Foundation Fieldbus transmitter are available.

5081-A AMPEROMETRIC TRANSMITTER

FEATURES

The 5081-A Transmitter with the appropriate sensor measures dissolved oxygen (ppm and ppb level), free chlorine, total chlorine, and ozone in a variety of process liquids. The transmitter is compatible with Rosemount Analytical 499A amperometric sensors for oxygen, chlorine, and ozone; and with Hx438 and Gx448 steam-sterilizable oxygen sensors.

For free chlorine measurements, both automatic and manual pH correction are available. pH correction is necessary because amperometric chlorine sensors respond only to hypochlorous acid, not free chlorine, which is the sum of hypochlorous acid and hypochlorite ion. To measure free chlorine, most competing instruments require an acidified sample. Acid lowers the pH and converts hypochlorite ion to hypochlorous acid. The 5081-A eliminates the need for messy and expensive sample conditioning by measuring the sample pH and using it to correct the chlorine sensor signal. If the pH is relatively constant, a fixed pH correction can be used, and the pH measurement is not necessary. If the pH is greater than 7.0 and fluctuates more than about 0.2 units, continuous measurement of pH and automatic pH correction is necessary. See Specifications section for recommended pH sensors. Corrections are valid to pH 9.5.

The transmitter fully compensates oxygen, ozone, free chlorine, and total chlorine readings for changes in membrane permeability caused by temperature changes.

For pH measurements — pH is available with free chlorine only — the 5081-A features automatic buffer recognition and stabilization check. Buffer pH and temperature data for commonly used buffers are stored in the transmitter. Glass impedance diagnostics warn the user of an aging or failed pH sensor.

GENERAL SPECIFICATIONS FOR 5081-A

Input ranges: 0-330 nA, 0.3-4µA, 3.7-30 µA, 27-100 µA

Repeatability (input): ±0.1% of range

Linearity (input): ±0.3% of range

Temperature range: 0-100°C (0-150°C for steam sterilizable sensors)

Temperature accuracy using RTD: ±0.5°C between 0 and 50°C, ±1°C above 50°C

Temperature accuracy using 22k NTC: ±0.5°C between 0 and 50°C, ±2°C above 50°C

Digital Communications:

HART: PV, SV, TV, and 4V assignable to measurement (oxygen, ozone, or chlorine), temperature, pH, and sensor current.

Fieldbus: Four (4) AI blocks assignable to measurement (oxygen, ozone, or chlorine), temperature, pH, and sensor current; execution time 75 msec. One PID block; execution time 150 msec. Device type: 4083. Device revision: 1. Certified to ITK 4.01.

SPECIFICATIONS — OXYGEN

Measurement Range: 0-99 ppm (mg/L), 0-200% saturation

Resolution: 0.01 ppm, 0.1 ppb for 499A TrDO sensor

Temperature correction for membrane permeability: automatic between 0 and 50°C (can be disabled)

Calibration: air calibration (user must enter barometric pressure) or calibration against a standard instrument

SENSORS — OXYGEN:

499A DO-54 for ppm level

499A TrDO-54 for ppb level

Hx438 and Gx448 steam-sterilizable oxygen sensors

SPECIFICATIONS — FREE CHLORINE

Measurement Range: 0-20 ppm (mg/L) as Cl_2

Resolution: 0.001 ppm (Autoranges at 0.999 to 1.00 and 9.99 to 10.0)

Temperature correction for membrane permeability: automatic between 0 and 50°C (can be disabled)

pH Correction: Automatic between pH 6.0 and 9.5. Manual pH correction is also available.

Calibration: against grab sample analyzed using portable test kit.

SENSOR — FREE CHLORINE:

499A CL-01-54

SPECIFICATIONS — pH

Application: pH measurement available with free chlorine only

Measurement Range: 0-14 pH

Resolution: 0.01 pH

Sensor Diagnostics: Glass impedance (for broken or aging electrode) and reference offset. Reference impedance (for fouled reference junction) is not available.

Repeatability: ±0.01 pH at 25°C

SENSORS — pH:

Use 399-09-62, 399-14, or 399VP-09.

SPECIFICATIONS — TOTAL CHLORINE

Measurement Range: 0-20 ppm (mg/L) as Cl_2

Resolution: 0.001 ppm (Autoranges at 0.999 to 1.00 and 9.99 to 10.0)

Temperature correction for membrane permeability: automatic between 5 and 35°C (can be disabled)

Calibration: against grab sample analyzed using portable test kit.

SENSOR — TOTAL CHLORINE:

499A CL-02-54 (must be used with SCS 921)

SPECIFICATIONS — OZONE

Measurement Range: 0-10 ppm (mg/L)

Resolution: 0.001 ppm (Autoranges at 0.999 to 1.00 and 9.99 to 10.0)

Temperature correction for membrane permeability: automatic between 5 and 35°C (can be disabled)

Calibration: against grab sample analyzed using portable test kit.

SENSOR — OZONE:

499A OZ-54

ORDERING INFORMATION

The **5081 Two-Wire Transmitter** is intended for the determination of pH/ORP, conductivity (both contacting and toroidal), and for measurements using membrane-covered amperometric sensors (oxygen, ozone, and chlorine). For free chlorine measurements, which often require continuous pH correction, a second input for a pH sensor is available. A hand-held infrared remote controller is required for local configuration and calibration of the transmitter.

5081	SMART TWO-WIRE MICROPROCESSOR TRANSMITTER
CODE	**REQUIRED SELECTION**
P	pH/ORP
C	Contacting conductivity
T	Toroidal conductivity

Rosemount™ 499ADO

Dissolved Oxygen Sensor

A robust sensor for reliably measuring dissolved oxygen

The Rosemount 499ADO dissolved oxygen sensor is an easy-to-use amperometric sensor with a rugged construction. This sensor is ideal for measuring dissolved oxygen in aeration basins in municipal and industrial wastewater treatment plants.

ROSEMOUNT™

EMERSON™

Overview

Ease of maintenance

- Extend sensor life with simple membrane and electrolyte replacement; no special tools needed.
- Automatic temperature correction with integral Pt-100 resistance temperature device (RTD).
- Easy in-air calibration.

Versatile installation option

- Forward and rear facing 1-in. male national pipe thread (MNPT) process connections to meet a variety of application installation requirements.
- Installs in aeration basins and sidestream samples.
- Variopol (VP6) cable connector option eliminates cable twisting and allows for quick sensor replacement.

High performance design

- Measures dissolved oxygen between 0 and 20 ppm.
- Operates in process temperatures up to 122 °F (50 °C).
- High accuracy of ±0.2 ppm at 77 °F (25 °C).

Ordering information

The Rosemount 499ADO Dissolved Oxygen Sensor is intended for the determination of dissolved oxygen at the ppm level. Sensors can be immersed directly in aeration basins using the handrail mounted assembly or mounted in a variety of flow cells. The sensor is available with either an integral cable or Variopol (VP6) quick disconnect fitting. Three replacement membrane assemblies, three O-rings, and a 4 oz. (125 mL) bottle of electrolyte solution are provided with each sensor.

Option	Description
499ADO	Dissolved Oxygen Sensor
Transmitter compatibility	
54	Rosemount 1056, 1066-DO, 56, and 5081-A compatible
Cable options	
_	Integral 25-ft. (7.6 m) optimum EMI/RFI protected cable
VP	Sensor with VP6 fittings (requires VP interconnecting cable)
02	Integral 15-ft. (4.6 m) optimum EMI/RFI protected cable
03	Integral 33-ft. (10 m) optimum EMI/RFI protected cable
50	Integral 50-ft. (15 m) optimum EMI/RFI protected cable
06	Integral 100-ft. (30 m) optimum EMI/RFI protected cable
Special	
_	No selection
99	Special (consult factory)
Calibration and conformance certificates - optional level	
CC	Certificate of Calibration (no test data given)
LC	Loop Calibration Certificate (sensor and transmitter calibrated together, with test data)
EC	Electronic Calibration Certificate (sensor calibrated against factory instrument, with test data)

Specifications

Table 2: Sensor Specifications

Physical characteristics	Specifications
Range	0 to 20 ppm (mg/L) as O_2. For measurements at the ppb level, choose Rosemount 499ATrDO.
Pressure	0 to 65 psig (101 to 549 kPa abs)
Temperature (operating)	32 to 122 °F (0 to 50 °C)

Table 2: Sensor Specifications *(continued)*

Physical characteristics	Specifications
Process connection	1-in. male national pipe thread (MNPT)
Wetted parts	Noryl®, Viton®, EPDM, Teflon® , and silicone
Cathode	Gold (not normally wetted)
Accuracy	±0.2 ppm at 77 °F (25 °C)
Linearity	2% (typical)
Repeatability	±0.5% of reading at 77 °F (25 °C)
Response time	<20 sec to 90% of final reading (0 to 2 ppm) at 77 °F (25 °C)
Electrolyte volume	0.8 oz. (25 mL), approximately
Electrolyte life	4 to 6 months (approximately)
Cable length	See Table 1 for standard cable lengths.
Cable length (maximum)	300 ft. (91 m), up to 100 ft. (30.5 m) is standard.
Sample flow	Flow through: 1 to 5 gpm (3.8 to 19 L/min) Open channel: 1 ft./sec (0.3 m/sec) Low flow cell: 2 to 5 gph (7.6 to 19 L/hr) Agitation produced by bubbles in aeration basins usually provides adequate flow.
Weight/shipping weight	1 lb./3 lb. (0.5 kg/1.5 kg)

ROSEMOUNT™

EMERSON™

Essential instructions

Read this page before proceeding!

Emerson designs, manufactures, and tests its products to meet many national and international standards. Because these instruments are sophisticated technical products, you must properly install, use, and maintain them to ensure they continue to operate within their normal specifications. The following instructions must be adhered to and integrated into your safety program when installing, using, and maintaining Emerson products. Failure to follow the proper instructions may cause any one of the following situations to occur: loss of life, personal injury, property damage, damage to this instrument, and warranty invalidation.

- Read all instructions prior to installing, operating, and servicing the product.
- If this Reference Manual is not the correct one, call 1-800-854-8257 or 949-757-8500 to request the correct Reference Manual. Save this Reference Manual for future reference.
- If you do not understand any of the instructions, contact your Emerson representative for clarification.
- Follow all warnings, cautions, and instructions marked on and supplied with the product.
- Inform and educate your personnel in the proper installation, operation, and maintenance of the product.
- Install equipment as specified in the installation instructions of the appropriate Reference Manual and per applicable local and national codes. Connect all products to the proper electrical and pressure sources.
- To ensure proper performance, use qualified personnel to install, operate, update, program, and maintain the product.
- When replacement parts are required, ensure that qualified people use replacement parts specified by Emerson. Unauthorized parts and procedures can affect the product's performance, place the safe operation of your process at risk, and VOID YOUR WARRANTY. Look-alike substitutions may result in fire, electrical hazards, or improper operation.
- Ensure that all equipment doors are closed and protective covers are in place, except when maintenance is being performed by qualified people, to prevent electrical shock and personal injury.

⚠ WARNING

Physical access

Unauthorized personnel may potentially cause significant damage to and/or misconfiguration of end users' equipment. This could be intentional or unintentional and needs to be protected against.

Physical security is an important part of any security program and fundamental to protecting your system. Restrict physical access by unauthorized personnel to protect end users' assets. This is true for all systems used within the facility.

Notice

ROSEMOUNT ("SELLER") SHALL NOT BE LIABLE FOR TECHNICAL OR EDITORIAL ERRORS IN THIS MANUAL OR OMISSIONS FROM THIS MANUAL. SELLER MAKES NO WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, WITH RESPECT TO THIS MANUAL AND, IN NO EVENT, SHALL SELLER BE LIABLE FOR ANY SPECIAL OR CONSEQUENTIAL DAMAGES INCLUDING, BUT NOT LIMITED TO, LOSS OF PRODUCTION, LOSS OF PROFITS, ETC.

PRODUCT NAMES USED HEREIN ARE FOR MANUFACTURER OR SUPPLIER IDENTIFICATION ONLY AND MAY BE TRADEMARKS/ REGISTERED TRADEMARKS OF THESE COMPANIES.

THE CONTENTS OF THIS PUBLICATION ARE PRESENTED FOR INFORMATIONAL PURPOSES ONLY, AND WHILE EVERY EFFORT HAS BEEN MADE TO ENSURE THEIR ACCURACY, THEY ARE NOT TO BE CONSTRUED AS WARRANTIES OR GUARANTEES, EXPRESSED OR IMPLIED, REGARDING THE PRODUCTS OR SERVICES DESCRIBED HEREIN OR THEIR USE OR APPLICABILITY. WE RESERVE THE RIGHT TO MODIFY OR IMPROVE THE DESIGNS OR SPECIFICATIONS OF SUCH PRODUCTS AT ANY TIME.

SELLER DOES NOT ASSUME RESPONSIBILITY FOR THE SELECTION, USE, OR MAINTENANCE OF ANY PRODUCT. RESPONSIBILITY FOR PROPER SELECTION, USE, AND MAINTENANCE OF ANY SELLER PRODUCT REMAINS SOLELY WITH THE PURCHASER AND END-USER.

Warranty

1. LIMITED WARRANTY: Subject to the limitations contained in Section 2 herein and except as otherwise expressly provided herein, Rosemount ("Seller") warrants that the firmware will execute the programming instructions provided by Seller and that the Goods manufactured or Services provided by Seller will be free from defects in materials or workmanship under normal use and care until the expiration of the applicable warranty period. Goods are warranted for twelve (12) months from the date of initial installation or eighteen (18) months from the date of shipment by Seller, whichever period expires first. Consumables and Services are warranted for a period of 90 days from the date of shipment or completion of the Services. Products purchased by Seller from a third party for resale to Buyer ("Resale Products") shall carry only the

warranty extended by the original manufacturer. Buyer agrees that Seller has no liability for Resale Products beyond making a reasonable commercial effort to arrange for procurement and shipping of the Resale Products. If Buyer discovers any warranty defects and notifies Seller thereof in writing during the applicable warranty period, Seller shall, at its option, promptly correct any errors that are found by Seller in the firmware or Services, or repair or replace F.O.B. point of manufacture that portion of the Goods or firmware found by Seller to be defective, or refund the purchase price of the defective portion of the Goods/Services. All replacements or repairs necessitated by inadequate maintenance, normal wear and usage, unsuitable power sources, unsuitable environmental conditions, accident, misuse, improper installation, modification, repair, storage or handling, or any other cause not the fault of Seller are not covered by this limited warranty, and shall be at Buyer's expense. Seller shall not be obligated to pay any costs or charges incurred by Buyer or any other party except as may be agreed upon in writing in advance by an authorized Seller representative. All costs of dismantling, reinstallation and freight, and the time and expenses of Seller's personnel for site travel and diagnosis under this warranty clause shall be borne by Buyer unless accepted in writing by Seller. Goods repaired and parts replaced during the warranty period shall be in warranty for the remainder of the original warranty period or ninety (90) days, whichever is longer. This limited warranty is the only warranty made by Seller and can be amended only in a writing signed by an authorized representative of Seller. Except as otherwise expressly provided in the Agreement, THERE ARE NO REPRESENTATIONS OR WARRANTIES OF ANY KIND, EXPRESSED OR IMPLIED, AS TO MERCHANTABILITY, FITNESS FOR PARTICULAR PURPOSE, OR ANY OTHER MATTER WITH RESPECT TO ANY OF THE GOODS OR SERVICES. It is understood that corrosion or erosion of materials is not covered by our guarantee.

2. LIMITATION OF REMEDY AND LIABILITY: SELLER SHALL NOT BE LIABLE FOR DAMAGES CAUSED BY DELAY IN PERFORMANCE. THE SOLE AND EXCLUSIVE REMEDY FOR BREACH OF WARRANTY HEREUNDER SHALL BE LIMITED TO REPAIR, CORRECTION, REPLACEMENT, OR REFUND OF PURCHASE PRICE UNDER THE LIMITED WARRANTY CLAUSE IN SECTION 1 HEREIN. IN NO EVENT, REGARDLESS OF THE FORM OF THE CLAIM OR CAUSE OF ACTION (WHETHER BASED IN CONTRACT, INFRINGEMENT, NEGLIGENCE, STRICT LIABILITY, OTHER TORT, OR OTHERWISE), SHALL SELLER'S LIABILITY TO BUYER AND/OR ITS CUSTOMERS EXCEED THE PRICE TO BUYER OF THE SPECIFIC GOODS MANUFACTURED OR SERVICES PROVIDED BY SELLER GIVING RISE TO THE CLAIM OR CAUSE OF ACTION. BUYER AGREES THAT IN NO EVENT SHALL SELLER'S LIABILITY TO BUYER AND/OR ITS CUSTOMERS EXTEND TO INCLUDE INCIDENTAL, CONSEQUENTIAL OR PUNITIVE DAMAGES. THE TERM “CONSEQUENTIAL DAMAGES” SHALL INCLUDE, BUT NOT BE LIMITED TO, LOSS OF ANTICIPATED PROFITS, LOSS OF USE, LOSS OF REVENUE, AND COST OF CAPITAL.

1 Start-up

Procedure

1. Using the infrared remote control (IRC), press **PROG**, **NEXT**, **NEXT**, and **ENTER** in this order.
2. Select the measurement type and unit of measurement.
3. Use the arrow keys to toggle between Celsius and Fahrenheit.
4. Press **ENTER** and then **RESET**.
5. Press **PROG**, **NEXT**, and **ENTER** in this order.
6. Use the arrow keys to toggle T AUTO between ON or OFF.

   This determines whether the transmitter uses the process temperature (ON) or a manual temperature (OFF).
7. Press **ENTER**.
8. If you select OFF, enter the manual temperature desired using the arrow keys.
9. Press **ENTER**.

2 Description and specifications

2.1 Features and applications

The Rosemount™ 5081 includes the following features:

General

The Rosemount 5081 explosion-proof transmitter is a loop powered device with a robust design that serves several industrial, commercial, and municipal applications. It offers a local operator interface (LOI) that can display values from a single measurement input. This transmitter is compatible with a multitude of analytical sensors.

Analytical measurements

- pH/ORP
- Contacting conductivity
- Toroidal conductivity
- Dissolved oxygen
- Ozone
- Chlorine

Maintenance features

- Automatic two-point buffer calibration routine
- Automatic recognition of resistance temperature device (RTD)
- Sensor diagnostics

Diagnostics

Continuous monitoring of sensor performance along with warnings and fault messages to alert the user of failures.

Enclosure

Explosion-proof and corrosion resistant

2.2 General specifications

Table 2-1: General Specifications

Housing	Cast aluminum with epoxy coating. NEMA® 4X(IP65) and NEMA7B. Neoprene O-ring seals.
Dimensions	6.3 x 6.9 x 6.4 in. (160.5 x 175.3 x 161.3 mm) See the engineering drawings in Engineering Drawings.
Conduit openings	¾-in. female national pipe thread (FNPT)
Ambient temperature	-4 to 149 °F (-20 to 65 °C)

Table 2-1: General Specifications *(continued)*

Storage temperature	-22 to 176 °F (-30 to 80 °C)
Relative humidity	0 to 95% (non-condensing)
Weight / shipping weight	10 lb./11 lb. (4.5 kg/5.0 kg)
Display	First line: 7 segment LCD, 0.8 in. (20 mm) high. This line shows process variables (pH/ORP, contacting conductivity, toroidal conductivity, etc.) Second line: 7 segment LCD, 0.3 in. (7 mm) high. This line shows process temperature, output current, warnings, faults, and messages during calibration/programming. Display board can be rotated 90 degrees clockwise or counterclockwise if desired.
Temperature resolution	0.1 °C
Hazardous location approval	For details, see Rosemount 5081 - (A/P/C/T) product certifications.
RFI/EMI	Meets all industrial requirements of EN61326.
Diagnostics (may slightly vary based on measurement type)	• Calibration error • Low temperature error • High temperature error • Sensor failure • Line failure • CPU failure • Calibration error • Zero error • Temperature slope error • Sensor failure • ROM failure • Input warning Once one of the above warnings/faults are diagnosed, the LOI will display a message describing the failure detected.

Table 2-2: HART® Digital Communications

Power and load requirements	Supply voltage at the transmitter terminals should be at least 12 Vdc. Power supply voltage should cover the voltage drop on the cable plus the external load resistor required for HART communications (250 Ohms minimum). Minimum power voltage is 12 Vdc. Maximum power voltage is 42.4 Vdc (30 Vdc for intrinsically safe operation). Figure 4-1 shows the supply voltage required to maintain 12 Vdc (upper line) and 30 Vdc (lower line) at the transmitter terminals when the current is 22 mA.
Analog output	Two-wire, 4-20 mA output with superimposed HART digital signal, scalable over the operating range of the sensor.
Output accuracy	±0.05 mA

Table 2-2: HART® Digital Communications *(continued)*

Variables assignable to	• pH • Temperature • mV • Glass impedance • Reference impedance • RTD resistance • Oxidation reduction potential (ORP) • Conductivity • Resistivity • Concentration • Raw conductivity • Chlorine • Dissolved oxygen • Dissolved ozone

Table 2-3: FOUNDATION™ Fieldbus Digital Communications

Power and load requirements	A power supply voltage of 9-32 Vdc at 22 mA is required.
AI blocks assignable to	• pH • Temperature • mV • Glass impedance • Reference impedance • RTD resistance • ORP • Conductivity • Resistivity • Concentration • Raw conductivity • Chlorine • Dissolved oxygen • Dissolved ozone

2.3 Rosemount 5081 - (A/P/C/T) product certifications

Rev 1.0

2.3.1 European Directive Information

A copy of the EU Declaration of Conformity can be found at the end of the Quick Start Guide. The most recent revision of the EU Declaration of Conformity can be found at Emerson.com/Rosemount.

2.3.2 Ordinary Location Certification

As standard, the Power Module has been examined and tested to determine that the design meets the basic electrical, mechanical, and fire protection requirements by a nationally recognized test laboratory (NRTL) as accredited by the Federal Occupational Safety and Health Administration (OSHA).

2.3.3 Installing equipment in North America

The US National Electrical Code® (NEC) and the Canadian Electrical Code (CEC) permit the use of Division marked equipment in Zones and Zone marked equipment in Divisions. The marking must be suitable for the area classification, gas, and temperature class. This information is clearly defined in the respective codes.

2.3.4 USA

FM hazardous locations

Certificate	FM17US0021X
Standards	FM Class 3600:2011, FM Class 3610:2015, FM Class 3611:2016 FM Class 3615:2006, FM Class 3810:2005, ANSI/NEMA 250:1991
Markings	FM APPROVED Intrinsically safe for use in Class I, II, and III, Division 1, Groups A, B, C, D, E, F, and G; T4 Ta = -20 °C to 70 °C; per control drawing numbers 1400676; 1400677 Nonincendive for Class I, Division 2, Groups A, B, C, and D; T4 Ta = -20 °C to 70 °C; per control drawing numbers 1400676; 1400677 Dust-ignitionproof for use in Class II and Class III, Division 1, Groups E, F, and G; T6 Ta = -20 °C to 70 °C;per control drawing number 1400678 Explosionproof for use in Class I, Div 1, Groups B, C, and D; T6 Ta = -20 °C to 70 °C; per control drawing number 1400678 Type 4X

Special Conditions for Safe Use (X):

1. The Rosemount 5081-T conductivity transmitters shall only be used with the Rosemount 222, 225, 226, 228 (1 in. and 2 in. only) and 245 toroidal sensors.

2.3.5 Canada

CSA hazardous locations

Certificate	1132747
Standards	C22.2 No. 0-M1987, C22.2 No. 25-1966, C22.2 No. 30-M1986 C22.2 No. 94-M91, C22.2 No 142-M1987, C22.2 No. 157-92, C22.2 No. 213-M1987
Markings	Intrinsically safe for Class I Groups A, B, C, and D; Class II Groups E, F, and G; Class III; T4 Tamb = 70 °C, per installation drawing 1400674 and 1400675 Non-incendive for Class I, Div. 2 for Groups A, B, C, and D; Class II, Div. 2, Groups F and G; Class III; T4 Tamb = 70 °C, per installation drawing 1400674 and 1400675 (Rosemount 5081-A/P/C/T) and per 1700462 (Rosemount 5081-T) Explosion-proof for Class I, Groups B, C, and D; Class II, Groups E, F, and G, Class III, T6 Tamb = 70 °C Type 4X

2.3.6 Europe

Rosemount 5081-A and 5081-P liquid transmitters

ATEX

Certificate	BAS02ATEX1284X
Standards	EN 60079-0:2012+A11:2013 EN 60079-11:2012
Markings	II 1 G Ex ia IIC T4 Ga (-20 °C ≤ Ta ≤ +65 °C)

Special Conditions for Safe Use (X):

1. The Rosemount 5081 enclosure may be made of aluminum alloy and given a protective polyurethane paint finish; however, care should be taken to protect it from impact or abrasion of located in a zone 0.

Rosemount 5081-C liquid transmitter

ATEX

Certificate	Baseefa03ATEX0099X
Standards	EN 60079-0:2012+A11:2013 EN 60079-11:2012

Markings	 II 1 G Ex ia IIC T4 Ga (-20 °C ≤ Ta ≤ +65 °C)

Special Conditions for Safe Use (X):

1. The equipment enclosure may contain light metals. The equipment must be installed in such a manner as to minimize the risk of impact or friction with other metal surfaces.

Rosemount 5081-T liquid transmitter

ATEX

Certificate	Baseefa03ATEX0399X
Standards	EN 60079-0:2012+A11:2013 EN 60079-11:2012
Markings	 II 1 G Ex ia IIC T4 Ga (-20 °C ≤ Ta ≤ +65°C)

Special Conditions for Safe Use (X):

1. The equipment may contain light metals. The equipment must be installed in such a manner as to minimize the risk or impact or friction with other metal surfaces.

2.3.7 International

IECEx

Certificate	IECEx BAS 09.0159X
Standards	IEC 60079-0:2011 IEC 60079-11:2011
Markings	Ex ia IIC T4 Ga (-20 °C ≤ Ta ≤ +65°C)

Special Conditions for Safe Use (X):

1. The Rosemount 5081 enclosure may be made of aluminum alloy and given a protective polyurethane paint finish; however, care should be taken to protect it from impact or abrasion if located in a zone 0 environment.

2.4 Functional specifications

The sections below display the specifications for measuring different substances with the Rosemount 5081.

2.4.1 pH/ORP specifications

pH range	0 to 14
ORP range	-1400 to +1400 mV
Calibration/standardization	The automatic buffer recognition uses stored buffer values and their temperature curves for the most common buffer standards available worldwide. The transmitter also performs a stabilization check on the sensor in each buffer. To make a manual two-point calibration, immerse the sensor in two different buffer solutions and enter the pH values. The microprocessor automatically calculates the slope which is used for self-diagnostics. The transmitter displays an error message if the pH sensor is faulty. The operator can read the slope on the display and/or manually adjust it if desired. To complete an on-line, one-point standardization process, enter the pH or ORP value of a grab sample as measured by a lab reference.
Preamplifier location	Use a preamplifier to convert the high impedance pH electrode signal to a low impedance signal for transmitter use. Use the transmitter's integral preamplifier when the sensor to transmitter distance is less than 15 ft. (4.5 m). Use a sensor with a built-in preamplifier or a junction box if distance is longer than 15 ft. (4.5 m).
Automatic temperature compensation	External 3 or 4 wire Pt 100 resistance temperature device (RTD) or Pt 1000 RTD, located in the sensor, compensates the pH reading for temperature fluctuations. Compensation covers the range 5 to 270 °F (-15 to 130 °C). The operator may also select manual temperature compensation.
Accuracy	±01 mv at 77 °F (25 °C) ± 0.01 pH
Repeatability	±01 mv at 77 °F (25 °C) ±0.01 pH
Stability	0.25% / year at 77 °F (25 °C)

2.4.2 Contacting conductivity specifications

Measured range	0-20,000 µS/cm
Calibration	To calibrate, immerse the sensor in a known solution and enter its value or enter the cell constant for ultra-pure applications.
Automatic temperature compensation	3-wire Pt 100 or Pt 1000 resistance temperature device (RTD) Conductivity: 32 to 392 °F (0 to 200 °C) Resistivity: 32 to 212 °F (0 to 100 °C) Low conductivity: 32 to 212 °F (0 to 100 °C)
Accuracy	± 0.5% of reading and ±0.001 µS/cm

Repeatability	± 0.25% of reading
Stability	0.25% of output range/month, non-cumulative
Ambient temperature coefficient	± 0.05% of reading/°C
Temperature slope adjustment	0 to 5%/°C
Other temperature compensation algorithms	Ultra-pure water compensation Cation conductivity Raw (uncompensated) conductivity
Compatible RTD	100 Ohm or 1000 Ohm with automatic recognition

2.4.3 Toroidal conductivity specifications

Measured range	50 to 2,000,000 µS/cm
Calibration	To calibrate, immerse the sensor in a known solution and enter its value.
Automatic temperature compensation	3-wire Pt 100 resistance temperature device (RTD) Conductivity: 32 to 392 °F (0 to 200 °C) % concentration: 32 to 212 °F (0 to 100 °C)
Accuracy	±1.0% of reading
Repeatability	±0.25% of reading
Stability	0.25% of output range/month, non-cumulative
Ambient temperature coefficient	±0.2% of FS/°C
Temperature slope adjustment	0 to 5% / °C
% concentration ranges	Sodium hydroxide: 0 to 15% Hydrochloric acid: 0 to 16% Sulfuric acid: 0 to 25% and 96 to 99.7%

2.4.4 Dissolved oxygen specifications

Measurement range	0 - 99 ppm (mg/L), 0 - 200 saturation
Resolution	0.01 ppm, 0.1 ppb for Rosemount 499ATrDO sensor
Temperature correction for membrane permeability	Automatic between 32 and 122 °F (0 and 50 °C). Can be disabled.
Calibration	Air calibration (user must enter barometric pressure) or calibration against a standard instrument

2.4.5 Free chlorine specifications

Measurement range	0-20 ppm (mg/L) as Cl_2
Resolution	0.001 ppm (auto-ranges at 0.999 to 1.00 and 9.99 to 10.0)
Temperature correction for membrane permeability	Automatic between 32 and 122 °F (0 and 50 °C). Can be disabled.

pH correction	Automatic between pH 6.0 and 9.5. Manual pH correction is also available.
Calibration	Calibrate against grab sample with portable test kit.

2.4.6 Total chlorine specifications

Measurement range	0-20 ppm (mg/L) as Cl_2
Resolution	0.001 ppm (auto-ranges at 0.999 to 1.00 and 9.99 to 10.0)
Temperature correction for membrane permeability	Automatic between 41 and 95 °F (5 and 35 °C). Can be disabled.
Calibration	Calibrate against grab sample with portable test kit.

2.4.7 Ozone specifications

Measurement range	0-10 ppm (mg/L)
Resolution	0.001 ppm (auto-ranges at 0.999 to 1.00 and 9.99 to 10.0)
Temperature correction for membrane permeability	Automatic between 41 and 95 °F (5 and 35 °C). Can be disabled.
Calibration	Against grab sample analyzed using portable test kit.

2.4.8 Percent oxygen in gas

Measurement range	0 - 25% oxygen
Resolution	0.1% - TBD
Calibration	Air calibration (automatic measurement of barometric pressure with internal pressure sensor)
Sample pressure	0 to 50 psig
Sample temperature	32 to 110 °F (0 to 43 °C)

2.5 Ordering information

The Rosemount 5081 two-wire transmitter is intended for the determination of pH/ORP, conductivity (both contacting and toroidal), and for measurements using membrane-covered amperometric sensors (oxygen, ozone, and chlorine). For free chlorine measurements, which often require continuous pH correction, a second input for a pH sensor is available. Use a hand-held infrared remote controller to locally configure and calibrate the transmitter.

Rosemount 5081	**Smart two-wire microprocessor transmitter**
Option	**Description**
P	pH/ORP
C	Contacting conductivity

T	Toroidal conductivity
A	Amperometric (oxygen, ozone, and chlorine)
Option	**Description**
HT	Analog 4-20 mA output with superimposed HART® digital signal
FF	FOUNDATION™ Fieldbus digital output
FI	FOUNDATION Fieldbus digital input with FISCO
Option	**Description**
20	Infrared remote controller included
21	Infrared remote controller not included
Option	**Description**
60	No approval
67	FM approved intrinsically safe, non-incendive (when used with appropriate sensor and safety barrier), and explosion-proof
69	CSA approved intrinsically safe, non-incendive (when used with appropriate sensor and safety barrier), and explosion-proof
73	ATEX/IECEx approved intriniscally safe (when used with appropriate sensor and safety barrier)
Example	**5081-P-HT-20-67**

3 Install

3.1 Unpack and inspect

To unpack the instrument:

Procedure

1. Inspect the shipping container(s). If there is damage, contact the shipper immediately for instructions.
2. If there is no apparent damage, unpack the container(s).
3. Ensure that all items shown on the packing list are present.
   If items are missing, contact your local Customer Care representative
4. Save the shipping container and packaging.
   They can be used to return the instrument to the factory in case of damage.

3.2 Installation guidelines

1. The transmitter tolerates harsh environments. For best results, install the transmitter in an area where temperature extremes, vibrations, and electromagnetic and radio frequency interference are minimized or absent.
2. To prevent unintentional exposure of the transmitter circuitry to the plant environment, keep the security lock in place over the circuit end cap. To remove the circuit end cap, loosen the lock nut until the tab disengages from the cap end and then unscrew the cover.
3. The transmitter has two ¾-in. conduit openings, one on each side of the housing. Run sensor cable through the left side opening (as viewed from the wiring terminal end of the transmitter) and run power wiring through the right side opening.
4. Use water tight cable glands to keep moisture out of the transmitter.
5. If using conduit, plug and seal the connections at the transmitter housing to prevent moisture from getting inside the transmitter.

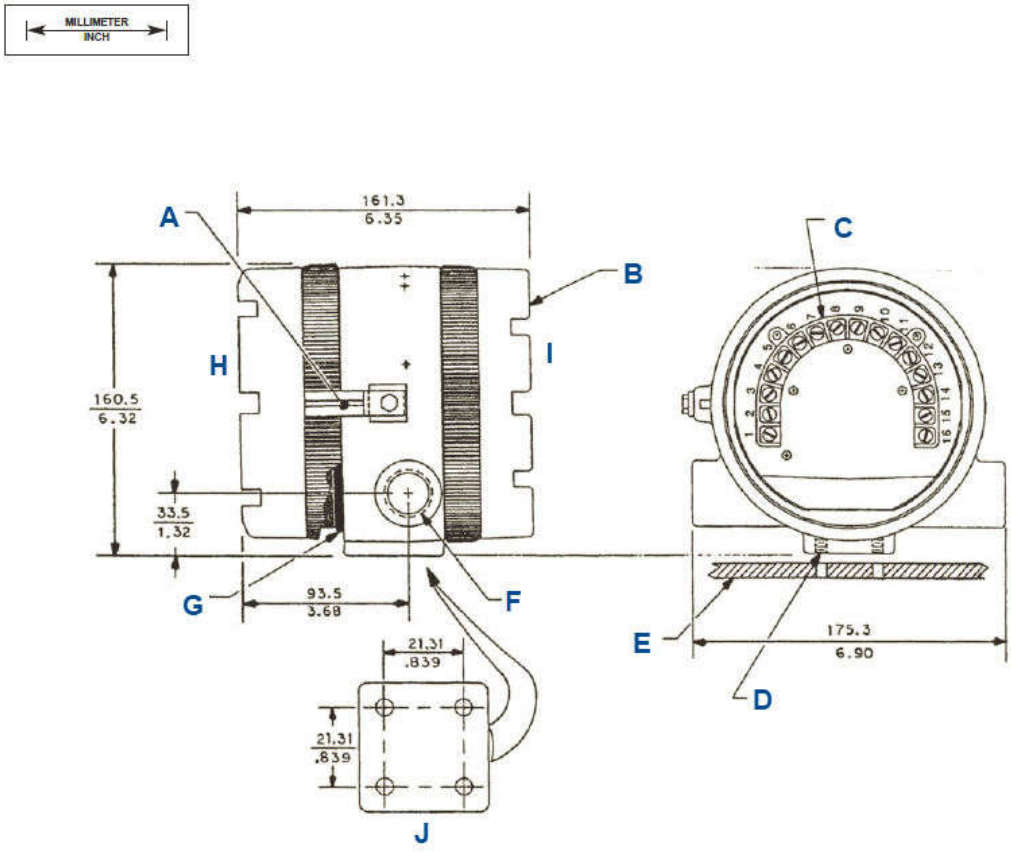
   ⚠ CAUTION

   Equipment damage

   Moisture accumulating in the transmitter housing can affect the performance of the transmitter and may void the warranty.

6. If the transmitter is installed some distance from the sensor, a remote junction box with preamplifier in the junction box or in the sensor may be necessary. Consult the sensor reference manual for maximum cable lengths.

3.3 Orient the display board



The display board can be rotated 90 degrees, clockwise or counterclockwise, from the original position. To reposition the display:

Procedure

1. Loosen the cover lock nut until the tab disengages from the circuit end cap. Unscrew the cap.
2. Remove the three bolts holding the circuit board stack.
3. Lift and rotate the display board 90 degrees, clockwise or counterclockwise, into the desired position.
4. Position the display board on the stand offs. Replace and tighten the bolts.
5. Replace the circuit end cap.

3.4 Mount on a flat surface

Figure 3-1: Mounting Transmitter on a Flat Surface

B. *Threaded cap (two places)*
C. *Terminal block (TB). Terminal end cap omitted for clarity this view.*
D. *¼-in. - 20 threads (four places)*
E. *Surface plate (by others)*
F. *O-ring (two places)*
G. *Circuit end*
H. *Terminal end*
I. *Flat surface mounting pad hole pattern*

3.5 Mount on a pipe

Use pipe mounting kit (23820-00 or 23820-01).

Figure 3-2: Mounting Transmitter on a Pipe

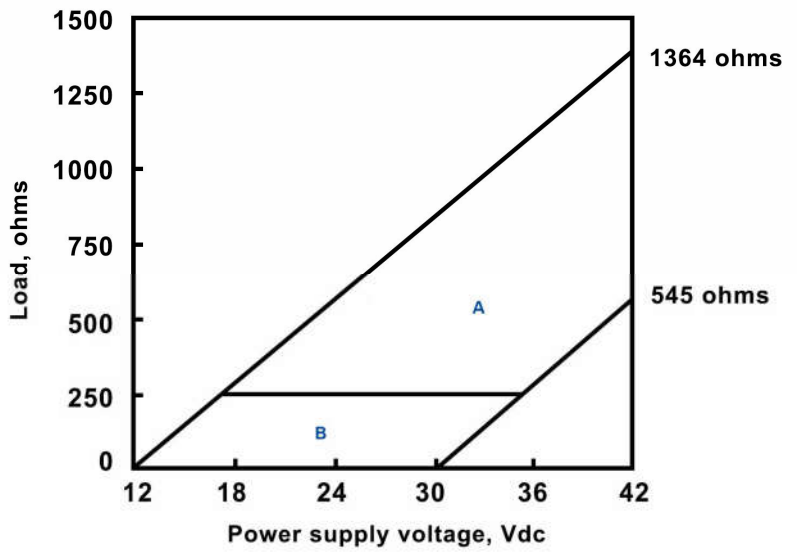
A. *Over look*
B. *Terminal block*
C. *Kit, 2-in. pipe/wall mounting bracket*
   Order PN2002577 as a separate item.
D. *½ - 20 threads*
E. *¼ - 20 screw*
   Screws furnished with mounting kit only. Not furnished with transmitter.
F. *1½-in. to 2-in. pipe (customer furnished)*
G. *U-bolt*

H. 5/16 washer
I. 6/18 - 18 nut
J. ¾ - 14 FNPT (two places)
K. 2-in. pipe supplied by customer
L. ¾ - 14 NPT (two places)
M. Threaded cap, two places
N. Circuit end
O. Terminal end
P. Terminal end cap omitted for clarity this view
Q. Four mounting holes
R. Bottom view

4 Wire

4.1 Wiring overview

To find wiring diagrams for specific sensors, check the wiring sections of the reference manuals for those particular sensors.



4.2 Power supply/current loop

4.2.1 Power supply overview

The tables below display the minimum and maximum voltages needed to operate the transmitter.

Minimum supply voltage at the transmitter terminals	12.0 Vdc
Minimum power supply for load resister	250 Ohms
Maximum power supply voltage	42.0 Vdc
Maximum power supply voltage for intrinsically safe installations	30.0 Vdc

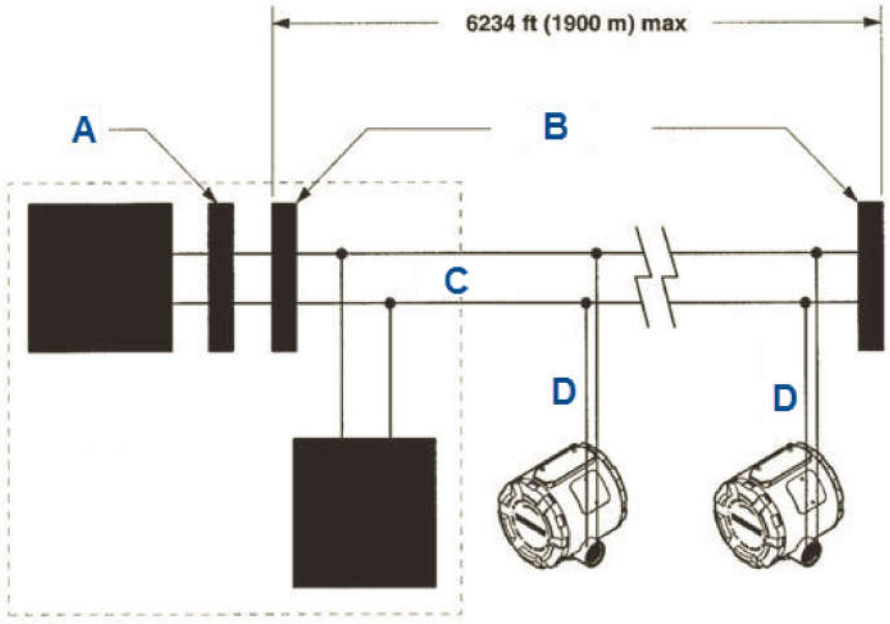
Figure 4-1: Power Supply Voltage for HART® or without HART Communication Configurations

A. With HART communication
B. Without HART communication

Table 4-1: Values from Graph

Upper line	Power supply voltage needed to provide 12 Vdc at the transmitter terminals for a 22 mA current
Lower line	Power supply voltage needed to provide 30 Vdc for a 22 mA current
Maximum current	About 24 mA
Minimum load for digital communications	250 Ohms
Minimum power supply voltage to supply the 12.0 Vdc lift off voltage at the transmitter	17.5 Vdc

4.2.2 Wire to HART® or FOUNDATION™ Fieldbus communication protocol



Procedure

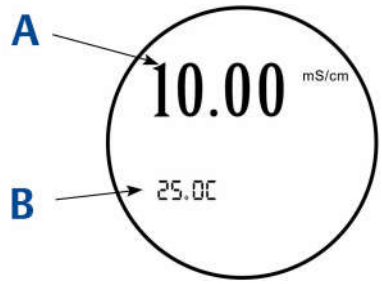
1. Run the power/signal wiring through the opening nearest terminals 15 and 16.
2. Use shielded cable and ground the shield to the power supply.
3. To ground the transmitter, attach the shield to the grounding screw on the inside of the transmitter case.

   You can also use a third wire to connect the transmitter to earth ground.

Note
For optimum EMI/RFI immunity, shield the power supply and enclose it in an earth ground metal conduit. Do not run power supply/signal wiring in the same conduit or cable tray with AC power lines or with relay actuated signal cables. Keep power supply/signal wiring at least 6 ft. (2 m) away from heavy electrical equipment. An additional 0-1 mA current loop is available between TB-14 and TB-15. A 1 mA current in this loop signifies a sensor fault. See Figure 4-2 for wiring instructions. See Diagnostics and troubleshooting for more information about sensor faults.

Figure 4-2: General Wiring Architecture

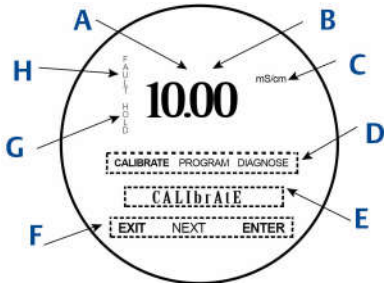
A. Filter
B. Terminators
C. Trunk
D. Spur



The power supply, filter, first terminator, and configuration device are typically located in the control room.

5 Display and operate

5.1 User interface and main display

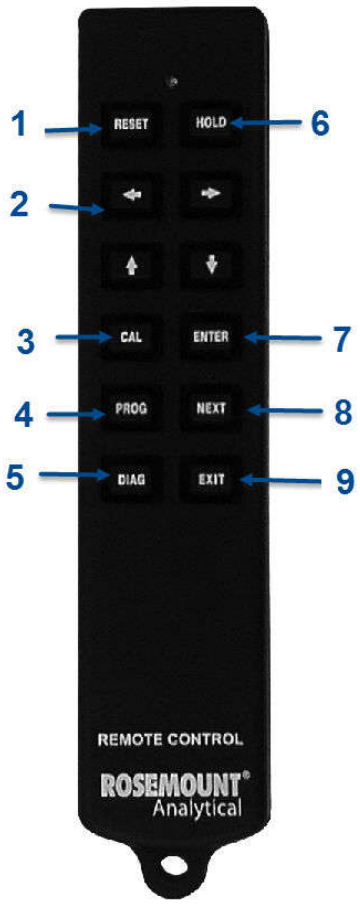


The following are examples of the main (process) display screen (Figure 5-1) and the program display screen (Figure 5-2).

Figure 5-1: Main Display Screen

A. Conductivity value
B. Temperature in °C or °F

Figure 5-2: Program Display Screen



A. Indicates HART® or FOUNDATION™ Fieldbus digital communiciations
B. Conductivity value
C. Units of display
D. Active menu: CALIBRATE, PROGRAM, or DIAGNOSE
E. Sub-menus, prompts, and diagnostic messages appear here.
F. Available commands for sub-menus, prompts, or diagnostic messages
G. Appears when transmitter is in hold
H. Appears when a disabling condition has occurred

5.2 Infrared remote control (IRC)

Use the IRC to read diagnostics messages, calibrate connected sensors, and program the transmitter. Hold the IRC within 6 ft. (1.8 m) of the transmitter and less than 15 degrees from the horizontal of the display window.

Figure 5-3: Infrared Remote Control (IRC) Functions

1. **RESET** • End current operation and return to the main display. • Changes are not saved. • Does not return the transmitter to factory default settings.		6. **HOLD** • Access to turn hold readings on or off.
2. Editing (arrow) keys • Change values of a flashing display. • Left and right arrows move the cursor by one digit. • Up and down arrows increase or decrease the values and navigate through the display options.		7. **ENTER** • Advance to the next prompt. • Store selected item. • Store value in memory.
3. **CAL** • Access to ***Calibration*** menu.		8. **NEXT** • Advance to the next sub-menu.
4. **PROG** • Access to ***Program*** menu.		9. **EXIT** • End current operation. • Return to the first prompt in the present sub-menu. • Changes are not saved.
5. **DIAG** • Access to diagnostics.		

Guidelines for using IRC

- Do not use harsh chemicals or abrasive brushes when cleaning the remote control.
- If the green LED does not light when you press a key, the issue is probably a weak battery. To restore operation, remove four screws to access and replace the two batteries. Observe the two warning messages posted at the rear of the remote control.
- Requires two 1.5 V AAA batteries. If used in hazardous areas, replacement batteries must be Energizer E92/EN92 or Duracell MN2400/PC2400.
- All functions for remote control PN 24479-00 are the same as those for the previous remote control, PN 23572-00.

5.3 Menu system

There are three main menus: ***Calibrate***, ***Program***, and ***Diagnose***. ***Calibrate*** and ***Program*** menus have additional sub-menus as shown in the figures below.

Table 5-1: Program Menu

Displayed item	Definition
OUtpUt	Current output menu header
4MA	4 mA current output (setpoint)
20MA	20 mA current output (setpoint)
HoLd	Current output on hold
FAULt	Fault condition current output setting
dPn	Current output dampening time
tESt	Current output test value
tAUtO	Automatic temperature compensation
tMAn	Manual temperature compensation
dISPLAY	Display menu header
tYP	Measurement type
tEMP	° C/° F toggle selection
OUtPUt	Current (mA) or percent of full scale display
COdE	Access code
OFFSt	Offset value

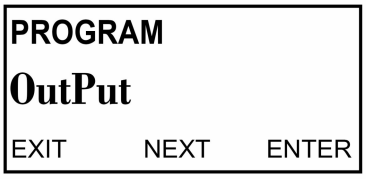
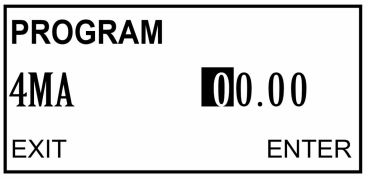
6 Programming basics

6.1 Programming



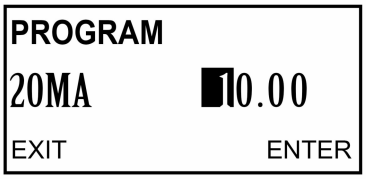
The following can be programmed in the Rosemount™ 5081:

- 4-20 mA outputs
- Current generated by the transmitter during hold
- Current generated by the transmitter when fault is detected
- Automatic temperature correction (enable or disable)
- Type of measurement
- Measurement range
- Factory default setting

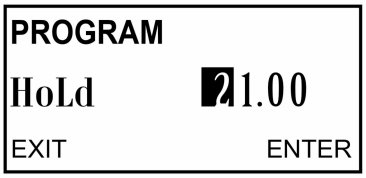


6.2 Test 4-20 mA outputs and current generated during hold and faults

Procedure



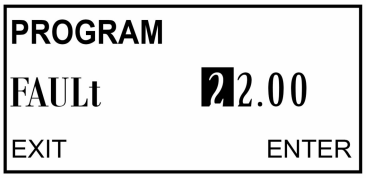
1. Press **PROG** on the remote controller.
   The *OUTPUT* submenu appears.



2. Press **ENTER**.
   The screen displays the `4mA` prompt.

3. Use the arrow keys to change the setting. Press **ENTER** to save.
   The screen displays the `20mA` prompt.

4. Use the arrow keys to change the setting. Press **ENTER** to save.
   The screen displays the `HOLD` prompt.



5. Use the arrow keys to change the setting to the output desired when the transmitter is in hold mode.

   The range is 3.80 to 22.0 mA. If you select 00.00, the transmitter will hold the output value.

6. Press **ENTER** to save.

Note
The hold setting overrides the fault setting.

   The screen displays the `FAULT` prompt.

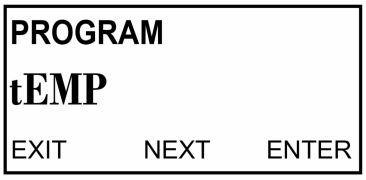
7. Use the arrow keys to change the setting to the output desired when the transmitter is in fault mode.

   The range is 3.80 to 22.0 mA. If you select 00.00, the transmitter will hold the output value.

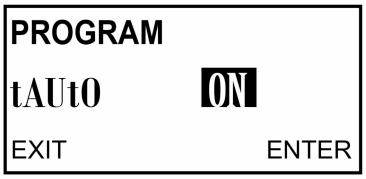
8. Press **ENTER** to save.
   The screen displays the `DPN` prompt.

9. Use the arrow keys to change the setting.
   The range is 0 to 225.

10. Press **ENTER** to save.
    The screen displays the `TEST` prompt.

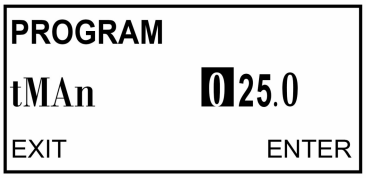


11. Use the arrow keys to enter the desired test current. Press **ENTER** to start the test. Press **EXIT** to end the test.
12. Press **RESET** to return to the main display.



6.3 Correct temperature

Procedure



1. Press **PROG**. Press **NEXT** until the ***TEMP*** submenu appears on the display.

2. Press **ENTER**.
   The screen displays the `T AUTO` prompt.

3. Use the up or down arrow keys to enable (ON) or disable (OFF) the automatic temperature correction feature. Press **ENTER** to save.
   The screen displays the `T MAN` prompt.

4. Use the arrow keys to change to the desired temperature.

   To enter negative numbers, press the left or the right arrow key until no digit is flashing. then press the up or down arrow keys to display the negative sign. The range is 23 to 266 ° F (-5.0 to 130 °C).

5. Press **ENTER** to save. Press **RESET** to return to the main display.

Note
If you disabled T AUTO in Step 3, then the transmitter will use the temperature entered in this step in all subsequent measurements, no matter the actual process temperature.

6.4 Set up a custom curve (conductivity measurements only)

Use custom curves to correlate conductivity to concentration of the measured liquid. The Rosemount 5081 has programmable custom curves that can create a curve (second order) from three to five user supplied points. If it only uses two points, then then the transmitter creates a linear curve (straight lin). In order for the curve to be accurate, take the data points from the liquid having the same reference temperature.

To obtain best results, select data points that are representative of the typical operating range and have at least 5% difference in conductivity values. Observe the graph of conductivity vs. concentration for the particular liquid to ensure that unsuitable points are avoided. Unsuitable points include conductivity values with two concentrations associated with them. In addition to unsuitable points, record any critical points - points that best describe the curve. Following these general guidelines will provide optimal results.

Enter the first point (COND 1) at the normal operating condition. Then enter other points above and below COND 1. Nonlinear conductivity curves require additional data points to characterize these regions. Do not use the same data point more than once and only use actual data (do not interpolate data points).

Note
The default values for the custom curve are three data points, reference temperature of 77 °F (25 °C), and a linear temperature slope of two percent/°C. This combination will yield the best results in most applications. If the normal temperature is over 104 °F (40 °C) or under 50 °F (10 °C), change the reference temperature to the normal process temperature. If known, use the temperature slope at the reference temperature.

Procedure

1. From the main menu, select PROG and then press **NEXT** four times.
   `SETUP CUST` appears.
2. Press **ENTER**.
   `T REF` appears.
3. If needed, change the reference temperature from the factory default 77 °F (25 °C) to a different reference temperature for the process. Press **ENTER**.
   `UNIT` appears.
4. Press the up or down arrow to select the desired measurement units: `µS` (microsiemens), `mS` (millisiemens), `none` (no units displayed), `%` (percent), or `ppm` (parts per million); then press **ENTER**.
   `NUM PTS` appears.

5. Press up or down arrows to select the desired number of data points for a custom conductivity curve. Select `2` to generate a linear relationship for conductivity and concentration at the given temperature.
   a) Enter the concentration for point 1 (displayed as `µS 1`). Press **ENTER**.
   b) Enter the known conductivity for point 1 in µS/cm. Press **ENTER**.
   c) Complete this process for additional known data points. Press **ENTER**.
   `CALC CUST` appears briefly.
   d) Press **ENTER**.
   `PROCESSING` appears briefly; then `APPLY CUST` appears.
   e) Press **ENTER** to register the custom curve into memory and return to the ***SETUP CUST*** screen.

The custom curve will now be used to display and output all conductivity measurement when the operator selects `CUST` as the measurement type in the ***Display*** menu.

6.5 Restore to factory default settings

The operator can erase user-defined configurations to return the transmitter to the factory default settings.

Procedure

1. Press **PROG** on the remote controller.
2. Press **NEXT** until `DEFAULT` appears in the display. Press **ENTER**.
3. Use the up and down arrows to toggle between NO and YES. Press **ENTER** to return to the factory default settings.

6.6 Set access (security) code

6.6.1 Security overview

The access (security) code prevents program and calibration settings from accidental changes. Emerson ships the transmitter with the access (security) code disabled.

6.6.2 Enter the access (security) code

Procedure

1. If calibration and program settings are protected with a security code, press **PROG** or **CAL** on the infrared remote controller.
   The ***ID*** screen appears.
2. Use the editing keys to enter the code. Press **ENTER**.
   If the code is correct, the first sub-menu appears. If the security code is incorrect, the process display reappears.

6.6.3 Retrieve a lost security code

Procedure

1. If the you forget the security code, enter `555` at the ID prompt and press **ENTER**.
   The transmitter displays the present code.
2. Press **EXIT** to return to the process display.
3. Press **PROG** or **CAL**.
   The ***ID*** screen appears.
4. Use the editing keys to enter the security code. Then press **ENTER**.
   The first sub-menu under the selected menu appears.

6.7 Activate or deactivate HOLD

Activating HOLD keeps the transmitter output at the last value or sends the output to a previously determined value. This is particularly useful when doing calibrations. During calibrations, the sensor may be exposed to solutions that have concentrations outside the normal range of the process. HOLD prevents false alarms and undesired operation as a result of that reading. You can deactivate HOLD when the sensor is reinstalled in the process stream and the readings have relatively stabilized.

Procedure

1. Press **HOLD** on the remote controller.
   The `HOLD` prompt appears in the display.
2. Press **3** (up) or **5** (down) to toggle HOLD between ON and OFF.
3. Press **ENTER** to save.

7 Measurements

7.1 Calibrating pH sensors

7.1.1 Calibration overview

The ***Calibration*** menu allows you to calibrate the pH and temperature response of the sensor. To calibrate, use either the manual or the auto-calibration option. In both cases, the transmitter does a two-point calibration for pH and one-point standardization against a reference thermometer for temperature. In auto-calibration, the transmitter automatically stores the temperature-corrected calibration data. In manual calibration, you have to enter buffer values. The values are only registered when the readings are stable (automatically determined by the transmitter). All calibration procedures are guided by prompts on the display.

7.1.2 Calibration standards (buffer solutions)

- Calibrations are critical to make accurate pH measurements.
- Emerson recommends that the value of one of the pH buffer solutions is lower than the pH of the process stream and the value of the other pH buffer solution is higher than the pH of the process stream.
- For best results, make sure that the temperature of the solution is the same temperature as that of the sensor. Allow the entire measurement cell, sensor, and solution to reach relatively constant temperature.
- Using buffers at high temperatures can cause evaporation, which will change the concentration of the buffer. The change in concentration causes a change in the pH, thus resulting in an inaccurate calibration.
- Buffers have limited shelf lives. Do not use a buffer if the expiration date has passed. Store buffers at controlled room temperatures.
- Do not reuse buffer solutions. Protect buffers from excessive exposure to air. Exposure to air can cause changes in the pH of the buffer solution.
- Always rinse the sensor with DI water and remove excess water by dabbing with a clean tissue before placing it in a buffer. Only dab the sensor and do not wipe it. Wiping the sensor builds static charge which alters the reading.

7.1.3 Auto-calibrate

Prerequisites

Ensure that auto-calibration is turned ON and the appropriate buffers are used.

Procedure

1. Press **CAL** on the IRC to enter the ***CALIBRATE*** menu.

The *CALIBRATE* sub-menu appears.

2. At the *CALIBRATE* sub-menu, press **ENTER**.
   The `CAL bF1` prompt appears.
3. Rinse the sensor and place it in the first buffer. Be sure the glass bulb and the temperature element are completely submerged. Keep the sensor at least 3 in. below the liquid level. Do not rest the sensor on the glass bulb. Dislodge any trapped bubbles by swirling the sensor body.
4. Press **ENTER**.
   `BF1` flashes until the measured pH meets the programmed stability limits. If the pH reading is not relatively stable after 20 minutes, the transmitter automatically leaves the *CALIBRATE* menu and returns to the main display. If this occurs, consult Diagnostics and troubleshooting for assistance. Once the reading is stable, the display moves forward by showing a flashing number with the nominal pH.
5. Change the value by using the up and down arrows until the correct pH of the buffer solution appears. Press **ENTER** to save the first calibration point.
   `CAL BF2` appears.
6. Remove the sensor from the first buffer.
7. Rinse the sensor and place it in the second buffer solution. Again, make sure the bulb is completely submerged and the bubbles are dislodged by swirling the sensor body.
8. Press **ENTER**.
   `BF2` flashes until the reading is stable.
9. Repeat steps Step 4 and Step 5.
   The calibration is now complete, but the transmitter remains in the *CALIBRATE* sub-menu for two minutes after you press **ENTER**.
10. Remove the sensor from the buffer and reinstall it into the process stream. If the HOLD feature was used, be sure to turn off HOLD.

    The sensor will not calibrate if the electrode slope (calculated by the transmitter during calibration) is unacceptable. The transmitter displays a `SLOPE ERR HI` or `SLOPE ERR LO` error message. Refer to Diagnostics and troubleshooting for assistance.

Note
To display the electrode slope, press **CAL** on the IRC. The *CALIBRATE* sub-menu appears. Press **NEXT**. The *STD* sub-menu appears. Press **ENTER**. The `STD` prompt appears. Press **ENTER** again, and the slope appears on the display. For a good sensor, the slope is generally 50 to 60 mV.

7.1.4 Calibrate manually

Prerequisites

Ensure that auto-calibration is OFF and the appropriate buffers are used.

Procedure

1. Press **CAL** on the IRC to enter the *CALIBRATE* menu.

The *CALIBRATE* sub-menu appears.

2. At the *CALIBRATE* sub-menu, press **ENTER**.
   The `CAL BF1` prompt appears.
3. Rinse the sensor with DI water and place it in the first buffer along with a calibrated thermometer. Submerge the sensor tip at least 3 in. (76 mm) below the liquid level. Do not rest the sensor on the glass bulb. Dislodge any trapped bubbles by swirling the sensor body.
4. Once the pH reading and temperature are relatively stable, press **ENTER**. Use the editing keys to change the flashing display to the appropriate pH of the buffer solution. Press **ENTER** to save the value as buffer BF1.
   The transmitter expects a reading to be entered within 20 minutes after the `CAL BF1` prompt. If you do not press **ENTER**, the transmitter exits the *CALIBRATE* menu and returns to the process mode.
5. At the `CALBF2` prompt, remove the sensor from the first buffer. Repeat steps Step 3 and Step 4.
   The calibration is now complete, but the transmitter remains in the *CALIBRATE* sub-menu for two minutes after you press **ENTER**.
6. Remove the sensor from the buffer and reinstall it into the process stream. If the HOLD feature was turned on, be sure to turn off HOLD.

   The sensor will not calibrate if the electrode slope (calculated by the transmitter during calibration) is unacceptable. The transmitter displays a SLOPE ERR HI or SLOPE ERR LO error message. Refer to Diagnostics and troubleshooting for assistance.

Note
To display the electrode slope, press **CAL** on the IRC. The *CALIBRATE* sub-menu appears. Press **NEXT**. The *STD* sub-menu appears. Press **ENTER**. The `STD` prompt appears. Press **ENTER** again, and the slope appears on the display. For a good sensor, the slope is generally 50 to 60 mV.

7.1.5 Standardize for pH

Use standardization to match the transmitter values with those of another transmitter. The transmitter converts the difference between the two pH values into an equivalent voltage, called the reference offset.

Note
If a sensor that has been calibrated with buffers is standardized, then placing it back in the buffer will show a different measured pH than that of the buffer due to the standardization offset.

Procedure

1. Press **CAL** on the IRC to enter the *CALIBRATE* menu.
   The *CALIBRATE* submenu appears.
2. At the *CALIBRATE* submenu, press **NEXT**.
   The *STD* submenu appears.
3. Press **ENTER** to enter the STD prompt.

The process pH and temperature should be relatively stable.

4. Take a grab sample from the process stream as close to the pH sensor as possible.
   This transmitter reading is called the pH_trans.
5. Measure the pH of the sample (pH_std) using the second pH meter.
6. Note the current process reading (pH_curr). Calculate the corrected reading from the equation: ph_corr = ph_curr + (pH_std - pH_trans)
   - pH_corr = corrected pH value
   - pH_curr = current pH value
   - pH_std = standard instrument's pH value
   - pH_trans = measured sample's pH value
7. Use the editing keys to enter the pH_corr value calculated using the equation above. Press **ENTER** to save the value.
   If the corrected value is acceptable, then the display shows the slope (current electrode slope).
8. If the slope is acceptable, press **EXIT**. If the slope is unacceptable, use the editing keys to change it. Then press **ENTER**.
9. To leave the *CALIBRATE* menu, press **EXIT**.

7.2 Calibrating oxidation reduction potential (ORP) sensors

7.2.1 Oxidation reduction potential (ORP) overview

ORP is a function of temperature. The accuracy of a sensor/transmitter loop is about ±1 °C. A new sensor does not need to be calibrated often. Only calibrate the loop when:

1. ±1 °C is not acceptable.
2. You suspect an error in temperature measurement

7.2.2 Calibrate temperature with an oxidation reduction potential (ORP) sensor

Procedure

1. Place the ORP sensor and a reference thermometer in an insulated container of water at ambient temperature. Keep the sensor submerged at least 3 in. (76 mm) below the water level. Stir continuously and wait at least 20 minutes for the water, sensor, and thermometer to reach a constant temperature.
2. Press **CAL** on the IRC to enter the *CALIBRATE* menu.
   The *STD* submenu appears.
3. At the *STD* submenu, press **NEXT**.
   The *TEMP ADJ* submenu appears.

4. Press **ENTER** to display the temperature editing prompt.
5. Compare the temperature displayed by the transmitter with the temperature measured by the reference thermometer. If there is a discrepancy between the two values, use the editing keys to change the measured value to that of the thermometer.

Note
The reading cannot be changed more than 15 °C.

6. Press **ENTER**.
   The transmitter saves the value, and the display returns to the ***TEMP ADJ*** submenu.
7. Press **EXIT** to leave the ***CALIBRATE*** menu.
8. Check for linearity by measuring the temperature of water: -10 to -15 °C and +10 to +15 °C than the water used for calibration.

7.2.3 Standardize with an oxidation reduction potential (ORP) sensor

ASTM d 1498-93 gives procedures for making iron (ii) - iron (iii) and quinhydrone ORP standards. Emerson recommends the iron (ii) - iron (iii) standard. It is fairly easy to make and has a shelf life of approximately one year; in contrast, quinhydrone standards contain toxic quinhydrone and have only an eight hour shelf life. Iron (ii) - iron (iii) standard is available from Rosemount™ as PN R508-16OZ. The ORP of the standard solution measured against a silver-silver chloride reference electrode is 476 ± 20 mV at 77 °F (25 °C).

Procedure

1. Press **CAL** on the IRC to enter the ***CALIBRATE*** menu.
   The ***STD*** submenu appears.
2. Rinse the sensor with DI water and place it in the ORP standard with a reference thermometer. Ensure that the ORP sensor is submerged at least 3 in. (76 mm) below the water level.
3. Once the temperature and ORP readings are stable, press **ENTER**.
4. Use the editing keys to change the flashing display to the desired ORP reading. Press **ENTER** to save.
5. Press **EXIT** to return to the main display.

7.2.4 Match transmitter to oxidation reduction potential (ORP) sensor's temperature element

Procedure

1. Press **PROG** on the IRC.
2. Press **NEXT** until the ***TEMP*** submenu appears in the display. Press **ENTER**.
3. Press **EXIT** to return to the main display.

7.3 Calibrating contacting and toroidal conductivity sensors

7.3.1 Overview of calibrating contacting conductivity sensors

Contacting conductivity sensors do not require frequent calibrations. The sensors are ready to be installed right out of the box.

7.3.2 Calibrate contacting conductivity sensors

Procedure

1. Pres **CAL** on the IRC. Press **ENTER**.
   The *CALIBRATE* submenu appears.
2. Place the sensor in a standard solution of known conductivity and allow the measurement reading to become relatively stable.
3. Press **ENTER** to access the CAL segment with the flashing prompt.
4. Use the IRC editing keys to enter the conductivity value of the standard solution. Press **ENTER**.
5. Press **EXIT** to return to the main display.

7.3.3 Zero the sensor

Procedure

1. Press **CAL** and then **NEXT** to enter the *SENSOR 0* menu.
2. Press **ENTER** to access the *SENSOR 0* submenu.
3. Hold the sensor in the air and press **ENTER** again to zero the sensor.
4. Press **EXIT** to return to the *SENSOR 0* submenu.

7.3.4 Adjust temperature

Procedure

1. Press **CAL** and then **NEXT** until you see `TEMP`.
2. Press **ENTER**.
   The *TEMP* submenu appears.
3. Place the sensor in any solution of known temperature. Allow the temperature of the sensor to become relatively stable.
4. Use the editing keys of the IRC to change the values as needed.
5. Press **ENTER** to standardize the temperature reading and return to the *TEMP ADJ* screen.
6. Press **EXIT** to return to the main display.

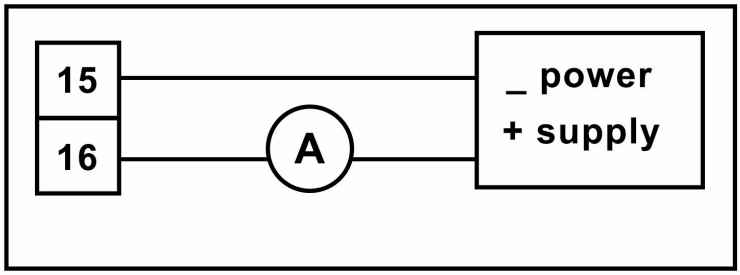
7.3.5 Calibrate in-process

Procedure

1. Press **CAL** and then **NEXT** three times to access MTR CAL.
2. Use the IRC to go through the on-screen prompts.
3. Press **EXIT** to return to the main display.

7.3.6 Calibrate temperature slope

Procedure



1. From the *CAL* menu, press **NEXT** until `TEMP SLOPE` displays.
2. Use the IRC arrow keys to enter the slope. Press **ENTER** to register the slope in the memory of the transmitter. Press **EXIT** to return to the main screen.
3. If you don't know the temperature slope of the process, then refer to the below guide:
   - Acids: 1.0 percent to 1.6 percent per °C
   - Bases: 1.8 percent to 2.2 percent per °C
   - Salts: 2.2 percent to 3.0 percent per °C
   - Water: 2.0 percent per °C
4. Press **ENTER** to proceed to the *T SLOPE* submenu with the flashing prompt. Use the IRC keys to generate the desired slope value. Press **ENTER**.
5. Press **EXIT** to return to the main screen.

7.3.7 Calibrate output

Procedure

1. Wire an accurate milliammeter as shown in Figure 7-1.

Figure 7-1: Milliammeter Wiring

2. Press **CAL** on the IRC.
3. Press **NEXT** until the *OUTPUT CAL* submenu appears. Press **ENTER**.

4. Use the arrow keys to change the display to match the reading from the milliammeter. Press **ENTER**.
5. Press **RESET** to return to the main display.

7.4 Calibrating dissolved oxygen, ozone, free chlorine, total chlorine, and ozone sensors

7.4.1 Calibrating amperometric sensors

You can calibrate amperometric sensors in multiple ways: zeroing, air calibrations, dual slope calibrations, and in process calibrations.

7.4.2 Zero the sensor

Procedure

1. Place the sensor in a solution of 5% sodium sulfite (Na_2SO_3) in water. Ensure that air bubbles are not trapped against the membrane.
2. Go to the main display; press **DIAG** and then **NEXT**.
   The `SENSOR CUR` prompt appears.
3. Press **ENTER** to view the sensor current. Make sure the sensor reaches its zero current.

   This may require several hours. Do not start the zero routine until the sensor has been in zero solution for at least two hours.
4. Press **CAL** on the IRC.
   The `SENSOR 0` prompt appears.
5. Press **ENTER**.
   The screen shows the appropriate value correlating to the zero value. The screen shows `0.02`. The reading must be below 0.02 ppm for the zero calibration to be accepted.
6. To change the zero limit, use the editing keys and then press **ENTER**.
   The `TIME DELAY` message appears and remains until the zero current is below the concentration limit. If the current is already below the limit, `TIME DELAY` will not appear.
7. To bypass the time delay, press **ENTER**.
   When the procedure is complete, `0 DONE` appears.
8. Press **EXIT**.
9. Press **RESET** to return to the main display.

7.4.3 Calibrate in air (dissolved oxygen)

Procedure

1. Remove the sensor from the process liquid. Use a soft tissue and a wash bottle to clean the membrane. Dry it by blotting.
   The membrane must be completely dry during air calibration.
2. Pour some water into a beaker and suspend the sensor with the membrane approximately ½ in. (approximately 1 cm) above the water surface.
   Keep the sensor out of direct sunlight.
3. Monitor the dissolved oxygen and temperature reading. Once the readings are relatively stable, begin the calibration.
   It may take 10 - 15 minutes for the sensor reading in the air to stabilize.
4. Press **CAL** on the IRC.
5. Press **NEXT**.
   The *SENSOR CAL* submenu appears.
6. Press **ENTER**.
   The `AIR CAL` prompt appears.
7. Press **ENTER**.
8. Select the units. Then press **NEXT**.
9. Use the arrow keys to enter the barometric pressure. Press **ENTER** when done.
   The `TIME DELAY` message appears and remains until the sensor reading is relatively stable.
10. To bypass the time delay, press **ENTER**.
    `CAL DONE` appears when the calibration is complete.
11. Press **EXIT**.
12. To return to the main display, press **RESET**.

7.4.4 Calibrate in process (dissolved oxygen)

You can calibrate the sensor against a standard instrument.

Procedure

1. Press **CAL** on the IRC.
2. Press **NEXT**.
   The *SENSOR CAL* submenu appears.
3. Press **ENTER**.
4. Press **NEXT**.
   The `AIR CAL` prompt appears.
5. Press **NEXT**.
   The `INPROCESS` prompt appears.
6. Press **ENTER**.

The TIME DELAY message appears and will remain until the sensor is relatively stable. To bypass the time delay, press **ENTER**. The GRAP SPL message appears.

7. Press **ENTER**.
8. Use the arrow keys to change the flashing display to the value indicated by the standards instrument. Press **ENTER**.
9. Press **RESET** to return to the main display.

7.4.5 Calibrate full scale (free chlorine, total chlorine, ozone)

Procedure

1. Place the sensor in the process liquid. Ensure that the pH sensor is calibrated or the pH value is entered in case of manual pH correction, if applicable.
2. Adjust the chlorine concentration until it is near the upper end of the control range. Wait until the reading is relatively stable before starting the calibration.
3. Press **CAL** on the IRC.
4. Press **NEXT**.
   The *SENSOR CAL* submenu appears.
5. Press **ENTER**.
   The TIME DELAY message appears and will remain until the sensor reading is relatively stable. To bypass the time delay, press **ENTER**. The GRAB SPL prompt appears.
6. Take a sample of the process liquid and determine the concentration of chlorine in the sample. Press **ENTER**.
7. Press **RESET** to return to the main display.

7.4.6 Calibrate dual slope (free chlorine, total chlorine)

Procedure

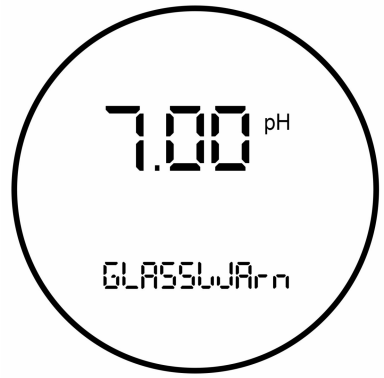
1. Zero the sensor.
2. Place the sensor in the process liquid. Ensure that the pH sensor is calibrated or the pH valve is entered in case of manual pH correction, if applicable.
3. Press **CAL** on the IRC. Press **NEXT**.
   The *SENSOR CAL* prompt appears.
4. Press **ENTER**.
   The CAL PT1 prompt appears.
5. Adjust the chlorine concentration until it is near the upper end of the linear range of the sensor. Press **NEXT**.
   The TIME DELAY message appears and will remain until the sensor reading is relatively stable. To bypass the time delay, press **ENTER**. The GRAB SPL prompt appears.
6. Take a sample of the process liquid and determine the concentration of chlorine in the sample.
7. Press **ENTER**.

The PT1 prompt appears.

8. Use the arrow keys to change the flashing display to the concentration of chlorine determined in the grab sample. Press **ENTER** to save.
   The CAL PT2 prompt appears.
9. Adjust the concentration of chlorine until it is near the top end of the range. Press **ENTER**.
   The TIME DELAY message appears and will remain until the sensor reading is relatively stable. To bypass the time delay, press **ENTER**. The GRAB SPL prompt appears.
10. Take the sample of the process liquid and determine the concentration of chlorine in the sample.
11. Press **ENTER**.
    The PT2 prompt appears.
12. Use the arrow keys to change the flashing display to the concentration of chlorine determined in the grab sample. Press **ENTER** to save.
13. Press **RESET** to return to the main display.

8 Diagnostics and troubleshooting



8.1 Warning and fault messages

The Rosemount™ 5081 transmitter continuously monitors the measurement loop (sensor and transmitter) for conditions that cause inaccurate measurements. When a problem occurs, the transmitter displays either a warning or fault message. A warning alerts you that a potentially system disabling condition exists. If you don't fix the problem, there is a high probability that the measurement will be incorrect. A fault alerts you that a system disabling condition exists. If a fault message is showing, regard all measurements as incorrect.

When a warning condition exists:

1. The main display remains stable; it does not flash.
2. A warning message appears alternately with the temperature display. See Figure 8-1. See Troubleshooting when a diagnostic message is showing for an explanation of the different warnings and suggested ways of correcting the problem.

Figure 8-1: Warning Annunciation

When a Fault exists:

1. The main display flashes.
2. The words FAULT and HOLD appear in the main display.
3. A fault message appears alternately with the temperature/output display. See Figure 8-2. See Troubleshooting when a diagnostic message is showing for an explanation of the different fault messages and suggested ways of correcting the problem.
4. The output current will remain at the present value or go to the programmed fault value.
5. If the transmitter is in Hold when the fault occurs, the output remains at the programmed hold value. To alert you that a fault exists, the word FAULT appears in the main display, and the display flashes. A fault or diagnostic message also appears.

6. If the transmitter is simulating an output current when the fault occurs, the transmitter continues to generate the simulated current. To alert you that a fault exists, the word `FAULT` appears in the display, and the display flashes.

Figure 8-2: Fault Annunciation

When a a fault occurs, the display appears as pictured above. To further alert you that measurements are in error, the display flashes. Diagnostic messages appear in the temperature/output area on the screen.

8.2 pH/ORP diagnostics and troubleshooting

8.2.1 Calibration errors

If an error occurs during calibration, an error message appears in the main display and the transmitter does not update the calibration. The calibration errors are `Std Err`, `SLOPE Err LO`, and `SLOPE Err HI`. See Troubleshooting when a diagnostic message is showing for an explanation of the error messages and suggested ways of correcting the problem.

8.2.2 General troubleshooting

Procedure

1. Look for a diagnostic message on the display to help identify the problem.

   Refer to Troubleshooting when a diagnostic message is showing for an explanation of the message and a list of the possible problems that triggered it.
2. Refer to Troubleshooting when no diagnostic message is showing for common measurement problems and the recommended actions to resolve them.
3. Follow the step-by-step troubleshooting approach, offered in Displaying diagnostic variables, to diagnose and correct less common or more complex problems.

8.2.3 Troubleshooting when a diagnostic message is showing

The Rosemount 5081-P pH/ORP transmitter continuously monitors the measurement loop (sensor and transmitter) for problems. If a problem is detected, the transmitter

displays a fault or error message. The message appears in the temperature/output area of the main display. The table lists each diagnostic message and the section to consult for help.

Message	Section
GLASSFAIL	GLASSFAIL
GLASSWArn	GLASSWArn
rEF FAIL	rEF FAIL
rEF WArn	rEF WARn
CALIbrAtE	CALIbrAtE
tEMP HI	tEMP HI and tEMP LO
tEMP LO	tEMP HI and tEMP LO
LInE FAIL	LinE FAIL
InPUt WArn	InPUt WArn
SLOPE Err LO	SLOPE Err LO
SLOPE Err HI	SLOPE Err HI
Std Err	Std Err
rOM FAIL	rOM FAIL or CPU FAIL
CPU FAIL	rOM FAIL or CPU FAIL
AdC WArn	AdC WArn or CyCLE PWr
CyCLE PWr	AdC WArn or CyCLE PWr
WrItE Err	WritE Err
FACt FAIL	FACt FAIL

GLASSFAIL

`GLASSFAIL` is an electrode fault message. It means the glass impedance is outside the programmed Glass Fault High (GFH) or Glass Fault Low (GFL) limit. Glass Fault High suggests the electrode is aging or the electrode is not immersed in the process liquid. Glass Fault Low implies that the pH sensitive glass is cracked. `GLASSFAIL` also appears if inappropriate limits have been entered into the transmitter.

If the measurement system was previously commissioned and operating correctly, `GLASSFAIL` likely means a real problem exists. However, if the system is being started up or if the advanced diagnostic feature is being used for the first time, `GLASSFAIL` could be caused by a miswired sensor or by programmed limits that are not correct for the sensor.

Note
`GLASSFAIL` is a sensor diagnostic message. Sensor diagnostic messages are optional. They can be turned off.

Recommended actions

1. Be sure the sensor is completely immersed in the process liquid.

If the diagnostic message disappears, the sensor is in good condition.

If the diagnostic message remains, go to Step 2.

2. Measure the glass impedance. See Testing the transmitter by simulating the pH for the procedure. Note the reading.

   If the glass impedance is low (< 40 megohms)...

   a. Check preamp location in program menus (PAMP = _____).
      - If the location is incorrect, go to 2.b.
      - If after selecting the correct location of Preamp in the Program menu, the glass impedance is still low, go to Step b.

   b. Calibrate the sensor.
      - If the sensor calibrates properly...
        1. The sensor is in good condition, but the Glass Fail Low (GFL) limit is set too high.
        2. Lower the GFL limit to about 10 megohms below the glass impedance value (GIMP).
        3. If the Glass Warning Low (GWL) message was also flashing, lower the limit from its former value by the same amount the GFL was lowered from its former value.
      - If the sensor cannot be calibrated, the pH glass membrane is likely cracked and the sensor must be replaced. The crack in the glass may not be visible or may be difficult to see.

   If the glass impedance is high (> 800 megohms)...

   a. Check that the sensor is correctly wired to the transmitter. Pay particular attention to the following:
      1. For Rosemount PLUS (+) and TUpH sensors with integral preamplifiers, the blue solution ground wire must be attached to TB-8 (SOL GND), and the gray reference in wire must be attached to TB-7 (REF IN).

         Note
         TB-8 means terminal 8 on the terminal board.

      2. If the sensor was wired with the blue solution ground wire unattached and a jumper between the terminals TB-8 and TB-7, remove the jumper and reattach the blue solution ground wire to TB-8. Keep the gray reference in wire attached to TB-7.
      3. For Rosemount PLUS (+) and TUpH sensors that do not have an integral preamplifier, attach the blue solution ground wire to TB-8 or, better, leave the blue wire unattached and jumper TB-7 to TB-8.
      4. If the sensor does not have a blue solution ground wire, jumper terminals TB-7 and TB-8.
         - If the wiring was correct and the glass impedance is still too high, go on to 2.b.

- If correcting wiring errors causes the diagnostic message to disappear, the sensor is in good condition.
- If after correcting wiring errors, the glass impedance is still high, go on to Step b.

b. Inspect and clean the sensor. After cleaning the sensor, calibrate it. Be sure to note the sensor slope.
   - If cleaning the sensor lowers the impedance below 800 megohms:
     1. The sensor is in good condition.
     2. Return the calibrated sensor to service.
   - If cleaning does not lower the glass impedance and the sensor can be calibrated:
     1. The sensor is probably in good condition; however, it may be nearing the end of its life. The electrode slope is a good indicator of remaining life.

Slope	Condition of sensor
54-60 mV/unit pH	Sensor is in good condition.
48-50 mV/unit pH	Sensor is nearing the end of its life. Once the slope drops below 48 mV/unit pH, the sensor can no longer be calibrated.

     2. The Glass Fail High (GFH) limit is probably set too low for the sensor. Set the GFH limit to about 150 megohms greater than the measured glass impedance.
     3. If the `GLASSWArn` message was also flashing, raise the GWH limit from its former value by the same amount the GFH was raised from its former value.
   - If cleaning does not lower the glass impedance and the sensor cannot be calibrated, the sensor has failed and should be replaced.

GLASSWArn

`GLASSWArn` is an electrode fault message. It means the glass impedance is outside the programmed Gas Warning High (GWH) or Glass Warning Low (GWL) limit. Ideally, when the measurement system exceeds the glass warning limits, you will have adequate time to diagnose and correct problems before a failure occurs. High impedance implies the electrode is aging or the sensor is not completely submerged in the process liquid. Low impedance suggests the pH sensitive glass is cracked. The message also appears if inappropriate limits have been entered into the transmitter.

If the measurement system was previously commissioned and operating correctly, `GLASSWArn` likely means a real problem exists. However, if the system is being started up or if the advanced diagnostic feature is being used for the first time, `GLASSWArn` could be caused by a miswired sensor or by programmed limits that are not correct for the sensor.

Note
GLASSWArn is a sensor diagnostic message. All sensor diagnostic messages are optional. They can be turned off.

Troubleshooting GLASSWArn problems is exactly the same procedure as troubleshooting GLASSFAIL problems. Refer to GLASSFAIL.

rEF FAIL

rEF FAIL is an electrode fault message. rEF FAIL means that the reference impedance exceeds the programmed reference high fault (RFH) limit. A plugged or dry reference junction is the usual cause of a high reference impedance. High reference impedance also occurs if the sensor is not submerged in the process liquid or if inappropriate limits have been entered into the transmitter.

If the operator previously commissioned the measurement system and it was operating correctly, rEF FAIL likely means a real problem exists. However, if the operator is just starting up the system or using the advanced diagnostic feature for the first time, rEF FAIL could be caused by a miswired sensor or by programmed limits that are not correct for the sensor.

Note
rEF FAIL is a sensor diagnostic message. All sensor diagnostic messages are optional. They can be turned off.

Recommended actions

1. Be sure the sensor is completely immersed in the process liquid.
   - If the diagnostic message disappears, the sensor is in good condition.
   - If the diagnostic message remains, go to Step 2.
2. Check that the sensor is properly wired to the transmitter. Be sure the reference in wire is attached to TB-7 and the solution ground wire is attached to TB-8.

   Note
   TB-8 means terminal 8 on the terminal board.

   - If correcting wiring problems makes the diagnostic message disappear, the sensor is in good condition.
   - If the wiring is correct and the message still remains, go to Step 3.
3. Measure and make a note of the reference impedance (rIMP). See Testing the transmitter by simulating the pH.
   - If the reference impedance is low (< 70 kilohms)...
     a. The reference electrode is in good condition. pH sensors manufactured by Rosemount use low impedance silver/silver chloride reference electrodes.
     b. The reference failure high (RFH) limit is probably set too low. Change the limit to a value about 50 kilohms greater than the measured reference impedance. If rEF WARN was also displayed, change the reference

warning high (RWH) limit to about 25 kilohms above the measured reference impedance.

- If the reference impedance is high (> 70 kilohms)...
  a. The sensor may be dirty, in which case cleaning it will lower the impedance. If the sensor is rebuildable, the reference electrolyte may be depleted. Finally, the sensor may be in good condition. The warning and failure limits are simply set too high.
  b. Inspect and clean the sensor. If the sensor is rebuildable, replace the reference junction and replenish the electrolyte solution. Refer to the sensor reference manual for details. Check the reference impedance again.
     — If cleaning the sensor reduces the impedance...
        1. The sensor is in good condition. Calibrate the sensor and return it to the process.
        2. Change the reference failure high (RFH) limit to a value about 50 kilohms greater than the measured reference impedance. If `rEF WARN` was also displayed, change the reference warning high (RWH) limit to about 25 kilohms above the measured reference impedance.
     — If cleaning does not reduce the impedance and the sensor is not rebuildable...
        1. Try the reference junction rejuvenation procedure. The rejuvenation procedure may not work. At best, it will get a little more life out of a sensor with a plugged reference.
        2. Whether or not the rejuvenation procedure worked, go to 3.c.
  c. Recalibrate the sensor using the autocalibration procedure.
     — If the sensor can be calibrated:
        1. The sensor is in good condition. Return it to the process.
        2. Change the reference failure high (RFH) limit to a value about 50 kilohms greater than the measured reference impedance. If `rEF WARN` was also displayed, change the reference warning high (RWH) limit to about 25 kilohms greater than the measured reference impedance.
     — If the sensor cannot be calibrated, the sensor has failed and must be replaced.

rEF WARn

`rEF WArn` is an electrode fault message. It means the reference electrode impedance exceeds the programmed reference warning high (RWH) limit. Ideally, when the measurement system exceeds the warning limits, you will have adequate time to diagnose and correct problems before a failure occurs. A high reference impedance implies that the liquid junction is plugged or the reference electrolyte is depleted. The message also appears if an inappropriate limit has been entered into the transmitter.

If the measurement system was previously commissioned and operating correctly, rEF WArn likely means a real problem exists. However, if the system is being started up or if the advanced diagnostic feature is being used for the first time, rEF WArn could be caused by a miswired sensor or by programmed limits that are not correct for the sensor.

Note
rEF WArn is a sensor diagnostic message. Sensor diagnostic messages are optional. They can be turned off.

Troubleshooting rEF WArn problems is exactly the same as troubleshooting rEF FAIL problems. Refer to rEF FAIL.

CALIbrAtE

CALIbrAte is a diagnostic intended for future use. If the CALIbrAte message is showing, disable CALIbrAte.

tEMP HI and tEMP LO

tEMP HI and tEMP LO mean the transmitter has detected a problem with the temperature measuring circuit. The problem may lie in the sensor, the cable, or the transmitter. The determination of temperature is an integral part of the pH measurement. Therefore, failure of the temperature measuring circuit is a system disabling condition. However, in an emergency, automatic temperature compensation can be disabled and the transmitter placed in manual temperature compensation. For manual temperature compensation, choose a temperature equal to the average temperature of the process. The resulting pH reading will be in error. The more variable the temperature and the further the pH from 7, the greater the error.

Recommended actions

1. Check wiring, jumper settings, and software settings.
   a. Check the wiring between the sensor and the transmitter. Pay particular attention to TB=3 (RTD RTN), TB-4 (RTD SN), and TB-5 (RTD RTN).

      Note
      TB-3 means terminal 3 on the terminal board.

   b. Be sure the software settings match the type of resistance temperature device (RTD) in the sensor.
      - If the diagnostic message disappears, the sensor is in good condition.
      - If the message persists, go to Step 2.

2. Check the sensor. Disconnect the RTD leads and measure the resistances shown in Figure 8-3.

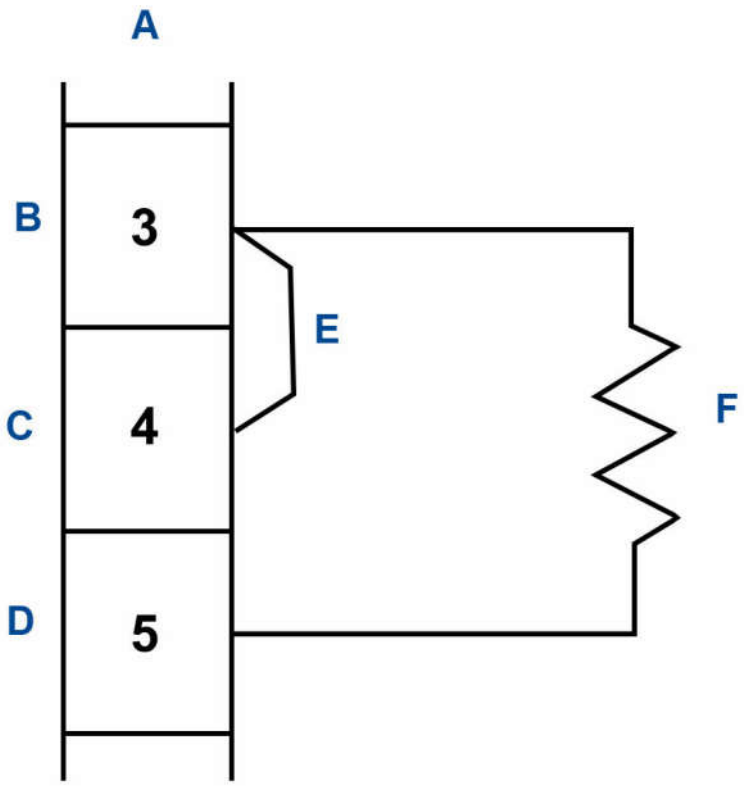
   The measured resistance should agree with the value in Table 8-1 to within about one percent. If the measured resistance is appreciably different (between one and five percent) from the value shown, the operator can calibrate out the discrepancy.

Figure 8-3: Three-Wire RTD

A. Compare resistance between these wires to the values in Table 8-1.
B. Resistance between these wires should be less than 2 ohms.

Consult Table 8-1 for resistance-temperature data. Lead resistance is about 0.05 ohm/ft at 77 °F (25 °C). Therefore, 15 feet of cable increases the resistance by about 1.5 ohm. The resistance between the RTD return and RTD sense leads should be less than 2 ohms.

Table 8-1: RTD Resistance Values



Temperature	Pt-100 resistance	Pt-1000 resistance
0 °C (32 °F)	100.0 ohms	1000 ohms
10 °C (50 °F)	103.9 ohms	1039 ohms
20 °C (68 °F)	107.8 ohms	1078 ohms
25 °C (77 °F)	109.6 ohms	1096 ohms
30 °C (86 °F)	111.7 ohms	1117 ohms
40 °C (104 °F)	115.5 ohms	1155 ohms
50 °C (122 °F)	119.4 ohms	1194 ohms
60 °C (140 °F)	123.2 ohms	1232 ohms
70 °C (158 °F)	127.1 ohms	1271 ohms
80 °C (176 °F)	130.9 ohms	1309 ohms
90 °C (194 °F)	134.7 ohms	1347 ohms
100 °C (212 °F)	138.5 ohms	1385 ohms

- If a connections is open or shorted and it should not be, the sensor has failed. Replace the sensor.

- If the measured resistances are acceptable, go to Step 3.

3. Check the transmitter. Disconnect the RTD sensor leads and wire the circuit shown in Figure 8-4. Set the resistance to the value for 25 °C (77 °F) shown in Table 8-1. The measured temperature should equal 25 °C (77 °F) within ±1 °C.

Figure 8-4: Temperature Simulation into the Rosemount 5081 pH/ORP Transmitter

A. Terminal board
B. RTD return
C. RTD sense
D. RTD in
E. Jumper
F. Standard resistor(s) to stimulate RTD

- If the measured temperature is correct, the transmitter is working properly.
- If the measured temperature is incorrect, calibrate the transmitter against the standard resistance equivalent to 77 °F (25 °C). Change the resistance and verify that the temperature reading changes to the correct value.
  - If the transmitter works properly after temperature calibration, the original calibration was in error. Re-attach the RTD wires and check the temperature performance of the sensor.

— If the reading is still wrong, the transmitter electronics have failed. Replace the sensor board stack.

LinE FAIL

`LinE FAIL` almost always means the transmitter is measuring an incorrect distance between terminal TB-3 (resistance temperature device [RTD] return) and TB-4 (RTD sense). These terminals are critical connections for the three-wire RTD measurement. Figure 8-3 shows a three-wire RTD connection.

Recommended actions

1. Check for miswires and open connections at TB-3 and TB-4. Open connections can be caused by loose connections, poor spade crimps, or broken wires. Be sure the check junction boxes for proper pass through of all wires.
   - If correcting a wiring problem makes the message disappear, the system is in good condition.
   - If the message is still showing, go to Step 2.
2. The RTD sense or the RTD return wire inside the sensor cable may be broken. Keep the sensor wires attached and jumper TB-3 and TB-4.
   - If the diagnostic message disappears, either the RTD return or RTD sense wire is broken. To verify a broken wire, disconnect the leads and measure the resistance between them. Installing the jumper completes the circuit, but bypasses the three-wire function. The transmitter no longer corrects for changes in lead wire resistance with temperature. replace the sensor as soon as possible.
   - If the diagnostic message remains, go to Step 3.
3. The cable connecting the sensor to the transmitter may be too long. Test using a sensor with a shorter cable.
   - If shortening the cable eliminates the problem, move the transmitter closer to the sensor. It may also be possible to increase diameter of the RTD wires. Consult the factory for assistance.
   - If the diagnostic message remains, go to Step 4.
4. Check the temperature of the transmitter. Simulate both temperature and pH. See tEMP HI and tEMP LO (steps 2 and 3) for temperature simulation and Simulating inputs - pH for pH simulation.
   - If the transmitter fails either simulation, the electronic board stack should be replaced.
   - If the transmitter passes the simulations, the transmitter is not in good condition, and the sensor should be replaced.

InPUt WArn

`InPUt WArn` means that the input value or the calculated pH is outside the measurement range. The measured pH is less than -2 or greater than 16.

Recommended actions

1. Check for miswires and open connections, particularly at TB-10. Open connections can be caused by loose connections, poor spade crimps, or broken wires. Be sure to check junction boxes for proper pass through of all wires.
   - If correcting a wiring problem clears the message, the system is in good condition.
   - If the message is still showing, go to Step 2.
2. Check that the transmitter is working properly by simulating a pH input. See Testing the transmitter by simulating the pH.
   - If the transmitter does not respond to simulated inputs, replace the board stack.
   - If the transmitter performs satisfactorily and the preamplifier is located in a remote junction box or in a sensor-mounted junction box, go to Step 3.
   - If the transmitter performs properly and the preamplifier is located in the transmitter, the sensor has failed and should be replaced.
3. The problem may lie with the remote preamplifier or with the cable connecting the preamplifier and junction box to the transmitter.
   a) Be sure all wires between the junction box and transmitter are connected.
   b) Use Rosemount cable.
      Generic cable may not work.
   - If the disagnostic message clears, the interconnecting cable was the problem.
   - If the message remains, go to Step 4.
4. Confirm that the problem is with the remote preamplifier.
   a) Wire the pH sensor directly to the transmitter.
   b) Change the menu from PAMP=SnSr to trAnS for the test and return it to SnSr afterwards.
   - If the error message clears, the remote preamplifier is faulty. Replace the preamplifier.
   - If the error message remains, the sensor has failed. Replace the sensor.

SLOPE Err LO

`SLOPE Err LO` means that a two-point buffer calibration attempt has failed. The slope is too low (<40 mV/pH) for a good measurement.

Recommended actions

1. Repeat the calibration.
   a) Inaccurate buffers can cause a low slope. Repeat the calibration using fresh buffers. Alkaline buffers, pH 10 or greater, are particularly susceptible to changing value in air or with age. If you used a high pH buffer in the failed calibration, try a lower pH buffer when repeating the calibration. For example, use pH 4 and 7 buffer instead of pH 7 and 10 buffer.

b) Allow adequate time for readings in buffer to become constant. If the sensor was in a process substantially colder or hotter than the buffer, allow at least 20 minutes for readings in the buffer to stabilize. Alternatively, place the sensor in a container of water at ambient temperatures for 20 minutes before starting the calibration.

c) Be sure the correct buffer values are being entered during calibration.

- If the second calibration was successful, an error was made during the first attempt.
- If the second calibration fails, go to Step 2.

2. Check wiring. Connections to TB-10, TB-7, and TB-8 are particularly important. Recalibrate the sensor.
   - If the wiring was the only problem, the sensor should calibrate.
   - If the message persists, go to Step 3.
3. Inspect and clean the sensor. Recalibrate the sensor.
   - If the sensor was dirty, it should calibrate after cleaning.
   - If the message persists, go to Step 4.
4. Check for a faulty sensor.
   - If a spare sensor is available, connect it to the transmitter. Use the auto calibration procedure to calibrate the sensor.
     — If the new sensor cannot be calibrated, the transmitter is faulty. Go to Step 5.
     — If the new sensor can be calibrated, the old sensor has failed.
   - If a spare sensor is not available, measure the glass impendance (GIMP). See Testing the transmitter by simulating the pH.
     — If the glass impedance is less than about 20 megohms, the glass has cracked and the electrode must be replaced.
     — If the glass impedance is greater than about 20 megohms, the sensor is probably in good condition. Go to Step 5.
5. Check transmitter performance by simulating pH inputs. See Testing the transmitter by simulating the pH.
   - If the transmitter performs satisfactorily, go to Step 6.
   - If the transmitter does not respond to stimulated inputs, replace the board stack.
6. If the transmitter responds to simulated inputs, the problem must lie with the sensor or the interconnecting wiring. Verify the interconnecting wiring point to point. Fix or replace bad cable. If the cable is good, replace the pH sensor.

SLOPE Err HI

`SLOPE Err HI` means that a two-point buffer calibration attempt has failed. The slope is too high (> 62 mV/pH) for a good measurement.

Recommended actions

1. Repeat the calibration.
   a) Inaccurate buffers can cause a high slope. Repeat the calibration using fresh buffers. Alkaline buffers, pH 10 or greater, are particularly susceptible to changing value in air or with age. If you used a high pH buffer in the failed calibration, try a lower pH buffer when repeating the calibration. For example, use pH4 and 7 buffer instead of pH 7 and 10 buffer.
   b) Allow adequate time for readings in buffer to become constant. If the sensor was in a process substantially colder or hotter than the buffer, allow at least 20 minutes for readings in the buffer to stabilize. Alternatively, place the sensor in a container of water at ambient temperature for 20 minutes before starting the calibration.
   c) Be sure the correct buffer values are being entered during calibration. To minimize errors caused by entering the wrong buffer values, use the autocalibration procedure.
   d) Verify that the temperature reading is accurate. Compare the sensor reading against a thermometer known to be accurate. Recalibrate if necessary.

   - If the second calibration was successful, an error was made during the first attempt.
   - If the second calibration fails, go to Step 2.

2. There is a remote possibility of a problem with the autocalibration program. Repeat the calibration using the manual calibration procedure.
   - If manual calibration was successful when autocalibration failed, the problem might be with the sensor electronics. Call the factory for assistance.
   - If manual calibration is not possible, go to Step 3.

3. Check the transmitter performance by simulating pH inputs. See Testing the transmitter by simulating the pH.
   - If the transmitter performs satisfactorily, go to Step 4.
   - If the transmitter does not respond to stimulated inputs, replace the board stack.

4. If the transmitter responds to simulated inputs, the problem must lie with the sensor or the interconnecting wiring. Verify the interconnecting wiring point to point. Fix or replace bad cable. If cable is good, replace the pH sensor.

Std Err

`Std Err` means the reference electrode voltage has changed drastically. Typical causes are exposure to poisoning agents, sulfides or cyanides, or prolonged exposure to high temperature.

Troubleshooting depends on the type of sensor.

Recommended actions

1. If the sensor is rebuildable, replenish the electrolyte solution and replace the liquid junction. Calibrate the sensor.
   - If the sensor can be calibrated, the problem has been corrected.
   - If the sensor cannot be calibrated, replace the sensor. If the sensor has separate measuring and reference electrodes, replace only the reference electrode.
2. If the sensor is not rebuildable, try the reference electrode rejuvenation procedure.
   - If the rejuvenated sensor can be calibrated, the problem has been corrected.
   - If the sensor cannot be calibrated, replace the sensor.

rOM FAIL or CPU FAIL

`rOM FAIL` or `CPU FAIL` means the transmitter electronics have failed.

Recommended action

Replace the electronic board stack (PN 23992-02 [-HT] or PN 23992-03 [-HF]).

AdC WArn or CyCLE PWr

The `Adc WArn` or `CyCLE PWr` message appears momentarily when the transmitter has recognized an internal calculation problem. The transmitter repeats the calculation, and the message disappears once the calculation is successful. If the message is displayed constantly, the transmitter electronics may be faulty.

Recommended actions

1. Check transmitter performance by simulating pH inputs. See Testing the transmitter by simulating the pH.
   - If the transmitter performs satisfactorily, go to Step 2.
   - If the transmitter does not respond to simulated inputs, replace the board stack.
2. If the transmitter responds to simulated inputs, the problem must lie with the sensor or the interconnecting wiring. Verify the interconnecting wiring point to point. Fix or replace bad cable. If cable is good, replace the pH sensor.

WritE Err

`WriTE Err` means that jumper JP1 on the CPU board is not in place. If the sensor is not in place, the transmitter cannot be programmed or calibrated.

Recommended actions

1. Check the position of jumper JP1 on the CPU board. If the jumper is hanging off one of the pins, place it across both pins. If the jumper is missing entirely, use jumper JP3 (50/60 Hz), which is not a critical jumper.

   There are similar numbered jumpers on the analog board. The jumper to be checked is on the CPU board, which is the center board in the stack.
2. Turn the power to the transmitter off and then back on.

- Toggling the power should cause the message to disappear.
- If the message does not disappear, replace the electronic board stack.

FACt FAIL

`FACt FAIL` means the unit has not been factory calibrated. Call the factory. The transmitter will probably need to be returned to the factory for calibration.

8.2.4 Troubleshooting when no diagnostic message is showing

If no diagnostic message is showing, locate the symptom(s) in the table below and refer to the appropriate section for assistance.

Symptom	Section
`Id000` appears in display when trying to program or calibrate transmitter	Id000 in display
Error message flashing in display	Troubleshooting when a diagnostic message is showing
Transmitter does not respond to remote controller	Transmitter not responding to IRC
Calibration problems	
`SLOPE Err HI` or `SLOPE Err LO` appears after calibration attempt	SLOPE Err LO or SLOPE Err Hi appear after calibration attempt
`bF1` or `bF2` continuously flashes during auto calibration	bF1 or bF2 continuously flashes during autocalibration
pH reading in buffer drifts during manual calibration	pH reading in buffer drifts during manual calibration
Measurement problems	
Sensor does not respond to known pH changes	Sensor does not respond to known pH changes
Buffer calibration is acceptable; process pH is slightly different from expected value	Buffer calibration is acceptable; process pH is slightly different from expected value.
Buffer calibration is acceptable; process pH is grossly wrong and/or readings are noisy	Buffer calibration is acceptable; process pH is grossly different from expected value
Temperature reading is inaccurate	Temperature reading is inaccurate
Transmitter problems	
No display	No display
Display segments missing or display incorrect	Display segments missing
Transmitter locked up, all display segments lit	Transmitter locks up
Transmitter periodically restarts itself	Transmitter periodically restarts itself

Id000 in display

A security code has been programmed into the transmitter. The correct code must be entered before the transmitter can be programmed or calibrated.

Transmitter not responding to IRC

Recommended actions

1. Be sure the transmitter is receiving the signal.
   a) Clean the window in front of the IR detector.
      The detector is a small rectangle just above the main display.
   b) Hold the IRC at least 6 ft. (1.8 m) from the transmitter and not more than 15 degrees from the center.
   c) Hold the IRC closer (within 2 ft. [.6 m]) in case the batteries are getting weak.
2. If Step 1 fails, check the IRC.
   a) If a second transmitter is available, test the IRC on that transmitter. If a spare transmitter is not available, continue with Step b.
   b) The green LED, located just above and between the **RESET** and **HOLD** buttons, should light when a key is pressed. A piece of black rubber film may be covering the LED. Scrape the film away with your fingernail to expose the LED.
      The two clear LEDs on the front end of the IRC never light. They transmit the invisible IR signal.
   c) If the green LED does not light, the IRC is not working. Go to Step 3.
3. Take the IRC to a non-hazardous area and replace the two 1.5 Vdc AAA batteries.
   - If the green LED lights, but the transmitter still does not respond, go to Step 4.
   - If neither the LED lights nor the transmitter responds, replace the IRC.
4. Replace the transmitter display board.

SLOPE Err LO or SLOPE Err Hi appear after calibration attempt

Refer to SLOPE Err LO and SLOPE Err HI for assistance in solving calibration slope problems.

bF1 or bF2 continuously flashes during autocalibration

During autocalibration, `bF1` or `bF2` flashes until the pH reading of the sensor in the buffer is stable.

Recommended actions

1. Check the stability limits.
   If the stabilization range (prompt `PH`) is set too narrow or the stabilization time (prompt `tIME`) is set too long, the transmitter will not accept buffer readings. A good choice for `PH` is 0.02, and a good choice for `tIME` is 10 - 20 seconds.

2. Allow adequate time for the temperature of the sensor to reach the temperature of the buffer. If the sensor was in a process substantially hotter or colder than the buffer, allow at least 20 minutes for readings in the buffer to stabilize. Alternatively, place the sensor in a container of water at ambient temperature for 20 minutes before starting the calibration.
3. Be sure to swirl the sensor after placing it in each new buffer solution.
4. Finally, check the sensor. Verify that wiring is correct. Also, the sensor may be dirty or aged, or the reference junction may be depleted.
    a) Check that the sensor is properly wired to the transmitter.

       Pay particular attention to terminals TB-10 (mV in), TB-7 (reference), and TB-8 (solution ground).

    b) Clean the sensor.
    c) If the sensor is not rebuildable, rejuvenate the reference junction.
    d) If the sensor is rebuildable, replenish the reference electrolyte and replace the liquid junction.
    e) Replace the sensor.
       A clean pH sensor should not drift in buffer.

pH reading in buffer drifts during manual calibration

Recommended actions

1. Allow adequate time for the temperature of the sensor to reach the temperature of the buffer. If the sensor was in a process substantially hotter or colder than the buffer, allow at least 20 minutes for readings in the buffer to stabilize. Alternatively, place the sensor in a container of water at ambient temperature for 20 minutes before starting the calibration.
2. Be sure to swirl the sensor after placing it in each new buffer solution.
3. Finally, check the sensor. Verify that wiring is correct. Also, the sensor may be dirty or aged, or the reference junction may be depleted.
    a) Check that the sensor is properly wired to the transmitter.

       Pay particular attention to terminals TB-10 (mV in), TB-7 (reference), and TB-8 (solution ground).

    b) Clean the sensor.
    c) If the sensor is not rebuildable, rejuvenate the reference junction.
    d) If the sensor is rebuildable, replenish the reference electrolyte and replace the liquid junction.
    e) Replace the sensor.
       A clean pH sensor should not drift in buffer.

Sensor does not respond to known pH changes

Recommended actions

1. Verify that the change really happened. If you were checking pH response in buffers, recheck performance with fresh buffers. If a process pH reading was not what was expected, check the performance of the sensor in buffers. Also, use a second pH meter to verify that the expected change in the process pH really occurred.
2. Check the sensor. Verify that wiring is correct. Also, the sensor may be dirty or aged, or the reference junction may be depleted. Check that the sensor is properly wired to the transmitter.

   See Wire. Pay particular attention to terminals TB-10 (mv in), TB-7 (reference), and TB-8 (solution ground).
3. If a clean, properly wired sensor does not respond to pH changes, the glass bulb is probably broken or cracked.
   a) If a spare sensor is available, check the spare.
   If the spare sensor responds to pH changes, the old sensor has failed.

   If the spare sensor does not respond to pH changes, go to Step 4.

   b) If a spare sensor is not available, check the glass impedance (GIMP) of the existing sensor.
   If the impedance is less than about 20 megohm, the pH sensor is cracked. Replace the sensor.

   If the impedance is greater than about 20 megohm, go to Step 4.
4. Check transmitter performance by simulating pH inputs.

   See Testing the transmitter by simulating the pH.

   If the transmitter responds to simulated inputs, the problem must lie with the sensor or the interconnecting wiring. Verify the interconnecting wiring point to point. Fix or replace bad cable. If cable is good, replace pH sensor.

   If the transmitter does not respond to simulated inputs, replace the board stack.

Buffer calibration is acceptable; process pH is slightly different from expected value.

Differences between pH readings made with an on-line instrument and a laboratory or portable instrument are normal. The on-line instrument is subject to process variables (for example, ground potentials, stray voltages, and orientation effects) that do not affect the laboratory or portable instrument.

Buffer calibration is acceptable; process pH is grossly different from expected value

The systems suggest a ground loop (measurement system connected to earth ground at more than one point), a floating system (no earth ground), or noise being induced into the transmitter by a sensor cabling.

The problem arises from the process or installation. It is not a fault of the transmitter. The problem should disappear once the sensor is taken out of the system.

Recommended actions

1. To confirm a ground loop:
   a) Verify that the system works properly in buffers. Be sure there is no direct electrical connection between the buffer containers and the process liquid or piping.
   b) Strip back the ends of a heavy gauge wire. Connect one end of the wire to the process piping or place it in the process liquid. Place the other end of the wire in the container of buffer with the sensor.
      The wire makes an electrical connection between the process and sensor.

   If similar symptoms develop after making the connection, a ground loop exists. If no symptoms develop, a ground loop may or may not exist.
2. Check the grounding of the process.
   The measurement system needs one path to ground: through the process liquid and piping. Plastic piping, fiber glass tanks, and ungrounded or poorly grounded vessels do not provide a path. A floating system can pick up stray voltages from other electrical equipment.
   a) Ground the piping or tank to a local earth ground.
      Metal tees, grounding rings, or grounding rods may be required.
   b) If problems persist, connect a wire from the ground connection at the dc power supply to the transmitter case. Connect a second wire from the transmitter case to the process.
      These connections force the grounds to the same potential.

   If the problem persists, simple grounding is not the problem. The sensor wiring is probably carrying noise into the instrument. Go to Step 3.
3. Simplify the sensor wiring.
   a) Disconnect all sensor wires at the transmitter except: TB-4 (resistance temperature device [RTD] sense), TB-5 (RTD IN), TB-7 (Reference IN), and TB-10 (pH/ORP IN). If you are using a remote preamplifier, disconnect the wires at the input side of the junction box.
   b) Tape back the ends of the disconnected wires, including all shield and drain wires, to keep them from making accidental connections with other wires, terminals, or the transmitter case.
   c) Connect a jumper wire between TB-3 (RTD return) and TB-4 (RTD sense). Connect a second jumper wire between TB-7 (Reference IN) and TB-8 (Solution ground).
   d) Place the sensor back in the process liquid. If diagnostic measures such as `GLASSFAIL` or `REF WArn` appear, turn off the sensor diagnostics.

   If the symptoms disappear, interference was coming into the transmitter along one of the sensor wires. The measurement system can be operated permanently with simplified wiring.

If symptoms still persist, go to Step 4.

4. Check for extra ground connections or reduced noise.

   The electrode system is connected to earth ground through the process. If other ground connections exist, there are multiple paths and ground loops are present. Noise enters the measurement either by a direct connection, usually between the cable and grounded metal, or by an indirect connection, usually EMI/RFI picked up by the cable.

   a) If the sensor cable is run inside conduit, there may be a short between the cable and the conduit. Re-run the cable outside the conduit. If symptoms disappear, then a short exists between the table and the conduit. Likely a shield is exposed and is touching the conduit. Repair the cable and reinstall it in the conduit.

   b) To avoid induced noise in the sensor cable, run it as far away as possible from the power cables, relays, and electric motors. Keep sensor wiring out of crowded panels and cable trays.

   c) Occasionally, noise can travel into the transmitter housing from the metal it is mounted on. The noise is then radiated into the transmitter electronics. If isolating the transmitter from its metal mounting eliminates the symptoms, move the transmitter to a different location or mount it with isolating materials.

   If ground loop problems persist, consult the factory. It may require a visit from an experienced service technician to solve plant-induced problems.

Temperature reading is inaccurate

Recommended actions

1. To troubleshoot temperature problems, refer to tEMP HI and tEMP LO.
2. Calibrate the temperature response of the sensor.
3. If necessary, automatic temperature compensation can be temporarily disabled and the transmitter placed in manual temperature compensation. For manual temperature, choose a temperature equal to the average temperature of the process.
   The resulting pH reading will be in error. The more variable the temperature and the further from pH 7, the greater the error.

HART® communication problems

Recommended actions

1. If the handheld communicator software does not recognize the =transmitter, order an upgrade from Rosemount at 800 999 9307.
2. Be sure the HART load and voltage requirements are met.
   - HART communications requires a minimum 250 ohm load in the current loop.
   - Install a 250 - 500 ohm resistor in series with the current loop. Check the actual resistor value with an ohmmeter.

- For HART communications, the power supply voltage must be at least 18 Vdc.

3. Be sure the HART communicator is properly connected.
   - The communicator leads must be connected across the load.
   - The communicator can be connected across the power terminals (TB-15 and TB-16).
4. Verify that the handheld communicator is working correctly by testing it with another HART Smart device.
   If the communicator is working, the transmitter electronics may have failed. Call Rosemount for assistance.

   If the communicator seems to be malfunctioning, call Rosemount at 800 999 9307 for assistance.

No display

Recommended actions

1. Be sure power requirements are being met.
   a. The positive voltage lead must be connected to TB-16.
   b. Check dc voltage requirements and load restrictions.
2. Check for bad connections between the circuit boards. Be sure the ribbon cable between the display and CPU boards is firmly seated in the socket on the CPU board. Be sure the socket connection between the CPU and analog boards is firm.

Display segments missing

Recommended action

Replace the display board.

Transmitter locks up

Recommended actions

1. Turn the dc power off; then turn it back on.
2. If the problem persists, replace the electronic board stack (HART®: PN 23992-02; FOUNDATION™ Fieldbus: PN 23992-03).

Transmitter periodically restarts itself

Recommended actions

1. The problem is usually related to improperly wired resistance temperature device (RTD) input terminals.
   a) The RTD return wire must be connected to TB-3. The RTD sense wire must be connected to TB-4, and the RTD in wire must be connected to TB-5. If the pH sensor does not have an RTD, connect a jumper wire across the terminals TB-3 and TB-4 and a second jumper across TB-4 and TB-5.

b) If you have jumpered the RTD connections as described in 1.a, turn off automatic temperature compensation and operate the transmitter in manual temperature mode.

2. If RTD wiring is correct and problems still persist:
   a) Monitor the power supply. Be sure the power is not intermittent and the correct voltage is present.
   b) Try connecting the transmitter to a different power supply.

8.2.5 Displaying diagnostic variables

This section describes how to display the diagnostic variables listed below:

Diagnostic measurements

1. Sensor voltage in mv (`InPut`)
2. Glass impedance in megohms (`GIMP`)
3. Reference temperature in kilohms (`rIMP`)(1)
4. Temperature in °C

Diagnostic messages

1. Software version (`VEr`)
2. Display last three fault messages (`ShoW FLt`)

Note
Displays are read only.

Procedure

1. Press **DIAG** on the IRC to enter the ***Diagnostic*** menu.
   Sensor voltage in mV (`InPut`) appears.
2. Press **NEXT**.
   The temperature corrected glass impedance in megohms (`GIMP`) appears.
3. Press **NEXT**.
   The reference impedance (`rIMP`) appears. For conventional low impedance silver/silver chloride reference electrodes, the reference impedance has units of kilohms. For the rare occasions when a high impedance reference is used, the units are megohms.
4. Press **NEXT**.
   The model number and software version (`Ver`) appears.
5. Press **NEXT**.
   The temperature (`tEMP`) measured by the sensor appears.
6. Press **NEXT**.
   The ***ShoW Fit*** submenu appears.

(1) For high impedance reference electrodes, the reference impedance is in megohms.

7. Press **ENTER**.
   The most recent fault message appears in the display.
8. Press **NEXT** repeatedly to scroll through the stored messages.
   The transmitter only remembers the three most recent messages. `nonE` appears if there are no faults. Press **EXIT** to clear all the stored messages and return the transmitter to the ***ShoW Fit*** display. If the transmitter loses power, all stored warnings and fault messages are lost.
9. Press **EXIT** to return to the process display.

8.2.6 Testing the transmitter by simulating the pH

Overview of simulating a pH input

This section describes how to simulate a pH input into the Rosemount 5081-P pH/ORP transmitter. pH is directly proportionsl to voltage.

To simulate the pH measurement, connect a standard millivolt source to the transmitter. If the transmitter is working properly, it will accurately measure the input voltage and convert it to pH. Although the general procedure is the same, the wiring details depend on the location of the preamplifier. Consult the table to find the correct procedure.

Preamplifier located in	Section
Transmitter	Simulate pH when the preamplifier is located in the transmitter
Remote junction box	Simulate pH when the preamplifier is located in a remote junction box or in a sensor-mounted junction box
Sensor-mounted junction box	Simulate pH when the preamplifier is located in a remote junction box or in a sensor-mounted junction box
Sensor	Simulate pH when preamplifier is in sensor

Simulate pH when the preamplifier is located in the transmitter

Procedure

1. Program PAMP to transmitter.
2. Turn off sensor diagnostics.
3. Turn off automatic temperature compensation. Set manual temperature compensation to 77 °F (25 °C).
4. Disconnect the sensor and wire transmitter as shown in Figure 8-5.
5. Attach a jumper between TB-7 (Reference IN) and TB-10 (pH IN).
6. Measure the voltage. Press **DIAG** on the infrared remote control (IRC).
   The InPut voltage in millivolts appears in the temperature-output area. The main display continues to show pH. The measured voltage should be 0 mV, and the pH should be approximately 7. Because the calibration data in the transmitter may be offsetting the input voltage, the displayed pH may not be exactly 7.0. If the actual readings are close to expected, the transmitter is probably operating normally.

7. If a standard millivolt source is available, remove the jumper between TB-7 and TB-10 and connect the voltage source.
8. Calibrate the transmitter. Use 0.0 mV for pH 7 (bF1) and -177.4 mV for pH 10 (bF2). If the transmitter is working, it should accept the calibration.
9. To check linearity, leave autocalibration and return to the main display. Set the voltage source to the values in the table and verify that the pH reading matches the expected value.

Voltage (mV)	pH
295.8	2.00
118.3	5.00
-118.3	9.00
-295.8	12.00

Example

Figure 8-5: pH simulation when the preamplifier is located in the transmitter

A. Transmitter
B. Earth ground
C. Shield
D. Resistance temperature device (RTD) return
E. -RTD sense
F. RTD in
G. Reference ground
H. Reference in
I. Solution ground
J. pH guard
K. pH in
L. +RTD sense
M. mV source

Simulate pH when the preamplifier is located in a remote junction box or in a sensor-mounted junction box

Procedure

1. Program PAMP to sensor.

2. Turn off sensor diagnostics.
3. Turn off automatic temperature compensation. Set manual temperature compensation to 77 °F (25 °C).
4. Disconnect the sensor and wire the sensor side of the junction box as shown in Figure 8-5. Leave the interconnecting cable between the junction box and transmitter in place.
5. Attach a jumper between TB1-7 (Reference IN) and TB1-10 (pH IN)
6. From this point on, continue with steps 6 through 9 in Simulate pH when the preamplifier is located in the transmitter.

   For testing using a standard millivolt source. Be sure to remove the jumper between TB1-7 and TB1-10 before connecting the standard millivolt source.

Example

Figure 8-6: pH simulation when the preamplifier is located in a remote junction box or in a sensor mounted junction box

A. Remote junction box: PN 23555-00 (includes preamplifier). Board PN 23557-00
B. mV source
C. Jumpers
D. No connection
E. Normally closed
F. Far side
G. Extension cable point to point wiring terminals 2 to 12
H. Earth ground
I. Shield
J. Resistance temperature device (RTD) return
K. -RTD sense
L. RTD in
M. Reference ground
N. Solution ground
O. pH guard
P. pH in
Q. +RTD sense
R. Transmitter

Simulate pH when preamplifier is in sensor

The preamplifier in the sensor simply converts the high impedance signal into a low impedance signal without amplifying it.

8.3 Contacting and toroidal conductivity diagnostics and troubleshooting

8.3.1 Diagnose menu

The transmitter automatically monitors for fault conditions. The ***Diagnose*** menu displays current variable settings and fault messages. The messages are defined in Table 8-2.

Troubleshoot contacting conductivity analyzers

Procedure

1. Look for a diagnostic fault message on the display to help pinpoint the problem.
   Refer to Diagnostic messages for an explanation of the message recommended actions to solve it.
2. Refer to Troubleshooting when no diagnostic message is showing for common loop problems and the recommended actions to resolve them.

Display diagnostic values

Use the **DIAG** key on the IRC is used to access the ***Diagnose*** menu. The messages are defined in Table 8-2.

Use the ***FAuLtS*** submenu to show the last three faults/warnings. The most recent is displayed first. Use **NEXT** to scroll through the remaining faults. Press **EXIT** to clear all fault/warnings and returns the ***FAuLtS*** segment. Disconnecting the transmitter removes all fault messages from memory. The `nonE` message is displayed when no faults/warnings have occurred.

Table 8-2: Diagnostic variables mnemonics

AbS	Absolute conductivity (µS/cm or mS/cm)
0 A ir	Sensor zero in air
CELL ConSt	Sensor cell constant (used in C mode)
tSLOPE	Temperature slope in %/° C
CAL F	Calibration factor
SoFt	Software version
HArd	Hardware version
FAuLtS	Show fault messages
nonE	No fault messages in memory

8.3.2 Fault conditions

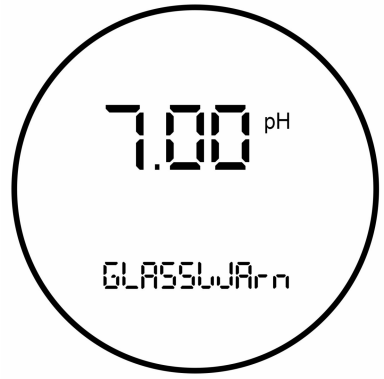
The diagnostic program detects and diffentiates three classes of error conditions/ problems. System disabling problems are faults caused by failures in the loop or significant variations in the process. System non-disabling problems are warnings and deal with input or A to D conversion settings. The third class of detection problems are error messages and occur when the calibration limits are exceeded.

Disabling faults

When a disabling fault occurs:

1. Both FAULT and HOLD annunciation fields become active (Figure 8-7).
2. The process variable flashes at the rate of 1 second on and 1 second off.
3. The appropriate fault message alternates with the normal Temperature/Current output display (see Figure 8-7).
4. The output current loop is forced to run the non-zero fault value last entered or held at last value if fault value = 0 if the transmitter is not in the TEST, HOLD, or Multidrop operational modes.
5. A 0-1 mA output signal is available for external use when system disability conditions are active. These conditions drive this output to 1 mA. Please contact factory for specific application information.

Figure 8-7: Disabling Fault Annunciation



Non-disabling warnings

When a non-system-disabling condition occurs, a warning message is displayed.

The process variable does not flash. The appropriate message alternates with the Temperature/Current output display (see Figure 8-8).

If more than one fault exists, the display will sequence through each diagnostic message. This will continue until the cause of the fault has been corrected.

Figure 8-8: Warning Annunciation

8.3.3 Diagnostic messages

The transmitter's diagnostics constantly monitor the conductivity loop for possible problems. If an operational problem is encountered, check the display for a fault or error message. These are displayed in the ***Temperature/Current output*** segment of the display. Note the message and refer to the following sections for a description of possible problems that may have triggered the diagnostic message.

Faults

tEmP LO

Temperature is too low.

Recommended actions

1. Check wiring or sensor/process temperature.
2. Check resistance temperature device (RTD).

tEmP HI

Temperature is too high.

Recommended actions

1. Check wiring or sensor/process temperature.
2. Check resistance temperature device (RTD).

rtd FAIL

The resistance temperature device (RTD) sensor line fault limits have been exceeded into the sensor.

Recommended action

Check wiring or check ***Program/Temp*** menu setting to verify the 100-3 or 100-4 sensor type connected.

CPU FAIL

The CPU has failed during RAM or EEPROM verification.

Recommended action

Recycle. If persistent, contact the factory.

FACt FAIL

`FACt FAIL` appears if the transmitter factory calibration message has been triggered.

A stray noise spike can cause this message to appear.

Recommended actions

1. If the pH reading seems acceptable, reset the calibration flag.
   a) Press **2** on the infrared remote control (IRC) ten times to enter the ***factory calibration*** menu.
   The display does not change.
   b) Press **3**.
   `FActorYCAL` appears in the display.
   c) Press **NEXT**.
   `rEPAir` appears in the display.
   d) Press **NEXT**.
   `ConFIG` appears in the display.
   e) Press **NEXT**.
   `rESEt` appears in the display.
   f) Press **NEXT**.
   `rESEtCFG` appears in the display.
   g) Press **ENTER**.
   `rESET` appears again.
   h) Press **NEXT**.
   `FActorYCAL` reappears.
   i) Press **ENTER**.
   `FactOn` appears in the display.
   j) Press **3**.
   `FactOFF` appears.
   k) Press **ENTER** to store the settings.
   l) Press **EXIT** repeatedly until the main display reappears.

   If the message does not clear or problems persist, the electronics have failed. Replace the electronic board stack.
2. Contact factory.

rOm FAIL

The PROM failed the check-sum test.

Recommended action

Contact factory.

CyCLE PoWr

A wrong value was detected during power-up.

Recommended action

Recycle the power.

SEnSor FAIL

Bad sensor means that the sensor current is a large negative number. `SEnSor FAIL` may appear for a while when the sensor is first placed in service.

Recommended actions

1. Observe the sensor. Go to SEnSor Cur under the ***Diagnostic*** menu.
   If the sensor is moving in the positive direction, there is probably nothing wrong. The error message should soon disappear.
2. Verify that wiring is correct. Pay particular attention to the anode and cathode connections.
3. Verify that the transmitter is configured for the correct measurment.

   Configuring the measurement sets several things, including the polarizing voltage. Applying the wrong polarizing voltage to the sensor can cause a negative current.
4. Replace the sensor membrane and electrolyte solution and clean the cathode if necessary.

   See the sensor reference manual for details.
5. Replace the sensor.

Warnings

InPUt WArn

`InPUt WArn` means that the input value or the calculated pH is outside the measurement range. The measured pH is less than -2 or greater than 16.

Recommended actions

1. Check for miswires and open connections, particularly at TB-10. Open connections can be caused by loose connections, poor spade crimps, or broken wires. Be sure to check junction boxes for proper pass through of all wires.
   - If correcting a wiring problem clears the message, the system is in good condition.
   - If the message is still showing, go to Step 2.
2. Check that the transmitter is working properly by simulating a pH input. See Testing the transmitter by simulating the pH.
   - If the transmitter does not respond to simulated inputs, replace the board stack.

- If the transmitter performs satisfactorily and the preamplifier is located in a remote junction box or in a sensor-mounted junction box, go to Step 3.
- If the transmitter performs properly and the preamplifier is located in the transmitter, the sensor has failed and should be replaced.

3. The problem may lie with the remote preamplifier or with the cable connecting the preamplifier and junction box to the transmitter.
   a) Be sure all wires between the junction box and transmitter are connected.
   b) Use Rosemount cable.
      Generic cable may not work.

- If the disagnostic message clears, the interconnecting cable was the problem.
- If the message remains, go to Step 4.

4. Confirm that the problem is with the remote preamplifier.
   a) Wire the pH sensor directly to the transmitter.
   b) Change the menu from PAMP=SnSr to trAnS for the test and return it to SnSr afterwards.

- If the error message clears, the remote preamplifier is faulty. Replace the preamplifier.
- If the error message remains, the sensor has failed. Replace the sensor.

OvEr rAnGE and AMP FAIL

The current range setting has been exceeded or the measurment exceeds the display limit.

This error message appears if the sensor current is too high. Normally, excessive sensor current implies that the sensor is miswired or the sensor has failed.

Recommended actions

1. Verify the 4 and 20 mA settings in the ***Program/output*** menu.
2. Verify that the wiring is correct and connections are tight. Be sure to check connections at the junction box if one is being used.
3. Replace the sensor membrane and electrolyte solution and clean the cathode if necessary.
   See the sensor reference manual for details.
4. Replace the sensor.

AdC Error

`AdC Error` means the analog to digital converter has failed.

Recommended actions

1. Verify that the sensor wiring is correct and connections are tight.
   Be sure to check connections at the junction box if one is being used.
2. Disconnect sensor(s) and simulate temperature and sensor input.

If the transmitter does not respond to simulated signals, the analog PCB has probably failed.

3. Recycle the power.
4. Call the factory for assistance.

nEEd 0 CAL

The message `nEEd 0 CAL` means that the concentration of the analyte is too negative.

Recommended actions

1. Check the zero current (go to `0 CurrEnt` under the ***Diagnose*** menu).
   If the zero current is appreciably greater than the measurement current, the `nEEd 0 CAL` warning appears.
2. Verify that the zero current is close to the value given in the calibration section for the analyte being determined.
3. Rezero the sensor.
   Refer to the calibration and troubleshooting sections of the sensor reference manual for more information.

Errors

CAl Err or OFFSEt Err

A calibration error has occurred between the standard and process.

Recommended action

Press **RESET** and repeat. Check calibration standards and unit configuration.

tSLOPE Err

The limit for T-2 in a two point calibration has been exceeded.

Recommended action

Press **RESET** and repeat the ***calibration/temp. slope*** menu setting.

-0- Err

Sensor zero limit has been exceeded.

Recommended actions

Press ***RESET*** and repeat the ***calibrate/sensor*** menu setting.

WritE Err

An attempt to write on the EEPROM has failed.

The jumper JP-1 on the CPU board has been removed.

SenSE OPEn

Most Rosemount sensors use a Pt100 or Pt1000 in a three-wire configuration. The in and return leads connect the resistance temperature device (RTD) to the measuring circuit in the transmitter. A third wire, called the sense line, is connected to the return lead. The

sense line allows the transmitter to correct for the resistance of the in and return leads and to correct for changes in lead wire resistance with changes in ambient temperature.

Recommended actions

1. Verify all wiring connections, including wiring in a junction box if one is being used.
2. Disconnect the RTD SENSE and RTD RETURN wires. Measure the resistance between the leads.

   It should be less than 5 Ω.
3. If the sense line is open, replace the sensor as soon as possible.

   The transmitter can be operated with the sense line open. The measurement will be less accurate, because the transmitter can no longer compensate for lead wire resistance. However, if using the sensor at approximately constant ambient temperatures, you can eliminate the lead wire resistance error by calibrating the sensor to the measurement temperature. Errors caused by changes in ambient temperature cannot be eliminated.
4. To make the error message disappear, connect the RTD SENSE and RETURN terminals with a jumper.

8.3.4 Troubleshooting when no diagnostic message is showing

The following sections identify some of the more common symptoms and suggest actions to help resolve a problem. In general, wiring is the most common cause.

Wrong temperature reading

Recommended actions

1. Perform a temperature standardization.
2. Verify sensor's resistance temperature device (RTD).

Suspected temperature compensation problem

Recommended action

Check wiring.

Display segments missing

Recommended action

Replace the display board.

Transmitter locks up

The transmitter won't respond

Recommended actions

1. Replace PCB stack.

2. Press **RESET**.
3. Check batteries in infrared remote control (IRC).

Erratic displays

Recommended action

Check sensors in process.

Transmitter won't respond to infrared remote control (IRC) key presses

Recommended actions

1. Verify and clean ribbon cable connection on CPU board.
2. Check batteries in IRC.

Key press gives wrong selection

Recommended actions

1. Replace infrared remote control (IRC).
2. Check ribbon cable connection on CPU board.

Wrong or no current output

Recommended actions

1. Verify that output is not being overloaded.
2. Remove load.
3. Replace PCB stack.

No display or indicators

Recommended action

Replace PCB stack.

Excess input

Recommended action

Check sensor wiring.

Reverse input

Recommended action

Perform sensor zero.

Check sensor zero

The transmitter will not zero.

Recommended action

Place the sensor in the air and access zero routine.

8.3.5 Troubleshoot in the field

When it is apparent by grab sample analysis that the transmitter is giving inaccurate readings, try the following:

Prerequisites

Make sure the sensor surfaces are totally wetted by the process and that air bubbles are not trapped in the vicinity of electrodes. If you find air bubbles, change the installation technique to eliminate air bubbles.

Procedure

1. Visually inspect the installation.
   a) Check that the transmitter is mounted securely and that its internal parts are properly connected.
   b) Check all input and output wiring.
2. If Step 1 did not indicate the source of the problem, isolate the problem to either the transmitter or the sensor.
3. To troubleshoot the sensor:
   a) Disconnect the sensor from the transmitter.
   b) Remove the sensor from the process.
   c) Thoroughly dry the sensor electrodes.

   Refer to the sensor reference manual for additional troubleshooting checks.
4. To troubleshoot the transmitter independently of the sensor, use an appropriate resistor across the temperature input connectors and connect the conductivity inputs to resistance decade box.

8.3.6 Troubleshoot conductivity measurement

If troubleshooting in the field does not resolve the error, try the following procedure to troubleshoot a conductivity measurement problem in the process.

Note
Before starting this procedure, make sure that all wiring is correct.

Procedure

1. Remove the sensor from process and place the sensor in air. Zero the transmitter.
   This step is for normal contacting only, not for low conductivity or resistivity.
   If the transmitter zeros correctly, place the sensor in the process and standardize.
2. If the transmitter does not zero correctly:
   a) Check diagnostic messages.
      Refer to Diagnostic messages.

b) Check wiring for short.

c) Consult service center.

3. If the sensor does not standardize:
   a) Remove the sensor from the process and test it in a known conductivity solution or against a certified conductivity instrument.
   b) Check for ground loops and/or improper installation.

8.3.7 Resistance temperature device (RTD) resistance values

Table 8-3 is a ready reference of RTD resistance values at various temperatures. Use these values to test and evaluate the sensor.

Note
Resistance values are read across the RTD element and are based on the manufacturer's stated values (±1%). Allow enough time for the RTD element in the sensor to stabilize to the surrounding temperature.

Table 8-3: RTD Resistance Values

Temperature	Pt-100 resistance (ohms)	Pt-1000 resistance (ohms)
32 °F (0 °C)	100.00	1000
50 °F (10 °C)	103.9	1039
68 °F (20 °C)	107.79	1078
77 °F (25 °C)	109.62	1096
86 °F (30 °C)	111.67	1117
104 °F (40 °C)	115.54	1155
122 °F (50 °C)	119.40	1194
140 °F (60 °C)	123.24	1232
158 °F (70 °C)	127.07	1271
176 °F (80 °C)	130.89	1309
194 °F (90 °C)	134.70	1347
212 °F (100 °C)	138.50	1385

Figure 8-9: Conductivity Determination

Formula:

$$\frac{\text{cell constant value x } 1{,}000{,}000}{\text{desired simulated conductivity in } \mu\text{S/cm}} = \text{resistance in ohms}$$

Example:

$$\frac{.01 \text{ x } 1{,}000{,}000}{10\ \mu\text{S/cm}} = \text{use } 1{,}000 \text{ ohm resistance}$$

Use the formula to determine the appropriate resistance value to use to simulate a conductivity value.

8.4 Chlorine, dissolved oxygen, and ozone diagnostics

8.4.1 Diagnostics overview

The Rosemount 5081 transmitter can display diagnostic information that is useful in troubleshooting. The diagnostics available depend on the measurement being made. To read diagnostic information, go to the main display and press **DIAG** on the infrared remote controller. Press **NEXT** until the desired diagnostic message appears. Refer to the appropriate section below for more information.

8.4.2 Diagnostic messages for dissolved oxygen

Message	See section
TYPE O2	TYPE O2
SEnSor Cur	SEnSor Cur
SEnSitvtY	SEnSitviTY
0 CurrEnt	0 CurrEnt.
bAr PreSS	bAr PreSS.
5081-A-Ht	5081-A-Ht.
FAULtS	FAULtS

TYPE O2

Transmitter is measuring oxygen.

Recommended action

Press **NEXT** to view diagnostics.

SEnSor Cur

Recommended action

Press **ENTER** to display raw current from sensor.

SEnSitviTY

Sensitivity is calculated during calibration. It is the measured current divided by the concentration.

Recommended action

Press **ENTER** to display sensitivity.

0 CurrEnt

Recommended actions

1. Press **ENTER** to display the zero current measured during calibration.
2. Note units.

bAr PreSS

Recommended action

Press **ENTER** to display the barometric pressure used by the transmitter during air calibration.

5081-A-Ht

This is the model number.

Recommended actions

1. Press **ENTER** to display the software revision level (`SFtr`).
2. Press **NEXT** to show the hardware revision level (`HArdr`).

FAULtS

Recommended action

Press **ENTER** to scroll through existing fault messages.

8.4.3 Diagnostic messages for ozone and total chlorine

Message	See section
TYPE O3 or tCL	TYPE O3 or TYPE tCL
SEnSor Cur	SEnSor Cur

Message	See section
SEnSitvtY	SEnSitviTY
0 CurrEnt	0 CurrEnt
5081-A-Ht	5081-A-Ht
FAULtS	FAULtS

TYPE O3 or TYPE tCL

The transmitter is measuring ozone or total chlorine.

Recommended actions

Press **NEXT** to view diagnostics.

8.4.4 Diagnostic messages for free chlorine

Message	See section
TYPE FCL	TYPE FCL
SEnSor Cur	SEnSor Cur
SEnSitvtY	SEnSitviTY
0 CurrEnt	0 CurrEnt
pH	pH
InPut	InPut
SLOPE	SLOPE
OFFSt	OFFSt
GIMP	GIMP
5081-A-Ht	5081-A-Ht
FAULtS	FAULtS

TYPE FCL

Transmitter is measuring free chlorine.

Recommended action

Press **NEXT** to view diagnostics.

pH

Recommended actions

1. Press **ENTER** to view pH diagnostics.
2. Press **NEXT** to skip pH diagnostics.

InPut

Current pH sensor input voltage in millivolts.

SLOPE

Sensor slope in millivolts per unit pH. Slope is calibrated during buffer calibration.

OFFSt

Sensor voltage in millivolts in pH 7 buffer.

GIMP

Glass impedance in MΩ.

8.5 Chlorine, dissolved oxygen, and ozone troubleshooting

8.5.1 Troubleshooting fault or warning messages

Message	Explanation	See section
OvEr rAnGe	Over range, measurement exceeds display limit.	OvEr rAnGE and AMP FAIL
AMP FAIL	Amperometric sensor failure, sensor current is too high.	OvEr rAnGE and AMP FAIL
bAd SEnSor	Bad sensor, sensor current is a large negative number.	bAd SEnSor
0 too biG	Zero current is too large, sensor was zeroed while current exceeded 100 nA.	0 too bIG
CAL Error	Calibration error, sensitivity (nA/ppm) is too high or too low.	CAL Error
nEEd 0 CAL	Sensor needs re-zeroing; reading is too negative.	nEEd 0 CAL
bAd rtd	Bad temperature reading.	bAd rtd and rtd OPEn
TEMP HI	Temperature reading exceeds 302 °F (150 °C).	tEmP HI
TEMP LO	Temperature reading is less than 5 °F (-15 °C).	tEmP LO.
rtd OPEn	Resistance temperature device (RTD) or thermistor is open.	bAd rtd and rtd OPEn
SenSE OPEn	Sense line is not connected.	SenSE OPEn
PH in	Raw millivolt reading from pH sensor is too large.	pH IN

Message	Explanation	See section
SLOPE HI	pH sensor slope exceeds 62 mV/pH.	SLOPE Err HI
SLOPE LO	pH sensor slope is less than 40 mV/pH.	SLOPE Err LO
-0- OFFSEt	Zero offset during standardization exceeds programmed limit.	-0- OFFSEt
GLASSFAIL	Measured glass impedance is less than programmed limit.	GLASSFAIL
FACt FAIL	Unit has not been factory calibrated.	FACt FAIL
CPU FAIL	Internal CPU tests have failed.	CPU FAIL
ROM FAIL	Internal memory has failed.	rOm FAIL
AdC	Analog to digital conversion failed.	AdC Error
bAd Gnd	Bad ground.	bAd Gnd
In too biG	mV signal from pH sensor is too large.	In too biG
RitE Err	CPU PCB jumper (JP-1) has been removed.	RitE Err

bAd SEnSor

Bad sensor means that the sensor current is a large negative number. `bAd SEnSor` may appear for a while when the sensor is first placed in service. Observe the sensor current by going to SEnSor Cur under the ***Diagnostic*** menu. If the sensor current is moving in the positive direction, there is probably nothing wrong, and the error message should soon disappear.

Recommended actions

1. Verify that wiring is correct. Pay particular attention to the anode and cathode connections.
2. Verify that the transmitter is configured for the correct measurement.

   Configuring the measurement sets (among other things) the polarizing voltage. Applying the wrong polarizing voltage to the sensor can cause a negative current.
3. Replace the sensor membrane and electrolyte solution and clean the cathode if necessary.

   See the sensor reference manual for details.
4. Replace the sensor.

0 too bIG

Normally, the transmitter will not accept a zero current until the current has fallen below a reasonable value. See the calibration section of the appropriate sensor reference manual for the analyte being determined for zero currents. However, you can force the transmitter to accept the present current as the zero value. The `0 too bIG` warning appears if the current at the time the sensor is zeroed is greater than 100 nA. Because the transmitter subtracts the zero current from the measured current before converting the result to a concentraiton, zeroing too soon will cause readings to be too low.

Procedure

1. Allow adequate time, possibly as long as overnight, for the sensor to stabilize before starting the zero routine.
2. Verify that the solution used for zeroing the sensor contains no analyte.

   Refer to the calibration section of the appropriate sensor reference manual for details.
3. Replace the sensor membrane and electrolyte solution and clean the cathode if necessary.

   See the appropriate sensor manual for details.
4. Replace the sensor.

CAL Error

At the end of the calibration step, the transmitter calculates the sensitivity in nA/ppm. If the sensitivity is outside the range normally expected, the transmitter displays the CAL Error message, and the transmitter does not update the calibration. For assistance, refer to the troubleshooting section specific to the sensor.

bAd rtd and rtd OPEn

These messages usually mean that the resistance temperature device (RTD) (or themistor in the case of the Rosemount Hx438sensor) is open or shorted or there is an open or short in the connecting wiring.

Recommended actions

1. See Simulate temperature.
2. Verify all wiring connections, including wiring in a junction box if one is being used.
3. Disconnect the RTD IN, RTD SENSE, and RTD RETURN leads or the thermistor leads at the transmitter. Note the color of the wire and where it was attached. Measure the distance between the RTD IN and RETURN leads. For a thermistor, measure the resistance between the two leads. The resistance should be close to the value in Table 8-4. If the temperature element is open or shorted, replace the sensor. In the meantime, use manual temperature compensation.

pH IN

`pH In` means the voltage from the pH measuring cell is too large.

Recommended actions

1. Verify all wiring connections, including connections in a junction box.
2. Check that the pH sensor is completely submerged in the process liquid.
3. Check the pH sensor for cleanliness. If the sensor looks fouled or dirty, clean it.

   Refer to the sensor reference manual for cleaning procedures.
4. Replace the sensor.

-0- OFFSEt

The `-0- OFFSEt` message appears if the standardization offset (in mV) exceeds the programmed limit. The default limit is 60 mV, which is equivalent to about a unit change in pH. Before increasing the limit to make the `-0- OFFSEt` message disappear, check the following:

Recommended actions

1. Verify that the reference pH meter is working properly and is properly calibrated.
2. Verify that the process pH sensor is working. Check its response in buffers.
3. If the transmitter is standardized against pH determined in a grab sample, be sure to measure the pH before the temperature of the grab sample changes more than a few degrees.
4. Verify that the process sensor is fully immersed in the liquid.

   If the sensor is not completely submerged, it may be measuring the pH of the liquid film covering the sensor. The pH of this film may be different from the pH of the bulk liquid.
5. Check the pH sensor for cleanliness. If the sensor looks fouled or dirty, clean it.

   Refer to the sensor reference manual for cleaning procedures.A large standardization offset may be caused by a poisoned reference electrode. Poisoning agents can cause the pH to be offset by as much as two pH units. To check the reference voltage, see Measuring reference voltage.

bAd Gnd

`bAd Gnd` usually means a problem with the analog PCB.

Recommended action

Contact the factory.

In too biG

`In too biG` means the raw millivolt signal from the pH sensor is too large.

Recommended actions

1. Verify that sensor wiring is correct and connections are tight. Be sure to check connections at the junction box if one is being used.
2. Replace the pH sensor with a sensor known to be working.
3. If replacing the pH sensor does not cause the message to disappear, call the factory for assistance.

RitE Err

Cause

CPU PCB jumper (JP-1) has been removed.

Recommended action

Reinsert the JP-1 jumper into the CPU board.

8.5.2 Oxygen measurement and calibration problems

Problem	See section
Zero current is too high.	Zero current too high
Zero reading is unstable.	Zero reading unstable
Sensor current during air calibration is substantially different from expected.	Sensor current outside range
Process and standard instrument readings during in-process calibration are substantially different.	Process and standard readings different
Process readings are erratic.	Process readings erratic
Readings drift.	Readings drift
Sensor does not respond to changes in oxygen level.	Sensor does not respond to changes in oxygen level
Readings are too low.	Oxygen readings are too low

Zero current too high

The zero current is substantially greater than the values in the table below.

Sensor	Zero current
Rosemount 499ADO	< 50 nA
Rosemount 499ATrDO	< 5 nA
Rosemount Hx438	< 1 nA

Recommended actions

1. Make sure the sensor is properly wired to the transmitter.
2. Make sure the membrane is completely covered with zero solution and that air bubbles are not trapped against the membrane. Swirl and tap the sensor to release air bubbles.
3. Make sure the zero solution is fresh and properly made. Zero the sensor in a solution of five percent sodium sulfite in water. Prepare the solution immediately before use.

   It has a shelf life of only a few days.
4. If you are zeroing the sensor with nitrogen gas, verify that the nitrogen is oxygen-free and the flow is adequate to prevent back-diffusion of air into the chamber.
5. The major contributor to the zero current is dissolved oxygen in the electrolyte solution inside the sensor. A long zeroing period usually means that an air bubble is trapped in the electrolyte. To ensure that the Rosemount 499ADO or 499ATrDO sensor contains no air bubbles, carefully follow the procedure in the appropriate

sensor reference manual for filling the sensor. After replacing the electrolyte solution, allow several hours for the zero current to stabilize.

On rare occasions, the sensor may need 24 hours to zero.

6. Check the membrane for damage and replace the membrane if necessary.

Zero reading unstable

Recommended actions

1. Make sure the sensor is properly wired to the transmitter and that all wiring connections are tight.
2. Readings are often erratic when a new or rebuilt sensor is first placed in service. Wait an hour for the readings to stabilize.
3. Make sure that the space between the membrane and the cathode is filled with electrolyte solution and that the flow path between the electrolyte reservoir and the membrane is clear. Hold the sensor with the membrane end pointing down and sharply shaking the sensor a few times as though shaking down a clinical thermometer.
4. If shaking does not work, try the following:
   a) For Rosemount 499ADO and 499ATrDO sensors, verify that the holes at the base of the cathode stems are open (use a straightened paper clip to clear the holes). Also verify that air bubbles are not blocking the holes. Fill the reservoir and establish electrolyte flow to the cathode.

      Refer to the sensor reference manual for the detailed procedure.

   b) For Rosemount Hx438 sensors, add fresh electrolyte solution to the sensor.

      Refer to the sensor reference manual for details.

Sensor current outside range

The sensor current is different from the numbers in the table below.

Sensor	nA/ppm
Rosemount 499ADO	1800 - 3100
Rosemount 499ATrDO	3600 - 6100
Rosemount Hx438	4.8 - 9.8

Recommended actions

1. Make sure the sensor is properly wired to the transmitter and that all connections are tight.
2. Make sure the membrane is dry.

   The membrane must be dry during air calibration. A droplet of water on the membrane during air calibration will lower the sensor current and cause an inaccurate calibration.
3. If the sensor current in the air is very low and the sensor is new, either the electrolyte flow has stopped or the membrane is torn or loose.

For instructions on how to restart electrolyte flow, see Zero reading unstable or refer to the sensor reference manual. To replace a torn membrane refer to the sensor reference manual.

4. Check the temperature.

   Sensor current is a strong function of temperature. The sensor current decreases about 3% for every 1 °C drop in temperature.

5. Check if the membrane is fouled or dirty. A dirty membrane inhibits diffusion of oxygen through the membrane, reducing the sensor current. Clean the membrane by rinsing it with a stream of water from a wash bottle or by gently wiping the membrane with a soft tissue. If cleaning the membrane does not improve the sensor response, replace the membrane and electrolyte solution. If necessary, polish the cathode.

   See the sensor reference manual for more information.

Process and standard readings different

This error warning appears if the current process reading and the reading it is being changed to (i.e., the reading from the standard instrument) are appreciably different.

Recommended actions

1. Make sure the standard instrument is properly zeroed and calibrated.
2. Make sure the standard and process sensor are measuring the same sample. Place the sensors as close together as possible.
3. Make sure the process sensor is working properly. Check the response of the process sensor in air and in sodium sulfite solution.

Process readings erratic

Readings are often erratic when a new sensor or a rebuilt sensor is first placed in service. The current usually stabilizes after a few hours.

Recommended actions

1. Make sure the sample flow is within the recommended range.

   High sample flow may cause erratic readings. Refer to the sensor reference manual for flow rates.

2. Make sure gas bubbles are not impinging on the membrane. Orient the sensor at an angle away from the vertical to reduce the noise.
3. Make sure the holes between the membrane and electrolyte reservoir might be plugged (applies to Rosemount 499ADO and 499ATrDO sensors only).

   Refer to Zero reading unstable.

4. Verify that wiring is correct. Pay particular attention to shield and ground connections.
5. Make sure the membrane is in good condition and the sensor is filled with electrolyte solution. Replace the fill solution and electrolyte.

   Refer to the sensor reference manual for details.

Readings drift

Recommended actions

1. See if the sample temperature is changing.

   Membrane permeability is a function of temperature. For the Rosemount 499ADO and 499ATrDO sensors, the time constant for a response to a temperature change is about five minutes. Therefore, the reading may drift for a while after a sudden temperature change. The time constant for Rosemount Hx438 sensors is much shorter; these sensors respond fairly rapidly to temperature changes.

2. Make sure the membrane is clean.

   For the sensor to work properly oxygen must diffuse freely through the membrane. A coating on the membrane will interfere with the passage of oxygen, resulting in a slow response.

3. Move the sensor out of direct sunlight.

   If the sensor is in direct sunlight during air calibration, readings drift as the sensor warms up. Because the temperature reading lags the true temperature of the membrane, calibrating the sensor in direct sunlight may introduce an error.

4. Make sure the sample flow is within the recommended range.

   Gradual loss of sample flow will cause downward drift.

5. See if the sensor is new or has recently been serviced.

   New or rebuilt sensors may require several hours to stabilize.

6. Check if the reagent flow is about 0.2 mL/min.

Sensor does not respond to changes in oxygen level

Recommended actions

1. If you are comparing readings with a portable laboratory instrument, verify that the laboratory instrument is working.
2. See if the membrane is clean. Clean the membrane and replace it as necessary. Check that the holes at the base of the cathode stem are open. Use a straightened paper clip to clear blockages. Replace the electrolyte solution.
3. Replace the sensor.

Oxygen readings are too low

Potential cause

Low readings can be caused by zeroing the sensor before the residual current has reached a stable minimum value. Residual current is the current the sensor generates even when no oxygen is in the sample. Because the residual current is subtracted from subsequent measured currents, zeroing before the current is a minimum can lead to low results.

Example: The true residual (zero) current for a Rosemount 499ADO sensor is 0.05 µA, and the sensitivity based on calibration in water-saturated air is 2.35 µA/ppm. Assume the measured current is 2.00 µA. The true concentration is (2.00 - 0.05)/2.35 or 0.83 ppm. If the sensor was zeroed prematurely when the current was 0.2 µA, the measured concentration will be (2.00 - 0.02)/2.35 or 0.77 ppm. The error is 7.2%. Suppose the

measured current is 5.00 µA. The true concentration is 2.11 ppm, and the measured concentration is 2.05 ppm. The error is now 3.3%. The absolute difference between the readings remains the same, 0.06 ppm.

Recommended action

Sensor response depends on flow. If the flow is too low, readings will be low and flow sensitive. Verify that the flow past the sensor equals or exceeds the minimum value. See the sensor reference manual for recommended flows. If the sensor is in an aeration basin, move the sensor to an area where the flow or agitation is greater.

8.5.3 Free chlorine measurement and calibration problems

Problem	See section
Zero current is substantially outside the range -10 to 10 nA.	Zero current outside range
Zero reading is unstable.	Zero reading unstable
Sensor current during calibration is substantially less than about 350 nA/ppm at 25 °C (77 °F) and pH 7.	Sensor current too low
Process readings are erratic.	Process readings erratic
Readings drift.	Readings drift
Sensor does not respond to changes in chlorine level.	Sensor not responding to chlorine changes
Chlorine reading spikes following rapid change in pH (automatic pH correction only).	Chlorine readings spike
Readings are too low.	Chlorine readings too low

Zero current outside range

The zero current is substantially outside the range: -10 to 10 nA.

Recommended actions

1. Make sure the sensor is properly wired to the transmitter.
2. Make sure the zero solution is chlorine-free. Take a sample of the solution and test it for free chlorine level.

   The concentration should be less than 0.02 ppm.
3. Make sure you have allowed adequate time for the sensor to reach a minimum stable residual current.

   It may take several hours, sometimes as long as overnight, for a new sensor to stabilize.
4. Check the membrane for damage and replace if necessary.

Zero reading unstable

Recommended actions

1. Make sure the sensor is properly wired to the transmitter and that all wiring connections are tight.
2. Readings are often erratic when a new or rebuilt sensor is first placed in service. Wait an hour for the readings to stabilize.
3. Make sure that the space between the membrane and the cathode is filled with electrolyte solution and that the flow path between the electrolyte reservoir and the membrane is clear. Hold the sensor with the membrane end pointing down and sharply shaking the sensor a few times as though shaking down a clinical thermometer.
4. If shaking does not work, try the following:
   a) For Rosemount 499ADO and 499ATrDO sensors, verify that the holes at the base of the cathode stems are open (use a straightened paper clip to clear the holes). Also verify that air bubbles are not blocking the holes. Fill the reservoir and establish electrolyte flow to the cathode.

      Refer to the sensor reference manual for the detailed procedure.

   b) For Rosemount Hx438 sensors, add fresh electrolyte solution to the sensor.

      Refer to the sensor reference manual for details.

Sensor current too low

The sensor current during calibration is substantially less than 250 nA/ppm at 77 °F (25 °C).

Recommended actions

1. Check to see if the temperature is low or the pH is high.

   Sensor current is a strong function of pH and temperature. The sensor current decreases about 3% for every °C drop in temperature. Sensor current also decreases as pH increases. Above pH 7, a 0.1 unit increase in pH lowers the current about 5%.

2. Check the rate of the sample flow.

   Sensor current depends on the rate of sample flow past the sensor tip. If the flow is too low, chlorine readings will be low. Refer to the sensor reference manual for recommended sample flows.

3. Check the electrolyte flow to the cathode and membrane.

   See step 3 in Zero reading unstable

4. Check if the membrane is fouled or coated. A dirty membrane inhibits diffusion of free chlorine through the membrane, reducing the sensor current and increasing the response time. Clean the membrane by rinsing it with a stream of water from a wash bottle.

⚠ CAUTION

Equipment damage

Do not use a tissue to wipe the membrane.

5. If cleaning the membane does not improve the sensor response, replace the membrane and electrolyte solution. If necessary, polish the cathode.

   See the sensor reference manual for details.

Sensor not responding to chlorine changes

Recommended actions

1. Make sure the grab sample test is accurate and that the grab sample representative of the sample is flowing to the sensor.
2. Check if the pH compensation is correct. If the transmitter is using manual pH correction, verify that the pH value in the transmitter equals the actual pH to within ±0.1 pH. If the transmitter is using automatic pH correction, check the calibration of the pH sensor.
3. Clean the membrane and replace if necessary. Check that the holes at the base of the cathode stem are open. Use a straightened paper clip to clear blockages. Replace the electrolyte solution.
4. Replace the sensor.

Chlorine readings spike

Chlorine readings spike following sudden changes in pH.

Cause

Changes in pH alter the relative amounts of hypochlorous acid (HOCl) and hypochlorite ion (OCl^-) in the sample. Because the sensor responds only to HOCl, an increase in pH causes the sensor current (and the apparent chlorine level) to drop even though the actual free chlorine concentration remains constant.

To correct the pH effect, the transmitter automatically applies a correction. Generally, the pH sensor responds faster than the chlorine sensor. After a sudden pH change, the transmitter will temporarily over-compensate and gradually return to the correct value.

A time constant for return to normal is about five minutes.

Chlorine readings too low

Recommended actions

1. Make sure the sample was tested as soon as it was taken.

   Chlorine solutions are unstable. Test the sample immediately after collecting it. Avoid exposing the sample to sunlight.

2. Low readings can be caused by zeroing the sensor before the residual current has reached a stable minimum value. Residual current is the current the sensor generates even when no chlorine is in the sample. Because the residual current is

subtracted from subsequent measured currents, zeroing before the current is a minimum can lead to low results.

3. Sensor response depends on flow. If the flow is too low, readings will be low and flow sensitive. Verify that the flow past the sensor equals or exceeds the minimum value.

   See the sensor reference manual for recommended flow.

8.5.4 Ozone measurement and calibration problems

Problem	See section
Zero current is substantially outside the range -10 to 10 nA.	Ozone zero current outside range
Zero reading is unstable.	Ozone zero reading unstable
Sensor current during calibration is substantially less than about 350 nA/ppm at 77 °F (25 °C).	Sensor current less than 350 nA/ppm
Process readings are erratic.	Ozone process readings erratic
Readings drift.	Ozone readings drift
Sensor does not respond to changes in ozone level.	Sensor not responding to ozone changes
Ozone readings are too low.	Oxygen readings are too low

Ozone zero current outside range

The ozone zero current is substantially outside the range: -10 to 10 nA.

Recommended actions

1. Make sure the sensor is properly wired to the transmitter.
2. Make sure the zero solution is ozone free. Test the zero solution for ozone level.

   The concentration should be less than 0.02 ppm.
3. Make sure you allow adequate time for the sensor to reach a minimum stable residual current.

   It may take several hours, sometimes as long as overnight, for a new sensor to stabilize.
4. Check the membrane for damage and replace it if necessary.

Ozone zero reading unstable

Recommended actions

1. Verify that the sensor is properly wired to the transmitter and that all wiring connections are tight.
2. Readings are often erratic when a new or rebuilt sensor is first placed in service. Wait about an hour for readings to stabilize.

3. Make sure that the space between the membrane and cathode is filled with electrolyte solution and the flow path between the electrolyte reservoir and membrane are clear.
    a) Hold the sensor with the membrane end pointing down and shake it sharply a few times as though shaking down a clinical thermometer.
    b) If shaking does not work, try cleaning the holes around the cathode stem. Hold the sensor with the membrane end pointing up. Be sure the wood ring remains with the membrane assembly. Use the end of a straightened paper clip to clear the holes at the base of the cathode stem. Replace the membrane.
    c) Verify that the sensor is filled with electrolyte solution.

       Refer to the sensor reference manual for details.

Sensor current less than 350 nA/ppm

The sensor current is less than 350 nA/ppm at 77 °F (25 °C).

Recommended actions

1. Check the temperature.

   Sensor current is a strong function of temperature. The sensor current decreases about 3% for every °C drop in temperature.
2. Check the rate of the sample flow past the sensor tip.

   If the flow is too low, ozone readings will be low. Refer to the sensor instruction sheet for recommended sample flows.
3. Check the electrolyte flow.

   A lack of electrolyte flow to the cathode and membrane can cause low current. See Step 3 in Ozone zero reading unstable.
4. Check if the membrane is fouled or coated.

   A dirty membrane inhibits diffusion of ozone through the membrane, reducing the sensor current and increasing the response time.
    a) Clean the membrane by rinsing it with a stream of water from a wash bottle or gently wipe the membrane with a soft tissue.
    b) If cleaning the membrane does not improve the sensor response, replace the membrane and electrolyte solution.
    c) If necessary, polish the cathode.

       See the sensor reference manual for details.

Ozone process readings erratic

The ozone process readings are erratic.

Recommended actions

1. Readings are often erratic when a new sensor or rebuilt sensor is first placed in service. Wait a few hours for the current to stabilize.

2. Check if the sample flow is within the recommended range.

   High sample flow may cause erratic readings. Refer to the sensor reference manual for recommended flow rates.

3. Check if the holes between the membrane and the electrolyte reservoir are open.

   Refer to Ozone zero reading unstable.

4. Verify that the wiring is correct. Pay particular attention to shield and ground connections.
5. Make sure the membrane is in good condition and the sensor is filled with electrolyte solution. Replace the fill solution and electrolyte.

   Refer to the sensor reference manual for details.

Ozone readings drift

Recommended actions

1. Check if the sample temperature is changing.

   Membrane permeability is a function of temperature. The time constant for the Rosemount 499AOZ sensor is about five minutes. Therefore, the reading may drift for a while after a sudden temperature change.

2. Check if the membrane is clean.

   For the sensor to work properly, ozone must diffuse freely through the membrane. A coating on the membrane will interfere with the passage of ozone, resulting in a slow response. Clean the membrane by rinsing it with a stream of water from a wash bottle, or gently wipe the membrane with a soft tissue.

3. Check if the sample flow is within the recommended range.

   Gradual loss of sample flow will cause a downward drift.

4. Check if the sensor is new or recently serviced.

   New or rebuilt sensors may require several hours to stabilize.

Sensor not responding to ozone changes

Recommended actions

1. Make sure the grab sample test is accurate and representative of the sample flowing to the sensor.
2. Clean the membrane and replace it if necessary.
   a) Check that the holes at the base of the cathode stem are open.
   b) Use a straightened paper clip to clear blockages.
   c) Replace the electrolyte solution.
3. Replace the sensor.

Ozone readings too low

Recommended actions

1. Test the sample immediately after collecting it.
   Ozone solutions are highly unstable.
2. Zeroing the sensor before the residual current has reached a stable minimum value can cause low readings.
   Residual current is the current the sensor generates even when no ozone is in the sample. Because the residual current is subtracted from subsequent measured currents, zeroing before the current is a minimum can lead to low results. See Oxygen readings are too low.
3. Verify that the flow past the sensor equals or exceeds the minimum value.
   Sensor response depends on flow. If the flow is too low, readings will be low and flow sensitive. See the sensor reference manual for recommended flows.

8.5.5 pH measurement and calibration problems

Problem	See Section
SLOPE HI or SLOPE LO message is showing.	SLOPE Err HI or SLOPE Err LO
-0- OFFSEt message is showing.	-0- OFFSEt
Transmitter will not accept manual slope.	Transmitter not accepting manual slope
Sensor does not respond to known pH changes.	Sensor not responding to pH changes
Process pH is slightly different from the expected value.	Process pH slightly different
Process pH reading changes when flow changes.	Process pH reading changes with flow
Process pH is grossly wrong and/or noisy.	Process pH grossly wrong or noisy
Process readings are noisy.	Process readings noisy

Transmitter not accepting manual slope

Recommended action

If you know the slope from other sources, enter it directly into the transmitter.

The transmitter will not accept a slope (at 77 °F [25 °C]) outside the range 45 to 60 mV/pH. If you attempt to enter a slope less than 45 mV/pH, the transmitter will automatically change the entry to 45. If you attempt to enter a slope greater than 60 mV/pH, the transmitter will change the entry to 60 mV/pH.

Sensor not responding to pH changes

Recommended actions

1. If the process pH reading was not as expected, check the performance of the sensor in buffers. Also, use a second pH meter to verify the change.
2. Make sure the sensor is properly wired to the transmitter.
3. Check the glass electrode impedance to see if the glass bulb is cracked or broken.
4. Check the transmitter by simulating the pH input.

Process pH slightly different

Differences between pH readings made with an online instrument and a laboratory or portable instrument are normal. The online instrument is subject to process variables (for example, ground potentials, stray voltages, and orientation effects) that may not affect the laboratory or portable instrument.

Process pH reading changes with flow

The sensor has some degree of flow sensitivity (i.e., changing the sample flow causes the pH readings to change). Flow sensitivity varies from sensor to sensor.

Flow sensitivity can be a source of error if the pH and chlorine sensor flow cells are connected in series. The chlorine sensor requires a fairly rapidly flowing sample, and high flows may affect the pH reading. Typically, the difference in pH reading from a pH sensor in a rapidly (16 gph) and slowly (<2 gph) flowing sample is less than about 0.05.

Recommended action

If the change is greater than 0.05, install the pH and chlorine sensors in parallel streams.

Process pH grossly wrong or noisy

Grossly wrong or noisy readings suggest a ground loop (measurement system connected to earth ground at more than one point), a floating system (no earth ground), or noise being brought into the transmitter by the sensor cable. The problem arises from the process or installation. It is not a fault of the transmitter. The problem should disappear once the sensor is taken out of the system. Check the following:

Recommended actions

1. Check if a ground loop is present.
   a) Verify that the system works properly in buffers. Be sure there is no direct electrical connection between the buffer containers and the process liquid or piping.
   b) Strip back the ends of a heavy gauge wire. Connect one end of the wire to the process piping or place it in the process liquid. Place the other end of the wire in the container of buffer with the sensor.

      The wire makes an electrical connection between the process and sensor.

   If offsets and noise appear after making the connection, a ground loop exists.
2. Check if the process is grounded. Ground the piping or tank to a local earth ground.

The measurement system needs one path to ground: through the process liquid and piping. Plastic piping, fiber-glass tanks, and ungrounded or poorly grounded vessels do not provide a path. A floating system can pick up stray voltages from other electrical equipment.

If noise still persists, simple grounding is not the problem. The sensor wiring is probably carrying noise into the instrument.

3. Simplify the sensor wiring.
   a) Verify that pH sensor wiring is correct.
   b) Disconnect all sensor wires at the transmitter except pH/mV IN, REFERENCE IN, RTD IN, and RTD RETURN. If the sensor is wired to the transmitter through a remote junction box containing a preamplifer, disconnect the wires at the sensor side of the junction box.
   c) Tape back the ends of the disconnected wires to keep them from making accidental connections with other wires or terminals.
   d) Connect a jumper wire between the RTD RETURN and RTD SENSE terminals.

   If noise and/or offsets disappear, the interference was coming into the transmitter through one of the sensor wires. The system can be operated permanently with simplified wiring.
4. Check for ground connections or induced noise.
   a) If the sensor cable is run inside conduit, there may be a short between the cable and the conduit. Re-run the cable outside the conduit. If symptoms disappear, there is a short between the cable and the conduit. Likely, a shield is exposed and touching the conduit. Repair the cable and reinstall it in the conduit.
   b) To avoid induced noise in the sensor cable, run it as far away as possible from the power cables, relays, and electric motors. Keep sensor wiring out of crowded panels and cable trays.
   c) If ground loops persist, contact the factory. A visit from a service technician may be required to solve the problem.

Process readings noisy

Recommended actions

1. Check the conductivity of the sample.

   Measuring pH in samples having conductivity less than about 50 µS/cm can be very difficult. Special sensors are often needed and special attention must be paid to grounding and sample flow rate.

   Note
   Measuring free chlorine in samples having low conductivity can also be a problem. Generally, for a successful chlorine measurement, the conductivity should be greater than 50 µS/cm.

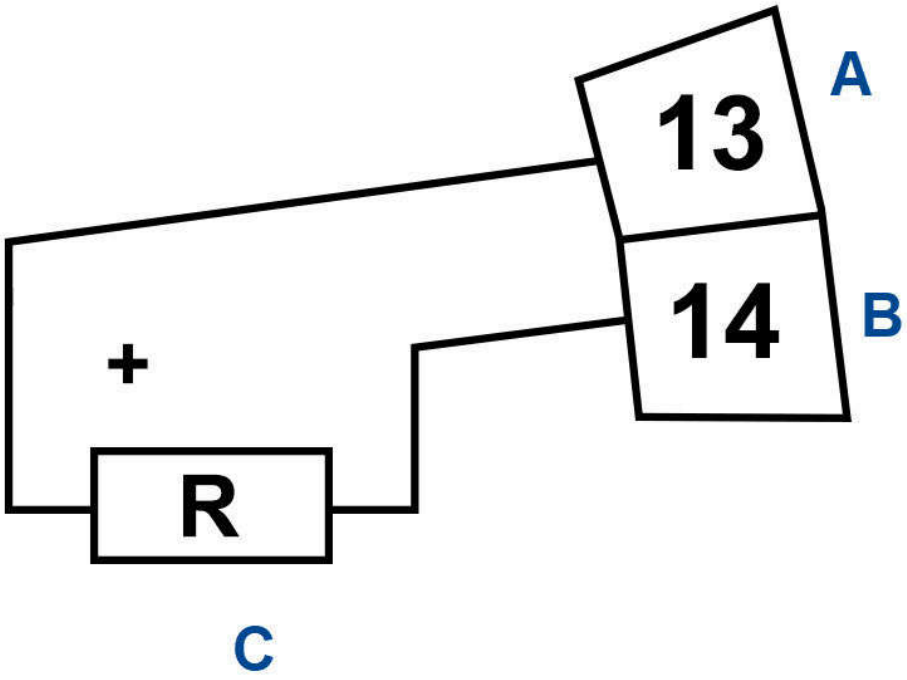
2. Check if the sensor is dirty of fouled.

Suspended solids in the sample can coat the reference junction and interfere with the electrical connection between the sensor and the process liquid. The result is often a noisy reading.

3. Make sure the sensor is properly wired to the transmitter.
4. Check if a ground loop is present.

   Refer to Process pH grossly wrong or noisy.

8.5.6 Simulate input currents - dissolved oxygen



To check the performance of the transmitter, use a decade box to simulate the current from the oxygen sensor.

Procedure

1. Disconnect the anode and cathode leads from terminals 13 and 14 and connect a decade box as shown in Figure 8-10.

   It is not necessary to disconnect the resistance temperature device (RTD) leads.

Figure 8-10: Simulate Dissolved Oxygen

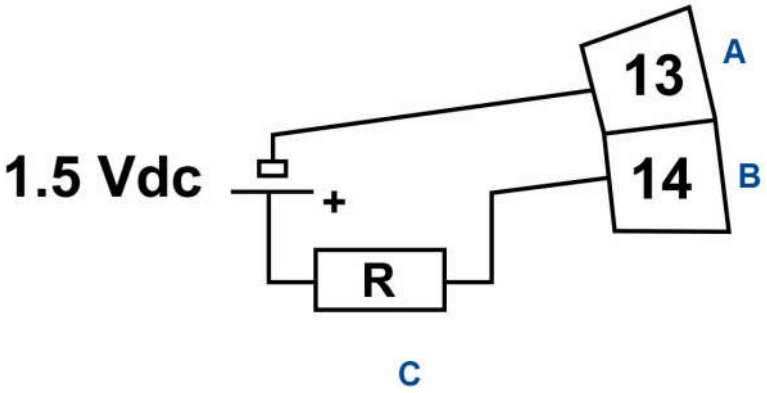
A. Anode
B. Cathode
C. Simulates sensor

2. Set the decade box to the resistance shown in the table.

Sensor	Polarizing voltage	Resistance	Expected current
Rosemount 499ADO	-675 mV	34 kΩ	20 µA
Rosemount 499ATrDO	-800 mV	20 kΩ	40 µA
Rosemount Hx438	-675 mV	8.4 MΩ	80 nA

3. Note the sensor current. To view the sensor current:
   a) Go to the main display and press **DIAG**.
   b) Press **NEXT**.
      `SEnSor Cur` appears in the display.
   c) Press **ENTER**.
      The display shows the sensor current.
   d) Note the units.
      µA is microamps; nA is nanoamps.
4. Change the decade box resistance and verify that the correct current is shown. Calculate the current from the equation:

$$\text{current } (\mu A) = \frac{\text{voltage } (mV)}{\text{resistance } (k\Omega)}$$



8.5.7 Simulate input currents - chlorine and ozone

To check the performance of the transmitter, use a decade box and a battery to simulate the current from the sensor. The battery, which opposes the polarizing voltage, is necessary to ensure that the sensor current has the correct sign.

Procedure

1. Disconnect the anode and cathode leads from terminals 13 and 14 and connect a decade box and battery as shown in Figure 8-11.
   It is not necessary to disconnect the resistance temperature device (RTD) leads.

Figure 8-11: Simulate Chlorine and Ozone

A. Anode
B. Cathode
C. Simulates sensor

2. Set the decade box to the resistance shown in the table.

Sensor	Polarizing voltage	Resistance	Expected current
Rosemount 499ACL-01 (free chlorine)	200 mV	28 MΩ	500 nA
Rosemount 499ACL-02 (total chlorine)	250 mV	675 kΩ	2000 nA
Rosemount 499AOZ	200 mV	2.7 MΩ	500 nA

3. Note the sensor current.

   It should be close to the value in the table. The actual value depends on the voltage of the battery. To view the sensor current:

   a) Go to the main display and press **DIAG**.

   b) Press **NEXT**.
   `SEnSor Cur` appears in the display.

   c) Press **ENTER**.
   The display shows the sensor current.

   d) Note the units
   µA is microamps; na is nanoamps.

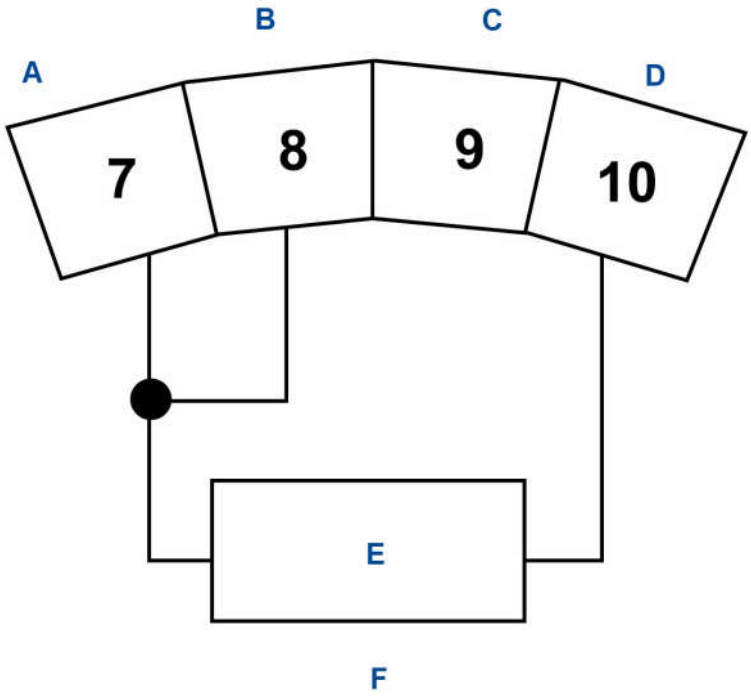
4. Change the decade box resistance and verify that the correct current is shown. Calculate the current from the equation:

$$\text{current } (\mu\text{A}) = \frac{\text{V}_{\text{battery}} - \text{V}_{\text{polarizing}}\,(\text{mV})}{\text{resistance } (\text{k}\Omega)}$$

The voltage of a fresh 1.5 volt battery is about 1.6 volt (1600 mV).

8.5.8 Simulating inputs - pH

General information about simulating pH inputs



This section describes how to simulate a pH input into the transmitter. To simulate a pH measurement, connect a standard millivolt source to the transmitter. If the transmitter is working properly, it will accurately measure the input voltage and convert it to pH. Although the general procedure is the same, the wiring details depend on whether the preamplifier is in the sensor, a junction box, or the transmitter.

Simulate pH inputs when the preamplifier is in the transmitter

Procedure

1. Turn off automatic temperature correction and set the manual temperature to 77 °F (25 °C).
2. Disconnect the pH sensor. Also, disconnect the chlorine sensor anode lead. Connect a jumper wire between the pH IN and REF IN terminals.
3. Confirm that the transmitter is reading the correct mV value.
   a) With the main display showing, press **DIAG**.
   b) Press **NEXT** until the display shows `PH`.
   c) Press **ENTER**.
   The display shows `InpUt` followed by a number. The number is the raw input signal in millivolts. The measured voltage should be 0 mV.
4. Confirm that the transmitter is reading the correct pH value.
   a) Go to the main display.
   b) Press **3** or **5**.
   The second line of the display shows the pH. The pH should be approximately 7.00. Because calibration data stored in the transmitter may be offsetting the input voltage, the displayed pH may not be exactly 7.00
5. If a standard millivolt source is available, disconnect the jumper wire between the pH IN and REF IN terminals and connect the voltage source as shown in Figure 8-12.

Figure 8-12: Simulate pH

A. Reference in
B. Solution ground
C. pH guard
D. pH in
E. mV source
F. Simulates pH

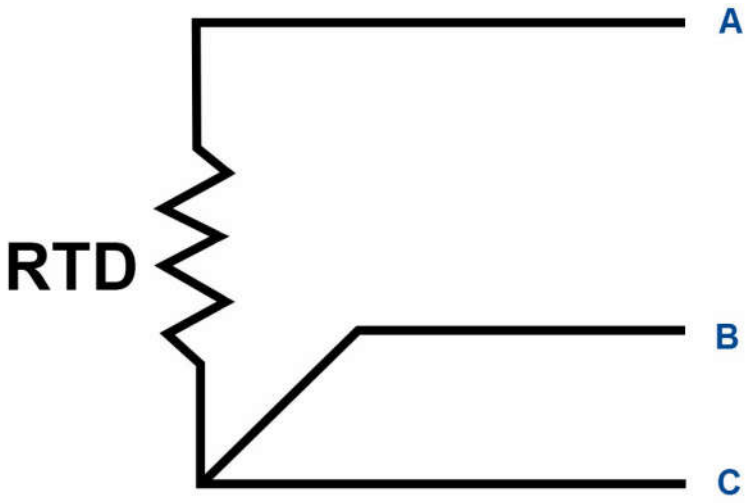
6. Calibrate the transmitter. Use 0.0 mV for Buffer 1 (pH 7.00) and -177.4 mV for Buffer 2 (pH 10.00).
   If the transmitter is working properly, it should accept the calibration. The slope should be 59.16 mV/pH, and the offset should be zero.
7. To check linearity, set the voltage source to the values shown in the table and verify that the pH and millivolt readings match the values in the table.

Voltage (mV)	pH (at 77 °F [25 °C])
295.8	2.00
177.5	4.00
59.2	6.00
59.2	8.00
177.5	10.00
295.8	12.00

Simulate pH inputs when the preamplifier is in a junction box

The procedure is the same as described in Simulate pH inputs when the preamplifier is in the transmitter. Keep the connection between the transmitter and the junction box in place. Disconnect the sensor at the sensor side of the junction box and connect the voltage source to the sensor side of the junction box.

Simulate pH inputs when the preamplifier is in a sensor



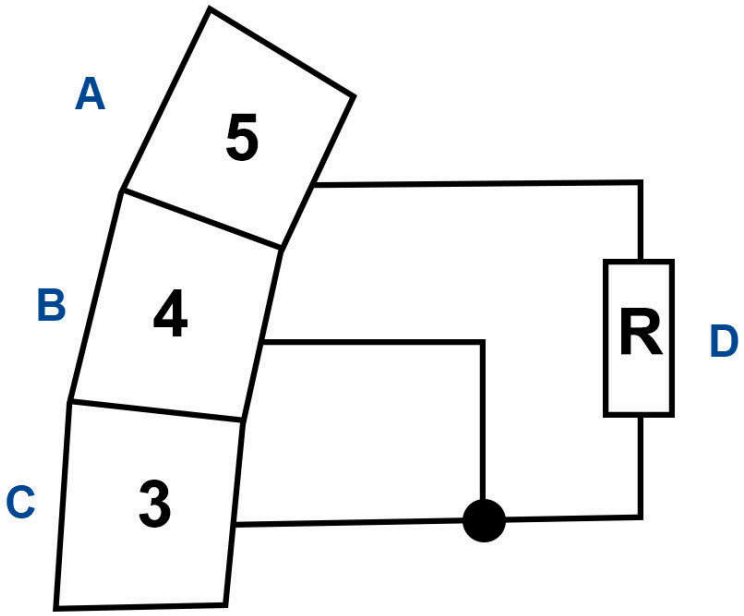
The preamplifier in the sensor converts the high impedance signal into a low impedance signal without amplifying it. To simulate pH values, follow the procedure in Simulate pH inputs when the preamplifier is in the transmitter.

8.5.9 Simulate temperature

The transmitter accepts either a Pt100 resistance temperature device (RTD) (used in Rosemount pH, 499ADO, 499ATrDO, 499ACL-01, 499ACL-02, and 499AOZ sensors) or a 22k NTC thermistor (used in Rosemount Hx438 dissolved oxygen sensors and most steam-sterilizable sensors from other manufacturers).

The Pt100 RTD has a three-wire configuration. See Figure 8-13. The thermistor has a two-wire configuration.

Figure 8-13: Three-Wire RTD Configuration



A. RTD in
B. RTD sense
C. RTD return

Although only two wires are required to connect the RTD to the transmitter, using a third wire allows the transmitter to correct for the resistance of the lead wires and for changes in the lead wire resistance with temperature.

Procedure

1. To simulate the temperature input, wire a decade box to the transmitter or junction box as shown in Figure 8-14.

Figure 8-14: Simulating RTD Inputs

A. RTD in
B. RTD sense
C. RTD return
D. Simulates RTD

The figure shows wiring connections for sensors containing a Pt 100 RTD. For sensors using a 22k NTC thermistor (Rosemount Hx438), wire the decade box to terminals 1 and 2 on TB6.

2. To check the accuracy of the temperature measurement, set the resistor to simulating the RTD to the values indicated in Table 8-4 and not the temperature readings.

   The measured temperature might not agree with the value in the table. During sensor calibration, an offset might have been applied to make the measured temperature agree with a standard thermometer. The offset is also applied to the simulated resistance. The controller is measuring temperature correctly if the difference between measured temperatures equals the difference between the values in the table to within ±0.1 °C.

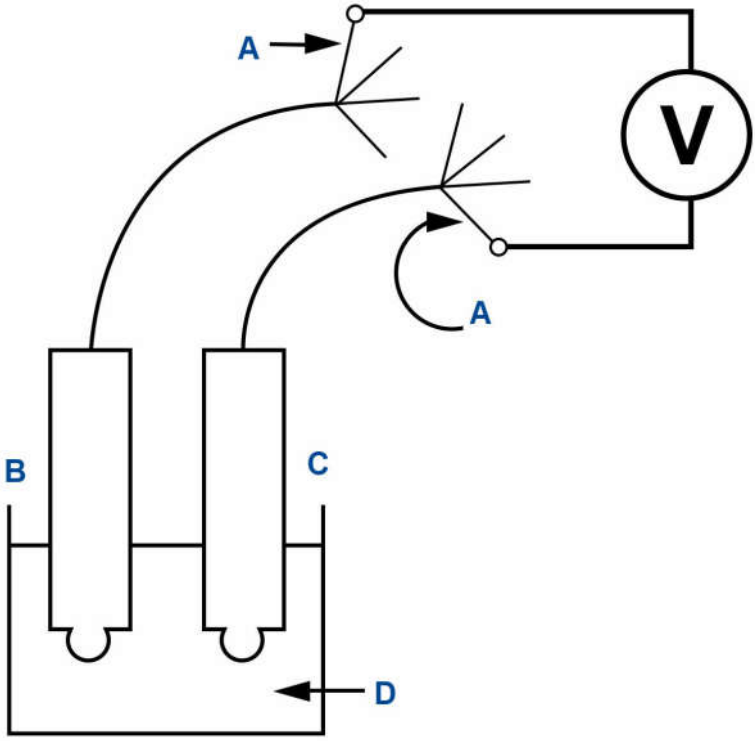
Table 8-4: RTD Values

Temp	Pt 100 (Ω)	22k NTC (kΩ)
1 °C (34 °F)	100.0	64.88
10 °C (50 °F)	103.9	41.33
20 °C (68 °F)	107.8	26.99
25 ° C (77 °F)	109.7	22.00
30 °C (86 °F)	111.7	18.03

Table 8-4: RTD Values *(continued)*

Temp	Pt 100 (Ω)	22k NTC (kΩ)
40 °C (104 °F)	115.5	12.31
50 °C (122 °F)	119.4	8.565
60 °C (140 °F)	123.2	6.072
70 °C (150 °F)	127.1	4.378
80 °C (176 °F)	130.9	3.208
85 °C (185 °F)	132.8	2.761
90 °C (194 °F)	134.7	2.385
100 (212 °F)	138.5	1.796

Example



For example, start with a simulated resistance of 103.9 Ω, which corresponds to 10.0 °C (50 °F). Assume that the offset from the sensor calibration was -0.3 Ω. Because of the offset, the transmitter calculates temperature using 103.6 Ω. The result is 9.2 °C (48.6 °F). Now change the resistance to 107.8 Ω, which corresponds to 20.0 °C (68 °F). The transmitter uses 107.5 Ω to calculate the temperature, so the display reads 19.2 °C (66.6 °F). Because the difference between the displayed temperatures (10.0 °C) is the same as the difference between the simulated temperatures, the transmitter is working correctly.

8.5.10 Measuring reference voltage

Some processes contain substances that poison or shift the potential of the reference electrode. Sulfide is a good example. Prolonged exposure to sulfide converts the reference electrode from a silver/silver chloride electrode to a silver/silver sulfide electrode. The change in reference voltage is several hundred millivolts.

A good way to check for poisoning is to compare the voltage of the reference electrode with a silver/silver chloride electrode known to be good. The reference electrode from a new sensor is best. See Figure 8-15. If the reference electrode is good, the voltage difference should be no more than about 20 mV. A poisoned reference electrode usually requires replacement.

Figure 8-15: Checking for a Poisoned Reference Electrode

A. Reference lead
B. Suspect sensor
C. Good sensor
D. Buffer of KCl solution

Refer to the sensor wiring diagram to identify the reference leads. A laboratory silver/silver chloride electrode can be used in place of the second sensor.

8.6 Factory assistance and repairs

For assistance in correcting transmitter, sensor, and measurement problems:

- In the United States, call Emerson Liquid Division at +1 800 854 8257
- Outside the United States, call the nearest Emerson office. See the back page of the manual.

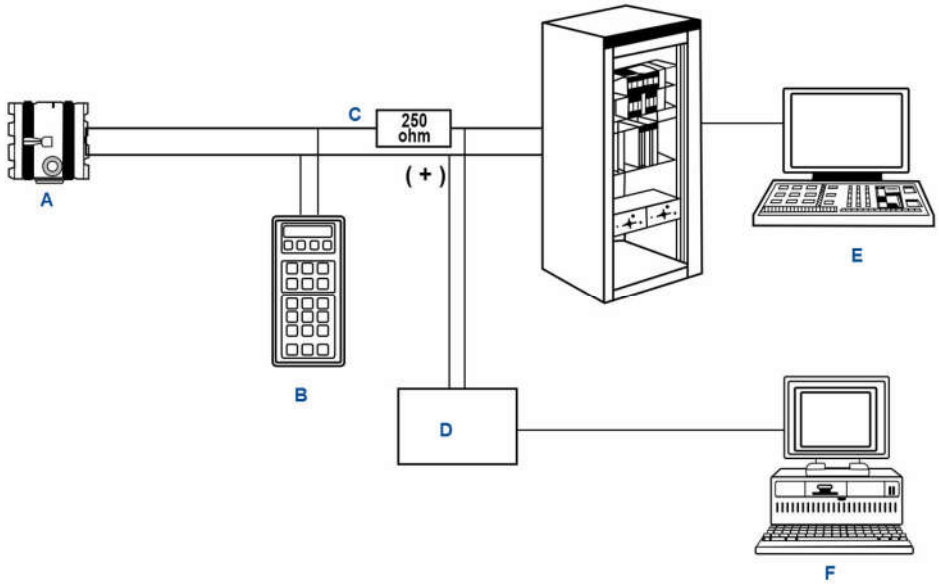
9 Digital communications

9.1 HART® communications

9.1.1 HART® communications overview

HART (highway addressable remote transducer) is a digital communication system in which two frequencies are superimposed on the 4 to 20 mA output signal from the transmitter. A 1200 Hz sine wave represents the digit 1, and a 2400 Hz sine wave represents the digit 0. Because the average value of a sine wave is zero, the digital signal adds no dc component to the analog signal. HART permits digital communication while restarting the analog signal for process control.

The HART protocol, originally developed by Fisher-Rosemount, is now overseen by the independent HART Communication Foundation. The foundation ensures that all HART devices can communicate with one another. For more information about HART communications, call the HART Communication Foundation at (512) 794-0369. The web address is http://www.fieldcommgroup.org.



9.1.2 HART® interface devices

With HART communicators, you can view measurement data (pH, ORP, and temperature), program the transmitter, and download information from the transmitter for transfer to a computer for analysis. You can also send downloaded information to another HART transmitter. To access the HART interface, you can use either a handheld communicator or a computer.

HART interface devices operate from any wiring termination point in the 4 - 20 mA loop. A minimum load of 250 ohms must be present between the transmitter and the power supply. See Figure 9-1.

If your communicator does not recognize the Rosemount™ 5081 transmitter, you may need to update the device description library. Call the manufacturer of your HART communication device for updates.

9.2.1 FOUNDATION™ Fieldbus specifications

Model	Rosemount 5081 Fieldbus transmitter
Device ITK profile	6 (released for (ITK 6.0.0/6.0.1)
Manufacturer identification (MANUFAC_ID)	0x524149
Device type (DEV_TYPE)	0x4084
Device revision (DEV_REV)	0x03
Linkmaster	Yes
Number of link objects	20
VCRs supported	20

Mandatory features	• Resource block • Alarm and events • Function block linking • Trending • Multi-bit alert reporting • Field diagnostics
Additional features	• Common software download • Block instantiation • Supports DeltaV auto commissioning • Supports DeltaV auto replacement • Supports DeltaV firmware live download • PlantWeb alerts with re-annunciation/ multibit • Supports easy configuration assistant
Function blocks (execution time)	• 4 - analog input blocks (15 mseconds) • AI block channels Channel 1: Conductivity, resistivity, concentration Channel 2: Temperature Channel 3: Raw conductivity • Proportional integral derivative (25 milliseconds)
Power	• Two wire device; Fieldbus polarity insensitive • Current draw: 21 mA • Device certifications: IS / FISCO • Maximum certified input voltage for IS: 30 V • Maximum certified input current for IS: 300 mA • Maximum certified input power for IS: 1.3 W • Internal capacitance (Ci): 0 nF • Internal inductance (Li): 0 µH

9.3 Asset Management Solutions

Asset Management Solutions (AMS) is software that helps plant personnel better monitor the performance of analytical instruments, pressure and temperature transmitters, and control valves. Continuous monitoring means maintenance personnel can anticipate equipment failures and plan preventative measures before costly breakdown maintenance is required.

AMS uses remote monitoring. The operator, sitting at a computer, can view measurement data, change program settings, read diagnostic and warning messages, and retrieve historical data from any HART®-compatible device, including the Rosemount 5081 transmitter. Although AMS allows access to the basic functions of any HART compatible device, Rosemount has developed additional software that allows access to all features of the Rosemount 5081 transmitter.

AMS can play a central role in plant quality assurance and quality control. Using AMS Audit Trail, plant operators can track calibration frequency and results as well as warnings and diagnostic messages. The information is available to Audit Trail whether calibrations were done using the infrared remote controller, the HART communicator, or AMS software.

AMS operates in Windows 95. AMS communicates through a HART-compatible modem with any HART transmitters, including those from other manufacturers. AMS is also compatible with FOUNDATION™ Fieldbus, which allows future upgrades to Fieldbus instruments.

Rosemount AMS windows provide access to all transmitter measurement and configuration variables. You can read raw data, final data, and program settings and can reconfigure the transmitter from anywhere in the plant.

10 Return of material

10.1 General information

To expedite the repair and return of instruments, proper communication between the customer and the factory is important. Call 1-800-999-9307 for a Return Materials Authorization (RMA) number.

10.2 Warranty repair

To return instruments still under warranty:

Procedure

1. Contact Rosemount™ for authorization.
2. To verify warranty, supply the factory sales order number or the original purchase order number.

   In the case of individual parts or sub-assemblies, supply the serial number on the unit.
3. Carefully package the materials and enclose your Letter of Transmittal. If possible, pack the materials in the same manner as they were received.
4. Send the package prepaid to:

   Emerson Automation Solutions

   8200 Market Blvd

   Chanhassen, MN 55317

   RMA No. _____
5. Mark the package: *Returned for Repair*

   Model No. _____

10.3 Non-warranty repair

To return instruments that are no longer under warranty for repair:

Procedure

1. Call Rosemount for authorization.
2. Supply the purchase order number and make sure to provide the name and telephone number of the individual to be contacted should additional information be needed.
3. Do steps 3-5 of Warranty repair.

Note
Consult the factory for additional information regarding service or repair.

A Engineering Drawings

The following is a list of engineering drawings in the order in which they appear in this manual.

Drawing number	Title
1400674	Schem, CSA I.S. / NIFW installation 5081 C/T
1400675	Schem, CSA I.S. / NIFW install 5081 P/A
1400676	Schem, FM I.S. / NIFW install 5081 A/P
1400677	Schem, FM I.S / NIFW installation 5081 C/T
1400678	Sch, system FM DIP/EXP proof 5081 C/T
1400679	Sch, system FM DIP/EXP proof 5081 P/A
1700783	Certified product, 5081 XMTR, CSA
1700784	Certified product, 5081 XMTR, FM
1700785	Certified product, 5081 P/A ATEX/IECEx
1700786	Certified product, 5081 C/T ATEX/IECEx

TABLE I

GAS GROUPS	C OPTION OUTPUT PARAMETERS Ca (uf)		La (mH)
	FF / FI		HT

C	490.05	1.6	7.0
D	9990.05	3.1	3.7

TABLE II

C OPTION OUTPUT PARAMETERS	5081C TB1, PINS 1 THRU 12	
	FF / FI	HT
Vt	6.51 Vdc	6.51 Vdc
It	302.59 mA	280 mA
Pt	365 mW	442 mW

TABLE III

5081C/T INPUT PARAMETERS, SUPPLY/SIGNAL TERMINALS, TB1 PINS 15 & 16						Voc MAX OUT (Vdc)	Isc MAX OUT (mA)
OPTIONS	Vmax(Vdc)	Imax (mA)	Pmax (W)	Ci (nF)	Li (uH)		
FI (FISCO)	17.5	380	5.32	5	10		
FF/FI (NON-FISCO)	30	300	1.3	27.8	0		
HT (NON-FISCO)	30	200	0.9	27.8	0		
ENTITY PARAMETERS: FIELD COMMUNICATOR							
375/475	30	200	1	.00	0.0	1.9	3.2

17. FOR THE C OPTION, THE CAPACITANCE AND INDUCTANCE CONNECTED TO THE SENSOR TERMINALS MUST NOT EXCEED THE VALUES SPECIFIED IN TABLE I.
16. FOR C OPTION, SENSORS SHALL BE CSA APPROVED IN ACCORDANCE WITH THE ENTITY REQUIREMENTS OR MEET THE REQUIREMENTS OF SIMPLE APPARATUS AS DEFINED IN ANSI/ISA RP12.6 AND THE NEC, ANSI/NFPA 70. THEY CANNOT GENERATE NOR STORE MORE THAN 1.5V, 0.1mA, 25mW OR A PASSIVE COMPONENT THAT DOES NOT DISSIPATE MORE THAN 1.3W. SEE TABLES I AND II.

△15 NON-INCENDIVE FIELD WIRING METHODS MAY BE USED FOR CONNECTING SENSORS TO THE INSTRUMENT. ATTACHED SENSORS MUST BE CSA APPROVED AS NON-INCENDIVE FOR CLASS 1, DIVISION 2, GROUPS ABCD WITH INPUT VALUES OF Vmax AND Imax ≥ Voc (Vt) AND Isc (It) LISTED IN TABLE II AND THE Ci AND Li OF THE SENSOR AND INTERCONNECTED WIRING MUST BE ≤ Ca AND La LISTED IN TABLE 1 OR BE CLASSIFIED AS "SIMPLE APPARATUS". SIMPLE APPARATUS ARE DEVICES WHICH ARE INCAPABLE OF GENERATING OR STORING MORE THAN 1.2 V, 0.1 A, 25 mW OR 20 µJ (CONTACTING CONDUCTIVITY SENSORS QUALIFY AS SIMPLE APPARATUS).

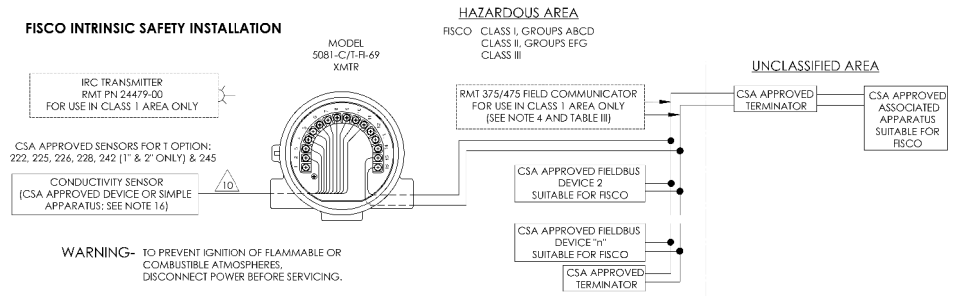
△14 INSTALLATION TO BE IN ACCORDANCE WITH THE CANADIAN ELECTRICAL CODE.

△13 DIVISION 2 WIRING METHOD PER THE CANADIAN ELECTRICAL CODE (EXCLUDING NONINCENDIVE FIELD WIRING).

△12 INTRINSICALLY SAFE APPARATUS (5081, IRC TRANSMITTER, 375/475 FIELD COMMUNICATOR, FIELDBUS TERMINATOR OR ANY OTHER FIELDBUS DEVICES) AND ASSOCIATED APPARATUS (SAFETY BARRIER) SHALL MEET THE FOLLOWING REQUIREMENTS:
THE VOLTAGE (Vmax) AND CURRENT (Imax) OF THE INTRINSICALLY SAFE APPARATUS MUST BE EQUAL TO OR GREATER THAN THE VOLTAGE (Voc OR Vt) AND CURRENT (Isc OR It) WHICH CAN BE DELIVERED BY THE ASSOCIATED APPARATUS (SAFETY BARRIER). IN ADDITION, THE MAXIMUM UNPROTECTED CAPACITANCE (Ci) AND INDUCTANCE (Li) OF THE INTRINSICALLY SAFE APPARATUS, INCLUDING INTERCONNECTING WIRING, MUST BE EQUAL OR LESS THAN THE CAPACITANCE (Ca) AND INDUCTANCE (La) WHICH CAN BE SAFELY CONNECTED TO THE APPARATUS. (REF. TABLE III)

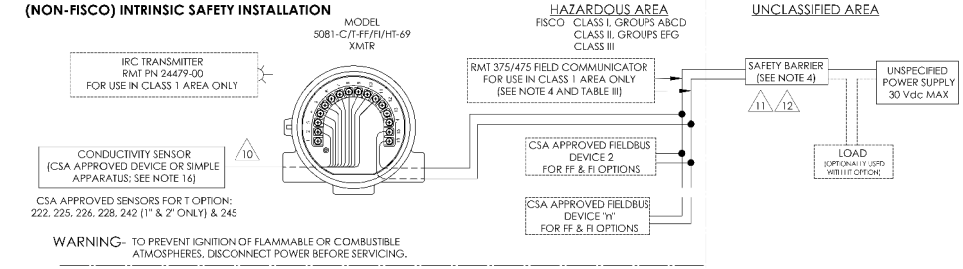
△11 FOR (NON-FISCO) INTRINSIC SAFETY INSTALLATION, ANY SINGLE SHUNT ZENER DIODE SAFETY BARRIER APPROVED BY CSA HAVING THE FOLLOWING OUTPUT PARAMETERS:
SUPPLY/SIGNAL TERMINALS ON TB1, PINS 15 AND 16.
Voc OR Vt NOT GREATER THAN 30 V FOR FF, FI AND HT OPTIONS
Isc OR It NOT GREATER THAN 300 mA FOR FF AND FI OPTIONS, OR 200 mA FOR HT OPTION
Pmax NOT GREATER THAN 1.3 W FOR FF AND FI OPTIONS, OR 0.9 mW FOR HT OPTION.

△10 FOR T OPTION, MAXIMUM CABLE LENGTH IS 250 FEET.



9. USE SUPPLY WIRES SUITABLE FOR 5°C ABOVE SURROUNDING AMBIENT.
8. NO REVISION TO DRAWING WITHOUT PRIOR CSA APPROVAL.
7. THE CONFIGURATION OF ASSOCIATED APPARATUS MUST BE CSA APPROVED UNDER THE ASSOCIATED CONCEPT AND (FOR HT AND FF OPTIONS) BE RESISTIVELY LIMITED WITH LINEAR OUTPUTS.
6. CONTROL EQUIPMENT CONNECTED TO ASSOCIATED APPARATUS MUST NOT USE OR GENERATE MORE THAN 250 Vrms OR Vdc.
5. ASSOCIATED APPARATUS MANUFACTURER'S INSTALLATION DRAWING MUST BE FOLLOWED WHEN INSTALLING THIS EQUIPMENT.
4. THE ENTITY CONCEPT ALLOWS INTERCONNECTION OF INTRINSICALLY SAFE APPARATUS WITH ASSOCIATED APPARATUS WHEN THE FOLLOWING IS TRUE:

FIELD DEVICE INPUT		ASSOCIATED APPARATUS OUTPUT
Vmax OR Ui	≥	Voc, Vt OR Uo
Imax OR Ii	≥	Isc, It OR Io
Pmax OR Pi	≥	Po
Ci + Ccable	≤	Ca, Ct OR Co (FOR NON-FISCO INSTALLATIONS)
Li + Lcable	≤	La, Lt OR Lo (FOR NON-FISCO INSTALLATIONS)



3. RESISTANCE BETWEEN INTRINSICALLY SAFE GROUND AND EARTH GROUND MUST BE LESS THAN 1.0 Ohm.
2. DUST-TIGHT CONDUIT SEAL MUST BE USED WHEN INSTALLED IN CLASS II AND CLASS III ENVIRONMENTS.
1. INSTALLATION SHOULD BE IN ACCORDANCE WITH ANSI/ISA RP12.06 "INSTALLATION OF INTRINSICALLY SAFE SYSTEMS FOR HAZARDOUS (CLASSIFIED) LOCATIONS" (EXCEPT CHAPTER 5 FOR FISCO INSTALLATIONS) AND THE CANADIAN ELECTRICAL CODE (CSA C22.1).

NOTES: UNLESS OTHERWISE SPECIFIED

17. THE CAPACITANCE AND INDUCTANCE CONNECTED TO THE SENSOR TERMINALS MUST NOT EXCEED THE VALUES SPECIFIED IN TABLE II.
16. NO REVISION TO DRAWING WITHOUT CSA APPROVAL.
15. NON-INCENDIVE FIELD WIRING METHODS MAY BE USED FOR CONNECTING SENSORS TO THE INSTRUMENT, ATTACHED SENSORS MUST BE CSA APPROVED AS NON-INCENDIVE FOR CLASS 1, DIVISION 2, GROUPS ABCD WITH INPUT VALUES OF Vmax AND Imax ≥ Voc (Vt) AND Isc (It) LISTED IN TABLE II AND THE CABLE AND CONNECTED APPARATUS SIMPLE APPARATUS LIMITS OF Co AND Lo LISTED IN TABLE I OR BE CLASSIFIED AS SIMPLE APPARATUS. SIMPLE APPARATUS ARE DEVICES WHICH ARE INCAPABLE OF GENERATING OR STORING MORE THAN 1.2 V, 0.1 A, 25 mW OR 20 µJ (AMPEROMETRIC SENSORS WITHOUT PREAMPS QUALIFY AS SIMPLE APPARATUS).
14. INSTALLATION TO BE IN ACCORDANCE WITH THE CANADIAN ELECTRICAL CODE.
13. DIVISION 2 WIRING METHOD (EXCLUDING NONINCENDIVE FIELD WIRING).
12. INTRINSICALLY SAFE APPARATUS (5081, IRC TRANSMITTER, 375/475 FIELD COMMUNICATOR, FIELDBUS TERMINATOR OR ANY OTHER FIELDBUS DEVICES) AND ASSOCIATED APPARATUS (SAFETY BARRIER) SHALL MEET THE FOLLOWING REQUIREMENTS:
THE VOLTAGE (Vmax) AND CURRENT (Imax) OF THE INTRINSICALLY SAFE APPARATUS MUST BE EQUAL OR LESS THAN THE ASSOCIATED APPARATUS (SAFETY BARRIER). IN ADDITION, THE MAXIMUM UNPROTECTED CAPACITANCE (Ci) AND INDUCTANCE (Li) OF THE INTRINSICALLY SAFE APPARATUS, INCLUDING INTERCONNECTING WIRING, MUST BE EQUAL OR LESS THAN THE CAPACITANCE (Co) AND INDUCTANCE (Lo) WHICH CAN BE SAFELY CONNECTED TO THE APPARATUS. (REF. TABLE III)
11. FOR INTRINSIC SAFETY (NON-FISCO) INSTALLATION:
ANY SINGLE SHUNT ZENER DIODE SAFETY BARRIER APPROVED BY FM HAVING THE FOLLOWING OUTPUT PARAMETERS:
Voc OR Vt NOT GREATER THAN 30 V FOR FF, FI AND HT OPTIONS
Isc OR It NOT GREATER THAN 300 mA FOR FF AND FI OPTIONS, OR 200 mA FOR HT OPTION
Pmax NOT GREATER THAN 1.3 W FOR FF AND FI OPTIONS, OR 0.9 mW FOR HT OPTION.
10. INTEGRAL PREAMPLIFIER: A WEATHER RESISTANT ENCLOSURE MUST BE USED, USE THE 273546-00 PREAMPLIFIER. OTHER PREAMPS OR PREAMP CONTAINING SENSORS MAY BE USED IF OVERALL C AND L ARE < THE LIMITS DETAILED IN NOTE 9 AND THE MAXIMUM ENITY PARAMETERS ARE > THOSE IN TABLE II.
9. THE 5081 P/A INCLUDES INTEGRAL PREAMPLIFIER CIRCUITRY. AN EXTERNAL PREAMPLIFIER MAY ALSO BE USED, THE OUTPUT PARAMETERS SPECIFIED IN TABLE II ARE VALID FOR EITHER PREAMPLIFIER, THE CAPACITANCE AND INDUCTANCE OF THE LOAD CONNECTED TO THE SENSOR TERMINALS MUST NOT EXCEED THE VALUES SPECIFIED IN TABLE II. FOR EXAMPLE, FOR THE 5081-P-A-FF/HT-69 WITH 7.62 m (25 ft) OF 3180R/FB2 Lcable, THE MAXIMUM ALLOWABLE CAPACITANCE OF THE ENTITY REQUIREMENTS OR MEET THE REQUIREMENTS OF SIMPLE APPARATUS AS DEFINED IN ANSI/ISA RP12.6 AND THE NEC, ANSI/NFPA 70. THEY CANNOT GENERATE NOR STORE MORE THAN 1.5V, 0.1mA, 25mW OR A PASSIVE COMPONENT THAT DOES NOT DISSIPATE MORE THAN 1.3W, SEE TABLES I AND II.
8. SENSORS SHALL BE CSA APPROVED FOR USE IN CLASS I, DIVISION 2, GROUPS ABCD AND THE ENTITY REQUIREMENTS OR MEET THE REQUIREMENTS OF SIMPLE APPARATUS AS DEFINED IN ANSI/ISA RP12.6 AND THE NEC, ANSI/NFPA 70. THEY CANNOT GENERATE NOR STORE MORE THAN 1.5V, 0.1mA, 25mW OR A PASSIVE COMPONENT THAT DOES NOT DISSIPATE MORE THAN 1.3W, SEE TABLES I AND II.
7. THE CONFIGURATION OF ASSOCIATED APPARATUS MUST BE CSA APPROVED UNDER THE ASSOCIATED CONCEPT AND BE RESISTIVELY LIMITED HAVING LINEAR OUTPUTS.
6. CONNECTION OF NON-CSA APPROVED ASSOCIATED APPARATUS MUST NOT USE OR GENERATE MORE THAN 250 Vrms, OR Vdc.
5. ASSOCIATED APPARATUS MANUFACTURER'S INSTALLATION DRAWING MUST BE FOLLOWED WHEN INSTALLING THIS EQUIPMENT.
4. THE ENTITY CONCEPT ALLOWS INTERCONNECTION OF INTRINSICALLY SAFE APPARATUS WITH ASSOCIATED APPARATUS WHEN THE FOLLOWING IS TRUE:

ASSOCIATED APPARATUS OUTPUT		FIELD DEVICE INPUT
Voc OR Ui	≥	Vmax OR Ui
Isc OR Ii	≥	Imax OR Ii
Po	≥	Pmax OR Pi
Co	≥	Ci + Ccable
Lo	≥	Li + Lcable

3. RESISTANCE BETWEEN INTRINSICALLY SAFE GROUND AND EARTH GROUND MUST BE LESS THAN 1.0 Ohm.
2. DUST-TIGHT CONDUIT SEAL MUST BE USED WHEN INSTALLED IN CLASS II AND CLASS III ENVIRONMENTS.
1. WIRING MUST COMPLY WITH THE NATIONAL ELECTRICAL CODE ANSI/NFPA 70 FOR INSTALLATION OF INTRINSICALLY SAFE SYSTEMS FOR HAZARDOUS (CLASSIFIED) LOCATIONS"
(EXCEPT CHAPTER 5 FOR FISCO INSTALLATIONS) AND THE CANADIAN ELECTRICAL CODE (CSA C22.1).

NOTES: UNLESS OTHERWISE SPECIFIED

17. THE CAPACITANCE AND INDUCTANCE CONNECTED TO THE SENSOR TERMINALS MUST NOT EXCEED THE VALUES SPECIFIED IN TABLE I.
16. NO REVISION TO DRAWING WITHOUT FM APPROVAL.
/15. NON-INCENDIVE FIELD WIRING METHODS MAY BE USED FOR CONNECTING SENSORS TO THE INSTRUMENT. ATTACHED SENSORS MUST BE FM APPROVED AS NON-INCENDIVE FOR CLASS 1, DIVISION 2, GROUPS ABCD WITH INPUT VALUES OF: Vmax ≥ Voc (Vt) AND Imax ≥ Isc (It) LISTED IN TABLE II AND THE Ci AND Li OF THE SENSOR AND INTERCONNECTED WIRING MUST BE ≤ Co AND Lo LISTED IN TABLE 1 OR BE CLASSIFIED AS "SIMPLE APPARATUS". SIMPLE APPARATUS ARE DEVICES WHICH ARE INCAPABLE OF GENERATING OR STORING MORE THAN 1.2 V, 0.1 A, 25 mW OR 20 µJ. (AMPEROMETRIC SENSORS WITHOUT PREAMP QUALIFY AS SIMPLE APPARATUS).
/14. INSTALLATION TO BE IN ACCORDANCE WITH THE NATIONAL ELECTRICAL CODE.
/13. DIVISION 2 WIRING METHOD PER THE NEC (EXCLUDING NONINCENDIVE FIELD WIRING).
/12. INTRINSICALLY SAFE APPARATUS (5081, IRC TRANSMITTER, 375/475 FIELD COMMUNICATOR, FIELDBUS TERMINATOR OR ANY OTHER FIELDBUS DEVICES) AND ASSOCIATED APPARATUS (SAFETY BARRIER) SHALL MEET THE FOLLOWING REQUIREMENTS: THE VOLTAGE (Vmax) AND CURRENT (Imax) OF THE INTRINSICALLY SAFE APPARATUS MUST BE ≥ THE VOLTAGE AND CURRENT (Voc, Isc) OF THE ASSOCIATED APPARATUS (SAFETY BARRIER). IN ADDITION, THE MAXIMUM UNPROTECTED CAPACITANCE (Ci) AND INDUCTANCE (Li) OF THE INTRINSICALLY SAFE APPARATUS, INCLUDING INTERCONNECTING WIRING, MUST BE EQUAL OR LESS THAN THE CAPACITANCE (Cca) AND INDUCTANCE (Lo) WHICH CAN BE SAFELY CONNECTED TO THE APPARATUS. (REF. TABLE III)
11. FOR INTRINSIC SAFETY (NON-FISCO) INSTALLATION, ANY SINGLE SHUNT ZENER DIODE SAFETY BARRIER APPROVED TO THE FOLLOWING PARAMETERS MAY BE USED IN THE SENSOR SUPPLY/SIGNAL TERMINALS ON TB1, PINS 15 AND 16.
Voc OR Vt NOT GREATER THAN 30 V FOR FF, FI AND HT OPTIONS
Isc OR It NOT GREATER THAN 300 mA FOR FF AND FI OPTIONS, OR 200 mA FOR HT OPTION
Pmax NOT GREATER THAN 1.3 W FOR FF AND FI OPTIONS, OR 0.9 mW FOR HT OPTION
10. PREAMPLIFIER PART NUMBER 23446-00 (NON-FISCO) AND 23446-01 (FISCO) MAY BE USED WITH THE 5081P,D,D/2 INTEGRAL PREAMPHER. A WEATHER RESISTANT ENCLOSURE MUST HOUSE THE TYPE 23446-00 PREAMPLIFIER. OTHER PREAMPS OR PREAMP CONTAINING SENSORS MAY BE USED IF OVERALL C AND L ARE < THE LIMITS DETAILED IN NOTE 9 AND THE MAXIMUM ENTITY PARAMETERS ARE > THOSE IN TABLE II.
9. THE 5081-A/P INCLUDES INTEGRAL PREAMPLIFIER CIRCUITRY. AN EXTERNAL PREAMPLIFIER MAY ALSO BE USED. THE OUTPUT OF THE PREAMPLIFIER MUST BE LINEAR WITH RESPECT TO SENSOR CURRENT. THE CAPACITANCE AND INDUCTANCE OF THE LOAD CONNECTED TO THE SENSOR TERMINALS MUST NOT EXCEED THE VALUES SPECIFIED IN TABLE I WHERE Co > Ci (SENSOR) + Ccable AND Lo > Li(SENSOR) + Lcable.
8. SENSORS SHALL BE FM APPROVED IN ACCORDANCE WITH THE ENTITY REQUIREMENTS OR MEET THE REQUIREMENTS OF SIMPLE APPARATUS AS DEFINED IN ANSI/ISA RP12.6 AND THE NEC. ANSI/NFPA 70. THEY CAN DISSIPATE NOT MORE THAN 1.5 W. SEE TABLE I, II, III.
7. THE CONFIGURATION OF ASSOCIATED APPARATUS MUST BE FM APPROVED UNDER THE ASSOCIATED CONCEPT.
6. CONTROL EQUIPMENT CONNECTED TO ASSOCIATED APPARATUS MUST NOT USE OR GENERATE MORE THAN 250 Vrms OR Vdc.
5. ASSOCIATED APPARATUS MANUFACTURER'S INSTALLATION DRAWING MUST BE FOLLOWED WHEN INSTALLING THIS EQUIPMENT.
4. THE ENTITY CONCEPT ALLOWS INTERCONNECTION OF INTRINSICALLY SAFE APPARATUS WITH ASSOCIATED APPARATUS WHEN THE FOLLOWING IS TRUE:

FIELD DEVICE INPUT	≥	ASSOCIATED APPARATUS OUTPUT
Vmax OR Ui	≥	Voc, Vt OR Uo
Imax OR Ii	≥	Isc, It OR Io
Pmax OR Pi	≥	Po
Ci + 3Ccable	≤	Ca, Ct OR Co (FOR FISCO INSTALLATIONS)
Li + 3Lcable (FOR FISCO INSTALLATIONS)	≤	La, Lt OR Lo; Ic/Rc ≤ Ia/Ra OR Lo/Ro) AND Li/Ri ≤ Ia/Ra OR Lo/Ro)
Ci + Ccable	≤	Ca, Ct OR Co (FOR FISCO INSTALLATIONS)
Li + Lcable	≤	La, Lt OR Lo (FOR FISCO INSTALLATIONS)

3. RESISTANCE BETWEEN INTRINSICALLY SAFE GROUND AND EARTH GROUND MUST BE LESS THAN 1.0 Ohm.
2. DUST-TIGHT CONDUIT SEAL MUST BE USED WHEN INSTALLED IN CLASS II AND CLASS III ENVIRONMENTS.
1. INSTALLATION SHOULD BE IN ACCORDANCE WITH ANSI/ISA RP12.06 "INSTALLATION OF INTRINSICALLY SAFE SYSTEMS FOR HAZARDOUS (CLASSIFIED) LOCATIONS" EXCEPT CHAPTER 5 FOR FISCO INSTALLATIONS) AND THE NATIONAL ELECTRICAL CODE (ANSI/NFPA 70)SECTIONS 504 AND 505.

NOTES: UNLESS OTHERWISE SPECIFIED

TABLE I

GAS GROUPS	C OPTION OUTPUT PARAMETERS		
	Ca (µf)	La (mH)	
		FF / FI	HT

HT (NON-FISCO)	30	200	0.9	27.8	0		
ENTITY PARAMETERS: FIELD COMMUNICATOR							
375/475	30	200	1	.00	0.0	1.9	32

17. FOR THE C OPTION, THE CAPACITANCE AND INDUCTANCE CONNECTED TO THE SENSOR TERMINALS MUST NOT EXCEED THE VALUES SPECIFIED IN TABLE I.

16. FOR C OPTION, SENSORS SHALL BE FM APPROVED IN ACCORDANCE WITH THE ENTITY REQUIREMENTS OR MEET THE REQUIREMENTS OF SIMPLE APPARATUS AS DEFINED IN ANSI/ISA RP12.6 AND THE NEC, ANSI/NFPA 70. THEY CANNOT GENERATE NOR STORE MORE THAN 1.5V, 0.1mA, 25mW OR A PASSIVE COMPONENT THAT DOES NOT DISSIPATE MORE THAN 1.3W. SEE TABLES I AND II.

△15 NON-INCENDIVE FIELD WIRING METHODS MAY BE USED FOR CONNECTING SENSORS TO THE INSTRUMENT. ATTACHED SENSORS MUST BE FM APPROVED AS NON-INCENDIVE FOR CLASS 1,DIVISION 2, GROUPS ABCD WITH INPUT VALUES OF Vmax AND Imax ≥ Voc (Vt) AND Isc (It) LISTEDIN TABLE II AND THE Ci AND Li OF THE SENSOR AND INTERCONNECTED WIRING MUST BE ≤ Ca AND La LISTED IN TABLE I OR BE CLASSIFIED AS "SIMPLE APPARATUS". SIMPLE APPARATUS ARE DEVICES WHICH ARE INCAPABLE OF GENERATING OR STORING MORE THAN 1.2 V, 0.1 A, 25 mW OR 20 µJ (CONTACTING CONDUCTIVITY SENSORS QUALIFY AS SIMPLE APPARATUS).

△14 INSTALLATION TO BE IN ACCORDANCE WITH THE NATIONAL ELECTRICAL CODE.

△13 DIVISION 2 WIRING METHOD PER THE NEC (EXCLUDING NONINCENDIVE FIELD WIRING).

△12 INTRINSICALLY SAFE APPARATUS (5081, IRC TRANSMITTER, 375/475 FIELD COMMUNICATOR, FIELDBUS TERMINATOR OR ANY OTHER FIELDBUS DEVICES) AND ASSOCIATED APPARATUS (SAFETY BARRIER) SHALL MEET THE FOLLOWING REQUIREMENTS: THE VOLTAGE (Vmax) AND CURRENT (Imax) OF THE INTRINSICALLY SAFE APPARATUS MUST BE EQUAL TO OR GREATER THAN THE VOLTAGE (Voc OR Vt) AND CURRENT (Isc OR It) WHICH CAN BE DELIVERED BY THE ASSOCIATED APPARATUS (SAFETY BARRIER). IN ADDITION, THE MAXIMUM UNPROTECTED CAPACITANCE (Ci) AND INDUCTANCE (Li) OF THE INTRINSICALLY SAFE APPARATUS, INCLUDING INTERCONNECTING WIRING, MUST BE EQUAL OR LESS THAN THE CAPACITANCE (Ca) AND INDUCTANCE (La) WHICH CAN BE SAFELY CONNECTED TO THE APPARATUS. (REF. TABLE III)

△11 FOR (NON-FISCO) INTRINSIC SAFETY INSTALLATION, ANY SINGLE SHUNT ZENER DIODE SAFETY BARRIER APPROVED BY FM HAVING THE FOLLOWING OUTPUT PARAMETERS:
SUPPLY/SIGNAL TERMINALS ON TB1, PINS 15 AND 16.
Voc OR Vt NOT GREATER THAN 30 V FOR FF, FI AND HT OPTIONS
Isc OR It NOT GREATER THAN 300 mA FOR FF AND FI OPTIONS, OR 200 mA FOR HT OPTION
Pmax NOT GREATER THAN 1.3 W FOR FF AND FI OPTIONS, OR 0.9 mW FOR HT OPTION.

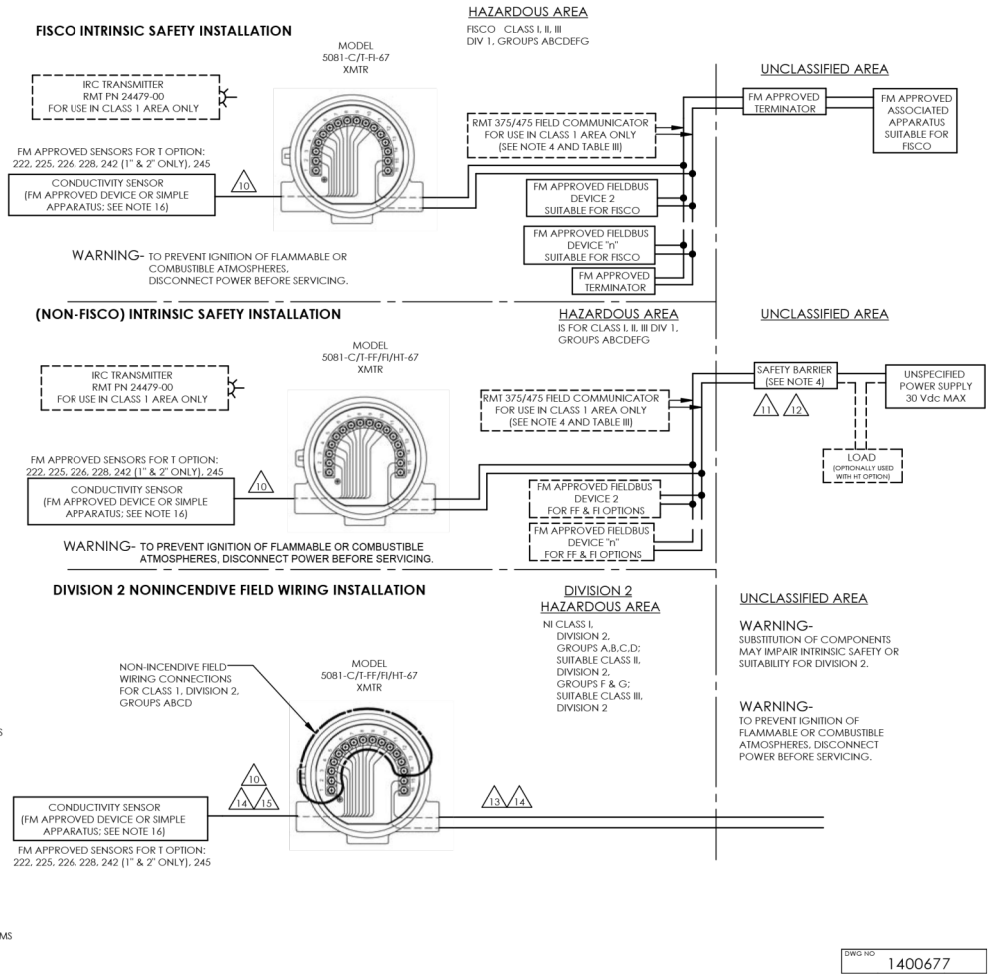
△10 FOR T OPTION, MAXIMUM CABLE LENGTH IS 250 FEET.

9. USE SUPPLY WIRES SUITABLE FOR 5°C ABOVE SURROUNDING AMBIENT.
8. NO REVISION TO DRAWING WITHOUT PRIOR FM APPROVAL.
7. THE CONFIGURATION OF ASSOCIATED APPARATUS MUST BE FM APPROVED UNDER THE ASSOCIATED CONCEPT.

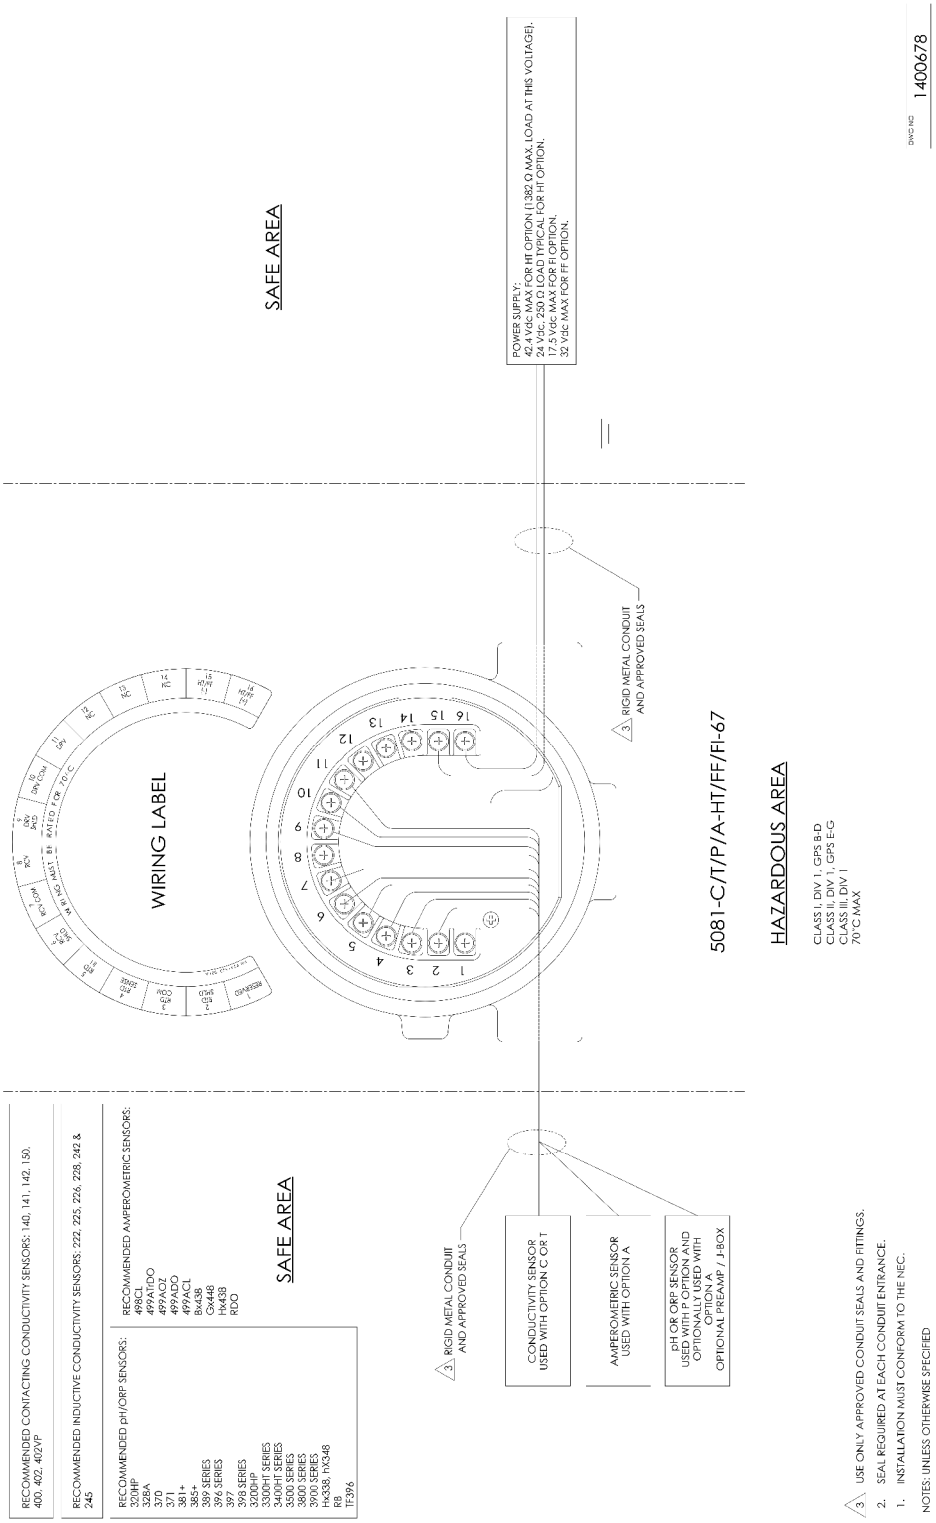
6. CONTROL EQUIPMENT CONNECTED TO ASSOCIATED APPARATUS MUST NOT USE OR GENERATE MORE THAN 250 Vrms OR Vdc.

5. ASSOCIATED APPARATUS MANUFACTURER'S INSTALLATION DRAWING MUST BE FOLLOWED WHEN INSTALLING THIS EQUIPMENT.

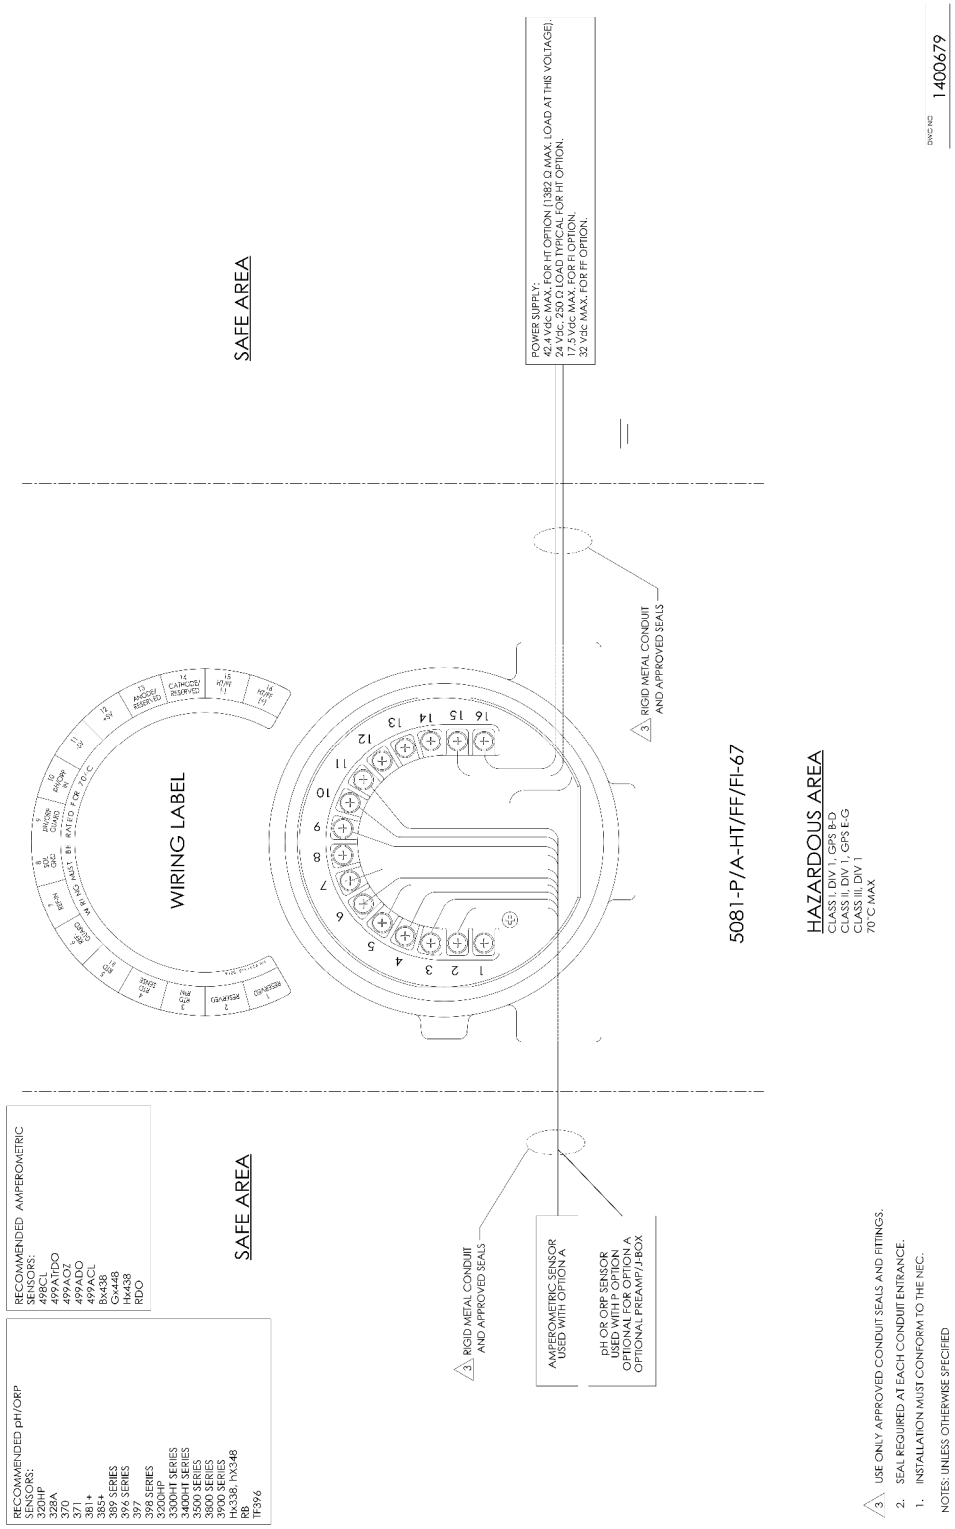
4. THE ENTITY CONCEPT ALLOWS INTERCONNECTION OF INTRINSICALLY SAFE APPARATUS WITH ASSOCIATED APPARATUS WHEN THE FOLLOWING IS TRUE:



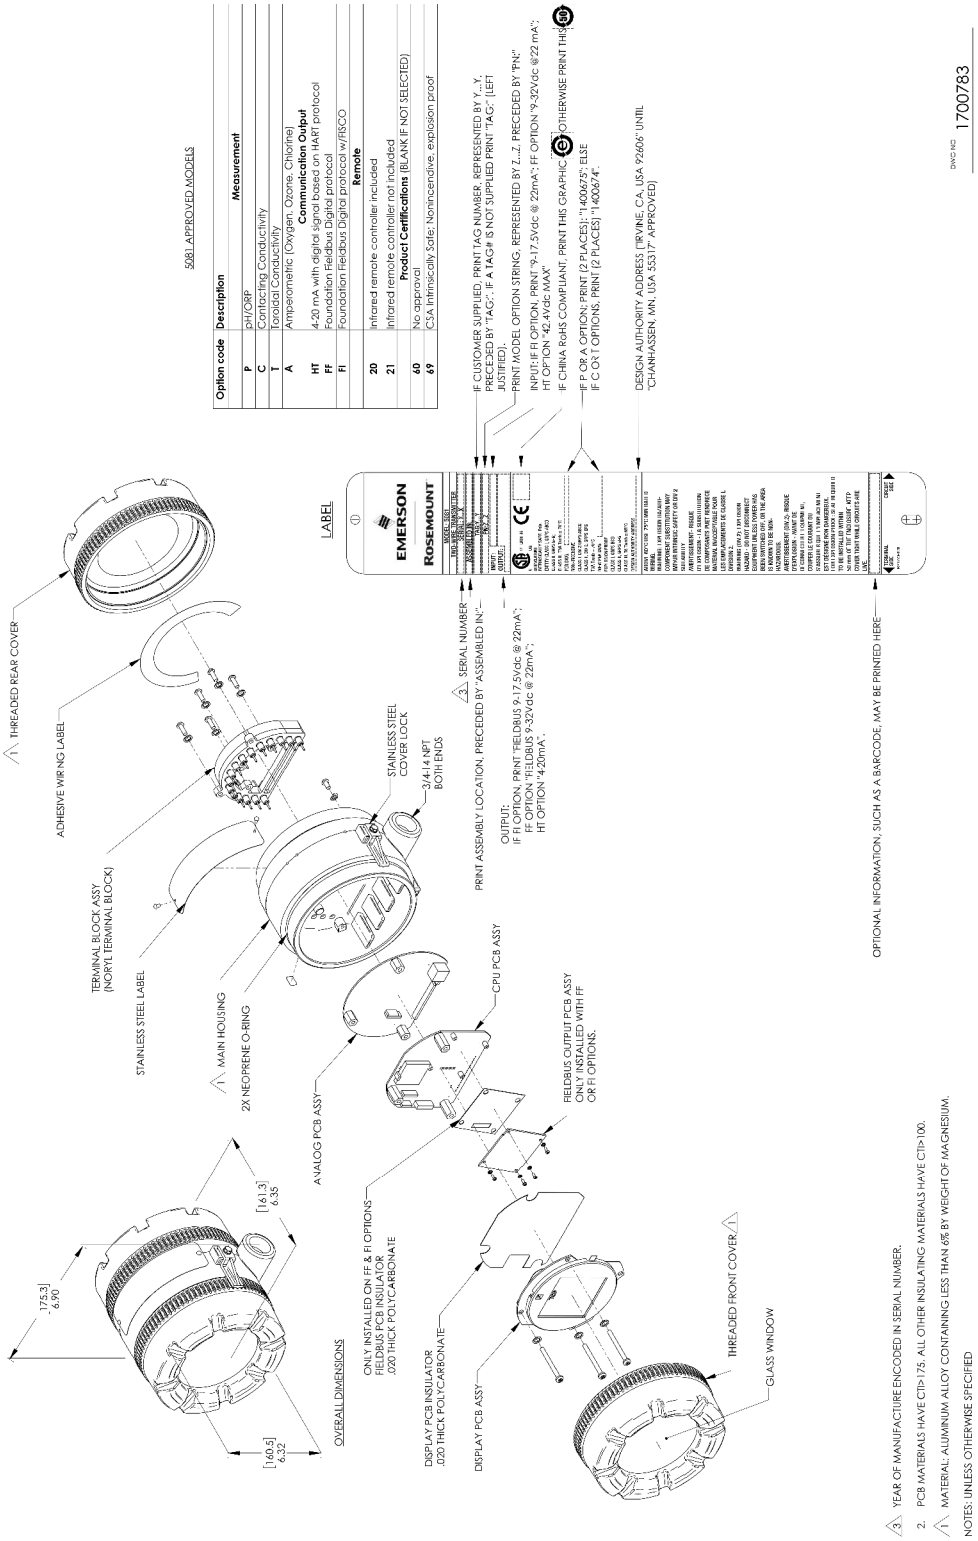
FIELD DEVICE INPUT		ASSOCIATED APPARATUS OUTPUT
Vmax OR Ui	≥	Voc, Vt OR Uo
Imax OR Ii	≥	Isc, It OR Io
Pmax OR Pi	≥	Po
3Ci + 3Ccable	≤	Ca, Ct OR Co (FOR FISCO INSTALLATIONS)
3Li + 3Lcable (FOR FISCO INSTALLATIONS)	≤	La, Lt OR Lo; Lc/Rc ≤ (La/Ra OR Lo/Ro) AND Li/Ri ≤ (La/Ra OR Lo/Ro)
Ci + Ccable	≤	Ca, Ct OR Co (FOR FIELDBUS (NON-FISCO) INSTALLATIONS)
Li + Lcable	≤	La, Lt OR Lo (FOR FIELDBUS (NON-FISCO) INSTALLATIONS)



3. RESISTANCE BETWEEN INTRINSICALLY SAFE GROUND AND EARTH GROUND MUST BE LESS THAN 1.0 Ohm.



2. DUST-TIGHT CONDUIT SEAL MUST BE USED WHEN INSTALLED IN CLASS II AND CLASS III ENVIRONMENTS.



1. INSTALLATION SHOULD BE IN ACCORDANCE WITH ANSI/ISA RP12.06 "INSTALLATION OF INTRINSICALLY SAFE SYSTEMS FOR HAZARDOUS (CLASSIFIED) LOCATIONS" (EXCEPT CHAPTER 5 FOR FISCO INSTALLATIONS) AND THE NATIONAL ELECTRICAL CODE (ANSI/NFPA 70) SECTIONS 504 AND 505.

pH Sensor

TWO-WIRE TRANSMITTERS FOR pH, ORP, CONDUCTIVITY, OXYGEN, OZONE, AND CHLORINE

5081 Family of Two-wire Transmitters

- CHOICE OF COMMUNICATION PROTOCOL: HART® or FOUNDATION Fieldbus.
- LARGE, EASY-TO-READ two-line display shows the process measurement and temperature.
- SIMPLE MENU STRUCTURE.
- ROBUST TYPE 4X ENCLOSURE.
- INTRINSICALLY SAFE DESIGN allows the transmitter to be used in hazardous environments (with appropriate safety barriers).
- NON-VOLATILE MEMORY retains program settings and calibration data during power failures.

FEATURES AND APPLICATIONS

The 5081 family of transmitters can be used to measure pH, ORP, conductivity (using either contacting or toroidal sensors), resistivity, oxygen (ppm and ppb level), free chlorine, total chlorine, and ozone in a variety of process liquids. The 5081 is compatible with most Rosemount Analytical sensors. See the Specification sections for details.

The transmitter has a rugged, weatherproof, corrosion-resistant enclosure

The transmitter has a two-line seven-segment display. The main measurement appears in 0.8-inch (20 mm) high numerals. The secondary measurement, temperature (and pH if free chlorine is being measured), appears in 0.3-inch (7 mm) high digits.

Two digital communication protocols are available: HART (model option -HT) and Foundation Fieldbus (model options -FF or -FI). Digital communications allows access to AMS (Asset Management Solutions). Use AMS to set up and configure the transmitter, read process variables, and troubleshoot problems from a personal computer or host anywhere in the plant.

A handheld infrared remote controller or the HART and Foundation Fieldbus 375 communicator can also be used for programming and calibrating the transmitter. The remote controller works from as far away as six feet.

5081-P pH/ORP Transmitter

- CHANGING FROM pH TO ORP operation takes only seconds.
- AUTOMATIC TWO-POINT BUFFER CALIBRATION reduces errors.
- SOLUTION TEMPERATURE COMPENSATION converts measured pH to the pH at 25°C.
- CONTINUOUS DIAGNOSTICS monitor sensor performance and warn the user of failure (FAULT) or approaching failure (WARNING).

5081-C Contacting Conductivity Transmitter

- MEASURES CONDUCTIVITY, RESISTIVITY, OR CUSTOM CURVE VARIABLE.
- AUTOMATIC TC RECOGNITION simplifies start up.
- AUTOMATIC/MANUAL TEMPERATURE COMPENSATION ensures accurate monitoring and control.
- AUTOMATIC COMPENSATION FOR SENSOR CABLE RESISTANCE improves accuracy of high conductivity/ low resistivity measurements.
- BUILT-IN TEMPERATURE COMPENSATION ALGORITHMS include straight slope, ultra-pure water, cation conductivity, and no compensation.

5081-T Toroidal Conductivity Transmitter

- MEASURES CONDUCTIVITY, PERCENT CONCENTRATION, OR CUSTOM CURVE VARIABLE.
- AUTOMATIC TC RECOGNITION simplifies start up.
- AUTOMATIC/MANUAL TEMPERATURE COMPENSATION ensures accurate monitoring and control.
- BUILT-IN CONCENTRATION CURVES FOR 0-12% NaOH, 0-15% HCl, 0-25% and 96-99.7% H_2SO_4.
- PROGRAMMABLE REFERENCE TEMPERATURE enables temperature compensation to temperatures other than 25 degrees Celsius.
- AUTOMATIC COMPENSATION FOR SENSOR CABLE RESISTANCE improves accuracy of high conductivity measurements.

5081-A Amperometric Transmitter

- MEASURES dissolved oxygen (ppm and ppb level), free chlorine, total chlorine, and ozone.
- SECOND INPUT FOR A pH SENSOR ALLOWS AUTOMATIC pH CORRECTION for free chlorine measurement. No expensive, messy reagents needed.
- AUTOMATIC BUFFER RECOGNITON FOR pH CALIBRATION.

SPECIFICATIONS - GENERAL

Housing: Cast aluminum with epoxy coating. Type 4X (IP65). Neoprene O-ring cover seals. 160.5 mm x 175.3 mm x 161.3 mm (6.3 in. x 6.9 in. x 6.4 in.)

Dimensions: See drawing.

Conduit Openings: ¾-in. NPT

Ambient Temperature: -4 to 149°F (-20 to 65°C)

Storage Temperature: -22 to 176°F (-30 to 80°C)

Relative Humidity: 0 to 95% (non-condensing)

Weight/Shipping Weight: 10 lb/11 lb (4.5/5.0 kg)

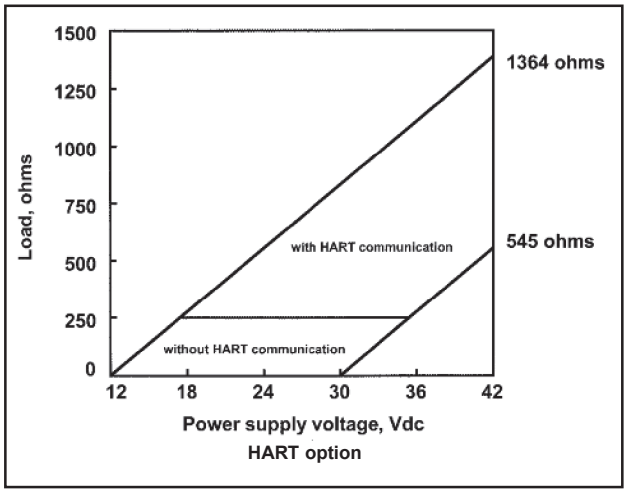
Display: Two-line LCD; first line shows process variable (pH, ORP, conductivity, % concentration, oxygen, ozone, or chlorine), second line shows process temperature and output current. For pH/chlorine combination, the second line can be toggled to show pH. Fault and warning messages, when triggered, alternate with temperature and output readings.

First line: 7 segment LCD, 0.8 in. (20 mm) high.

Second line: 7 segment LCD, 0.3 in. (7mm) high.

Display board can be rotated 90 degrees clockwise or counterclockwise.

During calibration and programming, messages and prompts appear in the second line.



Temperature resolution: 0.1°C

Hazardous Location Approval: For details, see specifications for the measurement of interest.

RFI/EMI: EN-61326 CE

Digital Communications: For details, see specifications for the measurement of interest.

Specifications subject to change without notice.

HART —
Power & Load Requirements:
Supply voltage at the transmitter terminals should be at least 12 Vdc. Power supply voltage should cover the voltage drop on the cable plus the external load resistor required for HART communications (250 Ω minimum). Minimum power supply voltage is 12 Vdc. Maximum power supply voltage is 42.4 Vdc (30 Vdc for intrinsically safe operation). The graph shows the supply voltage required to maintain 12 Vdc (upper line) and 30 Vdc (lower line) at the transmitter terminals when the current is 22 mA.

Analog Output: Two-wire, 4-20 mA output with superimposed HART digital signal. Fully scalable over the operating range of the sensor.

Output accuracy: ±0.05 mA

FOUNDATION fieldbus —

Power & Load Requirements: A power supply voltage of 9-32 Vdc at 22 mA is required.

Fieldbus **I**ntrinsically **S**afe **CO**ncept/FISCO-compliant versions of 5081 Foundation Fieldbus transmitter are available.

5081-P pH/ORP TRANSMITTER

FEATURES

The 5081-P Transmitter with the appropriate sensor can be configured for either pH or ORP (oxidation reduction potential) measurement of aqueous solutions. Housed in a Type 4X case, the 5081 can be located close to the sensor even in the harshest environments, including process, water or wastewater monitoring. Advanced features include automatic 2-point buffer calibration routine, automatic recognition of Pt100 or Pt1000 RTD, and menu-selected internal preamplifier. Predictive sensor diagnostic capability is possible through the impedance measurement of the pH glass membrane and reference electrode, fully supported by AMS. Solution temperature calibration allows the instrument to calculate and display the pH at 25°C when the temperature coefficient of the measured liquid is provided.

FUNCTIONAL SPECIFICATIONS

pH Range: 0 to 14

ORP Range: -1400 to +1400mV

Calibrations/standardization: The automatic buffer recognition uses stored buffer values and their temperature curves for the most common buffer standards available worldwide. The transmitter also performs a stabilization check on the sensor in each buffer.

A manual two-point calibration is made by immersing the sensor in two different buffer solutions and entering the pH values. The microprocessor automatically calculates the slope which is used for self-diagnostics. An error message will be displayed if the pH sensor is faulty. This slope can be read on the display and/or manually adjusted if desired.

An on-line one-point process standardization is accomplished by entering the pH or ORP value of a grab sample.

Preamplifier Location: A preamplifier must be used to convert the high impedance pH electrode signal to a low impedance signal for transmitter use. The integral preamplifier of the 5081-P may be used when the sensor to transmitter distance is less than 15 ft (4.5 m). Locate the preamplifier in the sensor or junction box for longer distances.

Automatic Temperature Compensation: External 3 or 4 wire Pt 100 RTD or Pt 1000 RTD located in the sensor, compensates the pH reading for temperature fluctuations. Compensation covers the range -15 to 130°C (5 to 270°F). Manual temperature compensation is also selectable.

Accuracy: ±1 mV @ 25°C ±0.01 pH

Repeatability: ±1 mV @ 25°C ±0.01 pH

Stability: 0.25% / year @ 25°C

Diagnostics: The internal diagnostics can detect:

Calibration Error	Low Temperature Error
High Temperature Error	Sensor Failure
Line Failure	CPU Failure
ROM Failure	Input Warning
Glass Failure	Glass Warning
Reference Failure	Reference Warning

Once one of the above is diagnosed, the LCD will display a message describing the failure/default detected.

Digital Communications:

HART (pH): PV assigned to pH. SV, TV, and 4V assignable to pH, temperature, mV, glass impedance, reference impedance, or RTD resistance.

HART (ORP): PV assigned to ORP. SV, TV, and 4V assignable to ORP, temperature, reference impedance, or RTD resistance.

Fieldbus (pH): Four AI blocks assigned to pH, temperature, reference impedance, and glass impedance.

Fieldbus (ORP): Three AI blocks assigned to ORP, temperature, and reference impedance.

Fieldbus (pH and ORP): Execution time 75 msec. One PID block; execution time 150 msec. Device type 4085. Device revision 1. Certified to ITK 4.5.

ORDERING INFORMATION

The **5081 Two-Wire Transmitter** is intended for the determination of pH/ORP, conductivity (both contacting and toroidal), and for measurements using membrane-covered amperometric sensors (oxygen, ozone, and chlorine). For free chlorine measurements, which often require continuous pH correction, a second input for a pH sensor is available. A hand-held infrared remote controller is required for local configuration and calibration of the transmitter.

Rosemount™ 3900/3900VP

General Purpose pH/ORP Sensors

High performance for your process pH/ORP needs

The Rosemount 3900 and 3900VP pH/ORP combination sensors are used for reliable pH or oxidation reduction potential measurements of aqueous solutions in pipelines, open tanks, or ponds. Their robust designs allow the Rosemount 3900 and 3900VP sensors to be used in a wide range of applications.

Overview

A robust sensor design

- Extended sensor life and protection against poisoning ions using a double junction reference.
- Enhanced performance and increased life with cracking resistant glass.
- Maximum chemical resistance provided by a rugged polyphenylene sulfide body.
- Operates in sub-zero temperatures down to 14 °F (-10 °C).
- Built-ins solution ground for advanced diagnostics.

Versatile installation options

- The sensor body features a one-piece construction with both front facing and rear facing process threads.
- ¾-in. and 1-in. male national pipe thread (MNPT) process connections to meet a variety of application installation requirements.
- Variopol (VP8) cable connection option, for quick cable-to-sensor release, eliminates cable twisting.

SMART preamplifier

- Automatic recognition of pH sensors by Rosemount transmitters: 1066, 1057, 1056, and 56.
- pH calibration data is stored, which allows sensors to be calibrated in advance for "plug and play" installations in the field.

Ordering information

The Rosemount 3900 and 3900VP General Purpose pH/ORP Sensors feature a chemically resistant Ryton® plastic body, along with a built-in solution ground for advanced diagnostics and a Pt-100 resistance temperature device (RTD) for temperature compensation. These sensors are available with either an integral cable connection (Rosemount 3900) or Variopol (VP8) connector (Rosemount 3900VP). Variopol cables are sold separately (see Accessories).

CONFIGURE > VIEW PRODUCT >

Note
The Rosemount 3900 pH/ORP Sensor is housed in a Ryton® plastic body with built-in solution ground for advanced diagnostics. Pt-100 is offered for a temperature compensator. The sensor is available with an integral cable. You can mount the sensor using a process connector, both ordered separately. You can also order junction box kits with preamplifiers separately if the transmitter does not have an integral preamplifier.

Specifications

Table 1: Percent Linearity over pH Range

pH range	Linearity
0-7	97%
1-7	98%
4-7	98%
7-10	99%
7-12	97%
7-13	96%
7-14	95%

Table 2: Rosemount 3900/3900VP pH/ORP Sensor Specifications

Measurement range	
pH	0 to 14
Oxidation reduction potential (ORP)	-1500 to +1500 mV
Operating temperature	
14 to 212 °F (-10 to 100 °C), automatic temperature compensation from 14 to 212 °F (-10 to 100 °C)	
Maximum pressure	
100 psig (790 kPa) at 212 °F (100 °C) CRN rating: 60 psig up to 212 °F (100 °C)	
Materials of construction	
Sensor body	Ryton®: polyphenylene sulfide (PPS)
O-ring	EPDM
pH electrode	Glass
ORP electrode	Glass, platinum
Solution ground	Stainless steel
Reference junction	PTFE
Conductivity	
Responds to changes in pH at a minimum conductivity of 0.1 µS/cm when used with the low flow panel. The sample flow rate must be controlled to 2 gallons per hour (7.61 liters per hour).	
Process connection	
Front facing	¾-in. and 1-in. male national pipe thread (MNPT)
Rear facing	1-in. MNPT
Temperature compensation	
Pt-100	

Table 2: Rosemount 3900/3900VP pH/ORP Sensor Specifications *(continued)*

Cable	
3900	Various cable lengths (see Preamplifier options) with integral preamplifier; 15-ft. (4.6 m) and less without preamplifier
3900VP	Use 24281-XX, 2.5-ft. (0.8 m) to 100 ft. (30.5 m). See Accessories.
Weight/shipping weight	
1 lb./2 lb. (0.45 kg/0.9 kg)	

Rosemount pH/ORP sensor(s) product certifications

Rev 0.5

European directive information

A copy of the EU Declaration of Conformity can be found at the end of the Quick Start Guide. The most recent revision of the EU Declaration of Conformity can be found at Emerson.com/Rosemount.

Ordinary location certification

As standard, the transmitter has been examined and tested to determine that the design meets the basic electrical, mechanical, and fire protection requirements by a nationally recognized test laboratory (NRTL) as accredited by the Federal Occupational Safety and Health Administration (OSHA).

Installing equipment in North America

The US National Electrical Code® (NEC) and the Canadian Electrical Code (CEC) permit the use of Division marked equipment in Zones and Zone marked equipment in Divisions. The markings must be suitable for the area classification, gas, and temperature class. This information is clearly defined in the respective codes.

Specific Conditions for Safe Use (X):

1. Sensors with Model 1700702 preamplifier:
    a. Model 385+-a-b-c. Triple junction pH/ORP sensor

b. Model 389-a-b-c-d-e. pH/ORP sensor
c. Model 389VP-a-b-c-d. pH/ORP sensor
d. Model 396VP-a-b-c-d. Submersion/insertion pH/ORP sensor
e. Model 396P-a-b-c-d-e. Submersion/insertion pH/ORP sensor
f. Model 396PVP-a-b-c-d-e. Submersion/insertion pH/ORP sensor
g. Model 396RVP-a-b-c-d-e. Retraction/submersion/insertion pH/ORP sensor
h. Model 398RVP-a-b-c-d-e-f. pH/ORP sensor
i. Model 3200HP-00. High purity water pH sensor
j. Model 3300HTVP-a-b-c-d. High performance pH and ORP sensor
k. Model 3400HTVP-a-b-c-d-e. High performance pH and ORP sensor
l. 3500P-a-b-c-d-e-f. High performance pH and ORP sensor
m. 3500VP-a-b-c-d-e-f. High performance pH and ORP sensor
n. Model 3900-a-b-c. General purpose pH/ORP sensor
o. Model 3900VP-a-b. General purpose pH/ORP sensor

The polymeric surface of all the apparatus listed above may store electrostatic charge and become a source of ignition. Clean surface should only be done with a damp cloth.

2. Sensors without Model 1700702 preamplifier (simple apparatus):
   a. Model 385-a-b-c-d-e. Retractable pH/ORP sensor
   b. Model 385+-a-b-c Triple junction pH/ORP sensor
   c. Model 389-a-b-c-d-e. pH/ORP sensor
   d. Model 389VP-a-b-c. pH/ORP sensor
   e. Model 396-a-b-c. Submersion/insertion pH sensor
   f. Model 396VP-a-b. Submersion/insertion pH sensor
   g. Model 396P-a-b-c-d-e. Submersion/insertion pH/ORP sensor
   h. Model 396PVP-a-b-c-d. Submersion/insertion pH/ORP sensor
   i. Model 396R-a-b-c-d-e. Retraction/submersion/insertion pH/ORP sensor
   j. Model 396RVP-a-b-c-d. Retraction/submersion/insertion pH/ORP sensor
   k. Model 397-a-b-c-d-e. pH sensor
   l. Model 398-a-b-c-d-e. pH/ORP sensor
   m. Model 398VP-a-b-c. pH/ORP sensor
   n. Model 398R-a-b-c-d-e-f. pH/ORP sensor
   o. Model 398RVP-a-b-c-d-e-f. pH/ORP sensor
   p. Model 3200HP-00. High purity water pH sensor
   q. Model 3300HT-a-b-c-d. High performance pH and ORP sensor
   r. Model 3300HTVP-a-b-c-d. High performance pH and ORP sensor
   s. Model 3400HT-a-b-c-d-e-f. High performance pH and ORP sensor
   t. Model 3400HTVP-a-b-c-d-e-f. High performance pH and ORP sensor
   u. Model 3500P-a-b-c-d-e-f. High performance pH and ORP sensor

v. Model 3500VP-a-b-c-d-e-f. High performance pH and ORP sensor

w. Model 3800-a. Autoclaveable and steam sterilizable pH sensors

x. Model 3800VP-a. Autoclaveable and steam sterilizable pH sensors

y. Model 3900-a-b-c. General purpose pH/ORP sensor

z. Model 3900VP-a-b. General purpose pH/ORP sensor

The polymeric surface of all the apparatus listed above may store electrostatic charge and become a source of ignition. Clean surface should only be done with a damp cloth.

Specific Conditions for Safe Use (X):

1. All pH/ORP sensor models with a plastic enclosure or exposed plastic parts may provide an electrostatic ignition hazard and must only be cleaned with a damp cloth to avoid the danger of ignition due to build-up of electrostatic charge.
2. All pH/ORP sensor models with a metallic enclosure may provide a risk of ignition by impact or friction. Care should be taken during installation to protect the sensor from the risk.
3. External connections to the sensor must be suitably terminated and provide a degree of protection of at least IP20.
4. All pH/ORP sensor models are intended to be in contact with the process fluid and may not meet the 500V r.m.s. test to earth. This must be taken into consideration at installation.

E. ¼-in. (6.4 mm) 316 stainless steel
F. ¼-in. (6.4 mm) polypropylene
G. Stainless set screw for adjustable spray nozzle height
H. 2-in. (50.8 mm) NPT threads
I. Sensor
J. 1-in. (25.4 mm) PVC coupling for submersible applications (supplied by others)
K. 1-in. (25.4 mm) PVC or stainless conduit (supplied by others)
L. Cable
M. Timer supplied by others or use timer feature in Rosemount instrument.

Figure 8: Rosemount 3900 Sensor with Jet Spray Cleaner

The jet spray cleaner eliminates routine, manual sensor maintenance by cleaning the sensor with water or compressed air. You can control flow through the cleaner with a solenoid valve.

Note

You can use the jet spray cleaner with the handrail mounting assembly (PN 11275-01, not shown), or you can mount it through the conduit as shown in Figure 8.

Figure 9: Low Flow Panel PN 00390-7101-0001

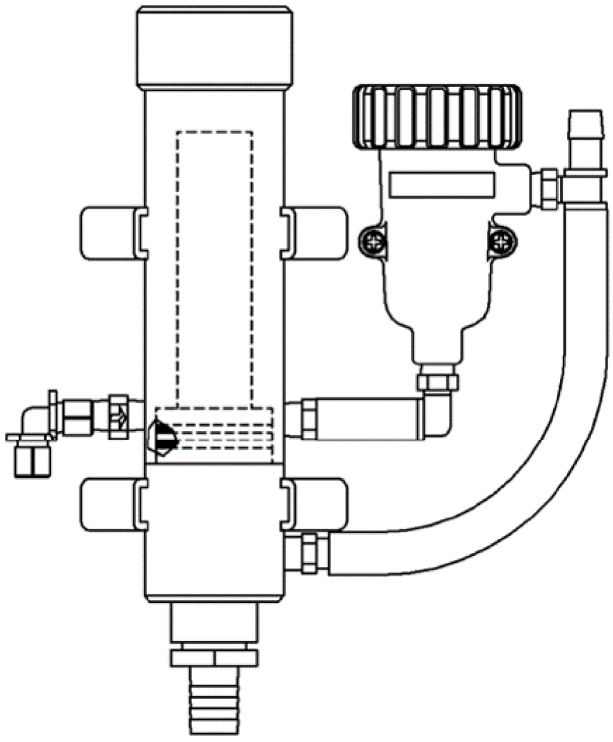

Table 5: Low Flow Panel Specifications

Inlet flow	3 to 80 gallons per hour (11.4 to 304 liters per hour)
Inlet pressure	3 to 65 psig (122 to 549 kPa)(1)
Temperature	32 to 122 °F (0 to 50 °C)

(1) *The minimum inlet pressure is required to open a check valve, which prevents the flow cell from draining if sample flow is lost. Removing the check valve lowers the inlet pressure requirement to a few feet of water head.*

October 2019

Rosemount™ 5081

Explosion Proof, Single-Input Intelligent Transmitter

ROSEMOUNT™

EMERSON™

Essential instructions

Read this page before proceeding!

Emerson designs, manufactures, and tests its products to meet many national and international standards. Because these instruments are sophisticated technical products, you must properly install, use, and maintain them to ensure they continue to operate within their normal specifications. The following instructions must be adhered to and integrated into your safety program when installing, using, and maintaining Emerson products. Failure to follow the proper instructions may cause any one of the following situations to occur: loss of life, personal injury, property damage, damage to this instrument, and warranty invalidation.

- Read all instructions prior to installing, operating, and servicing the product.
- If this Reference Manual is not the correct one, call 1-800-854-8257 or 949-757-8500 to request the correct Reference Manual. Save this Reference Manual for future reference.
- If you do not understand any of the instructions, contact your Emerson representative for clarification.
- Follow all warnings, cautions, and instructions marked on and supplied with the product.
- Inform and educate your personnel in the proper installation, operation, and maintenance of the product.
- Install equipment as specified in the installation instructions of the appropriate Reference Manual and per applicable local and national codes. Connect all products to the proper electrical and pressure sources.
- To ensure proper performance, use qualified personnel to install, operate, update, program, and maintain the product.
- When replacement parts are required, ensure that qualified people use replacement parts specified by Emerson. Unauthorized parts and procedures can affect the product's performance, place the safe operation of your process at risk, and VOID YOUR WARRANTY. Look-alike substitutions may result in fire, electrical hazards, or improper operation.
- Ensure that all equipment doors are closed and protective covers are in place, except when maintenance is being performed by qualified people, to prevent electrical shock and personal injury.

⚠ WARNING

Physical access

Unauthorized personnel may potentially cause significant damage to and/or misconfiguration of end users' equipment. This could be intentional or unintentional and needs to be protected against.

Physical security is an important part of any security program and fundamental to protecting your system. Restrict physical access by unauthorized personnel to protect end users' assets. This is true for all systems used within the facility.

Notice

ROSEMOUNT ("SELLER") SHALL NOT BE LIABLE FOR TECHNICAL OR EDITORIAL ERRORS IN THIS MANUAL OR OMISSIONS FROM THIS MANUAL. SELLER MAKES NO WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, WITH RESPECT TO THIS MANUAL AND, IN NO EVENT, SHALL SELLER BE LIABLE FOR ANY SPECIAL OR CONSEQUENTIAL DAMAGES INCLUDING, BUT NOT LIMITED TO, LOSS OF PRODUCTION, LOSS OF PROFITS, ETC.

PRODUCT NAMES USED HEREIN ARE FOR MANUFACTURER OR SUPPLIER IDENTIFICATION ONLY AND MAY BE TRADEMARKS/ REGISTERED TRADEMARKS OF THESE COMPANIES.

THE CONTENTS OF THIS PUBLICATION ARE PRESENTED FOR INFORMATIONAL PURPOSES ONLY, AND WHILE EVERY EFFORT HAS BEEN MADE TO ENSURE THEIR ACCURACY, THEY ARE NOT TO BE CONSTRUED AS WARRANTIES OR GUARANTEES, EXPRESSED OR IMPLIED, REGARDING THE PRODUCTS OR SERVICES DESCRIBED HEREIN OR THEIR USE OR APPLICABILITY. WE RESERVE THE RIGHT TO MODIFY OR IMPROVE THE DESIGNS OR SPECIFICATIONS OF SUCH PRODUCTS AT ANY TIME.

SELLER DOES NOT ASSUME RESPONSIBILITY FOR THE SELECTION, USE, OR MAINTENANCE OF ANY PRODUCT. RESPONSIBILITY FOR PROPER SELECTION, USE, AND MAINTENANCE OF ANY SELLER PRODUCT REMAINS SOLELY WITH THE PURCHASER AND END-USER.

Warranty

1. LIMITED WARRANTY: Subject to the limitations contained in Section 2 herein and except as otherwise expressly provided herein, Rosemount ("Seller") warrants that the firmware will execute the programming instructions provided by Seller and that the Goods manufactured or Services provided by Seller will be free from defects in materials or workmanship under normal use and care until the expiration of the applicable warranty period. Goods are warranted for twelve (12) months from the date of initial installation or eighteen (18) months from the date of shipment by Seller, whichever period expires first. Consumables and Services are warranted for a period of 90 days from the date of shipment or completion of the Services. Products purchased by Seller from a third party for resale to Buyer ("Resale Products") shall carry only the

warranty extended by the original manufacturer. Buyer agrees that Seller has no liability for Resale Products beyond making a reasonable commercial effort to arrange for procurement and shipping of the Resale Products. If Buyer discovers any warranty defects and notifies Seller thereof in writing during the applicable warranty period, Seller shall, at its option, promptly correct any errors that are found by Seller in the firmware or Services, or repair or replace F.O.B. point of manufacture that portion of the Goods or firmware found by Seller to be defective, or refund the purchase price of the defective portion of the Goods/Services. All replacements or repairs necessitated by inadequate maintenance, normal wear and usage, unsuitable power sources, unsuitable environmental conditions, accident, misuse, improper installation, modification, repair, storage or handling, or any other cause not the fault of Seller are not covered by this limited warranty, and shall be at Buyer's expense. Seller shall not be obligated to pay any costs or charges incurred by Buyer or any other party except as may be agreed upon in writing in advance by an authorized Seller representative. All costs of dismantling, reinstallation and freight, and the time and expenses of Seller's personnel for site travel and diagnosis under this warranty clause shall be borne by Buyer unless accepted in writing by Seller. Goods repaired and parts replaced during the warranty period shall be in warranty for the remainder of the original warranty period or ninety (90) days, whichever is longer. This limited warranty is the only warranty made by Seller and can be amended only in a writing signed by an authorized representative of Seller. Except as otherwise expressly provided in the Agreement, THERE ARE NO REPRESENTATIONS OR WARRANTIES OF ANY KIND, EXPRESSED OR IMPLIED, AS TO MERCHANTABILITY, FITNESS FOR PARTICULAR PURPOSE, OR ANY OTHER MATTER WITH RESPECT TO ANY OF THE GOODS OR SERVICES. It is understood that corrosion or erosion of materials is not covered by our guarantee.

2. LIMITATION OF REMEDY AND LIABILITY: SELLER SHALL NOT BE LIABLE FOR DAMAGES CAUSED BY DELAY IN PERFORMANCE. THE SOLE AND EXCLUSIVE REMEDY FOR BREACH OF WARRANTY HEREUNDER SHALL BE LIMITED TO REPAIR, CORRECTION, REPLACEMENT, OR REFUND OF PURCHASE PRICE UNDER THE LIMITED WARRANTY CLAUSE IN SECTION 1 HEREIN. IN NO EVENT, REGARDLESS OF THE FORM OF THE CLAIM OR CAUSE OF ACTION (WHETHER BASED IN CONTRACT, INFRINGEMENT, NEGLIGENCE, STRICT LIABILITY, OTHER TORT, OR OTHERWISE), SHALL SELLER'S LIABILITY TO BUYER AND/OR ITS CUSTOMERS EXCEED THE PRICE TO BUYER OF THE SPECIFIC GOODS MANUFACTURED OR SERVICES PROVIDED BY SELLER GIVING RISE TO THE CLAIM OR CAUSE OF ACTION. BUYER AGREES THAT IN NO EVENT SHALL SELLER'S LIABILITY TO BUYER AND/OR ITS CUSTOMERS EXTEND TO INCLUDE INCIDENTAL, CONSEQUENTIAL OR PUNITIVE DAMAGES. THE TERM “CONSEQUENTIAL DAMAGES” SHALL INCLUDE, BUT NOT BE LIMITED TO, LOSS OF ANTICIPATED PROFITS, LOSS OF USE, LOSS OF REVENUE, AND COST OF CAPITAL.

10.2 Warranty repair....137
10.3 Non-warranty repair....137

Appendix A Engineering Drawings....139

1 Start-up

Procedure

1. Using the infrared remote control (IRC), press **PROG**, **NEXT**, **NEXT**, and **ENTER** in this order.
2. Select the measurement type and unit of measurement.
3. Use the arrow keys to toggle between Celsius and Fahrenheit.
4. Press **ENTER** and then **RESET**.
5. Press **PROG**, **NEXT**, and **ENTER** in this order.
6. Use the arrow keys to toggle T AUTO between ON or OFF.

   This determines whether the transmitter uses the process temperature (ON) or a manual temperature (OFF).
7. Press **ENTER**.
8. If you select OFF, enter the manual temperature desired using the arrow keys.
9. Press **ENTER**.

2 Description and specifications

2.1 Features and applications

The Rosemount™ 5081 includes the following features:

General

The Rosemount 5081 explosion-proof transmitter is a loop powered device with a robust design that serves several industrial, commercial, and municipal applications. It offers a local operator interface (LOI) that can display values from a single measurement input. This transmitter is compatible with a multitude of analytical sensors.

Analytical measurements

- pH/ORP
- Contacting conductivity
- Toroidal conductivity
- Dissolved oxygen
- Ozone
- Chlorine

Maintenance features

- Automatic two-point buffer calibration routine
- Automatic recognition of resistance temperature device (RTD)
- Sensor diagnostics

Diagnostics

Continuous monitoring of sensor performance along with warnings and fault messages to alert the user of failures.

Enclosure

Explosion-proof and corrosion resistant

2.2 General specifications

Table 2-1: General Specifications

Housing	Cast aluminum with epoxy coating. NEMA® 4X(IP65) and NEMA7B. Neoprene O-ring seals.
Dimensions	6.3 x 6.9 x 6.4 in. (160.5 x 175.3 x 161.3 mm) See the engineering drawings in Engineering Drawings.
Conduit openings	¾-in. female national pipe thread (FNPT)
Ambient temperature	-4 to 149 °F (-20 to 65 °C)

Table 2-1: General Specifications *(continued)*

Storage temperature	-22 to 176 °F (-30 to 80 °C)
Relative humidity	0 to 95% (non-condensing)
Weight / shipping weight	10 lb./11 lb. (4.5 kg/5.0 kg)
Display	First line: 7 segment LCD, 0.8 in. (20 mm) high. This line shows process variables (pH/ORP, contacting conductivity, toroidal conductivity, etc.) Second line: 7 segment LCD, 0.3 in. (7 mm) high. This line shows process temperature, output current, warnings, faults, and messages during calibration/programming. Display board can be rotated 90 degrees clockwise or counterclockwise if desired.
Temperature resolution	0.1 °C
Hazardous location approval	For details, see Rosemount 5081 - (A/P/C/T) product certifications.
RFI/EMI	Meets all industrial requirements of EN61326.
Diagnostics (may slightly vary based on measurement type)	• Calibration error • Low temperature error • High temperature error • Sensor failure • Line failure • CPU failure • Calibration error • Zero error • Temperature slope error • Sensor failure • ROM failure • Input warning Once one of the above warnings/faults are diagnosed, the LOI will display a message describing the failure detected.

Table 2-2: HART® Digital Communications

Power and load requirements	Supply voltage at the transmitter terminals should be at least 12 Vdc. Power supply voltage should cover the voltage drop on the cable plus the external load resistor required for HART communications (250 Ohms minimum). Minimum power voltage is 12 Vdc. Maximum power voltage is 42.4 Vdc (30 Vdc for intrinsically safe operation). Figure 4-1 shows the supply voltage required to maintain 12 Vdc (upper line) and 30 Vdc (lower line) at the transmitter terminals when the current is 22 mA.
Analog output	Two-wire, 4-20 mA output with superimposed HART digital signal, scalable over the operating range of the sensor.
Output accuracy	±0.05 mA

Table 2-2: HART® Digital Communications *(continued)*

Variables assignable to	• pH • Temperature • mV • Glass impedance • Reference impedance • RTD resistance • Oxidation reduction potential (ORP) • Conductivity • Resistivity • Concentration • Raw conductivity • Chlorine • Dissolved oxygen • Dissolved ozone

Table 2-3: FOUNDATION™ Fieldbus Digital Communications

Power and load requirements	A power supply voltage of 9-32 Vdc at 22 mA is required.
AI blocks assignable to	• pH • Temperature • mV • Glass impedance • Reference impedance • RTD resistance • ORP • Conductivity • Resistivity • Concentration • Raw conductivity • Chlorine • Dissolved oxygen • Dissolved ozone

2.3 Rosemount 5081 - (A/P/C/T) product certifications

Rev 1.0

2.3.1 European Directive Information

A copy of the EU Declaration of Conformity can be found at the end of the Quick Start Guide. The most recent revision of the EU Declaration of Conformity can be found at Emerson.com/Rosemount.

2.3.2 Ordinary Location Certification

As standard, the Power Module has been examined and tested to determine that the design meets the basic electrical, mechanical, and fire protection requirements by a nationally recognized test laboratory (NRTL) as accredited by the Federal Occupational Safety and Health Administration (OSHA).

2.3.3 Installing equipment in North America

The US National Electrical Code® (NEC) and the Canadian Electrical Code (CEC) permit the use of Division marked equipment in Zones and Zone marked equipment in Divisions. The marking must be suitable for the area classification, gas, and temperature class. This information is clearly defined in the respective codes.

2.3.4 USA

FM hazardous locations

Certificate	FM17US0021X
Standards	FM Class 3600:2011, FM Class 3610:2015, FM Class 3611:2016 FM Class 3615:2006, FM Class 3810:2005, ANSI/NEMA 250:1991
Markings	FM APPROVED Intrinsically safe for use in Class I, II, and III, Division 1, Groups A, B, C, D, E, F, and G; T4 Ta = -20 °C to 70 °C; per control drawing numbers 1400676; 1400677 Nonincendive for Class I, Division 2, Groups A, B, C, and D; T4 Ta = -20 °C to 70 °C; per control drawing numbers 1400676; 1400677 Dust-ignitionproof for use in Class II and Class III, Division 1, Groups E, F, and G; T6 Ta = -20 °C to 70 °C;per control drawing number 1400678 Explosionproof for use in Class I, Div 1, Groups B, C, and D; T6 Ta = -20 °C to 70 °C; per control drawing number 1400678 Type 4X

Special Conditions for Safe Use (X):

1. The Rosemount 5081-T conductivity transmitters shall only be used with the Rosemount 222, 225, 226, 228 (1 in. and 2 in. only) and 245 toroidal sensors.

2.3.5 Canada

CSA hazardous locations

Certificate	1132747
Standards	C22.2 No. 0-M1987, C22.2 No. 25-1966, C22.2 No. 30-M1986 C22.2 No. 94-M91, C22.2 No 142-M1987, C22.2 No. 157-92, C22.2 No. 213-M1987
Markings	Intrinsically safe for Class I Groups A, B, C, and D; Class II Groups E, F, and G; Class III; T4 Tamb = 70 °C, per installation drawing 1400674 and 1400675 Non-incendive for Class I, Div. 2 for Groups A, B, C, and D; Class II, Div. 2, Groups F and G; Class III; T4 Tamb = 70 °C, per installation drawing 1400674 and 1400675 (Rosemount 5081-A/P/C/T) and per 1700462 (Rosemount 5081-T) Explosion-proof for Class I, Groups B, C, and D; Class II, Groups E, F, and G, Class III, T6 Tamb = 70 °C Type 4X

2.3.6 Europe

Rosemount 5081-A and 5081-P liquid transmitters

ATEX

Certificate	BAS02ATEX1284X
Standards	EN 60079-0:2012+A11:2013 EN 60079-11:2012
Markings	II 1 G Ex ia IIC T4 Ga (-20 °C ≤ Ta ≤ +65 °C)

Special Conditions for Safe Use (X):

1. The Rosemount 5081 enclosure may be made of aluminum alloy and given a protective polyurethane paint finish; however, care should be taken to protect it from impact or abrasion of located in a zone 0.

Rosemount 5081-C liquid transmitter

ATEX

Certificate	Baseefa03ATEX0099X
Standards	EN 60079-0:2012+A11:2013 EN 60079-11:2012

Markings	 II 1 G Ex ia IIC T4 Ga (-20 °C ≤ Ta ≤ +65 °C)

Special Conditions for Safe Use (X):

1. The equipment enclosure may contain light metals. The equipment must be installed in such a manner as to minimize the risk of impact or friction with other metal surfaces.

Rosemount 5081-T liquid transmitter

ATEX

Certificate	Baseefa03ATEX0399X
Standards	EN 60079-0:2012+A11:2013 EN 60079-11:2012
Markings	 II 1 G Ex ia IIC T4 Ga (-20 °C ≤ Ta ≤ +65°C)

Special Conditions for Safe Use (X):

1. The equipment may contain light metals. The equipment must be installed in such a manner as to minimize the risk or impact or friction with other metal surfaces.

2.3.7 International

IECEx

Certificate	IECEx BAS 09.0159X
Standards	IEC 60079-0:2011 IEC 60079-11:2011
Markings	Ex ia IIC T4 Ga (-20 °C ≤ Ta ≤ +65°C)

Special Conditions for Safe Use (X):

1. The Rosemount 5081 enclosure may be made of aluminum alloy and given a protective polyurethane paint finish; however, care should be taken to protect it from impact or abrasion if located in a zone 0 environment.

2.4 Functional specifications

The sections below display the specifications for measuring different substances with the Rosemount 5081.

2.4.1 pH/ORP specifications

pH range	0 to 14
ORP range	-1400 to +1400 mV
Calibration/standardization	The automatic buffer recognition uses stored buffer values and their temperature curves for the most common buffer standards available worldwide. The transmitter also performs a stabilization check on the sensor in each buffer. To make a manual two-point calibration, immerse the sensor in two different buffer solutions and enter the pH values. The microprocessor automatically calculates the slope which is used for self-diagnostics. The transmitter displays an error message if the pH sensor is faulty. The operator can read the slope on the display and/or manually adjust it if desired. To complete an on-line, one-point standardization process, enter the pH or ORP value of a grab sample as measured by a lab reference.
Preamplifier location	Use a preamplifier to convert the high impedance pH electrode signal to a low impedance signal for transmitter use. Use the transmitter's integral preamplifier when the sensor to transmitter distance is less than 15 ft. (4.5 m). Use a sensor with a built-in preamplifier or a junction box if distance is longer than 15 ft. (4.5 m).
Automatic temperature compensation	External 3 or 4 wire Pt 100 resistance temperature device (RTD) or Pt 1000 RTD, located in the sensor, compensates the pH reading for temperature fluctuations. Compensation covers the range 5 to 270 °F (-15 to 130 °C). The operator may also select manual temperature compensation.
Accuracy	±01 mv at 77 °F (25 °C) ± 0.01 pH
Repeatability	±01 mv at 77 °F (25 °C) ±0.01 pH
Stability	0.25% / year at 77 °F (25 °C)

2.4.2 Contacting conductivity specifications

Measured range	0-20,000 µS/cm
Calibration	To calibrate, immerse the sensor in a known solution and enter its value or enter the cell constant for ultra-pure applications.
Automatic temperature compensation	3-wire Pt 100 or Pt 1000 resistance temperature device (RTD) Conductivity: 32 to 392 °F (0 to 200 °C) Resistivity: 32 to 212 °F (0 to 100 °C) Low conductivity: 32 to 212 °F (0 to 100 °C)
Accuracy	± 0.5% of reading and ±0.001 µS/cm

Repeatability	± 0.25% of reading
Stability	0.25% of output range/month, non-cumulative
Ambient temperature coefficient	± 0.05% of reading/°C
Temperature slope adjustment	0 to 5%/°C
Other temperature compensation algorithms	Ultra-pure water compensation Cation conductivity Raw (uncompensated) conductivity
Compatible RTD	100 Ohm or 1000 Ohm with automatic recognition

2.4.3 Toroidal conductivity specifications

Measured range	50 to 2,000,000 µS/cm
Calibration	To calibrate, immerse the sensor in a known solution and enter its value.
Automatic temperature compensation	3-wire Pt 100 resistance temperature device (RTD) Conductivity: 32 to 392 °F (0 to 200 °C) % concentration: 32 to 212 °F (0 to 100 °C)
Accuracy	±1.0% of reading
Repeatability	±0.25% of reading
Stability	0.25% of output range/month, non-cumulative
Ambient temperature coefficient	±0.2% of FS/°C
Temperature slope adjustment	0 to 5% / °C
% concentration ranges	Sodium hydroxide: 0 to 15% Hydrochloric acid: 0 to 16% Sulfuric acid: 0 to 25% and 96 to 99.7%

2.4.4 Dissolved oxygen specifications

Measurement range	0 - 99 ppm (mg/L), 0 - 200 saturation
Resolution	0.01 ppm, 0.1 ppb for Rosemount 499ATrDO sensor
Temperature correction for membrane permeability	Automatic between 32 and 122 °F (0 and 50 °C). Can be disabled.
Calibration	Air calibration (user must enter barometric pressure) or calibration against a standard instrument

2.4.5 Free chlorine specifications

Measurement range	0-20 ppm (mg/L) as Cl_2
Resolution	0.001 ppm (auto-ranges at 0.999 to 1.00 and 9.99 to 10.0)
Temperature correction for membrane permeability	Automatic between 32 and 122 °F (0 and 50 °C). Can be disabled.

pH correction	Automatic between pH 6.0 and 9.5. Manual pH correction is also available.
Calibration	Calibrate against grab sample with portable test kit.

2.4.6 Total chlorine specifications

Measurement range	0-20 ppm (mg/L) as Cl_2
Resolution	0.001 ppm (auto-ranges at 0.999 to 1.00 and 9.99 to 10.0)
Temperature correction for membrane permeability	Automatic between 41 and 95 °F (5 and 35 °C). Can be disabled.
Calibration	Calibrate against grab sample with portable test kit.

2.4.7 Ozone specifications

Measurement range	0-10 ppm (mg/L)
Resolution	0.001 ppm (auto-ranges at 0.999 to 1.00 and 9.99 to 10.0)
Temperature correction for membrane permeability	Automatic between 41 and 95 °F (5 and 35 °C). Can be disabled.
Calibration	Against grab sample analyzed using portable test kit.

2.4.8 Percent oxygen in gas

Measurement range	0 - 25% oxygen
Resolution	0.1% - TBD
Calibration	Air calibration (automatic measurement of barometric pressure with internal pressure sensor)
Sample pressure	0 to 50 psig
Sample temperature	32 to 110 °F (0 to 43 °C)

2.5 Ordering information

The Rosemount 5081 two-wire transmitter is intended for the determination of pH/ORP, conductivity (both contacting and toroidal), and for measurements using membrane-covered amperometric sensors (oxygen, ozone, and chlorine). For free chlorine measurements, which often require continuous pH correction, a second input for a pH sensor is available. Use a hand-held infrared remote controller to locally configure and calibrate the transmitter.

Rosemount 5081	**Smart two-wire microprocessor transmitter**
Option	**Description**
P	pH/ORP
C	Contacting conductivity

T	Toroidal conductivity
A	Amperometric (oxygen, ozone, and chlorine)
Option	**Description**
HT	Analog 4-20 mA output with superimposed HART® digital signal
FF	FOUNDATION™ Fieldbus digital output
FI	FOUNDATION Fieldbus digital input with FISCO
Option	**Description**
20	Infrared remote controller included
21	Infrared remote controller not included
Option	**Description**
60	No approval
67	FM approved intrinsically safe, non-incendive (when used with appropriate sensor and safety barrier), and explosion-proof
69	CSA approved intrinsically safe, non-incendive (when used with appropriate sensor and safety barrier), and explosion-proof
73	ATEX/IECEx approved intriniscally safe (when used with appropriate sensor and safety barrier)
Example	**5081-P-HT-20-67**

3 Install

3.1 Unpack and inspect

To unpack the instrument:

Procedure

1. Inspect the shipping container(s). If there is damage, contact the shipper immediately for instructions.
2. If there is no apparent damage, unpack the container(s).
3. Ensure that all items shown on the packing list are present.
   If items are missing, contact your local Customer Care representative
4. Save the shipping container and packaging.
   They can be used to return the instrument to the factory in case of damage.

3.2 Installation guidelines

1. The transmitter tolerates harsh environments. For best results, install the transmitter in an area where temperature extremes, vibrations, and electromagnetic and radio frequency interference are minimized or absent.
2. To prevent unintentional exposure of the transmitter circuitry to the plant environment, keep the security lock in place over the circuit end cap. To remove the circuit end cap, loosen the lock nut until the tab disengages from the cap end and then unscrew the cover.
3. The transmitter has two ¾-in. conduit openings, one on each side of the housing. Run sensor cable through the left side opening (as viewed from the wiring terminal end of the transmitter) and run power wiring through the right side opening.
4. Use water tight cable glands to keep moisture out of the transmitter.
5. If using conduit, plug and seal the connections at the transmitter housing to prevent moisture from getting inside the transmitter.

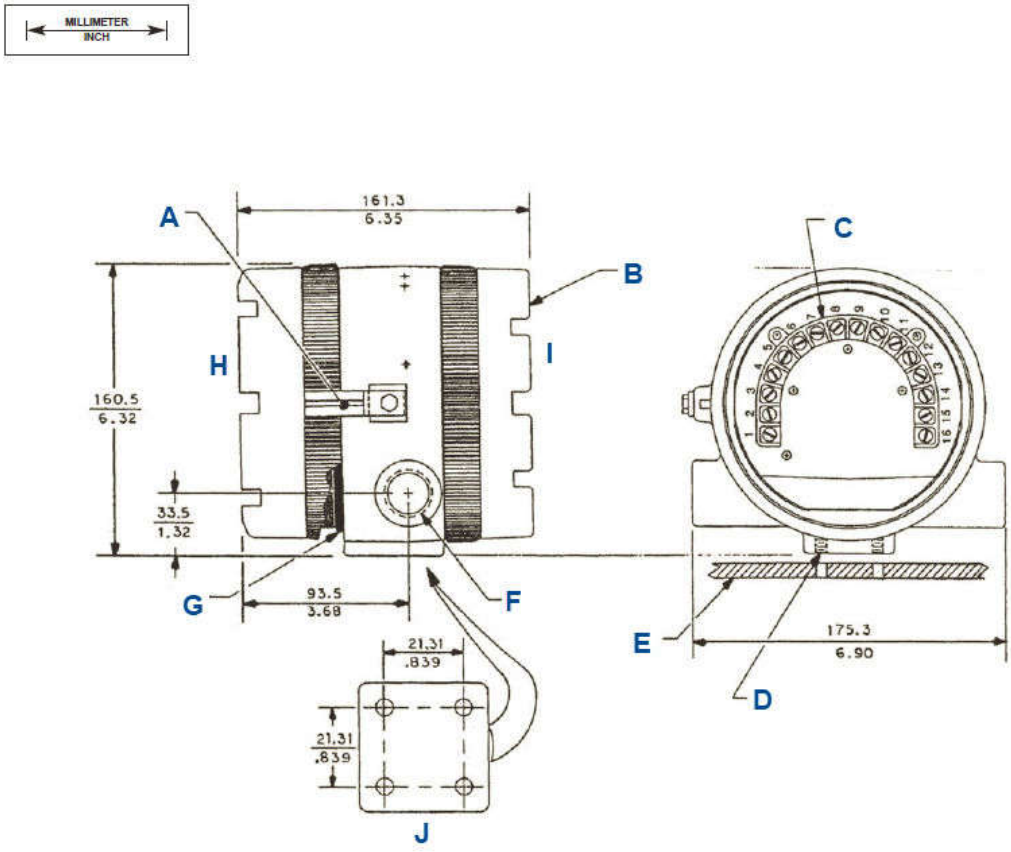
   ⚠ CAUTION

   Equipment damage

   Moisture accumulating in the transmitter housing can affect the performance of the transmitter and may void the warranty.

6. If the transmitter is installed some distance from the sensor, a remote junction box with preamplifier in the junction box or in the sensor may be necessary. Consult the sensor reference manual for maximum cable lengths.

3.3 Orient the display board



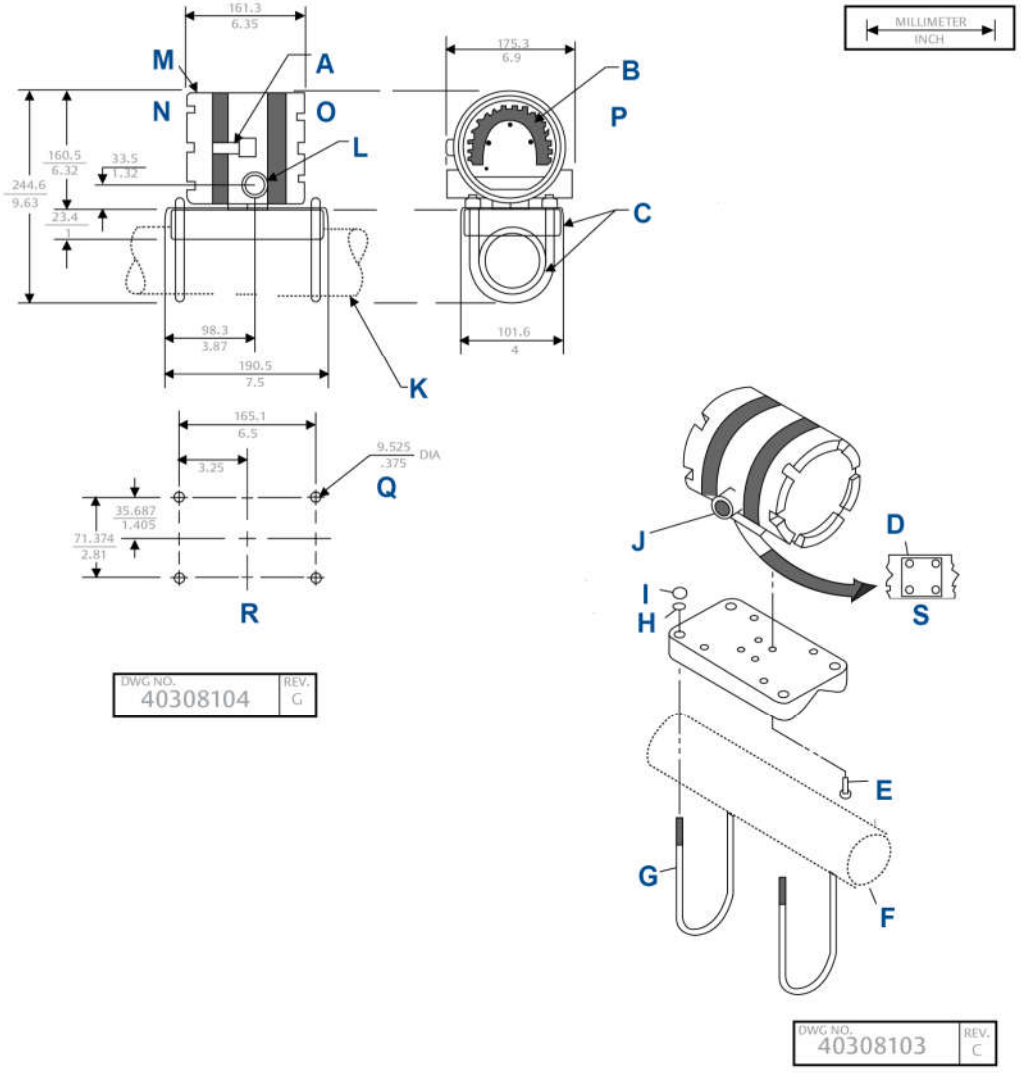
The display board can be rotated 90 degrees, clockwise or counterclockwise, from the original position. To reposition the display:

Procedure

1. Loosen the cover lock nut until the tab disengages from the circuit end cap. Unscrew the cap.
2. Remove the three bolts holding the circuit board stack.
3. Lift and rotate the display board 90 degrees, clockwise or counterclockwise, into the desired position.
4. Position the display board on the stand offs. Replace and tighten the bolts.
5. Replace the circuit end cap.

3.4 Mount on a flat surface

Figure 3-1: Mounting Transmitter on a Flat Surface



A. *Cover lock*
B. *Threaded cap (two places)*
C. *Terminal block (TB). Terminal end cap omitted for clarity this view.*
D. *¼-in. - 20 threads (four places)*
E. *Surface plate (by others)*
F. *O-ring (two places)*
G. *Circuit end*
H. *Terminal end*
I. *Flat surface mounting pad hole pattern*

3.5 Mount on a pipe

Use pipe mounting kit (23820-00 or 23820-01).

Figure 3-2: Mounting Transmitter on a Pipe

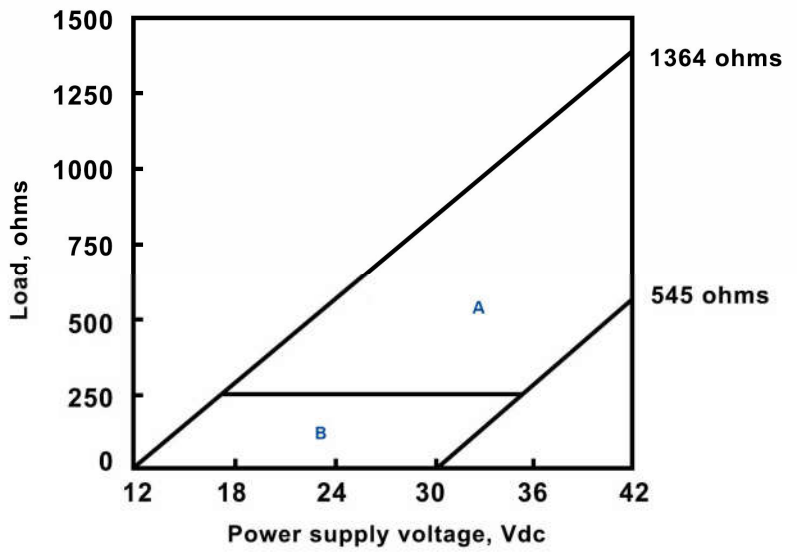
A. *Over look*
B. *Terminal block*
C. *Kit, 2-in. pipe/wall mounting bracket*
   Order PN2002577 as a separate item.
D. *½ - 20 threads*
E. *¼ - 20 screw*
   Screws furnished with mounting kit only. Not furnished with transmitter.
F. *1½-in. to 2-in. pipe (customer furnished)*
G. *U-bolt*

H. 5/16 washer
I. 6/18 - 18 nut
J. ¾ - 14 FNPT (two places)
K. 2-in. pipe supplied by customer
L. ¾ - 14 NPT (two places)
M. Threaded cap, two places
N. Circuit end
O. Terminal end
P. Terminal end cap omitted for clarity this view
Q. Four mounting holes
R. Bottom view

4 Wire

4.1 Wiring overview

To find wiring diagrams for specific sensors, check the wiring sections of the reference manuals for those particular sensors.



4.2 Power supply/current loop

4.2.1 Power supply overview

The tables below display the minimum and maximum voltages needed to operate the transmitter.

Minimum supply voltage at the transmitter terminals	12.0 Vdc
Minimum power supply for load resister	250 Ohms
Maximum power supply voltage	42.0 Vdc
Maximum power supply voltage for intrinsically safe installations	30.0 Vdc

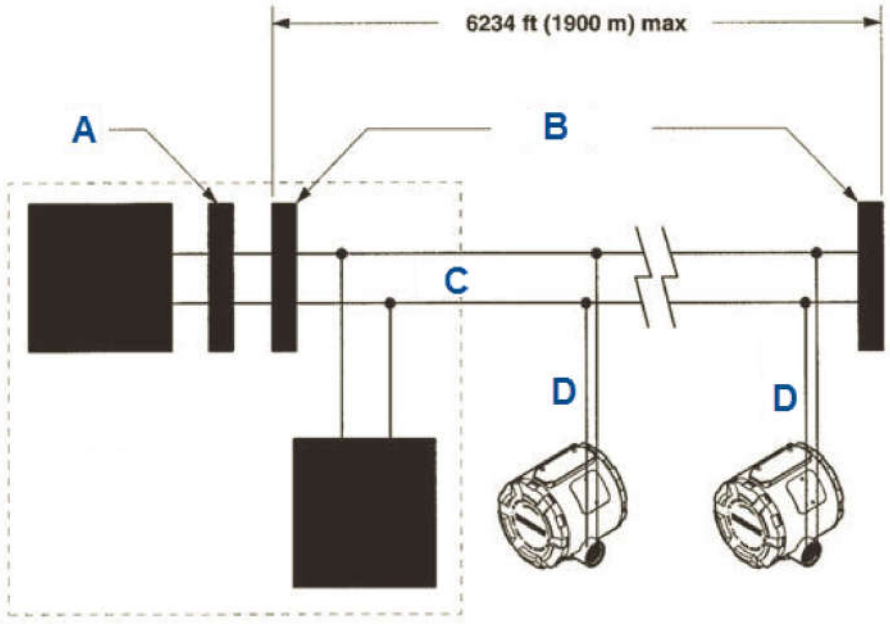
Figure 4-1: Power Supply Voltage for HART® or without HART Communication Configurations

A. With HART communication
B. Without HART communication

Table 4-1: Values from Graph

Upper line	Power supply voltage needed to provide 12 Vdc at the transmitter terminals for a 22 mA current
Lower line	Power supply voltage needed to provide 30 Vdc for a 22 mA current
Maximum current	About 24 mA
Minimum load for digital communications	250 Ohms
Minimum power supply voltage to supply the 12.0 Vdc lift off voltage at the transmitter	17.5 Vdc

4.2.2 Wire to HART® or FOUNDATION™ Fieldbus communication protocol



Procedure

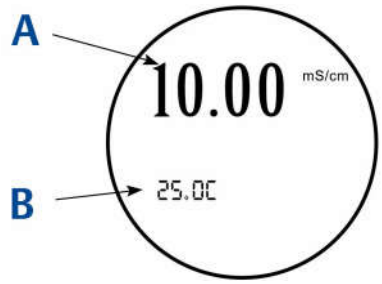
1. Run the power/signal wiring through the opening nearest terminals 15 and 16.
2. Use shielded cable and ground the shield to the power supply.
3. To ground the transmitter, attach the shield to the grounding screw on the inside of the transmitter case.

   You can also use a third wire to connect the transmitter to earth ground.

Note
For optimum EMI/RFI immunity, shield the power supply and enclose it in an earth ground metal conduit. Do not run power supply/signal wiring in the same conduit or cable tray with AC power lines or with relay actuated signal cables. Keep power supply/signal wiring at least 6 ft. (2 m) away from heavy electrical equipment. An additional 0-1 mA current loop is available between TB-14 and TB-15. A 1 mA current in this loop signifies a sensor fault. See Figure 4-2 for wiring instructions. See Diagnostics and troubleshooting for more information about sensor faults.

Figure 4-2: General Wiring Architecture

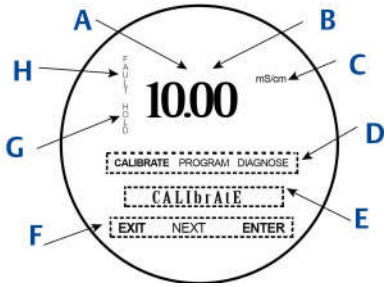
A. Filter
B. Terminators
C. Trunk
D. Spur



The power supply, filter, first terminator, and configuration device are typically located in the control room.

5 Display and operate

5.1 User interface and main display

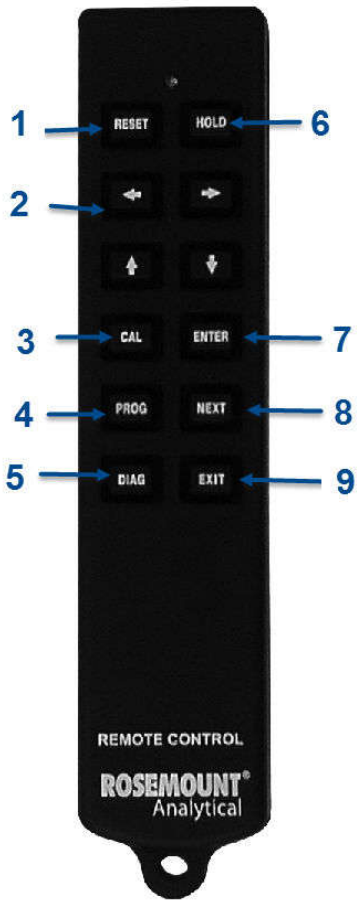


The following are examples of the main (process) display screen (Figure 5-1) and the program display screen (Figure 5-2).

Figure 5-1: Main Display Screen

A. Conductivity value
B. Temperature in °C or °F

Figure 5-2: Program Display Screen



A. Indicates HART® or FOUNDATION™ Fieldbus digital communiciations
B. Conductivity value
C. Units of display
D. Active menu: CALIBRATE, PROGRAM, or DIAGNOSE
E. Sub-menus, prompts, and diagnostic messages appear here.
F. Available commands for sub-menus, prompts, or diagnostic messages
G. Appears when transmitter is in hold
H. Appears when a disabling condition has occurred

5.2 Infrared remote control (IRC)

Use the IRC to read diagnostics messages, calibrate connected sensors, and program the transmitter. Hold the IRC within 6 ft. (1.8 m) of the transmitter and less than 15 degrees from the horizontal of the display window.

Figure 5-3: Infrared Remote Control (IRC) Functions

1. **RESET** • End current operation and return to the main display. • Changes are not saved. • Does not return the transmitter to factory default settings.		6. **HOLD** • Access to turn hold readings on or off.
2. Editing (arrow) keys • Change values of a flashing display. • Left and right arrows move the cursor by one digit. • Up and down arrows increase or decrease the values and navigate through the display options.		7. **ENTER** • Advance to the next prompt. • Store selected item. • Store value in memory.
3. **CAL** • Access to ***Calibration*** menu.		8. **NEXT** • Advance to the next sub-menu.
4. **PROG** • Access to ***Program*** menu.		9. **EXIT** • End current operation. • Return to the first prompt in the present sub-menu. • Changes are not saved.
5. **DIAG** • Access to diagnostics.		

Guidelines for using IRC

- Do not use harsh chemicals or abrasive brushes when cleaning the remote control.
- If the green LED does not light when you press a key, the issue is probably a weak battery. To restore operation, remove four screws to access and replace the two batteries. Observe the two warning messages posted at the rear of the remote control.
- Requires two 1.5 V AAA batteries. If used in hazardous areas, replacement batteries must be Energizer E92/EN92 or Duracell MN2400/PC2400.
- All functions for remote control PN 24479-00 are the same as those for the previous remote control, PN 23572-00.

5.3 Menu system

There are three main menus: ***Calibrate***, ***Program***, and ***Diagnose***. ***Calibrate*** and ***Program*** menus have additional sub-menus as shown in the figures below.

Table 5-1: Program Menu

Displayed item	Definition
OUtpUt	Current output menu header
4MA	4 mA current output (setpoint)
20MA	20 mA current output (setpoint)
HoLd	Current output on hold
FAULt	Fault condition current output setting
dPn	Current output dampening time
tESt	Current output test value
tAUtO	Automatic temperature compensation
tMAn	Manual temperature compensation
dISPLAY	Display menu header
tYP	Measurement type
tEMP	° C/° F toggle selection
OUtPUt	Current (mA) or percent of full scale display
COdE	Access code
OFFSt	Offset value

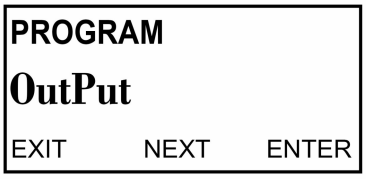
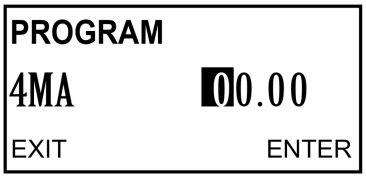
6 Programming basics

6.1 Programming



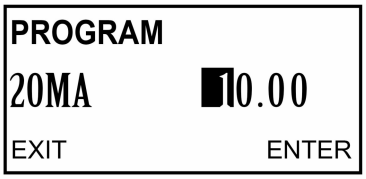
The following can be programmed in the Rosemount™ 5081:

- 4-20 mA outputs
- Current generated by the transmitter during hold
- Current generated by the transmitter when fault is detected
- Automatic temperature correction (enable or disable)
- Type of measurement
- Measurement range
- Factory default setting

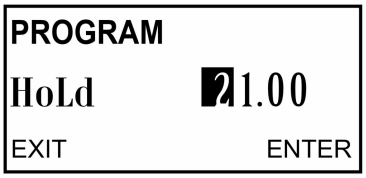


6.2 Test 4-20 mA outputs and current generated during hold and faults

Procedure



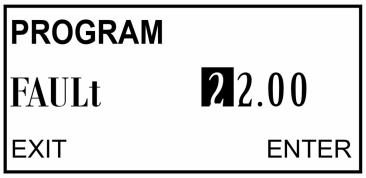
1. Press **PROG** on the remote controller.
   The *OUTPUT* submenu appears.



2. Press **ENTER**.
   The screen displays the `4mA` prompt.

3. Use the arrow keys to change the setting. Press **ENTER** to save.
   The screen displays the `20mA` prompt.

4. Use the arrow keys to change the setting. Press **ENTER** to save.
   The screen displays the `HOLD` prompt.



5. Use the arrow keys to change the setting to the output desired when the transmitter is in hold mode.

   The range is 3.80 to 22.0 mA. If you select 00.00, the transmitter will hold the output value.

6. Press **ENTER** to save.

Note
The hold setting overrides the fault setting.

   The screen displays the `FAULT` prompt.

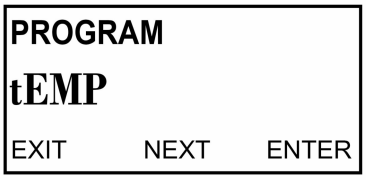
7. Use the arrow keys to change the setting to the output desired when the transmitter is in fault mode.

   The range is 3.80 to 22.0 mA. If you select 00.00, the transmitter will hold the output value.

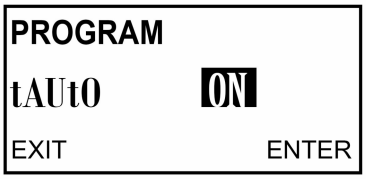
8. Press **ENTER** to save.
   The screen displays the `DPN` prompt.

9. Use the arrow keys to change the setting.
   The range is 0 to 225.

10. Press **ENTER** to save.
    The screen displays the `TEST` prompt.

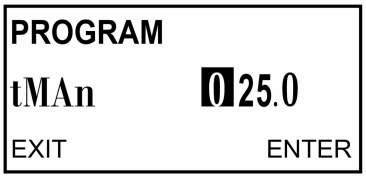


11. Use the arrow keys to enter the desired test current. Press **ENTER** to start the test. Press **EXIT** to end the test.
12. Press **RESET** to return to the main display.



6.3 Correct temperature

Procedure



1. Press **PROG**. Press **NEXT** until the ***TEMP*** submenu appears on the display.

2. Press **ENTER**.
   The screen displays the `T AUTO` prompt.

3. Use the up or down arrow keys to enable (ON) or disable (OFF) the automatic temperature correction feature. Press **ENTER** to save.
   The screen displays the `T MAN` prompt.

4. Use the arrow keys to change to the desired temperature.

   To enter negative numbers, press the left or the right arrow key until no digit is flashing. then press the up or down arrow keys to display the negative sign. The range is 23 to 266 ° F (-5.0 to 130 °C).

5. Press **ENTER** to save. Press **RESET** to return to the main display.

Note
If you disabled T AUTO in Step 3, then the transmitter will use the temperature entered in this step in all subsequent measurements, no matter the actual process temperature.

6.4 Set up a custom curve (conductivity measurements only)

Use custom curves to correlate conductivity to concentration of the measured liquid. The Rosemount 5081 has programmable custom curves that can create a curve (second order) from three to five user supplied points. If it only uses two points, then then the transmitter creates a linear curve (straight lin). In order for the curve to be accurate, take the data points from the liquid having the same reference temperature.

To obtain best results, select data points that are representative of the typical operating range and have at least 5% difference in conductivity values. Observe the graph of conductivity vs. concentration for the particular liquid to ensure that unsuitable points are avoided. Unsuitable points include conductivity values with two concentrations associated with them. In addition to unsuitable points, record any critical points - points that best describe the curve. Following these general guidelines will provide optimal results.

Enter the first point (COND 1) at the normal operating condition. Then enter other points above and below COND 1. Nonlinear conductivity curves require additional data points to characterize these regions. Do not use the same data point more than once and only use actual data (do not interpolate data points).

Note
The default values for the custom curve are three data points, reference temperature of 77 °F (25 °C), and a linear temperature slope of two percent/°C. This combination will yield the best results in most applications. If the normal temperature is over 104 °F (40 °C) or under 50 °F (10 °C), change the reference temperature to the normal process temperature. If known, use the temperature slope at the reference temperature.

Procedure

1. From the main menu, select PROG and then press **NEXT** four times.
   `SETUP CUST` appears.
2. Press **ENTER**.
   `T REF` appears.
3. If needed, change the reference temperature from the factory default 77 °F (25 °C) to a different reference temperature for the process. Press **ENTER**.
   `UNIT` appears.
4. Press the up or down arrow to select the desired measurement units: `µS` (microsiemens), `mS` (millisiemens), `none` (no units displayed), `%` (percent), or `ppm` (parts per million); then press **ENTER**.
   `NUM PTS` appears.

5. Press up or down arrows to select the desired number of data points for a custom conductivity curve. Select `2` to generate a linear relationship for conductivity and concentration at the given temperature.
   a) Enter the concentration for point 1 (displayed as `µS 1`). Press **ENTER**.
   b) Enter the known conductivity for point 1 in µS/cm. Press **ENTER**.
   c) Complete this process for additional known data points. Press **ENTER**.
   `CALC CUST` appears briefly.
   d) Press **ENTER**.
   `PROCESSING` appears briefly; then `APPLY CUST` appears.
   e) Press **ENTER** to register the custom curve into memory and return to the ***SETUP CUST*** screen.

The custom curve will now be used to display and output all conductivity measurement when the operator selects `CUST` as the measurement type in the ***Display*** menu.

6.5 Restore to factory default settings

The operator can erase user-defined configurations to return the transmitter to the factory default settings.

Procedure

1. Press **PROG** on the remote controller.
2. Press **NEXT** until `DEFAULT` appears in the display. Press **ENTER**.
3. Use the up and down arrows to toggle between NO and YES. Press **ENTER** to return to the factory default settings.

6.6 Set access (security) code

6.6.1 Security overview

The access (security) code prevents program and calibration settings from accidental changes. Emerson ships the transmitter with the access (security) code disabled.

6.6.2 Enter the access (security) code

Procedure

1. If calibration and program settings are protected with a security code, press **PROG** or **CAL** on the infrared remote controller.
   The ***ID*** screen appears.
2. Use the editing keys to enter the code. Press **ENTER**.
   If the code is correct, the first sub-menu appears. If the security code is incorrect, the process display reappears.

6.6.3 Retrieve a lost security code

Procedure

1. If the you forget the security code, enter `555` at the ID prompt and press **ENTER**.
   The transmitter displays the present code.
2. Press **EXIT** to return to the process display.
3. Press **PROG** or **CAL**.
   The ***ID*** screen appears.
4. Use the editing keys to enter the security code. Then press **ENTER**.
   The first sub-menu under the selected menu appears.

6.7 Activate or deactivate HOLD

Activating HOLD keeps the transmitter output at the last value or sends the output to a previously determined value. This is particularly useful when doing calibrations. During calibrations, the sensor may be exposed to solutions that have concentrations outside the normal range of the process. HOLD prevents false alarms and undesired operation as a result of that reading. You can deactivate HOLD when the sensor is reinstalled in the process stream and the readings have relatively stabilized.

Procedure

1. Press **HOLD** on the remote controller.
   The `HOLD` prompt appears in the display.
2. Press **3** (up) or **5** (down) to toggle HOLD between ON and OFF.
3. Press **ENTER** to save.

7 Measurements

7.1 Calibrating pH sensors

7.1.1 Calibration overview

The ***Calibration*** menu allows you to calibrate the pH and temperature response of the sensor. To calibrate, use either the manual or the auto-calibration option. In both cases, the transmitter does a two-point calibration for pH and one-point standardization against a reference thermometer for temperature. In auto-calibration, the transmitter automatically stores the temperature-corrected calibration data. In manual calibration, you have to enter buffer values. The values are only registered when the readings are stable (automatically determined by the transmitter). All calibration procedures are guided by prompts on the display.

7.1.2 Calibration standards (buffer solutions)

- Calibrations are critical to make accurate pH measurements.
- Emerson recommends that the value of one of the pH buffer solutions is lower than the pH of the process stream and the value of the other pH buffer solution is higher than the pH of the process stream.
- For best results, make sure that the temperature of the solution is the same temperature as that of the sensor. Allow the entire measurement cell, sensor, and solution to reach relatively constant temperature.
- Using buffers at high temperatures can cause evaporation, which will change the concentration of the buffer. The change in concentration causes a change in the pH, thus resulting in an inaccurate calibration.
- Buffers have limited shelf lives. Do not use a buffer if the expiration date has passed. Store buffers at controlled room temperatures.
- Do not reuse buffer solutions. Protect buffers from excessive exposure to air. Exposure to air can cause changes in the pH of the buffer solution.
- Always rinse the sensor with DI water and remove excess water by dabbing with a clean tissue before placing it in a buffer. Only dab the sensor and do not wipe it. Wiping the sensor builds static charge which alters the reading.

7.1.3 Auto-calibrate

Prerequisites

Ensure that auto-calibration is turned ON and the appropriate buffers are used.

Procedure

1. Press **CAL** on the IRC to enter the ***CALIBRATE*** menu.

The *CALIBRATE* sub-menu appears.

2. At the *CALIBRATE* sub-menu, press **ENTER**.
   The `CAL bF1` prompt appears.
3. Rinse the sensor and place it in the first buffer. Be sure the glass bulb and the temperature element are completely submerged. Keep the sensor at least 3 in. below the liquid level. Do not rest the sensor on the glass bulb. Dislodge any trapped bubbles by swirling the sensor body.
4. Press **ENTER**.
   `BF1` flashes until the measured pH meets the programmed stability limits. If the pH reading is not relatively stable after 20 minutes, the transmitter automatically leaves the *CALIBRATE* menu and returns to the main display. If this occurs, consult Diagnostics and troubleshooting for assistance. Once the reading is stable, the display moves forward by showing a flashing number with the nominal pH.
5. Change the value by using the up and down arrows until the correct pH of the buffer solution appears. Press **ENTER** to save the first calibration point.
   `CAL BF2` appears.
6. Remove the sensor from the first buffer.
7. Rinse the sensor and place it in the second buffer solution. Again, make sure the bulb is completely submerged and the bubbles are dislodged by swirling the sensor body.
8. Press **ENTER**.
   `BF2` flashes until the reading is stable.
9. Repeat steps Step 4 and Step 5.
   The calibration is now complete, but the transmitter remains in the *CALIBRATE* sub-menu for two minutes after you press **ENTER**.
10. Remove the sensor from the buffer and reinstall it into the process stream. If the HOLD feature was used, be sure to turn off HOLD.

    The sensor will not calibrate if the electrode slope (calculated by the transmitter during calibration) is unacceptable. The transmitter displays a `SLOPE ERR HI` or `SLOPE ERR LO` error message. Refer to Diagnostics and troubleshooting for assistance.

Note
To display the electrode slope, press **CAL** on the IRC. The *CALIBRATE* sub-menu appears. Press **NEXT**. The *STD* sub-menu appears. Press **ENTER**. The `STD` prompt appears. Press **ENTER** again, and the slope appears on the display. For a good sensor, the slope is generally 50 to 60 mV.

7.1.4 Calibrate manually

Prerequisites

Ensure that auto-calibration is OFF and the appropriate buffers are used.

Procedure

1. Press **CAL** on the IRC to enter the *CALIBRATE* menu.

The *CALIBRATE* sub-menu appears.

2. At the *CALIBRATE* sub-menu, press **ENTER**.
   The `CAL BF1` prompt appears.
3. Rinse the sensor with DI water and place it in the first buffer along with a calibrated thermometer. Submerge the sensor tip at least 3 in. (76 mm) below the liquid level. Do not rest the sensor on the glass bulb. Dislodge any trapped bubbles by swirling the sensor body.
4. Once the pH reading and temperature are relatively stable, press **ENTER**. Use the editing keys to change the flashing display to the appropriate pH of the buffer solution. Press **ENTER** to save the value as buffer BF1.
   The transmitter expects a reading to be entered within 20 minutes after the `CAL BF1` prompt. If you do not press **ENTER**, the transmitter exits the *CALIBRATE* menu and returns to the process mode.
5. At the `CALBF2` prompt, remove the sensor from the first buffer. Repeat steps Step 3 and Step 4.
   The calibration is now complete, but the transmitter remains in the *CALIBRATE* sub-menu for two minutes after you press **ENTER**.
6. Remove the sensor from the buffer and reinstall it into the process stream. If the HOLD feature was turned on, be sure to turn off HOLD.

   The sensor will not calibrate if the electrode slope (calculated by the transmitter during calibration) is unacceptable. The transmitter displays a SLOPE ERR HI or SLOPE ERR LO error message. Refer to Diagnostics and troubleshooting for assistance.

Note
To display the electrode slope, press **CAL** on the IRC. The *CALIBRATE* sub-menu appears. Press **NEXT**. The *STD* sub-menu appears. Press **ENTER**. The `STD` prompt appears. Press **ENTER** again, and the slope appears on the display. For a good sensor, the slope is generally 50 to 60 mV.

7.1.5 Standardize for pH

Use standardization to match the transmitter values with those of another transmitter. The transmitter converts the difference between the two pH values into an equivalent voltage, called the reference offset.

Note
If a sensor that has been calibrated with buffers is standardized, then placing it back in the buffer will show a different measured pH than that of the buffer due to the standardization offset.

Procedure

1. Press **CAL** on the IRC to enter the *CALIBRATE* menu.
   The *CALIBRATE* submenu appears.
2. At the *CALIBRATE* submenu, press **NEXT**.
   The *STD* submenu appears.
3. Press **ENTER** to enter the STD prompt.

The process pH and temperature should be relatively stable.

4. Take a grab sample from the process stream as close to the pH sensor as possible.
   This transmitter reading is called the pH_trans.
5. Measure the pH of the sample (pH_std) using the second pH meter.
6. Note the current process reading (pH_curr). Calculate the corrected reading from the equation: ph_corr = ph_curr + (pH_std - pH_trans)
   - pH_corr = corrected pH value
   - pH_curr = current pH value
   - pH_std = standard instrument's pH value
   - pH_trans = measured sample's pH value
7. Use the editing keys to enter the pH_corr value calculated using the equation above. Press **ENTER** to save the value.
   If the corrected value is acceptable, then the display shows the slope (current electrode slope).
8. If the slope is acceptable, press **EXIT**. If the slope is unacceptable, use the editing keys to change it. Then press **ENTER**.
9. To leave the *CALIBRATE* menu, press **EXIT**.

7.2 Calibrating oxidation reduction potential (ORP) sensors

7.2.1 Oxidation reduction potential (ORP) overview

ORP is a function of temperature. The accuracy of a sensor/transmitter loop is about ±1 °C. A new sensor does not need to be calibrated often. Only calibrate the loop when:

1. ±1 °C is not acceptable.
2. You suspect an error in temperature measurement

7.2.2 Calibrate temperature with an oxidation reduction potential (ORP) sensor

Procedure

1. Place the ORP sensor and a reference thermometer in an insulated container of water at ambient temperature. Keep the sensor submerged at least 3 in. (76 mm) below the water level. Stir continuously and wait at least 20 minutes for the water, sensor, and thermometer to reach a constant temperature.
2. Press **CAL** on the IRC to enter the *CALIBRATE* menu.
   The *STD* submenu appears.
3. At the *STD* submenu, press **NEXT**.
   The *TEMP ADJ* submenu appears.

4. Press **ENTER** to display the temperature editing prompt.
5. Compare the temperature displayed by the transmitter with the temperature measured by the reference thermometer. If there is a discrepancy between the two values, use the editing keys to change the measured value to that of the thermometer.

Note
The reading cannot be changed more than 15 °C.

6. Press **ENTER**.
   The transmitter saves the value, and the display returns to the ***TEMP ADJ*** submenu.
7. Press **EXIT** to leave the ***CALIBRATE*** menu.
8. Check for linearity by measuring the temperature of water: -10 to -15 °C and +10 to +15 °C than the water used for calibration.

7.2.3 Standardize with an oxidation reduction potential (ORP) sensor

ASTM d 1498-93 gives procedures for making iron (ii) - iron (iii) and quinhydrone ORP standards. Emerson recommends the iron (ii) - iron (iii) standard. It is fairly easy to make and has a shelf life of approximately one year; in contrast, quinhydrone standards contain toxic quinhydrone and have only an eight hour shelf life. Iron (ii) - iron (iii) standard is available from Rosemount™ as PN R508-16OZ. The ORP of the standard solution measured against a silver-silver chloride reference electrode is 476 ± 20 mV at 77 °F (25 °C).

Procedure

1. Press **CAL** on the IRC to enter the ***CALIBRATE*** menu.
   The ***STD*** submenu appears.
2. Rinse the sensor with DI water and place it in the ORP standard with a reference thermometer. Ensure that the ORP sensor is submerged at least 3 in. (76 mm) below the water level.
3. Once the temperature and ORP readings are stable, press **ENTER**.
4. Use the editing keys to change the flashing display to the desired ORP reading. Press **ENTER** to save.
5. Press **EXIT** to return to the main display.

7.2.4 Match transmitter to oxidation reduction potential (ORP) sensor's temperature element

Procedure

1. Press **PROG** on the IRC.
2. Press **NEXT** until the ***TEMP*** submenu appears in the display. Press **ENTER**.
3. Press **EXIT** to return to the main display.

7.3 Calibrating contacting and toroidal conductivity sensors

7.3.1 Overview of calibrating contacting conductivity sensors

Contacting conductivity sensors do not require frequent calibrations. The sensors are ready to be installed right out of the box.

7.3.2 Calibrate contacting conductivity sensors

Procedure

1. Pres **CAL** on the IRC. Press **ENTER**.
   The *CALIBRATE* submenu appears.
2. Place the sensor in a standard solution of known conductivity and allow the measurement reading to become relatively stable.
3. Press **ENTER** to access the CAL segment with the flashing prompt.
4. Use the IRC editing keys to enter the conductivity value of the standard solution. Press **ENTER**.
5. Press **EXIT** to return to the main display.

7.3.3 Zero the sensor

Procedure

1. Press **CAL** and then **NEXT** to enter the *SENSOR 0* menu.
2. Press **ENTER** to access the *SENSOR 0* submenu.
3. Hold the sensor in the air and press **ENTER** again to zero the sensor.
4. Press **EXIT** to return to the *SENSOR 0* submenu.

7.3.4 Adjust temperature

Procedure

1. Press **CAL** and then **NEXT** until you see `TEMP`.
2. Press **ENTER**.
   The *TEMP* submenu appears.
3. Place the sensor in any solution of known temperature. Allow the temperature of the sensor to become relatively stable.
4. Use the editing keys of the IRC to change the values as needed.
5. Press **ENTER** to standardize the temperature reading and return to the *TEMP ADJ* screen.
6. Press **EXIT** to return to the main display.

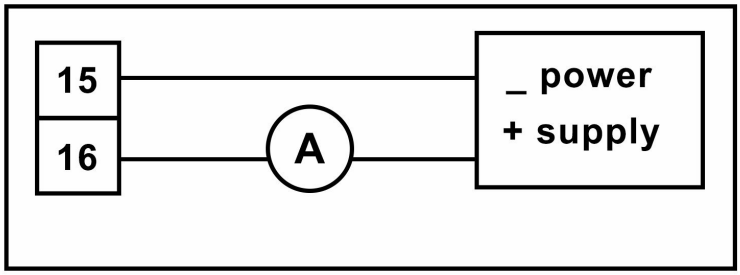
7.3.5 Calibrate in-process

Procedure

1. Press **CAL** and then **NEXT** three times to access MTR CAL.
2. Use the IRC to go through the on-screen prompts.
3. Press **EXIT** to return to the main display.

7.3.6 Calibrate temperature slope

Procedure



1. From the *CAL* menu, press **NEXT** until `TEMP SLOPE` displays.
2. Use the IRC arrow keys to enter the slope. Press **ENTER** to register the slope in the memory of the transmitter. Press **EXIT** to return to the main screen.
3. If you don't know the temperature slope of the process, then refer to the below guide:
   - Acids: 1.0 percent to 1.6 percent per °C
   - Bases: 1.8 percent to 2.2 percent per °C
   - Salts: 2.2 percent to 3.0 percent per °C
   - Water: 2.0 percent per °C
4. Press **ENTER** to proceed to the *T SLOPE* submenu with the flashing prompt. Use the IRC keys to generate the desired slope value. Press **ENTER**.
5. Press **EXIT** to return to the main screen.

7.3.7 Calibrate output

Procedure

1. Wire an accurate milliammeter as shown in Figure 7-1.

Figure 7-1: Milliammeter Wiring

2. Press **CAL** on the IRC.
3. Press **NEXT** until the *OUTPUT CAL* submenu appears. Press **ENTER**.

4. Use the arrow keys to change the display to match the reading from the milliammeter. Press **ENTER**.
5. Press **RESET** to return to the main display.

7.4 Calibrating dissolved oxygen, ozone, free chlorine, total chlorine, and ozone sensors

7.4.1 Calibrating amperometric sensors

You can calibrate amperometric sensors in multiple ways: zeroing, air calibrations, dual slope calibrations, and in process calibrations.

7.4.2 Zero the sensor

Procedure

1. Place the sensor in a solution of 5% sodium sulfite (Na_2SO_3) in water. Ensure that air bubbles are not trapped against the membrane.
2. Go to the main display; press **DIAG** and then **NEXT**.
   The `SENSOR CUR` prompt appears.
3. Press **ENTER** to view the sensor current. Make sure the sensor reaches its zero current.

   This may require several hours. Do not start the zero routine until the sensor has been in zero solution for at least two hours.
4. Press **CAL** on the IRC.
   The `SENSOR 0` prompt appears.
5. Press **ENTER**.
   The screen shows the appropriate value correlating to the zero value. The screen shows `0.02`. The reading must be below 0.02 ppm for the zero calibration to be accepted.
6. To change the zero limit, use the editing keys and then press **ENTER**.
   The `TIME DELAY` message appears and remains until the zero current is below the concentration limit. If the current is already below the limit, `TIME DELAY` will not appear.
7. To bypass the time delay, press **ENTER**.
   When the procedure is complete, `0 DONE` appears.
8. Press **EXIT**.
9. Press **RESET** to return to the main display.

7.4.3 Calibrate in air (dissolved oxygen)

Procedure

1. Remove the sensor from the process liquid. Use a soft tissue and a wash bottle to clean the membrane. Dry it by blotting.
   The membrane must be completely dry during air calibration.
2. Pour some water into a beaker and suspend the sensor with the membrane approximately ½ in. (approximately 1 cm) above the water surface.
   Keep the sensor out of direct sunlight.
3. Monitor the dissolved oxygen and temperature reading. Once the readings are relatively stable, begin the calibration.
   It may take 10 - 15 minutes for the sensor reading in the air to stabilize.
4. Press **CAL** on the IRC.
5. Press **NEXT**.
   The *SENSOR CAL* submenu appears.
6. Press **ENTER**.
   The `AIR CAL` prompt appears.
7. Press **ENTER**.
8. Select the units. Then press **NEXT**.
9. Use the arrow keys to enter the barometric pressure. Press **ENTER** when done.
   The `TIME DELAY` message appears and remains until the sensor reading is relatively stable.
10. To bypass the time delay, press **ENTER**.
    `CAL DONE` appears when the calibration is complete.
11. Press **EXIT**.
12. To return to the main display, press **RESET**.

7.4.4 Calibrate in process (dissolved oxygen)

You can calibrate the sensor against a standard instrument.

Procedure

1. Press **CAL** on the IRC.
2. Press **NEXT**.
   The *SENSOR CAL* submenu appears.
3. Press **ENTER**.
4. Press **NEXT**.
   The `AIR CAL` prompt appears.
5. Press **NEXT**.
   The `INPROCESS` prompt appears.
6. Press **ENTER**.

The TIME DELAY message appears and will remain until the sensor is relatively stable. To bypass the time delay, press **ENTER**. The GRAP SPL message appears.

7. Press **ENTER**.
8. Use the arrow keys to change the flashing display to the value indicated by the standards instrument. Press **ENTER**.
9. Press **RESET** to return to the main display.

7.4.5 Calibrate full scale (free chlorine, total chlorine, ozone)

Procedure

1. Place the sensor in the process liquid. Ensure that the pH sensor is calibrated or the pH value is entered in case of manual pH correction, if applicable.
2. Adjust the chlorine concentration until it is near the upper end of the control range. Wait until the reading is relatively stable before starting the calibration.
3. Press **CAL** on the IRC.
4. Press **NEXT**.
   The *SENSOR CAL* submenu appears.
5. Press **ENTER**.
   The TIME DELAY message appears and will remain until the sensor reading is relatively stable. To bypass the time delay, press **ENTER**. The GRAB SPL prompt appears.
6. Take a sample of the process liquid and determine the concentration of chlorine in the sample. Press **ENTER**.
7. Press **RESET** to return to the main display.

7.4.6 Calibrate dual slope (free chlorine, total chlorine)

Procedure

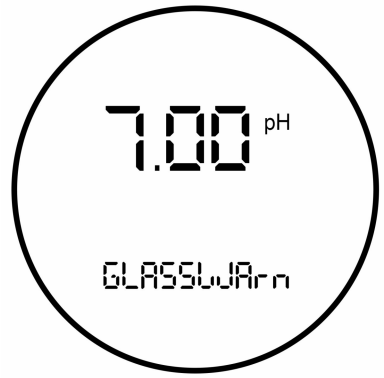
1. Zero the sensor.
2. Place the sensor in the process liquid. Ensure that the pH sensor is calibrated or the pH valve is entered in case of manual pH correction, if applicable.
3. Press **CAL** on the IRC. Press **NEXT**.
   The *SENSOR CAL* prompt appears.
4. Press **ENTER**.
   The CAL PT1 prompt appears.
5. Adjust the chlorine concentration until it is near the upper end of the linear range of the sensor. Press **NEXT**.
   The TIME DELAY message appears and will remain until the sensor reading is relatively stable. To bypass the time delay, press **ENTER**. The GRAB SPL prompt appears.
6. Take a sample of the process liquid and determine the concentration of chlorine in the sample.
7. Press **ENTER**.

The PT1 prompt appears.

8. Use the arrow keys to change the flashing display to the concentration of chlorine determined in the grab sample. Press **ENTER** to save.
   The CAL PT2 prompt appears.
9. Adjust the concentration of chlorine until it is near the top end of the range. Press **ENTER**.
   The TIME DELAY message appears and will remain until the sensor reading is relatively stable. To bypass the time delay, press **ENTER**. The GRAB SPL prompt appears.
10. Take the sample of the process liquid and determine the concentration of chlorine in the sample.
11. Press **ENTER**.
    The PT2 prompt appears.
12. Use the arrow keys to change the flashing display to the concentration of chlorine determined in the grab sample. Press **ENTER** to save.
13. Press **RESET** to return to the main display.

8 Diagnostics and troubleshooting



8.1 Warning and fault messages

The Rosemount™ 5081 transmitter continuously monitors the measurement loop (sensor and transmitter) for conditions that cause inaccurate measurements. When a problem occurs, the transmitter displays either a warning or fault message. A warning alerts you that a potentially system disabling condition exists. If you don't fix the problem, there is a high probability that the measurement will be incorrect. A fault alerts you that a system disabling condition exists. If a fault message is showing, regard all measurements as incorrect.

When a warning condition exists:

1. The main display remains stable; it does not flash.
2. A warning message appears alternately with the temperature display. See Figure 8-1. See Troubleshooting when a diagnostic message is showing for an explanation of the different warnings and suggested ways of correcting the problem.

Figure 8-1: Warning Annunciation

When a Fault exists:

1. The main display flashes.
2. The words FAULT and HOLD appear in the main display.
3. A fault message appears alternately with the temperature/output display. See Figure 8-2. See Troubleshooting when a diagnostic message is showing for an explanation of the different fault messages and suggested ways of correcting the problem.
4. The output current will remain at the present value or go to the programmed fault value.
5. If the transmitter is in Hold when the fault occurs, the output remains at the programmed hold value. To alert you that a fault exists, the word FAULT appears in the main display, and the display flashes. A fault or diagnostic message also appears.

6. If the transmitter is simulating an output current when the fault occurs, the transmitter continues to generate the simulated current. To alert you that a fault exists, the word `FAULT` appears in the display, and the display flashes.

Figure 8-2: Fault Annunciation

When a a fault occurs, the display appears as pictured above. To further alert you that measurements are in error, the display flashes. Diagnostic messages appear in the temperature/output area on the screen.

8.2 pH/ORP diagnostics and troubleshooting

8.2.1 Calibration errors

If an error occurs during calibration, an error message appears in the main display and the transmitter does not update the calibration. The calibration errors are `Std Err`, `SLOPE Err LO`, and `SLOPE Err HI`. See Troubleshooting when a diagnostic message is showing for an explanation of the error messages and suggested ways of correcting the problem.

8.2.2 General troubleshooting

Procedure

1. Look for a diagnostic message on the display to help identify the problem.

   Refer to Troubleshooting when a diagnostic message is showing for an explanation of the message and a list of the possible problems that triggered it.
2. Refer to Troubleshooting when no diagnostic message is showing for common measurement problems and the recommended actions to resolve them.
3. Follow the step-by-step troubleshooting approach, offered in Displaying diagnostic variables, to diagnose and correct less common or more complex problems.

8.2.3 Troubleshooting when a diagnostic message is showing

The Rosemount 5081-P pH/ORP transmitter continuously monitors the measurement loop (sensor and transmitter) for problems. If a problem is detected, the transmitter

displays a fault or error message. The message appears in the temperature/output area of the main display. The table lists each diagnostic message and the section to consult for help.

Message	Section
GLASSFAIL	GLASSFAIL
GLASSWArn	GLASSWArn
rEF FAIL	rEF FAIL
rEF WArn	rEF WARn
CALIbrAtE	CALIbrAtE
tEMP HI	tEMP HI and tEMP LO
tEMP LO	tEMP HI and tEMP LO
LInE FAIL	LinE FAIL
InPUt WArn	InPUt WArn
SLOPE Err LO	SLOPE Err LO
SLOPE Err HI	SLOPE Err HI
Std Err	Std Err
rOM FAIL	rOM FAIL or CPU FAIL
CPU FAIL	rOM FAIL or CPU FAIL
AdC WArn	AdC WArn or CyCLE PWr
CyCLE PWr	AdC WArn or CyCLE PWr
WrItE Err	WritE Err
FACt FAIL	FACt FAIL

GLASSFAIL

`GLASSFAIL` is an electrode fault message. It means the glass impedance is outside the programmed Glass Fault High (GFH) or Glass Fault Low (GFL) limit. Glass Fault High suggests the electrode is aging or the electrode is not immersed in the process liquid. Glass Fault Low implies that the pH sensitive glass is cracked. `GLASSFAIL` also appears if inappropriate limits have been entered into the transmitter.

If the measurement system was previously commissioned and operating correctly, `GLASSFAIL` likely means a real problem exists. However, if the system is being started up or if the advanced diagnostic feature is being used for the first time, `GLASSFAIL` could be caused by a miswired sensor or by programmed limits that are not correct for the sensor.

Note
`GLASSFAIL` is a sensor diagnostic message. Sensor diagnostic messages are optional. They can be turned off.

Recommended actions

1. Be sure the sensor is completely immersed in the process liquid.

If the diagnostic message disappears, the sensor is in good condition.

If the diagnostic message remains, go to Step 2.

2. Measure the glass impedance. See Testing the transmitter by simulating the pH for the procedure. Note the reading.

   If the glass impedance is low (< 40 megohms)...

   a. Check preamp location in program menus (PAMP = _____).
      - If the location is incorrect, go to 2.b.
      - If after selecting the correct location of Preamp in the Program menu, the glass impedance is still low, go to Step b.

   b. Calibrate the sensor.
      - If the sensor calibrates properly...
        1. The sensor is in good condition, but the Glass Fail Low (GFL) limit is set too high.
        2. Lower the GFL limit to about 10 megohms below the glass impedance value (GIMP).
        3. If the Glass Warning Low (GWL) message was also flashing, lower the limit from its former value by the same amount the GFL was lowered from its former value.
      - If the sensor cannot be calibrated, the pH glass membrane is likely cracked and the sensor must be replaced. The crack in the glass may not be visible or may be difficult to see.

   If the glass impedance is high (> 800 megohms)...

   a. Check that the sensor is correctly wired to the transmitter. Pay particular attention to the following:
      1. For Rosemount PLUS (+) and TUpH sensors with integral preamplifiers, the blue solution ground wire must be attached to TB-8 (SOL GND), and the gray reference in wire must be attached to TB-7 (REF IN).

         Note
         TB-8 means terminal 8 on the terminal board.

      2. If the sensor was wired with the blue solution ground wire unattached and a jumper between the terminals TB-8 and TB-7, remove the jumper and reattach the blue solution ground wire to TB-8. Keep the gray reference in wire attached to TB-7.
      3. For Rosemount PLUS (+) and TUpH sensors that do not have an integral preamplifier, attach the blue solution ground wire to TB-8 or, better, leave the blue wire unattached and jumper TB-7 to TB-8.
      4. If the sensor does not have a blue solution ground wire, jumper terminals TB-7 and TB-8.
         - If the wiring was correct and the glass impedance is still too high, go on to 2.b.

- If correcting wiring errors causes the diagnostic message to disappear, the sensor is in good condition.
- If after correcting wiring errors, the glass impedance is still high, go on to Step b.

b. Inspect and clean the sensor. After cleaning the sensor, calibrate it. Be sure to note the sensor slope.
   - If cleaning the sensor lowers the impedance below 800 megohms:
     1. The sensor is in good condition.
     2. Return the calibrated sensor to service.
   - If cleaning does not lower the glass impedance and the sensor can be calibrated:
     1. The sensor is probably in good condition; however, it may be nearing the end of its life. The electrode slope is a good indicator of remaining life.

Slope	Condition of sensor
54-60 mV/unit pH	Sensor is in good condition.
48-50 mV/unit pH	Sensor is nearing the end of its life. Once the slope drops below 48 mV/unit pH, the sensor can no longer be calibrated.

     2. The Glass Fail High (GFH) limit is probably set too low for the sensor. Set the GFH limit to about 150 megohms greater than the measured glass impedance.
     3. If the `GLASSWArn` message was also flashing, raise the GWH limit from its former value by the same amount the GFH was raised from its former value.
   - If cleaning does not lower the glass impedance and the sensor cannot be calibrated, the sensor has failed and should be replaced.

GLASSWArn

`GLASSWArn` is an electrode fault message. It means the glass impedance is outside the programmed Gas Warning High (GWH) or Glass Warning Low (GWL) limit. Ideally, when the measurement system exceeds the glass warning limits, you will have adequate time to diagnose and correct problems before a failure occurs. High impedance implies the electrode is aging or the sensor is not completely submerged in the process liquid. Low impedance suggests the pH sensitive glass is cracked. The message also appears if inappropriate limits have been entered into the transmitter.

If the measurement system was previously commissioned and operating correctly, `GLASSWArn` likely means a real problem exists. However, if the system is being started up or if the advanced diagnostic feature is being used for the first time, `GLASSWArn` could be caused by a miswired sensor or by programmed limits that are not correct for the sensor.

Note
GLASSWArn is a sensor diagnostic message. All sensor diagnostic messages are optional. They can be turned off.

Troubleshooting GLASSWArn problems is exactly the same procedure as troubleshooting GLASSFAIL problems. Refer to GLASSFAIL.

rEF FAIL

rEF FAIL is an electrode fault message. rEF FAIL means that the reference impedance exceeds the programmed reference high fault (RFH) limit. A plugged or dry reference junction is the usual cause of a high reference impedance. High reference impedance also occurs if the sensor is not submerged in the process liquid or if inappropriate limits have been entered into the transmitter.

If the operator previously commissioned the measurement system and it was operating correctly, rEF FAIL likely means a real problem exists. However, if the operator is just starting up the system or using the advanced diagnostic feature for the first time, rEF FAIL could be caused by a miswired sensor or by programmed limits that are not correct for the sensor.

Note
rEF FAIL is a sensor diagnostic message. All sensor diagnostic messages are optional. They can be turned off.

Recommended actions

1. Be sure the sensor is completely immersed in the process liquid.
   - If the diagnostic message disappears, the sensor is in good condition.
   - If the diagnostic message remains, go to Step 2.
2. Check that the sensor is properly wired to the transmitter. Be sure the reference in wire is attached to TB-7 and the solution ground wire is attached to TB-8.

   Note
   TB-8 means terminal 8 on the terminal board.

   - If correcting wiring problems makes the diagnostic message disappear, the sensor is in good condition.
   - If the wiring is correct and the message still remains, go to Step 3.
3. Measure and make a note of the reference impedance (rIMP). See Testing the transmitter by simulating the pH.
   - If the reference impedance is low (< 70 kilohms)...
     a. The reference electrode is in good condition. pH sensors manufactured by Rosemount use low impedance silver/silver chloride reference electrodes.
     b. The reference failure high (RFH) limit is probably set too low. Change the limit to a value about 50 kilohms greater than the measured reference impedance. If rEF WARN was also displayed, change the reference

warning high (RWH) limit to about 25 kilohms above the measured reference impedance.

- If the reference impedance is high (> 70 kilohms)...
  a. The sensor may be dirty, in which case cleaning it will lower the impedance. If the sensor is rebuildable, the reference electrolyte may be depleted. Finally, the sensor may be in good condition. The warning and failure limits are simply set too high.
  b. Inspect and clean the sensor. If the sensor is rebuildable, replace the reference junction and replenish the electrolyte solution. Refer to the sensor reference manual for details. Check the reference impedance again.
     — If cleaning the sensor reduces the impedance...
        1. The sensor is in good condition. Calibrate the sensor and return it to the process.
        2. Change the reference failure high (RFH) limit to a value about 50 kilohms greater than the measured reference impedance. If `rEF WARN` was also displayed, change the reference warning high (RWH) limit to about 25 kilohms above the measured reference impedance.
     — If cleaning does not reduce the impedance and the sensor is not rebuildable...
        1. Try the reference junction rejuvenation procedure. The rejuvenation procedure may not work. At best, it will get a little more life out of a sensor with a plugged reference.
        2. Whether or not the rejuvenation procedure worked, go to 3.c.
  c. Recalibrate the sensor using the autocalibration procedure.
     — If the sensor can be calibrated:
        1. The sensor is in good condition. Return it to the process.
        2. Change the reference failure high (RFH) limit to a value about 50 kilohms greater than the measured reference impedance. If `rEF WARN` was also displayed, change the reference warning high (RWH) limit to about 25 kilohms greater than the measured reference impedance.
     — If the sensor cannot be calibrated, the sensor has failed and must be replaced.

rEF WARn

`rEF WArn` is an electrode fault message. It means the reference electrode impedance exceeds the programmed reference warning high (RWH) limit. Ideally, when the measurement system exceeds the warning limits, you will have adequate time to diagnose and correct problems before a failure occurs. A high reference impedance implies that the liquid junction is plugged or the reference electrolyte is depleted. The message also appears if an inappropriate limit has been entered into the transmitter.

If the measurement system was previously commissioned and operating correctly, rEF WArn likely means a real problem exists. However, if the system is being started up or if the advanced diagnostic feature is being used for the first time, rEF WArn could be caused by a miswired sensor or by programmed limits that are not correct for the sensor.

Note
rEF WArn is a sensor diagnostic message. Sensor diagnostic messages are optional. They can be turned off.

Troubleshooting rEF WArn problems is exactly the same as troubleshooting rEF FAIL problems. Refer to rEF FAIL.

CALIbrAtE

CALIbrAte is a diagnostic intended for future use. If the CALIbrAte message is showing, disable CALIbrAte.

tEMP HI and tEMP LO

tEMP HI and tEMP LO mean the transmitter has detected a problem with the temperature measuring circuit. The problem may lie in the sensor, the cable, or the transmitter. The determination of temperature is an integral part of the pH measurement. Therefore, failure of the temperature measuring circuit is a system disabling condition. However, in an emergency, automatic temperature compensation can be disabled and the transmitter placed in manual temperature compensation. For manual temperature compensation, choose a temperature equal to the average temperature of the process. The resulting pH reading will be in error. The more variable the temperature and the further the pH from 7, the greater the error.

Recommended actions

1. Check wiring, jumper settings, and software settings.
   a. Check the wiring between the sensor and the transmitter. Pay particular attention to TB=3 (RTD RTN), TB-4 (RTD SN), and TB-5 (RTD RTN).

      Note
      TB-3 means terminal 3 on the terminal board.

   b. Be sure the software settings match the type of resistance temperature device (RTD) in the sensor.
      - If the diagnostic message disappears, the sensor is in good condition.
      - If the message persists, go to Step 2.

2. Check the sensor. Disconnect the RTD leads and measure the resistances shown in Figure 8-3.

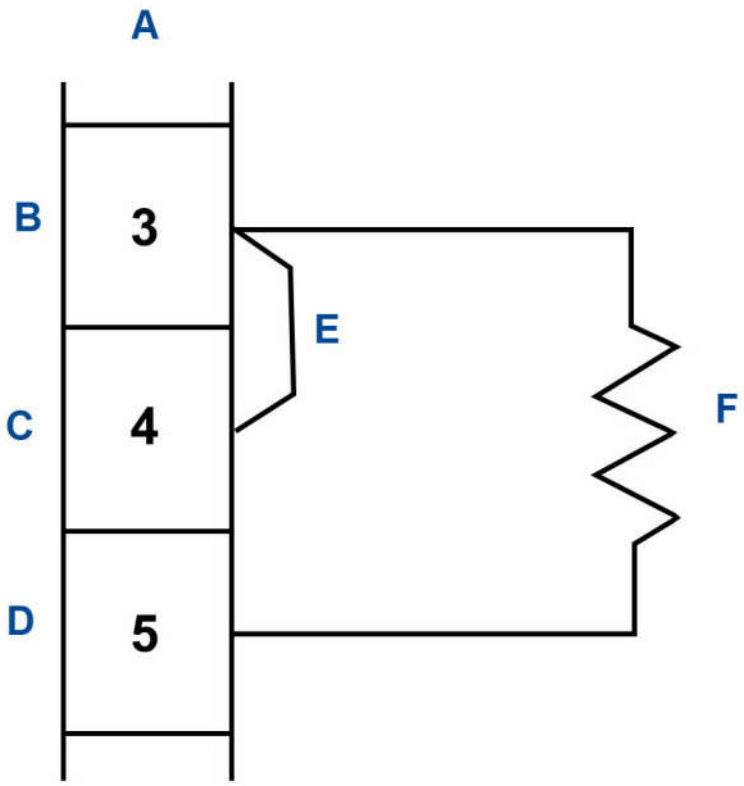
   The measured resistance should agree with the value in Table 8-1 to within about one percent. If the measured resistance is appreciably different (between one and five percent) from the value shown, the operator can calibrate out the discrepancy.

Figure 8-3: Three-Wire RTD

A. Compare resistance between these wires to the values in Table 8-1.
B. Resistance between these wires should be less than 2 ohms.

Consult Table 8-1 for resistance-temperature data. Lead resistance is about 0.05 ohm/ft at 77 °F (25 °C). Therefore, 15 feet of cable increases the resistance by about 1.5 ohm. The resistance between the RTD return and RTD sense leads should be less than 2 ohms.

Table 8-1: RTD Resistance Values



Temperature	Pt-100 resistance	Pt-1000 resistance
0 °C (32 °F)	100.0 ohms	1000 ohms
10 °C (50 °F)	103.9 ohms	1039 ohms
20 °C (68 °F)	107.8 ohms	1078 ohms
25 °C (77 °F)	109.6 ohms	1096 ohms
30 °C (86 °F)	111.7 ohms	1117 ohms
40 °C (104 °F)	115.5 ohms	1155 ohms
50 °C (122 °F)	119.4 ohms	1194 ohms
60 °C (140 °F)	123.2 ohms	1232 ohms
70 °C (158 °F)	127.1 ohms	1271 ohms
80 °C (176 °F)	130.9 ohms	1309 ohms
90 °C (194 °F)	134.7 ohms	1347 ohms
100 °C (212 °F)	138.5 ohms	1385 ohms

- If a connections is open or shorted and it should not be, the sensor has failed. Replace the sensor.

- If the measured resistances are acceptable, go to Step 3.

3. Check the transmitter. Disconnect the RTD sensor leads and wire the circuit shown in Figure 8-4. Set the resistance to the value for 25 °C (77 °F) shown in Table 8-1. The measured temperature should equal 25 °C (77 °F) within ±1 °C.

Figure 8-4: Temperature Simulation into the Rosemount 5081 pH/ORP Transmitter

A. Terminal board
B. RTD return
C. RTD sense
D. RTD in
E. Jumper
F. Standard resistor(s) to stimulate RTD

- If the measured temperature is correct, the transmitter is working properly.
- If the measured temperature is incorrect, calibrate the transmitter against the standard resistance equivalent to 77 °F (25 °C). Change the resistance and verify that the temperature reading changes to the correct value.
  - If the transmitter works properly after temperature calibration, the original calibration was in error. Re-attach the RTD wires and check the temperature performance of the sensor.

— If the reading is still wrong, the transmitter electronics have failed. Replace the sensor board stack.

LinE FAIL

`LinE FAIL` almost always means the transmitter is measuring an incorrect distance between terminal TB-3 (resistance temperature device [RTD] return) and TB-4 (RTD sense). These terminals are critical connections for the three-wire RTD measurement. Figure 8-3 shows a three-wire RTD connection.

Recommended actions

1. Check for miswires and open connections at TB-3 and TB-4. Open connections can be caused by loose connections, poor spade crimps, or broken wires. Be sure the check junction boxes for proper pass through of all wires.
   - If correcting a wiring problem makes the message disappear, the system is in good condition.
   - If the message is still showing, go to Step 2.
2. The RTD sense or the RTD return wire inside the sensor cable may be broken. Keep the sensor wires attached and jumper TB-3 and TB-4.
   - If the diagnostic message disappears, either the RTD return or RTD sense wire is broken. To verify a broken wire, disconnect the leads and measure the resistance between them. Installing the jumper completes the circuit, but bypasses the three-wire function. The transmitter no longer corrects for changes in lead wire resistance with temperature. replace the sensor as soon as possible.
   - If the diagnostic message remains, go to Step 3.
3. The cable connecting the sensor to the transmitter may be too long. Test using a sensor with a shorter cable.
   - If shortening the cable eliminates the problem, move the transmitter closer to the sensor. It may also be possible to increase diameter of the RTD wires. Consult the factory for assistance.
   - If the diagnostic message remains, go to Step 4.
4. Check the temperature of the transmitter. Simulate both temperature and pH. See tEMP HI and tEMP LO (steps 2 and 3) for temperature simulation and Simulating inputs - pH for pH simulation.
   - If the transmitter fails either simulation, the electronic board stack should be replaced.
   - If the transmitter passes the simulations, the transmitter is not in good condition, and the sensor should be replaced.

InPUt WArn

`InPUt WArn` means that the input value or the calculated pH is outside the measurement range. The measured pH is less than -2 or greater than 16.

Recommended actions

1. Check for miswires and open connections, particularly at TB-10. Open connections can be caused by loose connections, poor spade crimps, or broken wires. Be sure to check junction boxes for proper pass through of all wires.
   - If correcting a wiring problem clears the message, the system is in good condition.
   - If the message is still showing, go to Step 2.
2. Check that the transmitter is working properly by simulating a pH input. See Testing the transmitter by simulating the pH.
   - If the transmitter does not respond to simulated inputs, replace the board stack.
   - If the transmitter performs satisfactorily and the preamplifier is located in a remote junction box or in a sensor-mounted junction box, go to Step 3.
   - If the transmitter performs properly and the preamplifier is located in the transmitter, the sensor has failed and should be replaced.
3. The problem may lie with the remote preamplifier or with the cable connecting the preamplifier and junction box to the transmitter.
   a) Be sure all wires between the junction box and transmitter are connected.
   b) Use Rosemount cable.
      Generic cable may not work.
   - If the disagnostic message clears, the interconnecting cable was the problem.
   - If the message remains, go to Step 4.
4. Confirm that the problem is with the remote preamplifier.
   a) Wire the pH sensor directly to the transmitter.
   b) Change the menu from PAMP=SnSr to trAnS for the test and return it to SnSr afterwards.
   - If the error message clears, the remote preamplifier is faulty. Replace the preamplifier.
   - If the error message remains, the sensor has failed. Replace the sensor.

SLOPE Err LO

`SLOPE Err LO` means that a two-point buffer calibration attempt has failed. The slope is too low (<40 mV/pH) for a good measurement.

Recommended actions

1. Repeat the calibration.
   a) Inaccurate buffers can cause a low slope. Repeat the calibration using fresh buffers. Alkaline buffers, pH 10 or greater, are particularly susceptible to changing value in air or with age. If you used a high pH buffer in the failed calibration, try a lower pH buffer when repeating the calibration. For example, use pH 4 and 7 buffer instead of pH 7 and 10 buffer.

b) Allow adequate time for readings in buffer to become constant. If the sensor was in a process substantially colder or hotter than the buffer, allow at least 20 minutes for readings in the buffer to stabilize. Alternatively, place the sensor in a container of water at ambient temperatures for 20 minutes before starting the calibration.

c) Be sure the correct buffer values are being entered during calibration.

- If the second calibration was successful, an error was made during the first attempt.
- If the second calibration fails, go to Step 2.

2. Check wiring. Connections to TB-10, TB-7, and TB-8 are particularly important. Recalibrate the sensor.
   - If the wiring was the only problem, the sensor should calibrate.
   - If the message persists, go to Step 3.
3. Inspect and clean the sensor. Recalibrate the sensor.
   - If the sensor was dirty, it should calibrate after cleaning.
   - If the message persists, go to Step 4.
4. Check for a faulty sensor.
   - If a spare sensor is available, connect it to the transmitter. Use the auto calibration procedure to calibrate the sensor.
     — If the new sensor cannot be calibrated, the transmitter is faulty. Go to Step 5.
     — If the new sensor can be calibrated, the old sensor has failed.
   - If a spare sensor is not available, measure the glass impendance (GIMP). See Testing the transmitter by simulating the pH.
     — If the glass impedance is less than about 20 megohms, the glass has cracked and the electrode must be replaced.
     — If the glass impedance is greater than about 20 megohms, the sensor is probably in good condition. Go to Step 5.
5. Check transmitter performance by simulating pH inputs. See Testing the transmitter by simulating the pH.
   - If the transmitter performs satisfactorily, go to Step 6.
   - If the transmitter does not respond to stimulated inputs, replace the board stack.
6. If the transmitter responds to simulated inputs, the problem must lie with the sensor or the interconnecting wiring. Verify the interconnecting wiring point to point. Fix or replace bad cable. If the cable is good, replace the pH sensor.

SLOPE Err HI

`SLOPE Err HI` means that a two-point buffer calibration attempt has failed. The slope is too high (> 62 mV/pH) for a good measurement.

Recommended actions

1. Repeat the calibration.
   a) Inaccurate buffers can cause a high slope. Repeat the calibration using fresh buffers. Alkaline buffers, pH 10 or greater, are particularly susceptible to changing value in air or with age. If you used a high pH buffer in the failed calibration, try a lower pH buffer when repeating the calibration. For example, use pH4 and 7 buffer instead of pH 7 and 10 buffer.
   b) Allow adequate time for readings in buffer to become constant. If the sensor was in a process substantially colder or hotter than the buffer, allow at least 20 minutes for readings in the buffer to stabilize. Alternatively, place the sensor in a container of water at ambient temperature for 20 minutes before starting the calibration.
   c) Be sure the correct buffer values are being entered during calibration. To minimize errors caused by entering the wrong buffer values, use the autocalibration procedure.
   d) Verify that the temperature reading is accurate. Compare the sensor reading against a thermometer known to be accurate. Recalibrate if necessary.

   - If the second calibration was successful, an error was made during the first attempt.
   - If the second calibration fails, go to Step 2.

2. There is a remote possibility of a problem with the autocalibration program. Repeat the calibration using the manual calibration procedure.
   - If manual calibration was successful when autocalibration failed, the problem might be with the sensor electronics. Call the factory for assistance.
   - If manual calibration is not possible, go to Step 3.

3. Check the transmitter performance by simulating pH inputs. See Testing the transmitter by simulating the pH.
   - If the transmitter performs satisfactorily, go to Step 4.
   - If the transmitter does not respond to stimulated inputs, replace the board stack.

4. If the transmitter responds to simulated inputs, the problem must lie with the sensor or the interconnecting wiring. Verify the interconnecting wiring point to point. Fix or replace bad cable. If cable is good, replace the pH sensor.

Std Err

`Std Err` means the reference electrode voltage has changed drastically. Typical causes are exposure to poisoning agents, sulfides or cyanides, or prolonged exposure to high temperature.

Troubleshooting depends on the type of sensor.

Recommended actions

1. If the sensor is rebuildable, replenish the electrolyte solution and replace the liquid junction. Calibrate the sensor.
   - If the sensor can be calibrated, the problem has been corrected.
   - If the sensor cannot be calibrated, replace the sensor. If the sensor has separate measuring and reference electrodes, replace only the reference electrode.
2. If the sensor is not rebuildable, try the reference electrode rejuvenation procedure.
   - If the rejuvenated sensor can be calibrated, the problem has been corrected.
   - If the sensor cannot be calibrated, replace the sensor.

rOM FAIL or CPU FAIL

`rOM FAIL` or `CPU FAIL` means the transmitter electronics have failed.

Recommended action

Replace the electronic board stack (PN 23992-02 [-HT] or PN 23992-03 [-HF]).

AdC WArn or CyCLE PWr

The `Adc WArn` or `CyCLE PWr` message appears momentarily when the transmitter has recognized an internal calculation problem. The transmitter repeats the calculation, and the message disappears once the calculation is successful. If the message is displayed constantly, the transmitter electronics may be faulty.

Recommended actions

1. Check transmitter performance by simulating pH inputs. See Testing the transmitter by simulating the pH.
   - If the transmitter performs satisfactorily, go to Step 2.
   - If the transmitter does not respond to simulated inputs, replace the board stack.
2. If the transmitter responds to simulated inputs, the problem must lie with the sensor or the interconnecting wiring. Verify the interconnecting wiring point to point. Fix or replace bad cable. If cable is good, replace the pH sensor.

WritE Err

`WriTE Err` means that jumper JP1 on the CPU board is not in place. If the sensor is not in place, the transmitter cannot be programmed or calibrated.

Recommended actions

1. Check the position of jumper JP1 on the CPU board. If the jumper is hanging off one of the pins, place it across both pins. If the jumper is missing entirely, use jumper JP3 (50/60 Hz), which is not a critical jumper.

   There are similar numbered jumpers on the analog board. The jumper to be checked is on the CPU board, which is the center board in the stack.
2. Turn the power to the transmitter off and then back on.

- Toggling the power should cause the message to disappear.
- If the message does not disappear, replace the electronic board stack.

FACt FAIL

`FACt FAIL` means the unit has not been factory calibrated. Call the factory. The transmitter will probably need to be returned to the factory for calibration.

8.2.4 Troubleshooting when no diagnostic message is showing

If no diagnostic message is showing, locate the symptom(s) in the table below and refer to the appropriate section for assistance.

Symptom	Section
`Id000` appears in display when trying to program or calibrate transmitter	Id000 in display
Error message flashing in display	Troubleshooting when a diagnostic message is showing
Transmitter does not respond to remote controller	Transmitter not responding to IRC
Calibration problems	
`SLOPE Err HI` or `SLOPE Err LO` appears after calibration attempt	SLOPE Err LO or SLOPE Err Hi appear after calibration attempt
`bF1` or `bF2` continuously flashes during auto calibration	bF1 or bF2 continuously flashes during autocalibration
pH reading in buffer drifts during manual calibration	pH reading in buffer drifts during manual calibration
Measurement problems	
Sensor does not respond to known pH changes	Sensor does not respond to known pH changes
Buffer calibration is acceptable; process pH is slightly different from expected value	Buffer calibration is acceptable; process pH is slightly different from expected value.
Buffer calibration is acceptable; process pH is grossly wrong and/or readings are noisy	Buffer calibration is acceptable; process pH is grossly different from expected value
Temperature reading is inaccurate	Temperature reading is inaccurate
Transmitter problems	
No display	No display
Display segments missing or display incorrect	Display segments missing
Transmitter locked up, all display segments lit	Transmitter locks up
Transmitter periodically restarts itself	Transmitter periodically restarts itself

Id000 in display

A security code has been programmed into the transmitter. The correct code must be entered before the transmitter can be programmed or calibrated.

Transmitter not responding to IRC

Recommended actions

1. Be sure the transmitter is receiving the signal.
   a) Clean the window in front of the IR detector.
      The detector is a small rectangle just above the main display.
   b) Hold the IRC at least 6 ft. (1.8 m) from the transmitter and not more than 15 degrees from the center.
   c) Hold the IRC closer (within 2 ft. [.6 m]) in case the batteries are getting weak.
2. If Step 1 fails, check the IRC.
   a) If a second transmitter is available, test the IRC on that transmitter. If a spare transmitter is not available, continue with Step b.
   b) The green LED, located just above and between the **RESET** and **HOLD** buttons, should light when a key is pressed. A piece of black rubber film may be covering the LED. Scrape the film away with your fingernail to expose the LED.
      The two clear LEDs on the front end of the IRC never light. They transmit the invisible IR signal.
   c) If the green LED does not light, the IRC is not working. Go to Step 3.
3. Take the IRC to a non-hazardous area and replace the two 1.5 Vdc AAA batteries.
   - If the green LED lights, but the transmitter still does not respond, go to Step 4.
   - If neither the LED lights nor the transmitter responds, replace the IRC.
4. Replace the transmitter display board.

SLOPE Err LO or SLOPE Err Hi appear after calibration attempt

Refer to SLOPE Err LO and SLOPE Err HI for assistance in solving calibration slope problems.

bF1 or bF2 continuously flashes during autocalibration

During autocalibration, `bF1` or `bF2` flashes until the pH reading of the sensor in the buffer is stable.

Recommended actions

1. Check the stability limits.
   If the stabilization range (prompt `PH`) is set too narrow or the stabilization time (prompt `tIME`) is set too long, the transmitter will not accept buffer readings. A good choice for `PH` is 0.02, and a good choice for `tIME` is 10 - 20 seconds.

2. Allow adequate time for the temperature of the sensor to reach the temperature of the buffer. If the sensor was in a process substantially hotter or colder than the buffer, allow at least 20 minutes for readings in the buffer to stabilize. Alternatively, place the sensor in a container of water at ambient temperature for 20 minutes before starting the calibration.
3. Be sure to swirl the sensor after placing it in each new buffer solution.
4. Finally, check the sensor. Verify that wiring is correct. Also, the sensor may be dirty or aged, or the reference junction may be depleted.
    a) Check that the sensor is properly wired to the transmitter.

       Pay particular attention to terminals TB-10 (mV in), TB-7 (reference), and TB-8 (solution ground).

    b) Clean the sensor.
    c) If the sensor is not rebuildable, rejuvenate the reference junction.
    d) If the sensor is rebuildable, replenish the reference electrolyte and replace the liquid junction.
    e) Replace the sensor.
       A clean pH sensor should not drift in buffer.

pH reading in buffer drifts during manual calibration

Recommended actions

1. Allow adequate time for the temperature of the sensor to reach the temperature of the buffer. If the sensor was in a process substantially hotter or colder than the buffer, allow at least 20 minutes for readings in the buffer to stabilize. Alternatively, place the sensor in a container of water at ambient temperature for 20 minutes before starting the calibration.
2. Be sure to swirl the sensor after placing it in each new buffer solution.
3. Finally, check the sensor. Verify that wiring is correct. Also, the sensor may be dirty or aged, or the reference junction may be depleted.
    a) Check that the sensor is properly wired to the transmitter.

       Pay particular attention to terminals TB-10 (mV in), TB-7 (reference), and TB-8 (solution ground).

    b) Clean the sensor.
    c) If the sensor is not rebuildable, rejuvenate the reference junction.
    d) If the sensor is rebuildable, replenish the reference electrolyte and replace the liquid junction.
    e) Replace the sensor.
       A clean pH sensor should not drift in buffer.

Sensor does not respond to known pH changes

Recommended actions

1. Verify that the change really happened. If you were checking pH response in buffers, recheck performance with fresh buffers. If a process pH reading was not what was expected, check the performance of the sensor in buffers. Also, use a second pH meter to verify that the expected change in the process pH really occurred.
2. Check the sensor. Verify that wiring is correct. Also, the sensor may be dirty or aged, or the reference junction may be depleted. Check that the sensor is properly wired to the transmitter.

   See Wire. Pay particular attention to terminals TB-10 (mv in), TB-7 (reference), and TB-8 (solution ground).
3. If a clean, properly wired sensor does not respond to pH changes, the glass bulb is probably broken or cracked.
   a) If a spare sensor is available, check the spare.
   If the spare sensor responds to pH changes, the old sensor has failed.

   If the spare sensor does not respond to pH changes, go to Step 4.

   b) If a spare sensor is not available, check the glass impedance (GIMP) of the existing sensor.
   If the impedance is less than about 20 megohm, the pH sensor is cracked. Replace the sensor.

   If the impedance is greater than about 20 megohm, go to Step 4.
4. Check transmitter performance by simulating pH inputs.

   See Testing the transmitter by simulating the pH.

   If the transmitter responds to simulated inputs, the problem must lie with the sensor or the interconnecting wiring. Verify the interconnecting wiring point to point. Fix or replace bad cable. If cable is good, replace pH sensor.

   If the transmitter does not respond to simulated inputs, replace the board stack.

Buffer calibration is acceptable; process pH is slightly different from expected value.

Differences between pH readings made with an on-line instrument and a laboratory or portable instrument are normal. The on-line instrument is subject to process variables (for example, ground potentials, stray voltages, and orientation effects) that do not affect the laboratory or portable instrument.

Buffer calibration is acceptable; process pH is grossly different from expected value

The systems suggest a ground loop (measurement system connected to earth ground at more than one point), a floating system (no earth ground), or noise being induced into the transmitter by a sensor cabling.

The problem arises from the process or installation. It is not a fault of the transmitter. The problem should disappear once the sensor is taken out of the system.

Recommended actions

1. To confirm a ground loop:
   a) Verify that the system works properly in buffers. Be sure there is no direct electrical connection between the buffer containers and the process liquid or piping.
   b) Strip back the ends of a heavy gauge wire. Connect one end of the wire to the process piping or place it in the process liquid. Place the other end of the wire in the container of buffer with the sensor.
      The wire makes an electrical connection between the process and sensor.

   If similar symptoms develop after making the connection, a ground loop exists. If no symptoms develop, a ground loop may or may not exist.
2. Check the grounding of the process.
   The measurement system needs one path to ground: through the process liquid and piping. Plastic piping, fiber glass tanks, and ungrounded or poorly grounded vessels do not provide a path. A floating system can pick up stray voltages from other electrical equipment.
   a) Ground the piping or tank to a local earth ground.
      Metal tees, grounding rings, or grounding rods may be required.
   b) If problems persist, connect a wire from the ground connection at the dc power supply to the transmitter case. Connect a second wire from the transmitter case to the process.
      These connections force the grounds to the same potential.

   If the problem persists, simple grounding is not the problem. The sensor wiring is probably carrying noise into the instrument. Go to Step 3.
3. Simplify the sensor wiring.
   a) Disconnect all sensor wires at the transmitter except: TB-4 (resistance temperature device [RTD] sense), TB-5 (RTD IN), TB-7 (Reference IN), and TB-10 (pH/ORP IN). If you are using a remote preamplifier, disconnect the wires at the input side of the junction box.
   b) Tape back the ends of the disconnected wires, including all shield and drain wires, to keep them from making accidental connections with other wires, terminals, or the transmitter case.
   c) Connect a jumper wire between TB-3 (RTD return) and TB-4 (RTD sense). Connect a second jumper wire between TB-7 (Reference IN) and TB-8 (Solution ground).
   d) Place the sensor back in the process liquid. If diagnostic measures such as `GLASSFAIL` or `REF WArn` appear, turn off the sensor diagnostics.

   If the symptoms disappear, interference was coming into the transmitter along one of the sensor wires. The measurement system can be operated permanently with simplified wiring.

If symptoms still persist, go to Step 4.

4. Check for extra ground connections or reduced noise.

   The electrode system is connected to earth ground through the process. If other ground connections exist, there are multiple paths and ground loops are present. Noise enters the measurement either by a direct connection, usually between the cable and grounded metal, or by an indirect connection, usually EMI/RFI picked up by the cable.

   a) If the sensor cable is run inside conduit, there may be a short between the cable and the conduit. Re-run the cable outside the conduit. If symptoms disappear, then a short exists between the table and the conduit. Likely a shield is exposed and is touching the conduit. Repair the cable and reinstall it in the conduit.

   b) To avoid induced noise in the sensor cable, run it as far away as possible from the power cables, relays, and electric motors. Keep sensor wiring out of crowded panels and cable trays.

   c) Occasionally, noise can travel into the transmitter housing from the metal it is mounted on. The noise is then radiated into the transmitter electronics. If isolating the transmitter from its metal mounting eliminates the symptoms, move the transmitter to a different location or mount it with isolating materials.

   If ground loop problems persist, consult the factory. It may require a visit from an experienced service technician to solve plant-induced problems.

Temperature reading is inaccurate

Recommended actions

1. To troubleshoot temperature problems, refer to tEMP HI and tEMP LO.
2. Calibrate the temperature response of the sensor.
3. If necessary, automatic temperature compensation can be temporarily disabled and the transmitter placed in manual temperature compensation. For manual temperature, choose a temperature equal to the average temperature of the process.
   The resulting pH reading will be in error. The more variable the temperature and the further from pH 7, the greater the error.

HART® communication problems

Recommended actions

1. If the handheld communicator software does not recognize the =transmitter, order an upgrade from Rosemount at 800 999 9307.
2. Be sure the HART load and voltage requirements are met.
   - HART communications requires a minimum 250 ohm load in the current loop.
   - Install a 250 - 500 ohm resistor in series with the current loop. Check the actual resistor value with an ohmmeter.

- For HART communications, the power supply voltage must be at least 18 Vdc.

3. Be sure the HART communicator is properly connected.
   - The communicator leads must be connected across the load.
   - The communicator can be connected across the power terminals (TB-15 and TB-16).
4. Verify that the handheld communicator is working correctly by testing it with another HART Smart device.
   If the communicator is working, the transmitter electronics may have failed. Call Rosemount for assistance.

   If the communicator seems to be malfunctioning, call Rosemount at 800 999 9307 for assistance.

No display

Recommended actions

1. Be sure power requirements are being met.
   a. The positive voltage lead must be connected to TB-16.
   b. Check dc voltage requirements and load restrictions.
2. Check for bad connections between the circuit boards. Be sure the ribbon cable between the display and CPU boards is firmly seated in the socket on the CPU board. Be sure the socket connection between the CPU and analog boards is firm.

Display segments missing

Recommended action

Replace the display board.

Transmitter locks up

Recommended actions

1. Turn the dc power off; then turn it back on.
2. If the problem persists, replace the electronic board stack (HART®: PN 23992-02; FOUNDATION™ Fieldbus: PN 23992-03).

Transmitter periodically restarts itself

Recommended actions

1. The problem is usually related to improperly wired resistance temperature device (RTD) input terminals.
   a) The RTD return wire must be connected to TB-3. The RTD sense wire must be connected to TB-4, and the RTD in wire must be connected to TB-5. If the pH sensor does not have an RTD, connect a jumper wire across the terminals TB-3 and TB-4 and a second jumper across TB-4 and TB-5.

b) If you have jumpered the RTD connections as described in 1.a, turn off automatic temperature compensation and operate the transmitter in manual temperature mode.

2. If RTD wiring is correct and problems still persist:
   a) Monitor the power supply. Be sure the power is not intermittent and the correct voltage is present.
   b) Try connecting the transmitter to a different power supply.

8.2.5 Displaying diagnostic variables

This section describes how to display the diagnostic variables listed below:

Diagnostic measurements

1. Sensor voltage in mv (`InPut`)
2. Glass impedance in megohms (`GIMP`)
3. Reference temperature in kilohms (`rIMP`)(1)
4. Temperature in °C

Diagnostic messages

1. Software version (`VEr`)
2. Display last three fault messages (`ShoW FLt`)

Note
Displays are read only.

Procedure

1. Press **DIAG** on the IRC to enter the ***Diagnostic*** menu.
   Sensor voltage in mV (`InPut`) appears.
2. Press **NEXT**.
   The temperature corrected glass impedance in megohms (`GIMP`) appears.
3. Press **NEXT**.
   The reference impedance (`rIMP`) appears. For conventional low impedance silver/silver chloride reference electrodes, the reference impedance has units of kilohms. For the rare occasions when a high impedance reference is used, the units are megohms.
4. Press **NEXT**.
   The model number and software version (`Ver`) appears.
5. Press **NEXT**.
   The temperature (`tEMP`) measured by the sensor appears.
6. Press **NEXT**.
   The ***ShoW Fit*** submenu appears.

(1) For high impedance reference electrodes, the reference impedance is in megohms.

7. Press **ENTER**.
   The most recent fault message appears in the display.
8. Press **NEXT** repeatedly to scroll through the stored messages.
   The transmitter only remembers the three most recent messages. `nonE` appears if there are no faults. Press **EXIT** to clear all the stored messages and return the transmitter to the ***ShoW Fit*** display. If the transmitter loses power, all stored warnings and fault messages are lost.
9. Press **EXIT** to return to the process display.

8.2.6 Testing the transmitter by simulating the pH

Overview of simulating a pH input

This section describes how to simulate a pH input into the Rosemount 5081-P pH/ORP transmitter. pH is directly proportionsl to voltage.

To simulate the pH measurement, connect a standard millivolt source to the transmitter. If the transmitter is working properly, it will accurately measure the input voltage and convert it to pH. Although the general procedure is the same, the wiring details depend on the location of the preamplifier. Consult the table to find the correct procedure.

Preamplifier located in	Section
Transmitter	Simulate pH when the preamplifier is located in the transmitter
Remote junction box	Simulate pH when the preamplifier is located in a remote junction box or in a sensor-mounted junction box
Sensor-mounted junction box	Simulate pH when the preamplifier is located in a remote junction box or in a sensor-mounted junction box
Sensor	Simulate pH when preamplifier is in sensor

Simulate pH when the preamplifier is located in the transmitter

Procedure

1. Program PAMP to transmitter.
2. Turn off sensor diagnostics.
3. Turn off automatic temperature compensation. Set manual temperature compensation to 77 °F (25 °C).
4. Disconnect the sensor and wire transmitter as shown in Figure 8-5.
5. Attach a jumper between TB-7 (Reference IN) and TB-10 (pH IN).
6. Measure the voltage. Press **DIAG** on the infrared remote control (IRC).
   The InPut voltage in millivolts appears in the temperature-output area. The main display continues to show pH. The measured voltage should be 0 mV, and the pH should be approximately 7. Because the calibration data in the transmitter may be offsetting the input voltage, the displayed pH may not be exactly 7.0. If the actual readings are close to expected, the transmitter is probably operating normally.

7. If a standard millivolt source is available, remove the jumper between TB-7 and TB-10 and connect the voltage source.
8. Calibrate the transmitter. Use 0.0 mV for pH 7 (bF1) and -177.4 mV for pH 10 (bF2). If the transmitter is working, it should accept the calibration.
9. To check linearity, leave autocalibration and return to the main display. Set the voltage source to the values in the table and verify that the pH reading matches the expected value.

Voltage (mV)	pH
295.8	2.00
118.3	5.00
-118.3	9.00
-295.8	12.00

Example

Figure 8-5: pH simulation when the preamplifier is located in the transmitter

A. Transmitter
B. Earth ground
C. Shield
D. Resistance temperature device (RTD) return
E. -RTD sense
F. RTD in
G. Reference ground
H. Reference in
I. Solution ground
J. pH guard
K. pH in
L. +RTD sense
M. mV source

Simulate pH when the preamplifier is located in a remote junction box or in a sensor-mounted junction box

Procedure

1. Program PAMP to sensor.

2. Turn off sensor diagnostics.
3. Turn off automatic temperature compensation. Set manual temperature compensation to 77 °F (25 °C).
4. Disconnect the sensor and wire the sensor side of the junction box as shown in Figure 8-5. Leave the interconnecting cable between the junction box and transmitter in place.
5. Attach a jumper between TB1-7 (Reference IN) and TB1-10 (pH IN)
6. From this point on, continue with steps 6 through 9 in Simulate pH when the preamplifier is located in the transmitter.

   For testing using a standard millivolt source. Be sure to remove the jumper between TB1-7 and TB1-10 before connecting the standard millivolt source.

Example

Figure 8-6: pH simulation when the preamplifier is located in a remote junction box or in a sensor mounted junction box

A. Remote junction box: PN 23555-00 (includes preamplifier). Board PN 23557-00
B. mV source
C. Jumpers
D. No connection
E. Normally closed
F. Far side
G. Extension cable point to point wiring terminals 2 to 12
H. Earth ground
I. Shield
J. Resistance temperature device (RTD) return
K. -RTD sense
L. RTD in
M. Reference ground
N. Solution ground
O. pH guard
P. pH in
Q. +RTD sense
R. Transmitter

Simulate pH when preamplifier is in sensor

The preamplifier in the sensor simply converts the high impedance signal into a low impedance signal without amplifying it.

8.3 Contacting and toroidal conductivity diagnostics and troubleshooting

8.3.1 Diagnose menu

The transmitter automatically monitors for fault conditions. The ***Diagnose*** menu displays current variable settings and fault messages. The messages are defined in Table 8-2.

Troubleshoot contacting conductivity analyzers

Procedure

1. Look for a diagnostic fault message on the display to help pinpoint the problem.
   Refer to Diagnostic messages for an explanation of the message recommended actions to solve it.
2. Refer to Troubleshooting when no diagnostic message is showing for common loop problems and the recommended actions to resolve them.

Display diagnostic values

Use the **DIAG** key on the IRC is used to access the ***Diagnose*** menu. The messages are defined in Table 8-2.

Use the ***FAuLtS*** submenu to show the last three faults/warnings. The most recent is displayed first. Use **NEXT** to scroll through the remaining faults. Press **EXIT** to clear all fault/warnings and returns the ***FAuLtS*** segment. Disconnecting the transmitter removes all fault messages from memory. The `nonE` message is displayed when no faults/warnings have occurred.

Table 8-2: Diagnostic variables mnemonics

AbS	Absolute conductivity (µS/cm or mS/cm)
0 A ir	Sensor zero in air
CELL ConSt	Sensor cell constant (used in C mode)
tSLOPE	Temperature slope in %/° C
CAL F	Calibration factor
SoFt	Software version
HArd	Hardware version
FAuLtS	Show fault messages
nonE	No fault messages in memory

8.3.2 Fault conditions

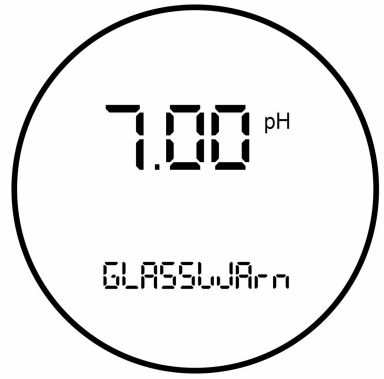
The diagnostic program detects and diffentiates three classes of error conditions/ problems. System disabling problems are faults caused by failures in the loop or significant variations in the process. System non-disabling problems are warnings and deal with input or A to D conversion settings. The third class of detection problems are error messages and occur when the calibration limits are exceeded.

Disabling faults

When a disabling fault occurs:

1. Both FAULT and HOLD annunciation fields become active (Figure 8-7).
2. The process variable flashes at the rate of 1 second on and 1 second off.
3. The appropriate fault message alternates with the normal Temperature/Current output display (see Figure 8-7).
4. The output current loop is forced to run the non-zero fault value last entered or held at last value if fault value = 0 if the transmitter is not in the TEST, HOLD, or Multidrop operational modes.
5. A 0-1 mA output signal is available for external use when system disability conditions are active. These conditions drive this output to 1 mA. Please contact factory for specific application information.

Figure 8-7: Disabling Fault Annunciation



Non-disabling warnings

When a non-system-disabling condition occurs, a warning message is displayed.

The process variable does not flash. The appropriate message alternates with the Temperature/Current output display (see Figure 8-8).

If more than one fault exists, the display will sequence through each diagnostic message. This will continue until the cause of the fault has been corrected.

Figure 8-8: Warning Annunciation

8.3.3 Diagnostic messages

The transmitter's diagnostics constantly monitor the conductivity loop for possible problems. If an operational problem is encountered, check the display for a fault or error message. These are displayed in the ***Temperature/Current output*** segment of the display. Note the message and refer to the following sections for a description of possible problems that may have triggered the diagnostic message.

Faults

tEmP LO

Temperature is too low.

Recommended actions

1. Check wiring or sensor/process temperature.
2. Check resistance temperature device (RTD).

tEmP HI

Temperature is too high.

Recommended actions

1. Check wiring or sensor/process temperature.
2. Check resistance temperature device (RTD).

rtd FAIL

The resistance temperature device (RTD) sensor line fault limits have been exceeded into the sensor.

Recommended action

Check wiring or check ***Program/Temp*** menu setting to verify the 100-3 or 100-4 sensor type connected.

CPU FAIL

The CPU has failed during RAM or EEPROM verification.

Recommended action

Recycle. If persistent, contact the factory.

FACt FAIL

`FACt FAIL` appears if the transmitter factory calibration message has been triggered.

A stray noise spike can cause this message to appear.

Recommended actions

1. If the pH reading seems acceptable, reset the calibration flag.
   a) Press **2** on the infrared remote control (IRC) ten times to enter the ***factory calibration*** menu.
   The display does not change.
   b) Press **3**.
   `FActorYCAL` appears in the display.
   c) Press **NEXT**.
   `rEPAir` appears in the display.
   d) Press **NEXT**.
   `ConFIG` appears in the display.
   e) Press **NEXT**.
   `rESEt` appears in the display.
   f) Press **NEXT**.
   `rESEtCFG` appears in the display.
   g) Press **ENTER**.
   `rESET` appears again.
   h) Press **NEXT**.
   `FActorYCAL` reappears.
   i) Press **ENTER**.
   `FactOn` appears in the display.
   j) Press **3**.
   `FactOFF` appears.
   k) Press **ENTER** to store the settings.
   l) Press **EXIT** repeatedly until the main display reappears.

   If the message does not clear or problems persist, the electronics have failed. Replace the electronic board stack.
2. Contact factory.

rOm FAIL

The PROM failed the check-sum test.

Recommended action

Contact factory.

CyCLE PoWr

A wrong value was detected during power-up.

Recommended action

Recycle the power.

SEnSor FAIL

Bad sensor means that the sensor current is a large negative number. `SEnSor FAIL` may appear for a while when the sensor is first placed in service.

Recommended actions

1. Observe the sensor. Go to SEnSor Cur under the ***Diagnostic*** menu.
   If the sensor is moving in the positive direction, there is probably nothing wrong. The error message should soon disappear.
2. Verify that wiring is correct. Pay particular attention to the anode and cathode connections.
3. Verify that the transmitter is configured for the correct measurment.

   Configuring the measurement sets several things, including the polarizing voltage. Applying the wrong polarizing voltage to the sensor can cause a negative current.
4. Replace the sensor membrane and electrolyte solution and clean the cathode if necessary.

   See the sensor reference manual for details.
5. Replace the sensor.

Warnings

InPUt WArn

`InPUt WArn` means that the input value or the calculated pH is outside the measurement range. The measured pH is less than -2 or greater than 16.

Recommended actions

1. Check for miswires and open connections, particularly at TB-10. Open connections can be caused by loose connections, poor spade crimps, or broken wires. Be sure to check junction boxes for proper pass through of all wires.
   - If correcting a wiring problem clears the message, the system is in good condition.
   - If the message is still showing, go to Step 2.
2. Check that the transmitter is working properly by simulating a pH input. See Testing the transmitter by simulating the pH.
   - If the transmitter does not respond to simulated inputs, replace the board stack.

- If the transmitter performs satisfactorily and the preamplifier is located in a remote junction box or in a sensor-mounted junction box, go to Step 3.
- If the transmitter performs properly and the preamplifier is located in the transmitter, the sensor has failed and should be replaced.

3. The problem may lie with the remote preamplifier or with the cable connecting the preamplifier and junction box to the transmitter.
   a) Be sure all wires between the junction box and transmitter are connected.
   b) Use Rosemount cable.
      Generic cable may not work.

- If the disagnostic message clears, the interconnecting cable was the problem.
- If the message remains, go to Step 4.

4. Confirm that the problem is with the remote preamplifier.
   a) Wire the pH sensor directly to the transmitter.
   b) Change the menu from PAMP=SnSr to trAnS for the test and return it to SnSr afterwards.

- If the error message clears, the remote preamplifier is faulty. Replace the preamplifier.
- If the error message remains, the sensor has failed. Replace the sensor.

OvEr rAnGE and AMP FAIL

The current range setting has been exceeded or the measurment exceeds the display limit.

This error message appears if the sensor current is too high. Normally, excessive sensor current implies that the sensor is miswired or the sensor has failed.

Recommended actions

1. Verify the 4 and 20 mA settings in the ***Program/output*** menu.
2. Verify that the wiring is correct and connections are tight. Be sure to check connections at the junction box if one is being used.
3. Replace the sensor membrane and electrolyte solution and clean the cathode if necessary.
   See the sensor reference manual for details.
4. Replace the sensor.

AdC Error

`AdC Error` means the analog to digital converter has failed.

Recommended actions

1. Verify that the sensor wiring is correct and connections are tight.
   Be sure to check connections at the junction box if one is being used.
2. Disconnect sensor(s) and simulate temperature and sensor input.

If the transmitter does not respond to simulated signals, the analog PCB has probably failed.

3. Recycle the power.
4. Call the factory for assistance.

nEEd 0 CAL

The message `nEEd 0 CAL` means that the concentration of the analyte is too negative.

Recommended actions

1. Check the zero current (go to `0 CurrEnt` under the ***Diagnose*** menu).
   If the zero current is appreciably greater than the measurement current, the `nEEd 0 CAL` warning appears.
2. Verify that the zero current is close to the value given in the calibration section for the analyte being determined.
3. Rezero the sensor.
   Refer to the calibration and troubleshooting sections of the sensor reference manual for more information.

Errors

CAl Err or OFFSEt Err

A calibration error has occurred between the standard and process.

Recommended action

Press **RESET** and repeat. Check calibration standards and unit configuration.

tSLOPE Err

The limit for T-2 in a two point calibration has been exceeded.

Recommended action

Press **RESET** and repeat the ***calibration/temp. slope*** menu setting.

-0- Err

Sensor zero limit has been exceeded.

Recommended actions

Press ***RESET*** and repeat the ***calibrate/sensor*** menu setting.

WritE Err

An attempt to write on the EEPROM has failed.

The jumper JP-1 on the CPU board has been removed.

SenSE OPEn

Most Rosemount sensors use a Pt100 or Pt1000 in a three-wire configuration. The in and return leads connect the resistance temperature device (RTD) to the measuring circuit in the transmitter. A third wire, called the sense line, is connected to the return lead. The

sense line allows the transmitter to correct for the resistance of the in and return leads and to correct for changes in lead wire resistance with changes in ambient temperature.

Recommended actions

1. Verify all wiring connections, including wiring in a junction box if one is being used.
2. Disconnect the RTD SENSE and RTD RETURN wires. Measure the resistance between the leads.

   It should be less than 5 Ω.
3. If the sense line is open, replace the sensor as soon as possible.

   The transmitter can be operated with the sense line open. The measurement will be less accurate, because the transmitter can no longer compensate for lead wire resistance. However, if using the sensor at approximately constant ambient temperatures, you can eliminate the lead wire resistance error by calibrating the sensor to the measurement temperature. Errors caused by changes in ambient temperature cannot be eliminated.
4. To make the error message disappear, connect the RTD SENSE and RETURN terminals with a jumper.

8.3.4 Troubleshooting when no diagnostic message is showing

The following sections identify some of the more common symptoms and suggest actions to help resolve a problem. In general, wiring is the most common cause.

Wrong temperature reading

Recommended actions

1. Perform a temperature standardization.
2. Verify sensor's resistance temperature device (RTD).

Suspected temperature compensation problem

Recommended action

Check wiring.

Display segments missing

Recommended action

Replace the display board.

Transmitter locks up

The transmitter won't respond

Recommended actions

1. Replace PCB stack.

2. Press **RESET**.
3. Check batteries in infrared remote control (IRC).

Erratic displays

Recommended action

Check sensors in process.

Transmitter won't respond to infrared remote control (IRC) key presses

Recommended actions

1. Verify and clean ribbon cable connection on CPU board.
2. Check batteries in IRC.

Key press gives wrong selection

Recommended actions

1. Replace infrared remote control (IRC).
2. Check ribbon cable connection on CPU board.

Wrong or no current output

Recommended actions

1. Verify that output is not being overloaded.
2. Remove load.
3. Replace PCB stack.

No display or indicators

Recommended action

Replace PCB stack.

Excess input

Recommended action

Check sensor wiring.

Reverse input

Recommended action

Perform sensor zero.

Check sensor zero

The transmitter will not zero.

Recommended action

Place the sensor in the air and access zero routine.

8.3.5 Troubleshoot in the field

When it is apparent by grab sample analysis that the transmitter is giving inaccurate readings, try the following:

Prerequisites

Make sure the sensor surfaces are totally wetted by the process and that air bubbles are not trapped in the vicinity of electrodes. If you find air bubbles, change the installation technique to eliminate air bubbles.

Procedure

1. Visually inspect the installation.
   a) Check that the transmitter is mounted securely and that its internal parts are properly connected.
   b) Check all input and output wiring.
2. If Step 1 did not indicate the source of the problem, isolate the problem to either the transmitter or the sensor.
3. To troubleshoot the sensor:
   a) Disconnect the sensor from the transmitter.
   b) Remove the sensor from the process.
   c) Thoroughly dry the sensor electrodes.

   Refer to the sensor reference manual for additional troubleshooting checks.
4. To troubleshoot the transmitter independently of the sensor, use an appropriate resistor across the temperature input connectors and connect the conductivity inputs to resistance decade box.

8.3.6 Troubleshoot conductivity measurement

If troubleshooting in the field does not resolve the error, try the following procedure to troubleshoot a conductivity measurement problem in the process.

Note
Before starting this procedure, make sure that all wiring is correct.

Procedure

1. Remove the sensor from process and place the sensor in air. Zero the transmitter.
   This step is for normal contacting only, not for low conductivity or resistivity.
   If the transmitter zeros correctly, place the sensor in the process and standardize.
2. If the transmitter does not zero correctly:
   a) Check diagnostic messages.
      Refer to Diagnostic messages.

b) Check wiring for short.

c) Consult service center.

3. If the sensor does not standardize:
   a) Remove the sensor from the process and test it in a known conductivity solution or against a certified conductivity instrument.
   b) Check for ground loops and/or improper installation.

8.3.7 Resistance temperature device (RTD) resistance values

Table 8-3 is a ready reference of RTD resistance values at various temperatures. Use these values to test and evaluate the sensor.

Note
Resistance values are read across the RTD element and are based on the manufacturer's stated values (±1%). Allow enough time for the RTD element in the sensor to stabilize to the surrounding temperature.

Table 8-3: RTD Resistance Values

Temperature	Pt-100 resistance (ohms)	Pt-1000 resistance (ohms)
32 °F (0 °C)	100.00	1000
50 °F (10 °C)	103.9	1039
68 °F (20 °C)	107.79	1078
77 °F (25 °C)	109.62	1096
86 °F (30 °C)	111.67	1117
104 °F (40 °C)	115.54	1155
122 °F (50 °C)	119.40	1194
140 °F (60 °C)	123.24	1232
158 °F (70 °C)	127.07	1271
176 °F (80 °C)	130.89	1309
194 °F (90 °C)	134.70	1347
212 °F (100 °C)	138.50	1385

Figure 8-9: Conductivity Determination

Formula:

$$\frac{\text{cell constant value x } 1{,}000{,}000}{\text{desired simulated conductivity in } \mu\text{S/cm}} = \text{resistance in ohms}$$

Example:

$$\frac{.01 \text{ x } 1{,}000{,}000}{10\ \mu\text{S/cm}} = \text{use } 1{,}000 \text{ ohm resistance}$$

Use the formula to determine the appropriate resistance value to use to simulate a conductivity value.

8.4 Chlorine, dissolved oxygen, and ozone diagnostics

8.4.1 Diagnostics overview

The Rosemount 5081 transmitter can display diagnostic information that is useful in troubleshooting. The diagnostics available depend on the measurement being made. To read diagnostic information, go to the main display and press **DIAG** on the infrared remote controller. Press **NEXT** until the desired diagnostic message appears. Refer to the appropriate section below for more information.

8.4.2 Diagnostic messages for dissolved oxygen

Message	See section
TYPE O2	TYPE O2
SEnSor Cur	SEnSor Cur
SEnSitvtY	SEnSitviTY
0 CurrEnt	0 CurrEnt.
bAr PreSS	bAr PreSS.
5081-A-Ht	5081-A-Ht.
FAULtS	FAULtS

TYPE O2

Transmitter is measuring oxygen.

Recommended action

Press **NEXT** to view diagnostics.

SEnSor Cur

Recommended action

Press **ENTER** to display raw current from sensor.

SEnSitviTY

Sensitivity is calculated during calibration. It is the measured current divided by the concentration.

Recommended action

Press **ENTER** to display sensitivity.

0 CurrEnt

Recommended actions

1. Press **ENTER** to display the zero current measured during calibration.
2. Note units.

bAr PreSS

Recommended action

Press **ENTER** to display the barometric pressure used by the transmitter during air calibration.

5081-A-Ht

This is the model number.

Recommended actions

1. Press **ENTER** to display the software revision level (`SFtr`).
2. Press **NEXT** to show the hardware revision level (`HArdr`).

FAULtS

Recommended action

Press **ENTER** to scroll through existing fault messages.

8.4.3 Diagnostic messages for ozone and total chlorine

Message	See section
TYPE O3 or tCL	TYPE O3 or TYPE tCL
SEnSor Cur	SEnSor Cur

Message	See section
SEnSitvtY	SEnSitviTY
0 CurrEnt	0 CurrEnt
5081-A-Ht	5081-A-Ht
FAULtS	FAULtS

TYPE O3 or TYPE tCL

The transmitter is measuring ozone or total chlorine.

Recommended actions

Press **NEXT** to view diagnostics.

8.4.4 Diagnostic messages for free chlorine

Message	See section
TYPE FCL	TYPE FCL
SEnSor Cur	SEnSor Cur
SEnSitvtY	SEnSitviTY
0 CurrEnt	0 CurrEnt
pH	pH
InPut	InPut
SLOPE	SLOPE
OFFSt	OFFSt
GIMP	GIMP
5081-A-Ht	5081-A-Ht
FAULtS	FAULtS

TYPE FCL

Transmitter is measuring free chlorine.

Recommended action

Press **NEXT** to view diagnostics.

pH

Recommended actions

1. Press **ENTER** to view pH diagnostics.
2. Press **NEXT** to skip pH diagnostics.

InPut

Current pH sensor input voltage in millivolts.

SLOPE

Sensor slope in millivolts per unit pH. Slope is calibrated during buffer calibration.

OFFSt

Sensor voltage in millivolts in pH 7 buffer.

GIMP

Glass impedance in MΩ.

8.5 Chlorine, dissolved oxygen, and ozone troubleshooting

8.5.1 Troubleshooting fault or warning messages

Message	Explanation	See section
OvEr rAnGe	Over range, measurement exceeds display limit.	OvEr rAnGE and AMP FAIL
AMP FAIL	Amperometric sensor failure, sensor current is too high.	OvEr rAnGE and AMP FAIL
bAd SEnSor	Bad sensor, sensor current is a large negative number.	bAd SEnSor
0 too biG	Zero current is too large, sensor was zeroed while current exceeded 100 nA.	0 too bIG
CAL Error	Calibration error, sensitivity (nA/ppm) is too high or too low.	CAL Error
nEEd 0 CAL	Sensor needs re-zeroing; reading is too negative.	nEEd 0 CAL
bAd rtd	Bad temperature reading.	bAd rtd and rtd OPEn
TEMP HI	Temperature reading exceeds 302 °F (150 °C).	tEmP HI
TEMP LO	Temperature reading is less than 5 °F (-15 °C).	tEmP LO.
rtd OPEn	Resistance temperature device (RTD) or thermistor is open.	bAd rtd and rtd OPEn
SenSE OPEn	Sense line is not connected.	SenSE OPEn
PH in	Raw millivolt reading from pH sensor is too large.	pH IN

Message	Explanation	See section
SLOPE HI	pH sensor slope exceeds 62 mV/pH.	SLOPE Err HI
SLOPE LO	pH sensor slope is less than 40 mV/pH.	SLOPE Err LO
-0- OFFSEt	Zero offset during standardization exceeds programmed limit.	-0- OFFSEt
GLASSFAIL	Measured glass impedance is less than programmed limit.	GLASSFAIL
FACt FAIL	Unit has not been factory calibrated.	FACt FAIL
CPU FAIL	Internal CPU tests have failed.	CPU FAIL
ROM FAIL	Internal memory has failed.	rOm FAIL
AdC	Analog to digital conversion failed.	AdC Error
bAd Gnd	Bad ground.	bAd Gnd
In too biG	mV signal from pH sensor is too large.	In too biG
RitE Err	CPU PCB jumper (JP-1) has been removed.	RitE Err

bAd SEnSor

Bad sensor means that the sensor current is a large negative number. `bAd SEnSor` may appear for a while when the sensor is first placed in service. Observe the sensor current by going to SEnSor Cur under the ***Diagnostic*** menu. If the sensor current is moving in the positive direction, there is probably nothing wrong, and the error message should soon disappear.

Recommended actions

1. Verify that wiring is correct. Pay particular attention to the anode and cathode connections.
2. Verify that the transmitter is configured for the correct measurement.

   Configuring the measurement sets (among other things) the polarizing voltage. Applying the wrong polarizing voltage to the sensor can cause a negative current.
3. Replace the sensor membrane and electrolyte solution and clean the cathode if necessary.

   See the sensor reference manual for details.
4. Replace the sensor.

0 too bIG

Normally, the transmitter will not accept a zero current until the current has fallen below a reasonable value. See the calibration section of the appropriate sensor reference manual for the analyte being determined for zero currents. However, you can force the transmitter to accept the present current as the zero value. The `0 too bIG` warning appears if the current at the time the sensor is zeroed is greater than 100 nA. Because the transmitter subtracts the zero current from the measured current before converting the result to a concentraiton, zeroing too soon will cause readings to be too low.

Procedure

1. Allow adequate time, possibly as long as overnight, for the sensor to stabilize before starting the zero routine.
2. Verify that the solution used for zeroing the sensor contains no analyte.

   Refer to the calibration section of the appropriate sensor reference manual for details.
3. Replace the sensor membrane and electrolyte solution and clean the cathode if necessary.

   See the appropriate sensor manual for details.
4. Replace the sensor.

CAL Error

At the end of the calibration step, the transmitter calculates the sensitivity in nA/ppm. If the sensitivity is outside the range normally expected, the transmitter displays the CAL Error message, and the transmitter does not update the calibration. For assistance, refer to the troubleshooting section specific to the sensor.

bAd rtd and rtd OPEn

These messages usually mean that the resistance temperature device (RTD) (or themistor in the case of the Rosemount Hx438sensor) is open or shorted or there is an open or short in the connecting wiring.

Recommended actions

1. See Simulate temperature.
2. Verify all wiring connections, including wiring in a junction box if one is being used.
3. Disconnect the RTD IN, RTD SENSE, and RTD RETURN leads or the thermistor leads at the transmitter. Note the color of the wire and where it was attached. Measure the distance between the RTD IN and RETURN leads. For a thermistor, measure the resistance between the two leads. The resistance should be close to the value in Table 8-4. If the temperature element is open or shorted, replace the sensor. In the meantime, use manual temperature compensation.

pH IN

`pH In` means the voltage from the pH measuring cell is too large.

Recommended actions

1. Verify all wiring connections, including connections in a junction box.
2. Check that the pH sensor is completely submerged in the process liquid.
3. Check the pH sensor for cleanliness. If the sensor looks fouled or dirty, clean it.

   Refer to the sensor reference manual for cleaning procedures.
4. Replace the sensor.

-0- OFFSEt

The `-0- OFFSEt` message appears if the standardization offset (in mV) exceeds the programmed limit. The default limit is 60 mV, which is equivalent to about a unit change in pH. Before increasing the limit to make the `-0- OFFSEt` message disappear, check the following:

Recommended actions

1. Verify that the reference pH meter is working properly and is properly calibrated.
2. Verify that the process pH sensor is working. Check its response in buffers.
3. If the transmitter is standardized against pH determined in a grab sample, be sure to measure the pH before the temperature of the grab sample changes more than a few degrees.
4. Verify that the process sensor is fully immersed in the liquid.

   If the sensor is not completely submerged, it may be measuring the pH of the liquid film covering the sensor. The pH of this film may be different from the pH of the bulk liquid.
5. Check the pH sensor for cleanliness. If the sensor looks fouled or dirty, clean it.

   Refer to the sensor reference manual for cleaning procedures.A large standardization offset may be caused by a poisoned reference electrode. Poisoning agents can cause the pH to be offset by as much as two pH units. To check the reference voltage, see Measuring reference voltage.

bAd Gnd

`bAd Gnd` usually means a problem with the analog PCB.

Recommended action

Contact the factory.

In too biG

`In too biG` means the raw millivolt signal from the pH sensor is too large.

Recommended actions

1. Verify that sensor wiring is correct and connections are tight. Be sure to check connections at the junction box if one is being used.
2. Replace the pH sensor with a sensor known to be working.
3. If replacing the pH sensor does not cause the message to disappear, call the factory for assistance.

RitE Err

Cause

CPU PCB jumper (JP-1) has been removed.

Recommended action

Reinsert the JP-1 jumper into the CPU board.

8.5.2 Oxygen measurement and calibration problems

Problem	See section
Zero current is too high.	Zero current too high
Zero reading is unstable.	Zero reading unstable
Sensor current during air calibration is substantially different from expected.	Sensor current outside range
Process and standard instrument readings during in-process calibration are substantially different.	Process and standard readings different
Process readings are erratic.	Process readings erratic
Readings drift.	Readings drift
Sensor does not respond to changes in oxygen level.	Sensor does not respond to changes in oxygen level
Readings are too low.	Oxygen readings are too low

Zero current too high

The zero current is substantially greater than the values in the table below.

Sensor	Zero current
Rosemount 499ADO	< 50 nA
Rosemount 499ATrDO	< 5 nA
Rosemount Hx438	< 1 nA

Recommended actions

1. Make sure the sensor is properly wired to the transmitter.
2. Make sure the membrane is completely covered with zero solution and that air bubbles are not trapped against the membrane. Swirl and tap the sensor to release air bubbles.
3. Make sure the zero solution is fresh and properly made. Zero the sensor in a solution of five percent sodium sulfite in water. Prepare the solution immediately before use.

   It has a shelf life of only a few days.
4. If you are zeroing the sensor with nitrogen gas, verify that the nitrogen is oxygen-free and the flow is adequate to prevent back-diffusion of air into the chamber.
5. The major contributor to the zero current is dissolved oxygen in the electrolyte solution inside the sensor. A long zeroing period usually means that an air bubble is trapped in the electrolyte. To ensure that the Rosemount 499ADO or 499ATrDO sensor contains no air bubbles, carefully follow the procedure in the appropriate

sensor reference manual for filling the sensor. After replacing the electrolyte solution, allow several hours for the zero current to stabilize.

On rare occasions, the sensor may need 24 hours to zero.

6. Check the membrane for damage and replace the membrane if necessary.

Zero reading unstable

Recommended actions

1. Make sure the sensor is properly wired to the transmitter and that all wiring connections are tight.
2. Readings are often erratic when a new or rebuilt sensor is first placed in service. Wait an hour for the readings to stabilize.
3. Make sure that the space between the membrane and the cathode is filled with electrolyte solution and that the flow path between the electrolyte reservoir and the membrane is clear. Hold the sensor with the membrane end pointing down and sharply shaking the sensor a few times as though shaking down a clinical thermometer.
4. If shaking does not work, try the following:
   a) For Rosemount 499ADO and 499ATrDO sensors, verify that the holes at the base of the cathode stems are open (use a straightened paper clip to clear the holes). Also verify that air bubbles are not blocking the holes. Fill the reservoir and establish electrolyte flow to the cathode.

      Refer to the sensor reference manual for the detailed procedure.

   b) For Rosemount Hx438 sensors, add fresh electrolyte solution to the sensor.

      Refer to the sensor reference manual for details.

Sensor current outside range

The sensor current is different from the numbers in the table below.

Sensor	nA/ppm
Rosemount 499ADO	1800 - 3100
Rosemount 499ATrDO	3600 - 6100
Rosemount Hx438	4.8 - 9.8

Recommended actions

1. Make sure the sensor is properly wired to the transmitter and that all connections are tight.
2. Make sure the membrane is dry.

   The membrane must be dry during air calibration. A droplet of water on the membrane during air calibration will lower the sensor current and cause an inaccurate calibration.
3. If the sensor current in the air is very low and the sensor is new, either the electrolyte flow has stopped or the membrane is torn or loose.

For instructions on how to restart electrolyte flow, see Zero reading unstable or refer to the sensor reference manual. To replace a torn membrane refer to the sensor reference manual.

4. Check the temperature.

   Sensor current is a strong function of temperature. The sensor current decreases about 3% for every 1 °C drop in temperature.

5. Check if the membrane is fouled or dirty. A dirty membrane inhibits diffusion of oxygen through the membrane, reducing the sensor current. Clean the membrane by rinsing it with a stream of water from a wash bottle or by gently wiping the membrane with a soft tissue. If cleaning the membrane does not improve the sensor response, replace the membrane and electrolyte solution. If necessary, polish the cathode.

   See the sensor reference manual for more information.

Process and standard readings different

This error warning appears if the current process reading and the reading it is being changed to (i.e., the reading from the standard instrument) are appreciably different.

Recommended actions

1. Make sure the standard instrument is properly zeroed and calibrated.
2. Make sure the standard and process sensor are measuring the same sample. Place the sensors as close together as possible.
3. Make sure the process sensor is working properly. Check the response of the process sensor in air and in sodium sulfite solution.

Process readings erratic

Readings are often erratic when a new sensor or a rebuilt sensor is first placed in service. The current usually stabilizes after a few hours.

Recommended actions

1. Make sure the sample flow is within the recommended range.

   High sample flow may cause erratic readings. Refer to the sensor reference manual for flow rates.

2. Make sure gas bubbles are not impinging on the membrane. Orient the sensor at an angle away from the vertical to reduce the noise.
3. Make sure the holes between the membrane and electrolyte reservoir might be plugged (applies to Rosemount 499ADO and 499ATrDO sensors only).

   Refer to Zero reading unstable.

4. Verify that wiring is correct. Pay particular attention to shield and ground connections.
5. Make sure the membrane is in good condition and the sensor is filled with electrolyte solution. Replace the fill solution and electrolyte.

   Refer to the sensor reference manual for details.

Readings drift

Recommended actions

1. See if the sample temperature is changing.

   Membrane permeability is a function of temperature. For the Rosemount 499ADO and 499ATrDO sensors, the time constant for a response to a temperature change is about five minutes. Therefore, the reading may drift for a while after a sudden temperature change. The time constant for Rosemount Hx438 sensors is much shorter; these sensors respond fairly rapidly to temperature changes.

2. Make sure the membrane is clean.

   For the sensor to work properly oxygen must diffuse freely through the membrane. A coating on the membrane will interfere with the passage of oxygen, resulting in a slow response.

3. Move the sensor out of direct sunlight.

   If the sensor is in direct sunlight during air calibration, readings drift as the sensor warms up. Because the temperature reading lags the true temperature of the membrane, calibrating the sensor in direct sunlight may introduce an error.

4. Make sure the sample flow is within the recommended range.

   Gradual loss of sample flow will cause downward drift.

5. See if the sensor is new or has recently been serviced.

   New or rebuilt sensors may require several hours to stabilize.

6. Check if the reagent flow is about 0.2 mL/min.

Sensor does not respond to changes in oxygen level

Recommended actions

1. If you are comparing readings with a portable laboratory instrument, verify that the laboratory instrument is working.
2. See if the membrane is clean. Clean the membrane and replace it as necessary. Check that the holes at the base of the cathode stem are open. Use a straightened paper clip to clear blockages. Replace the electrolyte solution.
3. Replace the sensor.

Oxygen readings are too low

Potential cause

Low readings can be caused by zeroing the sensor before the residual current has reached a stable minimum value. Residual current is the current the sensor generates even when no oxygen is in the sample. Because the residual current is subtracted from subsequent measured currents, zeroing before the current is a minimum can lead to low results.

Example: The true residual (zero) current for a Rosemount 499ADO sensor is 0.05 µA, and the sensitivity based on calibration in water-saturated air is 2.35 µA/ppm. Assume the measured current is 2.00 µA. The true concentration is (2.00 - 0.05)/2.35 or 0.83 ppm. If the sensor was zeroed prematurely when the current was 0.2 µA, the measured concentration will be (2.00 - 0.02)/2.35 or 0.77 ppm. The error is 7.2%. Suppose the

measured current is 5.00 µA. The true concentration is 2.11 ppm, and the measured concentration is 2.05 ppm. The error is now 3.3%. The absolute difference between the readings remains the same, 0.06 ppm.

Recommended action

Sensor response depends on flow. If the flow is too low, readings will be low and flow sensitive. Verify that the flow past the sensor equals or exceeds the minimum value. See the sensor reference manual for recommended flows. If the sensor is in an aeration basin, move the sensor to an area where the flow or agitation is greater.

8.5.3 Free chlorine measurement and calibration problems

Problem	See section
Zero current is substantially outside the range -10 to 10 nA.	Zero current outside range
Zero reading is unstable.	Zero reading unstable
Sensor current during calibration is substantially less than about 350 nA/ppm at 25 °C (77 °F) and pH 7.	Sensor current too low
Process readings are erratic.	Process readings erratic
Readings drift.	Readings drift
Sensor does not respond to changes in chlorine level.	Sensor not responding to chlorine changes
Chlorine reading spikes following rapid change in pH (automatic pH correction only).	Chlorine readings spike
Readings are too low.	Chlorine readings too low

Zero current outside range

The zero current is substantially outside the range: -10 to 10 nA.

Recommended actions

1. Make sure the sensor is properly wired to the transmitter.
2. Make sure the zero solution is chlorine-free. Take a sample of the solution and test it for free chlorine level.

   The concentration should be less than 0.02 ppm.
3. Make sure you have allowed adequate time for the sensor to reach a minimum stable residual current.

   It may take several hours, sometimes as long as overnight, for a new sensor to stabilize.
4. Check the membrane for damage and replace if necessary.

Zero reading unstable

Recommended actions

1. Make sure the sensor is properly wired to the transmitter and that all wiring connections are tight.
2. Readings are often erratic when a new or rebuilt sensor is first placed in service. Wait an hour for the readings to stabilize.
3. Make sure that the space between the membrane and the cathode is filled with electrolyte solution and that the flow path between the electrolyte reservoir and the membrane is clear. Hold the sensor with the membrane end pointing down and sharply shaking the sensor a few times as though shaking down a clinical thermometer.
4. If shaking does not work, try the following:
   a) For Rosemount 499ADO and 499ATrDO sensors, verify that the holes at the base of the cathode stems are open (use a straightened paper clip to clear the holes). Also verify that air bubbles are not blocking the holes. Fill the reservoir and establish electrolyte flow to the cathode.

      Refer to the sensor reference manual for the detailed procedure.

   b) For Rosemount Hx438 sensors, add fresh electrolyte solution to the sensor.

      Refer to the sensor reference manual for details.

Sensor current too low

The sensor current during calibration is substantially less than 250 nA/ppm at 77 °F (25 °C).

Recommended actions

1. Check to see if the temperature is low or the pH is high.

   Sensor current is a strong function of pH and temperature. The sensor current decreases about 3% for every °C drop in temperature. Sensor current also decreases as pH increases. Above pH 7, a 0.1 unit increase in pH lowers the current about 5%.

2. Check the rate of the sample flow.

   Sensor current depends on the rate of sample flow past the sensor tip. If the flow is too low, chlorine readings will be low. Refer to the sensor reference manual for recommended sample flows.

3. Check the electrolyte flow to the cathode and membrane.

   See step 3 in Zero reading unstable

4. Check if the membrane is fouled or coated. A dirty membrane inhibits diffusion of free chlorine through the membrane, reducing the sensor current and increasing the response time. Clean the membrane by rinsing it with a stream of water from a wash bottle.

⚠ CAUTION

Equipment damage

Do not use a tissue to wipe the membrane.

5. If cleaning the membane does not improve the sensor response, replace the membrane and electrolyte solution. If necessary, polish the cathode.

   See the sensor reference manual for details.

Sensor not responding to chlorine changes

Recommended actions

1. Make sure the grab sample test is accurate and that the grab sample representative of the sample is flowing to the sensor.
2. Check if the pH compensation is correct. If the transmitter is using manual pH correction, verify that the pH value in the transmitter equals the actual pH to within ±0.1 pH. If the transmitter is using automatic pH correction, check the calibration of the pH sensor.
3. Clean the membrane and replace if necessary. Check that the holes at the base of the cathode stem are open. Use a straightened paper clip to clear blockages. Replace the electrolyte solution.
4. Replace the sensor.

Chlorine readings spike

Chlorine readings spike following sudden changes in pH.

Cause

Changes in pH alter the relative amounts of hypochlorous acid (HOCl) and hypochlorite ion (OCl^-) in the sample. Because the sensor responds only to HOCl, an increase in pH causes the sensor current (and the apparent chlorine level) to drop even though the actual free chlorine concentration remains constant.

To correct the pH effect, the transmitter automatically applies a correction. Generally, the pH sensor responds faster than the chlorine sensor. After a sudden pH change, the transmitter will temporarily over-compensate and gradually return to the correct value.

A time constant for return to normal is about five minutes.

Chlorine readings too low

Recommended actions

1. Make sure the sample was tested as soon as it was taken.

   Chlorine solutions are unstable. Test the sample immediately after collecting it. Avoid exposing the sample to sunlight.

2. Low readings can be caused by zeroing the sensor before the residual current has reached a stable minimum value. Residual current is the current the sensor generates even when no chlorine is in the sample. Because the residual current is

subtracted from subsequent measured currents, zeroing before the current is a minimum can lead to low results.

3. Sensor response depends on flow. If the flow is too low, readings will be low and flow sensitive. Verify that the flow past the sensor equals or exceeds the minimum value.

   See the sensor reference manual for recommended flow.

8.5.4 Ozone measurement and calibration problems

Problem	See section
Zero current is substantially outside the range -10 to 10 nA.	Ozone zero current outside range
Zero reading is unstable.	Ozone zero reading unstable
Sensor current during calibration is substantially less than about 350 nA/ppm at 77 °F (25 °C).	Sensor current less than 350 nA/ppm
Process readings are erratic.	Ozone process readings erratic
Readings drift.	Ozone readings drift
Sensor does not respond to changes in ozone level.	Sensor not responding to ozone changes
Ozone readings are too low.	Oxygen readings are too low

Ozone zero current outside range

The ozone zero current is substantially outside the range: -10 to 10 nA.

Recommended actions

1. Make sure the sensor is properly wired to the transmitter.
2. Make sure the zero solution is ozone free. Test the zero solution for ozone level.

   The concentration should be less than 0.02 ppm.
3. Make sure you allow adequate time for the sensor to reach a minimum stable residual current.

   It may take several hours, sometimes as long as overnight, for a new sensor to stabilize.
4. Check the membrane for damage and replace it if necessary.

Ozone zero reading unstable

Recommended actions

1. Verify that the sensor is properly wired to the transmitter and that all wiring connections are tight.
2. Readings are often erratic when a new or rebuilt sensor is first placed in service. Wait about an hour for readings to stabilize.

3. Make sure that the space between the membrane and cathode is filled with electrolyte solution and the flow path between the electrolyte reservoir and membrane are clear.
    a) Hold the sensor with the membrane end pointing down and shake it sharply a few times as though shaking down a clinical thermometer.
    b) If shaking does not work, try cleaning the holes around the cathode stem. Hold the sensor with the membrane end pointing up. Be sure the wood ring remains with the membrane assembly. Use the end of a straightened paper clip to clear the holes at the base of the cathode stem. Replace the membrane.
    c) Verify that the sensor is filled with electrolyte solution.

       Refer to the sensor reference manual for details.

Sensor current less than 350 nA/ppm

The sensor current is less than 350 nA/ppm at 77 °F (25 °C).

Recommended actions

1. Check the temperature.

   Sensor current is a strong function of temperature. The sensor current decreases about 3% for every °C drop in temperature.
2. Check the rate of the sample flow past the sensor tip.

   If the flow is too low, ozone readings will be low. Refer to the sensor instruction sheet for recommended sample flows.
3. Check the electrolyte flow.

   A lack of electrolyte flow to the cathode and membrane can cause low current. See Step 3 in Ozone zero reading unstable.
4. Check if the membrane is fouled or coated.

   A dirty membrane inhibits diffusion of ozone through the membrane, reducing the sensor current and increasing the response time.
    a) Clean the membrane by rinsing it with a stream of water from a wash bottle or gently wipe the membrane with a soft tissue.
    b) If cleaning the membrane does not improve the sensor response, replace the membrane and electrolyte solution.
    c) If necessary, polish the cathode.

       See the sensor reference manual for details.

Ozone process readings erratic

The ozone process readings are erratic.

Recommended actions

1. Readings are often erratic when a new sensor or rebuilt sensor is first placed in service. Wait a few hours for the current to stabilize.

2. Check if the sample flow is within the recommended range.

   High sample flow may cause erratic readings. Refer to the sensor reference manual for recommended flow rates.

3. Check if the holes between the membrane and the electrolyte reservoir are open.

   Refer to Ozone zero reading unstable.

4. Verify that the wiring is correct. Pay particular attention to shield and ground connections.
5. Make sure the membrane is in good condition and the sensor is filled with electrolyte solution. Replace the fill solution and electrolyte.

   Refer to the sensor reference manual for details.

Ozone readings drift

Recommended actions

1. Check if the sample temperature is changing.

   Membrane permeability is a function of temperature. The time constant for the Rosemount 499AOZ sensor is about five minutes. Therefore, the reading may drift for a while after a sudden temperature change.

2. Check if the membrane is clean.

   For the sensor to work properly, ozone must diffuse freely through the membrane. A coating on the membrane will interfere with the passage of ozone, resulting in a slow response. Clean the membrane by rinsing it with a stream of water from a wash bottle, or gently wipe the membrane with a soft tissue.

3. Check if the sample flow is within the recommended range.

   Gradual loss of sample flow will cause a downward drift.

4. Check if the sensor is new or recently serviced.

   New or rebuilt sensors may require several hours to stabilize.

Sensor not responding to ozone changes

Recommended actions

1. Make sure the grab sample test is accurate and representative of the sample flowing to the sensor.
2. Clean the membrane and replace it if necessary.
   a) Check that the holes at the base of the cathode stem are open.
   b) Use a straightened paper clip to clear blockages.
   c) Replace the electrolyte solution.
3. Replace the sensor.

Ozone readings too low

Recommended actions

1. Test the sample immediately after collecting it.
   Ozone solutions are highly unstable.
2. Zeroing the sensor before the residual current has reached a stable minimum value can cause low readings.
   Residual current is the current the sensor generates even when no ozone is in the sample. Because the residual current is subtracted from subsequent measured currents, zeroing before the current is a minimum can lead to low results. See Oxygen readings are too low.
3. Verify that the flow past the sensor equals or exceeds the minimum value.
   Sensor response depends on flow. If the flow is too low, readings will be low and flow sensitive. See the sensor reference manual for recommended flows.

8.5.5 pH measurement and calibration problems

Problem	See Section
SLOPE HI or SLOPE LO message is showing.	SLOPE Err HI or SLOPE Err LO
-0- OFFSEt message is showing.	-0- OFFSEt
Transmitter will not accept manual slope.	Transmitter not accepting manual slope
Sensor does not respond to known pH changes.	Sensor not responding to pH changes
Process pH is slightly different from the expected value.	Process pH slightly different
Process pH reading changes when flow changes.	Process pH reading changes with flow
Process pH is grossly wrong and/or noisy.	Process pH grossly wrong or noisy
Process readings are noisy.	Process readings noisy

Transmitter not accepting manual slope

Recommended action

If you know the slope from other sources, enter it directly into the transmitter.

The transmitter will not accept a slope (at 77 °F [25 °C]) outside the range 45 to 60 mV/pH. If you attempt to enter a slope less than 45 mV/pH, the transmitter will automatically change the entry to 45. If you attempt to enter a slope greater than 60 mV/pH, the transmitter will change the entry to 60 mV/pH.

Sensor not responding to pH changes

Recommended actions

1. If the process pH reading was not as expected, check the performance of the sensor in buffers. Also, use a second pH meter to verify the change.
2. Make sure the sensor is properly wired to the transmitter.
3. Check the glass electrode impedance to see if the glass bulb is cracked or broken.
4. Check the transmitter by simulating the pH input.

Process pH slightly different

Differences between pH readings made with an online instrument and a laboratory or portable instrument are normal. The online instrument is subject to process variables (for example, ground potentials, stray voltages, and orientation effects) that may not affect the laboratory or portable instrument.

Process pH reading changes with flow

The sensor has some degree of flow sensitivity (i.e., changing the sample flow causes the pH readings to change). Flow sensitivity varies from sensor to sensor.

Flow sensitivity can be a source of error if the pH and chlorine sensor flow cells are connected in series. The chlorine sensor requires a fairly rapidly flowing sample, and high flows may affect the pH reading. Typically, the difference in pH reading from a pH sensor in a rapidly (16 gph) and slowly (<2 gph) flowing sample is less than about 0.05.

Recommended action

If the change is greater than 0.05, install the pH and chlorine sensors in parallel streams.

Process pH grossly wrong or noisy

Grossly wrong or noisy readings suggest a ground loop (measurement system connected to earth ground at more than one point), a floating system (no earth ground), or noise being brought into the transmitter by the sensor cable. The problem arises from the process or installation. It is not a fault of the transmitter. The problem should disappear once the sensor is taken out of the system. Check the following:

Recommended actions

1. Check if a ground loop is present.
   a) Verify that the system works properly in buffers. Be sure there is no direct electrical connection between the buffer containers and the process liquid or piping.
   b) Strip back the ends of a heavy gauge wire. Connect one end of the wire to the process piping or place it in the process liquid. Place the other end of the wire in the container of buffer with the sensor.

      The wire makes an electrical connection between the process and sensor.

   If offsets and noise appear after making the connection, a ground loop exists.
2. Check if the process is grounded. Ground the piping or tank to a local earth ground.

The measurement system needs one path to ground: through the process liquid and piping. Plastic piping, fiber-glass tanks, and ungrounded or poorly grounded vessels do not provide a path. A floating system can pick up stray voltages from other electrical equipment.

If noise still persists, simple grounding is not the problem. The sensor wiring is probably carrying noise into the instrument.

3. Simplify the sensor wiring.
   a) Verify that pH sensor wiring is correct.
   b) Disconnect all sensor wires at the transmitter except pH/mV IN, REFERENCE IN, RTD IN, and RTD RETURN. If the sensor is wired to the transmitter through a remote junction box containing a preamplifer, disconnect the wires at the sensor side of the junction box.
   c) Tape back the ends of the disconnected wires to keep them from making accidental connections with other wires or terminals.
   d) Connect a jumper wire between the RTD RETURN and RTD SENSE terminals.

   If noise and/or offsets disappear, the interference was coming into the transmitter through one of the sensor wires. The system can be operated permanently with simplified wiring.
4. Check for ground connections or induced noise.
   a) If the sensor cable is run inside conduit, there may be a short between the cable and the conduit. Re-run the cable outside the conduit. If symptoms disappear, there is a short between the cable and the conduit. Likely, a shield is exposed and touching the conduit. Repair the cable and reinstall it in the conduit.
   b) To avoid induced noise in the sensor cable, run it as far away as possible from the power cables, relays, and electric motors. Keep sensor wiring out of crowded panels and cable trays.
   c) If ground loops persist, contact the factory. A visit from a service technician may be required to solve the problem.

Process readings noisy

Recommended actions

1. Check the conductivity of the sample.

   Measuring pH in samples having conductivity less than about 50 µS/cm can be very difficult. Special sensors are often needed and special attention must be paid to grounding and sample flow rate.

   Note
   Measuring free chlorine in samples having low conductivity can also be a problem. Generally, for a successful chlorine measurement, the conductivity should be greater than 50 µS/cm.

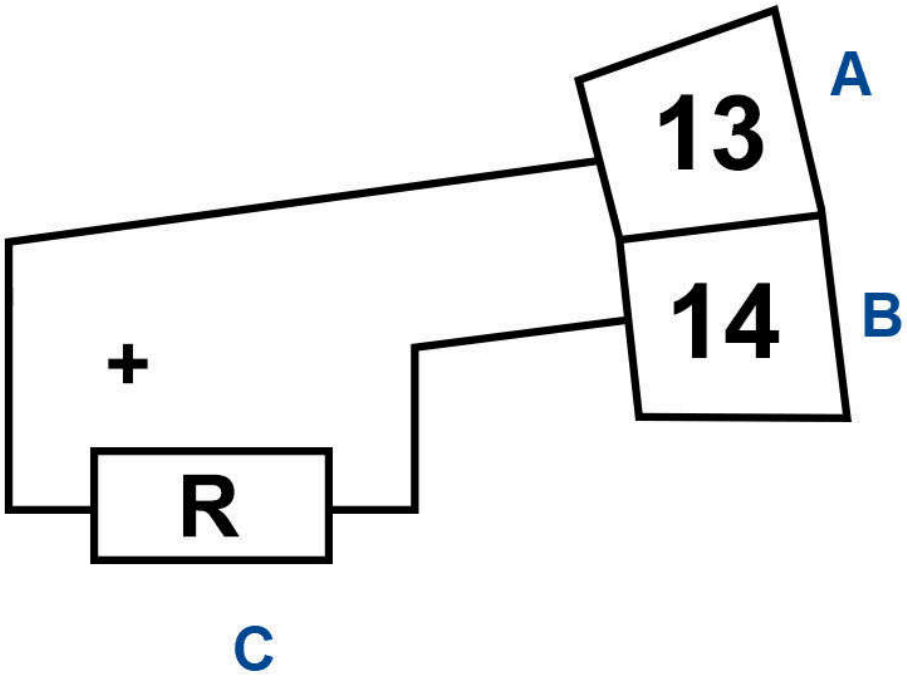
2. Check if the sensor is dirty of fouled.

Suspended solids in the sample can coat the reference junction and interfere with the electrical connection between the sensor and the process liquid. The result is often a noisy reading.

3. Make sure the sensor is properly wired to the transmitter.
4. Check if a ground loop is present.

   Refer to Process pH grossly wrong or noisy.

8.5.6 Simulate input currents - dissolved oxygen



To check the performance of the transmitter, use a decade box to simulate the current from the oxygen sensor.

Procedure

1. Disconnect the anode and cathode leads from terminals 13 and 14 and connect a decade box as shown in Figure 8-10.

   It is not necessary to disconnect the resistance temperature device (RTD) leads.

Figure 8-10: Simulate Dissolved Oxygen

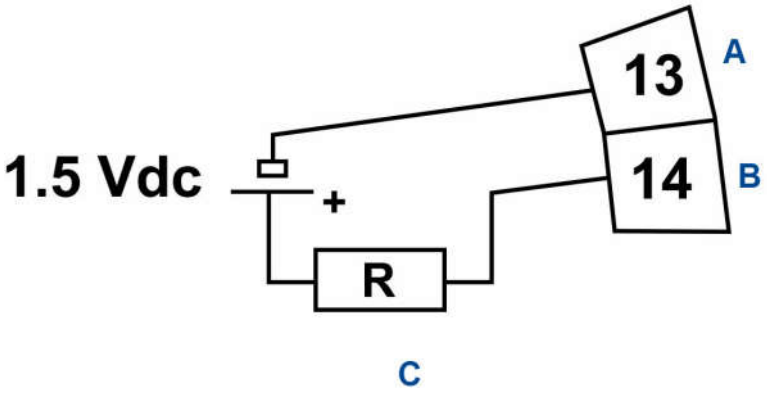
A. Anode
B. Cathode
C. Simulates sensor

2. Set the decade box to the resistance shown in the table.

Sensor	Polarizing voltage	Resistance	Expected current
Rosemount 499ADO	-675 mV	34 kΩ	20 µA
Rosemount 499ATrDO	-800 mV	20 kΩ	40 µA
Rosemount Hx438	-675 mV	8.4 MΩ	80 nA

3. Note the sensor current. To view the sensor current:
   a) Go to the main display and press **DIAG**.
   b) Press **NEXT**.
      `SEnSor Cur` appears in the display.
   c) Press **ENTER**.
      The display shows the sensor current.
   d) Note the units.
      µA is microamps; nA is nanoamps.
4. Change the decade box resistance and verify that the correct current is shown. Calculate the current from the equation:

$$\text{current } (\mu A) = \frac{\text{voltage } (mV)}{\text{resistance } (k\Omega)}$$



8.5.7 Simulate input currents - chlorine and ozone

To check the performance of the transmitter, use a decade box and a battery to simulate the current from the sensor. The battery, which opposes the polarizing voltage, is necessary to ensure that the sensor current has the correct sign.

Procedure

1. Disconnect the anode and cathode leads from terminals 13 and 14 and connect a decade box and battery as shown in Figure 8-11.
   It is not necessary to disconnect the resistance temperature device (RTD) leads.

Figure 8-11: Simulate Chlorine and Ozone

A. Anode
B. Cathode
C. Simulates sensor

2. Set the decade box to the resistance shown in the table.

Sensor	Polarizing voltage	Resistance	Expected current
Rosemount 499ACL-01 (free chlorine)	200 mV	28 MΩ	500 nA
Rosemount 499ACL-02 (total chlorine)	250 mV	675 kΩ	2000 nA
Rosemount 499AOZ	200 mV	2.7 MΩ	500 nA

3. Note the sensor current.

   It should be close to the value in the table. The actual value depends on the voltage of the battery. To view the sensor current:

   a) Go to the main display and press **DIAG**.

   b) Press **NEXT**.
   `SEnSor Cur` appears in the display.

   c) Press **ENTER**.
   The display shows the sensor current.

   d) Note the units
   µA is microamps; na is nanoamps.

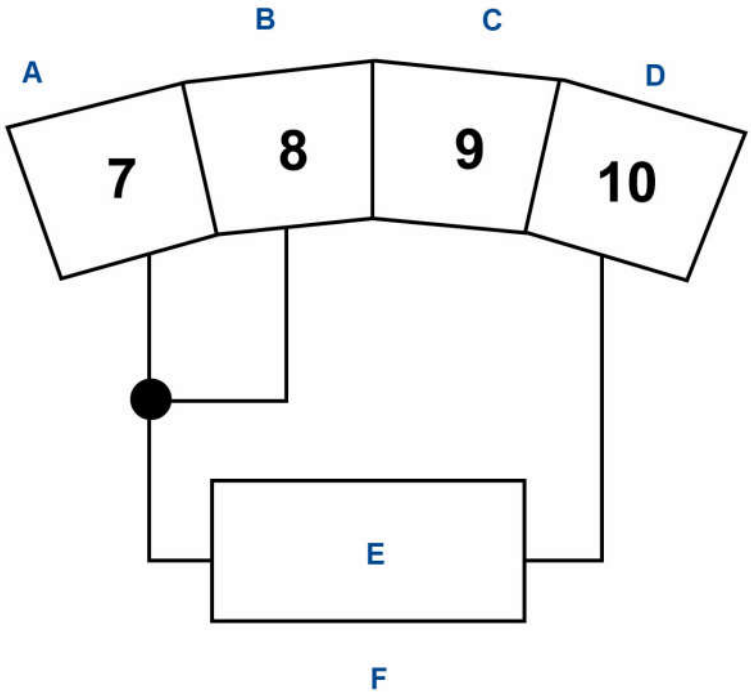
4. Change the decade box resistance and verify that the correct current is shown. Calculate the current from the equation:

$$\text{current } (\mu\text{A}) = \frac{\text{V}_{\text{battery}} - \text{V}_{\text{polarizing}}\,(\text{mV})}{\text{resistance } (\text{k}\Omega)}$$

The voltage of a fresh 1.5 volt battery is about 1.6 volt (1600 mV).

8.5.8 Simulating inputs - pH

General information about simulating pH inputs



This section describes how to simulate a pH input into the transmitter. To simulate a pH measurement, connect a standard millivolt source to the transmitter. If the transmitter is working properly, it will accurately measure the input voltage and convert it to pH. Although the general procedure is the same, the wiring details depend on whether the preamplifier is in the sensor, a junction box, or the transmitter.

Simulate pH inputs when the preamplifier is in the transmitter

Procedure

1. Turn off automatic temperature correction and set the manual temperature to 77 °F (25 °C).
2. Disconnect the pH sensor. Also, disconnect the chlorine sensor anode lead. Connect a jumper wire between the pH IN and REF IN terminals.
3. Confirm that the transmitter is reading the correct mV value.
   a) With the main display showing, press **DIAG**.
   b) Press **NEXT** until the display shows `PH`.
   c) Press **ENTER**.
   The display shows `InpUt` followed by a number. The number is the raw input signal in millivolts. The measured voltage should be 0 mV.
4. Confirm that the transmitter is reading the correct pH value.
   a) Go to the main display.
   b) Press **3** or **5**.
   The second line of the display shows the pH. The pH should be approximately 7.00. Because calibration data stored in the transmitter may be offsetting the input voltage, the displayed pH may not be exactly 7.00
5. If a standard millivolt source is available, disconnect the jumper wire between the pH IN and REF IN terminals and connect the voltage source as shown in Figure 8-12.

Figure 8-12: Simulate pH

A. Reference in
B. Solution ground
C. pH guard
D. pH in
E. mV source
F. Simulates pH

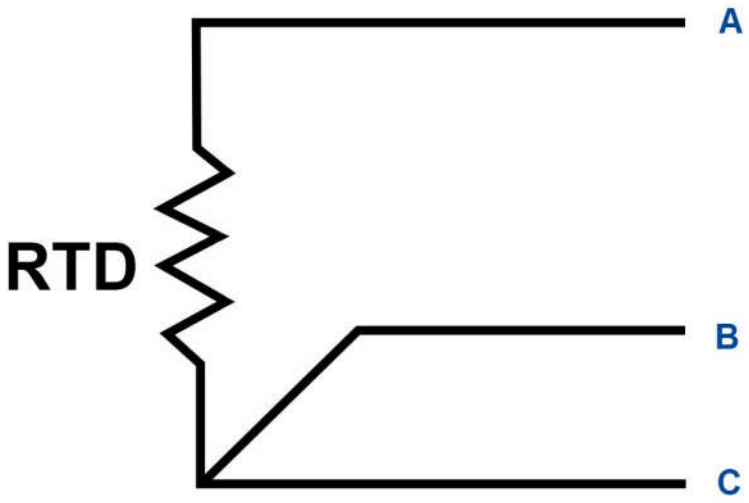
6. Calibrate the transmitter. Use 0.0 mV for Buffer 1 (pH 7.00) and -177.4 mV for Buffer 2 (pH 10.00).
   If the transmitter is working properly, it should accept the calibration. The slope should be 59.16 mV/pH, and the offset should be zero.
7. To check linearity, set the voltage source to the values shown in the table and verify that the pH and millivolt readings match the values in the table.

Voltage (mV)	pH (at 77 °F [25 °C])
295.8	2.00
177.5	4.00
59.2	6.00
59.2	8.00
177.5	10.00
295.8	12.00

Simulate pH inputs when the preamplifier is in a junction box

The procedure is the same as described in Simulate pH inputs when the preamplifier is in the transmitter. Keep the connection between the transmitter and the junction box in place. Disconnect the sensor at the sensor side of the junction box and connect the voltage source to the sensor side of the junction box.

Simulate pH inputs when the preamplifier is in a sensor



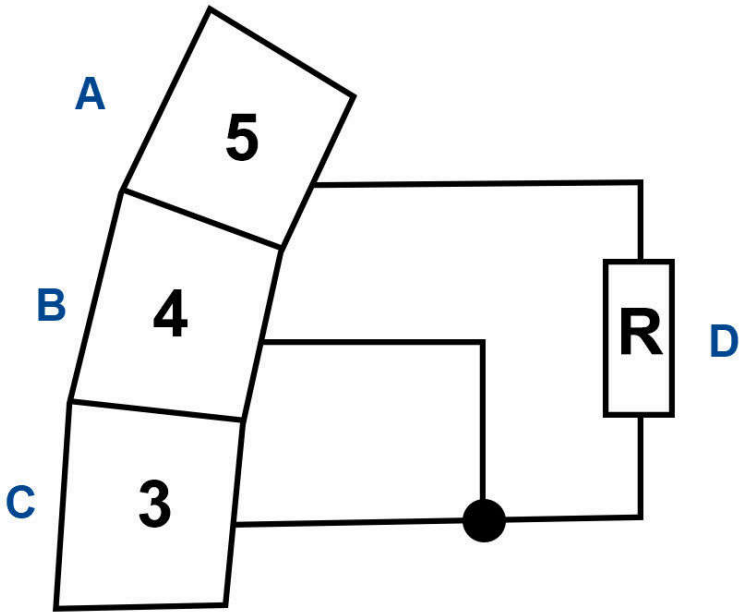
The preamplifier in the sensor converts the high impedance signal into a low impedance signal without amplifying it. To simulate pH values, follow the procedure in Simulate pH inputs when the preamplifier is in the transmitter.

8.5.9 Simulate temperature

The transmitter accepts either a Pt100 resistance temperature device (RTD) (used in Rosemount pH, 499ADO, 499ATrDO, 499ACL-01, 499ACL-02, and 499AOZ sensors) or a 22k NTC thermistor (used in Rosemount Hx438 dissolved oxygen sensors and most steam-sterilizable sensors from other manufacturers).

The Pt100 RTD has a three-wire configuration. See Figure 8-13. The thermistor has a two-wire configuration.

Figure 8-13: Three-Wire RTD Configuration



A. RTD in
B. RTD sense
C. RTD return

Although only two wires are required to connect the RTD to the transmitter, using a third wire allows the transmitter to correct for the resistance of the lead wires and for changes in the lead wire resistance with temperature.

Procedure

1. To simulate the temperature input, wire a decade box to the transmitter or junction box as shown in Figure 8-14.

Figure 8-14: Simulating RTD Inputs

A. RTD in
B. RTD sense
C. RTD return
D. Simulates RTD

The figure shows wiring connections for sensors containing a Pt 100 RTD. For sensors using a 22k NTC thermistor (Rosemount Hx438), wire the decade box to terminals 1 and 2 on TB6.

2. To check the accuracy of the temperature measurement, set the resistor to simulating the RTD to the values indicated in Table 8-4 and not the temperature readings.

   The measured temperature might not agree with the value in the table. During sensor calibration, an offset might have been applied to make the measured temperature agree with a standard thermometer. The offset is also applied to the simulated resistance. The controller is measuring temperature correctly if the difference between measured temperatures equals the difference between the values in the table to within ±0.1 °C.

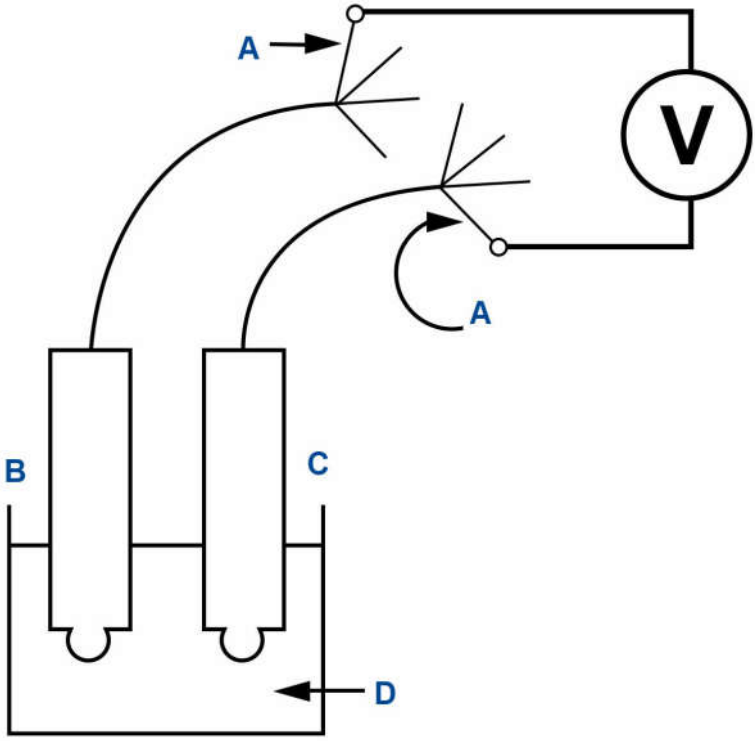
Table 8-4: RTD Values

Temp	Pt 100 (Ω)	22k NTC (kΩ)
1 °C (34 °F)	100.0	64.88
10 °C (50 °F)	103.9	41.33
20 °C (68 °F)	107.8	26.99
25 ° C (77 °F)	109.7	22.00
30 °C (86 °F)	111.7	18.03

Table 8-4: RTD Values *(continued)*

Temp	Pt 100 (Ω)	22k NTC (kΩ)
40 °C (104 °F)	115.5	12.31
50 °C (122 °F)	119.4	8.565
60 °C (140 °F)	123.2	6.072
70 °C (150 °F)	127.1	4.378
80 °C (176 °F)	130.9	3.208
85 °C (185 °F)	132.8	2.761
90 °C (194 °F)	134.7	2.385
100 (212 °F)	138.5	1.796

Example



For example, start with a simulated resistance of 103.9 Ω, which corresponds to 10.0 °C (50 °F). Assume that the offset from the sensor calibration was -0.3 Ω. Because of the offset, the transmitter calculates temperature using 103.6 Ω. The result is 9.2 °C (48.6 °F). Now change the resistance to 107.8 Ω, which corresponds to 20.0 °C (68 °F). The transmitter uses 107.5 Ω to calculate the temperature, so the display reads 19.2 °C (66.6 °F). Because the difference between the displayed temperatures (10.0 °C) is the same as the difference between the simulated temperatures, the transmitter is working correctly.

8.5.10 Measuring reference voltage

Some processes contain substances that poison or shift the potential of the reference electrode. Sulfide is a good example. Prolonged exposure to sulfide converts the reference electrode from a silver/silver chloride electrode to a silver/silver sulfide electrode. The change in reference voltage is several hundred millivolts.

A good way to check for poisoning is to compare the voltage of the reference electrode with a silver/silver chloride electrode known to be good. The reference electrode from a new sensor is best. See Figure 8-15. If the reference electrode is good, the voltage difference should be no more than about 20 mV. A poisoned reference electrode usually requires replacement.

Figure 8-15: Checking for a Poisoned Reference Electrode

A. Reference lead
B. Suspect sensor
C. Good sensor
D. Buffer of KCl solution

Refer to the sensor wiring diagram to identify the reference leads. A laboratory silver/silver chloride electrode can be used in place of the second sensor.

8.6 Factory assistance and repairs

For assistance in correcting transmitter, sensor, and measurement problems:

- In the United States, call Emerson Liquid Division at +1 800 854 8257
- Outside the United States, call the nearest Emerson office. See the back page of the manual.

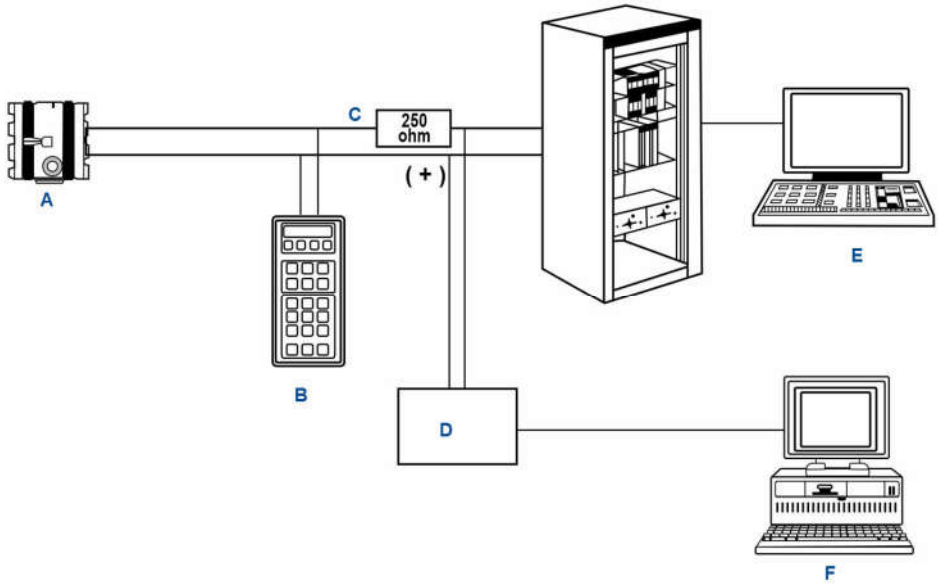
9 Digital communications

9.1 HART® communications

9.1.1 HART® communications overview

HART (highway addressable remote transducer) is a digital communication system in which two frequencies are superimposed on the 4 to 20 mA output signal from the transmitter. A 1200 Hz sine wave represents the digit 1, and a 2400 Hz sine wave represents the digit 0. Because the average value of a sine wave is zero, the digital signal adds no dc component to the analog signal. HART permits digital communication while restarting the analog signal for process control.

The HART protocol, originally developed by Fisher-Rosemount, is now overseen by the independent HART Communication Foundation. The foundation ensures that all HART devices can communicate with one another. For more information about HART communications, call the HART Communication Foundation at (512) 794-0369. The web address is http://www.fieldcommgroup.org.



9.1.2 HART® interface devices

With HART communicators, you can view measurement data (pH, ORP, and temperature), program the transmitter, and download information from the transmitter for transfer to a computer for analysis. You can also send downloaded information to another HART transmitter. To access the HART interface, you can use either a handheld communicator or a computer.

HART interface devices operate from any wiring termination point in the 4 - 20 mA loop. A minimum load of 250 ohms must be present between the transmitter and the power supply. See Figure 9-1.

If your communicator does not recognize the Rosemount™ 5081 transmitter, you may need to update the device description library. Call the manufacturer of your HART communication device for updates.

9.2.1 FOUNDATION™ Fieldbus specifications

Model	Rosemount 5081 Fieldbus transmitter
Device ITK profile	6 (released for (ITK 6.0.0/6.0.1)
Manufacturer identification (MANUFAC_ID)	0x524149
Device type (DEV_TYPE)	0x4084
Device revision (DEV_REV)	0x03
Linkmaster	Yes
Number of link objects	20
VCRs supported	20

Mandatory features	• Resource block • Alarm and events • Function block linking • Trending • Multi-bit alert reporting • Field diagnostics
Additional features	• Common software download • Block instantiation • Supports DeltaV auto commissioning • Supports DeltaV auto replacement • Supports DeltaV firmware live download • PlantWeb alerts with re-annunciation/ multibit • Supports easy configuration assistant
Function blocks (execution time)	• 4 - analog input blocks (15 mseconds) • AI block channels Channel 1: Conductivity, resistivity, concentration Channel 2: Temperature Channel 3: Raw conductivity • Proportional integral derivative (25 milliseconds)
Power	• Two wire device; Fieldbus polarity insensitive • Current draw: 21 mA • Device certifications: IS / FISCO • Maximum certified input voltage for IS: 30 V • Maximum certified input current for IS: 300 mA • Maximum certified input power for IS: 1.3 W • Internal capacitance (Ci): 0 nF • Internal inductance (Li): 0 µH

9.3 Asset Management Solutions

Asset Management Solutions (AMS) is software that helps plant personnel better monitor the performance of analytical instruments, pressure and temperature transmitters, and control valves. Continuous monitoring means maintenance personnel can anticipate equipment failures and plan preventative measures before costly breakdown maintenance is required.

AMS uses remote monitoring. The operator, sitting at a computer, can view measurement data, change program settings, read diagnostic and warning messages, and retrieve historical data from any HART®-compatible device, including the Rosemount 5081 transmitter. Although AMS allows access to the basic functions of any HART compatible device, Rosemount has developed additional software that allows access to all features of the Rosemount 5081 transmitter.

AMS can play a central role in plant quality assurance and quality control. Using AMS Audit Trail, plant operators can track calibration frequency and results as well as warnings and diagnostic messages. The information is available to Audit Trail whether calibrations were done using the infrared remote controller, the HART communicator, or AMS software.

AMS operates in Windows 95. AMS communicates through a HART-compatible modem with any HART transmitters, including those from other manufacturers. AMS is also compatible with FOUNDATION™ Fieldbus, which allows future upgrades to Fieldbus instruments.

Rosemount AMS windows provide access to all transmitter measurement and configuration variables. You can read raw data, final data, and program settings and can reconfigure the transmitter from anywhere in the plant.

10 Return of material

10.1 General information

To expedite the repair and return of instruments, proper communication between the customer and the factory is important. Call 1-800-999-9307 for a Return Materials Authorization (RMA) number.

10.2 Warranty repair

To return instruments still under warranty:

Procedure

1. Contact Rosemount™ for authorization.
2. To verify warranty, supply the factory sales order number or the original purchase order number.

   In the case of individual parts or sub-assemblies, supply the serial number on the unit.
3. Carefully package the materials and enclose your Letter of Transmittal. If possible, pack the materials in the same manner as they were received.
4. Send the package prepaid to:

   Emerson Automation Solutions

   8200 Market Blvd

   Chanhassen, MN 55317

   RMA No. _____
5. Mark the package: *Returned for Repair*

   Model No. _____

10.3 Non-warranty repair

To return instruments that are no longer under warranty for repair:

Procedure

1. Call Rosemount for authorization.
2. Supply the purchase order number and make sure to provide the name and telephone number of the individual to be contacted should additional information be needed.
3. Do steps 3-5 of Warranty repair.

Note
Consult the factory for additional information regarding service or repair.

A Engineering Drawings

The following is a list of engineering drawings in the order in which they appear in this manual.

Drawing number	Title
1400674	Schem, CSA I.S. / NIFW installation 5081 C/T
1400675	Schem, CSA I.S. / NIFW install 5081 P/A
1400676	Schem, FM I.S. / NIFW install 5081 A/P
1400677	Schem, FM I.S / NIFW installation 5081 C/T
1400678	Sch, system FM DIP/EXP proof 5081 C/T
1400679	Sch, system FM DIP/EXP proof 5081 P/A
1700783	Certified product, 5081 XMTR, CSA
1700784	Certified product, 5081 XMTR, FM
1700785	Certified product, 5081 P/A ATEX/IECEx
1700786	Certified product, 5081 C/T ATEX/IECEx

TABLE I

GAS GROUPS	C OPTION OUTPUT PARAMETERS Ca (uf)		La (mH)
	FF / FI		HT
A, B	2.05	0.4	0.5
C	490.05	1.6	7.0
D	9990.05	3.1	3.7

TABLE II

C OPTION OUTPUT PARAMETERS	5081C TB1, PINS 1 THRU 12	
	FF / FI	HT
Vt	6.51 Vdc	6.51 Vdc
It	302.59 mA	280 mA
Pt	365 mW	442 mW

TABLE III

5081C/T INPUT PARAMETERS, SUPPLY/SIGNAL TERMINALS, TB1 PINS 15 & 16						Voc MAX OUT (Vdc)	Isc MAX OUT (mA)
OPTIONS	Vmax(Vdc)	Imax (mA)	Pmax (W)	Ci (nF)	Li (uH)		
FI (FISCO)	17.5	380	5.32	5	10		
FF/FI (NON-FISCO)	30	300	1.3	27.8	0		
HT (NON-FISCO)	30	200	0.9	27.8	0		
ENTITY PARAMETERS: FIELD COMMUNICATOR							
375/475	30	200	1	.00	0.0	1.9	3.2

17. FOR THE C OPTION, THE CAPACITANCE AND INDUCTANCE CONNECTED TO THE SENSOR TERMINALS MUST NOT EXCEED THE VALUES SPECIFIED IN TABLE I.
16. FOR C OPTION, SENSORS SHALL BE CSA APPROVED IN ACCORDANCE WITH THE ENTITY REQUIREMENTS OR MEET THE REQUIREMENTS OF SIMPLE APPARATUS AS DEFINED IN ANSI/ISA RP12.6 AND THE NEC, ANSI/NFPA 70. THEY CANNOT GENERATE NOR STORE MORE THAN 1.5V, 0.1mA, 25mW OR A PASSIVE COMPONENT THAT DOES NOT DISSIPATE MORE THAN 1.3W. SEE TABLES I AND II.

△15 NON-INCENDIVE FIELD WIRING METHODS MAY BE USED FOR CONNECTING SENSORS TO THE INSTRUMENT. ATTACHED SENSORS MUST BE CSA APPROVED AS NON-INCENDIVE FOR CLASS 1, DIVISION 2, GROUPS ABCD WITH INPUT VALUES OF Vmax AND Imax ≥ Voc (Vt) AND Isc (It) LISTED IN TABLE II AND THE Ci AND Li OF THE SENSOR AND INTERCONNECTED WIRING MUST BE ≤ Ca AND La LISTED IN TABLE 1 OR BE CLASSIFIED AS "SIMPLE APPARATUS". SIMPLE APPARATUS ARE DEVICES WHICH ARE INCAPABLE OF GENERATING OR STORING MORE THAN 1.2 V, 0.1 A, 25 mW OR 20 µJ (CONTACTING CONDUCTIVITY SENSORS QUALIFY AS SIMPLE APPARATUS).

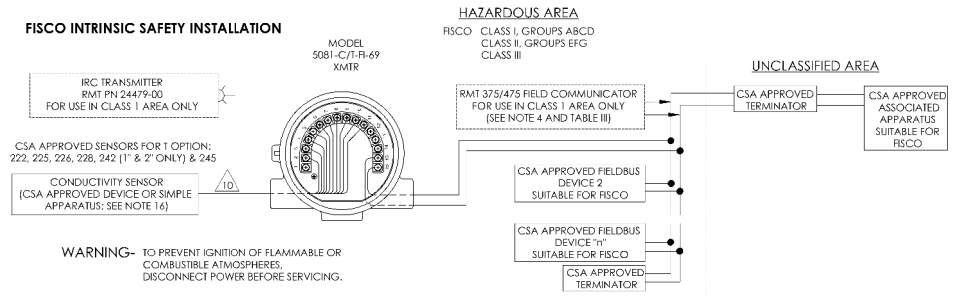
△14 INSTALLATION TO BE IN ACCORDANCE WITH THE CANADIAN ELECTRICAL CODE.

△13 DIVISION 2 WIRING METHOD PER THE CANADIAN ELECTRICAL CODE (EXCLUDING NONINCENDIVE FIELD WIRING).

△12 INTRINSICALLY SAFE APPARATUS (5081, IRC TRANSMITTER, 375/475 FIELD COMMUNICATOR, FIELDBUS TERMINATOR OR ANY OTHER FIELDBUS DEVICES) AND ASSOCIATED APPARATUS (SAFETY BARRIER) SHALL MEET THE FOLLOWING REQUIREMENTS:
THE VOLTAGE (Vmax) AND CURRENT (Imax) OF THE INTRINSICALLY SAFE APPARATUS MUST BE EQUAL TO OR GREATER THAN THE VOLTAGE (Voc OR Vt) AND CURRENT (Isc OR It) WHICH CAN BE DELIVERED BY THE ASSOCIATED APPARATUS (SAFETY BARRIER). IN ADDITION, THE MAXIMUM UNPROTECTED CAPACITANCE (Ci) AND INDUCTANCE (Li) OF THE INTRINSICALLY SAFE APPARATUS, INCLUDING INTERCONNECTING WIRING, MUST BE EQUAL OR LESS THAN THE CAPACITANCE (Ca) AND INDUCTANCE (La) WHICH CAN BE SAFELY CONNECTED TO THE APPARATUS. (REF. TABLE III)

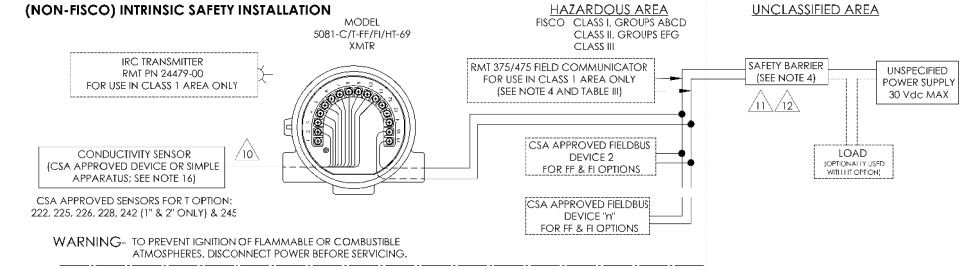
△11 FOR (NON-FISCO) INTRINSIC SAFETY INSTALLATION, ANY SINGLE SHUNT ZENER DIODE SAFETY BARRIER APPROVED BY CSA HAVING THE FOLLOWING OUTPUT PARAMETERS:
SUPPLY/SIGNAL TERMINALS ON TB1, PINS 15 AND 16.
Voc OR Vt NOT GREATER THAN 30 V FOR FF, FI AND HT OPTIONS
Isc OR It NOT GREATER THAN 300 mA FOR FF AND FI OPTIONS, OR 200 mA FOR HT OPTION
Pmax NOT GREATER THAN 1.3 W FOR FF AND FI OPTIONS, OR 0.9 mW FOR HT OPTION.

△10 FOR T OPTION, MAXIMUM CABLE LENGTH IS 250 FEET.



9. USE SUPPLY WIRES SUITABLE FOR 5°C ABOVE SURROUNDING AMBIENT.
8. NO REVISION TO DRAWING WITHOUT PRIOR CSA APPROVAL.
7. THE CONFIGURATION OF ASSOCIATED APPARATUS MUST BE CSA APPROVED UNDER THE ASSOCIATED CONCEPT AND (FOR HT AND FF OPTIONS) BE RESISTIVELY LIMITED WITH LINEAR OUTPUTS.
6. CONTROL EQUIPMENT CONNECTED TO ASSOCIATED APPARATUS MUST NOT USE OR GENERATE MORE THAN 250 Vrms OR Vdc.
5. ASSOCIATED APPARATUS MANUFACTURER'S INSTALLATION DRAWING MUST BE FOLLOWED WHEN INSTALLING THIS EQUIPMENT.
4. THE ENTITY CONCEPT ALLOWS INTERCONNECTION OF INTRINSICALLY SAFE APPARATUS WITH ASSOCIATED APPARATUS WHEN THE FOLLOWING IS TRUE:

FIELD DEVICE INPUT		ASSOCIATED APPARATUS OUTPUT
Vmax OR Ui	≥	Voc, Vt OR Uo
Imax OR Ii	≥	Isc, It OR Io
Pmax OR Pi	≥	Po
Ci + Ccable	≤	Ca, Ct OR Co (FOR NON-FISCO INSTALLATIONS)
Li + Lcable	≤	La, Lt OR Lo (FOR NON-FISCO INSTALLATIONS)



3. RESISTANCE BETWEEN INTRINSICALLY SAFE GROUND AND EARTH GROUND MUST BE LESS THAN 1.0 Ohm.
2. DUST-TIGHT CONDUIT SEAL MUST BE USED WHEN INSTALLED IN CLASS II AND CLASS III ENVIRONMENTS.
1. INSTALLATION SHOULD BE IN ACCORDANCE WITH ANSI/ISA RP12.06 "INSTALLATION OF INTRINSICALLY SAFE SYSTEMS FOR HAZARDOUS (CLASSIFIED) LOCATIONS" (EXCEPT CHAPTER 5 FOR FISCO INSTALLATIONS) AND THE CANADIAN ELECTRICAL CODE (CSA C22.1).

NOTES: UNLESS OTHERWISE SPECIFIED

14. INSTALLATION TO BE IN ACCORDANCE WITH THE CANADIAN ELECTRICAL CODE.
13. DIVISION 2 WIRING METHOD (EXCLUDING NONINCENDIVE FIELD WIRING).
12. INTRINSICALLY SAFE APPARATUS (5081, IRC TRANSMITTER, 375/475 FIELD COMMUNICATOR, FIELDBUS TERMINATOR OR ANY OTHER FIELDBUS DEVICES) AND ASSOCIATED APPARATUS (SAFETY BARRIER) SHALL MEET THE FOLLOWING REQUIREMENTS:
THE VOLTAGE (Vmax) AND CURRENT (Imax) OF THE INTRINSICALLY SAFE APPARATUS MUST BE EQUAL OR LESS THAN THE ASSOCIATED APPARATUS (SAFETY BARRIER). IN ADDITION, THE MAXIMUM UNPROTECTED CAPACITANCE (Ci) AND INDUCTANCE (Li) OF THE INTRINSICALLY SAFE APPARATUS, INCLUDING INTERCONNECTING WIRING, MUST BE EQUAL OR LESS THAN THE CAPACITANCE (Co) AND INDUCTANCE (Lo) WHICH CAN BE SAFELY CONNECTED TO THE APPARATUS. (REF. TABLE III)
11. FOR INTRINSIC SAFETY (NON-FISCO) INSTALLATION:
ANY SINGLE SHUNT ZENER DIODE SAFETY BARRIER APPROVED BY FM HAVING THE FOLLOWING OUTPUT PARAMETERS:
Voc OR Vt NOT GREATER THAN 30 V FOR FF, FI AND HT OPTIONS
Isc OR It NOT GREATER THAN 300 mA FOR FF AND FI OPTIONS, OR 200 mA FOR HT OPTION
Pmax NOT GREATER THAN 1.3 W FOR FF AND FI OPTIONS, OR 0.9 mW FOR HT OPTION.
10. INTEGRAL PREAMPLIFIER: A WEATHER RESISTANT ENCLOSURE MUST BE USED, USE THE 273546-00 PREAMPLIFIER. OTHER PREAMPS OR PREAMP CONTAINING SENSORS MAY BE USED IF OVERALL C AND L ARE < THE LIMITS DETAILED IN NOTE 9 AND THE MAXIMUM ENITY PARAMETERS ARE > THOSE IN TABLE II.
9. THE 5081 P/A INCLUDES INTEGRAL PREAMPLIFIER CIRCUITRY. AN EXTERNAL PREAMPLIFIER MAY ALSO BE USED, THE OUTPUT PARAMETERS SPECIFIED IN TABLE II ARE VALID FOR EITHER PREAMPLIFIER, THE CAPACITANCE AND INDUCTANCE OF THE LOAD CONNECTED TO THE SENSOR TERMINALS MUST NOT EXCEED THE VALUES SPECIFIED IN TABLE II. FOR EXAMPLE, FOR A 5081-P-A-FF/HT-69 WITH 23546-00 PREAMPLIFIER, THE MAXIMUM ALLOWABLE CABLE CAPACITANCE AND INDUCTANCE WITH THE ENTITY PARAMETERS OF THE PREAMPLIFIER REQUIREMENTS OF SIMPLE APPARATUS AS DEFINED IN ANSI/ISA RP12.6 AND THE NEC, ANSI/NFPA 70, THEY CANNOT GENERATE NOR STORE MORE THAN 1.5V, 0.1mA, 25mW OR A PASSIVE COMPONENT THAT DOES NOT DISSIPATE MORE THAN 1.3W, SEE TABLES I AND II.
8. THE CONFIGURATION OF ASSOCIATED APPARATUS MUST BE CSA APPROVED UNDER THE ASSOCIATED CONCEPT AND BE RESISTIVELY LIMITED HAVING LINEAR OUTPUTS.
7. CONNECTION SHALL BE MADE TO CSA APPROVED ASSOCIATED APPARATUS MUST USE OR GENERATE MORE THAN 250 Vrms, OR Vdc.
6. ASSOCIATED APPARATUS MANUFACTURER'S INSTALLATION DRAWING MUST BE FOLLOWED WHEN INSTALLING THIS EQUIPMENT.
5. THE ENTITY CONCEPT ALLOWS INTERCONNECTION OF INTRINSICALLY SAFE APPARATUS WITH ASSOCIATED APPARATUS WHEN THE FOLLOWING IS TRUE:

ASSOCIATED APPARATUS OUTPUT		FIELD DEVICE INPUT
Voc OR Vt	≥	Vmax OR Ui
Isc OR It	≥	Imax OR Ii
Pmax OR Pi	≥	Po
Ci + Ccable	≤	Co, Ca OR Co
Li + Lcable	≤	Lo, La OR Lo

4. RESISTANCE BETWEEN INTRINSICALLY SAFE GROUND AND EARTH GROUND MUST BE LESS THAN 1.0 Ohm.
3. DUST-TIGHT CONDUIT SEAL MUST BE USED WHEN INSTALLED IN CLASS II AND CLASS III ENVIRONMENTS.
2. INSTALLATION SHOULD BE IN ACCORDANCE WITH ANSI/ISA RP12.06.01 "RECOMMENDED PRACTICE FOR INTRINSICALLY SAFE SYSTEMS FOR HAZARDOUS (CLASSIFIED) LOCATIONS"
1. (EXCEPT CHAPTER 5 FOR FISCO INSTALLATIONS) AND THE CANADIAN ELECTRICAL CODE (CSA C22.1).

NOTES: UNLESS OTHERWISE SPECIFIED

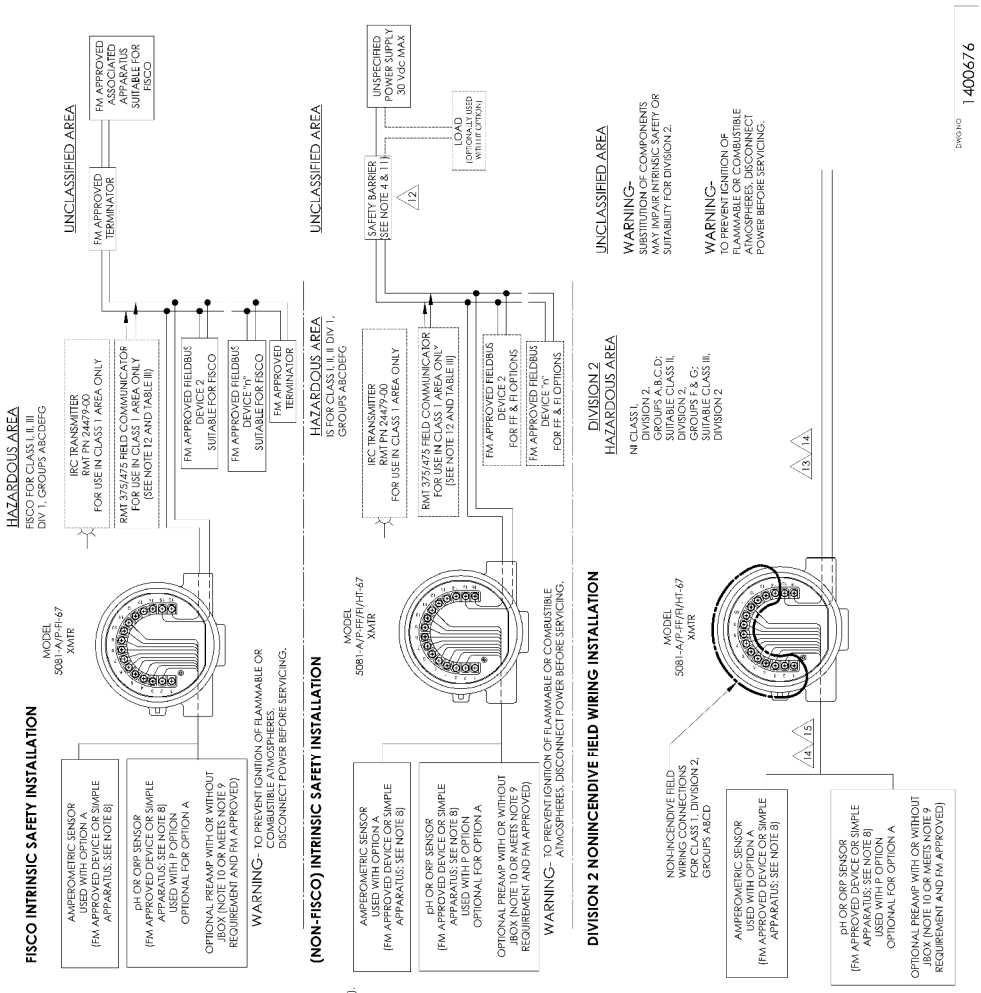

TABLE I

GAS GROUPS	5081-A/P OUTPUT PARAMETERS Co [µF]		Lo [mH]

375/475	PER FF PARAMETERS						
	30	300	1	00	0.0	1.9	39

17. THE CAPACITANCE AND INDUCTANCE CONNECTED TO THE SENSOR TERMINALS MUST NOT EXCEED THE VALUES SPECIFIED IN TABLE I.
16. NO REVISION TO DRAWING WITHOUT FM APPROVAL.
/15. NON-INCENDIVE FIELD WIRING METHODS MAY BE USED FOR CONNECTING SENSORS TO THE INSTRUMENT. ATTACHED SENSORS MUST BE FM APPROVED AS NON-INCENDIVE FOR CLASS 1, DIVISION 2, GROUPS ABCD WITH INPUT VALUES OF Vmax AND Imax ≥ Voc (Vt) AND Isc (It) LISTED IN TABLE II AND THE Ci AND Li OF THE SENSOR AND INTERCONNECTED WIRING MUST BE ≤ Co AND Lo LISTED IN TABLE 1 OR BE CLASSIFIED AS "SIMPLE APPARATUS". SIMPLE APPARATUS ARE DEVICES WHICH ARE INCAPABLE OF GENERATING OR STORING MORE THAN 1.2 V, 0.1 A, 25 mW OR 20 µJ. (AMPEROMETRIC SENSORS WITHOUT PREAMP QUALIFY AS SIMPLE APPARATUS).
/14. INSTALLATION TO BE IN ACCORDANCE WITH THE NATIONAL ELECTRICAL CODE.
/13. DIVISION 2 WIRING METHOD PER THE NEC (EXCLUDING NONINCENDIVE FIELD WIRING).
/12. INTRINSICALLY SAFE APPARATUS (5081, IRC TRANSMITTER, 375/475 FIELD COMMUNICATOR, FIELDBUS TERMINATOR OR ANY OTHER FIELDBUS DEVICES) AND ASSOCIATED APPARATUS (SAFETY BARRIER) SHALL MEET THE FOLLOWING REQUIREMENTS: THE VOLTAGE (Vmax) AND CURRENT (Imax) OF THE INTRINSICALLY SAFE APPARATUS MUST BE LESS THAN OR EQUAL TO (≤) THE VOLTAGE (Voc) AND CURRENT (Isc) OUTPUT WHICH CAN BE DELIVERED BY THE ASSOCIATED APPARATUS (SAFETY BARRIER). IN ADDITION, THE MAXIMUM UNPROTECTED CAPACITANCE (Ci) AND INDUCTANCE (Li) OF THE INTRINSICALLY SAFE APPARATUS INCLUDING INTERCONNECTING WIRING, MUST BE EQUAL OR LESS THAN THE CAPACITANCE (Co) AND INDUCTANCE (Lo) WHICH CAN BE SAFELY CONNECTED TO THE APPARATUS. (REF. TABLE III)
11. FOR INTRINSIC SAFETY (NON-FISCO) INSTALLATION, ANY SINGLE SHUNT ZENER DIODE SAFETY BARRIER APPROVED TO THE FOLLOWING PARAMETERS MAY BE USED IN THE SENSOR SUPPLY/SIGNAL TERMINALS ON TB1, PINS 15 AND 16.
Voc OR Vt NOT GREATER THAN 30 V FOR FF, FI AND HT OPTIONS
Isc OR It NOT GREATER THAN 300 mA FOR FF AND FI OPTIONS, OR 200 mA FOR HT OPTION
Pmax NOT GREATER THAN 1.3 W FOR FF AND FI OPTIONS, OR 0.9 mW FOR HT OPTION
10. PREAMPLIFIER PART NUMBER 24244-00 (SEE DRAWING 24244-00) MAY BE USED TO CONNECT 5081P,D,D2 INTEGRAL PREAMPHER. A WEATHER RESISTANT ENCLOSURE MUST HOUSE THE TYPE 23544-00 PREAMPLIFIER. OTHER PREAMPS OR PREAMP CONTAINING SENSORS MAY BE USED IF OVERALL C AND L ARE < THE LIMITS DETAILED IN NOTE 9 AND THE MAXIMUM ENTITY PARAMETERS ARE > THOSE IN TABLE II.
9. THE 5081-A/P INCLUDES INTEGRAL PREAMPLIFIER CIRCUITRY. AN EXTERNAL PREAMPLIFIER MAY ALSO BE USED. THE OUTPUT OF THE PREAMPLIFIER MUST BE LIMITED SUCH THAT THE SENSOR TERMINALS MUST NOT EXCEED THE VALUES SPECIFIED IN TABLE I WHERE Co > Ci (SENSOR) +Ccable AND Lo > Li(SENSOR) + Lcable.
8. SENSORS SHALL BE FM APPROVED IN ACCORDANCE WITH THE ENTITY REQUIREMENTS OR MEET THE REQUIREMENTS OF SIMPLE APPARATUS AS DEFINED IN ANSI/ISA RP12.6 AND THE NEC. ANSI/NFPA 70. THEY CAN DISSIPATE NOT MORE THAN 1.3 W. SEE TABLE I, II, III.
7. THE CONFIGURATION OF ASSOCIATED APPARATUS MUST BE FM APPROVED UNDER THE ASSOCIATED CONCEPT.
6. CONTROL EQUIPMENT CONNECTED TO ASSOCIATED APPARATUS MUST NOT USE OR GENERATE MORE THAN 250 Vrms OR Vdc.
5. ASSOCIATED APPARATUS MANUFACTURER'S INSTALLATION DRAWING MUST BE FOLLOWED WHEN INSTALLING THIS EQUIPMENT.
4. THE ENTITY CONCEPT ALLOWS INTERCONNECTION OF INTRINSICALLY SAFE APPARATUS WITH ASSOCIATED APPARATUS WHEN THE FOLLOWING IS TRUE:

FIELD DEVICE INPUT	≥	ASSOCIATED APPARATUS OUTPUT
Vmax OR Ui	≥	Voc, Vt OR Uo
Imax OR Ii	≥	Isc, It OR Io
Pmax OR Pi	≥	Po
Ci + 3Ccable	≤	Co, C1 OR Co (FOR FISCO INSTALLATIONS)
Li + 3Lcable	≤	Lo, Lt OR Lo; Lc/Rc ≤ Lo/Ro OR Lo/Ro) AND Li/Ri ≤ (Lo/Ro OR Lo/Ro) (FOR FISCO INSTALLATIONS)
Ci + Ccable	≤	Co, C1 OR Co (FOR FISCO INSTALLATIONS)
Li + Lcable	≤	Lo, Lt OR Lo (FOR FIELDBUS, NON-FISCO) INSTALLATIONS)
Ci + Ccable	≤	Co, C1 OR Co (FOR FIELDBUS, NON-FISCO) INSTALLATIONS)

3. RESISTANCE BETWEEN INTRINSICALLY SAFE GROUND AND EARTH GROUND MUST BE LESS THAN 1.0 Ohm.
2. DUST-TIGHT CONDUIT SEAL MUST BE USED WHEN INSTALLED IN CLASS II AND CLASS III ENVIRONMENTS.
1. INSTALLATION SHOULD BE IN ACCORDANCE WITH ANSI/ISA RP12.06 "INSTALLATION OF INTRINSICALLY SAFE SYSTEMS FOR HAZARDOUS (CLASSIFIED) LOCATIONS" EXCEPT CHAPTER 5 FOR FISCO INSTALLATIONS) AND THE NATIONAL ELECTRICAL CODE (ANSI/NFPA 70)SECTIONS 504 AND 505.

NOTES: UNLESS OTHERWISE SPECIFIED

TABLE I

GAS GROUPS	C OPTION OUTPUT PARAMETERS

ENTITY PARAMETERS: FIELD COMMUNICATOR							
375/475	30	200	1	.00	0.0	1.9	32

17. FOR THE C OPTION, THE CAPACITANCE AND INDUCTANCE CONNECTED TO THE SENSOR TERMINALS MUST NOT EXCEED THE VALUES SPECIFIED IN TABLE I.

16. FOR C OPTION, SENSORS SHALL BE FM APPROVED IN ACCORDANCE WITH THE ENTITY REQUIREMENTS OR MEET THE REQUIREMENTS OF SIMPLE APPARATUS AS DEFINED IN ANSI/ISA RP12.6 AND THE NEC, ANSI/NFPA 70. THEY CANNOT GENERATE NOR STORE MORE THAN 1.5V, 0.1mA, 25mW OR A PASSIVE COMPONENT THAT DOES NOT DISSIPATE MORE THAN 1.3W. SEE TABLES I AND II.

△15 NON-INCENDIVE FIELD WIRING METHODS MAY BE USED FOR CONNECTING SENSORS TO THE INSTRUMENT. ATTACHED SENSORS MUST BE FM APPROVED AS NON-INCENDIVE FOR CLASS 1,DIVISION 2, GROUPS ABCD WITH INPUT VALUES OF Vmax AND Imax ≥ Voc (Vt) AND Isc (It) LISTEDIN TABLE II AND THE Ci AND Li OF THE SENSOR AND INTERCONNECTED WIRING MUST BE ≤ Ca AND La LISTED IN TABLE I OR BE CLASSIFIED AS "SIMPLE APPARATUS". SIMPLE APPARATUS ARE DEVICES WHICH ARE INCAPABLE OF GENERATING OR STORING MORE THAN 1.2 V, 0.1 A, 25 mW OR 20 µJ (CONTACTING CONDUCTIVITY SENSORS QUALIFY AS SIMPLE APPARATUS).

△14 INSTALLATION TO BE IN ACCORDANCE WITH THE NATIONAL ELECTRICAL CODE.

△13 DIVISION 2 WIRING METHOD PER THE NEC (EXCLUDING NONINCENDIVE FIELD WIRING).

△12 INTRINSICALLY SAFE APPARATUS (5081, IRC TRANSMITTER, 375/475 FIELD COMMUNICATOR, FIELDBUS TERMINATOR OR ANY OTHER FIELDBUS DEVICES) AND ASSOCIATED APPARATUS (SAFETY BARRIER) SHALL MEET THE FOLLOWING REQUIREMENTS: THE VOLTAGE (Vmax) AND CURRENT (Imax) OF THE INTRINSICALLY SAFE APPARATUS MUST BE EQUAL TO OR GREATER THAN THE VOLTAGE (Voc OR Vt) AND CURRENT (Isc OR It) WHICH CAN BE DELIVERED BY THE ASSOCIATED APPARATUS (SAFETY BARRIER). IN ADDITION, THE MAXIMUM UNPROTECTED CAPACITANCE (Ci) AND INDUCTANCE (Li) OF THE INTRINSICALLY SAFE APPARATUS, INCLUDING INTERCONNECTING WIRING, MUST BE EQUAL OR LESS THAN THE CAPACITANCE (Ca) AND INDUCTANCE (La) WHICH CAN BE SAFELY CONNECTED TO THE APPARATUS. (REF. TABLE III)

△11 FOR (NON-FISCO) INTRINSIC SAFETY INSTALLATION, ANY SINGLE SHUNT ZENER DIODE SAFETY BARRIER APPROVED BY FM HAVING THE FOLLOWING OUTPUT PARAMETERS:
SUPPLY/SIGNAL TERMINALS ON TB1, PINS 15 AND 16.
Voc OR Vt NOT GREATER THAN 30 V FOR FF, FI AND HT OPTIONS
Isc OR It NOT GREATER THAN 300 mA FOR FF AND FI OPTIONS, OR 200 mA FOR HT OPTION
Pmax NOT GREATER THAN 1.3 W FOR FF AND FI OPTIONS, OR 0.9 mW FOR HT OPTION.

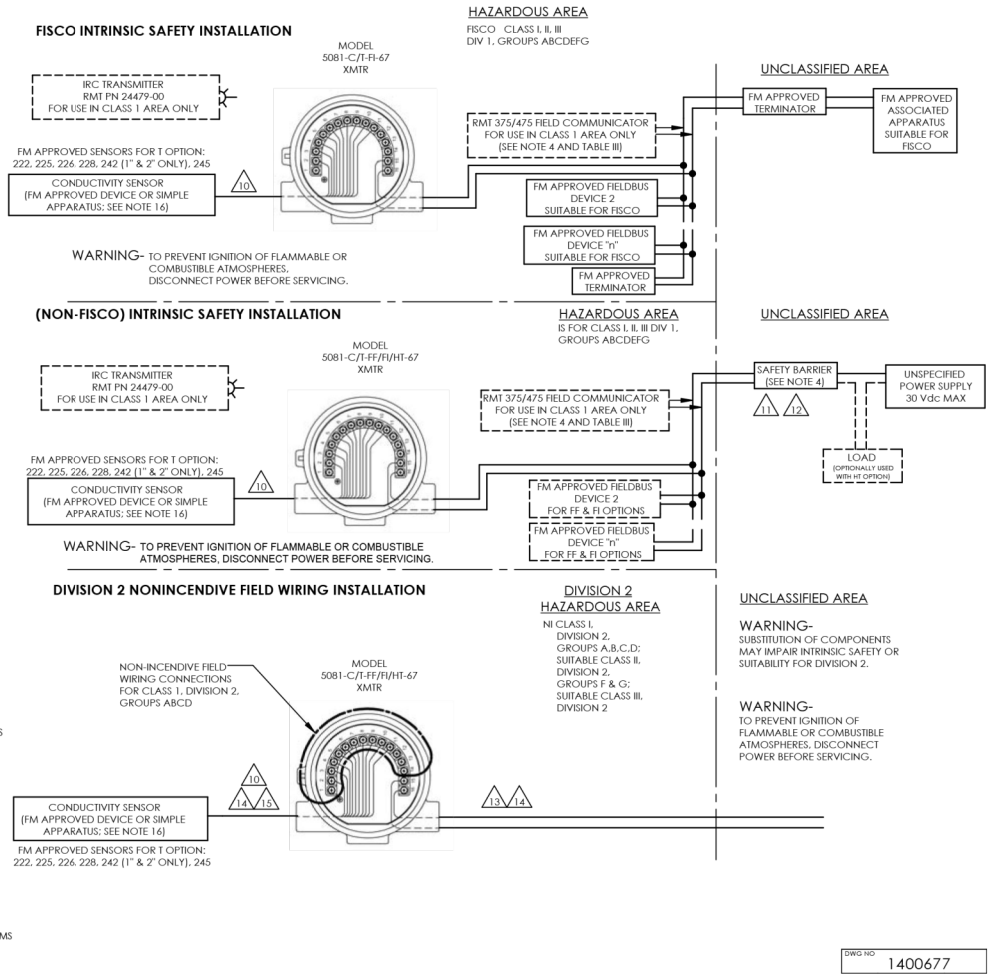
△10 FOR T OPTION, MAXIMUM CABLE LENGTH IS 250 FEET.

9. USE SUPPLY WIRES SUITABLE FOR 5°C ABOVE SURROUNDING AMBIENT.
8. NO REVISION TO DRAWING WITHOUT PRIOR FM APPROVAL.
7. THE CONFIGURATION OF ASSOCIATED APPARATUS MUST BE FM APPROVED UNDER THE ASSOCIATED CONCEPT.

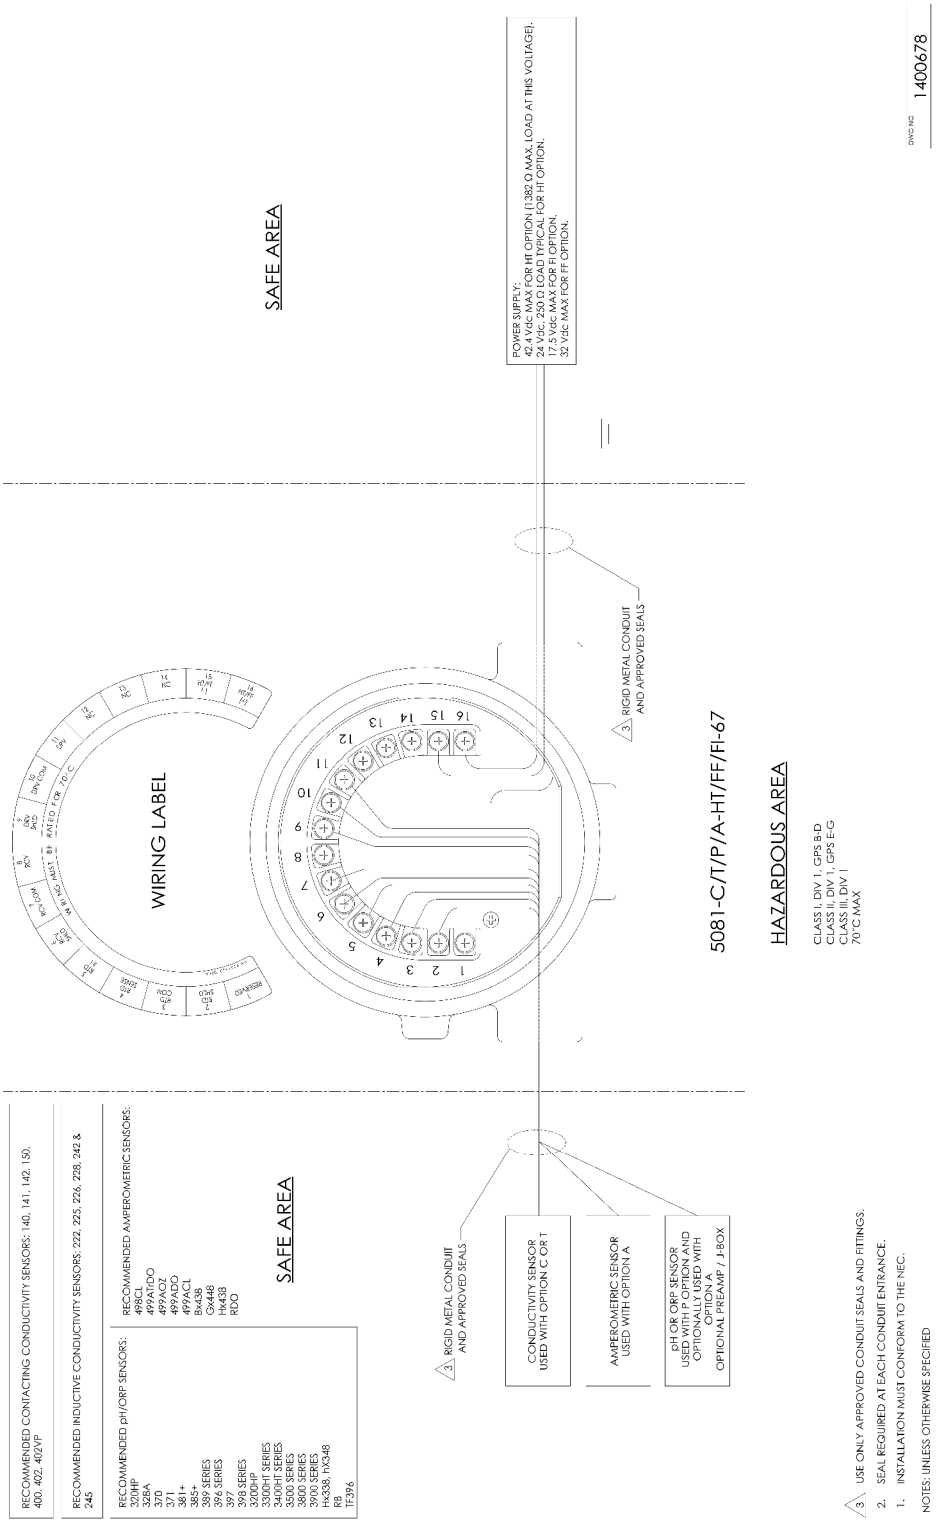
6. CONTROL EQUIPMENT CONNECTED TO ASSOCIATED APPARATUS MUST NOT USE OR GENERATE MORE THAN 250 Vrms OR Vdc.

5. ASSOCIATED APPARATUS MANUFACTURER'S INSTALLATION DRAWING MUST BE FOLLOWED WHEN INSTALLING THIS EQUIPMENT.

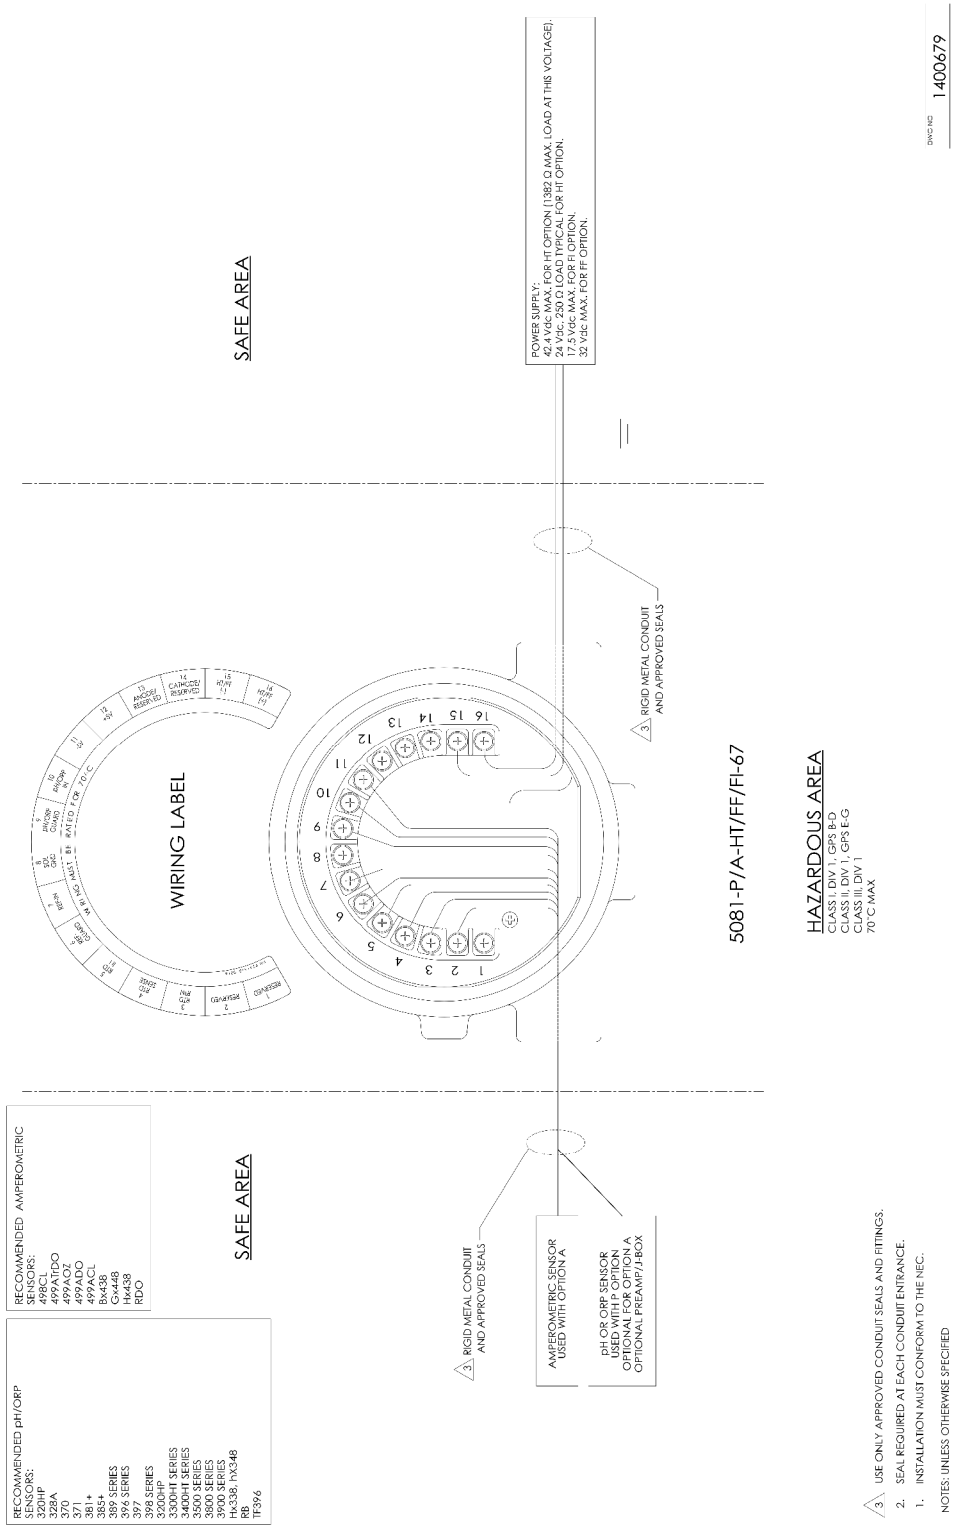
4. THE ENTITY CONCEPT ALLOWS INTERCONNECTION OF INTRINSICALLY SAFE APPARATUS WITH ASSOCIATED APPARATUS WHEN THE FOLLOWING IS TRUE:



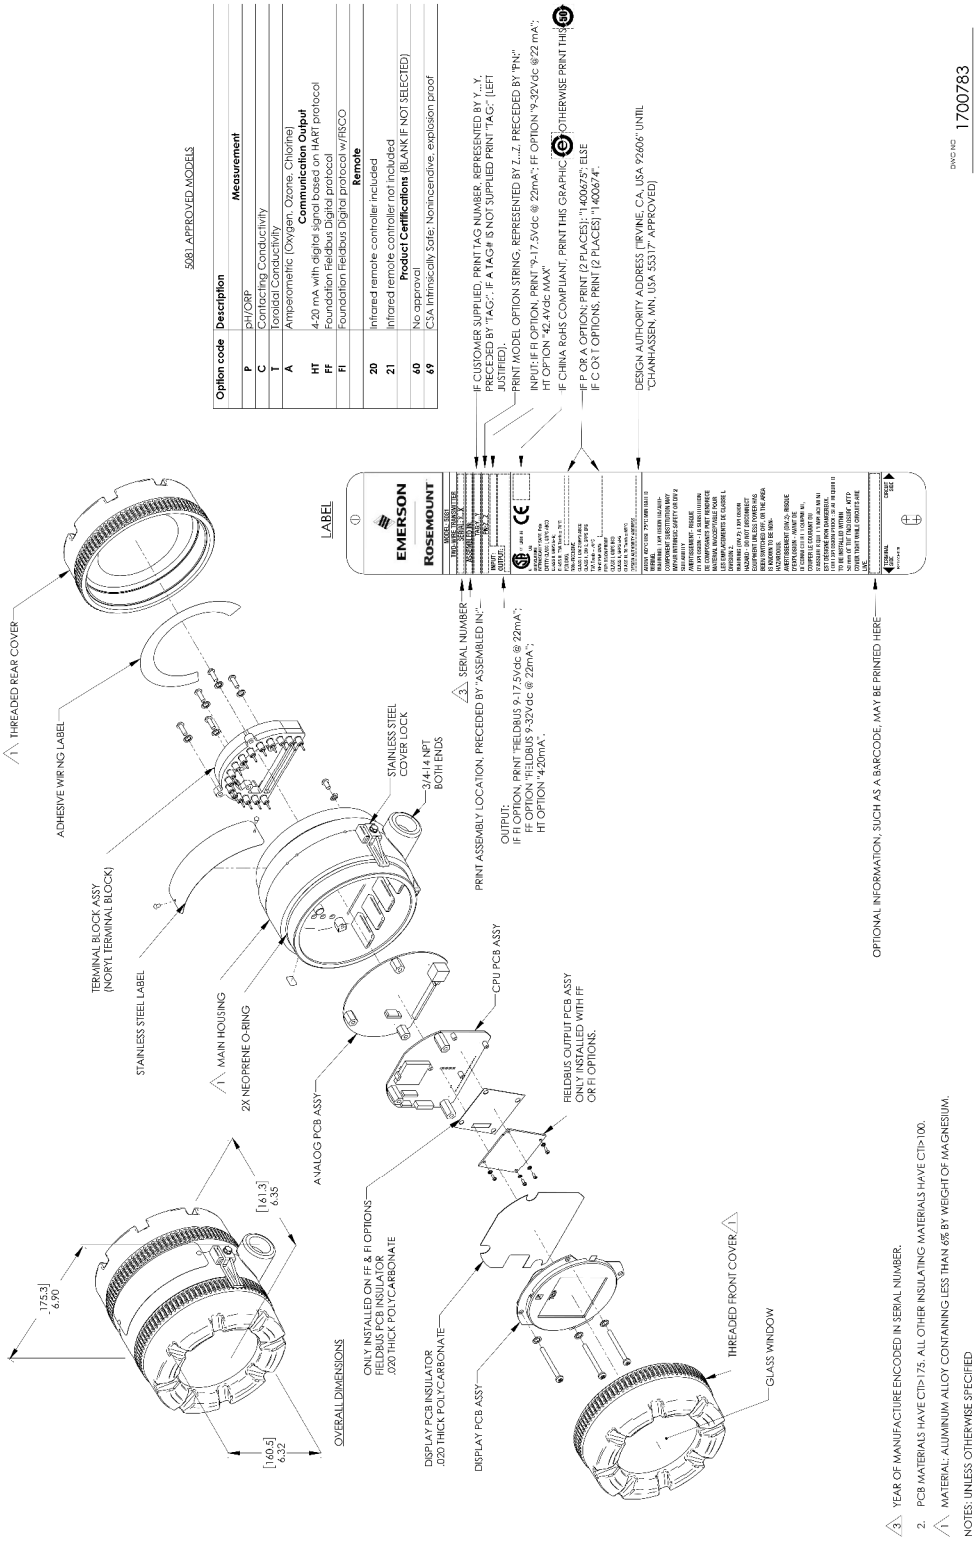
FIELD DEVICE INPUT		ASSOCIATED APPARATUS OUTPUT
Vmax OR Ui	≥	Voc, Vt OR Uo
Imax OR Ii	≥	Isc, It OR Io
Pmax OR Pi	≥	Po
3Ci + 3Ccable	≤	Ca, Ct OR Co (FOR FISCO INSTALLATIONS)
3Li + 3Lcable (FOR FISCO INSTALLATIONS)	≤	La, Lt OR Lo; Lc/Rc ≤ (La/Ra OR Lo/Ro) AND Li/Ri ≤ (La/Ra OR Lo/Ro)
Ci + Ccable	≤	Ca, Ct OR Co (FOR FIELDBUS (NON-FISCO) INSTALLATIONS)
Li + Lcable	≤	La, Lt OR Lo (FOR FIELDBUS (NON-FISCO) INSTALLATIONS)



3. RESISTANCE BETWEEN INTRINSICALLY SAFE GROUND AND EARTH GROUND MUST BE LESS THAN 1.0 Ohm.



2. DUST-TIGHT CONDUIT SEAL MUST BE USED WHEN INSTALLED IN CLASS II AND CLASS III ENVIRONMENTS.



1. INSTALLATION SHOULD BE IN ACCORDANCE WITH ANSI/ISA RP12.06 "INSTALLATION OF INTRINSICALLY SAFE SYSTEMS FOR HAZARDOUS (CLASSIFIED) LOCATIONS" (EXCEPT CHAPTER 5 FOR FISCO INSTALLATIONS) AND THE NATIONAL ELECTRICAL CODE (ANSI/NFPA 70) SECTIONS 504 AND 505.

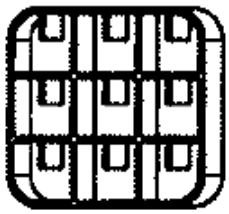
Biofilm Carrier



Product Name – BWTX™

Application

The BWT X™ Biofilm Carrier element is used in biological treatment processes for both water and wastewater treatment.

Design

The BWT X™ elements consist of nine (9) cells, with following dimensions:

Width/Height :	14.5 mm (±0.5 mm)
Length :	8.2 mm (+0.2/-0.2mm)
Outer Perimeter :	55 mm
Inner Perimeter :	197 mm
Wall Thickness :	0.35 (±0.1 mm)

Note: Tolerances according to DIN 16941/3.

Material

Material :	Polyethylene, High-Density (HDPE).
Colour :	Natural
Specific Weight :	
Raw Material	0.96 (± 0.02) kg/L
Extruded Material	0.95 (± 0.02) kg/L

Note: Add-Max® 104 added to material to improve stabilization for extruding process.

The biofilm carrier elements are produced from a material and with a procedure that ensures that material will have a prolonged aging time; guaranteeing proper operation for its service life, provided that the carrier elements are:

- stored and packaged, as from the producer, and;
- applied in the biological reactors, according to standard practice.

The shape of the biofilm carrier elements may in some cases be irregular, which has no negative effect on the total guaranteed specific surface area.

Specifications

Carrier Element :	
Specific Surface Area (Protected)	650 m^2 per m^3
Weight	131 kg/m^3 (in bulk, at production)

Quality Assurance

The producer is instructed to visually inspect/test to control form, dimensions and density (kg/m^3 in bulk), to ensure conformity to specification.

Warning

Prior to installation, read these installation and operating instructions. Installation and operation must comply with local regulations and accepted codes of good practice.

1. Safety instructions

These installation and operating instructions contain general instructions that must be observed during installation, operation and maintenance of the pump. It must therefore be read by the installation engineer and the relevant qualified operator prior to installation and start-up, and must be available at the installation location at all times.

1.1 Symbols used in this document

Warning
If these safety instructions are not observed, it may result in personal injury.

Caution — If these safety instructions are not observed, it may result in malfunction or damage to the equipment.

Note — Notes or instructions that make the job easier and ensure safe operation.

1.2 Qualification and training of personnel

The personnel responsible for the installation, operation and service must be appropriately qualified for these tasks. Areas of responsibility, levels of authority and the supervision of the personnel must be precisely defined by the operator. If necessary, the personnel must be trained appropriately.

Risks of not observing the safety instructions

Non-observance of the safety instructions may have dangerous consequences for the personnel, the environment and the pump and may result in the loss of any claims for damages.

It may lead to the following hazards:

- Personal injury from exposure to electrical, mechanical and chemical influences.
- Damage to the environment and personal injury from leakage of harmful substances.

1.3 Safety instructions for the operator/user

The safety instructions described in these instructions, existing national regulations on health protection, environmental protection and for accident prevention and any internal working, operating and safety regulations of the operator must be observed.

Information attached to the pump must be observed.

Leakages of dangerous substances must be disposed of in a way that is not harmful to the personnel or the environment.

Damage caused by electrical energy must be prevented, see the regulations of the local electricity supply company.

Caution — Before any work to the pump, the pump must be in the "Stop" operating state or be disconnected from the power supply. The system must be pressureless!

Note — The mains plug is the separator separating the pump from the mains.

Only original accessories and original spare parts should be used. Using other parts can result in exemption from liability for any resulting consequences.

1.4 Safety of the system in the event of a failure in the dosing pump

The dosing pump was designed according to the latest technologies and is carefully manufactured and tested.

If it fails regardless of this, the safety of the overall system must be ensured. Use the relevant monitoring and control functions for this.

Caution — Make sure that any chemicals that are released from the pump or any damaged lines do not cause damage to system parts and buildings.

The installation of leak monitoring solutions and drip trays is recommended.

1.5 Dosing chemicals

Warning

Before switching the supply voltage back on, the dosing lines must be connected in such a way that any chemicals in the dosing head cannot spray out and put people at risk.

The dosing medium is pressurised and can be harmful to health and the environment.

Warning

When working with chemicals, the accident prevention regulations applicable at the installation site should be applied (e.g. wearing protective clothing).

Observe the chemical manufacturer's safety data sheets and safety instructions when handling chemicals!

Caution

A deaeration hose, which is routed into a container, e.g. a drip tray, must be connected to the deaeration valve.

Caution

The dosing medium must be in liquid aggregate state!

Observe the freezing and boiling points of the dosing medium!

Caution

The resistance of the parts that come into contact with the dosing medium, such as the dosing head, valve ball, gaskets and lines, depends on the medium, media temperature and operating pressure.

Ensure that parts in contact with the dosing media are resistant to the dosing medium under operating conditions, see data booklet!

Should you have any questions regarding the material resistance and suitability of the pump for specific dosing media, please contact Grundfos.

1.6 Diaphragm breakage

If the diaphragm leaks or is broken, dosing liquid escapes from the drain opening (fig. 41, pos. 11) on the dosing head. Observe section *7.6 Diaphragm breakage*.

Warning

Danger of explosion, if dosing liquid has entered the pump housing!

Operation with damaged diaphragm can lead to dosing liquid entering the pump housing.

In case of diaphragm breakage, immediately separate the pump from the power supply!

Make sure the pump cannot be put back into operation by accident!

Dismantle the dosing head without connecting the pump to the power supply and make sure no dosing liquid has entered the pump housing. Proceed as described in section *7.6.1 Dismantling in case of diaphragm breakage*.

To avoid any danger resulting from diaphragm breakage, observe the following:

- Perform regular maintenance. See section *7.1 Regular maintenance*.
- Never operate the pump with blocked or soiled drain opening.
  - If the drain opening is blocked or soiled, proceed as described in section *7.6.1 Dismantling in case of diaphragm breakage*.
- Never attach a hose to the drain opening. If a hose is attached to the drain opening, it is impossible to recognise escaping dosing liquid.
- Take suitable precautions to prevent harm to health and damage to property from escaping dosing liquid.
- Never operate the pump with damaged or loose dosing head screws.

2. General information

The DDA dosing pump is a self-priming diaphragm pump. It consists of a housing with stepper motor and electronics, a dosing head with diaphragm and valves and the control cube.

Excellent dosing features of the pump:

- Optimal intake even with degassing media, as the pump always works at full suction stroke volume.
- Continuous dosing, as the medium is sucked up with a short suction stroke, regardless of the current dosing flow, and dosed with the longest possible dosing stroke.

2.1 Applications

The pump is suitable for liquid, non-abrasive, non-flammable and non-combustible media strictly in accordance with the instructions in these installation and operating instructions.

Areas of application

- Drinking water treatment
- Wastewater treatment
- Swimming pool water treatment
- Boiler water treatment
- CIP (Clean-In-Place)
- Cooling water treatment
- Process water treatment
- Wash plants
- Chemical industry
- Ultrafiltration processes and reverse osmosis
- Irrigation
- Paper and pulp industry
- Food and beverage industries

2.2 Improper operating methods

The operational safety of the pump is only guaranteed if it is used in accordance with section *2.1 Applications*.

Warning

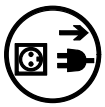
Other applications or the operation of pumps in ambient and operating conditions, which are not approved, are considered improper and are not permitted. Grundfos cannot be held liable for any damage resulting from incorrect use.

Warning

The pump is NOT approved for operation in potentially explosive areas!

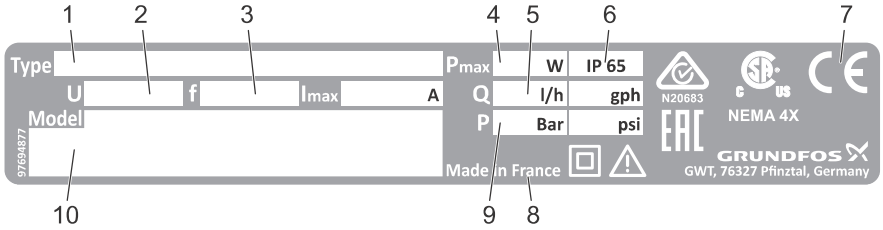
Warning

A sunscreen is required for outdoor installation!



Caution

Frequent disengagement from the mains voltage, e.g. via a relay, can result in damage to the pump electronics and in the breakdown of the pump. The dosing accuracy is also reduced as a result of internal start procedures.



Do not control the pump via the mains voltage for dosing purposes!

Only use the "External stop" function to start and stop the pump!

2.3 Symbols on the pump

Symbol	Description
	Indication of universally dangerous spot.
	In case of emergency and prior to all maintenance work and repairs, take the mains plug out of the mains supply!
	The device complies with electrical safety class II.
	Connection for deaeration hose at dosing head. If the deaeration hose is not correctly connected, danger will arise due to possible leakage of dosing liquid!

2.4 Nameplate

4. Assembly and installation

For use in Australia:

Note

Installation of this product must comply with AS/NZS3500!

Certificate of suitability number: CS9431

C-tick number: N20683

4.1 Pump assembly

Warning

Install the pump in such a way that the plug can easily be reached by the operator during operation! This will enable the operator to separate the pump from the mains quickly in case of emergency!

The pump is delivered with a mounting plate. The mounting plate can be mounted vertically e.g. on a wall or horizontally e.g. on a tank. It takes just a few quick steps to firmly secure the pump to the mounting plate by means of a slot mechanism.

The pump can easily be released from the mounting plate for maintenance.

4.1.1 Requirements

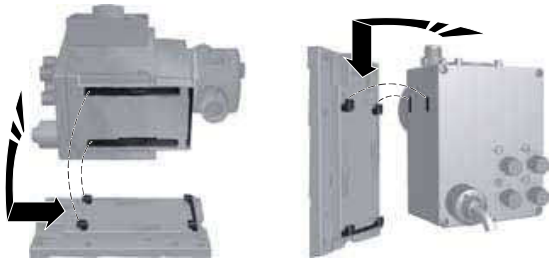
- The mounting surface must be stable and must not vibrate.
- Dosing must flow upwards vertically.

4.1.2 Align and install mounting plate

- **Vertical installation**: Mounting plate slot mechanism must be above.
- **Horizontal installation**: Mounting plate slot mechanism must be opposite the dosing head.
- The mounting plate can be used as a drill template, please see fig. 4 for drill hole distances.

TM04 1162 0110

Fig. 5 Locate mounting plate



Warning

Make sure that you do not damage any cables and lines during installation!

1. Indicate drill holes.
2. Drill holes.
3. Secure mounting plate using four screws, diameter 5 mm, to the wall, on the bracket or the tank.

4.1.3 Engage pump in mounting plate

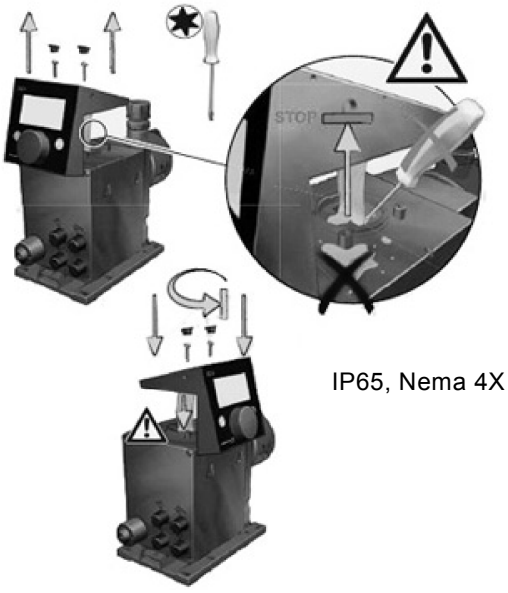
1. Attach the pump to the mounting plate support clamps and slide under slight pressure until it engages.

TM04 1159 0110

Fig. 6 Engaging the pump

4.1.4 Adjusting control cube position

The control cube is fitted to the front of the pump on delivery. It can be turned by 90 ° so that the user can select to operate the pump from the right or left side.



Caution

The enclosure class (IP65/Nema 4X) and shock protection are only guaranteed if the control cube is installed correctly!

Caution

Pump must be disconnected from the power supply!

1. Carefully remove both protective caps on the control cube using a thin screwdriver.
2. Loosen screws.
3. Carefully lift off control cube only so far from the pump housing that no tensile stress is produced on the flat band cable.
4. Turn control cube by 90 ° and re-attach.
   – Make sure the O-ring is secure.
5. Tighten screws slightly and attach protective caps.

IP65, Nema 4X

TM04 1182 0110

Fig. 7 Adjusting control cube

4.2 Hydraulic connection

Warning

Risk of chemical burns!

Wear protective clothing (gloves and goggles) when working on the dosing head, connections or lines!

The dosing head may contain water from the factory check!

Caution When dosing media which should not come into contact with water, another medium must be dosed beforehand!

Caution Faultless function can only be guaranteed in conjunction with lines supplied by Grundfos!

Caution The lines used must comply with the pressure limits as per section *3.1 Technical data*!

Important information on installation

- Observe suction lift and line diameter, see section *3.1 Technical data*.
- Shorten hoses at right angles.
- Ensure that there are no loops or kinks in the hoses.
- Keep suction line as short as possible.
- Route suction line up towards the suction valve.
- Installing a filter in the suction line protects the entire installation against dirt and reduces the risk of leakage.
- Only control variant FC/FCM: For discharge quantities < 1 l/h we recommend the use of an additional spring-loaded valve (approx. 3 bar) on the discharge side for the safe generation of the necessary differential pressure.

Hose connection procedure

1. Push union nut and tensioning ring across hose.
2. Push cone part fully into hose, see fig. 8.
3. Attach cone part with hose to corresponding pump valve.
4. Tighten union nut manually.
   – Do not use tools!
5. Tighten up union nuts after 2-5 operating hours if using PTFE gaskets!
6. Attach deaeration hose to the corresponding connection (see fig. 3) and run into a container or a collecting tray.

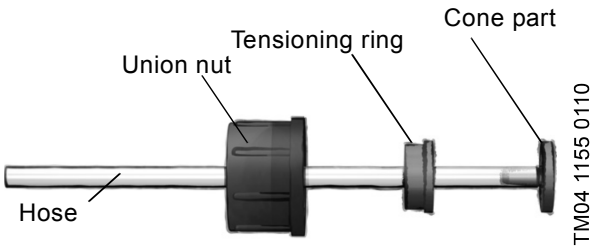


Fig. 8 Hydraulic connection

Note Pressure differential between suction and discharge side must be at least 1 bar/14.5 psi!

Caution Tighten the dosing head screws with a torque wrench once before commissioning and again after 2-5 operating hours at 4 Nm.

Installation example

The pump offers various installation options. In the picture below, the pump is installed in conjunction with a suction line, level switch and multifunction valve on a Grundfos tank.

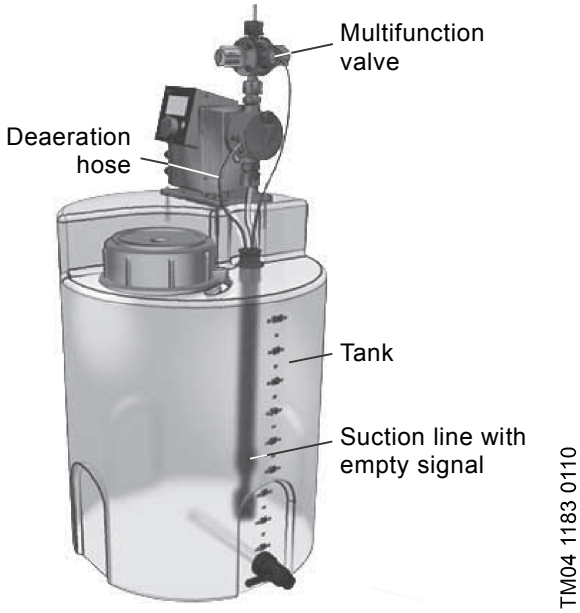

Fig. 9 Installation example

4.3 Electrical connection

Warning

The enclosure class (IP65/Nema 4X) is only guaranteed if plugs or protective caps are correctly installed!

Warning

The pump can start automatically when the mains voltage is switched on!

Do not manipulate mains plug or cable!

The mains plug is the separator separating the pump from the mains.

Note The rated voltage of the pump, see section *2.4 Nameplate*, must conform to local conditions.

Signal connections

Warning

Electric circuits of external devices connected to the pump inputs must be separated from dangerous voltage by means of double or reinforced insulation!

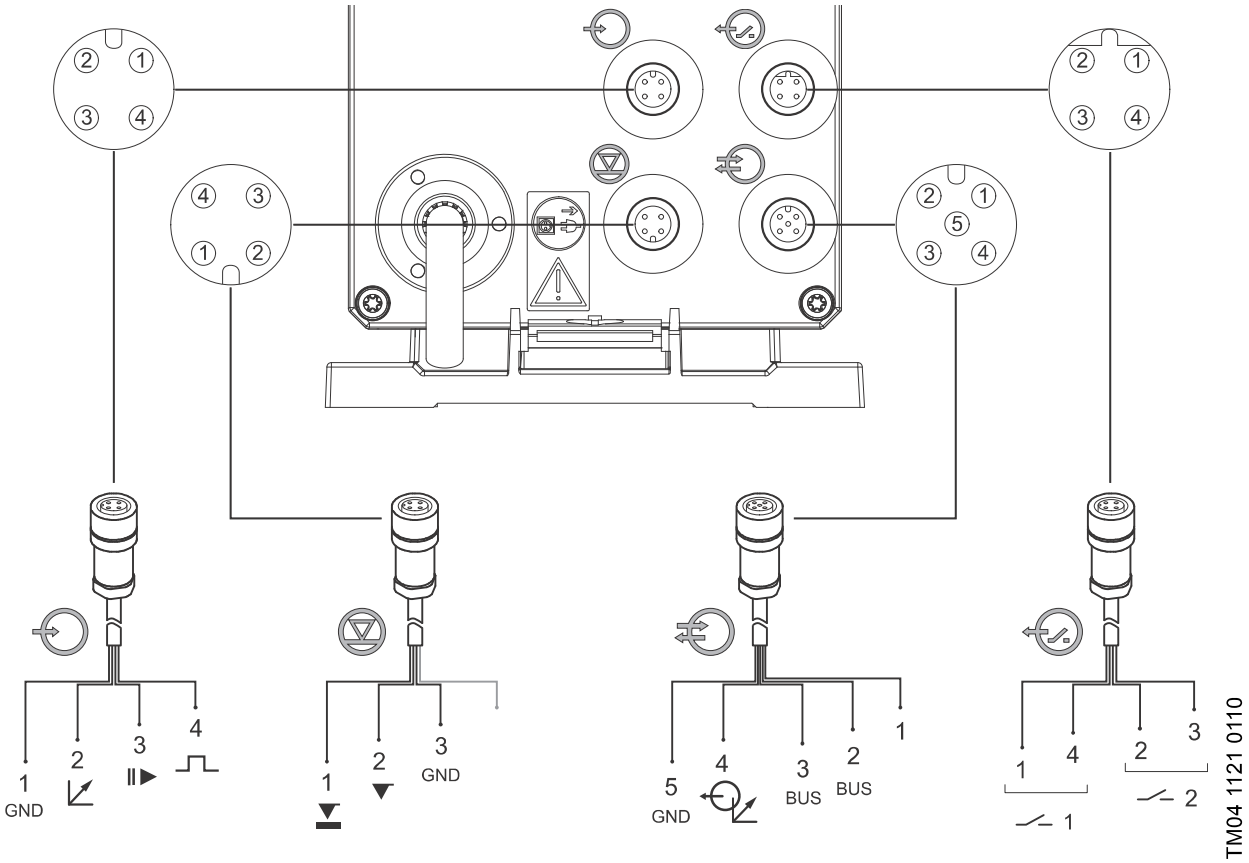

Fig. 10 Wiring diagram of the electrical connections

Analog, External stop and pulse input

Function	Pins				Plug type
	1/brown	2/white	3/blue	4/black	
Analog	GND/(-) mA	(+) mA			mA signal
External stop	GND		X		Pulse
Pulse	GND			X	Pulse

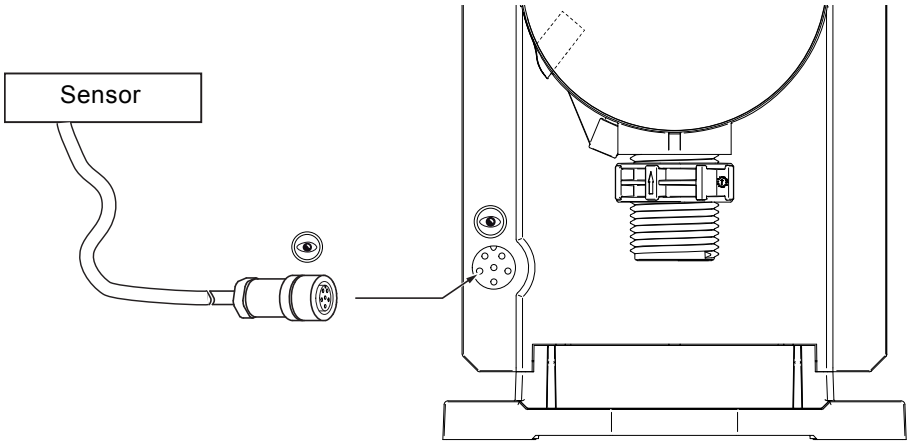
Level signals: Empty signal and Low-level signal

Function	Pins				Plug type
	1	2	3	4	
Low-level signal	X		GND		Pulse
Empty signal		X	GND		Pulse

GENIbus, Analog output

Caution

Danger of damage to the product due to short circuit! Pin 1 supplies 30 VDC.



Never short-circuit pin 1 with any of the other pins!

Function	Pins					Plug type
	1/brown	2/white	3/blue	4/black	5/yellow/ green	
GENIbus	+30 V	GENI bus TXD	GENI bus RXD		GND	Bus
Analog output				(+) mA	GND/(-) mA	mA signal

Relay outputs

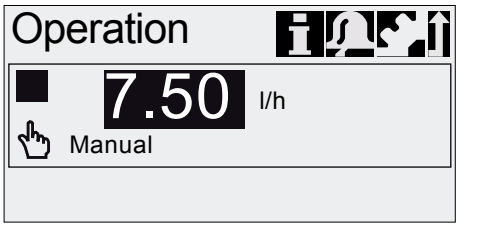
Relay 1	X			X	Pulse
Relay 2		X	X		Pulse

FlowControl signal connection

TM04 1158 1716

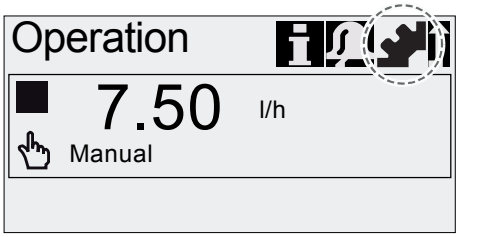
Fig. 11 FlowControl signal connection



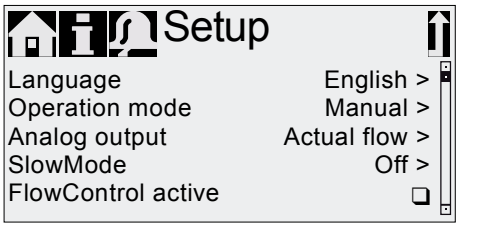
5. Startup

5.1 Setting the menu language

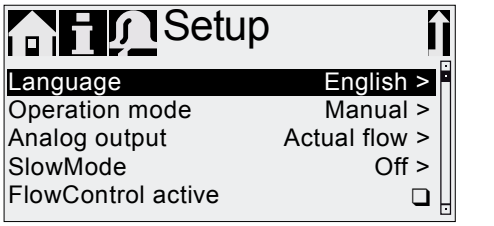
For description of control elements, see section 6.



1. Turn click wheel to highlight the cog symbol.

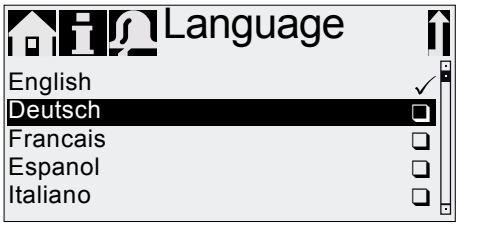


2. Press the click wheel to open the "Setup" menu.



3. Turn the click wheel to highlight the "Language" menu.

4. Press the click wheel to open the "Language" menu.



5. Turn the click wheel to highlight the desired language.

6. Press the click wheel to select the highlighted language.

7. Press the click wheel again to confirm the "Confirm settings?" prompt and apply the setting.

TM04 1184 1110

Fig. 12 Set menu language

5.2 Deaerating the pump

Warning
The deaeration hose must be connected correctly and inserted into a suitable tank!

1. Open deaeration valve by approximately half a turn.
2. Press and hold down the [100%] key (deaeration key) until liquid flows continuously without any bubbles from the deaeration hose.
3. Close deaeration valve.

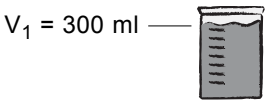
Note

Press the [100%] key and simultaneously turn the click wheel clockwise to increase the duration of the process to up to 300 seconds. After setting the seconds, do not press the key any longer.

5.3 Calibrating the pump

The pump is calibrated in the factory for media with a viscosity similar to water at maximum pump backpressure (see section *3.1 Technical data*).

If the pump is operated with a backpressure that deviates or if dosing a medium whose viscosity deviates, the pump must be calibrated.

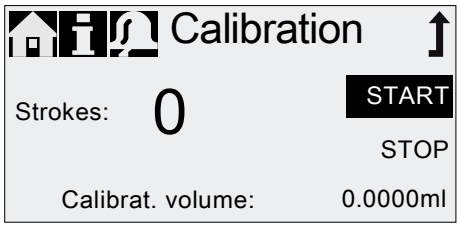


For pumps with FCM control variant, it is not necessary to calibrate the pump if there is deviating or fluctuating backpressure as long as the "AutoFlowAdapt" function has been enabled (see section *6.10 AutoFlowAdapt*).

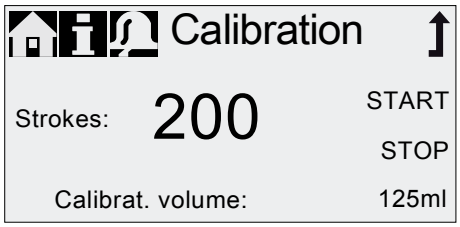
Requirements

- The hydraulics and electrics of the pump are connected (see section *4. Assembly and installation*).
- The pump is integrated into the dosing process under operating conditions.
- The dosing head and suction hose are filled with dosing medium.
- The pump has been deaerated.

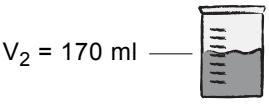
Calibration process - example for DDA 7.5-16



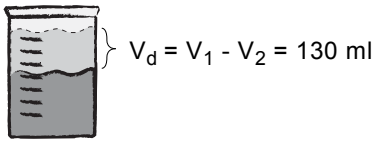
1. Fill a measuring beaker with dosing medium. Recommended filling volumes V_1:
   – DDA 7.5-16: 0.3 l
   – DDA 12-10: 0.5 l
   – DDA 17-7: 1.0 l
   – DDA 30-4: 1.5 l



2. Read off and note down the fill volume V_1 (e.g. 300 ml).
3. Place the suction hose in the measuring beaker.

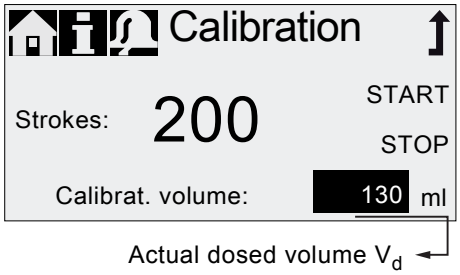


4. Start the calibration process in the "Setup > Calibration" menu.



5. The pump executes 200 dosing strokes and displays the factory calibration value (e.g. 125 ml).

6. Remove the suction hose from the measuring beaker and check the remaining volume V_2 (e.g. 170 ml).



7. From V_1 and V_2, calculate the actual dosed volume $V_d = V_1 - V_2$ (e.g. 300 ml - 170 ml = 130 ml).

8. Set and apply V_d in the calibration menu.

• The pump is calibrated.

TM04 1154 1110

6. Operation

6.1 Control elements

The pump control panel includes a display and the following control elements.

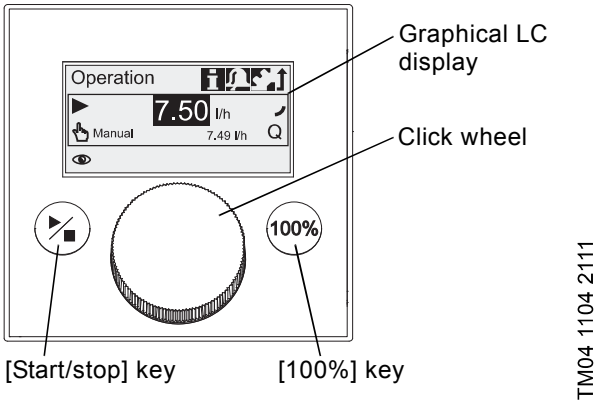


Fig. 13 Control panel

Keys

Key	Function
[Start/stop] key	Starting and stopping the pump.
[100%] key	The pump doses at maximum flow regardless of the operation mode.

Click wheel

The click wheel is used to navigate through the menus, select settings and confirm them.

Turning the click wheel clockwise moves the cursor clockwise in increments in the display. Turning the click wheel counter-clockwise moves the cursor counter-clockwise.

6.2 Display and symbols

6.2.1 Navigation

In the "Info", "Alarm" and "Setup" main menus, the options and submenus are displayed in the rows below. Use the "Back" symbol to return to the higher menu level. The scroll bar at the right edge of the display indicates that there are further menu items which are not shown.

The active symbol (current cursor position) flashes. Press the click wheel to confirm your selection and open the next menu level. The active main menu is displayed as text, the other main menus are displayed as symbols. The position of the cursor is highlighted in black in the sub-menus.

When you position the cursor on a value and press the click wheel, a value is selected. Turning the click wheel clockwise increases the value, turning the click wheel counter-clockwise reduces the value. When you now press the click wheel, the cursor will be released again.

6.2.2 Operating states

The operating state of the pump is indicated by a symbol and display colour.

Display	Fault	Operating state		
White	-	Stop ■	Standby ❙❙	
Green	-			Running ▶
Yellow	Warning	Stop ■	Standby ❙❙	Running ▶
Red	Alarm	Stop ■	Standby ❙❙	

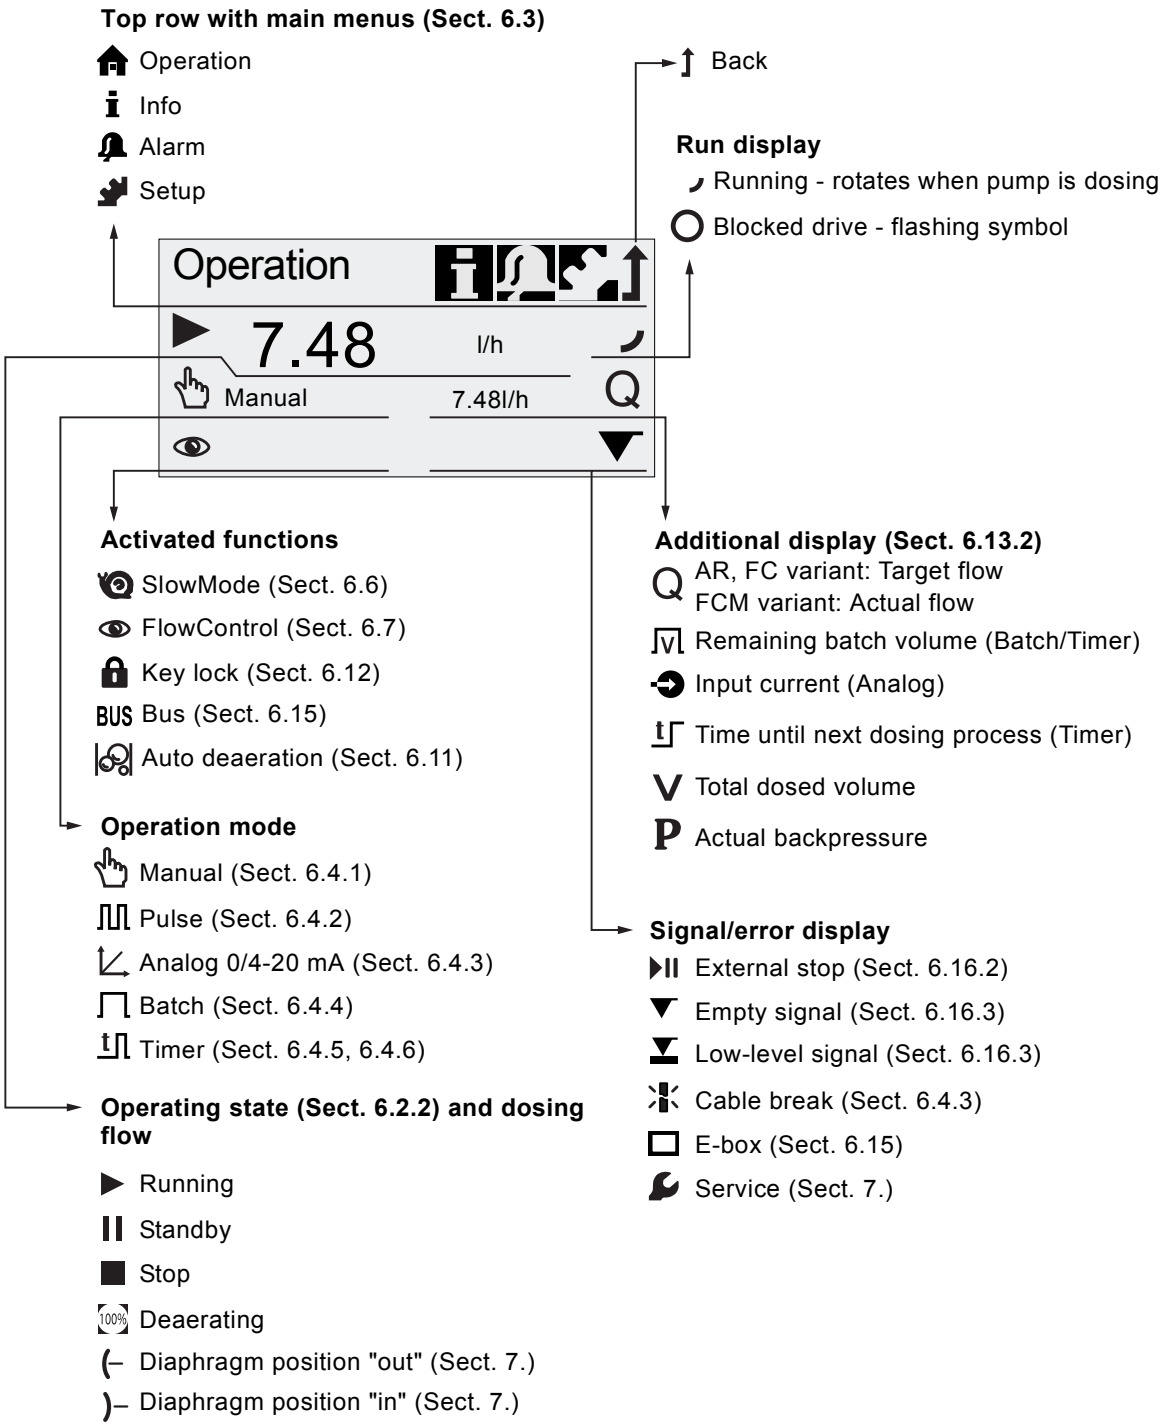
6.2.3 Sleep mode (energy-saving mode)

If in the "Operation" main menu the pump is not operated for 30 seconds, the header disappears. After two minutes, the display brightness is reduced.

If in any other menu the pump is not operated for two minutes, the display switches back to the "Operation" main menu and the display brightness is reduced. This state will be cancelled when the pump is operated or a fault occurs.

6.2.4 Overview of display symbols

The following display symbols may appear in the menus.



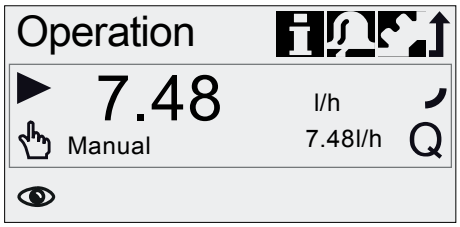


Fig. 14 Overview of display symbols

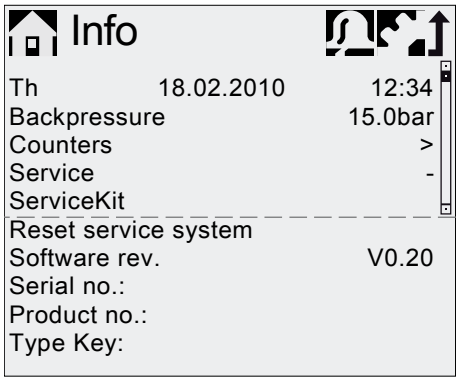
6.3 Main menus

The main menus are displayed as symbols at the top of the display. The currently active main menu is displayed as text.

6.3.1 Operation

Status information such as the dosing flow, selected operation mode and operating state is displayed in the "Operation" main menu.



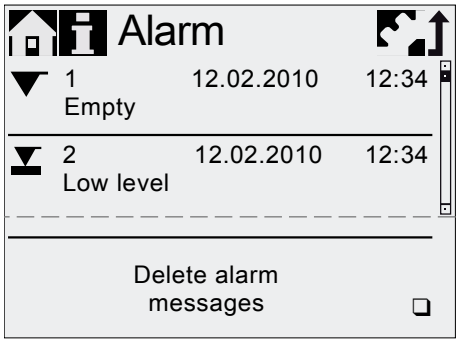
TM04 1157 2011

6.3.2 Info

You can find the date, time and information about the active dosing process, various counters, product data and the service system status in the "Info" main menu. The information can be accessed during operation.

The service system can also be reset from here.

TM04 1106 1010



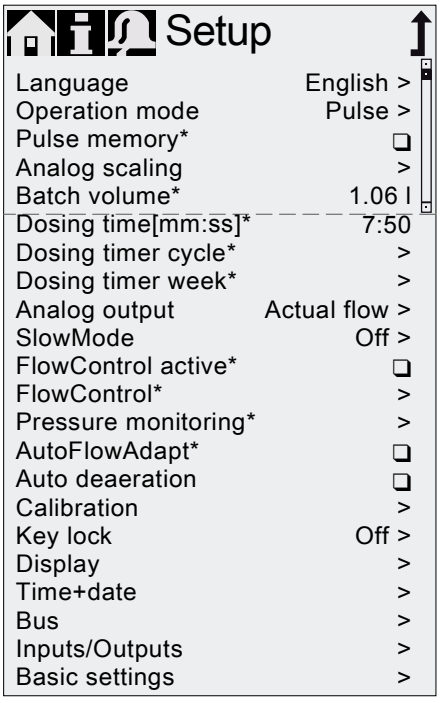
Counters

The "Info > Counters" menu contains the following counters:

Counters	Resettable
Volume Total dosed volume [l] or US gallons	Yes
Operating hours Accumulated operating hours (pump switched on) [h]	No
Motor runtime Accumulated motor runtime [h]	No
Strokes Accumulated number of dosing strokes	No
Power on/off Accumulated frequency of switching mains voltage on	No

6.3.3 Alarm

You can view errors in the "Alarm" main menu.



TM04 1109 1010

Up to 10 warnings and alarms, together with their date, time and cause, are listed in chronological order. If the list is full, the oldest entry will be overwritten, see section *8. Faults*.

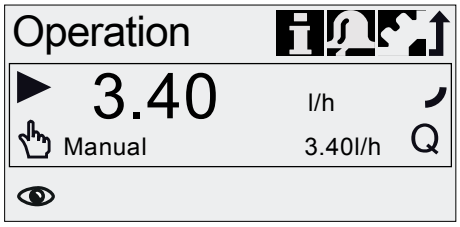
6.3.4 Setup

The "Setup" main menu contains menus for pump configuration. These menus are described in the following sections.

Note Check all pump settings after any change in the "Setup" menu.

TM04 1110 1010

* These submenus are only displayed for specific default settings and control variants.
The contents of the "Setup" menu also vary depending on the operation mode.



6.4 Operation modes

Six different operation modes can be set in the "Setup > Operation mode" menu.

- Manual, see section 6.4.1
- Pulse, see section 6.4.2
- Analog 0-20 mA, see section 6.4.3
  Analog 4-20 mA, see section 6.4.3
- Batch (pulse-based), see section 6.4.4
- Dosing timer cycle, see section 6.4.5
- Dosing timer week, see section 6.4.6

6.4.1 Manual

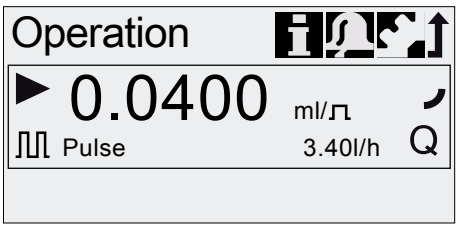
In this operation mode, the pump constantly doses the dosing flow set with the click wheel. The dosing flow is set in l/h or ml/h in the "Operation" menu. The pump automatically switches between the units. Alternatively, the display can be reset to US units (gph). See section *6.13 Display Setup*.

TM04 1125 1110

Fig. 15 Manual mode

The setting range depends on the pump type:

Type	Setting range*	
	[l/h]	[gph]
DDA 7.5-16	0.0025 - 7.5	0.0007 - 2.0
DDA 12-10	0.012 - 12	0.0031 - 3.1
DDA 17-7	0.017 - 17	0.0045 - 4.5
DDA 30-4	0.03 - 30	0.0080 - 8.0



* When the "SlowMode" function is active, the maximum dosing flow is reduced, see section *3.1 Technical data*.

6.4.2 Pulse

In this operation mode, the pump doses the set dosing volume for each incoming (potential-free) pulse, e.g. from a water meter. The pump automatically calculates the optimum stroke frequency for dosing the set volume per pulse.

The calculation is based on:

- the frequency of external pulses
- the set dosing volume/pulse.

TM04 1126 1110

Fig. 16 Pulse mode

The dosing volume per pulse is set in ml/pulse in the "Operation" menu using the click wheel. The setting range for the dosing volume depends on the pump type:

Type	Setting range [ml/pulse]
DDA 7.5-16	0.0015 - 14.9
DDA 12-10	0.0029 - 29.0
DDA 17-7	0.0031 - 31.0
DDA 30-4	0.0062 - 62.0

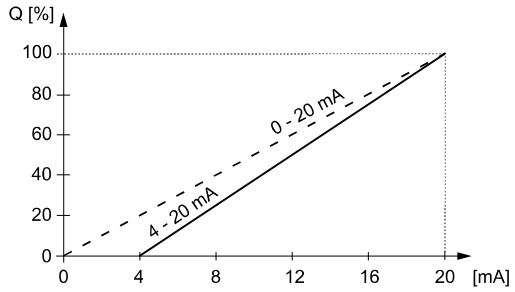
The frequency of incoming pulses is multiplied by the set dosing volume. If the pump receives more pulses than it can process at the maximum dosing flow, it runs at the maximum stroke frequency in continuous operation. Excess pulses will be ignored if the memory function is not enabled.

Memory function

When the "Setup > Pulse memory" function is enabled, up to 65,000 unprocessed pulses can be saved for subsequent processing.

Warning
Subsequent processing of saved pulses can cause local increase in concentration!

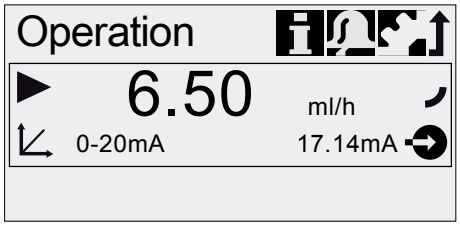
The contents of the memory will be deleted by:



- Switching off the power supply
- Changing the operation mode
- Interruption (e.g. alarm, External stop).

6.4.3 Analog 0/4-20 mA

In this operation mode, the pump doses according to the external analog signal.
The dosing volume is proportional to the signal input value in mA.



Operation mode	Input value [mA]	Dosing flow [%]
4-20 mA	≤ 4.1	0
	≥ 19.8	100
0-20 mA	≤ 0.1	0
	≥ 19.8	100

If the input value in operation mode 4-20 mA falls below 2 mA, an alarm is displayed and the pump stops. A cable break or signal transmitter error has occurred. The "Cable break" symbol is displayed in the "Signal and error display" area of the display.

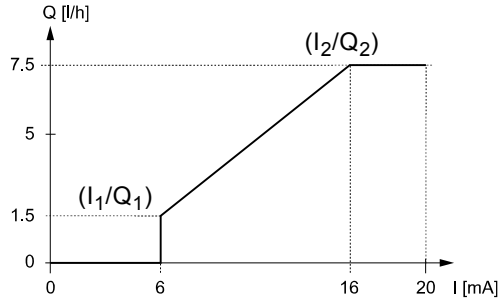
TM04 1120 2010

Fig. 17 Analog scaling

TM04 1127 1110

Fig. 18 Analog operation mode

Set analog scaling



Analog scaling refers to the assignment of the current input value to the dosing flow.

Changes of analog scaling affect also the analog output signal. See section *6.5 Analog output*.

Analog scaling passes through the two reference points (I_1/Q_1) and (I_2/Q_2), which are set in the "Setup > Analog scaling" menu. The dosing flow is controlled according to this setting.

Example 1 (DDA 7.5-16)

Analog scaling with positive gradient:

TM04 1160 2010

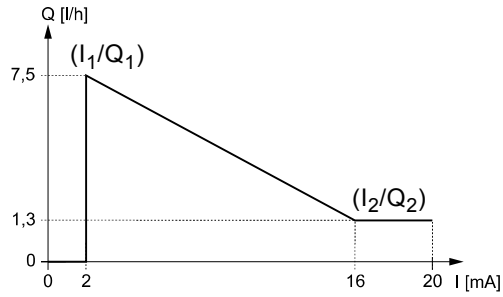


Fig. 19 Analog scaling with pos. gradient

In example 1, the reference points I_1 = 6 mA, Q_1 = 1.5 l/h and I_2 = 16 mA, Q_2 = 7.5 l/h have been set.

From 0 to 6 mA analog scaling is described by a line that passes through Q = 0 l/h, between 6 mA and 16 mA it rises proportionally from 1.5 l/h to 7.5 l/h and from 16 mA onwards it passes through Q = 7.5 l/h.

Example 2 (DDA 7.5-16)

Analog scaling with negative gradient (Operation mode 0-20 mA):

TM04 1101 2010

Fig. 20 Analog scaling with neg. gradient

In example 2, the reference points I_1 = 2 mA, Q_1 = 7.5 l/h and I_2 = 16 mA, Q_2 = 1.3 l/h have been set.

From 0 to 2 mA analog scaling is described by a line that passes through Q = 0 l/h, between 2 mA and 16 mA it drops proportionally from 7.5 l/h to 1.3 l/h and from 16 mA onwards it passes through Q_2 = 1.3 l/h.

Set analog scaling in the "Operation" menu

Analog scaling can also be modified after a security prompt directly in the "Operation" menu. This is how the dosing flow is directly modified for the current flow input value.

Caution Please observe that changes also have a direct effect on point I_2/Q_2 (see fig. 21)!

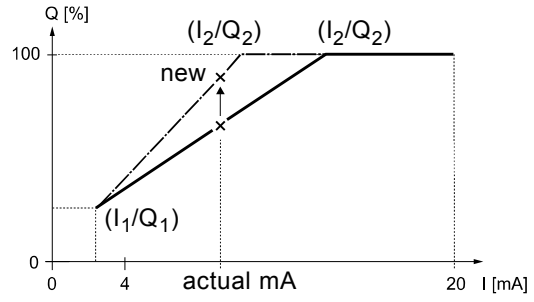

Fig. 21 Set analog scaling ("Operation" menu)

6.4.4 Batch (pulse-based)

In this operation mode, the pump doses the set batch volume in the set dosing time (t_1). A batch is dosed with each incoming pulse.

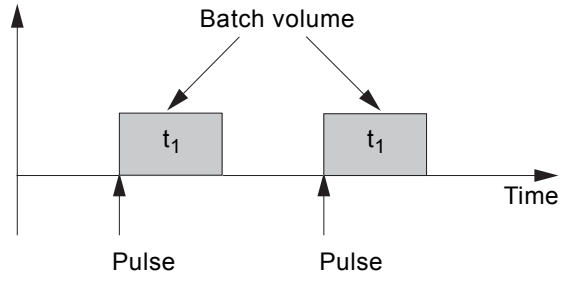

Fig. 22 Batch (pulse-based)

The setting range depends on the pump type:

Type	Setting range per batch		
	from [ml]	to [l]	Resolution* [ml]
DDA 7.5-16	0.74	999	0.0925
DDA 12-10	1.45	999	0.1813
DDA 17-7	1.55	999	0.1938
DDA 30-4	3.10	999	0.3875

* Thanks to the digital motor control, dosing quantities with a resolution of up to 1/8 of the dosing stroke volume can be dosed.

The batch volume (e.g. 75 ml) is set in the "Setup > Batch volume" menu. The minimum dosing time required for this (e.g. 36 seconds) is displayed and can be increased.

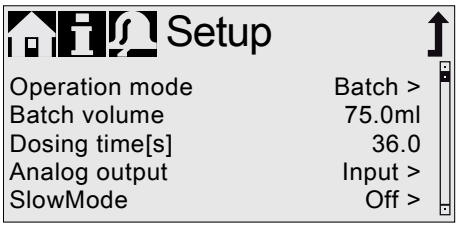

Fig. 23 Batch mode

Signals received during a batch process or an interruption (e.g. alarm, External stop) will be ignored. If the pump is restarted following an interruption, the next batch volume is dosed on the next incoming pulse.

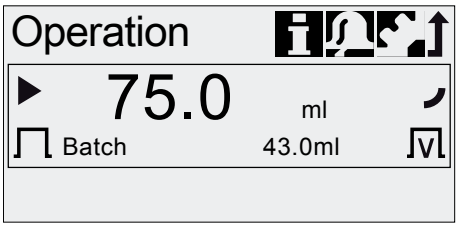

Fig. 24 Batch mode

In the "Operation" menu, the total batch volume (e.g. 75 ml) and the remaining batch volume still to be dosed (e.g. 43 ml) are shown in the display.

6.4.5 Dosing timer cycle

In this operation mode, the pump doses the set batch volume in regular cycles.
Dosing starts when the pump is started after a singular start delay. The setting range for the batch volume corresponds to the values in section *6.4.4 Batch (pulse-based)*.

Warning

When time or date is changed in "Time+date" menu, timer dosing and timer relay output functions (Relay 2) are stopped!

Timer dosing and timer relay output functions must be restarted manually!

Changing time or date can cause increase or decrease in concentration!

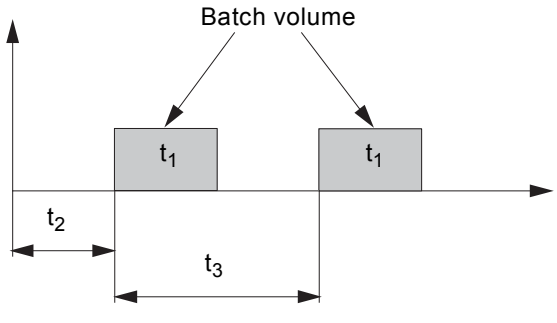

Fig. 25 Dosing timer cycle diagram

t_1	Dosing time
t_2	Start delay
t_3	Cycle time

In the event of an interruption (e.g. interruption of the mains voltage, External stop), the dosing will be stopped while the time continues running.
After suspending the interruption, the pump will continue to dose according to the actual timeline position.

The following settings are required in the "Setup > Dosing timer cycle" menu:

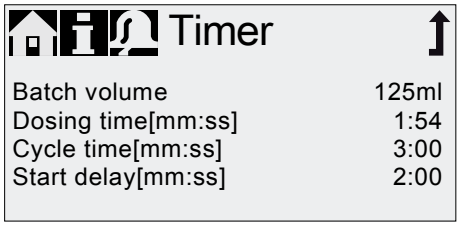

Fig. 26 Dosing timer cycle

The batch volume to be dosed (e.g. 125 ml) is set in the "Setup > Dosing timer cycle" menu. The dosing time required for this (e.g. 1:54) is displayed and can be changed.

The total batch volume (e.g. 125 ml) and the remaining batch volume still to be dosed are displayed in the "Operation" menu. During breaks in dosing, the time until the next dosing process (e.g. 1:21) is displayed.

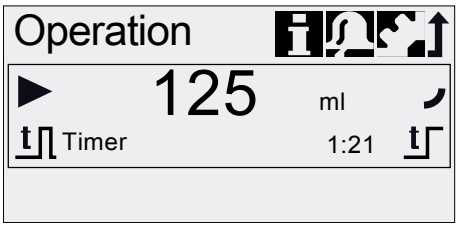

Fig. 27 Dosing timer cycle

6.4.6 Dosing timer week

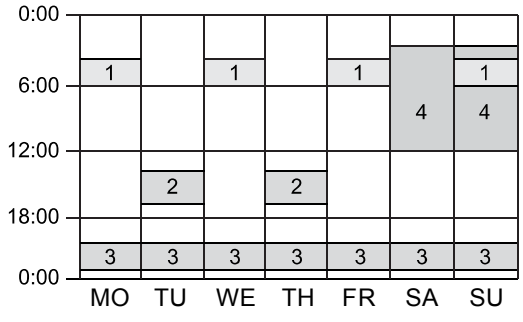
In this operation mode, up to 16 dosing procedures are defined for a week.
These dosing procedures may take place regularly on one or several week days. The setting range for the batch volume corresponds to the values in section *6.4.4 Batch (pulse-based)*.

Warning

When time or date is changed in "Time+date" menu, timer dosing and timer relay output functions (Relay 2) are stopped!

Timer dosing and timer relay output functions must be restarted manually!

Changing time or date can cause increase or decrease in concentration!



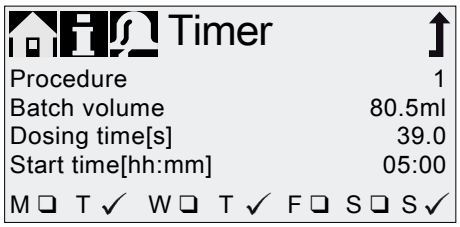


Fig. 28 Example for Dosing timer week function

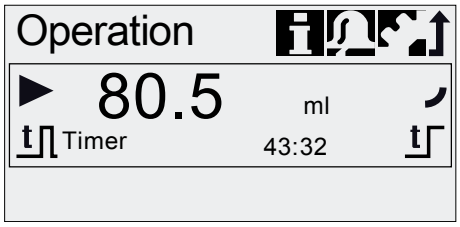
Note If several procedures overlap, the process with the higher dosing flow has priority!

In the event of an interruption (e.g. disconnection of the mains voltage, External stop), the dosing is stopped while the time continues running.
After suspending the interruption, the pump continues to dose according to the actual timeline position.

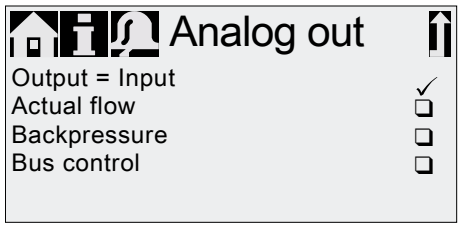
The following settings are required in the "Setup > Dosing timer week" menu for each dosing procedure:



TM04 1138 1110

Fig. 29 Setting the timer

The batch volume (e.g. 80.5 ml) is set in the "Setup > Dosing timer week" menu. The dosing time required for this (e.g. 39.0) is displayed and can be changed.



In the "Operation" menu, the total batch volume (e.g. 80.5 ml) and the remaining batch volume to be dosed is displayed. During breaks in dosing, the time (e.g. 43:32) until the next dosing is displayed.

TM04 1136 1110

Fig. 30 Weekly timer dosing (break in dosing)

6.5 Analog output

TM04 1153 1110

Fig. 31 Configure analog output

The analog output of the pump is parametrised in the "Setup > Analog output" menu. The following settings are possible:

Setting	Description of output signal	Variant FCM	FC	AR
Output = Input	Analog feedback signal (not for master-slave application). The analog input signal is mapped 1:1 to the analog output.	X	X	X
Actual flow**	Current actual flow • 0/4 mA = 0 % • 20 mA = 100 % see section *6.9 Flow measurement*	X	X*	X*
Backpressure	Backpressure, measured in the dosing head • 0/4 mA = 0 bar • 20 mA = Max. operating pressure see section *6.8 Pressure monitoring*	X	X	
Bus control	Enabled by command in Bus control, see section *6.15 Bus communication*	X	X	X

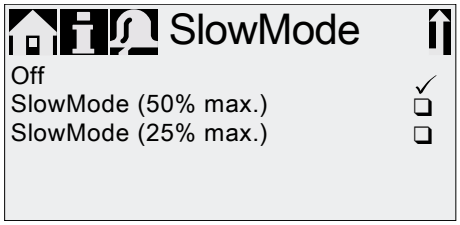
* Output signal is based on motor speed and pump status (target flow).

** Signal has same analog scaling as the current analog input signal. See *6.4.3 Analog 0/4-20 mA*.

Wiring diagram see section *4.3 Electrical connection*.

Note

In all operation modes, the analog output has a range of 4-20 mA. Exception: Operation mode 0-20 mA. Here, the analog output range is 0-20 mA.



6.6 SlowMode

When the "SlowMode" function is enabled, the pump slows down the suction stroke. The function is enabled in the "Setup > SlowMode" menu and is used to prevent cavitation in the following cases:

- for dosing media with a high viscosity
- for degassing dosing media
- for long suction lines
- for large suction lift.

In the "Setup > SlowMode" menu, the speed of the suction stroke can be reduced to 50 % or 25 %.

Caution Enabling the 'SlowMode' function reduces the maximum dosing flow of the pump to the set percentage value!

TM04 1153 1110

Fig. 32 SlowMode menu

6.7 FlowControl

Applies to DDA-FC/FCM control variant.

This function is used to monitor the dosing process. Although the pump is running, various influences e.g. air bubbles, can cause a reduced flow or even stop the dosing process. In order to guarantee optimum process safety, the enabled "FlowControl" function directly detects and indicates the following errors and deviations:

- Overpressure
- Damaged discharge line
- Air in the dosing chamber
- Cavitation
- Suction valve leakage > 70 %
- Discharge valve leakage > 70 %.

The occurrence of a fault is indicated by the "eye" symbol flashing. The faults are displayed in the "Alarm" menu (see section *8. Faults*).

FlowControl works with a maintenance-free sensor in the dosing head. During the dosing process, the sensor measures the current pressure and continuously sends the measured value to the microprocessor in the pump. An internal indicator diagram is created from the current measured values and the current diaphragm position (stroke length). Causes for deviations can be identified immediately by aligning the current indicator diagram with a calculated optimum indicator diagram. Air bubbles in the dosing head reduce e.g. the discharge phase and consequently the stroke volume (see fig. 33).

Requirements for a correct indicator diagram are:

- FlowControl function is active
- pressure difference between suction and discharge side is > 2 bar
- No interruption/pause in discharge stroke
- Pressure sensor and cable are functioning properly
- No leakage > 50 % in suction or discharge valve

If one of these requirements is not met, the indicator diagram cannot be evaluated.

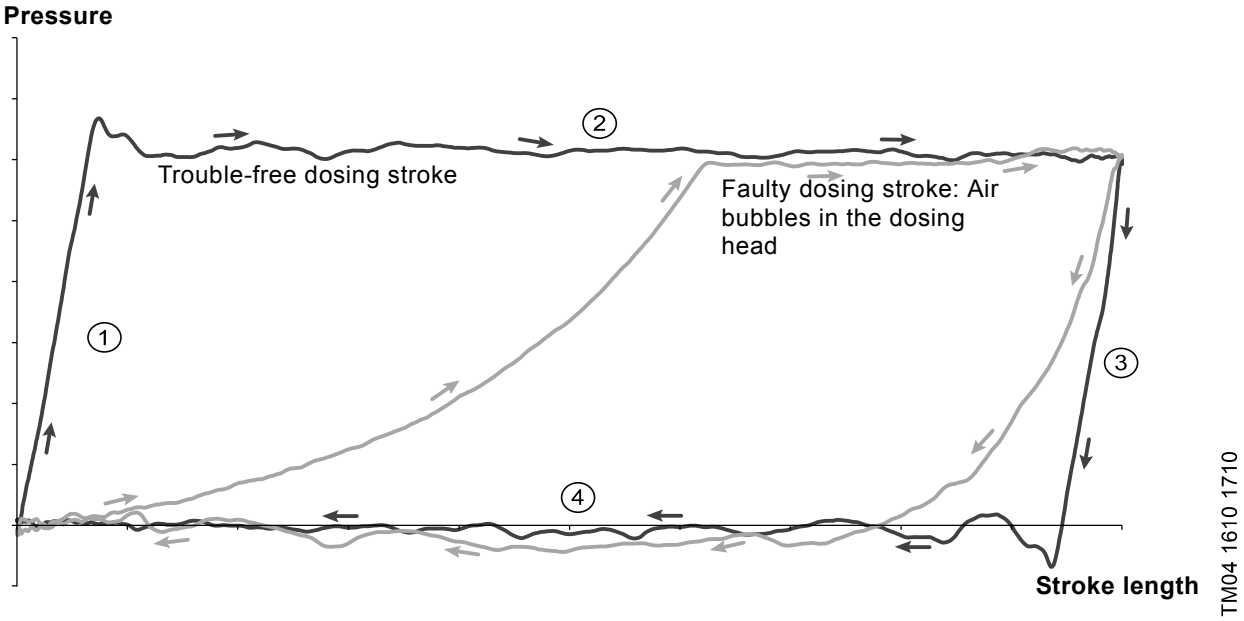


Fig. 33 Indicator diagram

1	Compression phase
2	Discharge phase
3	Expansion phase
4	Suction phase

Setting FlowControl

The "FlowControl" function is set using the two parameters "Sensitivity" and "Delay" in the "Setup > FlowControl" menu.

Sensitivity

In "Sensitivity" the deviation in stroke volume, which will result in an error message, is set in percent.

Sensitivity	Deviation
low	approx. 70 %
medium	approx. 50 %
high	approx. 30 %

Delay

The "Delay" parameter is used to define the time period until an error message is generated: "short", "medium" or "long". The delay depends on the set dosing flow and therefore cannot be measured in strokes or time.

Air bubbles

The "FlowControl" function identifies air bubbles > 60 % of the stroke volume. After switching to "Air bubble" warning status, the pump adapts the stroke frequency to approximately 30-40 % of max. stroke frequency, and starts a special motor drive strategy. The adaptation of the stroke frequency allows the air bubbles to rise from suction to discharge valve. Due to the special motor drive strategy the air bubbles are displaced from the dosing head into the discharge line.

If the air bubbles have not been eliminated after a maximum of 60 strokes, the pump returns to the normal motor drive strategy.

6.8 Pressure monitoring

Applies to DDA-FC/FCM control variant.

A pressure sensor monitors the pressure in the dosing head. If the pressure during the discharge phase falls below 2 bar, a warning is generated (pump continues running). If in the "Setup > Pressure monitoring" menu the function "Min. pressure alarm" is activated, an alarm is generated and the pump is stopped.

If the pressure exceeds the "Max. pressure" set in the "Setup > Pressure monitoring" menu, the pump is shut down, enters the standby state and indicates an alarm.

Caution

The pump restarts automatically once the backpressure falls below the set "Max. pressure"!

6.8.1 Pressure setting ranges

Type	Fixed min. pressure [bar]	Adjustable max. pressure [bar]
DDA 7.5-16	< 2	3-17
DDA 12-10	< 2	3-11
DDA 17-7	< 2	3-8
DDA 30-4	< 2	3-5

Warning

Install a pressure-relief valve in the pressure line to provide protection against impermissibly high pressure!

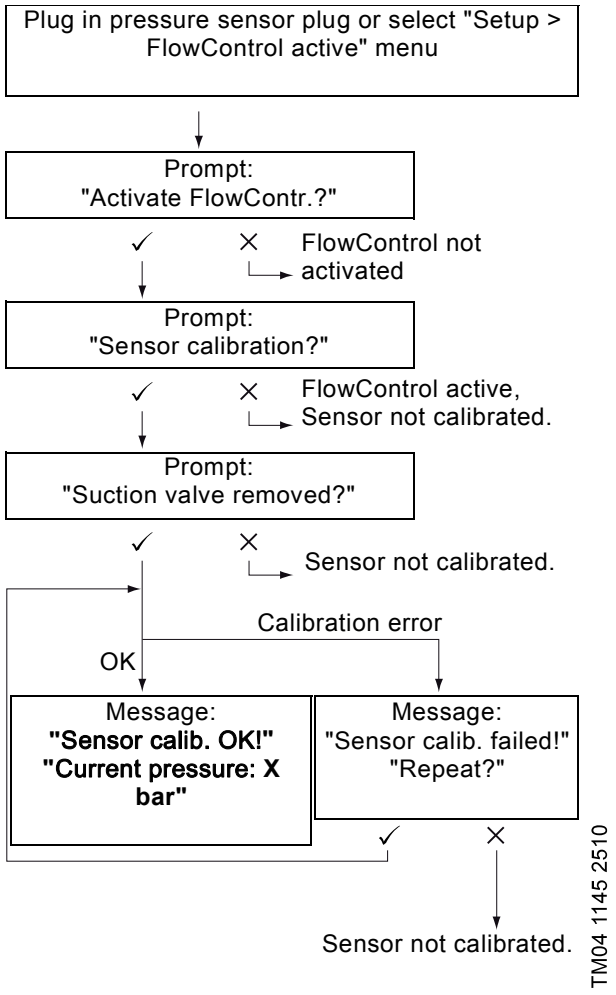
Caution

The pressure measured in the dosing head is slightly higher than the actual system pressure.

Therefore the "Max. pressure " should be set at least 0.5 bar higher than the system pressure.

6.8.2 Calibration of pressure sensor

The pressure sensor is calibrated in the factory. As a rule, it does not need to be re-calibrated. If specific circumstances (e.g. pressure sensor exchange, extreme air pressure values at the location of the pump) necessitate a calibration, the sensor can be calibrated as follows:



1. Set pump to "Stop" operating state.
2. Make system pressureless and flush.
3. Dismantle suction line and suction valve.

Warning

Calibrating when the suction valve is installed produces incorrect calibration and can cause personal injuries and damage to property!

Only carry out a calibration if this is technically required!

4. Proceed as described below to calibrate:

If a calibration is not successfully possible, check plug connections, cable and sensor and replace defective parts where necessary.

6.9 Flow measurement

Applies to DDA-FCM control variant.

The pump accurately measures the actual flow and displays it. Via the 0/4-20 mA analog output, the actual flow signal can easily be integrated into an external process control without additional measuring equipment (see section *6.5 Analog output*).

The flow measurement is based on the indicator diagram as described in section *6.7 FlowControl*. The accumulated length of the discharge phase multiplied by the stroke frequency produces the displayed actual flow. Faults e.g. air bubbles or backpressure that is too low result in a smaller or larger actual flow. When the "AutoFlowAdapt" function is activated (see section *6.10 AutoFlowAdapt*), the pump compensates for these influences by correction of the stroke frequency.

Note

Strokes which cannot be analysed (partial strokes, pressure differential which is too low) are provisionally calculated based on the setpoint value and displayed.

6.10 AutoFlowAdapt

Applies to DDA-FCM control variant.

The "AutoFlowAdapt" function is activated in the "Setup" menu. It detects changes in various parameters and responds accordingly in order to keep the set target flow constant.

Note

Dosing accuracy is increased when "AutoFlowAdapt" is activated.

This function processes information from the pressure sensor in the dosing head. Errors detected by the sensor are processed by the software. The pump responds immediately regardless of the operation mode by adjusting the stroke frequency or where necessary compensating for the deviations with a corresponding indicator diagram.

If the target flow cannot be achieved by the adjustments, a warning is issued.

"AutoFlowAdapt" operates on the basis of the following functions:

- FlowControl: malfunctions are identified (see section *6.7 FlowControl*).
- Pressure monitoring: pressure fluctuations are identified (see section *6.8 Pressure monitoring*).
- Flow measurement: deviations from the target flow are identified (see section *6.9 Flow measurement*).

Example of "AutoFlowAdapt"

Pressure fluctuations

The dosing volume decreases as backpressure increases and conversely the dosing volume increases as the backpressure decreases.

The "AutoFlowAdapt" function identifies pressure fluctuations and responds by adjusting the stroke frequency. The actual flow is thus maintained at a constant level.

6.11 Auto deaeration

Dosing degassing media can result in air pockets in the dosing head during breaks in dosing. This can result in no medium being dosed when restarting the pump. The "Setup > Auto deaeration" function performs pump deaeration automatically at regular intervals. Software-controlled diaphragm movements encourage any bubbles to rise and gather at the discharge valve so that they can be removed on the next dosing stroke.

The function works:

- when the pump is not in the "Stop" operating state
- during breaks in dosing (e.g. External stop, no incoming pulses, etc.).

Note

The diaphragm movements can displace small volumes into the discharge line. When dosing strongly degassing media, this is however virtually impossible.

6.12 Key lock

The key lock is set in the "Setup > Key lock" menu by entering a four-digit code. It protects the pump by preventing changes to settings. Two levels of key lock can be selected:

Level	Description
Settings	All settings can only be changed by entering the lock code. The [Start/stop] key and the [100%] key are not locked.
Settings + keys	The [Start/stop] key and the [100%] key and all settings are locked.

It is still possible to navigate in the "Alarm" and "Info" main menu and reset alarms.

6.12.1 Temporary deactivation

If the "Key lock" function is activated but settings need to be modified, the keys can be unlocked temporarily by entering the deactivation code. If the code is not entered within 10 seconds, the display automatically switches to the "Operation" main menu. The key lock remains active.

6.12.2 Deactivation

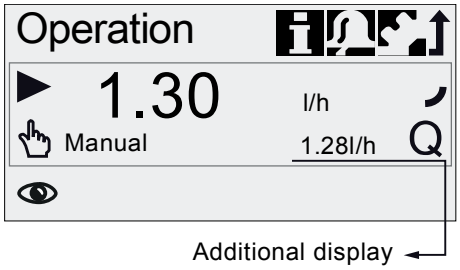
The key lock can be deactivated in the "Setup > Key lock" menu via the "Off" menu point. The key lock is deactivated after the general code "2583" or a pre-defined custom code has been entered.

6.13 Display Setup

Use the following settings in the "Setup > Display" menu to adjust the display properties:

- Units (metric/US)
- Display contrast
- Additional display.

6.13.1 Units



Metric units (litres/millilitres/bar) or US units (US gallons/PSI) can be selected. According to the operation mode and menu, the following units of measurement are displayed:

Operation mode / function	Metric units	US units
Manual control	ml/h or l/h	gph
Pulse control	ml/⊓	ml/⊓
0/4-20 mA Analog control	ml/h or l/h	gph
Batch (pulse- or timer-controlled)	ml or l	gal
Calibration	ml	ml
Volume counter	l	gal
Pressure monitoring	bar	psi

6.13.2 Additional display

The additional display provides additional information about the current pump status. The value is shown in the display with the corresponding symbol.

In "Manual" mode the "Actual flow" information can be displayed with Q = 1.28 l/h (see fig. 34).

TM04 1151 2011

Fig. 34 Display with additional display

The additional display can be set as follows:

Setting	Description
Default display	Depending on the operation mode:
	Q Actual flow (Manual/Pulse)[1), 2)]
	Q Target flow (Pulse)
	Input current (analog)
	Remaining batch volume (Batch, Timer)
	t Period until next dosing (Timer)
Dosed volume	V Dosed vol. since last reset (see *Counters* on page 21)
Actual flow	Q Current actual flow[1)]
Backpressure	P Current backpressure in the dosing head[3)]

1) only DDA-FCM control variant

2) only if indicator diagram can be evaluated (see *6.7 FlowControl*)

3) only DDA-FCM/FC control variant

6.14 Time+date

The time and date can be set in the "Setup > Time+date" menu.

Warning

When time or date is changed in "Time+date" menu, timer dosing and timer relay output functions (Relay 2) are stopped!

Timer dosing and timer relay output functions must be restarted manually!

Changing time or date can cause increase or decrease in concentration!

Caution

The conversion between summer and winter time does not take place automatically!

6.15 Bus communication

BUS

The bus communication enables remote monitoring and setting of the pump via a fieldbus system.

Further manuals, functional profiles and support files (e.g. GSD-files) are available on the CD delivered with the interface hardware and on www.grundfos.com.

6.15.1 GENIbus communication

The pump is supplied with an integrated module for GENIbus communication. The pump identifies the bus control after connecting to the corresponding signal input. The "Activate communication?" prompt is displayed. After confirmation, the corresponding symbol appears in the "Activated functions" area in the "Operation" menu.

In the "Setup > Bus" menu the GENIbus address can be set from 32 to 231 and bus control can be deactivated.

TM04 1139 2410

Fig. 35 Bus menu

Caution The maximum cable length for GENIbus connection is 3 m and must not be exceeded!

6.15.2 Possible industrial bus types

The pump can be integrated into several networks using the additional E-box (Extension-Box).

Bus type	Interface hardware	Retrofitting possible for pump software
Profibus® DP	E-Box 150	V2.0 and higher
Modbus RTU	E-Box 200	V2.5 and higher

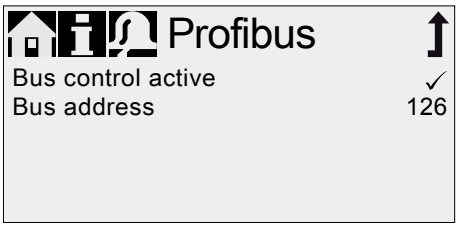
The pump can also be connected to a Grundfos CIU unit (CIU = Communication Interface Unit) equipped with one of the following CIM modules (CIM = Communication Interface Module):

- CIM150 Profibus
- CIM200 Modbus
- CIM270 GRM
- CIM500 Ethernet

For internal communication between the E-Box/CIU and the dosing pump, GENIbus is used.

Caution The maximum cable length for GENIbus connection is 3 m and must not be exceeded!

Caution Prior to installation and start-up, read the documentation delivered with the E-Box or CIU unit!



6.15.3 Activate communication

1. Set the pump to operating state "Stop" with the [Start/stop] key.
2. Switch off the power supply of the pump.
3. Install and connect the E-Box/CIU as described in the respective separate installation and operating instructions.
4. Switch on the power supply of the pump.

The "Activate communication?" prompt is displayed.

After confirmation, the "Bus" symbol appears in the "Activated functions" area of the "Operation" menu, no matter if the prompt was accepted or refused.

If the prompt has been accepted, the bus control function is activated. If the prompt has been refused, bus control function can be activated in "Setup > Bus" menu.

TM04 1139 2410

Fig. 36 Example of submenu for Profibus®

6.15.4 Setting the bus address

1. Enter "Setup > Bus" menu and set desired bus address:

Bus type	Address range
Profibus® DP	~~0 – 126~~0-126
Modbus RTU	~~1 – 247~~1-247

2. The pump needs to be restarted to initialise the new bus address. Switch off the power supply of the pump and wait for approximately 20 seconds.
3. Switch on the power supply of the pump.

The pump is initialised with the new bus address.

6.15.5 Characteristics of bus communication

To start and stop the pump via bus, it needs to be in operating state "Running". When the pump is remotely stopped from bus, the "External stop" symbol is displayed and the pump switches to operating state "Standby".

While bus control function is activated, the "Setup" menu only shows the "Bus" and "Key lock" submenus. The other main menus, the "External stop" function and the keys are still available.

All operation modes (see section *6.4 Operation modes*) can still be used when bus control is activated. This allows to use the bus control only for monitoring and setting the pump. In this case the respective "BusWatchDog" (see funtional profile on E-Box/CIU product CD) should be deactivated in bus control, because otherwise faults in communication can stop the pump.

Note

To change any settings manually, the bus control function must be deactivated temporarily.

The analog output can not be used while the pump is bus-controlled as both functions use the same electrical connection. See section *4.3 Electrical connection*.

6.15.6 Deactivate communication

Warning

After deactivating the bus control function, the pump can start automatically!

Before deactivating the bus control function, set the pump to operating state "Stop"!

Bus control function can be deactivated in the "Setup > Bus" menu. After deactivation all submenus in "Setup" menu are available.

The "Bus" symbol in the display disappears at next restart of the pump, after the E-Box/CIU plug was disconnected.

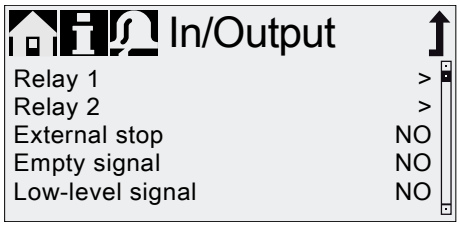
Caution

After disconnecting any plug, always refit protective cap!

6.15.7 Communication faults

Faults are only detected, if the respective "BusWatchDog" (see functional profile on E-Box/CIU product CD) is activated.

Warning



After a communication fault is repaired, the pump can start automatically, depending on current bus control and pump settings!

Before repairing any fault, set the pump to operating state "Stop"!

In case of bus communication faults (e.g. communication cable break), the pump stops dosing and switches to operating state "Standby" approximately 10 seconds after the fault was detected. An alarm is triggered, detailing the cause of the fault. See section *8. Faults*.

6.16 Inputs/Outputs

In the "Setup > Inputs/Outputs" menu, you can configure the two outputs "Relay 1+Relay 2" and the signal inputs "External stop", "Empty signal" and "Low-level signal".

TM04 1152 1110

Fig. 37 Inputs/Outputs menu

Warning

When time or date is changed in "Time+date" menu, timer dosing and timer relay output functions (Relay 2) are stopped!

Timer dosing and timer relay output functions must be restarted manually!

Changing time or date can cause increase or decrease in concentration!

6.16.1 Relay outputs

The pump can switch two external signals using installed relays. The relays are switched by potential-free pulses. The connection diagram of the relays is shown in section *4.3 Electrical connection*. Both relays can be allocated with the following signals:

Relay 1 signal	Relay 2 signal	Description
Alarm*	Alarm	Display red, pump stopped (e.g. empty signal, etc.)
Warning*	Warning	Display yellow, pump is running (e.g. low-level signal, etc.)
Stroke signal	Stroke signal	Each full stroke
Pump dosing	Pump dosing*	Pump running and dosing
Pulse input**	Pulse input**	Each incoming pulse from pulse input
Bus control	Bus control	Activated by a command in the bus communication
	Timer Cycle	See following sections
	Timer Week	See following sections
Contact type		
NO*	NO*	Normally open contact
NC	NC	Normally closed contact

* Factory setting

** The correct transmission of incoming pulses can only be guaranteed up to a pulse frequency of 5 Hz.

Timer Cycle (Relay 2)

For the "Relay 2 > Timer Cycle" function, set the following parameters:

- On (t_1)
- Start delay (t_2)
- Cycle time (t_3)

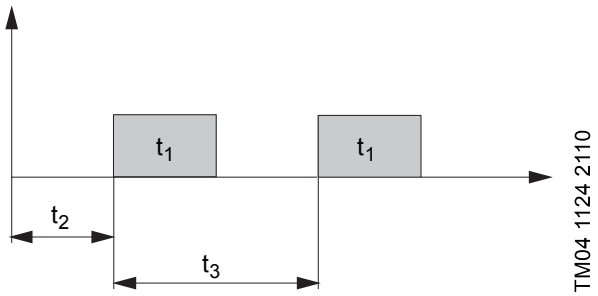


Fig. 38 Diagram

Timer Week (Relay 2)

This function saves up to 16 relay on-times for a week. The following settings can be made for each relay switching operation in the "Relay 2 > Timer Week" menu:

- Procedure (No.)
- On time (duration)
- Start time
- Weekdays.

6.16.2 External stop

The pump can be stopped via an external pulse, e.g. from a control room. When activating the external stop pulse, the pump switches from the operating state "Running" into the operating state "Standby". The corresponding symbol appears in the "Signal/error display" area of the display.

Caution

Frequent disengagement from the mains voltage, e.g. via a relay, can result in damage to the pump electronics and in the breakdown of the pump. The dosing accuracy is also reduced as a result of internal start procedures.

Do not control the pump via the mains voltage for dosing purposes!

Only use the "External stop" function to start and stop the pump!

The contact type is factory-set to normally open contact (NO). In the "Setup > Inputs/Outputs > External stop" menu, the setting can be changed to normally closed contact (NC).

6.16.3 Empty and Low level signals

In order to monitor the filling level in the tank, a dual-level sensor can be connected to the pump. The pump responds to the signals as follows:

Sensor signal	Pump status
Low level	• Display is yellow • ⧗ Flashes • Pump continues running
Empty	• Display is red • ▼ Flashes • Pump stops

Caution When the tank is filled up again, the pump restarts automatically!

Both signal inputs are allocated to the normally open contact (NO) in the factory. They can be re-allocated in the "Setup > Inputs/Outputs" menu to normally closed contact (NC).

6.17 Basic settings

All settings can be reset to the settings default upon delivery in the "Setup > Basic settings" menu.

Selecting "Save customer settings" saves the current configuration to the memory. This can then be activated using "Load customer settings".

The memory always contains the previously saved configuration. Older memory data is overwritten.

7. Service

In order to ensure a long service life and dosing accuracy, wearing parts such as diaphragms and valves must be regularly checked for signs of wear. Where necessary, replace worn parts with original spare parts made from suitable materials.

Should you have any questions, please contact your service partner.

Warning

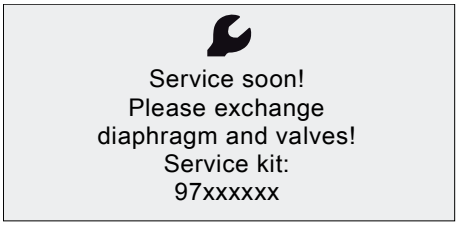
Maintenance work must only be carried out by qualified staff.

7.1 Regular maintenance

Interval	Task
Daily	Check, if liquid leaks from the drain opening (fig. 41, pos. 11) and if the drain opening is blocked or soiled. If so, follow the instructions given in section *7.6 Diaphragm breakage*.
	Check, if liquid leaks from the dosing head or valves. If necessary, tighten dosing head screws with a torque wrench at 4 Nm. If necessary, tighten valves and cap nuts, or perform service (see *7.4 Perform service*).
	Check, if a service requirement is present at the pump display. If so, follow the instructions given in section *7.3 Service system*.
Weekly	Clean all pump surfaces with a dry and clean cloth.
Every 3 months	Check dosing head screws. If necessary, tighten dosing head screws with a torque wrench at 4 Nm. Replace damaged screws immediately.

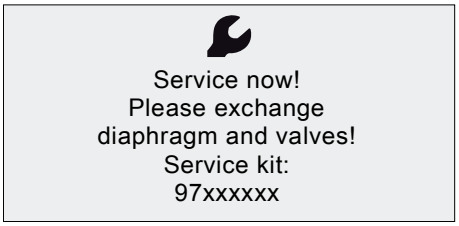
7.2 Cleaning



If necessary, clean all pump surfaces with a dry and clean cloth.

7.3 Service system

According to the motor runtime or after a defined period of operation, service requirements will appear. Service requirements appear regardless of the current operating state of the pump and do not affect the dosing process.



Service requirement	Motor runtime [h]*	Time interval [months]*
Service soon!	7500	23
Service now!	8000	24

* Since the last service system reset

TM04 1131 1110

Fig. 39 Service soon!

TM04 1131 1110

Fig. 40 Service now!

Caution For media which result in increased wear, the service interval must be shortened.

The service requirement signals when the replacement of wearing parts is due and displays the number of the service kit. Press the click wheel to temporarily hide the service prompt.

When the "Service now!" message appears (displayed daily), the pump must be serviced immediately. The symbol appears in the "Operation" menu.

The number of the service kit required is also displayed in the "Info" menu.

7.4 Perform service

Only spare parts and accessories from Grundfos should be used for maintenance. The usage of non-original spare parts and accessories renders any liability for resulting damages null and void.

Further information about carrying out maintenance can be found in the service kit catalogue on our homepage. See www.grundfos.com.

Warning

Risk of chemical burns!

When dosing dangerous media, observe the corresponding precautions in the safety data sheets!

Wear protective clothing (gloves and goggles) when working on the dosing head, connections or lines!

Do not allow any chemicals to leak from the pump. Collect and dispose of all chemicals correctly!

Caution

Before any work to the pump, the pump must be in the "Stop" operating state or be disconnected from the power supply. The system must be pressureless!

7.4.1 Dosing head overview

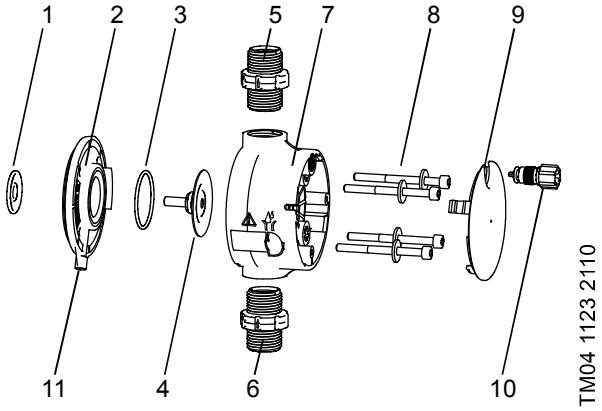

Fig. 41 Changing the diaphragm and valves

1	Safety diaphragm
2	Flange
3	O-ring
4	Diaphragm
5	Valve on discharge side
6	Valve on suction side
7	Dosing head
8	Screws with discs
9	Cover
10	Deaeration valve
11	Drain opening

7.4.2 Dismantling the diaphragm and valves

Warning

Danger of explosion, if dosing liquid has entered the pump housing!

If the diaphragm is possibly damaged, don't connect the pump to the power supply! Proceed as described in section *7.6 Diaphragm breakage*!

This section refers to fig. 41.

1. Make system pressureless.
2. Empty dosing head before maintenance and flush it if necessary.
3. Set pump to "Stop" ■ operating state using the [Start/stop] key.
4. Press the [Start/stop] and [100%] keys at the same time to put the diaphragm into "out" position.
   – Symbol (– must be displayed (see fig. 14).
5. Take suitable steps to ensure that the returning liquid is safely collected.
6. Dismantle suction, pressure and deaeration hose.
7. Dismantle valves on suction and discharge side (5, 6).
8. Remove the cover (9).
9. Loosen screws (8) on the dosing head (7) and remove with discs.
10. Remove the dosing head (7).
11. Unscrew diaphragm (4) counter-clockwise and remove with flange (2).
12. Make sure the drain opening (11) is not blocked or soiled. Clean if necessary.
13. Check the safety diaphragm (1) for wear and damage. Replace if necessary.

If nothing indicates that dosing liquid has entered the pump housing, go on as described in section *7.4.3 Reassembling the diaphragm and valves*. Otherwise proceed as described in section *7.6.2 Dosing liquid in the pump housing*.

7.4.3 Reassembling the diaphragm and valves

The pump must only be reassembled, if nothing indicates that dosing liquid has entered the pump housing. Otherwise proceed as described in section *7.6.2 Dosing liquid in the pump housing*.

This section refers to fig. 41.

1. Attach flange (2) correctly and screw on new diaphragm (4) clockwise.
   – Make sure that the O-ring (3) is seated correctly!
2. Press the [Start/stop] and [100%] keys at the same time to put the diaphragm into "in" position.
   – Symbol)– must be displayed (see fig. 14).
3. Attach the dosing head (7).
4. Install screws with discs (8) and cross-tighten with a torque wrench.
   – Torque: 4 Nm.
5. Attach the cover (9).
6. Install new valves (5, 6).
   – Do not interchange valves and pay attention to direction of arrow.
7. Connect suction, pressure and deaeration hose (see section *4.2 Hydraulic connection*)
8. Press the [Start/stop] key to leave the service mode.

Caution

Tighten the dosing head screws with a torque wrench once before commissioning and again after 2-5 operating hours at 4 Nm.

9. Deaerate dosing pump (see section *5.2 Deaerating the pump*).
10. Please observe the notes on commissioning in section *5. Startup*!

7.5 Resetting the service system

After performing the service, the service system must be reset using the "Info > Reset service system" function.

7.6 Diaphragm breakage

If the diaphragm leaks or is broken, dosing liquid escapes from the drain opening (fig. 41, pos. 11) on the dosing head.

In case of diaphragm breakage, the safety diaphragm (fig. 41, pos. 1) protects the pump housing against ingress of dosing liquid.

When dosing crystallising liquids the drain opening can be blocked by crystallisation. If the pump is not taken out of operation immediately, a pressure can build up between the diaphragm (fig. 41, pos. 4) and the safety diaphragm in the flange (fig. 41, pos. 2). The pressure can press dosing liquid through the safety diaphragm into the pump housing.

Most dosing liquids don't cause any danger when entering the pump housing. However a view liquids can cause a chemical reaction with inner parts of the pump. In the worst case, this reaction can produce explosive gases in the pump housing.

Warning

Danger of explosion, if dosing liquid has entered the pump housing!

Operation with damaged diaphragm can lead to dosing liquid entering the pump housing.

In case of diaphragm breakage, immediately separate the pump from the power supply!

Make sure the pump cannot be put back into operation by accident!

Dismantle the dosing head without connecting the pump to the power supply and make sure no dosing liquid has entered the pump housing. Proceed as described in section *7.6.1 Dismantling in case of diaphragm breakage*.

To avoid any danger resulting from diaphragm breakage, observe the following:

- Perform regular maintenance. See section *7.1 Regular maintenance*.
- Never operate the pump with blocked or soiled drain opening.
  – If the drain opening is blocked or soiled, proceed as described in section *7.6.1 Dismantling in case of diaphragm breakage*.
- Never attach a hose to the drain opening. If a hose is attached to the drain opening, it is impossible to recognise escaping dosing liquid.
- Take suitable precautions to prevent harm to health and damage to property from escaping dosing liquid.
- Never operate the pump with damaged or loose dosing head screws.

7.6.1 Dismantling in case of diaphragm breakage

Warning

Danger of explosion, if dosing liquid has entered the pump housing!

Do not connect the pump to the power supply!

This section refers to fig. 41.

1. Make system pressureless.
2. Empty dosing head before maintenance and flush it if necessary.
3. Take suitable steps to ensure that the returning liquid is safely collected.
4. Dismantle suction, pressure and deaeration hose.
5. Remove the cover (9).
6. Loosen screws (8) on the dosing head (7) and remove with discs.
7. Remove the dosing head (7).
8. Unscrew diaphragm (4) counter-clockwise and remove with flange (2).
9. Make sure the drain opening (11) is not blocked or soiled. Clean if necessary.
10. Check the safety diaphragm (1) for wear and damage. Replace if necessary.

If nothing indicates that dosing liquid has entered the pump housing, go on as described in section *7.4.3 Reassembling the diaphragm and valves*. Otherwise proceed as described in section *7.6.2 Dosing liquid in the pump housing*.

7.6.2 Dosing liquid in the pump housing

Warning

Danger of explosion!

Immediately separate the pump from the power supply!

Make sure the pump cannot be put back into operation by accident!

If dosing liquid has entered the pump housing:

- Send the pump to Grundfos for repair, following the instructions given in section *7.7 Repairs*.
- If a repair isn't economically reasonable, dispose of the pump observing the information in section *9. Disposal*.

7.7 Repairs

Warning

The pump housing must only be opened by personnel authorised by Grundfos!

Repairs must only be carried out by authorised and qualified personnel!

Switch off the pump and disconnect it from the voltage supply before carrying out maintenance work and repairs!

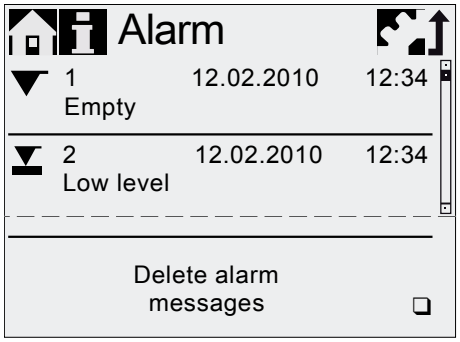
After consulting Grundfos, please send the pump, together with the safety declaration completed by a specialist, to Grundfos. The safety declaration can be found at the end of these instructions. It must be copied, completed and attached to the pump.

The pump must be cleaned prior to dispatch!

Caution If dosing liquid has possibly entered the pump housing, state that explicitly in the safety declaration! Observe section *7.6 Diaphragm breakage*.

If the above requirements are not met, Grundfos may refuse to accept delivery of the pump. The shipping costs will be charged to the sender.

8. Faults



In the event of faults in the dosing pump, a warning or an alarm is triggered.
The corresponding fault symbol flashes in the "Operation" menu, see section *8.1 List of faults*.
The cursor jumps to the "Alarm" main menu symbol.
Press the click wheel to open the "Alarm" menu and, where necessary, faults to be acknowledged will be acknowledged.

A yellow display indicates a warning and the pump continues running.

A red display indicates an alarm and the pump is stopped.

The last 10 faults are stored in the "Alarm" main menu. When a new fault occurs, the oldest fault is deleted.

The two most recent faults are shown in the display, you can scroll through all the other faults. The time and cause of the fault are displayed.

TM04 1109 1010

The list of faults can be deleted at the end of the list.

If there is a service requirement, this appears when the "Alarm" menu is opened. Press the click wheel to temporarily close the service prompt (see section *7.3 Service system*).

8.1 List of faults

8.1.1 Faults with error message

Display in the "Alarm" menu	Possible cause	Possible remedy
▼ Empty (Alarm)	• Dosing medium tank empty	• Fill tank. • Check contact setting (NO/NC).
⧗ Low level (Warning)	• Dosing medium tank almost empty	
Overpressure (Alarm)	• Discharge valve blocked • Isolating valve in discharge line closed • Pressure peaks due to high viscosity • Max. pressure set too low (see section *6.8 Pressure monitoring*)	• Replace valve if necessary (see section *7.4 Perform service*). • Check flow direction of valves (arrow) and correct if necessary. • Open the isolating valve (on the discharge side). • Enlarge diameter of discharge line. • Change pressure setting (see section *6.8 Pressure monitoring*).
Low backpressure (Warning/alarm*)	• Faulty diaphragm • Broken discharge line • Pressure differential between suction and discharge side too low • Leakage in the pressure loading valve at Q < 1 l/h • Deaeration valve open	• Change the diaphragm (see section *7.4 Perform service*). • Check discharge line and repair if necessary. • Install additional spring-loaded valve (approx. 3 bar) on the discharge side. • Close the deaeration valve.
Air bubble (Warning)	• Broken/leaky suction line • Strongly degassing medium • Tank dosing medium empty	• Check suction line and repair if necessary. • Provide positive inlet pressure (place dosing medium tank above the pump). • Enable "SlowMode" (see section *6.6 SlowMode*). • Fill tank.
👁 Cavitation (Warning)	• Blocked/constricted/squeezed suction line • Blocked/constricted suction valve • Suction lift too high • Viscosity too high	• Enable "SlowMode" (see section *6.6 SlowMode*). • Reduce suction lift. • Increase suction hose diameter. • Check suction line and open isolating valve if necessary.
Suct. valve leak (Warning)	• Leaky/dirty suction valve • Deaeration valve open	• Check valve and tighten it up. • Flush system. • Replace valve if necessary (see section *7.4 Perform service*). • Check O-ring position. • Install filter in suction line. • Close the deaeration valve.
Disch. valve leak (Warning)	• Leaky/dirty discharge valve • Leakage in the pressure loading valve • Deaeration valve open	• Check valve and tighten it up. • Flush system. • Replace valve if necessary (see section *7.4 Perform service*). • Check O-ring position. • Install screen in suction line. • Close the deaeration valve. • Install spring-loaded valve on the discharge side.
Flow deviation (Warning)	• Considerable deviation between target and actual flow • Pump not or incorrectly calibrated	• Check installation. • Calibrate the pump (see section *5.3 Calibrating the pump*).

Display in the "Alarm" menu	Possible cause	Possible remedy
Pressure sensor (Warning)	• Broken "FlowControl" cable (see fig. 11) • Sensor defect • Pressure sensor not correctly calibrated.	• Check plug connection. • Change sensor if necessary. • Calibrate pressure sensor correctly (see section *6.8.2 Calibration of pressure sensor*).
Motor blocked (Alarm)	• Backpressure greater than nominal pressure • Damage to gears	• Reduce backpressure. • Arrange for repair of gears, if necessary.
BUS Bus error (Alarm)	• Fieldbus communication error	• Check cables for correct specification and damage; replace if necessary. • Check cable routing and shielding; correct if necessary.
E-Box (Alarm)	• E-Box connection error • Faulty E-Box	• Check plug connection. • Replace E-Box if necessary.
Cable break (Alarm)	• Defect in analog cable 4-20 mA (input current < 2 mA)	• Check cable/plug connections and replace, if necessary. • Check signal transmitter.
Service now (Warning)	• Time interval for service expired	• Perform service (see section *7.4 Perform service*).

* Depending on setting

8.1.2 General faults

Fault	Possible cause	Possible remedy
Dosing flow too high	Inlet pressure greater than backpressure	Install additional spring-loaded valve (approx. 3 bar) on the discharge side.
		Increase pressure differential.
	Incorrect calibration	Calibrate the pump (see section *5.3 Calibrating the pump*).
No dosing flow or dosing flow too low	Air in dosing head	Deaerate the pump.
	Faulty diaphragm	Change the diaphragm (see section *7.4 Perform service*).
	Leakage/fracture in lines	Check and repair lines.
	Valves leaking or blocked	Check and clean valves.
	Valves installed incorrectly	Check that the arrow on the valve housing is pointing in the direction of flow. Check whether all O-rings are installed correctly.
	Blocked suction line	Clean suction line/install filter.
	Suction lift too high	Reduce suction lift.
		Install priming aid.
		Enable "SlowMode" (see section *6.6 SlowMode*).
	Viscosity too high	Enable "SlowMode" (see section *6.6 SlowMode*).
		Use hose with larger diameter.
		Install spring-loaded valve on the discharge side.
	Faulty calibration	Calibrate the pump (see section *5.3 Calibrating the pump*).
	Deaeration valve open	Close the deaeration valve.
Irregular dosing	Valves leaking or blocked	Tighten up valves, replace valves if necessary (see section *7.4 Perform service*).
	Backpressure fluctuations	Keep backpressure constant.
		Activate "AutoFlowAdapt" (only DDA-FCM).
Liquid escaping from the drain opening on the flange	Faulty diaphragm	Immediately separate the pump from the power supply! Observe section *7. Service* and especially section *7.6 Diaphragm breakage*.
Liquid escaping	Dosing head screws not tightened	Tighten up screws (see section *4.2 Hydraulic connection*).
	Valves not tightened	Tighten up valves/union nuts (see section *4.2 Hydraulic connection*).
Pump not sucking in	Suction lift too high	Reduce suction lift; if necessary, provide positive inlet pressure.
	Backpressure too high	Open the deaeration valve.
	Soiled valves	Flush system, replace valves if necessary (see section *7.4 Perform service*).

9. Disposal

This product or parts of it must be disposed of in an environmentally sound way.
Use appropriate waste collection services.
If this is not possible, contact the nearest Grundfos company or service workshop.

Important Safety Warnings

Please Read These Warnings Carefully Before Unpacking the Mixer

The following safety instructions must be COMPLETELY REVIEWED AND FOLLOWED before operating any Dynamix Mixer. FAILURE TO FOLLOW THESE INSTRUCTIONS COULD RESULT IN SERIOUS INJURY

In the installation, operation and maintenance of the Mixer, SAFETY comes first.

ALL safety precautions listed in this manual MUST be followed by all personnel working on or with the equipment if serious injury is to be avoided.

1. This mixer is intended for professional use only.
2. The installation of this equipment does not normally require the services of factory personnel. If required, these services can be agreed upon before or after purchase. These services are available from Dynamix Agitators by contacting the Sales Department.
3. Adequate installation, maintenance, and safety instructions must be given by the operator to personnel directly responsible for the operation of the drive and accessory equipment. In addition, the procedures set forth in the operating instructions must be carefully followed.
4. All service personnel MUST be knowledgeable relative to the equipment before performing any maintenance or repair work. Use proper clothing, tools and methods of handling to prevent serious accidents.
5. The operator is responsible for furnishing and installing any guards or other safety equipment needed to protect operating personnel as required by Occupational Safety and Health Administration standards (OSHA) or other applicable safety regulations. This equipment normally is not furnished by Dynamix Agitators except when specified as part of the order. In all cases, however, the operator has the responsibility of complying with all local, state / province and national fire, electrical, and safety regulations when installing the equipment.
6. Each mixer is selected for a specific application. **Do not use this mixer in applications other than that for which was designed and quoted. Applying a mixer in applications outside of intended use may result in overload conditions, which will damage the mixer.** If you are unsure of the appropriate application, please contact Dynamix Agitators with the relevant mixer serial number.
7. Do not connect to air motor to power source until this Manual is followed and the mixer is properly assembled and installed as per design.
8. Your mixer has been tested and checked for shaft straightness before shipping. Care must be taken while handling the shaft to ensure proper operation.
9. Do not alter or modify this mixer. Any alteration or modification will void the mixer's Warranty.
10. If the mixer features a detachable coupling, ensure that the coupling is fully engaged and seated in the fully rotated position of the coupling lock (rotated 10 degrees).
11. Ensure all equipment and personnel are clear of all rotating parts.
12. Do not touch rotating mixer parts.
13. If your mixer requires lifting by eyebolt or by another method, ensure that eyebolts or other means are securely fastened before lifting the mixer.
14. Some electric motors will run excessively hot under continued load. Always use lifting handles to lift modular drive segments off their coupling.

15. Do not exceed the working air pressure of 100 psi for air motors
16. Check equipment daily. Repair and replace damaged parts immediately.
17. Do not uninstall or service this mixer until you have followed your “Control of Hazardous Energy Sources” procedure as per OSHA Guidelines and/or the Canadian Occupational Health and Safety Regulations.

FIRE AND EXPLOSION HAZARD

Improper grounding, poor ventilation, open flames, or sparks can cause a hazardous condition and result in a fire or explosion and serious injury.

Receiving, Inspection & Storage

Please Read These Warnings Carefully Before Unpacking the Mixer

The following safety instructions must be COMPLETELY REVIEWED AND FOLLOWED before operating any Dynamix Mixer. FAILURE TO FOLLOW THESE INSTRUCTIONS COULD RESULT IN SERIOUS INJURY

Goods must be inspected with 30 days of receive date. It is assumed that goods are satisfactory if Dynamix is not notified within this period.

Your mixer has been tested and checked for shaft straightness before shipping. Care must be taken while handling the shaft to ensure proper operation.

Please follow the following steps to prevent injury or damage to equipment:

1. Immediately upon delivery, check all crating and boxes for damage which may have occurred during transit, and report any damage to the carrier and Dynamix Agitators Inc.
2. Carefully inventory all furnished equipment against packing list to determine if any shortages exist in delivered material. Any such shortages must immediately be reported to Dynamix Agitators and the Carrier if a timely claim is to be made.
3. The Dynamix Factory has tested and checked this mixer for operation and shaft straightness before shipping. Care must be taken when handling this mixer to ensure proper operation and longevity.
4. Store the mixer in a clean, dry environment, with a relatively constant temperature. Electric motors are easily damaged by moisture. Circulating air will help prevent moisture buildup in the mixer.
5. Store the mixer assembly off the floor, covered by plastic.
6. Do not seal the plastic covering as this will increase the chance of condensation. Use desiccants if possible.

MOVING PARTS HAZARD

Always shut off the mixer power source (unplug electric power and disconnect air power source) before performing any maintenance, repair, or adjustments. Not doing so can result in serious injury.

Operation Instructions

Please Read These Warnings Carefully Before Operating the Mixer

WARNING!

The following safety instructions must be COMPLETELY REVIEWED AND FOLLOWED before operating any Dynamix Mixer. FAILURE TO FOLLOW THESE INSTRUCTIONS COULD RESULT IN SERIOUS INJURY

Important: This instruction manual is not intended to include a comprehensive listing of all details for all procedures required for installation, operation and maintenance. If you have a question about a procedure or are uncertain about any detail, **Do Not Proceed**. Please contact Dynamix Agitators for more information or clarification.

1. Do not uninstall or service this mixer until you have followed your “Control of Hazardous Energy Sources” procedure as per OSHA Guidelines and/or the Canadian Occupational Health and Safety Regulations.
2. Read and fully understand the manual before installation and start-up.
3. Ensure the mixer is designed for the application. Operating outside of the mixer's intended use will result in damage. Refer to original quotation to ensure proper application.
4. Do not handle the mixer by the shaft. Lifting and handling the mixer by the shaft will cause damage.
5. Check the straightness of the shaft by slowly rotating by hand before operation in fluid.
6. On start-up jog the mixer in order to ensure the mixer shaft and impeller is not obstructed from rotation.
7. Fluid level should be one diameter above the impeller for proper mixing unless approved by Dynamix Engineering
8. Avoid drawing fluid level down past last impeller. Impeller should not operate out of fluid unless specifically designed for this.
9. Avoid extended operation when fluid level is at or near the bottom impeller
10. Do not start mixer in settled solids. Impeller cannot be buried in solids at start-up. For best performance axial flow impellers (Dynaflow™ and Pitch) should be positioned at least ½ of their diameter above the tank floor or settled solids.
11. If the impeller is buried, disperse any settled solids before starting the mixer. This may be done using an air hose, re-circulating pump, or a large stick.
12. Reversed rotation may cause overloading and inefficient mixing. Confirm rotation with sticker on side of mixer.
13. Vortexing may occur if the fluid level is too close to the impeller. Aeration of the product and excess vibration may occur.
14. When mixing materials of different viscosities or specific gravities, the lighter or less viscous material should be introduced first. Add heavier materials gradually in the center of the tank while the mixer is running. **Do not dump large quantities of solids or powders into the tank.** This will cause impacting on the impeller and may cause equipment damage.
15. Check the quotation data sheet for operating speed requirements if a variable speed drive is used
16. Some shaft vibration is normal. A bent shaft may cause excess vibration.
17. Keep motors clean and dry. Air motor intakes and exhaust ports must be clear of foreign material. The electric motors supplied are designed for outdoor use, but may be damaged due to harsh weather. A rain cover may be added to extend motor life.
18. Do not run air motors above 2000 RPM. **See Page 16** for proper air consumption and pressure charts. See the **Technical Drawing** for the motor size.

Start-up Checklist

Please Review This Checklist Carefully Before Operating the Mixer

Prior to, and during start-up, please check that the following things have been done:

1. **Manual has been read and followed** ☐
2. Drive coupling is fully engaged ☐
3. Sufficient protection for motor (*if outdoors*) ☐
4. Wiring correctly installed, grounded, and insulated ☐
5. Impeller(s) installed correctly. See Installation section of Manual. ☐
6. Impellers spaced correctly (*if two or more*) for maximum and minimum liquid levels ☐
7. Impeller immersed in liquid and no equipment or obstructions can impact the impeller ☐
8. Proper shaft rotation (*counter-clockwise looking down, unless otherwise noted*) Refer to Directional Sticker on Impellers to show proper impeller assembly and rotation

☐

9. Correct voltage / amperage upon starting ☐
10. Check against motor nameplate data: Record: _____ Volts _____Amps
11. Excessive noise after start-up? Record: _____ db @ 3ft ☐
12. Excessive vibration of tank or support ☐

_____ _____

Inspector Date

Assembly & Installation

Clamp Mount

Installing the Mixer Shaft and Impellers

1. The mixer shaft has one end which is machined to fit the drive coupling. This is the motor end. Slide the impeller(s) onto the other end of the shaft; ensure the impeller is mounted according to the sticker and rotation indicated on the sticker.
2. A single impeller must be mounted at the end of the shaft. This impeller position will be set by the factory but should be no lower than ½ the diameter from the tank floor for axial flow impellers.
3. For dual impellers the upper impeller is usually mounted at least one impeller diameter from lower impeller.
4. Tighten the setscrews securely. Higher power mixers will have impressions in the shaft to seat the setscrews.
5. Remove the service port cover [3] from the bearing spool housing. Rotate the coupling until the clamping bolts [2] are accessible. Install the mixer shaft through the lip seal [5] into the coupling [8]. Use no oil to assist assembly, as slippage may occur in use.
6. Tighten the two clamping bolts [2] using the 3/16" hex key supplied. These bolts must be tightened firmly to secure as loose bolts may result in slippage and power loss.
7. Tighten the two bearing set screws [4] using the 1/8" hex key provided.
8. Re-install service port cover.

Mounting

1. Set the mixer drive on the edge of the tank. Tighten the c-clamp screw [10] to secure the mixer.
2. Ensure both vertical and horizontal mounting surface are in even contact with the tank.

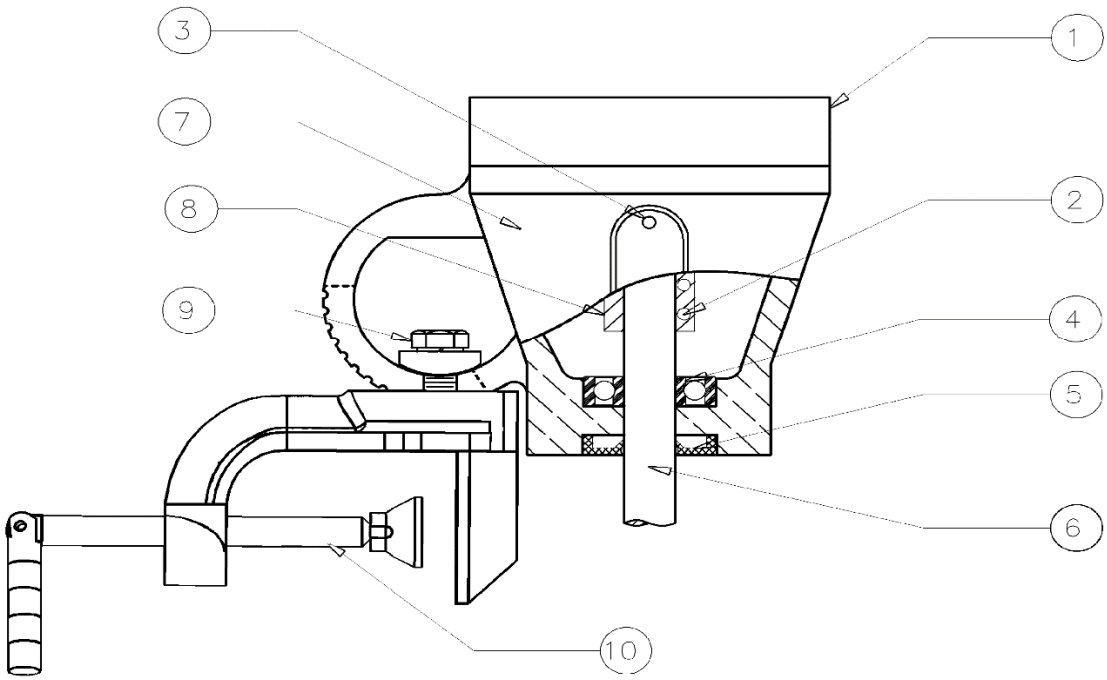

Figure 1

Mixer Positioning

1. Dynamix “Clamp Mount“ mixers are designed to be angled @ 10 to 15 ° (Fig. 2) to the vertical wall and @ 15 to 30° (Fig 3) from the tank center, as shown. The following illustrations are for reference only. If there are any questions regarding the proper positioning of your mixer, please contact your Dynamix representative.
2. To adjust position of mixer, loosen the hex head bolt item 9 (Fig.1) in the clamp, position and tighten.
3. Rotate the mixer shaft by hand to ensure the impeller will clear any obstructions in the tank.
4. The c-clamp and cup plate mounting design allows for 360° rotation and 90° shaft angle adjustment.

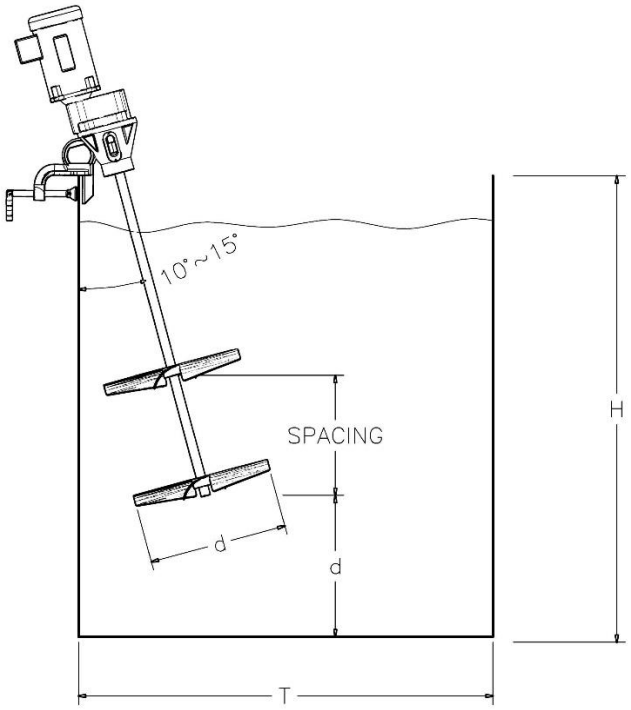

Figure 2

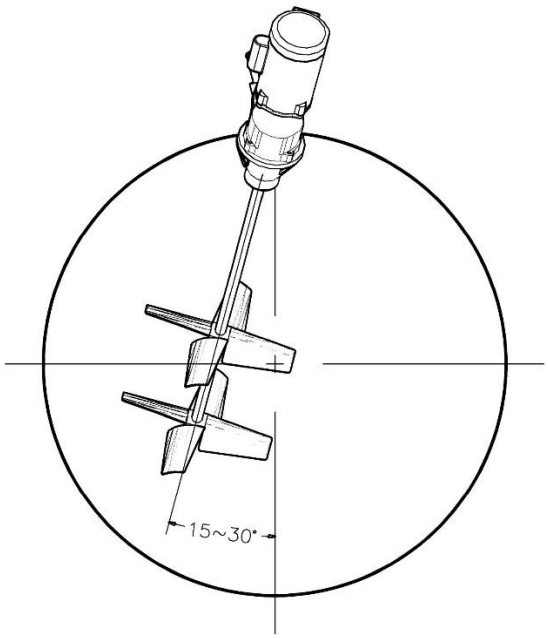

Figure 3

Plate Mount

Installing the Mixer Shaft

1. The mixer shaft has one end which is machined to fit the drive coupling. This is the motor end. Slide the impeller(s) onto the other end of the shaft; ensure the impeller is mounted according to the sticker and rotation indicated on the sticker.
2. A single impeller must be mounted at the end of the shaft. This impeller position will be set by the factory but should be no lower than ½ the diameter from the tank floor for axial flow impellers. For dual impellers the upper impeller is usually mounted at least one impeller diameter from lower impeller. Tighten the setscrews securely. Higher power mixers will have impressions in the shaft to seat the setscrews.
3. Remove the service port cover [3] from the bearing spool housing. Rotate the coupling until the clamping bolts [2] are accessible. Install the mixer shaft through the lip seal [5] and bearing [4] into the coupling [8]. Use no oil to assist assembly, as slippage may occur in use.
4. Tighten the two clamping bolts using the 3/16" hex key supplied. These bolts must be secure, as loose bolts may result in slippage and power loss.
5. Tighten the two bearing set screws [4] using the 1/8" hex key provided.
6. Re-install service port cover.

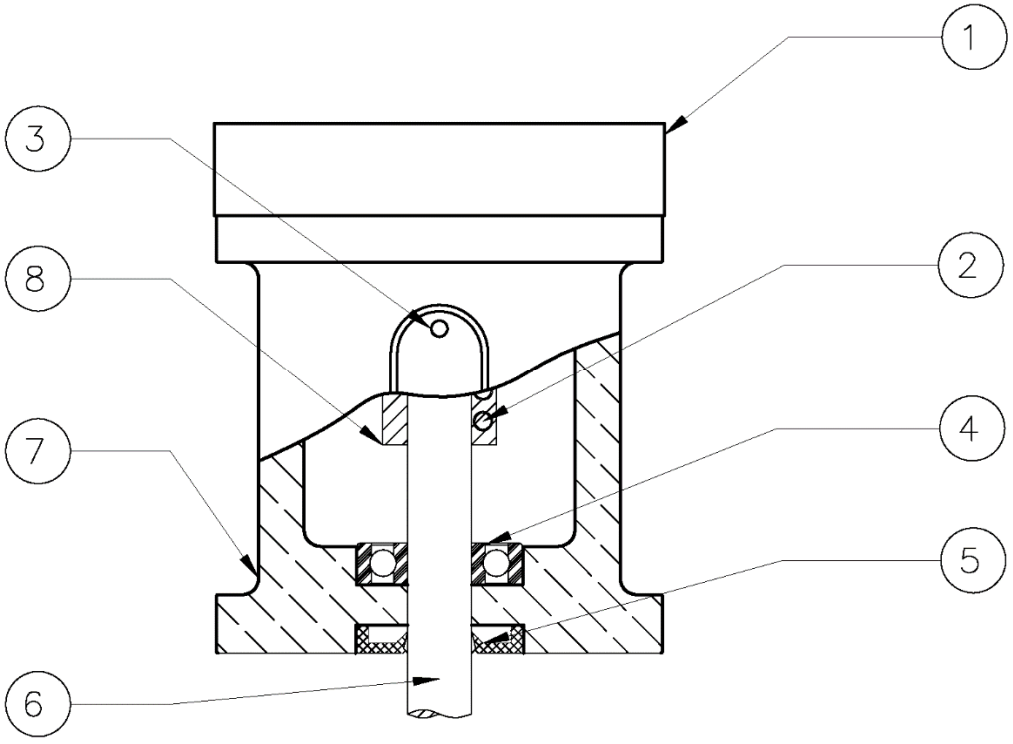

Figure 4

Mixer Mounting

1. The mounting structure must be stable and secure. If the mixer is not mounted to a stable platform, damage to the tank or mixer may occur, as well as harm to personnel.
2. The mixer is supplied with rubber vibration mounts, which absorb the vibrations of the shaft. This will help reduce the stresses in longer shafts.
3. Both the angle mounted and flat plate mounted mixers use four (4) 3/8” bolts. Lock washers or double nuts are recommended to prevent loosening during operation.
4. Mixer mounts are selected according to application requirements. Refer to quotation for intended mixer mounting.

Centre Mounted Mixer for Tank with Baffles

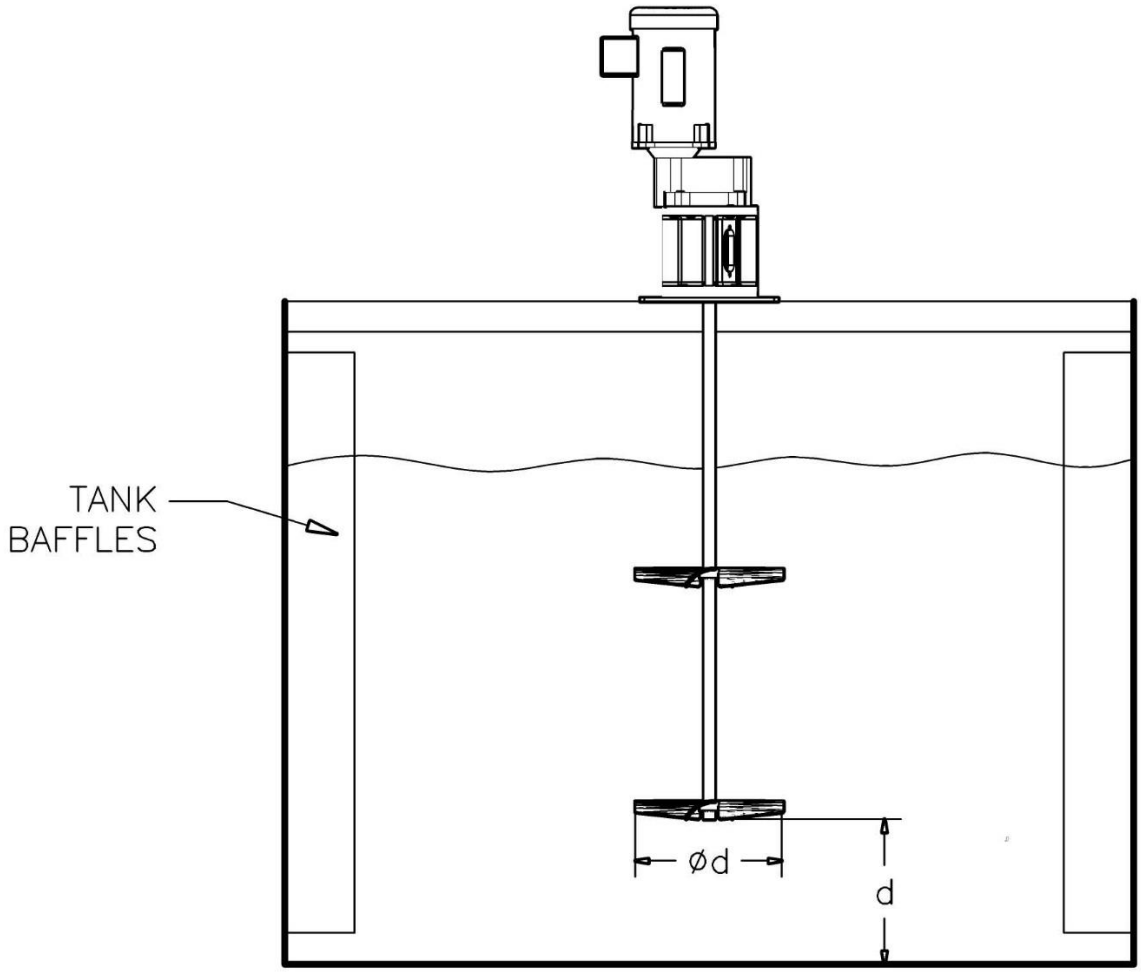

Figure 5

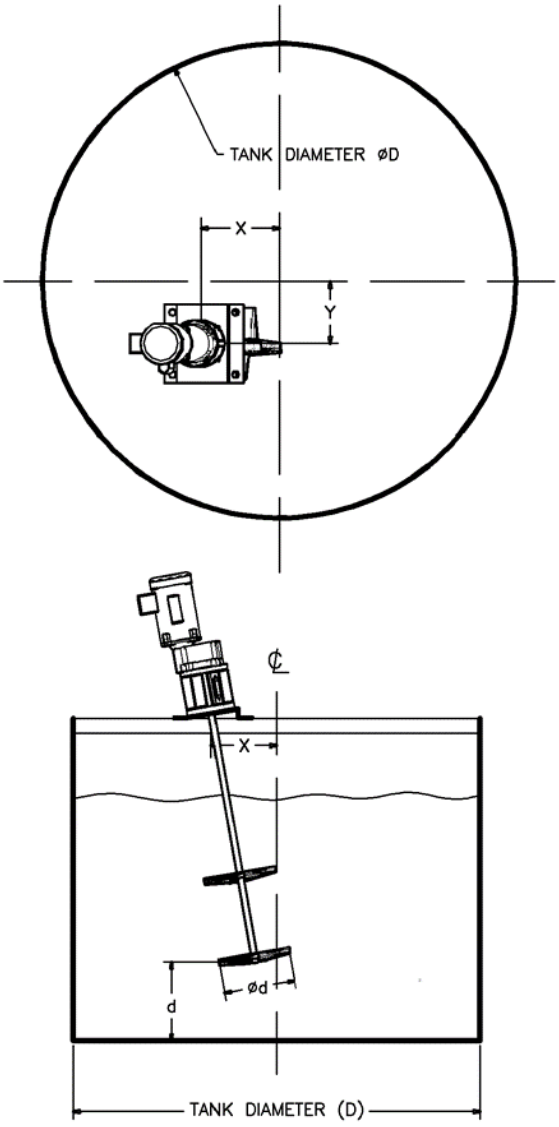

Offset Mounting

If your mixer has been approved and designed for “Offset Mounting” you can use the following instructions.

If it is not approved for offset mixing, then do not use this as it will damage the mixer. Contact Dynamix to confirm if needed.

Offset mounting should be 1/5th to 1/6th of tank diameter.

Angle Mounted Mixer

	ANGLE MOUNT OFFSET
X	D/3.5
Y	D/6

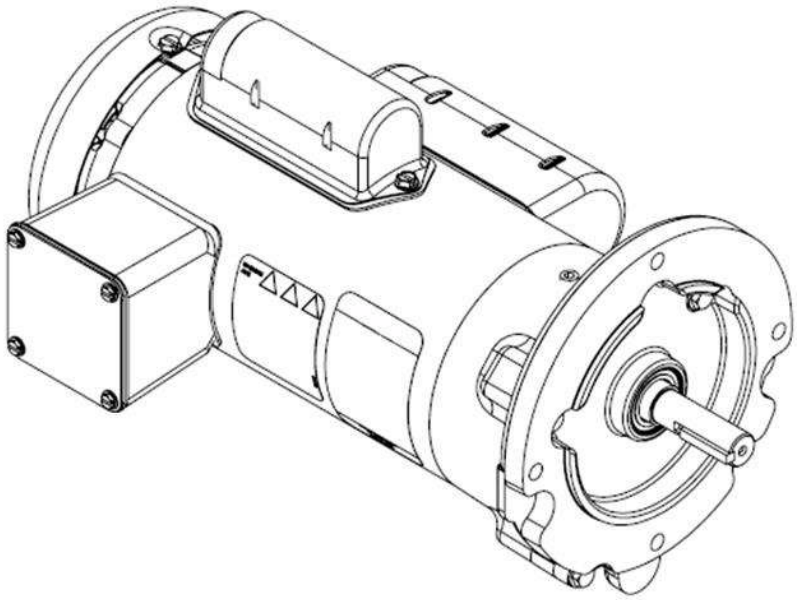
General Information Regarding Electric Motors

Overview



For your protection, do not install, operate or attempt to perform maintenance procedures until you understand the Warning and Caution statements. A Warning statement indicates a possible unsafe condition that can cause harm to personnel. A Caution statement indicates a condition that can cause damage to equipment.

Before you operate or perform maintenance, become familiar with the following:

1. NEMA Publication MG-2, Safety Standard for Construction and Use of Electric Motors
2. The National Electrical Code
3. Local codes and Practices
4. “Control of Hazardous Energy Sources” procedure as per OSHA Guidelines, and the Canadian Occupational Health and Safety Regulations

Motor Enclosures

TEFC, totally enclosed motors are intended for use where moisture, dirt and/or corrosive materials are present in indoor and outdoor locations.

Safety Notice

This equipment contains **high voltage. Electrical shock can cause serious or fatal injury.** Only qualified personnel should attempt installation, operation and maintenance of electrical equipment. Be sure that you are completely familiar with NEMA publication MG-2, safety standards for construction and guide for selection, installation and use of electric motors and the National Electrical Code and local codes and practices. Unsafe installation or use can cause conditions that lead to serious or fatal injury.

Only qualified personnel should attempt the installation, operation and maintenance of this equipment.

WARNING!

- Do not touch electrical connections before you first ensure that power has been disconnected. Electrical shock can cause serious or fatal injury. Only qualified personnel should attempt the installation, operation and maintenance of this equipment.
- Be sure the system is properly grounded before applying power. Do not apply AC power before you ensure that all grounding instructions have been followed. Electrical shock can cause serious or fatal injury. National Electrical Code and Local codes must be carefully followed.
- Use proper care and procedures that are safe during handling, lifting, installing, operating, and maintaining operations. Improper methods may cause muscle strain or other harm.
- Disconnect all electrical power from the motor windings and accessory devices before disassembly of the motor. Electrical shock can cause serious or fatal injury.
- Do not use these motors in the presence of flammable or combustible vapors or dust. These motors are not designed for atmospheric conditions that require explosion proof operation.
- Motors that are to be used in flammable and/or explosive atmospheres must display the on the nameplate the UL label showing the correct classification for the area it is operated in. Specific service conditions for these motors are defined in NEC 70-599.
- To prevent equipment damage, be sure that the electrical service is not capable of delivering more than the maximum motor rated amps listed on the rating plate.

Motor Connections

1. **Wiring:** Match the motor starter and overload protection to the motor rating. Follow the control manufacturer's instructions.
2. All electrical connections must conform to National Electrical Code and all local regulations. Match line voltage and wire capacity to motor rating found on the motor nameplate.
3. Single-phase electric motors may be pre-wired with a six (6) foot electrical cord. If not provided, follow the wiring diagram on the motor for proper connections. Ensure the switch is in the OFF position before connecting to a power supply. Switch the connections to achieve proper rotation.
4. Three phase electric motors must be wired according to the diagram on the motor.
5. Variable speed DC motors using an SCR controller must be wired following the controller instructions. Before applying power, read the instructions carefully, and make the required adjustments.
6. Mixer standard rotation direction is counter-clockwise facing lead end.

General Information Regarding Air Motors

Air motors operate best with lubricated, dry, clean air at air pressures below 100psi.

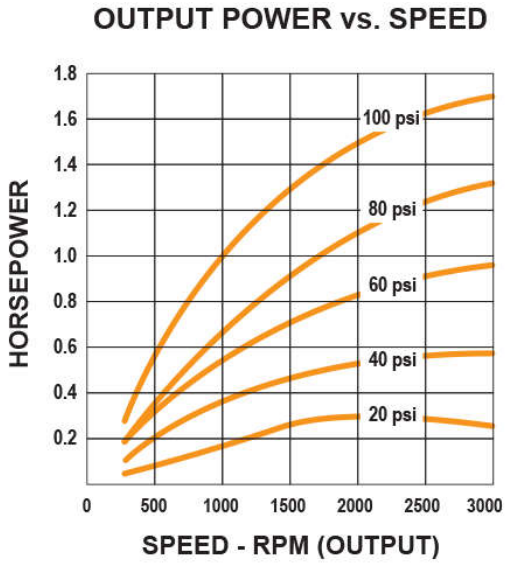
Air Lubricator: Lubricated air is typically available from the air system. If not, an automatic lubricator must be installed in the air- line ahead of the air motor. Use a pneumatic air lubricant e.g. ISO VG32 or detergent SAE #10 automotive oil. Lubricator should be adjusted to feed one drop of oil for every 50 to 75cfm.

Moisture: Excessive moisture in the air-line can cause rust formation in the motor and ice to form in the muffler. An in-line separator must be used on your pneumatic system to reduce this.

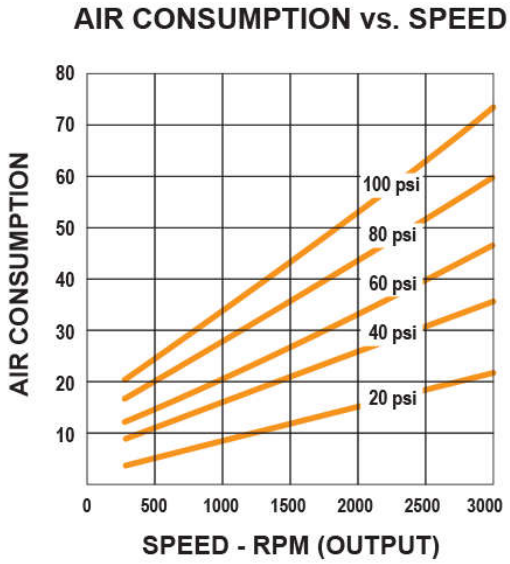
Air Filter: If the air is dirty this will cause the motor to run sluggishly and can break the motor vanes. An in-line filter must be used on your pneumatic system to reduce this.

Pressure Regulator: Air motors are designed to operate with a maximum air pressure of 100 psi. If higher air pressure is supplied, an in-line air pressure regulator should be used to reduce the pressure. This can also be used to vary the speed of the air motor

Flushing: Should excessive dirt, foreign particles, moisture, or excess oil be permitted to enter the air motor, the unit will act sluggish. Flushing the air motor should remove this.

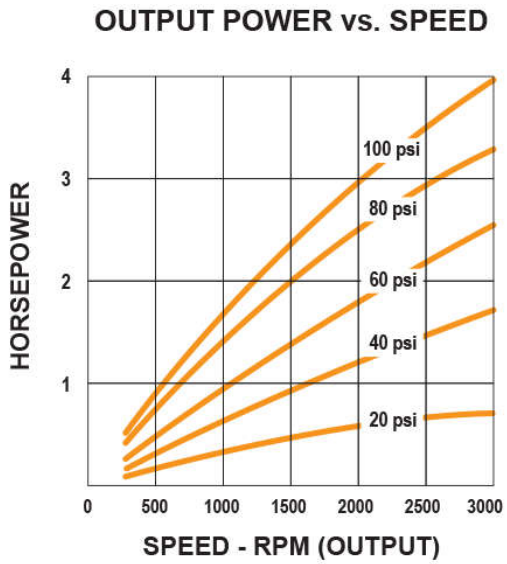


WARNING!

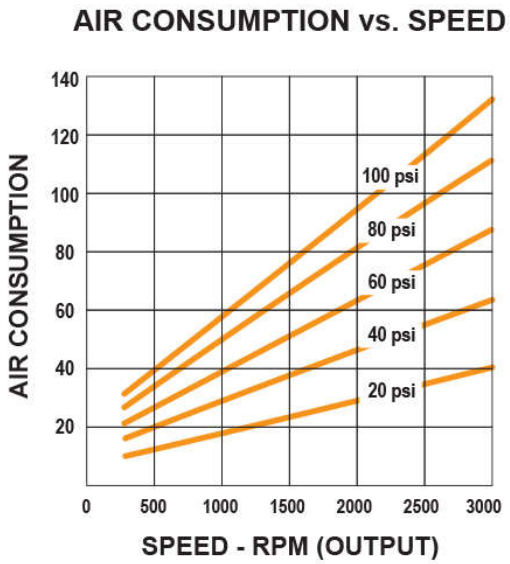


- Use only non-combustible solvents.
- Do not use kerosene or other flammable solvents to flush the air motor.
- Flushing with Flammable solvents could cause fire or explosion and result in serious injury or property damage.
- Using **GAST Flushing Solvent AH255D** will reduce this concern.
- **Wear eye protection** and flush in a well-ventilated area.

1. Disconnect air line and muffler
2. Pour several tablespoons of solvent directly into intake port
3. Rotate shaft by hand in both directions for 3 to 4 minutes
4. Reconnect air line and slowly apply pressure until there is no trace of solvent in the exhaust air
5. Re-lubricate motor with a squirt of oil in chamber



Air Motor Horsepower Rating & Air Consumption



For Air Motors Rated at 1.5HP

For Air Motors Rated at 4HP

Note: Output rpm refers to motor output shaft only. For gear reduced drives refer to gear ratio on quotation.

Lubrication

Air Motor Connection

Air Motors must always have a filter, lubricator and moisture trap installed on the air supply line. Supply pipe should be one size larger than the intake port on the motor. A regulator may be installed to control motor speed. Install the airline on the correct port on reversible motors for proper rotation direction.

Air Motor

Air Motor lubricator should be adjusted to feed one drop of oil every 50-75 CFM.

Use SAE #10automotive detergent engine oil.

Gear Driven

Gear drivers for mixers are lubricated at the factory using the proper type and amount of lubricant for normal service, and are maintenance free. For additional information contact Dynamix Agitators.

Mixer Shaft Bearings

Mixer Shaft Bearings are pre-lubed and sealed and do not require re-lubrication.

Troubleshooting Guide

Use This Chart to Diagnose Operation Issues

Problem	Possible Cause	Possible Solution
Mixer Will Not Start	• Loose connections • Incorrect wiring • Blown fuse • Wrong size heaters in starter • Mechanical jamming • Water damage to motor	• Check and tighten connection • Check wiring diagram and wire correctly • Replace fuse • Replace heaters • Free all debris for rotation • Service or replace motor
Motor Runs Hot	• Restricted ventilation • Amperage overload • Low or high voltage • Unbalanced voltage between phases • Frequent starting and stopping • Product too viscous • Impeller(s) upside down • Incorrect rotation	• Clear the vents • **CONSULT FACTORY** • Wire for correct voltage • Consult electrician • Check with factory – a special motor may be required • Check viscosity and specific gravity of product (consult factory) • Reinstall in correct position • Change motor leads per nameplate instructions
Mixer Will Not Reach Correct Speed	• Overload of motor • Loose drive coupling bolts • *Also See: "Mixer Will Not Start"*	• Check amperage against nameplate data • Check coupling bolt tension (coupling and/or shaft may be damaged if mixer has been run with slipping coupling)
Shaft Will Not Fit Into Drive	• Shaft over size (proper diameter: 0.001" – 0.002" under normal diameter) • Wrong end of shaft (only one end fits) • (2) Coupling bolts are too tight • Wrong size shaft, coupling or bearing • Damaged shaft, coupling or bearing	• Measure and consult factory • Install end marked motor end • Loosen bolts • **CONSULT FACTORY** • **CONSULT FACTORY**
Shaft Vibration	• Unstable mounting platform • Bent mixer shaft • Bent or uneven impeller blades • Impeller not immersed in liquid • Impeller too close to surface • Worn or damaged drive bearings	• Reinforce platform • **CONSULT FACTORY** • **CONSULT FACTORY** • Fill tank • Fill tank and lower impeller (see S3) • Replace damaged parts
Noisy Operation	• Foreign material in lubricant • Dry lip seal in spool • Insufficient lubricant • Incorrect lubricant • Loose drive coupling bolts • Worn or faulty bearings/gears	• Change lubricant • Apply lubricant to lip seal • Fill proper amount of lubricant • Change to correct lubricant • Check and tighten coupling bolts • Check bearings/gears – replace if necessary
Oil Leakage	• Damaged broken gasket • Excessive lubricant • Seals worn or damaged • Loose bolts around side plates	• Replace gasket • Check manual for proper amount of lubricant and drain excess • Replace seals • Check and tighten bolts
Bearing Failure	• Water damage • High temperature product • *Also See: "Noisy Operation"*	• Replace bearings (check all other parts) • Provide heat shield • **CONSULT FACTORY**

Terms & Conditions

These Delivered Terms and Conditions (the "Delivered Terms") apply to the purchase of Dynamix Agitators Inc. ("**Dynamix**", "**We**" or "**Our**") products ("**Products**") by a customer (the "**Customer**"). Unless otherwise indicated, these terms and conditions will apply to all purchases of Products from Dynamix.

PURCHASE TERMS

The Customer's purchase of Products is governed by: (1) the quotation sent to the Customer for the Products, which sets out the Customer's name and address, the Products covered, price and payment terms (the "**Quotation**"); (2) the terms and conditions attached to the Quotation; (3) these Delivered Terms; and (4) any additional terms referenced in the Quotation (collectively, the "**Agreement**").

CONFIDENTIAL INFORMATION

The Product pricing, terms and conditions of sale, the Quotation, and other information contained in or disclosed by Dynamix pursuant to the Agreement is confidential. Customer may not disclose such pricing, terms and conditions, Quotation and other information to any other party without Dynamix's prior written approval, except for any legally required disclosures. Dynamix reserves the right to enforce these confidentiality restrictions against any party who wrongfully discloses, receives or further disseminates Dynamix's confidential information.

LIMITATION OF REMEDIES

Customer's remedy for breach of any of the foregoing warranties shall be limited to those set forth in the **Warranty Section** provided below, however, that We will not be responsible for removal, loading, installation, freight or similar related expenses in connection with any modification, replacement or repair. The determination of which remedy shall be applicable, shall be determined by Dynamix, in its sole discretion.

DYNAMIX AND ITS AFFILIATES AND REPRESENTATIVES HAVE NO LIABILITY TO CUSTOMER FOR ANY DIRECT, INDIRECT, SPECIAL, PUNITIVE, INCIDENTAL OR CONSEQUENTIAL DAMAGES OR DELAY WHATSOEVER, INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOST OR INTERRUPTED BUSINESS, LOSS OF USE, LOST PROFITS OR LOST REVENUES, HOWEVER CAUSED AND UNDER ANY THEORY OF LIABILITY (INCLUDING, BUT NOT LIMITED TO, CONTRACT, TORT, WARRANTY OR NEGLIGENCE), EVEN IF WE HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. THE TOTAL LIABILITY OF DYNAMIX AND ITS AFFILIATES AND REPRESENTATIVES TO CUSTOMER AND CUSTOMER'S EXCLUSIVE REMEDY FOR ANY AND ALL CLAIMS ARISING OUT OF OR RELATING TO THIS CONTRACT, INCLUDING, BUT NOT LIMITED TO, THE PRODUCTS PROVIDED HEREUNDER, IS LIMITED TO THE PURCHASE PRICE OF THE PRODUCT THAT IS THE BASIS FOR THE CLAIM.

Customer will be barred from any remedy unless Customer gives Dynamix prompt written notice of the problem. Further, any returns of Products for modification, repair or replacement must be authorized by Dynamix in writing prior to return of the Products by the Customer.

Dynamix will not be responsible for any repairs performed by third parties unless the extent, or terms and costs of such repairs, are authorized by Dynamix, in writing in advance.

PATENTS

Dynamix represents and warrants that, to its knowledge, the Products do not infringe upon any patents granted to others. We do not assume any responsibility or liability for any claim of infringement brought against the Customer, its successors, assigns, customers or users of the Products.

UNAUTHORIZED MODIFICATIONS

Modifications to the Products ordered by Customer, or any of their components, could significantly affect their performance or conformance to Dynamix's features. Any modification of the Products, or any of their components, other than as performed or authorized in writing by Dynamix, is prohibited and will invalidate and terminate Dynamix's warranty for the Products, effective on the date of any such modification.

LEGAL FEES

If a suit or action is brought by any party under this Contract to enforce or interpret any of its terms or in any appeal therefrom, it is agreed that the prevailing party shall be entitled to reasonable legal fees to be fixed by the trial court and/or appellate court. Customer shall be responsible for any and all costs of collection incurred by Dynamix in connection herewith, including legal fees and costs.

JURISDICTION / VENUE

These Delivered Terms will be governed by and construed in accordance with the laws in force in the Province of British Columbia and the federal laws of Canada, as applicable therein, without regard to its conflict of laws principles. The Parties agree to attorn to the exclusive jurisdiction of the courts of British Columbia.

GENERAL MATTERS

Any assignment of these Delivered Terms will be void without the other party's prior written consent, which will not be unreasonably withheld. Dynamix may hire subcontractors or use its affiliates to perform the obligations under this Agreement. If any part of these Delivered Terms are found invalid, the remaining part will be effective. No waiver, alteration or modification of any of the provisions of these Delivered Terms will be binding on Dynamix, unless made in writing and signed by a duly authorized officer of Dynamix. These Delivered Terms, the Quotation and its attached terms and conditions, and any other terms referenced in the Quotation contain the entire agreement of the parties.

Warranty

Dynamix warrants to the Customer that the Product will perform substantially in accordance with the features and Solution Assurance as set out in the Quotation and be free from defects in materials and workmanship under normal use.

We warrant that we will modify, repair or replace the Product provided to the Customer, at Our sole discretion and at no charge, Ex Works (Incoterms 2000) Dynamix plant, if the Product is defective in materials or workmanship under normal use.

WE DO NOT GUARANTEE THE PRODUCTS AGAINST CHEMICAL OR ABRASIVE ATTACK OR OTHER DETERIORATION DUE TO EXPOSURE.

THE FOREGOING WARRANTIES EXTEND ONLY FOR 12 MONTHS AFTER FIRST INSTALLATION OF THE PRODUCT AT CUSTOMER'S FACILITY OR FOR 18 MONTHS AFTER ITS SHIPMENT FROM DYNAMIX'S PLANT, WHICHEVER PERIOD IS SHORTER, OR AS OTHERWISE STATED IN WRITING BY DYNAMIX.

EXCEPT AS EXPRESSLY PROVIDED IN THE AGREEMENT, WE EXPRESSLY DISCLAIM AND MAKE NO EXPRESS OR IMPLIED REPRESENTATIONS, CONDITIONS, GUARANTEES OR WARRANTIES OF ANY KIND, ORAL OR WRITTEN, INCLUDING, BUT NOT LIMITED TO, IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, NON-INFRINGEMENT, INTER-OPERABILITY OF PRODUCTS, USAGE, CUSTOM OR TRADE, AND OF ALL OTHER OBLIGATIONS OR LIABILITIES ON THE PART OF DYNAMIX. THE ABOVE WARRANTIES SHALL NOT APPLY TO FAILURES RESULTING FROM (A) NORMAL WEAR AND TEAR, (B) ACCIDENT, NEGLIGENCE, ALTERATION, ABUSE, MISUSE OR USE INCONSISTENT WITH ANY INSTRUCTIONS PROVIDED AS TO STORAGE, HANDLING, MAINTENANCE, LUBRICATION, INSTALLATION, STARTUP, OPERATION AND SAFETY, (C) IMPROPER INSTALLATION AND/OR (D) INACCURATE AND/OR INCOMPLETE SPECIFICATIONS, DESIGN CONDITIONS OR OTHER DATA FURNISHED BY OR ON BEHALF OF CUSTOMER. WE MAKE NO WARRANTY WHATSOEVER WITH RESPECT TO ACCESSORIES OR PARTS NOT SUPPLIED BY DYNAMIX.

Warranty & Claims Policy

The following statement of our Warranty and Claims Policy is intended to assist our customers in understanding the terms of our warranty, the circumstances under which we will honor claims, and the procedure for making claims.

Our Warranty and Claims Policy should be read in conjunction with and is subject in as respect to the Terms and Conditions of Sale which appear on our quotation and acknowledgment forms and the specific terms of any distributorship or other such agreement between us and the individual customer.

1. **Warranty Manufactured Products**

   We warrant Products manufactured by us to be free from defects in material and workmanship for a period of twelve (12) months after first installation of mixer or for eighteen (18) months after shipment from our factory, whichever occurs first.

   Our liability under this warranty or in connection with any other claim relating to our Products is limited to the repair, or at our option, the replacement or refund of the purchase price, of any Products or parts or components which are returned to us freight prepaid and which are defective in material or workmanship. Products or parts or components thereof, which are repaired or replaced by us will be returned to our customer freight collect.

2. **Limitation of Liability**

   The only warranty that we offer our customers is that warranty which is set forth on our quotation and acknowledgment forms and which is summarized above.

   WE DO NOT MAKE ANY OTHER EXPRESS WARRANTIES OR ANY IMPLIED WARRANTIES, INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY OR OF FITNESS FOR A PARTICULAR PURPOSE OR USE.

   In addition, we do not assume and we expressly disclaim any liability for

   a. any SPECIAL, INDIRECT, INCIDENTAL, OR CONSEQUENTIAL DAMAGES which anyone may suffer as the result of the sale, delivery, servicing, use or loss of use, of any Product, or

   b. any charges or expenses of any nature which are incurred without our express written consent.

   Our total liability under our warranty or in connection with any claim involving any Product is expressly limited to the purchase price of the Product in respect of which damages are unclaimed.

3. **What Is Not Covered By Warranty:** Damages and Claims for Which Dynamix Is Not Responsible

   The Seller's Warranty applies insofar as the unit is operated within the rating and service conditions for which it was specifically sold. The Purchaser must prevent the existence of any destructive external conditions that might typically include vibratory loads, severe shock loading, mechanical or thermal overloads or other conditions that may adversely affect the operation. The gear drive must be installed and maintained in accordance with instructions and provided in this manual.

   The following are examples of the kinds of defect which are not covered by Our warranty; defects which are caused by improper installation, improper or abnormal use or operation, or improper storage or handling; defects caused by our customer's failure to perform normal preventive maintenance; defects caused by repairs by persons not authorized by us; defects caused by modification alterations made by our customer; and any damage to our Product occurring while is in our customer’s possession.

   Since these are examples and not a complete list, we suggest that our customers contact our Customer Service Department if they have any question concerning the scope of our warranty.

   Additional costs incurred by our customers because of delays in delivery are consequential damages for which we are not responsible.

   Risk of loss or damage to our Products passes to our customer when we tender our Products to the carrier. Although we cannot process transit damage claims with any carrier on a customer's behalf, we will provide reasonable assistance to our customers when such claims arise.

4. **Consultations with Customers**

When so requested, our engineers and other personnel may consult with our customers concerning our Products. While our employees will offer their best judgment on any question, the ultimate responsibility for selecting that Product which will perform the functions and applications desired by the customer rests with the customer. As noted above, we make no warranty, express or implied, as to the fitness of any Product for any Product for any particular purpose or use.

5. How to Make a Claim

Within the limits of the terms and conditions set forth on our quotation and acknowledgment forms and in the Warranty and Claims Policy, we will honor reasonable and justified claims when adequate evidence is provided to show that our Product was defective.

Whenever a customer has a claim concerning a Product, the customer should contact the Customer Service Department.

CUSTOMERS SHOULD NOT RETURN ANY PRODUCTS OR PARTS OR COMPONENTS TO US WITHOUT FIRST CONTACTING US.

When contacting us, customers should have the following information available:

a) Customer name, location, purchase order number and date of purchase

b) Factory/Branch order number (serial number)

c) Product/Model number

d) Equipment installation date

e) Equipment failure date

f) Application or service of unit

g) Details of claim

Dynamix will notify the customer whether it will be necessary to return the Product or part or component to us. If so, we will send the customer an "AUTHORIZED RETURN NUMBER" that must be attached to the product or part or component before returning it. All items returned to us must be returned freight prepaid.

If we determine that the Product or part or component is defective and that the defect is covered by our warranty, we will, as explained above, correct the defect or refund the purchase price.

Customers should promptly inspect all Products upon delivery. The Customer must make claims for shortages within 20 days after the date of shipment from our factory or warehouse. We suggest that shortages be noted on the bill of lading or packing list, which should then be sent to our Customer Service Department for verification.

All other claims must be submitted within 60 days after the date of shipment from our factory or warehouse, or in the case of an alleged breach of warranty, within 60 days after the date within the warranty period on which the defect is or should have been discovered. Claims may not be deducted from payments made to us unless we have so agreed in writing in advance.

In the event of malfunction within the warranty period, Dynamix Agitators must be notified promptly, within thirty (30) days, if it is intended that the warranty is to cover the incident.

DATA SHEET

Single Phase Induction Motor - Squirrel Cage

Customer	: H2flow Equipment, Inc.
Customer reference	: PO-0713-22

Product line	: Single-Phase	Product code :	14078277
		Catalog # :	FC.50104W01DOE

Frame	: W56C	Locked rotor time	: 36s (cold) 20s (hot)
Output	: 0.5 HP (0.37 kW)	Temperature rise	: 80 K
Poles	: 4	Duty cycle	: Cont.(S1)
Frequency	: 60 Hz	Ambient temperature	: -20°C to +40°C
Rated voltage	: 115/208-230 V	Altitude	: 1000 m.a.s.l.
Rated current	: 5.22/2.90-2.61 A	Protection degree	: IP55
L. R. Amperes	: 38.6/21.5-19.3 A	Cooling method	: IC411 - TEFC
LRC	: 7.4x(Code K)	Mounting	: F-1
No load current	: 2.80/1.21-1.40 A	Rotation[1]	: Both (CW and CCW)
Rated speed	: 1740 rpm	Noise level[2]	: 52.0 dB(A)
Slip	: 3.33 %	Starting method	: Direct On Line
Rated torque	: 1.51 ft.lb	Approx. weight[3]	: 27.3 lb
Locked rotor torque	: 300 %		
Breakdown torque	: 270 %		
Insulation class	: F		
Service factor	: 1.15		
Moment of inertia (J)	: 0.0558 sq.ft.lb		
Design	: N		

Output	50%	75%	100%
Efficiency (%)	68.0	72.0	77.0
Power Factor	0.67	0.71	0.80

Foundation loads	
Max. traction	: 25 lb
Max. compression	: 53 lb

		Drive end	Non drive end
Bearing type	:	6203 ZZ	6202 ZZ
Sealing	:	V'Ring	V'Ring
Lubrication interval	:	-	-
Lubricant amount	:	-	-
Lubricant type	:	Mobil Polyrex EM	

Notes
Dynamix mixer S/N 74727 (Q58506)

This revision replaces and cancel the previous one, which must be eliminated.
(1) Looking the motor from the shaft end.
(2) Measured at 1m and with tolerance of +3dB(A).
(3) Approximate weight subject to changes after manufacturing process.
(4) At 100% of full load.

These are average values based on tests with sinusoidal power supply, subject to the tolerances stipulated in NEMA MG-1.

Warning

Prior to installation, read these installation and operating instructions. Installation and operation must comply with local regulations and accepted codes of good practice.

1. Safety instructions

These installation and operating instructions contain general instructions that must be observed during installation, operation and maintenance of the pump. It must therefore be read by the installation engineer and the relevant qualified operator prior to installation and start-up, and must be available at the installation location at all times.

1.1 Symbols used in this document

Warning
If these safety instructions are not observed, it may result in personal injury.

Caution — If these safety instructions are not observed, it may result in malfunction or damage to the equipment.

Note — Notes or instructions that make the job easier and ensure safe operation.

1.2 Qualification and training of personnel

The personnel responsible for the installation, operation and service must be appropriately qualified for these tasks. Areas of responsibility, levels of authority and the supervision of the personnel must be precisely defined by the operator. If necessary, the personnel must be trained appropriately.

Risks of not observing the safety instructions

Non-observance of the safety instructions may have dangerous consequences for the personnel, the environment and the pump and may result in the loss of any claims for damages.

It may lead to the following hazards:

- Personal injury from exposure to electrical, mechanical and chemical influences.
- Damage to the environment and personal injury from leakage of harmful substances.

1.3 Safety instructions for the operator/user

The safety instructions described in these instructions, existing national regulations on health protection, environmental protection and for accident prevention and any internal working, operating and safety regulations of the operator must be observed.

Information attached to the pump must be observed.

Leakages of dangerous substances must be disposed of in a way that is not harmful to the personnel or the environment.

Damage caused by electrical energy must be prevented, see the regulations of the local electricity supply company.

Caution — Before any work to the pump, the pump must be in the "Stop" operating state or be disconnected from the power supply. The system must be pressureless!

Note — The mains plug is the separator separating the pump from the mains.

Only original accessories and original spare parts should be used. Using other parts can result in exemption from liability for any resulting consequences.

1.4 Safety of the system in the event of a failure in the dosing pump

The dosing pump was designed according to the latest technologies and is carefully manufactured and tested.

If it fails regardless of this, the safety of the overall system must be ensured. Use the relevant monitoring and control functions for this.

Caution — Make sure that any chemicals that are released from the pump or any damaged lines do not cause damage to system parts and buildings.

The installation of leak monitoring solutions and drip trays is recommended.

1.5 Dosing chemicals

Warning

Before switching the supply voltage back on, the dosing lines must be connected in such a way that any chemicals in the dosing head cannot spray out and put people at risk.

The dosing medium is pressurised and can be harmful to health and the environment.

Warning

When working with chemicals, the accident prevention regulations applicable at the installation site should be applied (e.g. wearing protective clothing).

Observe the chemical manufacturer's safety data sheets and safety instructions when handling chemicals!

Caution

A deaeration hose, which is routed into a container, e.g. a drip tray, must be connected to the deaeration valve.

Caution

The dosing medium must be in liquid aggregate state!

Observe the freezing and boiling points of the dosing medium!

Caution

The resistance of the parts that come into contact with the dosing medium, such as the dosing head, valve ball, gaskets and lines, depends on the medium, media temperature and operating pressure.

Ensure that parts in contact with the dosing media are resistant to the dosing medium under operating conditions, see data booklet!

Should you have any questions regarding the material resistance and suitability of the pump for specific dosing media, please contact Grundfos.

1.6 Diaphragm breakage

If the diaphragm leaks or is broken, dosing liquid escapes from the drain opening (fig. 41, pos. 11) on the dosing head. Observe section *7.6 Diaphragm breakage*.

Warning

Danger of explosion, if dosing liquid has entered the pump housing!

Operation with damaged diaphragm can lead to dosing liquid entering the pump housing.

In case of diaphragm breakage, immediately separate the pump from the power supply!

Make sure the pump cannot be put back into operation by accident!

Dismantle the dosing head without connecting the pump to the power supply and make sure no dosing liquid has entered the pump housing. Proceed as described in section *7.6.1 Dismantling in case of diaphragm breakage*.

To avoid any danger resulting from diaphragm breakage, observe the following:

- Perform regular maintenance. See section *7.1 Regular maintenance*.
- Never operate the pump with blocked or soiled drain opening.
  - If the drain opening is blocked or soiled, proceed as described in section *7.6.1 Dismantling in case of diaphragm breakage*.
- Never attach a hose to the drain opening. If a hose is attached to the drain opening, it is impossible to recognise escaping dosing liquid.
- Take suitable precautions to prevent harm to health and damage to property from escaping dosing liquid.
- Never operate the pump with damaged or loose dosing head screws.

2. General information

The DDA dosing pump is a self-priming diaphragm pump. It consists of a housing with stepper motor and electronics, a dosing head with diaphragm and valves and the control cube.

Excellent dosing features of the pump:

- Optimal intake even with degassing media, as the pump always works at full suction stroke volume.
- Continuous dosing, as the medium is sucked up with a short suction stroke, regardless of the current dosing flow, and dosed with the longest possible dosing stroke.

2.1 Applications

The pump is suitable for liquid, non-abrasive, non-flammable and non-combustible media strictly in accordance with the instructions in these installation and operating instructions.

Areas of application

- Drinking water treatment
- Wastewater treatment
- Swimming pool water treatment
- Boiler water treatment
- CIP (Clean-In-Place)
- Cooling water treatment
- Process water treatment
- Wash plants
- Chemical industry
- Ultrafiltration processes and reverse osmosis
- Irrigation
- Paper and pulp industry
- Food and beverage industries

2.2 Improper operating methods

The operational safety of the pump is only guaranteed if it is used in accordance with section *2.1 Applications*.

Warning

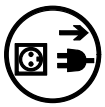
Other applications or the operation of pumps in ambient and operating conditions, which are not approved, are considered improper and are not permitted. Grundfos cannot be held liable for any damage resulting from incorrect use.

Warning

The pump is NOT approved for operation in potentially explosive areas!

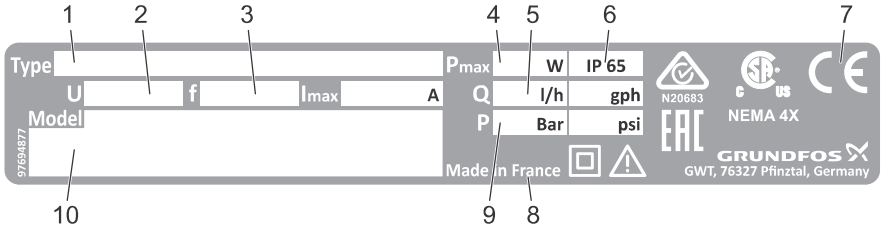
Warning

A sunscreen is required for outdoor installation!



Caution

Frequent disengagement from the mains voltage, e.g. via a relay, can result in damage to the pump electronics and in the breakdown of the pump. The dosing accuracy is also reduced as a result of internal start procedures.



Do not control the pump via the mains voltage for dosing purposes!

Only use the "External stop" function to start and stop the pump!

2.3 Symbols on the pump

Symbol	Description
	Indication of universally dangerous spot.
	In case of emergency and prior to all maintenance work and repairs, take the mains plug out of the mains supply!
	The device complies with electrical safety class II.
	Connection for deaeration hose at dosing head. If the deaeration hose is not correctly connected, danger will arise due to possible leakage of dosing liquid!

2.4 Nameplate

4. Assembly and installation

For use in Australia:

Note

Installation of this product must comply with AS/NZS3500!

Certificate of suitability number: CS9431

C-tick number: N20683

4.1 Pump assembly

Warning

Install the pump in such a way that the plug can easily be reached by the operator during operation! This will enable the operator to separate the pump from the mains quickly in case of emergency!

The pump is delivered with a mounting plate. The mounting plate can be mounted vertically e.g. on a wall or horizontally e.g. on a tank. It takes just a few quick steps to firmly secure the pump to the mounting plate by means of a slot mechanism.

The pump can easily be released from the mounting plate for maintenance.

4.1.1 Requirements

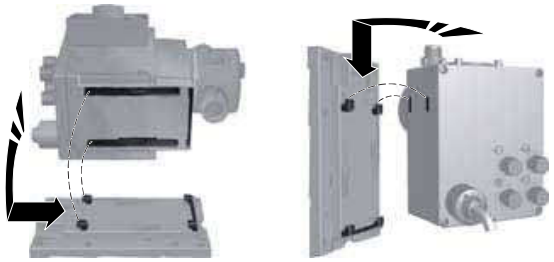
- The mounting surface must be stable and must not vibrate.
- Dosing must flow upwards vertically.

4.1.2 Align and install mounting plate

- **Vertical installation**: Mounting plate slot mechanism must be above.
- **Horizontal installation**: Mounting plate slot mechanism must be opposite the dosing head.
- The mounting plate can be used as a drill template, please see fig. 4 for drill hole distances.

TM04 1162 0110

Fig. 5 Locate mounting plate



Warning

Make sure that you do not damage any cables and lines during installation!

1. Indicate drill holes.
2. Drill holes.
3. Secure mounting plate using four screws, diameter 5 mm, to the wall, on the bracket or the tank.

4.1.3 Engage pump in mounting plate

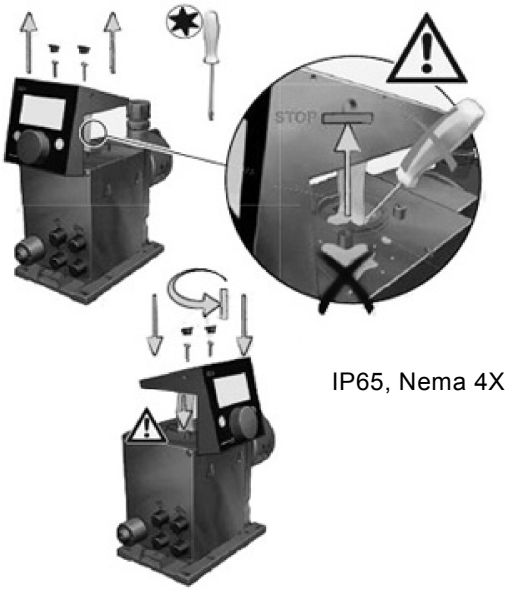
1. Attach the pump to the mounting plate support clamps and slide under slight pressure until it engages.

TM04 1159 0110

Fig. 6 Engaging the pump

4.1.4 Adjusting control cube position

The control cube is fitted to the front of the pump on delivery. It can be turned by 90 ° so that the user can select to operate the pump from the right or left side.



Caution

The enclosure class (IP65/Nema 4X) and shock protection are only guaranteed if the control cube is installed correctly!

Caution

Pump must be disconnected from the power supply!

1. Carefully remove both protective caps on the control cube using a thin screwdriver.
2. Loosen screws.
3. Carefully lift off control cube only so far from the pump housing that no tensile stress is produced on the flat band cable.
4. Turn control cube by 90 ° and re-attach.
   – Make sure the O-ring is secure.
5. Tighten screws slightly and attach protective caps.

IP65, Nema 4X

TM04 1182 0110

Fig. 7 Adjusting control cube

4.2 Hydraulic connection

Warning

Risk of chemical burns!

Wear protective clothing (gloves and goggles) when working on the dosing head, connections or lines!

The dosing head may contain water from the factory check!

Caution When dosing media which should not come into contact with water, another medium must be dosed beforehand!

Caution Faultless function can only be guaranteed in conjunction with lines supplied by Grundfos!

Caution The lines used must comply with the pressure limits as per section *3.1 Technical data*!

Important information on installation

- Observe suction lift and line diameter, see section *3.1 Technical data*.
- Shorten hoses at right angles.
- Ensure that there are no loops or kinks in the hoses.
- Keep suction line as short as possible.
- Route suction line up towards the suction valve.
- Installing a filter in the suction line protects the entire installation against dirt and reduces the risk of leakage.
- Only control variant FC/FCM: For discharge quantities < 1 l/h we recommend the use of an additional spring-loaded valve (approx. 3 bar) on the discharge side for the safe generation of the necessary differential pressure.

Hose connection procedure

1. Push union nut and tensioning ring across hose.
2. Push cone part fully into hose, see fig. 8.
3. Attach cone part with hose to corresponding pump valve.
4. Tighten union nut manually.
   – Do not use tools!
5. Tighten up union nuts after 2-5 operating hours if using PTFE gaskets!
6. Attach deaeration hose to the corresponding connection (see fig. 3) and run into a container or a collecting tray.

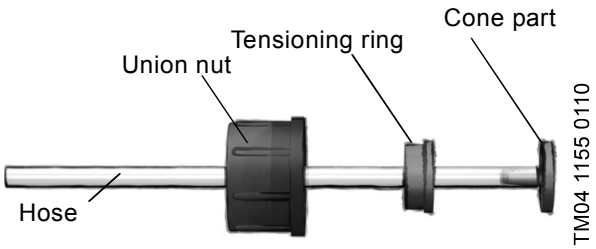


Fig. 8 Hydraulic connection

Note Pressure differential between suction and discharge side must be at least 1 bar/14.5 psi!

Caution Tighten the dosing head screws with a torque wrench once before commissioning and again after 2-5 operating hours at 4 Nm.

Installation example

The pump offers various installation options. In the picture below, the pump is installed in conjunction with a suction line, level switch and multifunction valve on a Grundfos tank.

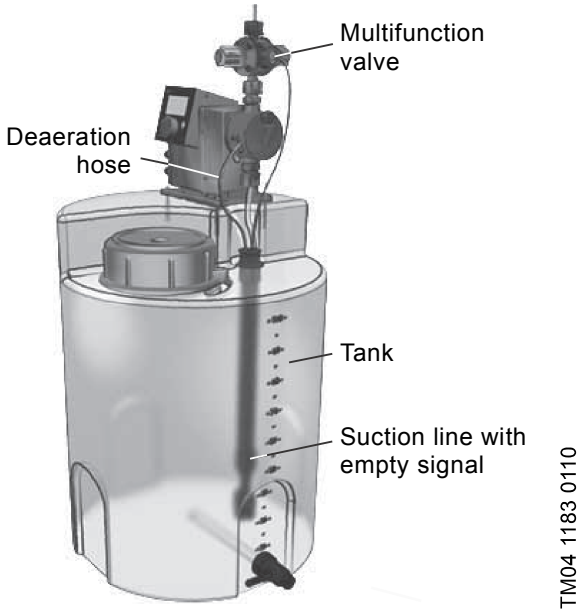

Fig. 9 Installation example

4.3 Electrical connection

Warning

The enclosure class (IP65/Nema 4X) is only guaranteed if plugs or protective caps are correctly installed!

Warning

The pump can start automatically when the mains voltage is switched on!

Do not manipulate mains plug or cable!

The mains plug is the separator separating the pump from the mains.

Note The rated voltage of the pump, see section *2.4 Nameplate*, must conform to local conditions.

Signal connections

Warning

Electric circuits of external devices connected to the pump inputs must be separated from dangerous voltage by means of double or reinforced insulation!

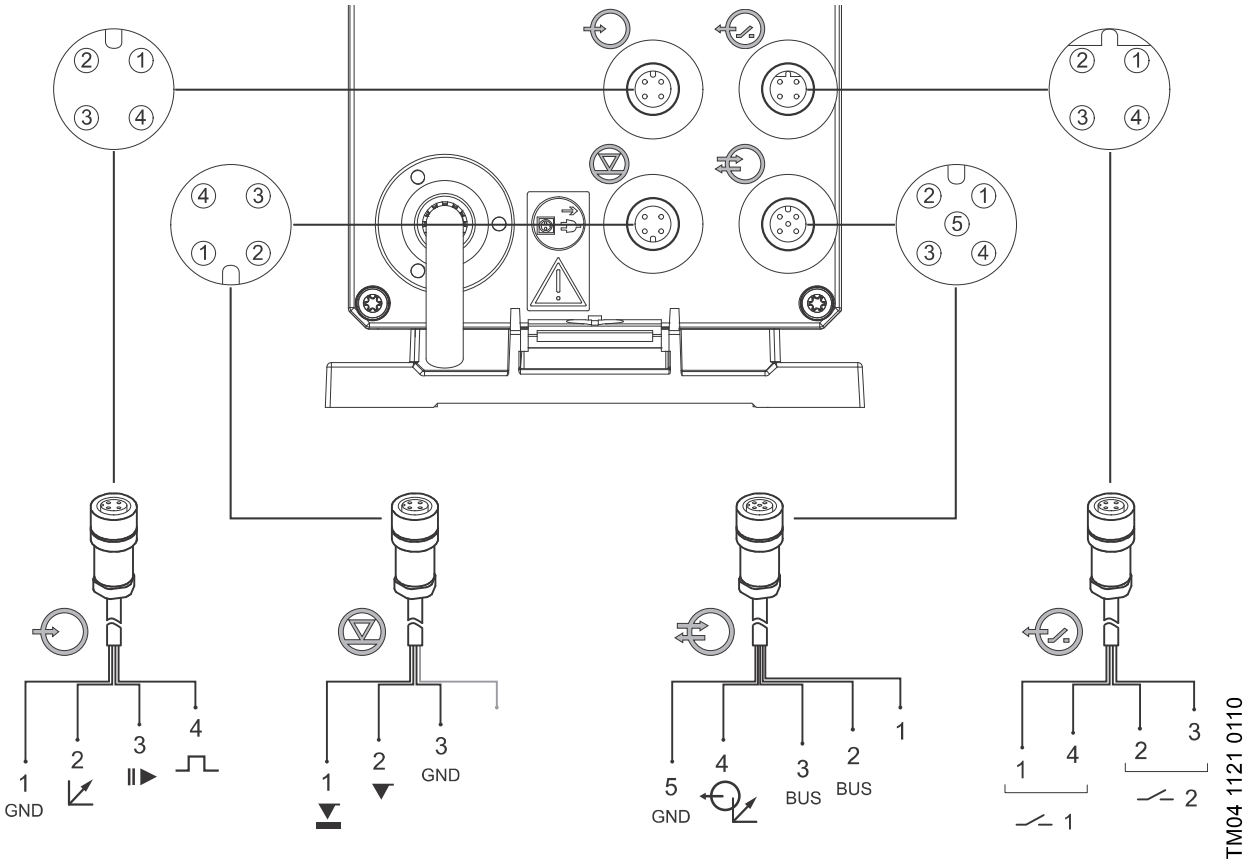

Fig. 10 Wiring diagram of the electrical connections

Analog, External stop and pulse input

Function	Pins				Plug type
	1/brown	2/white	3/blue	4/black	
Analog	GND/(-) mA	(+) mA			mA signal
External stop	GND		X		Pulse
Pulse	GND			X	Pulse

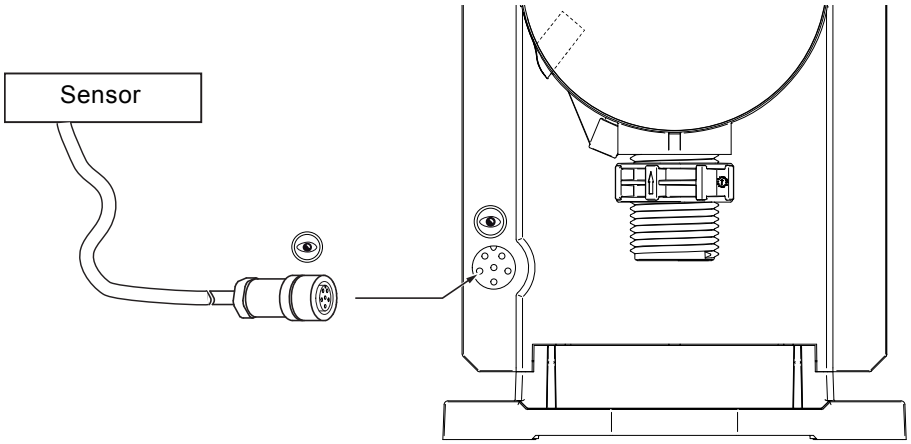
Level signals: Empty signal and Low-level signal

Function	Pins				Plug type
	1	2	3	4	
Low-level signal	X		GND		Pulse
Empty signal		X	GND		Pulse

GENIbus, Analog output

Caution

Danger of damage to the product due to short circuit! Pin 1 supplies 30 VDC.



Never short-circuit pin 1 with any of the other pins!

Function	Pins					Plug type
	1/brown	2/white	3/blue	4/black	5/yellow/ green	
GENIbus	+30 V	GENI bus TXD	GENI bus RXD		GND	Bus
Analog output				(+) mA	GND/(-) mA	mA signal

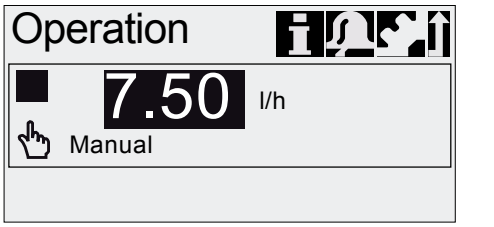
Relay outputs

Function	Pins				Plug type
	1/brown	2/white	3/blue	4/black	
Relay 1	X			X	Pulse
Relay 2		X	X		Pulse

FlowControl signal connection

TM04 1158 1716

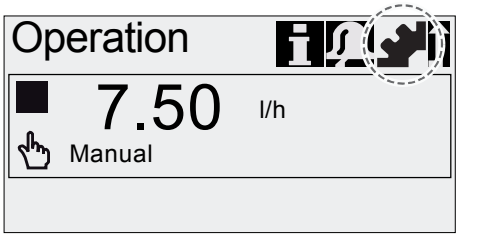
Fig. 11 FlowControl signal connection



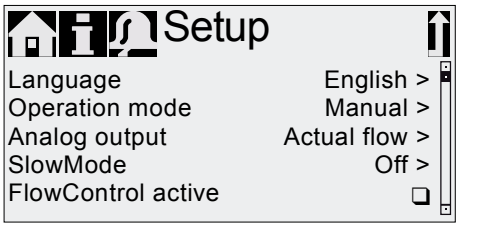
5. Startup

5.1 Setting the menu language

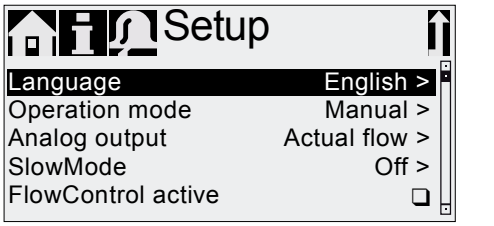
For description of control elements, see section 6.



1. Turn click wheel to highlight the cog symbol.

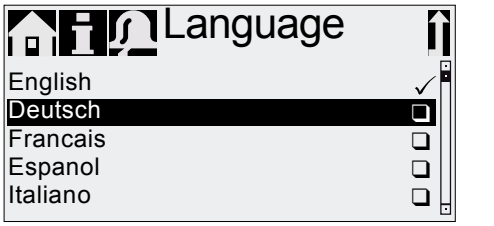


2. Press the click wheel to open the "Setup" menu.



3. Turn the click wheel to highlight the "Language" menu.

4. Press the click wheel to open the "Language" menu.



5. Turn the click wheel to highlight the desired language.

6. Press the click wheel to select the highlighted language.

7. Press the click wheel again to confirm the "Confirm settings?" prompt and apply the setting.

TM04 1184 1110

Fig. 12 Set menu language

5.2 Deaerating the pump

Warning
The deaeration hose must be connected correctly and inserted into a suitable tank!

1. Open deaeration valve by approximately half a turn.
2. Press and hold down the [100%] key (deaeration key) until liquid flows continuously without any bubbles from the deaeration hose.
3. Close deaeration valve.

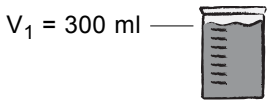
Note

Press the [100%] key and simultaneously turn the click wheel clockwise to increase the duration of the process to up to 300 seconds. After setting the seconds, do not press the key any longer.

5.3 Calibrating the pump

The pump is calibrated in the factory for media with a viscosity similar to water at maximum pump backpressure (see section *3.1 Technical data*).

If the pump is operated with a backpressure that deviates or if dosing a medium whose viscosity deviates, the pump must be calibrated.

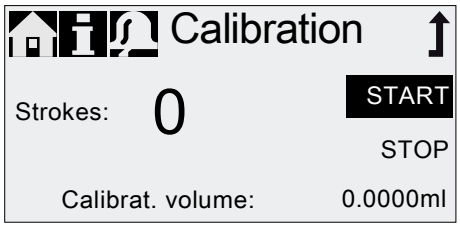


For pumps with FCM control variant, it is not necessary to calibrate the pump if there is deviating or fluctuating backpressure as long as the "AutoFlowAdapt" function has been enabled (see section *6.10 AutoFlowAdapt*).

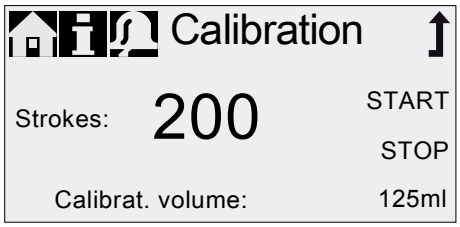
Requirements

- The hydraulics and electrics of the pump are connected (see section *4. Assembly and installation*).
- The pump is integrated into the dosing process under operating conditions.
- The dosing head and suction hose are filled with dosing medium.
- The pump has been deaerated.

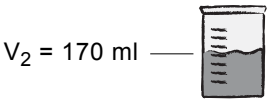
Calibration process - example for DDA 7.5-16



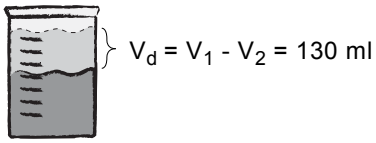
1. Fill a measuring beaker with dosing medium. Recommended filling volumes V_1:
   – DDA 7.5-16: 0.3 l
   – DDA 12-10: 0.5 l
   – DDA 17-7: 1.0 l
   – DDA 30-4: 1.5 l



2. Read off and note down the fill volume V_1 (e.g. 300 ml).
3. Place the suction hose in the measuring beaker.

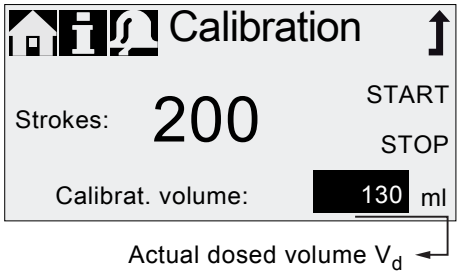


4. Start the calibration process in the "Setup > Calibration" menu.



5. The pump executes 200 dosing strokes and displays the factory calibration value (e.g. 125 ml).

6. Remove the suction hose from the measuring beaker and check the remaining volume V_2 (e.g. 170 ml).



7. From V_1 and V_2, calculate the actual dosed volume $V_d = V_1 - V_2$ (e.g. 300 ml - 170 ml = 130 ml).

8. Set and apply V_d in the calibration menu.

• The pump is calibrated.

TM04 1154 1110

6. Operation

6.1 Control elements

The pump control panel includes a display and the following control elements.

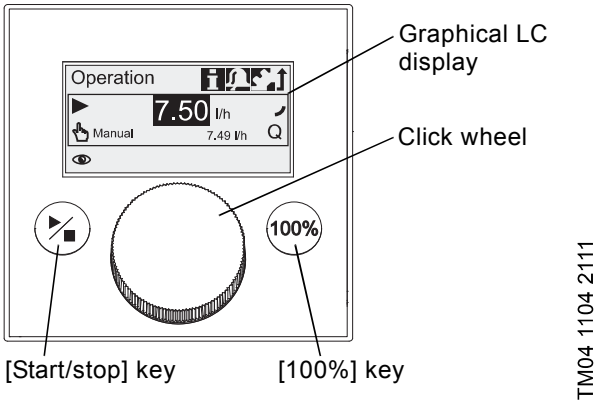


Fig. 13 Control panel

Keys

Key	Function
[Start/stop] key	Starting and stopping the pump.
[100%] key	The pump doses at maximum flow regardless of the operation mode.

Click wheel

The click wheel is used to navigate through the menus, select settings and confirm them.

Turning the click wheel clockwise moves the cursor clockwise in increments in the display. Turning the click wheel counter-clockwise moves the cursor counter-clockwise.

6.2 Display and symbols

6.2.1 Navigation

In the "Info", "Alarm" and "Setup" main menus, the options and submenus are displayed in the rows below. Use the "Back" symbol to return to the higher menu level. The scroll bar at the right edge of the display indicates that there are further menu items which are not shown.

The active symbol (current cursor position) flashes. Press the click wheel to confirm your selection and open the next menu level. The active main menu is displayed as text, the other main menus are displayed as symbols. The position of the cursor is highlighted in black in the sub-menus.

When you position the cursor on a value and press the click wheel, a value is selected. Turning the click wheel clockwise increases the value, turning the click wheel counter-clockwise reduces the value. When you now press the click wheel, the cursor will be released again.

6.2.2 Operating states

The operating state of the pump is indicated by a symbol and display colour.

Display	Fault	Operating state		
White	-	Stop ■	Standby ❙❙	
Green	-			Running ▶
Yellow	Warning	Stop ■	Standby ❙❙	Running ▶
Red	Alarm	Stop ■	Standby ❙❙	

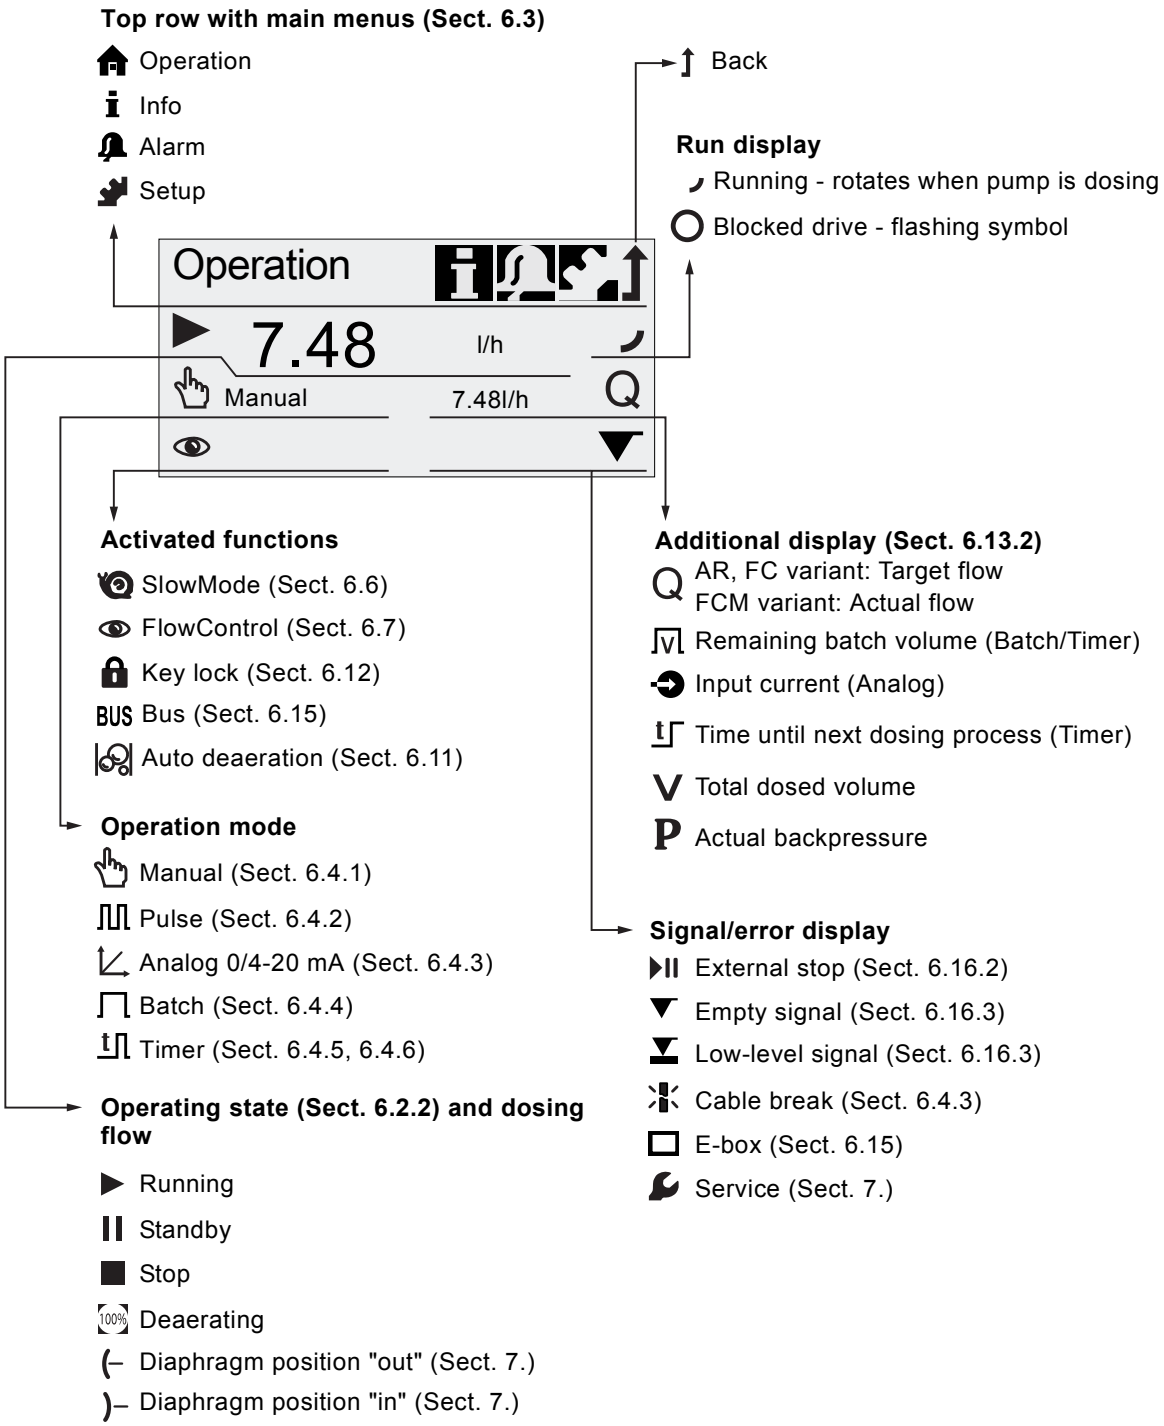
6.2.3 Sleep mode (energy-saving mode)

If in the "Operation" main menu the pump is not operated for 30 seconds, the header disappears. After two minutes, the display brightness is reduced.

If in any other menu the pump is not operated for two minutes, the display switches back to the "Operation" main menu and the display brightness is reduced. This state will be cancelled when the pump is operated or a fault occurs.

6.2.4 Overview of display symbols

The following display symbols may appear in the menus.



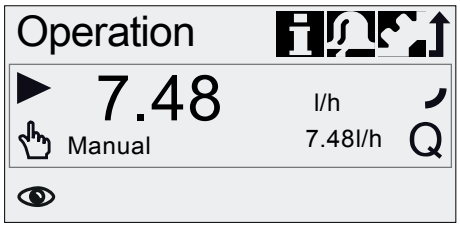


Fig. 14 Overview of display symbols

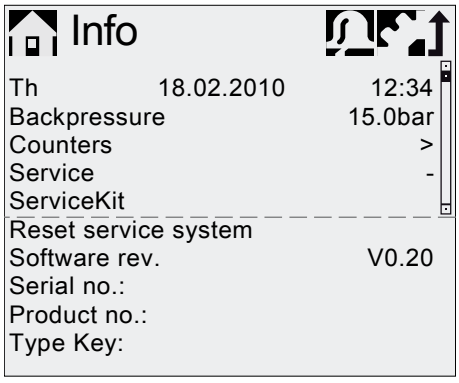
6.3 Main menus

The main menus are displayed as symbols at the top of the display. The currently active main menu is displayed as text.

6.3.1 Operation

Status information such as the dosing flow, selected operation mode and operating state is displayed in the "Operation" main menu.



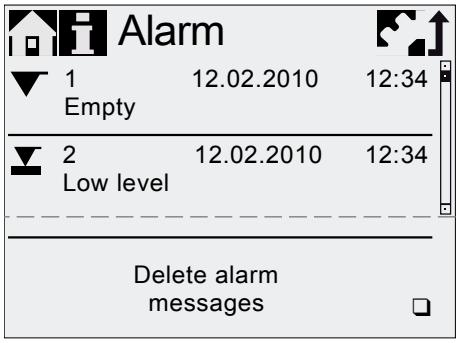
TM04 1157 2011

6.3.2 Info

You can find the date, time and information about the active dosing process, various counters, product data and the service system status in the "Info" main menu. The information can be accessed during operation.

The service system can also be reset from here.

TM04 1106 1010



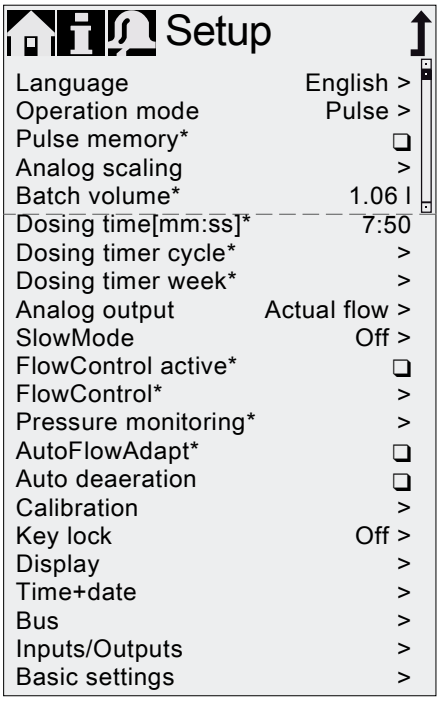
Counters

The "Info > Counters" menu contains the following counters:

Counters	Resettable
Volume Total dosed volume [l] or US gallons	Yes
Operating hours Accumulated operating hours (pump switched on) [h]	No
Motor runtime Accumulated motor runtime [h]	No
Strokes Accumulated number of dosing strokes	No
Power on/off Accumulated frequency of switching mains voltage on	No

6.3.3 Alarm

You can view errors in the "Alarm" main menu.



TM04 1109 1010

Up to 10 warnings and alarms, together with their date, time and cause, are listed in chronological order. If the list is full, the oldest entry will be overwritten, see section *8. Faults*.

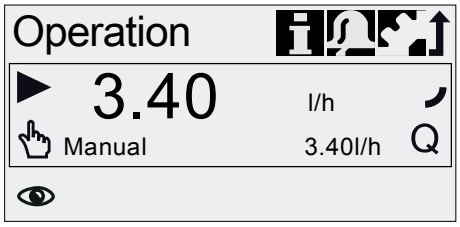
6.3.4 Setup

The "Setup" main menu contains menus for pump configuration. These menus are described in the following sections.

Note Check all pump settings after any change in the "Setup" menu.

TM04 1110 1010

* These submenus are only displayed for specific default settings and control variants.
The contents of the "Setup" menu also vary depending on the operation mode.



6.4 Operation modes

Six different operation modes can be set in the "Setup > Operation mode" menu.

- Manual, see section 6.4.1
- Pulse, see section 6.4.2
- Analog 0-20 mA, see section 6.4.3
  Analog 4-20 mA, see section 6.4.3
- Batch (pulse-based), see section 6.4.4
- Dosing timer cycle, see section 6.4.5
- Dosing timer week, see section 6.4.6

6.4.1 Manual

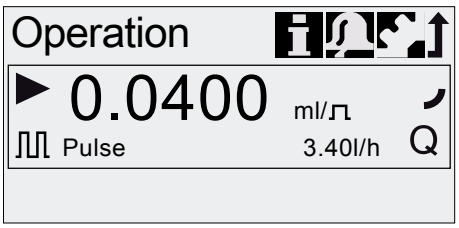
In this operation mode, the pump constantly doses the dosing flow set with the click wheel. The dosing flow is set in l/h or ml/h in the "Operation" menu. The pump automatically switches between the units. Alternatively, the display can be reset to US units (gph). See section *6.13 Display Setup*.

TM04 1125 1110

Fig. 15 Manual mode

The setting range depends on the pump type:

Type	Setting range*	
	[l/h]	[gph]
DDA 7.5-16	0.0025 - 7.5	0.0007 - 2.0
DDA 12-10	0.012 - 12	0.0031 - 3.1
DDA 17-7	0.017 - 17	0.0045 - 4.5
DDA 30-4	0.03 - 30	0.0080 - 8.0



* When the "SlowMode" function is active, the maximum dosing flow is reduced, see section *3.1 Technical data*.

6.4.2 Pulse

In this operation mode, the pump doses the set dosing volume for each incoming (potential-free) pulse, e.g. from a water meter. The pump automatically calculates the optimum stroke frequency for dosing the set volume per pulse.

The calculation is based on:

- the frequency of external pulses
- the set dosing volume/pulse.

TM04 1126 1110

Fig. 16 Pulse mode

The dosing volume per pulse is set in ml/pulse in the "Operation" menu using the click wheel. The setting range for the dosing volume depends on the pump type:

Type	Setting range [ml/pulse]
DDA 7.5-16	0.0015 - 14.9
DDA 12-10	0.0029 - 29.0
DDA 17-7	0.0031 - 31.0
DDA 30-4	0.0062 - 62.0

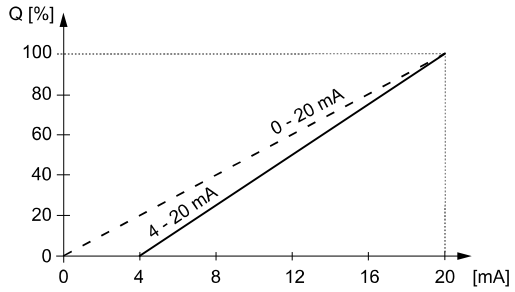
The frequency of incoming pulses is multiplied by the set dosing volume. If the pump receives more pulses than it can process at the maximum dosing flow, it runs at the maximum stroke frequency in continuous operation. Excess pulses will be ignored if the memory function is not enabled.

Memory function

When the "Setup > Pulse memory" function is enabled, up to 65,000 unprocessed pulses can be saved for subsequent processing.

Warning
Subsequent processing of saved pulses can cause local increase in concentration!

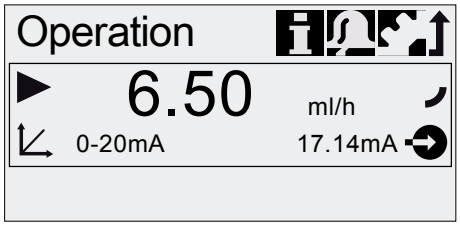
The contents of the memory will be deleted by:



- Switching off the power supply
- Changing the operation mode
- Interruption (e.g. alarm, External stop).

6.4.3 Analog 0/4-20 mA

In this operation mode, the pump doses according to the external analog signal.
The dosing volume is proportional to the signal input value in mA.



Operation mode	Input value [mA]	Dosing flow [%]
4-20 mA	≤ 4.1	0
	≥ 19.8	100
0-20 mA	≤ 0.1	0
	≥ 19.8	100

If the input value in operation mode 4-20 mA falls below 2 mA, an alarm is displayed and the pump stops. A cable break or signal transmitter error has occurred. The "Cable break" symbol is displayed in the "Signal and error display" area of the display.

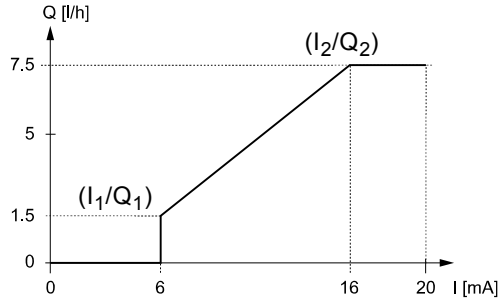
TM04 1120 2010

Fig. 17 Analog scaling

TM04 1127 1110

Fig. 18 Analog operation mode

Set analog scaling



Analog scaling refers to the assignment of the current input value to the dosing flow.

Changes of analog scaling affect also the analog output signal. See section *6.5 Analog output*.

Analog scaling passes through the two reference points (I_1/Q_1) and (I_2/Q_2), which are set in the "Setup > Analog scaling" menu. The dosing flow is controlled according to this setting.

Example 1 (DDA 7.5-16)

Analog scaling with positive gradient:

TM04 1160 2010

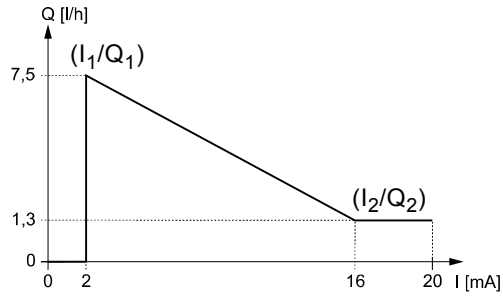


Fig. 19 Analog scaling with pos. gradient

In example 1, the reference points I_1 = 6 mA, Q_1 = 1.5 l/h and I_2 = 16 mA, Q_2 = 7.5 l/h have been set.

From 0 to 6 mA analog scaling is described by a line that passes through Q = 0 l/h, between 6 mA and 16 mA it rises proportionally from 1.5 l/h to 7.5 l/h and from 16 mA onwards it passes through Q = 7.5 l/h.

Example 2 (DDA 7.5-16)

Analog scaling with negative gradient (Operation mode 0-20 mA):

TM04 1101 2010

Fig. 20 Analog scaling with neg. gradient

In example 2, the reference points I_1 = 2 mA, Q_1 = 7.5 l/h and I_2 = 16 mA, Q_2 = 1.3 l/h have been set.

From 0 to 2 mA analog scaling is described by a line that passes through Q = 0 l/h, between 2 mA and 16 mA it drops proportionally from 7.5 l/h to 1.3 l/h and from 16 mA onwards it passes through Q_2 = 1.3 l/h.

Set analog scaling in the "Operation" menu

Analog scaling can also be modified after a security prompt directly in the "Operation" menu. This is how the dosing flow is directly modified for the current flow input value.

Caution Please observe that changes also have a direct effect on point I_2/Q_2 (see fig. 21)!

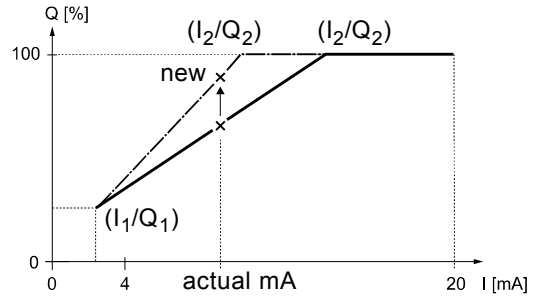

Fig. 21 Set analog scaling ("Operation" menu)

6.4.4 Batch (pulse-based)

In this operation mode, the pump doses the set batch volume in the set dosing time (t_1). A batch is dosed with each incoming pulse.

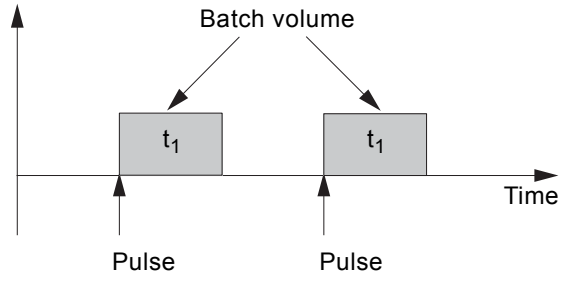

Fig. 22 Batch (pulse-based)

The setting range depends on the pump type:

Type	Setting range per batch		
	from [ml]	to [l]	Resolution* [ml]
DDA 7.5-16	0.74	999	0.0925
DDA 12-10	1.45	999	0.1813
DDA 17-7	1.55	999	0.1938
DDA 30-4	3.10	999	0.3875

* Thanks to the digital motor control, dosing quantities with a resolution of up to 1/8 of the dosing stroke volume can be dosed.

The batch volume (e.g. 75 ml) is set in the "Setup > Batch volume" menu. The minimum dosing time required for this (e.g. 36 seconds) is displayed and can be increased.

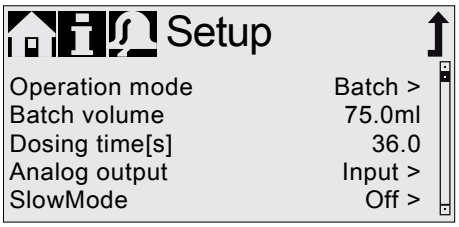

Fig. 23 Batch mode

Signals received during a batch process or an interruption (e.g. alarm, External stop) will be ignored. If the pump is restarted following an interruption, the next batch volume is dosed on the next incoming pulse.

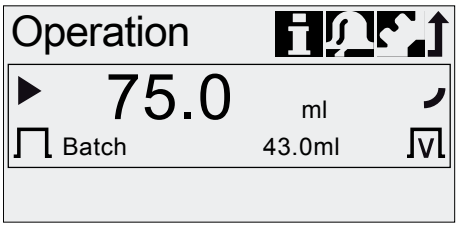

Fig. 24 Batch mode

In the "Operation" menu, the total batch volume (e.g. 75 ml) and the remaining batch volume still to be dosed (e.g. 43 ml) are shown in the display.

6.4.5 Dosing timer cycle

In this operation mode, the pump doses the set batch volume in regular cycles.
Dosing starts when the pump is started after a singular start delay. The setting range for the batch volume corresponds to the values in section *6.4.4 Batch (pulse-based)*.

Warning

When time or date is changed in "Time+date" menu, timer dosing and timer relay output functions (Relay 2) are stopped!

Timer dosing and timer relay output functions must be restarted manually!

Changing time or date can cause increase or decrease in concentration!

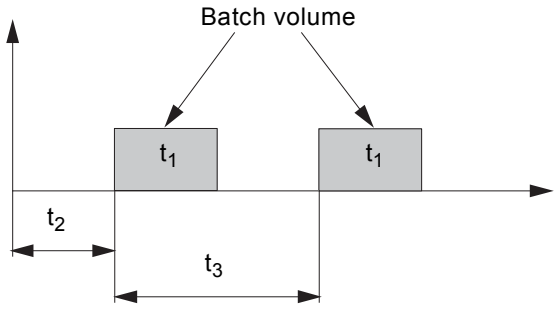

Fig. 25 Dosing timer cycle diagram

t_1	Dosing time
t_2	Start delay
t_3	Cycle time

In the event of an interruption (e.g. interruption of the mains voltage, External stop), the dosing will be stopped while the time continues running.
After suspending the interruption, the pump will continue to dose according to the actual timeline position.

The following settings are required in the "Setup > Dosing timer cycle" menu:

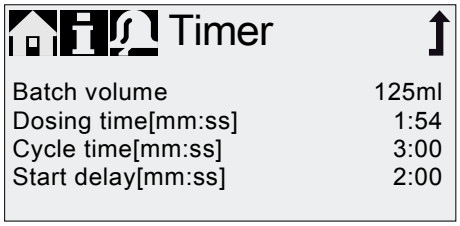

Fig. 26 Dosing timer cycle

The batch volume to be dosed (e.g. 125 ml) is set in the "Setup > Dosing timer cycle" menu. The dosing time required for this (e.g. 1:54) is displayed and can be changed.

The total batch volume (e.g. 125 ml) and the remaining batch volume still to be dosed are displayed in the "Operation" menu. During breaks in dosing, the time until the next dosing process (e.g. 1:21) is displayed.

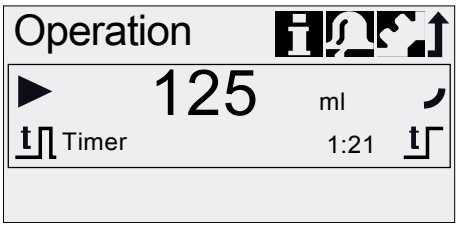

Fig. 27 Dosing timer cycle

6.4.6 Dosing timer week

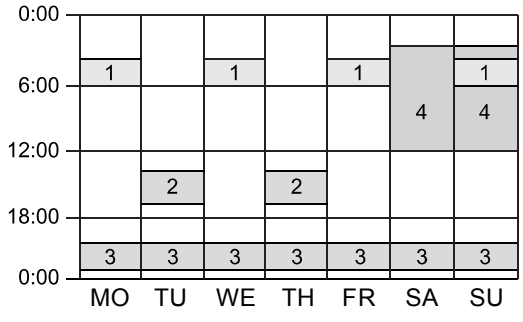
In this operation mode, up to 16 dosing procedures are defined for a week.
These dosing procedures may take place regularly on one or several week days. The setting range for the batch volume corresponds to the values in section *6.4.4 Batch (pulse-based)*.

Warning

When time or date is changed in "Time+date" menu, timer dosing and timer relay output functions (Relay 2) are stopped!

Timer dosing and timer relay output functions must be restarted manually!

Changing time or date can cause increase or decrease in concentration!



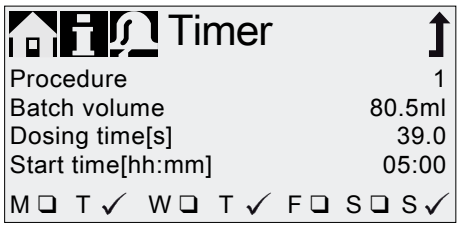


Fig. 28 Example for Dosing timer week function

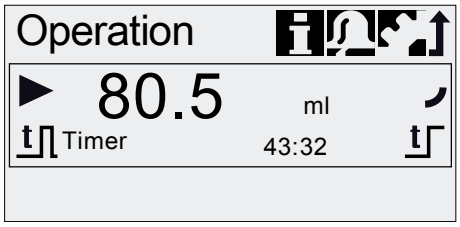
Note If several procedures overlap, the process with the higher dosing flow has priority!

In the event of an interruption (e.g. disconnection of the mains voltage, External stop), the dosing is stopped while the time continues running.
After suspending the interruption, the pump continues to dose according to the actual timeline position.

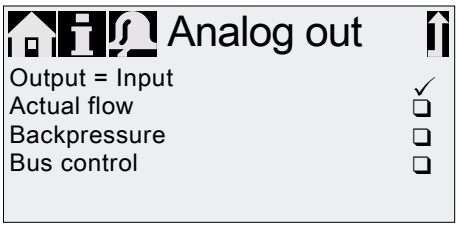
The following settings are required in the "Setup > Dosing timer week" menu for each dosing procedure:



TM04 1138 1110

Fig. 29 Setting the timer

The batch volume (e.g. 80.5 ml) is set in the "Setup > Dosing timer week" menu. The dosing time required for this (e.g. 39.0) is displayed and can be changed.



In the "Operation" menu, the total batch volume (e.g. 80.5 ml) and the remaining batch volume to be dosed is displayed. During breaks in dosing, the time (e.g. 43:32) until the next dosing is displayed.

TM04 1136 1110

Fig. 30 Weekly timer dosing (break in dosing)

6.5 Analog output

TM04 1153 1110

Fig. 31 Configure analog output

The analog output of the pump is parametrised in the "Setup > Analog output" menu. The following settings are possible:

Setting	Description of output signal	Variant FCM	FC	AR
Output = Input	Analog feedback signal (not for master-slave application). The analog input signal is mapped 1:1 to the analog output.	X	X	X
Actual flow**	Current actual flow • 0/4 mA = 0 % • 20 mA = 100 % see section *6.9 Flow measurement*	X	X*	X*
Backpressure	Backpressure, measured in the dosing head • 0/4 mA = 0 bar • 20 mA = Max. operating pressure see section *6.8 Pressure monitoring*	X	X	
Bus control	Enabled by command in Bus control, see section *6.15 Bus communication*	X	X	X

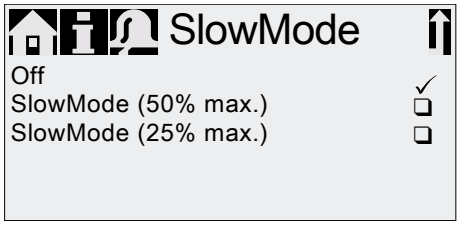
* Output signal is based on motor speed and pump status (target flow).

** Signal has same analog scaling as the current analog input signal. See *6.4.3 Analog 0/4-20 mA*.

Wiring diagram see section *4.3 Electrical connection*.

Note

In all operation modes, the analog output has a range of 4-20 mA. Exception: Operation mode 0-20 mA. Here, the analog output range is 0-20 mA.



6.6 SlowMode

When the "SlowMode" function is enabled, the pump slows down the suction stroke. The function is enabled in the "Setup > SlowMode" menu and is used to prevent cavitation in the following cases:

- for dosing media with a high viscosity
- for degassing dosing media
- for long suction lines
- for large suction lift.

In the "Setup > SlowMode" menu, the speed of the suction stroke can be reduced to 50 % or 25 %.

Caution Enabling the 'SlowMode' function reduces the maximum dosing flow of the pump to the set percentage value!

TM04 1153 1110

Fig. 32 SlowMode menu

6.7 FlowControl

Applies to DDA-FC/FCM control variant.

This function is used to monitor the dosing process. Although the pump is running, various influences e.g. air bubbles, can cause a reduced flow or even stop the dosing process. In order to guarantee optimum process safety, the enabled "FlowControl" function directly detects and indicates the following errors and deviations:

- Overpressure
- Damaged discharge line
- Air in the dosing chamber
- Cavitation
- Suction valve leakage > 70 %
- Discharge valve leakage > 70 %.

The occurrence of a fault is indicated by the "eye" symbol flashing. The faults are displayed in the "Alarm" menu (see section *8. Faults*).

FlowControl works with a maintenance-free sensor in the dosing head. During the dosing process, the sensor measures the current pressure and continuously sends the measured value to the microprocessor in the pump. An internal indicator diagram is created from the current measured values and the current diaphragm position (stroke length). Causes for deviations can be identified immediately by aligning the current indicator diagram with a calculated optimum indicator diagram. Air bubbles in the dosing head reduce e.g. the discharge phase and consequently the stroke volume (see fig. 33).

Requirements for a correct indicator diagram are:

- FlowControl function is active
- pressure difference between suction and discharge side is > 2 bar
- No interruption/pause in discharge stroke
- Pressure sensor and cable are functioning properly
- No leakage > 50 % in suction or discharge valve

If one of these requirements is not met, the indicator diagram cannot be evaluated.

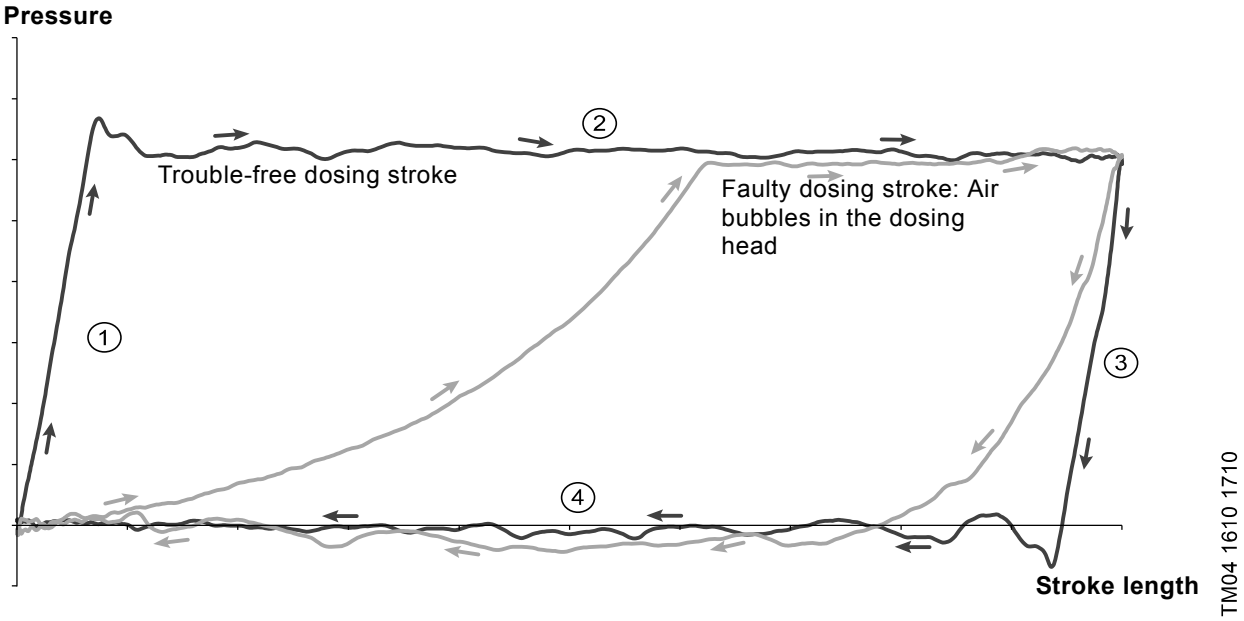


Fig. 33 Indicator diagram

1	Compression phase
2	Discharge phase
3	Expansion phase
4	Suction phase

Setting FlowControl

The "FlowControl" function is set using the two parameters "Sensitivity" and "Delay" in the "Setup > FlowControl" menu.

Sensitivity

In "Sensitivity" the deviation in stroke volume, which will result in an error message, is set in percent.

Sensitivity	Deviation
low	approx. 70 %
medium	approx. 50 %
high	approx. 30 %

Delay

The "Delay" parameter is used to define the time period until an error message is generated: "short", "medium" or "long". The delay depends on the set dosing flow and therefore cannot be measured in strokes or time.

Air bubbles

The "FlowControl" function identifies air bubbles > 60 % of the stroke volume. After switching to "Air bubble" warning status, the pump adapts the stroke frequency to approximately 30-40 % of max. stroke frequency, and starts a special motor drive strategy. The adaptation of the stroke frequency allows the air bubbles to rise from suction to discharge valve. Due to the special motor drive strategy the air bubbles are displaced from the dosing head into the discharge line.

If the air bubbles have not been eliminated after a maximum of 60 strokes, the pump returns to the normal motor drive strategy.

6.8 Pressure monitoring

Applies to DDA-FC/FCM control variant.

A pressure sensor monitors the pressure in the dosing head. If the pressure during the discharge phase falls below 2 bar, a warning is generated (pump continues running). If in the "Setup > Pressure monitoring" menu the function "Min. pressure alarm" is activated, an alarm is generated and the pump is stopped.

If the pressure exceeds the "Max. pressure" set in the "Setup > Pressure monitoring" menu, the pump is shut down, enters the standby state and indicates an alarm.

Caution

The pump restarts automatically once the backpressure falls below the set "Max. pressure"!

6.8.1 Pressure setting ranges

Type	Fixed min. pressure [bar]	Adjustable max. pressure [bar]
DDA 7.5-16	< 2	3-17
DDA 12-10	< 2	3-11
DDA 17-7	< 2	3-8
DDA 30-4	< 2	3-5

Warning

Install a pressure-relief valve in the pressure line to provide protection against impermissibly high pressure!

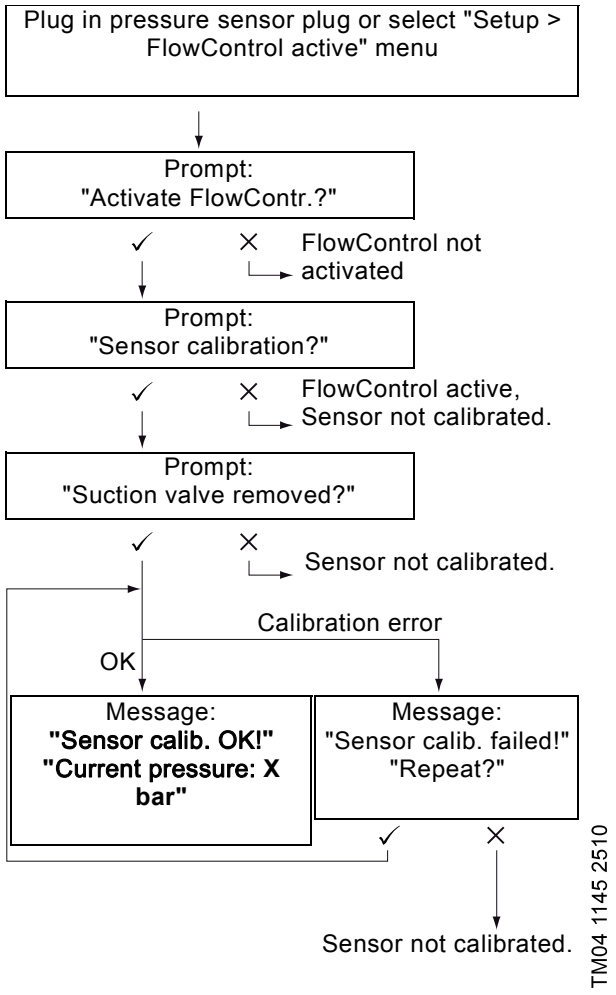
Caution

The pressure measured in the dosing head is slightly higher than the actual system pressure.

Therefore the "Max. pressure " should be set at least 0.5 bar higher than the system pressure.

6.8.2 Calibration of pressure sensor

The pressure sensor is calibrated in the factory. As a rule, it does not need to be re-calibrated. If specific circumstances (e.g. pressure sensor exchange, extreme air pressure values at the location of the pump) necessitate a calibration, the sensor can be calibrated as follows:



1. Set pump to "Stop" operating state.
2. Make system pressureless and flush.
3. Dismantle suction line and suction valve.

Warning

Calibrating when the suction valve is installed produces incorrect calibration and can cause personal injuries and damage to property!

Only carry out a calibration if this is technically required!

4. Proceed as described below to calibrate:

If a calibration is not successfully possible, check plug connections, cable and sensor and replace defective parts where necessary.

6.9 Flow measurement

Applies to DDA-FCM control variant.

The pump accurately measures the actual flow and displays it. Via the 0/4-20 mA analog output, the actual flow signal can easily be integrated into an external process control without additional measuring equipment (see section *6.5 Analog output*).

The flow measurement is based on the indicator diagram as described in section *6.7 FlowControl*. The accumulated length of the discharge phase multiplied by the stroke frequency produces the displayed actual flow. Faults e.g. air bubbles or backpressure that is too low result in a smaller or larger actual flow. When the "AutoFlowAdapt" function is activated (see section *6.10 AutoFlowAdapt*), the pump compensates for these influences by correction of the stroke frequency.

Note

Strokes which cannot be analysed (partial strokes, pressure differential which is too low) are provisionally calculated based on the setpoint value and displayed.

6.10 AutoFlowAdapt

Applies to DDA-FCM control variant.

The "AutoFlowAdapt" function is activated in the "Setup" menu. It detects changes in various parameters and responds accordingly in order to keep the set target flow constant.

Note

Dosing accuracy is increased when "AutoFlowAdapt" is activated.

This function processes information from the pressure sensor in the dosing head. Errors detected by the sensor are processed by the software. The pump responds immediately regardless of the operation mode by adjusting the stroke frequency or where necessary compensating for the deviations with a corresponding indicator diagram.

If the target flow cannot be achieved by the adjustments, a warning is issued.

"AutoFlowAdapt" operates on the basis of the following functions:

- FlowControl: malfunctions are identified (see section *6.7 FlowControl*).
- Pressure monitoring: pressure fluctuations are identified (see section *6.8 Pressure monitoring*).
- Flow measurement: deviations from the target flow are identified (see section *6.9 Flow measurement*).

Example of "AutoFlowAdapt"

Pressure fluctuations

The dosing volume decreases as backpressure increases and conversely the dosing volume increases as the backpressure decreases.

The "AutoFlowAdapt" function identifies pressure fluctuations and responds by adjusting the stroke frequency. The actual flow is thus maintained at a constant level.

6.11 Auto deaeration

Dosing degassing media can result in air pockets in the dosing head during breaks in dosing. This can result in no medium being dosed when restarting the pump. The "Setup > Auto deaeration" function performs pump deaeration automatically at regular intervals. Software-controlled diaphragm movements encourage any bubbles to rise and gather at the discharge valve so that they can be removed on the next dosing stroke.

The function works:

- when the pump is not in the "Stop" operating state
- during breaks in dosing (e.g. External stop, no incoming pulses, etc.).

Note

The diaphragm movements can displace small volumes into the discharge line. When dosing strongly degassing media, this is however virtually impossible.

6.12 Key lock

The key lock is set in the "Setup > Key lock" menu by entering a four-digit code. It protects the pump by preventing changes to settings. Two levels of key lock can be selected:

Level	Description
Settings	All settings can only be changed by entering the lock code. The [Start/stop] key and the [100%] key are not locked.
Settings + keys	The [Start/stop] key and the [100%] key and all settings are locked.

It is still possible to navigate in the "Alarm" and "Info" main menu and reset alarms.

6.12.1 Temporary deactivation

If the "Key lock" function is activated but settings need to be modified, the keys can be unlocked temporarily by entering the deactivation code. If the code is not entered within 10 seconds, the display automatically switches to the "Operation" main menu. The key lock remains active.

6.12.2 Deactivation

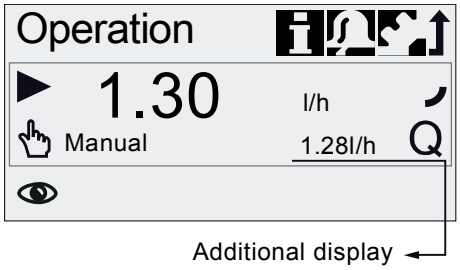
The key lock can be deactivated in the "Setup > Key lock" menu via the "Off" menu point. The key lock is deactivated after the general code "2583" or a pre-defined custom code has been entered.

6.13 Display Setup

Use the following settings in the "Setup > Display" menu to adjust the display properties:

- Units (metric/US)
- Display contrast
- Additional display.

6.13.1 Units



Metric units (litres/millilitres/bar) or US units (US gallons/PSI) can be selected. According to the operation mode and menu, the following units of measurement are displayed:

Operation mode / function	Metric units	US units
Manual control	ml/h or l/h	gph
Pulse control	ml/⊓	ml/⊓
0/4-20 mA Analog control	ml/h or l/h	gph
Batch (pulse- or timer-controlled)	ml or l	gal
Calibration	ml	ml
Volume counter	l	gal
Pressure monitoring	bar	psi

6.13.2 Additional display

The additional display provides additional information about the current pump status. The value is shown in the display with the corresponding symbol.

In "Manual" mode the "Actual flow" information can be displayed with Q = 1.28 l/h (see fig. 34).

TM04 1151 2011

Fig. 34 Display with additional display

The additional display can be set as follows:

Setting	Description
Default display	Depending on the operation mode:
	Q Actual flow (Manual/Pulse)[1), 2)]
	Q Target flow (Pulse)
	Input current (analog)
	Remaining batch volume (Batch, Timer)
	t Period until next dosing (Timer)
Dosed volume	V Dosed vol. since last reset (see *Counters* on page 21)
Actual flow	Q Current actual flow[1)]
Backpressure	P Current backpressure in the dosing head[3)]

1) only DDA-FCM control variant

2) only if indicator diagram can be evaluated (see *6.7 FlowControl*)

3) only DDA-FCM/FC control variant

6.14 Time+date

The time and date can be set in the "Setup > Time+date" menu.

Warning

When time or date is changed in "Time+date" menu, timer dosing and timer relay output functions (Relay 2) are stopped!

Timer dosing and timer relay output functions must be restarted manually!

Changing time or date can cause increase or decrease in concentration!

Caution

The conversion between summer and winter time does not take place automatically!

6.15 Bus communication

BUS

The bus communication enables remote monitoring and setting of the pump via a fieldbus system.

Further manuals, functional profiles and support files (e.g. GSD-files) are available on the CD delivered with the interface hardware and on www.grundfos.com.

6.15.1 GENIbus communication

The pump is supplied with an integrated module for GENIbus communication. The pump identifies the bus control after connecting to the corresponding signal input. The "Activate communication?" prompt is displayed. After confirmation, the corresponding symbol appears in the "Activated functions" area in the "Operation" menu.

In the "Setup > Bus" menu the GENIbus address can be set from 32 to 231 and bus control can be deactivated.

TM04 1139 2410

Fig. 35 Bus menu

Caution The maximum cable length for GENIbus connection is 3 m and must not be exceeded!

6.15.2 Possible industrial bus types

The pump can be integrated into several networks using the additional E-box (Extension-Box).

Bus type	Interface hardware	Retrofitting possible for pump software
Profibus® DP	E-Box 150	V2.0 and higher
Modbus RTU	E-Box 200	V2.5 and higher

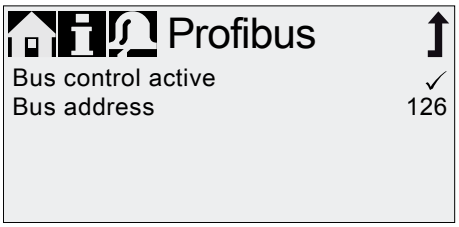
The pump can also be connected to a Grundfos CIU unit (CIU = Communication Interface Unit) equipped with one of the following CIM modules (CIM = Communication Interface Module):

- CIM150 Profibus
- CIM200 Modbus
- CIM270 GRM
- CIM500 Ethernet

For internal communication between the E-Box/CIU and the dosing pump, GENIbus is used.

Caution The maximum cable length for GENIbus connection is 3 m and must not be exceeded!

Caution Prior to installation and start-up, read the documentation delivered with the E-Box or CIU unit!



6.15.3 Activate communication

1. Set the pump to operating state "Stop" with the [Start/stop] key.
2. Switch off the power supply of the pump.
3. Install and connect the E-Box/CIU as described in the respective separate installation and operating instructions.
4. Switch on the power supply of the pump.

The "Activate communication?" prompt is displayed.

After confirmation, the "Bus" symbol appears in the "Activated functions" area of the "Operation" menu, no matter if the prompt was accepted or refused.

If the prompt has been accepted, the bus control function is activated. If the prompt has been refused, bus control function can be activated in "Setup > Bus" menu.

TM04 1139 2410

Fig. 36 Example of submenu for Profibus®

6.15.4 Setting the bus address

1. Enter "Setup > Bus" menu and set desired bus address:

Bus type	Address range
Profibus® DP	~~0 – 126~~0-126
Modbus RTU	~~1 – 247~~1-247

2. The pump needs to be restarted to initialise the new bus address. Switch off the power supply of the pump and wait for approximately 20 seconds.
3. Switch on the power supply of the pump.

The pump is initialised with the new bus address.

6.15.5 Characteristics of bus communication

To start and stop the pump via bus, it needs to be in operating state "Running". When the pump is remotely stopped from bus, the "External stop" symbol is displayed and the pump switches to operating state "Standby".

While bus control function is activated, the "Setup" menu only shows the "Bus" and "Key lock" submenus. The other main menus, the "External stop" function and the keys are still available.

All operation modes (see section *6.4 Operation modes*) can still be used when bus control is activated. This allows to use the bus control only for monitoring and setting the pump. In this case the respective "BusWatchDog" (see funtional profile on E-Box/CIU product CD) should be deactivated in bus control, because otherwise faults in communication can stop the pump.

Note

To change any settings manually, the bus control function must be deactivated temporarily.

The analog output can not be used while the pump is bus-controlled as both functions use the same electrical connection. See section *4.3 Electrical connection*.

6.15.6 Deactivate communication

Warning

After deactivating the bus control function, the pump can start automatically!

Before deactivating the bus control function, set the pump to operating state "Stop"!

Bus control function can be deactivated in the "Setup > Bus" menu. After deactivation all submenus in "Setup" menu are available.

The "Bus" symbol in the display disappears at next restart of the pump, after the E-Box/CIU plug was disconnected.

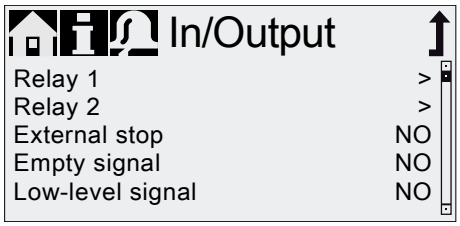
Caution

After disconnecting any plug, always refit protective cap!

6.15.7 Communication faults

Faults are only detected, if the respective "BusWatchDog" (see functional profile on E-Box/CIU product CD) is activated.

Warning



After a communication fault is repaired, the pump can start automatically, depending on current bus control and pump settings!

Before repairing any fault, set the pump to operating state "Stop"!

In case of bus communication faults (e.g. communication cable break), the pump stops dosing and switches to operating state "Standby" approximately 10 seconds after the fault was detected. An alarm is triggered, detailing the cause of the fault. See section *8. Faults*.

6.16 Inputs/Outputs

In the "Setup > Inputs/Outputs" menu, you can configure the two outputs "Relay 1+Relay 2" and the signal inputs "External stop", "Empty signal" and "Low-level signal".

TM04 1152 1110

Fig. 37 Inputs/Outputs menu

Warning

When time or date is changed in "Time+date" menu, timer dosing and timer relay output functions (Relay 2) are stopped!

Timer dosing and timer relay output functions must be restarted manually!

Changing time or date can cause increase or decrease in concentration!

6.16.1 Relay outputs

The pump can switch two external signals using installed relays. The relays are switched by potential-free pulses. The connection diagram of the relays is shown in section *4.3 Electrical connection*. Both relays can be allocated with the following signals:

Relay 1 signal	Relay 2 signal	Description
Alarm*	Alarm	Display red, pump stopped (e.g. empty signal, etc.)
Warning*	Warning	Display yellow, pump is running (e.g. low-level signal, etc.)
Stroke signal	Stroke signal	Each full stroke
Pump dosing	Pump dosing*	Pump running and dosing
Pulse input**	Pulse input**	Each incoming pulse from pulse input
Bus control	Bus control	Activated by a command in the bus communication
	Timer Cycle	See following sections
	Timer Week	See following sections
Contact type		
NO*	NO*	Normally open contact
NC	NC	Normally closed contact

* Factory setting

** The correct transmission of incoming pulses can only be guaranteed up to a pulse frequency of 5 Hz.

Timer Cycle (Relay 2)

For the "Relay 2 > Timer Cycle" function, set the following parameters:

- On (t_1)
- Start delay (t_2)
- Cycle time (t_3)

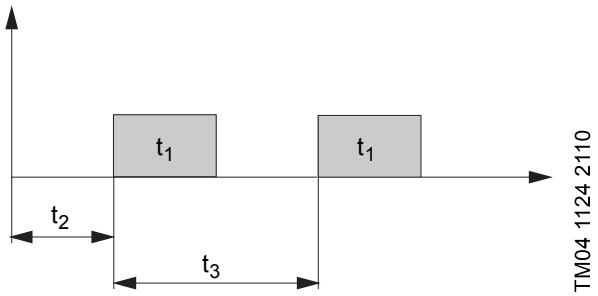


Fig. 38 Diagram

Timer Week (Relay 2)

This function saves up to 16 relay on-times for a week. The following settings can be made for each relay switching operation in the "Relay 2 > Timer Week" menu:

- Procedure (No.)
- On time (duration)
- Start time
- Weekdays.

6.16.2 External stop

The pump can be stopped via an external pulse, e.g. from a control room. When activating the external stop pulse, the pump switches from the operating state "Running" into the operating state "Standby". The corresponding symbol appears in the "Signal/error display" area of the display.

Caution

Frequent disengagement from the mains voltage, e.g. via a relay, can result in damage to the pump electronics and in the breakdown of the pump. The dosing accuracy is also reduced as a result of internal start procedures.

Do not control the pump via the mains voltage for dosing purposes!

Only use the "External stop" function to start and stop the pump!

The contact type is factory-set to normally open contact (NO). In the "Setup > Inputs/Outputs > External stop" menu, the setting can be changed to normally closed contact (NC).

6.16.3 Empty and Low level signals

In order to monitor the filling level in the tank, a dual-level sensor can be connected to the pump. The pump responds to the signals as follows:

Sensor signal	Pump status
Low level	• Display is yellow • ⧗ Flashes • Pump continues running
Empty	• Display is red • ▼ Flashes • Pump stops

Caution When the tank is filled up again, the pump restarts automatically!

Both signal inputs are allocated to the normally open contact (NO) in the factory. They can be re-allocated in the "Setup > Inputs/Outputs" menu to normally closed contact (NC).

6.17 Basic settings

All settings can be reset to the settings default upon delivery in the "Setup > Basic settings" menu.

Selecting "Save customer settings" saves the current configuration to the memory. This can then be activated using "Load customer settings".

The memory always contains the previously saved configuration. Older memory data is overwritten.

7. Service

In order to ensure a long service life and dosing accuracy, wearing parts such as diaphragms and valves must be regularly checked for signs of wear. Where necessary, replace worn parts with original spare parts made from suitable materials.

Should you have any questions, please contact your service partner.

Warning

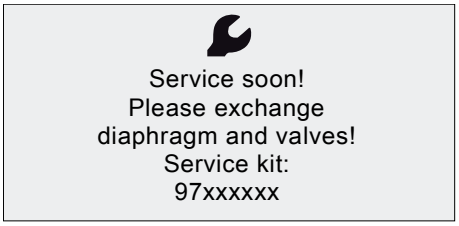
Maintenance work must only be carried out by qualified staff.

7.1 Regular maintenance

Interval	Task
Daily	Check, if liquid leaks from the drain opening (fig. 41, pos. 11) and if the drain opening is blocked or soiled. If so, follow the instructions given in section *7.6 Diaphragm breakage*.
	Check, if liquid leaks from the dosing head or valves. If necessary, tighten dosing head screws with a torque wrench at 4 Nm. If necessary, tighten valves and cap nuts, or perform service (see *7.4 Perform service*).
	Check, if a service requirement is present at the pump display. If so, follow the instructions given in section *7.3 Service system*.
Weekly	Clean all pump surfaces with a dry and clean cloth.
Every 3 months	Check dosing head screws. If necessary, tighten dosing head screws with a torque wrench at 4 Nm. Replace damaged screws immediately.

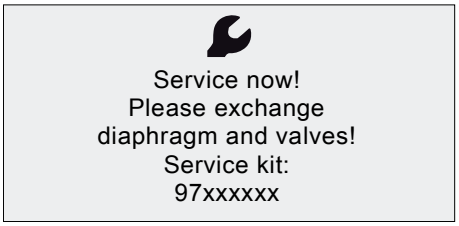
7.2 Cleaning



If necessary, clean all pump surfaces with a dry and clean cloth.

7.3 Service system

According to the motor runtime or after a defined period of operation, service requirements will appear. Service requirements appear regardless of the current operating state of the pump and do not affect the dosing process.



Service requirement	Motor runtime [h]*	Time interval [months]*
Service soon!	7500	23
Service now!	8000	24

* Since the last service system reset

TM04 1131 1110

Fig. 39 Service soon!

TM04 1131 1110

Fig. 40 Service now!

Caution For media which result in increased wear, the service interval must be shortened.

The service requirement signals when the replacement of wearing parts is due and displays the number of the service kit. Press the click wheel to temporarily hide the service prompt.

When the "Service now!" message appears (displayed daily), the pump must be serviced immediately. The symbol appears in the "Operation" menu.

The number of the service kit required is also displayed in the "Info" menu.

7.4 Perform service

Only spare parts and accessories from Grundfos should be used for maintenance. The usage of non-original spare parts and accessories renders any liability for resulting damages null and void.

Further information about carrying out maintenance can be found in the service kit catalogue on our homepage. See www.grundfos.com.

Warning

Risk of chemical burns!

When dosing dangerous media, observe the corresponding precautions in the safety data sheets!

Wear protective clothing (gloves and goggles) when working on the dosing head, connections or lines!

Do not allow any chemicals to leak from the pump. Collect and dispose of all chemicals correctly!

Caution

Before any work to the pump, the pump must be in the "Stop" operating state or be disconnected from the power supply. The system must be pressureless!

7.4.1 Dosing head overview

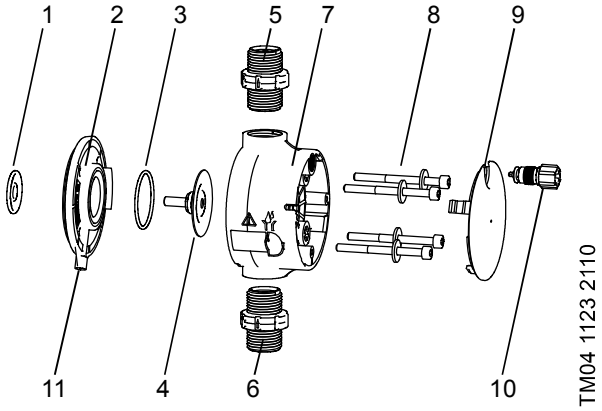

Fig. 41 Changing the diaphragm and valves

1	Safety diaphragm
2	Flange
3	O-ring
4	Diaphragm
5	Valve on discharge side
6	Valve on suction side
7	Dosing head
8	Screws with discs
9	Cover
10	Deaeration valve
11	Drain opening

7.4.2 Dismantling the diaphragm and valves

Warning

Danger of explosion, if dosing liquid has entered the pump housing!

If the diaphragm is possibly damaged, don't connect the pump to the power supply! Proceed as described in section *7.6 Diaphragm breakage*!

This section refers to fig. 41.

1. Make system pressureless.
2. Empty dosing head before maintenance and flush it if necessary.
3. Set pump to "Stop" ■ operating state using the [Start/stop] key.
4. Press the [Start/stop] and [100%] keys at the same time to put the diaphragm into "out" position.
   – Symbol (– must be displayed (see fig. 14).
5. Take suitable steps to ensure that the returning liquid is safely collected.
6. Dismantle suction, pressure and deaeration hose.
7. Dismantle valves on suction and discharge side (5, 6).
8. Remove the cover (9).
9. Loosen screws (8) on the dosing head (7) and remove with discs.
10. Remove the dosing head (7).
11. Unscrew diaphragm (4) counter-clockwise and remove with flange (2).
12. Make sure the drain opening (11) is not blocked or soiled. Clean if necessary.
13. Check the safety diaphragm (1) for wear and damage. Replace if necessary.

If nothing indicates that dosing liquid has entered the pump housing, go on as described in section *7.4.3 Reassembling the diaphragm and valves*. Otherwise proceed as described in section *7.6.2 Dosing liquid in the pump housing*.

7.4.3 Reassembling the diaphragm and valves

The pump must only be reassembled, if nothing indicates that dosing liquid has entered the pump housing. Otherwise proceed as described in section *7.6.2 Dosing liquid in the pump housing*.

This section refers to fig. 41.

1. Attach flange (2) correctly and screw on new diaphragm (4) clockwise.
   – Make sure that the O-ring (3) is seated correctly!
2. Press the [Start/stop] and [100%] keys at the same time to put the diaphragm into "in" position.
   – Symbol)– must be displayed (see fig. 14).
3. Attach the dosing head (7).
4. Install screws with discs (8) and cross-tighten with a torque wrench.
   – Torque: 4 Nm.
5. Attach the cover (9).
6. Install new valves (5, 6).
   – Do not interchange valves and pay attention to direction of arrow.
7. Connect suction, pressure and deaeration hose (see section *4.2 Hydraulic connection*)
8. Press the [Start/stop] key to leave the service mode.

Caution

Tighten the dosing head screws with a torque wrench once before commissioning and again after 2-5 operating hours at 4 Nm.

9. Deaerate dosing pump (see section *5.2 Deaerating the pump*).
10. Please observe the notes on commissioning in section *5. Startup*!

7.5 Resetting the service system

After performing the service, the service system must be reset using the "Info > Reset service system" function.

7.6 Diaphragm breakage

If the diaphragm leaks or is broken, dosing liquid escapes from the drain opening (fig. 41, pos. 11) on the dosing head.

In case of diaphragm breakage, the safety diaphragm (fig. 41, pos. 1) protects the pump housing against ingress of dosing liquid.

When dosing crystallising liquids the drain opening can be blocked by crystallisation. If the pump is not taken out of operation immediately, a pressure can build up between the diaphragm (fig. 41, pos. 4) and the safety diaphragm in the flange (fig. 41, pos. 2). The pressure can press dosing liquid through the safety diaphragm into the pump housing.

Most dosing liquids don't cause any danger when entering the pump housing. However a view liquids can cause a chemical reaction with inner parts of the pump. In the worst case, this reaction can produce explosive gases in the pump housing.

Warning

Danger of explosion, if dosing liquid has entered the pump housing!

Operation with damaged diaphragm can lead to dosing liquid entering the pump housing.

In case of diaphragm breakage, immediately separate the pump from the power supply!

Make sure the pump cannot be put back into operation by accident!

Dismantle the dosing head without connecting the pump to the power supply and make sure no dosing liquid has entered the pump housing. Proceed as described in section *7.6.1 Dismantling in case of diaphragm breakage*.

To avoid any danger resulting from diaphragm breakage, observe the following:

- Perform regular maintenance. See section *7.1 Regular maintenance*.
- Never operate the pump with blocked or soiled drain opening.
  – If the drain opening is blocked or soiled, proceed as described in section *7.6.1 Dismantling in case of diaphragm breakage*.
- Never attach a hose to the drain opening. If a hose is attached to the drain opening, it is impossible to recognise escaping dosing liquid.
- Take suitable precautions to prevent harm to health and damage to property from escaping dosing liquid.
- Never operate the pump with damaged or loose dosing head screws.

7.6.1 Dismantling in case of diaphragm breakage

Warning

Danger of explosion, if dosing liquid has entered the pump housing!

Do not connect the pump to the power supply!

This section refers to fig. 41.

1. Make system pressureless.
2. Empty dosing head before maintenance and flush it if necessary.
3. Take suitable steps to ensure that the returning liquid is safely collected.
4. Dismantle suction, pressure and deaeration hose.
5. Remove the cover (9).
6. Loosen screws (8) on the dosing head (7) and remove with discs.
7. Remove the dosing head (7).
8. Unscrew diaphragm (4) counter-clockwise and remove with flange (2).
9. Make sure the drain opening (11) is not blocked or soiled. Clean if necessary.
10. Check the safety diaphragm (1) for wear and damage. Replace if necessary.

If nothing indicates that dosing liquid has entered the pump housing, go on as described in section *7.4.3 Reassembling the diaphragm and valves*. Otherwise proceed as described in section *7.6.2 Dosing liquid in the pump housing*.

7.6.2 Dosing liquid in the pump housing

Warning

Danger of explosion!

Immediately separate the pump from the power supply!

Make sure the pump cannot be put back into operation by accident!

If dosing liquid has entered the pump housing:

- Send the pump to Grundfos for repair, following the instructions given in section *7.7 Repairs*.
- If a repair isn't economically reasonable, dispose of the pump observing the information in section *9. Disposal*.

7.7 Repairs

Warning

The pump housing must only be opened by personnel authorised by Grundfos!

Repairs must only be carried out by authorised and qualified personnel!

Switch off the pump and disconnect it from the voltage supply before carrying out maintenance work and repairs!

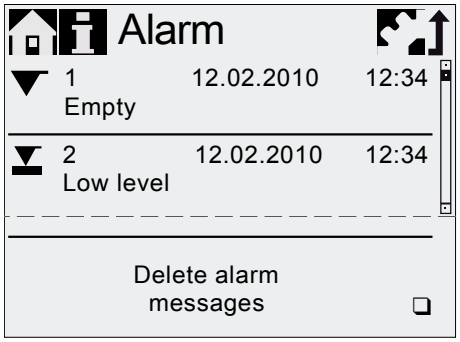
After consulting Grundfos, please send the pump, together with the safety declaration completed by a specialist, to Grundfos. The safety declaration can be found at the end of these instructions. It must be copied, completed and attached to the pump.

The pump must be cleaned prior to dispatch!

Caution If dosing liquid has possibly entered the pump housing, state that explicitly in the safety declaration! Observe section *7.6 Diaphragm breakage*.

If the above requirements are not met, Grundfos may refuse to accept delivery of the pump. The shipping costs will be charged to the sender.

8. Faults



In the event of faults in the dosing pump, a warning or an alarm is triggered.
The corresponding fault symbol flashes in the "Operation" menu, see section *8.1 List of faults*.
The cursor jumps to the "Alarm" main menu symbol. Press the click wheel to open the "Alarm" menu and, where necessary, faults to be acknowledged will be acknowledged.

A yellow display indicates a warning and the pump continues running.

A red display indicates an alarm and the pump is stopped.

The last 10 faults are stored in the "Alarm" main menu. When a new fault occurs, the oldest fault is deleted.

The two most recent faults are shown in the display, you can scroll through all the other faults. The time and cause of the fault are displayed.

TM04 1109 1010

The list of faults can be deleted at the end of the list.

If there is a service requirement, this appears when the "Alarm" menu is opened. Press the click wheel to temporarily close the service prompt (see section *7.3 Service system*).

8.1 List of faults

8.1.1 Faults with error message

Display in the "Alarm" menu	Possible cause	Possible remedy
▼ Empty (Alarm)	• Dosing medium tank empty	• Fill tank. • Check contact setting (NO/NC).
⧗ Low level (Warning)	• Dosing medium tank almost empty	
Overpressure (Alarm)	• Discharge valve blocked • Isolating valve in discharge line closed • Pressure peaks due to high viscosity • Max. pressure set too low (see section *6.8 Pressure monitoring*)	• Replace valve if necessary (see section *7.4 Perform service*). • Check flow direction of valves (arrow) and correct if necessary. • Open the isolating valve (on the discharge side). • Enlarge diameter of discharge line. • Change pressure setting (see section *6.8 Pressure monitoring*).
Low backpressure (Warning/alarm*)	• Faulty diaphragm • Broken discharge line • Pressure differential between suction and discharge side too low • Leakage in the pressure loading valve at Q < 1 l/h • Deaeration valve open	• Change the diaphragm (see section *7.4 Perform service*). • Check discharge line and repair if necessary. • Install additional spring-loaded valve (approx. 3 bar) on the discharge side. • Close the deaeration valve.
Air bubble (Warning)	• Broken/leaky suction line • Strongly degassing medium • Tank dosing medium empty	• Check suction line and repair if necessary. • Provide positive inlet pressure (place dosing medium tank above the pump). • Enable "SlowMode" (see section *6.6 SlowMode*). • Fill tank.
👁 Cavitation (Warning)	• Blocked/constricted/squeezed suction line • Blocked/constricted suction valve • Suction lift too high • Viscosity too high	• Enable "SlowMode" (see section *6.6 SlowMode*). • Reduce suction lift. • Increase suction hose diameter. • Check suction line and open isolating valve if necessary.
Suct. valve leak (Warning)	• Leaky/dirty suction valve • Deaeration valve open	• Check valve and tighten it up. • Flush system. • Replace valve if necessary (see section *7.4 Perform service*). • Check O-ring position. • Install filter in suction line. • Close the deaeration valve.
Disch. valve leak (Warning)	• Leaky/dirty discharge valve • Leakage in the pressure loading valve • Deaeration valve open	• Check valve and tighten it up. • Flush system. • Replace valve if necessary (see section *7.4 Perform service*). • Check O-ring position. • Install screen in suction line. • Close the deaeration valve. • Install spring-loaded valve on the discharge side.
Flow deviation (Warning)	• Considerable deviation between target and actual flow • Pump not or incorrectly calibrated	• Check installation. • Calibrate the pump (see section *5.3 Calibrating the pump*).

Display in the "Alarm" menu	Possible cause	Possible remedy
Pressure sensor (Warning)	• Broken "FlowControl" cable (see fig. 11) • Sensor defect • Pressure sensor not correctly calibrated.	• Check plug connection. • Change sensor if necessary. • Calibrate pressure sensor correctly (see section *6.8.2 Calibration of pressure sensor*).
Motor blocked (Alarm)	• Backpressure greater than nominal pressure • Damage to gears	• Reduce backpressure. • Arrange for repair of gears, if necessary.
BUS Bus error (Alarm)	• Fieldbus communication error	• Check cables for correct specification and damage; replace if necessary. • Check cable routing and shielding; correct if necessary.
E-Box (Alarm)	• E-Box connection error • Faulty E-Box	• Check plug connection. • Replace E-Box if necessary.
Cable break (Alarm)	• Defect in analog cable 4-20 mA (input current < 2 mA)	• Check cable/plug connections and replace, if necessary. • Check signal transmitter.
Service now (Warning)	• Time interval for service expired	• Perform service (see section *7.4 Perform service*).

* Depending on setting

8.1.2 General faults

Fault	Possible cause	Possible remedy
Dosing flow too high	Inlet pressure greater than backpressure	Install additional spring-loaded valve (approx. 3 bar) on the discharge side.
		Increase pressure differential.
	Incorrect calibration	Calibrate the pump (see section *5.3 Calibrating the pump*).
No dosing flow or dosing flow too low	Air in dosing head	Deaerate the pump.
	Faulty diaphragm	Change the diaphragm (see section *7.4 Perform service*).
	Leakage/fracture in lines	Check and repair lines.
	Valves leaking or blocked	Check and clean valves.
	Valves installed incorrectly	Check that the arrow on the valve housing is pointing in the direction of flow. Check whether all O-rings are installed correctly.
	Blocked suction line	Clean suction line/install filter.
	Suction lift too high	Reduce suction lift.
		Install priming aid.
		Enable "SlowMode" (see section *6.6 SlowMode*).
	Viscosity too high	Enable "SlowMode" (see section *6.6 SlowMode*).
		Use hose with larger diameter.
		Install spring-loaded valve on the discharge side.
	Faulty calibration	Calibrate the pump (see section *5.3 Calibrating the pump*).
	Deaeration valve open	Close the deaeration valve.
Irregular dosing	Valves leaking or blocked	Tighten up valves, replace valves if necessary (see section *7.4 Perform service*).
	Backpressure fluctuations	Keep backpressure constant.
		Activate "AutoFlowAdapt" (only DDA-FCM).
Liquid escaping from the drain opening on the flange	Faulty diaphragm	Immediately separate the pump from the power supply! Observe section *7. Service* and especially section *7.6 Diaphragm breakage*.
Liquid escaping	Dosing head screws not tightened	Tighten up screws (see section *4.2 Hydraulic connection*).
	Valves not tightened	Tighten up valves/union nuts (see section *4.2 Hydraulic connection*).
Pump not sucking in	Suction lift too high	Reduce suction lift; if necessary, provide positive inlet pressure.
	Backpressure too high	Open the deaeration valve.
	Soiled valves	Flush system, replace valves if necessary (see section *7.4 Perform service*).

9. Disposal

This product or parts of it must be disposed of in an environmentally sound way.
Use appropriate waste collection services.
If this is not possible, contact the nearest Grundfos company or service workshop.

Section 3.4.3

Chemical Dosing Guide

As per influent samples taken on August 25th (Report 25129-2526) t, the plant's inlet parameters are exceeding design specifications putting the system under significant stress. Influent loading is not consentient, so it's difficult to have standard dosing setpoints or control logic. Due to fluctuation of influent parameter, there is a risk of chemical over-dosing.

In the meantime, we're basing nutrient dosing on flow-paced (system adjust automatically based on flow rate) control using the following assumed influent quality:

- BOD: 320 mg/L
- $N–NH_3$: 35 mg/L
- TP: 10 mg/L

General approach

- The plant is designed to achieve treatment with minimal chemicals at full design flow. At maximum flow, nutrients should not be required; only antifoam, alkalinity, and polymer are expected.
- At flows below design, nutrient dosing pumps will run flow-paced to prevent starvation while staying within acceptable loading limits.

DESIGN PARAMETER	UNITS	VALUE
Design Wastewater Flow	m^3/day	9.45
Maximum Design Wastewater Flow	m^3/day	13.5
Peak Design Wastewater (max day)	m^3/day	18.9
Minimum Design Wastewater Flow	m^3/day	1.8
Winter Influent Design Temperature	°C	7
Summer Influent Design Temperature	°C	20
Peak Hour Flow	m^3/day	28

Table 1: Design Flowrate

Full-flow operation (expected chemicals on)

1. Alkalinity
    - Demand: 7.14 mg/L per 1 mg/L $N–NH_3$ nitrified.
    - Effluent target: ≥ 75 mg/L alkalinity for stable performance.
    - Because current alkalinity is unknown, pump capacity has been sized conservatively (worst-case: zero influent alkalinity, to ensure quick response).
    - Control logic: Maintain pH 7.0–7.5. alkalinity dosing pump runs only when outside this range; stops within range. Alarm at pH < 6.5 (LL) or pH > 8.2 (HH). (To be validated on site against effluent alkalinity to confirm ≥ 75 mg/L).
2. Antifoam
    - Flow-paced at minimum effective rate (~5 mg/L) to manage foam.
3. Polymer (dewatering)
    - Initial dose: 25 mg/L.
    - Jar testing with the chemical vendor is required to optimize dose and polymer selection.

Current reduced-flow strategy (avoid biomass starvation; target 100: 5:1 (100 mg/L BOD: 5 mg/L Nitrogen: 1 mg/L phosphorus), without exceeding plant acceptable maximum load):
Carbon source (The dosing is directly proportional to the flow rate):

- ≤ 1.8 m^3/d ➔ 0.576 kg/d (alarm if < 1.8 m^3/d for more than 12 hrs).
- 9.2 m^3/d ➔ 2.94 kg/d.
- 18.9 m^3/d➔ 0 kg/d (no dosing required).

Nitrogen source:

- < 9.2 m^3/d: constant consumption ➔ 0.3024 kg/d
- 9.2 to < 14 m^3/d: ramp-down linearly from 0.3024 → 0 kg/d
- 14 to 18.9 m^3/d: ramp-down linearly from 0.268 → 0 kg/d

Control note: Nutrient dosing pumps activate after 2 hours of sustained sub-design flow to prevent false “no dosing” scenario. Antifoam and polymer are unaffected by these flow-based nutrient adjustments.

Safety Data Sheets

Section 3.4.4.1

Industrial Defoamer

SLS CHEMICAL INC.

SAFETY DATA SHEET
SLS 825

1. CHEMICAL PRODUCT AND COMPANY IDENTIFICATION

PRODUCT NAME : SLS 825	
APPLICATION : Industrial Defoamer	
COMPANY IDENTIFICATION : SLS Chemical Inc. 8830 19 Ave. SW Edmonton, AB T6X 1X6 1 (833) 757-2436	Emergency Contact **CANUTEC: 1-613-996-6666** **SLS Chemical Inc. 1 (833) 757-2436**

NFPA 704M/HMIS RATING
HEALTH : 0 / 1 FLAMMABILITY : 1 / 1 REACTIVITY : 0 / 0 OTHER :
0 = Insignificant 1 = Slight 2 = Moderate 3 = High 4 = Extreme

2. HAZARDS IDENTIFICATION

EMERGENCY OVERVIEW: Material can create slippery conditions.

REMARKS: This product is a mixture. Health hazard information is based on its components.

EMERGENCY OVERVIEW: Repeated or prolonged exposure may cause slight irritation of eyes and skin.

INHALATION: Prolonged or excessive inhalation may cause coughing or sneezing. May cause irritation of respiratory tract.

INGESTION: Low acute oral toxicity.

CHRONIC EXPOSURE: No known carcinogenic or other chronic effects.

3. COMPOSITION/INFORMATION ON INGREDIENTS

CHEMICAL CHARACTERIZATION
Water based fatty-alcohol dispersion.

HAZARDOUS OR REGULATED COMPONENTS
Not applicable

FURTHER INFORMATION
This product contains no WHMIS regulated (hazardous) components above WHMIS Concentration (disclosure) Thresholds..

4. FIRST AID MEASURES

EYE CONTACT :
Flush affected area with water. If symptoms develop, seek medical advice.

SKIN CONTACT :
Immediately wash with plenty of soap and water. If symptoms develop, seek medical advice.

INGESTION :
Do not induce vomiting without medical advice. If conscious, washout mouth and give water to drink. Get medical attention.

INHALATION :
Remove to fresh air, treat symptomatically. Get medical attention.

NOTE TO PHYSICIAN :
Based on the individual reactions of the patient, the physician's judgement should be used to control symptoms and clinical condition.

5. FIRE FIGHTING MEASURES

SUITABLE EXTINGUISHING MEDIA
Use water spray, alcohol-resistant foam, dry chemical or carbon dioxide.

EXTINGUISHING MEDIA WHICH SHALL NOT BE USED FOR SAFETY REASONS:
None

Specific Hazards During Firefighting
This material will not burn until water has evaporated. In case of fire hazardous decomposition products may be produced such as:
Carbon oxides (COx), Hydrocarbons, Smoke, Fumes

SPECIAL PROTECTIVE EQUIPMENT FOR FIREFIGHTERS
Wear full protective clothing and self-contained breathing apparatus.

SPECIFIC METHODS
In the event of fire, cool tanks with water spray. Use extinguishing measures that are appropriate to local circumstances and the surrounding environment.
Fire residues and contaminated fire extinguishing water must be disposed of in accordance with local regulations.

6. ACCIDENTAL RELEASE MEASURES

PERSONAL PRECAUTIONS :
Do not touch spilled material. Restrict access to area as appropriate until clean-up operations are complete. Use personal protective equipment recommended in Section 8 (Exposure Controls/Personal Protection). Stop or reduce any leaks if it is safe to do so. Ventilate spill area if possible. Remove sources of ignition.

METHODS FOR CLEANING UP :

SMALL SPILLS: Soak up spill with absorbent material. Place residues in a suitable, covered, properly labeled container. Wash affected area.

LARGE SPILLS: Contain liquid using absorbent material, by digging trenches or by diking. Reclaim into recovery or salvage drums or tank truck for proper disposal. Clean contaminated surfaces with water or aqueous cleaning agents. Contact an approved waste hauler for disposal of contaminated recovered material. Dispose of material in compliance with regulations indicated in Section 13 (Disposal Considerations).

ENVIRONMENTAL PRECAUTIONS :
Do not contaminate surface water. See Sections 7 and 8 for proper handling and protective measures and Section 13 for proper waste
disposal measures.

7. HANDLING AND STORAGE

HANDLING :
Do not get in eyes, on skin, on clothing. Do not breathe vapors/gases/dust. Use with adequate ventilation. Keep the containers closed when not in use. Do not take internally. Ensure all containers are labelled. Have emergency equipment (for fires, spills, leaks, etc.) readily available.

STORAGE CONDITIONS :
Keep container tightly closed. Store at room temperature in the original container. Avoid freezing.
Incompatible products:
Keep away from oxidizing agents and strongly acid or alkaline materials.
Materials to avoid:
Strong oxidizing agents, Strong acids and strong bases.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

OCCUPATIONAL EXPOSURE LIMITS :
This product does not contain any substance that has an established exposure limit.

Handle in accordance with good industrial hygiene and safety practice. Ensure that eyewash stations and safety showers are close to the workstation location. Ensure adequate ventilation. Ensure adequate ventilation. Ensure that eyewash stations and safety showers are close to the workstation location.

ENGINEERING MEASURES :
General ventilation is recommended.

RESPIRATORY PROTECTION :
Respiratory protection is not normally needed.

HAND PROTECTION :
Nitrile gloves, PVC gloves, Viton# gloves

SKIN PROTECTION :
Wear standard protective clothing.

EYE PROTECTION :
Wear chemical splash goggles.

HYGIENE RECOMMENDATIONS :
Keep an eye wash fountain available. Keep a safety shower available. If clothing is contaminated, remove clothing and thoroughly wash the affected area. Launder contaminated clothing before reuse.

9. PHYSICAL AND CHEMICAL PROPERTIES

PHYSICAL STATE	Liquid, aqueous dispersion
APPEARANCE	Opaque white or Off-white
ODOR	Not significant
SPECIFIC GRAVITY	0.98
SOLUBILITY IN WATER	Complete
pH (100 %)	7.0 – 8.0 in water
VISCOSITY	420 cps @ 22 °C
BOILING POINT	>100 °C
FREEZING POINT	0 C

10. STABILITY AND REACTIVITY

STABILITY :
Stable under normal conditions.

HAZARDOUS POLYMERIZATION :
Hazardous polymerization will not occur.

CONDITIONS TO AVOID :
None known.

MATERIALS TO AVOID :
Contact with strong oxidizers (e.g. chlorine, peroxides, chromates, nitric acid, perchlorate, concentrated oxygen, permanganate) may generate heat, fires, explosions and/or toxic vapors.

HAZARDOUS DECOMPOSITION PRODUCTS :

No decomposition if stored normally
Under fire conditions: Oxides of carbon, Oxides of nitrogen, Carbon monoxide, carbon dioxide, ammonia.

11. TOXICOLOGICAL INFORMATION

ACUTE TOXICITY
Based on available data, the classification criteria are not met.

IRRITATION AND CORROSION
Skin: Calculation method:
Based on available data, the classification criteria are not met.
Eyes: Calculation method:
Based on available data, the classification criteria are not met.

SENSITIZATION
Calculation method
Based on available data, the classification criteria are not met.

LONG TERM TOXICITY
Carcinogenicity
Based on available data, the classification criteria are not met.
Mutagenicity
Remarks: No data available
No known effect.
Based on available data, the classification criteria are not met.

HUMAN HAZARD CHARACTERIZATION :
Based on our hazard characterization, the potential human hazard is: Low

12. ECOLOGICAL INFORMATION

ECOTOXICOLOGICAL EFFECTS
Aquatic toxicity
LC50/96 h/Oncorhynchus mykiss (rainbow trout)/Acute aquatic toxicity: ca. 3,500 mg/l
LC50/48 h/Daphnia magna (Water flea)/Acute aquatic toxicity: ca. 1,400 mg/l

Remarks: The data is based on the toxicological properties of individual components of the product.
Not harmful to aquatic organisms.
Toxicity to other organisms

MOBILITY
Vapour pressure: 23 hPa (20 °C)
Water solubility: dispersible
Surface tension: not determined

No data available

PERSISTENCE AND DEGRADABILITY
Biological degradability:
The data is based on the toxicological properties of individual components of the product. Inherently biodegradable. Product is not persistent.

BIOACCUMULATIVE POTENTIAL
The product is not expected to bioaccumulate.
Partition coefficient: n-octanol/water: not determined

OTHER ADVERSE EFFECTS
Adsorbed organic bound halogens (AOX):
Remarks: Product does not contain any organic halogens.
None known.
Additional ecological information: This product has no known ecotoxicological effects
.

13. DISPOSAL CONSIDERATIONS

Local and national regulations should be followed.

Dispose of wastes in an approved incinerator or waste treatment/disposal site, in accordance with all applicable regulations. Do not dispose of wastes in local sewer or with normal garbage.

14. TRANSPORT INFORMATION

The information in this section is for reference only and should not take the place of a shipping paper (bill of lading) specific to an order. Please note that the proper Shipping Name / Hazard Class may vary by packaging, properties, and mode of transportation. Typical Proper Shipping Names for this product are:

PRODUCT IS NOT REGULATED DURING TRANSPORTATION ON AIR:SEA:LAND

15. REGULATORY INFORMATION

NATIONAL REGULATIONS, CANADA and USA:

WORKPLACE HAZARDOUS MATERIALS INFORMATION SYSTEM (WHMIS) :
This product has been classified in accordance with the hazard criteria of the Controlled Products Regulations (CPR) and the MSDS contains all the information required by the CPR.

WHMIS CLASSIFICATION :
Not considered a WHMIS controlled product.

CANADIAN ENVIRONMENTAL PROTECTION ACT (CEPA) :
The substances in this preparation are listed on the Domestic Substances List (DSL), are exempt, or have been reported in accordance with the New Substances Notification Regulations.

NOTIFICATION STATUS

- All components of this product are included in the United States TSCA Chemical Inventory or are not required to be listed on the United States TSCA Chemical Inventory.
- This product's Australian Inventory of Chemical Substances (AICS) status has not been determined.
- All components of this product are included in the Canada Domestic Substance List (DSL) or are not required to be listed on the Canada Domestic Substance List (DSL).
- All components of this product are included on the Chinese inventory or are not required to be listed on the Chinese inventory.
- All components of this product are included in the European Inventory of Existing Chemical Substances (EINECS) or are not required to be listed on EINECS.
- All components of this product are included on the Japanese (ENCS) inventory or are not required to be listed on the Japanese (ENCS) inventory.
- All components of this product are included in the Korean (ECL) inventory or are not required to be listed on the Korean (ECL) inventory.
- This product's New Zealand Inventory of Chemical Substances (NZIoC) status has NOT been determined.
- This product's Philippine (PICCS) inventory status has NOT been determined.

16. OTHER INFORMATION

The information hereby provided is based on the supplier’s knowledge at the time of issuing the data. It is provided for information only and does not amount to a guarantee and therefore no legal responsibility or liability will be accepted.

Prepared By : SLS Chemical Inc.
Date issued : January. 1, 2021
Replaces : January 1, 2019

Section 3.4.4.2

Flocculation/Dewatering

SLS CHEMICAL INC.

SAFETY DATA SHEET
SLS 31560

1. CHEMICAL PRODUCT AND COMPANY IDENTIFICATION

PRODUCT NAME : SLS 31560	
APPLICATION : Flocculation/Dewatering	
COMPANY IDENTIFICATION : SLS Chemical Inc. Address 8830 19 Ave. SW Edmonton, AB T6X 1X6 Ph 1 (833) 757 2436	**Emergency Contact 24Hr** **CANUTEC: 1-613-996-6666** **CHEMTREC: 1-800-424-9300** **SLS Chemical Inc 1 (833) 757 2436**

NFPA 704M/HMIS RATING
HEALTH : 0 / 1 FLAMMABILITY : 1 / 1 REACTIVITY : 0 / 0 OTHER :
0 = Insignificant 1 = Slight 2 = Moderate 3 = High 4 = Extreme

2. HAZARDS IDENTIFICATION

CAUTION
May cause irritation with prolonged contact. Toxic to aquatic organisms.
Do not get in eyes, on skin, on clothing. Use with adequate ventilation. Do not take internally. In case of contact with eyes, rinse immediately with plenty of water and seek medical advice. After contact with skin, wash immediately with plenty of soap and water. Water in contact with the product will cause slippery floor conditions. Wear suitable protective clothing, gloves and eye/face protection.
Low Fire Hazard; liquids may burn upon heating to temperatures at or above the flash point. Water in contact with the product will cause slippery floor conditions. May evolve oxides of carbon (COx) under fire conditions. May evolve oxides of nitrogen (NOx) under fire conditions.

HUMAN HEALTH HAZARDS - ACUTE :

EYE CONTACT :
May cause irritation with prolonged contact.

SKIN CONTACT :
May cause irritation with prolonged contact.

INGESTION :
Not a likely route of exposure. No adverse effects expected.

INHALATION :
Not a likely route of exposure. No adverse effects expected.

AGGRAVATION OF EXISTING CONDITIONS :
Skin contact may aggravate an existing dermatitis condition.

HUMAN HEALTH HAZARDS - CHRONIC :
No adverse effects expected other than those mentioned above.

3. COMPOSITION/INFORMATION ON INGREDIENTS

Based on our hazard evaluation, none of the substances in this product are hazardous.

4. FIRST AID MEASURES

EYE CONTACT :
Flush affected area with water. If symptoms develop, seek medical advice.

SKIN CONTACT :
Immediately wash with plenty of soap and water. If symptoms develop, seek medical advice.

INGESTION :
Do not induce vomiting without medical advice. If conscious, washout mouth and give water to drink. Get medical attention.

INHALATION :
Remove to fresh air, treat symptomatically. Get medical attention.

NOTE TO PHYSICIAN :
Based on the individual reactions of the patient, the physician's judgement should be used to control symptoms and clinical condition.

5. FIRE FIGHTING MEASURES

Flash Point :	> 93 °C (PMCC)
LOWER EXPLOSION LIMIT :	Not flammable
UPPER EXPLOSION LIMIT :	Not flammable

EXTINGUISHING MEDIA :
Carbon dioxide, Foam, Dry powder, Other extinguishing agent suitable for Class B fires, For large fires, use water spray or fog, thoroughly drenching the burning material.
Water mist may be used to cool closed containers.

UNSUITABLE EXTINGUISHING MEDIA :
Do not use water unless flooding amounts are available.

FIRE AND EXPLOSION HAZARD :
Low Fire Hazard; liquids may burn upon heating to temperatures at or above the flash point. Water in contact with the product will cause slippery floor conditions. May evolve oxides of carbon (COx) under fire conditions. May evolve oxides of nitrogen (NOx) under fire conditions.

SPECIAL PROTECTIVE EQUIPMENT FOR FIRE FIGHTING :
In case of fire, wear a full face positive-pressure self contained breathing apparatus and protective suit.

SENSITIVITY TO MECHANICAL IMPACT :
Not expected to be sensitive to mechanical impact.

SENSITIVITY TO STATIC DISCHARGE :
Not expected to be sensitive to static discharge.

6. ACCIDENTAL RELEASE MEASURES

PERSONAL PRECAUTIONS :
Do not touch spilled material. Restrict access to area as appropriate until clean-up operations are complete. Use personal protective equipment recommended in Section 8 (Exposure Controls/Personal Protection). Stop or reduce any leaks if it is safe to do so. Ventilate spill area if possible. Remove sources of ignition.

METHODS FOR CLEANING UP :
SMALL SPILLS: Soak up spill with absorbent material. Place residues in a suitable, covered, properly labeled container. Wash affected area. LARGE SPILLS: Contain liquid using absorbent material, by digging trenches or by diking. Reclaim into recovery or salvage drums or tank truck for proper disposal. Clean contaminated surfaces with water or aqueous cleaning agents. Contact an approved waste hauler for disposal of contaminated recovered material. Dispose of material in compliance with regulations indicated in Section 13 (Disposal Considerations).

ENVIRONMENTAL PRECAUTIONS :
Do not contaminate surface water.

7. HANDLING AND STORAGE

HANDLING :
Do not get in eyes, on skin, on clothing. Do not breathe vapors/gases/dust. Use with adequate ventilation. Keep the containers closed when not in use. Do not take internally. Ensure all containers are labelled. Have emergency equipment (for fires, spills, leaks, etc.) readily available.

STORAGE CONDITIONS :
Store away from heat and sources of ignition. Store separately from oxidizers. Store the containers tightly closed.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

OCCUPATIONAL EXPOSURE LIMITS :
This product does not contain any substance that has an established exposure limit.

ENGINEERING MEASURES :
General ventilation is recommended.

RESPIRATORY PROTECTION :
Respiratory protection is not normally needed.

HAND PROTECTION :
Nitrile gloves, PVC gloves, Viton# gloves

SKIN PROTECTION :
Wear standard protective clothing.

EYE PROTECTION :
Wear chemical splash goggles.

HYGIENE RECOMMENDATIONS :
Keep an eye wash fountain available. Keep a safety shower available. If clothing is contaminated, remove clothing and thoroughly wash the affected area. Launder contaminated clothing before reuse.

9. PHYSICAL AND CHEMICAL PROPERTIES

PHYSICAL STATE	DRY
APPEARANCE	Opaque white or Off-white
ODOR	Hydrocarbon

SPECIFIC GRAVITY	1.01 - 1.04
SOLUBILITY IN WATER	Partial
pH (100 %)	5.0
VISCOSITY	420 cps @ 22 °C
BOILING POINT	97 °C
VOC CONTENT	22.16 %

10. STABILITY AND REACTIVITY

STABILITY :
Stable under normal conditions.

HAZARDOUS POLYMERIZATION :
Hazardous polymerization will not occur.

CONDITIONS TO AVOID :
None known.

MATERIALS TO AVOID :
Contact with strong oxidizers (e.g. chlorine, peroxides, chromates, nitric acid, perchlorate, concentrated oxygen, permanganate) may generate heat, fires, explosions and/or toxic vapors.

HAZARDOUS DECOMPOSITION PRODUCTS :
Under fire conditions: Oxides of carbon, Oxides of nitrogen, Carbon monoxide, carbon dioxide, ammonia.

11. TOXICOLOGICAL INFORMATION

This is a low toxicity product.

Oral LD 50 (rat) >2000mg/kg.

SENSITIZATION :
This product is not expected to be a sensitizer.

CARCINOGENICITY :
None of the substances in this product are listed as carcinogens by the International Agency for Research on Cancer (IARC), the National Toxicology Program (NTP) or the American Conference of Governmental Industrial Hygienists (ACGIH).

HUMAN HAZARD CHARACTERIZATION :
Based on our hazard characterization, the potential human hazard is: Low

12. ECOLOGICAL INFORMATION

ECOTOXICOLOGICAL EFFECTS

96hr LC 50(fish) >10ppm when tested in pure water.

ENVIRONMENTAL HAZARD AND EXPOSURE CHARACTERIZATION
Based on our hazard characterization, the potential environmental hazard is: Low

13. DISPOSAL CONSIDERATIONS

Local and national regulations should be followed.

Dispose of wastes in an approved incinerator or waste treatment/disposal site, in accordance with all applicable regulations. Do not dispose of wastes in local sewer or with normal garbage.

14. TRANSPORT INFORMATION

The information in this section is for reference only and should not take the place of a shipping paper (bill of lading) specific to an order. Please note that the proper Shipping Name / Hazard Class may vary by packaging, properties, and mode of transportation. Typical Proper Shipping Names for this product are:

PRODUCT IS NOT REGULATED DURING TRANSPORTATION

15. REGULATORY INFORMATION

NATIONAL REGULATIONS, CANADA :

WORKPLACE HAZARDOUS MATERIALS INFORMATION SYSTEM (WHMIS) :
This product has been classified in accordance with the hazard criteria of the Controlled Products Regulations (CPR) and the MSDS contains all the information required by the CPR.

WHMIS CLASSIFICATION :
Not considered a WHMIS controlled product.

CANADIAN ENVIRONMENTAL PROTECTION ACT (CEPA) :
The substances in this preparation are listed on the Domestic Substances List (DSL), are exempt, or have been reported in accordance with the New Substances Notification Regulations.

NATIONAL POLLUTANT RELEASE INVENTORY (NPRI) :
This product does not contain any substances listed in Schedule I of the NPRI at a concentration of one percent or more by weight.

TOXIC SUBSTANCES CONTROL ACT (TSCA) :
The substances in this preparation are included on or exempted from the TSCA 8(b) Inventory (40 CFR 710)

16. OTHER INFORMATION

The information hereby provided is based on the supplier's knowledge at the time of issuing the data. It is provided for information only and does not amount to a guarantee and therefore no legal responsibility or liability will be accepted.

Prepared By : SLS Chemical Inc.
Date Issued : January 19, 2022
Replaces : March 19, 2020

Section 3.4.4.3

Reducing Agent for Biological Processes

SAFETY DATA SHEET

MicroC® 2000

1. PRODUCT AND COMPANY IDENTIFICATION

Product Name:	MicroC® 2000	**Publication Date:**	February 26, 2024
Product Code:	NA	**Replaces:**	October 17, 2023
Product Use:	A reducing agent for biological processes		

Supplier Information:

Environmental Operating Solutions, Inc	Phone:	508-743-8440
53 Portside Drive	Fax:	844-308-5537
Pocasset, MA 02559	Website:	www.microc.com

EMERGENCY TELEPHONE NUMBER: **CHEMTREC** **800-424-9300**

2. HAZARDS IDENTIFICATION

OSHA Regulatory Status:
This product when used as intended is not hazardous according to 29 CFR 1910.1200
This product when used as intended is not hazardous according to GHS categories

GHS Pictograms:	None Applicable
Signal Word:	None Applicable
GHS Hazard Classification:	None Applicable
Hazard Statements:	None Applicable

Note: When vaporized, glycerin mist may cause irritation of the respiratory tract.

Potential Health Effects

Routes of Exposure	Ingestion, inhalation, skin contact, eye contact
Eyes	May cause slight irritation
Skin	May cause slight irritation
Inhalation	High mist concentrations may cause irritation of respiratory tract.
Ingestion	May be harmful if swallowed in large quantities

3. COMPOSITION / INFORMATION ON INGREDIENTS

Chemical Name	CAS #	% by Weight
Glycerin; glycerol	56-81-5	70-74%
Water	7732-18-5	22-26%
Sodium Chloride	7647-14-5	4-6%
Methanol	67-56-1	< 1%

4. FIRST AID MEASURES

Eye Contact	Immediately flush eyes thoroughly with plenty of water for 15 minutes and consult a physician immediately.
Skin Contact	Remove contaminated clothing and wash affected area with water and soap. Consult physician if irritation develops
Inhalation	Remove individual to fresh air. Seek medical attention if breathing problems persist
Ingestion	Do not induce vomiting. Rinse mouth thoroughly. Seek medical attention.
General Advice	If individual feels unwell following the exposure to the product consult a physician immediately. Present this Safety Data Sheet to the doctor in attendance
Note to physician	Treat patient symptomatically

5. FIRE FIGHTING MEASURES

Flammability Summary (OSHA and NFPA)	Non-flammable Material
Protection of Firefighters:	Wear suitable protective equipment. Wear self contained breathing apparatus if necessary
Extinguishing Media	Use equipment appropriate to the main source of the fire. Water spray, alcohol foam, dry chemical or CO2. Water or alcohol foam may cause frothing
Specific hazards arising from the chemical	Carbon oxides

6. ACCIDENTAL RELEASE MEASURES

Personal Protection for Spills	Keep unnecessary personnel away from spill. Use personal protective equipment. Ventilate area of leak or spill. Avoid breathing vapors and mist.
Methods for Containment	Eliminate all sources of ignition. Stop flow of material if safe to do so. Dike spilled material. Absorb spill with inert absorbent material. Sand, earth and vermiculite are suitable absorbent materials.
Environmental Precautions	Prevent further leakage. Contain spill if safe to do so. Do not let product enter storm drains if possible.

7. HANDLING AND STORAGE

Precautions for Safe Handling	See other relevant sections of this SDS. Avoid contact with skin and eyes. Avoid breathing mist. Use with adequate ventilation. Do not handle and store near open flames, high heat or sources of ignition.
Storage	Keep containers closed when not in use. Minimize evaporative losses. Keep away from ignition sources.
Incompatible Materials for Storage	None known

8. EXPOSURE CONTROLS / PERSONAL PROTECTION

INSUFFICIENT DATA ON MIXTURE. DATA ON INDIVIDUAL COMPONENTS PROVIDED BELOW

Component	Concentration in Product	ACGIH TLV	OSHA TABLE Z-1 Limits for Air Contaminants	NIOSH
Glycerin CAS No: 56-81-5	70-74% w/w	Form: Glycerin Mist TWA: 10 mg/m3	Form: Total Dust PEL: 15 mg/m3 Form: Respirable Fraction PEL: 5 mg/m3	Insufficient Data on Glycerin Mist
Methanol CAS No: 67-56-1	< 1 % w/w	TWA: 260 mg/m3	PEL: 260 mg/m3	TWA: 260 mg/m3

Engineering Controls — Use proper equipment and storage conditions to control airborne levels below recommended exposure limits.

Personal Protective Equipment

Eye Protection: — Use normal eye protection practices such as safety glasses with side shields. Use chemical goggles if risk of splashing is high.

Skin Protection — Handle with chemical resistant gloves. Dispose of contaminated gloves after use. Nitrile gloves recommended.

Respiratory Protection — If workers could be exposed to concentrations above the exposure limits in Section 8, use a full face respirator with multipurpose combination cartridges.

9. PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid	**Flash Point**	None to Boil (ASTM D93)
Color	Light brown	**Boiling Point**	Not determined
Odor	Musty – Sweet Odor	**Evaporation Rate**	Not determined
Odor Threshold	Not determined	**UEL/LEL**	Not determined
		Flammability (solid, gas)	Not determined
pH	4.00-11.00	**Vapor Pressure**	Not determined
Solubility in Water	Highly soluble in water	**Vapor Density**	Not determined
		Relative Density	Not Determined
Bulk Density	10.2 lbs/gal	**Partition Coefficient**	Not determined
Specific gravity	1.22@ 20°C	**Autoignition Temperatures**	
		Decomposition	
Viscosity	45 cPs @ 20C	**Temperature**	Not determined

Environmental Operating Solutions, Inc.
53 Portside Drive, Pocasset, MA 02559

10. STABILITY AND REACTIVITY

Reactivity	Avoid contact with oxidizing agents (e.g. nitric acid, peroxides, chromates)
Chemical Stability	Stable under normal storage conditions
Possibility of hazardous reactions	None known
Conditions to Avoid	Heat, flames, sparks. Contact with oxidizing agents
Incompatible Materials	None known
Hazardous Decomposition Products	Oxides of carbon under high heat

11. TOXICOLOGY

INSUFFICIENT DATA ON MIXTURE. DATA ON INDIVIDUAL COMPONENTS PROVIDED BELOW

Eye Contact	The components in this product may result in mild eye irritation from contact with liquid or vapors. Symptoms include redness, swelling, watering.
Skin Contact	The components in this product may result in mild skin irritation. Symptoms include redness, itching, burning, dermatitis.
Inhalation	Breathing high mist concentrations may be harmful. Inhalation can cause irritation of the throat and lungs.
Ingestion	Ingestion of this product may result in nausea, vomiting and diarrhea. Aspiration into the lungs can cause damage and inflammation to the lungs.
Target Organs	Lungs, Kidneys
Prolonged Exposure	Symptoms include nausea, headache, vomiting

Glycerin; Glycerol CAS No. 56-81-5

Acute Toxicity	Dermal LD50 = > 10,000 mg/kg (Rabbit) Inhalation LC50 = > 570 mg/m^3 1 hr (Rat) Oral LD50 = 12,600 mg/kg (Rat)
Carcinogenicity	Not listed by ACGIH, IARC, NIOSH, NTP or OSHA
Mutagenicity	No data available
Reproductive Toxicity	No data available

Methanol 67-56-1

Acute Toxicity	Dermal LD50 = 15,800 mg/kg (Rabbit) Inhalation LC50 = 64,000 mg/m^3 4 hr (Rat) Oral LD50 = 5,600 mg/kg (Rat)
Carcinogenicity	Not listed by ACGIH, IARC, NIOSH, NTP or OSHA
Mutagenicity	No data available
Reproductive Toxicity	No data available

12. ECOLOGICAL INFORMATION

Ecotoxicity
MicroC 2000:

Acute Toxicity:	Ceriodaphnia dubia, LC50 @48 hr > 400 mg/L. Pimephales promelas, LC50 @ 96 hr > 400 mg/l.
Chronic Toxicity:	Ceriodaphnia dubia, NOEC 400 mg/L, LOEC > 400 mg/L and IC25 > 400 mg/L. Pimephales promelas, NOEC 200 mg/L, LOEC > 400 mg/L and IC25 284.3 mg/L.
Persistence and degradability	No data available
Bioaccumulative potential	No data available
Mobility in soil	No data available
Other adverse effects	No data available

13. DISPOSAL CONSIDERATIONS

This product as supplied is not classified as a RCRA hazardous waste according to 40 CFR 261. However it should be fully characterized prior to disposal as contamination with other materials may subject it to hazardous waste regulations. RCRA requires the user of the product to determine whether the product meets RCRA criteria for hazardous waste. Always consult with local, state and federal regulations prior to disposal.

14. TRANSPORTATION INFORMATION

US Domestic DOT	Not Regulated
Shipping Name	Glycerin; Glycerol
IMDG	Not dangerous goods
IATA	Not dangerous goods
Marine pollutant	No

15. REGULATORY INFORMATION

United States

Toxic Substances Control Act

The components of this product are listed on the TSCA Inventory of Existing Chemical Substances

16. ADDITIONAL INFORMATION

SDS REVISION STATUS: February 26, 2024 | Replaces: October 17, 2023

THIS SAFETY DATA SHEET (SDS) HAS BEEN PREPARED IN COMPLIANCE WITH THE FEDERAL OSHA HAZARD COMMUNICATION STANDARD, 29 CFR 1910.1200. THE INFORMATION IN THIS SDS SHOULD BE PROVIDED TO ALL WHO WILL USE, HANDLE, STORE, TRANSPORT, OR OTHERWISE BE EXPOSED TO THIS PRODUCT. WE BELIEVE THIS INFORMATION TO BE RELIABLE AND UP TO DATE AS OF ITS PUBLICATION DATE, BUT MAKE NO WARRANTY THAT IT IS. IF THIS SDS IS MORE THAN THREE YEARS OLD YOU SHOULD CONTACT THE SUPPLIER TO MAKE CERTAIN THAT THE INFORMATION IS CURRENT.

Section 3.4.4.4

Urea

SAFETY DATA SHEET

SECTION 1: Identification of the substance/mixture and of the company/undertaking

1.1 Product identifiers

Product name	Urea
CAS number	57-13-6
Synonyms	Carbamide

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses	Food, Pharma, Technical.

1.3 Details of the supplier of the safety data sheet

Company	Lab Alley, LLC 12501 Pauls Valley Road Austin, Texas 78737 U.S.A.
Telephone	512-668-9918
Fax	512-886-4008

1.4 Emergency telephone

Emergency Phone #	US & Canada: 1-800-535-5053	INFOTRAC
	International 1-352-323-3500	INFOTRAC

SECTION 2: Hazards identification

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)
This chemical is not considered hazardous by the 2012 OSHA Hazard Communication Standard (29 CFR 1910.1200).

2.2 GHS Label elements, including precautionary statements

None required.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS

None identified.

SECTION 3: Composition/information on ingredients

3.1 Components

Chemical name	Common name and synonyms	CAS number	Concentration
Urea	Carbamide	57-13-6	<=100%

SECTION 4: First aid measures

4.1 Description of first-aid measures

General advice

If inhaled Remove to fresh air. Get medical attention immediately if symptoms occur. If not breathing, give artificial respiration.

In case of skin contact Wash off immediately with plenty of water for at least 15 minutes. If skin irritation persists, call a physician.

In case of eye contact Rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes. Get medical attention.

If swallowed Do NOT induce vomiting. Get medical attention if symptoms occur.

4.2 Most important symptoms and effects, both acute and delayed

No information available.

4.3 Indication of any immediate medical attention and special treatment needed

If symptoms persist, call a physician. Treat symptomatically.

SECTION 5: Firefighting measures

5.1 Extinguishing media

Suitable extinguishing media Water spray. Carbon dioxide (CO 2). Dry chemical. Chemical foam.

Unsuitable extinguishing media No information available.

5.2 Specific hazards arising from the substance or mixture

Thermal decomposition can lead to release of irritating gases and vapors. Keep product and empty container away from heat and sources of ignition.
Hazardous Combustion Products: Nitrogen oxides (NOx). Carbon monoxide (CO). Carbon dioxide (CO2). Ammonia.

5.3 Special protective equipment and precautions for firefighters

As in any fire, wear self-contained breathing apparatus pressure-demand, MSHA/NIOSH (approved or equivalent) and full protective gear.

5.4 Further information

Flash Point No information available.

Autoignition Temperature No information available.

Explosion limits

Upper No data available.
Lower No data available.

Sensitivity to Mechanical Impact No information available.
Sensitivity to Static Discharge No information available.

NFPA

Health	Flammability	Instability	Physical hazards
1	0	0	N/A

SECTION 6: Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures

Ensure adequate ventilation. Use personal protective equipment as required. Avoid dust formation.

6.2 Environmental precautions

Should not be released into the environment.

6.3 Methods and materials for containment and cleaning up

Sweep up and shovel into suitable containers for disposal.

6.4 Reference to other sections

For disposal see Section 13.

SECTION 7: Handling and storage

7.1 Precautions for safe handling

Precautions on safe handling

Ensure adequate ventilation. Wear personal protective equipment/face protection. Do not get in eyes, on skin, or on clothing. Avoid ingestion and inhalation. Avoid dust formation.

Hygiene measures
Handle in accordance with good industrial hygiene and safety practice.

7.2 Conditions for safe storage, including any incompatibilities

Storage conditions
Keep in a dry, cool, and well-ventilated place. Keep container tightly closed.

Incompatibilities
Strong oxidizing agents. Chlorine. Sodium hypochlorite.

SECTION 8: Exposure controls/personal protection

8.1 Occupational exposure limits
This product does not contain any hazardous materials with occupational exposure limits established by the region specific regulatory bodies.

8.2 Exposure controls

Appropriate engineering controls
Ensure adequate ventilation, especially in confined areas. Ensure that eyewash stations and safety showers are close to the workstation location.

Personal protective equipment

Eye/face protection
Wear appropriate protective eyeglasses or chemical safety goggles as described by OSHA's eye and face protection regulations in 29 CFR 1910.133 or European Standard EN166.

Skin protection
Wear appropriate protective gloves and clothing to prevent skin exposure.

Body Protection
Wear appropriate protective gloves and clothing to prevent skin exposure.

Respiratory protection
Follow the OSHA respirator regulations found in 29 CFR 1910.134 or European Standard EN 149. Use a NIOSH/MSHA or European Standard EN 149 approved respirator if exposure limits are exceeded or if irritation or other symptoms are experienced.

Control of environmental exposure
No information available.

SECTION 9: Physical and chemical properties

9.1 Information on basic physical and chemical properties

Physical State	Solid
Appearance	White
Odor	Ammonia-like
Odor Threshold	No information available
pH	7.2 (10% solution)
Melting Point/Range	132.5 - 134.5 °C
Boiling Point/Range	Decomposes below BP
Evaporation Rate	Not applicable
Flammability (solid)	No information available
Flammability or explosive limit	No data available
Upper	
Lower	
Vapor Pressure	0.002 hPa (750°C)
Vapor Density	Not applicable
Density	No information available
Solubility	590 g/l (20°C)
Partition coefficient; n-octanol/water	Log Kow=-2.11; Log P(oct)=-2.97 to -2.26
Autoignition Temp	No information available
Decomposition Temp	At 180°C, decomposition begins
Viscosity	Not applicable
Molecular Formula	C H4 N2 O
Molecular Weight	60.06 g/mol
VOC Content(%)	No information available
Oxidizing properties	No information available

9.2 Other safety information

No information available.

SECTION 10: Stability and reactivity

10.1 Reactivity

No information available.

10.2 Chemical stability

Stable under normal conditions.

10.3 Possibility of hazardous reactions

None under normal processing.

10.4 Conditions to avoid

Incompatible products.

10.5 Incompatible materials
Strong oxidizing agents, Chlorine, Sodium hypochlorite.

10.6 Hazardous decomposition products
Nitrogen oxides (NOx), Carbon monoxide (CO), Carbon dioxide (CO2), Ammonia.

SECTION 11: Toxicological information

11.1 Information on toxicological effects

Product Information, Component Information

Acute toxicity

Component	LD50 Oral	LD50 Dermal	LC50 Inhalation
Urea	8471 mg/kg (Rat)	-	-

Skin corrosion/irritation
No information available.

Serious eye damage/eye irritation
No information available.

Respiratory or skin sensitization
No information available.

Germ cell mutagenicity
Mutagenic effects have occurred in experimental animals.

Carcinogenicity

Component	CAS	IARC	NTP	ACGIH	OSHA	Mexico
Urea	57-13-6	Not listed	Not listed	Not listed	Not listed	Not listed

Specific target organ toxicity - single exposure
None known.

Specific target organ toxicity - repeated exposure
None known.

Reproductive toxicity
No information available.

Chronic effects
No information available.

11.2 Additional Information

The toxicological properties have not been fully investigated. See actual entry in RTECS for complete information.

SECTION 12: Ecological information

12.1 Toxicity

Product		Species	Test Results
Urea	LC50	Poecilia reticulata	16200 - 18300 mg/L/96h
	EC50	Photobacterium phosphoreum	23914 mg/L/5 min
	EC50	Daphnia magna	3910 mg/L/48h static

12.2 Persistence and degradability

No information available.

12.3 Bio accumulative potential

No information available.

12.4 Mobility in soil

No information available.

12.5 Results of PBT and vPvB assessment

No information available.

12.6 Endocrine disrupting properties

No information available.

12.7 Other adverse effects

No information available.

SECTION 13: Disposal considerations

13.1 Waste Disposal Methods

Chemical waste generators must determine whether a discarded chemical is classified as a hazardous waste. Chemical waste generators must also consult local, regional, and national hazardous waste regulations to ensure complete and accurate classification.

SECTION 14: Transport information

DOT (US) Not regulated.

IMDG Not regulated.

IATA Not regulated.

SECTION 15: Regulatory information

US federal regulations This product is a "Hazardous Chemical" as defined by the OSHA Hazard Communication Standard, 29 CFR 1910.1200.

TSCA Section 12(b) Export Notification (40 CFR 707, Subpt. D)

Not applicable.

CERCLA Hazardous Substance List (40 CFR 302.4)

Not regulated.

SARA 304 Emergency release notification

Not regulated.

OSHA Specifically Regulated Substances (29 CFR 1910.1001-1053)

Not regulated.

Superfund Amendments and Reauthorization Act of 1986 (SARA)

SARA 302 Extremely hazardous substance

Not listed.

SARA 311/312 Hazardous

See Section 2 for more information.

SARA 313 (TRI reporting)

Not regulated.

Other federal regulations

Clean Air Act (CAA) Section 112 Hazardous Air Pollutants (HAPs) List

Not regulated.

Clean Air Act (CAA) Section 112(r) Accidental Release Prevention (40 CFR 68.130)

Not regulated.

Clean Water Act (CWA)

Not regulated.

FEMA Priority Substances Respiratory Health and Safety in the Flavor Manufacturing Workplace

Not listed.

US state regulations

US. Massachusetts RTK - Substance List

Not listed.

US. New Jersey Worker and Community Right-to-Know Act

Not listed.

US. Pennsylvania Worker and Community Right-to-Know Law

Not listed.

California Proposition 65

Not listed.

SECTION 16: Other information

Issue date: 01/08/2024
Revision 1: 11/12/2024

SECTION 17: Disclaimer

The information provided on this Safety Data Sheet is correct to the best of our knowledge, information and belief at the date of its publication. The information given is designed only as a guide for safe handling, use, processing, storage, transportation, disposal and release and is not to be considered as a warranty or quality specification. The information relates only to the specific material designated and may not be valid for such material used in combination with any other material or in any process, unless specified in the text.

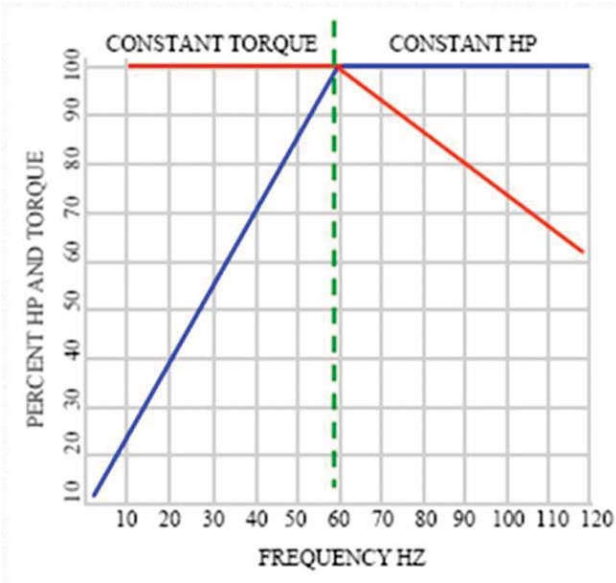
WARNING!!!!

When **Variable Frequency Drives (VFD's)**
are being used to vary the speed of the
NETZSCH Progressing Cavity Pumps, then they
MUST be CONSTANT TORQUE VFD's.



How the pump works

NETZSCH Progressing Cavity Pumps operate at a constant torque requirement for a specific operating pressure. The speed of the pump does NOT affect the torque requirement. **For example:** a pump running at 60psi output pressure at a speed of 200 revolutions per minute requires the same toque input as if it were running at 60psi output pressure at a speed of 600 revolutions per minute. The only exception to this rule is during pump startup; at the moment the pump starts the motor must provide more torque than the pump requires when it is running. This is due to the force of static friction that the motor must overcome in order to begin rotation. Although this is only a momentary force, enough torque has to be available to break the static load.

How the VFD works

Variable Frequency Drives work by taking the supplied power and modulating the supplied power frequency in linear proportion to the supplied voltage. This proportional modulation allows the motors speed to be altered without the motor drawing too many amps and burning out. A VFD can be built to perform this modulation in one of two ways. The VFD can be set to modulate the frequency above the normal supplied 60HZ frequency allowing the output to provide a constant amount of power but the torque will drop off as speed is increased **(THIS IS A CONSTANT HP VFD**) or it can modulate the frequency below the normal supplied 60HZ frequency allowing the output to provide constant Torque but the power will decrease as the speed is reduced **(THIS IS A CONSTANT TORQUE VFD).** This relationship is shown in the detail below. The manufacturers of VFD's typically offer two service factors. Normal Duty; which

has an overload capacity of the VFD's full load ampere rating times 110% - 120% for one minute and Heavy Duty; which has an overload capacity of the VFD's full load ampere rating times 150% for one minute. Typically, constant Hp VFD's are sold with a Normal duty rating since the applications don't call for high starting torque which causes amp draw to spike. Constant torque VFD's are usually sold with heavy duty ratings so that they can supply elevated startup amp draws for high starting torque applications.

VFD Speed Torque Characteristics

Blue = Horsepower
Red = Torque
Green = Motor Nameplate Frequency (60 Hz)

In Constant Torque Area - VFD supplies rated motor nameplate voltage and motor develops full horsepower at 60 hertz base frequency.

In Constant Horsepower Area - VFD delivers motor nameplate rated voltage from 60 Hertz to 120 hertz (or drive maximum). Motor horse-power is constant in this range but motor torque is reduced as frequency increases.
Note: Motor HP = Torque x RPM

Application:

Because while running a progressing cavity pump the torque value required by the pump is fixed; any reduction in supplied torque as a result of operational speed could cause the pump to fail. Also, depending on the running speed required, a constant HP VFD may not be capable of supplying the torque needed for pump startup. This is the reason a **Constant Torque** VFD **MUST** be used to operate a progressing cavity pump.

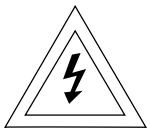
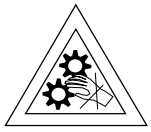
Remark: Because of data transfer the text sheet printouts of our operating instructions do not contain a personal signature.

1 Safety Instructions



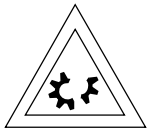
This manual contains basic instructions which must be observed when installing, operating and servicing the machine / equipment. It is essential therefore for the user / installer or responsible technician to read the manual thoroughly prior to installation and operation.
A copy of the manual must always be at hand where the machine / equipment is being used. In addition to the general safety instructions listed in this main section on safety, it is necessary to observe the special safety rules included in other sections of the manual, eg. for private use.

1.1 Safety Signs



The signs below are printed in the manual as general hazard / danger symbols to mark those safety instructions whose non-observance can result in danger to personnel or to the machine / equipment. These signs are:

Hazard sign DIN 4844 - W9
Danger to general public



Hazard sign DIN 4844 - W8
Risk of electric shock

Risk of injury from machinery

Danger from suspended loads

Damage to machinery

Risk of injury to your eyes: goggles required.

Continued Page 1.0R

Warning plates located directly on the pump/ equipment showing for example the correct direction of rotation or the fluid connections used must always be observed and kept completely legible.

1.2 Personnel Qualifications and Training

Operating, maintenance, inspection and installation staff must possess the correct qualifications for their work. Areas of responsibility, scope of authority and staff supervision must be exactly defined by the user. If personnel do not have the necessary knowledge they must receive due training and instruction. If necessary, the user of the machine / equipment can arrange for such training and instruction to be provided by the manufacturer / supplier. The user must also make sure that the content of the manual is fully understood by the staff concerned.

Responsibilites

All work on and operation of the pump/ equipment should be carried out by trained/ competent and qualified operators, tradesmen and / or engineers as appropriate.

Any person responsible for or in charge of

– **working with lifting gear** and ropes when moving a pump / equipment will have to be duly instructed prior to doing the transportation job;

– **mounting a drive** to a pump / equipment must be qualified / trained as an industrial mechanic / technician;

– **setting up installations into a plant** must be qualified / trained as an industrial mechanic/ technician and must be familiar with the design and functioning of the plant in which the pump / equipment is being installed;

– **doing work on starting up, operation and maintenance** must gain knowledge of the pump / equipment principle prior to performing such works and must study the safety instructions and the manual thoroughly;

– **doing repair works**, and prior to doing such works, must be trained and skilled in the job. He must have due knowledge of the pump/ equipments specific details set up in the repair instructions. Unskilled personnel must be trained and repair works checked.

1.3 Dangers arising from Non-Observance of the Safety Instructions

Non-observance of the safety instructions can result in danger to personnel as well as to the environment and the machine. Non-observance of the safety instructions can result in the loss of claims for compensation.

Non-observance of the safety instructions can have, for example, the following consequences:

▲ Failure of essential functions of the machine / equipment

▲ Failure of mandatory maintenance and servicing methods

Continued Page 1.1

- ▲ Danger to personnel from electricity, machinery and chemicals
- ▲ Danger to the environment from leakage of hazardous substances.

1.4 Safety Conscious Working

In addition to the safety instructions listed in the manual, it is essential to observe the national accident prevention directives currently in force and any of the users own internal regulations concerning work and safety.

1.5 Safety Instructions for the User / Operator

- ▲ If there is a risk of danger from any hot or cold machine component, the user must fit protective guards to prevent such components from being touched (according to Standard EN 563).
- ▲ Protective guards fitted to prevent contact with moving parts (eg. couplings) must be in position when the machine / equipment is in use.
- ▲ Leakages (eg. from a shaft seal) of hazardous materials (eg. explosive, toxic, hot material) must be discharged in such a way that neither personnel nor the environment are placed at risk. Legal directives must be observed.
- ▲ All possible danger from electricity must be eliminated (for details see eg. the regulations of your local power supply company).

1.6 Safety Instructions for Maintenance, Inspection and Installation

The user must ensure that all maintenance, inspection and installation work is carried out by authorized and qualified personnel who understand the operating instructions and are adequately trained.

Work on a pump / equipment must only be carried out with the machine stopped and electrical power supply turned off. The pump/ equipment must not be under any pressure and must have cooled off. All procedures detailed in these operating instructions on the stoppage of the machine must always be adhered to.

Pumps / equipment which convey harmful media must be decontaminated.

Immediately after the maintenance work is finished all safety devices and guards must be re-installed and the safety trips must be tested.

Before putting the machine back into operation the points detailed in section "Start-up" should be observed.

Continued Page 1.1R

1.7 Unauthorized Modifications and Manufacture of Spares

Modifications or changes to machines / equipment are only permissible with the manufacturer's agreement. Original spare parts and accessories authorized by the manufacturer ensure safety.
The use of other components revokes any liability for consequences which may result.

1.8 Improper Application

Delivered machinery / equipment is only guaranteed safe for the use specified.

This machine / equipment was designed in accordance with the prescribed conditions of use.
The limits of use are laid down in the conditions of use and should in no way be exceeded.

1.9 Specific Points for the Use of a NEMO® Pump

A NEMO® pump must be used for the **purpose only** for which it was sold.

If you change or wish to change the process medium, you must check with either the supplier or manufacturer that the pump is suitable for the new medium. This is especially important with aggressive, poisonous or otherwise hazardous substances.

Pump criteria include:

1. Compatibility with the medium
2. Suitability for seal design / material, especially the shaft seal
3. Resistance to pressure and temperature of the medium.

Please note that NEMO® pumps are progressing cavity pumps and as such can generate very high pressure.

A blockage or the chance closure of a valve in the discharge line can cause a pressure rise **manifold as high as can be tolerated by the installation**. This can result in the bursting of pipes, which must be avoided especially in the case of dangerous media.

Corresponding safety equipment must therefore be installed, for example an emergency stop button, a pressure relief valve with return pipe or a bursting disc.

During maintenance and repair work on the pump please note the following:

1. Ensure that the pump drive **can not** be turned on without authorization.
2. When opening the pump follow the instructions for handling the medium (eg. protective clothing, no smoking etc).
3. Before putting the pump back into operation ensure that all guards and other safety devices (eg. drive–belt protection, coupling protection) are properly re–installed.

Continued Page 1.2

1 SAFETY PRECAUTIONS

Always bear in mind your safety during operation, maintenance and installation of equipment. Please adhere to the EC-Directive for machinery including the national regulations and follow the US OSHA regulation #1910.219 & 1910.147 titled Mechanical Power transmission apparatus as well as the European Standard EN 292 with the accidents prevention rules laid down by the trade unions and other appropriate technical institutions.

Always bear in mind your safety during operation, maintenance and installation of equipment. Please adhere to the EC-Directive for Machinery including the national regulations and follow the European Standard EN 292 with the accident prevention rules laid down by the trade unions and other appropriate technical institutions.

Continued Page 1.2R

1.10 Notes on Inspection and Repair

The legal regulations for safety at work, such as regulations for the workplace, regulations governing dangerous materials, accident prevention, environmental protection eg. regulations on disposal and water balance obligate all commercial business to protect their employees and / or people and the environment from adverse effects caused by contact with dangerous materials.

Important:

Inspection / repair of machinery and its parts only takes place when a safety conformity certificate has been completed by an authorized and qualified specialist. Please use a copy and leave the original in the operation and maintenance manual.

Where special safety precautions are necessary in spite of careful emptying and cleaning of the machinery, the necessary information must be given.

Machinery operating with radio-active media will only be repaired or inspected by one of our specialist engineers under the safety of the owner.

The safety conformity certificate is part of the inspection / repair service. We reserve the right to refuse acceptance of this order / service for other reasons.

Continued Page 1.3

1.11 Instructions concerning explosion protection

The instructions below are to be considered and kept to when using pumps in potentially explosive areas in order to guarantee durable explosion protection of the pumps and avoid any danger of ignition.

In accordance with the regulations 94 / 9 / EC, the pumps are admitted for use in the area II 2G IIB T 4 or II 2G IIB T 3
(pls. see manufacturer's declaration or declaration of conformity).

It is to be taken into account that in case of aggregates the components (e.g. gears, couplings) mounted on the pumps must comply with the regulations 94 /9 / EC as well. The relevant documentation concerning these components is to be considered.
The application area of aggregates is determined by the application area of the mounted component with the lowest approval and thus may deviate from the allowed application area of the pump.

Temperature category	Max. temperature of the conveying product
T 4	100 °C
T 3	165 °C
T 2	265 °C
T 1	415 °C

The maximum conveying product temperatures apply when mechanical seals of Messrs. Burgmann with **carbide – carbide** and **carbide – carbon** as sliding material combinations are used.
In the case of other manufacturers or other sliding material combinations it is necessary to consult the manufacturer.

1. **Assembly and repair in potentially explosive areas**

   When performing assembly and repair work, it is to be seen to it that no dangers of ignition arise especially during heating up the pump parts. This means e.g. heating up by explosion-proof heating devices or exclusively in non-explosive areas. The temperature of the heated part and the ignition temperature of the materials by which the danger of explosion may be caused are to be considered.

2. **Dry-running protection**

   Under no circumstances is the pump to run dry.
   The pump is to be equipped with an appropriate dry-running protection device.

Continued Page 1.3R

The device for dry-running protection should be self-regulating.
This means that this device can give alarm signals and/or switch off the pump also in case of failures in its own control system.

Dry-running protection concerning stationary immersion pumps (with mounting plate)

Operation is only permitted with redundant or self-regulating automatic devices to guarantee dry-running protection as well as to control the pump capacity.

Dry-running protection concerning movable immersion pumps (drum pumps)

The filling with liquid during the operation is to be ensured by specific requirements of behavior:

- Drum pumps may only be introduced in and removed from the container in switched-off condition
- Drum pumps, after being introduced in the container to be discharged, may only be started after they have immerged in the fluid.
- Drum pumps are to be switched off before they run dry or are to be switched off at once when specific noises ("slurping" or speed rise) suggest that dry running may or will immediately occur.

3. **Overpressure protection**

   The pump must not be loaded over the maximum allowable pressure.
   The pump is to be equipped with an appropriate overpressure protection device. The pump must not convey against a closed slide valve.
   The overpressure protection device should be self-regulating.

4. **Drives**

   The drives must be adjusted to the performance of each pump.
   In the case of a blocking of the pump, the drives must be turned off automatically by means of a motor protection unit.

5. **Alignment of the drive (concerning the pump types SY / SH / SA / SO / SF / SP)**

   It is absolutely necessary that the drive be aligned within the maximum allowable tolerances. Incorrect alignment causes damage to the seals and the shaft bearings.

6. **Potential equalization concerning immersion pumps**

   The immersion pumps are to be integrated in the potential equalization of the installation. Hand-operated movable immersion pumps are to be grounded before being introduced in the container.

Continued Page 1.4

The connection to ground is to be maintained until the pump has been completely pulled out of the container.
There must not be any potential difference between the pump and a conductive container. This means that container and pump are to be connected at a common grounding point and thus be conductively connected with each other.
(see information brochure "Statische Elektrizität, Zündgefahren und Schutzmaßnahmen" (Static electricity, dangers of ignition and preventive measures); Publisher: "Internationale Sektion für die Verhütung von Arbeitsunfällen und Berufskrankheiten in der chemischen Industrie der IVSS" (International section for the prevention of employment accidents and occupational diseases in the chemical industry of the ISSA (International Social Security Association)) , Heidelberg 1995).
The hand-operated movable immersion pumps are to be provided with an indication referring to the grounding measure (pay attention to grounding).

7. **Potential equalization concerning all other pump types (no immersion pumps)**

   All conductive parts of the pump are to be integrated in the potential equalization of the pumping set unless the conductive connection to the ground potential is guaranteed by the drive or connecting shafts or otherwise.

8. **Stator**

   The stator is to be regularly checked for wear. When the allowable wear limit is reached, the stator is to be replaced. Before exchanging the conveying product, the pump operator has to consult the manufacturer concerning the durability of the stator unless the stator has already been confirmed for the intended application.

   Inspection and maintenance interval of the stator:
   - **in the case of an operating time of > 16 h/day, at least twice a year**
   - **in the case of an operating time of < 16 h/day, at least once a year.**

9. **Joints / joint lubrication**

   The sealing and the lubrication of the joints are to be regularly checked. If necessary, the seals and the lubricants are to be replaced.

   Inspection and maintenance interval of the joints:
   - **in the case of an operating time of > 16 h/day, at least twice a year**
   - **in the case of an operating time of < 16 h/day, at least once a year.**

10. **Inspection after initial startup**

    The aspects relevant for ensuring the explosion protection (such as lubrication and wear check) are to be checked six months after the initial startup of the pump at the latest.

Continued Page 1.4R

11. **Shaft bearings**
(concerning the pump types SY / SH / SA / SO / SF / SP)

Replacement of the bearings after 14,500 operating hours (according to prEN 13463-5: replacement after 90 % of the designated service life).

12. **Materials**

Although being allowed as material for the pumps, aluminum should be avoided in potentially explosive areas.
The pumps may only be used if, under the particular operating conditions, the materials are resistant to mechanical and/or chemical influences or corrosion such that the explosion protection will be maintained.

13. **Noise development**
(concerning the pump types SO / BO / SF / BF / SP / BP)

As soon as unusual noises (such as knocking or rubbing) are realized, the pump is to be switched off. The cause of the failure is to be eliminated before the pump is reoperated.
Regular check of the paddle equipment.

14. **Direction of flow of immersion pumps**

The direction of flow of immersion pumps always has to be from the end connection piece to the pressure nozzle at the top. The reverse direction of flow is not allowed.

15. **Mechanical seal of immersion pumps**

Before the initial startup and after a prolonged shutdown, the mechanical seal is to be lubricated from outside before the pump is started. In this connection, the compatibility of the lubricant with the sealing material is to be considered.

16. **Impurities in immersion pumps**

Especially in the case of hand-operated movable immersion pumps it is to be seen to it that no impurities can get into the pump. The pumps are to be deposited only on clean and solid ground or else to be suspended. In case of unusual noises or power losses, the immersion pumps are to be switched off immediately.

17. **Gland**

If a gland packing is applied it has to be observed that the permitted temperature corresponding to the temperature category is not exceeded. Recommendation: fasten the screws of the stuffing box gland only with low torque (approx. 5 Nm).

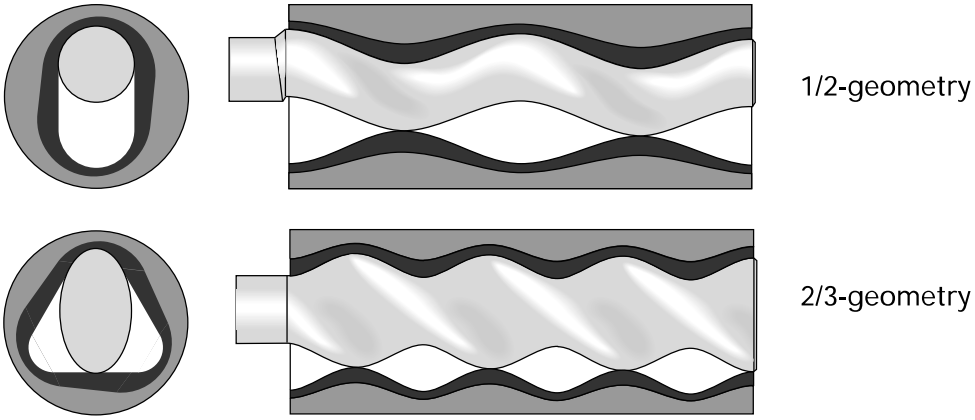
2 Description

The NEMO® pump is a progressing cavity pump.
The main components which determine the system discovered by Professor René Moineau are a rotating part, called the rotor and a static part, called the stator.
The rotor is a helical screw with an extremely large pitch, large thread depth and small centre diameter with round cross-section for 1/2-geometry and elliptical cross-section for 2/3-geometry. The stator has a two start or resp. 3 start thread and is double or resp. 1.5 the pitch length of the rotor. This provides space for the medium between the rotor and stator. When the rotor turns round inside the stator the medium moves continuously from the inlet to the outlet.



The universal NEMO® pump system unifies many positive characteristics of other pump types:

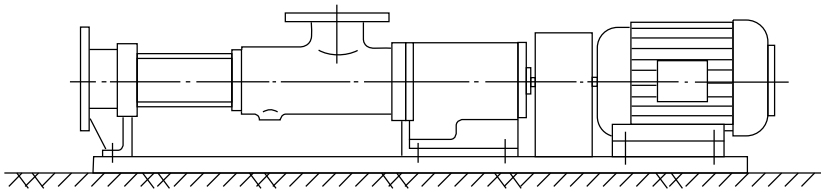
- Like centrifugal pumps NEMO® pumps have no suction or pressure valves, but do have a stable flow rate in proportion to the number of revolutions.
- Like piston pumps NEMO® pumps have a suction capability of up to 8.5 m vacuum metric.
- Like membrane and peristaltic pumps the NEMO® pump can transport every type of inhomogenous, gaseous and abrasive media, as well as those that are not of a liquid consistency or contain solids and/or fibrous material.
- Like gear pumps and screw pumps the NEMO® pump is capable of coping with high medium viscosities.
- Like piston, membrane, gear or screw pumps the NEMO® pump can perform dosing operations.

Length and cross-sections through the rotor and stator with 1/2-geometry during a rotation.

Continued Page 2.0R

Length and cross-sections through the stator with rotor
with reduced stator wall thickness

2.2 General Data



Noise emissions:

The maximum permitted noise emission level at a work place is 70 dB (A).

The noise level was measured in accordance with DIN Standard 45635-24-01-KL2 to assure that the pump does not exceed 70 dB (A).

Noises generated by the drive and pipes are not included in the above emission value.

A prerequisite for the noise emission level of ≤ 70 dB (A) is that the pump is operated in a cavity free regime and is bolted to a concrete base.

3 Packaging, Transportation, Storage

3.1 Packaging and Transportation

NEMO® pumps are shipped in railroad containers or crates unless the customer specifies otherwise.
The packings are labelled and symbols give the handling instructions in accordance with DIN 55402.
On receipt check for any transport damages.
Transport damages should be reported to the transporter immediately.
The pumps should be transported as closely as possible to the location of installation and only there should they be uncrated.

Uncrated horizontal pumps should be lifted by using a shackle which can be attached to the baseplate. The bolt holes of the frame or the lifting lugs attached to the baseplate could be used as shown on the installation drawing.

Vertical pumps should be lifted by using the bolt down holes, lifting lugs or shackles attached to the baseplate. This is shown on the installation drawing. For most applications, the drive is mounted on top of the pump.

Be careful when lifting top heavy pumps. The centre of gravity may be above the points where the lifting gear is attached to. If the case, secure additionally against tipping over!

Vertical pumps should not be deposited unless they are secured vertically. **Hazards of tipping!** Deposit only in horizontal position!

It is essential to avoid that the total pump unit be suspended with eye bolts of the motor or gear box. These eye bolts should be used for lifting the motor and/or the gear box **only.**

The Accident Prevention Rules, Section 18.4 relating to lifting accessories for the lifting of loads (VBG 9a) must be strictly adhered to.

Because of the variety of possible pump designs and applications, only general instructions can be given here. These should be good enough for experienced assemblymen or transportation experts.
When in doubt, please ask for detailed information on the pump unit concerned.

Continued Page 3.0R

When moving the pump or unit on **wheels** strictly attend to the following:

- Pad lock the motor drive and secure against unintended starting up.
- Move the pump unit carefully and slowly, especially where the ground is uneven. **Hazards of tipping!**
- Ensure a stable position of the pump or unit at the operating/storage place and secure it by actuating **all** clamping devices on **all** the wheels or rollers against voluntary moving away.
- Where fitted loosely, carefully watch the pipe bends when pumping. **Power of repulsion!**
- Where necessary, secure the pump unit additionally with support blocks.

3.2 Storage

The pumps are preserved for transport unless specified otherwise.
In cases of longer storage the pumps should be handled as follows until installation:

- **Stator:**

If the pump is not to be used immediately, then the elastomer along the contact line between rotor and stator may become permanently distorted (compression-set). This will increase the break away torque. Therefore, the stator should be removed and kept separately in a clean, cool and dry environment.
Standard DIN 7716 summarizes detailed information on the storage of rubber products, some of which is gathered here, and the following notice applies to a storage for a period of up to six months.

General

Most of the rubber products may change their physical properties under unfavourable conditions or if treated improperly, which will result in a shorter lifetime.
Or they may become useless through excessive hardening, aging, regenerating or permanent deformation, also because of blistering, cracking or other damages appearing on the surfaces.
The changes may occur under the influence of oxygen, ozone, heat, light, humidity, solvents or because of storing the products under tension.
If stored and treated properly, the rubber products will keep their properties, even over a long period of time (some years), almost unchanged.
This does, however, not apply to uncured rubber compounds.

Continued Page 3.1

Store room

The environment in which rubber products are being kept must be cool, dry, free of dust and rather airy, and they must not be stored in the open, not even in a weather sheltered space.
Rubber products should be kept in surroundings not having less than minus 10 °C and not more than plus 15 °C.
Store rooms should not be damp, and it must be ensured that there will be no condensation.
Most favourable is an environment offering a relative humidity under 65 %.
Rubber products must be protected against light, particularly direct sunlight or artificial light when having a high UV portion.
They should furthermore be kept away from ventilation, especially draught, by wrapping them up.
As ozone is very aggressive and harmful there should be no store room used which houses equipment likely to produce ozone, e.g. electric motors or other equipment which might bring about sparks or other electrical discharges.
There must be no solvents, oil, grease, lubricants or any chemicals kept in a store room.

- **Rotor**

  Please support with wooden blocks and cover up against harm from mechanical impact.
  For rotors of RCC (material number 1.2436):
  coat the surfaces with protective grease to avoid rusting.

- **Shaft Sealing by packing gland**

  Remove the gland and coat the exposed shaft surface with grease.

- **Pump parts in stainless steel**

  No grease coating necessary.

- **Other, non-coated pump parts**

  Protect with grease.

- **Drives**

  Please observe the drive supplier's instructions.

4 Mounting and Installation

If the NEMO® pump was stored and the rotor grease protected: Remove the grease before installing the stator. Clean the rotor thoroughly in order to avoid unsuitability of the grease with the stator material and the pumping medium.

Screw the pump at all fixing points (bearing housing / drive stool, end stud, support feet) using all fixing bores securely down to the sub-structure (ground plate, machine frame, foundation etc.).

4.1 Direction of Rotation

The direction of rotation of the pump is given on the model plate and in the order confirmation. The direction of delivery of the NEMO® pump is a function of the direction of rotation.

Changes must be agreed upon and confirmed by the supplier.

4.2 Pressure

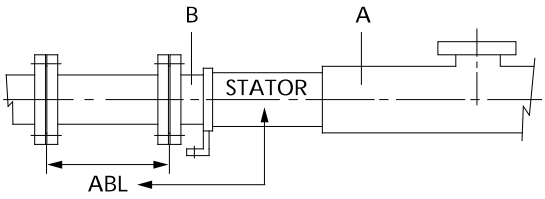
If not explicitly confirmed otherwise in the order confirmation, the **maximum permissible pressure (e.g. when turning clockwise) inside the pump housing (A)**

– for models with pump housing of cast iron 6 bar

– for models with welded pump housing 10 bar.

The maximum permissible pressures inside the end flange (B) is a function of the design applied for connections

- with flange: maximum nominal pressure (e.g. PN 16)
- with threaded internal socket: maximum 25 bar
- with DIN 11851 "dairy" thread up to DN 100 for one or two stage pumps: max. 12 bar, for multi stage pumps: max. 25 bar
- for other versions: maximum permissible pressure of the socket connection, but not more than 6 bar per pump stage, depending on the stator installed.



4.3 Piping System

- Arrange suction and pressure pipes so that when the pump is not running, the medium is still present before and after the pump. Sufficient media should remain inside in order to lubricate the pump during restart.

Continued Page 4.0R

4 INSTALLATION INSTRUCTIONS

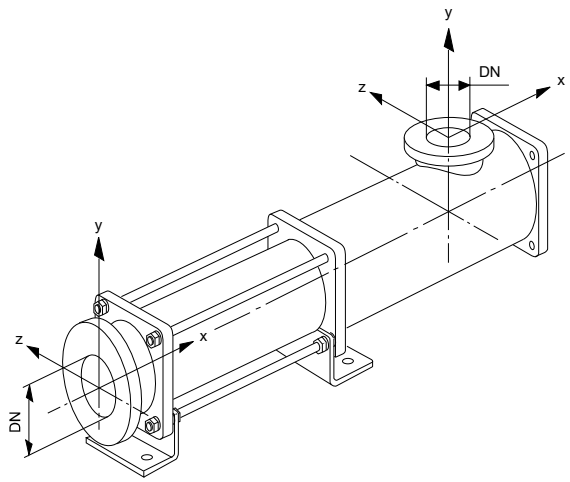
■ The installation of a removable distance piece between the end flange (B) and the pipe work is recommended in order to make the dismantling of the stator easy. The distance piece (see sketch) needs to have a minimum "ABL" disassembly length the values of which are shown in the table below, depending on the pump size and the number of stages.

Disassembly length ABL in mm:

Pump size	Number of stages			
	1 *)	2	3	4
0 1 5	90	160	230	310
0 2 1	130	230	340	450
0 3 1	170	310	450	590
0 3 8	230	430	630	830
0 4 5	270	500	730	960
0 5 3	320	600	880	1170
0 6 3	370	690	1010	1330
0 7 6	420	800	1170	1540
0 9 0	500	950	1390	1840
1 0 5	630	1180	1740	-
1 2 5	740	1400	-	-

*) for one stage pumps with L or P geometry the ABL values of 2 stage pumps are valid

Continued Page 4.1



Type key

Example: NM 090 BY 02 S 12 B

- Internal
- **Pump size**
- Type
- Model
- **Number of stages**
- Geometry
- max. permissible pressure difference
- anti–clockwise
- Joint

The disassembly length "ABL" is also shown in the arrangement drawings in accordance with our Standard QSH V - TB 01 - 002.

- Clean the pipe work and rinse thoroughly before installing the pump.
- Connect the pipe work ensuring that no external stress attacks the pump body. The installation of compensators between the pump and the pipework is recommended:
  - No risk of damage to the pump housing from pipelines "resting" on the pump.
  - No risk of damage to the pump housing through vibrating pipelines.
- The twisting loads (F_x, F_y, F_z) and bending loads (M_x, M_y, M_z) permitted to be put on the suction/discharge flange comply with the requirements of API 676 and exceed the requirements of EN ISO 14847. They are shown in the table below.

Continued Page 4.1R

Pump type NM	Standard nominal diameter DN	F_x, F_y, F_z N	M_x, M_y, M_z Nm	
015 021	(32) G 1¼"	550	(300)	Screwed joints must not be charged with loads which may result in tightening or loosening these joints
31	50	780	420	
38	65	990	530	
45 53	80	1160	620	
63	100	1490	800	
76	125	1820	980	
90 105	150	2190	1180	
125	200	2850	1530	

4.4 Shaft Sealing

- Where applicable, ensure that adequate supply lines for the buffer, flushing or quenching fluid for the shaft seals are connected **before** the pump is put into **operation**.
  For more details see Section 7.4!

4.5 Electrical Connection

All work relating to electricity shall only be made by **authorized and qualified personnel** and it should be in compliance with the requirements of the relevant national regulations!

In particular for control systems should the latest version of the **EC-Directive for Machinery 98/37/EEC, Annex I, Section 1.2 Controls** be carefully observed!

Note for frequency converter operation:
It is absolutely necessary to connect the PTC-resistors of the drive in case of frequency converter operation to protect the drive against overheating.

5 Start-up

The NEMO® pump design requires strict attention to the following:

Never run the NEMO® pump dry!
A few rotations in dry condition
will damage the stator!

- Before starting up for the first time, fill the pump with medium.
  In the case of high viscosity media fill with a liquid.
  Pump priming is vital to ensure lubrication of the rubber stator.
  Fill the piping on the pump suction side.
  In anti–clockwise rotation only: Fill the pump housing.

The NEMO® pump is a progressing cavity pump which can produce pressures that may cause the bursting of vessels or pipes.

The power transmission train (shaft, coupling rod, joints, rotor) of the pump may be overloaded thus resulting in damage or breakage.

Also the pump housing parts with their connections may be overloaded and break. There is a table in Section 4 of these Maintenance and Operating Instructions showing the pressure resistance of the pump housing parts.

Never run the pump against a closed inlet or outlet valve!

- **Open valves and vents before starting the pump!**
- **Check the direction of rotation by briefly switching on the pump motor.**

DETERMINING WHEN TO LOCKOUT

Having performed a hazard analysis on your company's equipment, you can now determine when machines must be locked out – i.e., when employees are exposed to injury from each (or any) of a machine's hazardous energy sources during servicing or maintenance activities. To do this, use your Hazard Analysis Checklist and the "Four Key Questions for Lockout Implementation."

OSHA Requirements

OSHA rules state that equipment must be locked out during equipment servicing and maintenance whenever employees are exposed to injury from unintentional machine movement or startup. According to OSHA's regulations, servicing or maintenance procedures that require lockout include:

"Workplace activities such as construction, installing, setting up, inspecting, modifying, and maintaining and/or servicing machines or equipment. These activities include lubrication, cleaning, or un-jamming of machines or equipment and making adjustments or tool changes, where the employee may be exposed to the unexpected energization or startup of the equipment or release of hazardous energy."

In addition, lockout is required during any machine service or maintenance that requires an employee to:

- Remove or bypass a safety device; or
- Place any part of his or her body into a point of operation or similar danger zone during a machine's operating cycle.

Routine, Repetitive Activities

Routing and repetitive servicing procedures that take place during normal production operations, such as minor tool changes and adjustments, do not require lockout tagout, as long as the work is performed using "alternative measures which provide effective protection." These "alternative measures" include safeguarding methods approved by OSHA and ANSI (American Standards Institute) to protect operators, such as:

- Presence sensing devices
- Interlocking barrier guards

Remember, the factor that determines whether these or any other safeguarding methods eliminate the need for lockout tagout during routine, repetitive activities is whether the employee is protected from injury.

If lockout is not required, you MUST have clearly written procedure that describe the alternative safeguarding measures used and the tasks that may be performed. Refer to OSHA and ANSI standards for approved safeguarding methods.

6 Temporary Shutdown

- After stopping the pump empty and if necessary rinse it if

  - the medium might freeze due to the temperature surrounding the pump. Especially where there is a danger of frost if the pump is installed outside a building
  - the medium tends to solidify or harden
  - the medium tends to glue up the shaft seal.

- Stator:

  When stored for a long period, the elastomer along the contact line between the rotor and stator may become permanently distorted (compression-set).
  This will increase the break away torque. For this reason, the stator should be removed (please observe Section 9!), and stored in a cool, dry place in air tight package to give protection against light and air.

- Rotor:

  Remove **ceramic rotors** (please observe Section 10!) and store away, safe in the original packing.

  Support **other rotors** on wooden blocks and cover to protect them from mechanical damage, after the stator has been removed.

  Rotors made of RCC (material number 1.2436):
  Protect the rotor surfaces against corrosion with protective grease.

  Remove the grease before re–installing the stator and clean the rotor thoroughly in order to avoid unsuitability of the grease with the pumping medium or the stator material.

- Stand-by pump:

  A stand-by pump is sometimes used as a back-up for the main pump and, when standing idle for longer periods, should be operated from time to time. The pump may otherwise become seized when being started up. This is due to compression set i.e. distortion of the stator against the surface of the rotor.

7 Maintenance

7.1 Pumps in General

- The pumps should be regularly rinsed or cleaned if deposits of medium are likely to build up (sedimentation).

If the pump needs to be opened to do this, ensure that the pump and motor are switched off and cannot be turned on accidently (eg. by removing the fuse).

Periodical standstill to allow for cleaning during operation depends on the medium and type of operation.

- The pump can be cleaned:

  - through the cleaning ports provided in the pump housing
  - manually by dismantling the pump
  - automatically (CIP cleaning) for special housings with a flushing section (important instructions for CIP procedures are given in Section 5 (START UP).

7.2 Lubrication

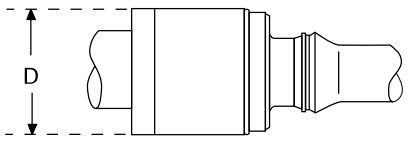
The NEMO® pump does not require frequent lubrication.

- Maintenance of the drive should be carried out according to the drive manufacturers instructions.

- Maintenance
  - where no manufacturers instructions are available and
  - when normal conditions of use exist:

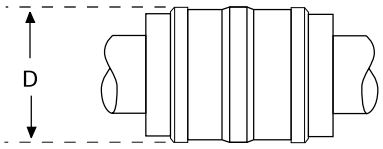
  - Strip down the drive unit
  - Remove the bearings
  - Clean all parts
  - Renew the lubricant

  every 5000 operating hours or at least every two years.



Special lubricants are often specified for mechanically controlled variable speed drives.
It is therefore important to follow the drive manufacturers maintenance instructions.

7.3 Lubricating the Pin Joints with SM-Pin Joint Seals



- It is advisable to change the oil and check the seals of the pin joints:
  - when renewing worn joint parts
  - when opening the pump for any reason.

  The quantity of oil added per pin joint is a function of the joint external diameter D:

Joint external diameter D in mm (see sketch)	Basic joint size	Quantity of oil per joint in cm^3
28	NM 015	1,5
30	NM 021	2
40	NM 031	5
54	NM 038	15
65	NM 045	22
76	NM 053	36
83	NM 063	78
102	NM 076	165

Continued Page 7.2R

Lubricating Oil:

Industrial application	Designation DIN 51502	Permitted Product
Food and Beverage Industry only	Authorized for use in foodstuffs — CLP HC 460	"KLÜBER" KLÜBEROIL 4 UH 1 - 460 authorized under USDA H1

This synthetic oil meets both the German "Arzneimittelbuch" requirements and the still stricter US American FDA regulations.
Nevertheless, it is not quite harmless if swallowed in more than minor quantities!

At a sudden break in a joint up to 450 ml of lubricating oil together with metal rubbings may enter the pumping medium. It is therefore of essential importance to regularly check the state of the joint seals and renew in time, if necessary.

If the pin joints operate without lubricating oil or seals, there will be no risk of contaminating the medium with oil. This operation, however, results in a higher amount of rubbed off metal parts through wear on the joints. These metal rubbings will inevitably and continuously come into contact with the pumping medium.

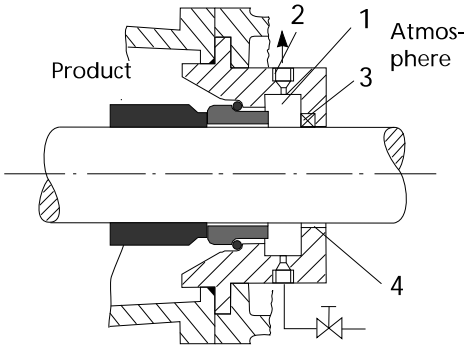
General Industry	CLP 460	"SHELL" Omala 460
	with SM-pin joint seal (8235) of EPDM CLP PG 320	prescribed: KLÜBERSYNTH GH 6-320

7.5 Shaft Sealing through Single Mechanical Seal

There are various constructions of mechanical seals. Especially advantageous is the use of standard mechanical seals according to DIN 24960. These seals have regardless of their brand the same fitting dimensions which makes them interchangeable. Mechanical seals with a coil spring can only be used for pumps which are run in one direction of rotation.

- The seal specification of a NEMO® pump is recorded on the order confirmation sheet.
- Pumps fitted with direction dependent seals should **never** be run in the opposite direction of the rotation arrow.
- If excessive leakages occur the spring tension and the seal surfaces should be checked, and the seal be replaced, if necessary.

Single mechanical seals usually work without any additional equipment. Their application range can be increased by operating them with a rinsing or cooling system.



a) **Quench**, in accordance with ISO 5199, Appendix E, Plan Nos. 08, 09, 10 or 13 or API 610, Appendix D, Plan No. 62.

Quench is the designation commonly used in sealing engineering for an arrangement that applies a non pressurized external fluid to the atmospheric side of a mechanical seal. The quench is used when

- a single mechanical seal will not work or only to a limited extent without auxiliary measures or
- a double mechanical seal with pressurized buffer fluid is not necessary.

Recommended for the following applications:

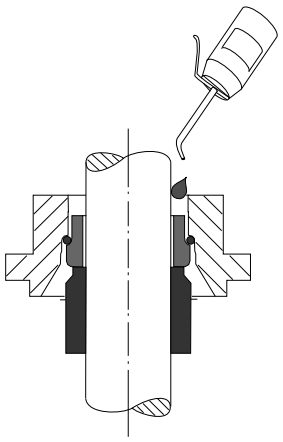
- Low temperature (danger of freezing)
- Operation in a vacuum (dry running)
- Media which must be isolated from the atmosphere (eg. due to build up of solid deposits or because of less severe damage to the environment, like smell).

Continued Page 7.5R

Leakages will be transportet away by the quenching liquid.
In vacuum operation dry running of the seals is avoided.

No pressure higher than that of the pumped medium **in front** of the mechanical seal is allowed to build up in the quenching area (1) **behind** the mechanical seal. Otherwise the counter ring will be pushed out of the housing. **Free discharge** from (2) is necessary!

Closing off the quenching area from the atmosphere can be done in three ways:



1. In the case that high emission levels can be tolerated:
   Through a throttle bush (4). Cooling liquid not permanently used, only released from time to time.
2. In the case that medium emission levels can be tolerated:
   By a radial shaft seal ring (3). Permanent radial shaft seal lubrication through quenching liquid is necessary.

b) **Top lubrication**

Attention: For vertically installed pumps with overhead drive as type NT:

On initial start-up the mechanical seal has not come in contact with the medium. It runs therefore dry for a short period of time until the air is displaced from the pump housing.

- On first start–up and if stood idle for longer periods lubricate the mechanical seal before switching on the pump.
- Apply water, glycerine or oil depending on their compatibility with the pumping medium and the elastomer of the mechanical seal.
- Fill the quench cup of the mechanical seal housing.

8 Trouble-Shooting and Remedying

8.1 Trouble Chart

The chart overleaf lists possible problems

- the type
- the likely reason / cause
- the remedy.

- A problem may have various causes: Several boxes in the vertical column are marked with a cross.
- A reason/cause may result in various problems:
  Several boxes in the horizontal column are marked with a cross.

8.2 How do you trace the kind of problem to find the possible cause ?

- The column describing a possible problem shows one or several boxes marked with a cross.
- On the corresponding lines you will find the possible reasons/cause and some hints how to handle the problem .
  Thus the actual cause of the problem can be narrowed down and eventually detected.
- If you find further cross-marked boxes on one of the lines and should there appear corresponding problems as well, then the likely cause of the problem has been detected.

- The table helps in finding the root of the problem and will give you the remedy if it is straight forward. For more complicated problems the manufacturer has to be consulted.

Continued Page 8.0R

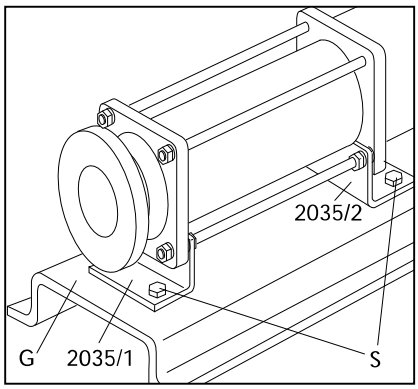
The NEMO®-pump is a well established product which was thoroughly tested before leaving the factory. If you use the pump in keeping with your Order Specification and treat it in accordance with our Operating and Maintenance Instructions, it will run satisfactorily for a long period of time.

Possible Problems											
The pump is no longer starting	The pump is no longer sucking	The pumped medium is too little	The pressure is too low	The pumped medium is unstable	The pump is running loudly	The pump is stuck	The drive is overloaded	The stator life time is too short	The rotor life time is too short	The shaft seal is leaking	**Possible Causes** (Remedy overleaf)
X							X				In new pumps or stators : the static friction is too great.
X		X	X				X				The pump electrical equipment is not compatible with the electrical supply.
		X					X	X	X		The pressure is too high.
X						X	X				There are foreign bodies in the pump.
X						X	X	X	X		The temperature of the liquid medium is too high, the stator is too ductile.
X						X	X	X			The stator has swollen, the elastomer is not compatible with the medium.
X						X	X	X			The solids content of the medium is too high and leads to blockages.
X						X	X	X	X	X	The liquid medium sediments or hardens when left to stand.
		X	X	X							There is air in the suction pipe.
	X	X	X	X							The suction pipe is leaking.
	X	X	X	X							The shaft seal is leaking.
		X	X								The rpm is too low.
	X	X	X								With reduced diameter rotors : operating temperature has not been reached.
		X	X	X	X			X	X		The suction is too great or pressure too low (cavitation).
		X	X		X	X	X	X			The pump is running dry.
	X	X	X		X						The stator is worn out, or temperature of liquid is too low.
	X	X	X		X			X	X		The stator material is brittle.
	X	X	X		X			X			The rotor is worn out.
					X						The joints are worn out.
					X						The pump and drive are not axially aligned.
					X						The elastic element of the coupling is worn out.
					X					X	The roller bearings are destroyed.
							X				The rpm is too high.
							X				The viscosity is too high.
							X				The specific weight of the medium is too high.
							X			X	The stuffing box is incorrectly tightened.
										X	The packing is not suited to the liquid medium.
	X									X	Mechanical seal : rotation is incorrect.
										X	Mechanical seal : mechanical seal and mating ring have failed.
										X	Mechanical seal : elastomers damaged, swollen or brittle.

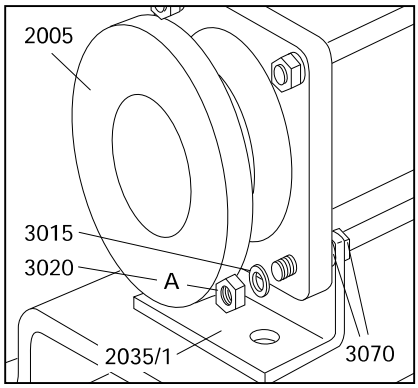
Remedy
Fill the pump up, then pump through manually using a suitable appliance; if necessary use glycerine as lubricant in the stator.
Check order information. Examine electrical installation (possibly 2 phase operation).
Measure the pressure with a manometer and check against order details. Reduce the pressure or change the drive.
Remove foreign bodies and eliminate possible damage.
If the liquid medium temperature cannot be lowered, use a reduced diameter rotor.
Check whether the liquid medium agrees with the order requirements. Possibly change stator material..
Increase the liquid part of the medium.
Clean the pump and rinse through after each run.
Increase the suction liquid level, prevent turbulance and air bubbles at the inlet.
Check seals and tighten pipe connections.
Stuffing box : tighten or renew. Mechanical seal : renew seals, eliminate solid deposits.
In the case of adjustable drives : increase the rpm. If necessary change the drive.
Warm up the pump (stator) to operating temperature first of all.
Decrease suction resistance, lower the temperature of the liquid medium, install the pump at a lower location.
Fill up the pump, provide for dry running protection, move the pipes.
Replace with a new stator or ensure correct liquid temperature.
Fit a new stator. Check the liquid medium agrees with order details; if necessary change the stator material.
Change rotor, establish the cause. Wear and tear, corrosion, cavitation; if necessary change to a different material or coating.
Replace relevant parts, carefully reseal and lubricate.
Re-align the unit.
Use a new connection and re-align the pump.
Replace roller bearings, lubricate, reseal. At higher temperatures observe the lubricant and the bearings.
In the case of adjustable drives : lower the rpm.
Measure the viscosity and compare with order details. If necessary adjust viscosity or change the drive.
Measure specific weight and compare with order details. If necessary adjust specific weight or change the drive.
Service stuffing box according to page 7.4, if necessary renew worn shaft.
Replace fitted packing with another packing type.
Change electrical connection.
Replace relevant rings with new ones.
Replace elastomers. Check whether the liquid medium agrees with order details, if necessary change material.

9 Removal and Fitting of End Stud, Stator and Pump Housing

The pump with attached pipework should be empty and must have cooled off!
Disconnect the pipework on the suction side and pressure side of the pump.



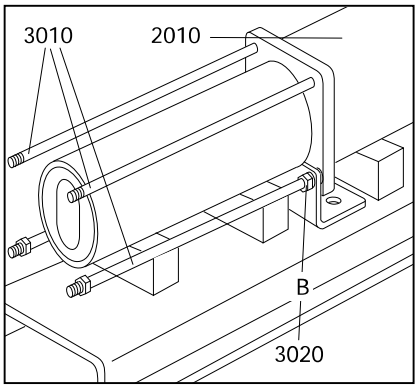
Caution for pumps with ceramic rotors!



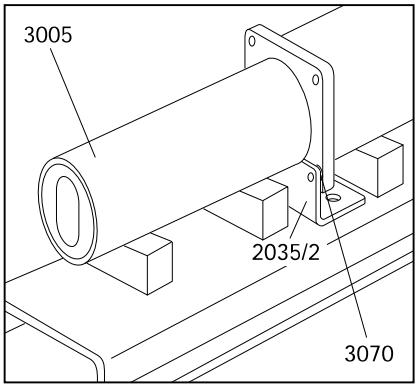
Where a pump is fitted with a **ceramic** rotor (1999) the following operations should be carried out **with great care.**
Do not use any force or sharp tools! Special care must be taken to prevent heavy strokes, vibrations or impact by a hammer.

Dismantling

- Remove the securing screws (S) from support feet (2035) to baseplate (G).



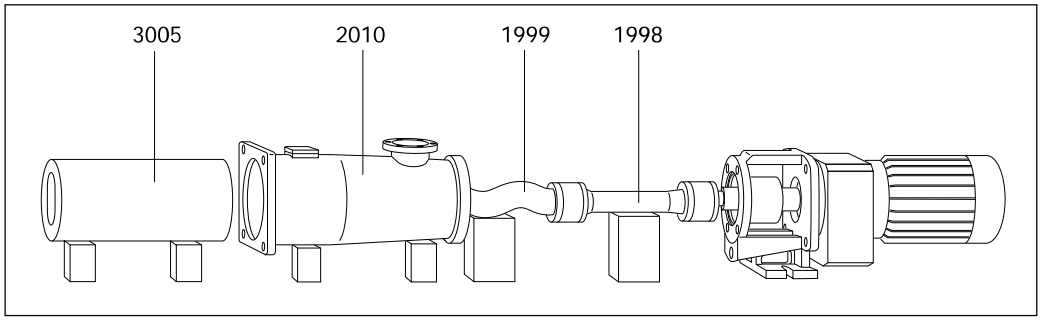
- Unscrew the hex nuts A (3020) and remove with spring washers (3015), then withdraw the end stud (2005) and first support foot (2035/1) with washers (3070).



Continued Page 9.0R

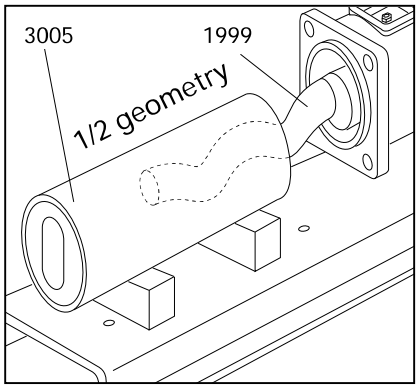
9 DISMANTLING AND ASSEMBLY OF THE PUMP HOUSING

- Support pump housing (2010) and stator (3005) with wooden blocks.
- Loosen the hex nuts B (3020), where fitted, and remove the thru bolts (3010).



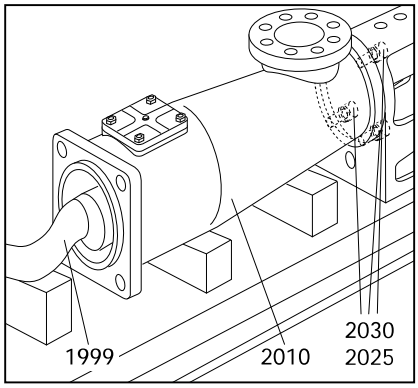
- Where fitted, remove the second support foot (2035/2) and the washers (3070).

Caution for pumps with ceramic rotors!



When the stator (3005) is removed from the **ceramic** rotor (1999), the stator must be supported to prevent it from suddenly tilting away downwards. The same applies to the rotor (1999) as soon as it is disengaged from the stator (3005). Removing the stator (3005) from the **ceramic** rotor (1999) is easier by using an extractor. This should be done slowly and with care in a rotating movement. When sliding pump housing (2010) over **ceramic** rotor (1999), both coupling rod (1998) and rotor (1999) should be lifted as the **ceramic** rotor (1999) must not knock onto the pump housing (2010).

Continued Page 9.1

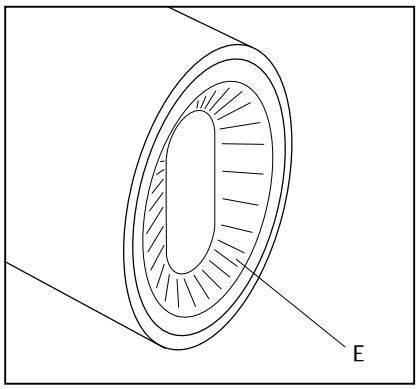


Caution for pumps with tubular rotors:

Where the walls of tubular rotors are worn in the wear zones, pumping medium may occur inside the rotor and may come out when pulling off the stator.
Ensure that protective measures have been taken when pumping dangerous media!

- Pull the stator (3005) out forward.
  A stator extractor can be supplied as special accessory.

- Remove the hex nuts (2030) with spring washers (2025).
- Pull the pump housing (2010) off forward.



Assembly

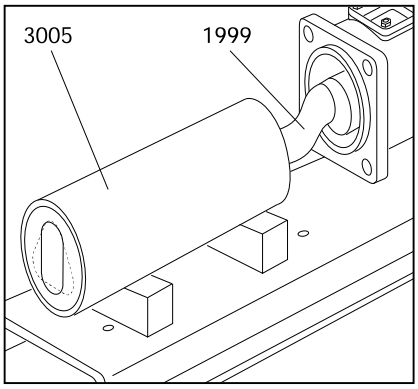
- Refitting is a simple reversal of this procedure.

  When refitting the stator (3005) check direction of stator (3005) is correct! The funnel-shaped inflow side (E) of the stator (3005) must show to
  - the pump housing (2010) when rotation is **anti-clockwise**
  - the end stud (2005) when rotation is **clockwise**

  when viewed on pump shaft end.

- **Elastomer stators (A)** have integrated front side sealing profiles (D). They don't need additional gaskets for sealing off the end stud (2005) and the pump housing (2010).

- **Solid stators (B)** have **no** integrated front side sealing profiles. Therefore additional gaskets (8005) should be installed to seal off the end stud (2005) as well as the pump housing (2010).



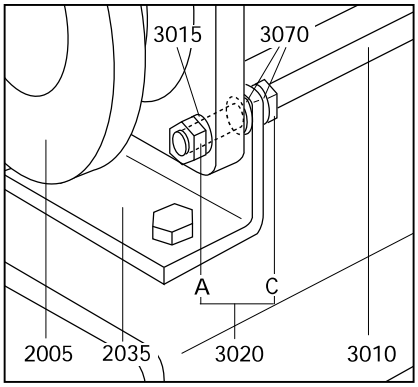
Continued Page 9.1R

9 DISMANTLING AND ASSEMBLY OF THE PUMP HOUSING

Be careful when engaging the stator (3005) and rotor (1999). Do not trap your fingers!
Do not reach inside the stator!

- Push the stator (3005) with a rotating movement on to rotor (1999).
  Apply an assembly device and some glycerine to ease engaging the stator (3005) and rotor (1999).

- When tightening hex nuts (2030) a gap will remain between drive stool (0085) and pump housing (2010).



Please do not try to close this gap by overtightening the nuts!
Drive stool (0085) may break!

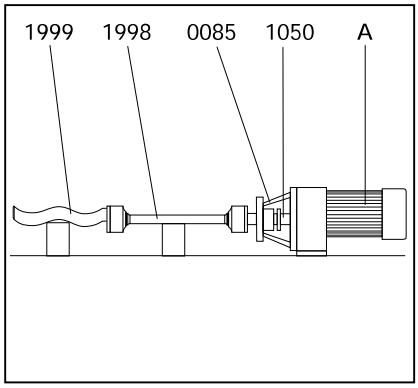
Torque values for hex nuts (2030):

Size	M6	M8	M10	M12	M16	M20	M24	M30
Required torque Nm	8	15	30	45	75	80	100	120

- Fastening the end stud (2005):

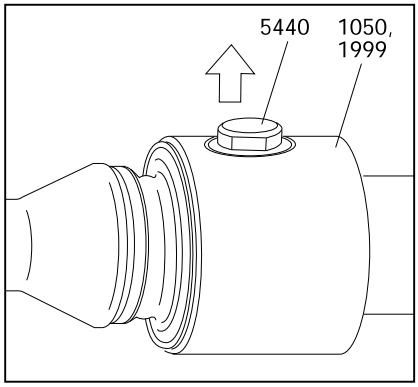
Screw the hex nuts C (3020) down into the thru bolts (3010) as far as possible.
Slip on the first washers (3070), the support foot (2035), the second washers (3070), the end stud (2005) and tighten with spring washers (3015) and hex nuts A (3020).
Finally, fasten the support foot (2035) from behind with the two hex nuts C (3020).

Ensure during refitting that the O-ring (8015) or, where a heating jacket (3025) is installed, the O-rings (8030) are in perfect condition and will sit correctly.



Ensure that the drain plug (2015) is not screwed too tightly into the pump housing (2010), since otherwise its conical thread may break the pump housing (2010).
The torque should be about 40 - 50 Nm.

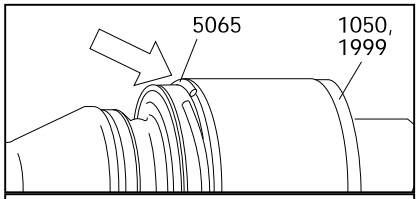
10 Dismantling and Assembly of the Rotating Parts with Pin Joints with SM-Pin Joint Seal (basic joint size NM015 - NM125)



10.1 Removal of Rotor and Coupling Rod

Where a pump is fitted with a **ceramic** rotor (1999) the following operations should be carried out **with great care.** Do not use any force or sharp tools! Special care must be taken to prevent heavy strokes, vibrations or impact by a hammer.
For removal of the rotor (1999) and coupling rod (1998) the pin joints should be dismantled as follows:

- Place the dismantled unit – consisting of drive stool (0085) with drive (A) and connecting shaft (1050), coupling rod (1998) and rotor (1999) – on the work-bench with a wooden block supporting the rotor (1999).

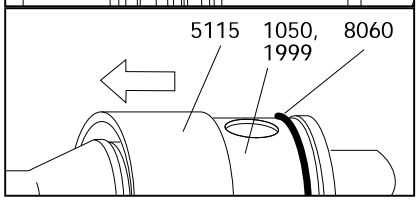


Basic joint size NM125:

- Unscrew the wear sleeves (5440) from the head of rotor (1999) or connecting shaft (1050)

Basic joint size NM021 - NM105:

- Push circlip (5065) out of its groove and slip off over the head of rotor (1999 or connecting shaft (1050).

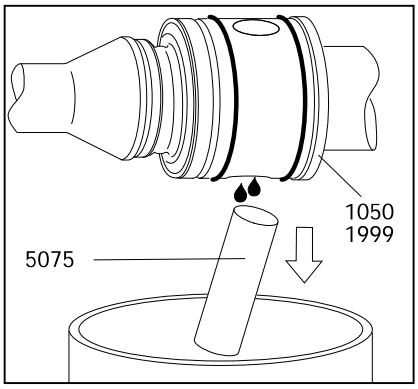


Pumps fitted with a ceramic rotor (1999):

- **Carefully** turn safety sleeve (5115) with a squeeze belt wrench, and remove.

The following method should **not** be employed for pumps fitted with a **ceramic** rotor.

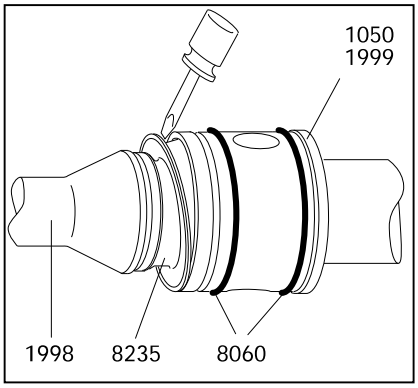
Pumps fitted with a metallic rotor (1999):



- If necessary hit the edge of sleeve (5115) at an angle with the help of a wooden block and a plastic hammer. Taking care not to damage the O-rings (8060)!

Continued Page 10.0R

10 DISMANTLING AND ASSEMBLY OF THE ROTATING PARTS

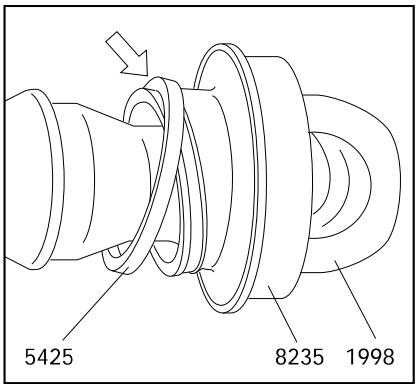


Basic joint size NM021 - NM125:

- Press the pin (5075) out of the head of rotor (1999) or connecting shaft (1050). If necessary use a hammer and a thin cylindrical pin (DIN 6450 C).
  Drain the oil into a receptacle.

  Caution for pumps with ceramic rotors!

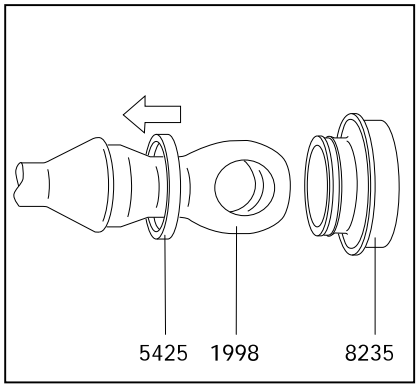
  Where a pin (5075) may not come out easily, the metallic head of rotor (1999) should be supported on wooden blocks. Then the pin (5075) can be driven out with the help of a pin punch (DIN 6450 C). This should be done **with care**, holding the **ceramic** rotor with your hands.
  Please dispose of this oil in the proper manner.



- Using a screwdriver, carefully lever the SM-pin joint seal (8235) out of the head of rotor (1999) or connecting shaft (1050).

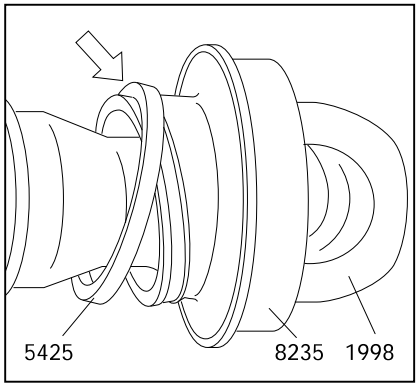
Taking care not to damage the SM-pin joint seal (8235)!

- Pull apart the rotor (1999)/ coupling rod (1998) / connecting shaft (1050) assembly. Remove the O-rings (8060).



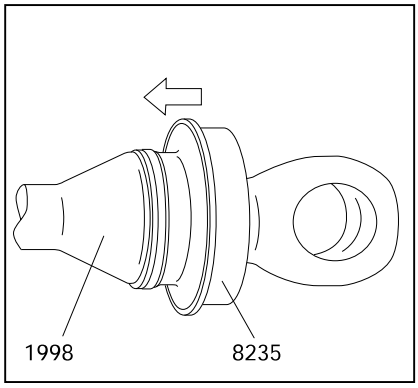
- Push the SM-pin joint seal (8235) towards the head of coupling rod (1998). In the narrow coupling rod section press the clamp ring (5425) out of the groove of the seal. Then slip the SM-pin joint seal (8235) and clamp ring (5425) off over the head of the coupling rod (1998).

Continued Page 10.1



10.2 Fitting the Rotor and Coupling Rod

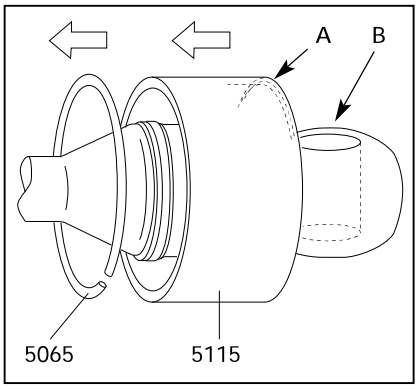
For fitting the rotor (1999) with coupling rod (1998), the two pin joints should be assembled as follows:



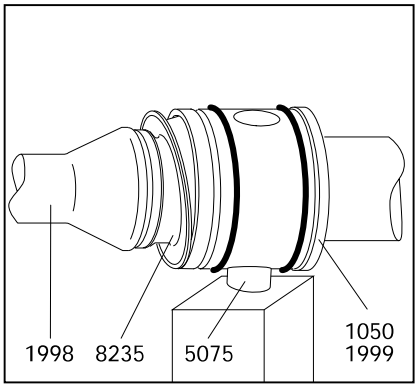
- Slip the clamp ring (5425) over the head of coupling rod (1998).

- Push the SM-pin joint seal (8235) over the head of coupling rod (1998) towards its narrow section, there sqeezing the clamp ring (5425) into the groove of the SM-pin joint seal (8235).

- Push the SM-pin joint seal (8235) with the correctly placed clamp ring (5425) up to the shoulder of coupling rod (1998).

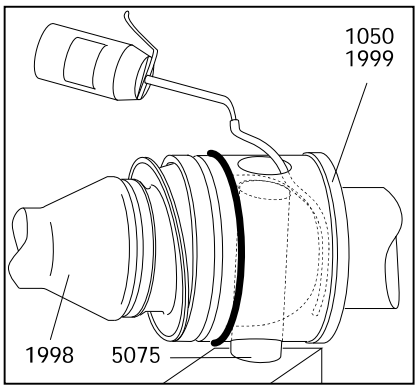


Continued Page 10.1R

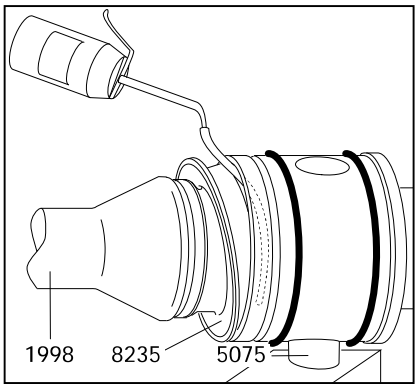


10 DISMANTLING AND ASSEMBLY OF THE ROTATING PARTS

Basic joint size NM021 - NM105:

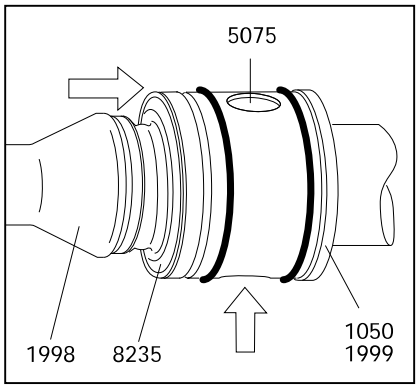


- Slip the circlip (5065) on to the coupling rod (1998). Slide the sleeve (5115) on to coupling rod (1998) so the inside diameter of chamfering (A) is being placed towards the coupling rod (1998) extension. Chamfering (A) will later on ease the installation over the O-rings (8060).
  Orient the head of coupling rod (1998) until it is in vertical position for the bore (B) for the pin (5075).

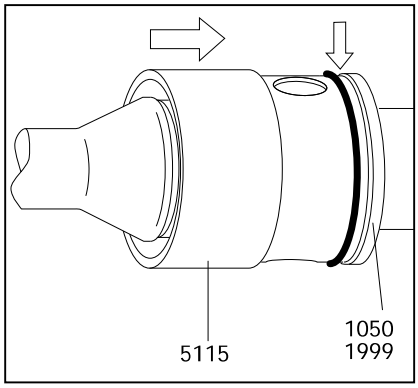


- Slide the coupling rod (1998) with SM-pin joint seal (8235) into the bore of rotor (1999) or connecting shaft (1050) and insert the pin (5075) from below and push up to the upper edge of coupling rod (1998).
  Support the pin (5075) against dropping out.
  Slide the SM-pin joint seal (8235) into the rotor (1999) or connecting shaft (1050) only from below, and in a slightly slanted position.

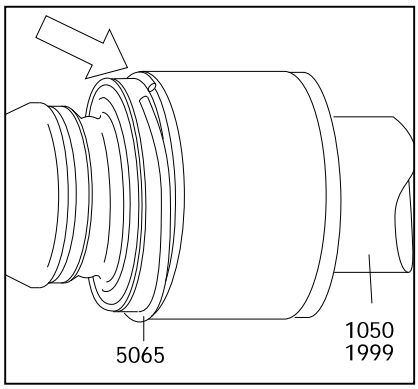
- For lubrication, use an oil can which should be fitted with a thin plastic hose having an outside diameter of not more than 4 mm.
  Insert this hose into the upper oil port opening in the rotor (1999) or connecting shaft (1050). Then slide the hose end past the coupling rod (1998) all the way down to the bottom section of the rotor head (1999) or connecting shaft (1050).
  Slowly fill with lubricating oil up to the filling port.



- Pull the hose out.
  Then insert the hose end through the small gap on the topside of SM-pin joint seal (8235) and guide it down to the bottom of the hollow space between coupling rod (1998) and SM-pin joint seal (8235).
  Slowly fill with lubricating oil up to the gap.

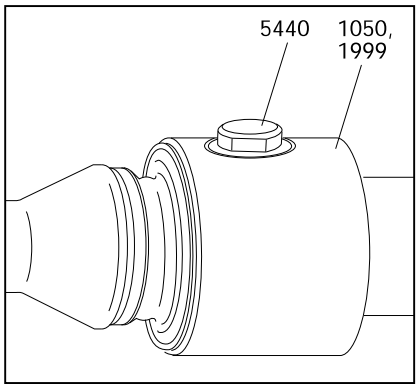


Continued Page 10.2

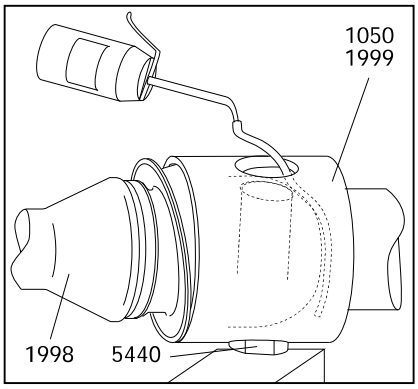


- Pull the hose out.
  Push the pin (5075) entirely into the bore of head of rotor (1999) or connecting shaft (1050) and retain in place.
  Only now, press the SM-pin joint seal (8235) into the bore of head of rotor (1999) or connecting shaft (1050) and push up to the shoulder. In doing so the SM-pin joint seal (8235) should be slightly bulbous around the outer surface. Wipe off overflow oil. Use this oil for lubricating the O-rings (8060).

- Slip the sleeve (5110) or (5115), with its chamfering (A) forward, on to the head of rotor (1999) or connecting shaft (1050) and push up to the shoulder.

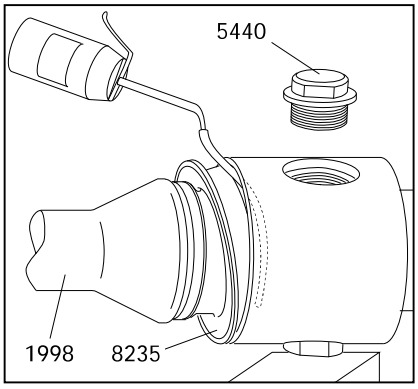


- Place the circlip (5065) into its groove on the rotor head (1999) or connecting shaft (1050) and carefully snap in place all around.



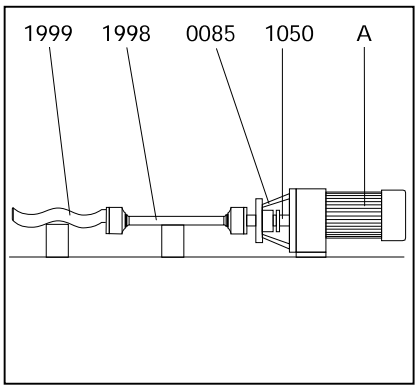
- **Basic joint size NM125:**

  Slide the coupling rod (1998) into the bore of the head of rotor (1999) and connecting shaft (1050) and insert the pins (5075).
  Insert the SM-pin joint seal (8235) (8235) into the head of rotor (1999) and connecting shaft (1050).
  Only then screw in one wear sleeve (5440) with O-ring (8060) into the head of rotor (1999) and connecting shaft (1050) and turn upside down.



10 DISMANTLING AND ASSEMBLY OF THE ROTATING PARTS

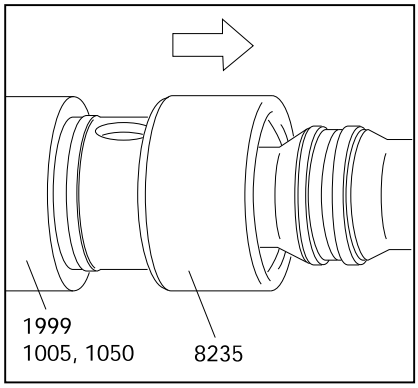
- For lubrication, use an oil can which should be fitted with a thin plastic hose having an outside diameter of not more than 4 mm.
  Insert this hose into the upper oil port opening in the rotor (1999) or connecting shaft (1050). Then slide the hose end past the coupling rod (1998) all the way down to the bottom section of the rotor head (1999) or connecting shaft (1050).
  Slowly fill with lubricating oil up to the filling port.



- Pull the hose out.
  Then insert the hose end through the small gap on the topside of SM-pin joint seal (8235) and guide it down to the bottom of the hollow space between coupling rod (1998) and SM-pin joint seal (8235).
  Slowly fill with lubricating oil up to the gap.
- Screw in the second wear sleeve (5440) with O-ring (8060) into the head of rotor (1999) and connecting shaft (1050).

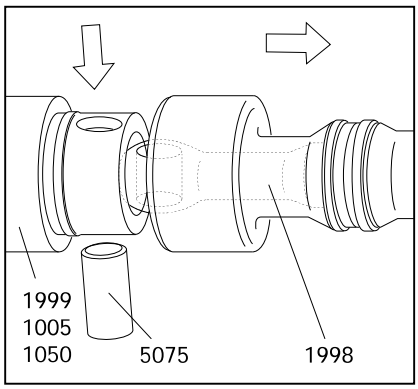
- **Basic joint size NM021 - NM125:**

  Drive connecting shaft (1050), coupling rod (1998) and rotor (1999) are now joined by means of the two pin joints.
  Pump housing (2010), stator (3005) and end stud (2005) may now be fitted.



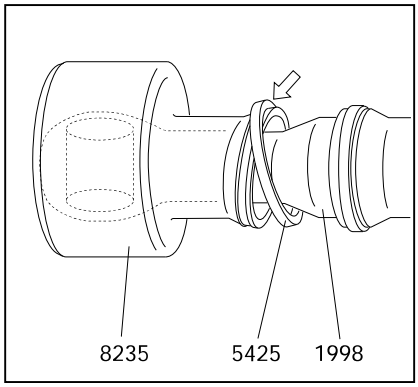
Continued Page 10.3

10.3 Dismantling and Assembly of the Rotating Parts with Pin Joints with SM-Pin Joint Seal (joint basic size NM015)



For removal and refitting of the rotor (1999) and coupling rod (1998) the pin joints should be dismantled and re-assembled as follows:

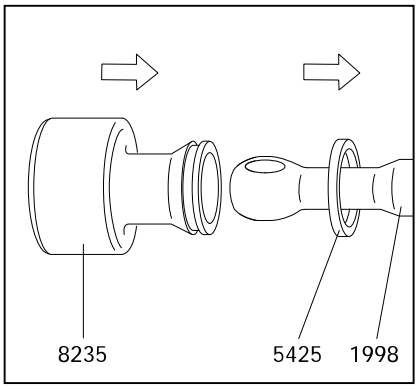
Dismantling:



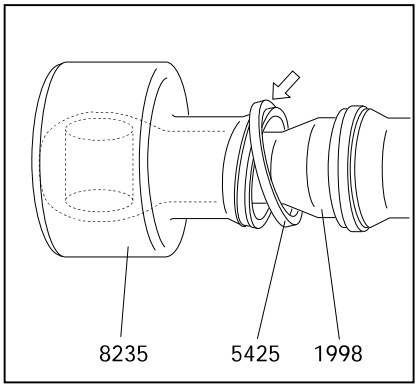
- Push the SM-pin joint seal (8235) away from the rotor (1999), drive shaft (1005) or connecting shaft (1050) so the bore for the pin (5075) comes free.

- Press the pin (5075) out of the rotor (1999), connecting shaft (1050) or drive shaft (1005). Then withdraw the coupling rod (1998) from the bore of rotor (1999), connecting shaft (1050) or drive shaft (1005).

- Push the SM-pin joint seal (8235) towards the head of coupling rod (1998). In the narrow coupling rod section press the clamp ring (5425) out of the groove of the seal. Then slip the SM-pin joint seal (8235) and clamp ring (5425) off over the head of the coupling rod (1998).

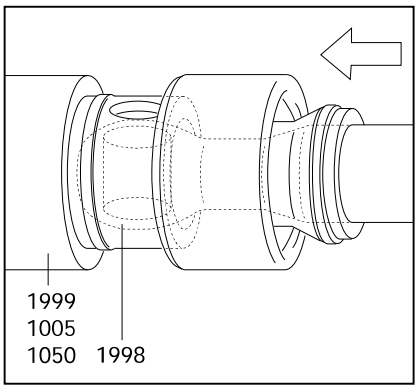


Continued Page 10.0R



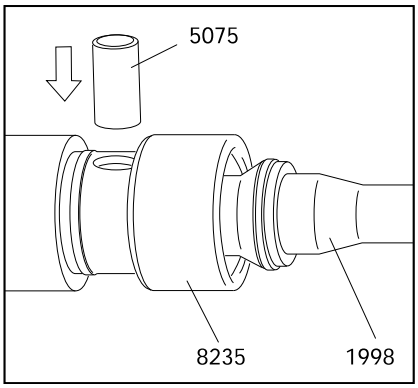
10 DISMANTLING AND ASSEMBLY OF THE ROTATING PARTS

Re-Assembly:



- Slip the clamp ring (5425) and the SM-pin joint seal (8235) on over the head of the coupling rod (1998).

- Push the SM-pin joint seal (8235) towards the narrow section on the head of coupling rod (1998) and place the clamp ring (5425) back into the groove of the SM-pin joint seal (8235).
  Then move the SM-pin joint seal (8235) up to the coupling rod (1998) shoulder.



- Place the head of coupling rod (1998) into the bore of the rotor (1999), drive shaft (1005) or connecting shaft (1050).

- Join the rotor (1999), drive shaft (1005) or connecting shaft (1050) and coupling rod (1998) by the pin (5075).
  Then push the SM-pin joint seal (8235) up to the shoulder of the rotor (1999), drive shaft (1005) or connecting shaft (1050).

  Re-assemble the second pin joint in the same manner.

11 Removal and Fitting of the Connecting Shaft with Shaft Seal

Removal:

- Push the circlip (1035) in the direction to the mechanical seal.
- Remove pin (1030).
- Remove the shaft seal housing (7005) and mechanical seal (7010) together with connecting shaft (1050) and set ring (1035) from drive stool (0085) and the drive shaft.
  The thread of cylindrical head screw (1040) can be used as forcing screw.
- If a mechanical seal is installed, see description "Removal and Fitting of Mechanical Seal" after Page 12.0.

Fitting:

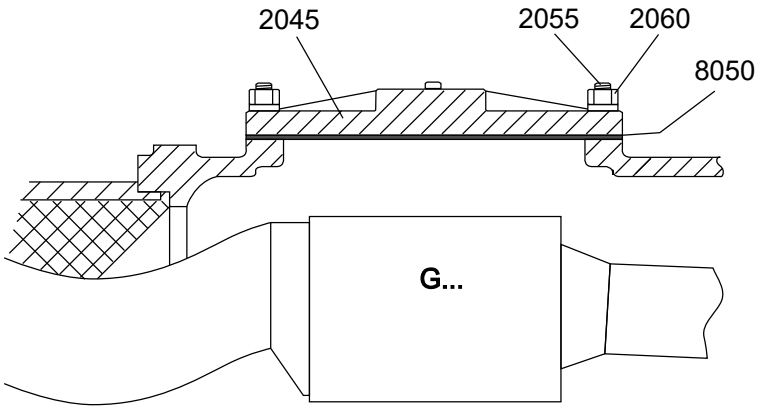
- Apply grease into the bore of the connecting shaft (1050) to avoid rust (e.g. TCE-Metallic 600).
- Assemble the shaft seal housing (7005) and mechanical seal (7010) together with connecting shaft (1050) and set ring (1035) with drive stool (0085) and push connecting shaft (1050) on to the drive shaft.
  At this please observe the installation direction of set ring (1035) (please see mark).
- If a mechanical seal is installed, see description "Removal and Fitting of Mechanical Seal" after Page 12.0.
- Connect the connecting shaft (1050) and the drive shaft by pin (1030).
  Push set ring (1035) on pin (1030).

12.1 Removal and Fitting of the Single Mechanical Seal

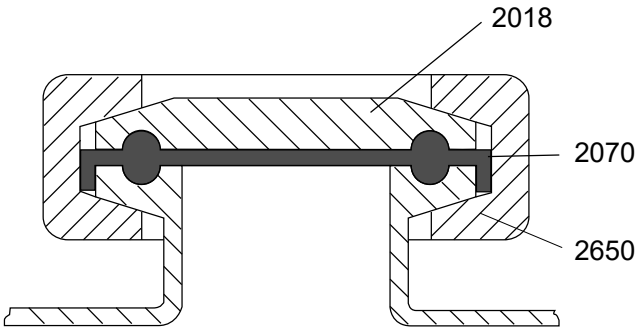
- **Carefully** slide out mechanical seal housing (7005) together with the parts of the mechanical seal contained in it from connecting shaft (1050).
- **Carefully** push mechanical seal (7010) stationary seat out of mechanical seal housing (7005).

Refitting is a simple reversal of the above procedure.

- To reduce frictional forces during seal assembly, apply some glycerine to the shaft and the seal housing in the area of the gaskets.
- Special care must be taken when fitting double PTFE-coated gaskets: the **joint** of the outer coating must point away from the seal assembly direction, otherwise the coating may open or be pulled off!



Ensure that the distribution of pressure is uniform when inserting the pressure sensitive counter rings. When inserting larger rings, use a suitable mandrel.
Do not allow any foreign bodies to get between the sliding surfaces.



- Exactly keep to the seal installation dimensions and ensure that the sealing faces are correctly pressed together (see table on sectional drawing W 209.000 or W 210.000).
- Insert mechanical seal (7010) stationary seat into mechanical seal housing (7005).
- Insert mechanical seal housing (7005) together with the stationary seat into the drive stool **without the installed connecting shaft (1050).**
- If necessary take the installation dimension from the table and add the thickness S of the set ring (7086) when existing.
- Mark this installation dimension on the connecting shaft (1050).
- Fix the rotating unit of the mechanical seal (7010) on the connceting shaft (1050) depending on the installation dimension so that the rotating unit of the mechanical seal (7010) or the set ring (7086) is at the mark.
- Insert connecting shaft (1050) with the rotating unit of the mechanical seal (7010) into drive stool (0085) and install lip seal (7091, if existing. Push the set ring (1035) on to connecting shaft (1050) and observe at this the installation direction (see mark).
Push connecting shaft (1050) on to the drive shaft and connect with pin (1030). Push the set ring (1035) on pin (1030).

Inspection Opening at the Pump Housing

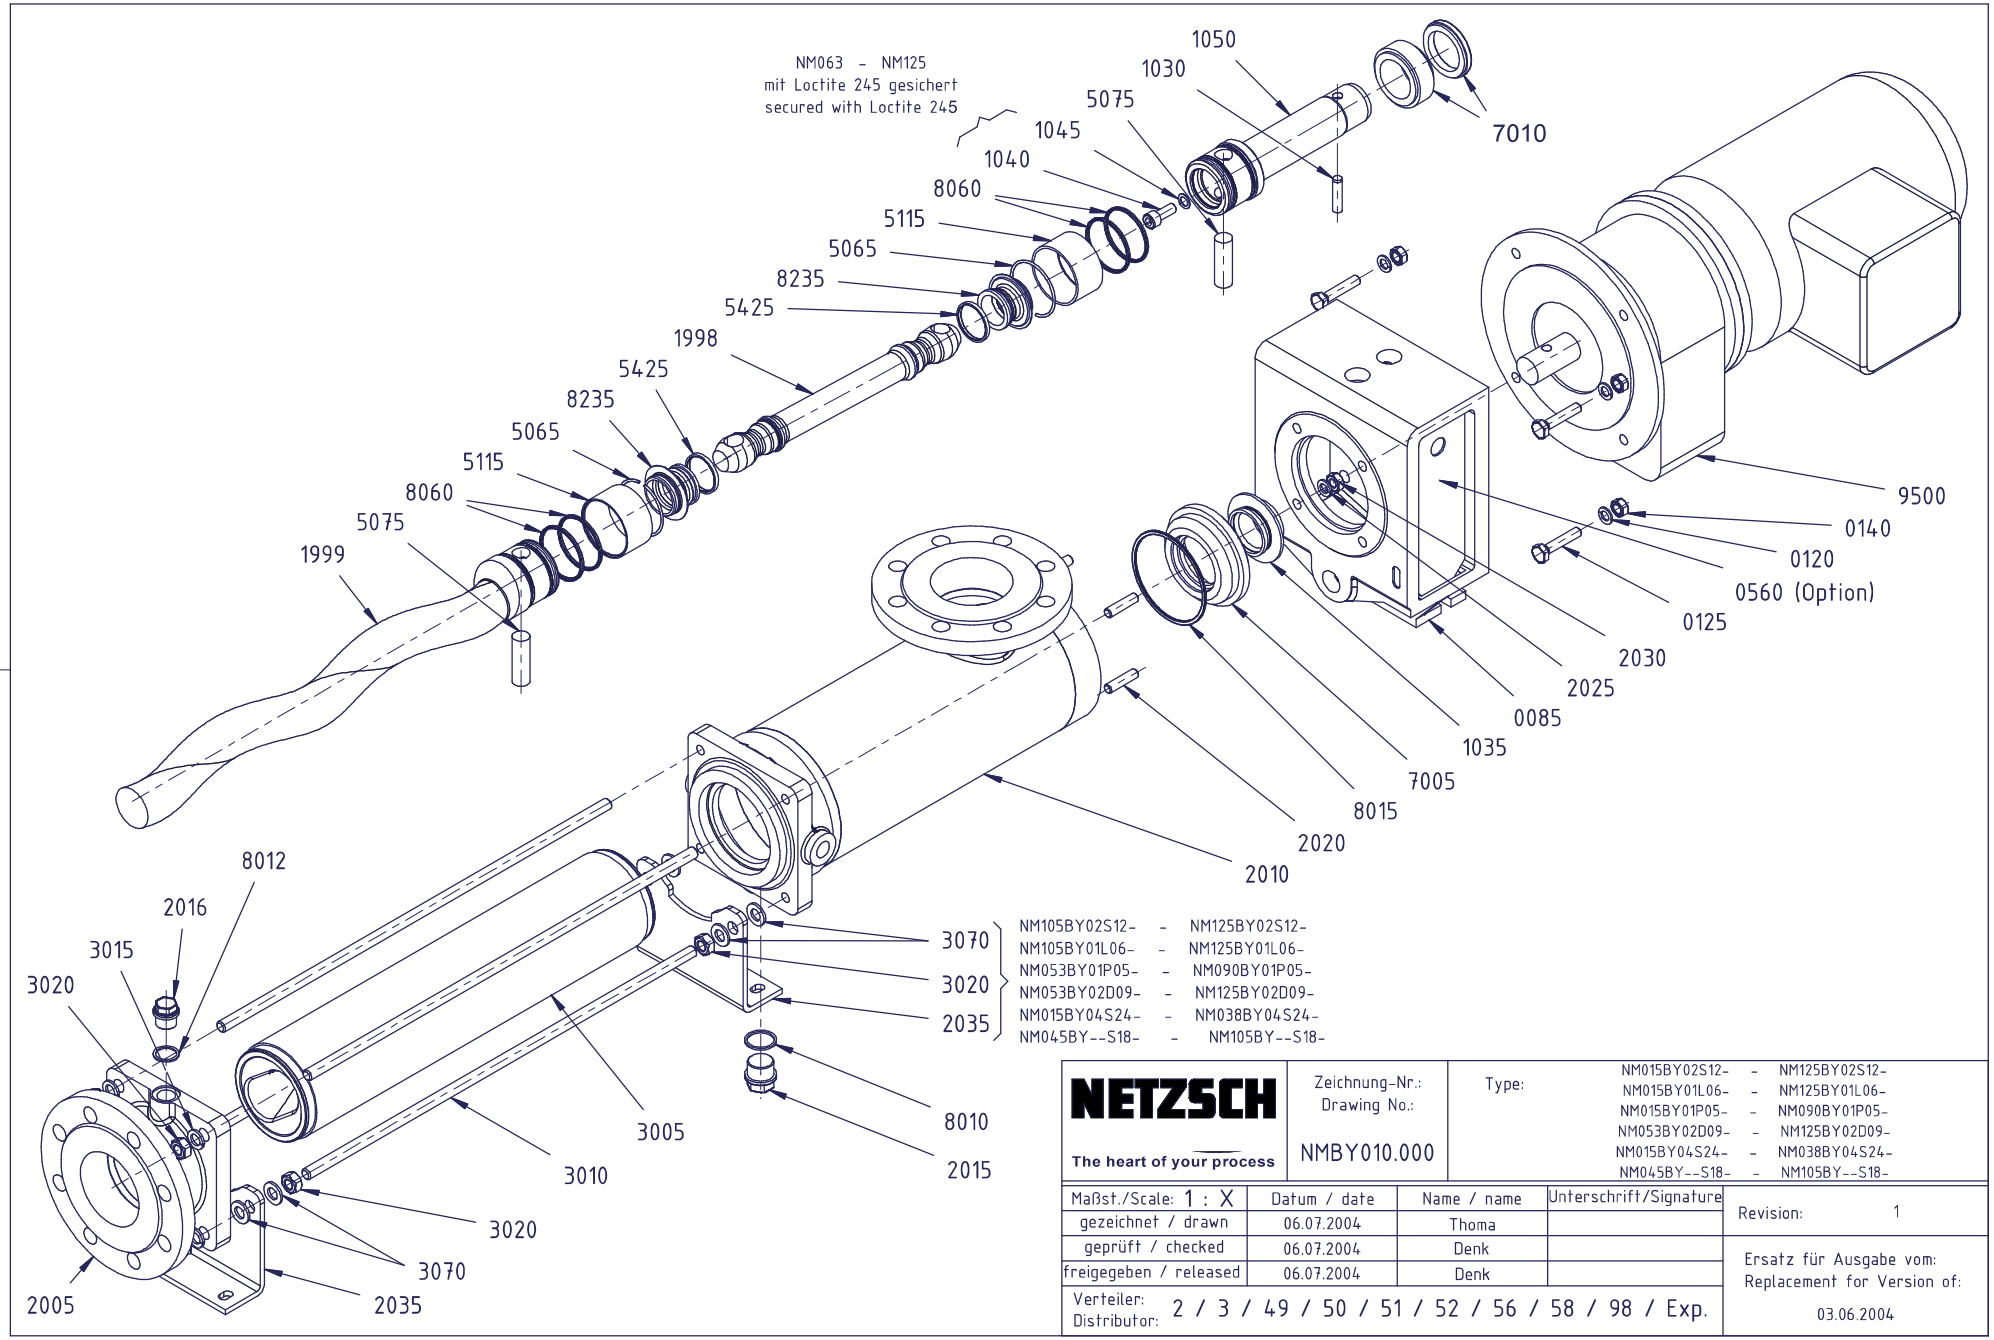
14 Recommended Spare Parts

In general, we have all spare parts in stock. Our subsidiaries and exclusive representatives also hold a certain stock. For special cases and when short waiting periods are not acceptable, we recommend to keep an amount of spare parts, corresponding to the pump, in stock on site (please see table below).

- **Rotor**
- **Stator**
- **Elastomer parts as O-rings and sleeves**
- **joint parts**
- **shaft seals.**

To avoid mistakes in delivery, please identify the parts by their position number shown in the spare parts list or on the sectional drawing.

For placing a spare parts order, it is absolutely necessary to give the following details:



Pieces (see column 2) - Designation (see column 3) - Identification Number (see column 4)

The column details are taken from the spare parts list. See example.

Example:

SPARE PARTS LIST		10.05.94		10:50:18	Page: 1 / 5
1		2		3	4
PART EURO	POS.	Quantity	Unit	Designation Size – Norm – Material/Surface	Ident-Number
3410	0005	1,000	pc	bearing housing	850221
2910	0010	1,000	pc	distance sleeve	850220
3520	0015	1,000	pc	bearing cover	850222

DATA SHEET

Three Phase Induction Motor - Squirrel Cage

Customer	:

Product line	: NEMA Premium Efficiency Three-Phase	Product code :	14337968

Frame	: 143/5TC	Cooling method	: IC411 - TEFC
Insulation class	: F	Mounting	: F-1
Duty cycle	: Cont.(S1)	Rotation¹	: Both (CW and CCW)
Ambient temperature	: -20°C to +40°C	Starting method	: Direct On Line
Altitude	: 1000 m.a.s.l.	Approx. weight³	: 31.5 kg
Protection degree	: IP55	Moment of inertia (J)	: 0.0041 kgm²
Design	: B		

Output [HP]		1
Poles		4
Frequency [Hz]		60
Rated voltage [V]		575
Rated current [A]		1.14
L. R. Amperes [A]		9.84
LRC [A]		8.6x(Code M)
No load current [A]		0.748
Rated speed [RPM]		1760
Slip [%]		2.22
Rated torque [kgfm]		0.414
Locked rotor torque [%]		290
Breakdown torque [%]		370
Service factor		1.15
Temperature rise		80 K
Locked rotor time		32s (cold) 18s (hot)
Noise level²		51.0 dB(A)
Efficiency (%)	25%	
	50%	80.0
	75%	82.5
	100%	85.5
Power Factor	25%	
	50%	0.57
	75%	0.70
	100%	0.77

		Drive end	Non drive end
Bearing type	:	6205 2RS	6204 2RS
Sealing	:	Oil Seal	Lip Seal
Lubrication interval	:	-	-
Lubricant amount	:	-	-
Lubricant type	:	Mobil Polyrex EM	

Foundation loads

Max. traction : 27 kgf

Max. compression : 59 kgf

Notes

This revision replaces and cancel the previous one, which must be eliminated.
(1) Looking the motor from the shaft end.
(2) Measured at 1m and with tolerance of +3dB(A).
(3) Approximate weight subject to changes after manufacturing process.
(4) At 100% of full load.

These are average values based on tests with sinusoidal power supply, subject to the tolerances stipulated in NEMA MG-1.

MOTORS AND DRIVES

INSTALLATION AND MAINTENANCE INSTRUCTIONS FOR ELECTRIC MOTORS

Frames 143/5T - 586/7T

QUALITY SYSTEM ISO9001 WEG MOTORES

ISO 9001

READ CAREFULLY THIS MANUAL BEFORE INSTALLING THE MOTOR.

RECEIVING CHECK

✓ Check if any damage has occured during transportation.
✓ Check nameplate data.
✓ Remove shaft locking device (if any) before operating the motor.
✓ Turn the shaft with the hand to make sure if it is turning freely.

HANDLING AND TRANSPORTATION

1 - General

MOTORS MUST NOT BE LIFTED BY THE SHAFT, BUT BY THE EYE BOLTS WHICH ARE PROPERLY DESIGNED TO SUPPORT THE MOTOR WEIGHT.

Lifting devices, when supplied, are designed only to support the motor. If the motor has two lifting devices then a double chain must be used to lift it.

Lifting and lowering must be done gently without any shocks, otherwise the bearings can get damaged.

DURING TRANSPORTATION, MOTORS FITTED WITH ROLLER OR ANGULAR CONTACT BEARINGS ARE PROTECTED AGAINST BEARING DAMAGES WITH A SHAFT LOCKING DEVICE.

THIS LOCKING DEVICE MUST BE USED ON ANY FURTHER TRANSPORT OF THE MOTOR, EVEN WHEN THIS MEANS TO UNCOPULE THE MOTOR FROM THE DRIVEN MACHINE.

STORAGE

If motors are not immediately installed, they must be stored in dry places, free of dust, vibrations, gases, corrosive smokes, under constant temperature and in normal position free from other objects.

In case the motors are stored for more than two years, the bearings must be changed or the lubrication grease must be totally replaced after cleaning.

Single phase motors when kept in stock for 2 years or more must have their capacitors replaced (if any).

We recommend to turn the shaft (by hands) at least once a month, and to measure the insulation resistance before installing it, in cases of motors stored for more than 6 months or when subject to high humidity areas.

If motor is fitted with space heaters, these should be switched on.

Insulation Resistance Check

Measure the insulation resistance before operating the motor and/or when there is any sign of humidity in the winding.

The resistance measured at 25°C (77°F) must be:

Ri > (20 x U) / (1000 + 2P) [Mohm] (measured with a MEGGER at 500 V d.c.); where U = voltage (V); P = power (kW).

If the insulation resistance is less than 2 megaohms, the winding must be dried according to the following:
✓ Warm it up inside an oven at a minimum temperature of 80°C (176°F) increasing 5°C (41°F) every hour until 105°C (221°F), remaining under this temperature for at least one hour. Check if the stator insulation resistance remains constant within the accepted values. If not, stator must be reimpregnated.

INSTALLATION

1 - Safety

All personnel involved with electrical installations, either handling, lifting, operation or maintenance must be well informed and up-to-dated concerning the safety standard and principles that govern the work and carefully follow them.

We strongly recommend that these jobs are carried out by qualified personnel.

MAKE SURE THAT THE ELECTRIC MOTORS ARE SWITCHED OFF BEFORE STARTING ANY MAINTENANCE SERVICE.

Motors must be protected against accidental starts.

When performing any maintenance service, disconnect the motor from the power supply. Make sure all accessories have been switched off and disconnected.

Do not change the regulation of the protecting devices to avoid damaging.

LEAD CONNECTION IN SULATION INSIDE THE TERMINAL BOX MUST BE DONE WITH AN INSULATING MATERIAL COMPATIBLE WITH MOTOR THERMAL CLASS WHICH IS SHOWN ON THE MOTOR NAMEPLATE.

2 - Operating Conditions

Electric motors, in general, are designed for operation at an altitude of 1000m above sea level for an ambient temperature between 25°C (77°F) and 40°C (104°F). Any variation is stated on the nameplate.

COMPARE THE CURRENT, VOLTAGE, FREQUENCY, SPEED, OUTPUT AND OTHER VALUES DEMANDED BY THE APPLICATION WITH THE DATA GIVEN ON THE NAMEPLATE.

Motors supplied for hazardous locations must be installed in areas that comply with that specified on the motor nameplate.

KEEP AIR INLET AND OUTLET FREE AND CLEAN. THE AIR BLOWN OUT BY THE MOTOR SHALL NOT ENTER AGAIN. THE DISTANCE BETWEEN THE AIR INLET AND THE WALL MUST BE AROUND ¼ OF THE INLET OPENING DIAMETER.

3 - Foundation

Motors provided with feet must be installed on though foundations to avoid excessive vibrations.

The purchaser is fully responsible for the foundation.

Metal parts must be painted to avoid corrosion.

The foundation must be uniform and sufficiently tough to support any short circuit strengths. It must be designed in such a way to stop any vibration originated from resonance.

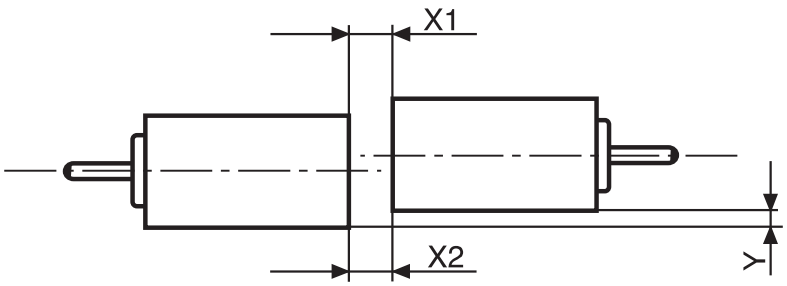
4 - Drain Holes

Make sure the drains are placed in the lower part of the motor when the mounting configuration differs from that specified on the motor purchase order.

5 - Balancing

WEG MOTORS ARE DYNAMICALLY BALANCED, WITH HALF KEY AT NO LOAD AND UNCOUPLED.

Transmission elements such as pulleys, couplings, etc must be dynamically balanced with half key before installation. Use always appropriate tools for installation and removal.



6 - Alignment

ALIGN THE SHAFT ENDS AND USE FLEXIBLE COUPLING, WHENEVER POSSIBLE.

Ensure that the motor mounting devices do not allow modifications on the alignment and further damages to the bearings.

When assembling a half-coupling, be sure to use suitable equipment and tools to protect the bearings.

Suitable assembly of half-coupling: check that clearance Y is less than 0.05mm and that the difference X1 to X2 is less than 0.05m as well.

Note: The "X" dimension must be at least 3mm.

7 - Belt Drive

When using pulley or belt coupling the following must be observed:
✓ Belts must be tighten just enough to avoid slippage when running, according to the specifications stated on the belt supplier recommendation.

WARNING:
Excessive tension on the pulleys will damage the bearings and lead to a probable shaft rupture.

8 - Connection

WARNING: Voltage may be connected at standstill inside the terminal box for heating elements or direct winding heating.

WARNING: The capacitor on single-phase motors can retain a charge which appears across the motor terminals, even when the motor has reached standstill.

A WRONG CONNECTION CAN BURN THE MOTOR.

Voltage and connection are indicated on the nameplate. The acceptable voltage variation is ± 10%, the acceptable frequency variation is ± 5% and the total acceptable variation is ± 10%.

9 - Starting Methods

The motor is rather started through direct starting. All Weg motors must be connected as shown on the motor nameplate, failure to follow the motor nameplate could lead to motor failure.

In case this is not possible, use compatible methods to the motor load and voltage.

✓ 3 lead single voltage and 9 lead dual voltage motors can be started as follows:
Full Voltage Direct On Line.
Auto-Transformer Starting.
Electronic Soft-Starting.
VFD Starting - subject to verification and application analysis.

✓ 6 lead single voltage motors and 12 lead dual voltage motors can be connected as follows:
Full Voltage Direct On Line.
WYE/DELTA Starting.
Auto-Transformer Starting.
Electronic Soft-Starting.
VFD Starting - subject to verification and application analysis.

The rotation direction is clockwise if the motor is viewed from DE side and if the phases are connected according to the sequence L1, L2, L3.

To change the rotation direction, interchange two of the connecting leads.

THE CONNECTION TO THE POWER SUPPLY MUST BE DONE BY QUALIFIED PERSONNEL AND WITH FULL ATTENTION TO ASSURE A SAFE AND PERMANENT CONNECTION. AFTER CONNECTING THE MOTOR, CHECK FOR ANY STRANGE BODY INSIDE THE TERMINAL BOX. THE CABLE INLETS NOT IN USE MUST BE CLOSED.

Make sure to use the correct cable dimension, based on the rated current stamped on the motor nameplate.

BEFORE ENERGIZING THE TERMINALS, CHECK IF THE EARTHING IS MADE ACCORDING TO THE ACTUAL STANDARDS. THIS IS ESSENTIAL AGAINST ACCIDENT RISKS.

When the motor is supplied with protective or monitor temperature device such as thermostats, thermistors, thermal protector, etc, connect their terminals to the corresponding devices on the control panel.

10- Start-Up

THE KEY MUST BE FASTENED OR REMOVED BEFORE STARTING THE MOTOR.

a) The motor must start and operate smoothly. In case this does not occur, turn it off and check the connections and the mounting before starting it again.

b) If there is excessive vibration, check if the fastening screws are correctly fastened. Check also if the vibration comes from a neighbour machine. Periodical vibration checks must be done.

c) Run the motor under rated load for a short period of time and compare if the running current is equal to that stamped on the nameplate.

MAINTENANCE

WARNING:
SAFETY CHECK LIST.

1 - General Inspection

- ✓ Check the motor periodically.
- ✓ Keep the motor clean and assure free air flow.
- ✓ Check the seals or V Ring and replace them, if required.
- ✓ Check the connections as well as supporting screws.
- ✓ Check the bearings and observe:
  Any excessive noise, bearing temperature and grease condition.
- ✓ When a changing, under normal conditions, is detected, check the motor and replace the required parts.
  The frequency of the inspections depends on the motor type and on the application conditions.

LUBRICATION

FOLLOW THE REGREASING INTERVALS. THIS IS FUNDAMENTAL FOR PROPER MOTOR OPERATION.

1 - Machines without Grease Nipples

In these cases the regreasing shall be done at the preventive maintenance job observing the following aspects:

✓ Disassemble carefully the motors.
✓ Take all the grease out.
✓ Wash the bearing with querosene or diesel.
✓ Regrease the bearing immediately.

2 - Machines Fitted with Grease Nipples

It is strongly recommended to grease the machine while running. This allows the grease renewal in the bearing housing. When this is not possible due to turning parts by the grease device (pulleys, bushing, etc) that offer some risk to the physical integrity of the operator, proceed as follows:

✓ Clean the area near to the grease nipple.
✓ Put approximately half of the total grease and run the motor for 1 minute at full speed. Then turn off the motor and pump the rest of the grease.
✓ The injection of all the grease with the motor in standstill can make the grease penetrate into the motor, through the inner seal of the bearing housing.

When regreasing, use only special bearing grease with the following properties:

RELUBRICATION INTERVALS RECOMMENDED - POLYREX® EM GREASE (ESSO/EXXON)

Frame	Amount of grease (g)	3600 rpm	3000 rpm	1800 rpm	1500 rpm	1200 rpm	1000 rpm	900 rpm	750 rpm	720 rpm	600 rpm	500 rpm

WARNING:

The table above is specifically intended for relubrication with Polyrex® EM grease and bearing absolute operating temperature of:

✓ 70°C (158°F) for 254/6T to 324/6T frame motors;
✓ 85°C (185°F) for 364/5T to 586/7T frame motors.

For every 15°C (59°F) above these limits, relubrication interval must be reduced by half.

Shielded bearing (ZZ) are lubricated for bering's life as long as they operate under normal ambient conditions and temperature of 70°C(158°F).

WE RECOMMEND TO USE BALL BEARINGS FOR MOTORS DIRECTLY COUPLED TO THE LOAD.

WARNING:
EXCESS OF GREASE CAN CAUSE BEARING OVERHEATING RESULTING IN COMPLETE DAMAGE.

Compatibility of Polyrex® EM grease with other types of grease:

Containing polyurea thickener and mineral oil, the Polyrex® EM grease is compatible with other types of grease that contain:

- ✓ Lithium base or complex of lithium or polyurea and highly refined mineral oil;
- ✓ Inhibitor additive against corrosion, rust and anti-oxidant additive.

Notes:

- ✓ Although Polyrex® EM is compatible with the types of grease given above, we do no recommend to mix it with any other greases.
- ✓ If you intend to use a type of grease different than those recommended above, first contact WEG.
- ✓ On applications (with high or low temperatures, speed variation, etc), the type of grease and relubrication interval are given on an additicional nameplate attached to the motor.
- ✓ Vertical mounted motors must have the relubrication intervals reduced by half.

THE USE OF STANDARD MOTORS IN SPECIFIC AREAS OR SPECIAL APPLICATIONS MUST BE DONE BY CONSULT TO THE GREASE MANUFACTURER OR WEG.

ASSEMBLY AND DISASSEMBLY

Disassembly and assembly must be done by qualified personnel using only suitable tools and appropriated methods. The stator grips must be applied over the side face of the inner ring to be disassembled or over and adjacent part.

It is essential that the bearings disassembly and assembly be done under cleanning conditions to ensure good operation

and to avoid damages. New bearings shall only be taken out from their cases when assembling them.

Before installing a new bearing it is required to check the shaft fitting for any sharp edge or strike signals.

For bearing assembly, warm their inner parts with suitable equipment - inductive process - or use suitable tools.

SPARE PARTS

When ordering spare parts, please specify the full type designation and product code as stated on the motor nameplate.

Please also inform the motor serial number stated on the nameplate.

MOTORS FOR HAZARDOUS LOCATIONS

Besides the recommendations given previously, these ones must be also followed:

THE SPECIFICATION OF THE MOTOR INSTALLATION PLACE IS FOR CUSTOMER'S RESPONSIBILITY, WHO WILL ALSO DETERMINE THE ENVIRONMENT CHARACTERISTICS.

Motors for hazardous locations are manufactured according to specific standards for such environments and they are certified by worldwide certifying entities.

1 - Installation

The complete installation must follow procedures given by the local legislation in effect.

THE INSTALLATION OF HAZARDOUS LOCATION MOTORS MUST BE CARRIED OUT BY SKILLED PEOPLE, AND THE THERMAL PROTECTION MUST BE ALWAYS INSTALLED, EITHER INSIDE OR OUTSIDE THE MOTOR, OPERATING AT THE RATED CURRENT.

2 - Maintenance

Maintenance must be carried out by repair shops authorized by WEG.

Repair shops and people without WEG's authorization who will perform any service or hazardous location motors will be fully responsible for such service as well as for any consequential damage.

ANY ELECTRICAL OR MECHANICAL MODIFICATION MADE ON HAZARDOUS LOCATION MOTORS WILL VOID THE CERTIFICATION.

When performing maintenance, installation or relubrication, follow these instructions:

- ✓ Check if all components are free of edges, knocks or dirt.
- ✓ Make sure all parts are in perfect conditions.
- ✓ Lubricate the surfaces of the endshield fittings with protective oil to make the assembly easier.
- ✓ Use only rubber hammer to fit the parts.
- ✓ Check for correct bolts tightening.
- ✓ Use clearance calibrator for correct T-box fitting (smaller than 0.05mm).

DO NOT REUSE DAMAGED OR WORN PARTS. REPLACE THEM BY NEW ONES SUPPLIED BY THE FACTORY.

MOTORS DRIVEN BY VFD

Applications using VFD´s without filter can affect motor performance as follows:

- ✓ Lower efficiency.
- ✓ Higher vibration.
- ✓ Higher noise level.
- ✓ Higher rated current.
- ✓ Higher temperature rise.
- ✓ Reduced motor insulation.
- ✓ Reduced bearing life.

1 - Standard Motors

- ✓ Voltages lower than 440V do not require filter.
- ✓ Voltages equal or higher than 440V or lower than 575V require filter for motor power supply cables longer than 20 meters.
- ✓ Voltages equal or higher than 575V require filter for any size of power supply cables.

IF SUCH RECOMMENDATIONS ARE NOT FOLLOWED ACCORDINGLY, MOTOR WARRANTY WILL BE VOID.

2 - Inverter Duty Motors

- ✓ Check power supply voltage of the forced cooling set.
- ✓ Filters are not required.

WARRANTY TERMS
SERIES AND ENGINEERING PRODUCTS

WEG warrants its products against defects in workmanship and materials for 18 months from the invoice date issued by the factory, authorized distributor or agent limited to 24 months from manufacturing date independent of installation date as long as the following items are fulfilled accordingly:
- Proper transportation, handling and storage;
- Correct installation based on the specified ambient conditions and free of corrosive gases;
- Operation under motor capacity limits;
- Observation of the periodical maintenance services;
- Repair and/or replacement effected only by personnel duly authorized in writing by WEG;
- The failed product be available to the supplier and/or repair shop for a required period to detect the cause of the failure and corresponding repair;
- Immediate notice by the purchaser about failures occured and that these are accepted by WEG as manufacturing defects.

This warranty does not include disassembly services at the urchaser facilities, transportation costs with product, tickets, accomodation and meals for technical personnel when requested by the customer. The warranty service will be only carried out at WEG Authorized Repair Shops or at WEG´s facilities.

Components whose useful life, under normal use, is shorter than the warranty period are not covered by these warranty terms.

The repair and/or replacement of parts or components, when effected by WEG and/or any WEG Authorized Repair Shop, will not give warranty extension.

This constitutes WEG´s only warranty in connection with this sale and the company will have no obligation or liability whatsoever to people, third parties, other equipment or installations, including without limitation, any claims for consequential damages or labor costs.

CE CRN cULus LISTED EAC EC 1935/2004 IO-Link UKCA

Product characteristics			
Number of inputs and outputs		Number of digital outputs: 2; Number of analog outputs: 1	
Measuring range		1.5...396 gph	0.03...6.6 gpm
Process connection		threaded connection 1/2" NPT DN15	
Application			
System		gold-plated contacts	
Application		Totalizer function; for industrial applications	
Media		Conductive liquids; water; water-based media	
Note on media		conductivity: ≥ 20 µS/cm	
		viscosity: < 70 mm²/s (40 °C)	
Medium temperature	[°F]	14...158	
Pressure rating	[bar]	16	
Pressure rating	[psi]	232	
MAWP (for applications according to CRN)	[bar]	17.7	
Electrical data			
Operating voltage	[V]	18...30 DC; (according to EN 50178 SELV/PELV)	
Current consumption	[mA]	95; (24 V)	
Min. insulation resistance	[MΩ]	100; (500 V DC)	
Protection class		III	
Reverse polarity protection		yes	
Power-on delay time	[s]	5	
Inputs / outputs			
Number of inputs and outputs		Number of digital outputs: 2; Number of analog outputs: 1	
Inputs			
Inputs		counter reset	

SM6601

Magnetic-inductive flow meter

SMN12GGXFRKG/US-100

Outputs			
Total number of outputs		2	
Output signal		switching signal; analog signal; pulse signal; IO-Link; (configurable)	
Electrical design		PNP/NPN	
Number of digital outputs		2	
Output function		normally open / closed; (configurable)	
Max. voltage drop switching output DC	[V]	2	
Permanent current rating of switching output DC	[mA]	200	
Number of analog outputs		1	
Analog current output	[mA]	4...20; (scalable)	
Max. load	[Ω]	500	
Analog voltage output	[V]	0...10; (scalable)	
Min. load resistance	[Ω]	2000	
Pulse output		flow rate meter	
Short-circuit protection		yes	
Type of short-circuit protection		yes (non-latching)	
Overload protection		yes	
Measuring/setting range			
Measuring range		1.5...396 gph	0.03...6.6 gpm
Display range		-475.5...475.5 gph	-7.925...7.925 gpm
Resolution		0.5 gph	0.01 gpm
Set point SP		3.5...396.5 gph	0.06...6.6 gpm
Reset point rP		1.5...394 gph	0.03...6.57 gpm
Analog start point ASP		0...318 gph	0...5.3 gpm
Analog end point AEP		78...396 gph	1.3...6.6 gpm
In steps of		0.5 gph	0.01 gpm
Volumetric flow quantity monitoring			
Pulse value		0.01...30 000 000 gal	
Pulse length	[s]	0,01...2	
Temperature monitoring			
Measuring range	[°F]	-4...176	
Resolution	[°F]	0.1	
Set point SP	[°F]	-2.5...176	
Reset point rP	[°F]	-3.5...175	
Analog start point	[°F]	-4...140.5	
Analog end point	[°F]	31.5...176	
In steps of	[°F]	0.5	
Accuracy / deviations			
Flow monitoring			
Accuracy (in the measuring range)		± (0,8 % MW + 0,5 % MEW)	
Repeatability		± 0,2% MEW	

SM6601

Magnetic-inductive flow meter

SMN12GGXFRKG/US-100

Temperature monitoring			
Accuracy	[K]	± 2,5 (Q > 0,26 gpm)	
Reaction times			
Flow monitoring			
Response time	[s]	0.15; (dAP = 0, T19)	
Delay time programmable dS, dr	[s]	0...50	
Damping for the switching output dAP	[s]	0...5	
Temperature monitoring			
Dynamic response T05 / T09	[s]	T09 = 20 (Q > 0,26 gpm)	
Software / programming			
Parameter setting options		Flow monitoring; quantity meter; Preset counter; Temperature monitoring; hysteresis / window; normally open / closed; switching logic; current/ voltage/pulse output; Start-up delay; display can be deactivated; Display unit	
Interfaces			
Communication interface		IO-Link	
Transmission type		COM2 (38,4 kBaud)	
IO-Link revision		1.1	
SDCI standard		IEC 61131-9	
Profiles		Smart Sensor: Process Data Variable; Device Identification, Device Diagnosis	
SIO mode		yes	
Required master port class		A	
Process data analog		3	
Process data binary		2	
Min. process cycle time	[ms]	5	
Supported DeviceIDs		Type of operation	DeviceID
		default	570
Operating conditions			
Ambient temperature	[°F]	14...140	
Storage temperature	[°F]	-13...176	
Protection		IP 67	
Tests / approvals			
EMC		DIN EN 60947-5-9	
Shock resistance		DIN EN 68000-2-27	20 g (11 ms)
Vibration resistance		DIN EN 60068-2-6	5 g (10...2000 Hz)
MTTF	[years]	145	
Pressure equipment directive		sound engineering practice; can be used for group 2 fluids; group 1 fluids on request	
Mechanical data			
Weight	[g]	593.5	
Material		stainless steel (1.4404 / 316L); PBT-GF20; PC; FKM; TPE	
Materials (wetted parts)		stainless steel (1.4404 / 316L); PEEK; FKM	
Process connection		threaded connection 1/2" NPT DN15	

SM6601

Magnetic-inductive flow meter

SMN12GGXFRKG/US-100

Displays / operating elements

Display	Display unit	6 x LED, green (gpm, gph, gal, °F, 10^3, 1000 x 10^3)
	Switching status	2 x LED, yellow
	Measured values	alphanumeric display, 4-digit
	Programming	alphanumeric display, 4-digit

Remarks

Remarks	MW = Measured value
	MEW = Final value of the measuring range
Pack quantity	1 pcs.

Electrical connection

Connector: 1 x M12; Contacts: gold-plated

Service Request Type: BPV-Fitting Registration
Service Request No.: 2079952
Your Reference No.:
Registered to: IFM PROVER GMBH

Dear KARL KLINGER,

Technical Standards and Safety Authority (TSSA) is pleased to inform you that your submission has been reviewed and registered as follows:

CRN No.: 0F20267.5

Main Design No.: SCOPE OF REGISTRATION - IFM SENSORS
Expiry Date: 18-Apr-2028

Please be advised that a valid quality control system must be maintained for the fitting registration to remain valid until the expiry date.

The stamped copy of the approved registration and the invoice are mailed separately. Should you have any questions or require further assistance, please contact a Customer Service Advisor at 1.877.682.TSSA (8772) or e-mail customerservices@tssa.org. We will be happy to assist you. When contacting TSSA regarding this file, please refer to the Service Request number provided above

Yours truly,

Liliana Constantinescu
Tel. : 416-734-3425

NOTE: You cannot save the DATA you entered on this form, you must print a copy and FAX it or MAIL it!

STATUTORY DECLARATION
Registration of Fittings

I, Karl Klinger, Director of Marketing
(Name and Position, e.g. President, Plant Manager, Chief Engineer)

of ifm efector, inc.
(Name of Manufacturer)

Located at 1100 Atwater Drive, Malvern, PA 19355 610-524-2000 610-524-2800
(Plant Address) *(Telephone No.)* *(Fax No.)*

☐ do solemnly declare that the fittings listed hereunder, which are subject to the ***Technical Standards and Safety Act***, Boilers and Pressure Vessels Regulation, comply with all of the requirements of

(Title of recognized North American Standard)

which specifies the dimensions, materials of construction, pressure/temperature ratings, identification marking the fittings and service;

☑ or are not covered by the provisions of a recognized North American standard and are therefore manufactured to comply with ASME B31.3 2012 ED. as supported by the attached data which identifies the dimensions, material of construction, pressure/temperature ratings and the basis for such ratings, the marking of the fitting for identification and service.

I further declare that the manufacture of these fittings is controlled by a quality system meeting the requirements of ISO 9001:2008 which has been verified by the following authority, DQS GmbH.

The items covered by this declaration, for which I seek registration, are category F type fittings. In support of this application, the following information and/or test data are attached as follows:

Test reports and drawings for sensor families LM (level), PG, PI & PM (pressure) and SA, SB, SI, SM & SV (flow)
(drawings, calculations, test reports, etc.)

Declared before me at 1100 Atwater Dr **in the** State **of** PA

the 4th **day of** May **AD 20** 17.

COMMONWEALTH OF PENNSYLVANIA
NOTARIAL SEAL
Maureen G. Marabella, Notary Public

Maureen G Marabella
(Signature)

K. Klinger
(Signature of Declarer)

FOR OFFICE USE ONLY

To the best of my knowledge and belief, the application meets the requirements of the ***Technical Standards and Safety Act***, Boilers and Pressure Vessels Regulation, and CSA Standard B51 and is accepted for registration in Category F.

CRN: OF 20267.5

Registered by:

1 Preliminary note

▶ Instructions

> Reaction, result

[…] Designation of keys, buttons or indications

→ Cross-reference

Important note
Non-compliance may result in malfunction or interference.

Information
Supplementary note.

⚠ CAUTION

Warning of personal injury.
Slight reversible injuries may result.

2 Safety instructions

- Read this document before setting up the product and keep it during the entire service life.
- The product must be suitable for the corresponding applications and environmental conditions without any restrictions.
- Only use the product for its intended purpose (→ 3 Functions and features).
- Only use the product for permissible media (→ Technical data).
- If the operating instructions or the technical data are not adhered to, personal injury and/or damage to property may occur.
- The manufacturer assumes no liability or warranty for any consequences caused by tampering with the product or incorrect use by the operator.
- Installation, electrical connection, set-up, operation and maintenance of the unit must be carried out by qualified personnel authorised by the machine operator.
- Protect units and cables against damage.
- For medium temperatures above 50 °C (122 °F) some parts of the housing can heat up to over 65 °C (149 °F). Moreover, during installation or in case of a fault (e.g. housing damage) media under high pressure or hot media can leak from the system. To avoid personal injury, take the following measures:

- ▶ Install the units according to the applicable rules and regulations.
- ▶ Ensure that the system is free of pressure during installation.
- ▶ Protect the housing against contact with flammable substances and unintentional contact. To do so, equip the units with suitable protection (e.g. protective cover).
- ▶ Do not press the pushbuttons manually. instead use another object (e.g. ballpoint pen).

3 Functions and features

The unit monitors liquid media. It detects the 3 process categories volumetric flow, consumed quantity, medium temperature.

Pressure Equipment Directive (PED)

The units comply with the Pressure Equipment Directive and are designed and manufactured for group 2 fluids in accordance with the sound engineering practice. Use of group 1 fluids on request.

Application area

Conductive liquids with the following properties:

- Conductivity: ≥ 20 µS/cm
- Viscosity: < 70 mm^2/s at 40 °C; < 70 cSt at 104 °F

4 Function

- The unit detects the flow based on the magnetic-inductive volumetric flow measuring principle.
- The unit also detects the medium temperature.
- It features an IO-Link interface.
- The unit displays the current process value.

4.1 Processing of the measured signals

The unit generates 2 output signals according to the parameter settings:

OUT1/IO-Link: 4 selection options	Parameter setting
- Switching signal for volumetric flow quantity limit	→ 10.2.1
- Pulse signal for quantity meter	→ 10.3.1
- Switching signal for preset counter	→ 10.3.2
- Switching signal for direction of flow	→ 10.2.4

OUT2: 6 selection options	Parameter setting
- Switching signal for volumetric flow quantity limit	→ 10.2.2
- Switching signal for temperature limit	→ 10.4.1
- Analogue signal for volumetric flow quantity	→ 10.2.3
- Analogue signal for temperature	→ 10.4.2
- Switching signal for direction of flow	→ 10.2.4
- Input for external counter reset signal (InD)	→ 10.3.7

4.2 Direction of flow

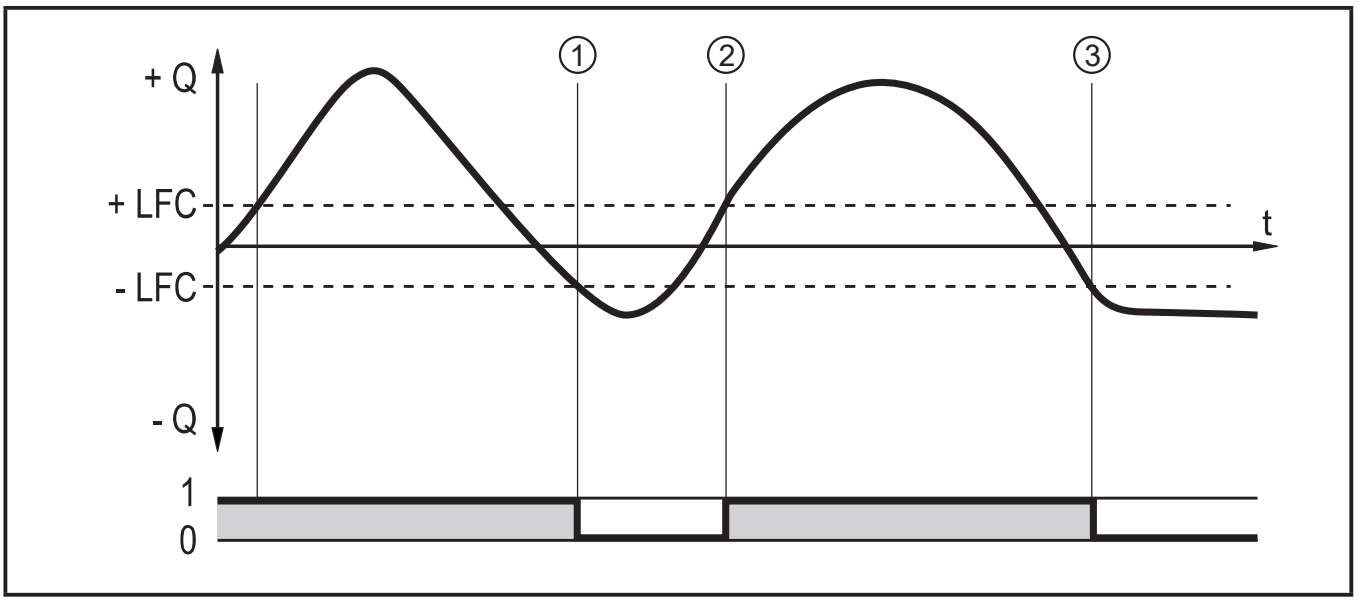
In addition to the flow velocity and the volumetric flow quantity, the unit also detects the direction of flow.

4.2.1 Determination of the direction of flow (Fdir)

An arrow with the text "flow direction" on the unit indicates the positive flow direction. The flow direction can be inversed (→ 10.5.9).

▶ Use the supplied label to mark the changed flow direction (new positive direction of flow).

Flow...	Process value display
corresponds to the marked flow direction	+ (positive)
against the marked flow direction	- (negative)



4.2.2 Detection of the direction of flow (dir.F)

When dir.F is activated (→ 10.2.4), the direction of flow is indicated by a switching signal.

The output is switched on until the set minimum volumetric flow quantity in negative direction of flow (- LFC) is not reached (1).
Afterwards the following applies:

- The output switches ON when + LFC is exceeded (2).
- The output switches OFF when - LFC is not reached (3).

UK

+ Q : Flow in positive direction of flow
- Q : Flow in negative direction of flow
+ LFC: Minimum volumetric flow quantity in positive direction of flow
- LFC : Minimum volumetric flow quantity in negative direction of flow

Positive direction of flow = marked direction of flow,
with the factory setting marked by the arrow on the unit or after change via Fdir marked by the attached label (→ 4.2.1).

4.3 Consumed quantity monitoring (ImP)

The unit has an internal quantity meter (totaliser). It continuously totals the consumed quantity after the last reset. Pulse signals or a switching signal can be used to monitor the consumed quantity.
→ 10.3.1 Quantity monitoring by pulse output (OUT1)
→ 10.3.2 Quantity monitoring by preset counter (OUT1)

4.3.1 Display and counting method of the quantity meter

Meter reading:

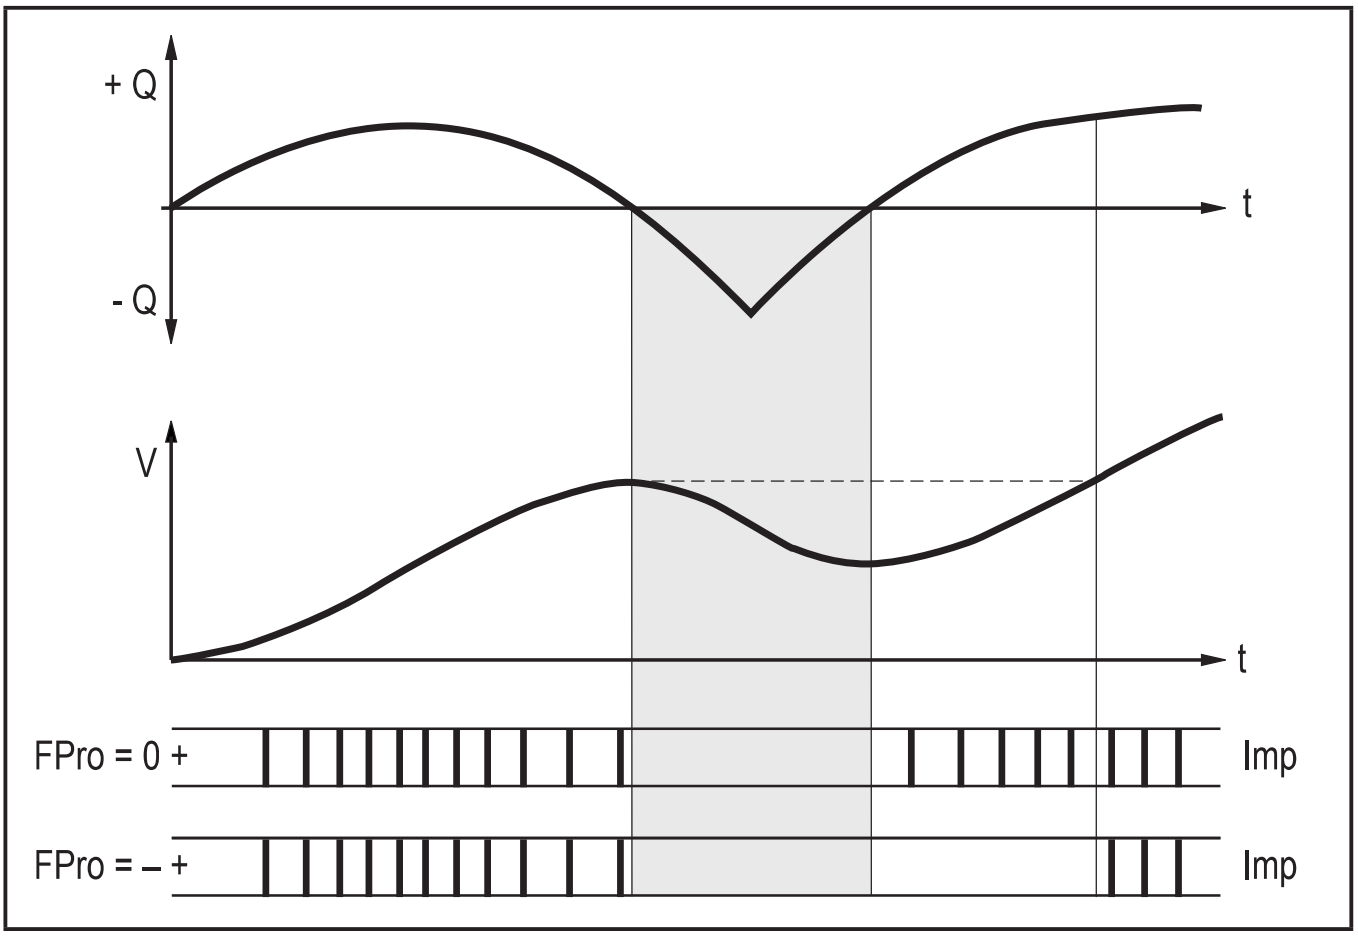
- The current meter count can be indicated (→ 11.2).
- In addition the value before the last reset is saved. This value can also be displayed (→ 11.2).

The meter saves the totalled volumetric flow quantity every 10 minutes. After a power failure this value is available as the current meter reading. If a time-controlled reset is set, the elapsed time of the set reset interval is also saved. So the possible data loss can be maximum 10 minutes.

Counter reset:

- There are different ways to reset the quantity meter.
  → 10.3.4 Manual counter reset
  → 10.3.5 Time-controlled counter reset
  → 10.3.7 Counter reset using an external signal
- If the quantity meter is not reset using one of the above-mentioned processes, an automatic reset will be made when the maximum volumetric flow quantity that can be displayed is exceeded (overflow).

Taking into consideration the direction of flow:



- The quantity meter takes account of the flow direction for totalisation. The following counting methods can be defined via the parameter [FPro] (→ 10.5.8):

[FPro]	Counting method
0+	Negative flow values (against the marked direction of flow) are not taken into consideration for totalling.
– +	Negative flow values are subtracted from the consumed quantity.

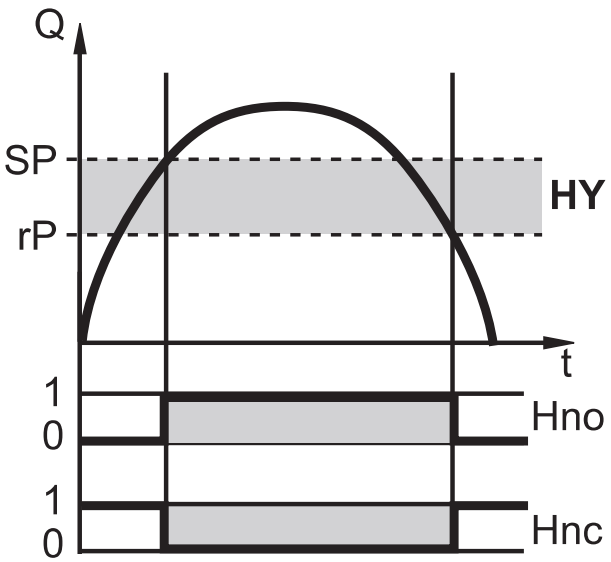
4.3.2 Consumed quantity monitoring via pulse output

Output 1 indicates a pulse signal when the set volumetric flow quantity has been reached (pulse value → 10.3.3).

Depending on the setting of the counting method [FPro] totalling of the volumetric flow quantity takes into account the flow in negative direction of flow (– +) or does not take it into account (0+) → 4.3.1.

+ Q = volumetric flow quantity in positive direction
- Q = volumetric flow quantity in negative direction
V = volumetric flow quantity absolute (= sum of negative and positive flow)

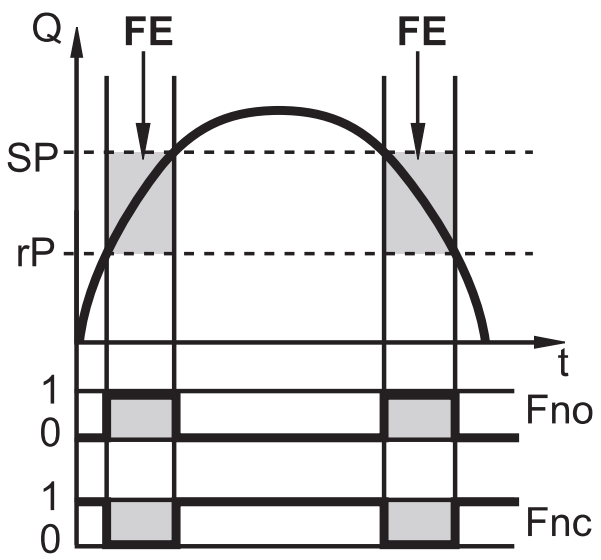
4.3.3 Consumed quantity monitoring via preset counter



2 kinds of monitoring are possible which can be set via the parameter [rTo].

[rTo]	Output	Counter reset
OFF (→ 10.3.6)	OUT1 switches when the volumetric flow quantity set with [ImPS] has been reached.	The preset counter is only reset - when a manual reset is made (→ 10.3.4) or - when the maximum display range has been exceeded.
1, 2,... h 1, 2,... d 1, 2,... w (→ 10.3.5)	OUT1 switches when the volumetric flow quantity set with [ImPS] is reached within the set time.	The preset counter is reset automatically when the time has elapsed and counting starts again.

4.4 Switching function



OUTx changes its switching status if it is above or below the set switching limits (flow or temperature). Hysteresis or window function can be selected. Example of volumetric flow monitoring:

Hysteresis function

SP = set point
rP = reset point
HY = hysteresis
Hno = hysteresis NO (normally open)
Hnc = hysteresis NC (normally closed)

Window function

SP = upper limit
rP = lower limit
FE = window
Fno = window NO (normally open)
Fnc = window NC (normally closed)

When the hysteresis function is set, the set point [SP] is defined first and then the reset point [rP] which must have a lower value. If only the set point is changed, the reset point remains constant.

When set to the window function, the upper limit [SP] and the lower limit [rP] have a fixed hysteresis of 0.5 % of the final value of the measuring range. This keeps the switching status of the output stable if the flow rate varies slightly.

4.5 Analogue function

- The unit provides an analogue signal that is proportional to the volumetric flow quantity and the medium temperature.
- The analogue signal can be provided as current or voltage signal.
- Within the measuring range the analogue signal is 4...20 mA (current output) or 0...10 V (voltage output).
- If the measured value is outside the measuring range or in the event of an internal error, the current or voltage signals indicated in Figure 1 are provided.
- The measuring range is scalable:
  [ASP2] determines at which measured value the output signal is 4 mA or 0 V.
  [AEP2] determines at which measured value the output signal is 20 mA or 10 V.

  Minimum distance between [ASP2] and [AEP2] = 20 % of the final value of the measuring range.

MAW	Initial value of the measuring range	For non-scaled measuring range (= factory setting)
MEW	Final value of the measuring range	
ASP2	Analogue start point	For scaled measuring range
AEP2	Analogue end point	

Table 1: Definitions

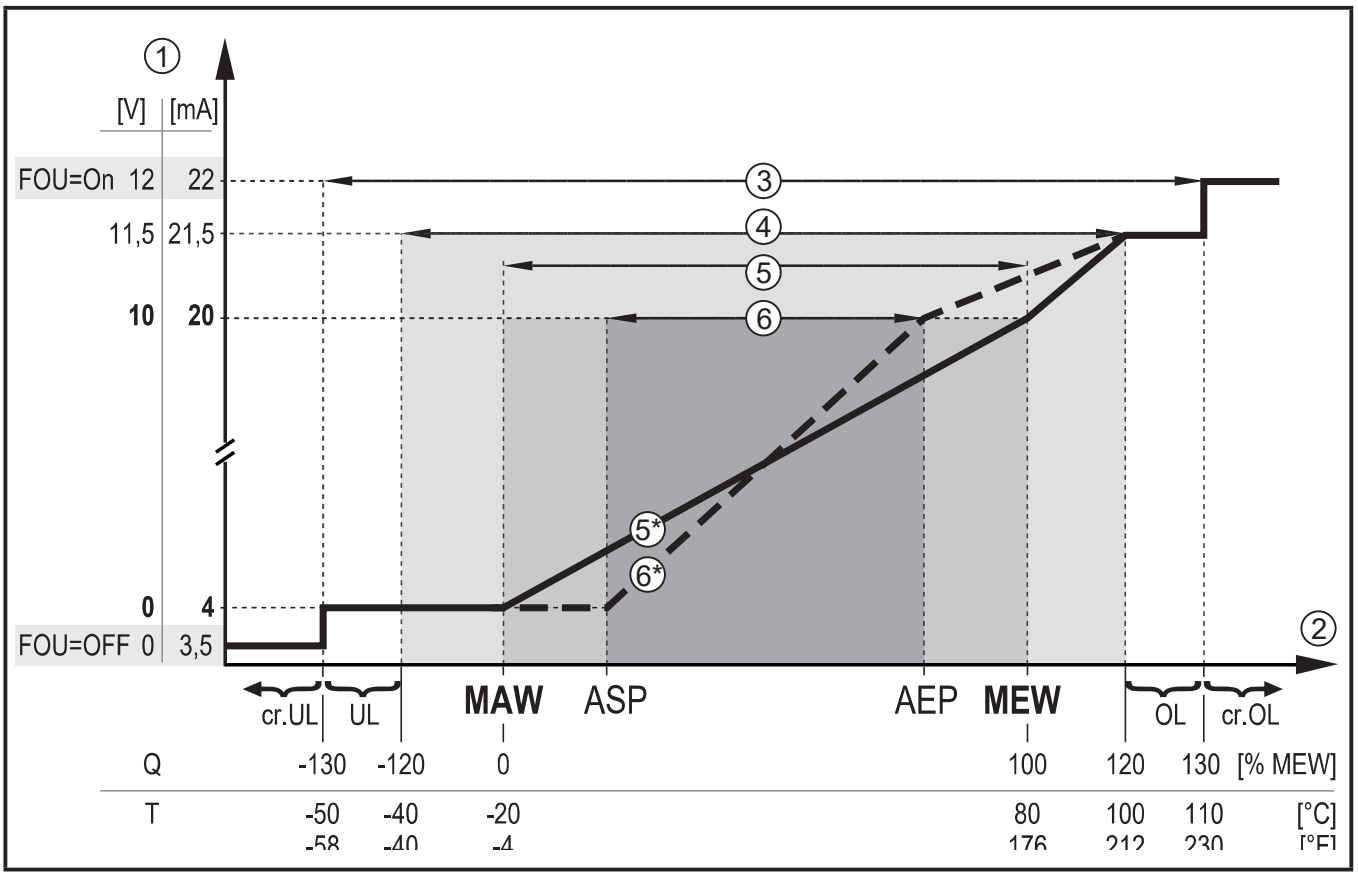


Figure 1: Characteristics of the analogue output according to the standard IEC 60947-5-7.

Q: Flow (a negative flow value means flow against the marked flow direction)
T: Temperature
UL: Below the display range
OL: Above the display range
cr.UL: Below the detection zone (error)
cr.OL: Above the detection zone (error)
FOU=On: Default setting at which the analogue signal goes to the upper final value in case of an error.*
FOU=OFF: Default setting at which the analogue signal goes to the lower final value in case of an error.*

* The type of error is displayed: cr.UL, cr.OL, Err (→ 12).

① Analogue signal (voltage or current)
② Measured value (flow or temperature)
③ Detection zone
④ Display range
⑤ Measuring range
⑤* Analogue signal in the measuring range with factory setting
⑥ Scaled measuring range
⑥* Analogue signal for scaled measuring range

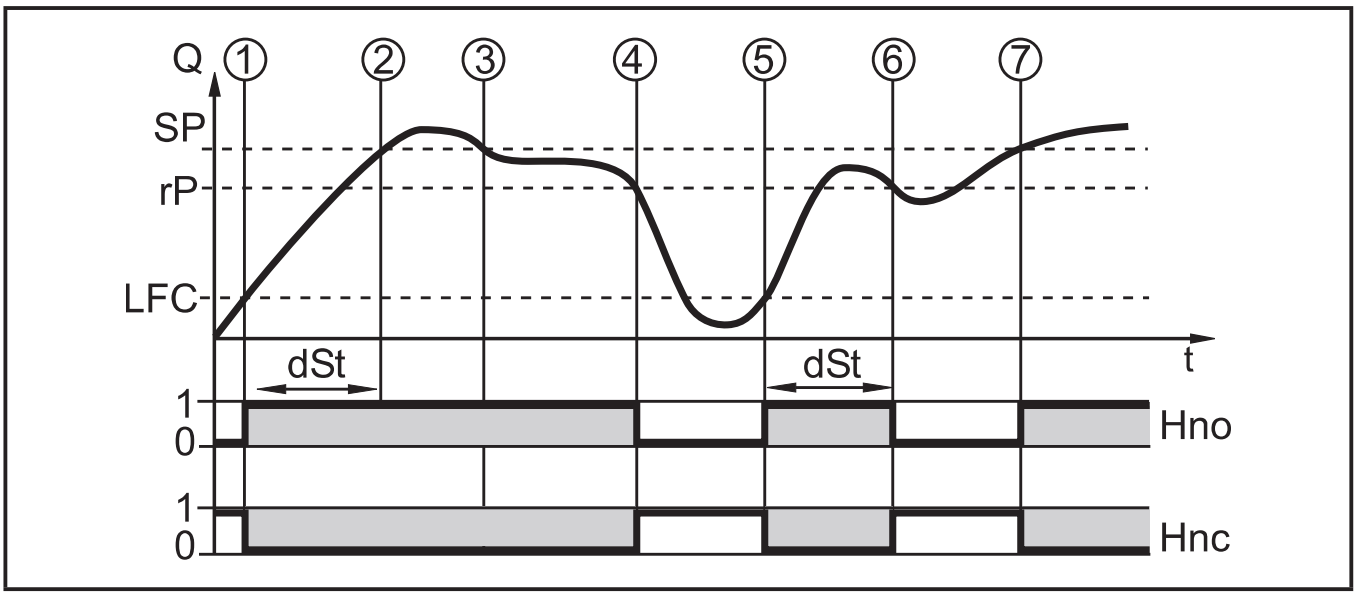
4.6 Measured value damping (dAP)

The damping time allows to set after how many seconds the output signal has reached 63 % of the final value if the flow value changes suddenly. The set damping time stabilises the outputs, the display and the process value transfer via the IO-Link interface. The signals [UL] and [OL] (→ 12 Troubleshooting) are defined under consideration of the damping time.

4.7 Start-up delay (dST)

The start-up delay [dST] influences the switching outputs of the volumetric flow monitoring.

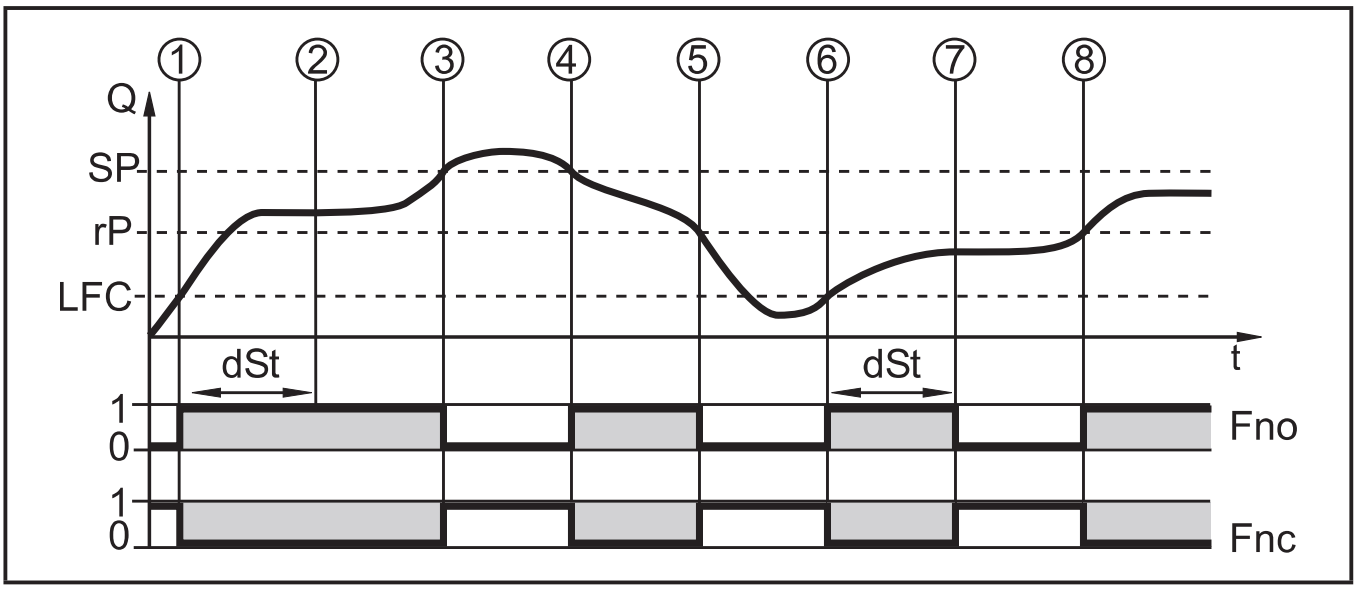
If the start-up delay is active ([dST] > [0]), note: As soon as the volumetric flow exceeds the LFC value (→ 4.8), the following processes are carried out:



> The start-up delay is activated.

> The outputs switch as programmed: ON for NO function, OFF for NC function.

After the start of the start-up delay there are 3 options:



1. The volumetric flow increases quickly and reaches the set point / good range within [dST].
   > Outputs remain active.
2. The volumetric flow increases slowly and does not reach the set point /good range within [dST] > Outputs are reset.
3. Volumetric flow quantity falls below [LFC] within [dST].
   > Outputs are reset at once; [dST] is stopped.

Example: dST for hysteresis function

	Condition	Reaction
1	Volumetric flow quantity Q reaches LFC	dST starts, output becomes active
2	dST elapsed, Q reached SP	Output remains active
3	Q below SP but above rP	Output remains active
4	Q below rP	Output is reset
5	Q reaches again LFC	dST starts, output becomes active
6	dST elapsed, Q has not reached SP	Output is reset
7	Q reaches SP	Output becomes active

Example: dST for window function

UK

	Condition	Reaction
1	Volumetric flow quantity Q reaches LFC	dST starts, output becomes active
2	dST elapsed, Q reached good range	Output remains active
3	Q above SP (leaves good range)	Output is reset
4	Q again below SP	Output becomes active again
5	Q below rP (leaves good range)	Output is reset again
6	Q reaches again LFC	dST starts, output becomes active
7	dST elapsed, Q has not reached good range	Output is reset
8	Q reaches good range	Output becomes active

4.8 Low flow cut-off (LFC)

With the function Low Flow cut-off small volumetric flow quantities can be suppressed (→ 10.5.7). Flows below the LFC value are evaluated by the sensor as standstill (Q = 0).

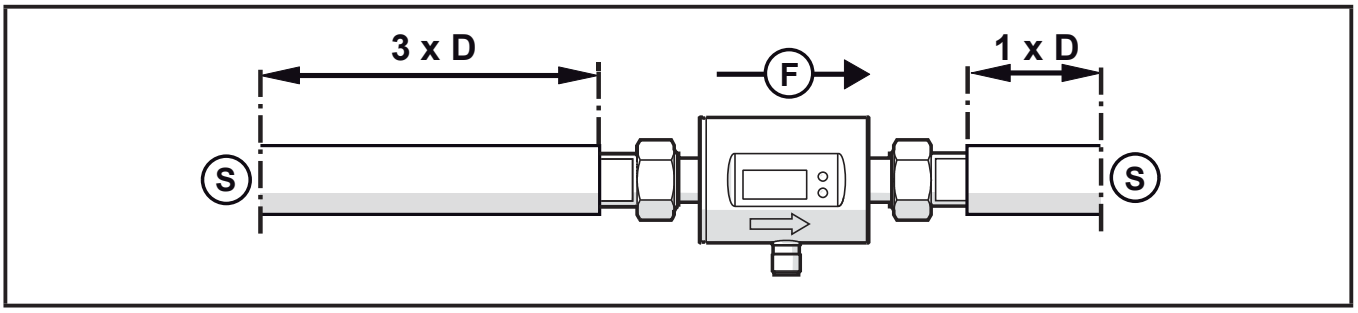
4.9 IO-Link

This unit has an IO-Link communication interface which enables direct access to process and diagnostic data. In addition it is possible to set the parameters of the unit during operation. Operation of the unit via IO-Link interface requires an IO-Link capable module (IO-Link master).

With a PC, suitable IO-Link software and an IO-Link adapter cable communication is possible when the system is not in operation.

For the IODDs necessary for the configuration of the unit, detailed information about process data structure, diagnostic information, parameter addresses and the necessary information about the required IO-Link hardware and software visit www.ifm.com.

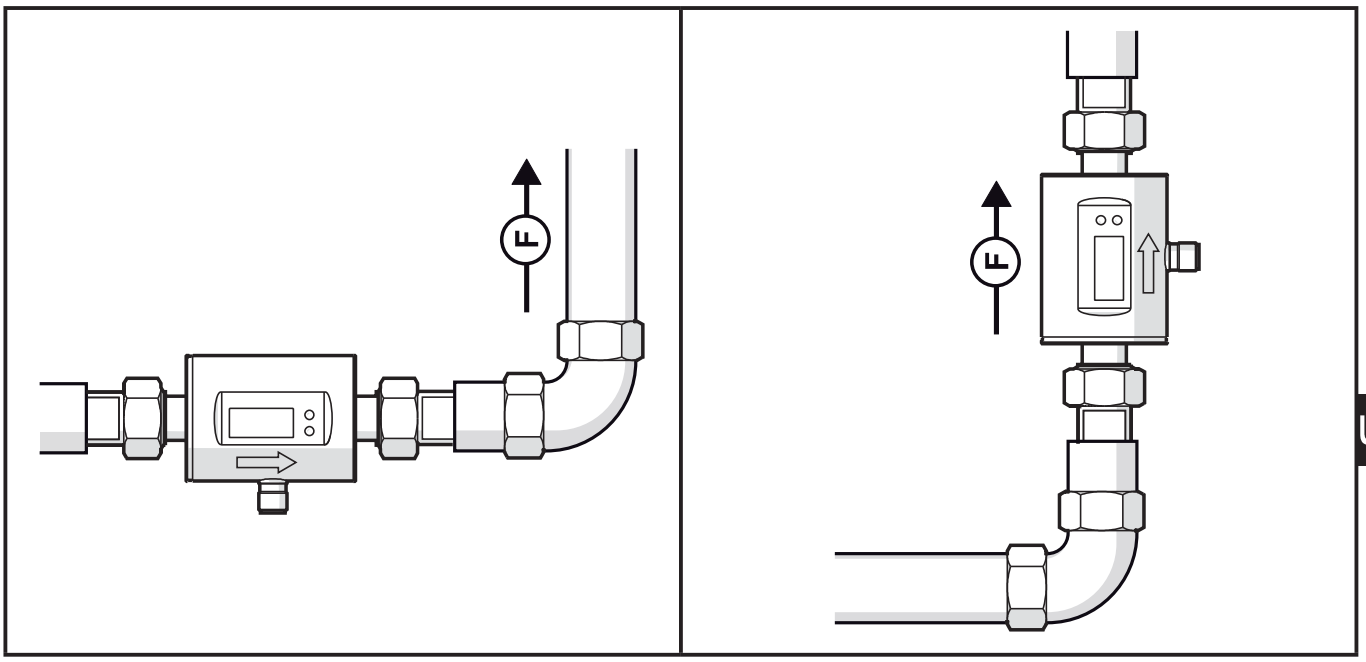
5 Mounting



- ▶ Ensure that the system is free of pressure during installation.
- ▶ Ensure that no media can leak at the mounting location during installation.
- ▶ Attach the supplied warning label to the sensor cable.

The unit can be installed independently of the orientation if the following is ensured:

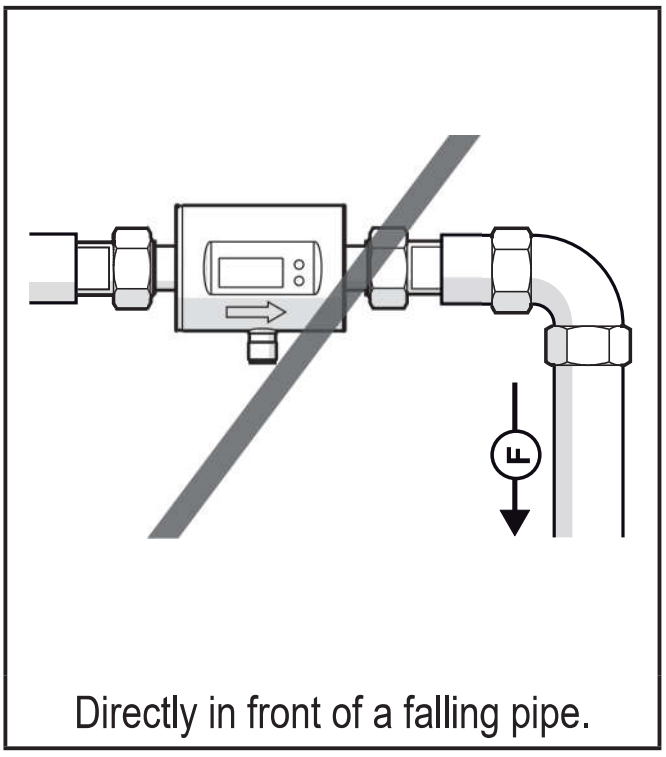
- No air bubbles can form in the pipe system.
- The pipes are always completely filled.



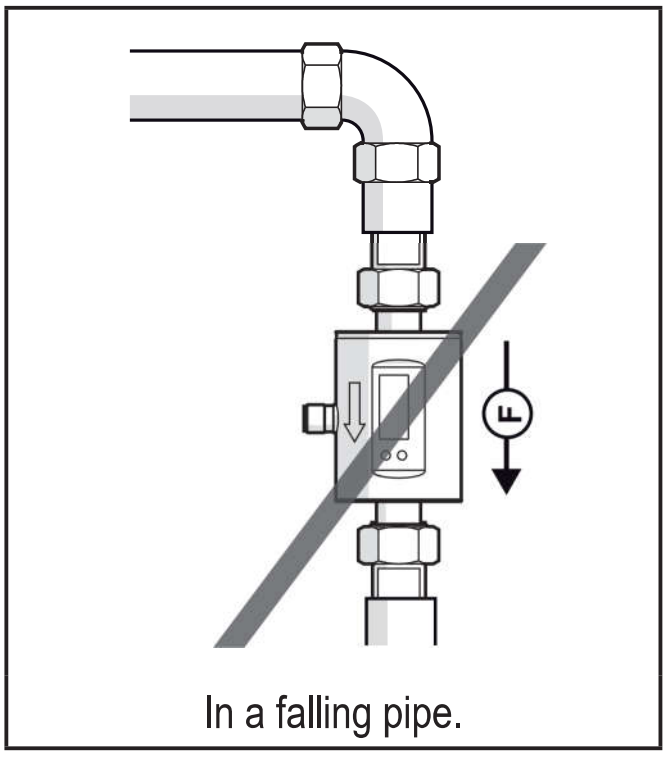
5.1 Recommended installation position

- ▶ Install the unit so that the measuring pipe is always completely filled.
- ▶ Arrange for inlet and outlet pipe lengths. Disturbances caused by bends, valves, reductions, etc. are compensated for. It applies in particular: no shut-off and control devices are allowed directly in front of the unit.

S = disturbance (e.g. shut-off / control device, pump, bends)
D = pipe diameter
F = direction of flow

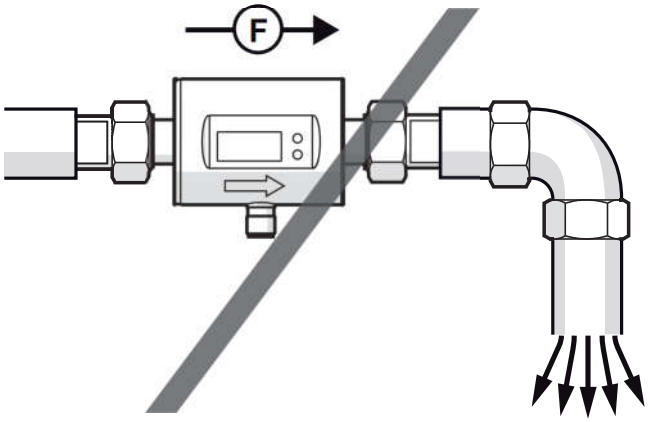


▶ Install in front of or in a rising pipe.

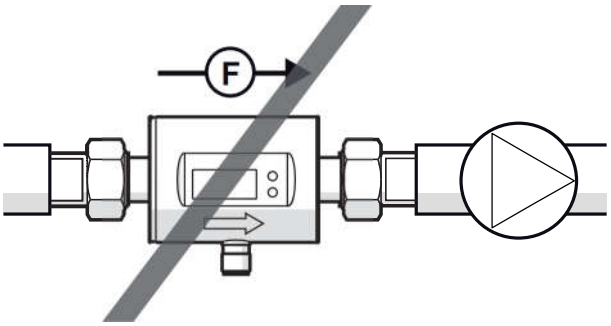


UK

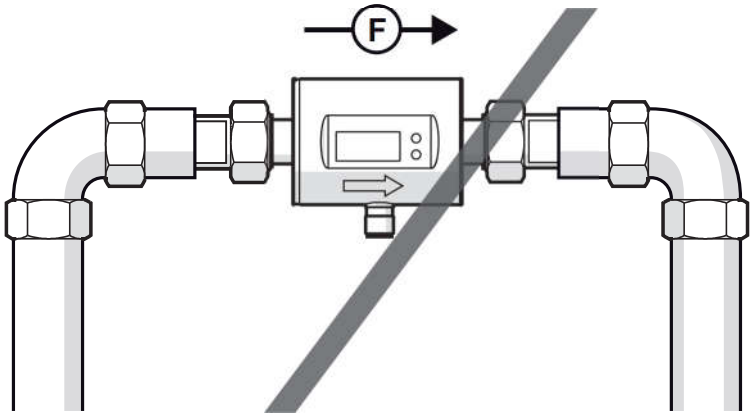
5.2 Not recommended installation position



▶ Avoid the following installation positions:



Directly in front of a falling pipe.



In a falling pipe.

Directly in front of
the spout of the pipe.

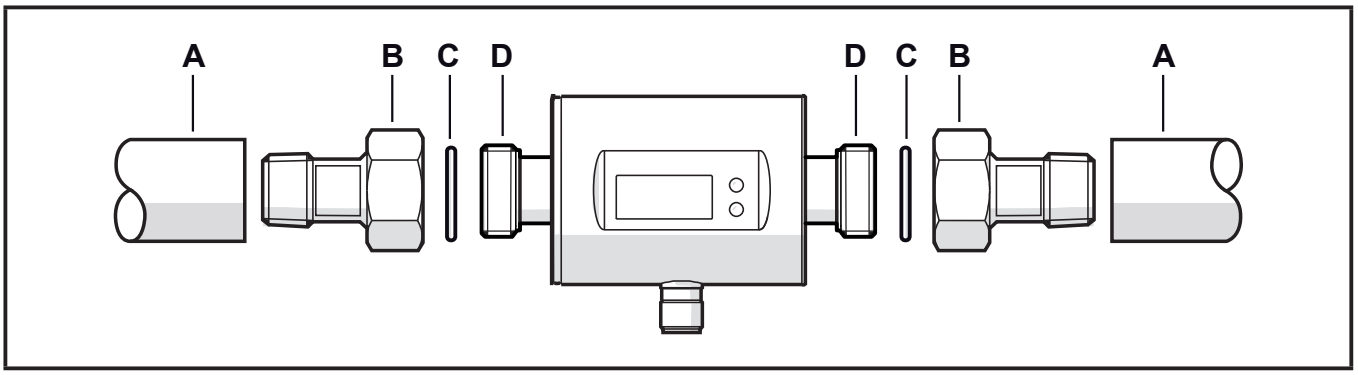
On the suction side of a pump.

At the highest point
of the pipe system.

F = flow direction

5.3 Grounding

If installed in an ungrounded pipe system (e.g. plastic pipes), the unit must be grounded (functional earth).



Ground brackets for the M12 connector are available as accessories
→ www.ifm.com.

5.4 Installation in pipes

The units with a G thread can be installed in the pipes using adapters.

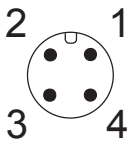
Information about the available mounting accessories at www.ifm.com.

A correct fit of the unit and ingress resistance of the connection are only ensured using ifm adapters.

1. Grease the threads of the process connection, adapter and sensor. Use a lubricating paste which is suitable and approved for the application.
2. Screw the adapter (B) into the pipe (A).
3. Place the seals (C) and install the unit according to the marked flow direction.
4. Screw the adapter (B) with the threads (D) until it is hand-tight.
5. Tighten the two adapters in opposite direction:
   Tightening torque: SM6/SM7/SM8 = 30 Nm; SM4 = 15 Nm.

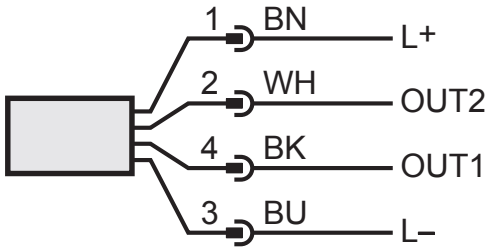
After installation air bubbles in the system can affect the measurement.

▶ Corrective measures: Rinse the system after installation for ventilation.



In case of horizontal installation:
As a result of design requirements a small quantity of the medium always remains in the measuring channel after switching off the pump.

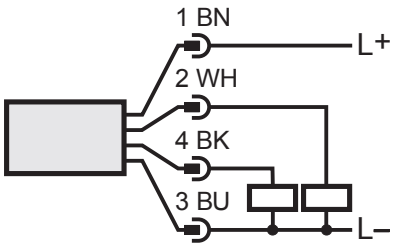
6 Electrical connection



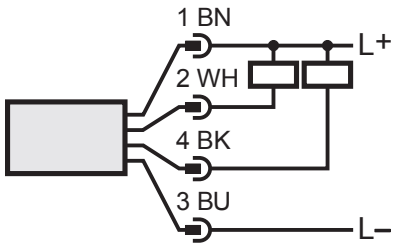
The unit must be connected by a qualified electrician.
The national and international regulations for the installation of electrical equipment must be adhered to.
Voltage supply according to EN 50178, SELV, PELV.

▶ Disconnect power.

▶ Connect the unit as follows:

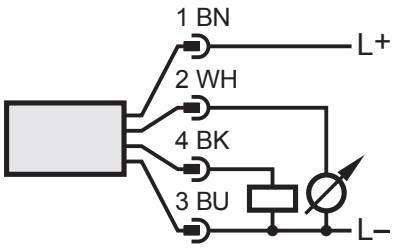


BK: black
BN: brown
BU: blue
WH: white

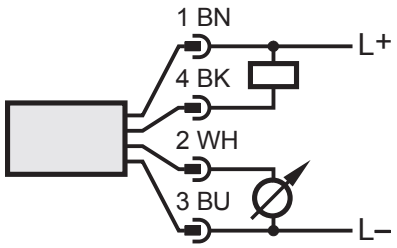


Colours to DIN EN 60947-5-2

Sample circuits:

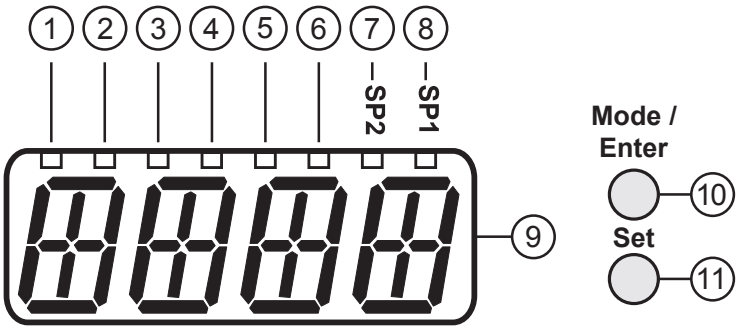


2 x positive switching



2 x negative switching

1 x positive switching / 1 x analogue



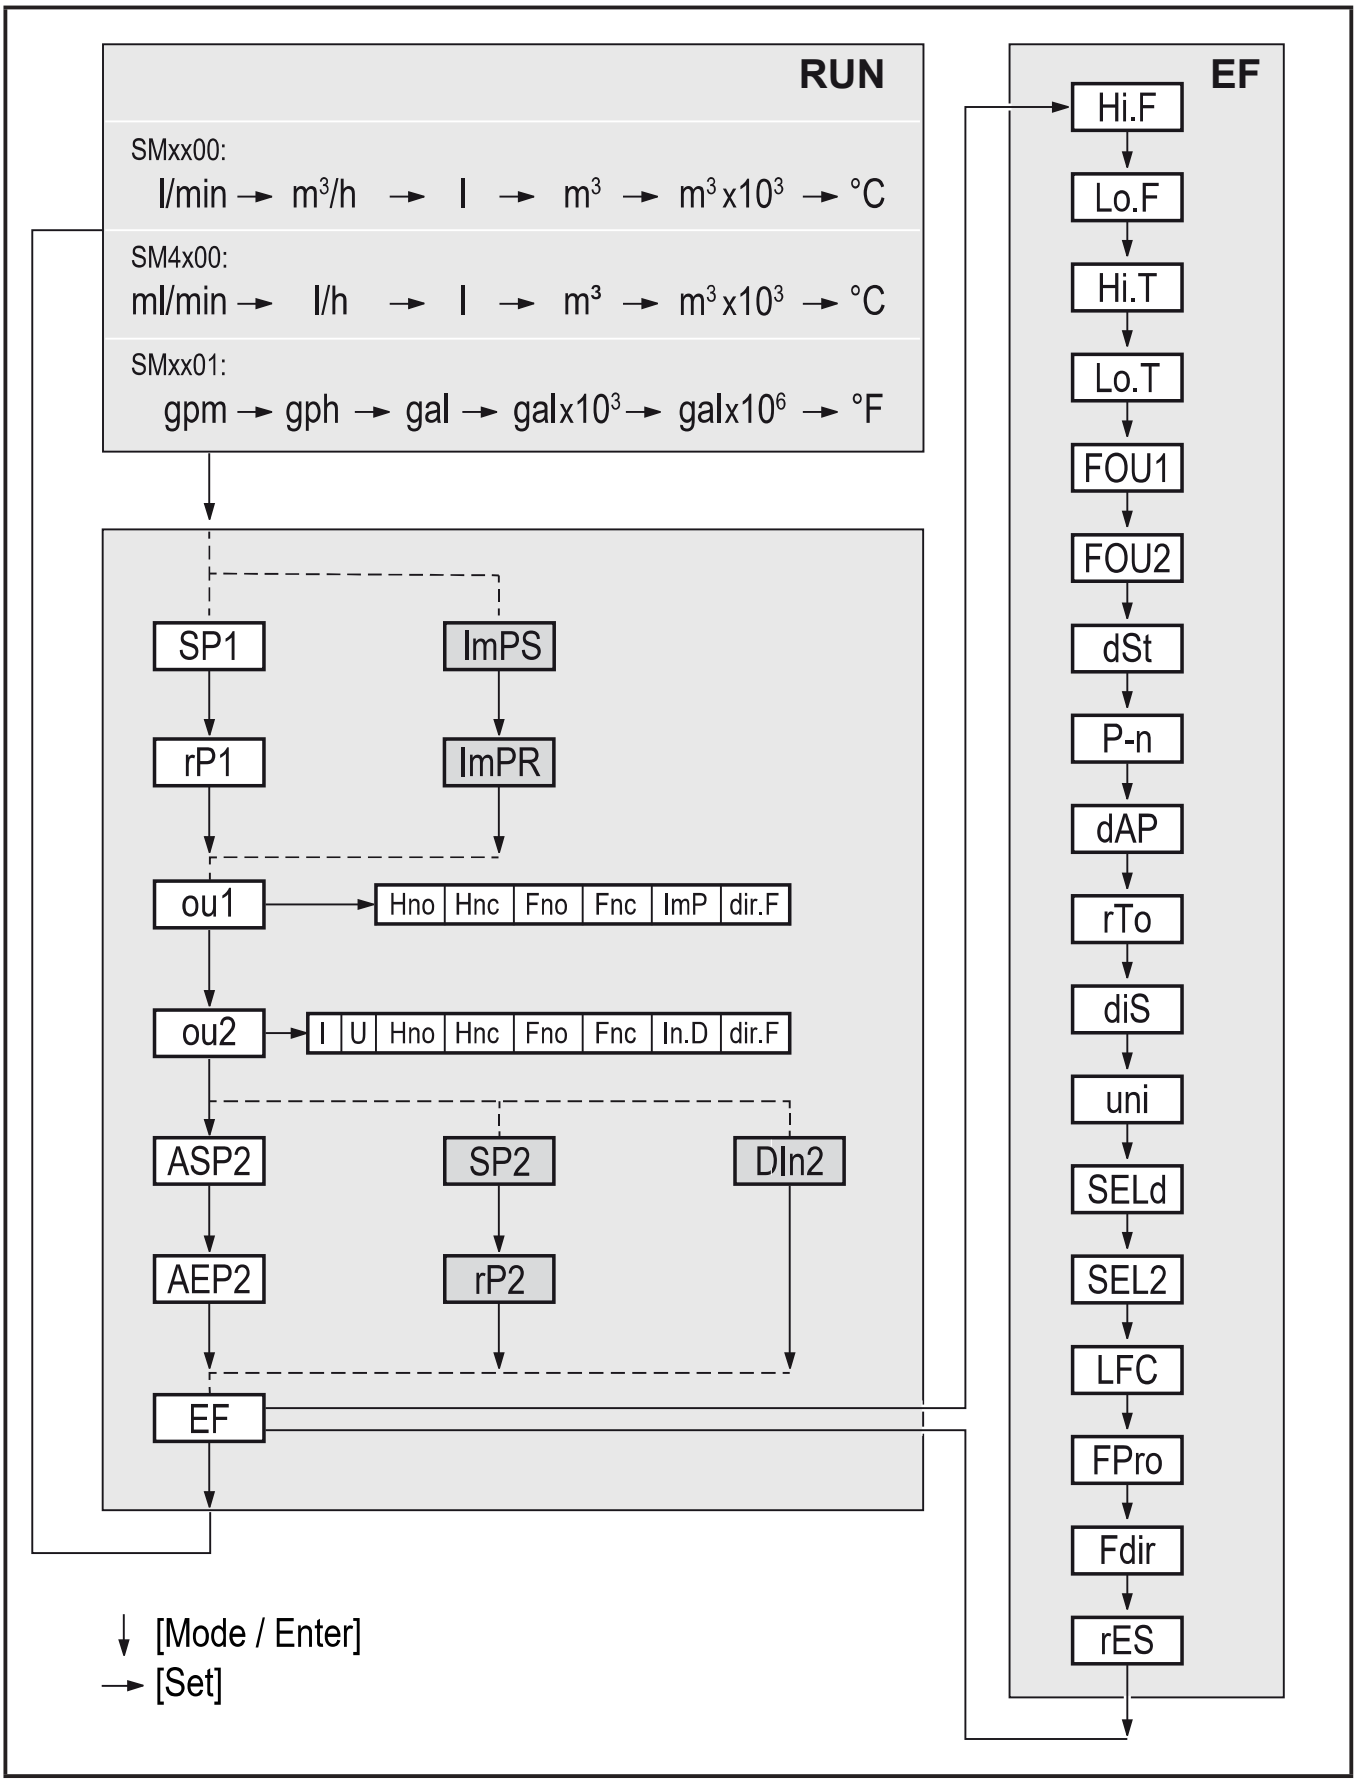
1 x negative switching / 1 x analogue

Pin 1	L+
Pin 3	L-
Pin 4 (OUT1)	• Switching signal: limits for volumetric flow • Pulse signal: 1 pulse every time the defined volumetric flow quantity is reached • Switching signal: quantity meter reached preset value • Switching signal for direction of flow • IO-Link
Pin 2 (OUT2/ InD)	• Switching signal: limits for volumetric flow • Switching signal: limits for temperature • Analogue signal for volumetric flow quantity • Analogue signal for temperature • Switching signal for direction of flow • Input for external counter reset signal (InD)

7 Operating and display elements

1-6: Indicator LEDs for process value indication

SMxx00: LED		Process value display		Unit SMxx00	Unit SM4x00
1	□	Current flow volume per minute		l/min	ml/min
2	□	Current flow volume per hour		m^3/h	l/h
3	□	Current consumed quantity (= meter reading) since the last reset	Totaliser *	l	l
4	□			m^3	m^3
4 + 6	□			$m^3 \times 10^3$	$m^3 \times 10^3$
3	⧈	Consumed quantity (= meter reading) before the last reset		l	l
4	⧈			m^3	m^3
4 + 6	⧈			$m^3 \times 10^3$	$m^3 \times 10^3$
5	□	Current medium temperature		°C	°C



SMxx01: LED		Process value display		Unit
1	□	Current flow volume per minute		gpm
2	□	Current flow volume per hour		gph
3	□	Current consumed quantity (= meter reading) since the last reset	Totaliser *	gal
3 + 5	□			gal x 10^3
3 + 6	□			gal x 10^6
3	⧈	Consumed quantity (= meter reading) before the last reset		gal
3 + 5	⧈			gal x 10^3
3 + 6	⧈			gal x 10^6
4	□	Current medium temperature		°F

□ LED is lit; ⧈ LED flashes

* The consumed quantity is automatically displayed in the unit of measurement providing the highest accuracy.

7-8: Indicator LEDs for switching output
LED 7: Switching status OUT2 (lights when output 2 is switched) LED 8: Switching status OUT1 (lights when output 1 is switched)
9: Alphanumeric display, 4 digits
• Current volumetric flow quantity with setting [SELd] = FLOW • Meter reading of the totaliser with setting [SELd] = TOTL • Current medium temperature with setting [SELd] = TEMP • Parameters and parameter values
10: [Mode/Enter] button
• Change from the RUN mode to the main menu • Select parameters • Acknowledge the set parameter value
11: [Set] button
• Change parameter values (hold button pressed) • Change of the display unit in the normal operating mode (RUN mode)

8 Menu

Parameters with white background are indicated in case of factory setting (→ 14). Parameters with grey background are indicated in case of changes of the preset for ou1 and ou2.

Parameters	Explanation and setting options (→ 4 Function)
SP1 / rP1	Maximum / minimum value for volumetric flow on OUT1.
ImPS	Pulse value = volumetric flow quantity at which 1 pulse is delivered.
ImPR	Configuration of the output for consumed quantity monitoring: YES (pulse signal), no (switching signal).
ou1	Output function for OUT1 (volumetric flow): - Hno, Hnc, Fno, Fnc: switching signal for the limits - ImP: consumed quantity monitoring (totaliser function) - dir.F: detection of direction
ou2	Output function for OUT2 (volumetric flow or temperature): - Hno, Hnc, Fno, Fnc: switching signal for the limits - I (current signal 4...20 mA), U (voltage signal 0...10 V) - dir.F: detection of direction Input function for OUT2: - In.D: input for external meter reset signal
ASP2 / AEP2	Analogue start point / analogue end point for volumetric flow or temperature on OUT2.
SP2 / rP2	Maximum / minimum value for volumetric flow or temperature on OUT2.
DIn2	Configuration of the input for external meter reset signal: HIGH, +EDG, LOW, -EDG (→ 10.3.7)
EF	Extended functions: opening of the lower menu level.
Hi.F / Hi.T	Maximum value memory for volumetric flow / temperature.
Lo.F / Lo.T	Minimum value memory for volumetric flow / temperature.
FOU1 / FOU2	Behaviour of OUT1 / OUT2 in case of an internal fault: OU, On, OFF (→ 10.5.6).
dST	Start-up delay in seconds.
P-n	Output logic: PnP, nPn.
dAP	Measured value damping: damping constant in seconds.
rTo	rES.T (meter reset: manual), h/d/w (time-controlled: hours/days/weeks), OFF.
diS	Update rate and orientation of the display: d1...d3, rd1...rd3, OFF (→ 10.5.2).
uni	Standard unit of measurement for volumetric flow
SELd	Standard measured variable of the display: FLOW (volumetric flow value), TEMP (medium temperature), TOTL (meter reading).
SEL2	Standard unit of measurement for evaluation by OUT2: FLOW (volumetric flow) or TEMP (temperature).

LFC	Low flow cut-off.
FPro	Counting method of the totaliser: –+ or 0+ (→ 10.5.8).
Fdir	Direction of flow: + or - (→ 10.5.9).
rES	Restoring the factory settings.

9 Set-up

After power on and expiry of the power-on delay time of approx. 5 s the unit is in the RUN mode (= normal operating mode). It carries out its measurement and evaluation functions and generates output signals according to the set parameters.

- During the power-on delay time the outputs are switched as programmed:
  - ON with normally open function (Hno / Fno)
  - OFF with normally closed function (Hnc / Fnc).
  - ON for detection of direction (dir.F)
- If output 2 is configured as analogue output, the output signal is at 20 mA (current output) or 10 V (voltage output).

10 Parameter setting

Parameters can be set before installation or during operation.

If you change parameters during operation, this will influence the function.

▶ Ensure that there will be no malfunctions in your plant.

During parameter setting the unit remains in the operating mode. It continues to monitor with the existing parameter until the parameter setting has been completed.

The parameters can also be set via the IO-Link interface (→ 4.9).

⚠ CAUTION

For medium temperatures above 50 °C (122 °F) some parts of the housing can heat up to over 65 °C (149 °F).

▶ Do not press the pushbuttons manually. Instead use another object (e.g. ballpoint pen).

10.1 Parameter setting in general

1. Change from the RUN mode to the main menu and selection of the requested parameter	[Mode/Enter]
2. Acknowledge the set parameter value	[Set]
3. Change the setting mode	[Set] > 5 s
4. Modification of the parameter value - incrementally by pressing once - continuously by keeping the button pressed To reduce the value: let the display move to the maximum setting value. Then the cycle starts again at the minimum setting value.	[Set]
5. Acknowledge the set parameter value	[Mode/Enter]
6. Return to the RUN mode	> 30 seconds (timeout) or [Mode/Enter] until the RUN mode is reached.

10.1.1 Change to the menu "Extended functions"

1. Change from the RUN mode to the main menu and selection of the parameter EF	[Mode/Enter]
2. Change to sub-menu EF	[Set]

10.1.2 Locking / Unlocking

The unit can be locked electronically to prevent unintentional settings. On delivery: not locked.

Locking	▶ Make sure that the unit is in the normal operating mode. ▶ Press [Mode/Enter] and [Set] simultaneously for 10 s until [Loc] is displayed.
Unlocking	▶ Make sure that the unit is in the normal operating mode. ▶ Press [Mode/Enter] and [Set] simultaneously for 10 s until [uLoc] is displayed.

10.1.3 Timeout

If no button is pressed for 30 s during parameter setting, the unit returns to the operating mode with unchanged values.

10.2 Settings for volumetric flow monitoring

10.2.1 Limit monitoring volumetric flow (OUT1)

- ▶ Select [ou1] and set the switching function: Hno, Hnc, Fno or Fnc.
- ▶ Select [SP1] and set the upper limit of the volumetric flow.
- ▶ Select [rP1] and set the lower limit of the volumetric flow.

10.2.2 Limit monitoring volumetric flow (OUT2)

- ▶ Select [SEL2] and set FLOW.
- ▶ Select [ou2] and set the switching function: Hno, Hnc, Fno or Fnc.
- ▶ Select [SP2] and set the upper limit of the volumetric flow.
- ▶ Select [rP2] and set the lower limit of the volumetric flow.

10.2.3 Analogue output flow rate (OUT2)

- ▶ Select [SEL2] and set FLOW.
- ▶ Select [ou2] and set the analogue function: I (4...20 mA) or U (0...10 V).
- ▶ Select [ASP2] and set the volumetric flow value at which the minimum current or voltage value is provided.
- ▶ Select [AEP2] and set the volumetric flow value at which the maximum current or voltage value is provided.

10.2.4 Detection of the direction of flow (OUT1 or OUT2)

- ▶ Select [ou1] or [ou2] and set dir.F.

10.3 Settings for consumed quantity monitoring

10.3.1 Quantity monitoring by pulse output (OUT1)

- ▶ Select [ou1] and set ImP.
- ▶ Select [ImPR] and set YES.
- ▶ Select [ImPS] and set the volumetric flow quantity at which 1 pulse is provided (→ 10.3.3).

10.3.2 Quantity monitoring by preset counter (OUT1)

- ▶ Select [ou1] and set ImP.
- ▶ Select [ImPR] and set no.
- ▶ Select [ImPS] and set the volumetric flow quantity at which output 1 switches (→ 10.3.3).

10.3.3 Pulse value

- ▶ Select [ou1] and set the consumed quantity monitoring: → 10.3.1 or → 10.3.2.
- ▶ Select [ImPS].
- ▶ Press [Set] briefly.
- > The currently set value is displayed.
- ▶ Keep [Set] pressed until "cccc" is displayed.
- ▶ Press [Set] to select the setting range.
- > With each press of the pushbutton the display changes to the next setting range (decimal point shifts and / or LED* changes).
- ▶ Press [Mode/Enter] to confirm the setting range.
- ▶ Press [Set] until the requested numerical value is displayed.
- ▶ Press [Mode/Enter] briefly.

* LED 1...6 → 7 Operating and display elements

10.3.4 Manual counter reset

- ▶ Select [rTo] and set rES.T.
- > The counter is reset to zero.

10.3.5 Time-controlled counter reset

- ▶ Select [rTo] and set the requested value (intervals of hours, days or weeks).
- > The counter is reset automatically with the value now set.

10.3.6 Deactivation of the counter reset

▶ Select [rTo] and set OFF.
> The meter is only reset after overflow (= factory setting).

10.3.7 Counter reset using an external signal

▶ Select [ou2] and set In.D.
▶ Select [DIn2] and set the counter reset signal:
HIGH = reset for high signal
LOW = reset for low signal
+EDG = reset for rising edge
-EDG = reset for falling edge

10.4 Settings for temperature monitoring

10.4.1 Limit monitoring temperature (OUT2)

▶ Select [SEL2] and set TEMP.
▶ Select [ou2] and set the switching function: Hno, Hnc, Fno or Fnc.
▶ Select [SP1] and set the upper temperature limit.
▶ Select [rP2] and set the lower temperature limit.

10.4.2 Analogue output temperature (OUT2)

▶ Select [SEL2] and set TEMP.
▶ Select [ou2] and set the analogue function: I (4...20 mA) or U (0...10 V).
▶ Select [ASP2] and set the temperature value at which the minimum current or voltage value is provided.
▶ Select [AEP2] and set the temperature value at which the maximum current or voltage value is provided.

10.5 User settings (optional)

10.5.1 Standard unit of measurement for volumetric flow

▶ Select [uni] and set the unit of measurement.

The setting only has an effect on the volumetric flow value. The consumed quantity (meter reading) is automatically displayed in the unit of measurement providing the highest accuracy.

10.5.2 Standard display

▶ Select [SELd] and define the standard unit of measurement
FLOW = display shows the current volumetric flow value in the standard unit of measurement.
TOTL = display shows the current meter reading in the unit providing the highest accuracy.
TEMP = the current medium temperature in °C / F° is displayed.
▶ Select [diS] and set the update rate and orientation of the display:
d1 = update of the measured values every 50 ms.
d2 = update of the measured values every 200 ms.
d3 = update of the measured values every 600 ms.
rd1, rd2, rd3 = display like d1, d2, d3; rotated by 180.
OFF = the display is switched off in the operating mode. The LEDs remain active even if the display is deactivated. Error messages are displayed even if the display is deactivated.

10.5.3 Output logic

▶ Select [P-n] and set PnP or nPn.

10.5.4 Start-up delay

▶ Select [dST] and set the numerical value in seconds.

10.5.5 Measured value damping

▶ Select [dAP] and set the damping constant in seconds (τ value 63 %).

10.5.6 Error behaviour of the outputs

▶ Select [FOU1] and set the value:
- On = Output 1 switches ON in case of a fault.
- OFF = Output 1 switches OFF in case of an error.
- OU = Output 1 switches irrespective of the fault as defined with the parameters.

▶ Select [FOU2] and set the value:

1. Switching output:
- On = Output 2 switches ON in case of a fault.
- OFF = Output 2 switches OFF in case of a fault.
- OU = Output 2 switches irrespective of the fault as defined with the parameters.

2. Analogue output:
- On = The analogue signal goes to the upper fault value (→ 4.5).
OFF = The analogue value goes to the lower fault value (→ 4.5).
OU = The analogue signal corresponds to the measured value.

10.5.7 Low flow cut-off

▶ Select [LFC] and set the limit.

10.5.8 Counting method of the totaliser

▶ Select [FPro] and set the value:
-+ = totalling the volumetric flow values with the correct sign.
0+ = totalling only positive volumetric flow values.

10.5.9 Direction of flow

▶ Select [Fdir] and set the direction of flow:
+ = flow in the direction of the flow arrow (= factory setting)
- = flow against the flow arrow ▶ label over the arrow

10.6 Service functions

10.6.1 Read min/max values

Read minimum or maximum measured values:
▶ Select Hi.x or Lo.x.
Hi.F = maximum volumetric flow, Lo.F = minimum volumetric flow
Hi.T = maximum temperature, Lo.T = minimum temperature

Delete memory:
▶ Select Hi.x or Lo.x.
▶ Press and hold [Set] until [----] is displayed.
▶ Briefly press [Mode/Enter].

It makes sense to delete the memories as soon as the unit operates under normal operating conditions for the first time.

10.6.2 Restoring the factory settings

▶ Select [rES].
▶ Press and hold [Set] until [----] is displayed.
▶ Briefly press [Mode/Enter].

→ 14 Factory setting. We recommend taking down your own settings in that table before carrying out a reset.

11 Operation

11.1 Reading the process value

The LEDs 1-6 signal which process value is currently displayed.
The process value to be displayed as standard (temperature, volumetric flow quantity or meter reading of the totaliser) can be preset → 10.5.2 Standard display.
A standard unit of measurement can be defined for the volumetric flow quantity → 10.5.1.

11.2 Changing the process value display in the RUN mode

▶ Briefly press [Set] in the RUN mode. Press the pushbutton to move to the next display unit.

> The unit displays the current measured value in the selected display unit for approx. 30 s, the corresponding indicator LED lights (→ 7).

11.3 Reading the set parameters

▶ Briefly press [Mode/Enter] to scroll through the parameters.

▶ Briefly press [Set] when the requested parameter is displayed.

> The unit displays the corresponding parameter value. After about 30 s it returns to the RUN mode.

12 Troubleshooting

The unit has many self-diagnostic options. It monitors itself automatically during operation.

Warnings and error states are displayed, even when the display is switched off. Error indications are also available via IO-Link.

Display	Type	Description	Fault correction
Err	Error	Unit faulty / malfunction	▶ Replace the unit.
No display	Error	• Supply voltage too low. • Setting [diS] = OFF	▶ Check the supply voltage. ▶ Change the setting [diS] → 10.5.2
Loc	Warning	Setting pushbuttons on the unit locked, parameter change rejected.	▶ Unlock the unit → 10.1.2
C.Loc	Warning	Setting buttons on the unit temporarily locked, parameter setting via IO-Link communication active.	▶ Finish parameter setting via IO-Link communication.
S.Loc	Warning	Setting buttons locked via parameter software, parameter change rejected.	▶ Unlock the unit via IO-Link interface using the parameter setting software.
UL	Warning	Below the display range. • Current value between -130 % ... -120 % MEW • Temperature value between -50...-40 °C or -58...-40 °F	▶ Check flow range / temperature range.
cr.UL	Error	Below the detection zone. • Flow value < -130 % MEW • Temperature value < - 50 °C or -58 °F	▶ Check flow range / temperature range.
OL	Warning	Display range exceeded. • Current value between 120 % ... 130 % MEW • Temperature value between 100...110 °C or 212...230 °F	▶ Check flow range / temperature range.
cr.OL	Error	Detection zone exceeded. • Flow value > 130 % MEW • Temperature value > 110 °C or 230 °F	▶ Check flow range / temperature range.

Display	Type	Description	Fault correction
PArA	Error	Parameter setting outside the valid range.	▶ Repeat parameter setting.
SC1	Warning	Switching status LED for OUT1 flashing: short circuit OUT1.	▶ Check switching output OUT1 for short-circuit or excessive current.
SC2	Warning	Switching status LED for OUT2 flashing: short circuit OUT2.	▶ Check switching output OUT2 for short-circuit or excessive current.
SC	Warning	Switching status LEDs for OUT1 and OUT2 flashing: short circuit in both outputs.	▶ Check switching outputs OUT1 and OUT2 for short-circuit or excessive current.

MEW = final value of the measuring range

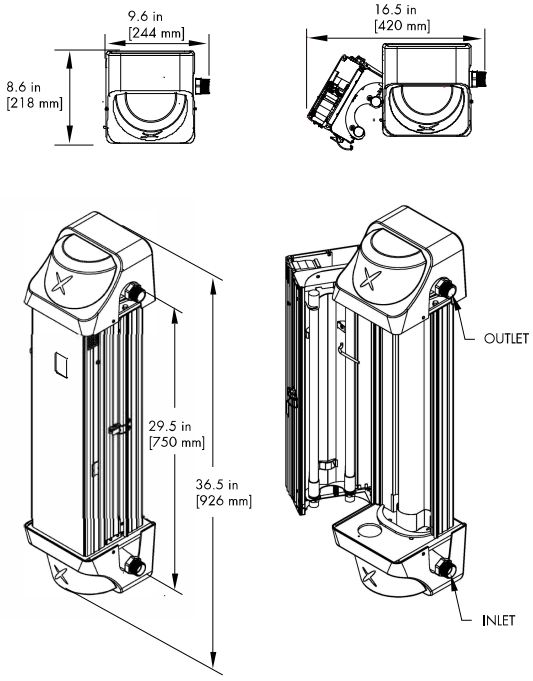
Technical Data Sheet
Hallett™ 500W

www.uvpure.com

Wastewater Applications

Model	Hallett 500W
Validation protocol	Third Party (PENDING)

Operating Range



Flow (single unit)	Up to 40 US gpm (151 Lpm)
UV dose	Min. 30 mJ/cm^2
UV Transmittance [UVT] (water)	50 - 95% UVT
Hardness (water)	Maximum 855 mg/L (50 gpg)
Iron (water)	Maximum 3 mg/L (3 ppm)
Temperature (air and water)	34 - 104°F (1 - 40°C)
Water pressure	5 - 100 psig (34 - 690 kPa)
Relative humidity (air)	Maximum 70%

Features

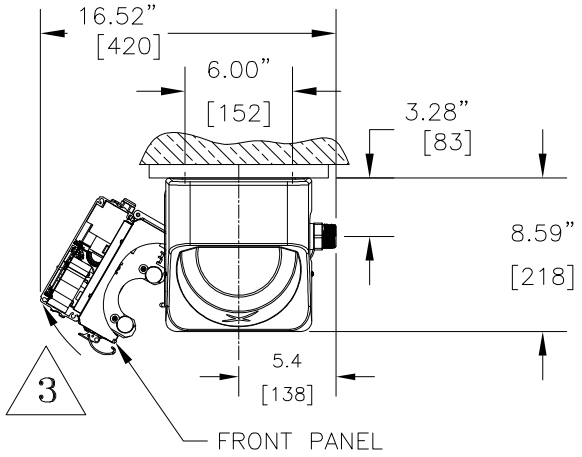
Quartz sleeve cleaning	Built-in - automatic mechanical wiper
Wiper position switch	Built-in
Purge valve	Built-in
Cooling	Built-in - forced air
Flow restrictor	Optional - internal
Shut-off valve	Optional - automatic solenoid

Electrical/Instrumentation

Voltage	120 V AC, 50/60 Hz
Power consumption (nominal)	196 W
Certifications	UL 979
UV lamps	Dual LPHO - air mounted
Lamp life (typical)	9,000 hours
Lamp cycles (recommended)	Maximum 2 per 24 hours
Sensors	Dual UV - calibrated to NIST standards
Dry contacts	Built-in - 2 provided (warning and alarm)
Interface	Colour LCD resistive touchscreen display
Alarming	Indicator light and audible alarms
Remote start/stop	Built-in
Onboard diagnostics	Built-in
4-20mA Output & Modbus	Optional

Physical

Dimensions (H x W x D)	36.5 x 9.6 x 8.6 in (926 x 244 x 218 mm)
Weight (dry)	32 lb (14.6 kg)
Weight (wet)	36 lb (16.3 kg)
Wetted parts	Meets NSF/ANSI/CAN 61 & NSF/ANSI 372 for water up to 73°F (23°C)
Body materials	Anodized aluminum and 316 Stainless Steel
Body configuration	Double door with side hinges
Inlet/outlet ports	1" MNPT Stainless Steel, optional - Stainless Steel hose
Ingress Protection rating	IP 51, optional - IP 66 for NEMA cabinet systems
Multiple units	Multiplex manifold and cabinets available
Warranty	5-year limited warranty for structural, hardware and mechanical components; 3-year limited warranty on electrical components and quartz sleeves; 12-month limited warranty on bulbs; and 1-year limited warranty on sensor probes



Contact a UV Pure representative to confirm product operating parameters for specific applications.

† 120V versions of the product are certified by QPS
†† 230V versions of the product meet IEC 60335.1, IEC 60335-2-109 (National Differences: EU Group Differences, AU, NZ, SG) and are CE.

NOTICE

THANK YOU

By purchasing a UV system with Crossfire Technology, you can now be certain that your application is receiving world-class treatment.

UV Pure units are designed to outperform conventional systems by delivering highly effective UV dosage rates for the inactivation of pathogens, including:

- viruses
- bacteria
- cryptosporidium
- giardia
- legionella
- E. coli
- Total coliforms

UV Pure products conform to the applicable provisions of the Code of Federal Regulations (CFR) requirements including, Title 21, Chapter 1,Subchapter J, Radiological Health.

1. IMPORTANT INSTRUCTIONS AND SAFETY INFORMATION

When operating the Hallett unit, basic precautions should always be followed to reduce the risk of fire, electric shock, and injury to persons, including the following:

1. Read all the instructions before installing or operating the system.
2. Pay attention to all warning and caution statements, and also safety symbols throughout these instructions. Failure to do so may result in personal injury and/or damage to equipment.
3. This unit is not intended for use by persons (including children) with reduced physical, sensory or mental capabilities, or lack of experience and knowledge, unless they have been given supervision or instruction concerning use of the unit by a person responsible for their safety.
4. Do not contact moving parts.
5. Only use attachments or spare parts recommended or sold by UV Pure.
6. The unit is intended only for indoor use in a dry location.
7. Do not unplug the unit by pulling on cord. To unplug, grasp the plug, not the cord.
8. Unplug the unit from the outlet when not in use and before any servicing or cleaning.
9. The UV chamber contains an interlock to disable the UV lamps if the event the chamber is accessed when the power is on. Do not defeat its purpose or attempt to service without opening the panel completely.
10. Do not operate the unit with a damaged cord or plug, or after a significant malfunction or is dropped or damaged in any manner. Return the unit to the nearest authorized service facility for examination, repair, or electrical or mechanical adjustment. If the supply cord is damaged, it must be replaced by a special cord available from UV Pure.
11. Connect the unit only to a circuit that is protected by a ground-fault circuit-interrupter (GFCI). See Grounding Instructions.
12. If an extension cord is necessary, the cord should contain a ground and be rated for the same amperage as the unit or combined units.
13. Do not plug in the unit if water is present on the unit or if any nearby piping connections are leaking.
14. Service to the unit does not require the removal of the aluminum endplates and they must remain assembled.
15. In the event of an alarm or shut down of the UV unit and water continues to flow either accidentally or for emergency purposes, or if the UV system is bypassed, it is recommended that any water used for drinking be boiled.
16. Do not operate the unit dry.
17. Do not operate this unit at altitudes over 3000m.
18. If the unit is installed in a room storing chemicals or is exposed to unnatural substances such as hydrogen sulphide, the room must be ventilated.

Grounding Instructions

This UV unit must be grounded. In the event of a malfunction or breakdown, grounding will reduce the risk of electric shock by providing a path of least resistance for electric current. This unit is equipped with a cord having an appliance-grounding conductor and a grounding plug. The plug must be plugged into an appropriate outlet that is installed and grounded in accordance with all local codes and ordinances. The piping connected to the UV unit must also be properly grounded. Install a grounding lug or strap as required.

WARNING - Improper connection of the equipment-grounding conductor can result in a risk of electric shock. Check with a qualified electrician or service representative if you are in doubt whether the unit is properly grounded. Do not modify the plug provided with this unit; if it will not fit the outlet, have a proper outlet installed by a qualified technician.

WARNING: If connection is made to a potable water system, the system shall be protected against backflow.

Ground-Fault Circuit-Interrupter

To comply with National Electrical Code, NFPA 70, the circuit where the UV unit(s) is connected must be protected by a ground-fault circuit-interrupter (GFCI). UV Pure recommends the use of Hubbell GFCIs for 120Vac.

Safety Symbols

WARNING: **Potential Shock Hazard**
Shutdown and unplug the unit before servicing.

DANGER: Ultraviolet Radiation
Disconnect power before replacing lamps. The lamps in the unit emit ultraviolet (UV) light that can cause permanent damage to the skin & eyes. **Never look at the lamp when it is operating.** Do not plug the unit in unless it is properly installed and all the panels are closed and secured. Do not open a panel or perform any service unless the unit has been unplugged. Never look into the unit or place any exposed skin into the illuminated areas when it is operating. Do not operate a unit that has been damaged or missing any components or safety devices. If a part is missing from your unit, contact your dealer**.**

CAUTION: **Safety Alert**
Pay attention to warning or caution statements in the instructions.

CAUTION: **UV Lamps Contain Mercury**
The UV lamps are fragile and must be handled with care. If lamp breakage occurs, avoid inhalation or ingestion of debris and avoid exposure to skin and eyes. Do not use a vacuum cleaner or broom for

cleanup. Follow local guidelines and regulations to remove and dispose of old UV lamps or mercury debris.

CAUTION: **Wear appropriate safety equipment**
Wear safety glasses when performing maintenance on the unit.
For non-potable applications, do not handle wetted parts with bare hands - use latex or vinyl gloves or equivalent.

CAUTION: **Quartz sleeves are fragile**
The quartz sleeve can break or chip if mishandled. Always handle it with care and keep it in a safe place if it is removed from the unit. Do not strike the quartz sleeve with any tool, since even the smallest chip can cause it to break under pressure.

2. ABOUT THE HALLETT

The Hallett system, manufactured by UV Pure Technologies, is the world's only ultraviolet water disinfection device with patented Crossfire Technology.

> Patented in US 6,707,048, Canada 2,463,503, Australia 2,002,333,084, Mexico 248805
> Patent Pending in Japan, UK, Europe, & Eurasia

UV Pure's UV systems employ revolutionary Crossfire Technology that is self-cleaning, self-monitoring, and fail-safe. The Hallett system with Crossfire Technology is designed to eliminate the potential risks associated with conventional single lamp UV systems.

Committed to exceeding UV disinfection standards, UV Pure has turned conventional technology inside-out by flowing the water inside the quartz sleeve and including two lamps mounted in air, dual or quad smart sensors, software-designed reflectors and an optional fail-safe solenoid valve.

Crossfire Technology is complete UV disinfection: Crossfire Technology incorporates *two* proprietary high-output UV lamps, with software-designed reflectors, that target pathogens with radiation from 360º, to deactivate pathogens and provide microbiologically safe drinking water or in the case of waste or reuse water, reduces pathogen counts below required discharge limits. Amalgam UV lamp technology has been introduced into the largest units to not only provide higher UV output, but also increased stability over a wider range of operating temperatures. In addition, the amalgam lamps can be cycled more often than conventional low pressure high output (LPHO) UV lamps – See Product Specifications Tables.

Crossfire Technology is capable of treating low UVT water: The Ultraviolet Transmittance (UVT) of water impacts the amount of treatment since UV light is absorbed rather than being available for disinfection. With a shorter path length for the UV light to travel, Crossfire Technology outperforms conventional UV systems and can treat potable applications as low as 50% UVT and also reuse and waste water in low UVT applications.

Crossfire Technology is engineered to be risk-free and fail-safe: Crossfire Technology uses dual or quad smart UV sensors mounted in air, which are designed to not foul and are more reliable indicators of system performance than ordinary systems. The lamps are fan-cooled and maintain consistent levels of UV output for maximum pathogen deactivation. Computerized alarms and an optional auto shutoff fail-safe valve are designed so that only treated water will pass through the unit.

Crossfire Technology is self-cleaning: Crossfire Technology uses a stainless steel wiper to clean the inside of the quartz sleeve eliminating fouling and the need for a water softener making abrasive quartz sleeve cleaning a thing of the past – saving money and the environment. The wiper is automated to cycle for 5 minutes every 4 hours. The cycle begins 5

minutes after power is applied. Self-cleaning not available on the NC models.

Crossfire Technology is virtually maintenance-free: Crossfire technology utilizes two lamps mounted in air, outside the quartz sleeve so maintaining a UV Pure unit is as easy as changing a light bulb with no system draining required. The UV lamps require replacement after 12 or 16 months of operation depending on the lamp type and notification of lamp replacement is given via a warning one month in advance.

Crossfire Technology is easy to install: The units are provided with either 1” or 2” male NPT connections. Optional stainless steel flexible hoses with Female Iron Pipe (FIP) connections are available for purchase for quick and simple installation.

The Hallett has a smart display: The operator interface is a colour touchscreen designed to allow unprecedented access to information such as lamp lifetime, real-time message history and UV dose display. A real-time clock is now available for improved troubleshooting and fault resolution.

The Hallett has a built-in purge valve: The purge valve eliminates the need to shut down the unit in the event of no water flow for hours, or even days (as long as a pressurized water supply is present). It is designed to prevent buildup of metals and minerals on internal components. The purge valve also eliminates nuisance alarms from changing water transmittance conditions. The purge valve is not available on some models.

The Hallett has remote status indication: The units come standard with warning and run contacts to remotely signal a control panel. In addition, the units can be started & stopped via external device.

The Hallett has a built-in surge protection: The power distribution circuit board contains filters and surge protection devices to increase the reliability of the on-board electronics and ballasts for the UV lamp.

The Hallett offers new interfaces: The Hallett units are available with a pair of 4-20mA outputs for UV Intensity, Net UV Transmittance, or UV Dose through an optional add-on device. Modbus, a smart electronic communication protocol, will also be available when the 4-20mA option is purchased.

The Hallett offers data logging: The Hallett units are available with an optional USB drive to continuously record performance on a daily basis.

3. PRODUCT SPECIFICATIONS

Specifications & Features common to all units

Operating Pressure[1]	5-100 psig (34-690 kPa)
Water Temperature Range (Hallett 1000XX)[2]	34-95° F (1-35° C) [5]
Water Temperature Range (Hallett 400-750XX)[2]	34-104° F (1-40° C) [5]
Air Temperature Range[2]	34-104° F (1-40° C)
Maximum Relative Humidity[3]	70%
Voltage Input	120Vac 50/60Hz for North America. 230 or 240 Vac 50/60Hz for International. **See power input label on left side of unit near power cord.**
Manifold materials	316 Stainless Steel
External Contact	2 available - Standard
Remote Start/Stop	Standard
Data Logging to USB Drive	Optional on all units
Automatic Solenoid Shutoff Valve	Optional on all units
Wetted Parts[4]	Meets NSF/ANSI/CAN 61 & NSF/ANSI 372

[1] Purging requires pressure to work properly. The optional shutoff valve requires min. 10psig to operate.
[2] In extreme conditions, high air temperatures may require lower water temperatures for proper operation and vice versa.
[3] For continuous flow potable applications, it is recommended to dehumidify the room where the UV unit is located.
[4] The Hallett 400NC does not meet NSF/ANSI/CAN 61 or 372
[5] Certified by WQA to 73° F or 23° C

Flow restrictors are devices that limit the water flow through the UV unit despite the demand or the amount of supply pressure. A flow restrictor is mandatory for an NSF/ANSI 55 Class A system but optional for other units.

Warning: Removal of this device may allow the water flow to exceed the validated performance of the system which therefore may not provide the necessary UV dose to inactivate all pathogens.

Potable Water

Hallett Models	Hallett 1000P	Hallett 750PN	Hallett 750P	Hallett 500PN	Hallett 500P
Max. Flow Rate[1]	100 gpm 378 L/min 22.7 m^3/hr	27.4 gpm 104 L/min 6.2 m^3/hr	30 gpm 114 L/min 6.8 m^3/hr	16.5 gpm 62 L/min 3.8 m^3/hr	23 gpm 87 L/min 5.2 m^3/hr

Lamp Heaters	No	Standard	Standard	Standard	Standard
4-20mA Output	Optional	Optional	Optional	Optional	Optional
Modbus connectivity	Optional	Optional	Optional	Optional	Optional
Power Draw	403W	222W	222W	196W	196W
Inlet & Outlet Port size	2" MNPT	1" MNPT	1" MNPT	1" MNPT	1" MNPT
Nominal Dimensions (H x W x D)	56x11x9" (142x29x 22cm)	40x10x9" (103x24x 22cm)	40x10x9" (103x24x 22cm)	36x10x9" (93x24x 22cm)	36x10x9" (93x24x 22cm)

1 Based on UV Dose of 40mJ/cm^2 at alarm setpoint.
2 NSF/ANSI 55 Class A certifications substantiated by NSF International only. Third party validations are pending.
3 The Hallett 1000P can operate over a wide range of UVTs with the UV dose EPA validated between 16-200mJ/cm^2. Consult UV Pure to correctly configure the unit. The Hallett 750P and 500P can be configured to high or low UVT applications by service technicians.
4 The flow restrictor adds significant pressure drop so the value presented is at 75% of maximum flow capacity.
5 Amalgam lamp lifetime is 12,000hrs/500 days and LPHO lifetime is 9000hrs/375 days
6 Instant Start (I.S.) LPHO limited to 2 cycles/day; Preheat (P.H.) models have 6-12 cycles/day. Exceeding the recommended daily cycles will accelerate the age of the UV lamps. LPHO lamps perform more reliably when operated 24/7.

Reuse and Waste Water

Hallett Models	Hallett 1000X[1]	Hallett 750W	Hallett 750R	Hallett 500W	Hallett 500R

Built-in Purge Valve	Standard	Standard	Standard	Standard	Standard
Automatic Quartz Sleeve Cleaning Device	Standard	Standard	Standard	Standard	Standard
Wiper Position Switch	Standard	Standard	Standard	Standard	Standard
Lamp Heaters	No	Standard	Standard	Standard	Standard
4-20mA Output	Optional	Optional	Optional	Optional	Optional
Modbus connectivity	Optional	Optional	Optional	Optional	Optional
Power Draw	403W	222W	222W	196W	196W
Inlet & Outlet Port size	2" MNPT	1" MNPT	1" MNPT	1" MNPT	1" MNPT
Nominal Dimensions (H x W x D)	56x11x9" (142x29x 22cm)	40x10x9" (103x24x 22cm)	40x10x9" (103x24x 22cm)	36x10x9" (93x24x 22cm)	36x10x9" (93x24x 22cm)

1 The suffix X will be either R for Reuse or W for Waste water.
2 The maximum flow of the unit will depend on various parameters such as UVT, TSS, and level of UV dose required. The Hallett 1000X is capable of specific flow and UVT configurations. The peak flow & min. UVT for the unit is indicated in the proposal document prepared by UV Pure. The Hallett 750W, 750R, 500W and 500R can be configured to high or low UVT applications by service technicians.
3 The Hallett 1000X is NWRI validated between 19-150mJ/cm^2. Third party validations are pending.
4 Values presented are without the flow restrictor. The flow restrictor adds significant pressure drop.
5 Amalgam lamp lifetime is 12,000hrs/500 days and LPHO lifetime is 9000hrs/375 days
6 Instant Start (I.S.) LPHO limited to 2 cycles/day; Preheat (P.H.) models have 6-12 cycles/day. Exceeding the recommended daily cycles will accelerate the age of the UV lamps. LPHO lamps perform more reliably when operated 24/7.

Unregulated Water Applications

Hallett Models[1]	**Hallett 1000NC**	**Hallett 750NC**	**Hallett 500NC**	**Hallett 400NC**[7]
Max. Flow Rate[2]	90 gpm 341 L/min 20.4 m^3/hr	34 gpm 129 L/min 7.7 m^3/hr	29 gpm 110 L/min 6.6 m^3/hr	21 gpm 79 L/min 4.8 m^3/hr

Wiper Position Switch	No	No	No	No
Lamp Heaters	No	No	No	No
4-20mA Output	No	No	No	No
Modbus connectivity	No	No	No	No
Power Draw	403W	222W	196W	162W
Inlet & Outlet Port size	2" MNPT	1" MNPT	1" MNPT	1" MNPT
Nominal Dimensions (H x W x D)	56x11x9" (142x29x 22cm)	40x10x9" (103x24x 22cm)	36x10x9" (93x24x 22cm)	32x10x9" (82x24x 22cm)

1 The NC Hallett models require pretreatment for high hardness or iron levels. Review sales literature for pre-conditioning requirements.
2 The max. flow is based on UV Dose of 40mJ/cm^2 at alarm setpoint at UVT of 85%. The max. flow and min. UVT values can be modified to suit applications.
3 Third party validations are pending.
4 Values presented are without the flow restrictor. The flow restrictor adds significant pressure drop.
5 Amalgam lamp lifetime is 12,000hrs/500 days and LPHO lifetime is 9000hrs/375 days
6 Instant Start (I.S.) LPHO limited to 2 cycles/day; Preheat (P.H.) models have 6-12 cycles/day. Exceeding the recommended daily cycles will accelerate the age of the UV lamps. LPHO lamps perform more reliably when operated 24/7.
7 The Hallett 400NC does not meet NSF/ANSI/CAN 61 or 372

4. INSTALLATION INSTRUCTIONS

Before Beginning Installation

Water Conditions - Pre-treatment Parameters

Note this section is designed to ensure the optimal performance of your Hallett system. Please review the following pre-treatment parameters prior to installation. If any specifications are of concern or unclear please contact your water treatment dealer or specialist. Note some of the information below is technical in nature and you may want to contact your water treatment specialist to review the parameters.

IMPORTANT - Should any of the following water parameters exceed the recommended limits; the system will not be serviceable under warranty. **DO NOT INSTALL THE UNIT** until you have confirmed the unit's capabilities matches the application – see Product Specifications Tables.

Water Parameters for Treating <u>Potable</u> Water:
The minimum water requirements are:

- **UV Transmittance (UVT)** – see Product Specification Tables. It is recommended for the water to be tested for UV transmittance in any applications using cisterns, surface water or ground water under the influence of surface water.
- **Total Dissolved solids (TDS)** - must be less than or equal to 1000 mg/L (mg/L=ppm)
- **Level of turbidity** - or cloudiness - of less than or equal to 1 NTU (nephelometric turbidity unit). In a point of entry application, a 5 micron sediment filter is recommended before the unit to reduce turbidity (the presence of a filter will also simplify disinfection of plumbing – see *Disinfecting the Plumbing* section). For surface waters, a dual gradient pre-filter (75x25 or 50x5) is recommended.

Water Parameters for Treating <u>Waste & Reuse</u> Water:
The minimum water requirements are:

- **UV Transmittance** (**UVT)** – The minimum UVT level is 50% or as indicated in the proposal document prepared by UV Pure.
  Total Suspended Solids (TSS) - The amount of suspended solids affect treatment by blocking UV light. The maximum TSS level is 20 mg/L or as indicated in the proposal document prepared by UV Pure.

Parts Included

- UV system complete with integral wall brackets (1)
- Ultraviolet lamps (2) – installed within the unit
- Instruction manual (1)
- Power cord (1) (located within packaging)
- 20 feet of flexible hose to connect purge valve to drain (if applicable)
- Flow Restrictor (only for NSF/ANSI 55 Class A units, optional for other units)

Optional - Automatic shutoff solenoid valve
- Stainless flexible hoses (useful for installation & maintenance)
- Pre-treatment sediment and or carbon filter designed to remove water particles, odor or trace chemicals for improved taste.
- Strain Relief Kit for external wiring # GD21

UNIT (MODEL)	Ø NPT MALE	A inches [mm]	B inches [mm]	C inches [mm]	D inches [mm]	E inches [mm]
Hallett 1000XX	2"	55.8" [1418]	47.8" [1214]	11.5" [291]	18.4" [467]	45.9" [1166]
Hallett 750XX	1"	40.4" [1026]	33.5" [850]	9.6" [244]	16.5" [420]	30.5" [774]
Hallett 500XX	1"	36.5" [926]	29.5" [750]	9.6" [244]	16.5" [420]	26.5" [674]
Hallett 400XX	1"	32.4" [823]	25.4" [646]	9.6" [244]	16.5" [420]	22.4" [570]

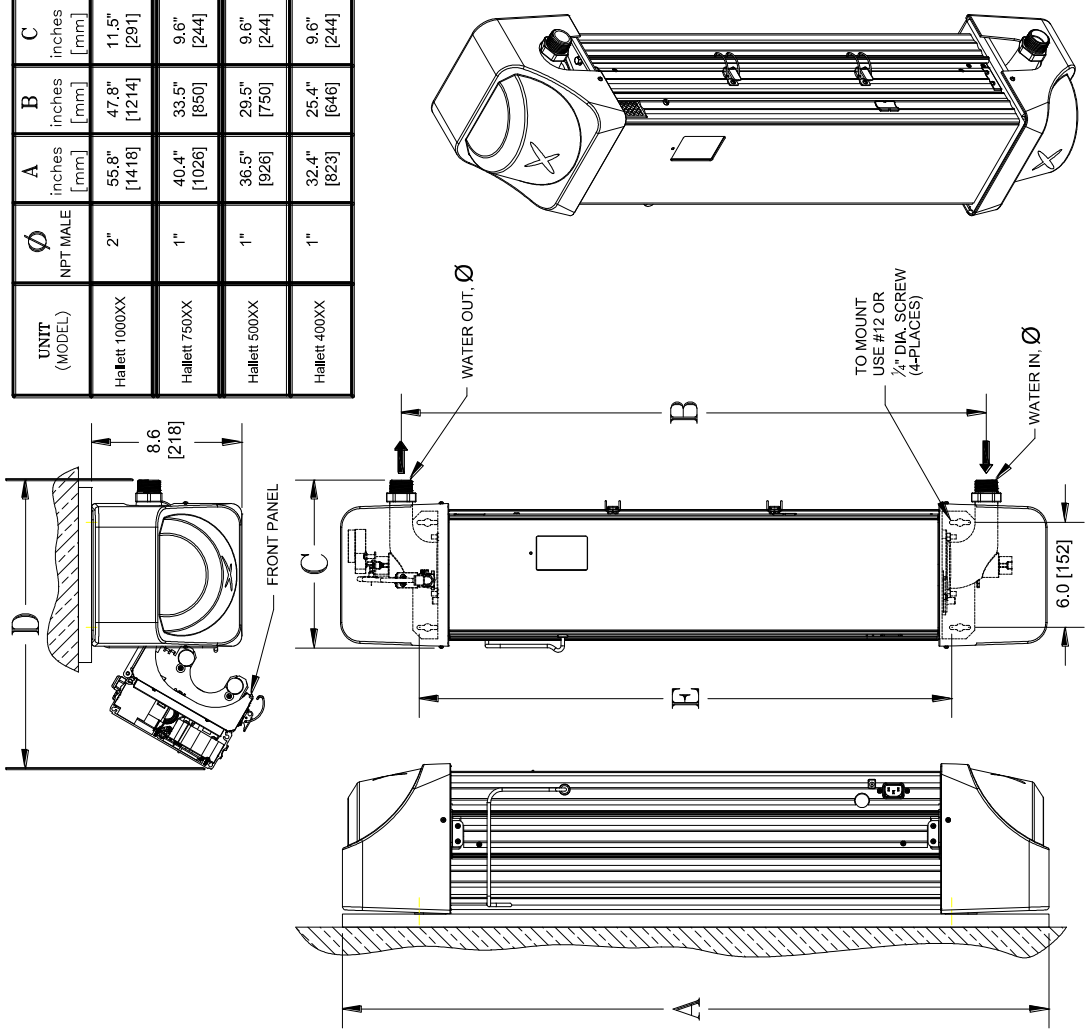

Figure 4.1

Other Materials Needed

The UV Pure unit requires four #12 to 1/4" diameter fasteners (not provided) to mount to a wall. Pipe insulation is recommended for any overhead piping to prevent condensation from dripping onto unit. The unit also requires a drain for the purge valve discharge line.

Warning – Use metal piping such as copper or stainless steel at the **outlet** of the UV unit since water temperatures can reach 176°F (80°C) if the UV unit operates without water flow or the ability to purge. **DO NOT USE PVC**.

These fittings, pipe insulation, and any piping compatible with the plumbing should be on hand before you begin installation. See Figure 4.2 and make a list of all necessary components including solder, paste and thread sealant. Bypass piping and valves that isolate the unit are optional, (but recommended) as is a drain valve for draining the unit.

Tools Needed

- pipe cutter, torch and other typical plumbing tools for modifying piping
- Wrench for tightening hose connections
- Phillips screwdriver
- Slotted screwdriver

Location

Warning - The unit must be positioned vertically on a solid wall **(the performance of the system will be adversely affected if mounted horizontally or is subjected to vibrations).** The installation of the unit (see Figures 4.1 through 4.4) should be done in compliance with all applicable federal, state/provincial, and local regulations. We recommend that the unit be installed by a qualified service technician. Failure to install the system properly may result in property damage (leaks/flooding) or personal injury (electrical shock) and will void warranty.

In a potable water application, the UV Pure unit should be installed downstream of (after) any pre-treatment devices such as filters, water softeners etc and also any pressure tanks. However, it must be installed **before any branches** in the piping so that **all** the water is disinfected before splitting and distributing throughout the home or facility. The unit **must be before** any chlorine injection system or this will void warranty.

Time Required

Please note that full installation of the Hallett requires shutting off the main water supply for a number of hours. If disinfection is necessary, all pipes must be treated and flushed. Once the unit is plugged in, the new UV lamps may take from a few moments to several hours to reach full power depending on the type of lamps. Having a Dose Alarm is normal with a new system (or with newly installed lamps) until the lamps have reached full power.

Summary of Installation:
Unpack and install Hallett on a wall
Prepare connections to inlet and outlet ports
Install purge valve discharge line to a suitable drain line
Install optional shutoff solenoid valve
Install optional bypass & drain plumbing
Check for leaks
Install insulation to overhead piping
Connect system power cord from unit to GFCI

Assembling the Unit

Step 1: Unpack the unit, being careful to remove all packaging material. Inspect the unit for damage particularly the quartz sleeve – See the *Accessing UV Chamber* section. Check if UV lamps are fully inserted. Write model number, serial number, & installation date on front on the Instruction Manual.

Step 2: The UV unit has keyhole slots for convenient mounting – use all four mounts. **Do not mount the unit directly to an outside wall; mount on plywood or shims – See Figure 4.1.** Remove the top and bottom covers of the unit to make the mounting holes accessible. Mounting hole templates are provided to simplify installation.

Step 3: The unit can be connected directly to the water mains or using the optional Stainless flexible hoses purchased through UV Pure. Use only new hoses; old hoses should be discarded. If hoses are being used, connect them now to both the top and bottom of the unit. Make sure that the sealing washer is inside the hose end before making the connection. Hold the stainless manifold with a wrench then tighten the hose securely.

Connecting the Pipes

Warning - Water must flow into the inlet at the bottom of the unit. The outlet is located at the top of the unit. For 1" systems, hold the stainless manifolds with a wrench when tightening mating connections. For 2" systems, the pump flange should be removed and threaded into mating connection then reconnected to UV unit. Do not damage sealing surfaces.

Caution: Always shut off the water supply and relieve the water pressure before beginning any plumbing modifications.

Step 1: See Figure 4.2 on how to arrange the piping and optional devices such as the solenoid valve, bypass line, sample ports and drain. If the pressure tank is downstream of the unit, a purge valve relocation kit is required (# GE3).

Step 2: The optional solenoid valve ensures that should the system fail, due to power loss, low UVT or low UV lamp output, the system will fail in safe mode and shut down the water flow. It is recommended install the solenoid valve just after the UV unit provided that a flood detection device exists at the site – this allows the unit to purge during alarm situations. If a flood detection device is not present, install the solenoid valve ahead of the UV unit. The direction of flow through the solenoid valve is important – verify flow direction with label on the valve. Water will not flow backwards through the valve. Keep the coil of the valve pointing upward (to prevent water from dripping on it). The valve requires minimum 69kPa (10psig) to fully open.

The optional solenoid valve is normally closed and must be powered to open. Some of the solenoid valves offered have a manual override (white lever) that can be used to force the valve open. In any regulated sites such as municipal applications, the manual override should not be used. For normal operation,

always leave valve in automatic position. In the *Advanced Settings* menu, item 2.7.3, toggle the valve to be “Installed” and a monthly reminder will appear to test valve. Please test valve monthly.

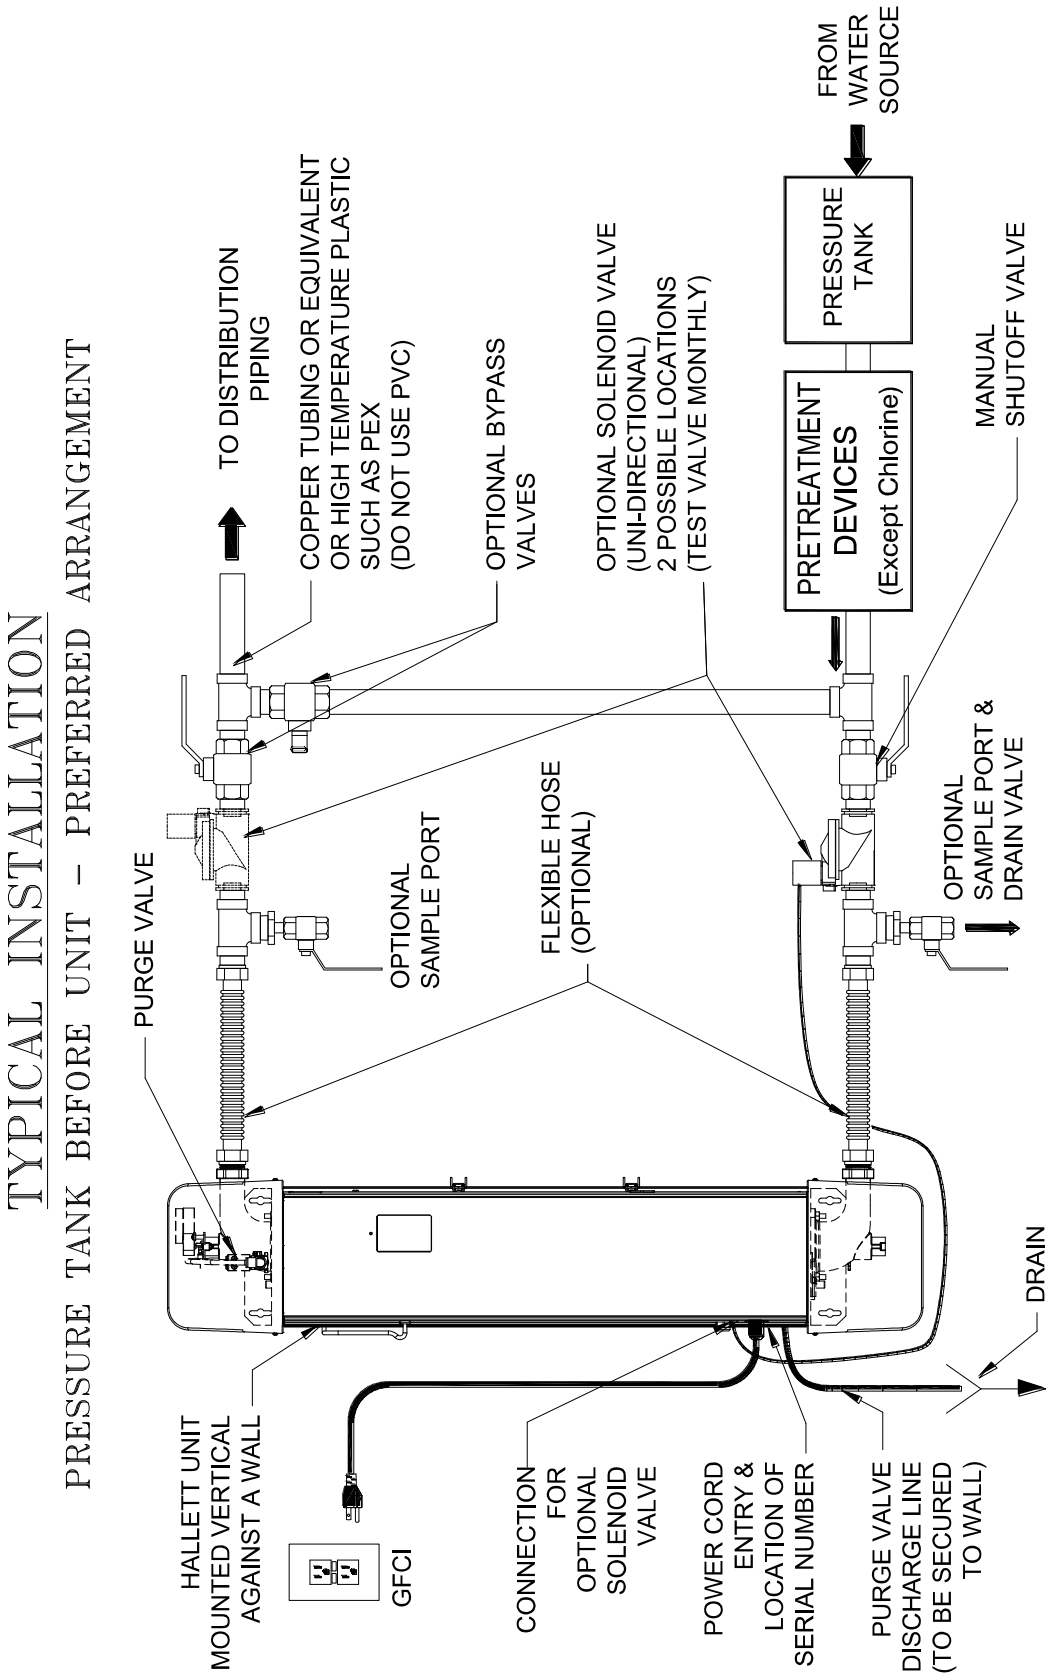

Figure 4.2

Step 3: Connect the purge valve to a drain using the tubing provided – see Figure 4.3. Note that an air gap is typically required between tubing and drain - follow local plumbing regulations. The tubing can be placed down the back side of the unit. The tubing should be secured to the wall or floor to prevent it from moving during the purging cycle. **During startup of the unit, it is strongly recommended to test the purge valve to confirm connections are free of leaks and the water discharges to drain.**

Step 4: Caution: do not allow the inside of the unit to get wet. Before opening the water supply, double check all connections and taps. Slowly turn on the water supply, vent out trapped air and check for leaks. If leaks exist, investigate the cause and repair before plugging in the unit.

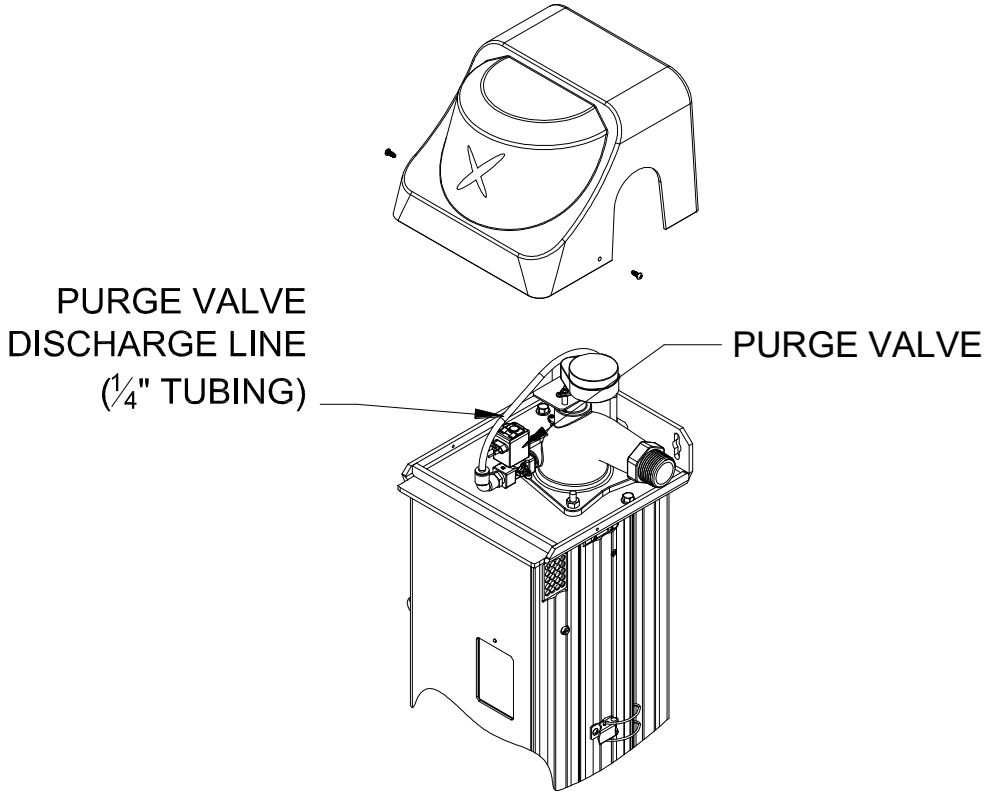

Figure 4.3

Step 5: Once the system is checked for leaks under full system pressure, install pipe insulation to any overhead piping to prevent condensation from falling onto or into the unit.

Important: after the unit has been operating for a few hours, check all connections for leaks (specifically at flexible hoses if purchased). **Repeat this procedure periodically.**

Parallel Installation

When more than one unit is installed in parallel (flow split between units), the

units must be installed with manual shutoff valves both upstream and downstream of each unit. This allows one unit to be serviced without interrupting the flow to the other units. Another requirement is the installation of a check valve downstream of the UV unit (after the UV unit). This will prevent the backflow of water to a unit.

Installation is now complete.

Control Interfaces

WARNING: Shutdown and unplug the unit before installing any external wiring.

External wiring can be introduced through a port in the left side of the unit – see Figure 4.4. By default, a plug is installed into this port in a standard unit and a strain relief (Kit # GD21) can be purchased if connection to remote devices is required. For External Contacts and Remote Start/Stop, 20 gauge wire is recommended and if the 4-20mA option is used, 20 gauge wire with foil and drain wire. Install wires onto spring cage terminals provided.

External Contacts

All Hallett systems provide two “dry” contacts for remote alarms or autodialers – the word “dry” indicates no voltage present at the contact. The first contact labeled RUN is a “System Run” condition – when closed, the unit is treating; if the contact is open, the unit is in alarm, has lost power, or perhaps the wire has been cut. The second contact labeled WARNING is to indicate the existence of an abnormal condition such as high water temperature. When this contact is open, the system is normal; when this contact is closed, a warning condition exists. Both contacts are meant for control purposes only, not to drive devices. The maximum rating of the contact is 24 Vac or Vdc, 2A.

Remote Start/Stop

All Hallett systems have remote start/stop capability which allows them to remain idle without operating the UV lamps. When a signal is given (voltage applied), UV lamps are energized. This is convenient for locations requiring periodic disinfection such as pump houses. The voltage rating range of the contact is 5-24 Vdc or Vac, 0.5W max. The remote start/stop is disabled by default and can be enabled in the Advanced Settings menu.

Caution: Avoid continuously starting and stopping the unit within a 24 hr period, as this will accelerate the aging of the UV lamps and will not be covered under warranty. See Product Specification Tables for permissible lamp cycles.

4-20mA & Modbus Option

A 4-20mA option is available on certain models. This device will provide a continuous analog output signal for UV Intensity and UV Transmittance. Modbus capability will also be available when the 4-20mA option is purchased. For more details, refer to the 4-20mA Instruction Sheets which are supplemental to this manual.

Data Logging on USB Option

Data logging capability is an available option on all Hallett units. A small USB drive is used to record system performance every 30 seconds. The USB drive has the capacity to store up to 4 years' worth of daily records. For more details, refer to the Data Logging Instruction Sheets which are supplemental to this manual.

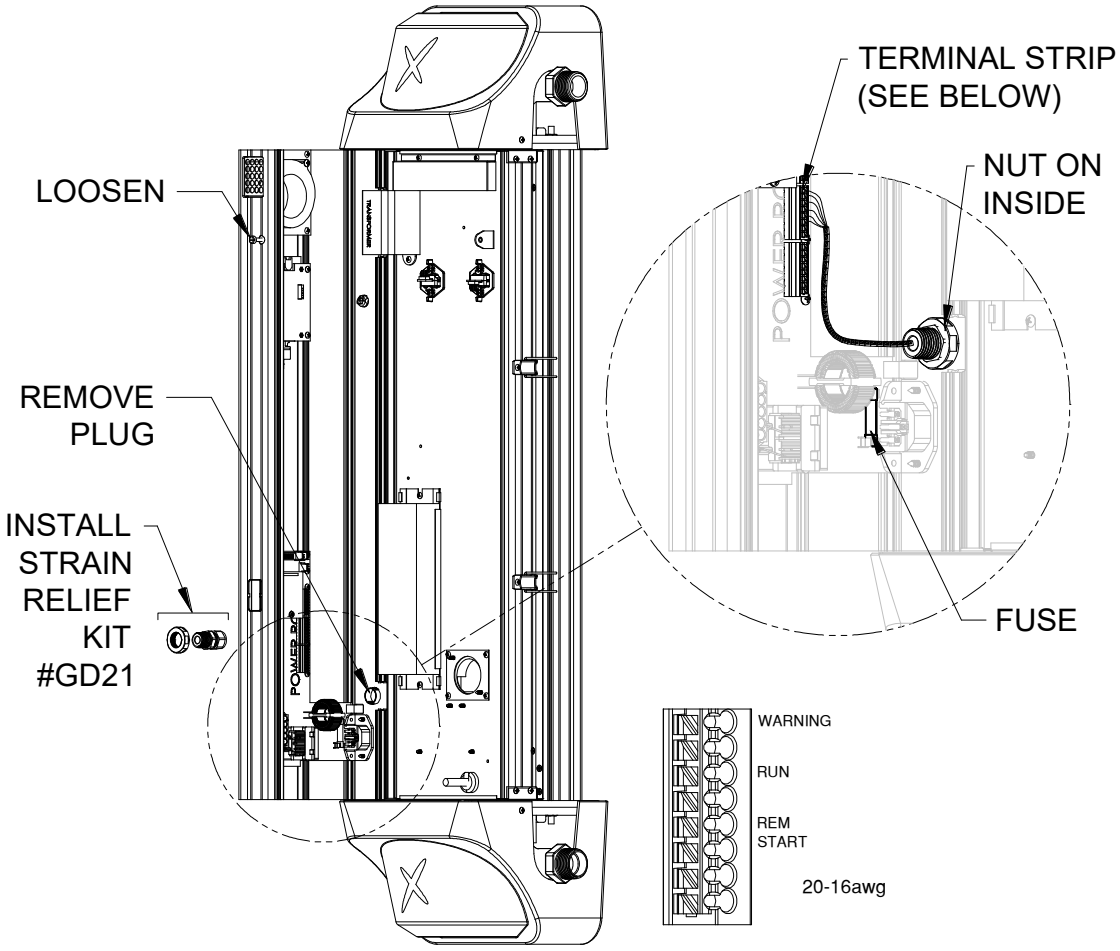

Figure 4.4

5. Operating Instructions

The Hallett applies advanced Crossfire Technology yet is simple to operate. The automatic quartz sleeve cleaning technology available on most models has been designed to reduce, and in most cases, eliminate the periodic shutdowns necessary to inspect the cleanliness of the quartz sleeve. The only required maintenance is the replacement of the two UV lamps.

The unit should be operated with both top and bottom plastic covers installed.

Unit Functions

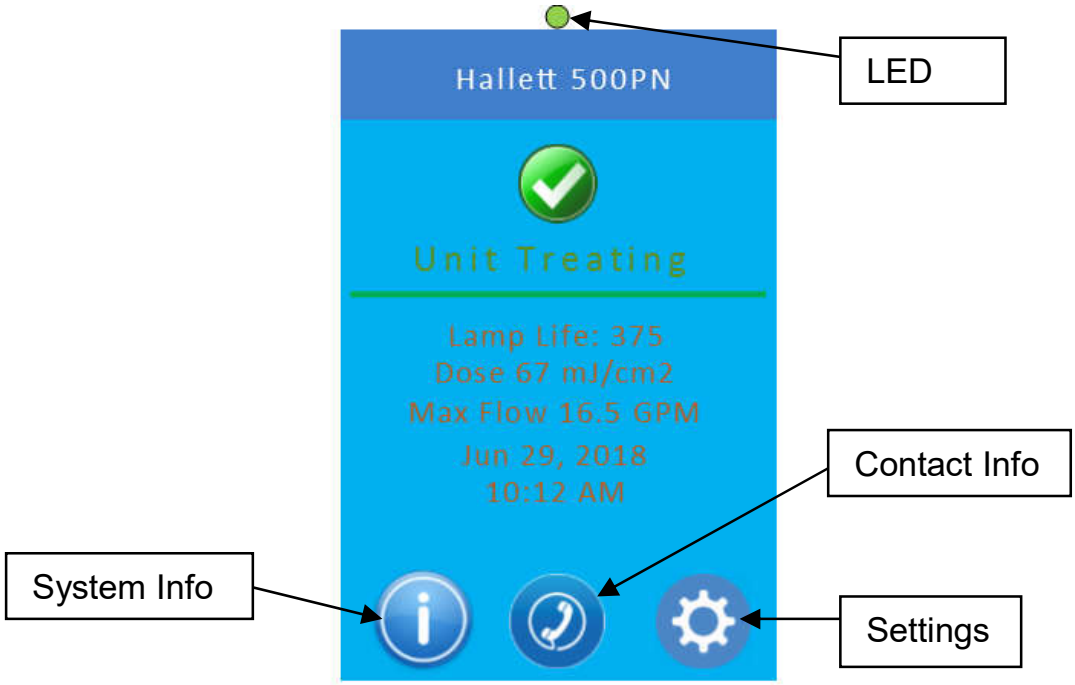

Figure 5.1

The user interface consists of a color touchscreen and a single multi-color LED. See Figure 5.1. The LED will always be illuminated when the UV unit is plugged in and powered up. The touchscreen enters sleep mode after 10 minutes and requires the user to touch it to wake it up. The touchscreen will change colors if any significant event occurs such as warnings or alarms. See the section on *Navigating the Menus* for a complete layout of the screens.

Indicating LED

Green Light – an illuminated green light indicates the unit is treating normally. A slow flashing green light means the UV lamps are not yet at full power or the unit is in standby mode awaiting a remote start. A fast flashing green light means the wiper is cycling.

Red Light – an illuminated red light indicates either a warning or an alarm has occurred. A warning is a condition that, if not addressed, could impact the unit's performance. Warnings should be addressed as soon as possible. Warnings are accompanied with a flashing red LED, a single beep, a message, and a yellow screen. An alarm is a condition that has significantly impacted the unit's performance and it must be addressed immediately. Alarms are accompanied with a solid red LED, continuous beeping, a message, and a red screen.

Audio Alarm

The audio alarm or beeper, will alert the operator to any conditions out of the ordinary. A single beep will sound if a warning occurs; continuous beeping will sound if an alarm occurs. The audio alarm may be disabled temporarily or permanently in the Settings Menu, item 2.3. The sound level of a unit operating normally is less than 70db(A). However, sound levels can exceed 85 db(A) with the audio alarm on.

Starting the Unit

Plugging in the Hallett for the first time

Step 1: Ensure that all external wiring is complete (see *Control Interface*s section) and all the panels of the unit are closed before connecting the power cord.

Step 2: Plug the female end of the power cord into the power entry module located on the left side of the front panel. Plug the male end of the power cord into a ground-fault circuit-interrupter (GFCI).

Caution: Avoid continuously starting and stopping the unit within a 24 hr period, as this will accelerate the aging of the UV lamps and will not be covered under warranty. See Product Specification Table for permissible lamp cycles.

Caution: Do not operate unit dry. There must be water in the treatment chamber to prevent damage to internal components.

In the event of a lack of water or water supply being turned off, shutdown the unit until the water supply can be restored. In the event of a power failure, the unit will shut down and the optional solenoid valve will close, preventing water from flowing. When the power returns, the unit will automatically restart and perform a self-test. If no faults are detected, the unit will return to normal operation and the optional solenoid valve will open. Note that even during a brownout, the supply voltage may drop low enough to cause the unit to shut down. If the unit does not automatically restart as described above, shutdown and unplug the unit and plug it in again.

Step 3: Once the unit is plugged in, the LED illuminates, an audible tone is issued and the display becomes active to confirm all three devices are functional. The unit then performs a self-diagnostic. The user/installer should enter the date of installation in the Settings Menu, and treatment parameters if required.

Step 4: When the UV Lamps have started, (lamp ignition for amalgam lamps may take up to 30 seconds) the unit will wait at 10 - 15 minutes depending on the model to allow the lamps to stabilize before transitioning into Treating mode. This will occur every time the UV lamps are powered up. During this warm up, the green LED will flash, the unit will display the countdown to startup, and the optional shutoff valve will remain closed. **New LPHO lamps may take from a few moments to several hours to reach full power. Continue to operate the unit until the lamps reach full power – this may last 24 hours. It is recommended for new LPHO lamps to be operated initially 3-4 hours as a burn-in to achieve lamp stability.** When the warm up process is complete, a solid green light appears and the message “Unit Treating” will be displayed. The optional solenoid valve will be allowed to

open only if treatment levels are adequate, otherwise it will remain closed. This is the normal operating mode of the unit.

During normal operation if a power outage occurs, upon return of the power, the unit will start up automatically and perform a diagnostic check. After a 10-15 minute stabilization period, the unit will begin treating if treatment levels are adequate, otherwise an alarm will be issued if the unit is not treating.

Test the wiper motor and purge valve - see Advanced Settings menu, items 2.7.1.2 and 2.7.1.3.

Flushing Instructions

Flushing the system is required after installation or after any disassembly and cleaning. Flushing may also be required to remove colored or contaminated water from the unit. Most filters (if installed) also require flushing prior to use – follow the manufacturer's recommendations.

The system may be flushed in two ways. It can be done manually by disassembling the unit and filling and draining the unit by hand (see *In-place Cleaning* section). Flushing may also be done while the unit is operating. Plug in the unit and open a tap closest to the unit and have the water flow for a minimum of 15 minutes.

Shutting Down of Unit and Seasonal Use

To shut the unit down, initiate the Power Down procedure located as the second item in the Settings Menu. When this procedure is complete, simply unplug the unit.

The Hallett can operate for extended periods of time without water usage **as long as pressurized water is present to allow for purging.** The unit may be shutdown in the case of seasonal residences or during a vacation. If the possibility of freezing exists, the unit and any valves and filters must be drained. (See *Draining the Unit* section.)

Disinfecting the Plumbing

Disinfection of the household or facility plumbing should be performed after the Hallett has been installed and is operating. This procedure should also be done if the unit is not functioning normally; if a bypass has been used; or if there has been a high background bacteria count in a water sample. UV Pure has found that disinfecting the plumbing will ensure that any potential bacteria or contaminants in the distribution system are treated prior to system use.

Please note that this procedure is ineffective against protozoa that can be found in surface water or shallow wells under the influence of surface water. Under these circumstances, it is important to perform the disinfecting procedure and then operate the Hallett. UV Pure has found that this procedure does not work with sediments or heavy biofilm and encrustations, which must be removed mechanically.

UV Pure recommends sanitizing the household or facility plumbing by adding

50 ppm chlorine from bleach for 12 hours and then flushing. This can be achieved by doing the following:

Step 1: Shutdown and unplug the unit.

Step 2: Shut off the water supply and relieve the water pressure by opening a tap.

Step 3: Remove the filter from its housing and fill the housing with bleach

Step 4: Re-mount the housing (but not the filter) and plug in the unit to turn it on.

Step 5: Once the unit is operating, turn on the water supply and have the water flow to all taps (hot and cold), toilets, the washing machine and other water-using appliances – the bleach must fill every inch of plumbing. The Dose Alarm may arise due to low UVT after the introduction of bleach. If this occurs, use the manual override on the optional solenoid valve to keep valve open during procedure. **Return override to auto position afterward.**

Step 6: When you detect the odor of chlorine at each spot, turn off the water and let the bleach remain in the lines for at least 12 hours and **turn off** the UV unit during this time.

Caution: Do not allow corrosive chemicals to remain in the unit for more than 12 hours – Do not operate unit during this time period as heating the water will increase corrosive nature of chemicals.

Step 7: After the waiting period is over, plug in the unit. Once stable, flush every line for at least five minutes or until the odor of chlorine is gone. See local regulations for proper disposal of chlorine residual, especially in the case of discharge into a septic system.

Step 8: Now that the disinfection procedure is complete you will need to return the filter to its housing. Shut off the water supply, relieve water pressure by opening a tap, and return the filter to the housing. Allow a few days after a disinfection procedure before getting a sample since residual chlorine may affect the results.

Have the water tested by a local recognized testing agency prior to any water consumption. UV Pure partners with water testing organizations in select locations throughout North America. Contact UV Pure for potential water testing partners: 1-888-407-9997. The testing should be performed on a regular basis as required by local regulations.

Automatic Quartz Sleeve Cleaning Device (available on most models)

The self-cleaning feature of the Hallett system involves a wiper turning inside the quartz sleeve. The wiper operates soon after power up of the lamps and then every 4 hours it will cycle for 5 minutes. The wiper can be enabled anytime in the Advanced Settings menu, item 2.2.1.2. The LED will flash

quickly during a wiper cycle.

Built in Purge Valve (available on most models)

The Hallett contains a flushing or purge valve that cycles water through the unit during long periods of no water usage. The unit monitors water usage by measuring the rise in water temperature within the treatment chamber. During periods of no water flow, the purge valve on the small units can expel 1 gallon (4 liters) of water every 60-90 minutes; the largest unit can expel up to 4 gallons (15 liters). If the largest unit fails to purge and the water temperature exceeds 113°F (45°C), the unit will shutdown to prevent overheating.

6. TROUBLESHOOTING

The Hallett will operate unattended until a fault arises.

If an **alarm** occurs, the solenoid valve (optional) will close, preventing water from flowing; the LED turns red; the audio alarm will beep continuously; the touchscreen turns red and displays a message; the RUN contact will open to indicate the unit is no longer treating. The fault should be corrected to return the unit to normal operation and have the water flow again.

If a **warning** occurs, the solenoid valve (optional) remains open; the LED flashes red; the audio alarm will beep once; the screen turns yellow and displays a message; the warning contact will close to indicate the unit is still treating but in an abnormal state. The warning should be addressed as soon as possible and if left unattended, could turn into an alarm.

The Message History, available in the Settings menu, item 2.6, is very useful in troubleshooting since it contains up to 100 messages/events with associated recorded data such as times, UVI, UVT, UV sensor values, and temperatures.

In the event of an alarm, in many cases, a physical inspection of the unit with the power off should be done to try to identify a cause. A slow water leak for instance, near the top of the unit could stain lamps or reflectors and may not be uncovered without a full system inspection.

Dose Alarm

The Dose Alarm occurs when there is insufficient UV dose to treat the maximum flow rate prescribed by the unit. The Dose Alarm could be a result of low UV intensity or low UV Transmittance (UVT) or a combination of both. Review both values in the System Info Menu to determine which is causing the alarm and take corrective action. It is highly recommended to have a UVT sample taken to confirm system prediction.

The Advanced Settings menu under Force Outputs conveniently provides the ability to manually turn on and off devices to confirm their operation. Devices return back to their automatic position after 10 minutes.

Cycling the power is also useful to occasionally reset the software.

Troubleshooting Guide

System Status	Possible Cause	Corrective Action
No Power (LED is off, touchscreen is off)	Ground-fault circuit-interrupter (GFCI) tripped.	Check for water leaks. Reset GFCI.
	Fuse Blown.	Check for water leaks. Replace fuse (see Fig. 4.4 for fuse location)
	Touchscreen pcb not connected to power pcb.	Ensure ribbon cable is connected at both ends.
	Circuit Board is damaged.	Confirm if Power pcb has any illuminated LEDs. If so replace Touchscreen pcb (LCD).
UV Lamps not starting (occurs after 6 unsuccessful attempts)	UV Chamber interlock not engaged.	Check that each latch is correctly positioned and secure UV chamber door.
	# of lamp starts have exceeded specification.	Review Total Lamp starts in System Info Menu. Replace lamps but reduce future lamp cycles.
	UV lamp failure	Replace lamps
	UV Ballast Failure	Replace ballast
	Over temperature condition.	Either the system, pcb or water temperature has occurred. Allow to cool off and investigate cause by reviewing Message History.
UV Lamps on but UVI is low	Lamps are warming up after a power interruption.	Allow lamps up to 15 minutes to reach full power
	New LPHO lamps installed.	First time LPHO lamps are turned on it may take 3 to 4 hours to reach full power. After this initial “burn-in”, warmup time will be a few minutes.
	The UV output of the lamps have diminished.	Lamps have exceeded their lifetime. Replace lamps.
		# of lamp starts have exceeded specification. Replace lamps but reduce future lamp cycles.
	UV sensor requires recalibration/replacement.	Install reference sensor to confirm status of unit sensor.
	UV Lamps operating outside of recommended temperature conditions.	Check if UV blower is operating correctly.
		For cold water applications, increase room temperature or install LPHO lamp heater kit.
Water Temperature High Warning & Alarm	Warning issued when water temperature within the UV chamber exceeds 95°F (35°C) for H1000XX and 104°F (40°C) for H400-H750XX. Alarm issued when water temperature within the UV chamber exceeds 113°F (45°C) – UV Lamps are turned off (applies to Hallett 1000XX models)	Check if sufficient water pressure to operate purge valve. Check for blockage in purge discharge tubing. Check for debris in purge valve.
System Temperature High Warning & Alarm	The system temperature has exceeded a safe operating level causing the UV lamps to be turned off.	Check if water flow has been turned off. Check if operating temperatures have exceeded specifications. Check if both system blowers are operating correctly.
Circuit Board Temperature High Alarm	The temperature within the electrical chamber has exceeded a safe operating level causing the UV lamps to be turned off.	Check if operating temperatures have exceeded specifications. Check if the pcb blower is operating.
Wiper Not Turning Warning	The system has failed to detect wiper motion during the routine wiper cycle.	Check wiper motor operation
		Check wiper position switch & cam.

7. MAINTENANCE

The disinfection of water will occur as long as the unit is properly maintained with genuine parts in accordance with the instructions set out in this manual. Operating a malfunctioning unit or defeating any system sensors may jeopardize the safety of the water. Online videos are available to help with typical maintenance tasks. Simple tasks such as quartz inspections and lamp replacements can be done by end-user. More in-depth activities such as quartz replacement, should be done by authorized service representatives.

Test Shutoff Valve Monthly
The optional solenoid shutoff valve should be tested monthly to confirm it opens and closes. Unplug valve from unit to confirm water stops flowing. Plug the valve in again to confirm water continues to flow.

Clean Air Filter Periodically
The Hallett contain a washable air filter in the located at the air inlet port (See Figure 7.1). Periodically check and clean the filter to ensure blower operation is not impeded.

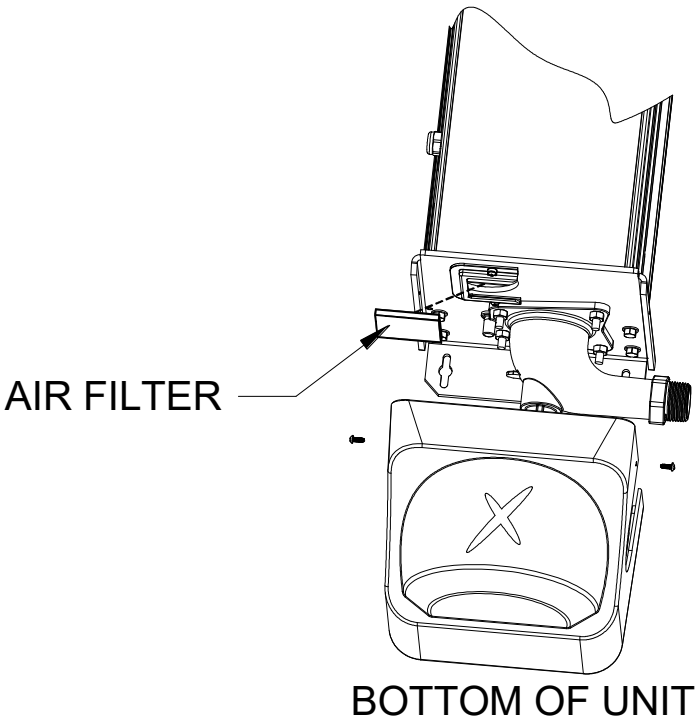

Figure 7.1

Accessing the UV Chamber

The UV chamber can easily be opened for lamp replacement or quartz sleeve inspection without having to drain the unit and without any tools.

Caution: Always shutdown and unplug the unit before accessing the UV chamber.

Step 1: Shutdown and unplug the unit then wait 5 minutes before opening the

UV chamber to allow the lamps to cool. The lamps heat up after continuous use and can burn your skin if touched.

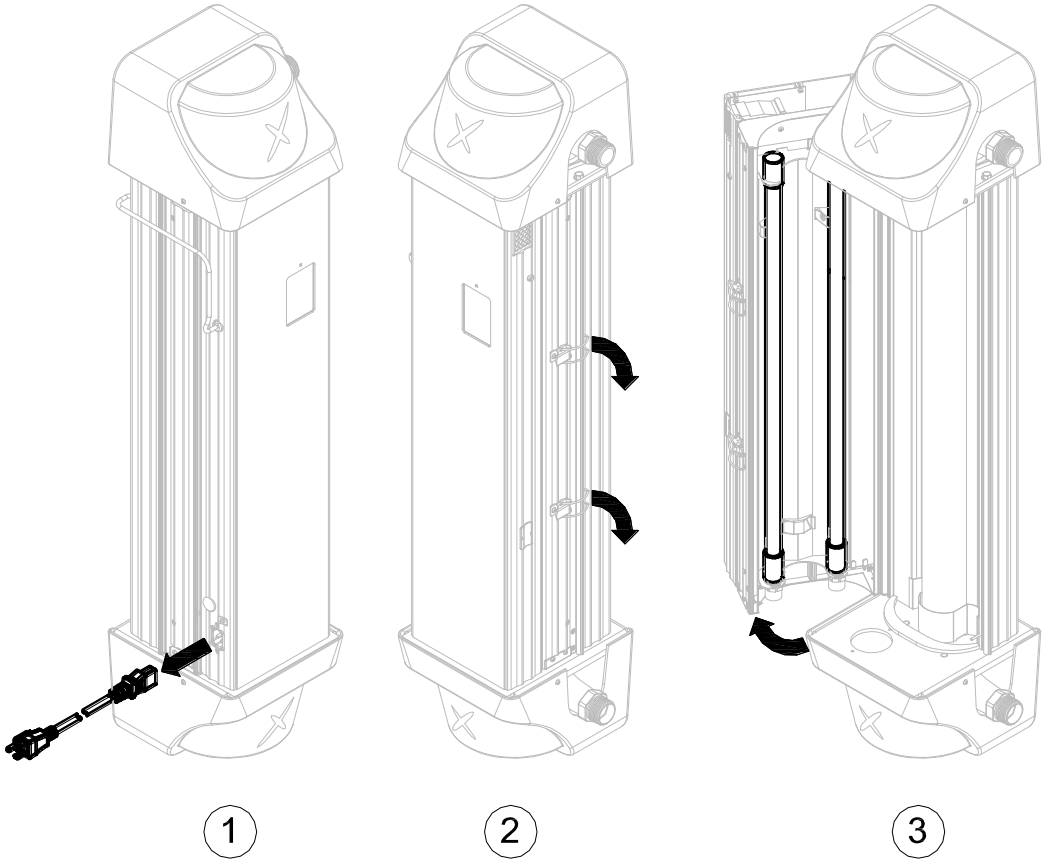

Figure 7.2

Step 2: See Figure 7.2. Open the UV Chamber by undoing the over-the-center latch (may be more than 1). Note where the latch wire engages the extrusion feature – it must be re-latched in same manner.

Step 3: Slowly swing the door completely to the left to reveal the two UV lamps installed in the front half of the UV chamber. Note that the quartz sleeve can be easily inspected.

Step 4: To close the UV chamber, slowly swing the door back towards the back half of the UV chamber. Close all over-the-center latches ensuring the wire correctly grabs the extrusion feature.

Step 5: Plug the unit in again.

Replacing and Cleaning UV Lamps

The Hallett contains two ultraviolet (UV) lamps that emit high-intensity UV light in the germicidal range, providing effective disinfection of the water flowing through the unit. The lamps in the unit will decay over time and they should be replaced every 12 or 16 months for optimum performance – see Product Specification Tables for lamp lifetimes. Note that lamps will only decay while in operation. Shutting down the system for seasonal use will

extend lamp life.

The unit has an internal timer to keep track of the lifetime of the lamps. The Hallett will issue a warning when the end of lamp lifetime approaches and it will warn again when the lamp lifetime is exceeded. The amount of life remaining on the lamps is measured in days and can be seen in the Home menu.

The lamps can be replaced in a few minutes. See Figures 7.3-7.5.

Caution: Do not allow water to flow until new lamps have been installed and reach full power.

Never touch the bulb (quartz portion) of a lamp with your fingers. Handle the lamp by its ends only. If the surface of the lamp becomes dusty or dirty, use a clean lint-free cloth and some rubbing alcohol to remove the dirt. For more difficult stains such as water spots, use a scale remover to remove the stain and then rubbing alcohol afterwards.

Tools Needed

- Slotted screwdriver

NOTE: Resetting the Lamp Lifetime counter will clear the Message History, Lamp Starts counter and Power Ups counter. If this information is required, review it first before proceeding to Step 1.

Step 1: Open the UV chamber as described in *Accessing UV Chamber* section.

Step 2: Use a slotted screwdriver and pry the lamps up between lamp base and ceramic socket, see Figure 7.3

When the bottom pins have disengaged the socket, lift the lamp up, then swing the lamp base away from socket. Lower the lamp to disengage it from the top lamp holder. With the lamp free from the unit, carefully place it aside and remove the other lamp.

Dispose of the old lamps in the same way as you would dispose of ordinary fluorescent tubes. Note that old lamps should be disposed of at a household waste management depot or transfer station; contact your local recycling and waste management authority for proper disposal procedures in your area.

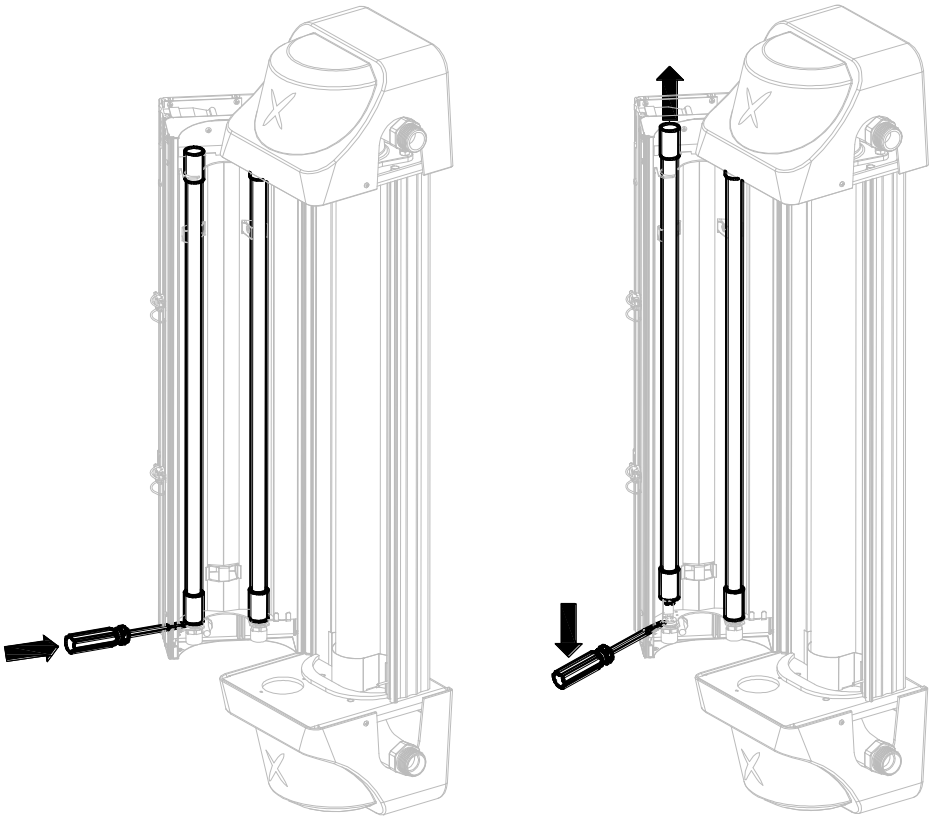

Figure 7.3

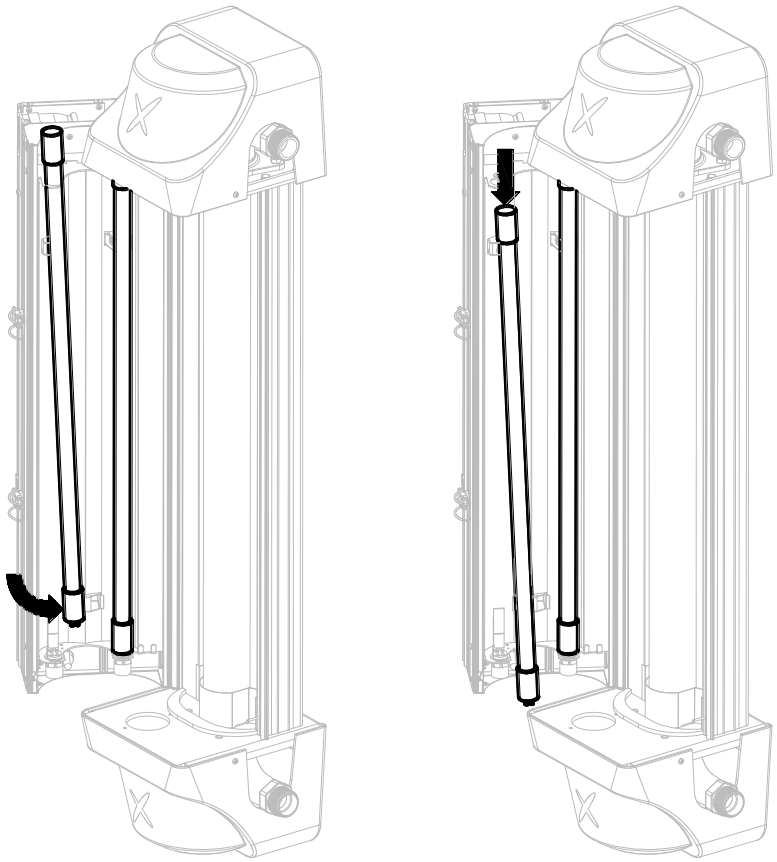

Figure 7.4

Step 3: Install the new lamps into the unit, one at a time being careful not to touch the bulb. Insert the top end of the lamp through the top lamp holder then swing lamp base in over the socket. For a LPHO lamp, rotate it until the “Stop Sign” symbol printed on the top ceramic is towards the left. See Figure 7.5. For an amalgam lamp, rotate it until the wires running down the lamp are facing the back of the unit. The proper orientation of the LPHO and amalgam lamp has the lamp wires opposite the UV sensors.

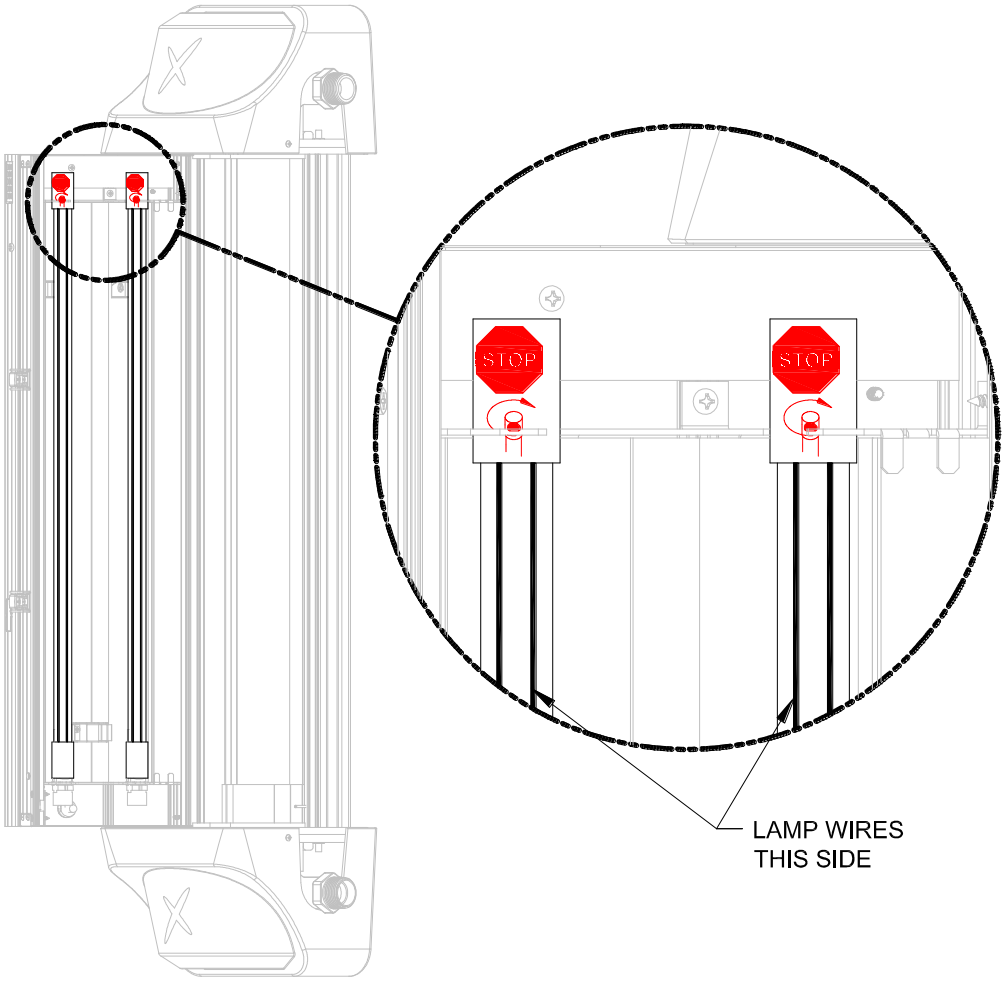

Figure 7.5

After the lamp has been rotated correctly, allow the 4 pins of the lamp to engage into the socket, push **firmly down** on the top of the lamp while holding socket. Do not twist the lamps when they are inserted. **Observe the base of the lamp to confirm the pins are fully seated into the socket.** Repeat for other lamp.

Step 4: Close the UV Chamber and secure door.

Step 5: Record the date of the lamp replacement in your Service Record Sheet.

Step 6: Plug in the unit. The lamp lifetime counter can be reset in the Settings menu, item 2.5 (365 days for LPHO lamps, 500 days for amalgam

lamps). **New LPHO lamps may take from a few moments to several hours to reach full power. Continue to operate the unit until the lamps reach full power.** The UV intensity value can be observed to confirm output levels. It is recommended for new LPHO lamps to be operated initially 3-4 hours as a burn-in to achieve lamp stability.

Draining the Unit

The Hallett does not normally require draining for routine operation or lamp replacement. Draining is necessary to disassemble the system, to protect against freezing, or to remove poor-quality water.

Tools Needed

- Pipe wrench

Step 1: Shut off the water supply and relieve the pressure.

Step 2: Shutdown and unplug the unit.

Step 3: Place a bucket under the unit to collect the water.

Step 4: Open a tap downstream of the unit to vent.

Step 5: If you have installed an optional drain valve, open the drain valve. If you do not have an optional drain valve, disconnect the flexible hose or piping at the bottom port to allow the system to drain for a few minutes. Note that the water will not flow backwards through the optional automatic valve.

Step 6: When draining is complete, close the drain valve or reconnect the flexible hose or pipe connections.

Step 7: Close any taps that were previously opened.

Cleaning the Unit

UV Pure has designed the automatic quartz sleeve cleaning device within the Hallett systems to virtually eliminate the disassembly and cleaning of the quartz sleeve - the quartz sleeve will remain clear and transparent as glass. If a component of the cleaning device fails, such as the wiper motor, or in extreme water cases with unique water chemistry, the quartz sleeve may become fouled and require manual cleaning. In this situation the Dose Alarm will arise and alert you to the unsatisfactory conditions. Follow the steps below to inspect the quartz sleeve and disassemble the unit for cleaning.

Determining the Need for Cleaning

Step 1: Shutdown and unplug the unit.

Step 2: Open the UV chamber as described in *Accessing UV Chamber* section.

Step 3: Examine the quartz sleeve both inside and out – See Figure 7.2. If it

is clean, no disassembly is required and the unit can be closed. Restart the unit by plugging it in.

Step 4: If the quartz sleeve is dirty on the outside, proceed to wipe it down with a clean lint-free cloth and rubbing alcohol to remove the dirt. If the quartz sleeve is dirty on the inside, proceed with in-place cleaning or disassembly.

In-place cleaning

This procedure will clean the quartz sleeve without its removal from the unit. This is a quick and easy procedure that works well in most cases.

Tools Needed

- slotted screwdriver
- Philips screwdriver
- Pipe wrench

Step 1: Fill a bucket or container with 1 gallon (4 liters) of clean water - this will be required later to clean the quartz sleeve. A squeeze bottle is useful for applying water or cleaning solution to the inside of the quartz sleeve.

Step 2: Shutdown and unplug the unit.

Step 3: Shut off the water supply and relieve the pressure.

Step 4: Open the UV Chamber as described in *Accessing UV Chamber* section.

Step 5: Place another bucket under the unit and drain the unit until there is about 1” (3cm) of water left in the quartz sleeve (see *Draining the Unit* section).

Step 6: Disconnect the fitting at the top outlet port of the UV unit. If the stainless flexible hose was installed, disconnect the hose opposite from the UV unit then bend the open end upwards – this will make the next step easier.

Step 7: Add about 2 oz. (60cc) of cleaning solution to the top hose/manifold. The cleaning solution can be a citric acid, vinegar or other non-hazardous solutions. **Any solution used should be thoroughly rinsed out afterwards.** Fill the rest of the quartz sleeve with water.

Step 8: Let the cleaning solution remain in the quartz sleeve for at least 10-20 minutes.

Step 9: Manually turning the wiper may greatly assist the cleaning process. To do this, remove the top plastic cover then remove the motor and turn the wiper shaft with a slotted screwdriver (counterclockwise while looking at the shaft). If the optional wiper positioner switch is installed, leave the trigger cam in place.

Step 10: Drain the unit and inspect the quartz sleeve. If clean, flush the unit with clean water. If fouling remains, repeat procedure or proceed to disassembling the unit.

Step 9: Once the unit is clean, reassemble the system including the motor, plastic cover, top port connection(s) and UV chamber door.

Step 10: Slowly open the water supply and check for leaks.

Step 11: Restart the unit by plugging it in.

Disassembling the Unit

NOTE: This procedure is not recommended for untrained users - please contact your certified water specialist to assist should disassembly be required.

Tools Needed

- slotted screwdriver
- Philips screwdriver
- Pipe wrench
- 7/16” (11mm) wrench or nut driver
- Bottle clean brush with long handle

Step 1: Fill a bucket or container with 1 gallon (4 liters) of clean water - this will be required later to clean the quartz sleeve. A squeeze bottle is useful for applying water or cleaning solution to the inside of the quartz sleeve.

Step 2: Shutdown and unplug the unit.

Step 3: Shut off the water supply and relieve the pressure.

Step 4: Place another bucket under the unit and drain the unit completely (see *Draining the Unit* section). Note that piping connections to the inlet and outlet ports will have to be removed in order to disassemble the unit’s stainless manifolds. Perform these disconnections now.

Step 5: Open the UV Chamber as described in *Accessing UV Chamber* section. It may be necessary to have the UV chamber door held open for this procedure.

Step 6: Remove top plastic cover.

Step 7: Disconnect wires to wiper motor, purge valve, and water temperature sensor (thermistor).

Step 8: Remove the wiper motor by removing the two screws holding it to the plate.

Step 9: Remove the motor mounting plate from the top manifold by removing the two screws and nuts. Removing this plate will allow top manifold to come

free from the wire bundle.

Caution: Do not damage the sealing surfaces of the manifolds or the shaft adapter for the wiper - handle these parts with care to prevent water leaks. The wiper assembly must also be handled with care to prevent damage to cleaning edges. **The wiper blades are sharp, handle them with care.**

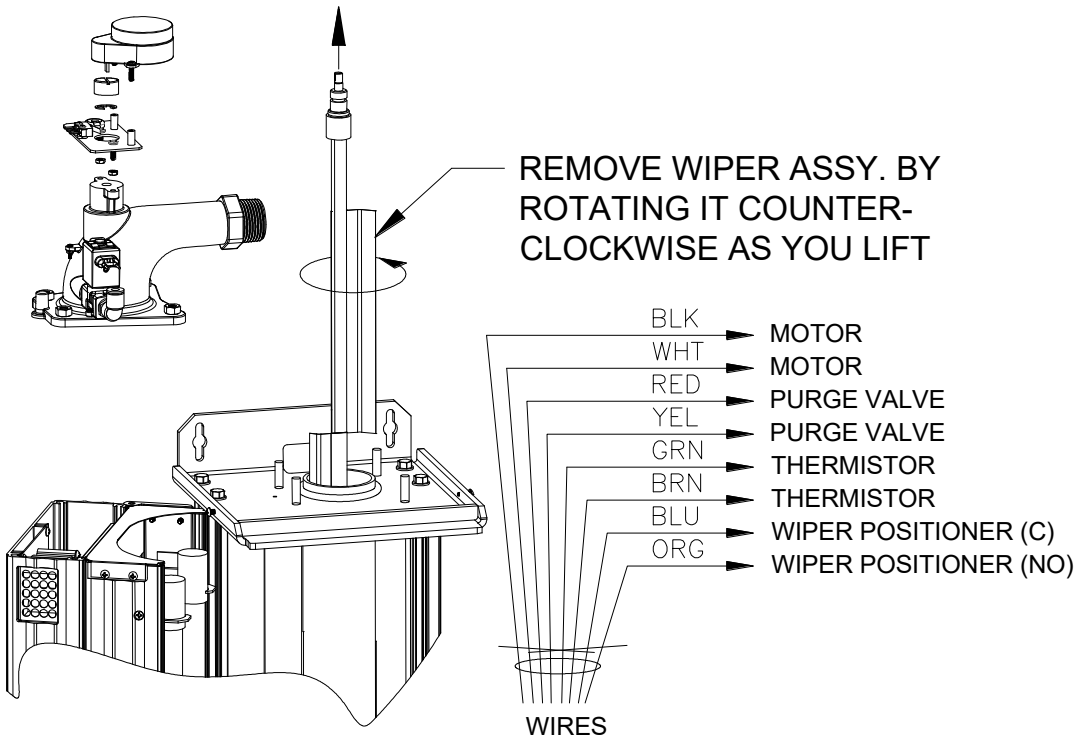

Figure 7.6

Step 10: Remove the retaining ring (E-ring) holding the wiper shaft.

Step 11: Use the 7/16” (11mm) wrench or nut driver to remove the four nuts of the top manifold in an alternating pattern (top left, bottom right, bottom left, then top right). The bottom manifold does not require removal to clean the quartz sleeve, so leave it in place. This will support the quartz sleeve during cleaning and simplify the overall process.

Step 12: Press down on the wiper shaft and remove the top manifold (Figure 7.6) by lifting it straight up to disengage the wiper shaft. The shaft adapter should remain on the top of the wiper shaft. Note the orientation of the slot to the wiper blades – the slot is aligned to the wiper blades.

Step 13: Remove the wiper assembly by carefully lifting it up and out of the quartz sleeve. Rotating it counter-clockwise as you lift will help. Prevent the shaft adapter from falling off the wiper assembly. Note that the shaft adapter sits on the top end of the wiper shaft - the top end of the shaft has a hole, the bottom end of the shaft does not.

Cleaning/Removing the Quartz Sleeve

Step 1: Use a bottle cleaning brush with a long handle to scrub the inside of the quartz sleeve. Scrub and flush it with water repeatedly to clean the quartz sleeve. Use a squeeze bottle to apply water or solution to the quartz sleeve to keep the area tidy. **Note: Keep the rest of the unit free from moisture.** Examine the quartz sleeve.

Step 2: If the quartz sleeve is still dirty, use a scale remover such as CLR or Lime Away and apply it to the inside of the quartz sleeve. Citric acid, available at a drug store, can also be used. **Always flush with clean water afterwards.**

Step 3: Once the quartz sleeve is clean, reassemble the unit (see Figure 7.8). Replace any seals that appear to have been damaged.

Step 4: If the quartz sleeve is still not clean, it requires replacement. This is done by removing the bottom manifold (see Figure 7.7). Replacing a quartz sleeve is easier when the unit is placed on a horizontal surface – removing the unit from the wall to work on a bench is recommended, especially for the Hallett 1000 models.

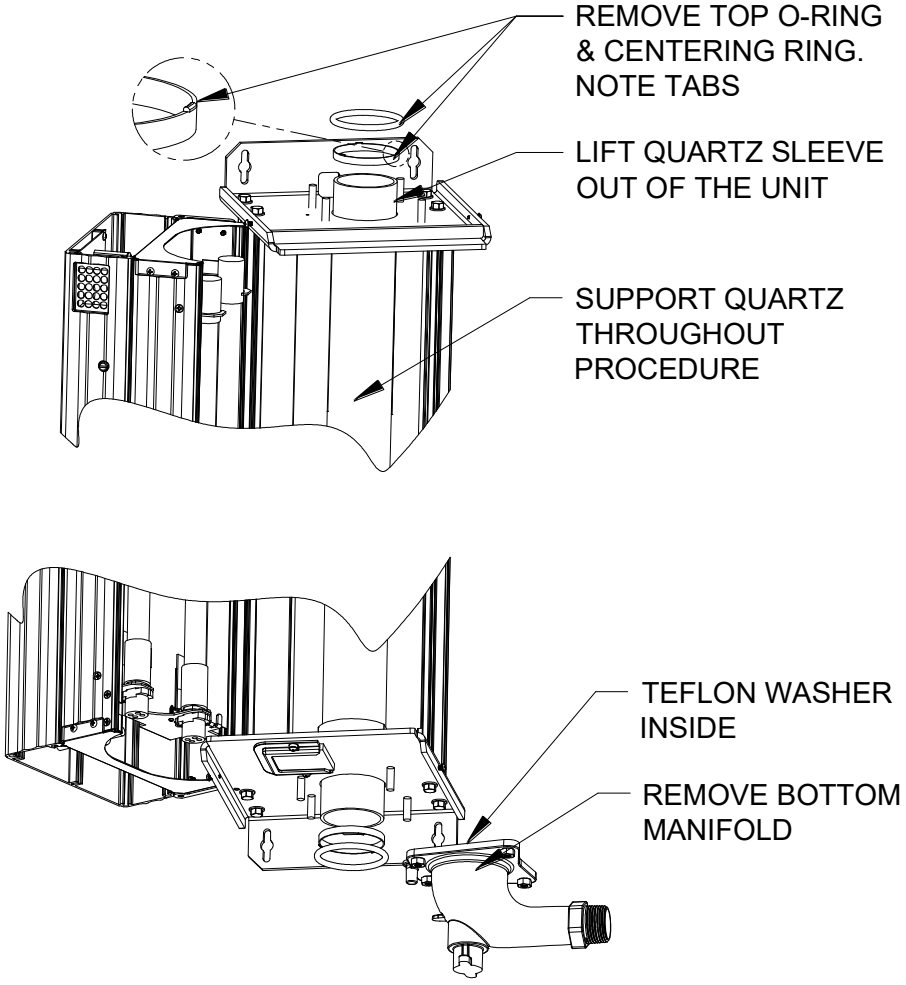

Figure 7.7

Step 5: Remove the bottom plastic cover and then the bottom manifold by undoing the four nuts in an alternating pattern (top left, bottom right, bottom left, then top right). Do not allow the Teflon washer at the lower cavity of the bottom manifold to fall out – the wiper shaft sits on this washer. Support the quartz sleeve as you remove this item.

Step 6: Remove the quartz sleeve by removing the top and bottom O rings and then the quartz centering rings. Lift the quartz sleeve out of the unit.

Step 7: Install the new quartz sleeve into the unit and center it vertically. **Be careful not to chip the ends.** Support the quartz sleeve for the next two actions.

Step 8: Install the quartz centering rings (small tabs face outwards) and then the top and bottom O rings, keeping the quartz sleeve centered vertically in the unit.

Step 9: Replace the bottom manifold (see Fig. 7.7) by installing the four nuts in an alternating pattern (top left, bottom right, bottom left, then top right). Check again for Teflon washer.

Reassembling the Unit

Step 1: Replace the wiper assembly carefully in the quartz sleeve -wetting the inside of the quartz sleeve with water will also make the task easier. Turn the wiper assembly counter-clockwise (looking from the top) as it is being inserted into the quartz sleeve – this will make the task easier and align the wiper blades properly. Ensure the bottom of the wiper is correctly seated into bottom manifold.

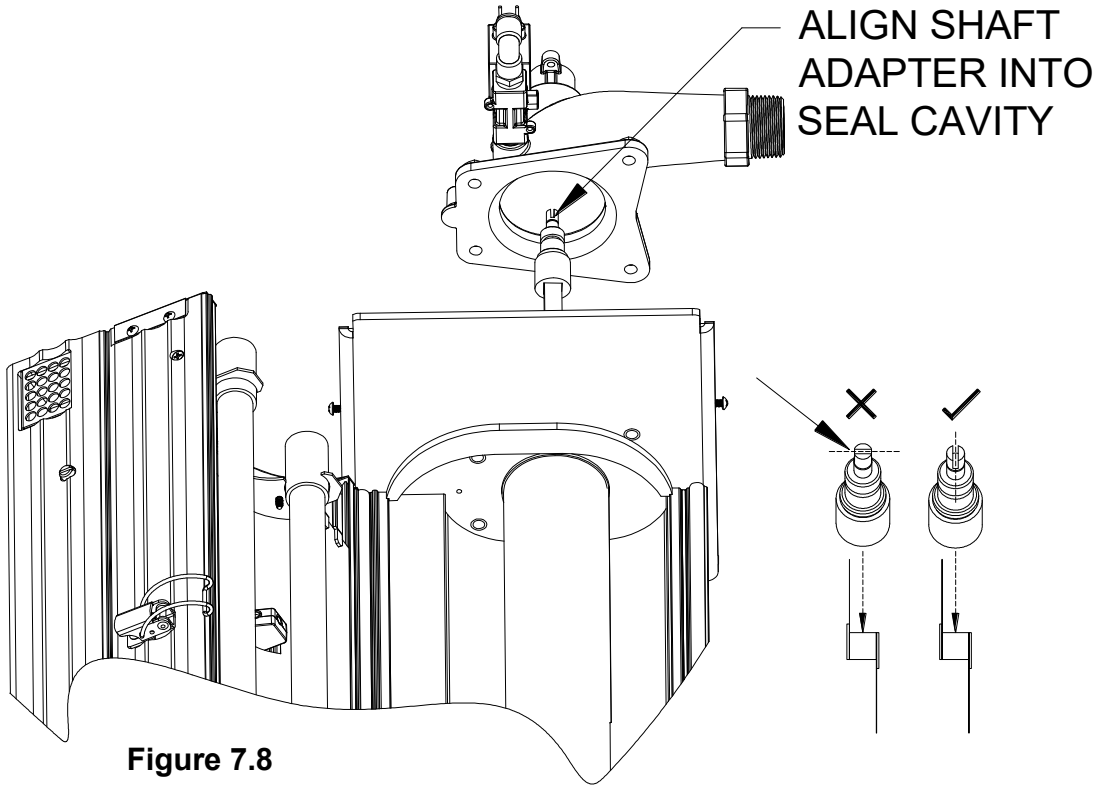

Figure 7.8

Step 2: Ensure the quartz O-ring seal is in place around the quartz sleeve and then replace the top manifold by aligning the shaft adapter into the seal cavity of the top manifold (see Figure 7.8).

Step 3: Tighten the nuts in an alternating pattern. Once top manifold is secure, replace the retaining ring on the wiper shaft. Rotate the wiper assembly CCW to have the top wiper blade facing the back of the unit.

Step 4: Reconnect both top and bottom piping connections. Close the UV Chamber door.

Step 5: Close any taps and slowly open the water supply. Inspect for leaks. Repair any leaks if necessary before plugging in the unit.

Step 6: Reinstall the motor mounting plate by using the trigger cam to center the plate (center hole to be concentric with wiper shaft). With the wiper blade opposite the UV sensor facing the back, the trigger cam should have the dimple in the 10 o'clock position. Install the wiper motor, then reconnect all the wires.

Step 7: Reinstall the top and bottom plastic covers.

Step 8: Plug in the unit. Check operation of wiper motor, purge valve and water temperature switch.

Step 9: Make an entry in the service record to establish a cleaning schedule.

Replacement Parts

Use only genuine parts from UV Pure Technologies when servicing your Hallett disinfection system. Failure to use genuine replacement parts will void the factory warranty, and any laboratory validation and/or certification for water safety and system operating performance. Figures 7.9A-B shows a complete list of original factory parts.

Replacement parts and service are available from your Installer, a Certified Service Dealer (CSD), or directly from UV Pure Technologies on our e-commerce site: www.uvpure.com . A complete list of Certified Service Dealers and their coverage areas is available on UV Pure's website: www.uvpure.com.

Hallett Spare Parts List

Item No.	Part Name	Model			
		Hallett 1000XX	Hallett 750XX	Hallett 500XX	Hallett 400XX
1	UV Lamps (Shipped in pairs)	**GC19**			
			C300065 (single lamp p/n is C300064)		
				E300210 (single lamp p/n is E300209)	
					E300165
2	Electronic Ballast	GD37 (2 per unit)	GD40 (for 120V instant start systems) (1 per unit) GD41 (for preheat & 230V systems) (1 per unit)		
3	UV Sensor Kit	GD1 (some units have 2 - see Product Spec. Table)			
4	Wiper Motor Kit	R400005			
5	Purge Valve Kit	H400000			
6	Quartz Sleeve Replacement Kit (includes 2 O rings)	GDQ-XL	GDQ-L	GDQ-M	GDQ-S
7	Wiper Assembly Kit	GDW-XL	GDW-L	GDW-M	GDW-S
8	Reflector Kit (shipped & sold in pairs)	GDR-XL	GDR-L	GDR-M	GDR-S
9	Circuit Board - LCD	Contact UV Pure			
10	Circuit Board – Power	GD3 (for 120V systems) GD3-230 (for 230V systems)			
11	Fuse Pack (5 pcs)	GD4 (for 120Vac systems, fuse is 6A, 250V 3AG) GD4-230 (for 230Vac systems, fuse is 3A, 250V 3AG)			
12	Seal Kit (complete)	GD5 (2" Port)	GD6 (1" port)		
13	Air Filter	GD7			
14	UV Chamber Blower Kit	GD8			
15	Circuit Board Blower Kit	GD9			
16	Temperature Sensor (Thermistor) Kit	GD10 (3 per unit)			
17	Top Plastic Cap	GD11			
18	Bottom Plastic Cap	GD12			
19	Lamp Socket Wire Harness	GD42 (2 per unit)	GD43 (for 120V instant start systems) (1 per unit) GD44 (for preheat & 230V systems) (2 per unit)		
20	Top SS Manifold/ Thermistor/Purge Valve Kit	GD13 (2 inch)	GD14 (1 inch)		
21	Bottom SS Manifold	GD15 (2 inch)	GD16 (1 inch)		
22	2" NPT Adapter (1 pc.)	GC25			
23	Fastener Kit for 2" Adapter (2 per unit)	GD22			
24	Optional Flexible SS Hose	GD17 (2" hose)	R400007 (1" hose)		
25	Optional Solenoid shut-off Valve – Nylon	550213	550229 (1" ports)		
	Optional Solenoid shut-off Valve – Brass		550195 (1"ports)		
26	Heaters for LPHO Lamps		GD18		
27	Wiper Position Switch Kit	GD19			

28	Optional Strain Relief Kit	GD21	
29	Power Cord	150013 - for 120V North America 150161 - for 230V Europe; 150135-for 230V Aus/NZ	
-	Purge Valve Relocation Kit	GE3	
-	10gpm Flow R. Kit		GD24
-	13.2gpm Flow R. Kit		GD25

9. UV PURE TECHNOLOGIES LIMITED WARRANTY

Limited Warranty for UV Pure Technologies'® water disinfection systems and peripheral parts purchased in Canada, the United States, Australia and New Zealand.

What this warranty covers:

Defects in materials and workmanship in Products and Parts manufactured by UV Pure Technologies Inc. (UV Pure) including Hallett® systems, and parts such as replacement UV lamps other original equipment manufacturer components such as manifolds or NEMA cabinets sold or certified by UV Pure Technologies Inc.

What the period of coverage is for UV Pure Products and Parts:

Five-year Limited Warranty for structural, hardware, and mechanical components. Specifically, this includes the following UV Pure Parts: system casing (machined and extruded aluminum parts, stainless steel parts, and plastic molded components), stainless steel manifolds, NEMA cabinets, welded steel skids and structural components, stainless steel self-cleaning mechanism, and mechanical fasteners.

Three-year Limited Warranty for electrical components, reflectors, and quartz sleeve. Specifically, this includes the following UV Pure Parts: wiper motor, air blowers, circuit boards, ballast and micro-processor with digital display, wiring harnesses, lamp sockets, reflectors, and quartz sleeves.

One-year Limited Warranty sensor probes and valves, Specifically this includes the following UV Pure Parts: UV sensors and the circuit board they are mounted in, temperature probes, and purge valves.

12-month Limited Warranty for all replacement LPHO lamps

16-month Limited Warranty for all replacement amalgam lamps

Ninety-day Limited Warranty or Balance of Original Warranty for replacement Parts or Products. Specifically this includes any UV Pure Parts or Products replaced or repaired under this Limited Warranty, and any Parts purchased for routine service or maintenance. This warranty period is for the balance of the original warranty or for 90 days from the date the Product or Part is repaired and/or returned to the first end-user whichever is longer. An exception is all replacement lamps that are covered for 12 or 16 months from date of replacement depending on lamp type.

Who is covered:

This Limited Warranty extends to you only if you are the FIRST END-USER PURCHASER and with respect to the ORIGINAL INSTALLATION; the **warranty period shall commence upon the Date of Purchase**.

What we will do to correct problems covered by this Limited Warranty:

During the warranty period, as set out above, UV Pure will repair or replace Products or Parts, at its sole discretion and cost, with the exception of shipping and handling charges. UV Pure may require that certain failed part be returned to UV Pure within 45 days for analysis and to facilitate continuous improvement; for example, circuit boards and sensors that fail must be returned to UV Pure. Replacement parts or systems may be functionally equivalent reconditioned/refurbished/pre-owned or new products or parts at UV Pure's sole discretion. UV Pure may provide software updates, at its discretion, but is under no obligation to do so. Based on an agreement between UV Pure and its service providers, Certified Service Dealers, this warranty will be honoured by either UV Pure or a Certified Service Dealer.

In North America, based on an agreement between UV Pure and its service providers, Certified Service Dealers, this warranty will be honoured by either UV Pure or a Certified Service Dealer.

Outside North America UV Pure has appointed Distributors that will honour this warranty and that provide service directly or via local Certified Service Dealers.

How to get help:

Call a Certified Service Dealer (CSD) or UV Pure's Customer Service toll free line: 1-888-407-9997. A complete list of Certified Service Dealers and their coverage areas is available on UV Pure's website: www.uvpure.com. Or, email UV Pure's Customer Service Center: info@uvpure.com.

What this Limited Warranty does NOT cover:

Maintain your original PROOF OF PURCHASE. UV Pure or its Certified Service Dealers reserve the right to deny warranty coverage if you cannot provide proof of original purchase including date of purchase, who you purchased the Product or Part from, and serial number.

USE OF REPLACEMENT UV LAMPS THAT ARE NOT ORIGINAL UV PURE EQUIPMENT WILL VOID THIS WARRANTY.

USE OF REPLACEMENT UV LAMPS THAT ARE NOT ORIGINAL UV PURE EQUIPMENT WILL INVALIDATE CERTIFICATION TO OR BY EPA, NSF, MENV, NWRI AND OTHER VALIDATION PROTOCOLS AND CERTIFYING BODIES.

All UV lamps lose power over their usable lifetime; original equipment UV Pure lamps are engineered and tested to ensure that all of our systems achieve the

minimum power for disinfection specified, at the end of lamp life. Lamps that are not made by, or that are not approved by UV Pure may not meet those same high standards. Of course UV Pure performs rigorous testing of its systems and original equipment components to its own high quality control standards, and external testing and certification protocols are performed with original equipment UV Pure lamps. NON-ORIGINAL EQUIPMENT UV LAMPS have not been approved by certifying bodies, thereby invalidating those tests and certifications. If you have a question as to whether UV Pure lamps are original equipment, please call our Toll Free Customer Service line at: 1-888-407-9997.

UV Pure may source and supply equipment that is manufactured and warrantied by other companies (the Original Equipment Manufacturer) and **offered as options** in conjunction with UV Pure's Products and Parts. For example: heaters or AC units used in NEMA cabinets, solenoid shut-off valves, stainless flexible hoses, filter housings and inserts, UPS power supplies, and on-line instrumentation or web-enabling communications equipment. **Warranties for those components are solely the responsibility of the Original Equipment Manufacturer, and NOT UV Pure.** UV Pure uses reasonable efforts to ensure that OEM options are of the highest quality possible and consistent with UV Pure's high standards.

UV Pure is not responsible for Parts or Products that are improperly installed, used and/or not maintained as set out in the Product Manual or as expressly advised by UV Pure. This Limited Warranty does not cover damage caused by accidents, acts of God, minor scratches or imperfections and normal wear and tear. This Limited Warranty is void if the Product is improperly installed, used in conditions that exceed UV Pure's specifications as set out in the Manual or Product Specifications, or if there is water damage due to improper installation or poorly or improperly tightened plumbing connections. This Limited Warranty is void if the Product or Parts have been altered or modified in any way by anyone other than a UV Pure technician or a Certified Service Dealer. Warranty coverage may be void if the Product is operated in combination with ancillary or peripheral equipment not approved by UV Pure for use with the Products.

This Limited Warranty excludes the cost of labour in removing and/or reinstalling any defective Product or Part. In the event that a Product is returned to UV Pure for repair or replacement under the terms of this Limited Warranty, the Product must be returned in its original shipping container and packaging. UV Pure will not be liable for damage to the Product during shipping otherwise.

UV Pure does not assume any liability for personal injury or property damage caused by the use or misuse of any Product or Part. UV Pure is not liable for special, incidental, indirect or consequential damages. UV Pure's liability is limited to repair or replacement of the defective Part or Product and this liability shall terminate upon the expiration of the applicable warranty period as set out above.

This Limited Warranty may be amended or changed at any time, at UV Pure's sole discretion, without notice.

UV Pure offers inspection and refurbishing for older systems.

To assist our customers, UV Pure's certified technicians can provide inspection, recommendations, cost estimates, and complete refurbishing of older systems that may be out of warranty.

TO THE EXTENT PERMITTED BY APPLICABLE CONSUMER PROTECTION LAWS, ANY WARRANTIES PROVIDED FOR HEREIN ARE IN LIEU OF ANY OTHER WARRANTY, AND ALL OTHER WARRANTIES ARE HEREBY DISCLAIMED, WHETHER EXPRESS OR IMPLIED.

10. NSF STATEMENT

The Hallett 500PN and Hallett 750PN systems are Tested and Certified by NSF International against NSF/ANSI Standard 55 for Disinfection Performance, Class A.

Who is the NSF? The NSF is the global gold standard accepted by environmental regulatory agents worldwide for water treatment and disinfection.

This Class A system conforms to NSF/ANSI 55 for the disinfection of microbiologically contaminated water that meets all other public health standards. This system is not intended to convert wastewater or raw sewage to drinking water. The system is intended to be installed on visually clear water.

NSF/ANSI 55 defines wastewater to include human and/or animal body waste, toilet paper, and any other material intended to be deposited in a receptacle designed to receive urine and/or feces (black waste); and other waste materials deposited in plumbing fixtures (grey waste).

If this system is used for the treatment of untreated surface waters or ground water under the direct influence of surface water, a device found to be in conformance for cyst reduction under the appropriate NSF/ANSI Standard shall be installed upstream of the system.

The information contained in this document is subject to change without notice. UV Pure Technologies Inc. shall not be liable for errors contained herein or for consequential damages from improper installation or operation of this unit.

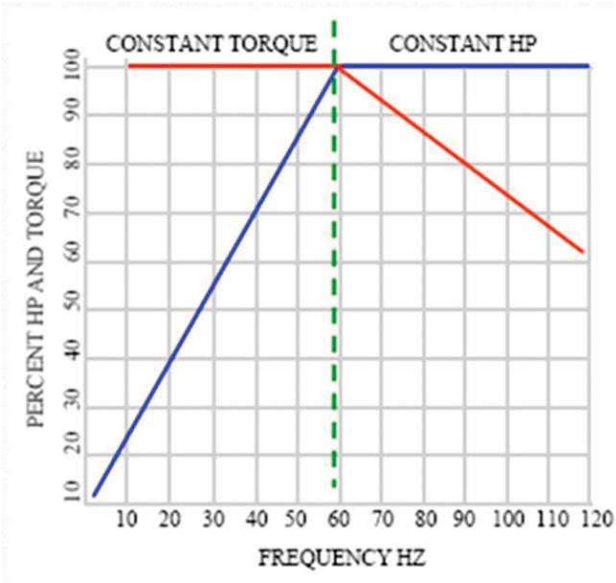
WARNING!!!!

When **Variable Frequency Drives (VFD's)**
are being used to vary the speed of the
NETZSCH Progressing Cavity Pumps, then they
MUST be CONSTANT TORQUE VFD's.



How the pump works

NETZSCH Progressing Cavity Pumps operate at a constant torque requirement for a specific operating pressure. The speed of the pump does NOT affect the torque requirement. **For example:** a pump running at 60psi output pressure at a speed of 200 revolutions per minute requires the same toque input as if it were running at 60psi output pressure at a speed of 600 revolutions per minute. The only exception to this rule is during pump startup; at the moment the pump starts the motor must provide more torque than the pump requires when it is running. This is due to the force of static friction that the motor must overcome in order to begin rotation. Although this is only a momentary force, enough torque has to be available to break the static load.

How the VFD works

Variable Frequency Drives work by taking the supplied power and modulating the supplied power frequency in linear proportion to the supplied voltage. This proportional modulation allows the motors speed to be altered without the motor drawing too many amps and burning out. A VFD can be built to perform this modulation in one of two ways. The VFD can be set to modulate the frequency above the normal supplied 60HZ frequency allowing the output to provide a constant amount of power but the torque will drop off as speed is increased **(THIS IS A CONSTANT HP VFD**) or it can modulate the frequency below the normal supplied 60HZ frequency allowing the output to provide constant Torque but the power will decrease as the speed is reduced **(THIS IS A CONSTANT TORQUE VFD).** This relationship is shown in the detail below. The manufacturers of VFD's typically offer two service factors. Normal Duty; which

has an overload capacity of the VFD's full load ampere rating times 110% - 120% for one minute and Heavy Duty; which has an overload capacity of the VFD's full load ampere rating times 150% for one minute. Typically, constant Hp VFD's are sold with a Normal duty rating since the applications don't call for high starting torque which causes amp draw to spike. Constant torque VFD's are usually sold with heavy duty ratings so that they can supply elevated startup amp draws for high starting torque applications.

VFD Speed Torque Characteristics

Blue = Horsepower
Red = Torque
Green = Motor Nameplate Frequency (60 Hz)

In Constant Torque Area - VFD supplies rated motor nameplate voltage and motor develops full horsepower at 60 hertz base frequency.

In Constant Horsepower Area - VFD delivers motor nameplate rated voltage from 60 Hertz to 120 hertz (or drive maximum). Motor horse-power is constant in this range but motor torque is reduced as frequency increases.
Note: Motor HP = Torque x RPM

Application:

Because while running a progressing cavity pump the torque value required by the pump is fixed; any reduction in supplied torque as a result of operational speed could cause the pump to fail. Also, depending on the running speed required, a constant HP VFD may not be capable of supplying the torque needed for pump startup. This is the reason a **Constant Torque** VFD **MUST** be used to operate a progressing cavity pump.

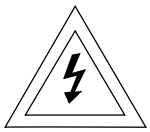
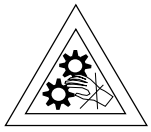
Remark: Because of data transfer the text sheet printouts of our operating instructions do not contain a personal signature.

1 Safety Instructions



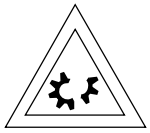
This manual contains basic instructions which must be observed when installing, operating and servicing the machine / equipment. It is essential therefore for the user / installer or responsible technician to read the manual thoroughly prior to installation and operation.
A copy of the manual must always be at hand where the machine / equipment is being used. In addition to the general safety instructions listed in this main section on safety, it is necessary to observe the special safety rules included in other sections of the manual, eg. for private use.

1.1 Safety Signs



The signs below are printed in the manual as general hazard / danger symbols to mark those safety instructions whose non-observance can result in danger to personnel or to the machine / equipment. These signs are:

Hazard sign DIN 4844 - W9
Danger to general public



Hazard sign DIN 4844 - W8
Risk of electric shock

Risk of injury from machinery

Danger from suspended loads

Damage to machinery

Risk of injury to your eyes: goggles required.

Continued Page 1.0R

Warning plates located directly on the pump/ equipment showing for example the correct direction of rotation or the fluid connections used must always be observed and kept completely legible.

1.2 Personnel Qualifications and Training

Operating, maintenance, inspection and installation staff must possess the correct qualifications for their work. Areas of responsibility, scope of authority and staff supervision must be exactly defined by the user. If personnel do not have the necessary knowledge they must receive due training and instruction. If necessary, the user of the machine / equipment can arrange for such training and instruction to be provided by the manufacturer / supplier. The user must also make sure that the content of the manual is fully understood by the staff concerned.

Responsibilites

All work on and operation of the pump/ equipment should be carried out by trained/ competent and qualified operators, tradesmen and / or engineers as appropriate.

Any person responsible for or in charge of

– **working with lifting gear** and ropes when moving a pump / equipment will have to be duly instructed prior to doing the transportation job;

– **mounting a drive** to a pump / equipment must be qualified / trained as an industrial mechanic / technician;

– **setting up installations into a plant** must be qualified / trained as an industrial mechanic/ technician and must be familiar with the design and functioning of the plant in which the pump / equipment is being installed;

– **doing work on starting up, operation and maintenance** must gain knowledge of the pump / equipment principle prior to performing such works and must study the safety instructions and the manual thoroughly;

– **doing repair works**, and prior to doing such works, must be trained and skilled in the job. He must have due knowledge of the pump/ equipments specific details set up in the repair instructions. Unskilled personnel must be trained and repair works checked.

1.3 Dangers arising from Non-Observance of the Safety Instructions

Non-observance of the safety instructions can result in danger to personnel as well as to the environment and the machine. Non-observance of the safety instructions can result in the loss of claims for compensation.

Non-observance of the safety instructions can have, for example, the following consequences:

▲ Failure of essential functions of the machine / equipment

▲ Failure of mandatory maintenance and servicing methods

Continued Page 1.1

- ▲ Danger to personnel from electricity, machinery and chemicals
- ▲ Danger to the environment from leakage of hazardous substances.

1.4 Safety Conscious Working

In addition to the safety instructions listed in the manual, it is essential to observe the national accident prevention directives currently in force and any of the users own internal regulations concerning work and safety.

1.5 Safety Instructions for the User / Operator

- ▲ If there is a risk of danger from any hot or cold machine component, the user must fit protective guards to prevent such components from being touched (according to Standard EN 563).
- ▲ Protective guards fitted to prevent contact with moving parts (eg. couplings) must be in position when the machine / equipment is in use.
- ▲ Leakages (eg. from a shaft seal) of hazardous materials (eg. explosive, toxic, hot material) must be discharged in such a way that neither personnel nor the environment are placed at risk. Legal directives must be observed.
- ▲ All possible danger from electricity must be eliminated (for details see eg. the regulations of your local power supply company).

1.6 Safety Instructions for Maintenance, Inspection and Installation

The user must ensure that all maintenance, inspection and installation work is carried out by authorized and qualified personnel who understand the operating instructions and are adequately trained.

Work on a pump / equipment must only be carried out with the machine stopped and electrical power supply turned off. The pump/ equipment must not be under any pressure and must have cooled off. All procedures detailed in these operating instructions on the stoppage of the machine must always be adhered to.

Pumps / equipment which convey harmful media must be decontaminated.

Immediately after the maintenance work is finished all safety devices and guards must be re-installed and the safety trips must be tested.

Before putting the machine back into operation the points detailed in section "Start-up" should be observed.

Continued Page 1.1R

1.7 Unauthorized Modifications and Manufacture of Spares

Modifications or changes to machines / equipment are only permissible with the manufacturer's agreement. Original spare parts and accessories authorized by the manufacturer ensure safety.
The use of other components revokes any liability for consequences which may result.

1.8 Improper Application

Delivered machinery / equipment is only guaranteed safe for the use specified.

This machine / equipment was designed in accordance with the prescribed conditions of use.
The limits of use are laid down in the conditions of use and should in no way be exceeded.

1.9 Specific Points for the Use of a NEMO® Pump

A NEMO® pump must be used for the **purpose only** for which it was sold.

If you change or wish to change the process medium, you must check with either the supplier or manufacturer that the pump is suitable for the new medium. This is especially important with aggressive, poisonous or otherwise hazardous substances.

Pump criteria include:

1. Compatibility with the medium
2. Suitability for seal design / material, especially the shaft seal
3. Resistance to pressure and temperature of the medium.

Please note that NEMO® pumps are progressing cavity pumps and as such can generate very high pressure.

A blockage or the chance closure of a valve in the discharge line can cause a pressure rise **manifold as high as can be tolerated by the installation**. This can result in the bursting of pipes, which must be avoided especially in the case of dangerous media.

Corresponding safety equipment must therefore be installed, for example an emergency stop button, a pressure relief valve with return pipe or a bursting disc.

During maintenance and repair work on the pump please note the following:

1. Ensure that the pump drive **can not** be turned on without authorization.
2. When opening the pump follow the instructions for handling the medium (eg. protective clothing, no smoking etc).
3. Before putting the pump back into operation ensure that all guards and other safety devices (eg. drive–belt protection, coupling protection) are properly re–installed.

Continued Page 1.2

1 SAFETY PRECAUTIONS

Always bear in mind your safety during operation, maintenance and installation of equipment. Please adhere to the EC-Directive for machinery including the national regulations and follow the US OSHA regulation #1910.219 & 1910.147 titled Mechanical Power transmission apparatus as well as the European Standard EN 292 with the accidents prevention rules laid down by the trade unions and other appropriate technical institutions.

Always bear in mind your safety during operation, maintenance and installation of equipment. Please adhere to the EC-Directive for Machinery including the national regulations and follow the European Standard EN 292 with the accident prevention rules laid down by the trade unions and other appropriate technical institutions.

Continued Page 1.2R

1.10 Notes on Inspection and Repair

The legal regulations for safety at work, such as regulations for the workplace, regulations governing dangerous materials, accident prevention, environmental protection eg. regulations on disposal and water balance obligate all commercial business to protect their employees and / or people and the environment from adverse effects caused by contact with dangerous materials.

Important:

Inspection / repair of machinery and its parts only takes place when a safety conformity certificate has been completed by an authorized and qualified specialist. Please use a copy and leave the original in the operation and maintenance manual.

Where special safety precautions are necessary in spite of careful emptying and cleaning of the machinery, the necessary information must be given.

Machinery operating with radio-active media will only be repaired or inspected by one of our specialist engineers under the safety of the owner.

The safety conformity certificate is part of the inspection / repair service. We reserve the right to refuse acceptance of this order / service for other reasons.

Continued Page 1.3

1.11 Instructions concerning explosion protection

The instructions below are to be considered and kept to when using pumps in potentially explosive areas in order to guarantee durable explosion protection of the pumps and avoid any danger of ignition.

In accordance with the regulations 94 / 9 / EC, the pumps are admitted for use in the area II 2G IIB T 4 or II 2G IIB T 3
(pls. see manufacturer's declaration or declaration of conformity).

It is to be taken into account that in case of aggregates the components (e.g. gears, couplings) mounted on the pumps must comply with the regulations 94 /9 / EC as well. The relevant documentation concerning these components is to be considered.
The application area of aggregates is determined by the application area of the mounted component with the lowest approval and thus may deviate from the allowed application area of the pump.

Temperature category	Max. temperature of the conveying product
T 4	100 °C
T 3	165 °C
T 2	265 °C
T 1	415 °C

The maximum conveying product temperatures apply when mechanical seals of Messrs. Burgmann with **carbide – carbide** and **carbide – carbon** as sliding material combinations are used.
In the case of other manufacturers or other sliding material combinations it is necessary to consult the manufacturer.

1. **Assembly and repair in potentially explosive areas**

   When performing assembly and repair work, it is to be seen to it that no dangers of ignition arise especially during heating up the pump parts. This means e.g. heating up by explosion-proof heating devices or exclusively in non-explosive areas. The temperature of the heated part and the ignition temperature of the materials by which the danger of explosion may be caused are to be considered.

2. **Dry-running protection**

   Under no circumstances is the pump to run dry.
   The pump is to be equipped with an appropriate dry-running protection device.

Continued Page 1.3R

The device for dry-running protection should be self-regulating.
This means that this device can give alarm signals and/or switch off the pump also in case of failures in its own control system.

Dry-running protection concerning stationary immersion pumps (with mounting plate)

Operation is only permitted with redundant or self-regulating automatic devices to guarantee dry-running protection as well as to control the pump capacity.

Dry-running protection concerning movable immersion pumps (drum pumps)

The filling with liquid during the operation is to be ensured by specific requirements of behavior:

- Drum pumps may only be introduced in and removed from the container in switched-off condition
- Drum pumps, after being introduced in the container to be discharged, may only be started after they have immerged in the fluid.
- Drum pumps are to be switched off before they run dry or are to be switched off at once when specific noises ("slurping" or speed rise) suggest that dry running may or will immediately occur.

3. **Overpressure protection**

   The pump must not be loaded over the maximum allowable pressure.
   The pump is to be equipped with an appropriate overpressure protection device. The pump must not convey against a closed slide valve.
   The overpressure protection device should be self-regulating.

4. **Drives**

   The drives must be adjusted to the performance of each pump.
   In the case of a blocking of the pump, the drives must be turned off automatically by means of a motor protection unit.

5. **Alignment of the drive (concerning the pump types SY / SH / SA / SO / SF / SP)**

   It is absolutely necessary that the drive be aligned within the maximum allowable tolerances. Incorrect alignment causes damage to the seals and the shaft bearings.

6. **Potential equalization concerning immersion pumps**

   The immersion pumps are to be integrated in the potential equalization of the installation. Hand-operated movable immersion pumps are to be grounded before being introduced in the container.

Continued Page 1.4

The connection to ground is to be maintained until the pump has been completely pulled out of the container.
There must not be any potential difference between the pump and a conductive container. This means that container and pump are to be connected at a common grounding point and thus be conductively connected with each other.
(see information brochure "Statische Elektrizität, Zündgefahren und Schutzmaßnahmen" (Static electricity, dangers of ignition and preventive measures); Publisher: "Internationale Sektion für die Verhütung von Arbeitsunfällen und Berufskrankheiten in der chemischen Industrie der IVSS" (International section for the prevention of employment accidents and occupational diseases in the chemical industry of the ISSA (International Social Security Association)) , Heidelberg 1995).
The hand-operated movable immersion pumps are to be provided with an indication referring to the grounding measure (pay attention to grounding).

7. **Potential equalization concerning all other pump types (no immersion pumps)**

   All conductive parts of the pump are to be integrated in the potential equalization of the pumping set unless the conductive connection to the ground potential is guaranteed by the drive or connecting shafts or otherwise.

8. **Stator**

   The stator is to be regularly checked for wear. When the allowable wear limit is reached, the stator is to be replaced. Before exchanging the conveying product, the pump operator has to consult the manufacturer concerning the durability of the stator unless the stator has already been confirmed for the intended application.

   Inspection and maintenance interval of the stator:
   - **in the case of an operating time of > 16 h/day, at least twice a year**
   - **in the case of an operating time of < 16 h/day, at least once a year.**

9. **Joints / joint lubrication**

   The sealing and the lubrication of the joints are to be regularly checked. If necessary, the seals and the lubricants are to be replaced.

   Inspection and maintenance interval of the joints:
   - **in the case of an operating time of > 16 h/day, at least twice a year**
   - **in the case of an operating time of < 16 h/day, at least once a year.**

10. **Inspection after initial startup**

    The aspects relevant for ensuring the explosion protection (such as lubrication and wear check) are to be checked six months after the initial startup of the pump at the latest.

Continued Page 1.4R

11. **Shaft bearings**
(concerning the pump types SY / SH / SA / SO / SF / SP)

Replacement of the bearings after 14,500 operating hours (according to prEN 13463-5: replacement after 90 % of the designated service life).

12. **Materials**

Although being allowed as material for the pumps, aluminum should be avoided in potentially explosive areas.
The pumps may only be used if, under the particular operating conditions, the materials are resistant to mechanical and/or chemical influences or corrosion such that the explosion protection will be maintained.

13. **Noise development**
(concerning the pump types SO / BO / SF / BF / SP / BP)

As soon as unusual noises (such as knocking or rubbing) are realized, the pump is to be switched off. The cause of the failure is to be eliminated before the pump is reoperated.
Regular check of the paddle equipment.

14. **Direction of flow of immersion pumps**

The direction of flow of immersion pumps always has to be from the end connection piece to the pressure nozzle at the top. The reverse direction of flow is not allowed.

15. **Mechanical seal of immersion pumps**

Before the initial startup and after a prolonged shutdown, the mechanical seal is to be lubricated from outside before the pump is started. In this connection, the compatibility of the lubricant with the sealing material is to be considered.

16. **Impurities in immersion pumps**

Especially in the case of hand-operated movable immersion pumps it is to be seen to it that no impurities can get into the pump. The pumps are to be deposited only on clean and solid ground or else to be suspended. In case of unusual noises or power losses, the immersion pumps are to be switched off immediately.

17. **Gland**

If a gland packing is applied it has to be observed that the permitted temperature corresponding to the temperature category is not exceeded. Recommendation: fasten the screws of the stuffing box gland only with low torque (approx. 5 Nm).

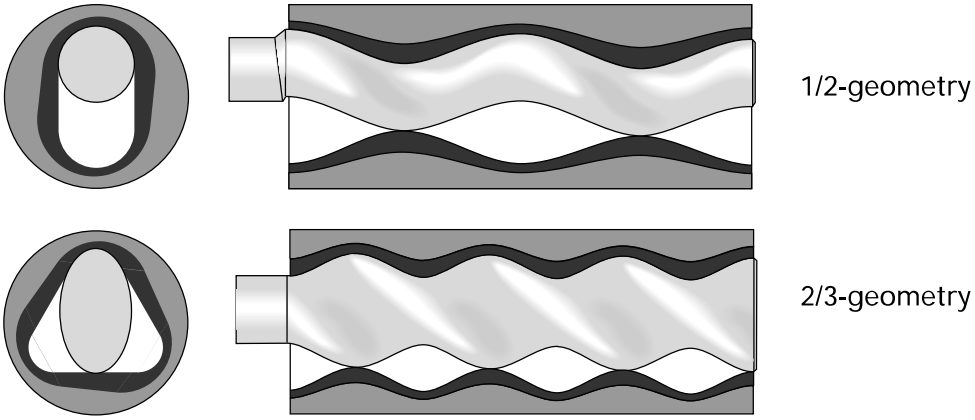
2 Description

The NEMO® pump is a progressing cavity pump.
The main components which determine the system discovered by Professor René Moineau are a rotating part, called the rotor and a static part, called the stator.
The rotor is a helical screw with an extremely large pitch, large thread depth and small centre diameter with round cross-section for 1/2-geometry and elliptical cross-section for 2/3-geometry. The stator has a two start or resp. 3 start thread and is double or resp. 1.5 the pitch length of the rotor. This provides space for the medium between the rotor and stator. When the rotor turns round inside the stator the medium moves continuously from the inlet to the outlet.



The universal NEMO® pump system unifies many positive characteristics of other pump types:

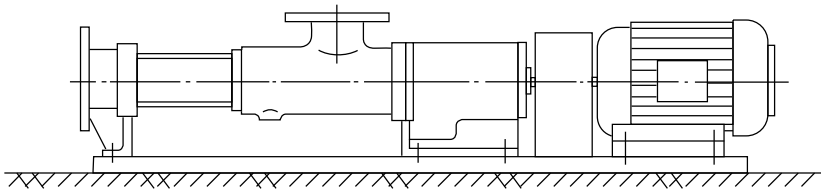
- Like centrifugal pumps NEMO® pumps have no suction or pressure valves, but do have a stable flow rate in proportion to the number of revolutions.
- Like piston pumps NEMO® pumps have a suction capability of up to 8.5 m vacuum metric.
- Like membrane and peristaltic pumps the NEMO® pump can transport every type of inhomogenous, gaseous and abrasive media, as well as those that are not of a liquid consistency or contain solids and/or fibrous material.
- Like gear pumps and screw pumps the NEMO® pump is capable of coping with high medium viscosities.
- Like piston, membrane, gear or screw pumps the NEMO® pump can perform dosing operations.

Length and cross-sections through the rotor and stator with 1/2-geometry during a rotation.

Continued Page 2.0R

Length and cross-sections through the stator with rotor
with reduced stator wall thickness

2.2 General Data



Noise emissions:

The maximum permitted noise emission level at a work place is 70 dB (A).

The noise level was measured in accordance with DIN Standard 45635-24-01-KL2 to assure that the pump does not exceed 70 dB (A).

Noises generated by the drive and pipes are not included in the above emission value.

A prerequisite for the noise emission level of ≤ 70 dB (A) is that the pump is operated in a cavity free regime and is bolted to a concrete base.

3 Packaging, Transportation, Storage

3.1 Packaging and Transportation

NEMO® pumps are shipped in railroad containers or crates unless the customer specifies otherwise.
The packings are labelled and symbols give the handling instructions in accordance with DIN 55402.
On receipt check for any transport damages.
Transport damages should be reported to the transporter immediately.
The pumps should be transported as closely as possible to the location of installation and only there should they be uncrated.

Uncrated horizontal pumps should be lifted by using a shackle which can be attached to the baseplate. The bolt holes of the frame or the lifting lugs attached to the baseplate could be used as shown on the installation drawing.

Vertical pumps should be lifted by using the bolt down holes, lifting lugs or shackles attached to the baseplate. This is shown on the installation drawing. For most applications, the drive is mounted on top of the pump.

Be careful when lifting top heavy pumps. The centre of gravity may be above the points where the lifting gear is attached to. If the case, secure additionally against tipping over!

Vertical pumps should not be deposited unless they are secured vertically. **Hazards of tipping!** Deposit only in horizontal position!

It is essential to avoid that the total pump unit be suspended with eye bolts of the motor or gear box. These eye bolts should be used for lifting the motor and/or the gear box **only.**

The Accident Prevention Rules, Section 18.4 relating to lifting accessories for the lifting of loads (VBG 9a) must be strictly adhered to.

Because of the variety of possible pump designs and applications, only general instructions can be given here. These should be good enough for experienced assemblymen or transportation experts.
When in doubt, please ask for detailed information on the pump unit concerned.

Continued Page 3.0R

When moving the pump or unit on **wheels** strictly attend to the following:

- Pad lock the motor drive and secure against unintended starting up.
- Move the pump unit carefully and slowly, especially where the ground is uneven. **Hazards of tipping!**
- Ensure a stable position of the pump or unit at the operating/storage place and secure it by actuating **all** clamping devices on **all** the wheels or rollers against voluntary moving away.
- Where fitted loosely, carefully watch the pipe bends when pumping. **Power of repulsion!**
- Where necessary, secure the pump unit additionally with support blocks.

3.2 Storage

The pumps are preserved for transport unless specified otherwise.
In cases of longer storage the pumps should be handled as follows until installation:

- **Stator:**

If the pump is not to be used immediately, then the elastomer along the contact line between rotor and stator may become permanently distorted (compression-set). This will increase the break away torque. Therefore, the stator should be removed and kept separately in a clean, cool and dry environment.
Standard DIN 7716 summarizes detailed information on the storage of rubber products, some of which is gathered here, and the following notice applies to a storage for a period of up to six months.

General

Most of the rubber products may change their physical properties under unfavourable conditions or if treated improperly, which will result in a shorter lifetime.
Or they may become useless through excessive hardening, aging, regenerating or permanent deformation, also because of blistering, cracking or other damages appearing on the surfaces.
The changes may occur under the influence of oxygen, ozone, heat, light, humidity, solvents or because of storing the products under tension.
If stored and treated properly, the rubber products will keep their properties, even over a long period of time (some years), almost unchanged.
This does, however, not apply to uncured rubber compounds.

Continued Page 3.1

Store room

The environment in which rubber products are being kept must be cool, dry, free of dust and rather airy, and they must not be stored in the open, not even in a weather sheltered space.
Rubber products should be kept in surroundings not having less than minus 10 °C and not more than plus 15 °C.
Store rooms should not be damp, and it must be ensured that there will be no condensation.
Most favourable is an environment offering a relative humidity under 65 %.
Rubber products must be protected against light, particularly direct sunlight or artificial light when having a high UV portion.
They should furthermore be kept away from ventilation, especially draught, by wrapping them up.
As ozone is very aggressive and harmful there should be no store room used which houses equipment likely to produce ozone, e.g. electric motors or other equipment which might bring about sparks or other electrical discharges.
There must be no solvents, oil, grease, lubricants or any chemicals kept in a store room.

- **Rotor**

  Please support with wooden blocks and cover up against harm from mechanical impact.
  For rotors of RCC (material number 1.2436):
  coat the surfaces with protective grease to avoid rusting.

- **Shaft Sealing by packing gland**

  Remove the gland and coat the exposed shaft surface with grease.

- **Pump parts in stainless steel**

  No grease coating necessary.

- **Other, non-coated pump parts**

  Protect with grease.

- **Drives**

  Please observe the drive supplier's instructions.

4 Mounting and Installation

If the NEMO® pump was stored and the rotor grease protected: Remove the grease before installing the stator. Clean the rotor thoroughly in order to avoid unsuitability of the grease with the stator material and the pumping medium.

Screw the pump at all fixing points (bearing housing / drive stool, end stud, support feet) using all fixing bores securely down to the sub-structure (ground plate, machine frame, foundation etc.).

4.1 Direction of Rotation

The direction of rotation of the pump is given on the model plate and in the order confirmation. The direction of delivery of the NEMO® pump is a function of the direction of rotation.

Changes must be agreed upon and confirmed by the supplier.

4.2 Pressure

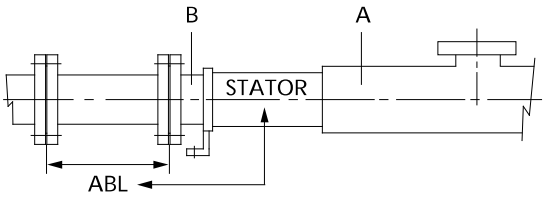
If not explicitly confirmed otherwise in the order confirmation, the **maximum permissible pressure (e.g. when turning clockwise) inside the pump housing (A)**

– for models with pump housing of cast iron 6 bar

– for models with welded pump housing 10 bar.

The maximum permissible pressures inside the end flange (B) is a function of the design applied for connections

- with flange: maximum nominal pressure (e.g. PN 16)
- with threaded internal socket: maximum 25 bar
- with DIN 11851 "dairy" thread up to DN 100 for one or two stage pumps: max. 12 bar, for multi stage pumps: max. 25 bar
- for other versions: maximum permissible pressure of the socket connection, but not more than 6 bar per pump stage, depending on the stator installed.



4.3 Piping System

- Arrange suction and pressure pipes so that when the pump is not running, the medium is still present before and after the pump. Sufficient media should remain inside in order to lubricate the pump during restart.

Continued Page 4.0R

4 INSTALLATION INSTRUCTIONS

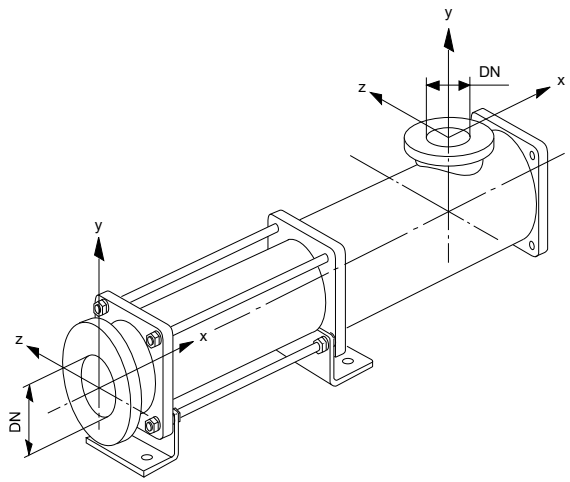
■ The installation of a removable distance piece between the end flange (B) and the pipe work is recommended in order to make the dismantling of the stator easy. The distance piece (see sketch) needs to have a minimum "ABL" disassembly length the values of which are shown in the table below, depending on the pump size and the number of stages.

Disassembly length ABL in mm:

Pump size	Number of stages			
	1 *)	2	3	4
0 1 5	90	160	230	310
0 2 1	130	230	340	450
0 3 1	170	310	450	590
0 3 8	230	430	630	830
0 4 5	270	500	730	960
0 5 3	320	600	880	1170
0 6 3	370	690	1010	1330
0 7 6	420	800	1170	1540
0 9 0	500	950	1390	1840
1 0 5	630	1180	1740	-
1 2 5	740	1400	-	-

*) for one stage pumps with L or P geometry the ABL values of 2 stage pumps are valid

Continued Page 4.1



Type key

Example: NM 090 BY 02 S 12 B

- Internal
- **Pump size**
- Type
- Model
- **Number of stages**
- Geometry
- max. permissible pressure difference
- anti–clockwise
- Joint

The disassembly length "ABL" is also shown in the arrangement drawings in accordance with our Standard QSH V - TB 01 - 002.

- Clean the pipe work and rinse thoroughly before installing the pump.
- Connect the pipe work ensuring that no external stress attacks the pump body. The installation of compensators between the pump and the pipework is recommended:
  - No risk of damage to the pump housing from pipelines "resting" on the pump.
  - No risk of damage to the pump housing through vibrating pipelines.
- The twisting loads (F_x, F_y, F_z) and bending loads (M_x, M_y, M_z) permitted to be put on the suction/discharge flange comply with the requirements of API 676 and exceed the requirements of EN ISO 14847. They are shown in the table below.

Continued Page 4.1R

Pump type NM	Standard nominal diameter DN	F_x, F_y, F_z N	M_x, M_y, M_z Nm	
015 021	(32) G 1¼"	550	(300)	Screwed joints must not be charged with loads which may result in tightening or loosening these joints

63	100	1490	800	
76	125	1820	980	
90 105	150	2190	1180	
125	200	2850	1530	

4.4 Shaft Sealing

- Where applicable, ensure that adequate supply lines for the buffer, flushing or quenching fluid for the shaft seals are connected **before** the pump is put into **operation**.
  For more details see Section 7.4!

4.5 Electrical Connection

All work relating to electricity shall only be made by **authorized and qualified personnel** and it should be in compliance with the requirements of the relevant national regulations!

In particular for control systems should the latest version of the **EC-Directive for Machinery 98/37/EEC, Annex I, Section 1.2 Controls** be carefully observed!

Note for frequency converter operation:
It is absolutely necessary to connect the PTC-resistors of the drive in case of frequency converter operation to protect the drive against overheating.

5 Start-up

The NEMO® pump design requires strict attention to the following:

Never run the NEMO® pump dry!
A few rotations in dry condition
will damage the stator!

- Before starting up for the first time, fill the pump with medium.
  In the case of high viscosity media fill with a liquid.
  Pump priming is vital to ensure lubrication of the rubber stator.
  Fill the piping on the pump suction side.
  In anti–clockwise rotation only: Fill the pump housing.

The NEMO® pump is a progressing cavity pump which can produce pressures that may cause the bursting of vessels or pipes.

The power transmission train (shaft, coupling rod, joints, rotor) of the pump may be overloaded thus resulting in damage or breakage.

Also the pump housing parts with their connections may be overloaded and break. There is a table in Section 4 of these Maintenance and Operating Instructions showing the pressure resistance of the pump housing parts.

Never run the pump against a closed inlet or outlet valve!

- **Open valves and vents before starting the pump!**
- **Check the direction of rotation by briefly switching on the pump motor.**

DETERMINING WHEN TO LOCKOUT

Having performed a hazard analysis on your company's equipment, you can now determine when machines must be locked out – i.e., when employees are exposed to injury from each (or any) of a machine's hazardous energy sources during servicing or maintenance activities. To do this, use your Hazard Analysis Checklist and the "Four Key Questions for Lockout Implementation."

OSHA Requirements

OSHA rules state that equipment must be locked out during equipment servicing and maintenance whenever employees are exposed to injury from unintentional machine movement or startup. According to OSHA's regulations, servicing or maintenance procedures that require lockout include:

"Workplace activities such as construction, installing, setting up, inspecting, modifying, and maintaining and/or servicing machines or equipment. These activities include lubrication, cleaning, or un-jamming of machines or equipment and making adjustments or tool changes, where the employee may be exposed to the unexpected energization or startup of the equipment or release of hazardous energy."

In addition, lockout is required during any machine service or maintenance that requires an employee to:

- Remove or bypass a safety device; or
- Place any part of his or her body into a point of operation or similar danger zone during a machine's operating cycle.

Routine, Repetitive Activities

Routing and repetitive servicing procedures that take place during normal production operations, such as minor tool changes and adjustments, do not require lockout tagout, as long as the work is performed using "alternative measures which provide effective protection." These "alternative measures" include safeguarding methods approved by OSHA and ANSI (American Standards Institute) to protect operators, such as:

- Presence sensing devices
- Interlocking barrier guards

Remember, the factor that determines whether these or any other safeguarding methods eliminate the need for lockout tagout during routine, repetitive activities is whether the employee is protected from injury.

If lockout is not required, you MUST have clearly written procedure that describe the alternative safeguarding measures used and the tasks that may be performed. Refer to OSHA and ANSI standards for approved safeguarding methods.

6 Temporary Shutdown

- After stopping the pump empty and if necessary rinse it if

  - the medium might freeze due to the temperature surrounding the pump. Especially where there is a danger of frost if the pump is installed outside a building
  - the medium tends to solidify or harden
  - the medium tends to glue up the shaft seal.

- Stator:

  When stored for a long period, the elastomer along the contact line between the rotor and stator may become permanently distorted (compression-set).
  This will increase the break away torque. For this reason, the stator should be removed (please observe Section 9!), and stored in a cool, dry place in air tight package to give protection against light and air.

- Rotor:

  Remove **ceramic rotors** (please observe Section 10!) and store away, safe in the original packing.

  Support **other rotors** on wooden blocks and cover to protect them from mechanical damage, after the stator has been removed.

  Rotors made of RCC (material number 1.2436):
  Protect the rotor surfaces against corrosion with protective grease.

  Remove the grease before re–installing the stator and clean the rotor thoroughly in order to avoid unsuitability of the grease with the pumping medium or the stator material.

- Stand-by pump:

  A stand-by pump is sometimes used as a back-up for the main pump and, when standing idle for longer periods, should be operated from time to time. The pump may otherwise become seized when being started up. This is due to compression set i.e. distortion of the stator against the surface of the rotor.

7 Maintenance

7.1 Pumps in General

- The pumps should be regularly rinsed or cleaned if deposits of medium are likely to build up (sedimentation).

If the pump needs to be opened to do this, ensure that the pump and motor are switched off and cannot be turned on accidently (eg. by removing the fuse).

Periodical standstill to allow for cleaning during operation depends on the medium and type of operation.

- The pump can be cleaned:

  - through the cleaning ports provided in the pump housing
  - manually by dismantling the pump
  - automatically (CIP cleaning) for special housings with a flushing section (important instructions for CIP procedures are given in Section 5 (START UP).

7.2 Lubrication

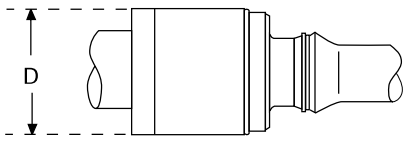
The NEMO® pump does not require frequent lubrication.

- Maintenance of the drive should be carried out according to the drive manufacturers instructions.

- Maintenance
  - where no manufacturers instructions are available and
  - when normal conditions of use exist:

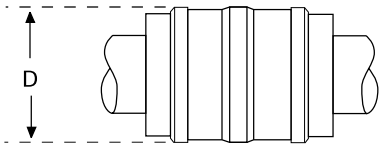
  - Strip down the drive unit
  - Remove the bearings
  - Clean all parts
  - Renew the lubricant

  every 5000 operating hours or at least every two years.



Special lubricants are often specified for mechanically controlled variable speed drives.
It is therefore important to follow the drive manufacturers maintenance instructions.

7.3 Lubricating the Pin Joints with SM-Pin Joint Seals



- It is advisable to change the oil and check the seals of the pin joints:
  - when renewing worn joint parts
  - when opening the pump for any reason.

  The quantity of oil added per pin joint is a function of the joint external diameter D:

Joint external diameter D in mm (see sketch)	Basic joint size	Quantity of oil per joint in cm^3
28	NM 015	1,5
30	NM 021	2
40	NM 031	5
54	NM 038	15
65	NM 045	22
76	NM 053	36
83	NM 063	78
102	NM 076	165
125	NM 090	205
148	NM 105	450
162	NM 125	470
Journal cross joint 175	NM125	1650

Continued Page 7.2R

Lubricating Oil:

Industrial application	Designation DIN 51502	Permitted Product
Food and Beverage Industry only	Authorized for use in foodstuffs — CLP HC 460	"KLÜBER" KLÜBEROIL 4 UH 1 - 460 authorized under USDA H1

This synthetic oil meets both the German "Arzneimittelbuch" requirements and the still stricter US American FDA regulations.
Nevertheless, it is not quite harmless if swallowed in more than minor quantities!

At a sudden break in a joint up to 450 ml of lubricating oil together with metal rubbings may enter the pumping medium. It is therefore of essential importance to regularly check the state of the joint seals and renew in time, if necessary.

If the pin joints operate without lubricating oil or seals, there will be no risk of contaminating the medium with oil. This operation, however, results in a higher amount of rubbed off metal parts through wear on the joints. These metal rubbings will inevitably and continuously come into contact with the pumping medium.

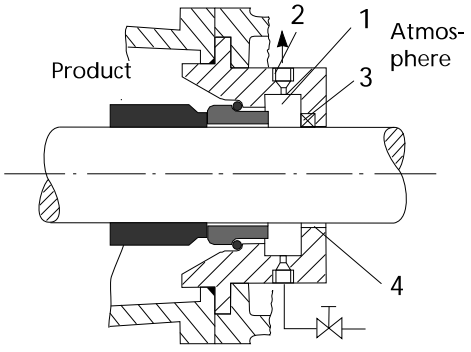
General Industry	CLP 460	"SHELL" Omala 460
	with SM-pin joint seal (8235) of EPDM CLP PG 320	prescribed: KLÜBERSYNTH GH 6-320

7.5 Shaft Sealing through Single Mechanical Seal

There are various constructions of mechanical seals. Especially advantageous is the use of standard mechanical seals according to DIN 24960. These seals have regardless of their brand the same fitting dimensions which makes them interchangeable. Mechanical seals with a coil spring can only be used for pumps which are run in one direction of rotation.

- The seal specification of a NEMO® pump is recorded on the order confirmation sheet.
- Pumps fitted with direction dependent seals should **never** be run in the opposite direction of the rotation arrow.
- If excessive leakages occur the spring tension and the seal surfaces should be checked, and the seal be replaced, if necessary.

Single mechanical seals usually work without any additional equipment. Their application range can be increased by operating them with a rinsing or cooling system.



a) **Quench**, in accordance with ISO 5199, Appendix E, Plan Nos. 08, 09, 10 or 13 or API 610, Appendix D, Plan No. 62.

Quench is the designation commonly used in sealing engineering for an arrangement that applies a non pressurized external fluid to the atmospheric side of a mechanical seal. The quench is used when

- a single mechanical seal will not work or only to a limited extent without auxiliary measures or
- a double mechanical seal with pressurized buffer fluid is not necessary.

Recommended for the following applications:

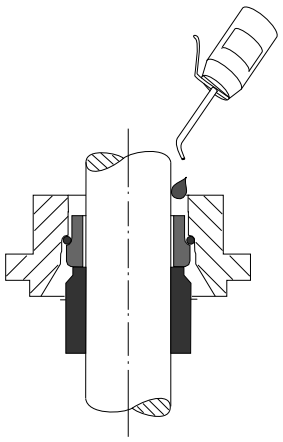
- Low temperature (danger of freezing)
- Operation in a vacuum (dry running)
- Media which must be isolated from the atmosphere (eg. due to build up of solid deposits or because of less severe damage to the environment, like smell).

Continued Page 7.5R

Leakages will be transportet away by the quenching liquid.
In vacuum operation dry running of the seals is avoided.

No pressure higher than that of the pumped medium **in front** of the mechanical seal is allowed to build up in the quenching area (1) **behind** the mechanical seal. Otherwise the counter ring will be pushed out of the housing. **Free discharge** from (2) is necessary!

Closing off the quenching area from the atmosphere can be done in three ways:



1. In the case that high emission levels can be tolerated:
   Through a throttle bush (4). Cooling liquid not permanently used, only released from time to time.
2. In the case that medium emission levels can be tolerated:
   By a radial shaft seal ring (3). Permanent radial shaft seal lubrication through quenching liquid is necessary.

b) **Top lubrication**

Attention: For vertically installed pumps with overhead drive as type NT:

On initial start-up the mechanical seal has not come in contact with the medium. It runs therefore dry for a short period of time until the air is displaced from the pump housing.

- On first start–up and if stood idle for longer periods lubricate the mechanical seal before switching on the pump.
- Apply water, glycerine or oil depending on their compatibility with the pumping medium and the elastomer of the mechanical seal.
- Fill the quench cup of the mechanical seal housing.

8 Trouble-Shooting and Remedying

8.1 Trouble Chart

The chart overleaf lists possible problems

- the type
- the likely reason / cause
- the remedy.

- A problem may have various causes: Several boxes in the vertical column are marked with a cross.
- A reason/cause may result in various problems:
  Several boxes in the horizontal column are marked with a cross.

8.2 How do you trace the kind of problem to find the possible cause ?

- The column describing a possible problem shows one or several boxes marked with a cross.
- On the corresponding lines you will find the possible reasons/cause and some hints how to handle the problem .
  Thus the actual cause of the problem can be narrowed down and eventually detected.
- If you find further cross-marked boxes on one of the lines and should there appear corresponding problems as well, then the likely cause of the problem has been detected.

- The table helps in finding the root of the problem and will give you the remedy if it is straight forward. For more complicated problems the manufacturer has to be consulted.

Continued Page 8.0R

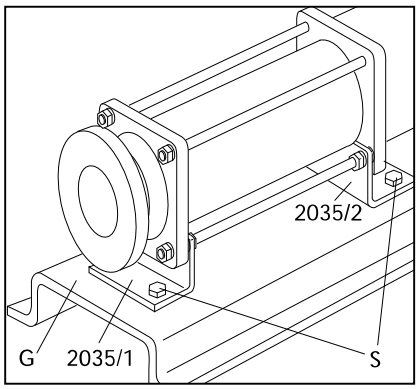
The NEMO®-pump is a well established product which was thoroughly tested before leaving the factory. If you use the pump in keeping with your Order Specification and treat it in accordance with our Operating and Maintenance Instructions, it will run satisfactorily for a long period of time.

Possible Problems											
The pump is no longer starting	The pump is no longer sucking	The pumped medium is too little	The pressure is too low	The pumped medium is unstable	The pump is running loudly	The pump is stuck	The drive is overloaded	The stator life time is too short	The rotor life time is too short	The shaft seal is leaking	**Possible Causes** (Remedy overleaf)
X							X				In new pumps or stators : the static friction is too great.
X		X	X				X				The pump electrical equipment is not compatible with the electrical supply.
		X					X	X	X		The pressure is too high.
X						X	X				There are foreign bodies in the pump.
X						X	X	X	X		The temperature of the liquid medium is too high, the stator is too ductile.
X						X	X	X			The stator has swollen, the elastomer is not compatible with the medium.
X						X	X	X			The solids content of the medium is too high and leads to blockages.
X						X	X	X	X	X	The liquid medium sediments or hardens when left to stand.
		X	X	X							There is air in the suction pipe.
	X	X	X	X							The suction pipe is leaking.
	X	X	X	X							The shaft seal is leaking.
		X	X								The rpm is too low.
	X	X	X								With reduced diameter rotors : operating temperature has not been reached.
		X	X	X	X			X	X		The suction is too great or pressure too low (cavitation).
		X	X		X	X	X	X			The pump is running dry.
	X	X	X		X						The stator is worn out, or temperature of liquid is too low.
	X	X	X		X			X	X		The stator material is brittle.
	X	X	X		X			X			The rotor is worn out.
					X						The joints are worn out.
					X						The pump and drive are not axially aligned.
					X						The elastic element of the coupling is worn out.
					X					X	The roller bearings are destroyed.
							X				The rpm is too high.
							X				The viscosity is too high.
							X				The specific weight of the medium is too high.
							X			X	The stuffing box is incorrectly tightened.
										X	The packing is not suited to the liquid medium.
	X									X	Mechanical seal : rotation is incorrect.
										X	Mechanical seal : mechanical seal and mating ring have failed.
										X	Mechanical seal : elastomers damaged, swollen or brittle.

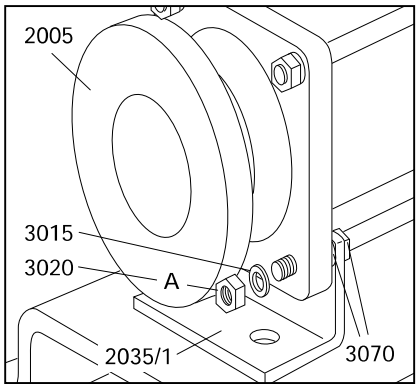
Remedy
Fill the pump up, then pump through manually using a suitable appliance; if necessary use glycerine as lubricant in the stator.
Check order information. Examine electrical installation (possibly 2 phase operation).
Measure the pressure with a manometer and check against order details. Reduce the pressure or change the drive.
Remove foreign bodies and eliminate possible damage.
If the liquid medium temperature cannot be lowered, use a reduced diameter rotor.
Check whether the liquid medium agrees with the order requirements. Possibly change stator material..
Increase the liquid part of the medium.
Clean the pump and rinse through after each run.
Increase the suction liquid level, prevent turbulance and air bubbles at the inlet.
Check seals and tighten pipe connections.
Stuffing box : tighten or renew. Mechanical seal : renew seals, eliminate solid deposits.
In the case of adjustable drives : increase the rpm. If necessary change the drive.
Warm up the pump (stator) to operating temperature first of all.
Decrease suction resistance, lower the temperature of the liquid medium, install the pump at a lower location.
Fill up the pump, provide for dry running protection, move the pipes.
Replace with a new stator or ensure correct liquid temperature.
Fit a new stator. Check the liquid medium agrees with order details; if necessary change the stator material.
Change rotor, establish the cause. Wear and tear, corrosion, cavitation; if necessary change to a different material or coating.
Replace relevant parts, carefully reseal and lubricate.
Re-align the unit.
Use a new connection and re-align the pump.
Replace roller bearings, lubricate, reseal. At higher temperatures observe the lubricant and the bearings.
In the case of adjustable drives : lower the rpm.
Measure the viscosity and compare with order details. If necessary adjust viscosity or change the drive.
Measure specific weight and compare with order details. If necessary adjust specific weight or change the drive.
Service stuffing box according to page 7.4, if necessary renew worn shaft.
Replace fitted packing with another packing type.
Change electrical connection.
Replace relevant rings with new ones.
Replace elastomers. Check whether the liquid medium agrees with order details, if necessary change material.

9 Removal and Fitting of End Stud, Stator and Pump Housing

The pump with attached pipework should be empty and must have cooled off!
Disconnect the pipework on the suction side and pressure side of the pump.



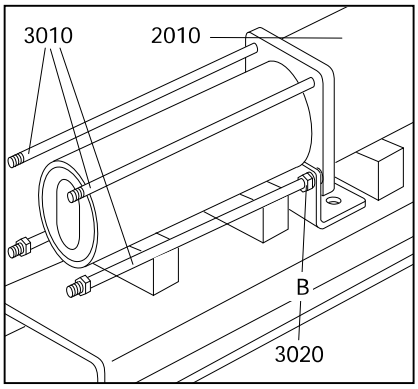
Caution for pumps with ceramic rotors!



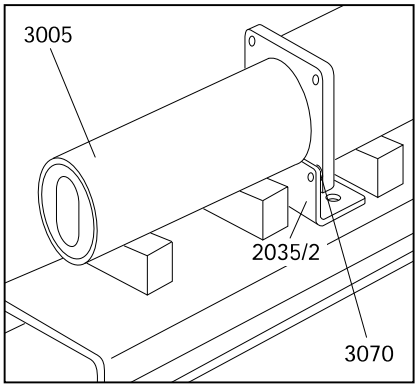
Where a pump is fitted with a **ceramic** rotor (1999) the following operations should be carried out **with great care.**
Do not use any force or sharp tools! Special care must be taken to prevent heavy strokes, vibrations or impact by a hammer.

Dismantling

- Remove the securing screws (S) from support feet (2035) to baseplate (G).



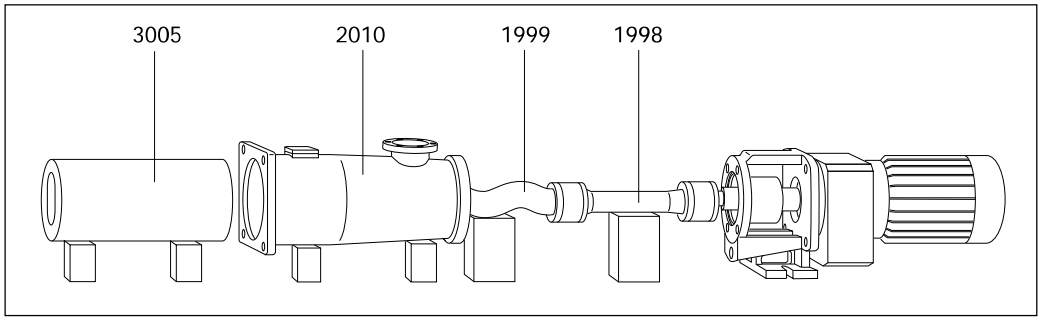
- Unscrew the hex nuts A (3020) and remove with spring washers (3015), then withdraw the end stud (2005) and first support foot (2035/1) with washers (3070).



Continued Page 9.0R

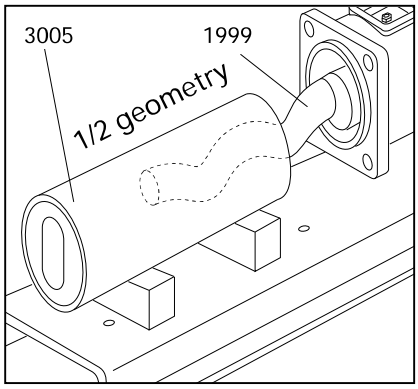
9 DISMANTLING AND ASSEMBLY OF THE PUMP HOUSING

- Support pump housing (2010) and stator (3005) with wooden blocks.
- Loosen the hex nuts B (3020), where fitted, and remove the thru bolts (3010).



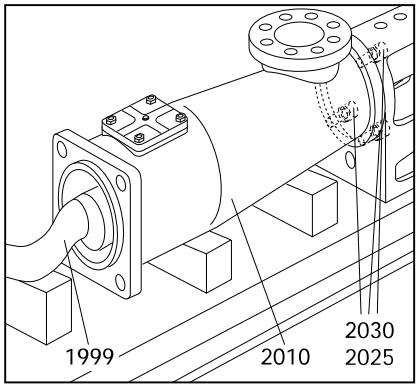
- Where fitted, remove the second support foot (2035/2) and the washers (3070).

Caution for pumps with ceramic rotors!



When the stator (3005) is removed from the **ceramic** rotor (1999), the stator must be supported to prevent it from suddenly tilting away downwards. The same applies to the rotor (1999) as soon as it is disengaged from the stator (3005). Removing the stator (3005) from the **ceramic** rotor (1999) is easier by using an extractor. This should be done slowly and with care in a rotating movement. When sliding pump housing (2010) over **ceramic** rotor (1999), both coupling rod (1998) and rotor (1999) should be lifted as the **ceramic** rotor (1999) must not knock onto the pump housing (2010).

Continued Page 9.1

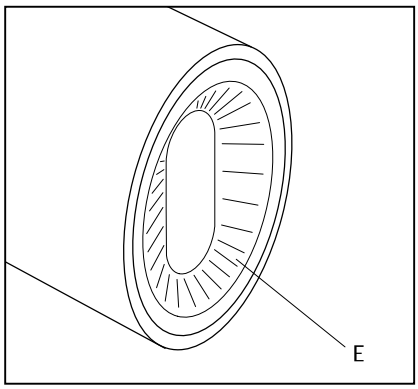


Caution for pumps with tubular rotors:

Where the walls of tubular rotors are worn in the wear zones, pumping medium may occur inside the rotor and may come out when pulling off the stator.
Ensure that protective measures have been taken when pumping dangerous media!

- Pull the stator (3005) out forward.
  A stator extractor can be supplied as special accessory.

- Remove the hex nuts (2030) with spring washers (2025).
- Pull the pump housing (2010) off forward.



Assembly

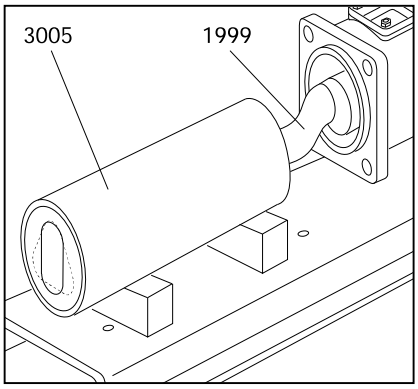
- Refitting is a simple reversal of this procedure.

  When refitting the stator (3005) check direction of stator (3005) is correct! The funnel-shaped inflow side (E) of the stator (3005) must show to
  - the pump housing (2010) when rotation is **anti-clockwise**
  - the end stud (2005) when rotation is **clockwise**

  when viewed on pump shaft end.

- **Elastomer stators (A)** have integrated front side sealing profiles (D). They don't need additional gaskets for sealing off the end stud (2005) and the pump housing (2010).

- **Solid stators (B)** have **no** integrated front side sealing profiles. Therefore additional gaskets (8005) should be installed to seal off the end stud (2005) as well as the pump housing (2010).



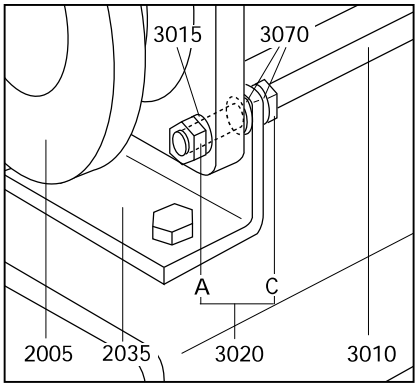
Continued Page 9.1R

9 DISMANTLING AND ASSEMBLY OF THE PUMP HOUSING

Be careful when engaging the stator (3005) and rotor (1999). Do not trap your fingers!
Do not reach inside the stator!

- Push the stator (3005) with a rotating movement on to rotor (1999).
  Apply an assembly device and some glycerine to ease engaging the stator (3005) and rotor (1999).

- When tightening hex nuts (2030) a gap will remain between drive stool (0085) and pump housing (2010).



Please do not try to close this gap by overtightening the nuts!
Drive stool (0085) may break!

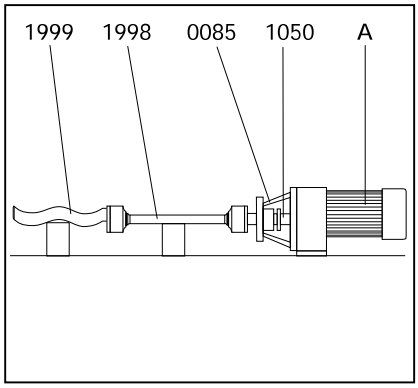
Torque values for hex nuts (2030):

Size	M6	M8	M10	M12	M16	M20	M24	M30
Required torque Nm	8	15	30	45	75	80	100	120

- Fastening the end stud (2005):

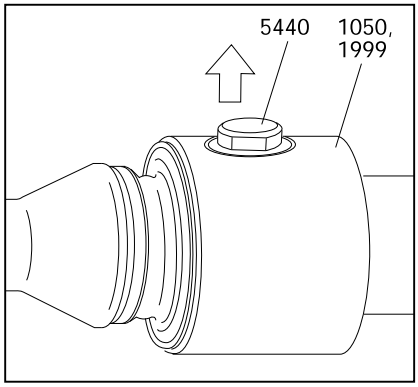
Screw the hex nuts C (3020) down into the thru bolts (3010) as far as possible.
Slip on the first washers (3070), the support foot (2035), the second washers (3070), the end stud (2005) and tighten with spring washers (3015) and hex nuts A (3020).
Finally, fasten the support foot (2035) from behind with the two hex nuts C (3020).

Ensure during refitting that the O-ring (8015) or, where a heating jacket (3025) is installed, the O-rings (8030) are in perfect condition and will sit correctly.



Ensure that the drain plug (2015) is not screwed too tightly into the pump housing (2010), since otherwise its conical thread may break the pump housing (2010).
The torque should be about 40 - 50 Nm.

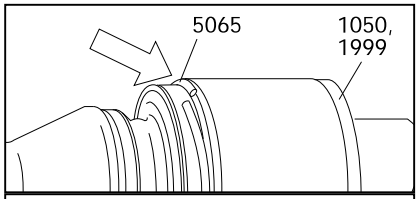
10 Dismantling and Assembly of the Rotating Parts with Pin Joints with SM-Pin Joint Seal (basic joint size NM015 - NM125)



10.1 Removal of Rotor and Coupling Rod

Where a pump is fitted with a **ceramic** rotor (1999) the following operations should be carried out **with great care.** Do not use any force or sharp tools! Special care must be taken to prevent heavy strokes, vibrations or impact by a hammer.
For removal of the rotor (1999) and coupling rod (1998) the pin joints should be dismantled as follows:

- Place the dismantled unit – consisting of drive stool (0085) with drive (A) and connecting shaft (1050), coupling rod (1998) and rotor (1999) – on the work-bench with a wooden block supporting the rotor (1999).

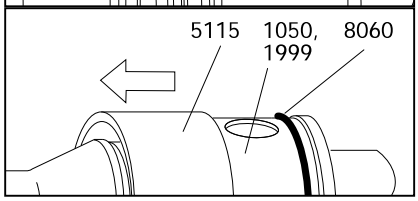


Basic joint size NM125:

- Unscrew the wear sleeves (5440) from the head of rotor (1999) or connecting shaft (1050)

Basic joint size NM021 - NM105:

- Push circlip (5065) out of its groove and slip off over the head of rotor (1999 or connecting shaft (1050).

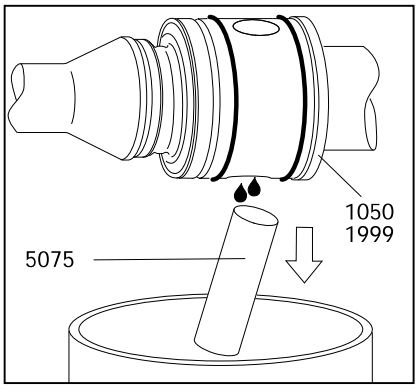


Pumps fitted with a ceramic rotor (1999):

- **Carefully** turn safety sleeve (5115) with a squeeze belt wrench, and remove.

The following method should **not** be employed for pumps fitted with a **ceramic** rotor.

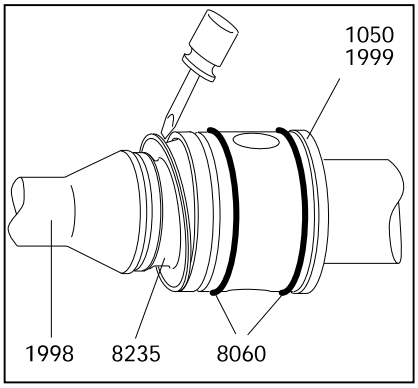
Pumps fitted with a metallic rotor (1999):



- If necessary hit the edge of sleeve (5115) at an angle with the help of a wooden block and a plastic hammer. Taking care not to damage the O-rings (8060)!

Continued Page 10.0R

10 DISMANTLING AND ASSEMBLY OF THE ROTATING PARTS

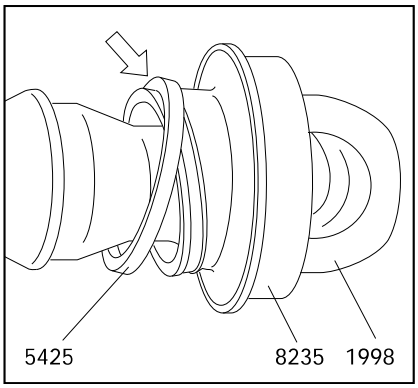


Basic joint size NM021 - NM125:

- Press the pin (5075) out of the head of rotor (1999) or connecting shaft (1050). If necessary use a hammer and a thin cylindrical pin (DIN 6450 C).
  Drain the oil into a receptacle.

  Caution for pumps with ceramic rotors!

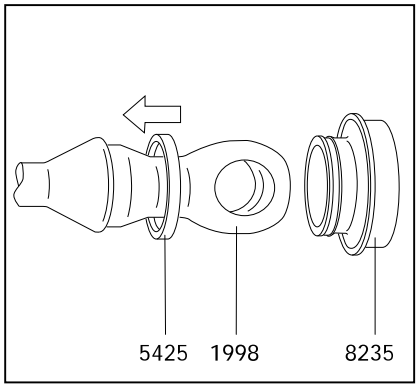
  Where a pin (5075) may not come out easily, the metallic head of rotor (1999) should be supported on wooden blocks. Then the pin (5075) can be driven out with the help of a pin punch (DIN 6450 C). This should be done **with care**, holding the **ceramic** rotor with your hands.
  Please dispose of this oil in the proper manner.



- Using a screwdriver, carefully lever the SM-pin joint seal (8235) out of the head of rotor (1999) or connecting shaft (1050).

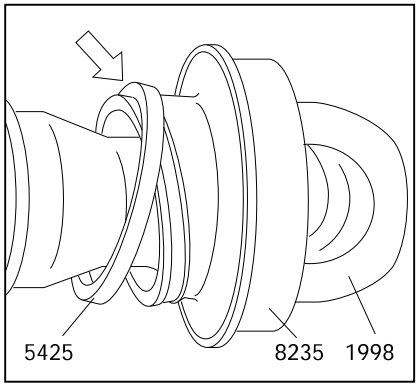
Taking care not to damage the SM-pin joint seal (8235)!

- Pull apart the rotor (1999)/ coupling rod (1998) / connecting shaft (1050) assembly. Remove the O-rings (8060).



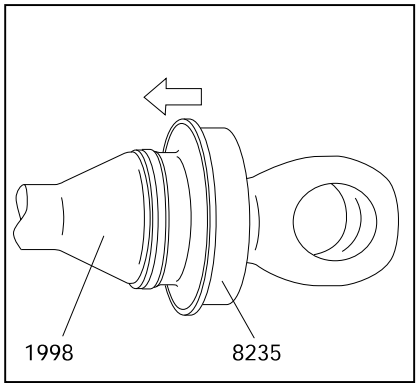
- Push the SM-pin joint seal (8235) towards the head of coupling rod (1998). In the narrow coupling rod section press the clamp ring (5425) out of the groove of the seal. Then slip the SM-pin joint seal (8235) and clamp ring (5425) off over the head of the coupling rod (1998).

Continued Page 10.1



10.2 Fitting the Rotor and Coupling Rod

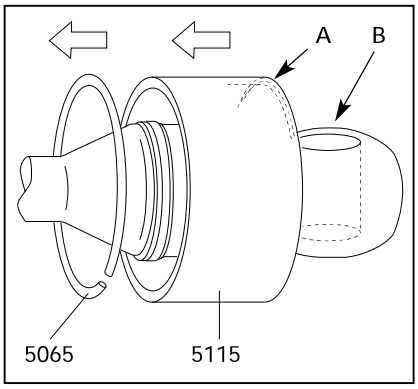
For fitting the rotor (1999) with coupling rod (1998), the two pin joints should be assembled as follows:



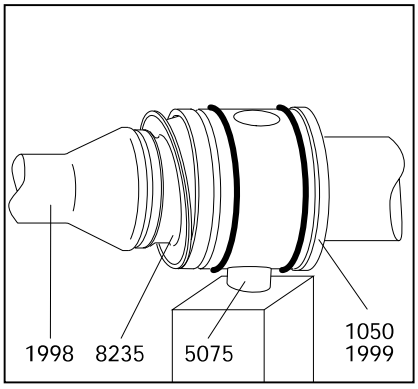
- Slip the clamp ring (5425) over the head of coupling rod (1998).

- Push the SM-pin joint seal (8235) over the head of coupling rod (1998) towards its narrow section, there sqeezing the clamp ring (5425) into the groove of the SM-pin joint seal (8235).

- Push the SM-pin joint seal (8235) with the correctly placed clamp ring (5425) up to the shoulder of coupling rod (1998).

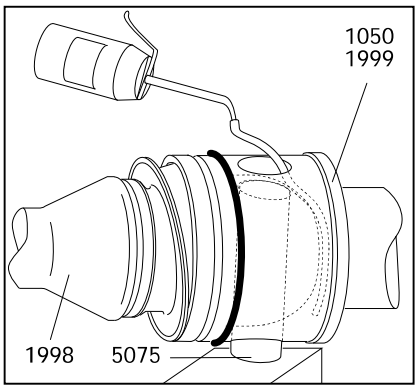


Continued Page 10.1R

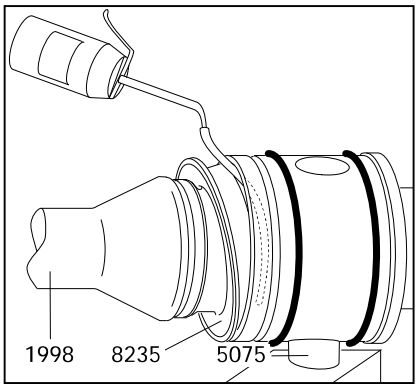


10 DISMANTLING AND ASSEMBLY OF THE ROTATING PARTS

Basic joint size NM021 - NM105:

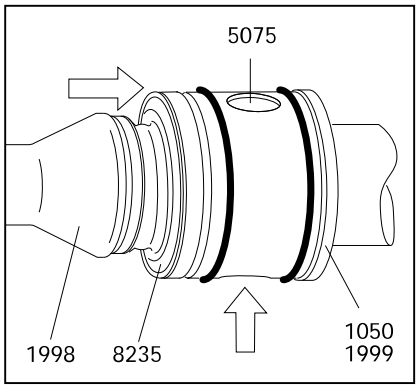


- Slip the circlip (5065) on to the coupling rod (1998). Slide the sleeve (5115) on to coupling rod (1998) so the inside diameter of chamfering (A) is being placed towards the coupling rod (1998) extension. Chamfering (A) will later on ease the installation over the O-rings (8060).
  Orient the head of coupling rod (1998) until it is in vertical position for the bore (B) for the pin (5075).

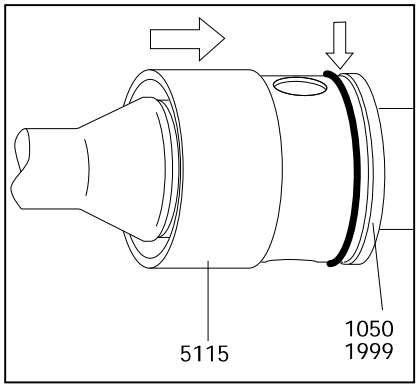


- Slide the coupling rod (1998) with SM-pin joint seal (8235) into the bore of rotor (1999) or connecting shaft (1050) and insert the pin (5075) from below and push up to the upper edge of coupling rod (1998).
  Support the pin (5075) against dropping out.
  Slide the SM-pin joint seal (8235) into the rotor (1999) or connecting shaft (1050) only from below, and in a slightly slanted position.

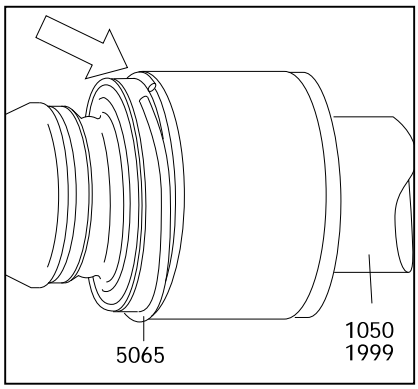
- For lubrication, use an oil can which should be fitted with a thin plastic hose having an outside diameter of not more than 4 mm.
  Insert this hose into the upper oil port opening in the rotor (1999) or connecting shaft (1050). Then slide the hose end past the coupling rod (1998) all the way down to the bottom section of the rotor head (1999) or connecting shaft (1050).
  Slowly fill with lubricating oil up to the filling port.



- Pull the hose out.
  Then insert the hose end through the small gap on the topside of SM-pin joint seal (8235) and guide it down to the bottom of the hollow space between coupling rod (1998) and SM-pin joint seal (8235).
  Slowly fill with lubricating oil up to the gap.

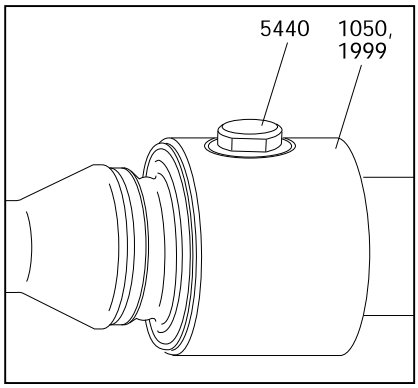


Continued Page 10.2

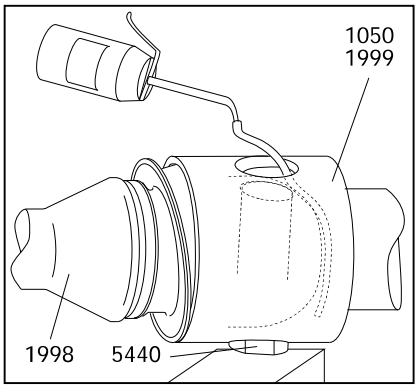


- Pull the hose out.
  Push the pin (5075) entirely into the bore of head of rotor (1999) or connecting shaft (1050) and retain in place.
  Only now, press the SM-pin joint seal (8235) into the bore of head of rotor (1999) or connecting shaft (1050) and push up to the shoulder. In doing so the SM-pin joint seal (8235) should be slightly bulbous around the outer surface. Wipe off overflow oil. Use this oil for lubricating the O-rings (8060).

- Slip the sleeve (5110) or (5115), with its chamfering (A) forward, on to the head of rotor (1999) or connecting shaft (1050) and push up to the shoulder.

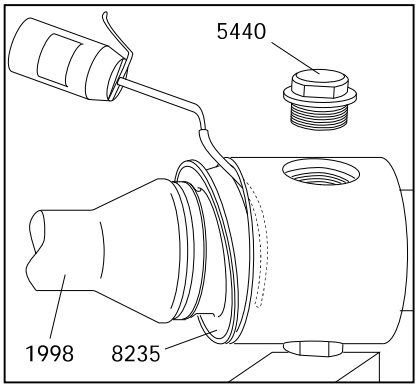


- Place the circlip (5065) into its groove on the rotor head (1999) or connecting shaft (1050) and carefully snap in place all around.



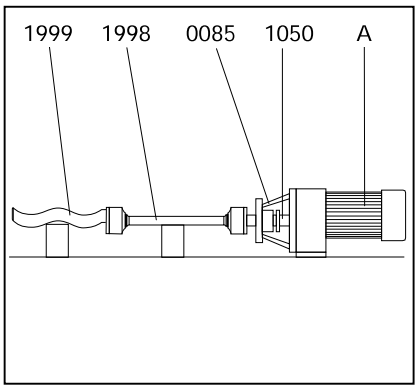
- **Basic joint size NM125:**

  Slide the coupling rod (1998) into the bore of the head of rotor (1999) and connecting shaft (1050) and insert the pins (5075).
  Insert the SM-pin joint seal (8235) (8235) into the head of rotor (1999) and connecting shaft (1050).
  Only then screw in one wear sleeve (5440) with O-ring (8060) into the head of rotor (1999) and connecting shaft (1050) and turn upside down.



10 DISMANTLING AND ASSEMBLY OF THE ROTATING PARTS

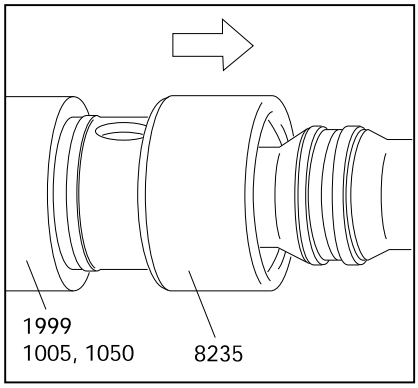
- For lubrication, use an oil can which should be fitted with a thin plastic hose having an outside diameter of not more than 4 mm.
  Insert this hose into the upper oil port opening in the rotor (1999) or connecting shaft (1050). Then slide the hose end past the coupling rod (1998) all the way down to the bottom section of the rotor head (1999) or connecting shaft (1050).
  Slowly fill with lubricating oil up to the filling port.



- Pull the hose out.
  Then insert the hose end through the small gap on the topside of SM-pin joint seal (8235) and guide it down to the bottom of the hollow space between coupling rod (1998) and SM-pin joint seal (8235).
  Slowly fill with lubricating oil up to the gap.
- Screw in the second wear sleeve (5440) with O-ring (8060) into the head of rotor (1999) and connecting shaft (1050).

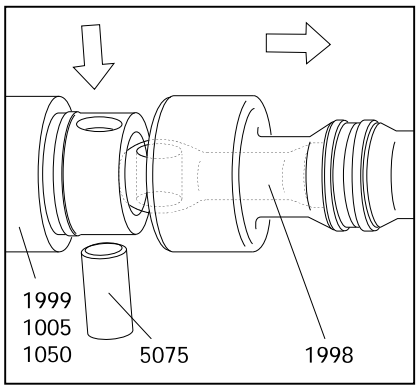
- **Basic joint size NM021 - NM125:**

  Drive connecting shaft (1050), coupling rod (1998) and rotor (1999) are now joined by means of the two pin joints.
  Pump housing (2010), stator (3005) and end stud (2005) may now be fitted.



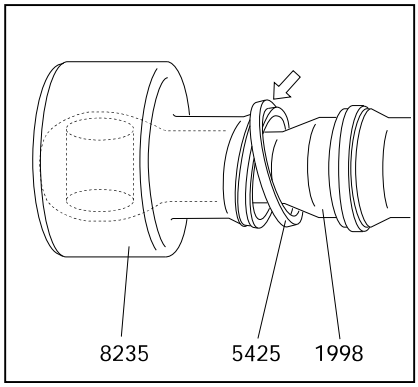
Continued Page 10.3

10.3 Dismantling and Assembly of the Rotating Parts with Pin Joints with SM-Pin Joint Seal (joint basic size NM015)



For removal and refitting of the rotor (1999) and coupling rod (1998) the pin joints should be dismantled and re-assembled as follows:

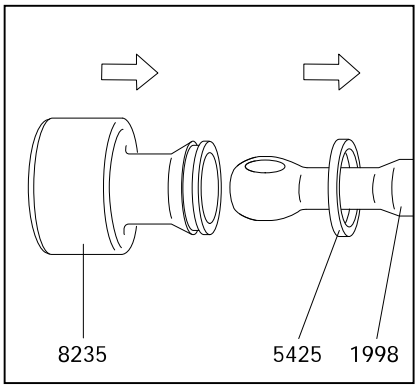
Dismantling:



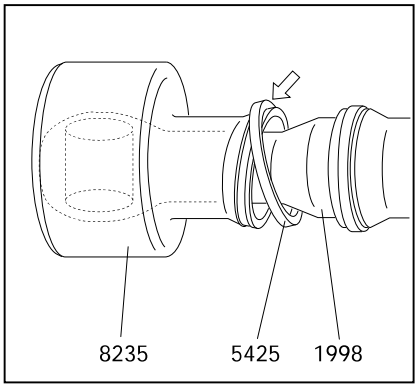
- Push the SM-pin joint seal (8235) away from the rotor (1999), drive shaft (1005) or connecting shaft (1050) so the bore for the pin (5075) comes free.

- Press the pin (5075) out of the rotor (1999), connecting shaft (1050) or drive shaft (1005). Then withdraw the coupling rod (1998) from the bore of rotor (1999), connecting shaft (1050) or drive shaft (1005).

- Push the SM-pin joint seal (8235) towards the head of coupling rod (1998). In the narrow coupling rod section press the clamp ring (5425) out of the groove of the seal. Then slip the SM-pin joint seal (8235) and clamp ring (5425) off over the head of the coupling rod (1998).

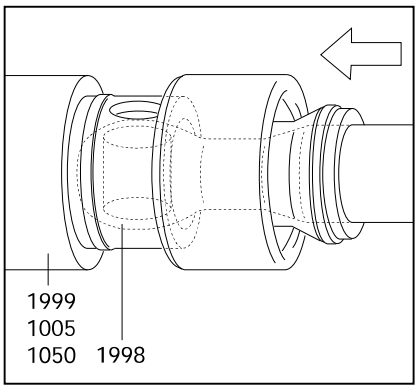


Continued Page 10.0R



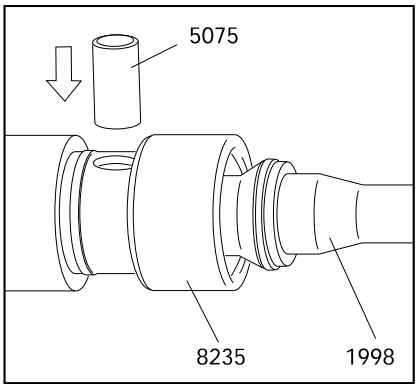
10 DISMANTLING AND ASSEMBLY OF THE ROTATING PARTS

Re-Assembly:



- Slip the clamp ring (5425) and the SM-pin joint seal (8235) on over the head of the coupling rod (1998).

- Push the SM-pin joint seal (8235) towards the narrow section on the head of coupling rod (1998) and place the clamp ring (5425) back into the groove of the SM-pin joint seal (8235).
  Then move the SM-pin joint seal (8235) up to the coupling rod (1998) shoulder.



- Place the head of coupling rod (1998) into the bore of the rotor (1999), drive shaft (1005) or connecting shaft (1050).

- Join the rotor (1999), drive shaft (1005) or connecting shaft (1050) and coupling rod (1998) by the pin (5075).
  Then push the SM-pin joint seal (8235) up to the shoulder of the rotor (1999), drive shaft (1005) or connecting shaft (1050).

  Re-assemble the second pin joint in the same manner.

11 Removal and Fitting of the Connecting Shaft with Shaft Seal

Removal:

- Push the circlip (1035) in the direction to the mechanical seal.
- Remove pin (1030).
- Remove the shaft seal housing (7005) and mechanical seal (7010) together with connecting shaft (1050) and set ring (1035) from drive stool (0085) and the drive shaft.
  The thread of cylindrical head screw (1040) can be used as forcing screw.
- If a mechanical seal is installed, see description "Removal and Fitting of Mechanical Seal" after Page 12.0.

Fitting:

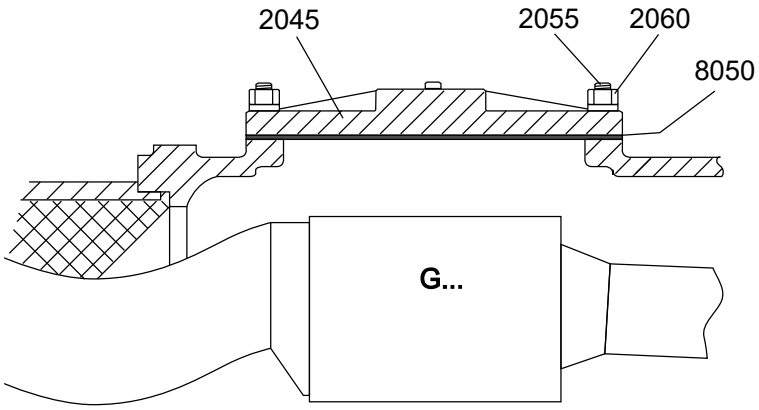
- Apply grease into the bore of the connecting shaft (1050) to avoid rust (e.g. TCE-Metallic 600).
- Assemble the shaft seal housing (7005) and mechanical seal (7010) together with connecting shaft (1050) and set ring (1035) with drive stool (0085) and push connecting shaft (1050) on to the drive shaft.
  At this please observe the installation direction of set ring (1035) (please see mark).
- If a mechanical seal is installed, see description "Removal and Fitting of Mechanical Seal" after Page 12.0.
- Connect the connecting shaft (1050) and the drive shaft by pin (1030).
  Push set ring (1035) on pin (1030).

12.1 Removal and Fitting of the Single Mechanical Seal

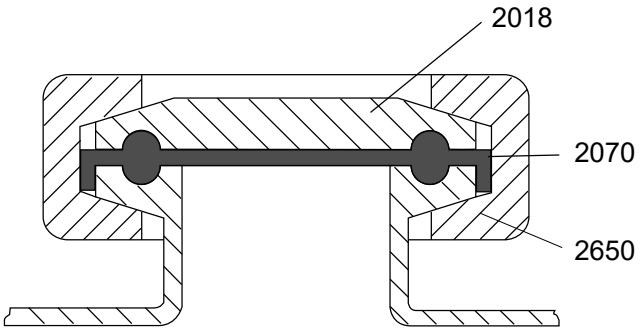
- **Carefully** slide out mechanical seal housing (7005) together with the parts of the mechanical seal contained in it from connecting shaft (1050).
- **Carefully** push mechanical seal (7010) stationary seat out of mechanical seal housing (7005).

Refitting is a simple reversal of the above procedure.

- To reduce frictional forces during seal assembly, apply some glycerine to the shaft and the seal housing in the area of the gaskets.
- Special care must be taken when fitting double PTFE-coated gaskets: the **joint** of the outer coating must point away from the seal assembly direction, otherwise the coating may open or be pulled off!



Ensure that the distribution of pressure is uniform when inserting the pressure sensitive counter rings. When inserting larger rings, use a suitable mandrel.
Do not allow any foreign bodies to get between the sliding surfaces.



- Exactly keep to the seal installation dimensions and ensure that the sealing faces are correctly pressed together (see table on sectional drawing W 209.000 or W 210.000).
- Insert mechanical seal (7010) stationary seat into mechanical seal housing (7005).
- Insert mechanical seal housing (7005) together with the stationary seat into the drive stool **without the installed connecting shaft (1050).**
- If necessary take the installation dimension from the table and add the thickness S of the set ring (7086) when existing.
- Mark this installation dimension on the connecting shaft (1050).
- Fix the rotating unit of the mechanical seal (7010) on the connceting shaft (1050) depending on the installation dimension so that the rotating unit of the mechanical seal (7010) or the set ring (7086) is at the mark.
- Insert connecting shaft (1050) with the rotating unit of the mechanical seal (7010) into drive stool (0085) and install lip seal (7091, if existing. Push the set ring (1035) on to connecting shaft (1050) and observe at this the installation direction (see mark).
Push connecting shaft (1050) on to the drive shaft and connect with pin (1030). Push the set ring (1035) on pin (1030).

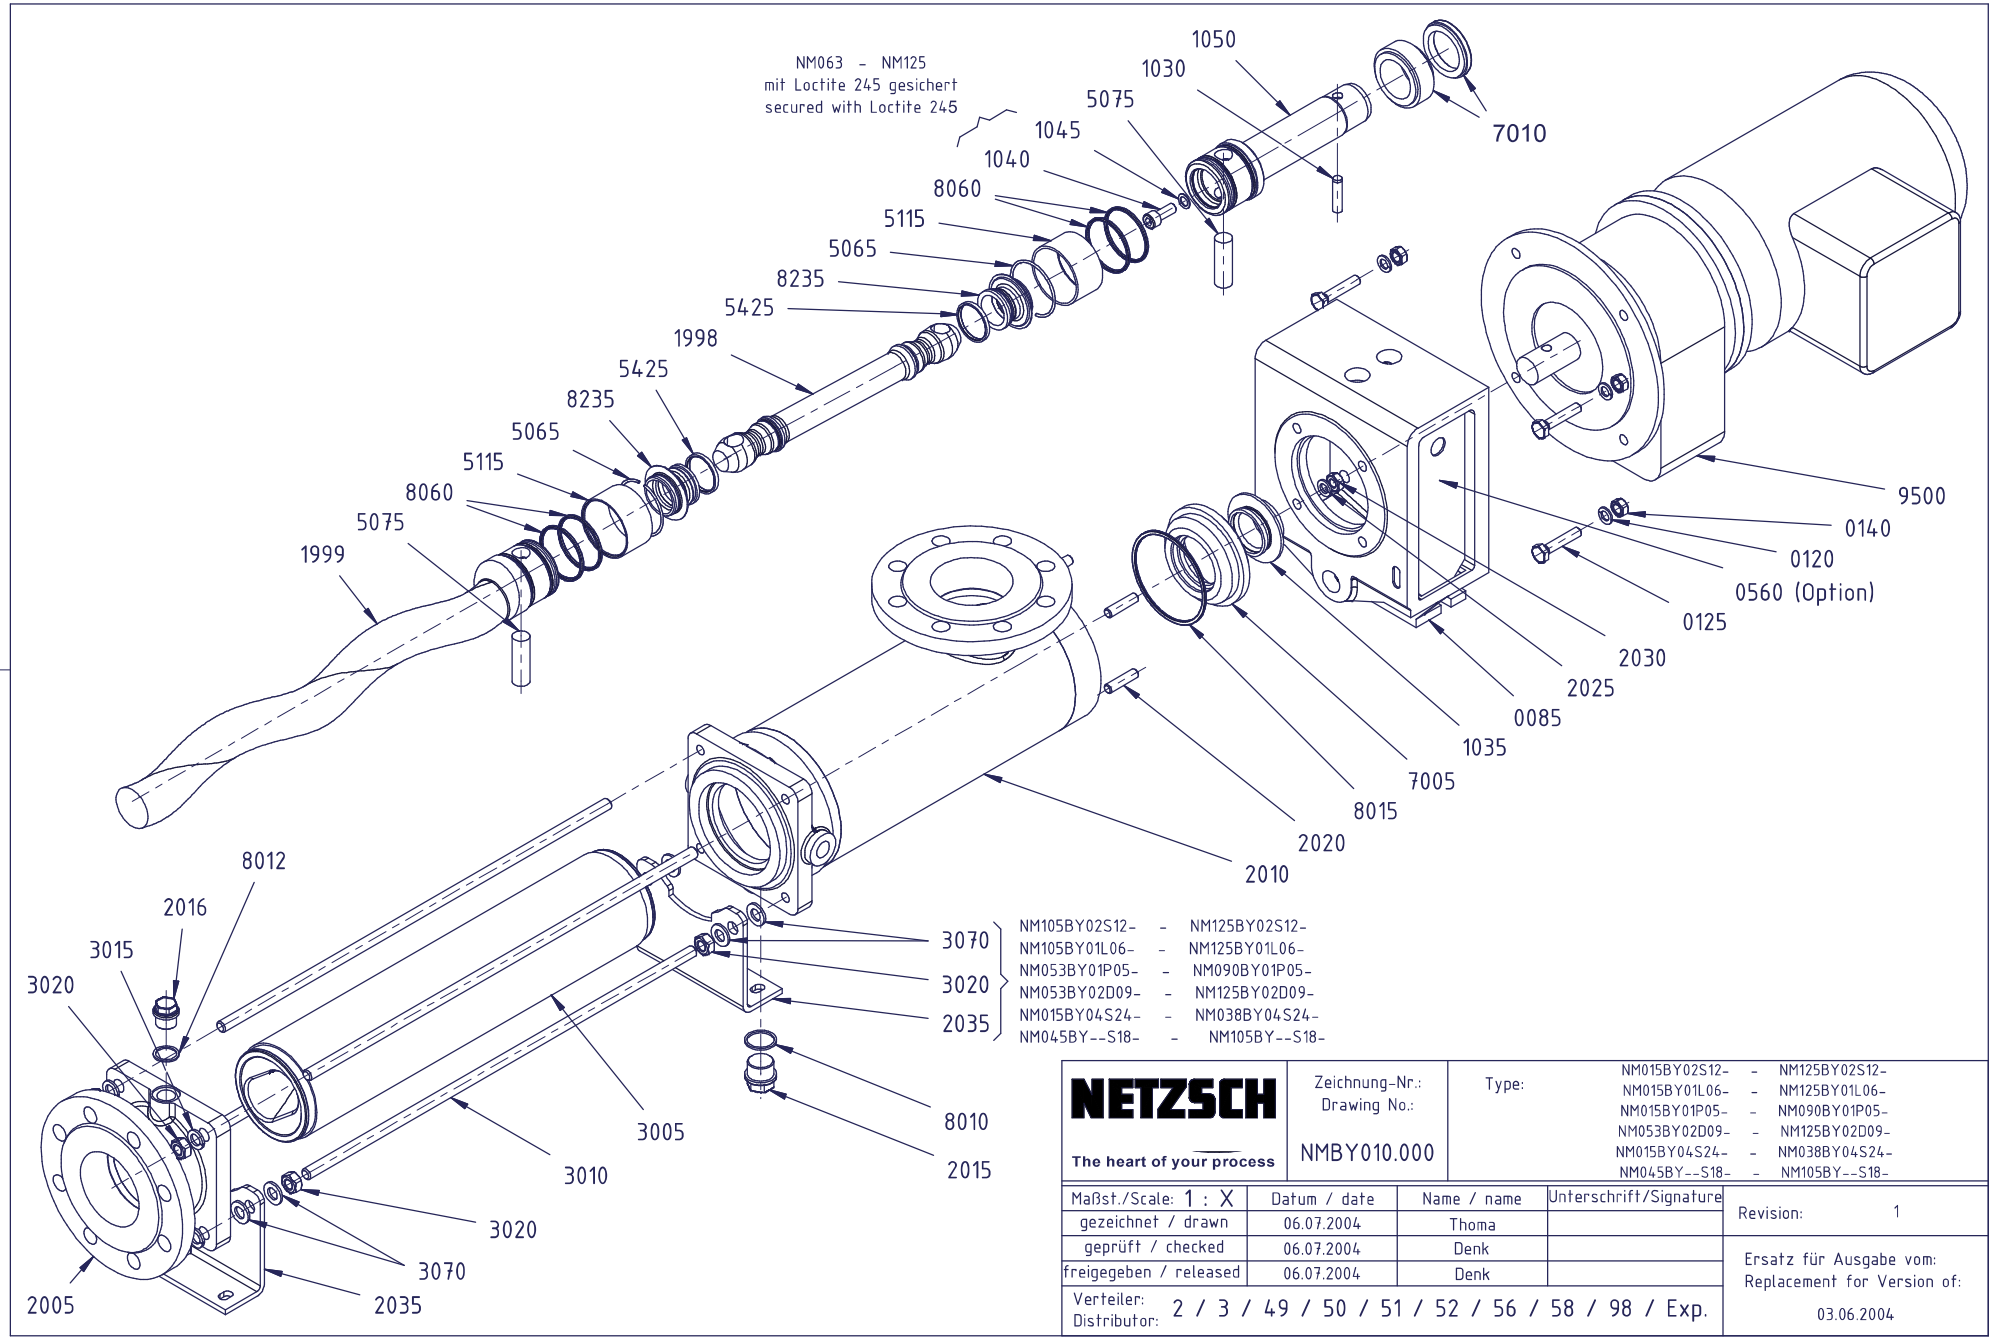
14 Recommended Spare Parts

In general, we have all spare parts in stock. Our subsidiaries and exclusive representatives also hold a certain stock. For special cases and when short waiting periods are not acceptable, we recommend to keep an amount of spare parts, corresponding to the pump, in stock on site (please see table below).

- **Rotor**
- **Stator**
- **Elastomer parts as O-rings and sleeves**
- **joint parts**
- **shaft seals.**

To avoid mistakes in delivery, please identify the parts by their position number shown in the spare parts list or on the sectional drawing.

For placing a spare parts order, it is absolutely necessary to give the following details:



Pieces (see column 2) - Designation (see column 3) - Identification Number (see column 4)

The column details are taken from the spare parts list. See example.

Example:

SPARE PARTS LIST		10.05.94		10:50:18	Page: 1 / 5

Three Phase Induction Motor - Squirrel Cage

Customer	:

Product line	: NEMA Premium Efficiency Three-Phase	Product code :	14337968

Frame	: 143/5TC	Cooling method	: IC411 - TEFC
Insulation class	: F	Mounting	: F-1
Duty cycle	: Cont.(S1)	Rotation¹	: Both (CW and CCW)
Ambient temperature	: -20°C to +40°C	Starting method	: Direct On Line
Altitude	: 1000 m.a.s.l.	Approx. weight³	: 31.5 kg
Protection degree	: IP55	Moment of inertia (J)	: 0.0041 kgm²
Design	: B		

Output [HP]		1
Poles		4
Frequency [Hz]		60
Rated voltage [V]		575
Rated current [A]		1.14
L. R. Amperes [A]		9.84
LRC [A]		8.6x(Code M)
No load current [A]		0.748
Rated speed [RPM]		1760
Slip [%]		2.22
Rated torque [kgfm]		0.414
Locked rotor torque [%]		290
Breakdown torque [%]		370
Service factor		1.15
Temperature rise		80 K
Locked rotor time		32s (cold) 18s (hot)
Noise level²		51.0 dB(A)
Efficiency (%)	25%	
	50%	80.0
	75%	82.5
	100%	85.5
Power Factor	25%	
	50%	0.57
	75%	0.70
	100%	0.77

		Drive end	Non drive end

Lubricant amount	:	-	-
Lubricant type	:	Mobil Polyrex EM	

Foundation loads

Max. traction : 27 kgf

Max. compression : 59 kgf

Notes

This revision replaces and cancel the previous one, which must be eliminated.
(1) Looking the motor from the shaft end.
(2) Measured at 1m and with tolerance of +3dB(A).
(3) Approximate weight subject to changes after manufacturing process.
(4) At 100% of full load.

These are average values based on tests with sinusoidal power supply, subject to the tolerances stipulated in NEMA MG-1.

MOTORS AND DRIVES

INSTALLATION AND MAINTENANCE INSTRUCTIONS FOR ELECTRIC MOTORS

Frames 143/5T - 586/7T

QUALITY SYSTEM ISO9001 WEG MOTORES

ISO 9001

READ CAREFULLY THIS MANUAL BEFORE INSTALLING THE MOTOR.

RECEIVING CHECK

✓ Check if any damage has occured during transportation.
✓ Check nameplate data.
✓ Remove shaft locking device (if any) before operating the motor.
✓ Turn the shaft with the hand to make sure if it is turning freely.

HANDLING AND TRANSPORTATION

1 - General

MOTORS MUST NOT BE LIFTED BY THE SHAFT, BUT BY THE EYE BOLTS WHICH ARE PROPERLY DESIGNED TO SUPPORT THE MOTOR WEIGHT.

Lifting devices, when supplied, are designed only to support the motor. If the motor has two lifting devices then a double chain must be used to lift it.

Lifting and lowering must be done gently without any shocks, otherwise the bearings can get damaged.

DURING TRANSPORTATION, MOTORS FITTED WITH ROLLER OR ANGULAR CONTACT BEARINGS ARE PROTECTED AGAINST BEARING DAMAGES WITH A SHAFT LOCKING DEVICE.

THIS LOCKING DEVICE MUST BE USED ON ANY FURTHER TRANSPORT OF THE MOTOR, EVEN WHEN THIS MEANS TO UNCOPULE THE MOTOR FROM THE DRIVEN MACHINE.

STORAGE

If motors are not immediately installed, they must be stored in dry places, free of dust, vibrations, gases, corrosive smokes, under constant temperature and in normal position free from other objects.

In case the motors are stored for more than two years, the bearings must be changed or the lubrication grease must be totally replaced after cleaning.

Single phase motors when kept in stock for 2 years or more must have their capacitors replaced (if any).

We recommend to turn the shaft (by hands) at least once a month, and to measure the insulation resistance before installing it, in cases of motors stored for more than 6 months or when subject to high humidity areas.

If motor is fitted with space heaters, these should be switched on.

Insulation Resistance Check

Measure the insulation resistance before operating the motor and/or when there is any sign of humidity in the winding.

The resistance measured at 25°C (77°F) must be:

Ri > (20 x U) / (1000 + 2P) [Mohm] (measured with a MEGGER at 500 V d.c.); where U = voltage (V); P = power (kW).

If the insulation resistance is less than 2 megaohms, the winding must be dried according to the following:
✓ Warm it up inside an oven at a minimum temperature of 80°C (176°F) increasing 5°C (41°F) every hour until 105°C (221°F), remaining under this temperature for at least one hour. Check if the stator insulation resistance remains constant within the accepted values. If not, stator must be reimpregnated.

INSTALLATION

1 - Safety

All personnel involved with electrical installations, either handling, lifting, operation or maintenance must be well informed and up-to-dated concerning the safety standard and principles that govern the work and carefully follow them.

We strongly recommend that these jobs are carried out by qualified personnel.

MAKE SURE THAT THE ELECTRIC MOTORS ARE SWITCHED OFF BEFORE STARTING ANY MAINTENANCE SERVICE.

Motors must be protected against accidental starts.

When performing any maintenance service, disconnect the motor from the power supply. Make sure all accessories have been switched off and disconnected.

Do not change the regulation of the protecting devices to avoid damaging.

LEAD CONNECTION IN SULATION INSIDE THE TERMINAL BOX MUST BE DONE WITH AN INSULATING MATERIAL COMPATIBLE WITH MOTOR THERMAL CLASS WHICH IS SHOWN ON THE MOTOR NAMEPLATE.

2 - Operating Conditions

Electric motors, in general, are designed for operation at an altitude of 1000m above sea level for an ambient temperature between 25°C (77°F) and 40°C (104°F). Any variation is stated on the nameplate.

COMPARE THE CURRENT, VOLTAGE, FREQUENCY, SPEED, OUTPUT AND OTHER VALUES DEMANDED BY THE APPLICATION WITH THE DATA GIVEN ON THE NAMEPLATE.

Motors supplied for hazardous locations must be installed in areas that comply with that specified on the motor nameplate.

KEEP AIR INLET AND OUTLET FREE AND CLEAN. THE AIR BLOWN OUT BY THE MOTOR SHALL NOT ENTER AGAIN. THE DISTANCE BETWEEN THE AIR INLET AND THE WALL MUST BE AROUND ¼ OF THE INLET OPENING DIAMETER.

3 - Foundation

Motors provided with feet must be installed on though foundations to avoid excessive vibrations.

The purchaser is fully responsible for the foundation.

Metal parts must be painted to avoid corrosion.

The foundation must be uniform and sufficiently tough to support any short circuit strengths. It must be designed in such a way to stop any vibration originated from resonance.

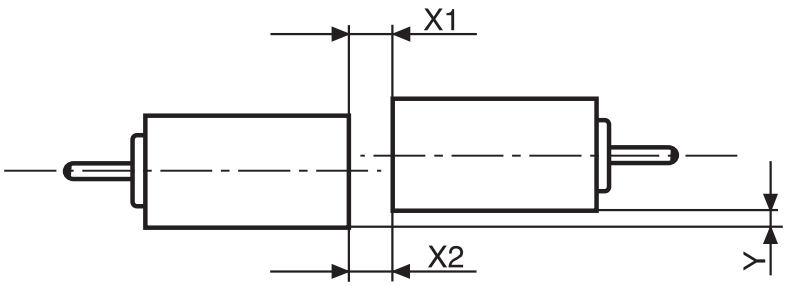
4 - Drain Holes

Make sure the drains are placed in the lower part of the motor when the mounting configuration differs from that specified on the motor purchase order.

5 - Balancing

WEG MOTORS ARE DYNAMICALLY BALANCED, WITH HALF KEY AT NO LOAD AND UNCOUPLED.

Transmission elements such as pulleys, couplings, etc must be dynamically balanced with half key before installation. Use always appropriate tools for installation and removal.



6 - Alignment

ALIGN THE SHAFT ENDS AND USE FLEXIBLE COUPLING, WHENEVER POSSIBLE.

Ensure that the motor mounting devices do not allow modifications on the alignment and further damages to the bearings.

When assembling a half-coupling, be sure to use suitable equipment and tools to protect the bearings.

Suitable assembly of half-coupling: check that clearance Y is less than 0.05mm and that the difference X1 to X2 is less than 0.05m as well.

Note: The "X" dimension must be at least 3mm.

7 - Belt Drive

When using pulley or belt coupling the following must be observed:
✓ Belts must be tighten just enough to avoid slippage when running, according to the specifications stated on the belt supplier recommendation.

WARNING:
Excessive tension on the pulleys will damage the bearings and lead to a probable shaft rupture.

8 - Connection

WARNING: Voltage may be connected at standstill inside the terminal box for heating elements or direct winding heating.

WARNING: The capacitor on single-phase motors can retain a charge which appears across the motor terminals, even when the motor has reached standstill.

A WRONG CONNECTION CAN BURN THE MOTOR.

Voltage and connection are indicated on the nameplate. The acceptable voltage variation is ± 10%, the acceptable frequency variation is ± 5% and the total acceptable variation is ± 10%.

9 - Starting Methods

The motor is rather started through direct starting. All Weg motors must be connected as shown on the motor nameplate, failure to follow the motor nameplate could lead to motor failure.

In case this is not possible, use compatible methods to the motor load and voltage.

✓ 3 lead single voltage and 9 lead dual voltage motors can be started as follows:
Full Voltage Direct On Line.
Auto-Transformer Starting.
Electronic Soft-Starting.
VFD Starting - subject to verification and application analysis.

✓ 6 lead single voltage motors and 12 lead dual voltage motors can be connected as follows:
Full Voltage Direct On Line.
WYE/DELTA Starting.
Auto-Transformer Starting.
Electronic Soft-Starting.
VFD Starting - subject to verification and application analysis.

The rotation direction is clockwise if the motor is viewed from DE side and if the phases are connected according to the sequence L1, L2, L3.

To change the rotation direction, interchange two of the connecting leads.

THE CONNECTION TO THE POWER SUPPLY MUST BE DONE BY QUALIFIED PERSONNEL AND WITH FULL ATTENTION TO ASSURE A SAFE AND PERMANENT CONNECTION. AFTER CONNECTING THE MOTOR, CHECK FOR ANY STRANGE BODY INSIDE THE TERMINAL BOX. THE CABLE INLETS NOT IN USE MUST BE CLOSED.

Make sure to use the correct cable dimension, based on the rated current stamped on the motor nameplate.

BEFORE ENERGIZING THE TERMINALS, CHECK IF THE EARTHING IS MADE ACCORDING TO THE ACTUAL STANDARDS. THIS IS ESSENTIAL AGAINST ACCIDENT RISKS.

When the motor is supplied with protective or monitor temperature device such as thermostats, thermistors, thermal protector, etc, connect their terminals to the corresponding devices on the control panel.

10- Start-Up

THE KEY MUST BE FASTENED OR REMOVED BEFORE STARTING THE MOTOR.

a) The motor must start and operate smoothly. In case this does not occur, turn it off and check the connections and the mounting before starting it again.

b) If there is excessive vibration, check if the fastening screws are correctly fastened. Check also if the vibration comes from a neighbour machine. Periodical vibration checks must be done.

c) Run the motor under rated load for a short period of time and compare if the running current is equal to that stamped on the nameplate.

MAINTENANCE

WARNING:
SAFETY CHECK LIST.

1 - General Inspection

- ✓ Check the motor periodically.
- ✓ Keep the motor clean and assure free air flow.
- ✓ Check the seals or V Ring and replace them, if required.
- ✓ Check the connections as well as supporting screws.
- ✓ Check the bearings and observe:
  Any excessive noise, bearing temperature and grease condition.
- ✓ When a changing, under normal conditions, is detected, check the motor and replace the required parts.
  The frequency of the inspections depends on the motor type and on the application conditions.

LUBRICATION

FOLLOW THE REGREASING INTERVALS. THIS IS FUNDAMENTAL FOR PROPER MOTOR OPERATION.

1 - Machines without Grease Nipples

In these cases the regreasing shall be done at the preventive maintenance job observing the following aspects:

✓ Disassemble carefully the motors.
✓ Take all the grease out.
✓ Wash the bearing with querosene or diesel.
✓ Regrease the bearing immediately.

2 - Machines Fitted with Grease Nipples

It is strongly recommended to grease the machine while running. This allows the grease renewal in the bearing housing. When this is not possible due to turning parts by the grease device (pulleys, bushing, etc) that offer some risk to the physical integrity of the operator, proceed as follows:

✓ Clean the area near to the grease nipple.
✓ Put approximately half of the total grease and run the motor for 1 minute at full speed. Then turn off the motor and pump the rest of the grease.
✓ The injection of all the grease with the motor in standstill can make the grease penetrate into the motor, through the inner seal of the bearing housing.

When regreasing, use only special bearing grease with the following properties:

RELUBRICATION INTERVALS RECOMMENDED - POLYREX® EM GREASE (ESSO/EXXON)

Frame	Amount of grease (g)	3600 rpm	3000 rpm	1800 rpm	1500 rpm	1200 rpm	1000 rpm	900 rpm	750 rpm	720 rpm	600 rpm	500 rpm

WARNING:

The table above is specifically intended for relubrication with Polyrex® EM grease and bearing absolute operating temperature of:

✓ 70°C (158°F) for 254/6T to 324/6T frame motors;
✓ 85°C (185°F) for 364/5T to 586/7T frame motors.

For every 15°C (59°F) above these limits, relubrication interval must be reduced by half.

Shielded bearing (ZZ) are lubricated for bering's life as long as they operate under normal ambient conditions and temperature of 70°C(158°F).

WE RECOMMEND TO USE BALL BEARINGS FOR MOTORS DIRECTLY COUPLED TO THE LOAD.

WARNING:
EXCESS OF GREASE CAN CAUSE BEARING OVERHEATING RESULTING IN COMPLETE DAMAGE.

Compatibility of Polyrex® EM grease with other types of grease:

Containing polyurea thickener and mineral oil, the Polyrex® EM grease is compatible with other types of grease that contain:

- ✓ Lithium base or complex of lithium or polyurea and highly refined mineral oil;
- ✓ Inhibitor additive against corrosion, rust and anti-oxidant additive.

Notes:

- ✓ Although Polyrex® EM is compatible with the types of grease given above, we do no recommend to mix it with any other greases.
- ✓ If you intend to use a type of grease different than those recommended above, first contact WEG.
- ✓ On applications (with high or low temperatures, speed variation, etc), the type of grease and relubrication interval are given on an additicional nameplate attached to the motor.
- ✓ Vertical mounted motors must have the relubrication intervals reduced by half.

THE USE OF STANDARD MOTORS IN SPECIFIC AREAS OR SPECIAL APPLICATIONS MUST BE DONE BY CONSULT TO THE GREASE MANUFACTURER OR WEG.

ASSEMBLY AND DISASSEMBLY

Disassembly and assembly must be done by qualified personnel using only suitable tools and appropriated methods. The stator grips must be applied over the side face of the inner ring to be disassembled or over and adjacent part.

It is essential that the bearings disassembly and assembly be done under cleanning conditions to ensure good operation

and to avoid damages. New bearings shall only be taken out from their cases when assembling them.

Before installing a new bearing it is required to check the shaft fitting for any sharp edge or strike signals.

For bearing assembly, warm their inner parts with suitable equipment - inductive process - or use suitable tools.

SPARE PARTS

When ordering spare parts, please specify the full type designation and product code as stated on the motor nameplate.

Please also inform the motor serial number stated on the nameplate.

MOTORS FOR HAZARDOUS LOCATIONS

Besides the recommendations given previously, these ones must be also followed:

THE SPECIFICATION OF THE MOTOR INSTALLATION PLACE IS FOR CUSTOMER'S RESPONSIBILITY, WHO WILL ALSO DETERMINE THE ENVIRONMENT CHARACTERISTICS.

Motors for hazardous locations are manufactured according to specific standards for such environments and they are certified by worldwide certifying entities.

1 - Installation

The complete installation must follow procedures given by the local legislation in effect.

THE INSTALLATION OF HAZARDOUS LOCATION MOTORS MUST BE CARRIED OUT BY SKILLED PEOPLE, AND THE THERMAL PROTECTION MUST BE ALWAYS INSTALLED, EITHER INSIDE OR OUTSIDE THE MOTOR, OPERATING AT THE RATED CURRENT.

2 - Maintenance

Maintenance must be carried out by repair shops authorized by WEG.

Repair shops and people without WEG's authorization who will perform any service or hazardous location motors will be fully responsible for such service as well as for any consequential damage.

ANY ELECTRICAL OR MECHANICAL MODIFICATION MADE ON HAZARDOUS LOCATION MOTORS WILL VOID THE CERTIFICATION.

When performing maintenance, installation or relubrication, follow these instructions:

- ✓ Check if all components are free of edges, knocks or dirt.
- ✓ Make sure all parts are in perfect conditions.
- ✓ Lubricate the surfaces of the endshield fittings with protective oil to make the assembly easier.
- ✓ Use only rubber hammer to fit the parts.
- ✓ Check for correct bolts tightening.
- ✓ Use clearance calibrator for correct T-box fitting (smaller than 0.05mm).

DO NOT REUSE DAMAGED OR WORN PARTS. REPLACE THEM BY NEW ONES SUPPLIED BY THE FACTORY.

MOTORS DRIVEN BY VFD

Applications using VFD´s without filter can affect motor performance as follows:

- ✓ Lower efficiency.
- ✓ Higher vibration.
- ✓ Higher noise level.
- ✓ Higher rated current.
- ✓ Higher temperature rise.
- ✓ Reduced motor insulation.
- ✓ Reduced bearing life.

1 - Standard Motors

- ✓ Voltages lower than 440V do not require filter.
- ✓ Voltages equal or higher than 440V or lower than 575V require filter for motor power supply cables longer than 20 meters.
- ✓ Voltages equal or higher than 575V require filter for any size of power supply cables.

IF SUCH RECOMMENDATIONS ARE NOT FOLLOWED ACCORDINGLY, MOTOR WARRANTY WILL BE VOID.

2 - Inverter Duty Motors

- ✓ Check power supply voltage of the forced cooling set.
- ✓ Filters are not required.

WARRANTY TERMS
SERIES AND ENGINEERING PRODUCTS

WEG warrants its products against defects in workmanship and materials for 18 months from the invoice date issued by the factory, authorized distributor or agent limited to 24 months from manufacturing date independent of installation date as long as the following items are fulfilled accordingly:
- Proper transportation, handling and storage;
- Correct installation based on the specified ambient conditions and free of corrosive gases;
- Operation under motor capacity limits;
- Observation of the periodical maintenance services;
- Repair and/or replacement effected only by personnel duly authorized in writing by WEG;
- The failed product be available to the supplier and/or repair shop for a required period to detect the cause of the failure and corresponding repair;
- Immediate notice by the purchaser about failures occured and that these are accepted by WEG as manufacturing defects.

This warranty does not include disassembly services at the urchaser facilities, transportation costs with product, tickets, accomodation and meals for technical personnel when requested by the customer. The warranty service will be only carried out at WEG Authorized Repair Shops or at WEG´s facilities.

Components whose useful life, under normal use, is shorter than the warranty period are not covered by these warranty terms.

The repair and/or replacement of parts or components, when effected by WEG and/or any WEG Authorized Repair Shop, will not give warranty extension.

This constitutes WEG´s only warranty in connection with this sale and the company will have no obligation or liability whatsoever to people, third parties, other equipment or installations, including without limitation, any claims for consequential damages or labor costs.

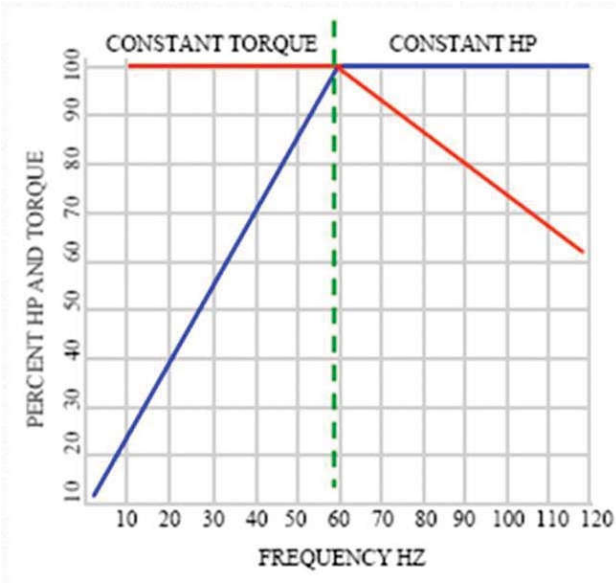
WARNING!!!!

When **Variable Frequency Drives (VFD's)**
are being used to vary the speed of the
NETZSCH Progressing Cavity Pumps, then they
MUST be CONSTANT TORQUE VFD's.



How the pump works

NETZSCH Progressing Cavity Pumps operate at a constant torque requirement for a specific operating pressure. The speed of the pump does NOT affect the torque requirement. **For example:** a pump running at 60psi output pressure at a speed of 200 revolutions per minute requires the same toque input as if it were running at 60psi output pressure at a speed of 600 revolutions per minute. The only exception to this rule is during pump startup; at the moment the pump starts the motor must provide more torque than the pump requires when it is running. This is due to the force of static friction that the motor must overcome in order to begin rotation. Although this is only a momentary force, enough torque has to be available to break the static load.

How the VFD works

Variable Frequency Drives work by taking the supplied power and modulating the supplied power frequency in linear proportion to the supplied voltage. This proportional modulation allows the motors speed to be altered without the motor drawing too many amps and burning out. A VFD can be built to perform this modulation in one of two ways. The VFD can be set to modulate the frequency above the normal supplied 60HZ frequency allowing the output to provide a constant amount of power but the torque will drop off as speed is increased **(THIS IS A CONSTANT HP VFD**) or it can modulate the frequency below the normal supplied 60HZ frequency allowing the output to provide constant Torque but the power will decrease as the speed is reduced **(THIS IS A CONSTANT TORQUE VFD).** This relationship is shown in the detail below. The manufacturers of VFD's typically offer two service factors. Normal Duty; which

has an overload capacity of the VFD's full load ampere rating times 110% - 120% for one minute and Heavy Duty; which has an overload capacity of the VFD's full load ampere rating times 150% for one minute. Typically, constant Hp VFD's are sold with a Normal duty rating since the applications don't call for high starting torque which causes amp draw to spike. Constant torque VFD's are usually sold with heavy duty ratings so that they can supply elevated startup amp draws for high starting torque applications.

VFD Speed Torque Characteristics

Blue = Horsepower
Red = Torque
Green = Motor Nameplate Frequency (60 Hz)

In Constant Torque Area - VFD supplies rated motor nameplate voltage and motor develops full horsepower at 60 hertz base frequency.

In Constant Horsepower Area - VFD delivers motor nameplate rated voltage from 60 Hertz to 120 hertz (or drive maximum). Motor horse-power is constant in this range but motor torque is reduced as frequency increases.
Note: Motor HP = Torque x RPM

Application:

Because while running a progressing cavity pump the torque value required by the pump is fixed; any reduction in supplied torque as a result of operational speed could cause the pump to fail. Also, depending on the running speed required, a constant HP VFD may not be capable of supplying the torque needed for pump startup. This is the reason a **Constant Torque** VFD **MUST** be used to operate a progressing cavity pump.

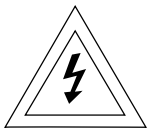
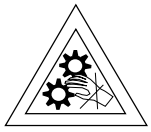
Remark: Because of data transfer the text sheet printouts of our operating instructions do not contain a personal signature.

1 Safety Instructions



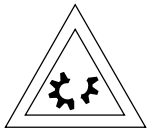
This manual contains basic instructions which must be observed when installing, operating and servicing the machine / equipment. It is essential therefore for the user / installer or responsible technician to read the manual thoroughly prior to installation and operation.
A copy of the manual must always be at hand where the machine / equipment is being used. In addition to the general safety instructions listed in this main section on safety, it is necessary to observe the special safety rules included in other sections of the manual, eg. for private use.

1.1 Safety Signs



The signs below are printed in the manual as general hazard / danger symbols to mark those safety instructions whose non-observance can result in danger to personnel or to the machine / equipment. These signs are:

Hazard sign DIN 4844 - W9
Danger to general public



Hazard sign DIN 4844 - W8
Risk of electric shock

Risk of injury from machinery

Danger from suspended loads

Damage to machinery

Risk of injury to your eyes: goggles required.

Continued Page 1.0R

Warning plates located directly on the pump/ equipment showing for example the correct direction of rotation or the fluid connections used must always be observed and kept completely legible.

1.2 Personnel Qualifications and Training

Operating, maintenance, inspection and installation staff must possess the correct qualifications for their work. Areas of responsibility, scope of authority and staff supervision must be exactly defined by the user. If personnel do not have the necessary knowledge they must receive due training and instruction. If necessary, the user of the machine / equipment can arrange for such training and instruction to be provided by the manufacturer / supplier. The user must also make sure that the content of the manual is fully understood by the staff concerned.

Responsibilites

All work on and operation of the pump/ equipment should be carried out by trained/ competent and qualified operators, tradesmen and / or engineers as appropriate.

Any person responsible for or in charge of

– **working with lifting gear** and ropes when moving a pump / equipment will have to be duly instructed prior to doing the transportation job;

– **mounting a drive** to a pump / equipment must be qualified / trained as an industrial mechanic / technician;

– **setting up installations into a plant** must be qualified / trained as an industrial mechanic/ technician and must be familiar with the design and functioning of the plant in which the pump / equipment is being installed;

– **doing work on starting up, operation and maintenance** must gain knowledge of the pump / equipment principle prior to performing such works and must study the safety instructions and the manual thoroughly;

– **doing repair works**, and prior to doing such works, must be trained and skilled in the job. He must have due knowledge of the pump/ equipments specific details set up in the repair instructions. Unskilled personnel must be trained and repair works checked.

1.3 Dangers arising from Non-Observance of the Safety Instructions

Non-observance of the safety instructions can result in danger to personnel as well as to the environment and the machine. Non-observance of the safety instructions can result in the loss of claims for compensation.

Non-observance of the safety instructions can have, for example, the following consequences:

▲ Failure of essential functions of the machine / equipment

▲ Failure of mandatory maintenance and servicing methods

Continued Page 1.1

- ▲ Danger to personnel from electricity, machinery and chemicals
- ▲ Danger to the environment from leakage of hazardous substances.

1.4 Safety Conscious Working

In addition to the safety instructions listed in the manual, it is essential to observe the national accident prevention directives currently in force and any of the users own internal regulations concerning work and safety.

1.5 Safety Instructions for the User / Operator

- ▲ If there is a risk of danger from any hot or cold machine component, the user must fit protective guards to prevent such components from being touched (according to Standard EN 563).
- ▲ Protective guards fitted to prevent contact with moving parts (eg. couplings) must be in position when the machine / equipment is in use.
- ▲ Leakages (eg. from a shaft seal) of hazardous materials (eg. explosive, toxic, hot material) must be discharged in such a way that neither personnel nor the environment are placed at risk. Legal directives must be observed.
- ▲ All possible danger from electricity must be eliminated (for details see eg. the regulations of your local power supply company).

1.6 Safety Instructions for Maintenance, Inspection and Installation

The user must ensure that all maintenance, inspection and installation work is carried out by authorized and qualified personnel who understand the operating instructions and are adequately trained.

Work on a pump / equipment must only be carried out with the machine stopped and electrical power supply turned off. The pump/ equipment must not be under any pressure and must have cooled off. All procedures detailed in these operating instructions on the stoppage of the machine must always be adhered to.

Pumps / equipment which convey harmful media must be decontaminated.

Immediately after the maintenance work is finished all safety devices and guards must be re-installed and the safety trips must be tested.

Before putting the machine back into operation the points detailed in section "Start-up" should be observed.

Continued Page 1.1R

1.7 Unauthorized Modifications and Manufacture of Spares

Modifications or changes to machines / equipment are only permissible with the manufacturer's agreement. Original spare parts and accessories authorized by the manufacturer ensure safety.
The use of other components revokes any liability for consequences which may result.

1.8 Improper Application

Delivered machinery / equipment is only guaranteed safe for the use specified.

This machine / equipment was designed in accordance with the prescribed conditions of use.
The limits of use are laid down in the conditions of use and should in no way be exceeded.

1.9 Specific Points for the Use of a NEMO® Pump

A NEMO® pump must be used for the **purpose only** for which it was sold.

If you change or wish to change the process medium, you must check with either the supplier or manufacturer that the pump is suitable for the new medium. This is especially important with aggressive, poisonous or otherwise hazardous substances.

Pump criteria include:

1. Compatibility with the medium
2. Suitability for seal design / material, especially the shaft seal
3. Resistance to pressure and temperature of the medium.

Please note that NEMO® pumps are progressing cavity pumps and as such can generate very high pressure.

A blockage or the chance closure of a valve in the discharge line can cause a pressure rise **manifold as high as can be tolerated by the installation**. This can result in the bursting of pipes, which must be avoided especially in the case of dangerous media.

Corresponding safety equipment must therefore be installed, for example an emergency stop button, a pressure relief valve with return pipe or a bursting disc.

During maintenance and repair work on the pump please note the following:

1. Ensure that the pump drive **can not** be turned on without authorization.
2. When opening the pump follow the instructions for handling the medium (eg. protective clothing, no smoking etc).
3. Before putting the pump back into operation ensure that all guards and other safety devices (eg. drive–belt protection, coupling protection) are properly re–installed.

Continued Page 1.2

1 SAFETY PRECAUTIONS

Always bear in mind your safety during operation, maintenance and installation of equipment. Please adhere to the EC-Directive for machinery including the national regulations and follow the US OSHA regulation #1910.219 & 1910.147 titled Mechanical Power transmission apparatus as well as the European Standard EN 292 with the accidents prevention rules laid down by the trade unions and other appropriate technical institutions.

Always bear in mind your safety during operation, maintenance and installation of equipment. Please adhere to the EC-Directive for Machinery including the national regulations and follow the European Standard EN 292 with the accident prevention rules laid down by the trade unions and other appropriate technical institutions.

Continued Page 1.2R

1.10 Notes on Inspection and Repair

The legal regulations for safety at work, such as regulations for the workplace, regulations governing dangerous materials, accident prevention, environmental protection eg. regulations on disposal and water balance obligate all commercial business to protect their employees and / or people and the environment from adverse effects caused by contact with dangerous materials.

Important:

Inspection / repair of machinery and its parts only takes place when a safety conformity certificate has been completed by an authorized and qualified specialist. Please use a copy and leave the original in the operation and maintenance manual.

Where special safety precautions are necessary in spite of careful emptying and cleaning of the machinery, the necessary information must be given.

Machinery operating with radio-active media will only be repaired or inspected by one of our specialist engineers under the safety of the owner.

The safety conformity certificate is part of the inspection / repair service. We reserve the right to refuse acceptance of this order / service for other reasons.

Continued Page 1.3

1.11 Instructions concerning explosion protection

The instructions below are to be considered and kept to when using pumps in potentially explosive areas in order to guarantee durable explosion protection of the pumps and avoid any danger of ignition.

In accordance with the regulations 94 / 9 / EC, the pumps are admitted for use in the area II 2G IIB T 4 or II 2G IIB T 3
(pls. see manufacturer's declaration or declaration of conformity).

It is to be taken into account that in case of aggregates the components (e.g. gears, couplings) mounted on the pumps must comply with the regulations 94 /9 / EC as well. The relevant documentation concerning these components is to be considered.
The application area of aggregates is determined by the application area of the mounted component with the lowest approval and thus may deviate from the allowed application area of the pump.

Temperature category	Max. temperature of the conveying product
T 4	100 °C
T 3	165 °C
T 2	265 °C
T 1	415 °C

The maximum conveying product temperatures apply when mechanical seals of Messrs. Burgmann with **carbide – carbide** and **carbide – carbon** as sliding material combinations are used.
In the case of other manufacturers or other sliding material combinations it is necessary to consult the manufacturer.

1. **Assembly and repair in potentially explosive areas**

   When performing assembly and repair work, it is to be seen to it that no dangers of ignition arise especially during heating up the pump parts. This means e.g. heating up by explosion-proof heating devices or exclusively in non-explosive areas. The temperature of the heated part and the ignition temperature of the materials by which the danger of explosion may be caused are to be considered.

2. **Dry-running protection**

   Under no circumstances is the pump to run dry.
   The pump is to be equipped with an appropriate dry-running protection device.

Continued Page 1.3R

The device for dry-running protection should be self-regulating.
This means that this device can give alarm signals and/or switch off the pump also in case of failures in its own control system.

Dry-running protection concerning stationary immersion pumps (with mounting plate)

Operation is only permitted with redundant or self-regulating automatic devices to guarantee dry-running protection as well as to control the pump capacity.

Dry-running protection concerning movable immersion pumps (drum pumps)

The filling with liquid during the operation is to be ensured by specific requirements of behavior:

- Drum pumps may only be introduced in and removed from the container in switched-off condition
- Drum pumps, after being introduced in the container to be discharged, may only be started after they have immerged in the fluid.
- Drum pumps are to be switched off before they run dry or are to be switched off at once when specific noises ("slurping" or speed rise) suggest that dry running may or will immediately occur.

3. **Overpressure protection**

   The pump must not be loaded over the maximum allowable pressure.
   The pump is to be equipped with an appropriate overpressure protection device. The pump must not convey against a closed slide valve.
   The overpressure protection device should be self-regulating.

4. **Drives**

   The drives must be adjusted to the performance of each pump.
   In the case of a blocking of the pump, the drives must be turned off automatically by means of a motor protection unit.

5. **Alignment of the drive (concerning the pump types SY / SH / SA / SO / SF / SP)**

   It is absolutely necessary that the drive be aligned within the maximum allowable tolerances. Incorrect alignment causes damage to the seals and the shaft bearings.

6. **Potential equalization concerning immersion pumps**

   The immersion pumps are to be integrated in the potential equalization of the installation. Hand-operated movable immersion pumps are to be grounded before being introduced in the container.

Continued Page 1.4

The connection to ground is to be maintained until the pump has been completely pulled out of the container.
There must not be any potential difference between the pump and a conductive container. This means that container and pump are to be connected at a common grounding point and thus be conductively connected with each other.
(see information brochure "Statische Elektrizität, Zündgefahren und Schutzmaßnahmen" (Static electricity, dangers of ignition and preventive measures); Publisher: "Internationale Sektion für die Verhütung von Arbeitsunfällen und Berufskrankheiten in der chemischen Industrie der IVSS" (International section for the prevention of employment accidents and occupational diseases in the chemical industry of the ISSA (International Social Security Association)) , Heidelberg 1995).
The hand-operated movable immersion pumps are to be provided with an indication referring to the grounding measure (pay attention to grounding).

7. **Potential equalization concerning all other pump types (no immersion pumps)**

   All conductive parts of the pump are to be integrated in the potential equalization of the pumping set unless the conductive connection to the ground potential is guaranteed by the drive or connecting shafts or otherwise.

8. **Stator**

   The stator is to be regularly checked for wear. When the allowable wear limit is reached, the stator is to be replaced. Before exchanging the conveying product, the pump operator has to consult the manufacturer concerning the durability of the stator unless the stator has already been confirmed for the intended application.

   Inspection and maintenance interval of the stator:
   - **in the case of an operating time of > 16 h/day, at least twice a year**
   - **in the case of an operating time of < 16 h/day, at least once a year.**

9. **Joints / joint lubrication**

   The sealing and the lubrication of the joints are to be regularly checked. If necessary, the seals and the lubricants are to be replaced.

   Inspection and maintenance interval of the joints:
   - **in the case of an operating time of > 16 h/day, at least twice a year**
   - **in the case of an operating time of < 16 h/day, at least once a year.**

10. **Inspection after initial startup**

    The aspects relevant for ensuring the explosion protection (such as lubrication and wear check) are to be checked six months after the initial startup of the pump at the latest.

Continued Page 1.4R

11. **Shaft bearings**
(concerning the pump types SY / SH / SA / SO / SF / SP)

Replacement of the bearings after 14,500 operating hours (according to prEN 13463-5: replacement after 90 % of the designated service life).

12. **Materials**

Although being allowed as material for the pumps, aluminum should be avoided in potentially explosive areas.
The pumps may only be used if, under the particular operating conditions, the materials are resistant to mechanical and/or chemical influences or corrosion such that the explosion protection will be maintained.

13. **Noise development**
(concerning the pump types SO / BO / SF / BF / SP / BP)

As soon as unusual noises (such as knocking or rubbing) are realized, the pump is to be switched off. The cause of the failure is to be eliminated before the pump is reoperated.
Regular check of the paddle equipment.

14. **Direction of flow of immersion pumps**

The direction of flow of immersion pumps always has to be from the end connection piece to the pressure nozzle at the top. The reverse direction of flow is not allowed.

15. **Mechanical seal of immersion pumps**

Before the initial startup and after a prolonged shutdown, the mechanical seal is to be lubricated from outside before the pump is started. In this connection, the compatibility of the lubricant with the sealing material is to be considered.

16. **Impurities in immersion pumps**

Especially in the case of hand-operated movable immersion pumps it is to be seen to it that no impurities can get into the pump. The pumps are to be deposited only on clean and solid ground or else to be suspended. In case of unusual noises or power losses, the immersion pumps are to be switched off immediately.

17. **Gland**

If a gland packing is applied it has to be observed that the permitted temperature corresponding to the temperature category is not exceeded. Recommendation: fasten the screws of the stuffing box gland only with low torque (approx. 5 Nm).

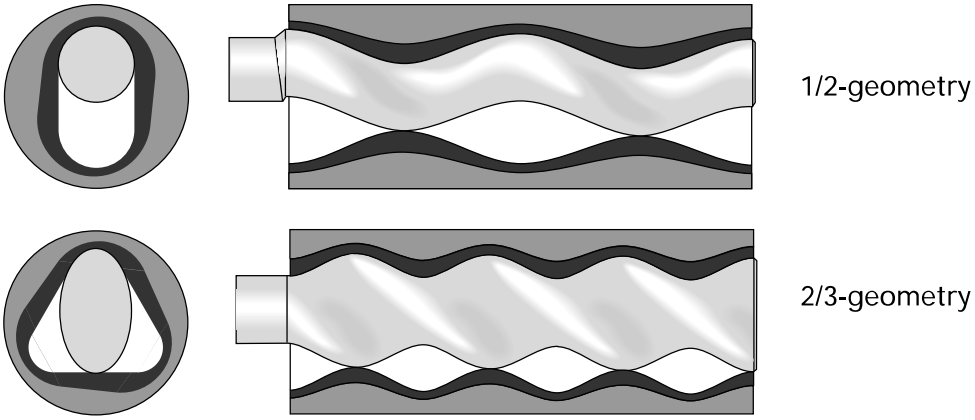
2 Description

The NEMO® pump is a progressing cavity pump.
The main components which determine the system discovered by Professor René Moineau are a rotating part, called the rotor and a static part, called the stator.
The rotor is a helical screw with an extremely large pitch, large thread depth and small centre diameter with round cross-section for 1/2-geometry and elliptical cross-section for 2/3-geometry. The stator has a two start or resp. 3 start thread and is double or resp. 1.5 the pitch length of the rotor. This provides space for the medium between the rotor and stator. When the rotor turns round inside the stator the medium moves continuously from the inlet to the outlet.



The universal NEMO® pump system unifies many positive characteristics of other pump types:

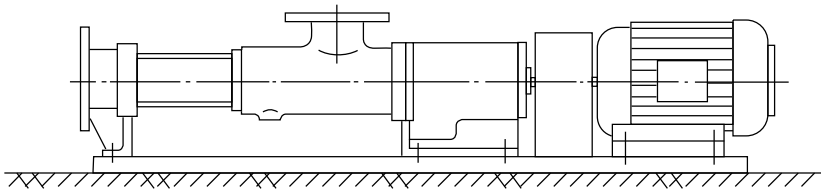
- Like centrifugal pumps NEMO® pumps have no suction or pressure valves, but do have a stable flow rate in proportion to the number of revolutions.
- Like piston pumps NEMO® pumps have a suction capability of up to 8.5 m vacuum metric.
- Like membrane and peristaltic pumps the NEMO® pump can transport every type of inhomogenous, gaseous and abrasive media, as well as those that are not of a liquid consistency or contain solids and/or fibrous material.
- Like gear pumps and screw pumps the NEMO® pump is capable of coping with high medium viscosities.
- Like piston, membrane, gear or screw pumps the NEMO® pump can perform dosing operations.

Length and cross-sections through the rotor and stator with 1/2-geometry during a rotation.

Continued Page 2.0R

Length and cross-sections through the stator with rotor
with reduced stator wall thickness

2.2 General Data



Noise emissions:

The maximum permitted noise emission level at a work place is 70 dB (A).

The noise level was measured in accordance with DIN Standard 45635-24-01-KL2 to assure that the pump does not exceed 70 dB (A).

Noises generated by the drive and pipes are not included in the above emission value.

A prerequisite for the noise emission level of ≤ 70 dB (A) is that the pump is operated in a cavity free regime and is bolted to a concrete base.

3 Packaging, Transportation, Storage

3.1 Packaging and Transportation

NEMO® pumps are shipped in railroad containers or crates unless the customer specifies otherwise.
The packings are labelled and symbols give the handling instructions in accordance with DIN 55402.
On receipt check for any transport damages.
Transport damages should be reported to the transporter immediately.
The pumps should be transported as closely as possible to the location of installation and only there should they be uncrated.

Uncrated horizontal pumps should be lifted by using a shackle which can be attached to the baseplate. The bolt holes of the frame or the lifting lugs attached to the baseplate could be used as shown on the installation drawing.

Vertical pumps should be lifted by using the bolt down holes, lifting lugs or shackles attached to the baseplate. This is shown on the installation drawing. For most applications, the drive is mounted on top of the pump.

Be careful when lifting top heavy pumps. The centre of gravity may be above the points where the lifting gear is attached to. If the case, secure additionally against tipping over!

Vertical pumps should not be deposited unless they are secured vertically. **Hazards of tipping!** Deposit only in horizontal position!

It is essential to avoid that the total pump unit be suspended with eye bolts of the motor or gear box. These eye bolts should be used for lifting the motor and/or the gear box **only.**

The Accident Prevention Rules, Section 18.4 relating to lifting accessories for the lifting of loads (VBG 9a) must be strictly adhered to.

Because of the variety of possible pump designs and applications, only general instructions can be given here. These should be good enough for experienced assemblymen or transportation experts.
When in doubt, please ask for detailed information on the pump unit concerned.

Continued Page 3.0R

When moving the pump or unit on **wheels** strictly attend to the following:

- Pad lock the motor drive and secure against unintended starting up.
- Move the pump unit carefully and slowly, especially where the ground is uneven. **Hazards of tipping!**
- Ensure a stable position of the pump or unit at the operating/storage place and secure it by actuating **all** clamping devices on **all** the wheels or rollers against voluntary moving away.
- Where fitted loosely, carefully watch the pipe bends when pumping. **Power of repulsion!**
- Where necessary, secure the pump unit additionally with support blocks.

3.2 Storage

The pumps are preserved for transport unless specified otherwise.
In cases of longer storage the pumps should be handled as follows until installation:

- **Stator:**

If the pump is not to be used immediately, then the elastomer along the contact line between rotor and stator may become permanently distorted (compression-set). This will increase the break away torque. Therefore, the stator should be removed and kept separately in a clean, cool and dry environment.
Standard DIN 7716 summarizes detailed information on the storage of rubber products, some of which is gathered here, and the following notice applies to a storage for a period of up to six months.

General

Most of the rubber products may change their physical properties under unfavourable conditions or if treated improperly, which will result in a shorter lifetime.
Or they may become useless through excessive hardening, aging, regenerating or permanent deformation, also because of blistering, cracking or other damages appearing on the surfaces.
The changes may occur under the influence of oxygen, ozone, heat, light, humidity, solvents or because of storing the products under tension.
If stored and treated properly, the rubber products will keep their properties, even over a long period of time (some years), almost unchanged.
This does, however, not apply to uncured rubber compounds.

Continued Page 3.1

Store room

The environment in which rubber products are being kept must be cool, dry, free of dust and rather airy, and they must not be stored in the open, not even in a weather sheltered space.
Rubber products should be kept in surroundings not having less than minus 10 °C and not more than plus 15 °C.
Store rooms should not be damp, and it must be ensured that there will be no condensation.
Most favourable is an environment offering a relative humidity under 65 %.
Rubber products must be protected against light, particularly direct sunlight or artificial light when having a high UV portion.
They should furthermore be kept away from ventilation, especially draught, by wrapping them up.
As ozone is very aggressive and harmful there should be no store room used which houses equipment likely to produce ozone, e.g. electric motors or other equipment which might bring about sparks or other electrical discharges.
There must be no solvents, oil, grease, lubricants or any chemicals kept in a store room.

- **Rotor**

  Please support with wooden blocks and cover up against harm from mechanical impact.
  For rotors of RCC (material number 1.2436):
  coat the surfaces with protective grease to avoid rusting.

- **Shaft Sealing by packing gland**

  Remove the gland and coat the exposed shaft surface with grease.

- **Pump parts in stainless steel**

  No grease coating necessary.

- **Other, non-coated pump parts**

  Protect with grease.

- **Drives**

  Please observe the drive supplier's instructions.

4 Mounting and Installation

If the NEMO® pump was stored and the rotor grease protected: Remove the grease before installing the stator. Clean the rotor thoroughly in order to avoid unsuitability of the grease with the stator material and the pumping medium.

Screw the pump at all fixing points (bearing housing / drive stool, end stud, support feet) using all fixing bores securely down to the sub-structure (ground plate, machine frame, foundation etc.).

4.1 Direction of Rotation

The direction of rotation of the pump is given on the model plate and in the order confirmation. The direction of delivery of the NEMO® pump is a function of the direction of rotation.

Changes must be agreed upon and confirmed by the supplier.

4.2 Pressure

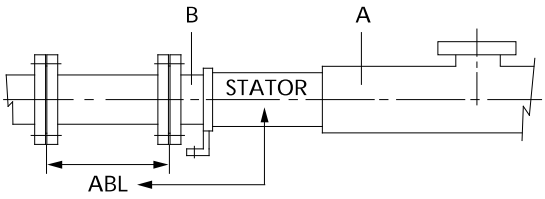
If not explicitly confirmed otherwise in the order confirmation, the **maximum permissible pressure (e.g. when turning clockwise) inside the pump housing (A)**

– for models with pump housing of cast iron 6 bar

– for models with welded pump housing 10 bar.

The maximum permissible pressures inside the end flange (B) is a function of the design applied for connections

- with flange: maximum nominal pressure (e.g. PN 16)
- with threaded internal socket: maximum 25 bar
- with DIN 11851 "dairy" thread up to DN 100 for one or two stage pumps: max. 12 bar, for multi stage pumps: max. 25 bar
- for other versions: maximum permissible pressure of the socket connection, but not more than 6 bar per pump stage, depending on the stator installed.



4.3 Piping System

- Arrange suction and pressure pipes so that when the pump is not running, the medium is still present before and after the pump. Sufficient media should remain inside in order to lubricate the pump during restart.

Continued Page 4.0R

4 INSTALLATION INSTRUCTIONS

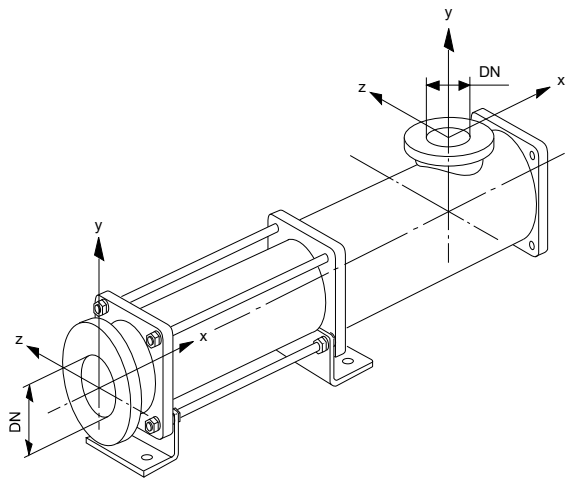
■ The installation of a removable distance piece between the end flange (B) and the pipe work is recommended in order to make the dismantling of the stator easy. The distance piece (see sketch) needs to have a minimum "ABL" disassembly length the values of which are shown in the table below, depending on the pump size and the number of stages.

Disassembly length ABL in mm:

Pump size	Number of stages			
	1 *)	2	3	4
0 1 5	90	160	230	310
0 2 1	130	230	340	450
0 3 1	170	310	450	590
0 3 8	230	430	630	830
0 4 5	270	500	730	960
0 5 3	320	600	880	1170
0 6 3	370	690	1010	1330
0 7 6	420	800	1170	1540
0 9 0	500	950	1390	1840
1 0 5	630	1180	1740	-
1 2 5	740	1400	-	-

*) for one stage pumps with L or P geometry the ABL values of 2 stage pumps are valid

Continued Page 4.1



Type key

Example: NM 090 BY 02 S 12 B

- Internal
- **Pump size**
- Type
- Model
- **Number of stages**
- Geometry
- max. permissible pressure difference
- anti–clockwise
- Joint

The disassembly length "ABL" is also shown in the arrangement drawings in accordance with our Standard QSH V - TB 01 - 002.

- Clean the pipe work and rinse thoroughly before installing the pump.
- Connect the pipe work ensuring that no external stress attacks the pump body. The installation of compensators between the pump and the pipework is recommended:
  - No risk of damage to the pump housing from pipelines "resting" on the pump.
  - No risk of damage to the pump housing through vibrating pipelines.
- The twisting loads (F_x, F_y, F_z) and bending loads (M_x, M_y, M_z) permitted to be put on the suction/discharge flange comply with the requirements of API 676 and exceed the requirements of EN ISO 14847. They are shown in the table below.

Continued Page 4.1R

Pump type NM	Standard nominal diameter DN	F_x, F_y, F_z N	M_x, M_y, M_z Nm	
015 021	(32) G 1¼"	550	(300)	Screwed joints must not be charged with loads which may result in tightening or loosening these joints
31	50	780	420

76	125	1820	980	
90 105	150	2190	1180	
125	200	2850	1530	

4.4 Shaft Sealing

- Where applicable, ensure that adequate supply lines for the buffer, flushing or quenching fluid for the shaft seals are connected **before** the pump is put into **operation**.
  For more details see Section 7.4!

4.5 Electrical Connection

All work relating to electricity shall only be made by **authorized and qualified personnel** and it should be in compliance with the requirements of the relevant national regulations!

In particular for control systems should the latest version of the **EC-Directive for Machinery 98/37/EEC, Annex I, Section 1.2 Controls** be carefully observed!

Note for frequency converter operation:
It is absolutely necessary to connect the PTC-resistors of the drive in case of frequency converter operation to protect the drive against overheating.

5 Start-up

The NEMO® pump design requires strict attention to the following:

Never run the NEMO® pump dry!
A few rotations in dry condition
will damage the stator!

- Before starting up for the first time, fill the pump with medium.
  In the case of high viscosity media fill with a liquid.
  Pump priming is vital to ensure lubrication of the rubber stator.
  Fill the piping on the pump suction side.
  In anti–clockwise rotation only: Fill the pump housing.

The NEMO® pump is a progressing cavity pump which can produce pressures that may cause the bursting of vessels or pipes.

The power transmission train (shaft, coupling rod, joints, rotor) of the pump may be overloaded thus resulting in damage or breakage.

Also the pump housing parts with their connections may be overloaded and break. There is a table in Section 4 of these Maintenance and Operating Instructions showing the pressure resistance of the pump housing parts.

Never run the pump against a closed inlet or outlet valve!

- **Open valves and vents before starting the pump!**
- **Check the direction of rotation by briefly switching on the pump motor.**

DETERMINING WHEN TO LOCKOUT

Having performed a hazard analysis on your company's equipment, you can now determine when machines must be locked out – i.e., when employees are exposed to injury from each (or any) of a machine's hazardous energy sources during servicing or maintenance activities. To do this, use your Hazard Analysis Checklist and the "Four Key Questions for Lockout Implementation."

OSHA Requirements

OSHA rules state that equipment must be locked out during equipment servicing and maintenance whenever employees are exposed to injury from unintentional machine movement or startup. According to OSHA's regulations, servicing or maintenance procedures that require lockout include:

"Workplace activities such as construction, installing, setting up, inspecting, modifying, and maintaining and/or servicing machines or equipment. These activities include lubrication, cleaning, or un-jamming of machines or equipment and making adjustments or tool changes, where the employee may be exposed to the unexpected energization or startup of the equipment or release of hazardous energy."

In addition, lockout is required during any machine service or maintenance that requires an employee to:

- Remove or bypass a safety device; or
- Place any part of his or her body into a point of operation or similar danger zone during a machine's operating cycle.

Routine, Repetitive Activities

Routing and repetitive servicing procedures that take place during normal production operations, such as minor tool changes and adjustments, do not require lockout tagout, as long as the work is performed using "alternative measures which provide effective protection." These "alternative measures" include safeguarding methods approved by OSHA and ANSI (American Standards Institute) to protect operators, such as:

- Presence sensing devices
- Interlocking barrier guards

Remember, the factor that determines whether these or any other safeguarding methods eliminate the need for lockout tagout during routine, repetitive activities is whether the employee is protected from injury.

If lockout is not required, you MUST have clearly written procedure that describe the alternative safeguarding measures used and the tasks that may be performed. Refer to OSHA and ANSI standards for approved safeguarding methods.

6 Temporary Shutdown

- After stopping the pump empty and if necessary rinse it if

  - the medium might freeze due to the temperature surrounding the pump. Especially where there is a danger of frost if the pump is installed outside a building
  - the medium tends to solidify or harden
  - the medium tends to glue up the shaft seal.

- Stator:

  When stored for a long period, the elastomer along the contact line between the rotor and stator may become permanently distorted (compression-set).
  This will increase the break away torque. For this reason, the stator should be removed (please observe Section 9!), and stored in a cool, dry place in air tight package to give protection against light and air.

- Rotor:

  Remove **ceramic rotors** (please observe Section 10!) and store away, safe in the original packing.

  Support **other rotors** on wooden blocks and cover to protect them from mechanical damage, after the stator has been removed.

  Rotors made of RCC (material number 1.2436):
  Protect the rotor surfaces against corrosion with protective grease.

  Remove the grease before re–installing the stator and clean the rotor thoroughly in order to avoid unsuitability of the grease with the pumping medium or the stator material.

- Stand-by pump:

  A stand-by pump is sometimes used as a back-up for the main pump and, when standing idle for longer periods, should be operated from time to time. The pump may otherwise become seized when being started up. This is due to compression set i.e. distortion of the stator against the surface of the rotor.

7 Maintenance

7.1 Pumps in General

- The pumps should be regularly rinsed or cleaned if deposits of medium are likely to build up (sedimentation).

If the pump needs to be opened to do this, ensure that the pump and motor are switched off and cannot be turned on accidently (eg. by removing the fuse).

Periodical standstill to allow for cleaning during operation depends on the medium and type of operation.

- The pump can be cleaned:

  - through the cleaning ports provided in the pump housing
  - manually by dismantling the pump
  - automatically (CIP cleaning) for special housings with a flushing section (important instructions for CIP procedures are given in Section 5 (START UP).

7.2 Lubrication

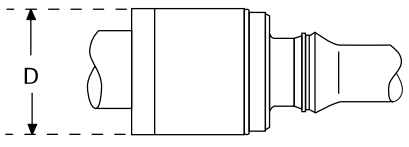
The NEMO® pump does not require frequent lubrication.

- Maintenance of the drive should be carried out according to the drive manufacturers instructions.

- Maintenance
  - where no manufacturers instructions are available and
  - when normal conditions of use exist:

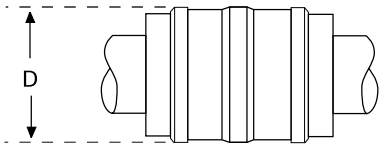
  - Strip down the drive unit
  - Remove the bearings
  - Clean all parts
  - Renew the lubricant

  every 5000 operating hours or at least every two years.



Special lubricants are often specified for mechanically controlled variable speed drives.
It is therefore important to follow the drive manufacturers maintenance instructions.

7.3 Lubricating the Pin Joints with SM-Pin Joint Seals



- It is advisable to change the oil and check the seals of the pin joints:
  - when renewing worn joint parts
  - when opening the pump for any reason.

  The quantity of oil added per pin joint is a function of the joint external diameter D:

Joint external diameter D in mm (see sketch)	Basic joint size	Quantity of oil per joint in cm^3
28	NM 015	1,5
30	NM 021	2
40	NM 031	5
54	NM 038	15
65	NM 045	22
76	NM 053	36
83	NM 063	78
102	NM 076	165
125	NM 090	205
148	NM 105	450
162	NM 125	470
Journal cross joint 175	NM125	1650

Pin joint

Journal cross joint

Continued Page 7.2R

Lubricating Oil:

Industrial application	Designation DIN 51502	Permitted Product
Food and Beverage Industry only	Authorized for use in foodstuffs — CLP HC 460	"KLÜBER" KLÜBEROIL 4 UH 1 - 460 authorized under USDA H1

This synthetic oil meets both the German "Arzneimittelbuch" requirements and the still stricter US American FDA regulations.
Nevertheless, it is not quite harmless if swallowed in more than minor quantities!

At a sudden break in a joint up to 450 ml of lubricating oil together with metal rubbings may enter the pumping medium. It is therefore of essential importance to regularly check the state of the joint seals and renew in time, if necessary.

If the pin joints operate without lubricating oil or seals, there will be no risk of contaminating the medium with oil. This operation, however, results in a higher amount of rubbed off metal parts through wear on the joints. These metal rubbings will inevitably and continuously come into contact with the pumping medium.

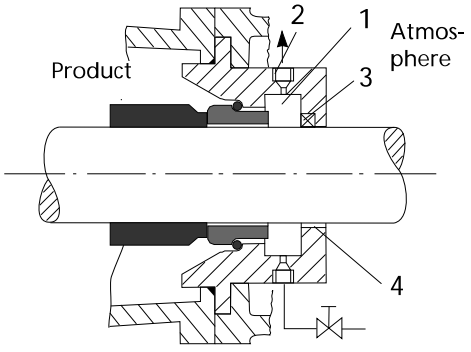
General Industry	CLP 460	"SHELL" Omala 460
	with SM-pin joint seal (8235) of EPDM CLP PG 320	prescribed: KLÜBERSYNTH GH 6-320

7.5 Shaft Sealing through Single Mechanical Seal

There are various constructions of mechanical seals. Especially advantageous is the use of standard mechanical seals according to DIN 24960. These seals have regardless of their brand the same fitting dimensions which makes them interchangeable. Mechanical seals with a coil spring can only be used for pumps which are run in one direction of rotation.

- The seal specification of a NEMO® pump is recorded on the order confirmation sheet.
- Pumps fitted with direction dependent seals should **never** be run in the opposite direction of the rotation arrow.
- If excessive leakages occur the spring tension and the seal surfaces should be checked, and the seal be replaced, if necessary.

Single mechanical seals usually work without any additional equipment. Their application range can be increased by operating them with a rinsing or cooling system.



a) **Quench**, in accordance with ISO 5199, Appendix E, Plan Nos. 08, 09, 10 or 13 or API 610, Appendix D, Plan No. 62.

Quench is the designation commonly used in sealing engineering for an arrangement that applies a non pressurized external fluid to the atmospheric side of a mechanical seal. The quench is used when

- a single mechanical seal will not work or only to a limited extent without auxiliary measures or
- a double mechanical seal with pressurized buffer fluid is not necessary.

Recommended for the following applications:

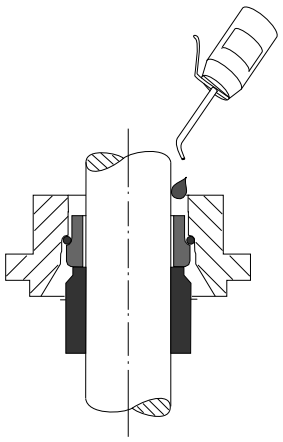
- Low temperature (danger of freezing)
- Operation in a vacuum (dry running)
- Media which must be isolated from the atmosphere (eg. due to build up of solid deposits or because of less severe damage to the environment, like smell).

Continued Page 7.5R

Leakages will be transportet away by the quenching liquid.
In vacuum operation dry running of the seals is avoided.

No pressure higher than that of the pumped medium **in front** of the mechanical seal is allowed to build up in the quenching area (1) **behind** the mechanical seal. Otherwise the counter ring will be pushed out of the housing. **Free discharge** from (2) is necessary!

Closing off the quenching area from the atmosphere can be done in three ways:



1. In the case that high emission levels can be tolerated:
   Through a throttle bush (4). Cooling liquid not permanently used, only released from time to time.
2. In the case that medium emission levels can be tolerated:
   By a radial shaft seal ring (3). Permanent radial shaft seal lubrication through quenching liquid is necessary.

b) **Top lubrication**

Attention: For vertically installed pumps with overhead drive as type NT:

On initial start-up the mechanical seal has not come in contact with the medium. It runs therefore dry for a short period of time until the air is displaced from the pump housing.

- On first start–up and if stood idle for longer periods lubricate the mechanical seal before switching on the pump.
- Apply water, glycerine or oil depending on their compatibility with the pumping medium and the elastomer of the mechanical seal.
- Fill the quench cup of the mechanical seal housing.

8 Trouble-Shooting and Remedying

8.1 Trouble Chart

The chart overleaf lists possible problems

- the type
- the likely reason / cause
- the remedy.

- A problem may have various causes: Several boxes in the vertical column are marked with a cross.
- A reason/cause may result in various problems:
  Several boxes in the horizontal column are marked with a cross.

8.2 How do you trace the kind of problem to find the possible cause ?

- The column describing a possible problem shows one or several boxes marked with a cross.
- On the corresponding lines you will find the possible reasons/cause and some hints how to handle the problem .
  Thus the actual cause of the problem can be narrowed down and eventually detected.
- If you find further cross-marked boxes on one of the lines and should there appear corresponding problems as well, then the likely cause of the problem has been detected.

- The table helps in finding the root of the problem and will give you the remedy if it is straight forward. For more complicated problems the manufacturer has to be consulted.

Continued Page 8.0R

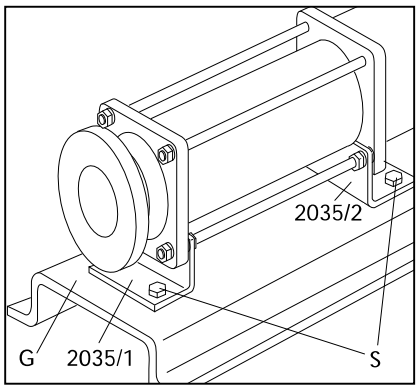
The NEMO®-pump is a well established product which was thoroughly tested before leaving the factory. If you use the pump in keeping with your Order Specification and treat it in accordance with our Operating and Maintenance Instructions, it will run satisfactorily for a long period of time.

Possible Problems											
The pump is no longer starting	The pump is no longer sucking	The pumped medium is too little	The pressure is too low	The pumped medium is unstable	The pump is running loudly	The pump is stuck	The drive is overloaded	The stator life time is too short	The rotor life time is too short	The shaft seal is leaking	**Possible Causes** (Remedy overleaf)
X							X				In new pumps or stators : the static friction is too great.
X		X	X				X				The pump electrical equipment is not compatible with the electrical supply.
		X					X	X	X		The pressure is too high.
X						X	X				There are foreign bodies in the pump.
X						X	X	X	X		The temperature of the liquid medium is too high, the stator is too ductile.
X						X	X	X			The stator has swollen, the elastomer is not compatible with the medium.
X						X	X	X			The solids content of the medium is too high and leads to blockages.
X						X	X	X	X	X	The liquid medium sediments or hardens when left to stand.
		X	X	X							There is air in the suction pipe.
	X	X	X	X							The suction pipe is leaking.
	X	X	X	X							The shaft seal is leaking.
		X	X								The rpm is too low.
	X	X	X								With reduced diameter rotors : operating temperature has not been reached.
		X	X	X	X			X	X		The suction is too great or pressure too low (cavitation).
		X	X		X	X	X	X			The pump is running dry.
	X	X	X		X						The stator is worn out, or temperature of liquid is too low.
	X	X	X		X			X	X		The stator material is brittle.
	X	X	X		X			X			The rotor is worn out.
					X						The joints are worn out.
					X						The pump and drive are not axially aligned.
					X						The elastic element of the coupling is worn out.
					X					X	The roller bearings are destroyed.
							X				The rpm is too high.
							X				The viscosity is too high.
							X				The specific weight of the medium is too high.
							X			X	The stuffing box is incorrectly tightened.
										X	The packing is not suited to the liquid medium.
	X									X	Mechanical seal : rotation is incorrect.
										X	Mechanical seal : mechanical seal and mating ring have failed.
										X	Mechanical seal : elastomers damaged, swollen or brittle.

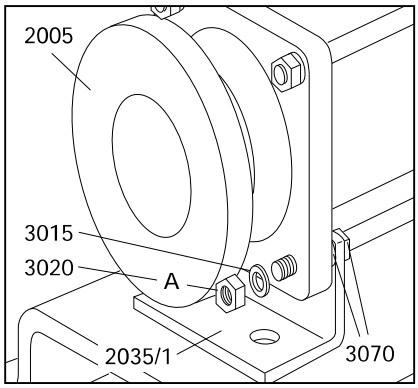
Remedy
Fill the pump up, then pump through manually using a suitable appliance; if necessary use glycerine as lubricant in the stator.
Check order information. Examine electrical installation (possibly 2 phase operation).
Measure the pressure with a manometer and check against order details. Reduce the pressure or change the drive.
Remove foreign bodies and eliminate possible damage.
If the liquid medium temperature cannot be lowered, use a reduced diameter rotor.
Check whether the liquid medium agrees with the order requirements. Possibly change stator material..
Increase the liquid part of the medium.
Clean the pump and rinse through after each run.
Increase the suction liquid level, prevent turbulance and air bubbles at the inlet.
Check seals and tighten pipe connections.
Stuffing box : tighten or renew. Mechanical seal : renew seals, eliminate solid deposits.
In the case of adjustable drives : increase the rpm. If necessary change the drive.
Warm up the pump (stator) to operating temperature first of all.
Decrease suction resistance, lower the temperature of the liquid medium, install the pump at a lower location.
Fill up the pump, provide for dry running protection, move the pipes.
Replace with a new stator or ensure correct liquid temperature.
Fit a new stator. Check the liquid medium agrees with order details; if necessary change the stator material.
Change rotor, establish the cause. Wear and tear, corrosion, cavitation; if necessary change to a different material or coating.
Replace relevant parts, carefully reseal and lubricate.
Re-align the unit.
Use a new connection and re-align the pump.
Replace roller bearings, lubricate, reseal. At higher temperatures observe the lubricant and the bearings.
In the case of adjustable drives : lower the rpm.
Measure the viscosity and compare with order details. If necessary adjust viscosity or change the drive.
Measure specific weight and compare with order details. If necessary adjust specific weight or change the drive.
Service stuffing box according to page 7.4, if necessary renew worn shaft.
Replace fitted packing with another packing type.
Change electrical connection.
Replace relevant rings with new ones.
Replace elastomers. Check whether the liquid medium agrees with order details, if necessary change material.

9 Removal and Fitting of End Stud, Stator and Pump Housing

The pump with attached pipework should be empty and must have cooled off!
Disconnect the pipework on the suction side and pressure side of the pump.



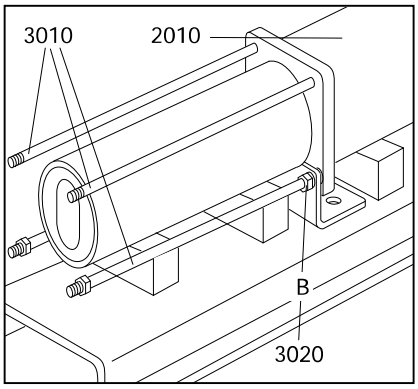
Caution for pumps with ceramic rotors!



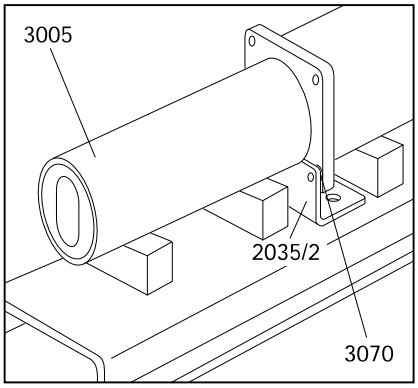
Where a pump is fitted with a **ceramic** rotor (1999) the following operations should be carried out **with great care.**
Do not use any force or sharp tools! Special care must be taken to prevent heavy strokes, vibrations or impact by a hammer.

Dismantling

- Remove the securing screws (S) from support feet (2035) to baseplate (G).



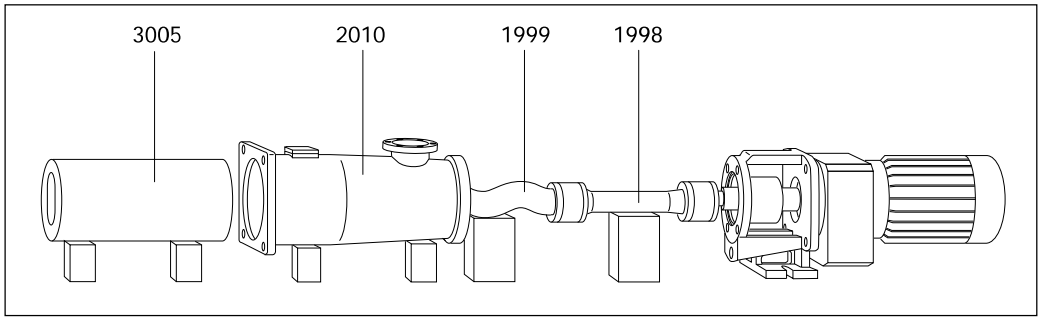
- Unscrew the hex nuts A (3020) and remove with spring washers (3015), then withdraw the end stud (2005) and first support foot (2035/1) with washers (3070).



Continued Page 9.0R

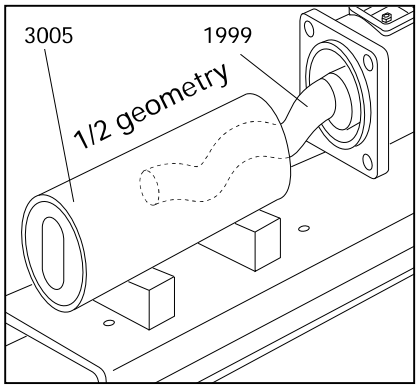
9 DISMANTLING AND ASSEMBLY OF THE PUMP HOUSING

- Support pump housing (2010) and stator (3005) with wooden blocks.
- Loosen the hex nuts B (3020), where fitted, and remove the thru bolts (3010).



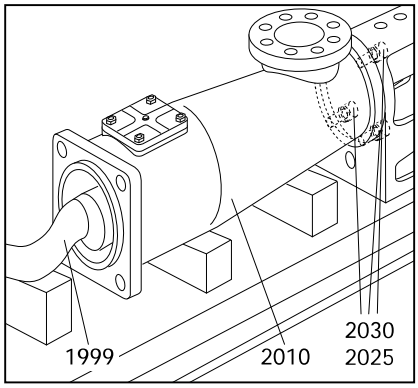
- Where fitted, remove the second support foot (2035/2) and the washers (3070).

Caution for pumps with ceramic rotors!



When the stator (3005) is removed from the **ceramic** rotor (1999), the stator must be supported to prevent it from suddenly tilting away downwards. The same applies to the rotor (1999) as soon as it is disengaged from the stator (3005). Removing the stator (3005) from the **ceramic** rotor (1999) is easier by using an extractor. This should be done slowly and with care in a rotating movement. When sliding pump housing (2010) over **ceramic** rotor (1999), both coupling rod (1998) and rotor (1999) should be lifted as the **ceramic** rotor (1999) must not knock onto the pump housing (2010).

Continued Page 9.1

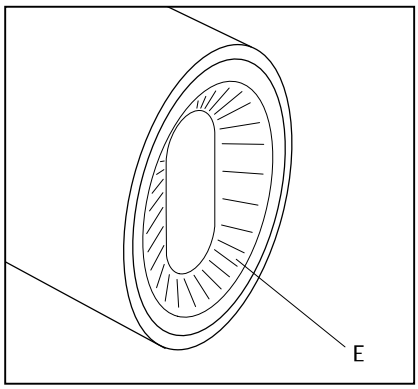


Caution for pumps with tubular rotors:

Where the walls of tubular rotors are worn in the wear zones, pumping medium may occur inside the rotor and may come out when pulling off the stator.
Ensure that protective measures have been taken when pumping dangerous media!

- Pull the stator (3005) out forward.
  A stator extractor can be supplied as special accessory.

- Remove the hex nuts (2030) with spring washers (2025).
- Pull the pump housing (2010) off forward.



Assembly

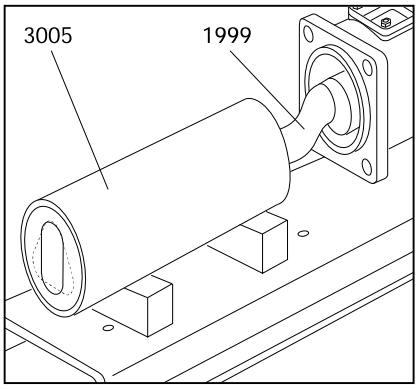
- Refitting is a simple reversal of this procedure.

  When refitting the stator (3005) check direction of stator (3005) is correct! The funnel-shaped inflow side (E) of the stator (3005) must show to
  - the pump housing (2010) when rotation is **anti-clockwise**
  - the end stud (2005) when rotation is **clockwise**

  when viewed on pump shaft end.

- **Elastomer stators (A)** have integrated front side sealing profiles (D). They don't need additional gaskets for sealing off the end stud (2005) and the pump housing (2010).

- **Solid stators (B)** have **no** integrated front side sealing profiles. Therefore additional gaskets (8005) should be installed to seal off the end stud (2005) as well as the pump housing (2010).



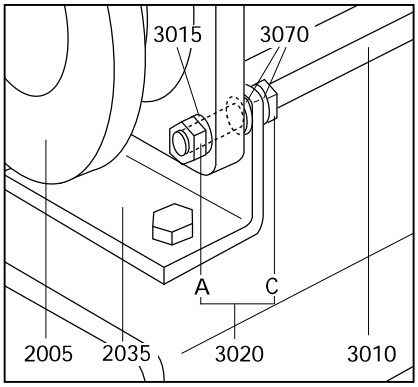
Continued Page 9.1R

9 DISMANTLING AND ASSEMBLY OF THE PUMP HOUSING

Be careful when engaging the stator (3005) and rotor (1999). Do not trap your fingers!
Do not reach inside the stator!

- Push the stator (3005) with a rotating movement on to rotor (1999).
  Apply an assembly device and some glycerine to ease engaging the stator (3005) and rotor (1999).

- When tightening hex nuts (2030) a gap will remain between drive stool (0085) and pump housing (2010).



Please do not try to close this gap by overtightening the nuts!
Drive stool (0085) may break!

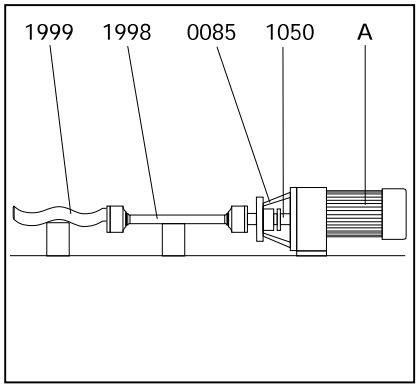
Torque values for hex nuts (2030):

Size	M6	M8	M10	M12	M16	M20	M24	M30
Required torque Nm	8	15	30	45	75	80	100	120

- Fastening the end stud (2005):

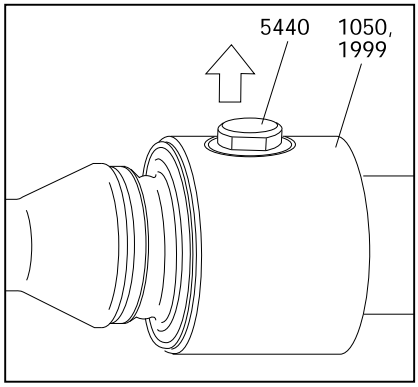
Screw the hex nuts C (3020) down into the thru bolts (3010) as far as possible.
Slip on the first washers (3070), the support foot (2035), the second washers (3070), the end stud (2005) and tighten with spring washers (3015) and hex nuts A (3020).
Finally, fasten the support foot (2035) from behind with the two hex nuts C (3020).

Ensure during refitting that the O-ring (8015) or, where a heating jacket (3025) is installed, the O-rings (8030) are in perfect condition and will sit correctly.



Ensure that the drain plug (2015) is not screwed too tightly into the pump housing (2010), since otherwise its conical thread may break the pump housing (2010).
The torque should be about 40 - 50 Nm.

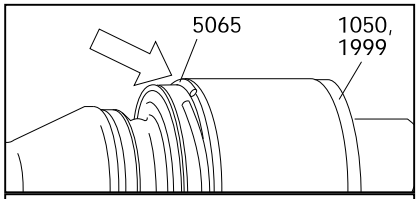
10 Dismantling and Assembly of the Rotating Parts with Pin Joints with SM-Pin Joint Seal (basic joint size NM015 - NM125)



10.1 Removal of Rotor and Coupling Rod

Where a pump is fitted with a **ceramic** rotor (1999) the following operations should be carried out **with great care.** Do not use any force or sharp tools! Special care must be taken to prevent heavy strokes, vibrations or impact by a hammer.
For removal of the rotor (1999) and coupling rod (1998) the pin joints should be dismantled as follows:

- Place the dismantled unit – consisting of drive stool (0085) with drive (A) and connecting shaft (1050), coupling rod (1998) and rotor (1999) – on the work-bench with a wooden block supporting the rotor (1999).

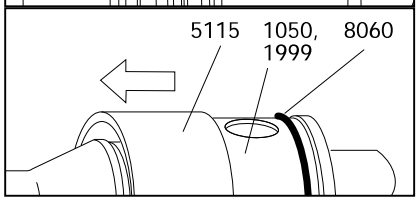


Basic joint size NM125:

- Unscrew the wear sleeves (5440) from the head of rotor (1999) or connecting shaft (1050)

Basic joint size NM021 - NM105:

- Push circlip (5065) out of its groove and slip off over the head of rotor (1999 or connecting shaft (1050).

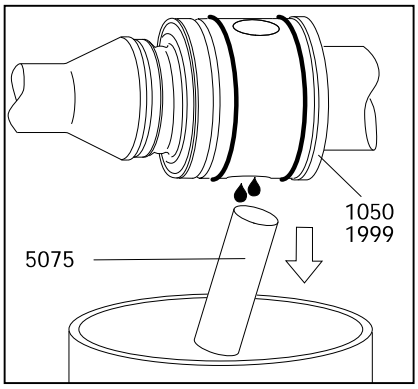


Pumps fitted with a ceramic rotor (1999):

- **Carefully** turn safety sleeve (5115) with a squeeze belt wrench, and remove.

The following method should **not** be employed for pumps fitted with a **ceramic** rotor.

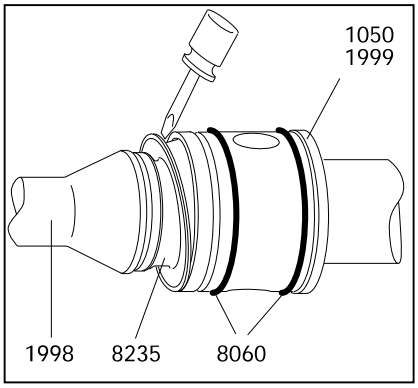
Pumps fitted with a metallic rotor (1999):



- If necessary hit the edge of sleeve (5115) at an angle with the help of a wooden block and a plastic hammer. Taking care not to damage the O-rings (8060)!

Continued Page 10.0R

10 DISMANTLING AND ASSEMBLY OF THE ROTATING PARTS

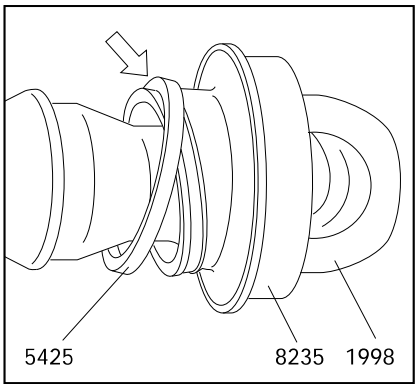


Basic joint size NM021 - NM125:

- Press the pin (5075) out of the head of rotor (1999) or connecting shaft (1050). If necessary use a hammer and a thin cylindrical pin (DIN 6450 C).
  Drain the oil into a receptacle.

  Caution for pumps with ceramic rotors!

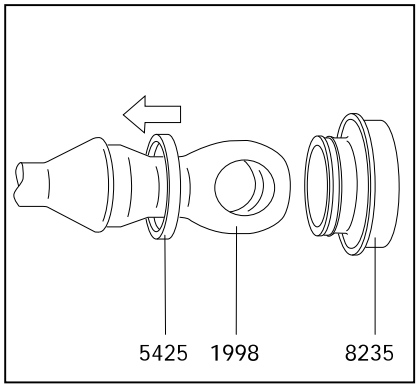
  Where a pin (5075) may not come out easily, the metallic head of rotor (1999) should be supported on wooden blocks. Then the pin (5075) can be driven out with the help of a pin punch (DIN 6450 C). This should be done **with care**, holding the **ceramic** rotor with your hands.
  Please dispose of this oil in the proper manner.



- Using a screwdriver, carefully lever the SM-pin joint seal (8235) out of the head of rotor (1999) or connecting shaft (1050).

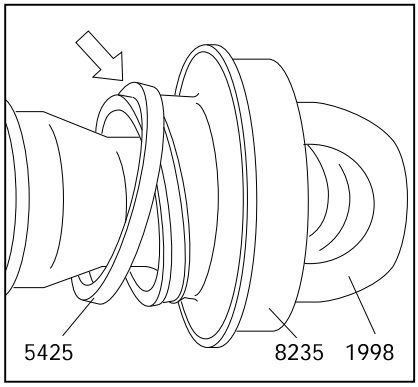
Taking care not to damage the SM-pin joint seal (8235)!

- Pull apart the rotor (1999)/ coupling rod (1998) / connecting shaft (1050) assembly. Remove the O-rings (8060).



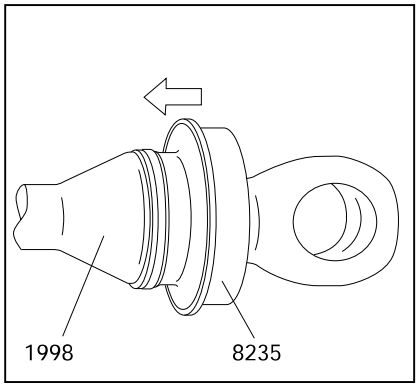
- Push the SM-pin joint seal (8235) towards the head of coupling rod (1998). In the narrow coupling rod section press the clamp ring (5425) out of the groove of the seal. Then slip the SM-pin joint seal (8235) and clamp ring (5425) off over the head of the coupling rod (1998).

Continued Page 10.1



10.2 Fitting the Rotor and Coupling Rod

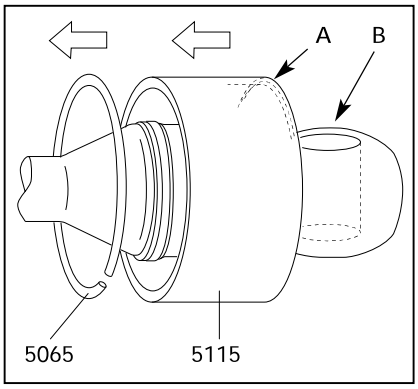
For fitting the rotor (1999) with coupling rod (1998), the two pin joints should be assembled as follows:



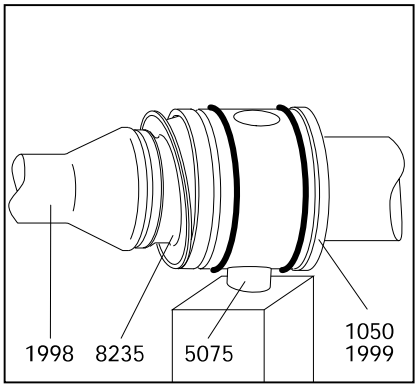
- Slip the clamp ring (5425) over the head of coupling rod (1998).

- Push the SM-pin joint seal (8235) over the head of coupling rod (1998) towards its narrow section, there sqeezing the clamp ring (5425) into the groove of the SM-pin joint seal (8235).

- Push the SM-pin joint seal (8235) with the correctly placed clamp ring (5425) up to the shoulder of coupling rod (1998).

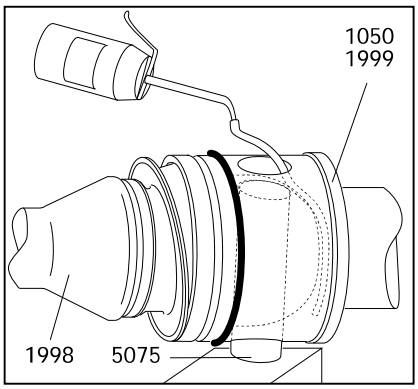


Continued Page 10.1R

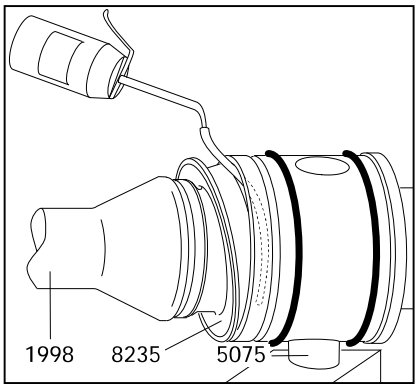


10 DISMANTLING AND ASSEMBLY OF THE ROTATING PARTS

Basic joint size NM021 - NM105:

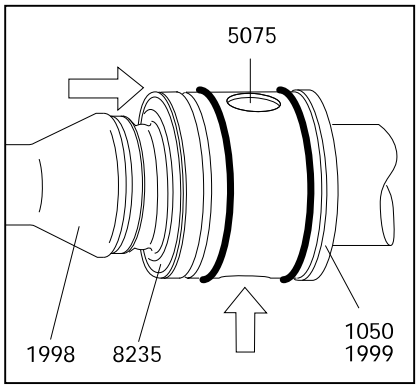


- Slip the circlip (5065) on to the coupling rod (1998). Slide the sleeve (5115) on to coupling rod (1998) so the inside diameter of chamfering (A) is being placed towards the coupling rod (1998) extension. Chamfering (A) will later on ease the installation over the O-rings (8060).
  Orient the head of coupling rod (1998) until it is in vertical position for the bore (B) for the pin (5075).

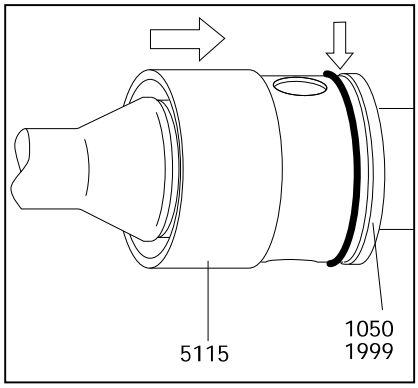


- Slide the coupling rod (1998) with SM-pin joint seal (8235) into the bore of rotor (1999) or connecting shaft (1050) and insert the pin (5075) from below and push up to the upper edge of coupling rod (1998).
  Support the pin (5075) against dropping out.
  Slide the SM-pin joint seal (8235) into the rotor (1999) or connecting shaft (1050) only from below, and in a slightly slanted position.

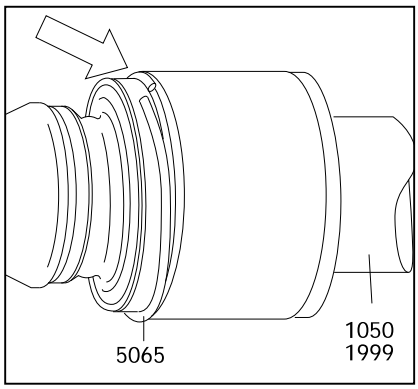
- For lubrication, use an oil can which should be fitted with a thin plastic hose having an outside diameter of not more than 4 mm.
  Insert this hose into the upper oil port opening in the rotor (1999) or connecting shaft (1050). Then slide the hose end past the coupling rod (1998) all the way down to the bottom section of the rotor head (1999) or connecting shaft (1050).
  Slowly fill with lubricating oil up to the filling port.



- Pull the hose out.
  Then insert the hose end through the small gap on the topside of SM-pin joint seal (8235) and guide it down to the bottom of the hollow space between coupling rod (1998) and SM-pin joint seal (8235).
  Slowly fill with lubricating oil up to the gap.

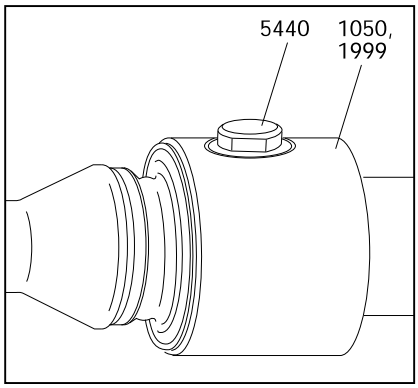


Continued Page 10.2

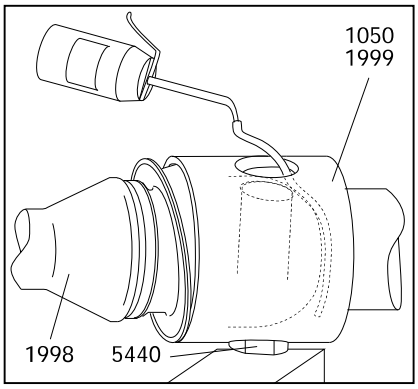


- Pull the hose out.
  Push the pin (5075) entirely into the bore of head of rotor (1999) or connecting shaft (1050) and retain in place.
  Only now, press the SM-pin joint seal (8235) into the bore of head of rotor (1999) or connecting shaft (1050) and push up to the shoulder. In doing so the SM-pin joint seal (8235) should be slightly bulbous around the outer surface. Wipe off overflow oil. Use this oil for lubricating the O-rings (8060).

- Slip the sleeve (5110) or (5115), with its chamfering (A) forward, on to the head of rotor (1999) or connecting shaft (1050) and push up to the shoulder.

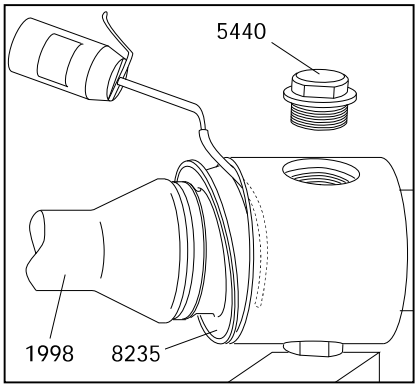


- Place the circlip (5065) into its groove on the rotor head (1999) or connecting shaft (1050) and carefully snap in place all around.



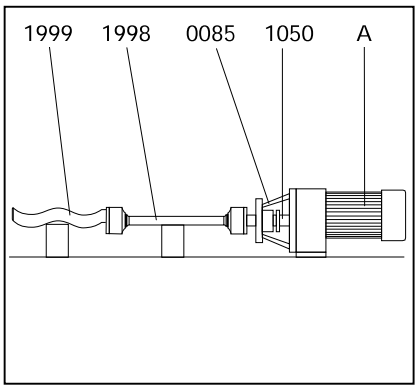
- **Basic joint size NM125:**

  Slide the coupling rod (1998) into the bore of the head of rotor (1999) and connecting shaft (1050) and insert the pins (5075).
  Insert the SM-pin joint seal (8235) (8235) into the head of rotor (1999) and connecting shaft (1050).
  Only then screw in one wear sleeve (5440) with O-ring (8060) into the head of rotor (1999) and connecting shaft (1050) and turn upside down.



10 DISMANTLING AND ASSEMBLY OF THE ROTATING PARTS

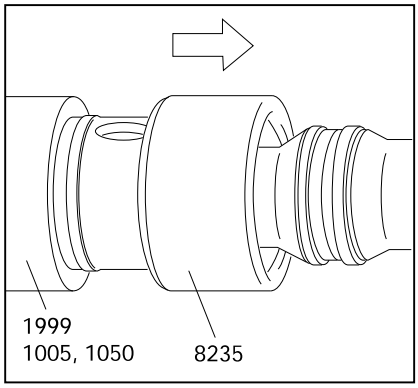
- For lubrication, use an oil can which should be fitted with a thin plastic hose having an outside diameter of not more than 4 mm.
  Insert this hose into the upper oil port opening in the rotor (1999) or connecting shaft (1050). Then slide the hose end past the coupling rod (1998) all the way down to the bottom section of the rotor head (1999) or connecting shaft (1050).
  Slowly fill with lubricating oil up to the filling port.



- Pull the hose out.
  Then insert the hose end through the small gap on the topside of SM-pin joint seal (8235) and guide it down to the bottom of the hollow space between coupling rod (1998) and SM-pin joint seal (8235).
  Slowly fill with lubricating oil up to the gap.
- Screw in the second wear sleeve (5440) with O-ring (8060) into the head of rotor (1999) and connecting shaft (1050).

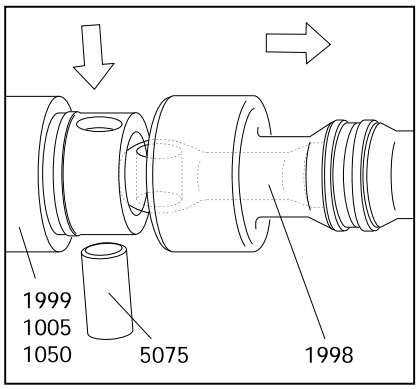
- **Basic joint size NM021 - NM125:**

  Drive connecting shaft (1050), coupling rod (1998) and rotor (1999) are now joined by means of the two pin joints.
  Pump housing (2010), stator (3005) and end stud (2005) may now be fitted.



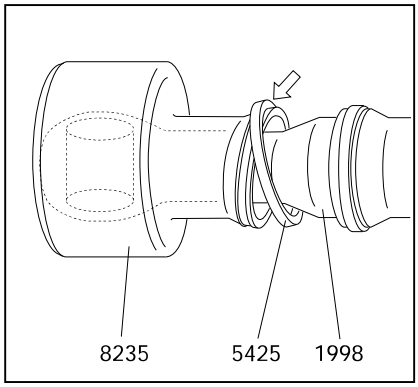
Continued Page 10.3

10.3 Dismantling and Assembly of the Rotating Parts with Pin Joints with SM-Pin Joint Seal (joint basic size NM015)



For removal and refitting of the rotor (1999) and coupling rod (1998) the pin joints should be dismantled and re-assembled as follows:

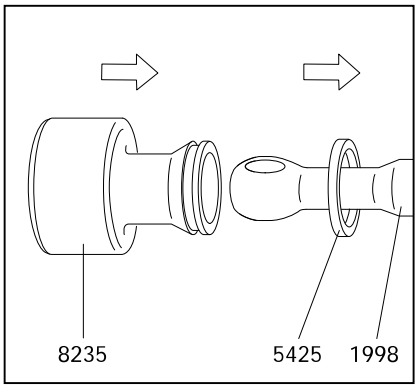
Dismantling:



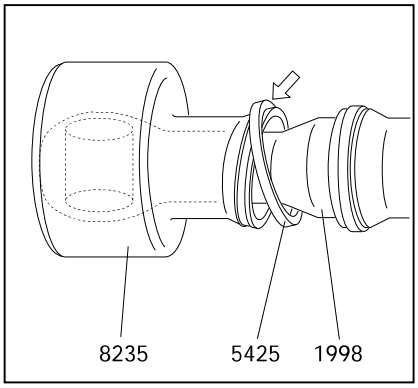
- Push the SM-pin joint seal (8235) away from the rotor (1999), drive shaft (1005) or connecting shaft (1050) so the bore for the pin (5075) comes free.

- Press the pin (5075) out of the rotor (1999), connecting shaft (1050) or drive shaft (1005). Then withdraw the coupling rod (1998) from the bore of rotor (1999), connecting shaft (1050) or drive shaft (1005).

- Push the SM-pin joint seal (8235) towards the head of coupling rod (1998). In the narrow coupling rod section press the clamp ring (5425) out of the groove of the seal. Then slip the SM-pin joint seal (8235) and clamp ring (5425) off over the head of the coupling rod (1998).

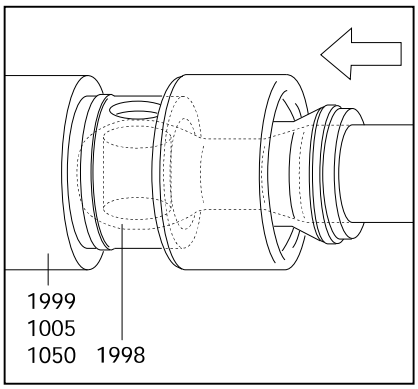


Continued Page 10.0R



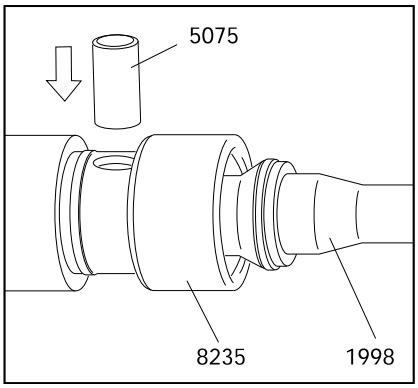
10 DISMANTLING AND ASSEMBLY OF THE ROTATING PARTS

Re-Assembly:



- Slip the clamp ring (5425) and the SM-pin joint seal (8235) on over the head of the coupling rod (1998).

- Push the SM-pin joint seal (8235) towards the narrow section on the head of coupling rod (1998) and place the clamp ring (5425) back into the groove of the SM-pin joint seal (8235).
  Then move the SM-pin joint seal (8235) up to the coupling rod (1998) shoulder.



- Place the head of coupling rod (1998) into the bore of the rotor (1999), drive shaft (1005) or connecting shaft (1050).

- Join the rotor (1999), drive shaft (1005) or connecting shaft (1050) and coupling rod (1998) by the pin (5075).
  Then push the SM-pin joint seal (8235) up to the shoulder of the rotor (1999), drive shaft (1005) or connecting shaft (1050).

  Re-assemble the second pin joint in the same manner.

11 Removal and Fitting of the Connecting Shaft with Shaft Seal

Removal:

- Push the circlip (1035) in the direction to the mechanical seal.
- Remove pin (1030).
- Remove the shaft seal housing (7005) and mechanical seal (7010) together with connecting shaft (1050) and set ring (1035) from drive stool (0085) and the drive shaft.
  The thread of cylindrical head screw (1040) can be used as forcing screw.
- If a mechanical seal is installed, see description "Removal and Fitting of Mechanical Seal" after Page 12.0.

Fitting:

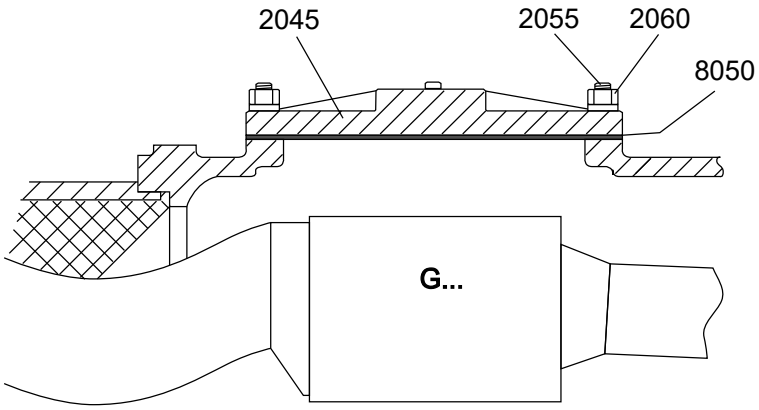
- Apply grease into the bore of the connecting shaft (1050) to avoid rust (e.g. TCE-Metallic 600).
- Assemble the shaft seal housing (7005) and mechanical seal (7010) together with connecting shaft (1050) and set ring (1035) with drive stool (0085) and push connecting shaft (1050) on to the drive shaft.
  At this please observe the installation direction of set ring (1035) (please see mark).
- If a mechanical seal is installed, see description "Removal and Fitting of Mechanical Seal" after Page 12.0.
- Connect the connecting shaft (1050) and the drive shaft by pin (1030).
  Push set ring (1035) on pin (1030).

12.1 Removal and Fitting of the Single Mechanical Seal

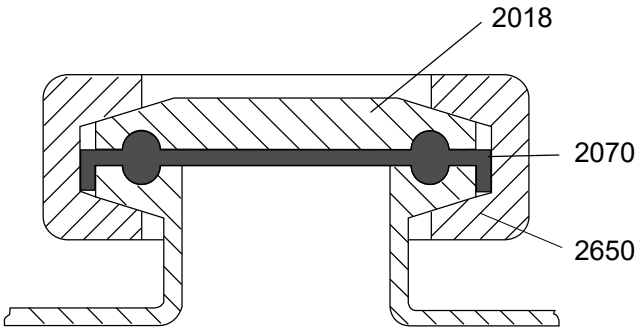
- **Carefully** slide out mechanical seal housing (7005) together with the parts of the mechanical seal contained in it from connecting shaft (1050).
- **Carefully** push mechanical seal (7010) stationary seat out of mechanical seal housing (7005).

Refitting is a simple reversal of the above procedure.

- To reduce frictional forces during seal assembly, apply some glycerine to the shaft and the seal housing in the area of the gaskets.
- Special care must be taken when fitting double PTFE-coated gaskets: the **joint** of the outer coating must point away from the seal assembly direction, otherwise the coating may open or be pulled off!



Ensure that the distribution of pressure is uniform when inserting the pressure sensitive counter rings. When inserting larger rings, use a suitable mandrel.
Do not allow any foreign bodies to get between the sliding surfaces.



- Exactly keep to the seal installation dimensions and ensure that the sealing faces are correctly pressed together (see table on sectional drawing W 209.000 or W 210.000).
- Insert mechanical seal (7010) stationary seat into mechanical seal housing (7005).
- Insert mechanical seal housing (7005) together with the stationary seat into the drive stool **without the installed connecting shaft (1050).**
- If necessary take the installation dimension from the table and add the thickness S of the set ring (7086) when existing.
- Mark this installation dimension on the connecting shaft (1050).
- Fix the rotating unit of the mechanical seal (7010) on the connceting shaft (1050) depending on the installation dimension so that the rotating unit of the mechanical seal (7010) or the set ring (7086) is at the mark.
- Insert connecting shaft (1050) with the rotating unit of the mechanical seal (7010) into drive stool (0085) and install lip seal (7091, if existing. Push the set ring (1035) on to connecting shaft (1050) and observe at this the installation direction (see mark).
Push connecting shaft (1050) on to the drive shaft and connect with pin (1030). Push the set ring (1035) on pin (1030).

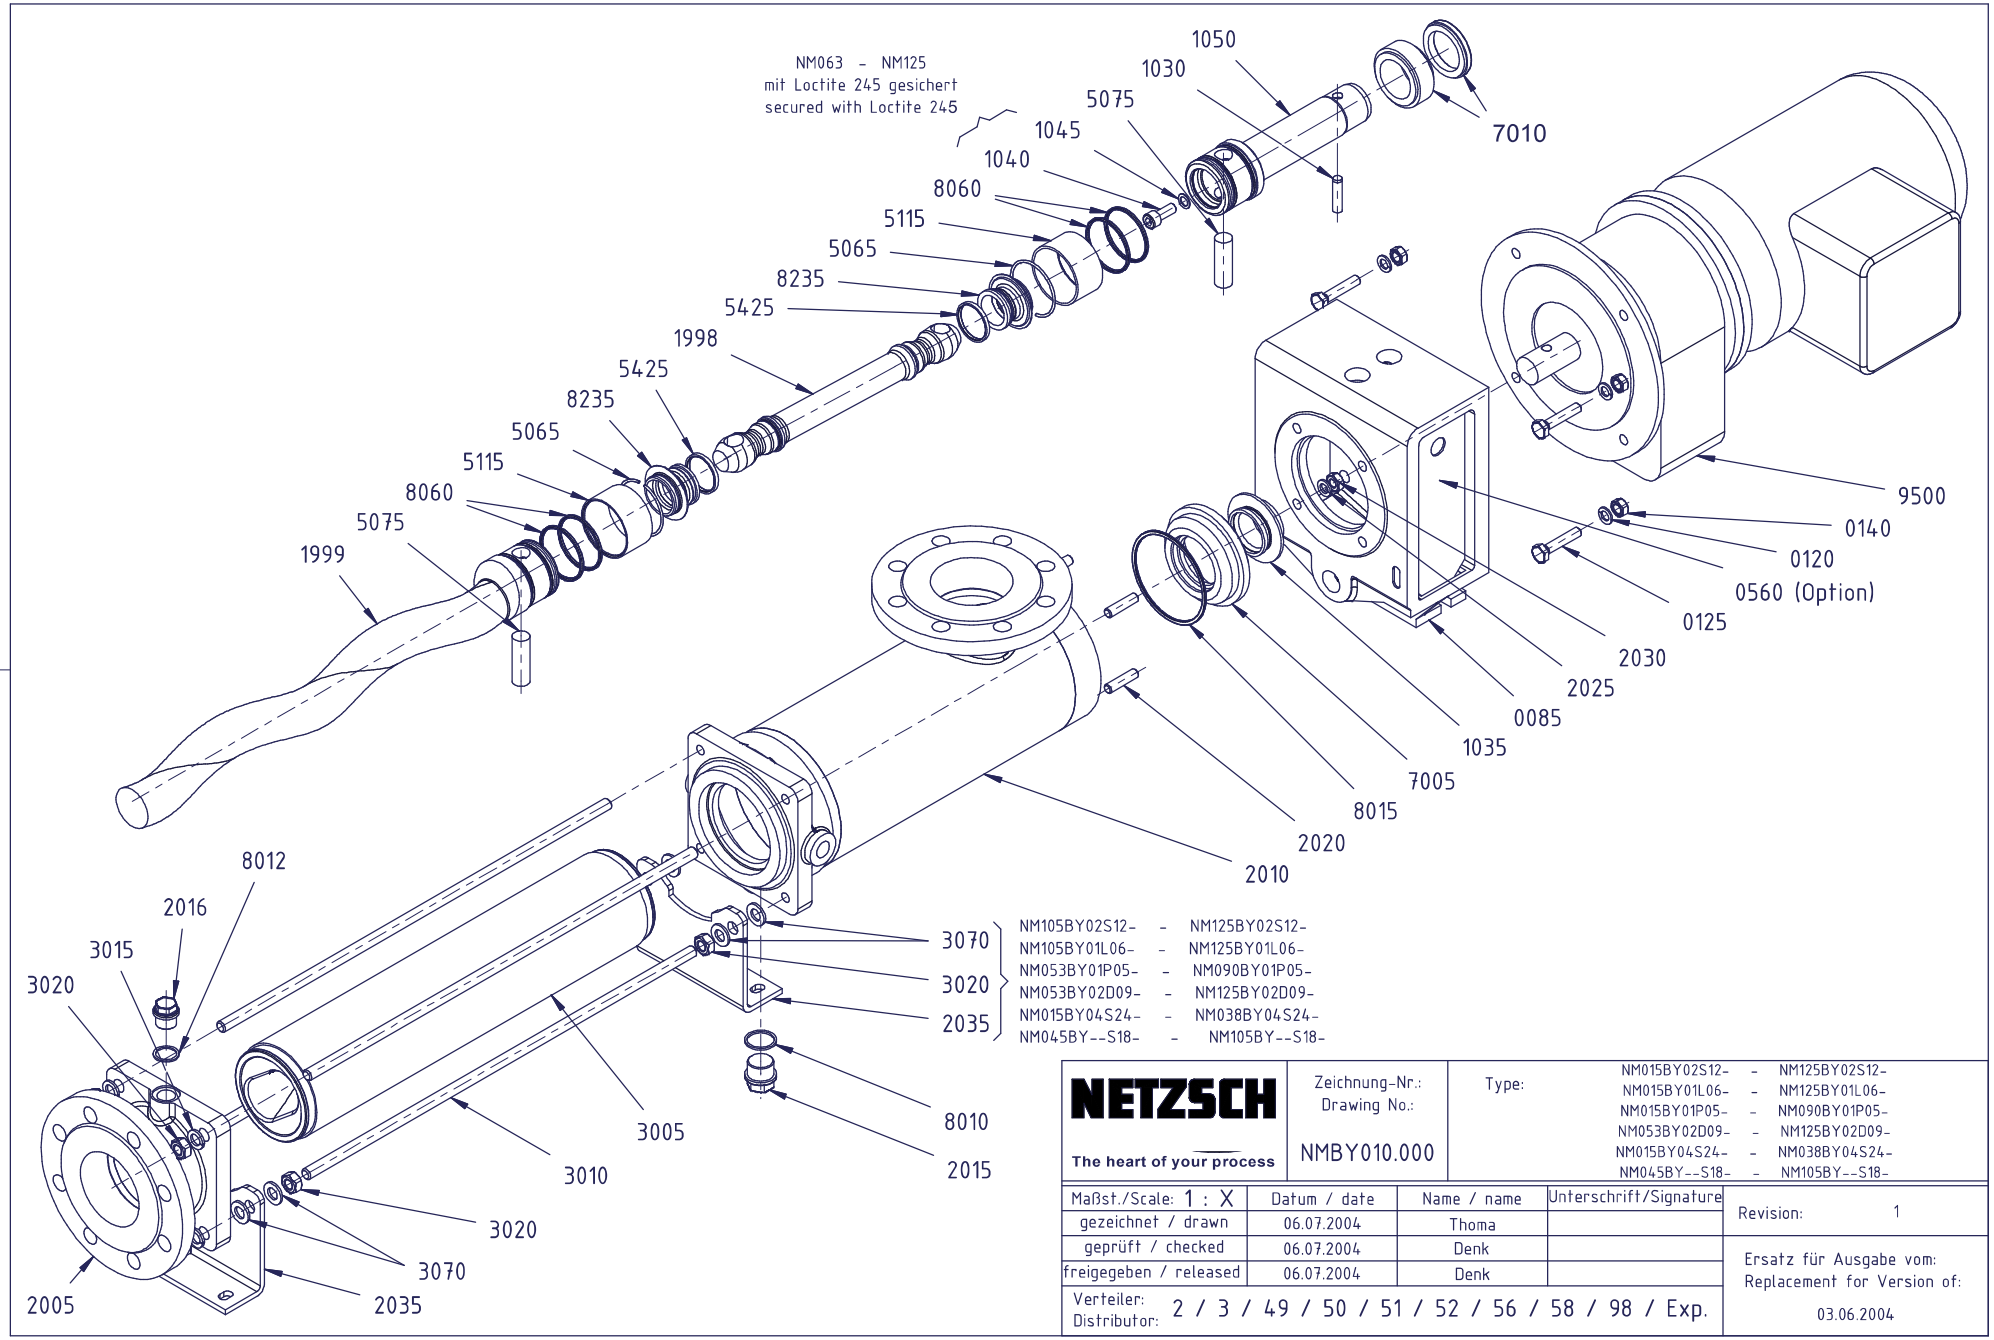
14 Recommended Spare Parts

In general, we have all spare parts in stock. Our subsidiaries and exclusive representatives also hold a certain stock. For special cases and when short waiting periods are not acceptable, we recommend to keep an amount of spare parts, corresponding to the pump, in stock on site (please see table below).

- **Rotor**
- **Stator**
- **Elastomer parts as O-rings and sleeves**
- **joint parts**
- **shaft seals.**

To avoid mistakes in delivery, please identify the parts by their position number shown in the spare parts list or on the sectional drawing.

For placing a spare parts order, it is absolutely necessary to give the following details:



Pieces (see column 2) - Designation (see column 3) - Identification Number (see column 4)

The column details are taken from the spare parts list. See example.

Example:

SPARE PARTS LIST		10.05.94		10:50:18	Page: 1 / 5

MOTORS AND DRIVES

INSTALLATION AND MAINTENANCE INSTRUCTIONS FOR ELECTRIC MOTORS

Frames 143/5T - 586/7T

QUALITY SYSTEM ISO9001 WEG MOTORES

ISO 9001

READ CAREFULLY THIS MANUAL BEFORE INSTALLING THE MOTOR.

RECEIVING CHECK

✓ Check if any damage has occured during transportation.
✓ Check nameplate data.
✓ Remove shaft locking device (if any) before operating the motor.
✓ Turn the shaft with the hand to make sure if it is turning freely.

HANDLING AND TRANSPORTATION

1 - General

MOTORS MUST NOT BE LIFTED BY THE SHAFT, BUT BY THE EYE BOLTS WHICH ARE PROPERLY DESIGNED TO SUPPORT THE MOTOR WEIGHT.

Lifting devices, when supplied, are designed only to support the motor. If the motor has two lifting devices then a double chain must be used to lift it.

Lifting and lowering must be done gently without any shocks, otherwise the bearings can get damaged.

DURING TRANSPORTATION, MOTORS FITTED WITH ROLLER OR ANGULAR CONTACT BEARINGS ARE PROTECTED AGAINST BEARING DAMAGES WITH A SHAFT LOCKING DEVICE.

THIS LOCKING DEVICE MUST BE USED ON ANY FURTHER TRANSPORT OF THE MOTOR, EVEN WHEN THIS MEANS TO UNCOPULE THE MOTOR FROM THE DRIVEN MACHINE.

STORAGE

If motors are not immediately installed, they must be stored in dry places, free of dust, vibrations, gases, corrosive smokes, under constant temperature and in normal position free from other objects.

In case the motors are stored for more than two years, the bearings must be changed or the lubrication grease must be totally replaced after cleaning.

Single phase motors when kept in stock for 2 years or more must have their capacitors replaced (if any).

We recommend to turn the shaft (by hands) at least once a month, and to measure the insulation resistance before installing it, in cases of motors stored for more than 6 months or when subject to high humidity areas.

If motor is fitted with space heaters, these should be switched on.

Insulation Resistance Check

Measure the insulation resistance before operating the motor and/or when there is any sign of humidity in the winding.

The resistance measured at 25°C (77°F) must be:

Ri > (20 x U) / (1000 + 2P) [Mohm] (measured with a MEGGER at 500 V d.c.); where U = voltage (V); P = power (kW).

If the insulation resistance is less than 2 megaohms, the winding must be dried according to the following:
✓ Warm it up inside an oven at a minimum temperature of 80°C (176°F) increasing 5°C (41°F) every hour until 105°C (221°F), remaining under this temperature for at least one hour. Check if the stator insulation resistance remains constant within the accepted values. If not, stator must be reimpregnated.

INSTALLATION

1 - Safety

All personnel involved with electrical installations, either handling, lifting, operation or maintenance must be well informed and up-to-dated concerning the safety standard and principles that govern the work and carefully follow them.

We strongly recommend that these jobs are carried out by qualified personnel.

MAKE SURE THAT THE ELECTRIC MOTORS ARE SWITCHED OFF BEFORE STARTING ANY MAINTENANCE SERVICE.

Motors must be protected against accidental starts.

When performing any maintenance service, disconnect the motor from the power supply. Make sure all accessories have been switched off and disconnected.

Do not change the regulation of the protecting devices to avoid damaging.

LEAD CONNECTION IN SULATION INSIDE THE TERMINAL BOX MUST BE DONE WITH AN INSULATING MATERIAL COMPATIBLE WITH MOTOR THERMAL CLASS WHICH IS SHOWN ON THE MOTOR NAMEPLATE.

2 - Operating Conditions

Electric motors, in general, are designed for operation at an altitude of 1000m above sea level for an ambient temperature between 25°C (77°F) and 40°C (104°F). Any variation is stated on the nameplate.

COMPARE THE CURRENT, VOLTAGE, FREQUENCY, SPEED, OUTPUT AND OTHER VALUES DEMANDED BY THE APPLICATION WITH THE DATA GIVEN ON THE NAMEPLATE.

Motors supplied for hazardous locations must be installed in areas that comply with that specified on the motor nameplate.

KEEP AIR INLET AND OUTLET FREE AND CLEAN. THE AIR BLOWN OUT BY THE MOTOR SHALL NOT ENTER AGAIN. THE DISTANCE BETWEEN THE AIR INLET AND THE WALL MUST BE AROUND ¼ OF THE INLET OPENING DIAMETER.

3 - Foundation

Motors provided with feet must be installed on though foundations to avoid excessive vibrations.

The purchaser is fully responsible for the foundation.

Metal parts must be painted to avoid corrosion.

The foundation must be uniform and sufficiently tough to support any short circuit strengths. It must be designed in such a way to stop any vibration originated from resonance.

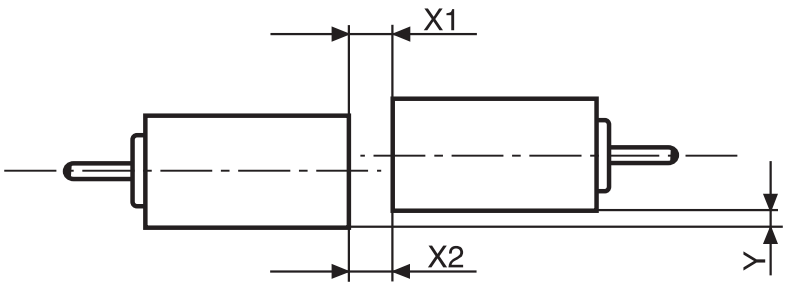
4 - Drain Holes

Make sure the drains are placed in the lower part of the motor when the mounting configuration differs from that specified on the motor purchase order.

5 - Balancing

WEG MOTORS ARE DYNAMICALLY BALANCED, WITH HALF KEY AT NO LOAD AND UNCOUPLED.

Transmission elements such as pulleys, couplings, etc must be dynamically balanced with half key before installation. Use always appropriate tools for installation and removal.



6 - Alignment

ALIGN THE SHAFT ENDS AND USE FLEXIBLE COUPLING, WHENEVER POSSIBLE.

Ensure that the motor mounting devices do not allow modifications on the alignment and further damages to the bearings.

When assembling a half-coupling, be sure to use suitable equipment and tools to protect the bearings.

Suitable assembly of half-coupling: check that clearance Y is less than 0.05mm and that the difference X1 to X2 is less than 0.05m as well.

Note: The "X" dimension must be at least 3mm.

7 - Belt Drive

When using pulley or belt coupling the following must be observed:
✓ Belts must be tighten just enough to avoid slippage when running, according to the specifications stated on the belt supplier recommendation.

WARNING:
Excessive tension on the pulleys will damage the bearings and lead to a probable shaft rupture.

8 - Connection

WARNING: Voltage may be connected at standstill inside the terminal box for heating elements or direct winding heating.

WARNING: The capacitor on single-phase motors can retain a charge which appears across the motor terminals, even when the motor has reached standstill.

A WRONG CONNECTION CAN BURN THE MOTOR.

Voltage and connection are indicated on the nameplate. The acceptable voltage variation is ± 10%, the acceptable frequency variation is ± 5% and the total acceptable variation is ± 10%.

9 - Starting Methods

The motor is rather started through direct starting. All Weg motors must be connected as shown on the motor nameplate, failure to follow the motor nameplate could lead to motor failure.

In case this is not possible, use compatible methods to the motor load and voltage.

✓ 3 lead single voltage and 9 lead dual voltage motors can be started as follows:
Full Voltage Direct On Line.
Auto-Transformer Starting.
Electronic Soft-Starting.
VFD Starting - subject to verification and application analysis.

✓ 6 lead single voltage motors and 12 lead dual voltage motors can be connected as follows:
Full Voltage Direct On Line.
WYE/DELTA Starting.
Auto-Transformer Starting.
Electronic Soft-Starting.
VFD Starting - subject to verification and application analysis.

The rotation direction is clockwise if the motor is viewed from DE side and if the phases are connected according to the sequence L1, L2, L3.

To change the rotation direction, interchange two of the connecting leads.

THE CONNECTION TO THE POWER SUPPLY MUST BE DONE BY QUALIFIED PERSONNEL AND WITH FULL ATTENTION TO ASSURE A SAFE AND PERMANENT CONNECTION. AFTER CONNECTING THE MOTOR, CHECK FOR ANY STRANGE BODY INSIDE THE TERMINAL BOX. THE CABLE INLETS NOT IN USE MUST BE CLOSED.

Make sure to use the correct cable dimension, based on the rated current stamped on the motor nameplate.

BEFORE ENERGIZING THE TERMINALS, CHECK IF THE EARTHING IS MADE ACCORDING TO THE ACTUAL STANDARDS. THIS IS ESSENTIAL AGAINST ACCIDENT RISKS.

When the motor is supplied with protective or monitor temperature device such as thermostats, thermistors, thermal protector, etc, connect their terminals to the corresponding devices on the control panel.

10- Start-Up

THE KEY MUST BE FASTENED OR REMOVED BEFORE STARTING THE MOTOR.

a) The motor must start and operate smoothly. In case this does not occur, turn it off and check the connections and the mounting before starting it again.

b) If there is excessive vibration, check if the fastening screws are correctly fastened. Check also if the vibration comes from a neighbour machine. Periodical vibration checks must be done.

c) Run the motor under rated load for a short period of time and compare if the running current is equal to that stamped on the nameplate.

MAINTENANCE

WARNING:
SAFETY CHECK LIST.

1 - General Inspection

- ✓ Check the motor periodically.
- ✓ Keep the motor clean and assure free air flow.
- ✓ Check the seals or V Ring and replace them, if required.
- ✓ Check the connections as well as supporting screws.
- ✓ Check the bearings and observe:
  Any excessive noise, bearing temperature and grease condition.
- ✓ When a changing, under normal conditions, is detected, check the motor and replace the required parts.
  The frequency of the inspections depends on the motor type and on the application conditions.

LUBRICATION

FOLLOW THE REGREASING INTERVALS. THIS IS FUNDAMENTAL FOR PROPER MOTOR OPERATION.

1 - Machines without Grease Nipples

In these cases the regreasing shall be done at the preventive maintenance job observing the following aspects:

✓ Disassemble carefully the motors.
✓ Take all the grease out.
✓ Wash the bearing with querosene or diesel.
✓ Regrease the bearing immediately.

2 - Machines Fitted with Grease Nipples

It is strongly recommended to grease the machine while running. This allows the grease renewal in the bearing housing. When this is not possible due to turning parts by the grease device (pulleys, bushing, etc) that offer some risk to the physical integrity of the operator, proceed as follows:

✓ Clean the area near to the grease nipple.
✓ Put approximately half of the total grease and run the motor for 1 minute at full speed. Then turn off the motor and pump the rest of the grease.
✓ The injection of all the grease with the motor in standstill can make the grease penetrate into the motor, through the inner seal of the bearing housing.

When regreasing, use only special bearing grease with the following properties:

RELUBRICATION INTERVALS RECOMMENDED - POLYREX® EM GREASE (ESSO/EXXON)

Frame	Amount of grease (g)	3600 rpm	3000 rpm	1800 rpm	1500 rpm	1200 rpm	1000 rpm	900 rpm	750 rpm	720 rpm	600 rpm	500 rpm
Relubrication intervals in hours - ball bearings												
254/6T	*13*	*15700*	*18100*	*20000*	*20000*	*20000*	*20000*	*20000*	*20000*	*20000*	*20000*	*20000*

WARNING:

The table above is specifically intended for relubrication with Polyrex® EM grease and bearing absolute operating temperature of:

✓ 70°C (158°F) for 254/6T to 324/6T frame motors;
✓ 85°C (185°F) for 364/5T to 586/7T frame motors.

For every 15°C (59°F) above these limits, relubrication interval must be reduced by half.

Shielded bearing (ZZ) are lubricated for bering's life as long as they operate under normal ambient conditions and temperature of 70°C(158°F).

WE RECOMMEND TO USE BALL BEARINGS FOR MOTORS DIRECTLY COUPLED TO THE LOAD.

WARNING:
EXCESS OF GREASE CAN CAUSE BEARING OVERHEATING RESULTING IN COMPLETE DAMAGE.

Compatibility of Polyrex® EM grease with other types of grease:

Containing polyurea thickener and mineral oil, the Polyrex® EM grease is compatible with other types of grease that contain:

- ✓ Lithium base or complex of lithium or polyurea and highly refined mineral oil;
- ✓ Inhibitor additive against corrosion, rust and anti-oxidant additive.

Notes:

- ✓ Although Polyrex® EM is compatible with the types of grease given above, we do no recommend to mix it with any other greases.
- ✓ If you intend to use a type of grease different than those recommended above, first contact WEG.
- ✓ On applications (with high or low temperatures, speed variation, etc), the type of grease and relubrication interval are given on an additicional nameplate attached to the motor.
- ✓ Vertical mounted motors must have the relubrication intervals reduced by half.

THE USE OF STANDARD MOTORS IN SPECIFIC AREAS OR SPECIAL APPLICATIONS MUST BE DONE BY CONSULT TO THE GREASE MANUFACTURER OR WEG.

ASSEMBLY AND DISASSEMBLY

Disassembly and assembly must be done by qualified personnel using only suitable tools and appropriated methods. The stator grips must be applied over the side face of the inner ring to be disassembled or over and adjacent part.

It is essential that the bearings disassembly and assembly be done under cleanning conditions to ensure good operation

and to avoid damages. New bearings shall only be taken out from their cases when assembling them.

Before installing a new bearing it is required to check the shaft fitting for any sharp edge or strike signals.

For bearing assembly, warm their inner parts with suitable equipment - inductive process - or use suitable tools.

SPARE PARTS

When ordering spare parts, please specify the full type designation and product code as stated on the motor nameplate.

Please also inform the motor serial number stated on the nameplate.

MOTORS FOR HAZARDOUS LOCATIONS

Besides the recommendations given previously, these ones must be also followed:

THE SPECIFICATION OF THE MOTOR INSTALLATION PLACE IS FOR CUSTOMER'S RESPONSIBILITY, WHO WILL ALSO DETERMINE THE ENVIRONMENT CHARACTERISTICS.

Motors for hazardous locations are manufactured according to specific standards for such environments and they are certified by worldwide certifying entities.

1 - Installation

The complete installation must follow procedures given by the local legislation in effect.

THE INSTALLATION OF HAZARDOUS LOCATION MOTORS MUST BE CARRIED OUT BY SKILLED PEOPLE, AND THE THERMAL PROTECTION MUST BE ALWAYS INSTALLED, EITHER INSIDE OR OUTSIDE THE MOTOR, OPERATING AT THE RATED CURRENT.

2 - Maintenance

Maintenance must be carried out by repair shops authorized by WEG.

Repair shops and people without WEG's authorization who will perform any service or hazardous location motors will be fully responsible for such service as well as for any consequential damage.

ANY ELECTRICAL OR MECHANICAL MODIFICATION MADE ON HAZARDOUS LOCATION MOTORS WILL VOID THE CERTIFICATION.

When performing maintenance, installation or relubrication, follow these instructions:

- ✓ Check if all components are free of edges, knocks or dirt.
- ✓ Make sure all parts are in perfect conditions.
- ✓ Lubricate the surfaces of the endshield fittings with protective oil to make the assembly easier.
- ✓ Use only rubber hammer to fit the parts.
- ✓ Check for correct bolts tightening.
- ✓ Use clearance calibrator for correct T-box fitting (smaller than 0.05mm).

DO NOT REUSE DAMAGED OR WORN PARTS. REPLACE THEM BY NEW ONES SUPPLIED BY THE FACTORY.

MOTORS DRIVEN BY VFD

Applications using VFD´s without filter can affect motor performance as follows:

- ✓ Lower efficiency.
- ✓ Higher vibration.
- ✓ Higher noise level.
- ✓ Higher rated current.
- ✓ Higher temperature rise.
- ✓ Reduced motor insulation.
- ✓ Reduced bearing life.

1 - Standard Motors

- ✓ Voltages lower than 440V do not require filter.
- ✓ Voltages equal or higher than 440V or lower than 575V require filter for motor power supply cables longer than 20 meters.
- ✓ Voltages equal or higher than 575V require filter for any size of power supply cables.

IF SUCH RECOMMENDATIONS ARE NOT FOLLOWED ACCORDINGLY, MOTOR WARRANTY WILL BE VOID.

2 - Inverter Duty Motors

- ✓ Check power supply voltage of the forced cooling set.
- ✓ Filters are not required.

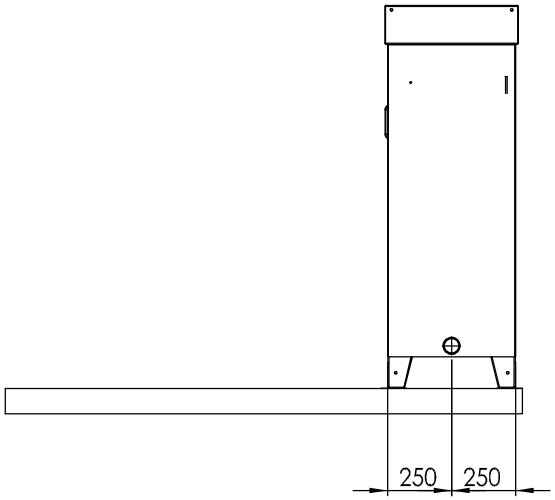
WARRANTY TERMS
SERIES AND ENGINEERING PRODUCTS

WEG warrants its products against defects in workmanship and materials for 18 months from the invoice date issued by the factory, authorized distributor or agent limited to 24 months from manufacturing date independent of installation date as long as the following items are fulfilled accordingly:
- Proper transportation, handling and storage;
- Correct installation based on the specified ambient conditions and free of corrosive gases;
- Operation under motor capacity limits;
- Observation of the periodical maintenance services;
- Repair and/or replacement effected only by personnel duly authorized in writing by WEG;
- The failed product be available to the supplier and/or repair shop for a required period to detect the cause of the failure and corresponding repair;
- Immediate notice by the purchaser about failures occured and that these are accepted by WEG as manufacturing defects.

This warranty does not include disassembly services at the urchaser facilities, transportation costs with product, tickets, accomodation and meals for technical personnel when requested by the customer. The warranty service will be only carried out at WEG Authorized Repair Shops or at WEG´s facilities.

Components whose useful life, under normal use, is shorter than the warranty period are not covered by these warranty terms.

The repair and/or replacement of parts or components, when effected by WEG and/or any WEG Authorized Repair Shop, will not give warranty extension.



This constitutes WEG´s only warranty in connection with this sale and the company will have no obligation or liability whatsoever to people, third parties, other equipment or installations, including without limitation, any claims for consequential damages or labor costs.

This guide refers to models: **“02BM”; “03BM”; “06BM”.**

Before installing the machine, the user must:

- have identified the type of the machine (see the metal label “0”).
- have prepared the area of the installation according the drawing of the “foundation” and of the “dimensions”.
- have identified the operators which will carry out the installation, the first start up and the daily usage of the machine.

INTENDED USES OF THE MACHINE AND PROHIBITED USES

The TEKNOBAG®-DRAIMAD® are machines for dewatering sludge coming from any waste water treatment plant.

The sludge must be stabilised, with neutral pH and with a temperature between 10°C and 30°C.

Average treatment capacities of the TEKNOBAG®-DRAIMAD® are indicated in the table below. Please note that these values are obtained with a well flocculated sludge and that they can vary on the basis of the different specific characteristics of the sludge to be treated.

TEKNOBAG®-DRAIMAD®	Hydraulic flow (m^3/h)	Dry Solids (%)	m^3/day (D.S. 1%)	D.S./day (Kg)
02BM	1 – 2	0,5 - 4	2 – 4	10 - 20
03BM	1 – 3	0,5 - 4	3 – 6	15 – 30
06BM	2 - 6	0,5 - 4	6 – 12	30 - 60

The TEKNOBAG®-DRAIMAD® can dewater sludge without a previous treatment with flocculant, even though with poorer result.

It is not permitted:
To treat or use substances with different chemical, physical and biological properties from those indicated above;
To tamper with the safety guards and devices;
To modify any of the parts of the machine mentioned in this handbook;
To use power supply (electric, hydraulic, pneumatics) with different characteristics from the ones shown in this handbook.

WARNING! **The characteristics of the sludge generated by the waste water treatment plants make it possible to be exposed to hazardous chemical/biological substances.**
Users and operators must be aware.
All the operators must be familiar with the potential hazards connected with the sludge being dewatered, and how to protect themselves.

TEKNOFANGHI will not be held responsible for damage to persons and/or property and/or to the machine itself due to non-implemented and/or inadequate safety precautions.

INSTALLATION

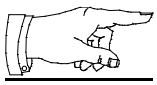
Refer to drawing at back of the frontal cover:

- Connect to point 20 the sludge supply line using a pipe flanged DN50 PN10 UNI2277 (Model "02BM" has no connection flange, provide a pipe over the upper tank to allow the filling). Fasten the piping so that they are not supported by the machine.

- Connect to the filtrate outlet (point 23) a gasketed plastic pipe DN100 UNI 8320 DIN19560 DIN4102-B1 (Model "02BM" has a 2" GF manifold).

- Provide the installation of a control panel to start / stop the sludge and polyelectrolyte pumps. If the supply of the sludge is made by gravity feeding, provide the installation of an interception valve.

Once that all above indicated has been done, the installation is complete.



DAILY USAGE

Operators must follow the instructions below, in order to properly operate the TEKNOBAG®-DRAIMAD® daily.

On the TEKNOBAG®-DRAIMAD® unit must be installed the TEKNOBAG®-DRAIMAD® bags (see point S): follow the table here below reported to operate the removal / installation of the bags. If some clumps of sludge are present inside the bag enclosure, remove them by means of the water hose.

Once that each funnel has its own new bag, the unit is ready to operate the dewatering: activate the sludge pump or open the interception valve in order to fill the bags (FILLING CYCLE). Stops the sludge before it arrives to the "TP" overflow outlet of the hood ("02BM" unit has the overflow in the middle of the hood).

Once the unit is filled, and the filtrate start to drain it does not need to be manned continuously, however visual checking is suggested (DRAINING CYCLE).

CAUTION: ***Before leaving the working machine, the operator must ensure that:***
The plant has no leaks.
The filtrate discharging from 23 is as clear as expected.
The sludge does not leak from around the clamps of the bags.

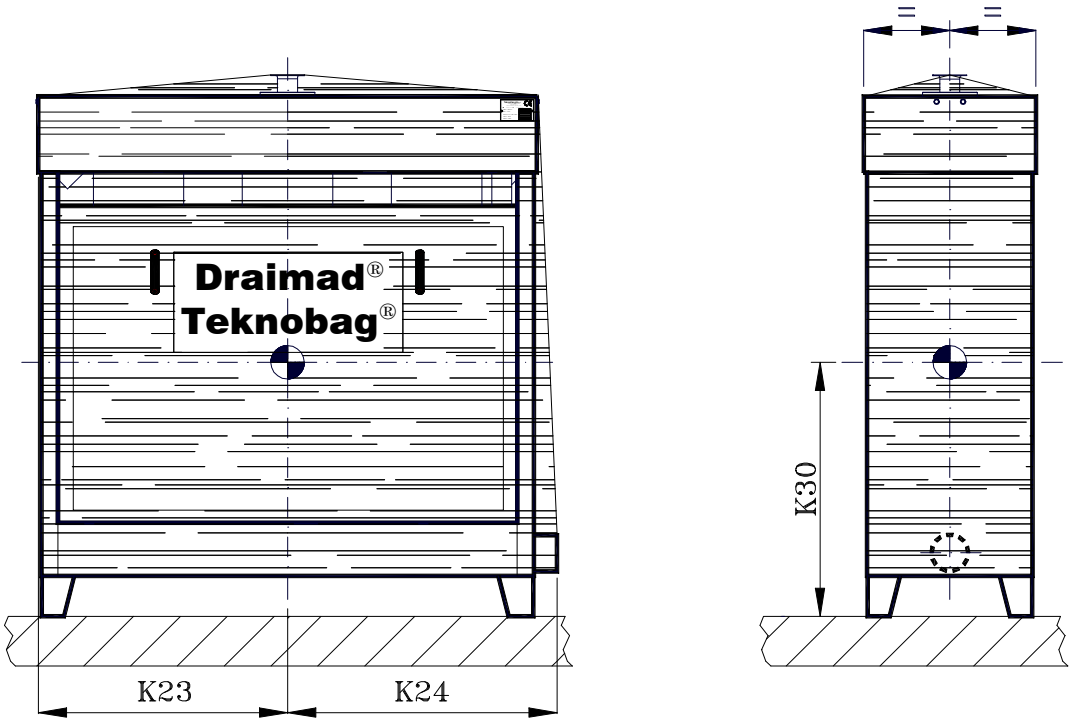
Once the level inside the bags is quite below the point "SL", it can be operated the FILLING CYCLE again. These two cycles should be repeated until the bag are full of dewatered sludge. After that it will be necessary to change the bags.

BAG REMOVAL AND STORAGE

OPERATION	EFFECT	DISPLAY
Look inside the top tank.	The top tank is empty.	The access of the funnels of the bags is visible.
Remove the safety guard which closes the access to the bags by pulling it towards the right then lift it and extract it from the unit	The bags are accessible.	It is possible to verify whether the level of the sludge is near point "SL" (see picture at page 1).
If the cages “G” are available, lift the fastening rod of one of them and open it.	The hand cart fork can enter up to the bag	The shield of the hand cart fork touches the bag.
Slide the hand cart fork under the bag and crank it up.	The bag is lifted off the bottom supports.	The bag does not touch the bottom supports.
Release the clamp "F".	The upper part of the bag is free.	It is possible to see inside the bag
Squeeze the bag together at the top of the sludge line.	The bag is ready to be sealed	
Wrap two wire ties together at the top of the sludge line.	The wire ties are ready to be tightened.	
Insert the tying tool into the loops and pull several times. Do not pull too much otherwise they will break.	The bag is sealed and can be easily removed and stacked.	
Remove the bag and lay it on a pallet.	The funnel of the unit is free.	
Stack the bags with one layer horizontally and the next perpendicularly and so on. The bags can be stacked as high as convenient. New bags can be stacked on old bags.	The bags are ready to be moved to the storage area before the disposal.	

Repeat this sequence for every bag. If some sludge drops are spilled, wash them away with the water hose.

INSTALLATION OF THE NEW BAGS



OPERATION	EFFECT	DISPLAY
Remove the bags from the carton.	Verify the integrity of the bag.	The bag has no holes or cuts or bad welding or bad sewing.
Open the clamp "F"; if available open also cages "G".	The operator can fit one bag	
Slip the bag "S" over the funnel nearly all the way to the top. Place the vertical seal of the bag to the rear. Holding the bag tight against the funnel at the front, pull the loose out and forward, and tuck under, to form a tight seal to the funnel.	The bag is ready to be clamped to the funnel "E"	The upper part of the bag touches the hood, the bottom part is perpendicular to the bottom support and the vertical seal is opposite to the operator.
Bring the clamp "F" around the bag and tighten	The bag is sealed to the funnel.	There are no gaps between the clamp and the bags, all around the funnel
Push the bottom of the bag into the cage, and slip the cage fastening rod through the loops provided on the cage.	The bag is ready to be filled.	The bag can be moved without entanglement in the cage.

Repeat this sequence for every bag. Once all the bags are fitted, replace the safety guard used to keep the filtrate splash inside the unit.

TROUBLE SHOOTING

PROBLEM	DIAGNOSIS	ACTION
During the "FILLING CYCLE" the sludge does not enter the bags	The sludge supply line is clogged or there is a problem with the sludge and polyelectrolyte pumps.	Check the sludge supply line and the rotation direction of the motor of the sludge pump.
There is leakage between a funnel and a clamp.	The clamp is not properly tightened or the gasket “EG is broken, missing or bad positioned.	At the next bag change, adjust the clamp grip so it tightens properly. Check whether the gasket is present.
There is a lot of sludge in the filtrate coming from the bags.	Bad flocculation.	Check the sludge and polyelectrolyte feeding rates and the flocculation.
The filtrate has a lot of foam.	Bad flocculation.	Check the sludge and polyelectrolyte feeding rates and the flocculation.

Polymer Addition

EXCELL SERIES 6000PSA

EMULSION POLYMER FEEDER

EXCELL SERIES 6000PSA
EMULSION POLYMER FEEDER

The EXCELL Series 6000PSA Polymer Feeder uses a peristaltic type polymer metering pump. The peristaltic pump is ideal for low polymer feed applications. The main benefits of the peristaltic type pumps are:

* They are self-priming.
* They can run dry.
* They do not have check valves.
* Capacity can be changed by switching the pump tube.
* Pump capacities range from less than 0.3 GPD, up to 43 GPD.

Polymer Activation Apparatus

The EXCELL activates polymer through a patented, motor-less, high energy, activation apparatus. The apparatus uses the energy available in the water flow to activate all types of liquid polymers. The polymer is activated as it passes through the high turbulence generated by the patented orifice. The pressure required to operate the apparatus is less than 5 psi.

The orifice opening automatically compensates for solution flow changes. This assures that the polymer activation energy level remains adequate for the flow range of the feeder. The activation apparatus components are made of corrosion resistant plastics. The open frame design allows easy access for quick repairs.

Self-Cleaning Sight Tube

The activated polymer solution flows through a patented, self cleaning sight tube, before it exits the feeder. The sight tube allows the operator to see that the feeder is operating properly.

SERIES 6000PSA MODELS

MODEL NUMBER	POLYMER FEED RATE GPD (LPH)	WATER FLOW RATE GPH (LPH)
6005PSA-SX	0.3 to 5 GPD (0.05 to 0.8 LPH)	6 to 60 GPH (25 to 230 LPH)
6005PSA2-SX	0.3 to 5 GPD (0.05 to 0.8 LPH)	6 to 120 GPH (25 to 460 LPH)
6012PSA-SX	0.6 to 12 GPD (0.1 to 1.9 LPH)	6 to 60 GPH (25 to 230 LPH)
6012PSA2-SX	0.6 to 12 GPD (0.1 to 1.9 LPH)	6 to 120 GPH (25 to 460 LPH)
6020PSA2-SX	1 to 20 GPD (0.2 to 3.2 LPH)	15 to 300 GPH (55 to 1140 LPH)
6043PSA2-SX	2 to 43 GPD (0.4 to 6.8 LPH)	15 to 300 GPH (55 to 1140 LPH)

TECHNICAL INFORMATION

* The Model 60XXPSA has a one-gallon (4 liter) blending-aging tank and primary water flow.
* The Model 60XXPSA2 has the blending-aging tank, primary, and post dilution water flow.
* The feeders operate with potable or filtered process dilution water at 30 to 65 psi (2 to 4.4 Bar).
* A solenoid valve is included.
* The pump speed can be controlled locally or by a remote 4-20 mA signal.
* A digital display indicates pump speed.
* An H-O-A Switch allows remote start-stop control.
* A water low-flow switch stops the polymer pump when the water flow is interrupted. A light provides local alarm indication. Alarm contacts allow remote indication.
* The frame is made of welded stainless steel. Frame dimensions are: 16” x 18” x 24” tall. Various frame configurations are available.
* The external injection valve is accessible without disturbing the activation apparatus. All components are modular and easy to access from the front.
* Operating voltage is 120 VAC. Power consumption is less than 3 Amps.

AVAILABLE OPTIONS

* A polymer strainer and a pump calibration cylinder are available.
* Pump cycle timer to allow pump feed rates below 0.3 GPD.
* Timer to allow a flush cycle.
* Pump speed controlled by the dilution water flow to maintain solution concentration.
* Voltages other than 120 VAC are available.
* Custom designed to meet your needs.

EXCELL POLYMER FEEDER OPERATING INSTRUCTIONS

1.0 **INTRODUCTION:** This manual addresses the installation, operation, maintenance, and troubleshooting for EXCELL polymer feeder, Model 60XXPS-SX. Please review the manual carefully. Pay special attention to warnings and precautions. Always follow good safety procedures, including the use of proper eye, face, and clothing protection.

2.0 **UNPACKING:** Your carton will contain the items listed on the packing slip.
Notify the carrier immediately if there are any signs of damage to the feeder or its parts.
Notify EXCELL if any of the parts are missing.

3.0 **PRE-INSTALLATION INSTRUCTIONS:**

3.1 **PROTECTIVE CLOTHING:** Refer to the MSDS precautions from the supplier of the polymer to be mixed in the feeder. Always wear the recommended apparel.

3.2 **SOLUTION COMPATIBILITY:** The feeder can mix a variety of solutions. Check that the feeder is compatible with the solutions you are intending to mix.

3.3 **PLUMBING:** Always adhere to your local plumbing codes and requirements. Be sure that installation does not constitute a cross connection. Check local plumbing codes for guidelines. If using potable water, a backflow preventer is required.

3.4 **ELECTRICAL:** All wiring must conform to local electrical codes. The feeder should be plugged into a grounded outlet protected by a Ground Fault Interrupter.

4.0 **INSTALLATION:**

4.1 **LOCATION:** This EXCELL FEEDER is suitable for indoor dry locations. The area is to be free of flammable vapors or dust. Ambient temperature is to be between 40 F and 120 F. (5 C and 50 C). Protect from freezing temperatures.

If the EXCELL FEEDER is to be used in areas exposed to flammable vapors or dusts, the Explosion Proof Option is required.

4.2 **ELECTRICAL CONNECTION**: The EXCELL FEEDER comes standard with a 7' long power cord with a 3-prong grounded plug. It should be plugged into a grounded outlet protected by a ground fault interrupter.

4.3 **WATER SUPPLY CONNECTION:** Provide a clean or filtered water supply to within 3' of the feeder. Water pressure should be at least 30 psi and must not exceed 100 psi or 100 F (38 C). Water pressure should be at least 25 psi higher than where the solution is being injected. Provide a shutoff valve.

4.4 CONTROLS:

1. **REMOTE START-STOP**: Connect wiring from the remote Start/Stop switch to the terminals in the junction box per the attached wiring diagram. The remote switch is to be a dry contact with no voltage. The feeder will provide the 120 VAC to power the circuit.

2. **REMOTE 4-20 mA PUMP SPEED CONTROL**: Connect wiring from a remote 4-20 mA signal source to the terminals in the junction box per the attached wiring diagram. A digital indicator provides local indication of pump speed, 0 to 100%.

3. **REMOTE ALARM:** A set of dry contacts allow remote indication when the water flow is below minimum. Connect wiring from the terminals in the junction box to the remote alarm per the attached wiring diagram. A light provides local alarm indication. The contacts are limited to 240 VAC, 5 Amps.

4.5 ACTIVATED SOLUTION CONNECTION:

1. Connect the feeder to the activated solution piping. Tighten all connections.
2. Use only pipe or tubing that is designed to withstand up to 100 psi pressure. Do not use clear unreinforced vinyl tubing.

4.6 POLYMER CONNECTION:

1. Install the pump tube on the metering pump. See pump manual for details.
   Note: If the feeder is not to be used for a long period of time, the tube should be removed to extend tube life.

2. The polymer can be supplied to the metering pump through a flooded suction or suction lift.

   a. Suction lift is to be less than 4'. Install the strainer supplied with the feeder at the end of the inlet tube. Insert the tube in the container.

   b. Flooded suction. For proper pump operation, to prevent over pumping and siphoning, the polymer level is to be less than 5' above the feeder. Connect the polymer supply to the inlet of the in-line strainer before the pump suction.

5.0 START-UP:

1. Turn on the water to the EXCELL FEEDER.

2. Turn the feeder selector switch to the "ON" position. This switch will open the water solenoid and turn on the metering pump. There must be adequate water flow to the feeder to trip the flow switch before the metering pump will turn on.

3. Re-adjust the low water flow switch setting, if necessary. The switch has been preset for the water flowmeter minimum indication.

   Slowly close the valve on the dilution water flow meter until the flow is slightly higher than the lowest line on the flowmeter. Turn the adjusting screw on the low water flow-switch until it turns on the metering pump. Loosen the screw to reduce the trip point flow.
   Turn off the water flow. The flow-switch should turn the pump off.

   Adjust the flow to the desired rates.

4. Adjust the metering pump to the desired flow rate. See the pump manual.

5. The pump has been set as follows:

   a. Local. The pump speed is manually adjustable from 0 to 100% of capacity.

   b. Remote. The pump speed is adjustable from 0 to 100% of capacity by a 4-20 mA signal.

   The minimum pump speed is set at 0 % when the pump receives a 4mA signal.

   The maximum pump speed is set at 100 % when the pump receives a 20mA signal.

   The minimum and maximum pump speeds can be reset as desired.
   See the DC motor controller manual.

5.1 CALIBRATE THE METERING PUMP:

1. The metering pump can be calibrated only if the pump is supplied by flooded suction.
2. Fill the calibration cylinder with polymer.
3. Close the polymer supply valve and immediately open the calibration cylinder valve.
4. Measure the time needed to pump out a desired amount of polymer.

   The pump flow in Gallons Per Day equals:

   $$\frac{22.8 \times (\#\text{ of ml})}{(\#\text{ of seconds})} = \#\text{ of GPD}$$

   EXAMPLE: $22.8 \frac{(20\text{ ml})}{90\text{ sec}} = 5.1\text{ GPD}$

6.0 CLEANING:

6.1 CLEANING THE SIGHT GLASS:

1. Turn the metering pump off.
2. Flow water through the feeder for about two minutes to flush it of polymer.
3. Turn the feeder main switch to "OFF."
4. Turn the water supply valve off. Don't use the flow meter valve to turn off water flow.
5. Drain the sight glass using the drain valve.
6. Remove the sight tube by removing the four nuts; save the nuts and O-Rings.
7. Rinse the sight tube cleaning assembly. Wipe the sight tube with a clean cloth.
8. Reinstall the top cap O-Ring and cap. Tighten the nuts. Check for leaks

6.2 CLEANING THE WATER FLOWMETER:

1. Turn the Feeder main switch to "OFF."
2. Close the water supply valve.
3. Open the drain valve to relieve system pressure. Close the valve.
4. Unscrew the plug on top of the flow meter.
5. Clean the flow tube with a soft brush and mild soap and water.
6. Apply petroleum jelly to the plug O-ring and reinstall. Don't over-tighten.

7.0 SHUT-DOWN FOR OVER 48 HOURS:

1. Fill the calibration column with oil that is compatible with the process. Pump the oil until all the polymer is displaced out of the system.
2. Turn the water supply valve off
3. Turn the feeder switch "OFF".
4. If needed, drain the feeder using the drain valve. Note that some feeder components will not fully drain and will be damaged if exposed to freezing temperatures.

8.0 MAINTENANCE: The EXCELL FEEDER was designed to require minimum maintenance, with all components easy to replace. The estimated life of the pump tube will range from two to six months, depending on operating parameters.

9.0 REPAIRS: Contact EXCELL at (732) 828-8655 for assistance or replacement parts.

9.1 METERING PUMP REPAIRS: See the attached manufacturer's manual.

9.2 RECOMMENDED SPARE PARTS:

1. Metering Pump Tube
2. Injection Valve
3. Blending Tank O-Ring Set
4. Relay
5. Solenoid Valve

10.0 TROUBLESHOOTING:

A. SYMPTOM: METERING PUMP WILL NOT RUN.

1. LIKELY CAUSE: Not enough water flow to satisfy the flow switch.
   SOLUTION: Increase water flow, until the flow switch closes, or adjust the flow switch setting.

2. LIKELY CAUSE: Not plugged in or no power at outlet.
   SOLUTION: Plug the feeder in; test the outlet for power.

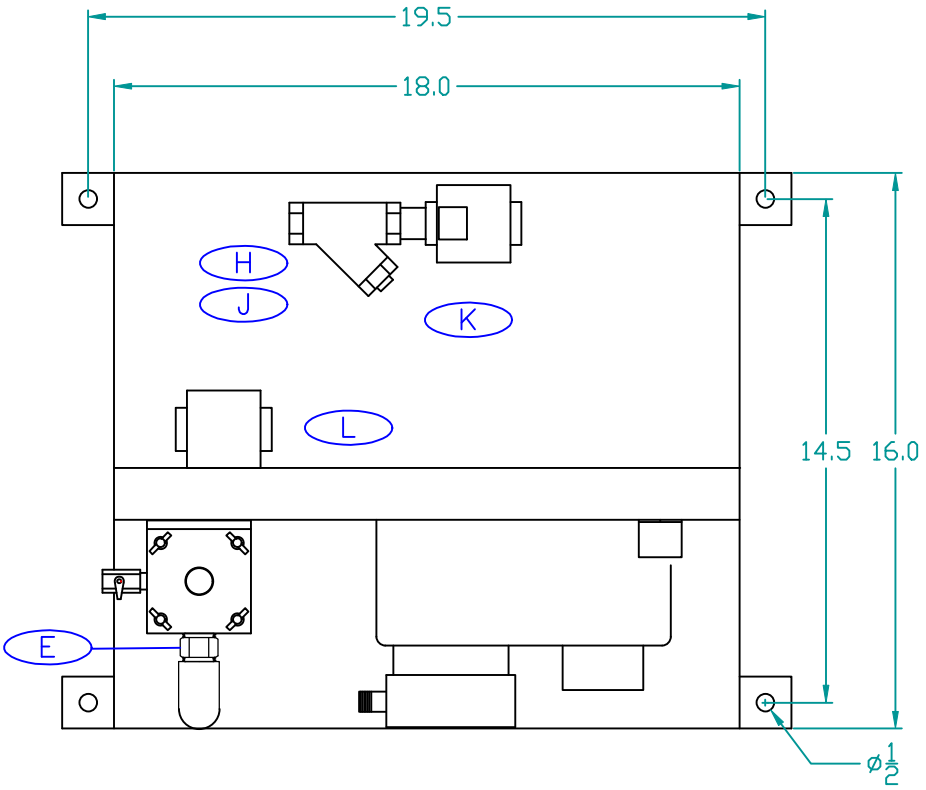
3. LIKELY CAUSE: Pump is in “Remote” and not receiving a remote signal.
   SOLUTION: Set the switch to the proper setting.

B. SYMPTOM: METERING PUMP DOES NOT PUMP TO CAPACITY.

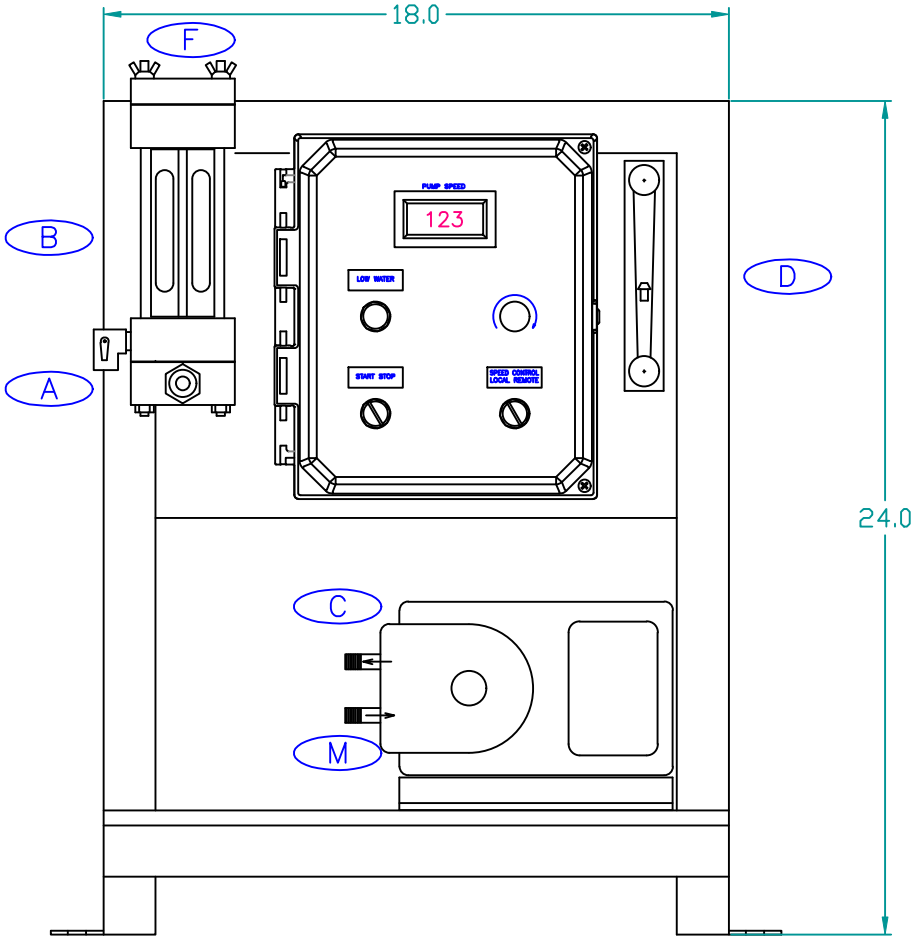
1. LIKELY CAUSE: Damaged tube.
   SOLUTION: Clean and replace parts as needed.

2. LIKELY CAUSE: Feeder injection valve is plugged.
   SOLUTION: Disconnect the polymer feed to the valve. Clean or replace the valve.

3. LIKELY CAUSE: Polymer viscosity is too high.



C. SYMPTOM: FEEDER INJECTION VALVE IS LEAKING.



1. LIKELY CAUSE: Debris in the valve.
   SOLUTION: Disconnect the polymer feed to the valve. Clean or replace the valve.

D. SYMPTOM: SIGHT TUBE WIPER IS NOT SPINNING.

1. LIKELY CAUSE: Not enough solution flow to operate the wiper.
   SOLUTION: Temporarily increase water flow until the wiper begins spinning.

0529-X

Specifications

Maximum Working Pressure	65 psig / 4.5 bar (most models)
Maximum Fluid Temperature	130° F / 54°C
Ambient Temperature Range	14 to 110° F / -10 to 43° C
Duty Cycle	Continuous
Maximum Solids	50% by volume
Maximum Viscosity	5,000 Centipoise
Maximum Suction Lift	up to 30 ft. water
Power Requirements	90VDC 60 Watts,
Dimensions	6-1/8" H x 10-1/8" W x 9" D
Weight	8 lb.

Features

- Peristaltic Pump Tube does not require valves.
- Self priming under maximum pressure. Cannot vapor lock.
- High outlet pressure capability of 65 psig (most models).
- High inlet suction lift capability of 30 feet.
- Patented pump tube assembly design.
- Corrosion proof Valox housing.
- Tamper resistant electronic control panel cover.

Pump Capacity:

Model	#1 tube	#2 tube	#3 tube

1.0 Introduction

Congratulations on purchasing the 0529-X Peristaltic Metering Pump. The 0529-X is designed to inject chemicals into piping systems. The 0529-X can be equipped with control circuitry which allows the pump output to be externally controlled by a 4-20 mA signal.

2.0 Specifications

Maximum Working Pressure	65 psig / 4.5 bar (most models)
Maximum Fluid Temperature	130° F / 54°C
Ambient Temperature Range	14 to 110° F / -10 to 43° C
Duty Cycle	Continuous
Maximum Solids	50% by volume
Maximum Viscosity	5,000 Centipoise
Maximum Suction Lift	up to 30 ft. water
Power Requirements	90VDC 60 Watts,
Dimensions	6-1/8" H x 10-1/8" W x 9" D
Weight	8 lb.

3.0 Features

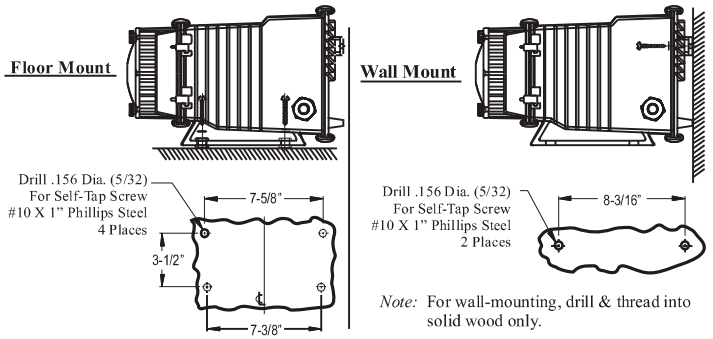
- Peristaltic Pump Tube does not require valves.
- Self priming under maximum pressure. Cannot vapor lock.
- High outlet pressure capability of 65 psig (most models).
- High inlet suction lift capability of 30 feet.
- Patented pump tube assembly design.
- Corrosion proof Valox housing.
- Tamper resistant electronic control panel cover.

4.0 Unpacking

Your pump package should contain the following:
1 - Injector pump with 1 pump tube assembly
1 - suction tube strainer
1 - ceramic tubing weight
1 - 5' Length of clear PVC suction tubing

5.0 Installation

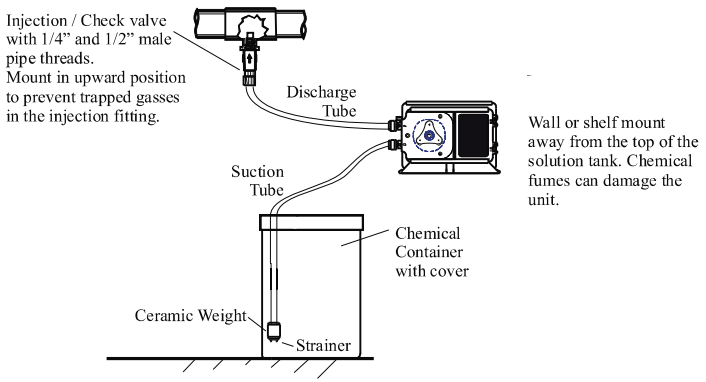
CAUTION: Proper eye and skin protection must be worn when installing and servicing the pump.



Note: *All diagrams are strictly for guideline purposes only. Always consult an expert before installing the pump into specialized systems. The pump should be* ***serviced by qualified persons only.***

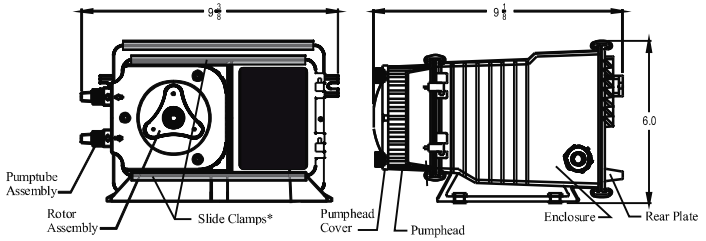
5.1 Mounting Location

Choose an area located near the chemical supply tank, chemical injection point and electrical supply. Although the pump is designed to withstand outdoor conditions, a cool, dry, well ventilated location is recommended. Install the pump where it can be easily serviced.



- Mount the pump to a secure surface or wall using the enclosed hardware. Wall mount to a solid surface only. Mounting to drywall with anchors is not recommended.
- Mount the pump close to the injection point. Keep the outlet (discharge) tubing as short as possible. Longer tubing increases the back pressure at the pump tube.
- Your solution tank should be sturdy. Keep the tank covered to reduce fumes. Do not mount the pump directly over your tank. Chemical fumes may damage the unit. Mount the pump off to the side or at a lower level than the chemical container.
- Mounting the pump lower than the chemical container will gravity feed the chemical into the pump. This "flooded suction" installation will reduce output error due to increased suction lift. You must install a shut-off valve, pinch clamp or other means to halt the gravity feed to the pump during servicing.
- Be sure your installation does not constitute a cross connection with the drinking water supply. Check your local plumbing codes.

INJECTOR MOUNTING

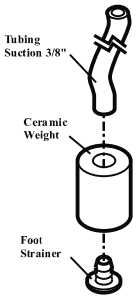


Note: For wall-mounting, drill & thread into solid wood only.

TYPICAL INSTALLATION

PARTS LOCATOR DRAWING

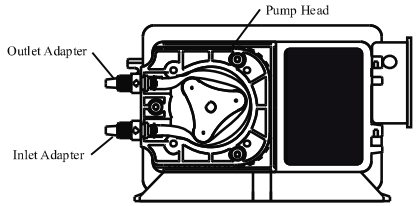
5.2 Input Power Connections



WARNING: Risk of electric shock.

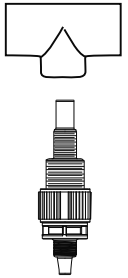
- Be certain to connect the pump to the proper supply voltage. Using the incorrect voltage will damage the pump and may result in injury. The voltage requirement is printed on the pump serial label.

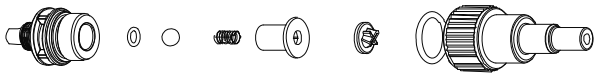
5.4 How To Install the Tubing and Fittings



CAUTION: Proper eye and skin protection must be worn when installing and servicing the pump.

- **Inlet Tubing -** Locate the inlet fitting of the Pump Tube. Remove the tube nut. Push the clear PVC suction tubing onto the compression barb of the fitting. Use the tube nut to secure the tube. Hand tighten only.
- **Strainer** - Trim the inlet end of the suction tubing so that the strainer will rest approximately two inches from the bottom of the solution tank. This will prevent sediment from clogging the strainer. Slip the ceramic weight over the end of the suction tube. Press the strainer into the end of the tube. Secure the ceramic weight to the strainer. Drop the strainer into the solution tank.





- **Outlet Tubing -** Locate the outlet fitting of the Pump Tube. Remove the tube nut. Push the opaque outlet (discharge) tubing onto the compression barb of the fitting. Use the tube nut to secure the tube. Hand tighten only.

  Keep outlet tube as short as possible.

- **Injection/Check Valve Fitting Installation** - The Injection/Check valve fitting is designed to install directly into either 1/4" or 1/2" female pipe threads. This fitting will require periodic cleaning, especially when injecting fluids that calcify such as sodium hypochlorite. See section 7.0. Install the Injection/Check valve directly into the piping system. To prevent trapped gasses, install the fitting in an upward direction. Use Teflon thread sealing tape on the pipe threads.
  Push the opaque outlet (discharge) tubing onto the compression barb of the Injection/Check valve fitting. Use the tube nut to secure the tube. Hand tighten only.

6.0 How to Maintain the Pump

CAUTION: Proper eye and skin protection must be worn when installing and servicing the pump.

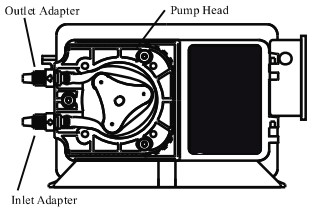
6.1 Routine Inspection and Maintenance

The pump requires very little maintenance. However, the pump and all accessories should be checked weekly. This is especially important when pumping chemicals. Inspect all components for signs of leaking, swelling, cracking, discoloration or corrosion. Replace worn or damaged components immediately.

Cracking, crazing, discoloration and the like during the first week of operation are signs of severe chemical attack. If this occurs, immediately remove the chemical from the pump. Determine which parts are being attacked and replace them with parts that have been manufactured using more suitable materials. The manufacturer does not assume responsibility for damage to the pump that has been caused by chemical attack.

6.2 How to Clean and Lubricate the Pump

The pump will require occasional cleaning and lubricating. The amount will depend on the severity of service.

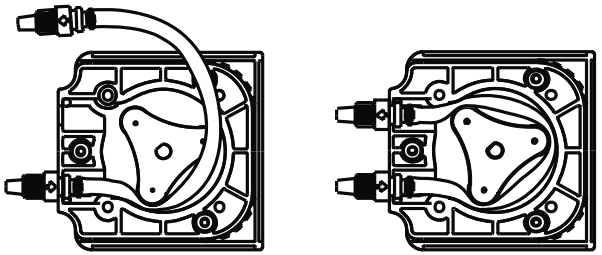


- When changing the pump tube assembly, the pump head chamber, roller assembly and pump head cover should be wiped free of any dirt and debris.
- The pump head cover bearing may require grease periodically. Apply a small amount of grease (Aeroshell aviation grease #5 or equivalent) when necessary.
- Although not necessary, 100% silicon lubrication may be used on the roller assembly and tube assembly.
- Periodically clean the injection/check valve assembly, especially when injecting fluids that calcify such as sodium hypochlorite. These lime deposits and other build ups can clog the fitting, increase the back pressure and interfere with the check valve operation.
- Periodically clean the suction strainer.
- Periodically inspect the air vents located under the motor compartment and on the rear panel. Clean if necessary.

6.3 How to Replace the Pump Tube

The pump tube assembly will eventually break if not replaced. The tube has been designed for a minimum service life of 500 hours. However, the life of the tube is affected by many factors such as the type of chemical being pumped, the amount of back pressure, the motor RPM, temperature and others. The pump tube assembly must be inspected and replaced regularly.

Remove the Old Pump Tube - The pump roller assembly spins in a counter clockwise direction. The pump head inlet (suction) side is located at the bottom of the pump and the outlet (discharge) is located at the top of the pump head.



- Release any pressure that may be in the discharge tubing.
- Disconnect the suction and discharge tubes from the pump tube.
- Remove the pump head cover.
- With the pump running, pull the inlet fitting out of the pumphead. Guide the tube counter clockwise away from the rollers. Pull the outlet fitting out of the pump head.

Install the New Pump Tube - Be sure the pump head chamber is clean and free of any debris.

Remove and inspect the roller assembly. Be sure the rollers spin freely. If required, apply a small amount of grease to the pump head cover bearing.

- With the pump running, insert the inlet (suction) side of the Pump Tube fitting into the pump head.
- **Carefully** guide the Pump Tube into the pump head. Stretch the tube slightly and insert the outlet (discharge) fitting into the upper retaining slot in the pump head.
- Place the clear cover on the pump head and secure with three screws.

LIMITED WARRANTY

Your new pump is a quality product and is warranted to be free of defects as set down in this policy. Peristaltic pump tube assemblies are not warranted. Parts are covered under warranty for 12 months from the date of purchase. Warranty coverage does not include damage to the pump that results from misuse, carelessness, abuse or alteration. Only the repair or the replacement of the pump is covered. Excell Feeders does not assume responsibility for any other loss or damage.

Warranty status is determined by the pump's serial label. The serial label must be on the pump to obtain warranty coverage. The warranty status of the pump will be verified by Excell Feeders.

PROCEDURE FOR IN WARRANTY REPAIR

Carefully pack the pump to be repaired. Enclose a brief description of the problem. Prepay all shipping costs. COD shipments will not be accepted. Warranty service must be performed by the factory. Damage caused by improper packaging is the responsibility of the sender.

Users of electrical and electronic equipment (EEE) with the WEEE marking per Annex IV of the WEEE Directive must not dispose of end of life EEE as unsorted municipal waste, but use the collection framework available to them for the return, recycle, recovery of WEEE and minimize any potential effects of EEE on the environment and human health due to the presence of hazardous substances. The WEEE marking applies only to countries within the European Union (EU) and Norway. Appliances are labeled in accordance with European Directive 2002/96/EC.
Contact your local waste recovery agency for a *Designated Collection Facility* in your area.

GSD4 Series DC Drives User Manual

User Manual Number: IH-GSD4-User-M

WARNING

Thank you for purchasing automation equipment from Automationdirect.com®, doing business as AutomationDirect. We want your new automation equipment to operate safely. Anyone who installs or uses this equipment should read this publication (and any other relevant publications) before installing or operating the equipment.

To minimize the risk of potential safety problems, you should follow all applicable local and national codes that regulate the installation and operation of your equipment. These codes vary from area to area and usually change with time. It is your responsibility to determine which codes should be followed, and to verify that the equipment, installation, and operation is in compliance with the latest revision of these codes.

At a minimum, you should follow all applicable sections of the National Fire Code, National Electrical Code, and the codes of the National Electrical Manufacturer's Association (NEMA). There may be local regulatory or government offices that can also help determine which codes and standards are necessary for safe installation and operation.

Equipment damage or serious injury to personnel can result from the failure to follow all applicable codes and standards. We do not guarantee the products described in this publication are suitable for your particular application, nor do we assume any responsibility for your product design, installation, or operation.

Our products are not fault-tolerant and are not designed, manufactured or intended for use or resale as on-line control equipment in hazardous environments requiring fail-safe performance, such as in the operation of nuclear facilities, aircraft navigation or communication systems, air traffic control, direct life support machines, or weapons systems, in which the failure of the product could lead directly to death, personal injury, or severe physical or environmental damage ("High Risk Activities"). AutomationDirect specifically disclaims any expressed or implied warranty of fitness for High Risk Activities.

For additional warranty and safety information, see the Terms and Conditions section of our catalog. If you have any questions concerning the installation or operation of this equipment, or if you need additional information, please call us at 770-844-4200.

This publication is based on information that was available at the time it was printed. At AutomationDirect we constantly strive to improve our products and services, so we reserve the right to make changes to the products and/or publications at any time without notice and without any obligation. This publication may also discuss features that may not be available in certain revisions of the product.

TRADEMARKS

This publication may contain references to products produced and/or offered by other companies. The product and company names may be trademarked and are the sole property of their respective owners. AutomationDirect disclaims any proprietary interest in the marks and names of others.

GSD4 DC DRIVES USER MANUAL OVERVIEW

OVERVIEW OF THIS PUBLICATION

The IronHorse GSD4 Series DC Drives User Manual describes the installation, configuration, and methods of operation of the GSD4 Series DC Drives.

All information contained in this manual is intended to be correct. However, information and data in this manual are subject to change without notice. AutomationDirect (ADC) makes no warranty of any kind with regard to this information or data. Further, ADC is not responsible for any omissions or errors or consequential damage caused by the user of the product. ADC reserves the right to make manufacturing changes which may not be included in this manual.

WHO SHOULD READ THIS USER MANUAL

This manual contains important information for those who will install, maintain, and/or operate any of the GSD4 Series DC Drives.

TECHNICAL SUPPORT

By Telephone: 770-844-4200 (Mon.–Fri., 9:00 a.m.–6:00 p.m. E.T.)

On the Web: www.automationdirect.com

Our technical support group is glad to work with you in answering your questions. If you cannot find the solution to your particular application, or, if for any reason you need additional technical assistance, please call Technical Support at 770-844-4200. We are available weekdays from 9:00 a.m. to 6:00 p.m. Eastern Time.

We also encourage you to visit our web site where you can find technical and non-technical information about our products and our company. Visit us at www.automationdirect.com.

IRONHORSE GSD4 SERIES DC DRIVES GENERAL INFORMATION

IronHorse GSD4 DC drives are designed to control DC Permanent Magnet, Shunt Wound, and some Universal (AC/DC) motors. Incoming AC voltage is converted to adjustable full-wave rectified DC voltage to operate the DC motor. Also, a full-wave field voltage is provided for shunt wound motors.

CAREFULLY CHECK THE DC DRIVE FOR SHIPPING DAMAGE. REPORT ANY DAMAGE TO THE CARRIER IMMEDIATELY. DO NOT ATTEMPT TO OPERATE THE DRIVE IF VISIBLE DAMAGE IS EVIDENT TO EITHER THE CIRCUIT OR TO THE ELECTRONIC COMPONENTS.

STANDARD FEATURES

- Input voltages 24/36VAC or 120/240VAC @ 50/60Hz; output 0–24/36VDC or 0–90/180VDC.
- Adjustable horsepower settings.
- Barrier terminal strip.
- Full-wave bridge supply.
- 1% speed regulation with armature voltage feedback; ±1/2% with tachometer feedback.
- Adjustable Minimum speed, Maximum speed, IR Compensation, Current Limit, Acceleration & Deceleration (enclosed models).
- Line voltage compensation.
- 5kΩ speed potentiometer with leads, dial, and knob included.
- 50:1 speed range.
- Transient voltage protection.
- Voltage following mode or DC tachometer follower by supplying ungrounded 0–12VDC analog input signal.
- DC tachometer feedback (6V at base speed).
- Inhibit circuit permits start & stop without breaking AC lines.
- Shunt field supply provided.
- GSD4-240-10N4X only: NEMA 4X enclosure, Power ON/OFF switch, Power ON indicator, Adjustable acceleration and deceleration.

CONTROL FEATURES

MINIMUM SPEED – Allows adjustment of the motor speed when the speed pot is set at minimum (CCW). This permits the user to eliminate "Deadband" on the main speed control, permitting zero calibration. Clockwise rotation of "MIN" trim pot increases speed.

MAX SPEED (Maximum Speed) – Allows adjustment of the motor speed when the speed pot is set at maximum (CW). This permits the user to eliminate the top end "Deadband", which will provide full speed at maximum rotation. Rotation of the "MAX" trim pot in the clockwise direction increases the maximum motor speed.

I.R. COMP (Speed Regulation) – This allows for adjustment of the circuitry that controls the speed regulation of the motor. The circuitry controls armature speed by changing the armature voltage to compensate for increased or decreased motor loading. Clockwise rotation of the "IR COMP" trim pot will increase compensation.

CUR. LIM. (Current Limit) – Provides protection from excessive armature current by limiting the maximum armature current the drive can provide. This enables adjustment of the maximum torque the motor can deliver. Torque adjustment (Cur. Lim.) is preset at 125% of rated motor torque (current) based on horsepower. Clockwise rotation of the "CUR. LIM." trim pot increases the torque (current) the drive will provide.

INHIBIT TERMINAL PIN – An adjustable acceleration ramp that allows the user a choice of stopping and starting hard (fast), or stopping hard with a soft start (without breaking the AC lines).

There are two ways to Inhibit a drive:

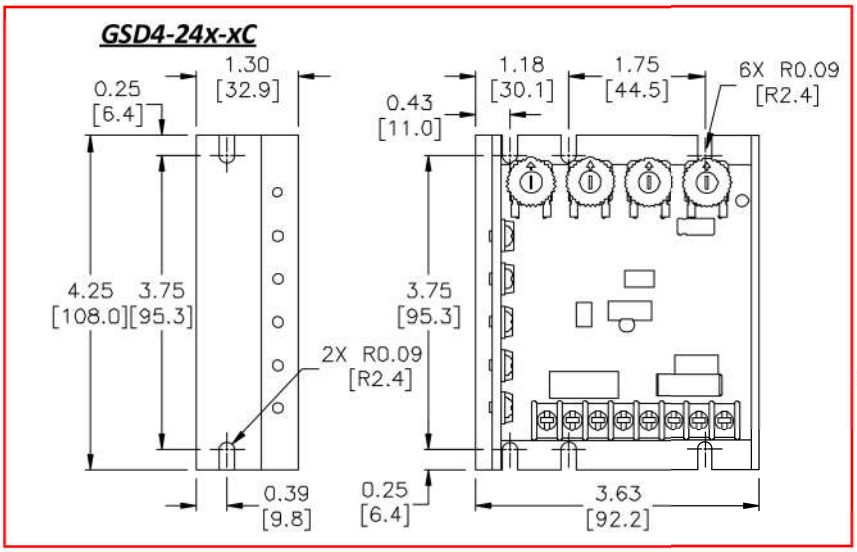
1) For all GSD drives (using the drive's speed pot):

   Remove power from the Speed Pot Wiper, which makes the input to the drive drop to Zero volts. A switch or contact can be placed in either the Speed Pot High lead, or in the Speed Pot Wiper lead.

2) For GSD4, GSD5, and GSD7 drives (using the drive's inhibit feature):

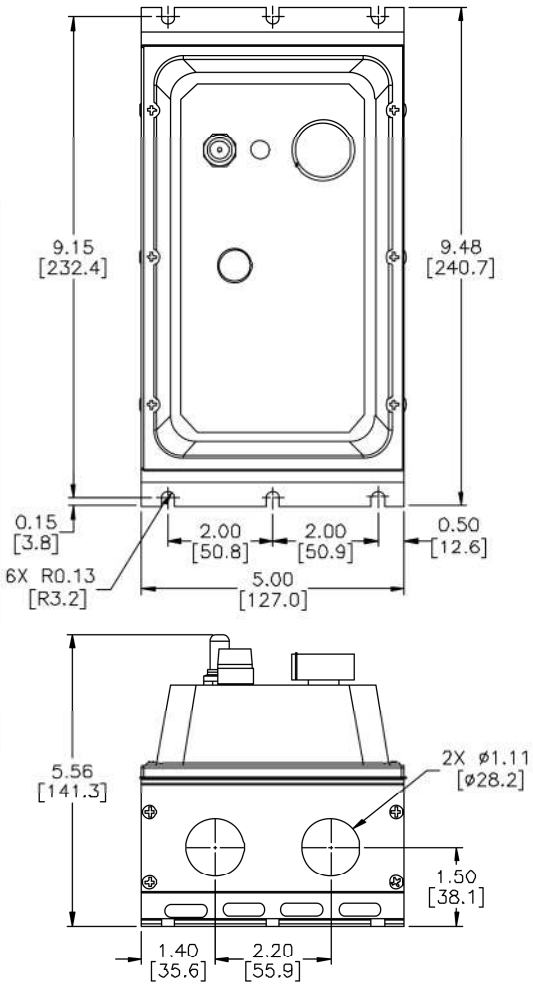
   The inhibit feature provides a way to start/stop output of these drives by using a low-power rated contact (12VDC, mA of current), as opposed to a high-power contact that would be required to switch the source power to the drive.

   Close the circuit between the Inhibit pin (GSD4 & GSD5 Series) or the +TACH terminal (GSD7 only), and the drive's Speed Pot Hi terminal. The drive will stop and start quickly – bypassing any fixed or adjustable ACCEL or DECEL setting. When this connection is CLOSED, the drive's 12VDC logic supply is collapsed by connecting it to a chassis COMMON point – the board logic shuts down and output to the motor ceases. Output to the motor resumes when this contact is opened again.



SELECTION AND SPECIFICATIONS

GSD4 Series DC Drives – Selection & Specifications					
Model		**GSD4-24A-5C**	**GSD4-240-1C**	**GSD4-240-5C**	**GSD4-240-10N4X**
Package Configuration		open frame			NEMA 4X
Power Quality Form Factor		1.4			
Input Voltage (@50/60Hz)		24/36 VAC ±10%	120/240 VAC ±10%		
Output Voltage		0–24/36 VDC	0–90/180 VDC		
Shunt Field Voltage		20VDC @ 24VAC in 30VDC @ 36VAC in (1A max)	100VDC @ 120VAC in 200VDC @ 240VAC in (1A max)		100VDC @ 120VAC in 200VDC @ 240VAC in (0.5A max)
Motor Rating @ Low V (hp) **Motor Rating @ High V (hp)**		1/50 – 1/6	1/50 – 1/8 1/25 – 1/4	1/8 – 1/2 1/4 – 1	1/8 – 1 1/4 – 2
Output Current (continuous)		5.5A (DC)	1.2A (DC)	5.5A (DC)	10A (DC)
Current Overload Capacity		200% for 60s			
Current Limit (adjustable)		1–15A (DC)	0.3–2.5A (DC)	1–15A (DC)	
Transient Protection		–	Metal Oxide Varistor (MOV)		
I.R. Compensation		adjustable			
Speed Adjustment	**Potentiometer**	5kΩ potentiometer or 0–10VDC isolated input signal (See "GSDA-AI-V4" on page 18.)			
	Current	4–20mA			n/a
	Voltage	n/a	0–5VDC thru 0–250VDC		
Speed Range		50:1			
Speed Regulation		±1% of base speed			
Maximum Speed		adjustable from 60% to 110% of base speed			
Minimum Speed		0–30% of adjustable maximum speed			
Acceleration		0.5 seconds			adjustable 0.5–8 seconds
Deceleration					
Dynamic Braking		no			
Plugging Capability **		no			
Electrical Connections		8-position terminal strip; 22–14 AWG			
External Fusing Required		Bussman ABC or Littlefuse 314 series ceramic fuses or equivalent For details, refer to "Fusing" on page page 8.			
Operating Temperature		-10 to 45 °C [14 to 113 °F]			-10 to 40 °C [14 to 104 °F]
Thermal Protection		current limiting			
Mounting Orientation		can be mounted in any orientation			
Corrosive Gases		NOT compatible with any corrosive gases			
Weight		8.0 oz [203g]	37 oz [1049g]	10.5 oz [297g]	59.5 oz [1687g]
Agency Approvals		RoHS, CE	cULus Listed (E198015), RoHS, CE		cULus Listed (E198015), RoHS
Optional Accessories *					
Replacement Potentiometer		GSDA-5K			
Digital Potentiometer		GSDA-DP			
Manual Reverse Switch		GSDA-MREV			
Accel/Decel Adjustment Card		GSDA-ACCDEC-4			
Analog Current Input Card		GSDA-AI-A			–
Analog Voltage Input Card		–	GSDA-AI-V4		–
Heatsink		GSDA-HTSNK-4			–



** For accessories details, please visit www.AutomationDirect.com.*
*** Plugging is a method of rapidly changing motor direction by reversing motor armature polarity, while the motor is still running.*

DIMENSIONS (dimensions = in [mm])

GSD4-24x-xC

GSD4-240-10N4X

Installation and Wiring

Install open-frame drives in an enclosure with a volume at least three times the volume of the open-frame drive.

Do not mount GSD4-24x-xxxxx DC drive where ambient temperature is outside the range of -10 to 45 °C (14 to 113 °F).

Size all wires that carry armature or line currents as specified by applicable national, state, and/or local codes. All other wires may be 18AWG or smaller as permitted by the codes.

Separate control wires from the armature and AC lines when routed in conduit or wire trays.

These drives do not provide motor over-temperature sensing or motor overload protection. The need for additional motor overload and motor over-temperature protection shall be determined based on conditions in the end installation in accordance with the NEC.

CAUTION!! Turn power OFF while making wiring connections.

Improper installation or operation of this DC Drive may cause injury to personnel or drive failure. The drive must be installed in accordance with local, state, and national safety codes. Make certain that the power supply is disconnected before attempting to service or remove any components!!! If the power disconnect point is out of sight, lock it in disconnected position and tag it to prevent unexpected application of power. Only a qualified electrician or service personnel should perform any electrical troubleshooting or maintenance. At no time should circuit continuity be checked by shorting terminals with a screwdriver or other metal device.

Before attempting to wire the DC Drive, make sure all power is disconnected. Recheck code designation to assure proper voltage is present for the DC Drive. Carefully select proper wire size for current and voltage drop. Limit the voltage drop through the wiring to 5% of the line voltage at full load

CAUTION!! Do not attempt to perform a hi-pot test across the AC lines with the DC drive in the circuit. This will result in immediate or long-term damage to the drive.

1) Ensure that the GSD4 drive chassis is properly grounded.
2) Motor armature connections must not be switched or broken while the GSD4 drive is ON. Serious damage may result.
3) The inputs to the speed pot terminals (P1-6, P1-7, P1-8) must not be grounded. Serious damage may result.

Fusing

Fuse Selection *				
	GSD4-24A-5C	Select fusing based on 200% of motor Full-Load Current		
	GSD4-240-xC		GSD4-240-10N4X	
Motor HP	Fuse @ 120 VAC Input	Fuse @ 240 VAC Input	Fuse @ 120 VAC Input	Fuse @ 240 VAC Input
1/50	2A	–	–	–
1/20	2A	1A	–	–
1/8	3A	2A	2A	–
1/4	4A	3A	4A	2A
1/3	6A	3A	6A	3A
1/2	8A	4A	8A	4A
3/4	12A	6A	12A	6A
1.0	15A	8A	15A	8A
1.5	–	12A	–	12A
2.0	–	15A	–	15A

** Select fuse type Bussman ABC or Littlefuse 314 series or equivalent. Fuse hot legs only; do not fuse AC neutrals. (AutomationDirect sells ABC series fuses.)*

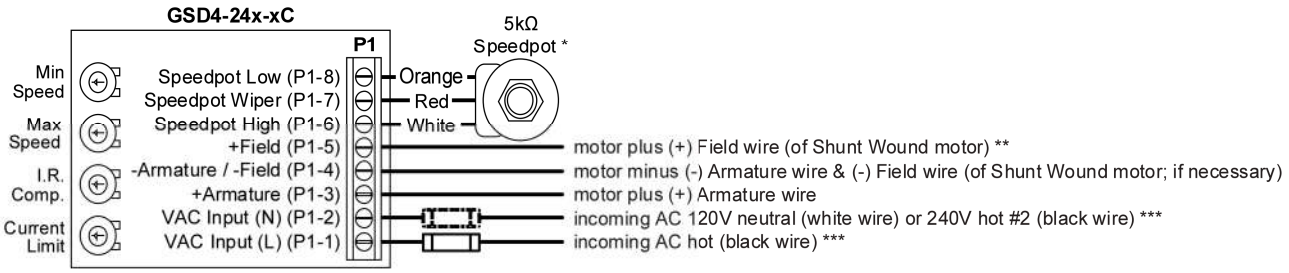
WIRING TERMINALS

GSD4 Wiring Terminals			
Type	**Wire Range**	**Customer Wiring Temp Rating**	**Tightening Torque**
8-position terminal strip	22–14 AWG	300V, 75 °C [167 °F] minimum	9.0 lb·in [1.0 N·m]

WIRING TERMINAL FUNCTIONS

GSD4-xxx-xC WIRING TERMINALS

GSD4-xxx-xC Series DC Drives – Terminal Strip Functions CAUTION: BE SURE DRIVE HOUSING IS PROPERLY GROUNDED.	
Number	**Purpose**
P1-1	(L / AC1) 120VAC – Connect incoming hot AC (black wire) to this terminal. (L / AC1) 240VAC – Connect either hot side. Connect ground (green wire) to drive chassis.
P1-2	(N / AC2) 120VAC – Connect the neutral AC (white wire) to this terminal. (N / AC2) 240VAC – Connect either hot side. Connect ground (green wire) to drive chassis.
P1-3	(+ ARM) – Connects to the plus (+) Armature wire on the motor. 0-90VDC for 120VAC input or 0-180VDC for 240 VAC input. See "SPECIFICATIONS" for output rating. *CAUTION: ARMATURE CONNECTION MUST NOT BE SWITCHED OR BROKEN WHILE DRIVE IS ON, OR SERIOUS DAMAGE TO THE DRIVE MAY RESULT.*
P1-4	(- ARM / -FIELD) – Connects to minus (-) Armature wire on the motor, and, if necessary, (-) Field wire of Shunt Wound motor.
P1-5	(+ FIELD) – DO NOT use for Permanent Magnet motor. This supplies (+) Field voltage for a Shunt Wound motor. For motors with dual voltage field (i.e. 50/100V or 100/200V), make sure the highest value is connected.
P1-6	(SPEEDPOT HI) – Connects to high side (white wire) of the Speed pot (CW end). This is internal +12 volts. *INPUT MUST NOT BE GROUNDED !*
P1-7	(SPEEDPOT WIPER) – Connects to the wiper (red wire) of the Speed pot (center lead). For voltage-follower applications, this *INPUT MUST NOT BE GREATER THAN +12V MAXIMUM AND MUST NOT BE GROUNDED !* *Speed pot can be replaced by 0–10V analog signal. See "GSDA-AI-V4" on page 18, or use FC-33 or equivalent.*
P1-8	(SPEEDPOT LO) – Connects to the low side (orange wire) of the 5kΩ Speed pot (normally the CCW end). This input is raised and lowered by the MIN trim pot. Electronic speed input voltage (voltage follower) may be referenced to Speed pot LO if the MIN trim pot adjustments are to be active. Otherwise, inputs may be referenced to -ARM (P1-4), which will bypass the MIN trim pot. *INPUT MUST NOT BE GROUNDED !*



GSD4-240-10N4X WIRING TERMINALS

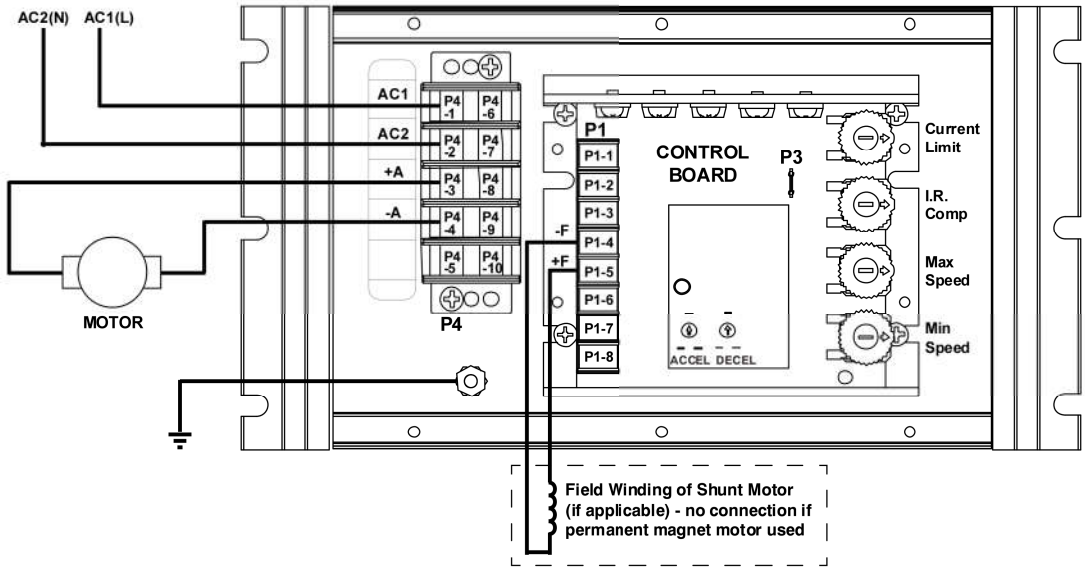
GSD4-240-10N4X Series DC Drives – Terminal Strip Functions CAUTION: BE SURE DRIVE HOUSING IS PROPERLY GROUNDED.	
Number	**Purpose**
	P4 – Terminal Strip for Power & Motor Armature Wiring
P4-1	(L / AC1) 120VAC – Connect incoming hot AC (black wire) to this terminal. (L / AC1) 240VAC – Connect either hot side. Connect ground (green wire) to drive ground lug.
P4-2	(N / AC2) 120VAC – Connect the neutral AC (white wire) to this terminal. (N / AC2) 240VAC – Connect either hot side. Connect ground (green wire) to drive ground lug.
P4-3	(+ ARM) – Connects to the plus (+) Armature wire on the motor.
P4-4	(- ARM) – Connects to minus (-) Armature wire on the motor.
	P1 – Terminal Strip for Shunt-Wound Motor Field Wiring
P1-4	(-FIELD) – Connects to minus (-) Field wire of shunt-wound motors ONLY.
P1-5	(+ FIELD) – DO NOT use for Permanent Magnet motor. This supplies (+) Field voltage for a Shunt-Wound motor. For motors with dual voltage field (i.e. 50/100V or 100/200V), make sure the highest value is connected

WIRING DIAGRAMS

GSD4-24x-xC BASIC WIRING DIAGRAM

SPEED POT CAN BE REPLACED BY AN 0–10V ANALOG SIGNAL FOR SPEED CONTROL (FROM A PLC, ETC.). SEE "GSDA-AI-V4" ON PAGE 18.

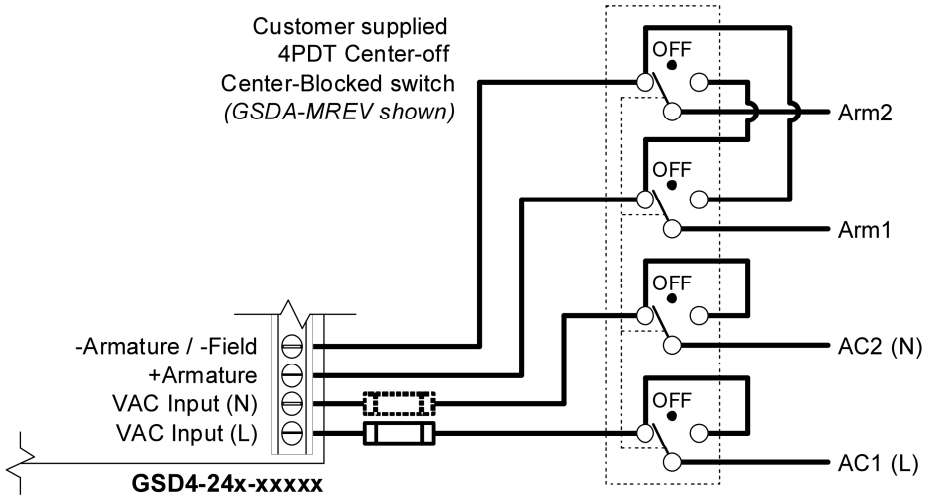
* *P1-6 has internal +12V, and connects to Speedpot High (white wire). THIS INPUT MUST NOT BE GROUNDED! For start-stop applications, the connection between P1-6 and Speedpot High can be opened and closed by a SPST switch.*



* *P1-7 connects to Speedpot Wiper (red wire). THIS INPUT MUST NOT BE GROUNDED! For Voltage-Follower applications, THIS INPUT MUST NOT BE GREATER THAN +12V MAXIMUM!*

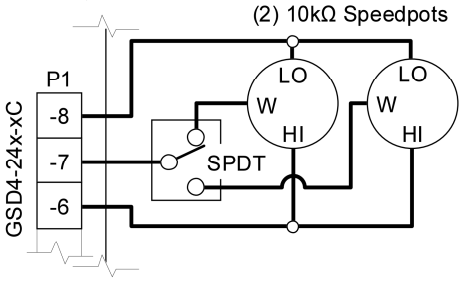
* *P1-8 connects to Speedpot Low, and is raised and lowered by the Min Speed trimpot. THIS INPUT MUST NOT BE GROUNDED! Electronic speed input (voltage follower) may be referenced to this input if the Min Speed trimpot adjustments are to be active. Otherwise, inputs may be referenced to -Armature, which will bypass the Min Speed trimpot.*

** *+F connection is only for Shunt Wound motor; NOT for Permanent Magnet motor. For motors with dual voltage field, i.e. 50/100V or 100/200V, connect the highest value.*



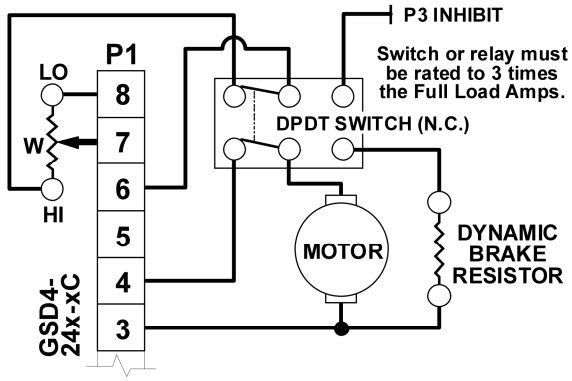
*** *Fuse hot AC inputs only; refer to Fusing section for size and type. Fuse both AC lines for 240 VAC input. Do NOT fuse AC(N) on 120V systems. Connect incoming AC ground (green wire) to GSD4 chassis.*

GSD4-240-10N4X BASIC WIRING DIAGRAM



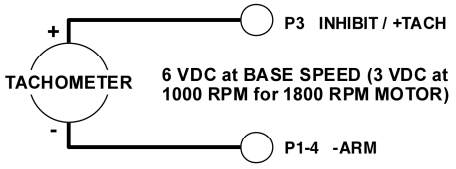
GSD4-24x-xxx Reversing Wiring Diagram

CAUTION: WHEN REVERSING A SPINNING PERMANENT MAGNET DC MOTOR, CAUTION MUST BE TAKEN THAT THE RESULTING CURRENT THROUGH THE ARMATURE OF THE MOTOR DOES NOT EXCEED THE OVERLOAD RATINGS OF THE DC DRIVE, OR THE DEMAGNETIZE RATING OF THE MOTOR BEING REVERSED. A CENTER-BLOCKED SWITCH WILL DELAY SWITCHING THE MOTOR DIRECTION. IF USING RELAYS TO AUTOMATICALLY REVERSE THE MOTOR, MAKE SURE TO HAVE A DELAY BETWEEN CHANGING MOTOR DIRECTIONS.



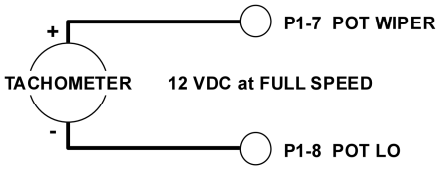
GSD4-24x-xC Two-Speed Operation

Two-speed operation is done using two 10 kΩ speed potentiometers in parallel, with both Highs connected to terminal P1-6, and both Lows connected to P1-8. A SPDT switch selects which pot Wiper is connected to terminal P1-7.



GSD4-24x-xC Dynamic Braking

A DPDT switch is used to control and to connect a customer-supplied Dynamic Braking Resistor (DBR). Typical values for the DBR are 35–50W at 5Ω for 120V, or 10Ω for 240V. Motor horsepower, inertia, and cycle time affect the sizing of the DBR.



GSD4-24x-xxx Tachometer Feedback

Improves regulation to ± 1/2% of base speed.

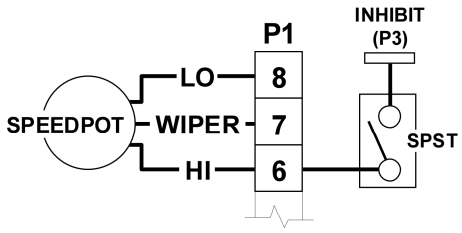
GSD4-24x-xxx Tachometer Follower

Allows drive output to follow tachometer voltage.

TACHOMETER CONTROL NEEDS TACHOMETER OUTPUT OF 7VDC/1000RPM WITH RIPPLE LIMITED TO 1% OR LESS.

INSTALLATION AND WIRING – WIRING DIAGRAMS (CONTINUED)

INHIBIT FEATURE START/STOP CONTROL



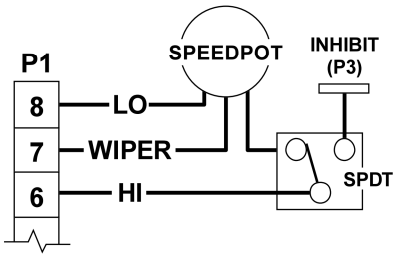
The inhibit feature allows the motor to be remotely started and stopped using a lower-rated 12VDC contact in the drive control circuit, instead of a higher-rated contact in the power circuit.

GSD4-24X-XC INHIBIT (USED INDEPENDENTLY)

This inhibit method bypasses the drive's Accel and Decel settings to start and stop the motor. It instantly shuts off the drive's output, and the motor freewheels to a stop. Start and stop rates are determined by the inertia of the load.

The customer-supplied SPST switch is connected in series between the Speed Pot High (P1-6) and the Inhibit pin (P3). To inhibit (stop motor), close Speed Pot High to the Inhibit pin. To restart, return the switch to open.

Fast Stop & Start:



GSD4-24X-XC INHIBIT (USED WITH SPEED POT)

This inhibit method bypasses the drive's Decel settings when stopping the motor, and the motor freewheels to a stop at a rate determined by the inertia of the load. However, the start rate is determined by drive's Accel setting.

The common of the SPDT switch is connected to control pot High, and is switched between Speed Pot High (P1-6) and the Inhibit pin (P3). To inhibit (stop motor), Speed Pot High is closed to the Inhibit pin. To restart, return the switch to Speed Pot High.

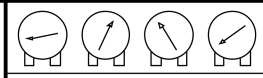
Fast Sop. Soft Start (thru accel range):

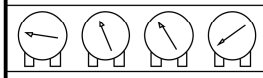
1) IN THE EVENT OF SCR FAILURE OR FALSE TRIGGERING, THE INHIBIT CIRCUIT WILL NOT STOP THE MOTOR.
2) ALWAYS USE SHIELDED WIRE WHEN CONNECTING TO THE INHIBIT TERMINAL, AND CONNECT THE SHIELD TO THE -ARMATURE OR COMMON OF THE DRIVE.

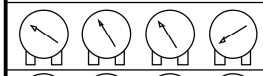
START-UP

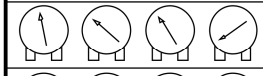
START-UP FOR GSD4-24X-XC

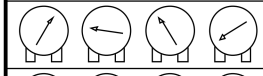
3) Recheck all wiring. Accidental grounds, loose or pinched wires on armature or speed pot wires may damage the DC drive when power is applied.
4) Check to see that the incoming power is of the correct voltage.
5) Turn the speed pot to zero (fully CCW).
6) Turn power on, and advance the speed pot while observing motor.
   Power must be turned off again before step 5 can be accomplished!
7) If the motor rotation is incorrect, turn power off at external disconnect, and reverse the +ARM and -ARM connections.
8) Check for satisfactory operation throughout the speed range.
9) *If operation is satisfactory, no readjustments are needed.*
10) If instability or surging is observed, or if maximum speed is higher than desired, refer to the "Trim Pot Adjustments" section."
11) For other problems, consult the "Troubleshooting" section.

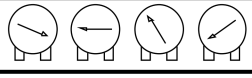




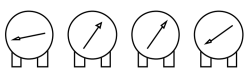


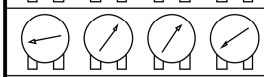


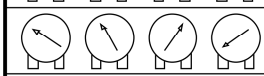


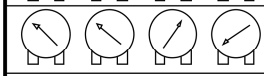


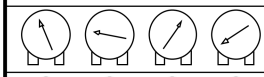
START-UP FOR GSD4-240-10N4X

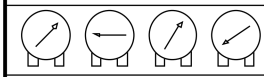


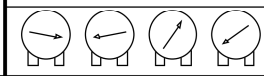












1) Safety Precautions:
   a) Observe the normal safety precautions for the voltages involved. We strongly suggest that only qualified electricians or service people should install, troubleshoot, maintain, or service the drive, motor, and interconnect wiring.
   b) Be sure power is disconnected or shut OFF at fuse box or circuit breaker when installing the drive and making adjustments (except running adjustments).
   c) Remove the load from motor (or gearmotor) before running it.
   d) Use an insulated screwdriver to make trim pot adjustments.

WHEN MAKING RUNNING ADJUSTMENTS, BE VERY CAREFUL NOT TO TOUCH ANY COMPONENTS EXCEPT THE ADJUSTING POTS.

2) On the drive front panel, turn the drive ON-OFF switch to off and set the drive pot knob fully counterclockwise (CCW) and check line fuse. The fuse should be as specified by the Fuse Selection Table.
3) Check all the connections at the drive terminals and at the motor. Make sure that they are tight and are made according to the "Installation and Wiring" section.
4) Rotate the motor's shaft manually to make sure it turns freely. A slight resistance may be noticed.
5) Turn the drive ON-OFF switch to the ON position and then slowly turn the Speed Control knob clockwise (CW) while observing direction of motor rotation. If opposite direction of rotation is desired, correct by turning OFF the drive and then reverse the motor armature connections.
6) With AC line power and control back ON, slowly turn Speed Control knob fully CW while observing the motor. Motor should accelerate smoothly to top speed.
7) Turn OFF control and AC power to drive.
8) Reconnect the motor load that the motor will normally drive.
9) Turn AC power and the drive back ON and adjust the trim pots as shown below for the motor horsepower and voltage being used.

	CL IR MAX MIN	HP
GSD-240-10NX4 INPUT 120 VAC OUTPUT 0-90 VDC		1/8
		1/4
		1/3
		1/2
		3/4
		1.0
Operation of the control beyond ±10% of the normal line voltage could result in re-adjustment. These adjustments are permanent; periodic re-adjustment is normally not needed.		

	CL IR MAX MIN	HP
GSD-240-10NX4 INPUT 230 VAC OUTPUT 0-180 VDC		1/4
		1/3
		1/2
		3/4
		1.0
		1.5
		2.0

10) Test the drive and motor under actual operating and load conditions; run the motor through the entire range of speeds required while it is fully loaded. Check motor speed with a tachometer. If control/motor performance is still not satisfactory, continue adjusting the control by following the procedures given in the "GSD4-240-10N4X Trim Pot Adjustment" section on page 15.

TRIM POT ADJUSTMENTS

If the system is unstable after the previous Start-Up procedure, then adjust the trim pots as described in this section.

GSD4-24A-5C TRIM POT ADJUSTMENT

GSD4-24A-5C Trim Pot Adjustment *		
Trim Pot	***Function***	***Adjustment***
Min	Sets minimum motor speed when speed pot is set at zero. CW rotation will increase minimum motor speed.	1) Set Speed pot to zero (fully CCW). 2) Rotate MIN trim pot CW until motor starts to rotate. 3) Slowly rotate MIN trim pot CCW until motor stops. NOTE: If motor rotation is desired, rotate MIN trim pot CW until desired MIN speed is reached.
IR Comp	Provides a means of improving motor speed regulation in the armature feedback mode. If a slowdown due to load change is of no concern, rotate this trim pot fully CCW.	1) Set Speed pot at 50%. 2) Observe motor speed at no load condition. 3) Apply full load to motor. 4) Turn IR COMP trim pot CW to obtain the same motor speed as with no load.
Max	Sets maximum motor speed when speed pot is set at maximum (fully CW rotation). CW rotation of MAX trim pot increases maximum motor speed.	1) TURN DRIVE POWER OFF!! 2) Connect a DC Voltmeter: + to +ARM; - to -ARM. *NOTE: Meter must not be grounded!!* 3) Set meter voltage range: (90 VDC for 120 VAC; 180 VDC for 240 VAC). 4) Turn power on. Set Speed pot at 100%. 5) Adjust MAX trim pot to rated motor armature voltage as shown on meter. *NOTE: A tachometer or strobe may be used in lieu of a meter.* Follow above steps, except adjust MAX trim pot to rated motor base speed indicated by tachometer or strobe.
Cur Lim	Limits DC motor armature current (torque) to prevent damage to the motor or drive. The current limit is set for the rated motor current. CW rotation of this trim pot increases the armature current (or torque produced).	1) TURN DRIVE POWER OFF! 2) Connect a DC Ammeter between A1 on motor and +ARM on drive. This is in series with the motor. 3) Turn power on. 4) Set Speed pot at the 50% position. 5) Apply friction braking to motor shaft until motor stalls. 6) With motor stalled, set current at 125% of rated motor armature current by adjusting CUR. LIM. trim pot.
** This adjustment procedure is only for the GSD4-24A-5C DC Drive. Adjustments are done with motor connected to drive.*		

GSD4-240-xC TRIM POT ADJUSTMENT

Settings apply when using a 5K ohm master speedpot. This chart is used in conjunction with the adjustment procedure and is approximate.

	C.L.	I.R.	MAX	MIN	HP
GSD4-240-1C 120 VAC input; 0-90 VDC output					**1/50**
					1/20
					1/8
GSD4-240-5C 120 VAC input; 0-90 VDC output					**1/8**
					1/4
					1/3
					1/2
					3/4*
					1.0*

Operation of the control beyond ±10% of the normal line voltage could result in re-adjustment. These adjustments are permanent; periodic re-adjustment is normally not needed.

Settings apply when using a 5K ohm master speedpot. This chart is used in conjunction with the adjustment procedure and is approximate.

2.0*					

* ADDITIONAL CUSTOMER HEATSINK REQUIRED for GSD4-240-5C with 120 VAC input & motors > 1/2 hp, and with 240 VAC input & motors > 1hp. Extrusion temperatures must not exceed 70 °C.

TRIM POT ADJUSTMENTS (CONTINUED)

GSD4-240-10N4X TRIM POT ADJUSTMENT

Use the applicable sections of the following procedures if the "Start-Up" procedures did not provide satisfactory motor/control performance. Follow the Safety Precautions given in the "Start-Up" section.

MAX SETTING

If a different maximum speed or voltage is desired, adjust the MAX trim pot (on circuit board) as follows:

1) Turn ON AC power to the control.
2) Set Speed Control knob fully (100%) CW.
3) Check motor speed and voltage with a tachometer and a DC Voltmeter.
4) Using an insulated handle screwdriver, adjust the MAX trim pot on the drive PC board. CW adjustment of the pot increases the maximum output to the motor; CCW adjustment decreases the maximum output to the motor.
   NOTE: Do not increase maximum motor speed above 1800 RPM for motors rated at 1725 RPM. Do not operate motor continuously above the rated DC voltage.

MIN SETTING

If a minimum speed is desired, adjust as follows:

1) Turn ON AC power to the drive.
2) Turn Speed Control knob CCW as far as possible.
3) Check motor output speed or voltage
4) Adjust the MIN trim pot on the drive PC board. CW adjustment of the pot increases output to the motor; CCW adjustment decreases.
   NOTE: Typically the MIN pot should be set at Deadband which is the point in the CW rotation just before getting an output.

IR SETTING

If better speed regulation is needed, then adjust the IR pot as follows:

1) Set speed at 50%.
2) Check speed with Tach at no load.
3) Apply normal load to the motor.
4) Adjust the IR pot CW to increase speed regulation or CCW to decrease speed regulation until loaded motor speed is equal to unloaded motor speed.

CUR LIM SETTING

Limits DC motor current to prevent damage to the motor or drive. CW rotation of this trim pot increases the maximum allowable armature current (or torque produced). To set:

1) Connect a DC current meter between A1 on motor and +ARM on the control (in series with the motor).
2) Set Speed pot at 50% or above.
3) Turn CL trim pot full CCW.
4) Stall and lock motor shaft so it can not spin.
5) With motor stalled, set current at 125% of rated motor current by adjusting CL trim pot CW.

ACCEL/DECEL SETTING

Individually Adjustable Linear Accel and Decel. These trim pots provide independently adjustable linear accel and decel from 0.5 to 8.0 seconds. Adjustment of both trim pots are accomplished via the labeled access holes on adder board. Full CCW rotation equals minimum accel or decel time, and full CW rotation equals maximum accel or decel time. Note: Each trim pot operates independently of the other.

TROUBLESHOOTING

If a newly installed DC Drive will not operate, it is likely that a terminal connection is loose. Check the terminal connections and ensure that they are secure and correct. If the drive is still inoperative, refer to the Troubleshooting Table.

Troubleshooting		
Problem	***Possible Cause(s)***	***Corrective Action***
Motor doesn't run	1) Blown fuse or circuit breaker 2) Incorrect or no power 3) Speed pot set at zero 4) Worn motor brushes	1) Replace fuse or reset breaker 2) Install proper power service 3) Rotate Speed pot CW to start 4) Replace motor brushes
Armature output voltage cannot be adjusted; output is a constant DC level ***Motor stalls, or runs very slowly with speed control set fully CW***	1) No motor or load connected 2) Speed pot low connection open 3) Low voltage 4) Overload condition 5) Worn motor brushes 6) Max speed set incorrectly	1) Ensure that motor or load is connected to armature terminals 2) Ensure that Speed pot Low wire is connected 3) Ensure that VAC is above 100VAC 4) Reduce load or increase motor size Current Limit setting 5) Replace brushes 6) Consult "Trim Pot Adjustments" section
Motor "hunts"	1) Motor current less than 150 mA 2) Too much IR Comp 3) Motor is in Current Limit 4) Motor speed is above rated speed 5) Max set too high	1) Motor current must be greater than 150 mA (DC) 2) Consult "Trim Pot Adjustments" section 3) Consult "Trim Pot Adjustments" section 4) Reduce speed 5) Consult "Trim Pot Adjustments" section
Repeated fuse blowing	1) Low voltage 2) Overload condition 3) Worn motor brushes 4) Defective motor bearings 5) Defective electrical components	1) Ensure that VAC is above 100 VAC for 120V systems and above 200V for 240V systems 2) Reduce load – disconnect to test 3) Replace brushes 4) Replace bearings 5) Contact AutomationDirect "Product Returns" for replacement

Series DX Differential Pressure Switch

Specifications - Installation and Operating Instructions

The Series DX is a pressure switch that makes a contact output based on the differential pressure between two pressure sources. Unit incorporates a SPDT snap switch in a weatherproof, type 4X enclosure. Series DX features low differential pressure set points with high single pressure limit.

OPERATING PRINCIPLE

The DX uses opposing diaphragms to sense the high and low pressure. A pivot mechanism transfers the difference of the two pressures to the switch.

Example	DX	W	1	1	153	2	M	DXW-11-153-2-M
Series	DX							Differential Pressure Switch
Construction		W						Weatherproof
Wetted Materials			1					Brass/Fluoroelastomer
Process Connection				1				1/4″ NPT
Circuit Options					153			SPDT
Range						1		2.5 to 10 psi
						2		10 to 25 psi
						3		25 to 50 psi
						4		50 to 75 psi
Options							SST	Stainless Steel tag
							PRESET	Preset set point

SPECIFICATIONS

Service: Compatible gases and liquids.
Wetted Materials: Connection: Brass; Diaphragm: Fluoroelastomer.
Temperature Limits: 30 to 140°F (-1 to 60°C).
Pressure Limits: 200 psig (13.8 bar).
Enclosure Rating: Weatherproof UL type 4X (IP65).
Repeatability: ±2% of full range.
Switch Type: SPDT snap switch.
Electrical Rating: 5A @ 125/250 VAC (~), 5A res. @ 30 VDC (⎓).
Electrical Connection: Removable terminal block.
Conduit Connection: 0.871″ diameter hole for 1/2″ conduit fitting.
Process Connection: 1/4″ NPT female. Continuous single side only pressure should not exceed 1.25 x full differential range.
Mounting Orientation: Ports on horizontal plane, ±10°.
Set Point Adjustment: External screw.
Housing Materials: Body: Aluminum; Housing: Polycarbonate; Cover: 300 SS.
Vibration and Shock: Set point repeats after 2.5 Gs, 5 to 500 Hz. Set point repeats after a 15 Gs, 10 millisecond duration.
Altitude Limit: 6560 ft (2000 m).
Humidity Limit: 80% (non-condensing).
Pollution Degree: 2.
Environment: Intended for indoor and outdoor use.
Weight: 1 lb 3 oz (0.54 kg).
Agency Approvals: CE, UL.

Adjustable Range psid (bar)	Fixed Deadband psid (bar)	
	At Low Set Point	At High Set Point
2.5 to 10 (0.17 to 0.69)	1.5 (0.10)	2.5 (0.17)
10 to 25 (0.69 to 1.72)	2.5 (0.17)	3.5 (0.24)
25 to 50 (1.72 to 3.45)	3.5 (0.24)	6.0 (0.41)
50 to 75 (3.46 to 5.17)	6.0 (0.41)	8.0 (0.55)

UNPACKING

Remove the DX from the shipping carton and inspect for damage. If damage is found, notify the carrier immediately.

INSTALLATION

⚠CAUTION Insure that the process fluid is compatible with the wetted materials.

⚠CAUTION Do not exceed the maximum device ratings.

⚠CAUTION Insure that the system is not pressurized before installing or removing this device or other objects from the system.

The DX is to be mounted with the pressure connections horizontal ±10°.

For pipe mounting, mount the unit from the pressure connections to the pipe. Make sure the piping is properly supported to handle the weight of the pressure switch.

For surface mounting, mount the unit to the selected surface using the mounting ear holes provided using two #6 or #8 screws. See the Figure 2 for mounting hole spacing.
Make sure that connections are connected to the proper port. The high pressure

the unit. Piping or tubing should always be turned into the pressure port, do not turn the pressure switch. When installing the piping or tubing into the switch always use a wrench on the flats of the pressure connection. Use pipe thread sealant tape or other suitable pipe joint compound when making the pressure connection.

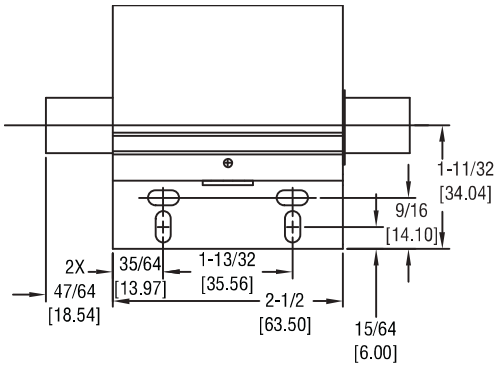

Figure 2: Mounting Hole Dimensions

ELECTRICAL CONNECTION

A SPDT snap action switch is provided. The output logic is shown in Table 1.

Condition	NO	NC
Differential Pressure Above Set Point	Closed	Open
Differential Pressure Below Set Point	Open	Closed

Table 1: Switch Action

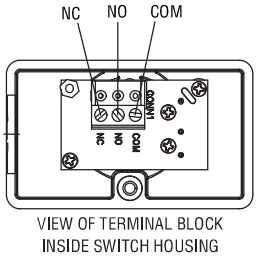

Figure 2: Wiring Diagram

⚠WARNING Power must be off while wiring connections are being made.

NOTICE Installation must be made in accordance with local codes and regulations.

Electrical connections are made to the removable terminal block inside the enclosure. Remove the terminal block from the circuit board for wiring if desired. Feed stripped and tinned leads through the conduit opening and connect them as shown in Figure 2. 250V @ 60C 14 to 24 AWG / 2.5 to .25 mm² wiring with PVC or equivalent insulation with 94-V0 or FV-0 flammability rating is recommended for the switch. Replace terminal block after wiring. The DX provides one 0.871″ diameter hole for 1/2″ conduit fitting. The conduit connections must be made such that condensation is not allowed to enter the sensor housing. If necessary install a conduit breather drain in a separate conduit body to prevent buildup of moisture.

NOTICE For weatherproof applications, install directly to conduit or use the optional cable gland accessory.

SETPOINT ADJUSTMENT

The set point is adjusted with a standard slotted head screw driver.

1) Remove rubber plug over set point adjustment screw located on the right side of the unit (with the label side facing you).
2) Insert the screw driver to turn the set point adjustment.
3) A clockwise rotation is an increase in differential pressure set point and a counterclockwise rotation is a decrease in differential pressure set point. (The set point screw can be turned too far as to fall out; do not turn the screw to the point that there are no longer any female threads visible in the switch body).
4) Using a pressure source and pressure gauge adjust the set point screw to the set point desired while monitoring the contact output.
5) Once desired set point is achieved replace set point adjustment cover.

NOTICE Design a fail-safe system that takes into consideration the possibility of switch failure, power failure, and operator error.

Explanation of Symbols:

Symbol	Publication	Description
⎓	IEC 50417 - 5031	Direct current
~	IEC 50417 - 5032	Alternating current
⏚	IEC 50417 - 5019	Protective conductor terminal

MAINTENANCE & REPAIR

Inspect and clean switch with water or damp cloth as needed. Disassembly or modifications made by the user will void the warranty and could impair the continued safety of the product. If repair is required obtain a Return Goods Authorization (RGA) number and send the unit, freight prepaid, to the address below. Please include a detailed description of the problem and conditions under which the problem was encountered.

Flo-Rite™ Series FR Flowmeters

DESCRIPTION

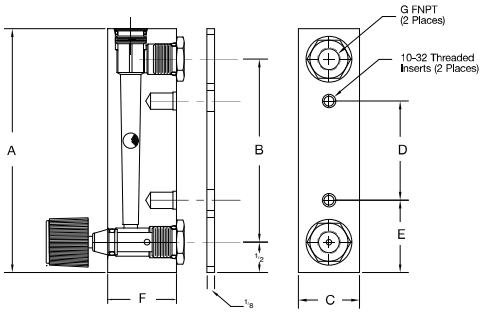
Series FR2000/FR4000/FR4500/FR5000 is a standard precision-machined acrylic flow meter for liquids or gases, has direct reading air or water scales and is available in either English or Metric scales.

The FR2000/FR4000/FR4500 flowmeters can be configured with a control valve on the inlet or no valve at all; fittings and valve can be specified in either brass or stainless steel; O-rings can be provided with Buna-N, Viton® or other optional elastomers.

FR5000 flowmeters have 1" FNPT PVC fittings with either an inline (FR5000-I) or panel mount (FR5000-S) configuration. The panel mount version is available with an integral valve on the inlet (FR5000-V) or no valve at all.

FEATURES

- Easy-to-read English or Metric Scales
- Water ranges from 4 CCM to 20 GPM
- Air ranges from 40 CCM to 4000 LPM
- Threaded brass inserts for quick installation
- Easy disassembly and assembly for maintenance
- Durable one-piece clear acrylic construction
- Stable, easy-to-read float
- Superior quality



APPLICATIONS

- Air sampling equipment aquaculture
- Desalinization equipment
- Gas analyzers
- Medical systems
- Photoprocessing equipment
- Water treatment and distribution systems

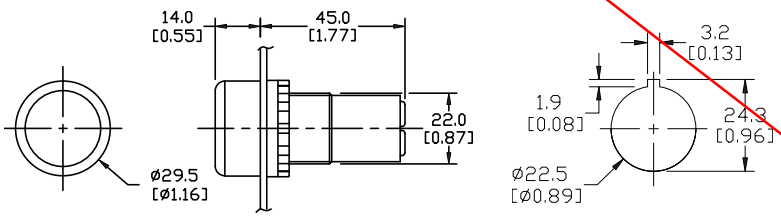
ECX Series 22 mm Plastic Indicator Lights

Plastic incandescent indicator lights

ECX1051-24

These indicators have a key to prevent rotation when mounted.



12 models available:

- Available in six colors
- 24V and 120V models
- Incandescent bulbs included
- Accepts LED replacement lamps
- Monoblock design for easy mounting
- Side wire entry with back screw terminals for easy wiring and maintenance
- IP20 rated before installation
- IP65 rated after installation

Note: When using LED replacement lamps with these indicators, it may be necessary to remove the frosted diffuser for enhanced illumination.

For accessories, see 22 mm Plastic Pilot Device Accessories in this section.

Octal Base Plug-In General-Purpose Relay — MKS Series

RoHS

Reliable, high quality, long life. Silver contacts rated at 10 amps. UL, CSA rated. Built-in indicator standard. **Options Include:** LED indicator, diode or varistor suppression and reverse polarity coil connections. All MKS models with "I" also come with push-to-test button.

Slim, Space-Saving Power Plug-In Relay — G2RS Series

RoHS

One and two pole plug-in relays. **Specifications. Contact Form:** G2R-1-S — SPDT; G2R-2-S — DPDT. **Contact Resistance:** 100 mΩ. **Contact Ratings:** G2R-1-S — 10 A @ 250 VAC; G2R-2-S — 5 A @ 250 VAC (resistive). **Operate Time:** 15 ms max. **Release Time:** 1 pole = AC — 10 ms max.; DC — 5 ms max.; 2 pole = AC — 15 ms max.; DC — 10 ms max.; Diode version = 20 ms max. Available options include LED indicators, push-to-test button, and diode suppression (DC coils). Other coil voltages available.

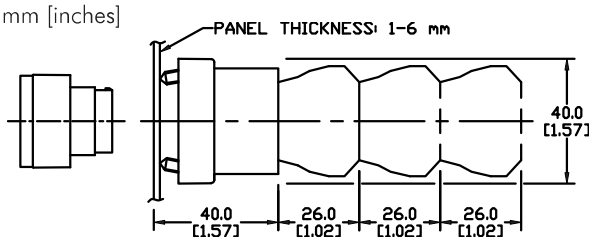
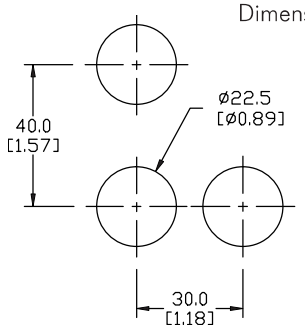
GCX Series 22 mm Plastic Pilot Devices Specifications

Assembly information



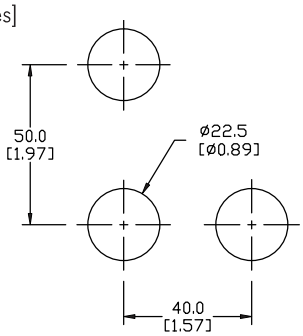
These pushbuttons and indicator lights are supplied with the appropriate contact blocks, unless otherwise indicated. Use these drawings as a guide to make sure there is adequate clearance behind the panel.

Pushbuttons and selector switches



Dimensions: mm [inches]

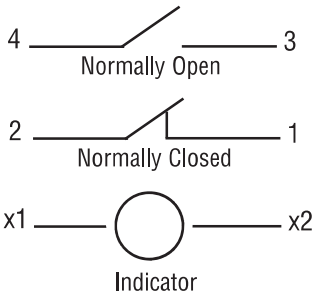
Illuminated pushbuttons and selector switches/indicator lights



Mounting

Dimensions: mm [inches]

This layout is suitable if all switches are 230V or less and the same polarity.



This layout is suitable if all switches are 400V or less and different polarity.

NOTE: Contact blocks can be arranged up to three deep by two wide.

Typical Wiring

Specifications

These specifications apply to all the GCX and ECX 22 mm plastic pushbuttons and switches.

Physical Specifications	
Standards Reference	CEI EN 60947-5-1, CSA C22-2 n.14
Approvals	CSA, IMQ (where specified), UL File E189258
Enclosure Material	Fiberglass reinforced thermoplastic
Contacts Material	Silver
Protection Degree	IP 40 for GCX3151-24, GCX3151-120, GCX3153-24 and GCX3153-120. IP 65 for all others.(See Appendix of this catalog for explanation of IP ratings according to IEC 144 CEI 70-1.)
Electric Shock Protection	IEC 536, Class II
Temperature Ratings	Storage: -40° -to 80°C (-40° to 176° F) Operating: -25° to +70°C (-13° to 158° F)
Working Positions	All working positions are allowed
Mechanical Life	Pushbuttons, selector switches, joy stick switches: 1,000,000 operations Emergency mushrooms and push-push pushbuttons: 300,000 operations
Positive Opening Operation	(according to IEC 947-5-1) All functions incorporating an NC contact are positive opening operation

Electrical Specifications	
Rated Thermal Current (contact block)	A300, Q300 (Refer to E22 Series mounting/contact rating section for details)
Rated Insulation Voltage	Ui 660V according to CEI EN 60947-5-1, 300V according to CSA C22-2 n.14 and UL 508
Dielectric Strength	3kV (1 second)
Insulation Resistance	2MΩ min. (500VDC)
Initial Contact Resistance	≤25mΩ
Short-Circuit Protection*	Cartridge fuses gI 10 A-500V 10, 3x38I1 100 KA
Terminal Markings	According to CENELEC EN 50013
Connections	Single screw with non-loosening plate clamp,14AWG max., Tighten to 0.8Nm max
Contacts Operation	Self-cleaning types EN01 (N.C.) EN 10 (N.O.) slow action, positive opening
Operation Frequency	3600 operations per hour max.
Utilization Category	**AC15** (Control of AC electromagnetic loads) 24 volts AC at 10 amps 130 volts AC at 6.5 amps **DC13** (Control of DC electromagnetic loads) 24 volts DC at 1.5 amps 110 volts DC at 0.5 amps

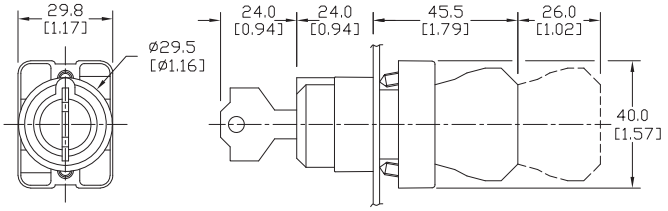
Note: Recommended, not supplied

GCX Series 22 mm Plastic Key Switches and Selector Switches

Key-operated selector switches

Part Number	Price	Description
GCX3420	<—>	22 mm plastic selector switch, key-operated, **two-position maintained**, key can be removed in all positions. **One N.O.** contact block. Replacement keys available
GCX3430	<—>	22 mm plastic selector switch, key-operated, **two-position spring-return from right.** **One N.O.** contact block. Replacement keys available
GCX3470-22	<—>	22 mm plastic selector switch, key-operated, **three-position maintained**, key can be removed in all positions. **Two N.O.** and **two N.C.** contact blocks. Replacement keys available

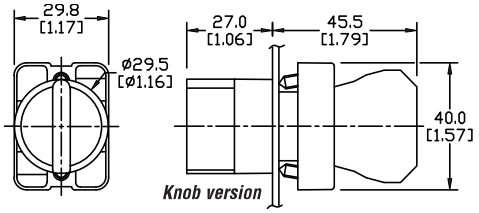
Note: Keyed switches come with two keys. All plastic 22 mm keyed switches are keyed the same. Replacement keys are available. Order part no. ECX1067-2 (pkg. of 2). Keys for plastic 22 mm keyed switches are not compatible with Cutler-Hammer key switches.



Note: When using switches having two-deep contact blocks (such as, Model GCX3470-22) with the 22 mm plastic enclosures, be sure to use enclosures that are 74 mm deep. 51 mm-deep enclosures are too shallow and the switch body will not fit.

GCX3420 (2-position maintained)
- Keyed switches come with two keys.

Dimensions: mm [inches]



Two-position selector switches

Part Number	Price	Description - 2-Position Switches
GCX3300	<—>	22 mm plastic selector switch, two-position **maintained**, black knob. **One N.O.** contact block
GCX3310	<—>	22 mm plastic selector switch, two-position **spring-return from right**, black knob. **One N.O.** contact block
GCX3350	<—>	22 mm plastic selector switch, two-position **maintained**, black lever. **One N.O.** contact block
GCX3360	<—>	22 mm plastic selector switch, two-position **spring-return from right,** black lever. **One N.O.** contact block

Technical Information
Proline Promag P 500

Electromagnetic flowmeter

High-temperature flowmeter for process applications, as remote version with up to 4 I/Os

Application

- The bidirectional measuring principle is virtually independent of pressure, density, temperature and viscosity
- Dedicated to chemical and process applications with corrosive liquids and high medium temperatures

Device properties

- Nominal diameter: max. DN 600 (24")
- All common Ex approvals
- Liner made of PTFE or PFA
- Remote version with up to 4 I/Os
- Backlit display with touch control and WLAN access
- Standard cable between sensor and transmitter

Your benefits

- Versatile applications – wide variety of wetted materials
- Energy-saving flow measurement – no pressure loss due to cross-section constriction
- Maintenance-free – no moving parts
- Full access to process and diagnostic information – numerous, freely combinable I/Os and fieldbuses
- Reduced complexity and variety – freely configurable I/O functionality
- Integrated verification – Heartbeat Technology

	Flow direction

Function and system design

Measuring principle

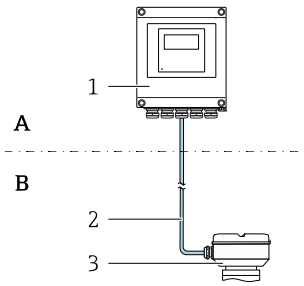
Following *Faraday's law of magnetic induction*, a voltage is induced in a conductor moving through a magnetic field.

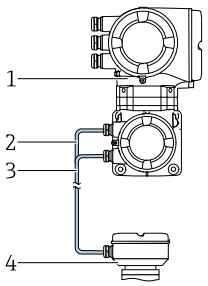
A0028962

Ue Induced voltage
B Magnetic induction (magnetic field)
L Electrode spacing
I Current
v Flow velocity

In the electromagnetic measuring principle, the flowing medium is the moving conductor. The voltage induced (U_e) is proportional to the flow velocity (v) and is supplied to the amplifier by means of two measuring electrodes. The flow volume (Q) is calculated via the pipe cross-section (A). The DC magnetic field is created through a switched direct current of alternating polarity.

Formulae for calculation

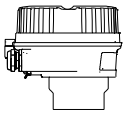


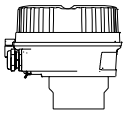


- Induced voltage $U_e = B \cdot L \cdot v$
- Volume flow $Q = A \cdot v$

Measuring system

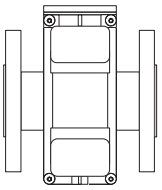
The measuring system consists of a transmitter and a sensor. The transmitter and sensor are mounted in physically separate locations. They are interconnected by connecting cables.





Transmitter

Two versions of the transmitter are available.



Proline 500 – digital	Proline 500
For use in applications not required to meet special requirements due to ambient or operating conditions.	For use in applications required to meet special requirements due to ambient or operating conditions.
 *A Non-hazardous area or Zone 2; Class I, Division 2* *B Non-hazardous area or Zone 2; Class I, Division 2 or Zone 1; Class I, Division 1* *1 Transmitter* *2 Connecting cable: cable, separate, standard* *3 Sensor connection housing with integrated ISEM*	 *Non-hazardous area or Zone 2; Class I, Division 2 or Zone 1; Class I, Division 1* *1 Transmitter with integrated ISEM* *2 Coil current cable* *3 Signal cable* *4 Sensor connection housing*
▪ Flexible and cost-effective separate installation. ▪ A standard cable can be used as the connecting cable.	Application examples for sensors without electronics: Strong vibrations at the sensor.
▪ Electronics in the transmitter housing, ISEM (intelligent sensor electronics module) in the sensor connection housing ▪ Signal transmission: digital Order code for "Integrated ISEM electronics", option **A** "Sensor"	▪ Electronics and ISEM (intelligent sensor electronics module) in the transmitter housing ▪ Signal transmission: analog Order code for "Integrated ISEM electronics", option **B** "Transmitter"
Connecting cable (can be ordered in various lengths)→ 🖹 106	
▪ Length: max. 300 m (1 000 ft) ▪ Standard cable with common shield (pair-stranded) ▪ Not sensitive to external EMC interference.	▪ Length: max. 200 m (656 ft), depending on medium conductivity ▪ Two connecting cables: ▪ One cable for coil current with a common shield (1 pair) ▪ One cable for signal transmission with a common shield and individual shielded cores (2 pairs)

Safety

IT security

Our warranty is valid only if the device is installed and used as described in the Operating Instructions. The device is equipped with security mechanisms to protect it against any inadvertent changes to the settings.

IT security measures, which provide additional protection for the device and associated data transfer, must be implemented by the operators themselves in line with their security standards.

Device-specific IT security

The device offers a range of specific functions to support protective measures on the operator's side. These functions can be configured by the user and guarantee greater in-operation safety if used correctly. An overview of the most important functions is provided in the following section.

Function/interface	Factory setting	Recommendation
Write protection via hardware write protection switch → 🖹 8	Not enabled.	On an individual basis following risk assessment.
Access code (also applies for Web server login or FieldCare connection) → 🖹 8	Not enabled (0000).	Assign a customized access code during commissioning.
WLAN (order option in display module)	Enabled.	On an individual basis following risk assessment.
WLAN security mode	Enabled (WPA2-PSK)	Do not change.
WLAN passphrase (password) → 🖹 9	Serial number	Assign an individual WLAN passphrase during commissioning.
WLAN mode	Access Point	On an individual basis following risk assessment.
Web server→ 🖹 9	Enabled.	On an individual basis following risk assessment.
CDI-RJ45 service interface → 🖹 9	–	On an individual basis following risk assessment.

Protecting access via hardware write protection

Write access to the device parameters via the local display, Web browser or operating tool (e.g. FieldCare, DeviceCare) can be disabled via a write protection switch (DIP switch on the motherboard). When hardware write protection is enabled, only read access to the parameters is possible.

Hardware write protection is disabled when the device is delivered.

Protecting access via a password

Different passwords are available to protect write access to the device parameters or access to the device via the WLAN interface.

- User-specific access code
  Protect write access to the device parameters via the local display, Web browser or operating tool (e.g. FieldCare, DeviceCare). Access authorization is clearly regulated through the use of a user-specific access code.
- WLAN passphrase
  The network key protects a connection between an operating unit (e.g. notebook or tablet) and the device via the WLAN interface which can be ordered as an option.
- Infrastructure mode
  When the device is operated in infrastructure mode, the WLAN passphrase corresponds to the WLAN passphrase configured on the operator side.

User-specific access code

Write access to the device parameters via the local display, Web browser or operating tool (e.g. FieldCare, DeviceCare) can be protected by the modifiable, user-specific access code.

WLAN passphrase: Operation as WLAN access point

A connection between an operating unit (e.g. notebook or tablet) and the device via the WLAN interface, which can be ordered as an optional extra, is protected by the network key. The WLAN authentication of the network key complies with the IEEE 802.11 standard.

When the device is delivered, the network key is pre-defined depending on the device. It can be changed via the **WLAN settings** submenu in the **WLAN passphrase** parameter.

Infrastructure mode

A connection between the device and WLAN access point is protected by means of an SSID and passphrase on the system side. Please contact the relevant system administrator for access.

General notes on the use of passwords

- The access code and network key supplied with the device should be changed during commissioning.
- Follow the general rules for generating a secure password when defining and managing the access code or network key.
- The user is responsible for the management and careful handling of the access code and network key.

Access via Web server

The device can be operated and configured via a Web browser with the integrated Web server. The connection is via the service interface (CDI-RJ45) or the WLAN interface. For device versions with the EtherNet/IP and PROFINET communication protocols, the connection can also be established via the terminal connection for signal transmission with EtherNet/IP or PROFINET (RJ45 connector).

The Web server is enabled when the device is delivered. The Web server can be disabled if necessary (e.g. after commissioning) via the **Web server functionality** parameter.

The device and status information can be hidden on the login page. This prevents unauthorized access to the information.

For detailed information on device parameters, see:
The "Description of Device Parameters" document → 109

Access via OPC-UA

The "OPC UA Server" application package is available in the device version with the HART communication protocol → 105.

The device can communicate with OPC UA clients using the "OPC UA Server" application package.

The OPC UA server integrated in the device can be accessed via the WLAN access point using the WLAN interface - which can be ordered as an optional extra - or the service interface (CDI- RJ45) via Ethernet network. Access rights and authorization as per separate configuration.

The following Security Modes are supported as per the OPC UA Specification (IEC 62541):
- None
- Basic128Rsa15 – signed
- Basic128Rsa15 – signed and encrypted

Access via service interface (CDI-RJ45)

The device can be connected to a network via the service interface (CDI-RJ45). Device-specific functions guarantee the secure operation of the device in a network.

The use of relevant industrial standards and guidelines that have been defined by national and international safety committees, such as IEC/ISA62443 or the IEEE, is recommended. This includes organizational security measures such as the assignment of access authorization as well as technical measures such as network segmentation.

Transmitters with an Ex de approval may not be connected via the service interface (CDI-RJ45)!

Order code for "Approval transmitter + sensor", options (Ex de): BA, BB, C1, C2, GA, GB, MA, MB, NA, NB

The device can be integrated in a ring topology. The device is integrated via the terminal connection for signal transmission (output 1) and the connection to the service interface (CDI-RJ45) .

Input

Measured variable

Direct measured variables

- Volume flow (proportional to induced voltage)
- Electrical conductivity

Calculated measured variables

- Mass flow
- Corrected volume flow

Measuring range

Typically v = 0.01 to 10 m/s (0.03 to 33 ft/s) with the specified accuracy

Flow characteristic values in SI units: DN 15 to 125 (½ to 4")

Nominal diameter		Recommended flow	Factory settings		
		min./max. full scale value (v ~ 0.3/10 m/s)	Full scale value current output (v ~ 2.5 m/s)	Pulse value (~ 2 pulse/s)	Low flow cut off (v ~ 0.04 m/s)
[mm]	[in]	[dm³/min]	[dm³/min]	[dm³]	[dm³/min]

Recommended measuring range

Flow limit → 64

Operable flow range

Over 1000 : 1

Input signal

Input and output versions

→ 13

External measured values

To increase the accuracy of certain measured variables or to calculate the mass flow, the automation system can continuously write different measured values to the measuring device:
- Medium temperature enables temperature-compensated conductivity measurement (e.g. iTEMP)
- Reference density for calculating the mass flow

Various pressure transmitters and temperature measuring devices can be ordered from Endress +Hauser: see "Accessories" section → 108

It is recommended to read in external measured values to calculate the corrected volume flow.

HART protocol

The measured values are written from the automation system to the measuring device via the HART protocol. The pressure transmitter must support the following protocol-specific functions:
- HART protocol
- Burst mode

Current input

The measured values are written from the automation system to the measuring device via the current input → 12.

Digital communication

The measured values can be written from the automation system to the measuring via:
- FOUNDATION Fieldbus
- PROFIBUS DP
- PROFIBUS PA
- Modbus RS485
- EtherNet/IP
- PROFINET

Current input 0/4 to 20 mA

Current input	0/4 to 20 mA (active/passive)
Current span	▪ 4 to 20 mA (active) ▪ 0/4 to 20 mA (passive)
Resolution	1 µA
Voltage drop	Typically: 0.6 to 2 V for 3.6 to 22 mA (passive)
Maximum input voltage	≤ 30 V (passive)
Open-circuit voltage	≤ 28.8 V (active)
Possible input variables	▪ Temperature ▪ Density

Status input

Maximum input values	▪ DC −3 to 30 V ▪ If status input is active (ON): R_i >3 kΩ
Response time	Configurable: 5 to 200 ms
Input signal level	▪ Low signal: DC −3 to +5 V ▪ High signal: DC 12 to 30 V
Assignable functions	▪ Off ▪ Reset the individual totalizers separately ▪ Reset all totalizers ▪ Flow override

Output

Output and input variants

Depending on the option selected for output/input 1, different options are available for the other outputs and inputs. Only one option can be selected for each output/input 1 to 4. The following tables must be read vertically (↓).

Example: If the option BA "4–20 mA HART" was selected for output/input 1, one of the options A, B, D, E, F, H, I or J is available for output 2 and one of the options A, B, D, E, F, H, I or J is available for output 3 and 4.

Output/input 1 and options for output/input 2

Options for output/input 3 and 4

Order code for "Output; input 1" (020) →	Possible options										
Current output 4 to 20 mA HART	**BA**										
Current output 4 to 20 mA HART Ex i passive	↓	**CA**

Output signal

Current output 4 to 20 mA HART

Order code	"Output; input 1" (20): Option BA: current output 4 to 20 mA HART
Signal mode	Can be set to: ▪ Active ▪ Passive
Current range	Can be set to: ▪ 4 to 20 mA NAMUR ▪ 4 to 20 mA US ▪ 4 to 20 mA ▪ 0 to 20 mA (only if the signal mode is active) ▪ Fixed current
Open-circuit voltage	DC 28.8 V (active)
Maximum input voltage	DC 30 V (passive)
Load	250 to 700 Ω
Resolution	0.38 µA
Damping	Configurable: 0 to 999.9 s
Assignable measured variables	▪ Volume flow ▪ Mass flow ▪ Corrected volume flow ▪ Flow velocity ▪ Conductivity ▪ Electronics temperature

Current output 4 to 20 mA HART Ex i

Order code	"Output; input 1" (20) choose from: ▪ Option CA: current output 4 to 20 mA HART Ex i passive ▪ Option CC: current output 4 to 20 mA HART Ex i active
Signal mode	Depends on the selected order version.
Current range	Can be set to: ▪ 4 to 20 mA NAMUR ▪ 4 to 20 mA US ▪ 4 to 20 mA ▪ 0 to 20 mA (only if the signal mode is active) ▪ Fixed current
Open-circuit voltage	DC 21.8 V (active)
Maximum input voltage	DC 30 V (passive)
Load	▪ 250 to 400 Ω (active) ▪ 250 to 700 Ω (passive)
Resolution	0.38 µA
Damping	Configurable: 0 to 999.9 s
Assignable measured variables	▪ Volume flow ▪ Mass flow ▪ Corrected volume flow ▪ Flow velocity ▪ Conductivity ▪ Electronics temperature

FOUNDATION Fieldbus

FOUNDATION Fieldbus	H1, IEC 61158-2, galvanically isolated
Data transfer	31.25 kbit/s

Current consumption	10 mA
Permitted supply voltage	9 to 32 V
Bus connection	With integrated reverse polarity protection

PROFIBUS DP

Signal encoding	NRZ code
Data transfer	9.6 kBaud...12 MBaud

PROFIBUS PA

PROFIBUS PA	In accordance with EN 50170 Volume 2, IEC 61158-2 (MBP), galvanically isolated
Data transmission	31.25 kbit/s
Current consumption	10 mA
Permitted supply voltage	9 to 32 V
Bus connection	With integrated reverse polarity protection

Modbus RS485

Physical interface	RS485 in accordance with EIA/TIA-485 standard
Terminating resistor	Integrated, can be activated via DIP switches

EtherNet/IP

Standards	In accordance with IEEE 802.3

PROFINET

Standards	In accordance with IEEE 802.3

Current output 4 to 20 mA

Order code	"Output; input 2" (21), "Output; input 3" (022) or "Output; input 4" (023): Option B: current output 4 to 20 mA
Signal mode	Can be set to: ▪ Active ▪ Passive
Current span	Can be set to: ▪ 4 to 20 mA NAMUR ▪ 4 to 20 mA US ▪ 4 to 20 mA ▪ 0 to 20 mA (only if the signal mode is active) ▪ Fixed current
Maximum output values	22.5 mA
Open-circuit voltage	DC 28.8 V (active)
Maximum input voltage	DC 30 V (passive)
Load	0 to 700 Ω
Resolution	0.38 µA

Damping	Configurable: 0 to 999.9 s
Assignable measured variables	▪ Volume flow ▪ Mass flow ▪ Corrected volume flow ▪ Flow velocity ▪ Conductivity ▪ Electronics temperature

Current output 4 to 20 mA Ex i passive

Order code	"Output; input 2" (21), "Output; input 3" (022): Option C: current output 4 to 20 mA Ex i passive
Signal mode	Passive
Current span	Can be set to: ▪ 4 to 20 mA NAMUR ▪ 4 to 20 mA US ▪ 4 to 20 mA ▪ Fixed current
Maximum output values	22.5 mA
Maximum input voltage	DC 30 V
Load	0 to 700 Ω
Resolution	0.38 µA
Damping	Configurable: 0 to 999 s
Assignable measured variables	▪ Volume flow ▪ Mass flow ▪ Corrected volume flow ▪ Flow velocity ▪ Conductivity ▪ Electronics temperature

Pulse/frequency/switch output

Function	Can be set to pulse, frequency or switch output
Version	Open collector Can be set to: ▪ Active ▪ Passive ▪ Passive NAMUR Ex-i, passive
Maximum input values	DC 30 V, 250 mA (passive)
Open-circuit voltage	DC 28.8 V (active)
Voltage drop	For 22.5 mA: ≤ DC 2 V
Pulse output	
Maximum input values	DC 30 V, 250 mA (passive)
Maximum output current	22.5 mA (active)
Open-circuit voltage	DC 28.8 V (active)
Pulse width	Configurable: 0.05 to 2 000 ms
Maximum pulse rate	10 000 Impulse/s
Pulse value	Adjustable
Assignable measured variables	▪ Volume flow ▪ Mass flow ▪ Corrected volume flow

Frequency output	
Maximum input values	DC 30 V, 250 mA (passive)
Maximum output current	22.5 mA (active)
Open-circuit voltage	DC 28.8 V (active)
Output frequency	Adjustable: end value frequency 2 to 10 000 Hz (f_{max} = 12 500 Hz)
Damping	Configurable: 0 to 999.9 s
Pulse/pause ratio	1:1
Assignable measured variables	▪ Volume flow ▪ Mass flow ▪ Corrected volume flow ▪ Flow velocity ▪ Conductivity ▪ Electronics temperature
Switch output	
Maximum input values	DC 30 V, 250 mA (passive)
Open-circuit voltage	DC 28.8 V (active)
Switching behavior	Binary, conductive or non-conductive
Switching delay	Configurable: 0 to 100 s
Number of switching cycles	Unlimited

Assignable functions	▪ Off
	▪ On
	▪ Diagnostic behavior
	▪ Limit value:
	  ▪ Off
	  ▪ Volume flow
	  ▪ Mass flow
	  ▪ Corrected volume flow
	  ▪ Flow velocity
	  ▪ Conductivity
	  ▪ Totalizer 1-3
	  ▪ Electronics temperature
	▪ Flow direction monitoring
	▪ Status
	  ▪ Empty pipe detection
	  ▪ Low flow cut off

Double pulse output

Function	Double pulse
Version	Open collector Can be set to: ▪ Active ▪ Passive ▪ Passive NAMUR
Maximum input values	DC 30 V, 250 mA (passive)
Open-circuit voltage	DC 28.8 V (active)
Voltage drop	For 22.5 mA: ≤ DC 2 V
Output frequency	Configurable: 0 to 1 000 Hz
Damping	Configurable: 0 to 999 s

Pulse/pause ratio	1:1
Assignable measured variables	▪ Volume flow ▪ Mass flow ▪ Corrected volume flow ▪ Flow velocity ▪ Conductivity ▪ Electronics temperature

Relay output

Function	Switch output
Version	Relay output, galvanically isolated
Switching behavior	Can be set to: ▪ NO (normally open), factory setting ▪ NC (normally closed)
Maximum switching capacity (passive)	▪ DC 30 V, 0.1 A ▪ AC 30 V, 0.5 A

Assignable functions	▪ Off
	▪ On
	▪ Diagnostic behavior
	▪ Limit value:
	  ▪ Off
	  ▪ Volume flow
	  ▪ Mass flow
	  ▪ Corrected volume flow
	  ▪ Flow velocity
	  ▪ Conductivity
	  ▪ Totalizer 1-3
	  ▪ Electronics temperature
	▪ Flow direction monitoring
	▪ Status
	  ▪ Empty pipe detection
	  ▪ Low flow cut off

User-configurable input/output

One specific input or output is assigned to a user-configurable input/output (configurable I/O) during device commissioning.

The following inputs and outputs are available for assignment:
- Choice of current output: 4 to 20 mA (active), 0/4 to 20 mA (passive)
- Pulse/frequency/switch output
- Choice of current input: 4 to 20 mA (active), 0/4 to 20 mA (passive)
- Status input

The technical values correspond to those of the inputs and outputs described in this section.

Signal on alarm

Depending on the interface, failure information is displayed as follows:

HART current output

Device diagnostics	Device condition can be read out via HART Command 48

PROFIBUS PA

Status and alarm messages	Diagnostics in accordance with PROFIBUS PA Profile 3.02
Failure current FDE (Fault Disconnection Electronic)	0 mA

PROFIBUS DP

Status and alarm messages	Diagnostics in accordance with PROFIBUS PA Profile 3.02

EtherNet/IP

Device diagnostics	Device condition can be read out in Input Assembly

PROFINET

Device diagnostics	According to "Application Layer protocol for decentralized periphery", Version 2.3

FOUNDATION Fieldbus

Status and alarm messages	Diagnostics in accordance with FF-891
Failure current FDE (Fault Disconnection Electronic)	0 mA

Modbus RS485

Failure mode	Choose from: ▪ NaN value instead of current value ▪ Last valid value

Current output 0/4 to 20 mA

4 to 20 mA

Failure mode	Choose from: ▪ 4 to 20 mA in accordance with NAMUR recommendation NE 43 ▪ 4 to 20 mA in accordance with US ▪ Min. value: 3.59 mA ▪ Max. value: 22.5 mA ▪ Freely definable value between: 3.59 to 22.5 mA ▪ Actual value ▪ Last valid value

0 to 20 mA

Failure mode	Choose from: ▪ Maximum alarm: 22 mA ▪ Freely definable value between: 0 to 20.5 mA

Pulse/frequency/switch output

Pulse output	
Failure mode	Choose from: ▪ Actual value ▪ No pulses
Frequency output	
Failure mode	Choose from: ▪ Actual value ▪ 0 Hz ▪ Defined value (f_{max} 2 to 12 500 Hz)

Switch output	
Failure mode	Choose from: ▪ Current status ▪ Open ▪ Closed

Relay output

Failure mode	Choose from: ▪ Current status ▪ Open ▪ Closed

Local display

Plain text display	With information on cause and remedial measures
Backlight	Red backlighting indicates a device error.

Status signal as per NAMUR recommendation NE 107

Interface/protocol

- Via digital communication:
  - HART protocol
  - FOUNDATION Fieldbus
  - PROFIBUS PA
  - PROFIBUS DP
  - Modbus RS485
  - EtherNet/IP
  - PROFINET
- Via service interface
  - CDI-RJ45 service interface
  - WLAN interface

Plain text display	With information on cause and remedial measures

Additional information on remote operation → 89

Web browser

Plain text display	With information on cause and remedial measures

Light emitting diodes (LED)

Status information	Status indicated by various light emitting diodes The following information is displayed depending on the device version: ▪ Supply voltage active ▪ Data transmission active ▪ Device alarm/error has occurred ▪ EtherNet/IP network available ▪ EtherNet/IP connection established ▪ PROFINET network available ▪ PROFINET connection established ▪ PROFINET blinking feature

Load	Output signal → 15

Ex connection data

Safety-related values

Order code for "Output; input 1"	Output type	Safety-related values "Output; input 1"	
		26 (+)	27 (–)
Option **BA**	Current output 4 to 20 mA HART	U_N = 30 V_{DC} U_M = 250 V_{AC}

		24 (+)	25 (–)	22 (+)	23 (–)	20 (+)	21 (–)
Option C	Current output 4 to 20 mA Ex i passive	U_i = 30 V I_i = 100 mA P_i = 1.25 W L_i = 0 C_i = 0					
Option G	Pulse/frequency/switch output Ex i passive	U_i = 30 V I_i = 100 mA P_i = 1.25 W L_i = 0 C_i = 0					

1) The order code "Output; input 4" is only available for the Proline 500 – digital transmitter.

Low flow cut off

The switch points for low flow cut off are user-selectable.

Galvanic isolation

The outputs are galvanically isolated from one another and from earth (PE).

Protocol-specific data

HART

Manufacturer ID	0x11
Device type ID	0x3C
HART protocol revision	7
Device description files (DTM, DD)	Information and files under: www.endress.com
HART load	Min. 250 Ω
System integration	Information on system integration: Operating Instructions → 📄 109. ▪ Measured variables via HART protocol ▪ Burst Mode functionality

FOUNDATION Fieldbus

Manufacturer ID	0x452B48 (hex)
Ident number	0x103C (hex)
Device revision	1
DD revision	Information and files under: ▪ www.endress.com ▪ www.fieldbus.org
CFF revision	
Interoperability Test Kit (ITK)	Version 6.2.0
ITK Test Campaign Number	Information: ▪ www.endress.com ▪ www.fieldbus.org
Link Master capability (LAS)	Yes
Choice of "Link Master" and "Basic Device"	Yes Factory setting: Basic Device
Node address	Factory setting: 247 (0xF7)
Supported functions	The following methods are supported: ▪ Restart ▪ ENP Restart ▪ Diagnostic ▪ Set to OOS ▪ Set to AUTO ▪ Read trend data ▪ Read event logbook
Virtual Communication Relationships (VCRs)	
Number of VCRs	44
Number of link objects in VFD	50
Permanent entries	1
Client VCRs	0
Server VCRs	10
Source VCRs	43
Sink VCRs	0
Subscriber VCRs	43
Publisher VCRs	43
Device Link Capabilities	
Slot time	4
Min. delay between PDU	8

Max. response delay	16
System integration	Information regarding system integration: Operating Instructions → 🖹 109. ▪ Cyclic data transmission ▪ Description of the modules ▪ Execution times ▪ Methods

PROFIBUS DP

Manufacturer ID	0x11
Ident number	0x1570
Profile version	3.02
Device description files (GSD, DTM, DD)	Information and files under: ▪ www.endress.com On the product page for the device: Documents/Software → Device drivers ▪ www.profibus.org
Supported functions	▪ Identification & Maintenance Simplest device identification on the part of the control system and nameplate ▪ PROFIBUS upload/download Reading and writing parameters is up to ten times faster with PROFIBUS upload/download ▪ Condensed status Simplest and self-explanatory diagnostic information by categorizing diagnostic messages that occur
Configuration of the device address	▪ DIP switches on the I/O electronics module ▪ Via operating tools (e.g. FieldCare)
Compatibility with earlier model	If the device is replaced, the measuring device Promag 500 supports the compatibility of the cyclic data with previous models. It is not necessary to adjust the engineering parameters of the PROFIBUS network with the Promag 500 GSD file. Earlier models: ▪ Promag 50 PROFIBUS DP ▪ ID No.: 1546 (hex) ▪ Extended GSD file: EH3x1546.gsd ▪ Standard GSD file: EH3_1546.gsd ▪ Promag 53 PROFIBUS DP ▪ ID No.: 1526 (hex) ▪ Extended GSD file: EH3x1526.gsd ▪ Standard GSD file: EH3_1526.gsd Description of the function scope of compatibility: Operating Instructions → 🖹 109.
System integration	Information regarding system integration: Operating Instructions → 🖹 109. ▪ Cyclic data transmission ▪ Block model ▪ Description of the modules

PROFIBUS PA

Manufacturer ID	0x11
Ident number	0x156C
Profile version	3.02
Device description files (GSD, DTM, DD)	Information and files under: ▪ www.endress.com ▪ www.profibus.org

Supported functions	▪ Identification & Maintenance Simplest device identification on the part of the control system and nameplate ▪ PROFIBUS upload/download Reading and writing parameters is up to ten times faster with PROFIBUS upload/download ▪ Condensed status Simplest and self-explanatory diagnostic information by categorizing diagnostic messages that occur
Configuration of the device address	▪ DIP switches on the I/O electronics module ▪ Local display ▪ Via operating tools (e.g. FieldCare)
Compatibility with earlier model	If the device is replaced, the measuring device Promag 500 supports the compatibility of the cyclic data with previous models. It is not necessary to adjust the engineering parameters of the PROFIBUS network with the Promag 500 GSD file. Earlier models: ▪ Promag 50 PROFIBUS PA ▪ ID No.: 1525 (hex) ▪ Extended GSD file: EH3x1525.gsd ▪ Standard GSD file: EH3_1525.gsd ▪ Promag 53 PROFIBUS PA ▪ ID No.: 1527 (hex) ▪ Extended GSD file: EH3x1527.gsd ▪ Standard GSD file: EH3_1527.gsd Description of the function scope of compatibility: Operating Instructions → 109.
System integration	Information regarding system integration: Operating Instructions → 109. ▪ Cyclic data transmission ▪ Block model ▪ Description of the modules

Modbus RS485

Protocol	Modbus Applications Protocol Specification V1.1
Response times	▪ Direct data access: typically 25 to 50 ms ▪ Auto-scan buffer (data range): typically 3 to 5 ms
Device type	Slave
Slave address range	1 to 247
Broadcast address range	0
Function codes	▪ 03: Read holding register ▪ 04: Read input register ▪ 06: Write single registers ▪ 08: Diagnostics ▪ 16: Write multiple registers ▪ 23: Read/write multiple registers
Broadcast messages	Supported by the following function codes: ▪ 06: Write single registers ▪ 16: Write multiple registers ▪ 23: Read/write multiple registers
Supported baud rate	▪ 1 200 BAUD ▪ 2 400 BAUD ▪ 4 800 BAUD ▪ 9 600 BAUD ▪ 19 200 BAUD ▪ 38 400 BAUD ▪ 57 600 BAUD ▪ 115 200 BAUD
Data transfer mode	▪ ASCII ▪ RTU

Data access	Each device parameter can be accessed via Modbus RS485. For Modbus register information
Compatibility with earlier model	If the device is replaced, the measuring device Promag 500 supports the compatibility of the Modbus registers for the process variables and the diagnostic information with the previous model Promag 53. It is not necessary to change the engineering parameters in the automation system. Description of the function scope of compatibility: Operating Instructions → 109.
System integration	Information on system integration: Operating Instructions → 109. ▪ Modbus RS485 information ▪ Function codes ▪ Register information ▪ Response time ▪ Modbus data map

EtherNet/IP

Protocol	▪ The CIP Networks Library Volume 1: Common Industrial Protocol ▪ The CIP Networks Library Volume 2: EtherNet/IP Adaptation of CIP
Communication type	▪ 10Base-T ▪ 100Base-TX
Device profile	Generic device (product type: 0x2B)
Manufacturer ID	0x11
Device type ID	0x103C
Baud rates	Automatic $^{10}/_{100}$ Mbit with half-duplex and full-duplex detection
Polarity	Auto-polarity for automatic correction of crossed TxD and RxD pairs
Supported CIP connections	Max. 3 connections
Explicit connections	Max. 6 connections
I/O connections	Max. 6 connections (scanner)
Configuration options for measuring device	▪ DIP switches on the electronics module for IP addressing ▪ Manufacturer-specific software (FieldCare) ▪ Add-on Profile Level 3 for Rockwell Automation control systems ▪ Web browser ▪ Electronic Data Sheet (EDS) integrated in the measuring device
Configuration of the EtherNet interface	▪ Speed: 10 MBit, 100 MBit, auto (factory setting) ▪ Duplex: half-duplex, full-duplex, auto (factory setting)
Configuration of the device address	▪ DIP switches on the electronics module for IP addressing (last octet) ▪ DHCP ▪ Manufacturer-specific software (FieldCare) ▪ Add-on Profile Level 3 for Rockwell Automation control systems ▪ Web browser ▪ EtherNet/IP tools, e.g. RSLinx (Rockwell Automation)
Device Level Ring (DLR)	Yes
System integration	Information regarding system integration: Operating Instructions → 109. ▪ Cyclic data transmission ▪ Block model ▪ Input and output groups

PROFINET

Protocol	Application layer protocol for decentral device periphery and distributed automation, Version 2.3
Communication type	100 MBit/s

Conformity class	Conformance Class B
Netload Class	Netload Class II
Baud rates	Automatic 100 Mbit/s with full-duplex detection
Cycle times	From 8 ms
Polarity	Auto-polarity for automatic correction of crossed TxD and RxD pairs
Media Redundancy Protocol (MRP)	Yes
System redundancy support	System redundancy S2 (2 AR with 1 NAP)
Device profile	Application interface identifier 0xF600 Generic device
Manufacturer ID	0x11
Device type ID	0x843C
Device description files (GSD, DTM, DD)	Information and files under: ▪ www.endress.com On the product page for the device: Documents/Software → Device drivers ▪ www.profibus.org
Supported connections	▪ 2 x AR (IO Controller AR) ▪ 1 x AR (IO-Supervisor Device AR connection allowed) ▪ 1 x Input CR (Communication Relation) ▪ 1 x Output CR (Communication Relation) ▪ 1 x Alarm CR (Communication Relation)
Configuration options for measuring device	▪ DIP switches on the electronics module, for device name assignment (last part) ▪ Manufacturer-specific software (FieldCare, DeviceCare) ▪ Web browser ▪ Device master file (GSD), can be read out via the integrated Web server of the measuring device
Configuration of the device name	▪ DIP switches on the electronics module, for device name assignment (last part) ▪ DCP protocol ▪ Process Device Manager (PDM) ▪ Integrated Web server
Supported functions	▪ Identification & Maintenance Simple device identification via: ▪ Control system ▪ Nameplate ▪ Measured value status The process variables are communicated with a measured value status ▪ Blinking feature via the onsite display for simple device identification and assignment ▪ Device operation via operating tools (e.g. FieldCare, DeviceCare, SIMATIC PDM)
System integration	Information regarding system integration: Operating Instructions → 109. ▪ Cyclic data transmission ▪ Overview and description of the modules ▪ Status coding ▪ Startup configuration ▪ Factory setting

Power supply

Terminal assignment

Transmitter: supply voltage, input/outputs

HART

Supply voltage		Input/output 1		Input/output 2		Input/output 3		Input/output 4	
1 (+)	2 (–)	26 (+)	27 (–)	24 (+)	25 (–)	22 (+)	23 (–)	20 (+)	21 (–)

Transmitter and sensor connection housing: connecting cable

The sensor and transmitter, which are mounted in separate locations, are interconnected by a connecting cable. The cable is connected via the sensor connection housing and the transmitter housing.

Terminal assignment and connection of the connecting cable:
- Proline 500 – digital→ 🖹 33
- Proline 500 → 🖹 33

Device plugs available

Device plugs may not be used in hazardous areas!

Device plugs for fieldbus systems:
Order code for "Input; output 1"
- Option **SA** "FOUNDATION Fieldbus" → 🖹 30
- Option **GA** "PROFIBUS PA" → 🖹 30
- Option **NA** "EtherNet/IP" → 🖹 30
- Option **RA** "PROFINET" → 🖹 30

Device plug for connecting to the service interface:
Order code for "Accessory mounted"
option **NB**, adapter RJ45 M12 (service interface) → 🖹 32

Order code for "Input; output 1", option SA "FOUNDATION Fieldbus"

Order code for "Electrical connection"	Cable entry/connection → 🖹 33	
	2	3
M, 3, 4, 5	7/8" connector	–

Order code for "Input; output 1", option GA "PROFIBUS PA"

Order code for "Electrical connection"	Cable entry/connection → 🖹 33	
	2	3
L, N, P, U	Connector M12 × 1	–

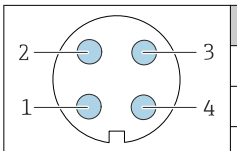
Order code for "Input; output 1", option NA "EtherNet/IP"

Order code for "Electrical connection"	Cable entry/connection → 🖹 33	
	2	3
L, N, P, U	Connector M12 × 1	–
R [1) 2)], S [1) 2)], T [1) 2)], V [1) 2)]	Connector M12 × 1	Connector M12 × 1

1) Cannot be combined with an external WLAN antenna (order code for "Enclosed accessories", option P8) of an RJ45 M12 adapter for the service interface (order code for "Accessories mounted", option NB) or of the remote display and operating module DKX001
2) Suitable for integrating the device in a ring topology.

Order code for "Input; output 1", option RA "PROFINET"

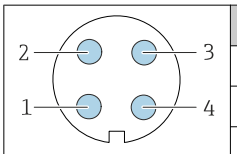
Order code for "Electrical connection"	Cable entry/connection → 🖹 33	
	2	3
L, N, P, U	Connector M12 × 1	–
R [1) 2)], S [1) 2)], T [1) 2)], V [1) 2)]	Connector M12 × 1	Connector M12 × 1



1) Cannot be combined with an external WLAN antenna (order code for "Enclosed accessories", option P8) of an RJ45 M12 adapter for the service interface (order code for "Accessories mounted", option NB) or of the remote display and operating module DKX001.
2) Suitable for integrating the device in a ring topology.

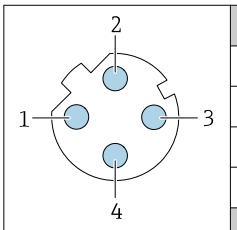
Order code for "Accessory mounted", option NB "Adapter RJ45 M12 (service interface)"

Order code "Accessory mounted"	Cable entry/coupling → 🖹 33	
	Cable entry 2	Cable entry 3
NB	Plug M12 × 1	–



Pin assignment, device plug

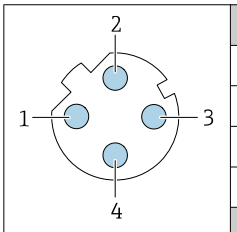
FOUNDATION Fieldbus



Pin		Assignment	Coding	Plug/socket
1	+	Signal +	A	Plug
2	-	Signal –		
3		Grounding		
4		Not assigned		

PROFIBUS PA

Pin		Assignment	Coding	Plug/socket
1	+	PROFIBUS PA +	A	Plug
2		Grounding		
3	-	PROFIBUS PA –		
4		Not assigned		

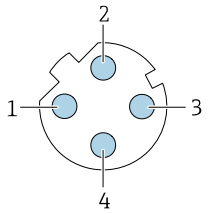


PROFINET

Pin		Assignment
1	+	TD +
2	+	RD +
3	-	TD –
4	-	RD –
Coding		**Plug/socket**
D		Socket

Recommended plug:
- Binder, series 763, part no. 99 3729 810 04
- Phoenix, part no. 1543223 SACC-M12MSD-4Q

EtherNet/IP



Pin		Assignment
1	+	Tx
2	+	Rx
3	-	Tx
4	-	Rx
Coding		**Plug/socket**
D		Socket

Recommended plug:
- Binder, series 763, part no. 99 3729 810 04
- Phoenix, part no. 1543223 SACC-M12MSD-4Q

Service interface

Order code for "Accessories mounted", option **NB**: Adapter RJ45 M12 (service interface)

Pin		Assignment
1	+	Tx
2	+	Rx
3	-	Tx
4	-	Rx
Coding		**Plug/socket**
D		Socket

Recommended plug:
- Binder, series 763, part no. 99 3729 810 04
- Phoenix, part no. 1543223 SACC-M12MSD-4Q

Supply voltage

Order code for "Power supply"	Terminal voltage		Frequency range
Option **D**	DC 24 V	±20%	–
Option **E**	AC 100 to 240 V	−15 to +10%	50/60 Hz, ±4 Hz
Option **I**	DC 24 V	±20%	–
	AC 100 to 240 V	−15 to +10%	50/60 Hz, ±4 Hz

Power consumption

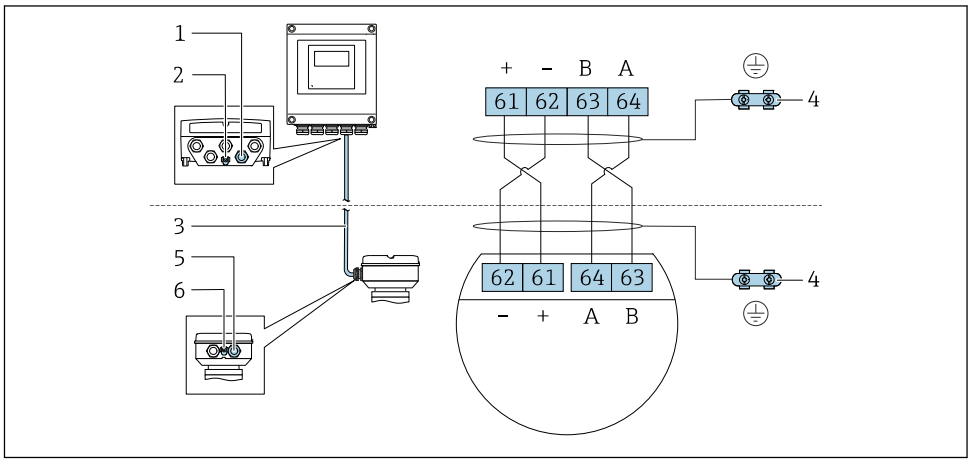
Transmitter

Max. 10 W (active power)

switch-on current	Max. 36 A (<5 ms) as per NAMUR Recommendation NE 21

Current consumption

Transmitter

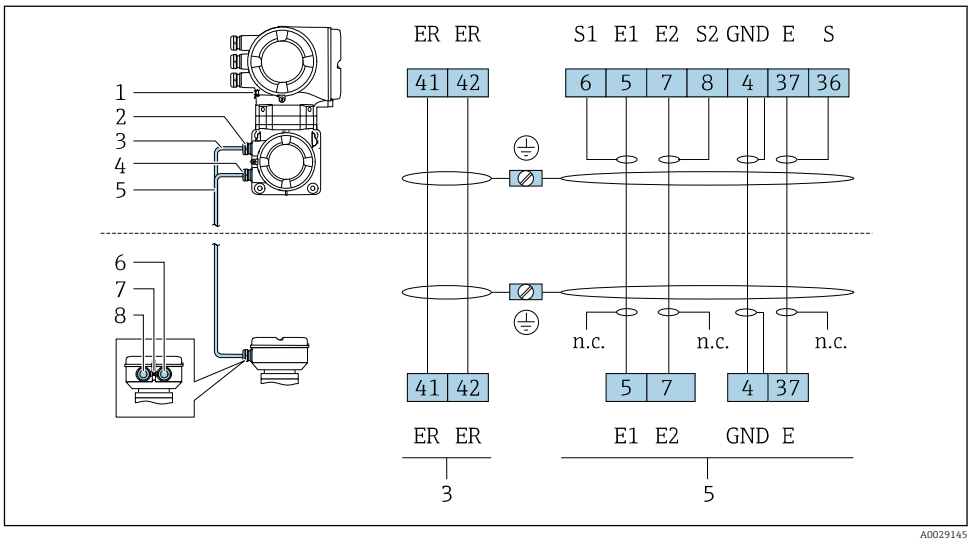


- Max. 400 mA (24 V)
- Max. 200 mA (110 V, 50/60 Hz; 230 V, 50/60 Hz)

Power supply failure

- Totalizers stop at the last value measured.
- Depending on the device version, the configuration is retained in the device memoryor in the pluggable data memory (HistoROM DAT).
- Error messages (incl. total operated hours) are stored.

Electrical connection

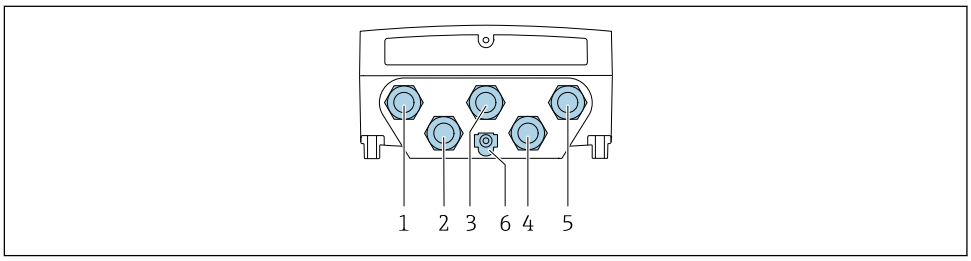


Connection of connecting cable: Proline 500 – digital

1 *Cable entry for cable on transmitter housing*
2 *Protective ground (PE)*
3 *Connecting cable ISEM communication*
4 *Grounding via ground connection; on device plug versions grounding is through the plug itself*
5 *Cable entry for cable or connection of device plug on sensor connection housing*
6 *Protective ground (PE)*

Connection of the connecting cable: Proline 500

The connecting cable is connected via terminals.

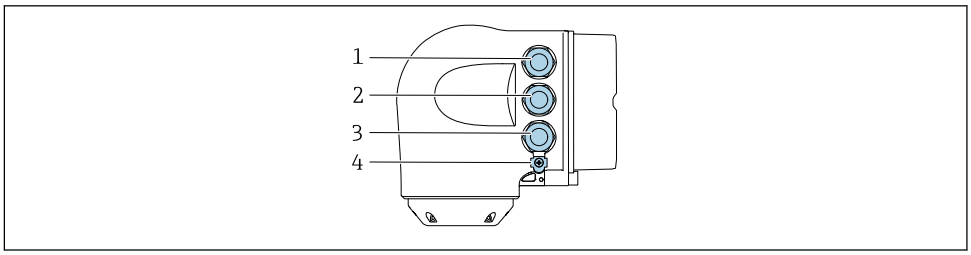


1 *Protective ground (PE)*
2 *Cable entry for coil current cable on transmitter connection housing*
3 *Coil current cable*
4 *Cable entry for signal cable on transmitter connection housing*
5 *Signal cable*
6 *Cable entry for signal cable on sensor connection housing*
7 *Protective ground (PE)*
8 *Cable entry for coil current cable on sensor connection housing*

Connecting the transmitter

- Terminal assignment → 29
- Device plug pin assignment → 31

Connecting the Proline 500 – digital transmitter



1 Terminal connection for supply voltage
2 Terminal connection for signal transmission, input/output
3 Terminal connection for signal transmission, input/output
4 Terminal connection for connecting cable between sensor and transmitter
5 Terminal connection for signal transmission, input/output or terminal for network connection (DHCP client) via service interface (CDI-RJ45); optional: terminal connection for external WLAN antenna
6 Protective ground (PE)

An adapter for RJ45 and the M12 connector is optionally available:
Order code for "Accessories", option **NB**: "Adapter RJ45 M12 (service interface)"

The adapter connects the service interface (CDI-RJ45) to an M12 connector mounted in the cable entry. Therefore the connection to the service interface can be established via an M12 connector without opening the device.

Network connection (DHCP client) via service interface (CDI-RJ45) → 📄 95

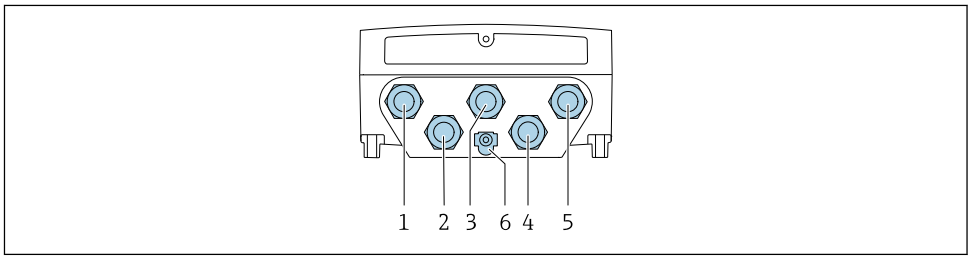
Connecting the Proline 500 transmitter

1 Terminal connection for supply voltage
2 Terminal connection for signal transmission, input/output
3 Terminal connection for signal transmission, input/output or terminal for network connection (DHCP client) via service interface (CDI-RJ45); optional: terminal connection for external WLAN antenna
4 Protective ground (PE)

An adapter for RJ45 and the M12 connector is optionally available:
Order code for "Accessories", option **NB**: "Adapter RJ45 M12 (service interface)"

The adapter connects the service interface (CDI-RJ45) to an M12 connector mounted in the cable entry. Therefore the connection to the service interface can be established via an M12 connector without opening the device.

Network connection (DHCP client) via service interface (CDI-RJ45) → 📄 95

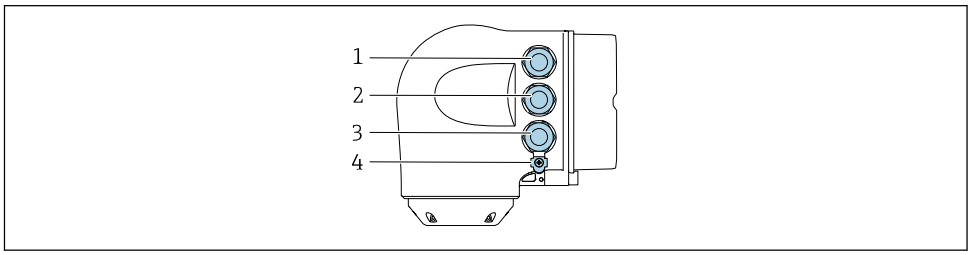


Connecting in a ring topology

Device versions with EtherNet/IP and PROFINET communication protocols can be integrated into a ring topology. The device is integrated via the terminal connection for signal transmission (output 1) and the connection to the service interface (CDI-RJ45).

Transmitters with an Ex de approval may **not** be connected via the service interface (CDI-RJ45)! Order code for "Approval transmitter + sensor", options (Ex de):
BB, C2, GB, MB, NB

Integrating the transmitter into a ring topology:
- EtherNet/IP
- PROFINET

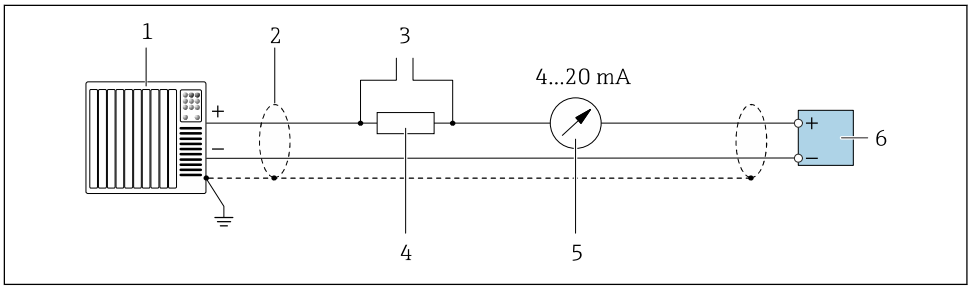


Transmitter: Proline 500 – digital

A0028200

1 Terminal connection for supply voltage
2 Terminal connection for signal transmission, input/output
2 Terminal connection for signal transmission: PROFINET or EtherNet/IP (RJ45 connector)
4 Terminal connection for connecting cable between sensor and transmitter
5 Terminal connection to service interface (CDI-RJ45)
6 Protective ground (PE)

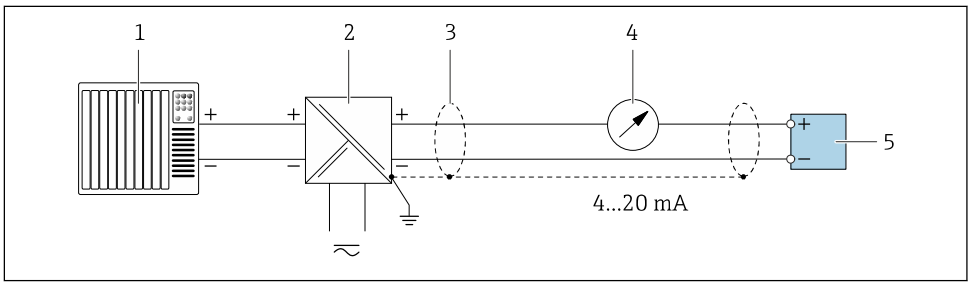
Transmitter: Proline 500



A0026781

1 Terminal connection for supply voltage
2 Terminal connection for signal transmission: PROFINET or EtherNet/IP (RJ45 connector)
3 Terminal connection to service interface (CDI-RJ45)
4 Protective ground (PE)

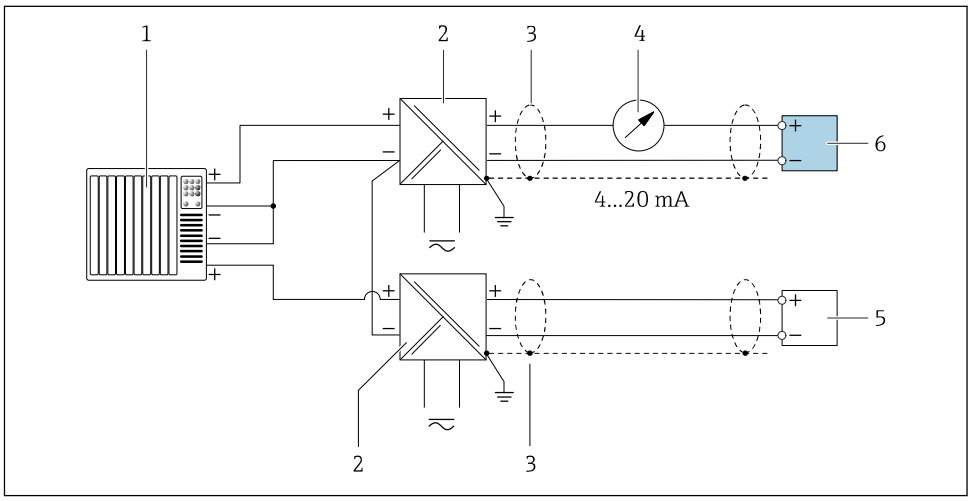
If the device has additional inputs/outputs, these are routed in parallel via the cable entry for connection to the service interface (CDI-RJ45).



Connection examples

Current output 4 to 20 mA HART

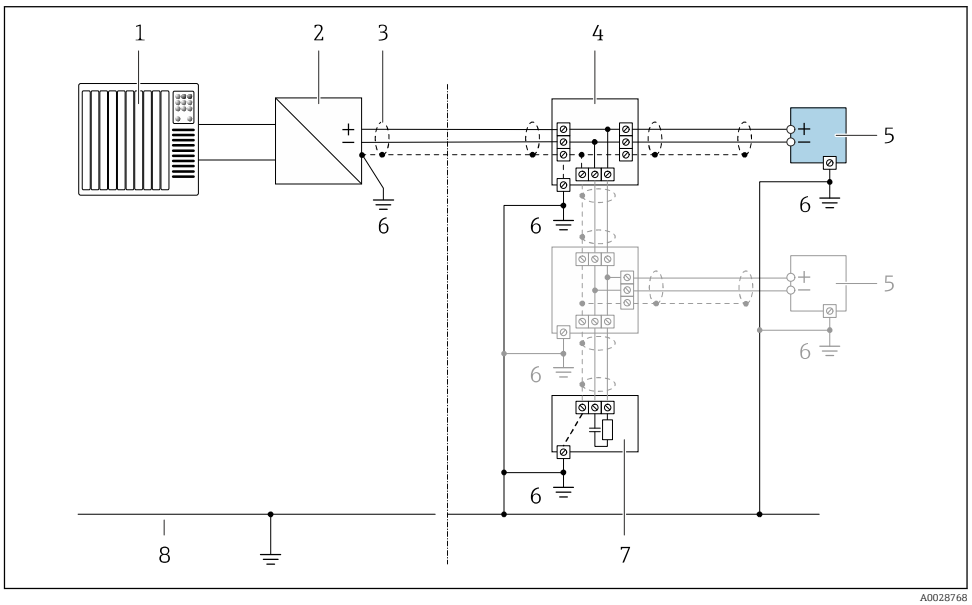
2 Connection example for 4 to 20 mA HART current output (active)



1 *Automation system with current input (e.g. PLC)*
2 *Cable shield provided at one end. The cable shield must be grounded at both ends to comply with EMC requirements; observe cable specifications → 46*
3 *Connection for HART operating devices → 89*
4 *Resistor for HART communication (≥ 250 Ω): observe maximum load → 15*
5 *Analog display unit: observe maximum load → 15*
6 *Transmitter*

3 Connection example for 4 to 20 mA HART current output (passive)

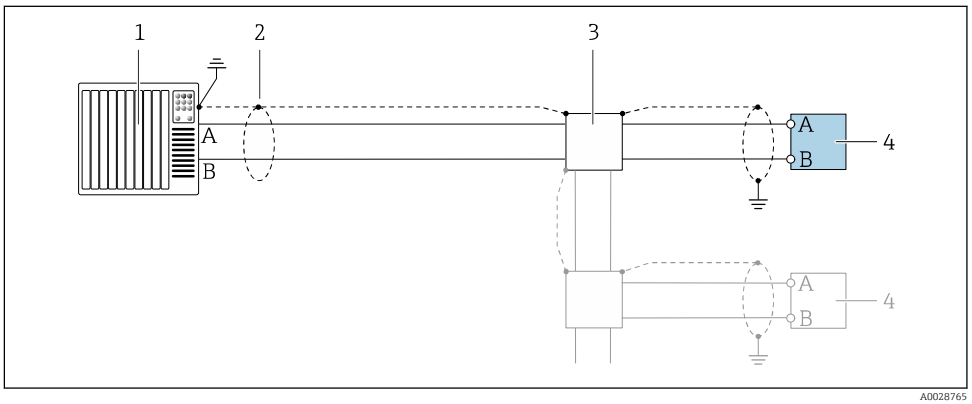
1 *Automation system with current input (e.g. PLC)*
2 *Power supply*
3 *Cable shield provided at one end. The cable shield must be grounded at both ends to comply with EMC requirements; observe cable specifications → 46*
4 *Analog display unit: observe maximum load → 15*
5 *Transmitter*



HART input

4 Connection example for HART input with a common negative (passive)

1 *Automation system with HART output (e.g. PLC)*
2 *Active barrier for power supply (e.g. RN221N)*
3 *Cable shield provided at one end. The cable shield must be grounded at both ends to comply with EMC requirements; observe cable specifications*
4 *Analog display unit: observe maximum load → 15*
5 *Pressure measuring device (e.g. Cerabar M, Cerabar S): see requirements*
6 *Transmitter*

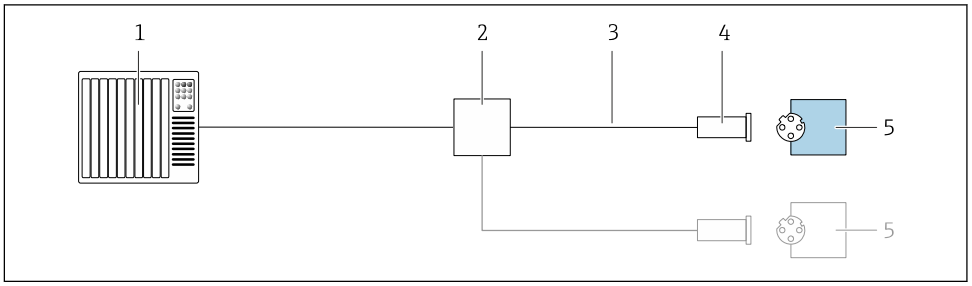


PROFIBUS PA

5 Connection example for PROFIBUS PA

1 *Control system (e.g. PLC)*
2 *PROFIBUS PA segment coupler*
3 *Cable shield provided at one end. The cable shield must be grounded at both ends to comply with EMC requirements; observe cable specifications*
4 *T-box*
5 *Measuring device*
6 *Local grounding*
7 *Bus terminator*
8 *Potential matching line*

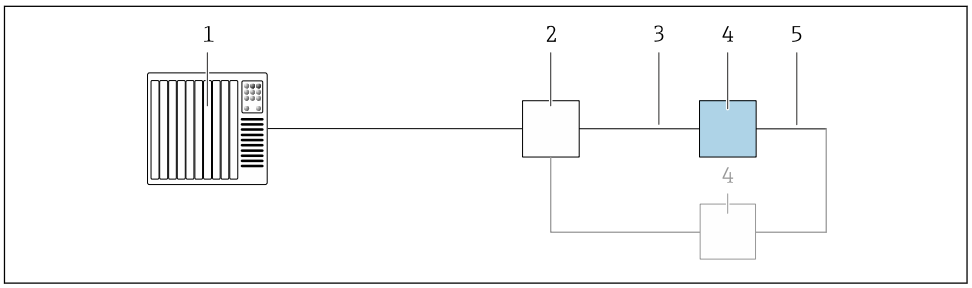
PROFIBUS DP



6 *Connection example for PROFIBUS DP, non-hazardous area and Zone 2/Div. 2*

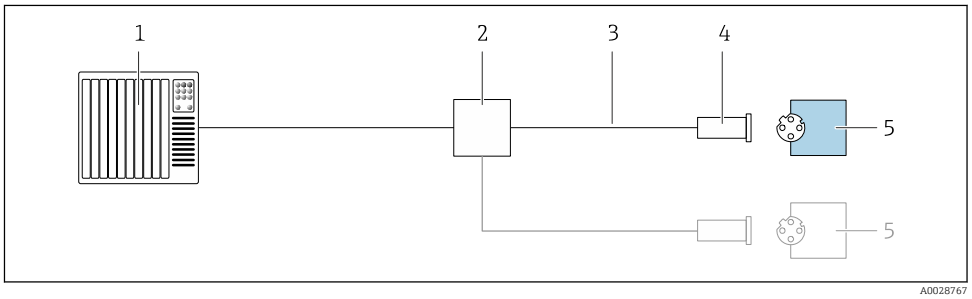
1 *Control system (e.g. PLC)*
2 *Cable shield provided at one end. The cable shield must be grounded at both ends to comply with EMC requirements; observe cable specifications*
3 *Distribution box*
4 *Transmitter*

If baud rates > 1.5 MBaud an EMC cable entry must be used and the cable shield must continue as far as the terminal wherever possible.



EtherNet/IP

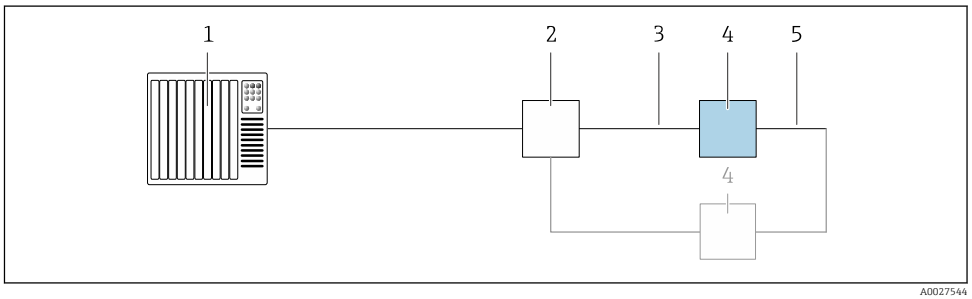
7 *Connection example for EtherNet/IP*



1 *Control system (e.g. PLC)*
2 *Ethernet switch*
3 *Observe cable specifications*
4 *Device plug*
5 *Transmitter*

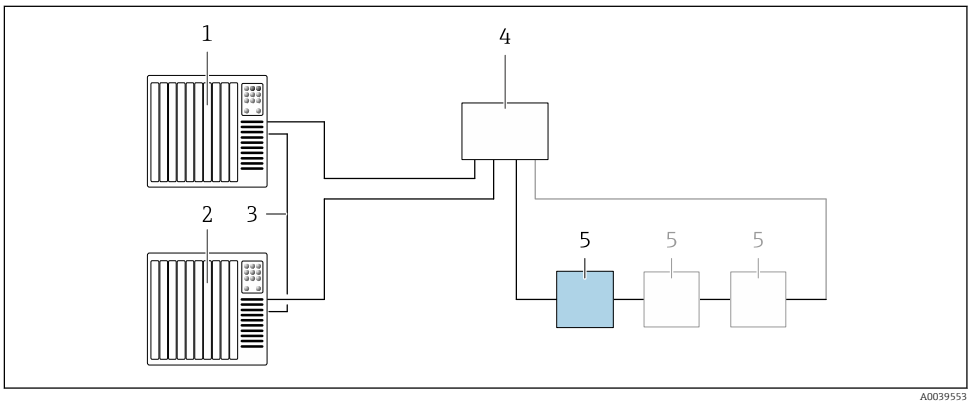
EtherNet/IP: DLR (Device Level Ring)

1 Control system (e.g. PLC)
2 Ethernet switch
3 Observe cable specifications → 46
4 Transmitter
5 Connecting cable between the two transmitters



PROFINET

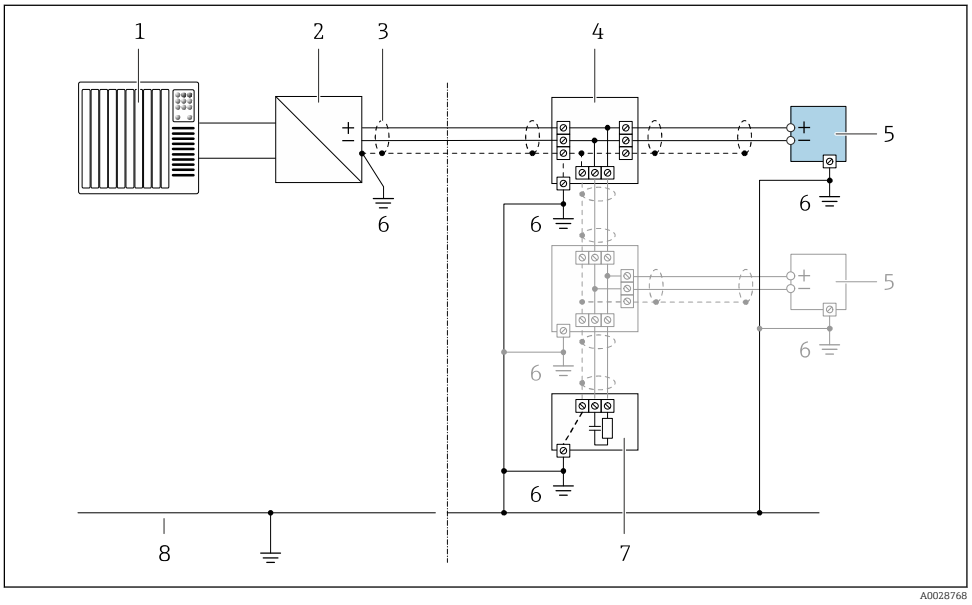
8 Connection example for PROFINET



1 Control system (e.g. PLC)
2 Ethernet switch
3 Observe cable specifications
4 Device plug
5 Transmitter

PROFINET: MRP (Media Redundancy Protocol)

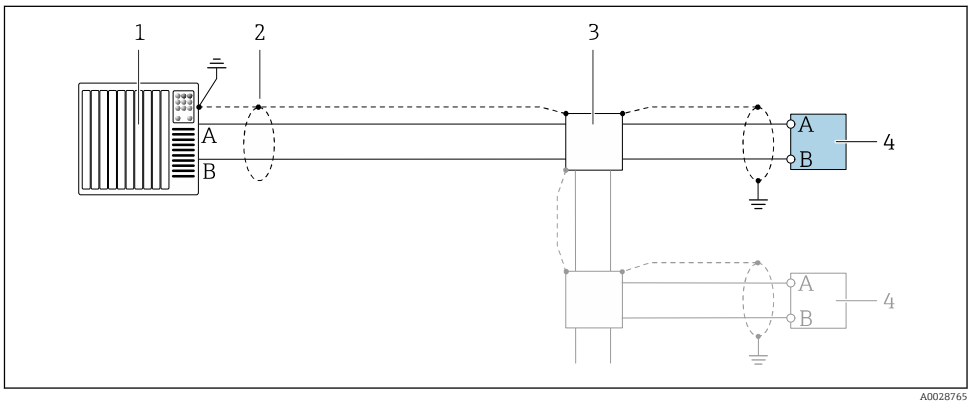
1 Control system (e.g. PLC)
2 Ethernet switch
3 Observe cable specifications → 46
4 Transmitter
5 Connecting cable between the two transmitters



PROFINET: system redundancy S2

9 Connection example for system redundancy S2

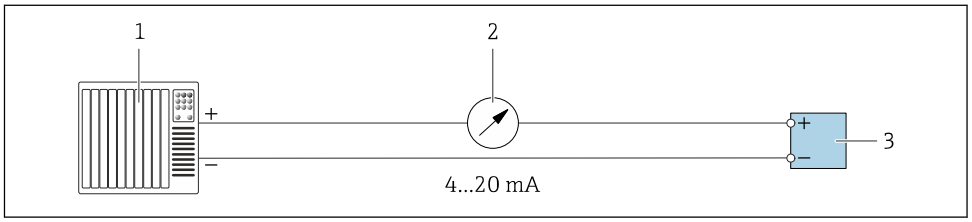
1 *Control system 1 (e.g. PLC)*
2 *Synchronization of control systems*
3 *Control system 2 (e.g. PLC)*
4 *Industrial Ethernet Managed Switch*
5 *Transmitter*



FOUNDATION Fieldbus

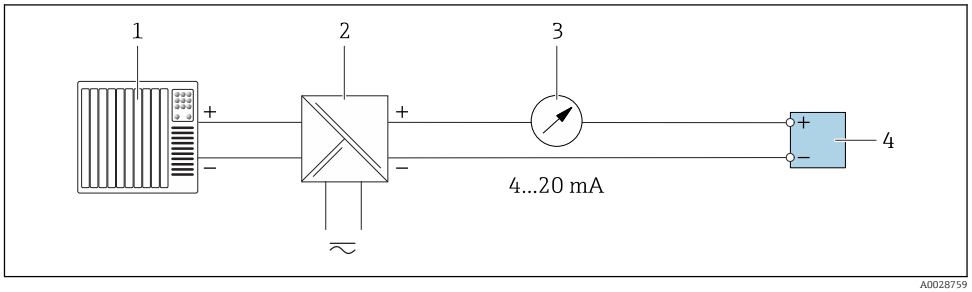
10 Connection example for FOUNDATION Fieldbus

1 *Control system (e.g. PLC)*
2 *Power Conditioner (FOUNDATION Fieldbus)*
3 *Cable shield provided at one end. The cable shield must be grounded at both ends to comply with EMC requirements; observe cable specifications*
4 *T-box*
5 *Measuring device*
6 *Local grounding*
7 *Bus terminator*
8 *Potential matching line*



Modbus RS485

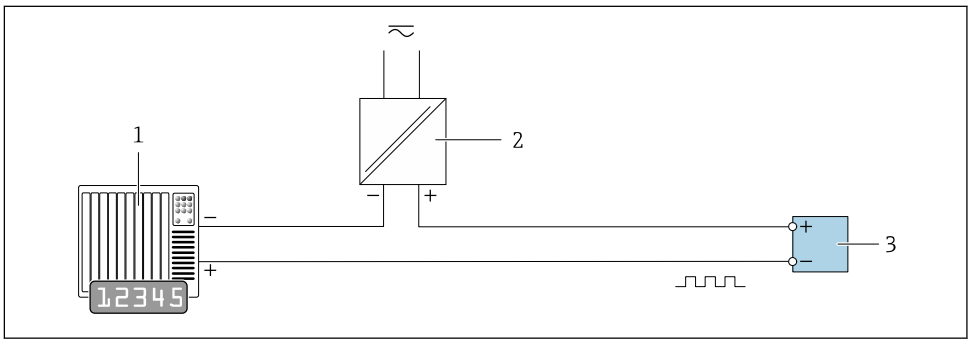
11 Connection example for Modbus RS485, non-hazardous area and Zone 2/Div. 2



1 Control system (e.g. PLC)
2 Cable shield provided at one end. The cable shield must be grounded at both ends to comply with EMC requirements; observe cable specifications
3 Distribution box
4 Transmitter

Current output 4-20 mA

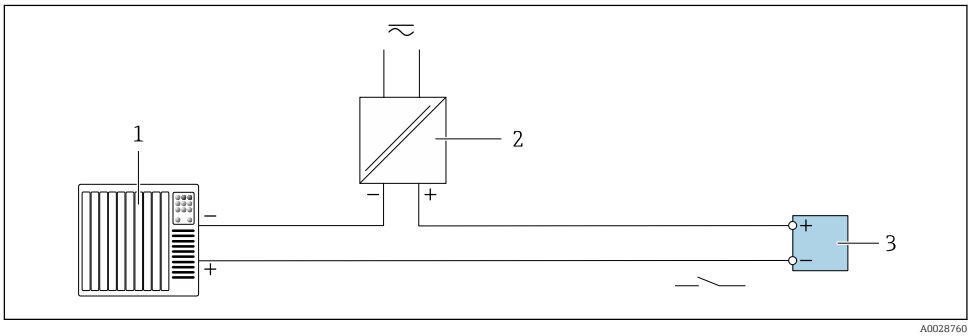
12 Connection example for 4-20 mA current output (active)



1 Automation system with current input (e.g. PLC)
2 Analog display unit: observe maximum load → 15
3 Transmitter

13 Connection example for 4-20 mA current output (passive)

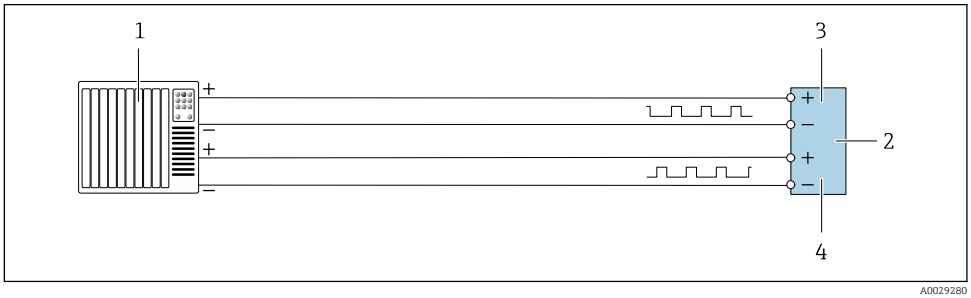
1 Automation system with current input (e.g. PLC)
2 Active barrier for power supply (e.g. RN221N)
3 Analog display unit: observe maximum load → 15
4 Transmitter



Pulse/frequency output

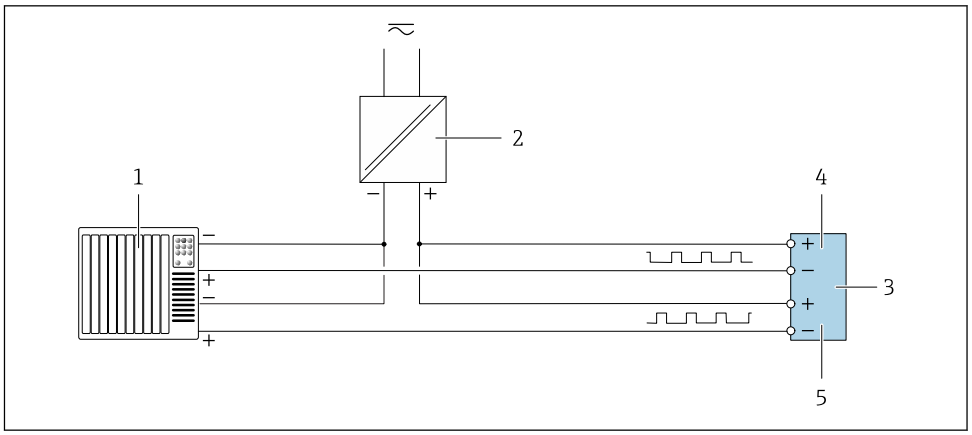
14 Connection example for pulse/frequency output (passive)

1 Automation system with pulse/frequency input (e.g. PLC)
2 Power supply
3 Transmitter: Observe input values → 17



Switch output

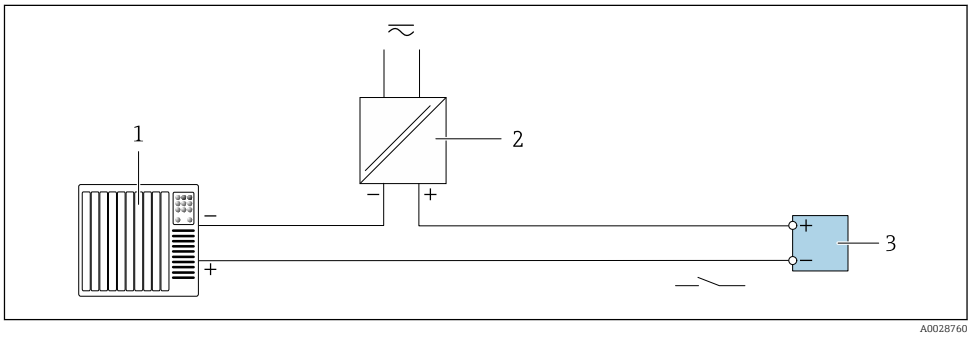
15 Connection example for switch output (passive)



1 Automation system with switch input (e.g. PLC)
2 Power supply
3 Transmitter: Observe input values → 17

Double pulse output

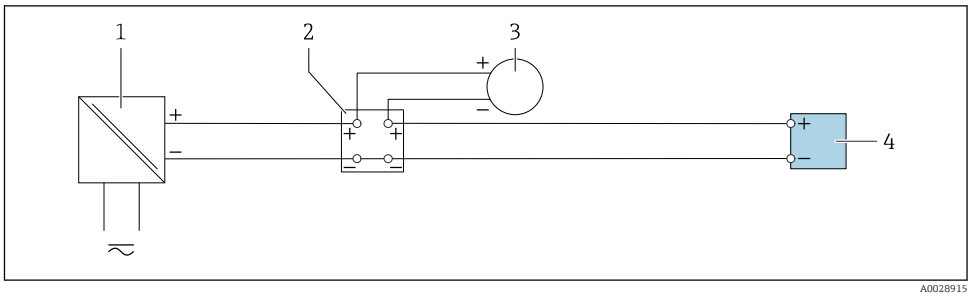
16 Connection example for double pulse output (active)



1 Automation system with double pulse input (e.g. PLC)
2 Transmitter: Observe input values → 18
3 Double pulse output
4 Double pulse output (slave), phase-shifted

17 *Connection example for double pulse output (passive)*

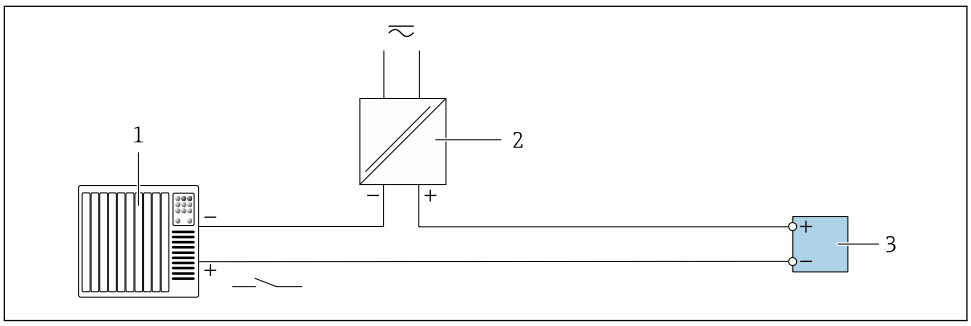
1 *Automation system with double pulse input (e.g. PLC)*
2 *Power supply*
3 *Transmitter: Observe input values → 18*
4 *Double pulse output*
5 *Double pulse output (slave), phase-shifted*



Relay output

18 *Connection example for relay output (passive)*

1 *Automation system with relay input (e.g. PLC)*
2 *Power supply*
3 *Transmitter: Observe input values → 19*



Current input

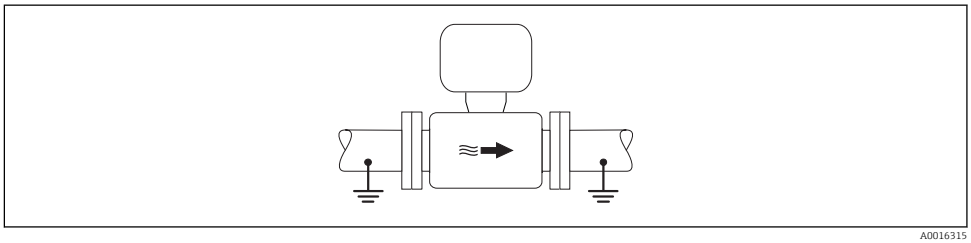
19 *Connection example for 4 to 20 mA current input*

1 *Power supply*
2 *Terminal box*
3 *External measuring device (to read in pressure or temperature, for instance)*
4 *Transmitter*

Status input

20 *Connection example for status input*

1 *Automation system with status output (e.g. PLC)*
2 *Power supply*
3 *Transmitter*



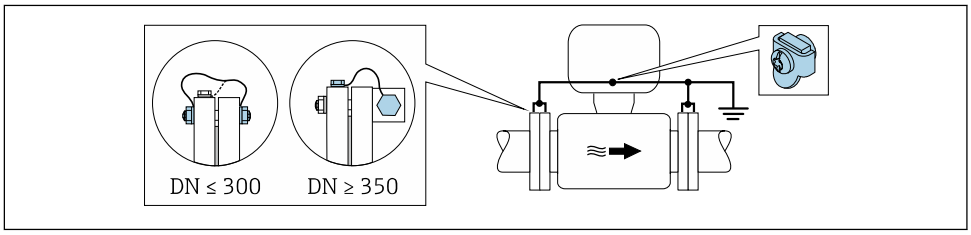
Potential equalization

Requirements

Please consider the following to ensure correct measurement:
- Same electrical potential for the fluid and sensor
- Company-internal grounding concepts
- Pipe material and grounding

Connection example, standard scenario

Metal, grounded pipe



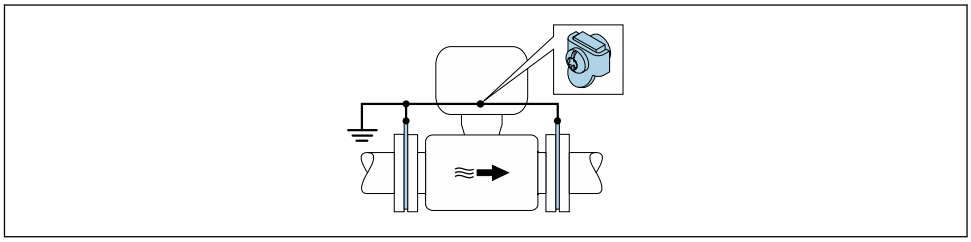
21 *Potential equalization via measuring tube*

Connection example in special situations

Unlined and ungrounded metal pipe

This connection method also applies in situations where:
- The customary potential equalization is not used
- Equalizing currents are present

Ground cable	Copper wire, at least 6 mm² (0.0093 in²)



22 *Potential equalization via ground terminal and pipe flanges*

Note the following when installing:
- Connect both sensor flanges to the pipe flange via a ground cable and ground them.
- Connect the connection housing of the transmitter or sensor to ground potential by means of the ground terminal provided for the purpose. To mount the ground cable:
  - If DN ≤ 300 (12"): Mount the ground cable directly on the conductive flange coating of the sensor with the flange screws.
  - If DN ≥ 350 (14"): Mount the ground cable directly on the metal transport bracket.

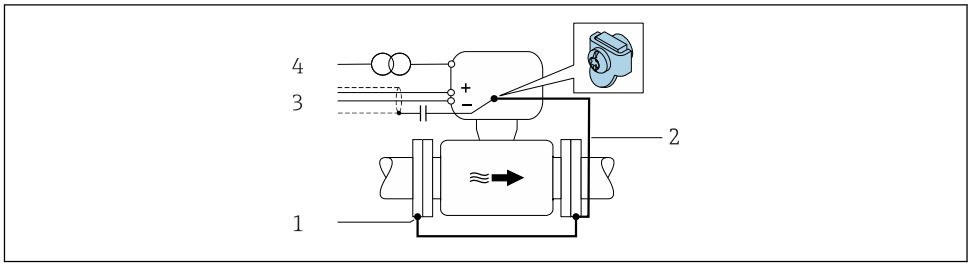
You can order the necessary ground cable from Endress+Hauser: → 106.

Plastic pipe or pipe with insulating liner

This connection method also applies in situations where:
- Standard company potential equalization cannot be guaranteed
- Equalizing currents can be expected

A0029339

23 Potential equalization via ground terminal and ground disks



Note the following when installing:
The ground disks must be connected to the ground terminal via the ground cable and be connected to ground potential.

The ground cable and ground disks can be ordered from Endress+Hauser → 106.

Pipe with a cathodic protection unit

This connection method is only used if the following two conditions are met:
- Metal pipe without liner or pipe with electrically conductive liner
- Cathodic protection is integrated in the personal protection equipment

Ground cable	Copper wire, at least 6 mm² (0.0093 in²)

A0030377

1 Connection of the two flanges of the pipe via a ground cable
2 Signal line shielding via a capacitor
3 Measuring device connected to power supply such that it is floating in relation to the protective ground (isolation transformer)

Note the following when installing:
The sensor is installed in the pipe in a way that provides electrical insulation.

You can order the necessary ground cable from Endress+Hauser: → 106.

Terminals

Spring-loaded terminals: Suitable for strands and strands with ferrules.
Conductor cross-section 0.2 to 2.5 mm² (24 to 12 AWG).

Cable entries

- Cable gland: M20 × 1.5 with cable Ø 6 to 12 mm (0.24 to 0.47 in)
- Thread for cable entry:
  - NPT ½"
  - G ½"
  - M20
- Device plug for digital communication: M12
  Only available for certain device versions → 30.

Cable specification

Permitted temperature range

- The installation guidelines that apply in the country of installation must be observed.
- The cables must be suitable for the minimum and maximum temperatures to be expected.

Power supply cable (incl. conductor for the inner ground terminal)

Standard installation cable is sufficient.

Protective grounding cable for the outer ground terminal

Conductor cross-section ≤2.08 mm² (14 AWG)

Grounding impedance must be less than 2 Ω.

Signal cable

Current output 4 to 20 mA HART

A shielded cable is recommended. Observe grounding concept of the plant.

PROFIBUS PA

Twisted, shielded two-wire cable. Cable type A is recommended .

For further information on planning and installing PROFIBUS networks see:
- Operating Instructions "PROFIBUS DP/PA: Guidelines for planning and commissioning" (BA00034S)
- PNO Directive 2.092 "PROFIBUS PA User and Installation Guideline"
- IEC 61158-2 (MBP)

PROFIBUS DP

The IEC 61158 standard specifies two types of cable (A and B) for the bus line which can be used for every transmission rate. Cable type A is recommended.

Cable type	A
Characteristic impedance	135 to 165 Ω at a measuring frequency of 3 to 20 MHz
Cable capacitance	< 30 pF/m
Wire cross-section	> 0.34 mm² (22 AWG)
Cable type	Twisted pairs
Loop resistance	≤110 Ω/km
Signal damping	Max. 9 dB over the entire length of the cable cross-section
Shield	Copper braided shielding or braided shielding with foil shield. When grounding the cable shield, observe the grounding concept of the plant.

For further information on planning and installing PROFIBUS networks see:
- Operating Instructions "PROFIBUS DP/PA: Guidelines for planning and commissioning" (BA00034S)
- PNO Directive 2.092 "PROFIBUS PA User and Installation Guideline"
- IEC 61158-2 (MBP)

EtherNet/IP

The standard ANSI/TIA/EIA-568-B.2 Annex specifies CAT 5 as the minimum category for a cable used for EtherNet/IP. CAT 5e and CAT 6 are recommended.

For more information on planning and installing EtherNet/IP networks, please refer to the "Media Planning and Installation Manual. EtherNet/IP" of ODVA Organization

PROFINET

Standard IEC 61156-6 specifies CAT 5 as the minimum category for a cable used for PROFINET. CAT 5e and CAT 6 are recommended.

For more information on planning and installing PROFINET networks, see: "PROFINET Cabling and Interconnection Technology", Guideline for PROFINET

FOUNDATION Fieldbus

Twisted, shielded two-wire cable.

For further information on planning and installing FOUNDATION Fieldbus networks see:

- Operating Instructions for "FOUNDATION Fieldbus Overview" (BA00013S)
- FOUNDATION Fieldbus Guideline
- IEC 61158-2 (MBP)

Modbus RS485

The EIA/TIA-485 standard specifies two types of cable (A and B) for the bus line which can be used for every transmission rate. Cable type A is recommended.

Cable type	A
Characteristic impedance	135 to 165 Ω at a measuring frequency of 3 to 20 MHz
Cable capacitance	< 30 pF/m
Wire cross-section	> 0.34 mm^2 (22 AWG)
Cable type	Twisted pairs
Loop resistance	≤110 Ω/km
Signal damping	Max. 9 dB over the entire length of the cable cross-section
Shield	Copper braided shielding or braided shielding with foil shield. When grounding the cable shield, observe the grounding concept of the plant.

Current output 0/4 to 20 mA

Standard installation cable is sufficient.

Pulse/frequency/switch output

Standard installation cable is sufficient.

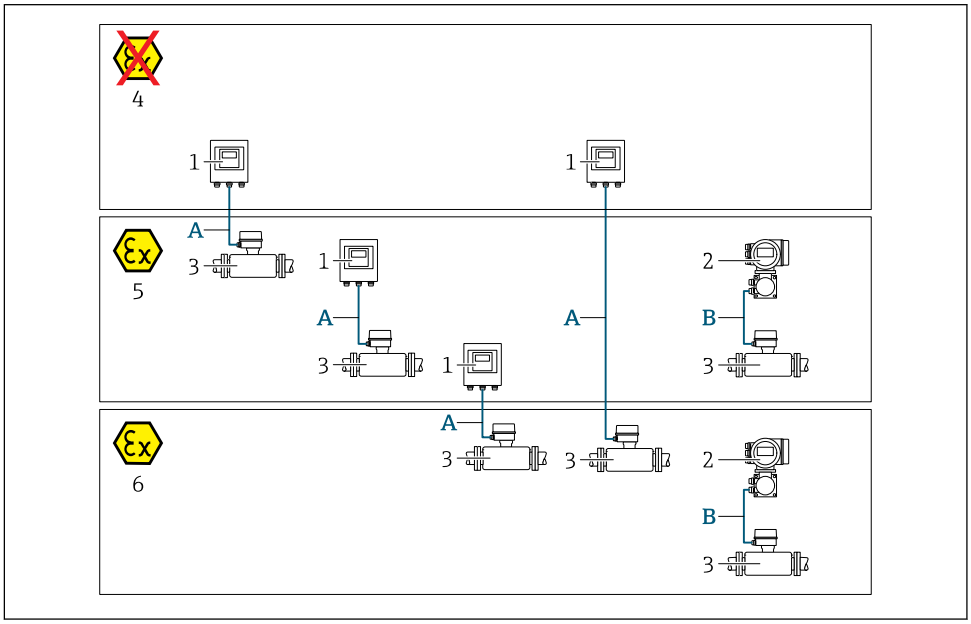
Double pulse output

Standard installation cable is sufficient.

Relay output

Standard installation cable is sufficient.

Current input 0/4 to 20 mA



Standard installation cable is sufficient.

Status input

Standard installation cable is sufficient.

Choice of connecting cable between the transmitter and sensor

Depends on the type of transmitter and the installation zones

1 Proline 500 digital transmitter
2 Proline 500 transmitter
3 Promag sensor
4 Non-hazardous area
5 Hazardous area: Zone 2; Class I, Division 2
6 Hazardous area: Zone 1; Class I, Division 1
A Standard cable to 500 digital transmitter → 48
Transmitter installed in the non-hazardous area or hazardous area: Zone 2; Class I, Division 2 / sensor installed in the hazardous area: Zone 2; Class I, Division 2 or Zone 1; Class I, Division 1
B Signal cable to 500 transmitter → 49
Transmitter and sensor installed in the hazardous area: Zone 2; Class I, Division 2 oder Zone 1; Class I, Division 1

A: Connecting cable between sensor and transmitter: Proline 500 – digital

Standard cable

A standard cable with the following specifications can be used as the connecting cable.

Design	4 cores (2 pairs); uninsulated stranded CU wires; pair-stranded with common shield
Shielding	Tin-plated copper-braid, optical cover ≥ 85 %
Cable length	Maximum 300 m (1000 ft), see the following table.

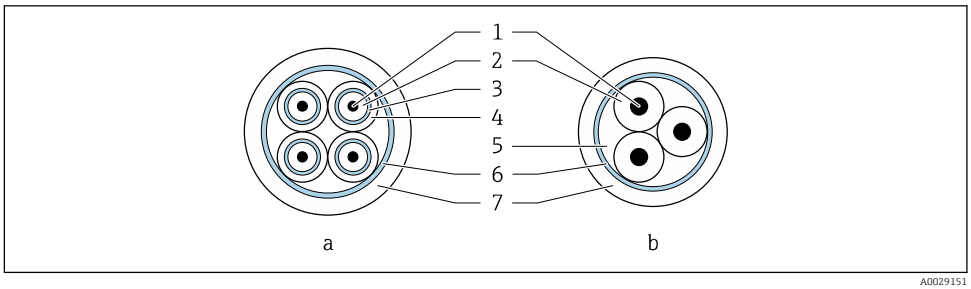
Cross-section	**Cable lengths for use in**	
	Non-hazardous area, Hazardous area: Zone 2; Class I, Division 2	**Hazardous area: Zone 1; Class I, Division 1**
0.34 mm² (AWG 22)	80 m (270 ft)	50 m (165 ft)
0.50 mm² (AWG 20)	120 m (400 ft)	60 m (200 ft)
0.75 mm² (AWG 18)	180 m (600 ft)	90 m (300 ft)
1.00 mm² (AWG 17)	240 m (800 ft)	120 m (400 ft)

Cross-section	Cable lengths for use in	
	Non-hazardous area, Hazardous area: Zone 2; Class I, Division 2	Hazardous area: Zone 1; Class I, Division 1
1.50 mm² (AWG 15)	300 m (1 000 ft)	180 m (600 ft)
2.50 mm² (AWG 13)	300 m (1 000 ft)	300 m (1 000 ft)

Optionally available connecting cable

Design	2 × 2 × 0.34 mm² (AWG 22) PVC cable [1] with common shield (2 pairs, uninsulated stranded CU wires; pair-stranded)
Flame resistance	According to DIN EN 60332-1-2
Oil-resistance	According to DIN EN 60811-2-1
Shielding	Tin-plated copper-braid, optical cover ≥ 85 %
Operating temperature	When mounted in a fixed position: −50 to +105 °C (−58 to +221 °F); when cable can move freely: −25 to +105 °C (−13 to +221 °F)
Available cable length	Fixed: 20 m (65 ft); variable: up to maximum 50 m (165 ft)

1) UV radiation can impair the cable outer sheath. Protect the cable from direct sunshine where possible.



B: Connecting cable between sensor and transmitter: Proline 500

Signal cable

Design	3 × 0.38 mm² (20 AWG) with common, braided copper shield (Ø ~ 9.5 mm (0.37 in)) and individual shielded cores
Conductor resistance	≤50 Ω/km (0.015 Ω/ft)
Capacitance: core/shield	≤420 pF/m (128 pF/ft)
Cable length (max.)	Depends on the medium conductivity, max. 200 m (656 ft)
Cable lengths (available for order)	5 m (15 ft), 10 m (32 ft), 20 m (65 ft) or variable length up to max. 200 m (656 ft)
Operating temperature	−20 to +80 °C (−4 to +176 °F)

Coil current cable

Design	3 × 0.75 mm² (18 AWG) with common, braided copper shield (Ø ~ 9 mm (0.35 in)) and individual shielded cores
Conductor resistance	≤37 Ω/km (0.011 Ω/ft)
Capacitance: core/core, shield grounded	≤120 pF/m (37 pF/ft)
Cable length (max.)	Depends on the medium conductivity, max. 200 m (656 ft)
Cable lengths (available for order)	5 m (15 ft), 10 m (32 ft), 20 m (65 ft) or variable length up to max. 200 m (656 ft)
Operating temperature	−20 to +80 °C (−4 to +176 °F)
Test voltage for cable insulation	≤ AC 1433 V rms 50/60 Hz or ≥ DC 2026 V

24 Cable cross-section

a Electrode cable
b Coil current cable
1 Core
2 Core insulation

7 Outer jacket

Operation in zones of severe electrical interference

The measuring system meets the general safety requirements → 104 and EMC specifications → 59.

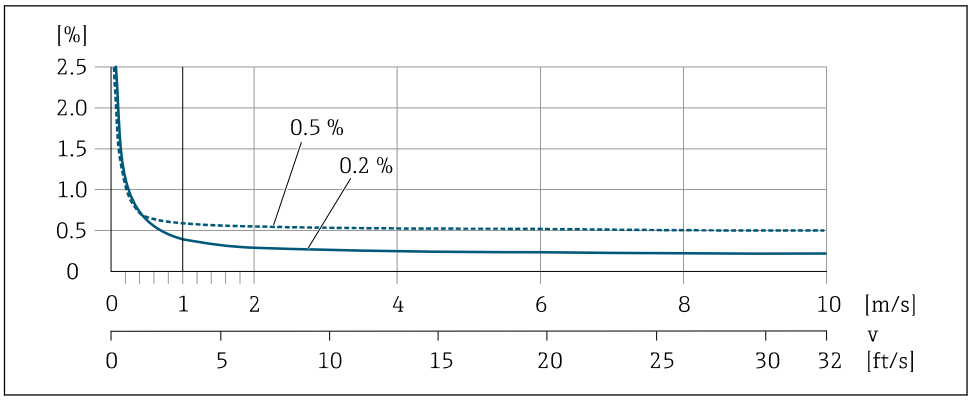
Grounding is by means of the ground terminal provided for the purpose inside the connection housing. The stripped and twisted lengths of cable shield to the ground terminal must be as short as possible.

Performance characteristics

Reference operating conditions

- Error limits following DIN EN 29104, in future ISO 20456
- Water, typically: +15 to +45 °C (+59 to +113 °F); 0.5 to 7 bar (73 to 101 psi)
- Data as indicated in the calibration protocol
- Accuracy based on accredited calibration rigs according to ISO 17025

Maximum measured error



o.r. = of reading

Error limits under reference operating conditions

Volume flow

- ±0.5 % o.r. ± 1 mm/s (0.04 in/s)
- Optional: ±0.2 % o.r. ± 2 mm/s (0.08 in/s)

Fluctuations in the supply voltage do not have any effect within the specified range.

25 *Maximum measured error in % o.r.*

Electrical conductivity

Max. measured error not specified.

Accuracy of outputs

The outputs have the following base accuracy specifications.

Current output

Accuracy	±5 µA

Pulse/frequency output

o.r. = of reading

Accuracy	Max. ±50 ppm o.r. (over the entire ambient temperature range)

Repeatability

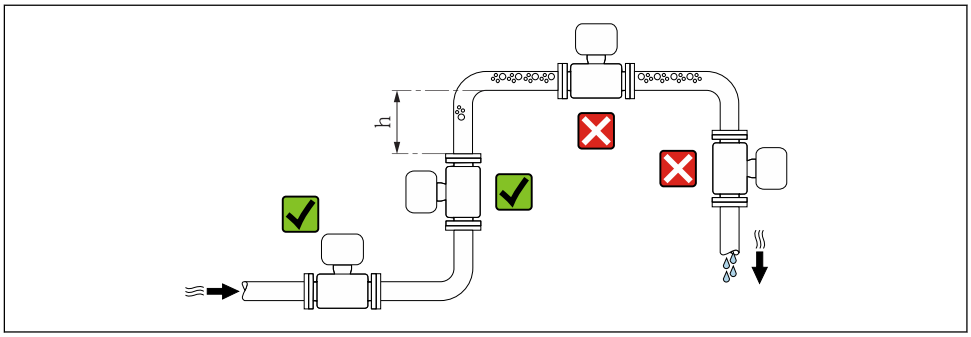
o.r. = of reading

Volume flow
Max. ±0.1 % o.r. ± 0.5 mm/s (0.02 in/s)

Electrical conductivity
Max. ±5 % o.r.

Influence of ambient temperature

Current output

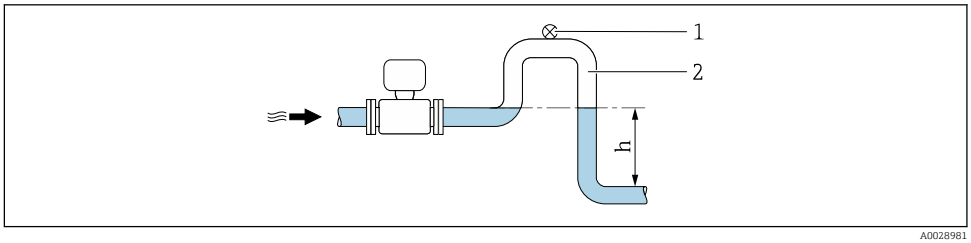


Temperature coefficient	Max. 1 µA/°C

Pulse/frequency output

Temperature coefficient	No additional effect. Included in accuracy.

Installation

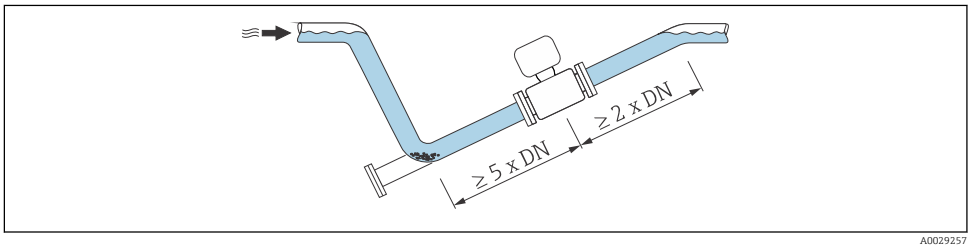


Mounting location

Preferably install the sensor in an ascending pipe, and ensure a sufficient distance to the next pipe elbow: h ≥ 2 × DN.

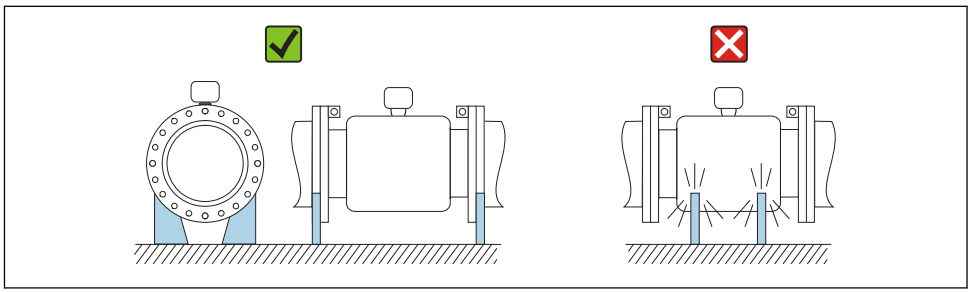
Installation in down pipes

Install a siphon with a vent valve downstream of the sensor in down pipes whose length h ≥ 5 m (16.4 ft). This precaution is to avoid low pressure and the consequent risk of damage to the measuring tube. This measure also prevents the system losing prime.



26 *Installation in a down pipe*

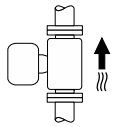
1 Vent valve
2 Pipe siphon
h Length of down pipe

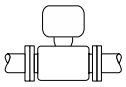


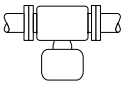
Installation in partially filled pipes

A partially filled pipe with a gradient necessitates a drain-type configuration.

No inlet runs necessary with order code for "Design", option C, H, I



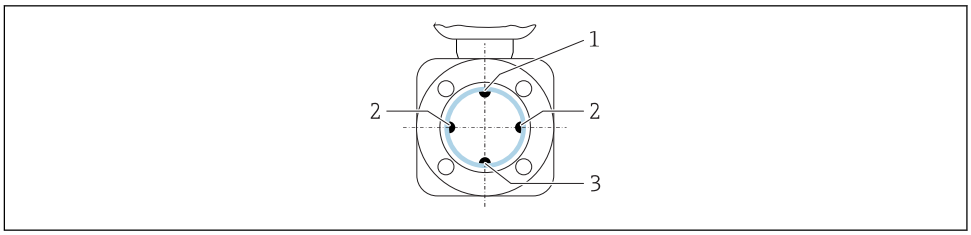




For heavy sensors DN ≥ 350 (14")

A0016276

Orientation



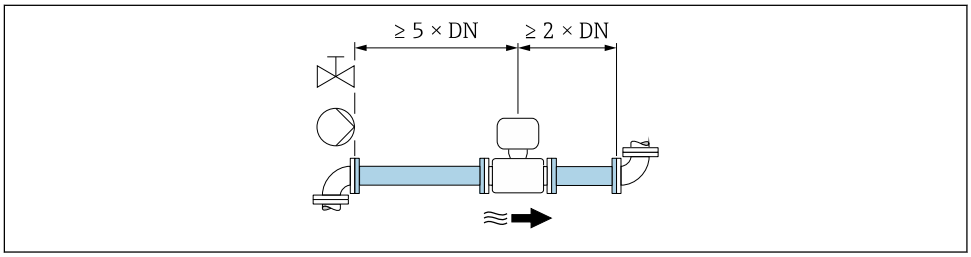
The direction of the arrow on the sensor nameplate helps you to install the sensor according to the flow direction (direction of medium flow through the piping).

Orientation			Recommendation
A	Vertical orientation	 A0015591	✓✓
B	Horizontal orientation, transmitter at top	 A0015589	✓✓ 1)
C	Horizontal orientation, transmitter at bottom	 A0015590	✓✓ 2) 3) ✗ 4)
D	Horizontal orientation, transmitter at side	 A0015592	✗

1) Applications with low process temperatures may decrease the ambient temperature. To maintain the minimum ambient temperature for the transmitter, this orientation is recommended.
2) Applications with high process temperatures may increase the ambient temperature. To maintain the maximum ambient temperature for the transmitter, this orientation is recommended.
3) To prevent the electronics module from overheating in the case of a sharp rise in temperature (e.g. CIP or SIP processes), install the device with the transmitter component pointing downwards.
4) With the empty pipe detection function switched on: empty pipe detection only works if the transmitter housing is pointing upwards.

Horizontal

- Ideally, the measuring electrode plane should be horizontal. This prevents brief insulation of the measuring electrodes by entrained air bubbles.
- Empty pipe detection only works if the transmitter housing is pointing upwards as otherwise there is no guarantee that the empty pipe detection function will actually respond to a partially filled or empty measuring tube.



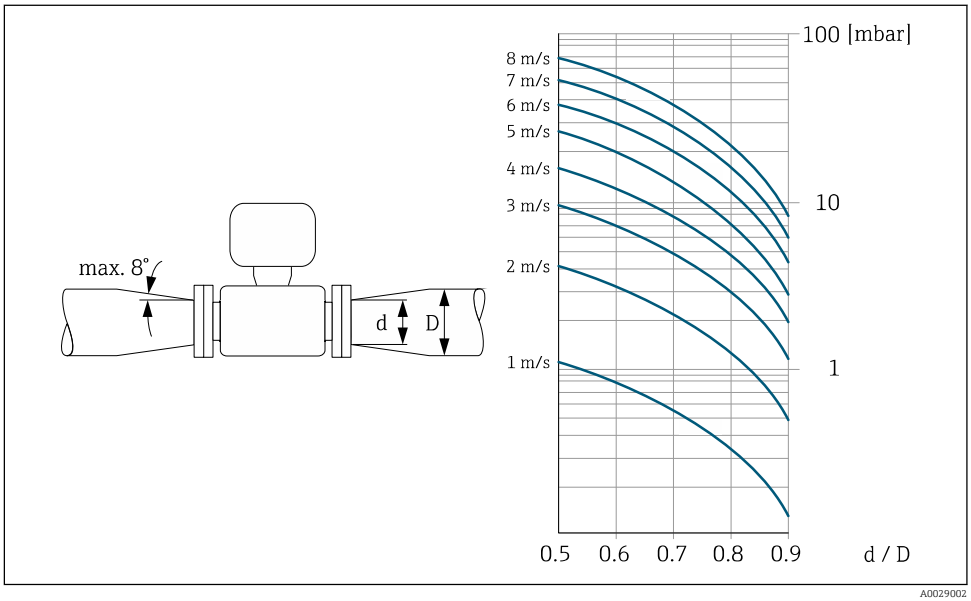
1 EPD electrode for empty pipe detection
2 Measuring electrodes for signal detection
3 Reference electrode for potential equalization

Measuring devices with tantalum or platinum electrodes can be ordered without an EPD electrode. In this case, empty pipe detection is performed via the measuring electrodes.

Inlet and outlet runs

If possible, install the sensor upstream from fittings such as valves, T-pieces or elbows.

Observe the following inlet and outlet runs to comply with accuracy specifications:

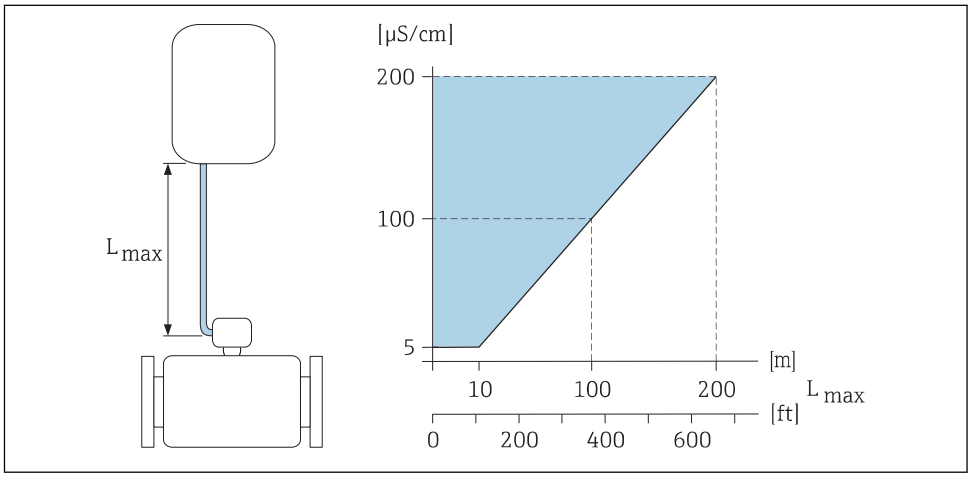


Adapters

Suitable adapters to DIN EN 545 (double-flange reducers) can be used to install the sensor in larger-diameter pipes. The resultant increase in the rate of flow improves measuring accuracy with very slow-moving fluids.

The nomogram shown here can be used to calculate the pressure loss caused by reducers and expanders:
- Calculate the ratio of the diameters d/D.
- From the nomogram read off the pressure loss as a function of flow velocity (downstream from the reduction) and the d/D ratio.

The nomogram only applies to liquids with a viscosity similar to that of water.

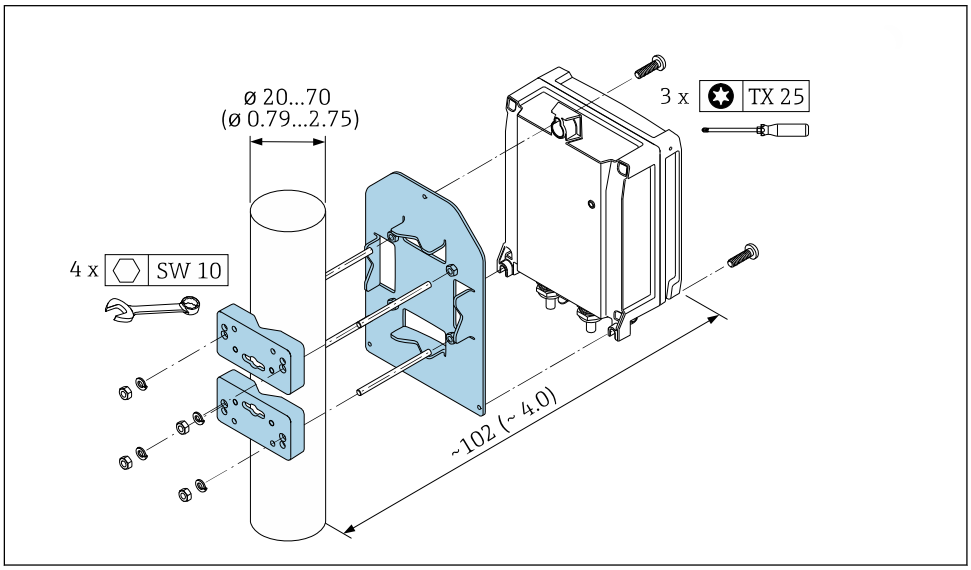


Length of connecting cable

Proline 500 – digital transmitter
Lengths of connecting cable → 48

Proline 500 transmitter
Max. 200 m (650 ft)

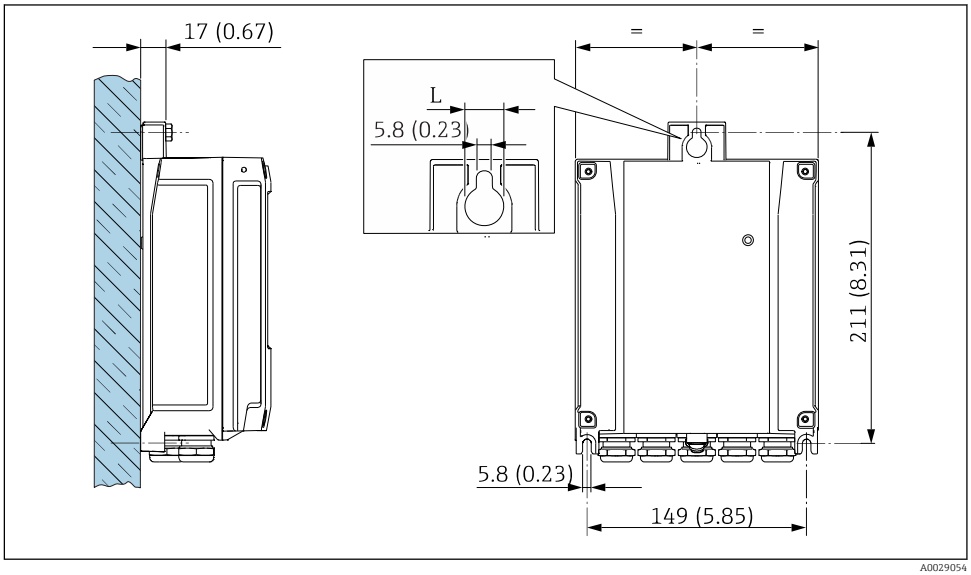
To obtain correct measurement results, observe the permitted connecting cable length of L_{max}. This length is determined by the conductivity of the fluid. If measuring liquids in general: 5 µS/cm



27 *Permitted length of connecting cable*

Colored area = permitted range
L_{max} = length of connecting cable in [m] ([ft])
[µS/cm] = fluid conductivity

Mounting the transmitter housing



Proline 500 – digital transmitter

Post mounting

28 *Engineering unit mm (in)*

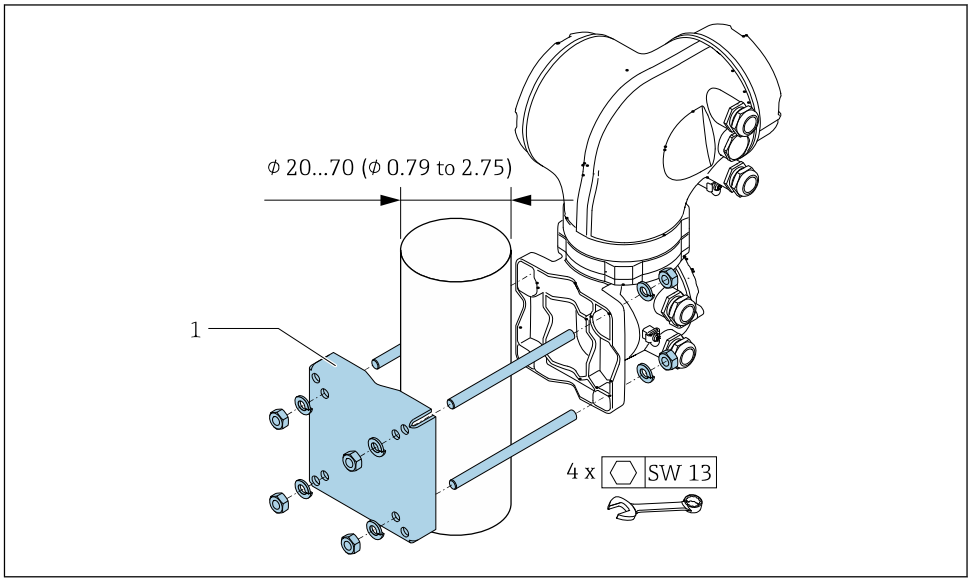
Wall mounting

29 *Engineering unit mm (in)*

L Depends on order code for "Transmitter housing"

Order code for "Transmitter housing"
- Option **A**, aluminum coated: L =14 mm (0.55 in)
- Option **D**, polycarbonate: L = 13 mm (0.51 in)

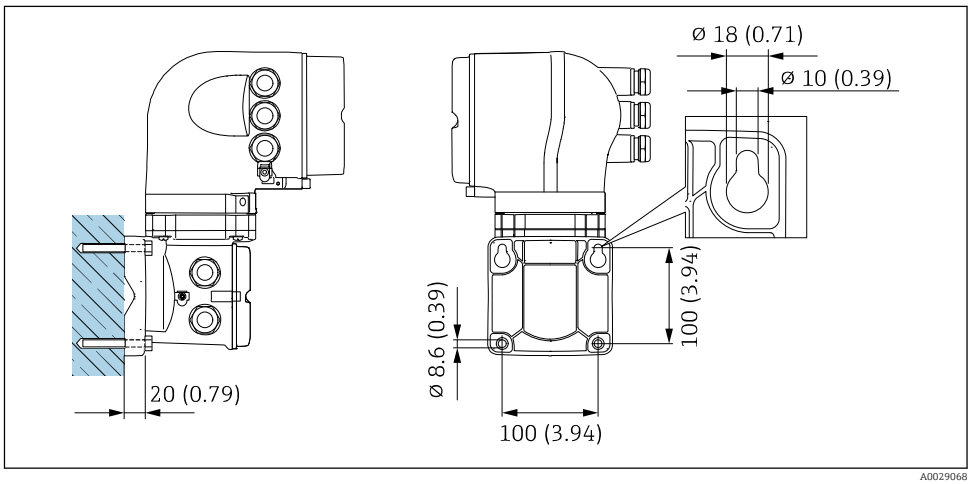
Proline 500 transmitter



Post mounting

⚠ WARNING

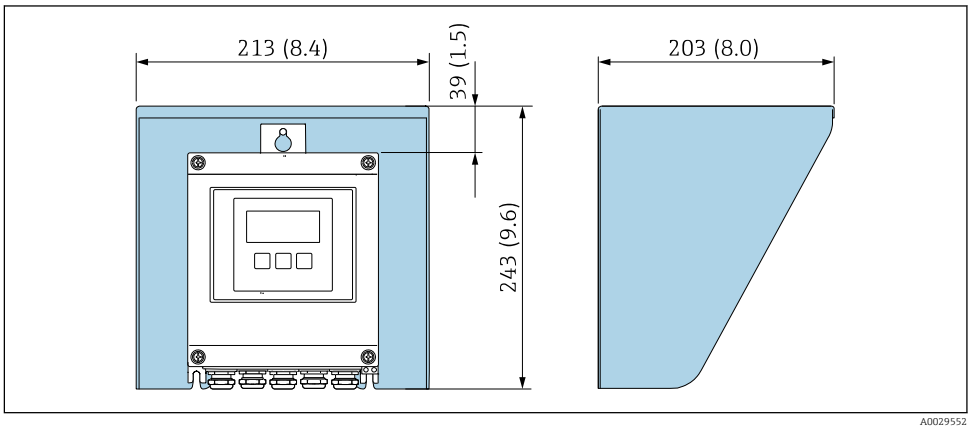
Order code for "Transmitter housing", option L "Cast, stainless": cast transmitters are very heavy.



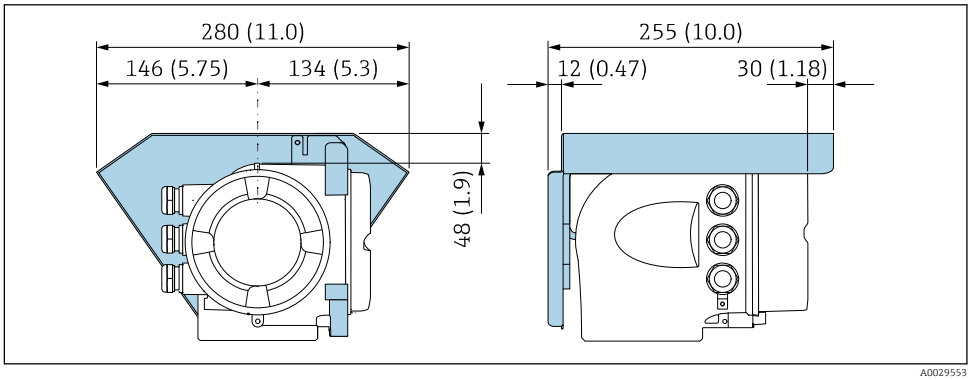
They are unstable if they are not mounted on a secure, fixed post.

► Only mount the transmitter on a secure, fixed post on a stable surface.

30 *Engineering unit mm (in)*



Wall mounting



31 *Engineering unit mm (in)*

33 *Weather protection cover for Proline 500*

Environment

Ambient temperature range

Transmitter	▪ Standard: −40 to +60 °C (−40 to +140 °F) ▪ Optional: −50 to +60 °C (−58 to +140 °F) (order code for "Test, certificate", option **JN** "Ambient temperature of transmitter −50 °C (−58 °F)")
Local display	−20 to +60 °C (−4 to +140 °F), the readability of the display may be impaired at temperatures outside the temperature range.
Sensor	▪ Process connection material, carbon steel: −10 to +60 °C (+14 to +140 °F) ▪ Process connection material, stainless steel: −40 to +60 °C (−40 to +140 °F) Mount the transmitter separately from the sensor if both the ambient and fluid temperatures are high.
Liner	Do not exceed or fall below the permitted temperature range of the liner .

If operating outdoors:
- Install the measuring device in a shady location.
- Avoid direct sunlight, particularly in warm climatic regions.
- Avoid direct exposure to weather conditions.

Storage temperature

The storage temperature corresponds to the operating temperature range of the transmitter and the sensor → 58.

- Protect the measuring device against direct sunlight during storage in order to avoid unacceptably high surface temperatures.
- Select a storage location where moisture cannot collect in the measuring device as fungus or bacteria infestation can damage the liner.
- If protection caps or protective covers are mounted these should never be removed before installing the measuring device.

Degree of protection

Transmitter
- As standard: IP66/67, type 4X enclosure
- When housing is open: IP20, type 1 enclosure
- Display module: IP20, type 1 enclosure

Sensor
As standard: IP66/67, type 4X enclosure

External WLAN antenna
IP67

Vibration- and shock-resistance

Vibration sinusoidal, in accordance with IEC 60068-2-6

Order code for "Sensor junction housing", option L "Cast, stainless" and order code for "Sensor option", option CG "Extended neck for insulation"
- 2 to 8.4 Hz, 3.5 mm peak
- 8.4 to 2 000 Hz, 1 g peak

Order code for "Sensor connection housing", option A "Alu, coated"
- 2 to 8.4 Hz, 7.5 mm peak
- 8.4 to 2 000 Hz, 2 g peak

Vibration broad-band random, according to IEC 60068-2-64

Order code for "Sensor junction housing", option L "Cast, stainless" and order code for "Sensor option", option CG "Extended neck for insulation"
- 10 to 200 Hz, 0.003 g^2/Hz
- 200 to 2 000 Hz, 0.001 g^2/Hz
- Total: 1.54 g rms

Order code for "Sensor connection housing", option A "Alu, coated"
- 10 to 200 Hz, 0.01 g^2/Hz
- 200 to 2 000 Hz, 0.003 g^2/Hz
- Total: 2.70 g rms

Shock half-sine, according to IEC 60068-2-27

- Order code for "Sensor junction housing", option L "Cast, stainless" and order code for "Sensor option", option CG "Extended neck for insulation"
  6 ms 30 g
- Order code for "Sensor connection housing", option A "Alu, coated"
  6 ms 50 g

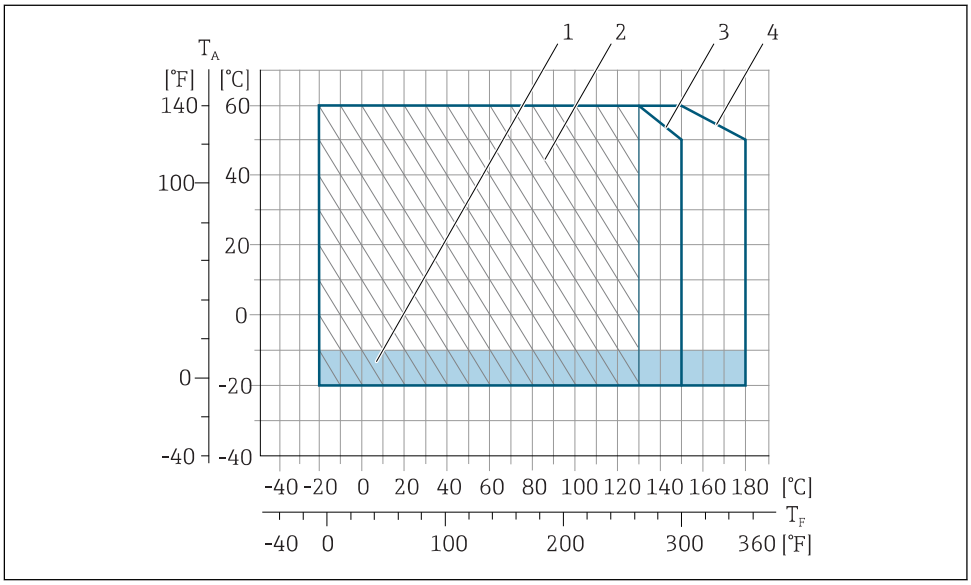
Rough handling shocks according to IEC 60068-2-31

Mechanical load

- Protect the transmitter housing against mechanical effects, such as shock or impact.
- Never use the transmitter housing as a ladder or climbing aid.

Electromagnetic compatibility (EMC)

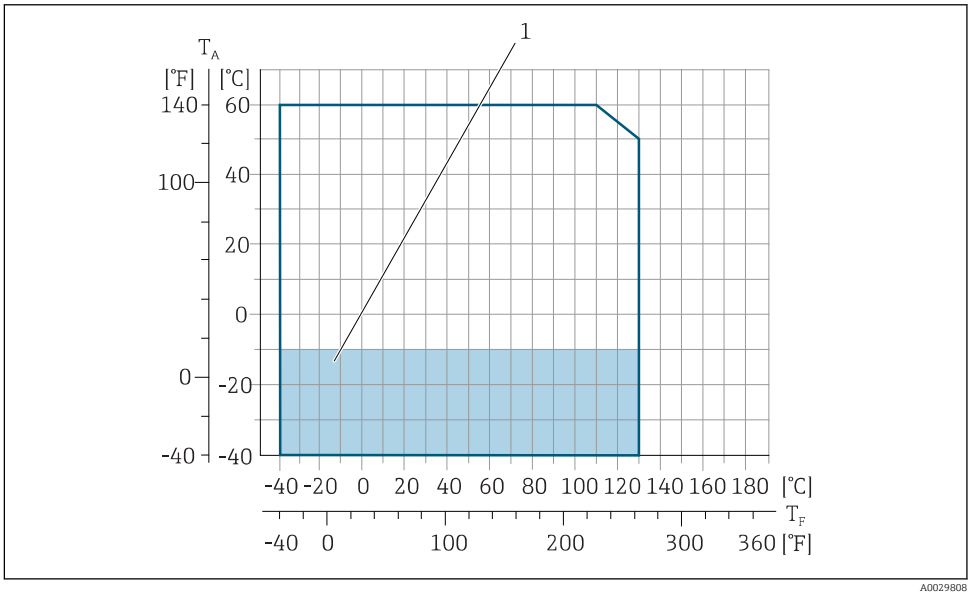
- As per IEC/EN 61326 and NAMUR Recommendation 21 (NE 21)
- Device version with PROFIBUS DP: Complies with emission limits for industry as per EN 50170 Volume 2, IEC 61784



The following applies for PROFIBUS DP: If baud rates > 1.5 MBaud, an EMC cable entry must be used and the cable shield must continue as far as the terminal wherever possible.

Details are provided in the Declaration of Conformity.

Process



Medium temperature range

- −20 to +150 °C (−4 to +302 °F) for PFA, DN 25 to 200 (1 to 8")
- −20 to +180 °C (−4 to +356 °F) for PFA high-temperature, DN 25 to 200 (1 to 8")
- −40 to +130 °C (−40 to +266 °F) for PTFE, DN 15 to 600 (½ to 24")

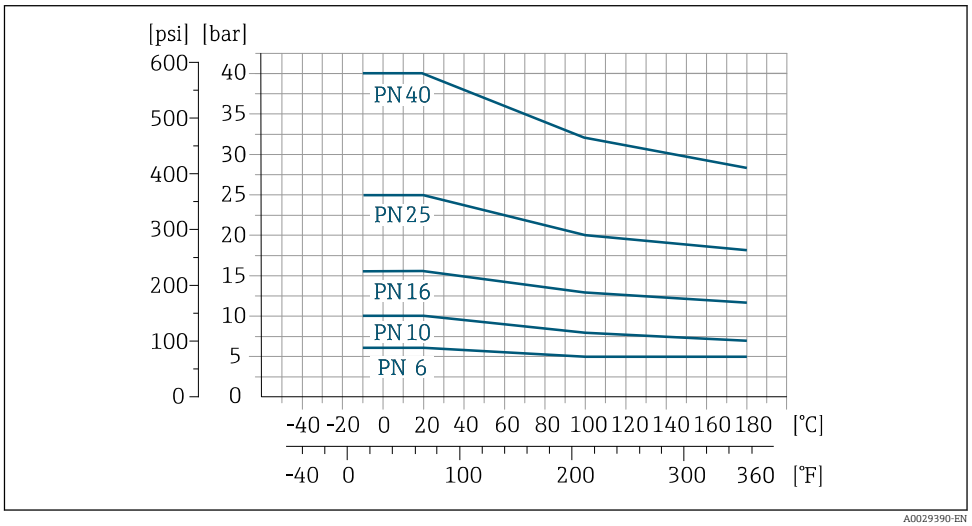
34 *PFA*

T_A *Ambient temperature*
T_F *Medium temperature*
1 *Colored area: the ambient temperature range −10 to −20 °C (+14 to −4 °F) applies to stainless flanges only*
2 *Hatched area: harsh environment only for medium temperature range −20 to +130 °C (−4 to +266 °F)*
3 *−20 to +150 °C (−4 to +302 °F) for PFA, DN 25 to 200 (1 to 8")*
4 *−20 to +180 °C (−4 to +356 °F) for PFA high-temperature, DN 25 to 200 (1 to 8")*

35 *PTFE*

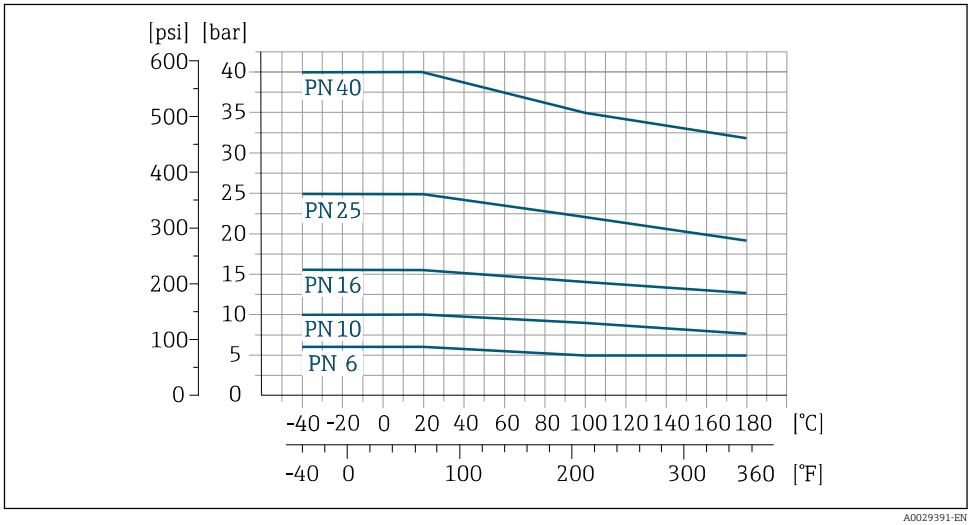
T_A *Ambient temperature*
T_F *Medium temperature*
1 *Colored area: the ambient temperature range of −10 to −40 °C (+14 to −40 °F) applies to stainless flanges only*

Conductivity



≥ 5 µS/cm for liquids in general.

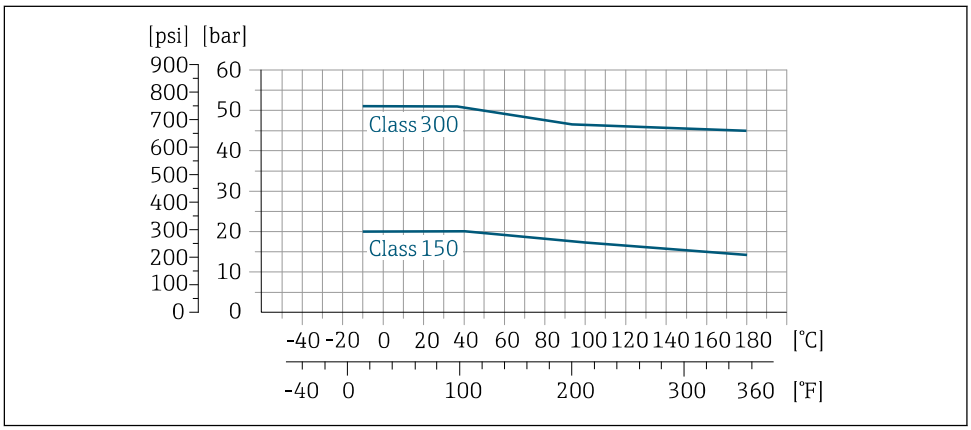
Proline 500
The necessary minimum conductivity also depends on the cable length → 55.



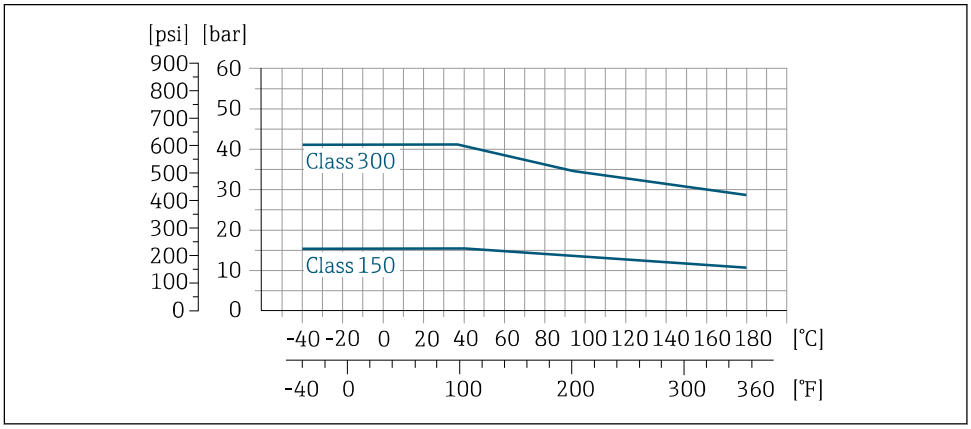
Pressure-temperature ratings

The following pressure/temperature diagrams apply to all pressure-bearing parts of the device and not just the process connection. The diagrams show the maximum permissible medium pressure depending on the specific medium temperature.

Process connection: flange according to EN 1092-1 (DIN 2501)

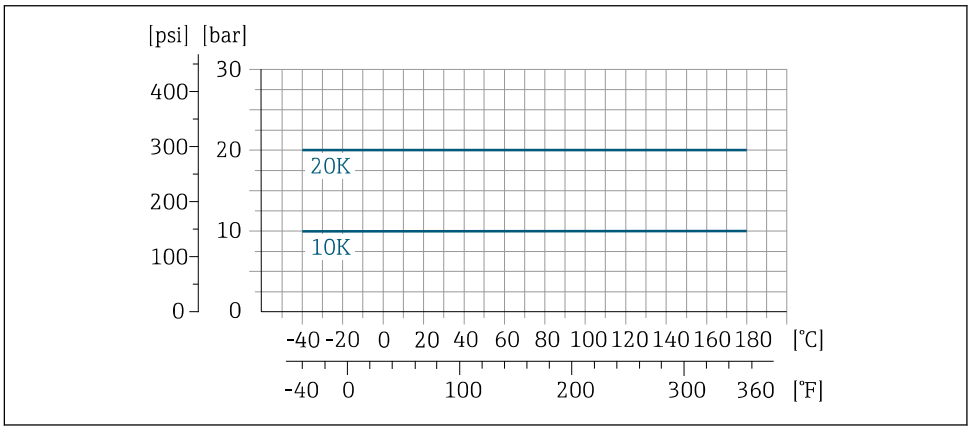


36 *Process connection material: carbon steel, FE410WB/S235JRG2; Alloy C22, 2.4602 (UNS N06022)*

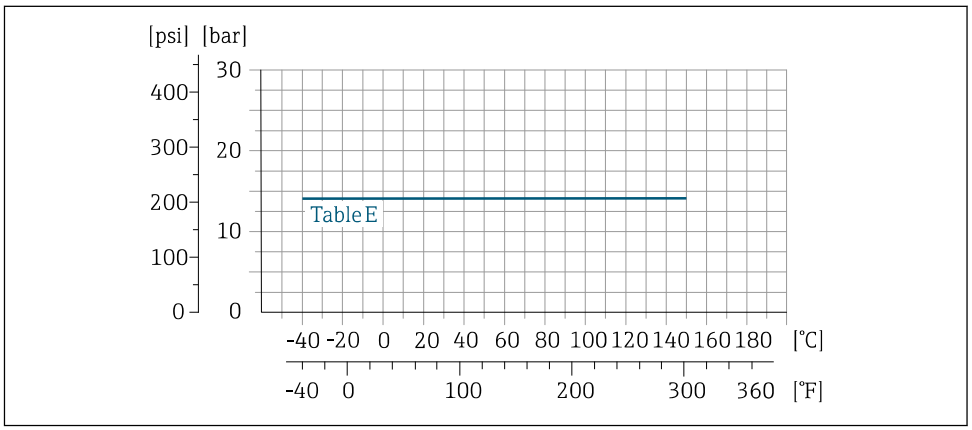


37 *Process connection material: stainless steel, 1.4571*

Process connection: flange according to ASME B16.5



38 Process connection material: carbon steel, A105



39 Process connection material: stainless steel, F316L

Process connection: flange according to JIS B2220

40 Process connection material: stainless steel, F316L; carbon steel, S235JRG2/HII

Process connection: flange according to AS 2129 (Table E) or AS 4087 (PN 16)

41 *Process connection material: carbon steel, A105/S235JRG2/S275JR*

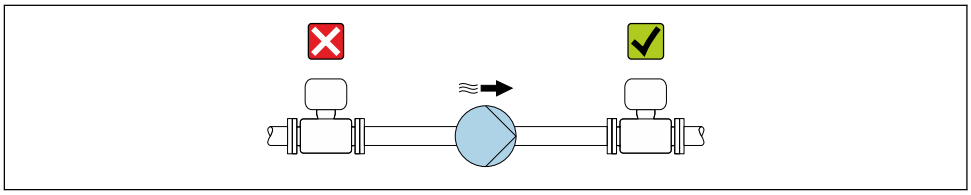
Flow limit

The diameter of the pipe and the flow rate determine the nominal diameter of the sensor. The optimum velocity of flow is between 2 to 3 m/s (6.56 to 9.84 ft/s). Also match the velocity of flow (v) to the physical properties of the fluid:
- v < 2 m/s (6.56 ft/s): for abrasive fluids (e.g. potter's clay, lime milk, ore slurry)
- v > 2 m/s (6.56 ft/s): for fluids producing buildup (e.g. wastewater sludge)



A necessary increase in the flow velocity can be achieved by reducing the sensor nominal diameter.

For an overview of the full scale values for the measuring range, see the "Measuring range" section

Pressure loss

- No pressure loss occurs if the sensor is installed in a pipe with the same nominal diameter.
- Pressure losses for configurations incorporating adapters according to DIN EN 545 → 54

System pressure

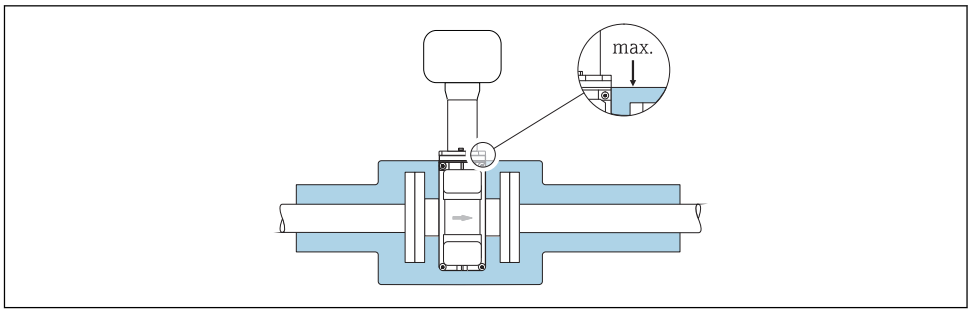
A0028777

Never install the sensor on the pump suction side in order to avoid the risk of low pressure, and thus damage to the liner.

Furthermore, install pulse dampers if reciprocating, diaphragm or peristaltic pumps are used.

- Information on the liner's resistance to partial vacuum
- Information on the shock resistance of the measuring system
- Information on the vibration resistance of the measuring system

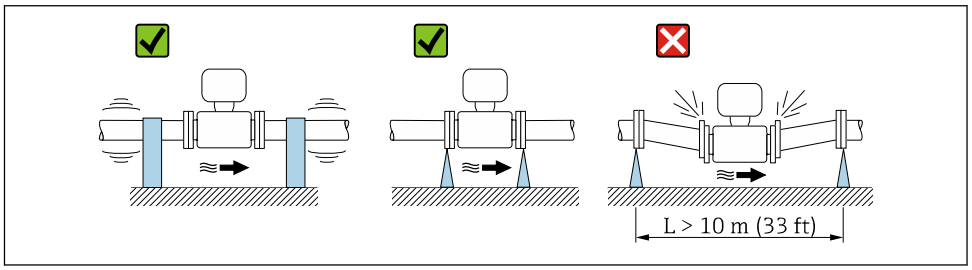
Thermal insulation



If process fluids are very hot, it is necessary to insulate pipes in order to reduce energy loss and to prevent individuals from accidentally coming into contact with hot pipes. Please observe the applicable standards and guidelines for insulating pipes.

A housing support/an extended neck is used for heat dissipation:
- Devices with the order code for "Lining", option **B** "PFA high-temperature" always come with a housing support.
- In the case of all other devices, a housing support can be ordered via the order code for "Sensor option", option **CG** "Sensor extended neck".

⚠ WARNING

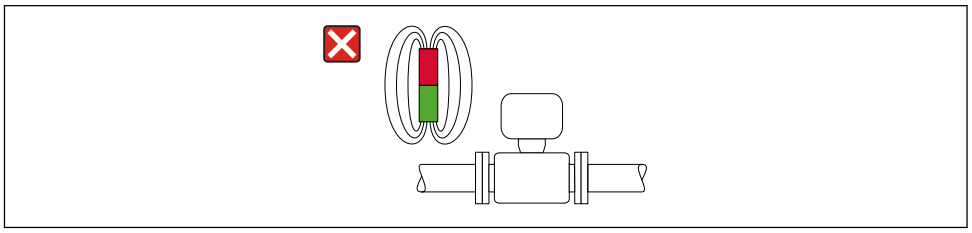


Electronics overheating on account of thermal insulation!

▶ The housing support is used for heat dissipation and must be completely free (i.e. uncovered). At the very maximum, the sensor insulation may extend as far as the upper edge of the two sensor half-shells.

A0031216

Vibrations



A0029004

42 *Measures to prevent vibration of the device*

In the event of very strong vibrations, the pipe and sensor must be supported and fixed.

Accessories

Protective cover

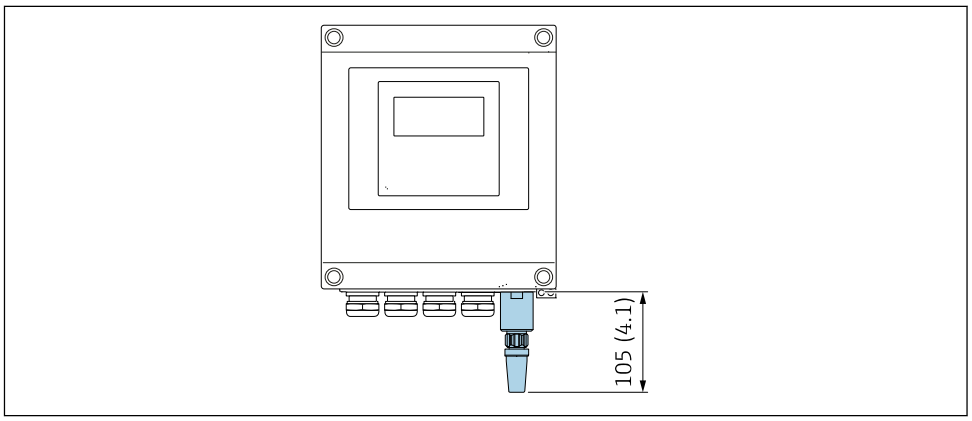
50 Weather protection cover for Proline 500 – digital

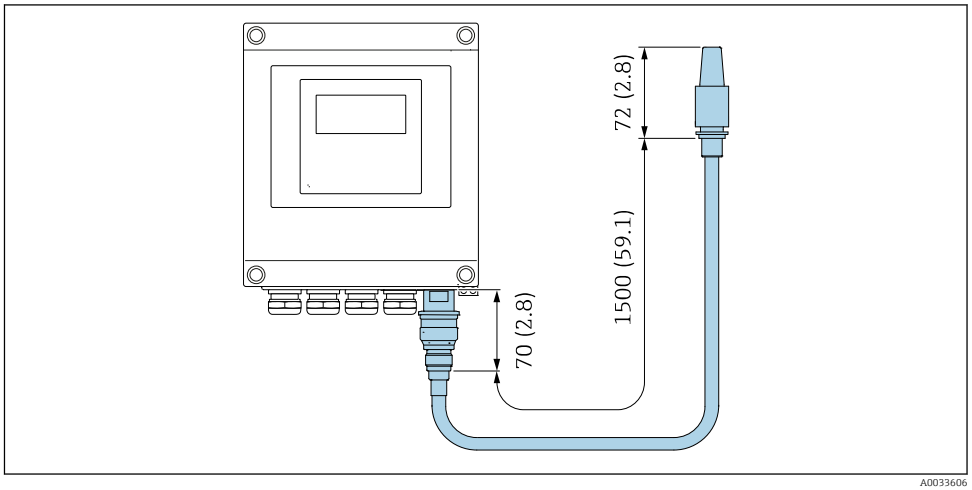


51 Weather protection cover for Proline 500

External WLAN antenna

The external WLAN antenna is not suitable for use in hygienic applications.

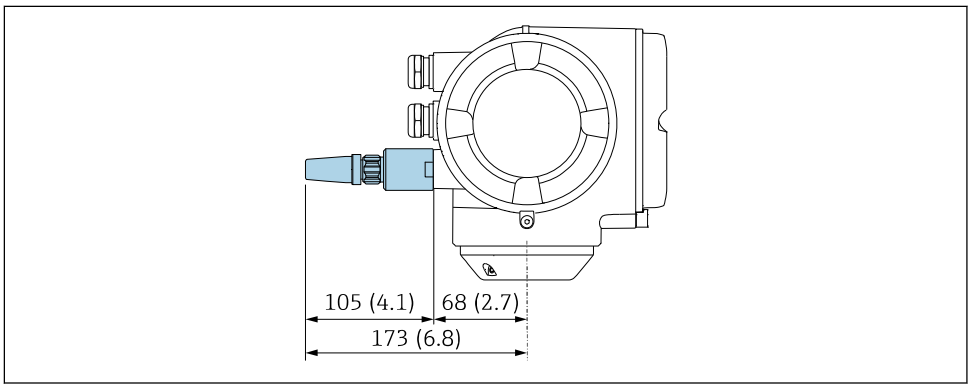
Proline 500 – digital



External WLAN antenna mounted on device

52 *Engineering unit mm (in)*

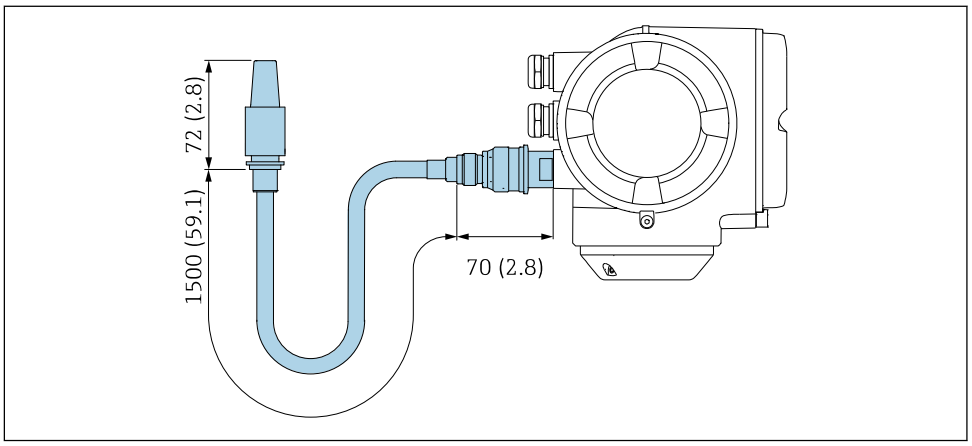
External WLAN antenna mounted with cable



The external WLAN antenna can be mounted separately from the transmitter if the transmission/ reception conditions at the transmitter mounting location are poor.

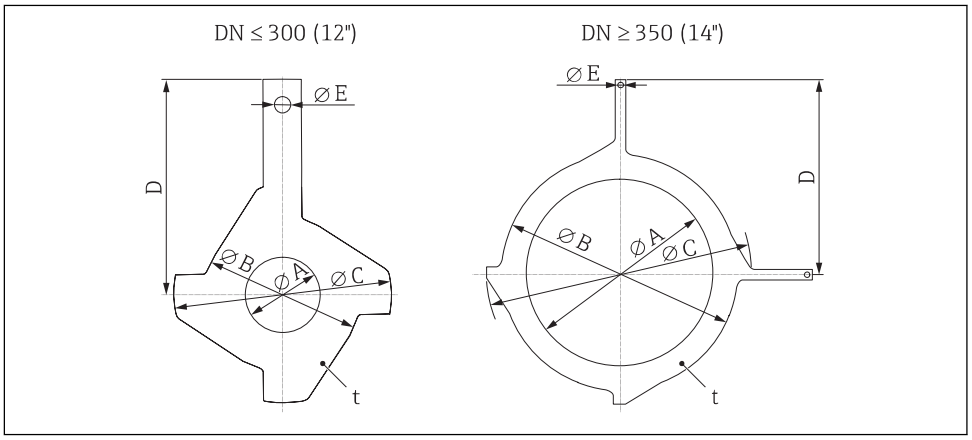
53 *Engineering unit mm (in)*

Proline 500



External WLAN antenna mounted on device

54 *Engineering unit mm (in)*



External WLAN antenna mounted with cable

The external WLAN antenna can be mounted separately from the transmitter if the transmission/ reception conditions at the transmitter mounting location are poor.

55 *Engineering unit mm (in)*

Ground disk for flange connection

1) Ground disks can be used for all available pressure ratings.

Weight

All values (weight exclusive of packaging material) refer to devices with flanges of the standard pressure rating.
The weight may be lower than indicated depending on the pressure rating and design.

Transmitter
- Proline 500 – digital polycarbonate: 1.4 kg (3.1 lbs)
- Proline 500 – digital aluminum: 2.4 kg (5.3 lbs)
- Proline 500 aluminum: 6.5 kg (14.3 lbs)
- Proline 500 cast, stainless: 15.6 kg (34.4 lbs)

Sensor
- Sensor with aluminum connection housing version: see the information in the following table
- Sensor with cast connection housing version, stainless: +3.7 kg (+8.2 lbs)

Weight in SI units

Nominal diameter		EN (DIN), AS [1]		ASME		JIS

Materials

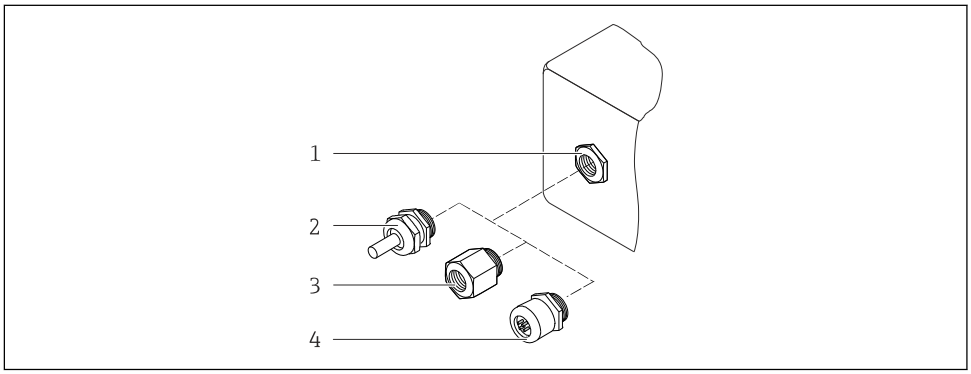
Transmitter housing

Housing of Proline 500 – digital transmitter

Order code for "Transmitter housing":
- Option **A** "Aluminum coated": aluminum, AlSi10Mg, coated
- Option **D** "Polycarbonate": polycarbonate

Housing of Proline 500 transmitter

Order code for "Transmitter housing":
- Option **A** "Aluminum coated": aluminum, AlSi10Mg, coated
- Option **L** "Cast, stainless": cast, stainless steel, 1.4409 (CF3M) similar to 316L



Window material

Order code for "Transmitter housing":
- Option **A** "Aluminum, coated": glass
- Option **D** "Polycarbonate": plastic
- Option **L** "Cast, stainless": glass

Sensor connection housing

Order code for "Sensor connection housing":
- Option **A** "Aluminum coated": aluminum, AlSi10Mg, coated
- Option **L** "Cast, stainless": 1.4409 (CF3M) similar to 316L

Cable entries/cable glands

56 *Possible cable entries/cable glands*

1 *Female thread M20 × 1.5*
2 *Cable gland M20 × 1.5*
3 *Adapter for cable entry with internal thread G ½" or NPT ½"*
4 *Device plugs*

Cable entries and adapters	Material
Cable gland M20 × 1.5	Plastic

▪ Adapter for cable entry with internal thread G ½"
▪ Adapter for cable entry with internal thread NPT ½"
Only available for certain device versions:
▪ Order code for "Transmitter housing":
  ▪ Option **A** "Aluminum, coated"
  ▪ Option **D** "Polycarbonate"
▪ Order code for "Sensor connection housing":
  ▪ Proline 500 – digital:
  Option **A** "Aluminum coated"
  Option **L** "Cast, stainless"
  ▪ Proline 500:
  Option **A** "Aluminum coated"
  Option **L** "Cast, stainless"
	Nickel-plated brass

▪ Adapter for cable entry with internal thread G ½"
▪ Adapter for cable entry with internal thread NPT ½"
Only available for certain device versions:
▪ Order code for "Transmitter housing":
  Option **L** "Cast, stainless"
▪ Order code for "Sensor connection housing":
  Option **L** "Cast, stainless"
	Stainless steel, 1.4404 (316L)

Adapter for device plug Device plug for digital communication: Only available for certain device versions → 30.	Stainless steel, 1.4404 (316L)

Device plug

Electrical connection	Material
Plug M12x1	▪ Socket: Stainless steel, 1.4404 (316L) ▪ Contact housing: Polyamide ▪ Contacts: Gold-plated brass

Connecting cable

UV rays can impair the cable outer sheath. Protect the cable from exposure to sun as much as possible.

Connecting cable for sensor - Proline 500 – digital transmitter

PVC cable with copper shield

Connecting cable for sensor - Proline 500 transmitter

- Standard cable: PVC cable with copper shield
- Reinforced cable: PVC cable with copper shield and additional steel wire braided jacket

Sensor housing

- DN 15 to 300 (½ to 12"): coated aluminum AlSi10Mg
- DN 350 to 600 (14 to 24"): carbon steel with protective varnish

Measuring tubes

Stainless steel, 1.4301/304/1.4306/304L
For flanges made of carbon with Al/Zn protective coating (DN 15 to 300 (½ to 12")) or protective varnish (DN 350 to 600 (14 to 24"))

Liner

- PFA
- PTFE

Process connections

EN 1092-1 (DIN 2501)
Stainless steel, 1.4571; carbon steel, E250C [1)]/S235JRG2/P245GH

ASME B16.5
Stainless steel, F316L; carbon steel, A105 [1)]

JIS B2220
Stainless steel, F316L [1)]; carbon steel, A105/A350 LF2

AS 2129 Table E
- DN 25 (1"): carbon steel, A105/S235JRG2
- DN 40 (1 ½"): carbon steel, A105/S275JR

AS 4087 PN 16
Carbon steel, A105/S275JR

Electrodes

Stainless steel, 1.4435 (F316L); Alloy C22, 2.4602 (UNS N06022); platinum; tantalum; titanium

Seals

As per DIN EN 1514-1, form IBC

Accessories

Protective cover

Stainless steel, 1.4404 (316L)

External WLAN antenna

- Antenna: ASA plastic (acrylic ester-styrene-acrylonitrile) and nickel-plated brass
- Adapter: Stainless steel and nickel-plated brass
- Cable: Polyethylene
- Plug: Nickel-plated brass
- Angle bracket: Stainless steel

Ground disks

Stainless steel, 1.4435 (F316L); Alloy C22, 2.4602 (UNS N06022); tantalum; titanium

1) DN 15 to 300 (½ to 12") with Al/Zn protective varnish; DN 350 to 600 (14 to 24") with protective varnish

Fitted electrodes

Measuring electrodes, reference electrodes and electrodes for empty pipe detection:
- Standard: stainless steel, 1.4435 (F316L); Alloy C22, 2.4602 (UNS N06022); tantalum, titanium
- Optional: only platinum measuring electrodes

Process connections

- EN 1092-1 (DIN 2501)
- ASME B16.5
- JIS B2220
- AS 2129 Table E
- AS 4087 PN 16

For information on the different materials used in the process connections → 87

Surface roughness

Stainless steel electrodes, 1.4435 (F316L); Alloy C22, 2.4602 (UNS N06022); platinum; tantalum; titanium:
≤ 0.3 to 0.5 µm (11.8 to 19.7 µin)
(All data relate to parts in contact with fluid)

Liner with PFA:
≤ 0.4 µm (15.7 µin)
(All data relate to parts in contact with fluid)

Human interface

Operating concept

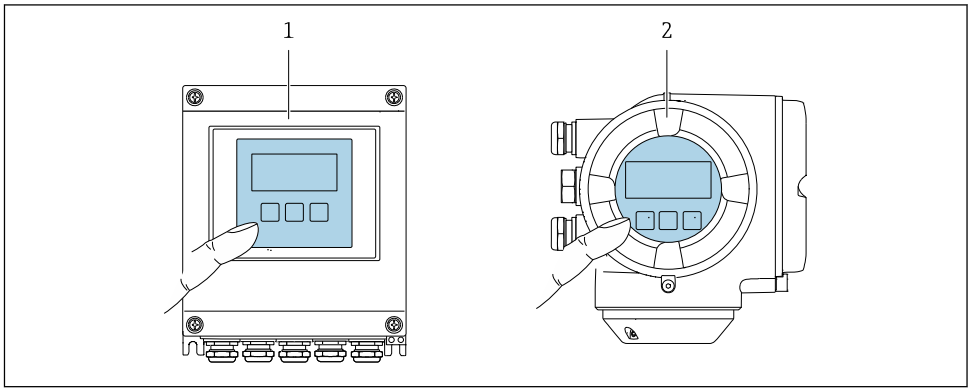
Operator-oriented menu structure for user-specific tasks
- Commissioning
- Operation
- Diagnostics
- Expert level

Fast and safe commissioning
- Guided menus ("Make-it-run" wizards) for applications
- Menu guidance with brief descriptions of the individual parameter functions
- Access to the device via Web server → 108
- WLAN access to the device via mobile handheld terminal, tablet or smart phone

Reliable operation
- Operation in local language → 88
- Uniform operating philosophy applied to device and operating tools
- If replacing electronic modules, transfer the device configuration via the integrated memory (HistoROM backup) which contains the process and measuring device data and the event logbook. No need to reconfigure.

Efficient diagnostics increase measurement availability
- Troubleshooting measures can be called up via the device and in the operating tools
- Diverse simulation options, logbook for events that occur and optional line recorder functions

Languages



Can be operated in the following languages:
- Via local operation
  English, German, French, Spanish, Italian, Dutch, Portuguese, Polish, Russian, Turkish, Chinese, Japanese, Korean, Bahasa (Indonesian), Vietnamese, Czech, Swedish
- Via Web browser
  English, German, French, Spanish, Italian, Dutch, Portuguese, Polish, Russian, Turkish, Chinese, Japanese, Korean, Bahasa (Indonesian), Vietnamese, Czech, Swedish
- Via "FieldCare", "DeviceCare" operating tool: English, German, French, Spanish, Italian, Chinese, Japanese

Local operation

Via display module

Equipment:
- Order code for "Display; operation", option F "4-line, illuminated, graphic display; touch control"
- Order code for "Display; operation", option G "4-line, illuminated, graphic display; touch control + WLAN"

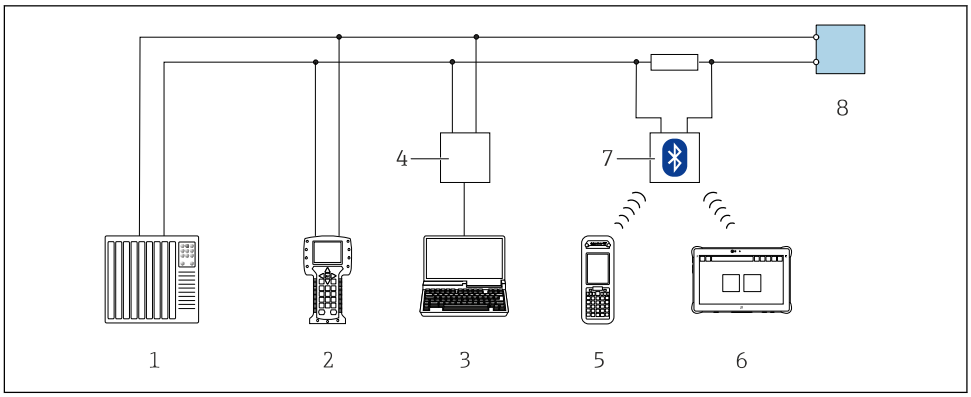
Information about WLAN interface → 95

57 *Operation with touch control*

1 Proline 500 – digital
2 Proline 500

Display elements

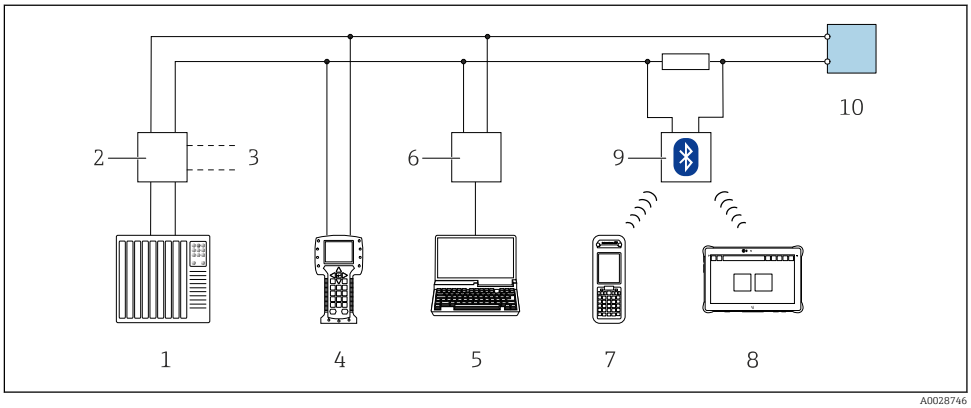
- 4-line, illuminated, graphic display
- White background lighting; switches to red in event of device errors
- Format for displaying measured variables and status variables can be individually configured
- Permitted ambient temperature for the display: –20 to +60 °C (–4 to +140 °F)
  The readability of the display may be impaired at temperatures outside the temperature range.



Operating elements

- External operation via touch control (3 optical keys) without opening the housing: ⊞, ⊟, Ⓔ
- Operating elements also accessible in the various zones of the hazardous area

Remote operation

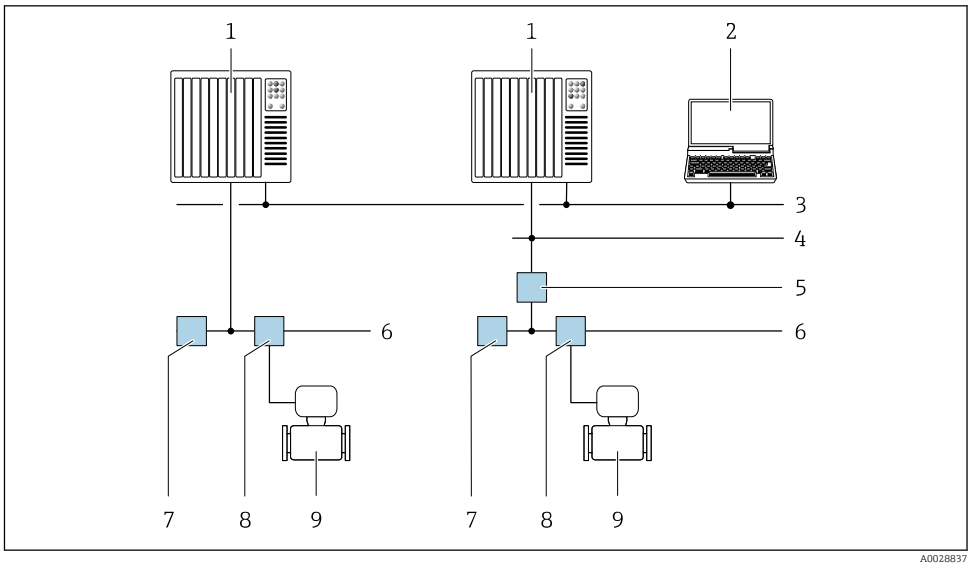


Via HART protocol

This communication interface is available in device versions with a HART output.

58 *Options for remote operation via HART protocol (active)*

1 *Control system (e.g. PLC)*
2 *Field Communicator 475*
3 *Computer with Web browser (e.g. Internet Explorer) for access to the integrated device Web server or computer with an operating tool (e.g. FieldCare, DeviceCare, AMS Device Manager, SIMATIC PDM) with COM DTM "CDI Communication TCP/IP"*
4 *Commubox FXA195 (USB)*
5 *Field Xpert SFX350 or SFX370*
6 *Field Xpert SMT70*
7 *VIATOR Bluetooth modem with connecting cable*
8 *Transmitter*

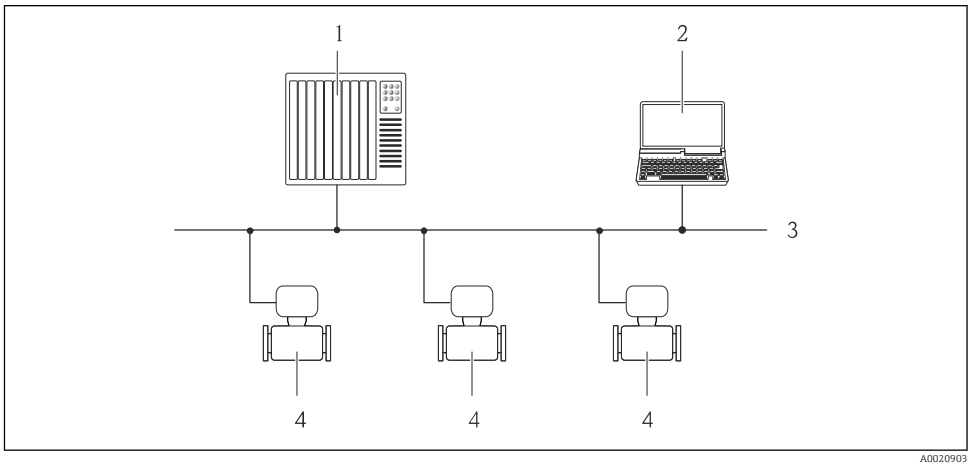


59 *Options for remote operation via HART protocol (passive)*

1 *Control system (e.g. PLC)*
2 *Transmitter power supply unit, e.g. RN221N (with communication resistor)*
3 *Connection for Commubox FXA195 and Field Communicator 475*
4 *Field Communicator 475*
5 *Computer with Web browser (e.g. Internet Explorer) for access to the integrated device Web server or computer with an operating tool (e.g. FieldCare, DeviceCare, AMS Device Manager, SIMATIC PDM) with COM DTM "CDI Communication TCP/IP"*
6 *Commubox FXA195 (USB)*
7 *Field Xpert SFX350 or SFX370*
8 *Field Xpert SMT70*
9 *VIATOR Bluetooth modem with connecting cable*
10 *Transmitter*

Via FOUNDATION Fieldbus network

This communication interface is available in device versions with FOUNDATION Fieldbus.

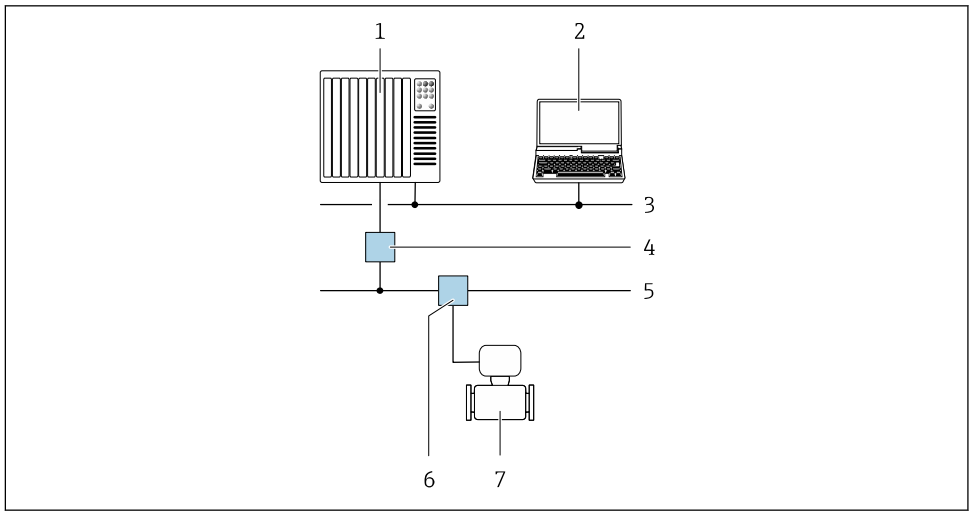


60 *Options for remote operation via FOUNDATION Fieldbus network*

1 *Automation system*
2 *Computer with FOUNDATION Fieldbus network card*
3 *Industry network*
4 *High Speed Ethernet FF-HSE network*
5 *Segment coupler FF-HSE/FF-H1*
6 *FOUNDATION Fieldbus FF-H1 network*
7 *Power supply FF-H1 network*
8 *T-box*
9 *Measuring device*

Via PROFIBUS DP network

This communication interface is available in device versions with PROFIBUS DP.

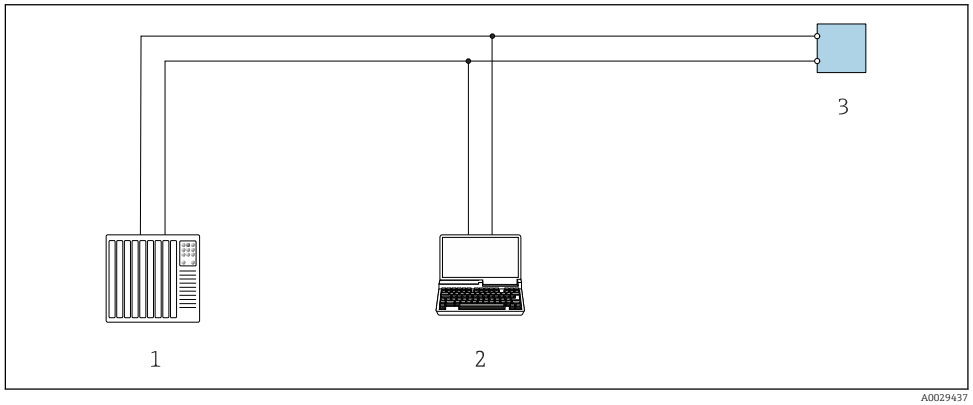


61 *Options for remote operation via PROFIBUS DP network*

1 *Automation system*
2 *Computer with PROFIBUS network card*
3 *PROFIBUS DP network*
4 *Measuring device*

Via PROFIBUS PA network

This communication interface is available in device versions with PROFIBUS PA.

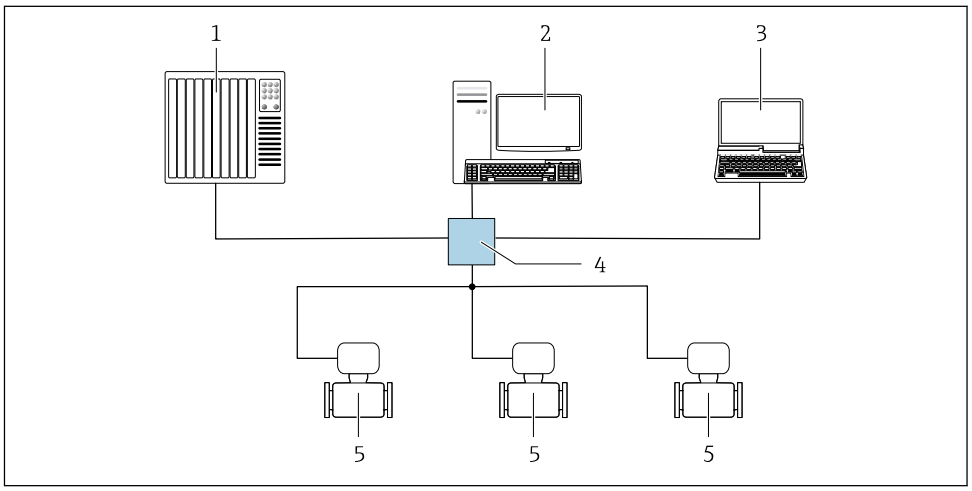


62 *Options for remote operation via PROFIBUS PA network*

1 Automation system
2 Computer with PROFIBUS network card
3 PROFIBUS DP network
4 Segment coupler PROFIBUS DP/PA
5 PROFIBUS PA network
6 T-box
7 Measuring device

Via Modbus RS485 protocol

This communication interface is available in device versions with a Modbus-RS485 output.



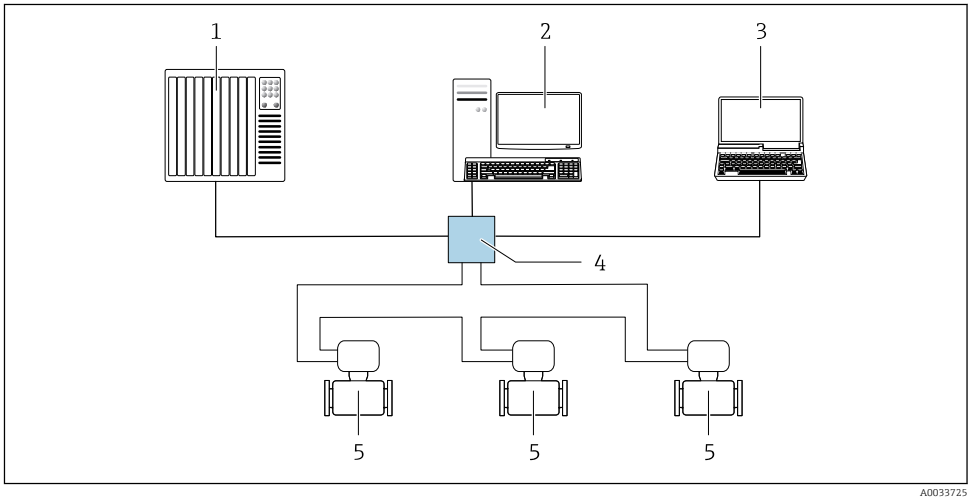
63 *Options for remote operation via Modbus-RS485 protocol (active)*

1 Control system (e.g. PLC)
2 Computer with Web browser (e.g. Internet Explorer) for accessing the integrated device Web server or with operating tool (e.g. FieldCare, DeviceCare) with COM DTM "CDI Communication TCP/IP" or Modbus DTM
3 Transmitter

Via EtherNet/IP network

This communication interface is available in device versions with EtherNet/IP.

Star topology

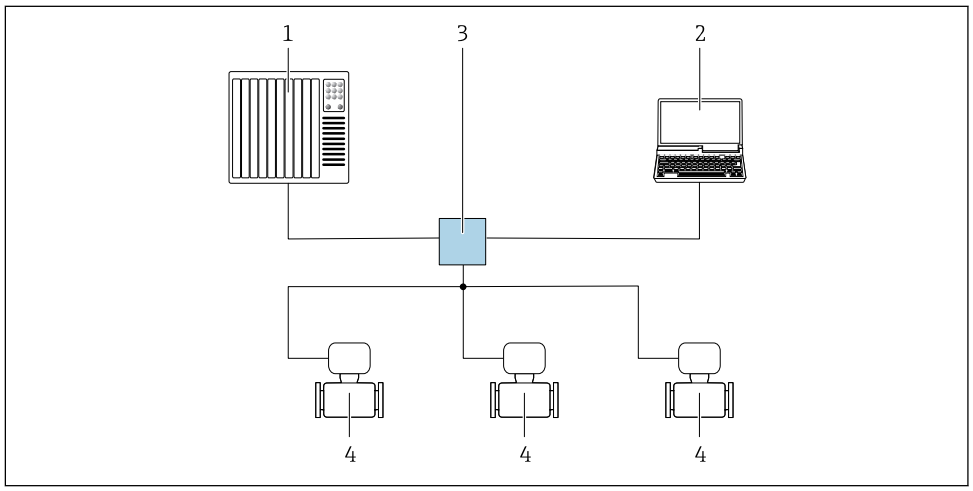


64 *Options for remote operation via EtherNet/IP network: star topology*

1 *Automation system, e.g. "RSLogix" (Rockwell Automation)*
2 *Workstation for measuring device operation: with Custom Add-On Profile for "RSLogix 5000" (Rockwell Automation) or with Electronic Data Sheet (EDS)*
3 *Computer with Web browser (e.g. Internet Explorer) for accessing the integrated device Web server or computer with operating tool (e.g. FieldCare, DeviceCare) with COM DTM "CDI Communication TCP/IP"*
4 *Ethernet switch*
5 *Measuring device*

Ring topology

The device is integrated via the terminal connection for signal transmission (output 1) and the service interface (CDI-RJ45).



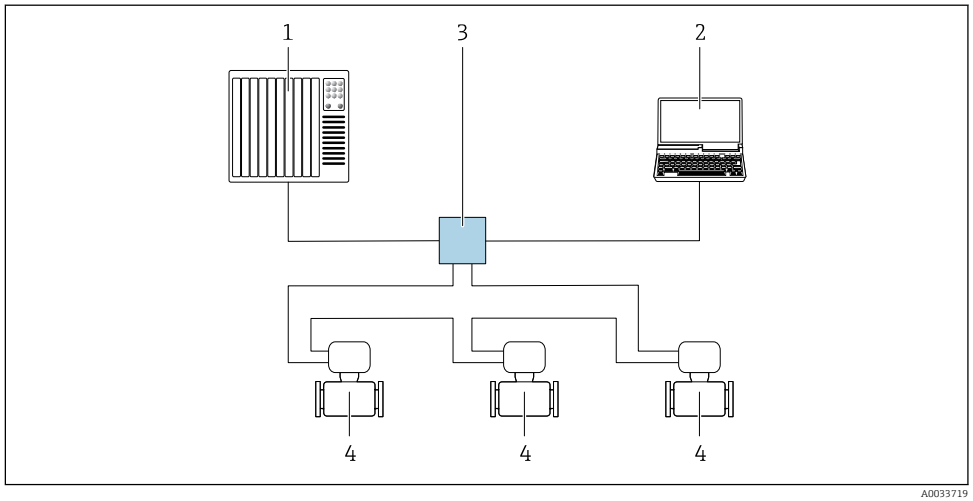
65 *Options for remote operation via EtherNet/IP network: ring topology*

1 *Automation system, e.g. "RSLogix" (Rockwell Automation)*
2 *Workstation for measuring device operation: with Custom Add-On Profile for "RSLogix 5000" (Rockwell Automation) or with Electronic Data Sheet (EDS)*
3 *Computer with Web browser (e.g. Internet Explorer) for accessing the integrated device Web server or computer with operating tool (e.g. FieldCare, DeviceCare) with COM DTM "CDI Communication TCP/IP"*
4 *Ethernet switch*
5 *Measuring device*

Via PROFINET network

This communication interface is available in device versions with PROFINET.

Star topology



66 Options for remote operation via PROFINET network: star topology

1 *Automation system, e.g. Simatic S7 (Siemens)*
2 *Computer with Web browser (e.g. Internet Explorer) for accessing the integrated device Web server or computer with operating tool (e.g. FieldCare, DeviceCare, SIMATIC PDM) with COM DTM "CDI Communication TCP/IP"*
3 *Switch, e.g. Scalance X204 (Siemens)*
4 *Measuring device*

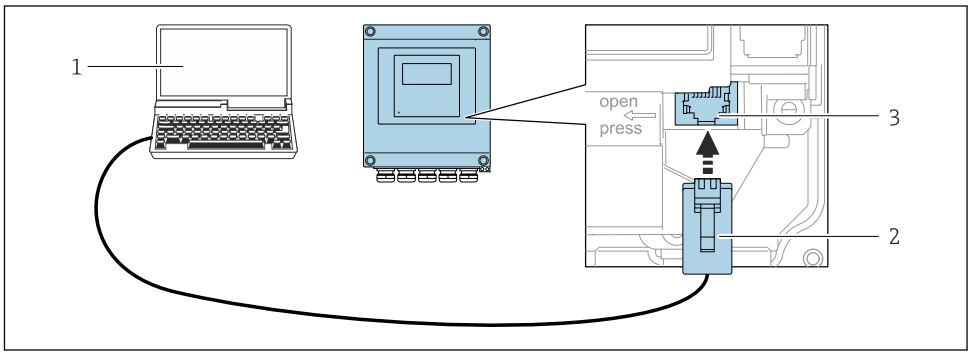
Ring topology

The device is integrated via the terminal connection for signal transmission (output 1) and the service interface (CDI-RJ45).

67 Options for remote operation via PROFINET network: ring topology

1 *Automation system, e.g. Simatic S7 (Siemens)*
2 *Computer with Web browser (e.g. Internet Explorer) for accessing the integrated device Web server or computer with operating tool (e.g. FieldCare, DeviceCare, SIMATIC PDM) with COM DTM "CDI Communication TCP/IP"*
3 *Switch, e.g. Scalance X204 (Siemens)*
4 *Measuring device*

Service interface

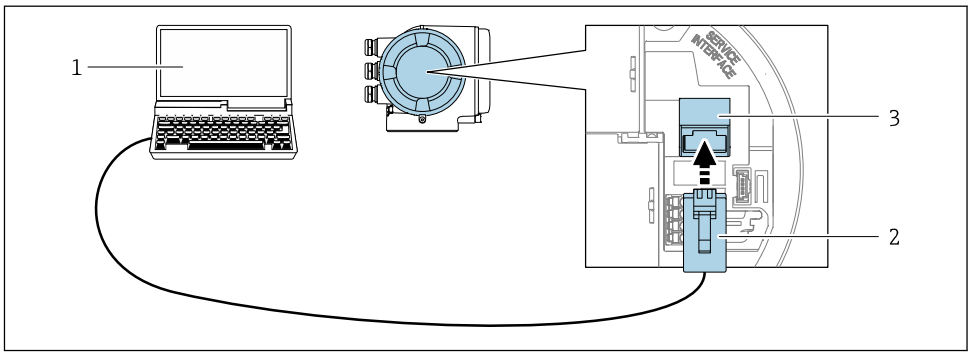


Via service interface (CDI-RJ45)

A point-to-point connection can be established to configure the device onsite. With the housing open, the connection is established directly via the service interface (CDI-RJ45) of the device.

An adapter for RJ45 and the M12 connector is optionally available:
Order code for "Accessories", option **NB**: "Adapter RJ45 M12 (service interface)"

The adapter connects the service interface (CDI-RJ45) to an M12 connector mounted in the cable entry. Therefore the connection to the service interface can be established via an M12 connector without opening the device.

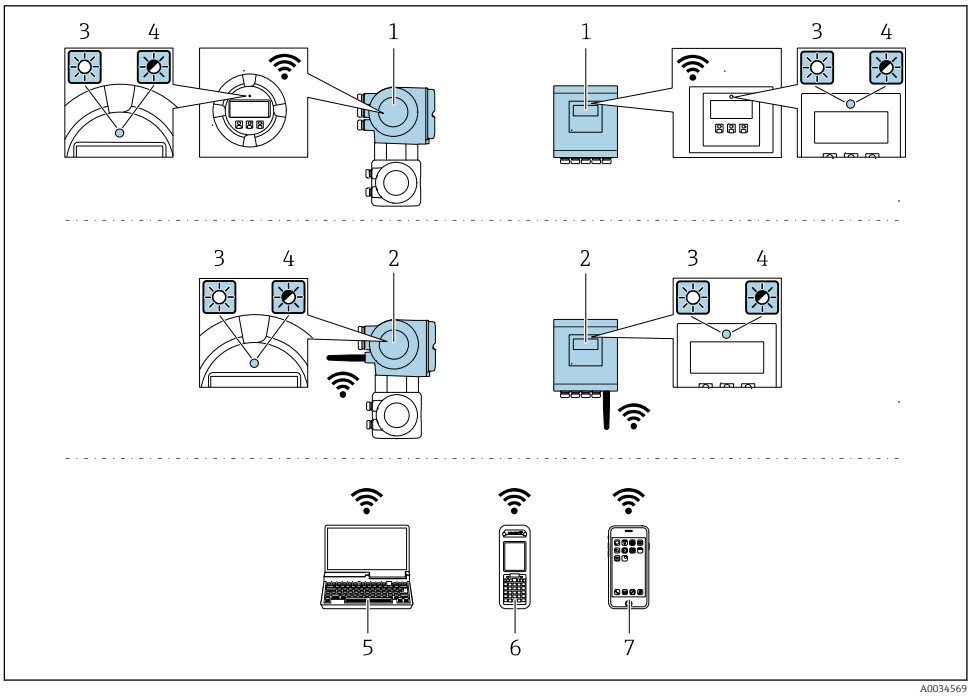


Proline 500 – digital transmitter

68 *Connection via service interface (CDI-RJ45)*

1 *Computer with Web browser (e.g. Microsoft Internet Explorer, Microsoft Edge) for accessing the integrated device Web server or with "FieldCare", "DeviceCare" operating tool with COM DTM "CDI Communication TCP/IP" or Modbus DTM*
2 *Standard Ethernet connecting cable with RJ45 connector*
3 *Service interface (CDI-RJ45) of the measuring device with access to the integrated Web server*

Proline 500 transmitter



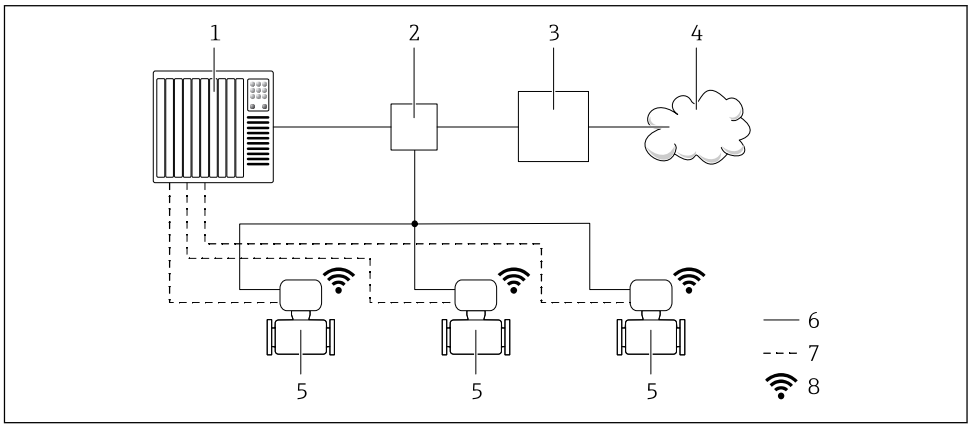
69 *Connection via service interface (CDI-RJ45)*

1 *Computer with Web browser (e.g. Microsoft Internet Explorer, Microsoft Edge) for accessing the integrated device Web server or with "FieldCare", "DeviceCare" operating tool with COM DTM "CDI Communication TCP/IP" or Modbus DTM*
2 *Standard Ethernet connecting cable with RJ45 connector*
3 *Service interface (CDI-RJ45) of the measuring device with access to the integrated Web server*

Via WLAN interface

The optional WLAN interface is available on the following device version:
Order code for "Display; operation", option G "4-line, illuminated; touch control + WLAN"

1 *Transmitter with integrated WLAN antenna*
2 *Transmitter with external WLAN antenna*
3 *LED lit constantly: WLAN reception is enabled on measuring device*
4 *LED flashing: WLAN connection established between operating unit and measuring device*
5 *Computer with WLAN interface and Web browser (e.g. Microsoft Internet Explorer, Microsoft Edge) for accessing the integrated device Web server or with operating tool (e.g. FieldCare, DeviceCare)*
6 *Mobile handheld terminal with WLAN interface and Web browser (e.g. Microsoft Internet Explorer, Microsoft Edge) for accessing the integrated device Web server or operating tool (e.g. FieldCare, DeviceCare)*
7 *Smart phone or tablet (e.g. Field Xpert SMT70)*



Function	WLAN: IEEE 802.11 b/g (2.4 GHz) ▪ Access point with DHCP server (default setting) ▪ Network
Encryption	WPA2-PSK AES-128 (in accordance with IEEE 802.11i)
Configurable WLAN channels	1 to 11
Degree of protection	IP67
Available antennas	▪ Internal antenna ▪ External antenna (optional) In the event of poor transmission/reception conditions at the place of installation. Available as an accessory → 106. Only one antenna active in each case!
Range	▪ Internal antenna: typically 10 m (32 ft) ▪ External antenna: typically 50 m (164 ft)
Materials (external antenna)	▪ Antenna: ASA plastic (acrylic ester-styrene-acrylonitrile) and nickel-plated brass ▪ Adapter: Stainless steel and nickel-plated brass ▪ Cable: Polyethylene ▪ Connector: Nickel-plated brass ▪ Angle bracket: Stainless steel

Network integration

With the optional "OPC-UA Server" application package, the device can be integrated into an Ethernet network via the service interface (CDI-RJ45 and WLAN) and communicate with OPC-UA clients. If the device is used in this way, IT security must be considered.

Transmitters with an Ex de approval may **not** be connected via the service interface (CDI-RJ45)!
Order code for "Approval transmitter + sensor", options (Ex de):
BB, C2, GB, MB, NB

For permanent access to device data and for device configuration via the Web server, the device is incorporated directly in a network via the service interface (CDI-RJ45). In this way, the device can be accessed any time from the control station. The measured values are processed separately via the inputs and outputs through the automation system.

1 *Automation system, e.g. Simatic S7 (Siemens)*
2 *Ethernet switch*
3 *Edge Gateway*
4 *Cloud*
5 *Measuring device*
6 *Ethernet network*
7 *Measured values via inputs and outputs*
8 *Optional WLAN interface*

The optional WLAN interface is available on the following device version:
Order code for "Display; operation", option **G** "4-line, illuminated, graphic display; touch control + WLAN"

Special Documentation for the OPC-UA Server application package → 110.

Supported operating tools

Different operating tools can be used for local or remote access to the measuring device. Depending on the operating tool used, access is possible with different operating units and via a variety of interfaces.

Supported operating tools	Operating unit	Interface	Additional information
Web browser	Notebook, PC or tablet with Web browser	▪ CDI-RJ45 service interface ▪ WLAN interface ▪ Ethernet-based fieldbus (EtherNet/IP, PROFINET)	Special Documentation for device
DeviceCare SFE100	Notebook, PC or tablet with Microsoft Windows system	▪ CDI-RJ45 service interface ▪ WLAN interface ▪ Fieldbus protocol	→ 108

Supported operating tools	Operating unit	Interface	Additional information
FieldCare SFE500	Notebook, PC or tablet with Microsoft Windows system	▪ CDI-RJ45 service interface ▪ WLAN interface ▪ Fieldbus protocol	→ 🖹 108
Device Xpert	Field Xpert SFX 100/350/370	HART and FOUNDATION Fieldbus fieldbus protocol	Operating Instructions BA01202S Device description files: Use update function of handheld terminal

Other operating tools based on FDT technology with a device driver such as DTM/iDTM or DD/EDD can be used for device operation. These operating tools are available from the individual manufacturers. Integration into the following operating tools, among others, is supported:

- FactoryTalk AssetCentre (FTAC) by Rockwell Automation → www.rockwellautomation.com
- Process Device Manager (PDM) by Siemens → www.siemens.com
- Asset Management Solutions (AMS) by Emerson → www.emersonprocess.com
- FieldCommunicator 375/475 by Emerson → www.emersonprocess.com
- Field Device Manager (FDM) by Honeywell → www.honeywellprocess.com
- FieldMate by Yokogawa → www.yokogawa.com
- PACTWare → www.pactware.com

The associated device description files are available at: www.endress.com → Downloads

Web server

Thanks to the integrated Web server, the device can be operated and configured via a Web browser and via a service interface (CDI-RJ45) or via a WLAN interface. The structure of the operating menu is the same as for the local display. In addition to the measured values, status information on the device is also displayed and allows the user to monitor the status of the device. Furthermore the device data can be managed and the network parameters can be configured.

A device that has a WLAN interface (can be ordered as an option) is required for the WLAN connection: order code for "Display; operation", option G "4-line, illuminated; touch control + WLAN". The device acts as an Access Point and enables communication by computer or a mobile handheld terminal.

Supported functions
Data exchange between the operating unit (such as a notebook for example) and the measuring device:
- Upload the configuration from the measuring device (XML format, configuration backup)
- Save the configuration to the measuring device (XML format, restore configuration)
- Export event list (.csv file)
- Export parameter settings (.csv file or PDF file, document the measuring point configuration)
- Export the Heartbeat verification log (PDF file, only available with the "Heartbeat Verification" application package)
- Flash firmware version for device firmware upgrade, for instance
- Download driver for system integration
- Visualize up to 1000 saved measured values (only available with the **Extended HistoROM** application package → 🖹 105)

Web server special documentation → 🖹 110

HistoROM data management

The measuring device features HistoROM data management. HistoROM data management comprises both the storage and import/export of key device and process data, making operation and servicing far more reliable, secure and efficient.

When the device is delivered, the factory settings of the configuration data are stored as a backup in the device memory. This memory can be overwritten with an updated data record, for example after commissioning.

Additional information on the data storage concept

There are different types of data storage units in which device data are stored and used by the device:

	Device memory	T-DAT	S-DAT

Available data	▪ Event logbook such as diagnostic events for example
	▪ Parameter data record backup
	▪ Device firmware package
	▪ Driver for system integration for exporting via Web server, e.g:
	  ▪ GSD for PROFIBUS DP
	  ▪ GSD for PROFIBUS PA
	  ▪ GSDML for PROFINET
	  ▪ EDS for EtherNet/IP
	  ▪ DD for FOUNDATION Fieldbus
		▪ Measured value logging ("Extended HistoROM" order option)
		▪ Current parameter data record (used by firmware at run time)
		▪ Peakhold indicator (min/max values)
		▪ Totalizer values
			▪ Sensor data: nominal diameter etc.
			▪ Serial number
			▪ Calibration data
			▪ Device configuration (e.g. SW options, fixed I/O or multi I/O)

Storage location	Fixed on the user interface board in the connection compartment	Attachable to the user interface board in the connection compartment	In the sensor plug in the transmitter neck part

Data backup

Automatic
- The most important device data (sensor and transmitter) are automatically saved in the DAT modules
- If the transmitter or measuring device is replaced: once the T-DAT containing the previous device data has been exchanged, the new measuring device is ready for operation again immediately without any errors
- If the sensor is replaced: once the sensor has been replaced, new sensor data are transferred from the S-DAT in the measuring device and the measuring device is ready for operation again immediately without any errors
- If exchanging the electronics module (e.g. I/O electronics module): Once the electronics module has been replaced, the software of the module is compared against the current device firmware. The module software is upgraded or downgraded where necessary. The electronics module is available for use immediately afterwards and no compatibility problems occur.

Manual
Additional parameter data record (complete parameter settings) in the integrated device memory HistoROM backup for:
- Data backup function
  Backup and subsequent restoration of a device configuration in the device memory HistoROM backup
- Data comparison function
  Comparison of the current device configuration with the device configuration saved in the device memory HistoROM backup

Data transfer

Manual
- Transfer of a device configuration to another device using the export function of the specific operating tool, e.g. with FieldCare, DeviceCare or Web server: to duplicate the configuration or to store in an archive (e.g. for backup purposes)
- Transmission of the drivers for system integration via Web server, e.g.:
  - GSD for PROFIBUS DP
  - GSD for PROFIBUS PA
  - GSDML for PROFINET
  - EDS for EtherNet/IP
  - DD for FOUNDATION Fieldbus

Event list

Automatic
- Chronological display of up to 20 event messages in the events list
- If the **Extended HistoROM** application package (order option) is enabled: up to 100 event messages are displayed in the events list along with a time stamp, plain text description and remedial measures
- The events list can be exported and displayed via a variety of interfaces and operating tools e.g. DeviceCare, FieldCare or Web server

Data logging

Manual
If the **Extended HistoROM** application package (order option) is enabled:
- Record up to 1 000 measured values via 1 to 4 channels
- User configurable recording interval
- Record up to 250 measured values via each of the 4 memory channels
- Export the measured value log via a variety of interfaces and operating tools e.g. FieldCare, DeviceCare or web server

Certificates and approvals

Currently available certificates and approvals can be called up via the product configurator.

CE mark

The device meets the legal requirements of the applicable EU Directives. These are listed in the corresponding EU Declaration of Conformity along with the standards applied.

Endress+Hauser confirms successful testing of the device by affixing to it the CE mark.

RCM-tick symbol

The measuring system meets the EMC requirements of the "Australian Communications and Media Authority (ACMA)".

Ex approval

The measuring device is certified for use in hazardous areas and the relevant safety instructions are provided in the separate "Safety Instructions" (XA) document. Reference is made to this document on the nameplate.

The separate Ex documentation (XA) containing all the relevant explosion protection data is available from your Endress+Hauser sales center.

Proline 500 – digital

ATEX, IECEx

Currently, the following versions for use in hazardous areas are available:

Ex ia, Ex db

Transmitter		Sensor

Pharmaceutical compatibility

- FDA
- USP Class VI
- TSE/BSE Certificate of Suitability

Functional safety

The measuring device can be used for flow monitoring systems (min., max., range) up to SIL 2 (single-channel architecture; order code for "Additional approval", option LA) and SIL 3 (multichannel architecture with homogeneous redundancy) and is independently evaluated and certified by the TÜV in accordance with IEC 61508.

The following types of monitoring in safety equipment are possible:

Functional Safety Manual with information on the SIL device → 📄 109

HART certification

HART interface

The measuring device is certified and registered by the FieldComm Group. The measuring system meets all the requirements of the following specifications:

- Certified according to HART 7
- The device can also be operated with certified devices of other manufacturers (interoperability)

FOUNDATION Fieldbus certification

FOUNDATION Fieldbus interface

The measuring device is certified and registered by the FieldComm Group. The measuring system meets all the requirements of the following specifications:
- Certified in accordance with FOUNDATION Fieldbus H1
- Interoperability Test Kit (ITK), revision version 6.2.0 (certificate available on request)
- Physical Layer Conformance Test
- The device can also be operated with certified devices of other manufacturers (interoperability)

Certification PROFIBUS

PROFIBUS interface

The measuring device is certified and registered by the PNO (PROFIBUS User Organization Organization). The measuring system meets all the requirements of the following specifications:
- Certified in accordance with PROFIBUS PA Profile 3.02
- The device can also be operated with certified devices of other manufacturers (interoperability)

EtherNet/IP certification

The measuring device is certified and registered by the ODVA (Open Device Vendor Association). The measuring system meets all the requirements of the following specifications:
- Certified in accordance with the ODVA Conformance Test
- EtherNet/IP Performance Test
- EtherNet/IP PlugFest compliance
- The device can also be operated with certified devices of other manufacturers (interoperability)

Certification PROFINET

PROFINET interface

The measuring device is certified and registered by the PNO (PROFIBUS User Organization). The measuring system meets all the requirements of the following specifications:
- Certified according to:
  - Test specification for PROFINET devices
  - PROFINET Security Level 2 – Netload Class
- The device can also be operated with certified devices of other manufacturers (interoperability)
- The device supports PROFINET S2 system redundancy.

Radio approval

The measuring device has radio approval.

For detailed information regarding radio approval, see Special Documentation

Pressure Equipment Directive

The devices can be ordered with or without a PED approval. If a device with a PED approval is required, this must be explicitly stated in the order. For devices with nominal diameters less than or equal to DN 25 (1"), this is neither possible nor necessary.

- With the identification PED/G1/x (x = category) on the sensor nameplate, Endress+Hauser confirms conformity with the "Essential Safety Requirements" specified in Appendix I of the Pressure Equipment Directive 2014/68/EU.
- Devices bearing this marking (PED) are suitable for the following types of medium: Media in Group 1 and 2 with a vapor pressure greater than, or smaller and equal to0.5 bar (7.3 psi)
- Devices not bearing this marking (PED) are designed and manufactured according to good engineering practice. They meet the requirements of Article 4 paragraph 3 of the Pressure Equipment Directive 2014/68/EU. The range of application is indicated in tables 6 to 9 in Annex II of the Pressure Equipment Directive 2014/68/EU.

Measuring instrument approval

The measuring device is qualified to OIML R117 and has an OIML Certificate of Conformity (optional).

Additional certification

PWIS-free

PWIS = paint-wetting impairment substances

Order code for "Service":
- Option **HC**: PWIS-free (version A)
- Option **HD**: PWIS-free (version B)
- Option **HE**: PWIS-free (version C)

For more information on PWIS-free certification, see "Test specification" document TS01028D

Other standards and guidelines

- EN 60529
  Degrees of protection provided by enclosures (IP code)
- EN 61010-1
  Safety requirements for electrical equipment for measurement, control and laboratory use - general requirements
- IEC/EN 61326
  Emission in accordance with Class A requirements. Electromagnetic compatibility (EMC requirements).

Ordering information

Detailed ordering information is available for your nearest sales organization www.addresses.endress.com or in the Product Configurator under www.endress.com :

1. Click Corporate
2. Select the country
3. Click Products
4. Select the product using the filters and search field
5. Open the product page

The Configuration button to the right of the product image opens the Product Configurator.

Product Configurator - the tool for individual product configuration
- Up-to-the-minute configuration data
- Depending on the device: Direct input of measuring point-specific information such as measuring range or operating language
- Automatic verification of exclusion criteria
- Automatic creation of the order code and its breakdown in PDF or Excel output format
- Ability to order directly in the Endress+Hauser Online Shop

Application packages

Many different application packages are available to enhance the functionality of the device. Such packages might be needed to address safety aspects or specific application requirements.

The application packages can be ordered with the device or subsequently from Endress+Hauser. Detailed information on the order code in question is available from your local Endress+Hauser sales center or on the product page of the Endress+Hauser website: www.endress.com.

Diagnostics functions

Package	Description
Extended HistoROM	Comprises extended functions concerning the event log and the activation of the measured value memory. Event log: Memory volume is extended from 20 message entries (standard version) to up to 100 entries. Data logging (line recorder): ▪ Memory capacity for up to 1000 measured values is activated. ▪ 250 measured values can be output via each of the 4 memory channels. The recording interval can be defined and configured by the user. ▪ Measured value logs can be accessed via the local display or operating tool e.g. FieldCare, DeviceCare or Web server.

Heartbeat Technology

Package	Description
Heartbeat Verification +Monitoring	**Heartbeat Verification** Meets the requirement for traceable verification to DIN ISO 9001:2008 Chapter 7.6 a) "Control of monitoring and measuring equipment". ▪ Functional testing in the installed state without interrupting the process. ▪ Traceable verification results on request, including a report. ▪ Simple testing process via local operation or other operating interfaces. ▪ Clear measuring point assessment (pass/fail) with high test coverage within the framework of manufacturer specifications. ▪ Extension of calibration intervals according to operator's risk assessment. **Heartbeat Monitoring** Continuously supplies data, which are characteristic of the measuring principle, to an external condition monitoring system for the purpose of preventive maintenance or process analysis. These data enable the operator to: ▪ Draw conclusions - using these data and other information - about the impact process influences (such as corrosion, abrasion, buildup etc.) have on the measuring performance over time. ▪ Schedule servicing in time. ▪ Monitor the process or product quality, e.g. gas pockets.

Cleaning

Package	Description
Electrode cleaning circuit (ECC)	The electrode cleaning circuit (ECC) function has been developed to have a solution for applications where magnetite (Fe_3O_4) deposits frequently occur (e.g. hot water). Since magnetite is highly conductive this build up leads to measuring errors and ultimately to the loss of signal. The application package is designed to AVOID build up of highly conductive matter and thin layers (typical of magnetite).

OPC-UA server

Package	Description
OPC-UA-Server	The application package provides the user with an integrated OPC-UA server for comprehensive instrument services for IoT and SCADA applications. Special Documentation for the "OPC-UA-Server" application package → 110.

Accessories

Various accessories, which can be ordered with the device or subsequently from Endress+Hauser, are available for the device. Detailed information on the order code in question is available from your local Endress+Hauser sales center or on the product page of the Endress+Hauser website: www.endress.com.

Device-specific accessories

For the transmitter

Accessories	Description
Transmitter ▪ Proline 500 – digital ▪ Proline 500	Transmitter for replacement or storage. Use the order code to define the following specifications: ▪ Approvals ▪ Output ▪ Input ▪ Display/operation ▪ Housing ▪ Software ▪ Proline 500 – digital transmitter: Order code: 5X5BXX-*********A ▪ Proline 500 transmitter: Order code: 5X5BXX-*********B Proline 500 transmitter for replacement: It is essential to specify the serial number of the current transmitter when ordering. Based on the serial number, the device-specific data (e.g., calibration factors) of the replacement device can be used for the new transmitter. ▪ Proline 500 – digital transmitter: Installation Instructions EA01151D ▪ Proline 500 transmitter: Installation Instructions EA01152D
External WLAN antenna	External WLAN antenna with 1.5 m (59.1 in) connecting cable and two angle brackets. Order code for "Accessory enclosed", option P8 "Wireless antenna wide area". ▪ The external WLAN antenna is not suitable for use in hygienic applications. ▪ Further information on the WLAN interface → 🖹 95. Order number: 71351317 Installation Instructions EA01238D
Pipe mounting set	Pipe mounting set for transmitter. Proline 500 – digital transmitter Order number: 71346427 Installation Instructions EA01195D Proline 500 transmitter Order number: 71346428
Protective cover Transmitter ▪ Proline 500 – digital ▪ Proline 500	Is used to protect the measuring device from the effects of the weather: e.g. rainwater, excess heating from direct sunlight. ▪ Proline 500 – digital transmitter Order number: 71343504 ▪ Proline 500 transmitter Order number: 71343505 Installation Instructions EA01191D
Display guard Proline 500 – digital	Is used to protect the display against impact or scoring from sand in desert areas. Order number: 71228792 Installation Instructions EA01093D
Ground cable	Set, consisting of two ground cables for potential equalization.

Connecting cable Proline 500 – digital Sensor – Transmitter	The connecting cable can be ordered directly with the measuring device (order code for "Cable, sensor connection) or as an accessory (order number DK5012). The following cable lengths are available: order code for "Cable, sensor connection" ▪ Option B: 20 m (65 ft) ▪ Option E: User configurable up to max. 50 m ▪ Option F: User configurable up to max. 165 ft Maximum possible cable length for a Proline 500 – digital connecting cable: 300 m (1 000 ft)
Connecting cable Proline 500 Sensor – Transmitter	The connecting cable can be ordered directly with the measuring device (order code for "Cable, sensor connection) or as an accessory (order number DK5012). The following cable lengths are available: order code for "Cable, sensor connection" ▪ Option 1: 5 m (16 ft) ▪ Option 2: 10 m (32 ft) ▪ Option 3: 20 m (65 ft) ▪ Option 4: User configurable cable length (m) ▪ Option 5: User configurable cable length (ft) Reinforced connecting cable with an additional, reinforcing metal braid: ▪ Option 6: User configurable cable length (m) ▪ Option 7: User configurable cable length (ft) Possible cable length for a Proline 500 connecting cable: depends on the medium conductivity, max. 200 m (660 ft)

For the sensor

Accessories	Description
Ground disks	Are used to ground the medium in lined measuring tubes to ensure proper measurement. For details, see Installation Instructions EA00070D

Communication-specific accessories

Accessories	Description
Commubox FXA195 HART	For intrinsically safe HART communication with FieldCare via the USB interface. Technical Information TI00404F
HART Loop Converter HMX50	Is used to evaluate and convert dynamic HART process variables to analog current signals or limit values. ▪ Technical Information TI00429F ▪ Operating Instructions BA00371F
Fieldgate FXA320	Gateway for the remote monitoring of connected 4-20 mA measuring devices via a Web browser. Technical Information TI00025S Operating Instructions BA00053S
Fieldgate FXA520	Gateway for the remote diagnostics and remote configuration of connected HART measuring devices via a Web browser. Technical Information TI00025S Operating Instructions BA00051S
Field Xpert SFX350	Field Xpert SFX350 is a mobile computer for commissioning and maintenance. It enables efficient device configuration and diagnostics for HART and FOUNDATION Fieldbus devices and can be used in non-hazardous areas. Operating Instructions BA01202S

Field Xpert SFX370	Field Xpert SFX370 is a mobile computer for commissioning and maintenance. It enables efficient device configuration and diagnostics for HART and FOUNDATION Fieldbus devices and can be used in the non-hazardous area and in the hazardous area. Operating Instructions BA01202S
Field Xpert SMT70	The Field Xpert SMT70 tablet PC for device configuration enables mobile plant asset management in hazardous and non-hazardous areas. It is suitable for commissioning and maintenance staff to manage field instruments with a digital communication interface and to record progress. This tablet PC is designed as an all-in-one solution with a preinstalled driver library and is an easy-to-use, touch-sensitive tool which can be used to manage field instruments throughout their entire life cycle. ▪ Technical Information TI01342S ▪ Operating Instructions BA01709S ▪ Product page: www.endress.com/smt70

Service-specific accessories

Accessories	Description
Applicator	Software for selecting and sizing Endress+Hauser measuring devices: ▪ Choice of measuring devices for industrial requirements ▪ Calculation of all the necessary data for identifying the optimum flowmeter: e.g. nominal diameter, pressure loss, flow velocity and accuracy. ▪ Graphic illustration of the calculation results ▪ Determination of the partial order code, administration, documentation and access to all project-related data and parameters over the entire life cycle of a project. Applicator is available: ▪ Via the Internet: https://portal.endress.com/webapp/applicator ▪ As a downloadable DVD for local PC installation.
W@M	W@M Life Cycle Management Improved productivity with information at your fingertips. Data relevant to a plant and its components is generated from the first stages of planning and during the asset's complete life cycle. W@M Life Cycle Management is an open and flexible information platform with online and on-site tools. Instant access for your staff to current, in-depth data shortens your plant's engineering time, speeds up procurement processes and increases plant uptime. Combined with the right services, W@M Life Cycle Management boosts productivity in every phase. For more information, visit www.endress.com/lifecyclemanagement
FieldCare	FDT-based plant asset management tool from Endress+Hauser. It can configure all smart field units in your system and helps you manage them. By using the status information, it is also a simple but effective way of checking their status and condition. Operating Instructions BA00027S and BA00059S
DeviceCare	Tool to connect and configure Endress+Hauser field devices. Innovation brochure IN01047S

System components

Accessories	Description
Memograph M graphic data manager	The Memograph M graphic data manager provides information on all the relevant measured variables. Measured values are recorded correctly, limit values are monitored and measuring points analyzed. The data are stored in the 256 MB internal memory and also on a SD card or USB stick. ▪ Technical Information TI00133R ▪ Operating Instructions BA00247R

Supplementary documentation

For an overview of the scope of the associated Technical Documentation, refer to the following:
- *W@M Device Viewer* (www.endress.com/deviceviewer): Enter the serial number from nameplate
- *Endress+Hauser Operations App*: Enter the serial number from the nameplate or scan the 2D matrix code (QR code) on the nameplate

- Make sure the document is stored in a safe place such that it is always available when working on or with the device.
- To avoid danger to individuals or the facility, read the "Basic safety instructions" section carefully, as well as all other safety instructions in the document that are specific to working procedures.
- The manufacturer reserves the right to modify technical data without prior notice. Your Endress+Hauser Sales Center will supply you with current information and updates to these instructions.

Index 210

1 About this document

1.1 Document function

These Operating Instructions contain all the information that is required in various phases of the life cycle of the device: from product identification, incoming acceptance and storage, to mounting, connection, operation and commissioning through to troubleshooting, maintenance and disposal.

1.2 Symbols

1.2.1 Safety symbols

⚠ DANGER
This symbol alerts you to a dangerous situation. Failure to avoid this situation will result in serious or fatal injury.

⚠ WARNING
This symbol alerts you to a dangerous situation. Failure to avoid this situation can result in serious or fatal injury.

⚠ CAUTION
This symbol alerts you to a dangerous situation. Failure to avoid this situation can result in minor or medium injury.

NOTICE
This symbol contains information on procedures and other facts which do not result in personal injury.

1.2.2 Electrical symbols

Symbol	Meaning
⎓	Direct current
~	Alternating current
⎓ ~	Direct current and alternating current
⏚	**Ground connection** A grounded terminal which, as far as the operator is concerned, is grounded via a grounding system.
⊕	**Protective Earth (PE)** A terminal which must be connected to ground prior to establishing any other connections. The ground terminals are situated inside and outside the device: ▪ Inner ground terminal: Connects the protectiv earth to the mains supply. ▪ Outer ground terminal: Connects the device to the plant grounding system.

1.2.3 Communication symbols

Symbol	Meaning
	Wireless Local Area Network (WLAN) Communication via a wireless, local network.
	LED Light emitting diode is off.

Symbol	Meaning
	**LED** Light emitting diode is on.
	**LED** Light emitting diode is flashing.

1.2.4 Tool symbols

Symbol	Meaning
	Torx screwdriver
	Phillips head screwdriver
	Open-ended wrench

1.2.5 Symbols for certain types of information

Symbol	Meaning
	**Permitted** Procedures, processes or actions that are permitted.
	**Preferred** Procedures, processes or actions that are preferred.
	**Forbidden** Procedures, processes or actions that are forbidden.
	**Tip** Indicates additional information.
	Reference to documentation.
	Reference to page.
	Reference to graphic.
	Notice or individual step to be observed.
1., 2., 3...	Series of steps.
	Result of a step.
	Help in the event of a problem.
	Visual inspection.

1.2.6 Symbols in graphics

Symbol	Meaning
1, 2, 3, ...	Item numbers
1., 2., 3., ...	Series of steps
A, B, C, ...	Views
A-A, B-B, C-C, ...	Sections
	Hazardous area

Symbol	Meaning
	Safe area (non-hazardous area)
	Flow direction

1.3 Documentation

For an overview of the scope of the associated Technical Documentation, refer to the following:
- *W@M Device Viewer* (www.endress.com/deviceviewer): Enter the serial number from nameplate
- *Endress+Hauser Operations App*: Enter the serial number from the nameplate or scan the 2D matrix code (QR code) on the nameplate

Detailed list of the individual documents along with the documentation code
→ 207

1.3.1 Standard documentation

Document type	Purpose and content of the document
Technical Information	**Planning aid for your device** The document contains all the technical data on the device and provides an overview of the accessories and other products that can be ordered for the device.
Sensor Brief Operating Instructions	**Guides you quickly to the 1st measured value - Part 1** The Sensor Brief Operating Instructions are aimed at specialists with responsibility for installing the measuring device. ▪ Incoming acceptance and product identification ▪ Storage and transport ▪ Installation
Transmitter Brief Operating Instructions	**Guides you quickly to the 1st measured value - Part 2** The Transmitter Brief Operating Instructions are aimed at specialists with responsibility for commissioning, configuring and parameterizing the measuring device (until the first measured value). ▪ Product description ▪ Installation ▪ Electrical connection ▪ Operation options ▪ System integration ▪ Commissioning ▪ Diagnostic information
Description of Device Parameters	**Reference for your parameters** The document provides a detailed explanation of each individual parameter in the Expert operating menu. The description is aimed at those who work with the device over the entire life cycle and perform specific configurations.

1.3.2 Supplementary device-dependent documentation

Additional documents are supplied depending on the device version ordered: Always comply strictly with the instructions in the supplementary documentation. The supplementary documentation is an integral part of the device documentation.

1.4 Registered trademarks

HART®
Registered trademark of the FieldComm Group, Austin, Texas, USA

2 Safety instructions

2.1 Requirements for the personnel

The personnel for installation, commissioning, diagnostics and maintenance must fulfill the following requirements:
- Trained, qualified specialists must have a relevant qualification for this specific function and task.
- Are authorized by the plant owner/operator.
- Are familiar with federal/national regulations.
- Before starting work, read and understand the instructions in the manual and supplementary documentation as well as the certificates (depending on the application).
- Follow instructions and comply with basic conditions.

The operating personnel must fulfill the following requirements:
- Are instructed and authorized according to the requirements of the task by the facility's owner-operator.
- Follow the instructions in this manual.

2.2 Designated use

Application and media
The measuring device described in these Brief Operating Instructions is intended only for flow measurement of liquids with a minimum conductivity of 5 µS/cm.

Depending on the version ordered, the measuring device can also measure potentially explosive, flammable, poisonous and oxidizing media.

Measuring devices for use in hazardous areas, in hygienic applications or where there is an increased risk due to process pressure, are labeled accordingly on the nameplate.

To ensure that the measuring device remains in proper condition for the operation time:
- Keep within the specified pressure and temperature range.
- Only use the measuring device in full compliance with the data on the nameplate and the general conditions listed in the Operating Instructions and supplementary documentation.
- Based on the nameplate, check whether the ordered device is permitted for the intended use in the hazardous area (e.g. explosion protection, pressure vessel safety).
- Use the measuring device only for media to which the process-wetted materials are sufficiently resistant.
- If the ambient temperature of the measuring device is outside the atmospheric temperature, it is absolutely essential to comply with the relevant basic conditions as specified in the device documentation. → 8
- Protect the measuring device permanently against corrosion from environmental influences.

Incorrect use
Non-designated use can compromise safety. The manufacturer is not liable for damage caused by improper or non-designated use.

⚠ WARNING

Danger of breakage due to corrosive or abrasive fluids and ambient conditions!
- Verify the compatibility of the process fluid with the sensor material.
- Ensure the resistance of all fluid-wetted materials in the process.
- Keep within the specified pressure and temperature range.

NOTICE

Verification for borderline cases:

- For special fluids and fluids for cleaning, Endress+Hauser is glad to provide assistance in verifying the corrosion resistance of fluid-wetted materials, but does not accept any warranty or liability as minute changes in the temperature, concentration or level of contamination in the process can alter the corrosion resistance properties.

Residual risks

WARNING

The electronics and the medium may cause the surfaces to heat up. This presents a burn hazard!

- For elevated fluid temperatures, ensure protection against contact to prevent burns.

2.3 Workplace safety

For work on and with the device:

- Wear the required personal protective equipment according to federal/national regulations.

For welding work on the piping:

- Do not ground the welding unit via the measuring device.

If working on and with the device with wet hands:

- Due to the increased risk of electric shock, gloves must be worn.

2.4 Operational safety

Risk of injury.

- Operate the device in proper technical condition and fail-safe condition only.
- The operator is responsible for interference-free operation of the device.

Conversions to the device

Unauthorized modifications to the device are not permitted and can lead to unforeseeable dangers.

- If, despite this, modifications are required, consult with Endress+Hauser.

Repair

To ensure continued operational safety and reliability,

- Carry out repairs on the device only if they are expressly permitted.
- Observe federal/national regulations pertaining to repair of an electrical device.
- Use original spare parts and accessories from Endress+Hauser only.

2.5 Product safety

This measuring device is designed in accordance with good engineering practice to meet state-of-the-art safety requirements, has been tested, and left the factory in a condition in which it is safe to operate.

It meets general safety standards and legal requirements. It also complies with the EU directives listed in the device-specific EU Declaration of Conformity. Endress+Hauser confirms this by affixing the CE mark to the device.

2.6 IT security

Our warranty is valid only if the device is installed and used as described in the Operating Instructions. The device is equipped with security mechanisms to protect it against any inadvertent changes to the settings.

IT security measures, which provide additional protection for the device and associated data transfer, must be implemented by the operators themselves in line with their security standards.

2.7 Device-specific IT security

The device offers a range of specific functions to support protective measures on the operator's side. These functions can be configured by the user and guarantee greater in-operation safety if used correctly. An overview of the most important functions is provided in the following section.

Function/interface	Factory setting	Recommendation
Write protection via hardware write protection switch → 🖹 11	Not enabled.	On an individual basis following risk assessment.
Access code (also applies for Web server login or FieldCare connection) → 🖹 12	Not enabled (0000).	Assign a customized access code during commissioning.
WLAN (order option in display module)	Enabled.	On an individual basis following risk assessment.
WLAN security mode	Enabled (WPA2-PSK)	Do not change.
WLAN passphrase (password) → 🖹 12	Serial number	Assign an individual WLAN passphrase during commissioning.
WLAN mode	Access Point	On an individual basis following risk assessment.
Web server→ 🖹 12	Enabled.	On an individual basis following risk assessment.
CDI-RJ45 service interface → 🖹 13	–	On an individual basis following risk assessment.

2.7.1 Protecting access via hardware write protection

Write access to the device parameters via the local display, Web browser or operating tool (e.g. FieldCare, DeviceCare) can be disabled via a write protection switch (DIP switch on the motherboard). When hardware write protection is enabled, only read access to the parameters is possible.

Hardware write protection is disabled when the device is delivered → 🖹 135.

2.7.2 Protecting access via a password

Different passwords are available to protect write access to the device parameters or access to the device via the WLAN interface.

- User-specific access code
  Protect write access to the device parameters via the local display, Web browser or operating tool (e.g. FieldCare, DeviceCare). Access authorization is clearly regulated through the use of a user-specific access code.
- WLAN passphrase
  The network key protects a connection between an operating unit (e.g. notebook or tablet) and the device via the WLAN interface which can be ordered as an option.
- Infrastructure mode
  When the device is operated in infrastructure mode, the WLAN passphrase corresponds to the WLAN passphrase configured on the operator side.

User-specific access code

Write access to the device parameters via the local display, Web browser or operating tool (e.g. FieldCare, DeviceCare) can be protected by the modifiable, user-specific access code (→ 🖹 134).

When the device is delivered, the device does not have an access code and is equivalent to *0000* (open).

WLAN passphrase: Operation as WLAN access point

A connection between an operating unit (e.g. notebook or tablet) and the device via the WLAN interface (→ 🖹 86), which can be ordered as an optional extra, is protected by the network key. The WLAN authentication of the network key complies with the IEEE 802.11 standard.

When the device is delivered, the network key is pre-defined depending on the device. It can be changed via the **WLAN settings** submenu in the **WLAN passphrase** parameter (→ 🖹 128).

Infrastructure mode

A connection between the device and WLAN access point is protected by means of an SSID and passphrase on the system side. Please contact the relevant system administrator for access.

General notes on the use of passwords

- The access code and network key supplied with the device should be changed during commissioning.
- Follow the general rules for generating a secure password when defining and managing the access code or network key.
- The user is responsible for the management and careful handling of the access code and network key.
- For information on configuring the access code or on what to do if you lose the password, see the "Write protection via access code" section → 🖹 134

2.7.3 Access via Web server

The device can be operated and configured via a Web browser with the integrated Web server (→ 🖹 77). The connection is via the service interface (CDI-RJ45) or the WLAN interface.

The Web server is enabled when the device is delivered. The Web server can be disabled if necessary (e.g. after commissioning) via the **Web server functionality** parameter.

The device and status information can be hidden on the login page. This prevents unauthorized access to the information.

For detailed information on device parameters, see:
The "Description of Device Parameters" document → 🖹 208.

2.7.4 Access via OPC-UA

The device can communicate with OPC UA clients using the "OPC UA Server" application package.

The OPC UA server integrated in the device can be accessed via the WLAN access point using the WLAN interface - which can be ordered as an optional extra - or the service interface (CDI- RJ45) via Ethernet network. Access rights and authorization as per separate configuration.

The following Security Modes are supported as per the OPC UA Specification (IEC 62541):
- None
- Basic128Rsa15 – signed
- Basic128Rsa15 – signed and encrypted

2.7.5 Access via service interface (CDI-RJ45)

The device can be connected to a network via the service interface (CDI-RJ45). Device-specific functions guarantee the secure operation of the device in a network.

The use of relevant industrial standards and guidelines that have been defined by national and international safety committees, such as IEC/ISA62443 or the IEEE, is recommended. This includes organizational security measures such as the assignment of access authorization as well as technical measures such as network segmentation.

Transmitters with an Ex de approval may not be connected via the service interface (CDI-RJ45)!

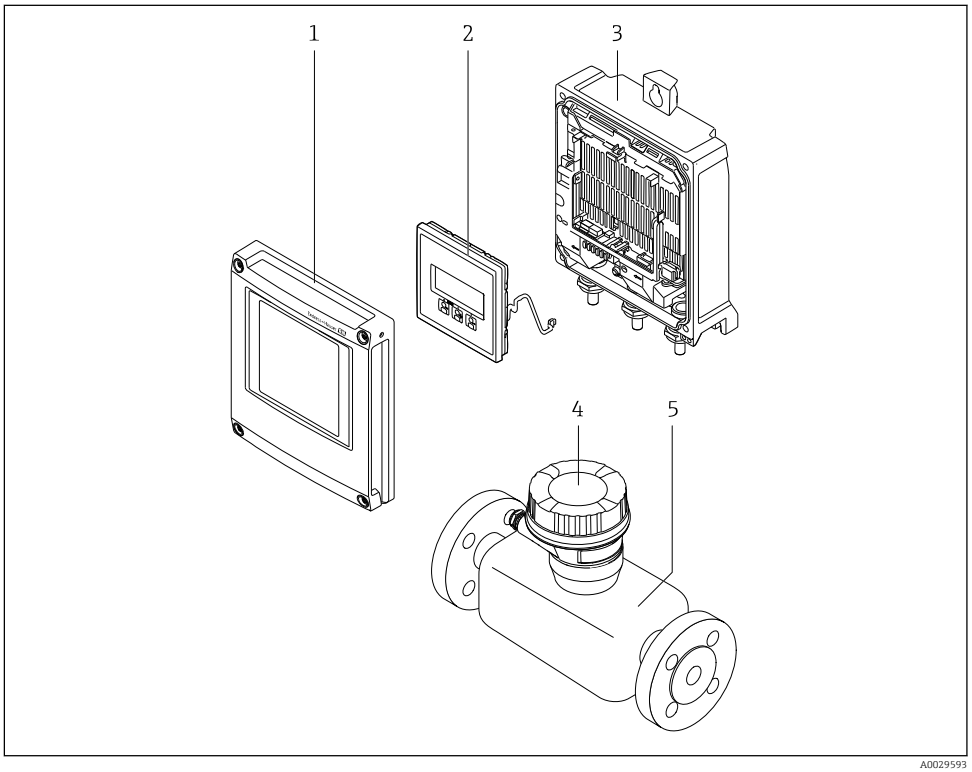
Order code for "Approval transmitter + sensor", options (Ex de): BA, BB, C1, C2, GA, GB, MA, MB, NA, NB

3 Product description

The measuring system consists of a transmitter and a sensor. The transmitter and sensor are mounted in physically separate locations. They are interconnected by connecting cables.

3.1 Product design

Two versions of the transmitter are available.



3.1.1 Proline 500 – digital

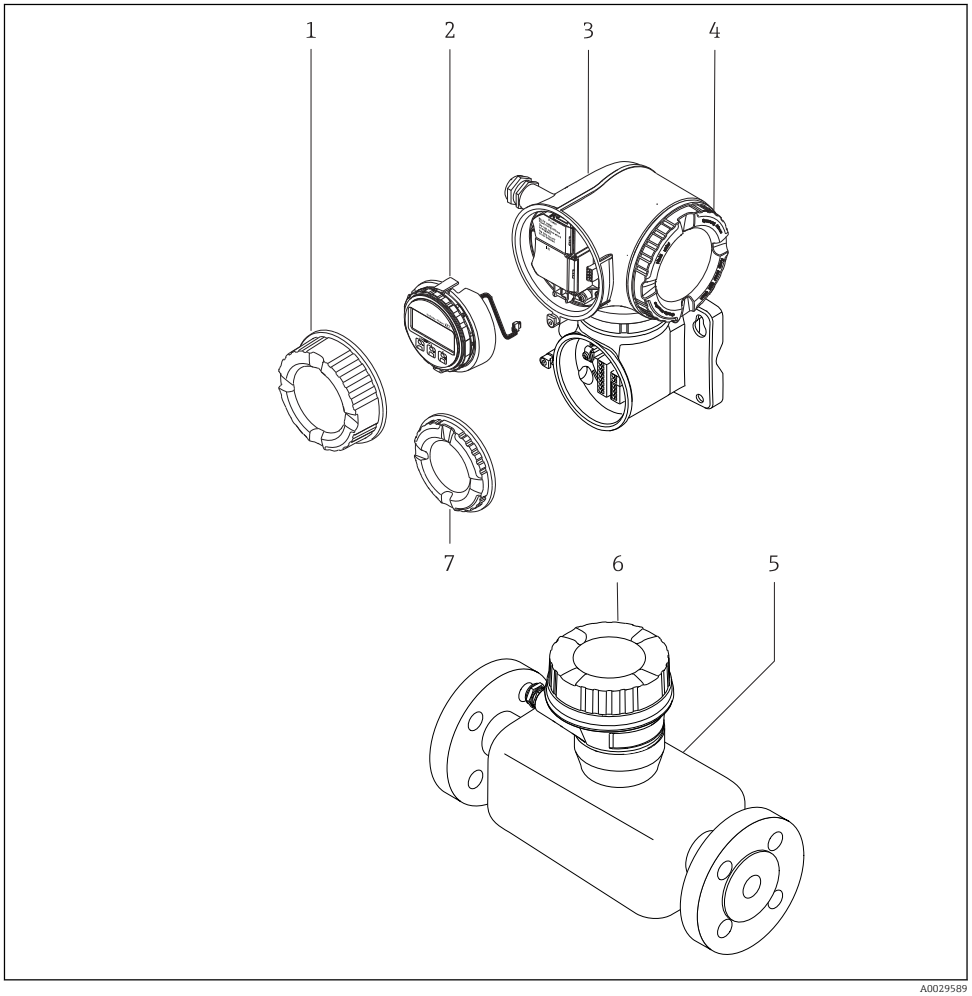
Signal transmission: digital
Order code for "Integrated ISEM electronics", option **A** "Sensor"

For use in applications not required to meet special requirements due to ambient or operating conditions.

As the electronics are located in the sensor, the device is ideal:
For simple transmitter replacement.

- A standard cable can be used as the connecting cable.
- Not sensitive to external EMC interference.

1 Important components of a measuring device



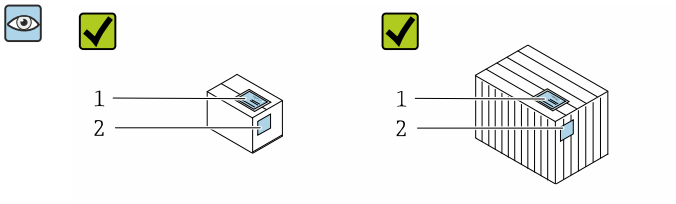
1 Electronics compartment cover
2 Display module
3 Transmitter housing
4 Sensor connection housing with integrated ISEM electronics: connecting cable connection
5 Sensor

3.1.2 Proline 500

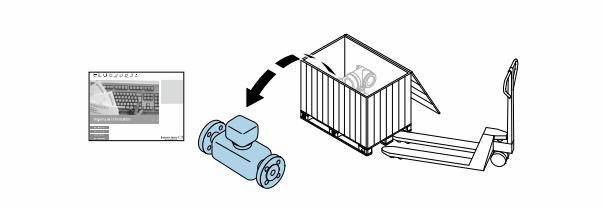
Signal transmission: analog
Order code for "Integrated ISEM electronics", option **B** "Transmitter"

For use in applications required to meet special requirements due to ambient or operating conditions.

As the electronics are located in the transmitter, the device is ideal in the event of:
- Sensor operation in underground installations.
- Permanent sensor immersion in water.



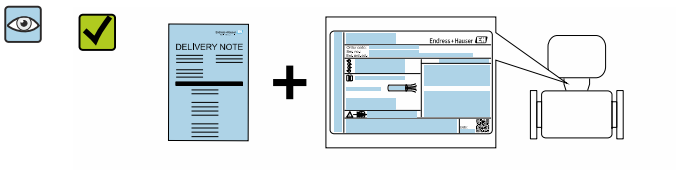
2 Important components of a measuring device



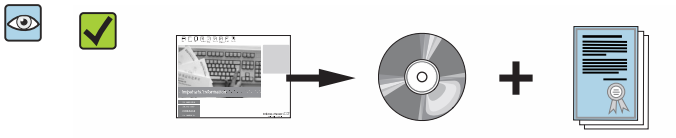
1 Connection compartment cover
2 Display module
3 Transmitter housing with integrated ISEM electronics
4 Electronics compartment cover
5 Sensor
6 Sensor connection housing: connecting cable connection
7 Connection compartment cover: connecting cable connection

4 Incoming acceptance and product identification

4.1 Incoming acceptance



Are the order codes on the delivery note (1) and the product sticker (2) identical?

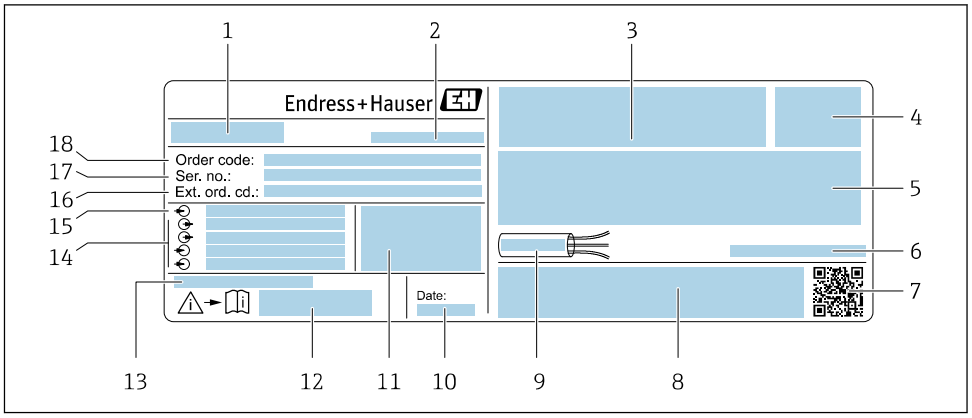


Are the goods undamaged?

Do the nameplate data match the ordering information on the delivery note?

Is the document folder present with accompanying documents?
Is the optional CD-ROM with the Technical Documentation present?

- If one of the conditions is not satisfied, contact your Endress+Hauser Sales Center.
- Depending on the device version, the CD-ROM might not be part of the delivery! The Technical Documentation is available via the Internet or via the *Endress+Hauser Operations App*, see the "Product identification" section → 17.

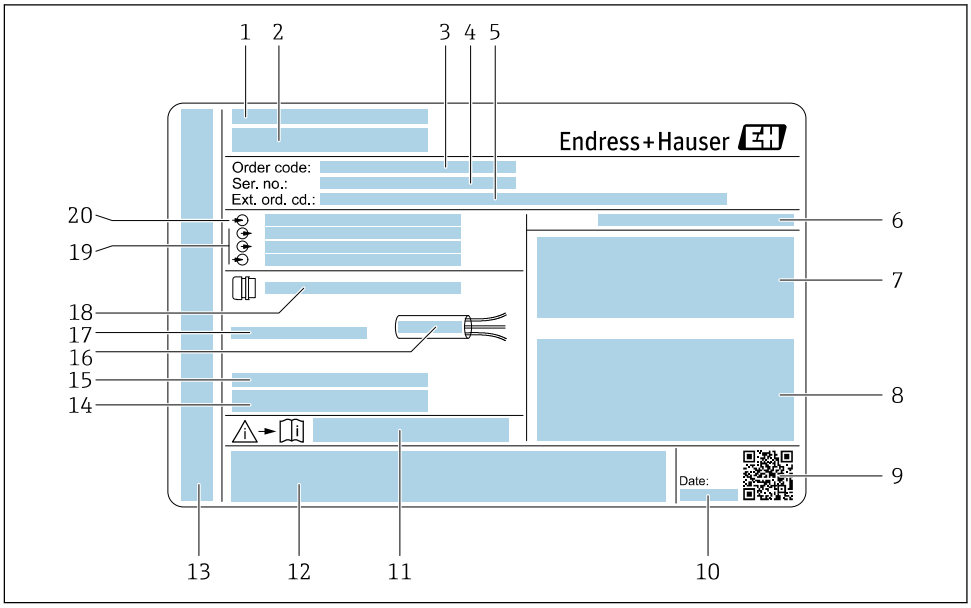


4.2 Product identification

The following options are available for identification of the device:
- Nameplate specifications
- Order code with breakdown of the device features on the delivery note
- Enter serial numbers from nameplates in the *W@M Device Viewer* (www.endress.com/deviceviewer): All information about the device is displayed.
- Enter the serial number from nameplates in the *Endress+Hauser Operations App* or scan the 2-D matrix code (QR code) on the nameplate using the *Endress+Hauser Operations App*: All information about the device is displayed.

For an overview of the scope of the associated Technical Documentation, refer to the following:
- The "Additional standard documentation on the device"→ 📄 8 and "Supplementary device-dependent documentation"→ 📄 8 sections
- The *W@M Device Viewer*: enter the serial number from the nameplate (www.endress.com/deviceviewer)
- The *Endress+Hauser Operations App*: Enter the serial number from the nameplate or scan the 2-D matrix code (QR code) on the nameplate.

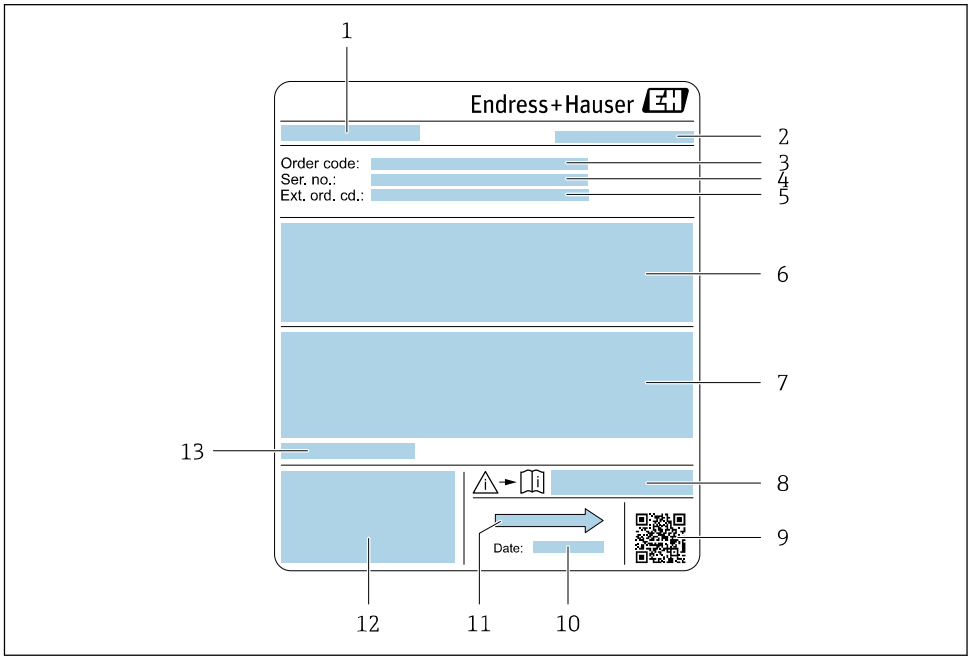
4.2.1 Transmitter nameplate



Proline 500 – digital

3 *Example of a transmitter nameplate*

1 *Name of the transmitter*
2 *Manufacturing location*
3 *Space for approvals: use in hazardous areas*
4 *Degree of protection*
5 *Electrical connection data: available inputs and outputs*
6 *Permitted ambient temperature (T_a)*
7 *2-D matrix code*
8 *Space for approvals and certificates: e.g. CE mark, C-Tick*
9 *Permitted temperature range for cable*
10 *Manufacturing date: year-month*
11 *Firmware version (FW) and device revision (Dev.Rev.) from the factory*
12 *Document number of safety-related supplementary documentation*
13 *Space for additional information in the case of special products*
14 *Available inputs and outputs, supply voltage*
15 *Electrical connection data: supply voltage*
16 *Extended order code (ext. ord. cd.)*
17 *Serial number (ser. no.)*
18 *Order code*



Proline 500

4 *Example of a transmitter nameplate*

1 *Manufacturing location*
2 *Name of the transmitter*
3 *Order code*

5 *Extended order code (ext. ord. cd.)*
6 *Degree of protection*
7 *Space for approvals: use in hazardous areas*
8 *Electrical connection data: available inputs and outputs*
9 *2-D matrix code*
10 *Manufacturing date: year-month*
11 *Document number of safety-related supplementary documentation*
12 *Space for approvals and certificates: e.g. CE mark, C-Tick*
13 *Space for degree of protection of connection and electronics compartment when used in hazardous areas*
14 *Firmware version (FW) and device revision (Dev.Rev.) from the factory*
15 *Space for additional information in the case of special products*
16 *Permitted temperature range for cable*
17 *Permitted ambient temperature (T_a)*
18 *Information on cable gland*
19 *Available inputs and outputs, supply voltage*
20 *Electrical connection data: supply voltage*

4.2.2 Sensor nameplate

5 *Example of sensor nameplate*

1 *Name of the sensor*
2 *Manufacturing location*
3 *Order code*
4 *Serial number (ser. no.)*
5 *Extended order code (Ext. ord. cd.)*
6 *Flow; nominal diameter of the sensor; pressure rating; nominal pressure; system pressure; fluid temperature range; material of liner and electrodes*
7 *Approval information for explosion protection, Pressure Equipment Directive and degree of protection*
8 *Document number of safety-related supplementary documentation*
9 *2-D matrix code*
10 *Manufacturing date: year-month*
11 *Flow direction*
12 *CE mark, C-Tick*
13 *Permitted ambient temperature (T_a)*

Order code

The measuring device is reordered using the order code.

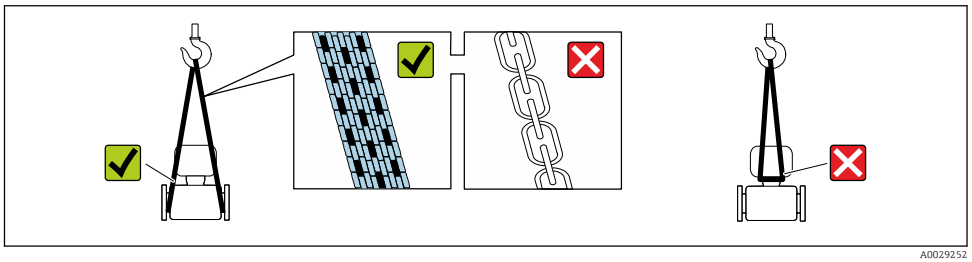
Extended order code

- The device type (product root) and basic specifications (mandatory features) are always listed.
- Of the optional specifications (optional features), only the safety and approval-related specifications are listed (e.g. LA). If other optional specifications are also ordered, these are indicated collectively using the # placeholder symbol (e.g. #LA#).
- If the ordered optional specifications do not include any safety and approval-related specifications, they are indicated by the + placeholder symbol (e.g. XXXXXX-ABCDE +).

4.2.3 Symbols on measuring device

Symbol	Meaning
	**WARNING!** This symbol alerts you to a dangerous situation. Failure to avoid this situation can result in serious or fatal injury.
	**Reference to documentation** Refers to the corresponding device documentation.
	**Protective ground connection** A terminal which must be connected to ground prior to establishing any other connections.

5 Storage and transport



5.1 Storage conditions

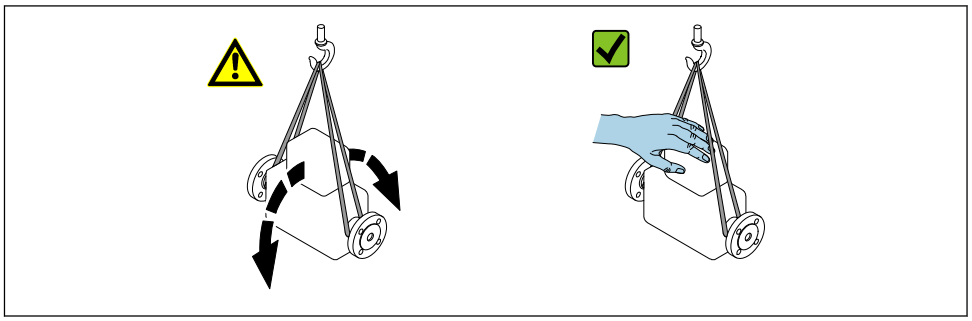
Observe the following notes for storage:
- Store in the original packaging to ensure protection from shock.
- Do not remove protective covers or protective caps installed on process connections. They prevent mechanical damage to the sealing surfaces and contamination in the measuring tube.
- Protect from direct sunlight to avoid unacceptably high surface temperatures.
- Select a storage location where moisture cannot collect in the measuring device as fungus and bacteria infestation can damage the lining.
- Store in a dry and dust-free place.
- Do not store outdoors.

Storage temperature→ 192

5.2 Transporting the product

Transport the measuring device to the measuring point in the original packaging.

A0029252



Do not remove protective covers or caps installed on process connections. They prevent mechanical damage to the sealing surfaces and contamination in the measuring tube.

5.2.1 Measuring devices without lifting lugs

WARNING

Center of gravity of the measuring device is higher than the suspension points of the webbing slings.

Risk of injury if the measuring device slips.
- Secure the measuring device against slipping or turning.
- Observe the weight specified on the packaging (stick-on label).

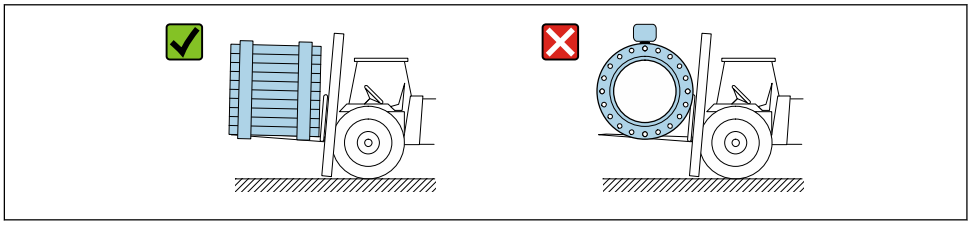
A0029214

5.2.2 Measuring devices with lifting lugs

⚠ CAUTION

Special transportation instructions for devices with lifting lugs

- ▶ Only use the lifting lugs fitted on the device or flanges to transport the device.
- ▶ The device must always be secured at two lifting lugs at least.



5.2.3 Transporting with a fork lift

If transporting in wood crates, the floor structure enables the crates to be lifted lengthwise or at both sides using a forklift.

⚠ CAUTION

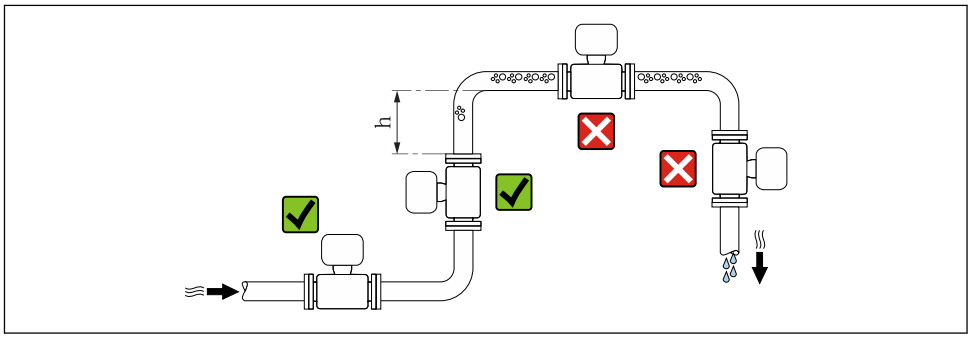
Risk of damaging the magnetic coil

- ▶ If transporting by forklift, do not lift the sensor by the metal casing.
- ▶ This would buckle the casing and damage the internal magnetic coils.

A0029319

5.3 Packaging disposal

All packaging materials are environmentally friendly and 100 % recyclable:

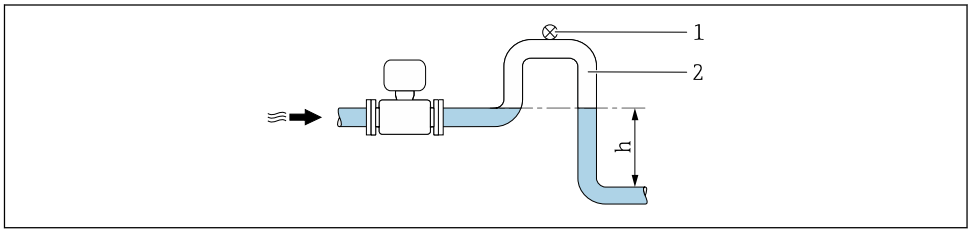


- Outer packaging of device
  Polymer stretch wrap that complies with EU Directive 2002/95/EC (RoHS)
- Packaging
  - Wooden crate treated in accordance with ISPM 15 standard, confirmed by IPPC logo
  - Cardboard box in accordance with European packaging guideline 94/62EC, recyclability confirmed by Resy symbol
- Carrying and securing materials
  - Disposable plastic pallet
  - Plastic straps
  - Plastic adhesive strips
- Filler material
  Paper pads

6 Installation

6.1 Installation conditions

6.1.1 Mounting position

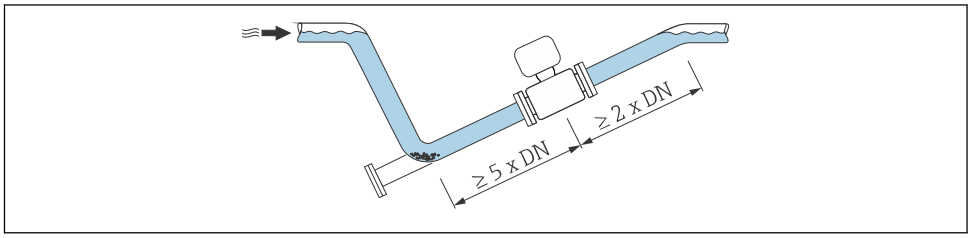


Mounting location

Preferably install the sensor in an ascending pipe, and ensure a sufficient distance to the next pipe elbow: h ≥ 2 × DN.

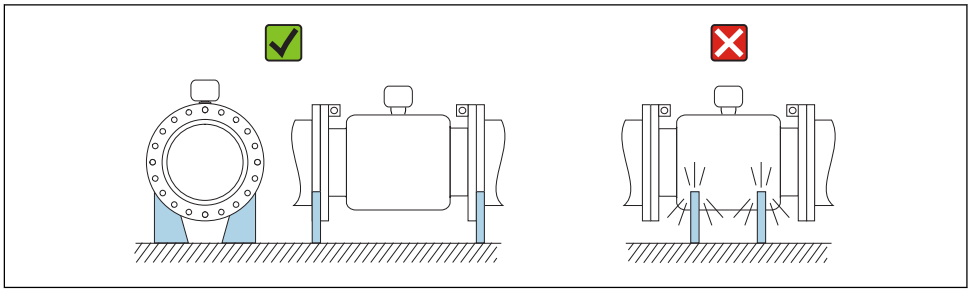
Installation in down pipes

Install a siphon with a vent valve downstream of the sensor in down pipes whose length h ≥ 5 m (16.4 ft). This precaution is to avoid low pressure and the consequent risk of damage to the measuring tube. This measure also prevents the system losing prime.



6 *Installation in a down pipe*

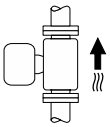
1 *Vent valve*
2 *Pipe siphon*
h *Length of down pipe*

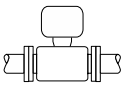


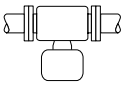
Installation in partially filled pipes

A partially filled pipe with a gradient necessitates a drain-type configuration.

No inlet runs necessary with order code for "Design", option C, H, I



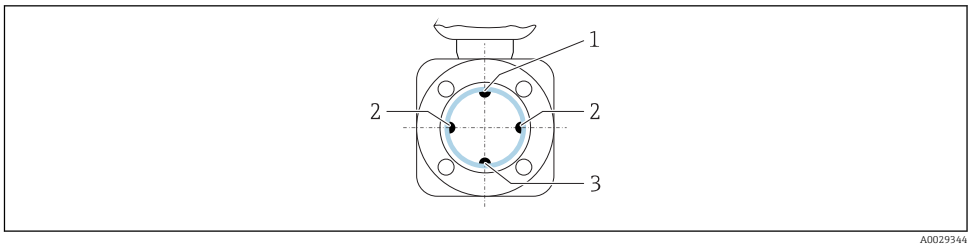




For heavy sensors DN ≥ 350 (14")

A0016276

Orientation



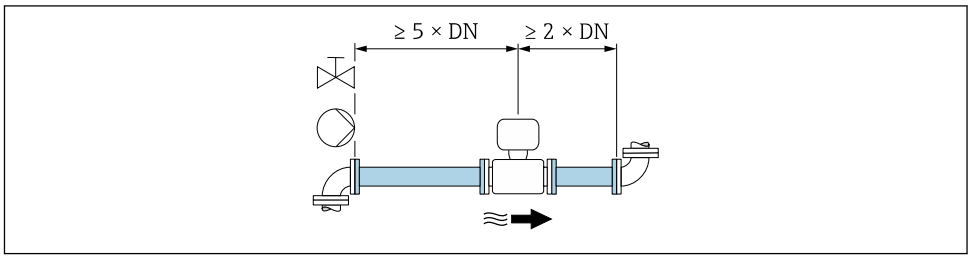
The direction of the arrow on the sensor nameplate helps you to install the sensor according to the flow direction (direction of medium flow through the piping).

Orientation			Recommendation
A	Vertical orientation	 A0015591	✓✓
B	Horizontal orientation, transmitter at top	 A0015589	✓✓ 1)
C	Horizontal orientation, transmitter at bottom	 A0015590	✓✓ 2) 3) ✗ 4)
D	Horizontal orientation, transmitter at side	 A0015592	✗

1) Applications with low process temperatures may decrease the ambient temperature. To maintain the minimum ambient temperature for the transmitter, this orientation is recommended.
2) Applications with high process temperatures may increase the ambient temperature. To maintain the maximum ambient temperature for the transmitter, this orientation is recommended.
3) To prevent the electronics module from overheating in the case of a sharp rise in temperature (e.g. CIP or SIP processes), install the device with the transmitter component pointing downwards.
4) With the empty pipe detection function switched on: empty pipe detection only works if the transmitter housing is pointing upwards.

Horizontal

- Ideally, the measuring electrode plane should be horizontal. This prevents brief insulation of the measuring electrodes by entrained air bubbles.
- Empty pipe detection only works if the transmitter housing is pointing upwards as otherwise there is no guarantee that the empty pipe detection function will actually respond to a partially filled or empty measuring tube.



1 *EPD electrode for empty pipe detection*
2 *Measuring electrodes for signal detection*
3 *Reference electrode for potential equalization*

Measuring devices with tantalum or platinum electrodes can be ordered without an EPD electrode. In this case, empty pipe detection is performed via the measuring electrodes.

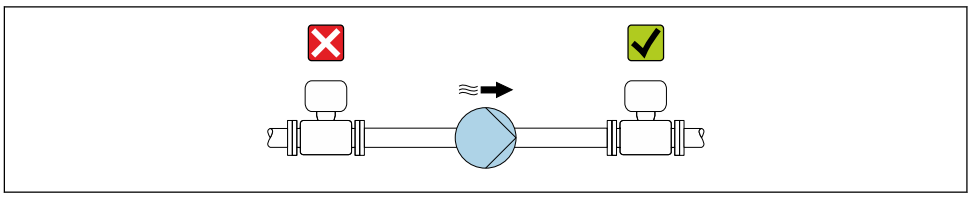
Inlet and outlet runs

If possible, install the sensor upstream from fittings such as valves, T-pieces or elbows.

Observe the following inlet and outlet runs to comply with accuracy specifications:

Installation dimensions

For the dimensions and installation lengths of the device, see the "Technical Information" document, "Mechanical construction" section.



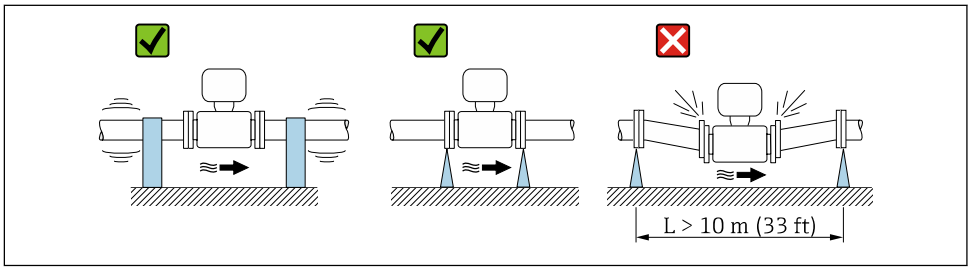
6.1.2 Environment and process requirements

Ambient temperature range

Transmitter	▪ Standard: −40 to +60 °C (−40 to +140 °F) ▪ Optional: −50 to +60 °C (−58 to +140 °F) (order code for "Test, certificate", option **JN** "Ambient temperature of transmitter −50 °C (−58 °F)")
Local display	−20 to +60 °C (−4 to +140 °F), the readability of the display may be impaired at temperatures outside the temperature range.
Sensor	▪ Process connection material, carbon steel: −10 to +60 °C (+14 to +140 °F) ▪ Process connection material, stainless steel: −40 to +60 °C (−40 to +140 °F)
Liner	Do not exceed or fall below the permitted temperature range of the liner .

If operating outdoors:
- Install the measuring device in a shady location.
- Avoid direct sunlight, particularly in warm climatic regions.
- Avoid direct exposure to weather conditions.

System pressure



Never install the sensor on the pump suction side in order to avoid the risk of low pressure, and thus damage to the liner.

Furthermore, install pulse dampers if reciprocating, diaphragm or peristaltic pumps are used.

- Information on the liner's resistance to partial vacuum
- Information on the shock resistance of the measuring system
- Information on the vibration resistance of the measuring system

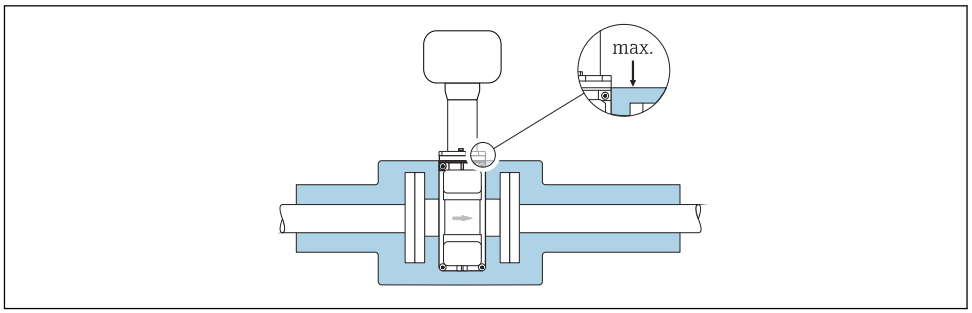
Vibrations

7 *Measures to prevent vibration of the device*

In the event of very strong vibrations, the pipe and sensor must be supported and fixed.

- Information on the shock resistance of the measuring system
- Information on the vibration resistance of the measuring system

Thermal insulation



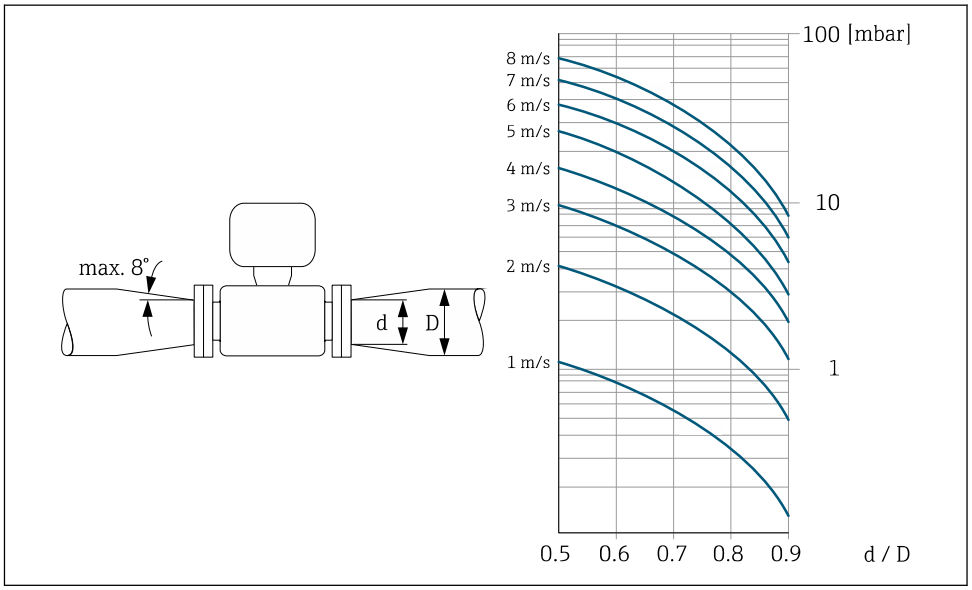
If process fluids are very hot, it is necessary to insulate pipes in order to reduce energy loss and to prevent individuals from accidentally coming into contact with hot pipes. Please observe the applicable standards and guidelines for insulating pipes.

A housing support/an extended neck is used for heat dissipation:
- Devices with the order code for "Lining", option **B** "PFA high-temperature" always come with a housing support.
- In the case of all other devices, a housing support can be ordered via the order code for "Sensor option", option **CG** "Sensor extended neck".

WARNING

Electronics overheating on account of thermal insulation!

▶ The housing support is used for heat dissipation and must be completely free (i.e. uncovered). At the very maximum, the sensor insulation may extend as far as the upper edge of the two sensor half-shells.

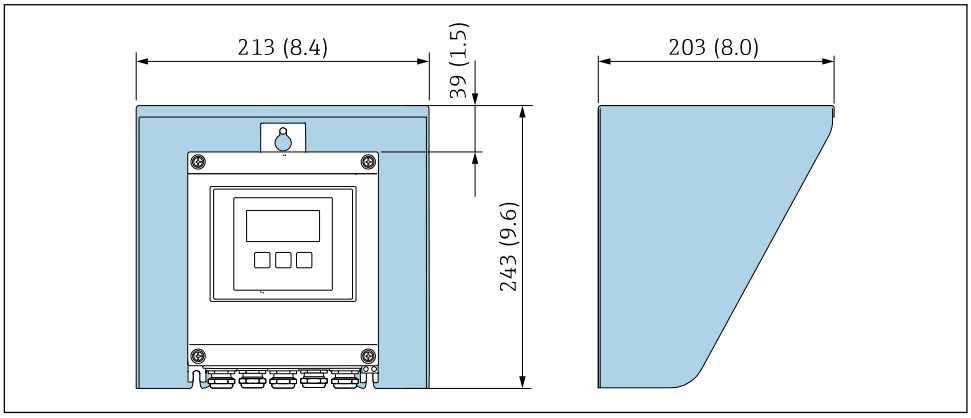


A0031216

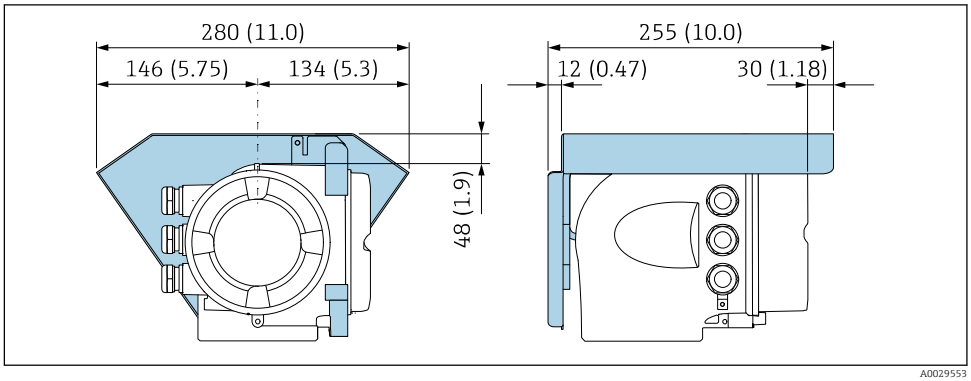
Adapters

Suitable adapters to DIN EN 545 (double-flange reducers) can be used to install the sensor in larger-diameter pipes. The resultant increase in the rate of flow improves measuring accuracy with very slow-moving fluids. The nomogram shown here can be used to calculate the pressure loss caused by reducers and expanders.

The nomogram only applies to liquids with a viscosity similar to that of water.



1. Calculate the ratio of the diameters d/D.
2. From the nomogram read off the pressure loss as a function of flow velocity (downstream from the reduction) and the d/D ratio.



A0029002

6.1.3 Special mounting instructions

Protective cover

8 *Weather protection cover for Proline 500 – digital*

9 *Weather protection cover for Proline 500*

6.2 Mounting the measuring device

6.2.1 Required tools

For transmitter

For mounting on a post:
- Proline 500 – digital transmitter
  - Open-ended wrench AF 10
  - Torx screwdriver TX 25
- Proline 500 transmitter
  Open-ended wrench AF 13

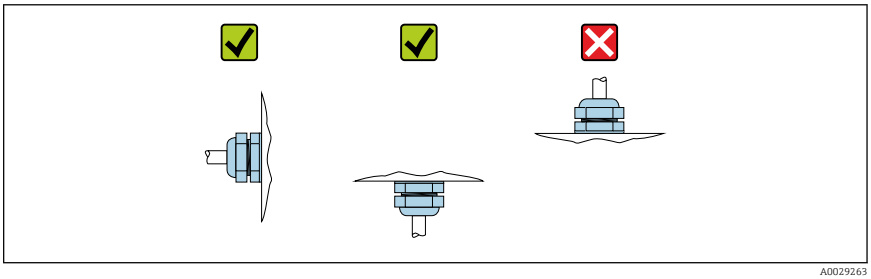
For wall mounting:
Drill with drill bit Ø 6.0 mm

For sensor

For flanges and other process connections: Corresponding mounting tools

6.2.2 Preparing the measuring device

1. Remove all remaining transport packaging.
2. Remove any protective covers or protective caps present from the sensor.
3. Remove stick-on label on the electronics compartment cover.



6.2.3 Mounting the sensor

⚠ WARNING

Danger due to improper process sealing!

- ▶ Ensure that the inside diameters of the gaskets are greater than or equal to that of the process connections and piping.
- ▶ Ensure that the gaskets are clean and undamaged.
- ▶ Install the gaskets correctly.

1. Ensure that the direction of the arrow on the sensor matches the flow direction of the medium.
2. To ensure compliance with device specifications, install the measuring device between the pipe flanges in a way that it is centered in the measurement section.
3. If using ground disks, comply with the Installation Instructions provided.
4. Observe required screw tightening torques → 🖹 30.
5. Install the measuring device or turn the transmitter housing so that the cable entries do not point upwards.

A0029263

Mounting the seals

⚠ CAUTION

An electrically conductive layer could form on the inside of the measuring tube!

Risk of measuring signal short circuit.

- ▶ Do not use electrically conductive sealing compounds such as graphite.

Comply with the following instructions when installing seals:

1. For DIN flanges: only use seals according to DIN EN 1514-1.
2. For "PFA" liner: generally additional seals are **not** required.
3. For "PTFE" liner: generally additional seals are **not** required.

Mounting the ground cable/ground disks

Comply with the information on potential equalization and detailed mounting instructions for the use of ground cables/ground disks .

Screw tightening torques

Please note the following:
- The screw tightening torques listed below apply only to lubricated threads and to pipes not subjected to tensile stress.
- Tighten the screws uniformly and in diagonally opposite sequence.
- Overtightening the screws will deform the sealing faces or damage the seals.

Nominal screw tightening torques → 33

6.2.4 Mounting the transmitter housing: Proline 500 – digital

⚠ CAUTION

Ambient temperature too high!

Danger of electronics overheating and housing deformation.

- ▶ Do not exceed the permitted maximum ambient temperature → 🖹 25.
- ▶ If operating outdoors: Avoid direct sunlight and exposure to weathering, particularly in warm climatic regions.

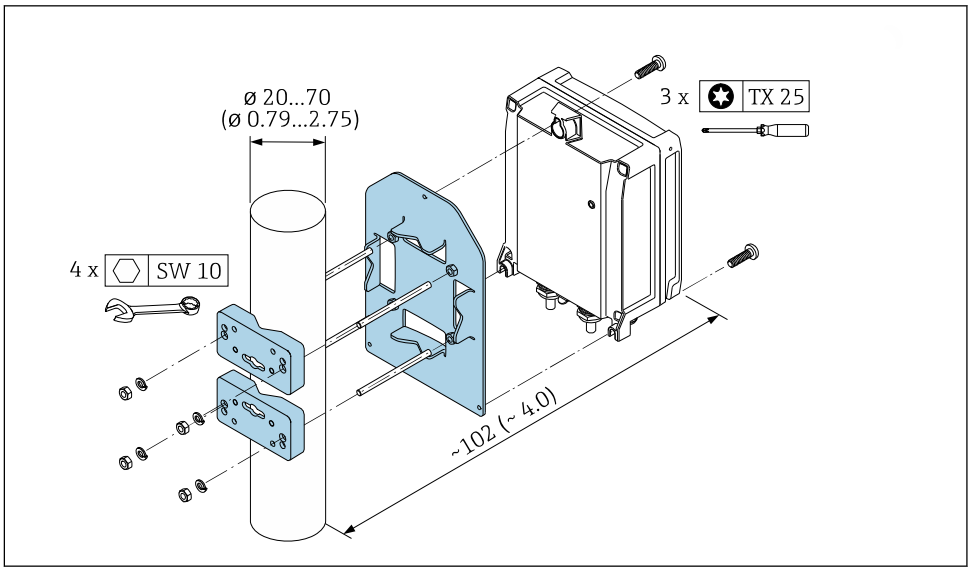
⚠ CAUTION

Excessive force can damage the housing!

- ▶ Avoid excessive mechanical stress.

The transmitter can be mounted in the following ways:

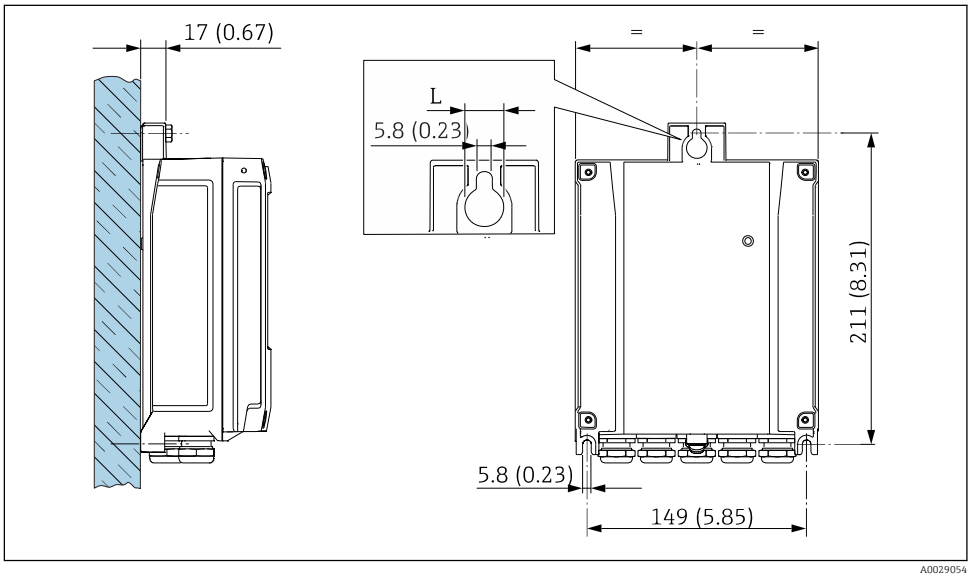
- Post mounting
- Wall mounting



Post mounting

⚠ WARNING

Excessive tightening torque applied to the fixing screws!



Risk of damaging the plastic transmitter.

- ▶ Tighten the fixing screws as per the tightening torque: 2 Nm (1.5 lbf ft)

10 *Engineering unit mm (in)*

Wall mounting

11 *Engineering unit mm (in)*

L Depends on order code for "Transmitter housing"

Order code for "Transmitter housing"
- Option **A**, aluminum coated: L =14 mm (0.55 in)
- Option **D**, polycarbonate: L = 13 mm (0.51 in)

1. Drill the holes.
2. Insert wall plugs into the drilled holes.
3. Screw in the securing screws slightly at first.
4. Fit the transmitter housing over the securing screws and mount in place.
5. Tighten the securing screws.

6.2.5 Mounting the transmitter housing: Proline 500

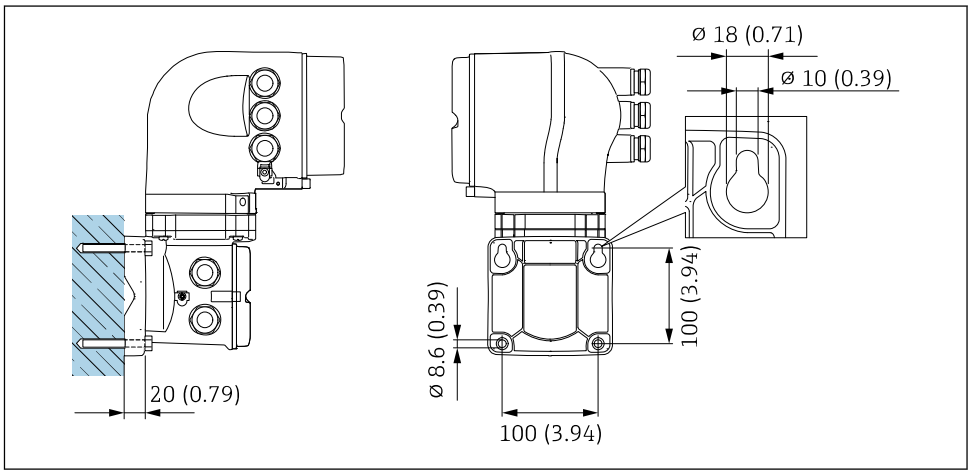
⚠ CAUTION

Ambient temperature too high!

Danger of electronics overheating and housing deformation.

- ▶ Do not exceed the permitted maximum ambient temperature → 🖹 25.
- ▶ If operating outdoors: Avoid direct sunlight and exposure to weathering, particularly in warm climatic regions.

⚠ CAUTION



Excessive force can damage the housing!

- ▶ Avoid excessive mechanical stress.

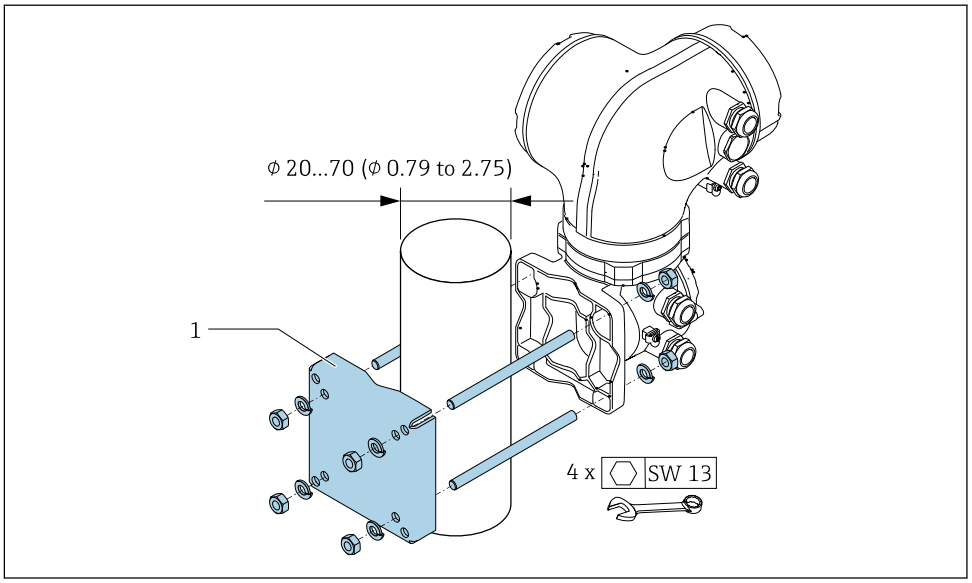
The transmitter can be mounted in the following ways:

- Post mounting
- Wall mounting

Wall mounting

12 *Engineering unit mm (in)*

1. Drill the holes.
2. Insert wall plugs into the drilled holes.
3. Screw in the securing screws slightly at first.
4. Fit the transmitter housing over the securing screws and mount in place.
5. Tighten the securing screws.

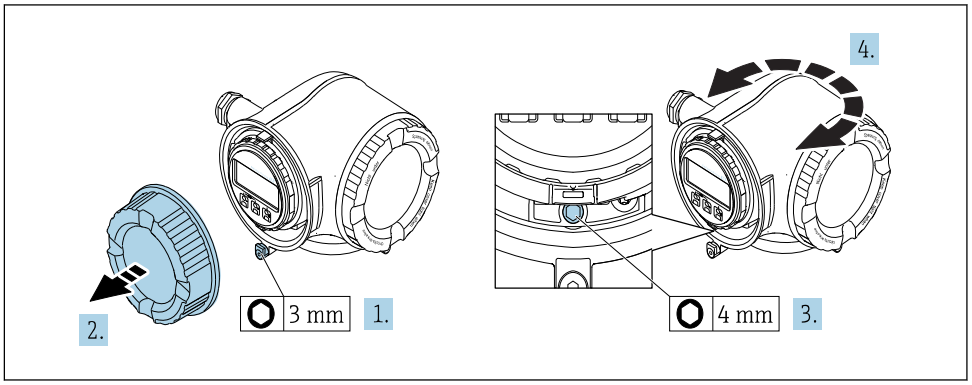


Post mounting

⚠ WARNING

Order code for "Transmitter housing", option L "Cast, stainless": cast transmitters are very heavy.

They are unstable if they are not mounted on a secure, fixed post.

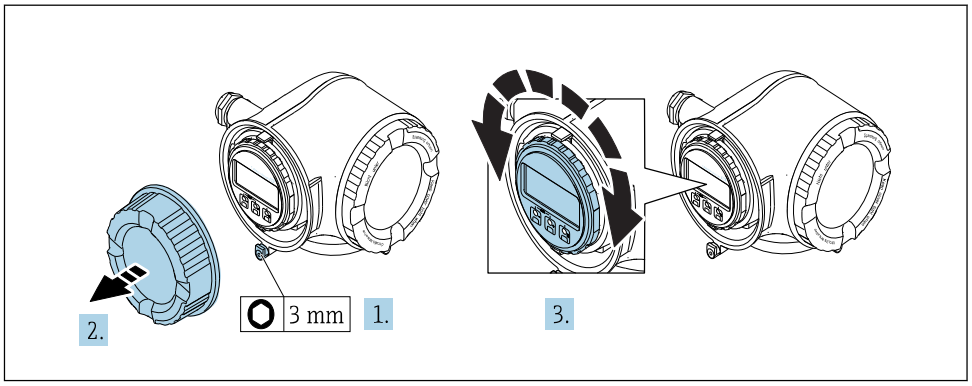


► Only mount the transmitter on a secure, fixed post on a stable surface.

13 *Engineering unit mm (in)*

6.2.6 Turning the transmitter housing: Proline 500

To provide easier access to the connection compartment or display module, the transmitter housing can be turned.



1. Depending on the device version: Loosen the securing clamp of the connection compartment cover.
2. Unscrew the connection compartment cover.
3. Release the fixing screw.
4. Turn the housing to the desired position.
5. Firmly tighten the securing screw.
6. Screw on the connection compartment cover

7. Depending on the device version: Attach the securing clamp of the connection compartment cover.

6.2.7 Turning the display module: Proline 500

The display module can be turned to optimize display readability and operability.

A0030035

1. Depending on the device version: Loosen the securing clamp of the connection compartment cover.
2. Unscrew the connection compartment cover.
3. Turn the display module to the desired position: max. 8 × 45° in each direction.
4. Screw on the connection compartment cover.
5. Depending on the device version: Attach the securing clamp of the connection compartment cover.

6.3 Post-installation check

Is the device undamaged (visual inspection)?	❑
Does the measuring device conform to the measuring point specifications? For example: ▪ Process temperature ▪ Process pressure (refer to the section on "Pressure-temperature ratings" in the "Technical Information" document) ▪ Ambient temperature ▪ Measuring range	❑
Has the correct orientation for the sensor been selected ? ▪ According to sensor type ▪ According to medium temperature ▪ According to medium properties (outgassing, with entrained solids)	❑
Does the arrow on the sensor nameplate match the direction of flow of the fluid through the piping ?	❑
Are the measuring point identification and labeling correct (visual inspection)?	❑
Is the device adequately protected from precipitation and direct sunlight?	❑
Have the fixing screws been tightened with the correct tightening torque?	❑

7 Electrical connection

NOTICE

The measuring device does not have an internal circuit breaker.

- ▶ For this reason, assign the measuring device a switch or power-circuit breaker so that the power supply line can be easily disconnected from the mains.
- ▶ Although the measuring device is equipped with a fuse, additional overcurrent protection (maximum 10 A) should be integrated into the system installation.

7.1 Connection conditions

7.1.1 Required tools

- For cable entries: Use corresponding tools
- For securing clamp: Allen key 3 mm
- Wire stripper
- When using stranded cables: crimper for wire end ferrule
- For removing cables from terminal: Flat blade screwdriver ≤ 3 mm (0.12 in)

7.1.2 Requirements for connecting cable

The connecting cables provided by the customer must fulfill the following requirements.

Electrical safety

In accordance with applicable federal/national regulations.

Protective ground cable

Cable ≥2.08 mm^2 (14 AWG)

The grounding impedance must be less than 1 Ω.

Permitted temperature range

- The installation guidelines that apply in the country of installation must be observed.
- The cables must be suitable for the minimum and maximum temperatures to be expected.

Power supply cable

Standard installation cable is sufficient.

Signal cable

Current output 4 to 20 mA HART

A shielded cable is recommended. Observe grounding concept of the plant.

Current output 0/4 to 20 mA

Standard installation cable is sufficient.

Pulse/frequency/switch output

Standard installation cable is sufficient.

Double pulse output

Standard installation cable is sufficient.

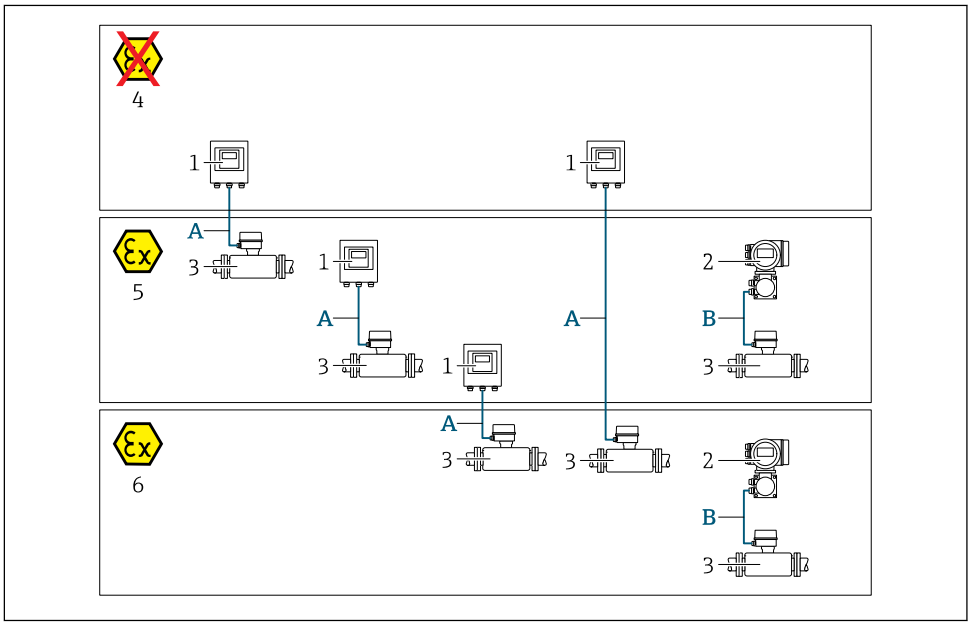
Relay output

Standard installation cable is sufficient.

Current input 0/4 to 20 mA

Standard installation cable is sufficient.

Status input



Standard installation cable is sufficient.

Cable diameter

- Cable glands supplied:
  M20 × 1.5 with cable Ø 6 to 12 mm (0.24 to 0.47 in)
- Spring-loaded terminals: Suitable for strands and strands with ferrules.
  Conductor cross-section 0.2 to 2.5 mm^2 (24 to 12 AWG).

Choice of connecting cable between the transmitter and sensor

Depends on the type of transmitter and the installation zones

1 *Proline 500 digital transmitter*
2 *Proline 500 transmitter*
3 *Promag sensor*
4 *Non-hazardous area*
5 *Hazardous area: Zone 2; Class I, Division 2*
6 *Hazardous area: Zone 1; Class I, Division 1*
A *Standard cable to 500 digital transmitter → 40*
Transmitter installed in the non-hazardous area or hazardous area: Zone 2; Class I, Division 2 / sensor installed in the hazardous area: Zone 2; Class I, Division 2 or Zone 1; Class I, Division 1
B *Signal cable to 500 transmitter → 41*
Transmitter and sensor installed in the hazardous area: Zone 2; Class I, Division 2 oder Zone 1; Class I, Division 1

A: Connecting cable between sensor and transmitter: Proline 500 – digital

Standard cable

A standard cable with the following specifications can be used as the connecting cable.

Design	4 cores (2 pairs); uninsulated stranded CU wires; pair-stranded with common shield
Shielding	Tin-plated copper-braid, optical cover ≥ 85 %
Cable length	Maximum 300 m (1 000 ft), see the following table.

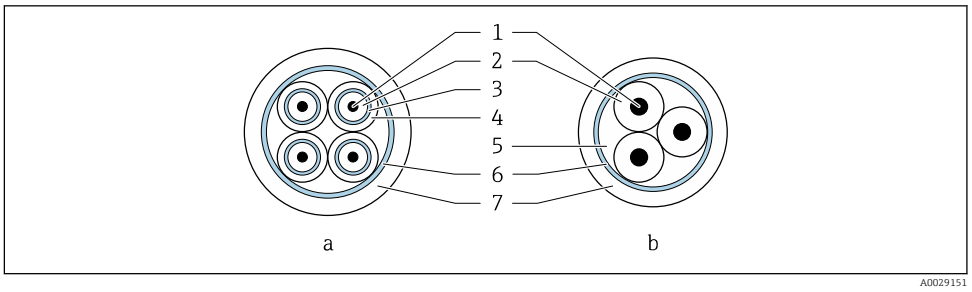
Cross-section	**Cable lengths for use in**	
	Non-hazardous area, Hazardous area: Zone 2; Class I, Division 2	**Hazardous area: Zone 1; Class I, Division 1**
0.34 mm² (AWG 22)	80 m (270 ft)	50 m (165 ft)
0.50 mm² (AWG 20)	120 m (400 ft)	60 m (200 ft)
0.75 mm² (AWG 18)	180 m (600 ft)	90 m (300 ft)
1.00 mm² (AWG 17)	240 m (800 ft)	120 m (400 ft)

Cross-section	Cable lengths for use in	
	Non-hazardous area, Hazardous area: Zone 2; Class I, Division 2	Hazardous area: Zone 1; Class I, Division 1
1.50 mm² (AWG 15)	300 m (1 000 ft)	180 m (600 ft)
2.50 mm² (AWG 13)	300 m (1 000 ft)	300 m (1 000 ft)

Optionally available connecting cable

Design	2 × 2 × 0.34 mm² (AWG 22) PVC cable [1] with common shield (2 pairs, uninsulated stranded CU wires; pair-stranded)
Flame resistance	According to DIN EN 60332-1-2
Oil-resistance	According to DIN EN 60811-2-1
Shielding	Tin-plated copper-braid, optical cover ≥ 85 %
Operating temperature	When mounted in a fixed position: −50 to +105 °C (−58 to +221 °F); when cable can move freely: −25 to +105 °C (−13 to +221 °F)
Available cable length	Fixed: 20 m (65 ft); variable: up to maximum 50 m (165 ft)

1) UV radiation can impair the cable outer sheath. Protect the cable from direct sunshine where possible.



B: Connecting cable between sensor and transmitter: Proline 500

Signal cable

Design	3 × 0.38 mm² (20 AWG) with common, braided copper shield (Ø ~ 9.5 mm (0.37 in)) and individual shielded cores
Conductor resistance	≤50 Ω/km (0.015 Ω/ft)
Capacitance: core/shield	≤420 pF/m (128 pF/ft)
Cable length (max.)	Depends on the medium conductivity, max. 200 m (656 ft)
Cable lengths (available for order)	5 m (15 ft), 10 m (32 ft), 20 m (65 ft) or variable length up to max. 200 m (656 ft)
Operating temperature	−20 to +80 °C (−68 to +176 °F)

Coil current cable

Design	3 × 0.75 mm² (18 AWG) with common, braided copper shield (Ø ~ 9 mm (0.35 in)) and individual shielded cores
Conductor resistance	≤37 Ω/km (0.011 Ω/ft)
Capacitance: core/core, shield grounded	≤120 pF/m (37 pF/ft)
Cable length (max.)	Depends on the medium conductivity, max. 200 m (656 ft)
Cable lengths (available for order)	5 m (15 ft), 10 m (32 ft), 20 m (65 ft) or variable length up to max. 200 m (656 ft)
Operating temperature	−20 to +80 °C (−68 to +176 °F)
Test voltage for cable insulation	≤ AC 1433 V rms 50/60 Hz or ≥ DC 2026 V

14 Cable cross-section

a Electrode cable
b Coil current cable
1 Core
2 Core insulation
3 Core shield
4 Core jacket
5 Core reinforcement
6 Cable shield
7 Outer jacket

Reinforced connecting cables

Reinforced connecting cables with an additional, reinforcing metal braid should be used for:
- When laying the cable directly in the ground
- Where there is a risk of damage from rodents

Operation in zones of severe electrical interference

The measuring system meets the general safety requirements → 206 and EMC specifications → 193.

Grounding is by means of the ground terminal provided for the purpose inside the connection housing. The stripped and twisted lengths of cable shield to the ground terminal must be as short as possible.

7.1.3 Terminal assignment

Transmitter: supply voltage, input/outputs

The terminal assignment of the inputs and outputs depends on the individual order version of the device. The device-specific terminal assignment is documented on an adhesive label in the terminal cover.

Supply voltage		Input/output 1		Input/output 2		Input/output 3		Input/output 4	
1 (+)	2 (–)	26 (+)	27 (–)	24 (+)	25 (–)	22 (+)	23 (–)	20 (+)	21 (–)
		Device-specific terminal assignment: adhesive label in terminal cover.							

Transmitter and sensor connection housing: connecting cable

The sensor and transmitter, which are mounted in separate locations, are interconnected by a connecting cable. The cable is connected via the sensor connection housing and the transmitter housing.

Terminal assignment and connection of the connecting cable:
- Proline 500 – digital→ 46
- Proline 500 → 51

7.1.4 Preparing the measuring device

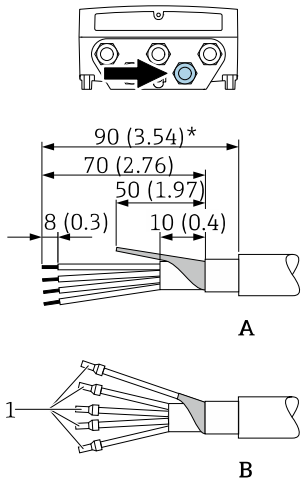
Carry out the steps in the following order:

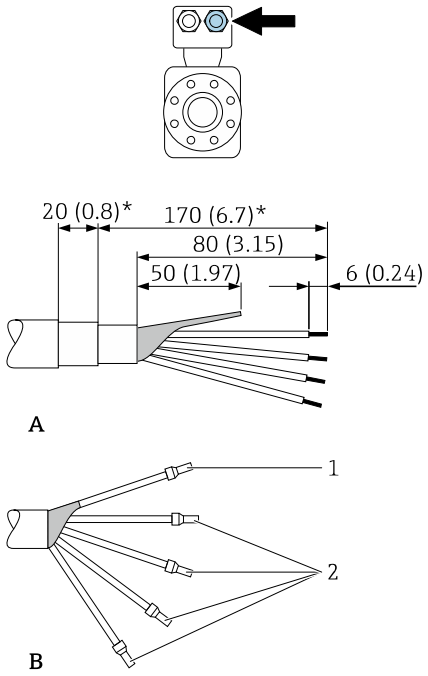
1. Mount the sensor and transmitter.
2. Connection housing, sensor: Connect connecting cable.
3. Transmitter: Connect connecting cable.
4. Transmitter: Connect signal cable and cable for supply voltage.

NOTICE

Insufficient sealing of the housing!

Operational reliability of the measuring device could be compromised.





▶ Use suitable cable glands corresponding to the degree of protection.

1. Remove dummy plug if present.
2. If the measuring device is supplied without cable glands:
   Provide suitable cable gland for corresponding connecting cable.
3. If the measuring device is supplied with cable glands:
   Observe requirements for connecting cables → 38.

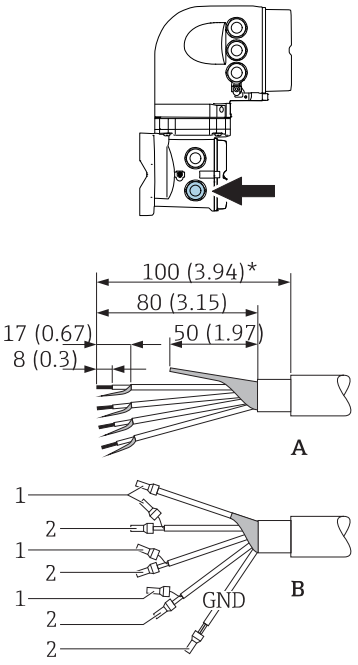
7.1.5 Preparing the connecting cable: Proline 500 – digital

When terminating the connecting cable, pay attention to the following points:

- For cables with fine-wire cores (stranded cables):
  Fit the cores with ferrules.

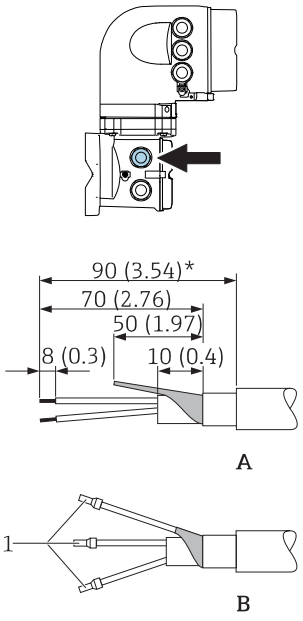
Transmitter	Sensor
	

Engineering unit mm (in)
A = Terminate the cable
B = Fit ferrules on cables with fine-wire cores (stranded cables)
1 = Red ferrules, Φ 1.0 mm (0.04 in)
2 = White ferrules, Φ 0.5 mm (0.02 in)
* = Stripping only for reinforced cables



7.1.6 Preparing the connecting cable: Proline 500

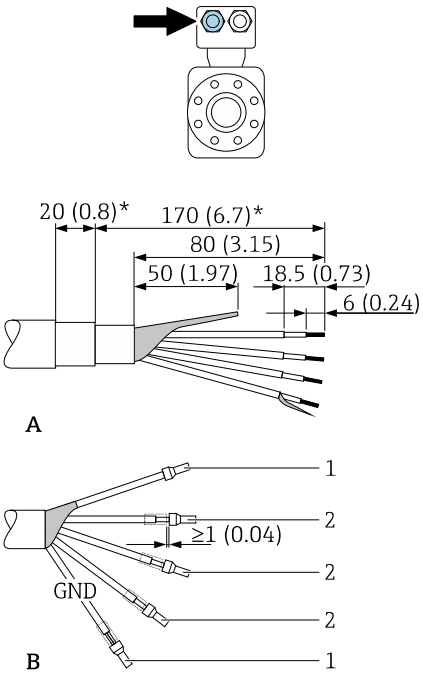
When terminating the connecting cable, pay attention to the following points:



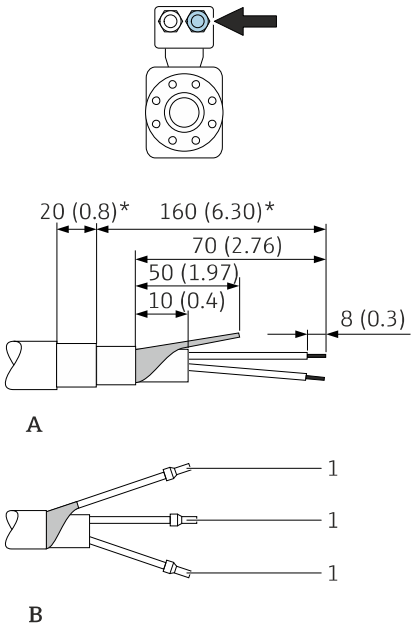
1. In the case of the electrode cable:
   Make sure that the ferrules do not touch the core shields on the sensor side.
   Minimum distance = 1 mm (exception: green “GND” cable)
2. In the case of the coil current cable:
   Insulate one core of the three-core cable at the level of the core reinforcement. You only require two cores for the connection.
3. For cables with fine-wire cores (stranded cables):
   Fit the cores with ferrules.

Transmitter

Electrode cable



Coil current cable



Sensor

Electrode cable

Coil current cable

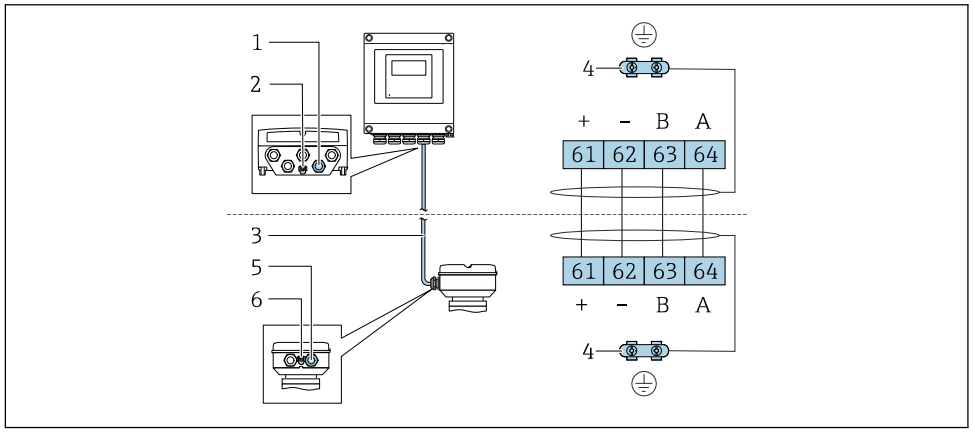
Engineering unit mm (in)
A = Terminate the cable
B = Fit ferrules on cables with fine-wire cores (stranded cables)
1 = Red ferrules, ϕ 1.0 mm (0.04 in)
2 = White ferrules, ϕ 0.5 mm (0.02 in)
* = Stripping only for reinforced cables

7.2 Connecting the measuring device: Proline 500 - digital

NOTICE

Limitation of electrical safety due to incorrect connection!

- ▶ Have electrical connection work carried out by appropriately trained specialists only.
- ▶ Observe applicable federal/national installation codes and regulations.
- ▶ Comply with local workplace safety regulations.
- ▶ Always connect the protective ground cable ⏚ before connecting additional cables.
- ▶ For use in potentially explosive atmospheres, observe the information in the device-specific Ex documentation.



7.2.1 Connecting the connecting cable

⚠ WARNING

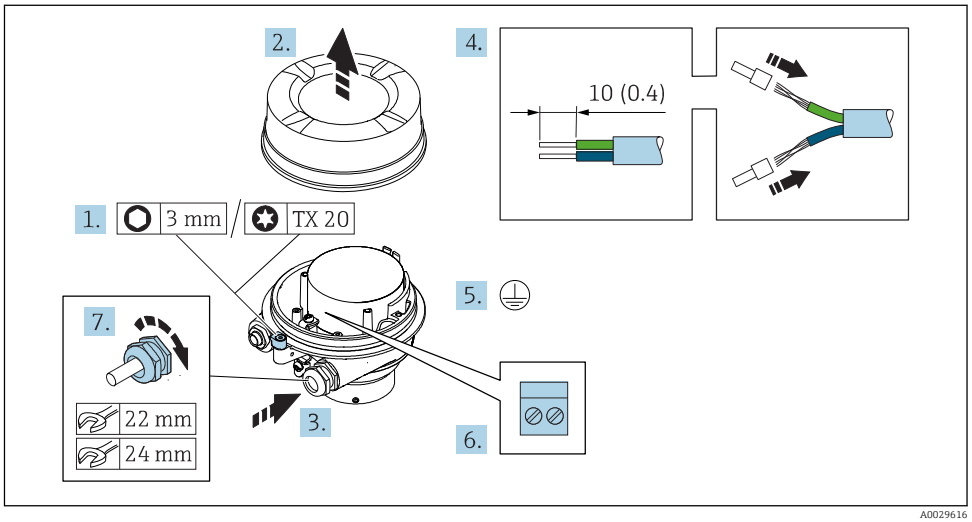
Risk of damaging the electronic components!

- ▶ Connect the sensor and transmitter to the same potential equalization.
- ▶ Only connect the sensor to a transmitter with the same serial number.
- ▶ Ground the connection housing of the sensor via the external screw terminal.

Connecting cable terminal assignment

1 Cable entry for cable on transmitter housing
2 Protective earth (PE)
3 Connecting cable ISEM communication
4 Grounding via ground connection; on device plug versions grounding is through the plug itself
5 Cable entry for cable or connection of device plug on sensor connection housing
6 Protective earth (PE)

Connecting the connecting cable to the sensor connection housing



Connection via terminals with order code for "Sensor connection housing":
- Option **A** "Aluminum, coated"→ 🖹 47
- Option **L** "Cast, stainless"→ 🖹 47

Connecting the connecting cable to the transmitter

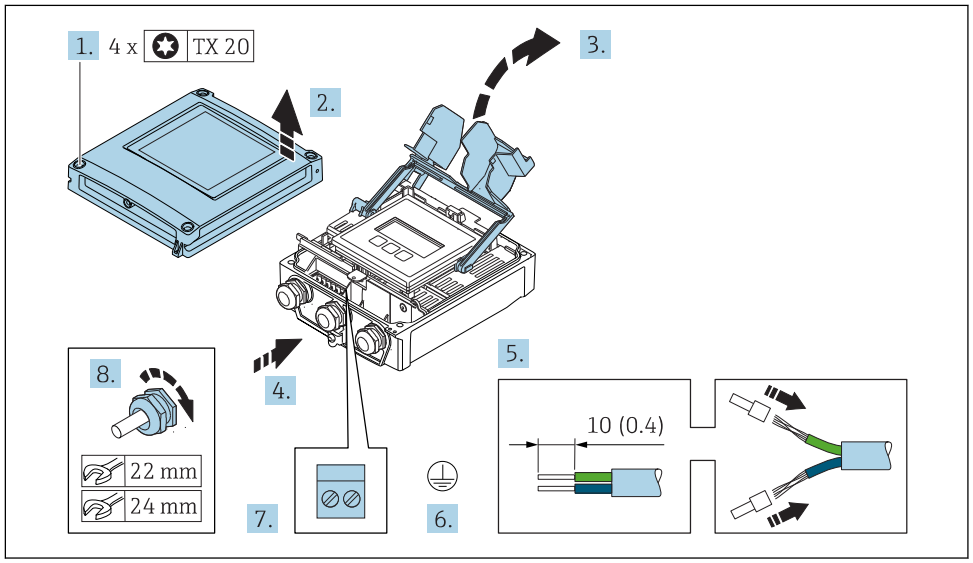
The cable is connected to the transmitter via terminals → 🖹 48.

Connecting the sensor connection housing via terminals

For the device version with the order code for "Sensor connection housing":
- Option **A** "Aluminum coated"
- Option **L** "Cast, stainless"

A0029616

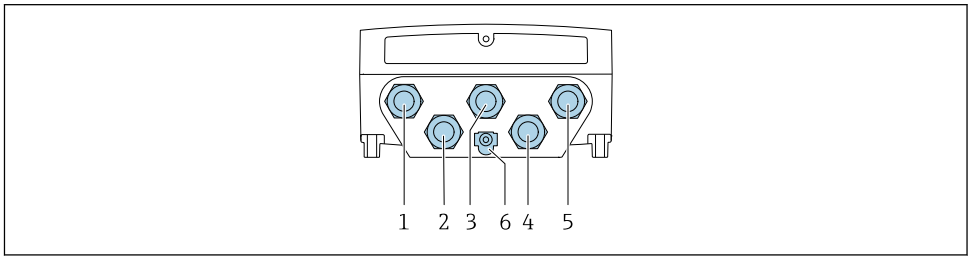
1. Loosen the securing clamp of the housing cover.
2. Unscrew the housing cover.
3. Push the cable through the cable entry . To ensure tight sealing, do not remove the sealing ring from the cable entry.
4. Strip the cable and cable ends. In the case of stranded cables, fit ferrules.
5. Connect the protective ground.
6. Connect the cable in accordance with the connecting cable terminal assignment.
7. Firmly tighten the cable glands.
   ↳ This concludes the process for connecting the connecting cable.



⚠ WARNING

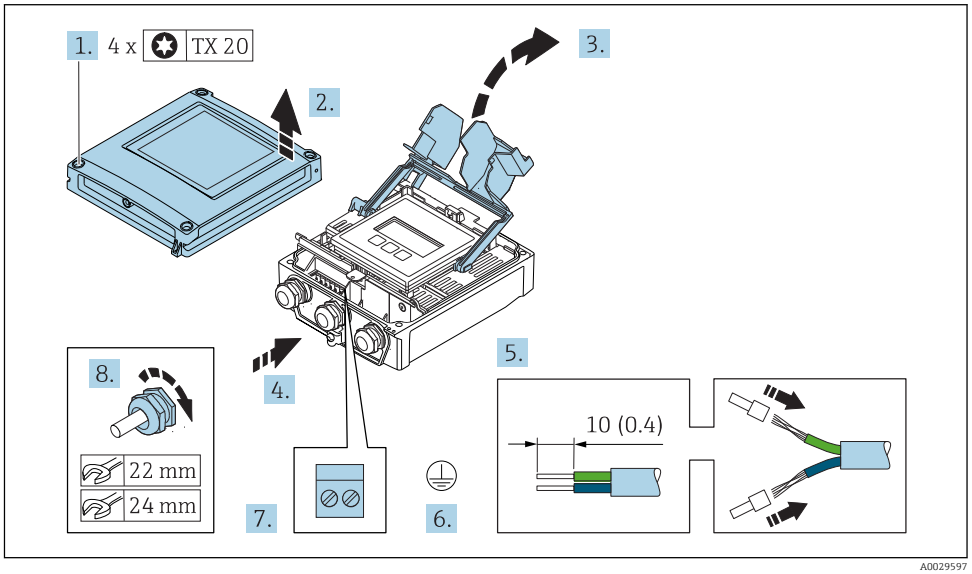
Housing degree of protection voided due to insufficient sealing of the housing.

▶ Screw in the thread on the cover without using any lubricant. The thread on the cover is coated with a dry lubricant.



8. Screw on the housing cover.
9. Tighten the securing clamp of the housing cover.

Connecting the connecting cable to the transmitter



1. Loosen the 4 fixing screws on the housing cover.
2. Open the housing cover.
3. Fold open the terminal cover.
4. Push the cable through the cable entry . To ensure tight sealing, do not remove the sealing ring from the cable entry.
5. Strip the cable and cable ends. In the case of stranded cables, fit ferrules.
6. Connect the protective ground.
7. Connect the cable in accordance with the connecting cable terminal assignment → 46.
8. Firmly tighten the cable glands.
   ↳ This concludes the process for connecting the connecting cable.
9. Close the housing cover.
10. Tighten the securing screw of the housing cover.
11. After connecting the connecting cable:
    Connect the signal cable and the supply voltage cable → 49.

7.2.2 Connecting the signal cable and the supply voltage cable

1 *Terminal connection for supply voltage*
2 *Terminal connection for signal transmission, input/output*
3 *Terminal connection for signal transmission, input/output*
4 *Terminal connection for connecting cable between sensor and transmitter*
5 *Terminal connection for signal transmission, input/output; optional: connection for external WLAN antenna*
6 *Protective earth (PE)*

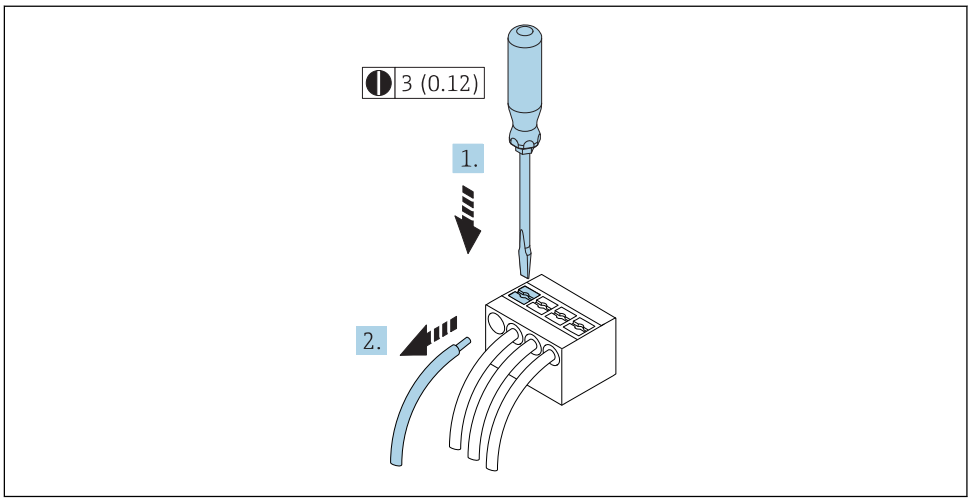
1. Loosen the 4 fixing screws on the housing cover.
2. Open the housing cover.
3. Fold open the terminal cover.
4. Push the cable through the cable entry . To ensure tight sealing, do not remove the sealing ring from the cable entry.
5. Strip the cable and cable ends. In the case of stranded cables, fit ferrules.
6. Connect the protective ground.
7. Connect the cable in accordance with the terminal assignment .
   ↳ **Signal cable terminal assignment:** The device-specific terminal assignment is documented on an adhesive label in the terminal cover.
   Supply voltage terminal assignment: Adhesive label in the terminal cover or → 📄 42.
8. Firmly tighten the cable glands.
   ↳ This concludes the cable connection process.
9. Close the terminal cover.
10. Close the housing cover.

⚠ WARNING

Housing degree of protection may be voided due to insufficient sealing of the housing.

▶ Screw in the screw without using any lubricant.

⚠ WARNING



Excessive tightening torque applied to the fixing screws!

Risk of damaging the plastic transmitter.

▶ Tighten the fixing screws as per the tightening torque: 2 Nm (1.5 lbf ft)

11. Tighten the 4 fixing screws on the housing cover.

Removing a cable

15 *Engineering unit mm (in)*

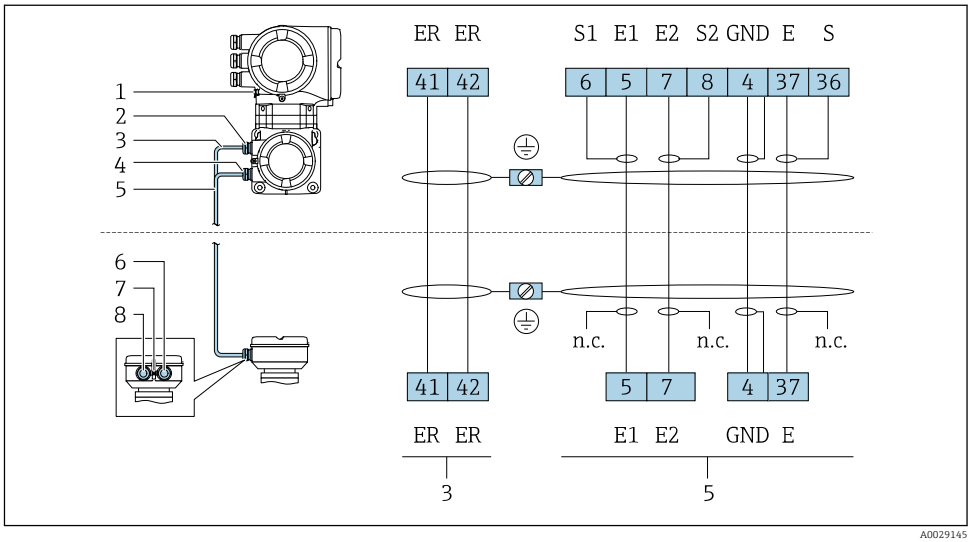
1. To remove a cable from the terminal, use a flat-blade screwdriver to push the slot between the two terminal holes
2. while simultaneously pulling the cable end out of the terminal.

7.3 Connecting the measuring device: Proline 500

NOTICE

Limitation of electrical safety due to incorrect connection!

- Have electrical connection work carried out by appropriately trained specialists only.
- Observe applicable federal/national installation codes and regulations.
- Comply with local workplace safety regulations.
- Always connect the protective ground cable ⏚ before connecting additional cables.
- For use in potentially explosive atmospheres, observe the information in the device-specific Ex documentation.



7.3.1 Connecting the connecting cable

⚠ WARNING

Risk of damaging the electronic components!

- Connect the sensor and transmitter to the same potential equalization.
- Only connect the sensor to a transmitter with the same serial number.
- Ground the connection housing of the sensor via the external screw terminal.

Connecting cable terminal assignment

1 Protective earth (PE)
2 Cable entry for coil current cable on transmitter connection housing
3 Coil current cable
4 Cable entry for signal cable on transmitter connection housing
5 Signal cable

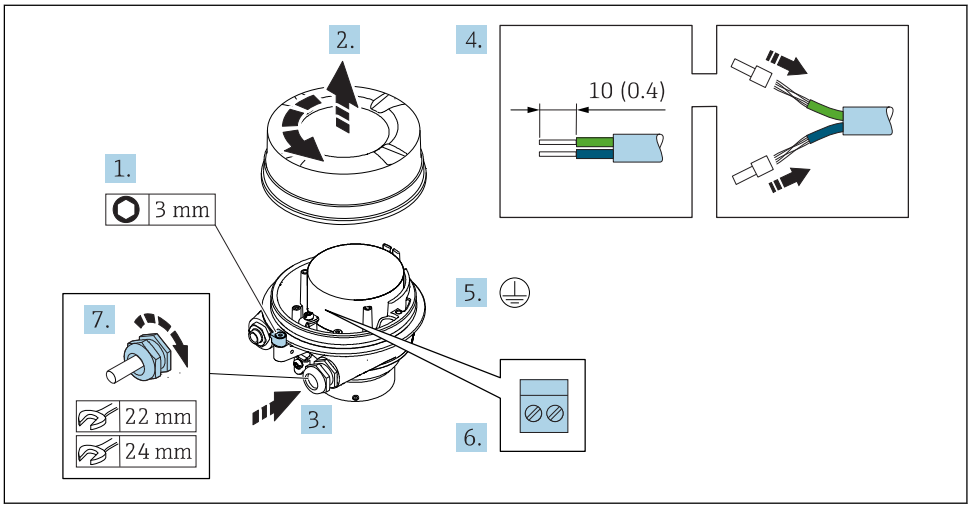
8 Cable entry for coil current cable on sensor connection housing

Connecting the connecting cable to the sensor connection housing



Connection via terminals with order code for "Housing":
Option **A** "Aluminum coated"→ 🖹 52

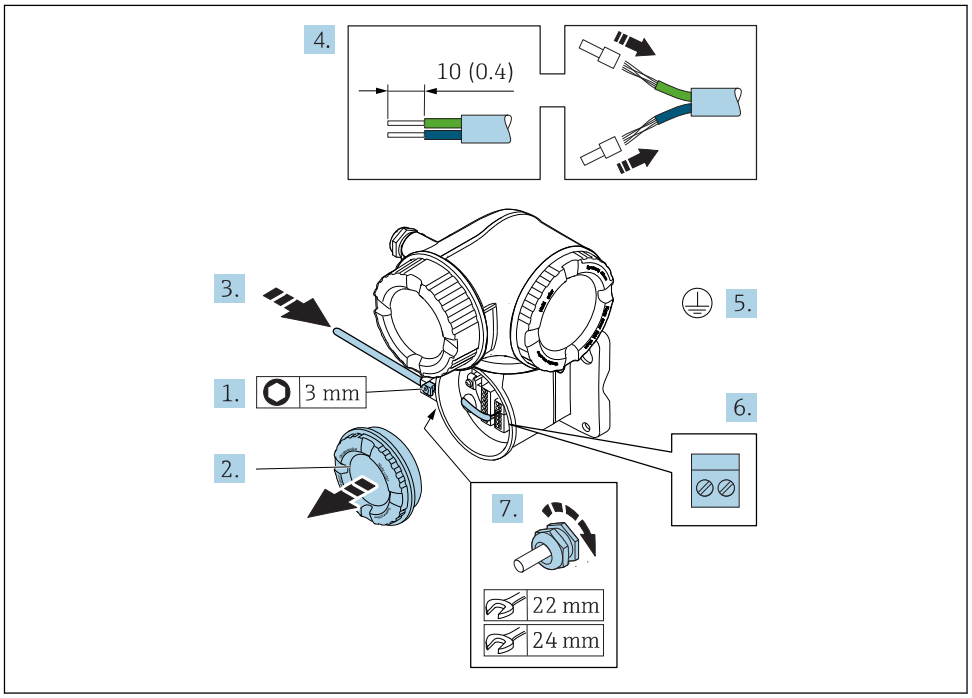
Connecting the connecting cable to the transmitter

The cable is connected to the transmitter via terminals → 🖹 53.

Connecting the sensor connection housing via terminals

For the device version with the order code for "Housing":
- Option **A** "Aluminum coated"
- Option **L** "Cast, stainless"

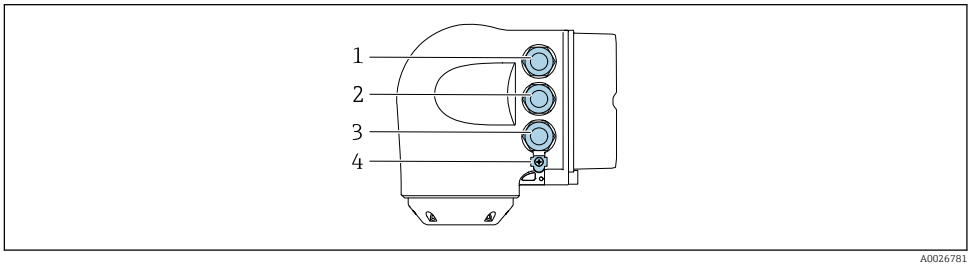
1. Loosen the securing clamp of the housing cover.
2. Unscrew the housing cover.
3. Push the cable through the cable entry . To ensure tight sealing, do not remove the sealing ring from the cable entry.
4. Strip the cable and cable ends. In the case of stranded cables, fit ferrules.
5. Connect the protective ground.
6. Connect the cable in accordance with the connecting cable terminal assignment.
7. Firmly tighten the cable glands.
   ↳ This concludes the process for connecting the connecting cables.



⚠ WARNING

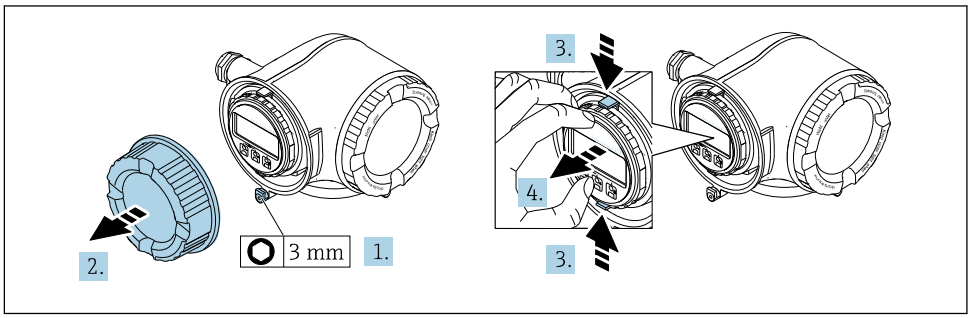
Housing degree of protection voided due to insufficient sealing of the housing.

▶ Screw in the thread on the cover without using any lubricant. The thread on the cover is coated with a dry lubricant.



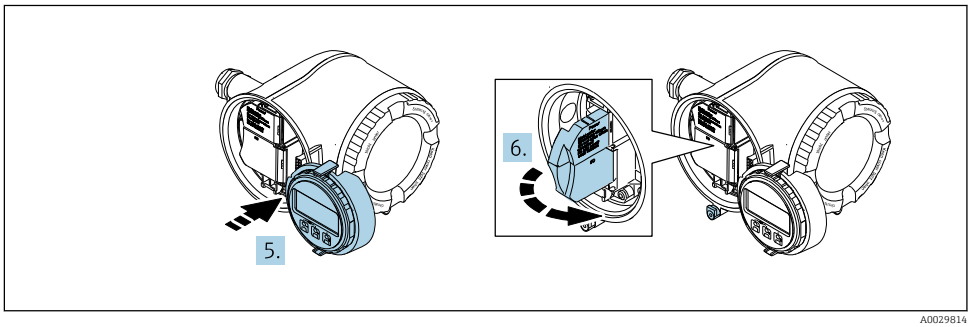
8. Screw on the housing cover.
9. Tighten the securing clamp of the housing cover.

Connecting the connecting cable to the transmitter



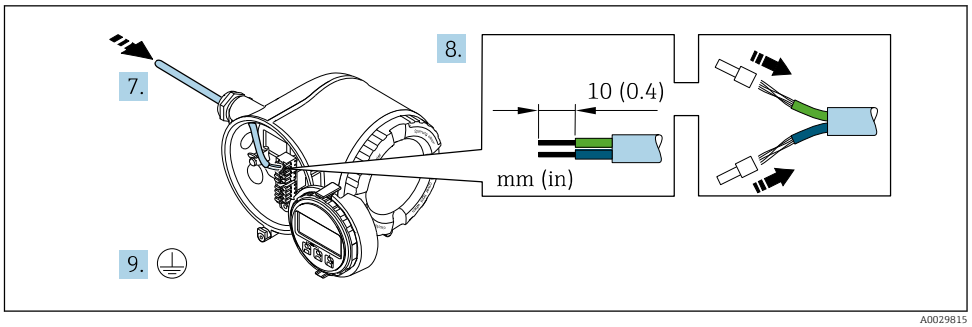
1. Loosen the securing clamp of the connection compartment cover.
2. Unscrew the connection compartment cover.
3. Push the cable through the cable entry . To ensure tight sealing, do not remove the sealing ring from the cable entry.
4. Strip the cable and cable ends. In the case of stranded cables, also fit ferrules.
5. Connect the protective ground.
6. Connect the cable in accordance with the connecting cable terminal assignment → 51.
7. Firmly tighten the cable glands.
   ↳ This concludes the process for connecting the connecting cables.
8. Screw on the connection compartment cover.
9. Tighten the securing clamp of the connection compartment cover.
10. After connecting the connecting cables:
    Connect the signal cable and the supply voltage cable → 54.

7.3.2 Connecting the signal cable and the supply voltage cable



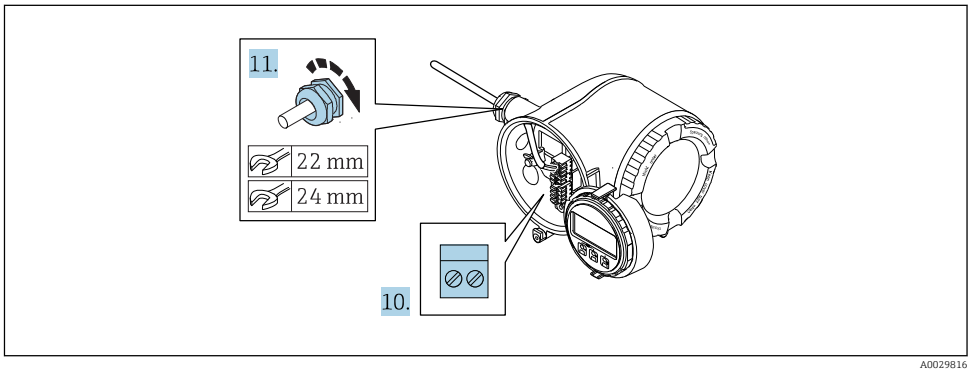
A0026781

1 Terminal connection for supply voltage
2 Terminal connection for signal transmission, input/output
3 Terminal connection for signal transmission, input/output or terminal connection for network connection via service interface (CDI-RJ45)
4 Protective earth (PE)



A0029813

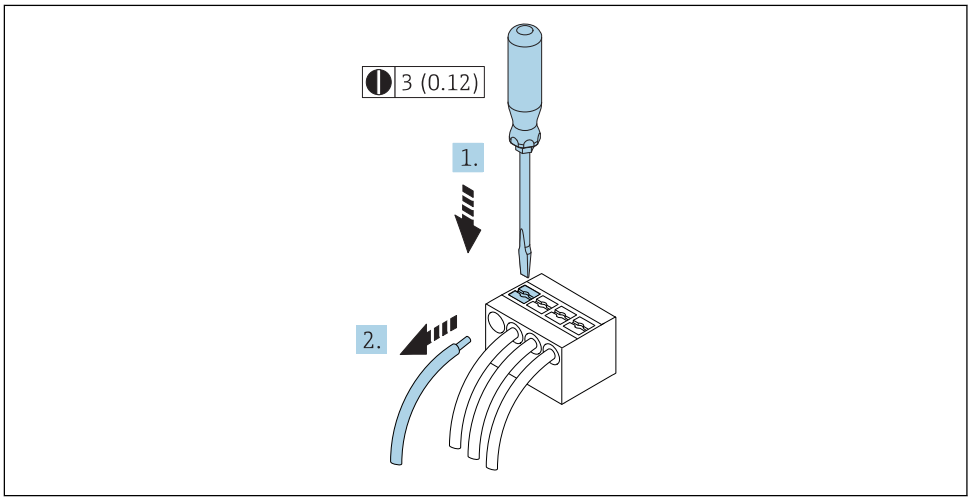
1. Loosen the securing clamp of the connection compartment cover.
2. Unscrew the connection compartment cover.
3. Squeeze the tabs of the display module holder together.
4. Remove the display module holder.



A0029814

5. Attach the holder to the edge of the electronics compartment.
6. Open the terminal cover.

A0029815



7. Push the cable through the cable entry . To ensure tight sealing, do not remove the sealing ring from the cable entry.
8. Strip the cable and cable ends. In the case of stranded cables, also fit ferrules.
9. Connect the protective ground.

A0029816

10. Connect the cable in accordance with the terminal assignment .
    ↳ **Signal cable terminal assignment:** The device-specific terminal assignment is documented on an adhesive label in the terminal cover.
    Supply voltage terminal assignment: Adhesive label in the terminal cover or → 42.
11. Firmly tighten the cable glands.
    ↳ This concludes the cable connection process.
12. Close the terminal cover.
13. Fit the display module holder in the electronics compartment.
14. Screw on the connection compartment cover.
15. Secure the securing clamp of the connection compartment cover.

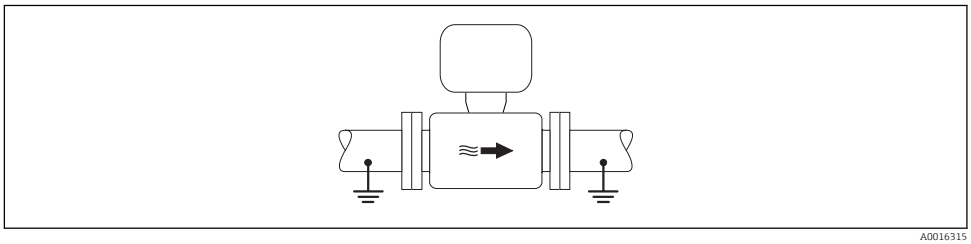
Removing a cable

16 *Engineering unit mm (in)*

1. To remove a cable from the terminal, use a flat-blade screwdriver to push the slot between the two terminal holes
2. while simultaneously pulling the cable end out of the terminal.

7.4 Ensuring potential equalization

7.4.1 Requirements



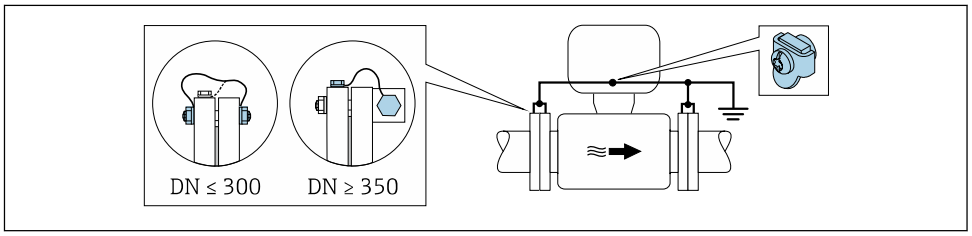
CAUTION

Electrode damage can result in the complete failure of the device!

- Same electrical potential for the fluid and sensor
- Company-internal grounding concepts
- Pipe material and grounding

7.4.2 Connection example, standard scenario

Metal, grounded pipe



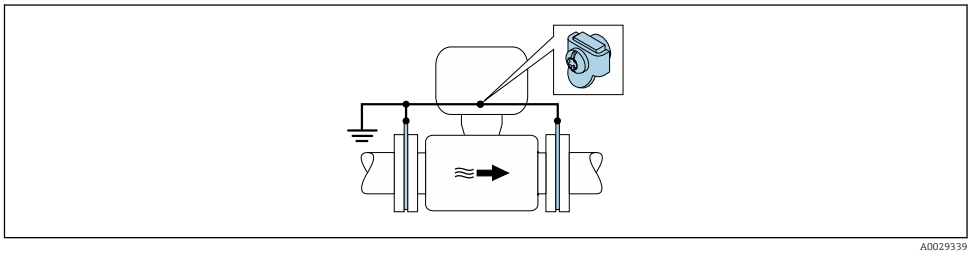
17 *Potential equalization via measuring tube*

7.4.3 Connection example in special situations

Unlined and ungrounded metal pipe

This connection method also applies in situations where:
- The customary potential equalization is not used
- Equalizing currents are present

Ground cable	Copper wire, at least 6 mm² (0.0093 in²)



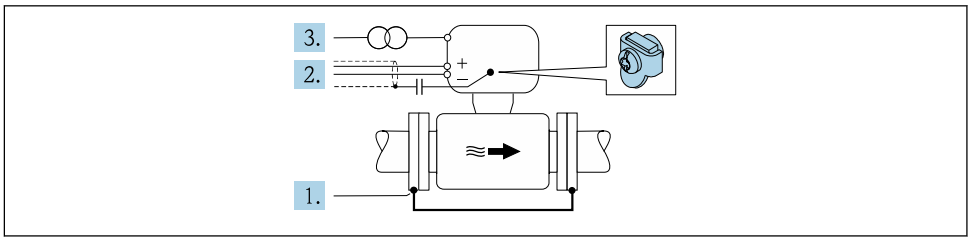
18 *Potential equalization via ground terminal and pipe flanges*

1. Connect both sensor flanges to the pipe flange via a ground cable and ground them.
2. If DN ≤ 300 (12"): Mount the ground cable directly on the conductive flange coating of the sensor with the flange screws.
3. If DN ≥ 350 (14"): Mount the ground cable directly on the metal transport bracket. Observe screw tightening torques: see the Sensor Brief Operating Instructions.
4. Connect the connection housing of the transmitter or sensor to ground potential by means of the ground terminal provided for the purpose.

Plastic pipe or pipe with insulating liner

This connection method also applies in situations where:
- The customary potential equalization is not used
- Equalizing currents are present

Ground cable	Copper wire, at least 6 mm² (0.0093 in²)



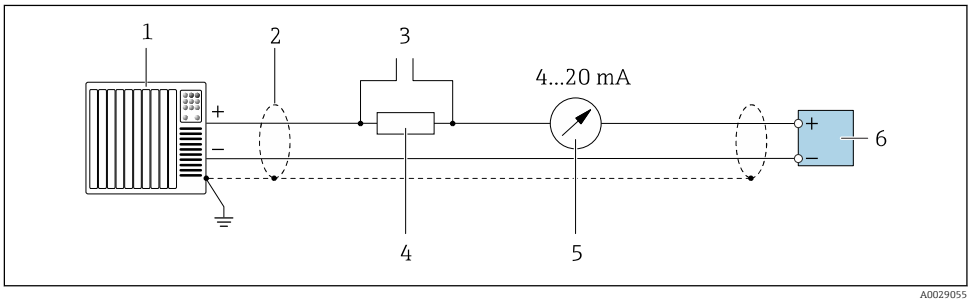
19 *Potential equalization via ground terminal and ground disks*

1. Connect the ground disks to the ground terminal via the ground cable.
2. Connect the ground disks to ground potential.

Pipe with a cathodic protection unit

This connection method is only used if the following two conditions are met:
- Metal pipe without liner or pipe with electrically conductive liner
- Cathodic protection is integrated in the personal protection equipment

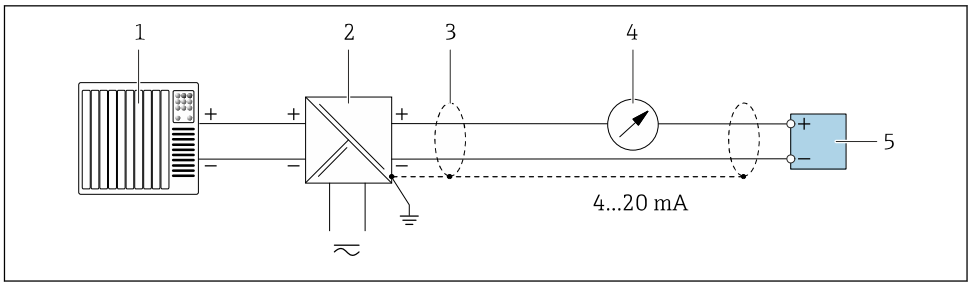
Ground cable	Copper wire, at least 6 mm² (0.0093 in²)



Prerequisite: The sensor is installed in the pipe in a way that provides electrical insulation.

1. Connect the two flanges of the pipe to one another via a ground cable.
2. Guide the shield of the signal lines through a capacitor.
3. Connect the measuring device to the power supply such that it is floating in relation to the protective ground (isolation transformer).

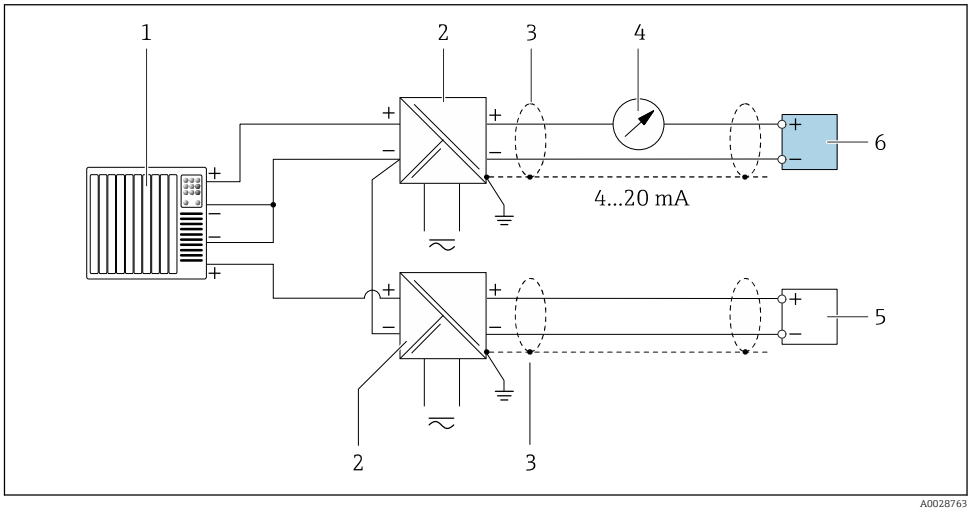
7.5 Special connection instructions



7.5.1 Connection examples

Current output 4 to 20 mA HART

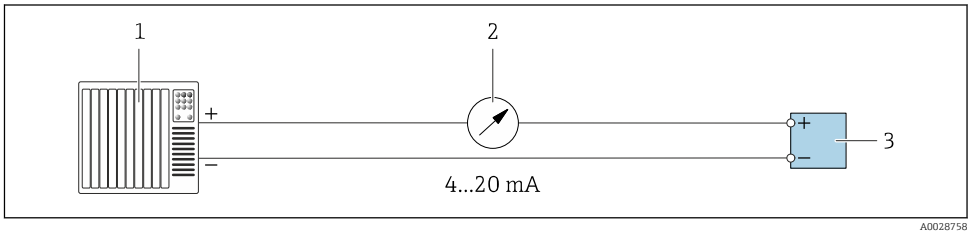
20 Connection example for 4 to 20 mA HART current output (active)



1 *Automation system with current input (e.g. PLC)*
2 *Cable shield provided at one end. The cable shield must be grounded at both ends to comply with EMC requirements; observe cable specifications*
3 *Connection for HART operating devices → 84*
4 *Resistor for HART communication (≥ 250 Ω): observe maximum load → 184*
5 *Analog display unit: observe maximum load → 184*
6 *Transmitter*

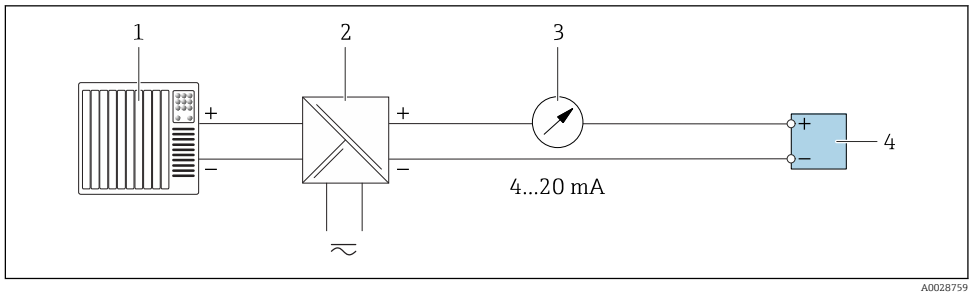
21 *Connection example for 4 to 20 mA HART current output (passive)*

1 *Automation system with current input (e.g. PLC)*
2 *Power supply*
3 *Cable shield provided at one end. The cable shield must be grounded at both ends to comply with EMC requirements; observe cable specifications*
4 *Analog display unit: observe maximum load → 184*
5 *Transmitter*



HART input

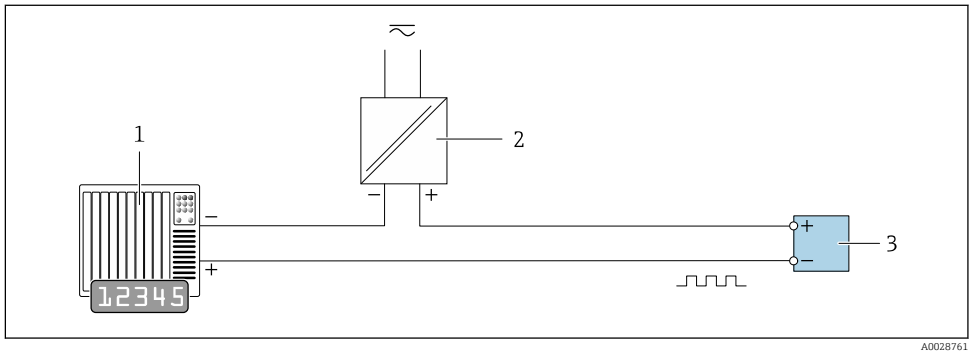
22 *Connection example for HART input with a common negative (passive)*



1 *Automation system with HART output (e.g. PLC)*
2 *Active barrier for power supply (e.g. RN221N)*
3 *Cable shield provided at one end. The cable shield must be grounded at both ends to comply with EMC requirements; observe cable specifications*
4 *Analog display unit: observe maximum load → 184*
5 *Pressure measuring device (e.g. Cerabar M, Cerabar S): see requirements*
6 *Transmitter*

Current output 4-20 mA

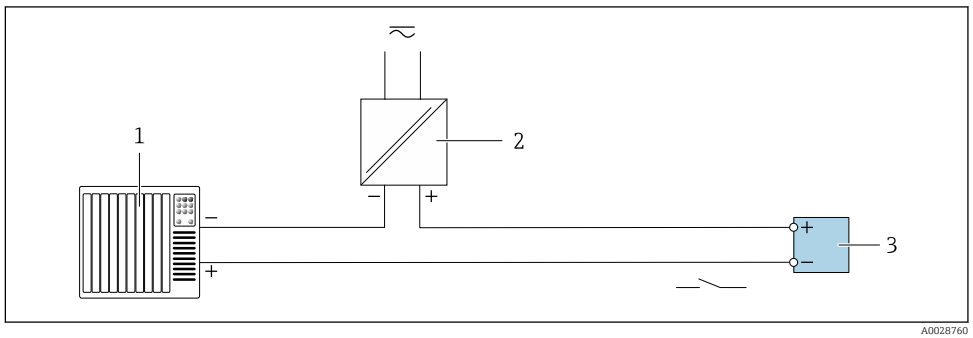
23 *Connection example for 4-20 mA current output (active)*



1 *Automation system with current input (e.g. PLC)*
2 *Analog display unit: observe maximum load → 184*
3 *Transmitter*

24 *Connection example for 4-20 mA current output (passive)*

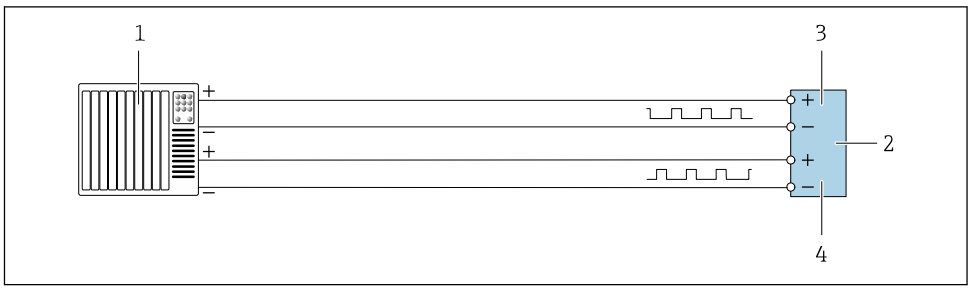
1 *Automation system with current input (e.g. PLC)*
2 *Active barrier for power supply (e.g. RN221N)*
3 *Analog display unit: observe maximum load → 184*
4 *Transmitter*



Pulse/frequency output

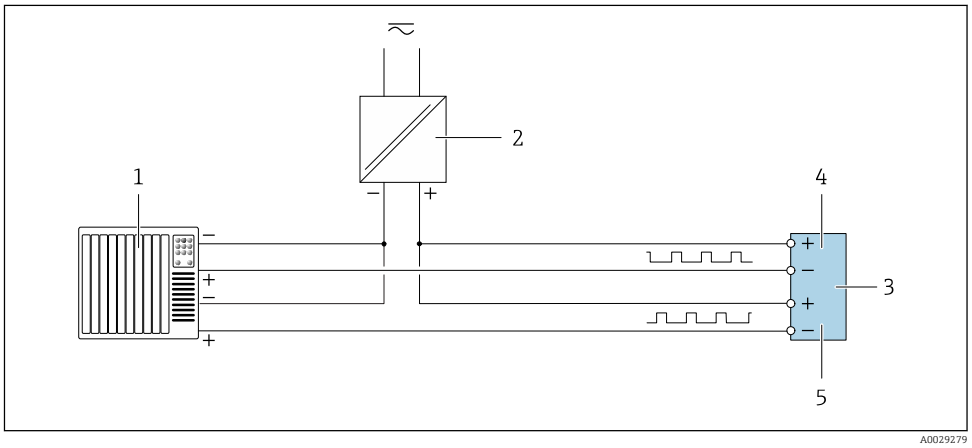
25 *Connection example for pulse/frequency output (passive)*

1 *Automation system with pulse/frequency input (e.g. PLC)*
2 *Power supply*
3 *Transmitter: Observe input values → 186*



Switch output

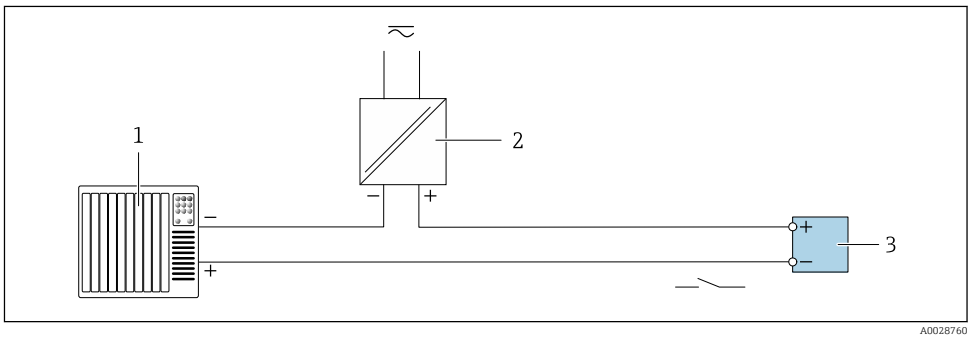
26 *Connection example for switch output (passive)*



1 *Automation system with switch input (e.g. PLC)*
2 *Power supply*
3 *Transmitter: Observe input values → 186*

Double pulse output

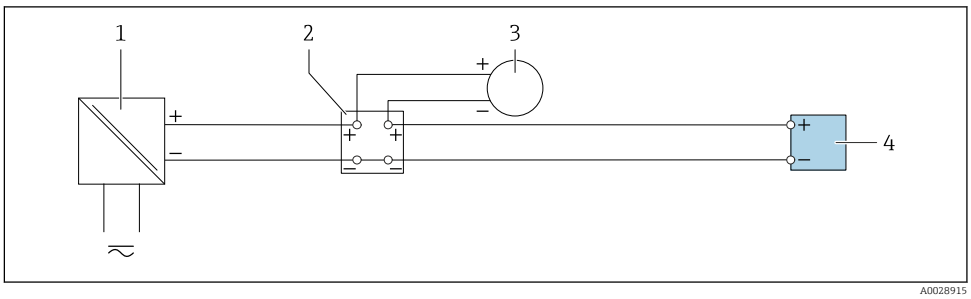
27 *Connection example for double pulse output (active)*



1 *Automation system with double pulse input (e.g. PLC)*
2 *Transmitter: Observe input values → 187*
3 *Double pulse output*
4 *Double pulse output (slave), phase-shifted*

28 *Connection example for double pulse output (passive)*

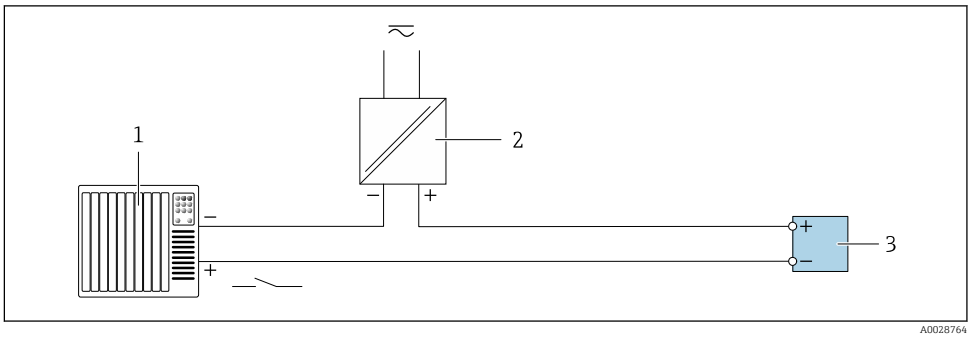
1 *Automation system with double pulse input (e.g. PLC)*
2 *Power supply*
3 *Transmitter: Observe input values → 187*
4 *Double pulse output*
5 *Double pulse output (slave), phase-shifted*



Relay output

29 *Connection example for relay output (passive)*

1 *Automation system with relay input (e.g. PLC)*
2 *Power supply*
3 *Transmitter: Observe input values → 187*



Current input

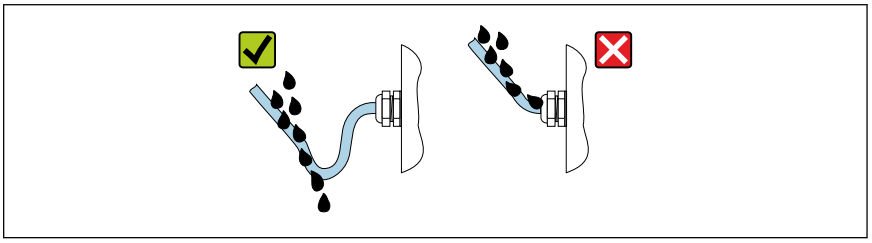
30 *Connection example for 4 to 20 mA current input*

1 *Power supply*
2 *Terminal box*
3 *External measuring device (to read in pressure or temperature, for instance)*
4 *Transmitter*

Status input

31 *Connection example for status input*

1 *Automation system with status output (e.g. PLC)*
2 *Power supply*
3 *Transmitter*



7.6 Ensuring the degree of protection

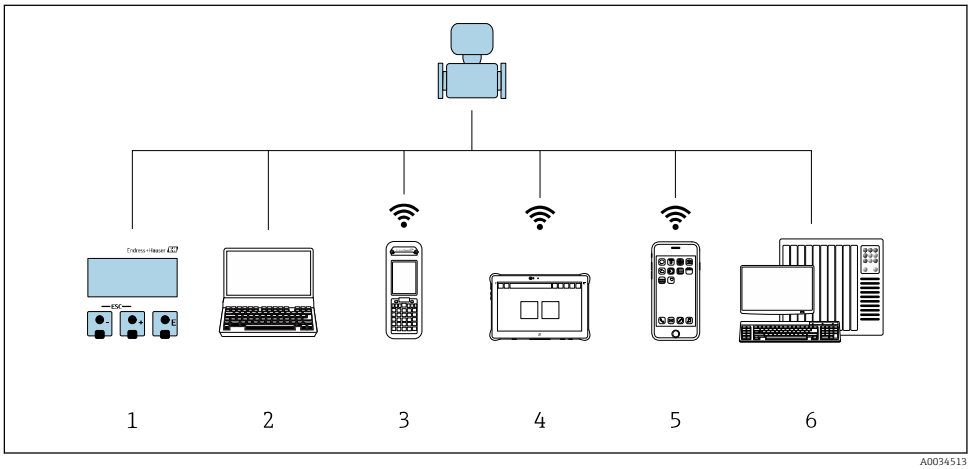
The measuring device fulfills all the requirements for the IP66/67 degree of protection, Type 4X enclosure.

To guarantee IP66/67 degree of protection, Type 4X enclosure, carry out the following steps after the electrical connection:

1. Check that the housing seals are clean and fitted correctly.
2. Dry, clean or replace the seals if necessary.
3. Tighten all housing screws and screw covers.
4. Firmly tighten the cable glands.

5. To ensure that moisture does not enter the cable entry:
   Route the cable so that it loops down before the cable entry ("water trap").
   ↳

A0029278



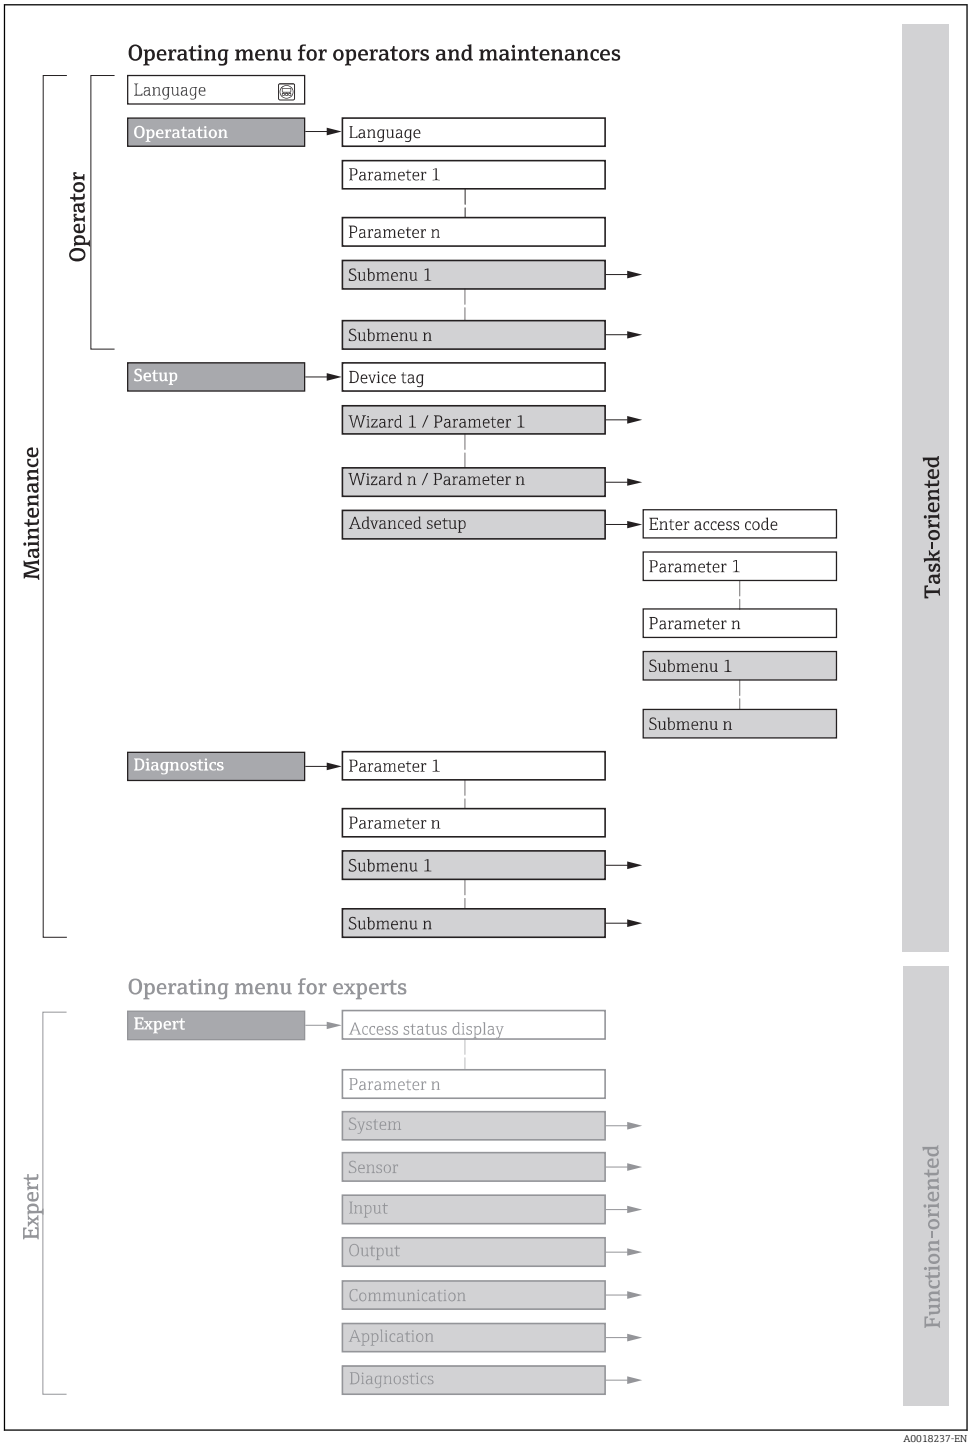
6. Insert dummy plugs into unused cable entries.

7.7 Post-connection check

Are cables or the device undamaged (visual inspection)?	❑
Do the cables used meet the requirements?	❑
Do the cables have adequate strain relief?	❑
Are all the cable glands installed, firmly tightened and leak-tight? Cable run with "water trap" → 🖹 62?	❑
Is the potential equalization established correctly ?	❑

8 Operation options

8.1 Overview of operation options



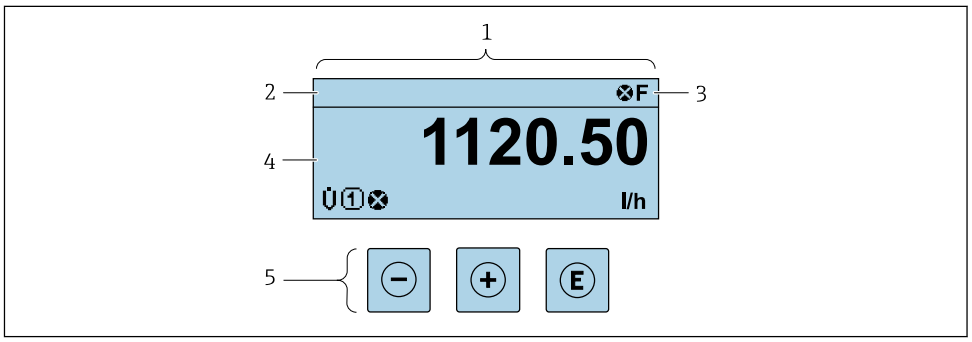
1 *Local operation via display module*
2 *Computer with Web browser (e.g. Internet Explorer) or with operating tool (e.g. FieldCare, DeviceCare, AMS Device Manager, SIMATIC PDM)*
3 *Field Xpert SFX350 or SFX370*
4 *Field Xpert SMT70*
5 *Mobile handheld terminal*
6 *Control system (e.g. PLC)*

8.2 Structure and function of the operating menu

8.2.1 Structure of the operating menu

For an overview of the operating menu for experts: "Description of Device Parameters" document supplied with the device→ 208

32 *Schematic structure of the operating menu*



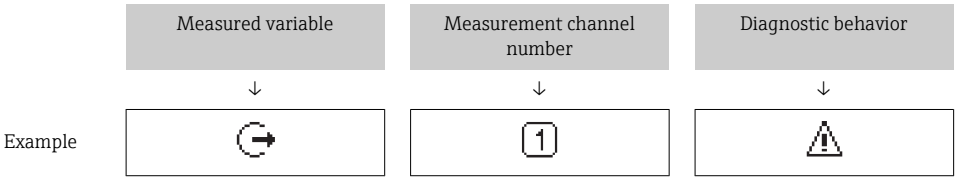
8.2.2 Operating philosophy

The individual parts of the operating menu are assigned to certain user roles (operator, maintenance etc.). Each user role contains typical tasks within the device lifecycle.

Menu/parameter		User role and tasks	Content/meaning
Language	task-oriented	**Role "Operator", "Maintenance"** Tasks during operation: ▪ Configuring the operational display ▪ Reading measured values	▪ Defining the operating language ▪ Defining the Web server operating language ▪ Resetting and controlling totalizers
Operation			▪ Configuring the operational display (e.g. display format, display contrast) ▪ Resetting and controlling totalizers
Setup		**"Maintenance" role** Commissioning: ▪ Configuration of the measurement ▪ Configuration of the inputs and outputs ▪ Configuration of the communication interface	Wizards for fast commissioning: ▪ Setting the system units ▪ Displaying the I/O/configuration ▪ Configuring the inputs ▪ Configuring the outputs ▪ Configuration of the operational display ▪ Setting the low flow cut off ▪ Configuring empty pipe detection Advanced setup ▪ For more customized configuration of the measurement (adaptation to special measuring conditions) ▪ Configuration of totalizers ▪ Configuration of electrode cleaning (optional) ▪ Configuring the WLAN settings ▪ Administration (define access code, reset measuring device)
Diagnostics		**"Maintenance" role** Fault elimination: ▪ Diagnostics and elimination of process and device errors ▪ Measured value simulation	Contains all parameters for error detection and analyzing process and device errors: ▪ Diagnostic list Contains up to 5 currently pending diagnostic messages. ▪ Event logbook Contains event messages that have occurred. ▪ Device information Contains information for identifying the device. ▪ Measured values Contains all current measured values. ▪ **Data logging** submenu with "Extended HistoROM" order option Storage and visualization of measured values ▪ Heartbeat The functionality of the device is checked on demand and the verification results are documented. ▪ Simulation Is used to simulate measured values or output values.
Expert	function-oriented	Tasks that require detailed knowledge of the function of the device: ▪ Commissioning measurements under difficult conditions ▪ Optimal adaptation of the measurement to difficult conditions ▪ Detailed configuration of the communication interface ▪ Error diagnostics in difficult cases	Contains all the parameters of the device and makes it possible to access these parameters directly using an access code. The structure of this menu is based on the function blocks of the device: ▪ System Contains all higher-order device parameters which do not concern the measurement or the communication interface. ▪ Sensor Configuration of the measurement. ▪ Input Configuration of the status input. ▪ Output Configuration of the analog current outputs as well as the pulse/frequency and switch output. ▪ Communication Configuration of the digital communication interface and the Web server. ▪ Application Configuration of the functions that go beyond the actual measurement (e.g. totalizer). ▪ Diagnostics Error detection and analysis of process and device errors and for device simulation and Heartbeat Technology.

8.3 Access to the operating menu via the local display

8.3.1 Operational display



1 *Operational display*
2 *Device tag* → 🖹 97
3 *Status area*
4 *Display area for measured values (4-line)*
5 *Operating elements* → 🖹 72

Status area

The following symbols appear in the status area of the operational display at the top right:
- Status signals → 🖹 154
  - **F**: Failure
  - **C**: Function check
  - **S**: Out of specification
  - **M**: Maintenance required
- Diagnostic behavior → 🖹 155
  - ⊗: Alarm
  - ⚠: Warning
- 🔒: Locking (the device is locked via the hardware)
- ⇆: Communication (communication via remote operation is active)

Display area

In the display area, each measured value is prefaced by certain symbol types for further description:

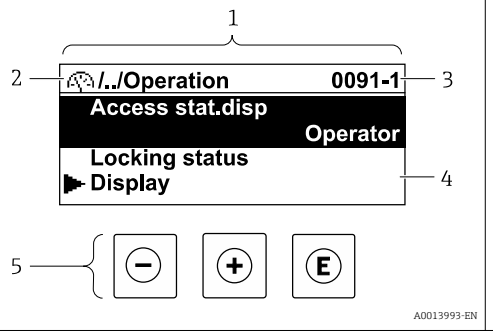
Appears only if a diagnostics event is present for this measured variable.

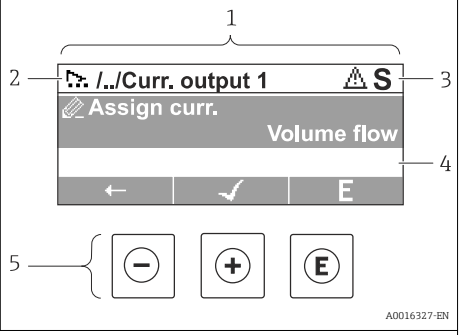
Measured values

Symbol	Meaning
U̇	Volume flow
G	Conductivity

	Mass flow
	Totalizer The measurement channel number indicates which of the three totalizers is displayed.
	Output The measurement channel number indicates which of the outputs is displayed.
	Status input

Measurement channel numbers



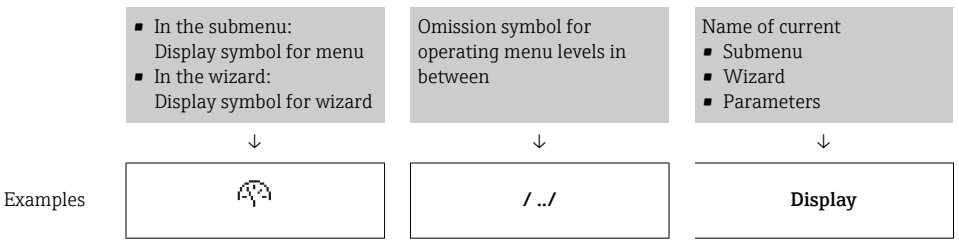


Symbol	Meaning
1 ... 4	Measurement channel 1 to 4
The measurement channel number is displayed only if more than one channel is present for the same measured variable type (e.g. Totalizer 1 to 3).	

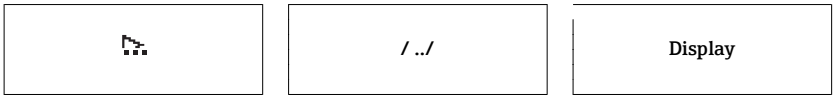
Diagnostic behavior

The diagnostic behavior pertains to a diagnostic event that is relevant to the displayed measured variable. For information on the symbols → 155

The number and display format of the measured values can be configured via the **Format display** parameter (→ 112).



8.3.2 Navigation view



In the submenu	In the wizard
	

1 Navigation view
2 Navigation path to current position
3 Status area
4 Display area for navigation
5 Operating elements → 72

Navigation path

The navigation path - displayed at the top left in the navigation view - consists of the following elements:

For more information about the icons in the menu, refer to the "Display area" section → 69

Status area

The following appears in the status area of the navigation view in the top right corner:
- In the submenu
  - The direct access code for the parameter you are navigating to (e.g. 0022-1)
  - If a diagnostic event is present, the diagnostic behavior and status signal
- In the wizard
  If a diagnostic event is present, the diagnostic behavior and status signal

- For information on the diagnostic behavior and status signal → 154
- For information on the function and entry of the direct access code → 74

Display area

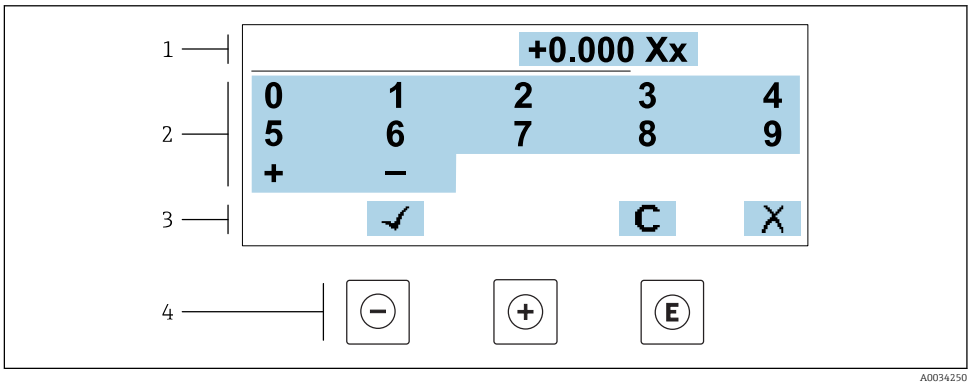
Menus

Symbol	Meaning
	Operation Appears: ▪ In the menu next to the "Operation" selection ▪ At the left in the navigation path in the **Operation** menu
	Setup Appears: ▪ In the menu next to the "Setup" selection ▪ At the left in the navigation path in the **Setup** menu
	Diagnostics Appears: ▪ In the menu next to the "Diagnostics" selection ▪ At the left in the navigation path in the **Diagnostics** menu
	Expert Appears: ▪ In the menu next to the "Expert" selection ▪ At the left in the navigation path in the **Expert** menu

Submenus, wizards, parameters

Symbol	Meaning
	Submenu
	Wizard
	Parameters within a wizard No display symbol exists for parameters in submenus.

Locking

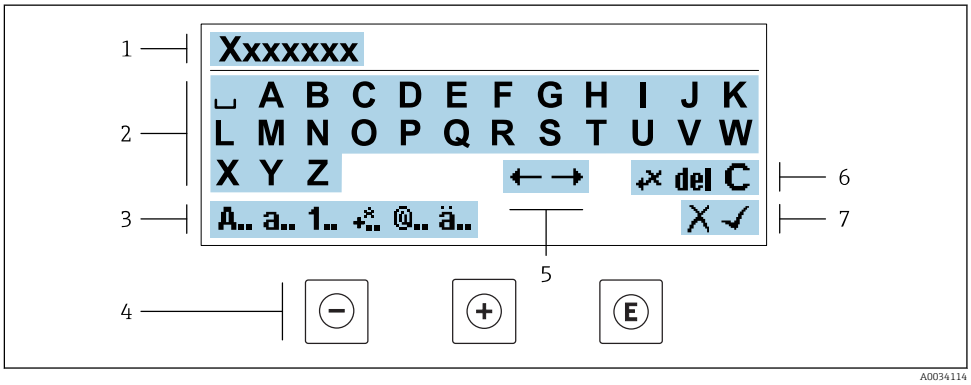


Symbol	Meaning
	Parameter locked When displayed in front of a parameter name, indicates that the parameter is locked. ▪ By a user-specific access code ▪ By the hardware write protection switch

Wizard operation

Symbol	Meaning
	Switches to the previous parameter.
	Confirms the parameter value and switches to the next parameter.
	Opens the editing view of the parameter.

8.3.3 Editing view



Numeric editor

33 *For entering values in parameters (e.g. limit values)*

1 *Entry display area*
2 *Input screen*
3 *Confirm, delete or reject entry*
4 *Operating elements*

Text editor

34 *For entering text in parameters (e.g. tag name)*

1 *Entry display area*
2 *Current input screen*
3 *Change input screen*
4 *Operating elements*
5 *Move entry position*
6 *Delete entry*
7 *Reject or confirm entry*

Using the operating elements in the editing view

Operating key(s)	Meaning
	**Minus key** Move the entry position to the left.
	**Plus key** Move the entry position to the right.
	**Enter key** ▪ Press the key briefly: confirm your selection. ▪ Press the key for 2 s: confirm the entry.
	**Escape key combination (press keys simultaneously)** Close the editing view without accepting the changes.

Input screens

Symbol	Meaning
	Upper case
	Lower case
	Numbers
	Punctuation marks and special characters: = + − * / ² ³ ¼ ½ ¾ ( ) [ ] < > { }
	Punctuation marks and special characters: ' " ` ^ . , ; : ? ! % µ ° € $ £ ¥ § @ # / \ I ~ & _
	Umlauts and accents

Controlling data entries

Symbol	Meaning
	Move entry position
	Reject entry
	Confirm entry
	Delete character immediately to the left of the entry position
	Delete character immediately to the right of the entry position
	Clear all the characters entered

8.3.4 Operating elements

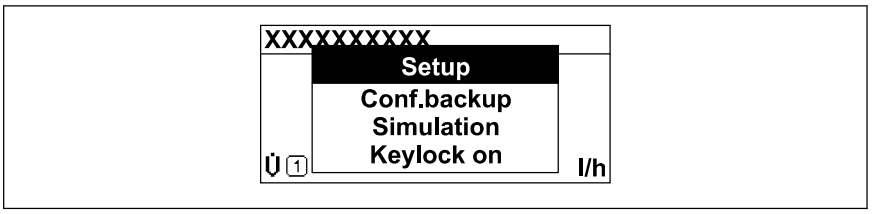
Operating key(s)	Meaning
	**Minus key** *In a menu, submenu* Moves the selection bar upwards in a picklist. *With a Wizard* Confirms the parameter value and goes to the previous parameter. *With a text and numeric editor* Move the entry position to the left.
	**Plus key** *In a menu, submenu* Moves the selection bar downwards in a picklist. *With a Wizard* Confirms the parameter value and goes to the next parameter. *With a text and numeric editor* Move the entry position to the right.

	**Enter key**
	For operational display
	Pressing the key briefly opens the operating menu.
	In a menu, submenu
	▪ Pressing the key briefly:
	  ▪ Opens the selected menu, submenu or parameter.
	  ▪ Starts the wizard.
	  ▪ If help text is open, closes the help text of the parameter.
	▪ Pressing the key for 2 s for parameter:
	  If present, opens the help text for the function of the parameter.
	With a Wizard
	Opens the editing view of the parameter.
	With a text and numeric editor
	▪ Press the key briefly: confirm your selection.
	▪ Press the key for 2 s: confirm the entry.

	**Escape key combination (press keys simultaneously)**
	In a menu, submenu
	▪ Pressing the key briefly:
	  ▪ Exits the current menu level and takes you to the next higher level.
	  ▪ If help text is open, closes the help text of the parameter.
	▪ Pressing the key for 2 s returns you to the operational display ("home position").
	With a Wizard
	Exits the wizard and takes you to the next higher level.
	With a text and numeric editor
	Close the editing view without accepting the changes.

	**Minus/Enter key combination (press the keys simultaneously)**
	▪ If the keypad lock is active:
	  Press the key for 3 s: deactivate the keypad lock.
	▪ If the keypad lock is not active:
	  Press the key for 3 s: the context menu opens along with the option for activating the keypad lock.

8.3.5 Opening the context menu



Using the context menu, the user can call up the following menus quickly and directly from the operational display:

- Setup
- Data backup
- Simulation

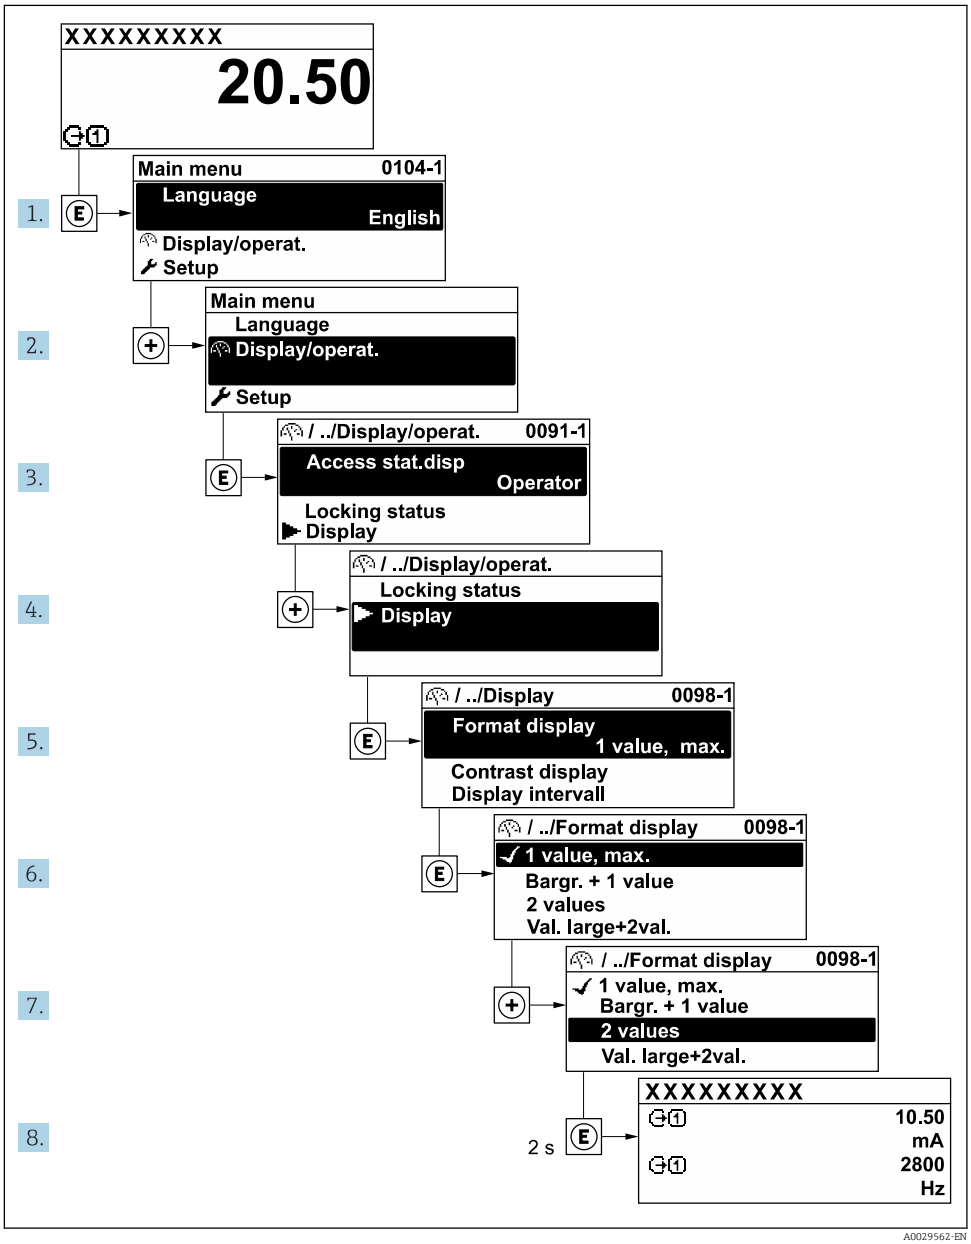
Calling up and closing the context menu

The user is in the operational display.

1. Press the ⊖ and Ⓔ keys for longer than 3 seconds.
   ↳ The context menu opens.

2. Press ⊖ + ⊕ simultaneously.
   ↳ The context menu is closed and the operational display appears.

Calling up the menu via the context menu



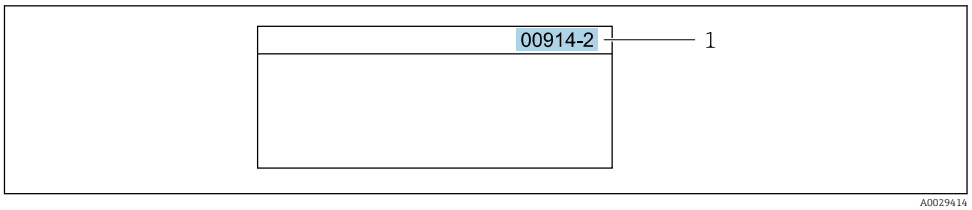
1. Open the context menu.
2. Press ⊕ to navigate to the desired menu.
3. Press Ⓔ to confirm the selection.
   ↳ The selected menu opens.

8.3.6 Navigating and selecting from list

Different operating elements are used to navigate through the operating menu. The navigation path is displayed on the left in the header. Icons are displayed in front of the individual menus. These icons are also shown in the header during navigation.

For an explanation of the navigation view with symbols and operating elements
→ 68

Example: Setting the number of displayed measured values to "2 values"



8.3.7 Calling the parameter directly

A parameter number is assigned to every parameter to be able to access a parameter directly via the onsite display. Entering this access code in the **Direct access** parameter calls up the desired parameter directly.

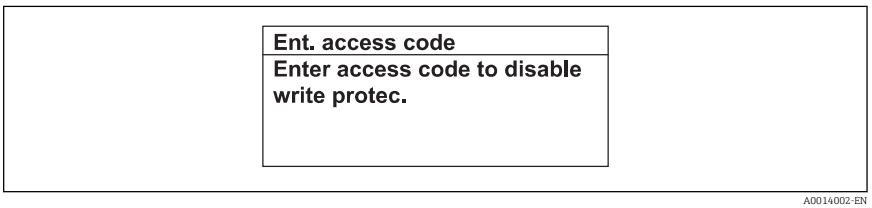
Navigation path
Expert → Direct access

The direct access code consists of a 5-digit number (at maximum) and the channel number, which identifies the channel of a process variable: e.g. 00914-2. In the navigation view, this appears on the right-hand side in the header of the selected parameter.

1 Direct access code

Note the following when entering the direct access code:
- The leading zeros in the direct access code do not have to be entered.
  Example: Enter **"914"** instead of **"00914"**
- If no channel number is entered, channel 1 is accessed automatically.
  Example: Enter **00914** → **Assign process variable** parameter
- If a different channel is accessed: Enter the direct access code with the corresponding channel number.
  Example: Enter **00914-2** → **Assign process variable** parameter

For the direct access codes of the individual parameters, see the "Description of Device Parameters" document for the device



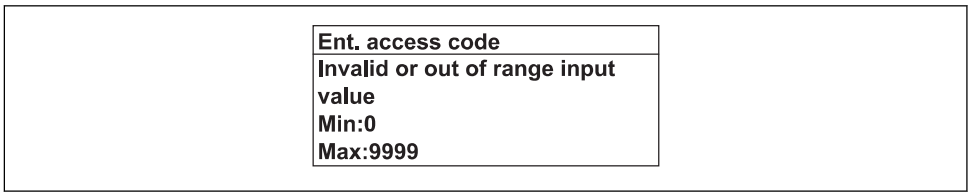
8.3.8 Calling up help text

Help text is available for some parameters and can be called up from the navigation view. The help text provides a brief explanation of the parameter function and thereby supports swift and safe commissioning.

Calling up and closing the help text

The user is in the navigation view and the selection bar is on a parameter.

1. Press E for 2 s.
   ↳ The help text for the selected parameter opens.



35 Example: Help text for parameter "Enter access code"

2. Press − + + simultaneously.
   ↳ The help text is closed.

8.3.9 Changing the parameters

Parameters can be changed via the numeric editor or text editor.
- Numeric editor: Change values in a parameter, e.g. specifications for limit values.
- Text editor: Enter text in a parameter, e.g. tag name.

A message is displayed if the value entered is outside the permitted value range.

For a description of the editing view - consisting of the text editor and numeric editor - with symbols → 70, for a description of the operating elements → 72

8.3.10 User roles and related access authorization

The two user roles "Operator" and "Maintenance" have different write access to the parameters if the customer defines a user-specific access code. This protects the device configuration via the local display from unauthorized access → 134.

Defining access authorization for user roles

An access code is not yet defined when the device is delivered from the factory. Access authorization (read and write access) to the device is not restricted and corresponds to the "Maintenance" user role.

- Define the access code.
  - The "Operator" user role is redefined in addition to the "Maintenance" user role. Access authorization differs for the two user roles.

Access authorization to parameters: "Maintenance" user role

Access code status	Read access	Write access
An access code has not yet been defined (factory setting).	✔	✔
After an access code has been defined.	✔	✔ 1)

1) The user only has write access after entering the access code.

Access authorization to parameters: "Operator" user role

Access code status	Read access	Write access
After an access code has been defined.	✔	-- 1)

1) Despite the defined access code, certain parameters can always be modified and thus are excepted from the write protection, as they do not affect the measurement. Refer to the "Write protection via access code" section

The user role with which the user is currently logged on is indicated by the **Access status** parameter. Navigation path: Operation → Access status

8.3.11 Disabling write protection via access code

If the 🔒-symbol appears on the local display in front of a parameter, the parameter is write-protected by a user-specific access code and its value cannot be changed at the moment using local operation → 134.

Parameter write protection via local operation can be disabled by entering the user-specific access code in the **Enter access code** parameter (→ 121) via the respective access option.

1. After you press E, the input prompt for the access code appears.

2. Enter the access code.
   ↳ The 🔒-symbol in front of the parameters disappears; all previously write-protected parameters are now re-enabled.

8.3.12 Enabling and disabling the keypad lock

The keypad lock makes it possible to block access to the entire operating menu via local operation. As a result, it is no longer possible to navigate through the operating menu or change the values of individual parameters. Users can only read the measured values on the operational display.

The keypad lock is switched on and off via the context menu.

Switching on the keypad lock

The keypad lock is switched on automatically:
- If the device has not been operated via the display for > 1 minute.
- Each time the device is restarted.

To activate the keylock manually:

1. The device is in the measured value display.
   Press the ⊟ and Ⓔ keys for 3 seconds.
   ↳ A context menu appears.
2. In the context menu select the **Keylock on** option.
   ↳ The keypad lock is switched on.

If the user attempts to access the operating menu while the keypad lock is active, the **Keylock on** message appears.

Switching off the keypad lock

▶ The keypad lock is switched on.
Press the ⊟ and Ⓔ keys for 3 seconds.
↳ The keypad lock is switched off.

8.4 Access to the operating menu via the Web browser

8.4.1 Function range

Thanks to the integrated Web server, the device can be operated and configured via a Web browser and via a service interface (CDI-RJ45) or via a WLAN interface. The structure of the operating menu is the same as for the local display. In addition to the measured values, status information on the device is also displayed and allows the user to monitor the status of the device. Furthermore the device data can be managed and the network parameters can be configured.

A device that has a WLAN interface (can be ordered as an option) is required for the WLAN connection: order code for "Display; operation", option G "4-line, illuminated; touch control + WLAN". The device acts as an Access Point and enables communication by computer or a mobile handheld terminal.

For additional information on the Web server, refer to the Special Documentation for the device

8.4.2 Prerequisites

Computer hardware

Hardware	Interface	
	CDI-RJ45	WLAN
Interface	The computer must have an RJ45 interface.	The operating unit must have a WLAN interface.
Connection	Standard Ethernet cable with RJ45 connector.	Connection via Wireless LAN.
Screen	Recommended size: ≥12" (depends on the screen resolution)	

Computer software

Software	Interface	
	CDI-RJ45	WLAN

Recommended operating systems	▪ Microsoft Windows 7 or higher.
	▪ Mobile operating systems:
	  ▪ iOS
	  ▪ Android
	Microsoft Windows XP is supported.	

Web browsers supported	▪ Microsoft Internet Explorer 8 or higher ▪ Microsoft Edge ▪ Mozilla Firefox ▪ Google Chrome ▪ Safari	

Computer settings

Settings	Interface	
	CDI-RJ45	WLAN
User rights	Appropriate user rights (e.g. administrator rights) for TCP/IP and proxy server settings are necessary (for adjusting the IP address, subnet mask etc.).	
Proxy server settings of the Web browser	The Web browser setting *Use a Proxy Server for Your LAN* must be **deselected** .	
JavaScript	JavaScript must be enabled. If JavaScript cannot be enabled: enter http://192.168.1.212/basic.html in the address line of the Web browser. A fully functional but simplified version of the operating menu structure starts in the Web browser. When installing a new firmware version: To enable correct data display, clear the temporary memory (cache) of the Web browser under **Internet options**.	
Network connections	Only the active network connections to the measuring device should be used.	
	Switch off all other network connections such as WLAN.	Switch off all other network connections.

In the event of connection problems: → 149

Measuring device: Via CDI-RJ45 service interface

Device	CDI-RJ45 service interface
Measuring device	The measuring device has an RJ45 interface.
Web server	Web server must be enabled; factory setting: ON For information on enabling the Web server → 83

Measuring device: via WLAN interface

Device	WLAN interface
Measuring device	The measuring device has a WLAN antenna: ▪ Transmitter with integrated WLAN antenna ▪ Transmitter with external WLAN antenna
Web server	Web server and WLAN must be enabled; factory setting: ON For information on enabling the Web server → 83

8.4.3 Establishing a connection

Via service interface (CDI-RJ45)

Preparing the measuring device

Proline 500 – digital

1. Loosen the 4 fixing screws on the housing cover.
2. Open the housing cover.
3. The location of the connection socket depends on the measuring device and the communication protocol:
   Connect the computer to the RJ45 connector via the standard Ethernet connecting cable .

Proline 500

1. Depending on the housing version:
   Release the securing clamp or securing screw of the housing cover.
2. Depending on the housing version:
   Unscrew or open the housing cover.
3. The location of the connection socket depends on the measuring device and the communication protocol:
   Connect the computer to the RJ45 connector via the standard Ethernet connecting cable .

Configuring the Internet protocol of the computer

The following information refers to the default Ethernet settings of the device.

IP address of the device: 192.168.1.212 (factory setting)

1. Switch on the measuring device.
2. Connect to the computer using a cable → 85.
3. If a 2nd network card is not used, close all the applications on the notebook.
   ↳ Applications requiring Internet or a network, such as e-mail, SAP applications, Internet or Windows Explorer.
4. Close any open Internet browsers.
5. Configure the properties of the Internet protocol (TCP/IP) as defined in the table:

IP address	192.168.1.XXX; for XXX all numerical sequences except: 0, 212 and 255 → e.g. 192.168.1.213
Subnet mask	255.255.255.0
Default gateway	192.168.1.212 or leave cells empty

Via WLAN interface

Configuring the Internet protocol of the mobile terminal

NOTICE

If the WLAN connection is lost during the configuration, settings made may be lost.

- Make sure that the WLAN connection is not disconnected while configuring the device.

NOTICE

In principle, avoid simultaneous access to the measuring device via the service interface (CDI-RJ45) and the WLAN interface from the same mobile terminal. This could cause a network conflict.

- Only activate one service interface (CDI-RJ45 service interface or WLAN interface).
- If simultaneous communication is necessary: configure different IP address ranges, e.g. 192.168.0.1 (WLAN interface) and 192.168.1.212 (CDI-RJ45 service interface).

Preparing the mobile terminal

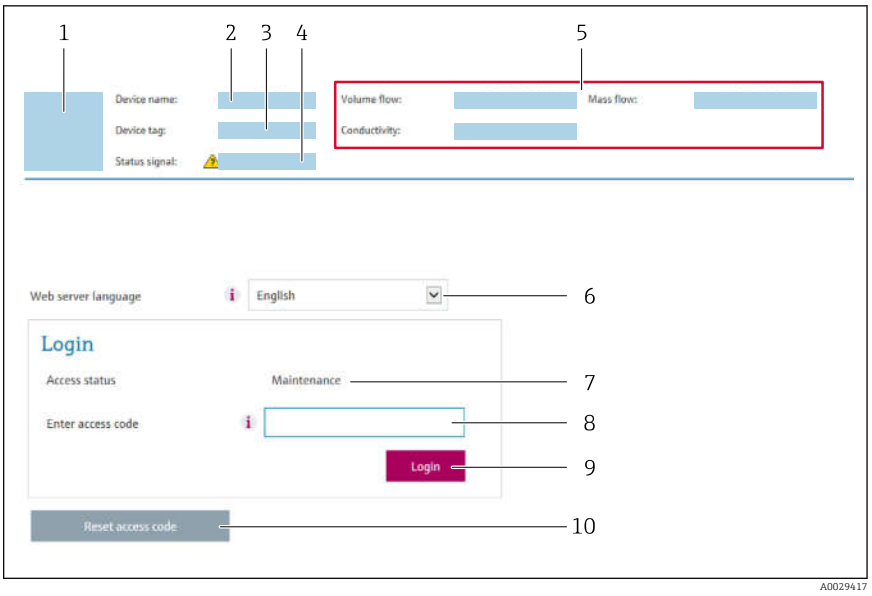
- Enable WLAN reception on the mobile terminal.

Establishing a connection from the mobile terminal to the measuring device

1. In the WLAN settings of the mobile terminal:
   Select the measuring device using the SSID (e.g. EH_Promag_500_A802000).
2. If necessary, select the WPA2 encryption method.
3. Enter the password: serial number of the measuring device ex-works (e.g. L100A802000).
   ↳ LED on display module flashes: it is now possible to operate the measuring device with the Web browser, FieldCare or DeviceCare.

The serial number can be found on the nameplate.

To ensure the safe and swift assignment of the WLAN network to the measuring point, it is advisable to change the SSID name. It should be possible to clearly assign the new SSID name to the measuring point (e.g. tag name) because it is displayed as the WLAN network.



Disconnecting

- After configuring the device:
  Terminate the WLAN connection between the operating unit and measuring device.

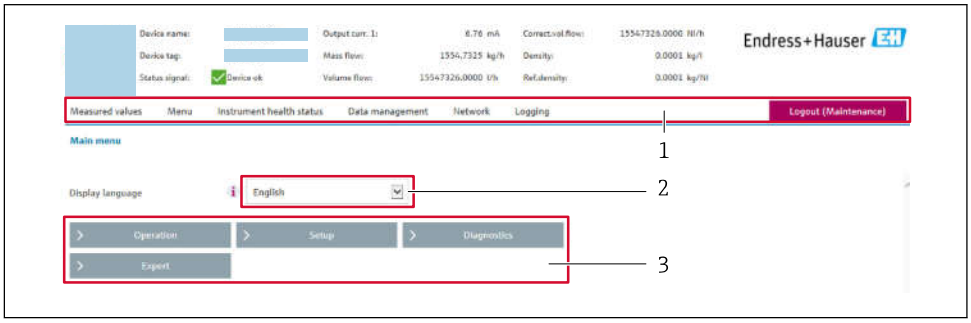
Starting the Web browser

1. Start the Web browser on the computer.

2. Enter the IP address of the Web server in the address line of the Web browser: 192.168.1.212
   ↳ The login page appears.

1 *Picture of device*
2 *Device name*
3 *Device tag (→ 97)*
4 *Status signal*
5 *Current measured values*
6 *Operating language*
7 *User role*
8 *Access code*
9 *Login*
10 *Reset access code (→ 131)*

If a login page does not appear, or if the page is incomplete → 149



8.4.4 Logging on

1. Select the preferred operating language for the Web browser.
2. Enter the user-specific access code.
3. Press **OK** to confirm your entry.

Access code	0000 (factory setting); can be changed by customer

If no action is performed for 10 minutes, the Web browser automatically returns to the login page.

8.4.5 User interface

1 Function row
2 Local display language
3 Navigation area

Header

The following information appears in the header:
- Device name
- Device tag
- Device status with status signal → 157
- Current measured values

Function row

Functions	Meaning
Measured values	Displays the measured values of the measuring device
Menu	▪ Access to the operating menu from the measuring device ▪ The structure of the operating menu is the same as for the local display For detailed information on the structure of the operating menu, see the Operating Instructions for the measuring device
Device status	Displays the diagnostic messages currently pending, listed in order of priority

Data management	Data exchange between PC and measuring device:
	▪ Device configuration:
	  ▪ Load settings from the device (XML format, save configuration)
	  ▪ Save settings to the device (XML format, restore configuration)
	▪ Logbook - Export Event logbook (.csv file)
	▪ Documents - Export documents:
	  ▪ Export backup data record (.csv file, create documentation of the measuring point configuration)
	  ▪ Verification report (PDF file, only available with the "Heartbeat Verification" application package)
	▪ Firmware update - Flashing a firmware version

Network configuration	Configuration and checking of all the parameters required for establishing the connection to the measuring device: ▪ Network settings (e.g. IP address, MAC address) ▪ Device information (e.g. serial number, firmware version)
Logout	End the operation and call up the login page

Navigation area

If a function is selected in the function bar, the submenus of the function open in the navigation area. The user can now navigate through the menu structure.

Working area

Depending on the selected function and the related submenus, various actions can be performed in this area:
- Configuring parameters
- Reading measured values
- Calling up help text
- Starting an upload/download

8.4.6 Disabling the Web server

The Web server of the measuring device can be switched on and off as required using the **Web server functionality** parameter.

Navigation

"Expert" menu → Communication → Web server

Parameter overview with brief description

Parameter	Description	Selection	Factory setting
Web server functionality	Switch the Web server on and off.	▪ Off ▪ HTML Off ▪ On	On

Function scope of the "Web server functionality" parameter

Option	Description
Off	▪ The web server is completely disabled. ▪ Port 80 is locked.
On	▪ The complete functionality of the web server is available. ▪ JavaScript is used. ▪ The password is transferred in an encrypted state. ▪ Any change to the password is also transferred in an encrypted state.

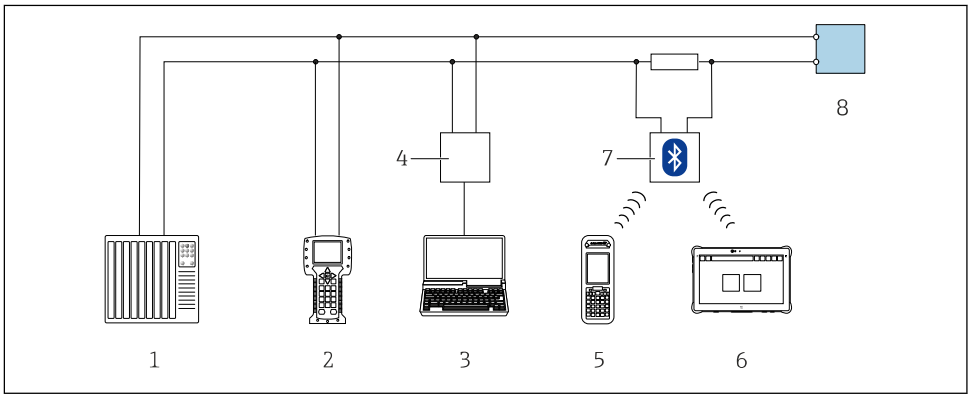
Enabling the Web server

If the Web server is disabled it can only be re-enabled with the **Web server functionality** parameter via the following operating options:
- Via local display
- Via Bedientool "FieldCare"
- Via "DeviceCare" operating tool

8.4.7 Logging out

Before logging out, perform a data backup via the **Data management** function (upload configuration from device) if necessary.

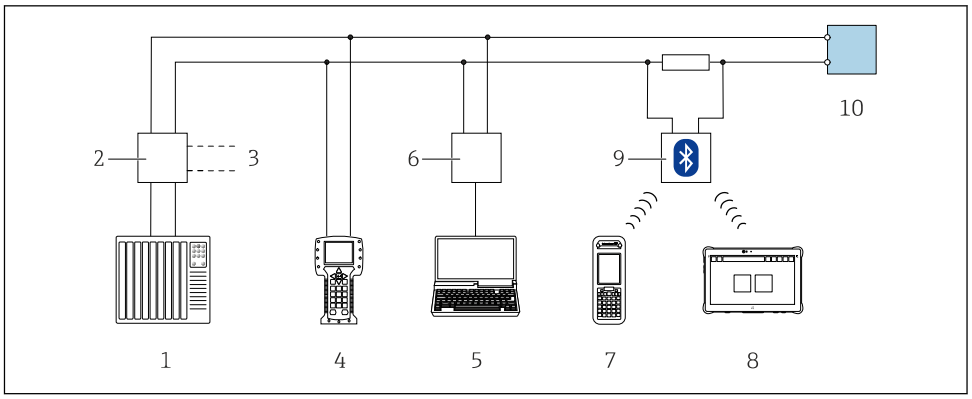
1. Select the **Logout** entry in the function row.
   ↳ The home page with the Login box appears.
2. Close the Web browser.
3. If no longer needed:
   Reset modified properties of the Internet protocol (TCP/IP) → 79.



8.5 Access to the operating menu via the operating tool

The structure of the operating menu in the operating tools is the same as for operation via the local display.

8.5.1 Connecting the operating tool



Via HART protocol

This communication interface is available in device versions with a HART output.

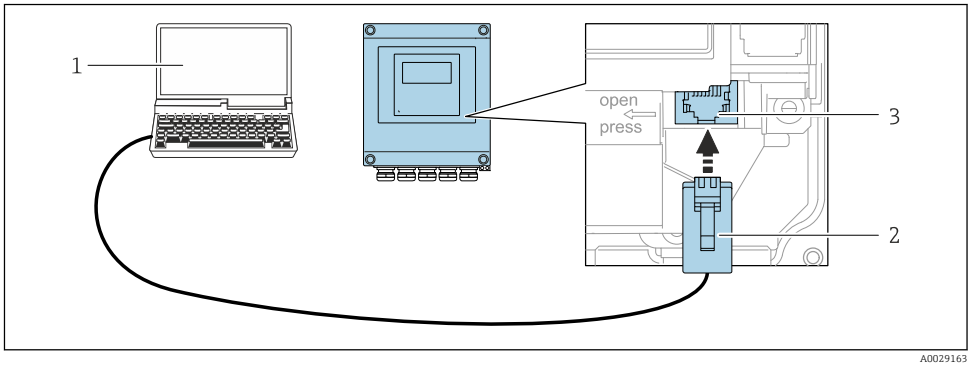
36 *Options for remote operation via HART protocol (active)*

1 *Control system (e.g. PLC)*
2 *Field Communicator 475*
3 *Computer with Web browser (e.g. Internet Explorer) for access to the integrated device Web server or computer with an operating tool (e.g. FieldCare, DeviceCare, AMS Device Manager, SIMATIC PDM) with COM DTM "CDI Communication TCP/IP"*
4 *Commubox FXA195 (USB)*
5 *Field Xpert SFX350 or SFX370*
6 *Field Xpert SMT70*
7 *VIATOR Bluetooth modem with connecting cable*
8 *Transmitter*

37 *Options for remote operation via HART protocol (passive)*

1 *Control system (e.g. PLC)*
2 *Transmitter power supply unit, e.g. RN221N (with communication resistor)*
3 *Connection for Commubox FXA195 and Field Communicator 475*
4 *Field Communicator 475*
5 *Computer with Web browser (e.g. Internet Explorer) for access to the integrated device Web server or computer with an operating tool (e.g. FieldCare, DeviceCare, AMS Device Manager, SIMATIC PDM) with COM DTM "CDI Communication TCP/IP"*
6 *Commubox FXA195 (USB)*
7 *Field Xpert SFX350 or SFX370*
8 *Field Xpert SMT70*
9 *VIATOR Bluetooth modem with connecting cable*
10 *Transmitter*

Service interface

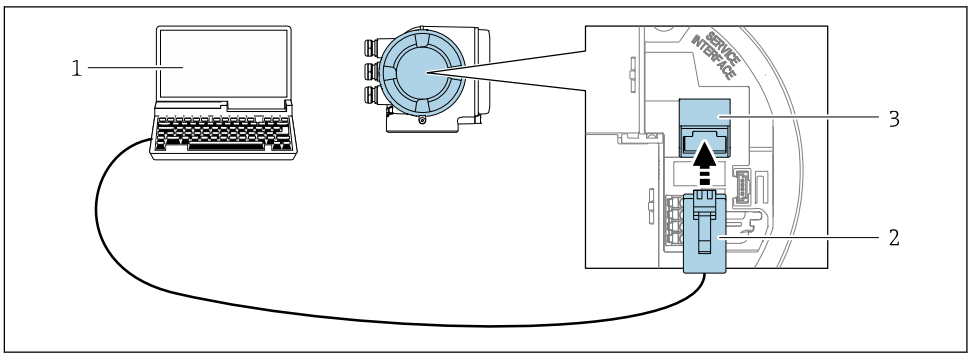


Via service interface (CDI-RJ45)

A point-to-point connection can be established to configure the device onsite. With the housing open, the connection is established directly via the service interface (CDI-RJ45) of the device.

An adapter for RJ45 and the M12 connector is optionally available:
Order code for "Accessories", option **NB**: "Adapter RJ45 M12 (service interface)"

The adapter connects the service interface (CDI-RJ45) to an M12 connector mounted in the cable entry. Therefore the connection to the service interface can be established via an M12 connector without opening the device.

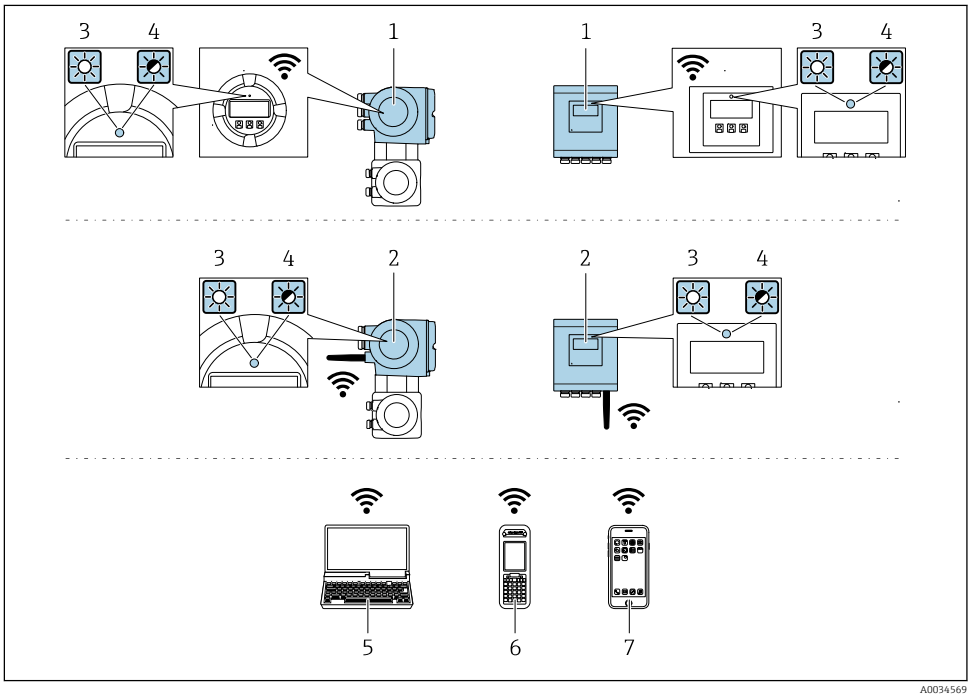


Proline 500 – digital transmitter

38 *Connection via service interface (CDI-RJ45)*

1 *Computer with Web browser (e.g. Microsoft Internet Explorer, Microsoft Edge) for accessing the integrated device Web server or with "FieldCare", "DeviceCare" operating tool with COM DTM "CDI Communication TCP/IP"*
2 *Standard Ethernet connecting cable with RJ45 connector*
3 *Service interface (CDI-RJ45) of the measuring device with access to the integrated Web server*

Proline 500 transmitter



39 Connection via service interface (CDI-RJ45)

1 Computer with Web browser (e.g. Microsoft Internet Explorer, Microsoft Edge) for accessing the integrated device Web server or with "FieldCare", "DeviceCare" operating tool with COM DTM "CDI Communication TCP/IP"
2 Standard Ethernet connecting cable with RJ45 connector
3 Service interface (CDI-RJ45) of the measuring device with access to the integrated Web server

Via WLAN interface

The optional WLAN interface is available on the following device version:
Order code for "Display; operation", option G "4-line, illuminated; touch control + WLAN"

1 Transmitter with integrated WLAN antenna
2 Transmitter with external WLAN antenna
3 LED lit constantly: WLAN reception is enabled on measuring device
4 LED flashing: WLAN connection established between operating unit and measuring device
5 Computer with WLAN interface and Web browser (e.g. Microsoft Internet Explorer, Microsoft Edge) for accessing the integrated device Web server or with operating tool (e.g. FieldCare, DeviceCare)
6 Mobile handheld terminal with WLAN interface and Web browser (e.g. Microsoft Internet Explorer, Microsoft Edge) for accessing the integrated device Web server or operating tool (e.g. FieldCare, DeviceCare)
7 Smart phone or tablet (e.g. Field Xpert SMT70)

Function	WLAN: IEEE 802.11 b/g (2.4 GHz)
Encryption	WPA2-PSK AES-128 (in accordance with IEEE 802.11i)
Configurable WLAN channels	1 to 11
Degree of protection	IP67
Available antennas	▪ Internal antenna ▪ External antenna (optional) In the event of poor transmission/reception conditions at the place of installation. Only one antenna active in each case!
Range	▪ Internal antenna: typically 10 m (32 ft) ▪ External antenna: typically 50 m (164 ft)
Materials (external antenna)	▪ Antenna: ASA plastic (acrylic ester-styrene-acrylonitrile) and nickel-plated brass ▪ Adapter: Stainless steel and nickel-plated brass ▪ Cable: Polyethylene ▪ Connector: Nickel-plated brass ▪ Angle bracket: Stainless steel

Configuring the Internet protocol of the mobile terminal

NOTICE

If the WLAN connection is lost during the configuration, settings made may be lost.

► Make sure that the WLAN connection is not disconnected while configuring the device.

NOTICE

In principle, avoid simultaneous access to the measuring device via the service interface (CDI-RJ45) and the WLAN interface from the same mobile terminal. This could cause a network conflict.

► Only activate one service interface (CDI-RJ45 service interface or WLAN interface).
► If simultaneous communication is necessary: configure different IP address ranges, e.g. 192.168.0.1 (WLAN interface) and 192.168.1.212 (CDI-RJ45 service interface).

Preparing the mobile terminal

► Enable WLAN reception on the mobile terminal.

Establishing a connection from the mobile terminal to the measuring device

1. In the WLAN settings of the mobile terminal:
   Select the measuring device using the SSID (e.g. EH_Promag_500_A802000).
2. If necessary, select the WPA2 encryption method.
3. Enter the password: serial number of the measuring device ex-works (e.g. L100A802000).
   ↳ LED on display module flashes: it is now possible to operate the measuring device with the Web browser, FieldCare or DeviceCare.

The serial number can be found on the nameplate.

To ensure the safe and swift assignment of the WLAN network to the measuring point, it is advisable to change the SSID name. It should be possible to clearly assign the new SSID name to the measuring point (e.g. tag name) because it is displayed as the WLAN network.

Disconnecting

► After configuring the device:
Terminate the WLAN connection between the operating unit and measuring device.

8.5.2 Field Xpert SFX350, SFX370

Function range

Field Xpert SFX350 and Field Xpert SFX370 are mobile computers for commissioning and maintenance. They enable efficient device configuration and diagnostics for HART and FOUNDATION Fieldbus devices in the **non-hazardous area** (SFX350, SFX370) and **hazardous area** (SFX370).

For details, see Operating Instructions BA01202S

Source for device description files

See information → 91

8.5.3 FieldCare

Function scope

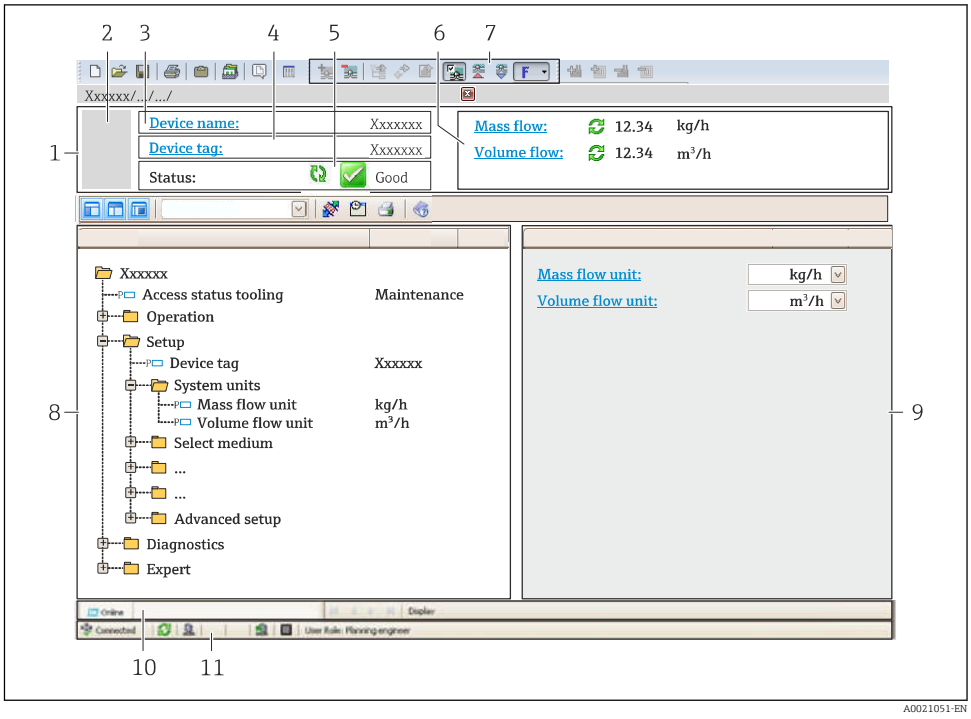
FDT-based plant asset management tool from Endress+Hauser. It can configure all smart field devices in a system and helps you manage them. By using the status information, it is also a simple but effective way of checking their status and condition.

Access is via:
- HART protocol
- CDI-RJ45 service interface → 85
- WLAN interface→ 86

Typical functions:
- Configuring parameters of transmitters
- Loading and saving device data (upload/download)
- Documentation of the measuring point
- Visualization of the measured value memory (line recorder) and event logbook

For additional information about FieldCare, see Operating Instructions BA00027S and BA00059S

Source for device description files



See information → 91

Establishing a connection

1. Start FieldCare and launch the project.
2. In the network: Add a device.
   ↳ The **Add device** window opens.
3. Select the **CDI Communication TCP/IP** option from the list and press **OK** to confirm.
4. Right-click **CDI Communication TCP/IP** and select the **Add device** option in the context menu that opens.
5. Select the desired device from the list and press **OK** to confirm.
   ↳ The **CDI Communication TCP/IP (Configuration)** window opens.
6. Enter the device address in the **IP address** field: 192.168.1.212 and press **Enter** to confirm.
7. Establish the online connection to the device.

For additional information, see Operating Instructions BA00027S and BA00059S

User interface

1 *Header*
2 *Picture of device*
3 *Device name*
4 *Device tag*
5 *Status area with status signal→ 157*
6 *Display area for current measured values*
7 *Edit toolbar with additional functions such as save/restore, event list and create documentation*
8 *Navigation area with operating menu structure*
9 *Working area*
10 *Range of action*
11 *Status area*

8.5.4 DeviceCare

Function scope

Tool to connect and configure Endress+Hauser field devices.

The fastest way to configure Endress+Hauser field devices is with the dedicated "DeviceCare" tool. Together with the device type managers (DTMs) it presents a convenient, comprehensive solution.

For details, see Innovation Brochure IN01047S

Source for device description files

See information → 91

8.5.5 AMS Device Manager

Function scope

Program from Emerson Process Management for operating and configuring measuring devices via HART protocol.

Source for device description files

See data → 91

8.5.6 SIMATIC PDM

Function scope

SIMATIC PDM is a standardized, manufacturer-independent program from Siemens for the operation, configuration, maintenance and diagnosis of intelligent field devices via HART protocol.

Source for device description files

See data → 91

8.5.7 Field Communicator 475

Function scope

Industrial handheld terminal from Emerson Process Management for remote configuration and measured value display via HART protocol.

Source for device description files

See data → 91

9 System integration

9.1 Overview of device description files

9.1.1 Current version data for the device

Firmware version	01.05.zz	▪ On the title page of the Operating Instructions ▪ On the transmitter nameplate ▪ Firmware version Diagnostics → Device information → Firmware version
Release date of firmware version	08.2019	---
Manufacturer ID	0x11	Manufacturer ID Diagnostics → Device information → Manufacturer ID
Device type ID	0x3C	Device type Diagnostics → Device information → Device type
HART protocol revision	7	HART revision Expert → Communication → HART output → Information → HART revision
Device revision	1	▪ On the transmitter nameplate ▪ Device revision Diagnostics → Device information → Device revision

For an overview of the different firmware versions for the device → 171

9.1.2 Operating tools

The suitable device description file for the individual operating tools is listed in the table below, along with information on where the file can be acquired.

Operating tool via HART protocol	Sources for obtaining device descriptions
FieldCare	▪ www.endress.com → Download Area ▪ CD-ROM (contact Endress+Hauser) ▪ DVD (contact Endress+Hauser)
DeviceCare	▪ www.endress.com → Download Area ▪ CD-ROM (contact Endress+Hauser) ▪ DVD (contact Endress+Hauser)
▪ Field Xpert SFX350 ▪ Field Xpert SFX370	Use update function of handheld terminal
AMS Device Manager (Emerson Process Management)	www.endress.com → Download Area
SIMATIC PDM (Siemens)	www.endress.com → Download Area
Field Communicator 475 (Emerson Process Management)	Use update function of handheld terminal

9.2 Measured variables via HART protocol

The following measured variables (HART device variables) are assigned to the dynamic variables at the factory:

Dynamic variables	Measured values (HART device variables)
Primary dynamic variable (PV)	Volume flow
Secondary dynamic variable (SV)	Totalizer 1
Tertiary dynamic variable (TV)	Totalizer 2
Quaternary dynamic variable (QV)	Totalizer 3

The assignment of the measured variables to the dynamic variables can be modified and assigned as desired via local operation and the operating tool using the following parameters:

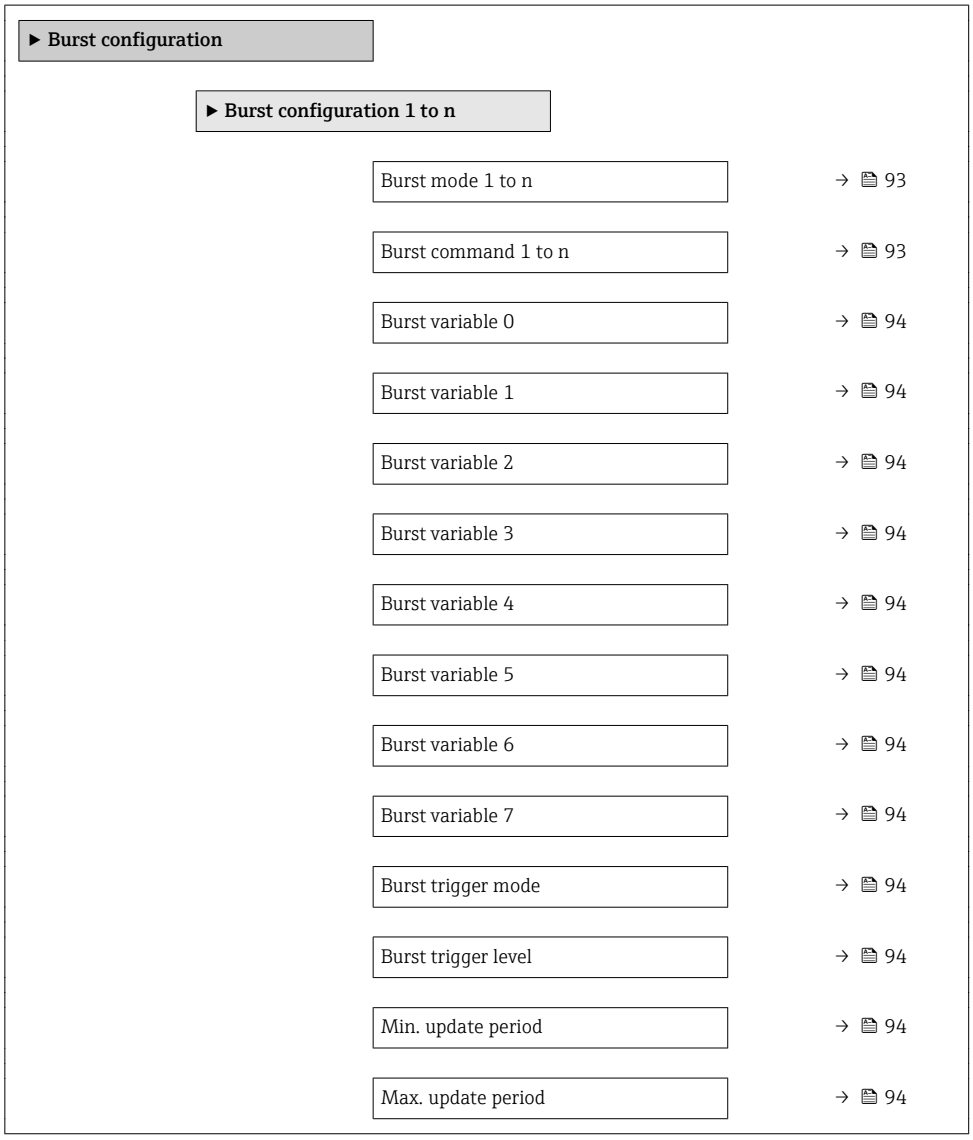
- Expert → Communication → HART output → Output → Assign PV
- Expert → Communication → HART output → Output → Assign SV
- Expert → Communication → HART output → Output → Assign TV
- Expert → Communication → HART output → Output → Assign QV

The following measured variables can be assigned to the dynamic variables:

Measured variables for PV (primary dynamic variable)
- Off
- Volume flow
- Mass flow
- Corrected volume flow
- Flow velocity
- Conductivity [1)]
- Electronic temperature

Measured variables for SV, TV, QV (secondary, tertiary and quaternary dynamic variable)
- Volume flow
- Mass flow
- Corrected volume flow
- Flow velocity
- Conductivity [2)]
- Electronic temperature
- Totalizer 1
- Totalizer 2
- Totalizer 3

The range of options increases if the measuring device has one or more application packages.



Device variables
The device variables are permanently assigned. A maximum of 8 device variables can be transmitted:
- 0 = volume flow
- 1 = mass flow
- 2 = corrected volume flow
- 3 = flow velocity
- 4 = conductivity
- 7 = electronic temperature
- 8 = totalizer 1
- 9 = totalizer 2
- 10 = totalizer 3

1) Visibility depends on order options or device settings
2) Visibility depends on order options or device settings

9.3 Other settings

Burst mode functionality in accordance with HART 7 Specification:

Navigation
"Expert" menu → Communication → HART output → Burst configuration → Burst configuration 1 to n

Parameter overview with brief description

Parameter	Description	Selection / User entry	Factory setting
Burst mode 1 to n	Activate the HART burst mode for burst message X.	▪ Off ▪ On	Off
Burst command 1 to n	Select the HART command that is sent to the HART master.	▪ Command 1 ▪ Command 2 ▪ Command 3 ▪ Command 9 ▪ Command 33 ▪ Command 48	Command 2

Parameter	Description	Selection / User entry	Factory setting
Burst variable 0	For HART command 9 and 33: select the HART device variable or the process variable.	▪ Volume flow ▪ Mass flow ▪ Corrected volume flow ▪ Flow velocity ▪ Conductivity * ▪ Electronic temperature ▪ Totalizer 1 ▪ Totalizer 2 ▪ Totalizer 3 ▪ Density ▪ HART input ▪ Percent of range ▪ Measured current ▪ Primary variable (PV) ▪ Secondary variable (SV) ▪ Tertiary variable (TV) ▪ Quaternary variable (QV) ▪ Not used	Volume flow
Burst variable 1	For HART command 9 and 33: select the HART device variable or the process variable.	See the **Burst variable 0** parameter.	Not used
Burst variable 2	For HART command 9 and 33: select the HART device variable or the process variable.	See the **Burst variable 0** parameter.	Not used
Burst variable 3	For HART command 9 and 33: select the HART device variable or the process variable.	See the **Burst variable 0** parameter.	Not used
Burst variable 4	For HART command 9: select the HART device variable or the process variable.	See the **Burst variable 0** parameter.	Not used
Burst variable 5	For HART command 9: select the HART device variable or the process variable.	See the **Burst variable 0** parameter.	Not used
Burst variable 6	For HART command 9: select the HART device variable or the process variable.	See the **Burst variable 0** parameter.	Not used
Burst variable 7	For HART command 9: select the HART device variable or the process variable.	See the **Burst variable 0** parameter.	Not used
Burst trigger mode	Select the event that triggers burst message X.	▪ Continuous ▪ Window * ▪ Rising * ▪ Falling * ▪ On change	Continuous
Burst trigger level	Enter the burst trigger value. Together with the option selected in the **Burst trigger mode** parameter the burst trigger value determines the time of burst message X.	Signed floating-point number	–
Min. update period	Enter the minimum time span between two burst commands of burst message X.	Positive integer	1 000 ms
Max. update period	Enter the maximum time span between two burst commands of burst message X.	Positive integer	2 000 ms

* Visibility depends on order options or device settings

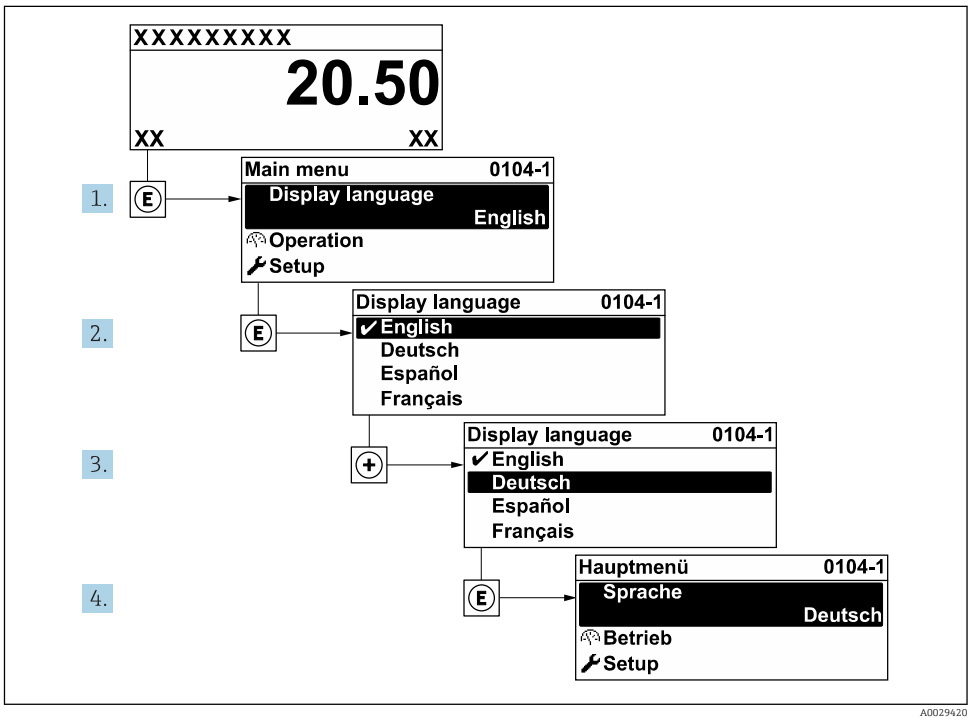
10 Commissioning

10.1 Function check

Before commissioning the measuring device:

▶ Make sure that the post-installation and post-connection checks have been performed.

- "Post-installation check" checklist→ 37
- "Post-connection check" checklist → 63

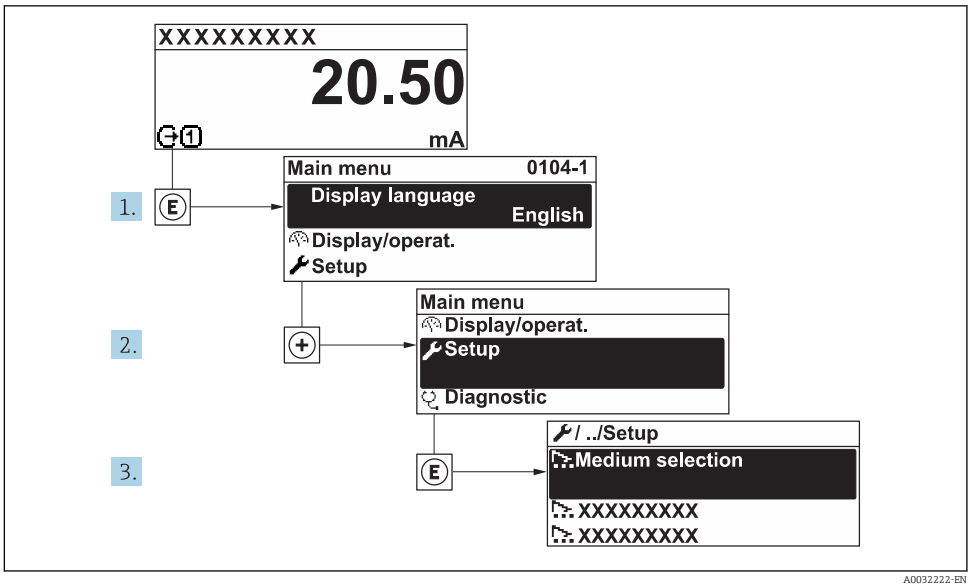


10.2 Switching on the measuring device

▶ After a successful function check, switch on the measuring device.
  ↳ After a successful startup, the local display switches automatically from the startup display to the operational display.

If nothing appears on the local display or a diagnostic message is displayed, refer to the section on "Diagnostics and troubleshooting" → 148.

10.3 Setting the operating language



Factory setting: English or ordered local language

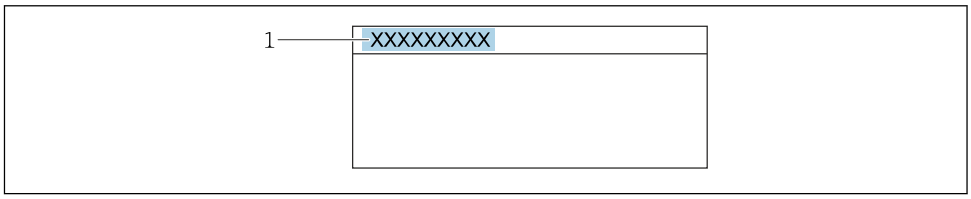
40 *Taking the example of the local display*

10.4 Configuring the measuring device

- The **Setup** menu with its guided wizards contains all the parameters needed for standard operation.
- Navigation to the **Setup** menu

41 *Taking the example of the local display*

The number of submenus and parameters can vary depending on the device version. Certain submenus and parameters in these submenus are not described in the Operation Instructions. Instead a description is provided in the Special Documentation for the device (→ "Supplementary documentation" section).



Setup

Device tag	→ 97
▶ System units	→ 97
▶ I/O configuration	→ 99
▶ Current input 1 to n	→ 101
▶ Status input 1 to n	→ 100
▶ Current output 1 to n	→ 102
▶ Pulse/frequency/switch output 1 to n	→ 105
▶ Relay output 1 to n	→ 116
▶ Double pulse output	→ 118
▶ Display	→ 111
▶ Low flow cut off	→ 113

▶ Empty pipe detection	→ 114
▶ Advanced setup	→ 120

10.4.1 Defining the tag name

To enable fast identification of the measuring point within the system, you can enter a unique designation using the **Device tag** parameter and thus change the factory setting.

42 *Header of the operational display with tag name*

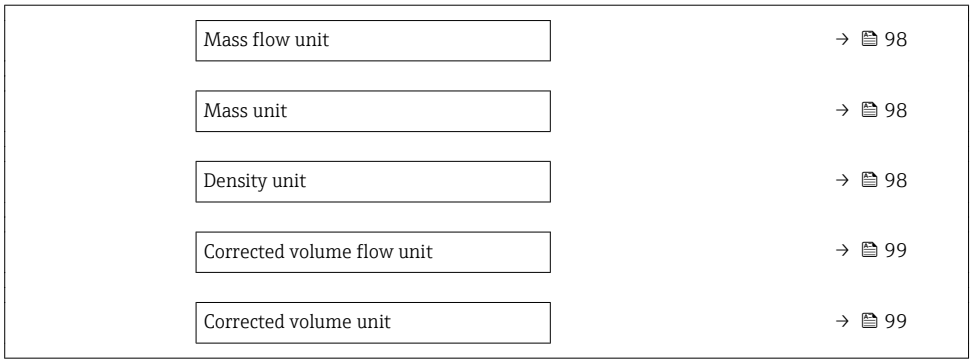
1 Tag name

Enter the tag name in the "FieldCare" operating tool → 89

Navigation
"Setup" menu → Device tag

Parameter overview with brief description

Parameter	Description	User entry	Factory setting
Device tag	Enter the name for the measuring point.	Max. 32 characters, such as letters, numbers or special characters (e.g. @, %, /).	Promag



10.4.2 Setting the system units

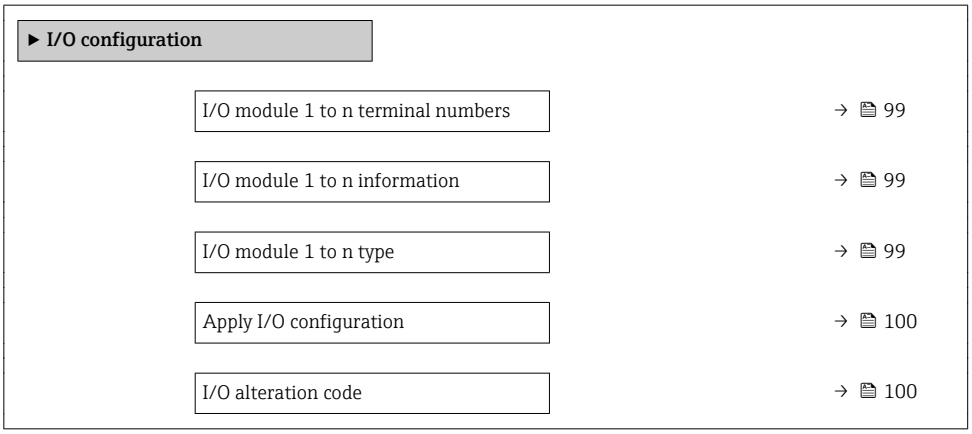
In the **System units** submenu the units of all the measured values can be set.

The number of submenus and parameters can vary depending on the device version. Certain submenus and parameters in these submenus are not described in the Operation Instructions. Instead a description is provided in the Special Documentation for the device (→ "Supplementary documentation" section).

Navigation
"Setup" menu → System units

▶ System units	
Volume flow unit	→ 98
Volume unit	→ 98
Conductivity unit	→ 98
Temperature unit	→ 98

Parameter overview with brief description



Parameter	Prerequisite	Description	Selection	Factory setting
Volume flow unit	–	Select volume flow unit. *Result* The selected unit applies for: ▪ Output ▪ Low flow cut off ▪ Simulation process variable	Unit choose list	Country-specific: ▪ l/h ▪ gal/min (us)
Volume unit	–	Select volume unit.	Unit choose list	Country-specific: ▪ m^3 ▪ gal (us)
Conductivity unit	The **On** option is selected in the **Conductivity measurement** parameter parameter.	Select conductivity unit. *Effect* The selected unit applies for: ▪ Current output ▪ Frequency output ▪ Switch output ▪ Simulation process variable	Unit choose list	µS/cm
Temperature unit	–	Select temperature unit. *Result* The selected unit applies for: ▪ **Temperature** parameter ▪ **Maximum value** parameter ▪ **Minimum value** parameter ▪ **External temperature** parameter ▪ **Maximum value** parameter ▪ **Minimum value** parameter	Unit choose list	Country-specific: ▪ °C ▪ °F
Mass flow unit	–	Select mass flow unit. *Result* The selected unit applies for: ▪ Output ▪ Low flow cut off ▪ Simulation process variable	Unit choose list	Country-specific: ▪ kg/h ▪ lb/min
Mass unit	–	Select mass unit.	Unit choose list	Country-specific: ▪ kg ▪ lb
Density unit	–	Select density unit. *Result* The selected unit applies for: ▪ Output ▪ Simulation process variable	Unit choose list	Country-specific: ▪ kg/l ▪ lb/ft^3

Parameter	Prerequisite	Description	Selection	Factory setting
Corrected volume flow unit	–	Select corrected volume flow unit. *Result* The selected unit applies for: **Corrected volume flow** parameter (→ 139)	Unit choose list	Country-specific: ▪ Nl/h ▪ Sft³/h
Corrected volume unit	–	Select corrected volume unit.	Unit choose list	Country-specific: ▪ Nm³ ▪ Sft³

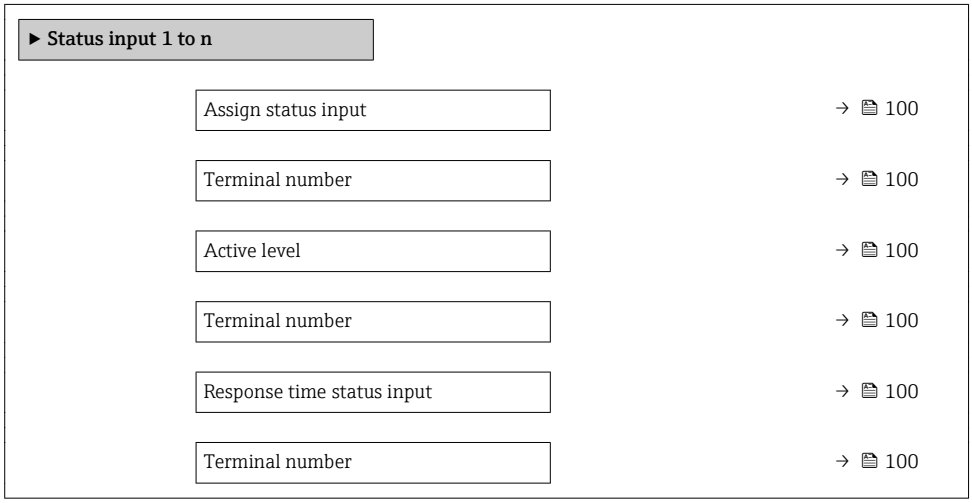
10.4.3 Displaying the I/O configuration

The **I/O configuration** submenu guides the user systematically through all the parameters in which the configuration of the I/O modules is displayed.

Navigation
"Setup" menu → I/O configuration

Parameter overview with brief description

Parameter	Description	User interface / Selection / User entry	Factory setting
I/O module 1 to n terminal numbers	Shows the terminal numbers used by the I/O module.	▪ Not used ▪ 26-27 (I/O 1) ▪ 24-25 (I/O 2) ▪ 22-23 (I/O 3) ▪ 20-21 (I/O 4) *	–
I/O module 1 to n information	Shows information of the plugged I/O module.	▪ Not plugged ▪ Invalid ▪ Not configurable ▪ Configurable ▪ HART	–
I/O module 1 to n type	Shows the I/O module type.	▪ Off ▪ Current output * ▪ Current input * ▪ Status input * ▪ Pulse/frequency/switch output * ▪ Double pulse output * ▪ Relay output *	Off



Parameter	Description	User interface / Selection / User entry	Factory setting
Apply I/O configuration	Apply parameterization of the freely configurable I/O module.	▪ No ▪ Yes	No
I/O alteration code	Enter the code in order to change the I/O configuration.	Positive integer	0

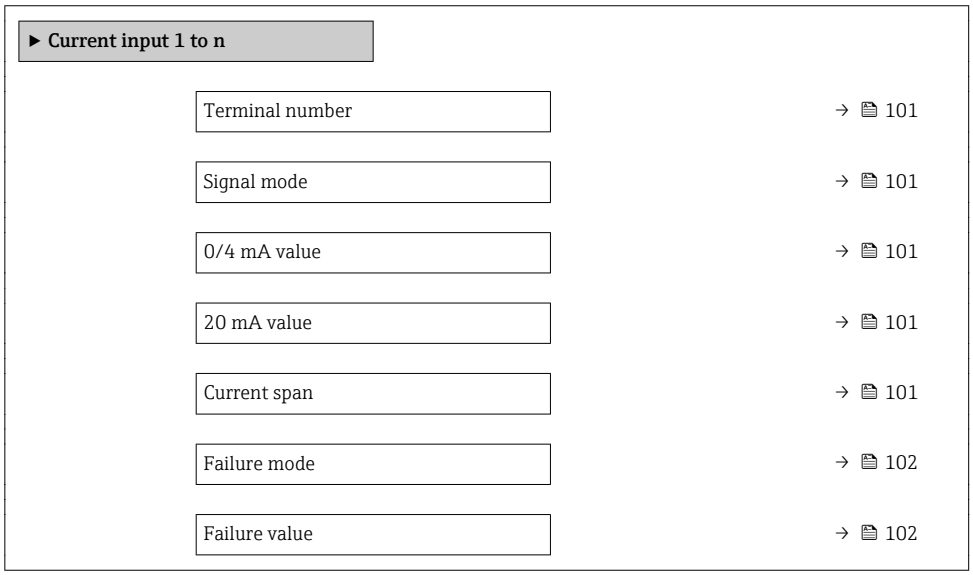
* Visibility depends on order options or device settings

10.4.4 Configuring the status input

The **Status input** submenu guides the user systematically through all the parameters that have to be set for configuring the status input.

Navigation
"Setup" menu → Status input

Parameter overview with brief description



Parameter	Description	User interface / Selection / User entry	Factory setting
Terminal number	Shows the terminal numbers used by the status input module.	▪ Not used ▪ 24-25 (I/O 2) ▪ 22-23 (I/O 3) ▪ 20-21 (I/O 4) *	–
Assign status input	Select function for the status input.	▪ Off ▪ Reset totalizer 1 ▪ Reset totalizer 2 ▪ Reset totalizer 3 ▪ Reset all totalizers ▪ Flow override	Off
Active level	Define input signal level at which the assigned function is triggered.	▪ High ▪ Low	High
Response time status input	Define the minimum amount of time the input signal level must be present before the selected function is triggered.	5 to 200 ms	50 ms

* Visibility depends on order options or device settings

10.4.5 Configuring the current input

The **"Current input" wizard** guides the user systematically through all the parameters that have to be set for configuring the current input.

Navigation
"Setup" menu → Current input

Parameter overview with brief description

Parameter	Prerequisite	Description	User interface / Selection / User entry	Factory setting
Terminal number	–	Shows the terminal numbers used by the current input module.	▪ Not used ▪ 24-25 (I/O 2) ▪ 22-23 (I/O 3) ▪ 20-21 (I/O 4) *	–
Signal mode	The measuring device is **not** approved for use in the hazardous area with type of protection Ex-i.	Select the signal mode for the current input.	▪ Passive ▪ Active *	Active
0/4 mA value	–	Enter 4 mA value.	Signed floating-point number	0
20 mA value	–	Enter 20 mA value.	Signed floating-point number	Depends on country and nominal diameter
Current span	–	Select current range for process value output and upper/lower level for alarm signal.	▪ 4...20 mA (4... 20.5 mA) ▪ 4...20 mA NAMUR (3.8...20.5 mA) ▪ 4...20 mA US (3.9...20.8 mA) ▪ 0...20 mA (0... 20.5 mA)	Country-specific: ▪ 4...20 mA NAMUR (3.8...20.5 mA) ▪ 4...20 mA US (3.9...20.8 mA)

Parameter	Prerequisite	Description	User interface / Selection / User entry	Factory setting
Failure mode	–	Define input behavior in alarm condition.	▪ Alarm ▪ Last valid value ▪ Defined value	Alarm
Failure value	In the **Failure mode** parameter, the **Defined value** option is selected.	Enter value to be used by the device if input value from external device is missing.	Signed floating-point number	0

* Visibility depends on order options or device settings

10.4.6 Configuring the current output

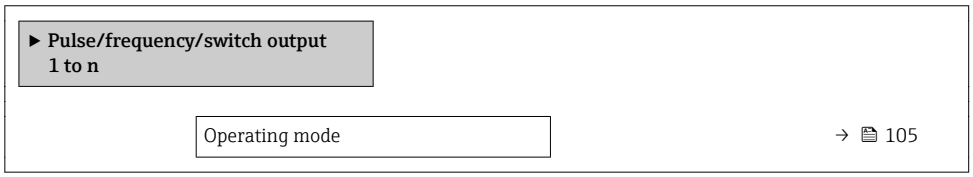
The **Current output** wizard guides you systematically through all the parameters that have to be set for configuring the current output.

Navigation
"Setup" menu → Current output

Parameter overview with brief description

Parameter	Prerequisite	Description	User interface / Selection / User entry	Factory setting
Terminal number	–	Shows the terminal numbers used by the current output module.	▪ Not used ▪ 26-27 (I/O 1) ▪ 24-25 (I/O 2) ▪ 22-23 (I/O 3) ▪ 20-21 (I/O 4) *	–
Signal mode	–	Select the signal mode for the current output.	▪ Active * ▪ Passive *	Active
Assign current output 1 to n	–	Select process variable for current output.	▪ Off * ▪ Volume flow ▪ Mass flow ▪ Corrected volume flow ▪ Flow velocity ▪ Conductivity * ▪ Electronic temperature ▪ Reference electrode potential against PE * ▪ Coil current shot time * ▪ Noise * ▪ Coating measured value * ▪ Test point 1 ▪ Test point 2 ▪ Test point 3	Volume flow
Current span	–	Select current range for process value output and upper/lower level for alarm signal.	▪ 4...20 mA NAMUR (3.8...20.5 mA) ▪ 4...20 mA US (3.9...20.8 mA) ▪ 4...20 mA (4... 20.5 mA) ▪ 0...20 mA (0... 20.5 mA) ▪ Fixed current	Country-specific: ▪ 4...20 mA NAMUR (3.8...20.5 mA) ▪ 4...20 mA US (3.9...20.8 mA)
0/4 mA value	In the **Current span** parameter (→ 🖹 103), one of the following options is selected: ▪ 4...20 mA NAMUR (3.8...20.5 mA) ▪ 4...20 mA US (3.9...20.8 mA) ▪ 4...20 mA (4... 20.5 mA) ▪ 0...20 mA (0... 20.5 mA)	Enter 4 mA value.	Signed floating-point number	Country-specific: ▪ 0 l/h ▪ 0 gal/min (us)
20 mA value	One of the following options is selected in the **Current span** parameter (→ 🖹 103): ▪ 4...20 mA NAMUR (3.8...20.5 mA) ▪ 4...20 mA US (3.9...20.8 mA) ▪ 4...20 mA (4... 20.5 mA) ▪ 0...20 mA (0... 20.5 mA)	Enter 20 mA value.	Signed floating-point number	Depends on country and nominal diameter
Fixed current	The **Fixed current** option is selected in the **Current span** parameter (→ 🖹 103).	Defines the fixed output current.	0 to 22.5 mA	22.5 mA

Parameter	Prerequisite	Description	User interface / Selection / User entry	Factory setting
Damping output 1 to n	A process variable is selected in the **Assign current output** parameter (→ 🖹 103) and one of the following options is selected in the **Current span** parameter (→ 🖹 103): ▪ 4...20 mA NAMUR (3.8...20.5 mA) ▪ 4...20 mA US (3.9...20.8 mA) ▪ 4...20 mA (4... 20.5 mA) ▪ 0...20 mA (0... 20.5 mA)	Set reaction time for output signal to fluctuations in the measured value.	0.0 to 999.9 s	1.0 s
Failure mode	A process variable is selected in the **Assign current output** parameter (→ 🖹 103) and one of the following options is selected in the **Current span** parameter (→ 🖹 103): ▪ 4...20 mA NAMUR (3.8...20.5 mA) ▪ 4...20 mA US (3.9...20.8 mA) ▪ 4...20 mA (4... 20.5 mA) ▪ 0...20 mA (0... 20.5 mA)	Define output behavior in alarm condition.	▪ Min. ▪ Max. ▪ Last valid value ▪ Actual value ▪ Defined value	Max.
Failure current	The **Defined value** option is selected in the **Failure mode** parameter.	Enter current output value in alarm condition.	0 to 22.5 mA	22.5 mA



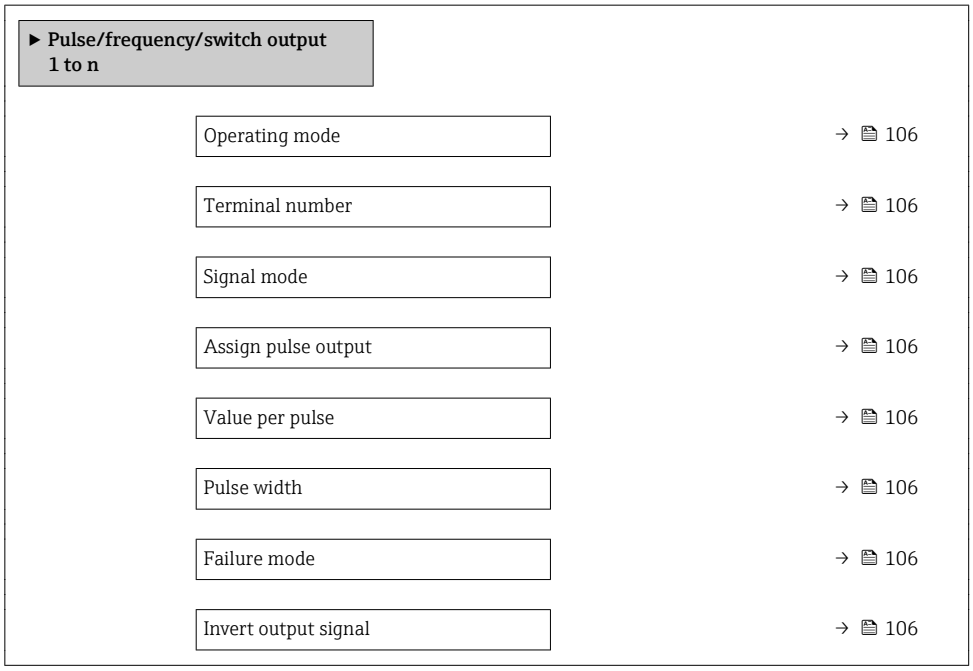
* Visibility depends on order options or device settings

10.4.7 Configuring the pulse/frequency/switch output

The **Pulse/frequency/switch output** wizard guides you systematically through all the parameters that can be set for configuring the selected output type.

Navigation

"Setup" menu → Advanced setup → Pulse/frequency/switch output



Parameter overview with brief description

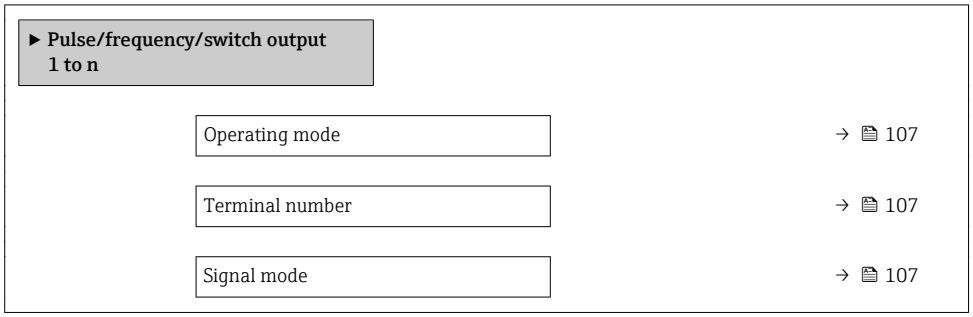
Parameter	Description	Selection	Factory setting
Operating mode	Define the output as a pulse, frequency or switch output.	▪ Pulse ▪ Frequency ▪ Switch	Pulse

Configuring the pulse output

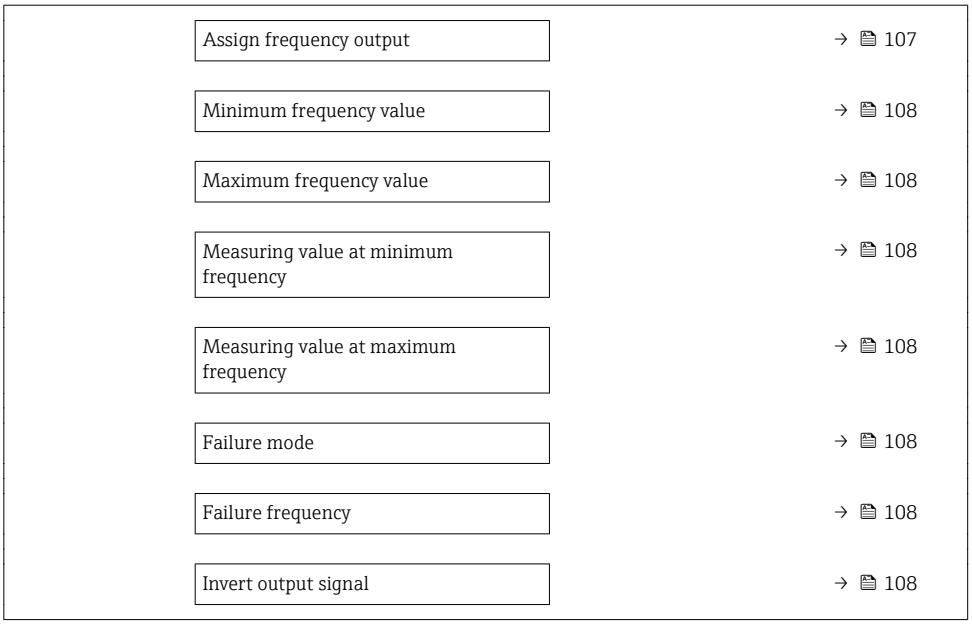
Navigation

"Setup" menu → Pulse/frequency/switch output

Parameter overview with brief description



Parameter	Prerequisite	Description	Selection / User interface / User entry	Factory setting
Operating mode	–	Define the output as a pulse, frequency or switch output.	▪ Pulse ▪ Frequency ▪ Switch	Pulse
Terminal number	–	Shows the terminal numbers used by the PFS output module.	▪ Not used ▪ 24-25 (I/O 2) ▪ 22-23 (I/O 3) ▪ 20-21 (I/O 4) *	–
Signal mode	–	Select the signal mode for the PFS output.	▪ Passive ▪ Active ▪ Passive NAMUR	Passive
Assign pulse output 1 to n	The **Pulse** option is selected in the **Operating mode** parameter parameter.	Select process variable for pulse output.	▪ Off ▪ Volume flow ▪ Mass flow ▪ Corrected volume flow	Off
Pulse scaling	The **Pulse** option is selected in the **Operating mode** parameter (→ 🖹 105) and a process variable is selected in the **Assign pulse output** parameter (→ 🖹 106).	Enter quantity for measured value at which a pulse is output.	Positive floating point number	Depends on country and nominal diameter
Pulse width	The **Pulse** option is selected in the **Operating mode** parameter (→ 🖹 105) and a process variable is selected in the **Assign pulse output** parameter (→ 🖹 106).	Define time width of the output pulse.	0.05 to 2 000 ms	100 ms
Failure mode	The **Pulse** option is selected in the **Operating mode** parameter (→ 🖹 105) and a process variable is selected in the **Assign pulse output** parameter (→ 🖹 106).	Define output behavior in alarm condition.	▪ Actual value ▪ No pulses	No pulses
Invert output signal	–	Invert the output signal.	▪ No ▪ Yes	No



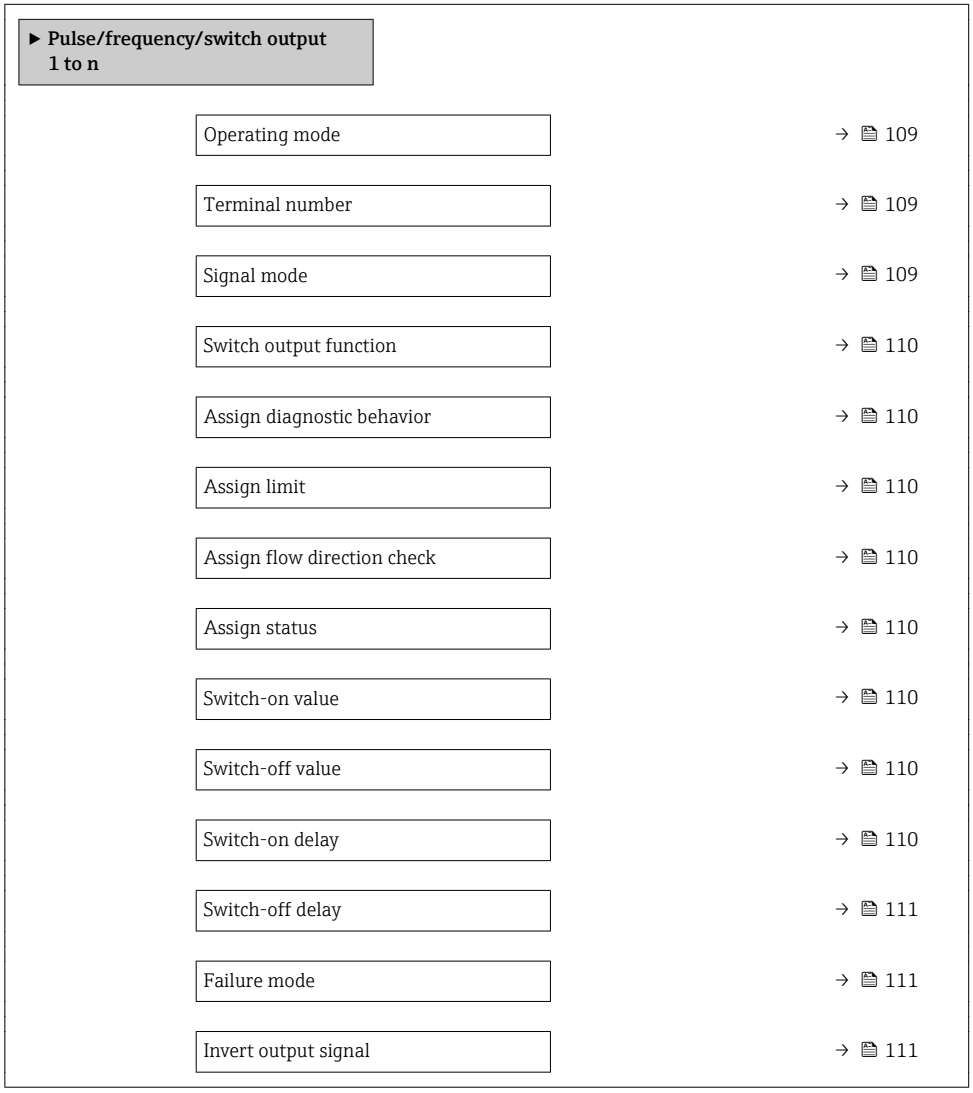
* Visibility depends on order options or device settings

Configuring the frequency output

Navigation

"Setup" menu → Pulse/frequency/switch output

Parameter overview with brief description



Parameter	Prerequisite	Description	Selection / User interface / User entry	Factory setting
Operating mode	–	Define the output as a pulse, frequency or switch output.	▪ Pulse ▪ Frequency ▪ Switch	Pulse
Terminal number	–	Shows the terminal numbers used by the PFS output module.	▪ Not used ▪ 24-25 (I/O 2) ▪ 22-23 (I/O 3) ▪ 20-21 (I/O 4) *	–
Signal mode	–	Select the signal mode for the PFS output.	▪ Passive ▪ Active ▪ Passive NAMUR	Passive
Assign frequency output	The **Frequency** option is selected in the **Operating mode** parameter (→ 105).	Select process variable for frequency output.	▪ Off ▪ Volume flow ▪ Mass flow ▪ Corrected volume flow ▪ Flow velocity ▪ Conductivity * ▪ Electronic temperature ▪ Noise * ▪ Coil current shot time * ▪ Reference electrode potential against PE * ▪ Coating measured value * ▪ Test point 1 ▪ Test point 2 ▪ Test point 3	Off

Parameter	Prerequisite	Description	Selection / User interface / User entry	Factory setting
Minimum frequency value	The **Frequency** option is selected in the **Operating mode** parameter (→ 🖹 105) and a process variable is selected in the **Assign frequency output** parameter (→ 🖹 107).	Enter minimum frequency.	0.0 to 10 000.0 Hz	0.0 Hz
Maximum frequency value	The **Frequency** option is selected in the **Operating mode** parameter (→ 🖹 105) and a process variable is selected in the **Assign frequency output** parameter (→ 🖹 107).	Enter maximum frequency.	0.0 to 10 000.0 Hz	10 000.0 Hz
Measuring value at minimum frequency	The **Frequency** option is selected in the **Operating mode** parameter (→ 🖹 105) and a process variable is selected in the **Assign frequency output** parameter (→ 🖹 107).	Enter measured value for minmum frequency.	Signed floating-point number	Depends on country and nominal diameter
Measuring value at maximum frequency	The **Frequency** option is selected in the **Operating mode** parameter (→ 🖹 105) and a process variable is selected in the **Assign frequency output** parameter (→ 🖹 107).	Enter measured value for maximum frequency.	Signed floating-point number	Depends on country and nominal diameter
Failure mode	The **Frequency** option is selected in the **Operating mode** parameter (→ 🖹 105) and a process variable is selected in the **Assign frequency output** parameter (→ 🖹 107).	Define output behavior in alarm condition.	▪ Actual value ▪ Defined value ▪ 0 Hz	0 Hz
Failure frequency	The **Frequency** option is selected in the **Operating mode** parameter (→ 🖹 105) and a process variable is selected in the **Assign frequency output** parameter (→ 🖹 107).	Enter frequency output value in alarm condition.	0.0 to 12 500.0 Hz	0.0 Hz
Invert output signal	–	Invert the output signal.	▪ No ▪ Yes	No

* Visibility depends on order options or device settings

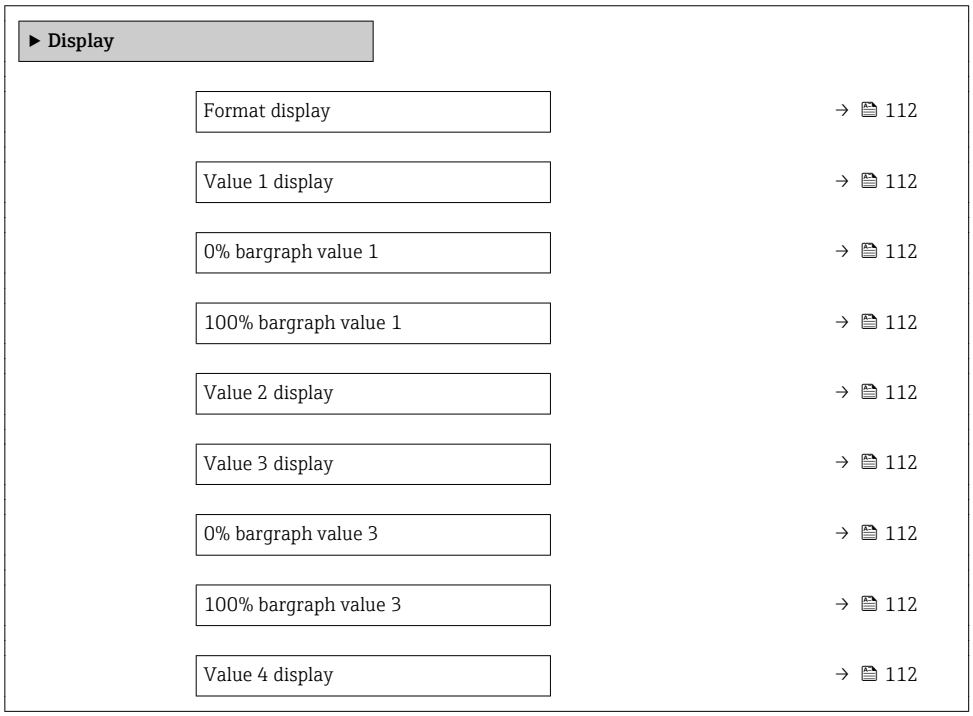
Configuring the switch output

Navigation
"Setup" menu → Pulse/frequency/switch output

Parameter overview with brief description

Parameter	Prerequisite	Description	Selection / User interface / User entry	Factory setting
Operating mode	–	Define the output as a pulse, frequency or switch output.	▪ Pulse ▪ Frequency ▪ Switch	Pulse
Terminal number	–	Shows the terminal numbers used by the PFS output module.	▪ Not used ▪ 24-25 (I/O 2) ▪ 22-23 (I/O 3) ▪ 20-21 (I/O 4) *	–
Signal mode	–	Select the signal mode for the PFS output.	▪ Passive ▪ Active ▪ Passive NAMUR	Passive

Parameter	Prerequisite	Description	Selection / User interface / User entry	Factory setting
Switch output function	The **Switch** option is selected in the **Operating mode** parameter.	Select function for switch output.	▪ Off ▪ On ▪ Diagnostic behavior ▪ Limit ▪ Flow direction check ▪ Status	Off
Assign diagnostic behavior	▪ In the **Operating mode** parameter, the **Switch** option is selected. ▪ In the **Switch output function** parameter, the **Diagnostic behavior** option is selected.	Select diagnostic behavior for switch output.	▪ Alarm ▪ Alarm or warning ▪ Warning	Alarm
Assign limit	▪ The **Switch** option is selected in the **Operating mode** parameter. ▪ The **Limit** option is selected in the **Switch output function** parameter.	Select process variable for limit function.	▪ Off ▪ Volume flow ▪ Mass flow ▪ Corrected volume flow ▪ Flow velocity ▪ Conductivity* ▪ Totalizer 1 ▪ Totalizer 2 ▪ Totalizer 3 ▪ Electronic temperature	Volume flow
Assign flow direction check	▪ The **Switch** option is selected in the **Operating mode** parameter. ▪ The **Flow direction check** option is selected in the **Switch output function** parameter.	Select process variable for flow direction monitoring.	▪ Off ▪ Volume flow ▪ Mass flow ▪ Corrected volume flow	Volume flow
Assign status	▪ The **Switch** option is selected in the **Operating mode** parameter. ▪ The **Status** option is selected in the **Switch output function** parameter.	Select device status for switch output.	▪ Empty pipe detection ▪ Low flow cut off	Empty pipe detection
Switch-on value	▪ The **Switch** option is selected in the **Operating mode** parameter. ▪ The **Limit** option is selected in the **Switch output function** parameter.	Enter measured value for the switch-on point.	Signed floating-point number	Country-specific: ▪ 0 l/h ▪ 0 gal/min (us)
Switch-off value	▪ The **Switch** option is selected in the **Operating mode** parameter. ▪ The **Limit** option is selected in the **Switch output function** parameter.	Enter measured value for the switch-off point.	Signed floating-point number	Country-specific: ▪ 0 l/h ▪ 0 gal/min (us)
Switch-on delay	▪ The **Switch** option is selected in the **Operating mode** parameter. ▪ The **Limit** option is selected in the **Switch output function** parameter.	Define delay for the switch-on of status output.	0.0 to 100.0 s	0.0 s



Parameter	Prerequisite	Description	Selection / User interface / User entry	Factory setting
Switch-off delay	▪ The **Switch** option is selected in the **Operating mode** parameter. ▪ The **Limit** option is selected in the **Switch output function** parameter.	Define delay for the switch-off of status output.	0.0 to 100.0 s	0.0 s
Failure mode	–	Define output behavior in alarm condition.	▪ Actual status ▪ Open ▪ Closed	Open
Invert output signal	–	Invert the output signal.	▪ No ▪ Yes	No

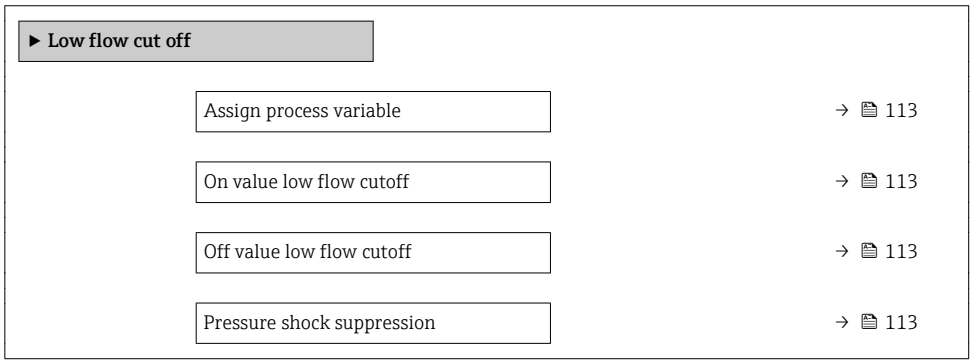
* Visibility depends on order options or device settings

10.4.8 Configuring the local display

The **Display** wizard guides you systematically through all the parameters that can configured for configuring the local display.

Navigation
"Setup" menu → Display

Parameter overview with brief description



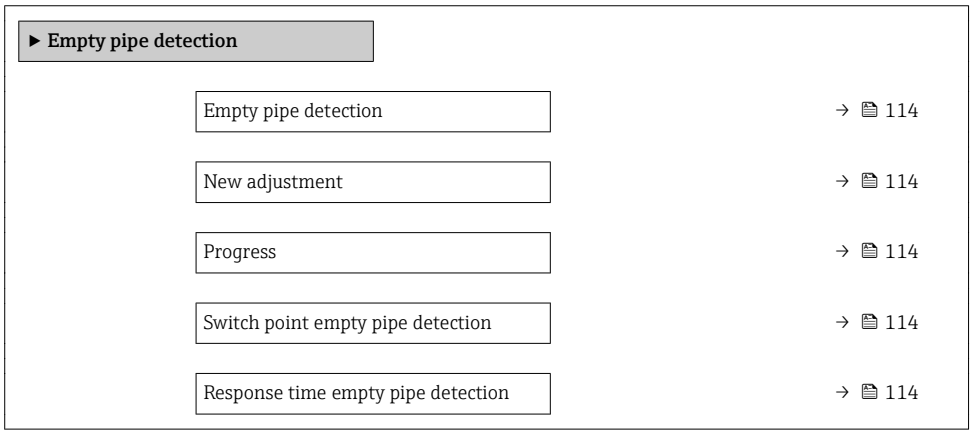
Parameter	Prerequisite	Description	Selection / User entry	Factory setting
Format display	A local display is provided.	Select how measured values are shown on the display.	▪ 1 value, max. size ▪ 1 bargraph + 1 value ▪ 2 values ▪ 1 value large + 2 values ▪ 4 values	1 value, max. size
Value 1 display	A local display is provided.	Select the measured value that is shown on the local display.	▪ Volume flow ▪ Mass flow ▪ Corrected volume flow ▪ Flow velocity ▪ Totalizer 1 ▪ Totalizer 2 ▪ Totalizer 3 ▪ Current output 1 * ▪ Current output 2 * ▪ Current output 3 * ▪ Current output 4 * ▪ Electronic temperature ▪ Noise * ▪ Coil current shot time * ▪ Reference electrode potential against PE * ▪ Coating measured value * ▪ Test point 1 ▪ Test point 2 ▪ Test point 3	Volume flow
0% bargraph value 1	A local display is provided.	Enter 0% value for bar graph display.	Signed floating-point number	Country-specific: ▪ 0 l/h ▪ 0 gal/min (us)
100% bargraph value 1	A local display is provided.	Enter 100% value for bar graph display.	Signed floating-point number	Depends on country and nominal diameter
Value 2 display	A local display is provided.	Select the measured value that is shown on the local display.	For the picklist, see the **Value 2 display** parameter (→ 112)	None
Value 3 display	A local display is provided.	Select the measured value that is shown on the local display.	For the picklist, see the **Value 2 display** parameter (→ 112)	None
0% bargraph value 3	A selection was made in the **Value 3 display** parameter.	Enter 0% value for bar graph display.	Signed floating-point number	Country-specific: ▪ 0 l/h ▪ 0 gal/min (us)
100% bargraph value 3	A selection was made in the **Value 3 display** parameter.	Enter 100% value for bar graph display.	Signed floating-point number	0
Value 4 display	A local display is provided.	Select the measured value that is shown on the local display.	For the picklist, see the **Value 2 display** parameter (→ 112)	None

* Visibility depends on order options or device settings

10.4.9 Configuring the low flow cut off

The **Low flow cut off** wizard systematically guides the user through all the parameters that must be set to configure low flow cut off.

Navigation
"Setup" menu → Low flow cut off



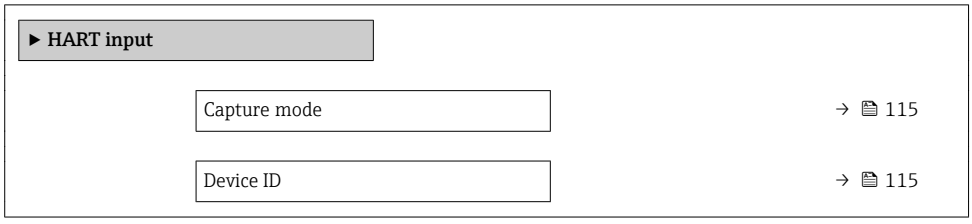
Parameter overview with brief description

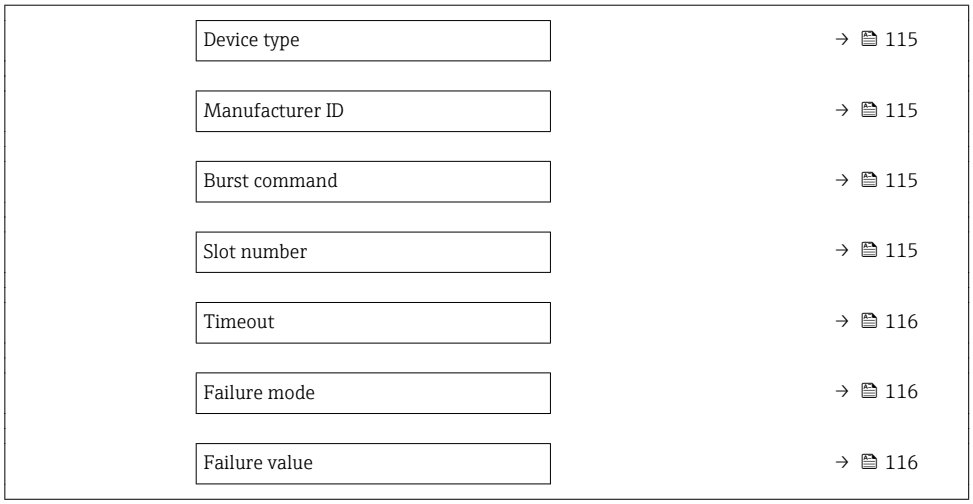
Parameter	Prerequisite	Description	Selection / User entry	Factory setting
Assign process variable	–	Select process variable for low flow cut off.	▪ Off ▪ Volume flow ▪ Mass flow ▪ Corrected volume flow	Volume flow
On value low flow cutoff	A process variable is selected in the **Assign process variable** parameter (→ 113).	Enter on value for low flow cut off.	Positive floating-point number	Depends on country and nominal diameter
Off value low flow cutoff	A process variable is selected in the **Assign process variable** parameter (→ 113).	Enter off value for low flow cut off.	0 to 100.0 %	50 %
Pressure shock suppression	A process variable is selected in the **Assign process variable** parameter (→ 113).	Enter time frame for signal suppression (= active pressure shock suppression).	0 to 100 s	0 s

10.4.10 Configuring empty pipe detection

The **Empty pipe detection** submenu contains parameters that must be configured for the configuration of empty pipe detection.

Navigation
"Setup" menu → Empty pipe detection





Parameter overview with brief description

Parameter	Prerequisite	Description	Selection / User interface / User entry	Factory setting
Empty pipe detection	–	Switch empty pipe detection on and off.	▪ Off ▪ On	Off
New adjustment	The **On** option is selected in the **Empty pipe detection** parameter.	Select type of adjustment.	▪ Cancel ▪ Empty pipe adjust ▪ Full pipe adjust	Cancel
Progress	The **On** option is selected in the **Empty pipe detection** parameter.	Shows the progress.	▪ Ok ▪ Busy ▪ Not ok	–
Switch point empty pipe detection	The **On** option is selected in the **Empty pipe detection** parameter.	Enter hysteresis in %, below this value the measuring tube will detected as empty.	0 to 100 %	10 %
Response time empty pipe detection	A process variable is selected in the **Assign process variable** parameter (→ 114).	Enter the time before diagnostic message S862 "Pipe empty" is displayed for empty pipe detection.	0 to 100 s	1 s

10.4.11 Configuring the HART input

Navigation
"Setup" menu → HART input

"Configuration" submenu

Navigation
"Expert" menu → Communication → HART input → Configuration

Parameter overview with brief description

Parameter	Prerequisite	Description	Selection / User entry	Factory setting
Capture mode	–	Select capture mode via burst or master communication.	▪ Off ▪ Burst network ▪ Master network	Off
Device ID	The **Master network** option is selected in the **Capture mode** parameter.	Enter device ID of external device.	6-digit value: ▪ Via local operation: enter as hexadecimal or decimal number ▪ Via operating tool: enter as decimal number	0
Device type	In the **Capture mode** parameter, the **Master network** option is selected.	Enter device type of external device.	2-digit hexadecimal number	0x00
Manufacturer ID	The **Master network** option is selected in the **Capture mode** parameter.	Enter manufacture ID of external device.	2-digit value: ▪ Via local operation: enter as hexadecimal or decimal number ▪ Via operating tool: enter as decimal number	0
Burst command	The **Burst network** option or the **Master network** option are selected in the **Capture mode** parameter.	Select command to read in external process variable.	▪ Command 1 ▪ Command 3 ▪ Command 9 ▪ Command 33	Command 1
Slot number	The **Burst network** option or the **Master network** option is selected in the **Capture mode** parameter.	Define position of external process variable in burst command.	1 to 8	1

Parameter	Prerequisite	Description	Selection / User entry	Factory setting
Timeout	The **Burst network** option or the **Master network** option is selected in the **Capture mode** parameter.	Enter deadline for process variable of external device. If the waiting time is exceeded, the **⊗F410 Data transfer** diagnostic message is displayed.	1 to 120 s	5 s
Failure mode	In the **Capture mode** parameter, the **Burst network** option or **Master network** option is selected.	Define behavior if external process variable is missed.	▪ Alarm ▪ Last valid value ▪ Defined value	Alarm
Failure value	The following conditions are met: ▪ In the **Capture mode** parameter, the **Burst network** option or **Master network** option is selected. ▪ In the **Failure mode** parameter, the **Defined value** option is selected.	Enter value to be used by the device if input value from external device is missing.	Signed floating-point number	0

"Input" submenu

Navigation
"Expert" menu → Communication → HART input → Input
